INDUSTRIAL CANADA

Make Up Your Mind Right Now

that you will attend the Annual Meeting of the C. M. A. It is going to be the best ever—the biggest and most enthusiastic Convention in the history of the Association. As a member you will be proud of the record of results accomplished during the past year. In direct and indirect benefits they represent thousands upon thousands of dollars to the manufacturers of Canada. Of this you got your share. With your help at the Convention we may be able to devise means whereby another year we can make an even better showing. Remember the place and date.

King Edward Hotel

Toronto, Sept. 24-26.

PUBLISHED MONTHLY *by*
The CANADIAN MANUFACTURERS
ASSOCIATION, *Incorporated.*

HEAD OFFICE, TORONTO.
BRANCH OFFICES, TORONTO, MONTREAL,
WINNIPEG, VANCOUVER, HALIFAX, QUEBEC.

The Radiant Shelby Lamp...

neither looks nor acts like any other lamp.

The only feature of resemblance is the price.

With double coil carbon, long life, useful light, perfect diffusion of rays.

RADIANT SHELBY LAMPS are designed to distribute the largest possible quantity of light through the end of the lamp opposite the base. In order to obtain from 50% to 100% more light on the work beneath the lamp use the Radiant Shelby with the same rated candle power as those you had in use. Specify the amount of current your lamps require and we will guarantee results.

A Good Business Man Knows A Good Business Proposition

PORTAGE LA PRAIRIE

Offers larger returns for money invested by Manufacturers
Wholesalers and Jobbers than any other Western City

☞ Free Sites, Exemption, Lowest Expenses and Unequalled Railroad Facilities in Connection with Industries is a Good Business Proposition that all Good Business Men will Recognize at Once.

☞ Portage la Prairie, Manitoba, is just 56 miles due west of Winnipeg, on the main lines of the Canadian Pacific, the Canadian Northern, the Grand Trunk Pacific, and the Midland branch of the Great Northern. All Roads Intersect.

☞ Portage la Prairie is therefore the Keystone of the Railroad Shipping and Distributing Situation of Western Canada, and is in the Best Position of any Western City to place her wares all over a vast territory where the demand for every known manufactured article is increasing daily.

☞ Equitable freight rates, together with a general Interchange Transfer System between our Four Great Railways, eliminates excessive charges and delays that are prevalent elsewhere.

☞ Conditions here are most propitious for the following :—Felt Shoe Factories, Skate Factories, Starch Factories, Pickling Plants, Cannery and Can Factory, Strawboard and Box Factory, Biscuit Works, Carriage Works, Iron and Stove Foundry, Soap Factory, Sash and Door Factory, Malting Plants, Distilleries, Agricultural Implement Works and Machinery of Every Kind.

VALUABLE
WATER FRONTAGE

In FORT WILLIAM

This property solves the problem of production for the enormous market of wealthy consumers in Western Canada. This market is making millionaires every year. As vast as a continent, its population advancing by leaps of a quarter of a million yearly, its wealth taxing the capacity of its elevators and railroads—very few minds can grasp the situation. Ten men in a million will. I am looking for these ten, for they are looking for this water frontage property. These lots have a frontage on the water of 100 feet by a depth of 500 feet, more or less. They are all on Island No. 1 in Fort William Harbor. They offer

- Cheap Electrical Power**, developed at Kakabeka Falls.
- Unequaled Conveniences for Shipping** by land or water.
- Competitive Rates** by three Transcontinental Railroads and several Water Transportation Companies.
- Inexhaustible Raw Material and Unlimited Market** in close proximity.

Fort William is nearer the market than any point farther East, has cheaper power than any point farther West, and is situated so fortunately that it possesses by either land or water, the most intimate connection with both East and West. Our country is bounding ahead. It is a land of opportunities, but they are being seized rapidly. Fort William water frontage means for you for a select number.

THE 1907 CONVENTION.

THE present issue marks the close of another year in the Association's life, a year whose story of deeds accomplished will one day be written large in the industrial history of the country. Every department has bristled with activity. Every committee has worked loyally and faithfully. Every officer has given to the Association the best that was in him.

The united result of their efforts will be embodied in the various reports to be presented to the annual meeting, which will be held in the King Edward Hotel, Toronto, September 24th to 26th next. These reports will be worth coming across Canada to hear. They will contain no padding—the record of results achieved leaves no room for anything of the sort—but will be brimful of meat, each item a crisp, business-like statement of fact, involving dollars to every member of the Association.

Interesting and instructive addresses are promised at convenient intervals during the business sessions. They will be delivered by men who are recognized authorities in their several departments. Reforestation, reciprocal demurrage and industrial education are three of the subjects to be dealt with. All are of vital importance to the manufacturing community.

An elaborate programme of entertainment will keep the spare moments fully occupied, while the closing banquet will,

according to the committee in charge, eclipse anything of the kind ever before attempted in Toronto.

Remember the date—September 24th to 26th—and promise yourself the pleasure of attending. You will be well repaid.

MANUFACTURERS' CONTRIBUTION TO NATIONAL PROSPERITY.

NOT the least interesting feature of the census reports that are now being given out, is the increase in wages paid by manufacturing establishments to employees. The enormous total of over one hundred and sixty-four million dollars (\$164,394,490) paid out in the year 1906 for labor alone is a telling indication of the importance of Canada's manufactures. A comparison for the years 1901 and 1906 is instructive. In the former year the census shows 344,035 wage-earners, receiving \$113,249,350 in wages. Five years later these figures have advanced to 391,487 and \$164,394,490, respectively.

Two points are outstanding in these comparative statements. One is the immense amount of money distributed annually by manufacturers for labor. The second is the great advance in the individual earnings. In 1901 the average wage per year for all employees was \$329.18; in 1906 the average wage was \$419.92. The increase averaged \$90.74, or over 27 per cent. These are points which must be considered in estimating the country's prosperity. When manufacturers urge the importance of so fixing the tariff that the industries will be given a chance to live, they are at times met with the argument that on the farmers depends the prosperity of the country. Having made such a general and, to themselves, convincing statement of their economic views, the low tariff advocates feel that further argument is useless; as, indeed, it is from their standpoint. But the figures before us put a somewhat different complexion on their statements. For instance, we may assume that a wage-earner represents a family of four on the average. The returns then show that 1,565,948, practically a fourth of the total population, are directly dependent upon manufacturing for their livelihood. But this does not express the whole truth. The returns are for establishments employing five or more hands. There are the countless small shops, where from one to four work, differing merely in degree from their bigger neighbors. They all pay workers for work that may be done in some other country, if tariff conditions are unfavorable enough here. Add to these the miners of coal and iron and other minerals, and the many other subsidiary activities which with shopkeepers, financial institutions and professional men represent a small army of workers.

Not that there is any tendency to minimize the importance of agriculture. It is a necessary element in the country's prosperity. Besides being productive itself, it supplies a market for much that is manufactured. But there is a correlation between industries, and the mere mention of the amount of money set in circulation among laborers shows the large part manufactures play in the general advancement.

Canada has been enjoying a period of prosperity. Who will say that the manufacturers have not contributed as much to that prosperity as they have received from it? The Government returns bear eloquent testimony to the benefits the workingman has reaped. He has been able to buy liberally of the products of the farm. The money that has been set in motion by the employer has circulated throughout every part of the country, to the advantage of the whole. There is not a citizen of Canada who is not the better for the industrial prosperity of the past few years.

Would not the country be proportionately better off if more manufacturing establishments were situated here? If instead of four hundred thousand employees there were a million, and instead of a million and a half paid out in wages there were three or four million? This is no idle dream. It could be done. Canada consumes enough manufactures to employ this number. If the tariff were high enough it would be accomplished.

DISCRIMINATION IN CIVIC PURCHASES.

THE citizens of Toronto periodically pay for the demagogic methods of some of their representatives. Recently it developed that no tenders were received from Toronto manufacturers for certain municipal supplies. The reason was that the specifications contained a clause requiring union wages to be paid on all work in connection with the contract. The local manufacturers could not fairly bind themselves in any such way. As a consequence competition was narrowed, which, in the long run, at any rate, will result in higher prices being paid by the people.

The crux of the situation does not centre around a choice between sweat-shop methods and fair wages. No citizen wants, or has a right to ask for, civic supplies which have been produced other than under fair conditions of labor. Sweat-shop methods are disappearing from Toronto, nor did they ever enter into the products which the city buys to any material extent.

The merging of the question of unfair and fair wages and unfair and union wages has clouded the original problem. In making a demand for union wages the city authorities go beyond all reason. The union scale is not struck at what is considered a fair figure. It is set at absolutely the highest figure which the union can obtain. If the employers are "up against it" in the matter of getting out work, the union will force up the scale. If conditions of demand, or transportation, or any thing else, are favorable to the union, a demand for higher wages follows.

Thus the "fairness" of the wage, in the sense of its having a fixed relation to the work done and the cost of living, is a myth. A fair wage and a union wage are not interchangeable terms.

Manufacturers are straightforward and consistent in their refusal to subscribe to such conditions. The company who are supplying goods have, in nine cases out of ten, only done a tithe of the total work on them. What they have received as a raw material has passed through probably a dozen hands before them. How can the last man say whether fair wages or union wages were paid on the earlier operations or not?

The controllers or aldermen who are responsible for the

present regulations have acted most unfairly. The union wage clause is an example of rank discrimination. Toronto has in its body of citizens many men who are not members of unions. Why should their work be refused by the city, while that of another class is accepted? Their work may be just as good or better. Membership in a union is not a certificate of efficiency. They may be law-abiding, industrious citizens; yet the product of their labor will not be accepted by the city. And Toronto has to go outside for its supplies. This dog-in-the-manger attitude of the unions, which they have succeeded in foisting off on a weak-kneed Council, works no good to the city, but much harm. Class legislation was ever pernicious.

JAPANESE IMMIGRATION.

MR. R. G. MACPHERSON, M.P., has taken strong ground on the question of Japanese immigration into Western Canada. Mr. Macpherson is in a good position to estimate the effects of Asiatic immigration, as he is a resident of Vancouver and represents the city in the Federal Parliament. The objection he makes is that the Japanese coolie is an inferior type and cannot be assimilated by the white residents. Hence he is not only a disturbing influence in industrial circles, but he is a menace to the moral life of the whites, as is invariably the case where higher civilization is brought into contact with an inferior people.

The question is a difficult one to face, yet it is of such great importance that it must be considered by the Canadian Government. Nor does it rest alone with the Canadian authorities. Their hands are practically tied by the British treaty with Japan, which makes the treatment of the Japanese one of Imperial import. It may fairly be questioned whether the British Government were justified in effecting a treaty which would compromise the action of a colony to such a vital extent as this has done.

Not that the advisability or the reverse of Japanese immigration has been satisfactorily settled yet. Canada, especially in the West, has a great need for cheap labor. We have almost illimitable natural resources waiting development; we have enormous tracts of agricultural lands needing but a railroad to change them into smiling wheat-fields. Japanese can be used to great advantage in these works. Moreover, the question of servants is more difficult in the West even than in the East. Asiatics have proven themselves willing and capable in this capacity.

The material advancement of the country is much; but the moral calibre of its inhabitants is more. In developing our resources with Asiatic labor, are we paying too high a price for our material prosperity? After all, our Western population is still comparatively small. There does not appear to be the slightest possibility of an admixture of the races. Still "East is East, and West is West, and never the twain shall meet." We are of a different civilization from them, and so we must count on having them live among us but not of us, not understanding our principles or motives. This is the danger to which Mr. Macpherson draws attention.

It is, as we have said, far from being an easy problem to solve. Japan is joined to the Empire by a particularly strong bond. The conditions surrounding Japanese immigration apply equally, if not to a greater extent, to natives of India, who profess the same allegiance as we. What is the solution? Are the effects on the character of our people likely to be such that exclusion is advisable, even at the cost of a labor supply that we urgently need? Or are the fears of those whose point of view Mr. Macpherson represents exaggerated? These are questions for our statesmen to consider.

SOME IMPORTANT RULINGS.

SPECIAL attention is called to the articles in this issue of INDUSTRIAL CANADA, outlining the changes which have been effected by the recent decisions of the Railway Commission. Not since the establishment of the Board has a decision been given having such widespread and important influence as have the findings in the International Rate Case and the New Classification.

The favorable orders which have now been made are the result of vigorous efforts carried on by the Canadian Manufacturers' Association ever since the inauguration of its transportation department. The results attained and the persistent work required during the many months while the negotiations were taking place, amply illustrate the necessity of having some organized machinery for taking up such problems. No single shipper has the time or the facilities for undertaking such a work.

The International Rate Case was based primarily on the "long and short haul clause" of the Railway Act. Up to the present time shippers in Windsor have been compelled to pay higher rates to points in Eastern Canada than competitors in Detroit. The same inequality extended to all shipping points in Western Ontario. The railways attempted to cover up the manifest unfairness of the tolls by introducing arguments based on the question of competition. However, the Act is explicit on the point, and the present decision of the Board is only putting into force a principle which exists within the law itself. A charge cannot be greater for a short haul than for a longer haul along the same line.

The saving to shippers will be very great, although the rates are not yet as low as they should be. A reference to the order, which is printed in another column, will show under what a burden manufacturers and others have been laboring. In many cases the railways have, by their high rates to Canadians, nullified the effects of the tariff as a protection to industry. The substantial reductions will be welcomed as a very tangible relief under existing circumstances.

Of even greater importance to the shipping public is the order calling for the adoption of the new classification not later than September 1st. This order is far-reaching in its effect. There has been no general revision of the classification for years. As an inevitable consequence the present classification is anything but scientific. The radical change in the owner's risk clause, by which two hundred and forty items have had this condition removed, shows the general tendency of the new regulations.

A NEW SPHERE OF USEFULNESS.

AT its annual meeting the Canadian Manufacturers' Association will be asked to approve of the establishment of a department for the collection of overdue accounts, to be operated along lines, details of which are now being worked out by the Commercial Intelligence Committee.

This important service is one from which every member will be able to derive a direct benefit. Bad debts are bound to be contracted, in spite of the greatest care, and once contracted they are a source of untold worry and annoyance. No business house but has its share of them, and few indeed are those that do not at some time or other make use of the collecting agency. The Agency furnishes a convenient method of disposing of a task that is generally regarded as distasteful, added to which it has the advantage of being able to produce results when the individual alone is often unsuccessful.

The Association now proposes to constitute itself such an agency for the benefit of its members. And it does so under

circumstances which promise well for the success of its operations.

Many a debtor who pays little or no attention to the average dunning letter will think twice before he refuses to give heed to the polite request of the solicitors for the Canadian Manufacturers' Association. To men of this stamp credit is everything, and they will probably surprise even themselves by their ability to raise the needful when confronted with the threatened destruction of their credit rating among all the big manufacturing houses of the Dominion.

In conjunction with the above it is also proposed to have the Association act for members in winding up insolvent estates. Prompt and concerted action on the part of creditors would frequently be the means of checking the frauds that are perpetrated before assignment. Such frauds ought not to go unpunished, yet the individual rarely cares about taking the initiative. But what the individual hesitates about doing the Association can do without fear, and it would doubtless be found that a few rigid prosecutions would exert a most salutary influence in checking a practice that is all too common.

The advantages of such a department are almost too obvious to call for explanation. The wonder is that the Association has never taken the matter up before. Its adoption now, however, after so much has been done in the fields of insurance, transportation, legislation, etc., furnishes new evidence of the fact that the Association is not yet done growing. By personal services of this kind it is steadily strengthening its hold on the manufacturers of Canada and acquiring for itself an influence and a prestige wielded by no other business organization in the Dominion.

THE MAXIMUM OF PROSPERITY.

THERE are no complaints by manufacturers about the prevailing prosperity. The fact that most manufacturing plants are running to their utmost capacity is ample proof that manufacturers are not taking a selfish view of things when they deplore the great amount of manufactured goods which are being imported annually into Canada. It probably means much less to the manufacturers if more industries are started here than it does to the farmers. To the former it means greater competition at their very doors, with more difficulty in the securing of an adequate labor supply. To the latter it means a greater demand for the products of the farm, and consequently quicker and better returns.

But when we consider the material benefits which have been conferred on the municipality and the surrounding country by the establishment of such works as the Canadian Westinghouse plant in Hamilton, the Pratt & Whitney factory in Dundas, and several other branches of United States companies, we can realize what we lose by not having many others who are now manufacturing in the United States and selling in Canada. For every million dollars' worth of goods we import we are supporting in a foreign country an industrial army of workmen and officers. Through these money is regularly put in circulation, helping merchants, farmers and manufacturers. It is the absence of these, which are within our reach, that is the subject of complaint. It is purely a question of tariff. If manufacturing abroad were discouraged they would operate on this side of the line, employing many men, developing subsidiary industries, giving additional business to transportation companies, and encouraging the settlement of the country.

The great need of Canada, we have been told time out of mention, is population. The sparseness of the country's

settlement works to the disadvantage of all. Up to a certain extent, at least, density of population tends to economy and efficiency of service. Transportation facilities increase, postal, telegraph, telephone and express services become more frequent and better, the provision of necessary supplies and luxuries becomes easier. More factories will play their part in bringing about the desired end. They will dot the country with towns, which will be centres of mercantile and educational life; and they will encourage the settlement of the now uncultivated agricultural lands. Manufacturers do not want prosperity at the expense of the farmer. They recognize that the truest prosperity will result from a harmonious growth of all classes.

CANADA'S FISHERIES.

THE monetary value of Canadian fisheries is discussed by the *Montreal Witness*, in a comment on a recent statement that, with proper care, the waters of Canada can be made to yield a yearly output in value in excess of our total possible agricultural output. "If," it says, "there really are such wonderful possibilities in our Canadian fisheries, which only require 'proper care' in order to make them available, it would seem to be the part of wisdom in Canadians to see that the proper care was given them, for although our fisheries have been developed for centuries, yet the value of their annual output does not now equal that of our cheese factories, which are but the growth of one-quarter of a century. Although nearly four million dollars has during the past twenty-five years been paid in the form of bounties to Canadian fishermen doing business on the eastern coasts of the Dominion, yet the value of the salt water fish, including oysters and lobsters, caught annually has shown but a trifling increase during that time, and the fishermen belonging to the Province of Quebec have a greatly diminished output to show now, compared with what they had twenty-five years ago. Owing to the operations of fish hatcheries, the fresh water fisheries of Ontario have been increasing their annual output considerably of late, yet there seems to be room for a manifold greater increase in that quarter. The older inhabitants can still remember the time when Atlantic salmon were to be found in abundance in the little rivers and streams emptying into Lake Ontario, and there seemed to be no limit to the supplies of whitefish and salmon trout in that lake. What is the condition of things at present? The Atlantic salmon have long since forsaken Ontario waters, and the whitefish and the salmon trout have become few and far between in Lake Ontario. The numerous American and Canadian fish hatcheries, situated on the shores of the upper lakes, are now sending hundreds of millions of fry yearly into those waters. This has already greatly improved the fishing there, yet so long as the sawdust nuisance is permitted to pollute the streams the products of the Canadian fisheries will continue to be of small account in comparison with Canadian agricultural products. The total value of all the fish caught—not including lobsters and oysters—during the year 1900, in the four provinces of Quebec, New Brunswick, Nova Scotia, and Prince Edward Island, was \$11,411,338. The value of the lobsters secured was \$3,055,350, and of the oysters the value was \$155,680. The value of the fish caught in the waters of Ontario in the year 1900 was \$1,333,294; in Manitoba and the Territories the value of fish caught was \$718,159, and in British Columbia the value of the fish and fur seals caught was \$4,878,820. The expenditure by the Government in connection with the fisheries during the fiscal year ended June 30th, 1901, was \$491,569, the chief items of expenditure being \$158,802 paid in bounties to

the fishermen, while the fisheries protection service cost \$121,211. The Government revenue, fines, license fees, and so forth, derived from the fisheries in the year was \$88,145."

OUR ADVERSE TRADE BALANCE.

COMMENTING on an article in the July issue of *INDUSTRIAL CANADA*, in which the serious deficiency of exports as compared with imports was pointed out, the *Weekly Sun* says that "if the argument is sound then Great Britain must already be on the commercial rocks, because in the last eleven years the imports of the Mother Country have exceeded her exports by a sum aggregating over twelve billion dollars. Even so wealthy a state as Great Britain could not stand up under an annual addition of from one billion to one and a quarter billion dollars to the national mortgage."

The *Sun* does not state the whole case. If Great Britain's wealth consisted entirely of her products, natural and manufactured, as Canada's does, then she would undoubtedly be in a serious condition as a result of this disparity. More so even than Canada, for she is no longer making capital expenditure to develop and open up a new country. It is a simple economic fact that no individual, or combination of individuals, as represented by a nation, can continue to buy more than they sell without bringing on a financial crisis, unless there are other means of revenue apart from these transactions.

What is the position before us? Great Britain buys over a billion a year more than she sells. Yes, but her revenue, in many cases as a result of this business, is annually many times a billion. British fire insurance companies take out of Canada alone eight and a half millions a year in premiums. They get probably twenty times that in the United States. These companies operate in every corner of the globe. Then there is the marine insurance, which reaches enormous proportions annually. British companies have no opposition in this field. British capital is being used in all parts of the world to build railways, to construct government works, to carry on private industries. From all of these flows in a golden stream of profits. Lastly, Great Britain takes her toll from the sea in her splendid carrying trade. These are what make an adverse trade balance of little importance to the Mother Country.

Canada has no such sources of revenue to offset a losing trade. What she buys from other countries she must repay in exchange. The money that we have to buy with comes from what we can sell abroad. Therefore, when Canada's imports exceed her exports by \$76,710,048, as they did in twelve months ending April 30th, there is a debt of that much chalked up against us somewhere.

Canadian and British conditions are so fundamentally different that one cannot argue from one to the other. In settling our fiscal policy we have to look to the conditions obtaining in Canada, not in England. The *Weekly Sun* does not adduce any proof to show that our adverse trade balance is anything but dangerous.

The city of Toronto is striving to settle its water-front question. The public have reached the stage of insisting that the present level crossings be eliminated. The contest is now being waged between the advocates of bridges over the tracks and the supporters of elevated tracks. Although the latter scheme is more costly, its manifest advantages should stamp it as the more far-sighted and complete solution of the question.

Comment of the Month

New Postal Regulations.

The Post Office Department recently commenced issuing to postmasters requiring them, special newspaper wrappers for the exclusive use of publishers when prepaying postage on second class matter addressed to the United States. These wrappers, which are considerably larger than the ordinary postband, are printed in the denominations of one, two and three cents, and have the following restrictive clause: "This wrapper to be used only by publishers and for the sole purpose of mailing second class matter to the United States."

To Improve Montreal Harbors.

It will be a pretty tough proposition that will prevent the present Board of Harbor Commissioners of the port of Montreal from making that port one of the best on the continent. The services of Mr. R. C. Davidson, of London, England, have been called in to outline a plan for its improvement. Mr. Davidson is a recognized authority on engineering works of this kind. He has now come to Canada, via the St. Lawrence, in order that he may become thoroughly acquainted with the conditions existing along the route. When he has informed himself on the accommodation that is required in the harbor, he will lay before the Commissioners a scheme of improvements, which will serve as a basis for all future work. In a statement to the press he said that in all his experience he has not yet seen a river channel into the heart of a great continent, such as the ship channel between Montreal and the sea, and is quite confident that there exists no reason to prevent the port of Montreal becoming, for quickness and economy of despatch, second to none in America or Europe.

Visit of Mr. Donly.

Mr. A. W. Donly, Canada's Commercial Agent in Mexico, is now in Canada interesting the people of this country in the possibilities of trade with Mexico. Mr. Donly has been doing excellent work in his present field. He has been indefatigable in looking after the interests of Canadian merchants, and he has succeeded admirably in keeping the subject of international trade in the public eye.

His present trip should result in renewed interest. It is well for Canada's representatives to get back home occasionally, just to keep in touch with the progress which is being made, and the changing conditions which have to be met. Personal knowledge is essential.

Mr. Donly is at present making a tour of the Maritime Provinces. He is telling the merchants down there of the demand in Mexico for cement and steel rails and other manufactured goods, for Mexico is not a manufacturing country. He is also urging the importers to buy direct, and not through American middlemen. Later, Mr. Donly will visit other parts of the Dominion, and the business public will, no doubt, learn much that is of interest to them from him. The courtesy he shows in Mexico will insure him a warm welcome in Canada.

A Forward Movement.

The *Globe* (Toronto) has taken up the subject of our pulp-wood supply, and as a result of a special investigation by a staff correspondent has called upon the Federal Govern-

ment to take prompt steps towards arriving at a plan of action by which our supply can be preserved and perpetuated. It is sincerely to be hoped that the Government will take the advice of the chief Liberal journal. The subject has been discussed in these columns too often to require any further elucidation at the present time. It is satisfactory, however, to note that the gravity of the case is becoming generally recognized. The importance of our timber areas is fully recognized by those interested in the paper industries of the United States. A Government investigation will soon reveal our true position.

In connection with this same discussion it may be noted that the whole subject of reforestation is meeting with general consideration. The work of the Canadian Forestry Association, the establishment of a department of forestry at the Provincial University of Ontario, and the widespread editorial notices, all point to an awakening to the importance of the movement. Public opinion is being formed, and it will go a long way in supporting any legislation looking to a betterment of existing conditions.

Relation of Railways to the Public.

The National Association of Freight Traffic Agents of the United States, composed exclusively of freight transportation men, is endeavoring to restore public confidence in common carriers, and it is proceeding in a way that cannot fail to produce good results.

Recently the president of the Pittsburgh Division of this organization invited L. C. Bihler, traffic manager of the Carnegie Steel Company, to point out from his own observation those things which are overlooked by the railroads—or only partly done—and which, if done, would please the shipping public and assist materially in establishing an era of good feeling—a thing highly desirable from the viewpoint of either interest.

Mr. Bihler discussed the subject as it appears from the industrial side, making certain suggestions regarding better or improved methods on the part of the railroads generally in handling claims for overcharge, loss or damage; suggesting that all officials of railroads in whose possession claim papers come, such as the local agent, or any other official, should not delay or pigeon-hole papers, but should handle them promptly, so that settlement may not be unduly delayed—since it is a fact that that road which best serves its patrons is the one which does so in all respects. Prompt and satisfactory handling of claims, prompt filing of requisitions for cars, prompt movement, prompt answers to inquiries as to delayed, lost or strayed freight, and the question of necessary and unnecessary tracing of freight, were touched on, as well as frankness on the part of railroads in voluntarily notifying patrons whenever an embargo or congestion exists, in order to give the patron an opportunity to seek other more satisfactory channels temporarily while an embargo or congestion is on, and to not knowingly or wilfully solicit additional business when the railroad cannot handle through a congested period that which they already have.

The question of more co-operation between railroads and the shippers when the railroads have in mind to advance rates was also considered by Mr. Bihler, his suggestion being to the effect that, if conditions make it necessary to change or advance freight rates materially, there should be friendly co-operation first, and the industries should be permitted to know in advance, and the railroads to receive the benefit of their advice and suggestions, as to whether it would be entirely just to advance freight rates. The subject of railroads carrying out designated routing as furnished by a shipper was also gone into at length.

All of these matters are of first importance to both ship-

per and carrier. Mr. Bihler presented the shippers' side in no spirit of hostility or petulance, but in the argumentative manner of a business man who knows exactly what he is talking about. Such talks cannot fail to impress men of intelligence and reason, and we felicitate the Pittsburgh transportation men upon the breadth of mind and the quality of initiative which distinguish their organization.

Commission and Reciprocal Demurrage.

The Railway Commission recently heard representatives of the Winnipeg Jobbers' Association, and also deputations from Regina and Prince Albert, and from the Manitoba Grain Growers' Association.

After the different interests had presented their case and been replied to by representatives of the Canadian Pacific and Canadian Northern, the chairman then gave the views of the Commission on the various points brought up. The information they had received led them to the conclusion that the severity of the past winter was largely responsible for the defects in transportation, a result that had been experienced also in the East.

They had had urged upon them the question of reciprocal demurrage. Boards of Trade and shippers all over the country were advocating this. They had never attempted to deal with that definitely, or committed themselves definitely either to it or against it. They felt that for the time, at least, it was not reasonable to introduce it.

The country had had a great and sudden development of business in two or three years, unexpected by everybody, and it was not reasonable that railway companies should be ready for the unexpected condition. He did not think the companies should have on hand equipment which should be sufficient for occasions of great activity and sudden plethora, although he believed that they had not fulfilled their responsibilities in the past. Still he did not think that the method proposed of fining them for their delinquencies would be fair.

They had set an expert to investigate and advise if they had an equipment such as they should reasonably have, and if, having his advice, they failed to keep up to the standard, if they did not realize their responsibilities, some system of that kind might be the only one to fall back on; and for that reason he had suggested that the Board be empowered to make regulations providing for demurrage charges upon railway companies. He did not know whether it would be properly workable, unless the service were put under a car service bureau, independent of the railway companies, the expense of which would be borne by these demurrage charges. There was some doubt in his mind as to that.

The distribution of cars was a very difficult matter. The Board could not be expected to take the management of the distribution of railway cars, and it would be difficult to make inquiry into the distribution, as to whether it was a fair and reasonable one, but they would be obliged, as definite complaints arrived, to investigate them and to endeavor to find a remedy.

A Noted Labor Leader.

Some pertinent questions naturally arise as a result of the recent address of Mr. J. Keir Hardie before the Canadian Club of Toronto. Mr. Hardie is an interesting personage. Any man who has wrested success from the midst of difficulties is interesting. There is a strong, and, on the whole, healthy admiration for success deeply rooted in most of us. But that admiration is associated with a strong critical faculty. A man must make good. He must show that success is not an accident, but a condition. With success comes a responsibility; the necessity of doing work

commensurate with one's reputation. How does Mr. Keir Hardie, how do the other leaders of his party, measure up to these requirements?

Mr. Hardie, we are told, commenced work in the mines at the age of seven, and worked regularly as a miner until he was twenty-four. In his later years he has had a varied career as a labor and socialistic propagandist, member of Parliament, and contributor to several papers and magazines of Great Britain. He is now chairman of the Socialist-Labor party in the Imperial House. He has been successful along his chosen path. Is he using his undoubted strength to further the best interests of the whole people? Or is he a prejudiced partizan aiming at the augmentation of the strength of a class, irrespective of its effect on other classes of the community? Mr. Hardie sets out his platform as a demand for sufficient food for the child, work for the able-bodied man and comfort for the aged. This is, of course, a platform about which no one will fight. Liberals and Conservatives, Lords and Commons, will fall into line in support of this. All recognize its desirability. But how? That is the question. Is it by a socialistic division of wealth without respect to the intelligence or industry of the individual, or is it by supplying the opportunity, which will be grasped in varying degrees according to the ability and enterprise of the individual?

It is worthy of note that Socialism has gained small headway in Canada. Here men, on the whole, are too busy to take up new and strange theories, much less to spend time in their propagation. The workingman is getting good wages, increasing more rapidly by far than the cost of living. The iron law of wages, which is the socialist's bugbear, has a complete disapproval in existing conditions. Where thrift is practised, workmen not only get the necessities of life, but many of the luxuries, with some savings to boot. Wherever the unions will permit it a man earns and receives in accordance with his merit. A man of superior intelligence and industry will get more than an inferior man. As a consequence, in course of time he may lay by some money and become a capitalist and an employer of labor. This, unless socialism is grossly misunderstood, is not as it would be under communistic conditions. It is little to be wondered at that socialism has such small strength here when it is considered how eminently successful has been the present principle—rewards in proportion to work done.

The legislation in the Imperial House with which the Socialist-Labor party was most closely connected, does not redound to its credit. The weakness of any small minority is that it raises the welfare of its own, often petty, constituency above all other considerations. So in the present case the party, led by Mr. Hardie, successfully fought against having the funds of an incorporated union subject to seizure through a judgment against the union. There is no justice in such a claim. If an employer wrongs a union, the union has recourse by law, and may collect damages to the limit of his resources. If a union wrongs an employer there is no recourse. A judgment such as was recorded in the Taff-Vale case can no longer be given. The legislation establishing the present inviolability of the union funds was enacted through the pressure of the labor party. To that party must be attached the blame of a measure which is class legislation of the worst kind. Hence the simple programme set forth by Mr. Keir Hardie is rather a specious mask to a destructive legislative policy.

The Town of Carman, Manitoba

An Ideal Location for Manufacturers in Southern Manitoba.

THE largest and liveliest town in Southern Manitoba, about fifty miles from Winnipeg, the Chicago of Canada, is beautifully situated on the banks of the Boyne River, and well sheltered by groves of oak, elm, maple, basswood and poplar. It is the centre of a magnificent and fertile agricultural district in the far-famed Red River Valley, where crop failures are unknown. Over two million (2,000,000) bushels of wheat, besides oats and barley, are grown and marketed yearly in the district tributary to the town.

To the west of the town the soil is a black loam, with some timber, and to the north, east and south it is a black clay loam with a clay subsoil, a large percentage of which is still uncultivated. When brought under cultivation this will greatly increase the demand for all manufactured articles. Pembina Mountain wood, with the prospect of a coal find, insures abundance of cheap fuel. The recent discovery of an unlimited quantity of cement, equal to the best Portland, and the establishment of a pressed brick plant, with a capacity of 30,000 per day, eighteen miles west of the town, also insures a supply of cheap and good building material,

effective fire protection which it is possible for a town to have. A by-law was submitted to the ratepayers to raise the necessary funds, and was carried by an almost unanimous vote. At the same time a by-law authorizing the town to purchase the existing electric lighting plant was voted on and also carried. The work of installing the water-works and sewers was at once proceeded with, and by using the power of the electric light works the town is in a position to very materially reduce the cost of water-works and electric light systems. The water-works system adopted is gravity pressure, secured by a large elevated tank, and also by pumping direct into the mains when necessary to do so, as in case of a large fire. Cheap light, power and water are available at a reasonable cost, and effective fire protection will therefore, be guaranteed to any manufactory which may be established in the town. Carman is also well advanced in the direction of good streets and sidewalks, all principal ten feet wide, and the streets are well graded and drained streets being well supplied with good sidewalks from four to into the sewers.

A View of Carman

while Davenport clay, graphite and gypsum have been discovered within a short distance of the town.

Railroad Facilities.

Carman is exceptionally situated in regard to railroad accommodation, being the point of intersection of three lines of railways. The Canadian Pacific gives two trains daily each way between Carman and Elm Creek, at which point connection is made with the Winnipeg-Souris division of that road. The Winnipeg-Virden section of the Canadian Northern Railway passes through Carman with a daily express service each way. The newly constructed Midland branch of the Great Northern from Gretna to Portage La Prairie also passes through the town, and has inaugurated a tri-weekly service, which will in all probability, be increased to a daily service in the near future. These railways give ready access to all parts of the country, and afford excellent shipping facilities both as to passenger and to freight service, and should be an inducement to those who intend to locate in the West to look into the advantages offered by Carman as a business location.

Public Improvements.

Early in 1906 the Town Council decided to install a system of waterworks and sewers, thereby securing the most

All these improvements have been secured without incurring any undue taxation, as the payments for the water-works and electric lighting have been extended twenty and thirty years, respectively. The rate of taxation last year was under twenty mills on an assessment of about two-thirds of the actual value of the property. This levy covered all ordinary expenditure, as well as the support of the schools.

The town also owns thirty acres of public park, with athletic grounds and race track; the park portion being covered by large forest trees, makes it an ideal resort for picnics and promenades.

A Residential Town.

Carman occupies a place by itself amongst the towns of the West. Picturesquely situated, with the Boyne River winding its way through the heart of the town, the scene gaining an attractiveness from a veritable forest of trees, which not only surround the town on all sides, affording protection from storms and winds, but are also distributed in unbroken and continuous luxuriance in almost all the streets of the town. Compared with the treeless aspect of many of the towns of the West, Carman presents a scene which makes it difficult to realize that it is a Western town.

With its many beautiful residences, public buildings, wind-

ing river and wealth of foliage, the views presented in this, the forest town of the West, cannot fail to evoke pleasure and create surprise.

From a social standpoint the town is all that could be desired—nearly all the fraternal societies are here represented, and mostly all have large memberships, and are in flourishing condition. Six religious denominations are represented, and all have beautiful and substantial churches.

The educational advantages of the town have been well looked after. In this respect Carman stands second to none in the province, the cities not excepted. The town possesses an eight-roomed school building, with a staff of eight teachers. In the higher grades, second and third class and matriculation courses, are taught. The building is constructed on the most approved methods as to lighting, heating and ventilation. Besides the class rooms, there is a large assembly hall, with a seating capacity for 600 persons. In the basement are play rooms for the younger children, to be used in inclement weather. The school is equipped with a fine library and a physical science laboratory. The standing and percentage of the pupils who pass the departmental examinations each year are amongst the highest in the province, and attest the excellent capabilities of the teaching staff.

The town has also a well-equipped general hospital, with an efficient staff of nurses and an experienced medical faculty. This was opened three years ago, but its success in the treat-

MARKET FOR CANADIAN IMPLEMENTS.

Discussing the possibilities for the sale of farm implements in Japan, Mr. A. MacLean says:

“For the present, farm machinery may be left over for consideration by, say, our successors—that is a wide enough limit. But there should be some farm implements, amongst those made in Canada, or patterned after them, that could be used to advantage, if the people here concerned were persuaded. The American grain-cutting ‘cradle,’ when offered for the cutting of crops that for ages had been reaped with the sickle, got a discouraging reception. The advantage was obvious from one point of view; but those whose labor was to be saved would see only disadvantage, and they would have none of it. It may be safely assumed that the Japanese, whose labor is the better part, or, perhaps, the whole of his capital, is human enough to resist the use of an article that may seem to threaten to deprive him of the present means of living.

“But of the minor farm implements, it would appear that there might be some introduction, if the venture were well considered. It would strike the stranger, say from Canada, that the plough might be introduced—that is, a one-horse plough—steel mould-board and share-point, with wood beam and handles, suited for the turning of what is literally garden soil. This would serve to displace the hoe, which is not the

Residential Section of Carman

ment of medical and surgical cases has popularized it to such an extent that a movement is under way to double its capacity by building an annex this summer.

The town is at present well supplied with all branches of mercantile enterprise, and is looking forward to becoming a prominent manufacturing centre. Its location, railway facilities, public improvements, cheap sites for factories and homes for employes are advantages unsurpassed, or even equalled, by any other town in the West, and fit it pre-eminently as a centre for manufacturing enterprises.

Three chartered banks have branches located here. Two flour mills, with a united capacity of 150 barrels daily, have an established business. There are also two fine hotels, with the most modern conveniences for the accommodation of the public. Last, but not least, are two live local newspapers, with well-equipped jobbing departments.

Manufacturers seeking locations in Western Canada cannot do better than correspond with the Carman Board of Trade.

Personal inspection of the town is especially invited, as its advantages, once seen, will be sure to commend it to investors.

garden or potato hoe, that has much to its credit in Canada and elsewhere, but an entirely different article, that is driven into the ground and pulled forward, and thus takes out and turns over its bite of soil. The plough I have indicated could be used in the small divisions of land allotted to the several crops, other than rice, and evidently would save an immense amount of manual labor applied to the raising of grain and vegetables.

“The grain crop of whatever kind in Japan is usually ‘planted’ in rows. It may be supposed that a seed-drill might be contrived that would sow the seed more evenly and economically than by the hand process.”

Mr. James Crombie, foreman boiler-maker of the Sawyer & Massey Company, Hamilton, won first prize at the recent Boiler-Makers' Convention, for his article on “How to Heat and Drive Steel Rivets.” The work of Mr. Crombie is most creditable, as he was in competition with the strongest men of his trade on the continent. The article was printed in full in the June issue of the *Boiler-maker*, of Pittsburgh, Pa.

International Rate Case

An Important Ruling in Transportation Case

THE so-called International Rate Case has at last been disposed of. The Board of Railway Commissioners issued an order on July 6th, in the matter of the application of the Canadian Manufacturers' Association and the shippers who were heard and represented at the hearings held by the Board in Windsor and Chatham, Ont., in the month of May, 1906.

On July 4th, 1906, the Secretary of the Board wrote the Railways, reciting the nature of the complaints with respect to international rates. This statement concluded as follows:

"The Board recognizes that the conditions of this traffic are affected by the existence of Companies in the United States independent of those operating in Canada, and by the operation of the corresponding clause (the long and short haul) in the Statute Law of the United States, and that the harmonizing of interests in making the changes necessary to apply the rule to traffic originating in the United States destined for points in Canada is a work of difficulty, and it thinks the Canadian Railway Companies should be given an opportunity to lay a scheme before the Board for its consideration, after negotiating with companies operating in the United States; and for that purpose the Board will defer further consideration of this complaint for a period of ninety days."

It was clear that no attempt at harmonizing the rates would be satisfactory under two classifications, namely, the "Official," from Port Huron, Detroit and Buffalo, as in effect throughout the Northern States, east of Chicago and the Mississippi, and the Canadian classification, from Sarnia, Windsor and Fort Erie, as in effect throughout the Dominion. One or the other would have to be adopted.

Meetings of the officials of the Canadian and United States Railway Companies were held, with the result that the United States Companies consented to adopt the Canadian classification and the Canadian tariff basis for their international traffic.

The tariff bases, as well as the classification, are different on the two sides of the frontier. The Canadian tariffs are built up on the 5th class, the 4th class being 25 per cent., 3rd 50 per cent., 2nd 75 per cent., and the 1st 100 per cent. higher than the fifth.

There appears to be no such established basis in Central Freight Association territory. From Detroit the present proportions are as follows:

	1	2	3	4	5
To Toronto	26%	210%	130%	60%	30%
Montreal	200%	159%	105%	41%	20%

An examination of the percentage tariff bases given above will show that if the rates from United States points were to be scaled up from 5th class, as is done in Canada, a great reduction in the International joint rates would result. Thus, Detroit to Toronto, instead of running from 5th, 13c., to 1st, 36 cents, as at present, would run from 13 to 26 cents; from Detroit to Montreal it would be from 23 1-2, 5th, to 47, 1st, instead of from 23 1-2 to 58 1-2, as now; and similarly with all points in the States west to the Mississippi; and this would be an impossible adjustment from the standpoint of the United States Railways. The alternative was to accept the present 1st class rates and scale down; and so far as Port Huron, Detroit and Buffalo are concerned, this is what has finally been done.

Draft Scheme Presented.

The Companies' draft scheme of the proposed revision of rates was presented to the Board on November 8th, 1906. It

was then arranged that the scheme should be examined by the Manager of the Transportation Department of the Manufacturers' Association and by the Chief Traffic Officer of the Board. A meeting was held with the Advisory Committee of the Companies on December 19th. At this meeting the representative of the Canadian Manufacturers' Association considered the basis as a whole unsatisfactory. It was finally agreed that new trial tables should be prepared, which was done. In submitting these the Railways stated that they had endeavored to evolve a plan which would conform to the recommendation of the Board, that whatever scheme of adjustments was finally adopted should take care of the Toronto Board of Trade complaint as well as that of the Manufacturers.

They also pointed out that the elaboration of the bases suggested at the Montreal Conference, December 19th, 1906, had proved the impossibility of their voluntary adoption by the Companies. The results would prove so disastrous that the officials of the Grand Trunk and Canadian Pacific Railways felt that they could not assume the responsibility for the loss of such a large amount of net revenue. Hence they could not agree to make the reduction which would follow the adoption of the suggested figures. At the same time, they fully recognized the authority of the Board's orders, but in that case the Board, of course, would have to assume the responsibility of the results.

The scheme was most elaborate, and apparently involved a loss of revenue on the part of the Grand Trunk of from half a million to a million and three-quarters annually. The Canadian Pacific loss would equal two-thirds that amount.

Although it was conceded that these figures merely represented approximations (there had been no time for an audit), it was felt in justice to the railway companies that the Board could not ignore these statistics. It was also manifest that the verification of the results by an expert investigation of the Companies' books would consume so much time that the decision of the Board would have to be indefinitely postponed. It was therefore suggested to the Canadian Manufacturers' Association, and agreed upon, to accept tentatively an adjustment, and a resolution was passed to that effect and forwarded to the Board on March 25th last. It was set forth in the resolution that in petitioning the Board it would be understood that the new rates would be considered experimental and without prejudice to the right of interested manufacturers or the Association to appeal against the new rates so proposed, or against the higher rates which then prevailed on east-bound traffic over those charged on west-bound traffic, and not in any way to prejudice any complaints such as that of the Toronto Board of Trade or of this Association or of any of its members, now pending or to be submitted to the Board for ruling.

Manufacturers' Case Settled.

This resulted in other tables being drawn up by the Companies, having for their object the satisfactory solution of the two cases combined, viz., the Manufacturers' and the Toronto Board of Trade's. These proved impracticable. It became apparent that the Manufacturers' case would have to be settled on its own merits and on the basis outlined in our communication to the Board. It was also apparent that the revision of the general mileage basis, which would be a factor in the case, would have a direct bearing on the discrepancies between the local tariffs of which the Toronto Board of Trade complained, and the order was issued accordingly. As a

result of the order a general reduction has been made at such points as London, Brantford, Chatham, St. Catharines, Hamilton, etc. It remedies the long outstanding complaint that the railways discriminate in favor of through traffic from the United States to Eastern Canadian points as compared with traffic originating on the Canadian side of the boundary.

There is a marked reduction in freight rates from practically all points in Western Ontario.

The Board has ordered that the special local class tariffs (known as town tariffs) of the Grand Trunk, the Canadian Pacific, the Michigan Central, the Pere Marquette, the Wabash, the Toronto, Hamilton and Buffalo, and the Canadian Northern Ontario Railways, east of the Detroit and St. Clair Rivers, Lake Huron and the Georgian Bay (east and south bound), and south of the Ottawa River be reduced so as to place them all on the same mileage scale.

The rates shall in all cases be based on the shortest workable mileage.

That for the purpose of compiling special tariffs from points west of Toronto to points east thereof, the territory be divided into groups.

That from points competitive with the lake and river lines the Companies may publish such commodity rates as may be necessary to meet the competition of the water carriers, etc.

That no special commodity rates now existing which may be lower than the corresponding class tariffs herein prescribed shall be advanced by reason of the changes herein ordered, or without the sanction of the Board.

That in the adjustment of the international rates, the rates on raw material from points in the United States to points in Canada shall not be advanced at the instance, direct or indirect, of the companies operating in Canada.

That no change shall be made in the west-bound rates from Montreal.

That the Railway Companies and their connections in the United States be permitted to substitute the Canadian freight classification for the Official from Detroit and Port Huron and points west thereof *via* the Detroit and St. Clair River crossings, etc.

The New Schedules.

From this territory the present and proposed 1st class rates to Montreal are as follows:

From	Present Winter.	Present Summer.	Proposed Winter & Summer
Windsor, Chatham, Newburg, Sarnia, etc.	70	60	58
Strathroy	68	60	56
Glencoe, Komoka, Park Hill	68	58	56
London, St. Thomas, St. Mary's	66	56	54
Woodstock, Ingersoll, Tillsonburg, Stratford, Simcoe	64	56	52
Berlin, Galt, Paris, Brantford	60	50	50
Guelph	58	50	48
Hamilton	54	42	winter 46 summer 42
Toronto	50	40	winter 44 summer 40
Goderich	68	60	56
Collingwood	68	60	56
Mount Forest, Harriston, Palmerston	68	60	52
Orangeville	64	64	48

The territory between Toronto and Montreal has been re-grouped. The following are examples of present and proposed rates from Windsor:

To	Present.	Proposed.
Whitby, Oshawa	44	40
Port Hope, Cobourg	46	42
Trenton, Belleville	48	44
Napanee	54	46
Kingston	54	48
Brockville	60	50
Prescott	60	52
Cornwall	66	54
Collingwood	50	42
Orillia	50	42
Quebec	84	70
Halifax	92	78
Sydney	1.00	86

The same scale will be used in revising the tariffs at the other common and distributing points.

From stations east of Toronto, from what is known as the Midland Division to Montreal, the straight mileage scale as adopted by the Board will apply.

The following is a comparison of present and proposed 1st class rates between other points:

	Present.	Proposed.
Chatham to—		
Guelph	36	32
Toronto	38	36
Kingston	54	50
London to—		
Hamilton	30	26
Toronto	36	32
Collingwood	38	34
Hamilton to—		
Toronto	22	18
Berlin	24	22
Woodstock	22	20
Palmerston	30	28
St. Thomas	30	26
Clinton	32	28
North Bay	46	40
Toronto to—		
Berlin	24	20
Guelph	24	20
Brantford	28	22
Woodstock	30	28
Stratford	30	28
Ingersoll	32	28
Penetang	34	30
Gravenhurst	34	32
Goderich	36	32
Southampton	38	34
Windsor	40	36
North Bay	46	38

The tariff applies both ways, and a higher rate cannot be charged to an intermediate point.

The railways are now busily engaged in the preparation of new tariffs for submission for the approval of the Board in accordance with the order.

A REVISED CLASSIFICATION.

The Board of Railway Commissioners have issued an order approving Canadian Freight Classification No. 13, to become effective not later than September 1st next. This classification will supersede all previous classifications and amendments thereto. The classification at present in use has been in effect since 1903. Various amendments have been made to it since that date, as a result of conferences with the railways and representation to the Board of Commissioners.

These amendments represent reductions in ratings, revised rules with regard to minimum weights for long cars in excess of the standard, mixed carloads, minimum charge for single articles too long for box cars, and requiring platform cars for carriage, a complete revised scale of minimum weights for freight loaded in cars in excess of the standard length; all of which necessitated various supplements.

Objection was taken to the "owner's risk" conditions of the present classification, as covered by rule 7 of the special regulations and conditions as follows:

Articles marked at O.R. must be so receipted for by agents, and the words "owner's risk" written in full on the shipping notes and receipts.

Articles marked "released" must also be so receipted for, and shippers or owners must duly execute a release in duplicate on the company's forms.

These conditions practically meant release from damage from any cause whatsoever. The carriers are relieved from liability even through negligence.

Representations were made urging strongly the elimination of the "owner's risk" condition altogether, and as a result of negotiations entered into between the Railway Commission, representatives of the Association and the railways it has been taken out as against some two hundred and forty items. Where it is retained the risk is specified and restricted.

Rule 7, as amended in the new classification, is as follows:

Articles at Owner's Risk—

Articles by the classification, shown as to be carried at owner's risk of weather (*i.e.*, O.R.W.), of breakage (*i.e.*, O.R.B.), or otherwise as the case may be, shall, unless otherwise required by the shipper, be carried at Owner's Risk as so specified and defined, and no special notation to that effect shall be necessary on the bill of lading.

Should the shipper decline to ship at owner's risk, as specified and defined in this classification, any article shown as to be so carried, he may ship them subject to the terms and conditions of the bill of lading approved by the Board of Railway Commissioners, in which case twenty-five per cent. over and above the rates which would be payable if such articles were shipped at owner's risk, will be charged.

These conditions are intended to cover risks necessarily incidental to transportation, but no such limitation, expressed or otherwise, shall relieve the carrier from liability for any loss or damage which may result from any negligence or omission of the company, its agents or employees.

Wherever the owner's risk condition is left in the classification it is defined as follows:

- O.R.B., Owner's Risk of Breakage.
- O.R.C., Owner's Risk of Chafing.
- O.R.D., Owner's Risk of Damage.
- O.R. Det., Owner's Risk of Deterioration.
- O.R.F., Owner's Risk of Fire.
- O.R.L., Owner's Risk of Loss.
- O.R. Lkge., Owner's Risk of Leakage.
- O.R.S., Owner's Risk of Shifting.
- O.R.W., Owner's Risk of Weather.

The present classification stipulates that if a shipper of goods, for which a rating is provided at "owner's risk," desires to have them sent at carrier's risk, he must pay an advance of 50 per cent. The amended rule reduces this charge to 25 per cent., making the increase about one class higher than the owner's risk classification.

The release which is at present exacted on shipments of furniture and similar commodities has been done away with.

The rule of the classification describing the minimum charge of "small's" rate has been amended to read as follows:

"The minimum charge for any complete shipment of one

or more classes between any two stations of one carrier will be 100 lbs. at first-class rate, but not less than 35 cents."

It is further ordered by the Board:

"That any person or company violating the provisions of section 400, sub-section 1, of the Railway Act, shall, in addition to the regular toll, be liable to pay to the company a further toll not exceeding fifty per centum of the regular charge."

The above clause refers to misrepresentation of freight with the view of obtaining transportation of such goods at less than the regular tolls then authorized and in force on the railway.

The new classification, whilst it does not fully meet with the requirements of the shipping public, is a vast improvement on the one now in effect, and a step in the right direction. The improved conditions of carriage authorized by the Board will be appreciated by the shipping public as a whole.

MARKING AND ADDRESSING PACKAGE FREIGHT.

The attention of shippers is directed to a circular of the Grand Trunk Railway System, *re* marking and addressing package freight, which we publish at the request of the representatives of the General Freight Department.

An observance of the directions contained therein will, no doubt, tend to minimize the number of claims classified as "stray freight."

To Agents, Shippers and Connecting Lines East of Detroit and St. Clair Rivers.

Marking and Addressing Package Freight.

The attention of all concerned is again directed to the necessity of fully marking all freight.

Each package or piece of less than carload freight forwarded all rail, also each package or piece of carload and less than carload freight forwarded rail and lake, must be plainly marked with the name and address of consignee, so as to insure prompt delivery even if separated from the waybill.

Marks on package or pieces, should be compared with bill of lading and correction, if necessary, made by the shipper or his representative. Old marks must be removed or effaced.

Tags should not be used when the nature of the goods will permit of the address being stencilled on packages or pieces. When impracticable to do this, some distinguishing mark or brand should be shown, and such mark or brand should also appear on bill of lading. Agents must show such mark or brand on the waybill, fully describing the goods. For example, in the case of a shipment of canned goods, the bill of lading (also the waybill) must show so many cases of tomatoes, so many cases of pears, so many cases of corn, etc., as well as the brand and the mark indicating the name of consignee and place of destination.

Waybills for less than carload traffic consigned to the larger cities, as, for instance, Montreal, Toronto, Hamilton, London, Buffalo, Detroit, Chicago, etc., must in all instances give in detail the full address of consignee, *i.e.*, number and name of street, as well as place of destination, in order that prompt delivery of such freight may be effected.

On traffic forwarded rail and lake, the waybill and bill of lading for carload freight, as well as for less than carload shipments, must show the number of packages or pieces, for instance,—if the shipment consists of vehicles, cutters or like freight, the waybill and bill of lading must, in detail, describe the nature of the shipment, *i.e.*, so many springs, so many shafts, so many bodies, etc., etc. Be careful that full information is given in all such instances.

The address on packages or pieces must correspond with that shown on bill of lading. For example, on a shipment to Toronto, the packages or pieces must be marked "Toronto," and not some other destination for which the goods may be ultimately intended. If packages or pieces are intended for redistribution beyond, a special designating mark may be used for the guidance of those attending to the redistribution, but only the destination given on bill of lading must be shown on the goods.

Frequently, in connection with rail and lake shipments, there is on the same boat more than one consignment for the same consignee, and in order to prevent such consignments becoming mixed, it will greatly facilitate the correct handling, if shippers will also show on packages their name or trade mark. Consignments can then be delivered complete and errors avoided.

Freight consigned to a destination of which there are two or more of the same name, must not be accepted, unless the name of the County and Province or State be given.

When freight is consigned to a destination not on the line of a railway, the shipper must be requested to state the name of the railway station at which the consignee will accept delivery; or if destination is reached by a water line, the name of the railway station at which delivery is to be made to such water line.

The proper marking and addressing of freight is in the interest of shipper, carrier and consignee, therefore agents must insist on these rules being observed.

Note and be governed accordingly.

J. E. DALRYMPLE,
General Freight Agent.

Rule 18 of the rules and conditions of carriage classification 13, recently approved by the Board of Railway Commissioners, to become effective not later than September 1st, 1907, provides as follows:

"Each package, bundle or piece of less than carload freight must be plainly marked with the information necessary to carry it to destination, and insure proper delivery. Old marks must be removed or effaced.

"All freight c.l. or l.c.l. for rail and lake transportation must be fully marked as above required.

"Freight consigned to a place of which there are two or more of the same name must not be accepted unless the name of the county and province or state be given.

"When freight is consigned to a place not located on the line of a railway the bill of lading must state the name of the railway station at which the consignee will accept delivery, or if destined to a place reached by a water line the name of the railway station at which delivery is to be made to such water line."

The circular sets forth in a clear and comprehensive manner the rules as approved of by the Railway Commission. It will, no doubt, prove of value as a guide to shippers in respect to less than carload and lake and rail shipments.

UNIFORM BILL OF LADING.

An article in the July number of INDUSTRIAL CANADA, giving the present status of the proposed new bill of lading in Canada, stated that good progress was being made in the United States with the uniform bill of lading. Conditions have been agreed upon by a joint committee of shippers and carriers, representing substantially all of the railroads in what is known as official classification territory, and sixty different associations in the same territory, with a total of 800,000 members. At a conference held in Chicago on May 24th and 25th, 1907, these conditions were submitted to the Interstate Commerce Commission, with the view of having

them incorporated in and form part of the Interstate Commerce Law.

In the new bill it is intended to hold the initial road and its connections liable for a shipment from the time it is delivered to the company until it is delivered to the consignee at its destination.

It is recommended that a draft of the bill of lading and conditions be submitted to the railways and commercial interests of the country early in July.

Freight, commenting on the new bill, says, in part: "It has required substantially two years to bring about this agreement. It is claimed, however, that the proposed document will not receive the approval of those carriers who were not directly a party to the agreement, or those shippers whose lines of business were not represented by the shippers who held membership in the committee. Some carriers are quarrelling with the railway representatives upon the Committee claiming the latter have given away their birthright. Shippers are objecting that the conditions are neither fair or equitable, and that the proposed document is little, if any, improvement upon the one now in use. It is, however, agreed that it is an improvement on the bill of lading proposed in December, 1903.

"So far the interested parties have been unable to agree as to what are and ought to be the rights, duties and liabilities of the several parties. The most important of these propositions is what shall be the liability of the carrier? Shall the shipper be justified in assuming that when he gives his property to the common carrier it will be delivered in specie, or he will be paid therefor?

"Such was the earlier law, even for connecting carriers, and there is good ground for insisting that such ought, at the present time, to be the foundation whereon a bill of lading should be framed."

It is to be observed that whilst the joint committee in the United States has been over two years at work on this agreement, and the same has been submitted for approval, that there is likely to be serious objections raised to the conditions as agreed upon. In fact objections have been taken and apparently will be taken to the first clause of the new bill. This will, no doubt, cause further delay. We are of the opinion that if shippers or carriers will continue to seek to introduce all sorts of conditions to form part of the receipt or contract to carry, just so long will there be a lack of uniformity of opinion as to what are the rights, duties and liabilities of the several parties.

The contention of the Canadian Manufacturers' Association is for a form of bill of lading without any conditions, simply an acknowledgment that the carrier has received the goods for transportation.

The Canadian Railway Act requires the companies to carry all traffic. They are insurers of the goods, and in case the same are injured, lost or destroyed whilst in transit should pay therefor. Why, therefore, should it be permitted to surround the receipt, which the carrier gives the shipper for his goods, with all sorts of conditions limiting his liability? The carrier is paid for the service, which he performs in accordance with the legal tolls, and thereby contracts to deliver the goods in the same conditions as he receives them. What further is necessary?

Considerable increases will be made in the rolling stock of the Intercolonial Railway during the present summer. Orders have been given by the Department of Railways and Canals for 400 box cars of 80,000 pounds each; 310 platform cars of 80,000 pounds each; 400 box cars of 60,000 pounds each; and 225 refrigerator cars. About thirty new locomotives will also be built in Kingston and Montreal for the I. C. R.

New Chairmen of Branches

MR. ED. J. FREYSENG.

In electing Mr. Ed. J. Freyseng, of the Freyseng Cork Co., Limited, their chairman for the year 1907-08, the members of the Toronto Branch, are honoring one whose zealous activity in the past in all Association matters is well known. Mr. Freyseng has occupied various positions of importance in the Branch administration since he became a member, and although he has suffered the inevitable penalty of willingness to serve his fellow-members by being placed on committees too numerous to mention, his record in attendance is equalled by few and surpassed by none. His tireless energy seems inexhaustible, for the more work he has to do the better he does it. In him the Branch will find an efficient, painstaking officer, willing to sacrifice his time whenever his position demands it.

Mr. Freyseng has lived in Toronto all his life, and now

MR. S. W. EWING.

Mr. S. W. Ewing, the newly elected Chairman of the Montreal Branch of the Canadian Manufacturers' Association, is a son of Mr. S. H. Ewing, President of the Montreal Cotton Company, and one of Montreal's best known business men.

He was born in Montreal, and educated at the Montreal High School. Entering business life, he was for thirteen years in the employ of Gault Bros. & Co., wholesale dry goods. Later he went into the coffee and spice business, and secured an interest in the firm of Bourgeon & Herron, which, in time, became the now prominent establishment of S. H. Ewing & Sons. The progress made by the new business was very extensive, and in June, 1906, it was further enlarged by the purchase of the firm of S. H. & A. S. Ewing.

Mr. Ewing has taken a deep interest in many things outside his own line of business. He is a past president of the

Mr. Ed. J. Freyseng

Mr. S. W. Ewing

bears on his shoulders the full responsibility of the management of the Freyseng Cork Co., Limited, of which he is vice-president and managing director. This company, founded by his father, Mr. Peter Freyseng, of Toronto over thirty-one years ago, now has branches in all the large cities of Canada. The success of the undertaking needs no comment, and simply bears out Mr. Ed. Freyseng's characteristic policy, "Keep-going."

The new chairman is also prominent in other city business organizations, being on the Executive of the Riverdale Business Men's Association, and on several committees of the Board of Trade. He is identified with several social and fraternal organizations in the city, in which he has held high offices, and among the citizens of Toronto his friends are legion. Mr. Freyseng is still a young man, capable of rendering great services in the future to the community to which he belongs, in addition to those he will undoubtedly render to the Canadian Manufacturers' Association.

Junior Conservative Club, Chairman of the Montreal Philharmonic Society, and Vice-Chairman of the Dominion College of Music. He is a life member of the St. George's Club, and a member of the M. A. A. A., Royal St. Lawrence Yacht Club, Montreal Board of Trade, and the Albany Club, Toronto. He is also a prominent Mason.

Mr. Ewing has brought his keen business ability to the service of the Canadian Manufacturers' Association. There are many calls on the time of an active member, but the new chairman has always been ready to do the work in hand. During the last year he has been Vice-Chairman of the Montreal Branch, and he is a frequent attendant at the monthly meetings of the Executive Council. The Montreal Branch is assured of an active year of progressive work, which, indeed, has been characteristic of the Branch for a considerable time.

The number of questions which come up for settlement in a big city like Montreal is steadily on the increase. It is well to have Mr. Ewing representing the manufacturing interests.

OUR NEW ZEALAND LETTER.

WELLINGTON, N.Z., July 1st, 1907.

I promised in my last letter some particulars about the trade possibilities between New Zealand and Canada. To plunge into the subject straight away, I can honestly say that Canada never had a better chance to open up trade with New Zealand, and get a share of the business, which still goes to the United States.

Everything being equal, New Zealand is eager to buy from Canada. The Government is doing everything to bring about a closer connection. A tariff revision, which will, no doubt, shower more favors on Canada, will be tackled during the next session.

The New Zealand Premier, Sir Joseph Ward, made some very practical suggestions at the Premiers' Conference in London, for a closer union, particularly between Canada and New Zealand, and as Sir Wilfrid Laurier is sympathetic, there is every prospect of a development, which can only benefit Canadian industries.

But are the Canadian manufacturers prepared for an export trade? And do they realize the importance of it, and the obligations which it puts on their shoulders?

Judging by past experiences I fear many are not.

When catering for an export trade three things must be strictly observed, otherwise all attempts will prove futile:

Prompt and regular deliveries.

Quality up to sample and description.

Economical, at the same time suitable, packing.

In all three essentials mentioned the majority of Canadian manufacturers have been singularly wanting. Deliveries have been at pleasure. I have seen orders twelve months old, and not even an excuse tendered for their non-execution. What this means to the merchants here can be hardly conceived by the offenders, otherwise they would strain every nerve to get their export orders away. How would these people feel with contracts in hand and no shipments in sight, and 10,000 miles away from the nearest source of supply? Many a merchant here deplores the day when he first diverted his orders to Canada. He did so, not because Canada held out any special inducement, but simply out of sentiment, and this is the way he has been treated.

If a manufacturer wants to cater for export trade, the first question he has to put to himself is, "Am I in a position to take care of such orders, and can I execute them regularly and promptly?" Only, then, when he can conscientiously answer in the affirmative has he a right to go after it.

The question of quality and honest workmanship is another serious thing. The manufacturer who thinks that he can send anything abroad, which he would not dare to offer his home customer, will be bitterly disappointed. Customers here are willing to pay a fair price, but they expect value for their money.

The third, and also a very material point, is the packing for export. Most of the Canadian manufacturers are in blissful ignorance of a serviceable, and, at the same time, economical, packing of their wares. The manufacturers have to bear in mind that shipments for New Zealand have to travel by direct route, at the least, 10,000 miles, and via New York more than 14,000 miles, with one or more transshipments thrown in. The handling of cargo at the port of transshipment is, as a rule, very rough; cases and bales are dumped down on the wharves, taken up by trucks and slung on board the ocean steamer with very little consideration. Once on board the trouble does not end. If the steamer strikes bad weather, the constant movement breaks up bad cases and boxes, or damages the contents through squeezing them into all sorts of shapes.

Even in fine weather the ship's movement is considerable, and much more destructive to packages than when they are

travelling on a train. The writer has seen expensive goods packed in such a risky way that it would not be considered safe here to send them fifty miles by rail.

Things would not be half so bad if the damage done affected only the guilty manufacturer; he would soon get the cold shoulder and drop out of the running. The worst of it is, that the deeds of a few reflect on the whole country, and if there is no change for the better, Canada will soon be played out in this market.

Another great drawback is that there is no direct connection between Canada and Australasia from the East Coast. This is not the fault of the manufacturer, but of the Government. As long as New York monopolizes the shipping business of Canada to Australasia this business cannot develop satisfactorily. Canada in this respect is under bondage to the United States, which is a very discreditable position to be in, for a country of Canada's industrial importance. A country which can afford it (and who to-day will say that Canada cannot) ought to do her own carrying. New Zealand, though ever so much smaller in territory, with only one-eighth of the population, maintains for her carrying trade, coastal and abroad, a fleet of steamers, which pro capita is about the largest in the world.

The United States are actually our only rivals in the Australasian trade, and still we entrust them with the carrying of our merchandise, give them a full insight into our business, and even employ them to sell our goods. Just think of it as an ordinary business proposition. Would any manufacturer give his carrying trade to his strongest competitor? Would he give his competitors a list of his customers, and show them what class of goods he is shipping to them? Or would he make use of the same agents as his competitors are employing to sell his goods? No fear! He would ridicule the idea. But that is exactly what Canada is doing by allowing the United States to do her carrying trade. Canada must have a direct connection from the East Coast with Australasia, and as long as the connection is not established she will always be at a disadvantage against her more powerful and industrially stronger neighbor.

I can prove that some Canadian manufacturers, by doing their business through New York, gradually lost the trade, as the New York firms have not the slightest interest in helping Canadian industries along. As soon as they have got hold of full information they try to find the same, or similar, goods in their own country, and one can't blame them. Much of the above will be unpleasant reading, and may not quite tally with the high opinion some manufacturers have of themselves, but I have only said what I know to be positively true, and if Canada wants to hold and increase her trade with New Zealand many things will have to be altered, and if this letter will, in any way, assist to bring this about I shall be sincerely glad.

In conclusion, and to show how perniciously the neglect of some firms acts against the best interests of the country, I will relate here one instance, without mentioning names or the article involved:

A certain commodity is benefited by the preferential duty. The Government of New Zealand has made it compulsory that the article in question must be of British manufacture when used for Government work. As this line is not made in Great Britain, merchants are compelled to buy from Canada. Now it happens that deliveries are so neglected that the market is entirely bare, and, no doubt, if no improvement takes place, contractors will explain the position to the Government, who will be obliged to rescind the preference.

Is it not time to awaken?

I could relate a good deal more to the same effect. Many of your readers may think that I overdraw; in fact, I have not done so. I could tell worse, and back up my assertions with documentary evidence.

Summing up the position I would say :

Don't cater for export trade if you cannot promise *prompt* and *regular* deliveries, or

If you are *inexperienced* with regard to packing your goods for export, or

If your lines *cannot stand* the long journey passing through various climates. This particularly applies to furniture.

Get rid of the New York bondage, do your own carrying, and do your business through your own people, and not through foreigners, who have no interest in your industries, and only make use of you when they cannot get the same lines in their own country. Would England be so powerful to-day if she had left the carrying of her manufactures to outsiders? Why is Germany so anxious to get a strong footing in the carrying trade? Because it is an economical and political factor in a country's industrial life, which cannot be neglected.

A country which is not able to handle her own carrying is always in a state of dependency, a position which cannot be satisfactory to any virile and self-respecting country.

COSMOPOLITAN.

FOREIGN TRADE NOTES.

Reductions in Tariff.

Manufacturers of structural steel and Portland cement will be interested in a recent report of the Canadian Commercial Agent in Jamaica on these items. He reports as follows :

At a meeting of the Legislative Council of the colony, held on 18th instant, an amendment to the present tariff law was introduced, which involved the placing on the free list of Portland cement, and also the necessary equipments for the erection of steel buildings.

The latter, previous to the passing of the law, were subject to an import duty of 16 2-3 per cent. *ad valorem* on first cost. Cement was rated at 2 per cent. per barrel of 400 pounds.

The Loss in Leaky Boiler Settings.

A notable case of saving fuel by stopping the air leaks in boiler settings has been made in the Stratford Hotel, Chicago, the mechanical plant of which, together with that of the Railway Exchange Building, Chicago, is in charge of F. J. Saxe. The boiler setting in this case was covered with a layer of asbestos cement over which canvas was pasted, and the whole covered with a coat of heavy paint. The saving as a result of this change is stated to be about \$100 a month, or 12½ per cent. of the monthly coal bill. The boiler is run twenty-four hours per day in lighting service. Mr. Saxe says that simply coating the brickwork thoroughly with red paint so as to fill the pores, will cause a marked saving of fuel in almost any boiler.—*Electrical World*.

Interior Freights.

In the matter of the addition of interior freights to the value of goods for duty in Australia, there seems to be some doubt in the minds of Canadian exporters. The broad principle in the levying of duty on Canadian goods, is that interior freight must be added to the value of the goods as exported from Canada to the nearest port of export. In the case of shipments from Nova Scotia, where they are sent by rail, for example, from Truro to Halifax, and thence to Halifax to New York, where they are transferred to an ocean-going ship, duty would be paid, not on the freight to New York, but only to Halifax, notwithstanding that the transshipment takes place at New York.

In the case of Canadian ports, like Brockville and Sault Ste. Marie, situated on neutral rivers, no freight need be added at any time, as they are ports of export. Again, in

the case of Toronto, where shipments can be made by boat to United States points, in the summer time no interior freight need be added, as Toronto in such case is a port of export, and Lake Ontario is a neutral water. When the exports are made after the close of navigation, the proportion of rail freight to New York paid to Niagara Falls would have to be added to the cost of the goods, as interior freight. If goods from an interior point are shipped to Australia and might be shipped via Toronto and hence to Rochester or some other United States point, there would need be added to the invoice, the freight paid to Toronto in the summer season. The same rule would apply to Hamilton and ports on the great lakes or the rivers, where they are boundary lines.

Descriptions Necessary.

In Australia the Commerce Act demands that a trade description must accompany all imports of boots and shoes, setting forth the principal material from which they are made. The following statements will show to what extent this description must go: "Unless the soles are of solid leather, the description must state the fact, and the nature of the admixture or addition. Numerous inquiries have reached the customs authorities as to whether the word 'soles' refers to both the inner and the outer soles, and also whether the presence of a small piece of waterproof felt or other similar substance inserted between the inner and outer soles to prevent water penetrating to the inner sole must be disclosed in the trade description. It has now been decided that the word 'soles' includes the inner and outer soles, but not the thin slip of paper or similar substance which is affixed inside the boot to the surface of the inner sole. It is further announced that the presence of the waterproof felt or other similar substance as mentioned must be indicated in the trade description."

Elevators for South Africa.

Of all the transformations South Africa has witnessed during the last ten years, none has been more complete than that in architecture. Instead of the insignificant structures which were accounted sufficient for a less progressive age, there have sprung up palatial Government, municipal, and commercial edifices, which would do credit to the most up-to-date cities of Europe and America. In some respects South Africa is actually more up-to-date than the United Kingdom, as, for instance, in its adoption of that type of mercantile architecture evolved in the New World, and known as the "sky-scraper." These towering masses of steel and stone are especially to the fore in Capetown and Johannesburg, but are also to be found in almost every other town of importance in the sub-continent.

That the erection of these buildings creates an enormous demand for material, such as steel, foreign to the architecture of the previous generation, is well known; but it is also true that the altitude to which they are carried—frequently eight or ten storeys—necessitates the utilization of other modern inventions, such as lifts and elevators for both passengers and goods; and it is, therefore, not surprising that a considerable market has been created for such appliances. Whereas, however, in the United Kingdom the hydraulic lift has a wide vogue, in South Africa, where in many places the scarcity of water presents difficulties, the electric elevator is more favored, in spite of the difficulty hitherto experienced in finding local mechanics capable of erecting and repairing these appliances—a difficulty, however, which is being rapidly overcome. Of course, there is, and there is likely to continue, a demand for hydraulic lifts, but it is improbable that it will attain the proportion of that for the electric variety for the reason stated, and also because of the general popularity of everything electrical in South Africa.

"Manufacturers' Mutual" Fire Insurance

IN the course of the canvass of the members of the Canadian Manufacturers' Association now being undertaken in the interest of the two Mutual Fire Insurance Companies, it has become apparent that the actual facts concerning the history and record of the "New England Mutuals" are known to very few. Indeed, it is open to question if the members of the Insurance profession are generally any better posted.

In *Best's Insurance News* for July there appears an article on the subject which we think we shall be doing service to the members in reprinting *in extenso*. *Best's Insurance News* is devoted to the interests of the insured, and not of the Companies; it is regarded as a carefully edited and reliable journal devoted to the protection of Insurance buyers, and is generally conceded to be an authority on the subject on which it treats. It is published by the Alfred M. Best Company, Incorporated, New York, and we desire to express our indebtedness to them for the article and for the figures that follow:

Below we print two tables showing the financial condition and transactions of various mutual companies composing the senior and junior conferences of mill mutual insurance companies. Several of the companies are members of both the senior and junior conferences, and we have duplicated their

have shown considerable saving to their members. They write large lines upon sprinklered manufacturing risks, usually isolated plants, so that they are not subject to the conflagration hazard. All of the companies have been successful, and while there is always a possibility that a series of heavy losses may necessitate an assessment; but this possibility is very remote. Lines should be graded in proportion to the size of the companies, particularly in dealing with the "Junior Conference." The assessment liability assumed by the members of the various companies is five times the cash premium, except in the case of the Metal Workers, Narragansett and Textile Manufacturers' Mutual Fire Insurance Companies, whose members are liable for only three times the cash premium.

The secretary of the Manufacturers' Mutual and its five associates explains the system in the following letter:

"Providence, R. I., July 11, 1907.

"Alfred M. Best Co.,

"100 William St., New York, N. Y.

"Dear Sirs:

"Our method of doing business is somewhat as follows:

"We charge a certain rate and write our policies for a

* Members of both Senior and Junior Conferences. † Average only for three and one-half years.

figures in order that persons desiring information as to the relative standing and results secured by the companies in either conference, will find in compact form the statistics of all the companies in either group. These factory mutuals

term of one year or less, making the expiration on the first day of a month. On the first of every month we deduct from the premiums received for the twelve months next preceding, the expenses and losses less the income from our investments,

and pay back to the policyholder the balance at an even percentage. As, for example, if we should earn 95.18 per cent., we would pay 95 per cent.

"By placing the income from our investments to the credit of the policy holders we reduce the expense account to a very small figure. Speaking for the six companies in this office, you will see by the enclosed statement that the expenses and taxes incurred during the year 1906 aggregated about \$193,000, but against this we credited the income from our investments of \$161,000, so that out of the \$3,520,000 received for premiums we retained only this difference of \$32,000 and \$147,000 for losses.

"In other words, the business handled for 1906, totalling over \$470,000,000.00, was handled at an expense of 91-100 of 1 per cent. of the premiums received, and the losses.

"By this you will see that whatever profit is made by the insurance companies goes back into the pockets of the policyholders, for we retain nothing but the fraction of the per cent., which in reality amounts to but a few dollars each year. The middleman is entirely eliminated, as well as all the unnecessary and extraordinary expenses incident to other business of the same character.

"An item of interest in the nature of adjustments of losses is the satisfaction we have given, for the record of our Manufacturers' Company for seventy-two years (which is true of our other companies) is that we have never forced our policyholders to resort to the courts at law to get their just claims.

"As to the classes of risk, we confine ourselves wholly to manufacturing property fully protected. We were the first to recognize the value of automatic sprinklers, and their introduction has shown their great advantage in cutting down the losses, and the consequent increase in our dividends. For the last ten years the dividends of the six companies in this office have averaged better than 90 per cent., and for the last five years a fraction under 92 per cent.

"Another interesting feature about our underwriting is the fact that by confining ourselves wholly to manufacturing property, it generally means that our risks are located on the outskirts of towns and cities, and are, therefore, not subject to the conflagration hazard. We lost nothing at Chicago, Boston, Waterbury, Paterson, Baltimore, Rochester, Toronto, or San Francisco, and what is true of our companies is true of most of the mutuals."

AN ATTRACTIVE PROPOSITION.

The Secretary has just received a communication from a well-known London, England, manufacturers' agent, which outlines a proposition which should prove attractive to all Canadian manufacturers desiring a first-class man who can act as their wholesale distributing agent and representative in Great Britain. The party writing has a large warehouse right in the heart of London, where he keeps stocks of the goods he now handles for Canadian and American manufacturers. His large staff of travellers cover every part of England, and he is in touch with all the most important buyers in the country. All correspondence, billing, etc., is done on the manufacturers' own letter-heads; the representative receiving a commission for the business placed. His warehouse is the manufacturers' British headquarters. He is at present desirous of taking on a few good houses exporting wooden handles of all kinds, wheel-barrows, rakes, skewers, ice-cream freezers, bench screws (maple), clothes pegs, chair seats, pastry boards, closet seats. Will be in Canada in October. Further particulars at this office.

Another large saw-mill will be added to British Columbia's lumbering industries. Richard T. Godman, an English capitalist, has made considerable investments in the Pacific Province and will erect a mill near Point Atkinson.

BOOKS AND CATALOGUES.

The Canadian Annual Review.

The publication of a new volume of the Canadian Annual Review is always a matter of interest. The volume for 1906, which has just appeared, in every way meets the expectations of the reader. It is a most complete review of Canadian events, and it has the additional grace of being thoroughly indexed.

Mr. J. Castell Hopkins has shown a happy faculty in accumulating facts and sifting the grain from the chaff. The activities and interests of our country are so diverse that the individual can no longer pretend to keep in touch with them all. Yet the six hundred pages of the Review contain the salient features in brief, lucid and unprejudiced form, of all that has taken place in Canada during the twelve months it covers. Our material development and resources, our transportation problem, our political affairs, are all treated of adequately. Nor does the volume stop at these bigger problems. It will be found a storehouse of information on Canadian current events.

The catalogue of the Ideal Concrete Machinery Company, Limited, London, gives a complete illustration of concrete machinery and the concrete blocks which are made from it. The use of concrete for building purposes has increased immensely in recent years. The establishment of the Canadian factory of this United States company is a proof of that. The booklet before us shows cuts of blocks and pillars made by the Ideal machines, which are sufficient reason in themselves for the popularity of cement. The results seem to justify the popularity.

A catalogue of exceptional merit has been issued by the Metal Shingle and Siding Co., Limited, of Preston, Ont. The 188 pages which it contains, give ample scope to the illustrator, and he has used his space to advantage. Reproductions of innumerable styles of metal work are shown. This class of ceiling and siding has been advanced to a high state of artistic development. In the book, not only are cuts shown of the individual pieces, but many attractive interiors of stores, churches and other public buildings are given, giving convincing proof of the popularity of these goods.

The book and stationery house of Brown Brothers, Limited, Toronto, has completed fifty years of service, and the golden anniversary has been celebrated by the issuance of a booklet descriptive of the firm, its history and progress. The book is illustrated throughout with cuts of members of the firm, employees, and warehouse and factory scenes. It is well gotten up, and will prove of great interest to the many who have come to look on the firm as one of Toronto's permanent institutions.

The Ottawa *Free Press* has issued a special number to commemorate the fortieth anniversary of Confederation. It is a souvenir which all who are interested in Canada's capital will be glad to receive. The pictorial section, consisting of sixteen pages printed on heavy paper, contains much to arrest the attention. Through its connection with the Federal Government, Ottawa has become the centre of much that is of imperial calibre. The *Free Press* is to be congratulated on the wealth of historic matter it has gathered together in this excellent issue.

Among the Industries

The G. C. Hanford Mfg. Co., of Syracuse, N.Y., have opened a branch factory in Montreal to manufacture patent and veterinary medicines.

The Standard Chemical Co., of Toronto, have purchased a large block of land in Montreal, where it is understood they will erect a large plant.

A new factory will be erected at once by the Chestnut Canoe Co., Ltd., at a cost of \$13,000. The building will be brick and three stories high.

A site has been selected for the new Wolverine Brass Factory, at Chatham. The contract for the building has been let and work will commence immediately.

It is reported that the Montreal Pipe Co., of Montreal, will establish a car-wheel manufacturing plant in Londonderry, U.S., during the present year.

The Dominion Pharmacal Company has been organized, under the presidency of H. W. Frick, to manufacture chemicals. The manufacturing will take place in Toronto.

The president and manager of the Alberta Biscuit Company of Calgary have decided to establish another factory in Edmonton. The company will be capitalized at \$150,000.

The citizens of St. Thomas have passed a by-law bonusing a car-manufacturing company, which wants to establish a plant in that city. The company is being largely financed by local capital.

The Waterloo Knitting Mills will remove from Waterloo, Que., to Carleton Place, Ont., in September. The change is chiefly on account of the increased bonus they will get from Carleton Place.

A flour mill at Campbellford, owned by L. H. Stephens, was destroyed by fire during the month. The loss is estimated at about \$11,000. The mill had just been equipped with \$4,000 worth of new machinery.

A company was recently organized in Stratford, Ont., for the manufacture of snow ploughs. It is now proposed to extend the scope of the work and manufacture steel box and flat cars. A prospectus has been issued showing the possibilities in this direction. Robert Larmour, of Stratford, has been appointed general manager.

The C. P. R. have decided to construct fifty giant locomotives, exceeding in size any engine ever built in Canada heretofore, for use on the mountain division. They will have a drawbar pull of 40,000 pounds, whereas the greatest traction effort of present locomotives is 31,000 pounds, which will move a train load of nine hundred tons.

At Swanson Harbor, near Vancouver, B.C., a pulp and paper industry will be established, which promises to add greatly to the industrial activity of the Pacific Province. The Canadian Sulphite and Pulp Co., Ltd., have already begun building operations, and it is expected that the necessary plant will soon be in running order. A sawmill, pulp mill and paper mill are all included in the company's plans.

The St. Charles Condensing Company, of New York, are considering the establishment of a plant in Woodstock, Ont. It is understood that if the city will guarantee a sufficient supply of water and grant a free site the company will proceed at once with operations.

J. F. Shadforth, formerly of the iron-working firm of Shadforth, Ltd., is endeavoring to organize a company to establish blast furnaces on Vancouver Island. The plant in contemplation would require a capital of \$2,000,000. With this Mr. Shadforth thinks that a most successful business could be developed. There is a big demand for iron and steel in the West, and requirements in the line of steel rails are great and increasing.

The proposition to establish a smelter in Toronto has been revived by Messrs. Mackenzie & Mann. Now that the Canadian Northern Ontario is completed to the north, it is recognized that such a smelter could be supplied with ore most advantageously. In case the proposal is carried out, car works and other industries, requiring in all \$50,000,000 capital, will be established. A suitable location in Ashbridge's Bay district is available.

The Jeffrey Manufacturing Company, who have now got their Canadian factory in Guelph in running order, have issued a supplement, No. 57B., to their catalogue, giving numerous illustrations of their conveying machinery in actual operation. They show machinery of this kind for saw-mills, lumber mills and wood-working industries. The catalogue is very complete, and will well repay a perusal. It can be had on application to the company at Guelph.

Sherbrooke, Quebec, is having plenty of activity in industrial circles at present. The E. & T. Fairbanks Co., scale manufacturers, of St. Johnsbury, Vt., have been voted a bonus and are to erect a large factory there. A new factory is in course of construction for W. R. Webster & Co., cigar manufacturers, and La Cie. J. L. Mathieu, patent medicines, are extending their plant. The Pearl Jewellery Co., a branch of an American concern, is also locating a large factory in Sherbrooke.

The Canadian Iron & Foundry Company, Ltd., whose head offices are at Montreal, is building a large pipe foundry at Fort William, Ontario. The plant is being constructed on a new plan, which provides for a system of continuous operation, and according to the number of hours run and the size of pipe cast. Besides the pipe works a large general foundry and car-wheel shop is being built, together with a machine-shop of corresponding capacity. The plant will be worked by electric current obtained from Kakabeka Falls.

The National Transcontinental Railway Commission has awarded contracts for 65,371 tons of steel rails and fastenings. The "Soo" Company will receive over 22,000 tons for the Abitibi section, the first half to be delivered on November 1st, 1908, and the other half in 1909. The balance of the rails, over 43,000 tons, go to the Sydney company. The first half will require to be delivered in November, 1907, and the balance in July, 1908. Delivery will be at Edmonton, Quebec and Levis. The round figures of the cost of the orders will be about \$1,850,000.

Situations Wanted

NOTE.—For further particulars regarding any applicant mentioned below, apply by number to the Secretary at Toronto, stating wages, whether work will be permanent, and giving such information as you think advisable. For all help secured through this medium, our regular Labor Department charges will be made.

Brass Workers.

- 124 **Linen and Cotton Handkerchief Warehouseman.**—Young, single Englishman, with 9 years' experience in large linen and cotton warehouse in Manchester, in the handkerchief branch, wants position as shipping clerk in Canadian house. Non-union.

Trade Enquiries

NOTE.—For further information regarding any inquiry mentioned under this heading or the names of inquiries, apply by numbers to the Secretary, at Toronto.

- 446 **Agent.**—Englishman would like to represent a few good Canadian houses in Great Britain. Excellent references, long experience, and good connections.
- 447 **Agent.**—Belgian commission agent with splendid connections wants to represent a few good houses exporting butter, cheese, provisions, or other lines. References; enterprising and experienced.
- 448 **Agent.**—Young man speaking French, German and English fluently would like to hear from firms who could use his services as a representative in Great Britain or the Continent. Good references.
- 449 **Apples, Cheese, Lard and Cured Meat.**—A large wholesale grocery merchant of Aberdeen, Scotland, desires to be put into communication with Canadian exporters of apples, cheese, lard and cured meats.
- 450 **Asbestos.**—Tyne firm, manufacturing asbestos goods, is prepared to consider samples and prices of Canadian asbestos in the crude and fibre.
- 451 **Axe Handles.**—An Australian firm, importing large quantities of axe and other handles, is anxious to receive Canadian catalogues and lowest export prices upon the basis of f.o.b. steamer, New York. It is necessary to receive samples of axe handles (they can be cut) by mail, in order to see the standard of the qualities quoted.
- 452 **Band Saws, Agricultural Machinery, Cottons of All Kinds.**—Well-known manufacturers' agent, in the Phillipines, thoroughly in touch with all the markets in the Orient, wants to hear from Canadian manufacturers who can export above articles. Band saws suitable for cutting hardwood wanted, 6" to 14" wide. Quote f.o.b., New York.
- 453 **Beeswax.**—A Manchester firm wishes to obtain prices and samples of beeswax from Canadian shippers of same.
- 454 **Birch, Oak and Ash Boards.**—Bradford firm, with a large demand for birch, oak and ash boards of the prime quality, asks for Canadian shippers who are in a position to guarantee prompt shipments. Prices and other particulars to be given for c.i.f. Bradford.
- 455 **Broom Handles, Dowels and Chair Rungs.**—A London firm would like to hear from Canadian manufacturers who are in a position to fill orders for broom handles, dowels and chair rungs. Details of the goods required: Broom handles, 50" x 1/8"; chair legs and fronts, chair reeds or dowels, 14" or 42" x 5/8", 14" or 42" x 11/16, 13" x 5/8", 13" x 11/16. They would purchase dowels in quantities of fifty thousand gross at a time, and Canadian manufacturers wishing to take the matter up should send a sample of each line, and quote per gross c.i.f. London.
- 456 **Butter and Cheese.**—An importing house in the city of Altamira, Mexico, wishes to make connection in Canada for the purchase of butter and cheese.
- 457 **Canned Apples.**—Old-established Leeds firm desires to make arrangements with Canadian exporters of canned apples and similar fruit for regular shipments.
- 458 **Canned Fruit and Evaporated Apples.**—An old-established

- Tyne firm is prepared to handle consignments of all classes of canned fruits and evaporated apples, and asks for Canadian exporters of these products.
- 459 **Canned Lobsters, Lard, etc.**—A general commission agent in Constantinople reports an opening for Canadian provisions, canned lobsters, and other goods, lard, etc., and asks to be placed in communication with first-class exporters.
- 460 **Canned Fish and Meats.**—An importing house in the city of Manzanillo, Mexico, wishes to make connections in Canada for the purchase of rough and dressed lumber.
- 461 **Canned Meats and Fish.**—An importing house in the city of Altamira, Mexico, wishes to make connections in Canada for the purchase of canned meats and fish.
- 462 **Canned Goods.**—A large firm in Birmingham, having a good connection, wishes to represent a first-class Canadian firm manufacturing goods saleable to grocers in Great Britain.
- 463 **Cloths and Dry Goods.**—An importing house in the city of Altamira, Mexico, wishes to make connections in Canada for the purchase of cloths and dry goods.
- 464 **Carbide of Calcium.**—Tyne firm asks for prices of carbide of calcium from Canadian exporters, with a view to purchasing when market is short. Prices to be quoted for shipments to Newcastle-on-Tyne in 25-ton lots in cases of 1 cwt. each.
- 465 **Chair Legs and Spindles.**—A Manchester firm asks for prices and samples of chair legs and spindles from Canadian manufacturers.
- 466 **Commission Agent.**—A commission agent of Port of Spain, Trinidad, is anxious to communicate with Canadian manufacturers, with the view of representing them and introducing their lines into Trinidad and the neighboring islands, on a commission basis.
- 467 **Distilled Water.**—Cobalt mining camp wants to purchase this commodity for drinking purposes.
- 468 **Evaporated Apples.**—A Yorkshire firm desires to hear from Canadian exporters of evaporated apples. Full particulars to be given.
- 469 **Evaporated Apples.**—A prominent Hull produce firm is open to hear from Canadian exporters of evaporated apples, packed whole in 50-pound boxes.
- 470 **Flour, Oats, Hay and Lumber.**—A merchant in the Bahamas wishes to be put in communication with Canadian shippers of flour, oats, hay and lumber.
- 471 **Essential Oils, Wintergreen, Sassafras and Peppermint.**—A Manchester firm asks for prices of essential oils, wintergreen, sassafras and peppermint, from Canadian manufacturers.
- 472 **Excelsior.**—London, England, house desires to purchase Excelsior for South Africa in Canada; must be hydraulically pressed and in bales. Quote in English ton. Prices range £3 to £6 per ton. Further particulars at this office. Good business in sight.
- 473 **Garden Seats, School Desks, etc.**—A large English firm of timber importers invites catalogues and prices from Canadian manufacturers of garden seats, school desks, and similar marketable commodities in the timber line. They must be made of oak or other suitable timber, and cut to English patterns, with or without the necessary ironwork. Prices c.i.f. any port in the north of England.
- 474 **Glazed Kid, Boots and Shoes, Shoe Polish.**—Australian commission house, with travellers covering whole of Australia, would like to hear from a few good Canadian houses who can do an export business in Australia or New Zealand.
- 475 **Hickory Perambulator and Go-Cart Handles.**—Large Australian importing house wants to buy these handles in Canada. Good orders, spot cash payment, samples on request with further description.
- 476 **Horse Fountain or Drinking Trough.**—Ontario town is anxious to purchase the above article at once.
- 477 **Knock-down Furniture, Light Wagons, Agricultural Machinery.**—A South African firm desires to obtain catalogues, prices, etc., from Canadian manufacturers of knock-down furniture, such as bedroom suites, etc., also of light wagons, pony traps, and agricultural machinery.
- 478 **Ladies Silk Belts, Barbers' Supplies, Bentwood Chairs, Toilet Combs, Chenille Curtains, Felt Carpet, Art Furniture, Go-Carts, Advertising Novelties, Wax Paper, Wood Novelties, Rugs, Towels.**—First-class Melbourne, Australia, importing house, with large trade, is anxious to purchase these goods in Canada. Payment, 30 or 60 days' draft. Will sell goods exclusively of one manufacturer, if desired.
- 479 **Lumber.**—Inquiry is made for the names of lumber brokers in Canada who are in a position to ship in such quantities as are required by a fairly large manufacturer of wood mantels, folding partitions, church and school furniture, etc.
- 480 **Lumber.**—An importing house in the city of Colima, Mexico, wishes to make connection with dealers on the Pacific Coast of Canada for the purchase of lumber.
- 481 **Lumber, Rough and Dressed.**—An importing house in the city of Manzanillo, Mexico, wishes to make connections in Canada for the purchase of rough and dressed lumber.
- 482 **Lumber, Timber Flooring, and Box Shooks.**—An importing house in the city of Tepic, Mexico, wishes to make connections in British Columbia, Canada, for the purchase of lumber, timber, flooring and box shooks.
- 483 **Manufacturers' Representative.**—Well-known commission agent in Belgium and France, good connections in both countries, would like to hear from Canadian firms desirng representation there. First-class references in Canada, and is already representing several Canadian houses, chiefly exporters of raw material. Particulars at this office.
- 484 **Maple Blocks.**—A large firm in the north of England, manufacturing bobbins for use in spinning mills, is open to hear from Canadian exporters of maple blocks, in various sizes suitable for this purpose.
- 485 **Mineral White, Whiting and Kaolin.**—A Manchester chemical firm broker asks for prices c.i.f. of mineral white, whiting and kaolin from Canadian exporters.
- 486 **Molasses.**—A merchant in the Barbados desires to be placed in touch with Canadian importers of fancy molasses.
- 487 **Oils, Liquor, Vinegar, Wines, Hams, Bacons.**—Mexican wholesale and retail merchants want to purchase the above articles in Canada. Payment monthly, good references, wants quotations on sample shipment.
- 488 **Picture Frame Mouldings, Turned Woods, etc.**—An old-established Leeds firm are buyers of plywood, 3 and 5 ply, in birch, maple or oak. Sizes: maximum, 60 inches by 42 inches; minimum, 24 inches by 18 inches. They can also dispose of picture frame mouldings, and all classes of turned woods, for use in the cabinet and building trades, and ask for prices from Canadian shippers.
- 489 **Potash.**—A London firm would like to hear from Canadian shippers of potash.
- 490 **Pulp-board Partitioning.**—A firm of egg importers in the North of England desire to get in touch with Canadian manufacturers of the pulp-board partitioning used by egg shippers.
- 491 **Redwood, Basswood and Poplar.**—A North of England firm is desirous of buying sawn squares of redwood, basswood or poplar in various sizes, 48" x 1" x 1" and upwards, the wood to be dry, tied in bundles and shipped underdeck, clear of knots and other imperfections, and to rank as first quality.
- 492 **Salmon.**—An old-established firm of fish merchants in Leeds are desirous of making arrangements with Canadian exporters of either frozen or fresh salmon.
- 493 **Seagrass.**—A Liverpool firm wishes to be placed in communication with Canadian shippers of seagrass (*Zostera Marina*), used for upholstery work.

- 494 **Slate Battens.**—A Manchester firm wishes to obtain prices of slate battens, sizes 1½" x ⅝", 2" x ⅝", and 2" x ¾", from 6 to 12' long, from Canadian saw-mill owners.
- 495 **Spruce and Birch Deals, etc.**—A Manchester firm asks quotations for spruce and birch deals and birch legs and squares from Canadian shippers of same.
- 496 **Striped Wood File Board.**—A Midlands company wish to obtain quotations from Canadian manufacturers who can supply striped wood fileboards about 14" x 10". They purchase in lots of from 5,000 to 10,000 boards.
- 497 **Tallow.**—An importing house in the city of Tepic, Mexico, wishes to make connections in British Columbia, Canada, for the purchase of tallow.
- 498 **Three-ply Veneer.**—A Manchester firm asks for prices of three-ply veneer from Canadian manufacturers.
- 499 **Vulcanite Substitute.**—Ontario man has a good proposition to make to a man with capital who can assist him in the manufacture of a splendid substitute for vulcanite and insulating material. Product has never been used before, and enquirer has an abundant supply on his property in Ontario, which is available at a cost of \$3.00 per cwt.
- 500 **Western Canada Representative.**—Well-known contractor and constructional engineer in Winnipeg desires to represent manufacturers of Building Specialties in the West. Covers territory between Lake Superior and Rocky Mountains.
- 501 **Wood Bedsteads and Bedroom Furniture.**—A Manchester firm invite correspondence from Canadian manufacturers of wood bedsteads and bedroom furniture.
- 502 **Wooden Handles.**—A London firm wish to purchase all kinds of wooden handles.
- 503 **Yellow Pine Sidings.**—A Manchester firm ask for prices of first quality, 2" yellow pine sidings from Canadian exporters.

"HERRINGBONE" Expanded Steel Lath

Is the most satisfactory metal lath for both interior and exterior construction.

It is the stiffest expanded metal lath made.

It is the easiest to apply and plaster.

It has absolutely uniform edges—it interlocks instead of overlapping, thus making a rigid joint with no waste of material.

And it Cannot Burn

MANUFACTURED BY

Underwood

The increase in Underwood sales this year has been over 100 machines a month. For any other typewriter this increase would be considered exceedingly satisfactory as total sales.

The Underwood Billing Typewriter has been sized up by business men as the greatest economizer and systematizer of office work ever produced. A large financial institution recently placed an order for forty, and in a few days duplicated the order.

Let us send you the book about the Biller.

PROPER BOOKKEEPING OR JAIL

Because he failed through keeping no books,
The Canadian Merchants Protective
Association have entered proceedings
against a man.

The law says:

"Any man who fails and who has
not for five years before his failure kept
proper books shall be liable to a fine of
\$800.00 and one year's imprisonment."

It is cheaper to keep proper books than to
pay a fine of \$800.00
and go to jail for a year,
isn't it?

NOS. 346 and 348 BROADWAY, N.Y. CITY, U.S.A.

THE BRADSTREET COMPANY gathers information that reflects the financial condition and the controlling circumstances of every seeker of mercantile credit. Its business may be defined as of the merchants, by the merchants, for the merchants. In procuring, verifying, and promulgating information, no effort is spared, and no reasonable expense considered too great, that the results may justify its claim as an authority on all matters affecting commercial affairs and mercantile credit. Its offices and connections have been steadily extended, and it furnishes information concerning mercantile persons throughout the civilized world.

Subscriptions are based on the service furnished, and are available only by reputable wholesale, jobbing and manufacturing concerns, and by responsible and worthy financial, fiduciary, and business corporations. Specific terms may be obtained by addressing the Company at any of its offices.

In addition to printing and publishing The Monetary Times, we print: Canadian Engineer, Canadian Churchman, Journal of Fabrics, Contract Record, Canada Lumberman, Architect and Builder, and half a dozen others. But catalogue and book work is our speciality.

PUMPING MACHINERY

CANADA FOUNDRY CO., Limited,
Head Office and Works—TORONTO,
ONT. District Offices—Montreal, Halifax, Ottawa, Winnipeg, Calgary, Vancouver, Rosslund.

Steam and Power Pumps of every description for all services.

RADIATORS

THE GURNEY-TILDEN CO., Limited,
HAMILTON, CAN.

Hamilton Radiators for Hot Water or Steam.

Catalogue on application.

We invite correspondence.

TAYLOR-FORBES COMPANY, Ltd.,
GUELPH, ONT.

Sovereign Radiators for Hot Water or Steam Heating.

Prices on application.

—We also make Hot Water Boilers. —

Railroad and Contractors' Supplies

The TORONTO PRESSED STEEL CO.,
Ltd., TORONTO, Canada.

Wheel and Drag Scrapers.
Railroad Ploughs, all kinds.
Railroad Dump Carts, ½ yds. to 10 yds. capacity.
Dump Carts and Dump Wagons.
Wheelbarrows and Trucks, every description.
Prompt Delivery "ALL CANADIAN MADE."

REFRIGERATORS

THE LINDE BRITISH REFRIGERATION CO. OF CANADA, Ltd.

Manufacturers of Refrigerating and Ice Making Machines for Meat Packers, Dairies, Cold Stores, etc.

Head Office—Coristine Building,
St. Nicholas St., Montreal.

RIVET AND STEEL PRODUCTS

THE CANADIAN RUBBER COMPANY
OF MONTREAL.

Sole makers of the Celebrated "Canadian" Rubbers, for over 50 years the inspiration of the trade for "Looks" and "Wear." Special attention given to the Export trade.

RUBBER BOOTS AND SHOES

THE PARMENTER & BULLOCH CO., Ltd.
GANANOQUE, ONT.

Iron and Copper Rivets, Iron and Copper Burrs, Bifurcated and Tubular Rivets, Wire Nails, Copper and Steel Boat and Canoe Nails, Escutcheon Pins, Leather Shoe and Overshoe Buckles, Bit Braces, Felloe Plates.

THE GUTTA PERCHA AND RUBBER
MFG. CO. OF TORONTO, Limited.

Sole Manufacturers of the Celebrated "Maltese Cross" and "Lion" Brands of Rubber Boots and Shoes.

RUBBER MECHANICAL GOODS

THE CANADIAN RUBBER CO. OF
MONTREAL.

Branches at HALIFAX, MONTREAL,
TORONTO, WINNIPEG, VANCOUVER.

Manufacturers of all kinds of High-Grade Mechanical Rubber Goods, Belting, Hose, Packing, Light Mechanical and Moulded Rubber Goods, Drugists' Sundries.

THE GUTTA PERCHA AND RUBBER
MFG. CO. OF TORONTO, Ltd.

Manufacturers of all kinds of Rubber Goods for Mechanical Purposes, Rubber Belting, Packing, Water Hose, Steam Hose, Air Drill Hose, Brewers Hose, "Maltese Cross" Carbonized Rubber Fire Hose, Solid and Pneumatic Tires.

SAWS

SAWS.

If the Maple Leaf is on your Saw, it is a guarantee that you have the best.

Manufactured only by

SHURLEY & DIETRICH,
GALT, ONT.

SAW MILL MACHINERY

THE WM. HAMILTON MFG. CO., LTD.
Peterborough, Ont.

Manufacturers of Sawmill Machinery, and Water Wheels, Mining and Pulp Mill Machinery, Engines and Boilers, Transmission Machinery.

SCALES

THE GURNEY SCALE CO.,

Established 1856.

HAMILTON, ONT.

Manufacturers of Standard Scales and Trucks.

SCREWS AND WIRE PRODUCTS

THE CANADA SCREW CO.,
HAMILTON.

Wood Screws, Wire, in coils and straight lengths, Wire Nails, Stove and Tire Bolts, Rivets, Machine Screws, Nuts, Burrs, Bright Wire Goods, etc..

SHEET METAL WORK

A. MATTHEWS,

TORONTO.

Slate and Metal Roofing, Sheet Metal Work, Exhaust Fans and Piping.

SHIRTS AND COLLARS

THE STANDARD SHIRT CO., Limited,
MONTREAL.

Manufacturers of Shirts, Collars, Cuffs, Overalls, etc.

The WILLIAMS, GREENE & ROME CO.,
BERLIN, ONT.

Manufacturers of

SHIRTS AND COLLARS.

SHOES

GEO. A. SLATER,

Shoemaker, MONTREAL.

Goodyear Welts Exclusively.

Men's, Boys' and Women's.

Factory capacity 1,000 pairs per day.

SIGNS AND PAINTING

GEORGE BOOTH & SON,
21 Adelaide Street West, Toronto.

BRASS AND BRONZE SIGNS

Manufacturers of Signs of all kinds. Brass, bronze, glass, and gold letters.

ILLUMINATED SIGNS, &c.

SILVERSMITHS

RODEN BROS.,
TORONTO, CAN.

Manufacturers of Table and Hollow Ware, Enamelled Belt Buckles, Brooches and Novelties, Medals, Badges and College Pins. Staple Silverware of all classes.

STANDARD SILVER CO.,

31 to 43 Hayter St.,

TORONTO, CAN.

Manufacturers of the finest quality of Electro-Silver Plated Wares. If interested write for catalogue.

THE TORONTO SILVER PLATE CO.,
Ltd.

Factories & Salesrooms, TORONTO, Can. Silversmiths and Manufacturers of Electro Silver Plate of every description.

E. G. GOODERHAM,

Managing Director.

SOIL PIPES AND FITTINGS

TORONTO FOUNDRY CO., Limited,
Jefferson and Pardee Avenues,
and Liberty St., TORONTO.
Manufacturers of Soil Pipe and Fittings, Sinks and Boiler Stands. Telephone, Park 335.

WARDEN, KING & SON, Limited,
Manufacturers,
MONTREAL.

"Daisy" Hot Water Heater. "Gem" Hot Water Heater. "Gem" Steam Heater. "Daisy" Bath Heater.
Send for Catalogue.

SPRINGS—OIL TEMPERED

BAILEY-UNDERWOOD CO., Limited
NEW GLASGOW, N.S.

Manufacturers of Oil Tempered Steel Springs, Rake and Harrow Teeth, Organ Springs, Piano Trap Springs, Wringer Springs, etc., and for all special purposes.

STEEL

THOMAS FIRTH & SONS, Limited,
MONTREAL STEEL WORKS, Limited,
Agents for Canada.

"Speedicut" High Speed Steel. Tool Steel. Axe Steel. Saw Steel. Files, etc.
A large stock carried in our warehouse.
51 St. Patrick Street, MONTREAL

STEEL STAMPS & DIE SINKING

Steel Stamps and Die Sinking
Hamilton Stamp & Stencil Works, Ltd.,
HAMILTON, ONT.

H. Barnard, President, B. Broughton, Vice-Pres.
G. Gomm, Sec.-Treas.
Die Sinkers and Manufacturers of Steel Stamps, Steel Letters and Figures etc. Canadian Agents for the BRADLEY STENCIL MACHINE.
Correspondence is respectfully solicited.

STOVES

THE GURNEY-TILDEN CO., Limited,
HAMILTON, CAN.

We are makers of the celebrated "Souvenir" Stoves and Ranges for wood or coal, etc., etc. Catalogues on application.

We solicit correspondence.

THE MOFFAT STOVE CO., Limited.
WESTON, ONT., CANADA.
NATIONAL STOVES

Are the latest in style and practical improvements for hard coal, soft coal or wood.

THE McCLARY MFG. CO.,

Manufacturers of Stoves, Ranges, Furnaces, Enamel and Tinware of all kinds, and dealers in Metals, Tinners' Supplies, and

"Everything for the Tinshop."

Head Office and Works—LONDON, Ont.
Branches—Toronto, Montreal, Winnipeg, Vancouver, St. John, N.B. Hamilton.

TENIS AND AWNINGS

J. J. TURNER & SONS,
PETERBOROUGH, ONT.

Manufacturers of Tents, Awnings, Flags, Sails, Waterproof Covers, Clothing, Coal Bags, Life Belts, Life Buoys and every description of Camping Goods. Tents and Camping Outfits to rent.

THRESHING MACHINERY

SAWYER & MASSEY CO., Limited,
HAMILTON, CAN.

Separators, Clover Hullers and Attachments of all kinds, Threshing Engines, Traction and Portable, Sweep and Tread Powers, Portable Saw Mills and Saw Mill Engines, Roadmaking Machinery, Graders, Scrapers, Rollers, etc.

TRUNKS AND BAGS

J. EVELEIGH & CO.,
MONTREAL.

Manufacturers of Travelling Requisites of every description.
Steel Commercial Trunks a specialty.

THE M. LANGMUIR MANUFACTURING CO. OF TORONTO, Limited.

Trunks and Travelling Bags, Telescope Cases, Suit Cases, etc. Steel Sample Cases.

TYPEWRITERS

UNITED TYPEWRITER CO., Limited.
7-9 Adelaide St. East, TORONTO.

Sole dealers in "Underwood" Typewriters; also all other makes, new and second-hand; manufacturers of Neostyle Duplicating Machines and supplies.
Write for price list.

VARNISHES

THE IMPERIAL VARNISH & COLOR CO., Limited,
TORONTO

Manufacturers of
Varnishes, Japans, Fillers, Paints,
Enamels, Stains, etc., for all uses.

WAGONS AND CARTS

The WILKINSON PLOUGH CO., Ltd.,
TORONTO, Canada.

Wagons, a full line.

The West Lorne Wagon Co. controlled by The Wilkinson Plough Co., Ltd.
Prices on application.

WATCH CASES

THE AMERICAN WATCH CASE CO., LTD.,
TORONTO, CANADA.

Largest Watch Case Factory in the British Empire. Manufacturers of Gold, Silver, Gold-filled and Nickel Watch Cases of every style and size. Goods marketed exclusively through the wholesale trade. Correspondence solicited.

WHEEL SCRAPERS

BECHTELS LIMITED

Manufacturers of the SIMPLICITY line of
Wire Cut Brick Machinery
Capacities up to 100,000 per day. Perfect
Carless Brick and Tile Driers.
Wheel Scrapers. Barrows, etc.

WINDOW SHADES, ETC.

GEO. H. HEES, SON & CO, Ltd.,
Manufacturers of
Window Shades, Upholstery Goods, Lace
Curtains, Curtain Poles, Fixtures, etc.

Executive Council

JULY MEETING.

The regular monthly meeting of the Executive Council was held in the Board Room of the Traders' Bank Building on Thursday, July 18th, at 2 p.m.

The Vice-President, Hon. J. D. Rolland, occupied the chair, other members present being: Messrs. C. C. Ballantyne, Montreal; H. Bertram, Dundas; C. A. Birge, Hamilton; Geo. Booth, Toronto; P. H. Burton, Toronto; W. Cauldwell, Montreal; R. J. Copeland, Toronto; J. A. Coulter, Ingersoll; J. W. Cowan, Toronto; J. F. Ellis, Toronto; P. W. Ellis, Toronto; Thos. Findlay, Toronto; J. Firstbrook, Toronto; H. W. Fleury, Aurora; S. Harris, Toronto; E. G. Henderson, Windsor; Jos. R. Henderson, Halifax; J. H. Housser, Toronto; Wm. McMaster, Montreal; Robt. Munro, Montreal; Denis Murphy, Ottawa; J. P. Murray, Toronto; W. C. Phillips, Toronto; T. A. Russell, Toronto; Alex. Saunders, Goderich; J. T. Sheridan, Toronto; Louis Simpson, Valleyfield; J. M. Sinclair, Toronto; Wm. Stone, Toronto; Dan. Wilson, Colingwood.

The Minutes of the June meeting, as published in INDUSTRIAL CANADA, were taken as read.

COMMUNICATIONS.

Communications were received as follows:

(a) From members of the Executive Council unable to be present: Messrs. Geo. D. Forbes, Hespeler; Arthur W. White, London; D. J. Fraser, St. Johns; J. B. Maclean, Toronto; Geo. Brigden, Toronto; Frank A. Rolph, Toronto; Geo. E. Amyot, Quebec; T. F. Matthews, Peterboro'; Edward Gurney, Toronto; S. W. Ewing, Montreal; Wm. Robins, Walkerville; Jas. Davidson, Montreal, J. J. McGill, Montreal; Wm. Smail, Montreal; S. J. Williams, Berlin; Chas. S. Meek, Toronto; C. H. Waterous, Brantford; A. S. Rogers, Toronto.

(b) From the Secretary of the Montreal Branch, stating that that body, in annual meeting assembled, urgently requested the Association to protest to the Dominion Government against the leeway in the Dumping Regulations allowed under Clause 6, Sub-section 7, of the Tariff of 1907. This communication was referred to the Tariff Committee.

(c) From the Secretary of the Toronto Branch, requesting permission for that Branch to extend its jurisdiction so as to include certain suburbs of the city of Toronto. Referred to the Reception and Membership Committee for Report.

Reports of Officers were then presented, as follows:

SECRETARY.

In the absence of the President, the Secretary reported that the visits to the various Branches had been completed. He congratulated the Association on the very able manner in which Mr. Cockshutt had represented its views at these Branch meetings, and expressed his belief that the experiment had been attended with good results.

TREASURER.

The Treasurer, Mr. Geo. Booth, read the statement of the receipts and disbursements for the month of June, showing a balance on hand on June 30th of \$10,952.34.

On motion of Mr. Booth, seconded by Mr. Ellis, the report was adopted.

FINANCE.

The report of the Finance Committee recommended for payment monthly accounts totalling \$1,315.04.

It presented details showing the overdraft of the Insurance Department, for which the Council decided to make provision.

The Committee reported a resolution which had been received from the Toronto Branch, expressing dissatisfaction with the room in which the Council meetings were held, and asked the Council for its pleasure in the matter. It was decided that the Finance Committee be requested to report what arrangements they could make for more suitable quarters at the next meeting.

The Committee's report also included a clause authorizing a grant of \$25 to the British Welcome League.

The report was adopted.

COMMERCIAL INTELLIGENCE.

The report of the Commercial Intelligence Committee was presented by the Chairman, Mr. T. A. Russell, and considered clause by clause. It read in part as follows:

At the regular monthly meeting of the Commercial Intelligence Committee, held on Tuesday last, a number of important matters came up for consideration, among which were the following:

Collection of Overdue Accounts, etc.

A report was received from the Special Committee appointed to investigate the advisability of the Association establishing a department for the procuring of credit reports, collecting overdue accounts, and handling the claims of members against insolvent debtors. It was thought that perhaps a co-operative plan might be worked out whereby the Head Office of the Association could keep closely in touch with matters affecting the credit of buyers all over Canada, and that interested members could thus obtain valuable information obtainable in no other way. Without going into details, your Committee foresee many difficulties in the way of such a proposal, and recommend that it be held over for the time being. They do, however, feel that steps might safely be taken at once to establish a Department for the collection of overdue accounts, and for handling the claims of members against insolvent estates. Particularly in the collection of overdue accounts, it is believed that a great deal could be done by a solicitor acting as legal adviser for the Association and using Association stationery, in cases where individuals acting on their own account might be unable to show any results.

It is recommended, therefore, that the council approve of such a step on the understanding that details will be worked out by the Committee for submission to the Annual Meeting. The plan will probably include the engagement of a solicitor, who will act independently or connect himself with some well-known firm of lawyers, and who will devote himself almost exclusively to work of this kind. He can undertake the collection of accounts on a percentage basis, which will enable the Association to derive a small revenue from the Department, and in the case of assignments he can act for interested members collectively, thus insuring better and more prompt results, and at a cost which will be considerably less than members would have to pay if acting individually.

Translation Bureau.

It has been felt for some time that the Association's Translation Bureau was in need of reorganization, for as at present conducted it is taken advantage of by so few, and to such a small extent, that it is practically a dead letter. In eleven months ending May, only 43 translations have been made, for the benefit of 14 members, involving expenses of \$12.28 and bringing in a revenue of \$16.13. These figures are even less

than they were three years ago, when the membership was not nearly so large as it is to-day. The falling off is due, no doubt, to the fact that the Bureau is not advertised extensively. It is also believed that it is poor policy to charge a fee of a few cents to members who only use this service once or twice a year, and that for all it costs the Association it might well afford to do the work for nothing.

Your Committee would recommend, therefore, that arrangements be made with one or two translators whereby they would be paid a monthly salary, to report at the office once a day and attend to any work that required to be done, these translators to be specialists in the principal commercial languages, including French, German, Italian and Spanish. It is further recommended that the widest publicity be given to the fact that we translate for members ordinary correspondence up to 25 letters per year, from or into any of the above languages, absolutely free of charge; that we make a charge for letters in excess of 25 per year, also for letters which include long specifications or lengthy extracts from catalogues or price lists, tabulated statements, circulars, legal documents, patents, specifications, blue prints, commercial and Consular invoices; extracts from newspapers and revision of translations made by others. Heretofore our rate has been, from a foreign language into English, 25 cents per hundred words; from English into a foreign language, 40 cents per hundred words. Where any great amount is to be attended to this charge appears to be excessive, and for the advertisement it would give the Association we think we might well afford to reduce these rates to 15 and 25 cents per hundred words, respectively. As soon as it becomes generally known that the Association undertakes this kind of work and does it satisfactorily, there will, no doubt, be calls made upon us to translate other languages which are not so frequently met with, such as Russian, Norwegian, Japanese, Chinese, etc. We would therefore recommend that arrangements be made with interpreters in these languages to take care of work sent them by the Association from time to time at the old rates of 25 and 40 cents per hundred words.

Foreign Report Service.

Careful investigation has been made of the system adopted by the Association for procuring financial reports on foreign houses. This service was worked up into a high state of efficiency some three years ago, but owing to the limited use made of it by members it has been allowed to drop very largely out of sight. It is now recommended that advertising leaflets be prepared and circulated among members, along with the ordinary correspondence, and that if the business offering warrants it, steps be immediately taken to revive the old system.

Duty on Exhibits.

Attention has been called to the fact that whereas Canada admits United States goods intended for exhibition purposes free of duty on the understanding that they are to be shipped out of the country again, the United States has steadily refused to accord Canadian exhibitors the same privilege. This is felt to be decidedly unfair, but before making any recommendations, your Committee will first consult with the Association's representatives on the Exhibition Board.

The adoption of the report, moved by Mr. Russell, seconded by Mr. Munro, was carried.

RAILWAY AND TRANSPORTATION.

The report of the above Committee was presented by the Manager of the Transportation Department. It was as follows:

The regular monthly meeting of the Railway and Transportation Committee was held on Thursday, July 11th, at which the following subjects were dealt with:

Readjustment and International Rate Case.

Your Committee begs to report that a communication has been received from the Chief Traffic Officer of the Board of Railway Commissioners to the effect that the order in the International Rate Case had been signed by the Board, but owing to pressure of work the order did not reach your Committee in time for its meeting.

The Chief Traffic Officer stated that no date for the issue of the tariffs would be given in the order, as it will take some time to do the setting and printing, and besides this, the Board has no jurisdiction over United States lines in the Central Freight Association whose international tariffs have to be changed. The intention is that when the Chief Commissioner returns from the West about September 1st the railways will be required to show progress, and if it is decided that any unreasonable delay has occurred, an order fixing the date will follow.

Your Committee regrets that the Board of Railway Commissioners did not see their way to fixing a date for the new tariffs to become effective, as we had been led to believe would be done. The Manager was instructed to write the Commission to this effect, calling particular attention to the fact that the shipping season commences about September 1st, and that it was particularly desirable that the tariffs should become effective not later than that date. The Manager was also instructed to make every effort, by personal representation if necessary, to that end.

The following resolution is submitted for approval:

"That the Board of Railway Commissioners be asked to make a supplementary order to the order in the International Rate Case fixing a date when tariffs are to become effective."

Since the above meeting a certified copy of order of the Board of Railway Commissioners, No. 3258, has been received by the Department, and the following is a summary of the case:

The order of the Board states, in part:

"In the matter of the application of the Canadian Manufacturers' Association and others, upon hearing what was alleged on behalf of the applicants and counsel for the railway companies, and upon the report and recommendation of the Chief Traffic Officer, the Board doth order, That the special local class tariffs (known as 'town tariffs') of the Grand Trunk Railway of Canada, the Canadian Pacific Railway Company, the Michigan Central Railroad Company, The Wabash Railway Company, the Toronto, Hamilton and Buffalo Railway Company, and the Canadian Northern Ontario Railway Company, east of the Detroit and St. Clair Rivers, Lake Huron and the Georgian Bay and North Bay (east and south bound) and south of the Ottawa River, be reduced so as to place them all on the same mileage scale, and that for this purpose the table of mileage rates particularly set forth in the schedule hereto annexed, marked 'A,' which is hereby made a part of this order, be adopted as the basis by the said companies, etc. The rates in all cases to be based on the shortest workable mileage.

"For the purpose of compiling through special winter and summer class freight tariffs from points west of Toronto to points east thereof, the territory be divided into groups and the rates to Montreal to be as outlined in the memorandum of the Toronto conference of May 23, 1907.

"That from points competitive with the Lake and River lines the companies may publish from and to such competitive points such commodity rates as may be necessary to meet the competition of the water carrier, and shall also publish from Toronto and Hamilton to Ottawa and Montreal competitive class tariffs on the basis now existing, but not to exceed the mileage rates referred to.

"Through rates from the aforesaid groups shall be reason-

ably graduated to points east of Toronto on the basis outlined at the Toronto Conference of May 23, 1907.

"That the eastbound rates from the territory east of Toronto and Orillia, and east of and including Depot Harbor, Parry Sound and North Bay, be in accordance with the mileage scale referred to, which is considerably lower than the present basis.

"That to points in Quebec west and east of Hull, and east and south of Montreal, the through rates from the group territory as defined be arrived at in accordance with the reduced scale.

"That no special commodity rates now existing which may be lower than the corresponding class tariff rates herein prescribed shall be advanced by reason of the changes herein ordered or without the sanction of the Board.

"The said railway companies and connections are permitted to substitute the Canadian Classification from Detroit and Port Huron and from points west thereof *via* the Detroit and St. Clair crossings, and to scale the lower classes on the first class rates now existing.

"That the rates from Canadian points on the Detroit and St. Clair River frontier to all points east to the Atlantic and north to the Ottawa River shall in no case exceed the rates from Detroit and Port Huron as fixed.

"That in the adjustment of the International rates referred to in clause 'H,' the rates on raw materials from points in the United States to points in Canada shall not be advanced at the instance direct or indirect of the companies operating in Canada.

"No change shall be made in the west bound rates from Montreal to the grouped territory west of and including Toronto and intermediate points as a consequence of this order of the Board."

The proposed scheme, it will be seen, means a marked reduction in freight rates to the east from practically all points in Western Ontario. It removes the discrimination which now exists at frontier points in favor of the United States manufacturers. It reduces from Toronto many of the rates which the Toronto Board of Trade complained of. The consideration of the International Rate Case which was adopted by the Canadian Manufacturers' Association involved the Toronto Board of Trade case. It became apparent that the revision of the general mileage basis, which would be a factor in the adjustment of our case, would have a direct bearing on the discrepancies between the local tariffs of which the Toronto Board of Trade complained. As a result, general reductions have been made at such points as London, Brantford, Chatham, St. Catharines, Hamilton, etc.

As an illustration of how the new basis works out, the present first class rate Windsor to Montreal is 70 cents in the winter and 60 cents in the summer. The new basis will be 58 cents all the year round.

	Present 1st Class.	New 1st Class.
From Windsor to—		
Collingwood	50c.	42c.
Brockville	60	50
Orillia	50	42

Goderich	36	32
Southampton	38	34
Windsor	40	36
North Bay	46	38

The same scale will be used in revising the tariffs at the other common points.

A synopsis of the principal features leading up to the adjustment is given herewith:

The companies submitted a draft scheme of the proposed revision of rates on November 8th, 1906. A meeting was held in Montreal, December 19th, 1906, to consider same. The Manager of the Department considered the basis on the whole unsatisfactory. As a result of this meeting new tables were prepared, submitted to the Board on January 24th, but only reached us on February 15th, 1907. This scheme was most elaborate, but it was pointed out to the Board of Commissioners the result would be so disastrous that the officials of the railways could not assume the loss of such a large amount of revenue which would follow the adoption of the suggested figures. At the same time they recognized the authority of the Board's orders, but in that case the Board, of course, assumes the responsibility of the results. These tables involved a loss of revenue on the part of the Grand Trunk Railway of from half a million to a million and three-quarters of dollars annually. The companies estimated that the Canadian Pacific Company's loss would equal two-thirds that of the Grand Trunk.

Although it was conceded that these figures merely represented approximations, the Board felt that in justice to the railways these statistics could not be ignored. It was also evident that an audit of the companies' books in order to verify these statements would postpone the decision of the Board indefinitely.

It was, therefore, suggested that a compromise might be arrived at for a tentative adjustment. Meetings with the Chief Traffic Officer of the Board of Railway Commissioners were held. As a result a resolution of the committee agreeing to a compromise on certain conditions was forwarded to the Board. This resulted in several new schemes being submitted by the railways. As they involved advances which the Board and your Committee could not consider, they were rejected. It, therefore, became apparent that the traffic managers of the railways were dodging the responsibility of the reduction, and if anything was to be done it was up to the Commission to do it. A final conference was held in Toronto on May 23rd, at which a scheme was outlined, which has been practically adopted and ordered by the Board, as already outlined.

Supplement No. 9 to Classification 12.

Your Committee reports the approval by the Board of Railway Commissioners of Supplement 9 to Classification 12. A number of advances had been recommended by the railways in this supplement, all of which were disallowed by representation of the Association.

Classification No. 13.

The resolution passed at the last meeting and approved of by this Council with regard to Rule 7 was forwarded to the Board of Railway Commissioners and duly acknowledged.

The Board approves of the revised classification as submitted, subject to the following conditions, alterations and amendments.

That the proposed change in the minimum weight of mixed carload shipments between points east of Port Arthur, as provided for in Rule 2, Section B, of the said classification, be, and the same is hereby, disallowed.

The present rule is that if the articles provided with a carload rating are of more than one class, the carload rate and minimum carload weight of the article in the highest class shall apply.

The change proposed is that the highest carload rating and highest minimum weight applicable on any article shall apply.

That Rule No. 7 be amended by adding to Section (A) the following provision, namely:

"These conditions are intended to cover risks necessarily incidental to transportation, but no such limitation, expressed or otherwise, shall relieve the carrier from liability for any loss or damage which may result from any negligence or omission of the company, its agents or employees."

Rule No. 7 covers owner's risk conditions.

That the proposed omission of the reduced rating of stoves that are returned to the shipper after having served their purpose for the protection from frost of perishable shipments be disallowed.

That the proposed increase in the minimum weight of matches in carloads from 20,000 to 24,000 lbs. per car be allowed, subject to the condition that the companies provide commodity tariffs for the shipment of mixed carloads of matches and woodenware at the minimum weight of 20,000 lbs. per carload as heretofore.

That Rule 20, describing the minimum charges or "smalls" rate be amended to read as follows:

"The minimum charge for any complete shipment of one or more classes between any two stations of one carrier will be one hundred pounds at first class rate, but not less than 35c."

The present rule is somewhat ambiguous in that it simply says that small consignments of one class, or including articles of several classes, will be charged at actual weight according to the classification of each article, but no single shipment will be taken for less than 100 lbs., 1st class, minimum charge 35 cents, whereas the new rule provides that it shall be the total charge between any two stations of one carrier.

Any person or company violating the provisions of Section 400, Sub-section 1 (misrepresentation) of the Railway Act shall in addition to the regular toll be liable to pay the company a further toll not exceeding fifty per centum of the regular toll.

The said classification to become effective not later than September 1, 1907.

As previously reported, the owner's risk condition has been eliminated as against some 240 items, and where it remains it has been clearly defined.

The release which heretofore has been exacted in the case of shipments of furniture and similar commodities has been done away with.

Car Shortage.

The Department reported a communication from the Board of Commissioners enclosing the report of the Chief Traffic Officer and operating assistant *re* car shortage and delays in transit on the Canadian Northern. The manner of obtaining and compiling of certain information in regard to the car situation was left with the Manager.

Bills of Lading.

A draft of the conditions for the uniform bill of lading in the United States, as agreed upon by a joint committee of shippers and carriers, now before the Interstate Commerce Commission for approval, has been received. The same was held over for consideration when our proposed new bill comes up for discussion. The joint committee referred to has been working upon these new forms more than two years, and its members express confidence of the result of its efforts. Notwithstanding that the joint committee, representing substantially all the railroads in what is known as Official Classification territory, and sixty different associations in the same territory, with a total of about 800,000 members, have practically agreed upon those terms, there is likely to be some further delay in the adoption of this uniform bill.

A communication was received from the Secretary of the Winnipeg Jobbers' and Shippers' Association, asking in what way and by whom this Association would be represented before the Board of Railway Commissioners when this matter is taken up, and suggesting that their Association might arrange to engage the same counsel as we do, with a view to joint effort. The manager was requested to write him that it was most desirable that all interests should be united; so far the committee have not definitely decided upon engaging counsel; that we are strongly of the opinion that our action, as already advised, in filing objections to the conditions submitted by the railways was the only course open; that when the time comes to take action we should be a unit in demanding a clean bill, and should it be decided to engage counsel we will be glad to consult with them further.

The Grand Trunk Railway requested the publication of their circular in reference to the marking and addressing of package freight in INDUSTRIAL CANADA. Your Committee has much pleasure in recommending the same.

Mr. Henderson complimented the Committee on their good work in securing these orders from the Board, and testified to the value of the readjustment order to shippers situated at the frontier.

Mr. Louis Simpson also expressed approval of what had been done. He stated that he had been asked to call the attention of the Executive to the loose practices adopted by the railways in weighing shipments of lumber. The weighing appeared to be conducted under conditions which made it impossible to give satisfaction; besides which, he was informed, the checkers had instructions to increase the weights wherever they were found to be short, and to leave them unaltered when they were found to be excessive. Mr. Simpson accordingly moved, seconded by Mr. Cowan, that the whole subject of weighing shipments as conducted by the railways, whether of lumber or other commodities, be investigated by the Transportation Department, with a view to seeing if something could not be done to do away with the present unsatisfactory conditions.—Carried.

INSURANCE.

The report of the Insurance Committee was read by the Chairman, Mr. Burton. It announced the progress that had been made to date in securing business for the two new Mutual Fire Insurance Companies, and expressed the opinion that practically half the task which the Committee had imposed upon itself was accomplished.

It further reported that Mr. Dakers Cameron, by the kind permission of the Montreal Branch, would devote himself to canvassing for the Companies for the next few weeks, and also that arrangements had been made with Mr. W. I. Fenton, of St. John, N.B., to canvass the Maritime Provinces.

The report further recommended that the Manager of the Department be instructed to visit the Winnipeg Branch for the purpose of consulting members there regarding their insurance difficulties.

The adoption of the report, moved by Mr. Burton, seconded by Mr. P. W. Ellis, was carried.

RECEPTION AND MEMBERSHIP.

In the absence of the Chairman, the report of the Reception and Membership Committee was read by the Secretary.

It recommended for acceptance 15 applications, as follows:

NEW MEMBERS.

MONTREAL, QUE.

Klein Bros. & Co.
R. W. Oliver Milling Co.

TORONTO, ONT.

Martin Corrugated Paper & Box Co.
Berlin Electrical Mfg. Co.
London Machine Tool Co. (A. E. Juhler, 2nd member).
Stevenson Printing Co.
Western Leather Goods Co.

HAMILTON, ONT.

Ellis Manufacturing Co., Ltd.

SYDNEY, N.S.

Sydney Cement Co., Ltd.

WINDSOR, ONT.

Fox Bros. & Co., Ltd.

WELLAND, ONT.

Robertson Machinery Co.

FRANKFORD, ONT.

Trent River Paper Co., Ltd.

WINNIPEG, MAN.

Robb Engineering Co., Ltd. (J. F. Porter, 2nd member).

VICTORIA, B.C.

Staneland Paint Co.

SOREL, QUE.

St. Lawrence Saw and Steel Works.

BRITISH OFFICE.

Mr. Thos. Findley read the report of the British Office Committee, which reviewed among other things the correspondence which had passed between the Association and the Minister of the Interior with reference to the Association's protest against the Government's Immigration policy in the matter of skilled labor. The Committee reported their belief that nothing was to be gained by carrying the correspondence on any further, and that they would therefore recommend that the matter be dropped.

The report also referred to a communication from Louis Leopold, stating that it was impossible to arrange with the Shipping Companies to check luggage through to destination. The Committee, however, did not consider this a serious difficulty, as the only parties whom it was necessary to hold were those whose fares had been advanced, and these, so far as known to the Committee, had all gone through to destination, and commenced to repay their employers for the assistance given them in coming out.

Mr. Stone seconded the adoption of the report, which was carried.

Under the head of unfinished business the Secretary reported Mr. Robins' motion, of which notice had been given at the last meeting of the Council. Owing to Mr. Robins' absence, it was decided to allow the matter to stand over another month in order that he might be heard from on the subject.

BRANCHES.

The reports of the Toronto and Montreal Branches were received and ordered to be printed in INDUSTRIAL CANADA.

The meeting then adjourned.

MONTREAL BRANCH.

The first meeting of the newly elected Executive was held on July 11th, with an unusually large attendance of members present. At this meeting a large number of matters were taken up and discussed.

The Secretary reported that after fifteen months' work the Branch had succeeded in settling the difficulties between the manufacturers of St. Henri and St. Cunegond Wards, and Ville St. Louis and Maisonneuve Wards, with the Montreal Water and Power Co. Accordingly the charge for automatic fire sprinklers had been reduced from 10 cents per annum to 5 cents per annum, and the fire hydrant rate was fixed at \$50 a year independent of the number of openings. The result of this settlement was an annual saving of \$1,325 for the fourteen firms interested, and the disposal of a question which has been annoying the manufacturers for many years past. The total expenses were \$434, which were assessed pro rata upon the members interested. The special thanks of the Committee were tendered to Ald. Roy and Ald. Ward for their assistance towards obtaining this reduction.

A deputation from the Committee will wait upon the Quebec Government to urge better facilities in Montreal for the placing of labor in factories.

Another deputation will wait upon Hon. W. A. Weir in regard to the recent change in the Quebec Industrial Establishment Act, whereby the age limit of factory employees was raised. The deputation will urge that this change be not put into force until education is compulsory in the Province of Quebec.

The lack of proper cartage facilities in Montreal was considered at length, and a special Committee was appointed to deal with the matter.

Nomination of twenty-nine representatives to the Executive Council were made, and the appointment of the Branch Finance Committee and the Branch Legislation Committee.

Two membership applications were recommended for acceptance.

Our Commercial Agent in Newfoundland.

Attention is again drawn to the fact that Canada has a Commercial Agent in Newfoundland. Mr. E. D. Arnaud is showing commendable enterprise in furthering the interests of Canadian merchants in that country. His reports to the Department of Trade and Commerce show a keen appreciation of the market, which is opening up in the ancient colony, and which lies open particularly to this country.

Exporters or their agents, when visiting Newfoundland, should call on Mr. Arnaud. His offices are in the *Gazette* Building, St. John's, Nfld., and are open to all business men. Moreover, through his sojourn in the island, he has become familiar with the needs of the people, and so can be of great assistance in developing trade. He will gladly supply any desired information on the subject, either by letter or personally.

ANNUAL MEETING OF MONTREAL BRANCH.

THE Seventh Annual Meeting of the Montreal Branch, Canadian Manufacturers' Association, was held in the Reading Room of the Montreal Board of Trade on June 7th, with the Chairman, Mr. J. S. N. Dougall, presiding.

The report of the Executive Committee for the year was read by the Montreal Secretary, Mr. Dakers Cameron, and unanimously adopted.

Report of Executive Committee.

To the Members of the Montreal Branch, Canadian Manufacturers' Association:

Your Executive Committee have pleasure in submitting their annual report upon the work of the Montreal Branch during the year, and a statement of some of the principal matters which have engaged their attention.

Change of Annual Meeting.

The holding of the Annual Meeting of the Montreal Branch at midsummer has proved inconvenient on account of the difficulty in securing a representative attendance of members at that time. The Committee have therefore brought the meeting forward into June to accommodate those who would be out of town in July or August.

Municipal Affairs.

The expiry of the Montreal-Light, Heat & Power Company franchise for gas supply has led to numerous efforts to make a new contract between the city and the Company, not only for gas but for electric light and power as well. In November a movement was set on foot to grant a 30 years' exclusive contract to the Company, in return for a small reduction in gas charges and electric light and power rates. Your Committee felt that there was no need at this time to combine gas and electric franchises, but that they should be kept entirely distinct. Action was taken reaffirming the resolution adopted by the Montreal Board of Trade, La Chambre de Commerce, and this Association in 1904 for the obtaining of an arbitration value for the gas plant, the purchase subject to ratification by the property holders of the city, and a vigorous protest was entered against any proposal to grant an exclusive monopoly of electric current. A month later what was known as the Payette offer for the extension of the gas and electric contracts for a period of 20 years was brought up, and with amendment passed the City Council. Your Committee felt justified in serving a notarial protest upon the City Council, pointing out that the granting of an exclusive monopoly in electricity would be contrary to the interests of Montreal manufacturers, and would place them in an unfair position as compared with manufacturers in other parts of the Dominion where electric power might be secured at much lower prices than those laid down in the proposed contract with the Montreal Light, Heat & Power Co.

So much public feeling was aroused by the Payette offer that the Citizens' Committee, assisted by this and other trade associations, petitioned the Quebec Government in February to put through a measure obliging all municipal councils to have ratified by the electors or by the Lieut.-Governor-in-Council all concessions for public utilities for a period of more than 10 years. The Provincial Government saw the seriousness of the Montreal situation, and in the last hours of the session put a measure through the Legislature on the lines indicated.

The work undertaken to secure a reduction in the charges made by the Montreal Water & Power Co. for water supplied to factory sprinkler systems has resulted in the rate being reduced from 10 cents per head to 5 cents per sprinkler head,

which will mean a saving of many hundreds of dollars annually to the manufacturers of St. Henri, St. Cunegonde, Ville St. Louis and Maisonneuve.

Successful opposition was made at Quebec to the City's attempt to obtain permission to place a new \$500 tax on Montreal meat-packing establishments. This industry has already to bear its full share of taxation, and it is gratifying to note that the tax has not been allowed.

Provincial Matters.

In accordance with the instructions given by the members at the last Annual Meeting of the Branch, the Executive Committee gave careful attention to the provisions of the Archambault Bill for Compensation of Workmen injured in accidents, and in this they were aided by a capable solicitor specially engaged for the purpose. This Bill and others of a similar nature were not considered at the last session of the Legislature on account of the Government's decision to appoint a Commission to investigate the whole subject. This Commission is now being formed, with Hon. W. A. Weir at its head, and we feel confident of its resulting in legislation that will be more equitable to both employer and employee.

The Quebec Law of Garnishment has been carefully considered by the Committee during the past year. Under this law serious loss of time and disturbance to business are caused employers, and often great burden and hardship have been brought about where wage earners have been sued for trifling amounts and have been involved in heavy costs, altogether out of proportion to the original amount.

The Committee felt that changes in the law were necessary, and a petition was prepared by their solicitor and presented to the Prime Minister of the Province, in February. It was then too late for anything to be done at that session, but we hope that substantial alterations will be made at the next sitting of the Legislature. The attention of the incoming Committee is called to this question, and a recommendation made that an interview be obtained with the Prime Minister of the Province on this subject at an early date.

Federal Legislation.

As usual, considerable attention was devoted to Federal legislation, and every assistance rendered to the Head Office in these matters. Deputations in regard to Technical Education and the two Mutual Fire Insurance Companies being organized by members of the Association, waited upon the Dominion Government.

Technical Education.

The generous offer of the Protestant School Commissioners to grant the use of the new Commercial and Technical High School for evening classes in manual training, has afforded a unique opportunity to the Montreal Technical Institute. An open evening on April 25th allowed the manufacturers and others to inspect the building, and it has since been decided to start technical classes next September. A guarantee fund of at least \$10,000 is now being raised to cover any deficit that might be incurred in the work of the first year.

Montreal Branch.

Your Committee have pleasure in reporting an increase in the membership of the Montreal Branch and a marked gain in interest among the members. The decision of the Executive Council to hold occasional meetings in Montreal has met with much favor, and the first of these events, in January, resulted in a splendid attendance by local members, as well as the manufacturers of both East and West.

Two social events were held: a complimentary banquet to Mr. C. C. Ballantyne at the Canada Club in November, and

a dinner and smoker at the St. Lawrence Hall in April, both of which were largely attended.

The Paint and Varnish, and the Gold and Silversmiths' Sections have had a successful year, with several well attended meetings.

The Chairman then delivered his annual address.

The report of the Finance Committee was presented by Mr. Geo. Esplin, and unanimously adopted.

Mr. Dougall then announced that in the annual elections Mr. S. W. Ewing had been chosen Chairman, and Mr. S. S. Boxer Vice-Chairman, for the coming year, both by acclamation. Mr. Dougall then retired from the chair in favor of Mr. Ewing, who thanked the members for the honor conferred in electing him to this important office.

On motion of Mr. C. C. Ballantyne, seconded by Mr. A. Ramsay, Mr. D. Lorne McGibbon, of the Canadian Rubber Co., of Montreal, Ltd., was unanimously nominated for Quebec Vice-President of the Association for the coming year.

An enthusiastic resolution was passed inviting the Association to hold its Annual Convention of 1908 in Montreal, and Hon. J. D. Rolland was asked to convey this resolution to the Toronto Convention.

Among the matters which were discussed at the meeting and referred to the Executive Committee for consideration were, the establishment of a local labor bureau in Montreal, the recent increase in the age limit of factory boys and girls, and the lack of cartage facilities in Montreal.

The meeting then adjourned until the following day to receive the report of the scrutineers upon the election.

The report showed that the following 18 members had been elected to the Montreal Executive Committee to represent Montreal city and suburbs:

C. P. Bingham, The Major Manufacturing Co.; Fred. Birks, Belding, Paul & Co., Ltd.; J. H. Birks, Henry Birks & Sons, Ltd.; A. H. Brittain, Atlantic Fish Companies, Ltd.; S. D. Joubert, Lamontagne, Ltd.; J. R. Kinghorn, Montreal Rolling Mills; L. H. Packard, L. H. Packard Co., Ltd.; Geo. W. Sadler, Sadler & Haworth; William Cauldwell, Canada Paper Co., Ltd.; C. W. Davis, The Williams Mfg. Co.; Geo. Esplin, G. & J. Esplin; Jos. Fortier; Robt. Gardner, R. Gardner & Son; J. H. Sherrard, Alaska Feather & Down Co.; Chas. A. Smart, Smart Bag Co., Ltd.; Clarence F. Smith, Jas. McCready Co., Ltd.; W. T. Whitehead, Mount Royal Spinning Co.; R. J. Younge, Canadian Rubber Co., Ltd.

Mr. Louis Simpson, of Valleyfield, and Mr. S. T. Duclos, of St. Hyacinthe, were elected by acclamation to represent the members of the Branch outside Montreal city.

ANNUAL MEETING OF THE TORONTO BRANCH.

The seventh annual meeting of the Toronto Branch was held in the Bank Board Room, Traders' Bank Building, on Thursday, July 11th, at 2 p.m.

Mr. John Firstbrook, Chairman, presided, and there were also present Messrs. Ed. J. Freyseng, J. P. Murray, W. K. McNaught, Frank Rolph, C. M. Murray, S. H. Chapman, Geo. B. Meadows, G. A. Howell, J. S. McKinnon, A. C. Knight, Wm. Stone, D. T. McIntosh, Geo. M. Rose, Frank Stanley, S. Harris, Robt. Greig, J. O. Thorn, E. C. Boeckh, W. B. Tindall, H. T. Stanton, Geo. Gillies, J. F. Ellis, A. Burton, J. T. Sheridan, and others.

The Secretary, Mr. H. D. Scully, presented his report and financial statement, showing that the past year had been an exceptionally busy one for the Branch in every way. Membership showed an increase of thirty-one for the year, and attendance at committee meetings was the best in the Branch's history.

The report of the Executive Committee, reviewing the

year's work, was then read by Mr. Ed. J. Freyseng, the retiring Vice-Chairman, as follows:

Your Executive Committee have pleasure in reporting the work of an exceptionally busy year, in which great success has attended the efforts of the Branch in all matters taken up. In number of meetings held, the past year broke all records. Thirteen meetings of your Executive, including three special meetings, have been held, with an average attendance of ten. All problems affecting the Branch at large have been carefully considered, and action taken in what seemed the best interests of the members individually and collectively.

Smoke By-law.

Your Executive continued throughout the year to give thought to the subject of the Smoke By-law. Following in the steps of the last Executive it conferred several times with Property Commissioner Harris, through a special sub-committee, and at last succeeded in working out a by-law which is mutually beneficial to manufacturers and the general public. This by-law was ratified by the Ontario Legislature at its last session and took effect immediately. It provides a penalty both for the manufacturer and his fireman, where it is conclusively shown that the emission of dense smoke for more than six minutes in any one hour is due to the negligence of either. Its successful enforcement will not only insure competent stokers and effect a saving in the manufacturers' fuel bill, but will confer a great boon on a long-suffering public. Your Executive have always given Mr. Harris their cordial co-operation in this matter, and are anxious to see the law enforced where negligence is shown.

Cheap Electric Power.

Perhaps the question of greatest importance dealt with by your Executive last year was the Niagara Falls power distribution problem. This question has been continually before the public for the past few years, and is of vital concern to manufacturers and every other class in the community. Your Executive, feeling that cheap power was the greatest consideration, fought consistently on behalf of these measures which would insure a plentiful supply of cheap power. At one stage, when the situation was particularly acute last March, a special meeting of the Executive passed a resolution endorsing the city's efforts to secure cheap power, and it is now assured that the citizens of Toronto will reap the full benefits of cheap Niagara power. Your Executive has conferred with the city officials on three different occasions regarding the best means of procuring reliable statistics of the power needs of Toronto manufacturers, and as a result up-to-date figures are now on file at the City Hall, which will enable the manufacturers of Toronto to obtain the full advantage of Niagara power as soon as it can be delivered here. This question is still before the public in another form, and we urge the incoming Executive to closely watch it.

Workmen's Homes.

Seized with the necessity of providing moderate priced homes for artisans, if Toronto is ever going to have a good supply of contented workmen for her industries, your Committee early in the year began to consider steps which would insure the erection of a large number of such homes. In November a special committee was appointed, which, under the able chairmanship of Mr. Thomas Roden, in less than a month, reported a comprehensive scheme for the building of 1,000 houses by a company formed of manufacturers in the city. You are all familiar with the details of this plan, and it will be unnecessary for me to go into them here. After careful investigation as to the feasibility of the plan, the project was launched at a very successful dinner held at McConkey's. It won commendation on every hand, and organi-

zation has been cautiously proceeded with ever since. The excessive stringency of the money market has somewhat retarded the accomplishment of the designs of the Committee, and restrained many manufacturers from tying up capital which is required in the expansion of their own businesses. But steady progress is being made, and the project will not only help solve the house problem of itself, but has attracted attention to the great scarcity of moderate priced houses, and resulted in the erection of many hundred houses of this class by private companies and individuals.

The credit which the Branch has gained in taking up this big question is almost entirely due to the tireless efforts of Mr. Thomas Roden, who, as Chairman of the Committee, has labored incessantly towards its successful consummation.

Harbor Improvement.

Another big civic problem attacked by your Executive is the question of general harbor and lake front improvement. This question has been before the people of Toronto for over a generation. Feeling that what was needed was one large, comprehensive plan for the solution of all phases of the water-front problem, including Ashbridge's Bay improvement, your Executive appointed a special sub-committee, who went thoroughly into the whole question. This was after the return of the Toronto deputation, which went to Ottawa regarding harbor improvement, and which exhibited such fatal disunion in presenting its case there. This sub-committee, after due deliberation, concluded that the only way to insure permanent improvements in the harbor situation, on a large scale, such as is required by this great commercial centre, was to submit a single plan, endorsed by all the local organizations interested. It, therefore, conferred with all these bodies. The result was a deputation to the City Council recommending the creation of a Commission of three members, representing the city, the Dominion and Ontario Governments, respectively, to deal with this question as the situation demanded. The City Council have given the proposal favorable consideration, and lately appointed a Civic Committee to confer with the organizations represented about this plan and measures which would make for a "Bigger Toronto." Your Committee will be represented at the first meeting of this Committee, and trusts that something permanent will really be done for Toronto harbor at last.

Toronto Improvement Association.

During the year the Branch was approached regarding the organization of the Toronto Improvement Association, which aims at promoting the general development of the city, and the raising of municipal politics to a higher plane, thus securing the election of better men to the Council. Your Executive passed a resolution approving of the aims and objects of this Association. The new Association will have a material influence in the welfare of our city, and will render effective service at the time of the next municipal election.

Ashbridge's Bay.

In December your Executive passed a resolution in favor of a progressive policy of municipal ownership in the Ashbridge's Bay district, and recommending that the locality be reserved for manufacturing sites, which should be leased, but not sold, by the city. The policy pursued by the city, with regard to Ashbridge's Bay since then, has been in accord with the lines of this resolution.

Other Questions.

In addition to the foregoing matters of particular concern to the Branch, the Executive brought the following questions to the attention of the Executive Council, their suggestions being acted on in each case by the Council:

1. The question of child labor and the agitation to have the child labor regulations made more stringent.

2. The Bureau of Labor circular requesting manufacturers to answer a series of twenty questions intimately concerning their business. The Branch recommended the sending out of a circular informing the Ontario members that answers to these questions were not compulsory.

3. The Executive carried on investigations showing the extent of the dearth of female labor in Ontario, and particularly in Toronto. The figures are truly startling, and will be referred to in the Chairman's address. Your Executive is now conferring with the Salvation Army with a view of bringing out a supply of girls for Canadian factories.

Convention Arrangements.

As you all know, the Toronto Branch have the honor of being hosts for the Annual Convention this year, and preparations have now been going on for some time. The members are loyally co-operating with the sub-committees, and a rousing convention is assured. Every Branch member is expected to take a week off during convention to see that our guests have a good time. An attractive programme is arranged already, and the day following the convention an excursion will be run to Niagara Falls.

The Branch has invited the American Foundrymen's Association to hold their next convention in Toronto in June, 1908, and has been informed that they will do so.

Other matters to receive consideration during the year were:

1. The location and equipment of the new Technical High School.
2. The arrangement of monthly luncheons.
3. Toronto Exhibition matters.

No resignations were received from the Executive during the year, and only one member failed to attend a meeting. All the others were most faithful in their attendance.

REPORTS OF OTHER COMMITTEES.

The following reports were also read: From the Industrial Exhibition Committee by Mr. W. K. McNaught, from the Technical Education Committee, by Mr. J. P. Murray, and from the Dinner Committee, by Mr. J. S. McKinnon. All were adopted. Mr. John Firstbrook then read his annual address, which was a very comprehensive review of industrial conditions in Canada, and particularly in Toronto. Several resolutions were also adopted, including one to extend the jurisdiction of the Toronto Branch over Toronto suburbs, such as Toronto Junction, Mimico, etc. Other resolutions adopted concerned Association administration, and will be dealt with finally elsewhere.

The approximate horse-power of gas engines may be calculated by empirical rules formulated by Dugald Clerk, the eminent British authority. He uses two rules, one for engines not exceeding 12 h.p., and the other for larger engines. In both formulas, D represents the diameter of the cylinder in inches, and N the number of cylinders. The mean effective pressure and the piston speed being about constant, are taken care of in the constants used in the expressions. For the smaller type the formula is

$$\text{Horsepower} = \frac{D^2 \times N}{3}$$

while the larger type uses the same formula, but the constant becomes 2.4 instead of 3, as used in the denominator. The mean effective pressure in each case is assumed to be 70 lbs. per square inch, while the piston speed is 800 ft. per minute for the smaller engine, and 1,000 ft. for the larger.

INDUSTRIAL CANADA

Loose Leaf Devices for accounting are a modern necessity to any business. Fifteen years ago we invented and introduced these devices to the world. From them we evolved our modern Systems for Business.

We have imitators but no competitors!

It is for you to decide whether you will experiment, or will buy quality goods with ten thousand constant users in the mercantile world. Write for literature on our different systems.

THE CAUSE AND THE EFFECT

As the making of good bread depends as much upon the flour you use as the ability of the cook to bake, so does the manufacture of telephone apparatus depend for perfection as much on the quality of machinery as the competency of the workman.

Our machines are of the most improved and up-to-date type, and they are looked after and made to do their work by the most able machinists Canada can produce, which is saying a great deal.

The natural result is that we put out only such apparatus as the strictest inspection can find absolutely no fault with.

You will need a telephonic communication in your locality very shortly and it will be profitable for you to write or call immediately. Do not put off till to-morrow what you can do to-day.

A Good Business Man Knows A Good Business Proposition

PORTAGE LA PRAIRIE

Offers larger returns for money invested by Manufacturers
Wholesalers and Jobbers than any other Western City

☐ Free Sites, Exemption, Lowest Expenses and Unequaled Railroad Facilities in Connection with Industries is a Good Business Proposition that all Good Business Men will Recognize at Once.

☐ Portage la Prairie, Manitoba, is just 56 miles due west of Winnipeg, on the main lines of the Canadian Pacific, the Canadian Northern, the Grand Trunk Pacific, and the Midland branch of the Great Northern. All Roads Intersect.

☐ Portage la Prairie is therefore the Keystone of the Railroad Shipping and Distributing Situation of Western Canada, and is in the Best Position of any Western City to place her wares all over a vast territory where the demand for every known manufactured article is increasing daily.

☐ Equitable freight rates, together with a general Interchange Transfer System between our Four Great Railways, eliminates excessive charges and delays that are prevalent elsewhere.

☐ Conditions here are most propitious for the following :—Felt Shoe Factories, Skate Factories, Starch Factories, Pickling Plants, Cannery and Can Factory, Strawboard and Box Factory, Biscuit Works, Carriage Works, Iron and Stove Foundry, Soap Factory, Sash and Door Factory, Malting Plants, Distilleries, Agricultural Implement Works and Machinery of Every Kind.

Standard Ideal Porcelain Enameled Ware

is of Canadian manufacture and is fully the equal of any foreign product

THE designs have been so selected as to meet the requirements of the man in moderate circumstances as well as those of the rich man. The smooth finish of Standard Ideal Porcelain Enameled Ware, together with its durable construction, ensures perfect sanitation, as there are no joints, crevices or corners for dust, dirt or germs to collect.

ARCHITECTS and Builders have no hesitation in recommending and guaranteeing Standard Ideal Porcelain Enameled Ware. We manufacture Bath Tubs, Sitz Baths, Shower Baths, Lavatories, Urinal Ranges, Slop Hoppers, Laundry Tubs, Sinks, Closet Ranges, Steamship Supplies, Railway Car Supplies, Hospital Appliances, etc. Catalogue and all necessary information sent on application.

OSTERMOOR PATENT ELASTIC FELT MATTRESSES

cure that "tired feeling" because, unlike feathers or hair, the felt with which they are filled does not absorb the exhalations of the body, and so they are REALLY sanitary. They cost less than half the price of a real horse hair mattress, and first cost is last and only cost, as they never require remaking.

Even though you do not need a mattress now, you should know all about the "Ostermoor" and its superiority to hair in health, comfort and economy.

CANADA'S POPULATION.

OUR population through immigration has again shown a large increase. Almost without our knowledge we are becoming a big people. For the twelve months ending June 30th, 1907, the Government returns show the total immigration to have been 252,038. For the same period in the preceding year the number was 189,064. The gain this year was 33 per cent.

Over a quarter of a million new citizens through immigration alone is a big item when we consider that our total population is only six and a half millions. The million and a quarter that the United States receive do not look so many when compared with the eighty million that they already have. The tide of emigration is turned Canadawards, and unless some unforeseen accident occurs, we may expect to see this number grow from year to year.

We have land and opportunities to satisfy all that come. The strip of land lying on each side of the C. P. R. was formerly considered to comprise all the wheat lands of the West. The Canadian Northern ran its line farther north and there were still fertile lands. The G.T.P. goes still farther north and the same report is received. What was formerly a slender belt across the prairies has expanded into a mighty empire waiting but development to yield harvests beyond the imagination of our fathers. There is room there for millions of settlers, where there are now thousands. Only a fraction of the land is under cultivation.

There are opportunities here for the artisan no less than for the agriculturalist. While in the West homesteads are awaiting the farmer, with a soil that requires no clearing to turn it into agricultural land, in the East factories are eagerly looking for workmen. Canada must have skilled workmen if she is to take her place in the world's industrial race.

Natural advantages are present, such as few countries enjoy. But the workshops must be manned if the work is to be done. Hitherto this phase of the immigration question has been deliberately shunned by the Government. It is just as necessary as the filling up of our farm lands. The crying need of Canada during the past year has been more skilled workmen.

A discussion of our immigration brings up the subject of the present agitation in British Columbia against the admission of Japanese. We have one advantage, at least, in seeking a solution of the problem. We have an example before our eyes, in the case of the United States, of the admission of a race which cannot be assimilated. Moreover, the Asiatics have been invading the United States for many years, so that the effect of their presence should be now fairly well marked. The quality of our citizens is of first importance. Numbers are of importance, but in any case it is just a question of time with them. But the character of our people is being formed now. If the nation is to be strong in the things that make a people great, the foundation must be laid now.

WILL THERE BE SUFFICIENT CARS?

IT is indeed pleasant to hear that there will be no car famine in Canada this autumn. It is probably because a report of this kind gives such general satisfaction that it is so oft repeated. We have distinct recollections of a similar statement appearing in 1905, and in spite of the almost incredibility of the story it was received with widespread applause. It is true there followed a serious tie-up in business, so severe that millions of bushels of grain were left in the West over winter which should have been marketed in the autumn, and even at that there were no cars to handle Eastern business; but the unprecedented prosperity, the unexpected volume of business offering, swamped the roads. They could not be expected to foresee anything of the kind. The railway managers themselves admitted it.

Then last year we heard the same story. The prosperity had continued. The volume of business was steadily increasing. The railways with the memory of the previous season's shortcomings fresh in their mind, had made adequate preparations. In 1906 there would be no repetition of the conditions that prevailed in 1905. The pleasant tidings went forth that the

mileage had increased and that rolling stock would be on hand. They would be able to give a satisfactory service, with their increased facilities. There would be no congestion.

Even the most optimistic will be forced to admit that the expectations of the public fell somewhat short of fulfilment. The harvest was excessive; the winter was severe. There may have been other equally satisfactory reasons. However, the predictions of the railways that conditions would not be as they were in the previous year, were made good. Conditions were not the same; they were infinitely worse. Perhaps after all that is what the managers meant.

So this year we are pleased to have the old story revived. It has become like an old friend; we would feel lost without it. All the lines are in better condition and more adequately equipped. We can hardly say we feel any great confidence in the outcome, unless the crop is so short that the demand for cars will be small. But it will be interesting to learn what the excuse will be this year.

The one sure thing about the situation is the urgent need of good quick service. This applies this year more than it has before. The demand for money is so pressing, not only in the industrial, but even in the civic world, that the tie-up of a large amount of capital by the crop being left in the West over winter would be little less than disastrous. The storekeepers and banks in the West are dependent on the returns from the year's harvest. If this fails to come in the autumn, the wholesale dealers and manufacturers in turn feel the pinch. This year the banks are so curtailing their credit that manufacturers and wholesalers must get returns from their sales; otherwise they will not have the capital to carry on their businesses. The public will look for a heroic effort on the part of the railways. In the meantime it is owing to the shipping public that a straightforward statement be issued by the railways. Much of the trouble of previous years could have been averted if the public had known in advance just what to expect. The companies should know by this time how they are fixed to handle the season's business.

A SCHOOL FOR APPRENTICES

IN the State of Illinois there is a law which provides that wherever a municipality establishes a trade school for apprentices it shall be compulsory on all master tradesmen to send their apprentices to these schools for three months each year, such time to be counted in as part of the term of apprenticeship. This scheme of compulsory industrial education is being worked out in a limited sphere at the present time in Chicago. One school is specially provided for the purpose and the master bricklayers, stonemasons, and carpenters have united to carry out the principle of the State law. The conditions are stated in the form of indenture, which a boy must sign before entering on an apprenticeship in any of these trades. He shall attend school for three months each year, during which time he will be paid the regular apprentice's wages. If he absents himself, the time thus lost is added to the time of his service. A certain bonus is paid at the end of his apprenticeship if his work has been satisfactory.

At this school trades are not taught. The curriculum is entirely subsidiary to the practical training of the boy's apprenticeship. The course of instruction, of necessity, is elastic, since some boys come in with only a smattering of the English language, while others are graduates of high schools. But if the main idea is kept clearly in view, there is no trouble. To the boy learning carpentering, a course in mathematics, such as will be of practical use in his trade, is given; mechanical drawing is an important subject; designing and estimating costs are taken up. For apprentices in other trades such changes are made in the course as will make it of most value to the student.

In a recent special report to the Superintendent of Schools, the following suggestions were made for a construction course in an apprentice school. This would be in addition to the regular classes in English, etc. The course here outlined would be in the nature of applied theory work—laboratory work in which the apprentice would make model buildings, studying why various things were done, and doing them because they were the best means of accomplishing a certain result, not merely because someone had done the like before.

For Carpenters' apprentices:

1. Make in wood-shop model cottages, barns or other frame buildings to a scale, showing foundation beams, framing doors and sides, partitions, roof constructions, sheathing, lathing and shingling, window frames, bay windows, doors inside and out.
2. Make working drawings, write out the specifications, and compute the cost of labor and material used in No. 1.
3. Study and construct in detail for both brick and frame building window frames, outside door frames, porches, dormers.
4. Practice on inside finishing work, casings, wainscoting, mop boards, paneling, grounds, corner heads, mouldings, beams, columns.

For Masons' apprentices:

1. Study different types of foundations on firm soils and on compressible soils.
Make drawings and scale models of foundations used under light and under heavy buildings. Footings, center of pressure, piles, grillage, concrete, masonry walls, caissons, off sets, inverted arches, retaining walls, vault walls, door and window spaces.
2. Laboratory work on:
Lime—characteristics, slacking and mixing; sands used for masonry—compositions; white and colored mortars; hydraulic limes; kinds of cement—analysis, testing, strength; cement mortars; effect of heat and cold upon fresh and set mortars; concrete—use in modern foundations and constructions, mixing, proportions, testing strength of different mixtures.
3. Study common types of building stones as to use, strength, durability, composition, etc.

For Bricklayers' apprentices:

1. Working drawings, blue prints, perspectives, and scale models of dwellings, and large buildings, which are representative of the typical styles of brick work. American Bond. English Bond. Flemish Bond. Brick Veneering Construction. Architectural Terra Cotta.
2. In the class-room, give practice in writing out specifications and contracts, and compute the cost of material and labor as used in No. 1.
3. Laboratory work:
Bricks—composition, manufacture, glazed and enameled, paving, fire brick, colored pressed brick. Lime, Cement, Mortar, Sand. Thickness of mortar joints—effect of cold and heat. Wetting brick, efflorescence. Damp proofing. Crushing strength of brickwork.

There can be no doubt about the efficacy of such a school. The boy who carries along a theoretical and scientific study parallel with his practical work is going to be the superior in skill, efficiency, and resourcefulness, of him who just

works by rote, blindly following the lead of his master. This is a phase of the bigger subject of industrial education, which Canada must face at once. We have entered the industrial race. In this we shall have as competitors the most highly-trained workmen of other countries. How are we going to meet that competition?

THE TORONTO EXHIBITION.

DURING the next two weeks the Toronto Exhibition will be in progress. Through its agency the buying and selling public are brought together in a manner which must prove of inestimable benefit to both parties. It is as necessary for the producer to hear the criticisms of his goods from the consumer's standpoint as it is for the consumer to hear the points of superiority from the producer. A personal comparison and inspection serve a good purpose.

The Exhibition in Toronto is national in every respect. The exhibits each year show an increasing wealth of production and variety of form. Working up from the raw materials the successive stages of manufacture are amazing in their diversity. Products of the farm vie with those of the factory alike in excellence and interest. The most optimistic statements of emigration agents are proved to be prosaic half truths by the prize pumpkins and melons of fabulous size which everywhere meet the eye. Again in the process building the actual making of goods is in progress. Industrial life has developed into a series of fine specializations. How much this is so is scarcely appreciated by the average consumer. The process of manufacture is rightly considered one of the most interesting features of the big show.

Each year new buildings meet the eye. That the Exhibition Association has been able to keep up the interest throughout the country so steadily is most creditable to it, and is in itself a sufficient proof that the directors have been working along the right lines. It is one of the institutions which depends for success absolutely on itself. So long as it progresses, increasing its usefulness and adding to its attractiveness, it will be supported. It is now undoubtedly the biggest and most complete annual exhibition on the continent. And it is growing.

THANKSGIVING DAY ON MONDAY.

A SUGGESTION which was made some years ago has been crystallized into definite form by the official action of the Commercial Travellers' Association and the Canadian Manufacturers' Association. Thanksgiving Day, since its inception, has been celebrated on a Thursday. It doesn't seem to have mattered much what week or month it fell in, but the day of the week was all important. The precedent was of so long standing that no one ever thought of suggesting a change, in spite of the obvious disadvantages of the day, until those iconoclasts, the commercial travellers, entered a protest. The travellers will never stick at effecting a reform through any undue modesty or conservatism. So an agitation in favor of a Monday Thanksgiving Day was commenced.

A holiday in the middle of the week is certainly objectionable. It disorganizes business. In a large factory its effects are felt for some time. It takes a little while at the beginning of the week to get things running smoothly and to the best advantage. If the same preliminary work has to be gone through with again on Friday a serious break in the output results. Commercial travellers feel the mid-week holiday particularly. They lose the holiday themselves, they can accomplish no work on that day, and usually the merchant is too busy the following day to give them consideration. And it may be said fairly that what hurts the traveller hurts the merchant. Then to the

great mass of work people a holiday on Monday is much more valuable; from Saturday noon till Tuesday gives a good resting period.

For these reasons the two associations will urge the Government to change the day this year. The request will undoubtedly be acceded to. To many people the change will make no difference. To the majority it will be gladly welcomed. No class will be adversely affected.

FIRE PROTECTION.

SOME public utilities, by common consent, have been taken over by municipalities to be managed by the councils in the common interests. Of these none is more important than the water supply. The need of abundance of water is so generally appreciated that it is felt that it should not be left to any private company to supply. In spite of this the inadequacy of the supply is a public scandal in a number of Canadian cities. Such a condition of affairs cannot be ascribed to any other cause than short-sightedness on the part of those who have been elected to office. It frequently happens that members of councils, while they are capable of administering the ordinary affairs of their municipalities, are quite unfit to cope with the bigger problems which present themselves from time to time for settlement.

The seriousness of the situation is being shown at the present time by the drastic measures which are being taken by the insurance companies in Montreal. The fire protection has become so impaired through a shortage of water that risks are being generally refused in some districts, and a suggestion of another increase in rates is heard. This would have a serious effect on the industrial growth of the city. Already the cost of insurance is abnormally high, much higher than the public should be called upon to pay. How much this is caused by an inordinate greed for profits on the part of the companies, and how much by the inefficiency of the water service, is difficult to determine. Certain it is, that if the fire protection were adequate, policies would not be allowed to lapse at a time when the companies are making such an energetic canvas for business in other places.

It simply means that aldermen in the past have not had imagination enough to foresee the growth of the city, nor have they had courage enough to spend money when an expenditure would be a real economy. Montreal is not the only city which has suffered from having aldermen who were not big enough for their job. Municipalities in Ontario and elsewhere are similarly afflicted.

Inefficiency is always expensive. If through lack of those statesmanlike qualities which are required in building for the future, public works are put off, the cost of repairing the defect will, each year, become greater. Those municipalities which are wrestling with water-front difficulties, or level crossing problems, appreciate this fact. It is false economy to save the cost of a proper water-works system, and have the whole citizen body bled annually by fire insurance companies.

The solution of the trouble is not hard to suggest. The carrying out of the remedy seems to present greater difficulties. If business men were put in charge of the civic government, we might fairly expect to have the civic affairs administered in a businesslike manner. Hitherto men of ability have, for various reasons, generally refrained from taking an active part in public affairs. They simply cannot afford to continue this policy. It will devolve upon the business men, including the manufacturers, to get good, competent men in the field and elect them. Only in this way will they insure good government.

THE CONVENTION.

AS the time for the annual meeting of the Canadian Manufacturers' Association approaches the interest in it grows greater. Every day brings in reports of more members who will be in Toronto for its sessions. This is but natural. During the past year many subjects of the greatest importance to manufacturers have been up for settlement. All these will be treated of in the reports of the various committees which have been working on them for the twelve months just closed.

The standing committees of the Association are doing a great work for the members. A small body of men, devoting their special attention to one line of work, can accomplish most effective results. They are ready to strike when the time is most opportune. In this way are the interests of the whole Association served throughout the entire year.

The discussions which arise out of these reports will be intensely interesting. That is where the policy of the Association is made. In no other place is such a breadth of view possible. Those present will represent every part of Canada from ocean to ocean. Members will be here from the Maritime Provinces and from British Columbia, from Quebec and Ontario, and from the Middle West. There can be no narrowness or provincialism in such a gathering.

A new feature of the business sessions this year will be a number of good strong business addresses, by men who are pre-eminent in their own sphere on this continent. Those who have heard Mr. James E. Emery, of the Citizens Industrial League of New York, will appreciate what a treat an address from him will be. Besides him there will be a number of others, whom the members will be equally glad to hear.

The Toronto Branch has prepared a busy programme of entertainment for the three days of the Convention. There will be no dearth of attractions. For the ladies of the party every effort has been made to ensure a pleasant outing. The Vice-regal reception in the beautiful grounds of Government House; the jaunt to Lambton Club; the Theatre Party at the Royal Alexandra; the automobile trip around Toronto's beautiful avenues; all these will combine to make the Convention memorable. Then there will be an excursion to Niagara by way of Hamilton, with a tour of some of the leading manufacturing plants of the latter city, and an instructive view of the development work at the Falls. Finally, there will be the Banquet, which has become one of the most enjoyable features of the annual meeting.

Toronto looks its best in the Autumn. Under the guidance of the members of the Toronto Branch every visitor will have ample opportunity of viewing the city, and enjoying its beauties and attractions. It is confidently expected that every member who can possibly be present will attend.

HIGH RATE OF WAGES.

THE unrest among workmen, which has been more or less general all year, is prejudicial to the best interests of all classes. It is not justified by the recent census reports showing the increase in wages paid during 1901 and 1906. In that period the total wages paid to workmen in Canada increased about 45 per cent. The average increase per man was 27 per cent. This in itself is a very liberal increase in a five year period. It is not, however, a complete statement of the situation. During the same period the hours of labor were

reduced in many lines of industry. In a number of cases eight hours were substituted for nine as a full day's work. In several others the reduction was made from ten to nine. This in itself makes the increase for the time worked very much greater than appears in the 27 per cent. If a man gets as much for eight hours as he formerly got for nine, his wages have been increased eleven per cent. In such cases this must be added to the 27 per cent. in showing the improved condition of the workingman.

Moreover, with the shortage of labor which has existed for a considerable time, a shortening of hours means a large positive increase. The shops are busy and the work must be turned out. It is impossible to increase the staff to make up for the loss of production through the decrease in the hours of labor. Hence the men must be kept on as long as formerly and overtime pay given.

Considering present conditions it would appear that it is the part of wisdom for workmen to refrain from further exorbitant demands. The season just past has shown that employers have reached the limit of their ability to pay increased wages. There is no use making goods if the cost of production is so great that the public will not buy them. Competition and the buying public are the determining factors. Canadian manufacturers are now in competition with other countries where wages are much lower. By further demands workmen may overshoot the mark and destroy the industries which are their support.

VISIT OF BRITISH JOURNALISTS.

ALARGE number of British journalists have been touring Canada during the past few weeks. They represent many of the most influential of the Old Country press, and have been over just to see what Canada was, whose name has been kept so prominently before their eyes for the past decade. They have been hurried from one end of the country to the other, not being given as much time as was to be desired to see the many points of interests, but ever being kept impressed with the bigness of the country, the teeming fertility of its soil, the abounding wealth of its forests, streams and mines, and the business acumen of its citizens.

Such a visit is of vast importance to Canada. It will not be alone the accounts of the trip which will appear in newspapers throughout Great Britain. These will prove of inestimable value in advertising our resources. But it will be in the knowledge of the country which these editorial writers will carry into their work henceforth, that the chief benefit to Canada will come. The only way to know a country is to visit it personally, to mingle with its people, and to get to appreciate their point of view. Upon this basis all succeeding events can be built and the proper position allotted to them.

Canada has suffered in the past from a lack of knowledge upon the part of Britishers. This is not to be wondered at. We are, or used to be, a long way from Europe. Fast steamships and the cables are apparently lessening this distance steadily. Nor were we so many in population or wealth as we are now. Now we have an enormous buying power. It behooves the people of Great Britain to get fully acquainted with us. It will be to their advantage.

Still we look on the visit of the journalists as of paramount importance to us, because we want immigrants of British stock. The sympathetic treatment of Canada by the newspapers is sure to be influential in turning their thoughts to this land. Canada will ever be glad to welcome members of the the fourth estate and show them the best we produce.

Comment of the Month

Labor in New Zealand.

The more detailed the information we get about the operation of the compulsory arbitration law in New Zealand, the less satisfactory it appears. The law in its present shape offers no means by which strikers can be made to abide by an adverse decision of the board of arbitration. They can be fined, but it is agreed that the fines are inadequate. One authority declares that no fines which the workers could pay, either as individuals or as a union, would be enough to balance the loss which a great strike might impose on an important manufacturing concern. It is held that the government itself must be compelled to carry on the business that is suspended by strike or lock-out—must save the employers from loss when strikers refuse to accept the court's decision, or save the workers from loss of wages should employers refuse to continue work after a lock-out.

Canadian Freight Classification—No. 13—Effective Sept. 1, 1907.

As announced in August number, Classification No. 13, as approved of by the Board of Railway Commissioners for Canada, came into effect September 1st, 1907. It supersedes all previous classifications and supplements thereto. As previously announced, there are a number of important changes in the new Classification, with regard to the rules and ratings, and especially in the owners' risk conditions. These changes have been legalized by the Board, and are therefore binding upon the shipping public as well as on the railways. It is important that shippers should compare the ratings in No. 13 with those in Classification No. 12, with supplements thereto formerly in effect, thus ascertaining whether or not any change has been made in the ratings of conditions of carriage in which they are interested. This will, no doubt, obviate any difficulty or possible misunderstandings in the shipping departments, as well as with customers in regard to freight charges.

Copies of the new Classification will be sent shippers without cost on application to T. Marshall, Secretary Canadian Freight Association, Toronto.

The Work of Factories.

"There would be no common people if there were no manufacturers." These words of Alderman Wright, of Hamilton, give expression to the spirit which has made the city on Burlington Bay the bustling hive of industry that it now is. A problem which is canvassed at every meeting of agriculturalists is how to keep the boys on the farm. The fact that boys leave the farm and gravitate to the cities is conclusive evidence that work in factories provides a more profitable and pleasant occupation than does agriculture. If Canada does not provide openings for her own sons in the occupations they desire, they will drift off to some country where such work is open to them. The investigations recently made by Mr. S. Morley Wickett showed that there were about a million and a quarter Canadian-born people resident in the United States. Did they go there because they liked the country better? Not so. Not one of them but would have preferred to remain in the land of his birth had the opportunities existed here. The opportunities were those which manufacturing industries provide. By an increase in factories all those subsidiary interests will be brought into existence which go to make up a prosperous country.

Exhibition in Edinburgh.

A national exhibition will be held in 1908 in Edinburgh. A successful exhibition was held in the same city in 1886, and this one is prompted by the excellent results of the former. The cities throughout Scotland have taken the scheme up with enthusiasm and the prospects are now exceedingly bright. The special aim of the exhibition will be to bring together all that is best in industry, art, science, and literature in British dominions, all over the world. Exhibits from other nationalities will be encouraged to the utmost as an incentive to greater enterprise. The corporation of Edinburgh has placed at the disposal of the Exhibition Committee Laughton Park. Most of the prominent men in Scotland have accepted positions on the various committees which will be in charge. Full information may be had from Mr. W. H. Knight, General Manager, 45 York Street, Edinburgh.

Important Orders Issued by the Board of Railway Commissioners.

The Board of Railway Commissioners has issued an order directing that every railway company, subject to the Legislative authority of the Parliament of Canada, furnish the Board on or before the first day of October next a written statement or statements for the year ending June 30th, 1907, showing in detail.

- A. The assets and liabilities of the company.
- B. The amount of stock issued and outstanding, etc.
- C. The amount and value of the consideration received by the company, etc.
- D. The gross earnings or receipts, expenditures, etc.
- E. The amount and nature of any bonus, gift or subsidy received by the company, etc.
- F. The bonds issued at any time by the company, etc.
- G. The amount and nature of the consideration received, etc.
- H. The character and extent of any liabilities outstanding, etc.
- I. The cost of construction of the company's railways or any part thereof, etc.
- J. The amount and nature of the consideration paid by the company for any property acquired by it.
- K. The particulars of any lease, contract or arrangement entered into between the company and any other company or person.
- L. And generally, the extent, nature, value and particulars of the property, earnings and business of the company.

The Board further directs that each railway company shall furnish to the Board on or before the first day of October next a statement showing the details and particulars for the year ending June 30th, 1907, as follows: Total miles under operation, details as to freight and passenger revenue per mile of road, and carried one mile, etc.

The Board has also ordered that the railways furnish within three months of the date of the order (namely, July 4th, 1907), information as to the railway company or companies with which it has direct connections in Canada, the railway company or companies with which they have joint tariffs, whether any such company is willing to extend the scope of such joint tariffs, the railway company or companies with which every such company is prepared to negotiate with such connecting company or companies for joint tariffs; if not, to state fully their reasons for objecting.

These orders are of importance in that they will enable the Board in the first place to determine whether or not rates being charged are fair and reasonable, and in the second place whether or not through routes and rates are being afforded by all of the railways.

Gray Iron—Its Manufacture and Properties

By S. B. CHADSEY, B.A.Sc., Metallurgist, International Harvester Company, Hamilton.

THE classification of the various materials known under the general names of iron and steel is a subject that has given rise to much discussion, and considerable ingenuity has been expended upon it owing to the difficulties by which it is beset, and the complex nature of many of the iron products. Without venturing upon this field we may refer to the popular view which regards steel and wrought iron as clearly distinct from the general class of products embraced under the term *cast iron*. The different varieties of steel and of cast iron belong in reality to a series, and the properties of its members vary so gradually that it is by no means easy to state just where a dividing line between any members of the series should be placed. What we know as cast iron, however, has a minimum carbon content not much below two per cent., and it is the percentage of carbon which finally determines the position of a member in the steel-iron series.

There are two well recognized grades of cast iron, namely, gray and white, so called on account of the appearance of the

least favorable when it is under tension or subjected to violent or repeated shocks. Its compressive strength per square inch may rise from 150,000 to 200,000 pounds, while its strength under tension rarely rises above 33,000 pounds, and may be as low as 15,000 pounds. It is possessed of but little ductility, and is consequently broken with comparative ease under shock. Its *shrinkage*, however, is small, much less than that of white iron, and this fact is of great value in the founders' practice. It may be readily machined, and it may be varied in character at the will of the founder to render it applicable to a wide variety of uses. Such are some of the characteristics of gray iron which render it so valuable a material, and when it is remembered that its cost is low, the reason for its prominent position as a commercial product is at once apparent.

It would be impossible to attempt to classify the uses to which gray iron is applied in daily practice. We have referred, however, to the fact that owing to the possibility of varying its properties within certain limits, it may be adapted to a variety

Fig. 1—Showing fractures of iron which grades No. 1 by fracture, but No. 3 by analysis

fractured surface; the white iron showing a silvery crystalline surface, and the gray a fracture that is best described by the term under which it is generally known. This difference is due to the condition of the carbon content, which in the white iron is almost entirely combined in a chemical manner with the iron, while in the gray it is largely separated in the form of graphite, the plates of which occurring between the crystals of iron give rise to the characteristic gray appearance. We will attempt in what follows to outline some features in connection with the manufacture and properties of gray iron, together with a statement of the tests that are more commonly employed as a check upon its quality.

General Properties.

With regard to the general properties of gray iron, one of the most valuable is the facility with which it may be cast, and the delicacy of pattern which the surface is capable of taking in the mold. This is due to its *fluidity*, and this depends not only upon the original temperature, but also upon the composition of the metal which greatly influences the maintenance of the fluid condition. In point of *strength* the best showing is made by gray iron when it is subjected to compression, and the

of situations of very diverse character. The founder may alter the density of his product, making it close grained and strong or of a softer and less compact nature. By proper attention to the mixture of the metals, and to the conditions of melting and casting, the tensile strength may be raised while the metal still retains a sufficient degree of softness to admit of its being readily machined. It must be admitted, however, that the control exercised by the founder under the best of conditions is in no way equal to that within the reach of the steel maker, and consequently the products of the former are subject to a greater variation in quality than those of the latter. In view of this fact, it is the more remarkable that while it is customary to subject steel to severe tests and a careful examination before it is put into service, it is comparatively rare that a similar examination is required in the case of gray iron. Inasmuch as the iron is much more likely to vary, it would seem more reasonable to give it at least as careful attention as is given to the product which is less likely to display unsatisfactory variations. The reason, of course, lies partly in the fact that as steel has been placed in the most important and trying positions the chief attention has been given to its quality, and it has been purchased under careful and well enforced specifications. It is

to be hoped, however, that greater attention will be given to the proper examination and testing of gray iron than has been the practice in the past.

Two Methods of Melting.

There are two processes by which gray iron is melted, namely, by means of the Reverberatory or Air Furnace, and by means of the Cupola Furnace, but, although the product of the

Fig. 2—Photo-micrograph taken under a magnification of 750 diameters. The dark portions represent the plates of graphite interspersed through the metallic iron

Reverberatory Furnace is markedly superior to that of the Cupola, it is by means of the latter that by far the larger part of such melting is done. This is due to the lower cost of cupola metal while its properties are sufficiently good to meet all ordinary requirements. The air furnace is adopted, therefore, only when the need of a superior product outweighs the considerations of cost. The cause of this superiority has never been clearly explained, although it is generally supposed to be due to the greater absorption of gases by the cupola metal as it flows through the area of blast in the furnace. It is evident, moreover, that it is possible to secure a greater uniformity in the air furnace in which the total charge is melted into one bath before it is cast than in the cupola where the iron is melted and drawn from the furnace in successive portions which must follow in composition the variations of the materials melted.

The raw materials for the manufacture of gray iron, considering only the cupola process, are mainly pig iron and scrap of various sorts, coke and limestone, or a substitute therefor. In the quality of these materials the founder is directly interested since it is upon that quality that the success of his work and the regularity of his product very largely depends. It was formerly the custom, and it still prevails to some extent, to purchase pig iron by grades that were determined by the appearance of the fracture to be No. 1, No. 2, No. 3, etc. This classification was based upon the crystal size, as it was considered that an open grained pig would produce softer castings than a more finely grained one would give. There was something in this method of classifying, or it would not for so long have been universally accepted by foundrymen. It was at one time the most reliable guide to quality available, and while it was always somewhat uncertain, it served a valuable purpose. But the day for such grading is passed, although some foundrymen still cling to it. Pig iron can, and always should be, pur-

chased upon the basis of chemical analysis, and not in any way upon the basis of fracture. The influence of the various elements present in pig iron upon the structure and general properties of the gray iron product are now fairly well understood, and all foundrymen should now be able to make up their furnace mixtures according to analytical results. Fractures are frequently misleading. It has been repeatedly demonstrated that an iron grading as No. 1 by fracture may grade No. 3 or lower by analysis, and as it is the composition and not the structure of the pig iron that determines the quality of the foundry product it is evident that good results could not be obtained by using such metal as No. 1 grade. We show in Fig. 1 two fractures in illustration of this point. The pig of open fracture was found to contain silicon, 1.17 per cent; sulphur, 0.28 per cent.; phosphorus, .60; manganese, .64; while the pig of close grain gave silicon, 3.20; sulphur, .025; phosphorus, .76; manganese, .95; the analysis thus reversing the grading of the metal. It is necessary to the best results, therefore, that all pig iron should be analyzed, if possible, in the laboratory of the founder, since, for various reasons, that we will not attempt to outline here, very considerable variations from the furnace analysis frequently are found to exist.

Importance of Coke.

Of the other materials used by the founder the one calling most urgently for analysis is the coke. This is due to the fact that the amount of sulphur contained by it may be sufficient to cause irreparable injury to the metal, and partial or total loss of the castings poured. Owing to the contact of the molten metal with the incandescent coke of the cupola, sulphur from the fuel is certain to be absorbed by the iron, and experience has shown that the maximum allowable limit of sulphur in foundry coke is 1.00 per cent. There is much coke on the market containing a larger percentage, and if such fuel is used trouble is certain to follow. It is important, moreover, that the amount of ash contained be held within reasonable limits, say, 11.00 per cent, or 12.00 per cent. The greater the ash the greater must be the slag produced in the furnace, and as much heat is required to produce this slag it is evident that economy demands it to be held as low as possible. Moreover, a large percentage of ash necessarily reduces directly the heating power of the coke, since it lowers the percentage of combustible material that is present. Analyses may profitably be made of other materials about the furnace, such as limestone

Fig 3—Apparatus for testing iron

and the various refractories, but we are unable to refer to them in this article.

Having the analysis of the various shipments of pig iron, of the fuel, of the shop scrap, and (approximately) of the miscellaneous purchased scrap, it is possible to control the mixtures of the metals charged, and consequently the quality of the resulting iron. By way of illustration we give a charge made up of two grades of pig and two of scrap. The analyses of the raw materials were as follows:

GRAY IRON.

	Silicon.	Sulphur.	Phos- phorus.	Manganese
Pig Iron, Pile 1	3.34	.038	1.00	1.12
Pig Iron, Pile 2	1.65	.061	.48	.64
Shop Scrap	2.25	.080	.90	.60
Miscellaneous Scrap	1.95	.090	.80	.55

Each charge of 3,000 lbs. was made up as follows :

1,100 lbs. pig, Pile 1.

700 lbs. pig, Pile 2.

1,000 lbs. pig, Shop scrap.

200 lbs. pig, Miscellaneous scrap.

The percentage of silicon in the mixture was therefore :

$$\begin{array}{r}
 3.34 \times 1100 = 3674.00 \\
 1.65 \times 700 = 1155.00 \\
 2.25 \times 1000 = 2350.00 \\
 1.95 \times 200 = 395.00 \\
 \hline
 7574.00 \\
 \hline
 \frac{7574.00}{3000} = 2.52 \text{ per cent.}
 \end{array}$$

The average percentages of the other elements calculated according to the same method give the total estimated analysis of the charge :

Silicon.	Sulphur.	Phosphorus.	Manganese.
2.52	.061.	.83	.79

There is always a loss of silicon during the melting amounting to about .25 per cent., and a gain in sulphur dependent upon the condition of the fuel and the furnace management, but usually amounting to .02 per cent. in average practice. The analysis of the gray iron resulting from the foregoing charge was :

Silicon.	Sulphur.	Phosphorus.	Manganese.
2.30	.085	.89	.62

Thus there was a loss in silicon of .22 per cent., a gain in sulphur of .024 per cent., a loss of manganese of .17 per cent., while the difference in phosphorus was very small.

In actual practice it is possible to maintain for long periods an average silicon in the product within a limit of .10 per cent., while the sulphur can be held within a limit of .10 per cent. The other elements can be similarly controlled by a suitable combination of raw metals, and as the grade of the metal is largely regulated by the percentages of these elements, it is possible to prevent serious variations in quality and to greatly reduce losses due to hard iron and the like.

Carbon the Controlling Element.

While we are not able in this paper to enter upon the subject of the influence of the individual elements, we wish to direct attention in passing to the fact that the real controlling element in iron is carbon, and that the influence of silicon and sulphur are secondary, their effect depending upon their influence upon the state of combination of the carbon. In gray iron the carbon exists most largely in the free state as graphitic scales between the crystals of iron, and other things being equal, the larger the percentage of graphite and the smaller the percentage of chemically combined carbon the softer will be the iron. Silicon and sulphur largely influence this state of combination, and consequently are much discussed in the foundry, while the carbon content is less frequently referred to. By way of illustration of the presence of plates of graphite in the body of gray iron metal, we reproduce a photo-micrograph taken under a magnification of 750 diameters, in which the dark portions represent the plates of graphite interspersed throughout the metallic iron, Fig. 2.

Physical Tests.

There are beside chemical tests a number of physical tests that may be applied to gray iron as indications of its quality, each of which serves a particular purpose, and may become a necessity in routine work. These tests are to determine (1) the *transverse strength* and deflection under pressure of a special test bar; (2) the amount of *shrinkage* per lineal foot; (3) the *chilling properties*; (4) *hardness*; (5) *tensile strength* per square inch. Of these the one least frequently used is that for determining the tensile strength, although this property is, in some cases, made a prominent condition of acceptance of material.

The transverse strength may be taken upon any bar of convenient size, but it is desirable that there should be a greater uniformity in this respect than is the case under current practice, inasmuch as for purposes of comparison of the product of different foundries a standard bar is very much to be desired. The bar which is probably most common at present, though not necessarily on that account the most de-

Fig. 4—Cast iron mold for testing the chilling properties of gray iron. The fracture of two chilled pieces is also shown, showing the chilled or crystalline margin.

sirable, is one inch square in section, and is broken in supports 12 inches apart. An attempt has been made to bring about the adoption of a round bar, but as yet we believe without very great success.

The shrinkage may be conveniently determined by casting bars one inch square in section, between cast iron yokes placed in the mold and measuring the shrinkage by means of a graduated tapered gauge placed in the space between the end of the test bar and a steel gauge corresponding in length to the yokes in which the bars were cast. We show in Figure 3 the apparatus required by which routine tests are regularly taken. The bars are cast 13-13 inches in length, and the actual shrinkage found is diminished by one-tenth to obtain the shrinkage per foot of length. The amount of shrinkage is dependent upon the size of the bar used, as well as upon the grade of the metal, a fact that is sometimes overlooked by persons generally well-informed regarding the working of metals, but it may be stated that the shrinkage of $\frac{1}{8}$ inch per foot, so frequently regarded as a sacred thing, is one which is only rarely met with in practical working.

A very useful and convenient test is one for determining the chilling properties of the iron, or the extent to which it may be transformed into white iron by casting it in a mold that will conduct away its heat very rapidly. For this pur-

pose a cast iron mold of tapered form is used, such as is shown in Figure 4. We show also in this cut the fracture of two chill test pieces in which a chilled or crystalline margin of different depths is shown. The existence of chilling properties in a marked degree may or may not be a desirable feature.

The hardness of the metal may be tested in a variety of ways, but for shop purposes a drilling test is probably the most convenient. An adaptation of a common drill press for this purpose is shown in Figure 5. In order to reduce the wearing of the drill as much as possible a special high speed drill is used in making the test, the size adopted being $\frac{1}{2}$ inch,

Fig. 5—Method of testing iron by a drill

and since differences in shape of the drill point produced in different grindings influence its cutting speed, standard bars of iron are kept with which any particular iron may be compared. A special weight is hung upon the feed lever in order that the pressure upon the drill may be kept uniform; and a revolution counter is arranged to register the number of revolutions required to drill a hole $\frac{1}{2}$ inch in depth. The time of drilling may also be taken by means of a stop watch, although this is not a necessary feature. By these means fairly satisfactory results may be obtained in determining the relative hardness of different grades.

It may be added that while it is not necessary in regular practice to use all the foregoing tests upon all irons cast, they may all be used with advantage as occasion demands, and by their means great assistance obtained in regulating and controlling the variations in the quality of the metal.

It is announced that the Bemis Bag Company will establish a plant in Welland, Ont. A number of cities have been negotiating for this factory. The company will spend a million and a half on its plant, and will employ 1,500 hands.

ALLOY STEELS.

Iron has been successfully alloyed with most of the known metals; only a few alloys, however, possess much commercial importance, and it is only with these that we have to deal in considering their adaptability for forgings, etc. Alloy steels possess many advantages over carbon steel for certain uses, and notwithstanding their increased cost are finding a wider field of application every year.

Tungsten steel was the first alloy steel to be exploited to any extent. It proved useful in metal cutting tools, and is more or less restricted to that use. Chromium steel was next exploited, and found a wider field of usefulness, being largely used in metal cutting tools as well as for other purposes, the most notable of which is armor piercing projectiles. Manganese steel was next introduced to the market. This steel is remarkable for its toughness, combined with hardness when quenched in water, but, owing to the fact that no means have ever been found of softening it, it cannot be machined. Nickel steel was next brought out, and found a much wider field of usefulness than the preceding, and is to-day the most largely used of any of the alloy steels.

Vanadium steel is the last applicant for favor, and while it holds out more promise than any, it has probably not fully passed the experimental stage that leads to wide application. It is being manufactured in increasing quantities every year.

Much has been done in combining two or more of the alloys in steel, with such beneficial result that it is hoped to reach almost any desired quality through the proper combination of the metals now at our disposal.

Chrome and nickel produce an alloy steel combining the good properties of each in a large measure, i.e., strength, elasticity and toughness. One desirable feature in this alloy steel is that, with proper heat treatment, it can be made fibrous like wrought iron, which gives it great resistance to shock, with less liability to crack at corners. It is highly susceptible to heat treatment, and requires exact temperatures in order to obtain the best results.

Nickel and manganese produce an alloy steel of high elastic limit proportion, and give great endurance qualities. The combination increases the susceptibility to heat treatment. Silicon and manganese produce an alloy steel of high elastic limit proportion, and also give great endurance qualities.—*American Exporter*.

PIG IRON PRODUCTION IN CANADA.

The pig iron production of the Dominion of Canada is keeping pace with the growth of other industries. In thirteen years the increase has risen about 1,200 per cent., an average of nearly 100 per cent. per year. In 1894 the output was 44,791 tons, and in 1906, 541,957 tons. The production last year was double that of 1904, when the output was only 270,942 tons. The output per year since 1894 up to last year is given in the following table:

1894	44,791
1895	37,829
1896	60,030
1897	53,796
1898	68,755
1899	94,077
1900	86,090
1901	244,976
1902	319,557
1903	265,418
1904	270,942
1905	468,003
1906	541,957

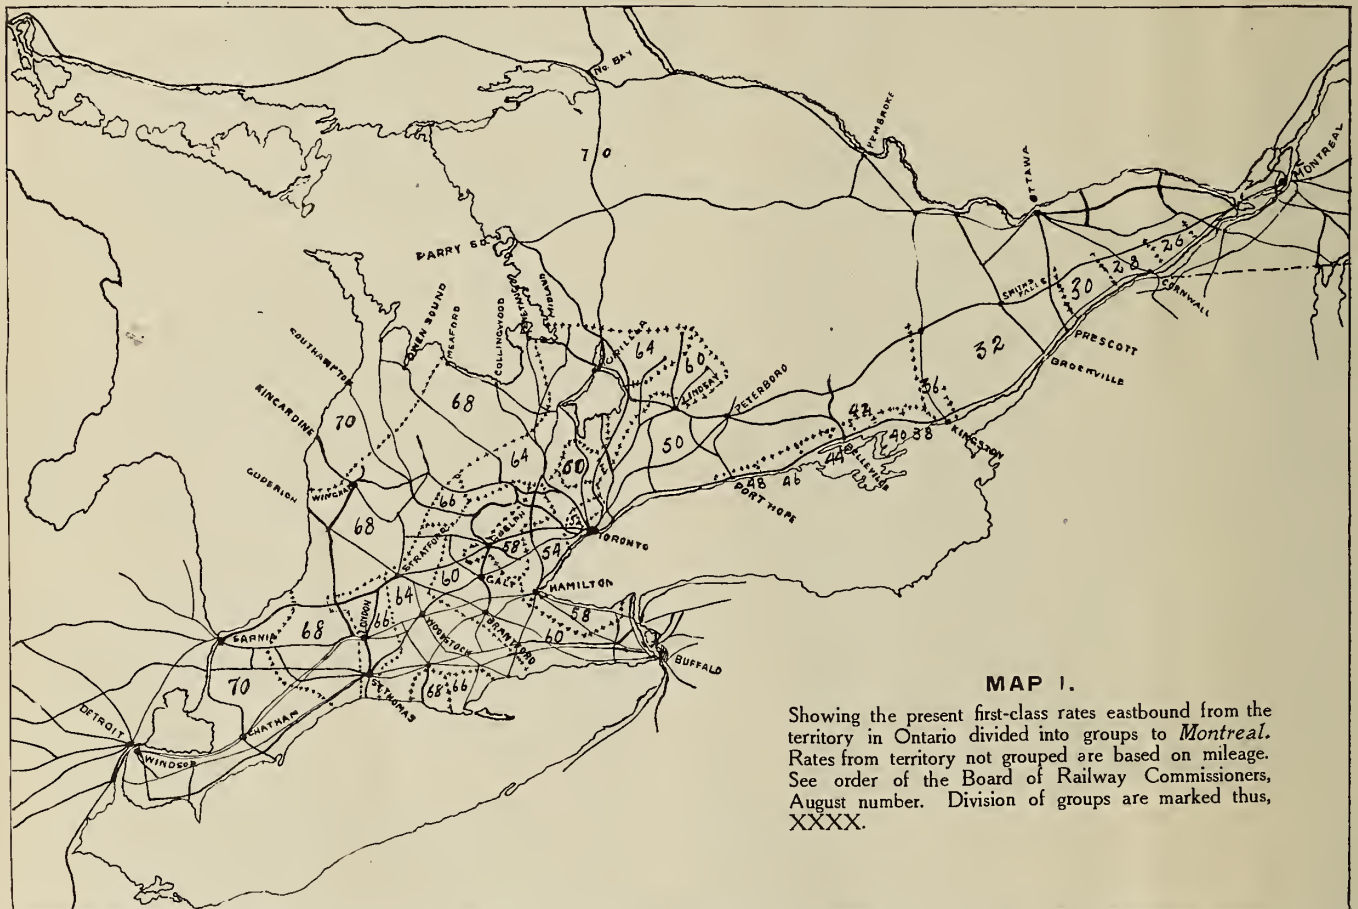

Transportation Problems

THE BOARD OF RAILWAY COMMISSIONERS FOR CANADA.

Recent orders issued by the Board, of vital importance to the Association, direct particular attention to the work of the Commission. A brief review may be interesting. When the Board of Railway Commissioners was constituted, under an Act of the Parliament of Canada, passed in 1903, coming into operation in February, 1904, it was, no doubt, intended for the purpose which the title implies, viz., jurisdiction

owned by the Provincial and Federal Governments. Before railways are constructed they have to approve of location places, of the gradients and curves proposed, etc.; before they are opened for traffic they have to be inspected by the Board's Engineer, and the Board must give leave for them to be operated. The plans of the bridges must be approved of by the Board; one railway cannot cross another without the Board's consent; nor can a railway cross or run along a highway, nor can a new railway be opened across a railway without such permission.

MAP I.

Showing the present first-class rates eastbound from the territory in Ontario divided into groups to Montreal. Rates from territory not grouped are based on mileage. See order of the Board of Railway Commissioners, August number. Division of groups are marked thus, XXXX.

Maps I and II show the freight rate in cents per hundred pounds under the old and the new schedules. A comparison will show the reductions.

over the railways. Since that time increased duties have been imposed upon it by parliament; that is to say, the telephone and express companies have been added. The Board has been invested with powers to prescribe and regulate their tolls. It has also been suggested that the telegraph and telephone companies be added to its numerous duties. No doubt this will come in time, as there seems to be a tendency on the part of parliament to refer any knotty questions affecting such public utilities to the Commission—a wise precaution.

Notwithstanding these increased duties, the personnel of the Commission has not been changed. That is to say, the Board consists of three commissioners, as originally provided for in the Act.

The jurisdiction of the Board extends to every railway subject to the legislative authority of the Parliament of Canada. This practically means all railways, except those

The Board has certain legislative power on subjects which Parliament has not seen fit to deal with in detail. The Board is a court of record, with the same power to enforce judgments as superior courts have. The Governor-General-in-Council is given jurisdiction to set aside, or vary, any order of the Board, and to the Governor-General an appeal lies, but that is the only general appeal. The Board has the power to prescribe the classification of goods, for the purpose of determining the tolls to be charged for their carriage, etc. If the Board at any time considers the rates unreasonable or unjust, as submitted by the railways, it may disallow the tariffs. Full control is thus given to the Board, and these tariffs are made subject to its discretion. Car shortages, demurrage rules, reciprocal demurrage, delays in transit, inadequate facilities, etc., are all matters subject to the regulation of the Board. The enormous amount of work placed upon the Board will therefore be seen readily. When a

comparison of the staff is made with that of the Interstate Commerce Commission the wonder is that they are able to accomplish anything like the work which has been done.

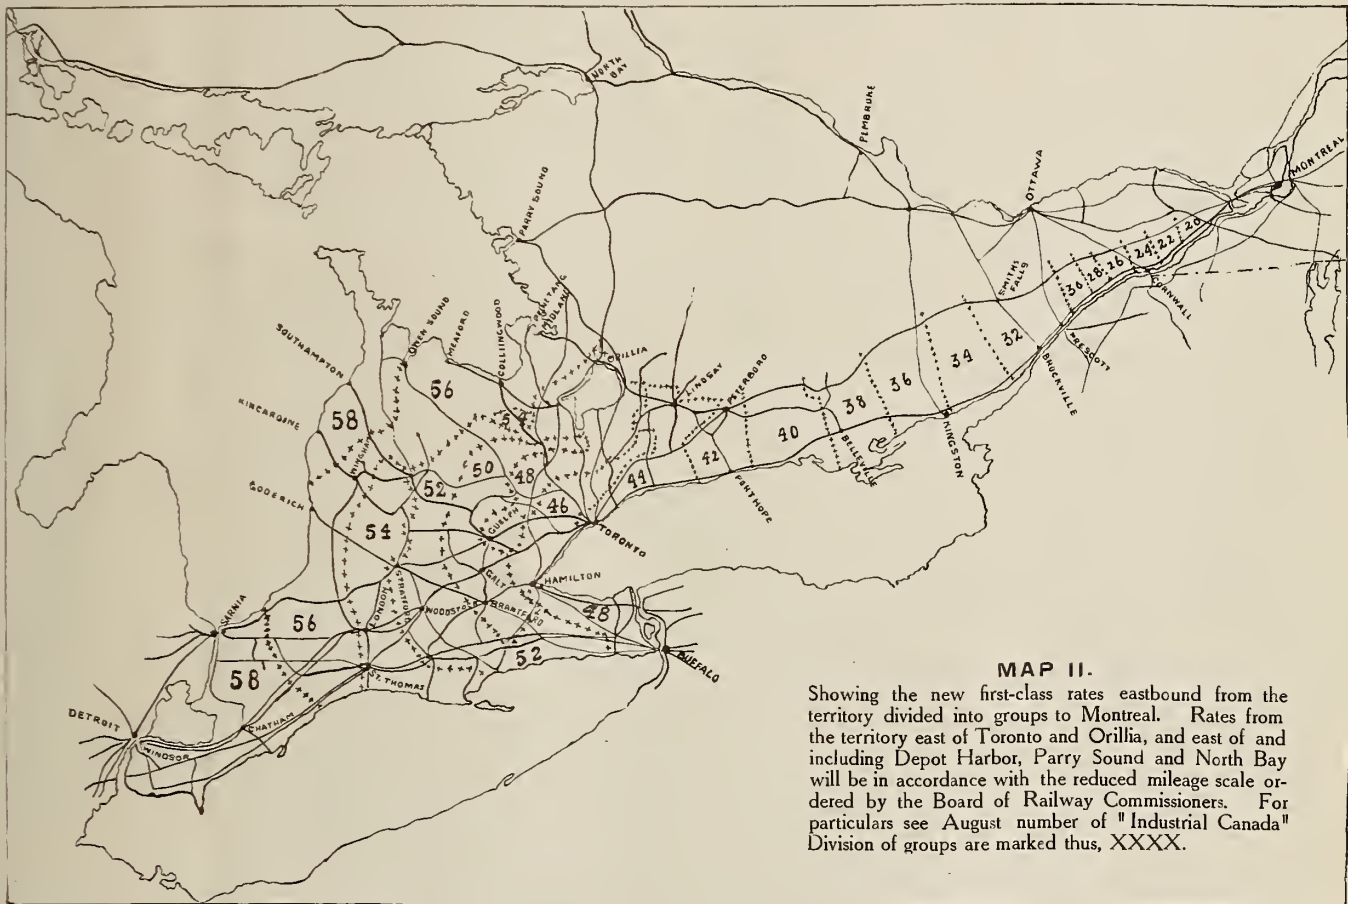

At the present time the official staff of the Commission (not including the Commissioner and Secretary), are as follows:—Chief Engineer, 1; Assistant Engineers, 3; Traffic Expert, 1; Law Clerk, 1; Inspectors of Accidents, 2; Inspector of Equipment, 1; Operating Assistant, 1; Clerical assistance in the various departments, about 30.

As against this there are employed on the staff of the Interstate Commission 221 persons (not including the Commissioners and Secretary), as follows:—Assistant Secretary, 1; Chief Statistician, 1; Assistant Statistician, 1; Solicitor, 1; Assistant Solicitor, 1; Auditor, 1; Assistant Auditor, 1; Special Agent, 1; Chief Clerk, 1; Law Clerks, 3; Confidential Clerks, 5; Official Stenographers, 2; Disbursing Clerk, 1;

delay, in the manner in which it is intended, an almost impossibility with the our present system. It will also be observed that every statistic pertaining to the operation of the railways under the jurisdiction of the Interstate Commerce Commission is published by that body, another impossible task at present with our Commission.

There can be no question of the enormous value of the Board of Railway Commissioners to Canada, although it is only in its infancy as compared with some of the Commissions in other countries. It is far superior in many respects to any other. Professor Mavor, of the University of Toronto, holds that the Canadian system of control over railways is the most satisfactory obtaining in any country in the world.

At the same time it is not expected of the present Board that they should continue to perform the duties which have devolved upon them without some reorganization which

MAP II.
Showing the new first-class rates eastbound from the territory divided into groups to Montreal. Rates from the territory east of Toronto and Orillia, and east of and including Depot Harbor, Parry Sound and North Bay will be in accordance with the reduced mileage scale ordered by the Board of Railway Commissioners. For particulars see August number of "Industrial Canada" Division of groups are marked thus, XXXX.

Clerks, 146; Inspector Clerk, 1; Inspectors, 19; Messengers, 14; Others, 21.

There are seven Commissioners, each of which, except the Chairman, has immediate charge of a branch of the routine, as follows:—One Chairman; one in charge of Statistics; one the Law Department; one the Tariff Department; one Accidents and Safety Appliances; one Accounts; and one Criminal Prosecutions. The Commissioners so arrange that investigations may be held in different parts of the union at the same time. It will be noted that their duties are confined to the operation of the various railways only, whereas the authority of the Canadian Commission not only extends to the construction of the lines, but continues after and during their operation.

The duties of the clerical staff of the Interstate Commerce Commission are so divided that the work can be carried on expeditiously and publicity given to same without

would tend to divide and specialize the work. The public generally will heartily endorse any recommendations to that end, which are made by the Chief Commissioner and his co-commissioners.

RELATION OF RAILWAYS TO THE PUBLIC.

In a circular recently issued to the employees of the Lake Shore and Michigan Southern R.R., the General Manager says:

"The public judges a railroad corporation very largely by the treatment it is accorded by the agent representing the company in whatever capacity he may be employed. A reputation for fair dealing, with courteous and absolutely fair treatment of all customers, is essential to the success of all railroads.

"The good-will and friendship of the community served by our railroad is the most valuable asset it can have; and the strongest recommendation for promoting any employee in any department can possibly have is the fact that by uniform courtesy and kind accommodation of patrons he has secured for himself and for the road the good-will and the friendship of the communities in which he is located."

There is no doubt as to the tendency of the railways in the United States to a better understanding of their relationship to the public, and it is largely in this way that it can be brought about. There is a strong feeling, and justly so, that the Canadian roads have not extended that courtesy to the public to which it is entitled. Any one who has had experience with a local agent in some small town, or even in larger ones, when there is practically no competition, will testify to this. The experience is not confined to station agents, for instance the average ticket clerk (usually exceedingly young and thereby consequential), is almost unapproachable.

These could easily be remedied if the higher officials in the midst of their strenuousness, would occasionally drop off and mingle with the people who pay the freight and contribute to the passenger earnings.

Courteous treatment on the part of railway officials and employees will go a long way to bring about a better understanding between the commercial and transportation interests of the country.

MISREPRESENTATION OF FREIGHT.

The railways in submitting classification No. 13 to the Board of Railway Commissioners for approval were particularly anxious to have, and succeeded in having, the Board order "that any person or company violating the provisions of section 400, sub-section 1, of the Railway Act, shall, in addition to the regular toll, be liable to pay the company a further toll not exceeding fifty per centum of the regular charge." Whilst the above is provided for in the Railway Act, it required an order of the Board before it could be acted upon.

As the order has now come into effect, it is thought advisable to inform the shipping public as to what action has been taken by the railways to enforce it; we, therefore, publish, for the information of shippers, the circular of instructions issued by the Canadian Freight Association to their freight inspectors, as follows:

CANADIAN FREIGHT ASSOCIATION.

TORONTO, ONT., September 1st, 1907.

To Freight Inspectors—

Your attention is called to Rule 17 of the Canadian Classification No. 13, effective 1st September, reading as follows:

(a) All shipments are subject to examination and inspection as to correct description and weight, and will be charged at the gross weight, except that when an article is classified to be accepted at estimated weight, such estimated weight will apply.

(b) If upon inspection it is ascertained that the articles shipped are not those described in the bill of lading, the charges must be paid upon the articles actually shipped, and at the rates and under the rules provided for by this classification, and subject to the provisions of sub-section "c" of this rule.

(c) If any person or company shall knowingly or wilfully by false classification, false weight, false representation of the contents of any package, or false report of weight, or by any other device or means, whether with or without the consent or connivance of any agent or agents of the transportation company, with the intention of obtaining transportation for goods at less than the regular tolls then authorized and in force, such person or company shall, in addition to the regular

tolls then authorized or in force, be liable to pay to the transportation company a further toll of fifty per cent. of the regular charge. (See Section 400 of the Railway Act, Chap. 37, R.S.C., 1906, page 1 of this classification.)

The purpose of this rule is to prevent the continuance of misrepresentation, a practice which places shippers who will not resort to fraudulent means in a most unfair and disadvantageous position as compared with shippers who commit such fraud.

There is no desire upon the part of the railways to penalize any shipper who may, through a misinterpretation of the classification, inadvertently misclassify a shipment; but such misinterpretation is not necessary, because a shipper is not asked to classify his goods. All he is required to do is to correctly and fully describe them in his shipping bills and the railways will apply thereto the proper classification.

The sole object of the railways is to stop deliberate fraud and to protect honest shippers.

If after reasonable efforts have been made by you to ascertain and determine the true character of the property, there remains no doubt in your minds as to the wilful intent of the shipper to misrepresent, you will impose the extra toll of fifty per cent. and report particulars to me. If, however, there is any reasonable doubt in your minds, you will permit the shipment to go forward as consigned, without imposing the extra toll, and report the circumstances to this office.

T. MARSHALL, *Secretary.*

It will be noticed that "there is no desire upon the part of the railways to penalize any shipper who may, through a misinterpretation of the classification, inadvertently misclassify a shipment," etc., etc.

Whilst the Board, in putting in effect the law, has left its application in the hands of the railways, it is yet to be proven whether or not this will be satisfactory to all interests.

A Swiss Electric Locomotive.

A new locomotive weighing in all 43 tons, including driving equipment, which alone weighs 23.5 tons, and equipped with single-phase commutator motors and carried on two four-wheeled trucks, has been built at Zurich by the Oerlikon Company. One motor is mounted on each truck, and geared in a ratio of 1 to 3.1 to an intermediate shaft, which, in turn, is coupled by means of a side bar to both axles. All four axles of the locomotive are thus positively driven. The bearing of the crank pin of the intermediate shaft is allowed a slight vertical motion, for the sake of flexibility. Each motor weighs 3.4 tons, and is rated at 200 h.p. when making 650 turns per minute. Tests have demonstrated that the locomotive can start a 250-ton train up a 12 per cent. grade, and that it can attain a speed of 45 km. (28 miles) per hour without any sparking at the brushes.

The current collecting apparatus consists of a curved tubular rod of steel, on which brass rubbing pieces are mounted. These rods are mounted upon a swinging frame, there being two collectors for each locomotive. The arrangement enables them to be placed in contact with the trolley wire when it is on either side of the track, or at a point above the locomotive. The current is delivered at the low frequency of 15 cycles per second, though it is said that the motors operate equally well at 25 cycles. The normal speed of the motor is about three times that of synchronism. There are in each unit eight main poles, provided with compensating windings in grooves, which may be either short-circuited on themselves, or placed in series with the main circuit.

Industrial Discussions.

EMPLOYER'S LIABILITY.

ANYTHING creating a class distinction, especially one of dependence and of special claims upon another class and upon law and government, is most obnoxious to the fundamental principles of a government of freedom and equality. Every man should stand on his own feet, take his own risks and accept the responsibilities of manhood. If an occupation is hazardous it is highly paid accordingly, and has to be so in order to secure men to work in it. The ordinary risk is paid for, and it is for the interest of the employer to lessen it as much as possible. If an accident occurs for which the employe is responsible through neglect to provide every reasonable safe-guard and to take every reasonable care, he should pay for the injury done. If it is caused by earthquake or lightning or fire, or by the negligence of workmen themselves, which he has taken every means to prevent, to compel him to make compensation would be neither justice nor sound policy. He would have no means of reimbursing himself from the "general public," and if the public was required to make up the loss it would be socialism in its rankest form. A general system of socialistic insurance against injury and loss for all members of the community would be more equitable.

One of the most perplexing difficulties of employers in industries using machinery and mechanical appliances, especially those involving special hazard, is to induce workmen to take reasonable care, to prevent them from being negligent and taking needless risks. Let all the risks of loss by accident be put upon the employer and let the workmen be assured of compensation for injury whatever happens, and the difficulty would be multiplied. The sense of responsibility on the part of the workman, hard enough to instill and maintain in any case, would be weakened if not wholly taken away. It is better for the workman to bear his share of responsibility and risk and to take his share of the consequences, so far as they are due to his own action or neglect, than to be put in a dependent and eleemosynary relation to his employer. Inculcation of this class principle, this treatment of the workmen of this free republic as an inferior caste, to be specially looked after and cared for by a paternal and benevolent Government, instead of being encouraged to take care of and provide for themselves and to become "superbly self-reliant" as citizens equal to all others before the law and under the Government, is demoralizing and degenerating to the very theory of our institutions. It is too common with demagogues and it is sad to see a high official of good intentions and purposes fall into it.—*Journal of Commerce.*

EXPROPRIATION RAMPANT.

"If there is work to be done essential to the public interest, but which the community at the time lacks the means of undertaking, hand it over to private enterprize to be carried out with private capital; when it has been done, proclaim the sacred supremacy of public ownership, and expropriate the work." Such seems to be the policy into which we are being gradually drawn. There can be no doubt as to the effect on the future application of private capital to public works. The question between private and public ownership is surely one not to be decided by any abstract

principle, but in accordance with the circumstances of each case, and with due regard for commercial justice. Private management under a compact with the public, properly framed and duly enforced, may be just as good as management by public officials. "The public" is a high-sounding title, but practically it means those who for the time have got public power or influence into their hands. Public ownership in England has proved, to say the least, not so decided a success as to warrant indiscriminate adoption. About the policy of respecting the rule of fair dealing in all cases, public or private, there can be no difference of opinion. Standard Oil is a case apart. The charge there is in effect public robbery on a large scale.—Goldwin Smith in the *Weekly Sun.*

INDUSTRIAL LEGISLATION AND ITS COST.

Legislative interference in labor affairs, viewed from the angle of the humanization of industry, is an inestimable boon, but when it adds to the cost of production, and thus increases the toiler's burdens, it is something of a handicap. At present in England and in America there is an unusual amount of activity in framing industrial legislation, and to show that improvements have been effected far more by the development and application of scientific working methods than by legislative enactments intended to be ameliorating is the task which Mr. T. Good sets himself in *Cassier's Magazine* for July. In general, the benefits secured by legislation cost more than they are worth, and the latter is not the most effective means to improve the condition of the operatives.

Confined to his experience in Great Britain, there is, nevertheless, sufficient relevancy to local conditions to make his paper one of interest to our readers. Taking up the new Workmen's Compensation act, imposing liability on employers, he says that when the act of 1897 was passed insurance companies charged only 32 cents per \$500 of wages as a premium in the case of risk on textile operatives. In 1905 this had risen to \$1.50. With railroads, cost of compensation in 1905 per \$500 was \$2.50. With iron and steel, \$1 compensation per \$100 has been paid. Under a new law, operative on July 1, these rates are all doubled. Statistics proving that mining, manufacturing, railroad and seafaring work is nine times more dangerous than textile-working alone, the writer assumes that this new act may impose a tax of \$27 per \$500 of wages paid on British industry in general.

This will not fall on capital alone. Much will fall inevitably on labor, supposedly a gainer by this legislation. Further economies will be attempted, elderly and delicate men will not be retained, and young and strong ones will be speeded up. There are other ways of benefiting labor than by means of legislation. Much mining legislation has been secured, and mining is now as safe as human foresight and present knowledge permit. But much of the general improvement is not due to legislative interference at all, but to the spread of knowledge, the growth of science, and the natural development of humanitarian ideas,—to voluntary effort quite as much as to compulsory regulation. "The moral, social, and educational conditions of our miners have been materially improved; and this improvement in the individual, this improvement in humanity, due to the influences of a progressive civilization, is reflected not only in improved

technical knowledge, but in increased thought and care; and increased knowledge and caution bring a huge increase in safety. Partly through legislation, but chiefly, we believe, through improved knowledge, there has been a large measure of progress in lessening personal risk and injury during the last fifty years." Fatalities dropped from one in every 250, between 1845 and 1855, to one in every 770, between 1896 and 1906.

State regulation within a period of about half a century has added 50 cents per ton to the cost of coal getting, thus increasing the cost of production. This means \$120,000,000 a year, and with \$185,000,000 threatened, in addition, for workmen's compensation, the writer thinks it is time to halt

ture of £2,300, and producing an income of £2,500, thus leaving a net return of £200. The financial efficiency of the business is therefore 20 per cent. It will at once be objected that it is not always possible to state the financial efficiency of, say, a machine, because the idea of an efficiency is that of a ratio between outgoing and incoming quantities of the same thing. Thus the mechanical efficiency of a steam engine is a ratio of two powers, and the thermal efficiency the ratio of two quantities of heat. In attempting to determine financial efficiency we are faced by the fact that in return for an expenditure of money we receive power, and the two cannot be compared as a ratio. The information as to the return in power from the given expenditure in

Canada's Exhibit at Dublin Exhibition

the movement for restrictive legislation and to adopt a new policy in industrial affairs, to settle the differences of capital and labor without state interference. The latter is a tax on production and a commercial handicap.

COMMERCIAL EFFICIENCY IN ENGINEERING.

A very suggestive article appears in a recent issue of the *Manchester Guardian*, on "Financial Efficiency in Engineering." By "financial efficiency," the writer explains that he means the ratio of the net return obtained from a given capital outlay to the capital outlay itself. For instance, on £1,000 capital business is transacted involving an expendi-

money is, however, valuable in itself, and when we have such information for alternative machines we can at once determine their relative financial efficiencies. Machinery buyers and users, the writer contends, should refuse to be satisfied with statements as to the physical efficiency of machinery and plant. Salesmen and consulting engineers should be required to work out the financial efficiencies of their schemes, and engineering professors should teach their students how to estimate the financial efficiency in a scientific manner.—*The Machinery Market*.

An effort is being made to reorganize the Southampton Furniture Company.

Atikokan Iron Works

THE first blast furnace in Western Canada has been completed by the Atikokan Iron Company at Port Arthur, and is now ready for operation. Some four years ago, when the U. S. Steel Company began extensive operations in the Duluth iron range, attention was called to the fact, which seemed to have been forgotten, that there was an extension of this range, showing an outcrop in the Thunder Bay District of Western Canada. Some work had been done on this, the Animikie range, but the demand for ore was not such as to guarantee the expenditure necessary to develop. Later on it was found that there were also extensive iron deposits in the district west of Port Arthur, cut by the Canadian Northern main line, and more particularly in the vicinity of Atikokan.

Suitable Ore Available.

Iron ore was becoming a valuable commodity, and the known iron fields were being eagerly sought after by some of

Blast Furnace

The Arrangement of the Plant.

The accompanying photographs give an excellent idea of the general layout of the plant. To the east are the coke ovens, a battery of 100, of the beehive type, with a pier running out to deep water, so that coal may be unloaded direct. Car tracks communicate with the charging bins, the coke being transferred by dump cars, giving a minimum of handling. The same system is used in handling the ore, the cars being dumped into a boot, as they are received from the mine, and elevated to the roaster by a bucket conveyor, returning to the charging bins by a gravity system. The charging cars are loaded direct from the bins, weighed and hoisted by an incline cableway to the mouth of the furnace, the cars operating in pairs.

The "stoves," three in number, are of an unusually large size, and are situated in a building adjoining the furnace and casting house, but separated from it only by a fireproof parti-

Furnace and Roasting Plant

the big corporations, so that the completion of a railroad through this section of the Animikie range brought with it a number of prospectors, who conducted tests with diamond drills. The cores obtained offered a sufficient guarantee of the quality and quantity of ore available, and the Atikokan Iron Company was organized. The town of Port Arthur was approached and a site was secured near the western boundary and on the shores of Thunder Bay. Here a smelter has been constructed, with a capacity of 125 tons of pig iron per day. From the analyses of the ore, and the character of the installation, it is expected that a high grade pig will be produced, one which, if a sufficiently low percentage of sulphur can be obtained, will bring a premium in the market.

The installation at Port Arthur is a most expensive one, a large portion of the cost being sunk in securing a suitable foundation for the docks, coke ovens and furnace. At the point chosen the ground is low and marshy, there being a great depth of alluvial mud, which has been carried down in ages past by the Kaministikwia River. This mud shoals off slowly into the bay, and the company decided to build its plant out over the bay, as being cheaper than dredging a channel to their docks. Spruce piling was put down to hold the foundations of the different buildings, and millions of feet of timber were used for the purpose.

tion. The refractory brick lining for the blast furnace, tuyeres and stoves, were imported from Dundee, Scotland, and a special design of tuyere and water cooling jacket has been adopted. The buildings for all of these departments are of steel. The engine-house is on the west side, and is built entirely of brick. In it is an engine of 1,000 horse-power capacity for driving the air compressors, pumps, dynamos and hoists. The charging cars, cranes in the casting room and bucket elevators, are electrically driven, while there is a battery of boilers for supplying steam for the main engine. When the plant is in operation, however, power will be furnished from the waste gases of the furnace, which are also utilized in heating the stoves, through which the air for the blast is forced before it enters the furnace, getting a temperature of about 1,200 degrees.

The By-Products.

As yet there has been no installation for the purpose of utilizing the by-products of the coke ovens, owing to the difficulty of finding a market. It is proposed, however, to utilize the gas generated, as a market develops, but the tar and ammonia cannot be saved in the beehive ovens. It is not yet known whether the slag can be utilized in the manu-

facture of cement, but if it is suitable, a cement plant will be added at a later date. The coking coal is being brought from Pennsylvania, and the limestone from the quarries on Lake Erie.

An analysis of the ore from the Atikokan district shows an average of 62 per cent. iron, and 2.5 per cent. of sulphur. It is expected that this latter will be reduced to at least .5 per cent. on roasting. There is only a trace of phosphorus and no titanium present. An analysis of the ores from the vicinity of Loon Lake, east of Port Arthur, shows, iron, 55.20 per cent.; phosphorus, .026 per cent., and sulphur, none.

Battery of Coke Ovens, fifty on each side

This was from a sorted ore, work which can be done mechanically owing to the nature of the ore body, which is cut by cherty bands.

At the Atikokan mines, the work so far has been largely in the way of development and blocking out the ore body. A couple of tunnels have been driven through the ore body, and it is the ore from these that has been shipped. The road-bed of the C. N. R. from Port Arthur to the mines is not in first-class condition for handling continuous heavy shipment, but it is expected that this will be remedied before the close of the present season. It has been suggested that the C. P. R. run a spur in from the north, but though the ground has been looked over by the engineers, no steps have yet been taken.

NATIONAL INDUSTRIAL TRAFFIC LEAGUE.

The National Industrial Traffic League was organized in Chicago on August 2, at a meeting of 35 representatives and traffic managers of organizations of shippers and large shipping concerns in all parts of the United States. The purpose of the organization is to secure better co-operation between the shippers, officials of railways, state railroad commissions and the Interstate Commerce Commission, for the promotion of the best interests of the transportation and shipping industries.

The men who attended the meeting represented over 13,000 business concerns. It is an interesting fact that of the 35 who were present, 30 were formerly connected with railways in some capacity.

The *Railway Age*, commenting upon the organization of the league, says:—"It may be made an agency for conferring great benefits upon both railways and their patrons if it shall be conducted along the lines indicated in its articles of association, and if it shall receive proper co-operation from officials of railways and the various state commissions and the Interstate Commerce Commission, etc. The assurance is given that the league's attitude is not and will not be one of hostility to either commissions or railways.

Its aim is to secure a better understanding and better co-operation between regulating authorities, carriers and shippers for the safe-guarding and promotion of the interests of all concerned.

It seems obvious that the railways have nothing to lose and everything to gain by meeting the National Industrial Traffic League half way.

This organization should understand the methods and needs of railways better than any other association of shippers that ever existed in the United States, for a large proportion of its members were formerly railway men. Past experience surely must have convinced every railway traffic manager that much more is to be gained by dealing candidly, fairly and directly with representatives of the shipping interests than by constantly trying issues with them before commissions.

The ideal to be aimed at is the formation of such relations between shipper and carriers that they will settle practically all their differences without the intervention of a third party, and will ask for the intervention of the Interstate and State Commissions only when unavoidable friction develops, and will resort to formal proceedings only when all other means have been exhausted."

The first meeting of the League since its organization will be held in Chicago, on August 27. There are some 18 items on the Agenda, all relating to traffic matters.

The operation of the League will be confined to the United States.

In this connection it may be observed that the policy of the Transportation Department of the Canadian Manufacturers' Association is to negotiate direct with the railways in all matters effecting the shipping and transportation interests of the Association, appealing to the Board of Railway Commissioners only when all other means of adjustment are exhausted. On the other hand, the railways have expressed their willingness to deal promptly with matters taken up with them, recognizing, no doubt, that the aim of the Association is better co-operation between shippers and carriers. In this the Board of Railway Commissioners and its traffic officials lend their assistance by bringing about a more satisfactory situation of affairs without the necessity of hearings or the arbitrary exercise of authority.

CANADIAN PIG IRON PRODUCTION.

The statistics of the American Iron and Steel Association show that the production of pig iron in the Dominion of Canada in the first half of 1907 was 270,100 gross tons, as compared with 259,947 tons in the second half of 1906 and 282,010 tons in the first half. Of the total 265,253 tons was coke iron and 4,847 charcoal iron. The production of Bessemer pig iron amounted to 73,023 tons, against 86,558 tons in the last half of 1906, and 79,051 tons in the first half. The production of basic pig iron was 161,403 tons, as compared with 110,930 tons in the last half of 1906 and 135,298 tons in the first half. The production of malleable Bessemer, foundry, forge and miscellaneous grades was 35,674 tons, a considerable falling off from the record of 62,459 tons in the last half of 1906, and 67,661 tons in the first half. The following table gives the half yearly production in gross tons since 1904:

	1904.	1905.	1906.	1907.
First half	120,643	210,206	282,010	270,100
Second half	150,299	257,797	259,947
Totals	270,942	468,003	541,957

On June 30, 1907, Canada had 14 completed blast furnaces, of which 10 were in blast and four idle. Of this total 12 were equipped to use coke and two to use charcoal. In addition one coke furnace was being built on June 30 and one charcoal furnace was being rebuilt. Three coke furnaces were also partly erected on the same date, work on which had been suspended for some time.

The Medicine Hat pressed brick works are now in running order, and the plant is turning out 20,000 bricks per day.

Collective Bargaining

A Consideration of Such Practice as Illustrated by the Agreement Between the Federated Engineering Employers and The Allied Trades Unions of the United Kingdom of Great Britain.

IN the evolution of the labor problem it is quite natural that various expedients are devised, advocated, and adopted for the solution of this vexed question, and with the hope that their efficacy may prove sufficient to materially augment industrial peace. All such plans are worthy of the closest scrutiny, with a view of determining their availability, practicability and wisdom. It must not, however, be overlooked that schemes which may be commendable in some instances and under certain conditions, are wholly inadmissible under another and less favorable regime. Thus in England collective bargaining may be justly advocated as a means of allaying friction between employers and employees, since many of the abuses and indefensible contentions of unionism with which America is familiar do not there exist, and for which reason methods of dealing with the problem are and must properly be different in the two countries.

Even in America collective bargaining has been adopted and is being practised in some instances, and there may be found advocates both for and against the procedure, according to the character of conditions with which employers are confronted. The very constituency of labor unions, together with that element of membership which is in control of their direction, must necessarily dictate the availability of any such practice. Certainly as conditions now exist in this country it is useless to advocate and impossible to expect that any such method of dealing with the problem may be alluring and successful.

Whether collective bargaining will ever become in this country a popular and practical solution of the difficulty will perhaps largely depend upon the evolution and possibly the revolution of the purposes and practices of labor unions. Certainly it will not be possible until unions admit the inviolability of several cardinal principles of equity, and abandon as indefensible many of the methods they now employ to enforce their demands. These principles and methods may be concisely stated as follows:

Principles That Must Be Respected.

- No closed shop.
- No restriction as to the use of tools, machinery, or materials, except such as are unsafe.
- No limitation of output.
- No restriction as to the number of apprentices and helpers when of proper age.
- No sacrifice of the independent workman to the labor union.

Methods That Must Be Abandoned.

- Sympathetic strikes.
- Picketing.
- Violence.
- Boycotting.
- Compulsory use of the union label.

A Sample of Collective Bargaining.

As an illustration of the possibility of an equitable collective bargain under the most favorable circumstances, reference may be made to the existing agreement between the

Federated Engineers Employers and the Allied Trade Unions of the United Kingdom of Great Britain. Under the agreement the employers are not to interfere with the unions and the unions are not to interfere with the employers in their management of their business. Each party is to enjoy perfect freedom within its own proper sphere. Employers may belong to the federation or not, and workmen may belong to the unions or not, as they please, and whichever they choose to do there shall be no discrimination against them on that account. Employers shall be free to hire whom they wish and workmen shall be similarly free to work for whom they wish. No employer is even to ask a workman whether he belongs to a union, and no union workman is to object to working by the side of non-union men. The "open shop" principle is to prevail in full measure on both sides.

The unions have the right of collective bargaining and of fixing the rate at which their members shall work. On the other hand, employers will not be bound to pay uniform rates to all, but may vary pay according to individual capacity, though, of course, they cannot require union men to work for less than the union scale. Employers will also have the right to select men for special work, at special rates, to assign men of their own choice for the operation of machines, ect., instead of being compelled to accept such men as the unions designate. Overtime work is to be discouraged and minimized, and at piece work no man is to receive less than he would earn at time wages. In case of any difference, to avoid disputes, the employers are to receive deputations of workmen for mutual discussion; trade union officials may negotiate with officials of the Employers' Federation, or either party may submit the matter at issue to a local conference representative of both sides, from which, failing settlement it may be carried to a conference of the central authorities of the Federation and the unions. Meantime, during all the negotiations there shall be no strike nor interruption of work.

Whatever individual opinion may be as to the desirability of such an arrangement, it is gratifying to observe that under such a plan of operation there would be recognized three principles which must be regarded as fundamental to any equitable and stable industrial system—namely, the right of man to labor independently of any arbitrary dictation; the right of employers to manage the businesses which they create, for which they provide the capital, and for which they are responsible; and the right of working men to combine for purposes of mutual advantage apart from all schemes of monopoly, odious discrimination, intimidation and violence.

Owing to the universal interest, in this country, in all methods and plans contributing to the solution of the labor problem, and as a suggestion to labor unions of the larger possibilities contributing to the security of labor which they are jeopardizing by their present policy, the agreement is herewith given in full, as adopted in 1898 and which has recently been again ratified with only a few immaterial changes.

Conditions of Management Mutually Adjusted and Agreed Upon Between The Federated Engineering Employers and the Allied Trade Unions.

General Principle of Freedom to Employers in the Management of Their Works.

"The Federated Employers, while disavowing any intention of interfering with the proper functions of Trade Unions, will admit no interference with the management of their

business, and reserve to themselves the right to introduce into any federated workshop, at the option of the Employer concerned, any condition of labor under which any members of the Trade Unions here represented were working at the commencement of the dispute in any of the workshops of the Federated Employers; but, in the event of any Trade Union desiring to raise any question arising therefrom, a meeting can be arranged by application to the Secretary of the Employers' Local Association to discuss the matter.

"Nothing in the foregoing shall be construed as applying to the normal hours of work, or to general rises and falls of wages, or to rates of remuneration."

NOTE.—No new condition of labor is introduced or covered by this clause. It simply provides for equality of treatment between the Unions and the Federation by reserving for all the Members of all the Trade Unions, as well as for all the Federated Employers, the same liberty which many Trade Unionists and many Employers have always had.

Special provision is made in the clause and in the subsequent "Provisions for avoiding future Disputes," to secure to workmen, or their representatives, the right of bringing forward for discussion any grievance, or supposed grievance.

1. Freedom of Employment.

"Every workman shall be free to belong to a Trade Union or not, as he may think fit.

"Every employer shall be free to employ any man, whether he belong or not to a Trade Union.

"Every workman who elects to work in a Federated Workshop shall work peaceably and harmoniously with all fellow employees, whether he or they belong to a Trade Union or not. He shall also be free to leave such employment, but no collective action shall be taken until the matter has been dealt with under the provisions for avoiding disputes.

"The Federation do not advise their members to object to union workmen or give preference to non-union workmen."

NOTE.—The right of a man to join a Trade Union if he pleases involves the right of a man to abstain from joining a Trade Union if he pleases. This clause merely protects both rights. The Federation sincerely hope that a better understanding will prevent any question of preference arising in the future, and advise the members not to object to Union workmen.

2. Piecework.

"The right to work piecework at present exercised by many of the Federated Employers shall be extended to all members of the Federation, and to all their Union workmen.

"The prices to be paid for piecework shall be fixed by mutual arrangement between the employer and the workman or workmen who perform the work.

"The Federation will not countenance any piecework conditions which will not allow a workman of average efficiency to earn at least the wage at which he is rated.*

"The Federation recommend that all wages and balances shall be paid through the office."

*In reply to an enquiry as to the interpretation of this paragraph, the Employers' Secretaries, on 21st January, 1898, wrote to the General Secretary of the A. S. E., stating that the general note (appended to the explanations) which disclaims any intention of reducing the rates of wages of skilled men "applies both to time wages and to piecework earnings—in the latter case there is no intention of interfering with the usual practice of making extra payment for extra effort."

NOTE.—These are just the conditions that have been for long in force in various shops. Individual workmen are much benefited by piecework.

A mutual arrangement as to piecework rates between employer and workman in no way interferes with the functions of the Unions in arranging with their own Members the rates and conditions under which they shall work."

3. Overtime.

"When overtime is necessary the Federated Employers recommend the following as a basis and guide:

"That no man shall be required to work more than 40 hours overtime in any four weeks after full shop hours have been worked, allowance being made for time lost through sickness or absence with leave."

"In the following cases overtime is not to be restricted, viz.:

"Breakdowns in plant.

"General repairs, including ships.

"Repairs or replace work, whether for the employer or his customers.

"Trial trips."

"It is mutually agreed that in cases of urgency and emergency restrictions shall not apply.

"This basis is to apply only to members of the Trade Unions who are represented at this Conference.

"All other existing restrictions as regards overtime are to be removed.

"It is understood that if mutually satisfactory to the Local Association of Employers and the workmen concerned existing practices regarding overtime may be continued."

NOTE.—These Overtime conditions are precisely the conditions now in operation in various places, though in many Federated Workshops no limitation whatever exists at the present time. In many cases this will be the first attempt to regulate or prevent excess of Overtime.

4. Rating of Workmen.

"Employers shall be free to employ workmen at rates of wages mutually satisfactory. They do not object to the Unions or any other body of workmen in their collective capacity arranging amongst themselves rates of wages at which they will accept work, but while admitting this position they decline to enforce a rule of any Society or an agreement between any Society and its members.

"The Unions will not interfere in any way with the wages of workmen outside their own Unions.

"General alterations in the rate of wages in any district or districts will be negotiated between the Employers' Local Association and the Local Representatives of the Trades Unions or other bodies of workmen concerned."

NOTE.—Collective bargaining between the Unions and the Employers' Association is here made the subject of distinct agreement.

The other clauses simply mean that as regards the Wages to be paid there shall be (1) Freedom to the Employer; (2) Freedom to the Union Workmen both individually and in their collective capacity—that is to say, collective bargaining in its true sense is fully preserved; and (3) Freedom to Non-Unionists.

These conditions are precisely those in operation at present on the North-East Coast, the Clyde, and elsewhere, where for years past alterations of wages have been amicably arranged at joint meetings of employers and representatives of the Trade Unions.

5. Apprentices.

"There shall be no limitation of the number of Apprentices."

NOTE.—This merely puts on record the existing practice, and is to prevent a repetition of misunderstandings which have arisen in some cases.

6. Selection, Training, and Employment of Operatives.

"Employers are responsible for the work turned out by their machine tools, and shall have full discretion to appoint the men they consider suitable to work them, and determine the conditions under which such machine tools shall be worked. The employers consider it their duty to encourage ability wherever they find it, and shall have the right to select, train, and employ those whom they consider best adapted to the various operations carried on in their workshops, and will pay them according to their ability as workmen."

NOTE.—There is no desire on the part of the Federation to create a specially favored class of workmen.

Provisions for Avoiding Disputes.

"With a view to avoid disputes in future, deputations of workmen will be received by their Employers, by appointment, for mutual discussion of questions, in the settlement of which both parties are directly concerned. In case of disagreement the local Association of Employers will negotiate with the local officials of the Trade Unions.

"In the event of any Trade Union desiring to raise any question with an Employers' Association, a meeting can be arranged by application to the Secretary of the Employers' Local Association to discuss the question.

"Falling Settlement by the Local Association and the Trade Union of any question brought before them, the matter shall be forthwith referred to the Executive Board of the Federation and the Central Authority of the Trade Union; and pending the question being dealt with, there shall be no stoppage of work, either of a partial or a general character, but work shall proceed under the current conditions."

NOTE.—A grievance may be brought forward for discussion either by the workman individually concerned, or by him and his fellow-workmen, or by the Representatives of the Union.

In no instance do the Federated Employers propose Conditions which are not at present being worked under by large numbers of the Members of the Allied Trade Unions.

The Federated Employers do not want to introduce any new or untried conditions of work, and they have no intention of reducing the rates of wages of skilled men.

These Conditions with relative Notes are to be read and construed together.

Scarcely Tenable in America.

It will instantly be recognized that any collective bargaining resulting in such an agreement in this country is scarcely tenable. The unions seem to be impressed with the conception that in order to accomplish their unreasonable aims they must resort to such drastic measures as can find no support in law or in equity. As a result a spirit of hostility is being engendered that is fast challenging among employers the unions' very power for usefulness, and is inevitably leading to a refusal to grant any recognition to them as a factor in labor negotiations and adjustments. It is a fact that frequently unions are under the dominance of socialistic leaders who feel that their positions can be maintained only as they encourage and foment bitterness and strife, while that portion of union membership, unfortunately

too frequently in the ascendency, whose wages are determined more by the unions' exaction than by individual capacity can be relied upon to blindly and unfaltering ratify whatever actions these leaders advocate.

So long as these conditions continue the necessity will exist for a united resistance to every union demand that is not based upon equity and sanctioned by enlightened judgment. Defeat after defeat must be administered until the unions realize that "kicking against the pricks" is an irritating, useless and foolhardy practice. Litigation after litigation must be prosecuted until courts recognize universally the injustice of even "peaceful picketing," since there is no such thing as "peaceful picketing," the illegality of intimidation, sympathetic strikes, blacklisting and boycotting. Such actions must not alone be prevented by injunctions, since injunctions are only restraining in influence and not punishing in design, but they must be followed whenever possible by actions for financial damages which alone can emphasize the danger of resort to such methods.

When a body of law has been built up that shall inevitably confine the actions of unions within rational and consistent lines, and a volume of precedents have been established both as a standard of judicial action, and as an encouragement to officials entrusted with the enforcement of law, then we may expect unions to be amenable to reason and ready to cooperate in the solution of the labor question on a basis consistent with common sense and humanitarian dictates. Then, and not until then, will collective bargaining become even a feasible process worthy of serious consideration.

Until that result is accomplished let it be recognized that the American Anti-Boycott Association will continue as a law and order instrumentality, especially organized, operated, and financed to deal with indefensible issues as they arise, and determined to keep constantly before the courts and the public the base principles of inequality, tyranny, monopoly and usurpation that are involved in the practices so common today on the part of organized labor.

Social Betterment.

A large number of the most prominent manufacturers of Rhode Island, including the heads of the largest machine shops, woollen mills and cotton factories, have banded together in a united effort to prevent the spread of consumption among their operatives. Rhode Island is a great manufacturing State, and its important cities and towns contain a closely-crowded population. The result, as shown by the latest figures, is that consumption carries off more than twice as many victims as all other preventable and communicable diseases combined. The newly formed league of millmen employs sanitary engineers and physicians who make constant inspections and watch each employee for signs of tuberculosis. Assistance and proper attention are provided for those who have the disease, and a campaign of education is conducted among all the operatives. House-to-house inspection of tenement districts, careful records of the removal and whereabouts of families in which the disease is present or has appeared, and the formation of a committee on legislation, are other steps which the millmen have taken. They are mentioned here because they are within the capacity of large employers of labor everywhere, and are not only humane but "good business."

The official tests on the new eight hundred kilowatt plant at Morrisburg, Ont., were made recently by Mr. Willis Chipman, C.E., and Mr. K. L. Aitken, C.E., both of Toronto.

Proper Packing of Freight for Shipment

By Charles E. E. Childers

THE main purpose for which the Traffic Club, of Pittsburgh, exists, is to promote fair-minded co-operation in all matters affecting their common interests between the railroad companies, the carriers of freight, and their patrons, the shippers. The President of the Club, at a recent banquet, declared that a man who saw only the side that affects his own greatest profit, regardless of the consideration due to the other side, was not Traffic Club stock, and was not capable of joining in an effort to improve the situation, by an adjustment fair to all.

One of the subjects which was placed in the forefront which required thorough development in this spirit of co-operation was that of the proper packing of freight before offering for transportation.

The following address on the subject was delivered by Mr. Chas. E. E. Childers:

No one is likely to dispute the fact that safety to goods should be the first consideration of all in the business of their transportation, from the viewpoint of the interest of both the carrier and the shipper, and should really take precedence over everything else. Of what avail is it to move a shipment from point of origin to destination in record time, if upon its arrival, the goods are damaged or destroyed? Yet its relative importance as compared with rapid movement and speedy delivery appears of late years to have been largely lost sight of. The carrier's energies, on the one hand, have been devoted to quick handling of traffic, and adequate supply of equipment, while the shippers, on the other hand, have been endeavoring in too many cases to meet the increased cost of their package material by the use of cheaper and flimsier package for their goods. This is all the more unfortunate, because modern conditions of transportation, and the improvements which have been introduced by the carriers, to render the best possible service, which is so vigorously demanded by the public, have carried with them a certain unavoidable increase in the risk of damage to the property transported, and there should have been in all equity a corresponding improvement in the methods of packing the commodities shipped, so as to offset this increased risk, while the reverse has in fact been the case.

In the days when emergency air brakes and automatic couplings were unknown on freight trains, and before the introduction of the heavy locomotives and high tonnage preferential trains nowadays in service on our roads, there was actually less liability than at present to injury in transit to goods loaded in cars. Yet under these old conditions, the goods were as a rule more strongly packed than to-day. The result of all this has been a great increase in the number of damage claims made against the carriers, this increase being estimated by some authorities, at as high as 50 per cent., which, in the absence of detailed specifications in the tariffs and classification as to the kind of packages to be used, they have preforce to pay. A condition of things most unjust to the carriers has thus grown up, which in the beginning might have been avoided, if shippers had only shown a disposition to meet the carriers in conference before changing the character of their packages, and a condition which now seems likely to force upon the carriers for their own necessary protection the irksome and laborious task of laying down rules in minute detail as to the kinds of packages which alone will be accepted by them for transportation for each and every commodity offered for shipment.

Carriers Partly To Blame.

It is no doubt true that many cases of damage are due to rough and careless handling by the carriers' own employees, for which, of course, under the law, they must and should be held responsible. Nevertheless I would respectfully submit that even this class of claims could be greatly diminished, if shippers would take the broad-minded view that rough handling, to some extent, is an almost unavoidable incident of transportation nowadays, and would be ready to do their part to meet it by extra care in the preparation of their commodities for shipment. The general scarcity of efficient labor, so universally prevalent in these prosperous times, is felt by the railroad companies as fully as by all other employers, and do what they can, it is impossible always to secure ideal service in this respect. In the rush and hurry of the huge volume of traffic with which railroad companies have to contend nowadays, some rough handling of the packages committed to their care must be expected, but the percentage of the damage caused thereby could be enormously reduced in very many cases, if reasonably strong, instead of unreasonably light packages had been used. I would commend this point rather strongly to the consciences of our shipping friends.

The Railroads Do Their Best.

The roads have, as a matter of fact, done their best at the expense of many million dollars, to insure greater safety of goods in cars, while being switched in the assembly and distribution yards, by the establishment of the so-called "gravity" system, in which the cars are pushed up an inclined track or "hump," cut off and allowed to run down by their own weight to the several classification tracks. Each cut of cars is manned by a brakeman, and impartial observers report, so gently and skilfully, as a rule, are the cars handled, that one might place one's hand between the bumpers as they come together and not suffer even a scratch. For the benefit of any doubting Thomases who may wish to make the test, I would suggest as a conservative measure, the use of a broom stick, spoke or like article. It's not quite so trying to the nerves, but demonstrates the point just as effectively.

That the present style and character of the packages used for shipping is at present unsatisfactory and unsuitable for railroad transportation purposes, is very positively demonstrated from reports by the local freight agents, inspection bureaux, and other observers all over the country. The following will serve as some specimen bricks in illustration of this:

Flour in paper sacks,—the quality of paper largely used at the present time in these sacks is such that piling of the flour to sufficient height in the car to load to the minimum weight, causes the sacks in the top rows to burst those in the bottom rows of the cars. Independently of the question of safe transportation, the number of times that this commodity must be handled between the mill and the consumer would necessitate the quality of the sacks used being of a superior kind to stand this frequent handling.

Crackers, tobacco, dry goods, notions, cereals and cereal products and preparations, lamp chimneys, and many other articles, formerly shipped in wood, are being packed for shipment in cases made of straw-board, wood-pulp, leather board, fibre and other analogous material, and these packages are not rigid enough or of sufficient strength to protect the

contents, or allow the proper stowing of them in the cars to meet modern transportation requirements.

The Straw Board Evil.

The superintendent in charge of one of the largest transfer stations in this district, where thousands of tons of through freight are handled every week, states that one of their greatest troubles in the way of damage to shipments, is on account of the use of these straw-board and analogous material packages, which may be of sufficient strength to stand ordinary transportation, but in promiscuous loading, such as is necessary with L. C. L. freight, will not stand contact with wooden boxes or other hard commodities. The fact is that all commodities that are liable to injury or puncture or rubbing, should be encased in tight strong constructed wooden cases. It is seldom that a car can be so solidly packed either on straight carload shipments going to one consignee or on miscellaneous L. C. L. lots, that some shifting of the load en route is not likely to occur. Directly the engine takes hold and the train begins to move, the churning process commences, and any one who has noticed a freight train moving at 20 or 30 miles an hour, and forced to come to a sudden stop, with a series of jerks and bumps, can imagine what must happen to the freight inside the cars, consisting of commodities, some of them not protected in any way from contact with the freight next to them, and others in such frail packages that the slightest concussion will break them open.

The crating of numerous articles, such as preserves and jellies in glass; wood mantels, arc light globes, machinery of all kinds, oil tanks, furniture, household goods, porcelain closets, bath tubs, sinks, oil, gas, alcohol and vapor stoves, heating stoves, and many other commodities, is constantly found to be insufficient to give proper protection to the articles, either when handled on platform or after being placed in the cars. These crates are made of inferior lumber, often not of sufficient thickness, or with an insufficient number of strips or slats to properly protect the articles.

The writer not long ago had an opportunity of personally inspecting a shipment of smoking tobacco, in process of transfer at one of our freight stations, the tobacco being put up in small paper bags, and packed in cases made of corrugated strawboard or wood pulp board, instead of, as used to be the case until quite recently, in wooden cases. Out of the hundred or more cases in this shipment, at least one-third were in bad order, the edges and corners of the strawboard cases being torn and broken open, so that it was perfectly possible to put one's hand in and take some of the contents. The cases could, without any effort, have been easily perforated with an ordinary lead pencil, and, if exposed to rain or even a damp atmosphere, become soft as pulp.

Poor Wooden Boxes Cause Heavy Losses.

Even where wooden boxes are still used, instead of the inferior substitutes named, the boxes are often of such poor quality of lumber that the nails driven into them will not hold, and the boards so thin that a very slight jar or concussion will break them open. The opinion has been positively expressed by persons in a position to know, that in 85 per cent. of the small lot shipments moving to-day, the construction of the material forming the box or crate, the size of nails, ec., is entirely inadequate to protect the contents:

Stove castings and other like cast iron articles, shipped in bundles, not crated or boxed,—a very small amount of rough handling or bumping in the car will cause these articles to break almost as readily as if they were made of glass.

Screen doors and window screens, put up in bundles, with no protection except perhaps two boards about six inches wide, and half an inch thick, running the length

of the doors or screens, on each side of the bundle. This is not a proper covering, as any sharp article is liable to pierce the wire netting.

Woven wire bedsteads or mattresses, shipped without any covering or protection whatever. Stove pipe elbows, shipped wired together in bundles, with no protection at all from contact with heavy boxes or other articles which would very easily damage them.

Tin plate put up for shipment in boxes made of $\frac{7}{8}$ -inch material for the sides and ends, and $\frac{1}{4}$ -inch stuff for the tops and bottoms, sometimes less. The sides and ends are heavy enough, but the tops and bottoms should be of at least $\frac{1}{2}$ to $\frac{3}{4}$ -inch stuff. It is only fair to state that this question of the packing of tin plate boxes, after vigorous agitation on the part of the carriers some time ago, has been to a large extent satisfactorily disposed of by the manufacturers deciding to use stronger and thicker material for their boxes.

It should be borne in mind that a package sufficient for transportation requirements under certain conditions, will not be sufficient under other conditions. For instance, on short haul or local movements of L. C. L. freight in way cars, where the cars have to be loaded in station order, the fact should be recognized that there is a greater risk of damage, on account of its not being possible to make the best stowage of goods in the car, than in the case of long haul. The goods may be, and no doubt usually are, well stowed in the cars at the commencement of the journey, but as the consignments for each station are taken out, disarrangement ensues, and it is impracticable to make a restowage at each local point.

The roads in this territory receive many cars of dried fruits, such as raisins, apricots, etc., from the Pacific coast. These commodities are packed in small wooden boxes, which are quite good enough for transporting in small lots, but when, as usually is the case, the through cars are loaded in the West, tight to the roof, of 300 or 400 such boxes, the result is that the lower tier of boxes in the car is often ground into the worst kind of pulp before it reaches its destination.

An illustration of the bad preparation of commodities for shipment, as distinguished from bad packing,—complaint was recently made by several of our local freight agents, in regard to shipments of shafting and cold rolled steel. These commodities, which are not boxed for shipment, are covered with a heavy mill grease, to protect them from rust. A car will be loaded for a transfer point at the manufacturer's mill or warehouse, with several L. C. L. shipments going to various destinations. After the pieces of shafting and steel are placed in the car, a heavy coating of mill grease is poured over them to further protect them from rust. The transfer car reaches the transfer point, and the various shipments have to be taken out, and put into separate cars with other freight. Not only is the other freight, loaded with these articles, exposed to great risk of damage, by coming in contact with the greased material, but the cars in which this material is originally loaded, as well as the several cars into which the shipments are transferred, are rendered practically unfit for loading merchandise freight in, on account of the floors of the cars being saturated with heavy oil and grease from the pieces of shafting and steel.

Ice Frequently Cause of Damage.

Another bad practice, which should be put a stop to, is the loading of ice with less than carload shipments of commodities, such as beer, for their preservation en route. The ice is piled on and around the beer packages, and in warm weather the ice of course rapidly melts, rendering it very dangerous to load other miscellaneous freight in the same car, and, after the beer and ice have been taken out, making

the car unfit, sometimes for days, for the loading of other merchandise, and thus together, putting it temporarily out of service.

The question arises as to how this extremely unsatisfactory state of affairs can be remedied. The carriers have already tried to protect themselves to some extent by minutely specifying, in the use of certain commodities, the precise kind of packages in which such commodities will be accepted for shipment. In the case of eggs, for instance, about half a column of the official classification is taken up with the description of the carriers, or cases, in which the eggs must be packed, but it can be readily understood that such specifications can, without very much difficulty,

packed in cases of the kind described, must also be substantially crated or boxed.

There is also a general classification rule in effect on our roads in this territory, under which the carrier reserves the right to refuse shipments in insecure packages. This again does not work out satisfactorily, for the reason that, while the agent at one station may not consider a package secure, and decline to receive it, his colleague at another station, possibly on the same road, may be more liberal in his views, and in this way a discrimination between different shipments of precisely the same property would be created, such as cannot be defended under the present law.

If it is upon rules of this kind that the proper packing

Canada's Exhibit at Dublin Exhibition

or risk of detection, be evaded by unscrupulous shippers of freight.

A special rule was not long ago added to the official classification, providing that property presented to carriers packed in *so-called* boxes or cases, made from straw-board, leather, board, wood, pulp, fibre, wired splint wood, or other analogous materials, shall be charged 10 per cent. higher than the classification provided for such property. This increase in revenue, however, has proved in practice inadequate to meet the additional risk involved:—even if it was, the object to be sought is securing immunity to the goods from damage, and not merely an insurance to the carriers against the results of such damage,—and it seems probable that the rule will have to be changed so as to require that property,

and preparation of freight is to depend, it will become necessary for the carriers to specifically describe in the classification and tariffs the exact kinds of packages in which each and every commodity must be offered for transportation. It would require a large force of experts to determine this, and the classification books will become volumes of such encyclopedic size that the average freight agent would find life too short to study them, to say nothing of trying to apply each of their complicated rules to all the shipments offered to him.

I would respectfully submit that it is to the shipper himself that we must look for the proper and adequate remedy. He knows or should know perfectly well, without the assistance of experts, just what kind of package will safely carry his freight and, if he would only use his conscience in the

matter, and deal with the carrier in the same way as he expects to be dealt with, there need be no further trouble, and the commodity can continue to be provided for in the classification "in boxes," "crates," or what not, or even simply "in packages," without any fear that undesirable packing of the articles, for economical or other reasons, will be the result.

Standard Shipping Box Often Inadequate.

It is not apparently in all cases from motives of economy that these inferior packages, *i.e.*, inferior from a transportation point of view, have of late years come into use. The practice has grown up, quite praiseworthy in itself, so long as no undue hardship is placed on the carrier, for the manufacturer to himself provide for certain kinds of commodities a package in which the goods can remain until they reach the final consumer, of a quality which will be both attractive and useful to the latter. Take the case of the familiar Mason fruit jar, for example; in the old days, the glass manufacturer would put these jars up for shipment to the jobber or dealer in a large, strong and substantial packing box, placing in the box as many jars as he could, stuffed in tight with prairie grass, hay and material of that kind. This made an excellent package for railroad transportation, but when it reached the jobber, or dealer, would be discarded by him, and the consumer who finally purchased the goods over the counter of the retail dealer, would take the jars home under his arm, wrapped in paper probably. Nowadays the manufacturer puts these jars up in small numbers, say a dozen to each case, in a fragile package made of veneered stuff—the whole designed to answer the purpose of a neat and attractive package as a carrier from the factory to the jobber, thence to the retailer, and finally to the user or consumer, but very little, if any, consideration is given to protecting the jars from injury while in transit on the railroad. This practice has not been extended to export shipments, which are still, to meet vessel requirements, put up in substantial cases. It seems a pity, by the way, that some happy medium could not be arrived at, under which, in the case of either export or domestic shipments, a package which should be attractive to the ultimate purchaser and at the same time strong enough for railroad transportation purposes, should not be devised and put into use. On the one hand, we have domestic shipment, in which the feature of strength is sacrificed to that of attractiveness to the customer, while in the case of export shipments the reverse is the case. It is an unfortunate fact that in the markets of the world the American manufacturer bears a very bad reputation for the way he puts his goods up, with little or no regard to the tastes, prejudices if you will, of the customers he is seeking to secure in foreign countries. The Germans have set an object lesson to the world about this, the goods they ship to foreign markets being as far as possible in every respect made to conform with the wishes of the customer. Until our American manufacturers recognize the importance of this fact, they will not make much headway in competing in the open door markets with their foreign rivals.

The Real Blame Rests on the Shipper.

In the case of domestic shipments, our shipping friends ought surely to pay more attention to the safety of their goods in transit than they are doing now, if only in their own exclusive interest. Manufacturers of wooden boxes state that there is no foundation for the fear that the supply of lumber will give out, which has prompted so many shippers to look around for other substitutes for their packages here.

It would certainly pay the manufacturers to use a box strong enough to carry their goods safely as much as it pays to use a box which will show the goods off to the best advantage. A box half fallen apart, with the goods exposed, and probably damaged on its arrival at destina-

tion, gives the merchant receiving it about the same sensation as would a darky applicant for a position to sell goods over his counter, whose arms were out of the elbows of his coat, and whose feet were out of the toes of his shoes. But, under conditions as they at present prevail, it seems as though the majority of shippers care not a jot what kind of an old thing they dump upon the carriers, so long as they can secure a clean bill of lading for it, and get it off their hands. Gentlemen of the Traffic Club, this is bad business, bad for the shipper and bad for the carrier. The evil is, I am glad to think, not so prevalent in the Pittsburg district as in other territories, on traffic at least originating in this section, due in part to the fact that our outbound tonnage consists so largely of raw material, not package freight, and in part also, I feel confident, because a better understanding and a desire for co-operation between the industrial and railroad interests exists here than elsewhere. The most frequently observed cases of bad packing are on inbound shipments, and through traffic passing here, but the conditions are bad enough as it is everywhere, and if our Club can do anything in the way of creating a public sentiment, so as to lead those responsible for the evil to see the error of their ways and mend them, our consideration of the subject will not have been in vain.

The Production of Asbestos.

Commercial asbestos includes two distinct types of fibrous minerals. The term asbestos was originally applied to actinolite or tremolite, but the more important asbestiform mineral is the fibrous variety of serpentine, known as chrysotile. This variety is always associated with serpentine, which is derived from the alteration of eruptive rocks. It has been reported as occurring in commercial quantities in Massachusetts, Vermont, North Carolina, Wyoming, Arizona, Washington, Oregon and California.

The eastern townships of the Province of Quebec furnish the greater part (85 per cent.) of the world's production of asbestos. In 1906 Canada exported 59,864 tons of asbestos, valued at \$1,629,257, most of which went to the United States. Improved methods of mining are being introduced in Canada and the output is increasing.

Both forms of asbestos are applied to many uses, depending in part upon the fibrous character of the material, but also upon its non-conductivity of heat and electricity. The best grade of chrysotile fiber is spun into thread, yarn and rope, and woven into cloth. The yarn is largely used for packings and the cloth for theatre curtains, while fabrics containing asbestos woven with other fibres are made into various household articles in which heat insulation rather than fire-proof character is required.

Asbestos is extensively used for plastering and for making lumber that is employed in buildings where insulation against fire and electricity are desired. Its use in fireproof structures, and especially to envelop electrical conductors, is constantly increasing.

The output of all existing asbestos mines is insufficient to supply the demand for this product, and the leading manufacturing firms interested in the industry are diligently searching for new deposits.

An item in the August issue of INDUSTRIAL CANADA, which stated that the factory of the Jeffrey Manufacturing Co. was now open in Guelph, was incorrect. The Jeffrey Manufacturing Co.'s plant is located in Montreal. The news item was confused with an announcement of the opening of the factory of the Gilson Manufacturing Co. in Guelph.

Among the Industries

The Imrie Printing Company, Limited, of Toronto, have moved to larger premises at 70-72 York Street.

The Canadian Condensing Co. has been organized, with a capital of \$50,000, with head office in Chesterville, Ont.

The Port Stanley Elevator Co. will erect a series of elevators at Winnipeg, Fort William, and other cities in the West.

The Record Stove and Furnace Co., with a capital of \$40,000, will carry on business in Canada, with Winnipeg as headquarters.

The cigar factory of A. & I. Isaacs, St. John, N.B., was partially destroyed by fire during the month. Ample insurance was carried on both the stock and building.

H. H. Dryden, Limited, Sussex, N.B., have bought land in that town, and will build a large tinware factory there. The site provides excellent shipping facilities.

Contracts have been let for the immense steel bridge on the C. P. R. line at Lethbridge, Alta. This bridge will be one of the biggest in Canada. It will cost about \$1,500,000.

The Library Bureau of Canada, whose factory was destroyed in the recent Edwards fire in Ottawa, have secured another site in that city, and will erect a new building shortly at a cost of \$30,000.

The Cascapedia Trading Co. will erect shingle and pulpwood mills and dry kilns at Dalhousie, N.B., at a cost of a million dollars. This company owns 1,700 miles of timber limits in Bonaventure County, Quebec.

An electric smelter in Ottawa seems now an assured fact. The company who have been promoting it have the machinery ordered, and it is expected that work will begin on the plant within the next three or four weeks.

The Benson Lumber Truck Co. have been incorporated with a capital of \$20,000. They will manufacture farm and lumber machinery and the patented Benson truck. Their place of business is Port Arthur.

Plans have been approved for the new \$1,500,000 Grand Trunk Depot at Ottawa. The structure, besides being a thoroughly modern railway station, will be an office building. It will be ten storeys in height and of handsome architecture.

The Red Cliff Brick Company is erecting a plant four miles from Medicine Hat, Alta. The company is capitalized at \$150,000, and a thoroughly modern works is being built. The capacity of the plant, when completed, will be 60,000 bricks daily.

A plant is being established at Ottawa for making pulp out of spruce and hemlock refuse. The Ottawa Pulp and Paper Co. has been formed to carry on the work. The process is a new one and will be superintended by the inventor, W. U. Cornell.

The Government recently, on the application of James Friel, of Dorchester, decided to grant the N. B. Petroleum Co. a lease of ten thousand acres of land in the eastern part of the

province, subject to the restrictions provided for in the Act. The company is required to spend \$20,000 per year in prospecting and development work, and Mr. Friel pointed out that \$200,000 had been expended in this manner. It is proposed to continue the work on a greater scale than ever.

The Borden Milk Co., of New York, are negotiating with the corporation of Woodstock, Ont., with a view to establishing a plant there for condensing milk. The plant will cost \$100,000. It is expected that the deal will go through satisfactorily.

A cutlery firm of Bradford, Pa., are negotiating for the purchase of a factory in Stratford, Ont. If the deal goes through they will install a plant at a cost of \$75,000. They ask the municipality to guarantee their bonds to the extent of \$30,000.

The Standard Sanitary Manufacturing Co., of Pittsburg, have become incorporated in Canada. By an order-in-council their name has been changed to the Sanitary Manufacturing Co. The capital is fixed at \$250,000, and the place of business, Montreal.

The Canada Woodenware Co., whose factory at Hampton, N.B., was destroyed by fire recently, will build a new factory in the near future. At present Chatham, N.B., is favored as a site for the industry. Strong inducements have been offered by that municipality.

A press report, which so far has not got past the stage of a rumor, has it that the Canadian Government will open an office in a central position in London, to serve as a bureau for Canadian products. Mr. Fielding is said to be carrying on negotiations towards this end.

Announcement is made that the business heretofore carried on under the name of J. Arthur Paquet will be continued by the Paquet Company, Limited. The business will continue under the management of Mr. G. A. Vandry, who has brought it to such a high state of excellence in the past.

The Eagle Knitting Company, of Hamilton, is contemplating the erection of another large factory. The establishment will cost in the neighborhood of \$75,000. The new building will have a frontage of sixty feet on East King Street, and will have a depth of 200 feet on Sanford Avenue. It is to be five stories in height, and contain all the latest improvements in knitting and spinning appliances. The walls will be of reinforced concrete. It is estimated that the new factory will give employment to over a thousand people. The plans have all been drawn up and a start can be made at any time on the factory.

An association has been formed in Scotland, under the name of the Scottish Products and Industries Association, having for its object the development of a market in London for the products of Scotland. The originators of the enterprise estimate that there are 10,000 Scotsmen in London who would be glad to buy their native goods. The association aims at opening a store in London where all goods produced in Scotland and suitable for that market will be kept. It is felt that such a store would be financially possible besides giving a great impetus to the goods sold.

Situations Wanted

NOTE.—For further particulars regarding any applicant mentioned below, apply by number to the Secretary at Toronto, stating wages, whether work will be permanent, and giving such information as you think advisable. - 68 **Broom Handles.**—A firm in London, England, desires to enter into communication with manufacturers of broom handles, 50 inches by 1½ inches. What they require is the common handle chiefly used for scavenger work; price to be quoted c. i. f. London and per gross. If price is favorable, would be in a position to give large orders.
- 69 **Butter, Bacon, Twine, Hides, Herrings, Tobacco, Fish dried and fresh, Soap, Biscuits, Textiles of all kinds, Rice Flour, Groceries, etc.** Port-au-Prince, Hayti, West Indies, Secretary of Board of Trade, inquires for Canadian firms who can export any of above articles to Hayti. Good references, and considerable business in sight.
- 70 **Cardboard.**—A Belgian firm desires the addresses of Canadian manufacturers of cardboard.
- 71 **Carriage Hardware and Woodenware.**—West Australian merchant seeks to purchase these goods in Canada. New York references and payment.
- 72 **Chair Legs and Fronts, etc.**—A firm in London, England, desires to enter into communication with manufacturers of chair legs and fronts, also chair reeds or dowels of the following dimensions; 14 inches or 42 inches x 5-8 inch and 13 inches x 5-8 inch. Lowest price c. i. f. London to be stated.
- 73 **Closet Seats.**—Particulars of a good opening for the sale of these seats in Germany may be secured at this office.
- 74 **Deckle Straps.**—Ontario firm (in C. M. A.) wish to purchase deckle straps for paper machines.
- 75 **Excelsior.**—A London firm invites samples and quotations of wood wool (excelsior) from Canadian manufacturers, partly for direct shipment to South Africa for the packing of fine fruits. Material must be hydraulically pressed and baled, and quotations to be accompanied by details of measurement per cwt. (112 lbs.).
- 76 **Flour.**—An inquirer in Bristol would be glad to have specifications and prices of barrels for flour from Canadian exporters.
- 77 **Flour.**—A Cape Town commission agent is desirous of corresponding with millers and exporters of flour, with a view to acting as agent for the sale of flour in South Africa.
- 78 **Fruit Pulp.**—A wholesale manufacturing company desires to be put in communication with Canadian exporters of fruit pulp.
- 79 **Fruit Boxes and Baskets.**—A South African firm of fruit dealers desires to get in touch with Canadian manufacturers of fruit boxes and baskets.
- 80 **Hides and Skins.**—A North of England firm desires to get into touch with Canadian exporters of hides and skins.
- 81 **Lead, Potash and Canadian Mineral.**—A Liverpool firm is open to buy lead and potash; also Canadian minerals.
- 82 **Machine Tools, Sewing Machines.**—Belfast, Ireland, wholesale machinery dealer desires to hear from Canadian manufacturers of above lines who could appoint him their representative.
- 83 **Manufacturers' Agent.**—Berlin, Germany, commission agent with wide experience and best connections would like to hear from Canadian exporters of interior decorations and woodwork, building specialties, novelties, etc..
- 84 **Manufacturers' Representative.**—A first-class Australian firm of manufacturers' representatives, with a large staff of travellers covering Australia and New Zealand four times a year, desires to hear of Canadian firms wishing to open business in those countries. Best of references, long experience. Partner will be in Ontario in September and would be glad to call on any firms interested.
- 85 **Mica.**—A Hamburg firm wishes to purchase Canadian mica.
- 86 **Mica and Wooden Handles.**—A London firm is open to buy mica and all kinds of wooden handles.

- 87 **News-Pulp Boards.**—An Irish firm of wholesale stationers, bag and box makers, is desirous of being placed in touch with makers of news-pulp boards in Canada.
- 88 **Oak Bark.**—An old-established Hull firm asks for prices from Canadian shippers of oak bark.
- 89 **Oat Offals, Oat-usk Meal, etc.**—An old-established Hull firm desires to get into immediate touch with Canadian brewers and malsters who can supply them with oat offals, oat-usk meal, barley dust, wheat bran, maltsprouts, brewers' dried grain, and similar commodities.
- 90 **Packings.**—A London manufacturer of packing desires to be placed in touch with Canadian asbestos mine owners, and also wishes to hear from firms in Canada who are not represented in Great Britain. Lumber consignments and shipments of grain would also be welcomed, as would also consignments of fruit (apples) on account of shippers.
- 91 **Peat Moss Litter.**—A Tyne firm is prepared to consider prices from Canadian exporters of peat moss litter.
- 92 **Pine and Spruce Boards.**—Turkish timber merchant desires to hear from Canadian shippers of lumber with a view to purchasing above material.
- 93 **Paper Washers or Gaskets.**—Ontario firm inquire for these gaskets suitable for water pipes and brass goods. Purchase in quantity for 10 days' discount.
- 94 **Representation.**—A London firm possessing facilities for exhibiting and distributing samples would like to hear from Canadian manufacturers seeking representation.
- 95 **Rice and Rice Meal.**—A Bristol firm would be glad to hear from Canadian shippers of rice and rice meal.
- 96 **Rubber Footwear, Shovels, Spades, Carpets and Paper Bag Machinery.**—Long-established Sydney, Australia, firm of manufacturers' representatives would like to hear from Canadian exporters of above lines. Will purchase in quantity for cash. Best of references in Canada.
- 97 **Sawmill Machinery, Saws, etc.**—Port-au-Prince, Hayti, firm of commission agents wish to purchase above material for customers. Saws must be suited for cutting hardwood, railway ties, etc. Want terms and catalogues from Canadian houses.
- 98 **Skins.**—Inquiry has been received from a firm of merchants and commission agents, Hong Kong, for names of exporters of skins in Canada.
- 99 **Soap, Vaseline, etc.**—Montserrat, B. W. I., general merchant wants to purchase bar and laundry soap and crude vaseline from Canadian manufacturers. Payment cash. References.
- 100 **Wheelbarrows, Ice-Cream Freezers, Bench Screws, Clothes Pegs, Chair Seats, Pastry Boards, Closet Seats, all kinds Wooden Handles, Skewers.** Well-known enterprising manufacturers' selling agent in London, England, would like to hear from Canadian exporters of these lines. Has a new proposition for representing them, and will be in Canada in October to call on any firms interested.
- 101 **Wooden Pill Boxes.**—London, England, firm desire to purchase large quantities of wooden pill boxes. Samples can be seen at this office. Good business in sight.
- 102 **Wooden Handles for Shovels, etc.**—Well-known manufacturers' representative can place large orders for these goods for Canadian firms in England. Party inquiring now in Toronto, and would be glad to call on interested manufacturers.
- 103 **Wood Pulp, Lumber, Grain, etc.**—A Liverpool firm interested in Canadian business generally desires to correspond with wood pulp exporters in the Dominion who are represented in Great Britain. Lumber consignments and shipments of grain would also be welcomed, as would also consignments of fruits (apples) on account of shippers.
- 104 **Wooden Handles.**—A London firm wishes to buy all kinds of wooden handles.

Just one kind of metal shingles is good enough for any building

Divide the first cost of an Oshawa-Shingled roof by 100. The result shows the cost per YEAR—and that's the right way to figure roof cost.

These are the 28-gauge steel, specially-toughened, semi-hardened, doubly-galvanized, locked-on-4 sides shingles that will outlast any roofing material on this earth—anywhere—on any kind of a building.

You get our corporate guarantee that an Oshawa-shingled roof won't leak in 25 years—and we can prove to you it will be a really GOOD roof for a century.

You needn't paint such a roof. Acid fumes won't corrode it. Fire can't touch it. It's the RIGHT roof for any building that's worth roofing to last.

Let us send you a book about this roofing—and some sample shingles. Worth seeing.

At the Canadian National Exhibition we will have the best exhibit of typewriters ever shown in Canada. It will be of unusual interest to business men who wish to have their office equipment a little ahead of the times.

The special feature of the exhibit will be the Condensed Biller, a machine which is indispensable in a business with a large number of accounts; the Retail Bill and Charge machine; and the Unit Biller.

Be sure to come and see us, and have our demonstrators put you in touch with these great systematizers of office work. They are economizers—of time, labor, money.

\$800 FINE AND A YEAR IN JAIL

If a man fails in business and it be proved that, for five years before his failure, he has not kept proper books, he is liable to a fine of \$800.00 and one year in jail.

It is almost better to keep your books right than pay a fine and go down for a year, isn't it?

* * * * *

Business Systems will enable you to keep your books right—Business Systems mean proper bookkeeping.

Business Systems allow nothing to be for-

gotten, and mean mechanical perfection in book-keeping.

Business Systems being proper bookkeeping, actually prevent failures—show a man where anything is going wrong in his business and enable him to prevent it.

* * * * *

We would like to give you details of all this and tell you how we can apply Business Systems to your business.

It will only cost you one cent for a post card to know more.

Capital and Surplus - \$1,500,000
OFFICES THROUGHOUT THE CIVILIZED WORLD

Executive Offices

NOS. 346 and 348 BROADWAY, N.Y. CITY, U.S.A.

THE BRADSTREET COMPANY gathers information that reflects the financial condition and the controlling circumstances of every seeker of mercantile credit. Its business may be defined as of the merchants, by the merchants, for the merchants. In procuring, verifying, and promulgating information, no effort is spared, and no reasonable expense considered too great, that the results may justify its claim as an authority on all matters affecting commercial affairs and mercantile credit. Its offices and connections have been steadily extended, and it furnishes information concerning mercantile persons throughout the civilized world.

Subscriptions are based on the service furnished, and are available only by reputable wholesale, jobbing and manufacturing concerns, and by responsible and worthy financial, fiduciary, and business corporations. Specific terms may be obtained by addressing the Company at any of its offices.

A SURE PROTECTION AGAINST FIRE AND A GOOD INVESTMENT ARE COMBINED IN AN INSTALLATION OF 'MANUFACTURERS' NON-CORROSIVE AUTOMATIC SPRINKLERS

They are always on guard, and act at the commencement of a fire (the time when it can be successfully combated). That is why they are a sure protection. The cost of installation will be saved in a very short space of time by the consequent reduction in insurance premiums. That is why they are a good investment.

Executive Council

THE regular monthly meeting of the Executive Council was held in the Board Room of the Traders Bank Building, on Thursday, August 15th, at 2 p.m.

The President, Mr. H. Cockshutt, occupied the chair, others present being:—Messrs. H. Bertram, Dundas; Geo. Booth, Toronto; S. B. Brush, Toronto; P. H. Burton, Toronto; R. J. Copeland, Toronto; J. W. Cowan, Toronto; John Dick, Toronto; L. V. Dusseau, Toronto; P. W. Ellis, Toronto; Thos. Findley, Toronto; H. W. Fleury, Aurora; Ed. Freyseng, Toronto; Jas. Goldie, Guelph; S. Harris, Toronto; E. G. Henderson, Windsor; J. H. Housser, Toronto; J. J. McGill, Montreal; R. McLaughlin, Oshawa; J. P. Murray, Toronto; A. Nordheimer, Toronto; J. Ransford, London; Wm. Robins, Walkerville; A. S. Rogers, Toronto; J. D. Rolland, Montreal; T. A. Russell, Toronto Junction; J. T. Sheridan, Toronto; F. J. Smale, Toronto; R. L. Torrance, Guelph; W. B. Tindall, Toronto; S. M. Wickett, Toronto.

Communications.

Communications were received as follows:—

1. From members of the Council regretting their inability to be present:—Messrs. W. C. Breckenridge, D. J. Fraser, Edward Gurney, Louis Simpson, Geo. Sweet, J. M. Sinclair, Robt. Munro, Jas. Davidson, S. W. Ewing, Esmond Peck, Thos. Roden and C. H. Waterous.

2. From the Private Secretary to the Governor-General, expressing His Excellency's thanks for the Council's invitation to be present at their Annual Convention Banquet, but regretting that previous engagements would prevent his acceptance.

3. From the Secretary of the Maritime Board of Trade, extending a cordial invitation to the officers and members of the Canadian Manufacturers' Association to attend their annual meeting, which took place in St. John, N.B., on August 21st.

Printed Reports.

Notice having been given at a previous meeting by Mr. Wm. Robins, of Walkerville, that he would move that hereafter the committee reports be printed and sent to members of the Executive Council before coming to the meeting; the motion was declared by the President to be duly before the meeting and open for discussion. At the request of Mr. Robins, the Secretary read the correspondence herein, after which Mr. Rolland explained that the committee meetings were held as close as possible to the Executive Council to oblige the Montreal members, some of whom always endeavored to get up to Toronto for them, and wait over for the Executive Council. The President outlined a few of the difficulties he saw in the way of adopting Mr. Robins' motion, though he admitted that if the plan could be worked out it would present many advantages.

There being no seconder to Mr. Robins' motion, it was finally declared lost.

Mr. J. P. Murray's motion that the names of those who sent in letters of regret be not read at the meeting, but simply published in INDUSTRIAL CANADA was then put, and being duly seconded by Mr. Ransford, was declared carried.

REPORTS OF OFFICERS.

The President referred briefly to his visit to the West, where he stated he had found members everywhere deeply interested in the work of the Association. He expressed his belief that the visits which had been made by himself and Secretary had accomplished a great deal of good by keeping

the members more closely in touch with what was going on, and strongly recommended that the work be continued.

The Treasurer, Mr. Booth, read a statement showing the receipts and expenditure for the month ending July, announcing that the Association had closed its financial year with a balance to its credit of \$10,273.38. He suggested that as one step towards meeting Mr. Robins' objection that the time of the meeting was taken up with needless detail, it might be well in future to have this statement typed and attached to the file of committee reports. In this suggestion the meeting concurred. The adoption of his report, moved by himself, and seconded by Mr. Tindall, was carried.

The reports of the various standing committees were then presented as follows:—

FINANCE.

The Chairman, Mr. W. B. Tindall, read the report of the Finance Committee, which recommended for payment the regular monthly accounts, amounting in all to \$552.50. It endorsed a recommendation received from the Commercial Intelligence Committee, to the effect that a new lot of Made in Canada cards be issued, and offered for sale at the rate of \$1.00 per dozen. It further reported the expenditure on account of the various branches for the year just closed, and where these had exceeded the expenditure authorized by the By-laws, it recommended that the surplus be approved of.

The adoption of the report, moved by Mr. Tindall, seconded by Mr. Cowan, was carried.

RECEPTION AND MEMBERSHIP.

The report of the Reception and Membership Committee presented by the Secretary recommended for acceptance ten applications, as follows:

NEW MEMBERS.

BELLEVILLE, ONT.

The Deacon Shirt Co.—Men's shirts.

BUCKINGHAM, QUE.

The James Maclaren Co., Limited—Sawn lumber, ground wood pulp.

The James Maclaren Co., Limited—(R. M. Kenny, 2nd member).

DELORO, ONT.

Deloro Mining & Reduction Co., Ltd.—Arsenic, gold and silver bullion.

GEORGETOWN, ONT.

The Canada Coating Mills, Limited—Coated papers, coated manila cardboard.

MONTREAL, QUE.

Merchants Awning Co., Ltd.—Awnings, tents, etc.

TORONTO, ONT.

Spanner Novelty Wood Turning Co.—All kinds of wood turning, curtain pole trimmings.

Thomson Engraving Co.—Photo engraving, steel and copper engraving.

TRURO, N.S.

Eastern Hat & Cap Mfg. Co., Limited—Exclusive headgear for men and boys.

VALLEYFIELD, QUE.

McDonald & Robb—Flour and mill feed.

WALKERVILLE, ONT.

The Anthony Fence Co., Limited—Woven wire fence.

It referred in some detail to the Convention arrangements, and the provision that was being made for the entertainment of the visiting delegates, and concluded with the recommendation that the jurisdiction of the Toronto Branch be extended so as to include all members within a radius of fifteen miles from the centre of the city.

The adoption of the report, moved by Mr. Dusseau, seconded by Mr. Rogers, was carried.

COMMERCIAL INTELLIGENCE.

The Chairman, Mr. T. A. Russell, read the report of the above committee. It stated that satisfactory progress had been made in formulating plans for the operation of the new Department for collecting overdue accounts. Other items in the committee's report were as follows:—

Exhibition Committee.

Your Committee proposes submitting an amendment to the By-laws at the Annual Meeting to provide for the creation of a standing committee on Exhibitions, whose duty it shall be to collect and disseminate information regarding international exhibitions in all parts of the world, and to assist members with the transportation and arrangement of their displays. For convenience and to avoid duplication, it will be recommended that the committee consist of the Association's representatives to the Industrial Exhibition Association.

West Indian Agents.

A letter has been received from a member of the Association calling attention to the fact that Mr. G. Eustace Burke, one of the Canadian Commercial Agents in the West Indies, was advising the purchase of United States flour as against Canadian flour. The correspondent stated that in his opinion any agent of the Canadian Government who could not recommend Canadian produce ought to be asked to explain the reason why. This information comes to hand very opportunely, apropos of the resolution that will go forward to the Annual Meeting favoring a change in that quarter. Meanwhile, the attention of the Department of Trade and Commerce will be called to the complaint.

Australian Tariff.

Very few details are as yet to hand regarding the new Australian tariff, but such as have come to the Committee's attention indicate that Canadian trade in bicycles, automobiles and agricultural implements will suffer a severe blow. The Secretary has been instructed to enquire of the Government whether they have exhausted all their diplomacy in securing better terms for Canada, suggesting that in any event they should do their utmost to have the operation of the tariff withheld as against goods that were on their way before the announcement was made.

After moving the adoption of the report, Mr. Russell took occasion to refer to the importance of prompt and vigorous action towards protecting Canada's interests in Australia, in view of the radical changes announced in the new Australian tariff. He stated that it meant the cutting out of much of the business now being done there by Canadian manufacturers, and that no pains should be spared to secure the adoption of the preference for this country. He believed that the Association should also press upon the Government the importance of taking steps to have the operation of the tariff withheld as against goods that were actually in transit when the announcement was made. He moved that a resolution be drawn up along these lines and sent on to the Government.

Mr. Thos. Findley supported Mr. Russell, stating that owing to the large contracts now going through certain Canadian

factories for goods that were being made specially to suit the Australian market, the operation of the new tariff should be withheld. Further discussion on this subject was deferred on the announcement by the President that the matter would come up later on in connection with the report of the Tariff Committee.

The adoption of the committee's report, moved by Mr. Russell, seconded by Mr. Murray, was carried.

PARLIAMENTARY.

The report of the Parliamentary Committee was read by the Chairman, Mr. A. S. Rogers. It referred to the movement that had been put on foot by the Commercial Travelers' Association to have Thanksgiving observed on Monday, instead of Thursday, and recommended that the support of the Association be lent to the movement on the understanding, however, that a preference be given to Friday as against Monday. Upon request the Chairman explained the reasons why the committee had favored Friday, but the Council felt almost unanimously that Monday would be a better day, and it was decided that the Secretary be authorized to inform the Secretary of State that the Association favored the change from Thursday to Monday.

RAILWAY AND TRANSPORTATION.

The report of the above committee was read by the Chairman, Mr. J. H. Housser. It stated that progress was being made by the railways in compiling their new tariffs, recently ordered by the Board, though it was not expected that they would be issued before the end of October. Information was also being obtained in regard to railway equipment, and would likely be in shape to report to the next meeting of the Council.

Reciprocal Demurrage.

A reference was made to some remarks of the Chief Commissioner of the Board on the subject of Reciprocal Demurrage, in the course of which he suggested that a careful investigation be made of the railways' equipment, and that as soon as it was brought up to the position where it ought to be able to handle the traffic satisfactorily, a system of demurrage charges be imposed upon the railway companies, by means of a car service bureau, which would be under Government supervision. Owing to the fact that it is not clear under the Railway Act whether the Board had power to order a system of reciprocal demurrage, the committee recommended that the matter be not pressed any further for the time being.

Other items contained in the report were as follows:—

Weights of Lumber and Track Scale Weights.

A complaint was made at the last meeting of the Executive in regard to the weights of lumber, green, partly dry and seasoned, that the estimated weights used by the railways were excessive, etc. This is being investigated.

It was also stated that in weighing, whilst the railways take care to charge for the increased weight when there is found to be an undercharge in the original billing, no allowance is made when the weighing shows the car to have been overbilled. The railways state, however, that their positive instructions to agents at scale stations are that in every instance they must insert full particulars of the weighing on the waybill, and when there is an undercharge, undercharge waybill must be issued, and when the weighing shows the car to have been overbilled the agent at destination must correct the charge to track scale weights, having regard to the proper minimum.

The Transportation Department should be advised of any cases where it is believed that the railways have failed to reduce the charges to track scale weights and where there has been an overcharge.

Discussing the report, Mr. Ransford stated that he did not think it went far enough in the matter of car weighing. He outlined the unsatisfactory manner in which the weighing was frequently done, referred to the inaccuracy of the tare printed on cars, and stated that in view of these circumstances it was very unfair that there was no appeal from the railway's own ruling. Mr. Henderson stated that he thought the only satisfactory way of obtaining relief was to have public weighers for freight cars, just as there were public weighers for all kinds of produce in the market places.

The adoption of the report, moved by Mr. Housser, seconded by Mr. Burton, was carried.

INSURANCE.

The report of the Insurance Committee, read by the Chairman, Mr. W. B. Tindall, was simply one of progress, stating that the work of securing the necessary applications for the Mutual Fire Insurance Companies was going ahead at a satisfactory rate, and it was fully expected the preliminary organization work would be completed by the time of the Annual Meeting.

On motion of Mr. Tindall, seconded by Mr. Burton, the adoption of the report was carried.

TARIFF.

In the absence of the Chairman, Mr. W. K. George, the report of the above committee was read by the Secretary. In connection with the new Australian Preferential Tariff, it recommended the adoption of the following resolution:—

Whereas, the Australian Commonwealth Parliament has recently announced the adoption of a new tariff wherein it definitely commits itself to the principle of an Imperial Preference by virtue of the concessions it has allowed Great Britain.

And whereas, Canada has not yet been admitted to the benefits of this preference.

And whereas, its application to Canada would undoubtedly be the means of securing to Canadian manufacturers a large share of the business now being done by United States houses.

Be it resolved, That the Executive Council of the Canadian Manufacturers' Association urge upon the Dominion Government the great importance of effecting a preferential tariff treaty with Australia at the earliest possible moment upon terms that will enable her to share the advantages of that market equally with other parts of the Empire.

And Be It Further Resolved, That the Government be urged to leave no stone unturned to have Australia withhold the application of the new tariff to goods that were actually in transit at the time the tariff was announced.

The communication of the Montreal Branch regarding the leeway provided for in the Dumping Clause was thought to be a matter that should come up for discussion at the Annual Meeting.

Complaints had been received from different sources regarding faulty wording in the new tariff schedule, whereby duties were imposed on articles of a kind not made in Canada, which were plainly intended to be admitted free or at a lower rate. Since the Commissioner of Customs had no course open to him but to enforce the law as he found it, the committee recommended that the Government be asked to rectify such cases by Orders-in-Council upon proof being submitted that the real object of the clause was being defeated.

In regard to the negotiations for an extension of the Franco-Canadian Treaty, the committee stated that it preferred to defer consideration of this question until some official announcement had been made by the Canadian Government.

"INDUSTRIAL CANADA."

The report of the INDUSTRIAL CANADA Committee, read by the Secretary, referred to the satisfactory condition of the paper's finances at the end of the fiscal year. The revenue account, after making allowance for bad and doubtful debts, would show a surplus on the year's business of more than \$2,500. Collections had been well sustained, there were a large number of valuable contracts on the books, and the paper appeared to be in a most prosperous condition.

The adoption of the report, moved by Mr. Wickett, seconded by Mr. Harris, was carried.

BRANCHES.

The report of the Montreal Branch was read by Mr. McGill, and that of the Toronto Branch by Mr. Freyseng, both of which will be found elsewhere.

Under the head of new business, Mr. Booth moved, seconded by Mr. Rolland, that henceforth meetings be held, if possible, in the Council Chamber of the Board of Trade.—Carried.

The President extended a cordial invitation to all the members present to attend the Convention in Toronto in September, after which the meeting adjourned.

TORONTO BRANCH.

The first meeting of the new Branch Executive took place on the 8th with an attendance of 11. There was a long agenda, and several important matters were dealt with.

Factory Extensions in Residential Districts.

The Branch will interview the Board of Control with a view of securing a permit for an extension to the factory of one of its members in a district made residential by a special by-law of this city. A permit for this extension was granted some time ago, but only on the understanding that it would be used as a warehouse. As the firm in question has occupied their present site for thirty-five years, many years before the special by-law was passed, and as the extension is being made on property they have owned during that time, the injustice of the city's refusal to grant a permit is apparent, and the Branch will make a strong fight against the city's policy of hampering the manufacturing industry in Toronto by imposing severe building restrictions.

Extensions of Branch Jurisdiction.

At the annual meeting of the Branch in July a motion was carried requesting the Executive Council to grant the Branch power to extend its jurisdiction to include Toronto suburbs. This power was granted at the last meeting of the Council.

Esplanade Question.

At a special meeting of the Branch, held on July 31st, a resolution approving of a viaduct, as opposed to an overhead bridge plan for the solution of Toronto's Esplanade problem, and the entrance of the railways was adopted. The Branch is lending its assistance in the campaign being waged to have the City Council adopt the viaduct plan.

Female Labor.

The practicability of bringing girls from Great Britain to work in Canadian factories, is being thoroughly investigated by a Branch sub-committee. There is no question but that a tremendous number of girls could be absorbed by Canadian factories if they were available, and after several conferences with the sub-committee, Brig. Howell, of the Salvation Army, is making investigations in England in this connection, while on his annual trip. As the indications are that a solution of

the problem may be worked out in this way, the Branch may take the matter up with the British Office Committee with a view of having them make a change in the arrangement with Mr. Leopold, so that the Salvation Army will be retained to bring out female help, as there is no doubt that they are in the best position to handle this class of help.

Bridge Contract.

A recent bridge contract in the City of Toronto was awarded to an English firm, no Canadian firms tendering, because of the wording of the specifications by the city, which provide that the "union and prevailing scale of wages" must be paid to all workmen engaged thereon. Canadian firms object to the word "union," and the Branch is obtaining an opinion as to the legality of the insertion of this word, which it feels is really a restriction of trade.

This question is of prime importance to every firm in Canada, and in this case the firms refusing to tender are both outside of Toronto.

Convention arrangements are complete in every detail, and the Branch hopes that it will enjoy a visit from a large number of outside members, who are particularly invited to bring with them their wives and daughters. It can promise them all a rousing convention and a good time generally.

MONTREAL BRANCH.

The regular monthly meeting of the Montreal Executive Committee was held on August 8th, with a large attendance of members. Among the matters discussed was the customs duty on aniline dyes and their ingredients. It was pointed out that while the dye itself was admitted free to Canada, a duty was imposed upon the ingredients, thus making impossible the manufacture of the dye in Canada. This matter was referred to the Tariff Committee, with the recommendation that action be taken upon it. Mr. J. Russell Murray appeared before the Committee in regard to the improvement of Canadian trade with the West Indies.

During the month delegations from the Branch have waited upon Hon. Lomer Gouin in regard to labor in the Province of Quebec, and upon Hon. W. A. Weir in regard to the recent increase in the age limit of factory employees. The special committee of the Branch is also working with the Montreal Board of Trade and La Chambre de Commerce to obtain improvement in Montreal cartage facilities.

The Montreal Secretary has been devoting as much time as possible to the insurance canvass in Montreal and the Province of Quebec generally.

TRADES UNION LAW.

The Judicial committee of the privy council has declined to permit an appeal *in forma pauperis* from the decision of the Ontario court of appeal in the case of the Metallic Roofing Company against members of the Amalgamated Sheet Metal Workers' International Association, No. 30. By the original judgment the company was given \$7,500 for damages caused to it by the calling out of its work people and by the publication of libelous statements in regard to its methods. While the judgment was against individual members, the property of the international and local unions was made liable for the amount. This judgment was maintained on two appeals, and now the privy council declines to interfere with it under the circumstances in which the application was made. As the case stands, therefore, the property of an incorporated trade union is liable for damages done to an employer by the ordering of a strike. The matter is one of great, and, it would seem, of growing importance. As the situation stands now it is calculated to make

trades union managers and members careful in their proceedings.—*Montreal Gazette.*

CANADIAN GOODS IN AUSTRALIA.

Mr. D. H. Ross writes in his report to the Trade and Commerce department as follows:

"The catalogues of Canadian manufacturers filed in this office have been more frequently referred to during the last month than at any other time since their receipt. Melbourne importers of a large variety of American goods are now turning their attention to Canada, more particularly on account of the exceedingly slow deliveries of orders placed in the United States. Manufacturers in the Dominion should promptly endeavor to make more determined efforts to avail themselves of the exceptional opportunity now presenting itself in increasing their exports of goods already well known, and introducing new lines to Australian buyers. If the same care and energy were devoted to the export business as is given to the home trade, the expansion in the values of Canadian exports to Australia would soon reach surprising figures. Capable representation in Australia is the principal factor in successfully introducing new lines and exploiting this important market.

Canadian Catalogues and Discount Sheets.

"The importance of having the catalogues of Canadian manufacturers filed in the various commercial agencies is demonstrated from week to week by trade inquiries at this office. The catalogues, however, are of no immediate service unless accompanied by the latest discount sheets, preferably upon a f.o.b. New York basis, or (on heavy lines) upon a c.i.f. Australian basis. To obviate prolonged delay, which frequently means the loss of a season's business, manufacturers are earnestly requested to send their latest export prices to this commercial agency. New catalogues with similar information will also be very acceptable."

Canadian News Paper in Australia.

"The consumption of news paper in Australia is increasing from year to year, and it is satisfactory to report that the demand for Canadian paper is becoming extensive throughout these States. It is estimated that approximately the Commonwealth will this year import 60,000 tons of news paper, of which 50,000 tons are required on reels and about 10,000 tons in flat. Paper mills in the Dominion are devoting more attention than heretofore to this trade, and it is not improbable that at least one-third of the 1907 Australian imports of 'news' will be obtained from Canadian sources of supply."

AN INDUSTRIAL DEPARTURE.

August first was a notable day in the history of Nova Scotia, being the inauguration of the power plant at the Chignecto mines, from which the electrical power is generated to operate the industries of Amherst. This is the only plant in America where electrical power is generated at the top of the mine for distribution. The power is supplied and transmitted six and a quarter miles to Amherst. The fuel used is the waste screenings, which makes the cost of power so low that its use will be practicable for all manufacturing purposes. A large number of prominent Canadians attended the formal opening, and Lieut.-Governor Fraser turned the switch setting the machinery in operation. A telegram was read from Thomas A. Edison, the wizard of electricity, whose father was born in Nova Scotia over a hundred years ago, congratulating the company on its unique enterprise.

The "Safford" Hot Water Boiler

Has developed a higher efficiency and greater heating capacity, relative to its fuel consumption, than any other Boiler on the market. It meets every requirement of up-to-date Hot Water Heating, and can be relied upon to perpetuate that enviable reputation which the "Safford" Radiator now enjoys.

Its fire-pot is constructed to hold sufficient coal to provide ample water circulation for proper amount of radiation, for not less than 8 hours with least amount of caretaking.

A certain volume of the hottest water quickly circulates upward directly to the mains and radiators, without circulating through all the sections, thus insuring quick results at radiators.

It has cast-iron machine-turned nipple joints, insuring a perfect joint and obviating the necessity of taking down the Boiler every few years to be regasketed or repacked.

It is very low in construction, permitting its erection in low cellars without a pit.

It illustrates economy of fuel in the highest degree.

Only scant attention needed to the firing.

No ash-sifting grate required, as fuel is burnt to an ash, the results of free combustion.

The "Triumph" Steam Sectional Boiler

Is the climax of scientific skill in Steam Heating appliance, having the largest fire-to-water surface possible.

It maintains heat for 8 hours in coldest weather.

Maintains heat 12 to 20 hours in moderate weather.

Has ample combustion chamber between fuel line and crown sheet.

It utilizes the highest possible percentage of fuel power.

It has a large door level with grate for cleaning fire with slice bar.

An exceedingly easily managed shaking and dumping grate.

The 'Safford' Hot Water Boiler or the 'Triumph' Steam Boiler when combined with 'Safford' Radiators form a matchlessly satisfactory and economical heating system for the largest institution or the smallest house,—a heating system that rightly merits and wins the unqualified commendation of both heating engineers and users.

THE FUTURE OF THE RAILWAY COMMISSION.

NO greater tribute could be paid to the Board of Railway Commissioners of Canada than the transference of such troublesome questions as the regulation of Express and Telephone Companies to their charge. Because they have been faithful in a few things the Government has placed them over many. Their work throughout has been difficult and onerous. They had to establish their own procedure; adjudicate in cases on which there were no previous decisions; and in a word settle the respective positions of the railways and the public. This was all the more arduous from the fact that during the last few years privileges which have been heretofore assumed as rights by the railways have come to be seriously questioned by shippers and even the foundation stone of railway traffic managers' theory and practice, the right to charge all the traffic will bear, in a cumulative rather than a reciprocal sense, has been shaken by sacrilegious hands.

The very power which resides in the Commission has made its labor all the more exacting. The questions which it has been deciding during the past three years are settled finally, or until the Railway Act is amended. There is no appeal from their decisions on points of fact; only on their interpretation of the law and with their own consent can an appeal be taken to the Supreme Court. Hence the decision on a submitted case must be made not only with a knowledge of all the conditions surrounding it, but also with consideration for all similar questions which might be affected by that case.

Investigations have had to be thorough, with ample opportunity for all interested parties to prepare a statement of their case and to submit evidence.

The work of the Board has been good. The tendency to refer to it every knotty question bearing on a public utility, however, and the multitude and variety of the problems on transportation which have been and are being submitted to it for decision, make some kind of a change necessary. There is too much work for the Board to accomplish expeditiously in its present form. A suggestion has come from the Chairman, Judge Killam, which will meet with much favor, representing as it does the opinion of the man who, more than any other, sees the amount of work to be done and the necessity of doing it promptly. His idea is to divide up the members and apportion the work among them, so that one will pursue independent inquiries along one line and another along another. Railway work would naturally fall into two divisions, traffic and equipment. These might in turn be subdivided. If telegraph, telephone and express companies are to remain under the jurisdiction of the Board, which, of course, they will, additions to the Board will have to be made. The Interstate Commerce Commission of the United States consists of seven members. It has, besides, a much larger staff of legal, secretarial and clerical assistance than the Canadian Board has.

It is sincerely to be hoped that the Chairman and his associates will succeed in working out a scheme of re-organization which will retain the excellent qualities of the present system, with an added capacity for the speedy transaction of business. The present Board, from their past experience, have a thorough grasp of the requirements of the commercial interests of the country. They would be strengthened by the addition to their ranks of men skilled in traffic affairs, the construction of rates and engineering. That any increase in the number of commissioners will be for the purpose of taking in such men is sincerely to be hoped. This, we feel sure, is the idea of the present Board.

A PULP WOOD POLICY.

A PULP WOOD policy has been adopted by the Government of Ontario, which will stimulate the paper making industry of the Province and add materially to its productive wealth. Tenders will be called for shortly for two extensive pulp wood concessions. A condition of sale will be that the purchaser shall manufacture the wood into paper in

the Province. The Government cannot be too highly commended for its decision, and it is only to be regretted that the action, being Provincial, can apply merely to future concessions. It rests with the Federal Government to put on an export duty and thus force the manufacture of all pulp wood into paper in Canada. By the present decision those who have concessions previously granted will not be disturbed in their holdings. The only way they can be affected is by a Federal export measure. Previous pulp wood concessions were granted on condition that the wood be manufactured into pulp in Ontario. The present policy goes a step farther and makes the manufacture of the pulp into paper an additional requirement.

The illuminating address of Prof. Fernow, at the recent Convention of the Canadian Manufacturers' Association, is deserving of careful thought in this connection. Canada's forests are not illimitable. We are accustomed to talk of this subject in superlatives. Undoubtedly our supply of timber is vast. But while it is decreasing each year, the demand for it is advancing with giant strides. We must protect and conserve what we have left.

The pinch is being felt in the United States. A recent meeting of newspaper men was held to discuss what they considered a critical condition in the paper supply. There is no let up in the demand. Every day in the week and every week in the year the presses all over the continent consume their tons upon tons of paper. The Sunday edition alone of a New York paper is estimated to use the pulp wood of twenty-eight acres of forest. The paper must be had and it must be had at the cheapest possible figure.

Here is a great national industry within our reach. Are we going to grasp it? When we consider the sacrifices that the United States made to establish their tin-plate industry and that England made to establish her woollen industry, and when we consider what wealth and prosperity they have in time brought to these countries, we cannot but view with mingled satisfaction and disappointment our own possibilities in the pulp and paper industry;—satisfaction at the excellence of our opportunity when compared with that of the other nations in the cases cited, and disappointment at our failure to seize that opportunity and coin it into national wealth.

It will be remembered that when the Ontario Government placed a ban on the export of unsawn timber, saw mills at the mouth of every river in Michigan were taken to pieces and set up in the timber lands of Ontario. The result was instantaneous. The capital invested in this country was greatly increased, many more men were employed and the forest products were greatly increased in value by manufacture.

Might we not expect similar results to follow the placing of an export duty on pulp wood? By it the products of our country will grow in value by millions of dollars, the number of our skilled workmen will be increased, and new towns will hum with industry.

A NATIONAL PROBLEM.

IT derogates nothing from the excellence of the oratory and enthusiasm of Mr. J. A. Emery to say that the strong effect of his recent speech before the Canadian Manufacturers' Association was to a large extent the result of the widespread interest which is now being taken in the subject of technical education. His audience on that occasion consisted of manufacturers from one end of Canada to the other. It was thoroughly representative of the manufacturing interests of the country. By such an audience and on such an

occasion the supreme need of industrial education in the race, not for commercial supremacy, but for commercial existence, as expressed in the compelling words of Mr. Emery, was listened to with breathless attention and frequent expressions of approval.

Not employers of labor alone, but workmen, too, are fully alive to the advantages of technical education. Unfortunately of recent years in the stress of life many causes of friction have arisen between capital and labor. It is an augury of a better relationship in the future, that these two great elements in the industrial life of the country should have recognized a common means for the betterment of both.

Few movements have met with such wide acceptance as the one which is now under way, urging upon the Federal Government the necessity of appointing a commission to inquire into the whole subject of technical education and to outline a comprehensive scheme for common action throughout Canada. We see what wonderful progress Germany has made during the past thirty years in an industrial way. From a group of practically unknown states she has risen to a position of eminence among the manufacturing nations of the world. She has been able to do this because by advanced methods of organization and technical training, she has made her working unit the most effective in the world. Efficiency has been the master word by which she has conjured success from the midst of difficulties.

As with the individual, so with the nation, competition makes success each year more difficult to attain. Methods which were perfectly satisfactory a generation ago are antiquated to-day. Recognizing the position of superiority, which a well-trained and well-equipped body of workmen makes possible, the other nations are following Germany's lead and are establishing technical schools. When England and the United States take the matter up in a large and adequate manner, it will be an evil day for the manufacturing country which is not similarly equipped. Canada has just entered upon her period of expansion. She must not be fettered by an inability on the part of her workmen to produce as actively and as well as the workmen of other countries. In national aptitude the Canadian flatters himself that the men of no nation excel him. It rests with the state to say whether that aptitude shall be developed into a working force of the maximum effectiveness.

THE AUSTRALIAN TARIFF.

AN examination of the new Australian tariff, full details of which are now at hand, fully substantiates the reports current some weeks ago regarding its strongly protective tone. With her isolated situation Australia may well be said to enjoy a certain amount of natural protection, for the foreigner must necessarily pay high freight tolls before gaining access to her markets. In framing her new tariff the Australian Government appear to have disregarded this fact, for the schedule they have adopted would of itself afford strong encouragement to native industries. When combined with the protection of over sea freight rates, however, it virtually prohibits the importation of many lines of manufactured goods, and as a result we may expect to see an immediate and widespread development of Australian manufacturing enterprises.

The new tariff is so entirely different from the old in its groupings that it is difficult to make comparisons, but the following statement of duties in effect on certain lines in which Canadians are interested will be sufficient to indicate how sincere Australia is in her desire to manufacture out of her own materials and with her own labor everything she is capable of producing economically:

Table waters, aerated or mineral, 25 per cent.
 Butter and cheese, 3d per lb.
 Canned fish, 1½d per lb.
 Wheat flour, 2s. 6d. per cwt.
 Garments, wholly or partly of wool or silk, 45 per cent.; preferential, 40 per cent.
 Other apparel of any material, including cravats, garters, belts, etc., 40 per cent.; preferential, 35 per cent.
 Blankets, flannels, buggy rugs, etc., 30 per cent.
 Carpets, 20 per cent.
 Curtains and blinds, 25 per cent., preferential, 20 per cent.
 Furs, partly or wholly made up, 35 per cent.
 Denims, 35 per cent.; preferential, 30 per cent.
 Woollen piece goods, 35 per cent.
 Socks and stockings, woollen, 30 per cent.; preferential, 25 per cent.; cotton, 25 per cent.; preferential, 15 per cent.
 Lawn mowers, spraying machines, garden hose reels, road scrapers, stump extractors, 20 per cent.
 Lumber, undressed, 1s. 6d. to 2s. 6d. per 100 feet.
 Lumber, dressed, 3s. per 100 feet.
 Ploughs, cultivators (not disc), corn shellers and huskers, 20 per cent.
 Disc ploughs and cultivators, drills, winnowers, 25 per cent.
 Churns, refrigerators, incubators, 25 per cent.
 Stripper harvesters, £16 each.
 Strippers, £8 each.
 Cream separators, hay teders, horse rakes, maize harvesters and binders, threshing machines, 10 per cent.; preferential, free.
 Barbed wire, 30 per cent.; preferential, 20 per cent.
 Wire netting, 30 per cent.; preferential, 25 per cent.
 Proprietary medicines, 15 per cent.
 Perfumery, 35 per cent.; preferential, 25 per cent.
 Furniture n. e. i. (except of metal, wicker, bamboo and cane), 40 per cent.; preferential, 30 per cent.
 Chairs, 7s. 5d. each, or 30 per cent., which ever returns the higher duty.
 Sash and door, 40 per cent.; preferential, 30 per cent.
 Boots and shoes, any material, 35 per cent.; preferential, 30 per cent.
 Rubber hose, belting, tires, 25 per cent.; preferential, 20 per cent.
 Leather belting, 25 per cent.; preferential, 20 per cent.
 Advertising matter, including catalogues, etc., 6d. per lb.
 Newspapers, 10 per cent.; preferential, free.
 Bicycles, £5, 5s. or 30 per cent., which ever rate returns the higher duty.
 Parts of bicycles, 15 to 25 per cent.; preferential, 10 to 15 per cent.
 Automobiles and parts of, 35 per cent.; preferential, 25 per cent.
 Perambulators and go-carts, 35 per cent.; preferential, 30 per cent.
 Pianos, upright, £5, 10s. or 40 per cent.; preferential, £5 or 30 per cent., which ever rate returns the higher duty.
 Provision is made for liberal increases in some of the above duties by public proclamation as soon as it is apparent that the manufacture of the goods in question has been sufficiently established in the Commonwealth, while other articles, now free, including the more elementary iron and steel products, as well as mowers and reapers, will become dutiable under similar circumstances.
 The effect of the new tariff on individual lines of trade is referred to in a recent issue of the Globe. According to Mr. Thos. Findley, of the Massey-Harris Co., it will entail considerable loss to that concern on shipments at present en route to Australia. About one-third of the implement trade between the two countries has been made up of stripper

harvesters alone. This is a machine peculiar to Australia, California, South America, and all the dry countries, for the grain is stripped, threshed, fanned and bagged all by the one machine operating in the field. Up to 1905 the duty on these machines was 12½ per cent., or in round figures, £5. In the fall of that year the duty was increased to £12 specific, with the frank avowal that it was intended to be prohibitive to protect Australian manufacturers. The new duty of £16 specific makes it practically impossible to do any further business in this article.

Mr. T. A. Russell, of the Canada Cycle & Motor Co., according to the same authority, states that their Company had a large consignment of bicycles on the way to Australia when the tariff was announced. The new duties are so prohibitive that all these bicycles will have to be returned, for to realize on them they would have to sell them at prices which the Australian market would not stand for. However, the Australian bicycle business is not lost to Canadians, for it is still possible to send all the parts of a wheel and have the assembling done by Australian workmen. It is just this protection to labor that is aimed at in the new tariff.

A still more glaring instance is furnished in the case of a consignment of chairs shipped by the North American Bent Chair Co., of Owen Sound. The chairs were ordered many months before the new tariff was introduced, but unfortunately were shipped just prior to its announcement. Under the old tariff the duty on the entire consignment of one hundred and twenty cases would have amounted to only £77, which the importer was quite prepared to pay. When the chairs reached Perth, on August 30th, the importer was informed on attempting to pass an entry through the Customs House that he would be required to pay in duty £1,093, a sum several times as large as the chairs were worth.

This office will be pleased to furnish details of the new tariff to any parties sufficiently interested to enquire.

AN UNFORTUNATE CITATION.

THE Toronto Globe cites the prosperity of the British tin-plate manufacturers as proof that trade laughs at tariffs. The prosperity of the British tin-plate manufacturers in no way affects the advisability of the United States or any other nation protecting its tin-plate industry. The object of a protective tariff is to develop a home industry, not to injure that industry in some other country.

Such being the case, let us consider the status of the tin-plate industry. Before the passage of the McKinley Tariff the United States bought practically its entire supply of tin-plate from Wales. The trade was very large and was increasing from year to year as the consumption of canned goods increased. Tin-plate was being made in England under exceptionally favorable conditions as to labor.

Under the aegis of the new tariff factories sprang up in the United States for the manufacture of tin-plate. For a time, until the plants got working to the best advantage, the cost of the product was high. But it soon declined. Home competition set in and before many years the price to the consumer compared favorably with that which was formerly paid for the imported plate.

But in the meantime a big industry had arisen. Hundreds of thousands of dollars were invested in buildings and machinery. This gave employment to people in many lines of trade. Thousands of men were directly employed in the manufacture of the plate. These had to be clothed and fed. An additional market was provided for the farmer, and generally speaking the course of trade received an impetus through the establishment of the new industry.

In this particular case there was no attempt to force the

situation. The demand grew from small beginnings till it reached such proportions as to justify the establishment of the industry. When it was established the market was there for the product.

We are told to look to Great Britain to see the effect of free trade on manufactures. We look and we see manufactures carried on with such, from our standpoint, impossible conditions as to labor that we recognize that on this continent we can never manufacture on an equality with her. Were the United States then to sit down in wonder at the achievements of the British manufacturers, and continue to buy their goods from them for all time to come? Or were they to take the only possible means whereby they, too, might become great as manufacturers? The object lesson is a double one. The United States chose the latter course. They protected their industry and now we see that they, too, as well as the British, are prosperous manufacturers of tin-plate.

We could, with advantage, take a careful look at the picture suggested by the Globe. We have a woollen industry which is in much the same condition as the United States tin-plate industry was before the passing of the McKinley tariff. Of the hundred and odd mills which have at various times struggled along in a precarious existence, a hundred have been forced to close. Meanwhile, the consumption of woollens in Canada has been growing enormously. The skilled hands which formerly manned these mills have scattered to various textile centres in the United States. They are lost to Canada. The capital invested in the buildings and machinery lies stagnant. It produces no revenue itself, nor does it enable a body of workmen to earn wages. It is in a double sense lost to the country.

What would be the result of a protective tariff for this industry? Let us revert to the United States and its tin-plate industry. The question is answered. Canada might have its busy mills, throbbing with industry, sending forth their army of well-paid workers, to be clothed and fed in turn by Canadian labor. Canada might have the millions of dollars, which are now sent abroad for imported woollens, kept within her own borders, circulating among her tradesmen and farmers. Canada might have the capital already invested in woollen mills, earning dividends to be invested in turn in the development of the country's resources. This is the true national policy. It is the policy which will perpetuate good times.

THE NEW ZEALAND TRAFFIC.

LATE advices giving the tariff schedules as they will be finally adopted by the New Zealand Government show that Canada will enjoy many advantages from the Preferential rate, although some articles which in the first draft were granted a preference have since been removed from this list. The new tariff will be scanned by many manufacturers with close interest. New Zealand opens up an advantageous market for our goods. The people are large buyers of foreign goods. They possess a fertile soil which, by advanced methods of intensive farming has been made to produce abundantly; their ranching and mining have been most successful. Added to these is the fact that they still buy most of their manufactured goods abroad.

Hitherto Canada has not taken her share of the trade that is offering. New Zealand's imports for the year before last were over sixty-six million dollars. Last year they were considerably above that figure. Of this amount Canada supplied 565,000 dollars' worth. That works out to just about four-fifths of one per cent. That is not enough. We are favorably situated to do the business and the New Zealanders are willing to buy from us. We have a distinct tariff advan-

tage over the United States, who are our nearest rivals. A fair appreciation of the value of the market seems to be the only thing necessary.

That such an appreciation is growing is shown by the large number of Canadian manufacturers who took advantage of the New Zealand International Exhibition to introduce their goods into that country. Over eighty Canadian companies sent extensive exhibits. This in itself is a fair proof of the growing desire to get a foothold in the new field.

A few of the lines in which Canadians are especially interested are given below. The complete schedule is on file in the INDUSTRIAL CANADA office, and information will be gladly supplied on any item not mentioned here.

Agricultural implements of all kinds are admitted free of duty as heretofore.

There are also on the free list:

Paper, printing and other specified qualities. Artificers' tools, including axes, spades, forks, etc. Bicycles and tricycles, fittings for—namely, tires, handle grips, pedal rubbers, and various steel parts when not plated, japanned, painted or varnished.

Dairying and mining machinery.

Metal fittings of various kinds.

Gauges and speed indicators.

Emery grinding machines.

Surgical and other fine instruments and appliances.

Rubber soles for shoes.

Glass bottles and earthen jars of a specified size.

Brass tubing and stamp work in the rough.

Arc lamp carbons.

Insulated cable.

Wheels and tires for locomotives and cars.

On the following articles a duty in addition to that levied under the ordinary tariff will be exacted when the goods are imported from a country other than Great Britain or its colonies:

Portland Cement and other structural and building cement.

Bicycles, tricycles, and the like vehicles, also finished, or partly finished, or machined parts of the same, not otherwise enumerated.

Boots and shoes.

Carriages, carts, vehicles and wheels for same.

Toys, sporting and gaming supplies.

Furniture and cabinetware.

Iron and fibre pipes.

Lamps and lanterns.

Electric batteries and cells.

Galvanized iron manufactures.

Matches.

Saddlery and Harness.

Leather goods, trunks, etc.

Plate glass.

Boilers, land and marine.

Cranes, capstans, etc.

Machinery not otherwise enumerated.

Steam engines and parts thereof.

Boats and launches.

Iron, galvanized corrugated sheets.

Paints and varnish.

Gas Engines.

Gum boots.

Hose, canvas, indiarubber or other.

Fire Engines.

The preference accorded varies for different items in the above list. In the case of Portland Cement it is 50 per cent. From that it runs down to 20 per cent. The articles mentioned are those which are most likely to be exported from Canada. The detailed list may be examined for other items.

A Forest Policy for Canada* How to Perpetuate a Great National Resource

By B. E. FERNOW, Professor of Forestry in the University of Toronto

IT is a great satisfaction to me, that I am permitted to make the first public utterance of my ideas on a forest policy for Canada before a set of men who are accustomed to think of and deal with concrete things. I propose this morning to make you see that forestry should not be in Canada a mere academic subject, an abstraction, but should become as soon as possible a concrete reality.

I dare say that there are few in this audience who are ignorant as to what in a general way forestry means, and why this art should be employed in the management of our woodlands. But as to the methods of its application even the best posted lumbermen may still have something to learn.

I do not propose, however, to discuss technical questions before an audience like this. As manufacturers you are naturally interested mainly in the question of raw material, the outlook of supplies for your manufactures, the question as to their continuousness, as to whether the natural supply is inexhaustible, as has been often claimed, as to whether the necessity has arrived for actively providing for the future, in other words, as to the policy which we should now pursue with regard to our timber supplies. Only when this question has been answered does the question of the technical details come up.

Where Forestry Begins.

The very title which your Secretary has proposed for my subject, "Reforestation," suggests—I beg the gentleman's pardon—a considerable ignorance as to the state of things, and as to the proper policy and proper method in the treatment of your timber resources, if by reforestation is meant artificial replanting. Reforestation presupposes deforestation, and the title of the Secretary's choosing implies that a forester's work begins when the country is deforested. But, truly, forestry begins, or should begin, when the first tree is cut, so as to make the laborious and expensive method of artificial reforestation unnecessary.

When I tell you that on the 12 million acres of German State Forests, which are managed for continuity of wood supplies, the expenditure for planting is less than 18 cents per acre per year, or less than 5 per cent. of the total expense, and that in Prussia of the cost of producing one cubic foot of wood, namely, 2 cents, only $\frac{1}{3}$ of a cent goes to planting, you will realize that in a well managed forest property the planting cost is a relatively small item.

There are, to be sure, large areas in Canada where deforestation has progressed to an undesirable, if not dangerous degree, and where it is not only desirable but practicable and profitable to begin the work of artificial reforestation of these denuded areas. The southern sections of Ontario, rich in agricultural lands, are almost entirely cleared of timber-growth. Here a farm area of five million acres can be found containing less than 10 per cent., or 500,000 acres, of woodland, and, I am told, there is altogether probably 50 per cent. of waste land on these farms that could be more profitably employed for wood crops than for farm crops. During the recent strike in the anthracite coal regions of the States, this section actually suffered from a fuel famine, because the farmers' woodlots were too scanty to supply domestic needs. In this section, indeed, reforestation by private land-owners has been

begun, stimulated by wise government aid with plant material and advice.

You should, however, understand that such planting of farmers' woodlots has no more meaning for the general lumber supply than the apples in your back garden have on the fruit supply of the country. It can, for practical and technical reasons, accomplish only three things, namely, to furnish local domestic supplies, to improve conditions of the farm, and to make waste lands useful producers. The policy begun a year or so ago by the Ontario Government of encouraging and assisting farmers by plant material and advice in re-establishing woodlots, is a wise one, and only needs to be expanded annually in order to hasten the day when its profitableness to the individuals and to the Province in general will be demonstrated beyond peradventure.

PROF. B. E. FERNOW

Value of Timber Areas.

But the much larger portion of Ontario, and of all the other Provinces in the East, is still in the woods, and the much more important question is as to the condition, present use, and future value and use of this portion.

At the very outset of an inquiry into the conditions of this property, we find a woeful dearth of collected information, an ignorance which leaves the answer open to challenge, because it is based on doubtful facts. Canada has the reputation of having been and still being a great forest country, and one of the most prominent wood exporters of the world. It is claimed by some that 800 million acres, or over 37 per cent. of the land area is under wood.

But if we look at this vast forest area from the manufacturer's point of view, from the standpoint of supplies for the arts and industries,—of its commercial value, and study merely the geography and nature of the country in the light of the reports on the more or less explored outlying parts of the same, we will come to the conclusion that 300 million acres and perhaps less will cover fully the commercially

*Address delivered at the Toronto Convention Canadian Manufacturers' Association.

valuable timberland area, actual and potential, or not much more than one-half of the commercial forest area of the United States. Relatively then, Canada is a poorly wooded country.

This may sound curious to those of you who are located in the vast forest region of Quebec, or Ontario, or New Brunswick, or British Columbia, but these are the smaller portions of your great country and the vast prairie and plains area which is not at all, or only scantily wooded, and is now beginning to be developed rapidly, must also be taken into consideration. Moreover, at least one-fifth of this area is on the Pacific side of the continent.

Possibilities of Our Woodlands.

Area, however, does not mean much except possibilities. Contents in the virgin woods are extremely variable and the more difficult yet more important question is how much available log material this commercial timber area can furnish. Large statistical figures appear to the layman a convincing argument of plenty, but the only way of understanding their meaning is to place them in relation with other figures. At the great forestry convention last year at Ottawa, the vastness of Canada's forest resources was attempted to be displayed by a placard stating, probably based on the best attainable authority, that 532 billion feet of lumber was still available for cutting, and this was stated as if it were a large supply. This apparently enormous figure, however, would not suffice to supply the present annual consumption of the United States for more than a dozen years, nor that of Great Britain, which is more frugal in wood consumption, for the time it takes to grow a good sized log, say 60 years.

All these statistics are, I repeat, merely random guesses, and nobody really knows with any reasonable degree of accuracy the conditions. But I suppose the Statistician of the Dominion had good basis for stating as long as 12 years ago that, "the first quality pine has nearly disappeared," and that "we are within reasonable distance of the time when, with the exception of spruce as to wood and of British Columbia as to Provinces, Canada shall cease to be a wood exporting country." If the estimates of that authority were anywhere near correct the amount of white pine remaining would now be less than 20 billion feet, not enough to supply the present demand for say another decade, and that relatively small balance is mostly confined to Ontario.

Elementary Facts.

Without going into further statistical guesses, I believe, any one familiar by observation and reading with the forest conditions of Eastern Canada will subscribe to the following general statements of the situation:

The larger portion of the commercial forest area of Eastern Canada is cut over and culled of its best timber.

The major part of the culled area, and especially the pineries, is burnt over; the natural reproduction being mainly of inferior kinds.

The supply of spruce for paper manufacture remains relatively the largest item in the commercial timber supply.

Little or nothing is done to protect or encourage the production of future supplies.

Perhaps a brief glance at the condition of the wood industry may be desirable.

Although Canada is rated as one of the foremost wood exporting countries, it has in later years fallen considerably behind the United States, the latter doubling its wood exports during the last decade, and having in 1904 exceeded the \$60,000,000 mark, while Canada has hardly exceeded at any time \$40,000,000, and the rate of increase in exports, although

steady, has been only one-third to one-half as rapid, namely, about three per cent. per annum. In comparison with other exports, however, the exports of forest products has considerably *declined*, for while in 1868 these form 34 per cent. of the total exports, in 1904 they represented only one-half of that figure. To my mind, this falling off of wood exports would appear as an advantage, if it were the result of policy and not of natural decline in accessible supplies. It is, also, to be considered an improvement that the proportion of lumber and manufactured wood goods, as against unmanufactured material, has constantly increased during the last decade, namely, from 5 per cent. to 12 per cent. of the total exports of forest products.

The Census of 1891 made the total forest production of Canada \$80,000,000 (\$16 per capita), the cut being figured at 1,400 million cubic feet for home consumption, and 600 million for the export, or altogether over 2,000 million feet, say 400 cubic feet per capita, a figure not very different from the per capita consumption in the States, but *twenty* times that of Great Britain.

Our Present Wood Consumption.

If we apply the same rate of consumption to our present population, which is probably not much below 6,000,000, we can safely place our present wood consumption at round 2,400 million cubic feet of actual material, which, with existing standards and wastefulness of logging, represents not less than 3,000 million cubic feet of wood as it grows in the forest. That is the annual growth of not less than 50 million acres under good management, and of three to six times as many if left to mere natural growth. I bring forward these crude and not altogether reliable figures to make you realize the fact that it is time to change the attitude towards the treatment of your timber resources, and that those who supinely laugh at the efforts of the forestry propagandists are either ill-informed or unpatriotic.

To Ensure Future Crops.

I have no doubt that when the Secretary chose the word Reforestation as the title for my remarks, he had nothing more in mind than to estimate the general subject of forestry, which certainly implies reforestation, artificially or otherwise, that is, the use of existing forests in such a manner as to insure future wood crops. Technically, there are no mysteries as to how this may be done. Some knowledge of the life history of the species composing our woods, and some knowledge of what experience has been gathered during the last hundred years or more by European foresters suffices to permit a judicious man to direct nature in doing his will. For, there is no question in spite of some uninformed doubters, that the technical knowledge gathered in the Old World in forest growing is as applicable in the New World as the knowledge of growing cabbages.

The difficulty of reforestation does not lie in the technical but in the *economic* direction. The question is not, "Can the White Pine be reproduced, and how?" but, "Can I afford to do the things which are necessary to reproduce it?" As far as private forest owners are concerned, it is purely and absolutely a financial question, as to whether it pays better to practise *destructive* lumbering or conservative lumbering, which is the beginning of practicing forestry.

The Economic Side of Forestation.

The answer to this question is, of course, a matter of calculation, as in every other business; the same factors which enter into profit calculations in other business enter here. There is only one factor that is essentially different and

characteristic in the forestry business, namely, the time element. In this it differs from every other business except life insurance. The manufacturer deals with months, and possibly a year or two which elapse between the receipt of the order and the delivery of the goods, the farmer reaps annually, and the fruit grower within 10 years from starting the orchard. But to grow a log of useful size takes from 60 to 120 years. Most of the trees which the lumberman cuts to-day, are over 150 years from the seeding time, and, while the forester can to some extent hasten the processes of nature, he will only rarely bring acres of forest growth to utilizeable size for lumber in less than two generations.

Let us look into this important factor of forest production and see what it implies. In the first place, the forester must be a seer into the future. He must feel sure that his crop will be in demand when it matures, that it will meet the changed requirements of a different civilization, that it will be able to compete with other materials which can be used as substitutes, and finally that it will pay for its production.

A Permanent Demand Exists.

Nobody who has studied the history of the world as regards wood consumption, and who has realized the reason for the extensive use of this most useful material, will doubt that, as long as civilization lasts, wood in some form will be a desirable and much-sought material, that cannot be displaced entirely by any substitutes, but of course the character and form and amount of its use may greatly vary.

No more interesting experience on this score could be cited than the ups and downs of the beech forests and tanbark forests of Germany. The latter have become unprofitable by the introduction of quebracho tan. The former, a result of the fuel famine of a hundred years ago, became a drug in the market, when coal was developed, then became valuable again for railroad ties (impregnated), these being displaced by metal ties, and now only by compromise between the Railroad and the Forestry Department do these beech forests find a market.

We see, then, that the time element in forestry is a *speculative* element which may all but ruin an otherwise legitimate business.

The time element, naturally, renders the financial calculations somewhat hazardous. What prices will rule when our crop comes to market? What interest rate shall we figure on the long time investment? What expenditures can we afford now with the assurance of profitable returns? These are all questions of a speculative character. Forestry really is dealing in futures!

We may have no doubt that wood prices will increase, as they have increased in the past; indeed, for a time at least, at a greater rate than in the past, for within the last decade not only has the per capita consumption of wood among all civilized nations increased at a rate of about 3 to 5 per cent. compound per annum, but all the exporting nations have waked up to the realization that their forest resources are not, as they had supposed, inexhaustible, but are, indeed, measurably near the time of exhaustion, and have begun to appreciate their value, and have placed bars on their exportation, or otherwise limited the cut.

Wood prices in Prussia for 65 years prior to 1895 experienced a rise of $1\frac{1}{2}$ per cent. per annum. They doubled in the next 35 years, and rose 50 per cent. in the next 30 years. Since the 15 years from 1890 to 1905, the rate of increase has been nearer $2\frac{1}{2}$ per cent., namely, from 4.4 to 6.8 cents per cubic foot.

In Canada, from 1850 to 1894, the average annual rise has been not less than 5 per cent. You know how much more rapidly it has risen since.

In the United States, the rise has been for some time at $2\frac{1}{2}$ to 3 per cent., and in 1900 precisely the timber famine began, if sudden high prices denote dearth.

There is no doubt that wood prices will rise and that quickly, but where is the limit, the definite figure which we may use in a calculation made to justify a present expenditure?

A World Price for Timber.

I believe we would be safe in expecting that within the next 25 years, when the United States and Canada will have pretty nearly careered through their entire timber wealth, will have learned to use wood economically, reducing their quota from 350 to 400 cubic feet per capita to 20 or 30, as is possible, and when all other nations will have done the same, namely, have nearly exhausted their natural timber growth and have come down to forest management, that then we shall have also come to world prices for wood as with other staples, and that probably the highest prices now prevailing in the interior parts of Europe will be ruling prices in general. Such prices will make common pine stumpage not less than \$20.00 per M.

As regards interest rates on such long time and, at present at least, hazardous investments, who will venture to suggest a proper figure? In Germany, where forest property is as safe as any other even as regards fires, it is customary to apply a rate varying between 2 and 3 per cent., compound, of course, if, or whenever, such calculations are made at all. For, although Germans are undoubtedly good business men, and know as well as the next neighbor how to figure, the forestry business is carried on very largely on other considerations than strict financial calculations. These considerations are partly general economic ones, partly of historical character.

Forestation a Government Duty.

The State Governments became large forest owners somewhat over 100 years ago, and they have learned to consider themselves the guardians of the future as well as of the present, hence they have persistently and jealously carried on a conservative forest policy, without permitting financial considerations to interfere with cultural ones. Forestry with the Government was a duty, a work of internal improvement, which could not be expected from private individuals. That in the end this work has paid handsome revenues was, of course, more than gratifying. There are even now in the German forest administrations many things done that would not stand a strict financial test.

City and town corporations were forest owners long before the States, for German communities were originally socialistic republics. The States assumed surveillance of the management of these properties, partly for fiscal reasons, partly for the same reasons that actuated them in the management of their State forests, so that about 50 per cent. of the forests of the country are under direct State control. Of the balance, owned by private individuals, a portion is subject to entail, family estates which by agreement of the noble owners in times gone by are under certain fiscal control by the Government, and another portion is also under partial control, to prevent mismanagement which would cause damage to neighbors or to the country at large.

We find, then, in the end, that only about 25 per cent. are left unconditionally to private will, and, if you want to see mismanaged woods in Germany, you must hunt up some of these private forests without State supervision.

There is now—and has been in progress for some time—among foresters a battle royal as to the proper way of figuring the financial results of forest management, but no agreement

has been reached, and even the necessity of such calculations, for the governments at least, is not admitted by many. Meanwhile the Governments and the supervised corporations and private owners reap the benefit of their persistent, conservative policy and of their improvements in the forests and in the forest service in the shape of continuously increasing revenues—true revenues, not derived at the expense of capital, without decrease may with rather added value to the investment and increased per-acre-production.

The Prussian State forests, for instance, with some seven million acres, yielded in 1850 a net revenue of less than 50 cents per acre; in 1890, \$1.30; in 1905, \$2.43. In Saxony, on a smaller area, somewhat over 400,000 acres, the felling budget was 60 cubic feet per acre in 1820, 70 cubic feet in 1860, 90 cubic feet in 1890, and 93 cubic feet in 1905; the net revenue rose from 95 cents in 1820, to \$2.39 in 1860; to \$4.37 in 1890; and is now (1905) \$5.25.

But to attain these results the Government had patiently to wait, patiently to spend money and energy and knowledge, like any other business man who is building up a business—only for a longer time, for a hundred years.

What private forest owners will work for such a long time and maintain an undeviating policy of conservative management?

There is one other aspect in this long time element that has much to do with the aversion which private capital has shown almost everywhere to this kind of business.

When Timber Becomes Marketable.

The maturity of timber, the ripeness for the axe, is not a matter of natural period, but of calculation and consideration of its marketableness. The year's growth cannot be harvested or marketed; it requires an accumulation of annual growths before a tree becomes useful. When the crop is 20 years old, it may furnish small firewood and possibly some posts; at 30 to 40, besides fuel, there may be telegraph poles and railroad ties; at 60 to 80 years, small log timber will have developed, and then this will increase in proportion constantly for the next hundred to two hundred years, quantity as well as quality improving. Now, this method of accumulating the harvest and being able to cut it at various times at our choice brings with it, just like a life insurance, a continuous locking-up of capital and interest, which only a capitalist, a man of means or a strong corporation, can stand. Thus, a 100-year-old stand of pine has not only locked up the soil and whatever initial investment was placed on it in the way of planting or otherwise, but it has also locked up the interest, a 100 years of growth, accumulating, say, 6,000 cubic feet of wood per acre, worth, say, \$200 at least.

Large Capital Necessary.

In order to turn wood crop production into an annual business, it would be necessary to have one stand become ripe or 100 years old every year, so that we may have a regular annual harvest—that means 100 such stands differing by a year in age. The capital involved in such a series of 100 age classes, as it is termed, would figure up according to different soils and species from 400,000 to 1,500,000 cubic feet, and probably not less than \$8,000 for the 100 acres. To make a living from forest growing as a business, you can readily see that not less than 50 such series, worth not less than \$400,000 in the wood capital alone, would have to be kept up to insure an annual income of \$10,000.

These calculations are, to be sure, only schematic, and would fall out more favorably here and there, but they give you an insight into the character of the financial aspect of forestry. It is a business for large capital, with long time investments.

Who will be willing to lock up his capital in such a business, especially in this country when still thousands of acres of grown timber are practically being given away, as in British Columbia?

The possibility of harvesting earlier, of lowering the rotation—as the length of time is called to which the crop is allowed to grow—is a constant temptation to do so, and, as a matter of fact, we find that in France, where private ownership prevails, the rotation has been constantly reduced, until now little more than firewood is grown on the larger portion of the forest area, and the bulk of sizeable material has to be imported.

Where Responsibility Rests.

My object in bringing these financial considerations before you is to point out that forestry financially defined means every time curtailing present revenue or making present expenditures for the sake of future revenue, that there is no good reason why we should expect timber limit holders as a rule to adopt forestry methods, voluntarily, that finally the State, the Government, the people as a whole, being the guardians of the future of the nation as well as of the present must realize that forestry is *their* business, that they alone can take the risks and the low interest rate which this business offers.

Private owners and timber limit holders may find it to their advantage here and there to do things, or rather to avoid things, the doing or avoiding of which will insure a better utilization in the present and a better future for their holdings, but ultimately I have no hope of an effective forestry system being introduced unless the governments are thoroughly committed, change their methods of disposal of timber, and introduce forestry principles in their land management.

Present Forestry Methods Must Go.

The proposition of a change of methods from the current ones does not necessarily imply a criticism of the latter. The methods as they exist are of historical growth and, where devised for pioneering conditions and with a different purpose in view, namely, to secure income and to open the country for settlement, and for these ends they probably were the best that could be devised. But the time is here, if I am not mistaken, or rapidly approaching, when it will be wisdom to change these methods, when a new purpose is to be substituted, when not merely present profitable exploitations, but the future needs are to be considered, and hence new methods are in order.

Some one has, with cogent logic, shown that the present method of disposing of timber limits under the triplex charge of ground-rent, bonus and stumpage dues, discourages the application of conservative logging methods on the part of the timber limit holder.

But I go further and maintain that the timber limit holder cannot, under *any* system of lease, be expected *voluntarily* to introduce forestry methods. It is the Government that must take the risk and stand the cost which new prescribed conditions of logging involve, and enforce such conditions.

There can be little doubt but that the Government alone can take care of the future, and whatever else may be said about Government ownership of public utilities, the long-time element in forest production singles it out as the most needful of Government activity.

Fortunately, in the Dominion the Government does own the basis of forest production, the land itself and the virgin as well as the cut-over forest—at least, the bulk of it. Can there be two opinions as to whether it should manage this property as a permanent investment, or merely exploit it for what is in it, placed there by nature?

A rational policy requires that a distinction be made between the lands that are only fit for timber growing and those which are more advantageously turned to farm use. There will then appear some land to be doubtful as to its classification, but that should be also left to timber-growing, until good reasons appear for settling it, *i.e.*, until the time has arrived when second class farm lands have become profitable and are needed.

Fortunately, timber will grow, though less rapidly, on the poorer soils, which lack in fertility or are physically difficult to farm, and hence there should be no quarrel between farmer and forester.

On such areas set aside for forest growing—forest reservations—the Government should dispose of the timber systematically in such manner as to make sure of a future crop, *i.e.*, practice forestry.

This requirement is bound to bring the Government to a double dilemma, an economic and a political one, namely, how far to consider the present and how far the future, but sooner or later, if the necessity of forestry is once admitted, it will have to choose the one horn which points to the future.

Hitherto, the Government has desired to secure an *income* from the timber before the land was to be settled or else has made the timber a source of income without the settlement in view. I do not use the word revenue, which implies a continuous income. Indeed, the policy proposed of introducing forestry methods means change of the temporary and limitable income into a continuous revenue for ever. Every one of you is financier enough to see, even if you do not realize the exact method, that that cannot be done without some expenditure or without curtailing present income.

This is the economic dilemma; the Government must be willing to forego or spend part of the present income in order to insure a continuous future revenue. I understand it can well afford to do so.

The political dilemma is, how to deal with the timber limit holders, and this, I dare say, is the more troublesome.

I know enough about the situation to recognize, first, that this is a complicated problem and, secondly, that I dare not even suggest the simple solution which the mere student of political economy and statecraft would readily propose, namely, to cut the Gordian Knot and make an all-round new and square deal.

Present Lease Holders.

There are, if I understand the situation correctly, three classes of limit holders (which may, of course, all three be found in the same person), namely, the limit holders of long ago, those of recent origin under changed conditions of lease, and those of the future. I also understand that, although the Government in the leases granted to the first two classes has reserved the right to change conditions of lease, usage has made this condition nugatory.

There are many objectionable features in these leases, but the worst feature of these earlier leases is that practically they do not terminate, and hence the much-praised ownership by the Government is a delusion, and the Government is apparently debarred from using its property, or having it used to the best advantage. It would appear that as long as any young growth of pine which may grow into timber exists on a limit, this is vested in the limit holder.

Unless, then, the Government can assert its rights and regain full possession of the property, either by adjudication or by compromise, or by imposing new and troublesome conditions for retaining ownership, these lands must be left to fate and the despair of the future.

The hope of the future must be found in the new deals

the Government may make with the future limit holder, and this it should do with a full reckoning of the future.

It is needless to add that to carry out such a forest policy technical advice will be needed, and it will be my pleasant task to prepare young men for this business.

The Advantages of University Training.

I have been asked whether the young men graduating from the University in the Faculty of Forestry will be fit to manage forest properties. I rejoin with the question whether you would entrust your life to a young physician just from the medical school. Managers are not made in school, they are either born like the poets, or they develop, as their judgment is developed in contact with realities and concrete things. But the technical knowledge imbibed during their training should stand them in good stead in accumulating and digesting experience, and thus in developing quickly into managers. When leaving the University they will have all the necessary theory, and more than needed for the present. They will have knowledge of woodcraft and they will have come sufficiently into contact with the practical problems of forest management to be useful in developing it.

Our aim will be to turn out men so well grounded in theory that there shall be no question as to their becoming the most practical men in the woods—not excepting the logging boss.

From you, as interested citizens, I hope to receive moral support and active interest in bringing about such a forest policy of the Government, as will give employment to this coming generation of foresters.

The Fire Fiend.

There is one feature of our forest conditions, without reference to which no discourse on forestry matters on this continent would be complete. I have left it to the last in order to make, if possible, a more lasting impression on you and to enlist your co-operation in eradicating it. There is no use talking about forest policies or forestry methods, reforestation and conservative lumbering until we have learned to cope with the fire fiend.

This is almost entirely a moral problem, in which all the people are involved, for the majority of forest fires are due to culpable carelessness—a carelessness quite general on this continent, born of a lack of a sense of civic responsibility. If there were a higher moral tone in the community, a greater care of other people's properties and interests, there would be fewer forest fires. The majority of these fires, I have no doubt, are due to preventable causes.

The origin of fires from locomotives, I believe, could be almost entirely stopped by application of a newly-devised screen, the invention of a Canadian, which overcomes the objections made to screens by engineers. It is applied on the outside of the stack, hence does not interfere with the draft, and is always within view for inspection.

The fire ranger system in use by the Ontario Government is good as far as it goes, but it is by necessity limited. Its development depends, to a large extent, on the desire of the limit holder; but it is often not at all to the interest of the lumberman, to guard effectively against fire, since the greatest danger from this menace is on cut-over lands and young stands of coniferous timber, in which the lumberman is not financially interested. Its weakest spot lies in the temporary employment of the fire rangers, who, therefore, shift from year to year, and in the fact that they have no permanent interest in the forest. Not until a real forest policy is introduced and foresters, employed all the year on some forest work, become its guardians, will the forest be efficiently protected at a reasonable cost.

Technical Education—An Industrial Necessity*

By JAMES A. EMERY, Secretary Citizens Industrial League of America

J.A. EMERY

I have expressed so frequently to your individual members my sense of privilege and pleasure in the prospect of addressing your Association that I feel I need no more than say "ditto" to myself with regard to that individual expression and again thank you for this opportunity to meet you, and not only to meet you and realize the character of the men to whom the industrial destinies of Canada are committed, but to receive that strong impression which in itself is a valuable lesson of the quickness with which this nascent nation has learned the lesson of unity of action. Coming from a nation that points with pride to a National Association of Manufacturers, numbering three thousand members and representing some twenty billion dollars of invested capital, it is a pleasure to realize, as one who springs from the same blood that you do, that here in Canada you have out-yanked the Yankee in your numbers and power; that you have learned the lesson of the way to meet honorably commercial rivalry with due regard for the future interests of your nation, and to create a national organization of manufacturers in which the bitterest of individual competitors can meet on the common ground of national welfare, struggling shoulder to shoulder to do as much as his competitor can do to bring about a condition of principle in which that future is assured.

Twenty years ago such a gathering of competitors would have been a practical impossibility; it would have been almost sure to result in a condition of affairs like that described by little Marshal Wilder, as attending a gathering of Irishmen in San Francisco, who were celebrating a little social evening. One of the friends of the host of the preceding evening met him next day, and being invited into the house, passed down through the walk to the door and noticed it hanging on one hinge; he observed that the hat rack was injured and stood somewhat poorly against the wall, that the carpet had here and there its tear, that the furniture scattered through the house all showed the marks of hard usage. Finally, arriving in the dining-room, he noticed the table staggering weakly against the wall, and pieces of the dining-room furniture uncertain in their ability to stand on their own feet. He halted and said, "Well, Dan, you must have had a fine time here last night." Dan said, "Yes, they all expressed themselves as being rather satisfied." He said, looking around over the room, "My heavens, man, you are an extravagant cuss. I know there is no one treats his friends as you do, but a man that will do what you did, buying grapes this time of the year for a gathering such as you had last night must be out of his senses." The other looked over the floor at those evidences of the preceding evening's pleasures and he said, "Grapes! grapes! you chump, them is not grapes, them is eyes." (Laughter).

Friendly Competition.

A gathering of competitors twenty years ago might have resulted in another means of settling such disputes as you gentlemen have engaged in here in the last two days. It is a wonderful age in which you participate, that the manufacturing mind of Canada can unify itself for action, that in a day in which all the intelligence of life has been brought into quick intercommunication, you can gather into one room

*Address delivered at the Toronto Convention Canadian Manufacturers' Association.

the manufacturing mind of Canada. For after all it is only the individual human being who is ignorant. The race and the nation are very wise. If it were possible to accumulate from all its stores the vast fund of human information in the possession of various individuals and put it into a mind big enough to hold it, with a judgment sound enough to use it, of what advantage to your race could such a mind be? And of what advantage to a community and nation like this it is to have you meeting together to consider the best means of directing the industrial future of Canada.

The Place of Industrial Education.

And, gentlemen, I conceive that there is no one instrument that offers so much to the future of your industry and the future of the meanest citizen that shall stand within your borders as the prospect of practical, systematic, wide-spread, industrial education. Scarcely two months have passed since the splendid educational institutions that grace your city turned out into the commonwealth hundreds of young minds to exchange their almost top heavy burden of wisdom for a practical living. The young physician has gone forth, lancet in hand, to carve his way to professional success (laughter); the young lawyer has raised the hopes of the prisoner in the dock; the young clergyman the prospects of theological unity; and the young lady, the joint product of four years' of education and three dressmakers, has riveted the attention of her audience as she gracefully darts down the aisle for the reception of her diploma.

In the nation from which I come, I can say to you, gentlemen, with confidence in the truth of my utterance, that it is far easier for a man to become a lawyer, an electrical engineer, a civil engineer, a doctor, a clergyman, than it is to become a first-class dyer or a perfect plumber (laughter); and yet, sirs, is the necessity for such individuals in our community generally perceived? Is there anyone within the sound of my voice who doubts that you need plumbers, dyers, carpenters, bricklayers; that you need mechanics and machinists in every skilled branch of manufacturing industry; that you are looking for men of whom you can make competent foremen, supervisors, floor directors? Is there a man among you who has not a place for a first-class practical mechanic, the man trained in the technicalities of your particular industry?

Our Faith in Education.

We come of a people that value education, that put into magnificent institutions of stone and marble the expression of their belief in culture, refinement and learning, that are turning the best minds of the age to the training of the youth of the land; but are we training them, gentlemen, with consideration for the fact that for every professional man that enters into life there are a thousand on the farm, in the forest, in the factory, who at an early age of life must forego the advantages of higher education for the practical calls of every day life. In the United States, of approximately six millions of school children that annually enter our public schools, less than two hundred thousand on an average pass the high schools, less than one hundred thousand secure the advantages of the Collegiate Institute, and the vast remainder, owing to the compulsion of necessity, of inclination, of ignorance of the value of education if you like—owing to hundreds

of those impulses, the pressures, and calls, and obligations of commercial, mercantile and business life, leave their school rooms to gain for themselves a way in life; and if it is a mark of an age of civilization to supply opportunities for that hundred thousand that are to be the professional lights of the nation, what shall be said in a democracy of the claims of those millions upon whom the future nation depends? . . . Sirs, I think I may lay it down as a proposition that may be absolutely demonstrated, that not only the industrial future of your nation as a whole, but the happiness, the material prosperity and contentment of your individual citizens, your progress along the pathway of civilization, are dependent upon that which each individual shall bring to his daily task. Nay, more, the very standard and measure of that progress, of that inheritance that supplies the forward movement that shall be handed down to your posterity, are dependent upon the efficiency and the skill with which the men of Canada of today take up their task.

Labor, A Divine Law.

For, sirs, it is not a thing to be criticized, because it is a fact of creation, that men come into this life with a burden of labor laid upon them. It is a burden from which no man can escape. It is not only the tax that he must pay for life, it is the treasury out of which he pays his way through it.

The Creator, in placing upon man the task of earning his living, provided him also with the means whereby he might determine the kind of living he should earn. Upon his own labor he is dependent, not simply for the necessities of life for himself and those depending upon him, but for all those conveniences, those refinements and those luxuries that make up the sum of civilized existence in our day and in our hour. So that in placing upon man the burden of supporting himself and those dependent upon him in his journey through life, the Creator also supplied him with the treasury out of which he should pay for that passage.

The Source of Wages.

And I think we can lay it down as a further fact, that there is no possible source out of which labor can be paid or its wages advanced except out of that thing which the hand and mind of labor produces; and that, therefore, the reward that labor shall have for its effort does not depend upon the whim and caprice of men; it is not something that is dependent upon the charity of an employer or upon his generosity, or upon his smallness; it is not something seized either from the profit of capital or from the wages of labor, but it is something that is dependent upon the effort which labor makes for itself. If I am the producer of this table there is no possible fund out of which I can ever pay for its production except the table itself. If I am the producer of that chair there is no possible thing out of which I am to be paid for my share in the production of that chair except the sum which it fetches upon sale; and not only am I who gave this chair its ultimate shape to be paid from the fund which its sale produces, but every single factor in the production, from the hand that laid the axe to the root of the tree from which that wood came, to the hand which exposes it for ultimate sale, is to be paid from that chair; and if I receive more than is my proportion in the production of that chair it must be at the expense of someone else who contributed to its production and gets less.

There is then absolutely no fund out of which labor can be paid for its share in the production, its wage, except the thing which it produces. It cannot be paid more than its share, otherwise it does injustice to him who employs that labor and drives away from it the investment of capital en-

gaged in the production. It cannot take less, otherwise if profit is being taken from the wage of labor and unduly added to the profit of capital, other capital tempted by the opportunity there presented of investment is immediately attracted into that particular industry. Let there be a change of five or ten per cent. in the rate of wages between Toronto and Montreal, and there is no marked migration of labor from this point to that, because that which labor has to sell is a part of his own person, and labor has social ties of family and it cannot easily transport itself from point to point; it must consider the cost of motion not only of itself, but of those dependent upon it; it is, therefore, in the very nature of things, attached to some extent to the shackles of locality. But capital is as free as the air. Let there be a change of one per cent. in interest between Toronto and Montreal and money flows from Toronto toward Montreal; for capital may invest itself in Hong Kong, in London, in Paris, in Peking, in Berlin for the cost of a postage stamp, or in the twinkling of that rapid motion of the electric current that transmits the message of the telegrapher.

Greater Rewards Follow Increased Production.

Labor, therefore, being dependent upon its own product for the reward of its labor, cannot, economically speaking, obtain a greater reward or a greater share of its product unless economically speaking it produces more than it did before. So that there is no certain, secure and permanently economical basis upon which wages can be increased or the profits of capital insured except increased production. (Applause.) You cannot on the one hand decrease production and increase wages; you cannot have more to divide unless there be more to divide. You cannot increase wealth except by adding to it; for it is not the fiat of a word, but it is the effect of energy applied and producing. (Applause.) The permanent reward of labor, then, and the permanent profit of capital are dependent in their continuous increase upon increased production. Increased production can be secured, other things being equal, only through multiplied mechanical labor-saving devices, which assume a better brain and higher intelligence not only to create but to sustain it, but also superior skill and efficiency on the part of the producer.

President Roosevelt said, "It is the man behind the gun that makes a Navy." The voice of experience and industry says, "It is the man behind the machine that makes an industry."

Methods of Production Revolutionized.

Now, in this day and in this hour, the marvellous improvement of the race, its wonderful development of material resources, its wonderful control of natural forces has revolutionized the whole science of production. It has not only enabled men to produce faster, but it has enabled them to produce cheaper; and it has connected the seller with the customer at points which one hundred years ago were beyond the range of its activity, if they were not even beyond the ken of its knowledge and vision. You do business to-day between Toronto and Chicago easier than your ancestors of two generations ago did between Toronto and Montreal. We have made ferries of the ocean; we have bound the whole vast earth with the steel bonds that send the blood of commerce throbbing through the highways of industry; we have taken the lightning from the skies and made it the hand-maid of man's effort. The very forces that aroused the superstitious fears of our ancestors have become the ser-vants of their posterity. (Applause) And with this vast mass of forces and energy at our disposal we have multiplied a thousand fold the producing power of each unit of labor to earn more for itself because of its increased capacity for production.

Pre-eminence of the Individual in Commerce.

We live in an age, it is true, of consolidation and organization, in which, as one gentleman said here yesterday, it seems as though the individual were lost. But, gentlemen, there is no consolidation or organization in industry that is not to-day as dependent as it ever was in the whole history of mankind upon individual leadership and supervision. If the world moves faster because quicker individual minds guide it more actively upon the pathways of rapid progress; but it is as dependent as it ever was upon systematic organization, co-ordination and direction. Hence it follows with respect to labor and with respect to capital, that permanent increase of wages and profits is dependent upon permanent increase of production, and upon that alone. Then those causes that tend to the direct immediate increase of the producing capacity of the individual, by increasing his skill and efficiency, are the great and exclusively potent factors in the increase of individual progress.

We Never Needed Industrial Efficiency More.

You tell me perhaps it is not so important that the individual be skillful because we have in our day a thousand varieties of labor-saving devices, a thousand machines that multiply with ghostly fingers the weak and impotent individual activities of men. Sirs, the race was never more dependent in all its life upon industrial efficiency, not only to maintain what civilization has added to the producing factors of industry, but to improve and better them for the years that are yet to come. With one hundred years of wonderful progress, in comparison with the industrial possibilities of the future, we have but touched the very outskirts of probability; as Newton said when complimented for the wonderful things which he had done for human progress, "Why, gentlemen, when I consider beside what I have thought and conceived the infinite possibilities of the race I feel like a child that has stood upon the edge of the sea and dipped from it with a spoon."

The Individual Supreme.

And you, sirs, like I, come of the races that desire to stand supreme among the nations of the earth; we come of a people, we represent a blood, we express principles of governmental and civil action that depend for their success upon the individual that is the basis of the civilization we seek to create. If then we rest upon principles of that character we rest the finality of our success upon the individual progress of our race, upon the moral improvement of each individual, upon the industrial improvement of each individual, and as we hope for a better moral civilization we must look to the moral enlargement and the moral advancement of each individual; or if we look for material progress or industrial advancement we must look to the preparation of the individual who is the sole factor and who alone makes such advancement possible.

A Lesson From Germany.

Do you want an example of what can be done in that way? In 1876 at the American Centennial Exposition, the German Industrial Commission sent over by the then Emperor of Germany, Frederick of Prussia, reported back, after an exhaustive examination resulting in a comparison between methods and results in the production of Germany and other nations there exhibiting, that the German exhibit was cheap but rotten. Germany then occupied an inferior position among the manufacturing nations of the earth. Under the wonderful reforms inaugurated by that Emperor and continued by his successor and the present Kaiser there has sprung up in Germany the most remarkable system of Industrial Education systematized and organized existing in any nation of the earth; and Ger-

many in practically a quarter of a century, with not one fraction of the natural material wealth of Canada, with a population that man for man is not the intellectual superior of the Canadian, with the competing markets of the world practically held by her rivals, without either the most modern machinery or mechanical genius that seems to have the capacity to provide it, by systematic industrial education, by the development of each single individual industrial unit in German industry, has come from the very rear rank, and in thirty years of manufacturing activity is second among the nations of the world as an exporter. (Applause) And it can be traced to no other single thing than systematic industrial education. (Applause)

Now, if that is the reward of effort, gentlemen, is not the effort worth while? If you are bonded together at this early point in Canada's National life with the realization of the wonderful possibilities of this rich Empire that surrounds you, with the task on your hands of developing it for your personal profit and for the advancement of the Nation of which you are proud to be citizens, isn't it worth while to consider now and here the giving of your activities to the systematic establishment of methods of industrial education that will assure you that while you manufacture products you are also making men? That while you are building an industry you are creating the mechanics that can not only sustain but advance it; that you will be depending no more upon the nations of this earth for men than you will for material? You are proud to think that within the borders of your Dominion you have every natural resource that can make Canada worthy of Canadians. Haven't you also within the boundaries of your nation the men that can sustain, build up and perpetuate your industries? You would not ask to be placed in a situation in which you would be dependent upon the nations of the earth for food for the mouths of your people, for material for your machinery to work upon. Yet, are you not to-day, and is your Government not to-day, pursuing a policy that eventually will lead to this, that Canada as she grows in industry, will not have men equal to meeting the demands of labor and leadership? It is a natural thing; it is an unavoidable consequence of the youth of a nation; it is an unavoidable effect of rapid growth, that you should necessarily look to older nations for the factors that are to support your industry. But in doing so it is the part of wisdom to provide that in your growth at each successive step you shall become less and less dependent upon them for the human factors that are to sustain and perpetuate your industry; and as you build up that industry you shall build up in Canada the individuals who will perpetuate it (applause); and in doing so you are not alone providing a means of livelihood for the Canadian; you are not alone providing employment for your citizens; you are providing the greatest moral safeguard with which a nation can surround its people, knowledge and the capacity for doing one task well. Man is so constituted that you cannot train his fingers without leaving your impress upon his mind; that you cannot make him a good mechanic, a good lawyer, a good doctor, a good clergyman, without also making him at once a good man and a good citizen. You cannot give a man the settled and fixed means for earning his livelihood, you cannot bring him to a realization of his relation to the general factors of industry, without bringing him to a sense of responsibility in the upholding of them. You cannot train him to industrial efficiency without giving him also the opportunity for attaining to the highest moral efficiency.

It follows, therefore, gentlemen, that if the nation realizes the necessity for training good lawyers it should stop quick and think sharp as to the necessity for training good mechanics. Remember, gentlemen, that if there is one right in this life that the English-speaking races have ever struggled

to make clear, not only to themselves, but to the rest of the family of nations, it is the right to labor. The right to live includes the right to labor. Moreover, there is an obligation in society corresponding to that right in man, which shall protect each individual in his right to labor. Society is obliged further to provide him with the best possible means of making the most that is in him, in order that he may profit by his own labor, and that the nation of which he is a part may receive the highest reward from his efforts. For the same God that made the flowers of the field, that gave the skies their stars, that surrounded all creation with the diversified beauty of nature, provided also an abundance of diversified talents among the children of man, that every possibility of human effort might be developed by that peculiar skill which the Creator gave to each individual for some particular pathway of life. The child as he thrives under the sunlight of parental love shows in a thousand ways his tendencies, his abilities, his one movement toward a true livelihood. It is for society, recognizing the part that the Creator has played in supplying it with the means of diversified development, to gain for the nation the development of those natural gifts, the entire fruit of their action; and it is by industrial education along material lines of activity that those diversified talents are assured, not only for individual reward, but for commercial advantage. The recognition of these principles tend after all towards the facts of creation that are driven home to us by daily experience. Let us not be like that most unhappy and yet apt figure in Virgil, the weakest of human beings, he, who *video meliora sed deteriora sequor*, "sees and approves the better course but follows the worse."

If you realize the advantages of industrial education to yourself and Canada, see that you have a unified and harmonious power building it up in this Dominion; utilize the forces that you represent to make it a distinctive Canadian movement; remember that as you are basing your belief in this thing upon the principles that are as sound as the moral law itself, you should confidently give it the publicity that will drive it home to the minds of your people. You shall have behind you the overwhelming force of a popular judgment to give it concrete reality in Canadian life. (Applause).

Let your Government understand that what the Canadian manufacturer struggles for, in securing a system of industrial education, is not his profit and his advantage, but the development of Canadian citizenship along those broad lines that mean the highest development to every single citizen who participates in them. There is no one thing upon which employer and employee, the manufacturer, the machinist, the workman and the master can be so thoroughly united as in a method of industrial development which will combine material profit with the surest moral gain. Gentlemen, knowing as you do the tremendous possibilities of this wonderful heritage you possess, stand together to secure the right of the working man, sometimes against his own ignorance, sometimes against those who misrepresent to him the things which are for his good; stand as a unit against your own kind when they are mis-guided and short-sighted or prejudiced in their dealings with their workmen. Let this prosperity which we have talked so much about be based upon the lines of permanent, fixed, moral action. For after all what is prosperity? Nothing but an abundance of commodities fairly distributed; and there is no means of securing that abundance except by intelligent skilled production; there is no means of securing its fair distribution unless we live an economical life that realize economics; laws as certain in their application as the fall of the apple from the tree beneath the impulse of gravitation.

Increased Consumption Accompanies Increased Production.

There are those who, not having the mind, perhaps, and not clearly seeing or grasping the thought, declare they want no industrial teaching, no trade training, because it means the development of too many workers. That is founded upon the theory that the jobs which men can do are like the hairs of the head, numbered and defined, and when job 1088 has been reached, 1089 cannot be born, for there is no demand upon which to base it. This would be true enough if the limits of production were definite, but practically speaking the limits of human production are indefinite. No sooner does a man apply himself to a new industry than he creates the employment of a thousand new hands. The Creator has so fashioned us in his goodness that he has made it absolutely impossible for a man to better himself without bettering others; so that even the foibles and extravagance and weakness of humanity itself help others who participate in the fruits of that extravagance, if they do not share the weakness itself. Vanity cannot deck itself with a dress that one hundred hands are not turned to the needle. Pride cannot build for itself a castle that a thousand hands do not find employment for themselves and bread for those dependent upon them. Learning cannot erect its temple of wisdom, art cannot found its shrine, religion cannot raise its cross to the blue sky of heaven, without giving employment to a thousand human hands to assist in the rearing of that superstructure. These not only share in the benefits of the completed work, but also are paid their share in each step of its progress. Wonderful is the kindness that has disposed such things about us. It only rests with us to keep clear the judgment that perceives them.

Realizing these things and fulfilling these principles the Canadian Manufacturers' Association moves on to the fruition of the highest ambition and the noblest realization of life of this great Dominion; securing for every one of its citizens the opportunity of earning a living in the manner in which God has given him a vocation. Your reward will be that you will not only guide a great and successful industry but a prosperous and contented staff of workmen. Your success will be builded upon the general education of your workmen, upon their realization of their relation to you and upon their development each in his own capacity of those moral and mental activities that alone insure the fullest development of the human mind and the fullest reward of human effort. (Applause).

Ontario Legislative Buildings

The Twentieth Century Belongs to Canada * Some Illustrations of Our Growth in the Last Six Years

By ARCHIBALD BLUE, Chief Officer of the Dominion Census

TO one not wholly a stranger, who at intervals of say half a year may stand on a corner of King and Yonge streets when the employees of business houses and workshops are going to their homes at the close of the day, it is obvious that Toronto is a growing city. He observes it in the closer throng on the walks, in the greater scramble for cars, in the tenses look of human faces, and in the hurry, hurry, hurry of human feet. For twenty-one years I lived in this city, and was on its streets daily, and knew many of its people. In the last year of last century I went elsewhere to live and work, but I have not been altogether a stranger here. Six months ago I walked from the Parliament Buildings to the King Edward at the noon hour, and although Yonge and King streets were alive with men and women the only face I saw and knew was Sir Wm. Mulock's, and we just nodded a recognition and walked on as if our meetings for the past seven years had been a daily happening. The unknown faces and the number of them told me the story of the city's growth as well as a census. It was an ocular proof, which if not as exact is more striking than a count of heads. But what one sees with the eye lies within a narrow circle, and as I purpose in this paper to offer some illustrations of the growth of Canada in the twentieth century I shall employ the only data that have value in mathematical demonstrations. Nearly all the great discoveries of science, Lord Kelvin has said, have been the reward of accurate measurement and patient labour in the minute sifting of numerical results. And this also is true, that far more of what is useful in helping to shape the affairs of the country is to be learned from the records of measurement we call statistics than from the most brilliant speculation.

Our foreign trade, exclusive of coin and bullion, of goods not the produce of Canada, and exports estimated short, has grown from \$336,018,000 in the last fiscal year of the nineteenth century to \$518,800,000 in the sixth year of the twentieth. It was \$123,000,000 in 1870 and \$162,374,000 in 1876. Thirty years ago, at the end of a period of six years, our trade showed a gain of \$39,391,000 and at the end of our last period of six years it shows a gain of \$182,748,000.

Our chartered banks, which in 1870 had assets of \$103,200,000 and in 1876 of \$183,500,000, had assets of \$459,700,000 in 1900, and of \$878,500,000 in 1906, being a gain in the former period of \$80,300,000 and in the latter of \$418,800,000. In 1870 the total cash on deposit in the banks was \$48,763,000 and \$72,853,000 in 1876; and after thirty years the amount was \$305,140,000 in 1900 and \$605,968,000 in 1906. In the first period of six years the gain was \$24,090,000 and in the last it was \$300,828,000. The monthly average reserve fund held by the banks was \$32,372,000 at the end of 1900 and \$64,000,000 at the end of 1906, and in the same period their paid-up capital was increased by \$25,881,000. The clearing house statements, which are a certain measure of the volume of the country's business, show an expansion of \$2,360,000,000 in the six years of this century, the amount being \$1,590,000,000 in 1900 and \$3,950,000,000 in 1906. There was at the credit of depositors in Post Office and Dominion Government savings banks at the end of June, 1870, a sum of \$3,411,000, which grew to \$7,044,000 in 1876, to \$53,150,000 in 1900 and to \$61,911,000 in 1906. Altogether there was at the credit of de-

positors in chartered and savings banks in 1906 a sum of \$667,880,000, whereof the large amount of \$309,590,000 has been an accumulation of this century. In the chartered banks alone the increase of deposits from \$48,763,000 in 1870 to \$305,140,000 in 1900 and to \$605,968,000 in 1906 shows the very large extent to which the banks have been assisted above their own capital in maintaining the business of the country.

Our steam railways in operation in the Dominion in 1870 had a length of 2,617 miles and in 1876 of 5,218 miles. At the end of the century they had a length of 17,657 and in 1906 of 21,353 miles, together with 814 miles of electric railways. The earliest statistics of railway operations go back to 1875, and in the following table a few comparative figures are given to show the progress of the Dominion in this great branch of transportation:

Comparative Statistics of Railway Transportation.

	1876.	1900.	1906.
Steam Railways			
Train mileage ... m.	18,103,628	52,647,684	72,723,482
Passengers NO.	5,544,814	17,122,193	27,989,782
Freight ton.	6,331,757	35,764,970	57,966,713
Gross earnings ... \$	19,358,085	70,231,979	125,322,865
Net earnings "	3,555,364	22,826,383	38,193,431

The increase of train mileage in the six years of the twentieth century is 20,000,000, of passengers 10,867,000, of freight 22,200,000 tons, of gross earnings \$55,000,000, and of net earnings \$15,367,000, as against an increase of 34,544,000 train mileage, of 11,577,000 passengers, of 29,433,000 freight tons, of \$50,874,000 gross earnings and \$19,271,000 net earnings in the twenty-four years of the nineteenth century. The statistics of electric railways are complete only for the six years of this century, in which they show an increase of 116,720,000 passengers carried and of \$2,137,000 net earnings, being for each in a period of five years an increase of 100 per cent. The subscribed capital of steam railways in 1876 was \$317,795,468 and the paid-up capital \$290,757,875. In 1900 the subscribed capital of steam and electric railways was \$1,040,486,378, and the paid-up capital \$998,264,405; and in 1906 the subscribed was \$1,456,176,443, and the paid-up \$1,396,356,675.

Trade, transportation and banking have been the most active and potent of all agencies in the development of our country. Without international trade we should exist as a hermit nation; without railways the opening up of our great interior between ocean and ocean could not be achieved; and without banks there would be little business beyond a simple exchange between neighbor and neighbor. The figures given show how Canada is advancing on the highways of the nations.

Western Development.

Illustrations of another sort are found in the records of the census of our North-West provinces, taken a year ago.

Manitoba, Saskatchewan and Alberta were an unknown and untravelled region less than forty years ago. Manitoba was admitted to the status of a province of the Confederation in 1870, and Saskatchewan and Alberta attained to the same rank only in 1905. In 1881, when the first census of those three areas was taken, they had a population of 105,681; in 1891 they had 219,305; and in 1901 they had 419,512. In 1906, five years later, the population was 808,863. Manitoba's share in this growth was 110,477, Saskatchewan's was 166,484, and

*Address delivered at the Toronto Convention Canadian Manufacturers' Association.

Alberta's was 112,390, and the rate of increase for the three provinces in the five years was 93 per cent. There were 2,370 townships with inhabitants in 1901 and 4,365 in 1906, and the cities, towns and incorporated villages grew in the same period from 84 to 185.

The number of farms in the three provinces in 1906 was 122,398, being 67,773 more than in 1901. In Manitoba there were 36,141, an increase of 4,329; in Saskatchewan, 55,971, an increase of 42,591; and in Alberta, 30,286, an increase of 20,853.

The whole number of horses in 1906 was 682,919, being an increase in five years of 342,590; of milch cows, 384,006, an increase of 59,790; of other horned cattle, 1,560,592, an increase of 802,183; of sheep and lambs 304,531, an increase of 121,915; and of swine 439,048, an increase of 238,673.

The area sown to wheat, oats, barley, rye, flax, potatoes, other field roots, forage crops and cultivated hay in 1900 was 3,597,700 acres, in 1905 it was 6,298,000 acres, and in 1906 it was 8,328,000 acres. In the first of these years crops were light, owing to an unusual season of drouth; but in the other two years, when the conditions were normal, the yield of wheat was 82,462,000 bushels in 1905, and 110,587,000 in 1906, of oats, 68,811,000 bushels in 1905 and 110,570,000 in 1906, and of barley, 10,972,000 bushels in 1905 and 18,685,000 in 1906. The increase in the areas of those field crops in the five years 1900 to 1905 was 2,700,000 acres, and in the six years 1900 to 1906 it was 4,730,300 acres.

Comparing the areas of all field crops in 1905 and 1906, there were in the North-West provinces 6,338,000 acres in the former, and 8,408,000 in the latter year, being an increase of 2,070,000 acres or nearly 33 per cent. in one year. In Manitoba the increase was 603,000 acres, in Saskatchewan, 1,167,000 and in Alberta 300,000, which in the aggregate is equal in extent to ninety townships. Yet the whole area in crops in the three provinces last year was only 28 per cent. of the land occupied as farms and only 7 per cent. of the surveyed land in the provinces—the land occupied as farms and ranches being 30,502,927 acres and the land surveyed for settlement 120,484,455 acres.

The Growth of Manufactures.

A census of manufactures taken last year for the year 1905 supplies illustrations of the growth of the Dominion in the twentieth century which may be to this Convention more interesting and appropriate than any one of the others.

In the collection of the returns of manufactures our work has been largely facilitated by the good-will and the kindly co-operation of the officers and members of this Association; and the fact that full reports have been gathered from every part of the Dominion through the medium of the Post Office, without resort to legal authority except in one instance, deserves acknowledgment and hearty recognition. If any works have been missed the fault is ours through failure to make up a full list, which is perhaps excusable in a country of such wide extent as Canada.

A comparison of works employing five hands and over in 1905 with those of 1900 cannot be accurately made for numbers, partly because in the interval many works have been merged under one management, such as butter and cheese factories and canning works; partly because in large establishments carrying on several kinds of industries one return has been made in 1906 where in 1901 separate returns were made for each kind; and partly also because owners of shops in receipt of stated salaries or allowances from the business who were counted in 1901 have not been so counted in 1906. Consequently in hundreds of cases in the census of the latter

year such shops are put into a class of four employees and under. For these reasons the number of works of the first who were counted in 1901 have not been so counted in 1906. In one establishment, for example, eleven kinds of industries are carried on under one management, and the statistics for it are compiled in the tables with the industry of greatest production. An attempt was made in all such cases to procure with the return a statement of the several kinds of products and the value of each product, which would be useful in showing the extensive variety of our manufactures, but many of the returns are defective in these particulars. In the example already referred to, the products for which separate values are given consist of corsets, furs, harness, men's and boys' clothing, photo-engraving, printing, shirts, ties, upholstery, white-wear and women's clothing, all of which are grouped with the class last named because it is one of greatest value, and the total values run up into several millions. Inquiries are often made of us by traders and consumers if particular kinds of articles are made in the country; and if the information was fully supplied by manufacturers it would possess not a practical use only, but an economic importance in exhibiting the extent and range of the country's industries.

The reasons already given account for the apparent decrease in the number of establishments employing five hands and over; but it may be added that in the 27 principal classes of industries showing a decrease in the number of works—a decrease numbering more than 3,000—there is an increase of \$40,000,000 in the value of products. Flouring mills and electric light plants, like butter and cheese factories, brick and tile works and lime-kilns, have been classed with establishments employing five hands and over on account of their relatively large production.

The principal industries employing less than five hands are those of baking, blacksmithing, carding, dress-making, tailoring, printing and harness-making. These comprise 3,249 shops or works with 8,610 employees, and the value of their products is \$11,906,025.

Taking the two classes of establishments, viz.: those employing five persons and over and those employing less than five—the whole number in the Dominion whose statistics have been compiled for the calendar year 1905 is 15,796. The capital employed in these works, including land, buildings, plant and working capital, is \$846,585,000. The employees on salaries and wages with earnings and average earnings are as in the following table:—

Employees and Earnings, 1905.			
Sex	No.	\$	Averages.
			\$
On salaries—			
Male	31,545	28,938,637	917 38
Female	4,951	1,785,449	360 62
On wages—			
Male	288,033	119,550,821	415 05
Female	68,001	14,825,104	218 01

The number of employees on salaries and wages is 392,530 and their total earnings is \$165,100,011, and the total value of products is \$718,352,603. But to make a fair comparison of 1900 and 1905 the statistics of works employing five persons and over will be used here.

The following table shows the growth of the Dominion in five years for manufacturing establishments employing five persons and over under the heads of capital, employees, earnings and value of products:—

Capital, Employees, Earnings and Products.

Schedule	1905	1900	Increase
Capital	\$ 833,916,155	446,916,487	386,999,668
Employees	NO. 383,920	339,173*	44,747
Salaries and wages	\$ 162,175,578	113,249,350	48,926,228
Value of products..	" 706,446,578	481,053,375	225,393,203

In the five years of this century capital has increased in the ratio of 100 to 187 and the value of products in the ratio of 100 to 147, which indicates that in some industries and works production has not reached a full measure of development. The average ratio of capital to production for all industries in 1900 was 100 to 108, and in 1905 it was 100 to 85. The cause of this change is revealed in the returns of some of the recently organized works. The capital invested in electric light and power plants, for example, increased during the five years by \$68,500,000, and its ratio to production is 100 to 9.44. So also with smelting works like those in Nova Scotia, Ontario and British Columbia, whose capital has been increased by nearly \$76,000,000, the ratio of capital to production is 100 to 32.50. It is obvious from the number of persons employed in some of these works that they have not been working to full capacity. But industries which show in the aggregate an increase of \$49,000,000 in salaries and wages and of \$225,000,000 in production in the fifth year of the twentieth century are setting a good pace for the century.

Compared by groups of industries for 1900 and 1905, the values of products in each year and the increase in five years are shown in the next table:—

Production by Groups of Industries.

Groups of Industries	1905	1900	Increase
	\$	\$	\$
Food products	172,017,002	125,202,620	46,814,382
Textiles	84,370,099	67,724,839	16,645,260
Iron and steel products.	52,587,051	34,878,402	17,708,649
Timber and lumber and their re-manufactures.	109,500,970	80,341,204	29,159,766
Leather and its finished products	41,201,872	34,720,513	6,481,359
Paper and printing	32,773,880	20,653,028	12,120,852
Liquors and beverages ..	13,928,701	9,191,700	4,737,001
Chemicals and allied products	15,290,822	11,437,300	3,853,522
Clay, glass and stone products	13,558,921	7,318,582	6,240,339
Metals and metal products other than steel	50,068,669	19,561,261	30,507,408
Tobacco & its Manufactures	15,189,720	11,802,112	3,387,608
Cars, carriages, wagons, etc.	36,911,124	19,971,605	16,939,519
Vessels for water transportation	1,892,253	2,043,668	151,415
Hand trades	1,433,753	599,329	834,424
Miscellaneous industries	65,721,741	35,607,212	30,114,529
Totals	706,446,578	481,053,375	225,393,203

The large increases have been made in food products, timber and lumber and their re-manufactures, metals and metal products other than iron and steel, iron and steel products,

*An excess error of 4,862 employees crept into the tables of the 1901 census, which is corrected here. It was made in the return of one establishment of men's factory clothing in Centre Toronto and was overlooked in the compilation.

textiles, cars, carriages, wagons, etc., and paper and printing, ranging in these several groups from \$12,000,000 to \$47,000,000 of increase.

Comparing the principal manufacturing establishments by value of products there were 479 works in 1905 with products of \$200,000, to under \$500,000 each, against 323 in 1900 of the same class; there were 139 in 1905 with products of \$500,000 to under \$1,000,000 each, against 68 in 1900 of this class; and there were 81 in 1905 with products of \$1,000,000 and over against 39 in 1900 of this class. And as showing growth in industrial efficiency, which implies improved methods and machinery and harder work, it can be said that in every group of our industries the average of production has increased substantially in five years. In 1900 it was for all industries \$1,559, and in 1905 it was \$1,990 per wage worker; or compared on the basis of all employees on salaries and wages, it was \$1,476 in 1900 and \$1,803 in 1905.

Another comparison may be made here, viz.: the cost for management and labor in manufacturing establishments. In 1900 the average salary of managers, officers, clerks, etc., was \$833 for males and \$317 for females, and in 1905 it was \$925 for males and \$362 for females. For wage-earners employed in the works the average in 1900 was \$334 for males and \$176 for females, and in 1905 it was \$417 for males and \$219 for females. But for both sexes the average cost of salary per employee was \$771 in 1900 and \$849 in 1905, an increase of \$78; while the cost of wages was \$286 in 1900 and \$379 in 1905, an increase of \$93 per employee. The capital employed in manufacturing establishments, including land, buildings, plant and working capital is shown by the following table for the provinces of the Dominion, together with the increase of capital in each province at the end of the fifth year.

Capital Employed in Manufactures.

Provinces.	1905.	1900.	Increase.
	\$	\$	\$
British Columbia	52,403,379	22,901,892	29,501,487
Manitoba	27,070,665	7,539,691	19,530,974
New Brunswick	26,461,664	20,741,170	5,720,494
Nova Scotia	74,599,738	34,586,416	40,013,322
Ontario	390,875,465	214,972,275	175,903,190
Prince Edward Island ..	1,553,916	2,081,766	527,850
Quebec	251,730,182	142,403,407	109,326,775
Saskatchewan	3,820,975	1,689,870	7,531,476
Alberta	5,400,371		

In all the provinces except Prince Edward Island there has been increase of capital as measured by the value of land, buildings, plant and working capital; and while the greatest per cent. of increase has been made in the western provinces, the large investments have been made in Ontario and Quebec.

The value of products is shown by provinces in the next table for the two census years, together with the increase in five years.

Products by Provinces, 1900 and 1905.

Provinces.	1905.	1900.	Increase.
	\$	\$	\$
British Columbia	37,796,740	19,447,778	18,348,962
Manitoba	27,857,396	12,927,439	14,929,957
New Brunswick	21,833,564	20,972,470	861,094
Nova Scotia	31,987,449	23,592,513	8,394,936
Ontario	361,372,741	241,533,486	119,839,255
Prince Edward Island ..	1,696,459	2,326,708	630,249
Quebec	216,478,496	158,287,994	58,190,502
Saskatchewan	2,433,801	1,964,987	5,458,746
Alberta	4,979,932		

British Columbia manufacturers nearly doubled the value of their products in the five years. Manitoba manufacturers doubled theirs, and Saskatchewan and Alberta nearly quadrupled theirs. The value of preserved fish in British Columbia was increased by \$1,492,000, of log products by \$6,960,000 and of smelting works by \$5,542,000. In Manitoba the chief increase has been in the products of flour and grist mills, which exceed \$3,000,000, and in Saskatchewan and Alberta the values of log products and flour and grist mill products have increased by \$2,452,000. Nova Scotia shows an increase of \$711,000 in log products and of more than \$5,500,000 in the products of smelting works. For Ontario and Quebec value and increase are given in the following table for industries in which the increase in the five years is \$2,000,000 and over:

Products of Principal Industries in Ontario and Quebec.

Industries.	1905	1900.	Increase.
Ontario.	\$	\$	\$
Agricultural implements...	11,926,233	8,295,170	3,631,063
Bread, biscuits and confectionery	9,981,136	6,102,430	3,878,706
Clothing, women's, factory.	7,144,892	1,309,627	5,835,265
Electrical apparatus and supplies	7,201,463	1,171,543	6,029,920
Flour and grist mill products	35,319,060	21,025,481	14,293,579
Foundry products	15,520,418	9,145,382	6,375,036
Furniture	7,375,528	5,212,997	2,162,531
Leather	9,572,334	6,255,337	3,316,997
Log products	31,626,222	25,672,424	5,953,798
Lumber products	12,882,223	6,152,853	6,729,370
Plumbing and tin-smithing	5,644,716	2,613,814	3,030,902
Printing and publishing ..	11,429,664	7,077,800	4,351,864
Smelting (ore products)...	11,870,183	1,894,012	9,976,171
Quebec.			
Car works and repairs....	13,225,317	5,905,805	7,319,512
Electric light and power..	4,188,760	646,563	3,542,197
Flour & grist mill products	8,598,830	3,195,911	5,402,919
Iron & steel products	5,510,596	3,455,578	2,055,018
Log products	14,489,206	10,391,638	4,097,568
Paper	6,163,240	2,621,071	3,542,169
Slaughtering & meat packing	5,351,739	3,079,440	2,272,299
Tobacco products	10,891,803	8,230,952	2,660,851
Wire	3,437,308	1,213,239	2,224,069

In Ontario the greatest increase is shown to be in flour and grist mill products, and in Quebec it is in car works and car repairs. Seven of the thirteen industries for Ontario and three of the nine for Quebec have values of \$10,000,000 and over.

The next comparison is made for the value of products of cities and towns in the five years in which the increase is \$2,000,000 and over. The places are arranged in alphabetical order.

Products of Cities and Towns, Showing Increase of \$2,000,000 and Over.

Cities and Towns.	1905.	1900.	Increase.
	\$	\$	\$
Amherst	4,174,929	1,551,907	2,623,022
Berlin	5,449,012	3,037,513	2,411,499
Brantford	8,545,679	5,564,695	2,980,984
Hamilton	24,625,776	17,122,346	7,503,430
Kingston	4,329,607	2,045,173	2,284,434

Cities and Towns.	1905.	1900.	Increase.
	\$	\$	\$
Montreal	99,746,772	71,099,750	28,647,022
Ottawa	10,641,378	7,638,688	3,002,690
Peterborough	11,566,805	3,789,164	7,777,641
Sault Ste. Marie ..	5,251,643	738,472	4,513,171
Sydney	4,058,659	631,396	3,427,263
Toronto	85,714,278	58,415,498	27,298,780
Vancouver	10,067,556	4,990,152	5,077,404
Winnipeg	18,983,290	8,616,248	10,367,042

In this list of fourteen cities and towns relative positions have not changed much in the five years as ranked by values of products. Montreal, Toronto, Hamilton, Winnipeg and London continue to hold the first five places in the order named. Peterborough has stepped up from ninth to sixth place and Ottawa has dropped from sixth to seventh. Vancouver retains the eighth rank, and Brantford drops from seventh to ninth. Berlin retains the tenth place. Sault Ste. Marie has displaced Kingston for the eleventh place, and Kingston, Amherst and Sydney are at the foot. But when ranked according to increase in the value of product the order is to some extent changed. Montreal and Toronto are yet in first and second places; but Winnipeg and Peterborough take rank before Hamilton, and Vancouver and Sault Ste. Marie before London. In the fourteen cities and towns the increase in the value of manufactures in the five years is \$112,419,041 or 58 per cent. Montreal's increase is 40 per cent. and Toronto's is 47 per cent. Adding to these cities the value of products for works employing less than five hands in 1905, Montreal's total is \$100,425,964 and Toronto's is \$86,838,101.

The evidences of the growth of Canada in the twentieth century found in the statistics of manufactures, of railways, trade and commerce are for the whole Dominion, and they show a surprising record of expansion. The census of population and agriculture in the North-West provinces shows if possible development on a larger scale, and while it will not be claimed that the older provinces are growing at the same rate there is no doubt that all parts of the country have prospered in their varied industries. The interests of agriculture, transportation, banking, manufactures, trade and all business affairs act and react upon each other, and with its great natural resources in land and forest, minerals, fisheries and water-powers, there is no limit within sight to the greatness to which Canada may attain before the century is out.

The manufacturers and merchants of Toronto and Montreal are busier to-day through their travellers and agents on the prairies of the West than twenty-five years ago they were in the counties of Ontario and Quebec. Thirty-five years ago the Government of this province and the Government of the Dominion began a contention for possession of the unknown tract between the height of land and Hudson Bay, and nearly twenty-five years ago the final award was made confirming the claim of the province. But for half the lifetime of a generation at the close of last century the new possession was kept as a miser keeps his horde, while our surplus population was going out by tens of thousands every year to find homes and take up citizenship in an alien country, and the victory over the Dominion was exploited for its politics at election after election. Then a young man comparatively new to the public life of the province arose and blazed out a new line into the region of business politics, and the result was the discovery and exploration of the clay belt. That was seven years ago, and the population of that wide northern wilderness stretching nine hundred miles from Mattawa town on the Ottawa River to Winnipeg was less than one per square mile. A new transcontinental railway is now under construction through that domain, and though some of us may

not, will not, live to see it, I am sanguine that long before the close of this century the clay belt of Ontario and its continuation into Quebec will sustain a population of two to three millions,—joining together by the strongest of ties the east and the west and serving to maintain Montreal and Toronto as the great industrial and commercial centres of the Dominion.

A Summary.

Our foreign trade, exclusive of coin and bullion, goods not the produce of Canada and exports estimated short, has grown from \$336,018,000 in the last fiscal year of the 19th century to \$518,800,000 in the sixth year of the 20th. Thirty years ago, at the end of a period of six years, it showed a gain of \$39,391,000, and at the end of our last period of six years the gain is \$182,748,000. Our chartered banks, which in 1870 had assets of \$103,200,000, and in 1876 of \$183,500,000, had in 1900 assets of \$459,700,000, and in 1906 of \$878,500,000, being a gain in the former period of \$80,300,000, and the latter of \$418,800,000. In 1870 the total cash on deposit in the banks was \$48,763,000, and \$72,853,000 in 1876; and after thirty years the amount was \$305,140,000 in 1900 and \$605,968,000 in 1906. In the first period of six years the gain was \$24,090,000, and in the last it was \$300,828,000. There was at the credit of depositors in chartered and savings banks in 1906 a sum of \$667,880,000, whereof the large amount of \$309,590,000 has been an accumulation of this century. In the chartered banks alone the increase of deposits from \$48,763,000 in 1870 to \$305,140,000 in 1900, and to \$605,968,000 in 1906 shows the very large extent to which the banks have been assisted above their own capital in maintaining the business of the country. Our steam railways in operation in the Dominion, which had a length of 2,617 miles in 1870 and of 5,218 miles in 1876, had 17,657 miles in 1900 and 21,353 miles in 1906. The increase of train mileage in the six years of the 20th century is 20,000,000 of passengers carried, 10,867,000, of freight 22,200,000 tons, of gross earnings \$55,000,000, and of net earnings \$15,367,000, as against an increase of 34,544,000 train mileage, of 11,577,000 passengers, of 29,433,000 freight tons, of \$50,874,000 gross earnings, and of \$19,271,000 net earnings in the last twenty-four years ending with 1900. Electric railways for the six years of this century show an increase of 116,720,000 passengers carried, and of \$2,137,000 net earnings, being for each in a period of five years an increase of 100 per cent. The paid-up capital of steam railways in 1876 was \$290,757,000, in 1900 it was \$998,000,000, and in 1906 it was \$1,396,000,000. Trade, transportation and banking have been the most active and potent of all agencies in the development of our country. Without international trade we should exist as a hermit nation; without railways the opening up of our great interior between ocean and ocean could not be achieved; and without banks there would be little business beyond a simple exchange between neighbor and neighbor. The figures given below show how Canada is advancing on the highways of the nations.

Illustrations of another sort showing our growth are found in the records of the census of our North-West provinces, taken a year ago. Manitoba became a province of the Confederation in 1870, and Saskatchewan and Alberta in 1905. In 1881, when the first census of those three areas was taken, they had a population of 105,681; in 1891 they had 219,305; and in 1901 they had 419,512. In 1906, five years later, the population was 808,863, an increase of 93 per cent. There were 2,370 townships with inhabitants in 1901, and 4,365 in 1906 and the cities, towns and incorporated villages grew in the same period from 84 to 185. The number of occupied farms increased from 67,773 in 1901 to 122,398 in 1906. Live stock shows increases in the five years of 342,590 horses, of 59,790 milch cows, of 802,183 other horned cattle, of 121,915 sheep and lambs, and of 238,673 swine. Comparing the areas of all

field crops in 1905 and 1906, there were in the three provinces 6,338,000 acres in the former, and 8,408,000 in the latter year, being an increase of 2,070,000 acres or nearly 33 per cent. in one year. Last year's area was more than three times the area of all crops in 1900, yet it was only 28 per cent. of the land occupied as farms and only seven per cent. of the surveyed land in the provinces.

Condensed Statement of Progress of Manufacturing.

A census of manufactures taken last year for the year 1905 supplies illustrations of the growth of the Dominion in the 20th century which may be to the Convention more interesting and appropriate than any one of the others. A comparison of works employing five hands and over in 1905 with those of 1900 cannot be accurately made for numbers, partly because in the interval many works have been merged under one management, such as butter and cheese factories and canning works; partly because in large establishments carrying on several kinds of industries one return has been made in 1906 where in 1901 separate returns were made for each kind; and partly also because owners of shops in receipt of stated salaries or allowances from the business who were counted in 1901 have not been so counted in 1906. Consequently in hundreds of cases in the census of the latter year such shops are put into a class of four employees and under. But it may be added that in the 27 classes of industries showing a decrease in the number of works there is an increase of \$40,000,000 in the value of products. Taking all works—those employing five hands and over, and those employing less than five—the number for 1905 was 15,796. The capital employed in those works, including land, buildings, plant and working capital, was \$846,585,000, the number of employees on salaries and wages was 392,530, whose total earnings were \$165,000,000, and the total value of products was \$718,352,000. But to make a fair comparison of 1900 and 1905 the statistics of works employing five persons and over will be used here. The capital employed in these works in 1905 was \$834,000,000, an increase of \$387,000,000; the number of employees was 383,920, an increase of 44,747; the amount of salaries and wages was \$162,175,000, an increase of \$48,926,000; and the value of products was \$706,446,000, an increase of \$225,393,000. In the five years of this century capital has increased in the ratio of 100 to 187, and value of products in the ratio of 100 to 147, which indicates that in some industries and works production has not reached a full measure of development. The average ratio of capital to production for all industries in 1900 was 100 to 108, and in 1905 it was 100 to 85. The cause of this change is revealed in the returns of some of the recently organized works. The capital invested in electric light and power plants, for example, increased during the five years by \$68,500,000, and its ratio to production was 100 to 9.44. So also with smelting works like those in Nova Scotia, Ontario and British Columbia, whose capital has been increased by \$76,000,000, the ratio to production is 100 to 32.50. But industries which show in the aggregate an increase of \$49,000,000 in salaries and wages and of \$225,000,000 in production in the fifth year of the twentieth century are setting a good pace for the century. The large increases have been made in food products, timber and lumber and their re-manufactures, metals and metal products other than steel, iron and steel products, textiles, cars, carriages, wagons, etc., and paper and printing, ranging in these several groups from \$12,000,000 to \$47,000,000 of increase. Comparing the principle manufacturing establishments by values of products, there were 479 works in 1905 with products of \$200,000 to under \$500,000 each, against 323 in 1900 of the same class; there were 139 in 1905 with products of \$500,000 to under \$1,000,000 each, against 68 in 1900 of this class; and there were 81 in 1905

with products of \$1,000,000 and over, against 39 in 1900 of this class. And as showing growth in industrial efficiency, which implies improved methods and machinery and harder work, it can be said that in every group of our industries the average of production has increased substantially in the five years. In 1900 it was for all industries \$1,559, and in 1905 it was \$1,990 per wage worker; or compared on the basis of all employees on salaries and wages, it was \$1,476 in 1900 and \$1,803 in 1905. As regards the cost for management and labor, the average salary of managers, officers, clerks, etc., was \$833 for males and \$317 for females in 1900, and \$925 for males, and \$362 for females in 1905. For wage-earners employed in the works the average in 1900 was \$334 for males and \$176 for females, and in 1905 it was \$417 for males and \$219 for females. But for both sexes the average cost of salary per employee was \$771 in 1900 and \$849 in 1905, an increase of \$78; while the cost of wages was \$286 in 1900 and \$379 in 1905, an increase of \$93 per employee. Capital and products show large increases in the five years for every province of the Dominion except Prince Edward Island, but the large figures are shown for Ontario and Quebec. In Ontario the greatest increase of production is in flour and grist mill products, which is over \$14,000,000, and in Quebec it is in car works and repairs, which is over \$7,000,000. Seven of thirteen principal industries in Ontario and three of nine in Quebec have values of \$10,000,000 and over. In fourteen cities and towns with increases in the values of product of \$2,000,000 and over, Montreal stands first with a production of \$99,746,000 and an increase of \$28,647,000, and Toronto second with a pro-

duction of \$85,714,000 and an increase of \$27,300,000. Hamilton is third, with a production of \$24,625,000 and an increase of \$7,500,000. But Winnipeg, with a production \$18,983,000 shows an increase of \$10,367,000, and Peterborough with \$11,566,000 shows an increase of \$7,777,000, and as regards increase each of them exceeds Hamilton at the end of the five years. Vancouver and Sault St. Marie also exceed London in the same comparison. In the fourteen cities and towns the increase in the value of manufactures in the five years is \$112,419,000 or 58 per cent. Montreal's increase is 40 per cent. and Toronto's is 47 per cent. Adding to these two cities the value of products for works employing less than five hands in 1905, Montreal's total is \$100,426,000 and Toronto's is \$86,838,000.

The evidences of the growth of Canada in the 20th century found in the statistics of manufactures, of railways, banking and commerce, are for the whole Dominion, and they show a surprising record of expansion. The census of population and agriculture in the North-West provinces shows if possible development on a larger scale, and while it will not be claimed that the older provinces are growing at the same rate there is no doubt that all parts of the country have prospered in their varied industries. The interests of agriculture, transportation, banking, manufactures, trade and all business affairs act and react upon each other, and with its great natural resources in land and forest, mineral, fisheries and water-powers, there is no limit within sight to the greatness to which Canada may attain before the century is out.

THE COST OF POWER*

By L. G. READ, Consulting Engineer, Montreal

L. G. READ

TO give full consideration to the great question of power—the backbone of all industry—the most vital requisite to material progress—would require time far beyond that which is at my disposal on this occasion. Nor can we view the broader and more interesting subject of the evolution of power—the advent of steam—with its quickening of the world's pulse and its development of its tremendous resources within almost a single generation. We are, therefore, compelled to deal briefly, to deliver, as it were, a little address on a big subject. We must deal directly with the facts as we see them to-day.

On the one hand are the manufacturers, with their almost countless thousands of employees, engaged in the most highly legitimate pursuit conceivable, the conversion of raw material into finished product for the infinite needs of mankind. On the other, the coal supply. Or let it be called by its proper name, the Coal Trust, which, like a gigantic octopus, extends a thirsty tentacle to every manufacturing plant on this continent, and whose fingers are slowly tightening their clutch upon your earning powers. The cost of power as a fixed charge in manufacturing is, therefore, a subject which now knocks at your door and demands admittance.

The cost of power is a subject which has gone so long

without expert treatment by the average manufacturer that he has come to look upon his coal bill as an item of expense with which little or nothing can be done, except pay it. I take it for granted that most of you are generating your own power, in your own premises. That some of you are purchasing power from hydro-electric sources. And that all of you are interested in the question—"Can I produce my own power in my own premises at a less cost than it can be purchased for from the outside?"

A manufacturer is in intimate touch with all his other departments. He knows exactly the outlay for advertising and he employs the best of talent in this department. He knows exactly his costs of selling, and in this department he employs the highest ability within his reach. In fact, at the end of the year he knows the exact percentage which his advertising, his selling and his other departments constitute in the total outlay for the year.

But as for power, beyond his coal bill and what he pays his engineer, he does not know and, in my opinion, does not make a proper effort to know the exact cost.

Since nearly every manufacturing plant which produces its own power is equipped with a steam plant, let us take as an illustration a moderate sized, ordinary steam plant and let us assume that it operates on a basis of 10 hours per day for 300 days in the year, and that the average actual power required throughout each day of 10 hours is 200 h.p., and let us take coal at \$3.50 per ton.

It is safe to say that the coal bill for one year in such a

*Address delivered at the Toronto Convention Canadian Manufacturers' Association.

plant will be not less than \$4,200, that you will pay your engineer \$1,000, a fireman \$720, and after the incidentals have been added, for oil, packing, waste, etc., the total will amount to \$6,200. Then, additions for interest and depreciation will easily bring this amount up to at least \$7,000, or, say, \$35 per h.p. for the average of 200 h.p.

It is probably safe to say that not one manufacturing plant in fifty is making its own power for so low a cost as \$35.

Now, let us see what this \$7,000 per year as a fixed charge for power really stands for.

\$7,000 represents the net profits on perhaps from \$75,000 to \$100,000 of finished product.

It represents a fixed charge against your business, equivalent to \$140,000 or 5 per cent. bonds, and it is needless to say that you would give much serious thought to the question of the issuance of such an amount of bonds.

It is needless to say that you would analyze all the vital elements in your business before you decided to incur such a burden upon your earnings. And, yet, you pay \$7,000 a year for power, without having given anything like a corresponding consideration to the question as to whether or not \$7,000 per year for an average of 200 h.p. is the right price. Look only at the coal bill of \$4,200. Perhaps most of you do not know that of this \$4,200 burned under your boilers, \$3,800 are lost, absolutely non-productive; that out of every dollar's worth of coal burned, over 90 cents goes up the chimney and out of the exhaust, without doing any work of any kind.

If you contracted to pay a man a salary of \$4,200 per year and should discover that the actual service he gave you was equal to only one hour out of each day, would you consider that good business? Or suppose you owed \$25,000 borrowed money and suppose you had to pay 17 per cent. interest on this money, would you consider that good finance. And yet—if yours is the average plant—I assure you that these are exactly the things which are happening in your coal bill.

It then becomes obvious that to get the cost of your power down to a point where the outlay in that department is consistent with the economies demanded in the science of modern manufacturing you must either secure a reduction in the price of coal or you must generate your power on less coal than you are now consuming.

The first alternative is out of the question, at least so far as we can see. To materially reduce the amount of coal required to produce your present horse-power is easily obtainable, if you will give this department the expert treatment which it deserves.

Let us now understand what one h.p. is. You hear on every hand, "So much per annum per horse power." "Cost per horse power hour." What is a horse power hour? If all the power in this little piece of coal could be utilized—if all its latent energy could be converted into actual work, it would lift 1,980,000 lbs. one foot high in one hour, or nearly 1,000 tons of dead weight off the ground for one hour.

It weighs but $2\frac{3}{4}$ ounces, and yet could lift a weight twelve million times greater than itself.

In other words, it contains the net equivalent of one horse power hour.

But, when you undertake to convert this amount of latent energy into the actual driving of your machinery, I will not say that you must burn, but that you do burn a piece this size (5 lbs.). It seems like a vast distance from this piece to that piece. But we cannot convert all of this latent energy into actual work, because nature demands a premium on what she gives us. On the other hand, however, she does not ask us to pay any such price as this (5 lbs.) for one b. h. p. hour, this 17 per cent. interest.

And since, under modern methods, we know that a brake

horse power hour of actual work can be produced for a piece this size (2 lbs.), it certainly becomes apparent that in the average plant there is being burned unnecessarily and without return the difference between 2 and 5 lbs., or 60 per cent. more coal than is required by refined engineering of to-day. If 60 per cent. of this \$4,200 coal bill can be saved or, say, \$2,500 per year, you may then consider that \$2,500 per year saved is equivalent to your having retired an obligation of \$41,500. Would you not consider a department worthy of expert treatment which unnecessarily places upon your business the equivalent of a \$41,500 obligation at 6 per cent.? If you will treat your power as a department and if you will give to that department the attention it deserves, you will easily confirm my claim that modern practice and actual results will place this great economy within your reach.

It would be impracticable, considering the limits of time on this occasion and considering the great variety of local conditions, for me to undertake to detail the actual ways and means by which you may attain these ends; but at least, I may say that—

You must approach this subject of power cost as a fixed charge in your manufacturing with a serious mind.

You must ascertain what your load factor is.

You must know what actual horse power it takes to drive your plant, and when you know this you have got the key which will open the door to an important department in your business, a department which you have hitherto neglected.

To ascertain your load factor a diagram covering your daily run must be made by an expert. This diagram must show the h. p. output from your engines at every hour during the day's run, and, preferably for a number of days in succession, so that you may arrive at your load factor, that is to say, the maximum load and at what hour, the minimum load and at what time and from these two you will obtain the load factor, the average actual h. p. you require.

Then open a power account. Charge into that account that part of your capital invested in engines, boilers, pumps, dynamos, power house, chimneys, foundation, piping, shafting, belting, and every part of your equipment which either generates or transmits power, together with all their accessories. This item will show you how much of your capital you have invested in your power department and upon it you will know what to charge for interest and depreciation. Charge into this account your fuel, engineers' and firemen's salaries, oil, water, repairs, upkeep and all the incidentals which in the average manufacturing plant are lost in other accounts.

Some of you may say "Yes, but all these items come out at the end of the year in some other account. So, what is the difference?"

The difference is simply this: that in order to manage your power department in a way that will insure your getting your power at the right price, you must know all about that department, just as you know and insist upon knowing all about the other departments in your business, and you cannot know all about your power department unless you follow it in this manner. With this load factor known, and with all these items charged into this account, it then becomes merely a matter of dividing the total number of dollars footed up by the average h. p. taken from your power diagram—for one year—and the quotient will be your cost per annum per h. p.

It may not be for me to set down an arbitrary price per annum per h. p. as representing the price at which you would be justified in generating your own power instead of purchasing it from outside sources, but I will assume the responsibility of saying that unless you can purchase from outside sources, after charging interest and depreciation and everything which is properly chargeable to such motor equipment and appliances as may be necessary for you to utilize outside

power—you must not pay any more than \$25.00 per annum per h. p., and only upon your average load and not upon your maximum load.

I will, however, place a limit upon your load factor; that is to say, your average h. p. requirement should be at least 60 per cent. of your maximum load. Or, in other words, with a maximum of 100 h. p. and a minimum of 20 h. p., or a load factor of 60 per cent. in your plant, you would contract to pay \$1,500 per year and no more. For, obviously, if it can be shown conclusively that you can produce your power on this basis, at this price, why should you pay a higher price than this for it from some outside source? Whatever you may pay to outside sources in excess of this price represents just that much dead loss in your business, and when you consider that a reduction in your fixed charges of even \$2.00 per day is equivalent to your going to your bank and paying off \$10,000 of outstanding 6 per cent. paper you will realize that the earning power of money, like the latent heat in coal, is fraught with great possibilities, when given the proper treatment.

Now, let us take the point of view of the power company that sells its power as a public utility. Some think that the development of water powers will solve this great problem of power cost. But, if you will look closely, you will find that the limits of these possibilities are soon reached. In the first place, water powers are not always located where we want them, and where we need them. Let us take a hypothetical case. Suppose we develop a water power with a maximum of 100,000 h. p. Our total investment will amount to at least \$65 per h. p. initial cost, or, say, \$6,500,000.

We contract to deliver power to thousands of users. Our whole equipment is designed and installed, with all our transmission lines, our transforming stations; with all the local equipment required at points of destination; our management and our organization are based upon \$6,500,000 actual investment. We will say that our peak load—that is, the top notch of our output each 24 hours—reaches the 100,000 h. p. mark. It is safe to say that the load plot—that is, a diagram showing the horse power output at each hour during the 24—will average not more than 40,000 h. p. In other words, the total amount of power we sell equals a load factor of 40 per cent. Now, 40,000 multiplied by \$65.00 per h. p. (initial cost), equals only \$2,600,000, and you will see at once that the price which must be charged per annum per h. p. must be an amount sufficiently high so that an average output of 40,000 h. p. (or \$2,600,000 of our investment), will earn a return sufficient to carry the entire \$6,500,000. And this is the condition which usually prevails when a water power is developed and expanded into a public utility.

On the other hand, if a water power is developed for local use, by an individual concern, obviating the necessity of long transmission losses and the low average h. p. output, you will readily see that, under these conditions, water power serves its best and most practicable purpose.

The ten best water power developments in the world—including the cheap water powers of Canada—show an average cost of \$10.00 to \$12.00 per annum per h. p. This is cost, not the price at which the power is sold. Suppose, after allowances for transmission, transformer losses, fixed charges and a fair profit, it were delivered to the consumer for \$20.00 per h. p. on the usual flat rate basis. You contract to pay for a

certain amount of power whether you use it or not. (Say 100 h. p.). At the end of the year you will find that since your own load factor will probably not average over 60 per cent. (for you, as well as the big power company, have your peak load and your minimum load and, consequently, your average horse power requirement), what you have actually gotten equals \$33.33 instead of \$20.00. Because, \$20.00 multiplied by 100 h. p. equals \$2,000, and \$2,000 divided by your actual average load of 60 h. p. equals \$33.33 per h. p., or 65 per cent. more per annum per h. p. than the rate named in your contract.

In other words, you pay the power company \$1,200 for power you do get and \$800.00 for power you do not get.

The Gas Company—a public utility—charges you for the exact amount of gas you use and no more.

The Water Company—a public utility—does the same.

Now, when a power company elects to expand itself into a public utility, on what theory has it the right to demand this premium of \$800.00, this 65 per cent. for something it does not deliver? Is it because "the power is there, if you want it?" Then, so is the gas "there if you want it!" So is the water "there if you want it!"

Is it because of the power company's low per cent. of load factor? Then why have not the Gas Company and the Water Company an equal right to make the consumer pay the difference between their average output and their maximum capacity?

The answer is, that the sale of power, as a public utility, is a new enterprise. The consumer has overlooked the importance of this department, hence the power companies make hay while the sun shines. But there are exceptions: where the average load factor in a plant is equal to and more than the minimum amount of power contracted for; but these exceptions are few, and you will find that a public power company avoids such contracts.

Now, just one final word. The key to this whole question is the load factor, the average actual h. p. required throughout the day's run. Do not confound this with your maximum h. p. requirement. When you talk of "So much per h. p. per annum," I insist that it be based upon the average h. p. and not the maximum rating. And I insist that with a load factor of 60 per cent. it should not cost you—whether you make it yourself or purchase it from the outside—more than \$25.00 or, say, 5-10 of a cent per h. p. hour flat.

Make up your minds now that you will make a department of your power; that you will open a power account; that you will study this question, and if you do these things, the small expense involved will come back multiplied ten fold, as profit.

I am indebted to the officers of this Association for the opportunity of even presenting so briefly the principal claims which I think the question of power has to the consideration of manufacturers. Since, however, justice cannot be done to so broad and so important a subject within such time limits, I shall be glad to send to any member of this Association more explicit details by which he may be guided in making a department of his power and the giving to that department the attention which, in this day of refined engineering, is easily within his reach. (Applause).

THE CONVENTION

The 36th Annual Meeting of the Canadian Manufacturers' Association,
Held in Toronto, September 24th, 25th, 26th, 1907.

IN speaking of the Conventions of the Canadian Manufacturers' Association it is no mere form of words to say that the last is ever the best. It was so two years ago at Quebec, it was so last year at Winnipeg, it was so, unqualifiedly so, this year at Toronto. In the number of registered delegates, in the volume and breadth of work outlined in the Reports of Committees, in the interest taken in the discussions, in the zest with which the entertainments were enjoyed, there never was a gathering in Canada to compare with this. A rare enthusiasm and spirit characterized the whole convention. It was to be seen in the friendly groups that came together in the rotunda, it was evident in the bustle of the registration rooms, it was especially observable in the good attendance and active discussions at the meetings.

The arrangements for the Convention were admirable. When Mr. John Firstbrook, at Winnipeg, extended an invitation to the Association to meet at Toronto this year, he aroused the enthusiasm of those present by the variety and attractiveness of the entertainment which he promised. His promises were exceeded by his acts a hundred fold. Since the decision to make Toronto the Convention City was made, the work of preparation went on without ceasing. How effectively the various committees worked was revealed when the results were produced at the meeting.

In the work of preparation so many were actively engaged that it would be invidious to mention individuals. To every member of the Toronto Branch the Association will feel grateful; first for the excellent arrangements for the comfort of the guests, then for arrangements which made the transaction of so much business possible, and finally for the quality and variety of the entertainment provided.

A pleasing feature of the Convention was the number of ladies in the party. For these ample provision was made by those in charge of the entertainments. Of the Reception by the Toronto Branch in the King Edward on Tuesday evening, the tally-ho and automobile trip to the Lambton Club, and the reception there for the ladies on Wednesday afternoon, the Theatre Party to the Royal Alexandra in the evening, the reception by the Lieutenant-Governor and Lady Mortimer Clark on Thursday afternoon, in the beautiful garden of Government House, the Banquet on Thursday night, with the Theatre Party to Shea's for the ladies, and the thoroughly enjoyable trip to Hamilton and Niagara Falls on Friday, mention will be made in the report to follow. Merely an

acknowledgment of the courtesies extended is given here. The truest thanks were expressed by the thorough enjoyment of the large number who were present at every function.

Uniform courtesy was extended by the King Edward Hotel management. The comfort of the guests was carefully looked after and ample provision was made for the convention meetings and registration work. The telegraph companies courteously accepted all social messages and transmitted them free during the time of the Convention. The railway companies had a representative vising certificates. The Clubs extended the privileges of their membership to the visitors.

The Convention was inspiring. The Association will profit by it throughout the coming year. No members could listen to the annual reports and hear of the great work which had been accomplished during the year just past without feeling a pride in the organization to which he belonged. It was a magnificent record of work done and results accomplished.

THE MEETING.

The President, Mr. Harry Cockshutt, opened the Convention in the words following:

Gentlemen, if you will come to order we will commence the business of the day. I wish to express to you how much pleasure it gives me to welcome you to the thirty-sixth convention of the Canadian Manufacturers' Association. It will be my pleasure to address you somewhat later on in the day, and consequently it is not necessary for me to make any lengthy remarks now. All I wish to say is that the Committee's reports, which are to be presented to you, are, I think, complete and tell you of the work the Association has been carrying on during the past year. I shall now call upon the Secretary to read the minutes of the last Annual Meeting, unless it is your pleasure that they be taken as read.

(By consent of the members present the minutes were taken as read).

The President,—We will now proceed with the reports of the officers. I shall first ask the Secretary to read his report.

REPORT OF THE SECRETARY.

Mr. G. M. Murray presented and read his report as Secretary as follows:

To the President and Members of the Canadian Manufacturers' Association.

It is indeed a pleasure for your Secretary to commence the proceedings of this important Convention by submitting

HON. J. D. ROLLAND (The Rolland Paper Co.)
PRESIDENT, 1907-08

as it were a bird's eye view of the field of operations in which the Association has been engaged during the year just closed.

Progress and expansion have so long been your watch-words that it is perhaps trite to remark that the year has been an exceptionally busy one, yet measured by the accomplishments of previous years it truly seems to have established a new record, both as regards the activity of committees, branches and sections, and the results thereby achieved.

Your Executive Council has held eleven meetings with an average attendance of thirty-seven, the largest it has ever been. As evidence of the interest taken in these meetings it is worthy of note that the attendance of members from outside points has averaged eighteen. The number of your standing committees has been increased by two, one for Technical Education, and one for the London Office, a fact which is responsible for the Committee meetings being more numerous than ever before, 93 for 1906-07, as against 79 for 1905-06. In addition to the above, there were twenty-five section and fifteen branch meetings at the Head Office, besides nearly fifty meetings of various kinds at the different branch offices, all combining to make the year one of exceptional activity.

But meetings in themselves would mean little if they were not followed by results, and it is therefore gratifying to be able to state that the benefits to the membership at large have been commensurate with this increased activity. Among the number of such benefits it is possible to mention only a few. An office has been opened in London, England, for the purpose of supplying members with the skilled help they are unable to obtain in Canada, and more than four hundred and fifty workmen have been brought out to date. The Insurance Department, after long study and experimentation, has undertaken the examination of policies and the inspection of risks on a contract system that not only promises to make the Department self-sustaining, but ensures for it a wide sphere of usefulness. Under its direction the organization of two mutual fire insurance companies has been carried through to a successful conclusion. The Transportation Department, after three years' of constant effort, has at length obtained an order from the Board of Railway Commissioners compelling the railways to do away with the discrimination against Canadian shippers at frontier points, and to materially reduce their rates in all territory east of Port Arthur. It has also obtained an order for the issuance of a new Freight Classification, from which the objectionable features of the "Owners' Risk" Clause will be largely eliminated. At Ottawa the eight hour day bill was so vigorously opposed that it had to be withdrawn to save it from ignominious defeat. At Toronto and at Quebec Branch Committees were almost equally successful in blocking provincial legislation of a hostile character. Substantial progress has been made in creating a strong public sentiment favorable to the establishment of technical schools. Foreign buyers to the number of 445 have been introduced to Canadian exporters, and profitable transactions have followed in many instances, while the distribution of another edition of the Trade Index has advertised Canadian manufacturers in every quarter of the globe.

A score of other practical results might be mentioned, but I shall refrain from further anticipating what is fully set forth in the reports that are before you. Some of these results have a monetary value that can readily be reckoned in dollars and cents; others are of such a nature that their full value can never be estimated. All of them may reasonably be regarded as dividends upon investment, payable daily at rates which are ever on the increase.

As regards material prosperity, the Association was never in a stronger position than it is to-day. Its balance of cash and liquid assets on July 31st was almost three times as

large as at the close of any previous year. INDUSTRIAL CANADA, which two years ago showed a deficit of over \$1,200, now rejoices in a surplus of \$2,800. Notwithstanding the increase of fees for Class B membership, we have made a net gain for the year of eighty-five names. The average fee payable per member has also made a satisfactory advance from \$12.27 in 1905-06, to \$12.92 in 1906-07. This fact is worthy of particular note, as it is to our membership fees that we must look as the only source of permanent revenue. Not only, therefore, is the number of subscriptions steadily increasing, but there is a marked tendency for the \$10 member to climb into the \$15 class, and for the \$15 member to climb into the \$25 class. Such a condition enables us to look forward to the future with renewed confidence in our ability to finance our way through the various operations which we have mapped out for ourselves.

G. M. MURRAY
General Secretary

In January last the Association moved into new and larger offices in the Traders' Bank Building. It had long since outgrown its narrow quarters in the Board of Trade and latterly it was only with the greatest difficulty that the immense volume of work incident to such an extensive organization could be satisfactorily performed. Ample accommodation is now provided for present needs, and what is perhaps of even greater significance, the Association is housed in a manner befitting its dignity and importance. A cordial invitation is extended to members to visit the new offices. A hearty welcome awaits them and an obliging staff will always be found in readiness to serve their interests.

It has been the Association's misfortune to lose two of its most valued officers since the last Annual Meeting, Mr. Stewart, the General Secretary, and Mr. Marlow, the Manager of the Transportation Department. The vacancies, caused by their resignations, were filled by the appointment of Mr. Walsh and Mr. Scully. Consequent upon the decision to be represented in Ottawa and in London two other additions have been made, while still further additions will be necessary if the

Convention authorizes the establishment of a department for the collection of overdue accounts, as proposed by the Commercial Intelligence Committee. Changes and additions are usually attended by a certain amount of disorganization, but I am pleased to report that owing to the care with which your committee selected its new officers, the work has been conducted with the same regularity as heretofore.

The entire working force at present numbers twenty-three employees, of whom sixteen devote their whole time to the service of the Association. All have applied themselves throughout the year to the discharge of their respective duties with a zeal and energy which it has been a pleasure for me to witness. They have had no union except the common bond of devotion to your interests. They have placed no restriction upon their output, nor have they demanded an eight hour day. On the contrary, they have always been glad to work overtime without extra pay, when by so doing they could contribute in however small a degree to the welfare of the manufacturing industries of Canada.

In accordance with instructions received from the Winnipeg Convention, it has been my privilege during the year to visit in company with the President all the Branches of the Association except the one in Vancouver. We have both endeavored on these occasions to meet as many of the members as possible, to explain to them the nature of the work we were carrying on, and to quicken their interest in their organization. While my best efforts in this direction have necessarily been feeble, I do not hesitate to express my belief that some good has been accomplished, and I would recommend, therefore, that for the coming year the experiment be repeated.

In concluding my report, I wish to take advantage of this opportunity to express my grateful appreciation of the honor you have done me in entrusting the work of your important organization to my hands. While I have been nearly four years in your service, I feel that the time has been all too short, and the experience all too limited, to fit me for the onerous duties attached to my office. For the shortcomings which I know have been frequently apparent, I crave your kind indulgence. Especially do I feel the need for doing so when I recall the men whom I have had to succeed. In Mr. Russell, Mr. Young, and Mr. Stewart, the Association has had Secretaries of exceptional ability, and to follow them I am aware that I am but courting comparison by which I can only suffer. It is a pleasure for me, however, to acknowledge the support I have received not only from the members of the Executive Council and the various standing committees, but from private members everywhere. It is to their assistance and the assistance of a loyal staff that I am indebted for such results as I have been able to accomplish. My earnest hope is that for the coming year this assistance will be continued, for it is only with the fullest and freest co-operation that the best interests of the Association will be served.

Respectfully submitted,

G. M. MURRAY, *Secretary*.

The President.—Gentlemen, is it your pleasure that the report of the Secretary be received?

(Voices: Carried).

The President.—In connection with the visiting of the different branches, the Secretary reports that he was not at Vancouver. I might say that I had the opportunity of being at Vancouver and visiting the branch there last year after the Winnipeg Convention.

The President called upon the Treasurer to present his report.

REPORT OF THE TREASURER.

Mr. George Booth presented and read his report as Treasurer as follows:

I herewith submit the financial statement of the Association for the year ending July 31st, 1907, a copy of which you have in your hands, and it has doubtless been read with interest and, I trust, with approval and satisfaction.

CONTINGENT ASSETS.

Liabilities assumed by the Mutual Fire Companies on expenses incurred in Insurance Department.

I certify that this Balance Sheet is a correct statement of the affairs of the Association; that I have duly audited the books and accounts of the Association, and that all my requirements as auditor have been complied with.

WILTON C. EDDIS, F.C.A., Auditor.

The first item that I wish to call your attention to is the surplus of \$16,111.42, which represents an increase over that of last year of \$8,711, 36. This increase is accounted for by \$3,753.89 as profit earned by INDUSTRIAL CANADA during the year; \$1,130.36 from the Trade Index; \$994.71 surplus from the Western excursion; \$2,204.23, excess of receipts from members' fees over amount disbursed for expenses; \$490.35 interest on deposits, and \$137.82 from sundry other sources.

During the year we have advanced to the Insurance Department \$2,575.42, which, added to \$2,481.43 previously advanced, makes a total of \$5,056.85. This is a contingent account, the liability for which, I am informed, is being assumed by the Mutual Insurance Companies. When paid, our surplus will be increased by the above amount. I presume the Association approves of continuing the same course towards this department that has been pursued hitherto.

The sum of \$822.26 has been advanced for the month of August.

Total receipts from all sources for the year amount to \$52,894.87, an excess of \$12,513.36 over the previous year.

GEORGE BOOTH
(The Booth Copper Company)
Treasurer

be credited to last year and debited to this, making \$3,896.30 to be deducted from \$12,513.36, leaving \$5,617.06 as the excess of receipts over the previous year.

This comparison is hardly fair, as last year we disbursed on Trade Index account \$3,448.15, which amount being due on last years disbursements, should, for the sake of comparison,

In examining the statement of assets, I call your attention to the item \$3,272.61 for furniture and fittings. Last year the value of the furniture and fittings was \$2,554.58, and if we add to this \$1,597.92, the amount expended during the year mostly for the fitting up of our new offices, we have \$4,152.50, which means a depreciation of furniture and fittings of \$879.89.

Having disposed of some of our old furniture, etc., at a considerable loss, and some of it being deteriorated in value by long use or damaged in removal, it was thought the right course to pursue in order to obtain the proper value of this portion of our assets was to have a true and correct inventory taken. This was done with the above results.

The accounts due, \$4,655.78, are safely guarded against loss by a reserve of \$1,000.00, leaving this item, \$3,655.78. It was thought judicious by your Finance Committee, and approved of by the Executive, that \$5,000.00 be deposited with

the Toronto General Trust at 4 per cent. interest. These two items, with fees owing, \$486.71, and \$56.22 interest accrued, together with cash on hand and in the bank, \$10,298.38, comprises our assets, which amount to \$22,769.70.

The liabilities other than that for members fees paid in advance and unearned, are quite small, the total amount being only \$515.37. The larger amount of \$6,142.91 for members' fees, while unearned, was not collected before they were due, as all fees are due in advance.

The British office has been established in London on a satisfactory financial basis, and with every prospect of success, and it is thought that eventually it may be self-sustaining, but for the present it is a small charge upon the Association.

As in previous years, your Finance Committee have considered the receipts from members' fees the one permanent source of revenue, and their endeavor has been to keep the fixed annual charges on the Association within the amount received therefrom.

Owing to the sum credited to revenue for the year being \$4,635.00 in excess of any previous year, which is \$1,778.00 in excess of our estimate, your Committee were enabled to pay all charges and expenses from this revenue, and have a balance on hand of \$2,204.23.

The increase in our receipts is largely accounted for by the payment of \$25.00 each from seventy-one members, and one hundred and one members each paying \$15.00, all of whom formerly came under the \$10.00 classification.

The indications are that the amending of the Constitution instituting a \$15.00 fee from those employing from fifty to one hundred hands, was a wise enactment. Nearly one hundred more during the current year have voluntarily remitted \$15.00 instead of \$10.00, as previously.

Estimated receipts from members' fees, 1907-1908..	\$23,000.00
Interest	400 00
	\$23,400 00
General expense	24,000 00
	\$4,400 00

Respectfully submitted,
GEO. BOOTH, Treasurer.

Mr. Booth moved, seconded by Mr. C. C. Ballantyne, that the Treasurer's report be adopted.

The President stated the motion and said: The report is now open for discussion, gentlemen. The balance sheet is here properly certified by the auditor.

There being no discussion the President put the motion to adopt the report, which, on a vote having been taken, was declared carried.

The President.—We have with us to-day Mr. Archibald Blue, who is going to deliver an address upon the progress of Canada in the twentieth century, but as Mr. Blue is not at the moment present in the room we might go on with one of the reports. I will call on Mr. Meek to read the report of the Reception and Membership Committee.

Mr. Charles Meek, Chairman, presented and read the report of the Reception and Membership Committee.

REPORT OF THE RECEPTION AND MEMBERSHIP COMMITTEE.

At last year's annual meeting some important changes were made in the membership by-law, with a view to drawing the lines more closely against those who were not *bona-fide* manufacturers. The feeling has slowly, but surely, been gaining ground that the Association should exercise the greatest care in selecting its new members, so as to guard against the pos-

sible admission of men whose chief interests lie in pursuits other than manufacturing.

During the year just closed your Reception and Membership Committee has kept this point well in mind in applying itself to the duties of office. Inquiries regarding the eligibility of prospective members have been conducted more thoroughly than ever before. Endorsement forms, specially printed for the purpose, have been sent in each case to a number of the members most likely to be acquainted with the applicant, and, therefore, able to supply the desired information about his business. Where the replies thus obtained have not been satisfactory other channels of inquiry have been used; in short no stone has been left unturned to see that the wishes of the Association were strictly observed.

The Year's Progress.

In the twelve months ending July 31st, 231 applications and 146 resignations were passed, a net gain for the year of 85. While the increase is not so large as in some previous years, it is nevertheless regarded as satisfactory considering all the circumstances. Since 1900 the expansion of the Association has been very rapid, and as it has advanced, the field left for the Committee to work in has steadily contracted. To maintain the old rate of progress indefinitely would have been quite impossible, and the figures for the past year indicate that for the future we must be satisfied with more moderate gains.

The number of resignations is rather larger than usual, but the Committee has satisfied itself that the reasons were sufficient in every case to warrant acceptance. For the most part they were due to amalgamations, retirements from business or financial failures. In some few instances disappointment over the tariff revision has led to the loss of a member, while the increase in fees for Class B membership from \$10 to \$15 has also caused some desertions. Any losses from the latter source, however, have been more than made up for by the increased revenue derived.

Distribution of Membership.

The total membership on July 31st last was 2,189, distributed as follows:

By Provinces.		By Branches.	
Ontario	1,287	Toronto	558
Quebec	576	Montreal	431
Nova Scotia	94	Quebec City	68
New Brunswick	44	Nova Scotia	94
P. E. Island	3	Manitoba	103
Manitoba	103	British Columbia	68
British Columbia	68	General	867
Alberta	13		
Saskatchewan	1		

Classified on the basis of fees paid, the figures are:

Class A. (up to 50 hands, \$10)	1,549
Class B. (up to 100 hands, \$15)	101
Class C. (over 100 hands, \$25)	362
Class D. (additional representatives, \$10)	177

The Membership Campaign.

Throughout the year the work of canvassing for new members has been vigorously proceeded with. Local committees have been appointed by the various branches to co-operate with the general committee, and particularly in Montreal, Winnipeg and Toronto have done effective work. A selected list of non-members has been systematically supplied with literature advertising the Association's usefulness. On two occasions an appeal was made to the general membership to assist in the work, with results that were fairly satisfactory.

It is believed, however, that much more could be done along

this line if those who have profited by the Association's activity would only interest themselves in enlisting the support of their fellow-manufacturers. No matter how convincing the literature sent out by the Head Office may be, it is never so effective as the personal solicitation of one who can speak from experience of the advantages of being a member. While the large majority of the more important establishments are now undoubtedly connected with the Association, there must still be a considerable number of eligible and desirable firms that could be secured if gone after in this way. All of them have been indirectly benefited by the work of the Association, and it should be an easy matter to make them realize that its existence is a necessity to them. On the other hand, the Association does not hesitate to say that it needs them, not only for the financial support they would lend, but for the increased influence and prestige to be had from the use of their names. It is to be hoped, therefore, that mem-

CHAS. S. MEEK

(Stewart, Howe & Meek Co., Ltd.)

Chairman Reception and Membership Committee, 1906-07

bers will look on it more and more as a duty they owe the Association to induce such people to join.

In this connection it may be stated that one difficulty the Committee has met with has been the unfortunate inability of many of the Association's best friends to explain the nature of the work that is being carried on. When the opportunity to do a little missionary work arises they are forced to admit that they are out of touch with what the Head Office is doing. To overcome this difficulty it was decided some few months ago to issue a quarterly circular, summing up the more important results achieved and drawing attention to the various kinds of personal service which the Association was in a position to render. The first of these was issued in May, under the title, "Quarterly Dividend No. 1." Apparently it met with a favorable reception; certainly it demonstrated its usefulness in canvassing for new members. Your Committee would recommend that this feature be continued.

Western Excursion.

On behalf of last year's Committee it is a pleasure to report that the excursion from Winnipeg to the coast and re-

turn proved a great success. It was participated in by as many as the train could conveniently carry, and all expressed themselves as delighted with the outing. Wherever stops were made advantage was taken of the opportunity to say a few words about the Association, and to explain the principles for which it stands. Considered purely as an advertisement, the excursion did the Association great service. Financially, too, it was a success, there being a surplus after meeting all expenses of \$963.31, which was in due course turned over to the general fund.

Receptions.

In January your Committee arranged an informal dinner in honor of Mr. Richard Grigg, of the British Board of Trade, and Mr. Graham Gow, Trade Commissioner from New Zealand, at which about seventy-five members were present. Through the winter a series of noon-day luncheons were held under the auspices of the Toronto Branch, at which subjects of interest to local manufacturers were discussed. The Montreal members marked the close of their winter's work by a smoker that proved to be the most successful and enjoyable event of the kind in the history of their branch. The visits of the President and Secretary to Halifax, St. John, Quebec and Winnipeg were also made the occasions for small gatherings of members, at which the work of the Association was explained at length. While only one of these functions was arranged for by your Committee, it is fitting that mention should be made of the others as illustrating the manner in which members are brought together at least once a year to renew their acquaintance one with another, and to keep alive an interest in their organization.

Branch Extension.

Permission was recently requested by the Toronto Branch to extend its field of operations, so as to include all members within a radius of fifteen miles from the centre of the city. Having ascertained that this proposal was acceptable to members in the territory affected, your Committee approved of same, and in due course it was acted upon by the Executive Council.

Council Meetings.

At the kind invitation of the Montreal Branch, the January meeting of the Executive Council was held in that city. It had been felt for some time that the meetings should occasionally take place there in deference to the wishes of the Montreal members of the Council who were seldom able to attend the meetings in Toronto. The success of the experiment was so pronounced as to leave no room for doubt as to the advisability of repeating it. Ottawa members have also expressed a desire to hold a meeting of the Council in their city. Your Committee is inclined to regard the proposal with favor, and would suggest that a date, shortly after the opening of Parliament, be selected for that purpose.

Annual Meetings.

As usual, responsibility for the convention arrangements has rested largely with this Committee, though acknowledgments are due to the various sub-committees of the Toronto Branch, that have worked indefatigably to make the affair a success. It is entirely to their efforts that we are indebted for the splendid programme of entertainment which has been mapped out, for the privileges extended, and for the comforts and conveniences with which we are surrounded. It is hoped that the general arrangements will meet with approval.

Respectfully submitted on behalf of the Committee.

CHAS. S. MEEK,
Chairman.

G. M. MURRAY,
Secretary.

The report was greeted with applause.

The President.—Gentlemen, the adoption of the report which you have just heard has been moved by Mr. Meek, seconded by Mr. McLaughlan. The report is now open for discussion.

There being no discussion the question was called for.

The President put the motion to adopt the report, which, on a vote having been taken, was declared carried.

The President.—We will now have the pleasure of an address from Mr. Blue, as I see he is present with us.

Mr. Archibald Blue then addressed the meeting on "Some illustrations of the growth of Canada in the twentieth century."

The address will be found in another part of the present number of INDUSTRIAL CANADA.

The address was received with applause.

Mr. D. Lorne McGibbon.—It gives me very great pleasure to move a vote of thanks of the members of this Association to Mr. Archibald Blue for his very able and instructive address on the progress of Canada. I am sure if these figures were not given to us by such a well known authority on statistics as

MR. E. COATSWORTH
(Mayor of Toronto.)

Mr. Blue, we would not believe them; and I am quite sure that a number of us will look forward to getting a copy of this address so that we will be able to study it in detail. I am also sure that each member will have more confidence in the future of Canada when we see what has taken place within the last few years in the development of Canada. I have much pleasure in moving a vote of thanks of the Association to Mr. Blue.

Mr. W. K. George.—I have very much pleasure indeed in seconding the vote of thanks, proposed by Mr. McGibbon, from this Association to Mr. Archibald Blue, in recognition of the very able address he has given us this afternoon.

The President put the motion, which, on a vote having been taken, was declared carried (applause).

The President (to Mr. Blue).—I have very much pleasure in tendering to you the hearty thanks of the Association.

The Vice-President, Hon. J. D. Rolland, then took the chair and called on Mr. Harry Cockshutt, to deliver his Presidential address.

THE PRESIDENT'S ADDRESS

A Statesmanlike Review of Canada's Industrial Progress

It is my privilege this afternoon, as President of the Canadian Manufacturers' Association, to bid you all a hearty welcome to our annual deliberations. I do so with more than ordinary pleasure, as we meet for the first time in four years in my own home Province, the Province of Ontario.

Since our last gathering in Toronto we have held Conventions in Montreal, in Quebec, and in Winnipeg. Twice have we crossed a continent to the far away waters of the Pacific; once have we crossed an ocean to visit the land of our forefathers, and whilst we have been fascinated by the charms of our ancient capitals, so rich in historic associations, yet so blessed with present-day prosperity; whilst we have enthused over the teeming resources of the West and viewed with satisfaction its rapid developments; whilst we have gloried in the splendor of the Motherland and rejoiced in her continued greatness, we can still come back to the sunny fields and busy workshops of old Canada and say from the bottom of our hearts, "Here, indeed, is a land to live for; here, if need be, a land to die for."

We in Ontario are proud of our Province, proud to call it our home, proud to claim it as our field of labor. Much has been said and written of the tremendous expansion in the West, but the fact remains Ontario farms and Ontario factories still lead the rest of Canada in the volume of their production. It is particularly appropriate, therefore, that we as manufacturers should periodically meet in the Queen City of Canada's Banner Province to review the work of our Association and to shape its future policy.

Looking Backward.

The year just closed has been marked by a steady growth in most branches of Canadian industry. Production has materially increased, and since it is by production that we gauge a nation's prosperity, we may assume that Canada has been fairly prosperous.

The tide of immigration has continued to sweep through our gates in ever-increasing volume. The railroads, hungry for traffic, have burrowed their way with feelers of steel through 3,000 miles of new territory, opening up for us new markets and bringing back to our doors the raw materials of a virgin soil and of a virgin forest. Our factories have been kept busily employed, and sales on the whole have kept pace with the advancement in other lines. Though collec-

tions from the West have been poor, it is satisfactory to note that there were fewer commercial failures in 1906 than any year since 1896. Savings bank deposits on June 30th last show an increase over 1906 of \$53,644,783, while the confidence of our financial institutions in Canadian enterprise is forcibly illustrated by the jump in current loans from \$559,338,229 in 1906 to \$639,970,696 in 1907.

Agriculture.

The prosperity of our country is directly traceable to the soundness of our basic industries, and of these the chief corner-stone is agriculture. Our mines, rich beyond the dreams of avarice, will one day be exhausted; our fisheries

have already begun to show signs of having reached their maximum yield; our forest wealth is year by year retreating to the wilds of the North in the face of devastating fires and the onslaught of the lumbermen's axe, but the fertile soil of Canada will ever remain a treasure house of inexhaustible wealth, the key to which is a plowshare and a reaping hook. Less than one hundred years ago the land upon which we now stand was little more than a clearing, cut out of the forest primeval; to-day the Ontario farm lands yield an annual crop of 190,000,000 bushels of grain. Less than forty years ago Manitoba and the Provinces beyond were to us an unknown quantity, a name on the map but nothing more. Last year the combined yield of Manitoba, Alberta and Saskatchewan was 211,000,000 bushels of grain. It is agriculture that has built the city of Winnipeg, with its 125,000 inhabitants; agriculture that has covered the North-West with a network of railway; agriculture that has erected a chain of elevators from Edmonton to Port Arthur, with a capacity

of over 55,000,000 bushels; agriculture that has developed our splendid Upper Lake Marine with its tonnage of 165,000; agriculture that has built and maintained the majority of the factories represented in our Association. As Canadians we are all proud of our agricultural industry; we are proud of the men who have made it what it is, and we are glad to do honor to them here to-day.

It is indeed a pleasure to note the steps our Federal and Provincial Governments are taking to foster the growth of this important industry, and to establish it upon a sound and economic basis. No one will rejoice more heartily than

HARRY COCKSHUTT
(Cockshutt Plow Co., Ltd.)
PRESIDENT, 1906-07

the manufacturer in the success which has followed the work of the experimental farms. In so far as they have contributed to a better understanding of the scientific side of agriculture, and made it possible to grow two blades of grass where one grew before, they have benefited not alone the farmer, but the entire country. The same is equally true of the encouragement given by the Government to agriculture in other ways. The attention which is paid to dairying, cold storage, and the marketing of Canadian butter and cheese abroad has worked wonders for the farm. Its experimentation and research along the line of scientific stock feeding and dairying has revolutionized the industry, in Ontario and Quebec at least, where farmers are now amassing small fortunes by feeding their crop products to live stock instead of marketing them direct. The Government has taught our farmers, as it were, the first principles of manufacturing; it has shown them how to turn out a more highly finished article; how to utilize wastes in the manufacture of by-products, and how to prevent depreciation of plant, which, in their case, means how to prevent soil exhaustion.

Forestry.

It is gratifying, too, to note the awakening of interest in another of our basic industries. I refer to forestry. This subject is one of such tremendous scope that it is impossible to do more than touch upon its fringe. Apart altogether from the material uses to which they may be put, forests are of incalculable value in tempering our climate. They are a potent factor in inducing rain-fall, and in regulating the run-off of surface water. Without them the rivers of Canada, particularly in hilly districts, would be raging torrents to-day and insignificant streams to-morrow. The magnificent water falls which mean so much to the industrial future of our country would fluctuate between extremes that would make hydraulic development well nigh impossible. Last year Canada imported over six million tons of coal, worth on a very conservative estimate, \$25,000,000, and when one considers the extent to which these importations might be replaced by the white coal of electrical energy, one cannot but be impressed with the importance of preserving intact so valuable an asset.

The figures representing the value and quantity of our standing timber are so large as to be fairly startling. The Superintendent of Forestry has stated that at the very lowest estimate there must be 281,240 square miles of wooded land still vested in the Crown. Supposing that this land will yield only 2,000 feet per acre, or 1,280,000 feet to the square mile, over ten inches at the stump, it means a production of 359,987,200,000 feet of matured timber on which the Government royalty at the rate of \$1.00 per thousand would be \$359,987,200. If to this we add the value of the timber to the community at large, our forest wealth assumes a magnitude quite beyond the grasp of the imagination.

Per head of population, Canada easily stands first among the countries of the world in forest wealth, with 148 acres of wooded land for every man, woman and child within her borders. Norway and Sweden come next with about nine acres each, followed by the United States with only seven.

Here is surely an estate worthy of our greatest care. And yet, if reports be true, huge tracts are year by year being devastated by fire, involving the loss of millions of dollars. Not long since a settler in Quebec, to clear ground for a five-acre potato patch, started a fire which burned \$5,000,000 worth of pine timber. In the Ottawa valley the annual loss by fire is nine times the value of the lumbermen's cut. In North Saskatchewan the cut is said to be only one per cent. of the total annual destruction, while amongst the resinous

timber acres of the far North fires have been known to sweep across the country for hundreds of miles with such destructive fury that literally hundreds of millions of dollars have vanished into thin air in the course of a few days.

These losses are particularly regrettable in view of the fact that many of them might easily be prevented by the exercise of greater care on the part of railway employees, settlers, prospectors and hunters. Fires originating on private property from the same causes which so often mark their commencement on Government lands would inevitably be followed by rigid prosecutions, and there seems no valid reason why the same course should not be pursued in both cases.

The whole question is one of such tremendous importance

Head Office of the Canadian Manufacturers' Association, Toronto

to Canada that it is surely time we were adopting a vigorous forestry policy. It seems to me that the first step to this end should be a careful stock-taking of our national possessions. We must not lose sight of the fact that in this matter we are simply acting as trustees for posterity, and that even as we have received a priceless estate from our forefathers, so will it be our duty in turn to hand it over to those who are to follow us with its value unimpaired. I would favor the immediate creation of more forest reserves; particularly is it important that the heights of land where so many of our rivers find their source should be under perpetual forest. I believe that no reasonable expense should be spared in providing our forest land with fire rangers sufficient in number to properly protect them. I am further of the opinion that legislation should be enacted making it a criminal offence, punishable by imprisonment, to expose our forests in any way to danger from fire.

The administration of such an estate is, I believe, of

sufficient importance to justify the Government in creating a Portfolio of Forestry. In addition to the duties above referred to, a Minister of the Crown might render valuable service in encouraging the establishment of schools of forestry, where practical instruction would be given on a subject which seems destined to form the ground work of one of our foremost professions. He might also extend the scope of the tree-planting operations which the Government has carried on with much success for the past five years. The 9,346,000 trees with which the prairie provinces have been dotted since 1901 mean a great deal to the farmers of the West, yet the territory to be benefited is so vast that nothing more than a beginning has been made.

Export Duty on Pulp.

In this connection I wish to express my strong personal sympathy with the proposal to place an export duty on pulp wood. The United States consumes 2,500,000 cords of pulp wood every year, of which Canada now supplies twenty-five per cent. By allowing this material to leave our country in its unmanufactured state, we are simply contributing to the upbuilding of our greatest industrial rival, whereas the imposition of an export duty would unquestionably compel the investment of United States capital in Canadian pulp mills; would provide employment for thousands of Canadian workmen, and would ultimately open the door for the sale of Canadian pulp across the border. Every year we defer our decision in this matter we relatively weaken ourselves and strengthen a highly protected competitor whom we already have reason to fear; moreover, we postpone the enjoyment of a prosperity which is well within our reach.

Fishing and Mining.

If time but permitted I should like to refer at length to the progress of our other basic industries, fishing and mining. Of both of them we may justly feel proud, the former with its yield for 1906 of \$30,000,000, and the latter of \$80,000,000. No national industrial policy would be complete which did not pay due regard to their interests, and it is a pleasure, therefore, to observe the steady encouragement given by the Government to their development. Biological stations and fish hatcheries, schools of mining and geological surveys have all been productive of the greatest good, and we, as manufacturers, will, I am sure, gladly endorse any further efforts that will promote the prosperity of these industries and add to our wealth as a nation.

For manufacturing can only prosper as all other industries prosper. Agriculture, forestry, mining and fishing are, in a sense, the foundations upon which we build. Where they leave off in the process of production we begin. Their finished product is our raw material. Yet the obverse statement is equally true that our finished product is their raw material, for the tools, the machinery, the clothing and the articles of food turned out by our factories constitute the necessary equipment for the farmer, the lumbermen, the miner and the fisherman to pursue their respective occupations. No one industry is sufficient unto itself; all are inseparable, interwoven and interdependent the one upon the other. What helps one indirectly helps the other; what retards one indirectly retards the others. It is for this reason we are glad to bear our share of the expense incurred in promoting the welfare of the basic industries, and for a similar reason we feel sure that those engaged in these occupations will not hesitate to co-operate with us in shaping conditions that will be beneficial to manufacturing.

Manufacturing.

The importance of Canadian factories to the community at large happily needs little pointing out. There was a time, not so very many years ago, when public opinion consigned them to a secondary position in the scale of industries, but the expansion they have undergone in recent times has entirely dispelled any erroneous ideas as to their real significance. According to some figures supplied by the Census Commissioner, regarding industries in 1901, the value of manufactured goods produced in that year exceeded by \$110,000,000 the combined value of the production of agriculture, dairying, mining, lumbering and fishing. While the figures for 1906 are not available in all these departments, it seems safe to estimate, in view of the numerous increases in our manufacturing output, that the relative proportions have not materially altered to our disadvantage.

But perhaps the best touch-stone to determine the econ-

Characteristic Poses

omic value of any industry is the number of people to whom it gives employment, and the amount of money it distributes in wages. When measured by this test, manufacturing stands pre-eminent among its fellow industries. In 1905 the wage earners in Canadian factories numbered 391,487, as against 344,035, in 1900, a gain for the five years of 47,452. Wages for the same period increased from \$113,249,350 to \$164,394,490, a gain of \$51,145,140 or forty-five per cent. In 1900 the average yearly wage per employee was \$329.17, in 1905 it was 419.91, a gain of \$90.74 or twenty-seven per cent. Each of these comparisons tells its own story of progress and expansion, of activity in our work-shops, of business for our shop-keepers, and of home comforts and more congenial surroundings for our working classes.

But Canada has been no exception to the rule. For some years past the industrial nations of the world have all been enjoying remarkable prosperity. Expansion has been general, buyers have been plentiful, and as a consequence there has

not been the same eager haste to enter foreign markets. Conditions more favorable than those for the Canadian producer could scarcely be desired, for the competition he has had to meet in the home market from the products of specialized industry and cheap foreign labor has been at its lowest ebb. It is not surprising, therefore, that he should have made considerable progress, and we are quite prepared for the census announcement that during the five-year period the output of our factories has increased from \$481,053,371 to \$717,118,092.

And yet, substantial as this growth may seem to have been, Canadian manufacturers have no more than kept pace with the expansion in other directions. At any rate they have not materially strengthened their hold on the home market, as may be seen from the following simple calculation: If to the output of our factories for any year we add the imports of manufactured goods, and from the amount so obtained deduct the exports of manufactured goods, the result should represent the home consumption of manufactured goods, providing we leave out of consideration the stocks carried over unsold, which we have no means of estimating. And further, if from the output of our factories we deduct the exports of manufactured goods, the result should represent the proportion of manufactured goods marketed at home. By following out these various steps, with the aid of figures supplied me by the Census Department, I find that the home consumption in 1901 was approximately \$539,953,002, of which Canadian manufacturers supplied \$401,221,709, or roughly, seventy-four per cent. By 1906 the home consumption had increased to \$972,930,286, of which Canadian manufacturers supplied \$595,830,253, or roughly, seventy-five per cent. Relatively speaking, therefore, the manufactures of this country are in the same position to-day that they were five years ago. Their capital has increased, their wage bill has increased, their output has increased, but their share in the Canadian home market has remained practically at a standstill.

Parenthetically it should be stated that while the above calculation is sufficiently accurate and logical, so far as indicating any increase or decrease is concerned, the percentage of the home market which it shows the Canadian manufacturer to be supplying must be liberally discounted by reason of the numerous instances of duplication in the census figures of output. For example, the value which is set upon the flour produced by the miller again appears in the value of the bread made by the baker; the value of the leather produced by the tanner is counted a second time in the value of the footwear made by the shoemaker. I simply mention this fact lest it be inferred that the Canadian manufacturer actually controls seventy-five per cent. of the home market. In reality his share of the trade is considerably smaller, though in proportion to the gross volume of business done in manufactured goods it was practically the same at both census periods.

The trade and navigation returns give further evidence of the fact that we are not progressing as we should. Compared with an increase in factory production between census periods of forty-eight per cent., the imports of dutiable goods, goods which are taxed to encourage their production in Canada, show an increase of fifty-three per cent. Our export trade shows a regrettable tendency to fall away. Comparing the figures of 1907 with those for 1906 in the exports of merchandise, there is an actual decrease of \$5,862,754. Ever since 1901 our imports have been increasing much more rapidly than our exports, with the result that a balance of trade in our favor that year of \$6,072,107 has, for the twelve

months ending June last, been converted into an adverse balance of \$104,476,142.

Such conditions should not obtain in a young country like Canada, for, with the variety and abundance of our natural resources, combined with native enterprise, we should easily be able to produce enough for our own requirements and have a substantial surplus to sell to countries that are more thickly populated and less richly endowed. By the adoption of a policy sufficiently protective, such as our Association has always advocated, capital would be irresistably attracted by the opportunities here afforded. Our home market would be supplied by home industries, manufacturing would become more specialized, the cost of production would be reduced, and a substantial beginning would be made towards the development of an export trade that would successfully carry us over any ordinary period of domestic depression.

It is deeply to be regretted that the significance of the figures above referred to did not appeal to the Government when making their revision of the tariff, for they clearly indicate what we may expect, under a continuance of the present policy, when the inevitable period of depression overtakes us. A tariff which under the most favorable circumstances barely enables our manufacturing establishments to relatively hold their own, cannot but prove utterly inadequate to stem the swelling tide of imports when the foreign producer seriously and systematically prepares to unload his surplus products on the Canadian market.

And this he will do, as surely as the sun will rise on the morrow, the moment that darkening days begin to restrict his trade in other quarters. No hastily improvised tariff will then suffice to secure for Canada a continuance of her present prosperity. Retrenchment, not expansion, will be the policy of capital. Production will be curtailed, workmen will be thrown out of employment, and hard times will once more be found knocking at our doors.

We believe it to be the part of wisdom to guard against the possibility of such a situation materializing by affording immediate encouragement to the investment of capital in our manufacturing enterprises. It is only by so doing that we can firmly entrench ourselves against foreign competition and build up the industries of our country on a sure and solid foundation.

Preferential Trade.

Our attitude towards the policy of an imperial preference has been so frequently misconstrued that it becomes my duty to repeat what all my predecessors in office since 1902 have stated in their annual messages. As Canadians we stand first and foremost for the upbuilding of our own country. Our aim is to produce from Canadian materials and with Canadian labor everything which the economic conditions of this country permit of our producing. To this end we ask for a tariff whose minimum protection will be high enough to reserve the home market for the Canadian manufacturer. We realize, however, that there are many articles we do not and cannot produce in this country, and when it becomes necessary for us to go abroad, we believe in a preference which will give the Mother Country and our sister colonies the refusal of our trade, before passing it on to foreigners. In other words, our motto is, "Keep your money in circulation at home by buying goods made in Canada, and when you cannot get what you want at home, buy within the British Empire."

Financial.

But deeply as we have been disappointed over the tariff revision, our apprehensions on that score have for some months past been giving away to the dangers of a new situa-

tion that has arisen from an unexpected quarter. I refer to the present financial stringency. Like a threatening cloud the scarcity of money began to be noticed on the financial horizon early in the year. Slowly but steadily it has advanced, spreading itself out in all directions until to-day the outlook is more or less overcast.

Paradoxical though it may seem, trade is very good. Orders are plentiful. Our factories are working to their capacity. Settlers keep hurrying to our shores in steadily-increasing numbers. Yet there is a most embarrassing lack of money to provide for necessary expansion, and even to support the business we already enjoy.

While the situation is a complicated one, we are able to look back over the perspective of the past few months and lay our finger on a few of the causes that have contributed to the present stringency. Inadequate transportation facilities throughout the winter seriously interfered with the mar-

MR. JOHN HENDRY
(B. C. Mills, Timber and Trading Co.)
First Vice-President, 1907-08.

keting of last year's crop and with the deliveries of manufactured goods, so that collections have been delayed, and in many instances orders cancelled. Speculation in Western farm lands and town lots has run riot, and money that should have been sent East to discharge debts owing to manufacturers and wholesalers has been used to purchase more land. From this cause alone Eastern houses have been compelled to carry many thousands of dollars on their books that would otherwise have been applied to the expansion of legitimate enterprise. The listing of some scores of Cobalt mining stocks on the Toronto and Montreal Mining Exchanges, and the seeming opportunity thereby afforded of acquiring a fortune quickly, and without effort, has resulted in the closing out of many savings bank accounts. Provincial loans which might have been negotiated abroad have been negotiated at home, to the detriment of Canadian industry, whose credit cannot so easily be pledged in Europe. For five years prior to 1906 there was a steady growth in the amount of coin and bullion in the country, the imports always exceeding the exports by a substantial amount. Last year, however, the tide was turned in the other direction, and we lost over \$2,000,000, while for the twelve months ending June, 1907, our supply was decreased by a further \$3,000,000. This fact seems par-

ticularly significant when considered in connection with the adverse balance of trade previously referred to, for it indicates that if we cannot settle our foreign obligations in goods we must sooner or later settle them in money.

None of the items I have mentioned points to any inherent weakness in our financial institutions. On the contrary, they rather lead to the belief that the stringency is due to some slight over-development and an unfortunate combination of untoward circumstances. The resources of our banks are not unlimited; they cannot loan what they have not got, and if the savings of a prosperous community seek other channels for investment the banks cannot be held responsible.

I feel that the criticisms to which our banks have been subjected is uncalled for by reason of their having increased the amount of their call loans in New York. At a critical time, like the present, it is of the utmost importance that they should keep up their reserves. Money at call in New York is practically the same as cash in hand, for it can always be had at twenty-four hours' notice, which is just what is required in times like these. Personally I have every confidence in the men who have given the country one of the finest banking systems in the world, and I feel sure that as a result of their concerted policy the best interests of Canadian industry will ultimately be served.

Operating Conditions.

A further obstacle to the natural expansion of our manufacturing enterprises, an obstacle that seems to be ever present with us, is the scarcity of skilled labor. All branches of trade have suffered more or less from this cause during the present year. The country is growing, new districts are being opened up, the market for manufactured goods is expanding, but the strength of our artisan class shows no tendency to increase in proportion. In five years the number of work-people in Canadian factories has increased by only twelve per cent., whereas the wages paid have increased forty-five per cent. It is not, therefore, a question of wages. The average employer is willing to pay anything within reason. But the workmen are not to be had; they are not in the country.

The difficulty admits of but two solutions, either we must import more artisans from other countries, or we must provide educational facilities whereby our own young Canadians will be able to qualify themselves for the more important positions in our factories. The first method is the one means of obtaining immediate relief; the second is the one means of ensuring an adequate supply for our future needs.

It is to be regretted that the Government has not seen its way clear to meet the wishes of the Association in regard to the immigration of skilled mechanics. Without any desire to belittle the importance of providing the country with more farm hands and more railroad laborers, we maintain it is only fair and reasonable that our immigration policy should reflect the requirements of all classes of industry. To stimulate development in one department and leave another unprepared to meet the sudden demands that must inevitably be made upon it is, we believe, short-sighted and unstatesmanlike, and it is with reluctance that we have been compelled, since our last annual meeting, to assume the expense of encouraging this class of immigration ourselves.

Technical Education.

It is further to be regretted that the Government has hesitated to act in the matter of Technical Education. The rapid development of trade schools and schools of technology in all the great industrial countries of the world practically forces upon Canada a policy of liberal encouragement in this direc-

tion, if she is to keep pace with the advancing quality of foreign manufactured products. Technical education, more than anything else, is an incentive to individual effort amongst our working classes. It opens the door to industrial preferment, elevates the standard of living, and removes one of the most fruitful sources of unrest and discontent.

Immigration.

Apart from the objection referred to above, immigration has continued to improve, both in quantity and quality. For the fiscal year ending June 30, 1906, it was 189,064; for the twelve months ending June 30, 1907, it was 252,038, a gain of 62,974, or thirty three per cent. A satisfactory feature of this growth has been our steady increase of immigration from the United Kingdom. For 1906 it was 86,796; for 1907 it was 115,051, a gain of 28,255. It is also gratifying to note that this year for the first time Canada is attracting more British emigration than the United States, the latter country receiving approximately only 102,000, as against our 115,000.

Labor Conditions.

One of the most regrettable features of the labor situation is the steady growth in the number and importance of industrial disputes. According to the Labor Gazette, there were 128 strikes in Canada during the twelve months of 1906, the largest for any year on record, with the single exception of 1903. The number of people directly affected was 26,014, and the actual loss of working days was 489,775. Even at the low estimate of \$1.50 per day, this means a direct loss to the working people of our country for one year of \$734,662. And yet it represents but a fraction of the loss to the community at large, for to it we must add the loss entailed upon manufacturers and employers through the suspension and disorganization of their business, as well as the general falling-off in trade by reason of the diminished purchasing power of our labor classes.

From whatever point of view they may be regarded, strikes are always to be deplored. As a prominent welfare worker in the Association recently remarked, "You never win but you lose." Financially they are a dead loss to the country, for in stopping the wheels of industry they stop production, and production is the only way to increase wealth. Socially they create conditions conducive to violence and lawlessness on the one hand, and suffering and privation on the other. For these reasons I am of the opinion that our Association would be undertaking a noble work if it would devise means of reducing the number of industrial disputes.

Transportation.

I have already had occasion, in discussing the financial situation, to refer to the inadequacy of our transportation facilities. The subject is one upon which I should like to dwell at considerable length, for I consider it second in importance to no other question before the Canadian public today, but time prevents my referring to more than one or two aspects of it.

Generally speaking, freight transportation constitutes a far greater tax on the people of this country than the customs tariff. The total duty collected in 1906 was \$46,471,101, which, estimating the population at 6,000,000 means a tax per head of \$7.78. The total revenue to the railways from the carriage of merchandise for the same period was \$81,433,115, a tax per head of \$13.57. While I do not wish to be understood as in any way objecting to this amount, I feel that it behooves us as business men to see that we receive full value for it. Further, I feel that paying as much as we do, we are entitled to a service commensurate with our needs.

That the present equipment of Canadian lines is far from sufficient to meet the demands made upon them by the Canadian shipping public is all too apparent. Let me cite a few figures in connection with the distribution of grain shipments from the North-West. In 1905 Canadian vessels carried away 29,763,910 bushels from the spout at Port Arthur and Fort William; last year they carried away 31,978,341, an increase of over two million bushels. Deliveries of Canadian grain to Canadian ports in 1905 were 30,488,969 bushels, last year they were only 27,924,436 bushels, a decrease of about two and one-half millions. Deliveries of Canadian grain to United States ports amounting to 10,493,823 in 1905 rose to 16,451,907 in 1906, an increase of six million.

From the above it would appear that while our vessels are providing a better service and carrying a bigger tonnage, they are delivering less freight to Canadian ports and more to United States ports.

The inference is obvious; Canadian railways are not prepared to handle the traffic from the boats, whereas United States railways are.

This conclusion is borne out by other comparisons which may be made. The total receipts of Canadian grain at the port of Montreal were greater by 1,653,830 bushels in 1906 than in 1905. Shipments to Montreal by the all-water route were greater by 2,394,615 bushels in 1906 than in 1905. The difference, therefore, 740,785 bushels, represents the falling away in receipts by rail. Again, the exports of Canadian grain via Montreal in 1905 were 9,954,348; in 1906 they were 14,298,251, an increase of 43 per cent. The exports of Canadian grain via United States ports in 1905 were 12,119,637, in 1906 they were 24,159,240, an increase of almost 100 per cent.

Statistics, I know, are not easily absorbed, but even at the risk of becoming wearisome I must venture to refer to the statement of railroad equipment prepared by the Department of Railways and Canals. For the years 1905 and 1906 the figures are as follows:

	Miles in Operation.	Locomotives.	Cattle, Box, Platform, Dump & Coal Cars.	Tons Freight Carried.
1906	21,353	2931	88,749	57,966,713
1905	20,487	2906	84,685	50,893,957
Increase ..	866	25	4,064	7,072,756

From the above it will be seen that in proportion to the miles of road in operation, there were fewer locomotives in 1906 than in 1905. This is, perhaps, offset to some extent by the increased traction power of the new style locomotives, yet the significant fact cannot be overlooked that for the operation of 866 miles of new track only 25 locomotives were provided. The proportion of freight cars shows, it is true, a slight improvement, one car for every 244 miles of track in 1905, as against one for every 241 in 1906. Here, too, allowance must be made for the increased capacity of the modern type of car, but even so it is evident that the railroads are adding to their equipment only in about the same ratio that they are adding to their mileage.

All the figures which I have quoted clearly indicate that our companies are making little progress towards taking care of the growing volume of traffic on the older portions of their lines. As a result of their failure to provide the necessary facilities business is being diverted into other channels, and the ports of a foreign country are being built up at the expense of our own.

Such a condition of affairs can only be regarded as a national misfortune. Every pound of Canadian produce that is forwarded to destination by a purely Canadian route provides a market for Canadian labor and encourages the investment of capital in Canadian enterprises, whereas every

pound of Canadian produce that is forwarded to destination by a United States route goes to enrich a rival nation and relatively to weaken ourselves.

In so far as this condition is due to congestion, the railway companies cannot be held wholly to blame. Manufacturers themselves have in many cases failed to keep their freight handling equipment up to the proper standard. For this they must be held strictly to account. But the railways have been by far the worse offenders. In order to head off future competition they have spent their money in building new lines through undeveloped country, when they should have spent it in properly equipping the ones already in operation. As a result every section has suffered from the shortage of cars. Eastern business houses have been crippled, and Western settlers have been left to suffer from cold and hunger. The situation is most serious, and I believe Parliament would be acting in the best interests of the community at large if it would refuse to grant any more charters to old roads for the construction of branch lines until such time as the lines they are now operating are properly equipped and in a position satisfactorily to handle all traffic offering.

Insurance.

Coming to the work of the Association proper there is just one feature I wish to touch upon, and that is the subject of Fire Insurance.

Notwithstanding the protests that have been voiced on all sides throughout the year against the burdensome taxes imposed by the Companies, high rates have continued to prevail, and there is no indication that any measures of relief are in contemplation.

Both from financial and patriotic reasons it is desirable that the premiums paid on Canadian risks should be kept as far as possible in the country. Out of \$14,712,030 paid in premiums during 1906 on purely Canadian business, only \$3,193,470 or, roughly, twenty-two per cent. went to Canadian companies, the balance going to build up foreign financial institutions and feed foreign industrial enterprises.

This it is which has justified our Association in lending its best support to the organization of two Mutual Fire Insurance Companies. Our object has been not only to serve the Canadian manufacturer, by providing some insurance at actual cost, but also to demonstrate the possibilities of a system of mutual insurance, so that as the years go by the tendency will steadily be towards the development of our own resources and the upbuilding of our own institutions.

In attempting to establish ourselves in this field new legislative ground has had to be broken, and the most strenuous opposition from so-called "vested interests" has had to be met. The year has, therefore, been marked by sustained and persistent fighting. But success has now practically crowned our efforts; the ground has been broken, and for the future there is open to us the possibility of a development commensurate with the needs of the manufacturers, and of the country.

The Association.

I will not attempt further to anticipate the work of the Association during the year just closed. The reports of the various committees are before you. Each tells its own story of results achieved, each brings its own message of hope for still greater things in the future.

To all of us it must be a source of satisfaction that our efforts as an Association have proved beneficial, not to ourselves alone, but to the manufacturing industries of the country as a whole. Every Canadian manufacturer, be his interests large or be they small, has profited by our activity. Every Canadian manufacturer is to-day enjoying advantages

that would never have been his but for the effective work of our organization.

As individuals we cannot afford to spend either the time or the money required to remedy general grievances, or to improve general conditions. Success in matters of this kind is possible only by co-operation, and the fuller and freer the co-operation the greater the measure of success.

Thus far we have had the united support of 2,200 manufacturers, yet I venture to say there are hundreds of others who have never contributed one cent of their money towards defraying the cost of work whereby they have profited equally with ourselves.

My one wish in laying down the cares of office would be that this great body of manufacturers outside our membership might speedily be convinced of the fact that they need the Association as much as the Association needs them; that, realizing this, they might assist us in extending the sphere of our operations; that they might join hands with us in advancing those principles for which we have always stood, and thus hasten the day when Canada will take rank among the great industrial nations of the world.

In closing, let me say to you how much I have appreciated the kindly way in which all the members of the Association have treated me during my term of office. Especially are my thanks due to the Executive Council, to the Committees, and to the Chairmen of same. They have taken an earnest and active interest in the Association, and the success of the year is, to a large extent, due to their efforts, and again I cannot say how much I have appreciated their kindly help.

During the year we have lost our old Secretary, Mr. Stewart, whom all of you knew as a hard and faithful worker. We have also lost Mr. Marlow, Manager of the Transportation Department, whose services have resulted in such general benefit to the shippers of this country. I am glad to say to you, however, that we have in their places been able to secure men who have proven themselves capable in every way of handling the work of the Association. Our General Secretary, Mr. Murray, deserves the greatest credit for the able way in which he has looked after the affairs of the Association since his appointment, and what I have to say of him relates, also, to all the other members of the staff.

To the Canadian Manufacturers' Association for the coming year, and to my successor in office, I wish the greatest success and utmost prosperity.

The President's address was received with prolonged applause.

Mr. C. C. Ballantyne.—Mr. Chairman and gentlemen,—It is indeed a great privilege and pleasure to me to move, seconded by Mr. W. K. George, a hearty vote of thanks to our worthy President, for the most able and instructive address which we have had the privilege of listening to to-day. I can assure you, Mr. President, that the members of the Canadian Manufacturers' Association are very proud of you indeed. (Hear, hear!) It is impossible for us at this time to fully grasp all the important features which you have set forth so faithfully in your address, but at our leisure when it is published in INDUSTRIAL CANADA we shall have time to read it over in detail. I therefore, Mr. Chairman and gentlemen, have very much pleasure indeed in moving a vote of thanks to our President for his very able address. (Applause).

Mr. W. K. George.—Mr. Rolland, I beg to second the vote of thanks moved by our past President, Mr. Ballantyne, and I would ask you to put the motion to the meeting.

Hon. Mr. Rolland.—Gentlemen, you have heard the motion moved by Mr. Ballantyne, seconded by Mr. George, that a vote of thanks be tendered to our President, Mr. Cockshutt, for the illuminating and instructive address that he has

given to us. This address, as has been said by Mr. Ballantyne, will certainly form a subject for the study of our members and will prove very interesting, and I hope very effective. I will now put the motion.

The Vice-President put the motion, which, on a rising vote having been taken, was declared carried amid applause.

The President.—Gentlemen, I thank you most heartily for the vote of thanks which you have tendered me.

Mr. George Brigden will now present the report of the INDUSTRIAL CANADA Committee, after which we will adjourn the session.

Mr. Brigden presented and read the report of the INDUSTRIAL CANADA Committee.

REPORT OF THE "INDUSTRIAL CANADA" COMMITTEE.

The truth of the old adage that "Nothing succeeds like success," is aptly illustrated in the progress that is being made from year to year by the Association's official organ, the Committee in charge of which has pleasure in submitting the following report for 1906-1907 :

Financial.

Those who attended the annual meeting in Quebec will recall the regret with which the Committee was compelled to report a deficit of \$1,067.85 on the year's business. It was firmly believed by the Committee of the following year that INDUSTRIAL CANADA should and could be placed on a self-sustaining basis. Steps were immediately taken to reorganize the paper's financial department, and by effecting economies wherever possible, and at the same time instituting a vigorous campaign for new advertising, the deficit referred to was, ere another twelve months, converted into a surplus of \$1,259.17. When the present Committee assumed charge, therefore, the paper was in a flourishing condition; not only was it paying its own way, but it was contributing a substantial sum to the Association's revenue.

Throughout the year just closed your Committee have closely followed the line of policy laid down by their predecessors in office. Exceptionally favorable terms were obtained for the printing, expenditure of every sort was carefully scrutinized, and a close watch was kept over the collection of accounts. The advertising field was worked over more thoroughly than ever before, and a score of new contracts were secured, in addition to the renewal of practically all the old ones. As a net result it is gratifying to be able to report the largest surplus in the paper's history. After allowing a liberal margin of \$900 for bad and doubtful debts, INDUSTRIAL CANADA's revenue account shows a credit balance for the year of \$2,853.89, an increase over 1906 of more than \$1,500, and over 1905 of more than \$3,700. As may be seen from the Treasurer's statement, the actual cash receipts exceed the disbursements by \$3,348.14, which is in itself evidence that the collections have been well looked after.

The fixed charges against INDUSTRIAL CANADA include a fair share of the office rental, telephone, stationery and postage, besides the entire salary of the editor, the advertising manager and one stenographer. In addition to the above, it is, of course, charged with the cost of all cuts, the paper, composition, printing, binding and mailing of the monthly issue, as well as travelling and other expenses that may be incurred in its behalf.

The gross earnings per month are now slightly in excess of \$1,000. Their advance has been at a uniformly steady rate, showing each month a fair increase over the corresponding month of 1905-06.

It is, perhaps, only fair to state that owing to the new agreement between the master printers and the Typographical Union, which became effective in June last, the printing of INDUSTRIAL CANADA will now cost the Association nearly

\$100 a month more, so that in the ordinary course of events the showing for next year will not likely be so good. In addition to this, your Committee feel that the time has come when the Association should seriously consider the engagement of expert editorial assistance. To meet these added items of expense, the present revenue, while ample, will be none too much, and it is of the first importance, therefore, that the advertising contracts for the coming year should be well looked after.

Size and Circulation.

Side by side with this growth in earning capacity, there is to be noticed a healthy growth in size and circulation. The volume ending with the July number contains in all 974 pages, a gain over 1906 of 124 pages. The average size of the monthly issue, exclusive of special numbers, was for 1906-1907, 72 pages, as against 65 in 1905-1906, and 57 in 1904-1905. Much of this increase is, of course, due to the added volume of advertising matter, though the aim of your Committee has been to maintain a fairly fixed ratio between read-

MR. GEO. BRIGDEN

(Toronto Engraving Co.)

Chairman "Industrial Canada" Committee, 1906-07

ing and advertising, and to add to the former from time to time such an amount of space as seemed justified by the growing revenue from the latter. The average monthly circulation to-day is approximately 200 more than it was a year ago.

Typographical.

The suggestion has more than once been received that INDUSTRIAL CANADA might with advantage be reduced to what is known as standard magazine size. It was believed that a change of this kind, together with the use of a slightly larger face of reading type, would give the paper a much smarter appearance. Your Committee beg to report that they have gone very carefully into this matter, but regret that they cannot see their way clear to recommend any changes along the lines proposed, for the reason that they would materially increase the cost of publication, and at the same time give rise to considerable dissatisfaction on the part of the present advertisers. So long as the latter are prepared to support the

paper as liberally as they are doing, it is thought to be unwise to alter existing arrangements.

Editorial.

The editorial columns of the paper continue to be used to advocate those principles, for which we, as manufacturers, are banded together.

They still preach the doctrine of adequate protection as the only means of enabling our great national industries to grow to maturity, untrammelled by ruinous competition from abroad. They still proclaim the fact—now happily becoming an accepted one—that Canadian goods are good goods, comparable with the best, and, therefore, worthy of confidence from the Canadian buying public. The paper's discussions on insurance have helped to make possible the establishment of the mutual companies, of which the Association may justly be proud. They have prepared the ground, not only among members, but among the public generally, for the improvements in service and methods that the department is striving for. The articles on transportation have been equally helpful in educating the business men of this country to a proper appreciation of the importance of the problems with which the Association is grappling. In this connection, it is worthy of note, as instancing the value which outsiders attach to INDUSTRIAL CANADA as a medium of publicity, that the Canadian Freight Association have requested your Committee to publish the circulars they issue to shippers from time to time.

Situations Wanted.

Acting upon the suggestion received from the British Office Committee, a new department was commenced in the July issue for the benefit of British artisans wishing to come to Canada to seek employment. As such a step is in line with the Association's general policy to encourage the immigration of skilled labor, it is hoped that members will make use of the department whenever possible.

In conclusion, your Committee desire to record their grateful appreciation of the liberal support which the members generally have given to INDUSTRIAL CANADA. Such loyalty to the Association's official organ has made it indeed a pleasure to be associated with its management. For their successors in office they bespeak the same assistance that has been so freely given themselves.

All of which is respectfully submitted.

GEO. BRIGDEN,
Chairman.

G. M. MURRAY,
Secretary.

The report was greeted with applause.

Mr. Brigden moved, seconded by Mr. Ballantyne, that the report be adopted.

The President put the motion to adopt the report, which, on a vote having been taken, was declared carried.

The Secretary made the announcements, after which the President declared the Convention adjourned until Wednesday, September 25th, at 9.30 a.m.

THE RECEPTION.

The reception tendered by the Toronto Branch to the members in the King Edward on Tuesday evening was a splendid function. The beautiful balcony, rich with tapestries and oriental rugs and luxurious in its furnishings, was thronged with guests. In the reception-room President and Mrs. Harry Cockshutt and Mr. and Mrs. Ed. Freyseng welcomed the members and their ladies, with a hospitality that characterized the whole evening's entertainment. The drawing-room

presented a fitting contrast to the balcony. In the latter the subdued lights and dull richness of the decorations were suggestive of repose. In the former the brilliancy alike of lights and decorations invited a gaiety which won its response in the vivacity and sprightliness that permeated the whole assemblage. The handsome toilettes of the ladies made a picture of outstanding beauty. It was a fitting prelude to the social events of the Convention.

After the guests had been officially received, Hon. J. J. Foy, Attorney-General for the Province of Ontario, and Mayor Coatsworth, in graceful speeches welcomed the manufacturers to Toronto. Hon. J. D. Rolland thanked the representatives of the Government and the City Council for their welcome.

One of the most pleasing features of the Convention then took place in the presentation to Mr. C. C. Ballantyne, of an illuminated address by the Association. Mr. Harry Cockshutt spoke in an appreciative way of the good work Mr. Ballantyne

Characteristic Poses

had accomplished during his term of office as President. Mr. Ballantyne had proved himself an able officer, under whose administration the Association had grown strong and robust. The President's speech was punctuated by applause constituting a spontaneous expression of approval which has never been excelled within the Association. Mr. G. M. Murray then read the address which formed the presentation. Mr. Ballantyne briefly thanked the members for the remembrance and felicitated the Association on its growth and position.

During the evening Mrs. Ed. Freyseng sang most acceptably in solo and with Mr. Arthur Blight in duet. Mr. Blight and Mr. Harold Frederick Massey, soloists, were received with marked favor.

After the programme, refreshments were served in the reception room. The guests then indulged in social intercourse, which was all the more enjoyable from the fact that

many were from out of the city and were then renewing friendships made at previous conventions. Last year's excursion to the coast was revived in many a recollection called up by the meeting of old friends. It was a late hour when the gathering unwillingly broke up.

WEDNESDAY, Sept. 25th, 1907.

MORNING SESSION.

At 10 o'clock a.m. the President took the chair, and, having called the Convention to order, requested Mr. A. S. Rogers to read the report of the Parliamentary Committee. However, as this was a very important report, and the attendance was small, it was decided to allow it to stand for the present and take up the report of the British Office Committee. In the absence of the Chairman, Mr. Watts, the report was read by the Secretary, Mr. G. M. Murray.

REPORT OF THE BRITISH OFFICE COMMITTEE.

It is with more than ordinary pleasure that your Committee, charged with making the necessary arrangements for the opening of an office in Great Britain, presents its first annual report.

Before entering into any explanation of what has actually been done, it is desirable to recall for a moment the recommendations adopted by the Winnipeg Convention for the government of such an office. They were briefly, as follows :

1. The office should be a general one for the work of the Association, and not for the particular purpose of securing labor.
2. The Association should make an annual appropriation of \$2,000 towards its maintenance.
3. Expenses in excess of this amount should be met by charging small fees for services rendered.
4. All its affairs should be under the supervision of a standing committee appointed for that purpose.

The first step of the Special Committee of 1906, temporarily continued in office, was to recommend the appointment of the following gentlemen as members of the Standing Committee: Messrs. Geo. W. Watts (Chairman), Thomas Findley, Gerhard Heintzman, W. B. Tindall, J. P. Murray, John Turnbull, Geo. McLagan, L. J. Breithaupt, Robt. McLaughlin, C. Bermingham, S. W. Ewing, Louis Simpson.

This recommendation having been approved of by the Executive Council, the Committee now reporting entered upon its duties.

Appointment of London Agent.

Twenty-six applications were considered from parties wishing to act as the Association's British representative. Before arriving at any decision it was first necessary for your Committee definitely to decide the nature and scope of the duties which the representative would have to perform, so that care could then be taken to secure a man with the desired qualifications.

In debating this question there were two points that weighed heavily with your Committee; first, that the chief function the office would be called upon to exercise, for the present at least, would be to supply members with skilled help; and, second, that it would be an exceedingly difficult matter to secure a man qualified to act in this capacity who would also be able to act with credit as the Association's representative in other matters. While somewhat at variance, therefore, with the recommendations of the last annual meeting, it was unanimously decided by your Committee that the appointment of a general representative should be postponed, and that for the time being an experienced and well qualified party should be engaged to act as special labor agent for the Association in Great Britain.

After a careful survey of the field the appointment was offered to Mr. Louis Leopold at a salary of \$1,750 per year, on the understanding that he would collect no fees, either from members served or from mechanics placed, though he might still arrange with the steamship companies for his commission on bookings. This, it will be observed, was well within the appropriation authorized. The offer was duly accepted by Mr. Leopold, who came to Canada and personally visited a number of centres, so as to acquaint himself with the conditions surrounding employment in the various trades.

The Fees Charged.

In order that the office might involve the Association in as little expense as possible, it was decided to ask a fee from

The Convention Place—Entrance to King Edward Hotel

those members taking advantage of its facilities. After due consideration the following scale of charges was finally adopted :

For engaging employees who will earn less than \$5 per week	\$2 00
For engaging employees who will earn from \$5 to \$10 per week	3 00
For engaging employees who will earn from \$10 to \$18 per week	4 00
For engaging employees who will earn more than \$18 per week	5 00

Before commencing operations your Committee deemed it advisable to take such precautions as would spare the Association any possible criticism on the ground that it was misrepresenting conditions in Canada, and seeking to bring out workmen for whom there was not steady employment. In a circular announcing the inauguration of the department, sent to members on February 1st, the position of the Association in this matter was made perfectly clear, and members were informed that it would be necessary for them, in availing themselves of the services of the department, to make their application on a form approved by the Committee. This form was drawn up with a view to supplying the prospective em-

ployee with all the particulars he would desire to know, while at the same time placing the Loudon agent in possession of all the information necessary to enable him to procure the exact class of help wanted. Thus far its use has been attended with most satisfactory results, not a single charge of misrepresentation having been made. There were, it is true, two or three minor complaints on the part of artisans whose feelings had been worked upon by labor agitators, but these were readily answered by reference to their signed statements to the effect that they had carefully read the applications under which they had been brought out, and were aware of all the conditions surrounding employment referred to therein.

Analysis of Help Engaged.

The applications received to date number in all 70. They come from 61 different members of the Association, and call for 838 work people. Distributed according to the provinces in which they will be employed, 516 of these work people are for Ontario, 234 for Quebec, 3 for New Brunswick, 35 for Nova Scotia, 10 for Manitoba, and 40 for Alberta. Classified according to the wages they will receive, 95 will fall in the class drawing less than \$5 per week; 303 in the class from \$5 to \$10 per week; 414 in the class from \$10 to \$18 per week, and 26 will receive over \$18 per week. The large majority—602—will be males, 29 of whom will bring their families with them.

The following analysis on the basis of occupations to be pursued is interesting, as illustrating the variety of trades affected by the present scarcity of labor. The figures indicate the number of hands the Association has applications for :

Engravers and lithographers	24
Manufacturing stationers	5
Printers	7
Weavers and spinners	136
Knitters	54
Dyers	2
Garment makers	35
Cordage makers	20
Machinists	47
Moulders	50
Tinsmiths	10
Boilermakers	45
Pattern makers	2
Riveters	9
Handymen and helpers	62
Painters	9
Ship joiners and ship carpenters	25
Wood turners	3
Cabinet makers and upholsterers	44
Gilders, polishers and buffers	21
Paper makers	30
Leather workers	7
Confectioners	16
Carriage workers	3
Cigar makers	75
Jewellers	7
Glazers	2
Musical instrument maker	1
Color mixers	6
Wire and straw weavers	6
Laborers	75

Reports received from the London Office up to September 1st show that by that date 430 hands had been engaged, all but a very few of whom had actually sailed for Canada. The balance of the applications is being filled as rapidly as is consistent with careful and efficient work, and members generally have expressed themselves as well satisfied with the results.

Considerable difficulty was experienced by Mr. Leopold,

particularly in the spring, in securing accommodation on the boats for the hands he had engaged, by reason of the fact that railroad contractors and other large employers of labor had reserved the space on many of the vessels for weeks ahead. This difficulty is now fast disappearing, and help is arriving in larger and more regular parties.

Another difficulty he has had to contend with has been to secure men who were able to pay their own passage out. Employers have been very reluctant to authorize him to advance fares, for reasons that do not require explanation. As a result a great deal more time has been consumed in filling applications than would otherwise have been necessary. This is, perhaps, offset to some extent by the fact that the class of men thus secured is, generally speaking, more satisfactory.

Financial.

The total amount standing at the credit of the British Office on the books of the Association on August 31st was

MR. ROBT. HOBSON
(Hamilton Steel and Iron Co., Ltd.)
Ontario Vice-President, 1907-08

\$1,118.30, of which \$216.35 had been collected, the balance, \$901.95, being earned, but still unpaid. As against this there were cash disbursements and outstanding liabilities of \$1,530.58. Included in the latter amount, however, were \$271.00 of preliminary expenses. Compared with current expenses, therefore, the revenue is most gratifying, as it indicates that the office is operating almost on a self-sustaining basis.

Collections have been somewhat slow, owing to the fact that only a few contracts have been actually filled. Credit is given the office for each employee as he is engaged, but many of the latter have expressed a desire to defer settlement until the entire order has been satisfactory filled.

Difficulties Encountered.

It would be useless to attempt to conceal the fact that cases of dissatisfaction sometimes occur. No matter how much care is exercised in the selection of men, a certain percentage will always prove to be disappointments. The incompetent man, whom no one will employ at home, will frequently misrepresent things in order to obtain a start in some new field of

labor. Occasionally, too, the employer invites trouble for himself by failing to make his instructions sufficiently explicit. Particularly in the initial stages of a labor bureau's operations is dissatisfaction likely to arise from causes of this kind. Experience, however, is a valuable teacher, and it should rather be a matter of congratulation than otherwise that the pitfalls have been encountered and passed with so little serious trouble. The policy of the Committee has been to replace unsatisfactory employees without extra charge, and members who have been supplied with inferior help are requested to report their complaints promptly, to exercise a little patience, and to give the department further opportunity to demonstrate its usefulness.

Twelve cases have been brought to the notice of your Committee, where employees have failed to report at destination. Unfortunately nothing can be done to stop this practice, which happily is by no means common. If a man pays his own way out he is at perfect liberty on arrival to accept work wherever he can find it; if he has been assisted, the contract he has signed is invalid unless signed afresh in Canada, and even then there is little satisfaction in prosecuting a party from whom it is impossible to recover.

An effort was made to have the steamship companies check baggage through to destination, in hopes that by mailing the checks to the employer on this side the employee's arrival at proper destination would be ensured. In this however, our London agent was unsuccessful, the companies being unwilling to make any change in their old system of handling baggage without checks. The only solution seems to lie in exercising greater care with the selection of men, to see that they are honorable enough to stand by the employers whose promise of work has been their encouragement to emigrate.

Encouraging Desirable Immigrants.

In the course of his work the Association's agent has received applications from a great many desirable artisans who wish to come to Canada, but for whom there are no vacancies among the lists supplied him from time to time by employers. It has seemed to your Committee that consistency with the Association's policy to encourage the immigration of skilled workmen required that something be done to find these people work. A recommendation was accordingly made to the Industrial Canada Committee, that mention should be made of each individual case in the columns of the Association's official organ. It is a pleasure to state that the idea was at once adopted, and many artisans are now being assisted to employment in this way.

In connection with the correspondence referred to in the report of the Parliamentary Committee, as passing between the Association and the Minister of the Interior, it might be mentioned that an effort was made to have the Government immigration agents in the United Kingdom recognize our London office to the extent of referring inquiries regarding the employment of skilled labor in Canada to it for information and advice. Notwithstanding the fact that it was pointed out that the Association was an incorporated body with responsible officers, the Government declined to act in the manner indicated.

In conclusion, your Committee wishes to express its appreciation, not only of the liberal support given to the new Labor Department, but also of the indulgence of those members whose wants have not been supplied as satisfactorily as they might have been. It is believed that the progress thus far made is most gratifying, and that with the advantage of a varied experience the department will steadily increase in usefulness and efficiency.

All of which is respectfully submitted.

GEO. W. WATTS,

Chairman.

G. M. MURRAY,

Secretary.

Mr. Scarfe moved, seconded by Mr. Wilson, that the report as read be adopted.

The President.—Gentlemen, you have heard the report read and the motion for its adoption. It is now open for consideration. Does anyone wish to say anything upon this report?

Mr. E. G. Henderson.—I would like to ask if the Minister of the Interior gives any reason for refusing to have the Immigration Officials in England refer these applications to our office in London?

The Secretary.—In answer to the question raised by Mr. Henderson I might state that while our correspondence with the Minister dealt very explicitly with that feature of the situation, in his reply that point was completely ignored. His reply dealt almost entirely with the justification which they had for bringing in agricultural laborers and railroad navvies, but so far as assigning any reason for refusing to direct applicants to enquirers for skilled labor in this country our correspondence was ignored.

Mr. E. G. Henderson.—It seems to me, that being the case, it is time this Association made some kind of protest. We were told yesterday by Mr. Blue that the interests of the Manufacturers of Canada were greater than anything else in the country, and yet here we make a request to the Minister of the Interior and it is totally ignored. It is a remarkable thing that the representations and protestations of all the labor organizations are fully recognized by the Government, but when a large body like the Manufacturers' Association makes a request it is entirely ignored. I think it is time we, as a body, made a strong protest against such treatment.

The President.—I think you will find that that will come up in the Parliamentary Committee's report. The matter can then, perhaps, be more thoroughly discussed.

The President put the motion to adopt the report, which, on a vote having been taken, was declared carried.

The President.—The next item we have on the agenda is an address by Mr. Sam Harris. He is not present and we will proceed with the next report. We will now have the report of the Parliamentary Committee, by Mr. A. S. Rogers.

Mr. Rogers.—Mr. President and Gentlemen.—Before reading the report I would like to mention that there was an inadvertent omission in the printed list of names of this Committee of the name of Mr. J. O. Thorn, who was a faithful attendant at the meetings and a valuable member. Also I wish to express my very great appreciation of the work of our Secretary in connection with this Committee—the former Secretary, Mr. Stewart, and particularly the present Secretary, Mr. Murray. Mr. Murray, taking up this work in the middle of the year, entered upon a very difficult task, and I confess I admire very much the efficient manner in which he took hold of it and the great help he gave us. The details of the work were largely in his hands, and he gave our Committee most efficient service, for which we are very grateful.

In presenting this report is it your wish, gentlemen, that we should take it clause by clause?

The President.—I think it would be a good idea to take the report up clause by clause and if there is any subject matter that the members wish to discuss in the different clauses they can do so, and then we can adopt the report as a whole afterwards. Is that your pleasure, gentlemen?

(Consent was given).

For greater convenience of reference, the report is printed in full here. The discussion of clauses follows.

REPORT OF THE PARLIAMENTARY COMMITTEE.

Your Parliamentary Committee is pleased to submit the following review of matters that have engaged its attention during the year just closed. In all eleven meetings have been held, and a close watch has been kept over legislation, both Dominion and Provincial, where the interests of manufacturers seemed to be affected.

The Labor Situation.

While the field of your Committee's activity has been varied, it is perhaps worthy of note that the greater part of its time has had to be given to the consideration of questions directly affecting the relations of capital and labor. Trade unionism has continued to follow an aggressive course in seeking to further its own interests at the expense of the community at large. At Ottawa, at Quebec, and at Toronto, labor agitators have been steadily at work, clamoring for the enactment of class legislation, and endeavoring to enlist the support of members of both political parties. It is only a few years since the representations of organized labor carried considerable weight in parliamentary circles, but more recently, thanks to the determined opposition of associations like our own, its efforts have met with less success. In such matters as immigration, however, its influence is still exerted to some effect, to the detriment, be it said, of our manufacturing industries and the country generally. That legislators, in order to obtain favor with unincorporated bodies, who have steadily declined to assume their lawful responsibilities, should adopt measures which react upon those whose interest are centred in the upbuilding of the nation, indicates a regrettable degree of weakness, and points to the necessity for vigorous and concerted action by the employing classes if they are to protect their own.

Scarcity of Labor.

The scarcity of skilled labor continues to act as a serious obstacle to the natural expansion of Canadian industry. Development of all kinds is progressing at a rate which makes it difficult for manufacturers to keep pace with the swelling tide of orders. New factories are being erected. Old factories are being enlarged. In five years our output of manufactured goods has increased nearly 50 per cent. And yet, according to the blue books, our imports are growing more rapidly than ever before, while our exports for the four months ending July have actually fallen behind. So far as machinery is concerned, Canada is well equipped to produce many millions of manufactured goods more than she is doing, but the wheels of industry are all too often left to rust in idleness, for no other reason than that it is impossible to procure skilled help to operate them.

Realizing the seriousness of the situation, your Committee has again pointed out to the Government the importance of advertising Canada's needs abroad, in such a way as to encourage the immigration of skilled artisans. Settlers and railroad navvies we need, and need badly, but we maintain it is a short-sighted policy that seeks to stimulate the growth of one industry, while it allows another, and, equally important industry, to struggle along as best it can against the unequal odds of foreign competition.

In laying the Association's views before the Government your Committee has been met with the reply that there is little hope of any change of policy, that they have seen no reason to alter their attitude as defined in the instructions issued to booking agents last November, wherein they state that "The demand in Canada is for people to occupy the, as yet, vacant lands of the country, to aid in the cultivation of those already occupied, and also to assist in providing additional transportation facilities. This it is which justifies the Government in assuming the expense of immigration effort. To go beyond the attempt to meet these requirements would

be to use the money of certain classes of Canadian taxpayers for the purpose of securing competitors against them in their several callings, for which they would naturally hold the Government to account." To say nothing of the inconsistency which a union of farm laborers or railroad navvies might be able to point out in such an argument, it implies a deference to the demands of organized labor, which seems difficult to understand, for, as has frequently been pointed out, the unions represent less than 10 per cent. of the workers in our industrial establishments. Moreover, to pay a commission for bringing out laborers, and to refuse to pay it for bringing out artisans, would indicate that, in the opinion of the Government, the man who digs a ditch is worth more to Canada than the man who builds a house.

The Association is already on record as regards immigration, in the form of the following resolution, which your Committee would recommend be reaffirmed in annual meeting :

"Whereas it is necessary for the permanent development of

MR. A. S. ROGERS

(Queen City Oil Co.)

Chairman Parliamentary Com., 1906-07

Canada, and in the true interests of all its citizens, that the manufacturing, farming, lumbering, contracting and other industries of the country should be able to procure a sufficient supply of skilled and unskilled labor to produce and manufacture, as far as possible, what is required for home consumption and to increase our exports abroad ;

"And whereas, the rapid growth of new settlements and industries throughout the country, the mining camps, the enormous railway and other construction in progress, or in prospect, are withdrawing a constantly increasing number of skilled and unskilled men from the older parts of the country, who are greatly needed in the factories, as well as on the farms of these districts ;

"And whereas, employers are prevented by the Alien Labor Act from bringing workmen from the United States, and our Government immigration agents abroad not only do not encourage, but, in effect, discourage immigration to Canada of skilled artisans ;

"And whereas, the scarcity of good workmen, both on the

farms and in the towns and cities, has become a matter of public notoriety, which cannot be gainsaid :

"Resolved,—That the Dominion Government be respectfully urged to encourage, through its present immigration officers, and by the appointment of special representatives for this purpose, the immigration not only of farm laborers, but also of skilled mechanics, where opportunities are known to exist, and thus assist in building up our national industries."

The Eight Hour Day.

Early in the year an effort was made by the unions, through their representatives in Parliament, to bring about the adoption of an eight hour day on all Government contract work. Such a proposal seemed to your Committee most objectionable, for, besides disorganizing business, it aimed to prohibit every employer and every employee who worked more than eight hours a day from sharing in Government orders. When it was remembered, however, that it would likely prove but the thin

MR. D. LORNE MCGIBBON

(The Canadian Rubber Co. of Montreal, Ltd.)
Quebec Vice-President, 1907-08

end of the wedge, to be followed another year by a bill to make the eight hour day compulsory everywhere, it assumed a seriousness which justified your Committee in marshalling all its forces in opposition.

An eight hour day at the present stage of Canada's development is an industrial impossibility. A reduction in the hours of labor would mean that the shortage of help, already a serious problem, would be greatly accentuated. A shorter working day would mean an increased cost of production, which, in turn, would mean a material advance in prices to the consumer. With an increased cost of production the manufacturer would be at a decided disadvantage in meeting foreign competition, both at home and abroad. Shorter factory hours would also mean that hired help for the farm would be more difficult than ever to secure and to retain.

Having these facts in mind, your Committee instituted a vigorous campaign in opposition to the bill. Without going

into details, it is gratifying to be able to report that the measure was finally withdrawn in order to save it from certain defeat.

Merchants' Shipping Act of Great Britain.

Through the instrumentality of the Federal Department of Labor, the Merchants' Shipping Act of Great Britain, was recently amended so as to make it a criminal offence to induce emigration by means of false representations. It appears that certain unscrupulous employment agents have in times past indulged in this practice, with results that were anything but beneficial to Canada. Your Committee have no sympathy for agents who would bring to this country men for whom there is no work, and, so far as it will check this evil, the legislation is to be commended.

It is believed, however, that due regard for all interests concerned would have dictated a policy that would act both ways, to punish not only those who, for the sake of gain, make false representations that tend to overcrowd the Canadian labor market, but also those who, by false representations, seek to maintain a scarcity of labor for their own selfish ends. There is abundant evidence of the fact that Canadian labor unions, through their affiliated societies in England, are endeavoring to check the emigration of skilled mechanics to this country by misrepresenting the actual conditions prevailing here, and it is to be regretted that the Government could not have devised some means of putting a stop to practices which result in checking valuable immigration.

The Lemieux Act.

After very careful consideration, your Committee decided to make no recommendations to the Government in the above matter. For the most part the Act applies to lines of business in which members of the Association are but indirectly interested. While generally speaking, the principle of conciliation is one to be approved of, the boards constituted under the Act are, so far as Canada is concerned, a decided innovation. It is plainly the part of wisdom, therefore, to go slowly, to test them out carefully in a narrow sphere of action before giving them a wider application. The Act is now on trial, and its operation will be watched by manufacturers with deep interest.

United States Silver.

It is a matter of regret that the Department of Finance has delayed acting on the Association's recommendations regarding the exportation of United States silver. The arrangement effected early in 1906 with the Bankers' Association, whereby the Government bore the cost of shipping this coinage out of the country, appears to have worked out to the satisfaction of both parties, and to have accomplished the desired result. At the end of three months, however, the limited appropriation voted for the purpose was exhausted, and the arrangement has not since been renewed. As pointed out in the resolution of 1903, it is desirable, both from financial and patriotic reasons, that foreign silver coinage circulating in Canada should be replaced by coins of our own. Now that the Ottawa mint is nearing completion, it is believed that it would be an opportune time to urge the matter once more upon the Government. It is recommended by the Committee that this be done.

An Ottawa Representative.

On account of the variety and importance of the Association's interests at Ottawa, it became apparent in the early part of the session that to properly care for them it would be necessary to have a man constantly on the ground who would act under the Committee's instructions, and keep them advised of new developments. An eminently suitable party was selected for this purpose, and it is gratifying to be able to report that he rendered satisfactory service.

Measurement of Water Flow and Rain Fall.

Requests have been received from different sources, asking for the support of the Association in a movement to have the various provincial governments record regularly the flow of water in their rivers, in order to facilitate the development of water power. There can be no doubt that this information would prove very valuable to engineers in determining the efficiency of water powers. Where estimates for hydraulic development have to be based on limited data and deductions drawn from observations covering only a brief period of time they are likely to be erroneous, frequently leading to serious results. Since the work could be done at moderate cost, and would likely result in the investment of more foreign capital in developing our water powers, it is recommended that the Association lend its assistance in the manner indicated.

Commercial Travellers' Taxes.

The Association's continued agitation for the repeal of provincial acts which impose taxes on commercial travellers from outside points, has borne fruit during the year, Quebec having abandoned her tax altogether, and British Columbia having dropped it as against all travellers, except those representing liquor and tobacco houses. It is to be regretted that Prince Edward Island has not yet seen its way clear to abandon a measure which her sister provinces have acknowledged to be an unreasonable interference with internal trade.

Ontario Legislation.

It is a pleasure to be able to state that the Stationary Engineers' Act of 1906, which was the subject of so much adverse criticism in this Committee's report a year ago, has been superseded by a new Act, which will be found much more satisfactory. The chief objection to the 1906 Act was that it was put through as an amendment to an old Act incorporating the Ontario Association of Stationary Engineers, thus delegating to a private organization powers that should have been exercised only by the Government.

Early in the year your Committee, in conjunction with other bodies, made strong representations to the Ontario Government, with the result that the Act was entirely recast, in such a way as to bring its administration directly under the supervision of the Department of Agriculture. Provision is now made to exempt from its operation steam heating plants working at a pressure of 20 lbs. or less. In cases of emergency a person who is not the holder of a certificate may be employed in operating a steam plant for a period of 30 days. Experienced engineers may, up to July 1st next, obtain certificates of competency without examination, and the Act will not apply to firemen working under the personal supervision of such engineers. Other improvements were fully set forth in a circular issued to members under date May 11th, accompanying which was a copy of the Act itself.

Joint Stock Company Act.

A bill to consolidate and amend the Ontario Companies' Act was the subject of careful study on the part of your Committee, and a number of recommendations subsequently made to the Provincial Secretary were incorporated in the measure as finally passed. Permission was granted to abbreviate the word "limited," under conditions which are carefully defined. The time allowed for company organization was extended from 40 to 90 days, with provision for further extension on application to the Lieutenant-Governor. A clause to prevent the payment of salaries to presidents and directors, unless authorized by by-law, confirmed by a vote of two-thirds in value of the shareholders present at a general meeting, was changed to make it permissible when confirmed simply by a majority vote. Certain restrictions surrounding the invest-

ment of company funds in high class securities were also removed.

Ontario Assessment Act.

Enquiries made of members throughout the Province of Ontario showed a general desire to have the Assessment Act amended in three ways: (1) To reduce the business assessment on manufacturers from 60 to 50 per cent.; (2) To place shareholders who were officers in incorporated companies on the same basis as partners in a partnership, so far as assessment on income was concerned; (3) To relieve employers from responsibility for the delivery of assessment and tax notices intended for their employees.

MR. JOHN
RANSFORD

Characteristic Poses

As regards the last, a legal opinion was obtained to the effect that employers are not compelled, under the Act, to deliver notices to their employees, so no action was taken. Bills covering the first two points were drafted and introduced, but were finally allowed to drop in deference to the wish of the House that the Act be given another year's trial before being amended.

Ontario Bureau of Labor.

Following the change of management in the Ontario Bureau of Labor, an effort was made last fall to have the schedule of questions asked of manufacturers by the bureau amended in such a way as to relieve it of its objectionable features from the employer's standpoint, while still preserving its usefulness from the standpoint of labor. A memorandum em-

bodying the Committee's recommendations was accordingly drawn up and presented to the Minister of Public Works, and in due course an interview was had with the new Secretary of the Bureau, who seemed favorable to the changes suggested. When the schedule afterwards made its appearance, your Committee was disappointed to note that many of the questions to which particular exception had been taken were found to have been retained.

Failing to secure the elimination from the bureau's report of certain data regarding labor unions, your Committee endeavored to have it compiled in more complete form, so as to show of each union whether or not it was incorporated, the number of its men out of employment, its foreign affiliations, if any, the amount of money forwarded to foreign or international organizations, and its liability to assessment by such bodies. These recommendations have not as yet been adopted.

In other respects the report continues to invite criticism by reason of the worthless and misleading statements it con-

MR. L. C. McINTYRE
(Pauline Chambers Co., Ltd.)
Manitoba Vice-President, 1907-08

tains, and an early opportunity will be taken to acquaint the Minister with the Committee's views.

Factory Inspectors.

A great deal of dissatisfaction has been caused by the report that the Ontario Government intends to fill the three new factory inspectorships from the ranks of organized labor. Among manufacturers the fear is expressed that when labor troubles beset them they may be subjected to unfair and annoying treatment by inspectors whose sympathies are biased, and who may use their authority to act as spies for the union. The members of the Cabinet have accordingly been advised that while the Association approves of the principle of factory inspection, it is strongly of the opinion that the inspectors appointed for this purpose should be chosen outside the membership of any association of employers or manufacturers or of any labor union.

Pawnbrokers.

The old Ontario regulations governing pawnbrokers left the door open to all kinds of dishonest practices, whereby the

recovery of stolen goods was rendered exceedingly difficult. In co-operation with the Jewellers' Section, a bill was drafted, and finally passed by the House, which has been found to work out much more satisfactorily. It provides for a daily report to the Chief of Police, and prohibits the melting of gold or silver on the premises of any pawnbroker.

Quebec Legislation.

Through the activity of the Montreal Branch some important legislative work has been accomplished in the interests of the Province of Quebec members.

A bill to authorize the City of Montreal to impose a tax of \$500 on the manufacturers of certain kinds of food products was defeated.

A proposal to extend the Montreal gas and electric contract for a 22-year term without consulting the ratepayers, led to the passing of an Act making it compulsory for all municipalities to submit to a vote any proposal to grant an exclusive franchise for the operation of public utilities for a period of more than ten years.

Attention was also directed to a number of abuses that had crept in under the Garnishment Act, and steps were taken to prevent the piling up of heavy costs against unfortunate debtors and wage-earners, as well as to spare employers the necessity of appearing so frequently in court.

Metallic Roofing Co. vs. Sheet Metal Workers' Union.

No review of the labor situation for the year would be complete without an extended reference to the developments in the above action, which has come to be a *cause celebre* in union litigation.

For the information of members who may not be familiar with the case, it may be stated that suit was entered by the Metallic Roofing Company some five years ago against Local No. 30, International Sheet Metal Workers' Union, to recover damages sustained by reason of a boycott instituted by the latter against the goods of the former. At the very outset the plaintiffs were met with the difficulty that an unincorporated union had no legal status, and could not, therefore, be sued. After much obstruction they succeeded in obtaining an order from the court, which practically defined the proper manner of entering suit against an unincorporated union to be by means of a representative action, wherein certain individual members, specified by the plaintiffs, would have to represent not only themselves, but every other member of the union with which they were connected. They next succeeded in establishing the fact that each of the individual members, not only of the local union, but of the international organization of which the local body was a recognized branch, was amenable to the law for the misdeeds committed by his officers or fellow-members in the name of the union, and that his goods could be seized to satisfy judgment.

Damages were in due course assessed by a jury at \$7,000, and ordered by the court to be paid, which order was sustained on appeal. Failure on the part of the union to pay these damages led to the issue of a further order appointing the Metallic Roofing Company receiver for the union and all its individual members for a period of twenty years, subject to renewal for an equal period if the claims were not all satisfied at the end of that time.

The union then announced its intention of carrying the appeal to the Privy Council, and as a preliminary step to this end made application to have its case heard without security. This the plaintiffs opposed and the application was disallowed, otherwise it would have meant that no labor dispute in Canada, involving legal proceedings, would have terminated short of the Privy Council.

Whether the union will go ahead with its appeal under these circumstances remains to be seen. In any event the outcome of the action will be watched with keen interest, as

upon it will depend the validity of the legal precedents thus far established.

When it became necessary for the company to send their solicitor to England, your Committee felt that it was time for the Association to bear a share of the expense in maintaining a principle which was of the utmost importance and value to every employer of labor. A recommendation to this effect was accordingly sent on to the Executive Council and approved of, and in due course financial aid was given, accompanied by an expression of thanks from the Association for the valuable service the company had rendered in fixing the responsibility of trades unions.

The Union Label.

Spasmodic attempts have been made within the year to secure Government recognition of the Union Label. Following an effort to have its use made compulsory on all text-books authorized by the Ontario Education Department, a joint memorial was presented to the Premier of the Province by the Association and the Toronto employers. The matter is one which needs continual watching, at the Dominion and Provincial capitals, as well as in the various municipalities, where constant efforts are being put forth to secure its adoption on all kinds of civic contracts.

Other matters which the incoming Committee will require to give attention to are the laws relating to Compensation to Workmen and the Franchise for Incorporated Companies. The former are sadly in need of revision and consolidation, and, in Ontario at least, will probably receive consideration at the hands of the Government at the approaching session. With the latter question considerable progress has been made, and before another year has passed it is believed that some of the Provinces will have amended their statutes in conformity with the wishes of the Association.

In concluding this report, the Committee desires to record its grateful appreciation of the splendid manner in which the membership at large has come to its assistance in making representations at Ottawa. When it has been necessary to issue calls for assistance they have been responded to promptly and generously. The strength and value of the Association is never shown to better advantage than on occasions of this kind, and the efficiency of its organization is a matter upon which the members are to be congratulated.

All of which is respectfully submitted.

A. S. ROGERS,
Chairman.

G. M. MURRAY,
Secretary.

Mr. Rogers read clause *re* "The Labor Situation," which was adopted without discussion.

Mr. Rogers read clause *re* "Scarcity of Labor."

The President.—Gentlemen, that clause deals, I think, pretty fully with Mr. Henderson's remark, and there is the resolution submitted on the same subject. If there is anything to say upon this clause of the report we will be glad to hear you now. Of course the resolution will be finally adopted in the whole, but you have it now before you for discussion.

Mr. J. O. Thorn.—In connection with that portion of the report which has been read by Mr. Rogers, I would like to draw attention to the fact that the Trades and Labor Congress of Canada held a meeting in Winnipeg only last week, and amongst other things they pointed out this—I will read their exact words: "That our Executive cannot comment too severely upon the ill-advised action of the Canadian Manufacturers' Association in retaining as their special representative in England the notorious Louis Leopold, alias Lazarus, who, during this past month, continued to send workmen to this country under false representations as to the condition of the labor market in Canada."

And the Congress passed a resolution authorizing an assessment of 10c. per capita upon all those affiliated with the

Congress for the purpose of raising a special fund to be used in sending and maintaining in Great Britain an agent, whose special business will be that of doing all that he possibly can towards deterring skilled mechanics and others from coming to Canada.

There is evidently a special effort being made to restrict, if possible, the incoming of skilled artisans, no matter whether it may be the Canadian Manufacturers' Association or anyone else that is trying to bring them into the country; and with reference to that it appears that Mr. Scott, the Dominion Superintendent of Immigration, has been asked to report upon regulations preventing immigrants coming into the country unless they have a certain amount of money. I think it is a well-known fact that there are many good, skilled mechanics in Great Britain, especially, who have been working for many years, but owing to various circumstances, are not possessed of very much means, but I see no valid reason why those men, as long as there are positions here

MR. T. M. CUTLER

(Acadia Sugar Refining Co., Ltd.)
Nova Scotia Vice-President, 1907-08

for them, should be prevented from coming into this country because they have not a certain amount of cash in their possession. In fact manufacturers have in many cases been advancing the railway and steamship fares for skilled mechanics and have been providing them with positions as soon as they arrived here. I think it would be most unfortunate if any law were passed preventing men of that kind coming into the country unless they were possessed of a certain amount of cash.

It is quite evident that politicians generally have felt that Labor Unions are of very great power in the land, that they represent a very large vote. I think we have very good proof of the fact that that is really not so. At the Trades and Labor Congress, held in Winnipeg, last week, the official report of the Secretary-Treasurer presented to that meeting shows that they have in affiliation with them 515 unions, representing 32,997 men; and further they say that there are about 20,000 other members of international unions in this country not affiliated. That makes only a total of about 50,000 union men in the Dominion of Canada. That is all the Trades and Labor Congress itself claims, and that, I think, to a very large extent dissipates the idea that the Trades and Labor vote has any very great strength to it.

Mr. E. G. Henderson.—The resolution covers the whole ground, but if I mistake not that resolution has been in effect

for more than a year. It does not seem to me that the resolution has accomplished anything. I think Mr. Thorn touched the pith of the whole matter when he said it was a question of votes. As I said before, this organization represents very much more than any labor organization or agricultural organization, and yet the Government pays attention to the labor agitators instead of paying attention to us. Why? They know very well, we as Liberals or Conservatives, will still go on voting for our party, but the vote of the Labor Organization is very easily changed, and it is nearly time we took that into our consideration if we are going to get anything from either Government. (Hear! hear!)

Mr. Rogers.—The Committee felt very keenly about this situation, that the Government should positively refuse, as they have done in the Department, to encourage the immigration of skilled men. Now, there is no doubt but that the Immigration Department has done good work in bringing out agricultural and other laborers. I understand they pay a premium and a commission for this work to booking agents, and their immigration agents themselves are instructed to

MR. F. L. HASZARD
(Charlottetown Condensed Milk Co., Ltd.)
P. E. I. Vice-President, 1907-08

encourage the immigration of agricultural laborers and so on, but as a matter of fact skilled artisans are discouraged by the booking agents from coming to this country. Why is it that that should be done? Is it not as much to the interest of the country generally as to the manufacturing class? By the exclusion of the skilled artisan the manufacturers get a certain amount of the better class of farm laborers, and in every part of the country, in the small hamlets, here, there and all over, the farmer knows there is a scarcity of men not only to do his farm work, but to build a barn or pig sty or anything else that requires a carpenter or mechanic. It seems to me that if some method could be adopted to let the country understand generally the influence and effect that the restriction of this importation of the better class of labor is having on business generally it would have a good effect. It seems unreasonable that the Government should be willing to pay booking agents commission for worthless men, so long as they are agriculturalists, and refuse to pay it for men who earn twice the money and are worth twice as much to the country.

Mr. J. Ransford.—Mr. President and Gentlemen.—I don't

wish to detain you by going over ground that has already been covered, but I wish to raise my voice in protest against the policy that we have hitherto adopted of being as it were a suppliant at the knees of the Government. I am sick and tired of the way in which the Government treats the Canadian Manufacturers' Association. It seems to me, sir and gentlemen, that whatever we do, or whatever we ask for, is treated practically with—I don't think it is too strong a word to say—contempt. We ask for the most reasonable things and we simply get nothing in return. As a previous speaker, Mr. Henderson, remarked, this resolution we are now going to adopt has been passed by us before and has gained for us no results whatsoever. I am perfectly alive, as any other ordinary man is, to the advantage of going sometimes with what is called "policy," but where is the good of everlastingly continuing policy or politic action? Why shouldn't we get up boldly and express ourselves and say what we think? I would remind you that the Trades Unions and the Labor Organizations do not hesitate to ask for what they want; they do not hesitate to express plainly what they think. I would remind you that the agricultural organizations, the farmer, does not hesitate to say what he wants and thinks. Why should we everlastingly be talking about adequate protection when we believe in protection pure and simple? And why should we be everlastingly talking about protection until our industries reach maturity? We only make ourselves a laughing stock; we only form and create a subject for a clever cartoon on the part of the humorist who comes out and draws something very funny for the people to laugh at, about infant industries.

I myself would be in favor of cutting out this clause altogether and not going before the Government any longer respectfully soliciting this or that. We have proved the futility of that action beyond a doubt. Let us go to work and do what any other sensible men would do under the circumstances—help ourselves. We have established an agency in England, let us make use of that; let us devote our money and exert our energy in that direction and once and forever stop going down to Ottawa with our hats off in a deferential attitude before Minister this or Minister that, asking for something most politely and respectfully which will never be given us as long as we live. (Applause.)

There being no further discussion, the clause was adopted.

Mr. Rogers read clauses *re* "Eight Hour Day," "Merchants' Shipping Act," "Lemieux Act," "United States Silver," "Ottawa Representative," "Measurement of Water Flow and Rain Fall," "Commercial Travellers' Taxes," "Ontario Legislation," "Joint Stock Company Act," and "Ontario Assessment Act," which were adopted without discussion.

Mr. Rogers read clause *re* "Ontario Bureau of Labor."

Mr. J. O. Thorn.—In connection with this I would like to draw attention to the fact that the Trades and Labor Congress at its recent meeting in Winnipeg instructed its representatives in this Province to appear before the Ontario Government to urge the passing of a law compelling manufacturers to give this information. If such a law were passed, in my opinion you might as well give the Labor Unions your balance sheets at once, because it is quite equal to doing that to give the information which they have been asking us for, and which they are now trying to get the Government to compel us to give.

Mr. W. H. Rowley.—I would like to ask Mr. Rogers, through you, Mr. President, whether the Committee has considered the advisability of the Manufacturers having a list and interchanging and exchanging among themselves by card system, a register of those of their employees who have left them, either left of their own accord or been discharged or have otherwise been removed because they have been turbulent or disturbing; and whether it would or would not be, in the

opinion of the Association or of this Committee, a good plan to have such a system by which the names of the men who had been employed might be kept tab of, and other employers of similar labor kept advised.

Mr. Rogers.—I might say in reply to Mr. Rowley's enquiry that that question has not been before our Committee.

The President.—It is one which would have to be taken up and considered very carefully, and it is one which should really go before the Council of the Association to be dealt with. You might undertake that at some time.

Mr. Rowley.—Thank you. It ought to be considered, I think.

There being no further discussion the clause was adopted.

Mr. Rogers read clause *re* "Factory Inspectors."

Mr. C. R. McCullough.—Mr. Chairman and Gentlemen.—I happened to be a member of the small committee that waited upon the Minister having this matter in charge, some few months ago, and we were listened to very respectfully for the period of half an hour, and we rather felt we were making some progress with the Minister, but as he rose to bid us good day and on his walk to the door to let us out he very ingenuously remarked that the whole matter had been decided as to the appointment of these inspectors. We had urged upon him the desirability of choosing as inspectors men who neither represented the manufacturers nor were active agitators amongst the labor classes. He quite agreed with us in this; we tried to put it on a national ground, and we felt, as I said before, we were making progress, but when he stated that they had made their choice and we asked what the choice was, it was intimated to us in a very round-about way that they were to be selected from the laboring branch. We regretted that this was being done, but the remarks that have been made on this floor have simply demonstrated the fact that the manufacturers as a body are not considered by the Legislative bodies of this country; they do not amount to anything, and it is high time for this Association, if it is to do for itself what it ought to do, to rise with its arm not lifted too high, but high enough to indicate to the powers to which we go that we demand not only a hearing, but a careful consideration of our requests, and that the decision should be not a class decision, but it should be a decision consistent with the very best interests of the country. If we as a body demand that we be treated as a class organization we shall go to the extreme that the Labor Organizations have gone to, and the pendulum which has gone so far is, I am sure, about to swing back. We should not seek to hasten that pendulum in its swing to the other extreme. I think the Manufacturers are amongst the most liberally educated people of the country. We should therefore demonstrate to the citizens of Canada that we seek only that which is fair and which will build up the country and build it up permanently. This question of Inspectors is a small matter, perhaps, but it is one of those things that indicate the trend of feeling, and we ought to watch them most carefully, and this Committee is to be commended for taking this matter up and laying the facts as they have done before this body. I trust when the Manufacturers go to the Government at Ottawa or in Ontario or any other Province of the Dominion they shall go there and not seek as suppliants, but demand that they shall have what is eminently fair and right.

Mr. J. O. Thorn.—We have had a very good illustration quite recently in the City of Toronto of the objectionable features of having Labor Union officials as Factory Inspectors. There has been a strike amongst the machinists in this city—there is one on at the present time—and factory inspectors whom we had not seen for twelve months before came around very shortly after the strike was in operation. We naturally think, and I wish to say so without desiring to do any injustice to the factory inspectors, that if informa-

tion as to the number of men working in our respective factories has not been conveyed, they are at least in a position whereby they can convey it, to the Labor Unions which are trying to work against us. It is exceedingly objectionable to have Labor Unions getting information about our factories from Inspectors in the employ of the Government, especially when they come to our factories when a strike is on, whereas we have not seen them for twelve months previously.

Mr. Ransford.—I think Mr. Thorn could tell us something about the number of men employed in the Labor Unions as compared with the number of voters.

The President.—That has already been done.

Mr. W. K. McNaught.—I would like to say a word in reference to what has been said in regard to the position of the Ontario Government as to Legislation. I think the mem-

MRG M.
MURRAY

Characteristic Poses

bers of the Committee will say so far as the Government of this Province is concerned that in the past few years they have been absolutely fair to the Manufacturers, and have not been biased or swayed unduly by the representatives of the Unions. The report itself, which has been read by the Chairman, I think bears me out fully in that respect.

In so far as the appointment of Inspectors is concerned, I am not aware at the present moment that Inspectors have been appointed from Union men or that they have been appointed at all in fact; and, as I understand the matter, as yet no appointments have been made. I therefore think that some of the remarks which have fallen from previous speakers have been unfair to the Government of this Province; and as a member of the House I think it only fair to myself, as well as to the Government, to say that I think remarks of that kind should not be made in a public place in this way.

In regard to the report which has just been read, you will

find by going through it that reference is made to four or five different topics which have been before the Government of this Province for this Association, and in every case the action of the Government has been commended—that is, where they have taken action. If that is the case, I think the inference in regard to the factory inspectors allowed to be appointed is hardly warranted by the facts. That is my only reason for making these remarks at this time.

Mr. Rogers.—It would be most unjust if I should not corroborate what Mr. McNaught has said with regard to the generous treatment that has been given to matters that have come before the Committee—other matters I refer to—during the last year, and I think the members should know also that Mr. McNaught has been a most helpful member of the Association, in connection with other matters that are really of great importance to the Association.

Mr. George W. Walker.—Mr. President, I had the pleasure of being one of the Committee that waited on the Hon. Mr.

MR. ED. J. FREYSENG
(Freyseng Cork Co., Ltd.)
Chairman Toronto Branch, 1907-08

Monteith in regard to the factory inspectorship; and Minister Monteith, as Mr. McCullough has just told you, in dismissing us after the interview, intimated to us that the Labor Organizations of this country were very powerful and they must needs take cognizance of that fact. We presented to him a petition from the citizens of Hamilton, representing an investment there of over twenty-five millions of dollars, asking for the appointment as factory inspector of a man from the city of Hamilton, who does not belong to the Manufacturers' Association or to any Labor Organization, but who is a good mechanic. Mr. Monteith said, "Gentlemen, it is too late; we have practically made up our slip." We asked him if he would give us any further information as to who they would be. That is when he said they would have to take cognizance of the Labor Unions. We left there with our minds made up that they were going to appoint inspectors from the Labor Unions.

Mr. Rogers.—I understand these appointments have to be made by the Cabinet on the recommendation of the Minister,

and so far as I know these names have not been presented yet, and it was thought there might be an opportunity of laying our views before the Minister or the Cabinet later.

Mr. McCullough.—The expressions which have been uttered here on the floor to-day may have influence upon the final appointment, and if it should be so I think the time we have occupied would be well spent.

Mr. Rogers read clauses *re* "Pawn Brokers," and "Quebec Legislation," which were adopted without discussion.

Mr. Rogers read clause *re* "Metallic Roofing Company."

The President.—I do not think it is necessary to adopt that clause, but if you wish to make any remarks in reference to it, now is the time.

Mr. Rogers read clause *re* "The Union Label," and moved, seconded by Mr. G. Henderson, that the report be adopted as a whole.

Mr. Ransford.—I would beg to move in amendment, seconded by Mr. McGill, that in view of the indifference shown by the Government to the representations made by our representatives from time to time, the words on page 30 (of the printed reports), commencing, "The Association is already on record," etc., down to the words, "Building up our national industries," on page 31, be eliminated. You have already heard my views on this subject, and I only wish to say this, if that amendment is defeated, as it may be, if it has no other effect than calling the attention of the Government to the fact that we have got some life within us and some energy and some development policy and some power to act for ourselves, I shall be pleased.

The President.—You have heard the motion to adopt the report and you have also heard the amendment. Before it is declared open for discussion I wish to say a few words. I do not like to disagree with my good friend, Mr. Ransford, and in some respects he is perhaps correct in regard to this matter, but so far as the Canadian Manufacturers' Association is concerned, and so far as their influence with the Governments of this country is concerned, their influence is for good. We have accomplished much and we have been treated with respect, and we have been treated with dignity by all the Governments of Canada in so far as I know. We have been refused things, and we expect to be refused, because there are other people who consider and think entirely different to what we do ourselves. The questions of tariff and of labor are questions that are controversial, and when they are controversial there are two sides to the question. If the Government desires to consider differently to what we do we have to bow to their good judgment and bear it as best we can. But when we get into other matters, into matters of trade and commerce, the Government has lent to us a listening ear and it has helped us many times, and I desire to give it credit for that. When we get into these controversial subjects it is necessary for this Association to take one stand, and that is political or non-political. We are a non-political Association. If we desire to stand upon that platform we must take our rebuffs. If we desire to go into the political arena and declare ourselves as politicians, then we can say to the Government, "You must do this or do that or we are against you."

Mr. McGill.—In seconding Mr. Ransford's amendment, I don't think there is any politics in this matter whatever. This is a subject that has been before the Association for four or five years. We are all familiar with the fact that about four years ago the walls of Great Britain were placarded with notices that skilled mechanics were not wanted in Canada, or something to that effect. As Mr. Ransford has said, this resolution has been passed year after year without any apparent notice being taken of it. The amendment, as I understand, is simply to eliminate this resolution

and simply state our case in our report. For that reason I am quite pleased to second the amendment.

Mr. Rogers.—I am not quite sure if I fully understand Mr. Ransford's amendment.

The President.—It is just to eliminate the whole of that resolution.

Mr. Ransford.—It is merely to eliminate your reference to that motion which we have already passed. You distinctly say it is only a reaffirmation. We have already done it year after year. It begins with the words, "The Association," on page 30, and ends with the words, "National industries," on page 31. I desire that all of that be cut out, because we have already done that, and I do not want to keep on doing what is useless.

Mr. Rogers.—I think Mr. Ransford is under a misapprehension with regard to the meaning of this resolution. This resolution was framed by the present Parliamentary Committee during the present year, and was passed on to the Executive Council and approved of by them and sent to the Government. I believe Mr. Ransford is a member of the Council, and as I understand we are simply reporting what we have done as the Parliamentary Committee. We are now asking the Convention, as a Convention, to approve of the action of the Council and of the Parliamentary Committee. If Mr. Ransford has something further to insert in the report which would express his ideas better, something of that kind could be done, but why should we eliminate this action which we have already taken as an Executive Council and Parliamentary Committee?

The President.—Possibly you didn't understand that, Mr. Ransford?

Mr. Ransford.—I did not.

The President.—It has been passed by the Council and it is simply being reported on to the Convention.

Mr. Ransford.—If the Council did pass it they did what in their wisdom seemed best. We now as a Convention meet and express our conviction, and I for one member of this Convention would be averse to repeating that action of the Council. What we may say in Convention would certainly have more influence and weight than merely the action of the Council; and as a member of this Convention I would be averse to this Association taking that action and respectfully urging the Dominion Government, a thing I am sick and tired of doing.

Mr. Rogers.—Do I understand Mr. Ransford's amendment to be that this resolution should not be forwarded again to the Government?

The President.—He wants to eliminate this from the report.

Mr. Rogers.—If that is the wish of the meeting could that wish not be reached by simply changing the preliminary wording and not forwarding it to the Government; that is, not reaffirming it any further than in the acceptance of this report?

Mr. Ransford.—Yes, I will agree to that if my seconder will.

The President.—Do you withdraw your amendment if that change is made?

Mr. Ransford.—I do.

The President.—Then the original motion stands. Are you ready for the adoption of the Parliamentary Committee's report? If there are any other remarks on the report we shall be glad to have them, but I think it has been pretty fully discussed.

Mr. McNaught.—Before you put that resolution I wish to draw attention to the last clause which refers to the Workmen's Compensation Bill. I think that was brought up last session in the Legislature of this Province, and was sent over till the coming year. In my opinion that is one of the most

far-reaching and important bills this Association will have to consider for a long time to come. A preliminary Bill has been brought into the House, founded on the English Bill, which went into operation last July, and I think every manufacturer who studies that Bill will come to the same conclusion as the English manufacturer has done since it came in operation, that it is a very hazardous bill indeed, and one which has worked a hardship on the manufacturer and on the public generally. If any bill is passed in the House here on the lines laid down in Great Britain, you will find that no matter how an accident occurs in your factory you will be held liable for it. I think that in this case we should take time by the forelock. This Association should put itself on record in regard to what it desires from the Government and take steps to deal with the matter properly when the Bill is brought before the Government.

MR. S. W. EWING

(S. H. Ewing & Sons)

Chairman Montreal Branch, 1907-08

The President.—That will be a matter which the Parliamentary Committee will deal with in due course.

The President put the motion to adopt the report, which, on a vote having been taken, was declared carried.

The Secretary made the announcements.

Mr. Thorn.—I would suggest that any member having a resolution to move should be given an opportunity to appear before the Resolutions Committee.

The President.—I don't think there would be any objection to that, but as far as the consideration of the resolution is concerned I think that should be a matter for the Committee itself to decide.

It is necessary that scrutineers be appointed for the counting of the ballots. This is a matter that takes a good deal of time, and possibly the gentlemen here would not care to be the scrutineers themselves; if not the office staff of the Association are at your disposal, the same as they have been in previous years. If you would like the office staff to take charge of the matter, you might appoint them, or else select members from this body.

Mr. Rowley moved, duly seconded, that the same scrutineers be appointed as last year.

The President put the motion, which, on a vote having been taken, was declared carried.

The President called on Mr. Sam Harris to address the Convention.

ORGANIZATION OF EMPLOYERS.

Mr. Harris.—Mr. Chairman and gentlemen, this is a little innovation not mentioned in the programme. I am speaking at the suggestion of some of the Toronto members, who are

Characteristic Poses

members not only of the Canadian Manufacturers' Association, but also of the Employers' Association. It was thought by some of them that it would be wise, when there was a large convention of this kind assembled, to place before those present, particularly the outside members, the fact that there is such an organization as an Employers' Association in Canada. I believe the one in Toronto at the present time is the only one in Canada. We thought it advisable to tell the Association why it was formed and for what purpose. Our esteemed President, Mr. Thomas Roden, was expected to speak to you, but at the last moment he was called away on a pressing engagement, so that it devolves upon me to do the best I can.

The Manufacturers' Association and the Employers' Association in some ways run together. In Legislative matters the two Associations work in harmony, and in many things they have, as the Parliamentary Committee's report has stated, accomplished much good. But when it comes to a strike, when it comes to a crucial part of a labor dispute, any one of you, if you have ever gone through such an experience, will know how necessary is co-operation. Then the Employers' Association comes in; it goes farther than the Manufacturers' Association, inasmuch as it embraces all the employers of labor. It does not leave any poor fellow out to bear the brunt of the attack; it takes him in hand and, if he wants to act fairly, he will be helped. We do not encourage a man to pay big dividends and keep his men on small wages. We have no desire to do that and would not tolerate it for a moment. In this I speak for the officers and members of the Association. My object in bringing the subject of the Employers' Association before you is to direct your attention to this means of safeguarding your interests during times of labor unrest. Toronto employers have been face to face with troubles already. The same condition is spreading to every industrial centre in the country. You will have trouble. Make your preparations now.

I just wish to read a little extract from the Toronto Star. I want to show you that the tyranny of organized labor is coming your way. It says here that "the Toronto Manufacturers frequently urge that one of the chief reasons why they cannot afford to pay the high wages demanded by the Labor Unions of this city is the fact they have to compete with manufacturers in towns in other parts of the country where there are no unions, but present indications are that it will be but a short time before the city manufacturers will have to find a new set of arguments in dealing with the demands of local unions. In all parts of the Province the organizer is at work, or, rather, organizers, for a number of them are on the road." So that he will come your way about the time you are not looking for him.

The Employers' Association of Toronto was organized in Toronto in 1902. It was called into existence by the tyranny of the times in which employers were afraid to combat labor. At that time Mr. J. P. Murray, a member of both organization, invited a number of gentlemen to meet him at Webb's, and by some mischance, or through the persevering attempts of the Press representatives, the names of the firms were published, and it so affected some of them that they wrote the Press stating that they were not in sympathy with the movement, nor had they joined. However, the Association went on and prospered. At that time the leaders of the Labor Organizations used to pick out the prominent men of the Employers' Association and give them trouble. For instance, they picked out Mr. Dixon, of the Dixon Carriage Company, and struck for no other reason than that he was a member of the Organization, and they gave him a pretty bad time; but that was their first defeat, and it must have been at that time a very very strange sensation, and a hard bump, for they had not known defeat for a long time. Since then the Employers' Association has taken part in almost every labor trouble. If the employers were not in at the time they came in after the strike started. We have also arbitrated several troubles and have adjusted a number of things in co-operation with the Manufacturers' Association. With the latter Association we opposed the Union Label Bill and the Stationary Engineers' Bill. The Association does not act on the aggressive. Its object is the equitable settlement of such disputes as are forced upon its members. In this work it advises employers outside of Toronto to join by the organization of similar associations.

FORESTRATION.

The President called upon Dr. Fernow, Dean of the Faculty of Forestry in the University of Toronto, to address the Convention on the subject of "Forestration." The address, which is published in full in another part of INDUSTRIAL CANADA, was listened to with great attention and interest.

Mr. W. H. Rowley.—Mr. Chairman, I beg leave to move, seconded by the Hon. J. D. Rolland, that the thanks of this Association are due and are hereby tendered to Dr. Fernow, for the full and exhaustive paper he has just read on the very important subject of the Forestry of Canada, and that the paper be printed and published in INDUSTRIAL CANADA among the records of the proceedings of this Convention of the Canadian Manufacturers' Association.

I will not speak to the motion because that portion of it which appeals more particularly to manufacturers of lumber, pulp and paper, among whom I am included, and in which my seconder is also very much interested, is so exhaustive that I would be taking up too much time were I to discuss it, but I should like to have an opportunity of talking the matter over a little and elaborating it at some other time.

Dr. Foster.—Might I suggest that a copy of the paper be sent to all the Provincial Governments, and also to the Dominion Government?

Hon. J. D. Rolland.—In seconding this vote of thanks I might say I have always taken a great deal of interest in this subject of "Forestry." Reforestation is a matter for the Government to deal with. We cannot count on lumbermen and settlers protecting the forest. The settlers want to clear off the forest so that they may have the use of the land, so that we must not expect anything from the settler or the lumberman in the line of the preservation of our forests.

The preservation of our forests will also protect our water powers. If the Government does not take up this question of the preservation of our forests, the water powers in years to come, which furnish such cheap power at the present time, will have disappeared. Therefore, it is with pleasure that I second the motion of my friend, Mr. Rowley, and with his consent we will add to the motion the suggestion made by Dr. Foster that a copy of the paper be sent to the different Provincial Governments and to the Dominion Government.

The President put the motion, which, on a vote having been taken, was declared carried.

The President.—I have much pleasure in tendering you a hearty vote of thanks, Dr. Fernow. (Applause.)

The President.—We will now proceed with the Insurance Committee's report, which will be presented by Mr. W. B. Tindall.

Mr. Tindall presented and read the report of the Committee on Insurance.

REPORT OF THE INSURANCE COMMITTEE.

During the year the time of the Insurance Department has largely been taken up with the organization of the

MUTUAL FIRE INSURANCE COMPANIES,

which, prior to the last convention, had received the unanimous approval of the Executive Council, and which were enthusiastically endorsed at the special meeting of subscribers held in Winnipeg on the 17th of September last.

In view of the great importance of this movement to the membership of the Association as a whole, of the time and energy expended in its development, and of the serious oppo-

sition offered by the stock companies and their agents throughout the Dominion to the plans formulated by the Committee, it is fitting that we should now place on record circumstances and events that have played important parts in the work we have undertaken.

To fully appreciate the situation, it must be borne in mind that we have been promoting an entirely new departure in the Canadian fire insurance field, for up to this time there has been neither legislation nor precedent established by the Dominion Government on the subject of strictly mutual fire insurance companies, let alone of such companies by and for manufacturers only. It is almost incredible that after more than seventy years of most successful operation of such companies in the United States, with a development in recent years far outstripping the normal growth of the business of the stock companies, there should have been a total absence of all effort to introduce a similar system into the Dominion. While this is unfortunately true, the practice is not by any means

MR. W. B. TINDALL
(Parry Sound Lumber Co., Ltd.)
Chairman Insurance Committee, 1906-'07

unknown or unpopular here, for the Mutual fire insurance companies of the United States have a firm grip upon a very large amount of the best and most desirable insurance business of this country. The first step towards inaugurating the system under Dominion authority was, however, only taken when, as a result of the full and comprehensive investigation of the department, there was laid before Parliament the bills for the incorporation of the Eastern Canada and Central Canada companies.

It is little wonder, therefore, that the task undertaken caused the expenditure of more time than was anticipated, or that the stock companies, already in undisputed possession of the field, should vigorously and persistently oppose the organization of companies in Canada similar to those which have so materially and beneficially affected the manufacturing interests on the other side.

Postponement of Legislation Amending the Dominion Insurance Act.

At the last convention it was pointed out that the Dominion Act was silent on the question of the organization of mutual fire insurance companies, and a resolution was adopted requesting the Executive Committee, through the Insurance Committee, to "make every effort to have the Act amended at the ensuing session of Parliament, so as to permit the licensing of such companies without a deposit with the Government, but under conditions that will ensure safety in administration and in the security offered to policyholders."

The Executive Council at its November session confirmed this resolution, on the express understanding that the entire expenses incurred should be borne by the companies, when organized, and appointed a strong deputation to wait on the Government in furtherance of the views expressed therein.

Pending the reception of the report of the Royal Commission on life insurance, the Minister of Finance found himself entirely unable to say whether the Insurance Act would be

oughly considered by the Committee, with the result that it was decided to put ourselves in order by the presentation of our bills of incorporation in regular form, and this was accordingly done.

Through the courtesy of the Minister of Finance, and the chairman of the Private Bills Committee, our bills were allowed to remain in suspense until the latter part of February, when the condition of the business of the session necessitated that they should either be dropped or proceeded with. By this time it was apparent there would be no legislation amending the Insurance Act at this session, and we were again face to face with the same problem we had previously met.

The Committee, therefore, decided to interview the Minister of Finance in the interest of our bills, and while we had a cordial, we had not a very sympathetic hearing, but we received enough encouragement to warrant us in reaching the conclusion that we had better allow the Private Bills Committee to pass upon the measures.

It is not necessary that we should go into any details of the most strenuous opposition that was offered by the stock companies, or of the attitude of the responsible Minister, suffice it to say that our bills, as amended by the Insurance Superintendent, went through, with the further provision that each company must, before the issue of the licenses, put up with the Receiver-General a deposit of fifty thousand dollars in approved securities. The addition of this provision was opposed as strongly as possible, and it was only incorporated after a very close vote of the Committee. As thus amended the Acts of Incorporation received the Royal assent on the 27th of April, 1907.

Shall the Charters of the Two Companies, as Amended by the Government, be Utilized or Dropped?

The vital question had now to be considered whether the imposition of the "deposit" by the Government had rendered the companies unworkable, or whether a practicable scheme could be evolved that would permit the completion of the organizations. It is needless to say that this question engaged the most serious consideration of the Committee. It realized in a manner that cannot be adequately expressed the seriousness of the task that was before them, yet it was felt if the members of the Association were in earnest in desiring the inauguration of a system that had proved itself of immense value to the manufacturers of the United States, and indirectly of Canada, too, the provision required to be made to meet the "deposit" should not be an insurmountable difficulty. The very fact that the stock companies had presented such a formidable and persistent opposition plainly evidenced their strong desire to kill the system at the start, and equally as plainly indicated to your Committee that such an opposition would not have been offered if their plans had not been meritorious and capable of development in the interest of our members.

After the most careful consideration by the provisional directors of both companies in Toronto and Montreal, a plan was decided upon, and afterwards approved by the Insurance Committee and by the Executive Council at its June session. It is not necessary that time should now be taken to refer to the plan in its various details, particularly as the members have been fully informed thereon by letter and pamphlet. Suffice it to say that the plan involved the definite promise by members of the Association of four million dollars of insurance in each company, a task the magnitude of which can only be appreciated when it is remembered that this meant the active present co-operation of 700 members, covering 800 risks of \$5,000 each.

Canvass of Members.

The Executive Council has from time to time agreed to advance the funds to enable a canvass to be made, as far as practicable, of all members of the Association. In the month of June, Mr. B. L. Anderson was temporarily transferred from INDUSTRIAL CANADA, through the courtesy of that Committee,

MAJOR T. S. HETHERINGTON

Chairman Quebec Branch, 1907-08

amended or not at that session of Parliament, and, therefore, suggested that it would be better to postpone hearing our deputation until it was decided whether the revision of the Act would be reached or postponed.

Meanwhile, we were face to face with the serious dilemma that by the rules of Parliament all private bills must be introduced into the House not later than an appointed day in December, and if we decided to defer the presentation of our bills until the interview with the Government had taken place, we should be too late to secure legislation until another session of Parliament, entailing the loss of a year in our work. On the other hand, if our bills were presented prior to the interview, we should necessarily have to stand our chance of obtaining from the House terms less onerous than those prescribed in the Insurance Act, as applicable to Canadian companies.

The serious problem thus facing us was carefully and thor-

for the ensuing three months, and since the beginning of July three others have been employed on a similar mission.

Results of Canvass.

The results of the canvass just referred to have exceeded the most sanguine expectations of the Committee, who are now glad to announce that the task they assumed, great as it was, has been practically completed, and applications are now in the hands of the Superintendent of Insurance at Ottawa for the issue of the licenses. That this really serious undertaking has been brought to a successful close within the short space of three and a half months is, in the opinion of the Committee, not only ample justification of the course they have pursued, but is a standing testimony to the energy of the department officers.

Permanent Organization.

Much, of course, requires to be done to get the companies in shape for business after the licenses have been granted, but we are glad to say arrangements have been entered into by which all that remains to be done will be assumed by the directors of the companies, who have completed arrangements for this purpose. It is expected definite announcements will be sent out by them within a few days, as to the date upon which business will be commenced.

Expenses of Preliminary Organization.

As already explained, the outlay of the Association, whatever it may be found it has amounted to, will be recouped when the mutual companies start business, and it is safe to say that no mutual companies will have started under more favorable auspices, or have organized at less cost, than those which your Committee have brought to the condition in which they can now safely leave them.

Association's Representative on Boards of Directors.

Under the provision of the company's charters the Canadian Manufacturers' Association has the right to nominate one director on the Board of each of the companies, and your Committee now recommends that you appoint the manager of the Insurance Department, Mr. E. P. Heaton, to this office. In this way the Insurance Department will be able to constantly watch the proceedings, and see that the policy of the companies continues to warrant the support and endorsement of the Association.

Work of the Department for the Year.

Notwithstanding the encroachment upon the manager's time, in the work incidental to the organization of the mutual companies, the department has had a busy and successful year, as the following reports indicate :

	No. of Risks.	Amount of Insurance.
Policies examined	93	\$5,408,983
Risks inspected	38	2,797,800
	<u>131</u>	<u>\$8,206,783</u>

	No.	Amount.
Losses adjusted	7	\$98,302.81

Since organization on February 1st, 1905, the record of the department in respect of these items is as follows :

	No. of Risks.	Amount of Insurance.
Policies examined	200	\$16,160,257
Risks inspected	202	12,504,314
	<u>402</u>	<u>\$28,664,571</u>

Losses adjusted, 14, amounting to.....\$166,176.81

It must be borne in mind that the gross total of \$28,664,571 is of insurance for the current year in which the risk was dealt with, and to ascertain the aggregate amount of insurance for the two and one-half years in which the department has been in existence the amount should, at least, be doubled; in other words, the total insurance that has passed through our office since its inception may, on a conservative estimate, be stated at \$50,000,000. At the average rate shown by the Government Blue Book to be paid to all companies, viz., 1.65 per cent., this insurance represents premium payments to the companies of \$825,000. The aggregate claims made on the companies in respect of this large business in the period of two and one-half years, has been \$17,900.

As stated in our last report, we are not disposed to build

Characteristic Poses

any theory upon this somewhat remarkable showing, but are satisfied to record it as evidencing the fact that the members who have utilized the services of the department have contributed enormously to the profits the companies have derived from the entire Canadian fire insurance operations of the same period.

We shall not attempt to make any summary of the department's work in the matter of advice on building construction, the supervision of plans and specifications therefor, private fire protection, automatic sprinkler equipments, improvements in risks, etc. In all these features there has been a growing disposition to make full use of the department, and we are certainly encouraged to believe that we are entering upon a period of increased usefulness and benefit to the members.

Change of Policy in Work of Department.

At the March Executive Council, your Committee presented a report recommending that the work of the department should be extended and developed along the following lines :

- (a) Examination of policies.
- (b) General expert advice and assistance.
- (c) The protection of risks by modern fire fighting appliances, including automatic sprinkler installations.
- (d) Adjustment of fire losses.
- (e) Development of mutual insurance plans.

They pointed out that the department could do much more effective work for the members generally if the creation of a revenue by means of commission on business placed was not necessary, and more time given to the work above outlined. The Council approved the recommendation of the Committee, and a pamphlet was accordingly sent to each member announcing the change, and recording clearly the charges that would be made in connection with each branch of the work.

The increasing proportion of revenue derived from "fees," as thus recorded, affords reasonably good grounds for believing that the new policy will be attended by correspondingly favorable results, although, as pointed out in the report to the Council, it will take some time for the department to adjust itself to the altered circumstances, and to bring the revenue to a figure approximating the expenses. Since the issue of the pamphlet to the members the Committee has had ample proof that the change in policy will materially increase the opportunities for effective service to a much larger number of the members than was possible on the lines upon which the department was inaugurated.

Finances.

During the year the Treasurer has paid on account of the department the sum of \$5,490.82, and there was received by him from the department the sum of \$2,887.04, showing a deficiency of \$2,603.78. The actual disbursements on account of the mutual companies has been \$1,351.94, showing a net deficiency in the ordinary revenue of the department of \$1,251.84.

At various meetings of the Council the Treasurer has presented the condition of the finances of the department, and money has been voted to provide for its needs. Your Committee think the time has now arrived when the Finance Committee should be empowered to treat the Insurance Department in the same manner as it treats other departments, without having to go to the Council for specific authority to cover an overdraft, or to make appropriation to meet anticipated needs.

This point was raised at the last convention, and a recommendation adopted which was intended to depute to the Finance Committee the desired authority. In view of the fact that the recommendation referred to does not seem to have been made sufficiently clear, it is now recommended that the Association, in annual meeting, authorize the continuance of the Insurance Department, under plans to be approved by the Executive from time to time, and that the Finance Committee be empowered to pay all expenditure incurred by the department under plans so approved.

All of which is respectfully submitted.

W. B. TINDALL, *Chairman.*

G. M. MURRAY,
Secretary.

E. P. HEATON,
Manager Insurance Department.

Mr. Tindall moved the adoption of the report.

Mr. Burton.—Mr. President, I would like to say a few words in seconding the adoption of the report. The work of this Association follows the Swiss motto of, "Each for all and all for each"; that is to say that in an Association of this kind we try to benefit everybody and that everybody should try to benefit the Association, and if we do not all of us get exactly what we want and what is suited to our

individual cases, that does not relieve us of the responsibility of doing all we can in the way of pushing forward what is considered best.

With regard to the benefits of co-operation, I need not speak. We know very well how we have benefited here in the matter of transportation from the Transportation Department. It was only the other day that I had the pleasure of reading in a Manchester paper a very appreciative article of what had been done by the Canadian Manufacturers' Association in getting the way bills made out in such a way that the responsibility of the railways would be put just about where it should be.

Now, this question of insurance is a thing that affects everybody. There is not one in the Association who is not affected. The policy of the old line companies has not been towards the prevention of fires, but towards the collection of the largest amount of money that could be got for what they gave. I don't know whether all the gentlemen here have taken notice of the fact which has been published in INDUSTRIAL CANADA that taking the years 1904, 1905 and 1906 together—and 1904 was the year of the Toronto conflagration—that taking the three years together the companies doing business in Canada, the Canadian, British and American, have made after all over three million dollars in the three years, which shows very clearly they have been making a very decent profit, and also shows very clearly that there is room for insurance to be done on a much more economical foundation than it has been done; and this we think we can do, because if we follow the lines of the mutuals in New England we shall be aiming to prevent fires, not merely to pay for them after they occur.

Might I say one or two things that have occurred in my own experience, being one of the unfortunates who have been burned out. The manager of one insurance company called me up and wanted to know if a certain young fellow connected with an insurance company had been recommending a sprinkler system; as if it was a crime for a young fellow connected with an insurance company to advise a man to put in sprinklers as a preventative measure. Another man, the manager of another company, whose advice I asked about the best style of sprinkler to be used, told me that he thought so and so was pretty good, but it wasn't the business of the insurance people to say what plan should be adopted; their business was to sell insurance. It seems to me that although they are altering a little bit, which is perhaps partly due to some of the rubs they have been getting, yet the policy of the companies is not the policy which the mutuals want to establish, which is to prevent fires and not to bring them on.

Now, we want the help of every member of the Association. We have had a hard fight and we are having a bit of a hard fight now. It is very evident that the Department in Ottawa is going to demand the utmost of the pound of flesh, but we do not think as an Association we ought to be put down; we do not think we ought to turn tail and be defeated, and we do not intend to; but we want the support and co-operation of every member of the Association. I am pleased to say that the Montreal members have practically allowed us up here in Toronto *carte blanche* in the carrying on of the business here, that is, to make Toronto the Head Office; and it is only in accord with the liberal ideas of the Montreal people. I lived there for nineteen years and I have always had respect for the liberality and breadth of view of the Montreal men, and I take this opportunity of acknowledging the help we have always received from them. I would add that not the least of their work is the fact that it was they who sent us Mr. Heaton, to whose energetic

effort and thorough knowledge of the insurance question we are very largely indebted. I have very great pleasure in seconding the adoption of the report.

Mr. Rowley.—I would like to say, Mr. Chairman, that I understand one of the hardest and most difficult propositions that we are up against is the cash deposit. Am I right in that?

Mr. Burton.—Yes.

Mr. Rowley.—I think some one, perhaps the Chairman, might just say a word in explanation of what will be taken up in a circular letter that is to be sent to members asking

Mr. Tindall.—That would suit my views entirely. I don't know that I myself would make the explanation which Mr. Rowley asks, but I would certainly like to have the Manager of the Department given the opportunity of making the matter perfectly clear.

The President put the motion that the report as read be adopted, and that there be five or ten minutes devoted to the question at the afternoon session, which, on a vote having been taken, was declared carried.

The meeting adjourned at 12.45 p.m. to meet again at 2.15 o'clock p.m.

MAJOR J.O. THORN

MR. A.S. ROGERS

LT.-COLONEL
GARTSHORE

Characteristic Poses

that not only the fifteen per cent. that we have all agreed to pay within a certain time be paid at once, but that we also pay—those of us who can, and I fancy everyone can—the extra ten per cent. demanded by the Government. I am not on the Committee, but I am one of the directors of one of the companies. Unfortunately, I was not at the meeting yesterday, so that I cannot speak as fully or intelligently on this subject as I would like to do, but I would like to have the Chairman say a few words about it, so that those of us who are here will be ready for and be impressed by the letters that are coming out.

The President.—How would it be to adopt this report now and then have the Chairman address the meeting when more are present?

Mr. Rowley.—I cannot speak for the Chairman, but before the Chairman does speak, I would like to say that that would be splendid.

□ AFTERNOON SESSION.

At 2.30 o'clock p.m. the President took the chair and said: Gentlemen, if you will come to order we will proceed with business. The first thing on the programme this afternoon is the report of the Railway and Transportation Committee. Mr. Housser will present the report; it is very lengthy, and he will read a summary of it. You have the details before you.

The report in full is as follows:

REPORT OF RAILWAY AND TRANSPORTATION COMMITTEE.

Your Committee submits herewith its annual report relating to the operation of the Transportation Department.

It was decided at the outset that the greater interest of the Association for the present lay in disposing, as far as possible, of matters pending before the Board of Railway Com-

missioners for Canada, in which manufacturers were vitally interested. The result will be found in the general summary.

Other matters, as they presented themselves during the year, were promptly taken up, and either satisfactorily disposed of or are now pending before the Railway Commission or with the railways.

It has been the policy of the department to negotiate direct with the railways in all matters pertaining to transportation, appealing only to the Railway Commission when all other means of adjustment were exhausted.

The railways' traffic officials have shown their willingness to deal promptly with matters brought before them, recognizing, no doubt, that the Association is endeavoring to secure better co-operation between shippers and themselves, and that through the organization of the Association differences can be adjusted much more expeditiously than by dealing with the individual shipping interests.

Your Committee takes this opportunity of recognizing the courteous treatment extended to it and the department by the Railway Commission and its officials during the year.

In this connection we are of the opinion that the work of the Commissioners has become so onerous, in view of the increased duties imposed upon them by Parliament, that the Association should go on record in support of such reorganization as would help to divide and specialize their work. A resolution to that effect will be submitted for the approval of the Association.

The department continues to render valuable assistance to individual members in the settlement of claims and in negotiating their differences with the railway companies. Difficulties in regard to freight rates and classification have been removed. Numerous enquiries have been received from members during the year relating to transportation matters, all of which have received prompt attention.

Your Committee announce the resignation of Mr. J. R. Marlow, Manager of the Department, during the year. Although Mr. Marlow's resignation took effect December 31st, 1906, he continued connected with the department during the month of January, assisting his successor, Mr. J. E. Walsh, in reviewing the work, more particularly those matters which had not been closed. Since then Mr. Marlow has served on the Committee, rendering valuable services to it and the department.

The following is a general summary of matters dealt with during the year :

Freight Classification.

The revision of the Canadian Freight Classification, referred to in the last annual report, has been completed and it became effective September 1st by order of the Railway Commission. It supersedes all previous classifications and amendments thereto. There has been no previous revision of the classification since 1903, although various amendments have been made since that date as a result of negotiations with the railways and representations to the Railway Commission by the department, all of which are embodied in the new book.

Chief among the important changes which necessitated the revision of the classification was Rule 7 of the rules and conditions of carriage, which deals with articles classified to be carried at owner's risk.

The old rule read as follows :

"Articles marked at 'O. R.' must be so receipted for by agents, and the words 'owner's risk' written in full on the shipping notes and receipts.

"Articles marked 'Released' must also be so receipted for and shippers or owners must duly execute a release in duplicate on the company's forms."

The conditions practically meant release from damage from

any cause whatsoever, the carriers being relieved from liability even through negligence.

Rule 7, as amended in the new classification, is as follows:

Articles at Owner's Risk.

"Articles by the classification shown as to be carried at owner's risk of weather (*i.e.*, O. R. W.), of breakage (*i.e.*, O. R. B.), or otherwise, as the case may be, shall, unless otherwise required by the shipper, be carried at owner's risk as so specified and defined, and no special notation to that effect shall be necessary on the bill of lading."

"Should the shipper decline to ship at owner's risk (as specified and defined in this classification), any article shown as to be so carried, he may ship them, subject to the terms and conditions of the bill of lading, approved by the Board of Railway Commissioners, in which case twenty-five per cent. over and above the rates which would be payable if such articles were shipped at owner's risk will be charged.

"These conditions are intended to cover risks necessarily incidental to transportation, but no such limitation, expressed or otherwise, shall relieve the carrier from liability for any loss or damage which may result from any negligence or omission of the company, its agents or employees."

Wherever the owner's risk condition is left in the classification it is defined as follows :

O.R.B., Owner's Risk of Breakage.

O.R.C., Owner's Risk of Chafing.

O.R.D., Owner's Risk of Damage.

O.R. Det., Owner's Risk of Deterioration.

O.R.F., Owner's Risk of Fire.

O.R. Lkge., Owner's Risk of Leakage.

O.R.S., Owner's Risk of Sifting.

O.R.W., Owner's Risk of Weather.

The old classification stipulated that if a shipper of goods, for which a rating was provided at owner's risk, desired to have them sent at carrier's risk, he would have to pay an advance of 50 per cent.

The new classification, it will be observed, provides for an advance of 25 per cent., making the increased charge for transportation at carrier's risk only about one class higher than if carried at owner's risk.

The more important features of this revised classification are that some two hundred and forty commodities, which have been hitherto carried at the risk of the owner, will hereafter be carried at the carrier's risk, without any advance in the ratings, and that on those articles which will still be carried at the risk of the owner the risk is specified and restricted.

The release which was formerly exacted on shipments of furniture and similar commodities has been done away with.

The railways, in submitting the classification to the Commission for approval, proposed a change in the minimum weight of mixed carload shipments between points east of Port Arthur, as provided for in Rule 2, Section B, which would have resulted in an increase in the minimum weight. This was disallowed.

It was also proposed by the railways to omit the reduced ratings on stoves that are returned to shipper after having served their purpose, for the protection from frost of perishable shipments. This was also disallowed.

The classification has been rearranged, and as far as possible articles classified under their proper headings, so that it will be more easily understood by shippers.

Individual Reductions in Classification.

During the year a number of changes and reductions have been made, in which the department took an active part. Some of the important ones are :

Stoves.

There has been a general revision of the ratings on stoves and parts thereof (including castings), furnaces, heaters, etc.,

in which the third-class rating is given for stoves in less than carloads, when crated. In many instances the ratings have been reduced from one to two classes.

Furniture.

Rating for lounges, back and legs off, l.c.l., reduced from first and a half-class to first-class.

Bureaus, wardrobes, washstands, dressing cases and side-boards, knocked down, reduced from first to second class.

Revision of minimum weights to Pacific Coast terminals in carloads, resulting in the following reductions :

Cars 36 feet in length	\$21 00
Cars 40 feet in length	35 50
Cars 42 feet in length	86 00
Cars 45 feet in length	20 50

Chair seats, perforated, crated or boxed, reduced from first to second class.

Children's Carriages.—A reduction from three times first-class to double first, and a change in the conditions of carriage. Heretofore in order to obtain the lower ratings the classification called for the removal of the handles. This has been amended to read "wheels off only."

Hardware.

Castor pins have been given a rating of third class, l.c.l. and 5th c.l., same as iron rivets, and may be mixed with articles in iron and steel list.

Curry combs, in boxes or barrels, have been given a rating of 2nd l.c.l., and 5th c.l., and added to the hardware list.

Meat and food choppers or cutters (hand), boxed, have been given a carload rating, and added to the hardware list. The amended classification reads l.c.l., 2nd, c.l., 5th class.

Refrigerators have been given a rating in and added to the hardware list.

Saddlery hardware, c.l., reduced from fourth to fifth class.

Miscellaneous.

Wall and counter show cases reduced from three times first-class to double first-class.

Wooden tanks, vats and cisterns, reduced from 5th to 6th class, carloads.

Proposed Advances Disallowed.

Some of the advances proposed by the railways in the ratings or conditions of carriage, which were amended, withdrawn or disallowed after action by the department, are :

Requiring bureaus, wardrobes, washstands, dressing cases, side boards, when entirely taken apart, k.d., to be boxed. This item was amended to read "wrapped, crated or boxed."

Centre or extension tables, k.d., legs off, stipulating they should be crated or boxed. Amended to read, "Wrapped, crated or boxed."

Elimination of lawn or garden rollers from the agricultural implement list, and insertion of the same in the hardware list at fifth class, carloads. The proposition was withdrawn, leaving them in the agricultural implement list at same ratings. They were also added to the hardware list.

Packing, metallic and rubber, in boxes, l.c.l., second, and c.l., fourth, was amended to read "in boxes or bales."

Requiring electric storage batteries, in view of the elimination of the owner's risk condition, to be boxed, amended to read "crated or boxed." Same ratings.

Increase in rating on brushes, silver mounted, boxed, from 2nd to 1½ class, and on brushes, bristle or hair, boxed, from 2nd to 1st. Disallowed.

Increase in the minimum weight from 5,000 lbs. to 8,000 lbs., on large automobiles, s.u., or with wheels detached only; also increasing the minimum carload weight from

10,000 lbs. to 14,000 lbs. on s.u., automobiles, with a counter proposition for a decrease in the rating from first-class to second class. Disallowed.

There are a number of changes and reductions now under consideration.

International Rate Case.

The long outstanding complaint that the railways discriminate in favor of through traffic from the United States, as compared with traffic originating on the Canadian side of the boundary, has at last been disposed of. The Railway Commission issued an order on July 6th, in which the Association, the complainants, were sustained at practically every point. The case was based primarily on the "long and short haul clause" of the Act. The result of the decision will have an important influence as it establishes the long and short haul principle of the Act. In this alone it may be considered one of the most important decisions yet given by the Commission.

On July 4th, 1906, the Secretary of the Commission issued

MR. J. H. HOUSSER

(Massey-Harris Co., Ltd.)

Chairman Railway and Transportation, 1906-07

a memorandum, in which the railways were given ninety days wherein to submit a scheme to the Board for its consideration.

It was clear that no attempt at harmonizing the rates would be satisfactory under two classifications, viz., the Official in the United States and the Canadian Classification in effect throughout the Dominion. As a result of meetings between the railways interested it was agreed to adopt the Canadian classification and Canadian tariff basis for their international traffic. The tariff basis, as well as the classification, are different on the two sides of the frontier.

The Canadian tariffs are built up on the fifth class, the fourth class being 25 per cent.; third class, 50 per cent.; second class, 75 per cent., and the first, 100 per cent. higher than the fifth. The basis is entirely different in Central Freight Association, United States territory, which is affected by the change. As an illustration: The rates from Detroit to Toronto, run from 5th, 13 cents, to 1st, 36 cents, at present. If they were based on the Canadian scale they would run from

13 cents to 26 cents. From Detroit to Montreal it would be from 5th, 23½ cents, to 1st, 47 cents, instead of from 23½ cents to 58½ cents as now, and similarly with all points in the United States to the Mississippi, and this would be an impossible adjustment from the standpoint of the United States railways. The alternative was to accept the present 1st class rates and scale down on the Canadian scale; and so far as Port Huron, Detroit and Buffalo are concerned this has been done.

The railway companies submitted their first draft scheme in response to the memorandum of the Commission on November 8th, 1906. A meeting for its consideration took place in December, at which the Manager of the Department considered the basis, as a whole, unsatisfactory. New tables were

Characteristic Poses

prepared, reaching the Committee on February 15th, 1907. The railways stated they had endeavored to evolve a plan whereby whatever scheme of adjustment was finally adopted would take care of the Toronto Board of Trade complaint, as well as that of the manufacturers. They pointed out that the adoption of the basis suggested at the Montreal conference would prove so disastrous that the officials of the Grand Trunk and Canadian Pacific Railways, who were chiefly interested, could not assume the responsibility for such a large loss of revenue. At the same time they recognized the authority of the Commission's orders, but in that case the Commission would have to assume the responsibility of the results.

The scheme was most elaborate and apparently involved a loss of revenue on the part of the Grand Trunk of from half a million to a million and three-quarter dollars annually. The Canadian Pacific alleged their loss would equal two-thirds that amount. Although it was conceded that these figures merely

represented approximations (there had been no time for an audit), the Commission felt that in justice to the railways their statistics could not be ignored. It was also evident that an audit of the companies' books, in order to verify these statements, would postpone the decision of the Commission indefinitely.

It was evident to your Committee that whatever immediate readjustment could be arrived at would be a step in the right direction. An important factor in the proposition submitted was a revision of the general mileage basis, which would have a direct bearing on the discrepancies between the local tariffs, of which the Toronto Board of Trade complained, and bring about generally a reduction in freight rates throughout Eastern Canada. It was, therefore, suggested that a compromise might be arrived at for a tentative adjustment. A resolution was passed to that effect, and forwarded to the Railway Commission on March 25th last. It was set forth in the resolution that in petitioning the Commission it should be understood that the new rates would be considered experimental, and without prejudice to the rights of interested manufacturers or the Association to appeal against the new rates so proposed, or against the higher rates which then prevailed on east-bound traffic over those charged on west-bound traffic, and in no way to prejudice any complaints, such as that of the Toronto Board of Trade, or of this Association, or of any of its members now pending or to be submitted to the Board for ruling. It was further set forth in the resolution, namely:

A. There shall be no increase from United States frontier points, namely, Detroit, Port Huron and Buffalo, beyond those brought about by the classification scale.

B. Rates to be scaled down by groups from intermediate and branch line points, lined down in proportion with the new rates proposed from Sarnia, Detroit and Niagara.

C. Commodity tariffs to be issued, covering rates on commodities imported from the United States and used as raw materials by manufacturers on the basis of the present commodity rates, or if there be no commodity rates in effect, then commodity tariffs to be issued containing the present class rates.

D. There shall be no disturbance of any special commodity tariffs or commodity rates now in effect east-bound from Ontario points, where lower than the new class rates; such, for instance, as the application of the west-bound rates east-bound, as embodied in commodity tariffs now in effect from Ontario points to the East.

E. There shall be no interference with or advance in the present basis of rates from Montreal west-bound on the winter and summer scale.

This resulted in other tables being drawn up by the companies, having for their object the satisfactory solution of the manufacturers' and the Toronto Board of Trade cases. These proved impracticable. It became apparent that our case would have to be settled on its own merits, and on the basis outlined in our communication to the Commission. It was also apparent that the traffic officials hesitated to assume the responsibility of the reductions, and that the Commission would have to assume such responsibility. A final conference was held in Toronto on May 23rd, at which a scheme was practically adopted.

The order of the Commission states in part:

"That the special local class tariffs (known as town tariffs) of the Grand Trunk, the Canadian Pacific Railway, the Michigan Central, the Wabash, the Toronto, Hamilton and Buffalo, and the Canadian Northern Ontario Railway, east of the Detroit and St. Clair Rivers, Lake Huron and the Georgian Bay and North Bay (east and south-bound), and south of the Ottawa River, be reduced so as to place them on the same mileage scale, and that for this purpose the table of mileage rates, particularly set forth in the schedule hereto annexed marked "A," which is hereby made a part of this order, be adopted as the basis by the said companies.

The rates in all cases shall be based on the shortest workable mileage.

"That for the purpose of compiling special tariffs from points west of Toronto to points east thereof, the territory be divided into groups.

"Through rates from the aforesaid groups shall be reasonably graduated to points east of Toronto on the basis outlined at the Toronto conference May 23rd, 1907.

"That from points competitive with the lake and river lines the companies may publish such commodity rates as may be necessary to meet the competition of the water carriers.

"That the east-bound rates from the territory east of Toronto and Orillia, and east of and including Depot Harbor, Parry Sound and North Bay, be in accordance with the mileage scale referred to.

"That to points in Quebec, west and east of Hull, and east and south of Montreal, through rates from the groups defined be arrived at, in accordance with the reduced scale of arbitraries submitted.

"That no special commodity rates now existing, which may be lower than the corresponding class tariff rates herein prescribed, shall be advanced by reason of the changes herein ordered or without the sanction of the Commission.

"The said railway companies and connections are permitted to substitute the Canadian classification from Detroit and Port Huron, and from points west thereof, via the Detroit and St. Clair River crossings, and to scale the lower classes on the first-class rates now existing.

"That the rates from Canadian points on the Detroit and St. Clair River, frontier to all points east to the Atlantic and north to the Ottawa River, shall in no case exceed the rates from Detroit and Port Huron as fixed.

"That in the adjustment of the international rates, the rates on raw materials from points in the United States to points in Canada, shall not be advanced at the instance direct or indirect of the companies operating in Canada."

The New Schedules.

From the group territory the present and proposed rates to Montreal in the first five classes are as follows. A corresponding reduction applies to all intermediate points :

From	PRESENT WINTER.					PRESENT SUMMER.					PROPOSED WINTER AND SUMMER.				
	1	2	3	4	5	1	2	3	4	5	1	2	3	4	5

The same scale will be used in revising the tariffs at the other common and distributing points.

The railways are busily engaged in the preparation of the new tariffs for submission to the Commission. It is not expected, however that they will become effective before the end of October.

Whilst the decision of the Commission establishes the long and short haul clause of the Act, and to a certain extent disposes of the discrimination complained of in east-bound traffic, it does not settle our contention for the application of the west-bound rates east-bound where lower, and that there should be a general reduction in what is known as the "standard mileage tariffs." These matters are still under consideration.

Uniform Bill of Lading—General Terms and Conditions of Carriage.

Your Committee regret that they have been unable to report more progress in this important matter, especially as the Association has pressed the Railway Commission continuously for nearly three years for a revision of the bill of lading contract, which would give to the public, at least, some of the protection to which they are entitled by law. The resolution urging the revision of the traffic forms, passed at the Winnipeg Convention, September, 1906, was forwarded to the proper authorities at Ottawa. After much delay a date was fixed for the consideration of same. This was further postponed. The railways finally submitted to the Commission a form of contract, as prepared by their legal representatives. This was the first practical step taken by the railways to conform with the order made by the Commission in October, 1904, directing a revision of all traffic forms. The draft submitted was sent out by the Commission on March 6th, with a request that all parties interested should make any representations

MR. WILLIAM LEVIS

(The Robt. Taylor Co., Ltd.);

Chairman of Nova Scotia Branch, 1907-08

and objections thereto, which they desired, and file the same on or before May 1st.

The draft was carefully considered by your Committee. It was found that the conditions were, as a whole, unjust, unreasonable, and in contravention of the spirit of the Railway Act, and that they were, in many instances, more onerous than those now in use.

Objections were taken to all of the 29 clauses submitted, as the railways in nearly every instance sought to limit their liability as common carriers. The Railway Act says, "The railways shall receive, carry and deliver all traffic. Every person aggrieved by any neglect or refusal in the premises, shall have an action therefor against the company, from which action the company shall not be relieved by any notice, condition or declaration, if the damage arises from any negligence or omission of the company or its servants." This is the statute law. In view of this your Committee are of the opinion that there is no just reason why the railways should be permitted to restrict in any way their liability when such

traffic is carried in accordance with the classification and tariff of tolls approved of by the Railway Commission.

An important point which seems to have been overlooked by some interests who submitted a draft of what was considered a proper bill of lading, is that the railways propose to receive the property "marked consigned and destined." Thus the initial carrier agrees to carry to its usual place of delivery at said destination, if on its road, otherwise to deliver to another carrier on the route to said destination.

The objections taken to the conditions of carriage submitted by the railways were duly filed with the Board, together with a copy of the resolution passed by the Association in convention at Winnipeg, September, 1906, asking for a *simple form of bill of lading, which would be a receipt for the goods and an undertaking to carry and deliver them at destination.* Failing the adoption of this clean bill of lading a request was made that we be permitted to appear before the Commission in support of our demand.

As the question is largely a legal matter, your Committee recommended the advisability of employing counsel when the proper time came, in order to protect the interests of the Association. This action was approved of by the Executive Council.

Permission was asked of the Commission to submit for their consideration a bill of lading in accordance with the resolutions passed by the Association. No action has been taken further than to acknowledge receipt of our communication.

Circulars were issued by the department to Boards of Trade and kindred associations throughout Canada, with the result that there was a hearty and general endorsement of the action taken by the Committee, and resolutions to that effect were filed with the Railway Commission.

The matter is still pending.

Reciprocal Demurrage.

In view of the numerous complaints of delay in securing cars, and in handling traffic after being loaded, as well as delays in placing cars for unloading after arrival at destination, your Committee were of the opinion that the Railway Commission should adopt some regulation to provide for demurrage charges upon railway companies. A communication to that effect was filed with them in October last, asking that some such arrangement be put in effect before the provisional demurrage rules are made permanent.

The Commission has stated that it was not clear that they (the Board) had the power to impose reciprocal demurrage, but that experts had been appointed by them to investigate and advise whether or not the railways had sufficient equipment and facilities. After this information is obtained it is proposed to ask that the Board be empowered to make regulations to provide for demurrage charges upon railway companies. In this connection, it is suggested that it might be desirable to have an independent car service bureau under the control of the Commission, who would look after the service.

Your Committee are of the opinion that the experience of the last two years has been such as to warrant immediate action being taken to that end.

If it is fair and in the public interest that a charge should be made where freight cars are detained in loading and unloading, in order that they may be kept available for service, it is reasonable to expect that the railways should be subject to a similar penalty when they delay cars entailing serious losses to the public.

The Railway Act requires railways to provide all proper facilities for receiving, carrying and delivering traffic. Shippers have the right of appeal to the courts in the case of loss sustained through failure on the part of the carriers to furnish proper facilities. This is, however, an almost impossible task. The railways are, therefore, practically safe from prosecutions.

On the other hand, the Railway Commission has authorized

that all freight traffic in carloads, or less, which is or is to be loaded or unloaded by the shippers or consignees thereof, shall be subject as follows :

When cars are held under load or awaiting loads beyond the free time allowed by the rule prescribed for any reason for which the consignee or shipper is responsible, a toll of one dollar per car per day of twenty-four hours, or any part thereof, shall be charged to and paid by the shipper, consignee or other party responsible therefor, *in addition to all other tolls paid or payable, in respect of the goods carried, or to be carried in or on such car.*

Your Committee recommends the adoption of the resolution, which will be submitted later on, urging the Railway Commission to grant some measure of relief.

Railway Equipment.

Your Committee has during the year given this important matter serious consideration. Information has been furnished the Railway Commission in regard to shortage of cars, delays in transit, etc., which would, we believed, warrant prompt action being taken.

The Railway Commission held sittings in Ottawa in February last, at which they stated that hitherto they had felt a difficulty in making orders for the supply of cars or other equipment upon specific complaints, for fear that this might result in taking from others the facilities to which they were equally entitled, with the complainants. It was also felt that the unprecedented activity of business could not have been fully foreseen by the railway companies. The Commission further stated that they did not desire to hold the railway companies to a higher standard than seemed to be reasonable, but they proposed in the future to adopt all means within their power to make railway companies live up to a reasonable standard, and to give to the public, so far as circumstances rendered it possible, the service which the statute required.

Statements respecting rolling stock and equipment of various descriptions, have been asked for. In order to have information at first hand, the Commission has appointed to its staff an operating expert and an inspector of railway equipment. These officers have been for some time engaged in investigating the existing conditions of the various railways. With their help it is proposed to devise a system under which the railway companies will report regularly on their equipment, so that the public will be kept more fully informed than it has been in the past.

Certain information has already been given to the public as a result of these investigations, and it is expected that further evidence of the inadequacy of the equipment of the railways will be forthcoming at an early date.

The following statistics will bear out the statement that the railways have not until recently made any serious attempt to provide equipment for the growing demands of the country.

Railway Mileage and Equipment in Canada.

YEAR.	MILES IN OPERATION.	LOCOMOTIVES, ALL KINDS	FREIGHT CARS, INCLUDING CATTLE, BOX, REFRIGERATOR, FLAT, COAL AND DUMP.
1903	18,988	2,587	80,252
1904	19,431	2,768	83,562
1905	20,487	2,906	86,296
1906	21,353	2,931	90,404

The equipment ordered by the principal railways for delivery in 1907 consists of (a) locomotives of all kinds, including switchers and passenger, 356; (b) cars of all kinds, which might be available for carriage of freight, 15,678. This includes flat, platform and ballast cars, which are at certain seasons of the year used by the railways for construction and ballasting purposes.

In considering these figures, allowance must, of course, be made for the fact that the traction power of the locomotives and the capacity of the cars have been greatly increased. But while it is satisfactory to note the improvements in this direction, it is still quite obvious that the equipment is not being added to as rapidly as would seem to be required by the steadily increasing mileage under operation, which, on June 30th last, was 21,819, with 5,000 new miles under construction.

Staking of Flat Cars for Lumber Shipments.

The question as to who shall provide stakes for flat and gondola cars for shipments of lumber is one of importance. At the present time the shippers are required to provide the necessary stakes and other equipment to secure loads on the

MR. W.K.
GEORGE

Characteristic Poses

cars. This involves an enormous expense and waste, and it is the opinion that it would be largely overcome by the railways in properly equipping their cars. The matter was dealt with in the last annual report. Since that time much information has been gathered as to the negotiations which have taken place in the United States. The Commission, who decided to allow the matter to remain in abeyance pending the outcome of these negotiations, advise that they feel they cannot take definite action until they have the benefit of the advice of their operating expert, who has been too busy since his recent appointment to make enquiries and to go fully into the subject. The Commission are also awaiting action of the Interstate Commerce Commission, on account of the international nature of the traffic.

Express Companies' Classification and Rates.

All express companies operating in Canada are now subject to the jurisdiction of the Railway Commission. The Railway Act provides that no company shall carry any goods by express until their tariffs have been submitted to and approved of by the Commission. The time for the filing and approval of the tariffs of tolls was limited to May 1st. Your Committee issued a circular to members of the Association, suggesting that as a general investigation of express matters was to take place, they file with the Transportation Department any complaints which they desired to make in regard to excessive rates or other grievances, in order that they might be brought to the attention of the Railway Commission. Considerable evidence and a number of complaints have been received.

A protest was made against the approval of the tariffs and classification of the companies, until such time as a thorough investigation could be made in order to ascertain whether or not the rates submitted were equitable. Particular attention was called to the fact that since November last the express companies had taken advantage of the compulsory filing of their tariffs to withdraw a number of special or commodity rates which had been in existence for some time. This, it was pointed out, should not be permitted, as it was fair to assume that conditions which existed when these special commodity rates were made, still exist, and their withdrawal would result in considerable hardship. It was suggested that the Commission should investigate the matter with the view of determining whether or not these rates should be continued and embodied in the tariffs to be approved.

As sufficient progress had not been made in the investigation, the time for the approval of the tariffs was further extended until November, 1907. In the meantime the express companies are permitted to charge such tolls as they might lawfully have charged, previous to July 13th, 1906, the date the Act came into effect.

In doing this it was stipulated that pending the approval of the said tariffs of tolls by the Commission, the express companies should not charge any tolls higher than those which were charged by them, respectively, on the first day of March, 1907, thus to a certain extent affording the protection against the withdrawal of commodity rates which we asked for.

It has been considered advisable that "express traffic" should be defined before the tariffs are finally approved, that is to say, what division should be made between express traffic and ordinary railway traffic. A conference has been suggested between the various interests for the early settlement of this question.

We are advised that counsel has been engaged for the investigation of the affairs of the express companies, and that such will take place as soon as possible after other matters, such as the telephone companies, etc., upon which the Commission has been engaged for some time are disposed of.

It will be noted that the Commission has determined that it shall be fully advised in respect to express traffic, tariffs, classification, etc., before finally approving of same. It is to be regretted similar action was not taken with the railway freight tariffs and traffic forms.

Weighing Carload Shipments.

Complaints have been received regarding the weighing of carload shipments. Many of the claims presented to the railways' claims departments are due to the arbitrary increase in weight, while the shipments are in transit. Instances have been given of accurate weights being furnished at the initial point and rechecked at destination, yet the weights secured by the railway scales en route were used for the collection of charges from the consignee, who was obliged to pay on this basis before he could receive his goods. After having paid the overcharge a claim may be presented to the railways for a refund—a very unsatisfactory procedure.

There are various and numerous ways in which errors are made in weighing on track scales, but as the weigher is in the employ of the railway company, he at all times is ready to endorse his weights as being absolutely correct. In consequence a dealer is frequently made to pay according to railway scales, for more weight than is received. This is particularly applicable to farm and other products sold on the basis of track scale weights.

Your Committee are of the opinion that there should be some independent arbitrator appointed at all the principal points known as "Track scale stations," for the purpose of weighing carload traffic, such person to be a sworn weigher, in the same manner as provided for at other public weigh scales. A resolution will be submitted to that effect.

Interchange Switching—Winnipeg Switching.

The Manager of the Department attended at the sitting of the Board of Railway Commissioners in Winnipeg, on September 21st, 1906, at the request of the Manitoba Branch, which complained of certain charges assessed by the railways in Winnipeg, in addition to the regular freight tolls.

On taking the matter up further with the Commission they stated that the application involved consideration of the following three questions:

1. The question or principle as to whether, when cars brought in over the Canadian Pacific Railway, and handed to the Canadian Northern Railway for final delivery on the tracks of that company or *vice versa*, the through rate charged should include delivery on the tracks of the delivering company.

2. What switching charge should be allowed the delivering company.

3. If the rates in and out of Winnipeg should include switching charge; are the present rates charged by the railway companies from and for delivery at their own terminals to be held to include this additional service, or should a further charge be added.

The railways were to have the privilege of submitting a written statement or argument in reply. This, we are advised, has been done.

Toronto Inter-switching.

A complaint on behalf of the Toronto Branch was filed with the Railway Commission in April last, protesting against the action of the Grand Trunk Railway in withdrawing from the arrangement for the interchange of traffic for delivery on industrial and other delivery sidings within the Toronto terminals. Formerly all carload traffic, regardless of where it originated, was placed upon such sidings without additional expense to the shippers or consignees over the regular rates to and from Toronto, as published in their tariffs. The only exception to this general arrangement was that the Grand Trunk fixed a maximum amount, which they would pay for the service on certain traffic upon which their revenue did not exceed \$15.00 per car, which, in many instances, covered the total cost of the service. A number of industries previous to locating their plants had assurances that there would be no additional tolls charged, so far as the public was concerned, for switching between the different railway lines, provided the traffic was originally consigned to point of final delivery. Contracts were entered into for deliveries based upon the continuance of the arrangement, which had been in effect for a great many years undisturbed. On March 1st last the Grand Trunk withdrew from the arrangement, declining to allow any division of the rate for the service of the connecting line on traffic from what they termed "local" or "non-competitive" points. They now assess on such traffic a toll for the service of the delivery company over and above the through tariff rate (which remains the same). At the same time, if the same class of traffic originates at what they term a "competitive point" (a point served by another railway), they apply the published Toronto

rates through to final destination, allowing a division of the rate to the delivering line.

Other lines continue to protect the old established arrangement for delivery of all traffic regardless of its origin.

Complaint is made that the Grand Trunk does not afford equality of treatment, and shippers located at non-competitive points are being discriminated against.

In filing the complaint it was urged that in the event of it being necessary to have a hearing that the same take place at the earliest possible date. We regret to state that so far there has been no decision given in this respect. The Commission has stated, however, that the Chief Traffic Officer has this particular complaint and similar complaints in hand, with a view of making an early report. We are also advised that in view of the numerous complaints in regard to switching service generally throughout the country, a general report is to be made upon the whole question. Afterwards the individual complaints will be taken up on their merits. Assurances have been given that this report will be forthcoming at an early date.

London Inter-switching Case.

The appeal of the Grand Trunk Railway against the decision of the Railway Commission in the London Inter-switching Case has been heard and dismissed. It will be remembered that the Commission ordered the interchange of freight traffic between the Canadian Pacific and Grand Trunk Railway companies at London, requiring the companies to protect the published rates through to the sidings upon which the freight was delivered without the addition of a switching charge for the interchange. The Supreme Court upheld the Commission in requiring the adoption of through rates to the final destination without the addition of switching charges, where traffic is interchanged in terminals. This is a very important decision, as it sets at rest the right of shippers to require the railway companies to grant through rates related to the whole distance over which the traffic is carried, and not to be made up on the basis of the rates to one terminal plus the local rate or switching charge beyond.

Insurance on Freight in Transit.

The Canadian Pacific Railway announced its intention of accepting responsibility for loss or damage to property by fire while in its possession, whether in cars or warehouses. This decision doubtless results in some manner from the continued agitation which the Association has kept up against limitation of liability in bills of lading. It is hoped that the other transportation companies will adopt the same policy. In any event it strengthens the contention of the Association for a clean bill of lading.

Shed Storage Tariffs.

The matter of the conditions in the shed storage tariffs of the railway companies was dealt with in the last annual report. The Commission have these tariffs now under consideration. The whole question is to be reported on by their Chief Traffic Officer at an early date.

Advertising on Freight Cars.

Complaints were made that foreign manufacturers were permitted to place cards or placards on cars coming into Canada advertising their goods, whilst a like privilege was denied the Canadian manufacturer. This practice is contrary to the regulations of the railways, both in the United States and Canada, and instructions have been issued by the railways that this must be discontinued.

Classification and Ratings on Iron Articles.

The department prepared statements showing the differences between the rates from various shipping points in Canada and in the United States to the same destination. A special committee was appointed to advise with the manager

in connection with the same. As the matter was involved in the International Rate Case, its consideration was left in abeyance until the new rates have come into effect.

Complaints re Pilferage in Transit.

A number of complaints regarding pilferages and shortages from packages whilst in transit have been received. Investigation was made in order to ascertain if the trouble was widespread. The opinion of the Committee was that it would be difficult for the Association to take any action which would improve the matter, as each case would have to be investigated individually, and it was thought this could be done better by the shipper or consignee. It is further expected that the bill of lading when adopted will, to a large extent, do away with many claims of this nature.

International Car Service Rules.

Interested parties complained that the car service rules in force on the Intercolonial Railway were those formerly adopted

MR. R. P. McLENNAN

(McLennan, McFeely & Co., Ltd.)
B. C. Vice-President, 1907-'08

by the Canadian Freight Association. The department communicated with the Minister of Railways and Canals, suggesting the adoption of the Railway Commission's rules, which are in effect on other railways, which has been done.

Rates to the North-West.

The lines from St. Paul and Minneapolis reduced the rates to Winnipeg, Portage la Prairie and Brandon in March last; that is to say, the proportional rates, which were in effect from Fort William to Winnipeg were put into effect from St. Paul. This reduction places manufacturers south of us in an advantageous position, as compared with manufacturers in the East. So far no reduction has been made in the rates from Eastern Canada. The department has the matter in hand and negotiations are now going on with the view of bringing about some reduction, to take effect at an early date.

The following matters are being dealt with by the Railway Commission:

Standard Mileage Tariffs.

The Commission has directed that every railway company, subject to the legislative authority of the Parliament of Canada, furnish on or before the first day of October next statements for the year ending June 30th, 1907, showing in detail:

- A. The assets and liabilities of the company.
- B. The amount of stock issued and outstanding.
- C. The amount and nature of the consideration received by the company for such issue.
- D. The gross earnings or receipts or expenditures.
- E. The amount and nature of any bonus, gift or subsidy received by the company from any source whatsoever.
- F. The bonds issued at any time by the company.
- G. The amount and nature of the consideration received for the issue of such bonds.
- H. The character and extent of any liabilities outstanding chargeable upon the property.
- I. The cost of construction of the company's railways or any part thereof.
- J. The amount and nature of the consideration paid by the company for any property acquired by it.
- K. The particulars of any lease, contract or arrangement entered into between the company or any other company or person.
- L. And generally the extent, nature, value and particulars of the property earnings and business of the company.

The Commission further directs that each railway company shall furnish to the Board on or before the first day of October next a statement, showing the details and particulars for the year ending June 30th, 1907, as follows: Total miles under operation, details as to freight and passenger revenue per mile of road and carried one mile.

Joint Tariffs.

The Commission has also ordered that each railway furnish within three months of the date of the order (namely, July 4th, 1907), information as to the railway company or companies with which it has direct connection in Canada, the railway company or companies with which it has joint tariffs; whether any such company is willing to extend the scope of such joint tariffs; the railway company or companies with which every such company is prepared to negotiate for joint tariffs; if not to state fully their reasons for objections.

These orders are of importance, in that they will enable the Commission in the first place to determine whether or not the rates being charged are fair and reasonable, and in the second place whether or not through routes and rates are being afforded by all the railways.

In dealing with the question of freight rates and of proper facilities for interchange of traffic between the respective railways, your Committee has represented the necessity for such information. Its importance cannot be over-estimated. It is, therefore, gratifying to know that the Commission has taken this action.

Recommendations.

Your Committee recommend the favorable consideration of the following resolutions:

Railway Commission.

Whereas the Parliament of Canada have, during the last two years, enlarged the duties of the Board of Railway Commissioners for Canada much beyond those mentioned in the Railway Act of 1903; and

Whereas, in our opinion, the duties devolving upon the present Commissioners have become so numerous and so diversified that it is impossible to render the service required in the interests of the public; be it

Resolved.—That the Canadian Manufacturers' Association;

now in convention, place upon record its recognition of the valuable services which the Board of Railway Commissioners has been rendering in the public interest, and in order to provide for the continuance of this important work, respectfully suggests the advisability of increasing the membership and reorganizing the Board under a plan to be devised or approved by the Board, which would divide and specialize the work of the Commissioners.

Reciprocal Demurrage.

Whereas the investigations which have been and are being made by the Railway Commission undoubtedly establish the fact that the railways have totally failed to supply sufficient equipment and adequate and proper facilities for the handling of the business of the country; and

Whereas the Railway Commission has authorized certain regulations, which provide for the charging of additional tolls to the shippers or consignees when cars are held under load or awaiting loads beyond the free time allowed; and

Whereas the car service rules, authorized by the Board, provide for certain exceptions, but in case of a dispute invariably cast the burden of proof upon the shipper or consignee, while the arbitrator is appointed by and under the control of the interested railways; be it

Resolved.—That the Canadian Manufacturers' Association, now in convention, respectfully petition the Honorable the Board of Railway Commissioners for Canada to provide and put in effect without delay some plan for penalties against the railway companies, for failure within a reasonable limit, first, to supply empty cars; second, to haul loaded cars to destination, or, third, to place cars for unloading after arrival at destination, so as to secure to the public a prompt and adequate service within the meaning of the Railway Act; shippers to be given the same protection by the Board as is afforded to the railways; the arrangement to provide for an equitable adjustment of demurrage charges by an independent body.

Weighing Carload Shipments.

Whereas the weighing of carload freight shipments on railway track scales for the purpose of assessing freight tolls is entirely under the control of the railway companies, who reserve the right to increase the weight of any shipments while in transit; and

Whereas there are various and numerous ways in which errors are made in weighing on railway track scales, resulting in overcharges and excessive freight tolls; and

Whereas adjustments of overcharges can only be secured after persistent protests involving voluminous correspondence and vexatious delays; be it

Resolved.—That the Canadian Manufacturers' Association, now in convention, being of the opinion that there should be independent sworn weighers stationed at all principal stations, known as "Track Scale Stations," for the purpose of weighing all carload traffic, hereby respectfully petitions the Honorable the Board of Railway Commissioners for Canada to make regulations to provide for the appointment of sworn weighers at the points designated; such appointments and the manner in which the weighing shall be done to be under the direction of the Board.

J. H. HOUSSEY, *Chairman*.

G. M. MURRAY,
Secretary.

J. E. WALSH,
Manager Transportation Department.

Mr. J. H. Houssey presented and read a summary of the report of the Railway and Transportation Committee, taking it up in sections, after first reading the preamble, the first section covering pages 6, 7, 8 and part of 9 of the Reports of Standing Committees.

Mr. T. L. Moffatt.—Before you dispose of that section let me remark that there are just five lines devoted to "Stoves."

I think we are very modest. Very great good has resulted from the work of this Committee. As an instance, we have had a shipment to Sherbrooke for the past four years of about seventy-five or eighty stoves. They are very conservative down there; they order about the same quantity every year. I was comparing the freight charges last week, and I find we saved \$35 in our shipment this year over that of last year. I think we ought to be proud of our Transportation Committee, and also proud of being connected with an Association that does things along that line. I think we are better off with the changes that have been made in the classification and the rates on stoves than with the ten per cent. addition to our tariff. We would prefer a tariff of twenty-five per cent., as it is now, and raise strangers to a thirty-five per cent. tariff.

Speaking for our own firm, I think we pay the railways something like \$20,000 a year, directly or indirectly, and we must have saved not less than \$2,000 on freights alone solely through the Transportation Committee. Of course, it is backed up by that popular institution that the Government created, the Railway Commission. But the Committee did not have to appeal to the Railway Commission; they did it themselves. We have to thank Mr. Marlow and Mr. Walsh, two very efficient officers. It is a pleasure to work with those two gentlemen.

The section as read was adopted.

Mr. Housser read sections of report, covering pages 9 to 15, which were adopted without discussion.

Mr. Housser read section of report on "Reciprocal Demurrage," contained on pages 15 and 16.

Mr. E. G. Henderson.—It seems to me that this section is the most important in the whole report, and the most important section of the whole proceedings of this Association. I may be wrong, but it seems to me that instead of lower rates and more tariff, the great want of Canada to-day is better transportation. Whether it is that the terminal facilities are not proper or the locomotives are not plentiful enough, I do not know; but manufacturers do not get the car service they ought to get; and it seems to me if the Railway companies can hold us up for delays in unloading cars, there ought to be some way whereby we can hold up the railway companies if they do not supply us with cars. It is simply an outrage the way some manufacturers have been dealt with during the last year. I know myself of instances where work has been closed down for weeks at a time simply because the railways can not or will not supply cars; and what is worse, they do not supply cars for Canadian produce, but they do it for through produce from the United States. I think it is time this Association impressed upon the Railway Commission, that cars must be provided for Canadian business before United States business is attended to by the Canadian railways.

I believe this is the most important paragraph, and the most important matter that could come before this Association.

Mr. Rowley.—I would like to ask the Chairman of the Committee whether the Committee has considered, in dealing with the question of reciprocal demurrage, the possibility of an arrangement similar to that which I understand prevails in some of the United States, or some parts of Great Britain? By this a shipper is allowed so many hours in which to load or unload certain cars. If he loads or unloads his cars in less time than that allotted, he is allowed a little longer time to load or unload other cars? Before the railways were so arbitrary as they are now, the company I represent had an arrangement of that sort, by which if we loaded cars in less than the regular time, that time was placed to our credit, and was allowed on other cars before demurrage was charged.

Mr. Marlow.—I did press upon the Commission the view suggested by Mr. Rowley. In England the practice of charging freight tolls is to have a certain rate for carriage and an

additional rate for terminal service, the terminal service including the tracks, unless you provide your own, and also the length of time you operate the cars. That practice does not prevail here, the freight toll including all the terminal as well as the carrying service. In the United States what is known as the average arrangement prevails, by which an allowance is made on one car to offset another; and that I brought to the attention of the Railway Commission. I also gave them a copy of the agreements under which these average arrangements prevail in Ohio and Virginia, and various States of the Union; and I suggested if they could not provide some means for relieving our trouble and avoiding these penalties, as I claim they were, that they should give us such an arrangement. The Commission answered me finally after some months by saying that after they considered it they felt that no good would be accomplished by approving of an arrangement that would allow a man by the exercise of diligence in one case to get his cars unloaded within the average time which the rule allowed, and in the other case through negligence allow the car which was required by his neighbor to remain under load, while he was not being mulcted in damages so as to force the release of the equipment. They thought in the present state of equipment of the railways it would be better to allow a reasonable average time for all unloading, and avoid such an arrangement; but they gave consideration to this reciprocal demurrage plan, and thought through this some means might be provided whereby a penalty applied to the railways would force them to provide additional equipment rather than pay the penalty.

Mr. Housser.—I may say further, I think since the Railway Commission have approved of the car service rules the railways are inclined to be a good deal more severe than they were before. That is my experience.

The clause was adopted.

Mr. Housser read sections of report as to "Railway Equipment," "Railway Mileage and Equipment in Canada," "Staking of Flat Cars for Lumber Shipments," "Express Companies' Classification and Rates," "Weighing Carload Shipments," and "Interchange Switches," covering pages 16, 17, 18, 19, 20 and part of 21, which were adopted without discussion.

Mr. Housser.—There are a number of other matters which your Committee dealt with during the year. I will read the headings: Page 21, "Insurance on Freight in Transit," "Shed Storage Tariffs," "Advertising on Freight Cars."

Mr. Rowley.—As to advertising on freight cars, they do not discontinue; it is still being done.

Mr. Housser.—The railways have done all in their power; it lies with their employees to carry it out.

Mr. Rowley.—When I am at home I pass the track of the Grand Trunk Railway six times a day at Ottawa, and I notice if by any possibility any Canadian papermaker or match-maker puts one of his labels on the car, it is immediately torn off, while foreign labels are nailed on and allowed to stay there. It was done last week; freight cars from Michigan, Wisconsin and all parts of the country contained advertisements.

Mr. Marlow.—I had a great deal to do with this, and perhaps I can explain the attitude of the committee. It was dealt with. It has been under consideration for the past two years, and there is no doubt about it that through traffic which comes on through trains and passes into Canada, particularly stuff carried in large blocks, passes through without the labels being touched in any way, whereas with that loaded in Canada the placards are torn off before the cars proceed from the yards.

The decision of the Committee was this: The placing of advertisements on freight cars is not a right of the shipper; there is nothing upon which he can base a claim to the right of putting a placard upon a car; and the decision of the railways seems to be that an advertisement shall not go on their

cars. As soon as we discussed it informally with them they commenced very actively to negotiate with the United States railways to stop it, and several bureaus in the United States replied that they were using their best endeavors to stop it over there, without much success owing to the competitive nature of the traffic, but they hoped to have it all stopped.

The Association cannot claim it has a right to place advertisements on cars, and if concerted action is to be taken, the railways assure us, it will be in the way of stopping the practice altogether. Some of our members have the privilege, whether by connivance of the railways or otherwise, and the Committee felt it would not receive thanks from anybody if it took up the question actively, and it resulted in the cutting off of the privileges the members enjoy at present without giving them any return.

Mr. Rowley.—The point is, a car will come into any switch or siding and will have an advertisement of carriages or stoves or sand or lime from the United States or some other foreign country, and that car will be allowed to remain there and the cards will not be removed, while the Canadian shipper is not allowed to put one over it or next to it or alongside of it. I don't claim we have any right to placard other people's cars with our labels; but we have a right, it seems to me, to demand that if Canadians are not allowed to do it, the yardmen should have instructions to take other people's cards off.

Mr. Marlow.—We reported the matter to the Executive Council in the hope that it would give us authority to proceed to the Railway Commission and ask them to cut it off entirely, but they did not give us that authority.

Mr. J. E. Walsh.—Since this matter was up for discussion by the Committee, the American Railway Association has taken it up actively, and nearly all lines have issued positive instructions that the advertisements must be removed; that in the case of cars coming to them at junction points, if they find these advertisements on, they have to take them off and charge the expense to the line owning the car. Those instructions have also been sent out here by the roads in Canada since the 1st of September, so that I think they are doing everything they possibly can.

Mr. Ballantyne.—As a shipper on both sides of the line, our company placards every car that goes out, and we have never had any trouble either with the American or Canadian railways.

Mr. Rowley.—I have seen your placards often. (Laughter.)

Mr. Housser continued reading the headings of the different sections, as follows: "Classification and Ratings of Iron Articles," "Complaints *re* Pilferage in Transit," "Inter-colonial Car Service Rules," "Rates to the Northwest."

Mr. Rowley.—Hasn't it always been the case that they got better rates than we here?

Mr. Housser.—No.

Mr. Walsh.—Prior to the time of the Hill line coming into Winnipeg over their own tracks, the rate from St. Paul, Minnesota, to Winnipeg was \$1.10; as soon as they got their line built they reduced it to 89 cents, with a proportional rate to Fort William and Port Arthur, and the situation remains the same to-day; there has been no corresponding reduction made in the rates from the east.

Mr. Rowley.—Cannot we take goods from St. Louis to Winnipeg very much cheaper than we can from other points at a lesser distance?

Mr. Walsh.—Yes. I might say that there is a tariff now in course of preparation which we expect will be issued shortly; I don't know just exactly what reduction will be made, but there is going to be some.

Mr. Housser read sections *re* "Standard Mileage Tariffs" and "Joint Tariffs," which with the foregoing sections, contained on pages 22 and 23, were adopted.

Mr. Housser read resolution *re* "Railway Commission" contained on page 24.

Mr. Marlow.—I move the adoption of that resolution, seconded by Mr. Housser. When the Commission was originally appointed, Mr. Blair, then Minister of Railways, was very emphatic in his statement that the Commissioners would have their time so divided that they could each give special attention to particular departments of railway work—that is, the legal, traffic and operating; but under the framing of the Act that was impossible. It was also rendered impossible later by reason of the fact that the express, telegraph and telephone companies were placed under their supervision, and a great many other things were included amongst their duties. As it is, although we have had cases before them for a period of sometimes as long as two years, they are hearing new matters relating to telephones, telegraphs and express, which take up as long as eight weeks in the hearing alone, to say nothing of the time for transcribing the notes and studying them afterwards. Consequently freight matters frequently rest in abeyance, while complaints relating to express, telephone and telegraph companies are being adjusted. If the work of the Commission is to reach the maximum of usefulness, it must be done as is it by the United States Commission, which divides itself into an operating division and a traffic division. In this way the work is subdivided among the various Commissioners, by which means complaints are expeditiously handled and decisions reached.

The resolution was adopted.

Mr. Housser read resolution "Reciprocal Demurrage" and moved its adoption, seconded by Mr. W. R. Dunn. Carried.

Mr. Housser read resolution *re* "Weighing Carload Shipments" contained on page 25 and moved its adoption.

Mr. J. F. Ellis.—I have much pleasure in seconding the motion for the adoption of that resolution. I endorse it most heartily. If it were not a matter of dollars and cents the way we were treated in the matter of railway weights would be really laughable.

We sent a carload of goods to Vancouver valued at about three or four thousand dollars. The goods were weighed before they left the warehouse, and weighed on the weigh scales at the station, and when they got to their destination the Railway claimed that we should pay thirty or forty dollars more freight, and they would not give up the goods until we made that payment. We proved we were right, but we have not yet been able to get that \$30 back.

The resolution was adopted.

Mr. Housser.—I beg to move the adoption of the report as a whole.

Mr. E. G. Henderson.—I have much pleasure in seconding the adoption of the report, and I think this report is the best evidence we have of the value of the Association. If any man has any doubt about his getting value for the small fee he pays I think the reading of this report will at once dispel that illusion. I am firmly convinced that no Committee, and I do not wish to disparage the work of any other Committee, has done better work for the Association than the Transportation Committee. For that reason I have very great pleasure in seconding the adoption of the report.

The President.—Before putting that motion to you I wish to say one word regarding the Transportation Committee. I think we as an Association deserve to congratulate ourselves upon the Chairman we have had during the past year, upon the members of that Committee, and upon the officials who have had charge of that department. There is no work in connection with this Association, as Mr. Henderson has said, that shows such good results and delivers so much goods for so little money as does the Transportation Department. Further than that, it is a benefit to every shipper in Canada, and I think we ought to make plain to these men outside our ranks the great work that is being done by this Association.

We should congratulate ourselves that the Transportation Department is in such strong hands and has done such good service. But we are just started, and in the years to come you will see still greater results brought about by this Committee.

The report as a whole was then adopted.

The President—We regret to announce that Mr. James Hardwell is unable, on account of illness, to be with us to-day, and consequently that that part of the programme must be cancelled.

PRESENTATION TO MR. J. F. M. STEWART.

I shall now ask Mr. J. F. Ellis and Mr. J. F. M. Stewart to come forward.

Mr. Ellis.—Mr. President and Gentlemen,—About eight years ago the membership of this Association did not amount to as many hundreds as it now does thousands. At that time, the beginning of this century, it was seriously considered by many of those members, "Had we not better close up the Canadian Manufacturers' Association?" They questioned its value. A few thought differently; they thought that this Association had a mission, and that if it was properly managed that mission would work out for the benefit of the manufacturers of the Dominion. In their meetings the first question they considered and the one which they thought the most important was the appointment of a Secretary. This Association has been singularly fortunate in the choice of its Secretaries during the past eight years, and without any reflection on the rest of the Executive, even from the President downward, I consider that the Secretaries that we have had for the past eight years are the cause of the brilliant success of the Canadian Manufacturers' Association. (Applause.)

We began at that time with Mr. Russell. All of you know what a hard worker and an efficient organizer he was. He had to take hold of the affairs of this Association without anyone to suggest how they should be carried on. He was followed by a very able successor, the genial and diplomatic Mr. Younge. (Applause.) These gentlemen made such a mark for themselves among the manufacturers of Canada that this Association found it impossible to retain their services. But, gentlemen, we did not despair because they were leaving us; we had others amongst us that we felt sure could fill their place, and we have never since then regretted that Mr. Stewart became Secretary of this Association. (Applause.)

As a member of the Finance Committee, I was associated very intimately with Mr. Stewart, and I can bear testimony to his zeal and earnestness in the work of this Association, and to his successful management during the time he filled the important position of Secretary.

Mr. Stewart, I feel highly complimented on being asked by the Association to make you a presentation as some slight token of its regard for you and the work you have done, and I trust this clock, which we wish you now to accept, may always remind you of the warm feeling that the members of the Association have for you and your success in the future. (Prolonged applause.)

Mr. Stewart.—Mr. Ellis, Mr. President and Gentlemen,—You have placed me in a very difficult position. It is actually harder to leave the Association than to do the Association's work. At least I do not remember of ever having been in a much tighter place than I am at the present time. I have received nothing but kindness at the hands of the Association, its officers and its members generally; it is really almost impossible for one with the little business experience I have had to express to you hard-headed business men what it really means to have this added kindness shown to me.

You were kind to me in keeping me in your service for a

little over five years. I assumed my duties first as Mr. Russell's assistant, to whom the Association owes so much. I was Mr. Younge's assistant during all of his successful incumbency of the office, and on his resignation you honored me by naming me his successor. During this time the Association grew from an organization of some six hundred members, having seed planted just in and around this city, into a thoroughly representative, permanent, national organization with a membership approaching twenty-five hundred. Six years ago the Secretary and his assistant were able to manage the affairs of your Association, which at that time included the publishing of your paper, handling the committee work as it was at that time, canvassing for new members and worrying about

Characteristic Poses

your financial statement. Since then you have added two men to your staff to look after INDUSTRIAL CANADA; you have placed an expert in charge of transportation matters; another expert in charge of insurance matters; and an office man has grown up in your service; and Mr. Booth, if he was so minded, could declare a handsome dividend.

It would be impossible to estimate in dollars and cents the value that that great development in the business world has been to myself; nor do I think that there is any organization in Canada or any position in Canada which gives a young man the same great privileges for meeting business men from Victoria to Sydney. Your Association, sir, is a great one; its aims are national, and its scope is only limited by

the business possibilities of this great Dominion; but I think the greatest guarantee of the permanency and usefulness of your big organization is the time and efforts that your honorary officers give, and give so freely, to the great work which they have undertaken.

I would like, Mr. President, to compliment your very capable Secretary on the most magnificent arrangements that we have seen for your present Convention. I think the Secretaries who have gone before can learn lessons about working out the details of an organization when it is holding its Annual Meeting from what we have seen this year. (Hear, hear.) I only hope that your Secretary, Mr. Murray, and his able assistants will always receive the individual co-operation of every member of the Association. Unless they do, the work that the Association should do will not reach its full limit.

On behalf of my good wife and of myself, I thank you for your beautiful gift. It will stand in our home as a permanent souvenir reminding us of your great kindness and thoughtfulness, and reminding me of the great debt I owe the Association, the Executive officers of the Association, and the members generally. I thank you. (Prolonged applause.)

The President.—I will call upon Mr. Housser to come forward and make the presentation to our friend, Mr. Marlow. (Applause.)

PRESENTATION TO MR. J. R. MARLOW.

Mr. Housser.—Mr. President and Gentlemen, as Chairman of the Railway and Transportation Committee, it is my privilege to perform this duty which is set down on the programme. The occasion is one which I feel calls for some extended remarks, but as the hour is already well advanced and there is much business to be gone through with, I shall be just as brief as possible.

Mr. Marlow, I need scarcely say that the Association has accepted your resignation with deep regret. In you we have always realized that we had a most valued officer, one who not only had a thorough grasp of the subjects with which the Department was called upon to deal, but one who possessed the rare faculty of retaining the friendship and good-will of the very men whom it was sometimes necessary for us to oppose. These qualifications, combined with an apparently unlimited capacity for work and a loyal devotion to the interests of the Association, gained for you our warmest esteem and our lasting gratitude.

Under your direction the Department made splendid progress, and we all appreciate more than we can say the value of the services it rendered. Much of the credit for the results that are even now being achieved is unquestionably due to the careful manner in which the ground was prepared by yourself.

We are genuinely sorry to lose you, but we are pleased that in making a change you cast in your lot with a manufacturing industry, and more than pleased that circumstances have enabled you still to connect yourself with our committee. We hope that this will long be the case, so that we may continue to profit by your advice and your experience.

On behalf of the Association, I have great pleasure in asking you, Mr. Marlow, to accept this watch, chain and locket, and to wish you a long life and prosperity in your new work.

Mr. Marlow.—Mr. President and Gentlemen,—I feel very deeply grateful to you for these beautiful gifts, and I feel much more embarrassed than Mr. Stewart said he was. (Laughter.) I thank you for the very very kind words you have used in expressing the Association's recognition of my work while in charge of the Transportation Department. I feel I do not deserve the praise that has been bestowed upon me. I recognize that the work of the Department has been

good, but those results, I think, flow from the practical methods that have been adopted by the Association, not only in its Transportation Department, but in all other branches of its work.

During my term of office I was always so fortunate as to act under the guidance of a Committee of gentlemen whose interest was in the work, and who were always willing, and never failed to give me assistance and advice whenever it was needed. I think that the members of the Committee may be credited with the good results that have been attained, and which have been referred to in such high terms of approval during the afternoon.

I was also fortunate in coming in contact during my term of office with a very great number of members of the Association, and by them I was invariably received with the utmost consideration and respect, and I always felt that whatever work I accomplished was inspired mainly by the good support that I received, not only from the Committee, but from the membership at large.

The work of the Department is an important one. The report which has been read this afternoon is an evidence of that fact. I fancy that the cost of transportation of raw materials and of finished products is vital to almost all national and industrial development, and the work of checking these numerous changes in classifications and freight tolls is a very difficult one indeed. Tremendous influences have been wielded by the railroad companies such as cannot be appreciated until one comes in contact with them; but on the other hand, through the Transportation Department the Association is able to exert a counteracting influence, which has been felt to such an extent that some of the prominent outstanding matters of contention between the Association and the railways have been satisfactorily adjusted. The preventive work of the Department must not be overlooked. It cannot be estimated, yet it is there, and of inestimable value to the membership at large. The policy of the Department under the direction of the Committee of treating with the railways in all matters of dispute, leads to protracted negotiations, which have to be tactfully managed; and the railways, being slow to adopt any changes in the nature of modifications or anything that appears so to them, force appeals at times to the Railway Commission; but, I am proud to say, in every case in which the Association has appealed to the Commission, even in the most contentious matters, such as "reciprocal demurrage" and Transcontinental Railway matters, the final result has been such as to reflect great credit upon the Association.

In selecting Mr. Walsh to succeed me, the Association has found a very capable and good officer, and one who has a wide range of experience in the railway traffic world, and whose services will be felt in the work that is before you. Mr. Walsh can be relied upon to conduct the Department successfully, and he will without a doubt extend its usefulness and influence. I feel sure he will continue to enjoy the splendid support which I received. I am satisfied that the Transportation Department will continue to improve and grow, and be one of the stars in the Association's firmament.

I thank you, Mr. Chairman and members, for your very generous recognition of my humble efforts on behalf of the Association, and I can assure you it will always be esteemed by me a privilege to be able to assist in the work. (Applause.)

MUTUAL INSURANCE COMPANIES.

The President.—This morning, when the meeting adjourned, the insurance report was adopted, with the understanding that there be just five minutes devoted to a speech, in which the Committee wished to put forward some matters in connection with it. The time has now arrived.

Mr. Tindall.—Mr. President and gentlemen, when the insurance report was presented and adopted this morning it was felt that there was one matter in particular that should be brought before the Association at a fuller meeting. It is not the intention to take up our time but for a few moments. When the Mutual Fire Insurance Companies finally got in a position where they could do business we found that the Department at Ottawa had imposed restrictions and regulations that were not contemplated. We are not in any way complaining of these restrictions or regulations; they are obstacles that we are quite capable of overcoming. But we desire to overcome them at once. We feel we have gone on with this insurance problem so long and we have been so successful with it that we cannot afford to have that success in any way lessened at the present time because we are asked to put up so large a cash deposit before we can do business.

I will let the Manager of the Department explain to you how that comes about and what the reason of it is. After he has spoken we have with us to-day Mr. E. E. Perry, of Indianapolis, who was organizer of the National Association of Factory Mutual Insurance Companies of the United States. In a few minutes, I think, he could give you some information that might be of value to you, and with your permission and that of the President's, he will make those few remarks to you. I will call upon Mr. Heaton to make the explanation to which I have referred.

Mr. Heaton.—Mr. President and gentlemen, the information I have to give you will be very brief, but it is of considerable importance. During the last three and a half months the officers in charge of my Department have canvassed practically every member of the Association in the Provinces of Ontario and Quebec, or at all events, the largest proportion of them, with a view to pressing the claims upon them of the two Mutual Insurance Companies that have been organized in connection with and under the supervision of our Insurance Department. We have made to you certain statements, amongst others that we expected to be organized by about the 1st day of September. When the charters for these two companies were granted to us by the Government certain conditions were imposed. Amongst others, the conditions were, first, that you should subscribe one million of dollars of insurance for each company; second, that you should give to the companies from time to time notes representing \$50,000, upon which assessments might in future be made. Those two conditions seemed to your Committee to be the minimum for which they should strive. So much were they impressed, however with the necessity of making the companies strong beyond any peradventure that the Committee voluntarily assumed the task of increasing the one million of insurance by four times and the \$50,000 of premium notes by seven times, and in order that we might test the sincerity of the members of the Association and ascertain how you viewed the proposals that had been made, a canvass was made amongst you on this behalf.

On Friday last, by instructions of the Insurance Committee, I went to Ottawa to lay our claim before the representative of the Government in the Insurance Department. At that time I laid before him the completed documents showing that the exceedingly high ideal and the arduous task we had set ourselves had been practically, if not entirely, accomplished. The task of obtaining \$8,000,000 of insurance and of obtaining the premium notes of the leading manufacturers of this country to the extent of \$700,000, is perhaps one that has scarcely been appreciated by you who have been called upon, and who in the course of fifteen minutes or half an hour have disposed of the whole situation; but when you come to think that it meant that we have had of necessity to secure from six hundred members of this Association in the Provinces of Ontario and Quebec and the Maritime Provinces, their practical adhesion to our scheme and their practical support by

the signing of premium notes, you will have some idea of the work that has been involved and of the task we have assumed. And yet, sir, much as we thought we were doing, and strong as we thought we were making these companies, on Friday we were met by a further condition imposed by the Government, a condition that I am frank to confess we did not expect, that, apart and above everything else, before the Insurance Department would grant us licenses to do business they must be satisfied that the members of this Association who are desirous of securing insurance in our mutual companies had actually paid in cash the sum of \$20,000.

Now, that is not a supreme task by any means, and yet just at this juncture, when we were hoping to be able to announce to you that the companies were ready to start business and the work of our Insurance Department in respect

MR. C. R. McCULLOUGH

(Ontario Engraving Co.)

Chairman Industrial Committee, 1907-08

to these companies had practically ceased, we are met with this somewhat unusual and fairly difficult task to accomplish.

At the meeting of the directors of the two companies yesterday it was decided that the membership of the Association, those who had already signed applications for insurance in our mutual companies, should be requested to pay to the trustees appointed for this particular purpose, Messrs. Burton and Burland, a sum representing from fifteen to twenty-five per cent. of the notes that have been so signed, in order that we may receive the funds necessary to place with the Dominion Government. These funds will be held in trust, and will be for the purpose of meeting the Government requirements in respect of deposit and cash on hand. The funds will not be used by the companies, except for this particular purpose. At the termination of the policy contract the money contributed for the special purpose of the "Deposit" will be returned to the policy-holders. A further provision has been made in the interval, that if at the end of three months no policy has been issued, at the request of the members the

money will be returned with interest at 4 per cent. per annum.

Now, sir, one final word. We are always meeting difficulties, and the last difficulty is this, that the Insurance Superintendent is leaving Ottawa on the 8th day of October for a somewhat protracted trip, and unless we can accomplish our task on or before the 8th day of October, we are likely to be delayed in the starting of our companies until the beginning of the year. Our Committee have, therefore, in the letter they are sending out to the members, suggested that promptness be a characteristic of your reply. We are asking for prompt remittance or the acceptance of a draft that will be made for this particular purpose.

That is the condition we are now in. I think you will be glad to hear from Mr. Perry; and in passing might I remark that, personally and as manager of the Department, I owe a great deal to Mr. Perry. The information with which he has furnished us, the books he has placed at our disposal, the ripe experience gained in many years of work of this kind which he has freely placed at our disposal, have been of immense value to us in the work we have undertaken, and I am satisfied when you hear from him that you will understand not only the urgency but the importance of the work we have been undertaking.

Mr. S. R. Wickett.—If you have \$700,000 in notes and you want \$20,000, why do you speak of 25 per cent.?

Mr. Heaton.—We hope to get 25 per cent. from all, but that will give us more than we immediately need. The Government say, "You must have at least \$20,000 now, and ultimately \$100,000; if you give us the full amount now, so much the better."

MR. PERRY DISCUSSES INSURANCE.

Mr. Perry.—Gentlemen, your President stated that you had a great deal of work ahead of you, and that I had better cut my remarks short. If he had known how little I could talk, he would not have taken that trouble.

Yesterday I had the opportunity of going over your situation with Mr. Heaton, and I can only say that after having had some eighteen to twenty years' experience in this same line, and having organized and assisted in the organization of some four or five companies, you have made the greatest headway in the shortest time of any experience I have ever had or have ever observed; and the character of the business which you are starting out with is better than any of the mutual companies that I have had the pleasure or honor of being connected with.

In a few words, my experience in something over eighteen years is that we have succeeded in returning to our policyholders several millions of dollars in profits and underwriting earnings, and have accumulated several hundred thousand dollars in cash surplus, and the largest sum we ever started with in one company was \$10,000.

Now, in addition to having furnished to the manufacturers of our country good indemnity, we have never had in that time to ask an attorney to appear in court for us; we have never disputed a claim; we have never had a proof of loss in our office over night; and in addition to having furnished these profits and furnished this indemnity, we have indirectly been the cause of every manufacturer who buys insurance in the United States getting a lower rate from the stock companies simply because we were in the field and giving competition. There never has been one single instance in our country where the stock companies have voluntarily reduced the rates; they have reduced them only as they had mutual competition to force that reduction. Much is said that mutual companies are not strong, and there is the liability and risk and all that sort of thing; but when you stop to think about it, all the insurance we organize on the mutual or stock plan

is mutual so far as the insurance buyer is concerned. Your experience with the Toronto conflagration and ours with our San Francisco disaster is a fair illustration of that. Every time they have heavy losses, who pays for it? The man who buys the insurance; and time and again the stock companies in our country have said, "Well, here is the manufacturer; we need more money; we have had too many losses; the manufacturer must buy insurance; he has to carry it, some of these other fellows don't have to, but these people do, and we will make them pay it." The result is that they have advanced the rates.

We have organized what we call the National Association of Factory Mutual Insurance Companies, and in connection with that we have an Inspection Department, and that Department is divorced absolutely from the Underwriting Depart-

MR. P. W.
ELLIS

MR. J. F.
ELLIS

Characteristic Poses

ment; and we claim the greatest service we render the manufacturer is that we inspect his risks from three to four times a year, and show him from our experience how to save losses and how to prevent fire. That Inspection Department or organization is at the disposal of this Association and of Mr. Heaton, and we shall be glad to serve and assist you as far as we can in either the Underwriting or the Inspection Department. (Applause.)

Mr. Ballantyne.—Mr. President, I wish to take this opportunity of tendering to Mr. Perry the most heartfelt thanks of the Canadian Manufacturers' Association for the very able speech which he has just given to us, as well as his very generous offer, throwing open the Inspection Department of his company, and also offering to underwrite some of our risks, if we find that necessary. I therefore have very much pleasure in moving a vote of thanks to Mr. Perry.

Mr. Rowley.—I take great pleasure in seconding that. I have personal knowledge of the fact that Mr. Perry has been of great assistance to Mr. Heaton; and as an outsider I have pleasure in seconding this motion and in saying that I know he has been of great service to us, and I think he will be of further great service to us.

The President called upon the members to signify their assent to the motion in the usual way. The motion was carried by a hearty clapping of hands.

The President.—Mr. Perry, I have much pleasure in tendering to you a hearty vote of thanks on behalf of the Association.

The next item on the programme which is in order is the report of the Tariff Committee. It has been suggested, for reasons which will develop a little later, that the Commercial Intelligence Committee's report be taken at this time, and that the report of the Tariff Committee follow, and if that is your pleasure, we will take them in that order.

Mr. T. A. Russell presented and read the report of the Commercial Intelligence Committee, which was taken up clause by clause.

REPORT OF THE COMMERCIAL INTELLIGENCE COMMITTEE.

Custom has ruled that all matters not properly referable to one of the other standing committees shall be dealt with by the Commercial Intelligence Committee, and this fact accounts for the number and variety of subjects covered in the following report, which the said Committee has pleasure in submitting:

Foreign Trade.

The returns of Canada's foreign trade for the twelve months, ending June, show another remarkable increase of imports, \$354,480,533, for 1907, as against \$294,286,015 for 1906. Exports have not increased in anything like the same proportion, the net gain over 1906 being only \$1,585,044. Whereas exports of fish, mineral and forest products have actually fallen off, it is gratifying to note that exports of manufactured goods have gone forward from \$27,650,278 in 1906 to \$28,574,087 in 1907, thus showing that our manufacturers are making progress in their effort to establish themselves in the foreign market.

It is a pleasure to observe the steps the Department of Trade and Commerce is taking to improve our commercial relations abroad. Tariff treaties are said to be under negotiation with Italy, France, and Australia. Subsidies are being freely given to extend and perfect our steamship connections. Valuable trade enquiries are being distributed through the department's Weekly Bulletin, while the Commercial Agents' reports show a decided improvement.

These items, however, form little more than a beginning towards what the department ought ultimately to do in the way of assisting export trade, and it is hoped they will prosecute the good work with vigor.

The West Indian Agencies.

Your Committee believe that some change should be made in the West Indian service. The agents in that territory, four in number, are able to give but very little of their time to the work. Nor could they be expected to do much for the pittance of £50 that is allowed them as a yearly honorarium. Though reputable and well-to-do-merchants, they are much larger buyers of United States goods than of Canadian goods. One of them is said to be the agent of a United States steamship line, while another has recently been reported to the Association as advising the purchase of United States flour in preference to Canadian. It is essential that Canada should be represented in that territory by a Canadian, one who is thoroughly conversant with trade conditions at home, and who

is absolutely untrammelled by business connections with the United States. It is recommended, therefore, that representations be at once made to the Government, with a view to replacing the present agents by a new officer who will devote his entire time to the work, travelling about from place to place, and keeping the Ottawa office advised as to changing trade conditions.

Brussels Sugar Bounty Convention.

In 1903 a number of the powers subscribed to an agreement, known as the Brussels Sugar Bounty Convention, the chief purpose of which was to abolish the payment of bounties on sugar manufactured for export. As one result of this treaty the sugar refining industry of the West Indies, once so depressed, has been quite revived. In September, 1908, any of the signatory powers to the convention may withdraw, hav-

MR. T. A. RUSSELL

(Canada Cycle and Motor Co., Ltd.)

Chairman Commercial Intelligence Committee, 1906-07

ing previously given one year's notice. With the consent of the refiners and large consumers of sugar represented in the Association, your Committee has expressed to the Secretary of State for the Colonies the wish that Great Britain may continue a party to an agreement that has done so much for a sister colony.

Trade Index.

The distribution of the 1906 edition of the *Trade Index* has been continued with care throughout the year, nearly 8,000 copies having been placed in the hands of foreign buyers. No better evidence of the value of this publication could be given than the enquiries for Canadian goods which it is the means of bringing to the Association. This year they are more numerous than ever before. All are being sent on promptly to interested members, who have not been slow to express their appreciation. Financially, too, the book has been a success, having a balance to its credit on July 31st of \$1,130.36.

Exhibitions.

As a means of developing export trade the International Exhibition has, during the past few years, come rapidly into favor, and the part which the Dominion Department of Agriculture has played in bringing Canadian produce to the attention of foreign buyers through the medium of these exhibitions, is heartily to be commended. Commencing with Osaka, displays have been sent to Liege, Milan, Christchurch, and Dublin, with results that have been most beneficial to the Dominion at large. It is difficult, however, for the Government unaided properly to care for the interests of manufacturers, and it therefore devolves upon Associations such as our own to co-operate with them in using these exhibitions as a means of advertising Canadian goods in foreign markets.

Inasmuch as five important international events are now in sight, it is recommended that a standing Exhibition Committee be appointed for the purpose of collecting and disseminating information regarding international exhibitions in all parts of the world, and assisting members with the transportation and arrangement of their displays.

Foreign Agents of Canadian Houses.

Acknowledgments are due to Mr. Harrison Watson, of the Imperial Institute, London, for a suggestion which your Committee have since acted upon, and which will doubtless facilitate the handling of trade enquiries by the Commercial Agents of the Canadian Government. No systematic attempt ever seems to have been made to obtain an exhaustive list of the foreign representatives of Canadian houses, and in the absence of the information which such a list would supply, Government agents have frequently had to direct the enquirer for Canadian goods to a Canadian address, while valuable time might have been saved by referring him to an agent nearer at hand.

Some few months ago your Committee made a beginning towards meeting this long-felt want. Circulars were sent out to all members asking them for the names and addresses of their foreign representatives. The replies received were carefully analyzed; lists were prepared, classified according to countries, and each Government officer was supplied with the names and connections of the agents operating in his territory.

While these lists were far from complete, it is known that they have already served a useful purpose. It is recommended, therefore, that they be revised and added to periodically in order that members may enjoy the full benefits to be derived therefrom.

Classification of Imports.

More than two years have elapsed since the Association first made representations to the Commissioner of Customs, with a view to having the classification of imports extended and improved. It will be recalled that in many lines of trade the articles imported have been grouped by the department in such a way as to defeat the very purpose for which the returns are published. It was believed that if consideration was to be given to the real interests of the business community, certain changes were not only desirable but necessary. Your Committee, therefore, worked out its recommendations carefully in detail, and laid them before the Commissioner, who deferred action until the tariff was brought down last winter.

Many of these recommendations have been adopted in the new classification, which was put into effect on April 1st. On the whole, the returns are now in very much better shape, though that further changes will have to be made is evidenced by the frequent requests that reach the office for details which the blue books fail to supply.

Franco-Canadian Treaty.

By the Franco-Canadian treaty of 1893 Canada admits wine, soap, nuts, almonds, prunes and plums of French origin

when imported direct at rates varying from 33 to 50 per cent. off the regular tariff, in return for which certain Canadian produce, including canned meats, condensed milk, fresh and preserved fruit, building timber, flooring, wood pulp, paper, wooden furniture and boots and shoes is given the benefit of the French minimum tariff. Since the date mentioned France has negotiated tariff treaties, embracing a great variety of items, with a number of foreign countries, and each time she has taken advantage of the occasion to increase the general tariff as against those countries that were not parties to the new arrangement. Every time a treaty has been made, therefore, with Russia, Italy, or Spain, Canada's possible market in France has been contracted, until to-day her treaty with that country is sadly in need of revision.

The difference between the French general and minimum tariff is now so pronounced that if given the benefit of the latter Canada should be able to do an extensive trade in cured meats, cheese, agricultural implements, carriages, machine tools, sewing machines, and all wooden goods—doors, window frames and joinery. It is likely, however, that France would require a substantial *quid pro quo*, involving such articles as perfumery and toilet preparations, brushes and kid gloves, to which there might be considerable opposition from Canadian manufacturers.

In view of the likelihood of legislation being introduced along this line at the forthcoming session of Parliament, the subject should receive careful consideration at an early date from the new Tariff Committee.

Commercial Reports.

Members are again reminded that the Association has splendid facilities for procuring reports on foreign houses. Arrangements are in effect with mercantile rating firms in England, Denmark, Scandanavia, Holland, Belgium, Switzerland, Germany, Austria, France, South Africa, Australia, the United States, the West Indies and South America, whereby the best report obtainable may be had on any house in any part of the world at a moderate price. A large number of these reports are now on hand, and valuable time may often be saved by consulting the department.

Translation Department.

It has been decided to operate this department on a different basis for the future. Heretofore a small fee has been charged each time a service was rendered. From now on members will be entitled to have 25 letters a year translated from or into French, German, Italian or Spanish free of charge. Letters in excess of 25 will be charged at nominal rates. Expert translators are to be engaged for this work, and members will be given prompt and careful service.

Collection of Accounts.

Your Committee has for some time been considering the advisability of establishing a department for the collection of overdue accounts. There is every indication that the Association could operate to particular advantage in a matter of this kind, and as it would involve no additional expense and might even result in a small revenue, it is recommended that immediate steps be taken to put the necessary machinery in motion.

The following suggestions indicate the manner in which it is thought the work could best be carried on.

1. The engagement of a lawyer, preferably one with experience, who shall not be an employee of the Association, but who shall act under the direction of the Secretary.
2. He shall be known as "Manager of the Legal Department."
3. All his letters in connection with Association work shall be on Association stationery, and signed "The Canadian Manufacturers' Association, per Manager Legal Department."

4. Charges for collection :

A. Accounts of \$200 and under, 10 per cent. of the amount of settlement. Minimum charge, \$2.00.

B. Accounts over \$200, 10 per cent. on first \$200, and 5 per cent. on the balance.

C. Authorized disbursements, such as travelling expenses, telegrams, law stamps and special agents, but no charge to be made for ordinary law costs, such as the bringing of suits, etc.

D. When unsuccessful there shall be no charge, except for such expenses as were authorized by the creditor.

5. The manager shall receive 75 per cent. of the commission, but out of this amount he shall pay all his office expenses, excepting the cost of the Association stationery he may use.

6. Applications for the service of the department shall be addressed to the Secretary, and all amounts collected shall be paid to him.

7. Where accounts cannot be collected by the usual methods, no expense shall be incurred without first obtaining the consent of the creditor ; otherwise it shall be borne by the Manager of the Department.

Assignments.

It is proposed that in cases of assignment the department might act for interested members upon request, for it is apparent that one man acting for several creditors could produce better results than if all acted separately.

The charge herein would be governed by the work done and the amount involved, in addition to actual expenses incurred, the total to be distributed among the creditors in proportion to their respective claims.

The value to members of the Association in having the names of slow or weak accounts would be considerable. The strength and protection of the department would increase with experience.

Fraudulent Schemes Exposed.

Twice within the past few months your Committee have felt themselves called upon to expose fraud, once for the protection of members, and once for the protection of the fair name of Canada. The first was a scheme that was being worked from Buenos Ayres to secure goods from Canadian manufacturers by means of worthless drafts on Spain. A circular issued to members, warning them to be on their guard against these parties, resulted in a number of shipments being stopped, thus averting losses, which in the aggregate might have amounted to thousands of dollars. The second was an attempt on the part of a Canadian with a penitentiary record to secure advertising contracts in England for certain Canadian papers by means of gross misrepresentations. In this case full particulars were sent to the High Commissioner for Canada in London, so that he might be in a position to warn the British public.

These items suggest a new field of usefulness for the Association ; a field in which it should be able to operate with great success, if members would make it a point to report promptly all cases of fraud that come to their notice.

Metric System.

In view of the continued agitation in certain quarters favoring compulsory legislation in the matter of weights and measures, a special meeting of the Committee was called to discuss the relative advantages of the metric system and the system now in vogue. Your Committee is firmly convinced that the only way the question can ever be satisfactorily disposed of is to make it the subject of investigation and report by a Royal Commission. The following resolution which has met with the approval of the executive Council is submitted for the endorsement of the Association:

Whereas the Canadian Manufacturers' Association has for

some years considered the question of weights and measures, the result being that the Association introduced a resolution at the Sixth Congress of the Chambers of Commerce of the Empire, in London, asking for a Royal Commission to enquire into the most suitable system for adoption within the Empire, and

Whereas the Decimal Association of London is advocating the metric system and its compulsory adoption, and

Whereas the British Weights and Measures Association is endeavoring to introduce the "inch" as a unit; be it

Resolved,—That the Canadian Manufacturers' Association reaffirm its resolution asking for the appointment of a Royal Commission to investigate the question of weights and measures; and be it further

Resolved,—That the Association place itself on record as being opposed to compulsory legislation on the subject until

MR
GERHARD
HEINTZMAN

Characteristic Poses

the Commission asked for has brought in its report; and be it further

Resolved,—That in the opinion of the Association no radical change in the system of weights and measures should be adopted, except after international conference between the English-speaking nations.

Stamped Envelopes.

The last annual report of this Committee referred to the desirability of modifying the regulations governing the issue of stamped envelopes, so as to provide for one or two additional sizes, and at prices more nearly approaching the prices charged in the United States, where a No. 8 envelope printed with the return address may be had for \$21.40 per 1,000, as against \$22 charged in Canada for a No. 7 without the return address.

While duly recognizing the many advantages of the stamped envelope, particularly if redeemable at its face value in postage when spoiled, your Committee feel that it would be unwise to offer the Government any encouragement to engage in a manufacturing enterprise in which private individuals already have their money invested. Moreover, they believe that, considered purely as a business undertaking, the Government would not be justified in installing the costly machinery

necessary to supply the envelopes asked for. It is recommended, therefore, that the matter be allowed to drop.

The above summary does not by any means exhaust the list of subjects that have engaged the attention of your Committee, though it includes all such as are now ready for report. The work has been full of interest for those who have participated in it, and it is hoped of profit to the membership at large.

Respectfully submitted on behalf of the Committee.

T. A. RUSSELL,
Chairman.

G. M. MURRAY,
Secretary.

Mr. Russell read sections of report on "Foreign Trade," "The West Indian Agencies," "Brussels Sugar Bounty Convention," and "Trade Index," which were adopted without discussion.

Mr. Russell read section on "Exhibitions."

Mr. Thorn.—I would suggest that the last portion of the section with reference to the appointing of a Standing Committee be left over till to-morrow till the question of amendments to the by-laws comes up. It would be rather awkward to refer to them now.

The suggestion was adopted.

Mr. Russell read sections *re* "Foreign Agents of Canadian Houses," "Classification of Imports," "Franco-Canadian Treaty," "Commercial Reports," and "Translation Department," which were adopted without discussion.

Mr. Russell read section *re* "Collection of Accounts," and said: I wish to move the adoption of that clause. This is a new department for this Association. It is a department which has been worked with very great success by the National Association of Manufacturers in the United States. They commenced it in a small way some years ago, and it has since grown to be a very large thing with them, and found to be very useful in collecting accounts where the laws vary in the different States, as they do with us in the different Provinces; and in cases of assignments or where there is trouble with a creditor, where several members of their Association are interested, collective action is possible, which in some cases may save loss, and in other cases may expose fraudulent work on the part of the debtor. I want to make it quite clear that the details of the suggested arrangement are really suggestions. We put them in this report so that you might see to what extent it was proposed to go in this direction, but our idea would be to leave the matter free for the Commercial Intelligence Committee to work out, subject, of course, at all events, to the approval of the Executive Council, but to approve of the recommendation here so that immediate steps might be taken to organize such a department, which, I believe, if you did, would become as important a department as Transportation, Insurance, Translation and other departments have become. I move the adoption of this clause.

Mr. Ballantyne.—I would like to ask Mr. Russell a question. It seems to me that you are introducing or proposing something that will place the members of this Association in a very delicate position. Supposing one member of the Association had a bill against another member of the Association and the collection could not be made promptly and he turned it over to the Legal Department of the Canadian Manufacturers' Association, would you have this Association get mixed up between one member and another?

Voices.—No, no.

Mr. William Robins.—Mr. President, on general principles I seriously consider the advisability of this Association going into any such thing as that. Not only do I think we would be unnecessarily scattering our efforts, but I venture the opinion that already there are two very efficient organizations for this purpose; and I happen to know that one of the most

important means which the existing large commercial agencies have of recompensing their army of correspondents who furnish them with their information is through their collection department. Many years ago I was a confidential man for R. G. Dun & Co. I know something of the work of those institutions, and I know if that great agency had had to pay its army of correspondents only \$5 a year apiece on an average, it would have taken more than the entire profits of the concern. I think on every ground we would be making a great mistake to enter upon anything like that. I move in amendment that that recommendation be not adopted.

Mr. E. G. Henderson.—I have great pleasure in seconding Mr. Robins' amendment. It seems to me it would be a most derogatory thing for this Association to turn itself into a debt collecting agency. While it is quite true that this gentleman to be appointed is not to be an officer of the Association, yet he is to use the Manufacturers' Association's stationery. It is a very nice thing to have the Association turned into a dunning association! I think we would do far more damage to the Association than any good we would do to the individual member.

Mr. James Kendry.—I fully concur in the remarks of the gentleman here, and add that if this Association is to branch out in all the different lines we have before us to-day, I think its usefulness will be gone. The idea when this Association was formed was to have a tariff Association. We are branching out into many lines, and I think, so far as this Association is concerned, we are going to drift away from the interests of the Canadian Manufacturers' Association. I certainly endorse the sentiments of the gentleman who has just spoken, that we should not become a collecting agency. (Applause.)

Mr. McGibbon.—I was not going to speak on this subject, inasmuch as I happen to be interested financially in a company doing the work that this Association now proposes to do. Still, I shall try to forget that fact, and express my opinion, that it would be suicidal for this Association to extend its operations any further at present. The Association, in my opinion, should be broad minded, and be able to carry through to a finish anything it undertakes. I think if you keep on extending in small branches of work of this kind you are simply going to antagonize every interest in Canada against that of the manufacturers. I therefore concur in what these gentlemen have said. In my humble opinion it would be suicidal for this Association to engage in any work of this kind.

Mr. Russell.—The Committee has given some thought to this subject, and it might be well to mention some of the points which weighed with them. In the first place, it is not a departure that this Association is taking without precedent. It is a department which has been organized and carried to a great success and considered one of the most successful branches of the National Association in the United States, and it has not been considered beneath the dignity of that large organization to assist some of its members, not as well and favorably situated perhaps as other members, to collect their accounts, where assistance was needed. It is all very well for one man to get up and say that the tariff is the whole issue. It is not. This Association is too big for that. There are some men and some businesses to whom the tariff is the whole issue. There are some men and some businesses to whom transportation is the whole issue; there are others with whom insurance is the main issue. We are such a large organization, and our interests are so varied, that we have to hold our membership and gain our strength by not assisting one man simply because the tariff is his whole business, but by assisting our members wherever they need assistance, so long as it is consistent with the proper management of the Association. The President of the United States Association told us that they have no trouble with one member endeavoring to collect from another. If it is between two members of

the Association, it is a matter for dispute as to accounts, and this can be adjusted; or if the other member is not solvent, is not able to pay it, then he should not be a member of the Association. It is very well to urge that these departments are going far afield. The same has been urged about insurance. No Committee had much more strenuous opposition than the Insurance Committee, but you see the culmination of that Committee's work to-day. There is hardly a member who does not hold up his hands in support of it. The same holds true in the case of transportation. There were many members of this Association who thought that they could do better with the railway companies individually than if they worked through the Association as a whole. The members of this Association do not believe that to-day. So your Committee who have looked into this question believe that good work can be done, and that they will not commit the Association to any great extent, and will render assistance to many of its members. The Committee are a unit in suggesting that their recommendation be put into effect.

Mr. McGibbon.—My opinion is that a halt has to be called some time to the extension of the work of the Association. It is a pretty big thing, and there is no reason in the world if this goes through why somebody should not propose that we organize a bank to loan the Association money at a lower rate of interest than the regular banks.

A Voice.—A good idea. (Laughter.)

Mr. J. F. Ellis.—This is apparently a live question. I believe that we should discuss it candidly and carefully, and I do not think we have the opportunity of doing that this afternoon. I would not like to see this resolution voted down; I think it is worthy of consideration. It has received a great deal of consideration from the Committee, and I think we should perhaps lay it on the table, but not vote it down altogether. I think it ought to come up again and have fair and full discussion, and it cannot have that this afternoon.

Mr. Kendry.—I move, Mr. President, that we put that off for a year, till the next meeting of this Association.

Mr. Robins.—Where will we be then? This idea of closing our eyes and shunting a thing forward is poor policy. The proposal is either a good thing or a bad thing. Let us decide. If we cannot do it to-day, let us do it by means of a canvass of the Association through circular or in some other way. I quite agree with Mr. Ellis, that we should not negative the proposition of a Committee which has given its serious consideration to the matter, but for my part my mind is fully made up that we don't want that sort of thing in the Association.

Mr. J. P. Murray.—I think you will find in the report that this will be submitted later on to the Executive Council. Let it be discussed as much as you please, but I don't think it is very complimentary to the Committee, which has given an immense amount of time to its consideration, to scratch it off the book entirely. We are asking the Association to put this matter in such a position that the Executive Council which you are going to elect can deal with it. If this Association is not going to have confidence in the Council it elects, it had better not elect one, but do the whole work of the Association in convention. The work of the Association at present is all done by the Committees, and by the hard work of the Committees, too, and in this particular matter the Commercial Intelligence Committee had many a session and devoted a great deal of thought to it. I certainly think that the members of the Association in convention here should allow the Commercial Intelligence Committee to go on with the work it is doing, and submit its report to the Executive Council for its approval or condemnation.

Mr. E. G. Henderson.—I rise to a point of order. Is this large body to be lectured here because it chooses to criticize the report of a committee? If that is so, the sooner we stop calling together the annual meeting the better. I object to the

remarks of Mr. Murray. If it is the Committee that is to decide, we don't want large bodies here; we simply want the Committees.

Mr. Kendry.—I think we ought to take the vote of this assembly here to-day, and this is the proper place to settle a question of this kind. So far as the Committees are concerned they bring those recommendations to us, and we have a right to vote them down or do as we think proper. I think this is the proper place to vote on the resolution.

The President.—Following parliamentary procedure, we will in future just allow one speech from each member on the subject.

Mr. Thorn.—We greatly appreciate the work that the Committee has done, but the matter is up for consideration, and now is the time to say what we feel in connection with this particular item. So far as I am personally concerned, I greatly regret having to oppose the recommendation of the Committee. Still, I think it would be a mistake for this Association to enter into the collection of accounts. There are agencies for that purpose now that are certainly giving very satisfactory service; the accounts are being collected promptly and the amounts paid over, and even upon more favorable terms than are proposed here. I really think it would be a mistake to enter upon work of this kind, although I greatly appreciate the work the Committee has been doing.

Mr. W. Cauldwell.—I quite agree with the remarks of the gentleman who has just sat down. I think it would be a great mistake for the Association to go into the business of collecting accounts. If this were adopted I, for one, would feel bound to send any accounts we wanted collected to the Association. There are many accounts I would not care to send here if we established this department. As it is, we have many companies throughout the country who collect accounts very satisfactorily. We don't know where the expense of such a department would end. I, for one, appreciate the work of the committee. I would, therefore, move in amendment to the amendment that the Committee be allowed to proceed and formulate a plan and report at the Convention to be held one year hence.

Mr. Fortier.—I second the motion.

The President stated the amendment to the amendment.

Mr. Robins.—We are told already that the Committee is unanimous. What is the adoption of this amendment going to result in? If the matter is not going to be disposed of now, should it not be referred to the Executive Council?

The President put the amendment to the amendment, which was lost.

The President put the amendment, that the clause be stricken out of the report. This was declared carried.

Mr. Russell read sections of report on "Fraudulent Schemes Exposed," "Metric System," with the resolution contained therein, also section *re* "Stamped Envelopes," which were adopted without discussion.

Mr. Russell moved, seconded by Mr. J. P. Murray, that the report as amended be adopted. Carried.

The Secretary made the announcements.

The President.—The next item is that of the report of the Tariff Committee, to be presented by the Chairman, Mr. W. K. George.

REPORT OF THE TARIFF COMMITTEE.

Mr. George presented and read the report of the Tariff Committee.

Since our last annual meeting the revision of the tariff, which was so anxiously awaited from the Government, has been brought down, and your Tariff Committee regret exceedingly that the new tariff does not embody more of the recommendations which were made to the Government by this Association.

At the inception of the Manufacturers' Association, the tariff question was the most important problem to be dealt with, and, in the opinion of your Committee, it has remained as the one subject which must at all times be kept uppermost in the councils of the Association.

Canada is as yet a young country, with great possibilities and vast resources, and in order that her development may be properly achieved by the establishment of industries which will utilize her resources and furnish employment to her people, it is imperative that she should have a tariff which will furnish sufficient protection against either the cheaper labor, or the more highly specialized and fully developed industries of her competitors.

Since the revision of the tariff in 1896 the policy of this Association has been (1) to deal with the tariff as a business problem apart from party politics; (2) to impress upon the Government, through every available means, the point of view

MR. W. K. GEORGE
(Standard Silver Co., Limited)
Chairman Tariff Committee, 1906-07

of the Association in desiring to build up Canadian industries and provide employment for Canadian artisans, and (3) to educate public opinion, both in the cities and in the rural districts, to realize how essential this policy is for the complete development and continued prosperity of the country, and to obtain public support for a protective policy, no matter by whom it should be advanced. We believe that the country, as a whole, is imbued with the idea that Canadian industries must be protected against the products of cheap foreign labor and specialized industries. We also believe that the public realizes more than it has ever done before, that the industries of Canada are providing a large and valuable home market for the products of the farm, and that everything should be done within reason, which will develop them.

In our efforts to impress our views upon the present Government, we have met with only partial success. The tariff which was brought down last winter, is largely a compromise measure. It is a source of satisfaction to manufacturers to

know that the party in power, which was originally a low tariff or free trade party, has, under the responsibility of office, seen how impossible such a policy is if Canada is to continue her progress as an industrial nation. At the same time, we feel that the Government has either not realized how essential it is in the case of many industries (which are even now, in these most prosperous times, feeling keenly the effects of foreign competition), that they should receive more adequate protection, or, if they have realized it, they have not had the courage to put such a policy into effect.

We recognize fully the measure of success and development which has attended many of our industries during the last few years, but we recognize at the same time the exceptional conditions which have prevailed during this period throughout the entire industrial world. In every country trade conditions have been unprecedentedly good, so that with prosperous and busy times at home the foreign manufacturer has not felt the same necessity for unloading his surplus stock upon the Canadian market. This lack of extra severe foreign competition, combined with the phenomenal development going on in Canada, has produced temporarily a condition of affairs satisfactory to many lines of industry. Under these conditions we are not surprised to learn that since 1901 the output of our Canadian factories has increased by 48 per cent., but it is rather startling to know that even then they are not growing proportionately with the growth of our country, and that during the same period our imports of dutiable goods have increased by 53 per cent., and further, that a trade balance, exclusive of coin and bullion, in Canada's favor in 1901 of six million dollars, has been converted into an adverse balance of one hundred and four million dollars for the year ending June 30th, 1907. Figures such as these are fraught with deep significance, and "settlement day" cannot be explained away by any fiscal theories.

As a Tariff Committee, we do not believe it would be in the interest of the manufacturers of this country to raise a hue and cry for increased protection for every Canadian industry. Some have sufficient protection to-day, others only very inadequate protection.

Our aim has been to secure, first, a tariff which would furnish relief to industries now suffering from unequal competition, and, second, a tariff which would not only encourage a reasonable development of industries already in operation, but would also serve as an incentive to investors to establish new enterprises.

We believe that the words of the Finance Minister of Canada, in speaking of the position of the manufacturers on the tariff question, (is) correct, in other words, that "eternal vigilance" must be the watchword of the Association in dealing with the tariff matter, for undoubtedly the manufacturers of this country, in many lines, did not receive the consideration they should in the tariff of 1907. Instead of being disheartened, however, we believe the Association should be encouraged by the adoption, by what was originally the free trade party of Canada, of a tariff which is protective in its principle, and that we should not relax our efforts to secure the application of the same policy of protection in those lines of manufacture which do not enjoy it to-day, and which, in the interest of Canada, should be developed in our midst.

We believe that, as in the past, our attitude on this question should be entirely outside of party politics, and that our efforts should be to deal with the question along business lines, and in the interests of all the industries of the country, and to this end we would recommend that the new Tariff Committee begin its work immediately after the close of this convention.

Regarding the intermediate tariff the Association is on record to the effect that "it is an innovation which will stand as a continuous invitation to countries competing with Can-

ada to negotiate with a view to having it made effective. If the same should at any time become operative in favor of any of Canada's principal competitors, it would deal a blow to Canadian enterprises, and prove disastrous to many lines of industry. The Government is given authority to make the same apply to any foreign country without receiving the consent of Parliament, and as long as Canada's development is menaced by the unknown possibilities of such a tariff, capital will remain timid, present industries will not be developed, nor will the establishment of new ones be encouraged."

The Australian Tariff.

With reference to Canada's relations abroad, it is to be regretted that our Government did not succeed in effecting a reciprocal preferential tariff with Australia. The tariff recently announced by the Commonwealth Parliament commits Australia to the principle of an Imperial preference, without admitting Canada to the benefits of the same.

Without questioning the right of Australia to protect her own interests, your Committee feel that, by virtue of the fact that Canada was the first to raise the standard of Imperial preference, we ought to be accorded equal privileges in the Australian market with our fellow-subjects from Great Britain. Given such a preference we could secure a large share of the business that is now going to the United States, as the lines which these two countries produce are almost identical, and are of a kind that Australia requires.

The following resolution voicing the views of the Association has been placed in the hands of the Government :

"Whereas the Australian Commonwealth Parliament has recently announced the adoption of a new tariff wherein it definitely commits itself to the principle of an Imperial preference by virtue of the concessions it has allowed Great Britain, and

"Whereas Canada has not yet been admitted to the benefits of this preference; and

"Whereas its application to Canada would undoubtedly be the means of securing to Canadian manufacturers a large share of the business now being done by United States houses; be it

"Resolved.—That the Executive Council of the Canadian Manufacturers' Association urge upon the Dominion Government the great importance of effecting a preferential tariff treaty with Australia at the earliest possible moment upon terms that will enable her to share the advantages of that market equally with other parts of the Empire. And be it further

"Resolved.—That the Government be urged to leave no stone unturned to have Australia withhold the application of the new tariff to goods that were actually in transit at the time the tariff was announced."

While there seems to be little hope that the duty will be withheld as against goods in transit, your Committee is assured that the Department of Trade and Commerce is sparing no effort and no expense to secure the benefits of this preference to Canada.

Franco-Canadian Treaty.

Your Committee have followed with interest the announcements regarding the proposed extension of the Franco-Canadian treaty of 1893, but in the absence of any official statement as to the items which it is proposed to include within the scope of the new treaty it has been impossible to take any action. The matter will be carefully watched, however, with a view to seeing that Canadian interests are properly represented when the amended treaty comes up for ratification in Parliament.

All of which is respectfully submitted.

W. K. GEORGE,

Chairman.

G. M. MURRAY,

Secretary.

Mr. George.—Before moving the adoption of the report, I think it might be well to put another motion. It has in the past been the desire of the Annual Convention to consider the Tariff Committee's report in private session. That has usually been done. I don't know whether it is the desire of this meeting to do so or not, but I think it would be well to test that feeling, and I will move first in relation to that, that the Tariff Committee's report be considered in private session.

Mr. Ballantyne.—I have very much pleasure in seconding the motion.

Mr. Ransford.—I do not see that we have anything to say about the tariff that we do not want the world to know. I bow with all deference to the superior wisdom of others, but in this case I don't see the superiority of the wisdom. I think, gentlemen, that the more we make our voices heard and the more publicity we give to our consideration of the tariff question, the better it will be for us. If we do not, to what

MR. W. R. DUNN

(The International Harvester Co., Limited)

Chairman Railway and Transportation Committee, 1907-08

do we lay ourselves open? We lay ourselves open to slurs of this kind: "The manufacturers met behind closed doors;" you will see that in the columns of the *Globe* to-morrow morning: "They are practically afraid to let their voices be heard, and they do it in secret," and all this kind of abominable politicians' language. The sooner we speak with no uncertain voice and the more public we make our voice, I submit, the better. Therefore, I shall most certainly oppose the motion.

The President put the motion, which, on a vote having been taken, was declared lost.

Mr. Ballantyne.—I might say that while it has always been the custom to meet in private, nevertheless I am perfectly willing to bow to the wish of the majority.

Mr. George.—I might say also that I quite agree with what Mr. Ransford has said. It has been the procedure in the past, and it was felt it would be well to afford the meeting the

opportunity of doing the same this year. I bow to the will of the majority.

Mr. George moved, seconded by Mr. Chapman, that the report be adopted.

Mr. Henderson.—I want to move in amendment that about a dozen words be struck out. I refer you to the first clause, on page 63, which reads as follows: "We believe that, as in the past, our attitude on this question should be entirely outside of party politics, and that our efforts," and so on. I wish to move that the words between "believe" and "efforts" be struck out. My object in moving that those words be struck out is this. We have for the last eight years been telling the politicians of this country that we won't introduce politics into the discussion of the tariff. It seems to me it is rather a jug-handled affair. Will any sane man in this room tell me to-day that the gentlemen charged with the revision of the

MR. JOHN TURNBULL

(The Nasmith Co., Limited)

Chairman Parliamentary Committee, 1907-08

tariff dealt with the tariff as a business proposition, or did they deal with it as a political proposition? That is a question I should like to have answered. We say, "No, we won't introduce politics," but they do. It is not fair. We have been talking about what the labor organizations are doing. Why is it that they are listened to? Is it because they are a more powerful body than we are? I don't think so. The finished product of labor is what a man can do with his hands. The finished product has come into this country very rapidly indeed in the form of importations of Orientals and Hindoos. What did organized labor do when they saw their business being interfered with? I saw in the *Globe*—I suppose it is correct—a commissioner is going to be sent to Japan to try and keep them out. They will be protected, but we won't get protection.

I wish to state here that I quite agree with the report. I think it is one of the best reports that the Tariff Committee has ever submitted to a Convention. I strongly commend the Committee for bringing it in, and I do not wish to find fault

with them in any particular. I commend them for saying that there are several industries in Canada that do not want higher protection. I don't think this Association has ever claimed that a general division of everything in Canada should take place, but we do want to put some industries in such a position that they won't be driven out of business, and as things exist now it seems to me there are some that will be driven out of existence unless they get a proper measure of protection. I move, seconded by Mr. Kendry, that those words be struck out of the report.

Mr. Fraser.—I think it would be a great mistake to strike those words out, because the only thing we can infer is that this Association does want to run its business along political lines, and if that is the case I, for one, would withdraw from the Association.

Mr. Henderson.—It rests with the individual whether he is going to make the tariff a matter of politics or not. It does not embroil the Association at all.

Mr. Fraser.—This is the declaration of the Association, and if we leave this part of the report out we can only infer that the Association in future is going to take an entirely new position.

Mr. Gurney.—When I rise to address an audience like this the presumption in the mind of every Grit in the room is that now we are going to hear from an old Tory, and therefore we must discount him just one hundred per cent. Now, I proclaim myself here to-day an independent in politics. I think that there is nothing in this country that we need so much as independent men in politics. On more than one occasion I have said to some of the men who are here to-day that something owns everybody in Canada. A labor man is owned by a union, and half a dozen leaders vote for it; the Manufacturers' Association members are owned by the Manufacturers' Association and the Executive vote for them; the individual Reformer in this country is owned by his party absolutely, and the Tory by his. A man is a churchman, and he is owned by his church. Individualism is almost lost in the country, because we lack good, robust manhood.

Now, Mr. Chairman, of all the foolish things in my business experience the most foolish is the statement that the tariff should be taken out of politics. Will you tell me what there is in politics that is distinctive in this country outside of the tariff? What is there in the United States to-day, outside of the tariff, that you can call politics at all? Let us be wise enough to recognize that the one thing that is of any significance in our politics to-day is the tariff. It does not simply mean protection on your product and mine; it means finding employment suited to the boy in my family who is not fitted to be a fisherman or a farmer. Men are born with certain aptitudes. I say, sir, that nothing is so important to this country as to keep the men of first-class ability in this country, and we cannot expect to do it if we say that the tariff is not the politics of the country.

Now, I don't want to say anything offensive of either party, or of the Government, or of the Opposition, but I do say that every man in this room should take sides on this tariff question, and I say that this Association should take an unequivocal position with reference to it, so that we may know that this Association is a high tariff organization.

I am not speaking for any particular industry, but it is a matter of awful significance to me that this body of men here present, because they are taken care of individually for the moment themselves, should care nothing that the large amounts of capital invested in the woollen industry in this country have been lying idle for years. (Hear, hear.) I sat down in a body of business men who are represented here to-day, and when these tariff schedules came out, what did we do; we looked down and said, "Why, stoves are taken care of;" and I was happy, and smiled, and went away from the meeting. Now, sir, that is not the attitude this Association

should take. We should look down that schedule and find out who is hurt, and we should go to Ottawa and never let up until that industry is taken care of. The attitude we have taken is pusillanimous, it is mean, it is not worthy of us as individual business men.

I want to say another thing: what we want to do in the future is to instruct the Tariff Committee that until every industry—not mine, not yours—but until every industry in the country, is adequately taken care of, the politics of this Association really is tariff. (Applause.)

The Woollen Industry Suffering.

Mr. Kendry.—Mr. President and Gentlemen,—I quite concur in the remarks of our friend, Mr. Gurney. We are here as the Canadian Manufacturers' Association, and we have a duty to perform. We are here to look after the interests of any industry that needs protection; it makes no difference, Mr. President, whether that industry is iron or leather or anything else.

Now, sir, it may be stated that I am interested in the woollen industry. The woollen industry is one of those that have suffered, and I say this Association has a right to protect and to help it. What is the condition? Out of one hundred and odd mills, nearly one hundred mills have gone out of existence. I can tell you the mills all over this country, operated on both small and large capital, which have been closed, and I can count on my fingers the mills which are left. We have come before this Association, we have come before the Ministers at Ottawa, we have made a good case; but while we have done that, we think that this Association has not backed us as strongly as it should; because I agree with Mr. Gurney, that no matter what that industry is, we are here to protect or help protect it. You have got one industry nearly wiped out, and there may be, and there will be, others.

What do we find here by the report of the President of this Association? That our imports have increased fifty-three per cent. The balance of trade against us is one hundred and four millions of dollars. How long can we stand that, gentlemen? How long will we go on with a deficit of that kind? What do we find in this woollen industry? Ninety per cent. of the woollen goods consumed in this country is imported into this country, and it is made by cheap labor in England, Germany, and other countries. What do we find? We look to our neighbors in the United States, and ninety-five per cent. of the goods they consume is made by the people in the United States. We just reverse the whole thing.

Now, Mr. Gurney knows, and a number of gentlemen here know, I know, and the President of this Association knows very well, the industries which have gone out of existence. Where have the workmen gone? Year after year we have been spending from seven to eight hundred thousand dollars bringing immigrants to this country, and where do we find these people who have been working in our woollen industry? We find them busy in the Eastern States, and all over the United States. One gentleman has said that the tariff is not the only question, but I say that the tariff is one of the principal questions that we have before us to-day. In my politics I believe like Mr. Gurney. Whenever any Government, no matter whether it be Tory or Grit, goes against the interests of this country, I am going to vote against it. Such ought to be the policy of every one of us.

Take the different towns in the country, Waterloo, Hespeler, Carleton Place, Montreal and Cornwall, for instance. In all these places the woollen industry has gone out of existence. With its policy of not protecting that industry, the Government has wiped it out, and those municipalities have lost their particular interests.

It may be said that I am speaking in my own interests; but I think I have a right to speak in my own interests; all

the capital I have is invested in that industry, and in an effort to carry it on I have lost thousands of dollars. I know of concerns that have lost \$500,000. Is this Association not going to take a hand and help us to put that industry where it belongs? Some will say that this industry has thirty per cent. protection. I grant you that; but the goods which come into this country to-day, what are they? The cheapest class of goods, made up of rubbish of all kinds. The Canadian manufacturer to-day makes a better class of goods for the price than the English manufacturer. But we find the clothing people of this country going to England to buy their goods. They give us no preference. They don't care whether the goods wear or not—whether they are intrinsically good or not; they want to sell a suit at a certain price, and they go to England and buy the cloth because it is cheap.

Moreover, I am paying fifty per cent. more for labor to-day than I did seven years ago. Who is getting the benefit of that? The labor people of this country. But English labor has been at a standstill, and that is exactly why we cannot compete with them. We must have a tariff to cover this difference, if we are to exist.

This is a vital point with a good many of us who have our capital invested in the woollen industry. I was very sorry to hear one member of this Association say that if we were going to bring politics into the Association, he would withdraw.

Mr. Fraser.—I do not mean politics; I mean party politics.

Mr. Kendry.—That is all right.

I could say a great deal more, but as there are other gentlemen here who want to speak, I thank you for the very kind hearing you have given me, and I hope this Association will go on in the same lines as it has in the past. I am opposed to its branching out into too many things. I think we are met here for a certain purpose. Do not let us lose sight of the main object. The main object of this Association, I hold, is the tariff.

Politics and Party Politics.

Mr. Robins.—There has just developed precisely the remark I was going to rise to make—that is, the great distinction between party politics and politics. My conception of the word "politics" is the interests of the country. My conception of the words "party politics" is party first and country second. I disagree with my good friend, Mr. Henderson, as to the elimination of the words which he proposes to strike out. Because I disagree on that and believe this Association should not introduce party politics, I beg leave to move that the word "either," in the last line on page 61 (Book of Printed Reports), be stricken out, and after the word "not" there be introduced the word "fully," and all the words from the word "or," in the fourth line on page 62, to the end of the fifth line, be stricken out. The sentence would then read thus: "At the same time, we feel that the Government has not fully realized how essential it is in the case of many industries (which are even now, in these most prosperous times, feeling keenly the effects of foreign competition), that they should receive more adequate protection." To leave these other words there, would savor of party politics. This is my reason for making this motion.

Mr. J. F. Ellis.—Would it not be better to dispose of the amendment that is already before us. In reference to this matter, I am sorry that the Tariff Committee is not a unit in this report. I supposed there was a unanimous report, as there was no minority report brought in. I feel sure that this committee for the last few years has worked as earnestly as any committee of the Association to further the interests of the manufacturers of this country. The members have done all that they possibly could by interviewing the members of the Government and pointing out to them the wishes of this Association and the wishes of the membership of this Association individually. They have gone there representing the

Association as a body. They have also gone there representing individual interests, and I fail to see why the Tariff Committee should be condemned in any measure for what it has done in the past. I think the report as brought in by the Tariff Committee is a wise, statesmanlike document. I think this Association would make a great mistake if they changed it even in a single sentence.

Mr. Gurney.—I rise to a question of privilege. I am a member of the Tariff Committee. The Tariff Committee, in making its report, was held down to the basis that was proclaimed by this Association, and that is that politics and tariff are not synonymous terms. The committee could make no report along any other lines. What I take exception to is not the report of the committee, but the whole attitude of this Association. What I would like to have would be the co-operation of every member of this Association for the common interest as against the world. (Hear, hear.) Establish that principle, and your Tariff Committee will come in with a very different report next year.

Mr. Dick.—I would like to call attention to two slips which, I think, have been made in two very important speeches. Mr. Gurney made a most important speech, most valuable to us, but he used the words "high tariff." I would like to know if he did not mean "higher," or "high enough"? Perhaps he made a slip there. I think Mr. Kendry used the words, "we have one hundred mills and one hundred mills wiped out."

The President.—He said, "one hundred and odd mills."

Mr. Gurney.—I think I stated in the course of my speech that some industries with which I am associated are sufficiently protected, but I used the woollen industry, not because I am interested in woollen goods—I haven't a dollar of interest in it—but as an illustration of the generic fact that industries may be wiped out in this country without the fact being recognized either by the Government or by the Manufacturers' Association. I said "high tariff"—yes, make it as high as Haman's gallows, if it is necessary, to keep the Yankees out.

Mr. R. J. Younge.—I presume we are discussing chiefly the amendment first made by Mr. Henderson. Speaking of that, I feel that if that amendment is carried, it will not bring about the good results which Mr. Henderson has in view. To remove the tariff question from the realm of party politics is in reality what any good Canadian wants to do. In other words, we want to be Canadians first and politicians afterwards. If we can have the feeling and the mutual confidence in each other as members of this Association that that ground is being taken, and that no matter which party is in power, so long as it is not doing justice to the industries of this country, that we will stand together as manufacturers and oppose it until the wrongs are righted, then I feel we have removed the question of the tariff from party politics. But if we leave the tariff as a party political question we are back where we were years ago, with every Liberal supporting the Liberal Government because it is a Liberal Government, and every Conservative supporting the Conservative Government because it is a Conservative Government. So that I feel the report as it stands is a strong expression from this Association, which will in the end bring us the results which we need from the Dominion Government.

Mr. Ransford.—Mr. President and gentlemen, I trust that no member of the Tariff Committee will think that the individual members of this Association do not fully and highly recognize the value of their work. I think I am voicing the opinion of all present when I say that we do value highly the result of their work, and that any criticism that may be given of this report must not be taken in the spirit that one speaker expressed when he intimated that in so doing we were captious and finding fault with and were belittling the work of the committee. I was exceedingly glad to hear the remark that fell from Mr. Gurney with regard to every member of this Association in this matter, regarding it as devoid of party

politics. I am a Tory born and bred—I don't use the word Liberal-Conservative, because I regard it in the light of one of those subterfuges that are so common in the present day; I would very much prefer the old-fashioned word "Tory." At the same time, although I am that, I want to tell you how far I have advanced in what I consider the road to improvement. On one occasion when the Hon. Israel Tarte was up at Goderich he came out publicly and announced that he was in favor of protection. I, a Tory, so far forsook old lines as actually to accept an invitation to a supper that was given in his honor, and to sit at the same table cheek by jowl with a Grit Cabinet Minister. I need not tell you that it was not an easy pill for me to swallow, but I made it public at the time that that was the position hereafter I was going to take. The Government that protects the industries of this country—that Government I will loyally support. May I, in closing these few words, humbly suggest that the Tariff Committee get into the field of practical results? I have been a member of this Association for some years, but so far as my particular industry is concerned, I have yet to see the slightest modicum of advantage that either years of associationship or the giving of my little money to these matters has afforded me. I have, gentlemen, not received one solitary iota of benefit from having been a member of this Association for years so far as any advantage to my particular industry is concerned. I do hope that in the future the Tariff Committee will go into what I have called the field of practical results, and that next year, or perhaps in two years, if I am spared to be present at a meeting of this kind, I will be able to do what I have never been able to do before, to congratulate the Tariff Committee upon some practical result with regard to my particular industry.

Mr. George.—Might I say, in reply to what Mr. Ransford has said, that, bad as he may be now, he might have been a great deal worse. I just want to explain that, by this statement; a gentleman, an officer of the Government, told us that we might congratulate ourselves on the work we had done; that unsatisfactory, perhaps, as the result was, as shown in the new tariff, had it not been for the energetic work of the Association, the hard work of the committee and the strong presentation of the cases, the results would have been infinitely worse. That is simply the statement of a gentleman who was connected with that commission, and knew the whole ins and outs of it.

I am glad to see that there is a good deal of unanimity in regard to the report. I think that all the features which were brought out by the different speakers are covered in the report. We were told that the tariff should be still considered an important part of the Association's work. If you will read the second clause, you will see that we say we consider it at all times must be kept uppermost in the counsels of the Association. You say that assistance should be given to suffering industries. We have made that especially important in the report. We believe that the Tariff Committee and the Association should exert every bit of their energy and efforts to secure that assistance and that improvement in the conditions of those industries which are now suffering under present conditions.

I do not like to disagree very much with my friend, Mr. Gurney. I know he likes his joke. But in justice to the committee, I think I might say that that was not exactly the way in which the committee received the report of the issuing of the new tariff—not simply looking over it and seeing whose industries were benefited and then smiling and going home. I think it was very different to that.

Mr. Gurney.—I beg your pardon. I didn't refer to the Committee. I said a party of business gentlemen sitting down.

Mr. George.—I thought you had reference to the committee. The committee, as you know, did issue a statement,

expressing its regret at the manner in which the tariff revision had been dealt with.

I am glad that the question of politics has been cleared. I think every one of us recognizes that the tariff must be a question of politics, but we have tried to keep the Association from being divided and carried into the two different camps, as has been the case in the past, and probably would again, if we made it a matter of party politics. Each individual can do as he likes. He can use his efforts and see what he can bring forth the next time he has an opportunity of dealing with the men who will have to do with the next revision of the tariff.

At the request of the President, the Secretary stated Mr. Henderson's amendment.

The President put the amendment, which, on a vote having been taken, was declared lost.

The Secretary then stated Mr. Robins' amendment.

The President put the amendment, which was declared lost.

The President put the motion to adopt the report. This was declared carried.

The Secretary made the announcements.

5.15 p.m. the Convention adjourned to meet Thursday, September 26th.

THE TRIP TO LAMBTON CLUB.

The hum of many voices was heard in the balcony of the King Edward on Wednesday afternoon as the hour for the tally-ho trip to Lambton approached. The fame of the Association conventions is having its effect in the ever-increasing number of wives and daughters who are attending.

Lambton Club

The ominous clouds which overcast the sky at noon had no terrors nor did the chill winds which blew discourage any from taking in the trip. Almost every lady of the party was present when Mr. Brush lead the way to the carriages at two o'clock.

An enjoyable drive through business streets, residential avenues, and park roads brought the party to the charming home of the Lambton Golf and Country Club. The club house is ideally situated on the top of a hill which recedes in terraced slopes to the valley of the Humber. Mrs. S. R. Hart received the guests and the warmth of her hospitality soon overcame the effects of the weather's chillness. Two big roaring grates crackled merrily and cast a ruddy glow of warmth about which was most acceptable to the visitors. Tea was served in the spacious reception rooms.

After an hour, which passed all too quickly, the carriages were brought around once more and the return trip began. If anything the journey back was more enjoyable than the trip out. The route lay through High Park, and the leaves were bright with their autumnal colors. It was the time of year when nature takes on her most gorgeous hues. The winding park roads through valley and hill reveal a succession of surprises which captivate the imagination. The afternoon was one of great enjoyment to the party.

THE THEATRE PARTY.

On Wednesday evening the visiting members were entertained at a theatre party in the Royal Alexandra. The boxes, ground floor and a large section of the first balcony were reserved for the Association and its friends, and every seat was taken. That most humorous of comedians, DeWolf

Royal Alexandra Theatre

Hopper, and his competent troupe, were the attraction, in a pretty and mirth-producing play, "Happyland." To the ordinary enjoyment of the play was added the pleasure of the social side. It was an occasion where everyone had a chance to see his friends, and the evening was thoroughly enjoyed. The boxes were occupied by the prominent officers of the Association, including Hon. J. D. Rolland, Mr. and Mrs. Harry Cockshutt, Mr. and Mrs. C. C. Ballantyne, Mr. and Mrs. Ed. Freyseng, Dr. and Mrs. Morin, and others.

After the first act Mr. Hopper was called before the curtain, and in response to enthusiastic applause, made a humorous speech, introducing the names of a number of well-known members of the Association. The points were quickly seen by the audience, and were enjoyed not more by the members at large than by the subjects of the jokes.

After the conclusion of his speech Mr. Hopper, on behalf of the Entertainment Committee, presented Mr. R. A. Donald

The King Edward Hotel

with a bouquet of roses. Mr. Donald, in graceful terms, thanked the donors, and expressed the appreciation of the Toronto Branch at the attendance of so many visitors.

The theatre party was in every way a great success. It brought the members together, and provided an entertainment that was most heartily enjoyed.

THURSDAY, September 26th, 1907.

MORNING SESSION.

At 10 o'clock a.m. the President called the Convention to order, and said: Gentlemen, we will proceed with the business of the session. The first item on the programme is that of the report of the Committee on Technical Education, which will be presented by Dr. Wickett.

Dr. S. Morley Wickett.—You will find the printed report of the Technical Education Committee on page 83 of the Reports of Standing Committees. It reads as follows:

TECHNICAL EDUCATION COMMITTEE.

The report which follows is the first made by your Technical Education Committee as a standing committee of the Association. The resolution adopted at the Montreal Convention in 1904 provided only for the appointment of a special committee, whose duty it was to be "to investigate the subject of technical education, as dealt with in other countries, with a view to recommending early action on the part of the Dominion Government in inaugurating a national movement for a standard system of technical education in Canada."

The programme here outlined was in due course carried out, and reported at the annual meetings in Quebec and Winnipeg. Realizing, however, that there was still much to be done, both in co-operating with the anticipated commission of enquiry and in permanently caring for the needs of industrial efficiency, your Committee recommended that it be constituted on a permanent basis, which recommendation the Association saw fit to approve of.

Your Committee's efforts have been steadily directed towards the accomplishment of the object referred to in the Montreal resolution, viz., the inauguration by the Dominion Government of a movement to secure for Canada a comprehensive national system of industrial training. The more the subject is studied the more apparent does it become that such a movement must be inaugurated, and inaugurated promptly, if Canadian industry is to hold its own in competition with the highly skilled and highly specialized industries of other countries, if important industrial positions are not to be filled by foreigners, and if Canadian workmen are to be given an opportunity to progress. Germany, France, England and the United States have long since recognized the important bearing of industrial efficiency on national trade and commerce, by affording their artisans every opportunity to attain the highest degree of skill in their respective trades. The great progress these countries have made as a direct outcome of such a policy is one of the most interesting chapters in the history of modern industrialism. There seems no reason why Canada, with the abundance and variety of her natural wealth, and the resourcefulness of her people, should not be able to do equally as well if her workmen were but given the same opportunities to acquire proficiency. But the question cannot be approached in any haphazard manner, by the establishment of a school here and a school there, to give a course of general instruction in technical subjects. It must be made a national question; it must be worked out on a broad and systematic basis, so that the needs of all localities, of all industries, and of all classes will be adequately provided for. This can only be done by securing the co-operation of private and municipal, with provincial and federal interests, and the Dominion Government, as the one central authority, seems best fitted to take the initiative in the interest of trade and commerce.

In bringing the matter to the attention of the Government your Committee has only asked for the appointment of a small expert commission to enquire carefully into the needs of the country in the way of technical education, and to suggest the means whereby these needs could best be taken care of. Such

a commission would, it is believed, clear the air, and prepare the way for intelligent action by all interested parties. To the appointment of a Dominion Commission there seems to be no reasonable objection on constitutional grounds; on the contrary it would plainly seem to be the duty of the Federal Government, in reserving to itself the regulation of affairs pertaining to trade and commerce, to take prompt action in a matter of such vital importance to our industrial welfare. Technical education is assuredly but the domestic side of the tariff.

Just what part the Dominion might eventually play in a national system of technical education would depend largely upon the recommendations of the Commission to be appointed, for in arriving at their conclusions they would, no doubt, go thoroughly into the constitutional aspect of the problem. It is not and never has been the desire of the Association that the Dominion should itself take part in the work of instruction. Tuition as heretofore must remain a matter of local administration, subject to provincial supervision and aided by provincial contributions. It is to be noted that in other federal countries—Germany, Switzerland and the United States—the

MR. S. M. WICKETT

(Wickett & Craig, Ltd.)

Chairman Technical Education Committee, 1906-07-08

central government extends important aid to industrial education as part of its industrial policy. Possibly the Government might find it advantageous to maintain a Department of Research, and to establish and thoroughly equip a Bureau of Standards in connection with the Department of Inland Revenue for aiding and encouraging the production of goods of the first quality. It might also find it advantageous to improve the work of our art and industrial museums, and to bring the federal and provincial museums into closer relation with one another. The Government might conceivably find it in the interests of trade and commerce to arrange with the provinces to provide facilities for certain kinds of technical training, and themselves pay for the expenses incurred, as has been done in the States. These, however, are but suggestions indicating the existence of a useful field wherein the federal authority might operate. For the present the main thing is to have the whole question thoroughly investigated by a competent Commission in the interests of the country at large.

That it is a national question no one will dispute. Manu-

facturers and employers of labor proclaim it such when they find it impossible to procure the higher grades of skilled help from among Canadian workmen. Workingmen, too, proclaim it such when they find themselves shut out from factory positions of higher responsibility by reason of their lack of technical training. Our Alien Labor Laws are framed to protect the Canadian workingman, yet little or no provision is made to qualify the man so protected for the work that may be offered him. Our tariff is framed to protect the Canadian manufacturer, yet little or no provision is made to supply the trained men to carry on the industry.

From whatever standpoint it may be looked at, technical education is inseparably a part of our national industrial policy. As already observed it is the domestic side of the tariff. The tariff, by regulating the amount of our imports, encourages native industry and secures a market for its products. Technical education by improving the efficiency of our artisans makes for economy of production, and enables industry eventually to do with less protection. Again, technical education brings with it a careful study of our national resources. It devises means whereby our raw materials can best be utilized in the process of manufacture, and thus stimulates the growth of our industrial establishments.

Throughout the year your Committee has conducted an active campaign to bring about the appointment of the desired commission of enquiry. To this end a letter was first sent to the leading Boards of Trade in Canada, together with a copy of the Association's memorial, asking for their co-operation. Twenty-eight Boards at once took favorable action; these include Halifax, St. John, Quebec, Montreal, Ottawa, Smith's Falls, Kingston, Peterboro', Lindsay, Toronto, Orillia, Hamilton, Brantford, Paris, London, Port Arthur, Winnipeg, Brandon, Regina, Moose Jaw, Prince Albert, Medicine Hat, Calgary, Edmonton, Nelson, Rossland, Vancouver and Victoria. Many of them had already been at work in the advancement of technical education, and all united to call on the Government to accede to our request. It is highly significant and important that organized labor presented a similar resolution, and came a second time to Ottawa to join our deputation. A new edition of the memorial, with a supplement containing the full text of the resolutions adopted by these various boards was then printed, and a copy placed in the hands of every member of the Senate and House of Commons, accompanied by a personal letter calling attention to the principal points involved. In addition to the above circulation, the booklet was sent to prominent and influential men in every part of Canada, where it was thought it would do good. An effort was next made to have the subject introduced for discussion at the conference of Provincial Premiers, in hopes that some united action might be taken, but without success, though the majority of the Premiers expressed strong personal sympathy with the movement. Interviews were subsequently had with the Minister of Trade and Commerce and other Cabinet Ministers, and on February 22nd a strong deputation, consisting of members of Parliament and representatives from the Canadian Manufacturers' Association and the Trades and Labor Congress waited on the Premier and a number of his colleagues to urge the importance of immediate action. The deputation met with a favorable reception, and your Committee feel that the Cabinet were duly impressed by the arguments set forth. Had it not been for the multitude of other business and the general desire to procure an early adjournment of the House to enable the Premier to attend the Colonial Conference, it is more than likely that the matter would have been dealt with last session. There is now every reason to believe that the Government are preparing to take action, and another year your Committee expects to be in a position to report substantial progress.

Meanwhile, it is a pleasure to state that public opinion is year by year growing more favorable to the adoption of a vigorous industrial policy that will keep Canadian workmen at home, and open to them the highest positions in the gift

of our manufacturing establishments. Men of every class and of every creed, whether rich or poor, whether Liberal or Conservative, can here meet on neutral ground and join hands in support of a movement that cannot but redound to their mutual benefit. And, as a prominent member of the Trades and Labor Congress recently remarked, when organized labor and the Senate chant the same tune, it is time for the Government to act. When presenting our memorial to the Cabinet at Ottawa one of the trades and labor delegates remarked significantly that labor is as radical and aggressive as it is, simply because it is not making the progress it should, and that if it but had better and more frequent opportunities for advancement, Parliament would be saved a great deal of time and worry, and labor would be much more content.

Characteristic Poses

With a view to further educating public opinion, and as it were to make assurance doubly sure, your Committee is preparing to have a series of illustrated lectures on the "Benefits of Industrial Training" delivered at various points throughout Canada during the coming winter.

In conclusion, your Committee wishes to submit for your approval the following resolution, which, it is hoped, will now realize all that is anticipated:

Whereas, adequate provision for technical education is one of the pressing industrial needs of the country, and

Whereas, the Dominion Government now has before it the memorial of this Association for the early appointment, in the interest of all localities and classes and of our great natural resources, of an expert commission of enquiry,

Be it resolved, that this Association in Convention assembled place itself on record as being solicitous for speedy,

favorable action by the Government, and that a copy of this resolution be forwarded to Sir Wilfrid Laurier.

Respectfully submitted.

S. MORLEY WICKETT,
Chairman.

G. M. MURRAY,
Secretary.

Dr. Wickett moved, seconded by Mr. Birge, that the report as read, together with the above resolution, be adopted.

The President put the motion, which was carried.

The President.—The next item on the programme is an address by Mr. Emery, of New York, but as the attendance is small at the present time, with your consent we shall place it further down on the programme. We shall take up the next item, which is amendments to the by-laws.

Mr. Thorn.—The Constitution and by-laws are exceedingly important. I would suggest that you wait until there is a much larger attendance before you take up the amendments. Some are of slight importance, but others are of exceeding importance.

The President.—The amendments have all been considered by the Resolution Committee, and they will be able to say what has been done about them.

Mr. Thorn.—Could we not have the address on "The Cost of Power as a Fixed Charge"?

Hon. Mr. Rolland.—I believe we might commence the discussion of the amendments to the by-laws at the present time, and I move, seconded by Mr. Finlay, that we proceed with that item.

The President put the motion, which, on a vote having been taken, was declared carried.

The President.—I will call on the Secretary to read the amendments.

AMENDMENTS TO CONSTITUTION AND BY-LAWS.

The Secretary.—In accordance with notifications which were sent out on September 10th, notices of amendments to the by-laws have been received as follows: The first is a by-law to amend the duties of the Treasurer, as outlined on page 9 of the by-laws, copies of which are available here for those who wish them. At present one of the clauses in the by-laws reads: "He shall, in conjunction with the Secretary, sign all cheques and have them countersigned by the President or one of the Vice-Presidents, or such other person as may be designated by the Executive Council." The proposed amendment is to strike out all words after the word "cheques." The object in striking out these additional words is that the present by-law requiring three signatures to every cheque sometimes delays the transaction of the Association's business. It is felt that two signatures on the cheque accomplishes all that was intended to be accomplished by the insertion of these precautions. This amendment meets with the approval of the Finance Committee and of the Treasurer himself.

Mr. Thorn.—I suppose it is not the intention really to strike out also the following: "He shall cause to be kept the accounts of the Association," etc. That is not made clear in this, and it should be.

The Secretary.—It was just the remainder of that single sentence that it was proposed to strike out.

Mr. Firstbrook.—The words to be struck out are in the proposed amendment.

On motion, duly seconded, the amendment was adopted.

The Secretary.—The second amendment is one to provide for a British Office Committee as one of the standing committees of the Association. It was practically decided that this should be done at the annual meeting a year ago, but through an oversight the necessary words were not added to the clause in the by-laws where that would most naturally come up. The clause referred to appears on page 11, clause

2. The amendment is to insert after the words "Technical Education Committee" the words "and the British Office Committee."

On motion of Mr. Birge, seconded by Mr. Sheridan, the amendment was adopted.

The Secretary.—The third amendment is one which has been introduced by the Commercial Intelligence Committee of the Association, in whose report, read yesterday afternoon, a recommendation was made that a Committee should be appointed for the purpose of collecting and disseminating information regarding international exhibitions in all parts of the world. The Commercial Intelligence Committee have given notice of the two amendments, both of which you will find on this sheet. The first is to insert between clause 4 and clause 5 on page 11 a new clause, and to change 4 and 5 to 5 and 6, respectively.

It was moved and seconded that the amendment be adopted.

Mr. Thorn.—I move, in amendment to the motion, that the consideration of clause 3 be left over until we come to clause 5, which also relates to the Exhibition Committee, so that everything pertaining to the Exhibition Committee may be discussed and considered at the same time.

Mr. J. P. Murray.—I second the amendment.

This was carried.

The Secretary.—The next amendment of which notice has been given is in connection with clause 5, on page 11, which is to deal with the Committee on Nominations and Resolutions. It was felt that it was necessary to empower this Committee to look over the by-laws each year and to suggest such changes as might be necessary, but which were not provided for in the notices of amendment sent in by private individuals. Their suggestion is to amend the by-law so as to make it read as follows: "The Chairmen of the various standing committees shall be constituted each year, for the special work of the Annual Meeting, a Committee on Resolutions, Nominations and Amendments."

I may say that since this amendment was drafted by the Committee on Resolutions and Nominations, a request was made to them that the Chairmen of the Branches should also be constituted members of this Special Committee, and the Committee on Nominations and Resolutions has the pleasure of recommending the acceptance of this suggestion to the meeting.

On motion of Mr. George, seconded by Dr. Wickett, the amendment as read was adopted.

The Secretary.—The next amendment in connection with which, I presume, amendment No. 3 will also be considered, is the words defining the duties of the two new Standing Committees of the Association: "British Office Committee.—This Committee shall deal with all matters relating to the management of the Association's office in Great Britain."

On motion of Mr. Murray, seconded by Mr. Harris, the amendment as read was adopted.

The Secretary.—The next is "Exhibition Committee.—It shall be the duty of the Exhibition Committee to collect and disseminate information regarding international exhibitions in all parts of the world, and to assist members with the transportation and arrangement of exhibits. It shall also be their duty to act as the Association's representatives to the Canadian National Exhibition Association."

Mr. Rogers moved, seconded by Mr. Fortier, that the amendment as read be adopted.

Mr. Murray.—I wish to move an amendment to that motion, and I do so because I think there is a misconception as regards the term, "Exhibition Committee." The representatives of this Association to the Canadian National Exhibition are really not a Committee of this Association. I think that in the preparation of the amendment this may have been overlooked, and to have this matter thoroughly well understood, and to have the best results in connection with exhibitions, I

have pleasure in proposing, seconded by Mr. Thorn, this resolution:

Whereas, at present the acquisition and distribution of information *re* transportation, placing and caring for exhibits of our members in any Canadian or other exhibition, is divided between different Committees and Branches,

Be it Resolved, that the Executive Council be hereby requested by the members in Convention to devise a method, which shall become operative when accepted by Council, by which greater facilities and better results may be obtained for Canadian manufacturers at exhibitions.

Mr. Thorn.—In rising to second Mr. Murray's amendment, I might explain, for the information of the Convention, that the Executive of the Toronto Branch did not approve of the proposal that is on the blue paper containing amendments to the By-laws; therefore, Mr. Freysing, Chairman of the Branch, Mr. J. P. Murray and myself were appointed a sub-committee for the purpose of bringing in something that was thought would meet with the approval of the Branch and of the Convention, and you will notice in the proposed amendment we suggest that the Executive Council take the matter into consideration, devise a plan that will be suitable, and then put it into operation.

Mr. Russell.—There is not any great difference between the amendment to the by-law as proposed here and the amendment to the amendment proposed by Mr. Murray and Mr. Thorn, except this: the amendment here (on blue paper) provides the specific way in which the interests of the Association on exhibition matters shall be looked after. We consider that it is best now, owing to the importance of these exhibitions, to have a Special Committee to deal with them; and as we have one Committee already representing the Association in the great Canadian National Exhibition, the idea is to constitute these twelve representatives into a General Committee. They are men who are selected because of some experience in exhibition matters. They represent the Association. Practically, the difference between the suggested amendment to the amendment, and this proposal is that instead of dealing with it to-day, you turn it back for the Executive Council to work out later. I think this proposed amendment is clear, and provides a proper way of handling the matter. The Annual Meeting is competent to pass on it, and adopt the proposed clause 3, that the Exhibition Committee be composed of twelve members, and in addition to being the representatives on the Canadian National Exhibition, they look after our interests at international exhibitions. I, therefore, support the amendment on this blue sheet.

The President.—At the meeting of the Resolution Committee yesterday the question was presented by Mr. Thorn and several other gentlemen, and after the Resolution Committee had considered it they came to the conclusion that the amendment as originally drawn up would be in the best interests of the Association, and that was what the Committee adopted.

Mr. J. P. Murray.—The reason that this amendment to the amendment is placed before you is because the original amendment is unconstitutional. We have no Exhibition Committee. It is not that we have no objection to the amendment as it is printed, except that it is not sufficiently clearly defined. The intent of the two amendments is the same. The amendment to the amendment was so prepared that it would not conflict with the amendment. We merely want to get it before the Association in a constitutional way.

Mr. Birge.—It would seem to me, in reply to Mr. Murray's objection that we have no Exhibition Committee, that we have simply got the cart before the horse. We are considering now clause 5, instead of clause 3. If we pass clause 3, we must appoint an Exhibition Committee. I would move, seconded by Mr. Russell, that clause 3 be adopted.

Mr. Thorn.—I wish to point out the effect that the adoption

of that will have. You will be taking away the right that the Local Branches now have under the by-laws, page 15, to nominate representatives to whom they are entitled, on any of the various Exhibition Boards. The Association will be forming those representatives into a Committee. It is to that that the Toronto Branch Executive has objected.

The President.—I might say, in reference to this matter, that this amendment No. 3, at Mr. Thorn's suggestion, was allowed to stand over until we discussed this other clause. According to the motion of Mr. Birge and Mr. Russell, that matter is now before you.

The President put the motion to adopt clause 3, which, on a vote having been taken, was declared carried.

The President.—Now, the other question is before you—that is, the Exhibition Committee. If you are ready for that, we will take the amendment first.

The Secretary having read Mr. Murray's amendment, said: This apparently is not an amendment to the by-laws, but is

MR. P. W. ELLIS

(P. W. Ellis & Co., Ltd.)

Chairman Tariff Committee, 1907-08

simply a resolution to pave the way for an amendment at some future meeting. The original amendment as proposed reads as follows, defining the duties of the proposed Exhibition Committee: "It shall be the duty of the Exhibition Committee to collect and disseminate information regarding international exhibitions in all parts of the world, and to assist members with the transportation and arrangement of exhibits. It shall also be their duty to act as the Association's representative to the Canadian National Exhibition Association."

The President put the amendment to the amendment. It was declared lost.

The President stated the motion to adopt the amendment.

Mr. McNaught.—It seems to me it would be a mistake to appoint that Committee as the Association's representatives to the Canadian National Exhibition. I think if that were left off it would be a great deal better. I think it is all right to appoint an Exhibition Committee, which will be a General Committee selected from the whole Association; but the last sentence appears to make that Committee representatives to the Canadian National Exhibition. In my opinion, the representatives to that should be appointed by the Toronto Branch. It would not be advisable to have members from

all over Canada on that Committee, because they would not come to the meetings. I think if it were amended by leaving the last sentence off, you would have a much better arrangement for your Association, and better for the Exhibition. If necessary, I will move in amendment that that last sentence be dropped.

Mr. Birge.—I will second that amendment. It seems to me that there is a very great deal of force in what Mr. McNaught says. I know from some years of observation, something of the work of the members of the Committee in Toronto in connection with the Exhibition, and if they have members on the Committee, they want them to work. If they are appointed from all over the Dominion, from outside of the City of Toronto, it would be almost impracticable to get them there; and as Mr. McNaught has remarked, the expense is borne by the citizens of Toronto, and not by this Association. Therefore, I have great pleasure in seconding the amendment to eliminate the last sentence.

Mr. Firstbrook.—Where shall we stand? It appears to me the wiser course would be to refer the matter to the Executive Council for them to thresh out. We cannot at this time go into details.

The President.—You have an Exhibition Committee. It is provided for in clause 3.

Mr. Firstbrook.—We shall want two Exhibition Committees, certainly. It appears to me the Executive Council can thresh this matter out and put it in proper shape.

Mr. Russell.—I agree with what Mr. McNaught says, that it is necessary to have the representatives to the Exhibition from Toronto or near Toronto, or at least most of them, any way; but I think you can trust the Canadian Manufacturers' Association to take that into consideration. You have the same thing in our Standing Committees. Our Standing Committees have to meet in Toronto, and they necessarily have to be composed of more Toronto men than outside men, and in some cases almost entirely so. The Exhibition is now a Canadian National Exhibition, and our Association is a Canadian National Association. Instead of confining its work to Toronto, we want all our manufacturers to take an interest in the Canadian National Exhibition. I favor the retention of the amendment—that is, on the blue sheet—because I believe it will help to widen the interests of the members, and I know you can trust this Association to elect the majority of the men from near Toronto, or men who can attend and help. I think the Association will profit. I support it as it stands.

Mr. George.—Before the members vote, I think we had better clearly understand just what position we are in. I must confess that at the moment, without going carefully into the by-laws, I don't. We are dealing with two separate propositions. The representation on the Canadian National Exhibition or the Toronto Industrial Exhibition is a separate matter from the work of keeping track of international exhibitions. The representation on the Toronto Industrial Exhibition is guarded by the charter of the Toronto Industrial Exhibition Association. We must provide for representation on that, irrespective of what we do in any other way. That representation, I think, should be practically from the City of Toronto, or from its very immediate neighborhood. This is advisable for many reasons, but chiefly in order that the Committee can work together for the special object for which it is appointed; and it is particularly necessary that that Committee should be convenient, so that the members can give support at times when such support is necessary. I refer particularly to election time in the spring.

The other question is to provide a Committee to handle the work that is detailed. You are trying to provide means for all members to exhibit at the National and other Exhibitions. I would like this meeting to consider well what position we are going to be in if we try to make the one Committee do

all the work. I think possibly that Committee will be well able to do it, but are we going to have the representation that we want from outside in dealing with outside exhibitions?

Mr. Fraser.—Might I suggest the following: "It shall be also their duty to elect representatives to the Canadian National Exhibition Association"; that would leave the whole matter in the hands of the Exhibition Committee, and I think, taking the interests of the Exhibition into consideration, they would probably elect all Toronto men.

The President.—Did I understand you to say, Mr. George, that it was in the charter of the Industrial Exhibition that the Canadian Manufacturers' Association should elect members to the Exhibition Committee?

Mr. George.—Yes.

Mr. McNaught.—No; it does not say that. It says we shall send twelve representatives.

The President.—If that is the case, I think the Canadian Manufacturers' Association can be safely trusted to send members to the Exhibition that will be convenient and do their duty; and while I do not wish to oppose anything that is for the best interests of the Exhibition, I think the Canadian Manufacturers' Association should have the privilege of choosing those men. I think the amendment that is here on the sheet, which has been carefully considered two or three times, is quite safe, and I don't think there would be any harm done to the National Exhibition by such an amendment.

Mr. McNaught.—At the risk of differing from you, I must take exception to what you have just said, for this reason: Mr. George pointed out that there are two Committees, and they should be different because their duties are different. As the resolution says, their work will have to do with disseminating information, arranging transportation, etc. That is a matter entirely distinct from anything we have in hand. But when you come down to our Canadian exhibitions you are singling out the Toronto Exhibition for different treatment from the others, according to our understanding to-day. For the Exhibitions at London, Halifax, Winnipeg and Ottawa we elect delegates from these cities. You propose to treat Toronto entirely different; you propose to elect a different Committee from all over the Province. In my opinion, it would be a very detrimental step, and, I think, very much against the interests of the Exhibition itself, and against the interests of the Association. I am satisfied you could not get twelve men selected from the Association at large who would do the work that the men selected in the City of Toronto are doing. I don't see why the Toronto Exhibition should be singled out for different treatment from the others. I think you are doing something which will injure the Exhibition, without advancing the interests of the Association in any way.

Mr. Henderson.—There is some force in what Mr. McNaught says, but will he kindly tell us how we are going to have these men appointed?

Mr. McNaught.—At the present time they are nominated by the Local Branch and elected here.

Mr. Thorn.—That is exactly the position. The Toronto Branch nominates. In accordance with the by-law on page 15, it nominates twelve representatives to the Toronto Industrial Exhibition. The names of those representatives will come before this Convention to-day for approval or otherwise. That is the procedure, and it is one that has worked out very satisfactorily in the past. It has been proposed to change that and to form those representatives into a Committee—in fact, to take away from the Toronto Branch the right it now has to nominate those gentlemen. That has not had the consideration of the Toronto Branch; they have had no opportunity of considering it; it has not had the consideration of the representatives to the Exhibition, because they have had no opportunity of considering it. As soon as it came before

the Executive of the Toronto Branch they wished us to suggest to this meeting that the Executive Council should have an opportunity of considering it and devising a plan that would work, and then putting it into operation. That was the proposition made by Mr. Murray, and seconded by myself. I think if you would allow that to be done you would find it would work out much more satisfactorily than the proposed amendment.

The President.—Strictly speaking, the amendment Mr. McNaught has made should have come before this. This has been put to the meeting. I thought you were all ready for the question when I put it. I was going to put the original motion when Mr. McNaught came forward with his amendment.

Mr. Murray.—On page 15 of our by-laws it reads, in the second clause from the top, "Local Branches will be asked to officially nominate the representatives to which they may be entitled on any of the various Exhibition Associations within the locality in which the Branch is organized." Is it the understanding of this Convention that that is going to be rescinded and no longer allowed?

Mr. Henderson.—No notice has been given, so it cannot come before the Annual Meeting.

Mr. Murray.—You are getting things very much mixed up. I contend my motion is one that will redound to the best interests of the Association. Turn this back to the Executive Council; let the thing be carefully studied out from all points; let the Executive Council recommend something, and on their recommendation let it become operative.

The President.—This has been defeated, as I said before; but if Mr. McNaught's amendment is now put it will be an amendment to the amendment, and Mr. Murray's amendment will be voted on again.

Mr. McNaught.—If I had understood the amendment could not have been amended and spoken on, I would have spoken to Mr. Murray's motion.

The Secretary.—Mr. McNaught's motion, I believe, would be an amendment to the amendment to the amendment. Strictly speaking, that proposal is to strike out from the amendment as originally proposed the following words: "It shall also be their duty to act as Association representatives," leaving the clause in the by-law standing as follows: "Exhibition Committee.—It shall be the duty of the Exhibition Committee to collect and disseminate information regarding international exhibitions in all parts of the world, and to assist members with the transportation and arrangement of exhibits."

The amendment to the amendment as moved by Mr. Murray and seconded by Mr. Thorn, is as follows:

"Whereas, the present system in the Association for acquiring and distributing information *re* transportation, placing and caring for exhibits of our members in any Canadian or other exhibition, is divided between different Committees and Branches,

"*Be it Resolved*, that the Executive Council be hereby requested by the members in Convention to devise a method, which shall become operative when accepted by Council, by which greater facilities and better results may be obtained for Canadian manufacturers at exhibitions."

Mr. Henderson.—Before that is put, would Mr. Murray withdraw the whole of that and move that the whole clause be referred back to the Executive Council for further consideration?

Mr. McNaught.—I will withdraw my amendment, and vote in favor of Mr. Murray's motion.

Mr. Rogers.—We have passed a clause to organize an Exhibition Committee. Can we not define what their duties will be?

The President.—I think that can be done easily enough. I want it to be distinctly understood that this motion of Mr.

Murray's, seconded by Mr. Thorn, has been put to the meeting and has been declared lost, but on account of the circumstances arising out of the case it is reopened, and with your permission I will put this again to the meeting. Those in favor of sending the resolution back to be voted on, please stand.

Those in favor stood, and it was declared carried.

The President then stated the amendment to the amendment proposed by Mr. Murray and seconded by Mr. Thorn.

Mr. George.—Might I point out that clause 3 will have to be considered in conjunction with that?

The President.—Clause 3 has already been adopted.

Mr. George.—Then you tie the hands of the Executive

Characteristic Poses

Council. They have to have practically two Committees.

Mr. Thorn.—Just to make the matter clear, because I think after all it is only a matter of having the meeting clearly understand, if the resolution moved by Mr. Murray and seconded by myself, is now carried, then you can bring up the point that Mr. George has referred to and deal with it as a separate item.

The President put the amendment to the amendment, proposed by Mr. Murray and seconded by Mr. Thorn, which, on a vote having been taken, was declared carried.

Mr. Thorn.—I would suggest that the meeting be asked if they are willing to reconsider clause 3, which was also carried, providing that the Exhibition Committee consist of twelve members? As you haven't any Committee, I think that ought to be repealed. That will cover the point mentioned by Mr. George.

Mr. McNaught.—I think that should be allowed to stand,

for this reason; if our Executive Committee reconsider this matter and they decide to have an Exhibition Committee, then you have got the machinery to put it in motion.

The President.—I think it is perfectly in order. Mr. Birge moved that some time ago, it was put to the meeting, and it was approved of. Do you wish to go back to it again?

Voices.—No, no.

The Secretary.—The next amendment of which notice has been received is that dealing with nominations from the various branches to the Executive Council. The clause in the by-law reads: "Wherever Local Branches are formed these shall have the privilege of officially nominating representatives to the Executive Council, the number of such nominations being one for each fifteen members of the Branch."

It was moved by the Toronto Branch that this clause be amended by inserting in place of the words "officially nominating" the words "electing their," and the Committee on Nominations and Resolutions to make the by-laws in the different parts consistent, substituted the word "twenty" for the word "fifteen," because it is stated under the head of meetings in other parts of the by-laws that representatives to the Executive Council shall be in the proportion of one to every twenty of the membership, as determined on the 31st August.

Mr. Thorn moved, seconded by Mr. Ewing, that the clause be adopted.

The President.—Before the question is put I wish to say something myself on this subject. I am one of those who are very much opposed to the Branches electing their representatives. I believe that since this Association is national, we who are on the outside have as much right to vote for any man as members of Branches have a right to vote for us; but if we put it in the hands of the Branches of the Association, we who belong to no Branch have no vote, and the Association becomes a clique. I don't believe in it. I think our aims are national, and I think we can be trusted to elect our own members.

Mr. Tindall.—I would like also to point out to the Convention that you cannot change this amendment in the way it is stated here, to "elect their," unless you change your whole by-laws. It will make your by-laws entirely inconsistent. The whole idea of the Executive Council most undoubtedly was that every one of the two thousand members of this Association should have the right to vote for who are to be on that Executive Council. If you put this in, as the President says, you change the whole constitution. It is all right if it is thought that the whole assembly are in accord with that and you change your method of election; but you cannot pass this unless you change your Constitution and change your by-laws.

Mr. Ewing.—This proposed amendment is very much favored by the Local Branches. Montreal is practically the big end of the Province of Quebec. We try to elect men to the Executive Council who will attend the monthly meetings. We send up those names, and it is quite possible, and I believe it has occurred, that these names may be added to by the Nominating Committee; and possibly because the new names are well known here they may carry in preference to the names nominated by the Branch in Montreal, men who we know are going to attend these meetings. It certainly does not seem altogether fair that our nominations can be turned down by the Nominating Committee here and men substituted who may not be as good as the men we sent up. It is quite true it will more or less localize the representation, but an important Branch like Montreal surely should be allowed to say who it is going to have represent it in the Executive Committee.

Mr. George.—The nominations of any branch are not turned down by having other names added to the ballot paper. Whether that is quite proper or not is a matter for the meeting to decide, but it is the general electorate of this Associa-

tion who have to be pleased and satisfied, and have the right to say who shall represent them on the Executive Council of the Association; and I think it rests with them to say whether or not they shall vote on all who are to control the destinies of this organization. I don't think it is wise to introduce any more localism into the Association than we can possibly help. Our aim has been to make it a national organization from start to finish. One of the difficulties we have had to encounter is to make the men on the outside feel they have an interest in the work of the Association. With many of them the only time they can get in close touch with the Association is at an Annual Meeting. If they come here and find everything is practically cut and dried, it takes away from them a very large portion of the interest they may have in the work of the Association. We have got along well in the past, and I think we had better stick to our previous policy instead of making any radical change that I believe would be absolutely antagonistic to the best interests and to the national spirit of this organization.

Hon. Mr. Rolland.—As has been said, if this amendment were adopted, it would change completely our by-laws. I believe in each Branch making suggestions, but if the Executive Council is elected by the Local Branch it makes this Association a Local Association. I would not favor the change that is proposed.

Mr. Henderson.—It seems to me, as an outside member, that it would be a great mistake to divide up the whole Association into cliques. The members elected would not be members of the Association, but perhaps of the different Branches to which they belong. As it is now, some men say this has all been cut and dried; but if this plan were carried out as proposed there would be good grounds for saying it. I would strongly support the amendment to the clause.

Mr. Murray.—We could get over the difficulty by having it made an order that nominations of the Branches, when they are on the ballot paper, should be so designated.

The President.—They are so now.

Mr. Murray.—This is the point. The Montreal Branch nominates a certain number of men, or the Toronto Branch, or any other Branch, to the Executive Council. Let these be specified as nominations of that Branch. Other names can be added to it by members of the Association, but the members will know those names that are designated as nominations by the different Branches.

The President.—There are no names on the Branch Association ballots that were not proposed by the Branches themselves.

Mr. Burland.—What is the constitution of this Nominating Committee? If this Committee consists largely of men representing the Toronto Branch, from Toronto and the country about there, it practically leaves in their hands the correction or addition of names which have not been received by the Local Branches. On the other hand, if this Committee is representative of the Local Branches, then—

The President.—We amended clause 5 before you came in. The Chairmen of the different Branches are now on the Nominating Committee. That Committee meets after nominations are in, and if there have not been sufficient nominations it puts more in nomination.

Mr. Booth.—It seems to me it is very fair the way it stands at present. It is left for the branches to officially nominate. They nominate twenty and we elect fifteen out of the twenty they have nominated.

Mr. Harris.—Yesterday, when I was marking my ballot, I had to go to a gentleman that I believe came from Montreal and ask him who were the men to represent the Montreal Branch. I probably missed some good men and voted for some inferior ones; and I know men from Montreal, in voting on the members for Toronto, do the same thing. They might miss the good ones and get bad ones. I don't know the people

from Montreal or Nova Scotia. I was simply taking the advice of somebody. I certainly am in favor of Mr. Ewing's suggestion. I think the members from the various sections are the best able to judge who should be their representatives on the Council.

Mr. Thorn.—The matter would be thoroughly satisfactory even now if it were only carried out in the way the by-laws provide, and the way it has been carried out, with the exception of the last two years. The Annual Meetings of the Branches are held, and every member is invited to attend and to nominate anyone he may choose. The Branches then in some cases have an election, and send forward the names of those they wish to represent them. What happens is this: After those names have been sent forward, the Nominating Committee, consisting of a few Toronto gentlemen, meet and undertake to add names to those that have been sent forward from the Branch. That is where the objection comes in, and that is, I understand, why it has been proposed to change the by-law.

The President.—It has not been done this year.

Mr. Thorn.—The intention was to do it until myself and two or three others objected to it. You spoke of a clique. I would be very sorry to accuse the Nominating Committee of being a clique. I was a member of that Committee, and I know exactly how it is done, and it is done in the same way to-day. I am not objecting to the names they send forward, but what the Branches maintain is that after they have officially nominated their representatives, no Committee should undertake to change what they have done.

Mr. Findley.—This probably has been a live question, and one well considered by the Executive of the Branches and some few who are particularly active in Branch work, but to me the question is largely new, and I am sure it must be to a large number here. Of course, it is on this paper sent out in reference to the amendments. Still, I propose to vote against the change on the ground that it has not received sufficient consideration. It seems to me that it is a very radical change, and one that should not be put through without consideration.

Mr. McNaught.—I think this matter has not been threshed out the way it ought to be. While I quite agree that the Branches should nominate their representatives to the Council, I think it very important, as the President has said, that the whole body of the Association should have the election of them. The difficulty heretofore has been that the election of representatives from the different Branches has been made by quite a very small proportion of the Branch. At the last Annual Meeting held in Toronto, I believe there were seventeen members there out of five hundred members. I don't think that is a representative gathering at all. My proposition was that if they were going to have that kind of election they should have it by ballot, so that every one of the five hundred should have an opportunity to say who was going to be his representative on the Council. I believe we ought to have an understanding now in regard to the duties of the Nominating Committee. I believe they should have the power to add names if they think the best men have not been put on. That, of course, has been objected to, but I think myself it is a good proviso. If the Branches do not nominate the men that are considered the best men for consideration, let this Committee have the right to add names, so that this Association as a whole will have the chance at the general election, in this way of saying who are the men they would have represent them.

Mr. McGill.—I have been getting a little information about this. I was always under the impression that the word "privilege," which was given to the Branches, of nominating their representatives to the Executive Council, conferred upon them the right solely of nominating those men. I can appre-

ciate the fact that if the Branch only nominates the requisite number it has the appearance of a selection on which there could be no contest, and it might be well if the Executive Council considered an alteration of the wording of that clause whereby it shall be stated that the Branches shall nominate so many, of which eighty per cent. shall be elected. If that was imposed upon the Branch it would give the members of the Association that choice which they seem to desire.

Referring to Mr. McNaught's point, that a few members meet and nominate a certain number of men without the great majority having the opportunity to do so, that is the fault of the great majority. Each Branch holds its Annual Meeting, and the members have a month's notice of that. Why do those who do not attend a meeting complain of those who do attend trying to override the Branch?

MR. G. FRANK BEER

(Eclipse Whitewear Co., Ltd.)

Chairman Reception and Membership Committee, 1907-08

I quite agree with you, Mr. Chairman, that this body should have the free election of every member of the Executive, and should control its destinies. I think if a change were made as I have said, the members would have the opportunity of making their choice in the election, and the members of the Branches would have the opportunity of selecting men whom they know can give the time to the Executive work. For instance, take it in Montreal. There are many good men, men that would be a benefit to the Association, who are rarely in Toronto. We have approached them, and they say, "We rarely go to Toronto; we can't serve on that Executive." Then the Montreal Branch men strive to nominate men to the Council who from time to time will be in Toronto and have an opportunity to do their duty to the Association.

Mr. Firstbrook.—May I correct a misstatement with reference to the Toronto Branch? Every member of the Toronto Branch had an opportunity of nominating by mail. That is the way the nominations are taken in the Toronto Branch. That perhaps explains why there was not a larger attendance at the meeting.

The President.—You are perfectly clear on the matter now, but I will have the Secretary read it over so that there will not be any misunderstanding in the vote.

The Secretary again stated the amendment as proposed on the blue paper.

The President put the amendment, which, on a vote having been taken, was declared lost.

Mr. McGill.—Is it in order for me to move an amendment?

The President.—I have put the question.

The Secretary.—The next amendment is one to provide for a point that was raised in connection with the appointment of this Exhibition Committee, that is to say, "Local Branches will be asked to officially nominate the representatives to which they may be entitled on any of the various Exhibition Associations within the locality in which the Branch is organized, except where otherwise provided." The idea was to provide for the appointment of representatives to the Toronto Exhibition Association to serve also on the permanent Exhibition Committee of the Association. As that has been referred back to the Executive Council. I presume the Chairman of the Commercial Intelligence Committee will now be willing to withdraw that amendment.

The Chairman of the Commercial Intelligence Committee gave consent, and the amendment was withdrawn.

Mr. Emery Speaks on Technical Education.

The President.—We have with us to-day a gentleman well known to many of us already. Mr. James A. Emery, of New York, will now address us on "Technical Education." (Applause.)

The address will be found in another part of the present issue of INDUSTRIAL CANADA.

Mr. Birge.—Mr. President, we have been listening to wise words, the statement of incontrovertible facts dressed in a pleasant garb, but of very deep interest to us as manufacturers, and I could wish that every member of the Association from Halifax to Vancouver had heard them. I could wish that every employer of labor in Canada could have heard them; and I could wish further that every industrial employee in our factories could have heard these words that have come to us from Mr. Emery to-day on Industrial Education. I wish to move a resolution that I think will meet with the approval of every member of this Association: That whereas, we have listened with a great deal of pleasure to the eloquent and practical address on the subject of Industrial Education, we do hereby express our sincere and heartfelt thanks to Mr. Emery. I move further that his address be printed and incorporated in the proceedings of this Convention. (Applause.)

Mr. P. W. Ellis.—I take great pleasure in seconding the resolution.

The motion was carried with applause, and three cheers were given for Mr. Emery.

The President.—I have much pleasure, Mr. Emery, in tendering to you a hearty vote of thanks.

Mr. L. G. Read's Address on Power.

The President.—Gentlemen, I would like to have you remain on to the end. Our meeting will not be very much longer now. We have with us a gentleman who has kindly consented to talk to us on the "Cost of Power as a Fixed Charge," Mr. Read.

Mr. L. G. Read then addressed the Convention. The address will be found elsewhere in the present issue of INDUSTRIAL CANADA.

Mr. Robins.—I think if the Canadian Manufacturers' Association gave us nothing at our Annual Convention but two such addresses as either of the two last to which we have had the pleasure of listening, its existence would be abundantly justified.

I have listened with very great interest to this address of Mr. Read's. I regret to say that I am not endowed by nature with any faculty for mechanics, and I perhaps have missed some of the points which he has made, but I am quite sure of its practicability; I am quite sure it must be very useful for those gentlemen who are better equipped than I am to follow it. I have very great pleasure in moving that the best thanks of this gathering be given to Mr. Read for his able and instructive address, and if he will not consider it too much of a liberty, I shall be glad if he will make a couple of things plainer to me. I did not quite follow his illustration with regard to the seventeen per cent. I should like to have that a little clearer in my mind. Another thing which interested me I would like to understand a little better. I will premise my question by the observation that I haven't a dollar of interest in any power company. I understand that a power company starts with an investment which means the possibility of a certain maximum production. Perhaps I was wrong, but I rather gathered that Mr. Read did not give them a return on their investment which is not utilized, and I cannot quite see how that can be avoided, if the plant is there to provide a maximum of 100,000 horsepower and only 40,000 or 50,000 horsepower is sold; I cannot see how the company can get along unless they have a return on their full capital investment. Perhaps I have misunderstood Mr. Read there.

My principal object in rising, however, was to move that our best thanks be given to Mr. Read for his very entertaining and instructive address, and I would add to that the suggestion that the address be printed, with his permission, in INDUSTRIAL CANADA.

Mr. P. W. Ellis.—We have listened to an eminently practical address. Many of us who have not studied the power question with his thoroughness or have not had the opportunities for investigating the problem that Mr. Read has had, must feel a sense of gratitude for the plain manner in which he has conveyed to us what he has had to say on this important subject.

The two points that Mr. Robins has mentioned I hope Mr. Read will elucidate. Mr. Read has stated that when we buy gas we purchase just what we use, and when we purchase water we pay just for what we use, whereas for electrical energy we also pay for what we do not use. I would like Mr. Read to go into the case where we obtain electrical energy by meter. Do we then only pay for exactly what we use?

I believe practical addresses of this character are very valuable. We should encourage them in every way possible. The address of Mr. Emery was eminently fair and unbiased, one which could be delivered at a workingmen's convention with the same approval as it has been addressed to us. It is just such addresses as that that will harmonize to a very large extent the differences between capital and labor, between employer and employee, addresses in which we discuss the problem in prudent, careful terms, recognizing that each has rights, and endeavoring to adjust those rights to the satisfaction of both.

The President.—The mover and seconder have requested that Mr. Read address himself to those subjects which they have mentioned, but without the permission of the Convention I think we would not have sufficient time. It is getting late, and we have quite a little business yet to dispatch. If you wish to hear Mr. Read, I shall be delighted to have him speak. I would suggest, however, that Mr. Read see these gentlemen privately afterwards or discuss the points in a later issue of INDUSTRIAL CANADA. I think that would cover the question.

The President put the motion, which was carried with applause.

The President.—I have much pleasure in tendering you a hearty vote of thanks, Mr. Read.

Mr. Read.—I would like to say as to the points that have

been raised, I should only be too glad to answer them either in the daily press or INDUSTRIAL CANADA or in any engineering paper, or in all of them. I have an answer for them.

The President.—We will take advantage of your offer, and have them in our INDUSTRIAL CANADA.

RESOLUTIONS.

The President.—We have before us the resolutions presented by the Resolution Committee. The Secretary will read them to you.

The Secretary read the following resolutions of thanks, which were carried with applause:

Resolved, that the heartiest thanks of the Canadian Manufacturers' Association be tendered

1. To His Honor the Lieutenant-Governor of Ontario and Lady Clark, for their splendid entertainment at Government House.

2. To the Chairman, the Executive Committee and members of the Toronto Branch, for the magnificent hospitality extended to visiting delegates to the Convention, as well as for the conveniences and comforts they have provided, which have contributed so much to the success of the meeting.

3. To the Canadian Pacific and Great North-Western Telegraph Companies, for the privileges which they have so kindly placed at the disposal of members.

4. To the President and members of the National Club, the Royal Canadian Yacht Club and the Lambton Golf and Country Club, for their courteous invitations.

5. To the transportation companies, for the reduced rates which they have so generously accorded.

6. To Mr. Arch. Blue, Dr. B. E. Fernow, Mr. L. G. Read and Mr. Jas. A. Emery, for their exceedingly interesting and profitable addresses with which they have favored us.

7. To our Treasurer, Mr. Geo. Booth, for the care with which he has continued to watch over the Association's finances.

8. To the Press of the Dominion, but of Toronto more particularly, for the publicity they have given the Convention proceedings.

Re Japanese Treaty.

The Secretary read resolution *re* Japanese Treaty as follows:

Whereas, there can be no doubt that it is the desire of all intelligent people in Canada that we should build up a trans-Pacific trade with Asia, from the results of which all parts of Canada, and especially British Columbia, would greatly benefit,

And whereas, it cannot be doubted that the existence of the present treaty, favorable as it is in many respects to Canada, has already done a great deal towards the development of trade with Japan, and the abrogation of the treaty would not only be disastrous so far as the existing trade is concerned, but all hope of future extended relations with Japan would have to be abandoned,

Be it resolved, that we do urgently recommend that the Dominion Government, while giving due consideration to all interests in Canada, should take no hurried action towards the abrogation of the treaty which stands to-day as a basis of the friendly alliance between Britain and Japan.

Mr. P. W. Ellis.—The resolution on the face of it seems justifiable in its request that the Government move slowly. We will all agree with that. But it is not what the resolution says, but what it does not say, that is the dangerous part; it seems to imply something which we hold back and do not in the daily press or INDUSTRIAL CANADA or in any engineering set forth frankly. It is rather late for a full discussion of so important a resolution.

Mr. George.—I don't think it is well to dodge the issue; I think that this Association, representing as it does the industrial interests of Canada so largely, being the most representative organization in the Dominion, should not be afraid to say what it thinks on this question. If it is the opinion of the meeting that we should not do so, that opinion, of course, must prevail. My own individual opinion is that it will be perfectly proper and right for this Association to suggest to the Government that it should go slow and consider fully what the effect would be before it accedes to the demand that has been made upon it, to abrogate the treaty which has lately been entered into. Such an action would nullify the

M.R.C.C.
BALLANTYNE

Characteristic Poses

possibilities of present extension of trade between Japan and our West. British Columbia must look, in my opinion, very largely to the East—Japan and China, for the extension of its trade. I do not think we are entering on any dangerous ground in asking the Government to consider carefully and fully every interest in this country before it accedes to the demand which has been made upon it, to abrogate the treaty existing between Great Britain and one of her allies.

Mr. Robins.—This matter, to my mind, elevates itself vastly above any question of trade. The Mother Country, to which we are all, I hope, so proud to belong, has felt it to be in her best interests to enter into an alliance with Japan. I

believe that to be the most statesmanlike and far-reaching treaty which has been made by the Mother Country in one hundred years. If we are not prepared in Canada to subordinate our interests to some extent to the greater interests of the greater community, then I think it is a very serious condition of affairs. I think we may safely leave these things to the judgment and wisdom of the Mother Country, and we must be prepared, as all communities and as all business partnerships are, to yield our views to that of the majority. It seems to me quite sufficient that Great Britain has made this treaty with Japan. I think it ill becomes any Province of Canada to do anything which would disturb those relations. I also think it ill becomes any part of the Anglo-Saxon race, which has penetrated every part of the world, and which has claimed the right of the enjoyment of life and liberty in every part of the world—our nation has fought wars in defence of that principle—I say I think it ill becomes any section of the Anglo-Saxon race to refuse admission to any part of the British Empire to any well-behaved man, whatever the color of his skin. I therefore do not hesitate to stand by the resolution of this Association, or even go very much farther than this resolution. This idea of mobbing men when they come here to behave themselves and observe the laws of our country, is a disgrace to our civilization. I think, therefore, that this great representative body of the Canadian Manufacturers' Association should not be afraid to put itself on record and give the Government at Ottawa such support as a resolution from this Association would give to it; and also to manifest to the Mother Country that we are not going to put the little trade interest of our section of the Empire above the greater interests of the great Empire.

The question was called for.

The President put the motion, which was carried.

The Secretary read the following communication from the Montreal Branch, and stated that it was considered first by the Tariff Committee of the Association, referred by them to the Executive Council, and now comes from the Executive Council to this meeting:

The Woollen Industry.

"Whereas, it has been brought home to the members of the Canadian Manufacturers Association that some important branches of the woollen industry of the Dominion have languished during the past ten years, throwing many hundreds of workpeople out of employment, closing up many factories and causing serious loss of invested capital; and,

Whereas, the recently enacted tariff has failed to adequately provide for the protection and development of these industries,

Be it resolved, that it is the opinion of this Association, in Annual Meeting assembled, that the Government of Canada should take immediate steps to fully investigate the needs of these industries and to adopt such tariff measures as will again enable them to develop satisfactorily and to compete on a fair basis with the products of other countries where the scale of wages and the standard of living are far below that of our workpeople. And be it further resolved, that the Tariff Committee and the Executive Council be hereby instructed to co-operate in every possible way with the Woollen Section in properly presenting its case to the Government for attention.

The President.—I think that communication will have to be referred back again to the Tariff Committee to deal with. If that is your pleasure, we will refer it to the Tariff Committee.

Consent was given.

Invitation from Montreal.

Hon. Mr. Rolland.—Gentlemen, I would propose that our next Convention be held in Montreal, if it the pleasure of the Association. (Applause.)

Mr. Ballantyne.—I would like to supplement and confirm what our Vice-President has said about inviting the next Annual Convention to the City of Montreal. I sincerely trust the invitation will be accepted. The members of the Canadian Manufacturers' Association of Montreal will be most happy and pleased to have you come, and we will do all in our power to make your visit profitable; and the city generally, I can assure you, will be most happy to have you. As a member of the Montreal Harbor Board, I can promise you, if you come next year, to take you down the river on one of the steamers, and the ladies also. We would like to show you the harbor and the improvements that are going on. I only mention that as one of the many things we hope to have the pleasure of doing for you. I trust that when the time comes Montreal will be selected as the next meeting place. (Applause.)

Mr. Ewing.—I want to supplement the invitation of the Hon. Mr. Rolland and Mr. Ballantyne. It is the unanimous wish of the Montreal members that the next meeting of the Association should be held there. I don't know that we can give you as pleasant a time as we have had in Toronto, but we will do our best, and you will be entertained there to the best of our ability. I hope the meeting, before we close to-day, will decide to hold the next Convention there. Last year in Winnipeg it was referred back with a little uncertainty. We would not like to have any uncertainty. We want, if possible, to rival Toronto in the magnificent reception they have given us here this year. I know we have a big task before us. So I would ask the present meeting to decide without further delay to meet in Montreal next year.

The President.—I feel satisfied the Manufacturers' Association will enjoy themselves if they decide to go to Montreal. However, this is a matter that is generally left in the hands of the Executive Committee and Council of the Association. We have also an invitation from Vancouver by telegram. If it is your pleasure, we will pass it on to the Council to decide at as early a date as possible.

ELECTION OF OFFICERS.

The Secretary announced that the Hon. J. D. Rolland had been elected President for the ensuing year.

Mr. Cockshutt.—Gentlemen, I can assure you I can congratulate the Hon. Mr. Rolland on being elected to this office. It is an office which is a great honor, and I feel satisfied he will do credit to it. He is from Montreal, and he is the first French-Canadian that has ever been elected President of the Canadian Manufacturers' Association. (Applause.) I congratulate him most heartily; I hope that the year will be one of progress, and that everything will go well with this Association.

On behalf of myself, retiring from the presidency, I desire to thank you, the members of the Association who have been here; you have helped me by your friendly advice and by your presence; and I also desire again to thank all the members of the Association for the very kindly way in which they have treated me throughout the year. I appreciate it; it has helped me. If I have been of any service in the least to the Association, I consider that sufficient honor. I thank you, gentlemen.

Hon. Mr. Rolland.—Gentlemen, I can assure you that I appreciate this great honor which you have done me, and you have my sincere thanks. I have been connected with the Manufacturers' Association for years past. I remember when we formed our organization in Montreal in 1879 I had the honor of being one of the Vice-Presidents; I was President of the Quebec Association. Now being made President, I can but promise on my part to put forth my greatest efforts to extend the power and scope of the Association. I rely very much on the counsels of the Executive Committee, which you have named, to accomplish the work in connection with the

important questions which we have before us in the present year.

Mr. Cockshutt deserves a great deal of credit for the excellent manner in which he has conducted the affairs of our Association during his term of office. I have had occasion to follow him in the different work of the Association, and I assure you he has been devoted to the interests of our Association.

Again, gentlemen. I appreciate more heartily than I can express to you my election to this high office.

Retiring President Thanked.

Mr. Younge.—Mr. President and Gentlemen of the Convention.—I feel that the year's work would hardly be complete without the Convention expressing in a tangible manner the thanks which I am sure we all have in our hearts towards the retiring President. The work has been very ably conducted during the year, and Mr. Cockshutt has set the precedent of being the first President of the Association to visit officially all the Branches during his term of office, a visit which, from the broad standpoint of his position, must surely mean a great deal to the Executive Council of the Association in carrying on its work; so that in addition to expressing upon our records our earnest thanks to him, I would move that the Executive Council prepare some tangible token of our appreciation to be presented to him later on, on some fitting occasion. (Applause.)

Mr. Rowley.—Mr. President, let me congratulate you upon your appointment. Permit me to say in seconding Mr. Younge's motion, that I think it would be proper to have the token to be presented of such a character that his worthy wife may have full benefit, use and advantage of it; because I am sure we all feel that the President is not the whole thing. A good President should have a good wife. I suppose nearly all of us have the pleasure of Mrs. Cockshutt's acquaintance. I feel, at all events, and I hope I voice the feeling of everyone here, that whatever the testimonial should be, it should be one in which Mrs. Cockshutt should enjoy the full advantage.

The President put the motion, which, on a vote having been taken, was declared carried with applause.

The Secretary read the names of the various Vice-Presidents who had been elected, which was received with applause.

The Secretary announced that Mr. George Booth had been re-elected Treasurer.

Mr. Booth.—I want to express my thanks and appreciation of the honor. I am proud and pleased to serve you. Such service is made very easy on account of the pleasantness of the assistance that is given by all the office staff. (Applause.)

The Secretary read the election of the various provincial representatives.

The President.—Gentlemen, you have heard the report of the election of your officers. I have no doubt you agree with the choice that the Association has made. I trust that these gentlemen will work earnestly in the interests of the Association, and that each Committee which will be formed will have a splendid report to present at the end of its term of office.

The Secretary read the report of the Committee on Nominations for the various Standing Committees.

Mr. P. W. Ellis.—I wish to have a vote of thanks to our Secretary, Mr. G. M. Murray. Our Association has been very fortunate during its history in the Secretaries it has had engaged in its service. Not the least successful of these nor the least devoted to the interests of this Association has been our present Secretary, Mr. Murray. The organization has grown to large proportions, and with that growth has grown the responsibility of the office of Secretary. A great deal depends upon him. The manner in which this Convention has been carried out, the details of which have been so ably arranged and carried out, is something worthy of the warmest approval of this Association.

I wish to couple with Mr. Murray the able staff he has associated with him in the work of the Association, the Managers of the various departments and the Secretaries of the different branches,—I regret time will not permit me to name each in person, but I say this, that together they are devoted to your interests and form a very capable organization. I wish to thank them. I am quite sure I voice the feelings of everyone present, and of all our members, in expressing to Mr. Murray, our General Secretary, our approval of the manner in which he has conducted the affairs of this Association since his appointment.

Mr. Cockshutt.—I desire to second that motion. I feel that Mr. Murray has done very much for the Association; he has

MR. T. A.
RUSSELL

Characteristic Poses

shown himself to be systematic, and to be persevering; and I am sure he will carry out the policy formulated by the Association in the very best possible manner. I think he deserves all credit for the way in which this Convention has been conducted.

The motion was carried.

The President.—I have had occasion since I have been connected with the Association to see the work of Mr. Murray, and my experience is that an Association may have a very good President and set of officers, but the Secretary is the one who will have to do most of the work. Our Association has been very fortunate in its selection of Secretaries in the past,

and I trust Mr. Murray will receive the support which he well deserves.

Mr. Murray.—Mr. President and gentlemen, this very unexpected vote of thanks finds me quite unprepared with words to express to you adequately the feelings which I experience at this moment. I assure you I appreciate your vote of thanks more than I can very well say. My regard for truth, however, compels me to take exception to some of the remarks that have been made, lest you should go away with the idea that the duties of the Secretary are more important than they really are. While it is true we Secretaries have to work long hours sometimes, I realize all too clearly that it is, after all, to the directing influences of the members of our Committees that we are indebted for the work of our Association.

As I pointed out in my report to the Association, without that help and that assistance our progress would be very limited; and I feel that particularly in my own case, if it were not for that assistance I would deviate very frequently and widely from the straight and narrow path of business wisdom.

I am exceedingly glad, on behalf of the staff whom you have so kindly coupled with me in this resolution, to be able to thank you most cordially. I think that they have given you the best that was in them, and if their efforts are appreciated in the manner that this motion seems to indicate, I know that they will consider that ample reward. (Applause.)

Mr. McNaught.—I wish to make a suggestion in regard to the speech of Mr. Emery delivered this morning. One of the members stated to me that he would like to be able to distribute that speech amongst his employees. I would, therefore, suggest that the Secretary be requested to keep the type up and prepare it in pamphlet form and give the members an opportunity of purchasing as many copies as they like to distribute amongst the employees in their factories.

Mr. Phillips.—I second the suggestion. I will take 500 copies at any price.

The President.—During the delivering of this speech I thought it would be a good idea to have it translated into French, because I believe it would be of as much value to the French working people as to the English.

The President.—I will now ask you to name an auditor.

Mr. Tindall moved, seconded by Mr. P. W. Ellis, that the present auditor, Mr. Eddis, be re-elected. Mr. Tindall stated that he did not think the Association could get anyone who would be more competent and who would do the work more faithfully than Mr. Eddis had done.

This was carried.

The President.—Gentlemen, before leaving, I must thank our Toronto members for the grand reception they have given us. I have also appreciated the attendance here of a large number of members who have important business to attend to, but who have been attending these meetings regularly during the last three days. This meeting has proved of great interest to the members of our Association. I thank you again sincerely for your attendance, and now that we have finished with our work, it seems that there is something more for us in a social way. The Toronto people have provided us with a good number of social functions, and this afternoon we are to have the honor of being received by the Lieutenant-Governor. I am also glad to announce that Sir Wilfrid Laurier has arrived, and will grace our banquet this evening.

The Secretary made the announcements, after which the Convention adjourned at 1.30 p.m., with the singing of the National Anthem.

THE GOVERNMENT HOUSE PARTY.

On the afternoon of the last day the members were entertained right royally by the Lieutenant-Governor and Lady Mortimer Clark, in the beautiful grounds of Government House. The charming garden which surrounds the viceregal

mansion was thronged with guests, while a big marquee served as a reception-room. Of the many social features of the Convention, none was more pleasant than this. Sir Wilfrid Laurier and many other guests were present to meet the members and their ladies. A regimental band played an excellent programme during the afternoon. The members appreciated most heartily the kind courtesy of Sir Mortimer and Lady Clark.

A THEATRE PARTY TO SHEA'S.

While the men were regaling themselves at the banquet, the ladies were indulging in a second theatre party, this time at Shea's. The function was most successful. A large number of ladies attended and enjoyed a good vaudeville performance. After the performance lunch was served in the tea-room of the King Edward.

MR. READ'S REPLY TO ENQUIRERS.

Answer to Mr. Robins's request "for an explanation of Mr. Read's illustration of the 17 per cent.:

A yearly coal bill of \$4,200 is equal to 17 per cent. on \$25,000—the point being that if the manufacturer can get the rate of interest down to 6 per cent., he should try to do so; likewise if he can get his coal bill down to \$1,500 he should do so. The latter is quite possible. I use the hypothetical case of \$25,000 at 17 per cent. merely as an illustration.

As for Mr. Robins's point:—"If the plant is there to provide 100,000 horse power, and only 40 or 50 thousand horse power are sold, how can the company get along unless they have a return on the entire investment?"

To be sure—capital is entitled to a just return, and I do not deny it this right. My contention is, however, that Electric Light and Power Companies which expand themselves into public utilities undertake to charge the consumers *far more* than a just return upon their investment—as evidenced by the fact that a certain Light and Power Co. in the Dominion (I am informed) has seventeen millions of dollars of water in its capital stock.

Answering the point raised by Mr. Ellis:

"When we obtain electrical energy through a meter, do we then only pay for exactly what we use? As Mr. Read states is the case with gas and water."

1. The consumer is required (almost invariably) to agree to pay a minimum yearly amount, whether he uses the power or not. The Water and Gas Company does not exact this.

2. If the consumer insists upon buying electric current through a meter, paying only for what he actually uses, with no minimum or stand-by charges, he will find that the rate charged him is exorbitant. Take even a rate, under such conditions, of only two cents per Kilo-Watt hour. This is equivalent to \$60.00 per annum per K. W. or \$40.00 per annum per horse power.

And I again submit the proposition that since the consumer can make his own power in his own premises for \$25.00 (and that, too, on a 60 per cent. average load), why should he pay forty?

3. If the public power company is prepared to meet the cost at which the consumer can produce his own power, it must name him a flat price of not more than three-quarters of one cent per actual *Brake Horse Power Hour* delivered to the consumers' motors, and even then the consumer must stand from 10 to 20 per cent. loss in motor efficiency—to say nothing of the fact that in his contract with the public power company (like all other public utilities) he must absolve the Company from all consequential damages "due to causes beyond its control."

That is to say, it makes practically no difference what happens, if the power fails and the consumers plant is shut down, he will find redress beyond his reach.

The Convention Banquet

THE banquet hall of the King Edward was filled when the guests took their seats on the evening of the last day of the Convention. In the words of Sir Wilfrid Laurier, "the banquets of the Canadian Manufacturers' Association have become as much an institution as the Association itself." It was fitting that the great Convention which had just come to a close should be celebrated in the best banquet of the Association's history. It was. The menu was satisfying, the entertainment was of the best, and the speeches were of a high order of excellence.

The surroundings were conducive to pleasure. The banqueting-room, always beautiful, was made additionally attractive by a fine display of maple leaves and flags. Cut flowers decorated the tables in splendid profusion. An orchestra played a popular programme during the banquet. The souvenirs, the beautiful cover of the menu card, supplied by the Harris Lithographing Co., the ash tray presented by the Booth Copper Co., the rubber boot match-holder presented by the Putta Percha and Rubber Mfg. Co., the miniature baths of the Standard Ideal Co., the mats upon which the courses were served, presented by the Toronto Carpet Co., the ball-bearing paper-weights of the Chapman Double Ball Bearing Co., the memorandum books of the Rolland Paper Co., the medal of William R. Perrin & Co., the special cream bottle of the City Dairy, all met with hearty approbation, and were the source of much amusement.

But fine as were the menu and the entertainment, the outstanding excellence of the banquet was the speeches. Few who were present will ever forget the appropriateness of Sir Mortimer Clark's utterance, the lofty theme and the rhetorical finish of Mr. Geo. T. Blackstock's speech, the felicitous expressions and the sustained dignity of Sir Wilfrid Laurier, the keen, direct, business address of Major Stephens, and the vigorous and stirring speech of the Hon. J. P. Whitney. The President, in his inaugural address, set a high standard for the Association to keep up during its coming year of activity.

At the head table with the Chairman, Hon. J. D. Rolland, were Sir William Mortimer Clark, Lieutenant-Governor of Ontario; Sir Wilfrid Laurier, Prime Minister of Canada; Hon. J. P. Whitney, Prime Minister of Ontario; Mr. G. T. Blackstock, K.C.; Major G. W. Stephens, Mr. Geo. Booth, Mr. Graham Gow, Trade Commissioner for New Zealand; Mr. Harry Cockshutt, Mr. C. C. Ballantyne, Mr. Archibald Blue, Mr. R. C. Steele, President Toronto Board of Trade; Mr. R. Hobson, Mr. L. G. Read, Prof. B. E. Fernow, Major Macdonald, Hon. Sydney Fisher, Minister of Agriculture; Hon. Wm. Pater-son, Minister of Customs; Mr. D. Lorne McGibbon, Major T. Hethrington, Mr. A. E. Kemp, M.P.

The Chairman, Hon. J. D. Rolland, proposed the health of the King. The toast was honored with great enthusiasm. The guests rose and united in singing "God Save the King."

The President's Inaugural Address

Hon. J. D. Rolland.—Sir William Mortimer Clark, Right Hon. Sir Wilfrid Laurier, and Gentlemen,—It is difficult to tell you how deeply I appreciate the honor you have done me to-day by electing me President of the Canadian Manufacturers' Association for the coming year. It is indeed a great honor. The Canadian Manufacturers' Association is the largest and most influential business organization in our great Dominion, and to be selected as its head is the greatest compliment that I have ever received.

The Association has great reason to be proud of its past Presidents. Since its reorganization it has been most for-

tunate in its leaders. When I remind you that such captains of industry as J. F. Ellis, P. W. Ellis, Robt. Munro, Cyrus A. Birge, Geo. E. Drummond, W. K. George, C. C. Ballantyne, and your retiring President, have successively held this office, you will understand how keenly I feel the responsibility of conducting the affairs of your organization. I can only say that the Association will have all of my time that the work requires, and in so far as I am able, I will direct your business along the lines laid down by my predecessors.

It is not expected that I should attempt a speech this evening. As your officer, I will be more or less before you all year, and we should give up to-night to our guests. I would, however, like to emphasize the national importance of our organization. Last year at this time we had just concluded a most successful Convention in Winnipeg, and were travelling through the heart of the Great West to the cities of Vancouver and Victoria. It makes no difference where in Canada we may go, the Association is represented, and members are waiting to receive us. We have held big meetings on the Atlantic seaboard as well as in the West, and in London and Paris we have received magnificent receptions. This recognition at home and abroad has had an immense value—difficult to estimate, I admit, but largely responsible for giving confidence to capital and encouragement to brain and energy as exemplified by the enormous development on every hand. To express this in figures I need only say that the census returns of Canada for the years 1901 and 1906 show that the value of manufactured goods has increased from four hundred and eighty-one to seven hundred and twelve millions of dollars, or over sixty per cent.

This enormous gain is particularly gratifying, but from the Government returns of imports we find that dutiable goods show about the same percentage of increase. Even though our factories are expanding rapidly the foreign manufacturer is able to sell greatly increased quantities of his products at our very doors. This fact, taken with the satisfactory immigration returns, is evidence that the present development and expansion of our factories should be continued.

Providence having dowered our country with all necessary resources to the development and augmentation of our large industries, we must preserve to producers the advantages of our national market by keeping for our own workmen all the employment they might need, in order to encourage and advance the transformation of our richness into products.

A reasonable protection would afford them a great help, to fight the strong competition, they have to meet on our market from the European manufacturers, operating with cheap salaried employees.

The Maritime Provinces have their coal and minerals which enable them to produce with advantage.

In Quebec and Ontario, we have white horse power, the water powers which go on for ever. But what these older provinces require is the opening of railroads, in order to utilize those great water powers which are flowing in the north of Quebec and Ontario, and also the protection of our forests in order to conserve for the future the sources of our water powers.

We have, also, large manufactures, the products of which are even superior to those imported from old countries, as they carried off the highest award, "Le Grand Prix," at the last Universal Exhibition in Paris. The time has come for us to revive a campaign in behalf of the goods manufactured in Canada.

No longer have we, in order to secure the sale of a Canadian product, to disguise its origin. On the contrary, foreign manufacturers are beginning to place the Maple Leaf and the Beaver on their goods in order to sell them.

We have succeeded in obtaining from the Provincial Governments the abolition of taxes imposed on Canadian Commercial Travellers resident in other provinces, as they were a direct restriction to trade in the Dominion.

Those who have had the chance to assist at the different meetings during the three days of this Convention, can now form an idea of the various questions which have been discussed and studied, by reading the different reports which have been adopted, such as "*Transportation, Insurance, Parliamentary, Commercial Intelligence*, and various other reports.

As in the past, I am sure that your Executive Council will consider all questions submitted in a careful and broad-minded manner, and will view all problems of policy from a national Canadian standpoint.

We have a number of prominent guests with us whom we are all anxious to hear, and I will close by again offering my sincere thanks for the confidence you have reposed in me.

Mr. Cockshutt proposed three cheers for the President, which were given amidst applause. The entire company joined in singing "For He's a Jolly Good Fellow," to which the President replied, shortly, in the French language.

The President.—It is my pleasure now to introduce to you our guests of the evening. We are honored by the presence of the Lieutenant-Governor of the Province of Ontario, Sir William Mortimer Clark, who so graciously received us this afternoon. It is with pleasure, gentlemen, that I call on you to fill your glasses and drink to the health of the Lieutenant-Governor.

Three cheers were given for the Lieutenant-Governor.

Sir William Mortimer Clark

Sir William Mortimer Clark.—Mr. President, Sir Wilfrid Laurier, Gentlemen and Members of the Canadian Manufacturers' Association,—I beg to thank you most cordially for having extended to me an invitation to be present at this most interesting and distinguished gathering. I thank you for the very cordial way in which you have been kind enough to receive the toast which was so gracefully proposed by our chairman. It affords me very great pleasure indeed to have the opportunity of meeting so many gentlemen from all parts of our Dominion who are interested in the manufactures of our country, and who have brought their intelligence and ability to bear upon that which does so much to develop the material prosperity of this country. I have read with a great deal of interest many of the speeches which have been delivered at this Convention, and I congratulate you, gentlemen, most heartily upon the success which has attended your meeting. The dissemination of what you have said through the press all over our country cannot fail to excite an intelligent interest in those great questions which so profoundly affect the well-being of the community. I was very much pleased indeed to find that you made some departure—I believe it is a departure—from your ordinary proceedings, and that you had certain papers read to you. Particularly was I interested to find that a paper was read to you on the subject of technical education. (Applause.) You all know, gentlemen, what a large part of the success of German manufacturers has been the result of technical education of late in that country. You know that the result of technical education has been to give (in some branches at least of manufactures) a very great pre-eminence to the German manufacturer. In Great Britain, and I presume here also, we have suffered to a very great extent from the want of technical education among members of the mercantile and manufacturing community; and I am very pleased indeed to have heard that

your attention has been directed to that subject. When I was at the University this afternoon I could not help thinking of the vast influence which that great institution, the University of Toronto, must have upon the whole community; and I think that that influence will be more and more felt if the manufacturers of Canada will direct their attention more to the subject of technical education, and will seek to have their sons and those in whom they are interested properly instructed along that line; and I think it will contribute very largely to the increase of productiveness in the manufacturing industries of this country.

Agriculture Not Sufficient Without Manufacturers.

We owe, gentlemen, a very great deal in Canada to you; you have largely changed the whole complexion of our country. In the past we have been in the habit of regarding Canada as a purely agricultural country; we have been slow

SIR WILLIAM MORTIMER CLARK
Lieutenant-Governor of Ontario

to discover that agriculture alone will not build up a great country (applause); we have perhaps been slow also to realize that agriculture is not absolutely necessary to the building up of a great country. We have before us an object lesson in the Republic of Venice, a city which was built upon sand banks and on piles, and had no agricultural country round about it, and yet for a thousand years it attained vast pre-eminence in manufacture and trade. We all know how the navy of that small city reigned supreme in the Mediterranean, and even struck terror into the Turk himself at Constantinople. So agriculture is not absolutely necessary to build up a great nation. We know ourselves to a certain extent that agriculture is not the source of the prosperity of Great Britain. Manufactures are the source of the pre-eminence of our Empire.

But in addition to the gradual growth of our manufactures we have a magnificent agricultural country behind us to back us up and sustain us. We have through that great agricultural country a field for the consumption of our manufactures, which is growing day by day. But I repeat, we owe a great deal to you, because you have changed the complexion of our country. For many a long year I remember, speaking

particularly of the Province of Ontario, with which I was familiar, our daily papers towards harvest time, and perhaps long before that, were filled with accounts of the condition of the crops; we heard of the rust and flies and mildew and smut and all sorts of things, and we all seemed to feel that the whole country was going down hill most rapidly if these various unfortunate circumstances were too prevalent. We hear practically nothing of that now. We hear sometimes of frost in the North west, but we hear nothing of those things which formed the principal topic of our newspapers in those days. That is because our field of productiveness has been vastly increased and diversified since that time. That is due, gentlemen, largely to you.

A National Spirit Formed by Manufacturers.

You have done also a great deal to raise up a national spirit in this country. I remember that in the time of which I speak the farmers were somewhat apathetic; they seemed to think that there was no hope for them beyond the daily routine of farm labor. There was no field open for the industry and ability of the young men who were raised upon the farm; they had all to seek for support and for occupation in foreign countries, and oftentimes under the flag which was not altogether friendly to us. Now, gentlemen, thanks largely to what you have done, our young men and young women can all find employment in the manufacturing institutions throughout this country. They are not obliged to go abroad. And I think the time will come, and in fact I think it has now come, when we shall require the assistance of all our young people to build up this nation. (Applause.) The development of this new life which has manifested itself in the country has tended largely to increase that national spirit which, I am so glad to say, is now permeating our whole population. It was with the beginning of the institution of manufacturing industries in this country that that new life began to pulsate throughout the whole Dominion, and day by day that spirit is increasing. What the future's undiscovered land may show to us I know not, but in the meantime it is quite evident that throughout the whole length and breadth of this country we find the pulsation of a new life, which can only tend to ennoble the people themselves and bring esteem and regard for the name of Canada throughout the world.

Encouragement to Manufacturers.

Gentlemen, I congratulate you from the bottom of my heart on what you have done. It is entirely out of my province and it would be improper for me to refer to those great questions of tariff which necessarily agitate you and must materially concern you; but I have a very great deal of sympathy in all your desires to give prominence to the manufacturing industries of this country. (Applause.) How that may be brought about it is not for me to say. But still I feel that so many hundreds and thousands of men throughout this country, who are giving their ability, their time, their energy and their great attention to the manufacturing interests of the nation deserve to have their interests carefully considered by all those who have charge of our political destinies. (Applause.)

Our National Wealth Unlimited.

The wealth of this country, as you know, has enormously increased. It has increased in almost every way. It has increased in our mines, it has increased in our harvests and manufactures, and in every way. So much so that one would hardly recognize the Canada of to-day from the Canada of fifty years ago. And that progress seems to be going on day by day; there seems to be no limit to it; and the best feature of it is to find that our whole people are actuated by a spirit of hopefulness and optimism which it is impossible to resist.

It seems to affect us all at present. Yesterday I had the pleasure of meeting a number of representatives of the great British journals, who had come out here to examine our new mining industries. They came to see for themselves what these industries were; they did not wish to take it second hand from Canadian reports. They came here not at the invitation of anybody, but as representing the press of Great Britain, to see if it was safe for the British people to put their money into our mining industries. They have gone away unanimously of the opinion that the wealth of this country's mines is almost illimitable. They have seen with their eyes enough to convince them.

Gentlemen, it rests with ourselves to maintain the character of this country and this people; it rests with us to do what we can to lay before the British public honestly and faithfully what we want, what we need, and what will yield them a suitable and reasonable return. (Applause.) It is

GEORGE TATE BLACKSTOCK, K.C.

the fault of the Canadian people if there is a failure in that respect.

I congratulate you again, gentlemen, upon the success which has attended your meeting. I think it is of the very greatest consequence that you have assembled from all parts of our Dominion to consult together upon the great questions which affect your respective interests. You look into each other's faces, you see each other, you gather from each other the ideas and aspirations and hopes which you all entertain, and this meeting, and such meetings as these, will do a very great deal to promote the unity of Canadian Confederation and to let the people of Canada realize more fully that they are one people under the aegis of the Imperial Government. (Applause.)

The President.—Gentlemen, I shall now ask Mr. Arthur Blight for a song.

Mr. Blight responded by singing "Heave, Ho!" followed by the "Maple Leaf Forever," in which the members joined.

The President.—Gentlemen, I have now to call on Mr. George T. Blackstock to propose the toast of "Canada and the Empire."

Canada and the Empire.

Mr. Blackstock.—Mr. Chairman and Gentlemen, my first duty and pleasure in rising to address you to-night is to thank you for the very great privilege of being present at this magnificent gathering; and also, sir, to congratulate you upon the high office to which you have been preferred in this Association, and to express the hope that under your administration its influence may be extended and its usefulness increased.

Gentlemen, I have it in command to-night to propose for your acceptance the toast of "Canada and the Empire," associated with the name of the Right Hon. Sir Wilfrid Laurier. (Applause.) I am glad to observe that that latter intimation meets with your approval and satisfaction. (Applause.) So also it did with mine. In truth, in accepting the task of proposing this toast I contented myself principally with the circumstance that the right honorable gentleman was to respond. I assumed the responsibility with an unwonted gaiety of spirit and lightness of heart, bordering indeed upon recklessness, not only because the right honorable gentleman illustrates in his own person some of the most pleasing features and picturesque consequences of our Empire, but because I felt, however much you might quarrel with my performance, at least you would be unable to detect any flaw in his (laughter), and that perhaps the cloak of the right honorable gentleman's excellence might be sufficiently ample not only to envelope him, but also a rhetorical tatterdemalion as well. I believe, in European diplomacy, in dealing with the political storm centres of Europe and Asia, it is accounted sound policy to introduce a strong buffer between powers with fomented imaginations and bellicose tendencies. Well, I have imitated that to-night, and in case I should be so unfortunate as to encounter your disapprobation, I intend to interpose the dignity and authority of the Prime Minister between me and your resentment.

Mr. Chairman, I am at a loss to know why I, and indeed for the matter of that, why any of the other speakers here to-night are desired to address you. I have been reading some of the rhetorical disquisitions of this Association during the past few days, and I have discovered in them a wealth of imagery and exuberance of fancy which left nothing to be desired; and I felt that any performance of my own, or even of the others who are seated about this board at this end of the room, would be, after all, more or less in the character of carrying coals to Newcastle. But, sir, I cannot spend time upon blandishment to-night. Time has often spoken against me. To-night I speak against time. The Chairman holds in his hand, I will not say the hour-glass, but the half-hour-glass, that marks alike the limits of your toleration and your torture. And after all is said and done, my task ought to be pretty simple; because it is summed up in dropping a nickel in the slot and producing a Prime Minister. (Laughter.)

Well, Mr. Chairman and gentlemen, when one comes to contemplate the British Empire as an after-dinner proposition one is apt to be impressed with the fact that there is an embarrassing amount of geography about such a subject. That Empire I think, now covers about one-quarter of the inhabitable globe, and extends over about sixteen million square miles, if one can realize that. When you take a square mileage like that and try to squeeze it up into dimensions where it will keep company comfortably with a danseuse, a pony of yellow chartreuse and a— (Laughter.) Well, I see with what quick intelligence you take me. I like to address an audience that arrives before the sentence does.

But even in the thought of our territorial domain, sir, there is food for reflection. When Shakespeare cast his patriotic vision over the domain of his day, the curtain fell on the north at the Tweed, on the south at the Lizard, on

the East in the English Channel, and on the west in the Irish Channel, and so when he put a speech descriptive of that domain into the mouth of John of Gaunt, when he spoke of

"This royal throne of kings, this scepter'd isle,
This earth of majesty, this seat of Mars,
This other Eden, demi-paradise,
This fortress built by Nature for herself
Against infection and the hand of war,
This happy breed of men, this little world,
This precious stone set in the silver sea,
Which serves it in the office of a wall
Or as a moat defensive to a house,
Against the envy of less happier lands,
This blessed plot, this earth, this realm, this England,"

he meant England, and England alone. No Scotchman, no Irishman got inside the canvas. Indeed, Scotland was then practically a separate and independent kingdom, and Ireland—well, it was a foreign country, where occasionally the adventurous Englishmen went, in the words of the old Scot, to "raise a row and ruction, to tread on the tail of me coat," and perhaps also to raise—well, Donnybrook Fair, and come back with a broken head. Since that time there have been very great changes. We are apt to impute a venerable age and antiquity to the British Empire. So far as the islands composing Great Britain and Ireland are concerned that is an accurate description. So far as that thing which we call the Empire in contradistinction to those islands is concerned, that is not so.

The Creation of Three Centuries

In the time of which I have been speaking, between three and four hundred years ago, things were entirely different. Drake and Frobisher and Hawkins and Sydney had not made those vast voyages of discovery and conquest; Clive and Hastings and the East India Company had not laid the foundations of our Indian Empire. The American colonies had been founded. Canada belonged to France. The great dark continent lay wrapped in the mist of centuries, and the great Australasian continent under the Southern Cross, and New Zealand, were unknown, and the South Sea Islands were inhabited by savages. I think the earliest colony of the British Crown is the colony of Newfoundland, and that dates back, I think, only to about 1612, and was really not securely ceded to Great Britain until 1713, by the Treaty of Utrecht. So that we have to contemplate the fact that this thing that we call the British Empire is the creation of about three hundred years, and in that circumstance, as I have said, there is food for reflection. Why, Mr. Chairman, in that Empire within the last eighty years there have been most notable additions of names which now are household words—Natal and Figi, the Punjab, Upper and Lower Burmah, Nyassaland and Zululand—all these vast territories, not to speak of those that have lately been added to the Empire—all these and a dozen or two dozen more, have been added within the last eighty years; and it was these mighty achievements accomplished within a comparatively short time that unchained the imagination of Mr. Webster fifty years ago, when, standing in the American House of Congress, he described Great Britain as that power which had dotted the world with its vessels and whose morning drum-beat followed the sun, and, keeping company with the hours, encircled the whole globe with one continuous strain of the martial airs of England. (Applause.)

Well, sir, we are to discover in this circumstance that it is with nations as with individuals—the time does not come when they can rest. They must go forward or they must go backward. It was along this line and in this sense that a few years ago was made that sagacious observation of that great man, the late Marquis of Salisbury. Contemplating the nations of the earth, he observed that amongst them there

seemed to be great, powerful nations with intellectual powers of extension and organization; and surrounding these and interlaced with them were dying nations, inert and incapable of these qualities; and, as in the past these nations have, not through the lust of conquest, as is sometimes supposed, but out of the very necessities of their own existence as well as ours, passed under our domain, so we ought to be persuaded that in the time to come similar conjunctures will arise entailing upon us similar consequences.

The Empire a Joy.

Sir, that Empire is no barren sceptre; it is no idle thing. In every relationship of life it is a joy, it is an advantage. You cannot have nations any more than you can have individuals without sentiments and without emotions; and there is no human institution which is comparable for excitation of senses and for pleasurable emotions with that of the vast Empire to which we belong. (Applause.) In the first place, it is a joyous circumstance that we who live in a young and rising community which is bursting the chrysalis of its importance, as it were, that we still belong to a group of nations, the civilization of which and the history of which carry us back almost to the time when history fades into fiction and romance. Then again it is indeed an incomparable joy to know that the great victories by which this Empire was won and consolidated are those that we have a right to share in and to be proud of as well. In addition to that there are the great educational advantages which spring from this circumstance. I have often noticed that the Canadian, in contradistinction to the citizen of the United States, takes a broader and more cosmopolitan view of this world than his neighbor does; he is less insular; he is better informed about the trend and current of the world's thought than his neighbor to the south of the line. And why should it not be so? When you talk of movements in India, when you talk of what goes forward in Australia, when you talk of what is happening in Africa, he has in these things only an academic interest, whereas you have a real and vital interest because you are a component part of that Empire. (Applause.) So it has its educational advantage, strengthening and amplifying our intellectual structure and fibre.

Then again it is a joy to know that in the great brew of bloods and races in the caldron of time which goes to constitute this great British Empire, there is so much that is fascinating. We in this particular portion of the British Empire should be the last to forget—we who have amongst us still, thank God, a splendid contingent remaining of the grand civilization of France lending strength and power to the Empire (applause), and of which we are all proud to know that we have present to-night the chief exponent in the person of Sir Wilfrid Laurier (applause), though the right honorable gentleman has accomplished a great straddle and become a felicitous amalgam of the best qualities of both races.

I might, if time permitted, Mr. Chairman, go on to amplify these remarks that I have been addressing to you as to the sentimental advantages which are derivable from our connection with the Mother Country. I sometimes think when I see at our festive gatherings at Christmas time some of that small contingent whom we have sent abroad in the service of the Empire returning from foreign naval stations and from foreign military stations, and when again I contemplate the return of our own contingents from the fields in South Africa, that in these very circumstances there are added to our commercial and national life strength and lustre and dignity which well repay any sacrifice we could possibly make. (Applause.)

Not only is that so, but on the material side there are advantages. I shall not expatiate upon them to-night. No doubt the right honorable gentleman who will follow me will have something to say of much more interest than I possibly

could upon that subject; but unquestionably in the future one of the greatest advantages which is to be derived from the association of these nations with the Mother Country is that in that retort of arduous discussion which has been going on and is now going on, there will at last be found at the bottom the white precipitate of sound sense and reasonable policy by which the various component parts of this Empire will profit in their trade with one another.

Our Responsibilities as Part of the Empire.

Mr. Chairman and gentlemen, those are some of the advantages. But what about the corresponding duties that devolve upon us in respect of them? Here let me say that I think we are hardly living up to what could be reasonably expected of us; and I affirm, sir, here to-night, that there is no part of the British Empire which has derived so much benefit from the English Navy and the English Army as this very Dominion of Canada in which we exist. (Applause.) For one hundred years, living alongside of an ambitious rival, a rival in the past not too friendly, with frequent causes for dispute arising between us, I am not addressing a solitary man in this audience to-night who does not know that it would have been impossible for us ever to have maintained our independence; and that not once, but again and again in those hundred years our country would have been drenched with gore, but for the great influence and power of England that was behind it. We have enjoyed the blessings of unexampled peace and prosperity, and we owe those blessings to that navy and that army, to which we contribute at this day scarcely a farthing by way of support.

Someone says, Why don't we? Well, we have got into the habit in this country—it is one of the misfortunes of luxury—of trying to put the responsibility for untoward states of affairs on somebody else's shoulders instead of our own. It is in vain to look to Cabinets and statesmen to take the lead in respect of these things. It is not their business to do so. It is your business to create public opinion which will support them in taking that step when the time comes.

The Oriental Problem.

Even to-night we are face to face with a perplexing problem which touches ourselves and the Mother Country. It is too delicate for me to trespass upon to-night, and I shall make only this allusion to it, that I am sure all of us will tender to the Prime Minister our sincere sympathy in the serious and grave circumstances in which he finds himself, and that we will express the hope, without regard to the petty considerations of party, that some solution may be found for this difficulty consonant with the great interests, local and Imperial, that are involved. (Applause.)

But remember, even in this crisis we depend again upon that navy. What would our position be to-night if the Empire of Japan were dealing with us as an independent and autonomous nation instead of as a part of the British Empire? What would be our position if there hovered on our Pacific coast a Japanese Navy, menacing us in respect to this question with which we are now dealing? So we are once more under the protection of the British Navy, and I cannot help but repeat that it ill becomes us to eternally prate about the prosperity of our country and what we are accomplishing, to sound the horn and summon all mankind to view our prosperity, if at the same time we are not willing to assume some of the obligations, the responsibilities and burdens of Empire. (Applause.)

Should Contribute to the Navy.

I know, sir, the reasons by which we attempt to excuse ourselves in the forum of our own conscience. I know how we say that there must be no taxation without representation. I know how we say that our business is to develop our own

domain, and to leave the Empire to take care of itself. Well, I have seen some not very creditable members of human society sidestep the church and charity subscriptions upon reasons that are analagous to those. No, we owe this to the Empire, and it is our business to supplement this deficiency as soon as we can, or to stop talking about our patriotism. I am quite willing to concede that our principal concern is to develop this particular portion of the Empire which we occupy. I am quite willing to concede that that cannot be demanded of us which can be demanded of the people at home. But yet, making all allowances for these, there is a reasonable contribution to the burdens of the Empire which we ought to give, not with sullen and churlish indifference, but as a matter of privilege and of joy.

Organization of the Empire.

There is one other thing, and I have only time to mention it, for I fear I have already spoken longer than I ought to. The time has come when there falls to those who are in important positions in the British Empire the great task of organizing that Empire. The Prime Minister has lately returned from that interesting Colonial Conference just held in London this summer, and I have no doubt he would be able to tell you that it was a matter of great interest to find the Prime Ministers and others of the various dependencies and colonies of the Crown gathered together and exchanging views upon these important subjects. I am not now talking of organic changes in the structure of the Empire; these will come; but I am talking rather of the creation of that great sentiment of union and cohesion and mutual accomodation, mutual succor and mutual support. Those are prime considerations. The particular form that these will take will follow upon the creation of that sentiment. I claim that we in this Dominion of Canada ought to take the position of leadership in the organization of the Empire. Why not? In the first place, there is a great quality on this North American continent, whether among our neighbors to the south or amongst us here, who live on the northern part of the continent; there is a great, broad, breezy, generous way of looking at things that does not exist in the old world, and why should it? The conditions are not there to produce it. That of itself constitutes one of the reasons why we should be competent to take a leading part in that organization of this Empire which must inevitably take place.

In addition to that, the lines have fallen to us in pleasant places; we have enjoyed peace; we have had an immunity from many of the burdens and troubles which beset the career of other nations; and in addition to that, we have a people constituted by the law of natural selection for this work. They are descended from adventurous spirits, who came into this country to work out a career for themselves. By their clearness of vision and intellectual capacity they are well qualified to take part in affairs of the Empire. So that I claim we ought to have in the great organization of the future the leading part to play in that capacity. Depend upon it, this Empire will not always be administered in the haphazard, go-as-you-please manner in which it has been in the past. Organization is one of the great qualities in which our race is efficient, and to organization we must look for the production of what is best in the Empire.

A High Type of Civilization.

In addition to that, one of the most effective things we can do in the interest of the Empire is to produce in this country itself a high type of civilization. One hundred years ago Oliver Goldsmith wrote that line, "Honor sinks where commerce long prevails." It is true if you look across the line into the United States. Read, if you will, the utterances of public men; read the familiar correspondence of one hun-

dred years ago, and one of the things you will be struck with is the declination in public morality along with the increase of wealth.

Now then, we have on the northern half of this hemisphere the same conditions confronting us as they have over there. Sir, I wish to take no pessimistic view of our condition, but he is little less than a madman who doubts that in many important respects to-day the condition is far, far different from what it ought to be, and we ought to apply some of this organizing power, which His Honor the Lieutenant-Governor has so well said, exists among us and which has produced the tremendous results that have flowed from your organization—I say we ought to apply some of that organizing power to bettering the conditions of the life and the character of the civilization which we have in this country.

These are some of the duties which devolve upon us. I might spend time in amplifying them, but it is impossible at this late hour to do so. My plea to-night is for a finer enthusiasm, for a broader and more generous patriotism, for a loftier conception of Imperial duty and of the destination of the great Empire of which we form a part; the honored instrument under Providence in the uplifting of nations—that nation under the influence of which the bondman has been made free, freedom has advanced its bounds, justice has enlarged its area, the arts and sciences have flourished, religion has advanced, and all the blessings of peace and prosperity have been poured upon us. All this was not of our creation—no, it was bequeathed to us as a sacred trust and legacy by the sires who won it in many a field and flood and court, placing upon us the duty of transmitting it in our turn to our posterity, unimpaired in its strength, untarnished in its glory. And depend upon it, if we are unmindful of this great obligation, if with coward hearts we falter in our duty the rod of Empire will pass to other hands and stouter hearts, and hope, prosperity and greatness totter to their fall. (Applause.)

The President.—Gentlemen, we shall now have the pleasure of hearing the Right Hon. Sir Wilfrid Laurier, Premier of Canada. (Applause.)

Sir Wilfrid Laurier.

Sir Wilfrid Laurier.—Mr. President, Sir Mortimer Clark, Gentlemen,—It is now many years since it was my privilege to sit down at the board, the hospitable board, of the Canadian Manufacturers' Association. Years come and years go, but the annual banquet of the Canadian Manufacturers' Association enjoys the stability of a fixture; it is almost as permanent as the institution. It has been my privilege again and again to be invited, but it so happened that of late years circumstances each year have arisen which compelled me to abstain. This year, however, I made a vow that if the Canadian Manufacturers' Association again invited me to their board, rain or shine, business or leisure, engagement or no engagement, nothing would prevent me from tasting their food, trying their wine and enjoying their company. And if I may be permitted to speak my own mind I would say that there was for me this year a further inducement in the fact that the meeting of the manufacturers in this year 1907 was to take place and took place in the good City of Toronto. Gentlemen, I am an admirer of the City of Toronto; I am a lover of the City of Toronto. Perhaps there may be some amongst you who will be surprised at what I say, but, gentlemen, there is no cause for surprise. Someone perhaps may say that I might apply to myself the words of that Irishman who, being reminded that he should talk for posterity, answered, What has posterity done for me? and perhaps one might say that I should observe also, What has Toronto done for me? (Laughter.) But, gentlemen, my sentiment does not spring from such a source at all. It is a fact which you well know, which is universally acknowledged, that if a mother has a wayward son, it is that unruly boy who is the cause of her most constant devotion. And in this, gentlemen,

you have the reason and the cause of my affection for Toronto—Toronto which killeth the prophets, which stoneth them which are sent to her, and how often, heaven only knows how often, have I endeavored to gather her children, even as a hen gathers her chickens under her wings, but she would not. (Laughter.) Let me say, however, that, notwithstanding that obdurate resistance to grace, I am not blind to the good points and qualities of Toronto. No one, for instance, knows better than I do that she is the most hospitable of all cities, and a stranger who visits her, whether friend or foe, is always sure to find in the City of Toronto a generous and courteous welcome. Her quarters are excellent, her public buildings are spacious and lofty, her streets are well kept, her private mansions are artistic, her merchants are princes, her people are bright and patriotic—patriotic according to their lights, though I am sorry to say they are very far from the lights which I would enjoy and approve of—but I am not so unfair or unjust as to hold Toronto responsible for that. It is the cause of circumstance; it may be the mist of the lake; but I have a deep feeling in my heart that this fair city will some day be radiated by another light than the light which she has at the present time.

But banter aside, gentlemen, I feel proud in the bottom of my heart. I am prouder than ever, not only of the City of Toronto, but of every inch of Canadian soil. To every nation, as well as to every man, come some day the hour and the opportunity of success. The hour and the moment and the opportunity have come at last to the people of Canada. Canada is no longer obscured and eclipsed by her powerful neighbor. Canada has at last emerged in the full flood of her own light. The great American star is no longer the great attraction of the firmament. The Canadian orb is now high in the sky, and toward that orb is turned the gaze, the expectations, the hopes of all those in other lands who, not being satisfied with their own land, are seeking a field where they will find scope adequate to their ambition and their courage.

Sir, that toast which we have just honored, the toast of Canada and the Empire, has been proposed in very felicitous terms by my friend, Mr. Blackstock. I shall not say that I agree in everything that has been said by Mr. Blackstock, but this is a free country, and we are accustomed to speak our mind; and, Mr. Blackstock having spoken his own views, you will permit me also to speak mine. My conception of the British Empire is not Mr. Blackstock's conception of it. If I have understood Mr. Blackstock aright, his conception of the British Empire is rather the Roman conception of community of organization. My conception is the true British conception of individuality of communities. Canada is a part of the British Empire, the prize gem of the British Crown; and to-day Canada, as a part of the British Empire, boasting of its loyalty to the Crown, has attained the full rank of a nation, a nation without any revolution, a nation without any breaking of the old traditions, a nation without any impairment of that loyalty to the British Crown which is ever dear to every Canadian heart. This has been the result of the conference to which my friend Mr. Blackstock alluded a moment ago, where, in the presence of the Prime Minister of England and in the presence of all the Prime Ministers of the self-governing dependencies, it was asserted and affirmed without a dissenting voice that the relations between the United Kingdom and the Dominions Beyond the Seas were relations of government and governments; that whilst all acknowledged the same allegiance to the same sovereign, still all were on a footing of equality. (Applause.)

Such being the case, all communities which now make up the British Empire being on the footing of equality, the question at once arose, what were to be the relations on questions military, on questions commercial, on questions diplomatic? On questions military there were many who believed we should have unity of organization. For my part, I speak my

words as I spoke them in London; my belief is that upon this question and upon all questions the motto is "Imperial unity, but local autonomy." (Applause.) We claim we should have our own military organization. There is no doubt whatever that when England was in danger some few years ago at the time of the Transvaal war the Canadian people were ready to give of their treasure and blood for the help of the Motherland. But, in my mind, it is a very different thing for the Canadian people to go forward in the moment of need and for the Canadian people to join the military organization of England as a part of the community of Europe.

The Sword of Damocles.

What is the condition of Europe to-day? The condition of Europe to-day is a condition of armed peace, almost as intolerable as war itself. There is an old Greek legend, which Mr. Blackstock knows better than I, that a citizen of Syracuse

SIR WILFRID LAURIER

by the name of Damocles was invited to dinner by the despot of Syracuse at a certain time, and being seated at the table and looking above him, saw over his head a naked sword suspended by a single horse hair. Sir, this was a legend; it is the living reality of this day—it is the reality of the nations of Europe. Every one has above its head a naked sword suspended by a hair, by a very slender thread, which may be broken at any moment. The thought of every nation in Europe is of war. The chief part of the revenue of Europe is consecrated to war. But we live on a continent where we never think of war. (Applause.) We live on a continent where we have no standing armies; we are satisfied either on one side of the line or the other to depend for our defence upon a citizen militia. In time of need the blood and the treasure of every Canadian would be at the command of the King, but in time of peace I claim we should follow our own instincts, should follow our own conditions, and not be drawn into the vortex of European militarism.

Imperial Commercial Relations.

This was the condition so far as our military relations are concerned. What about our commercial relations? I approach the subject with some diffidence, speaking as I do before an

assembly of commercial men, of manufacturers. Some ten years ago we adopted the policy of preference to Great Britain, and after an experience of ten years I do not believe that there will be anybody in this audience to find fault with it. It has carried with it its own success. It has not, perhaps, accomplished everything that might have been expected from it, but I have yet to know that any human institution is perfect; I have yet to know that any device of man can carry with it everything that is expected of it. But, on the whole, I claim that it has been reasonably satisfactory and reasonably successful. At all events, though that policy has been jeered at and sometimes laughed at, it has never yet been successfully assailed and never openly challenged. If I had my own point of view, if I had my own way in this matter, I am free to say I would have a different organization in the British Empire. I would have universal free trade in the British Empire. But against it there are three chief objections—Canada does not want it, Australia does not want it, Great Britain does not want it; and if nobody will have it, we need not trouble ourselves about it. Great Britain will not have it for the reason that Great Britain will not limit her free trade, even to the boundaries of the British Empire. Canada will not have it because Canada will not establish free trade, even within the extent of the British Empire.

Can we not have reciprocity of trade within the British Empire? This is a thing for which we are ready in this country, and this is the thing for which they are not ready in the Motherland. I have to tell you as Canadians, for my part, whilst we do not want to be dictated to in our domestic and fiscal policy by the people of Great Britain, so we will not attempt to dictate to the people of Great Britain. (Applause.) Let us have freedom of opinion, and let us resolve, whatever may be the difficulties of the condition, at least to maintain the policy which has been successful for the last ten years.

British Diplomacy and Canadian Rights.

Then, sir, there was another question, our diplomatic relations. How are these to be regulated? Up to the present time the diplomatic relations of Canada and the Empire, in so far as all events as Canada was concerned, have been very much on the lines that my friend Mr. Blackstock would have our military relations—that is to say, carried on by the Motherland. But we have learned by long experience that our diplomatic relations, so long as they are carried on by British diplomats, are not perhaps as successful as we think they ought to be. We have long harbored the opinion in this country that our diplomatic relations would be better carried on if they were in our own hands, in so far as questions affecting us are concerned. Not that we have not the highest regard for the diplomacy of Great Britain; on the contrary, we have the greatest respect for it, because the diplomacy of Great Britain is, as is every other branch in the service of Great Britain, in the hands of competent, able men. But experience has taught us that not only in affairs of state, but in private affairs also, less able men will do better where they are more personally interested in the business than abler men who perform their duties perfunctorily. (We take the record of the diplomacy of Great Britain in so far as Canada is concerned, and we find it is a repetition of sacrifices of Canadian interests. (Applause.) We have suffered on the Atlantic, we have suffered on the Pacific, we have suffered on the Lakes, we have suffered wherever there has been a question to be discussed between British diplomats and foreign diplomats. Well, then, we have come at last to the conclusion that upon this point also, in our relations with foreign countries, we would do better by attending to the business ourselves rather than having it trusted to the best men that can be found in Great Britain.)

The Treaty-making Power.

It has been long the desire of the Canadian people, if I mistake not, that we should be entrusted with the negotiation of our own treaties, especially in matters which affect trade. This long-looked-for reform has at last come to be a living reality, (Applause) and as I told you a moment ago, without revolution, without any breaking of the old traditions, without any impairment of our allegiance. The time has come when Canadian interests are entrusted to Canadians. Just within the last week a treaty has been concluded with France which affects Canada alone and which has been negotiated by Canadians alone. True it has been done with the full assent of the British Crown, the full assent of the Foreign Office, who have interposed no objection at all, but on the contrary have told us "it is a matter which chiefly concerns you, therefore take the management in your own hands and have the treaty which you want to have." The treaty has been completed. It is not for me to say what it has been or what it is, but I think I can say it will be found reasonably satisfactory for the producers and for the farmers of Canada, and for the manufacturers of Canada also. (Applause)

The Japanese Question.

Sir, we have also another treaty which was negotiated with the full assent and at the request of the Government of Canada, and with the assent of the people of Canada. I mean the treaty with Japan. When we came into office some twelve years ago, we found a treaty had been negotiated between Great Britain and Japan, a treaty of peace and commerce. It was referred to us in that treaty to be or not to be a party to it. We didn't choose at the moment to become a party to it, and why? Because there were difficulties raised at that time in one important section of the community, on the Pacific slope, as far as labor was concerned. But in the year 1905 and 1906, after the war of Japan with Russia, and the conquest of Corea by Japan, we saw that then the time had come when we might become a party to that treaty; especially as Japan had just passed a law to restrict its immigration to foreign countries. The Americans were our competitors in the Japanese markets, as they are in many other markets. They had the benefit of a treaty which gave them an advantage, a particular advantage in the markets of Japan. Our business men, the manufacturers, the producers of Canada, thought that they should be placed upon a footing of equality with their American competitors and therefore we concluded the treaty. We did it especially because at that moment Japan herself had undertaken to restrict the immigration from Japan to foreign shores, and especially to Canadian shores. Now, since that treaty has been in operation it has been of some advantage to our manufacturers and to our producers. Our trade with Japan has been increasing; it has increased every day. The farmers and manufacturers have got the advantage of it. But some difficulty has arisen on the shores of British Columbia because there has been a greater influx than before of Japanese immigrants. What are we going to do under such circumstances? A certain section of our fellow-countrymen assembled in the City of Winnipeg have called upon the Canadian Government at once to annul that treaty. That treaty has been in operation only for two years. We are just commencing to reap the benefit of it. To denounce it would be simply to act in panic, and for my part, I am not for it (applause); for my part I am not disposed, whether on this occasion or any other occasion, to act in a panic. I want to look about, to think, to reflect, to enquire, before I made up my mind; and it behooves the Canadian Government under such circumstances, seeing the difficulties which have arisen, seeing the condition of things which have not been contemplated, to enquire, to think, to reflect and to see what is the best course to be followed in the interests of the Canadian

people. But to annul the treaty at once, without enquiry, without investigation, would not be, in my humble judgment, playing the part of responsible men. (Applause.) It is the duty, it must be the duty of the Canadian Government under such circumstances to reflect, to enquire, to look about, if need be, to send a commission to have more information and to form their conclusion upon conditions which they know, and upon which they are able to form a deliberate judgment.

The All-Red Line.

Sir, there is all the less inclination on the part of the Canadian Government at present to denounce the treaty, because we are much in hope of having established what has been called the "all-red line." The "all-red line" is a new project, which was launched at the last conference, to have a line of communication from England to the Orient, not only to Japan and China, but to Australia also, over territory of Canada. And why? Because nature has made the Canadian route the shorter route between Europe and the Orient. It is true we are laboring under great difficulties; we have to compete with formidable neighbors; but though the difficulties are great they are not such as to deter us from the goal. (Applause.) I have full belief on my part that this project when it is accomplished, and accomplished it must be and will be (applause), will prove of the greatest possible advantage to Canada at large, to Ontario and to Quebec, but still more to the Maritime Provinces, and to the Province by the sea, British Columbia. I said we must succeed in that. Canada cannot do it alone. We must have the assistance of the Motherland. In this again I say, as I said a moment ago, we do not want to dictate to the people of Great Britain; we do not want to arrogate to ourselves the power to say, "You must do this." But, sir, when I reflect that at this moment the greatest ship, the Lusitania, has been built with British money, when I reflect that the Cunard Line have received a heavy subsidy to build a line of steamers between Liverpool and New York—while I say without hesitation that I do not begrudge and never shall begrudge what has been done or may be done in the future by our Motherland to cultivate better relations with our neighbors—no, I have no such sentiments; the better and the friendlier the relations may be with Great Britain and the United States the better pleased I will be; I want to have nothing but the most friendly relations with our neighbors—I cannot but say to myself: If the British people, if the British Parliament, if the British Government have taken out of the treasury of Great Britain in order to build a line of steamers between Great Britain and a foreign country, can I not expect that the British people, the British Parliament and the British Government will do as much for a line of steamers between British territory and British territory? (Applause.) Again I repeat, we have no intention to dictate to the people of Great Britain; but we may ask them that they shall do at least as much for those of their own kith and kin as they have done for those who at one time were their own kith and kin, but who have severed their allegiance. (Applause.)

Commerce Cements Friendship.

What we ask is a policy which will bind together the British Empire far more than the army will ever do, far more than the navy will ever do, a policy of building up trade and commerce. I noticed that my friend Mr. Blackstock a moment ago quoted these words of Oliver Goldsmith: "Honor sinks where commerce long prevails." I do not harbor that sentiment; I do not believe, for my part, that honor sinks where commerce long prevails. I rather believe that honor will rise where commerce prevails. For, after all, what is there to bind people more potent than the influence of commerce? Let two men trade together and they will be friends; let two nations trade together and they will be friends. Let the policy

of peace and commerce prevail, and we shall have peace in the world as we never saw it before. It is because this policy, this principle has been forgotten in the past that we have had wars. But the moment that commerce will arise among the nations, peace and honor will also rise with it.

With regard to the "all-red line," I do not know that it will meet with immediate success; it is surrounded with difficulties; but difficulties have no terror for me, at all events. (Applause.) I have been accustomed to deal with difficulties all my life; and indeed a man is no good until he has had difficulties to overcome. Difficulties we shall have; difficulties we have had; but difficulties we shall overcome. This project shall and will succeed. (Prolonged applause.)

The Legislature.

The President.—Gentlemen, I have now the pleasure of proposing the toast of our "Provincial Legislature." We expect a great deal from the Federal Government, and by past experience we know that sometimes we meet very many obstructions from the Provincial Governments. Those that we have had in the past have lately all been done away with, and I hope that in future the interests of the manufacturers shall continue to be protected. We shall now have the privilege of listening to the Premier of Ontario. I shall call upon the Hon. Mr. Whitney to respond to the toast of "Our Provincial Legislatures."

Mr. Whitney was greeted with applause and the singing of "For He's a Jolly Good Fellow."

Hon. J. P. Whitney.

Hon. J. P. Whitney.—Mr. Chairman, Your Honor, Sir Wilfrid Laurier and Gentlemen of the Canadian Manufacturers' Association,—Unfortunately, I am not so lucky as Mr. Blackstock; I have no buffer between me and the subject of my toast. But, sir, I do not need any buffer; the Ontario Legislature speaks for itself. The people of Ontario spoke, and the Ontario Legislature as it now exists was called into existence. It speaks by its acts. Far be it from me to-night, under the circumstances in which I find myself placed here with you and the distinguished company that you have gathered round about us, to dilate at all upon the manifest virtues of the Ontario Legislature. That would require a volume. A meeting would have to be devoted to that subject alone. I think you will quite understand me when I make the remark that I myself, at any rate, am quite well satisfied with the Ontario Legislature.

Now then, what else shall I say? I ask you gentlemen here present whether a man would not be brave indeed to the point of desperation, nay, to the point of utter and complete recklessness, if he were to attempt to-night to deal with the great questions which have been dealt with in the manner which you have heard by the lofty and stimulating eloquence of my distinguished friend here, whose name and fame is a household word in this Province, or by the clear and decisive utterances and very interesting statements that have been made by our good friend, the Leader of the Government of Canada, Sir Wilfrid Laurier. But, while I would not attempt to deal even at the length of a moment with either of those two great questions, still, as representing the Ontario Legislature, and to that extent unworthily for the time being representing the people of the Province of Ontario, the British people of this section of the Empire at large, let me offer one or two suggestions, in a quiet, unobtrusive way, I hope, with reference to and just touching upon the fringe of the great question of the future of the British Empire. I am not here to deal in detail with it at all. I don't think that there is very much difference, when the whole matter shall be analyzed, between the positions taken by my two distinguished friends to-night. I think there is very little difference, indeed. But I believe this, and no person is responsible for

what I say except myself—I believe firmly this, that the time is now within view, in face of the fact that events of the greatest seriousness and if importance are following each other all over this world with extreme rapidity and at short intervals—events carrying with them consequences of greatest importance to the people in the different portions of the world who are concerned with the outcome of these events—when some step—I do not say what step—will require to be taken in order to decide what shall be the future of the British Empire. Now, I will say to Sir Wilfrid Laurier that when that time comes it will be the duty of the different groups composing the British Empire to sit down together and take counsel as to what the future of the Empire should be, and as to what steps should be taken in order to secure the continuity, permanence and advancement of that greatest good to the human race, namely, the British Empire. (Applause.) I have every possible confidence in the future, and I agree

HON. J. P. WHITNEY

entirely with Sir Wilfrid when he says that any discussion or consideration of that great question, or any question growing out of it or allied to it, must be from the point of view that each group and each Dominion of the British Empire shall speak with an equal voice.

Now, I have thus feebly endeavored to express my view, perhaps out of place, because it does not refer to the toast to which I was allotted, but it is a difficult thing for me when I find myself in my public capacity on my feet at any gathering of intelligent men like this, to refrain from saying what I think on these questions, and that for two or three reasons: First, because I believe it is right that every man should express what he really feels and believes; secondly, because I believe that from discussion and from friction and clashing of opposing and differing ideas the best results come for the people at large; and thirdly, because I feel, in common with every man within the sound of my voice and with every adult citizen of the Dominion of Canada, a great, undying interest in the welfare and continuity and permanence of what I have called already that greatest of human secular influences for good that has ever existed in this world of ours, namely, the British Empire.

Now, Mr. Chairman, I have done. I might perhaps impose

further upon your patience and talk politics. I have already talked politics, but it is that higher politics which deserves well of all people who have the best interests of the community in view. With regard to the other politics, I just want to say one word. Some gentleman told me to-day that there was an objection raised to anybody in your Association discussing the question of tariff. I am not going to discuss it at all for reasons that are obvious, but I do not quite understand, and I am sure I may be pardoned for asking if it is possible for a company of manufacturing gentlemen to get together and discuss intelligently their business matters without speaking the word "tariff"?

Voices.—No, no.

I think it is quite impossible. There is an added reason. As I understand it, the people of Canada are united on the question of tariff, and therefore it seems to me it would be indeed bringing coals to Newcastle to discuss the question of tariff.

I have done. I ask your pardon for having detained you at this length under the circumstances in which I find myself here to-night. I am sure you agree with me in felicitating ourselves and each other upon the great opportunity which has been ours to-night to hear these two distinguished gentlemen and to hear the words of wisdom which have fallen from each. As far as I am concerned, I am bound to say that the day will be long away in the future when I shall have forgotten what I have heard to-night from both of these gentlemen, who are a credit to and should be the pride of our common Canada. (Applause.)

Sir Wilfrid Laurier knows, and I know enough of him to be convinced that he understands and appreciates thoroughly, the fact that aside from all conditions of party warfare, which are necessary under our system, he will find nowhere in the Dominion of Canada, nowhere in the Dominions of His Majesty the King, a more respectful welcome, more ardent feelings of friendship and cordial desire to meet him than he will find anywhere in the Province of Ontario. (Applause.)

I shall conclude by offering my fervent belief that when the time comes that the fruition of all our desires with regard to the making permanent and continuous the existence of the British Empire shall have taken place it will have been, found in that great work that a large amount of the progress toward it was made in Canada. (Applause.)

The President.—Hon. Mr. Rutherford, Premier of Alberta, was also to have spoken on this toast. I sincerely regret that he was unable to be with us to-night.

Mr. Blight sang in a manner that won enthusiastic applause.

Transportation.

After the song the President said: Gentlemen, I have now a toast to propose which interests the manufacturers very much, and that is "Transportation." Transportation is a question of first importance to manufacturers. Cheap transportation is our great object. During the past year the manufacturers have studied the question of cheaper transportation and better transportation. We have now the privilege and pleasure of having with us to-night Major Stephens, the Chairman of the Board of Harbor Commissioners of Montreal. I will ask you to fill your glasses and drink to the health of Major Stephens.

Three cheers were given for Major Stephens.

Major G. W. Stephens.

Major G. W. Stephens.—Mr. President, Sir Wilfrid Laurier, Ladies and Gentlemen,—It would be indeed an ambitious task to hold the attention of this distinguished company after its ears had been ravished by the eloquence of the orators that have preceded me. But, sir, as I look out into the faces of

this illustrious audience, as I look into the faces of the men who are upbuilding the industrial supremacy of this Dominion. I see beneath the armor of a stern, alert, keen business exterior the kindness of heart which encourages me to hope that I may be permitted at this late hour to ask your attention briefly to the serious contemplation of the subject of transportation.

Transportation has been defined as the key with which the wise statesman opened the doors of industrial prosperity. There can be, therefore, no subject which can engage the attention of the Canadian people equal in importance to that which has for its object the increasing of the carrying powers that will bring to tidewater the products of our western plains and in return carry the products of our eastern factories to the homes of the western consumer.

How, then, does this great Dominion of ours stand at the beginning of the twentieth century? How does she propose to encourage a share of international trade to which we are entitled? And how is she laying the foundations to-day for the future that looms high on the horizon before her? Let me for a moment draw your attention to the position in which our great neighbor to the south of us found herself at the opening of the nineteenth century, which the world has accorded to her as her own, and the twentieth century, which to-day the world is according to Canada. In the year 1807, so far as statistical information is obtainable, the population of our great neighbor to the south consisted of five million three hundred thousand people, grouped together in a fringe along the shores of the Atlantic Ocean. Behind these people to the westward stretched out an undiscovered waste of plain and mountain; not one single mile of railway; not one single mile of canal; no roads but the Indian trails; no wealth but the indomitable courage, faith and perseverance of the people who then found themselves in the United States; and upon that faith and upon that courage and upon that perseverance has been built up south of line 49 in one hundred years a nation numbering ninety millions of people, extending from ocean to ocean, owning 217,000 miles of railway in operation, and a country that has commanded the attention of the whole world during that time.

Canada in the Twentieth Century.

When we return to look at things a little nearer home we find that the twentieth century opens upon this Canada of ours with a Canadian people numbering six millions, not grouped or huddled together on the shores of the Atlantic Ocean, but stretched across this great continent of ours in a prosperous series of provinces filled with enthusiastic people, and 26,000 miles of railway in operation. Our great continent spanned by the steel ribbons of three transcontinental roads; a canal system, built by the money of the Canadian people, that has no rival on this continent or any other; our transportation facilities on land and water supplementing the natural position which we are heirs to; these give us, or ought to give us, the hope that the day is not far distant when Canada will command through her natural strategic position, a large share of the international trade that is bound to pass between the Mother Country and the Orient. And, sir, for every ton of freight that is carried over Canadian rails and over the linked waterways of our country the cost will be reduced. The through freight will reduce the cost on every ton of our domestic interchange of business.

Now, sir, we have not had, it seems to me, enough ginger in our appreciation of what we possess in our own country: and at the opening of this century, with the growth and the hopes that are before us, it should mean to every Canadian that he should put his shoulder to the wheel and be serious about working out a nation on the northern half of this continent that in a hundred years will show the United States that the men north of the line of 49 have fibre and brawn in their

build that will be worthy of a great neighbor. If in one hundred years the United States has been able to build up a nation with ninety millions of people and starting, as I described a moment ago, under very much greater difficulties than we start to-day, the hopes of the Canadian people ought to be high that in the century that is unfolding itself we too in Canada will be able to give to the world a wondrous development.

Now, I have no right to talk to the Manufacturers' Association on the subject of transportation, because you, gentlemen, in every day's business that you transact are studying and working out the problems of this transportation question. But, sir, during the last few months an honor has been placed in the hands jointly of three Canadians, under an Act of Parliament, to develop your national water highway at the port of Montreal, not on local principles, but in the interests of the whole people of Canada. Associated with me in this honorable work is a man whom this Association has given its highest tribute to, Mr. C. C. Ballantyne (applause), who has studied with you for many years the principles of cheap transportation. He is associated with Mr. L. E. Geoffrion, a prominent merchant of Montreal, and myself to try to solve

MAJOR G. W. STEPHENS

for the benefit of everybody the problem of cheaper transportation. We have only had opportunities during the last few months of looking this question in the face, but I am free to state to you that there is going on in the port of Montreal at the present moment a development to take care of the export and import trade of this country which is costing four millions and a half of dollars, and which, when completed, will give to the shippers of Canada fourteen ocean berths, and at those berths will be found fourteen double-decked, steel and concrete sheds, with a storage capacity of a million and a half square feet, and a working capacity per week of 150,000 tons of freight.

Now, just bear in mind for a moment that there are four millions and a half of dollars being spent to obtain this result, and it is interesting for you and everybody in this country to know whether you are getting four millions and a half worth for your money. Looking around for a comparison, only fifteen days ago the chief engineer of the Commission and myself were in New York. By courtesy of the New York Harbor Commission, we were shown over the docks of the harbor of New York, and we find that New York at the present

moment, in the year 1907, is spending twenty-nine millions of dollars to get an equivalent development to take care of her ocean trade, and she spends those twenty-nine million dollars and gets 120,000 square feet less of space than we are getting in Montreal for four millions and a half. (Applause.)

Apart from that we are putting these terminal sheds into direct communication with the rails that cross this continent and the rails that go into Chicago and St. Louis. It is now possible, after a few months' work in the harbor of Montreal, to have a trainload of dressed beef leave the abattoirs of Chicago and come right alongside of the ship in the harbor of Montreal, where the cargo of the train is transferred from the cold storage cars direct into the cold storage of the ships. What does that mean? Between the first day of May and the first day of August, three months in the operation of this harbor, there were handled one million tons of freight over the wharves of Montreal; and of this amount one hundred and fifty thousand tons were handled direct from car to shed at a cost of one-quarter what it used to cost before the tracks and the sheds were brought into connection. The consequence is this, that 150,000 tons of through freight coming from all parts of Canada and some parts of the United States and going to all parts of the world are being handled to-day at a quarter of the cost it took just a year ago to handle the same number of tons. If you look at the tremendous volume of trade that is being done by the Dominion, the railways are handling fifty million tons of freight in a year and twenty-five million passengers, and if you think that two cents a ton reduction in the handling charges on that volume of freight means a saving of a million dollars, you will see how interesting becomes the problem the Commission is trying to work out in the interests of Canadian shippers. (Hear, hear.)

Now, this is not said in a boasting spirit; it is said along the lines of a policy which was laid down when we took over the duties of that office, and that was that we three gentlemen would cast aside politics or any consideration of that kind and put the best business instincts we possessed into solving the problem of terminals on business lines for the benefit of the business people of this country. (Applause.)

Canada's Natural Advantages

Let me say one word more. Although we are working in the port of Montreal, Montreal is not the only port in Canada. Toronto may some day be an ocean port; judging from the oceans of Port I see on this table, it won't be long before we see the ships and cargoes alongside of Bay or Yonge Streets.

Now, sir, let me ask your attention just for one moment to what Canadians have got. We have got the shortest trade route between the North American Continent, Europe and Asia; that will some day mean a business connection not only with the inhabitants of the British Isles, but it will mean a business connection with millions and millions of people in the Orient. That is one reason why the Federal Government, I believe, has devoted so much attention to the St. Lawrence route. You have got a ship canal coming up to the end of tidewater at Montreal that has no rival in the world. One comparison will show you. The Suez Canal is 99 miles long, 139 feet wide, and has a draught of 26 feet, and through that canal go 20,000,000 tons of cargo every year. The ship canal that is being built, in its present capacity in the St. Lawrence, is 300 feet wide through its entire distance, and between 450 feet and 750 feet at curves, and the draught of water is 30 feet 6 inches from Montreal to the sea. That gives a supreme advantage in water-borne freight coming this way. When you realize that with the eighteen knot ships of the C. P. R. now carrying freight and passengers between Canada and Great Britain the mails of those ships are landed in Chicago before the mails are landed by the great ships that go to New York, you will appreciate the great advantage we enjoy in transportation between this continent and Europe.

Just one other thing. I believe that reforms in the trans-

portation problem must come in the development of the terminals of the railways and the ocean ports of this country. It may be a surprise to you to know that the daily work of a freight car in this country does not exceed 29 miles in 24 hours—it averages between 29 and 33 miles. Think what that means. It is almost a staggering fact to think that the thousands and thousands of freight cars in the service of our railroads in this country only do an average amount of work of between 29 and 33 miles in a day. Why is that? The reason of it is this, that we have been putting huge amounts of money into the rails that cross the continent; we have been putting money into great engines to carry heavy trains, and we have forgotten that these trains going at a great speed must be landed somewhere and must be taken care of when they land; and the consequence is that all the railway companies on this continent are face to face with terminal problems that up to the present they have not been able to solve. One train is held over because the trains ahead of it have not been taken out of the way, and that is the reason why transportation is blocked to such a degree as it is at present; and the problems we business men must try to help the railways solve is to increase the terminal capacity so that trains landing there can be moved out of the way to let others come in.

There is one great effect that our building of railways has. As we silently stretch these steel ribbons across our continent there is being brought nearer together all the uttermost parts of our country; and as the power passes over the wire that leads from Niagara to the far-off places of commerce, so there is a power of brotherhood and sympathy being built up by the pioneers of transportation in this country against which the roar of hostile cannon cannot avail. (Applause.)

The President.—Gentlemen, before I ask you to sing "God Save the King, I must, on behalf of the Canadian Manufacturers' Association, thank our guests for having accepted our invitation and having given us such interesting speeches as we have heard to-night. We thank you very sincerely, gentlemen, for having come from the different parts of this country to assist in our banquet at our thirty-sixth Convention. We have received such hospitality in Toronto that we regret to leave it. To-morrow we have an invitation to go to Hamilton and Niagara Falls. No doubt all of our people will accept this invitation.

Gentlemen, in bringing this banquet to a close I would ask you to join in singing "God Save the King."

Sir Wilfrid Laurier.—Gentlemen, one word before you part. I am sure it would be improper, after singing "God Save the King," to disperse without drinking the health of the new President, the Hon. Mr. Rolland.

The toast was received with applause.

The banquet closed at 12.15 a.m.

AN INDUSTRIAL POLICY.

THE following paragraph, taken from the Report of the Mosely Commission to the United States on Technical Education gives a fair idea of the importance of technical education on the industrial life and development of a country as it appeared to this body of trained economists and educationalists:

"Our visit has produced a strong impression that the future industries and commerce of America are being directly and profoundly affected by the schools of to-day. The great industrial and commercial firms are abandoning the traditional methods of waiting for apprentices."

Technical education is one of the great conditions of national industrial progress. Why are the best positions in our factories filled by foreigners? Why is Canadian labor feeling this and why is it correspondingly restless? Because technical education, as a part of our industrial policy, has been neglected.

THE EXCURSION TO HAMILTON AND NIAGARA FALLS.

On Friday all care was thrown to the winds. Business was forgotten, and nearly four hundred excursionists set out on a special Grand Trunk train for Hamilton and Niagara Falls. The members of the Association in Hamilton, with the ladies who assisted them, can never be sufficiently thanked for the unbounded hospitality they extended on that day. So complete were the arrangements of the Committees that not a minute was lost of the three hours the party was in the city.

On reaching the station, carriages were in waiting to take the ladies for a drive around the city. Cars and carriages were provided for the men, in which the various groups were taken to the manufacturing plants which they wished to visit. Hamilton was keeping open house for the day. Every factory was thrown open for inspection. And the extent and variety of the manufacturing plants was a revelation. Everyone was impressed with the immense progress the city had made.

After an hour and a half thus spent, the excursionists assembled in the new home of the Commercial Club. Here again courtesy and hospitality were shown in a large measure. Lunch was served to the guests both in the dining-room and in the reception-room. The members of the Ladies' Committee were everywhere in evidence, looking after the comfort of the visitors. It was with regret that the party departed and hastened for the train which was waiting to carry them to Niagara Falls. Before leaving, Hon. J. D. Rolland, on behalf of the Association, thanked the people of Hamilton for their kindness. His words were echoed in the feelings of everyone present.

The committees which carried the event through with such excellent success consisted of Mr. Robt. Hobson, chairman; Mr. C. R. McCullough, secretary; Mr. W. R. Dunn, treasurer, and Messrs. H. P. Coburn, J. A. Publow, Geo. Sweet, R. A. Robertson, F. W. Whitton, H. H. Champ, Col. J. R. Moodie, S. O. Greening, Paul J. Myler, W. C. Breckinridge, F. F. Dalley, A. L. Johnson, J. W. Lamoreaux, Jno. Lennox and A. M. Cunningham.

At 2.30 Niagara Falls was reached. While there the party enjoyed the hospitality of the Niagara Falls Board of Trade. The latter body had cars waiting, and took the excursionists up past the Falls to the power plants. These were visited in turn. It was a rare opportunity for the members to see these wonderful engineering triumphs. Even to the most sophisticated the sight of the turbines by which was generated the electricity that was running the street cars in Toronto was the subject of wonderment. Members of the Board of Trade

accompanied the different groups, and by their explanations added much to the enjoyment and profit of the trip.

At 6.30 the Board of Trade entertained the excursionists at dinner in the Refectory. The strenuous sight-seeing of the

Commercial Club Hamilton

afternoon made this entertainment particularly welcome. Through the courtesy of the Park Commissioners, the Falls were illuminated an hour earlier than usual. The effect was much admired.

At 9 o'clock the special pulled out, and its arrival in Toronto shortly after eleven marked the final close of the Convention. It did not mark the close of the members' memory of it, or of their appreciation of the countless kindnesses that were shown them.

Hardening an ordinary drill in sulphuric acid makes an edge that will cut tempered steel or facilitate cutting hard rock, says *Compressed Air*. The acid should be poured into a flat-bottomed vessel to a depth of about $\frac{1}{8}$ in. The point of the drill is heated to a dull cherry red, and dipped into the acid to that depth. This makes the point extremely hard, while the rest remains soft, and hence tough. If the point breaks, it may be rehardened with a little less acid in the vessel.

Hamilton from the Mountain

STANDING COMMITTEES

TARIFF.

Chairman—P. W. Ellis, P. W. Ellis & Co., Ltd., Toronto.
Vice-Chairman—H. Cockshutt, Cockshutt Plow Co., Ltd., Brantford.
 Geo. E. Drummond, Canada Iron Furnace Co., Montreal.
 Edward Gurney, The Gurney Foundry Co., Limited, Toronto.
 W. K. McNaught, The American Watchcase Co., of Toronto, Ltd., Toronto.
 R. Munro, The Canada Paint Co., Ltd., Montreal.
 Geo. W. Watts, Canada Foundry Co., Ltd., Toronto.
 Lt.-Col. W. M. Gartshore, The McClary Mfg. Co., London.
 Ralph Loveland, Loveland & Stone, Cutler.
 C. C. Ballantyne, The Sherwin Williams Co., Montreal.
 Chas. S. Meek, Stewart, Howe & Meek Co., Ltd., Toronto.

"INDUSTRIAL CANADA."

Chairman—C. R. McCullough, Ontario Engraving Co., Hamilton.
Vice-Chairman—S. R. Hart, Hart & Riddell, Toronto.
 Geo. Bridgen, Toronto Engraving Co., Limited, Toronto.
 J. M. Sinclair, Eureka Mineral Wool and Asbestos Co., Toronto.
 John Firstbrook, The Firstbrook Box Co., Limited, Toronto.
 R. J. Younge, The Canadian Rubber Co. of Montreal, Ltd., Montreal.
 H. T. Reason, H. T. Reason & Co., London.
 H. G. Nicholls, Canadian General Electric Co., Ltd., Toronto.

RAILWAY AND TRANSPORTATION.

Chairman—W. R. Dunn, International Harvester Co., of Canada, Ltd., Hamilton.
 J. O. Donagh, Imperial Lumber Co., Ltd., Toronto.
 Geo. Gillies, Toronto Bolt and Forging Co., Ltd., Toronto.
 T. L. Moffat, The Moffat Stove Co., Ltd., Weston.
 J. R. Marlow, Canada Cycle & Motor Co., Ltd., Toronto Junction.
 W. B. Champ, The Hamilton Bridge Works Co., Ltd., Hamilton.
 E. G. Henderson, Canadian Salt Co., Ltd., Windsor.
 R. J. Whyte, The Frost & Wood Co., Ltd., Smith's Falls.
 R. K. McIntosh, P. McIntosh & Son, Toronto.
 Jno. F. Ellis, The Barber & Ellis Co., Ltd., Toronto.
 Wm. Cauldwell, Canada Paper Co., Ltd., Montreal.
 Wm. McMaster, The Montreal Rolling Mills Co., Montreal.

PARLIAMENTARY.

Chairman—John Turnbull, The Nasmith Co., Ltd., Toronto.
Vice-Chairman—R. S. Gourlay, Gourlay, Winter & Leeming, Toronto.
 Lt.-Col. J. H. Burland, The Canada Engraving & Litho. Co., Montreal.
 Atwell Fleming, Atwell Fleming Printing Co., Toronto.
 W. K. McNaught, The American Watchcase Co., of Toronto, Ltd., Toronto.
 Louis Simpson, Montreal Cotton Co., Valleyfield, Que.
 Geo. E. Amyot, Dominion Corset Mfg. Co., Quebec.
 A. S. Rogers, The Queen City Oil Co., Ltd., Toronto.
 H. Cockshutt, Cockshutt Plow Co., Ltd., Brantford.
 Geo. Anderson, The Crown Tailoring Co., Ltd., Toronto.

J. O. Thorn, The Metallic Roofing Co. of Canada, Ltd., Toronto.
 Geo. W. Walker, The Hart Corundum Wheel Co., Ltd., Hamilton.

COMMERCIAL INTELLIGENCE.

Chairman—J. H. Housser, Massey-Harris Co., Ltd., Toronto.
Vice-Chairman—J. P. Watson, E. & S. Currie, Ltd., Toronto.
 F. Bull, The Williams Piano Co., Ltd., Oshawa.
 W. L. Edmonds, The MacLean Publishing Co., Ltd., Toronto.
 J. P. Murray, Toronto Carpet Mfg. Co., Ltd., Toronto.

Steel Direct From Iron Ore.

In a dingy laboratory in the yard of a steel-working company at Los Angeles, Cal., lies a 380-pound ingot of pure steel. It is the most remarkable piece of steel in the world, for it never saw coke or coal; never went through a Bessemer converter or open-hearth process; in fact, its production quite upset all the established methods of making the most used metal of the present century. Behind the ingot is the mysterious furnace in which it was made, and the story of the making of the ingot reads like a romance—a romance of iron and oil and lime and firebrick.

All his life long John Potter has been connected with steel in some one of its many forms. Finally, when he came to Los Angeles, fresh from an eastern blast furnace, he had so clear an idea of the new method that he succeeded in impressing its worth on three or four men, who furnished the money for making the experiments which have now proved successful.

In the centre of Potter's furnace, when he is ready to make a "run" of steel, he piles the crude iron ore, and a mixture of lime and asphaltum. The proportions of this mixture are the whole secret, and it is guarded well, for no man but John Potter, he who discovered it, knows the formula, and he is not telling it, not even to the men who are backing him in the great game for millions.

When this composite mass is all piled up, a jet of crude oil is turned on and lighted. With a terrific heat—up to 3,200 degrees and further if possible—the whole is fluxed, and the resultant steel flows down into a lake in the bottom of the furnace, then to be drawn off into puddles outside the brick wall.

DEATH OF MR. WIGGIN.

It is with regret that INDUSTRIAL CANADA chronicles the death of Mr. William H. Wiggin, Superintendent of the International Harvester Co. of Canada. Mr. Wiggin, while at the head of the big plant with which he was connected, made for himself a fine position among the manufacturers of Can-

The Late Mr. W. H. Wiggin

ada. He was a man of exceptional executive ability—one capable of handling a large proposition in a big way. In his death Hamilton has suffered a distinct loss.

It was always Mr. Wiggin's pride that he rose to his late position from the ranks. He went through a severe apprenticeship in a machine shop and learned his business as he advanced. It was that early experience which gave him his strength in dealing with men. No man in his employ lacked a word of encouragement when such was needed. Nowhere is his loss more sincerely felt than among the staff he had gathered around him.

DEATH OF MR. A. H. CAMPBELL.

The regrettable announcement is made of the death of Mr. A. H. Campbell, Vice-President of the firm of A. C. Leslie & Co., Montreal. Mr. Campbell is widely known among the manufacturers of Canada through his connection with the firm of Frothingham & Workman, and since 1896 as a partner in the firm of A. C. Leslie & Co. He was also Vice-President of the Ryall Screw and Specialty Co.

Mr. Campbell attended the annual meeting of the Association last year at Winnipeg, and made the trip to the coast. The many friends he had on that excursion will be especially grieved to hear of his death. He was a business man of high character, determination and ability.

Wants Position as Superintendent.

"Superintendent—Mechanical Engineer with extensive English and Canadian experience, well up in modern machine shop practice, at present in good position, desires change as Superintendent or Manager—can take full charge and get results. Box 12."

OUR NEW ZEALAND LETTER.

WELLINGTON, September 1st, 1907.

As foreshadowed in my last letter, the new Tariff proposals which were laid on the table of the House by the Government are greatly in favor of Canadian Manufacturers. The list of articles affected by the preferential clause in favor of Great Britain and her Dominions has been greatly increased, particularly in lines which are made by, and have been largely imported from, the United States. This naturally benefits Canada more than any other part of the Empire. Will manufacturers now avail themselves of their opportunity, or are they going, as has been done before, to raise their prices so much that practically the whole of the preference goes into their pockets? If they do, they will enable the foreign manufacturer to compete in this market notwithstanding the preference, and the only result will be, that for the good-will shown, the New Zealander will be penalized by having to pay so much more for his purchases than the preference amounts to, plus profits of the importer.

Should this happen, it stands to reason that the importation of such articles will diminish, or that they will still be drawn from foreign countries as before.

Ultimately when the people find out that by giving a preference to their kinsman, they only induce higher prices the Government will be forced to rescind the preference.

Already the attention of the Government has been drawn to the fact that some of the lines on which preference has been given in the past have proportionally risen in price and that imports of these lines from foreign countries have not perceptibly diminished. Manufacturers who want to cater to this market are earnestly warned not to be led by selfishness, which ultimately must kill the goose which lays the golden eggs.

I enclose a copy of the whole of the new Tariff proposals. It is expected that with the exception of a few lines the proposals will be adopted by the House.

The only item which so far seems to have roused public opposition is the duty on footwear of all kinds. The cheaper grades of boots and slippers are very hard hit, and the importation, if the Tariff is carried, will be practically prohibited. As rubber goloshes have been included, this point is of great interest to Canadian rubber manufacturers, who at present practically hold this market.

As a reason for the imposition of the very heavy duty on the cheaper grades of footwear, Mr. Millar, the Minister of Customs, explained that he wanted to discourage the importation of shoddy made footwear, and wished these goods replaced by the dearer, but more honestly made, colonial article. A shock and a surprise are coming to Mr. Millar when he reads the following paragraph in the local papers, under the heading of "Shoddy Footwear":

A further object lesson in regard to the shoddy nature of the material that enters into the composition of boots and shoes has been afforded to-day in the form of a small exhibit which a number of importers have arranged in one of the committee rooms for the edification of members of Parliament. One object of the exhibition is to show that the proposed tariff changes would press heavily on the poorer section of the community, and would allow the wealthier class to escape further taxation in regard to their footwear. There is a further object, viz., that of showing that the "shoddy," of which so much has been heard of late, enters into that composition of boots and shoes of New Zealand manufacture as well as of those imported.

There are five exhibits of a cheap class of boots said to be the product of New Zealand industry, and to have been purchased in Wellington. These boots, resplendent in all the polish of a faultless finish, have been clashed the full depth

of the sole from heel to toe, and their constituents are thus laid bare. Beneath the thin covering of leather, layers of brown paper, cardboard, and other shoddy materials are disclosed to the vulgar gaze.

A booklet, issued in connection with the exhibition, says: "And yet the trades and labor men and operatives are always howling about the shoddy imported goods, which, after all, are but an infinitesimal proportion of boots and shoes imported into New Zealand, and the worst of them will compare more than favorably with any of the local lot."

Another collection of similar articles has been got together by a Southern member, and will also, no doubt, provide food for discussion when the tariff proposals come before Parliament.

A deputation representing manufacturers, importers and distributors of footwear waited on the Minister on Monday last. The result was that the Minister promised to look into the whole matter again and, as he mentioned specially felt slippers and goloshes, it is presumed that these two lines in any case will be brought back under the old tariff.

It has been stated that a powerful combine of Southern manufacturers and tanners has had a lot to do with the framing of the new duties, and that their ultimate object was to prevent outside competition and then to buy up all the boot manufacturers in the Dominion and to create for themselves a monopoly in leather and footwear. Mr. Millar would be the first man to knock such a combine on the head, therefore, I do not think there is much truth in the rumor, though considering the almost prohibitive proposals color is lent to the assertion.

My attention has been drawn to the fact that Canadian through Bills of Lading very seldom disclose the name of the steamer by which shipment is made. This leads to no end of trouble at this end, and customers get tired of paying drafts against a document which gives them no clue as to where the goods are and when they may expect them; they simply refuse to pay or accept such drafts. Such refusals, justified as they are, are very unpleasant for the shipper, and very often lead to a loss of interest, as the banks are not prepared to hold such drafts over for an indefinite term.

Sometimes it happens that such goods have arrived some time ago, but as consignee does not know where to look for them, heavy storage charges are incurred which customer declines to pay.

Shippers must insist on having the name of the steamer by which the goods travel inserted in the Bill of Lading. It is not sufficient to state by C. P. R. or by "Tyser" line. The name of the ship must be clearly stated.

COSMOPOLITAN.

Manufacturing Opportunity.

Excelsior.—An enquiry has been received at the office from a gentleman contemplating engaging in the manufacture of Excelsior in the Ottawa Valley for an experienced man who could take charge of a small plant of this nature and assist in organizing work. A practical man who has some capital preferred. There is a good field for successful operation where it is proposed to locate, and this is a splendid chance for an honest, reliable man.

Manufacturers' Agency in Toronto.

Manufacturers' agency wanted for good selling lines. We are prepared to buy or sell, on commission. Can give window space and store room on Yonge St. Good references. Apply Box 14, INDUSTRIAL CANADA.

Trade Enquiries

NOTE.—For further information regarding any inquiry mentioned under this heading or the names of inquiries, apply by numbers to the Secretary, at Toronto.

- 105 Acetate of Lime.—Havre, France. merchant can place large orders for acetate of lime, and is desirous of receiving quotations and samples from Canadian exporters.
- 106 Agency for Manufacturing Lines.—A Belgian firm is open to take up agencies for various staple lines for any manufacturing firms desiring to extend their export business. A representative of the firm will be in Canada shortly to interview those intending to do business with them.
- 107 Agent.—Established agent and importer in Hull, having extensive trade connections, invites correspondence from Canadian manufacturers of any marketable commodity (preferably a specialty), with a view to acting as agent on the northeast coast of England.
- 108 Agency for Canadian Exporters.—Wholesale merchant at Zwolle, Holland, offering good references, is prepared to undertake the agency for Canadian exporters seeking a market in the Netherlands.
- 109 Agents.—A Hull firm is desirous of acting as agents for the sale of any marketable commodity of Canadian manufacture, and invites correspondence from firms interested.
- 110 Apricultural Implements.—A South African merchant desires to be placed in touch with Canadian manufacturers of agricultural implements.
- 111 Ash Logs and Squares.—A Manchester firm will welcome prices and descriptions of ash logs and squares from Canadian sawmill owners.
- 112 Asbestos Agate, Scrap Tin, Rubber, Wool, etc., Furs.—A large firm of general import and export agents, long established in Hamburg, Germany, desires c.i.f. quotations for large quantities of the above materials at various European ports. Excellent references. Payment, cash against documents.
- 113 Bag Split Leather.—A Lancashire firm asks for samples and prices of bag split leather from Canadian manufacturers.
- 114 Bag Split Leather.—A London firm will be glad to receive samples and prices of bag split leather from Canadian manufacturers.
- 115 Barbed Wire.—A firm of wholesale general merchants desire to be put into communication with Canadian manufacturers of barbed wire and other fencing material, also all kinds of plain wire in coils.
- 116 Blood Albumen.—A Manchester firm asks for prices of blood albumen from Canadian shippers.
- 117 Boxwood.—An important enquiry is made by a Hull firm for Canadian exporters of boxwood, who can send them large shipments of random sizes, either to Manchester or Liverpool. Lowest prices to be stated.
- 118 Boots and Shoes, Shirts, Underwear, Neckties, Hardware, Furniture, Paints and Varnishes, Flour and Leather.—Young Englishman just starting a general store in St. Kitts, B.W.I., is in the market to purchase the above goods of Canadian manufacture, is highly recommended by well-known Toronto citizen, under whom he has been educated. A growing business is in sight here.

- 119 **Bones and Bonemeal, Bran, Oil Seed Cake, Animal Hair, Honey and Wax, Fresh and Evaporated Fruits.**—A large firm of general import and export agents, long established in Hamburg, Germany, desires c.i.f. quotations for large quantities of the above materials at various European ports. Excellent references. Payment, cash against documents.
- 120 **Buyer and Shipping Agent.**—A London firm is desirous of hearing from Canadian houses requiring a buyer and shipping agent to look after export and import business in Great Britain, and is prepared to act for any parties specially interested in the automobile industry.
- 121 **Canadian Bacon.**—A Manchester firm wishes to correspond with shippers of Canadian bacon.
- 122 **Carriage Bolts.**—A Manchester firm asks for samples and c.i.f. prices of carriage bolts from Canadian manufacturers.
- 123 **Carriages.**—A South African merchant would like to communicate with a Canadian firm manufacturing light carriages, traps and buggies.
- 124 **Calcium Carbide.**—A Birmingham firm wishes to purchase calcium carbide.
- 125 **Canadian Spruce Boards.**—A timber merchant in Smyrna reports a demand for Canadian spruce board (3" by 10" or 12" to 20 feet in length best dimensions), and wishes to correspond with Canadian shippers.
- 126 **Caviare.**—The representative of a large importing firm in Germany interested in the sturgeon caviare trade, makes enquiry respecting the production of caviare in Canada, and specially in the province of British Columbia, with a view to obtaining supplies.
- 127 **Cellulose.**—An Italian firm desires the addresses of Canadian manufacturers of cellulose.
- 128 **Clothes-pins.**—A Manchester firm asks for prices of clothes-pins from Canadian manufacturers.
- 129 **Coffee Mills.**—London, England, agency is anxious to hear from Canadian manufacturers of coffee mills, which can compete with mills of American manufacture for the English trade.
- 130 **Dried Fruits.**—A German firm asks to be placed in communication with Canadian exporters of dried fruits (chopped apples, etc.).
- 131 **Dried Apples.**—London, England, house desires to get in touch with Canadian exporters of dried apples. References.
- 132 **Evaporated Apples.**—Rotterdam, Holland, firm can place large orders for evaporated apples of Canadian origin, and would like to hear from exporters who can fill orders promptly in quantity. References.
- 133 **Evaporated Apples.**—A Manchester firm with large connections, asks for prices of evaporated apple rings and whole apples cored, from Canadian producers.
- 134 **Excelsior.**—Numerous enquiries have been received from British consumers for excelsior. There is splendid business offering for Canadian exporters who can take on this trade. Quotations to be c.i.f. London for long ton (2240 lbs.). Usual price £6 per ton.
- 135 **Flooring.**—A South African firm of timber merchants, builders and contractors desire quotations for birch and maple tongued and grooved flooring, giving the different widths and thickness.
- 136 **Flooring.**—A South African firm of wholesale timber merchants desire to communicate with Canadian manufacturers of tongued and grooved flooring manufactured from birch, maple or pitch pine, f.o.b. St. John or Montreal.
- 137 **Furniture.**—A South African merchant desires to be placed in touch with Canadian manufacturers of furniture.
- 138 **Flour.**—A Hull firm is open to handle shipments of flour on a commission basis from Canadian firms desirous of developing a market in the northeast of England.
- 139 **Graphite and other Minerals.**—Enquiry is made by a Lancashire firm for the names of parties in Canada having graphite properties and other minerals of a similar class for disposal in Great Britain.
- 140 **Grain Cleaner.**—A South African merchant desires to get into communication with a Canadian manufacturer of seed and grain cleaners.
- 141 **Hides, Timber, Wood Pulp, etc.**—An Austrian firm desires to get into communication with Canadian exporters of the following articles: Hides, skins, seeds, oil, timber, wood pulp, pitch pine, drugs, dyes, tobacco.
- 142 **Hockey Blades.**—A Manchester firm requests prices of ash turned for hockey blades, from Canadian exporters.
- 143 **Knitting and Spinning Machines.**—An enquiry has been received from Cape Colony, South Africa, for machines of this nature to equip a knitting weaving and spinning school. Quotations are asked on two machines to start with, c.i.f. London. Correspondent also enquires for wool from Canadian exporters for South Africa. References.
- 144 **Lawn Mowers, Clothes Wringers, Ice Cream Freezers, Hay and Manure Forks, Hoes, Rakes of all kinds, Wooden Handles of every description, Wash Boards, Clothes-pins, Wooden Tubs and Pails, Washing Machines.**—A large, old-established firm of wholesale hardware merchants in Antwerp, Belgium, are in the market to purchase large quantities from time to time of the above articles from Canadian exporters. This is one of the most prominent firms in Belgium, and their enquiry means business. Wish to purchase c.i.f., Antwerp. Payment on receipt of goods.
- 145 **Leather.**—Well-known Leeds firm of leather importers is open to hear from Canadian exporters of upper and sole leather, with prices, etc.
- 146 **Lumber.**—A large South African firm of wholesale timber merchants desire quotations for fifty standards of spruce lumber, ranging from 2 feet to 9 feet and from 2 inches to 3 inches in thickness.
- 147 **Manufacturers' Representative and Foreign Buyer.**—Englishman with wide experience and good connections, formerly of the Indian Civil Service, is anxious to hear from Canadian manufacturers who desire a British representative or buyer. First-class references.
- 148 **Manufacturers' Agent.**—Old-established firm of manufacturers' representatives in London, England, with branches and wide connections in every part of the British Empire, would be willing to take on a few first-class Canadian firms who desire representation in any part of the world, particularly South Africa. First-class references.
- 149 **Manufacturers' Agent.**—Prominent North of England firm of manufacturers' agents desire to hear from Canadian firms who want representatives in Great Britain. Have excellent show-room facilities and a large staff of travellers, who call on the best English trade; will sell on commission or do business direct.
- 150 **Metal Laths.**—A Manchester firm asks for c.i.f. prices of metal laths from Canadian manufacturers.
- 151 **Metal Laths.**—A Liverpool firm asks for prices of metal laths from Canadian manufacturers.
- 152 **Morocco Leather.**—A Manchester firm asks for samples and prices of morocco leather from Canadian manufacturers.
- 153 **Maple and Birch Dowels.**—A London firm wishes to purchase maple and birch dowels, 36-inch to 42-inch, 7-16-inch to 12-13-inch.

- 154 **Manufacturers.**—A London firm of manufacturers and buying agents having an established connection in the Far East and in South Africa, is desirous of getting into communication with Canadian manufacturers, with the object of increasing their business with the Dominion.
- 155 **Neutral Mineral Oil.**—A Manchester firm asks for c.i.f. prices of sawn laths, 1 1-8 in. by 3-16 in., in lengths of 3 ft., 3 ft. 6 in., 4 ft., and 4 ft. 6 in., from Canadian manufacturers.
- 156 **Oak Staves.**—Well-known Leeds firm invites prices from actual manufacturers of oak staves suitable for the making of churns, pails, etc., and prices to be quoted for direct shipments.
- 157 **Oak Logs and Squares.**—A Manchester firm invites correspondence from Canadian exporters of oak logs and squares.
- 158 **Paper and Pulp-board Mills.**—A London firm, with branches in Glasgow, Manchester and Dublin, wishes to hear from Canadian paper and pulp-board mills wishing to dispose of their production in the United Kingdom. Wrapping-papers a specialty.
- 159 **Picture Frame Mouldings.**—A Manchester firm wishes to obtain samples and prices of picture frame and other mouldings from Canadian manufacturers.
- 160 **Plaster.**—New York forwarding house enquires for Canadian exporters of plaster who can ship to South Africa. Good business in sight.
- 161 **Producer Gas Plants.**—An enquiry has been received from Newfoundland for producer gas power plants of Canadian manufacture.
- 162 **Quilla Bark and Sassafras Chips.**—A Lancashire firm of essence distillers asks for samples and prices of quilla bark and sassafras chips from Canadian shippers.
- 163 **Representative.**—A London firm is anxious to get into communication with Canadian manufacturers desirous of introducing their goods to the English market.
- 164 **Roll-top Desks.**—A Manchester firm asks for prices and description of roll-top desks from Canadian manufacturers.

A Requisition Order System

The Current Binder of the Requisition Order System

ceived there. The duplicate copy of the original order, which shows the quantity ordered and the prices, is also compared with the invoice, and remains a splendidly convenient reference in case of a second order. All orders, whether given to a visiting salesman or sent by mail, are of uniform size, either 11 x 9 or 6½ x 9½. The copy retained in the office of the purchasing agent (we are particularly writing of the Triplicate System) is to be filed alphabetically, and the receiving clerk's copy numerically, on binders furnished with the C.-C. System. A Transfer binder is used also in the purchasing agent's office in which to file filled orders. Thus there is always a perpetual separation of filled from unfilled orders, and a direct reference to any particular one, no matter how many orders purchasee is executing at one time. Besides making you absolutely independent of invoices, it discourages substitutions, and the prevalent habit of padding orders is likewise prevented. The fact that the order number is marked on all boxes, barrels, crates etc., makes their identification on arrival a very easy matter. This assists in rapid handling of supplies. The blanks with which the System is conducted are furnished either in duplicate or triplicate, according to the requirements of your business. By an ingenious arrangement of the carbon paper, prices and quantities are not shown on the receiving clerk's copy. Further particulars and samples will be cheerfully furnished on application.

THIS new Requisition Order System of ours was designed to fill a long-demanded want, and has proved itself equal to the requirements. It not only arranges for and preserves a complete record of any goods ordered, but it also furnishes a check on the receiving clerk, simplifying his work and at the same time forcing him to actually check and record the goods without being aware of the quantity ordered or of the price paid. The expense connected with its installation will be found covered in the minimum time of operation. The old method of furnishing clerks with invoices from which to check off the arriving goods is a bad arrangement, loaded with the possibility of errors occurring, besides furnishing the clerk with information concerning your business dealings, which is not necessary to his particular position. The receiving clerk, by our system, furnishes an actual record of the goods received, which is filed in the office after being compared with the invoice re-

black walnut. All drafts, confirmation and shipping instructions will be supplied by Messrs. Cleghorn, Harris & Co., 88 Old Street, London, E.C.

- 174 **Timber.**—A wholesale firm of timber merchants, contractors and manufacturers of wood goods desire to be placed in communication with Canadian lumber merchants who can supply white spruce wood for box-making, in the following sizes: 3 in. x 6 in., 3 in. x 7 in., 3 in. x 8 in., 3 in. x 9 in., 3 in. x 11 in., in lengths from 3 ft to 6 and 7 ft.
- 175 **Pine Deals.**—A South African timber firm desire to correspond with Canadian exporters of lumber in large quantities, suitable for case-making, also quotations for pine deals in lengths from 4 ft. to 8 ft.
- 176 **Wire Nails.**—A London firm would be pleased to receive quotations from Canadian manufacturers of wire nails, who can fill orders for shipment to New Zealand.
- 177 **Wood Floor.**—A London firm, who import considerable quantities of wood floor, has asked to be placed in touch with Canadian manufacturers of this material.
- 178 **Whisks.**—A Manchester firm requests prices and descriptions of whisks from Canadian manufacturers.
- 179 **Wood Wheels and parts thereof.**—A Manchester firm asks for prices of wood wheels and parts thereof, from Canadian manufacturers.
- 180 **Wooden Pill Boxes.**—A London firm seeks supplies of wooden pill boxes (1 11-16 x 15-16), and invites quotations from Canadian manufacturers who can fill orders to sample.
- 181 **Western Canada Representative.**—Well-known traveller with wide connections in the West in the grocery trade would like to hear from manufacturers of grocers' sundries who desire representation in Alberta. References.
- 182 **Wooden Handles, Brooms, Hay and Manure Forks, Garden Rakes, Picks, Scythes, etc., Clothes-horses and Pins, Horse Hair, Wash-boards, etc.**—One of the best known woodenware wholesale houses of England is in the market to purchase carload lots of the above articles from Canadian exporters. Excellent references. Have been doing business in Canada for twenty years. Will purchase 60 days' draft against documents, or cash for discount. Shipment c.i.f. Bristol. The firm has been established nearly 200 years, and can place large orders.
- 183 **Tools.**—A Manchester firm invites correspondence from Canadian manufacturers of carpenter and other tools.

Address enquiries to INDUSTRIAL CANADA, Toronto.

The Ceiling For Safety For Looks For Economy

Just one concern in all Canada makes the ceiling that unites in itself real safety against fire-risk (saves enough in premiums to buy itself quick), real beauty and correctness of design (true to artistic ideals and stamped so the patterns are clear-cut and deep), and real economy in first and last cost (far cheaper than plaster or wood in the long run—indestructible). These are the facts about

PEDLAR ART STEEL CEILINGS

Their use adds to the structural strength of any building, helps exclude cold, heat and moisture from rooms. Priced lower than poorer ceilings used to bring. More than 2,000 designs—by far the largest range of choice you can get anywhere.

CANADIAN WORKS
OF THE
International Harvester Co.
OF CANADA, LIMITED,
HAMILTON, - - - ONTARIO

The Canadian works of the International Harvester Company of Canada, Limited, are located at Hamilton, Ontario. The plant occupies one end of a 200-acre tract, and is the largest on British soil devoted exclusively to the manufacture of harvesting machines, seeding machines and tillage implements.

Following are the names and dimensions of the various buildings which comprise the works:—

Grey iron foundry—80 x 740 ft., one story high, with annexes devoted to sand sheds, coke sheds and core room.
Malleable iron foundry—84 x 880 ft., one story high, with finishing department 84 x 80 ft., at one end, three stories high.
Forge shop—84 x 702 ft., one story high.
Erecting and assembling building—72 x 350 ft., two stories and basement.
Knife and bar building—78 x 121 ft., four stories and basement.

Wood shop—450 ft. long, a portion of which is 72 ft. wide and the remainder 100 ft. wide, all one story high.
Paint shop—72 x 178 ft., four stories and basement.
Transformer house—22 x 43 ft., one story high.
Malleable foundry core room—61 x 83 ft., one story high.
Grey iron core room—35 x 150 ft., one story high.
Pumping station and boiler house—41 x 119 ft., one story high.
Storage house—120 x 400 ft., four stories and basement.
Office building—25 x 40 ft., two stories and basement.

All of these buildings are of modern construction and embody the latest and best ideas for fire protection. A full line of both Deering and McCormick harvesting machines, seeding machines, and tillage implements are manufactured at this plant. The list of machines and implements includes the following: Grain binders, mowers, rakes, tedders, disc harrows, smoothing harrows, lever harrows, spring tooth harrows, hoe drills, shoe drills, disc drills, combined cultivators and seeders, and broadcast seeders.

A high standard of excellence is maintained in the manufacture of these machines and implements, and the demand for them throughout the Provinces of Canada and the British possessions is steadily increasing.

Underwood

Accurate alignment is an essential of good typewriting; not merely good alignment, but permanently good alignment.

The Underwood has a guide which compels every character to appear in exactly the right position.

The principle of this guide is fully protected by our patents. Other typewriter manufacturers have been working over-time in the endeavor to circumvent us in the matter of a guide—without success.

Without it their machines must continue to occupy their present position—of inferiority. Write for catalogues.

Gaff Linkum

By ARCHIE P. MCKISHNIE Cloth, \$1.25.

The book is replete with varying incident from cover to cover. That the author has a wonderful insight into boy life and character is shown by parts of the book pertaining to the hero, "Gaff Linkum," and his chum, Buz Fields. This new Canadian book will be read with interest.

The Songs of a Sourdough

By ROBERT W. SERVICE. Cloth, net, 75c.

The poems are written in the Kipling style of expression, but they have also a distinct quality of Canadianism and they are striking and forceful. Mr. Service's volume deserves a warm welcome.

St. Jude's

By IAN MACLAREN. Cloth, \$1.25.

Author of "Beside the Bonnie Briar Bush"

Ralph Connor says:—"As I turn the pages I discover new friends among Carmichael's flock worthy to stand with those others I discovered twelve years ago."

HEAT AND LIGHT AT COST OF 1

NOT Heat OR Light,
Doing without 1 to get the other 1,
Or paying double for the 2,
But 1 for 2, and 2 for 1, at the cost of only 1,
And the only 1 is the

Heats and Lights
any Room

Fits any Standard
Gas Fixture

Combining HEAT and ILLUMINATION in one

NO SMOKE

NO ODOR

NO RISKY RUBBER TUBE CONNECTION

Perfect Combustion. Its White Flame burns all the gas, leaving none Blue to waste, to permeate a room, to breathe—is therefore HYGIENIC, and because there is no waste of gas and because it illuminates as well as heats, it is very ECONOMICAL.

The "BANNER" Spiral Spring.

DO YOU SLEEP WELL?

One-third of our lives is spent in bed, yet many people do not realize the vast importance of a good Spring Bed. A poor Spring will spoil what otherwise would be a good night's rest—if it sags, or is too hard, or lacks resiliency, there can be no real sleep comfort.

The "Banner" Spring Bed is luxuriously comfortable. Made from the best oil-tempered carbon steel wire, each separate coil-spring yields instantly to

the slightest pressure—not the lifeless yielding of a feather bed, which retains the shape weight has given it—but with a quick resumption of the original level as soon as weight is removed.

Globe Time Recorder

These are the well known and universally used DRUM DIAL REGISTERS. Guaranteed free from mechanical defect. Absolutely reliable. No soiled, torn or LOST records, when same are unfavorable, with this system. With ours the sheet is placed on the drum inside the LOCKED case, through the glass sides of which inspection may be made of, but tampering with records is impossible. At the end of the day or the week, you have a clean, legible record, to the minute, in clear TYPE made by the employees themselves. No recopying necessary; the sheet, totalled, forms your pay book. Made in various styles (dailies and weeklies) and in four sizes, viz., for 50, 100, 150 and 200 employees. Built and adjusted to suit any business, and made to stand the hard usage Time Recorders are subject to.

**First Paid Press Message to Cross the
Atlantic by Wireless Telegraphy
comes to The Globe**

LORD STRATHCONA SENDS CONGRATULATIONS

London, via Marconi Wireless to Glace Bay, N.S.,
October 17th, 1907.

The Editor of THE GLOBE,
Toronto, Ont.

The initiation of a system of wireless telegraphy, by means of which direct communication now takes effect between Europe and North America, is a notable event in the history of the world. The Dominion of Canada has from the outset extended to Chevalier Marconi a most sympathetic support, and I congratulate myself on the privilege of sending this, an opening Marconigram, to SUCH AN IMPORTANT MEMBER OF THE CANADIAN PRESS AS THE TORONTO GLOBE.

My recollection goes back to the transmission of the first message by the Atlantic Cable, and to one of the earliest of these messages sent by myself from Newfoundland, where I happened to be at the moment—some twenty words—at a cost, if I remember aright, of twenty pounds. Contrast this with the Marconigram of to-day at ten cents a word to the general public and five cents to the press.

STRATHCONA.

THE INDUSTRIAL OUTLOOK IN CANADA.

SIX months ago there was no cloud on the horizon of Canada's commercial prosperity. Since that time conditions have developed which have aroused more or less anxiety, and business men in every part of the Dominion are preparing to face what threatens now to be an actual depression in trade. It would be unwise at the present time to predict that Canada is on the verge of "hard times," but it would be even more imprudent to shut our eyes to such significant factors as reduced crop returns and financial stringency, with their attending results already facing us.

The past ten years have brought to the whole world a period of wonderful prosperity, with only temporary setbacks—a prosperity of which Canada has enjoyed her full share. Production has been enormous. Nations have had products to sell, and, to this extent, money also to buy in return. But in the midst of a world-wide prosperity, with plans laid for extension and expansion, the announcement is made of a "short" crop, and is immediately followed by a scarcity of money. The Canadian farmer will probably find that his revenue this year has not decreased, for the small crop has insured him a higher price, but, as a nation, we have less to sell, and consequently will not have the same amount of revenue from

foreign sources. This affects us seriously, because we buy a great deal abroad, and we are now brought face to face with the fact that our annual imports exceed our exports by more than \$100,000,000.

It does not require any complicated chain of reasoning to understand that the industrial interests most seriously affected by the on-coming conditions in Canada are those of the manufacturer. It is true that up to the present time many factories have not felt any depression outside of the general scarcity of money. It is true that the consumption of manufactured goods in Canada for the coming year will probably equal, if not exceed, the demands of the year just closing. There has been so far no great scarcity of orders; but Canadian factories are bound to suffer before the conditions can be improved.

Why? In the first place, wholesalers and retailers in every part of Canada are reducing their stocks, and are straining every effort to carry only what they can pay for promptly. Having little or no export trade, the Canadian manufacturer depends on the home market, and he finds its purchasing power to-day very much reduced. A reduction in his output naturally increases his cost.

In the second place, the great manufacturing nations, who, through specialized effort and enormous output, have developed a large export trade, will certainly force their goods upon Canada when trade becomes dull and their own markets are overstocked. It is just at this point that tariffs, "evil" though they may be called, become an absolute necessity—particularly for a young country like Canada, which must stem the tide of slaughtered prices from giants such as the United States and Germany. Thus it is that, even though Canada should be blessed with good crops, her general prosperity in times like these depends on the height of her tariff wall, for unless well protected, no industrial nation can escape the effects of a foreign depression. It remains to be seen whether Canada's present tariff is strong enough to defend her working people in their hour of need.

Meantime, it should be the aim of every business house to buy conservatively and pay promptly. This is not the time to overreach, but rather to proceed cautiously and even slowly. There can be no doubt regarding the ultimate success of Canada and her industries. Our progress may be impeded for a little time, and our welfare depends largely on the industrial conditions of other countries. The general tone should be one of confidence, which is merely the natural reflection of our faith in our great resources, our growing population, and our business institutions.

THE TRANSPORTATION OF THE FUTURE.

MR. J. HILL, one of the most successful railroad men in the United States, has stated that railroad building is at an end in that country. By that he meant that the era of water transportation has arrived. President Roosevelt has just completed a trip down the Mississippi in company with the Inland Waterways Commission. The object of the trip was to investigate the actual conditions and possibilities for transportation along that route. The people of Chicago are persisting in their efforts to have the big drainage canal, which has reversed the current of the Chicago River and has made a direct water connection between Lake Michigan and the Mississippi, converted into a ship waterway. Their wishes are even now before the International Commission who look after our waterways. It has been stated that wheat can be transported from St. Louis to Liverpool from three to five cents a bushel cheaper *via* the all-water route than by rail and water. At the same time a large sum of money has been expended on improvements to the Erie Canal, it is being strongly urged, and the idea is meeting with general favor, that this canal be deepened so as to be of real service in grain shipments.

All these facts go to illustrate the importance which the people of the United States place upon the question of water transportation. It is, economically speaking, the biggest question they have to solve at the present time. If by improving the Mississippi channel the United States can save four cents a bushel on its Western wheat crop, it will place its farmers in a position of great advantage. Four cents a bushel on three hundred million bushels means twelve million dollars a year. Add to this a proportionate saving on every ton of exports and imports, and the sum becomes colossal.

The difficulties which the United States have had to face will soon be ours. But in the solution of them there is a difference. The United States enjoy no such natural advantages for water traffic as we do. Whereas their great stream runs north and south, ours runs west and east, in the course of commerce. Already the biggest ocean liners ply up to Montreal. In the upper lakes great grain vessels carry huge cargoes till winter sets in.

The problem before us is to find the cheapest route to the sea. The grain of the West cannot be carried by rail. The cost is prohibitive. The Hudson's Bay route has been discussed, but satisfactory proof of its practicability has not yet been adduced. It will have to be proved that the dangers of navigation in the straits are not insurmountable, that the season is of tolerable length, and that a safe harborage in the bay is obtainable.

The present canal system may be improved by deepening to a uniform depth, to permit of the vessels now plying in the Upper Lakes making the voyage to an ocean port without breaking bulk. The merits of this system may be readily estimated. The cost of the necessary improvements may be calculated fairly accurately. The saving in freight charges may also be computed.

Then there are still shorter routes along the line of lakes and rivers in Northern Ontario and Quebec, which would serve as a course for other canal systems. Of these the one that has been most discussed is the route generally known as the Georgian Bay and French River waterway. A few months ago *INDUSTRIAL CANADA* published an article which went to show that not only was the latter route feasible, but that it would open up a vast field for industrial development. Magnificent water falls, capable of developing unlimited power, would serve as a permanent source of revenue to the Government. It would provide short and cheap transportation for the grain of Western Canada, and would place our Western farmers in an exceptionally favorable position for getting the

greatest returns for their crops. In the era of water transportation, this route cannot but play an important part in the solution of our freight problem.

With these bigger problems of water transportation are inextricably bound up the more local ones of harbors and wharfage. Much has been done to improve channels, increase harbor facilities, etc. Taking a broad view of the future importance of our waterways, it will be necessary to carry on this work systematically. The work is national, and it should be done with a view to providing in the end a system of waterways which will work together to the best advantage of the country at large. There is little use in deepening two canals if a third on the same route is left shallow. Nor will it avail anything to make a harbor and not have terminal facilities for handling freight. There must be correlation between the parts. Only so can satisfactory results be attained.

THE LEMIEUX ACT IN OPERATION.

TWO cases which have come up under the Lemieux Act in the past few weeks point the criticism which has been made of that legislation from the first. The measure has been received most sympathetically by employers. It was the general feeling that everything possible should be done to facilitate its operation. And no doubt much good has resulted from it.

The essential feature of the Act, the section which makes it valuable, is that which says that there shall be no strike or lock-out during the progress of an investigation. The theory is that if the questions at issue are gone into by a small body of fair-minded men and the fairness or unfairness of the demands of employer or employee are made public, the party in the wrong will yield in the face of public opinion. It is easier to settle a question where no actual rupture has taken place, as in the case of a strike or lock-out, than later. Hence the Act provides for an investigating board and it provides that during the sittings of that board work shall continue.

But there is the crux of the whole problem. You can compel an employer to continue operating; if he does not you can fine or imprison him. No matter how big the corporation is there is always some one in charge and proceedings can be taken against him. Fines can be piled up and multiplied till he is forced to obey the rulings of the court. How can you compel five hundred or a thousand men to continue work if they do not want to? Or if you succeeded in compelling them to return to work how could you compel them to work, to do a day's work in a day's time?

Coal mining is distinctly a public utility. The whole people in their private and industrial capacities are dependent upon it. A dispute arose recently between the Hillcrest Coal and Coke Company and its workmen, and the manager told the men not to come back until the dispute was settled. A complaint was laid and a justice of the peace fined the manager \$200.00. In effect he compelled the company to submit to the provisions of the Lemieux Act, for if a fine of \$200.00 will not accomplish the purpose, the amount will be increased. That is one side of the shield. The other reveals a strike in the Springhill collieries, lasting for weeks, without any effective application of the provisions of the Lemieux Act. The Commission sat, the officials of the Dominion Labor Department used all possible means of persuasion, conciliation and diplomacy. But they could not compel several hundred miners to go to work. Much less could they have compelled them to do honest work if they had reported for duty.

That in a nutshell is the weakness of the Act. It is compulsory on one side; it is not on the other. The workmen will be satisfied so long as the decisions are in their favor.

The same thing has been found in other countries, where arbitration is in force. So long as the employees have been adjudged in the right they have been satisfied and have acclaimed the labor conditions as ideal. As soon as decisions begin to go against them, for employers are not always in the wrong, they at once rebel. To be successful, arbitration must be made capable of enforcement by adequate penalties.

The two aspects of the working of the Lemieux Act just recorded are not such as to win favor for the measure. The general public will not approve of legislation which only works in a one-sided way. The object of the act was to give force to public opinion. By that public opinion the Act will be condemned if we have further occurrences like the Spring-hill fiasco.

A GROWING SENSE OF RESPONSIBILITY.

AN encouraging tendency of the present day is the quickening of public interest in questions affecting the preservation of the natural wealth of this continent. Such considerations are not surprising in the older countries of Europe, for there the land has been long since denuded of its virgin resources, and a renewal of that wealth is only possible through extensive measures of conservation. On this continent up to within a few years ago, the great natural resources were generally considered to be inexhaustible, and they were treated in this spirit. Lakes and streams and the deep seas were pillaged of fish without regard to season; coal and other fuel areas were recklessly exploited; the forests were cut with extravagant prodigality. For years so vast was the supply in every department that future necessities were made subservient to present profit.

A sense of responsibility has come. Leaders have arisen who have challenged the right and questioned the expediency of the present generation reaping without sowing for a second crop. The general public are slow to appreciate that the fisheries are being depleted or that the land is becoming less fruitful. It is satisfactory to know that such leaders are at hand to direct public opinion. The proper development and conservation of our natural resources are subjects of pre-eminent national importance.

Many fields are open for Government activity along these lines. The fisheries which once flourished on the Atlantic coast have been going backward instead of forward. Hatcheries have been established for keeping up the supply of spawn. This policy must be continued and enlarged. There is nothing scientifically or economically impossible about doubling or trebling the supply of fish in the Atlantic coast waters. In connection with this the statement was recently made that the fisheries under proper care could be made to contribute as much to the wealth of Canada as her wheat lands. Both in the Maritime Provinces and in the Lake districts attention has of late been called to the situation. A critical public spirit will do much to bring about a better condition.

Then in forestry, on both sides of the international line, there is going up a demand for a policy that will perpetuate the forests, which in themselves will preserve the sources of streams, with all that that means to the agricultural and industrial welfare of the country. Prof. B. E. Fernow's able address at the recent meeting of the Canadian Manufacturers' Association sounded a warning note, but at the same time suggested a remedy. Upon him himself, as head of the Department of Forestry in the Provincial University of Ontario, will devolve in no small measure the work of preparing men to carry out the work he outlined. Canada's forest wealth is immense. Under a strong and consistent policy our present revenue from it may be kept up and increased without adversely affecting the industry in the future. By limiting the cutting to trees of mature size, by a proper scheme of replant-

ing, by avoiding losses through forest fires, the national heritage may be preserved from generation to generation.

Watercourses, too, are coming in for attention, and a measurement of the flow of water will be made in both Quebec and Ontario. This source of power has only been fully appreciated within the past few years, but it bids fair to revolutionize industry. In the future every flowing stream will be a centre of industrial life, and the prosperity of a country may be measured by its waterfalls.

These are some of the problems which are pressing for solution. They indicate that the age of prodigal exploitation is past and that we are on the threshold of an era of which conservation and scientific development will be the key-notes. With us as with the United States the great question is, Shall we continue the waste and destruction of our natural resources, or shall we conserve them?

EDUCATIONAL FADS AND FRILLS.

THAT there is a tendency abroad to load our school curriculum up with fads and frills is a statement frequently made. This statement is extremely difficult of proof, however, because those in charge of our educational policy hold varying views as to what constitutes a fad. No doubt there is great difficulty in discriminating between the foods and fads in education, just as there is in cereals, but from investigations recently carried on by the Technical Education Committee, it would appear that in Toronto, at any rate, some of the special subjects, or parts of the teaching system, if they are not fads, may at least prove detrimental to the acquisition by the pupils in our primary schools of a thorough grounding in the rudimentary subjects, such as writing, reading, arithmetic, composition and spelling.

In Toronto, particularly, in the past few years, complaints that pupils coming from the public schools cannot write, spell or compose properly have been all too common. Such complaints, coming from manufacturers and business men engaged in diversified branches of industry strike at the fundamentals of our educational system. They are made in most cases by sane, conservative business men who have been successful in their respective careers, and as such merit the serious consideration of the heads of our educational system, and of all voters, for after all it is the citizen's duty to see that the education of his children is carried out on the lines he favors. If his children receive poor mental nourishment it is his business to see that their diet is changed.

From a recent conversation with a gentleman high up in the educational councils of one of our largest cities, it would appear that there is some ground for the statements that special subjects cut in on the time devoted to the essentials. There is a tendency for special supervisors in such subjects as domestic science, drawing, typewriting and singing to magnify the importance of their work, with the result that they encroach on the time that should be devoted to reading, writing, arithmetic, spelling, etc. This is a tendency which the Inspectors are constantly called on to check, and the very fact that it exists gives cause for the complaints of those who cry out against the "frills."

The wretched handwriting of public school pupils is most widely commented on, and speaking of this complaint the same gentleman admitted there was some ground for criticism. He attributed the deficiencies in this respect to the introduction some years ago of the vertical system of handwriting. This is now abolished and an improvement is looked for in handwriting in the next decade. Here we have an admission from a man who knows that a system that was regarded as a fad by many during its vogue, has resulted in sending

forth pupils from the public schools poorly equipped for industrial life, in respect to writing.

Nor is this the only case of the kind. On good authority we learn that the far-famed "phonic" system of teaching reading is, in a measure, responsible for the atrocious spelling of public school pupils. It must be admitted, however, that the phonic system has resulted in an improvement in reading, according to those in charge of our educational system. But surely a system which makes one branch of study and mars another is capable of improvement. If there is room for improvements in such essentials as writing and spelling we must have it at all costs.

The authority quoted above agrees that thoroughness and simplicity are the chief considerations in a public school system, and that the tendency to increase the specials, "the frills," as they are commonly called, has to be guarded against. Coming from one who is in close touch with our school system, these remarks are worthy of the serious consideration of those in charge of our educational policy.

Progress must be secured without imperilling the consistent pursuit of primary principles. The pupil's development should be along a definite line. We cannot achieve the best results if we have vertical writing for ten years, followed by the moderate slant system. The same applies to spelling, composition and the other rudiments of a sound, practical education.

Let the aim of our educationists be a return to a rational system of instruction; a thorough drilling in fundamentals, a simple diet for the mental appetite, and one which is not vacillating from year to year. Two and two still make four, and Latin and Greek roots are still the foundation of good spelling and a good English vocabulary. It is time enough for the new system when the pupil has reached a more mature age and enters the High School.

Make the guiding principles of our public school system thoroughness, simplicity, and stability, and see whether we have not in ten years time better spellers and writers. Give our public school pupils foods, not fads.

MUTUAL INSURANCE COMPANIES IN OPERATION.

WITH the licensing of the two Manufacturers' Mutual Fire Insurance Companies, fire insurance in Canada has entered upon a new stage. The work of organizing companies to handle manufacturers' risks exclusively was not taken up by the Insurance Committee of the Canadian Manufacturers' Association without due consideration. Conditions were thoroughly investigated and relief from existing exorbitant and unwarrantable charges was sought from the companies then doing business in Canada. The comparative isolation of manufacturers' buildings, the provision made against fire, the large profits being earned by most of the companies doing business here, were all urged as reasons for a reduction in rates upon this class of risks. After a campaign of education and an appeal to reason extending over a period of two or three years, to which the companies showed themselves not only unsympathetic but actually hostile, the Insurance Department evolved the idea of establishing a mutual protection against fire losses.

The work undertaken thus after long and careful consideration was no light matter. It involved the working out of a complete system of insurance. Members of the Association had to be visited and the plan explained to them. It speaks volumes for the thoroughness of the preliminary work and the Committee's grasp of the situation, that the need of relief from existing conditions was so universally recognized, and that the means of obtaining that relief through the measures suggested by the Committee were so generally accepted as the best possible solution of the problem.

The companies are now in operation. It will be most interesting to watch their effect on the general insurance situation. Already the tariff companies are assuming a somewhat less arrogant tone. This is assured: if the mutual companies now doing business succeed in giving insurance at less than what it has heretofore cost, there will be a speedy reduction in the rates on this class of business. If the present mutual companies cannot handle all the business offering, and the tariff companies do not give a satisfactory service, other mutual companies will be formed quickly to supplement those already in existence.

✓ In consistently refusing to differentiate adequately between manufacturers' risks, which are isolated, and risks which are subject to a conflagration hazard, the tariff companies have forced the present issue. They should have recognized that a business man who is accustomed to look into the cost of what he buys would sooner or later cast an inquiring eye on the two statements, first, that the New England Mutuals were granting a rate as low as six cents on the hundred dollars, and, secondly, that stock companies doing business in Canada were paying dividends on their capital investment of as high as eighty-nine per cent. per annum. In those two facts would be found the reason of his own high rate. That is what happened. The Manufacturers' Mutual Fire Insurance Companies are the result of a general feeling that insurance could be had at a less cost than has been heretofore exacted.

A PREMIUM ON AGITATION.

SINCE his election to office Mr Whitney has rapidly been gaining for himself the reputation of an upright and fearless statesman who did what he believed to be right and in the interests of the public regardless of consequences. Up to the present this reputation has been so amply justified by his actions that it now comes as more or less of a shock to learn that he is but a politician after all, ever anxious to propitiate the man with the big stick.

By selecting even one of the new factory inspectors from the ranks of organized labor, Mr. Whitney proclaims that the satisfactory performance of the duties attaching to these inspectorships is of less consequence than the placating of that section of the electorate who are supposed to vote at the dictation of labor agitators.

He cannot plead a limited field to choose from, for he was virtually inundated with applications,—nearly 160, all told. He cannot plead ignorance of the real importance of the issue at stake, for the views of the manufacturers were laid before him and his colleagues both frequently and forcibly. He was made fully aware of the perverted uses to which the office of factory inspector can be and has been put by union fanatics to harass employers in the management of their business. He was also made fully aware of the fact that the Union exacts from its initiates an oath that their allegiance to the organization and the individual members thereof shall at all times take precedence over their allegiance to their King and their God.

And yet Mr. Whitney is bold enough to say not only that he considers a union agitator a fit and proper person to come into our factories and tell us how we shall run our business, but he even goes so far as to say that such a man is the best available for the purpose.

By this very act Mr. Whitney places the seal of Government approval on the tactics of those jawsmiths who make their living by fomenting trouble between employers and their work-people. He encourages them to keep it up by the offer of plums to those who create the biggest stir. Why does he not make Roadhouse Chairman of the Board of Examiners for Stationary Engineers and complete the fiasco?

Comment of the Month

Need of Expansion in the Wood Working Industry.

The attention of capitalists, promoters, and manufacturers already engaged in the wood working industry, is directed to the following extract from a letter recently received at this office from Mr. Harrison Watson, the Canadian agent in Loudon, England. Speaking of the need for expansion in this industry, Mr. Watson writes:

"It is rather curious that, considering the great natural facilities which Canada possesses for the production of so many lines of manufactures of wood, and in view of the great demand existing in almost all countries for such goods, there is not larger development in the Dominion in this industry. Indeed, it is doubtful whether, outside of grain and produce lines, there is any branch in which such a favorable opening exists for Canadian goods.

"I have repeatedly called attention to this matter in former Annual Reports, and was again struck by the anomaly when recently looking through the Industrial Census Returns, which showed that hardly any single industry in Canada had developed less than the wood working establishments. This industry would seem to offer a profitable opening for the investment of additional capital.

"Almost daily we receive enquiries from firms here seeking manufactures of wood of some kind, and when we place them in touch with Canadian manufacturers the result is almost invariably that these latter are full of orders and cannot undertake fresh business."

The statement regarding the number of enquiries for wood products is amply proven by the records at the office. During the last year every English mail has brought to the office an average of four export enquiries for such articles as wooden handles of every description, turned goods, such as dowels, ornaments, etc., timber of all kinds, flooring, excelsior, etc. In the majority of cases Canadian firms notified have replied stating their inability to fill export orders, as they had all they could do to keep pace with a growing home business. In some cases, it is true, the prices offered by foreigners for the goods are not high enough to attract Canadian shippers, and there is no doubt that the English buyer must be prepared to pay more if he hopes to purchase in Canada. Still the facts go to show that there is considerable room for expansion in this important Canadian industry, and we have no hesitation in recommending this as a profitable field for those seeking to invest capital.

Exporters Criticised.

With painful regularity criticisms are heard of unsatisfactory export methods of Canadian manufacturers. The unfortunate feature of these is that the harm is not felt alone by the one who offends, but it exercises an evil influence on those who are making every effort to work up an export trade. When a foreign importer gets no reply, or at best an unsatisfactory reply to enquiries, two or three times in succession, he with some considerable reason assumes that such treatment is a national failing. In this way all Canadians are being injured in business reputation by those who do not want an export trade, and who do not take the trouble of replying to letters of enquiry. The following is an extract from a letter of Mr. D. H. Ross, to the Canadian Department of Trade and Commerce. It deals with the question from the Australian standpoint:

The Situation Discussed.

"As a result of several recent interviews with Melbourne importers of Canadian goods, I regret to report just grounds for the revival of the old complaint that manufacturers and exporters in the Dominion—some in a large way of business—are not extending due consideration to correspondence and orders received from distant Australia. One importer contrasted the replies received from United States and Canadian manufacturers when approached for information as to the lines they have to export. The former almost invariably sends catalogues and export (f.o.b) prices of the goods he has to sell, whilst the Canadian frequently asks for further particulars of the inquirer's wants. This latter course is not appreciated for the following reasons:

"(a) It is well known that both United States and Canadian manufacturers look upon export trade as an outlet for their surplus production of lines for which they already have a home market. If other sizes or descriptions are asked for, either high prices are demanded, or such a minimum quantity stipulated that business is frequently impracticable.

"(b) The delay in obtaining definite information on which orders could be placed. Frequently a firm desires information in order to make up indent for seasonable goods, and writes say nine months before the goods are wanted here. The reply asking for further particulars reaches him in say three months, and another two or three months must elapse before the second reply with prices reaches Australia. Thus only four months are left for the ordering, manufacturing and delivery here, which would rarely suffice to bring the goods in time for the season.

Slow Deliveries of Canadian Goods.

"The very slow delivery of orders placed with Canadian manufacturers is operating seriously against the development of trade with Australia. I am aware of orders having been sent from Melbourne to Canada in June, 1906, and no advices have yet been received that the goods are shipped. There are numbers of instances of indents accepted by manufacturers 9 to 10 months ago that were not, at latest advices, executed. Australian buyers may be obliged to accept delivery when the goods arrive, but they decline to send repeat orders on account of the uncertainty of delivery.

Cancellation of Indents for Canadian Goods.

"Several instances have been brought under my notice of Canadian manufacturers repudiating business contracts, obviously on account of an increase in demand and higher rates ruling elsewhere. Upon the basis of their own quotations some manufacturers notified Australian importers of their acceptance of orders, and the buyers, after anticipating the arrival of the goods from month to month, simply received a notification that the orders could not be filled at the prices upon which the orders were in the first instance accepted. Such treatment is most reprehensible as it reflects upon the good name of all Canadian exporters, who are endeavoring to secure a larger share of the Australian trade."

A Dry-Dock for Montreal.

At a recent meeting of the Chambre de Commerce of Montreal an urgent request was made to the Dominion Government for a dry-dock. In a general review of the situation, the Committee on Transportation showed that in 1898 the Federal Parliament had passed an appropriation of \$750,000 for this purpose. No action, however, was taken, and the dry-dock remains unbuilt. Since that time the tonnage of vessels plying in the St. Lawrence has increased immensely. The need, which was recognized ten years ago, has grown with each year. The lack of a dry-dock has a prejudicial effect on

transportation. Vessels which meet with a mishap are compelled to make their way under temporary repairs to a port on the Atlantic where better facilities are provided. All these facts were set forth in the Committee's report. Already great improvements have been made in the Montreal harbor. It would appear that still greater ones will come in the future.

Traffic Through Our Canals.

The statistics of traffic through Canadian canals for the year 1906, just issued by the Department of Railways and Canals, show a notable expansion in tonnage passing through the great lakes and St. Lawrence canal system during the year. The total number of tons of freight passing up and down was 10,253,185, as compared with 9,371,744 for 1905. From United States ports to Canadian ports the number of tons carried was 3,594,784; from Canadian to United States ports, 861,130 tons, and from United States to United States ports through Canadian canals, 4,584,764 tons. The total tonnage handled up and down has increased by 287 per cent. during the past twenty years. The business westward showed a gain of 346 per cent., while the eastward business grew to the extent of 275 per cent. It is instructive to note that this expansion of business in the canals of Canada is relatively larger than that shown by the Canadian railways during the same period, which handled 254 per cent. more traffic last year than in 1887. This comparatively larger increase in the canal business as compared with railway traffic indicates the value and growing usefulness of the Canadian waterways system.

Will Operate Boats.

No small amount of interest has followed the statement of President Hays, of the Grand Trunk Pacific, that that company might operate steamship lines on the Atlantic and Pacific. While the completion of the road is still in the future, the subject is one which must have early consideration. When the C. P. R. was built, it was speedily discovered that without regular steamship connections a transcontinental business would be impossible. Freight could not be set down at either termini without an absolute assurance that boats would be ready at a certain time to receive it. So the G. T. P., when it is completed, will have as part of its equipment steamship lines either owned outright or in direct alliance with it. The transportation system of Canada is being evolved on big lines.

Employers' Right of Defence.

An interesting decision was handed down by Judge St. Pierre, of Montreal, recently. It established a precedent involving the right of employers to organize for mutual defence against the aggressions of trade unions. The case arose in the first place out of a threat on the part of the plasterers' union that after a certain day the members would not work for less than 40 cents an hour, whereas up to that time they had been receiving 33 1-3 cents. A meeting of employers was held, at which the feeling prevailed that the demand was exorbitant. They accordingly agreed to resist the demand, and in the event of a strike to stand together and refuse to engage men at any advance on the established rate then obtaining in the trade. To offset damages which might be done to the rest by the failure of any firm to live up to the agreement, each member deposited a note for \$500 with accredited trustees. The case in court arose over the collection of the amount of a note from a member who failed to stand by the agreement, without giving notice of his withdrawal from the association. Judge St. Pierre held that the agreement was legal. In his

judgment he pointed out that the law clearly gave workingmen the right to organize for the improvement of conditions, and held that if they possessed this right it was clear that the right also belonged to the employers of organizing to oppose such demands. The allegation that the agreement was in restraint of trade was met by the fact that the agreement only provided for the doing of a certain thing for a certain length of time, and that it interfered in no way with the operation of the law of supply and demand. If the union created an artificial condition, it could not be termed restraint of trade for the employers to oppose it. Besides, the elements of excessive profits and malice common to conspiracies of this nature were entirely lacking.

To Get a Share of Immigrants.

The Government of New Brunswick have entered upon an active campaign for immigration and manufacturing. The Salvation Army will be utilized to bring out settlers. Two officials will be appointed to direct operations, and it is expected that the coming year will see a large influx of settlers into the Province by the sea. The Government feel that the custom of not landing passengers till Quebec or Montreal was reached has militated against the Maritime Provinces. They have received practically none of the new arrivals. Hereafter the work of filling the agricultural fields with suitable settlers will be vigorously carried on.

At the same time an industrial policy will be adopted and consistently pursued. The Province has experienced the need of more factories, with their accompanying industrial armies of well-paid workmen. The forests, valuable as they are, are not in themselves sufficient to insure continued prosperity. They rather suggest the fine possibilities for all lines of manufactures into which lumber enters to an appreciable extent. The close proximity to coal areas should make many industries possible.

Nor is any further proof needed of the possibilities of that part of Canada as an industrial district than the success of the firms which are already established there, some of which have made their goods known from one end of Canada to the other. New Brunswick is out after factories, and it may fairly be expected that she will get them. Her new citizens will not regret their choice.

Advocate a Fisheries Board.

The Fisheries Committee of the Board of Trade had a conference recently with Hon. W. S. Fielding, urging upon him the desirability of the appointment of a Fisheries Board. Some months ago the Board of Trade adopted resolutions to the effect that a Fisheries Board should be appointed, along the lines of the Fishery Board of Scotland, to act under the Department of Marine and Fisheries, for the regulation and control of the Canadian Atlantic fisheries. It was urged that as far as the Maritime Provinces are concerned, fishery matters have been allowed to drift along without much attempt to improve the conditions or conserve the various branches of the industry. The conditions of the lobster and other fisheries were outlined, also the existing conditions under which pickled fish are handled. The experiences of Norway, Iceland, Holland and the United States, and the changes made in these countries, were set forth, and it was announced that it was thought desirable to call attention of the Dominion Government to the fact that a policy for encouragement of the fisheries can be worked out to better advantage to all concerned by the appointing of such a Board as suggested, to work in conjunction with the Marine and Fisheries Department in matters affecting the betterment of the conditions of the Atlantic fisheries.

Uniform Bill of Lading

IN the August number reference was made to the progress which was being made in the United States with the Uniform Bill of Lading. A joint committee of shippers and carriers had worked on a bill for nearly two years and had agreed upon its conditions. This committee represented substantially all of the railroads in what is known as Official Classification territory, and sixty-seven shipping associations in that territory. It was reported to the Interstate Commerce Commission with the request that it be prescribed as a uniform bill of lading, to be substituted for the bills of lading now and heretofore in use. The Commission ordered that all common carriers by railroad subject to the Act to regulate commerce, be made parties defendant to this proceeding, which would be heard in Washington on October 15th. The carriers were required to show cause why the proposed form of bill of lading should not be approved and prescribed by the Commission as a just and reasonable regulation and practice to be observed by them on and after January 1, 1908.

The hearing was one of the most important ever held by the Commission from the standpoint of the interests affected.

Strong representation was made for the adoption of the bill submitted for the approval of the Commission.

It was the consensus of opinion of the representatives of the shipping interests outside of Official Classification territory (who were the large majority, and represented interests throughout the United States and Canada), that a recommendation should be made for adoption by the Commission, instead of one which it was proposed to put into effect; of the two distinct bills of lading which would be uniform in character, one to be known as a "straight" bill of lading and the other an "order" bill of lading. An "order" bill of lading, it was explained, is a negotiable instrument upon which money can be loaned, and a "straight" bill of lading is an ordinary receipt which the railroad company gives for a consignment of goods.

One of the most important interests heard was the banking concerns, who pointed out that the crops of the country are moved upon loans to the producers made on bills of lading which are not negotiable, the courts having so held, although the banks still recognize them. The bankers were united in endorsing the simple form of order bill of lading submitted by the shippers.

Objections were made on both sides to the form proposed, in fact to such an extent that it became evident that the only practical solution was to adopt the simple form bill of lading submitted by the shippers and build up from that rather than down to it, as was strongly recommended.

The hearing continued on October 16th. Before adjournment the Commission asked each interest represented to suggest amendments to the bill by November 1st in written briefs.

Whilst some interests questioned the authority of the Commission to prescribe a uniform bill of lading, it was evident that all were united in their desire to have one.

The proposed uniform bill of lading, as submitted by the Committee on Official Classification territory:

The following appears on the face of the Bill of Lading:

Uniform Bill of Lading Conditions (As Agreed Upon By Conference May 24 and 25, 1907).

.....Railroad Company and connecting lines.

Received subject to classification and tariffs in effect on the date of issue of this original bill of lading, at

.....1907, from, the property described below, in apparent good order, except as noted (contents and condition of contents of packages unknown), marked, consigned, and destined as indicated below, which said Company agrees to carry to its usual place of delivery at said destination, if on its road, otherwise to deliver to another carrier on the route to said destination. It is mutually agreed, as to each carrier of all or any of said property over all or any portion of the said route to destination, and as to each party at any time interested, in all or any of said property that every service to be performed hereunder shall be subject to all the conditions, whether printed or written, herein contained (see conditions on back hereof), and which are agreed to by the shipper and accepted for himself and his assigns as just and reasonable. In issuing this bill of lading this Company, with respect to the portion of the route beyond its own line, acts only as agent and agrees to transport only over its own line.

Nothing herein contained, however, shall be construed as exempting the initial carrier from the liability, if any, imposed upon it by law for loss, damage or injury not occurring on its own line or its portion of the through route or occurring after said property has been delivered to the next carrier.

Insert "order" clause.

Insert description of articles, etc.

.....Agent.

If the word "order" is written in connection with the name of the party to whose order the property is consigned, the surrender of the original Bill of Lading properly endorsed shall be required before delivery of the property. Inspection will not be permitted on order Bills of Lading unless permission is endorsed on the original Bill of Lading, or given in writing by the shipper.

If the word "order" does not so appear the Bill of Lading is "not negotiable," and said property may be delivered without requiring such surrender.

On the back of the Bill of Lading it is proposed to print the following:

Conditions.

Section 1. The carrier or party in possession of any of the property herein described shall be liable for any loss thereof or damage thereto except as hereinafter provided.

No carrier or party in possession of any of the property herein described shall be liable for any loss thereof or damage thereto or delay caused by the act of God, the public enemy, quarantine, the authority of the law or the act of default of the shipper or owner or for differences in the weights of grain, seed or other commodities caused by natural shrinkage or discrepancies in elevator weights. For loss, damage or delay caused by fire occurring after forty-eight hours (exclusive of legal holidays) after notice of the arrival of the property at destination or at port of export (if intended for export), has been duly sent or given the carrier's liability shall be that of warehouseman only. Except in case of negligence of the carrier or party in possession (and the burden to prove freedom from negligence shall be on the carrier or party in possession), the carrier or party in possession shall not be liable for loss, damage or delay occurring while the property is stopped and held in transit upon request of the shipper, owner or party entitled to make such request; or resulting from a defect in the property or from

riots or strikes. When in accordance with general custom on account of the nature of the property or when at the request of the shipper the property is transported in open cars, the carrier or party in possession (except in case of loss or damage by fire), in which case the liability shall be the same as though the property had been carried in closed cars) shall be liable only for negligence, and the burden to prove freedom from such negligence shall be on the carrier or party in possession.

Section 2. No carrier shall be liable for loss, damage or injury not occurring on its road or its portion of the through route, nor after said property has been delivered to the next carrier except as such liability may be imposed by law, and any carrier shall be entitled to recover from the common carrier, railroad or transportation company on whose line the

rier shall be the same as though the entire carriage were by rail.

The amount of any loss or damage for which any carrier is liable shall be computed on the basis of the value of the property (being the bona fide invoice price, if any, to the consignee, including the freight, if prepaid) at the place and time of shipment under this Bill of Lading unless a lower value has been agreed upon or is determined by the classification or tariff upon which the rate is based, in either of which events such lower value shall be the maximum amount to govern such computation, whether or not such loss or damage occurs from negligence.

Claims for loss, damage or delay, must be made in writing to the carrier at the point of delivery, or at the point of origin, within sixty days after delivery of the property, or

MAP 1.—Showing freight rates from Ontario districts to Toronto as they were before the adoption of the New Schedule.

loss, damage or injury shall have been sustained, the amount of such loss, damage or injury as it may be required to pay to the owner of such property or the holder of this Bill of Lading, provided that it has given notice to such carrier, railroad or transportation company at least fifteen days before the payment of such claim, but no obligation respecting such recovery is hereby assumed by or imposed upon the shipper, owner or consignee.

Section 3. No carrier is bound to transport said property by any particular train or vessel, or in time for any particular market or otherwise than with reasonable dispatch, unless by specific agreement endorsed herein. Every carrier shall have the right in case of physical necessity to forward said property by any railroad or route between the point of shipment and the point of destination; but if such diversion shall be from a rail to a water route the liability of the car-

rier in case of failure to make delivery then within sixty days after a reasonable time for delivery has elapsed. Unless claims are so made the carrier shall not be liable.

Any carrier or party liable on account of loss of, or damage to, any of said property, shall have the full benefit of any insurance that may have been effected upon or on account of said property.

Section 4. All property shall be subject to necessary cooupage and baling at owner's cost. Each carrier over whose route cotton is to be transported hereunder shall have the privilege, at its own cost, of compressing the same for greater convenience in handling or forwarding, and shall not be held responsible for deviation or unavoidable delays in procuring such compression. Grain in bulk consigned to a point where there is a railroad, public or licensed elevator, may (unless otherwise expressly noted herein, and then if it is not

promptly unloaded) be there delivered and placed with other grain of same kind and grade without respect to ownership, and if so delivered shall be subject to a lien for elevator charges in addition to all other charges hereunder.

Section 5. Property not removed by the party entitled to receive it within forty-eight hours (exclusive of legal holidays) after notice of its arrival has been duly sent or given, may be kept in car, depot, or place of delivery of the carrier, or warehouse, subject to a reasonable charge for storage and to carrier's responsibility as warehouseman only, or may be, at the option of the carrier, removed to and stored in a public or licensed warehouse at the cost of the owner and there held at the owner's risk and without liability on the part of the carrier, and subject to a lien for all freight and other lawful charges, including a reasonable charge for storage.

value not specifically rated in the published classifications or tariff, unless a special agreement to do so and a stipulated value of the articles, are endorsed hereon.

Section 7. Every party, whether principal or agent, shipping explosive or dangerous goods, without previous full written disclosure to the carrier of their nature, shall be liable for all loss or damage caused thereby, and such goods may be warehoused at owner's risk and expense, or destroyed without compensation.

Section 8. The shipper, owner or consignee shall pay the freight and all other lawful charges accruing on said property before delivery. If upon inspection, it is ascertained that the articles shipped are not those described in this Bill of Lading the freight charges must be paid upon the articles actually shipped.

MAP 2.—Showing freight rates from Ontario districts to Toronto as they are under the New Schedule. The rates is in cents per hundred pounds.

The carrier may make a reasonable charge for the detention of any vessel or car for the use of tracks after the car has been held forty-eight hours (exclusive of legal holidays) for loading or unloading, and may add such charge to all other charges hereunder and hold such property subject to a lien therefor. Nothing in this section shall be construed as setting aside any local law or rule affecting car service or storage.

Property destined to or taken from a station at which there is no regularly appointed agent shall be entirely at risk of owner when unloaded from cars, or until loaded into cars, and when received from or delivered on private or other sidings, shall be at owner's risk until the cars are attached to, and after they are detached from trains.

Section 6. No carrier will carry, or be liable in any way, for any documents, specie, or for any articles of extraordinary

Section 9. Except in case of diversion from rail to water route, which is provided for in Section 3 hereof, if all or any part of said property is carried by water over any part of said route, such water carriage shall be performed subject to the liabilities, limitations and exemptions provided by statute and to the conditions contained in this Bill of Lading not inconsistent with such statutes or this section and subject also to the condition that no carrier or party in possession shall be liable for any loss or damage resulting from perils of the lakes, sea or other waters; or from explosion, bursting of boilers, breakage of shaft or any latent defect in hull, machinery or appurtenances; or from collision, stranding or other incidents of navigation, or from prolongation of the voyage. And any vessel carrying any or all of the property herein described shall have the liberty to call at intermediate ports; to tow and be towed and assist vessels in dis-

tress and to deviate for the purpose of saving life or property.

The term "water carriage," in this section, shall not be construed as including lighterage across rivers or in lake or other harbors and the liability for such lighterage shall be governed by the other sections of this instrument.

When property is carried under a rate which includes marine insurance, the liability of the water carrier shall cover all risks insured against and shall at least equal the liability hereunder for rail carriage in closed cars.

Section 10. Any alteration, addition or erasure in this Bill of Lading which shall be made without an endorsement thereof hereon, signed by the agent of the carrier issuing this Bill of Lading, shall be without effect, and this Bill of Lading shall be enforceable according to its original tenor.

The two forms of bills of lading proposed by the representatives of the National Industrial Traffic League, and endorsed by shippers generally, as well as the American Bankers Association, are as follows:

ORIGINAL.
Railroad Co.
Station.....190..

Received from
 the property described below, in apparent good order, except as noted (contents and condition of contents of packages unknown), to be transported and delivered, in accordance with the provisions of law, in like good order, to consignee.

(Insert description of articles, weight, rate, route; and car number and initials, if in carload.)

 It is only necessary to here state that the Canadian Manu-

facturers' Association have been on record for over a year as favoring the adoption of a simple form of bill of lading similar to the one above.

TRANS-ATLANTIC WIRELESS TELEGRAPHY.

MESSAGES have been successfully transmitted across the ocean by wireless electricity. The achievement, which two or three generations ago would have earned for the inventor a speedy death by fire on the charge of having uncannily intercourse with the Prince of darkness, passes now as a fit subject for a paragrapher's pen. That is all. The public read it and pass it by as just an item of news. There is an accident or a political meeting recorded in the next column; that is of more interest.

And yet what marvels of science must have been revealed during the past few years when such a discovery, such a strange and wonderful achievement, can pass without causing a nine days' wonder? The passenger on board a vessel in mid-ocean can know what is occurring on either continent as quickly as a man in the next street. The Atlantic, as has been said, has been made a ferry by the latest steamers, which cross almost at the speed of an express train. The sixteen cables which form a strange net work in the unfathomable depths of the ocean have brought the people of America and Europe into close contact. But in these cases there is something tangible which the mind can conjure up as forming the connection. The cable doesn't explain the mysterious action which for convenience sake we call an electric current, but we know that it is by means of it, by means of something material, which we can see and feel, that the communication from continent to continent takes place.

But what of the wizard Marconi's system? There is nothing tangible connecting the Glace Bay station with the coast of England. Nothing that we can picture in our mind as carrying a message. Yet a message written here is delivered across the ocean in as many seconds as it takes to tell it. A few upright poles with wires suspended to the top; batteries; and a telegrapher's key; that completes the equipment. The same on the other side, or on board ship.

And now that it is explained by students of electricity, it all seems simple enough. Every school of science has set up its instrument and demonstrated its practicability. The wonder is now, rather, that somebody did not discover it sooner. So we glance over the announcement that the Marconi Company will be ready to receive commercial messages within a week, and if they do not we grow impatient at the delay.

Yet Marconi is one of the few men of this generation. He pursued a scientific truth until its meaning was revealed to him—not its whole meaning, that is yet to come—it may reward his maturer years—but its meaning far beyond that which had been yet even dreamed of. He is a man of initiative, an investigator. He is the truest and best type of scientist, the one who discovers the truths of nature. This is a work which must precede the practical application of science. For its pursuit a large mind is required, an imagination and a zeal for the work.

An enterprise is under way at South Thomaston, Me., which, if it proves successful, will be an epoch-making event. A basin with an area of a little over one square mile is being used for the harnessing of the tides. There is a twelve foot rise in the tide at this point, by which it is intended to compress the air between the upper mechanism or platform and the water. It is expected to develop about 5,000 horse-power, the compressed air to be delivered through pipes anywhere within a radius of twenty miles. The experiment is being closely watched.

Valleyfield—A Canadian Cotton Centre

NO place in Canada can more appropriately claim the title of a factory town than Valleyfield, Que., the home of one of the largest cotton industries in the country. Not that it is a large industrial centre, estimated by the number of establishments within its borders, but because its life so largely centres around the cotton mills and other factories there situated.

The magnificent mills and equipment of the Montreal Cotton Co. are really the hub of the town's activity. There the wages of a great part of the population are earned, and upon the successful carrying on of this immense business depends the food and comfort of many thousands of people.

Delightfully Located.

Valleyfield is at the foot of Lake St. Francis, one of the St. Lawrence River lakes, and 32 miles above Montreal. The situation of Valleyfield at the head of one of the St. Lawrence Rapids, has allowed the extensive development of water power for the town and factories. Few places are more delightfully located, and full advantage of this has been taken to make it a most desirable place to live in. The mills, instead of being buried in the narrow streets of a big city, amongst rows of smoke-begrimed houses, are right on the edge of the lake, with fresh running water passing on all sides. There is no smoke to befoul the atmosphere on account of the extensive use of water and electric power.

The mills themselves remind one more of some ancient castle than a modern industrial establishment, yet this is only the first impression, because on entering the visitor soon realizes that he is in a factory whose equipment is thoroughly up-to-date and progressive. If there is one thing the present management of the Montreal Cotton Co. has been noted for, it is the fine condition in which the whole plant is maintained. Every room is scrupulously clean, well lighted and well ventilated. The surroundings are made beautiful by trimly kept lawns and flower beds. The mill buildings, with one exception, are built of stone, and their lofty towers present from a distance an imposing appearance. They are equipped with the most modern automatic system for extinguishing fires, and may be said to be practically fireproof.

The Montreal Cotton Co. believes that its own welfare is closely allied with the progress of the town, and consequently it is ever ready to undertake anything which will be of benefit to the town and to its employees. The Company has its own Hose and Fire Brigade, and on more than one occasion the town has been saved from bad fires through this means.

Model Houses.

Between two and three hundred houses and cottages are owned by the Company and rented to the employees of the mills. These houses are arranged in long avenues on model plans; they are lighted by electricity and have every modern convenience; they are surrounded by gardens and lawns. Those who desire to own their own home can purchase from the Company well-built houses upon a system of easy monthly payments. Fireproof houses of concrete or of hollow cement blocks are built to order and become desirable investments. The rents of these houses are kept at as low a figure as possible, running from \$5.00 per month to \$7.00 per month, including electric light. Many of these houses are semi-detached with seven rooms, a cellar and a woodshed, while provision is made for a lawn and flower garden in front, and plenty of land in the rear to raise vegetables. To encourage industry at home, annual prizes are given by the Company for the best kept garden.

Provision for Amusements.

A Club for bowling, skating, curling, lawn tennis and other sports, exists for the use of the employees of the Company, and with this is connected a reading room and large library, whence books can be taken home. The Club is a unique institution. The building and grounds, as well as the equipment, belong to the Company, and are maintained by them. A subscription of 25c. per month from each of the members pays the club-keeper, the heating, and for the purchasing of books for the library, which now contains upwards of 1,000 volumes. Billiards, cards, dominoes, checkers, and chess can be played, while there are splendid lawn tennis courts in summer and skating and curling rinks in winter. The bowling green is lighted at night by electric arc lamps; it is one of the best greens in the country.

The Company's Activities.

A co-operative store after the principle of the Lancashire and Scottish "Co-ops," does a good business, and the Company has established a savings bank, in which the earnings of their workers can be deposited, and upon which they receive interest at 5 per cent. per annum.

The Company also believes in proper food for its servants and runs a farm to supply pure milk to its employees.

Valleyfield has very fine schools, including the Gault Institute, which was built through the generosity of a former President of the Company. This school has already won an enviable reputation in the Province, and is carefully fostered by the Company. Free classes are maintained every night under the auspices of the Council of Arts and Manufacturers, and subsidized by the Government.

Outside of the Montreal Cotton Co. there are a number of other factories, including, especially, the flour mills of McDonald & Robb, and the fine new establishment of the Canadian Bronze Powder Works. All these work together to make Valleyfield an ideal factory town, and it is a typical place to study what can be accomplished by progressive industrial leaders to supply for their workmen the comforts and necessities of life.

CO-OPERATION OF WORKMAN AND EMPLOYER.

The interdependence of capital and labor was recognized in the action of the employees of a Chicago manufacturer recently. During the recent extreme stringency in the money market, when it was impossible for even the soundest of institutions to get advances from the banks, a score of the workmen provided enough funds to carry the manufacturer through two pay days. If more was needed they promised to provide it. The business which was being carried on was profitable. There was no reason for its discontinuance. Yet, as has been the case with a number of other industries, the inability to raise ready money might have necessitated the closing of the factory, and the throwing out of work of many employees. With the assistance thus received the manufacturer can continue his business, his employees will have steady employment, and those who have advanced money not only have the security of a prosperous business for their investment, but they have the additional personal satisfaction of having been active factors in preserving the business through which they earn their living.

Profit-Sharing Fire Insurance.

IN the practical working out of fire insurance business the cost, i.e., the rate paid by the assured, must cover the actual disbursements for losses, expenses, reserve and profit to the shareholders whose money is invested; this is the formula propounded times without number by the representatives of the Stock Fire Insurance Companies, and it has come to be recognized as their established creed.

The losses sustained are, of course, an uncontrollable and variable quantity; the Reserve is determined and defined by Government legislation, and whether the basis is right or wrong it must stand. The expenses and profit are two factors in the cost that the companies have entirely in their own hands, and both items have for many years caused much discussion and distrust amongst the policyholders.

The expenses, as is now well known, on Canadian business, have averaged about thirty per cent. of the premiums, of which considerably more than one-half has been given to agents and brokers by way of commission. The profits! Well the companies and their organs claim none have been made on Canadian business, and for proof appeal to the Government Blue Book since 1869 or some other date in ancient history. The companies and the public will never see eye to eye on this subject, and no good purpose can be served in discussing the abstract question.

Can the actual cost of fire insurance be reduced is the question that has been agitating the public mind for some time. That it can be reduced has been demonstrated by numerous successful Mutual Companies here and in the United States, and it is hoped that the companies organized under the auspices of the Manufacturers' Association, of which more will be said in our next issue, will add further convincing evidence on this point.

A further effort on somewhat different lines, but with the same object in view, is now about to be tried by Messrs. Burnett, Ormsby and Clapp, Limited, of this city, by issuing a policy which offers to the insured a share of the profit made in the working out of the class of business to be written thereunder. Particulars of this special policy will be found in our advertising columns.

Messrs. Burnett, Ormsby and Clapp have struck at the vulnerable point in inserting in the policy a guarantee that the expenses are to be limited to twenty per cent., and we cannot but heartily commend this movement as setting a good example, which might well be followed by those who so clearly have the power to place a limit on the controllable cost of getting the business. A saving of ten per cent. in this item means a reduction in the actual fire cost and corresponding benefit to those who avail themselves of the opportunity of taking insurance under the new (new for Canada, but old and well tried elsewhere) profit sharing policy.

We are interested in the reduction of the fire insurance cost, however it is accomplished, and we shall not only carefully watch the experiment being tried by Messrs. Burnett & Company, but we shall gladly encourage the use of the policy by manufacturers who are seeking a reduction in a direction where it may be reasonably looked for.

AN INTERPRETATION OF POLICY CONDITIONS.

The interpretation of the conditions specified in a Fire Insurance Policy is of interest to all manufacturers. We quote from the report of a recent decision:

"These two cases arose out of what, if one were to disregard the current euphemisms, would be characterized

as an attempt on the part of two fire insurance companies, which, I presume, consider themselves respectable, to defraud the plaintiff by refusing to pay him that part of his loss covered by their policies—and that on pretexts of the most flimsy character. The only thing about the defence that is to be commended is the admirable propriety and skill with which it was conducted in court by Mr. Raney and Mr. Eyre."

The above sentences form the introduction of Mr. Justice Riddell's judgment, issued this morning, in the cases of *Thompson vs. the Equity Fire Insurance Company*, and *Thompson vs. the Standard Mutual Fire Insurance Company*, tried at North Bay and Toronto.

From a Gasoline Stove.

The plaintiff had a furniture and drug store in New Liskeard, in Northern Ontario, and took out a policy of insurance in the Equity Fire Insurance Company on June 12th, 1906, for one year from May 25th, 1906. This policy was on the building, No. 214 Sharpe Street. He also had insured in the Standard Mutual Fire Insurance Company for \$1,500, including \$1,000 on the stock of drugs and \$500 on the fixtures, for twelve months from the 27th of August, 1906.

"Not being a qualified chemist," says the Judge, "and druggist himself, the plaintiff had in his employ in one branch of his business a member of that profession, Post by name. This gentleman was also a tenant of the plaintiff, and occupied the rooms above the store. He had a gasoline stove which he had used a very few times, and then discarded, leaving in it a small quantity of gasoline. On the 4th of September the druggist, desiring to make some 'fruit essences,—so called, I understand, because there is no fruit in them—for the soda fountain, and not having time for the longer process, brought down the discarded gasoline stove and lighted it, leaving it in the back room. In a short time smoke and fire were noticed. This, no doubt, was started from the stove. Every effort was made to extinguish the fire, but owing apparently to a break-down in the fire apparatus of the town, the attempt was unsuccessful."

Honesty is the Best Policy.

"I cannot part with these cases," concluded Mr. Justice Riddell, "without again deprecating the course taken by these companies. While at the bar, I had very considerable practice in insurance cases, and I think I may say that it was the universal custom of all respectable companies not to raise technical defences such as have been raised in these cases, except in cases in which there was well-grounded suspicion of fraud on the part of the insured. Judged even by the low ground of expediency, it was found for insurance companies, as for others, that 'honesty is the best policy.' And I must say it is rather against one's ideas of honesty and fair dealing that a claim such as this, having no suspicious circumstances and nothing to indicate aught but fair dealing, should be contested upon the grounds taken here. The court cannot prevent an insurance company taking advantage of everything law or practice entitles them to, technical or otherwise; but it might be well for insurance companies to consider whether such defences as these are not to some extent responsible for the feeling that notoriously exists in the country against them.

"The defences wholly fail, and there must be judgment for the plaintiffs for the full amount of the policies, with interest from a day sixty days after the receipt of the proofs of loss.

"The defendants will also pay the costs."

In using this extract *in extenso* from the *News*, we wish it understood that we have no desire to draw special attention to Mr. Justice Riddell's severe condemnation of the action of the two defendant companies. The point we desire to emphasize is that honest claimants may be deprived of their honest dues by frivolous objections by the insurance companies, and that "the Court cannot prevent an insurance company taking advantage of everything law or practice entitles them to, technical or otherwise."

It may safely be said that technical defences are the only ones upon which the Insurance Companies stand much chance of succeeding, and in only very rare and exceptional cases need the violation of the assured of a technical condition have rendered such a defence possible. For example, in the present case, the defence is based upon Section 10, Sub-Section "F," of the Ontario Statutory conditions, which reads as follows:

10. The Company is not liable for the losses following, that is to say:

(f) For loss or damage occurring while gasoline burning fluid, benzine, naphtha, or any liquid products thereof . . . is or are stored or kept in the building insured, or containing the property insured, unless permission is given in writing by the Company.

If the policies of insurance had been properly written, the permission provided in the last few words of the clause just quoted would have been secured, and the technical defence of the companies thereby avoided.

Mr. Justice Riddell in his judgment holds that the act of the insured's representative in using a gasoline stove to make some fruit essences did not constitute a violation of the condition in the Ontario Act previously quoted. Well and good. The technical pleading of the companies has, however, resulted in the practical hold-up of the assured from the 4th of September, 1906, during which time he has not only been kept out of his just dues, but even with a "win" to his credit is saddled with costs that cannot be recovered from the losing side.

This case is of much interest to manufacturers, because at some time or other gasoline, benzine, naphtha or some product thereof in larger or smaller quantities is used, kept, or stored by every one of them. If for nothing else than to prevent a technically inclined company using a purely technical defence, as employed in the case under review, all policies of fire insurance covering manufacturing establishments should provide the written permission to keep and use the articles referred to.

This, however, is only one phase of the question, but it enforces the suggestion made in these columns over and over again that the time to see that insurance policies are in order is before rather than after a fire.

JAPAN'S TRADE MARK LAWS.

Much criticism has been heard recently in some quarters as to Japan's inability or unwillingness to protect the trade marks of foreigners. The Japanese stoutly maintain that they do not discriminate against foreigners in the protection

of trade marks, and that their system of trade mark and patent legislation is strictly in line with that of many other countries.

The Japanese admit that the recent growth of trade in China proper and Manchuria may have produced some unscrupulous traders who are making dishonest profits by imitating not only foreign but Japanese marks also, but insist that such cases must be exceptional ones; and that if they really happen, the dishonest practice is not restricted to Japanese alone, as stories are often told of foreigners misappropriating Japanese trade marks in central and southern China in connection with earthenware, glassware, etc.

One Japanese journal says: "On our part, it is our opinion that confusion of trade mark rights is a phenomenon natural in newly opened markets, and it is especially difficult to avoid this in the present state of things in China. Japan, however, did not neglect to pay attention to this, and has been and is trying to suppress such illegal practices by establishing in China trade mark rights of all nationalities. For this purpose she has bound China in the additional treaty of commerce and navigation to enact a trade mark law.

"Were such law enacted in China, all foreigners would receive equal protection under one and the same law, and there could be no international difficulties about trade mark law. Japan's intention is honorable. She does not mean in any way to monopolize the Chinese trade, but simply to introduce into that empire an institution which is in force in all civilized countries, and to have the rights and interests of all foreigners respected and protected there. Of this there can be no doubt."

It is said that the first legislation as to trade marks was doomed to postponement for an indefinite time on account of objections from some of the foreign states. Japan listened to the arguments of these states, yielded to them as far as not inconsistent with her interests, and endeavored to bring about an amicable settlement, but in vain.

The spirit of Japanese legislation is to give protection to trade marks of prior use, but most of the marks offered for registration being new, she has adopted a system in which the title is given to the first registrant, instead of the first user, as is the case in some countries. The state of things in Japan led her to adopt the former system, and in adopting this system there is no discrimination against foreigners. Under the treaties of peace and commerce and the convention of the International Union for the Protection of Industrial Property, the subjects and citizens of the treaty powers and any other foreigners residing in Japan are said to receive the same protection as Japanese subjects regarding their trade marks.

If foreigners do not neglect to assume their rights, the Japanese law gives them sufficient protection, and they cannot justly hold the Japanese law responsible for injuries which are only caused by their own negligence. Besides, it is not Japan alone that adopts the "first application" system.

Of the principal commercial states in the world, there are eleven countries (Germany, France, Austria, Spain, Portugal, Denmark, Sweden, Switzerland, Norway, Canada and Brazil) where the same system is in force, against five (Great Britain, the United States, the Netherlands, Belgium and the Philippine Islands) where the "prior use" principle is adopted.

To sum up, there is of course the necessity of investigating whether or not there are any unscrupulous Japanese merchants trading in China who appropriate trade marks belonging to others. Suppression of such a dishonest practice is the avowed intention of Japan, and the Japanese say that in the sincerity of her desire to introduce into China a system of protection of industrial property for the sake of civilization and the development of commerce, Japan is next to none.

The Cotton Spinners' Visit

IN welcoming to Toronto, on Saturday, October 19th, the touring members of the International Federation of Master Cotton Spinners' and Manufacturers' Associations, the City and the Toronto Branch of the Canadian Manufacturers' Association welcomed the most important and cosmopolitan body of European manufacturers that ever crossed the Atlantic together. There were about one hundred and twenty in the party, of whom one half were British manufacturers, the remainder representing Germany, France, Austria, Italy, Portugal, Belgium, and United States. Six ladies also accompanied the party and enjoyed the entertainment provided by the city and the Toronto Branch. The International Federation, to which the tourists belong, is composed, as its name implies, of all the cotton manufacturers of the world, every civilized country being represented except Canada, and was formed in 1904, at Zurich, to protect the legitimate interests of the cotton industry and thwart the disastrous operations of the cotton speculators. Speaking of these operations, and their results, the President of the Association, Mr. Charles W. Macara, of Manchester, England, said:

"An evil infinitely more prejudicial than the fluctuations in the cotton crop has been the opportunities that have been given to men, who neither grow nor spin cotton, nor are legitimately engaged in its distribution, to bring about ruinous fluctuations in the price of the raw material. The burdens imposed and the disastrous influence of these operations upon all who are legitimately concerned in the progress of the industry, which is second only in importance to agriculture itself, cannot be exaggerated. It has led to the dislocation of business, to the stopping of mills, and to the ruin of many, including not a few of the speculators themselves. To such lengths has the evil extended that the need for a world-wide organization to combat the operations of the speculators was brought home to all Europe four years ago."

It will thus be seen that the organization has a solid foundation and legitimate ends to pursue. An idea of its importance can be gained when it is known that the Association represents 76,000,000 spindles, practically all of the cotton mills of Great Britain and Europe.

The visit to America and Canada, just completed, was organized primarily for the purpose of attending the second International Conference of Cotton Growers and allied interests, held in Atlanta, Georgia, Oct. 7, 8, 9, 1907. Subsequently a tour was arranged through the cotton fields of United States, where time was spent in inspection of the plantations and methods of handling the crop. The tourists then proceeded to St. Louis and Chicago, and thence to Toronto, which was the only Canadian city visited, on October 19th.

The party, which travelled in a special train, was met at St. Thomas by the Secretary of the Toronto Branch, who accompanied them to Toronto. Owing to delays at the Detroit River, and a bad engine on the Michigan Central, the train was over two hours and a half late in arriving at the Union Station. This, however, did not dampen the enthusiasm of the Civic Reception Committee, and the members of the Association who met them on arrival and conducted them to electric trolley-cars, in which they were conveyed to the City Hall. The Mayor received the party in the Council Chamber, which was handsomely decorated for the occasion, making a happy speech of welcome, which was replied to for the visitors by their President, Mr. C. W. Macara. Taking the trolley-cars again, the party proceeded up University Avenue through the University grounds and Queen's Park, to the Parliament Buildings, where they were received in the Council

Chamber by the Premier, Hon. J. P. Whitney, Hon. J. J. Foy, and Hon. Thomas Crawford. After the customary speeches the party proceeded on their drive through the chief residential sections of the city, arriving at McConkey's Restaurant at six o'clock, to partake of the dinner given in their honor by the Toronto Branch.

Over one hundred and fifty sat down at the dinner, which was one of the most successful functions ever given by the Toronto Branch. The Chairman of the local entertainment committee, Mr. J. S. McKinnon, presided over the gathering in admirable fashion, and seated at the head table with him, in addition to local public men, were representatives from nine different nations, including the President of the Association. After the dinner had been done justice to, Mr. McKinnon introduced the toast list in a very happy and clever speech.

Greetings were also given by Mr. E. J. Freyseng, Chairman of the Toronto Branch of the Canadian Manufacturers' Association, Mayor Coatsworth and Hon. J. J. Foy. On behalf of the visitors a happy reply was made by Mr. J. R. Barlow, Manchester, one of the largest manufacturers of cotton goods in England, and brother of Sir Edward Barlow, the King's physician. Mr. Barlow repeated an invitation previously extended to Canadian cotton manufacturers to join the Federation.

Dr. S. Morley Wickett spoke of the resources and economic conditions of Canada. He said there were 1,500,000 spindles in this country, but these could not supply the home market. Mr. J. S. Willison, Editor of the *Toronto News*, spoke of the spirit of toleration in the Dominion. Hon. Thomas Crawford proposed the toast to the guests.

The following spoke for the Europeans, the Frenchmen and Italians conveying their messages by means of their own languages—France, Mr. Daville Motte; Germany, Mr. Erich Fabarius, of Bremen; England, Mr. J. B. Tattersall, of Oldham; Austria, Mr. J. G. Haeble; Italy, Dr. Tullio Fosati, of Milan; Belgium, Mr. M. Buysse; Portugal, Mr. H. P. Tavira. For the United States Mr. G. O. Draper spoke.

An orchestra played during the dinner, which was further enlivened by the singing of three patriotic songs, by Mr. Frank Bemrose, and altogether a very enjoyable evening was spent. The party broke up at nine o'clock, when the guests were conducted around the city in small groups by the Toronto members present, and afterwards to the station, their special train pulling out at 11.30 p.m. While the banquet was in progress the ladies were taken to the Princess Theatre, by a small reception committee of Toronto ladies, where they enjoyed the performance of Sir Gilbert Parker's "Right of Way." The visitors all expressed satisfaction with the entertainment provided for them in Toronto, and went away loud in their praise of the beauties of the city.

They went from Toronto to Niagara Falls, where they spent the day following, sailing from New York on October 22nd. It was indeed a privilege for the Toronto Branch to entertain such a fine body of gentlemen, and the only regret is that they will never perhaps be passing this way again.

Mr. Hugh C. McLean, publisher of "The Commercial" and "The Western Lumberman," has purchased the C. H. Mortimer Pub. Co.'s trade papers. These papers include the "Western Canada Contractor," "The Canada Lumberman," "The Electrical News," "The Architect and Builder," and "The Contract Record." It is understood that the latter papers will be published altogether separately from Mr. McLean's original papers.

A Fight for Access to the Waterfront

THE City of Toronto is in the thick of a fight for the free use of its waterfront. It is a phase of development that most other large cities have had to pass through. It marks the passage from the stage where traffic was comparatively light, and as a consequence there was no great danger from level crossings, to the stage where both railway traffic and the ordinary traffic on the streets have grown so great that serious inconvenience and danger are caused.

The leading commercial and industrial organizations in the city have placed themselves on record as strongly favoring the elevation of the tracks, allowing only one track on each side on the level for switching purposes. As it is now, a wide expanse of railroad tracks stretch along the entire harbor front, making passenger traffic to the boats dangerous,

the problem grew. While at first Yonge Street was alone considered a pressing danger, now the need for improved conditions is felt from one end of the city to the other. Accordingly a viaduct is now demanded which will carry all the tracks above the street level, with the exception of tracks for switching purposes, the latter to be used only during certain hours of the night.

A number of considerations have to be kept in view in a case of this kind. The fundamental reason for demanding track elevation is that the public should be allowed the easiest possible access to the water. Heretofore, for various reasons, the water has not played a very important role in Toronto's transportation problem. This condition is not likely to obtain in the future. Apart, too, from the direct benefit secured,

The elevated tracks as advocated by the commercial and other interests,

and impeding the free use of the harbor for freight transportation.

The discussion which has been going on in the press and at representative gatherings of business men and citizens generally, has brought forward the whole relationship of the railways and the public so strongly that the local question has become of national interest. The results will be a fair test of the strength and influence of public opinion when intelligently directed.

It is almost a generation since the question first arose. Since then the contest has been waged chiefly around the Yonge Street bridge. When a level crossing became a peril to life, was it the duty of the railways to build a bridge over the tracks at their own expense, or was it distinctly a municipal affair, or should both contribute to the cost? The argument shifted backward and forward, with now the advantage resting with the railways, and now with the city. But this argument was not without avail. The necessity of getting some uninterrupted access to the water became firmly established.

But with the growth of the city and the constantly increasing number of trains, added to last year by the entrance of another Railway Company into the city, the importance of

there is a distinct advantage in having the competition present. For these reasons it is of first importance that there be no hindrance to the extended use of this facility.

The elevation, however, should be such as to cause the least possible disarrangement to existing conditions. All along the right of way factories are located, with sidings connecting them to the main tracks. The elevation of all the tracks would necessitate the rebuilding of many of these factories, which have been specially arranged for receiving and shipping goods on the level. To overcome this difficulty, and to obviate any hardship, it is urged that a track be run on the level on each side of the viaduct, and that these two tracks be connected with all sidings. However, in order that there be no interruption to vehicular or pedestrian traffic, these tracks should be used only at specified hours at night. In this way the desired results would be attained at the least expense and inconvenience.

The apportionment of the cost of the work is of importance, as it will no doubt govern the procedure in future cases. This, however, as indeed the whole of the project, rests in the lap of the gods, or, to be exact, the Railway Commission. The case has been presented from all standpoints. The outcome will be awaited with interest, if not with patience.

The Promotion of Employees.

By J. F. GAIRNS

THE selection and advancement of employees is a question of the utmost importance in modern commercial and industrial business, but it is so complicated by the many side issues, and it is so difficult to classify its various aspects that the following remarks can only be considered as an attempt to review the main features of policy in reference thereto as they affect the employee and the employer.

As regards the employee, the writer proposes to consider the relative importance of the various qualifications for promotion, bearing in mind also the great differences which are created by the different professions and industries, though there is really more standardization in this respect than may appear at first inspection.

As regards the employer, the same factors will be considered, but from a different aspect, though there is considerable correspondence between them in most cases, with the object of setting forth what are, in the writer's opinion, the main considerations which should govern an employer's policy in reference to the promotion of his employees or the alternative introduction of outsiders to fill vacant positions or new posts.

In all cases a ruling consideration will be that a modern business is a money-making concern, and not a philanthropic institution.

In default of a satisfactory method of classification, the various qualifications for the promotion of an employee will be first considered, both from the employee's and the employer's standpoints, concluding remarks dealing more specifically with the advantages and disadvantages of the "promotion" and "outsider" policies, favoritism and influence and a few general features of the whole subject.

Seniority.

For the purposes of our subject this may be considered as a qualification, though it is an impersonal one.

In large establishments where many employees are engaged on the same or similar work capable of classification in a few main divisions, promotion by seniority may, and often does, answer fairly well, but as a general principle it is unsatisfactory, both from the employer's and employee's point of view. Such a policy tends to mechanical work; initiative is at a discount; the incapable man has as good a chance as the capable man, though the latter usually has to make up for the deficiencies of the former, but without corresponding advantage; work may be neglected or be indifferently performed and, so long as he does not go too far, an employee is in a fairly safe position, while superior officers are comparatively helpless in dealing with the matter, even if they are inclined to do so, which is frequently not the case; work is done without thought as to its bearing on other sections; and altogether a premium is placed on incapability, while capability tends to become degraded. It is true that where promotion by seniority obtains a few opportunities must also occur for promotion for other reasons, but unless such opportunities are frequent, what has been said above is substantially correct.

As an example of the above, civil service departments may be instanced, though in some cases the actual work required to be done tends to prevent some of the unsatisfactory features mentioned becoming characteristic. A usual and almost inevitable corollary to the promotion by seniority policy, and one which is most associated with civil service departments, is the fact that in such cases employees are

rigidly classified in grades, and it is extremely difficult for an employee to become transferred from one grade to another, except in early years when examinations are available.

Promotion by seniority possesses some good features, but not many, and where it is satisfactory it will be generally found that other factors are really responsible.

Honesty.

Of the personal qualifications this is undoubtedly the one to be considered first, but in practice honesty is not always the most important.

For positions of trust and where the person concerned has to be trusted to work for the welfare of his employer though he has opportunities for doing otherwise, honesty is most important. But cases are common where a man is promoted for capability without special honesty or in order to ensure his honesty, because it is to his interest to be honest. It is not always the honest man who is promoted, even if he also possesses other qualifications, and there is many an instance where the man noted for his honesty is still in a subordinate position, while others less morally trustworthy have been promoted over his head, maybe time after time. The truth is that where honesty is all-important, then the honest man has a special opportunity, but where dishonesty is made difficult then it is other capabilities which govern promotion.

Orderliness, Neatness, Correctness and Painstaking Work.

These are very desirable qualifications, but they are sometimes somewhat out of place. A man who possesses these characteristics is very useful for some kinds of work, book-keeping on a large scale especially, but in many instances these are subordinate requirements. It very often occurs that the orderly clerk, or the splendid writer, or the absolutely correct accountant is rather superfluous. System and checking will discount these capabilities to some extent, especially if averagely capable men are available, whose mistakes are few and far between, while the typewriter has placed handwriting in a very secondary position. Moreover, it is very unusual that these capabilities tend to mediocrity in other respects, for the man who is scrupulously exact in everything, sometimes superfluously so, is often too much concerned with details to be able to grapple with matters of serious importance and emergencies.

In industrial work these characteristics are important, for they usually make good a certainty, but even there it often occurs that they also entail slowness of production and sometimes make work unprofitable. The work when done may be eminently satisfactory, but in very many cases work less perfect is equally satisfactory.

Reliability.

There is reliability and reliability. The man whose work can be depended upon without supervision, especially in respect of details, is a very useful assistant, for he leaves his superiors free to deal only with main items. But even in this connection there is another side, for associated with reliability one often finds a narrowness of ideas, an indifference to things with which the reliable individual is not concerned, and a tendency to labor detail considerations in preference to broader matters.

Thorough Knowledge.

For good work this is essential. The man who half knows his work rarely possesses many other qualifications for promotion; but thorough knowledge is only obtained by understanding as distinct from mere routine learning. There are many employees who can do one thing perfectly, simply because they are always doing it, but this only qualifies them for similar positions, and thorough knowledge implies more than this if it is to be a qualification for promotion.

Special Knowledge.

This usually implies that a man has exercised initiative and capability and that he realizes that to possess special knowledge is to render himself eligible for special positions. In a narrow sense this amounts to specialization and is not a qualification for promotion, except when a special man is required to do special work; but in a broader sense specialization means that a man has made himself master of a particular branch of industry in order to make himself indispensable or an acquisition to an employer. In many cases such a specialist develops his own promotion, for by proceeding on special lines a desirable position is often created as business develops.

Common Sense or "Gumption."

The candidate for promotion should cultivate this qualification. While a man is only one of many doing the same or similar work, a general knowledge of his work is usually sufficient to carry him through, but it is this indefinite quality, often termed "gumption," that lifts a man above his fellows and enables him to cope with difficulties. Many a man with indifferent training or experience is really a better workman than men who have had the best of training and long experience, simply because he can use his brain to help his hands, and because he can see a little way beyond his nose.

Initiative.

In many respects this is the same as the preceding, but not wholly so, for initiative goes a step further. A man possessing "gumption" can deal with what comes before him, but an initiative man will often develop beyond that. Moreover, an initiative employee quickly becomes a marked man for selection for favored work, and, as opportunities occur, for promotion also, for he can deal with matters which arise out of his work as well as with the work itself. Further, he is naturally a leader of men, and this alone is a qualification for a controlling position.

Originality.

This again corresponds very closely with "gumption" and "initiative," but proceeds a step further. An initiative man can originate developments, but the man who possesses originality can often introduce a new method of doing things, a new system, or can effect improvement in existing methods and systems.

In inferior positions originality is sometimes at a discount, for new methods are not desired or required, but in superior positions, and especially after the early stages of promotion have been effected, it is the man with originality who comes to the fore. There is, however, a limit to originality as a valuable asset. If carried beyond applicability and due regard for existing methods and circumstances, the original man may be somewhat of a nuisance, but in such cases it generally means that there is originality without "gumption."

The remaining qualifications for promotion belong to a somewhat different class.

Supervision, Management, and Control Capability.

These are undoubtedly the principal qualifications for promotion, for although it occasionally happens that a promoted man occupies a superior position solely in reference to his own work, as a rule promotion also entails control over one or more assistants, and the promoted individual is generally brought into connection with other people's work or the work of other departments.

It does not always follow that the best workman is the best man to control others on that work, or that the best controller is the best workman. Indeed, the reverse is more often the case. The old proverb, "Practice what you preach," is a very praiseworthy and generally correct maxim, but it often happens that the person who is most capable of directing and supervising the work of others is only an average worker himself. In fact, it is not always necessary that a good controller shall even know the work in all its details, but as a rule such knowledge is essential to efficient management and control.

Management and control capabilities are to some extent natural gifts, but they can be cultivated, and without such capabilities it is unlikely that the most honest, conscientious, painstaking, correct and reliable man will be a managerial success. Things may go smoothly, but unless there is managerial ability a department thus controlled lacks strength and consistency.

It is therefore probable that many apparently unfair promotions at the expense of long-service, trustworthy men are really evidences that an employer has acted most judiciously in the interests of his business.

In addition to capability for the management and control of men or of a section of work, self-management and self-control are also necessary for efficiency. There are many instances where the personal equation of the manager or controller is quite as important as regards himself as it is in reference to those under him.

Tact.

How many promoted individuals have come to grief because of want of tact, it would be impossible to estimate; but the man who has tact usually controls a harmoniously working and efficient department. It is tact that enables him to deal with those under him, with those on an equality with him, and with those above him in such ways that harmony is maintained, work progresses smoothly, and his department developed.

Relative Value of Above Qualifications.

Having thus considered the various qualifications for promotion, their relative importance as they appeal to an employer must now be dealt with, though briefly. For this purpose we must consider that a model employer is in question who considers things principally from a strictly business point of view, though with some humanitarianism, and who is capable of estimating things in a fair and unbiased manner.

Honesty, conscientiousness, painstaking work, reliability, neatness and orderliness are very desirable, but there is many a man possessing all these capabilities who is continually being passed over for promotion. As a rule he is quite unable to understand why this should be, and is correspondingly aggrieved. But his employer, and probably also many of his conferees, know that he does not possess initiative, management capability, and capacity for responsibility. Many a man by his experience has shown the truth of the saying, "A good servant may be a bad (or incapable) master," and conversely there is equal truth that "A bad servant sometimes makes a good master."

As soon as one takes a leading position, it may be as foreman of a department, clerk in charge of an office section, store-keeper, chief draughtsman, or it may be as a district representative, traveller, works manager, or general manager, then the primary requirements are, given knowledge of the work, initiative, management, capability, common sense or "gumption," and, above all, "tact." For real satisfaction, the other characteristics previously mentioned are necessary in a degree, and honesty and conscientiousness are generally required as a *sine qua non*, but initiative and capability are really more important.

When, therefore, a level-headed and fair employer has to fill a special post, or is creating a new position, he has to decide, not merely which employee most deserves promotion, but which employee is most capable. And sometimes the best solution is the introduction of an outsider. In the case of assistants who have developed their own work, or where promotion is the natural outcome of circumstances, no difficulty is experienced; but such cases are really outside our subject.

In many businesses, and especially in those associated with particular industries, the practice is to promote employees very rarely, if at all, outsiders being introduced to fill vacancies in preference; and there is a good deal to be said for such a policy. And when it is a general or fairly general policy, little or no hardship is entailed upon the employees; for although they may not be able to obtain much promotion by staying with particular employers, they are eligible for special posts with other employers, and are often specially fitted for them.

A man who is promoted over his companions is not always in a desirable position. His previous equals resent his superiority, and he himself is at a disadvantage in dealing with them. And his previous superiors cannot or will not always adapt themselves to the new conditions, nor can he always do so on his side. By changing his employer, however, a man is often able to show his capabilities in a way that he could not do by remaining in one employ, even if promoted. We thus have, besides the question of the promotion of employees, an alternative policy, that of the introduction of outsiders for special positions, forced upon our consideration, and it will be interesting to briefly summarize the advantages and disadvantages of the two policies.

I. Promotion of Employees.

1. Good service and merit are rewarded.
2. An employee is encouraged to do his best for his employer.
3. Promoted employees are familiar with the ins and outs of their employer's business and with peculiar methods.
4. Employees develop with their employer's business.
5. Encouragement is given to employees.
6. The interests of an employer become those of an employee.

II. Introduction of Outsiders.

1. A man occupying a promoted (to himself only) position is free to show his capabilities.
2. Men become familiar with the methods and practices of more than one firm.
3. Knowledge is extended.
4. Employers benefit from the introduction of men having experience other than their own.
5. Knowledge, capability and experience are at a premium.

On the other hand, the disadvantages of the two policies may be similarly expressed:

I. Promotion of Employees.

1. Non-promoted employees may be aggrieved and disheartened.
2. The promoted employee is not necessarily the most capable one, though he may be the most deserving.
3. There is a tendency to stagnation, for a promoted employee usually carries on, the methods and practices of his predecessor.
4. A promoted employee may occupy an anomalous position in dealing with those below and above him.

II. Introduction of Outsiders.

1. Employees passed over by newcomers may be aggrieved and disheartened.
2. The newcomer is somewhat of an interloper, and though he knows his work, he does not know the peculiar methods of his new employers.
3. Other ideas or familiarity with other methods will not always work well with those of the fresh employment.
4. A new man can quickly make enemies of those with whom he has to work, or with those below or above him, but it is less easy to change them to friends.
5. The interests of employees need not coincide with those of an employer.

It will be seen that in both cases (1) is the same, but when the introduction of outsiders is a usual policy, it is of little importance, for when it is known that particular men are introduced for particular positions, inferior employees realize that their own opportunities are to obtain similar positions somewhere else.

So far we have considered that employers are always judicious and level-minded, and that they act rightly and for the good of their businesses, humanitarianism being only introduced where it agrees with commercial acumen.

But, unfortunately, not all or nearly all employers fulfil these conditions, any more than all employees possess the required characteristics which render them eligible for promotion.

Many an employer acts injudiciously in regard to the filling of vacant positions. Sometimes humanity overrides proper business consideration. Sometimes the maxim that "a money-making concern is not a philanthropic institution" is carried to an extreme. In other cases the claims of kinship, friendship or acquaintance, influence and favoritism override the claims of merit, capability and fitness for a post. Further, it is nothing unusual for personal liking, prejudices or idiosyncrasies to outweigh judgment. Also there are many cases where principals or superior officers have the responsibility of decision without having the facilities for proper knowledge to guide them; and in other cases superior but subordinate officials can exert an influence that militates against the promotion of those employees who should be considered, and the writer has seen it seriously argued in reference to a large business having many ramifications, that it is better for a subordinate to become known to his principals for his misdoings than not to be known at all, for sometimes where applicants for promotion are all unknown, it may be that the familiarity of a name, the cause for such familiarity being overlooked or forgotten, may be the sole reason for a particular promotion.

It therefore behooves all employers, particularly those in control of extensive businesses, or chief officials themselves, responsible for the promotion or otherwise of employees beneath them, not only to act with proper regard to the well-being of business, but also with proper regard for their employees or subordinates.

Having thus reviewed briefly the principal considerations which affect this subject, a summary can be made as follows:

(1) In ordinary routine and mechanical work, the promotion of employees is a general practice. In fact, in the usual way, it occurs in the natural course of events and development.

(2) For superior positions, where a knowledge of methods and practices of a particular business, as distinct from the practices of businesses of similar kind, are concerned, promotion of employes is best, for the reason that the man who has worked up is usually the only one who can know the details necessary for control.

(3.) For superior positions, where knowledge of the methods and practices of a particular trade or industry, as distinct from the methods and practices of a particular firm, are concerned, the introduction of outsiders is often a preferable policy.

(4) Honesty, conscientiousness, careful and systematic work, and like characteristics, while desiderata, are not necessarily the only or principal credentials for promotion, though honesty and whole-heartedness may be said to be requirements in all cases.

(5) Managerial and controlling capabilities, initiative and tact are, as a rule, more important reasons for promotion than the characteristics set forth in (4).

(6) The combination of (4) and (5), though rather rare, should provide a practically certain argument for promotion.

(7) Humanitarianism and regard for employees should be introduced as far as possible, but in a money-making concern may not always conduce to the well-being of a firm, if carried to an extreme.

(8) Initiative and originality should be encouraged.

(9) The interests of an employer should be, or should be made to be, those of his employees.

(10) Harmonious relations should be cultivated between employer and employee, and between superior and other employees.

(11) Promotion, if a recognized policy, should be made with discretion, and with due consideration as to the possession of the necessary qualifications by the employee promoted.

(12) If promotion is not a recognized policy, usual methods should not be departed from without very good reason. At the same time, the promotion of a specially capable man will probably give general satisfaction.

(13) Specialization is good to a degree, but should not be a fetish with employees.

(14) Favoritism, influence, personal bias, prejudice, unreasonable selection and the claims of kinship or acquaintance should not be factors in deciding as to the promotion of employees. It sometimes occurs that such promotions are justified in practice, but that is due to the fact that the man promoted or appointed possesses the required capabilities.

(15) Just as the possession of certain characteristics in that others may be a bar to promotion of an employee, so judiciousness and level-headedness, with proper consideration before action, are required in the case of an employee or of officials responsible for promotion of employees or the introduction of outsiders.

A good deal more could be said on this subject, but enough has been said to indicate that the responsibility of the employer in deciding as to his promotion policy is great, while the characteristics required to fit an employee for promotion are also varied. As regards an employer who does not possess the necessary qualifications for correct decision, it is impossible to lay down any rules or to systematize the situation, though it is hoped that perusal of the foregoing may be useful in some such cases.—*Cassier's Magazine*.

BANQUET TO MR. G. A. VANDRY.

A complimentary banquet was tendered Mr. G. A. Vandry by a representative gathering of members of the Canadian Manufacturers' Association, on his return from a trip around the world recently. The Chateau Frontenac was the scene of the function, which was honored by the presence, in addition to the guest of the evening, of Hon. J. D. Rolland, President, Dr. Morin, Quebec Vice-President, Major T. S. Hetherington, Chairman Quebec Branch, and many other prominent members of the Canadian Manufacturers' Association.

After the dinner, Major T. S. Hetherington, who presided, proposed the health of Mr. Vandry. He referred to the fine business ability which he had exhibited in his management of the Paquet Company, and expressed the warm appreciation of him by his colleagues in the business world. The toast was received with great enthusiasm.

Mr. Vandry, after thanking his friends for their exceeding kindness, spoke of the pleasure he had felt in hearing of Mr. Rolland's election to the Presidency of the Association. He recalled that seven-eighths of the members were English-speaking, and so the election of a French-Canadian was a remarkable act of courtesy. Acts like that of the election of Hon. Mr. Rolland were to the honor of the English element. The descendant of a noble and proud race, the French-Canadian was sensitive to kind deeds, and his English fellow-members might rest assured that the act would be fully appreciated.

He then went on to describe his trip. Passing over the British Isles, Germany and France, which those present were acquainted with, he gave a most interesting account of the people and customs of Russia, Siberia and Japan. He also discussed the condition of Western Canada as he found it on his return to Vancouver. Mr. Vandry's speech was listened to with great enjoyment.

The health of Hon. J. D. Rolland was proposed in felicitous terms by Dr. Morin, and responded to by the President. The health of Major Hetherington and Mr. Geo. Amyot were also honored and appropriate replies were made.

CATALOGUES.

"The Factory Behind the Bearing" is the title of a booklet recently issued by the Chapman Double Ball Bearing Co., of Toronto. It contains an entertaining account of the evolution which has found its completion in the double ball-bearing. The discussion of the subject of friction is of inestimable value to users of machinery. The booklet is illustrated with views of the factory in which the bearings are made and the completed parts. A copy will be sent on application.

Specialties—Commercial and Miscellaneous is the name of a monthly publication issued by The Armac Press, Toronto. These enterprising commercial printers are interesting the public in their work by the excellence of their advertising ideas. The present number is fully up to the standard which they themselves have set.

The Goldie and McCulloch Co., Ltd., of Galt, have issued a catalogue which will be of great interest to the users of all classes of engines. The Ideal engines have been kept well before the public and their merits are fully recognized. The present catalogue, No. 6, shows illustrations of the various types of high-speed engines, with description and specifications. The catalogue will be sent to any address on request.

An attractive booklet has been issued by the city of Calgary, Alta. Besides giving a statement of the present industrial condition of the municipality, it contains the annual report of the Board of Trade, and an outline of what is being done to bring factories to the West. The booklet is artistically and effectively gotten up.

Book Reviews

A BOOK WORTH READING ON INDUSTRIAL PROBLEMS.

Mr. Henry Wood is the author of a useful little book, *The Political Economy of Humanism*, recently issued by Lee & Shepard (Boston). Writers of this class are gradually educating and moulding the reading public to conservative views on many irritative industrial problems. It is unfortunate that their books are so little read by the mass of workingmen and women. When so-called labor leaders are allowed to address meetings of laboring men and make assertions that are as false and misleading as themselves, the conviction comes home to one that the daily and monthly press have a great public duty to perform in counteracting irresponsible influences, and giving everyone the benefit of responsible investigations.

The present writer is an advocate of labor organizations; but he frankly points out certain defects that are worth studying: Labor unions, he says (1) Are adopting in spirit and temper an antagonistic attitude to capital; (2) Discouraging individual industry and excellence and tending to wards dependency; (3) Compel thoughtful workingmen to surrender themselves to others whose judgment is often faulty or prejudiced; (4) Are tyrannical towards all non-unionists; (5) Tend thus towards a levelling, coercive socialism.

He points out, also, the obligations, and privileges of employers, the abuses of corporate powers and the needs of industrial education. His style in writing is pleasing and his judgment most helpful. Let the daily press, who are handing over labor columns to labor agitators, use that space to reproduce and disseminate such thoughts as are contained in this small volume.

THE FEDERAL POWER OVER CARRIERS.

The Macmillan Company, of Canada, have just issued a book on this subject, by Mr. Z. Parmelee Prentice (\$1.50). Now-a-days constitutional questions are again becoming painfully prominent. As in the United States so in Canada, legislators and students are having to reconsider the distribution of powers between federal and local governments in the light of modern needs. The distribution is one of expediency, whether the policing is to be municipal or provincial or federal; whether street railways are to be regarded as part of the federal domain, etc. It is the extreme importance of what is expedient that is forcing people to retrace their steps back to the mass of later legal decisions. This stands sure: control of corporations of whatever kind, in the interests of corporations themselves, must be made effective. Justice must be expedited and democracy safeguarded.

AMERICAN IMMIGRATION.

"Races and Immigrants in America" is the title of a most interesting volume by Professor John R. Cummins, of the University of Wisconsin, just issued by the Macmillan Company of Canada (Toronto, \$1.50). No more vital problem can one find for American citizenship than the subject there dealt with, and it appeals naturally to Canadians who are meeting many of the same knotty problems in national development.

On the slender original parent stock in the United States has been grafted many a branch until the result has come to be something radically new. The Americans are not English-

men. They are a twentieth century melange of Europeans exploiting the great national resources of a big country under a political constitution, framed on an old English model, speaking the English language and inspired by big, good-natured ideals. They fascinate one because they are so endlessly curious and potentially so overwhelming an influence in the world's social and political evolution.

Did you ever stop to think what the world would have been had not the flood gates to the new world been opened for a century to the downcast and oppressed of Europe? Emigration is the strenuous attempt to do better. It is the angel of hope. For a number of years it looked as if the United States was to be composed mostly of Germans, Scandinavians and Irish. Of late years the flood has turned from north to south Europe, and Italians, Greeks, Hungarians, and Jews are the new elements offering.

Industrially the United States has been long leaning on these new comers. Were it not for them much greater attention would have had to be given to apprenticeship and technical training. The popular interest now being taken in technical education is therefore significant. It means that the great mass of workmen have come to see that to give skilled work to the foreigner is suicidal for the native artisan. The newcomer for the time being is naturally willing to work harder than ever. He is a stranger in a strange land and must sink or swim through his own exertions. He probably is without a family and for a time is able to underbid all competition.

Professor Cummins looks on the Trade Union as one of the great organizers of these new comers. As soon as workmen become economically equal they reach the level of American citizens, and Negroes, Jews and Gentiles become unionists, answer to the call of some Irish organizer and promulgate ideals against the sweat work they themselves have passed out from. The author does not fail to note with an air of regret and concern that the Saxon stock of the West is being seriously depleted by the immigration of farmers to Canada, who sell their homesteads to newer comers, usually of some non-English strain.

5,000 FACTS ABOUT CANADA.

A new edition has already been called for of the booklet containing "5,000 Facts About Canada," compiled by Frank Yeigh, of Toronto, and issued by the Canadian Facts Publishing Co., of that city, at 25 cents per copy. Nearly 20,000 have been sold in the few weeks since its appearance, the demand therefore coming not only from every part of Canada and the United States, but the British Isles and Empire. The publication certainly measures up to its claim of being "worth its weight in Yukon gold or Cobalt silver," and a copy should be in the hands of every intelligent Canadian.

Some years ago a fleet of British colliers was sunk during a storm in an English harbor, and remained under water for five years before being salvaged and brought to the surface. An examination of the coal showed that it had kept its value for steam purposes, and this led to some experiments by the naval authorities, which settled beyond all doubt that coal stored under water did not deteriorate as when stored in the air. Taking heed of this conserving power of water, the Western Electric Company is building flooded coal pits at its plant at Hawthorne, Ill. The excavation is 320 by 75 feet and 12 feet deep, built of concrete, and divided into twelve pits. The coal is dropped directly from the cars, which pass over the pits, and the fuel is removed when desired by means of a steam shovel.

TRADE WITH JAMAICA

MORE than once of late it has been pointed out that Jamaica provides a natural market for Canadian products, which has never received the attention that it deserved. The British West Indies occupy a peculiar position geographically and politically. They are cut off to a large extent from all other parts of the Empire, and they are placed in close relationship with a commercial and industrial country that would naturally exercise a predominating influence over them. Placed at the very doors of the United States, they are in the somewhat unfortunate position of growing almost exclusively things which are grown within the American Republic, and so they are placed at a disadvantage in dealing with that country.

The nearest market within the Empire is Canada, and it is to this country that the people of Jamaica are now turning their attention. That a closer trade relationship between the two countries would be of benefit to both is shown by even a casual glance at the trade figures.

Before discussing the reasons why a profitable trade could be done between Jamaica and Canada it might be well to look at some figures for some years back. At present the United States have the lion's share of the business. The following comparison shows the value of goods exported to Jamaica from Canada and from the United States for the year before last. Last year's figures are not yet complete, but they indicate little change from those herein given:

	From Canada.	From U.S.
Ale, beer and porter	\$.....	\$13,948
Animals, living	11,534	360
Bread and biscuits	268	36,222
Cheese	32,655	37,648
Butter and its substitute	5,747	17,369
Drugs, medicines, etc.	1,528	47,922
Fish	458,800	201,558
Flour	14,688	760,796
Lard	11,787
Leather and manufactures of	287	168,980
Meats	141	196,987
Metal and manufactures of	543	274,971
Spirits and wine	205	8,278
Textile manufactures	876	203,558
Tobacco	78	6,059
Vegetables (fresh)	8,278	10,361
Wood and timber	8,015	262,177

There is scarcely an item on this list which Canada could not sell to advantage. The biggest imports are of flour, meats, fish, metals, textiles, wood and timber, and leather. We are in as good a position to sell these as the United States. The sentiment is in our favor, the people would prefer to purchase their supplies from us, we have the goods to sell.

Why, then, is such a large percentage controlled by the United States? There are two chief reasons which naturally suggest themselves. First is the fact that New York enjoys a better and more frequent freight service than do the ports of Canada. This is but another example of the great bearing of transportation on the problem of trade. Time and cost are the factors, of which the first is not the least. When a merchant wants goods he usually wants them promptly. The time at present taken for an order to go to Canada, be filled and the goods to be shipped to Jamaica, is a great barrier to trade. Increased steamship service, with faster time and proper

cold storage equipment, is a *sine qua non* of a satisfactory commerce.

The second important reason for the United States' trade being greater than Canada's, consists in the fact that the manufacturers and merchants of the United States have a proper appreciation of the importance of the market. They go after business. To sell a people goods it is necessary to understand their needs. It is not sufficient to say that certain goods are correct, that they are the most effective for the purpose, that their build is the best. Local ideas or prejudices have to be considered. The British manufacturer has been frequently criticized for this very thing. He has refused to adapt himself to different conditions. There is a limit to the advisability of trying to sell a man what he ought to want instead of what he actually does want.

So the personal representative accomplishes a double purpose. He secures business which it is impossible to get by correspondence alone, and he keeps in touch with the actual consumers. He gets to understand their viewpoint and he caters to it. Canadian merchants are probably not in a position to get after business in this way, but it is essential that some similar scheme be worked out, either by joint representation or some other system whereby the market can be understood and personally worked.

The source of Jamaica's supplies is given in the following tables:

Live Animals, Food, Drink and Narcotics.

United Kingdom—		P.C.
1903-4	£155,725, or	19.7
1904-5	144,223, or	21
1905-6	160,400, or	22.1
United States—		
1903-4	460,930, or	58.3
1904-5	397,038, or	59
1905-6	380,919, or	52.5
Canada—		
1903-4	133,788, or	17
1904-5	112,465, or	16.4
1905-6	148,044, or	20.4
Other countries—		
1903-4	39,516, or	5
1904-5	30,114, or	4.6
1905-6	36,309, or	5

Raw Materials (Exclusive of Coal).

United Kingdom—		P.C.
1903-4	£86,653, or	80
1904-5	60,166, or	61.7
1905-6	38,237, or	44.6
United States—		
1903-4	20,321, or	18.7
1904-5	35,755, or	36.7
1905-6	44,149, or	51.5
Other countries—		
1903-4	1,394, or	1.3
1904-5	1,516, or	1.6
1905-6	2,066, or	2.4

Manufactured Articles.

	P.C.
United Kingdom—	
1903-4	£387,240, or 63
1904-5	583,604, or 65
1905-6	730,531, or 66
United States—	
1903-4	371,875, or 34
1904-5	286,470, or 32
1905-6	330,619, or 32.8
Other countries—	
1903-4	32,179, or 3
1904-5	27,180, or 3
1905-6	38,225, or 1.2

From the above it will be noticed that with the exception of the first category Canada figures only among the other countries, her exports being too small for individual mention.

Last year Jamaica imported over five million dollars worth of manufactured goods. Canada supplied about one per cent. The United States supplied thirty-two per cent. Such a condition is not flattering to our business acumen. It must not continue.

The most satisfactory trade is that which is mutual. What can we buy from Jamaica to offset our sales to that country? The answer lies in the reports of our trade and commerce. In the five months ending with August, 1907, which is as far as the reports have been issued, Canada imported from the British West Indies sugar alone to a value of nearly three million dollars. For the twelve months this will approximate seven millions. Then Canada can use tropical fruits, bananas, grapes; also cocoa. In fact all the products of the fruitful districts of Florida and California are indigenous to these islands. Everything is present to make commerce desirable. It remains for the merchants and manufacturers to crystallize those possibilities into trade returns.

Industrial Discussions

A UNIQUE PROFIT AND LOSS SHARING PLAN.

A manufacturing company in Bridgeport, Conn., conducting its business on a profit-sharing plan, has used a unique form of contract for six years.

The significant features of their profit-sharing contract are as follows:

(1) Employer and employee agree to share *both* profits and losses.

(2) Net gain or loss is ascertained by deducting from the gross results of the inventory on the first of February all expenses for the year previous of every kind, including depreciation of buildings, tools, machinery, and bad debts. In the case of gain, the capital invested, as shown by the inventory, shall first draw 6 per cent. interest; or, in case there is less than that amount, shall draw what there is, in liquidation of its claim; the balance, then remaining, to be divided between the company and the individual employee in the proportion which the capital invested bears to his total wages for the year.

(3) For each current year, one-tenth of the wages of every employee, who is a party to the contract, is withheld each week. In case there is not a net loss on the entire business of the year, this reserved money, together with any accrued profit, as figured above, is paid to the employee, on or before March first of each succeeding year.

(4) In case of a net loss on the business of the entire year, without figuring any dividend as above provided for capital, this loss is divided between the company and the employee in the same method as that prescribed for the dividing of profit; but in no case does the employee become responsible for losses greater than the amount reserved from his wages.

(5) Other employees may become parties to this contract upon the invitation of the company. Any employee may withdraw from the contract at any time, and from the firm's employ, but the company then holds the right to retain the 10 per cent. reserve till the end of the current year. In case

it is so held, its owner shares in the company's profit or losses.

(6) The firm may discharge any of its employees, but in that case he shall have the option of withdrawing his full reserve, or of leaving it till the end of the year, to share in profits and losses.

(7) It is agreed by the company that none of its employees who signs this contract shall be temporarily retired from work so long as the company has any work of the kind he is accustomed to do; but if there is a shortage of work in the hands of the company it shall reduce the hours of work, and so divide the work among its employees. If at any time an employee becomes sick or incapacitated to perform his duties, and has a certificate of a reputable physician that he is so incapacitated, he may draw on his reserve wages at a rate not greater than six dollars a week, without affecting his interests in the profits at the end of the year. If any employee is injured by any accident while in the employ of the company, the company, at its own expense, provides him with a competent physician or surgeon, upon application stating that such services are needed.

Such is the contract. In practice, it does not apply to the whole labor force. The company did not think the proposition would appeal to their unskilled laborers, comprising about two-thirds of the number in their employ. As regards the skilled laborers, it has been the company's practice not to invite further signatures to the contract at any time when three-fourths of their skilled laborers are already working under it; for the amount of business on hand is subject to some fluctuations, and the firm do not wish to enter into this relation with a larger number of employees than they can be reasonably sure of providing with steady employment. This limitation, however, does not apply to the office force. The result is that, out of a labor force of about 250, there are eighty who are eligible to admittance to the contract, and sixty are actually so enrolled. No man is ever urged to become a party to it, but there is always a long waiting list.—*American Industries.*

THE UNFORTUNATE ELEMENT.

Thrice blessed would be he who could hit on a mode of improving the relation between employer and employed and making it in some measure at least a partnership, instead of this war pregnant with evil consequences to the commonwealth as well as to the shop. Artisans are now, it seems, being dismissed in considerable numbers, partly, no doubt, owing to a temporary slackness in trade, but partly also to their extreme demands. It must be in the employer's interest as a rule to concede as much as he can, to keep the same men, and if possible attach them to his service. Unhappily, it is not with the men alone that the employer has to deal. He has to deal with the agitator, between whom and himself there is no sort of tie, and who is apt to be thinking of his own ascendancy and playing his own game—*Bystander, in The Weekly Sun.*

A SUCCESSFUL APPRENTICESHIP SYSTEM.

The supply of efficient workmen has been discussed from three standpoints during the past few weeks. More than one authority among manufacturers has welcomed a temporary relaxation in the demand of manufactured goods on the ground that it would result in raising the efficiency of the working unit. Where so much work was offering there was little difficulty in holding a job. Employers were forced to go on the principle that any labor was better than none, with the result that careless and slipshod work became the common thing. This was sometimes condoned by the manufacturer, who was so pressed for deliveries that everything had to be sacrificed to speed.

A slackening in business, it is pointed out, will go far to rectify these shortcomings. When a few of the most inefficient are laid off, when there isn't a job for everybody, there will be greater care among those who are left. They will do better work. They will recognize that if their work isn't good, someone else will be found to do it.

Then there is the necessity of technical education to give the workmen, particularly the boys and young men who are just entering upon their life work, the higher knowledge which will lift them into the highest ranks of efficiency. Industries have expanded so rapidly that the supply of skilled workmen has fallen far behind the demand. Moreover, the high specialization of present manufacturing methods has made it difficult to train a workman adequately in the shop. Hence the demand for technical schools is most urgent.

Finally, the apprenticeship system, which formerly was the road which all boys had to travel before becoming competent journeymen, has been discussed. The system is not dead, although it has disappeared from many shops. A significant example of what may be accomplished by a well-conducted apprenticeship system may be found at the works of the General Electric Company, at Lynn, Mass. The establishment of this system has been the outcome of a careful study of existing apprenticeship systems and their weaknesses. Thirty or forty years ago, when the entrance upon a skilled trade was universally achieved through the door of an apprenticeship, a boy was apprenticed to a journeyman who practised the trade in all its parts. Having a personal interest in the boy, the journeyman initiated him into the mysteries and arts of the trade, until the apprentice, after five or six years of tutelage, took and held his place by the side of his master. The introduction of the factory system and labor unions brought about a change in the condition of the apprentice.

As the shop departments grew and a larger percentage of unskilled labor was employed in the factory, the foreman or his assistants felt less inclined and were, in fact, less able

to devote special attention to the training of the boy, and then under the rules of the labor unions only a limited number of boys are qualified to serve an apprenticeship.

The General Electric Company, at Lynn, therefore, took the next logical step in the development of apprenticeship systems. It appointed a supervisor of apprentices, and placed him in charge of a special training department for apprentices, where the boys may receive their initial training under expert supervision in a thorough and systematic manner.

Under the system prevailing at Lynn every boy who wishes to learn a trade must serve a trial period of two months in the training room. During that time he is under close observation of the supervisor of apprentices, both as to his mental and moral make-up, and as to his ability for and attitude toward the practical work. Immediately upon entering the training room the young candidate is put at a machine and required to perform useful work. If he proves, during the trial period, that he possesses the right qualifications, he is allowed to sign the regular apprenticeship agreement, which calls for a service of four years for machinist, tool maker and pattern maker apprentices and three years for moulder apprentices. The apprentice remains now in the training-room for a period of about a year and a half to two years, according to his individual ability, and during that time is given an opportunity to work with the different machines and tools, and to perform different operations on a variety of work. At the end of this period he has gained a general knowledge of the trade and an ability for the work which must now be rounded out by a longer experience on a larger variety of work, such as the factory itself offers. The apprentice is, therefore, transferred from the training-room at the end of about two years to different departments of the factory, until at the end of the four years' term he is well qualified to assume a position as regular journeyman at journeyman's wages.

The boys, moreover, are taught to instruct others; for the object is to create a supply of skilled mechanics from whom the assistant foreman, foreman, and superintendents of the company may be chosen. Each boy, therefore, must help to break in a less advanced apprentice in one of the operations before he himself may advance to a more difficult task. The regular instructor, however, starts off the team of boy-teacher and boy-pupil, and follows their joint work from time to time throughout the day; this arrangement permits the instructor to supervise a large number of such teams in addition to the regular work of the department. Pedagogically this pupil teacher system is significant; for it tends to throw boys upon their own resources, thereby making them think for themselves; it develops in them the power to impart information and to make others perform the processes which they themselves understand; and, finally, it initiates them into the art of handling work and workmen. A possession of these qualifications determines to a large extent the success of a foreman, superintendent, in fact, any leader of men in whatever walk of life he may be engaged.

EFFICIENCY OF LABOR.

The gravest evil from which this country is now suffering, graver by far than the exaggerated dangers from monopolies or from freight rebates, is the decline in the efficiency of labor. It finds expression in slouchy work on the part of those who know how to do better, and poor work on the part of those who have never been taught or are incapable of learning. To the more serious defect of lowered quality is added the troublesome feature of lessened quantity. It is a curious fact that the one question above all which is uppermost in the minds of manufacturers and other employers of

labor, and which is privately discussed by them with helpless iteration, is so rarely touched upon in public utterances.

The hope of developing some remedy is the only consolation to the employers of labor when they face the prospect of a decline in the volume of business.

There has been an extraordinary demand for labor of all kinds. So far as that has raised wages and directly increased the cost of production employers have had no grievance, although it is a troublesome and difficult matter to carry them back to the normal level. Manufacturers know that prices for their products usually decline more rapidly than the labor cost, and must be willing to face that contingency. The laws of supply and demand never operate so promptly in the one case as they do in the other.

As for the quantity of output of labor, that, too, responds fairly well, when the demand for labor declines. The process of weeding out the lazy and the inefficient begins promptly, and it may be accepted as a general fact that few managers have not thoroughly examined their rolls with a view toward making their selections. The percentage, usually, will be small, but the moral effect is quite out of proportion to the numbers. During the past two years the knowledge that a job was waiting for any man who was willing to take it has had a demoralizing effect upon all labor throughout the country.

The fact will be firmly realized soon that steadiness, reasonable industry, and acquiescence in necessary measures of discipline are primary conditions for employment, and that simple application for work is not the only qualification.

There is every reason to hope, too, that a lessened demand for labor will be reflected in better quality of work, although in that respect deeper causes have been operative than temporary high pressure of production. The effect of levelling down which has been the curse of the labor unions can not be so quickly eradicated. It is true that the concentration of industry into larger units tends to deprive an individual workman of the hope of starting on his own account, and the necessity for preliminary scientific and technical training is closing him out of the ranks, once open to him, of managers and superintendents. It is further true that in the days of an extraordinary demand the manufacturer has often permitted or even encouraged some sacrifice of quality for the sake of quantity. But granting that all these factors have been at work, there remains a residuum of wretched work which must be directly charged to the spirit in which labor is facing its tasks. It almost seems as though the hard school of adversity can alone bring back a realization of the fact that the world owes a living only to those who deserve it.—*The Iron Age*.

A PLAN OF INDUSTRIAL EDUCATION.

A little more than a year has passed since the organization of the Massachusetts Commission on Industrial Education. This Commission, which is definitely instructed by statute to proceed toward the actual establishment of industrial schools, has largely devoted its time to preliminary study of existing conditions and to initiatory movements looking to that result.

It has definitely recognized the need of "industrial intelligence"—that is, comprehensive insight into and intelligent interest in the various trades—as well as skill therein. It has been deeply impressed with the necessity of providing an all-round training in different trades as the only means under present conditions of developing men for the positions of foremen, superintendents and managers.

A very careful examination of over 2,000 Massachusetts

boys seeking employment revealed the fact that nearly 900 would have gladly remained in school longer if they could have been taught some specific trade. Fully a thousand employers have been interviewed, and almost without exception have emphasized the fact that the boy is practically valueless as an industrial factor until he passes the age of sixteen. This condition, combined with the general dissolution of the old apprentice system, throws into purely juvenile occupations a multitude of boys and girls ranging from fourteen to sixteen years of age. At present these are practically wasted years. They are, however, peculiarly available for preliminary instruction in industrial lines, not for mere manual training, but in preparation for specific trades.

The Commission, therefore, seeks as a finality in its plan to provide vocational training for both boys and girls of ages ranging above fourteen years. Through industrial schools planned with this result in view a new educational need would be met. The work would parallel, but be independent of, that of the existing higher schools. Such schools, in the belief of the Commission, should offer four years of training. The first two years would include general shop instruction, mathematics, drawing, natural science and English. The work of the last two years could then be gradually completed during a longer period, in the evenings or on the part time system—*i.e.*, the alternation of a day's work in shop and school. This latter arrangement is compulsory in many of the foreign schools, the manufacturer being required to allow the employee the time therefor. Under the conditions of higher education the University of Cincinnati is already working under this plan; two students alternating, one working in the shop one week, the other in the school, then changing places for the next week.

Of course, the complete scheme of the independent school must be developed gradually, and in conjunction with individual municipalities. In the meantime immediate attention is being given to the establishment of evening schools. During the past month definite progress has been made along this line. For instance, in the city of Cambridge, evening instruction is to be furnished for machinists, pattern makers and forgers (utilizing therefor the equipment of a manual training school), and of mechanical and free hand drawing, domestic science and dressmaking. Under the provisions of the law the State pays in this case one-half the expense. In other communities similar work is progressing. The returns from inquiries to workmen indicate a large number desirous of availing themselves of the opportunities which may be provided. Proportional returns from workmen in the mechanical trades of such a city as Worcester would, for instance, indicate fully 2,000 as likely to take advantage of such instruction.

Early opposition, which existed largely through misapprehension, is vanishing, and a spirit of hearty co-operation is developing on every hand. It is becoming clearly recognized that, in order to hold its own among prosperous communities, Massachusetts must take the lead in the production of the highest and the finest grade of goods. It is practically devoid of raw material, but still proud of a population of superior workmen. But in too many industries the extremely fine division of labor gives practically no opportunity for the training of the all-round workman and his promotion to positions of greater responsibility. As a consequence, foremen and superintendents are being brought from abroad, where they have received the necessary training at public expense. On the other hand, the foreigner of low intelligence, because of the simplicity of the operations which he alone is permitted to perform in many industries, readily usurps the place of the native-born, and so the candle is burned at both ends.

The Inspiration of Competition

It Stimulates to Success

MR. JOHN J. ROBERTS discusses in the last issue of *Success*, the important significance of competition in the business world. It is, he points out, an incentive to the business man to conquer all obstacles and attain the greatest possible success.

Just as the keeper of a light-house is likely to think the world a very wet and lonesome place, just so are we all too prone to view things through the narrow slits of our own business visions. We are too prone to look downward, and backward—at our own struggle-stepped paths and hard-won accomplishments; instead of upward and forward—at the open opportunities a willing future invites us to win.

And so it is that we are likely to shudder in apprehension at the merest hearsay rumor of coming competition. So it is that we are wont to look on the newcomer in our field as a hideous monster, about to crowd us from our vantage points, threatening to throttle our hopes and thwart our plans.

Let us unbend, for a moment, from our cramping tasks—let us take our tired eyes from their monotonous strain, and let us look competition squarely in the face, without prejudice, without fear. Let us study it, analyze it, classify it.

If it be a power for good, let us learn to avail ourselves of it. If it be a menace, let us learn to meet it bravely.

Two Classes of Competitors.

Once in this attitude of mind, we find that there are two kinds of competitors; the one who sets out to steal our plans, our experience, our trade; and the other, who unaware perhaps, of our very existence, is tempted into the range of competition by the glittering success-opportunities he thinks he sees.

It is of first importance that we resolve each competitor into one or the other of these two classes. If he be of the former class, he may be expected to give us what, for simplicity, we may term *unintelligent* competition.

Such a competitor is more to be pitied than feared. He will create no profits for himself. He will cost us little of ours.

For the pirate in business cannot hope to succeed. He can copy the things he sees; he can imitate the methods he thinks we employ; but he can find no substitute for the hard-pan experience, no counterfeit for the judgment and stamina that can be had only in the stern school of "Learn to Do by Doing."

Success in business lies not in plans, in schemes, or in the mechanism of method. It lies in the minds that evolved them! Success lies not in an established trade. It lies in that genius that built, managed and handled and held that trade.

Study Competitors.

But *intelligent* competition—the competition of men of sense and standing and capital—how shall we deport ourselves toward that?

Welcome it. Watch it. Profit by it. For intelligent competition will see opportunities that we have failed to see; intelligent competition will invest money in experiments that we have not dared to try; intelligent competition will open up new markets, stir up fresh interest, create new demand. It will unearth new possibilities to our astonished eyes.

And by all of this we profit!

Competition must meet the same problems that we have met. If we advertise our products or our wares, competition, too, must advertise. If we do not advertise, competition may

be able to show us the way. If we have salesmen on the road, so, too, must competition have its salesmen.

And every move it makes is a move worth watching.

But our "market"—what shall become of our market when it is cut up into small bits by competition?

That is our dread of competition—our dread before we have learned that market knows no limits, save the limits of human demand; and human demand may be doubled, almost, overnight.

When we look at our slender lists of customers, and see the scattering names that we have gathered into our ledgers through years of effort, it seems that competition must surely be a dread and dangerous thing. But when we look at the market that is yet to be won, at the customers that might, and may, be ours; and when we consider that intelligent competition, if it is to succeed, itself, must open up new markets, must find new avenues of trade, by which we, too, may profit; then we see that competition will broaden our fields and increase our profits.

Develops the Individual.

But competition is not alone a maker of market—it is a maker of *men*. Competition will keep us, as individuals, from lulling ourselves to sleep with pleasant dreams of easy wealth,—dreams that close our eyes to to-day's work with alluring pictures of to-morrow.

Competition will harry our sense of contentment, and put action in our limbs and strength in our arms and alertness in our minds. It will make us do things with a spirit that nothing else but competition could inspire.

The rosy goal of ambition isn't half so effective a spur as the pointed goad of competition. Which do you suppose a jockey in a horse race is thinking of, as he turns the last quarter post—the \$400 purse that is his, if he wins, or the fact that he can feel the hot breath of the panting animal at his side which threatens to rob him of the glory of the race?

What do you think that hustling corner merchant puts into his work that makes him win—the abstract thought that he must please his customers, or the concrete knowledge that his neighbor across the street is straining every nerve to beat him?

Which do you suppose is the greater incentive to invention—the idealistic dream of improvement, or the cold, hard fact that there is a competitor to outwit?

What is it that makes men unloose their belts and shower their fullest energies on their tasks, what is it that makes over-time a willing service—the flowery beds of commercial ease, or the snap and crack of the competitor's whip?

Truly, our competitor is a better guide and adviser than our friends! He sees our weaknesses, to which our friends, in their nearness, are blind. He sneers openly at our faults when our friends preserve a well-meant but unjust silence.

Even while the shallow praises of our friends fill our ears, we hear the chortle of competition.

And when head-long impulse threatens to drag us into entanglements, it is the thought of competition that keeps us careful and saves us from foolishness.

Does personal vanity tempt us to erect an extravagant and needless plant? Competition cautions us to go slowly—we may need our reserve capital to meet its onslaught.

Are we dozing off into the slumberland of "letting well enough alone?" Competition will wake us up and enable us to shake off the sleep of business death.

Among the Industries

The Canadian Gypsum Co. has been incorporated with a capital of \$20,000, and head office in Toronto.

Cleveland, Ohio, parties will commence to manufacture a full line of paint products at Winnipeg in 1908.

The British Canadian Distillery Co. has been incorporated with a capital of \$250,000. The head office is Owen Sound.

The Standard Drain and Pipe Works, of New Glasgow, whose plant was destroyed recently by fire, will rebuild on the old site.

Capitalists interested in the Nipissing Cobalt property contemplate building a smelter in the north. North Cobalt has been selected as the site.

The Ladysmith Lumber Co. have arranged for the erection of a new saw mill in the Nanaimo district. It will have a capacity of 35,000 feet per day.

A company is being formed in Victoria, B.C., for the manufacture of explosives. Bond and Clark, of Victoria, are putting through the organization.

A United States firm of implement manufacturers have had representatives in Guelph, Ont., looking into the advantages of that place as a site for a factory.

The Sydney Cement Co., are installing new machinery which will add materially to the output of the plant. The company are now running their plant night and day.

The British-American Bank Note Co., Limited, have opened offices in Toronto, at 701-702-703 Traders Bank Building. Mr. W. J. Valleau will be in charge of this office.

A large Wisconsin wagon company will erect a Canadian branch factory at Winnipeg, to supply what has been their export trade in Western Canada for the past three years.

The Pett Biscuit factory, of Walkerton, has been taken over by N. Ogg and J. Zinkhann. They will install new machinery and will make both biscuits and confectionery.

A St. Paul, Minn., agricultural implement firm who have enjoyed a large export trade in Western Canada in the past four years, will erect an extensive factory building at Winnipeg, Man.

The Canadian Pin Co. will locate in Chatham, Ont. They will receive a loan from the municipality of \$20,000, and on their part agree to employ sixty workmen, and pay in wages \$18,000 per year.

An industry will be established at North Sydney, N.S., for the preparation of smoked, dried, cured, and pickled fish. The location is well suited for such work, and there is an unlimited market for the product.

Representatives of the Borden Milk Condensing Co. have been in Tillsonburg looking over the proposed site for their Canadian company. It is expected now that the factory will be gone ahead with at once.

A wood-ware manufacturing plant will be installed by the Londonderry Iron and Mining Co., Ltd., at Colchester. Its object will be to consume the by-product of the big hardwood lumber mill at Folly Lake.

The citizens of Lachine, P.Q., have voted a bonus of \$50,000 and exemption from taxation for twenty years to the Locomotive Company, who undertake to build a plant at a cost of two and a quarter million dollars.

The L. E. Waterman Co., of Canada, Ltd., manufacturers of fountain pens, etc., will erect a large factory at St. Lambert, Que. The town has granted them exemption from taxes for twenty years and a special water rate.

Winnipeg is the location selected by New York State Leather Glove and Mitten manufacturers, and a factory is to be started immediately, equipped with the latest labor-saving machinery, with a capacity of 100 dozen per day.

The Winnipeg Galvanising and Manufacturing Co. have commenced operations. Some months ago the company was formed to take over the business of the Red River Metal Co. Since then a new plant has been installed and work commenced.

The Silica Brick and Lime Co., Ltd., with works at Parson's Bridge, Vancouver Island, have increased their output materially. The company began business at the beginning of this summer, but already they are turning out double their initial production.

The Carriage Mountings Co., Ltd., have now moved their business from Toronto to their new buildings at Niagara Falls, Ont., where they have an up-to-date plant for the manufacture of Automobile and Carriage Nickel and Brass Work, and Lavatory supplies.

The buildings of Shaw & Mason, Limited, at Sydney, N.S., are nearing completion, and the pattern shop is already in operation. The plant will consist of a show-room, metal shop, tin shop, brass-finishing department, nickel-plating room, pattern shop and machine shop.

The new chapel of Assumption College, Sandwich, Ont., has just been completed by the Blonde Lumber and Manufacturing Co., of Chatham. The architectural sheet metal work on the exterior and interior of the building was done by the Metal Shingle & Siding Co., of Preston, Montreal, and Toronto.

The Bissell Carpet Sweeper Co. will move from Toronto to Niagara Falls, Ont. They have purchased a new factory building, commodious and of mill construction, which will admit of considerable expansion. The factory will be thoroughly equipped before the transfer from Toronto to Niagara Falls takes place.

The Metal Shingle and Siding Company, of Preston, Montreal, and Toronto, are now engaged in placing 6,000 square feet of skylights on the new Intercolonial R. R. Shops at Moncton, N.B. They have also just completed installing 6,000 square feet of copper skylight on the extension to the C. P. R. Angus Shops at Montreal.

Situations Wanted

NOTE.—For further particulars regarding any applicant mentioned below, apply by number to the Secretary at Toronto, stating wages, whether work will be permanent, and giving such information as you think advisable. For all help secured through this medium, our regular Labor Department charges will be made.

Brass Workers.

- 1 Fitter and Turner.—Liverpool man, married, with considerable experience on a lathe, in brass and iron work, well up in hand turning and cutting, wishes employment in his trade in Canada. Has also had some experience at steam-fitting and electrical work. Good references.
- 2 Moulder.—Young Scotchman, seven years' experience in locomotive works as a brass moulder, is anxious to come to Canada. Union man, good references.
- 3 Brazier and Tube Maker.—Young married man who has worked nine years in large band instrument makers' shops, wants position as a metal worker, brazier or tube maker in Canada. Has had long experience at brass and copper work, and can run a lathe. Is member of union not represented in Canada.

Carpenters and Joiners.

- 4 Young married Englishman with considerable experience as a Shop Fitter, and qualified to take a position as general foreman in any carpentering work, wants position in Canada. Good references, non-union.
- 5 Young man, single, with six years' experience in a builder's work shop, competent Carpenter and Joiner, wants work in Canada. Non-union, and good references.
- 6 Cabinet Maker.—Who has been working for years in London, England, with a mantel and looking-glass manufacturer, is anxious to communicate with Canadian manufacturers who can give him employment in his trade on arrival in Canada.
- 126 Picture Frame Joiner.—Young, married Englishman, with 11 years' experience in the moulding and picture frame trade at very fine work, wants position in Canada. Has worked on oak and white wood fancy mouldings and general fitting. References, non-union.

Compositors.

- 7 General Letter Press Printer.—With 20 years' experience in a first-class English office, wants position in Canada in printing office. Has knowledge of machine ruling, die stamping, office work, etc. Married, union, and excellent testimonials.
- 8 Music Composer and Monotype Operator.—15 years' experience in American and English houses, wants position in Canada. Former union man, married, with good references.
- 9 Machine Minder.—Young man with four years' experience in printing shop as machine minder. Non-union. Would come to Canada if he could secure position at his trade.

Engineers.

- 10 Engine Driver and Fitter.—Young Englishman, married, with thorough experience with locomotive, traction engines and steam cranes, etc., wants position in Canada. Non-union, good references.
- 11 Locomotive or Crane Driver.—Young Englishman, single, with several years' experience with Great Western Railway Co., wants position in his trade in this country. Non-union.
- 12 Engine Driver.—Married Englishman coming to Canada wants position as engine driver here. Has had 14 years' experience at driving and stoking in the Old Country, and is accustomed to all kinds of engines, dynamos, etc. Non-union.

13 Marine Engineer.—Young Welshman, single, who has served his apprenticeship as a marine engineer, wants position at marine or any general engineering work in this country. Has had experience at repairing, improving and tool-making, and is thoroughly qualified at every branch of the trade. Excellent references. Non-union.

14 Marine Engineer.—Londoner, married, with long experience with marine engines and boilers on all kinds of steamships, wishes to secure employment in Canada; is thoroughly qualified to run any engine or locomotive, and is a good, handy man with machinery of all kinds. Non-union, and splendid references.

15 Marine Engineer.—Young Englishman, single, with 12 years general engineering experience, 5 years with the Taff Vale Railway and 7 years' marine experience, the last two as chief engineer, would like a position in Canada. Holds a first-class Board of Trade certificate. Non-union and excellent references.

16 Mechanical Engineer Foreman.—Young Englishman with 8 years' experience at general engineering work, during part of which time he supervised the work of others, wants position in Canada. Would make a good handy man for any factory as a general repairer of machinery and tools. Non-union and good references.

17 Mechanical Engineer.—Englishman with 14 years' experience with hydraulic machinery and gas engines, and considerable general engineering experience, wants position in Canada. Has served some time as an engine erector and millwright. Testimonials on request. Non-union.

20 Mechanical Engineer with 20 years' experience on all classes of engines, marine and stationary, accustomed to all kinds of work around machinery, with good testimonials, wants a position in an engineering establishment in Canada. Excellent references. Non-union.

127 Draughtsman.—Young, single Englishman, with 9 years' experience in first-class English machine works, who has served his apprenticeship at fitting, turning, planing, etc., in the shop, wants position in good engineering firm as draughtsman. Has a thorough practical knowledge of machinery. Non-union.

128 Architectural Draughtsman, Surveyor, etc.—Married Englishman, with 17 years' experience as a draughtsman and clerk of works in large English engineering and construction firms, wants position in Canada. Excellent references and a thoroughly competent man, capable of taking charge of large construction. Non-union.

143 Engine Driver.—Young married Englishman with eighteen years' experience at his trade with Midland Railway Co., wants position of this nature in Canada. Fully competent man. Can furnish best references. Non-union.

Electricians and Electrical Engineers.

Underwood

The Underwood Unit, Bill or Order Typewriter, is used to facilitate the handling of bills or orders.

The order is made out upon a set of unit forms, as many as may be required for different departments. The original is the invoice; the second, an office copy or price sheet; the remaining copies may consist of acknowledgments, requisitions; shipping memoranda, etc., which are distributed to the various departments after the order is entered.

The forms may be so designed that each will contain only the information required by its special department. Let us send you a book about it.

BRADSTREET'S

Capital and Surplus - \$1,500,000

OFFICES THROUGHOUT THE CIVILIZED WORLD

Executive Offices

NOS. 346 and 348 BROADWAY, N.Y. CITY, U.S.A.

THE BRADSTREET COMPANY gathers information that reflects the financial condition and the controlling circumstances of every seeker of mercantile credit. Its business may be defined as of the merchants, by the merchants, for the merchants. In procuring, verifying, and promulgating information, no effort is spared, and no reasonable expense considered too great, that the results may justify its claim as an authority on all matters affecting commercial affairs and mercantile credit. Its offices and connections have been steadily extended, and it furnishes information concerning mercantile persons throughout the civilized world.

Subscriptions are based on the service furnished, and are available only by reputable wholesale, jobbing and manufacturing concerns, and by responsible and worthy financial, fiduciary, and business corporations. Specific terms may be obtained by addressing the Company at any of its offices.

Executive Council

OCTOBER MEETING.

The regular monthly meeting of the Executive Council was held in the Council Chamber of the Board of Trade Building, Toronto, on Thursday, October 7th, at 2 p.m.

The President, Hon. J. D. Rolland, occupied the chair, and there were also present: Messrs. G. Frank Beer, Toronto; P. H. Burton, Toronto; H. Cockshutt, Brantford; J. A. Coulter, Ingersoll; J. W. Cowan, Toronto; W. R. Dunn, Hamilton; L. V. Dusseau, Toronto; J. F. Ellis, Toronto; P. W. Ellis, Toronto; John Firstbrook, Toronto; Atwell Fleming, Toronto; W. M. Gartshore, London; Jas. Goldie, Guelph; W. P. Gundy, Toronto; S. Harris, Toronto; S. R. Hart, Toronto; E. G. Henderson, Windsor; R. Hobson, Hamilton; A. Jephcott, Toronto; J. S. McKinnon, Toronto; R. McLaughlin, Oshawa; J. B. MacLean, Toronto; Denis Murphy, Ottawa; J. P. Murray, Toronto; W. C. Phillips, Toronto; J. Ransford, Clinton; W. H. Rowley, Ottawa; Wm. Stone, Toronto; T. H. Smallman, London; Chas. A. Smart, Montreal; H. Stroud, Paris; Arnold W. Thomas, Toronto; J. O. Thorn, Toronto; W. B. Tindall, Toronto; S. M. Wickett, Toronto; D. Wilson, Colingwood.

The minutes of the August meeting, as published in INDUSTRIAL CANADA, were taken as read.

Communications.

Communications were received as follows:

(a) From the following members of the Executive Council, regretting their inability to be present: Messrs. Wm. Small, Montreal; T. H. Estabrooks, St. John; S. W. Ewing, Montreal; J. J. McGill, Montreal; Geo. Booth, Toronto; Robt. Munro, Montreal; John M. Taylor, Guelph; C. R. McCullough, Hamilton; C. R. H. Warnock, Galt; Wm. Robins, Walkerville; C. H. Waterous, Brantford; J. S. N. Dougall, Montreal; Jas. McLaughlan, Owen Sound; Arthur W. White, London.

(b) From Mr. Alex. Maclaren, of Buckingham, Que., regretting his inability to serve on the Executive Council, and suggesting that he be replaced by his son. Referred to the British Columbia Branch for report.

(c) From the National Municipal League, inviting the Association to be represented at their annual meeting, to be held in Providence, Rhode Island, November 19th to 22nd. Referred to the Reception and Membership Committee, with power to act.

(d) From the National Civil Service Reform League, inviting the Association to be represented at its annual meeting, to be held in Buffalo, November 7th and 8th. The Secretary was instructed to send the Association's regrets.

(e) From the Ontario Association of Architects, inviting the members of the Association to attend an exhibition of competitive drawings for the new Justice and Departmental Buildings at Ottawa. The Secretary was directed to acknowledge the receipt of this invitation with thanks.

Election of Officers.

Messrs. W. B. Tindall, A. W. Thomas and John Firstbrook were appointed members of the Finance Committee for the current year.

The officers of the Association then reported as follows:

PRESIDENT.

Hon. Mr. Rolland took occasion to thank the members in attendance at the first meeting of the Executive Council for the honor they had done him in electing him to the Presidency, assuring them that he would approach the duties of his office conscientiously, and endeavor to see that the policy of the Association, as laid down by the Council from month to month, was carried out. He stated that he had already found out that by no means the least of his duties were the social functions he was required to attend, and in this connection he reported a visit he had paid the Quebec Branch on the occasion of a banquet in honor of their former Chairman, Mr. Vandry.

TREASURER.

In the absence of the Treasurer, the Secretary read his report for the month ending September 30th. It showed receipts of \$4,235.37, and disbursements of \$3,585.18, with a balance at the bank of \$16,305.42. On motion, the report was adopted.

DELEGATE TO BATTLE CREEK CONVENTION.

Mr J. P. Murray reported on behalf of those who had attended the annual convention of the Citizens' Industrial Association at Battle Creek, on October 7th and 8th. He outlined the objects of the Association and mentioned a number of the practical results it was accomplishing in the cause of industrial peace. His report also dealt with the cost of membership in the Association, and recommended that a synopsis of some of the papers read at the meeting be published in INDUSTRIAL CANADA.

As the report concluded with a recommendation that an invitation be sent the Citizens' Industrial Association to hold their next year's meeting in Toronto, it was decided to refer the whole report to the Reception and Membership Committee.

FINANCE.

The report of the Finance Committee, read by the Vice-Chairman, Mr. W. B. Tindall, recommended for payment the accounts of the month, amounting in all to \$2,325.57. It endorsed the application of the Eastern Canada Manufacturers' Mutual Fire Insurance Co. for temporary accommodation in the Montreal office, providing such an arrangement met with the approval of the Montreal Branch. It also recommended that the request of the Montreal Branch to have its Contingent Fund increased from \$25 to \$100 be granted.

The report further stated that the Association's arrangement with its Auditor called only for an annual audit. In the opinion of the Committee the receipts and expenditure were now of a size to make it desirable to have a continuous audit, and it was recommended accordingly that they be authorized to make an arrangement to this effect. The adoption of the report, moved by Mr. Tindall, seconded by Col. Gartshore, was carried.

"INDUSTRIAL CANADA."

In the absence of the Chairman, Mr. John Firstbrook read the report of the above Committee, which showed that the paper's financial progress was being well sustained, the net surplus for two months ending September being \$510.41, while the cash balance for the same period was \$924.50.

The Committee reported that it accepted with regret the resignation of Mr. B. L. Anderson, who had been appointed Secretary of the Central Canada Manufacturers' Mutual Fire Insurance Co., and stated that immediate steps would be taken to procure a successor for him on the advertising work. The report recommended that Mr. Megan be sent to Montreal for the two weeks beginning November 10th to relieve Mr. Cameron, it being desirable in the interests of the paper that he should meet as many of the members and become as widely acquainted with industrial conditions as possible.

The Committee again raised the question of procuring expert editorial assistance for INDUSTRIAL CANADA. It was felt that such a policy must immediately result in good to the Association and bring about a more liberal patronage of the paper's advertising columns. The report recommended that an appropriation equal to one-half of last year's surplus be set apart for this purpose.

Following the resignation of Mr. J. S. N. Dougall, of Montreal, it was mentioned that Mr. H. T. Reason, of London, and Mr. H. G. Nicholls, of Toronto, had been invited to join the committee.

The adoption of the report moved by Mr. Firstbrook, seconded by Mr. Beer, was carried.

RECEPTION AND MEMBERSHIP.

The report of the Reception and Membership Committee, presented by Mr. G. Frank Beer, recommended for acceptance the following applications for membership:

New Members.

ATWOOD, ONT.

Western Ontario Portland Cement Co.—Portland Cement.

BELLEVILLE, ONT.

Lehigh Portland Cement Co., Ltd.—Portland Cement.

BRANTFORD, ONT.

T. J. Fair & Co., Limited—Cigars.

GUELPH, ONT.

Gilson Mfg. Co., Ltd.—Gas engines, implements, specialties, etc.

MONTREAL, QUE.

G. C. Hanford Mfg. Co.—Proprietary medicines.

TORONTO, ONT.

The Gendron Mfg. Co., Limited—(Chas. Rochereau de la Sabliere, 2nd member).

The Indestructible Brick, Limited—Sandstone bricks.

Toronto Lithographing Co., Ltd.—(F. W. Stone, 2nd member).

Warwick Bros. & Rutter—(George R. Warwick, 2nd member).

WESTON, ONT.

The Moffat Stove Co., Ltd.—(F. W. Moffat, 2nd member).

WINDSOR, ONT.

Windsor Boiler Works—Steam boilers.

In deference to the wishes of the Montreal members for an early decision regarding the place of next year's Annual Meeting, it was recommended that it now be settled that the Convention be held in Montreal.

The report further stated that in the opinion of the Committee it would be advisable to accept the invitation of the Ottawa members to hold the December meeting of the Executive Council in that city, but in order to avoid any conflict

with holiday business, it was suggested that the first, instead of the third, Thursday would be a more suitable date.

Commenting on the application of the Toronto Branch for an appropriation of \$200 to entertain the British Cotton Spinners, the Committee stated that in view of the precedent involved it might lead the Association into considerable expense on subsequent occasions, and they preferred to have the matter dealt with by the Council.

The Committee also intimated its intention to arrauge for a series of local dinners in different parts of the country during the winter, a programme of which would be submitted for approval at a later meeting.

The adoption of the report, moved by Mr. Beer, seconded by Mr. Dusseau, was carried, and after some discussion a subsequent motion by Messrs. McLaughlin and Firstbrook to vote the sum of \$200 for the entertainment of the cotton spinners was also carried.

PARLIAMENTARY.

The report of the Parliamentary Committee, presented by Mr. J. O. Thorn, read in part as follows:

Scarcity of Labor.

Reports having reached the Committee that the Government was considering amending its immigration regulations so as to make it necessary for the immigrant to be possessed of a certain amount of money before being admitted, and the statement having been made that the Trades and Labor Congress would send a representative to England to discourage the emigration of further skilled help from the United Kingdom to Canada, your Committee is of the opinion that steps should be taken to urge upon the Government more forcibly than ever before the importance of altering their present immigration policy. Numerous instances were made known to the Committee where valuable machinery had been imported and duty paid thereon, only to find that it must lie in idleness by reason of the lack of the necessary staff of operators to man it. Your Committee accordingly recommends that the Secretary be instructed to procure periodically throughout the year statistics regarding the scarcity of labor in the various trades, and to bring these statistics to the attention of the Government, with a view to seeing if they cannot be induced thereby to alter their policy.

United States Silver.

Following the recommendation contained in the report of this Committee to the Annual Meeting, a letter has been sent to the Minister of Finance, expressing the hope that at the approaching session an appropriation will be made for the purpose of continuing the arrangement formerly in effect between the Government and the Bankers' Association for the deportation of United States silver coins circulating in Canada.

Provincial Laws Regarding Liens.

The receipt of a communication from a member of the Association asking for details regarding the requirements of Quebec and the Maritime Provinces in the matter of liens on machinery suggested to your Committee the advisability of having on file in the Association offices, for the information of all members, a resumé of the various Provincial statutes so far as they have to deal with liens on any class of merchandize. It is felt, however, that this matter is rather one for the Commercial Intelligence Committee to deal with, and in turning it over to that Committee your Parliamentary Committee wishes to record its opinion that the matter is one of importance.

Workmen's Compensation.

In view of the likelihood of early action by the Governments both of Ontario and Quebec in the matter of a new law providing compulsory compensation for workmen injured in factories, your Committee proposes to call a special meeting in the near future for the purpose of discussing the question in all its phases with the idea of arriving at a draft bill which might be considered by the various Provincial Legislatures. In the meantime the Committee would be glad to have authority from the Council to engage legal assistance in the preparation of such a bill. The Secretary has been instructed to secure copies of such Acts from all possible sources.

Ottawa Representative.

It will become necessary for the Association at an early date to decide whether or not it wishes to be represented at Ottawa during the approaching session, and your Committee would recommend that it be empowered to co-operate with the Finance Committee in making such an arrangement as will be mutually satisfactory.

The adoption of the report was moved by Mr. Thorn, seconded by Mr. Fleming.

Speaking on the subject of Workmen's Compensation, the President stated that the Montreal Branch had been very active in opposing the Archambault Bill in Quebec, where the Legislature had finally decided to refer the whole question to a Commission for report. He thought that a similar course should be followed in Ontario. Meanwhile, in view of the steps which were being taken in Quebec, it would be premature to draft a Bill and endeavor to have it introduced into all the Provincial Legislatures.

Mr. Rowley enquired what the Committee's object was in drafting a bill for submission to the Legislatures. He thought such a step had better be left to the several Governments. Mr. Thorn explained that it was considered advisable to do this in order to circumvent those who would make the legislation one-sided. He referred in this connection to the ruinous bill recently passed by the British House of Commons and explained some of the absurd conditions to which its objectionable clauses gave rise. Mr. Tindall also intimated that he thought it well to have an alternative bill in readiness in case the question were forced from the other side. The President believed it would be best to have the whole matter handled by the Commission of Enquiry consisting of manufacturers, laborers and other representative interests.

The report was finally adopted as presented.

RAILWAY AND TRANSPORTATION.

The report of the Railway and Transportation Committee was presented by the Chairman, Mr. W. R. Dunn.

In connection with the readjustment of rates he stated that the railways were busily engaged preparing the town tariffs on the reduced scale ordered by the Board of Commissioners, and that the same would probably become effective in Ontario territory on November 15th. As regards tariffs on international traffic the railways had had several meetings and had practically agreed upon the class rates as ordered by the Board, but as the territory as far back as the Mississippi River was involved it was not likely that the rates would take effect as early as the rates in Ontario territory. The commodity rates as ordered by the Board would be continued.

Other features of the report were as follows:

Railway Equipment.

From information received it is expected that the Board of Railway Commissioners will issue at an early date a statement of the situation on other railways similar to that issued in connection with the Canadian Northern in June last.

The situation has decidedly improved but there is still considerable shortage of cars and it is likely to continue until the close of navigation.

As a result of the per diem arrangement now in effect whereby railways have to pay fifty cents per day for foreign cars, one of the principal lines of railways states that only 44 per cent. of their equipment is away from home at the present time, whereas 60 per cent. of it was on foreign roads at this time last year—a strong argument in favor of reciprocal demurrage.

Toronto Switching.

The complaint entered against the Grand Trunk on behalf of the Toronto Branch in regard to interswitching at Toronto, has not yet been disposed of by the Board of Railway Commissioners. The Canadian Pacific in a similar way are demanding a similar toll on so-called "non-competitive business." The Manager of the department wrote the Board in September last asking that they withhold the approval of any switching tariffs submitted or to be submitted in view of the complaints which are now before the Board until the whole question of switching has been ruled upon, as has been stated would be done. This action was approved of. It is recommended that the Manager of the Department go to Ottawa with instructions from this Committee to ascertain just what the position of the Commission is and obtain some definite information as to whether or not it is the purpose of the Board to permit of the railways to advance their rates for so-called switching without regard to the protests and complaints which have been made and filed by this Association with the Board.

The report concluded with a reference to the conference at Washington called for the purpose of arriving at a uniform bill of lading. Mr. Walsh, who had just returned from the Conference, was able to announce that shipping interests there represented had taken strong exception to the draft bill of lading submitted to the Interstate Commerce Commission by the railways, and that after much discussion they had agreed to join forces with the Banker's Association in advocating a simple bill of lading which would be a receipt for the goods and an undertaking to carry them through to destination, making the carrier subject in every respect to the common law. Mr. Walsh stated that he considered this a most important point, as the indications all pointed to the adoption of such a bill by the Interstate Commerce Commission, following which it would most surely be adopted in Canada.

On motion of Mr. Dunn, seconded by Mr. Ellis, the committee's report was approved.

INSURANCE.

Mr. Jephcott reported verbally on behalf of the Insurance Committee, whose meeting had not been held until 11.30 the same morning. He stated that the license had been received for the Central Canada Manufacturers' Mutual Fire Insurance Company, which was now accepting business. The license for the other company would follow very shortly. He took occasion to express the belief that the organization of the companies was made possible only by the loyal support which the members of the Association had given them. The conditions they had had to meet were very arduous, and he doubted whether they could have been overcome at

all by an organization less powerful than the Association. The last of the difficulties, however, had now been met, and everything was running along smoothly.

On behalf of his committee he reported the following resolutions:—

Resolved, That the Finance Committee be and they are hereby empowered to adjust accounts with the Mutual Fire Insurance Companies, to determine the amount to be due by them to the Association, and how the same shall be paid.

Resolved, That the Executive Council be requested to sanction an arrangement whereby the Manager of the Insurance Department will give a small portion of his time to the underwriting work of the Mutual Insurance Companies, and for which the Companies will remunerate the Manager direct.

On motion of Mr. Jephcott, seconded by Mr. Rowley, both resolutions were unanimously adopted.

TECHNICAL EDUCATION.

The report of the Technical Education Committee was read by Mr. J. P. Murray. It referred to the campaign that was being conducted to secure the appointment of an expert commission of enquiry. Apparently the attitude of the Government was that it would be inconsistent with their past policy to interfere in any way with provincial rights, though they did not attempt to disguise the fact that they believed a thorough system of industrial education to be a most important part of our national industrial policy.

The Committee stated that it would endeavor to secure from each of the provincial Premiers a statement of the entire acquiescence of his government to the Association's proposal, and that when these statements were secured they would again go before the Government to urge their request.

The adoption of the report moved by Mr. Murray, seconded by Mr. Henderson, was carried.

TARIFF.

Mr. P. W. Ellis reported on behalf of the Tariff Committee, that before laying down any plan of campaign for the year, it had been decided to enlarge the committee by asking each active section in the Association to appoint a representative to serve on it. It was believed that a plan of campaign which would be generally acceptable and productive of the best results could be formulated when this new and larger committee came together. The recommendation of the Montreal Branch regarding the leeway in the Dumping Clause regulations would be considered at that time.

The adoption of the report, moved by Mr. Ellis, seconded by Mr. Cockshutt, was carried.

The report of the Montreal Branch, read by Col. Smart, and that of the Toronto Branch, read by Mr. J. S. McKinnon, were both received and will be found below.

Under the head of new business, it was moved by Mr. Henderson, and carried, that in future the funds of the Association should not be drawn upon to make presentations to employees.

The meeting then adjourned.

MONTREAL BRANCH.

The regular monthly meeting of the Montreal Executive Committee, on October 10th, was the largest in the history of the Branch, sixteen members being present.

Report was made that at the Toronto Convention there were 84 present from Montreal, and it had been found possible to run a special train on the night of September 23rd.

At the present moment a large number of matters are under consideration by the Branch. At the invitation of the Canadian Fire Underwriters' Association, the Branch has been represented at special meetings of representative bodies to consider the present fire protection situation in the city of Montreal, and to find out what is necessary to increase the safety of the city.

The Labor Accidents Commission, appointed by the Quebec Government, is now sitting, and the Branch will shortly present a memorial setting forth the views of the members on this subject.

In view of the fact that the water rates on houses and shops in Montreal have been reduced, and nothing done to relieve the high charges made to manufacturers for water, information is now being collected on this subject, and it is probable a memorial will be sent to the City Council by the Branch. The customary Fall Entertainment will be held on November 5th, in the Canada Club, and will be of the nature of an informal dinner.

TORONTO BRANCH.

At the regular monthly meeting of the Toronto Branch Executive, a question was raised as to whether the city were within their legal rights in calling for the payment of the union or prevailing scale of wages in the specifications for all city contracts. The Executive feels that the present specifications are unfair to the contractors because the union is not a party to the clause covering the payment of union wages, and a Committee will, therefore, confer with the Association's solicitors with a view to drafting a clause which would be acceptable to the city and which would make the unions a party to the wages clause so that they will be prevented from declaring a strike for higher wages, and of hampering the contractor after the contract has been let.

Water Works Machinery.

At the request of some of its members, the Branch will oppose the attempt which is being made to restrict the purchase of water-works machinery by the city to firms working a nine-hour day and running a union shop. The unions are laying their views in this matter before the city at an early date, and the Branch will arrange to present the manufacturers' side of the case at a later date.

Customs House.

Some members of the Branch have complained of the delays in passing entries at the Customs House since the new system went into effect on September 3rd. The slowness in passing express entries and free entries are particularly complained of, and the Secretary was instructed to take these complaints up with the Inspector and report at the next meeting of the Branch.

The various Convention Committees made their final reports and were dissolved.

Promoters from Toronto have interviewed the City Council and the Board of Trade, of Stratford, regarding the establishment here of an immense industry to manufacture electrical cables and fittings, brass work and hardware. The concern is incorporated at a million and a half dollars, and would erect three separate buildings, 300 by 100 feet, at a cost with equipment of about half a million dollars, and would employ the first year 175 to 250 men. A site of ten acres would be required, and the company ask some concessions.

MONEY AND THE MAN.

THE present stringency of the money market should teach a lesson to the workingman which, if he learns it, will redound to his future profit. During the years just past, when money was easy, employment plenty, and wages high, he was inclined to listen to the pratings of agitators, who sought to teach him discontent. He was told that he was being wronged, that his employers were growing rich out of his labor, and that he was not getting a fair share of the profits. In far too many instances these arguments prevailed to the extent of causing the workingman to throw up his employment and go out on strike. Sometimes he got a small increase in his pay and sometimes he did not; but every time he lost all that he could have earned while wasting his energy following the lead of a professional agitator, whose very existence depended upon the wasteful strife he could create between the workingman and his employer. When the battle was over, the disturber of industrial peace justified the action he had advised by calculating for his dupes the amount of damage they had done to their employers' interests. This is a very fair description of the workingman's attitude in times of plenty.

But now that the turn has come, money is scarce and there is a possibility of a slackening in the demand for labor, where

has the workingman to turn for assistance and employment? The agitator, himself a parasite, cannot help him. Back he has to go to the manufacturer he tried to injure, and if his reason has returned, he will recognize that when the pinch comes the only friend he has is the man who risks his capital in establishing the industries of the country. He will not now begrudge him the profits he made and the surpluses he laid away when times were good, for out of these profits must come the wherewithal to sustain himself and his wife and children. The pity of it is that these plain truths are not brought home to the workingman. If he were taught to realize his helplessness without the aid of capital, and the folly of listening to self-interested agitators who seek at every opportunity to injure, and even to destroy, the industries that give value to labor, it would be better for him and for the country in which he lives.

If our mills are running to-day and our factories giving employment to the workmen of this country, it is because the manufacturer has husbanded his resources and saved his profits. If he had paid out all he made, without retaining a fair profit and a reasonable surplus, the state of the workingman would be pitiable indeed. The banks have no money to lend and the only money the workingman has to depend upon for his support is what the manufacturer has saved. It may be a startling way to put it, but nothing could be clearer than that the workingman, in times such as these, has to live on the past savings of his employer, and a lucky thing it is for him that his employer was able to save enough to carry them both over. When banks are not loaning money, and wages are being earned and paid, the money has to come from somewhere. It does not grow up out of the ground nor rain down out of the sky. There is only one place it can come from, and that is from the past savings of the employer.

"But," says someone, "if it had been paid out in wages the workingman could have saved it for himself and he would not now be dependent." The answer is that many workmen have saved a part of their earnings, and in the aggregate they amount to many millions; but the workingman does not take chances with his money. He will not take the risks the manufacturer does, and he will not even lend it to help on the industries in which he earned it. As soon as money got scarce in the United States, what did the workmen do? Did they go to the banks and say, "Lend our money to our employers to help keep the factories where we earned our living running. We took all these millions out of the industries of the country, and we want you to put them back there so as to maintain them in operation"? No, the

workingman does not take risks like that. He is not looking for extra profits at the risk of his savings. He is not made of the same heroic stuff out of which investors are made. What the workingmen of the United States did was to go to the banks and demand their money. In one day in New York they took eight millions out of one bank alone, and took it home with them and hid it for fear it might be loaned to some manufacturer to pay back to themselves or some other workingmen. The result over there is that many industries are closing down either in part or altogether. The wages they have been paying were so high that they were not able to lay aside enough to carry them over a crisis like this, and they are compelled to close down and dismiss their employees. That is the way the legitimate surplus of a business helps it when it has been paid out in wages.

If the workingmen of this country have any real friends amongst them who profess friendship for them, they will make a study of the present situation and teach them a few of the truths indicated above. The Canadian workingman is intelligent, but too easily influenced by agitators, and it is the duty of his real friends to put matters before him in a fair and reasonable light. No more opportune time could be chosen than the present, when he has before him the object lesson of the situation in the United States. Let him understand that his interests and the interests of his employers are one, and that the more money he can earn for them, the greater his own guarantee of profitable and uninterrupted employment at a fair wage. Teach him that when his employers are able to issue an annual statement showing a substantial surplus of profits, he should throw his hat up in the air and cheer for their success, for their success is his success, and their savings his only real guarantee of employment when times are hard and money tight.

MADE IN CANADA.

EVERY article sent out of the factory bearing the label "Made in Canada" should have more than the mere label to recommend it to the purchaser. It should have "quality," and "quality" of such a high standard that purchasers will look for it as a guarantee that they are getting their money's worth. Every patriotic Canadian should buy Canadian products in preference to all others, and the retailer should purchase from the Canadian manufacturer. It is in his own interests and the interests of the country at large that he should do so. The money he pays to foreign manufacturers goes out of the country, and is paid over to workingmen of another land, who can never become customers of his; while the money he pays the Canadian manufacturer is kept right here in Canada, and works back to him again in the course of time. It must be evident to anyone who gives the subject any thought at all that keeping our money at home, where we have a chance of getting it back, is by far a wiser thing to do than sending it so far away that it is never likely to return. If, then, the retailer buys foreign goods in preference to Canadian it is because there is a prejudice against the home product amongst his customers. It is to be feared that one reason for this prejudice is the inferior goods which some Canadian manufacturers have turned out, relying on the protection of the tariff and the patriotism of the people to secure sales for them. This is a great mistake, and it injures not only the one who is guilty of it, but every other manufacturer of Canadian products as well. Too much stress cannot be laid on the importance of quality. If it is "Made in Canada," have it made so well that it will be wanted for its intrinsic value and not merely as a matter of sentiment. Many of our manufacturers have become alive to the importance of quality, and are turning

out products equal, and in many instances superior, to foreign lines brought into competition with them. How often have you heard a salesman showing goods say, "These are superior quality imported goods; but here is a cheaper line made in Canada, which is not as fine, but may suit your purpose as well." It is a hard thing to have to listen to, but, unfortunately, the goods themselves are too often the salesman's justification.

There is no reason why anything we make in Canada cannot be made as well here as anywhere else in the world. We have the protection of a tariff, in many lines not as high as it should be, it is true, still we have some slight advantage in this respect, and if we put a part at least of that margin into our product there is no reason why we should not turn out goods which can hold their own with the world. The purpose of the tariff is not to enable us to force inferior goods of our manufacture on the people of this country. Its object is to enable us to turn out as good goods at home as we can get from abroad, and leave us a fair margin of profit. Those who have realized their opportunity in this direction are to-day turning out products of which all Canadians should be proud, and when all our manufacturers come to adopt this policy, the label "Made in Canada" will have a meaning for the purchaser, and will sell the goods.

Generally speaking, Canadians are not enthusiastic regarding articles manufactured in Canada, but there is a noticeable improvement in this respect of late years. Canadians talk enthusiastically now of the superior cheese and butter we manufacture, and what Canadian has not referred proudly to our wheat products as "the standard of the world?" This is a spirit that should be fostered. In the United States every citizen speaks with pride of their manufacturers, and maintain that they beat the world. A prominent New York woman recently gave her son \$5,000 on his birthday to buy himself an automobile. The only stipulation she made was that it should be one built in the United States. This is the spirit that has built up the vast industries across the line, and it is the spirit we are lacking in here. The press of the United States is largely to be thanked for having inspired the people with this national pride. They are not everlastingly picturing their manufacturers as highwaymen, as about half the press of Canada have been doing for years. Instead of grumbling at the protection their manufacturers enjoy, the United States press devotes its space to praising the superiority of their products, pointing out every advantage they possess. If our Canadian papers devoted more of their space to this kind of campaign they would find it a good investment. The people of Canada are not lacking in honest pride for things Canadian, as is shown by the instance already mentioned; what they lack is education. If the press would help in inspiring them the "Made in Canada" label would soon have a meaning for all Canadians that it does not possess to-day.

THE FARMER'S INTEREST.

IT has long been a favorite custom of politicians seeking the farmer's vote to go about telling him that he is a much abused individual, that all the good things the government has are being handed out to the manufacturers at his expense. This may be a clever way of getting votes along the back concessions, but it is not in accordance with fact. The manufacturers who are thus accused of living off the farmers are, as a matter of fact, doing more to build up the farming communities of this country than any other class. When

the settler arrives to take up land he, as a rule, invests all the money he has in the land itself. After he has bought all he thinks he can handle he has nothing left to give him a start, and he turns to the manufacturer, who trusts him for the machinery he requires and the necessaries of his home. If it were not for the manufacturer he would not be able to start at all, and if it were not for the protection he receives there would not be any manufacturer to trust him. It is very effective, no doubt, to tell the farmer how much cheaper he could purchase his needs if there were no tariff, but ploughs dumped on the Canadian market would not help him out if he did not have the money to pay the foreigner for them. The Canadian manufacturer is the Canadian farmer's best friend. He not only trusts him with his supplies when he starts, but he creates the market for his products when he has them ready for sale. Close up all our factories and the farmer will be one of the first to suffer.

It is foolish to talk of any one class of producers living off of any other. The farmer is necessary to the manufacturer and the manufacturer is necessary to the farmer. The one without the other would not prosper as both are prospering in Canada to-day. The best and the most profitable market the farmer has is the home market. Without it he could not make nearly as much money out of his crops as he does now. There are numerous products of the farm which are utterly useless for export, but which bring a big profit when sold in the manufacturing cities and towns within easy reach of the farmer. As proof of this, you have only to inquire the value of farm land within easy reach of a city or town, and compare it with the price of equally good or even better land which is more distant. The crops raised for home consumption on the convenient farm bring much larger returns than the crops grown for export on land so far removed from important manufacturing centres that they cannot be used for the purpose of supplying the demands of the workman's table. If, therefore, the tariff aids in the building up of manufacturing centres in Canada, it is one of the best things for the farmer that could be conceived. If the argument were followed out to the end, it would be found in the final analysis that the farmer is by far the greater gainer from the tariff, and the men who tell him the contrary are only pulling the wool over his eyes.

THE PROTECTION OF OUR PULPWOOD.

A DEPUTATION from the newspaper publishers of the United States has been waiting on President Roosevelt and urging upon him the advisability of removing the duty on paper, pulp and pulpwood, and he has sent it away satisfied that some action will be taken along the lines they suggested. The object of the removal of the duty on pulp and pulpwood is to enable the mills across the line to make an onslaught on the Canadian forests, now that their own are within a comparatively few years of exhaustion. The question to be considered by Canada is whether or not we are willing to become mere choppers of wood for the paper mills of the United States. When the full meaning of this move across the line is realized in this country, it is to be hoped our government will rise to the occasion and protect us against the humiliation and loss which is threatened. Surely we Canadians are not satisfied to eke out a humble existence chopping wood for the paper mills of the United States. If we are, then we are not worthy of the magnificent resources with which nature has endowed us. In our pulpwood forests we have an asset of marvellous value provided we take such measures as will ensure them being turned into a finished product in our own land. If, on the contrary, we

allow our American friends to come over here and turn the country into a wood yard for their benefit, our forest resources will become a source of humiliation rather than of profit.

Our salvation is in the hands of the Federal Government, who alone have the power to protect us. The government of the United States maintains a tariff against us out of all proportion to our tariff against them. They do not want anything we make or grow or possess which they have or can produce themselves. That much is quite evident from their attitude towards us; and when we find them proposing to remove the duty they have maintained against us on any product we possess, it is time for us to get on the defensive. They do not want our pulpwood because of any sudden outburst of trade friendship for us. There is, surely, no one in this country foolish enough to imagine anything so absurd. They want our pulpwood because they have used practically all they had of their own, and if they do not get ours their mills will have to close down, and their workmen be thrown out of employment. While we may sympathize with and be sorry for the men who lose their employment, still our first duty is to ourselves and to our own workmen. Our workmen are entitled to all the employment we can create for them, and it would be a crime on the part of our government if it allowed the workmen of a foreign land to steal it away from them, and that is what they would be doing if they were allowed to carry off our supply of pulpwood and turn it into paper in their own mills. The remedy is such a simple one that the approaching session of parliament should not be allowed to pass without provision being made for the application of it. A prohibitive export duty on pulp and pulpwood is the proper, and, in fact, the only defence against the threatened invasion.

When the Ontario Government put an embargo on the export of sawlogs cut on Crown lands, the mills on the American side moved over to the Canadian side, and our workmen got the benefit that was their due. It was a distinct gain to the Province, and stands to-day as an object lesson which should teach wisdom to the Federal authorities. If we refuse to allow our pulp forests to be hewn down and carried off to the American mills, the mills will have to come to the forests, and we will have an enormous industry spring up here which will give employment to thousands of men, who will spend their wages with our merchants, thus building up our towns and cities, and consuming the products of our farms and factories. This advantage we have, and surely we are not going to sit idly by and see it stolen from us under our very eyes. No sane people would tolerate such a state of affairs, and if we Canadians do we will leave ourselves open to the reproach of national imbecility.

TECHNICAL SCHOOLS.

EVERY year the need of technical schools for the training of our tradesmen in the various callings of the manufacturing field becomes more apparent. Competition has become so keen that the reduction of cost in manufacturing has grown into a fine art. Everything is specialized now-a-days, because the specialist can turn out more and better work than the all-round man, and he can do it at less cost. While this has been a boon to the manufacturer in one sense, it has brought him face to face with a new difficulty in the manning of his factory. He needs foremen, superintendents and managers, and for these positions men with all-round technical knowledge are required, and the problem

of getting men of this stamp is becoming more difficult to solve every day. Under our present system they are not developed in the factory itself, as was the case under the old order of things, when the factory was its own training school. No manufacturer who hopes to keep in the race can afford to have a student class on his pay roll. Competition has cut profits to such a fine point that every man who draws wages has to earn them, and he cannot earn them when he is only learning. Of course a certain amount of teaching has to be done, but it has been reduced to such an extent that it is next to impossible for an apprentice to acquire a trade in its entirety in any of our factories. He is taught how to make some particular part of a finished product, and he remains all his life making that part, and that is all he knows of the business. There may be twenty or a hundred parts in the finished article, and there are as many specialists employed to turn it out. In a clothing factory, for instance, one gang of men do all the cutting, another make coats, another trousers and another vests; and these again are divided into collar makers, sleeve makers, buttonhole workers, padders, and another gang devote their attention to the pressing; and of the whole lot possibly not one but the foreman could turn out a suit complete. The same is true of every line of manufacturing, and it can readily be understood how difficult it is to get men who understand the whole business to take charge of the factory.

The solution of the difficulty is the technical school, and it should be an institution maintained by the government, the same as all other schools. We have agricultural colleges for the training of farmers, which have proven highly beneficial; and we should have similar institutions in which ambitious young men could be trained to take the higher positions in our factories. The government owes it to the workingman to give him a chance, and there is nothing that could be of greater benefit to him than a training school of this description. Go into our factories to-day, and in many of them you will find the best positions held by men from countries that have realized the importance of this class of training. We have to do something of the same kind, or the day is not far distant when our workingmen will all be serving under foreign foremen and superintendents. The fault is not with the men, but with those in authority who fail to provide them with the opportunity which is their due. It is not reasonable to expect the Canadian manufacturer to turn his factory into a training school. He cannot afford to do it and keep in the strenuous race which competition has set. The government alone can come to the rescue, and if there is anything in its profession of friendship for the workingman it will not fail him at this stage in his development.

A CURIOUS CLAUSE.

HERE is a clause in all civic contracts let by Toronto which works in what is, to say the least, a very curious manner. It provides that a contractor doing work for city shall employ only citizens who have resided in the city for six months, and he shall not compel nor permit workingmen he employs to work more than nine hours a day except in cases of emergency, and then only by written permission of the City Engineer. This is bad enough if there was nothing else to it, but the authority of the city council does not extend beyond the city limits, and contractors outside the city who secure civic contracts are not bound by it. It, therefore, operates as a handicap to citizen-contractors, and is really an injury to those whom it is intended to benefit, for the reason that their employers cannot, working shorter hours, tender as low on contracts as outsiders can who have

the longer day. The local contractor has to charge the city with the lost hour, which enables his outside competitor to underbid him to that extent. Mr. J. G. Merrick, Secretary of the Employers' Association, has written to the city council calling attention to the curiosities of this piece of civic legislation. The occasion for the complaint was the demand made by the Machinists' Union to have the clause enforced. The Union have lately been defeated in an attempt to force the nine hour day on their employers, and they are now trying to induce the city council to take up their fight by enforcing the nine hour clause in civic contracts, which has been disregarded in the past. It will be interesting to watch how the council gets out of the tangle. If they enforce the clause they will be discriminating against the firms who pay them taxes, in favor of outsiders who contribute nothing to the city's revenues, and they will not be helping the workingmen, because the firms who will stand to get the city's work on the lowest tenders are those outside the city, and therefore are not affected by the city's legislation. The regulation of relations between employers and employees is too big an undertaking for a city council to handle. Even the Federal Government approaches it in fear and trembling. The Toronto legislators who conceived the nine hour clause are, therefore, to be congratulated for their bravery if not for their wisdom. As Mr. Merrick points out, it is very doubtful if a clause of this kind would stand in law, for the Municipal Act requires that public tenders be called, and tenders called subject to this discriminating clause cannot be properly called public, because they are not open to public competition on equal terms. There is a lot of trouble coming to Toronto's law makers if they persist in this kind of legislation. If it is in their power to secure men ten hours' pay for nine hours' work, it is also in their power to make it eight, or five, or three hours, or they might go only a step further and make every workingman who has resided in the city six months independently rich without working at all. Utopian legislation has never yet failed to make the fathers of it look ridiculous, and if the Toronto council are not careful history will repeat itself in their case.

OUR RAILWAY PERIOD.

THE notices of charters for new lines of railways and extensions of old ones which will be asked at the present session of the Dominion Parliament indicate that there will be no cessation of railway building in this country in the immediate future. We are told, on the other hand that railway building in the United States will be practically at a standstill during the next year, or perhaps longer. One of the greatest railway magnates across the line has said that the United States already has about all the railways it can support. The position of the two countries seems to be that while the period of railway building on a large scale is at an end in the United States it has just begun in Canada. In the United States there are a number of huge corporations whose success has come largely from the supplying of the materials necessary for the building of railway lines, and these immense plants will now be forced into idleness unless they can get a new market for their products. What is more natural than that they should turn to Canada as the most promising field for their future operation? If they can secure a footing in this country it will mean a new era of prosperity for them, but what will it mean for us?

Railways in this country are granted charters, carrying subsidies, bonding privileges, government guarantees and other advantages; all on the ground that they are works for the development of the country. Bearing this fact in mind the least the country can expect in return is that they will fulfil the promises held out on their behalf, and that every

dollar's worth of development of which they are capable shall be for the benefit of Canada and not for some other country. For instance, the building of our railways should carry with it the development of our steel industry. Every rail laid on a Canadian railway should be a "Made in Canada" rail. We are making steel rails at two plants now, and they are good rails, and if these plants are not able to turn out all the rails required as fast as they are wanted, the railways should build more slowly so that the rail makers will have a chance to catch up with them. The delay of a year or two in the laying of rails on any particular line would be more than offset by the building up of an industry which would give employment to thousands of men and be a lasting benefit to the whole country. If we do not take advantage of our railway building period to get all there is out of it for ourselves, the same opportunity will not come our way again. While the building of railways in the West is undoubtedly a great thing for the farmer, the building up of an immense industry in the East, where he can market his products at a good profit, is even a greater thing for him. The railway furnishes him transportation, the factory a market, and there is no reason why both should not be secured for him at the same time by the exercise of a little judgment and, if need be, a little patience. If he does not get both for the money he is paying out through the government, then he is being cheated out of half of that to which he is entitled.

THE ASIATIC LABOR PROBLEM. X

OUT in British Columbia there is a strong feeling against Asiatic labor, and the cry has been raised for a "white man's country." It is a cry that appeals to all of us. The employer is just as anxious to have the whole of Canada a white man's country as any workingman in British Columbia, but he has to have his work done, and if there are no white men to do it, he has to make use of such labor as he can secure. The great distance across the continent prevents the workingmen who come to Canada from European countries coming into competition with those of British Columbia, and if the latter can succeed in keeping out the Jap and the Chinaman, they will have a close corporation, and will be in a position to dictate terms to the employers. Such a condition of affairs is far from desirable, and would operate to the detriment of the Pacific Province. There is a lot of development work to be done out there and men have to be had to do it, whether they are white or Chinese or Japs. If the Federal Government takes measures to stop the inflow of the Japanese and the Chinese, it will have to provide some other means of supplying the demand of the labor market, or see the industries of the Province brought to a standstill.

Industries put at the mercy of labor are soon put out of business altogether, and cutting off the present supply of labor from the Orient, without providing some other source, would leave the industries of British Columbia in a bad predicament. The government would be compelled, in justice to the British Columbia employer, to see that a fair share of the laboring class who land at our Atlantic ports were passed on to British Columbia. It is not very clear how funds for this purpose are to be provided, but certainly if the government goes so far as to take away from the British Columbia employer his present source of supply, it cannot refuse to provide him with another in its stead. It is quite evident that the object of the workingmen of British Columbia in fighting Asiatic labor is to prevent competition and enable them to hold up employers. It is to be expected, therefore, that any scheme which the government would propose to relieve the shortage of labor brought about by its own act

would be as strenuously opposed out there as Asiatic labor is to-day. The fact that white men would be going in instead of Asiatics would not make any difference to the gentlemen who are carrying on the present agitation. The problem is certainly a difficult one to handle and do equal justice to everyone concerned.

POLICY OF CANADIAN BANKS.

MANY compliments are being paid the Canadian banks these days by American financiers; but the compliments which Canadian borrowers pay them are of a different character. Millions of good Canadian money are going across the line to earn dividends for the stockholders of the Canadian banks, while Canadian factories are compelled to lay off men because they cannot get the ready money to pay them their wages. While the Canadian banks are playing the part of an "uncle" to stranded Americans, they are telling their Canadian customers who ask for loans on gilt-edged securities that this is a time for caution, and they had better go slow, close down for a while and let the Canadian workingman go hungry. Our banks are given charters with privileges of the most valuable nature, on the plea that their purpose is to aid in the carrying on of the commerce of the country. It was not the intention of the Banking Act to empower any body of men to gather in the savings of the people of this country in order that they might become money lenders, at usurious rates of interest, in the United States. It was intended that the banks would act as a medium through which the savings of the Canadian people would be made available for the development and carrying on of Canadian business. If the spirit of our banking system had been lived up to we would not have felt any money stringency on this side of the line. In order that a similar state of affairs may not occur again, Parliament should pass an amendment to the Act at the present session, which will not leave the interpretation of its intention to interest-hungry bankers.

THE INVASION OF THE UNEMPLOYED.

THOUSANDS of workingmen who have been laid off in the United States are flocking into Canada in search of employment, and some one has raised the question of how to keep them out. There is not enough work for our own men in some lines, and it is pretty hard to see outsiders coming in to compete for what there is. It is no worse, however, to have these men coming in to make things harder for our own men than it is to have labor unions, with headquarters in the United States, sending agitators over here in times when labor is scarce to make trouble for the employer. The workingman is really only getting a little of his own medicine, and it is not the employer who is responsible for it, either. The Canadian employer should, and no doubt will, give the preference to the Canadian laborer. The "Made in Canada" principle should be applied to labor as well as to the output of labor. There is no doubt that manufacturers who find it necessary to lay off a portion of their hands for a time will give them the preference when their places become available again. Indeed, the employers are doing all they can to help their men, and many of them, rather than discharge any of their old hands, have given all half time, so that none of them will be left entirely out of work. It would be much less bother and expense to the manufacturer to lay off a part of his hands, but the average employer has his men's interest at heart, and, although he does not get credit for it, is always willing to stand any reasonable loss himself, rather than have them suffer. The Canadian workingman has, therefore, very little to fear from the American invasion. He will get the first opportunities that offer, and he ought not to forget it in the future.

BY - THE - WAY.

With men being laid off in all lines of industry the labor agitator is keeping very quiet. Nothing has such a sobering effect on these gentlemen as being thrown on their own resources for a period. It's one of the compensating features of a period of hard times.

Hard times have been defined as "a period of acute commercial cowardice." The definition seems to describe the position of affairs at the present time better than on any former occasion of depression. We are told that there is more money in existence to-day than ever before, but the people who have it are afraid of the risk.

Hon. Mr. Fielding offered to lend the banks \$10,000,000 of government money. The banks say they do not need it. Why, then, the cry of tight money and their refusal to accommodate their customers as usual?

Wheat is selling at a higher price in Canada than on the American market. A few years ago the farmers wanted to get free access to the American markets so as to get the best price for their products. They will now be as anxious to keep the Canadian market for Canadians as any other class.

When we have arrived at the point where people will say, "If it's made in Canada, it is good," it will be worth while to have it marked "Made in Canada." How soon we get to that point rests with ourselves.

A workingman out of a job learns to respect capital. He is like the boy who has set out to shift for himself. He never realized before how good his father was to him or what sacrifices he had to make for him.

WILL GIVE TECHNICAL TRAINING.

It came as a general surprise when the Government of Nova Scotia announced, early last spring, that they would establish Technical Schools throughout the Province. In some of the bigger provinces it has been the custom to smile indulgently at the industrial efforts of the provinces down by the sea. But while they were talking of technical schools Nova Scotia was laying its plans. The plan on which they will be developed has been outlined by Professor Frederic H. Sexton in the current issue of the *Canadian Labour Gazette*.

Most of the efforts of the Department of Technical Education have been occupied, since the passage of the legislation regarding technical education, in organizing the local technical schools as provided in the act. For the present year, there is to be one of these schools in each of the following industrial centres: Sydney, Amherst, Halifax, New Glasgow.

The classes for the ensuing year are to be held entirely in the evening, beginning November 3rd and closing April 30th, with two weeks' intermission covering the Christmas-New Year's holidays. Each class is to be held twice a week for two hours each session.

The teachers are for the most part men engaged in practical work, who hold positions of responsibility in various industries. A number of the instructors have had previous practical teaching experience, besides being eminently fitted

from long experience in having acquired just such knowledge as the workmen need.

Classes are to be held in the following subjects: English language, Practical Arithmetic, Practical Geometry, Mechanical Drawing, Architectural Drawing, Mechanism, Electricity and Chemistry.

It is intended to carry out all these classes in a practical rather than in an academic manner, so that they will engage and benefit the craftsman, who will attend only so long as he is learning something which is helping him in his every day work.

The expenses of the schools are to be borne by the locality in which they are situated and the Provincial Government, the former supplying proper rooms, heat, light, and one-half the cost of instructors, while the latter pays the other half for the teachers, and furnishes the equipment for conducting the classes.

The fees for each class are from three to five dollars, varying with the nature of the course. Two-thirds of the fee will be refunded to each student at the completion of the course who has attended 90 per cent. or more of the sessions of his class; three-fifths refunded for a percentage of 80 to 90 per cent., one-half for 70 or 80 per cent., and two-fifths for 60 to 70 per cent. attendance. Thus the classes will be practically free, the fee serving mostly as an incentive to attend well.

A diploma signed by the teacher and countersigned by the Director of Technical Education, will be granted to all students who have satisfactorily attained the required standard in any class, attesting to proficiency in that class.

Provision for Miners.

The schools for the instruction of coal miners have been transferred from the Department of Mines to the Department of Technical Education. These schools are conducted for the benefit of those miners who wish to educate themselves in the evenings, so that they may obtain Government certificates of competency. Under the new arrangement, in each of five coal mining districts, one teacher will be appointed, who will devote his whole time and effort to this work alone. This teacher must possess a manager's certificate or the proper practical and theoretical knowledge requisite to teach all the branches of the science and art of coal mining called for by the Board of Examiners who grant the certificates of competency. In each district there will be held two to four classes in different places, each class meeting two nights a week. If the teacher cannot overtake all the work in the district, he will have local assistants. Any intending students must possess a working knowledge of simple English composition and of arithmetic up through decimals and fractions. For such applicants as are deficient in these two branches, preparatory classes under a supplementary teacher will be held wherever there is a coal mining class if the number of deficient applicants warrants it. These schools will begin November 1st and continue to within a week of the examinations, which are usually held about the first of July, with the exception of two weeks at Xmas.

Transference of Instruction.

The schools for stationary engineers, which were conducted by the Mines Department heretofore for such persons as desired to obtain Government certificates of competency, were also transferred to the Department of Technical Education. For this year, they are to be held in any coal mining centre where there are ten or more applicants. The same educational requirements apply to these classes as to the coal mining classes, and deficient applicants are to attend the same preparatory classes in English and arithmetic as the coal miners.

Advantages of Motor Drive in Machine Shops

By W. J. B. Drew

MUCH has already been said and written on the subject of motor-driven machine tools, but the following remarks may not be out of place in keeping the many advantages of the electric drive before the minds of manufacturers.

The convenience, ease of control, ease of access to machinery, flexibility and elasticity of system, healthy conditions and adequate lighting obtainable, increased production and low cost of maintenance are reasons which should never be lost sight of for adopting the electrical rather than the mechanical system.

Can Cost be Reduced?

In the mechanical system the amount of power which is wasted in a large shop in order to drive the countershafting

the machine tools, on account of the greater efficiency of the system.

May Drive Machines in Groups.

When machines of the same class are likely to be needed for overtime working at the same time, they can be satisfactorily driven in groups. The system of group driving has the advantage of being cheaper than independent driving and less attention is required on the part of the electrician, for the reason that a smaller number of motors are to be looked after.

The Economy of Space.

In independent driving a machine is quite independent of all other tools. It can be easily placed, if desired, in a remote part of the shop at a considerable distance from other

Boring Mill Driven by Direct Current Motor.

and belts is astonishingly large, and often not more than 50 per cent. of the power given out by the engine is employed in useful work performed by the machine tools. With the electrical system the amount of countershafting is very considerably reduced and very much less power is wasted. The engine can be used to greater advantage on account of the greater efficiency of the system. For example, suppose that the efficiency of the mechanical system is 50 per cent., and that of the electrical system 75 per cent., and suppose that there is a plant driven mechanically by a 1,000 h.p. engine. This engine delivers 500 h.p. to the machine tools, but when the plant is changed over to the electrical system, 750 h.p., or an increase of 50 per cent. is supplied to

machines, whereas in the mechanical drive the long line of shafting necessary would often make this practically impossible. The motor can readily be mounted on a wall or ceiling by turning the end shields through 90 deg. or 180 deg.

In the laying out of new shops an overhead construction can be used which is lighter than that required for a mechanical drive, on account of the less amount of shafting and belts required. No special foresight is necessary in consideration of future extensions or additional machinery which may be installed, as cables can easily be led to any desired point. In the mechanical system, the addition of machinery may mean the reorganization of a whole shop, on account of the difficulty in the power transmission lines, and the want of flexibility of the system.

Makes Handling of Materials Easy.

The absence of belts greatly improves the conditions of crane service and the facilities for handling material.

In the mechanically driven plant injury to any one particular part often means the shutting down of the engine and interruption to the work of the entire shop. There is more chance of leakage from steam pipes than there is of injury to cables, there are fewer countershaft bearings to be looked after, and the cost of maintenance is lower in the electrical system. Men work under brighter and healthier conditions, and therefore do better work.

The reason which will probably appeal to the manufacturer more than any other for adopting the electric drive, is the increase in production which can be obtained. In the mechanical drive either a nest of gears or stepped cone pulleys are used in order to obtain the different speeds, and when changes of speed are constantly required considerable time is necessarily lost in changing these gears or pulleys. With the electric drive only a fraction of the machinist's time is taken up in moving a controller handle in order to obtain a change in speed, and also a far larger number of speeds is possible.

Quartering Machine for Boring Crank Pins, Driven by Direct Current Motor.

The Maximum Production.

The highest possible speed can always be used in order to give maximum production, the limit of speed being reached at the burning point of the cutting tool. It has often been found that production has increased from 25 per cent. to 30 per cent., owing to the adoption of the electrical in preference to the mechanical drive.

The accompanying curves which were plotted from a test on a 72-inch lathe will illustrate this. They show the cutting speeds and time taken to face a cast-iron disk from a 72-inch to a 6-inch diameter; Curve No. 1 being for a mechanically driven and Curve No. 2 for an electrically driven lathe. It will be seen from Curve No. 1 that the pulleys were not changed so as to obtain maximum cutting speed, whereas in Curve No. 2 during the whole of the time the maximum cutting speed and consequently the maximum production was obtained.

In one case the work was accomplished in 59 minutes, in the other case in 31 minutes, a gain of 90 per cent. in favor of the electrically driven tool.

In conclusion, the manufacturer will do well to remember

that the electric motor of to-day is very different from the motor of ten years ago. Of a sturdy and rugged construction,

mechanically strong and electrically efficient, it is admirably adapted to meet severe service conditions without requiring special care. The bearings are self-oiling and the wells can be filled with oil to last a long time, and closed by means of tightfitting covers.

Some Advantages.

The alternating current motor is especially suitable in cases where constant speed or a limited number of fixed speeds are required. It is well able to stand the momentary overload which occurs at the quick reverse on such tools as planing and slotting machines. It can be supplied with a

“squirrel-cage” armature, and without brushes, slip-rings or commutator, and in consequence can be installed without fear of danger in such places as powder mills, where the least

spark is a source of apprehension. It will work well under the most trying conditions of dust and dirt. It can be stopped dead without fear of injury, and the speed will not increase sufficiently to cause injury if the circuit is opened. In the case of a direct current motor if the field circuit is opened, it is quite possible that the speed of the motor will increase to such an extent that the motor and the machine will both be seriously damaged.

Place of Direct Current.

The direct current motor is especially suitable for variable speed work. It also can carry large overloads, and can be reversed with practically no sparking at the brushes. It is well ventilated, and when necessary it can either be totally enclosed, or supplied with perforated hand hole covers to give protection from flying particles.

The new commutating pole variable speed motor is especially suitable for the independent drive of a machine tool which requires a wide range of speed. The motor will run equally well in either direction, and sparkless commutation at all loads within the range is insured. The commutating pole motors can be operated at a higher output over a wider speed range, are particularly sturdy in construction and admirably adapted in every way for driving machine tools.

TORONTO BRANCH.

At the last regular meeting of the Toronto Branch Executive considerable discussion took place over the present situation in the power campaign as far as Toronto is concerned. The manufacturers of the city are vitally concerned in securing cheap electric light, heat and power, and it is felt that the city should take the necessary steps for providing a municipal power plant of its own at the earliest possible date.

With this end in view the Branch is of the opinion that the ratepayers must carry a by-law authorizing the city to construct a power plant which will enable them to supply power to certain sections of the city, to begin with, and it will support such a by-law at the January elections.

Viaduct Question.

While the Branch is entirely in favor of a viaduct which will provide for the elevation of the main tracks along the Esplanade, it is opposed to any plan which provides for the elevation of all tracks on the Esplanade, including sidings into existing factories and service tracks which are now on the level.

The raising of all sidings and service tracks seems unnecessary, and if a plan of this nature were carried out, as has been proposed by the city, it would drive many firms along the Esplanade out of business on their present sites, and would seriously hamper all the others.

The Branch is, therefore, watching the viaduct question carefully with a view to protecting the interests of its members who are situated on the Esplanade.

MONTREAL BRANCH.

The Montreal Executive Committee have been giving careful attention for some time past to the subject of Workmen's Compensation in the Province of Quebec, especially since the appointment of the Labor Accidents' Commission by the Quebec Government. After going into the matter thoroughly and after consulting with some of the prominent members, a memorial was drawn up embodying the views of the Committee and presented to the Labor Accidents' Commission on November 5th. Before presentation, this memorial was sent to all members of the Montreal Branch, asking them for their opinion thereon and suggesting, further, that

any members who did not agree with the stand taken by the Committee should appear before the Commission on their own account to present their views. So far the only replies received have endorsed the stand taken by the Montreal Executive on this question.

An informal dinner was held by the Montreal Branch in the Canada Club on November 5th, when over 100 people were present. The affair proved one of the most successful in the history of the Branch. Among the speakers were Rev. Dr. Johnston, who spoke from personal knowledge of the Japanese question; Hon. Alphonse Desjardins; Mr. A. W. Donly, Canadian Commercial Agent to Mexico; and Dr. Howard T. Barnes, of McGill University. The feature of the evening was the presentation of a handsome cabinet of silverware to the Montreal Secretary by the officers and members of the Montreal Executive Committee.

The regular monthly meeting of the Executive Committee was held on November 7th, when a number of matters were considered. A unanimous resolution was passed favoring the abolishment of tax exemptions in the City of Montreal.

A NEW FREIGHT ROUTE.

Up to the present there were two routes for carrying freight between Europe and British Columbia. Goods might be loaded on a boat at some European port, conveyed across the Atlantic and transported across the continent by the C.P.R., or they might be put on board a vessel and taken by a through route around Cape Horn, and discharged at a British Columbia port without transshipment. The cost of the latter method of transportation regulated the cost of the former. The long rail journey is expensive, and for some low-priced commodities is altogether impracticable. It provides, however, a much more rapid service, and for that reason gets a large amount of business of high-priced goods, where early delivery is a consideration.

A third route has just been completed, which will be watched with great interest. While the Panama Canal was being discussed and tossed back and forth between different sets of statesmen and engineers, a work was being carried on on the Central American Peninsula, in a part much farther north than Panama, which may be of tremendous importance in its relationship to the transportation problem of North America. The Tehuantepec Railroad was built. To appreciate what this means, take a map of Central America and measure the distance between Coatzacoalcos, or Salina Cruz, the termini of the railroad, and the line of the Panama Canal. This is looking many years in the future. But assuming the final completion of the canal, it will be found that on a trip from Liverpool to any port in North America on the Pacific coast, a saving of fifteen hundred miles will be made by the railway route over the canal route. Yet the railway is so short that it just constitutes a six hours' run. Over the present route by Cape Horn there is the whole circumference of South America.

The problem, then, is the relative cost of the water route to the Atlantic sea-board and across country by rail, occupying as it does the minimum time and including one transshipment and a long rail haul, the all-water route by Cape Horn, occupying the maximum of time, but with no transshipment; and the intermediate route by water to the narrow neck across Mexico, then by rail to the Pacific coast, and again by water to destination. The latter course would save weeks over the all-water route, and the cost of the transportation by rail would be very low, since it is just a couple of hundred miles across. It entails transshipping from boat to cars and again from cars to boat. It is stated that the harbor facilities are unrivalled, and that any boat can be loaded or unloaded at any time with no delay. If this were not so, much of the saving might be counterbalanced by stoppages at the harbors.

Shippers and the Railways

Some Features of the Transportation Problem

TWO EXPERIENCES WITH FREIGHT CLAIMS.

A CAR of building material was shipped by a manufacturer in Ontario to a builder in a town about a hundred miles away. The shipment was made on November 22nd, but did not reach its destination till about the middle of December. In the meantime the customer had finished his work and left the town. The consignors were compelled to make arrangements with a man in Windsor, which is thirteen miles distant, to unload the car at the town to which it had been destined, haul the material to Windsor and store it for the winter. In the meantime, while those arrangements were being completed, the railway company charged up a bill of \$9 demurrage on the car. This the shippers were compelled to pay.

No remarks that could be made would add anything to the bare recital of the facts. Such a conglomeration of inefficient service and gross injustice in the application of the demurrage rule is a spectacle for the gods to see and wonder at. It might be thought that such a palpable exhibition of unfairness would be rectified by the railway company as soon as complaint was made. Not so. The occurrence recited above took place on the Grand Trunk Railway in 1905. The claim was at that time filed with the Claims Agent, where it remains to this day.

The incident is not unique. The same manufacturer shipped a carload of material to a town in Ontario. Through the admitted mistake of a railway agent the car was sent on to a town of a similar name in Quebec. After the shipper had gone to considerable expense in telephoning and telegraphing the car was located and sent to the right address. The railway company demanded \$28 extra freight charges for bringing the car back from Quebec. The consignee was in urgent need of the goods and was forced to pay the amount. He charged it back to the manufacturer with an additional charge of one dollar for car demurrage.

In view of such occurrences as these we are not surprised that the public is not overly well-disposed to the railways. What would otherwise be considered irritability on the part of shippers takes on an aspect of positive patience and self-restraint. How long are these things to be endured?

ATTEMPTS TO SHIFT RESPONSIBILITY,

THE railways have from time to time announced through the daily press during the last year that the shortage of cars and the congestion at large terminals was almost entirely due to merchants and shippers. The statement has also been made to the Board of Railway Commissioners, at different times.

The Dominion Millers' Association has made a complaint that discrimination has occurred at Owen Sound and other lake ports in the distribution of cars for shipments of wheat. At the hearing before the Board of Railway Commissioners at Toronto, on November 6th, Mr. J. Osborne, Superintendent of the Canadian Pacific, asked permission to make a statement. He took occasion to reiterate what was said by another official before the Board at a hearing in February last, viz., that the public were largely responsible for the shortage of cars and for congestion generally.

This statement was made at a time when it was well known to the Board that the railways were unable to give any reasonably satisfactory service, and as a result shippers all

over the country were suffering heavy losses. The terminals at large traffic centres were so blocked, owing to lack of power and other proper facilities, that it was almost impossible to have cars placed for unloading. In fact, it has been known that consignees have had to wait six weeks before they could get their cars placed for unloading. This condition extended more or less through the spring and early summer, and so far as Montreal is concerned has been the situation up to the present time. It is stated that hundreds of cars have been delayed there on account of lack of proper transportation facilities, contributing largely to the shortage of cars, which the carriers are attributing to the shippers. It is unfortunate that if it is found necessary to make such statements both sides of the case are not stated.

The attention of the Board of Railway Commissioners has been drawn to this condition of affairs and a request made for a thorough investigation of the railways in Eastern Canada in the same manner as was done with the Canadian Northern, the result of the investigation to be made public in order that the blame may be placed where it properly belongs.

The Railway Commission appointed an expert for this purpose some time ago, but so far it would seem that his time has been taken up in the Northwest.

The Canadian Manufacturers' Association have realized that the railways have been working under a great disadvantage for some time past, and they accepted the situation as it presented itself. They now feel that broad statements of this kind, involving as it does every manufacturing interest in Canada, should not go unchallenged.

Hundreds of thousands of dollars have been spent in increasing plants and storage facilities in order to take care of the increased business offering, and as a result it can be said without hesitation that no interest in Canada has lived up more closely to the car demurrage rules, whereby an extra toll is permitted to be charged when cars are delayed in loading or unloading. Furthermore no interest has suffered more as a result of the delays of all kinds directly attributable to the carriers.

It is, therefore, the duty of the Railway Commission to thoroughly investigate and advise the public as to where the blame should be placed.

WILL THE REMEDY BE APPLIED?

RAILWAY equipment and inadequate facilities have been dealt with by the Railway and Transportation Committee for some time past. Information was furnished the Railway Commission in regard to shortage of cars, delays in transit, and in placing cars for unloading after arrival at destination. The Commission in March last appointed to its staff a former railway official, expert in operating, to investigate the numerous complaints. His first report concerned the Canadian Northern Railway. It summed up as follows: The Canadian Northern Railway Company has failed to provide adequate and suitable accommodation;—

The supply of motive power and cars is inadequate. More roundhouses and repair shops are necessary.

The railway has not the proper equipment with which to keep the tracks clear in the winter.

There is no systematic organization in connection with the operation of its train and train service.

Details of the report were given to the daily press by the Commission on July 8th last.

Nothing was heard of the other two principal lines of railway until November 26th, when it was given out by the Board that the Operating Assistant had made a report to the Board on October 12th as to the conditions found on the Canadian Pacific Railway in the West. It shows that the C.P.R. failed to give adequate and suitable accommodation for the receiving and handling of traffic without delay at its stations.

That the company has failed and still continues to fail to furnish the necessary equipment to move freight at the stations investigated in the West.

That there is required additional facilities such as round-houses, repair and machine shops, additional yards, sidings and warehouse accommodation.

It is probably to some extent gratifying to know that the complaints filed have been fully substantiated, but unless there is some guarantee of improvement there has been very little gained. We know what we have suffered. Is there any likelihood of its being repeated? What about the lines in the East? Are they to be investigated? Statements have been made that shippers have been to blame for much of the shortage. The Commission should investigate and put the blame where it belongs; and what is more, order and put in effect some remedy.

A SHIPPER'S COMPLAINT.

The letter from a shipper complaining of the treatment accorded him by the railways, which is reprinted in this issue, is indicative, says *The Railway Age*, of the attitude of a considerable portion of the public toward the railways, which to a very considerable extent is justified. While the incident recited is relatively an exceptional one, yet the aggregate of such occurrences wherein inefficient, indifferent or impudent subordinates give patrons cause for complaint of this character is large. The claim department is to blame for much of such trouble because of the dilatory way in which large percentages of claims against railways have been handled. The greater number of such grievances would be avoided were it possible for responsible officials to handle all of the details of their business, or even if what appear to be well-founded complaints or claims could be brought to the attention of the higher officials promptly. The condition is recognized, and on many roads there is being made a determined effort to find remedies for past abuses and devise methods of handling the business which should result in the removal of the cause of many such complaints in the future. The railways, as a whole, wish to pay all proper claims against them and to avoid practicing extortion on patrons, but to secure these ideals it is necessary that there be a campaign of education among employees.

Under the caption "A Railroad Experience," *The New York Post* printed in its issue of November 9 a communication signed "W. H.," which was as follows:

Injured Innocence.

"Few spectacles of injured innocence are more touching than the pathetic air and attitude with which the managers and controllers of our great railroads announce their awakening to the discovery that the people 'seem to have a grudge against the railroads.' They don't seem to be able to understand it, and incline to attribute it altogether to the proverbial ingratitude of the populace. Possibly a recent well-authenticated incident may serve to throw some light upon this feeling.

"I had occasion to transport my library from the Pacific to the Atlantic Coast. On consulting the local freight agent as to rates, the shipper was shown a copy of the published

tariffs now required by the interstate commerce commission, and informed that upon second-hand books he was entitled to a rate of \$1.85 per 100 pounds. He accordingly shipped some 3,000 pounds of books at that rate. On being notified of their arrival in New York he sent down an expressman to get them, prepared to pay a bill of a little less than \$50; but to his astonishment, the expressman returned with a bill demanding one hundred and twenty-odd dollars. He promptly visited the freight office in person and explained the situation, but was curtly and insolently told that he could pay the \$120 charge or go without his books. When he asked to be allowed to take a desk, containing valuable papers, and a chair, which had been shipped with the books, but as "furniture," and prepaid, he was refused these also, until he had paid the entire bill. He threatened to carry the matter up to the general freight office, upon which he was offered a reduction of the charges from \$120 to \$90. He refused this, and went in person to the head clerk of the freight department of the road. The latter gentleman hemmed and hawed for some minutes, then, after keeping him waiting for half an hour, came back and admitted that the charge was based on no bill of expense received from the western road, but merely on the highest first-class furniture rates. He pleaded entire ignorance of the true rates, had no book of tariffs, except the west-bound, which he said were different from the eastbound for the same goods, and must refer the shipper to the agent of the western road.

"To him accordingly the shipper went, and was promptly advised by him to pay the full amount charged, and then make demand for a rebate afterwards. He also professed ignorance of the proper rate, and of any knowledge of a lower rate upon books than upon household furniture. Fortunately, the shipper happened to recall the printed volume of tables, and demanded to be shown this. There, upon the first page, was the rate for which he had been contending. The agent grinned sheepishly, turned to his stenographer and dictated a letter, requesting the eastern railroad to deliver the goods at the rate specified, which was accordingly done. The moral is obvious. It distinctly recalls the celebrated, but promptly repudiated, remark of the late Collis Huntington, that the freight rates on the Southern Pacific were "all that the traffic would bear." It is also significant of the value of the requirement by the interstate commerce commission that freight tariffs should be printed and accessible on demand of the public.

"The same library had, in the health migrations of the shipper, been sent across the continent to the North Pacific Coast, and from the North Pacific Coast to the extreme south within a few years, and in both instances at full 'household goods' rates, no agent ever having revealed the fact of a lower tariff on books. Not merely 'all that the traffic will bear,' but all that a shipper can be bullied or cheated into paying, would seem to be the rule of the roads."

NOTIFICATION OF CHANGES IN FREIGHT RATES.

The Railway Act, Chapter 37, R.S.C., 1906, says: "No tolls shall be charged by the company (railway company) until a by-law authorizing the preparation and issue of tariffs of such tolls shall be approved of by the Board of Railway Commissioners.

The tariffs of tolls which the company shall be authorized to issue under this Act for the carriage of goods between points on the railway shall be divided into three classes, namely:

- (a) The standard freight tariff.
- (b) Special freight tariffs.
- (c) Competitive tariffs.

Every standard freight tariff shall be filed with the Board and shall be subject to the approval of the Board.

Upon any such tariff being filed and approved by the Board, the company shall publish the same with a notice of such approval in such form as the Board directs in at least two consecutive weekly issues of the "Canada Gazette."

Special freight tariffs shall be filed by the company with the Board, and every such tariff shall specify the date of the issue thereof and the date on which it is intended to take place.

When any such special freight tariff reduces tolls previously in force, the company shall file such tariff with the Board, and shall for three days previous to the date on which such tariff is intended to take effect, deposit and keep on file in a convenient place, open for the inspection of the public during office hours, a copy of such tariff.

When any such special freight tariff advances the toll, the company shall in like manner file and publish such tariff ten days previous to the date on which the tariff is intended to take effect.

Upon any such freight tariff being so filed, the company shall until such tariff is superseded or is disallowed by the Board charge the toll or tolls as specified therein; and such special freight tariff shall supersede any preceding tariff or tariffs so far as it reduces or advances the tolls therein."

As regard competitive tariffs the same conditions apply, except that when it may be necessary to meet the exigencies of competition, or as the Board may deem expedient, the Board may make rules and regulations governing the filing and publication of such tariffs, and may provide that any such tariffs may be acted upon and put in operation immediately upon the issue thereof by the company, before they have been filed with the Board.

These are the conditions which apply to the filing and publication of freight tariffs at the present time. It will be observed that standard tariffs only require the approval of the Board, special freight tariffs have only to be filed, and provided the conditions of the Act are complied with, become the legal tolls until otherwise ordered. Once the tariff is regularly published and filed with the Board it is no longer the rate imposed by the carrier but the rate imposed by the law.

Should the tariff prove onerous, a complaint, setting forth the objections, must be filed with the Board, and this will be heard in due course. In the meantime the carriers are permitted to charge rate as filed.

The Fixing of Rates.

The Canadian Freight Association, an organization representing all of the railways in Canada, agree upon certain changes, advances or otherwise, in freight tariffs or classification. These changes are duly filed with the Board in accordance with law, publicity given as provided for in the statutes, but the public have no general knowledge of the changes until they actually become effective. The Act, therefore, does not afford the public the protection which, no doubt, was intended. It frequently occurs that rates are advanced without the public having any previous knowledge, and are thus unable to meet the changed conditions. The same publicity should be given to changes in rates as in other matters affecting the carriers. As an illustration: In the construction of branch lines, four weeks' notice must be given in some paper published in each county or district through which the branch line is to pass, or if there is no paper there, in the "Canada Gazette." A change in rates or classification is of equal importance to the shipping public as the construction of branch lines. An amendment to the Act providing for thirty days' notice in cases of advances in

rates and ten days' in reductions, notice of the changes to be published in the district or territory affected, would obviate the present difficulties.

TORONTO INTERSWITCHING

THE complaint on behalf of the Toronto Branch, filed with the Railway Commission in April last, was heard in Toronto on November 5th, before Chairman Killam, Honorable Mr. Bernier and Dr. Mills, the full Board of Commissioners. There were five other complaints re inter-switching set down for this hearing. Mr. J. E. Walsh, Manager of the Transportation Department, appeared for the Association and other complainants. Mr. Biggar, K.C., and Mr. Cowan, K.C., appeared for the respondents, the Grand Trunk Railway, and Mr. McMurchy was present on behalf of the Canadian Pacific Railway.

The complaint sets out that the manufacturing interests alone represented in the petition had some seventy-four sidings within the city limits of Toronto provided for freight purposes, that a great deal of this freight consisted of low grade commodities which could not be crated, that the railway companies had encouraged manufacturers to locate within Toronto terminals at suitable points, that for the last fifteen or twenty years the railways had granted Toronto rates to and from all sidings, namely, Toronto rates applied to and from all sidings within Toronto terminals, on all traffic originating in or consigned to points outside the limits.

On March 1st last the respondents withdrew from this arrangement in so far as it applied to what they termed "local" or "non-competitive" traffic, that is, traffic originating at points not served by another line of railway. On such traffic Toronto rates through to destination are now refused, and an additional toll for the service of the connecting line is demanded. They also refuse to deliver the traffic to their connections unless the consignee prepays or guarantees the additional charges.

The respondents admitted the only notice of change in rates was given by telephone on or about the date mentioned.

The respondents still continue to apply Toronto rates through to final destination on such traffic as they term competitive, namely, such traffic as may be shipped by another line.

It was submitted that the action of the Grand Trunk was in violation of the discrimination clauses of the Railway Act. It was pointed out that the ultimate effect of these changed conditions would be serious to certain industries, and that it opened the door to favoritism and rebates. At present the consignee has no positive knowledge as to what he might have to pay. Some are charged Toronto rates and some are held up and compelled to pay additional charges.

A number of witnesses were examined in support of the complaint. The Grand Trunk claimed the right to discriminate between so-called local and non-competitive traffic and competitive traffic. On the former traffic they were not willing to pay the expense of delivery on another company's tracks, whereas they stated that as regards competitive traffic railways generally encouraged it to the utmost of their ability. They were, therefore, justified in making lower rates to this traffic, simply because it could be hauled by another line of railway.

The position taken by the Association's representative is that the Railway Act does not give the carriers the right to declare certain traffic non-competitive simply because it originates at a point or in a territory where there is only one

line of railway, and to decline to grant through rates as provided for in Section 271, Railway Act, 1903.

The Board alone may declare what is competitive or non-competitive, and the competition must be only enjoyed with due regard to the interests of the public.

A Consideration of Distance.

When traffic which originates at a point outside the limits of a traffic centre is consigned for delivery at a certain point, if there be proper facilities to reach that point, it should be delivered there at a through rate related to the whole distance which it is carried. The fact of the carrier having certain terminals near the destination of the consignment should not oblige the consignee to accept a part of his freight there at a loss, nor should it prevent him from getting all his freight where he wants it at a through rate, no matter whether the junction point of the two roads be within terminals or twenty or fifty miles away. Whilst the service of the connecting or delivering line may be a terminal one, entitling it to an arbitrary, that fact is no concern of the public, but rather a matter of division between the carrying companies which the Board has power to regulate in the absence of agreement.

The latter service is a transportation one in the same manner as that which the initial line performs, forming part of a through service in so far as the public is concerned, whether a switching engine is used or not by the connecting carrier.

Counsel for the Canadian Pacific asked permission to submit a brief, which was granted; at the same time the chairman stated that if it was not filed within ten days the Board would not wait any longer.

It is hoped that the Commission will give an early decision in this as well as other switching cases which have been before the Board for some time, and which will, no doubt, have a direct bearing on the question of interswitching generally throughout the Dominion.

TRADE WITH NEWFOUNDLAND.

The following report on the trade of Canada with Newfoundland has been made by E. D. Arnaud, Canadian Trade Commissioner to that country.

The following figures showing the totals of the imports and exports of the colony with the undermentioned countries have now been completed for the year ended June 3 last:

	<i>Imports.</i>	<i>Exports.</i>
Great Britain	\$2,669,934	\$1,492,795
Canada	3,669,098	1,611,480
United States	3,447,359	1,394,289

while the total imports from all sources were \$10,426,040, on which the duties collected amounted to \$2,354,056, and the total of exports to \$12,101,161.

A comparison of these figures with those of the previous year show the following results:

	1906	1907
Total of Imports	\$10,414,274	\$10,426,040
Total of duties	2,319,986	2,354,056
Great Britain imports	2,651,196	2,669,934
Canada imports	3,521,969	3,669,098
United States imports	3,609,192	3,447,359
Great Britain exports	1,662,612	1,492,795
Canada exports	1,777,169	1,611,480
United States exports	1,278,997	1,394,289
Total of exports	12,086,276	12,101,161

It will be noted from the above figures that Canadian trade

increased \$147,159, while that from the United States declined \$161,833 during the same period.

The figures on the whole show that trade has been well maintained, and that the revenue from Customs duties has increased some \$34,000 over that of the previous year.

Later on, when the returns have been printed and laid before the Legislature, probably in February or March next, it will be possible to go into the details of the figures given above, and so ascertain how far they affect the various items that go to form the total of Canadian trade with this colony.

NEW CASTING MACHINE.

Thomas H. Churchill, of Toronto, has obtained letters patent for an improved casting machine, and he has assigned one-half of it to James Scroggie, of Toronto.

This invention has for its object to provide an improved casting machine which is very simple in construction, and by the use of which it is possible for inexperienced labor to join the rails and fillings of the sides and ends of a crib or the head and foot of a bedstead quickly and without any reasonable possibility of making a mistake in the joining operation.

The invention consists of a casting machine comprising a set of molds, consisting of two groups of separable mold members, means for maintaining the groups of mold members relatively to each other, and for collectively separating and bringing them together, means for moving the molds into horizontal and vertical positions, and means for collectively revolving the molds in their horizontal and vertical positions.

A NEW FUEL FROM REFUSE.

There are at present three modes of disposing of ashbin refuse:

- (a) Consumption by fire in refuse destructors;
- (b) In dressing land, either with crude or pulverized refuse;
- (c) By tipping at refuse heaps.

Mr. H. G. Coales, A.M.I.C.E., the Town Surveyor of Market Harborough, has invented a fourth method, viz.: its consumption in ordinary boilers (or other manufacturing processes) after undergoing a new process. On the face of it this may seem difficult and insanitary, but when the crude ashbin refuse has been converted into "Coalesine Fuel"—as Mr. Coales has named the neat-looking briquettes—one forms a different opinion. The new fuel is made of pulverized ashbin refuse mixed with tar, or tar and pitch, and pressed into briquettes or cakes. The process converts the offensive and untidy ashbin refuse into a deodorised, marketable, and cheap fuel, which may be stored in confined situations without nuisance, and consumed in ordinary boilers.

The cost of putting up a plant to make "Coalesine Fuel" would be very much less than the installation of a refuse destructor, and quite within the reach of the smaller local authorities, who at present generally dump down their refuse in pestilential heaps outside the town.

It would be a great advance in sanitary practice if all ashbin refuse could be consumed by fire; but the idea is, perhaps, not likely to be realized unless it can be done without loss. There seems little doubt, however, that it would be a profitable process. The best refuse destructors in large towns, burning crude refuse, show satisfactory results; from which it is evident that by the addition of so good a fuel as tar the results could not be less favorable in the case of the new fuel. The invention seems to be on the right lines both from a sanitary and commercial point of view. Its development will be watched with interest.

System Applied to Factories

By C. R. Stevenson, Miller & Franklin Co., Business Engineers

THE natural aim of all manufacturers is to secure as large a profit as possible on the capital which they have invested. To do this, means that all of the different factors entering into the securing of such a profit must be handled in the most efficient way possible.

In the early stages of a factory's existence, the various details incident to its operation can be handled personally and efficiently by the chief executive.

As time goes on, and the factory increases in size and complications, the executive finds that he must entrust many of the duties he has hitherto performed himself to others; that it is impossible to keep in close personal touch with all of the details.

System Necessary as Business Increases.

The necessity of an organization and of trusting to records and reports for knowledge of what is occurring becomes recognised. It is now that a system of some kind becomes an absolute requisite if the business is to continue. Gradually some sort of a system, more or less efficient, more or less elaborate, grows up. On the efficiency and completeness of this system the success or failure of the factory now depends. That so many factories fail shows that the majority of these self-made systems are inefficient. That so few factories attain the maximum success possible shows that the really adequate system is a rarity.

Up to a few years ago the working out of the system was left wholly to chance. It was handled in the odd moments when there was nothing else to do. Gradually, however, the necessity of proper methods, of accurate and detailed knowledge of every phase of the situation, of obtaining a maximum percentage of efficiency from the human and material equipment, forced itself more and more to the attention of the leading factory managers.

Much careful thought and study was given to the subject, and notable improvement began to be brought about. A new profession was developed, devoting itself solely to the study and solving of the problems of factory organization and systematization.

To-day the factory manager desirous of obtaining the best results from his factory can call to his aid the services of any one of several experts who are devoting themselves solely to the handling of these problems.

A Possibility of Too Much System.

In many cases the desire to systematize led to overdoing. No matter how good a thing is, there can be too much of it. Many factories went several steps beyond the system necessary. They burdened themselves with red tape, circuitous methods, excessive clerical force and unnecessary detail. Naturally they suffered. They blamed their sufferings to system, forgetting that there is good system and bad system; that a proper and reasonable amount can not be gotten along without, but that an excess is fatal.

Many men without training, experience or knowledge attempted to do the work that requires an expert. Naturally the results were bad. Again system was blamed, but it was not the fault of system. There is nothing easier to go wrong on than system, nothing requiring more careful thought, more intelligent planning, more tactful carrying out.

Right system is simply the application of common sense,

knowledge and experience. No factory can run without some system. No factory can run with the maximum efficiency without a right system.

Things to Know.

The man who is running a factory in the best way must be assured that his purchases are being made in the right way and at the lowest prices, that deliveries are made as needed or promised, that material as received is properly checked, stored and issued; that no undue waste is developed as it passes through the factory; that the money invested and tied up in material is not too much, and that, at the same time, an adequate supply of all needful material should be on hand at the right moment, thus preventing needless delays.

He must know the efficiency of every man and every machine per labor hour and machine hour. He must keep track of all delays and the reasons for the failure to arrive at the maximum. He must have his plant operating on the most effective basis of wage payment.

He must have his organization properly arranged with a definite assignment of duty to each member of it. He must know that each member is performing his allotted work accurately, and whether or not he is keeping it up to date.

He must know the cost of every article which he produces in the three items of labor, material and expense. He must know the cost and accomplishment of each department into which his plant is divided. He must have proper methods of entering orders, and laying out production.

He must have his book-keeping proper in such shape that at any moment he can have drawn off a statement of assets and liabilities showing exactly where he stands. His selling organization must be so organized and handled that he knows at all times just what efforts each customer, prospective and actual, has had exerted on him to secure his trade. He must know the value of every salesman from the profit and loss point of view.

Finally, he should be in receipt of certain daily, weekly, monthly reports which will automatically bring all this and any other necessary or desirable information to his attention.

Simplicity Necessary.

All this must be accomplished in the simplest and most direct way, with the minimum of clerical labor. These are the questions which a right system covers and covers adequately.

In this article, the attempt has been made to show in a general way the necessity of system in a factory and what details a right factory system should cover.

In future articles an effort will be made to take up in some detail these necessities, and the general methods which have been found effective in handling them.

It must, of course, be remembered that every factory has special conditions, special needs, and that no blanket systems have yet been created which will cover these varying conditions.

Every factory is a separate problem, with its own special necessities, and should be studied separately, and a special system devised to cover its needs. There are, however, certain general conditions which must always be borne in mind, and these we will endeavor to present in our succeeding articles.

The Press and Otherwise

THE GOVERNMENT AS COAL MINERS.

The Government of Alberta is going into the coal-mining business, although there is no indication that they are going to adopt a general policy of public ownership of everything worth while. The case is explicitly stated to be exceptional. The Eagle Lake district boasts some coal areas which have been duly investigated by a mining engineer and pronounced workable. This section of the country lies forty miles from any surveyed line of railroad and is entirely barren of timber; in spite, too, of the dryness of the air, the Chinook winds, and other attributes of the salubrious climate in those parts, the thermometer gets so low in the winter that fuel is one of the essentials not so much of comfort as of existence. In fact unless a supply of coal is assured, the settlers will be compelled to forsake what is a fine wheat-growing district. Hence the Government have decided to start the necessary operations for the establishment of the mine, without delay.

THE WORKMAN HAS BENEFITED.

"Yes, wages have gone up," the average man will tell you in Montreal to-day, "and so has the price of everything you buy. Look at house rents; look at food and other necessaries of life how high they are." And the average man will clinch his argument by declaring that he is no better off than he was ten years ago. He is wrong, because even if he has not saved money his standard of comfort is higher and he is getting more out of life than was possible then.

It is not an easy matter to get at the true relation of wages to the cost of living—to work it out with mathematical precision, so to speak—but an attempt has been made by the United States Bureau of Labor, which has published an instructive bulletin giving comparative tables of recent increases in the cost of food and workmen's earnings, and these throw a flash of illumination over the subject.

While the economic conditions are not the same in Canada and the United States, there is a sufficiently close approximation in the standards of life among the working classes in the principal cities of the two countries to make the comparison interesting here. The statistics show that the average weekly earnings in four thousand representative establishments reported upon were 3.9 per cent. greater in 1906 than they were in 1905, while the retail cost of food purchased by the employees had increased by only 2.9 per cent. in the same time.

As there is nothing to offset the margin of one per cent. between the advance in wages and the cost of food, it is obvious that as the result of the increase in earning power the average worker was considerably better off in the United States last year than he was the year previous, so far at least as food prices govern the cost of living. But that is not all. While the tables show the proportional increases, they show also that there was an average reduction of one-half per cent. in the hours spent in labor each week.

When the comparison is extended from a single year to a series of years the improvement in conditions becomes more striking. The average weekly wage in the same 4,000 establishments was 18.1-2 per cent. in excess of the average weekly earnings during the closing decade of the last century. The increase in the retail price of food is shown to have been in the interval 15.7 per cent. The balance on the side of in-

creased earning power in the period under review was nearly 3 per cent. It seems a fair conclusion to draw that upon the whole the working classes are appreciably better off to-day than they were ten years ago. Savings deposited in the banks confirm this, and no one who looks around intelligently can fail to perceive that the standard of living is better—food, clothing, house accommodation, and the facilities for education.—*Montreal Herald.*

A SUPPLY OF LABOR.

An interesting incident occurred at one of the mills of the Cornwall and York Cotton Co., recently. An Englishman, a comparatively young man, applied for work. On being questioned he said he had worked at Windsor, N.S., but was desirous of getting in the mills here. In response to a question as to his family he replied that he had thirteen children, the eldest eighteen years of age, and as the family had accompanied him and were waiting outside the door, he produced them for the benefit of his interrogator. Without further preliminaries the man and the three eldest children were given work in the mills, and are earning collectively \$35 a week. They are comfortably housed and are happy and contented.

A REBUKE TO HATERS OF CAPITAL.

"Those theorists who have been carelessly denouncing capital as a public enemy will be forced to contemplate for a time how things are when capital runs short." A good many people in this and other countries will take a bitter satisfaction in the above reflection which the *Montreal Witness* gave utterance to a few days ago. The practice of taking a fall out of capital became such a pastime that it was a mean person or paper which could not take a slap at the capitalist as he passed by. The man who had enough money to start an industry had few friends. The more workmen he employed and the more money he put in circulation through the course of his business the more enmity he aroused. It never seemed to occur to these despisers of capital that without the man who was prepared to invest his money they would go hungry. What would become of the boiler-maker if the man who had the head to accumulate wealth did not erect a plant for the making of boilers? What of the carpenter, the mill-wright, the general mechanic?

The last few weeks have given the answer. There has not been enough capital to carry on the business of the country. Hundreds of men walk the streets of Hamilton; Toronto and Montreal are much worse off. The railway companies have dropped their construction staffs; so has the Bell Telephone Co. Lack of capital is most regrettable. To none is it more disastrous than to the workman. The present stringency, which it is hoped will be of very short duration, may help to restore a more rational sentiment toward capital, a sentiment that will recognize that the capitalist is of great benefit to the country, and recognizing this will hesitate about surrounding him with impediments which will discourage him from investing his money in works of development.

The capitalist has been the object of unreasoning attacks on all sides. Wherever a device has been found for instituting a tax on industry it has been promptly adopted. Yet there is an urgent need of capital in this country at the present time. We have natural resources on all sides waiting the magic hand of capital to turn them into active national wealth. A fair attitude towards capital will do the country no harm.

IT'S AN ILL WIND THAT BLOWS NO ONE GOOD.

A Western contemporary thus moralizes on the financial situation in the United States:

"There are thousands of people in the United States today who are lamenting the fact that they did not "put something by for a rainy day" when they had the opportunity. If as a result of the present depression which has overtaken the Republic to the south people will learn the value of thrift, what is now looked upon as calamitous will be regarded as a blessing in disguise. Wage-earners everywhere should take to heart this timely expression of opinion by one who bears the reputation of being a true friend of the laboring classes:

"I never saved a dollar which I was not prompted to save as a matter of common sense. If a man assumes the duty of working he cannot shirk the responsibility of saving. He has not worked sanely if he has not saved a fair percentage of his earnings."—John J. Mitchell, President of the Illinois Trust and Savings Bank."

REFUTES COMPLAINTS OF SLOW SHIPMENTS.

That general criticisms of Canadian manufacturers for neglecting export business and being slow in their deliveries are ill-founded or exaggerated is the claim of Mr. Alex. Saunders, of the Goderich Organ Co. The Canadian public have been treated to a steady line of complaints from some of our commercial agents for some time, until it has come to be believed that exporters are universally behind hand in their shipments. No doubt there are many cases in which these complaints are well founded. No one will condone the offence of those who neglect correspondence or deliver seasonable goods long after the selling season is over.

It is unfair, however, to draw general conclusions from isolated cases. For instance Mr. Saunders submits a letter which is "a sample of letters we have been receiving for the past seven or eight years." He adds, "We would just like to put ourselves on record as one of the firms who answer correspondents promptly, make shipments promptly, and are enjoying a good trade and pleasant trade relations in consequence." The letter is from an Australian house expressing satisfaction at the earliness of the delivery. Another letter received the same day, also from Australia, thanks the Canadian firm for its prompt attention.

It is a pleasure to record instances of this kind, which we believe are the rule rather than the exception. However, it is all the more necessary to impress on delinquents the necessity of giving prompt attention to enquiries from abroad. You may not want the business yourselves, but a failure to give satisfaction produces a bad impression against all Canadian manufacturers, and does almost irreparable harm to those who are making great efforts to develop an export trade.

THE WOOD-WORKING INDUSTRY.

Particulars of good openings for the sale of all kinds of wood products in Great Britain come to hand with every British mail. Dowels of all kinds, handles, chair stock, and various turned specialties are most frequently called for, but excelsior wood flour, pit-props, etc., are also enquired for occasionally. The apathy of Canadian manufacturers of these lines to such inquiries is induced partly, no doubt, by the great home demand for their products, but partly also by the low prices offered by British consumers. That there is a possibility of improvement in this last respect may be gathered from the following extract taken from a letter recently received from the office of the High Commissioner for

Canada in London. Speaking of the general demand for wood products he writes as follows:

"Upon the other hand, there can be no doubt that opportunities in these markets lie mainly in goods for which an active demand exists, owing to their not being produced in the United Kingdom, and this applies with particular force to manufactures of wood of all kinds.

"It is quite true that at times values have sunk to an unremunerative figure, and that firms here when quoting prices are prone to quote figures which are absurdly low. It should, however, be remembered that this market must draw its supplies from some source or other, and if Canadian manufacturers can produce what is wanted here and hold out for reasonable prices, they are pretty certain to obtain them in the long run, because the countries that formerly sent large supplies over here are either exhausting their raw materials or need the manufactured output more and more for their own market.

"I shall at all times be happy to hear from any Canadian manufacturer who is in a position to deal with export trade in handles, dowels, chair stock and various other lines, because we can always place him in touch with a number of concerns in this country who are apparently anxious to form new relations."

The Canadian manufacturer of these lines may perhaps profitably turn to this field when his trade slackens down a little in the coming winter months.

A DESIRABLE TRADE OPENING.

Considerable interest is being aroused in the slate industry of Newfoundland. The quality of the slate being quarried at the Bay of Islands is said by experts to be superior to that of the famous Welsh slate. If a market can be found for it in Canada it will be of advantage to both countries. A mutual trade is desirable, and every product which Newfoundland can supply to Canada will make our chances of increasing our sales to the island colony so much the better. For sentimental as well as mercenary reasons the Canadian public will be interested in seeing this trade developed.

PROFIT-SHARING ON A FARM.

An interesting example of a form of profit-sharing which was in operation for many years on a farm in Germany is given in *Fühlings Land, Zeitung*. The farm was valued at \$20,000, and the owner deducted in the first place from the net profit 5 per cent. on this sum for interest. The remainder was divided into 100 parts, which were shared in the following proportions: Owner, 50; manager, 20; book-keeper, 10; cowman, woodman and brickmaker, 4 each; head man, 2; and six laborers, 1 part each. According to the "Abstract of Labor Statistics of the United Kingdom," 1905-6, only one agricultural undertaking in which a profit-sharing scheme had been adopted was known to exist in that country on 30th June, 1906. The number of persons participating was 163.

PRIDE OF LABOR.

Adam Bede, in George Eliot's novel, is a carpenter, physically and morally stalwart, and he is proud of his calling. He loves work and is angry with his fellow workmen for flinging down their tools at the first stroke of the clock. To have seen his like now one must almost be an octogenarian. Honor has departed from manual labor. To do as little work as

possible, and to get the highest possible wages, is now the avowed aim—it might almost be said the pride—of the artisan. It may be, partly, that our system of popular education has raised the ambition of the laborer above his former lot. If that is so the change was inevitable, and the only cure for its evils would be some device identifying the interests of the workingman with that of his employer, so that he would feel that in working for the employer he was working for himself. No such blessed arrangement at present is in view. The only social revolution so far has been the other way. Even in the age of the Adam of "As you like it," the world of labor had outlived "the antique time when service sweated for duty, not for meed." It is only possible now so to arrange the meed that the sweating shall be less felt.—*Ex.*

BANQUET OF BOARD OF TRADE.

The progress which it is possible for a city to make when an aggressive body of citizens set out to accomplish it, is nowhere shown to better advantage than in the case of Peterborough. At the annual banquet of the Board of Trade of that city, held recently, the reason for its industrial activity in recent years was fully explained by the quality of the business men who give their attention to its industrial welfare.

The guest of honor at the banquet was Hon. J. D. Rolland, President of the Canadian Manufacturers' Association. That such was the case was no less an appreciation of the high position in the manufacturing world which Mr. Rolland occupies, than a recognition by the Board of Trade of the importance of manufactures in the life of Peterborough. Mr. Rolland discussed a number of the great questions which were pressing for solution in this country. He particularly referred to the need for cultivating a sentiment in favor of goods made in Canada. After speaking of the transportation problems of the country, he discussed at length the question of forest preservation.

Touching on the pulpwood problem he pointed out how lands in certain parts of Quebec were being laid bare to provide the raw material for the United States pulp mills. United States companies who have purchased limits in Canada are cutting away our forests to provide work for men in the country across the line. When the forests go, dry go the lakes and rivers that were once encircled by the forests.

Mr. Rolland advocated the manufacture of pulpwood in Canada, and referred to the advantages that would be forthcoming to Canadian labor providing we manufactured our own paper on this side of the line. Raw material for pulpwood is diminishing, and the demand from the United States is robbing us of our forests, and to preserve our pulp we must preserve our forests.

Mr. Rolland's address was received with great favor. Other speakers discussed various phases of the national life.

A BUSINESS EXCURSION.

The second of the series of excursions inaugurated by the Hundred Thousand Club, of Calgary, has just been successfully finished. The excursion train, consisting of a baggage car, four first-class day coaches and two standard sleeping cars, left Calgary at 9.30 a.m., October 30th, journeyed north, following out an extensive schedule, and arriving at the capital of the province that evening. Thanksgiving Day was spent in Edmonton and Strathcona, and the train started on the return trip Friday, Nov. 1st., at 8 a.m., visiting towns that were not called at on the going trip, and also taking a side trip on the branch line from Lacombe to Stettler, arriving in Calgary on the morning of November 2nd.

From thirty minutes to three hours was spent in the different towns, thus allowing the Calgary wholesalers to meet their customers in a social way. One hundred and seventy-five people took advantage of this exceptional opportunity to see the northern portion of the province of Alberta.

The first excursion visited the southern portion of the province on August 6th to 8th. The object of these excursions is to become better acquainted with the different districts tributary to Calgary, and increase as well as hold present trade done throughout these districts by the ninety-five wholesale houses located in Calgary.

AN IMPORTANT PUBLICATION.

An inspiring picture of the position of Montreal as an industrial and commercial metropolis is given in a recent Industrial Number of the *Montreal Witness*. Montreal occupies a wonderfully strong position geographically, situated as it is at the end of an unrivalled inland waterway system and at the beginning of ocean transportation. A view of the harbor in the summer will convince anyone of the immensity of the business which is carried on through this port. Ocean vessels belonging to five different lines enter its waters, while there is a procession of boats coming down from the lake ports. This natural position has been taken advantage of by manufacturers, financiers and other business men. The taxable and exempt property in the city is estimated at \$254,648,998. The customs receipts last year amounted to \$14,143,616. These are indications of the strength of the city. In population the city is adding to its numbers each year a city as large as Vancouver. Canadians have reason to be proud of the development of Montreal, and the *Witness*, containing an account of its many activities, will be a source of pleasure to all who are interested in the progress of the country.

ELEMENTS OF PROSPERITY.

Simmered down, future prosperity depends upon the crops and the railroads; the crops to feed the world and to create live stock and sustenance, and the railroads to make possible the movement of these products to market, and the transportation of manufactures and commodities to the interior.

The sooner these fundamental facts are understood and understandingly handled, the sooner will be recognized the basic part the railroads take in the structure of prosperity; instead of making them political and financial playthings, the sooner abiding prosperity will be with us, less subject to influences of the speculator and the demagogue.

The other contributor to the unwarranted financial disturbance at present getting the country by the ears, is the man who thinks it "wise to hang on to the money." He is the uninformed wage-earner, who knows little or nothing about finances; he is the suspicious man, who believes that everyone else has a streak of dishonesty in his make-up; he is the man whose avariciousness makes him afraid of his shadow, and whose lachrymose croakings are repeated with evident satisfaction, spreading distrust, and rolling up the amounts hidden away from the world, where they might do some good to the owner as well as to others in business. This is the class of man who will shout that "Life is worth living," and then go to some other city to buy his supplies because he can get them a few dollars cheaper than he can in his home town.

History will deal with these men as it will deal with those who are broad-minded, courageous, and honest with themselves, as well as with the people they meet in business.

Small hypocrisies, self-deception in paving the way for deceiving others, are the bane of business and the means of precipitating financial crises like the present one.—The Capital, Detroit.

WOULD OBTVIATE ACCIDENTS.

Means for lessening the possibility of accidents in factories are suggested in a special report recently issued by the Factory Inspectors of Ontario. No one will question the importance of keeping this subject everlastingly before workmen and employers alike. A sentence from a booklet issued by the American Institute of Social Service sums the matter up in a nut-shell: "We commend the common sense of those who build a fence at the top of a precipice even more than we admire the philanthropy of those who keep an ambulance at the bottom." It is the old dictum, "an ounce of prevention is worth a pound of cure." The present report consists almost exclusively of illustrations and descriptions of various machine guards. Following out the line of work which is here suggested, the factory inspectors can make themselves of real value to the public whom they serve. An inspection which will include suggestions to the employer for the better safe-guarding of his employees will be welcomed.

JAPAN'S IMPLEMENT INDUSTRY.

The tools and implements of the laborer, the mechanic, the farmer, and all the rest, are made within the country and used within the country by people to whom the making and the using alike have come down the line of ages from father to son. No doubt there has come down with primitive design a roughness of make and finish, that, if improved upon, would give a better impression, according to our idea. But here one discovers an apparent utilitarian trait or ruling principle; that is, the tools or implements may be best made to harmonize with the work for which they are intended. In other words, in Japan roughness of work and roughness of tools seem to have a proper relation to each other. One would judge that it was held as an economic and artistic principle, that polished steel and nickel-plated decoration were not of good taste in connection with the implements and tools of ordinary labor.

This view is sustained by reference to what is perhaps the finest class of edged steel workmanship. The secretary of the Yokohama Foreign Board of Trade, an old timer in the Far East, informed me that a British army surgeon, out here at the time of the Japan-China war, was struck with the excellence of the surgical instruments supplied to the Japanese staff doctors. He took with him upon his return home a complete case of these Japanese-made instruments, and reported afterwards that they were recognized as being essentially superior, especially the blade instruments, to those made and in use in England. And this is not an isolated assertion of the superior quality of the Japanese surgical instruments.

What has been said of axes, of the plane and the saw, may apply to the miscellaneous others, that go to make up a carpenter and joiner kit or chest of tools. There may be seen on view in some hardware stores a specimen or two, not much more than a sample, of the foreign style of edge tools and other appliances. Possibly some Japanese workmen may have crossed the Pacific and acquired some practice with the foreign hammer, screw-driver, brace and bits, and so on, and may sometimes fancy that sort of thing if only to gratify the curiosity of his untravelled associates. But that does not make Japan a market for edged tools of the foreign pattern.—*Trade and Commerce Report.*

PERIODICAL SMOKE SUIT.

Mrs. Emma B. Jenkins, wife of Dr. Mozart Jenkins, of Trenton, N.J., who has become famous in the Mercer County and State courts for her numerous suits against the Pennsylvania Railroad Company for damages for an alleged smoke nuisance since 1898, has commenced another action against the company.

Mrs. Jenkins' home is a block from the main line of the Pennsylvania, and she brought the first suit for damages in the United States Circuit Court in 1898, claiming damage to her furniture and other household articles from the black smoke from the locomotives. She was thrown out of court because she did not prove damages to the extent of \$2,000, the limit of that court. She then went to the Supreme Court, where her suit on trial was dismissed. Mrs. Jenkins appealed to the Court of Errors and Appeals; the verdict was reversed and she was given \$100 as a result of a new trial.

In August, 1902, Mrs. Jenkins brought another suit for accrued damages from the date of her former verdict, but the Mercer jury rendered a verdict of no cause for action. She appealed again, and this time got a verdict of six cents. The suit just brought is for accrued damages from the date of the last-mentioned verdict. Mrs. Jenkins claims the smoke is a continual nuisance, and holds that either the State or the city should move to prevent it. She brings these suits periodically to vindicate her stand in the matter.

LEGAL DECISION UPON C.I.F. QUOTATIONS.

Our Commercial Agent in Australia writes as follows in the Trade and Commerce Reports about an interesting question:

"In my report of August 7th of last year, I called attention to the report of a case decided in a court of New South Wales respecting a shipment of onions from Japan. The purchase had been made c.i.f. The onions, though loaded in good condition, arrived in Sydney in a bad condition. The purchaser refused to accept them, except on the shippers' account. An action was entered by the shippers to recover the price of the onions, and a counteraction by the Sydney receivers for damages for failure to deliver the quantity of onions in good condition. The trial judge decided that in shipping goods from Japan at a price c.i.f., Sydney, the risk of the transit fell on the vendor, and that he was bound to deliver the goods in merchantable condition at the port of destination. The case was appealed to the High Court of Australia, which is the highest court of appeal in Australia. The chief justice reversed the judgment of the court below, in which he was supported by his two colleagues sitting with him.

"It was held that the contract was for the shipment in Japan of that season's onions. They were to be sent at certain times in specified vessels, which was done. The duty of the shippers was to ship in Japan and not to deliver in Sydney, and that the action of the Sydney buyers was wrongly brought unless it was a term of the contract that the goods should be at the risk of the vendors during the voyage. This provision was not in the contract. The vendors were, therefore, entitled to a new trial, while a non-suit was entered in the case of the action of the buyers against the vendors. The decision of the High Court of Australia restores the definition of c.i.f. to the understanding in which it is usually regarded. Shipments under contract of c.i.f. mean shipments in good order at the railway station or port of export; the risk of carriage remaining with the buyers. This decision is of importance to Canadian exporters."

Spend the Money at Home*

The Pulp-Wood Problem

THOUGHTFUL men are beginning to realize that, apart from the mines and the harvests of the sea, the foundation of our material wealth is the soil and the foundation of soil tillage is the forest. The marvellous achievements due to the control of electricity and the relation of water-power to electrical energy bring home to those who study cause and effect the truth that the greatest asset in the material power of a nation in the twentieth century is the forest. Moreover, a survey of history shows that the decline and impoverishment of some of the greatest nations of ancient and modern times can be traced to the destruction of their forests—Mesopotamia among ancient nations and Spain among modern being striking examples.

It has been demonstrated that the planting of forests in a treeless country has increased and regulated the rainfall, and it has been proved with equal certainty that the stripping of the trees from a forested region has made the water supply irregular, and made fertile lands arid.

Lessons from the Past.

The effect of forest destruction in decreasing the regular flow of rivers has been shown with lamentable consequences in parts of Canada and the United States. For instance, the clearing of the forests from the Alleghany Mountains has reduced those regions to comparative sterility, and has been the direct cause of such fearful calamities as the Johnstown flood, which swept away almost a whole city during the spring freshet which broke up a reservoir. From a like cause, the spring floods which cause frequent disasters and destruction of property in the valleys of the Grand River and Thames River in Ontario, and of the St. Francis and Magog rivers in Quebec, are due to the destruction of the forests on the hills from which the tributaries of those rivers spring. In those districts, there are men still living who remember streams now completely dry in the summer, which once ran all the year round and furnished power enough to drive mills. The simple reason for such a change is that where forests surround the sources of a river, the snow and rain pass more gradually into the earth and into the tributary brooks, so that the flow of the river is more steadily maintained throughout the year; but if the trees are stripped from these hills, the snows and rains are carried away down the streams in torrents in the spring, leaving the streams low or completely dry in the summer. These sweeping freshets not only cause the destruction of bridges and loss of property, but they wash off the richer surface soil, and where this soil is thin, the land is sometimes reduced to such barrenness that it is incapable of either raising grain or again growing trees. Such desolating changes have been brought about in more than one place in the provinces of Quebec, New Brunswick and Ontario within the past hundred years.

An Essential for Power.

When we appreciate the growing importance of water-power as a generator of electricity, and when we remember that vast regions of Canada—for example, Ontario, Quebec, New Brunswick, and Prince Edward Island—are devoid of any large deposits of coal, we see the vital importance of maintaining the water-powers of our rivers and streams at their greatest efficiency, if our manufacturers are to thrive in competition with countries having cheap coal. We may thus see

what a crime it would be to our posterity if by one supreme act of folly we reduced whole regions of our fertile country to barrenness, and, at the same time, crippled the water-powers on which our future industries must depend.

As past generations of Canadians and Americans have had to clear away the woods to found settlements, and as forests have abounded over an enormous area of North America, many of us have by education imbibed the false notion that trees are an enemy to be got rid of rather than an asset vital to our national prosperity.

In the United States where forest destruction has been carried on to a more disastrous extent than in Canada, people are waking up to the fact that the forest is a national necessity, and, in about forty States of the Union, State legislation has been passed or is being prepared to preserve existing forests and restore those already wasted, especially those at the head waters of the more important streams and rivers.

The Demands of the Press.

Among the destructive agents in the wasting of the world's forests in recent years, the printing press stands pre-eminent. The experiments of Keller, in Germany, in 1844, by which pulp was produced by grinding wood, and the further experiments of Watt and Burgess in England in 1854, when pulp was made by a chemical process, resulted in greatly cheapening the cost of paper, especially those classes used for newspapers. The method of converting wood into pulp by mechanical grinding was introduced into the United States about 1870, and in ten years this process brought down the price of news print from 9 to 4c. per lb. Since then the improvement of processes and the extension of the industry have further reduced the price till recently it sold at 2 cents a pound. This cheapening has made possible the enormous increase in the size and circulation of the modern daily newspaper—one of the marvels of the age, and as fearful in its possibilities of evil as grand in its possibilities of good to the world. To satisfy this hungry demand of the daily press, the forests of spruce, fir, balsam and poplar in the United States have been slain by counties and states, until now those who have studied the situation begin to realize that America's supply of cheap pulp is at an end, because the remaining areas of pulp timber are either inaccessible or insufficient. Year by year, the United States pulp manufacturers have to go further away for their supplies of timber within their own territory, and year by year, they have had to draw to an ever increasing extent upon the forests of Canada for pulpwood. During the year ending June, 1907, the United States imported pulpwood from Canada to the amount of 650,366 cords, or enough to manufacture say 520,000 tons of news paper, while its imports of ground pulp from Canada were 149,827 tons, valued at \$3,230,272. Besides this it imported pulp from other countries, chiefly Norway, to the amount of 63,283 tons valued at \$3,118,585, largely chemical pulp. These are official figures of the United States, but while the Canadian official returns show an export to the United States of 452,846 cords in the nine months ending March, 1907, or at the rate of over 603,794 cords for the year, it is the opinion of the "Pulp and Paper Magazine of Canada" that the actual quantity of pulpwood shipped to the United States amounts to from 800,000 to 1,000,000 cords per year. Reasons for this estimate are given in a paper to be found in the Canadian Forestry Association's Report for 1906. According to a special report of

* Published by Biggar-Wilson, Ltd.

the United States Census Bureau the consumption of domestic spruce wood used by United States pulp mills increased 47 per cent. in quantity, and 122 per cent. in price in the five years from 1900 to 1905, while the consumption of Canadian spruce wood by United States mills increased 102 per cent. in quantity, and 150 per cent. in price in the same period. The general cost of wood used for mechanical and chemical pulp was more than doubled in the five years named, for every variety of pulpwood except domestic poplar. Canadian poplar had increased 176 per cent. If these percentages could be applied to the conditions in 1907 the increase would be still greater.

The Increasing Demand.

As the increase in the number and circulation of newspapers proceeds throughout the world, the difficulty of supplies must increase, unless some substitute, not yet practicable, is discovered for pulp from wood, so that what is now a national problem to the United States and other large paper manufacturing countries, will be a world's problem a few years hence. It is not alone the ever growing demand of the newspaper press, but the manifold uses of wood in other arts which is laying waste the forests of North America, and bringing this crisis near. Industrial statistics recently compiled show that while steel, concrete and other materials are increasing so rapidly for structural purposes, the consumption of wood is greater per head of population in civilized countries than ever before.

The vast expansion of manufacturing in America has brought about this exhaustion of its surplus timber so swiftly that it is only now beginning to be comprehended. It is but a few years, for example, since official documents spoke of the timber supplies of the State of Michigan as inexhaustible; but to-day large numbers of the wood-working establishments of that State have to import their raw materials from other parts of the continent, and the saw mills have had to depend for their operations on logs imported from Ontario, until the recent law of that province compelled the cutting of the logs on the Canadian side, to the great advantage of the Ontario lumber industry. The pulp mills of northern New York having eaten into the heart of the Adirondack Mountains have now to turn to Canada for a greater proportion of their supplies, while the pulp mills of Wisconsin, supposed also to have an inexhaustible supply of raw material in their own State, have, during 1907, been compelled to haul pulpwood by rail to the extent of about 70,000 cords all the way from the Province of Quebec to eke out their supplies. The last-named development is to some extent due to the conditions of water supply and difficulty of getting timber from the woods, but the irregular water supply is itself due to the exhaustion of the great forest areas, and all the facts tend to show the sure approach of the great crisis referred to, and to explain why some twenty-seven States of the American Union have already introduced, while a dozen other States are preparing to introduce legislation to check this devastation and recover, if possible, the waste already wrought.

By no Means Inexhaustible.

Apart from the Adirondacks and the Wisconsin and adjoining regions, the forests of Maine have been cited as furnishing inexhaustible supplies of timber, and as being able to supply the pulp mills of the United States for all time. No doubt these estimates have been believed by those who made them, as was the case with those who believed the forests of Michigan were sufficient for that State's needs, but it is a noteworthy fact that during the present year the International Paper Co., of New York, has obtained wharfing facilities at Portland, Me., to which port it is bringing vessels with cargoes of pulpwood from the coasts of Quebec

and New Brunswick for its own mills in New England, some of them in the State of Maine itself, while other American companies have obtained large timber limits in New Brunswick, Nova Scotia, and Northern and Eastern Quebec, with the same object of keeping up the supplies of wood no longer obtainable at home, except at greater expense. Counting the negotiations under way at the present moment for the acquisition of timber tracts in Eastern Canada, United States paper and pulp companies have purchased from 12,000 to 15,000 square miles of Canadian spruce limits. The Union Bag and Paper Co., which owns over 2,000 square miles of spruce limits in Quebec, recently explained to its shareholders, as the reason of reducing its dividend from 7 to 4 per cent., that it was necessary to acquire large bodies of timber in Canada "on account of the rapid increase in the market price of pulpwood, and the rapid disappearance of the spruce forests of this continent." This is, of course, the only reason the other large companies have for buying timber lands in Canada.

Canada has the largest forest area of any country in the world, and has also a far greater aggregate of water-power than any other country. Considering the relation of forests to water-powers, and the relation of water-power to electrical energy in a country largely deficient in coal—at least in its central provinces—and considering further the relation of forests to those industrial arts in which Canada excels, the conservation of those forests becomes the gravest problem in the whole range of our material life.

The area of the forests of Canada is estimated by Dr. Robt. Bell, of the Geological Survey of Canada, at 2,600,000 square miles, or about 1,657,600,000 acres, of which over half may be in pulpwood. This may appear to afford us timber limits illimitable, but huge areas of these timber lands are inaccessible and will remain so until vast sums of money are expended for transportation facilities, while in our more northerly regions, the annual growth and, consequently, the rate of reproduction, is slower than in areas to the south. Hence, we will find in Canada, as those engaged in the timber trade of the United States have already discovered to their dismay, that the stores of wood commercially available, are by no means inexhaustible. We still have this great advantage, that we can profit by the follies and mistakes of our neighbors, and apply the ounce of prevention rather than wait till we need the pound of cure.

The Zeal for Exploitation.

The zeal and energy of Americans in developing great enterprises, and the devotion of many of them to money, have led them into excesses which have brought suffering to the people, and will, if pursued, cause still more suffering and privation to future generations. The reckless exhaustion of the soil of the western prairies which is largely the cause of the migration of American farmers to the Canadian North-West; the wanton depletion of the white fish and herding on the American side of Lake Erie by American fishermen, who after the destruction of their own fishing grounds invaded the Canadian side regardless of Canadian laws or of danger to good relations between two countries; the clamor of the American fur sealing interests for a monopoly of the seal killing in Behring Sea, and the swift decimation of the seals in consequence of securing that monopoly; the fishing by the most destructive methods which has marked the operations of American fishermen on the Atlantic coasts, where many kinds of fish are almost extinct, and where encroachments on the territorial waters of Canada and Newfoundland have caused constant friction between neighboring peoples—these are examples of that zeal or greed for gain which is concerned with its own day and hour, and takes no thought of the claims of posterity.

But the evils that are being brought on the country by all these classes, are of little consequence compared with the destruction of American forests—an evil which in its effects on future generations, may truly be described as the abomination that maketh desolation.

Our Own Danger.

The same tendencies that will wreak havoc upon the United States if allowed to grow, are operating in Canada, but it is the duty of those who can shape our public policy to see that special interests are not permitted for their selfish ends to ruin that greatest of all our natural resources which it has taken a bountiful Providence hundreds of years to create, and whose beneficent influence was intended for the whole people and not for a class.

Canada now stands in two dangers—one the uncontrolled desolation by the hands of its own people of the forests which regulate and maintain the water-powers of our rivers and influence the rainfall upon which successful agriculture must depend in the future—the other, the depletion of those forest areas timbered with spruce, balsam, poplar and other woods, which are being taken out of the country to supply American pulp and paper mills, whose home supplies are being exhausted.

What it Means.

It is bad that the forests are thus unwisely treated at our own hands; it is worse when we invite outsiders in to assist in destroying the heritage of our children. Even if this matter concerned only the present generation, and the question were only one of an industrial policy for the passing years, it would be unwise, as the following considerations will show. The value of a cord of spruce pulpwood shipped from the Eastern Townships to the United States four years ago was about \$3.50 per cord; while a cord shipped in 1907 is worth \$6 to \$7 in the rough, or \$8 to \$10 when peeled. To the latter value—the highest valuation in the history of the province and being in itself a confirmation of the preceding statement as to developments in the United States—add the average railway freight (\$3 a cord), and the money left in the province from the export of the cord of wood is, say, \$10. Now if the same cord of wood is made into ground pulp in Canada, the result would be \$20 per cord, and if it were manufactured into news print the value would be \$45 per cord, or if into paper of the higher qualities the value would be from \$50 to \$100 per cord. Applying these results to the pulpwood exported from Canada, and taking the returns of the nine months of the official year as correct, the wood now exported to the United States would, if made into paper in Canada at an average of \$50 per ton, yield a product worth over \$30,000,000 a year.

This takes no account of the results to the railways and the communities affected by the creation of such an industry. The railway freight tariff on pulpwood is the lowest in the whole scale of freight rates in Canada and the United States. On pulp the freight is double that on pulpwood, and on paper about ten times. Then the creation of a paper industry means a great deal of new trade in machinery, supplies and general merchandise; the latter feature adding traffic and industry to the amount of from ten times to one hundred times the value of the traffic and merchandise directly concerned in the paper trade itself. The creation of a large paper industry would cheapen the cost of Canadian, as compared with foreign papers, and would bring into being other industries in paper products not now in existence, such as special kinds of stationery, paper boxes, and utensils made from paper and wood pulp, which are constantly being put on the market in countries whose paper industries are more highly developed than Canada's.

Thus, if Canada's pulpwood were all manufactured at home, industries would arise whose annual value would be millions of dollars, and yet all this could be accomplished while still so regulating the cutting of trees as to maintain the present rate of reproduction, and so conserving the value of our forests forever. Countries like Germany, France, Austria, etc., by scientifically treating their forests, have been able to restore depleted timber tracts and maintain present forest reserves, deriving from them a perpetual revenue which is a source of benefit to the whole nation.

A Case in Point.

The economic effect of prohibiting the export of pulpwood may be predicted upon the history of the lumber manufacturing relations of Michigan and Ontario. When the lumber manufacturers of Michigan found the timber supplies of their own State becoming depleted they bought timber limits in Ontario and rafted the logs across Georgian Bay and Lake Huron to Michigan, where they were made into lumber. This kept the lumber industry of that State active while the same business languished in Ontario, until the Ontario Government prohibited the export of logs. The Michigan mill owners had claimed that they were not dependent on Ontario logs to keep their mills running, but as soon as the Act was put into actual effect they at once began to move their mills to their Ontario limits, and the lumber industry of that part of Ontario has been in a thriving condition ever since, while the establishment of these new mills has also caused a development of general trade outside of the lumber business itself.

A Policy of Conservation.

The steps best designed to secure to our country the great national inheritance of its forests are:—first, the prohibition of the export of pulpwood and other woods that now go out of the country in an unmanufactured state; and, second, the creation of forest reserves on lands which form the chief watersheds of the rivers—especially rivers containing water-powers—and the gradual re-establishment of forests on those lands which investigation would show are better suited for timber growing than for agriculture. Large areas of such lands now exist in the country where, owing to the steadily increasing value of timber in recent years, tree growing will pay better than grain growing.

The pulp and paper industry has been cited as an example, showing the advantage, from an industrial point of view, of prohibiting the export of pulpwood. But the creation of a great Canadian pulp and paper industry is only an incidental advantage in such a policy—the greater purpose is national self-preservation. When our forests are despoiled, our water-powers are crippled, our agricultural regions put in danger by alternate drought and deluge, our great dairy and stock-raising industries must decline for the same reason, and the curse of barrenness must bring its sure blight upon the land as it has done in Spain and Mesopotamia, and as it is now doing in great tracts of United States territory.

No matter what the momentary advantage may be to the relatively few whose interests are in favor of exporting wood, we have no right to bring ruin to our children and desolation to our land, for that is what the indiscriminate destruction of the forest means. No one who frankly studies the history of the forests of other lands can fail to realize that, from the material point of view, the forestry question is the question of life and death to this future Dominion. What Canadian worthy of the name would bequeath a wilderness to his children in order that he might live out his own little day with a few extra dollars?

Modern Factory Construction

The Use of Re-inforced Concrete for Strength and Fire Protection

IN pace with the prosperity now for some years enjoyed throughout the Dominion, there has been a steadily increasing demand for a better class of structures for factory and warehouse purposes. "The Fireproof building" has come to its own. Two important factors have been responsible; the ever-ascendant cost of lumber, and the desire to keep insurance rates within reasonable bounds.

Manufacturers, also, do not lose sight of the fact—let their insurance outlay be what it may—that fireproof construction confers the boon of absolute freedom from apprehension lest

after the insurance adjustment incidental to stock damage or loss. The extra cost of a fireproof concrete building over that one of mill construction is only 5 per cent. to 15 per cent.

The framework of such a building is preferably of steel columns, steel girders and joists. Steel columns, connected with steel beams at each floor level, may also be used to carry the outer thin panel wall. Otherwise, solid brick walls are utilized. The columns are enclosed by concrete and a three or four inch floor slab is laid between the steel joists, these with the girders also being completely encased with con-

Re-inforced Concrete in Flooring

a conflagration should happen and cause a stoppage of business, more or less complete. Taking the case of mill construction, the last Toronto fire showed how quickly a conflagration, under certain conditions, can gallop through a building, however well sprinkled, and land floor after floor of the heavy beamed wood construction in the basement. Instead of causing this enforced cessation of business, a modern reinforced concrete warehouse, with its elevator and stair enclosures of expanded metal lath and Portland cement mortar, would be standing intact next morning. Upon whatever floor the fire entered or started, it would be confined there by these effectual firestops, and the floors being of reinforced concrete, this same storey would be ready for reoccupation

crete as the floor construction progresses. The floor slab is reinforced with expanded metal, so that—although light—it possesses great strength. By increasing the weight of the steel reinforcement according to well recognized engineering rules, it is possible to build floor slabs strong enough for any weights required. The all-concrete type differs from the above in that the columns and all beams are built of concrete, moulded in wood forms, and reinforced with high quality of steel rods and carried up storey by storey, simultaneously with the floors.

Reference to fire-proof construction would not be complete without mention of Portland cement walls, such as adopted by the E. B. Eddy Company, Ottawa, the Dominion Coal Com-

pany, Glace Bay, and the Dominion Iron & Steel Company, Sydney, B.C., etc. The method is simple. Light steel studding is erected, securely fastened with metal clips to the structural members, and to this is wired expanded metal lath, which receives two coat work of cement-gauged mortar each side, thus entirely covering and effectually protecting from rust the strong steel core. The usual thickness for this wall is two inches, and when completed it virtually forms a solid stone panel, with the internal steel reinforcement described to give it so much additional strength. Its lightness, 18 lbs. per square foot, obviates the cost of expensive footings, etc. This style of panel work being absolutely fireproof has also been adopted in many instances for sloping roofs, application of a water-proofing paint being the finishing operation. For flat roofs nothing better can be devised than a light panel built in same manner as above described for concrete floors, reinforced with expanded metal.

Where circumstances lead to the retention of structures built of combustible materials, while impossible to get perfect safeguards, it is feasible at reasonable expense to greatly

Modern Construction of T. Eaton Co.'s New Building

reduce the risk. The wrapping of wood beams and columns with expanded metal lath, this to receive a good thick coat of Portland Cement mortar, gives excellent results. A double covering, contriving a 2-inch air space between the outer and inner wrapping of lath and plaster, is often resorted to. Many industrial buildings of frame floor construction are being equipped with enclosures identical with the outer wall construction already described. This precludes the possibility of any fire starting in a lower flat taking advantage of the opening as a flue to spread to the flats above. Any window openings in same should be equipped with wire glass, and all frames should be of metal work as prescribed by the Underwriters. There are many instances of the adoption of this variety of partition as a firestop in long, low manufacturing buildings, while it is also favored on account of its lightness as a method of fireproofing steel trusses in one storey shops.

The Jeffrey Mfg. Co. of Montreal have issued a special catalogue illustrating the complete lines of screens manufactured by them.

A NEW ANNEALING PROCESS.

According to the Sheffield Telegraph, an engineer of Sheffield has invented a new annealing process. The principle of the new annealing furnace is that the re-heating of the steel is performed in a chemically reducing instead of in a chemically oxidizing atmosphere. This is the effect of burning air in gas instead of having, as in the ordinary annealing furnace, gas burning in air. A small producer-gas plant is an integral part of the installation. The producer-gas is led through recuperating chambers, and air already heated to a high temperature is forced under pressure into the gas. A great saving of fuel is effected in this way. A small coal, much cheaper than that at present employed in annealing, can be used, and owing to the close proximity of the producer-gas generator to the annealing furnaces, and to the fact that the furnaces are built down into the ground, with only their covers at the floor level, there is but little loss of heat through radiation.

The great advantage claimed for the new process is that

the finest high-speed and crucible steels can be annealed without oxidizing or "scaling" the surface of the bars. By the older process the scaling of the thin bars amounts to as much as two per cent. of the material, which is a consideration with steel sold at as much as 1s. 3d. a pound. Moreover, the new process gives a uniform dead softness to the steel so that it may be cut with a penknife, and this is considered a valuable property in the case of steels that have to be made up into twist drills, milling cutters, reamers, etc., before being hardened again after the tools have been shaped.

No other annealing furnace for steel bars is gas-fired, and it is found that annealing can be done with four hundred-weight of coal per ton of steel annealed, whereas the ordinary annealing furnace requires nearly a ton of coal per ton of steel annealed. The complete process is accomplished in forty-eight hours, whereas in all other annealing furnaces in steel works both in Great Britain and abroad the thermal treatment occupies four, five or six days, and results in more or less oxidation of the surface of the material.—*Trade and Commerce Reports.*

Defends Asiatic Immigration

Discussion at Dinner of Montreal Manufacturers

IT was the good fortune of the Montreal Branch of the Canadian Manufacturers' Association to have with them at their annual autumn banquet a speaker who was able to discuss the Japanese immigration question from first-hand information. That was not the only notable feature of the gathering. The occasion was seized by the members for showing their appreciation of the work of the Montreal Secretary, Mr. Dakers Cameron, in a tangible form. But that comes later.

Mr. S. W. Ewing presided, and around the tables were gathered an exceptionally large number of manufacturers. The dinner was served in the Canada Club, and was thoroughly enjoyed. After the menu had been taken care of, Mr. Ewing introduced the speakers. It is no reflection on the quality of the other speeches to say that the honors were carried off by Dr. Johnston, who, as a representative of the American Presbyterian Church, was in Vancouver during the time of the recent riots. He had a subject of absorbing interest, one of the very biggest in the world, upon the solution of which depends more than we can imagine.

Asiatic Labor.

Rev. Dr. Johnston took strong ground against the anti-Asiatic feeling in British Columbia, pointing out that the question of Asiatic immigration was far more than a merely local, or even an Imperial one, but pertained to the development of the whole world. The position taken by the British Columbians, he remarked, was somewhat one-sided. They wanted the privilege of sending all the Canadian exports they could to the countries of the Orient, but desired to forbid the eastern peoples to send back their great export—labor. And this despite the fact that the greatest need of Canada to-day was a plentiful supply of labor to exploit her undeveloped wealth. Further, he pointed out, the Eastern peoples could supply just the kind of labor Canada needed, the men who would do all sorts of coarse and heavy work which the white men of this country did not want to do.

In opening, Rev. Dr. Johnston took strong ground against any policy of exclusion that would shut out the Oriental and rob Canada both of present advancement and of the great place which she is destined to fill in the future as a world power.

The problem was peculiarly, he said, one relating to Canada's largest and, in some respects, richest province, British Columbia, but the people of British Columbia must learn, as we must all learn, to consider it in its relation not only to the Empire but to the world. There are questions in which even imperial thinking is too narrow; thought must widen until it includes the world.

The problem, he said, is of comparatively recent growth. On one side the Northern Pacific is a great land occupying half a continent, but recently discovered even to itself, sparsely settled, but a land that yields readily of its measureless wealth to hardy and persistent toil. On the other side is a great population, crowded, suffocated, starving, of not less than five hundred millions. The ocean separating these lands has been bridged, and it would look as though, while the products of one should flow into the hungry markets of the other, the labor from across the seas should come to us and help in the development of our as yet undeveloped resources. But now a cry is heard that while the markets of China and Japan must remain open for our trade, the Chinese and Japanese must not think of sharing the wealth of this new land. This did not seem fair.

An Impossible Policy.

For himself, Rev. Dr. Johnston questioned whether, aside entirely from all questions of expediency or justice, such a policy was possible. Scientifically, commercially, in some cases socially, the world to-day was a unit. We had entered upon the cosmopolitan era, and even the lines dividing nations were disappearing. The other day he had asked a gentleman prominent in Dominion politics if it appeared possible to him that at this stage of the world's history it was possible for any great nation to close its doors to the people of other great lands. The gentleman had confessed that to him it seemed hopeless. It is more than a question of navies and armies, it is a question of the spirit of the time. There are world-tendencies which a nation cannot oppose, and prosper. The trend of history cannot be stemmed, nor the wheels of the world's progress reversed.

A Call for Development.

A policy of exclusion, to the speaker, seemed as needless as it was impossible. The competition of Oriental labor was urged as a reason for the exclusion of the Oriental, but to-day what Canada needed more than any other single community was labor. We have undeveloped wealth in almost every form in which it is found in any part of the globe; we have capital within the Empire waiting for investment; what we have not, and what we must have if our land is not to lag in the race of national development, is labor—labor especially of that class that will submit to the hard conditions and endure the severe toils inevitable in the pioneer work of development in a land like ours.

The Oriental has been declared to be immoral and filthy. As to his filth, it is in no small measure due to the crowded condition of the quarters where he is herded, and for this the greed of landlords is not infrequently the cause. As to his immorality, it is true the Chinaman smokes opium, but medical men will tell you that in other parts of Vancouver and of Montreal the habits of drug using is not unknown. If two Chinamen found themselves together and unoccupied, they would find the means to gamble, but let half a dozen society ladies in Montreal be thrown together, and it is questionable if some one of them would not produce the necessary material for a game of bridge.

Two things are possible and are necessary. Let the Government demand of all who come, Asiatic or European, obedience to certain sanitary regulations. Overcrowding can be prevented, the number of occupants to a house or to a block of houses, can be limited; a Chinatown and a Little Italy can both be made an impossibility. Much would doubtless be done toward encouraging morality were Japanese and Chinese alike to be required to bring their wives and families. That, too, was a possible regulation which the Government could enforce.

Canada's Destiny.

To any student of history it was very evident that every nation that rightfully laid claim to greatness contributed something to the progress of the whole world. The conceptions of national life changed and advanced as the centre of world-power moved from Asia Minor to the Mediterranean, from the Mediterranean to the Eastern Atlantic, and from the Eastern Atlantic across the seas. The American Republic had taught in theory the equality of all men and had taken a long step in breaking

down the old barriers of caste and class. To the speaker it came at times as a vision that this Canada of ours was to be the land in which the unity of the race, the true brotherhood of men, was to be wrought out, not simply as a theory, but as a fact. To her he believed it was to be given to strike the last note in the orchestral harmony of the ages that should usher in the age when strife and division should cease.

Thus and thus only would Canada's true destiny be realized; thus would she attain to true greatness, in a service that should help to usher in the time for which the nations wait, when there shall be realized on earth the song the angels heard long ago, Peace on earth to men of good will.

The Speaker Thanked.

The Chairman, at the conclusion of Dr. Johnston's address, thanked him heartily on behalf of the Association. It was, he said, a great contribution to the discussion of the question which had been for weeks agitating the country.

At this stage of the proceedings a case was ceremoniously borne into the room, the bearers being preceded by a piper in full uniform, playing "The March of the Cameron Men." Mr. Dakers Cameron, the Secretary of the Branch, was then called forward, and Mr. Ewing read an address to him, expressive of the members' appreciation of his work and their pleasure at his approaching marriage. Hon. J. D. Rolland unlocked the casket and presented him with a handsome cabinet of silver. Mr. Cameron briefly thanked the members for their kindnesses, not only then, but upon all occasions.

Addresses were given during the evening by Hon. A. Desjardins, A. B. Donly, Canadian Commercial Agent in Mexico, Prof. H. T. Barnes, of McGill University, and G. M. Murray, of Toronto.

RECOGNIZES THE NECESSITY.

President Roosevelt has seized upon the great question of the preservation of the natural resources of the United States. Having taken a trip down the Mississippi, and having held conferences with men who have given the matter much thought, he has summoned a meeting of the Governors of all the States, to try and arrange a common plan of action. In his letter to the Governors he expresses his feeling about the importance and urgency of the question. He writes:

"The natural resources of the territory of the United States were, at the time of the settlement, richer, more varied and more available than those of any other equal area on the surface of the earth. The development of these resources has given us, for more than a century, a rate of increase in population and wealth undreamed of by the men who founded our Government, and without parallel in history. It is obvious that the prosperity which we now enjoy rests directly upon these resources. It is equally obvious that the vigor and success which we desire and foresee for this nation in the future, must have this as the ultimate material basis.

"In view of these evident facts it seems to me time for the country to take account of its natural resources and to inquire how long they are likely to last. We are prosperous now; we should not forget that it will be just as important to our descendants to be prosperous in their time as it is to us to be prosperous in our time.

"Recently I expressed the opinion that there is no other question now before the nation of equal gravity with the question of the conservation of our natural resources; and I added that it is the plain duty of those of us who, for the moment, are responsible, to make inventory of the natural resources which have been handed down to us, to forecast as well as we may the needs of the future and so to handle the great sources of our prosperity as not to destroy in advance all hope of the prosperity of our descendants.

"It is evident that the abundant natural resources on which the welfare of this nation rests are becoming depleted and in not a few cases are already exhausted. This is true of all portions of the United States; it is especially true of the longer settled communities of the East. The gravity of the situation must, I believe, appeal with special force to the Governors of the States because of their close relations to the people and their responsibility for the welfare of their communities. I have, therefore, decided in accordance with the suggestion of the Inland Waterways Commission to ask the Governors of the States and territories to meet at the White House on May 13, 14 and 15 to confer with the President and with each other upon the conservation of natural resources.

"It gives me great pleasure to invite you to take part in this conference. I should be glad to have you select three citizens to accompany you and to attend the conference as your assistants or advisors. I shall also invite the Senators and Representatives of the 60th Congress to be present at the sessions so far as their duties will permit. The matters to be considered at this conference are not confined to any region or group of States, but are of vital concern to the nation as a whole, and to all the people. Those subjects include the use and conservatism of the mineral resources, the resources of the land and the resources of the waters, in every part of our territory.

"In order to open discussion I shall invite a few recognized authorities to present brief descriptions or actual facts and conditions without argument, leaving the conference to deal with each topic as it may elect. The members of the Inland Waterways Commission will be present in order to share with me the benefit of information and suggestion, and, if desired, to set forth their provisional plans and conclusions.

"Facts, which I cannot gainsay, force me to believe that the conservatism of our natural resources is the most weighty question now before the people of the United States. If this is so, the proposed conference, which is the first of its kind, will be among the most important gatherings in our history in its effect upon the welfare of all of our people."

THE SOURCE OF RADIUM.

Doubts have been cast on the generally accepted theory that radium is a decomposition product of uranium, says Nature. A recent investigator showed that, starting with a solution of uranium nitrite carefully purified by repeated crystallization, the amount of radium formed in eighteen months was less than 1-2,000 of the amount which the disintegration theory called for. In a recent experiment upon the growth of radium from actinium, this same scientist decomposed a kilogramme (2,2046 pounds) of carnotite ore, containing about 20 per cent. of uranium, in an excess of hydrochloric acid. This solution was then so treated as to separate the actinium from the other constituents. It was secured in the form of a chloride, which was then sealed in a glass tube. After two months the gases from the tubes were placed in an electroscope and the activity of the emanation determined. The tube was then resealed and allowed to remain for several months longer. The emanation at the end of this time was found to indicate an activity corresponding to three times the former amount of radium. From this rate of increase it is computed that the half period for the evolution of the emanation would be about 3,100 years. Since the amount of actinium in a mineral is apparently always proportional to the amounts of uranium and radium present, it is thought that actinium may prove to be the looked-for intermediate product.

OUR NEW ZEALAND LETTER.

WELLINGTON, November 8, 1907.

The new tariff has passed both Houses with very slight alterations. With the exception of those on footwear and a few other lines the duties imposed are considered satisfactory to the majority. The arrangement of the new tariff, of which I send you a copy by the same mail, is very practical, and shows at a glance which articles are affected by the preferential duty and to what extent and when operative.

On the 26th of September this Colony was raised to the rank of a Dominion, consequently we celebrated on that day the first Dominion Day. The Government did its best to make the observance of the day as general as possible, but there was in spite of this very little enthusiasm. The majority of the people are indifferent, and as there was some fear that the statutory holidays would be augmented by another one, there was some strong opposition on the part of the mercantile section of the country. The Premier, however, dispelled these fears by announcing that in future the day would be merged with some other holiday.

"I am glad to be able to report that the business of the Alley Line is increasing. Both the *Bucentaur* and the *Pondo* were full ships. Unfortunately the *Bucentaur* ran on a reef in Suva Harbor, with the result that she had to dock in Auckland. The repair of the damage done will cost pretty near \$20,000. The *Pondo* has been ordered back to England, and the *Kazembe* will take up her running. The latter steamer left Wellington on the 3rd inst., and is now in Auckland to take some more cargo. The *Kazembe* is timed to leave for Vancouver on the 7th inst. She also is a full ship. She is on her maiden trip, and so far has given great satisfaction. She has room for about 8,000 tons, and is a fine type of the latest kind of cargo steamers and a decided improvement on the *Pondo*. I am informed that the *Bucentaur* also will be replaced by a new steamer of the same type as the *Kazembe*. This is a big improvement, and if in future the running of the steamers will be less erratic than in the past, business is bound to increase.

It is to be deplored that these new steamers are not fitted up with a refrigerator plant, as this is indispensable for the carrying of butter, fruit, meat, etc. There is a big exchange of these commodities during certain seasons between California and New Zealand, and the same business might be worked up between Canada and New Zealand, but it is impossible to do so without cold storage.

Business is very brisk here and in all other centres of the Dominion. 1907 will be a record year in every respect.

COSMOPOLITAN.

GAS-PRODUCER LOSSES.

The efficiency of a gas producer will always be less than unity. No producer ever has or ever will be made to operate without any loss. The problem confronting the gas-producer designer and user is not to attempt the elimination of all losses—which would be a physical impossibility—but rather to keep all the losses down to the lowest point commercially feasible. By "commercially feasible" is meant the co-ordination of all the commercial features of first cost, cost of fuel, cost of labor, etc. The question of commercial feasibility is frequently neglected and this has resulted in going to two extremes, either the producer is very inefficient or else a high-priced and complicated outfit is used where a simpler and lower-priced one would be better adapted. High efficiency always necessitates more expensive apparatus than is required for operating at a low efficiency. However, as a

low efficiency always means a large waste of fuel, it will frequently pay to install the more expensive producer. No general rules can be given for all cases. Each plant has its own special problems to be considered.

The heat losses in a gas producer may be divided into two general classes, and these may in turn be further subdivided as follows:

Heat Losses.

- A. Process losses.
 1. Lost in evolution of carbon monoxide.
 2. Lost in decomposing steam.
- B. Apparatus losses.
 1. Radiation.
 2. Evaporating moisture in coal.
 3. Heating undecomposed steam.
 4. Sensible heat in gas.
 5. Tar and soot.
 6. Coal in ashes.
 7. Sensible heat in ashes.
 8. Volatilization of hydrocarbons.
 9. Formation of carbon dioxide.

The process losses are due to the heat absorbed by the gasification process. The apparatus losses are in a large measure due to imperfections in the apparatus.

Every pound of carbon converted into carbon monoxide will evolve 4450 B.t.u. This reaction supplies the heat required to keep the process of gasification going continuously. This is absolutely fixed and cannot be altered.

Every pound of steam that is decomposed will absorb 3913 B.t.u. These heat units must come from the heat evolved in the formation of the carbon monoxide. In order to take care of all the apparatus losses it is of course obvious that only a fraction of a pound of steam can be used per pound of carbon converted into carbon monoxide if the gasification process is to be continuous.

The radiation loss is simply the heat that is radiated from the fuel bed. Proper jacketing of gas producers with non-conductors like mineral wool will reduce this loss materially. The relative values of a few substances used for heat insulating purposes is shown in the following, where the numerical values represent the B.t.u. radiated per square foot per minute. The respective materials are taken 1 in. thick:

Efficiency of Heat Insulators.

Hair felt	1.72
Mineral wool	2.17
Charcoal	2.32
Paper	2.33
Ashes (loose)	3.50
Asbestos	3.62
Air	8.00
Sand	10.35

Hair felt being combustible is not desirable for heat insulation around a gas producer. The radiation loss on many producers is excessively high on account of the entire absence of, or poor quality of the heat insulation. The above table shows the absurdity of using sand for retaining heat in a producer.—S. S. Wyer, in *Brick*.

The Young-Thomas soap factory, the latest acquisition to Regina's manufacturing industries, was formally opened last month, when the management on a general invitation held a reception at their factory building and showed their guests through the works, giving each visitor a sample of their product.

Train Their Own Workmen

IT is now about eighteen months since the problem of securing efficient labor became pressing with the New York Central management. They came to the conclusion that the solution lay in the training of workmen while they were at the receptive stage, to take them in as boys and utilize the apprenticeship system for giving them the necessary instruction to make them skilled mechanics. Mr. J. F. Deems, the General Superintendent of Motive Power, states that the new system was not adopted for unselfish motives, although it will better the condition of the men materially, and the boys are being paid while under instruction. The management after most careful consideration, decided that the better returns from an educated body of mechanics, would justify the initial expenditure on the classes.

Prior to the organization of the new system, apprenticeship schools had been carried on at only four of the twelve shops maintained by the New York Central Lines. Under the new system schools have been established at nine points, the aggregate number of apprentices enrolled in July being about 450, or 67 per cent., of all the apprentices employed on all the lines. When schools shall have been established, as proposed at 11 other large shops, as large a proportion as 92 per cent. of all the apprentices will have been provided for, leaving only 8 per cent. at thirteen points who will need to be reached by travelling instructors. It is quite possible that within a year a school may be opened at the new shops now being completed at Springfield, Mass. As yet there are none of these schools in this State.

The Organization.

The "apprenticeship department" appears to have been very efficiently organized. It has been placed under the immediate direction of a superintendent of apprentices, who reports directly to the general superintendent of motive power and devotes his entire time to the work. The superintendent is assisted by a graduate of a technical school who has charge of the educational features. The central organization has charge of the general administrative work of the department, outlines the different courses, organizes new schools, and keeps in touch with all of the schools.

At each of the larger shops are two instructors—a drawing instructor, who in most cases is the shop draughtsman and who has charge of the school work, and a shop-instructor who gives his entire time to instructing apprentices in their shop work and to seeing that they receive the proper shop experience. Both of these men report directly to the local officers of the road. The special features of the system, features which are common to all the schools are as follows:

Plan of Instruction.

The apprentices are instructed in drawing and in shop problems by a man already in the service of the company, on the shop property, during working hours and while under pay;

They are instructed in the trade in the shop by a special instructor, who gives the whole or part of his time to this work and who is responsible to the local shop management;

The instruction in the trade is given in the shop on the regular tools and in the regular run of shop work;

Apprentice schedules are followed, insuring a thorough

training in the trade and giving the necessary variety and work.

The drawing and the problem courses are arranged to allow each apprentice to progress as rapidly as he desires, but so as to enable a single instructor to handle classes with as many as twenty-four students in a class.

The character of the courses is such as to fit the standards of the road, and to suit any special conditions which may exist locally.

Novel Feature of Course.

The method of instruction differs radically from ordinary methods of teaching in that text-books are not an essential part of the plan, there is no subdivision into subjects, all principles are clothed in problem form, there is no arbitrary standard of the amount of ground to be covered, and, finally, no examinations are held, the progress and marks of the apprentices being based on the close personal touch maintained between the instructors and the apprentices.

Stated more briefly still, the system provides for (1) the close supervision and instruction of the apprentices in the shop by a qualified instructor; (2) an adequate shop training, including practical instruction in mechanical drawing, for all apprentices, each of whom receives pay while in attendance; and (3) additional outside training involved in following a course of problems carefully prepared in order to suit the needs of the apprentices. Under this system the apprentices receive valuable technical training while actually in contact with real shop conditions.

The System Satisfactory.

While the system has not yet been in operation for a sufficiently long period to justify the making of an accurate statement as to results, yet it may be said that its adoption has met with the unqualified approval of all concerned and has received an enthusiastic response from the apprentices themselves. The men in the shops, both foremen and workmen, have evinced considerable interest in the apprentice schools and have manifested a desire for evening schools at which they may receive similar instruction. Several such evening schools have already been opened and others are to be established wherever the demand may justify such establishment. In these evening schools a nominal fee for instruction is charged.

The superintendent says, with reference to the attitude of organized labor toward the new apprenticeship system, that when the proposed system was first discussed "some of the leaders of organized labor looked upon the movement with a little suspicion, but as the work progressed, and they came to know what we were doing, the leaders, so far as I know, have most heartily approved of the scheme. In fact, some of them are quite as enthusiastic over the work as we are, and there is a less tendency to restrict the number of apprentices we may employ in proportion to the number of journeymen, as they see the great benefits that will accrue to the apprentices. And, as we aim to select the boys from the families of those already in our employ, they are not inclined to look with favor on the restrictions ordinarily imposed, as they see in this system too great an opportunity for their sons."

Among the Industries

The Canadian Bronze Powder Works have completed a fine factory in Valleyfield, Que.

The Standard Shirt Co., of Montreal, is erecting a new factory, to cost in the neighborhood of \$100,000.

The Cement Brick Co., which was organized some time ago to operate at Sydney, will open a branch plant at Glace Bay.

The Crown Lithographing Co. have been incorporated with a capital of \$100,000. They will carry on business in Ottawa.

The Wilcox Manufacturing Co., of London, Ont., have gone into liquidation. The firm have been in business for about two years and employed fifty hands.

The Auto-Strop Safety Razor Co., Ltd., have been incorporated in Canada, with a capital of \$20,000, and head office at Montreal. Their business is indicated by the name of the company.

The Canada Tool Co. have been incorporated with head office in Montreal, to manufacture tools, electrical supplies, machinery articles and novelties. The capital stock is fixed at \$20,000.

The Collier-Cunningham Company, Peterborough, have purchased machinery for the equipment of their new factory, where they will manufacture electric irons and all kinds of electrical heating apparatus.

The town of Barrie may get the Grand Trunk car shops for the Northern Division. The railway company ask a fixed assessment of \$35,000 for all their property in the town. It is probable that the municipality will accept this proposition.

The Ham & Nott Manufacturing Company, of Brantford, will enlarge their factory, at a cost of \$40,000, this summer. They had previously thought of establishing a branch at Ottawa, but have decided to increase their facilities at Brantford instead.

The St. John's Foundries, Ltd., have been incorporated with a capital stock of \$30,000, to smelt, refine and prepare for the market metals of various kinds, and to do a general foundry and moulding business. The place of business is St. John's, Que.

The Doty Engine Works Co., of Goderich, are asking that town for a \$35,000 loan at 5 per cent. interest, and ten years exemption from taxes. The company want to extend their factory and install a plant for making boilers and steel frames for steamers.

The Canada Tin Plate and Sheet Steel Co., of Morrisburg, have formally opened their plant. A large number of citizens and others were present. Large pieces of sheet steel are now on exhibition throughout the town, labelled, "The first tin made in Canada."

Moncton, N.S., will offer special inducements to the Higgins Shoe Factory to locate in that city. For a specified bonus and other privileges, the company are to build a factory

within the city limits, employ 1,000 hands, and pay in wages at least \$300,000 per year.

The Fort William Car Company have been incorporated with a capital stock of \$1,500,000, to manufacture and sell cars and carry on such subsidiary industries as are deemed advisable. Wilfrid Bovey, of Montreal, is the legal representative of the new company.

A report from Prince Albert, Sask., announces that a United States firm have made a definite proposition to that town for the establishment of a \$100,000 factory there. The municipality is also negotiating with two companies with a view to the establishment of foundries.

The Red Cliff Lumber Company, of Duluth, have purchased large fir timber areas on Vancouver Island, and will establish a mill there at once. The mill to be erected will have a capacity of 250,000 feet a day, representing in connection with the logging roads an expenditure of half a million dollars and the employment of 500 men.

A company is being organized, of Canadian and United States capitalists, to manufacture railway cars. The company will be capitalized at three million dollars, of which half a million will be spent next year on the plant. The output at first will be twenty-five cars per day.

Valuable discoveries of bog iron are reported from the Port Arthur district. Mr. James Conmee, M.P., has had tests made and he states that the ore is rich in iron. Bog iron is found in Quebec and is used in the smelter at Three Rivers. It yields a high grade of iron. The district in which the deposits have just been discovered will be thoroughly explored.

The Canadian General Electric Co., and The Canada Foundry Co. have issued their set of catalogues, running from I. to VII. in a convenient binder, with an index for the complete volume. The binder is big enough to admit of a further extension, so that future sections of the catalogue may be inserted as they are published. Buyers will find the arrangement of great practical convenience. To those who are not receiving supply catalogues already the General Electric Co., and the Canada Foundry Co., will send them on application.

The Canada Chemical Mfg. Co. have again built a new addition to their Toronto warehouse, so that they now have a frontage of 200 feet on Mill Street, and the buildings run back to the C.P.R. tracks. The two sidings provide ample facilities for unloading tank cars and other carloads. This is the third addition which has been built to the warehouse since the company has located its distributing warehouse in Toronto; but the rapid growth of the sales for acids and chemicals in the district has necessitated this constant enlargement of storage space. For the last couple of years the Toronto sales office, with Mr. Nieghorn in charge, has been located in the McKinnon Building, but Mr. Nieghorn and his staff are now moving out to the new Mill Street warehouse, where the sales office for Toronto district will be located for the future.

Trade Enquiries

NOTE.—For further information regarding any inquiry mentioned under this heading or the names of inquiries, apply by numbers to the Secretary, at Toronto.

- 240 **Antimony Ore.**—A London firm is desirous of being placed in touch with Canadian producers of antimony ore, with a view to purchasing supplies.
- 241 **Articles for 5 and 10c. Store.**—A party in Regina, Saskatchewan, who is just opening a 5 and 10c. bazaar, is open to purchase domestic utensils, novelties of all kinds, candies, and any other articles suitable for this trade. Wishes catalogues from Canadian manufacturers.
- 242 **Baskets.**—A Hull merchant is open to buy at a reasonable price 20,000 wood chip baskets, suitable for holding 4 kilo net of black currants, and desires to hear from Canadian firms who can meet his requirements.
- 243 **Butter, Eggs, Preserved and Dried Fruits, Canned Fish and Meat, Fresh Fruit.**—Well-known firm of Liverpool produce importers, with good connections, is in the market to purchase large quantities of the above products from Canadian exporters. Will pay cash against documents, and purchase outright or sell on commission. Good references. Quote on delivery to Liverpool.
- 244 **Broom Handles.**—Dublin, Ireland, merchant is in the market to purchase broom handles, 50 x 1 1/8, in 50 to 1,000 gross lots. Quotations to be based on delivery to Liverpool. First class references.
- 245 **Broom Handles.**—A Manchester firm asks for prices and description of broom handles from Canadian manufacturers.
- 246 **Canned Fruits and Vegetables.**—A Manchester produce firm wishes to correspond with Canadian exporters of canned fruits and vegetables.
- 247 **Chair Seats.**—A Manchester firm asks for prices of three-pley chair seats from Canadian manufacturers.
- 248 **Commission Merchants.**—A firm of commission merchants at Delhi is desirous of offering its services to Canadian houses interested in trade with India.
- 249 **Doors, Windows, etc.**—A north of England firm desires to hear from Canadian makers of doors, windows, ballustrading and similar wood goods for the building trade.
- 250 **Essential Oils.**—A Manchester firm asks for prices of essential oils from Canadian manufacturers.
- 251 **Flooring.**—A London firm engaged in the flooring and paving industry wishes to get into correspondence with Canadian manufacturers who can supply maple wood flooring blocks in large quantities.
- 252 **Flour.**—A Newcastle-on-Tyne firm asks for prices and particulars from Canadian exporters of flour.
- 253 **Former Canadian now residing in Auckland, New Zealand,** is open to represent Canadian manufacturers of men's and women's wear of all kinds, also of Canadian specialties. References. Is a good business man, and should be able to place good orders.
- 254 **Go-carts.**—A Birmingham firm wishes to hear from a Canadian manufacturer of go-carts.
- 255 **Iron Pipe for Gas Lines.**—There is a good opening in Ontario for the sale of Iron Pipe for pipe lines in the gas fields. This pipe must be butt-welded, and specially threaded, and able to withstand a pressure of about 600 lbs. Most of this business now goes to United States firms, and there is no reason why Canadian firms should not get some of it. Specifications can be secured from the gas companies.
- 256 **Legging Leather.**—A Lancashire firm desires to correspond with Canadian manufacturers of split legging leather.
- 257 **Linseed Meal Cake.**—A Liverpool firm asks for prices of linseed meal cake from Canadian manufacturers.
- 258 **Lime Juice Filter.**—Canadian firm is in the market to purchase Filters used in the manufacture of Lime Juice.
- 259 **Manufacturer's Agent.**—A resident of Brussels, Belgium, is anxious to represent Canadian manufacturers of special machinery and tools, machine tools, etc., and fine machinery, Belgium and France. Is well connected with the machinery buyers of those countries and has had considerable experience.
- 260 **Manufacturer's Agent.**—Firms desiring to open up business with Austria should communicate with this office, as notice has been received that a representative of the Austrian Government will shortly tour Canada for the purpose of establishing import and export relations with reliable Canadian firms.
- 261 **Manufacturer's Agent.**—Canadian firms seeking to develop business with British India can obtain the address of a reliable firm of Commission Agents in Delhi at this office. This party is prepared to advertise extensively, and has a large staff of travellers covering all the principal cities of India.
- 262 **Maple Planks and Flooring.**—A Manchester firm asks for prices and dimensions of maple planks and flooring from Canadian exporters.
- 263 **Maple Handles.**—A well-known Mainz, Germany, merchant is open to purchase Maple Handles for forks, shovels, spades and hoes. Considerable business in sight.
- 264 **Meat, Fruit, etc.**—A correspondent in Scotland connected with the wholesale and retail grocery and provision trade is desirous of representing Canadian canners of meat, tongues, fruit, etc.
- 265 **Millers' Offals.**—A Tynside firm is open to hear from Canadian exporters of millers' offals—with prices and full particulars.
- 266 **Mica.**—A Manchester firm asks for samples and prices of mica, rough trimmed, and rectangular trimmed, from Canadian exporters.
- 267 **Nickel.**—A Manchester firm invites correspondence from Canadian exporters of nickel.

- 268 **Office Furniture, etc.**—A Bradford exporting house having a large trade connection in South Africa, wishes to get in touch with Canadian manufacturers of roll-top desks, office furniture, and similar manufactured wood goods.
- 269 **Office Furniture, Metal Office Fittings, Pottery Products.**—A wholesale firm in Cleveland, Ohio, is open to purchase the above articles for their Canadian business. Will pay cash, and would like quotations on large quantities f.o.b. where manufactured.
- 270 **Pig Iron.**—An importing and exporting firm of foreign merchants at Yokohama and Kobe (Japan) desires to form business connections with exporters from Canada of pig iron, bright and galvanized iron wire and wire nails.
- 271 **Pine Doors.**—A Manchester firm asks for prices and dimensions of pine doors from Canadian manufacturers.
- 272 **Pick and Hammer Handles.**—A Liverpool firm asks for prices of pick and hammer handles from Canadian manufacturers.
- 273 **Pitwood.**—Particulars of further openings for the sale of pit props in Wales can be obtained at this office. This should provide an outlet for spruce lumber waste in the mills in Eastern Canada.
- 274 **Pork Products.**—Well-known Ontario Pork Product manufacturing firm is anxious to secure representatives in various Canadian cities and towns, and would welcome correspondence from prospective agents.
- 275 **Razor Strop Leather.**—A London firm invites correspondence from Canadian manufacturers of razor strop leather.
- 276 **Representative.**—Inquiry has been made by a London agent offering good references and having an extensive knowledge of trade conditions, for names of Canadian firms desiring to appoint a representative in London to push their products or to take up any article for which a demand could be created in Great Britain.
- 277 **Representative.**—A London firm desires to be placed in touch with first-class Canadian firms who may wish to be represented in the United Kingdom. They have had experience in handling grain, flour-milling offals, tallows, fats, general product, etc., ores, minerals, wood pulp and paper.
- 278 **Rock Phosphate, Cattle Bones and Hoofs.**—There is an opening in Japan for firms who can ship this material to that country. The Secretary will be glad to hear from any parties who can engage in this business.
- 279 **Sawn Ash or Elm.**—A Manchester firm asks for prices of sawn ash or elm 1 in. x 2 in. wide and up, 12 feet long and over, from Canadian exporters.
- 280 **Sisal Ropes.**—Leeds firm using considerable quantities of sisal ropes inquires for Canadian manufacturers.
- 281 **Skewers, etc.**—A London firm would be pleased to hear from Canadian manufacturers of skewers, and also of other manufacturers of wood who are in a position to fill orders.
- 282 **Shovel Eye Handles.**—Inquiry is made by a London firm of hardware merchants for the names of exporters in Canada of shovel eye handles and straight arms.
- 283 **Tool Handles, Wheel Spokes, etc.**—An old-established and well-known firm in the north of England, with a large con-

nection among buyers of pick and other tool handles, wheel spokes and rims, etc., is desirous of hearing from a Canadian manufacturing firm with a view to acting as agents for the sale of these goods.

- 284 **Tool Handles.**—A Yorkshire firm is in a position to dispose of large quantities of pick and other tool handles, and inquires for the names of Canadian manufacturers.
- 285 **Wood Slats.**—A firm in the north of England desires to hear from Canadian timber millers who can supply them with wood slats 5 feet long, 7/8 in. wide, 3/8 in. full thick (with allowance for arched surface), suitable for use in repairing harvester canvases.
- 286 **Wood Rollers.**—A Yorkshire firm makes inquiry for Canadian firms which can supply them with quantities of wood rollers for lawn mowers.
- 287 **Wood Handles.**—Inquiry is made for Canadian firms manufacturing wood handles for ploughs by a Sheffield firm.
- 288 **Wood-Working Machinery.**—An English firm of manufacturing joiners desires to have particulars of any new improvements, etc., in wood-working machinery, and is open to hear from Canadian firms interested.
- 289 **Wood.**—An important inquiry is made by a Leeds firm for Canadian manufacturers of 2, 3, 4 and 5-ply wood (chiefly 3 and 4-ply), suitable for the manufacture of trouser stretchers.
- 290 **Wood-meal and Wood-flour.**—A London firm, open to take large quantities of wood-meal or wood-flour if the price is right, wishes to be placed in touch immediately with Canadian firms who can export.
- 291 **Wood Dowels.**—Well-known, old-established Birmingham England, firm of cane and dowel dealers is open to purchase 50,000 lots of wood dowels 36 inches and longer, in diameters ranging from 1/4 to 1 1/4 in. Will pay cash against documents, and quotations should be based f.o.b. Canadian port with freight rate to Liverpool. References.
- 292 **Wheel Spokes, etc.**—A well-known firm of coach ironmongers in Yorkshire desire to have prices and other particulars from Canadian firms making wheel spokes, bent hickory rims, hubs and "Warner wheels."
- 293 **Yellow Pine.**—Inquiry is made for Canadian exporters of yellow pine by a north of England firm who wishes to have prices and other particulars for direct shipments.

THE FRANZ SYSTEM FOR FUEL SAVING.

One of the latest types of fuel saving devices for stationary and locomotive boilers has just been placed on the market by Robert S. Franz, Etna, Pa. The device is also applicable to rolling mill furnaces, tin and sheet mill furnaces, etc.

The system, as patented by Mr. Franz, consists simply in distributing heated and compressed or forced super-heated hot air through contracted air-pipes, or air passages, so as to secure a more perfect and thorough combustion within the furnace—a series of air pipes and air passageways in such position as to create a forced draught in sufficient quantities in order to obtain a perfect combustion and upwards through the fire, and also by counter cross current of heated air from both sides of the furnaces to cause a cross current action contrary to the draught or cross-wise of the furnace flame or

You cannot roof for less money and save money—nor for more money and spend the money so wisely—than you do when you choose the perfected steel shingle which anybody can put on right with the simplest tools.

"OSHAWA"

Double Galvanized STEEL SHINGLES

Double-galvanizing makes it rust-proof and does away with all need for painting an Oshawa-shingled roof. Wind, rain, snow and weather proof, and

THE METAL SHINGLE AND SIDING CO., Limited

MONTREAL PRESTON TORONTO

draught, whereby you compel such gases to be forced and generated into heat.

When heated air is thus forced from each side, effectually covering the whole space above the grate bars or fire and between the side walls, it tends to direct the unconsumed gases or products of combustion into the fire, thus by forcing the supply of heated air into the combustion chamber a current of air and gases is directed in such a manner as to produce an oscillated and a whirling circulation and counter cross-wise current of the air and gases, or products of combustion, and at the same time a contrary cross-wise pressure of forced heated air and gases, thereby securing an inter-mixture of heated air supply with the unconsumed gases, effecting a complete burning of said gases and the products of combustion carried therewith in suspension before their final escape from the furnace; furthermore ensuring the highest efficiency of fuel in connection therewith by utilizing the heat and gases otherwise wasted.

The results are materially advanced in larger capacity and the temperature of the gases is secured and affords the highest degree of heat and combustion obtainable, and will burn low grades of fuel; advances the steaming capacity of boilers to their maximum. Also furnaces, which makes feasible a material increased capacity without enlarging the plant. It heats quickly and equally all over the furnace. The heat is not such a heat as to oxidize or crystallize the metal, but an intense, soft heat. It saves fuel, and abolishes smoke by utilizing the wasted heat and unconsumed gases, and less waste, such as ashes.

This invention allows the construction of furnace improvements that will be extremely simple, practical, strong, durable and comparatively inexpensive to maintain by manufacturers, and will be highly efficient in their uses.

In several establishments in Pittsburgh a 30-day test was made of the furnace, burning slack and run-of-mine coal.

One test showed a saving of 30 per cent. in the fuel bills, the furnace boiling 11 1-10 pounds of water to the pound of coal consumed. Another concern made a saving of from 20 to 25 per cent. in its fuel bills by the use of the Franz system.

Supply of Meerschaum.

Meerschaum, so highly prized by pipe manufacturers, and which has heretofore come from Turkey in Asia Minor, has recently been found in New Mexico, and the extreme scarcity which has characterized its production during the past few years will, according to a report published by the Washington Department of Commerce, soon be at an end. The new mines are located in the Diablo range of mountains, about 20 miles northwest of Pinos Altos, to which a branch of the Santa Fé Railroad runs from Deming. There have been stripped two true fissure veins continuous for 1,500 feet each, in which there is carried between strongly defined walls meerschaum in widths of 20 inches. "All of the veins appearing are vertical in position, and give indisputable evidence that they were formed through the splitting apart of volcanic conglomerate, a theory still farther confirmed by the blow-outs and deposits afloat that have been thus far discovered, and finally by the fact that 'kidneys' of pure meerschaum in various sizes are now obtainable from this surface material, although it has been subjected to the decomposing effects of the elements, impregnation of vegetable matter, and the seepage of other minerals in solution into it for centuries." A waggon road is now being built from the mines to Pinos Altos, a distance of 20 miles, and when this is completed the meerschaum will be marketed.—*American Exporter.*

Underwood

The Underwood Condensed Billing Typewriter describes itself in its title. An invoice (and as many carbon records as may be required) as well as the salesbook entry, are made at the one writing.

The salesbook entries are made on a long sheet, and are condensed, eliminating all waste space. Both sides of the sheet are utilized; disintegration columns may be added to the right of the total column upon the sales sheet, in which sales can be classified according to departments or ledgers.

We have an interesting catalogue which illustrates and fully explains this and the other special Underwood bookkeeping machines. It is worth the trouble of asking for it.

Executive Council

NOVEMBER MEETING.

THE regular monthly meeting of the Executive Council was held in the Council Chamber of the Board of Trade, Toronto, on Thursday, November 21st, at 2 p.m.

Honorable J. D. Rolland occupied the chair, and other members present were: Messrs. C. C. Ballantyne, Montreal; G. Frank Beer, Toronto; Henry Bértram, Dundas; Geo. Booth, Toronto; S. B. Brush, Toronto; J. C. Casavant, St. Hyacinthe; H. Cockshutt, Brantford; Hon. E. J. Davis, Newmarket; W. R. Dunn, Hamilton; L. V. Dusseau, Toronto; P. W. Ellis, Toronto; J. D. Flavelle, Lindsay; Atwell Fleming, Toronto; H. W. Fleury, Aurora; E. J. Freyseng, Toronto; W. M. Gartshore, London; S. Harris, Toronto; E. G. Henderson, Windsor; J. Hewton, Kingston; R. Hobson, Hamilton; J. B. Maclean, Toronto; C. R. McCullough, Hamilton; R. McLaughlin, Oshawa; W. K. McNaught, Toronto; J. J. McGill, Montreal; J. P. Murray, Toronto; A. S. Rogers, Toronto; Frank A. Rolph, Toronto; Louis Simpson, Montreal; Wm. Stone, Toronto; J. O. Thorn, Toronto; W. B. Tindall, Toronto; R. L. Torrance, Guelph; J. Turnbull, Toronto; Geo. W. Watts, Toronto; C. I. I. Wilson, Ingersoll; D. Wilson, Collingwood; W. H. Wyman, Montreal; R. J. Younge, Montreal.

Letters of regret from members unable to be present were reported from the following: Messrs. Robt. Munro, S. W. Ewing, D. Morrice, D. Lorne McGibbon, Arthur W. White, W. H. Rowley, J. S. N. Dougall, T. S. Hetherington, Alex. Saunders, Wm. Small, T. H. Estabrooks, R. Thomson, Wm. Rob'ns.

The minutes of the October meeting as published in INDUSTRIAL CANADA were taken as read.

The following business arising out of the annual meeting was then disposed of:

Resolution *re* Exhibition.

The Secretary reported that in accordance with a resolution adopted at the annual meeting on September 26th, the Executive Council were to devise a method for improving the services offered by the Association in the matter of foreign exhibitions. Referred to the Commercial Intelligence Committee for investigation and report.

ELECTION OF NEW MEMBERS TO THE COUNCIL.

A number of names were reported by the Secretary, of members elected to the Executive Council at the annual meeting, who were also *ex-officio* members of the Council, either by virtue of their chairmanship of a section, or of a standing committee. He enquired whether the Council wished to nominate other men in their places. It was pointed out that this would be a violation of the by-laws, so it was decided to take no action.

PRESIDENT.

Mr. Rolland reported that as President he had been invited to attend a banquet of the Peterboro' Board of Trade on Wednesday, the 20th where he had taken occasion to make a plea for Canadian made goods and the adequate protection of Canadian industrial enterprises.

TREASURER.

The Treasurer presented a statement of receipts and disbursements for the month ending, October 31st, showing a

balance of cash on hand amounting to \$15,609.37. On motion of Mr. Booth, seconded by Mr. Ballantyne, the report was adopted.

FINANCE.

The report of the Finance Committee, read by the Chairman, Mr. Tindall, recommended for acceptance the accounts of the month, amounting in all to \$3,228.95. It further recommended the engagement of Mr. Wilton C. Eddis to make a monthly audit of the Association's books, also the engagement of Mr. Coughlin and Mr. Gillies on the staff of INDUSTRIAL CANADA.

Report was made that a meeting had been held with the directors of the Mutual Insurance Companies to adjust expenses incurred by the Association in connection with the organization of these companies. It had been mutually agreed that the companies would make themselves responsible for the actual cash expenditures made on their behalf, together with an allowance for the services of Mr. Heaton, bringing the total amount up to \$3,661.04. Of this amount \$661.04 was to be paid on or before January 1st, 1908, and the balance in three annual payments of \$1,000 each on the first of each succeeding year, with interest at 4 per cent.

The adoption of this report, moved by Mr. Tindall, seconded by Mr. Booth, was then carried.

PARLIAMENTARY.

The report of the Parliamentary Committee was presented by the Chairman, Mr. John Turnbull.

Ontario Factory Inspection.

Dealing with the above matter it was reported with regret that the Ontario Government had appointed three of the four new factory inspectors from the ranks of organized labor. The committee felt, in view of the strong and repeated representations they had made to the Government on this subject, that the action finally taken could only be regarded as an indication that in the eyes of the Government the manufacturers were a body to be ignored. The committee expressed its willingness to take such further action as the Council might see fit to advise.

Other paragraphs of the report read as follows:

English Labour Agents Misrepresenting Canadian Conditions.

Complaint is made by two members of the Association that advertisements are being inserted in British papers without authority by irresponsible booking agents who state that a large number of hands are wanted at their respective factories for steady employment. These advertisements are the means of bringing people to Canada for whom there is at present no work, and as they have little or no money they must either return or become a burden on the community. Many booking agents also appear to be in the habit of furnishing emigrants letters of introduction to people on this side with whom they have had absolutely no dealings before, greatly to the annoyance of employers, who are not in need of help.

Your committee would recommend that every case thus reported be brought to the attention of the Department of Labor at Ottawa with the request that the guilty parties be prosecuted under the Merchants' Shipping Act of Great Britain.

Government Regulation of Telegraph Rates.

Judging from the number of complaints that are being made regarding delays in the transmission of telegrams, some of which prove very costly, and other unsatisfactory features of the telegraphic service, your committee is of the opinion that it is time the telegraph companies were brought under the jurisdiction of the Board of Railway Commissioners. It is suggested, therefore, that a memorial be addressed to Sir Wilfrid Laurier and the members of the Cabinet, urging that legislation to this effect be enacted forthwith.

Workmen's Compensation.

Satisfactory progress is being made towards the collection of information on the above subject, and by the time the Ontario Legislature meets the committee hopes to have a definite proposal to bring forward. It is understood the Government has pledged itself to introduce a measure at the next session, so that prompt action on the part of the Association becomes necessary.

Meanwhile the Montreal and Quebec branches have appeared before the Labor Accidents Commission of Quebec Province, advocating a system whereby all workmen injured in the discharge of their duties, other than those who were at the time intoxicated or wilfully and criminally disobedient, be given compensation without having to have recourse to expensive litigation. While not expressly so stated this recommendation involves the principle of compulsory accident insurance, upon which your committee is inclined to look with some favor. A counter proposition is to enact permissive legislation under which employers insuring their workmen up to a certain amount would be relieved of liability for compensation under the Act. In any event the views of the manufacturers in the two provinces seem to coincide sufficiently to make it certain that they will work in harmony.

The clause relating to the appointment of the new factory inspectors provoked a long discussion, which finally resulted in the passing of a motion that a strong letter of protest be sent from the Executive Council to the Ontario Cabinet objecting to the appointment of three of the new officers.

RAILWAY AND TRANSPORTATION.

The report of the Railway and Transportation Committee was presented by the Chairman, Mr. W. R. Dunn. It read in part as follows:

Readjustment of Rates.

Notwithstanding assurances given that the new east-bound rates would become effective on November 15th, the manager reported the receipt of a communication from the Chairman of the Advisory Committee of the Canadian Freight Association that it was impossible to give any definite information as to when the new rates would take effect owing to some unexpected difficulties in connection with the new tariffs. The committee protested vigorously against any further delay. The following resolution was adopted, and the manager instructed to forward it by wire to the Secretary of the Commission:

"Canadian Manufacturers' Association Transportation Committee meeting to-day calls attention of Board to failure of railways to put in effect east-bound rates under Board's order, July 6th. Notwithstanding promise to cooperate and publish rates quickly, and subsequent repeated promises to put rates in effect not later than November 15, letter from MacInnes, Chairman Freight Association, now advises impossible, say when rates can be effective. We protest against railways being allowed further delay. Request Board take immediate action enforcing order November 15. Answer requested."

Since the meeting of the Committee a copy of the order of the Board, dated November 13th, has been received, directing that the revised tariffs of freight tolls referred to in the order of the Board, dated July 6th, 1907, come into force from points in Canada not later than January 1st, 1907.

Express Tariffs and Classification.

The Board of Railway Commissioners have issued an order extending until March 1, 1908, the time for the approval of express tariffs and classification, and that pending the approval of the said tariffs the express companies shall not charge any tolls higher than those which were charged on the first day of March, 1907.

Toronto Interswitching.

The Manager reported that the Railway Commission had granted a hearing in this case on November 5th, and was instructed to press for an early decision.

All Rail Rates to the Northwest.

The new all-rail rates from Eastern Canada to the Northwest have been announced to take effect December 1, 1907.

New Freight Rates out of Winnipeg.

A vigorous protest has been filed with the Board of Railway Commissioners by the Winnipeg Branch of the Association, the Board of Trade and the Shippers' and Jobbers' Association of Winnipeg, against the new schedule of freight rates which the railways propose to put in effect November 25th. These rates cancel the traders rates which have been in effect for years, and bring about a general increase. The new tariff is the result of an order made by the Commission, because of representations made to them by Portage la Prairie, which claimed that discriminatory rates were in force from Winnipeg west, giving Winnipeg wholesale merchants a preference over merchants and others in outside communities.

The discrimination complained of has been done away with by advancing the rates out of Winnipeg so as to place them on a uniform basis with the towns complaining, instead of continuing and extending the old basis of rates which has been in force for a great many years. The Department is in communication with the Winnipeg Branch, who are sending full information.

Bill of Lading.

The Manager reported having attended a meeting of shippers and hearing before the Interstate Commerce Commission in Washington on October 14th, 15th and 16th, at which the adoption of a simple form of bill of lading was strongly urged. Your committee are of the opinion that this important matter has been too long delayed, and that we should press vigorously upon the Board of Railway Commissioners for the clean bill of lading which the Association has asked. We, therefore, recommend that a special committee with the Manager wait upon the Board of Railway Commissioners during the visit of the Executive to Ottawa on December 5th, with a view of getting early action.

Reorganization of the Board of Railway Commissioners.

Your committee recommend that a small deputation be appointed to wait upon the Government on December 5th, urging upon it our views in regard to the re-organization of the Commission.

It is also recommended that a special committee wait upon the Board of Railway Commissioners and press our claims for reciprocal demurrage and weighing of car-load traffic, the

committees to be arranged for by the Secretary and the Manager of the Department.

COMMERCIAL INTELLIGENCE.

The report of the Commercial Intelligence Committee was presented by Mr. L. V. Dusseau. The following are among the matters dealt with:

Inter-Imperial News Service.

A communication has been received from the Vancouver Board of Trade asking the Association to endorse its resolution favoring the establishment of an Inter-Imperial News Agency. While the idea of obtaining more and better news items from all parts of the Empire is one which your Committee think will readily commend itself to the members of the Association, they feel that the subject is one they are scarcely competent to deal with, and they would recommend therefore that it be referred by the Council to a special committee consisting of newspaper men and others familiar with the situation.

Commercial Agency Service, West Indies.

Following the recommendation contained in this Committee's report to the Annual Meeting in the above matter, a letter has been sent to the Minister of Trade and Commerce strongly favoring the replacement of the present commercial agents in the West Indies by a Trade Commissioner, who will give his entire time to the work, and will travel about from place to place, keeping the Ottawa office advised as to changing trade conditions. Your committee has reason to believe that the Government are already considering this step, and the receipt of the Association's letter should further strengthen their hand.

It is also stated that the Department is considering the appointment of a special commissioner for New Zealand, in this way relieving Mr. Larke, of Sydney, of a portion of his duties to which he is unable to give proper attention.

Weights and Measures in China.

A letter has been received from the Secretary of the British Weights and Measures Association stating that an Imperial edict has been issued in China requiring the Board of Revenue and Commerce to introduce a uniform system of weights and measures throughout the Empire, the standards of which are to be fixed on or before April 6th, next. In view of the fact that there is a possibility of the Chinese Government making a radical change which would seriously embarrass Canadian commercial interests at present trading with that country, it is suggested that the Association recommend the Canadian Government to work in harmony with the British and United States Governments, who are already known to be interesting themselves in the matter.

In addition to the above the report recommended that the INDUSTRIAL CANADA Committee be asked to take up at once the question of getting out a new edition of the Trade Index. It also suggested that the Dominion Government be asked to extend an invitation to Sir Joseph Ward to visit Canada next year.

The following committee was appointed to report on the question of an Inter-Imperial News Agency: Messrs. J. B. MacLean, J. F. MacKay and C. T. Pearce.

RECEPTION AND MEMBERSHIP.

The report of the Reception and Membership Committee as read by the Chairman, Mr. Beer, recommended for acceptance twenty-five applications for membership, the names of which will be found elsewhere.

Local Dinners.

Hamilton and Chatham were recommended as suitable places for the holding of Association dinners during the winter. The former will likely be held in January and the latter in March.

The adoption of the report, moved by Mr. Beer, seconded by Mr. Fleury, was then carried.

INDUSTRIAL CANADA.

The Chairman, Mr. C. R. McCullough, read the report of the INDUSTRIAL CANADA Committee, the principal items of which were recommendations regarding the appointment of Mr. D. B. Gillies as advertising solicitor, and of Mr. D. M. Coughlin, as editorial writer.

The report also referred with satisfaction to the paper's continued prosperity, the net revenue for the three months ending October being approximately \$1,178.

TARIFF.

The report of the Tariff Committee was read by the Chairman, Mr. P. W. Ellis, as follows:

Undervaluation Owing to Money Stringency.

Correspondence was read by the Secretary which had passed between himself and the Minister of Customs relative to the need for the utmost vigilance on the part of customs officials to guard against under-valuation likely to arise as a result of the present financial stringency in the United States. From information furnished by members of the committee who were present it is believed that the warning was a timely one, as there is abundant evidence of the fact that goods are being slaughtered. To furnish conclusive proof that such is the case is however a different matter.

The recommendation of your committee is that a carefully worded letter be sent at once to every member of the Association requesting him to furnish the Department at Ottawa with full particulars of every case of undervaluation or different interpretations of the tariff at different ports of entry which comes to his attention, and at the same time to furnish a copy of his complaint to the Secretary who, through the committee, will undertake to follow the matter up vigorously. It is proposed to advise the Minister beforehand fully of the steps to be taken in order that he may feel a personal interest and responsibility in a matter about which he has been consulted.

Leeway in the Dumping Regulations.

Consideration has again been given to the recommendation of the Montreal Branch to the effect that the leeway in the dumping regulations be disallowed. While the members of your committee are mostly favorable to the recommendations, it is apparent that certain interests are opposed to any change unless they are specially taken care of. A conference will be arranged among these interests before the next meeting of the Council, and it is hoped that an amended recommendation can then be brought forward which will meet with unanimous approval.

Memorial of Pulp and Paper Section.

In a recent interview with the Government the Pulp and Paper Section petitioned for legislation to prohibit the export of pulpwood from Canada. A letter has been received from the section asking the Association to endorse their petition. This your committee is pleased to recommend, and it is suggested that the Government be advised at once that the Association is in full accord with the memorial of the Pulp and Paper manufacturers.

General Plan of Campaign.

The above subject has again been discussed, and a number of very valuable suggestions have been made, upon which it is hoped a recommendation can be brought forward in the near future. The means which it is proposed to adopt to guard against undervaluation form of course one of the important features of the programme. Before going further, however, it is felt that little progress can be made until the Association has created a Tariff Department under the charge of a tariff expert, who will operate along somewhat similar lines as the managers of the Insurance and Transportation Departments. A sub-committee has been appointed to investigate and report at a later meeting. In framing their report they will naturally consult the Finance Committee regarding ways and means.

MONTREAL BRANCH.

The report of the Montreal Branch was read by Mr. Younge, and that of the Toronto Branch by Mr. Freyseng. Both were received, and will be found elsewhere.

Under the head of new business, Col. MacLean moved that the Parliamentary Committee be asked to consider the appointment of a permanent secretary, whose duty it would be to confine himself almost entirely to legislative and political work. Carried.

The President called attention once more to the meeting in Ottawa on December 5th, and expressed the hope that there might be a large attendance.

The meeting then adjourned.

NEW MEMBERS.

INDIAN LORETTE, QUE.

Henry Ross—Indian mocassins, mitts and gloves.

MONTREAL, QUE.

John Fee—Manufacturing machinists.

The J. W. Harris Mfg. Co.—Excavators and trenching machines.

The A. C. Lariviere Co.—Carriages and sleighs.

Wm. Scott & Sons—Picture frames.

Grip, Limited.—(G. A. Howell, 2nd member)

Ontario Metal Novelty Mfg. Co.—Metal novelties, bathroom fixtures & specialties.

Schofield Holden Machine Co., Ltd.—Special machinery motor boats, gasoline engines.

Sexton & Co., Limited.—Grilles, Art work goods, Turnings, Dowels, etc.

Ex-Officio Members.

Through an oversight the ex-officio members of the Toronto Branch Executive were omitted from the list published in the October INDUSTRIAL CANADA.

The ex-officio members, who comprise all the past Chairmen of the Branch, are as follows:

W. K. George, W. P. Gundy, J. O. Thorn, J. P. Murray, R. A. Donald, W. B. Tindall, and John Firstbrook.

TORONTO BRANCH.

The first of the series of monthly luncheons, given by the Toronto Branch, was held at McConkey's restaurant, on Wednesday, November 20th. Dr. Charles Sheard, Health Officer of Toronto, was the speaker, his subject being "Toronto's Water Supply and Sewage Disposal Problems," which he treated in his usual masterly fashion. As is well known, Dr. Sheard favors the immediate construction of a filtration plant at the Island by the city, which will ensure for the citizens a supply of pure water at least. This should be the first concern of the city, to be followed later, says Dr. Sheard, by a comprehensive sewage disposal plant, consisting of trunk sewers, contact beds, and filtration tanks, the operation of which would render the discharge into the lake absolutely harmless. A system of this kind would mean a vast improvement of our water front, and make our harbor a pleasant spot instead of the cesspool, which it closely resembles now. The cost of the two schemes combined would be \$5,250,000, the water filtration plant alone costing \$1,750,000, and the plants can be constructed independently of each other.

Dr. Sheard spoke in very convincing style, and by means of a blackboard, maps, and diagrams, succeeded in giving his hearers a practical idea of what the two schemes mean, and how they would make Toronto a cleaner and, therefore, a healthier city. The speaker was listened to with great attention and interest throughout, and at the close of his remarks Mr. W. B. Tindall, who presided, voiced the feelings of all present in moving a hearty vote of thanks, which was carried in the usual manner. About fifty were in attendance. The next luncheon will be held about the middle of December.

Lubrication Tests.

Some interesting and valuable experiments on friction and lubrication have been conducted for a research committee of the British Institution of Mechanical Engineers. The work was carried out with a steel shaft driven by a belt, and provided with a journal 4 in. in diameter and 6 in. long. Upon the upper side of the journal was fitted a gun metal step, the arc of contact being appreciably less than one-half the circumference. Various means of lubrication were tested, that one found the best being a bath of oil.

The experiments showed the friction to be nearly constant at all loads, within ordinary limits; which is at variance with the commonly accepted idea that it increases in direct proportion to the load. The coefficient of friction, with bath lubrication, varies inversely as the pressure. In other words, the friction of the bearing is entirely independent of the pressure upon it, provided this pressure does not exceed 400 to 600 lbs. per square inch. The coefficient, again, is inversely proportional to the temperature.

The Globe have these merits in a greater degree than any other.

Made in four sizes, viz. : for 50, 100, 150, and 200 employees.

Handshift or Automatic, Dailies or Weeklies, or built to order to meet your conditions.

In use by, and giving good satisfaction to many firms throughout Canada.

MADE IN CANADA

OUR LATEST. The Weekly Automatic, two-color ribbon Recorder. This is the best mechanical timekeeper on the market. No attention necessary; every movement automatic, suspending action, if desired, over Sundays and continuing Mondays, printing all irregular time (lates, short and overtime) in RED. Regular time in blue.

At the end of your week, you have a clear legible sheet, ready for totalling and when totalled a permanent pay roll. No recopying. Ask nearest office for particulars.
