Rigid, strong, convenient and efficient under the severest requirements of modern shop practice. Four-step cone, wide belt and double back gear give a remarkable range of work, from heavy cuts to finishing. It would be greatly to your advantage to investigate the merits of this lathe. We will be pleased to send full description on request.

WHAT DOES YOUR INSURANCE COST?

AS a manufacturer, with an isolated, well-protected risk, are you getting the rate to which you are entitled, or are you helping to pay the cost of carrying hazardous risks in the congested commercial districts of our big cities?

The Manufacturers Mutual Fire Insurance Companies

are writing only selected manufacturers' risks that come up to a fixed standard, and are able to give rates accordingly — manufacturers' insurance at manufacturers costs.

We have experts on factory risks who will gladly call on you on application, give you the benefit of their advice and show you how the risk of fire, and consequently the premium rate may be reduced.

Write for particulars. We can save you money if your risk comes up to our standard, or advise you how it can be put in better condition

MISLEADING THE MASSES.

A CERTAIN class of vote hunters and yellow journalists take great delight in attacking capital. It is a profitable occupation from their standpoint, because the masses are envious of the man who has made a success in life, and ready to follow anyone who menaces him. This is an unfortunate state of society, but one which has to be faced by every man who has the courage to establish an industry and the ability to make it successful. It arises out of a lack of education, or more correctly perhaps, too much education of the wrong kind. The trend of public utterances designed to capture the ear of the masses is antagonistic to capital, and that portion of the press which seeks so-called popular circulation follows in the same line. These false moulders of public opinion throw discredit on success and charge that it is obtained at the cost of labor, and this harmful policy is too often successful in its purposes. It wins votes and it wins subscribers, but it is manifestly unjust to the investor, and detrimental to the country. The application of a little reason and the knowledge of a few facts are all that is necessary to demonstrate the injustice of this course; but the masses do not reason, and the facts are not given to them. It is so much easier to get a following by attacking the successful, that those who seek popular

favor as a means of furthering their personal interest, do not hesitate to excite and mislead the masses by any reckless statement that serves the purpose.

How often, for instance, has the statement been made that no man can honestly become a millionaire? It is one of the most frequent declarations made by those who thrive on the discontent they are able to create amongst the people who have to work for a daily wage. It has been used as a text for elaborate essays, it has been shouted from the platform at labor meetings, and even the sensational preacher has flung it from the pulpit into the ears of his wrought-up congregation. That it is not true does not make any difference to these gentlemen. It may be that they think they are proclaiming a great truth. It is one of the weaknesses of the unsuccessful man to convince himself that the man who succeeds where he has failed, does so by means which are not strictly honest. He will not admit that his failure is due to any lack of ability on his own part. On the contrary you find the most useless tools with the highest opinion of their own cleverness. To them, therefore, success is not the result of ability. If it were, they reason, they would themselves have been successful. Consequently success, which in business means money-making, must come from the employment of means which are not strictly honest. There are so many demagogues preaching this false doctrine that the mind of the masses has become poisoned with it, and is open to receive any slander that may be uttered against the man who has succeeded.

If this sort of thing were confined to the unsuccessful it would not matter much. Their ability to do harm to themselves is probably no greater than their ability to win success in an open field. The real danger is that men of ability, but lacking in principles, seize upon the false sentiments thus created as a means of advancing their own selfish ends. They take up the fancied wrongs of labor, and charge capital with all manner of tyranny and injustice. They know the sentiment that exists amongst the masses, and by stirring up the wage-earners they perhaps win their way to Parliament. Once there they are quiet for a time, but the position is not permanent. In a few years they have to go to the people again, and in order to be able to show that they have done something, they get very active towards the close of their term, and their activity is likely to breed all manner of freak legislation. These are the men who have to be watched, for they are the real menace to the industries of the country. They are the men who are liable to tinker with tariffs, and hamper employers with unworkable labor acts, burdensome

restrictions and unreasonable responsibilities. Some of the legislation that has been proposed from time to time, would have brought ruin to the industries of this country, and as each general election approaches fresh attempts are to be expected. Fortunately our Parliament has not yet fallen into the control of this class of legislator, but the danger is always present, and those who have the country's real interest at heart cannot afford to relax their watchfulness.

In the United States this constant worrying of the investor has resulted in a panic, which has not only brought serious loss to all, and ruin to some investors, but has also driven labor out of employment, and brought hunger and misery into the home of the wage-earner. Labor unions in the hands of demagogues, self-seeking politicians pandering to popular prejudice, and yellow journalists inciting discontent, created such a sentiment against the great corporations in the United States, that even the President was carried away by it, and falling into line with the mob went marching with them against capital. Every minor fault that could be found with a corporation was magnified into a mountain of iniquity, while the real, overshadowing truth that the corporations have made the country was forgotten or ignored. The method of the President of the United States to remedy the admitted evils which have crept into many of its larger corporations reminds one of the farm lad who observed a mosquito about to sting his father on the cheek. He struck at the tiny insect with all his might, forgetting that his father was behind it. The mosquito was disposed of all right, but the old gentleman got a smack in the face that prostrated him. While President Roosevelt may dispose of many of the trust evils by his method, he is giving labor, which he professes to serve, a smack in the face that it will not recover from in a hurry. If the factories of the United States were wiped out of existence, its cities and towns would be depopulated, the chief market of the farmers would be gone, and the whole country would be rendered desolate. The men who have built up the industries may have made millions, but in the making of their fortunes they have also made the country.

We are told that this century belongs to Canada as the last century belonged to the United States. If the prophets are right, and everything at present indicates that they are, the next twenty-five years will see remarkable strides made in the industrial life of this country. We are now just at the beginning of an era of rapid development, both in agricultural pursuits and in manufacturing. It is, therefore, important that we should begin with a proper understanding. Labor should know at the outset that its hope lies in capital, that its future, as its present, depends upon the man who has money to invest and the courage to invest it in some line of production which will create employment. Let him understand, too, that the more money the employer makes through his first venture, the better able he will be to enlarge his plant and provide more work for more people. Get away from the false idea that the employer's success means the oppression of the employed. What his success really means is the development of Canada into a manufacturing country, where every kind of labor will be in constant demand, at fair wages and under reasonable conditions. If the false idea that labor and capital are antagonistic and should go about constantly armed against each other holds sway, industrial progress will be retarded and labor will be made to suffer. Let us understand at the beginning that labor and capital are dependent upon each other for profitable employment, and that the country in which they work together in the greatest harmony is the country in which each will find its richest reward.

THE FRENCH TREATY.

THE trade treaty with France which has been laid on the table of the House of Commons, is one of the most important documents that has ever come before the Canadian Parliament, as it marks a great departure in our national life, being a practical acknowledgment of nationhood, and our first attempt at the exercise of Imperial powers. It is also important as the first trial of the intermediate tariff, of which it will be impossible to judge fairly until it has been in operation for some time. There is no doubt it should be helpful to some lines of Canadian manufactures, but it is just as certain to hit others. Whether the gain will be greater than the loss remains to be seen.

At the very outset a blunder seems to have been made, for while we are to receive concessions from France alone, twenty other foreign countries from whom we get nothing, are to enjoy all the privileges and favors in our market that we are giving to France. The Foreign Office, as a London cable informs us, has admitted that Canada is bound by the most favored nation treaties to extend all the concessions given France under the new treaty to these twenty other foreign countries, even though they give us nothing in return. The following are the countries to get advantage of the treaty with France: All British countries, Norway, Sweden, Austria-Hungary, Denmark, Spain, Russia, Salvadore, Japan, Argentine Republic, Bolivia, Colombia, Corea, Algeria and the French Colonies, Liberia, Morocco, Muscat, Persia, Congo, Venezuela.

Can it be that the statesmen who negotiated the treaty on our behalf failed to appreciate its far-reaching effect? They must have neglected to consider this phase of the treaty, or, before concluding it, they would have tried to get something from those other countries, in return for the valuable tariff concessions they were giving. Some allowance has to be made for them in view of this being their first attempt at exercising Imperial powers, but one would have thought that even novices would not have gone so blindly into a matter of such grave importance.

The situation, as it looks at present, is that while Canada gets concessions from one country she gives concessions to twenty-one countries in return. Our manufacturers will, therefore, be able to do business with France on better terms, but they will have twenty other countries competing with them in Canada under conditions which are altogether in favor of the foreigner. It is a high price to pay for the French concession, and it looks at this stage as if we were getting decidedly the worst of the deal.

THE BY-PRODUCTS.

IN these days of small profits and keen competition the utilization of the by-product assumes an importance so great that it has become a matter of national concern. The by-product frequently represents the manufacturer's entire profit, and if it is not utilized the industry in which it is allowed to run to waste is doomed to failure. In the past, when manufacturing had less of science, the producer of any given article of commerce could afford to devote his entire attention to its production regardless of what raw material he wasted, which did not enter into his particular product. Millions upon millions of our forest wealth has been destroyed in the past through ignorance. The pulp-wood that to-day brings a large revenue to the settler was formerly burned up to get it out of the way, and we are still, in other

ways, handing over to destruction valuable materials which, in our ignorance, we account as useless. If we are to succeed as a manufacturing nation, this waste has got to be stopped. Every ounce of value in every pound of raw material has to be extracted from it, and it has got to be done by the most scientific and cheapest methods. Our natural resources have got to be studied and experimented with, till methods are discovered whereby we will be enabled to stop the waste and reap the entire benefit of every part of them.

This is no light task, but it is one that has to be grappled with. The individual manufacturer cannot be expected to undertake it on the large scale on which it will have to be carried on, any more than the farmer could be expected to conduct an experimental farm for the benefit of his neighbors. Nor would it be reasonable to expect an individual province to undertake a work which is manifestly in the interests of the entire country. And right here let it be noted that it is also in the interest of every class in every province. If what is wasted to-day were turned to account, the main product would be produced at a lower cost and sold at a lower price and as a consequence every consumer in the land would share in the saving.

Viewed from any standpoint it is apparent that the task of discovering ways and means of utilizing to the fullest extent our natural resources of farm, forest, sea and mine is one which properly belongs to the Dominion Government, and should be conducted under Federal authority, and paid for out of the Federal Revenue. Federal schools where workmen would be given technical training, and experiments carried on with all classes of products would meet the necessities of the situation, and the expenditure would be justified as a work for the general benefit of Canada. The manufacturer would benefit by the improved methods, the workman by his increased technical knowledge, and the consumer by the decreased cost of his supplies.

The longer this work is delayed the greater will be our loss. While we hesitate thousands of dollars' worth of valuable materials are being wasted daily, and our opportunities of reaping the reward that comes to those who are first in the field with a cheaper product, are growing less. The Germans have taught all nations a lesson on the value of technical knowledge and scientific experiment. They have astonished their competitors, and what is more to the purpose, they have beaten them out in the markets of the world. If we are to hold our own, even in our own country, we must take the lesson to heart, and bestir ourselves in the direction of taking practical advantage of it. The utilization of the by-product will be the key to manufacturing success in the future, and the sooner we come to a realization of this the better it will be for the country at large. The wealth of nations, as of individuals, is built up largely on their ability to let nothing go to waste that can be made to have a value.

THE PROPOSED TARIFF COMMISSION.

THE recommendation of the Executive of the Canadian Manufacturers' Association for the appointment by the government of a permanent tariff commission, somewhat along the lines of the Railway Commission, has been misconstrued by a good many newspapers, who have ventured to comment upon it without first informing themselves of its real meaning. They jump at the conclusion that the aim of the manufacturers is to get the tariff out of politics and into the hands of a commission which will do the bidding of the Association.

Nothing could be wider of the mark than such a construction placed upon the resolution adopted at the recent meeting in Ottawa. What is wanted and what was asked for, is a commission before which the manufacturers can appear when they have a case for investigation. If such a commission were appointed, the Association would create a tariff branch, in charge of an expert, who would study each case as it came up. For instance, if a manufacturer complained that his product was not sufficiently protected, an investigation would at once be made by the tariff branch of the Association to ascertain whether or not there was a case to go before the commission. If the complaint was found not to be well founded, the party making it would be so informed, and the Association would refuse to act. If, on the other hand, a real grievance was found to exist, the case would be carefully prepared and the facts laid before the commission in a form in which they could be dealt with intelligently. Due notice would be given of any application to be made before the commission, and all parties concerned would have an opportunity of making their views known. Surely this is a fair and reasonable proposition. It means fair play to the manufacturer, and the stability of the tariff.

The papers that oppose the appointment of a tariff commission, say that the Minister of Customs has already sufficient power to rectify any grievance under which any producer may lie. That may be, but the Minister of Customs has not the time to take up individual complaints, and make a thorough investigation into their merits. The Railway Commission is kept constantly engaged investigating transportation matters. The Minister of Railways never had the time to devote to the work that is being done so satisfactorily to-day by that commission. Tariff questions are even more important and more complicated than transportation problems, and it is only fair that the Minister of Customs should get the same relief as his confrere of the railway department, and the manufacturer is surely entitled to as much consideration as the railway corporation.

If the manufacturers were asking for some unfair advantage, the case would be different. What they ask is that a principle already recognized in the matter of transportation be extended to cover the customs tariff. They want an opportunity to make known their grievances and to produce the evidence to prove their claims. To-day they have nowhere to go. The Minister of Customs cannot spare the time from the administration of his department to make exhaustive investigations into specific cases, and the introducing of them into Parliament, which is not in possession of the facts, only results in a general tariff discussion with a periodical revision that upsets business conditions and disorganizes trade. The appointment of a permanent tariff commission would prevent this periodical disorganization of business and do equal justice to all. The proposal is in every sense a reasonable one, and if it gets the consideration to which it is entitled, its advantages cannot fail to impress the government so that it will be carried into effect at the earliest possible moment.

INTERESTING FIGURES.

THE banks have been curtailing loans and preaching caution to their Canadian customers for several months past, alleging that they did not have the funds to maintain the pace which progress and prosperity had set them. When they were accused of curtailing loans in Canada in order to increase their call loans at higher rates of interest in the United States, they denied the charge with indignation. Having in mind this attitude of the banks,

there are two curious items in the annual statement of the Canadian Bank of Commerce just issued. Call and short loans show an increase of \$3,694,162 during the year, and currency loans and discounts a decrease of \$3,229,957 during the same period. There is no "call money" in Canada. The call and short loans, which are loans on stock, presumably in the United States, show an increase that corresponds strangely with the decrease in currency loans and discounts which are business loans in Canada. Without further explanation or comment these figures look like a "deadly parallel."

THE FARMER'S ATTITUDE.

THE Dominion Grange and the Farmers' Association have amalgamated and are in arms on the tariff issue. They declare that "the demand of the manufacturers that practical prohibition of goods shall be the permanent policy of this country, must be met by the counter demand that the protection principle shall be wholly eliminated, and the tariff reduced to a purely revenue basis." They describe the demands of the Canadian manufacturers as selfish, and proceed to show their own unselfish spirit by adopting resolutions against the proposal to grant a subsidy from the Dominion treasury to the all-red line, endorsing the action of the government in erecting forest reserves, and the encouragement given to farm forestry, urging the adoption of a parcel post system as a means of relief from extortionate express charges on small parcels, and protesting against members of the legislature holding interests in Cobalt mining enterprises.

The Canadian manufacturers have every reason to expect a more friendly feeling from the farmers of this country. The manufacturers have always urged the adoption of every measure designed to advance the interests of the farmer. The agricultural colleges and experimental farms established and maintained by public funds, have no firmer friends in this country than the manufacturers, and no other class has fought so consistently in the farmer's interest in the matter of fair transportation rates for the products of his farm. Moreover, the manufacturer is the farmer's best customer. Indeed, if it were not for the Canadian manufacturer he would have no home market at all.

In view of all this, is it any wonder that the Canadian manufacturer should be surprised and pained to find the Canadian farmer misrepresenting him, and declaring that he is actuated by selfish and unworthy motives? When the farmer declares that the manufacturer selfishly demands a prohibitive tariff, he declares what is not a fact. The manufacturer is not asking, much less demanding, a prohibitive tariff. All he asks is fair play. He does not want any increase in the tariff where it is sufficient to enable him to carry on his business at a reasonable profit. If the Canadian farmer were wise to his own interests, instead of taking up arms against the Canadian manufacturer, he would support him in his efforts to maintain the industries of this country on a good footing.

What would be thought of our city merchants if they banded together for the purpose of opposing their customers and restricting their ability to purchase? They certainly would not be looked upon as wise or judicious merchants. On the contrary it would be thought that some strange germ of madness had got a hold on them and started an epidemic of insanity in their ranks. The Canadian manufacturer is the Canadian farmer's customer, and it certainly is not wis-

dom on the part of the latter to deny the former a fair and reasonable chance of success. The trouble with the farmer is that he overlooked altogether the merchandising end of his business. He considers every question from his standpoint as a buyer, and fails to take into account what his interests are in his role as a merchant. If he were taught to take this broader view of his position, it is safe to say that he would revise his opinions on many important points, and the most marked change would undoubtedly be in his attitude towards the Canadian manufacturer.

ENFORCING THE DUMPING ACT.

THE scarcity of real money in the United States has placed the manufacturers of that country in an awkward position. It is not so much a question of solvency with them as one of cash. No matter how great the surplus their assets show over their liabilities, they cannot, apparently, get the actual money in hand to meet the running expenses of their factories. Real money is not to be had there, and unless they can get it from some other source to meet their pay sheets they will have to discharge their employees and close down their plants. Almost in desperation they are turning to Canada with the hope of finding relief. Scores of travelers representing United States manufacturing concerns are now in this country, sacrificing goods in return for ready money. In other words they are dumping their surplus stocks into Canada. Cuts in prices of from thirty to fifty per cent. are being offered as an inducement to Canadian merchants, regardless of the fact that Canada has a Dumping Clause intended to meet just such a situation as this.

The Dumping Clause is excellent in theory but it is difficult to enforce. It is impossible for even the most expert customs' appraiser to be so conversant with values in all lines, that he can unfailingly detect goods invoiced at slaughter prices. In ladies' costumes for instance, style is as great a factor in determining value as the fabric of which they are made. It is too much to expect customs' officials to make a study of style books and fashion plates in order to be competent judges of value in this respect. Yet, ridiculous as it seems, there is no other method by which they can acquire the knowledge necessary to detect undervaluation in this line of imports. Other instances could be mentioned, but the above is sufficient to demonstrate the difficulty of enforcing the provisions of the Dumping Clause, and the necessity there is of rendering every assistance possible to the Department? Every manufacturer in Canada should make it a duty to report promptly to the proper officials every case of undervaluation that comes under his notice. The Customs Department has a few inspectors in the United States, whose duty it is to ascertain the price in that country of goods intended for export into Canada; but their number is so small that they cannot begin to cope with a situation such as the present. It is evident, therefore, that unless everyone in Canada interested in seeing the Dumping Act enforced lends his aid in that direction, the law will become a dead letter.

The seriousness of the situation is perhaps not as fully appreciated now as it will be later on. Slaughter prices are naturally very tempting to the merchant, and if the process of dumping is not checked, he is likely to load himself up for some time to come, and so curtail his purchasing power that the Canadian manufacturer will be unable to dispose of his output. Moreover, as the object of these slaughter sales is to secure ready money, it is evident that if they are

allowed to go on long enough the Canadian merchant will be relieved of his cash, and this country will be in as bad a plight financially as our neighbors to the South are to-day.

The Customs officials are willing and ready to enforce the Dumping Clause, and it is to the interest of the manufacturer and, in the end, of the merchant as well, to give them every possible assistance in detecting violations of it. If we allow our market to be flooded with the surplus product of the United States factories, there will be no market for our own, and we will have a period of depression that will be real.

THE TRANSPORTATION PROBLEM.

It is with a feeling of satisfaction that everyone interested in freight rates views the rapid development of competing lines of railways, for competition means lower rates. Mr. John Pullen, the assistant freight traffic manager of the Grand Trunk Railway, recently gave the Canadian Railway Club a very interesting talk on "The Work of the Freight Traffic Department," during which he mentioned what he said were a few of the factors entering into freight rate construction. Distance is one and, to the uninitiated it would seem that the rate should increase with the distance. Such is not necessarily the case however. On the contrary distance has often to be eliminated as the result of competition, either of water or of a rival rail line. If, he pointed out, there be two or more railways between two given points, the railway having the longer route must, of necessity, carry its freight between these two points at as low a rate as its rival which may be fortunate enough to have a much shorter line.

So much for the good effect of competition amongst railways, but the most important statement made by Mr. Pullen in his address had regard to the great advantages, from the shipper's standpoint, of water transportation. "If," he said, "a railway parallels navigable waterways then its rates must, of necessity, be kept down to the lowest possible figure, otherwise all the traffic would be attracted to the water route." This leaves no doubt, if there had been any before, of the desirability of developing to the fullest possible extent every mile of waterway that is or that can be made navigable. The money which has been spent on the St. Lawrence canals has been well invested. The people are getting a larger return from it than shows on the balance sheet, for it is not only the freight that passes up and down by boat that benefits by it, but also every pound of freight carried on the railways between points which enjoy the alternate advantages of the water route.

Rival railways reduce rates merely to a common basis fixed by the shorter line, but a navigable waterway cuts them down to the lowest possible figure at which commodities can be moved from one point to another. That the great advantage of water transportation is well understood and fully appreciated by our shippers, is evidenced every season by the mad rush to catch the "last boat" with shipments. The farmers of the West, too, strain every point to get their grain to the lake ports before the season closes, in order that it may reach the seaboard at the smallest possible cost.

As commercial and industrial progress is, in a large measure, dependent upon cheap transportation, it is surely the part of wisdom to make the most of our opportunities in that direction. No other country in the world possesses such great natural advantages in this respect as Canada, but

we are not making the most of our unequalled opportunities. No other country has equalled ours in its liberality to railway promoters; but we show a reluctance to aid in canal projects that is hard to understand. We point with reasonable pride to the St. Lawrence route, but we cannot afford to become so lost in admiration of what has already been done, as to forget that, after all, we have really only made a beginning.

That eminent railway magnate, James J. Hill, than whom there is no more competent authority on transportation problems, has stated that the secret of low freight rates lies in canal development. This emphasizes the statement of Mr. Pullen, whose official position with one of our great trunk lines entitles him to speak with authority, to the effect that railway freight rates are figured out under the menace of water charges, when there is an alternate water route, with the result that railway rates are, to use his words, "kept down to the lowest possible figure." With this fact before us, can we longer question the wisdom of a liberal policy of canal development? For over half a century there has been a canal project before the people of Canada, which, if carried into effect, would shorten the distance between Chicago and Liverpool in the neighborhood of one thousand miles. Some of the most eminent engineers have examined this project carefully and pronounced it sound and feasible, yet nothing has been done in the way of undertaking the work. During this period thousands of miles of government aided railways have been constructed, all of which were needed, and possibly furnished a reasonable excuse for our neglect of other national transportation projects. The time has now arrived, however, when we can afford to call a halt in further railway development on the magnificent scale to which we have become accustomed, and turn our attention to the development of water routes. The people of this country have been generous to the railways, and they owe us a lot in return for what we have done for them. They could have no grievance if we now let them shift for themselves, and turned our attention and our money to the development of water routes which will be the property of the nation and its best guarantee of fair and reasonable treatment in the matter of transportation charges.

THE PULPWOOD QUESTION.

As expected, President Roosevelt in his message to Congress declared in favor of the abolition of the tariff on forest products. He went further, however, and suggested that the repeal of the duties on wood pulp should be accompanied by an agreement with Canada that there shall be no export duty on Canadian pulpwood. This is characteristically American; but Canada has grown too wise to allow her resources to be exploited for the benefit of her neighbors. There was a time when some of our statesmen thought that the prosperity of this country was so dependent upon the favor of our big neighbor to the South, that they were willing to grant all manner of concessions to them. But happily that day has passed, and now, instead of a suppliant, the United States will find Canada grown into a self-reliant competitor, fully alive to the advantages she possesses, and determined to maintain them in the interests of her own people exclusively.

In few other products has Canada such advantages as in forest resources. The United States, on the other hand, are practically at the end of theirs. The cry of distress has already gone up from their paper mills and paper users, and it is in answer to that cry that the President has spoken.

No one in this country has been deceived by his declaration into believing that Canada is about to receive some special trade favor from her big neighbor. Instead of the rejoicing there once might have been in this country over an incident of this kind, there is to-day a feeling of suspicion, born of an experience which has taught us to be cautious in all our dealings with our friends at Washington. They have earned a reputation as adepts in the fine art of trading the shadow for the substance, but Canada has been too close a student of their methods to be caught by them at this late day.

Put in the plainest possible language the situation is this: There is an enormous and ever increasing demand for paper in the United States, and there are hundreds of paper mills equipped to supply the demand, but the raw material to keep the mills going has become practically exhausted, and the day is near at hand when they will have to be closed down if the shortage is not supplied from some other source. In Canada the consumption of paper is limited and the mills are comparatively few, but her supply of raw material is enormous.

The publishers of the United States have gone to the President and told him that they must have paper, and the paper-makers have gone to the President and told him that they can supply all the paper required, but they must have pulpwood, and now the President turns to Canada and says: "Give us all the pulpwood we require and we will allow you to sell us wood pulp without asking you to pay us anything for the privilege."

Such is the situation as it exists to-day, and it shows clearly that the advantage is all with us. The commodity that the American market demands is paper, and if Canada stands firm at this stage, and refuses to let anything but paper go out of the country, our American friends will be compelled to take it from us. The President, in his message, talks of an agreement with us and indicates the terms on which he would be willing to negotiate. He ignores, for he cannot fail to realize, the fact that Canada is in a position on this question where she does not have to enter into any agreement or negotiate with anybody. She can dictate the terms in full herself, and they do not need to be lengthy or involved. The only reply she needs to make to the President and his friends is: "Gentlemen, we have neither pulpwood nor wood pulp for sale, but we can supply you with paper in any quantities that you may require." That is all. The orders will come, and instead of our pulpwood bringing us a gross return of \$7.00 a cord in the raw, it will bring us \$40.00 as a finished product.

THE FOREIGN EMPLOYMENT AGENCY.

A GREAT deal of injury is being done to Canada by the employment agencies in the Old Country that misrepresent facts and mislead unfortunate workingmen with false promises of immediate and steady employment in this country. To-day there are hundreds of men walking the streets of our cities in search of work, who are the victims of these unscrupulous foreign agencies. At a time like the present, when employment is not over-abundant, our own people are able to fill all the positions offering, and they are entitled to the first call on them. That the labor market is allowed to be flooded with strangers who compete for every opening, is an injustice to our own working people of which they have every reason to complain. The remedy that at once suggests itself is the prosecution of the rascals who act

under the guise of employment or immigration agents, but are nothing more nor less than common swindlers.

The officials of the Canadian Government in England and elsewhere abroad confine their energies to the sending out of settlers, farm laborers, and domestic servants, too many of which classes it is scarcely possible for us to get. Mechanics and skilled laborers get neither encouragement nor advice from the accredited representatives of the Canadian Government, and are, therefore, left entirely at the mercy of the swindling agencies that rob them in the most shameful manner. Many of them are waxing wealthy on the head-money they collect from their victims, and as their revenues increase their methods become more daring and dangerous.

A case that was brought to the notice of the Canadian Manufacturers' Association, and was by them investigated in the interests of Canadian workingmen, illustrates how the swindle is carried on. In this particular instance a member of the Association reported that some twenty men from an English manufacturing town had called at his factory in Toronto and announced that they were the men sent out to fill the vacancies existing in the establishment. As there were no vacancies on the staff, and no one had been requested to send men out, they were naturally asked to explain how they came to get such an idea and from whom. In reply they produced an advertisement asking for twenty men skilled in their line to go to Toronto to fill vacancies. They had replied to the advertisement, and were sent on to Toronto. Further investigation disclosed the fact that the firm in question had purchased some new machinery in England which would give employment to a gang of twenty men. The transportation company that brought the machinery over jumped at the conclusion that there would be twenty new places in the factory to which it was delivered, and they passed the news along to an agent who advertised for the men. The agent got a good commission, the transportation company got the fares and the men got swindled. There is no other word with which to describe a transaction of this kind. The affair was reported by the Association to the proper authorities in order that some action might be taken to prevent the labor market of Canada becoming overcrowded with men brought in under similar circumstances.

While in this case there was at least a shadow of an excuse for the action taken by the agency, there are hundreds of other cases where there is no excuse at all. Lying advertisements are inserted in the press, and when victims go to enquire as many more lies are added as may be required to induce the applicant to part with his money. It is a cruel, heartless business, and those who engage in it should not be shown any consideration when detected.

The attitude of Canadian officials in European countries in withholding all information from intending immigrants of this class makes the work of the fake agency comparatively easy. If instead of refusing them advice our officials over there were kept posted on the labor situation in Canada, and instructed to tell the actual truth to all applicants, we would at least be relieved of responsibility in the matter. As it is the country gets the blame for every swindle of this kind that is perpetrated in Europe, and while it maintains its present policy of non-interference it is not wholly to be excused.

The labor unions are also to blame, inasmuch as they are responsible for the attitude of the government. There

are times when Canadian industries are seriously hampered through lack of sufficient skilled labor, and the unions fear that the government would, at such times, assist in relieving the shortage by announcing the facts. This is a foolish stand to take, for the manufacturers are well able to advertise for help themselves, whereas the unions are not in a position to prevent the unscrupulous agencies sending in men at all times to glut the labor market in lines that are already fully supplied. The working people of the country have everything to gain by the truth being made known through official sources, for they are the only ones in this country who suffer through the existing state of affairs.

A discussion on this subject was raised in the House of Commons, before the holidays, by the Leader of the Opposition, and the Minister of the Interior made an amazing statement in his reply. Mr. Borden read a copy of a circular sent to him by a man who was then in Toronto out of work. The author of the circular stated that he was in a position to find immediate employment, as weavers, for immigrants landing in Toronto, at wages of from \$17 to \$20 per week. The circular further stated that the Grand Trunk Railway had notified the agent to procure the weavers. Mr. Borden said he did not believe the Grand Trunk had ever given any such direction as that stated. Mr. Oliver, in reply, said that the individual responsible for the circular was not an agent of the Government, so far as they were aware. He rather fancied from the nature of the advertisement that he was an agent of the Canadian Manufacturers' Association, with which the Government had had some correspondence.

This is an amazing statement for a responsible Minister to make, and the more so as the impression sought to be conveyed to the public is utterly false. A man in the responsible position of the Minister of the Interior has no right to have "fancies," and having them, he should be careful not to utter them to the injury of anyone, much less of a body of men whose honesty and integrity and reputation for square dealing is the foundation on which the country has to build its commercial future. Had he taken the trouble to enquire into this particular case he would have found that the circular in question was the very one that the Canadian Manufacturers' Association had traced to its source and reported to the Labor Department. The Canadian manufacturers are not in the business of luring British artisans away from their employment at home and bringing them out to Canada to be turned adrift on the streets of our cities. Any men the manufacturers have brought or may bring out are men urgently required for the operation of their plants. The others are the victims of the swindlers whose operations are made possible by the attitude of non-interference maintained by the Canadian Government at the dictation of the labor unions. Unfounded insinuations against the Canadian Manufacturers' Association do not furnish an excuse for maintaining a policy which makes it possible for unscrupulous individuals to prey upon the ignorance of the British artisans. It is surely bad enough to allow labor conditions in Canada to be misrepresented abroad, without trying to make the Canadian manufacturers responsible for the acts of every swindler whose way is made easy by the indifference of the Canadian authorities. Such an attempt might be expected from an irresponsible labor agitator, but it comes with a bad grace from a responsible Cabinet Minister.

PURE FOOD LAWS.

IN January a meeting of the manufacturers of food products of every description will be held in the Association offices, Toronto, to discuss the advisability of urging on the Dominion Government the appointment of a Pure Food Commission. By thus bringing all the manufacturers interested together it is hoped that the suggestion first broached at the meeting of the Grocers' Section held in Toronto during the Annual Convention in September last, will be crystallized into a definite proposal which can be placed before the proper authorities with the approval of all the manufacturers concerned. In suggesting the creation of a Pure Food Commission the manufacturing grocers aimed at accomplishing some measure of reform in the manufacture of food products, which all are agreed is highly desirable. While the abuses which have crept into the Canadian food production business are not nearly so numerous nor so dangerous as those which were found among United States firms prior to the adoption of the present Pure Food Law in that country on January 1st, 1907, there is no doubt that there are some evil practices existing in Canada which will require concerted action on the part of the trade, backed up by a vigorous administration of a good law on the part of the Government, to eradicate. There are many signs which indicate that the Department of Inland Revenue will shortly introduce pure food legislation in Canada. The manufacturers quite approve of this action, but before any bill is introduced they are strongly convinced of the necessity of a thorough investigation into the conditions of manufacture in Canada, so that the requirements in any regulations that may be proposed will not be too drastic nor far-reaching, as it has been stated the requirements of the United States law are.

These are the reasons which prompted the grocers to suggest the appointment of a Commission. Whether all food manufacturers favor such a scheme will have to be determined at the meeting to be held shortly. In any case a plan must be devised which will enable the manufacturers and the Government officials to exchange ideas freely. It is altogether likely that the two parties can work closely in touch with each other to the advantage of consumer, producer and administrator alike, if the matter is proceeded with in the right manner. It is with this in view that the meeting will be called, and it is hoped that every manufacturer will arrange to be present so that an organization can be effected which will investigate, confer and labor with the department officials, on the Pure Food Commission if one is appointed, until a law satisfactory to the majority is passed. The manufacturers of Canada stand for purity and publicity in their own interests and those of the consumers, and earnestly desire to see a good pure food measure put on the statute books. It is only by concerted action and a reasonable attitude with regard to pure food measures that they can place themselves right with the public and the Government, and so avoid the trouble which the United States food manufacturers have fallen into. Let every firm be represented when the meeting is called to order in January.

The Canadian Government will discontinue the subsidy to the Union Steamship Line, which maintains the present service between Vancouver and Australia, when the present contract expires on August 1st next. This is the result of the recent tariff enactments in Australia which have shown that the Australian Government are not ready to make concessions in favor of Canada. It is felt that the Canadian advances for reciprocal concessions have not been received in a spirit which would justify Canada in going to any further expenditure to develop a direct trade. Should conditions improve before the date of the expiry of the present agreement, it is possible that the subsidy may be continued.

Joining Two Countries by a Tunnel

Trains Will Run Between Windsor and Detroit Through Twin Tubes Under the River

IN a very little while, measured by the swift flight of time in this era of rapid solution of transportation problems, the huge railway car ferries on the Detroit River will have passed from the traffic life of the busy stream. For many years these powerful steamers have transported the enormous freight tonnage and millions of travelers across the border between the two countries. The five trunk lines—the Michigan Central, the Grand Trunk System, the Wabash, the Pere Marquette, and the Canadian Pacific—operate no less than ten of these car floats.

When the Detroit River tunnel, one of the most important railway enterprises of the present time, is completed, the

tunnel, over the slow and uncertain ferry system, is deemed by the Michigan Central officials, in view of the ever-increasing tonnage of the road, of sufficient moment for the expenditure of \$10,000,000 in the construction of the International tunnelway. About three years ago the project was taken up by Mr. Henry B. Ledyard, then president of the Central, and through his untiring efforts the board of directors authorized the construction of the tunnel, and also the organization of the advisory board of engineers to carry out the great undertaking. The advisory board was appointed in June, 1905, and was composed of W. J. Wilgus, then chief engineer of the New York Central and in charge of the electrification of the

Scows and Dredging Apparatus

through "limited" and express trains and the long heavy freights of all the trunk lines will pass below the bed of the river, and rise to the surface of another country in six to seven minutes. By the present system, about thirty minutes is lost in ferrying and switching each express train, and from four to seven hours in handling through freights; while perishables, which are given the preference over all other classes in quick ferriage, do not get under way again within three hours. In winter, when the ice floes, brought down from Lake St. Clair by the swift current, often jam the river from bank to bank, the big steamers frequently become fast in the stream; and the delay from this cause to fast passenger service between the East and the West sometimes amounts to from three to twelve hours.

What Must Be Saved.

The saving in time and expense of operation in moving the heavy traffic across the river through a double-tracked

New York City terminals; H. A. Carson, consulting engineer, who designed and built practically all of the Boston subways; and W. S. Kinnear, chief engineer of the tunnel in charge of construction.

Trenches Along Bed of River.

Instead of digging parallel bores through the tough blue clay far below the bed of the river, by means of shields driven by hydraulic rams, a great trench has been dredged out of the bottom of the river, in which are being sunk successive tubes of steel, 23 feet in diameter and 260 feet long, secured together by transverse stiffening diaphragms of steel at every eleven feet of their length. These tubes form the water-proofing of the tunnel proper, which consists of a solid ring of concrete, two feet in thickness, formed within the tubes. The width of the river between dock lines is about half a mile, and the subaqueous section of the tunnel, or part entirely under the river, will consist of ten of these

twin tubes with a total length of 2,622 feet. Along the bottom of the trench, rows of piles have been driven and capped, to form a bearing for the tubes.

The tubes are built at the shipyard of the Great Lakes Engineering Company at St. Clair, forty-eight miles away. The ends of the tubes are "plugged" with stout wood bulkheads, to render them watertight. Then they are launched into the river sideways, very much as lake ships are launched. Floating lightly on the water, and drawing no more than six feet, the tubes are towed by a tug down the river to the place where they are to be sunk. On top of the tubes and near each end are two air cylinders, ten feet in diameter and sixty feet long, strapped securely to the tube diaphragms, and these serve to regulate the settling of the tubes, as they slowly fill with water, which is admitted at the will of the engineers through gate valves in the bulkheads. There is also provided at each end a detachable upright, firmly braced to the section and of sufficient length to indicate the position of the tubes when they have been entirely submerged. These uprights also show the engineers the exact position of the tubes when they are resting on the piling, eighty feet below the surface of the river, and act in adjusting them in their position laterally, so as to bring the sections into alignment. The uprights extend about ten feet above the water when the section is in place. After all is prepared and proper

Miniature View of Twin Tubes as They Will Appear

precautions have been taken to check the least deviating movement, the gate valves are opened, and the tubes slowly settle into position.

Made Absolutely Watertight.

Each tube as constructed in the shipyard is provided at one end with a sleeve, which is slipped over the end of the adjoining tube already sunk and in position. The sleeve is fitted with a flange, which is bolted to a corresponding flange of the other tube, a rubber gasket being placed between the two. A similar gasket is slipped in at the inner end of the sleeve, bearing up against the edge of the other tube. When the bolts are in place and all is ready, divers turn up the nuts, thus squeezing the rubber gaskets together between the ends of the tubes to form a tight joint. An annular space of three inches by eighteen inches is thus formed all around the tube at the joint, which is then filled with a grout of pure cement. To this end each sleeve is provided on the top with two small pipes, flexible at the joints and leading up to the cement scow floating above. The water in the space is then pumped out, and if the least leak occurs in the main joint, there is more work for the divers in bolting up. When the joint is absolutely watertight, pure cement is pumped into the space through one pipe and continued until it comes out through the other, which is evidence that the space is completely filled.

The water in the tubes is now pumped out and the inner bulkheads removed, leaving the space clear and dry to the outer bulkheads. Concrete gangs now come on the scene, and, pushing their big half circular wood forms along into the new tubes, proceed to build up the tunnel itself, which is of solid concrete varying in thickness from two to five feet. The concrete tube is calculated to be of sufficient strength to withstand all strains and vibrations of the heaviest trains, the steel tubes serving as waterproofing protection, while the outer covering of concrete in turn is the steel tube preservative. On each side of the lower section of the tubes there are benches of concrete four feet high and two and a half feet wide at the top, to serve as passageways and places of refuge for the trackmen. When the concreting is completed there is a clear head room of eighteen feet from the tops of the rails to the centre of the arch.

Applying the Cement.

Out in the stream are the cement scows, fitted out with the latest concrete mixers and with huge cranes and other devices for the rapid handling of the material from the lighters alongside. The scows are anchored as immobile as is possible in the swift current of the river, which is constantly churned into choppy waves by hundreds of passing freighters and excursion and ferryboats plying the busy stream. By means of hoppers placed at the top of long vertical delivery pipes, the concrete, as it is prepared, is deposited in the trench exactly where it is needed, and comes in contact with the water only when it is spread over the surface of the gravel bed which was prepared for it. As the work goes on, the concrete is held in proper form about the tubes by three-inch oak planking, firmly braced and backed up with clay and river slime from the dredges, working in the trench farther out in the river. Concrete is also chuted down between the tubes and continued up over them for five feet, thus encompassing them in a solid monolithic mass. The trench is then filled around the tunnel, and the top is covered with riprap.

The construction of the approach tunnels is proceeding on lines well established by the best engineering practice; and this part of the undertaking is a huge task of itself. Two shafts were first sunk at the river banks, one on each side, and from these excavating for the centre wall was carried on inland as far as other shafts, and from them to the portals. Concrete gangs followed, building up the centre wall, and when this was completed, the bores were pushed forward by a modification of the shield methods of the New York tunnel work, the change being necessary because of the tough clay of the under stratum. The shafts near the river will be permanent, and they are lined with double walls of concrete. They will serve to ventilate the tunnel, and as trains move in each tube only in one direction, a constant circulation of air will be maintained.

Electric Motive Power.

Electricity will be the motive power used in hauling trains through the tunnel, and current from the power plant of a local concern has been arranged for. Only a small transforming station will be needed to convert the alternating current, commercially supplied, to direct current for the locomotive motors. For the operation of the tunnel eight powerful electric locomotives are being constructed. It will be brilliantly lighted with electric lamps, and the walls will be clean and bright, for there will be none of the gas and soot that fill tunnels operated by steam locomotives. A system of block signals will be installed, and so arranged that no train or locomotive will enter either tube until the train ahead of it has passed beyond the summit on the other side. —*Scientific American.*

On What Basis of Value Shall Insurance Companies Pay for Burned Lumber

THERE is one class of lumber risks which, it is contended, has come in for peculiarly harsh treatment in the adjustment of losses. From time immemorial the manufacturer of lumber—the man who cuts up the log—has been confronted with the principle that in the adjustment of a fire loss the insurance companies will pay only such an amount as it has cost to produce the lumber burned.

It has been held by the insurance companies that "cost of production" is the proper basis of settlement. Here and there an aggressive lumberman has carried the opposite end of the argument to the courts and we have a number of decisions confirming the contention that losses must be settled on the basis of "market value" and that the cost of production may be ignored as a factor in determining the value of the property destroyed.

Before looking into the merits of the question it might be well to define clearly the exact conditions under which lumber losses are subject to this particular ground for disagreement. In the settlement of a retail lumber yard loss, there is no room for such a contention, for here the value of the lumber is clearly determined by the evidence in the retailer's books as to the price he has paid for the lumber burned. Almost invariably the lumber has been bought from a wholesaler at a definite price per thousand feet for each kind and grade. In like manner the value of lumber on a wholesale yard can usually be readily ascertained, the wholesaler having as a rule bought the lumber from some manufacturer at a definite and easily proved price per thousand.

Where the Manufacturer Suffers.

In the case of the manufacturer, however, there is no definite price paid. He is the man who owns timberland, builds logging railroads, fells trees and saws in his own mill the logs, producing rough and sometimes dressed lumber which he stacks on a yard to dry. Here there is infinite room for dispute as to the value of the lumber, and such disputes frequently arise when assured and adjuster undertake to determine how much shall be paid for such lumber when burned. It has been a favorite method of procedure for adjusters to demand that the assured establish the cost of production, and in more cases than might be supposed this method of arriving at the value per thousand has been accepted. To the practical lumberman it is not necessary to point out the numerous points at which disagreement might arise as to what enters into the cost of production. It would be most difficult to devise a formula for arriving at the value applicable to all cases. Superficially it might be said that the cost of production can be determined by adding to the cost per thousand of the standing timber, the cost per thousand of logging, milling and stacking on yard. But how can the exact cost per thousand of the standing timber be determined until the entire tract has been cut? How about interest on the original investment earned in the period, often one of many years, between the date of purchase of the timber and the date of the burning of the finished lumber? How about the time of office employees, and the travelling expenses and salaries of inspectors, the advertising expense, and the owners time in superintending the entire operation? All of these are obviously legitimate factors in producing the lumber ready for a market.

Foresight Must Be Recognised.

In view of all of these and many other points of difference of opinion, it is little wonder that there is a growing insistence that this is getting at the value wrong end to. It is asserted by lumbermen that there is a sufficiently broad and well established market for lumber, to make it possible to readily determine the value of a manufacturer's product on the basis of the market value. Between the cost of production and market value lies the manufacturer's profit. The adjusters have unanimously contended that a policy of insurance is an instrument of indemnity which contemplates no reimbursement for profit. They are ready to pay only "cost of production." The courts have never sustained this contention, and in more than one instance have held the opposite. The adjusters have never made it clear just what they regard as "profit." Whether the time and effort and energy and foresight of the manufacturer himself shall be taken into consideration as an element in the cost of production, or whether the manufacturer must see all of his own personal contribution to the production of his lumber sacrificed in the flames on the altar of "profit" is a point on which the adjusters do not commit themselves. A lumberman who by foresight and shrewdness has acquired timberland at two dollars an acre and who can consequently produce lumber at a cost many dollars less per thousand than the man who has later bought similar timberland at twenty dollars per acre, must see the fruits of his own sagacity wiped out in the event of the burning of his accumulated stock of lumber followed by an adjustment on the "cost of production" basis. An adjustment on the "market value" basis would on the contrary reward the two dollar an acre man for his foresight by paying him the same price per thousand as would be awarded the twenty dollar per acre man.

A Pertinent Parallel.

A parallel might be drawn between the settlement of lumber losses and grain losses.

It has never been contended that burned grain should be paid for on any other basis than market value. Yet there is just as much diversity in the cost of production of grain as in the cost of production of lumber. Would the adjuster who is ready enough to ask a lumberman to show the cost of timber, logging and milling, ask a farmer to show the cost of tilling, seed, harvesting and threshing, as a basis of value for grain? Perhaps the difference lies in the fact that the poor farmer might too often show that it has cost more to produce his grain than he can get for it, while the rich lumberman as a rule has a wide and easily get-a-able margin of profit. Another question for the adjusters to answer is what attitude would they take should the market price of lumber fall below the cost of production? Would they then fly for cover to the "market value" basis of adjustment?

There is every reason to believe that with the awakening of manufacturers to the fact that the cost of production method is unsound and has no legal recognition, there will be a passing of that manner of adjustment fraught with many fallacies and uncertainties of result as it is, and there will in due time be universally adopted the simpler and fairer method of adjustment which has as its foundation the market value. Nothing seems simpler in determining the value of the burned lumber than to start with the market value f.o.b. cars at the place of fire and deduct therefrom only the cost of loading and cost of selling—the expense of

which the assured is relieved of by reason of the lumber being destroyed.

The Moral.

We are glad to quote this article *in extenso* because it emphasizes the point of view of certain specializing lumber insurance companies on the important question of cost versus market value. The bone of contention between insurance companies or their adjusters and the saw millers on this subject, after a loss has occurred, has in the past caused much bickering, disputation and procrastination in the settlement of fire losses, and in not a few cases that have come under observation have the millers accepted a settlement on the "cost basis" at considerable and unnecessary financial loss.

Owing to the difficulties thus experienced it has become a fairly general rule to have fire insurance policies so written that there can be no possible question as to the basis upon which the adjustment will be made, and the obvious lesson to those millers who have not followed this course is that the time to put their policies in order is before rather than after a fire has happened.

WOULD CURTAIL EXPORTATION OF GAS.

A SERIOUS shortage of natural gas for domestic use in the Niagara Peninsula is again threatened, similar to that which adversely affected certain sections last winter. During the winter of 1906-1907 St. Catharines and Thorold suffered severely through the insufficient supply, although at the same time a great quantity was being piped daily to Buffalo. The same conditions obtain this year, and to anticipate the trouble the City Council of St. Catharines have decided to urge the Minister of the Interior to take such steps as he may deem necessary, to restrict the exportation. The following statement of the case is appended to the Council's resolution:

"The Provincial Natural Gas Company of Ontario, of which capital stock 51 per cent. is held by a foreign corporation, the Buffalo Gas Company, made a contract some years ago with the latter company, to deliver all its natural gas to the Buffalo company at 12½c. per thousand, at the Niagara River, and it has eight (8) main lines lying in the bed of the river, conveying said gas to Buffalo for distribution in a foreign country.

"These pipes are laid under the river by leave of the Provincial Government, and could be removed at any time, as the license to maintain and keep them there is revocable at will of the Lieutenant-Governor-in-Council.

"Attempts have been made to induce the Provincial Government to prevent the use of the river bed for carrying gas out of the country, but that Government has always declined to interfere.

"On the 27th of April, 1907, an Act was passed 6 and 7 Edward VII. Chap. 16, by the House of Commons, entitled 'The Electricity and Fluid Exportation Act.'

"By that Act fluid is defined to mean, petroleum, natural gas, etc.

"By Sec. 3 of said Act, no person shall export any power or fluid without a license.

"By Sec. 4 subject to any regulations of the Government in Council, licenses may be granted under such conditions as is thought proper for the exportation of power or fluid.

"By Sec. 5. Any such license may provide that the quantity of power or fluid, shall be limited to the surplus

after the licensee has supplied for distribution to customers for use in Canada, power or fluid to the extent defined by such license and every such license shall be revocable at will by the Governor-in-Council.

"Invoking the aid of this Act, the United Gas Company of St. Catharines in the month of October last lodged with the Governor-in-Council a protest against the Provincial Natural Gas Company sending natural gas to Buffalo until they had made fair arrangements with the St. Catharines Company to supply it with gas at a reasonable price for local consumption.

"The Provincial Company has wells surrounding those of the St. Catharines company, and the pull on the gas going to Buffalo has been so severe that the St. Catharines Gas Company's wells are almost depleted, that is to say, they are not able to stand the drain of the consumers on the United Gas Company's lines.

"Representations were made to this effect to the Governor-in-Council, and the matter was sent to the Department of the Interior, with the result that the department's chief engineer, Mr. Higman, was sent here to investigate the subject, and he has it now under consideration.

"It is learned that the Provincial Company are opposing the application, contending that they are not obliged to supply any consumers through the pipe line of a rival company. It is to be noted, however, that the Provincial Company makes no effort whatever to serve the field covered by the rival company through lines of its own, preferring to sell the whole or the greater part of its supply in Buffalo.

"The St. Catharines Company is prepared to pay the Provincial Company as much, at any rate, for any gas it should get from them, as they are getting from the foreign corporation.

"The pipe lines of the two systems are contiguous and a connection could and should be made forthwith.

"This same connection has been established for years in Welland and Port Colborne. The Mutual Company operating in Welland and Port Colborne supplies these two points, paying 15 cents per 1,000 for as much gas as they take from the Provincial company.

"The United Gas Company of St. Catharines desires the same privilege and the Provincial Company should be obliged to conform thereto, failing which, its export license should be revoked."

WILL INSTRUCT FOREIGNERS.

The Hamilton Board of Education have assumed the responsibility of a cosmopolitan population by deciding to open a night school for teaching foreigners the English language. This is as necessary as it is far-sighted. Assimilation of foreigners by native Canadians can never be accomplished until the foreigner becomes familiar with our language. That is the first essential to bringing about a community of sympathies and interests. It is frequently stated, and the statement has been corroborated, that in one district of Toronto the majority of the women are unable to speak English. The younger generations are acquiring the language, but in their homes their native tongue is alone heard, and their sentiments, ideas of citizenship and conceptions of public duty, are uninfluenced by the press of those who have been reared under existing conditions. Yet cities which have appreciated the importance of this problem and have provided facilities in the evening for instruction, have found the new-comers willing and eager to learn the language of their adopted country, and to become thereby a part of the community in which they live.

Shippers and the Railways

Problems of the Month

AN UNWISE SUGGESTION.

AN unwise suggestion was made by Mr. E. N. Lewis, M.P., in a speech before Parliament recently, when he advocated a separate railway commission for the West, on the assumption that the problems confronting Eastern and Western Canada are entirely different. Nothing could be more ill-advised than such a course. What shippers in every part of the country are most interested in is to get away from any division of authority. Those who have had to do with freight questions involving import and internal rates to Western points know how delicate is the matter, and how essential it is to strike a fair balance between the claims of all parties interested. So many questions of competition and distribution enter into the consideration of a freight rate that a commission would be worse than useless which, acting in the interests only of a section of the country, in its investigations and deliberations failed to take into account conditions in other parts of the country which had a bearing on the matter. Certain rates, while they were of advantage to the West, might be of such a discriminating nature as to seriously handicap shippers in the East. A Western Railway Commission would not necessarily see anything wrong in this condition. They would be appointed to protect Western consumers and shippers, and the injustice done to Canadian industries by such a condition would not in any way fall under their purview. Yet if a railway commission stands for anything, it stands for an equitable basis of rates for all Canada, by which neither shipper, consumer, nor carrier can be exploited to the special advantage of any one interest or section.

The wise man is he who profits by experience, and if the experience is bought and paid for by someone else, so much the better. Many of the states of the neighboring Republic have railway commissions in addition to the Federal body, the Interstate Commerce Commission. These commissions have jurisdiction in all cases where traffic originates and terminates within the state's borders. How this works out can be seen from the case of the Rock-Island-Frisco System, a combination of lines with a total mileage of about 15,000 miles, operating in fifteen states. Of these thirteen have railway commissions. Their decisions vary from time to time, and the state laws governing transportation are different. Hence complications are constantly arising. Equipment or facilities which are necessary by the law of one state are frequently unnecessary in another. Thus the company has to deal with almost as many commissions as there are states through which it passes. In Texas sleeping car companies must furnish sheets nine feet long and six feet wide on the berths. A train which was more than one hour late had to be annulled and held till the scheduled time next day. The latter law has, it is true, been declared ultra vires by the Interstate Commerce Commission. These regulations enforced by one commission, will serve to show what innumerable anomalies and interminable delays would be caused by a multiplicity of bodies of this kind; yet the appointment of a separate commission for Western Canada would bring about a similar condition here, and would be the entering wedge to the appointment of commissions for each province.

Shippers, consumers and traffic managers are alike satisfied that the best results will be attained by sticking to the present system of having one federal body which shall pass on all transportation disputes. Changes should come by increasing the number of members and sub-dividing the work

among them, but in every case having the decrees emanate from the commission as a whole. In this way individual commissioners could go to the West or the East, and could take evidence on any question which arose and report their findings to the commission. In the larger questions the full board would sit; but on the whole better and more expeditious results would be attained by apportioning the work and by letting one man give especial attention to a particular line of investigation.

We feel sure that this and not Mr. Lewis' method is the one which will bring the best results.*

INTERSTATE COMMERCE COMMISSION.

A bill has been introduced at Washington which is the result of conferences with many men prominent in the railway and shipping business, to provide for a division of the executive and quasi-judicial and legislative functions of the Interstate Commerce Commission.

It is not intended to add to or subtract from the powers of the commission. Its sole purpose is to divide the functions and vest the executive ones in a bureau to be created in the Department of Commerce and Labor.

It is proposed to obviate the difficulty which makes it impossible for that body to perform satisfactorily both the administrative and judicial duties now imposed upon the commission, by transferring the whole task of enforcing the law to a "Commissioner of Transportation," who would have charge of everything pertaining to the filing of tariffs, the enforcement of the safety appliance law, supervising the system of accounting, and enforcing the penalties for violations of the law. The Commission itself would be left free to hear complaints and to pass on the reasonableness of rates.

The inquisitorial functions of the Commission would also fall within the jurisdiction of the "Commissioner of Transportation."

RAILWAYS WOULD PENALIZE SHIPPERS.

THE *Toronto Globe* in a recent news item, entitled "The Railway View," and with the following sub-heads, "Cars now standing idle for want of business. If the roads are to be penalized for lack of cars in rush times, they ask why the business public should not be penalized for not supplying freight in dull times," says:

"With the shrinkage in earnings, which is the first decrease in a long while, the cry of 'reciprocal demurrage' is being interpreted in a new way. Positions are reversed. Today shippers are not shouting for cars; the railways have the cars, but they are standing idle awaiting orders. Naturally the 'reciprocal' end of the demurrage scheme has been forgotten and the shippers are quite satisfied.

"In view of this the railway men are enquiring just what the word 'reciprocal' means when applied to demurrage. The railways ask why the shippers should not be penalized when the railways have cars ready and idle because there is no business for them. Finally, it is admitted that there is no popular outcry to have the shippers fined for having no freight for the railways."

It must be admitted that the latter is a very charitable position for the railways to take, and will, no doubt, be ap-

preciated by the shipping public, especially as the railways have been so successful in having legislation enacted providing for additional tolls against the shippers for failure to load or unload cars promptly after they have been placed. No one disputes the propriety of such a charge. Shippers have no right to use cars for warehouse purposes, as has been done. Shippers generally favor such regulation; they recognize that in delaying cars in the loading or unloading they are taking from others as well as themselves some of the facilities required in the commerce of the country. The reasonableness of making a just and lawful charge for the storage of property in cars, which the consignee fails to unload promptly, is so manifestly in the interests not only of the carrier, but of its patron, that it is conceded. While granting this point, however, shippers are of the opinion that there should be some reciprocal regulation. Hence the term "reciprocal demurrage." Shippers do not want to be put in a position to demand one dollar per day from the carriers for failure to furnish cars or move them promptly, or place them for unloading as soon as they arrive at destination. What they want are the facilities to do business.

The term "reciprocal demurrage" is a misnomer in every sense of the word. It simply opens up many schemes which, if they were applied in the sense which the term conveys, would defeat the very object in view. What the shipping public wants is legislation to provide for penalties against the carriers for unreasonable detention of property. The railways now have this against the public. Why should the public not have similar protection?

It is the duty of a common carrier to transport property for all who may desire to have property transported. It must furnish adequate and suitable accommodation for the carrying, unloading and delivering of all such traffic, without delay and with due care and diligence, and furnish and use all necessary means for such.

The Railway Act provides for this, and the Railway Commission has the power to require that suitable accommodation be provided. Should a shipper sustain loss through the failure of the carrier to provide proper facilities his only recourse is to the courts. This is, however, an almost impossible task.

As to the question having been forgotten. This is not so. Shippers will not readily forget the experiences to which they have been subjected for the past two years, and the same reason exists for some reciprocal regulation to-day as it did then. Any steps taken in this direction will be continued. In this connection it may be observed that the reciprocal demurrage advocate is looking for service, rather than lower rates. All that he demands regarding rates is that they should be reasonable, uniform and not discriminatory. He probably does not object to an adjustment of rates on a reasonable basis to give the service he demands. In this way he is a friend of the railways and tries to work with them.

The tone of the article referred to leads one to believe that the railways have for so long legislated for themselves that any proposition submitted by the public of a reciprocal nature savors of sacrilege. Up to the time of the creation of the Railway Commission the railways assumed as rights privileges which are now questioned by shippers. This is substantiated in the article in question.

The question of reciprocal demurrage has been before the Railway Commission for some time past. The Board is not sure whether or not it has the power to impose penalties such as are asked for against the railways. It is, therefore, proposed to ask Parliament to give it that power.

As regards the question—Why should not the shippers be penalized when the railways have cars ready and idle be-

cause there is no business for them?—might we ask in reply why the railways were not penalized to the extent of hundreds of thousands of dollars, representing only a portion of the loss sustained by shippers during the last three years. Furthermore, have not the railways themselves contributed more or less to the present conditions? Might we not ask why the railways should not be penalized for the indirect loss through cancellation of orders, etc.? It is the custom of the carriers to assess all shippers for idle equipment in their regular rates. Therefore, to say that the shippers should be specially penalized for not supplying freight at times when there is an interruption in the whole commerce of the country would be to say that water carriers should be paid during the five months of the year when navigation is closed. The same applies to the industrial and agricultural interests of the country.

The transportation problem must be solved in its relationship to the interests of the business community, the community recognizing that its obligation and the carrier's obligation are interdependent.

What we ask for is the proper control of railways to the extent of compelling them to perform a service, and in case of their failure in this, to penalize them for it.

EXPRESS RATES UNDER INVESTIGATION.

WAS it necessary for Express Companies to prove that their charges were reasonable, or did the onus of proof rest with the objecting party to prove that any particular charge was unreasonable, was the question which occupied the time of the Railway Commission in its initial sittings on the Express Companies in Montreal during December. The contention of the companies that the section of the Act dealing with their tariffs differed from those referring to railway and telephone companies, was ably advanced by Mr. LaFleur, but after exhaustive discussion the Board ruled that evidence would have to be produced by the Express Companies to establish the reasonableness of their tariffs.

After this question was settled the Board settled down to the real business before it. The representative of the companies stated, that in proving the fairness of the tariffs, he would produce evidence along the following lines:

1. Rapidity of service.
2. Size and quantity of parcels.
3. Distance carried.
4. Space occupied.
5. Value and character of property.
6. Responsibility and risk.
7. Amount of detail work.
8. Extent of collections and delivery work.
9. Value of service to the shipper.

The claim was advanced that the last of these points in a sense embraced all the others and that the true test of the reasonableness of rates was the value of the service to the shipper. While it would be out of place to discuss this point at any length while the investigation before the Board is still unfinished, in ordinary fairness it must be pointed out that when the public is dealing with a practical monopoly, the mere fact that it is accepting the service offered and that it is paying the rates demanded does not indicate the value of the service to the shipper, much less is it a test of the reasonableness of the existing rates.

Considerable evidence was put in explaining the nature of the express business, and elucidating the various tariffs filed. The capitalization, value of property, and results produced in the past, were also brought out during the course

of the cross-examination. This evidence, however, was given in camera at the request of the Express Companies.

The hearing was then adjourned. The investigation will be resumed about the middle of January, when evidence of the reasonableness or unreasonableness of the specific tariffs filed will be heard.

INTERNATIONAL RATE CASE AND READJUSTMENT OF RATES.

THE new freight tariffs in Eastern Canada which the Board of Railway Commissioners on July 6th, 1907, ordered to be prepared and published, and filed by the railway companies, came into effect on January 1, 1908. It is impossible to say now just what the effect of the tariffs will be in so far as the reductions in rates are concerned. It is safe to say, however, from an industrial standpoint, that no legislation has been enacted by the Railway Commission in recent meetings, which will be so beneficial in its results. Aside from the reductions in rates which were brought about by the readjustment of rates at the frontier, the Railway Commission required that all special local class tariffs in the territory affected be placed on the same mileage scale. The rates were in all cases to be based on the shortest workable mileage. This involved an enormous amount of work, which could hardly be appreciated by those not immediately connected with the tariff department of the railways.

Now that the work has been practically completed it will no doubt prove a boon to the railway agents as well as the shipping public. Some of the old tariffs have been in effect over fifteen years. Each town had a distinctive tariff on a basis more or less conflicting with the basis in effect from other towns. Some of these tariffs were issued, particularly by the Grand Trunk, when the system was divided into districts with a general freight agent in charge, who had authority to issue tariffs.

In the readjustment, the special local class tariffs are continued, but instead of issuing a separate tariff for each town (as it was required that all rates should read between) one tariff is made to serve a number of distributing centres in the same territory. As an illustration—G.T.R. T. 1, effective January 1, 1908, special and competitive joint freight tariff of class rates, between (then are named forty-three towns throughout Western Canada), and Grand Trunk Railway System stations in Canada (North Bay to Toronto, Hamilton, Niagara Falls, Bridgeburg and west thereof) including Schomberg and Parry Sound.

The tariffs of class rates issued by the Canadian Pacific and Grand Trunk are as follows:

The New Tariffs.

No. E 579.—Between Canadian Pacific stations west and north of Toronto, also stations on the C.W. & L.E., G.P. & H., H.G. & B., N. St. C. & T. and T.H. & B. and stations east of Toronto to and including Montreal and Ottawa and north of Carleton Junction, to and including North Bay.

No. E 582.—Between stations on the Canadian Pacific Railway, west and north of Montreal in Ontario and Quebec, and stations east and south of Montreal in Quebec and New Brunswick.

No. E 583.—Between all stations on the Canadian Pacific, Toronto to Montreal, including the Lindsay, Brockville, Prescott branches, also the Chalk River, Montreal and Ottawa, and North Bay sections to North Bay inclusive.

No. E 585.—Between Canadian Pacific stations, Windsor to Toronto, including the branches.

There are in course of preparation several additional

tariffs. E 592 will cover rates between stations west of Toronto to stations on the B. of Q., C.O.R., K. & P., and B.W. & N.W. A similar tariff is being issued to cover rates between stations on the same lines and Canadian Pacific stations east of Toronto.

No. E 593.—This tariff will cover rates from all points on the Canadian Pacific, Eastern lines, to stations on the Wabash in Canada. A similar tariff is also being issued covering rates to stations on the Pere Marquette and Michigan Central, also between stations on the Canadian Pacific west of Toronto and stations on the G.P. & H., H.G. & B., N. St. C. & T. and T.H. & B.

Grand Trunk Railway System.

No. T 1.—Special and competitive joint freight tariff of class rates between Aurora, Barrie, Berlin, Brantford, Bridgeburg, Chatham, Collingwood, Depot Harbor, Doon, Dundas, Elora, Fergus, Galt, Guelph, Hamilton, Hespeler, Ingersoll, London, Meaford, Merritton, Midland, Newmarket, Niagara Falls, North Bay, Orillia, Owen Sound, Paris, Petrolia, Port Dalhousie, Preston, St. Catharines, St. Mary's, St. Thomas, Sarnia, Stratford, Thorold, Toronto, Waterloo, Welland, Wiarton, Windsor, Wingham, Woodstock, and Grand Trunk Railway stations in Canada (North Bay to Toronto, Hamilton, Niagara Falls, Bridgeburg and west thereof), including Schomberg and Parry Sound, Ont.

No. T 2.—Class rates between Belleville, Bowmanville, Brockville, Cobourg, Cornwall, Deseronto (B. Q. Ry.), Gananoque (T. Ry.), Kingston, Lindsay, Napanee, Orillia, Oshawa, Ottawa, Peterboro, Port Hope, Prescott, Trenton (C. O. Ry.), Toronto, Whitby, and Grand Trunk Railway System Stations in Canada (Toronto, Orillia and east to Dorval), including Ottawa division, east of Scotia Junction to St. Polycarpe.

N. C. 8.—Special joint freight tariff of class rates between Grand Trunk Railway System stations in Canada, Dorval and west, including Gananoque, Deseronto, Trenton, Schomberg and Parry Sound, Ont., and Montreal and Valleyfield, Que., and stations in Canada south and east thereof.

No. C 9.—Special joint freight tariff of class rates between Grand Trunk Railway System stations in Canada, North Bay to Thornhill, Swansea to Hamilton, Niagara Falls, Bridgeburg and stations west thereof (including Schomberg and Parry Sound, Ont.), and stations east of Toronto, Orillia and Scotia Junction to Dorval (including Trenton, Deseronto and Gananoque, Ont.)

It may be observed that G.T.R. No. T 1 now applies where there were formerly some twenty-four tariffs in effect. Through rates are published to and from all points east and south of Montreal including the Maritime Provinces.

All tariffs apply between all points designated in the tariff.

In the preparation of the tariffs, in order to comply with the spirit of the order of the Commission in so far as they apply to the short line mileage, it was found necessary to reduce many of the rates now covered by town tariffs, so that the new issue of tariffs practically means a revision of all freight rates throughout Eastern Canada.

In equipping their new plant at Montreal the Metal Shingle and Siding Co. found it advisable to install a high class tool department which is now in operation. With a view to future expansion the firm have provided a machine shop in advance of their present needs, and they are therefore undertaking considerable outside work, in the making of accurate dies, tools, gauges, special machinery and experimental work.

An Immense Industry Within Our Reach

Mr. W. H. Rowley, of the E. B. Eddy Co., Discusses the Pulp and Paper Question from a Practical Standpoint

IN considering the very important question of prohibiting the export of pulpwood and saw logs, many seem to forget, or not to know, that Canada has the most of the best green trees on earth, and that our magnificent heritage of evergreen, spruce and pine trees provides a crop that only requires careful handling on our part to be a permanent source of incalculable wealth to the country; and that, especially with reference to pulpwood, Canadian spruce makes the strongest, longest, and most fibrous and feathery wood pulp obtainable anywhere, far superior to that of Scandinavia, Russia, Austria, Finland, or to what remains in the United States. Canada has over 2,600,000 square miles (over 1,650,000,000 acres) of green timber, very largely spruce and pine, although there is besides a great deal of hardwood.

The Envy of the United States.

Canada's area of pulpwood is much more the envy of the United States than it is—as it should be—the pride of Canada. This is made clear when we realize that out of 70,000 square miles of timber lands under license in the Province of Quebec alone, the Yankees own nearly 15,000; therefore, as 15 is to 70, so is the position of these mercantile marauders to the south of us with respect to Quebec timber lands.

And unless we prohibit exportation of pulpwood from Canada, this ratio will increase year by year. In the last quarter of a century, I have seen it grow from practically nothing to its present alarming proportions, and those who come after me will find it worse for Canada and its paper industry, unless a stop is put to this marauding.

While pulpwood is a raw material of comparatively low value, it produces manufactured articles of high cost.

Millions upon millions of spruce logs, hundreds of thousands of cords of pulpwood, from Quebec, Ontario, Nova Scotia and New Brunswick, go annually to feed the pulp and paper mills of the Eastern, Middle and Western States; Canada gets but little out of this; the government do not get one dollar a cord for the standing wood; the chopper, the loader and the teamster not much more, and the railways only a low rate on coarse freight; so that in all not over \$6 to \$7 a cord is left in Canada on an average for the hundreds of thousands of cords of pulpwood taken out of our country annually.

What Paper Manufacture Means.

Grind this wood into pulp and watch the disbursements for wages and freight grow; every cord of wood made into pulp will realize about \$20; when made into fibre, about \$30 to \$32; when made into paper, \$40 to \$45 and upwards. The pulp and paper industry gives more healthy, steady, day and night employment to a larger number of men, women and children, at higher wages, all the year round, than any other industry in Canada.

Establish Mills in Canada.

Has Canada anything to fear from the United States about this? Can they retaliate? Will they? No, they got about all they could stand of that sort of medicine when the Dingley Tariff on eggs aroused the great Canadian hen. President Roosevelt's big stick has no retaliation knobs on it just now with which to whack Canadian wood pulp. The President and the press of the United States urge, let me

repeat, *urge*, the repeal of the United States import duty on pulpwood, wood pulp, and white news paper, and are now suggesting, nay, may soon be suing for and begging for an agreement with Canada to try and prevent the Canadian Government from imposing an export duty on pulpwood or from prohibiting the exportation of our wood and logs. But we must not permit our country and its forest products to be further devastated by these marauders; let them come over here and establish pulp and paper mills; just as the Eddys, the Baldwins, the Milens, the Bronsons, the Youngs, the Westons, the Hughsons and others came here and established saw mills. They are welcome to come to Canada. I would like to see Hull "the Holyoke of Canada," just as much as the Prime Minister will be glad to see Ottawa "the

Canada's Forest Wealth *Dashed*.

Washington of the North," and in this work will stand shoulder to shoulder with Sir Wilfrid Laurier or any other man who will do these two great things for Canada. Remember what happened throughout the Georgian Bay district when the Ontario Government restricted the export of sawlogs into Michigan, Wisconsin and other Western States. Saw mills sprang up by the dozens, factories started by the score. If all our wood was kept at home to be turned into pulp and paper in Canada, the result in ten years would surprise the most sanguine of us, while the result in twenty years would be almost beyond present imagination and dreams.

In 1888 there were 34 pulp mills in Canada, making 154 tons per day; 40 paper mills, making 173 tons per day; total,

327 tons per day. In 1907 there were 58 pulp mills in Canada, making 2,361 tons per day; 46 paper mills, making 966 tons per day; total 3,327 tons per day. That is, 15 times as many pulp mills and 5½ times as many paper mills in nine years.

The United States View Point.

The leading pulp and paper trade journal of the United States asked the United States pulp and paper makers the other day whether they were in favor of, or opposed to, the recommendation of President Roosevelt to repeal the duty on pulp and paper going into the United States.

Mr. N. W. Jones, manager of the Katahdin Pulp and Paper Co., Lincoln, Maine, says:

"The annual production of pulp in the United States

A Canadian Forest

Nov. 1st, 1906, is: Sulphite, 1,235,832 tons; ground wood, 1,737,216 tons; soda pulp, 327,600 tons; total, 3,300,648 tons.

"While the annual production of pulp in Canada is: Sulphite, 172,224 tons; ground wood, 550,368 tons; soda pulp, 10,920 tons; total, 733,512 tons."

Showing that Canada is producing only about one-fifth as much pulp as is produced in his country.

Mr. Jones also adds that if United States manufacturers were obtaining their entire supply of wood from lands wholly in the United States they would be using up the States territory nearly six times as fast as Canada is using up hers, but fortunately for them, a large proportion of the pulp wood used by them is obtained from Canada, hence they are getting the benefit of our timber, and so on.

Mr. Geo. W. Sissons, President of the Racquette River Paper Co., United States, says: "I am a staunch protec-

tionist from the period of Henry Clay. The Canadian Government and certain Canadian interests are agitating for such legislation there as will reduce the exportation of their pulp wood and compel its manufacture into paper by their own labor in Canada, and then to sell to us the finished product. I believe in protecting our own labor and industries, and am opposed to any present tariff revision, as a general proposition or as a special favor to interests which have it in their own power to protect themselves. The real prosperity of the varied interests of our country in which all classes participate, and never before to such a pronounced or general extent, is the strongest argument against unsettling such conditions through any uncertainty as to the extent of tariff revision if attempted at all."

Other answers are: "Cannot see how it will do the mills any harm, or the consumers any good. It will simply build up the industry of Canada. Do not think their industry can be singled out for tariff revision. Must go down the line."

"Would be opposed to the duty being removed on pulp or paper. While it would make no difference in the line we manufacture, it would be a very serious matter for the print mills of this country."

"If we read the signs of the times correctly, the moment the duty was taken off the commodities referred to Canada would immediately put on an export duty much heavier than the duty now levied by the United States."

"Would not object to reduction of tariff duty on pulp and paper, providing arrangements were made with Canadian Government to allow Canadian pulp wood to come into the United States without export duty, and on same basis on which Canadian mills receive their wood supply."

"Satisfactory if Canadians remove their wood restrictions; otherwise free trade with Canada."

"We are most emphatically in favor of repeal of all duty on wood pulp. The duty must be taken off pulp, and the sooner it is done the better it will be for every paper mill and consumer as also for the preservation of our own forests."

"We are not opposed to the repeal of the duties, provided an arrangement can be made whereby Canada will permit the exportation of pulp wood *without* export duty. The supply of pulp wood as you well know is very important for the paper making interests of this country; and if we let the bars down on paper and pulp from Canada, we should have some guarantee that their pulp wood can come into this country free so long as the pulp and paper does. Such an arrangement in our opinion would work no detriment to the American paper manufacturer; and we think with free wood we can stay in the game as long as the Canadian paper manufacturers. We have thought for some time that wood pulp and sulphite pulp should come in free, but have not been quite clear on the paper question. If paper manufacturers can be assured of free pulp wood, in our judgment there would be no objection to the repeal of duty on paper from Canada."

"Aside from any recommendation by the President we believe it would be wise to take off the duty from all wood pulp, both mechanical and chemical; also believe in lowering the duty on paper to say 20 per cent., which would afford a reasonable measure of protection."

"If Canada will take her duties off we would be glad to have duty off of our country."

"In Canada there is a widespread demand that the Canadian Parliament should enact an export duty on pulp logs. The American papermaker is not getting raw material from Canada, because his field of supply is exhausted. If such an export duty were imposed there it would merely mean that the cutting in American forests would be increased. The imposition of an export duty on pulpwood on Canada's

part would probably mean that American capital would cross the border and build up mills there, thus distributing its money through pay rolls in the Dominion rather than in the United States. This would not be a step of benefit to our own country and its people, I believe." And so on.

These are the opinions of the manufacturers across the line whose interests are vitally affected. The conclusions are obvious.

The Georgian Bay Canal.

Mr. Rowley passed from the subject of pulp and paper, to a discussion of transportation, which is closely bound up with all industries. He said in part:

The Key to the Situation.

The great problem of transportation on this continent is the passing of the products of the West that are all east-bound to the ocean. There is only one present practical solution for the relief of the congestion that has arisen and is increasing, and that is the construction of a water-way from the Great Lakes to the Seaboard that shall do away with the necessity of transferring freight at intermediate ports or points. Canada holds the key to the situation in the building of the Georgian Bay Canal. The economy of water transportation is no longer questioned, as it is now well known that the rate per ton per mile will thus be about one-sixth of the lowest present rate by rail.

The Georgian Bay Canal route is 600 miles shorter than the present best (but circuitous) route by the Welland and St. Lawrence canals; it is also well known that by the Georgian Bay canal route the time consumed will be only about $4\frac{1}{4}$ days or about 3 days less than are now consumed in the passage.

Commerce of Great Lakes.

The enormous magnitude of the commerce of the Great Lakes is represented by the vast tonnage that passes through the Soo Canal—over fifty-one million tons in 1906, which is over seven and a half million tons more than went through these canals in 1905. This traffic has doubled in the past six years. The lumber traffic, which amounts to over five and a half million tons, will at once be added to these large figures, when the Georgian Bay Canal is opened.

Coal from Nova Scotia to the volume of one and a half million tons already comes annually to Montreal (some as far west as Ottawa), but with the Georgian Bay Canal Nova Scotia coal can be laid down all along the route as far west and north as North Bay, thus pushing our coal supply 200 miles further north and west, and laying the coal down there as cheaply as United States coal is laid down at Toronto now.

35,000,000 tons of iron ore passed through the Soo canals last year.

Pulpwood, now shipped by rail from the Nipissing district at a cost of \$3 and up a cord, could be sent to the mills by the Georgian Bay Canal in vaster quantities at a much lower cost for freight.

The stone and marble quarries near Portage du Fort and other points all along the proposed route of the Georgian Bay Canal only await development until the opening and operation of the canal.

The cement industry, and this is the "cement age," will then develop all along the canal route in a way that now may look like a dream to some, but will be a paying and profitable enterprise when we get water transportation.

Thus cheap waterways will give to Canada an open market to the world, a market of which we have so far only touched the edge and fringe, just as I have only touched the edge and border of the subjects about which you have been good enough to be interested in hearing from me for the past few minutes.

"WE GET BETTER WORK FROM THE MEN."

This was the answer of the manager of a large industrial institution who was asked by a representative of the *Congregationalist* and *Christian World* if it paid, in a financial way, to treat his men with human consideration and generosity. It shows that even these virtues, when practised voluntarily and in kindness of heart, have a value that can be weighed from the ordinary commercial standpoint. The industrial establishment in question employs some 300 men, and has paid the wages of old employees during sickness and disability. Instead of laying off one-third of the men during a recent shrinkage in output the work was reduced to four days a week, and the men were allowed for these days ten hours' pay for nine hours' work. This was a purely voluntary grant or consideration to the men. It is a distressing paradox that men can win shorter hours only when there are not sufficient hands to do the work, and employers can resist such demands or force longer hours only when men are abundant and labor a drug in the market. The response of the men in better work shows that they in a measure pay back the favors freely extended. Whether such favors are partly, fully or abundantly paid back is a question that does not admit of a general answer from a strictly financial standpoint. But it is a world-wide truth that the man, whether employer or employee, who treats his fellow-man with human consideration has his reward already, whatever additional reciprocal favors may be accorded him.

One of the most familiar sources of trouble between employers and employees is the impression that the one confers a favor on the other. Some employers fancy that the giving of employment is a favor for which the recipients should be grateful. This feeling that a debt exists leads them to regard a few minutes' extra work after quitting time, a little more energy, or a greater effort as merely a partial repayment. This leads to an unconscious aggression which workmen are in time impelled to resist by the troublesome and ill-fitting rules of a trades union. Another source of trouble is the disappearance of human relationships with the organization of industry. The employer is generally a board of directors who cannot have the sympathy or understanding that would come with a personal acquaintance with their men, such as existed under earlier conditions. The intermediaries realize the impossibility of making either understand the other. They face the demand for greater results and less expense on the one hand and the resistance or aggression on the other.

In the midst of so much distressing antagonism it is refreshing and at the same time instructive to hear of an employer practising toward employees the higher virtues he is inclined to practise toward his friends, and to learn that it brings financial as well as other rewards. The rocks and shoals in the way of semi-benevolent employing enterprises are many, and disaster is generally the end. But for all this, human kindness is not going out of the world, and it still brings its sure reward of appreciation and personal contentment.—*The Globe*.

The Canadian Fish and Cold Storage Co. has been organized, with a capital of \$1,500,000, to handle all kinds of food fish on the Pacific Coast. It is proposed to erect at Prince Rupert the largest cold storage plant in the world, capable of holding six million pounds of fish, with provision for doubling its capacity later on. The directors are Andrew Kelly, of the Western Canada Flour Mills Co.; Jas. Caruthers, Montreal; J. W. Stewart, Winnipeg; Geo. H. Collins, Vancouver, and Greer Starratt, general manager of the New England Fish Co. Besides a cold storage plant, the company will operate ten large motor boats. Building operations will commence in the spring.

Views and News

NEW TRADE COMMISSIONER.

Mr. E. H. S. Flood, of St. John, N.B., has been appointed by the Canadian Department of Trade and Commerce to the position of Trade Commissioner to the Bermudas, British Guiana, and the British West Indies. This is in line with the general movement to cultivate trade with these colonies.

WANT A WEEKLY SERVICE.

The Board of Trade of Toronto think that Canada is not getting her share of the business of the West Indies. Out of \$82,000,000 trade enjoyed by the islands last year, Canada only got about 10 per cent. This condition the Board think could be improved by the establishment of a more frequent steamship service. There is no doubt that the big hold the United States have on that market results from the quick service by which an order can be filled promptly. At present Canada has a monthly service by the Pickford and Black steamships. If by chance an order is given at an odd time it may take three months to have the goods delivered. So long as this condition lasts a satisfactory trade is practically an impossibility. The subject received careful consideration during the year by representatives of Canadian trade bodies who visited the islands, saw for themselves the resources and possibilities of the country and became personally acquainted with the needs of the people. The present movement for the more thorough development of a mutual trade relationship is a direct result of this trip. Whether a weekly service, as has been advocated, would be justified by the business offering will have to be the subject of careful investigation. The fact that the business is not immediately present does not in itself vitiate the scheme. The big point to be kept in view is the fact that there is \$82,000,000 of trade being done, and on the face of it, Canada appears to be the most suitable country to handle it. Alike for reasons of sentiment and utility both countries would welcome an increased trade. We are assured that Canada is looked on with the utmost favor by the West Indies, that through their common allegiance a Canadian who has goods to sell is always received sympathetically, and where possible preference is shown to him. Then, too, Canada consumes large quantities of the goods the West Indies produce and vice versa. The foundation of a mutual trade is present in that fact. The efforts of the Toronto Board of Trade will be watched with the utmost interest.

MAY REFUSE ORDER.

An interesting legal decision was given by Chief Justice Sir William Mulock at North Bay recently. The action was entered by D. L. MacKinnon, of Sudbury, against the Wheat City Flour and Milling Company, of Brandon, for damages for non-delivery of four cars of oats. The defendant's traveller called on the plaintiff in September and took an order for four cars of oats at 54 cents per bushel. This order was forwarded to the head office of the defendant at Brandon, and was immediately declined by wire, defendant not having a sufficient supply of oats on hand.

The plaintiff contended that the order was an out and out

sale, but defendant contended that the order was simply an offer to purchase, which offer was not accepted but refused. Oats almost immediately after the order was refused advanced greatly in price.

Evidence was given by the defendant at the trial to show that according to the custom of the trade in Canada by commercial houses employing travellers the travellers do not make binding contracts, but simply take orders which are mere offers to purchase and consequently may be accepted or declined by the employers of travellers, and that the reason for this is twofold, namely, that travellers are not in a position to decide as to the financial standing of the persons giving orders, and that the seller may not have the goods on hand when the orders reach the firm.

With this view the Chief Justice agreed and dismissed the action with costs.

TOO MUCH IDLE GOLD.

It is now time for the Dominion Government to consider the wisdom of keeping forty-four and a half millions of gold idle in the treasury vaults. This immense reserve, over seven dollars per head of the population, is held largely for the redemption of Dominion notes, and it is certainly away above all the demands of safety in any panic that can possibly overtake the Dominion. The law requires as a safety fund against the first \$30,000,000 of Dominion notes outstanding a reserve of 25 per cent. in gold and securities guaranteed by the Government of the United Kingdom, the proportion of gold to be not less than 15 per cent., or \$4,500,000. For all notes outstanding in excess of \$30,000,000 the law requires a reserve of gold dollar for dollar. Under this act the reserve accumulated, according to the latest published statement, is \$46,564,410, made up of gold \$44,617,743, and guaranteed securities \$400,000, or \$1,946,666. Of this, \$6,142,611 is required to guarantee deposits in the savings banks, leaving \$40,421,799 as a reserve against outstanding Dominion notes. The total notes in circulation, for which this fund is intended to insure redemption, is \$61,241,544. Of this amount the banks hold, according to the latest monthly statement, \$48,131,162.

The law requires the banks to keep as near as possible one-half their reserves in Dominion notes, the minimum proportion below which they must not fall being 40 per cent. The latest statement gives the aggregate reserves as \$69,862,098, which would call for a holding of \$34,931,049, but not less than \$27,944,839. The reserve expected would leave only \$26,310,495 in notes that might be presented to the Dominion for redemption. Against this there is in the vaults a net reserve of \$40,421,799 in gold and guaranteed securities. If the banks should allow their proportion of Dominion notes held in reserve to shrink to the legal minimum there would still be only \$33,296,705 in fluid circulation and liable to be presented for redemption. The bank reserves might shrink and thus increase the floating Dominion notes, but in times of danger the policy is for the banks to increase reserves and thus increase holdings. Of the Dominion notes outstanding, \$37,950,000 are in \$5,000 denomination, and \$6,282,500 are in \$500 and \$1,000 denominations. This cuts down the floating currency to \$17,009,044. Of this, \$16,080,873 is made up of one's and two's required in daily trade. When it was decided to require a gold reserve of dollar for dollar on all issues above \$30,000,000 the aggregate did not seem likely to exceed that sum materially. Now that the aggregate has more than doubled the \$30,000,000 it would be well to consider the wisdom of avoiding the waste of idle capital by increasing the amount requiring only a 25 per cent. reserve.—*The Globe*.

AUSTRALIAN TARIFF MODIFIED.

The Trade and Commerce Department has received by cable from Trade Commissioner Ross, Melbourne, the announcement of the following changes in the Australian general tariff just made by the Lower House of the Commonwealth's Parliament. The new rates are reductions from the tariff as originally brought down: Newspaper on free list; wall paper, 20 per cent.; bicycles, 30 per cent.; motor cars, 35 per cent.; vehicles, 35 per cent.; harvesters, £12 sterling; strippers, £6 sterling; pianos, 30 per cent.; organs, 20 per cent.

AN ADVANCE ON WIRELESS.

A student of electricity has succeeded in operating electric lights and motors by electric magnetic waves, without the use of wires, at a distance of nine hundred feet. He expects to be able to transmit power regularly and in a practical manner over long distances by wireless. We have ceased scoffing at any claim or prophecy in which electricity is concerned.

THE ONLY TAX ON TRAVELLERS.

Prince Edward Island is the only province in Canada which now imposes a tax on commercial travellers. The Dominion Commercial Travellers' Association drew attention to this at their recent meeting in Montreal, and they have decided to take vigorous steps to have the impost removed. They point out that at the time the provinces were asking for an increased subsidy from the Federal Government, it was practically made a provision of the granting of an increase that the tax on commercial travellers should be repealed. All the other provinces have carried out this understanding. The government will therefore be urged to hold up the increased subsidy to Prince Edward Island, until such time as that province shall remove the objectionable tax.

SOME INNER HISTORY.

The inner affairs of the Standard Oil Company were discussed by the Vice-President of that corporation, in a recent issue of the *Saturday Evening Post*. The statement is of interest for several reasons, no less for the unprecedented energy and world-wide range of activity exhibited so successfully by the company, than for the persistent opposition to it which has become a tradition among the newspapers of the continent. The writer of the article in question maintains that this hostility is without reason, and that it is largely the result of exceptional success, legitimately won. There can be no doubt that there has been passing over this continent a wave of unreasoning opposition to capital, an opposition in many cases so senseless as to be directed against companies which are doing a great work for the very people who oppose them, in supplying them with labor and with the necessities and luxuries which make life livable. But in all cases the heaviest shafts have been hurled against the Standard Oil Company, with the result that it now holds a reputation for exacting extortionate profits and for waging a merciless war against its rivals, if any can be called such.

The experience of the past twenty years has proven one thing conclusively, that a policy of silence is not advantageous to a corporation. It pays to take the public into one's confidence. Had the statement which now appears from the pen of Mr. Archbold, been published from time to time during the growth of the company, much of the criticism of the company would never have taken place, nor would the settled opposi-

tion on the part of the public have become so strong or widespread.

This is the proposition. An ordinary oil company would get its revenue from refining oil and selling it. From such operations a fair profit would be expected. Another company would develop oil fields and supply crude petroleum. On this, too, a fair profit is conceded. Another company is engaged in the transportation business. Crude and refined oil must be transported, and this work entails a further profit. But the Standard Oil Company, exhibiting business abilities of a high order, gradually entered all these fields, and not only produced, manufactured, transported and sold oil, but they did each of these operations more efficiently and more cheaply than had ever been done before. Nor did they stop there. They found that they could manufacture barrels and other containers more cheaply than they could buy them, they went into the manufacture of oil-well machinery, of lamps, chimneys and wicks, they utilized by-products. As a consequence of all these activities and savings they have been able to pay a dividend of 40 per cent. on their capital. In this connection it is worthy of note that unlike many other industrial companies, the Standard did not anticipate its future greatness, in its capitalization. No criticism has ever been made that the company was over-capitalized. Mr. Archbold pertinently asks whether, if the founders, forecasting the future, had put the capital at \$500,000,000, instead of one-fifth of that sum, and had consequently paid 8 per cent. instead of 40 per cent. dividends, would there be any great criticism of undue prosperity?

In other words, if a company shows pre-eminent ability to economize and to lessen the cost of manufacturing and selling, should it not reap the benefit of its business acumen and its enterprise? As a concrete instance from the present article, we find that formerly oil was conveyed to Europe in barrels, with a loss by leakage in transit of from two to three per cent. The Standard company built bulk tank steamers, and now carry it with a loss of one-half of one per cent. Are they not entitled to the benefits from that saving? The cost of shipping oil from America to Europe has been reduced in twenty years from \$6 a ton to \$2.50 by improved methods devised and put in force by the company. There are other equally interesting details of the business given; in fact the story of the company's growth provides one of the most absorbing chapters of industrial history. It is understood that it will be the policy of the company in future to inform the public of its business. Such a policy should remove much of what is unjust in present day criticism of its methods.

WOULD ELIMINATE ROYALTIES.

Members of the Canadian Institute of Mines are dissatisfied with the present mining regulations in Ontario, in regard to taxation. Representatives who waited on the Government recently, pointed out that the 3 per cent. tax on ore was put on at a time of abnormal activity, when through excitement and speculation the profits of mining were made to appear extremely large. Now that the boom has subsided such is shown not to be the case. It is therefore urged that the Government appoint a commission to consider mining legislation as it appears in other countries and also to get the advice of practical mining men, in order that the recent act to tax mines be amended. The representatives maintained that the present Act, calling for the payment to the province, of royalties, operated so as to prevent foreign capital from being invested in this province. While it is unlikely that a commission will be appointed, consideration of the claims of the petitioners was promised.

CHINESE CONSULS IN CANADA.

A despatch from Vancouver states that the Chinese Government will appoint consuls in a number of Canadian cities. Whether they are to act as commercial agents, for the purpose of developing greater trade between the two countries, or whether their chief work shall be as interpreters after the periodic descents on fan-tan games by zealous police officers does not appear.

HOW THE FARMER WAXES FAT.

We call attention to the following schedule of prices for farmers' produce during the month of December, 1906 and 1907. It is interesting in view of the farmers' contention that the manufacturer is being protected at his expense. Where can a similar advance in price be found in the case of manufactured articles?

	1906.	1907.
Hay, per ton	\$8 50	\$15 75—\$16 00
Oats, per bush	0 34	0 42
Wheat, per bush	0 68	0 90
Barley, per bush	0 43	0 45
Flour, per cwt	2 30	2 90
Turkeys, per lb	0 14	0 14
Geese, each	0 85	1 00
Ducks, per pair	0 80	0 90
Chickens, each	0 40	0 40
Butter, per lb.	0 23	0 27
Eggs, per doz.	0 24	0 30
Potatoes, per bag	0 90	0 90
Apples, per bag	0 60	0 75
Live hogs, per cwt.	6 00	5 00

NEW ALL-RAIL RATES FROM EASTERN CANADA TO MANITOBA, ALBERTA, SASKATCHEWAN, BRITISH COLUMBIA AND THE KOOTENAY.

The new all-rail class rates from Eastern Canada to the Northwest went into effect on December 23rd, and to the Kootenay on the 26th last. As previously announced a general reduction has been made. Montreal has been placed in the same group as Western Ontario, so that the same basis of rates will apply from all stations, Montreal to the Detroit River. These rates were voluntarily put into effect by the Canadian Pacific Railway. One reason assigned for them was the fact that there was too much difference between the lake and rail and the all-rail rates, and as a result the lake and rail shipments, particularly just before the opening and close of navigation were very heavy. In the latter case the carriers give free storage at Fort William for an indefinite period so that the merchants who were able to take advantage of the lake and rail rates, and this free storage, were placed at a considerable advantage over the merchant who had to pay the all-rail rates. It was, therefore, decided to reduce the all-rail rates to as far as possible meet this situation. Another advantage which is expected from these new rates is that the business will probably be more evenly distributed throughout the year.

WILL NOT SCARE CAPITAL.

The opinion very widely prevails that the chief danger which confronts Canada in the disruption of normal conditions resultant upon the financial panic in the United States is a cessation of interest in the Dominion on the part of out-

side capital. We are inclined to question the accuracy of this view. Canada has just been put to a crucial test, and the splendid manner in which it is riding out the storm is eliciting world-wide praise, particularly in respect to the soundness of our banking institutions. We feel, then, that now, perhaps more than ever, we may count on receiving ample attention at the hands of foreign investors. The *Ottawa Citizen's* view of the situation is that Canada is becoming a wealthy country, and, unlike our neighbors to the south of us, our wealth is well distributed. Our laws are such as to really conserve the common weal and prevent the illegal acquirements of gross fortunes. The present prospects in the several lines of trade are good. The gist of the opinion of the directors of our greatest financial institution is that the only effect upon Canadian prosperity that we may anticipate as a result of outside conditions is a restriction in the inflow of capital necessary for the continuous exploitation of our magnificent resources. Whether the restrictive period will be long or short it is impossible to say.—*Victoria Colonist*.

A POSSIBLE SOLUTION.

Prof. L. P. Breckenridge, of the Steam Engineering Department of the United States Geological Survey, Washington, D.C., has a solution of the smoke problem which is very simple and which has been laid before the Survey Department for consideration. Prof. Breckenridge says:

"The essential thing is to have the boiler so placed that the flame from the coals does not touch it. The flame striking the boiler prevents a proper and complete combustion and results in making smoke. Light a candle and it will burn without smoke. Place a saucer in the flame and there will be plenty of smoke. So it is with the fire under the boiler. Little depends on the type of boilers.

"Of course different coals give different lengths of flame, according to the amount of volatile matter they contain. This means that the distance between the boiler and the grate must vary to suit the coal used. But I am of the opinion that six different types of furnaces will be sufficient to burn any coal in the United States without smoking. We are able to tell the amount of volatile matter in coal by chemical analysis, so if a manufacturer learns the chemical contents of his coal he will discover the length of flame it will make in burning, and adjust his furnace accordingly. Hundreds of chemical analyses of coals have been made by the technological branch of the Geological Survey, and it will keep the work up until we know every coal in the United States. Then there will be absolutely no excuse for smoke anywhere.

"Another point I should mention is that so long as there is hand-firing the smoke nuisance will not be completely done away with. Mechanical stokers must do the work if there is to be perfect combustion, and the coal used must be nearly uniform in size."

In his experiments at the University of Illinois, Prof. Breckenridge operated the heating plant of 2,000 horsepower for two years without smoke and at a saving of \$5,000 a year over carelessly managed commercial plants. One boiler was so well constructed and managed that it was practically impossible to make it smoke, even when special efforts were put forth to do so.

Work will begin at once on the big mill to be erected by the Red Cliff Lumber Co., at Alberni, B.C. Railway connection has been completed by the E. & N. railway, and two other lumber companies have now selected sites for large mills.

How Freight Rates are Made

By John Pullen, Assistant Freight Traffic Manager, Grand Trunk Railway

THERE is no branch of the traffic work of which so little is known to the outside world as that of making freight-rate schedules. The public demands, and is entitled to receive, fair and reasonable freight rates, so adjusted as to avoid unjust discriminations. With the keen competition between rival manufacturers and merchants, the prime requisite is that there should be stability of rates, fairly related, and given to all without partiality. A freight officer is sometimes asked—"How do you make these freight rates? What is the basis upon which you start? How do you determine what is a fair and reasonable rate? With the thousands and thousands of rates which you make, how do you determine what each shall be and the relation between them?"

In this brief paper it is possible to mention only a few of the factors which enter into rate construction. Distance is

Mr John Pullen

one. The rate is the unit of compensation for the service performed. Obviously then, the rate should increase with the distance; but distance alone does not determine the rate. Oftentimes, the element of distance must be dropped as the result of competition, either of water or of a rival rail line. If there be two or more railways between two given points, and the distance by one is longer than by the other, the railway having the longer route must, of necessity, carry its freight between these two points at as low a rate as its rival, which may be fortunate enough to have the shorter line. If a railway parallels navigable waterways, then its rates must, of necessity, be kept down to the lowest possible figure, otherwise all the traffic would be attracted to the water routes. In both these cases the element of mileage must be eliminated—competition, not the railway, determines the rate. Rival trade centres, though some distance apart, keenly competing in certain territory for the same trade, must often be given the same freight rates, otherwise one flourishes and the other will languish. To do this, distance must be disre-

garded. It would be unfair to reply that this lower rate proves that the railway can carry freight at less than the ordinary rate. It does not make this lower rate because it can well afford to do so, but because it must do so or haul its trains empty. It accepts a partial instead of a total loss.

The cost of the service is another factor, but as the cost is sometimes difficult to ascertain with mathematical exactness, and as the cost may differ on competing lines, or in different sections of the country, it is not always a determining factor, but only a guide to fix the point below which one may not go. Here again, competition comes in to determine the maximum rate which can be charged.

The value of the commodity carried is another important factor, because it determines the extent of the risk which the carrier is often obliged to assume under its bill of lading. Thus Cobalt silver ore, which, it is said, is sometimes worth \$50,000 per car load, ought to pay a higher freight rate than a car load of sand, which may not be worth \$50 per car load, though the weight carried and the length of the haul may be precisely the same.

The average weight loaded per car is another factor taken into consideration for the purpose of securing a reasonable revenue for the service rendered. Thus, a higher charge per hundred pounds must be made on paper boxes, which are light and bulky, than on pig iron, which is very heavy.

Deviations from Maximum Rate.

In Canada there is a maximum tariff fixed by law. This maximum tariff is constructed upon a mathematical scale starting with a certain rate per ton per mile for a certain class of traffic for a given distance. As the distance increases the rate per ton per mile, gradually diminishes, though the rate itself, expressed in cents per one hundred pounds, naturally increases. Each class of traffic, of which there are ten under the freight classification in use in Canada, has a fixed relation to each other class, and this relation is expressed in terms of percentages. For illustration—fifth class traffic may be the unit or 100 per cent., and each higher class takes a gradually increasing percentage until the first class is reached at 200 per cent. The lower classes are similarly diminished. Much of the traffic is carried at rates considerably below those in the legal maximum tariff. The duty of the freight department is to create traffic and not to prevent its movement. Whenever it is shown that the legal maximum rates are so high as to check the free movement of some particular commodity, it would be folly for the railways to refuse to reduce them. Then it is that the rates are made "only such as the traffic will bear." A manufacturer recently told me of his experience in trying to sell a certain article of commerce in China. He knew precisely what it cost him to produce his goods at the factory. He knew also what was the selling price in the world's market in China. The difference between the two was what he could afford to pay for the transportation. The railway company confirmed through its own agents in China the selling price there, and made its freight rate low enough to enable the manufacturer to market his product at a profit. That manufacturer was greatly benefited when the railway company fixed its rate on the principle of "what the traffic would bear." There is no possibility of the public being oppressed by such a method of rate-making as this, and yet we often find the railways ruthlessly condemned for exacting from the public "all the traffic will bear."

Some Factors in Rate Making.

A well-known writer on railway economics, in describing the factors upon which rates depend, recently said:

"Commercial conditions, the exigencies of business, the competition of one product with another product, the competition of one market with another market, the necessity as well as the privilege of developing the latent resources of the territory through which the line runs, or of promoting new industries and thereby increasing the wealth of several communities, these factors make the rates. So strong, indeed, is the force of these elements that a railroad is generally compelled to charge very low rates, and in many cases, unreasonably low rates. Rates that will attract traffic and that will enable producers in the territory contiguous to a railway to reach their markets and increase their production must be accepted or the business will not move. That economic laws make railroad rates would be a matter of common knowledge if well-known facts were applied."

Advantages of Agreement among Carriers.

A glance at the map will show that railway lines cross and recross each other in the thickly-settled parts and oftentimes closely parallel each other in all sections of the country. The large mercantile centres enjoy the benefit of several railway lines, each eagerly competing for traffic. If all these competitors were to allow the fighting instinct to govern their actions, and if their rivalry was not conducted with some degree of fair play and a spirit of tolerance each towards the other, there would be an utter lack of rate stability and unjust discriminations as between shippers and as between localities would prevail. Merchants and manufacturers would be in a constant state of uncertainty as to what rates their rivals were getting, and prices would be unsettled throughout the entire country. Any reckless competition between carriers would also result in a rapid decline in freight rates, and sooner or later be followed by railway bankruptcy. To avoid such unfortunate occurrences the freight traffic officers have organized committees and associations, through the medium of which matters of common interest are discussed and agreements made which are in harmony with the laws governing common carriers. In some countries the public have become so alarmed at what is alleged to be combinations in restraint of trade that restrictive legislation forbids railway companies making agreements with each other for uniform rules and traffic regulations. Wisely, in Canada, this extreme legislation has not been adopted. Railway associations are here permitted to exist and they serve a useful purpose. The cardinal principle of the Railway Act of Canada is to forbid discrimination. Discrimination cannot be avoided where each railway pursues a policy of unrestrained competition regardless of the welfare of the country or of every other carrier. Much assistance has been given by the associations to the Board of Railway Commissioners in their efforts to justly administer the laws. And not only have these associations been thus helpful, but they have been helpful in disseminating among the members information of a practical character and in exchanging experiences by railway officers from all sections of the country. Some of the most profitable knowledge which the railway officer gains is obtained in the discussions of railway problems at the meetings of these associations. The wiser legislators in the United States are rapidly reaching the conclusion that the laws there should be amended so as to permit this educational work to go on.

Shippers Should Receive Good Treatment.

A paper of this kind would not appear complete without some further reference to the relations which ought to exist between the public and the railway. It is of the highest im-

portance that friendly relations should always exist between the company and its patrons, because, after all, continued success can only be attained through the public good-will. The railway has transportation for sale, and the public will buy this transportation from that railway from which it receives the greatest amount of consideration in respect of the service, and service includes not only reasonable freight rates, but, what is perhaps more important, expedition in the movement and delivery of goods. The merchant who keeps an attractive store and employs courteous and talented salesmen to display and sell only the very best and most reliable of goods, is the one who attracts and keeps customers, and so it is with the railway. Its stations and offices should be kept neat and attractive, its passenger trains equipped with the necessary comforts for travel and kept as punctually as possible on advertised time. Its freight train service should be operated on a schedule, and its employees everywhere should be polite and accommodating. If in any of these things it be deficient, to that extent the service is rendered unattractive to the public and the result is reflected in decreasing earnings. The reputation of a railway company is just as susceptible to damage as that of the merchant, if proper service be not given, and it is just as readily enhanced when the public is pleased. People delight in telling with pride of some remarkable achievement in railway management which has come under their observation, and are just as ready freely to condemn when their reasonable expectations are not realized.

There is no other question which engages so much of the public attention to-day as railway transportation. The railway company is ever in the public eye. Every move of the railway is watched and praised or criticised. The officer and employee should, therefore, be ever alert to ascertain the public requirements, and as far as possible comply with them. He should be ready patiently to listen to every complaint, no matter how trivial it may seem, and make an honest effort to comply with the desire of the customer, or explain carefully why it is not possible to do so.

Where the Shipper Fails.

The public is exacting and occasionally, perhaps, inclined to be unreasonable, but as a rule it is considerate of the railway company and makes due allowance for unavoidable failures. People do not always understand why the crops of the country cannot be moved to the market within a few weeks of the harvest, or why there should be any shortage of cars in a certain section at a time when the railway is putting forth almost superhuman efforts to take care of the crop of perishable freight before winter weather destroys it. They do not always appreciate that terminals become congested with the enormously increasing traffic, while they themselves have withheld their co-operation by neglecting to increase their own "terminal" facilities at the factory or warehouse. Many merchants to-day are months behind in their orders because they have not increased their manufacturing and shipping and receiving facilities from year to year as their business has expanded. Many order at one time more goods than they can promptly take away from the railway tracks, thus causing serious detention to railway equipment, resulting in yard blockades and a further shortage of cars. The railways spend yearly a large part of their earnings in adding to their engine and car equipment and station and track facilities and can be depended upon to do their share in preparing to handle the ever-increasing traffic of this rapidly-growing country.

The Demand for Cheaper Transportation.

For some time past there has been a growing demand from the public for cheaper and better transportation of both

passengers and freight. As to cheaper freight rates, no doubt this demand is born of a desire to recover some of the diminishing profits which result from the demands of labor for increase compensation, and from the higher cost of material and supplies, rather than from any well-founded conviction that rates are in themselves too high for the service rendered. The public, and we fear also the railway commissions, sometimes lose sight of the fact that the great transportation companies equally feel the increased cost of labor and materials, as well as increased taxation, and are not only unable to make a corresponding increase in their freight rates and passenger fares, as every manufacturer or merchant may do in his prices, but are subject to the most serious enforced reductions in both. Is it reasonable or just to expect that the cost of everything else should rise, while at the same time the price of transportation should fall? It is obvious that with the diminishing unit of revenue and increasing expenses, the railways must slowly but surely reach the point when net earnings disappear, when their credit will be seriously impaired, and when they cannot raise in the financial markets of the world sufficient capital to carry on the work of improvement and expansion which the growth of the country requires. If they cannot guarantee investors that their money will yield fair returns, they cannot borrow. If they cannot borrow money they cannot spend, consequently, the country suffers from the unavoidable curtailment of railway expenditures. For every dollar which a railway earns from its traffic it pays back approximately 70 cents to its employees for labor, to manufacturers and merchants for supplies, and to the country in taxes. If its rates are reduced by say 20 per cent., it can only earn 80 cents where formerly it earned \$1.00. It will, therefore, be able to spend only 56 cents where it spent 70 cents before. It must reduce its expenses in the same ratio as its earnings are cut down. This would involve possible deterioration in the physical condition of the track, rolling stock and of service and reduction in wages, which would inevitably result in strikes and all sorts of labor troubles. The public, which sells to the railways, will soon find that they are losing rapidly the business of their largest customers. Furthermore, the railways will be prevented from improving, as they wish to do, their transportation facilities, and from increasing their locomotive and car equipment, which the public demands as a necessity to meet the growing requirements of the country.

It requires only an ordinary mind to grasp the truth, that if the country is to prosper and expand, it can only be done when the great carrying companies are permitted to prosper also. The material interests of the country and the material interests of the railways are so closely interwoven that when one suffers the other suffers with it. When one prospers the other prospers also. The lesson to be learned from this may be summed up in the old adage: "Live and let live." Meantime, with the public demanding and the legislatures enforcing lower rates on the one hand, and anxious stockholders on the other, the lot of the present day railway administrator is not a happy or an easy one by any means.

DELAYING FREIGHTS.

Can cargo, shipped to go by a certain vessel, be shut out and taken on by another vessel, of the same line, sailing subsequently, the vessel owners not being liable for the delay and consequent damage incurred? This is the issue raised in an action brought against the Hansa (German) line of steamships and their agents at Calcutta. The case was before the bench on the application of the defendants to have the case transferred to a higher court. Counsel for the application said

the important question involved was, whether a shipping company, when freight was booked to go by a certain ship, were bound to take it by that ship, the time of sailing being stipulated in the usual way. The plaintiff's case was, that the goods in question were for May shipment to London, and that the company were bound to take the cargo by that steamer provided it was delivered to them on their wharf by May 31. The defendants' case was that they were not so bound, if there was not space on that particular steamer, and in this case the goods were shipped by a subsequent vessel on June 8, or one week later; they therefore denied liability. His Lordship considered the case of sufficient public importance, although the damages claimed were small, to send it to a higher court.—Alex. MacLean, Yokohama.

DEATH OF MR. SMALE.

In the death of Mr. F. J. Smale, of the William Davies Co., Ltd., Toronto, the business world has suffered a distinct loss. In his short life he found time to accomplish much. After completing a university course of great brilliancy and devoting a few years to advanced research, he became connected with the William Davies Co. as chemist, and in a short time assumed the duties of the assistant general managership, a

The Late Mr. F. J. Smale

position he held with fine success. Nor did he permit his own business duties to absorb all his time. Many a cause of public benefit has been furthered by his advice and active assistance. He was a member of the Canadian Manufacturers' Association, having served on various committees, the "Industrial Canada" Committee in particular having received the benefit of his great abilities. His premature death is keenly regretted by a very wide circle of friends.

The mines and smelters of the Granby Co. have reopened under an agreement with the workmen to accept a reduction in wages. About 1,200 men are employed.

Books of the Month

THE EVOLUTION OF SOCIETY.

The copyright on Morgan's "Ancient Society," a historical classic, having just expired, Charles H. Kerr & Co., of Chicago, have issued a cheap reprint which will be welcomed by all students of social development. It is interesting to note that it is now published as one of a series of books of direct interest to those of socialist leanings. But Mr. Morgan's able volume is of equal value to the socialist advocate and to the unbiased student. Its serious study will broaden and strengthen every student's understanding of this fundamental truth; that all progress is the result of well-directed effort, and the outcome of long ages of rough experience and stumbling experiment. It proves to a demonstration that there is no quick jump into elysium, and that each step forward is gained slowly.

But such a survey of the evolution of society is a message of encouragement to all students—employers or employees or others. It reminds them that we owe, in the words of the learned writer, "our present condition, with its multiplied means of safety and of happiness, to the struggles, the sufferings, the heroic exertions and the patient toil of our barbarous, and more remotely, of our savage ancestors. Their labors, their trials and their successes were a part of the plan of the Supreme Intelligence to develop a barbarian out of a savage, and a civilized man out of this barbarian." Those wishing to continue their study of industrial society will find Bucher's "Industrial Evolution" (Henry Holt, New York) helpful.

THE WORKMEN AS A POLITICAL CLASS.

Have the Laboring Classes Prospered Since 1893?

The socialist press of America is becoming more aggressive and outspoken; and there is no denying it has put its finger on a number of desirable changes in political and industrial conditions. But it is just as true that from the mass of nonsense published it is often hard to winnow right from false in statements made, so inaccurate and misleading are the irresponsible observations. Very often all one can say is there is just enough truth to give an excuse for a new publication. This can be said of a small book just issued by Kerr & Company, of Chicago, "The Rise of the American Proletarian," by Austin Lewis.

The author seeks to show that the industrial history of the United States is the history of the influence of money over politics; that the Senate and Congress hold the fort for it to-day; that the result is dire political corruption and rottenness, and that the working class is coming to feel itself a class apart and is about to take the plunge and become a distinct political life. This is the result not merely of political conditions, but of the fact that during the last fifteen or twenty years the laboring classes have not only not progressed but have actually lost ground in the good things of this world, and to-day are relatively worse off than during less booming days.

This is an illustration of the author's historical and scientific immaturity. In the first place it is not true that the working classes have not progressed. They live better and enjoy life more than they have for a long time. Thousands of them have become employers, and they are enjoying a greater share in public benefits of all kinds than ever. Whether their lot has changed for the better as fast as their

employees is more open to question. But we must remember the world is passing through perilous times, and the basis of values is changing. Gold is falling, interest and all other prices are rising, and in the shifting of rates (wages, income of all kinds), hardships and bitter feelings frequently—and necessarily so—arise. Probably not for another four or five years can we expect to reach relative equilibrium again.

A GUIDE TO PRESENT FINANCIAL CONDITIONS.

Those seeking for an exceedingly helpful little book on present conditions which is at the same time an excellent explanation of the problems raised by Mr. Austin's book will find it in Mr. Thomas Gibson's "The Cycles of Speculation." (The Moody Corporation, New York. 1907. Price, \$1.50.)

The conclusions come to are worth careful reading, and the book will well repay purchase. Some of the conclusions are as follows:

- (1) The increased production of gold will lead to a still higher level of values, higher interest rates and lower prices for bonds and other long-time obligations.
- (2) Fixed charges will be more costly.
- (3) Real estate values of all kinds will rise.
- (4) Cost of living and wages will rise, though not so fast, and unrest or strikes will be not infrequent.
- (5) Higher prices mean not real prosperity, but only a marking up of things and great industrial confusion, in which some make and some lose. The greatest profits fall to the propertied classes.
- (6) The political, social, and industrial world will all be affected.

The second part of the book is taken up with a well written explanation of market terms and usages. Altogether the volume is one to be highly recommended to every reading business man.

THE SEASON'S GREETINGS.

A Souvenir of the West.

Each year brings a souvenir from the *Manitoba Free Press* which is more interesting and attractive than those which have gone before. This year the remembrance takes the form of a miniature barrel of flour from the now famous Peace River valley, where wheat is grown up to within 400 miles of the Arctic circle. The barrel is an exact reproduction in miniature of the product of the Vermilion mills. A glance at a map will show what an immense agricultural tract is embraced in the Canadian West, when the highest grade of grain can be grown far to the north of Edmonton. It is only when some picturesque representation like the present is brought to our attention that we begin to appreciate the magnitude of our country.

Canada in England.

A calendar and diary has been sent out to its friends by the Canadian United Manufacturers' Agency, Caxton House, Paternoster Square, London, E.C. The souvenir is of metal and contains on its face a commercial Atlas, bearing a map of Canada in his hands. The design is attractive, and the article itself will be most useful, at the same time keeping the name of this well-known agency for Canadian goods before the attention of the owner.

A Pictorial Attraction.

A handsome calendar in colors has been issued by the British-American Brewing Co., of Windsor, Ont. The pictorial part represents a woman in a riding habit, with all the accoutrements for riding worked into the design. The picture is a reproduction of a painting, entitled "The Queen of the Turf," by Clementz, Berlin.

The Future of the Small Manufacturer

Shall the Tendency Towards Centralization Continue?

OUR language has become free with words of science. We discuss with fluency, if not always with accuracy, electric power transmission lines and current at the tap. All this is since the discovery, for we may almost call it such, of the transmission possibilities of electricity. Do the developments of the past few years mean anything more than a mere facilitating of business, a possibility for increased production, an enlarging of the industrial activities? Or are they epoch-making, in revolutionizing our industrial life, turning back the stream that for centuries has been flowing city-wards? Centralization or decentralization, that is the question.

Two elements formerly entered to a large extent into the consideration of a manufacturer when deciding upon a location. One was the presence of a water power; the other was the ability to bring in coal at a low cost. There were other considerations of more or less interest, but these were always well to the front. So the lake ports where coal was most easily accessible became the nuclei of manufacturing cities. The tendency for big towns to grow bigger and small towns to stagnate or decline to nothingness was accentuated.

A reversion now to an era of perhaps smaller factories, scattered over the land with small regard for the big cities, would indeed be revolutionary. It would create a social change greater than any which has occurred for many decades. "The great question of the present day is the housing problem." That is a truth which every industrial city has had forced upon it times out of mention. Where many factories are gathered together there is sure to come a congested living district, not only to accommodate the legitimate working people, but even more so to house the by-products of an industrial centre, the undesirables whose manner of life is ever a menace to the public health and morals. Only in large cities do the street hawkers and their like find a profitable and congenial clientele. These are the people who do much to bring about the over crowding evil.

Time and thought have been given to solve the problem. Employers recognize all too well that the home life of the work-people means much to the efficiency of their work. Sordid lodgings, and insufficiency of air and sunlight, squalid surroundings, stifle ambition, stunt natural aptitudes and generally lower the efficiency of the man. Aside altogether from the humanitarian point of view, there is much reason in the effort which is constantly being evidenced, now in one city, now in another, to improve the living conditions of the working classes.

But it is difficult, if not actually impossible, to change the conditions in an established city. In factories and stores a large number of people are employed. Considerations of time and expense alike prevent them from living far from their work. They live in a limited district, which is bounded by walking distances from their work. Hence the tendency is to crowd together more and more closely; the demand for houses in the limited district grows, and with the demand grows the rent; it becomes necessary for two families to occupy the house originally intended for one; the evil of the

overcrowded tenement is at hand. The curse of this is increased by the knowledge that the people are paying as much thus huddled together in unlivable conditions as they formerly did for fair accommodation. The housing problem is in good truth difficult of solution.

Transmission of cheap electric power for long distances introduces a new element into the subject of manufacturing. The small manufacturer located away from the larger centres is decidedly strengthened. He can get his necessary power as cheap as or cheaper than his big rival in the city. He is enabled to enjoy several advantages which he would be debarred from under the former conditions.

The desirable conditions of successful manufacturing are briefly: To be as near as possible to the consuming public; to be in the best position for getting raw material at a minimum price; to have a sufficient supply of competent labor; to have power and other necessary adjuncts to manufacturing at the lowest cost.

Having in mind these requisites what are the chances in the future for the decentralization of factories? What chance will the small man have in the industrial contest that is to come? Will the tendency continue towards amalgamations, centralization, or is a change likely?

A concrete example will help to elucidate the problem. Take the case of a wood-working establishment in Western Ontario, after the transmission lines have been built from Niagara Falls. A competent man gets together enough capital to start a small factory. He puts a few machines into a building which he can build or rent for much less than he could in a big city. He engages the requisite number of men to whom he pays less than the big city manufacturer. He superintends the work himself, which constitutes an inestimable advantage in securing consistent results and honest workmanship. No factory system, necessary as it is in the case of a big establishment, can compensate for the lack of personal supervision of the manufacturer, which is possible alone in the less pretentious factory. He has a local market readily reached at small expense, on which he has a sentimental hold through his being a local manufacturer. Finally he has power to run his plant at a low rate. Cheaper land and less taxation, ample facilities for housing work people, etc.

To what extent cheap power has been effective in attracting manufacturers is seen in the case of Hamilton, Peterborough, Welland, etc. In fact these last two municipalities are an indication of a possible change from the former tendency to congregate in big industrial centres. The Welland canal provides a fine water power. Straightway it gives rise to factories. But there is a further point along this same line. The Consumers' Cordage Co. have built their plant outside the town limits. The Canadian Shipbuilding Co. have established yards away from any big centre of population. The Copeland-Chatterton Co. have transplanted their factory from Toronto to Brampton. Many others could be named who have done likewise. There is a reason for it, a business rea-

son. It is an interesting speculation to consider how far that reason will go in causing a general migration.

Not that there are not reasons, many and strong, for the movement of industries city-wards. The large home market at the minimum cost of transportation is of great importance, being in fact in some industries all important. In a big centre of population, too, there is a greater labor market, and it is more easy to meet a sudden demand for a number of skilled artisans. This, of course, is not an unmixed blessing, because where there are many workmen there is also sure to be an agitator, with the result that the cities are infested with extreme trades unionists, the kind who feel that there is a constant conflict between labor and capital. The big cities are the battlegrounds of most strikes. Then transportation must be considered. Naturally railroads converge on the cities; if it is a water shipping port so much the better. There are two points which are especially favorable to the city manufacturer. First, he usually has two or more railway lines, by which he may reach practically any point. Second, being at a terminal shipping point he is likely to get a more satisfactory car service. Without underestimating these at all it may be pointed out that the lack of railway competition, which formerly made the shipper who was thus affected a pretty helpless individual, does not operate in that way to the same extent since the establishment of the Railway Commission. The long and short haul clause of the Railway Act is of importance, but much more so is the assurance that fair treatment can always be enforced by application to the Board. In addition there is a tendency, which is likely to be increased in the future, to run electric lines widely throughout the country. These will make transportation more rapid and satisfactory.

The next few years will provide some interesting developments in the industrial world. What they will be is still only a subject for conjecture.

Communications

TECHNICAL EDUCATION.

To the Editor of INDUSTRIAL CANADA.

DEAR SIR,—With a view to keeping the members of the Association in touch with industrial education, perhaps you will find space for a few thoughts. Industrial education will here be taken to mean all education needed in industrial life, but for the present purpose, the manual and trade schools will not be included in consideration. Reference to commercial work and a university education to manufacturing interests may prove of more than a passing interest.

Technical schools are now being agitated as most important, and equally important should be commercial schools. They are of so much importance that they must not be overlooked in considering the efforts necessary in building up the manufacturing industries of the country. We must know not only how to manufacture but also how to sell our products. The two branches should run together, as training is as necessary in one as in the other. In Germany this is strongly recognized. Commercial methods are placed on a broad educational basis.

The Commercial Colleges, so-called and as now known in our cities, are mainly devoted to qualifying young men as office assistants, but such falls far short of the real meaning

of a thorough commercial education. The commercial school should produce the man who can make a reputation for the product of a manufacturer. He should be as important at the helm of commerce as is the merchant or the banker. The commercial school should stand as high as any technical school. The graduate should be equally ready and capable to challenge the distant market as the local one.

Nor should either of these schools be considered as independent of the University. Often the manufacturer looks on young men with academic degrees with adverse interest. Happily this condition is quickly dying, and the sooner this prejudice disappears the better for our industries. This does not mean that practical training may be overlooked. Genius of any kind is born not made, and may create greater success untrained than is achieved by the ordinary talent most highly trained. But as a whole, evidence derived from actual careers of university men shows that among graduates the greatest successes have been formed where men by their education have shown their power of organization, or by their scientific abilities and training their ability to become officers of great undertakings, technical, administrative or commercial.

Universities attract a large proportion of the best young men of the country, and the field for their usefulness to the country should be made as wide as possible. When the industrial life of the country learns of this new university industrial education expansion for the production of capable industrial graduates, the demand from manufacturing principals will be the warranty for Boards of University Governors in establishing registers of requirements, which will be the incentive to ability in choosing vocations congenial to desire.

And this is necessary. The great German philosopher Hegel says: "This is the absolute right of personal existence—to find itself satisfied in its activity and labor. If men are to interest themselves for anything, they must, so to speak, have part of their existence involved in it; find their individuality gratified by its attainment."

This is a consideration of special importance in this present epoch, when people are influenced less than formerly by reliance on others and by authority. Instead they are nearly always moved by devotion to an object, concentrating all their desires and powers upon it, under individual volition.

Such are the thoughts which urge themselves for presentation during the present when manufacturers are considering what shall be done to find educated trained help of all kinds, so necessary for the success of the commercial and industrial interests of Canada.

JAS. P. MURRAY.

Mr. Edwin S. Reed, manager of the International Varnish Co. in Toronto since the opening of the company's business in Canada three years ago, has severed his connection with it to engage in business for himself. He is succeeded by Mr. J. E. Ebersole, who was formerly with the Chicago branch of the Standard Varnish Works. Mr. Ebersole is a Canadian who has spent most of his business life in the United States, and now returns to take his place in the industrial life of Canada.

The new building of St. Jerome College, Berlin, is now almost completed. A feature of the building is the metal cornice 6 feet high, which was manufactured and erected by the Metal Shingle & Siding Co., Limited, of Preston, Montreal and Toronto. This cornice runs around the entire building, 356 feet, and adds greatly to its general attractiveness.

WHAT A BLUE BOOK CONTAINS.

A GOVERNMENT departmental report is not generally considered to be the most interesting of documents. We can at least say that it is not the thing one is likely to pick up to pass away a quiet hour. This is not to be wondered at, for a blue book contains a plain statement of facts, more or less interesting as facts, but necessarily unembellished with the picturesque detail or digressions which make a less formal book attractive. Attractiveness is highly desirable in them, because, after all, they are published with the idea of conveying certain information to the public, and unless the public, or someone for them, for instance the press, reads them they fail in their object. Yet the truth cannot be sacrificed to ornamentation and it is hard to imagine that the report of the Department of Trade and Commerce can become anything other than what it is, a series of tables, an almost endless series of tables, of imports and exports, and such other apparently uninteresting, dry and indigestible matter.

But it is only to the superficial person that for instance the September monthly report of the Department of Trade and Commerce is uninteresting, and it may be added that it is not for such that the information is published. There is a real attractiveness about figures when they are giving a strong, clear, vivid representation of the economic life of the country. When we glance down the column which shows the total trade of Canada year by year since Confederation, and when we trace the progress which has been made, the blue book speaks more eloquently than the silveriest of orators. Our imagination may be seized by the statements of the speaker, but our reason is persuaded by the unemotional figures which show that in 1868 Canada had a total trade of \$126,591,472, in 1888 this had increased to \$189,965,778, and in 1907 to \$612,581,351. The very figures in their coldness and nakedness suggest the whole history of Canada during that time, the years of hopefulness that followed the yoking of the Provinces together, the years of doubt and hesitation, when Canada was overshadowed by her bigger neighbor, and finally the years of triumphant progress in wealth and importance.

On the next page we find that for twelve months ending September, Canada imported \$66,100,364 worth of goods more than she did during the same period in 1906, and on closer investigation it develops that of this amount \$41,950,807 represents dutiable goods, which is equivalent to saying goods which could be manufactured in Canada. The total imports for the year, exclusive of bullion, were \$362,459,907, of which \$221,465,700 represent dutiable goods. These figures are far from being uninteresting; on the contrary they are of vital importance; they represent a condition which it is the urgent duty of every citizen to consider and investigate. Particularly so since on glancing farther along the page we learn that the exports for the year fell off \$1,362,785. Without wishing to stir up any economist to a string of platitudes on the course of international trade, we might suggest that on the face of it such a condition of purchases and sales is not likely to rebound to the wealth of Canada.

It is not intended here to discuss the conditions indicated by the figures and tables given in this report; the aim is merely to call attention to the valuable and interesting nature of the information provided. The outside of such a document, it cannot be denied, is usually forbidding. It requires some courage to open it up and get right into it. Yet, unless this be done, there will be little profit or pleasure to be had from it. To illustrate this, we open the report at a double

page which is one complete mass of figures—nothing else on the page with the exception of a couple of lines of headings. Not very promising, certainly, but we will overcome our inclination to pass on to the next page and examine it more closely. It is a statement of exports by classes—that is, products of the mine, the fisheries, the forest, animal produce, agricultural products, manufactures, and bullion. It gives the value of the exports of these classes for each of the last ten years. We now see how the \$27,322,977 of exports during September were made up. We have been told of late a good deal about the importance of our timber supply. Sometimes we are given figures, sometimes not. Usually we have been treated to much generalization and few facts, or when we got the latter they were so numerous and so stupendous that we scarcely followed them. But here we have a simple statement that in September, 1907, Canada exported timber, sawn or unsawn, to the value of \$5,981,590; agricultural products, \$5,897,044; manufactures, \$3,804,024; products of the mine, \$3,341,995; fish, \$1,036,478. Only one class exceeded in importance that of the forest, that was animal produce, which ran up to \$7,193,159. Here we have from the most uninviting of pages, matter of the greatest interest, put up in a clear, concise manner.

Whom do we buy all our goods from? To whom do we sell them? It would surprise not a few to read the list of countries with whom we deal. Over eleven States within the British Empire; twenty-seven, exclusive of the other foreign countries whose dealings are too small to receive independent mention, without the Empire—that takes in most of the countries worth while. All this is set forth, with the amount of our purchases and sales to each individual state on another page.

But after all the most important section is that containing the detailed statements of imports and exports. What is really wanted in most cases is the amount of some particular article and the principal sources or destinations of it. This is by no means an easy work, as those know who have tried to run down any number of articles. The same article would naturally be grouped under different heads according as it was for use in different industries. A limit has to be reached somewhere in the matter of detail. However through constant changes, rearrangements and re-groupings, the report now gives a very satisfactory service in this respect. It is possible to get at the amount of exports or imports, and the countries which buy or sell them, with on the whole commendable ease. These tables, which are comparative for the years 1906 and 1907, occupy a large part of the report, and are the material for many of the condensed statements previously referred to.

Finally the report contains reports from our commercial agents abroad, which are practically the same as those issued from week to week by the department, and a valuable and well-selected mass of general commercial information. The latter deals with the trade of foreign countries with which Canada is interested.

Exhibition of Japan, 1912.

Those nations that have announced their intention to take part in, or to favorably consider, the great exhibition that Japan is organizing, are given with the official answers in the following order: 1, Germany; 2, Mexico; 3, Canada; 4, New Zealand; 5, Great Britain; 6, France; 7, the United States.

OUR NEW ZEALAND LETTER.

Wellington, Dec. 1st, 1907.

In my letter of the 1st of August I made some remarks in connection with the preferential tariff to the effect that if manufacturers are not careful and want to pocket the whole difference themselves, that they will ultimately kill the goose that lays the golden eggs. Apparently my warning has not been heeded and the consequence is that the killing of the goose has commenced already.

A certain line of apparel used mostly by the laboring classes was benefitted by the preferential tariff to the extent of 20 per cent. Gradually the Canadian price went up until the difference in the landed cost was insignificant, and in some cases there was no difference at all.

The Minister of Customs, Hon. Millar, was informed of this, and promptly took the preferential duty off, and the business is going back to the United States. Even if Canadian manufacturers reduce their prices again to the level of the foreign manufacturer the business will go past them as merchants are disgusted with the manner in which the Canadian manufacturers have appreciated a benefit which was given to them, not for the purpose of filling their own pockets but to keep the foreign manufacturer out. This is only one line, but I am informed that several others will share the same lot if matters are not mended. The Minister has made up his mind that the preference shall not be paid by the inhabitants of New Zealand, or in any case, not to the full extent.

Canadian manufacturers must bear in mind that their doings are closely watched by the agents of foreign firms, and that any aggression of this kind is promptly reported to the Minister, who then investigates, and if found correct punishes offenders by taking the preferential duty off. This is a very serious matter, and the sooner manufacturers change their policy, and do their best to deserve the preference given to them the better. If once the preferential duty has been removed it will never be put on again.

There are rumors afloat concerning a change of management of the Alley line of steamers. According to some reports Bucknall Bros. have withdrawn, and the contract with Alley will be carried out by Barrie & Sons, Dundee, who are expected to put on some of their best steamers to establish a monthly service with fixed sailing dates from either end. If true, this would be a great improvement on the old service which is bi-monthly, and with regard to sailing dates very unreliable.

If the new steamers are fitted up with refrigerator plant, enabling them to carry perishable goods, a large extension of trade can be expected.

There is a splendid prospect for the sale of British Columbia apples, but owing to the very limited refrigerator space offered by the Canadian Australian line the imports are limited. Another drawback is that such shipments have to be transhipped in Sydney.

The apples imported by the Department of Agriculture during the Christchurch Exhibition arrived in splendid condition, and being in cool storage kept for many months. Big results were expected by the Commissioners, and they would have been fully realized if the necessary refrigerator space had been available on the steamers of the Alley Line. Fijian planters also are very anxious to send their fruits in cool storage, and are willing to pay a very good rate, knowing that if their produce arrives in good condition in New Zealand they can command far better prices, and they do not run the risk of having the greater part of their shipments condemned on arrival as has been very often the case in the past.

The first steamer of the new line to leave Sydney via New Zealand to Vancouver will be, I am informed, the "Den of

Ruthven." The sailing date was given as the 28th of November.

Business is getting quiet now, as is always the case at the end of the year, next month the holiday season commences and it will be far into January before the New Zealander will knuckle down to work again in earnest. I expected to be able to send you a copy of the amended laws on industrial arbitration, but as the bill is still before the house this is impossible. The proposals are in some respects very drastic, and there is some strong opposition on the part of the trade and labor councils, and it is more than probable that after the bill has finally passed it will be very much different to the original.

The New Zealand Year-book for 1907 has made its appearance. On glancing through I find that the imports from the United States have fallen off by £32,720, and those from Canada have increased by £34,152. Imports from British Columbia, which is separately mentioned, have increased by £26,817. Practically the imports from Canada increased by twice the amount the imports from the United States decreased.

This shows that Canada got the benefit of the total increase of importations from the American continent, and made a fairly large inroad on the United States imports.

When the new preferential tariff is in full operation Canada ought to benefit in an increasing measure; if she does not, it is the fault of the manufacturers for reasons pointed out above.

It will interest you to learn that the total loss on the Christchurch Exhibition has now been fixed at £21,000, or a little over \$100,000.

COSMOPOLITAN.

TRADE WITH BRITISH GUIANA.

From the statistics given in the report of the Comptroller of Customs for British Guiana for the year ending March 31st last, just come to hand, it would appear that there is considerable scope for the expansion of Canadian trade in that colony. Out of total importations during 1906-7 of \$8,115,862, British Guiana bought from Canada only \$547,231 worth of goods, while she exported to Canada produce valued at \$2,278,859 out of total exports to all countries of \$7,964,546. In other words, Canada took nearly one-third of British Guiana's exports, while British Guiana purchased only one-sixteenth of her importations from Canada. Even allowing for Canadian goods entering British Guiana from United States ports, and thus credited as United States goods, the discrepancy is still enormous, and surely indicates that Canadian exporters should make a serious effort to obtain a large portion of this near-by market. It should also suggest to the merchants and people of British Guiana that they turn a little more of their business to a country which is a better customer of theirs than the United States, from whom they now purchase over one-quarter of their goods.

But Canada must not expect trade to come to her unsolicited. Canadian exporters should prepare to exploit this little known market in a vigorous manner. From the returns before us it would appear that outside of farm produce such as grains, butter, cheese, potatoes, and live animals, and fish products, the best field lies in biscuits and confectionery, boots and shoes, cordage, flour, lumber, oils and paints, soap and varnishes. The attention of manufacturers of these articles is directed to this market in the hope that they will endeavor to secure a footing in it. There is no time more opportune than the present, when financial conditions in Canada have resulted in lessening the home demand. Further information regarding the British Guiana market, with the addresses of prominent merchants in that colony, will be gladly furnished to any manufacturer applying to the Secretary.

Among the Industries

The Imperial Glove Co. have been incorporated, with a capital stock of \$40,000, with chief place of business at Dundas, Ont.

The Belleville Iron and Horseshoe Co. have been incorporated with a capital of \$10,000, head office to be at Belleville, Que.

The Maple Leaf Flour Mills of Kenora were formally opened recently. Guests were present from all over the Canadian West.

The Canada Tag and Label Co. have been incorporated with a capital stock of \$49,000. The chief place of business will be Montreal.

The Howell Lithographing Co., of Hamilton, have issued a handsome calendar, showing the 91st Regiment of Highlanders, in full costume, on parade.

An attractive calendar has been received from Rhodes, Curry & Co., Amherst, N.S. It gives an illustration of the extensive car-building plant of that company.

The Taylor-Forbes Co., of Guelph, suffered a loss by fire recently which, while it was confined to a small area and amounted to only \$2,000, threatened for a time to be disastrous.

The silicate brick factory of North Sydney, N.S., which has been lying idle for the past two years, will be running full time again shortly, if negotiations which are now on are successful.

The White Candy Co., of St. John, N.B., are considering the removal of their factory to Moncton. No definite action has yet been taken as a number of other locations are also under consideration.

The Utica Shale Pipe Co. have been incorporated with a capital stock of \$20,000. W. K. Lowden, St. Lambert, Que., engineer, heads the directorate. The chief place of business is named as St. Lambert.

Enquiries have been made of the Bureau of Industries of British Columbia as to the best location for a tin-plate mill. The big canning business of the province makes such a manufacture very promising.

George E. Mills has secured the contract of building another large addition to the Hamilton Steel and Iron Company's blast furnace plant, of Hamilton, Ont. It is for a \$5,000 brick machine building.

An English company are negotiating for the purchase of the Perth Flax and Cordage Co., Limited, of Stratford, Ont. The company in question are large manufacturers of twines, ropes and cordage, and in the event of their establishing a Canadian branch, they would extend the present plant of the Stratford company to double its present capacity.

The Nova Scotia Cement and Plaster Co. have been incorporated with a capital of \$100,000, to manufacture gypsum, including Plaster Paris, and all articles made therefrom. The chief place of business is Toronto.

A company has been formed to build lifeboats in Canada. It will be known as the International Automatic Lifeboat Co., with a capital of \$350,000. The plant will be established at one of the Maritime Province seaports.

It is announced on the authority of Mr. Rudolphe Forget that an English company is prepared to spend \$10,000,000 in developing Canada's electrical railways. This sum would go to improve existing roads and to build new lines.

Seven electric locomotives will be put in commission in the St. Clair tunnel by the Grand Trunk Railway. The normal capacity of one of these engines is 750 horsepower. Two of them will make a locomotive capable of pulling a 1,000 ton train up the two per cent. tunnel grade. The trip will be made from Port Huron to Sarnia, nearly three miles, in seven minutes.

The Walbridge Manufacturing Co. have been incorporated with a capital of \$20,000, for the manufacturing of tools, wood and iron working machinery, engines, boilers, water wheels, hydraulic apparatus, shaftings, hangers, couplings, pulleys and general mill supplies, stoves, furnaces and appliances and general factory work. The chief place of business will be Mystic, Que.

The Metal Shingle and Siding Company, Limited, of Preston, Montreal and Toronto, have just completed shipping six carloads of "Acorn quality" corrugated galvanized sheets for the new plant of the Great Lakes Portland Cement Co., at Port Colborne, Ontario. They have also secured the contract for supplying the same material to be used in constructing the Vulcan Portland Cement Co.'s new works at Longue Point, near Montreal.

A company to be known as the Canadian Chemical Company, is being organized. They are to take up a feature of chemical manufacturing that is said to be new not only to Canada, but to the British Empire. This is the distillation of creosote from wood tar. The erection of a wood reduction plant is now going on at Needon, on the line of the Quebec Central, where the company are to operate. Here will be made the products of the ordinary wood alcohol plant, viz., wood alcohol, coke and acetate of lime. Aside from these there is a big product of thirty gallons of tar from every cord of wood, which in many plants is consumed for fuel. Messrs. Morton, J. Lyster and Benton Lyster, of Whitefield, N.H., claim to have discovered the secret of getting from this tar creosote, guayacol, and creosote paint, all under a process by which they can be made commercially. The Messrs. Lyster are interested in this company. A factory has been successfully operated under their charge at Whitefield, where a large quantity of these by-products have been manufactured. If the company is able to use the tar as they say then can, they have a process that has been sought for by chemists for years.

Trade Enquiries

NOTE.—For further information regarding any inquiry mentioned under this heading or the names of inquiries, apply by numbers to the Secretary, at Toronto.

- 293 Agency.—A wholesale firm in Denmark wishes to obtain the sole agency for Scandinavia for some Canadian specialties.
- 294 Agricultural Machinery and Implements.—An importing house in the City of Sayula, State of Jalisco, Mexico, desires to form connections with Canadian firms prepared to supply agricultural machinery and implements.

- 334 **Sisal Rope.**—A Leeds firm is open to consider prices from manufacturers in Canada of sisal rope, particularly of the finer qualities.

WHAT sense is there in buying a roof that surely must be repaired every few years?—when you can buy for less money a roof that is **GUARANTEED** to need no repairs—no even painting—for **TWENTY-FIVE** years. Specially when the 25-year roof is actually good for a **HUNDRED** years,—as is any roof that's covered with

Oshawa

Double Galvanized Steel

Shingles

Unskilled labour can put them on perfectly,—almost automatic, with their four-way lock. Any building they are on is practically fireproofed, is rain-and-snow and wind-and-weather proof, is proof against lightning. No special timbering needed,—a roof that costs less and is worth far, far more. Better get the book about them—likely to save you much trouble and more money. Just address, for book and sample shingles

Underwood

Every typewriting contest of any importance held in recent years has been won on the Underwood—the Championship of the World in nine successive events, as well as contests of a more local character.

At a contest held recently for the Championship of Canada, although various makes of machines were represented, the nine best records were made on the Underwood.

The Underwood is the best typewriter. That is the universal opinion of operators; and who knows more about a typewriter than the operator?

United Typewriter Co., Limited

Executive Council

DECEMBER MEETING.

The regular monthly meeting of the Executive Council was held in the Board of Trade rooms, Ottawa, on Thursday, December 5th, at 3 p.m.

The President, Hon. J. D. Rolland, occupied the chair. Other members present being Messrs. H. W. Aird, Montreal; Joseph Allen, Montreal; John Baillie, Montreal; C. C. Ballantyne, Montreal; G. Frank Beer, Toronto; Fred. Birks, Montreal; Geo. Booth, Toronto; Geo. Brigden, Toronto; P. H. Burton, Toronto; J. C. Casavant, St. Hyacinthe; Wm. Cauldwell, Montreal; W. B. Champ, Hamilton; Jas. Davidson, Montreal; J. S. N. Dougall, Montreal; W. R. Dunn, Hamilton; John F. Ellis, Toronto; S. W. Ewing, Montreal; J. D. Flavelle, Lindsay; Atwell Fleming, Toronto; G. W. Ganong, St. Stephen; W. M. Gartshore, London; W. K. George, Toronto; T. S. Hetherington, Quebec; R. Hobson, Hamilton; Jos. Horsfall, Montreal; Alfred Jephcott, Toronto; J. J. McGill, Montreal; J. B. MacLean, Toronto; W. K. McNaught, Toronto; D. Murphy, Ottawa; Wm. Robins, Walkerville; A. S. Rogers, Toronto; B. Rosamond, Almonte; W. H. Rowley, Hull; J. H. Sherrard, Montreal; T. H. Smallman, London; Chas. A. Smart, Montreal; G. A. Vandry, Quebec; R. H. Whyte, Smith's Falls; R. C. Wilkins, Montreal; C. C. L. Wilson, Ingersoll; R. J. Younge, Montreal.

The minutes of the November meeting as published in INDUSTRIAL CANADA were taken as read.

COMMUNICATIONS.

The Secretary reported the receipt of an invitation from the National Civic Federation inviting him to be present at their annual meeting to be held in New York on December 17th, and to speak on the Industrial Disputes Investigation Act from the employers' point of view.

Moved by Mr. Robins, seconded by Mr. Rowley, that as the invitation could only be regarded as a compliment to the Association the Secretary be instructed to accept same, and to consult with the Parliamentary Committee regarding the views he should express on the subject upon which he was asked to speak. Carried.

TREASURER.

The Treasurer, Mr. Geo. Booth, presented his statement of receipts and disbursements for the month ending November, which showed a balance to the Association's credit of \$15,234.81. There being no discussion the report was adopted.

INTER-IMPERIAL NEWS SERVICE.

On behalf of the committee appointed at the November meeting to consider the advisability of endorsing the resolution of the Vancouver and Victoria Boards of Trade in the matter of an Inter-Imperial News Agency, Col. MacLean reported as follows:

A meeting of the special committee appointed by the Executive Council to consider the advisability of encouraging the establishment of an Inter-Imperial News Agency was held in Toronto on November 26th.

The resolution of the Vancouver Board of Trade was read and thoroughly discussed. While your committee are prepared to recommend that the Executive Council should in a general way express sympathy with the proposal, as one intended to draw the different parts of the Empire more closely together, they believe the subject might better be left for the

Canadian Press Association to deal with. It so happens that the latter Association will shortly celebrate its fiftieth anniversary by a gathering at which publishers from all parts of Canada are expected to be present. The renewal of the Government's subsidy to the Canadian Associated Press will then come up for consideration, and as the proposition of the Vancouver Board of Trade necessarily involves Government support it may well be disposed of at the same time.

In response to requests for more information, Col. MacLean reviewed briefly the operations of the American Press Association, showing how a great deal of the British news which came to us was first filtered through United States channels. Exception had been taken to this method from time to time by prominent newspaper men, until now there seemed to be an organized movement to secure Government support towards an Imperial service that would operate entirely independently of the American Press Association.

The subsidy granted by the Government to the Canadian Associated Press was something like \$15,000 for the first year but had since been decreasing on a sliding scale until now it amounted only to about \$5,000. Two men were constantly employed in London for the purpose of forwarding such news as seemed to them might be of interest to Canadian readers, and for this service Canadian papers paid from \$100 to \$500 per year each.

Criticism was being found with the service on the ground that it was not broad enough as applied to the United Kingdom, and from other quarters criticism was being made that the service ought to be similarly extended to other parts of the Empire.

Col. MacLean pointed out that the Government might very well encourage the movement by bearing a portion of the expense of transmitting news cablegrams. The papers individually could not afford to do more than they were doing, but the cost would be comparatively trifling to the Government, and would no doubt prove to be a potent factor in bringing all parts of the Empire more closely together.

Moved by Col. MacLean, seconded by Mr. J. S. N. Dougall, that the Secretary be instructed to inform the Vancouver and Victoria Boards of Trade that the Association was cordially in sympathy with their desire to improve the news service, and that it was asking the Canadian Press Association at its annual meeting in February to consider the proposal and, if they could see their way clear, to support it. Carried.

Moved by Mr. Younge, seconded by Mr. McGill, that the special committee be continued in office for the purpose of reporting progress to the Executive Council after their conference with the Press Association. Carried.

FINANCE.

In the absence of the vice-chairman, Mr. Tindall, the report of the Finance Committee was read by the Treasurer. It recommended for payment a number of accounts, amounting in all to \$726.80, and suggested that in view of the long period that would intervene before the January meeting, the committee be empowered to pass the balance of the regular monthly accounts at the usual time.

The report also recommended the re-engagement of Mr. J. E. Walsh, as Manager of the Transportation Department, at a salary to be fixed after consultation with the Railway and Transportation Committee.

The adoption of the report moved by Mr. Booth, seconded by Mr. J. F. Ellis, was carried.

COMMERCIAL INTELLIGENCE.

The report of the Commercial Intelligence Committee was presented by the Secretary. The following are among the matters dealt with:

Duties on Exhibits.

Your Committee has recently had its attention directed to the fact that exhibits of Canadian firms sent to United States exhibitions have to pay duty at the usual rate on crossing the border, whereas United States manufacturers can exhibit their products at Canadian expositions in bond. While the number of Canadian firms affected by the United States regulations is comparatively few, it is felt that the United States authorities should be urged to make similar concessions, and your Committee will act with a view to securing reciprocal treatment in this matter.

Consuls' Fees.

Complaints having been received that the fees of American Consuls for passing shipments for United States points are unreasonable, your Committee is making an investigation into this question with a view to taking the matter up with the Government if deemed advisable.

Commercial Agent in West Indies.

From statements which have appeared in the press, your Committee has reason to believe that the Canadian Government will adopt the suggestion of the Association, and appoint a travelling commercial agent for the whole of the West Indies who will devote his entire time to the promotion of trade between the Islands and Canada.

Translations and Commercial Reports.

Since the last meeting of the Council leaflets advertising the new translation and commercial report facilities of the Association have been sent to all the members. The results already prove that these departments will be of great usefulness.

The adoption of the report, moved by Mr. Hobson, and seconded by Mr. Whyte, was carried.

RAILWAY AND TRANSPORTATION.

The Chairman, Mr. W. R. Dunn, read the report of the Railway and Transportation Committee, the most important paragraphs of which were as follows:

Readjustment of Rates.

The Department reports the receipt of an order from the Railway Commission directing that the revised tariffs of freight tolls referred to in the order of the Board dated July 6, 1907, go into force not later than January 1, 1908. The attention of the Commission was called to the fact that the railways had put in effect the winter rates on November 15, notwithstanding the order of the Board requiring a general reduction. We have, therefore, asked that the Board order a continuance of the summer rates until the new rates become effective. We have not yet been advised as to what action has been taken.

Rates to the Northwest.

The Department reports receipt of advice that the above rates will not become effective until December 15.

Re-organization of the Board of Railway Commissioners.

A delegation was arranged to wait upon the Premier and the Minister of Railways and Canals in regard to the re-

organization of the Board of Railway Commissioners, in accordance with the resolution passed at the last meeting of the Executive Council. The delegation was favorably received and every consideration promised to the views set forth.

Enquiry was made by Mr. Rowley regarding the proposed amendment to the Railway Act, whether or not it would require the railways to advertise more widely than they do at present the new freight tariffs which they issue from time to time. Mr. Walsh explained the present method of displaying these new tariffs in the various freight offices of the railways, but Mr. Rowley thought that notices of all advances in rates should be printed and distributed generally to shippers likely to be affected. To this Mr. Walsh replied that the amendment contemplated forcing the railways to give public notice of all advances in rates through the medium of the press.

Several suggestions were made, looking to an improvement in the method whereby shippers were informed of advancing rates, after which it was moved by Mr. Cauldwell, seconded by Mr. Rogers, that the matter be left in the hands of the Manager of the Department for him to make such arrangements as he could with the railway companies to be supplied with their new tariffs as issued, and then to publish such portion of same in INDUSTRIAL CANADA as he might see fit; failing to secure a promise from the railways that they would supply the tariffs, the Manager of the Department to be instructed to bring the matter up again for the consideration of the Committee. Carried.

The report of the committee was on motion of Mr. Dunn, seconded by Mr. Flavelle, regularly adopted.

TARIFF.

The report of the Tariff Committee was read by the Secretary as follows:

Leeway in Dumping Regulations.

In compliance with instructions given the Committee by the Executive Council in November, the bridge builders and representative boiler manufacturers have been communicated with to ascertain what objections, if any, they would offer to the proposal to abolish the 5 per cent. leeway allowed in the case of iron and steel products. It is quite apparent, both from the correspondence and from the personal representations of some bridge builders who appeared before the Committee, that strong opposition will be raised, first, on account of the endless disputes with customs officers to which the abolition of the leeway would give rise, and second, on account of the inability of Canadian rolling mills to supply certain classes of iron and steel material. Your Committee feel that the question is surrounded with too many technical difficulties to enable them to bring in a recommendation upon it, and they would therefore respectfully refer it back to the Council.

As regards the leeway of 7½ per cent. allowed in the case of articles other than those of iron and steel, your committee are inclined to believe that its abolition would meet with general favor, but as certain individual interests might here, too, be injuriously affected they prefer to make no recommendation, but to have the matter discussed in Council.

Establishment of Tariff Department.

Careful consideration has been given to the establishment in connection with the Association of a Tariff Department under the management of an expert tariff officer, whose time will be devoted to the investigation, on a thoroughly scientific basis, of all complaints of inadequate protection. While much good might be expected to result from the establishment of such a department, providing the responsibility of recommend-

ing changes in the tariff were left to independent commission, your Committee believe that until the Government appoints such a commission the efforts of the Association would be largely wasted.

It is recommended, therefore, that strong representations be made to the Government at once, favoring the appointment of a permanent Tariff Commission, and that as soon as the Government accedes to our request in this matter the Committee be instructed to take prompt steps towards securing the services of a tariff officer.

Woollen Section.

Further complaints having been received from the Woollen Section that their industry is in need of immediate attention at the hands of the Government, it is recommended that the Association place itself on record as follows:

That this Association is deeply impressed with the deplorable condition of the woollen industry of Canada, which it believes to be threatened with speedy and total extinction unless some relief be promptly given; it therefore strongly urges the Government to give its immediate consideration to the matter, to the end that a very important industry may be preserved to the country.

Franco-Canadian Treaty.

Owing to the fact that the new French treaty has only recently been made public, your Committee regret to have to state that they are not in a position to make any report. They do feel, however, in order that the French preference may be restricted absolutely to the class of goods to which it is intended to apply, that Government stamps should first be affixed to all shipments entitled to the benefit of same.

Discussing the leeway in the Dumping Regulations Mr. Younge stated that while the Council might be willing to allow the 5 per cent. leeway to stand until the interests affected could be gotten together and reconciled, he thought it very important that prompt steps should be taken to have the Government disallow the 7½ per cent. leeway provided in the case of articles other than those of iron and steel. He therefore moved, seconded by Mr. Beer, that the Association press for the abolition of the 7½ per cent. clause immediately.

Mr. J. F. Ellis was opposed to making any recommendations until such time as the Association could ask for the abolition of all leeways, for the reason that it might appear inconsistent to ask for it in one case and to allow it to stand in another.

Mr. McNaught pointed out that the leeway regulations were subject to modification at any time by Order-in-Council, and expressed the belief that the Government would gladly meet the wishes of the Association in the matter if a strong stand were taken.

Mr. Robins expressed the belief that the Association should also press for the abolition of the 5 per cent. clause, on the grounds that we should resist to the utmost the slightest attempt to slaughter United States goods in Canada during the present industrial depression.

Mr. Wilkins reminded the meeting that the predictions of the Tariff Committee regarding times of depression were now beginning to come true; that it was not a time for latitude of any kind, but that the Association should insist on keeping up all possible bars to foreign-made goods.

Mr. Rowley recalled the fact that the United States did not reciprocate in the matter of a dumping leeway, and he saw no reason why Canada should grant favors when she was given none.

The President stated that it had been agreed by the iron and steel men present at the meeting of the Tariff Committee that they would get together at an early date and endeavor to adjust their differences, and that for this reason

it was inadvisable for the Executive to press for any immediate change in the regulation affecting them.

After further discussion by Mr. Ellis, Mr. Ewing and Mr. Whyte, Mr. Younge's motion was put and carried.

The second paragraph recommending the establishment of a Tariff Department was also adopted.

The resolution regarding the woollen industry provoked a long discussion. The Committee had at first been prepared to recommend certain specific forms of redress for the woollen industry including (1) the elimination of the words "soluble in water" from item No. 203 of the tariff, (2) the modification of item No. 468 so as to permit of the importation of winding machinery at the lower rate of duty, and (3) the maintenance of a strong protective tariff on printed yarns.

Mr. Horsfall, however, pointed out that it would simply weaken the case of the woollen men if the Government were asked for what would after all be only trifles. What the industry required was 10 per cent. more protection all around, and unless it received it it would have to go to the wall sooner or later.

Mr. Wilkins, on behalf of the users of woollen goods, spoke strongly in favor of according them increased protection. Generally speaking he had found the cheaper class of English woollens absolutely unreliable, whereas Canadian woollens though costing a little more, wore more than twice as long. On motion of Mr. Robins these specific recommendations were replaced by the general resolution appearing above.

In response to some further remarks by Mr. Horsfall, who claimed that the Association had never properly looked after the interests of the woollen men, Mr. McNaught, as Chairman of the Tariff Committee for four successive years, stated that in his opinion the Association had gone to the Government in the interests of the woollen industry more frequently and expressed itself more clearly than in the case of any other trade. He strongly supported Mr. Robins' amendment incorporated above, which on a vote having been taken was declared carried.

The adoption of the entire report as moved by Mr. Ellis, and seconded by Mr. McNaught, was then carried.

RECEPTION AND MEMBERSHIP.

The Chairman, Mr. G. Frank Beer, read the report of the Reception and Membership Committee which recommended for acceptance the following applications:

New Members.

HAILEYBURY, ONT.

Haileybury Brick and Tile Co., Limited.—Brick and tile.

HAMILTON, ONT.

The Canadian Shovel & Tool Co., Limited.—Shovels, spades, scoops.

HORNINGS MILLS, ONT.

R. U. Irwin & Son.—Skewers, broom handles, lumber, hoops, children's school boxes.

QUEBEC, QUE.

Walter Sharpe.—Cement.

St. Lawrence Paper Bag Co.—Paper bags.

THETFORD MINES, QUE.

Bell Asbestos Mines.—Asbestos.

TORONTO, ONT.

McCann-Knox Milling Co., Limited.—Cereals of all kinds, flour, feed, etc.

Pratt Food Co., of Canada, Limited.—Veterinary remedies
TORONTO JUNCTION, ONT.

Dominion Brush & Mirror Co., Limited.—Toilet brushes and combination sets, hand mirrors.

The Giant Mfg. Co., Limited.—Varnishes, lubricating oils.

WIARTON, ONT.

Colonial Portland Cement Co., Limited.—Cement.

Hamilton Dinner.

The Committee was pleased to report the receipt of word from the Hamilton members to the effect that they would be glad to co-operate in the holding of a dinner in that city in the month of January, and in order to ensure as large an attendance as possible it was recommended that the next meeting of the Council be held in the city of Hamilton on January 16th, and that the dinner take place the same evening.

Emblem for Members' Stationery.

The Committee had for some time been considering the suggestion of adopting an emblem for use by members of the Association on their stationery, whereby they would advertise their membership among all those with whom they might be in correspondence. Sample designs were laid before the meeting, and after the views of a large number of those present had been received, the Committee were empowered to select a design which would be a modification of one of those submitted, and which would embody certain features more acceptable to the Council.

The adoption of the report moved by Mr. Beer, seconded by Mr. Fleming, was then carried.

INSURANCE.

The report of the Insurance Committee as presented by the Chairman, Mr. Alfred Jephcott, was regularly adopted.

It read as follows:

The Mutual Fire Insurance Companies having now completed their independent organization, the Department is free to develop the plans approved by the Council in respect to the general work of policy examinations, inspections and so forth. During the past three or four weeks it has become quite evident that there is a large amount of important work to be done on the lines laid down by the Committee when the time is opportune to secure it; meanwhile, the Department Manager is doing all the work it is possible for any one man to do.

It will interest the Council to know that the Department now has twenty-four triennial contracts for the examination and supervision of policies, aggregating over five million dollars of insurance with a guaranteed income of over one thousand dollars per annum, and it is gratifying to record that eight of these have been added in the month of November, totalling \$1,648,000 of insurance with an income of \$305.00. The Committee is of the opinion that this phase of the Department's work can be largely developed to the advantage of the members of the Association.

Another important section of the work is found in the arrangement and supervision of contracts for the installation of automatic sprinklers, and five contracts involving an outlay of over \$35,000 have been entered into on behalf of members. One is just completed and the Department fee paid to the Treasurer; four are in progress, and require constant watching, and it will be evident that this work alone occupies much of the time of the Manager of the Department. The financial stringency has temporarily checked the growth of this particular business, but on a return to normal conditions we believe there will be an increasing demand upon the Department in the arrangement of contracts for this unsurpassed method of fire extinguishing.

Within the last few days a serious accident occurred at the factory of one of our members owing to the collapse of a tower and tank used in connection with the sprinkler system. In view of the importance of the incident the Manager was instructed to make a thorough and careful study and examination of the structure with a view to ascertaining the cause of the disaster and profiting by any lessons it might teach. To assist in more clearly establishing its cause the

Committee sanctioned the employment of a consulting engineer of Toronto, and a report will be presented in due course. Meanwhile, as the contractors and the firm whose property was seriously damaged are both members of the Association, the Committee do not feel warranted in going into any further particulars at the present time.

At the July meeting of the Committee permission was given to the Manager of the Department to become a member of the Advisory Committee of the Ottawa Insurance Company in connection with the issue of a profit-sharing policy, the plan proposed being one that was felt to be in the direction of further relief from the existing high rates. This recommendation should have been reported to the Council for ratification at the succeeding meeting, but was inadvertently omitted.

Complaint has now been made to the Committee that the firm of agents in Toronto controlling the Ottawa Insurance Company, and issuing the profit-sharing policy, are circularizing the manufacturers in a manner that connects the Association with the private enterprise of the firm in question, and that is calculated to convey an erroneous impression of the meaning and support granted by the Committee to the particular class of policy. Steps have been taken to at once put a stop to the issuance of any literature that is not confined to the scope of the Committee's action, and we believe we may be safely trusted to fully safeguard the interest of the Association in this matter.

The recommendation of the Committee that the Manager of the Department be permitted to sit on the Advisory Committee of the Ottawa Insurance Company in connection with the profit-sharing policy is now before the Council for their approval.

"INDUSTRIAL CANADA."

In the absence of the Chairman the report of the INDUSTRIAL CANADA Committee was presented by Mr. Geo. Brigden. Taking up the suggestion passed on to it by the Commercial Intelligence Committee that it should superintend the issue of a new edition of the *Canadian Trade Index*, the Committee after careful consideration recommended that the issuance of a Trade Index, as such, be discontinued, and that for the future the Association publish once every year in INDUSTRIAL CANADA a classified directory of its membership. Several advantages were claimed for this plan, among which it is sufficient to mention that it would be the means of effecting a material saving, and at the same time give the membership the benefit of more frequent classification.

The adoption of the report, moved by Mr. Brigden, seconded by Mr. Younge, was carried.

BRITISH OFFICE.

The report of the British Office Committee was presented by the Secretary. The following extracts cover the principal matters dealt with:

Baggage Checking System.

An effort has been made to arrange with the General Passenger Agent of the C.P.R. for a through baggage checking system from Liverpool to points in Canada, for all immigrants booked over their line, the idea being to have one British agent collect checks from workmen whose fares have to be advanced and forward same to the employer on this side, thus ensuring the workman going through to destination and reporting for duty. Notwithstanding efforts made both in Canada and in England, the C.P.R. have stated that they are unable to meet the Association in this matter, and it is the belief of your Committee that until the roads in England alter their system of handling baggage it will be impossible to effect the change asked for.

Insuring Passage Money.

The necessity for such a checking system, however, is to a large extent done away with by the fact that arrangements have recently been made with a bonding company in England, whereby all advances of passage money may be insured. The applicant for the insurance must of course be able to satisfy the company that the moral hazard is a good one. The premium will be \$2.50 per fare, no fare to exceed \$35, and with each week the employee remains at work after his arrival the liability of the insuring company will automatically decrease \$2.50. This arrangement presupposes that the employer will reimburse himself out of the workman's wages to the extent of \$2.50 each week until the whole advance is repaid.

Before putting the arrangement into effect careful enquiry will be made into the financial standing of the insurers.

Complaints re Service.

A lengthy report was made by the Committee regarding complaints of unsatisfactory service that had been received from members. This report was based on the personal investigations made by Mr. Bermingham, a member of the Committee, who had visited the office of the Association's London agent.

It pointed out that generally speaking employers who had had no personal experience in engaging help abroad failed to realize the difficulties under which the work had to be carried on. Fully 90 per cent. of the people applying for work were either unfit or undesirable for employment in Canadian factories. Each one, however, had to be seen and spoken to before his fitness or otherwise could be ascertained, and this weeding out process involved a great deal of time and work. In the case of the remaining 10 per cent. references had to be looked up. Frequently they were found to have been given without sufficient justification, while sometimes they proved to be quite bogus. A number of the cases of dissatisfaction reported were shown on investigation to have been due to the unreliability of testimonials given by reputable firms, clergymen and others whose word would ordinarily be expected to carry weight.

Considering these points and balancing off the cases of dissatisfaction with the cases where absolute satisfaction had been given, the Committee were of the opinion that the work was being done as well as could reasonably be expected.

The report concluded with the recommendation that a hearty vote of thanks be extended to Mr. Bermingham for his valuable services.

The adoption of the report moved by Mr. Robins, seconded by Mr. Birks, was carried.

On motion of Mr. Beer, the Committee was requested to supply the Council at the January meeting with a statement showing the receipts and expenditures to date as well as the liabilities incurred and the revenue earned.

BRANCHES.

The report of the Quebec Branch was presented by Major Hetherington, and was regularly received. It will be found below.

NEW BUSINESS.

Under the head of new business Mr. Younge took occasion to express the appreciation felt by all those from outside points who had enjoyed the hospitality of the Ottawa members, and it was with pleasure that he moved that a hearty vote of thanks be tendered them. Mr. Casavant seconded the motion, which was also supported by Mr. Wilkins and carried unanimously.

Mr. Wilkins thought the Association should again make an

effort to secure the repeal of the tax on commercial travellers that was still being maintained by Prince Edward Island. He pointed out that this piece of provincialism had been abandoned in nearly every other part of Canada, and expressed the belief that its repeal could also be brought about in Prince Edward Island if gone after in the proper manner. He accordingly moved, seconded by Mr. Dougall, that the Parliamentary Committee be asked to co-operate with the Commercial Travellers' Association to this end. Carried.

The meeting then adjourned.

DINNER OF TORONTO BRANCH.

The Toronto Branch of the Canadian Manufacturers' Association held a dinner at McConkey's on Dec. 19 to discuss the Power By-law. The importance of the subject was sufficient to draw out a large attendance, and the members were rewarded by one of the clearest presentations of both sides of the question which was given during the whole campaign. Mr. E. J. Freyseng, Chairman of the branch, occupied the chair, and there were also present many manufacturers who have taken a leading part in helping to solve the problem of power. After a thorough discussion a resolution was proposed by Mr. J. O. Thorn and Mr. Thos. Roden in favor of the by-law. This was carried by a large majority.

QUEBEC BRANCH.

Since submitting the annual report of what had been done by our Branch, we have pleasure in announcing that as a result of our efforts, we have been able to convince the Quebec City Council of the inadvisability of hurrying the adoption of a most drastic smoke by-law, which we considered unreasonable.

Our civic authorities were particularly interested and impressed by the memorial we submitted to them on this matter, and we now have their assurance that no ordinance will be enacted without first consulting us and endeavoring to meet our own suggestions.

Our Branch adopted also special resolutions in favor of the two petitions placed before the Premier of this Province, Hon. Mr. Gouin regarding the labor of the Province of Quebec, and also an amendment to the law of garnishment. It has been decided that our Branch would support the Montreal Branch by all means at our disposal to obtain the earliest effective action of the Provincial Government on these questions.

On October the 15th last, our Branch gave a most successful dinner to its ex-Chairman, Mr. G. A. Vandry, on the occasion of his return to Quebec after a trip around the world. The President of the Association, Hon. Mr. Rolland, was present among the invited guests, and once more we had the occasion to recognize the good results of such pleasant gatherings, tending as they do to bring together and make better acquainted the members of the Manufacturers' Association in the ancient Capital.

Our Branch presented a memorial before the Government Commission re Workmen's Compensation. All the other public organizations, such as the Board of Trade, the Boot and Shoe Manufacturers' Association, and the Builders' Exchange of our city, were seen before taking action, and we are glad to say all were unanimous in adopting our own views on this matter. While admitting we were in favor of legislation preventing the recourse of interested parties to expensive litigation, we suggested that such matters being particularly

connected with industry and therefore trade and commerce, we would learn with pleasure the adoption of any law on this important question rather by the Federal Government than by the local legislature. So that the result would be a uniform law for all the Provinces, and all Canadian manufacturers would work under the same conditions.

Our Local Executive Committee, with the President of the Special Committee on Technical Education, had on November 27th an interview with our Premier, Hon. Mr. Gouin, on this question. You will no doubt learn from Mr. Wickett the result of this interview.

Our Branch has been for some time considering the advisability of enlarging its sphere of action by taking in all the manufacturers, members of the Association of the surrounding districts, who now as isolated individuals, have not the same means of making their influence felt in local affairs as if they belonged to a branch. This would be mutually beneficial to the Quebec Branch and the outlying parties concerned. A motion to this effect will be brought before your Council.

It is also a satisfaction for us to report that for the last two months, our membership has increased by 10 per cent., as seven new members have been proposed and accepted.

All of which is respectfully submitted.

MANUFACTURERS' REPRESENTATIVE.

A capable and enterprising business man with two years' experience in a high class Canadian manufacturing establishment is anxious to hear from a few good Canadian firms seeking to develop export business in Great Britain, which is his native land, and to which he is about to return. Can furnish excellent references, and has a good proposition to put before firms interested. Will handle any lines and push them hard. Address can be obtained at this office.

AN ARTISAN SCHOOL.

The following interesting account of the establishment of a school for workmen is given by Professor John E. Sweet, of Syracuse, N.Y., in a recent number of *American Industries*:

It having become known to some extent throughout the country that the proprietors of the iron industries in Syracuse had started the Artisan School, a place where boys could learn the machinists' and pattern-makers' trades, the letters of inquiry that have poured in on us indicate that the machinist branch of mechanical industries is alive to the notion that something ought to be done to give opportunities for American boys to learn the machinist trade, not only to give the boys a fair chance, but to meet the call for the fast growing demand for good men.

To learn that a thing ought to be done, and even to be willing to help if some one will show the way, is not doing it.

While our wealthy men like Rockefeller, Cornell, Vassar and many others have given fortunes to build up educational institutions and Carnegie libraries; and Pratt, Webb, Williamson, Sibley, L. C. Smith and others have established schools where book and hand learning are combined, they almost all lead to the production of men of a technical character who are not just what the country is most in need of; and cannot fill the want for that class of men for which there is the largest field, competent workmen.

The Artisan School, it is believed, is the first, or among the first started, with the sole view of training workmen pure and simple.

Whether it can be made to work is entirely problematical. It is easy to predict that it won't and enough reasons why can be advanced, but just whether it can or not no one can tell because no one has tried.

It is true that the Webb School, the Pratt Institute and the Williamson Schools are successful, but the money was given by individuals and the schools, as said before, are a combination of books and shop.

The Westinghouse, General Electric, and perhaps other schools established by great industries, succeed in making men for themselves, but they are so situated that they have at hand suitable kinds of work and all grades of work to meet the ability of the boy; but the school pure and simple has to purchase its material, has to devise its own work, has to dispose of its product. To make machinists it must do machine work, must have a plant, teachers, power, heat, light and water, and all these cost money.

To pay, after all these are provided, then will be the work of the boys which you either get for nothing or for pay, if it is decided to pay.

Some say you cannot get the boys if you do not pay. So far the Artisan School has demonstrated that you can.

It is said they will not stay; well, so far they do. Whether they will stay until they become good machinists no one knows yet.

It likely will depend on the teachers, the character of the work, which must be such as they can take an interest in, and the attractiveness of the place, or the influence of the parents for the first few years, and the salaries the journeymen receive after they are set adrift.

So far as the first seven or eight months show, it is certain the boys cannot earn one-third of the bare running expenses. Maybe the right management would do better. It has shown that the number of boys that one instructor can handle while all the boys are fresh are very few—five or six keep him busy.

It has been the aim to do everything better than the same class of work is done in the regular shops, believing that this will build up a reputation for the boys when they go out.

It is the belief that if the boys are trained to do honest work a stride has been made toward making honest men.

Just what could be done with boys if they had gone through such a course of training as President Van Cleave advocates no one can tell.

We have to deal with the boys as we find them, but whatever the plan, teaching trades is going to cost money. The glory is not great enough to have many wealthy men put it up.

The machinist trade cannot be taught, or rather the boy cannot learn the trade without the machines and tools to work with and make commercially workable machines and tools. He must do the work in the school that he is to do outside, and do it in the same way.

The best shop customs must prevail and the place must think, talk and smell of the shop, must create shop enthusiasm and pride in its product, and the product must be things at first and the best machinists in the end.

A National Type.

A most artistic and attractive Christmas remembrance has been received from the Ontario Engraving Co., of Hamilton. It takes the form of a reproduction of "The Habitant," a characteristic study of the French Canadian, an old man, with his ever present pipe. The head is mounted on colored mattes, and is so artistic as to ensure its exhibition in a prominent place in the owner's quarters.

FORD Model "S"

Price \$800
F. O. B. Walkerville
 including 2 side oil lamps,
 tail lamp, tube horn, tools,
 repair kit and pump.

THE 1908 "EDITION DE LUXE" of the famous Ford Runabout. Same chassis as Model "N," same general design but with special fenders, running board and storage battery ignition system. The fine finish and extremely handsome lines of this model appeals to the man of critical taste who wants elegance coupled with efficiency. Model "S" has 28" x 3" tires, ironed for top and in a word is the finished Ford idea of Runabout perfection. Don't forget when you are buying a Ford car, you are only paying for actual automobile value. The name "Ford" costs you nothing, but it's worth more than most guarantees. For catalog and full particulars write

THE EDITORIAL VIEWPOINT.

What Our Immigration Agents Do.

The Minister of the Interior, in a debate in the House of Commons on immigration matters, stated, as if it were something that justified the Government's whole policy on this question, that the Canadian agents abroad were instructed to confine their efforts exclusively to the sending out of farmers, railway laborers and domestic servants. No encouragement, advice or information was to be given to anyone concerning any other line of Canadian activity. If unscrupulous persons took advantage of the ignorance of skilled laborers and investors to fleece them in the name of Canada that was something for which the Government could not be held responsible. The Government had no interest in these people, and had instructed all its agents to refuse to enlighten them on Canada and its advantages from an industrial or commercial standpoint. So long as the agents of the Government confine their efforts to sending out farmers, laborers and domestic servants, there could be no ground for complaint, according to the Minister. Some of the rest of us take a different view, however. When, for instance, we see some of these railway laborers, of whom the Minister boasts, murdering each other on our streets; when, in a city like Mont-

real, the pistol and stiletto in the hands of these *protégés* of the Government have become a menace to the lives of our citizens, is it any wonder that we question the wisdom of paying a bounty for this class of citizens, while refusing all information to skilled laborers and small capitalists? The farmers, the laborers, and the domestic servants we need, and it is a good thing to send them out, but we also need capital, and very frequently there is an urgent need of skilled mechanics, and these should at least have an opportunity of finding out from a reliable source what prospects there are in Canada for them. The failure of our officials abroad to give this information, very frequently results in the loss to Canada of the most desirable class of citizens.

What They Don't Do.

About a year ago the writer was in the Canadian Immigration Office in London one day when an incident occurred that strikingly illustrates the folly of the present policy. A sharp, business looking man, of perhaps forty, came in, and, walking up to an official, stated that he had between five and six thousand pounds (\$25,000 to \$30,000), and had made up his mind to go to Canada or Australia and go into business. He wanted information as to whether it would be wise to open in Montreal or was there some other city or town with better opportunities? Here was a man with capital—more capital than four-fifths of our merchants—who could purchase and pay for a stock of goods, who would be a help to our manufacturers and to any town in which he located. This was the kind of man one would have expected to see received with open arms and assisted in every way possible. Not so, however. The instructions from Ottawa, which Mr. Oliver parades as the Government's defence, stood in the way. This man did not fit into farming, railroad navvying or domestic service. The services of the Canadian Office were not for him, and so he was told. The agent gave him some pamphlets about farming and let him go—most likely to Australia. Enquiry elicited the information that a great many men of this class called and all were treated in the same way. Surely this is not in the interest of Canada. It is hard to believe that such a stupid policy is in force, but what one sees with one's own eyes one is forced to credit.

What They Should Do.

If the Government Immigration offices in London and elsewhere were instructed to do all that they are in a position to do for the upbuilding of this country, there would be no chance of an incident such as the above occurring. They should be supplied with full information concerning the in-

dustrial and commercial conditions of Canada, and instructed to give all the assistance in their power to people seeking such knowledge. It is hard to understand the reasoning that makes it a virtue for the Canadian agents to send out railway laborers and a crime for them to send out skilled mechanics. It is a duty of the agent to hunt up laborers and tell them where they can get work in a railway camp; but an offence to even mention that a Canadian factory is short of hands. This does not seem right or fair on the face of it, and it needs some better explanation than has yet been given. One would think that the Government Immigration Offices abroad would be supplied with every possible kind of information concerning every feature in the life of the country, and that it would be freely given to every one that applied for it. The offices need not be turned into employment agencies, but they should act as information bureaus, which would offer some measure of protection to foreign workingmen, who are now at the mercy of unscrupulous fake agencies. It should be as much the duty of the Canadian offices to warn skilled workingmen who are not needed against coming, as to give them information of any shortage that may exist in any line of industry. If this were done there would be fewer skilled workingmen from abroad vainly seeking employment in this country and complaining of the deception of which they are the victims.

A Piano Deal.

It is not often that the purchase of a piano becomes a matter of public concern, but then the Government is not purchasing pianos every day, and perhaps it is as well for the reputation of Canadian instruments that it is not. Recently, two new pianos were purchased by the Government, one for the Speaker of the Senate and one for the Speaker of the House of Commons. The instruments chosen, strange to say, were not of Canadian manufacture, but two of an American make that at one time enjoyed an enviable reputation. To-day, however, there are a number of manufacturers in Canada turning out superior instruments, and it was to have been expected that one of these would have been chosen. The agent of the American instrument was not slow in making use of the advantage the Government had given him over the native article. He announced the fact in the press, using the Government's choice as an argument in favor of the imported instrument and a good argument it was, too. If the Government had to go outside of Canada to get a first-class instrument, the inference is that other people would do well to follow the example set them. The piano manufacturers of Canada have every reason to complain of the Government's action in this matter. The purchase of a piano more or less does not make any great difference to them ordinarily, but when it comes to the Government passing by all the high-class Canadian pianos to place the seal of its approval on a foreign instrument of inferior quality, there is just cause for a vigorous protest. Even had the piano chosen been superior to any made in Canada, that would not have been a sufficient excuse for going outside the country to make the purchase. As a matter of fact, Canadian manufacturers are turning out instruments that can hold their own with any in the world, so that even that excuse is denied the official responsible for the purchase. The politicians do a lot of talking about the deep interest they take in the progress of the country, and the great pride they feel in the advancement of its industries, but one has reason to doubt their sincerity when an instance of this kind crops up.

Enforcing the Dumping Act.

The Dumping Act is intended to protect Canadian manufacturers and merchants against slaughter sales of

foreign goods. At a time like the present, when there is a pressing need of ready money in the United States, the temptation to slaughter goods on the Canadian market, where the money stringency has scarcely been felt, is very great, and were it not for the provisions of the act our markets would be so flooded with slaughtered stocks that our factories would have to close down for want of orders. The act is right in principle, but in its operation it is sometimes very annoying and costly to Canadian merchants who have consignments seized through the ignorance of the customs officials. Very often there is a legitimate, though sudden, drop in the price of a commodity, and a Canadian merchant who secures a consignment at the reduced price runs the risk of having it held up by the Canadian Customs officials under the provisions of the Dumping Act. The officials are not to blame, for they are performing their duty to the best of their ability. They have neither the time nor the opportunity to follow the market fluctuations in the hundreds of lines of merchandise they are called upon to examine for entry. When a customs examiner comes across an invoice for a consignment of goods, which shows a reduction in price of twenty-five or even fifty per cent as compared with a similar entry of perhaps only a week before, his suspicions are naturally aroused and he refuses to pass the goods. The invoice may be perfectly correct, but how is he to know it? The merchant may be in urgent need of his goods, but he has to do without them till the matter is investigated, and this is a slow process. If the goods happen to be a part of his winter stock he has a fair chance of getting them some time in July, when they are practically worthless to him. Instances have been known where goods were held till the market actually dropped far below the invoiced price at which they were refused entry. In such a case the merchant has to take his losses. It is needless to say that this is a serious state of affairs and calls for a remedy.

Cases of Under-valuation.

On the other hand the undervaluation that passes without challenge is probably quite as common. There are very few people in Canada who have not received from their local merchants clothing or fur catalogues which were printed in the United States. The dealer sends his photographs to an American printer who has cuts made from them, prints the catalogue and invoices it at the mere cost of paper and printing. The cuts are kept on the other side of the line and are charged for in a separate invoice. For instance, a merchant orders a catalogue to cost him, say, \$1,000. Of this, \$500 goes into the engraving and the balance into the printing. When the shipment of catalogues arrives at the port of entry, it is invoiced at \$500, and passed at that figure. The bill for the cuts comes by mail and is paid for separately. This is a glaring instance of under-valuation that is costing our printers and engravers thousands of dollars every year. Another instance is that of a Montreal manufacturer, who was being ruined by unfair competition from London. Goods in his line were being passed through the customs at a valuation far below what he could manufacture them for. He complained repeatedly, but could get no satisfaction, till at last, in desperation, he packed his trunk and went to London himself. There he had no difficulty in collecting the evidence to prove his case, and so he got relief. He had to spend his time and his money, and neglect his business, but his only choice lay between that and ruin. It does not seem fair that anyone should be put to such great inconvenience and expense in order to get relief under the law.

The Remedy.

The remedy for these evils lies in an efficient staff of inspectors. At the present time the Government has only

five inspectors in the United States, and none at all in Europe. Even admitting that these five men are the most industrious and competent possible, to expect them to keep in touch with conditions throughout the United States is to expect something that is not within the range of human ability. The staff should be large enough to cover the ground and should include practical men in every line. In the case of the catalogues, for instance, a practical man could in a very few minutes estimate within a few dollars the actual cost of production and prevent them going through at an undervaluation that is unjust to our own printers and engravers. The Canadian printer has to pay duty on his type and printing presses, which are not manufactured here, and on certain lines of coated papers most commonly used in such work. In like manner the engraver has a heavy duty to pay on his copper and zinc and machinery, and he is not in a position to compete with the Americans if they are allowed to invoice their shipments at half their real value. The same is true in other lines, and the only way to stop it is to have a staff of inspectors with the necessary technical knowledge. If the customs tariff is to fulfill its purpose it is necessary to have it enforced in an intelligent manner, which in many instances is not the case at the present time.

Cancellation of Orders.

Many of our manufacturers have a grievance against wholesalers and jobbers who cancel orders months after they have been given, and at a time when the goods are nearing completion and most of the cost of their production has already been expended. Take, for instance, the case of a wholesale house ordering a line of woollen goods. The manufacturer purchases the raw material and sets to work on turning out the goods. When he has disbursed for material and labor probably three-quarters of the total value of the order, along comes a notification from the wholesaler to cancel it. The manufacturer can, of course, compel acceptance of the goods, but if he does so the wholesaler will never give him an order again. This is a very unfair position in which to place the manufacturer, but under the present system of selling through wholesale houses and jobbers, he is helpless. The only way for the manufacturer to free himself from this bondage, for it cannot well be otherwise described, is to put his own travellers on the road and sell his products direct to the retailer. This means a big increase in his office staff and sales department, but he would get a better price for his goods, and would not have to take the losses which the cancellation of half-completed orders entails. If the wholesalers persist in their present treatment of the manufacturer, the upshot will be that the latter will go after the retailer direct, and the middleman will find himself out of business. The manufacturer has the best side of the argument if he elects to put up a fight for fair, not to say honorable, treatment.

A Valuable Clause.

There is a clause in the French Treaty that is deserving of commendation. However the rest of the treaty may work out, the clause making it necessary for goods to be shipped direct to and from a Canadian port in order to enjoy its benefits, cannot fail to be of great service in the building up of our ocean ports. Some of the big American manufacturing firms who have branch factories in Canada, are already making arrangements to manufacture in this country all the goods they require for their French trade. This means, in addition to the increase in shipping, an increase in employment for our workingmen. To get the fullest benefit from this clause, however, there is need of a vast improvement in the trans-

portation facilities inland from our winter ports. A merchant in Toronto or Montreal can get delivery of goods by fast freight from New York in twenty-four hours, from St. John he is lucky if he gets it in a week. One Montreal firm that has a car shipped every Saturday morning from near Halifax, seldom gets it before Thursday, and often not until Friday, and this, notwithstanding that it is a regular shipment every week in the year and is supposed to take only forty-eight hours. This is a state of affairs that needs improving, if the advantages of the lower duties via a Canadian port are not to be more than offset by the losses which delays in transportation frequently entail.

The Pulpwood Question.

Press dispatches inform us that a United States syndicate has been making purchases of large tracts of pulpwood forests in New Brunswick, with a view to supplying the demands of their pulp and paper mills located in the New England States. This brings home to us the urgent need there is for immediate action on the part of the Dominion Government in the direction of some measure to prevent the sacrifice of our pulpwood forests for the benefit of American mill-owners. As already pointed out by INDUSTRIAL CANADA, our pulpwood forests are amongst the most valuable of our natural resources. Their conversion into paper here in Canada would add many millions to the wealth of the country. Thousands of men would find employment in the hundreds of factories necessary to carry on such an extensive undertaking, and the feeding, clothing and housing of these would mean profitable employment for thousands of others. The farmer, the manufacturer, and the merchant would all feel the benefit, and Canadians generally would be getting the full advantage. But all this depends upon the prompt action of the Government. It is not a matter to be put off from session to session and from parliament to parliament. While the Government hesitates, the Americans are at work hewing down the forests and hauling them across the line to give employment to American workingmen. Now is the time to act, not after the forests have been destroyed, and all the wealth that is in them has been extracted by foreigners. What is the good of being a Canadian if anyone from anywhere is at liberty to come in and carry away all the natural wealth of the country without let or hindrance? If the natural resources of Canada are not going to be conserved for the particular benefit of Canadians, we might as well throw the whole thing up, and stop our foolish talk about being a nation. Making treaties of questionable value with foreign countries is not going to deceive anyone into believing that we have suddenly sprung into full-fledged nationhood. A much better indication of nationhood, as of manhood, is to appreciate our advantages and protect them against all comers.

The Chartering of Railways.

At every session of parliament applications are made for railway charters, many of them from anywhere to nowhere. It would be interesting to know how many thousands of miles of railways have been chartered that have never been built, and were never intended to be built by the parties who obtained the charters. A charter which costs very little to obtain frequently sells at a big figure, and it is safe to say that many charters are secured for the sole purpose of speculation. The railways already in operation, especially the big systems, make applications every session for a whole grist of charters, and they usually get all they ask. Most of these charters are sought for the purpose of shutting competition out of the new districts which promise development. The

charters sought for the purpose of speculation should be refused in every instance; and those sought by companies already operating lines should not be granted until the lines already built are fully equipped. The feverish haste with which the big systems are building branch lines and feeders is responsible for the very unsatisfactory service given on main lines. As soon as a branch is completed into some new district, some other portion of the system is robbed of equipment to start the new service in operation. This results in a shortage of cars everywhere and gives satisfaction to no one, except, perhaps, the railway which has succeeded by this means in forestalling competition. The cry of shippers, both East and West, is for more cars and the reply of the railways is more miles of track. The railways should be compelled to maintain a fixed standard of equipment on every portion of their lines, and until that standard has been reached and the roads are in a position to maintain it, no new charters should be granted to them. Until some rule of this kind is made and maintained, shippers will have to contend with the present unsatisfactory conditions.

The Unemployed.

We have been hearing a good deal about the unemployed lately, and considerable sympathy has been wasted on them. It is true there are some cases which are deserving of sympathy, but they do not by any means form the majority. There are many men walking about in idleness to-day, not because they cannot get work, but because they will not work under the new conditions which the recent financial flurry has brought about. The manufacturer who keeps his plant working at its full capacity under the present uncertain conditions is taking big chances, for he is not sure that he will be able to dispose of his output, and if he does the chances are that it will be at a reduced price. To meet this he has to reduce the cost of production, and a lower scale of wages than has obtained in the past few years becomes a matter of necessity. He goes to his men and lays the case before them, offering to keep them employed if they are willing to accept a reasonable wage under the circumstances. It is a perfectly fair and reasonable proposition and, more than that, a generous one on the part of the employer. Some of his employees have the brains to appreciate the situation, but others rebel and quit work. These latter form a large part of the unemployed who want people to sympathize with them. A typical case was reported by the *Ottawa Citizen* recently. A reporter was commissioned to investigate the labor situation in that city, and amongst the many instances he came across was that of a man who had refused a dollar a day and his board for a winter's work, because last year he had been paid a dollar and a quarter. The advocate of the workman's rights was living on what his wife could earn over the wash-tub on two days in the week. In half an hour's walk about the market seeking employment, the reporter was offered five different jobs. The independent investigations of the *Citizen's* reporter demonstrated that the unemployed in that city were not suffering from lack of opportunity to work, so much as from lack of ambition to earn an honest living. What is true of Ottawa is true to a large extent of every other section of Canada. If all the positions that are open at a reasonable wage were filled, the ranks of the unemployed would be greatly reduced, and the few remaining idle would not have long to wait for an opportunity. The only difference between the labor situation now and a few months ago, is that the employer is to-day in a position to fix the salary he is able to pay, instead of having the terms dictated to him by the gentlemen of some union.

The Fake Farmer.

Another gentleman who contributes largely to the ranks of idleness is the fake farmer, for whose presence in this country the Government has paid a bonus of one pound sterling. While the theory is that none but farmers, navvies and domestic servants come under the bounty of the Government, the practice is for the agent to ship out anything that can be made to class as one of these and collect his reward. All the workman has to do is to represent himself as a farm laborer and the Government Immigration agent gets his commission on him. After he lands in this country he may become a bricklayer, a carpenter, a plumber or any other mechanic that he may have been in the old country. Some of the agents are not too scrupulous to tip the mechanic to represent himself as a farmer in order that the booking commission may be collected. Others tell applicants they will have nothing to do with them because they are not farmers, whereupon they pass along to the next Canadian Immigration agent, and, without waiting to be questioned, announce that they have been farmers from childhood and are anxious to get back to nature. On their arrival in Canada, they spend little or no time on the farm, but crowd into the cities and towns in search of employment. These are not the class of men the manufacturers want and they refuse to give them employment, whereupon the Government blames the manufacturer for the existing conditions. Investigation will show that this element forms no small part of the needy unemployed, as well as that of the fastidious class who want to choose jobs and fix salaries. Until the Government devises some plan to stop this traffic in fake farmers, it will have to bear the responsibility for flooding the labor market of Canada. There is no use in their trying to get from under it by shifting it to the shoulders of the manufacturers, who have troubles enough of their own without taking on those which belong to others.

Stock Companies and the Franchise.

This is an age when the joint stock company has replaced the old-fashioned partnership in nearly every business of importance. Indeed the entire wealth of many of our most substantial citizens is invested in this way. There are few really important interests in the country to-day, that do not take the form of joint stock companies, and there is a reason for it. A partnership is a really dangerous thing. The death of a partner or a disagreement amongst partners may easily result in the ruin of a business. With the stock company such things are impossible. The individual is lost in the company. He may die or he may dispose of his interests, but that does not affect the company. In case of death his heirs get the stock and all they can do is deal with it. The company is a thing apart from the individual member. It can buy and it can sell property, holding and giving deeds in its own name; it can sue and it can be sued, and it can even be fined for breaking the laws of the land. But it cannot vote, though it is taxed and made pay its taxes. Here is a weakness in the stock company, which very frequently amounts to a serious handicap. It is a theory of our form of government that there can be no taxation without representation; yet in all our cities and manufacturing towns the bulk of the taxes is paid by companies that have no votes, and therefore no voice in the selection of the men who are to levy taxes upon them. In their case this boasted British theory is given the lie. The stock company has to assume the responsibilities of citizenship, but is denied the privileges, chief amongst which is the franchise.

How It Handicaps.

At the municipal elections in January there was a by-law, known as the "Power By-law," submitted to the electors of a large number of municipalities in Ontario. The carrying of this by-law meant the assuming of a large responsibility by the taxpayers of these cities and towns, and it is safe to say that none will bear such a heavy share of this responsibility as the stock companies, of which there are thousands in the municipalities affected. Moreover, this power proposition was one which touched the companies more closely than any other interests; but they had no voice in the matter. The by-law was carried and the companies will be taxed to carry out its provisions. They have no resource but to pay the taxes whether or not they are satisfied with the proposition. This is a condition of things that does not measure up to what is supposed to be our standard of self-government. When the proposition was made that we should give a cash contribution to Great Britain in aid of the defence of the empire, it was promptly turned down on the plea that it was un-British, inasmuch as it would be recognizing the principle of taxation without representation, because we would have no voice in the selection of those who would have the spending of our money. It does not seem to have occurred to any of the advocates of the contribution to meet this objection by pointing out that the principle of taxation without representation is already well established in this country in the case of stock companies.

The Franchise Must Come.

With the rapid growth of the stock company idea, the day is not far distant when practically all the wealth invested in the business of this country will be represented by stock certificates, and a means will have to be found whereby these vast interests will be given a voice in the selection of the men who make the laws and levy the taxes to which they are compelled to submit. It is not to be expected that every man who holds stock in a company will be given a vote by reason of his holdings, but some plan will have to be devised whereby certain officers, or certain specially selected stockholders will be entitled to express the opinion of the company as a whole, by casting ballots in its behalf. Whether it will be one company, one vote or a number of votes based upon the capital and holdings of the company are matters for discussion and settlement. What is most apparent at present is the fact that the franchise, in some form or other, will have to be granted to the stock companies if the vested interests of the country are to have a say in its government. The stock companies created by the laws of the land, and having no existence outside their jurisdiction, are certainly more deeply interested in the well-being of the country than the individual who can pack his kit, forswear his allegiance and depart to return no more.

Public Ownership.

The Great West seems to have the public ownership bee in its bonnet, and it will be interesting to observe how it works out on the large scale on which they are undertaking it. The Province of Manitoba has purchased the telephone lines of the Bell Telephone Company throughout the province, and henceforth they will be operated as public property. The telephone is a good thing to begin on, for it is a natural monopoly, and if any service should be operated by the government it is one that ought to be successful. Of course the people are expecting all sorts of improvements in service at reduced prices, but by the time the government has paid the operating expenses and earned the interest it will have to pay on the bonds which it issued to cover the purchase price, there may not be much chance left of reducing the cost. If, however, the service is as efficient and the price no higher than was charged by the private company, it may prove a

good thing to have it operated by the government of the province. The telephone service is one that does not admit of competition, for competition only complicates matters, and wherever it has been attempted, it has proved to be both annoying and unprofitable. The chief difficulty with the operation of public utilities "by the people for the people," is that they do not receive the same close attention that is given to privately owned enterprises. There is the too frequent change in the governing body, both of our legislatures and municipal councils, and the result is that men who know absolutely nothing about them are called upon to direct the operation of the publicly owned services. It is true, competent managers may be hired and retained for years, but it has yet to be shown that any business enterprise can be carried on successfully when the principal is so ignorant of its workings that he has to depend upon his assistants to tell him what to do and when to do it at every turn. Private concerns do not succeed under such conditions, and it will be interesting to note whether a public enterprise so handicapped can be made successful.

The Lemieux Act.

The Lemieux labor law in operation has developed some features that were not expected of it by those who had a hand in its making. One of these is the killing effect it has had on the closed shop propositions of the labor unions. Wherever this has been a point at issue in a labor dispute that was being settled under the provisions of the Act, the labor men have had to back down. The proposition is so unreasonable and unjust that it could not be maintained successfully before any independent tribunal. The closed shop means a shop or factory dominated by unionism to such an extent that no workingman, however competent, can be employed therein unless he belongs to the union. More strikes and disagreements have grown out of the closed shop demands of labor unionism than out of any other cause. The employers have all along contended that it was unjust and unreasonable, but unionism has fought for it as for very existence. To the employer it meant the practical surrender of control over his own establishment. In the closed shop the unions fix the scale of wages and the conditions of employment. If the employer ventured to discharge a union man he was in danger of having his plant closed down; and if he engaged a non-union man he was in an equally embarrassing position. The union ran the place, and the man who put in the capital and took all the financial risks was expected to do as he was told. The position of the employer under these conditions was intolerable, and when it came to justify itself before an independent board of arbitrators the union had to give way on the closed shop proposition. The complete wiping out of the closed shop would do more to prevent labor troubles than any other action that could be taken with that end in view. Moreover, it would be removing a handicap from that large body of workingmen who prefer to fight the battle of life on their own merits rather than surrender their liberty of action to some union.

A Change in Method.

A striking change has also taken place in the method of conducting investigations under the Act, and it is a change for the better. In the earlier investigations the proceedings were carried on with all the formalities of a court of justice. The meetings were open to the public and the press was admitted and reported everything fully. Indeed, it was the original intention to give as much publicity to the proceedings as possible, but this method of conducting investigations had serious drawbacks. The formality overawed the workingman, and rendered him incompetent to do justice to himself or his cause. Moreover, if he happened to make a rash statement it was reported by the papers, and once it got into print

he felt he was bound to stand by it no matter how firmly he might be convinced later on of his error. This formality and publicity went a long way to making the earlier attempts at arbitration abortive, and had they been persisted in the Act would have been rendered useless. Boards of arbitration under the Act serve their purpose best by acting as mediums for the bringing together of the employer and the employed. All formalities should be carefully avoided, and the workman made to feel at his ease. Moreover, the shutting out of the press gives him more liberty of speech. He can tongue-thrash the "boss" all he has a mind to, and it will not be printed in the newspapers under scare headings. If he finds later that he has made a mistake and wants to take back some of the things he said in the heat of discussion, he can do so, and the general public will never know that he even so much as thought them. The tendency of all the more recent investigations is in the direction of bringing the two sides together in an informal way, and letting them have it out between themselves. It is a curious development from the first ideas, and indeed from the intention of the Act; but it is a development along the lines of least resistance, and is, therefore, one that is likely to produce the best results.

The Financial Situation.

There has been a decided improvement in the financial situation in the United States during the month, which was reflected in the rapid recovery in stocks traded in on the Wall Street market. The return of confidence is further indicated by the depositors who took fright in the early days of stock panic and withdrew their money from the banks, redepositing it. The outlook for easy money is much brighter, and there are those who predict that it will be a drug on the market before many months have passed. Yet, marked as the improvement has been, conditions are still far below normal, but that the danger point has been passed and a new period of prosperity is about to begin, seems to be the opinion of those best qualified to judge of the situation. While the shrinkage in values of securities reached the lowest point ever known, the period of depression was also of the shortest duration. The quick recovery indicates that there was no real cause for the collapse. It was more in the nature of a stage fright than the outcome of natural causes. Business throughout the country was in a healthy and prosperous condition and there was no reason to expect any change. It is said that the stock market reflects the general business conditions of a country, but in this instance the reverse was the case. While business conditions were the best ever known the stock market suddenly went to smash, causing a depression in trade and commerce, for which there was no reason outside the stock market itself. Right up to the time of the break in stocks deliveries were reported far behind orders, showing that there was no overproduction to cause trouble. Indeed, at no time during the panic were orders lacking. The difficulty was to get ready money to carry on manufacturing to meet the demand. The only way, therefore, to account for the slump in securities is to attribute it to stage fright amongst the gambling element on the market. This fear was communicated to the millions of workingmen and small traders who loaned their savings through the banks to manufacturers, and they demanded the return of their money. The banks in turn called upon their borrowers to take up their paper, and in this way the cash with which the business of the country was carried on was taken out of circulation, and the factories had to close down. Now that the general public has come to see that the trouble was with the stock gamblers, and not with the industries of the country, confidence is being restored, and the outlook is for a return of prosperity in 1908 greater even than that which preceded the panic.

The Situation in Canada.

Canada has suffered some from the trouble across the line; but we have had no serious commercial failures, none of our companies have passed dividends, and our banks, as shown by their annual statements, have added to their resources, with the exception of one the position of which was critical before the present financial troubles began. The only effect that the short-lived depression has had on Canada has been to make our business people act with a little more than usual caution. A feeling of uncertainty as to the future has had a tendency to curtail orders, and our manufacturers have sought to protect themselves by cutting down production. Some Canadians have been hit, and hit hard, but that was through investments made on the American stock market. If their experience has the effect of teaching them the wisdom of investing their surplus cash in good, substantial Canadian enterprises, it will, in the end, prove a good thing for them and for this country. The stock markets of the United States burn up a great deal of good Canadian money that could be safely and profitably invested at home. If it were not for the money that goes out of this country for investment in erratic American stocks, we could afford to view with smiling indifference the periodic panics they have over there. Unfortunately, however, some of us have got the get-rich-quick mania of the United States, and the steady, substantial growth of Canadian enterprises does not appeal to these. Aside from this class of investor, no one on this side of the line has been seriously hurt, and it is safe to predict that Canada in 1908 will continue to forge ahead as she has been doing in the past few years. We have too good a grip on the future to be frightened by some other person's misfortune into letting go.

The French Treaty in Parliament.

The French Treaty was discussed in Parliament during the past month, and was allowed to pass the first reading without a division, which is customary with all bills introduced in the House, but on this occasion the Opposition wanted it distinctly understood that they were not in any way bound by allowing the first reading to pass in the usual way. Hon. Mr. Fielding made a somewhat lengthy speech in favor of the treaty, but when he got through it cannot be said that anyone had received any new light on the subject. Hon. Geo. E. Foster followed with a criticism that was strongly partisan, and from that point to the close of the discussion the speeches were all of a like character, the Government speakers claiming all manner of good things for the Treaty and the Opposition finding no end of faults in it. One of the amusing features of the discussion was the argument as to whether or not the making of the treaty by Canadian Ministers was a new departure. The Opposition said it was not, that Sir Charles Tupper in 1893 made a treaty with France exercising just as great powers on the occasion as were exercised in the present instance. The Government denied that Sir Charles' powers were equal to those exercised by the representative of Canada on this august occasion. Sir Charles had the aid of an under secretary, or something of that kind, from the British legation in Paris, whereas on this occasion the brave Canadians tackled the job alone. This may be very interesting from a party point of view, but the people of this country in general, and the manufacturers in particular, who are the ones most interested, do not care a rap about who made the treaty or how it was made. What they are interested in is to know how it is going to affect the commercial interests of Canada, and the discussion leaves them in more doubt than ever on this point. One side says it is a good thing and the other says it is not. Therefore, you pay your taxes to keep the old mill going and you take your choice.

D. M. COUGHLIN.

The Security of Policy Holders Weakened

The proposed new Insurance Act objectionable from a fire insurance standpoint. No provision for licensing Mutual Fire Insurance Companies. Aggregate liabilities undertaken by the companies in the congested areas of large cities should be controlled.

THE consolidated and revised Insurance Act of Canada has been introduced by Hon. Mr. Fielding and presents several features worthy of special consideration by this Association. So much discussion has followed the proposals made by the Royal Commission on Life Insurance that it has become the general, but erroneous, opinion that the revised Insurance Act is exclusively taken up with matters pertaining to that branch of insurance. While the Insurance Committee have to record that many sections of the Act are devoted to vastly important points in the practice of life insurance, affecting a very large number of people in Canada, they have not thought it practicable to take any special cognizance of the sections dealing with that subject. They have felt that the agitation throughout Canada for the past two years, the knowledge that many minds are focussed on it and that associations of policy-holders and others are carefully studying the provisions of the Act, make it a work of supererogation for them to take any action in respect of life insurance.

Contrary to the prevailing opinion, however, the Act makes several changes of importance affecting fire insurance interests and fails to deal with some other features that it was thought would have received some consideration. For example, the Committee were of the opinion that the representations made to the Minister by a deputation from the Association in February last regarding the organization and licensing of mutual fire insurance companies would have led to the incorporation, in the Act, of provisions dealing with the same. Apparently the growth and successful development of this class of fire insurance in the United States does not seem to have inspired the Minister with any desire to provide for and control the class of insurance by wise and timely legislation.

The Committee has carefully considered the attitude of the Association to this particular feature and recommended that a further effort be made to have included in the Act provisions for the incorporation and licensing of mutual companies on safe lines.

Some thought has evidently been given by the Minister to the mutual insurance question, for a new section has been introduced as follows.—

Sec. 12.—“No license shall be granted to any individual underwriter, or underwriters, to carry on any kind of insurance business.”

Despite the fact that individual underwriting was the basis upon which the system of insurance was founded and that the principle is now being operated to great advantage and with much success in the United States, the clause just quoted will not only prevent its introduction into Canada, but more important still, it will effectually prevent existing reputable associations of individual underwriters from transacting a legal business in this country under provisions of the Act applicable to all other kinds of insurance.

The Committee is of the opinion that this is discrimination against a perfectly legitimate class of insurance and recommend that the clause be vigorously opposed.

Time of Issuing Annual Report.

Section 50 of the Act provides that

“The Minister shall lay the Superintendent’s annual report before Parliament within thirty days after the commencement of each session thereof.”

Apparently this means that the report, hitherto rarely issued before the month of October in each year, is now

likely to be longer delayed in view of the session commencing only in the month of November. As it is now the Committee would call attention to the fact that by the time the report is issued its usefulness is practically gone, as nine months’ business of another year has completely altered the standing of many offices. They, therefore, recommend that an effort be made to amend this section so that the Blue Book may be issued at a much earlier date than has hitherto been the case.

Penalties and Forfeitures.

The section of the old Act, which will be repealed, dealing with penalties and forfeitures has been considerably added to, partly as a necessity of the foregoing provision in respect of individual underwriting, and partly because of the ridiculous weakness of the old Act in this regard. The Committee sees no objection to the new section (No. 71) but merely draws the attention of the members to it. It reads as follows:

“Section 71. Every person who,—

- (a) delivers any policy of insurance or interim receipt of; or,
- (b) except only on policies of life insurance issued to persons not resident in Canada at the time of issue, collects any premium in respect of any policy of; or,
- (c) carries on any business of insurance on behalf of any individual underwriter or underwriters, or on behalf of any life, fire or inland marine insurance company, without the license provided for by this Act in that behalf shall on summary conviction before any two justices of the peace, or any magistrate having the powers of two justices of the peace, for a first offence, be liable to a penalty not exceeding fifty dollars and costs, and not less than twenty dollars and costs, and in default of payment, to imprisonment with or without hard labor for a term not exceeding three months and not less than one month; and for a second or any subsequent offence, to imprisonment with hard labor for a term not exceeding six months and not less than three months.”

Investments.

Section 64 of the new Act defines the class of investments Canadian companies (other than life insurance companies) may make. Sub-section 2 of this section is entirely new and reads as follows:

“2. Any such company may deposit outside of Canada such portion of its funds and securities as is necessary to the maintenance of any foreign branch or branches: Provided that all other funds and securities of such company shall be held at the head office of the company or elsewhere in Canada.”

The Committee’s attention is attracted to the fact that under this section it is open to our Canadian companies to transfer all their funds, over and above the amount required to be kept at home to meet Canadian liabilities, to foreign countries, thus adding to the protection of foreign policy-holders at the expense of a less adequate protection to our own people. This point will be more fully appreciated when a later section of our report dealing with “Reinsurance Reserve” has been read. Meanwhile we desire to point out that under Section No. 61 a similar permission is given to

life insurance companies to deposit outside of Canada, but in respect to this class of company there is the following safeguard:

“Provided that such deposit in any foreign country, for all branches therein, shall not exceed in value the amount, if any, which is required to be deposited by the foreign law, by more than one hundred thousand dollars, Canadian currency.”

The Committee believe the interests of the Canadian policy-holders of other than life companies should be safeguarded in a manner similar to the provision above quoted from Section No. 61 and recommend that they be authorized to urge the adoption of a similar clause to Section No. 64.

The Committee is further of the opinion that in the annual reports of the companies to the Dominion Government as provided in Sections 30 to 36 inclusive, it should be clearly and specifically stated where and how the assets of the Company are deposited, the same being divided into the states or countries in which same are held, and they recommend they be authorized to endeavor to secure the necessary amendment to this section to bring this about.

Reinsurance Reserve.

The new Act provides a radical departure in regard to this feature, and as it involves a technical subject the Committee must at the outset apologize to the Council for the space that must necessarily be taken in its treatment.

The stability of a fire insurance company is very largely gauged by its surplus. What this surplus consists of differs already in the United States and in Canada. The new Act greatly accentuates this difference and the safety line in Canada is materially lowered.

In the United States the rule is that a company's capital, as to the insured, is a liability; therefore the surplus must be over and above the capital. In Canada the capital is not considered as a liability and therefore the surplus need only be the difference between the assets and the liabilities. In the United States the capital must always be intact and unimpaired, or the company must cease to do business; on the other hand, in Canada a company may have lost 95 per cent. of its capital and it may yet continue to accumulate larger liabilities. It is necessary we should briefly explain that a company's liabilities consist of

1. All unpaid claims;
2. All unpaid accounts;
3. Reinsurance reserve.

The last item is of course the largest and most important factor. The term “reinsurance reserve” means, according to the Act, “the reinsurance value of a company's outstanding risks.” In other words, fire insurance premiums are paid in advance and the companies are merely trustees thereof until the last hour of each policy has passed; a company can only call its own, on any given day, the proportion of the premium it has actually earned for the number of days the policy has run; the balance belongs to and may be claimed by the insured and it is by no means uncommon for the insured, in making his own balance sheet, to count as a liquid asset the unexhausted portion of the premiums he has paid in advance. The reinsurance reserve is therefore the accumulated unexhausted portion of each policy at a given date, and is thus a trust fund for a special and particular purpose.

It is therefore manifest that the capital of a company and its surplus over and above all its liabilities is the security offered to policy-holders to meet losses sustained, either singly or in a conflagration. It must be equally manifest that as a general rule a company with a surplus over and above its capital offers to its policy-holders greater security than does a company with a largely impaired capital even although it has a surplus over all its liabilities. We think a concrete

illustration of the difference in the treatment of a company in the United States and Canada will more readily explain the situation and make more understandable the additional advantage the new Act proposes to give to Canadian companies at the expense of still further reduced security to Canadian policy-holders. The cases we cite are not suppositions but actual, and are taken from the last issued Government Returns.

United States Standard.

Total Assets	\$5,817,423
Liabilities—Unpaid losses and other	
Claims	\$ 318,272
Reinsurance Reserve ..	3,380,757
Capital paid up	1,000,000
	4,699,029
Surplus	\$1,118,394
Security to policy holders,	
Capital	\$1,000,000
Surplus	1,118,394
	Total Security \$2,118,394

Present Canadian Standard.

Total Assets	\$3,594,731
Liabilities—Unpaid Losses	\$1,062,858
Sundry other claims ...	309,932
Reinsurance Reserve ..	2,217,361
Capital paid up	2,500,000
	6,090,151
Impairment of Capital..	\$2,495,420
Security to policy holders,	
Capital paid up	\$2,500,000
Less impairment	2,495,420
	Total Security \$ 4,580

A Lower Standard.

Under the new Insurance Act it is proposed that for the purpose of the Government Report (that is the official standing of the company) a Canadian company may calculate “its liability in respect of all its outstanding unmatured policies at 80 per cent. of the unearned premiums computed pro rata as at the date of such statement.”

The effect of this change in the calculation of the Reinsurance Reserve in the case above cited would be to reduce the impairment of capital to \$2,051,949 and increase the security to the policy-holders to \$448,051.

It would almost seem as if the design of the new Act was to give a fictitious showing to three or four companies whose capital is now almost completely wiped out.

Taking this cited case as bearing upon the paragraph relating to investments abroad, unless a limit is placed upon the amount that can be deposited in a foreign country, there would seem to be no impediment to the Company taking advantage of our own lowered standard and transferring some portion of the nominally and gratuitously increased surplus to a foreign country, adding to the security there and by so much reducing the security to our own people whose protection under the existing standard is so much lower than the people of the United States get under their existing laws.

The Committee do not think it necessary to more than refer to the fact that foreign companies licensed to do business in Canada are not given the same benefit as Canadian companies under the new Act, a fact they are quite capable of themselves taking care of.

Fortunately in Canada we have not suffered from any conflagration such as those that happened in earlier times at Chicago and Boston, or in later times at Baltimore and San Francisco. But who can prophesy when disasters of comparatively equal magnitude will overtake us. From the far East to the far West our cities are growing with rapid strides, and aggregations of value are multiplying to such an extent as to leave no room for doubt but that serious conflagrations will sooner or later overtake us. It is scarcely likely that if the 20th century is Canada's the experience of the 19th century in respect of conflagrations will be altogether averted. Yet in the face of this startling probability the new Act proposes to lower the safety line of our insurance companies rather than taking the prudent course of raising the standard so that at the critical time, when it comes, if it does, the people who suffer may look for the full payment of the obligations contracted by those companies which have granted them protection.

Of fifteen companies organized in Canada and licensed by the Dominion Government, according to the return of 31st December, 1906,

1	has a surplus of over \$400,000 and under \$500,000.
1	" " " " 300,000 " " 400,000.
7	have " " " 100,000 " " 200,000.
3	" " " " 50,000 " " 100,000.
3	" " " less than 20,000.

How many of these companies would pay one hundred cents on the dollar if Halifax, St. John, Quebec, Montreal, Toronto, Winnipeg or Vancouver met with a disaster covering the area of a Baltimore or one-fourth of the area of a San Francisco fire?

Statements have been submitted to the Committee showing the losses incurred by companies in the Baltimore and San Francisco fires and the effect thereof upon the companies which were involved, and, after studying them, the Committee is strongly of the opinion that the interests of our manufacturers in congested districts, and of the insured generally, are not only prejudiced by the proposal of the new Act but that it is quite time our Government should look into the future and raise the standard of efficiency rather than lower it, as is now contemplated.

The above is the report of the Insurance Committee to the Executive Council of the Association at its Hamilton meeting on Jan. 16th, 1908, when the recommendations were unanimously concurred in. The following resolution was also passed:

The Executive Council of the Canadian Manufacturers Association places itself on record as unalterably opposed to the lowering of the Reinsurance Reserve computation by Canadian companies as proposed in Sections 136 and 137 of the revised Insurance Act, and in view of the serious disasters that have overtaken the people of the United States at Baltimore and San Francisco, within the last four years, whereby many fire insurance companies defaulted in meeting their just obligations to the great loss of those who were involved in the disasters, believes the time has come when the interest of the whole people of Canada should be safeguarded against similar contingencies by controlling the aggregate liabilities undertaken by the companies in the congested areas of large cities, a gradual increase in the cash capital, and that such capital should be over and above all liabilities as additional security to the policy-holders.

The Council request the Insurance Committee to give full force and effect to this resolution, and also to the other recommendations of the report.

WILL PROTECT OUR FORESTS.

The staff of the Forestry Branch of the Interior Department has been greatly strengthened by the appointment to the position of Inspector of Forest Reserves of Mr. A. Knechtel, lately the forester employed by the New York State Forest, Fish and Game Commission. This is but one step in the direction of enlarging and strengthening the staff of the Forestry Branch, which is being done as rapidly as trained men become available. It is also a good example of the fact that the tide is turning in the direction of Canada, and that Canadians who have gone over to the United States are finding that Canada is now offering greater opportunities.

Mr. Knechtel is a native of Huron County, Ontario, where he helped to clear his father's farm. He taught school for a number of years in Canada and afterward in the United States. He completed the four years' agricultural course in the Michigan Agricultural College and graduated with the degree of Bachelor of Science. His forestry course was taken at Cornell University, where he received the degree of Forest Engineer from the New York State College of Forestry.

Mr. A. Knechtel.

While teaching school and attending college he spent his vacations looking after the work in a saw-mill owned by him in Muskoka.

After completing his course he was first employed by the United States Bureau of Forestry in making a study of the natural regeneration of the commercial trees of the Adirondacks. Since that time he has been the Forester for the Forest, Fish and Game Commission for New York State, under direction of which he made a classification of the forest lands of the State, established forest nurseries, superintended the planting of 2,500,000 trees in the Adirondacks, organized the work of collecting forest tree seeds, and took charge of the fire protective service.

In 1904 he made a four months' tour of Europe, visiting France, Germany, Austria, Switzerland and Italy, studying and photographing the forests.

Mr. Knechtel has published a number of bulletins and articles on forestry subjects. Some of the more important are: "The Cultivated Forests of Europe," "Methods of Estimating and Measuring Standing Timber," and "Making a Woodlot from Seed."

Manufacturers Dine at Hamilton

Executive Council Meeting Followed by Successful Banquet

SELDOM outside of a C. M. A. convention has there been such a representative body of manufacturers gathered together as there was at Hamilton to attend the Executive Council meeting and the succeeding banquet on Thursday, January 16th. President Rolland led the invasion in the morning, the main contingent followed from Toronto at 1.15 p.m., and skirmishers for the banquet kept dropping in at all times and from all directions, during the afternoon. Much business was transacted at the afternoon meeting, a full report of which will be found in the last section of this paper.

Of the evening proceedings, much can never be told. It is impossible to transfer to paper the genial influence which the chairman, Mr. R. Hobson, spread throughout the banquets. Never was such hospitality shown as was everywhere in evidence, from the opening of the reception in the handsome parlors of the Hotel Royal, to the last farewell as the

outburst of applause which greeted him on rising to thank the members left no doubt as to the position he occupied in their regard.

The menu which was provided by mine host of the Royal ran the whole gamut of seasonable delicacies. It was well planned, nobly served, and appreciatively partaken of. Additional point was given to the various dishes by the local touches appearing on the menu, all of which provided much amusement for the banqueters.

While the dinner was still in progress, Hon. J. D. Rolland, who had to leave to catch a train, addressed the gathering, and ended by offering on behalf of the Association to set up a brass tablet in the Commercial Club, setting forth the facts pertaining to the opening of that club, which took place during the entertainment of the Association in Hamilton in September last. The gift was gracefully received on behalf of the club by Mr. Hobson. The President was then escorted to the door with much applause. After dinner a couple of hours were given over to speech-making. The toast of the King was proposed by the chairman, Mr. R. Hobson, and was duly honored. Canada was eulogized by Mr. McClelland, in proposing the toast of "Our Country." He especially referred to the work being carried on by the Canadian Clubs, the idea of which originated with Mr. C. R. McCullough, of Hamilton.

Agriculture and Manufactures was proposed by Mr. Cyrus A. Birge, and responded to by Mr. C. C. James, Deputy Minister of Agriculture for the Province of Ontario. Mr. James pointed out the impossibility of comparing any two industries in respect to the amount of benefit they were to the country, since the work they accomplished was mutual, each being necessary for the well-being of the other. He then spoke of the advance of agriculture and its allied industries of dairying, stock-raising, etc. The farmers benefited manufacturers in three ways. They supplied raw material; they provided a market for produce; they provided capital for industries. Mr. James described the progress of farmers, how as pioneers they had hewn out a clearing in the virgin forest and planted their grain crops, how the value of stock became evident and this became a feature of farming, later came the era of dairying, butter and cheese-making, and fruit raising. Side by side with the advance in farming went an increase in profits, so that last year the farmers of Ontario had produced beef, butter and cheese to a value of \$35,000,000 more than they did eight years ago. This sum, the speaker pointed out, was widely distributed, and being deposited in the banks, had provided capital for many manufacturers.

Agriculture formed a perpetual source of revenue. The forests, when they were cut, were not reproduced. The mines, when the metal was taken from them, were valueless. But the land could be made to yield year after year, with unabated productiveness. However, if the supply was to be increased the farmers must copy the manufacturers and adopt business methods. If they wanted to make bigger profits they must see to it that there was no wasting. And lastly, the most up-to-date machinery must be employed by the modern farmer if he wished to get the best results from his occupation. He gave as an illustration of what could be done by studying the science of farming some figures of the returns from cows and land belonging to the Guelph Agricultural College. An improved output, he said, could only be arrived at by a close attention to the best methods of treatment of animals and land. There should, therefore, be a good deal more specializing done by farmers than at present, and training along this line should be provided. No one asked a lawyer to practice

Mr. C. C. James,
Deputy Minister of Agriculture.

guests joined in singing "Auld Lang Syne." Those who had the good fortune to enjoy the hospitality of the people of Hamilton last September expected a warm welcome, but the excellence of the entertainment outdid anything which had been anticipated.

The banquet was notable in the annals of the Canadian Manufacturers Association for a number of reasons, but chiefly because it provided the opportunity for presenting Mr. Harry Cockshutt, President of the Association for 1906-1907, with a remarkably beautiful painting by a Canadian artist, as a mark of the Association's appreciation of his good work during his year of office. While the great strides in influence and usefulness which the Association made during his presidency must ever be Mr. Cockshutt's chief source of satisfaction for the time and work he devoted to it, it will be a pleasure to him to know that his efforts were appreciated. The spontaneous

first and get his legal education afterwards, and the only way to make competent farmers of the younger generation was to train them when young.

The Presentation.

Mr. R. J. Whyte then presented, on behalf of the Association, a water color painting, entitled "Passing Clouds," to Mr. Harry Cockshutt. Mr. Whyte dwelt on the importance of the industry which Mr. Cockshutt represented, and spoke in terms of high eulogy of the work the past president had accomplished for the Association and for Canada.

Mr. Cockshutt expressed the great pleasure it had been to him to serve the Association as President. The Association, he said, was doing a work not only for themselves, but for every element in the country. They provided a home market for the farmers, they provided the articles without which the farmers would be unable to carry on operations. They supported a great industrial army of workers. Mr. Cockshutt also thanked the Hamilton members particularly for their entertainment, which was ever the means of attracting Brantford citizens to that city, when things were not going right at home.

Industrial Training.

The toast of "Technical Education" was introduced by Mr. C. R. McCullough, who in a few words spoke of the vital importance it was to the national welfare. He coupled with it the name of Mr. James L. Hughes.

Mr. Hughes made a strong plea for a truer appreciation of the needs of the boy and girl. He pointed out that the natural instincts of the child was to do things, to build and play with material things. This natural tendency should be developed. It was not sufficient to load a child up with knowledge; it was just as essential that he be taught how to use that knowledge, how to exercise to advantage the natural aptitudes with which he had been endowed. The working man surely had the same right to train himself in his life's work as those who were to follow the higher professions. He must be educated to think for himself, and not be a mere imitator. That nation was richest which added most to its capital, and that nation which had a system whereby men were taught to turn a piece of shapeless clay, costing a dollar, into a vase worth five dollars, was adding to its capital. Train men to do this and wealth would multiply much quicker than it would by the advance of the farming industry, though he did not wish to speak disparagingly of that business. The nation which would pull the trade of the world must make useful and artistic things. When we had so much raw material in the country it behooved them to establish some sort of an educational system whereby our young men could learn to make it marketable. The speaker closed by congratulating Hamilton on the fact that it would soon be a centre of the new development in modern educational methods.

On Behalf of Organized Labor.

The chairman then called on Mr. C. G. Bird, who was present as the guest of the Association. Mr. Bird, who is the President of the Trades and Labor Council for Hamilton, stated that labor conditions in Hamilton were uniformly satisfactory. He believed that only when there was harmony between employers and employees would the best results to both be attainable. Mr. Bird's remarks were well received.

Mr. James L. Hughes.

The healths of the chairman and the committee who aided him were proposed by Mr. G. Frank Beer, and enthusiastically drunk. During the evening musical numbers were contributed by Messrs. Harold Hamilton, A. L. Garthwaite, and Edwin Skedden. Mr. Ed. Grey contributed a humorous monologue. An orchestra from the 91st Highlanders played throughout the evening.

The committee who had charge of the arrangements consisted of Messrs. R. Hobson, W. R. Dunn, C. R. McCullough, J. W. Lamoreaux, J. R. McMahon, and W. B. Champ.

The Solution of Labor Troubles

How the Industrial Disputes Investigation Act has operated during the ten months it has been in force

FEW measures which have ever been adopted by the Canadian Parliament have created such wide-spread interest as has the Industrial Disputes Investigation Act, passed last session. It represented an effort, an original effort, to bring about a solution of the differences which continually arise between workmen and employers without the use of the ruinous agencies of strikes and lock-outs. During the brief time that the Act has been in force, Boards have been appointed to investigate a wide range of differences, extending from one end of Canada to the other and embracing many lines of industry, and while every new dispute introduces new features, yet the general tendencies are now fairly definitely marked. The following discussion, from an address by Mr. G. M. Murray, Secretary of the Canadian Manufacturers' Association, before the National Civic Federation at New York, will show the way in which the Act has worked out :

The Scope of the Legislation.

The Canadian Industrial Disputes Investigation Act applies to what are known as public utilities, including steamship and railway companies, telegraph and telephone com-

Kept Apart.

panies, power, gas, and light companies, and coal mines. When the bill was introduced into Parliament for discussion last Winter our Association, through its Parliamentary Committee, studied it very carefully and followed its progress through the House with considerable interest. We preferred, however, to take no stand one way or the other on the bill at that time seeing that it did not affect us directly, but to defer making any representations whatever until we should have an opportunity of watching how it worked out in the narrower sphere to which it was proposed to limit it.

Generally speaking, the verdict of employers, so far as I have been able to gather, is favorable to the act. There are, of course, some exceptions, to which I will make reference later, such as the longshoremen's dispute in Montreal and the several disputes of the Western coal miners, but the consensus of opinion, even where everything did not go the way the employer wanted it, seems to be that the act on the whole is a very good thing.

Hasty Action is Deferred.

In the first place it defers hasty action on both sides, always provided, of course, that the act is observed. It prevents hasty action by stipulating in section 56 of the act that pending the reference of a dispute to a Board of Investigation there shall be no strike or lockout on the part of employees or employers; further that pending the investigation of the matter under dispute by such a Board there shall be a continuance of operations under the conditions then existing. Speaking from the employers' point of view, therefore, this makes it impossible for a grievance committee to wait upon you in the morning with a long list of demands which you must accede to at once on pain of having your entire staff called out within twenty-four hours, for all you have to do under these circumstances is simply to make application under the Act as provided in sections 15 to 19 and to file a copy of your application with the grievance committee. Then if they proceed with the strike, they are liable individually to a fine of \$10 to \$50 a day during the entire duration of the strike.

Now, Mr. Chairman, I am one of those who firmly believe the average working man is a decent fellow if you only treat him right. Perhaps some of you older gentlemen who are present will shake your heads and say that this is the sort of wisdom that is born of inexperience, but as Secretary of the most powerful organization of employers in Canada I have knocked against all sorts of workingmen and I am happy to say that in the vast majority of cases I have found them likable fellows who will do right if they are done right by,—provided no undue pressure is brought to bear upon them.

Action Usually Governed by Minority.

In conversation the other day with one of the coal mine employers affected by the act in Western Canada, he made the rather startling announcement that in his district, while the workingmen were nearly all members of the union, not more than 10 per cent. of them attended union meetings. This went to confirm a suspicion that I have long had that the policy of the union is largely dominated by a very few members. It is unfortunately true in the majority of cases, if we can believe half of what we hear, that this policy is dictated by men of extreme and radical views and the unions are all too frequently precipitated into striking against the better judgment of the more sober-minded of their members.

Difficult to Secure Snap Verdict.

Now under the Canadian act it becomes a matter of considerable difficulty for agitators in the Union to obtain a snap verdict to strike, particularly if the object is to call for an investigation under the act, because the act stipulates in Section 16 that an application for an investigation by the Board must be signed by two of its officers duly authorized by a majority vote taken by ballot of the members present at a meeting called for that purpose at not less than three days' notice. So far as the men are concerned, therefore, the act is well calculated to postpone hasty action.

And even when the decision to strike is arrived at, should the men not wish an investigation, the employer may make application for a Board of Investigation, thus ensuring a continuance of the work under existing conditions for a period which cannot very well be less than thirty days.

The Effect Reciprocal.

Employers are equally debarred from aiming sudden blows at labor, for the act requires that in every instance they shall post a notice thirty days in advance of any intention either to alter the rate of wages or to alter the hours, so that in the meantime the union have ample opportunity to discuss the matter and find out whether or not they wish to make application for a Board.

Not an Arbitration Act.

This then, as I take it, is the first and one of the main advantages which we may point out under the Canadian act, that is to say, it defers hasty action. The second point that I wish to make is that in no sense of the word is the Canadian act an arbitration act. It is purely and simply an investigation act.

I need not remind you that the best law ever enacted may fall far short of accomplishing what was anticipated for it if its administration is entrusted to incompetent men or to men lacking in tact, and it is significant that one or two somewhat glaring instances where the word failure has had to be written across the act in Canada are explainable by the fact that the Boards of Investigation clothed themselves with too much formality, conducted their investigations as they would in a court of law, called on each side in turn for a statement of its case, giving the other side an opportunity to reply, took all the evidence under oath and in the presence of a court stenographer, and then sent the disputants away until they could sift out the evidence themselves and arrive at what they called an award. Such a course might be all right where the disputants are not required to meet again, but where they must continue relations as employer and employee, the only course, it seems to me, is to find some neutral ground upon which both can stand, a ground which will permit of harmonious working relations and be mutually satisfactory to both parties.

Now I have the greatest respect for the Canadian judiciary and for the high prelates of the church, but I maintain that such functionaries are not as likely to effect an amicable settlement under this act as others who might be selected, and without wishing to cast any aspersions whatever upon them, it is only right to remark that the most signal failures of the act have been where such personages presided over the boards of investigation.

A Model Procedure.

On the other hand, let me picture to you the procedure in those investigations conducted by Professor Adam Shortt, of Queen's University, Kingston. This gentleman has had the honor of presiding over no less than four investigations under the Act and with a degree of success which I regard as quite remarkable.

To begin with, we have an ordinary business office or committee room, with a long table down the centre. No witness box, no platform and nothing to suggest the formality of a court. First of all, the board enters and seats itself at one end of the table; next the men appointed to represent the employees arrange themselves along one side of the table and the representatives of the employers take seats along the other side. The chairman of the Board makes a few introductory remarks, during the course of which those who feel inclined to smoke can light up their pipes, and then the spokesman of the party that has made application for a reference of the dispute to a board states his case. This man is not a lawyer, because lawyers are debarred from these proceedings, but he is a man who is probably well known to every one present and who uses language entirely devoid of legal phraseology, which only serves to befog the ordinary layman.

A Conversational Discussion.

After he has had his say the spokesman for the other side is called upon to state his case, and after he has replied in kind the whole matter is opened up to conversational discussion. There is no court stenographer present to take down every word that is said. There are no reporters of the press present to feature the angry retorts which are sometimes made, and which, if given publicity, would only prejudice the side giving utterance to them. No one gives evidence under oath, though he may be required to do so if the board suspects him of misrepresentation. If a man makes an indiscreet remark he is allowed to modify it or take it back entirely, and the public get only so much of that meeting as the chairman chooses to give out.

When the act was being discussed in the Canadian Parliament, one of the points upon which most emphasis was laid was that the press would be present and the public would be given an opportunity of deciding which side was right and which was wrong. Now, while it is true that the board is instructed under the act to admit the press, unless there are matters under discussion which they think it unwise to give out, the practice of the boards over which Professor Shortt has presided has been to exclude the press, and I think he has clearly demonstrated that by giving out only so much as is wise to give out, consistent with a full discussion of the sub-

Brought Together.

ject, public opinion will readily mould itself along the proper lines without engendering bitterness on either side.

It is easy to see therefore, how, under the directing influence of the clear-headed man who is not above mingling with all parties on terms of equality, very material progress may be made towards inducing both sides to abandon all extreme or unreasonable attitudes.

Advantage of Outside Conciliator.

And here let me say a word in favor of the outside conciliator who happens to be vested with a certain amount of authority by the Government. Hot-heads there undoubtedly are on both sides, and these men by their very hot-headedness so frequently provoke and antagonize their opponents that even excellent suggestions looking to an amicable settlement of the difficulty are likely to be turned down if emanating from one who is a party to the dispute. If coming from an outside party, however, particularly one who has established himself in the confidence of both sides, the chances are they will be immediately adopted. Let me give you a case in point.

The work-people engaged in a certain line of trade which will be nameless recently applied to their respective com-

panies for an increase in wages of about 20 per cent. There were four employing companies affected and in all some three thousand working men. A board was appointed to investigate, and it was agreed that the companies would be taken up separately. The investigation of the first company's affairs resulted in a compromise whereby the workmen accepted an increase of 14 per cent. instead of 20. Companies numbers two and three immediately accepted this decision, but company number four objected to it most strenuously. They said, No; we cannot afford it. This contention, of course, was met with a storm of protests on the part of the working men, who voiced their sentiments in language which was more forcible than parliamentary. The chairman, however, happened to have some intimate knowledge of the finances of the company in question and felt that their point might be well taken. He adjourned the board for two or three days to make investigations on his own account. When they met again he went into a statement of the case with the men; he explained to their entire satisfaction that owing to the somewhat restricted earnings of the company they were not in a position to advance their wages 14 per cent.; he showed that 10 per cent. was as far as they could possibly go, and told the men that that was as much as he, as chairman of the board, could recommend to be adopted.

The answer of the men was significant. They said, "Well, Prof. Shortt, if you state that a 10 per cent. increase is all that the company is able to pay, we are willing to accept it, but we would never have taken a statement of that sort from the company."

Influence of Act on Attitude of Capital Toward Labor and Vice Versa.

This brings me, Mr. Chairman, to one of the most important results following the operation of the act. So far as the prevention of strikes is concerned, the act has had its successes and its failures, the former, I am happy to say, largely in the majority; but it is important to observe the effect of the act upon the general attitude of capital toward labor and vice versa, because if we are to arrive at any opinion as to the permanent efficacy of the act we must know what it is that makes it acceptable to the employers and what it is that makes it acceptable to the employees. The case that I have just referred to shows that in one instance at least the union has been willing to abandon its adherence to the rule that there shall be a standard union wage.

I admit that you can point out all kinds of difficulties where you have two companies paying different standards of wages. But the fact remains that the union in that instance accepted a lower rate of wage than their fellow members were obtaining from another company. The principle was propounded by the chairman of the board that the workmen were entitled to a reasonable increase in their wages so long as the earnings of the company they were employed by justified it, but at the same time he laid down the firm principle that the standard wage in one company need not necessarily be adopted as the standard wage of another company, because each company should be asked to pay only as it was able. True, this is but a single instance of the union abandoning its wage doctrine, but at the same time it must not be forgotten that this is a precedent, and precedents are likely to repeat themselves.

The case of the Cumberland Railway & Coal Company illustrates a strike brought on to effect a closed shop and abandoned by the men when confronted with a public investigation. The assumption is that they considered their case too weak to stand before the limelight of public opinion. Again we have a precedent, this time of a union forsaking its principle of the closed shop. Already this precedent has repeated itself in the case of the Western coal miners, the telegraphers and the railway machinists.

The Question of Promotion.

The observance of seniority in making promotions is one of the rules that the telegraphers have always stood for. This, of course, carried with it the theory that the employee had a right to dictate to his employer in regard to the filling of vacancies on the staff. The telegraph companies took strong exception, and the following dialogue, very much abbreviated, of course, took place between the chairman of the board and the leaders of the men:

"Are you not prepared to make some allowance for the fact that sometimes the younger man is more competent than the one who has been longer in the service?" inquired the chairman.

"No," replied the men; "our rule is that seniority of appointment must be observed and that every man must take his turn at promotion."

"Your union, I presume, has a president?"

"Yes."

"And a secretary?"

"Yes."

"And a business agent?"

"Yes."

"Are these men appointed from among your own number?"

"Yes."

"Have you ever had any suggestions made to you by the bosses as to what man you should put in as your business manager, or as your secretary, or as your president?"

"No, we haven't."

"Would you welcome any such suggestions?"

"No; we would insist on appointing our own men."

"Then why are you not content to let the bosses run their own business?"

This line of argument appealed to the men. They conceded the point and pressed it no further.

Here again we have the establishment of a precedent. I do not know that this precedent has been repeated, but it stands as something to which the union has definitely committed itself, and something which we may expect in other cases to see repeated, because the same line of argument will always hold good.

Some Advantages.

Speaking solely from the employers' point of view, therefore, we have three good reasons why the act is acceptable: First, it has compelled unions to abandon the principle of the closed shop; second, it has compelled unions to abandon the principle of a standard union wage; third, it has compelled unions to abandon the principle that they have the right to nominate the men who shall fill certain positions. To this extent the act has undermined some of the fundamental doctrines of labor unionism, and it is scarcely to be wondered at if employers, who have suffered as a result of the unreasonable demands of paid agitators, regard its operation with favor.

I am sorry we have not some one here to speak for the other side. No bargain is really a bargain which does not benefit both parties, and if the Canadian workingman were present, he could tell you of hours that have been reduced and of wages that have been increased by reason of the investigations under this act. But that I must leave you to learn of from other sources.

Thus far nothing has been said about the weaknesses of the act, but lest you should get the idea that it is a perfect piece of legislation, I feel it my duty to mention one or two points in which it has been tried and found wanting.

Some Difficulties in Enforcement.

In the first place, while the penalties are readily enforceable against employers, it is practically impossible to enforce them against employees. In other words, the employer who declares a lockout may be promptly arrested and fined, but if his workmen to the number of a thousand go out on strike in violation of the act it is absurd to suppose that they could all be arrested and brought before a magistrate. Moreover, it would be the veriest folly for an employer, who is anxious to get his men back to work, to have some of their number arrested, for such action would immediately make the parties apprehended appear like heroes and martyrs in the eyes of their fellows. Passion would be inflamed, the determination to resist would become strengthened, and the day of settlement would be indefinitely postponed.

The Department of Labor has attempted to smooth this difficulty over in cases where the act has been violated by saying that the men did not understand its terms. But this excuse carries little weight with those who have an intimate acquaintance with the circumstances. Possibly in the case of the Cumberland coal miners the excuse is permissible, but not so in the case of the Western coal miners, for the union men were well aware of the provisions of the act. This fact is admitted in President Elliot's article in *McClure's Magazine*, though, in a subsequent passage of the same article, an effort is made to excuse the men on the ground that they were ignorant of the law.

Again, in the case of the longshoremen's strike in Montreal, which took place two months after the act had become effective, and after the widest kind of publicity had been given to it, the men went on strike in violation of its terms. A Government officer was despatched to the scene to reason with them, but without success, the men replying that they were not on strike, but merely taking a holiday. And yet again we hear the Government condoning the offence of these men by saying that they did not understand the terms of the act.

In one dispute out on Texada Island the employer went so far as to have the men arrested and brought before a magistrate, but the magistrate discharged them on the ground that they were in ignorance of the law when they offended.

The only case where an employer has been guilty under the act, so far as I have been able to find out, is that of Mr. Hill, of the Hillcrest Mining Company, in Alberta, who declared a lockout after the men had applied for a board. He was promptly haled before a magistrate and fined \$100 a day during the duration of the lockout.

Failures of Act are Exceptional.

These illustrations prove my contention that the act is enforceable as against employers but not as against employees. The cases I have quoted are, however, the exceptions, and not the rule, for, in the majority of instances, there has been no cessation of work pending the investigation of the matters under dispute. And here, too, the important consideration of precedent comes into play. When the act was under discussion in the House, all the unions favored it except the Locomotive Engineers and Firemen and the Railway Conductors. These have since withdrawn their opposition and come out openly in its support, so that the act, as it stands to-day, has practically the unanimous endorsement of all the labor organizations in Canada. They are on record with the public to this effect, and they already feel that it is incumbent upon them to abide by its terms. In most cases they have abided by its terms, and every time they defer declaring a strike, pending an investigation, they are committing themselves more and more firmly to the principles for which the act stands. It can only be a matter of a few years, to my mind, at

the very most, when the effect of this chain of precedent will become so binding upon the unions that they will not for one moment consider striking in violation of the act, for to do so would shake the confidence of the public in their protestations of sincerity and lose them the sympathy upon which they so much depend.

There are other weaknesses in the act which I might mention. Once an investigation has been decided upon there is an undoubted tendency on both sides to manufacture grievances, on the assumption that the worst that can happen is to have them disallowed. This results in considerable waste of time, though it seldom proves a factor in blocking a settlement. The clause forbidding anyone who is directly or in-

Prof. Adam Shortt,
Chairman of Several Boards.

directly interested in either side to a dispute, from serving on the Board of Investigation, is more frequently honored in the breach than in the observance, so far as the representatives of the men are concerned, for they have repeatedly been salaried officers of the union. These, however, are minor matters, which the time at my disposal does not permit me to discuss.

Notwithstanding the weaknesses I have referred to, I think the employers, even those who have seen their men violate the act, would be sorry to have it repealed. While the penalties may never be imposed, still they stand as a wholesome preventive against rash conduct for the sober-minded man, who is generally in the majority, and so long as they exercise even this deterrent effect employers will regard the measure with favor.

Books for Business Men

A GUIDE FOR INVESTORS.

Mr. John Moody, of New York, has just issued a handy little volume, entitled "The Investor's Primer (pp. 183, \$1.62), explaining in alphabetical order the various expressions used in the financial world, *e.g.*, adjustment bond, etc. The author follows this list up with a review of the characteristics of leading railway preferred stock issues.

GENERAL INFORMATION ABOUT CANADA.

Business men should have for ready reference a copy of the Commercial Handbook of Canada, the 1908 edition of which has just come to hand (Heaton's Agency, Toronto, price \$1.00). The book contains in concise form a great amount of information which may be required at short notice any time, and, what is of prime importance, the contents are carefully indexed. Among the parts which are of particular importance are complete and up-to-date tariff schedules, including the new French commercial convention, postal and telegraphic information, reports on insurance, transportation, and kindred subjects, etc. As a book of references for those interested in Canadian subjects it is invaluable.

SOCIALISM IN ESPERANTO.

That socialist advocates have been busy scattering literature of later years has been frequently evident. Now a little volume has just come to hand, printed in Esperanto and English on alternate pages, giving Marx & Engels' "Manifesto of the Communist Party" (pp. 65), with its impassioned appeal against existing social conditions. It is well to bear in mind that trade unionism is in theory opposed to socialism. But nowadays, one cannot overlook, unionists are often far from informed on the true basis of their own organization. Trade unionism is based on the system of wage-payments, and the idea that by union workingmen are in a position to secure the best possible wage—that is all. It is not subversive of society—which is more than can be said of many of the labor agitators who, as far as the real interests of workingmen are concerned, are wolves in sheep's clothing.

HOW TO JUDGE MINING INVESTMENTS.

"Mining Investments: How to Judge Them," is the inviting title of a small volume of 230 pages, by Dr. F. C. Nicholas, just issued by The Moody Corporation, New York (price, \$1.62). It will be consolation reading for many a person who has been nipped by the mine promoter or the mining shark. It is good stuff for anyone who may sometime wish to take "a flyer" in the mine—for, as the author frankly points out, anyone going into a mining investment inevitably takes big chances, and should look for big prospective returns to counterbalance.

Everything is explained from the initial organization of a mining company to its marketing and developing. A survey is also made of the mining regions of the world, of the trials of a mining engineer and the speculator, etc. Tales are told of the making of millions, and of the loss of millions by late investors.

Everywhere it is true that people often go into mining investments with less thought than they would to a good dinner. Against this lack of consideration the author protests and urges that adequate study of prospects, property, and the character of those in charge would lessen greatly the widespread losses now met with. It is a book that is worth many times its small cost.

MUNICIPAL PROBLEMS.

A book of great value to the man who is interested in civic questions has just been issued by the Librarian, University of Toronto, under the editorship of Mr. S. Morley Wickett, under the general title of "Municipal Government in Canada." The Book contains a series of papers on local government and civic administration in the Yukon, British Columbia, the Maritime Provinces, Newfoundland, Montreal, and Ottawa. A comprehensive discussion of present municipal problems is given in the paper on Present Conditions. The volume is rounded out with a most complete bibliography of the subject.

In all cases our municipal government is an evolution. Even the biggest of our present centres of urban population began as small and unassuming villages, where franchises were little thought of, and where expenditures passed under the eye of every burgess. The problems that confronted such a settlement were insignificant. But in the course of time bigger problems kept forging to the front, and the point is driven home time and again, in the book before us, that the machinery of government has not been brought into harmony with the new conditions. This is shown in the difficulty Montreal has had in raising sufficient funds to carry on the business of the city adequately, in the hardships the same city has undergone in provincial and federal interference, and in the piece-meal legislation which is constantly resorted to in Ontario to supply defects in municipal charters.

The writer summarizes the conclusions arrived at in his able analysis of present conditions, by advocating specifically wider local powers than are now customary under municipal charters; a municipal board for purposes of supervision and consultation; improved and uniform system of bookkeeping; a standard form of debentures; a longer term of office for councillors; more efficient service from heads of departments, and extension of the municipal franchise to incorporated companies.

If citizens can be aroused to a sense of responsibility for the welfare of the municipality in which they live, the good government of the whole country is assured. The greatest danger of a democratic government consists in the tendency among the mass of people to shift that responsibility to the shoulders usually of those who are mercenarily interested. Even in the weakest or corruptest of communities the great majority of the citizens are honest and intelligent. In every city and town there are some individuals who stand out pre-eminently for ability and straight dealing. With a proper combination or co-ordination of these two elements, an honest electorate and able leaders, there is no reason why even the larger problems which are now before municipal councils should not be dealt with in the best interests of the people at large.

R. D. Isaacs, who is organizing a car manufacturing company, has made a proposition to the city of St. John, N.B., looking to the establishment of the works there. The company will be capitalized at \$1,500,000. The city has been asked for sixteen and a half acres of free land, exemption from taxes for twenty years, and the guarantee of bonds to the extent of \$200,000.

Hints for Factory Construction

By D. C. N. Collins

MANUFACTURERS have, sooner or later, to face the problem of plant extensions or the construction of a new plant. They do not want the cheapest building possible, but they do want the most suitable one for the least money. The first consideration is economy in production; any means for saving labor or increasing production will be of permanent value; any obstacle to these ends will cause a steady loss.

The writer was recently called upon to look over an old plant and found an entire absence of railway connections and a corresponding annual cost of \$5,000 for trucking alone. Throughout the entire plant there was a waste of labor in carrying heavy material back and forth during the various stages of manufacture. The trucking expense of \$5,000 would pay 4 per cent. on \$125,000, which was practically the cost of buildings in a new plant, while every advantage in labor sav-

ification of architecture as it is generally understood. This class of work is the offspring of a cold commercial computation of dollars and cents. How much will they earn and how much will they cost. An industry should be made co-operative in every detail, the mechanical and human equipment and the buildings make one homogeneous unit. The manager who is responsible for the expenditure of large sums of money has a responsibility upon his shoulders sufficient to warrant the expenditure of a small portion of it in skilled and experienced engineering ability.

The birth of an enterprise should be attended by a comprehensive and clear preliminary study of all points, made with an intimate knowledge of values and costs so as to present the proposition in clear shape for criticism, for discussion and for proving the amount of appropriation necessary to launch it successfully. Too often is an owner influenced

Example of Saw-Tooth Construction, by which the Maximum of Light is Secured.

ing devices and economy in operation in a new plant was clear gain.

It requires \$20,000 invested at 4 per cent. to maintain one man in service at \$800 per annum. If his capacity can be doubled it means an equivalent to the increase of that amount in working capital. The cost and control of labor is a complex and important matter in all industrial improvements. The growing difficulty is not only to get good labor, but to hold it. To study the mental and physical condition of men is really more important than the careful adjustment and lubrication of machines.

Cost is the Vital Point.

Factory buildings are not a matter of pleasing effects nor of fastidious decoration. They do not come under the classi-

to begin an important improvement with insufficient funds to complete it. With the preliminary report accompanied by reliable estimates and information to provide a convincing check upon extravagance and error, an owner knows where he stands and is in the strongest possible position to decide intelligently when to begin spending money.

Information to be Secured.

After general plans are perfected the administration aims to secure their accomplishment for the least money. This means close planning to do the work with the least material, to decide upon material cheapest and best for the purpose, to establish just how much material will have to be purchased and to buy it right. The foundation of all good buying is broad competition on definite quantities and qualities of

material. Every contractor and material dealer has his own idea of successful business policy and it is seldom that one permits a loss to himself. Very few of them will quote bottom prices until they see positive evidences of an immediate sale unless it is in the preliminary stages of the work, when they may make their quotation attractive, knowing that the records do not bind them to any definite requirements.

Contractors Should Have Details.

A request to bid in competition is, virtually, a challenge to beat the other fellow, and in getting his price where the owner wants it, he is simply complying with the essence of the inquiry. This does not reflect upon the honesty or integrity of the contractor or material dealer. Every firm is measured and respected by its success in securing business at profitable rates. This merely points out the importance of establishing exactly what is to be done and how it is to be done before getting prices; uncertainties that add to the probable cost of the work should be eliminated and definite quantities fixed, so that each bidder will start on an even footing, and the work can only be controlled by price. It is even more necessary in order that the owner can control the delivery of the material and that he can feel sure that he is receiving full value for his money and that he may know that the accepted prices are right.

Plans and specifications are the sole technical and legal basis of adjustment in an exchange of money for building material delivered. If they are indefinite or incomplete, so will the results be. They are useful in analyzing market conditions and indispensable in compelling the proper delivery of material.

Real Competition.

A few thoughts on the ethics of contracting, as of recent practice, may illustrate the wisdom of a proficient handling of purchases. Many owners seem to think that competitive prices on a flat building of certain dimensions, without plans and specifications, satisfy all demands of competition without regard to the uncertainty of how much material each bidder includes in his estimate and without appreciation of the helpless position he would be placed in should he need to compel its proper completion. It is easy to place a contract, but much more difficult to feel sure that you get the value of payments on the work. Not knowing in detail what the contractor is buying or what it should cost, the manufacturer, merely accepts the lowest bid and assumes that the price is right.

It has been the custom in many quarters to ask steel companies to estimate upon a building of fixed size, that contains steel, each quoting a price according to its own design. In such a case each is bidding upon a different thing, and there is no real competition at all; they give very little data upon which to make a comparison. About all that is known is that "so and so agrees to put up a building for so much money, and he is the lowest bidder." The owner pays thousands of dollars for a thing and does not know what it is.

The first question would be, "Does he include everything?" A conscientious man who figures on giving everything required, will not likely be the lowest bidder, while the one who figures on "skinning" the weight, or can arrange to run in some of it as an "extra," can well afford to bid low. An important question will develop here as to whether a steel contractor, probably located at a distance, can drive piles, lay brick, excavate or do other work as cheaply as local people can who have a local acquaintance and organization.

One thousand tons of steel at \$100 and two thousand tons at \$50 amount to the same thing. Suppose, for illustration, that a building could be designed closely so that this 1,000 tons would answer all purposes and our record shows

the exact amount in detail; we can invite the same bidders to bid on this fixed amount and secure the \$50 bid, thus cutting the price in two.

General contractors, who bid on the entire work for a lump sum, do not always do every trade with their own men, and, consequently, will get sub-contractors to estimate on their special trade for them. They add these various amounts to their estimates on their own work, add their profit to the total, and send in this bid. In this way the profits are doubled up; each contractor has a cost and a profit, and the general builder adds his profit to the total, and the only work that is done at cost is the particular branch that he is equipped to do with his own men.

Percentage Contracts.

Some owners favor the percentage form of contract in order to overcome the possibility of excessive profits and to permit of convenient changes being made during erection. In this method the work is done at cost and the builder charges a fixed percentage of the total cost as his profit. This form of contract has many indefinite results. Many disputes have arisen over the settlement of percentage contracts, perhaps due in many cases to the owner's unfamiliarity with the details of the building business, and sometimes due to the abuse of the confidential nature of the agreement. Under this agreement there is no incentive to keep the cost down, nor to prosecute the work with diligence; in fact, the contractor's interests are rather in favor of slow and expensive construction.

These disadvantages have stimulated the presentation of many other methods. Some contractors will propose doing the work for a fixed profit, the owner paying all costs; others will offer to guarantee the limit of cost and charge a fixed profit; there are methods by which a proposal will be received to do the work for a fixed profit and at a limited cost, penalizing this profit for any overrun of the cost and sharing any saving made under the limit of cost. There may be contractors who will prefer doing only the labor and have all material furnished free by the owner. Sub-contractors will frequently bid on their special trade only, not wanting to assume work with which they are unfamiliar or poorly equipped to handle economically.

The Fundamental Considerations.

These methods all have advantages and disadvantages, and are worthy of consideration. There is one fact, however, that remains unchanged by any proposition, that in a well-planned building there is just so much material to be bought; there is just so much labor to be done in installing this material; there are specified details to be observed in its proper delivery and under fixed conditions it should cost just so much money.

The Material of Construction.

Industrial buildings are usually constructed of wood, brick, reinforced concrete, steel, or other material, according to the demands of service and the natural resources of the locality. Where the operations consist of transporting heavy loads during manufacture the introduction of labor-saving devices, such as cranes, trolleys, tramways, conveyors, elevators, etc., is necessary. These special requirements will largely control the type of construction; a study of these stresses will show whether the functions come within the limits of timber construction or will overrun into the more expensive reinforced concrete or into structural steel. In localities where lumber is easily obtained it is often cheaper, even if material must be sacrificed, to avoid heavy transportation charges on other material. The same advantage in

cost would hold in a steel territory by using steel instead of transporting timber or stone, cement and sand. In some cases the building site produces a desired quality of sand and stone for concrete, making reinforced concrete cheaper even than timber.

A Comparison of Cost.

This detailed arrangement of buildings into commercial quantities of material does not imply a mass of details to be supervised by the owner, nor does it tend to do away with the general contractor if his price is right. What it does do is to put a technical problem on a simple commercial basis, removing all doubt as to the best way of executing it economically. For instance, concrete is measured in cubic yards and analyzed into terms of so much sand, stone, cement, forms, labor cost of mixing, labor cost of placing it and finishing. Brickwork can be similarly assessed by classification of bricks, mortar, sand, cement, lime, labor cost of lay-

ters' irons, door sills, window sills, skylights, stairs, and all sub-trades, were similarly separated from the plans and completed on special drawings or lists, so as to read, so many like this and so many like that. Competitive prices were obtained and the orders placed. While the principal material was being prepared or in transit and other purchases being arranged, the foundation plans were completed and contracts for labor given to the lowest bidder. This permitted the completion of this part of the work by the time the plans were done and material being received.

All local contracts were for labor only at unit prices; so much per thousand or per square foot; thus relieving the local men from great financial responsibility. The specifications were written as the work developed, and were binding as to where one trade stopped and the other begun. Many sub-contracts were placed for the work erected complete. A competent superintendent was retained by the owner to work under the instructions of the engineer, and the work was

A Modern Factory Building (Robertson Bros, Toronto), where the Absence of Heavy Machinery Admits of a High Building.

ing, scaffolds, cleaning down, etc., each subdivision being subject to close valuation according to local conditions. The control of the work is entirely in the hands of the man who is spending the money, as it should be.

How Local Conditions Were Utilized.

A specific instance was developed in making purchases for a large mill building where the following conditions developed: Quick completion was desired; the separate local trades were hungry, but their rating was hardly in proportion to the magnitude of the work. General contract bids were excessively high when compared with the local prices on separate trades, and material was very hard to get quickly. The purchases were, therefore, directed in this way: All lumber schedules were made in detail in the engineer's office before the plans were complete, and prices secured from these definite lists in open competition; material was delivered at the building. This order was placed and the time of delivery fixed. The steel and iron work was separated from other work and developed to the smallest detail on separate drawings as a flat basis of competition. Windows, doors, carpen-

completed quickly, harmoniously and in a manner satisfactory to the owner and for a very low total cost.

Single Contract Sometimes Advantageous.

Other work can often be done under a single contract to good advantage. It is simply a matter of knowing exactly what is to be bought and saying so at the start.

When buildings are developed to incorporate every detail of efficiency in manufacture, every saving in maintenance cost, every practical precaution against loss of fire; when they are produced on paper and again in commercial quantities of material, there are absolute records established that prevent any tendency toward litigation. Legal disputes are generally the result of misunderstanding, uncertainty or unfair methods and the elimination of these elements breed co-operation among the varied interests and a harmonious, quick and satisfactory execution of the work involved.

Parsons & Parsons, manufacturers of rubber goods in Cleveland, Ohio, will establish a branch factory in Hamilton.

Sheet Metal Goods in Factory Construction

By J. G. Lorriman, Sales-Manager, Metal Shingle and Siding Co., Limited

WHEN a manufacturer decides to build, he does not select his material without carefully considering, above all else, its economy, durability, and speed in erection. Economy is essential because in our rapidly developing country a manufacturer requires all his available capital to properly finance the expansion of his business, without tying it up in factory buildings. The advantages of durability are obvious, but it is also most desirable to have buildings erected speedily, as a manufacturer rarely undertakes to enlarge his plant until he urgently needs the additional space.

It is because they meet all these requirements that sheet metal building goods have become so popular in factory construction. But they possess many other advantages, which likewise appeal strongly to the manufacturer. A sheet metal building is fireproof to a high degree. Beyond a doubt it affords perfect protection from fire on the outside. No flying cinders can ignite a metal-clad structure. Another important fact is that metal sheeting is impervious to the wind. Consequently, a building of this kind is very easily heated—an important item in such a climate as ours.

Great advances have been made in the manufacture of sheet metal building materials during recent years. In fact, it would surprise those who have not closely followed the industry to know the many uses which are now found for sheet metal in factory construction. Of course everybody is familiar with the corrugated galvanized steel sheets, which have gained a widespread popularity. They are extensively used for both roofing and siding, and are claimed to be the cheapest material obtainable for industrial buildings. They possess great rigidity, and, when applied to a very light framework without sheathing, they give an admirable construction for warehouses, and even for the more pretentious factory buildings. Sheet steel sidings, imitating the appearance of brick and stone, are also much used, and may be seen in almost any manufacturing town in the country. They give a substantial appearance at a very moderate cost. The factory of the Napanee Canning Company, which is illustrated on this page, is covered with sheet steel siding, as are many other canning factories in different parts of Ontario.

Where a permanent roof of good appearance is desired, there is nothing better than galvanized steel shingles of some approved make, if the roof has sufficient pitch. In the case of flat roofs, all the principal manufacturers of metal building goods have on the market a standing seam metal roof, which gives general satisfaction. From a manufacturer's standpoint the principal advantages of a metal roof are its durability and fire-resisting qualities.

Various Uses.

The general public are not yet familiar with sheet metal as used in the construction of fireproof windows, skylights and cornices. Nevertheless, manufacturers are constantly using greater quantities of metal building goods in these forms. Fireproof windows with sheet metal sash are now being adopted in many factory buildings of the better class, particularly in the large cities, and skylights with frames of sheet metal are also growing in popularity. They possess distinct advantages over the old style wooden frames altogether apart from their fireproof qualities. They are lighter in weight, give a greater glass area in proportion to size, and are more thoroughly weatherproof than the wooden frames. Furthermore, it is now the general practice to use wired glass in skylights, and it would be absurd to put fireproof

glass in an inflammable frame. Metal skylights are practically indestructible, and when it is considered that their cost is almost as low as that of the wooden type, their growing popularity is explained.

Metal cornices are gaining great favor in factory construction. They are probably the cheapest style of cornice available for any purpose, and are much lighter in weight than wooden cornices, and are capable of far neater and more artistic effects at a much lower cost. They closely imitate the appearance of a cut stone cornice, the crimping of the steel resembling the chisel marks, and the stamped medallions and brackets having the effect of hand-carved ornaments in stone. There is no warp to a metal cornice, as is the case with wood, and, in point of durability, it is far superior.

Even factory floors are now being made with the assistance of sheet metal. In many buildings where steel girders are employed, carved corrugated sheets are placed between the I beams, and the floor formed by filling in with concrete between the sheet and the top of the beam. This makes a very solid floor, and one which will stand the pounding of heavy machines without deflection. Perhaps a more usual practice, however, is to adopt concrete floors re-inforced with

Canning Factory in which Metal Siding is used to Advantage.

expanded metal. Some of the larger Canadian manufacturers of sheet metal building goods are now making expanded metal suitable for re-inforcing concrete floors and concrete roofs.

The large number of concrete factory buildings draws attention to one more field for sheet metal materials. Concrete must be re-inforced in some way. There are numerous systems on the market for this purpose, some using metal bars of various kinds, and some adopting sheet metal fabrics. At the present time some of the largest concrete factories and elevators are being constructed with sheet metal fabric as the bond which holds the concrete together.

The greater part of the sheet metal goods mentioned in this article have already become staples in the building trade, while, for the others, an immense development is expected. The various Canadian firms who are engaged in their manufacture are led by energetic and resourceful men, so that the future of the industry seems assured.

The New Brunswick Wire Fence Co. has increased its capital by \$12,500, to enable it to handle the increasing business which is offering.

Cement in Factory Construction

By Gustave Kahn

IN the building of a modern factory the owner is confronted with more problems than was formerly the case. We have outgrown the conditions where we merely built a building of a given size and made it suit our requirements. In order to keep pace with the onward march of progress, it is absolutely necessary that our factory buildings be of the most modern type of construction; for this reason, if for no other, the prospective builder should consult with the engineers who make a specialty of this class of work. The requirements of no two factories are exactly alike, the proper lighting, proper load-carrying ability, spacing of columns to suit special machinery, heating, ventilation, and other factors too numerous to mention, play very important parts in successful factory building. The question of danger to business due to fire is often more important than the danger of fire itself, as the

unnecessary destruction of existing work, and is practically free from damage due to natural wear and tear, therefore maintenance charges are reduced to a minimum. The first cost of a reinforced concrete building is usually about 10 or 12 per cent. greater than an ordinary type of mill construction. The saving in insurance alone will pay a large interest on the additional investment. It is a true saying, "A burnt child dreads the fire," so a manufacturer having once experienced a fire loss dreads a second such experience, and should protect himself accordingly by building in reinforced concrete.

A number of Canadian manufacturers have already recognized the merits of this type of construction, and have made practical demonstrations thereof by building their factory in this material. Our illustrations show some of these

Factory Under Construction, with Re-inforced Concrete, Showing the Immense Possibilities for Lighting Under this System.

business loss in a greater percentage of cases is more than the fire loss.

It is gradually becoming recognized that no building material known lends itself so admirably to modern factory construction as reinforced concrete. With it one may construct buildings of any form or size. If large, clear floor areas are wanted, they may be had; if numerous columns in the interior are not objectionable, the building is so planned; however, as a general rule it is conceded that the fewer columns there are to break up the floor spaces the better. The possibility of ample lighting is greater than in any other type of permanent building construction known. Successful reinforced concrete buildings have been built where fully 80 per cent. of the entire wall area has been given over to lighting. Splendid examples of saw tooth roof construction may also be seen in finished reinforced concrete buildings. If the manufacturer requires rapid running machinery, causing an unusual amount of vibration, reinforced concrete will absorb this vibration, so that it will hardly be noticeable. If the necessary loads are exceptionally heavy, reinforced concrete will carry the heaviest possible load. A properly built reinforced concrete building can at all times be enlarged without

examples as built in the Kahn system of reinforced concrete. To see these buildings is to be convinced. The Eagle Spinning Mills, originally built in 1906, having outgrown their original plant, doubled same at the close of the year 1907. Green, Swift & Co., London, manufacturers of clothing, completed their building in the spring of 1907. It is one of the most modern examples. The Canadian Billings & Spencer, of Welland, manufacturers of drop forgings, a new enterprise for Canada, have used reinforced concrete, and their buildings for their class cannot be excelled anywhere. The building just being completed for the Andrew Darling Co., of Toronto, clothing manufacturers, is, up to the present, the most pretentious attempt of this class of construction in Canada.

To sum up, reinforced concrete is a building material peculiarly well adapted to the modern factory. Under the general term "economy," it embraces almost countless advantages, including fire proof qualities, and durability, cheap, but none the less suitable construction, and it is undoubtedly ideal from a sanitary standpoint. It has entered into every feature of modern factory construction from foundation to roof, and the tendency to-day is more and more in the direction of concrete construction throughout.

Heating and Ventilating a Factory

By S. R. Sheldon, Sheldons Limited

NOTHING in the modern manufacturing plant does more to increase the productive power of the employee than a proper system of ventilation and heating, which can be depended upon to maintain an even temperature and keep the air fresh and healthful.

More attention is given to these matters now than a few years ago, and naturally the problem becomes more difficult in most instances owing to overcrowding and the increase in the vitiation of the air due to the process of manufacture.

Combination of Heating and Ventilating.

A factory can be advantageously heated by direct radiation, but if a system of ventilation is desired, a fan is used, and in most instances the ventilating system can be combined with the heating system in such a manner as to render the ventilation positive under all conditions, and the heating variable according to outside temperature.

In the accompanying illustration is shown a typical installation of this combined heating and ventilating system. In the fan room is situated the heater coils, fan and engine, and in the adjoining building is the boiler, which furnishes the heater and engine with steam. The fan is operated by a special low pressure direct connected engine, the exhaust steam from which is used in the heater coils.

Built in Sections.

The heater is usually built in six or seven sections, one or more of which are operated by the exhaust steam from the fan engine. The balance of the heater is furnished with steam direct from the boiler, or it can be arranged to utilize the exhaust steam from the main factory engine. Each section of the heater is usually fitted with valves, so that one or more sections can be cut out of service in mild weather.

The fan is arranged to draw the air through the coils, where it is heated to a comparatively high temperature, and discharge it into a system of underground ducts which conduct the hot air into the several departments. In each department overhead galvanized iron ducts are connected to the underground ducts. These overhead iron ducts conduct the heated air to the several parts of the building, and ensure an even distribution of the heat throughout the entire building. The speed of the engine can be varied to give a more or less rapid air change in the building. The heat can be shut off from any department by means of gates or dampers placed in the main ducts, and at all outlets. The water of condensation is usually returned from the heater to the boiler either by means of an automatic pump and receiver, steam trap or other suitable device.

Offices Should be Heated Independently.

In the accompanying illustration the offices are shown fitted with direct radiation entirely independent of the factory heating system. This is advisable, in that the offices are frequently in use in the evenings and at other times when the factory heating system is idle.

The boiler used for these heating systems is usually of the return tubular type in a brick setting. In most instances where the boiler is utilized for heating alone, it is operated at a pressure of 20 pounds per square inch, the exhaust steam from the fan engine being discharged into the coils at a back pressure not exceeding 2 pounds, the main steam supply from the boiler to the heater being fitted with a pressure reducing valve set to reduce the pressure from 20 pounds to 2 pounds pressure, thus making the low pressure steam supply to the coils entirely automatic.

A Vacuum Pump Should be Used.

In a factory which is operated by steam, the exhaust steam from the main engine is usually ample to heat the entire plant, and when this exhaust steam is used it is advisable to install a vacuum pump to return the water of condensation from the heater coils to the feed water heater in the boiler room. The use of a vacuum pump in this connection eliminates a great deal of the back pressure on the exhaust steam, ensures a perfect drainage of the entire piping system, and gives an unimpeded circulation of steam, also effectively prevents air binding and water hammer in the coils, while it also permits of the return of the water of condensation from points considerably below the line of drainage mains.

In the galvanized iron ducts, and in the underground ducts allowance is made for all turns and branches for the resistance these offer to the air. The entire air supply can be taken outside the building, or part or all of the air may be returned from the building to the fan to be re-heated. In ordinary factory heating and ventilating a complete change of air every fifteen or twenty minutes would be ample, but for factories where obnoxious gases or odors are given out, a more rapid air change is calculated on, and auxiliary ventilating fans are so placed and operated as to remove the odors, vapors, etc., as soon as made.

Cleansing the Air.

In buildings where absolute cleanliness is very essential, such as laundries, shirt factories, etc., an air washer should be installed to purify and cleanse all air admitted to the building. By using an air washer all air admitted into the building, or in fact all air handled by the fan, is first passed through a tempering coil, then it is passed through a series of water sprays, which separate or wash out all floating particles of soot, dust, etc., from the air. The air after being washed is passed through a series of baffle plates or eliminators, on which are deposited any particles of water that may have a tendency to travel with the air into the fan.

Ensures Healthy Condition.

By the use of this device the purification of the air to a great extent goes beyond the mere extraction of dirt and dust, many other impurities being eliminated; a healthy degree of humidity is also maintained irrespective of outside hygrometric changes. One charge of water is used over and over again for any desired length of time, circulation being maintained by means of a centrifugal pump which can be operated by belt from the fan shaft. By maintaining a proper degree of humidity in a building a lower temperature will be found satisfactory, as it is a well known fact that a moderate temperature with the humidity maintained at about 75 per cent. of saturation is more healthful and satisfying than higher temperature at a less degree of humidity.

Modifications for Different Factories.

Numerous adaptations occur where the convenience of the massed heating surface or the effects of perfect ventilation have a considerable commercial value. Of course the individual conditions must control the method of application and installation, and for this reason each plant has to be carefully considered, and the heating and ventilating should be designed by a competent engineer or by a manufacturer of these articles.

Factory Plan made for "Industrial Canada" by S. R. Sheldon, to Illustrate a Correct System of Heating and Ventilating.

Fireproof Windows, Doors and Skylights

By J. A. Findlay, Treasurer A. B. Ormsby, Limited

TO actually reduce our annual bonfire we have got to protect the vertical openings,—that is the window, door, stairway and elevator openings,—for of all the useless wastes that we, as people, have indulged in, that of fire is the most inexcusable. By it not only is the property devastated, but thousands of lives are yearly sacrificed. In 1904 in Canada and the United States seven thousand people were burned, an average of nineteen fatalities through fire every day in the year, and a record that nearly equalled that of all the railroad accidents in both the countries—generally considered the most fruitful source by far of fatal accidents; and the record of 1904 was not an extraordinary one. If the loss of lives is appalling, the loss of property is disgusting. Our fire losses are equal to a tax of twenty-five dollars per

Fireproof Window After Going Through a Hot Fire. Glass Cracked But None Fallen Out.

year per family, and that tax shows but the loss of property consumed. Canada and the United States have burned up one hundred million dollars' worth in three years, and fire loss is final and absolute.

Fire either originates inside a building or the building is ignited from an outside blaze. Statistics in recent years show that seventy-three per cent. of all fires start or spread via the window route alone, and forty-eight per cent. of all fires are caused from buildings becoming ignited from fires in adjoining buildings. That is, we can almost say that a fire starting in one building is most frequently the cause of another fire, and the other fire could not start if the openings were protected. If a live ember of a burning brand falls on an ordinary wooden window the wood is almost sure to take fire; so, too, intense heat radiated by fire in a burning building will ignite an ordinary wooden frame. These facts are strong recommendations for metallic frames. Any fire starting in an adjoining building is of no concern to you if

you have metal windows with wired fireproof glass in the sash, for no matter how hot the fire is, it will do them no harm if the windows are made automatic heat closing,—that is, made with one of the sashes to pivot, and held open by a chain on which is a fusible link. This fusible link is made of brass and solder. Under heat the solder melts, breaking the link, and the open sash closes of itself. Windows may be left open with the assurance that they will close of themselves without human agency. The necessity of thoroughness in this work has been amply proven in different fires on different occasions, where the properly made goods have stood very severe tests. This was shown in Baltimore, more recently in San Francisco, and also in some of our Canadian cities and towns. The foolishness of installing anything but standard goods was forcibly demonstrated by a recent fire in the Empire Plow Works, Cleveland, Ohio, where the windows utterly failed. A casual examination of the frames and sash of these windows that failed, tell the whole story; they were made of wood, covered with tin, and were tinsmith's work, having none of the necessary details required by the underwriters' specifications. There were no interlocking joints. The tin was simply nailed to the wood; apparently the wired glass was held in place by 1-inch brads and the ordinary application of putty.

Windows to meet the requirements for fire protection should be as follows: The frames and sash should be made of twenty-four gauge iron, that will not flake or break in bending. The joints should be made with interlocking seams and rivetted, and where possible the joints should be formed so that the edge will be towards the heat exposure. The joints do not depend on solder, as under fire this would melt and the window would fall to pieces. The head and sill of frame, where practical, is made of one piece, securely rivetted or fastened to the jamb by a double seaming, which affords suitable fire-resisting and weatherproof qualities. The head is closed at the top. The sills are filled with concrete, which makes it thoroughly substantial.

The sashes are glazed with $\frac{1}{4}$ -inch wired glass, rough rolled, cast or polished. This glass has a wire mesh midway between the two surfaces of the glass. The size of the glass used is governed by the severity of the exposure. In no case does it exceed 48 inches either way. The glass is retained in the sash under all conditions, and does not depend on putty to hold it in its place. It is set in rabbets $\frac{3}{8}$ -inch deep, and the glass has a bearing of $\frac{5}{8}$ -inch at all points.

A number of defects are to be guarded against in installing fireproof windows. Some of them are as follows:—

In the frame a wrong gauge iron is used, as it can be worked up much quicker and is a great cheapener. Instead of the joints being interlocked they depend entirely on solder, which, under fire, allows the frame and sash to fall apart. Instead of the sill being filled with concrete, a piece of wood, which will burn and fall out when struck by fire or will rot in course of time, is substituted. Some glass in the frames is only $\frac{3}{8}$ -inch thick and is larger than 48 inches either way, as there can be a saving made because the glass will cut to better advantage in larger sizes. Sometimes the glass depends upon putty alone, or sometimes the rabbet is shallow, and the glass in either case will not remain in its place when struck by fire or when a fire stream is put on it.

The most severe test, to the writer's knowledge, that fireproof windows have been subjected to in actual fire, was in the building of the California Electric Works at San Francisco at the time of the conflagration. It was a "mill con-

struction" building, built in the usual manner of this construction. The windows had concrete-filled metal sash and frames. The lower sashes were pivoted and held open by a fusible link attachment; the upper sashes were stationary, the sashes throughout being glazed, of course, with wired glass. The severest test of the glass was on the west side, where a three-storey warehouse was totally destroyed 27 feet from the west wall of this building. In the intervening space stood three car loads of insulated wire. The insulation of this burned fiercely, and the wind drove the flames against the many-windowed west wall of this building. Several windows were open when the adjoining building began to burn, but the fusible links closed them promptly. The heat against these windows became so great that the wood work four feet inside the glass was charred but did not ignite. The fact that this all occurred after the earthquake gives evidence that the efficiency of wired glass was not affected by the quake. The wired glass is at the present time considerably cracked, but in no case was there the smallest hole, and they do not consider it necessary to reglaze the windows.

Fireproof Doors.

It depends principally on the size of the unprotected areas as to what damage a fire starting in the interior of a building will do. The next greatest danger is that the fire may travel from one floor to another, either through the stairway openings or elevator shafts. We will deal first with these areas. The smaller the areas in any building the less likelihood of a bad fire, as when fire is confined to a small area it is easily handled, does little damage and is soon extinguished. If partition walls be well and strongly built, fire does not damage them, and if the openings be protected with tin-clad fireproof doors, then no fire can get out of the area in which it starts. The doors are automatic heat-closing. The great majority are sliding doors. They have in most cases an incline track (but not necessarily so, as either doors with straight or incline tracks are automatic heat-closing). The fusible link comes out an inch beyond the edge of the door, so that no matter in what position the door is the link is always right in the opening; that is, if the door is wide open the link is still in the opening; so no matter in what position the door is left it is sure to close of itself when struck by fire. When struck by fire the link fuses, releasing the rope on which the weights are held. The weights drop and the door closes of itself. The fire is then fought with comparative ease.

Tin-clad doors are made of well-seasoned matched pine, dressed, tongued and grooved, the boards being not over 6 inches in width. The doors are made of three thicknesses of $\frac{7}{8}$ -inch boards, the outside layers being vertical and the inside layers being horizontal. They are encased in tin, which is applied so that during its exposure to the fire it will present the greatest possible resistance to bulging or bending up at the seams. When covered in this way there are no nail-heads whatever to be seen, as each one has two layers of tin over it, and under fire there is no danger of the heat drawing the nails out, which was the case in the old-fashioned doors. The track is bolted through the wall, so that the doors are up as solid as the wall itself, and to ensure that no fire will burn away the portion of flooring under the door, the flooring should be of concrete or of steel (or wrought iron, not less than $\frac{1}{4}$ -inch in thickness). This has to be built into the wall at least 6 inches at each end and to extend over and flush with the outer surface of the door. The door should fit snug, that is, there should be no space between it and the floor which would allow fire to travel underneath the door, nor should it be out too far from the wall, which would allow space and allow fire or smoke to get through. Some manufacturers use adjustable hangers, which allow the doors to be adjusted any way at any time after being hung by simply turning a screw. As it is very essential that a fireproof door

should at all times work freely and smoothly, this is a big advantage, as the person in whose building the doors are, can readily adjust them himself at any time with very little trouble. Where a hinged door is used, through an ingenious device which would take too much space to describe, this door is also made automatic heat-closing.

Rolling Steel Doors for Elevator Shafts, Stairway Openings, Etc.

In an elevator shaft or a stairway, and sometimes in a partition opening through lack of space, a tin-clad or kala-

Kalameined Clad Fireproof Door with Wired Fireproof Glass
Installed in Passenger Elevator Opening.

meined-clad sliding or hinged door cannot be used. Something is wanted that takes up but little space outside the actual opening, something that is fireproof, that can be easily operated, that is endorsed by the underwriters and that reduces the insurance rates. Such a condition calls for a rolling steel door, which answers all the requirements. It requires but one foot of space above the opening and $1\frac{1}{2}$ inches on either side of opening.

A rolling steel door or shutter to the underwriters' requirements is an open-hearth, cold-rolled sheet steel, corrugated and rivetted together and forming an unbroken sur-

face. It is very strong, stands any amount of wear and rough usage, and along the edges of the shutter is a heavy metal shield to protect it from wearing out by the friction in the iron grooves. The deep corrugation gives the door an unusual strength and rigidity, and a few dents or buckles will not interfere with its operation. It is automatic heat-closing, and no matter in what position it is left it will drop automatically when struck by fire, being fitted with a fusible link, and will stop the fire from spreading. Once closed it remains in place without gaping or twisting, and proves an efficient fire-stop. The fusible link attachment does not in any way interfere with the working of the door. The door is raised by hand except where an opening of 10 x 18 feet or

Rolling Steel Door Protecting Opening in Elevator Shaft, Showing Door Up larger, where a chain gear is used, which a boy can easily raise in twenty seconds.

There are doors made with interlocking slats, but a door whose integral parts are not air-tight is certainly not fireproof. The National Fire Protection Association, composed of insurance boards, the National Board of Fire Underwriters and its affiliated bodies, in their annual rules, issued May 25th, 1905, under rules "For the Construction of Steel Rolling Doors and Shutters," on page 299, Class H, Rule 47 (with this note added), say:—

Rule 47.—Curtain or Shutter.

To be of galvanized steel not less than 24 U. S. gauge, and to be preferably of corrugated sheets securely rivetted together.

Note.—Curtains made up of interlocking slats or strips permit the passage of smoke and gases through the joints;

under severe pressure the gases passing through may be ignited on the inside. It is almost more difficult to protect curtains of this character against rust and injury.

A practical test of a one piece continuous rolling steel door happened in Toronto at Geo. H. Hees, Son & Co., Ltd. fire at 52 Bay Street a few weeks ago. The freight elevator openings were equipped with rolling steel doors. When the fire began the link on the door fused and it dropped, and although the fire was very severe it withstood the flames, did not gape or bulge, and remained right in place, keeping the flames from getting down the elevator shaft and reaching the other floors. The rolling steel doors that we speak of also underwent a test at the Underwriters' Laboratory at Chicago in 1904 in a chamber constructed for such tests. There were two shutters in the properly constructed chamber, one on either side of a 14 in. brick wall. The shutters were of the regular corrugated type with the grooves fastened to the wall by means of 3-8 in. bolts. At the end of fourteen minutes after this test was started the temperature on the fire side of the shutters was 1,170 degrees. The temperature of the chamber on outside of the shutter was 92 degrees. Bulging or buckling did not reach more than one inch at any time. At the end of forty-five minutes the temperature on the fire side was 1,272 degrees, with that of the chamber on outside 119 degrees. At the end of an hour the temperature on the fire side was 1,290 degrees, with no apparent change in the condition of the shutters. There was a bulging of less than 1-2 in. in the centre. The flames were then turned off and a 7-8 in. stream of water applied to the curtain for about one minute. After the shutters were cooled it was found that they were securely in position and in close contact with the wall; no openings were formed through or around either of these shutters.

These doors do not necessarily have to be installed in a brick wall, but may be installed in a fireproof partition which is composed of studding and expanded metal lath, on which is placed 2 in. of cement concrete. This fireproof partition is endorsed and recommended by the fire insurance experts.

Skylights.

On a building that is not as high as the surrounding ones a fireproof skylight is essential. A fireproof skylight is one that has no wood in its construction, that is glazed with wired glass and that possesses great strength. These points are essential, for if wood were used it would burn and the glass would fall out of the light, allowing an opening for fire. If ordinary glass is used heat would break the glass, with the same result as aforementioned, and strength is needed to withstand debris, as during a fire a skylight sometimes has to stand a very severe strain on account of falling bricks, planks, etc. It is a very difficult matter to break wired glass. You can crack it, but it is practically unbreakable. A skylight, besides being fireproof, should be also wind, dust and waterproof; then it is a fuel saver in winter, and keeps that portion of the building under the skylight dry, clean and warm.

In the Baltimore fire The Safe Deposit and Trust Company's building stood in the heart of the burning district, and had as its principal feature of construction a wired glass skylight 30 x 40. ft. in size and covering the centre of the large banking room. Although this skylight bore the brunt of the tremendous heat from without as well as the shock due to a section of falling wall from the adjoining five story building of the Baltimore *Sun* it remained in place absolutely. The interior of the building was quite unharmed, and the company was ready for business next morning.

The Locomotive and Machine Company, Ltd, Montreal, have on their locomotive shops over 40,000 feet of wired glass skylight surface. The Canadian Kodak Company on their works in Toronto have over 4,000 feet also.

Among the Industries

Mr. George C. Roe has resigned from the managership of the Ottawa Steel Castings Co., Ltd.

Lockerby & McComb, manufacturers of tarred felt paper and roofers' supplies, suffered a \$50,000 loss by fire recently.

The Ontario Sugar Co. of Berlin have decided to add the refining of raw sugar to their present business of manufacturing beet sugar.

The name of the Dominion Dump Car Company, Limited, Montreal, has been changed to that of the Hart-Otis Car Company, Limited.

A large new plant is being projected for the Loudon Machinery Co., Guelph. The present factory has proved inadequate to their needs.

The Sackville Paper Box Co., of Sackville, N.B., which was recently organized, have purchased a factory building, and will instal a complete plant of machinery at once.

A large meat packing factory will be built in Tillsonburg during the coming summer. Mr. A. Crawford, who is interested in the same line of business in Scotland, will establish the plant.

A company is being organized in Owen Sound to build a dry-dock there. Vessel owners have been urging for some time the establishment of a dry-dock at that port, and Mr. W. P. Telford is now getting a company together to carry on the work.

The Maple Leaf Flour Mills at Kenora were destroyed by fire during the past month. These mills were only opened about a month before, and were an important industry for Kenora. They had a capacity of 4,500 barrels a day. The loss was half a million dollars.

The new smelting plant of the Montreal Reduction Co. at Trout Mills, Ont., was put in operation for the benefit of the Minister of Mines and a delegation from North Bay recently. The company is handicapped by the present financial stringency, and have asked the Ontario Government to extend monetary assistance to them.

It is probable that the government of Nova Scotia will appoint an inspector of boilers for Cape Breton. His duties will cover the works of the Dominion Coal Company, Dominion Iron and Steel Company, Nova Scotia Steel and Coal Company, and the Inverness and Port Hood Mines, and he will keep constantly in touch with the conditions at the steam plants of these companies.

The modern plant of the Canadian Billings & Spencer, Limited, of Welland, Ont., which has been in course of erection since May, 1907, is now in full running order. This is practically the first drop forging plant in Canada, and it is welcomed by all users of drop forgings, which are used for intricate parts of machinery where strength and durability are very essential. They will also manufacture machine wrenches, lathe dogs, machinists' tools, locomotive forgings, railroad supplies, etc. This firm located in Welland, where they could procure cheap electric power and natural gas, the latter being used entirely for fuel. With these natural advantages, they are in a position to compete with any drop forging plant on the continent.

Trade Enquiries

NOTE.—For further information regarding any inquiry mentioned under this heading or the names of inquiries, apply by numbers to the Secretary, at Toronto.

- 340 Acetate of Lead.—A Manchester firm asks for samples and c.i.f. prices of grey, brown and white acetate of lead from Canadian exporters.
- 341 Agent.—Well-known Delhi, India, firm of commission agents is anxious to hear from Canadian exporters who could do business in India. They claim there is a good field for a profitable trade in that country, and offer their services to anyone interested on a commission basis. Are prepared to do extensive advertising and have a splendid connection.
- 342 Agent.—A commission agent and general import and export merchant in the north of England desires to get into touch with Canadian manufacturers requiring such services as he can render.
- 343 Agencies.—A Bristol firm would be glad of Canadian agencies, particularly in grocery trade.
- 344 Agent.—A Chester correspondent is prepared to act as agent for Canadian manufacturers. Small goods preferred, such as safes or implements.
- 345 Agents.—An Indian firm of importers of foreign goods desires to get into touch with Canadian firms wishing to export to that country. They would be willing to act as commission agents for Canadian exporters.
- 346 Apple Waste.—A London firm wishes to get into touch with Canadian shippers who can quote for several thousand barrels of apple waste (cores, skins, etc.).
- 347 Auger.—A South African firm of wholesale and retail hardware merchants desires to communicate with Canadian manufacturers of auger bits and augers of all kinds, and engineers' tools.
- 348 Bedsteads.—A Manchester firm asks for c.i.f. prices of straw-board from Canadian exporters.
- 349 Blood Albumen.—A Manchester firm asks for prices of blood albumen from Canadian exporters.
- 350 Broom Handles.—A Manchester firm asks for prices of bass-wood broom handles, sized 50 inches, 72 inches, 84 inches and 108 inches x 1 1-8 inches, and 50 inches x 1 1-4 inches, from Canadian manufacturers.
- 351 Barytes.—A Manchester firm asks for samples and prices of grey and white barytes from Canadian exporters.
- 352 Blowing and Exhaust Fans.—Wellington, New Zealand, firm of machinery dealers is anxious to get in communication with Canadian makers of blowing and exhaust fans who can do an export business. Reference.
- 353 Butter Boxes.—St. John, N.B., firm are in the market to purchase quantities of butter boxes.
- 354 Butter Casks.—A commission agent in Denmark desires to hear from Canadian importers of staves and bottoms for butter casks made from beech in Denmark.
- 355 Canned Apples.—A Manchester firm asks for prices of canned apples c.i.f. from Canadian exporters.
- 356 Canned Meats.—A Manchester firm wishes to obtain prices of canned meats from Canadian exporters.
- 357 Canned Goods.—Inquiry has been received from a correspondent at Nottingham for the names of high class exporters in Canada of canned goods and provisions.
- 358 Casein.—A Manchester firm desires to correspond with Canadian exporters.

- 359 **Corn Starch.**—A Manchester firm asks for prices of corn starch in 2 cwt. bags (224 lbs.), c.i.f. from Canadian manufacturers.
- 360 **Carriages.**—An importing firm in the city of La Barca, Jalisco, Mexico, wishes to get into communication with Canadian exporters of carriages, carts and wagons.
- 361 **Carriages.**—A South African firm of cartage contractors and horse dealers desires to correspond with Canadian manufacturers of carriages. Manufacturers are requested when communicating to state the cost of shipment from their factories to Montreal and St. John, N.B.
- 362 **Carriages and Trade Vehicles.**—Firm of general carriage dealers and cartage agents in Transvaal, South Africa, is in the market to purchase small lots of the above vehicles from Canadian exporters. Good reference, shipment direct by Canada South Africa line.
- 363 **Conveying Machinery, Hoisting and Gasoline Engines.**—A firm of engineers and contractors in Prince Rupert, B.C., desires to get in touch with Canadian makers of this class of machinery. Business in sight.
- 364 **Cold, Rolled and Drawn Steel.**—Canadian firm is in the market to purchase small quantities of bright, cold rolled and drawn steel. Member of C.M.A.
- 365 **Exporters' Agents.**—Well-known New York firm of exporters' agents has an attractive proposition to place before Canadian firms who can do Australian trade. Further particulars can be obtained at this office. The firm in question has a splendid connection, and is of high class.
- 366 **Fish Oils.**—A London firm desires the addresses of Canadian producers and shippers of fish oils.
- 367 **Fruit Pulp.**—A London firm wishes for the addresses of Canadian producers of fruit pulp, in a position to do export trade.
- 368 **5, 10 and 15c. Articles.**—A party about to open a 5, 10 and 15c. store in Saskatchewan is in the market to purchase suitable goods for his store.
- 369 **Furniture, Paper Hangings.**—A London firm would like to come into contact with some Canadian manufacturers of furniture, particularly chairs, and also of paper hangings, with a view of taking up their agencies for the United Kingdom, and also for Germany.
- 370 **Furniture.**—An importing firm in the city of La Barca, Jalisco, Mexico, wishes to get into communication with Canadian exporters of furniture.
- 371 **Glucose.**—A Manchester firm asks for prices of glucose from Canadian exporters.
- 372 **Handles.**—A large manufacturing firm in the North of England, making shovels, picks and hammers, will be pleased to consider prices from Canadian firms in a position to supply the necessary handles for these tools; samples will, if necessary, be forwarded.
- 373 **Handles.**—A Bristol firm desires to import car lots of best basswood broom handles in the following dimensions: 50 inches x 1 1-8 inches and 50 inches x 1 1-4 inches.
- 374 **Handles for Picks, Shovels and Spades.**—An important English firm, who are considering importing large quantities of handles direct for the making of picks and shovels and spades, inquire for the names of Canadian manufacturers. If necessary, samples will be forwarded.
- 375 **Leather, Hemlock Sides, Bends, etc.**—A Leeds firm wishes to hear from leather firms in Canada exporting hemlock sides, bends, and shoulders, with prices.
- 376 **Lumbermen's Supplies, Mackinaw Goods, Heavy Underwear, Mitts.**—A lumber contractor in Saskatchewan is open to purchase the above articles from Canadian manufacturers not now represented in the West.

- 377 Linseed Oil.—A Manchester firm asks for prices of linseed oil from Canadian manufacturrs.
- 378 Manufacturers' Agent.—Old established importing house, Manchester, England, will be pleased to hear from manufacturers of all kinds of handles, dowels, and every description of wooden ware, hardware, etc., who desire to be represented in Great Britain. Will buy outright, or act as agents on a commission basis.
- 379 Manufacturers' Agent.—A well-known firm of manufacturers' agents in Montreal, Canada, would be glad to hear from Ontario houses desiring first-class representation in Eastern Canada. References.
- 380 Manufacturers' Agent.—Well-known firm of manufacturers' agents in London is open to act as agents for first-class Canadian firms in any lines. This is a high-class firm with good references.
- 381 Maple Last Blocks.—Leicester, England, firms of wholesale boot and shoe appliance dealers are open to purchase supplies of maple last blocks in car load quantities from Canadian exporters. Quantities desired in sizes of 1 to 9 at prices varying from \$33.00 per thousand to \$51.00 per thousand. Shipment f.o.b. United States ports; payment cash against documents. Must be kiln dried. This is a good trade opportunity.
- 382 Marble Slabs for Counter Show Cases.—Canadian firm, member of C.M.A., is in the market for the above material.
- 383 Mica.—A Manchester firm asks for samples and prices of mica from Canadian exporters.
- 384 Mica Splittings.—A Manchester firm asks for prices of mica splittings from Canadian exporters.
- 385 Mica.—A Lancashire firm importing large supplies of mica, desires to get into touch with producers and exporters in Canada.
- 386 Molybdenite.—A Manchester firm asks for prices of molybdenite from Canadian exporters.
- 387 News Paper, Condensed Milk.—Inquiry has been made for the names of Canadian manufacturers of paper for use in the newspaper trade, condensed milk, and other commodities, by a London firm acting on behalf of buyers in South Africa.
- 388 Nickel and Other Ores.—Mines product dealer in Hamburg, Germany, is in the market to purchase 5,000 ton lots of nickel and other ores.
- 389 Pick Handles.—An important Sheffield firm makes inquiry respecting the prospects of securing supplies of from 50 to 60 tons of pick handles, must be of the very best quality and finish, and exporters must guarantee that shipments will be promptly, regularly, and continuously delivered. A large and profitable trade can be established in this direction, and sample of the required handle will be sent to Canadian manufacturers open to take a keen interest in the enterprise.
- 390 Pine Squares.—A Manchester firm asks for prices of pine squares of sizes, 4 inches x 4 inches, 5 inches x 5 inches, 6 inches x 6 inches, 7 inches x 7 inches, from Canadian manufacturers.
- 391 Planks.—A Manchester firm asks for prices of beech and maple planks from Canadian exporters.
- 392 Pulleys.—A Manchester firm asks for catalogues and prices of wood split pulleys from Canadian manufacturers.
- 393 Pulleys.—A Manchester firm, at present buying in the United States, asks for catalogues and prices of wrought iron pulleys from Canadian manufacturers.
- 394 Representative.—A commission agent in the South of England desires to get into communication with Canadian mill- ing firms wishing to be represented in Great Britain.

The
Inside Finish
IT PAYS
TO USE

IN ANY BUILDING worth the right kind of a ceiling and side-walls, Pedlar Art Steel Interior Finish will earn its cost by reducing fire-risks. It can't burn, of course; it is cleaner, more sanitary, and far handsomer than plaster, yet the first cost is about the same. You ought to learn all about

PEDLAR ^{A R T} STEEL
PRODUCTS

Let us send you illustrated literature that tells and shows why you want these products in any building—for business or residence—you care about.

THE PEDLAR PEOPLE

Metallic Skylights

The acme of Skylight perfection!

We make them from hollow bars of Copper or Galvanized Steel—in styles and sizes to suit all kinds of roofs.

They are very strong, and unaffected by cold or heat, as there is neither contraction nor expansion—and, if glazed with our fire-proof wired glass, they are absolutely fire-proof.

**METALLIC ROOFING CO.,
Limited,
Wholesale Manufacturers,
TORONTO, CANADA.**

Galt Steel Siding

may be easily and quickly applied to any frame structure, in any weather. Can be used over cheap or old weather-beaten lumber and will make the building warm and weather-proof, handsome, durable and fireproof.

Manufacturers—Do Yourselves Justice

Investigate our high grade line of Sheet Metal Building Goods. If you are in the market for anything in this line—we have it—and it's the best.

We ask an opportunity to demonstrate these facts to you. A pleasure to show you our goods and to give estimates and quotations.

“Galt” Fire-proof Doors, Windows and Curtains

“Galt” Skylights and Ventilators

“Galt” Expanded Steel Lath

“Galt” Corrugated Sheets, Etc.

Galt Sure Grip Shingles

are the latest and best form of Galvanized Steel Roof Covering. They are tightest and warmest; last longest and look best. Fire and lightning proof.

Underwood

It is worthy of note that out of 15 styles of typewriters introduced during the past few years, 13 have been built as closely in imitation of the Underwood as the patent laws would permit.

It took 25 years to learn that typewriters were built on the wrong plan—upside down in fact. The advent of the Underwood revolutionized the typewriter industry, and this revolutionizing has continued for ten years.

The latest achievement is the perfecting of the Underwood bookkeeping typewriters which are effecting wonderful economies in the work of the office. They are a source of very considerable profit. If you have orders to enter or bills to render you can't afford to be without them.

United Typewriter Co., Limited

Manufacturers of Tents, Awnings, Flags, Sails, Waterproof Covers, Clothing, Coal Bags, Life Belts, Life Buoys and every description of Camping Goods. Tents and Camping Outfits to rent.

THRESHING MACHINERY

SAWYER & MASSEY CO., Limited,
HAMILTON, CAN.

Separators, Clover Hullers and Attachments of all kinds, Threshing Engines, Traction and Portable, Sweep and Tread Powers, Portable Saw Mills and Saw Mill Engines, Roadmaking Machinery, Graders, Scrapers, Rollers, etc.

TRUNKS AND BAGS

J. EVELEIGH & CO.,
MONTREAL.

Manufacturers of Travelling Requisites of every description.
Steel Commercial Trunks a specialty.

THE M. LANGMUIR MANUFACTURING CO. OF TORONTO, Limited.

Trunks and Travelling Bags, Telescope Cases, Suit Cases, etc. Steel Sample Cases.

TYPEWRITERS

UNITED TYPEWRITER CO., Limited.
7-9 Adelaide St. East, TORONTO.

Sole dealers in "Underwood" Typewriters; also all other makes, new and second-hand; manufacturers of Neostyle Duplicating Machines and supplies. Write for price list.

VARNISHES

THE IMPERIAL VARNISH & COLOR CO., Limited, TORONTO

Manufacturers of Varnishes, Japans, Fillers, Paints, Enamels, Stains, etc., for all uses.

WAGONS AND CARTS

The **WILKINSON PLOUGH CO., Ltd.,** TORONTO, Canada.

Wagons, a full line.
The West Lorne Wagon Co. controlled by The Wilkinson Plough Co., Ltd.
Prices on application.

WATCH CASES

THE AMERICAN WATCH CASE CO., LTD., TORONTO, CANADA.

Largest Watch Case Factory in the British Empire. Manufacturers of Gold, Silver, Gold-filled and Nickel Watch Cases of every style and size. Goods marketed exclusively through the wholesale trade. Correspondence solicited.

WHEEL SCRAPERS

BECHTELS LIMITED

Manufacturers of the SIMPLICITY line of Wire Cut Brick Machinery
Capacities up to 100,000 per day. Perfect Carless Brick and Tite Driers,
Wheel Scrapers. Barrows, etc.

WINDOW SHADES, ETC.

GEO. H. HEES, SON & CO, Ltd.,

Manufacturers of Window Shades, Upholstery Goods, Lace Curtains, Curtain Poles, Fixtures, etc.
Office and Showrooms,
71 BAY STREET, TORONTO.

DALY & MORIN

Manufacturers of

Window Shades Shade Cloth
Curtain Poles and Trimmings
32 St. Sulpice St. - - - MONTREAL
Factory - - - LACHINE.

WIND MILLS—STEEL

GOOLD, SHAPELY & MUIR CO., Limited.
BRANTFORD, CANADA.

Galvanized Steel Pumping and Power Windmills, Gas and Gasoline Engines, Grain Grinders, Iron and Wood Pumps, Tanks, Water Supplies, Custom Galvanizing.
Automatic Concrete Mixers.

ONTARIO WIND, ENGINE & PUMP CO., LTD., TORONTO.

WINDMILLS, PUMPS, GASOLINE ENGINES,
TANKS AND SUBSTRUCTURES,
WATER SUPPLY APPLIANCES, GALVANIZING.

WIRE CLOTH

C. H. JOHNSON & SONS, Limited

St. Henry, Montreal

Makers of
IRON BRASS and COPPER
WIRE CLOTH

WIRE WORK

THE GEO. B. MEADOWS TORONTO WIRE, IRON AND BRASS WORKS CO., Limited, TORONTO, ONT.

Established 1854. Office, 479 Wellington St. W.
Wire Cloth, Wire Work, Ornamental Wrought Iron Work, Fencing, Bank and Office Railings, Window Fixtures, Elevator Guards, Mining Screens, Riddles.

WOOL

E. T. CARTER & CO.,

83 and 85 Front St. E., TORONTO.

Wool—Domestic and Foreign.
Cotton and Cotton Warps.

ROSAMOND WOOLLEN CO.,
ALMONTE, ONT.

Manufacturers of Worsted Coatings, Suitings and Serges. Fancy Tweeds and Overcoatings in Wool only.

COMMISSION MERCHANT

T. R. BILLETT,

Commission Merchant,
WINNIPEG

Correspondence Invited.

 A NET GAIN OF 2,122 OVER AVERAGE FOR 1906

This is a sworn statement of ACTUAL CIRCULATION—NOT PRESS RUN

Some papers flaunt sworn statements of their PRESS RUN as "CIRCULATION." Such a statement includes spoiled and unsold copies—everything, indeed, that they *intend to print*, always *more* than they *really do print*, and *many more* than their actual distributed circulation. This is misleading.

Above is the ACTUAL CIRCULATION OF THE MAIL AND EMPIRE. It does include free copies but it is circulation, every bit of it.

WHERE THEY GO

Further, in order to fatten a circulation statement, some publishers push for a circulation at reduced prices, far beyond the geographical limit within which the paper may be read on day of publication. A daily paper of yesterday is a dead thing, and of little value as an advertising medium. Discriminating space buyers always insist on knowing just where a circulation is distributed. THE MAIL AND EMPIRE has, therefore, pleasure in presenting a sworn statement of the distribution of the circulation, as follows:

IN ONTARIO, **39,741** OUTSIDE OF PROVINCE, **1,019**
 TORONTO CITY, **17,875** ONTARIO, OUTSIDE OF CITY, **21,866**

OFFICIAL DECLARATION

DOMINION OF CANADA } I, WILLIAM JAMES DARBY, of the City of Toronto, in the County of York, Circulation Manager of "THE DAILY MAIL
 CITY OF TORONTO } AND EMPIRE" newspaper, do solemnly declare:—
 To Wit: } That the average number of copies of "THE MAIL AND EMPIRE," circulated daily during 1907, within a radius of five miles from the corner of King and Yonge streets, Toronto, was Seventeen Thousand, Eight Hundred and Seventy-five (17,875).
 That the average number of copies circulated daily within the Province of Ontario (not including the district above mentioned) was Twenty-One Thousand, Eight Hundred and Sixty-Six (21,866).
 That the average number of copies circulated daily outside of the Province of Ontario was One Thousand and Nineteen (1,019).
 That the total daily average circulation for 1907 was Forty Thousand, Seven Hundred and Sixty (40,760).
 And I make this solemn declaration, conscientiously believing it to be true, and knowing that it is of the same force and effect as if made under oath, and by virtue of the Canada Evidence Act, 1893.
 Declared before me at Toronto, this 9th day of January, 1908.

Executive Council

JANUARY MEETING.

SECRETARY.

Much business transacted at Hamilton meeting—Report of officers—Should the Government renew subsidy to Canada-Australia steamship service?—A tariff department for the Association again recommended—More customs inspectors should be appointed—Several manufacturers admitted to membership—London office discontinued for present—Amendments to acts affecting incorporated companies—Criticism of new Insurance Act—Agitation for technical education growing—Will publish trade index this year—Report of Commercial Intelligence Committee.

The regular monthly meeting of the Executive Council was held in the Board of Trade Rooms, Hamilton, on Thursday, January 16th, at 2.30 p.m.

The President, Hon. J. D. Rolland, occupied the chair; other members present being G. Frank Beer, Toronto; Henry Bertram, Dundas; C. A. Birge, Hamilton; J. A. Coulter, Ingersoll; J. S. N. Dougall, Montreal; W. R. Dunn, Hamilton; S. W. Ewing, Montreal; John Firstbrook, Toronto; Atwell Fleming, Toronto; H. W. Fleury, Aurora; E. J. Freyseng, Toronto; S. R. Hart, Toronto; E. G. Henderson, Windsor; R. Hobson, Hamilton; Alf. Jephcott, Toronto; F. E. Leonard, London; J. B. MacLean, Toronto; C. R. McCullough, Hamilton; James McLauchlan, Owen Sound; J. P. Murray, Toronto; Carl Riordan, Montreal; Thos. Roden, Toronto; A. S. Rogers, Toronto; W. H. Rowley, Hull; T. A. Russell, Toronto Junction; Alex. Saunders, Goderich; J. H. Sherrard, Montreal; Chas. A. Smart, Montreal; Arthur W. White, London; R. J. Whyte, Smith's Falls; S. M. Wickett, Toronto; C. C. L. Wilson, Ingersoll; Dan Wilson, Collingwood.

The minutes of the December meeting, as reported in INDUSTRIAL CANADA, were taken as read.

COMMUNICATIONS.

Communications were received as follows:

1. From the following members of the Executive, regretting their inability to be present: Messrs. C. H. Waterous, J. W. Cowan, Louis Simpson, C. Birmingham, J. H. Burland, Wm. Cauldwell, J. H. Housser, W. B. Tindall, J. J. McGill, Henry Stroud, Wm. Stone, George Booth and Wm. Robins.

2. From Mr. Raymond L. Haskins, asking permission on behalf of a number of wine manufacturers, to organize what would be known as the Wine Growers' Section of the Association. On motion of Mr. Roden, seconded by Mr. Henderson, it was unanimously decided to accede to Mr. Haskins' request.

The officers of the Association then reported as follows:

PRESIDENT.

Mr. Rolland referred to the fact that a deputation of pulp and paper manufacturers had again waited upon the Dominion Government, to urge that the export of pulp-wood, in its unmanufactured state, be prohibited. In this connection he dwelt upon the necessity of taking steps to preserve our forests and water powers, and to make the most out of the wood which had to be cut for commercial purposes. While he doubted very much whether anything would be done at the present session, he felt convinced that sooner or later their agitation would bear fruit.

The Secretary reported with regret the death of Mr. E. Tougas, a member of the Executive Council from Montreal, and Dr. F. J. Smale, formerly a member of the Executive from Toronto. It was unanimously resolved that a letter should be sent by the Secretary to the bereaved families, conveying to them the sympathy of the Council.

TREASURER.

In the absence of Mr. Booth, the financial statement for the month was presented by the Secretary, and regularly adopted. It showed receipts of \$3,911.41, and disbursements of \$4,075.33, leaving a balance to the credit of the Association from the first of its financial year of \$15,070.89.

FINANCE.

The report of the Finance Committee, as presented by Mr. Firstbrook, recommended for payment the regular monthly accounts amounting to \$1,623.40.

It took occasion to point out, in connection with an expenditure incurred by the Furniture Section, that the by-laws of the Association did not make it sufficiently clear that the Sections' authority to spend 10 per cent. of their revenue was not retroactive, and in order that in future the Sections might not make the mistake of assuming that they could spend double the amount one year by virtue of their failure to expend anything the previous year, the Committee reported that at the next annual meeting they would propose an amendment to the by-laws covering this point.

The complaint of the Toronto Branch that they were being overcharged on certain items in connection with the distribution of expenditures, had been considered in conference with representatives of the Branch, and the Committee was pleased to report that after the situation had been fully gone into all parties had agreed to allow matters to stand as they were.

Travelling Expenses of Members.

A ruling was asked from the Council in regard to the payment of travelling expenses incurred by members when doing work on behalf of the Association. The Committee reported that a stated case had been under consideration, but that as it involved a principle which might have far reaching effects, they preferred to leave it for the Council to deal with.

Mr. Rowley thought that each case should be referred to the Association's auditor, while Mr. Birge believed it preferable to allow matters to stand as at present, so that the Finance Committee could deal with each case on its individual merits. Mr. Wickett pointed out the difficulty of establishing any fixed rule, on account of the fact that it was sometimes necessary for the chairman of a committee to take action before the consent of the Finance Committee could be obtained. He favored the idea, therefore, of referring the whole question back to the Finance Committee for a definite recommendation, and a motion to this effect, seconded by Mr. J. P. Murray, coupled with a suggestion that the report of the Committee be presented at the next meeting of the Council, was carried.

A supplementary report by the Finance Committee, recommending the re-engagement of Mr. Murray as General Secretary, Mr. Walsh as Manager of the Transportation Department, and Mr. Scully as Assistant Secretary, all for one year, was also adopted.

RAILWAY AND TRANSPORTATION.

The Chairman, Mr. W. R. Dunn, read the report of the Railway and Transportation Committee.

The following extracts indicate the principal matters dealt with :

Reorganization of Board of Railway Commissioners.

The deputation, which waited upon the Premier and Minister of Railways and Canals in Ottawa on December 5th, presented the resolution passed by the Association in convention in September last. Assurances were given that when the Government took action every consideration would be given to our representations.

Bill of Lading, Reciprocal Demurrage and Weighing Car-load Traffic.

The deputation which waited upon the Board of Railway Commissioners on the same date was received by the full Board. An opportunity was given to present our views fully in these important matters. We were assured that the Board appreciated their importance, and that some action would probably be taken at an early date, particularly in regard to the uniform bill of lading.

Readjustment of Rates.

The new tariffs, as ordered by the Board of Railway Commissioners on July 6th, 1907, in what is known as the International Rate Case, became effective on January 1st. These tariffs represent a general revision of rates throughout Eastern Canada. When the order was made it was expected that the tariffs would become effective not later than October 1st, but for reasons best known to the railways they were delayed, and it became necessary for your Committee to urge upon the Railway Commission to fix a date when they would take effect. We have assurance that the tariffs ordered, applying on international traffic east-bound from Central Freight Association territory are in the course of preparation, and will be issued at an early date.

These latter tariffs will be governed by the Canadian Freight Classification, which will advance all class rates below first.

In reply to a communication to the Board respecting the new tariffs, we were advised as follows : " We have arranged for checking up of the rates, class and commodity, issued or being issued under the orders of the Board in the International and Toronto Board of Trade Rate Case." This gives us the assurance that if there are any tariffs which do not comply with the spirit of the order they will be rejected.

Rates to the North-West, British Columbia and the Kootenay.

The railways have issued new tariffs, effected December 23rd and 26th, reducing the rates from Eastern Canada to the above points.

Rates Out of Winnipeg.

A communication has been received from the Chairman of the Manitoba Branch tendering their thanks for the assistance given the Branch in preparing for the hearing before the Chief Commissioner in regard to these rates, which was held on January 7th. The matter is to be further heard in Ottawa on January 27th, and the manager was instructed to attend the hearing in the interest of the Association.

Canada-Australia Steamship Service.

The amount usually voted for this service was not placed in the estimates recently submitted to Parliament. The Government feels that there is little use in Canada subsidizing a line in the face of the present discouraging trade conditions, and especially in view of the fact that 75 per cent. of the Canadian goods appear to be exported by way of New York. The present contract expires August 1st. The whole matter is still under negotiation. In view of this your Committee do not feel that they should take any action for the present at least.

Improvements to Water-ways.

Your Committee has for some time had before it a resolution passed by the Toronto Board of Trade, endorsing the Huron and Ontario Ship Canal project. The subject is a very broad one. The manager was instructed to read to the Executive the resolution referred to, and say that your Committee will be prepared to submit at the next meeting a resolution dealing with improvements to water-ways generally. This notice is given in order that a full discussion may be invited.

Express Matters.

A preliminary hearing was held in Montreal on December 12th, 13th and 14th. It was confined to the construction of the express tariffs, and the value of the service to the public. The investigation will be resumed about the middle of January, when the specific tariffs filed with the Board will be considered.

Mr. Rowley took occasion to congratulate the Committee upon the splendid work it had done in bringing about a readjustment of rates in the territory east of Port Arthur and the Detroit frontier. He thought that the benefits to the membership in the territory affected were so pronounced that a general circular should be issued by the Department, calling attention to the real significance of what the Association had achieved.

Shipments via Canadian Ports.

In connection with the discontinuance of the subsidy to the Australian steamship line, and the proposal to limit the benefits of the Franco-Canadian treaty to goods coming directly from or going directly to France, a general discussion arose regarding the volume of business entering Canada by United States ports. Mr. Dougall expressed surprise at the statement that 75 per cent. of our exports to Australia went via New York. Mr. Saunders referred to the stand which he had taken at the Winnipeg Convention in regard to the facilities afforded by the C. P. R. for shipping via Vancouver. He believed that Canadian exporters did not appreciate the advantages which that line had to offer. Personally he had always found their rates just as low as any he could get by New York, and he thought they should be encouraged much more than they were. He also pointed out that existing conditions led to serious misapprehensions regarding the distribution of Canada's exports, the ultimate destination being very frequently concealed owing to the fact that shipments were made through New York. Mr. Dougall moved that the clause referring to the Australian subsidy be referred back to the Committee for a further report. His motion was seconded by Mr. Russell, who believed that the Australian tariff, as finally adopted, would not be so inimical to Canada as at first anticipated, and that rather than cut off the subsidy to the line via Vancouver, it should be continued and another line subsidized from Montreal or some Eastern Canadian port. On a vote having been taken Mr. Dougall's motion was carried.

Improvement of Water-ways.

Referring to the resolution of the Toronto Board of Trade endorsing the Huron and Ontario Ship Canal project, Mr.

Henderson thought it was quite futile for the Council to undertake in an academic way to pronounce as between this route and the Ottawa River Canal. Mr. Birge was opposed to the Association taking any stand whatever on the question, owing to the fact that sectional differences were likely to arise; he accordingly moved, seconded by Mr. Saunders, that this clause be struck out of the Committee's report. Carried.

TARIFF.

The report of the Tariff Committee was read by Mr. J. P. Murray, and on motion of Mr. Birge it was considered clause by clause as follows:

Leeway in the Dumping Regulations.

As no move has been made either by the rolling mill men or by the bridge builders to bring about a meeting for the purpose of reconciling their conflicting views as regards the leeway of 5 per cent. provided in the dumping regulations in the case of certain iron and steel articles, instructions have been given the Secretary to communicate with the parties affected suggesting that the leeway be abolished on all articles of iron and steel except channels, beams and sheets.

Mr. A. W. White inquired why should not the leeway be abolished on all classes of goods, instead of making certain exceptions, to which Mr. Hobson replied that the articles mentioned were virtually not being made in Canada. On explanation by the Secretary that the suggestion as regards beams, channels and sheets was only a suggestion, thrown out with a view to effecting a compromise, it was agreed to allow this clause to pass.

Establishment of Tariff Department.

Your Committee regarded it as unfortunate that there was so small an attendance at its Ottawa meeting of those who were prominent in advocating the establishment of a Tariff Department in connection with the Association, as it is believed that a large majority of the members of the Committee are strongly in favor of proceeding at once in this matter. It is, we believe, of vital importance to members of the Association generally that we should have at our disposal at the earliest possible date the services of an expert tariff officer to investigate all tariff grievances, and report on same in a thoroughly scientific manner. It is now recommended, therefore, that steps be taken to establish the department forthwith, instead of waiting until the Government has been induced to appoint a Tariff Commission.

The question was raised whether the Association would be able to finance the proposed department. On motion of Mr. Ewing, seconded by Mr. Henderson, a motion to adopt this clause was carried, provided the Finance Committee could find ways and means.

Duty on Plaster Sacks.

At the request of the Manitoba Gypsum Company and the various bag manufacturers, it is recommended that the Association endorse their application to the Minister of Finance to impose a duty of two cents on every bag used in connection with the importation of wall plaster. This is no more than is done in the case of bags when used for carrying Portland cement, and your Committee feel that the application of the parties referred to is just and reasonable.

Mr. Henderson took exception to this clause, on the ground that it was not wide enough in its application. On motion of Col. Smart, seconded by Mr. Henderson, it was decided to amend the clause by asking for a duty of two cents per bag on all jute or cotton bags used in connection with the importation of any commodity whatsoever.

Separate Inspectors for the Various Trades.

Applications have been received from the Furniture Section, and from a prominent firm in the boot and shoe industry, asking the Association to recommend to the Government that special officers be attached to the outside service of the Customs Department for the purpose of investigating all cases of under-valuation which are reported in these respective trades. In support of these applications they point out that the facts of a case can be arrived at much more quickly, and more accurately by one who is technically familiar with the details of the trade than by one who has no special knowledge of it. There can be no doubt that a considerable amount of dumping is going on which escapes the attention of the customs officers, and particularly at the present time when so much pressure is being brought to bear upon United States manufacturers to sacrifice their stocks, is it desirable that the Government should have at its disposal the services of more than five men, which is the number of officers now employed.

Franco-Canadian Treaty.

Your Committee has spent some little time discussing the above question, but they feel that in a matter of such great importance to the whole of Canada no action should be taken without first sifting the proposition to the very bottom. It is proposed to call a special meeting to consider the same on Tuesday next, in order that the views of the Association may be made known before the treaty is disposed of in the House, and the Council is now asked to empower the Committee to express on its behalf the official attitude of the Association towards this treaty.

Mr. R. J. Whyte took strong exception to the above clause, as he believed it to be too important a matter to be referred to any one Committee to decide. He thought that the proper procedure would be to do the same as had been done a year ago, when the tariff revision was announced, that is to say, to call all the sections together, and let them deal as they saw fit with the items in which they were directly interested.

As against this, Mr. Murray pointed out that the treaty would likely pass the House before another meeting of the Executive, and if the Association were to take action at all it must do so promptly. Should it transpire that there would be time for the Tariff Committee to report to the Council before making the Association's views public, they would assuredly do so, but they wished to be empowered to speak for the Association in the event of an early debate on the treaty making such a course desirable.

Mr. Whyte reiterated his belief that the Tariff Committee should act only on the request of the sections after full consideration had been given by the latter to their own trade interests. He therefore moved, seconded by Mr. Sherrard, that any recommendations by the Tariff Committee in connection with the Franco-Canadian treaty be made only on the request of individual industries concerned. Carried.

The adoption of the report as amended, moved by Mr. Murray, seconded by Mr. Roden, was then carried.

RECEPTION AND MEMBERSHIP.

The report of the Reception and Membership Committee recommended for acceptance the following applications:

COLLINGWOOD.

Collingwood Shipbuilding Co.

GUELPH.

Sleeman & Sons.

HAMILTON.

Canadian Shovel and Tool Co. (F. Skelton, 2nd mem.).
Raymond L. Haskins.

MEAFORD.

The Georgian Bay Milling and Power Co., Ltd.

MONTREAL.

Canada Newspaper Syndicate, Ltd.
The Auto Strop Safety Razor Co.

NIAGARA FALLS.

The Stamford Park Wine Co.
T. G. Bright & Co.

OTTAWA.

W. H. Dwyer Co., Ltd.

PRESTON.

Preston Car and Coach Co., Ltd.

PRICE, QUE.

Metis Lumber Co.

QUEBEC.

Campbell Shoe Company.

SANDWICH.

Girardot Wine Mfg. Co., Ltd.

STRATFORD.

The McLeod Milling Co.

ST. CATHARINES.

Hillrust Wine Manufacturing Co.

TORONTO.

The House of Hobberlin.
Imperial Varnish and Color Co. (T. F. Monypenny).
Brunswick-Balke Collender Co.

WELLAND.

Canadian Billings & Spencer, Lt

Among other things it recommended :

(1) That permission be granted the Quebec Branch to extend its boundaries so as to include all the territory in that province east of a line drawn north-west and south-east from Three Rivers.

(2) That the Secretary be authorized to prepare a small advertising booklet setting forth the objects and work of the Association, at a cost not to exceed \$100.

(3) That the invitation of the Montreal Branch to hold a meeting of the Executive Council in that city be accepted for the month of March.

Mr. Ewing took occasion to emphasize the need of an advertising booklet such as the Committee had recommended. On behalf of the Montreal Branch he also assured the Council that they would be glad to have them as their guests for the March meeting.

Col. MacLean suggested that it might be advisable to hold one of the summer meetings of the Executive in the city of Guelph, so that advantage could be taken of the opportunity to visit the Macdonald Technical Institute and the Agricultural College.

Different members objected to the frequent holding of the monthly Council meetings away from Toronto. An amendment, moved by Mr. Henderson, seconded by Mr. Roden, that any decision as to a meeting in Montreal be left until the February Executive, was carried.

BRITISH OFFICE.

In the absence of the Chairman the report of the British Office Committee was presented by the Secretary as follows :

Since the last meeting of the Council the Association's immigration policy has been the subject of much adverse criticism, both in the House of Commons and in the press. Efforts have been made to saddle the Association with responsibility for the unemployed problem, by stating that its London office was used as a means of flooding the Canadian labor market in order to force down wages. False motives have been imputed

to it for asking that proceedings be instituted against those agents who have been guilty of misrepresentation, and the statement is now being made that this is simply the Association's way of repudiating the men who have been doing its dirty work.

It is, perhaps, unnecessary to assure the Council that these accusations are absolutely without foundation, for the British office has always been conducted in a fair and business-like manner, with the sole object of supplying members of the Association with help which it seemed impossible to procure in Canada. Your Committee has always been able to defend itself against the accusation that it has contributed in any way whatever to the present unfortunate position of the working classes, and in answer to the statements made in the House by Mr. Oliver and Mr. Verville, a letter was written by the Secretary on December 24th to papers in Montreal, Ottawa, Toronto and Hamilton, explaining fully the Department's method of operations, and showing that since its inauguration it had only brought out to Canada 527 working people.

A Misleading Advertisement.

At the same time that these charges were being made in the House your Committee received word from Lord Strathcona that Mr. Leopold was advertising in British papers to the effect that there were hundreds of vacancies in Canada for mechanics in all trades. In view of the fact that such an advertisement was palpably misleading, and calculated to lend color to the belief already cherished in certain quarters that the Association was unscrupulous in its methods to encourage the immigration of skilled labor, a cable was at once despatched to Mr. Leopold asking for his explanation, and stating that the advertisement must be immediately withdrawn. A meeting of the Toronto members of the Committee was hastily called to consider his reply, from which it appeared that the advertisement was an old one used in the month of August, which had now been re-inserted by the publisher without authority. Instructions were cabled Mr. Leopold to place a notice in the paper carrying the advertisement to the effect that it was not a correct representation of the situation, and that the manufacturers of Canada, except in a few special lines, were amply supplied with labor for the present. This, however, Mr. Leopold did not do, explaining in a subsequent letter that the paper had only a small circulation, and was already on the verge of bankruptcy. He offered to procure a letter from the editor that would relieve him, as the Association's agent, from all responsibility, and this he has now been asked to do.

Your Committee fully appreciate how unfortunate it is that such an incident should have occurred at the present time when there are so many out of employment, and when the Association is being accused of having brought about the situation, but they feel no blame whatever can be attached to Mr. Leopold.

Applications Cancelled.

As a further precaution against bringing out men for whom there were no positions, the Secretary was asked to communicate with all members whose applications to the Department for labor were unfilled, inquiring as to whether the balance of the help was still wanted. These have now been heard from, and in only one case has the Department been instructed to proceed with the order. Mr. Leopold has accordingly been requested to cancel all applications, except this one, for the time being.

Discontinue the Office.

In view of the above condition of affairs suggestions were made to the Committee that it might be well to discontinue the British office, until such time at least as there might be further need of its services. Your Committee has given this suggestion serious consideration, and has at the same time

looked carefully into the financial standing of the office as requested at the last meeting of the Council. Out of a total of 527 hands engaged to date, 58 were unsatisfactory or never reported. The fees with which the Department has been credited for having engaged the remainder total up to \$1,382, of which \$725.75 has been collected. The total disbursements to December 31st were \$2,116.76, so that assuming that all the book debts were collectable there would still be a deficit for the year of \$734.76. The final deficit, however, is likely to run considerably over this amount, because of the fact that there are still a number of cases of dissatisfaction to be dealt with.

After having given due consideration to this aspect of the case, and, further, in view of the fact that there is little likelihood of there being any marked scarcity of labor for the next six months or possibly longer, your Committee recommend that the British office be temporarily discontinued, and that Mr. Leopold be given three months' notice.

In moving the adoption of the report, which was seconded by Mr. Firstbrook, Mr. Beer criticized the Committee for fixing its scale of fees too low. He did not see how the work could possibly be done at such a moderate scale of charges. Mr. Beer's motion was duly carried.

PARLIAMENTARY.

The report of the Parliamentary Committee, as presented by Mr. A. S. Rogers, dealt among other things with the following matters :

Prosecution of Unscrupulous Agents.

In accordance with instructions given by the Council, the Secretary had forwarded all papers connected with the unauthorized engagement of some twenty weavers for a certain Toronto company to the Labor Department at Ottawa, with the request that the offenders be prosecuted under the Merchants' Shipping Act. At the suggestion of the Department additional documentary evidence had been procured to strengthen the case, and the Committee was now advised that the whole matter would at once be laid before the home authorities.

Misrepresentations by Mr. Trotter.

The attention of the Committee had been directed to the misleading statements which were being made about Canada by Mr. W. C. Trotter, the special delegate sent to England by the Trades and Labor Congress. If the British press reported him correctly, his speeches grossly exaggerated the unemployed situation, and were calculated to do the country much harm. Regret was expressed that organized labor should have adopted such a questionable policy to deter immigration, but the Committee deprecated the suggestion to answer Mr. Trotter in any way, as it might only lead to a controversy which would serve no useful purpose.

Amendment to the Criminal Code.

In connection with the campaign of the Retail Merchants' Association for an amendment to the criminal code, which would place merchants, manufacturers and employers on the same level as trade unions, so far as combinations for their mutual protection were concerned, it was recommended that no action be taken.

Ontario Assessment Act.

It had been decided to ask Mr. McNaught, M.P.P., to introduce the amendment to the Assessment Act, which was put forward last year, exempting from the income tax the salaries of officers in incorporated companies who are also stockholders of the companies.

Franchise for Incorporated Companies.

It was recommended that the Association's desire that incorporated companies should have a vote on all money by-laws, should be put in the form of a draft bill and forwarded to all the provincial branches for introduction into their respective legislatures.

INSURANCE.

The report of the Insurance Committee was presented by Mr. Alfred Jephcott. It will be found in the front of INDUSTRIAL CANADA.

Mr. Jephcott requested that an opportunity be given Mr. Heaton to explain more in detail a few of the important features of the new Insurance Act which it was recommended the Association should oppose, but as Mr. Hobson pointed out the printed report was already so lucid that it did not require further explanation.

A suggestion that copies of the report be sent to all members of Parliament, and the leading Boards of Trade throughout Canada, was unanimously approved of.

"INDUSTRIAL CANADA."

Mr. C. R. McCullough, the Chairman, reported progress on behalf of the above Committee. The net revenue earned by the paper for the six months ending January was estimated at \$1,282. Owing to business conditions the paper had suffered the loss of a number of its old contracts, but these had been more than counterbalanced by the new business which was being turned in by the advertising solicitor.

In connection with the special May edition, which was to contain a classified list of members, it was recommended that the alphabetical list corresponding to Part I. of the Trade Index be omitted on account of the fact that it was exceedingly bulky and of very little value.

TECHNICAL EDUCATION.

The following is the report of the Technical Education Committee, as presented by the Chairman, Mr. Wickett :

It is some months since your Technical Education Committee has had the pleasure of making a report, but in the interval the campaign for the appointment of a Federal Commission of Inquiry has been making steady progress.

Campaign Among Provincial Premiers.

Early in October it was learned that a deputation from the Toronto Reform Association were going to Ottawa to wait upon the Premier, and at the request of your Committee they gladly included Technical Education among the subjects to which they asked the Government to pay increased attention. Sir Wilfrid, in his reply to them, expressed entire sympathy with the Association's proposal, though he candidly told them he wished to avoid even the appearance of interfering with the rights of the Provinces in questions of education. Assuming that his reluctance to act would disappear once the Provincial Premiers had expressed their acquiescence in our petition, a letter was despatched forthwith to each of them explaining the situation, and asking them to forward direct to Sir Wilfrid a letter endorsing the memorial on behalf of their respective Governments, and stating that they would offer no opposition on constitutional grounds. In most cases this appeal was followed up by a personal interview by influential members of the Association in the various Provinces, with the final result that favorable replies were obtained from all the Premiers, except Mr. Gouin, of Quebec, who, while assuring the Association's deputation verbally that he would offer no opposition to the appointment of the Commission so long as the educational rights of the Province under the B. N. A. Act

were not impaired, preferred not to commit himself in writing.

Believing that with public opinion now solidly behind our request, the Government would have no further cause for hesitation, a deputation consisting of Mr. J. F. MacKay and the Secretary was appointed to call upon the Premier and urge the importance of immediate action.

Meanwhile, arrangements were made with Mr. Hugh Guthrie, M.P., to place upon the order papers of the House a resolution favoring a Government Inquiry, so that should the Premier prefer to have the question dealt with in that manner and made a non-political issue, his wishes could be complied with. Influential Conservatives have been approached to lend their support to Mr. Guthrie's resolution, and have gladly consented.

Toronto Technical School.

Your Committee has been freely co-operating with the Executive Committee of the Toronto Branch, and with the Toronto Board of Trade, in an effort to have the Board of Education in that city select a more suitable site for the new Technical High School than the one now chosen on Bloor Street. It is believed that if the school is to be of any real benefit it must be situated in a locality where it will be readily accessible to the majority of students who will wish to attend, and even though it costs a few thousand dollars more, it is felt that it will be far better in the end to purchase a site west of Spadina Avenue. A strong letter setting forth the views of the Committee has been sent to the Board of Education, and a small sub-committee has been appointed to look over the ground for a more suitable site.

On motion of Mr. Wickett, seconded by Mr. Henderson, the report was regularly adopted.

COMMERCIAL INTELLIGENCE.

The report of the Commercial Intelligence Committee was presented by the Secretary as follows:

Trade Commissioner for British West Indies.

It is to be noted with satisfaction that the Department of Trade and Commerce has at length acted on the Association's recommendation by appointing a special trade commissioner for the British West Indies, who will devote his entire time to the work instead of maintaining four correspondents in that field, whose services had never been of a very satisfactory character. While your Committee is not prepared to express any opinion as to the qualifications or ability of the man appointed, they feel it is at least due the Department that a resolution of thanks be tendered them for having acted on the Association's recommendation. It is suggested, therefore, that the Secretary be instructed to forward them the thanks of the Association.

Trade Commissioner for New Zealand.

In view of Canada's increasing exports to New Zealand and the favorable opening there afforded for Canadian goods, it is recommended that representations be at once made to the Government with a view to securing the appointment of a special officer for that territory. At the present time Mr. Larke is supposed to cover the New Zealand field, in addition to his territory in South Australia. It is obvious that he cannot do justice either to Australia or to New Zealand when he has so much ground to cover, so that the appointment of an additional officer would seem to be necessary.

Invitation to Sir Joseph Ward.

Information having been received that the Premier of New Zealand, Sir Joseph Ward, is contemplating a visit to Canada next year, and as there can be no doubt that such a visit

would be of far-reaching effect in cementing more closely the commercial ties which bind the two countries together, it is recommended that the Association ask the Dominion Government to extend a cordial invitation to Sir Joseph to pay our country a visit, and to use every effort to obtain his acceptance.

Absorbing the New Zealand Preference.

In the regular letter of the Association's New Zealand correspondent appearing in the January issue of *INDUSTRIAL CANADA*, mention is made of the fact that some Canadian manufacturers are killing the goose that lays the golden egg by absorbing in the prices they quote the full amount of the preference accorded them. To quote from the letter in question: "A certain line of apparel used mostly by the laboring classes was benefited by the Preferential Tariff to the extent of 20 per cent. Gradually the Canadian price went up until the difference in the landed cost was insignificant, and in some cases there was no difference at all. The Minister of Customs was informed of this and promptly took the preferential duty off and business is now going back to the United States. Even if Canadian manufacturers reduced their prices again to the level of the foreign manufacturers, the business will go past them, as merchants are disgusted with the manner in which the Canadian manufacturers have appreciated a benefit which was given them, not for the purpose of filling their own pockets, but to keep the foreign manufacturer out." Your Committee can only regret that some Canadian manufacturers should be so short-sighted, for there can be no doubt that such a policy, if persisted in, will jeopardize other Canadian interests, and detract from the fair name of Canadian business houses in foreign countries.

Exhibition Committee.

Careful consideration has been given to the constitution and organization of a department for collecting and disseminating information regarding exhibitions, both Canadian and international, and assisting members in the arrangement and transportation of their displays. It is now recommended that a Committee of five be appointed, the members to be chosen from among the representatives of the Association to the Canadian National Exhibition, such representatives to constitute a sub-committee of the Commercial Intelligence Committee, and to report from time to time through the Commercial Intelligence Committee to the Executive Council. In this way it is believed that all the advantages which are aimed at can be achieved without burdening the Association with additional and unnecessary machinery.

Seed Wheat for North-West Farmers.

The attention of the Committee has been called to the fact that the farmers of Alberta and Saskatchewan are asking for 2,000,000 bushels of seed wheat for next year's planting. The prosperity of Eastern Canada is so vitally related to the prosperity of the West that your Committee feel that no stone should be left unturned to provide the farmers in the West with an abundant supply of seed wheat of good germinating quality. It is, therefore, suggested that the Dominion Government be asked to take steps at once to see that their requirements are met.

BRANCHES.

The report of the Montreal and Toronto Branches, as presented by Mr. Ewing and Mr. Freyseng, were duly received.

Under the head of new business, Mr. Ewing read a letter from Mr. Charles A. E. Harriss, Ottawa, drawing attention to the fact that Canada was to be favored during the present year with a visit from the Sheffield Choir, England, who would prob-

ably be accompanied by the Lord Mayor of Sheffield. In view of the fact that many of the members of this choir were men occupying important industrial positions in Sheffield, who had no doubt helped to entertain the party of the Association who visited England in 1905, and also in view of the fact that on Imperial grounds it was important to have the Association take some recognition of the visit, Mr. Ewing moved, seconded by Mr. Rowley, that a letter be sent to the Lord Mayor of Sheffield, extending to himself and his choir a hearty welcome from the Association. Carried.

The President then called on Mr. Johnston to address the Council on the subject of "Trade Opportunities in South America." Mr. Johnston read a most interesting and valuable paper, for which he was extended a vote of thanks on motion of Mr. Saunders and Mr. Roden. It was also decided to publish the paper in INDUSTRIAL CANADA.

Moved by Mr. Dougall, seconded by Col. MacLean, that the thanks of the Association be extended to the Hamilton Board of Trade for the use of their Council Chamber. Carried.

The meeting then adjourned.

TORONTO BRANCH.

Exhibition Matters.

At the first meeting of the Toronto Branch Executive for the new year, Exhibition matters were discussed, and it was decided that the Branch advocate with the City Council that a good commercial highway, running north and south in the west end, and giving access to the water front, should be provided in the event of the plans for the improvement and extension of the Exhibition grounds obstructing the present thoroughfare, Dufferin Street. It is felt that a main thoroughfare of this kind will be a necessity for western manufacturers when Toronto's harbor facilities are adequately developed and a dock is provided.

An effort will again be made to elect four instead of three representatives on the directorate of the Exhibition, at the annual meeting to be held at the end of January. The Association's candidates will be Messrs. W. K. McNaught, W. K. George, George Booth, and J. P. Murray.

Technical Education Committee.

The Executive, through its Technical Education Committee, in conjunction with that of the Board of Trade, is making an effort to have the site for the new Technical School changed from its present location on Bloor Street East, which is not convenient for the artisan class, who will be attending it, to a site situated further to the west, and nearer to that section of the city in which the bulk of the industrial population reside.

American Foundrymen's Association.

Your Executive is endorsing the application of the American Foundrymen's Association, for the use of some exhibition buildings for their convention and exhibition of foundry appliances, which will be held in Toronto in June next.

Evening Dinners.

The Entertainment Committee of the Branch has arranged for an informal evening dinner at McConkey's on Monday, January 27th, when His Honor the Lieutenant-Governor and Dr. William Pakenham will speak on the subject of "Technical Education." All members of the Association are cordially invited to attend this dinner.

A second evening dinner will be held in February, the subject being "The Relations of Labor and Capital in Ontario," and the speaker, Mr. E. A. DuVernet.

MONTREAL BRANCH.

The Montreal Branch of the Canadian Manufacturers' Association presented the following report to the Executive Council:

The question of municipal reform was taken up by the Montreal Branch this month in a practical manner. A special meeting was held, when members were invited from each ward in the city to consider how good candidates could be brought out in the approaching municipal election. While we could not do anything as an organization in this regard, we have brought the matter to the serious attention of our members, and urged upon them the necessity of doing something to provide better government at the City Hall. As a direct result of our agitation the Citizens' Committee called a public meeting and nominated good government candidates in four of the English-speaking wards of the city.

The City Council in its last days of office raised the wages for civic laborers to \$2.00 a day. This step was taken by a number of the aldermen purely for election purposes. A letter was drafted by the Montreal Executive protesting against this increase of wage, as being both unnecessary and contrary to the general tendency of industrial conditions when establishments were reducing their hands or cutting down the wages of their employees.

At the funeral of Hon. J. I. Tarte, the Association was represented by Hon. J. D. Rolland, Mr. S. W. Ewing and the Montreal Secretary.

At the meeting of the Montreal Executive on January 9th, Mr. William Johnson, of Buenos Ayres, addressed the members in the interests of Canadian trade with South America.

OBITUARY.

The Association has suffered during the past few weeks in the deaths of a number of its members. In addition to those chronicled in the last issue of INDUSTRIAL CANADA, with regret we record the death of Mr. E. Tougas, of Montreal, who represented P. D. Dods & Co., and was at the time of his death a valued member of the Executive Council.

Mr. Fred. W. Barrett has also passed away within the last few days. Mr. Barrett was manager of The Luxfer Prism Co., and represented that company in the Association.

On January 31st, Mr. D. S. Perrin, of London, died. Mr. Perrin was head of D. S. Perrin & Co., and as such was known from one end of Canada to the other.

EXPORT PRICES FOR WOODEN HANDLES.

The attention of manufacturers of wooden handles and all kinds of turned wood goods is directed to the following extract regarding prices taken from a letter recently received from Mr. Harrison Watson, of the Canadian Commissioner's Office, London, England:

"Resulting from the paragraph in INDUSTRIAL CANADA, relating to manufacturers of wood, and also, we believe, to advice supplied by the Association, we have heard from several Canadian manufacturing firms informing us that they would like to look into the question of obtaining export trade in handles and other wooden lines, and, at the same time, asking us to supply them with prices which are being paid for such goods.

"We think it well to advise, in case of further inquiries, that it is practically impossible to obtain information of this kind. There are immense varieties of goods of all kinds, and the value depends both upon the peculiarities of each particular line, and also upon quality, and whereas it is possible to occas-

ionally get an idea of the value of some standard line, such as fork handles or hammer handles, even in this case the price would be liable to revision, depending upon the particular goods offering.

"We can quite appreciate that the factor of price is of paramount importance to the Canadian manufacturer, as it enables him to ascertain if the trade would be profitable to him or otherwise. We can, however, only suggest that such manufacturers as wish to take up export trade should communicate direct with firms seeking supplies, and forward them samples and their best quotation, c.i.f. United Kingdom port, or, failing that, f.o.b. Canadian port, because when the buyer sees that his Canadian correspondent is really in a position to do business, he may be willing to give him information which he would not furnish to an indefinite application.

"We have spoken to several buyers on the subject, and, although these firms would be glad to obtain supplies from Canada, they all state that it is practically impossible to make prices until they can see samples. We are, of course, pleased to do what we can in the matter, but think it well to inform you as above."

Inquiries are still being received for turned goods, handles, dowels, etc., wood floor and excelsior almost daily at the offices, Toronto, and addresses will be gladly supplied by the Secretary to any Canadian firms who can handle export business in these lines. Particulars as to prices, however, must be obtained from the buyers in England.

WOULD INCREASE EFFICIENCY.

How the workman may be trained and educated that he may develop his abilities to the highest possible point, was the subject for discussion at an evening dinner of the Toronto Branch of the Canadian Manufacturers' Association, on January 27th. The dinner was presided over by Mr. E. J. Freyseng, and among the guests were His Honor Lieutenant-Governor Sir Mortimer Clark, Dr. William Pakenham, J. T. Clarke, R. C. Steele, Dr. Ogden, A. H. Leake, and William Houston. The dinner was largely attended.

Sir Mortimer Clark, who was the first speaker, discussed the need for skilled labor and new blood in the industries of the country. He pointed out the great effect of organized technical education in the advancement of such countries as Switzerland, Germany, Great Britain, and France, and urged that what had been proven to be of immense benefit to other countries, should be put in operation here.

The subject was continued by Dr. Pakenham, who gave an effective review of what was being done both abroad and at home along the lines of industrial training. Education, with an eye to the life work of the boy and girl, was of practically recent growth. Formerly all education was literary. The importance of cultivating the faculties which would be brought into play in the actual struggle for existence was now at least recognized, though in Canada it was still handicapped by narrowness of conception and insufficiency of facilities.

The boy who is to be the mechanic now goes to school till he is fourteen. During that time he does nothing which is likely to stimulate his zeal to attain manual facility, to develop ideas of proportion, to make him resourceful, to learn the properties of raw materials, their sources and uses. He is then turned out to do what? The apprenticeship system is practically a thing of the past. He does one of two things: either he becomes a messenger boy or office helper, with no chance of becoming anything else; or he enters a factory, ill-equipped mentally, and learns some simple operation on a machine, and never gets beyond it. It is not of such stuff that foremen are made.

This is where technical instruction comes to the aid of the

factory system. Under a proper system the faculties, which must be brought into play in the workshop, should have been given some work to do during the elementary school period, in order that they might be alert, pliable, usable. Technical instruction carries this on a step further. It teaches the young mechanic why he does certain processes, why a given material should be treated in a given way, what enters into the consideration of the practicability of certain products, where substances are found, how bye-products can be utilized. It gives him the synoptic view of his industry, which makes him a capable foreman, a possible manager.

Dr. Pakenham pointed out the unreasonableness of the contention that the Federal Government should not interfere in education of any kind. He pointed out that experimental farms were operated under the control of the Department of Agriculture, an engineering course under the control of the Department of Militia. Why not industrial education, under the Department of Trade and Commerce.

Mr. S. M. Wickett reviewed the work of the Technical Education Committee during the past three years, and expressed a hope that a Commission would be appointed at an early date.

Other speakers were Mr. A. H. Leake, Dr. Ogden, William Houston, J. T. Clarke, R. C. Steele, J. S. McKinnon, J. P. Murray, and Thomas Davies.

TRADE WITH INDIA.

Excellent opportunities for Canadian exporters to build up trade with British India are said to await those firms which are prepared to spend a little time and money in working up business there, according to advices recently received from a firm of commission agents in Delhi. This firm claim that there are unlimited fields for profitable trade, particularly among the native states, which are not exploited to the same extent as those in which the British people are more numerous. Any Canadian manufacturer desiring to look into this matter can obtain further particulars, and the address of the firm in question, who are prepared to handle any lines, by applying to the Secretary, Toronto. Excellent references are given, and the firm claim to have had considerable experience in the Indian market.

MAY ESTABLISH CANADIAN BRANCHES.

The Manufacturers' Association of London, Eng., will send their Secretary, Mr. Ben. H. Morgan, to inquire into and report on the condition of the markets in Canada and Australasia. Among other things he will find out for the members the amount of encouragement which would be given to manufacturers establishing branch factories in the different colonies.

Will Do Translating.

French gentleman with commercial training will undertake translation of letters or conduct foreign correspondence. Address Box A, care of INDUSTRIAL CANADA, Toronto.

A Ship Subsidy Estimate.

J. H. Sinclair, M.P., estimates that if the Dominion Government would grant a bonus on steel shipbuilding of \$4.00 per ton for sail and \$6.00 per ton for steamers, this would be enough to enable steel shipbuilding to be carried on in Nova Scotia. He predicts that within five years from the time such a bonus is established, a fair start will have been made.

The Logical Car

The **OLDSMOBILE**, 4 cylinder Model "M," is the logical car at the logical price—\$3000.00. The lowest price at which a strictly high-class car, embodying style, comfort and roadability can be made.

The **OLDSMOBILE**, 4-cylinder, Model "M," demonstrates at the same time that \$3000.00 is the highest price you should pay for a car with boulevard appearance, coupled with roadability (the ability to travel all roads with all comers.)

For more money you cannot buy a better car. You can buy the larger type car. The 6-cylinder car, which is now the acknowledged standard for American, as well as foreign, cars, in the very large car class.

The **OLDSMOBILE**, Model "Z," 6-cylinder, at \$4750, gives you again the logical car at the logical price. You cannot pay less and get a good "six." You cannot buy a better "six" for more.

Our catalog, filled with simple automobile information, is sent to those interested in the **OLDSMOBILE**, on request. Address Department Sales.

The **FORD** Runabout

**A Plain
 Straightforward
 Business
 Proposition**

WE BELIEVE that the manufacturer of an automobile should be satisfied with about the same margin of profit as the manufacturer of any other similar commodity. The motor car is as much a necessity as the sewing machine. We manufacture Ford Runabouts; we don't "build" them. That is to say, every part of each car is exactly the same as the corresponding part of every other car. This means economy in machine work and assures the purchaser that the car he gets is exactly the same as every other car of the same model. For 1908 we offer two models—Model "S"—same chassis as Model "N" with special fenders, running board, storage battery ignition, 28 x 3 inch tires, ironed for top, and with full equipment, consisting of two side oil lamps, tube horn, tools, repair kit and pump. **Price, \$800.00.** Model "N"—the original 4 cylinder runabout with all 1908 improvements. All automobile without some of the "trimmings." Equipment includes two side oil lamps, post horn, repair kit and pump. **Price, \$750.00.** Don't forget when you are buying a Ford car, you are only paying for actual automobile value. The name "Ford" costs nothing, but it's worth more than most guarantees. For catalog and full particulars write

MUTUAL FIRE INSURANCE

A SUCCESS

FIRE INSURANCE is essentially mutual. In the long run the losses must be paid out of the pockets of the insurer. In the stock companies the profits go into the pockets of the shareholders; the commissions go into the pockets of the agents.

The experience of the American Factory Mutuals has shown that well selected and isolated risks, carefully and frequently inspected, can be carried at rates utterly impossible for the expensively conducted stock companies.

THE MANUFACTURERS MUTUAL FIRE INSURANCE COMPANIES

have been organized by the Canadian Manufacturers to secure the benefit of special class insurance at cost.

Let us explain the merits of our proposition: Our inspector will call, inspect your risk, and give you the rates to which you are entitled; possibly suggest how you can improve your risk at a slight expenditure.

It is worth investigating. Address for particulars.

HERE'S A SPRING BED THAT HOLDS ITS SHAPE

GUARANTEED FOR A LIFETIME

Nine times in ten an uncomfortable bed is caused by a poor SPRING. Even the best mattress gets like a hammock when the SPRING sags in the middle, stretches out of shape and loses its springiness.

A "BANNER" SPIRAL SPRING BED will give you the luxury of restful sleep. The powerful steel coils—all of equal size, strength and height—give an evenness and balance to the mattress that no other spring bed can.

The "BANNER" SPRING conforms to every movement of the body—rests the tired muscles—and induces sound, refreshing sleep.

No slats required for use on iron beds.

THE EDITORIAL VIEWPOINT.

Are we Buying Second-hand Machinery?

Sir William Van Horne, Chairman of the C.P.R., on his return from Cuba last month, was interviewed by a Montreal newspaper, and during his talk he touched upon several subjects of interest to Canadian manufacturers. While he expressed admiration of the way in which Canadians had invaded Mexico, the West Indies and portions of South America for the purpose of carrying on public utilities, and while he admitted that at home Canadians had shown no lack of enterprise in promoting the development of their own country, still he felt that the Canadian manufacturer had, to some extent, started on too small a scale. Moreover, instead of putting in the best plants, they had, in more than one instance, bought machinery which the Americans had discarded. This resulted in the Americans, in spite of the tariff, being able, in many instances, to undersell the Canadian manufacturer. A statement of this kind coming from a person in such a high position as Sir William, is worthy of more than a passing notice. It calls for serious consideration on the part of our manufacturers, and if they find that the statement is well founded, they should strive to overcome this weakness. The tariff is not intended to perpetuate obsolete methods and out-

of-date machinery in our manufacturing establishments. On the contrary, the tariff should be used as a means of making our factories the most thoroughly modern to be found anywhere. If it is true that some of our manufacturers are purchasing the discarded machinery of the American factories, and using it to start up business in this country under the protection of the tariff, there is cause of complaint. If the protection afforded by our tariff is to be used for the purpose of turning United States junk into Canadian manufacturing plants, there is need of some action to effect an improvement. Sir William says that this is the case in many instances, and Sir William speaks with an authority that cannot be overlooked. The transplanting of second-hand factory plants into Canada is an injustice both to the country and to the manufacturers who are making an honest endeavor to build up the industries of the Dominion on a lasting basis.

Sir William and the Tariff.

Sir William has some strong views on the tariff. He very truly remarked that tariff fluctuations were a serious handicap to manufacturing interests, inasmuch as they created an uncertainty that prevented the investment of needed capital, and nipped in the bud many promising enterprises. His idea of a tariff is a graduated one, starting at 35 per cent. and being gradually reduced till at the end of five years it would be continued on a 10 per cent. basis. A manufacturer should have such security that he would be able to look and plan ahead for twenty years. He would thus know what he had to meet. It would take him two years to start, in the next three years he should have his trade well in hand, and if then, on a 10 per cent. basis he could not make good, it might be assumed that his particular line of manufacturing could not be made indigenous to the country, and would have to perish. This sounds not too bad in theory, but it is a long way out in practice. A 10 per cent. tariff in many lines would be no protection at all. As a matter of fact, when conditions, entirely overlooked by Sir William, are taken into consideration, a 35 per cent. tariff even does not give a 10 per cent. protection. For instance, he overlooks the fact that Canada is still in its infancy, and that markets here are comparatively limited. Consequently the Canadian manufacturer cannot do things on so large a scale as those with a home market twelve or fifteen times as large. The saving in cost of production on the larger scale is more than 10 per cent., and Canadian industries would be put out of business if they had to compete on these terms. The United States, with its home market of eighty millions of people, has never dreamed of getting down to such a basis. On the contrary, they keep up a practically prohibitive tariff on every line in which they

fear competition. If Sir William's ideas were carried out not only would promising enterprises be nipped in the bud, but those already grown and bearing fruit would wither and die. The United States has become the great manufacturing country it is to-day by keeping its market for its own people, and Canada to become successful as a manufacturing country must be kept for the Canadians. In fixing the freight and passenger tariffs of his railway systems, Sir William does not start them down a toboggan chute of the kind he suggests as suitable for the Canadian Customs.

The All-Red Route.

Sir William also gave his views on the All-Red Route, but while on this topic he was not nearly so indifferent to the perishing of an enterprise that might not make good under unfair conditions. This is how he held forth: "After what the C.P.R. has done, without aid of any kind, in establishing and maintaining the Pacific trade, which is now so great as to demand further accommodation; after putting a fleet on the Atlantic, which comprises the *Empresses*, and creating a business which will need the building of larger and faster boats, I say it would be a shame to set up or try to set up what is called the All-Red Route." This sounds somewhat different. Sir William is not prepared to go up against a killing competition himself, but would view with indifference the perishing of Canadian manufacturers. Remove the tariff protection of the Canadian manufacturer and leave the monopoly of the Atlantic and the Pacific carrying trade to Sir William, that he may pour the products of the cheap labor of Europe and of the Orient into Canada, and you will be establishing conditions that to his mind are ideal. At any rate, that is the impression one gets from his interview. "Get the tariff down to a 10 per cent. basis and kill off the industries of the country," he says in effect, "but do not do anything so shameful as to build a steamship line to compete with our boats." It is not surprising to find a high Canadian railway official showing such indifference to the manufacturing interests of this country. They have become so accustomed to overlooking the Canadian manufacturer that his interests do not figure in their calculations. As a matter of fact, however, the Canadian manufacturer is, and always will be, the Canadian railway's best customer, and it would be wisdom on their part to aid him in every way possible. Sir William takes occasion to point out that the C.P.R. steamship lines were established without "aid of any kind." Does this mean that we should be grateful to the C.P.R. for not demanding fishing rights along our coasts as they got free lands along the line of their railway?

A Brilliant Idea.

The Toronto *Globe* has given birth to a brilliant idea, one of the most remarkable ideas of modern times. Some of the world's greatest men, in all ages, have tried to find a solution for the ever recurring problem of bad times, but not until the *Globe* hit upon it has any of earth's great ones been able to find a remedy. It sets out by announcing that the Canadian manufacturers are, through the protective tariff system, the recipients of a monetary consideration, and it continues: "Under these circumstances it is clearly incumbent on the beneficiaries of the system to depart from the lines of greatest profit sufficiently to relieve a passing time of distress. If this would be likely to result in serious losses, it would be an unreasonable demand. But the fact that large forces of men were until recently wanted in the leading industrial establishments of the province shows that no serious loss would result from giving them employment at the present time. The passing stock market flurry is but momentary.

Permanent demands of a few months ago have not vanished. It is only a matter of continuing operations and accumulating stocks till times resume their normal condition. Some effort should be made in this direction by those for whose benefit the Dominion is carrying a costly fiscal inheritance." It is strange that this solution of the difficulty was never thought of before. It is the essence of simplicity. All that has to be done is to keep the factories running and the men at work, and no one will feel the pinch. Of course the mere matter of getting cash to pay salaries is unworthy of consideration. All that is necessary in this connection, according to the *Globe's* idea, is for the manufacturers to become their own customers, paying the cost price of the product of their own factories out of their own pockets and piling the goods up till such time as the people want them. It is surely the simplest thing in the world, and we need never again have hard times. Some foolish people have been telling us that the manufacturing and storing up of goods for which there was no demand brought about bad times by what they called over-production. The *Globe*, however, wiser than they, has made the discovery that over-production is the cure for and not the cause of hard times. The *Globe* is either a great discoverer or a great humorist. The wise manufacturer will take the latter view, and laugh at its joke.

The New Zealand Preference.

In the January issue of INDUSTRIAL CANADA our New Zealand correspondent warned Canadian manufacturers against attempting to grab for themselves all of the difference between the preferential and the regular tariff of that country. Our correspondent complains that the Canadian manufacturer, instead of underselling his competitors, who do not enjoy the benefits of the preferential tariff, keeps on raising the Canadian price until all of the difference passes into his own pocket, and the New Zealand consumer gets none of the advantage whatever. He instances the action taken with regard to a certain line of wearing apparel, used mostly by the laboring classes, which enjoyed a preference of 20 per cent. The Canadian price of the line went up gradually till the whole of the 20 per cent. was going into the pockets of the Canadian manufacturer. The facts in this particular case were brought to the attention of the New Zealand Minister of Customs, with the result that the preference was promptly cancelled, and the business is now going back to the United States. While action has so far been taken in this one line only, our correspondent intimates that there are several others which will share the same fate if we in Canada do not mend our ways, the Minister having made up his mind that the preference shall not be paid by the New Zealand consumer. That the Minister is in the right there is no room for argument. The preference was given to Canada with the idea of keeping the foreign manufacturer out, and not for the purpose of increasing the profits of the Canadian. The preferential tariff enjoyed by Canada means a considerable loss of revenue to the New Zealand treasury, and the very least the Government can ask is that the loss in revenue it suffers shall be the gain of its own people. Canadian manufacturers seeking trade in that sister colony should bear this in mind, and do their best to show that they appreciate the advantages extended to them. If once the preferential duty is removed, it will never be put on again, our correspondent says, and the sooner our manufacturers come to realize this the better for themselves. Moreover, the Canadian manufacturer should not lose sight of the fact that the use he makes of the preferential tariff is being closely watched by the agents of foreign firms, who promptly report his shortcomings to the Minister of Customs, with a view to having the preference removed. With these jealous rivals ever on the watch to trap him, the Canadian cannot be too careful in his

treatment of the New Zealand consumer. Aside altogether from any fear of what foreign trade rivals might or might not do, it is the part of wisdom for the Canadian manufacturer to show that he appreciates the friendly spirit of New Zealand by giving the people of that country the best he has to offer, both in the matter of price and of quality. Under the preferential tariff we have exceptional opportunities for building up a profitable trade with New Zealand, and it would be a pity indeed to see them destroyed by an excessive greed for gain on our part. Surely we can make a reasonable profit without taking from the people the money which their government intended to give them through the medium of the preferential tariff.

What the Labor Unions Want.

The annual deputation representing Canadian organized labor, through the Dominion Trades and Labor Congress, waited on Sir Wilfrid Laurier and Hon. Rodolphe Lemieux recently, and placed before them a number of requests for legislation affecting labor. Amongst these were the following: Increased pay to letter carriers; inspection of the running gear of vessels to prevent accidents to longshoremen; an eight hour day on Government works; a commission on technical education; reservation of public lands for bona fide settlers; passing of the bill authorizing co-operative societies and extending the principle to banking; old age pensions; prevention of importation of strike breakers during negotiations under Lemieux Act; abolition of immigration bonuses, and exclusion of Hindu labor; respecting the Japanese question the delegation expressed its willingness to await the practical result of the Lemieux mission; a department of labor with a separate minister; regulation of hours of telephone employees. This makes a pretty long list, and would keep Parliament busy for some time if it were undertaken, but the chances are that the most of it will go on the shelf. Sir Wilfrid said that if a re-arrangement of the departments became necessary there should be a separate department of labor. Regarding old age pensions he said that while he was open to conviction he had not yet been convinced of their necessity. Mr. Lemieux told them that eventually the Railway Commission would regulate telephone matters, that the letter carriers would get an increase, that the question of co-operative banks was a serious one, that the Japanese question was settled for all time, and that the Hindus were practically to be kept out, and the deputation bowed itself out. If, instead of going up with a whole string of demands, these gentlemen concentrated

their energy on some one worthy object, they would be doing something in the interests of the people they profess to represent. For instance, they ask for a commission on technical education. If, instead of mixing this up with a lot of other impossible demands, they concentrated their energies on it alone, they would have the support of the manufacturers and employers, and their united action would be sure to produce the desired result.

The Agitator in New Zealand.

There is no spot on all the earth where organized labor holds such sway as in New Zealand. There its ideas have been tried out on a larger scale than anywhere else, and its power is well-nigh supreme. New Zealand has stood for all manner of labor legislation, but there is one product of unionism that it is beginning to find so great a detriment that it proposes to legislate against it. The professional agitator has become such a menace to New Zealand that the Government proposes to pass a law making his calling illegal. A new bill amending the Industrial Conciliation and Arbitration Act was introduced at the present session, but our New Zealand correspondent in his letter this month assures us that it will then be pressed to an issue. Clause 53 (1) reads:

“No person shall be qualified to be a member of the Committee of Management of any industrial union or industrial association, or an officer of any such union or association, unless he has been or is actually and bona fide engaged or employed in the industry in respect of which such union or association is established.”

A penalty of ten pounds is provided for any offence under this

clause. If this clause becomes operative the agitators who go about the country forming unions and using them for their own purposes will be effectually disposed of. The vast majority of labor troubles that occur in this country, as well as in New Zealand, are caused by these parasites, who would be out of employment if peace reigned between the employer and the employee. We have the labor agitator with us in Canada, too, and what makes him even more obnoxious here is the fact that he is usually an importation from another country, who comes for the express purpose of making trouble and departs as soon as the trouble is over. An Act somewhat after the one New Zealand proposes to pass is badly needed in Canada, not alone for the peace of the industrial field, but also for the protection of our workingmen, who are frequently misled by those foreign demagogues, whose sole aim is to get

A SURPRISE.

JACK CANUCK:—When Mr. Fielding invited her to the sugaring off, I wonder if he knew she intended filling all her friends' pails as well.

an easy living for themselves out of the honest, hard working members of the union. Our correspondent tells how they do the trick in New Zealand, but they have methods in this country that are fully as profitable to themselves. It is to be hoped that these labor men who are fond of quoting the enlightened labor legislation of New Zealand will take note of this Act and recommend it to the Canadian Parliament.

President Roosevelt's Message.

Canada has reason to be thankful that it has not a president—like Mr. Roosevelt. The United States have found him a heavy load to carry, and the men who have invested their all in the industries of that country have every reason to wish him out of office, and out of the way of writing inflammatory messages to Congress. One of the greatest weaknesses of a republican form of government is the opportunity it affords demagogues to obtain such great power that they become a real danger. The special message which President Roosevelt sent to Congress at the end of January is a bitter attack on all corporate interests in the United States, and cannot be looked upon as anything but a bold bid for the favor of the masses, whose votes he or his party will be in need of during the next few months. In Canada we have a certain class of politicians who make a bid for the votes of the masses by attacking the men who are building up our industries and developing our resources, but these attacks are made in their capacity as individuals seeking office. If our Governor-General in his Speech from the Throne made a bitter attack on our corporations, denouncing them as despoilers of the people, and criminals under the law, we would have a parallel for the President's message. A week or so after we would have a new Governor-General. In this country, when corporations violate the laws of the land they are proceeded against in a regular and dignified manner, and their punishment is sure and adequate to meet the demands of justice. No one would tolerate our Governor-General proclaiming our corporations, however bad they might be, criminals before they were tried. That is what President Roosevelt has done, and he has done it to the detriment of the whole country, for his inflammatory message has raised the masses against capital, regardless of whether it is honestly or dishonestly employed. Chancellor Day, of Syracuse University, says that much of the message reads like the "ravings of a disordered mind," and in this he pretty nearly describes the impression which it makes on a well-ordered mind. The conclusion to be drawn from the President's message is that the administration in his hands is so weak that it cannot deal with criminal corporations in a regular and judicial manner. He calls them law-breakers, and sensible people naturally ask why they are not taken before the courts and punished. There is no need to go to Congress with a ranting message asking authority to proceed against them. If they are law-breakers the laws must already be there, and the courts have authority to enforce them. The whole thing is a bid for votes, and it is a pity that so much ruin can be caused by the ambition of a politician to win popularity with the masses. It is to be hoped that Canada will never be placed in such a position that it will be possible for a ranting politician to send forth a tirade of this kind. Some Canadian newspapers have gone out of their way to comment favorably upon the President's message, which indicates that we have the material amongst us to produce a following for a presidential demagogue if we had one.

A Good Suggestion.

Mr. Fred C. Salter, the European Traffic Manager of the Grand Trunk System, is at present in Canada conferring with the officials of his company. In four years' time, Mr. Salter says, a great change has taken place in the public mind of

Europe concerning Canada. Canada is now fairly well known in all European states, and it is far easier to work up trade. He finds, however, a regrettable indifference amongst the British Consuls regarding Canada and Canadian trade interests. He suggests that Canadians should be attached to the several consulates, in order that the interests of this country may be properly represented. The suggestion is a good one. It is a serious handicap for Canada to be left without representation, or represented in an indifferent manner by a consul who never saw the country and does not care anything about it. At this period in our development what we need above all things else is enthusiasm, and we cannot expect an Englishman, who is not naturally enthusiastic about anything, to become so for our special benefit. Mr. Salter's suggestion is one that deserves consideration.

The Georgian Bay Canal.

The Georgian Bay Canal, that is, the one which proposes to make use of the French and the Ottawa Rivers, was recently discussed in Parliament. For more than half a century this project has been discussed periodically in Parliament, but all that has so far resulted from the discussion is a survey of the route made at a cost of about half a million dollars. The cost of the work would, it is estimated, be about \$80,000,000. Its advantages are a shortening of distance of nearly a thousand miles, a saving of time in making a round trip of nine days, and a very large saving in transportation charges. In addition it is claimed that the construction of the canal would open up vast forests of pulp-wood, and develop many thousands of horsepower that are now going to waste. The Government has not yet made any pronouncement of policy on the question, but some day some government will take the matter up in earnest and the canal will be built. Of water transportation it is scarcely possible for us to have too much. It means cheap rates for the moving of the productions of the farm, the factory, the forest and the mine, an advantage which is so widely distributed that everyone feels the benefit of it.

The Year's Immigrants.

The total immigrants into Canada last year was 277,376, as compared with 215,825 in 1906, an increase of 61,464. Of these 220,825 arrived at ocean ports, an increase of 68,695, and 56,551 came from the United States, a decrease of 7,231. Mr. J. Bruce Walker, who has been in charge of the Canadian Government immigration offices in London, and is now in Canada, expresses the opinion that 1908 will be the banner year from the point of view of the class of settlers coming into the country. He thinks there will be very few new arrivals who will need the support of the Government or of charitable organizations. This is encouraging, for in the past we have had too many arrivals who proved more of a charge than a benefit to the country. The people gathered in by the charitable organizations are usually of the unemployed class, which is made up largely of people who do not want employment. They will not work in the country of their origin, and they do not want to work when they come here. They seem to get the idea somewhere that Canada is a country in which people live well without working, and when they arrive they are insulted if anyone offers them employment. It is a satisfaction to know that this class is becoming enlightened on the subject and is keeping out of the country. Canada is no place for a man who wants to live without working.

Looking After the Farmers.

The Government has made a large appropriation for the purpose of supplying the farmers, whose crops were either injured or destroyed, with seed grain. There has been some

criticism of the Government's action in the matter, but it can stand any criticism that its opponents feel inclined to make. The circumstances fully justify the expenditure. The farmer has to be looked after, and he certainly cannot accomplish much if he is without seed for his land. Some one has said that it is a poor advertisement for Canada, but how much worse would the advertisement be if our farmers were not able to get their crops in for want of seed? If the Government never does anything worse than coming to the rescue of the farmer in a time of need, it will have no occasion to fear its critics.

Work vs. Preference.

Sir William Van Horne recently remarked, "An ounce of work is worth a ton of preference," and he is one of our shrewdest commercial critics. It is very true that the greatest preference ever conceived will not of itself build up a trade. It takes work, and good, hard, conscientious work, to introduce any product on a new market. As Sir William remarks, an ounce of work is worth a whole ton of preference. A striking illustration of the relative values of work and preference in building up trade is to be found in the volume of business done in Canada by English and United States firms. Canada gives England a preference of $33\frac{1}{3}$ per cent. in this market, and the Englishman wonders why trade does not pour into him in consequence. The United States manufacturer pays the full duty and goes on increasing the volume of the business he does with us. The Englishman cannot understand this, and complains that the preference is no great thing after all. The explanation is simple. The American works, the Englishman does not. The American comes after the trade, and spends large sums of money advertising his products in Canada. The Canadian knows what the American has for sale, and the reason why he should purchase it. Of English products he knows nothing, for he has not been told anything. If the Englishman worked as the American works he would soon find that the preference counted. Until he wakes up to the importance of work the preference will do him little good, and the American will continue to find in Canada his best customer.

An Object Lesson.

The day is perhaps not far distant when Canadian manufacturers will be enjoying a preference in the British market. Tariff reform is making headway in England. The English people are beginning to question the wisdom of clinging to their policy of free trade, while all the rest of the world maintains a protective tariff wall. Should the time come when Great Britain sees the wisdom of adopting a policy of protection, it is to be expected that Canada and the other colonies will get a preference over foreign countries. This is the policy which the Rt. Hon. Joseph Chamberlain has been fighting for, and it looks at present as if his campaign would bear fruit in the near future. When that day comes the object lesson which the United States is giving us in our own market should prove of value to our manufacturers in exploiting the British market. It should be useful in impressing on them that a preference without work is dead. Already we hear people talking of what a great boom it will give Canada to have a preference in the British market, just as the British manufacturer and merchant thought the Canadian preference was going to boom their trade in this country. They have been sadly disappointed, just as our own manufacturers would be if, like the Englishman, they failed to back the preference up by solid work and good advertising. The Englishman has great opportunities in Canada, but his lack of energy renders them valueless to him, while the American, by his push and enterprise, wins success despite the handicap he has to overcome. If the Canadian ever gets

the advantage on the British market that the Englishman has here, and goes after British trade the way the American goes after Canadian, the combination will carry him to the highest rung of success. If, on the other hand, like the Englishman, he thinks the preference sufficient of itself, he will meet with a sad disappointment.

Work for the Commission.

When the proposition was made that the Government appoint a Permanent Tariff Commission, with power to go into and report on tariff matters, and see to the proper enforcement of the customs laws of the country, certain newspapers set up the cry that an attempt was being made to get the tariff out of the control of Parliament and into the hands of a commission that could be "worked" in some mysterious way. What work was there for a tariff commission to do that the Minister of Customs could not do under existing conditions? was asked. That there is plenty of work for such a commission that the Minister does not and cannot do is well known to everyone who has dealings with the Customs Department. Take, for instance, the matter of fines imposed for undervaluation. Fines are imposed and fines are remitted, but as to the why and the wherefore, both of the imposing and the remitting of them, everyone is left completely in the dark. The whole thing is a matter of private arrangement, and the opportunity for the Government to do its friends a good turn is too great to be overlooked. The strength of the culprit's pull has a lot to do with the size of the fine he has to pay, or the amount remitted of a fine he has been condemned to pay. This jugglery is possible because it is all done in the dark. No return is published showing the size of the fine or the final disposition made of a case. Were there a Permanent Tariff Commission empowered to deal with cases of this kind, there would be no chance for favoritism. Every case would be dealt with on its merits. It would be tried in an open court and a proper record kept, so that all would be treated alike and favoritism shown to none. This is only one of the many benefits that would result from taking the administration of the tariff out of the control of the politicians. The remitting of fines imposed for undervaluation is an altogether too common occurrence under existing conditions, and it will continue to be, so long as the thing can be done as a matter of private arrangement between the Minister of Customs and the offender. If the latter is a friend of the Government, or a friend of friends of the Government, his chances are good of getting out of the difficulty at little or no cost. The remedy lies in the establishment of a Permanent Tariff Commission.

A Suggestion on Financing.

A correspondent draws attention to the great need there is of more capital at a reasonable price in this country, and he suggests a method of obtaining it. He points out that the various loan companies have not sufficient money to meet the requirements of this country, and owing to this shortage they have advanced the rate of interest to a point where it has become unprofitable to borrow. This has resulted in the restriction of trade, and he instances particularly the building trade, which is carried on almost entirely on borrowed capital. With money at $6\frac{1}{2}$ and 7 per cent., building is restricted, and this reacts on a great number of different factories, the products of which are utilized in the construction of buildings. There is a ready sale for houses with mortgages at 5 and $5\frac{1}{2}$ per cent.; but with money at $6\frac{1}{2}$ and 7 per cent. the demand disappears, and building ceases, throwing a host of men out of employment. To remedy this state of affairs he suggests that a delegate be sent to the Old Country by the Manufacturers' Association to demonstrate to the loan companies there that there is a very profitable field in this

country for the loaning of money with absolute security. He thinks that if this were done it might be possible to induce some of them to open offices in some of the principal cities, with men in charge capable of passing on loans and doing business by the same methods as our local companies. The undertaking on the part of the Manufacturers' Association would, as he admits, be an unusual one, but if it could be carried to a successful issue it would be well worth the effort. There is no disputing the fact that this country needs more capital, and any method by which it can be secured at a reasonable cost is worthy of consideration. There is any amount of money in the Old Country earning only 2 to 2½ per cent. that could be safely invested here at twice that rate and would prove a great benefit to the country. To convince its owners of this fact is, however, quite another matter, but perhaps not an impossible undertaking.

The Visit of Mr. Bryce.

The visit to Canada of Mr. Bryce, the British Ambassador at Washington, has been made the subject of a great deal of newspaper surmise and comment. From Washington came the information that the object of his visit was to confer with Sir Wilfrid Laurier and other prominent Canadian officials respecting various questions pending between Canada and the United States. It is encouraging to have this recognition from the British representative at Washington, and it is certainly a very striking departure from the method adopted by British Ambassadors in the past in settling Canadian questions at Washington. It is not so very long ago that it was considered quite the proper thing to give the United States everything they asked or claimed from Canada without taking the trouble to ask what we had to say about it. But Canada has grown into quite a big boy now, and has intimated that in future there is a new force to be reckoned with. That Mr. Bryce recognizes this and means to take advice at headquarters before venturing to conclude any settlement of Canadian-United States disputes, shows that he has the right idea. If any more blunders are made in dealing with questions between Canada and the United States, Canadians will know that the fault lies at home, or that the British Ambassador has deliberately turned down the advice of the Canadian Ministers.

The Niagara Power

One of the questions outstanding at the present time between Canada and the United States, and one on which we are told Mr. Bryce sought the advice of the Canadian Ministers, is the distribution of power from Niagara Falls. The Americans want all further development of power at the Falls stopped, which means that Canada is not to utilize this vast store of energy which, in Ontario, takes the place of coal in the development of her manufacturing industries. So far as the United States is concerned they have already developed all the power it is possible for them to get out of their share of the Falls. In addition to this, 50 per cent. of the power already developed on the Canadian side can be sold in the United States, so that, if development were suspended now, the Canadian manufacturer would have available only a very small percentage of the power to which he is entitled. Furthermore, the price of power on the Canadian side would be regulated by the price on the American, where, owing to the much smaller quantity available, the price is naturally much higher than it should be on our side of the line. The proposal coming from the United States to suspend further development now that they have got all they can get out of their share of the Falls, is very American, but it is not likely to meet with favor in this country, and certainly any treaty with that end in view should be strenuously opposed by the Cana-

dian Government. We have no coal in Ontario, and our water-powers, chief amongst which is Niagara, must make up to us for this disadvantage. Not only must we get every bit of power possible out of Niagara, but all of it should be kept in Canada and distributed to manufacturing cities and towns of Ontario. The preservation of the scenic beauty of Niagara Falls is all very well from a sentimental point of view, but it is asking too much to expect Canada to stand the whole cost of maintaining the show. We need the power for the development of our industries, and if the scenery suffers in the development of it, it is an unfortunate circumstance that can not be helped. On this subject Mr. Bryce should be left in no doubt as to where Canada stands, and no treaty that can in any way interfere with the fullest development of power on the Canadian side of the Falls should be entertained.

Reciprocal Mine Owning Rights.

Another subject which Mr. Bryce was said to have listed for discussion with the Canadian authorities was the question of reciprocal mine owning rights. According to the laws of the United States an alien could not stake and record a claim in that country. All mines were reserved for the benefit of citizens of the United States, that is, the original grants of them, and the law was a good one. No one could quarrel with the American Government for preserving the country's natural wealth for the benefit of its own citizens, or those who declared their intention of becoming citizens. It was an excellent law, and went a long way towards making the United States the wealthy country it is to-day. In the days when there was practically no mining in this country, a Canadian could not go to the United States and locate a claim for himself. If he had the price he might buy one from some American, but he had absolutely no rights as a prospector, unless he became a citizen of the United States. In those days there was no talk of reciprocal mine owning rights, but now that it has been demonstrated that Canada is a rich mineral country, Mr. American is showing great anxiety to get in here on an even footing with the Canadian. He wants reciprocity in mining, now that all the best of his own are gone, and Canada's development in that direction is only just beginning. It would be a shame for Canada to take advantage of this striking example of American generosity. Mr. Bryce should be instructed to convey our thanks for the offer back to Washington, and intimate to our friends down there that the mineral wealth of this country is the birthright of the Canadian people, and that the Government that took any part of it from them would be guilty of a criminal offence.

The Taxation of Companies.

A company which takes out a Dominion charter is relieved of a great many special taxes which are now imposed by various provinces. Hon. Mr. Scott, the Secretary of State, has given it as his opinion that if the matter were taken to the courts the taxing of companies with federal charters on the same basis as those with only provincial charters, would be held to be unconstitutional. The difference in cost between Provincial and Dominion charters is not so great that firms desiring to do a national business should hesitate about taking them out. It is true a Dominion charter can not be obtained for a company until it is really a company. It is necessary to have 50 per cent. of the proposed capital subscribed and 10 per cent. paid up before a Dominion charter can be obtained. Companies in existence and doing business should have no difficulty in meeting this requirement, and since the rendering of the above judgment it would seem to be necessary for all companies doing a national business to take out federal charters.

D. M. COUGHLIN.

The Ottawa Branch of the Royal Mint

The Place Where the Money is Made

THE people of Canada have been so busy making money in a figurative sense that they have had little time up to the present to inquire where or how our coins were literally made. The establishment of a mint at Ottawa, as a branch of the Royal Mint in England, has aroused a curiosity

an address given by Mr. A. H. W. Cleave, Superintendent of the Mint, before the Canadian Institute at Toronto. To Mr. Cleave also we are indebted for the photographs from which the cuts illustrating the article were made.

For the present it is not intended to coin gold. Silver and

1. Melting Ovens 2. The Strong-room 3. Metal Rolling Machinery. 4. Coin Presses.

about the methods of coinage, which becomes personal as we apprehend that we have in our midst the plant which turns out the shiny half dollars and the lesser units which make up our currency. It appears, too, that there is a profit to the country from the coinage of metals which will bring in a revenue increasing as the demand for coins increases. So that what was at first approved of largely from a sentimental standpoint, will be recognized as a sound business proposition.

The following description of the work is summarized from

copper pieces shall be turned out exclusively, and the plant is ample to supply the Canadian demand.

Native Metals Used.

All the metals used for coinage (with the exception of the tin used in bronze coins) can be obtained in Canada. The silver which has already been purchased by the Mint was obtained from Trail, B.C., where an electrolytic refinery for silver has been established. There is not at present in Canada

an electrolytic refinery for the treatment of copper, and this metal is therefore shipped to the United States, where it is refined, and then shipped back again to Canada. It is anticipated, however, that this arrangement will soon be altered, as there is a large and growing demand for copper in Canada; but unless this metal is so treated that most of the impurities are removed, it is very difficult to manipulate.

All the metals used for coinage purposes will be of a purity of 999 parts per 1,000, or over.

The demand for silver and bronze coin for use in the Dominion shows a marked increase since the passing of the British North America Act. For the ten years commencing 1870 the average annual demand was 284,000 dollars' worth. For the seven years commencing 1900 the average annual demand was 502,428 dollars' worth; the amount coined in England for the above service, in the single year 1906, being no less than 850,460 dollars' worth. In spite of this large increase, there is every reason to believe that the demand for these coins will continue to grow. There is a very large amount of United States silver coin in circulation throughout the Dominion, especially in the West. The manager of one of the leading Canadian banks has informed me that when, in 1906, the Government had allowed them a small commission for collecting and deporting the foreign silver, no less than 12,000 dollars' worth was collected by this bank alone, in a single day.

Foreign Silver Should be Refused.

Now that the Canadian Mint has been established, it is to be hoped that all foreign silver will be deported, and replaced by Canadian silver coins. With the co-operation of the banks and the public generally, the Mint will, after paying all running expenses, be a source of considerable revenue for the Dominion.

How large the seigniorage on silver really is may be readily seen when it is remembered that with silver at its present market value, the face value of a silver coin is about $2\frac{1}{2}$ times its intrinsic value. A Canadian 50 cent piece contains nearly 166 grains of pure silver. One troy ounce, or 480 grains of pure silver, can be purchased for about 57 cents; so that the 50 cent piece contains only about $19\frac{3}{4}$ cents' worth of pure silver. The manufacture of bronze coins is even more profitable, the face value of a cent piece being about $4\frac{1}{2}$ times its intrinsic value.

A very serious depreciation in the value of the early coins was caused by dishonest persons, who clipped or filed the edges of the coins, while not interfering with the designs, so that their weight was considerably reduced. To prevent this, the present device of graining or milling round the edges has been adopted. It was first introduced in 1631. On certain coins, letters are raised round the edges, in place of the milling, and this answers the same purpose. These raised letters are to be found on the British five-shilling piece and on certain foreign coins, including the new United States gold coins.

Many Departments of Work.

The Ottawa Mint is divided into six principal departments:

- (1) The Mint Office, into which all bullion is received for coinage purposes, and from which the finished coins are issued to the distributing centres.
- (2) The Melting House, in which the bullion is mixed, melted and made into coinage bars.
- (3) The Coining Department, where the finished coins are made from the coinage bars and tested, ready for issue.
- (4) The Assay Department, where the fineness and standard of the ingots, coinage bars and coins are ascertained.
- (5) The Die Department, where all the coinage dies are made.
- (6) The Mechanical Department, where the power is gen-

erated, renewals made, and repairs to the coinage machinery effected.

The Imperial gold coins are composed of eleven-twelfths of pure gold and one-twelfth of copper (known in the trade as 22 carat).

The Canadian silver coins are composed of thirty-seven-fortieths of pure silver and three-fortieths of copper (known in the trade as sterling silver). The bronze cents are composed of 95 per cent. of copper, 4 per cent. of tin, and 1 per cent. of zinc.

The Coining of Metal.

The various processes through which the metals pass in being transformed from the rough metal into the finished coin are as follows:

The ingots, as received from the refinery, are placed in the crucibles with the necessary amount of alloy, and charged into the melting furnaces. Starting with cold furnaces, the first charge is melted in about eighty minutes, but only about forty-five minutes are required to melt each of the subsequent charges.

When the metal is melted the crucibles are lifted from the furnaces, and the metal is poured into cast iron moulds, thus forming coinage bars. These bars are about two feet long, two inches wide, and half an inch thick. In the case of gold and silver, assay pieces are taken from the first and last bar from each crucible, and forwarded to the Assay Department, where they are tested. The bars are not passed into work until a satisfactory report has been received from that department stating that they are of the correct standard. All bars which are found to be above or below the legal standard fineness are re-melted.

The good bars then pass to the rolling mills, where they are rolled into long, thin strips (technically known as fillets). These fillets are, when finished, about seven or eight feet long and of the same thickness as the coins which will be produced from them. During the process of rolling, the enormous pressure to which they are subjected renders them hard and brittle. To overcome this brittleness they are passed through the fillet annealing furnace, which softens them again. The fillets are passed about ten times through the breaking down mill, and are then annealed. They are then passed about nine times through the thinning mill, and about six times through the finishing mill. In the case of silver and bronze this treatment is sufficiently accurate, the finishing mill being adjustable to the one five-thousandth of an inch.

The fillets are next transferred to the cutting machines, where the blanks are punched from them. Each cutting press cuts out two blanks at each stroke, and can produce three hundred blanks per minute. The skeletons of the fillets which are left after this process (technically known as "scissel") are made up into bundles and re-melted.

The blanks are then taken to the marking machine, where a protecting edge is raised round each blank. This raised edge protects the design on the coin and keeps it from being rapidly worn away when in circulation. The machine can mark six hundred blanks per minute.

The marked blanks are then softened, by passing them through a blank annealing furnace, cleaned or blanched, washed and dried.

They are then ready to receive the impression which will be given to them by the coinage dies.

For the storage of bullion the Mint is provided with three strongholds, the doors of which are fitted with double combination locks, controlled by triple time clocks. No stronghold can be opened, at any time, without the presence of at least two officers. After the day's work is completed and the metals locked up in the strongholds, the doors cannot be opened again until the clocks have run down. These clocks can be set for any time up to ninety-six hours ahead.

The Remedy for Inefficient Labor*

A Plea for Technical Education

WE must look at our problem from two points of view: There is your point of view—the point of view of the employer who knows the need of the workshop and office. There is my point of view—the point of view of the schoolmaster who should know how to train for those needs. It would not always be wise to accept without question the point of view of the man of affairs. It would always be dangerous to accept without question the point of view of the man of books. Approached from the *two* points of view the problem becomes less anxious. One view supplements the other; one view redresses the balance of error in the other.

factory labor is divided and sub-divided, the all-round workman becomes a narrow specialist, the man of many parts becomes the man of one part, and in that one part he quickly attains the limit of his powers and as quickly recedes from it. In that factory, moreover, work becomes standardized, and piecemeal, the machine-tool replaces the man, the automatic in the machine replaces the rational in one thousand men, cheap labor replaces expert labor, and a great band of average workmen presses down slowly among that host of happy-go-lucky fellows to whom "sufficient unto the day is the evil thereof." In that factory, in short, the workman knows not his employer, knows not his fellow worker, knows not the thing

Work of an Ontario Manual Training School.

The Point of View.

And now a word as to your point of view. Your business creed is "to make well and to sell cheap." Believe me, an altogether worthy creed! Honest doing and honest dealing! This becomes the adviser of His Majesty and the steward of the mysteries, as well as the captain of industry and the toiler at the bench!

You "make well" only as your workmen *know how* to "make well." Do they know? Can they learn? The apprenticeship system is going, or gone. It adopted, and, almost in the very bosom of the employer's family, tutored and trained the young workman. It is gone with its splendidly human sympathies before a modern cash basis which tends to deny all human relationships.

Even as the apprentice disappears, the shop itself begins to teach less and less. The kitchen loom of early days has now become the great city factory that covers acres. In that

which his hands must help to shape, whence comes its parts and what its parts form, is himself but a number.

"No admittance" is written over the door of that factory. "No admittance," not rarely, is written in spirit over its machines and its processes!

The Shop Demands Knowledge.

And while the shop teaches less, it demands more.

In the modern factory knowledge reigns supreme. Mathematics, Science, and Art, come upon not by accident but as the reasoned products of patient research, are transforming all industrial activities. Directly or indirectly they have made old trades more exact and scientific, as witness the trades of the woodworker, metalworker, textile worker, engineer. Directly or indirectly they have created new and highly-skilled trades—the trades of the art worker, chemist, electrician, and that vast army of tradesmen who minister to the comforts of our homes and our leisure hours. They lead the ambitious men up and out of the brutalizing trades. The steam crane replaces the man with the shovel. And they give rise to the insistent cry of the shop for the alert and resource-

*Address given before the Toronto Branch of the Canadian Manufacturers Association, by Dr. Wm. Pakenham.

ful man who will lead—the superintendent, inspector, manager and foreman.

Where are the Workmen to Learn?

Yes, you “make well” only as your workmen know how to “make well.” And where can they learn? Written large over all shop activities is the demand, “more knowledge,” and again, “more knowledge.” And side by side with it appears the answer, “less opportunity,” and again, “less opportunity.” They cannot learn in the shops.

You “sell cheap” when your employees know how to make well, and to “sell cheap.” Do they know how to sell? Can they learn?

Trade to-day is not the trade of fifty or one hundred years ago. It now knows no artificial or sentimental distinction. Goods from India, Austria, England and California lie side by side upon your shelves and jostle one another upon these tables!

Space is Annihilated.

Men to-day will buy in the cheapest market and sell in the dearest. Trade has annihilated space. The Toronto of to-day

Lump of clay worth 12c. is converted into vase worth \$25. This requires technical training.

is not more remote from the Liverpool of to-day than it was from the Montreal of sixty years ago. No longer has the Anglo-Saxon a monopoly in things industrial. All peoples approach a dead level, though a high level, of mechanical skill. Commerce has become a struggle, peaceful, perhaps, but none the less merciless, for the mere right to exist!

In the presence of these conditions the successful merchant of to-day must know more than how to write legibly, or to calculate interest. He must know in a minutely scientific way the commodities in which he deals, and he must know, too, the trade conditions of the world. He should understand the financial and commercial systems of his own and other countries, and he should not be unfamiliar with the problems of supply and demand, of capital and labor, and of exchange and transportation. In a peculiar sense he must know this country, its raw materials widely distributed and difficult of access, its motive power unlimited but remote, its problems of transportation greater than those ever yet faced successfully by 6,000,000 people, and its exposure to the competition of the greatest commercial nation of modern times. These things our merchant must know if he will sell well. Where can he learn? Certainly not in the office!

Just here some of you may protest. The great need of the shop and office is not expert knowledge! Perhaps you are right. Let us look at a concrete case. Here before us are lumber, nails, hammer and a workman. Out of these must come what is well made and sells cheap.

The man must drive nails quickly. He must have rapidity.

And he must drive nails persistently and with an eye single to his duty to his employer. In short, he must have character.

The man must know the nature of the wood and the nails; he must know when and where to drive the nails to give the best results; he must have the accuracy of the mathematician and the taste of the artist; he must be prepared for the new and unexpected in the material or the situation. He must then have *expert knowledge*.

Rapidity, character and expert knowledge, these are the three essentials. Rapidity must be acquired in the shop under commercial conditions. But is it so very important? Do men not differ but slightly in speed of work? And when they differ do not automatic machinery and the principles of organized labor minimize that difference? And in any case does not difference in *character* explain it? Are not character and expert knowledge, then, the two essentials? And are not these to be acquired in the main outside shop and office?

Approached, then, from the viewpoint of the employer, our problem presents a persistent demand for expert knowledge and for character, and these cannot be gained in the modern shop or office.

The Making of Citizens.

Let us now look at the problem from the schoolmaster's point of view:

Education was first given to the masses as a means of promoting intelligent citizenship. Those who opposed the gift said: “Let us not put down a ladder that the masses may come up and dispossess us.” Those who favored the gift said: “Let us educate our masters that they may know how to be our masters.” Both saw in public education a means of making citizens.

Now, what makes a good citizen tends to make a good workman. The good citizen is intelligent, thoughtful and provident. Even such should be the good workman. But the making of a good workman was a very subordinate object of public education. It did not aim at special callings.

Meanwhile the apprenticeship system trained for both professions and trades. The lawyer learned law in the attorney's office, the farmer learned farming on the farm, and the mechanic learned his trade in the shop.

These two systems of training, public education and the apprenticeship, worked side by side, with marked efficiency and in splendid harmony. Between them yawned no chasm. Without sudden jar or jolt, the journeyman was evolved out of the apprentice and the apprentice out of the schoolboy.

But changes came. Apprenticeship began to pass away. Divinity schools undertook the training of clergymen, schools of medicine opened their doors to prospective doctors, professional schools for lawyers, teachers and engineers followed in quick succession. And for the man in the trades? Nothing.

Public education also changed. New subjects were added—and not practical subjects at that! “Compulsory attendance brought larger and more regular attendance. Up went the age limits. Each day given up by the apprenticeship system was seized and filled by the schools with their literary subjects. At last public education stood alone—almost the one means of training boys for the trades—a means isolated and ineffective.”

Decline of Manual Efficiency.

The result was manual inefficiency. And something more. Population began to shift from the country, where the boy on

the farm had much to do, to the urban centre, where he had nothing to do. "Boy life now meant receiving much and giving nothing, consuming much and producing nothing, learning much and doing nothing." Out of this life came—and comes—"a one-sided attitude towards labor, a one-sided sense of values, a false standard for measuring time, possessions, and pleasures in terms of cost, and a wholly false view of life," in short, out of it comes moral and intellectual inefficiency in the workman.

How to Meet the New Conditions.

Convinced of this, the schoolmaster set about putting his house in order. He added bookkeeping, commercial arithmetic, commercial geography, shorthand and typewriting to his school curricula, but at once enveloped those subjects in

Industrial Training to the Rescue.

The demand is well-nigh universal. Italy, Germany, France, England, the United States, Japan, have recognized the demand and are meeting it.

The demand is local. Twenty thousand young men of this Province are subscribers to courses in correspondence schools. Two thousand students attend the shabbily-equipped class rooms of your Technical High School.

And the demand is pressing. Bear witness to that the hundreds of workmen whom you turn hopelessly from your doors as unskilled and incompetent. Bear witness to that, too, the thousands of industrial misfits throughout Ontario who pass aimlessly from shop to shop, the despised and rejected of the trades.

A Technical School Room in Japan.

the literary atmosphere of the other subjects. The school remained as detached from the commercial world as ever. He next added drawing and design. Lost in the intricacies of time-tables made by teachers whose interests were examinations and made for teachers whose competency was doubtful, drawing and design soon lost their industrial significance and became culture subjects. Later still he added manual training and domestic science. The cultural and disciplinary values of these subjects were at once recognized and emphasized. But what about the industrial significance? I hesitate to say, even in the presence of the Inspector of Technical Instruction, that we yet recognize fully their industrial importance.

Examined from the two points of view our problem has given the same results. The employer and the schoolmaster recognize the manual, intellectual and moral inefficiency of the employee. The employer knows that the inefficiency cannot be remedied in the shop or office. The schoolmaster knows that the inefficiency cannot be remedied, or is not being remedied, in the school. Here arises the demand for an organized industrial education.

Who Shall Assume the Responsibility?

Who must meet this demand?

Not the shops and offices, and not the existing schools. They are inadequate and ineffective, as we have seen.

Not the parents. They could not if they would. All too frequently they would not if they could.

Not the philanthropists! No, much as they have done for us, much as that prince among men, Sir Wm. McDonald, has done for us, not the philanthropists. The burden is too great for them.

But the state—the municipality, the Province, or the Dominion—must do it.

In one form or other the state safeguards the health and happiness of the workman, prescribes his hours of labor, and even at times his rate of wage. Why should it not educate him?

In one form or other it trains him by libraries, pamphlets and lectures. Why should it not give him schools? It aids material progress by charters, bonuses, tariffs and commissions. Why not by industrial education? It maintains higher

schools for the training of boys who enter the professions. Why should it not make provision for that greater host of boys who plunge into the activities of shop and office? To some extent the state has recognized the demand. In manual training, domestic science, and drawing throughout the schools, the city does something in behalf of industrial education, and in the proposed new Technical High School she promises—I love to dwell upon that word “promise”—to do more.

And the Province does something. Permit me to say, indeed, that she does much. Within the last two or three years she has begun to lay well and wisely the foundations upon which alone industrial education may be organized. She has improved the equipment of her regular schools, their courses of study, and their teachers. She has created agricultural and commercial high schools. She now advances boldly with her plans for technical schools.

Difficulties Must be Overcome.

Of course there will be hindrances to the progress of technical education. Organized labor is critical, if not suspicious

The same material is in both articles. The difference between the values consists in the technical skill of the worker.

—but not unreasonably so. You must disarm those suspicions. Organized labor must be convinced that the object of technical education is expert knowledge and not mere rapidity in shop operations, that technical schools are not trade schools, that the graduate of a technical school should not be able to say arrogantly: “I am now a carpenter,” or “I am now a machinist,” but rather, “I am a better carpenter than I was,” or “I shall now become a better carpenter than the shop could make me.” Technical schools must not be—pardon the jargon!—scab hatcheries.

And the schoolmaster is critical. In the matter of his education every man is conservative, and every teacher is particularly conservative. What wonder that the particularly conservative teacher looks with doubt upon industrial education? He must be shown that he views the world from his school window; that public education must reflect the national life; that our national life is industrial; that our industrial life is the life of the here and now, and not the life of other centuries and other races.

Finally, the ratepayer is critical—and necessarily so.

No two countries, no two educationists, agree as to the organization of technical education. The world experiments,

and experiments are expensive. These experiments have to do, moreover, with great hordes of students whose fee-paying powers are limited, and with teaching plants as varied as the trades and as unstable as machine shops. And so they are doubly expensive.

Who will bear the expense? Not the manufacturer. He now has his own burdens. Not the student. This burden would be prohibitive. Not the municipality. It is burdened to the breaking point with general education. Not the Province, perhaps. Its revenues are limited and already pre-empted. But the Dominion—aye, there's our hope!

The Dominion has an abundant revenue collected from the people of all the Provinces. It has a splendid asset in Crown lands purchased at the expense of all the Provinces. Finally, technical instruction is a large national issue, not a local issue, and national issues come within the purview of the Dominion and not the Province.

The Dominion's duty in this regard, it must be confessed, has not yet been fully recognized. Federal publicists, when urged to act, take shelter behind the letter of the B.N.A. Act. Education is, in the terms of the Constitution, a Provincial and not a Federal interest!

But trade and commerce are Federal interests. Does not instruction in the trades belong to trade and commerce, and is not such instruction, therefore, a Federal interest? The Dominion maintains a splendid type of instruction in engineering in the Military College at Kingston, and defends its action by the assurance that such technical instruction attaches naturally to militia and defense, which is a Federal interest in the terms of the Constitution. It maintains experimental farms, dairy stations and cold storage centres, with bulletins to instruct the people in the operations of these agencies, and defends this technical instruction as attaching naturally to agriculture, which in its largest phases is a Federal interest in the terms of the Constitution. It goes even further. It maintains commercial agencies in the world's great trade centres, and assists world expositions and national expositions, and justifies this form of technical instruction as attaching naturally to trade and commerce, which are Federal interests in the terms of the Constitution. In the name of all that is logical, should not the Federal Government go further and recognize instruction in the arts and crafts as within the sphere of trade and commerce, and therefore a Federal interest?

Even if technical instruction attached itself wholly to education and not to trade and commerce, the Federal Government might still aid it and be consistent. It assists the Canadian Mining Institute and the Royal Society. It maintains schools of navigation on the inland lakes. Through its grants to the Royal Canadian Academy it aids generally the art schools of the Provinces. Might it not consistently subsidize the science and art of the technical schools?

In Switzerland and Germany are many state-aided technical schools, but more interesting to us—and more pertinent—is the precedent set by the United States. State Rights mean more to the average American than Provincial Rights mean to us. Education is a State Right, and yet in the Morrill Act of 1862 the United States Congress granted the equivalent of 13,000,000 acres of land, valued at \$10,000,000, to the various States in aid of State colleges for instruction in agriculture and the mechanic arts. In the Morrill Act of 1890 Congress added to this an annual grant to each State of \$15,000 (which increased to \$25,000 in ten years). Going even further, Congress made a special annual grant to each State of \$15,000 on behalf of an experimental station in agriculture. From all sources the Federal grant to the States on behalf of technical education now amounts to 41 per cent. of the total revenue of all technical colleges in the United States. In the presence of such noble examples, need the Dominion hesitate?

Transportation Problems

ADVANCE IN CARTAGE CHARGES.

THE Canadian Pacific and Grand Trunk Railways have issued special freight tariffs advancing the cartage charges on the first, second, third, fourth and fifth classes of freight governed by the Canadian Classification to 2 cents per 100 pounds, subject to a minimum cartage charge of 15 cents for any one consignment. The same exceptions as heretofore are continued. These tariffs become effective on March 15th. The railways state that the rates published in their freight tariffs are exclusive of cartage, but that at certain stations which are mentioned, and of which there are twenty-two on the Grand Trunk and seventeen on the Canadian Pacific, a cartage service is maintained. At these points when cartage is performed by the railway companies' cartage agents the charge for such service must be collected from the consignee, or, in the case of prepaid freight, from shippers in addition to the freight charges.

The reason given by the railway representatives is that the increase has been rendered necessary by the enhanced cost of delivery due to the greater cost of wages, keep of horses and other expenses, which have led the big delivery companies to increase their charges to the railways, and that the increase will not meet the amount charged the railways by the cartage companies, which is well in excess of 2 cents per 100 pounds.

When the cartage service was first introduced into Canada it was performed without any additional charges; that is to say, all freight in the first five classes was delivered free with certain exceptions which applied to heavy freight. About 1893 the railways decided to make a charge for the service, and added 1¼ cents to the rate. Later on this was advanced to 1½ cents. It is now proposed to make it 2 cents.

Coming as this does almost immediately after the revision of rates ordered by the Board of Railway Commissioners, which became effective on January 1st, shippers are inclined to look upon it as intended to in some degree counteract the order of the Board. In view of the present trade conditions, and the likelihood of their continuance for some time at least, it would seem that the tendency should be towards lower wages and cheaper service. Therefore, the reasons given out for making the advance would hardly be considered satisfactory. More particularly is this the case in small centres, where the service can undoubtedly be performed at a much cheaper rate. Strong objections are taken to the advance in the rate on smalls. Many shippers send out a great number of small shipments in a day. A carter will take sometimes twenty or thirty small shipments on one load. According to the new tariffs a shipper will be required to pay 15 cents for each shipment.

Changes of this kind cannot be brought about without serious inconvenience to the shipping public, and it is to be regretted that an opportunity is not given to discuss them before they become effective. In this connection it may be pointed out that the public are in a rather unique position.

A railway can at any time publish a new tariff of rates. This is done by fying it with the Board of Railway Commissioners ten days before it is intended to put it into effect. If at the end of that period no complaint has been registered, the tariff goes into effect and becomes law, and as such is binding on the shipping public. It is not, then, the railway which is charging a certain rate; that rate is compulsory under the law. Yet shippers in general have no knowledge of such intended changes. They have not been taken into the confi-

dence of the railways as to the reasons for them. Their first information usually comes when the new rate is exacted on some shipment. Legislation in which they are interested equally with the transportation companies is enacted on the initiative of the latter. The railway companies would consult their own interests by discussing a little more frankly changes which are going to seriously affect their patrons the shippers.

HOW THE ENLARGED COMMISSION SHOULD OPERATE.

THE Board of Railway Commissioners will be enlarged during the present session of Parliament. The Minister has announced that telephone and telegraph companies will also be placed definitely under its jurisdiction. How the enlarged Board will operate is of first importance. As has been well pointed out, it will be of no avail to increase the membership if the whole Board is to sit on every case. That would delay rather than expedite matters. Nor would it be advisable to apportion certain territories to individual members, so that one commissioner would hear all the cases arising in a certain district, and so on, as has been suggested by some journals. The futility of such a system is manifest when we consider that the decisions of the Board not only settle specific cases under dispute, but they have the force of law in all similar cases. A case of inter-switching arising in London would, under this system, be investigated and reported upon by the commissioner for Western Ontario. But the decision arrived at would be final in similar cases arising in Montreal or Winnipeg.

To arrive at the most equitable decision it would seem reasonable to have one commissioner consider the question as it appeared in the different parts of the country, and then from this broad view bring in a recommendation to the Board.

A more conclusive proof of the inadvisability of the district scheme comes from the extensive nature of most questions which come before the Board. A complaint is made of an insufficiency of cars. The shortage is felt by the manufacturers of Quebec and Ontario, by the farmers of the Middle West, and by the lumbermen of British Columbia. How would a district commissioner work to advantage in such a case? The International rate case, the transcontinental rate case, demurrage, how could these be considered by the commissioner of any one locality?

Relief from the mass of work under which the Commission is now struggling should come through specialization. Such is the principle upon which the Interstate Commerce Commission works. One member might be allotted specially to complaints arising out of equipment, another to questions of construction, another to rates, and so on. By this means the commissioners would make their investigations with an eye to all other cases of a similar nature, no matter where they might come up. They would attain a greater expertness through giving their attention to definite lines of enquiry.

The Railway Commissioners have accomplished great work since their appointment. Large powers were vested in them, and they have used these powers uniformly in an effort to bring about a satisfactory understanding between transportation companies and shippers. The elimination of discriminations has in itself amply justified the existence of the Board. That the work has kept piling in and that its scope has been constantly enlarged, as by including express companies under

its jurisdiction, is a proof of the satisfaction with which its work has been received. The enlargement of its membership is the natural result of the increase in its activities.

THE PROPER EQUIPMENT OF RAILWAYS.

CANADA, like most other new countries, has had all too many railway projects, the promoters of which have secured franchises, not with any intention of carrying on construction, but purely with the idea of keeping the franchise alive until some buyer should appear. In a country of magnificent distances like this railways are necessary, and every encouragement should be given to the projectors of new lines, provided only that they are actually going to build and equip their lines adequately. But it is time that some measures were taken to separate the sheep from the goats, for under present conditions the issuance of a franchise frequently results in the holding back of a district from development rather than the opening of it up to settlement.

A franchise is now granted for five years; if the rights under it are not exercised in that time it is usually prolonged for another like period; it may be a mere speculator looking for a buyer; it may be a great railway corporation seeking to forestall a rival. In either case a rich territory may be held back from settlement. An amendment to the Railway Act has been proposed at Ottawa which would in a large measure overcome this trouble. It is recommended that all railway franchises be subject to the provision that 10 per cent. of the road be actually built within two years. The financing of the railroad is not a simple operation, but a promoter asking for a franchise should have some definite idea about his future procedure. It should not, therefore, be a hardship to demand that the *bona fides* of the scheme be demonstrated by the performance of some construction work.

Then there is the subject of equipping the roads after they are built. The Chairman of the Railway Commission has threatened to recommend that new franchises to old companies be withheld until their equipment is brought up to a reasonable standard. This is a fair stand, for if new branches are to be constructed without adding to the rolling stock, the already inadequate equipment will be still further reduced. The desirable condition is to have the branches, with the addition of a proportionate amount of rolling stock. We undoubtedly need transportation facilities. Land that lies twenty miles from a railroad is not of much value; it costs too much to haul products to any point of shipment. Run a line within five miles of the same place and the value of the land will soar. There is land, abundance of it, of the best agricultural quality, lying sixty or eighty miles from a railway in our Middle West. It is altogether desirable that this should be tapped by railroads as soon as possible. It would be the part of wisdom to be somewhat generous with franchises for branch and new lines, but to be insistent on the performance of the work undertaken and on the proper equipment of the road.

The time to make the necessary provisions is when the special Act incorporating the company is being passed. A railway company derives all its privileges from the public. Parliament gives it the right to expropriate private property because it is going to do a service to the public. That is the fundamental fact upon which the relationship of the railways and the public is based. In too many cases the operating companies have failed to recognize that in granting them the right to use the public highways and to take over private property for a right of way, the public has made possible their very existence. This was not done from philanthropic motives, or to provide an investment for capitalists' funds. It was purely selfish; the public granted this in order to get

transportation facilities. When a railway company fails to provide a reasonable service it in effect repudiates a bargain entered into with the public. The privileges thus given are specified in the Railway Act and in the special Act incorporating each company. In the same Act should be placed clauses setting forth in detail the services which shall be demanded of the railway. Only when these conditions are fulfilled should the government subsidy be paid. Subsidies are not payable by law till the road is accepted by the government as satisfactory. Heretofore satisfaction has consisted in having a track laid over a fixed course. Rolling stock and facilities for transacting business are no less necessary. It might be mentioned incidentally that a special Act over-rides the provisions of the Railway Act, so that a close scrutiny should be made of the charter of new lines before they are incorporated.

A CRITICISM OF CANADIAN METHODS.

Every once in a while word comes of unsatisfactory conditions surrounding the shipment of goods to New Zealand. Little attention was paid to these complaints for a considerable time, and they were laid to the account of too much business; manufacturers in many cases had so much business that they could not handle export orders. There were some complaints, however, which could not be explained in this way. We have a letter before us from a New Zealand importer to a representative of some Canadian lines, in which the former sets forth that six cases of hardware shipped on August 15th last, had not arrived on December 9th, and this in spite of the fact that two steamers had arrived at New Zealand after the one which should have carried the goods.

A further quotation from this letter will show just how New Zealand merchants look on Canadian trade. There is no one of the criticisms contained in it which cannot be eliminated by Canada, if we only appreciate that the trade is worth going after. The writer states: "We have tried to do business with Canada, but, as you know, so far, the execution of orders has been very unsatisfactory. The greatest drawback, in our opinion, is that there is no direct steamer line from the East coast. Your dependency on New York for shipping of heavy lines militates against prompt delivery. The omission of the name of the steamer from Bills of Lading is also very unsatisfactory. We have no time to watch every manifest that comes into this port in order to find out if a shipment for us has arrived. It appears to us that Canada has to look out for better and more satisfactory shipping facilities before she can rely on an increase of her export trade. We stand not alone in this opinion, as several of our friends have expressed themselves to the same effect. We would be only too glad to give our business to Canada, but as long as the shipping is so unreliable and vexatious, we are obliged to favor the United States."

"Shipments reach us weekly from all parts of the globe, but none give us so much trouble as those from Canada."

This is a serious indictment. We are making gigantic efforts in the internal development of our country. Never a day passes without the subject of transportation being brought forcibly before our attention. Factories have been expanding on all sides. It would be a serious reverse if our efforts to establish an export trade were spoiled by an inability to get our goods to the world's markets.

The Monarch Brass Works, Port Colborne, have shut down temporarily. The manager states the sole reason was the shortage of gas, which is being sent to Buffalo in large quantities.

The Fire Waste and How to Prevent It

By E. P. Heaton, Manager Insurance Department, Canadian Manufacturers' Association

THE fact is generally admitted by all who have given a moment's consideration to the problem of the fire waste, that the Dominion of Canada and the United States stand out conspicuously and unenviably as countries in which the fire-fiend, year after year, proves a tremendously destructive force. While this fact stands unquestioned, it is perhaps not generally known how completely they eclipse all other countries in the per capita loss thus sustained. The writer fully recognizes the difficulty in obtaining and presenting reliable data on the subject, but the Committee on Statistics of the National Board of Underwriters, through the co-operation of the United States Consular Service, at their annual convention held in May, 1906, presented in part the following statement:

Country.	Annual Average	
	Fire Loss.	Loss per Capita.
Austria	\$7,601,389	\$0.29
Denmark	660,924	0.26
France	11,699,275	0.30
Germany	27,655,600	0.49
Italy	4,112,725	0.12
Switzerland	999,364	0.30
United States (to 1905) ..	173,323,541	2.47
do. (1906) ..	231,000,000	3.30
Canada (average for 5 years)	11,012,207	2.00

Great Britain is not included in this list because the information is unobtainable, but we know fire insurance rates in that country are about one-fourth of what they are in Canada, with a larger margin of profit, and it is therefore fair to presume that the per capita loss is reduced in the same proportion. It cannot exceed \$0.50, and may, therefore, be said to rank about equally with Germany. How far we may be from the mark in this guess we cannot say, but for the purposes of this article we will assume we are not very far astray. Let us, therefore, put it down at \$0.50, or something under \$20,000,000.

It is not easy for the average man to understand what the tremendous fire waste of the United States and Canada means. How little, for example, does the ordinary mortal know what a million dollars signifies; the term implies so much that one fails to grasp its true significance; in the above table it is shown that the average annual fire waste of the two countries is about 185 million dollars! If we are dazed in the contemplation of one million dollars, we get mental paralysis when we speak of 185 millions.

A Startling Comparison.

Let me suggest a comparison which may help to bring home the great significance of this vast total. For the year 1907 the total assessment of the City of Toronto is \$184,632,463; the fire wastes of the United States and Canada each year practically represents the complete obliteration of a money value equal to the assessed value of all the real property within the corporate limits of this thriving prosperous city. Periodically the world stands aghast at the spectacle of a San Francisco or a Chicago conflagration, and for a brief period thereafter men wonder and plan how these may be averted; alas, the warning is soon forgotten, the episode has been a nine days' wonder! Yet the startling fact remains that each year there is consumed on this continent a value far exceeding that destroyed in the unparalleled disaster of

San Francisco. The marvel is that the people do not understand that this is not the insurance companies' loss, but the actual, positive, direct loss to the whole people, without one atom of compensation or advantage.

Why the Loss and What the Remedy.

There naturally arises from the consideration of these preliminary remarks the following questions:—

- 1st. Why should the fire loss be so much larger on the continent of North America than in any European country?
- 2nd. In what directions may we look for corrective and remedial measures?

The first question is apt to be answered in many ways, and agreement on the subject between any number of people of varied interests is impossible; it would, therefore, be folly on the writer's part to attempt to reconcile the divergent interests or to lay down his own "ipse dixit" by way of offering an acceptable solution. Probably, however, each of the following causes may have contributed something to the general result, viz:—

- Climatic conditions,
- Deficient fire protection,
- Insufficient water supply,
- Inferior construction,
- Narrow streets,
- Height and area of commercial risks,
- Exposures across alleys, lanes and yards,
- Fortuitous circumstances, as the earthquake at San Francisco, etc.

In considering the question of the loss per capita it may be that there are economic reasons which, in a measure, at least, make the contrast between the United States and Canada on the one hand, and European countries on the other, less conspicuous and alarming; possibly the greater per capita wealth of this continent might be urged as a set-off, but reasoning of this nature is much too abstract and academic to justify further consideration here.

Where the Blame Lies.

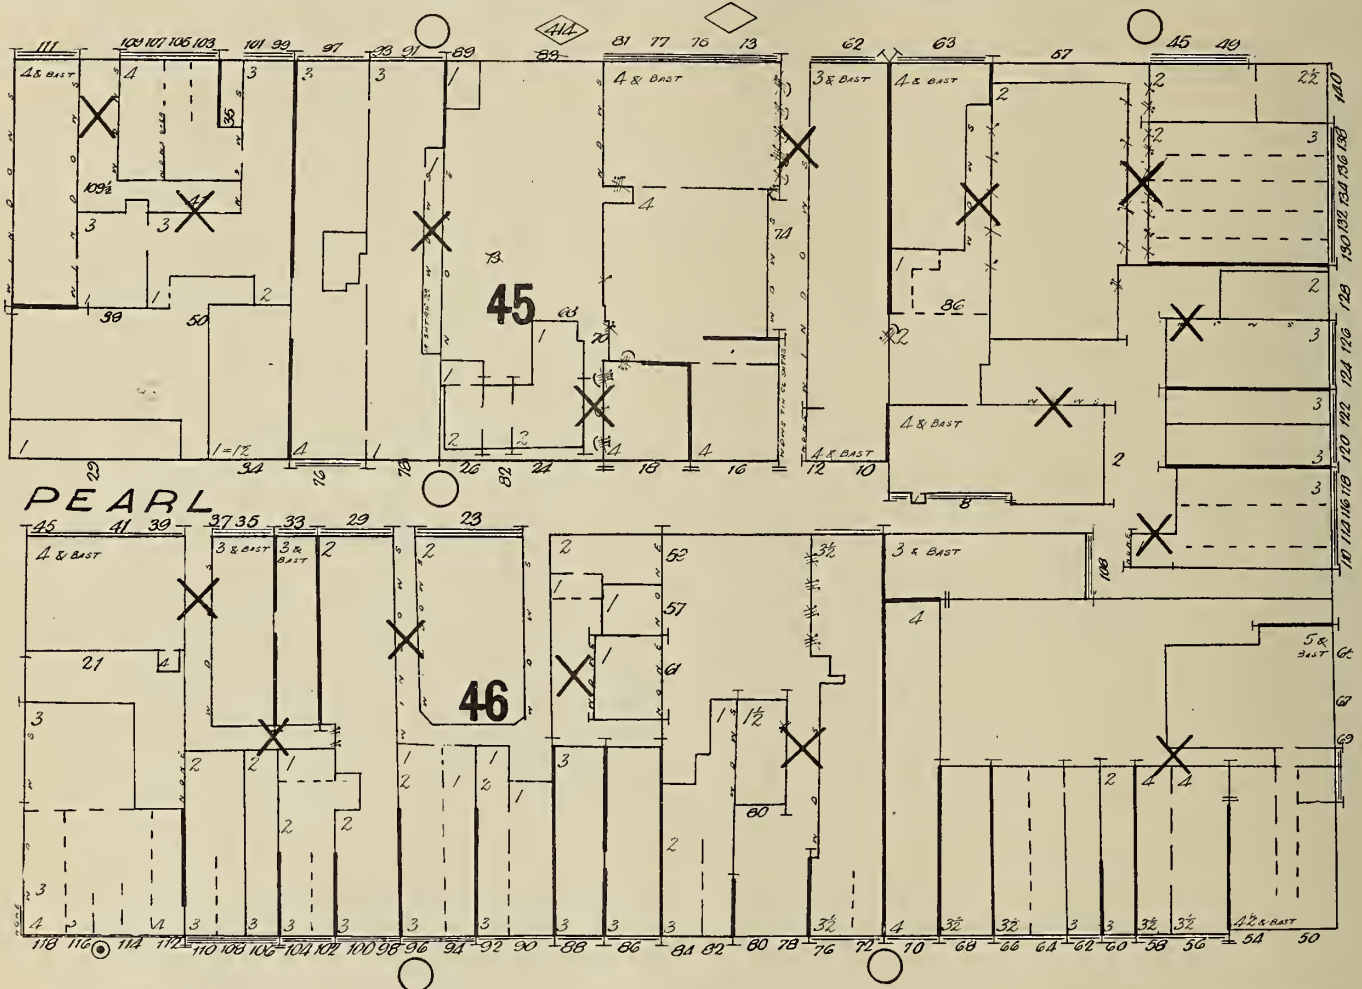

For the existing conditions of things blame is generally placed upon the people, who, it is claimed, build foolishly, who are lax in enforcing municipal regulations—in a word, it is the people's fault!! There is, however, another side to this question, which may be stated in the universal law of supply and demand. It is the business of the insurance companies to provide protection and indemnity. So long as the demands of the insured for protection and indemnity are fully met the question of cost is about the only one that counts, and even that point is regulated by the same law of supply and demand. Suppose, for a moment, the supply of insurance was curtailed by one-half, and in the conflagration district of cities such as Toronto, Buffalo, Pittsburg, Philadelphia, New York, etc., merchants, manufacturers and others could not buy insurance to an extent of more than one-half their requirements, what would happen? Assuredly the rate would go up, that goes without saying, any little excuse will cause that!! But would merchants and manufacturers quietly and meekly accept the situation and be satisfied? Hardly. Nothing would more quickly contribute to a distribution of risk or to greater care in construction and protection; without this stimulus the cost of handling goods

is of infinitely more importance than the cost of insurance thereon, and features of distribution, care and protection, necessarily take second place.

The writer admits that he has thus interpolated a feature that is, perhaps, foreign to the subject of the article, but there is, nevertheless, something in the thought of the last paragraph that has an indirect bearing on it, and which it would be exceedingly interesting to pursue. Twenty-five years ago a wholesale dry goods importer would pay a rate of from 40 to 50 cents per \$100; he now pays on risks similarly built and protected a rate of from \$2.00 to \$2.50 %. To trace the cause of this tremendous increase would without doubt afford an object lesson in the law of supply and demand. The people are not alone to blame!

Corrective and Remedial Measures.

What can be done to remedy the existing state of affairs?

A Typical Business Section in Toronto.—The heavy black crosses show where there are exposed windows. From these it will be seen that a wind from any direction will spread a fire if it once got under way.

There is probably few more serious questions than this before the public mind at the present time, and associations of municipalities, engineers, architects, fire brigade chiefs and insurance companies, to say nothing of the scientific and industrial press, are contributing very largely to the elucidation of the subject. There is, however, an apparent weakness in the work that is being done by these bodies in the side from which the subject is being approached. Largely, if not entirely, the main efforts of these various associations of men, with the exception perhaps of the fire insurance associations, are starting from the point of improving the class of construction of new buildings, and in this way making the lump of leaven leaven the whole. But what about the general mass of property, particularly in congested areas, where the

leavening process must be slow and tedious, so slow, in fact, that up to this date there has been no evidence that the improvement so far carried out has lowered by a fraction of a cent per capita fire waste?

It is true that every building, constructed and protected on the most modern principles so far discovered, creates an additional fire stop, or fire-fighting zone, and, therefore, should in the very nature of things, improve the situation, but have not recent fires in so-called fireproof buildings where inflammable goods are stored, demonstrated an interior weakness, which if put to the test of exposure from a conflagration, would be greatly accentuated?

Heroic Treatment Necessary.

While all that is being done is highly commendable, it does not strike at the root of the difficulty; like a festering sore it requires heroic treatment to be effective, and the remedy

must, it seems to us, come from somebody clothed with authority to order things done.

Where human life is endangered the municipality orders that this shall be done or that removed, and unless political "pull" steps in, the orders are carried out. Thus are the storage of explosives regulated, the exits from places of public entertainment made to meet emergencies and fire escapes provided. Is there to be found a municipality which will consider the fire waste, viewed in connection with conflagration possibilities, to say nothing of probable accompanying loss of life, and apply preventive measures in a whole-hearted heroic manner? If one such municipality could be found, we should have an object lesson for the world in grappling with an evil already described as one of tremendous force.

What Should be the Remedy?

Extreme boldness would be the characteristic of him who would attempt to teach mankind what the complete remedy should be,—truly would it be a case of a fool entering in where an angel fears to tread. Nevertheless, there are some practical things a municipality might do, each of which would contribute to a better state of things, and the sum total of which would be correspondingly better. Approving and endorsing the best of the many good laws for all new buildings, here are a few other things that might be done while not leaving the others undone:—

1. In all modern buildings wherein there is any accumulation of burnable property, insist upon automatic sprinklers being installed. The fire in the Parker building at 225-233 Fourth Avenue, New York, destroyed a few days ago, would doubtless have been caught and stopped at the fifth floor, where the fire started, if the property had been so equipped. This was nominally a fire-proof building, crowded with readily-burnable property, and the fire extended throughout the structure. The chief of the New York brigade is quoted by the *Journal of Commerce* as saying in reference to this fire: "If there had been a high wind the other night it is hard to tell where the fire would have stopped." The lesson is obvious, even in so-called fire-proof buildings.
2. Insist also upon the installation of automatic sprinklers in all buildings where concentration of values or class of occupancy, make it at all practicable. An efficient system of automatic sprinklers is the highest type of fire-fighting appliance, and the ideal check to the fire-fiend's voracity. No mistake is made in insisting upon its use to the utmost possible extent. Toronto in 1904 was saved from a much more disastrous conflagration than then visited the city because of the automatic sprinkler equipment in a large manufacturing establishment on the west side of Yonge Street.
3. Introduce party walls, parapet roofs, and remove wooden cornices wherever possible. Large areas under one roof increase the chances of a heavy loss on the contents of a building, and help to create a volume of flame that is dangerous to neighboring buildings. The cost of carrying out this great improvement would be comparatively light in proportion to the benefit that would be derived.
4. See that all skylights,—a dangerous and prolific source of spreading fires—are made by the use of wire, glass and metal frames, to prevent a fire outside communicating with the inside.
5. Similarly protect with modern coverings all exposed windows and doors across alleyways, narrow lanes or streets, courtyards or extensions. This, probably, is the most simple and effective remedy that can be suggested, yet it aims at and would, in the writer's opinion, contribute more than anything else to the elimination of the most dangerous existing hazard.
6. Let there also be used as freely as possible the outside water curtain, which is a standard exterior protection that over and over again has demonstrated its efficacy in creating an effective fire-stop.

There are many other simple improvements that can be applied gradually to the interior of existing buildings, but in

these respects we are passing out of the realm of the exercise of municipal authority. The remedies we have suggested are practical, and, with the exception of the introduction of automatic sprinklers, could be installed at comparatively small cost. Why should not some serious effort be undertaken to enforce their completion? The result would, we are sure, be so eminently satisfactory as to leave no regret that the power enjoyed by the municipality had thus been brought into play. If this tremendous fire waste was recognized to one-half its real extent, no plea for the exercise of such power would be necessary.

Exposure Across Lanes, Alleys and Courtyards.

I have already pointed out, in suggestion No. 5, what I think to be the most dangerous existing hazard and the remedy therefor. A glance at the typical Toronto block in skeleton form, now published, will furnish the fullest evidence of the point that is made. Mark the serious exposure from one building to another, and if this sketch does not loudly proclaim the necessity for municipal interference and the exercise of municipal authority, I fail to imagine anything, save the destruction of the block by fire, that will. If, too, the remedy is so easily and cheaply found, can there be any legitimate reason why it should not be speedily applied?

MANUFACTURERS' AGENTS.

Almost daily letters are received by the Secretary from commission and manufacturers' agents, offering their services to Canadian manufacturers. These letters come from Great Britain, Belgium, Australia, South Africa, the West Indies, South America, in fact, all parts of the world. Among them are a few from Canadian agents who desire to represent manufacturers in Western Canada or Eastern Canada, as the case may be. In some cases the prospective agent outlines a definite proposition on which he will work, while others merely express their desire to act as agents in their respective countries in a general way. Most of them will handle any lines that will sell in their territory. A few specify the lines they can handle.

There is no doubt that most of these enquirers are reputable agents and mean business. But the Secretary, except in a few instances, finds it impossible to place them in touch immediately with Canadian firms who desire representation, because he has no knowledge of the firms who are open to discuss an agency proposition. There is no doubt that there are some Canadian firms who would be glad to communicate with each enquirer who writes the office, and the Secretary therefore requests all Canadian firms who are interested in receiving particulars of agents' inquiries to notify him at once to this effect, specifying, if possible, the lines agents could handle for them, and the country or territory they wish covered. A list will be compiled from replies received and firms therein notified immediately of all inquiries received at this office from agents. This is a very opportune time to build up an export trade, owing to the slight depression, which is prevailing in the home market and the Association is adopting this plan with a view of assisting its members, in obtaining a foreign market.

A Definition.

A pessimist is a man who blows out the lamp to see how dark it is.—John R. Mott.

Automobiling in Canada

Some Considerations in the Buying of a Car

WITH the first suggestion of Spring weather the subject of automobiles takes on a renewed interest. The present month will see the big automobile shows in Toronto and Montreal revealing in all their splendor and attractiveness the 1908 offerings of the manufacturers.

A Russell in the big tree in British Columbia.

During the next few weeks the buying of cars will go on apace. The use of cars has so widened of late that it may fairly be expected that this year will far outrank any previous season in the number of the automobiles purchased. The rise of various automobile clubs and leagues has introduced an element of fellowship and mutual assistance that has added greatly to the popularity of motoring.

The all important question now is that of "make." Consistency is a jewel; it is only fair for Canadians to carry their theories into practice to the extent at least of investigating the qualities of Canadian made cars before buying. The advertisements of foreign cars reach Canada in enormous quantities through the medium of the United States magazines. Manufacturers from across the line can afford to use these papers, expensive as they are, because they are reaching the extensive population covered by them. It is, of course, out of the question for a Canadian manufacturer to pay advertising rates for a circulation of hundreds of thousands, when only a few hundreds come to Canada, where alone he can get results. Consequently, the Canadian public are familiar with the names of foreign made cars, with the appearance of them and with their speed and endurance records, better even than they know the cars which are built at their very doors.

Advantage Rests With Canada.

And yet a common sense consideration would indicate that the chances for producing a satisfactory machine rest strongly with the Canadian manufacturer. Our manufacturers have been building cars as long as or longer than many of the foreign companies which are now selling cars here. It should be distinctly understood that we have passed the experimental stage; our factories are just as well equipped, have just as efficient designers and just as skilled workmen, as have those in any other country. But they have this additional advan-

tage. Each year suggests some improvements on the design of the previous year. A new design does not mean a few changes in the appearance, a different color, or more luxurious appointments. It means definite changes in the working parts of the machine, made in consequence of close observation of the working out of all the cars of the preceding year. As the season develops breakages may occur, weaknesses may appear, the motive power may not be securing the maximum of effectiveness, the set of the car may not be most suitable for the roads, the wearing of the springs may indicate where changes can be made to advantage. The manufacturer and his staff watch every one of these points, and countless others, and the car of the following year is designed to overcome these weaknesses.

Now, the great majority of cars manufactured in the United States or France are sold in those countries, so that the observation of weaknesses consists in rectifying errors of manufacture as they develop in those countries. But the fine roads of France or the well paved streets of the cities of the United States do not develop the weaknesses which are developed by the roads of Canada. Hence the improvements from year to year are not aimed at covering the difficulties which arise here. They are intended to satisfy the conditions obtaining abroad, where the chief market lies.

Made for Local Conditions.

Not so, however, with the Canadian manufacturer. His market is Canada. Every improvement which has been made from year to year has been made to satisfy the exigencies of local conditions. As a result a peculiar type of car has been developed, embracing features which are not found in the cars of any other majority nation, cars built to travel on

A Ford in Action.

Canadian roads, to endure Canadian weather, cars built distinctly for the people who are to use them.

This is an elementary consideration which should be kept in mind by intending buyers of automobiles. It is not a case of favoring a Canadian car because it is made in Canada, excellent as this principle is; it is a case of favoring a Canadian

car because it is built with the one object in view of meeting Canadian conditions, and so may be presumed to be more satisfactory under these conditions.

Rise of the Industry.

The manufacture of automobiles began in Canada in 1901, when the Canada Cycle & Motor Co. commenced building cars

A Holiday Party in an Oldsmobile.

in Toronto Junction. A year later Canadian Motors Limited established a factory in Toronto, but the electrically driven machine was not destined to meet with immediate success, and the Company went out of business. The Ford Motor Company next entered the field, making Walkerville their manufacturing base. Soon after the Oldsmobile Company began manufacturing their cars in St. Catharines. Following them came the Comet Motor Co., who manufacture in Montreal, and the McLaughlin Motor Car Co. of Oshawa, who have brought their cars out this year for the first time. The Chatham Car Company, who commenced business last year, came to an early end, and have discontinued manufacturing.

A wide range of cars is shown by Canadian manufacturers, more extensive in style and price than in any previous year. A few are shown in illustration of this article. They run from the jaunty runabout to the lordly landaulette, and vary in price from \$750.00 to several thousands. Although the working mechanism is the essential part of the car, of almost equal importance are those things which go to make up its general appearance. An automobile is a luxurious vehicle. Its lines suggest power; it is perfect in finish, and its upholstery is all that a desire for comfort can suggest. It is little wonder that the owner of a car grows in enthusiasm from year to year and that he who is not so fortunate is living in more or less patient hope that some day he may be the proud possessor of one.

Its Growing Popularity.

Motoring is in the springtime of its popularity in Canada. The sport or system of locomotion—which shall we call it?—is growing in favor from year to year, not with the growth of a fad, but with the knowledge that enjoyment and healthy outdoor recreation are necessary antidotes to the strenuous existence of the average business man. It has become more than a pleasure; it is a necessity. As a consequence motor cars have changed from being the perquisites of the rich to being the ordinary vehicles of the successful man. Whereas a very few years ago they were never seen outside of two or three of the biggest cities, now the prosperous merchants of the smaller towns are joining the school of those who believe in enjoying life while they are living it. Conditions are improving. Each year finds the automobile more complete, more

perfect, less liable to go out of order; each year the roads are being improved, both in town and country, making the pleasure of touring ever greater.

Nor can anyone point to a country which offers more to the tourist than does Canada. It is replete with scenic splendors, showing in its broad expanse a variety of landscape of unequalled interest. So true is this that there is a constant stream of tourists from other countries revelling in the beauties of nature which most Canadians are themselves too ignorant of.

AN AUTOMOBILE SHOW.

From March 21st to 28th an automobile show will be in progress in the St. Lawrence Arena, Toronto. Arrangements are rapidly approaching perfection for the great occasion, when the motor vehicle can be seen in all its glory. Excellent displays are promised by all the Canadian manufacturers of automobiles, including the Canada Cycle & Motor Co., Toronto Junction, the Ford Motor Co., Walkerville, the Oldsmobile Co., St. Catharines, and the McLaughlin Motor Car Co., Oshawa. In addition to these the tire manufacturers, the Dunlop Tire & Rubber Goods Co., and the Canadian Rubber Co., and the motor boat and accessory manufacturers will be represented. Among others exhibiting will be the Canadian Fairbanks Co., Montreal; McKeough & Trotter Chatham; H. E. Gidley Co., Penetang; U. R. Thompson, Brantford; Beaudry Gasoline Co., Montreal; G. W. Lowney Co., Toronto; Conboy Co., Toronto; the International Carriage Co., Brighton, Ont.; S. F. Bowser & Co., Toronto, and the Gutta Percha & Rubber Mfg. Co., Toronto.

TAX EXPRESS COMPANIES.

A bill to amend the Assessment Act will be introduced at the present session of the Ontario Legislature. At the present time there is a divergence of opinion among members of the Bench as to the liability of express companies to be assessed for municipal taxation in those places where they transact business through the local railway agent. Judge Mabee, in a recent judgment, ruled that the words "mainly

A McLaughlin-Buick Car.

carry on express business" in the Assessment Act precluded the assessment of express companies by municipalities under the conditions mentioned, while, on the other hand, the rulings of all the County Court judges who have dealt with similar cases state that the business tax can be levied for the portion of the railway station and land occupied by an express company.

What to Read

INTERNATIONAL WEIGHTS AND MEASURES

ANY business man wanting full information on the weights, measures and currencies of different countries—and who does not?—can now find it in a convenient little volume just issued by the Macmillan Co., of Canada, for the small price of 90c, "The Weights and Measures of International Commerce, Tables and Equivalents," by Hatch and Vallentine (Toronto, 1907). It seems strange that in spite of the myriad of books pouring from the press it is still possible to say of any one that it fills "a long-felt want." The present little book, however, deserves the compliment. It explains and compares, in its 59 pages, the units used in different countries, gives tables converting them into metric and British and vice versa, and includes a table of comparative prices and rates of exchange. One little geographical slip is noticed in referring to Vancouver Island as if it were a separate colony.

TECHNICAL EDUCATION THE GREATEST PROBLEM IN THE UNITED STATES.

In "The Outlook of the Average Man," Mr. Albert Shaw, (Macmillan Co., of Canada, \$1.25), gives a gentle surprise to the reader. From the title one would rather expect a discussion of opportunities for the young mechanic and artisan; the book, in fact, gives an account of general, political, industrial, and social conditions in the United States. In this sense it is an Outlook.

The volume is made up of a series of addresses given to College students, and is consciously not ponderous in style, not overly critical, yet it is frankly suggestive. The people of the United States, it bears witness to, are coming to see clearly that making a great nation is not all smooth sailing; that to have to put up at the same hostelry with a rainbow of different nationalities and to live up to the principle adapted to the select, early colonial days—universal suffrage—is a severe strain on the democratic enthusiasm even of Mr. Shaw.

Mr. Shaw ever holds his hands over his eyes when he comes to the Philippine problem. That the United States should have given twenty millions to relieve Spain of the expense of governing these, and one hundred millions and more already in vainly trying to make the natives enthuse about western ideals, is one of those funny things in the, shall we say, diplomatic history of the world that can only be explained by the dear but terrible name of party politics. American experiments in the Philippines will do good, however. They will show the world whether the South Sea Islander can be civilized or not, and inferentially what western civilization can do for the Asiatic. And that is a mighty thing.

Mr. Shaw hits the nail on the head when he points to "The greatest problem that confronts American statesmanship"—education. "We must," he says, "consciously make our school systems minister to the solution of our social and industrial problems; technical education, and healthy individualism go hand in hand." This is a view of technical education that we are glad to note our Dominion Government is apparently sharing in practically, in promising a recent labor deputation to appoint a royal commission of enquiry.

THE MONEY STRINGENCY.

MR. GEORGE D. GRIFFIN, who has been a consistent advocate of protection in Canada for over sixty years, gives the following explanation of the present stringency of money, from a close observation of economic conditions extending over a very long period:

The increasing financial stringency is a question of surpassing importance, worthy of the fullest consideration. The comments of the press, so general in Canada and other countries, show that the cause of the scarcity of money is in many minds a yet unsolved problem, the result of want of the information that will herein be presented.

Excess Imports.

Is not the cause of the financial difficulty the result of imports in excess of exports to pay for them? Referring to this B. E. Walker, Esq., in his address to the stockholders of the Bank of Commerce at their annual meeting, November, 1905, in his anxiety in relation thereto, said that the excess was a mortgage upon the Dominion. The Toronto News of August 21, 1907, quoting from the current Quarterly Review, reported that Canada's debt to Great Britain was now over \$1,224,000,000. The Government returns prove that in round numbers the amount is the same as our imports in excess of exports since 1850, not a dollar of which has been paid, and in round numbers we have paid about \$1,250,000,000 of interest thereon, and are still paying interest. The fact is confirmed by The Toronto Globe about the same date as The News, that our present payable interest to Britain is \$60,000,000 annually, that is an average of 5 per cent. on the amount. The \$60,000,000 is an average of about \$50 per family for the 6,000,000 population of Canada. This indicates one cause of the scarcity of money.

A Worse Exhibit.

The total imports for the past five years as given in the Government returns, is \$1,412,000,000, and the exports, \$1,167,000,000. The excess is \$345,000,000 at invoice prices, and which B. E. Walker describes as a "mortgage" upon the Dominion. It is that much of the \$1,224,000,000 debt for excess imports above cited. The \$345,000,000 is an average of \$288 of Dominion mortgage per family in five years upon the 1,200,000 families in the Dominion. The bank returns show that they furnished the importers over \$200,000,000 of the amount in gold and on which the importers had paid no interest from Canadian earnings. Nevertheless, the banks today have much larger vital assets than a year ago. No wonder B. E. Walker, in his report in The Monetary Times of January 12, 1906, said that the mortgage the importers were laying on Canada was increasing too fast. Is it any wonder that the borrowing and scraping for more money otherwise than from the banks by so many importers to cover the balance is making money scarce?

From the United States.

The government returns show that the excess imports from the United States in the five years in excess of what they purchased of us that we could, and under wise legislation would have made in Canada, was fully the excess of our imports for the five years, and that for them our importers poured the \$345,000,000, or nearly \$70,000,000 a year, into the lap of the United States to pay their workmen to make goods for Canada, thus depriving their customers, for whom they imported, of work and ability to purchase and pay for their imports. This is amply proved in the \$200,000,000 which they have borrowed of the banks, and for which, as yet, the bank returns show that too many of them have not paid any interest from Canadian earnings.

Cost Finding in the Factory*

By Kenneth Falconer

THE value of many efficient systems of cost finding, not alone in the foundry industry, but in connection with other lines of manufacture, is frequently lost by failure to fully realize the end and aim of cost finding. In planning a system of cost finding, whether for a foundry employing one moulder and a helper, or for the largest industrial establishment in existence, it should always be borne in mind that the finding of costs is a means to an end—not an end in itself. The justification of any cost system is in direct proportion to its influence towards increased profits. This influence may be exerted along one or more of several lines, study of the results secured and judicious action based thereon; reduction of costs, increase of sales, and (not by any means least) elimination of unprofitable business, are directions in which an efficient cost system should tend towards increased net profits; looked at from this standpoint, a system of cost finding becomes as direct an influence towards increased profits as any mechanical betterment of plant, or any improvement of the selling organization. A manufacturing plant is a productive tool, its general organization being the cutting edge; a cost system is the test whereby the management is able to keep the cutting edge in the best possible condition, and to secure from the operations of the tool the maximum efficiency.

Records Up-to-Date.

Another essential point in a cost system is that the information secured by it shall always be a matter of current record—not ancient history—that the facts presented may be used before conditions have so changed as to make the information of no interest or real value.

Another point frequently overlooked in devising and installing cost finding methods is the harmonizing of such methods with the general scheme of commercial accounting. To secure the best results, methods of cost finding and the general scheme of accounts should each be part of one general plan covering records of all operations and transactions from the purchase of raw material to the shipment of finished product; also the data and information secured by the operation of a cost system should be susceptible of proof by comparison with the general results of the business as reflected from time to time in the general books.

There are other most important considerations to be borne in mind in order to secure the best results of any system of cost finding. Amongst these may be mentioned the tabulating of results in such manner as to automatically draw attention to any abnormal variations in costs.

What Cost Includes.

There is one feature in relation to "Costs," to which I would call your attention, and that is the regrettable fre-

quency with which the word is regarded as meaning cost of product. A thorough cost system should take cognizance of all "costs" of the business, which, broadly speaking, may be divided into three classes: Cost of production; Cost of administration; cost of selling.

It is a truism to say that cost of product is composed of three factors,—material, direct labor, and manufacturing expense. It is, however, not a truism to say that while in a great many instances the cost of direct labor and material is carefully watched and kept down to the lowest possible figure, the expense cost of product is not analyzed and studied to secure the greatest possible opportunities for economy of manufacture; yet it is this item of costs which, in the great majority of cases, affords best opportunity for cost reduction, and this, without entailing the risk of labor disturbances which attempts to reduce labor costs very frequently cause.

A Modest Beginning.

In planning to secure record of the cost of manufactured product, it is not always advisable to undertake at the start an analysis of expense cost to the extent to which it is recognized it will be ultimately advisable to go; it is rather better to get the cost system running accurately, showing the three factors of cost of product, vid., direct labor, direct material and general expenses, and then gradually install methods by which the expense costs may be analyzed to such degree as to afford opportunity for study and comparison of the different items which go to form this expense cost with a view to lessening it.

Assuming a cost system securing accurate record of labor, material and expense cost of product analyzed to such extent as to meet special requirements, the tabulating of the data secured has a greater bearing on the "Dollar and Cent value" of the cost system than might be thought possible. Recording the results of

similar operations and transactions in parallel columns month by month does not sometimes convey as much meaning to those interested in the welfare of the business as recording the information each month in conjunction, not with similar records of preceding months, but with items of related interest for the same and current months. Figures in themselves often fail to convey information which may be seen at a glance by means of curves and diagrams. For instance, if your labor cost per pound increases a fraction of a cent each month for twelve months, and this information is recorded in figures, it will, of course, be immediately noticed; if, however, your labor cost fluctuates, increasing slightly one month, decreasing the next, but always increasing a shade more than decreasing, you will hardly have the fact of the constant increase brought so clearly to mind as if the information is recorded by curves and diagrams, showing at a glance the constant upward tendency of your labor cost.

In finding the cost of castings, as in finding the cost of

Mr. Kenneth Falconer.

*Address delivered before American Foundrymen's Association.

any other manufactured product, it is always well to draw a definite line of division of cost covering operations up to definite point. It is generally recognized that a foundry cost system should show the cost of molten metal as the first defined point, followed by clear lines of definition between the several stages of completion. A Foundry Cost System which simply takes note of the average cost per pound of castings produced would probably work very satisfactorily if you could apply it to a foundry turning out from month to month its entire product composed of articles of exactly the same size, weight and quality. I do not imagine that anyone here represents a foundry working under such conditions; if so, he is to be congratulated, and his cost problem is a simple one. Where, however, as is the case in the great majority of foundries, the output is composed not only of castings varying in weight, but of articles, the cost of which (other than metal) varies widely, the average cost per pound is a misleading basis on which to make estimates or figure costs, profits or losses.

Some of you may have seen at a recent convention in Philadelphia a pamphlet on foundry costs, in which the statement is made that to "buy or sell castings at an average price per pound as though they were pig iron or coal is about as accurate as to buy or sell buildings at an average price per thousand bricks, or to buy or sell clocks, chairs or locks at an average price per pound."

Common Errors.

The statement is frequently made that it is impossible to secure accurately the cost of each individual casting made in a foundry turning out a large variety of product. This is probably true, but even the admission of this is no argument against getting as close to perfection as possible. Of course, if it could be done with a moderate expenditure of time at a reasonable cost, it would be very desirable for foundrymen to get the exact cost of each casting, and in case of special work, and exceptionally large castings, this information often may be, often is, and still oftener should be, obtained. In the case of a foundry producing a variety of castings, the use of one average rate per pound is absolutely misleading and unreliable. Between this, and the cost of each individual casting a compromise is to obtain the cost of product by classes.

If the output of a jobbing foundry is divided into two clearly defined classes, and the average cost of each class is recorded, that foundry is nearer securing correct costs of product than its competitor which uses only an average cost per pound for the entire output.

The number of classes into which it is advisable to separate the product depends in each instance on existing circumstances and conditions. I have in mind now a brass foundry which some years ago was dividing its output into two classes of castings, red and yellow; the division of cost as between these two classes was an arbitrary one, fixed largely by the ruling market price of copper and the guess of a very intelligent foreman. That foundry turned out a variety of brass castings ranging in weight from a cast nut for a basin cock to a tuyer weighing perhaps 300 pounds. Their output ranged from a cast handle for a compression bib to an intricate British Coat of Arms, measuring approximately 6 ft. x 4 ft., and weighing, perhaps, 4,000 pounds (which coat of arms, with an accompanying inscription plate, is now on the Jubilee Bridge across the St. Lawrence at Montreal).

The foundry referred to is now dividing its output into something like eight or nine different classes of castings; not only that, it is keeping record of the cost of special individual castings to a greater extent than formerly, which, by the way, the proprietor recently told me had proved of real dollar and cent value to him in figuring the cost of his finished product.

Some Suggestions.

My first suggestion for cost finding would be, if you have not a cost system, get one, not only for the sake of your individual profit, but for the general betterment of the trade. There is no surer way to put any manufacturing industry on a sound and legitimate basis than to have all concerned with that industry know just what their product is costing them.

My next suggestion would be, if you have a cost system, improve it; from one whose entire work is devoted to the question of manufacturers' costs and cost accounting, it may seem somewhat surprising to hear sincerely stated the belief that it is an exceedingly poor system of cost finding which cannot be improved; by that I mean it is a poor system of cost finding and a very poor system of accounting which is not sufficiently flexible to meet changing conditions from time to time.

My next suggestion would be to take a broad view of what is meant by "costs" and to always bear in mind that finding costs is a means to an end—not an end in itself.

I would also suggest that the cost system at the start be very simple. Many otherwise efficient and valuable systems have been rendered worthless by what is commonly called "too much red tape"; by which I mean recording a mass of

Part of the Cost System—The Stock Room.

detail that those interested could not study or use; thus burying the results of the cost finding methods in a mass of figures, some of them valuable, some of them worthless.

Find What Information is Valuable.

I would also suggest that before undertaking to secure record of the cost of castings produced by the plants in which members of this Association are interested, a very clear idea be determined upon as to just what information it is desirable to secure, and just how the information secured may be used towards reducing costs or increasing net profits.

One other suggestion, and I have done; there are very few here, I imagine, who believe that the plant with which they are connected is absolutely perfect, yet this does not prevent striving to get as near mechanical perfection as possible. The moral is, if you cannot get a perfect cost system, get as near to it as you can. If you cannot get accurate individual costs of castings, get at least an average cost of two classes of product, three would probably be better, four perhaps better still. It is up to each individual foundryman to determine whether five would be better than four, six better than five and so on.

The Stratford Shoddy Mills were destroyed by fire during the month, causing a loss of \$3,000.

TORONTO BRANCH.

At the regular monthly meeting of the Toronto Branch Executive it was decided to make an effort to induce British loan companies to establish branches in central points in Canada with a view to facilitating the making of loans to business men on ordinary first class investments. Your Executive has taken steps to have this proposal thoroughly investigated in London, England, through leading financial men, and to have articles published in leading English papers and financial journals calling attention to the big field there is in Canada, particularly at the present time, for loan companies for the profitable investment of English capital. The matter will also be given publicity in the columns of INDUSTRIAL CANADA, and it is hoped by these means considerable British money will be attracted to this country for loaning on ordinary securities.

Parks Re-organization.

The Executive will work in conjunction with the Guild of Civic Art in its efforts to have the parks system of Toronto re-organized and run on first class business lines. With this in view efforts will be made to have the City Council create a Parks Commission, who will have full control over the whole park system of the city.

Relief Fund.

The Branch is making an effort to raise a special relief fund of \$1,000 for the relief of the unemployed poor in and around Toronto, and is asking each of its members to contribute \$2.00 towards this fund.

Branch Luncheons.

Mr. E. A. DuVernet will address the members of the Branch sometime in March on "The Relations of Labor and Capital in Ontario." The date will be announced later, and a general invitation is extended to all the members of the Association to attend this meeting.

The Branch will make a grant of prize books to the Technical High School for the years 1908-9 for competition among the pupils of the night school.

MONTREAL BRANCH.

At the monthly meeting of the Montreal Executive on February 13th, a number of matters of importance were considered. A complaint from the Montreal Cotton Co., regarding delay of freight by the New York Central Railway, was sent on to the Transportation Committee. A request from the Canadian Bronze Powder Works for the abolition of the excise duty on fusel oil was referred to the Tariff Committee. Other matters discussed and specially referred to the Executive Council were Canadian bank loans in the United States, and the advisability of the boiler insurance companies employing smoke experts.

The Legislation Committee of the Branch is giving consideration to the question of revising the Municipal Code of the Province so that machinery shall not be taxable as part of a building.

Committees have already been named in connection with the September convention, and active work upon the arrangements will be commenced shortly.

British Trade Representative.

It is stated that Mr. Richard Grigg, of London, Eng., who recently made a report on British trade prospects in Canada for the home government, will shortly be appointed Canadian trade correspondent in Canada of the British Board of Trade, with headquarters in Montreal. He will have sub-correspond-

ents throughout the Dominion, including Toronto, Winnipeg, Halifax, St. John and the Pacific coast cities.

A Proper Declaration.

The Board of Investigation which sat in the case of the Grand Trunk Railway and its telegraphers went somewhat beyond the lines set by precedent in such matters, and got into the realm of what may be called higher politics of commerce. The decision points out, what many who take part in the discussion of such issues give no heed to, that there are two parties to be considered when demands that call for higher expenditure by railways are to the fore. There is no one who questions the worker's right to a living wage, and it may be added that in the end he will get it whether the men who have invested their money in constructing railways receive any return or not. But the men who invest their money in constructing railways have also rights to consideration, whether the demand be on the part of employees for larger recompense, from the public for improved service, or from shippers or travellers for reduced rates. If any or all of such demands are carried to the point where the operation of a road yields no profit, or only yields a smaller profit than can be obtained from other investments, then it becomes difficult or impossible to obtain money for extensions and improvements, and trade cannot be helped as it should be. In pointing this out, the Board, in this particular case, has laid down a principle that may well be considered by all who are called on to stand between the public, or sections of the public, and the investor in railway securities, who, while he must take the ordinary chances of bad judgment, bad management or unexpected competition, should not be subjected to artificial restrictions or conditions arising from political or non-commercial motives.—Montreal Gazette, February 5th, 1908.

EDISON'S CONCRETE HOUSE.

"I have constructed a model for a Queen Anne cottage, and next spring I intend to build a house of this pattern," says Mr. Edison, coatless and hair tousled, at his laboratory in Llewellyn Park, N.J. "I'm going to put her up in twelve hours, or try to do it—don't forget that! The expensive part of concrete construction to-day is the erection of wooden frames that can't be used again. With the aid of moulds, it is possible for any contractor to build a house of solid concrete, 25 feet wide, 45 feet deep, three storeys high, capable of housing two families, for \$1,000, with plenty of room.

"The most important feature lies in the moulds, which are of iron, for the concrete is anybody's. Wooden framed complete structures are built section upon section, after each section has been allowed time to solidify. This takes an annoying lot of time, varying according to the size of the building. Concrete in the iron frame can be stripped in six days, and the forms erected on another lot.

"By pouring in concrete, which is to be hoisted to the top of the house, and dumped in from there, until the mixture fills the mould, it will be possible to complete the structure in twelve hours. Are you on?

"The forms are of cast iron, and for \$1,000 the entire house can be built. This includes heating pipes of concrete, staircases of concrete, mantels of the same, roofs of concrete that won't leak, plumbing, wire conduits, and even bathtubs of concrete," he said, speaking vigorously.

"Such a house will stand forever. The houses which withstood the San Francisco disaster were concrete. Fire insurance will be a thing of the past with the new dwellings. Children may play with axes, but, chop as much as they like, they can't injure the structure. There will be no need for repairs."—Success.

BRITAIN'S SHARE OF OUR PURCHASES.

WHERE we shall buy our goods is of as great interest to us as to the manufacturing and producing countries of the world. We have, as a people, united on a national policy of buying what we can at home, but there is much which we cannot produce ourselves, and our purchases of this class of goods make Canada a market of importance to outside nations. The condition obtaining for several years was that of a steady increase in the relative amount of goods bought from the United States as compared with that bought from Great Britain. The preferential tariff stayed the decline of British sales, which have, during the past few years, shown a decided gross increase, although their percentage of our whole purchases has remained about stationary. For the year 1906 our purchases from Great Britain amounted to \$69,183,915, and from the United States \$168,798,376.

The existence of such conditions led the British Board of Trade to appoint a commissioner to make a thorough investigation of industrial and trade conditions in Canada, in order that the reasons for the comparatively small percentage going to Great Britain might be discovered. The commissioner, Mr. Richard Grigg, has presented his report, which is what was to be expected, a most comprehensive review of the situation, with some keen and valuable suggestions for overcoming the present conditions.

In leading up to the main subject of his report, Mr. Grigg gives a résumé of the characteristics of the market, special laws pertaining to trade and commerce, and tariff regulations. The reader is thus placed on firm footing in going into the questions surrounding the problem of imports.

For sentimental reasons, Canada would like to buy from Great Britain, but, as the Commissioner points out, this element is enough to turn the scale on an even or very slightly adverse bargain; it won't go beyond this. A number of causes favor competition from the United States, of which, of course, geographical position comes easily first. This is an advantage which it will be difficult to overcome. It operates in many ways; by enabling the salesmen to keep in close touch with the consumer; as a consequence of it the demand is for very similar goods; rapid delivery is possible; repair parts are always available; depots and distributing warehouses are kept in centres of consuming populations. Closely in line with this is the fact that many United States companies have built branch factories in this country, all of which are naturally equipped with similar machinery to that in use in the parent shop. Additions and repairs to such a plant are naturally drawn from a similar source. As was pointed out before, the habits of life of the people of this continent are very similar, and so the adaptation of goods to Canadian requirements is easily accomplished. It is a time-worn platitude, but yet unappreciated by many British manufacturers, that the manufacturer should give the consumer what he wants, not what the manufacturer thinks he ought to want. A sentence picked from the report before us illustrates what is a general ground for complaint: "English manufacturers of dry goods and underwear do not, as a rule, take sufficient trouble to produce exactly what is wanted for the market," and "the Germans are more ready to fill orders as buyers want them."

However, Mr. Grigg finds that conditions are not by any means discouraging. Great Britain has a tariff preference to overcome short hauls and small freight charges; she has sentiment in her favor; and she has a real live desire on the part of the British producers to share in the Canadian market to a greater extent than heretofore. The last of these conditions, in a way, is the most important of all, for without it other advantages would be valueless.

A striking suggestion is made that British manufacturers should consider carefully the establishment of branch factories in Canada. These would, in the majority of cases, be equipped with British machinery, they would get the home manufacturers in close touch with the market, and they would, in many cases, receive partly-finished materials from home works for completion. No doubt all of these results have followed the establishment of the numerous branches of United States factories.

The importance of fast and cheap transportation is dwelt on. It is a necessary condition to all trade. With it must be coupled the agitation for a cheaper cable service. This is now being pressed to the front, and will undoubtedly result in considerable reductions before long.

Other points of great practical importance are thoroughly discussed, among which may be mentioned the advisability of British manufacturers quoting prices and weights in Canadian standards. Mr. Grigg also urges the appointment of a number of trade representatives, to be situated in various centres of Canada.

The interest which gave rise to the appointment of a commission of enquiry, if kept up, should result in winning back to Great Britain some part of the trade which has been won from her by aggressive competitors.

NEW SYSTEM OF PRISON LABOR.

A COMMITTEE of the Ontario Legislature, which has been pursuing investigations during the intermission between the last and present sessions of the House, has brought in a report relative to prisons and prison labor. The recommendation that the Provincial prison be removed from Toronto to a country district, where five or six hundred acres of land could be secured, is in accordance with the best ideas on the treatment of criminals. Especially for first offenders the place of retention should be a reformatory, not a place of punishment.

The salvation of the situation rests in giving the inmates healthy employment. A man or boy who does a good day's work, in an occupation which demands intelligence and compels interest, is not in much danger of sinking into criminal pursuits. Such work must undoubtedly be given. Any one who has watched a group of prisoners pursuing the listless and dogged occupation of cracking stones will at once recognize how futile it is to attempt to better the moral condition of a man under such circumstances.

It may fairly be said that first offenders—and all criminals are that at some time—have offended through the result of environment, necessity or some cause exterior to themselves. The discipline resulting from compulsory work, the rousing of the mental faculties through putting up a work that will call for some thought, the interesting of the person in something which is healthy, and the eliminating as far as possible, of the usual prison features, which sap a man's self-respect, these are what are wanted to regain for the citizen-body the services of the one who is in the balance. The old method of gathering them into buildings, where offenders of every stage of criminality are assembled, where little or no work is possible, and where what is done is accomplished in a congested area, with the most objectionable environment, has been a failure. It is not a success from a moral standpoint.

The industrial aspect of the problem has also been difficult of solution. Workmen rebel against the competition of prison-made goods; manufacturers are not satisfied that individuals should be provided with cheaper labor than they can get in the free market. Many schemes have been devised for

utilizing the labor of prisoners, including that of selling it by the day, by the amount rendered as estimated by piece-work, on public works, and by selling the product to the consumer. All of these methods are objectionable in varying degrees. It has been impossible in practice to make use of prison labor without affecting injuriously the market prices of the goods manufactured. From the very nature of the labor it must be sold cheap, the cost of spoiled material is high, and for these and other reasons competition is uncertain. The rival manufacturer who has to go into the market and pay the rate of wages obtaining at the time, does not, and cannot know with any degree of accuracy, just what he is up against in the matter of competition.

The best opinion is concentrating on the farm work principle. The work, being out-of-doors and healthy, has much to recommend it; and the product of the labor has a world market, and so cannot injuriously or unfairly affect the general body of farmers. Many complaints have been made of the present system on its industrial side. The recommendation of the Committee of the Legislature is of great interest from this standpoint, in addition to its other features.

AN ALL-BRITISH CABLE SERVICE.

A cheap and efficient system of communication between the various parts of the British Empire is a necessary element in developing trade between these countries. It is almost a previous condition to such a trade. In putting forward the advantages of a complete state-owned cable system, whose termini shall be on British soil, the Ottawa Board of Trade, under the inspiring leadership of Sir Sandford Fleming, has opened up for discussion a subject which appeals no less to the man of business than to the Imperialist. It is essentially a business proposition, a means whereby commercial messages may be transmitted at a reasonable cost, which should be much less than the present rate, and without interruption, as is now unfortunately too often the case. To this must be added the advantage of the many constituent parts of the Empire being able to communicate with each other without being subject to the disabilities of using a foreign nation's service.

The idea of an all-British telegraph and cable system has been worked out to an appreciable extent in the case of the Pacific cable, to the cost of which all the colonies interested, together with Great Britain herself, contributed. The business which this cable, between Canada, New Zealand and Australia, has done during the past three years, in itself shows the need of it. Its revenues have risen from approximately \$400,000 in 1903-4 to over \$500,000 in 1906-7. It is noticeable that the cost of operation has increased very slightly, so that the excess of earnings over working expenses rose in the same period from \$125,000 to about \$275,000 per year. This would indicate that if the business could be largely increased the rate for the transmission of messages might be materially reduced.

A telegraphic system on the lines indicated by the Ottawa Board of Trade would include:—

1. A line from Great Britain to the Pacific, embracing a cable across the Atlantic and land lines through Canada.
2. A cable across the Pacific from Canada to New Zealand and Australia, with land lines across Australia to the Indian Ocean.
3. A cable from Australia across the Indian Ocean to South Africa, with a branch from Cocos Island to India.
4. A cable from Cape Town to the United Kingdom, via Ascension, the West Indies and Bermuda, with a branch to Canada.

Of these the second is an established fact. The others, it is estimated, could be established and completely equipped for an additional \$25,000,000. Divided up among the many parts of the Empire interested, this would be a comparatively small sum for each unit. In return large revenue would accrue from its operation, which would go to pay, not only the running expenses, but also, to a very considerable extent, sinking funds to cover the capital expenditure.

The cordial support which has been given to the project by Sir Sandford Fleming and the Governor-General, Earl Grey, will serve to place the proposition fairly before the public.

OUR NEW ZEALAND LETTER.

WELLINGTON, Dec. 20th, 1907.

THE new Bill amending the Industrial Conciliation and Arbitration Act has been shelved for the time being. It is said that the Trades and Labor Councils are not in love with the Bill and that they have been bringing pressure to bear on the Government with the above result. Though there may be some truth in this assertion, I do not think this is the sole reason for shelving the Bill. Mr. Millar, who worked his way up from the ranks of labor, is not the man to be easily intimidated.

The Bill is considered, by impartial critics, a big improvement, and the objection of the Labor Councils seems to be principally directed against clause 53—(1) and (2), reading:

53. (1) No person shall be qualified to be a member of the committee of management of any industrial union or industrial association, or an officer of any such union or association, unless he has been or is actually and bona fide engaged or employed in the industry in respect of which such union or association is established.

(2) Any person who acts as an officer or a member of a committee of management while disqualified under this section, shall be liable to a fine not exceeding ten pounds, to be imposed and recovered in the same manner as if such person had committed a breach of an award.

If this clause became operative it would mean the death knell of the political agitator who is ever busy to form new unions, and then gets appointed as secretary at a fixed salary. There are some of these men who act as secretary for a number of unions and whose combined salaries allow them to lead a life of comparative ease and idleness. They do not do a day's work in any of the trades represented by them.

No man knows better than Mr. Millar how baneful for the worker is the influence of the professional agitator, and he has been credited with the conception of this clause with the purpose of getting rid of these objectionable gentlemen.

The Bill will be one of the first items to be brought before the House next session, and though some think that the Bill will never come to life again, I am of opinion that Mr. Millar is determined to get the Bill on the Statute Book.

Parliament is at present homeless as the greater part of the house was burnt down last week. Happily, the library has been saved. The loss to the country is about £80,000, as the building was not insured. Steps, however, will be taken to have temporary premises erected on the same site in time for the next session.

COSMOPOLITAN.

The Londonderry Iron and Mining Company, Limited, are adding a rod and broom handle plant to their mill at Folly Lake. This new plant is now being put in, and it is expected to have it in operation in the near future. The company is also moving in other directions with a view to utilizing the entire by-product of the mill. The new department will call for the employment of several more hands.

Among the Industries

The Terrano Flooring Co. has been organized in Montreal, with a capital of one hundred thousand dollars.

The Capewell Horse Nail Co., of Toronto, have favored their friends with an attractive little calendar for the current year.

The municipality of St. Mary's will loan S. J. Doolittle, of Preston, \$6,000 toward the establishment of a wood-working factory in the former town.

The Rapid Tool Co., of Peterborough, suffered a sixteen thousand dollar loss by fire recently. The stock-room, containing a large quantity of finished tools, was destroyed. The loss was pretty well covered by insurance.

The Standard Foundry & Manufacturing Co. has been organized with a capital stock of ninety-five thousand dollars. The chief place of business is Longueuil, P. Q.

The Truro Foundry & Machine Company, of Truro, N. S., has been re-organized, with a capitalization of \$100,000. It is intended to extend the plant as soon as possible.

The McKinnon Dash & Metal Co., are making electric-welded coil chain in sizes up to three-eighths of an inch; also electric-welded chain for halters, traces and cow ties.

Bathurst, N. S., will be the site of the smelting works which the Drummond Mines Co. are going to erect, if suitable arrangements can be made with the municipality.

Mr. Herman Rosenberg, of New York, President of the Standard Varnish Works, New York, and of the International Varnish Works, Toronto, has been visiting the Toronto branch during the past two weeks.

Angus McIntosh, of Alexandria, has placed before the Council of Arnprior, Ont., a proposition for the establishment there of the plant of the Malleable Iron Foundry & Machine Company, which has been recently organized with a capital of \$100,000.

The International Paper Co., which holds timber interests in New Brunswick valued at \$4,000,000, are considering the establishment of pulp, and possibly, paper mills, in that Province. An expenditure of several hundred thousands of dollars will be made if the project is carried out.

Tolton Bros., of Guelph, have added to their farm implement factory a plant for making paper boxes. At present only ordinary paper boxes are being manufactured, but machinery is now being installed for the manufacture of collapse boxes, which will, in the future, form the major part of the output.

Financial arrangements have been completed for continuing the business of the Canadian Shipbuilding Co. Messrs. A. Berg & Sons have taken over the engine works in Toronto, and the Shipbuilding Company will concentrate its work at Bridgeburg, Ont., until such time as increased contracts will justify its resumption of business at the Toronto ship-yards.

The works of the Truro, N. S., Foundry & Machine Co., have been taken over by a new company, who are bringing in new capital, and who feel assured of a profitable business.

A company, headed by Messrs. H. Corby, M. P., and F. R. Trugham, are interested in cement clay properties near Belleville and it is reported that the largest plant in Canada will be established to develop them. The estimated cost of the cement works and lime kilns is \$7,000,000.

The Stratford Manufacturing Co., which is the Canadian branch of the Goshen Manufacturing Co., of Goshen, Indiana, has completed its factory building and the installation of machinery and will commence operations at once. The Company will manufacture some farm implements, ladders, outdoor and porch furniture, etc. W. E. Swartz is the Canadian manager.

The Gould, Shapley & Muir Co., Ltd., of Brantford, have built a new warehouse 264 by 50 feet, of three storeys and a basement, a blacksmith shop 116 by 54 feet, and a galvanizing plant 100 by 54 feet. As soon as building operations are possible this Spring they will erect a new machine shop of one storey and a gallery. They are expending \$70,000 on these additions and improvements.

The Canadian Fairbanks Co. have presented their friends with a serviceable calendar, which will find its way on to the walls of its recipients. Besides containing the calendar proper, in very clear and distinct type, it shows the various lines of machinery manufactured or sold by the company.

The B. Greening Wire Co.'s calendar has become almost an institution, and again we take pleasure in acknowledging the receipt of a copy. The background shows the extensive plant of the company in Hamilton, with the portraits of the founders and present head of the manufacturing plant.

The attention of all manufacturers is directed to the article "MANUFACTURERS' AGENTS," in this issue. Firms who are interested in receiving particulars of agents' enquiries are requested to forward their names to the SECRETARY, at TORONTO, specifying the lines they wish handled, and the territory or country they wish covered. Your prompt attention to this matter is desired.

BRASS PLANT.

A Birmingham (England) gentleman, who has been employed all his life in a managerial capacity in one of the large brass plants in that city, is anxious to come to Canada and open a factory here, or to take a position in one that is running now, as superintendent or manager. Knows the brass and metal working industry thoroughly and could invest £2,000 in any concern that would make a reasonable offer. His present firm, in which he is a partner, has specialized in chandeliers, gas and electrical fittings for many years, and he is thoroughly qualified to run such a department. Good references. Middle-aged. Well educated, and has a good business as well as practical experience in his trade.

Trade Enquiries

NOTE.—For further information regarding any inquiry mentioned under this heading or the names of inquiries, apply by numbers to the Secretary, at Toronto.

- 405 **Acids.**—A Manchester chemical firm asks for prices and samples of acids from Canadian manufacturers.
- 406 **Agricultural Implements.**—A Derbyshire correspondent is desirous of receiving price-lists from Canadian manufacturers of agricultural implements.
- 407 **Agency.**—An old-established firm in the canned goods trade is seeking the sole agency for the **United Kingdom** of a reliable Canadian exporter of canned fruit, fish or other provisions of high quality.
- 408 **Agency.**—A Warsaw, Russia-Poland, firm, who has been doing an import and export business for over twenty years, seeks agencies of first-rate firms in Canada, for the whole of Russia, especially for part of Russia, Poland, and Lithuania. Best references. Correspondence invited.
- 409 **Albumen.**—A Manchester firm asks for c.i.f. prices of blood and egg albumen.
- 410 **Albumen.**—A Lancashire chemical company asks for prices of blood and egg albumen from Canadian exporters.
411. **Asbestos Packing.**—A Lancashire firm wishes to correspond with Canadian exporters of asbestos packing.
- 412 **Bacon, Hams, etc.**—Bristol, England, produce broker, is anxious to hear from Canadian firms who can export these lines to Bristol. Can do extensive business and has excellent references.
- 413 **Barrel Staves.**—A Scotch firm desires the names of any timber merchants in Canada with a view of obtaining prices of whole and half-barrel staves for hhd. barrels. The timber must be close grown.
- 414 **Bacon.**—A South African firm of wholesale general merchants desire to correspond with Canadian exporters of bacon, three-quarter sides, green sides, selected lean; also hams about 10 lbs.
- 415 **Bored Boards for Brushes, Broom Handles, Dowels, Chair Legs.**—Well-known manufacturers' agent in London, (Eng.), with large connection, is open to act as selling agent for Canadian manufacturers of the above lines. Can do an extensive business for regular shippers. Broom Handles to be of standard quality, 51 x 1 $\frac{1}{8}$, made of basswood or pine. Dowels, 5 $\frac{1}{8}$ x 14 $\frac{1}{2}$. Chair legs, maple, beech or birch, 16 $\frac{3}{4}$ x 1 $\frac{1}{2}$. This is a good trade opportunity and the party making the inquiry has good references.
- 416 **Box Boards.**—A Manchester firm asks for prices and sizes of box boards, such as ordinarily cut in Canadian factory, and would welcome samples.
- 417 **Broom Handles.**—A Manchester firm wishes to get prices of maple broom handles, 50 in. x 1 $\frac{1}{8}$ in., from Canadian manufacturers.
- 418 **Brooms.**—A South African firm of wholesale general merchants desire to be placed in touch with Canadian manufacturers of 3-tie and 4-tie brooms.
- 419 **Broom and Brush Handles.**—A well-known Birmingham, (Eng.), firm are in the market to purchase the above handles of various sizes and qualities from Canadian manufacturers who can make regular shipments. References.
- 420 **Broom, Tool and Implement Handles.**—Old-established Lancashire, handle wholesaler, with good connections, is in the market for all kinds of handles, and is open to receive quotations from Canadian firms who can do an export business.
- 421 **Canned Fruit, Vegetables and Salmon.**—A New Zealand firm wishes to be placed in communication with Canadian canners of fruit, vegetables, and salmon.
- 422 **Canned Fruits, Vegetables, and Provisions.**—A Bristol firm desires to be placed in communication with Canadian exporters of butter, cheese, bacon, oatmeal, peas, seeds, apples, (green and evaporated), canned fruits and vegetables; also carbide of calcium, chemicals, oils, greases, sugar, syrup, etc.
- 423 **Canned Apples.**—A Manchester firm asks for prices of canned apples from Canadian exporters.
- 424 **Canned Fruits.**—A Manchester firm wishes to obtain prices of canned fruits, all varieties, from Canadian canning factories.
- 425 **Castings for School Desks.**—Western Canada manufacturing firm are in the market to purchase adjustable school desk castings from Canadian manufacturers, in quantities of 200. Member of C.M.A.; goods required immediately.
- 426 **Commission Agent.**—Well-known agent with good connections, of Trieste, Austria, desires to hear from Canadian firms who wish to extend their export business in that country. Excellent references.
- 427 **Calcium Carbide.**—A London firm is open to take large supplies of calcium carbide.
- 428 **Cobalt Ore.**—A Midlands firm wishes to purchase Canadian cobalt ore, and would like to get into communication with Canadian mine owners and shippers.
- 429 **Cattle Food Ingredients.**—A Hull firm, well known to cattle food manufacturers in all parts of Great Britain, especially inquires into the prospects of securing supplies of nut husk meal, wheat screenings, and similar ingredients, low enough in price to be advantageously used in the making of cattle feeding cakes.
- 430 **Cheddar Cheese.**—A South African firm of wholesale general merchants wishes to be placed in communication with manufacturers and exporters of Canadian Cheddar cheese.
- 431 **Cow and Calf Hair.**—A Hull firm of import merchants wish to hear from exporters in Canada of cow and calf hair.
- 432 **Dextrine.**—A Manchester firm asks for c.i.f. prices of dextrine, shipped in bags containing two cwt. (224 lbs).
- 433 **Dressed Beef.**—Commission agent in Antwerp, Belgium, is open to represent Canadian beef packing houses who can do business in Europe. Good references.
- 434 **Dry Goods, Groceries, etc.** A general dealer of Mosquito Cove, Burin, N.F., wishes to be put in communication with exporters of the following articles: Woollen and cotton goods, men's top shirts, flannelette, fleece-lined underwear, enamelled ware, leather ware, lines, twines, crockery ware, jewellery, groceries, etc.
- 435 **Evaporated Apples.**—An influential firm of wholesale grocers in London, is open to represent a first-class Canadian producer of evaporated apples for the United Kingdom and the Continent.
- 436 **Flour.**—A Cardiff firm is in a position to import large quantities of low-grade flour, and would like to hear from Canadian exporters.
- 437 **Flour.**—A London flour factor is desirous of getting into touch with Canadian exporters.
- 438 **Fit-ups.**—A London firm is open to purchase supplies of "fit-ups" suitable for umbrella sticks, in beech, birch and maple, and invites quotations (free warehouse, London), from Canadian manufacturers.
- 439 **Fish Oils.**—A London firm of import and export merchants, having a large outlet for all kinds of fish oils, desires to get into communication with Canadian manufacturers of these commodities.

- 440 **Handles.**—Principal of **London, England**, firm of manufacturers' agents, who will be in Canada during April and May, wishes to get in communication with manufacturers of any description of handles suitable for European market. The firm can place very large quantities, and is anxious to meet Canadian suppliers who can give regular shipments of well-graded goods.
- 443 **Hardware.**—Principal of a **London, Eng.**, firm of manufacturers' representatives will be in Canada during April and May, and would like to meet Canadian manufacturers of hardware and allied goods, who desire permanent representation in British Isles.
- 442 **Hardware.**—A firm of hardware importers in **New Zealand**, is desirous of getting into touch with Canadian exporters in this line.
- 443 **Hard Wheat Flour.**—A **South African** firm of wholesale general merchants wish to communicate with Canadian millers and exporters of hard wheat flour in 98 and 200-lb. sacks.
- 444 **Handles.**—A **Liverpool** firm asks for prices and descriptions of pick and hammer handles, from Canadian manufacturers.
- 445 **Linseed Oil Cake, Corn Oil, Corn Starch.**—**Antwerp, Belgium**, commission merchant, of excellent standing and wide connections, is in a position to place large orders for the above products for Canadian firms who can export in large quantities. Will act as exclusive agent for any firm desiring his services. Good references and long experience.
- 446 **Manufacturers' Agent.**—One of the best known representatives of **Canadian** manufacturing establishments in **London, England**, who has had long experience in handling Canadian goods, and has established a wide connection, will visit Canada in April and May, with the purpose of forming additional Canadian connections. Will be pleased to call on any firms who desire him to do so. Firms interested in this inquiry should write the Secretary, as the inquirer will call at this office for the purpose of securing addresses.
- 447 **Manufacturers' Representative.**—A **Canadian**, who has had several years' experience in **Mexico and the West Indies**, as a representative of Canadian manufacturers, has a good proposal to submit to Canadian firms who are interested in those markets. Has had wide experience and will be able to do good business.
- 448 **Packing Paper.**—A **Birmingham** firm, using all kinds of packing paper, is prepared to purchase from Canadian exporters.
- 449 **Paraffin Matches.**—A **North of Ireland** firm desires to import supplies of paraffin matches from Canada.
- 450 **Paraffin Wax.**—A **Manchester** firm asks for prices of paraffin wax from Canadian exporters.
- 451 **Printing Presses, Inks, Papers, etc.**—Well-known firm of wholesale dealers in **North India**, are anxious to receive catalogues, price-lists, etc., from Canadian manufacturers, who can export the above lines to India. References.
- 452 **Pine Sidings.**—A **Lancashire** firm will welcome prices of pine sidings, first, second, and third quality, from Canadian exporters.
- 453 **Provisions, etc.**—A correspondent in **Glasgow**, stated to have a connection with buyers of grain, flour, and provision, desires to represent Canadian exporters of these lines.
- 454 **Produce.**—Inquiry has been received from a firm of merchants in **London**, for the names of exporters of Canadian produce. They are willing either to purchase or to act as agents on commission for packers and shippers.
- 455 **Pulp Wood.**—A **Manchester** firm with extensive connections, wishes to correspond with Canadian exporters of pulp-wood.
- 456 **Pulverized Charcoal.**—A **Manchester** firm asks for samples and prices of pulverized charcoal.
- 457 **Pulps.**—A **London** firm, already receiving large quantities of fruit pulp from other markets, is desirous of obtaining supplies of Canadian raspberry and other pulps for sale, on commission.
- 458 **Purchasing Agent.**—Well-known manufacturers' agent, of **Trinidad, B.W.I.**, will be pleased to act as purchasing agent for Canadian rolling mills, who are looking for supplies of old iron and other metals. Claims to have excellent facilities for doing this class of business.
- 459 **Provisions.**—A **Welsh** firm desires to obtain the agency for Canadian exporters of bacon, hams and other provisions.
- 460 **Maple Blocks.**—A **Midlands** company is open to purchase supplies of maple last blocks, and invites quotations in car-load lots, from Canadian manufacturers.
- 461 **Mica.**—A **Manchester** firm asks for samples and prices of mica, from Canadian exporters.
- 462 **Representation.**—A well-established firm in **London**, having agents in various parts of the world, is anxious to get into touch with Canadian manufacturers of wood-pulp, who require representation.
- 463 **Rags.**—A **North of England** firm is desirous of being placed in touch with exporters of Canadian rags.
- 464 **Representative.**—An **Irish** firm desire to represent one or two first-class firms of Canadian shippers and lumber manufacturers. They desire to make contracts for parcels and cargoes for waney and white pine timber, red pine, spruce, and pine deals, boards, floorings, etc. The Irish firm referred to is an old-established firm who will give bankers' references.
- 465 **Riddle Rims.**—A **West Bromwich** firm wishes to purchase riddle rims.
- 466 **Rice Flour and Splie Peas.**—A **Bristol, England**, produce broker is in the market to purchase the above products from Canadian exporters. Will act as exclusive agent if desired. Good references and connections.
- 467 **Salmon.**—A firm in the **North of England**, dealing extensively in imported fish, is desirous of securing direct supplies of either frozen or fresh salmon from Canada, such as "Loggerbrands," etc., and inquires for exporters who are open to take an interest in the enterprise.
- 468 **Salmon.**—A **South African** firm of wholesale general merchants desire to correspond with Canadian exporters of full red Alaska salmon in 1-lb. tall tins; also salmon equal to Lazenby's in 1-b. and 1-2-lb. flat tins.
- 469 **Salmon.**—A **Leeds** wholesale fish firm is desirous of communicating with Canadian fish exporters with a view to arranging for direct shipments of "Loggerbrands" Sockeys, and other kinds of salmon.
- 470 **Slaughterers' by-products.**—A **London** firm desire to be placed in communication with Canadian meat-packers for the purchase of slaughterers' by-products. Particulars of requirements can be had at the Department of Trade and Commerce.
- 471 **Shovels, Spades, Picks, Axes.**—**Winnipeg** firm of manufacturers' agents is open to receive quotations for wholesale orders of the above lines. Will sell on commission, quotations to be f.o.b. factory. Payment as agreed upon. References Dunn's and Bradstreet's.
- 472 **Split Peas.**—A **Manchester** firm is open to buy large quantities of split peas from Canadian shippers.
- 473 **Steel Box Strapping.**—**New York** firm of export agents are anxious to get in touch with Canadian manufacturers of steel box strapping.
- 474 **Timber.**—A **Dutch** firm is desirous of getting into touch with Canadian exporters of timber.
- 475 **Tools.**—A **Manchester** firm asks for prices and description of machine tools from Canadian manufacturers.
- 476 **Washboards, etc.**—Inquiry has been received from an **English** firm for the names of Canadian exporters of washboards, broom-handles, etc.

Duty on Catalogues.

In reply to an inquiry respecting the duty on catalogues or on advertising matter sent to Australia, Mr. J. S. Larke writes as follows: The duty at present is 6d. per lb. But there is a possibility that it will be changed before the tariff finally passes. I have made an application to the Department of Customs of the Commonwealth that should there be a duty fixed upon advertising matter, an arrangement may be made, that when mailed in Canada there shall be a provision whereby the duty could be pre-paid there. I am given to understand that the matter is under consideration. I hope that a special duty stamp may be provided which could be sold in Canada and affixed to the documents when mailed.

The duty on printed matter in New Zealand is 3d. per lb. But there is an important and liberal exception whereby it is declared that this duty shall not apply to trade catalogues or price lists of the goods of firms or persons having no established business in New Zealand. It will be seen, therefore, that there is no difficulty in sending such matter to New Zealand. If the Canadian firm has an established house, the matter should be addressed to it and it would pay the duty. But if it has none, no duty will be levied.

Will Advertise the Country.

Members of the National Editorial Association of the United States, following their convention in St. Paul next summer, will visit Winnipeg, and from there will make a trip to the Canadian Rockies. The country they will pass through on such an excursion, especially during August, when the wheat lands are reaching their full growth, should inspire the editors with subjects for "copy" for the coming year, all of which will help to direct the attention of the thrifty farmers of the Republic to the greater advantages of Canada.

Underwood

There are three kinds of typewriters—
Underwood, Underwood imitations
and antiques.

It took 25 years to find that typewriters were built upside down—with the writing out of sight. There are still a few of these antiques on the market.

The Underwood revolutionized typewriter making. It introduced the front stroke machine with the writing always in full view of the operator. The Underwood is the world's best typewriter.

Since the advent of the Underwood a score of imitations have appeared, patterned as closely after the Underwood as the patent laws would permit, and sometimes a little closer. They look like the Underwood, but that does not give them Underwood quality.

Are you using an Underwood or only an imitation?

United Typewriter Co., Limited

Executive Council

FEBRUARY MEETING.

The regular monthly meeting of the Executive Council was held in the Council Chamber of the Board of Trade, Toronto, on Thursday, February 20th, at 2 p.m.

The Honorable J. D. Rolland presided, and there were also present: G. Frank Beer, Toronto; George Booth, Toronto; W. R. Dunn, Hamilton; L. V. Dusseau, Toronto; J. F. Ellis, Toronto; John Firstbrook, Toronto; Atwell Fleming, Toronto; George D. Forbes, Hespeler; Ed. Freyseng, Toronto; W. M. Gartshore, London; R. S. Gourlay, Toronto; Sam Harris, Toronto; S. R. Hart, Toronto; E. G. Henderson, Windsor; J. Hewton, Kingston; Alf. Jephcott, Toronto; Hugh C. MacLean, Winnipeg; J. B. MacLean, Toronto; J. S. McKinnon, Toronto; Robert McLaughlin, Oshawa; J. P. Murray, Toronto; A. Nordheimer, Toronto; W. C. Phillips, Toronto; J. Ransford, Clinton; W. H. Rowley, Hull; J. H. Sherrard, Montreal; J. O. Thorn, Toronto; W. B. Tindall, Toronto; and Dan Wilson, Collingwood.

The minutes of the January meeting as published in INDUSTRIAL CANADA were taken as read.

COMMUNICATIONS.

Communications were reported as follows:

1. From the following members of the Executive Council, regretting their inability to be present: R. Thomson, S. W. Ewing, R. J. Younge, Wm. Stone, Wm. Robins, Louis Simpson, H. Stroud, Robert Muuro, C. R. McCullough, C. H. Watrous.

2. From the Secretary of the Ottawa Board of Trade, inviting the attention of the members of the Association to their campaign in favor of an Imperial cable service to girdle the globe. Referred to the Commercial Intelligence Committee.

3. From the Montreal Executive, suggesting the desirability of interviewing the different Boiler Insurance Companies with a view to inducing them to add to their organization a department for the purpose of advising their clients regarding smoke consumption. It was decided that this communication should be tabled.

4. From the British Board of Trade, thanking the Association for the assistance it had given Mr. Richard Grigg in connection with his recent commercial investigations in Canada.

The Association officers and committees then reported as follows:

PRESIDENT.

The President stated that he had visited the Quebec branch since the January Executive, and hoped to meet them again after the opening of the Quebec Legislature at a general meeting, which he would like to have the Secretary, and the Managers of the Insurance and Transportation Departments present if possible.

TREASURER.

The Treasurer, Mr. Booth, presented his statement, showing receipts for the month of \$3,637.81, and disbursements of \$3,561.68, leaving a balance on hand of \$15,147.02. He pointed out that for the first six months of the present year the Association's expenses were \$3,000 more than for the corresponding period of last year. If new work were to be undertaken the expense could not be met out of current revenue, but would have to be financed temporarily, at least, from the surplus.

FINANCE.

The report of the Finance Committee was read by the Vice-Chairman, Mr. W. B. Tindall. It recommended for payment the accounts for the month, totalling \$1,665.65.

Travelling Expenses of Members.

Touching on the above matter, which was referred back to the Committee at the January meeting of the Executive, report was made as follows:

With reference to the payment of travelling expenses incurred by members when engaged on Association business, this Committee desires to record its opinion that the practice is one which should not be encouraged. Every manufacturer joining the Association should feel under obligations to do something more towards furthering its aims than the contribution of his annual fee, and, as a matter of fact, a great many do. With some it consists in the giving of valuable time to the work of committees, and with others it consists in travelling long distances to be present at the monthly meetings of the Executive Council. The man who comes from Montreal to Toronto purposely to give the Association the benefit of his advice on the matters engaging its attention, is, in a way, just as much entitled to compensation as the man who goes from Toronto to Ottawa to transact departmental business for the Association. The former does not expect to have his expenses paid, and the latter, as a rule, should not ask it.

If he be an honorary officer, we feel there is all the more reason why he should not ask it. The man who accepts the chairmanship of a committee accepts thereby responsibilities far exceeding those attaching to a private member, and it should be as much his duty to perform the Association's work when it involves a little travelling as it is to do that work when it simply involves attendance at committee meetings.

It is recognized, however, that there are sometimes exceptional cases, where the circumstances are such that it becomes the duty of the Association to reimburse members who have been put to expense on its account, and we would suggest that the Secretary report all such cases in the first instance to the Committee having charge of the matter in connection with which the expense was incurred, whose approval must be obtained before the account can be considered by the Finance Committee.

The report further recommended:

1. The re-engagement of Mr. E. P. Heaton as Manager of the Insurance Department for another year, with permission for him to act as Consulting Underwriter for the Central Canada and Eastern Canada Manufacturers' Mutual Fire Insurance Companies.

2. The appropriation of \$5,000 for the purpose of creating a Tariff Department for a period of one year, as referred to in the report of the Tariff Committee.

3. That permission be given the Treasurer to invest another \$5,000 in first-class securities.

In answer to a question raised by Mr. McLaughlin as to how the \$5,000 for the Tariff Department was to be spent, Mr. Tindall stated that the idea was to obtain the services of an expert tariff officer who would handle the tariff grievances raised by members of the Association in a thoroughly practical and scientific manner. After reciting in some detail the duties which would be expected of this officer, Mr. Tindall stated that it was felt that he would have to be paid

\$2,500 a year. The balance of the appropriation would be used up in travelling expenses, rent, office assistance, and general expense. The Committee realized that the money would have to come out of the Association's surplus, but there was ample on hand to justify the experiment for one year.

Mr. Murray, Mr. McLaughlin, and Mr. Booth also spoke in favor of the proposition, after which the adoption of the report was carried.

INSURANCE.

On behalf of the Insurance Committee, the Chairman, Mr. Alfred Jephcott, stated that he had no formal report to make. Since the Hamilton meeting the Committee had been carrying out instructions with regard to the circulation of its report on the new Insurance Bill, and it was now proposed to mail a copy of it, not only to every member of the Council, but to every member of the Association.

His Committee was pleased to recommend the re-engagement of Mr. Heaton, whose excellent work during the past year spoke for itself.

RAILWAY TRANSPORTATION.

The Manager of the Transportation Department, Mr. Walsh, presented the report of his Committee, as follows:

Improvement of Water-ways.

In our last report to the Executive this matter was referred to, but on motion the whole clause was eliminated. Your Committee are of the impression that it was not the intention of the Executive to eliminate the whole clause, but rather that portion of it which dealt with local agitations which might lead to sectional differences. There has been no intention of dealing in the matter other than in a broad manner, that is, without any reference to local conditions. Your Committee, therefore, would like to know whether it is the desire of the Executive that no future reference should be made to this matter or whether they have any instructions to give on the subject.

Flag Stations.

Your Committee has received a report from the Board of Railway Commissioners in reference to the handling of freight at flag stations. This is in the form of a recommendation, to which we are advised the railways have taken exception. Copies have been sent to the Secretaries of the Manitoba and Vancouver branches for their consideration.

Interswitching.

An opinion from the Board of Railway Commissioners and report from the Chief Traffic Officer have been received. The report recommends a reduction of 50 per cent. in the switching charges on what is termed "non-competitive traffic."

Bill of Lading.

An effort is being made to have a committee appointed at an early date to consider the terms and conditions for the new bill of lading. Shippers generally, are united in this matter, the only body which seems inclined to take individual action being the Canadian Bankers' Association. That Association, however, has assured us that their main contention will be that when a through bill of lading has been given to a shipper the carrier cannot be relieved of his responsibility until delivery. This is in accord with the views taken by the Association. The Manager was instructed to consult with some of the other principal bodies interested with a view of employing counsel jointly when the question is taken up.

Referring to the improvement of waterways, Mr. Henderson stated that he did not think it was the wish of the Council at the January meeting, to forbid the Committee giving

further consideration to the question in its broader aspects; that all it was expected of them was that they would avoid entangling the Association by endorsing schemes that were largely local or sectional in character. He accordingly moved, seconded by Mr. Firstbrook, that the Transportation Committee be empowered to continue their studies of the improvement to waterways in general, and to report thereon to the Executive Council.—Carried.

PARLIAMENTARY.

In the absence of the Chairman, the report of the Parliamentary Committee was presented by the Secretary. It read as follows:

Foreign Loans by Canadian Banks.

A letter has been received from the Executive Committee of the Montreal branch, calling attention to the practice of Canadian banks in keeping large sums of money loaned on call in the United States, and asking that consideration be given to the effect of this practice on Canadian industries. Your Committee feel that while investments in or loans to Mexican and South American enterprises on the part of Canadians ought to be discouraged, as long as there is so great a need of capital in our own country, it would be unwise to press for any amendment to the Bank Act which would prevent our banks from loaning money on call in New York. It so happens that this Act will come up for renewal in a few years, and it is suggested that the Association make a study of the question in the meantime, with a view to gaining as much information as possible.

Bribing Employees to Effect Sales.

The Association has been asked to consider the advisability of promoting a bill similar to the one in England, making it a criminal offence to bribe an employee with the object of getting his good-will in the sale of merchandise. There is no doubt that the practice is very generally resorted to, and that anything which could be done to put a stop to it would be a step in the right direction. Copies of the English bill will be procured, and the matter will be reported on at a later meeting.

Franchise for Incorporated Companies.

Instructions have been given the Association's solicitor to draft a bill which will give Incorporated Companies a vote on money by-laws. The subject is a very much more complicated one than originally supposed, and will require an amendment to three Acts, the Assessment Act, the Voters' List Act, and the Municipal Act.

At the request of the tanners in the Province of Quebec, an effort is being made to secure support from the tanners of Ontario for a Bill to amend the general Inspection Act, so as to provide for the compulsory inspection of green hides.

The City Architect, Toronto, has drafted a By-law providing for the compulsory inspection of elevators within the city. Your Committee believe that this is properly a matter which should come under the jurisdiction of the Provincial Government, as it involves the principle of liability for accidents happening on elevators that have passed inspection; further, it may clash with the inspection of the Insurance Companies carrying risks on the elevators. If the By-law is brought forward it is likely that it will be opposed on these grounds.

Mr. Rowley thought the Committee was not in possession of full information regarding the right of incorporated companies in the other Provinces to vote on money by-laws, stating that his company always had a vote in Hull. He considered it an injustice that he had to pay taxes in Ontario when he earned his income in the Province of Quebec. He also expressed the opinion that some reciprocal arrangement

ought to be entered into among the Provinces with reference to succession duties.

Mr. Henderson thought the Committee should make a strong protest against those clauses in the Assessment Act which made it necessary, first, for officers of incorporated companies paying a business tax, who were shareholders of those companies, to pay an income tax on their salaries, and second, for employers to give information regarding the wages paid their employees.

Mr. Thorn explained, on behalf of the Committee, that they had not been idle so far as the Assessment Act was concerned, as they had more than once introduced bills to bring the business assessment for manufacturers down from 60 to 50 per cent., and to exempt officers, who were also shareholders in incorporated companies, from the income tax on their salaries. Another effort was being made this year, and the necessary bills were being looked after by Mr. McNaught. He felt, however, that the manufacturers should not object to giving information regarding the wages of their employees.

RECEPTION AND MEMBERSHIP.

The report of the Reception and Membership Committee recommended the acceptance of fifteen applications:

HAMILTON, ONT.—Wm. Lees & Son.—Biscuits and Confectionery.

Thornton & Douglas, Ltd.—Clothing.

The Haskins Wine Co.—Wine.

I. Blumenstiel.—Cigars.

Canadian Meter Co. Limited.—Gas meters.

Berlin Machine Works.—Machinery.

KINGSTON, ONT.

S. Anglin & Co.—Sash and Doors.

MOORETOWN, ONT.

The Western Salt Co., Ltd.—Salt.

MONTREAL, QUE.

John W. Peck & Co., Ltd.—Clothing.

OTTAWA, ONT.

International Marine Signal Co., Ltd.—Gas buoys.

TORONTO, ONT.

Dominion Envelope Co., Ltd.—Envelopes.

Bawden Machine & Tool Co.—Machinery.

Whitworth & Restall.—Mattresses and Bedding.

William Neilson, Ltd.—Ice Cream.

WINNIPEG, MAN.

Sherwin-Williams Co., W. S. Follis, second member.—Paints.

Continuing the report read as follows:

Montreal Meeting.

It will be remembered that the Committee's recommendation last month, that the March meeting of the Council be held in Montreal, was held over for further consideration. In bringing the matter up again your Committee wishes to state that it still believes that the best interests of the Association will be served by accepting the invitation of the Montreal branch.

Bronze Plate for Commercial Club.

A suggestion has been made by the President that a bronze plate with a suitable inscription be donated to the Commercial Club, Hamilton, to commemorate its opening on September 27th last, when the visiting members of the Association were so splendidly entertained. Your Committee feels that the suggestion is a most happy one, and it is recommended that it be acted upon at once.

In adopting the report, the Council decided that a tablet should also be given to the Royal Alexandra Hotel, Winnipeg, to commemorate its formal opening, by the Convention of 1906.

COMMERCIAL INTELLIGENCE.

The following are the principal matters referred to in the report of the Commercial Intelligence Committee:

Manufacturers' Association of Great Britain.

The Secretary of the above organization writes our Association that he will visit Canada in June next for the purpose of looking into the possibilities of increasing British trade with Canada, the advantages to be derived from establishing branch factories here, the extent and condition of local industries, the operation of the Canadian tariffs and the preference, as well as other matters. The Secretary has been instructed to afford the writer every assistance in his power.

Franco-British Exhibition.

A limited amount of space is still available in the Canadian Government Building now being erected on the grounds of the Entente Cordiale Exhibition, London, and manufacturers desiring to send displays are urged to communicate at once with the Secretary of the Exhibition Branch, Department of Agriculture, Ottawa. All displays accepted will be taken entire charge of by the Government without expense to the manufacturer, and returned at the close of the Exhibition free of cost, or will be sold in London, at the pleasure of the owner.

Commercial Reports and Translations.

Since the office has begun to advertise its facilities for procuring Commercial Reports and for translating correspondence members have been making far greater use of its services. During December, 1906, and January, 1907, only three orders were received for reports, as against 12 for December, 1907, and January, 1908, while the translations made in the same two periods jumped from 2 to 87. Since the translator was engaged on a monthly basis, 44 different firms have sent in work, showing that the service is being widely appreciated:

Fraudulent Use of the Mails.

From information furnished by the Association, the Post Office Department has been able to suppress an attempt to defraud the public by obtaining subscriptions at \$10 each for a fictitious publication described as the "*Official Pink Book of Canada*." It purported to be a directory of Canadian manufacturers, containing over 14,000 names and 650 pages of classification. Your Committee wishes to state in this connection that if members generally would make a point of reporting promptly all questionable or fraudulent schemes which come to their attention, prompt steps could be taken to bring about their suppression, thus affording our membership an additional measure of protection.

"INDUSTRIAL CANADA."

The report of the INDUSTRIAL CANADA Committee, as read by Mr. Hart, referred with regret to the fact that the finances of the paper were not in as flourishing a condition as they were some months ago. This was accounted for partly by the general business depression, but more particularly by the higher cost of printing, the increase in the amount paid in salaries, owing to additions to the staff, and the loss of business arising from the fact that the paper was for months without an advertising solicitor. It was believed, however, that things were now on the mend and immediate improvement was looked for.

The report of advertising showed a net gain of \$738 for the preceding three months.

Mr. Harris complimented the Committee on the interesting character of the editorials it was printing, stating that he believed its efforts in this direction were widely appreciated.

TARIFF.

The following are the more important matters referred to in the report of the Tariff Committee:

Cement for Detroit Tunnel.

Your Committee is advised that large quantities of United States cement are being used in connection with the construction of the tunnel connecting Detroit and Windsor. It appears that it is admitted free of duty. The Department justifies its action by quoting section 596 of the Customs Tariff, whereby material used in Canada for the construction of bridges and tunnels crossing the boundary are admitted free of duty when similar materials used under similar circumstances are admitted free into the United States.

While the arrangement would seem on the face of it to be a reasonable one, it cannot be doubted that if, under it, any considerable quantity of Canadian goods were being used on the United States side, the authorities of that country would soon find some means of putting a stop to their free importation on technical grounds. In the opinion of your Committee the arrangement is all in favor of the United States, and furnishes another example of the manner in which Canadian interests are neglected.

Leeway in Dumping Regulations.

(a) 5% Clause.—

Acting under instructions from the Council, the Secretary has communicated with representative engine and boiler makers on the one hand, and rolling mill men on the other, to see if it would be mutually satisfactory to press for the abolition of the leeway on all articles of iron and steel other than channels, beams and sheets. To this the rolling mill men have assented, but the bridge builders and boiler makers still object. It has been suggested that a compromise might be reached by further excepting angles, plates and bars, and interested parties are now being sounded on this new proposition.

(b) 7½% Clause.—

Following the Council's decision at its Ottawa meeting, the Minister of Customs was advised of the Association's wishes regarding the abolition of the 7½ per cent. leeway. The Secretary was informed by the Minister under date January 24th, that the matter had had careful consideration, but that his Department did not see its way clear at the present time to abolish the allowance referred to. He stated that without this leeway certain rules of trade by exporters from foreign countries with reference to freight allowances, etc., might bear unfairly on some dealers in a country as large as Canada; moreover, that it would be very difficult for the Department to administer the law with reference to the special duty clause if the leeway were abolished.

Establishment of Tariff Department.

Your Committee has again had this important matter under consideration, and has decided to ask the Finance Committee for an appropriation of \$5,000 to carry on the work for the first year. It is believed that this estimate is the very lowest amount for which the work could be done. Ultimately it may involve an increase in the annual membership fee, but the amount asked for will enable the work to be continued until after the Annual Meeting, by which time it will be seen, to some extent at least, whether the Department is going to be of permanent service; if so, the method of financing it can then be definitely decided upon.

Franco-Canadian Treaty.

In view of the stand taken by the Association in January, 1907, with reference to the Intermediate Tariff, and further,

in view of the fact that it was quite impossible to tell what the ultimate effect might be of extending to some thirty other countries the concessions extended to France under the new treaty, it was strongly recommended by the Committee that the Association maintain a neutral attitude while the above matter was under discussion in the House.

Speaking on that clause of the report recommending the establishment of a Tariff Department, Mr. Rowley thought it was a mistake to proceed on the assumption that the Department might only be operated for one year. He believed it would be impossible to find a man who would take the position for a year. The Committee must therefore try to devise means of making the position permanent. The work to be done was of an exceptional character, so exceptional, in fact, that there were very few men in Canada who could qualify for it. Those men were probably already in good positions and they would not think of making a change unless it were for a long engagement.

Mr. Tindall stated that the Committee was fully seized of the importance of this point, but they did not like to engage any man for more than one year, that being the rule always followed in Association appointments. If the proper man were secured, he felt that he would make himself so valuable to the Association that he could not be dispensed with. It rested very largely with the man himself as to whether or not the position would be permanent.

There being no motion before the meeting on this point, the report was adopted as presented.

NEW BUSINESS.

Under the above heading, Mr. Thorn referred to the visit of the Hon. James Bryce, to Ottawa, for the purpose of securing the consent of the Canadian Government to an international treaty, which proposed, among other things, to restrict the development of power on the Canadian side of the Niagara frontier, to the amount specified in the charters already granted. For a number of reasons, which he proceeded to lay before the meeting, Mr. Thorn thought that such a treaty if ratified would be fatal to the industrial interests of Ontario. He accordingly moved, seconded by Mr. Hart, that Sir Wilfrid Laurier be advised by telegram that the Executive Council wished to express the hope that in any treaty to which the Dominion Government might give assent nothing would be done that would in any way restrict the production of electrical energy on the Canadian side of the Niagara frontier.—Carried.

BRANCHES.

The reports of the Montreal and Toronto Branches, as read by Mr. Sherrard and Mr. Freyseng, respectively, were both received, and will be found elsewhere.

On behalf of the Institute of Chartered Accountants, Mr. Tindall extended a cordial invitation to all members to attend the meeting on the 21st, when Mr. Mulvey, the Assistant Provincial Secretary, was to speak on the Company Law of Ontario.

The meeting then adjourned.

Engineering Profession.

Young Englishman, with first class engineering training in best British and Continental colleges, and several years' experience with good firms, is anxious to come to Canada if he can secure position with reliable firm of engineers or large manufacturing firm requiring engineer's services. Experienced in both electrical and mechanical work. Excellent references. Address can be obtained on applying to Secretary at Toronto.

AN IDEAL INVESTMENT

Model "M," 1908

What investment can you make that will yield you the positive dividends in **Health, Happiness and Comfort** that an

OLDSMOBILE

will bring to you and your family?

IT is the Everyday, Year-in-and-year-out Service which makes the OLDSMOBILE a necessity to so many modern homes. Then, too, there's a lot of satisfaction in knowing that the car in which you invest is standardized—that it will be style this year, and for years to come.

Model "M," shown above, is the Ideal Family Service Car—Powerful, Simple and, above all, Comfortable. A car as much at home on the muddy country road, as on the city pavement—distinctly a car for everyday Service. Send for our catalog.

OLDSMOBILE COMPANY OF CANADA, Limited

80 King St. East, Toronto, Ont.

FREDERICK SAGER, Manager

The FORD Runabout

Whenever a prospective buyer examines a Ford Car the first question that occurs to him is, how we can give so much automobile for the money.

Measured by the standards of value which have hitherto prevailed in the automobile market, a four cylinder car of fifteen horse power, made of the highest grade of materials throughout, machined with absolute accuracy and perfectly adjusted and tested, would cost about twice as much as the Ford \$800 runabout.

For 1908 we offer two models—Model "S"—same chassis as Model "N" with special fenders, running board, storage battery ignition, 28 x 3 inch tires, ironed for top, and with full equipment, consisting of two side oil lamps, tube horn, tools, repair kit and pump. **Price, \$800.00.** Model "N"—the original 4 cylinder runabout with all 1908 improvements. All automobile without some of the "trimmings." Equipment includes two side oil lamps, post horn, repair kit and pump. **Price, \$750.00.** Don't forget when you are buying a Ford car, you are only paying for actual automobile value. The name "Ford" costs nothing, but it's worth more than most guarantees. For catalog and full particulars write

PORTAGE LA PRAIRIE
MANITOBA**

PORTAGE LA PRAIRIE, Manitoba, offers more favorable opportunities to Manufacturers, Wholesalers and others for the profitable employment of funds than any other city or town in Western Canada.

FOUR great Railway Systems—Grand Trunk Pacific, Great Northern, Canadian Northern and Canadian Pacific, intersect and radiate in the city limits, providing Railway Shipping and Distributing Facilities not equalled elsewhere in this great Canadian West.

PORTAGE LA PRAIRIE is the centre of the richest and most reliable agricultural district the world has ever known, having produced good average crops of grain continuously for thirty years without crop failure.

Free Sites and other considerations are granted to Industries while favorable labor conditions and lowest rate of expenses prevail.

SEVERAL Industries have but recently selected Portage la Prairie as their Western base of operation because of the advantageous position the city holds as a point for distribution of every known manufactured article throughout a vast territory where the demand is increasing daily.

FOR those who wish to participate to the fullest possible extent in an era of wonderful prosperity which is about to set in throughout this great Western country, NOW IS THE TIME TO SELECT YOUR LOCATION.

THE EDITORIAL VIEW-POINT.

British Money for Canada.

THE success of recent Canadian loans on the London money market is a striking proof of the high standing of Canada and Canadian investments. Only a few years ago British capital was flowing into the United States, and it was almost impossible to get any consideration for Canadian offerings. To-day the situation is reversed. A London broker who was in Montreal recently said that it was impossible at the present time to get a "bob" for the United States in London, while Canada has secured over £10,000,000, and could have had as much more for the asking. While a part of this sum was a Government loan, the mass of it went to railway and industrial enterprises, indicating that everything Canadian has the confidence of the British investor. While this is very flattering to Canada, and promises well for our development, still care should be taken not to shake the confidence reposed in us by allowing our good name to be used in exploiting wild-cat schemes. There is ample opportunity for the safe investment in Canada of the surplus millions of England, and it should be the duty of every well-wisher of this country to help in the proper direction of foreign capital

seeking employment here. There is a class of get-rich-quick gentlemen who are ever on the lookout to take advantage of confiding capital and direct it into their own pockets through some fake enterprise which they float on the general good reputation of a country. Now that Canada has won the confidence of the British investor, we may expect to find these gentlemen trading on the reputation of the Dominion. Every Canadian who really wants to see Canada go ahead will keep a lookout for these fake promoters, and expose them whenever occasion arises. It has taken a long time to get the British capitalist interested in Canada, and now that he is turning to us we should use him right so that he will remain with us and help to develop the vast resources of this country.

The Bonus and the Emigrant.

RECENTLY Sir Marcus Samuel, presiding at Guildhall Court, London, attacked the Canadian bonus system, and made sweeping aspersions upon the work of the Canadian booking agents in general. Mr. George N. Savage, Secretary of the British Passenger Agents' Association, takes exception to the statements of the Magistrate, and writes a long letter to the Canadian Gazette, London, in defence of the booking agents. He says the agents desire to work in harmony with the Canadian authorities, and that it is most unfair to attack the system of bonuses, and to paint all agents "black" because of the methods of the few. He asserts that an agent doing his duty earns every penny he gets, and that a £1 bonus on an emigrant that the Canadian Government says is worth £200 to the country is not too great a price. The whole trouble, he says, has been caused by irresponsible and unscrupulous persons engaging in a business of which they know nothing, and out of which they seek to make money without regard to the injury they do and the suffering they cause. Dealing with these people, he says: "During the last three or four years the 'Canadian boom' has brought many undesirable elements into the emigration field, societies and innumerable agencies (some railway companies appointing all their booking clerks or station agents as steamship passenger agents, without any qualification—a system to be deplored and condemned), to scramble for the 'fruits of the careful pruning' by old-established agents. The mushroom agencies have become an intolerable nuisance, and are a menace to the community. Agencies and societies who work emigration into their religious and philanthropic labors—however good may be their intentions—have inundated Canada with a class of people which Canada, from choice, does not want, but which hitherto has been received

without open rebellion." This is certainly very strong language, but it bears out what "Industrial Canada" has maintained: that the fault lies with the Canadian Government, inasmuch as it recognizes these mushroom agencies and pays them commissions on their shipments. The Canadian Government lays down the rule that the bonus is to be paid only for farm laborers, navvies, and domestic servants, but it has not announced any rule by which a bricklayer can be told from a farmer. Mr. Savage tells us that the old-established agents prune the undesirable out, and the mushroom agents gather up the prunings and sell them to Canada at £1 apiece. When the matter of bringing mechanics into Canada for whom there was no employment was brought up in the House of Commons in the early part of the present session, Hon. Mr. Oliver sought to shirk responsibility by charging that the Canadian Manufacturers' Association was responsible for leading these people astray. It was promptly pointed out to him that the Association had nothing whatever to do with the bringing out of the men in question, and he was asked to take back what he had said where he had said it, in the House of Commons. Up to the present time Mr. Oliver has not shown himself to be one of those truly courageous men, who are ever ready to right a wrong unintentionally committed. Mr. Savage puts the blame for the sending of undesirables to Canada on the shoulders of mushroom agencies, religious societies, and philanthropic workers, all of whom exist on the encouragement given them by the Canadian Government, and in the final analysis the Government has to bear the responsibility.

We Want Population.

CANADA wants population—that much is conceded by everyone, and the Government is justified in paying for it. We are not, however, so badly in need of population that the Government is justified in buying the riff-raff of the Old Country and transplanting it into Canada. Mr. Savage says that the booking agent who sends out emigrants should be a man of conscience, and he should have a knowledge of the country and of the capabilities of the people he sends out. It is a serious business, and carries a grave responsibility, but it is to be feared that too many of the agents, who find recognition in Canada, look upon it merely as a good field for graft, and work it on that principle. The orders issued to the Government's accredited agents to restrict their energies to the selection of farm laborers, navvies, and domestic servants, leaves all the rest an easy prey to the grafter. They do not scruple to list them as farmers, domestics or navvies when it means £1 apiece for doing it. If the Government's representatives were authorized to deal with all classes seeking information they would be in a better position to check graft, and send the right people out. The point is that the mere issuing of orders not to send out mechanics does not prevent mechanics being sent out under false pretenses, and then working their way back to damn the country. There are times when we want mechanics for the development of the country and the extension of its industries, and at such times they are just as valuable to Canada as farmers, and the Government should see that they are given every chance to come. When they are not needed let them be warned to remain away. We need population, but it takes more than farmers, domestic servants and navvies to populate a country. It should be the aim, as it is the duty, of the Government to get the best class to come, and to see that they come as they are needed, and not have them pitchforked in here as suits the convenience or the need of the grafter.

A Timely Criticism.

MR. BRUCE WALKER, late Canadian emigration agent at London, England, has made a report to the Government at Ottawa, in which he condemns the methods of the Old Country charitable organizations that promote emigration to Canada. The societies work amongst the city slums of the Old Country, gathering up the scum of the population from the lowest quarters and shipping them out to Canada. In drawing attention to this practice, Mr. Walker has done Canada a real service. Canada is a very large country, and there is room enough here for many millions more people than we have; but there is no place in it for loafers and criminals. This is the worst country in the world for people who want to live without working.

Protection in England.

THE tariff-reform party in England is making headway more rapidly than even its best friends hoped for only a short time ago. Already it has gained sufficient strength to win elections, and after the next general election it will not be a surprise to see it with a respectable representation in Parliament. Indeed there are those sanguine enough now to hope to see it with a majority. For years free traders in Canada have held up England as an example of the wonderful things free trade can accomplish, but it looks at present as if the day was fast approaching when they will not have that peg on which to hang their arguments. If any country in the wide world could make a success of free trade that country is England in her "splendid isolation." Her manufacturers have a large population packed on a comparatively small island, and the transportation charges outsiders have to pay to reach her market are in themselves a protection to the home industries. But even this is not enough, and the sentiment in favor of a Customs tariff is growing, and growing rapidly. Foreign competition in the home market is hitting the British manufacturer harder every year, and he naturally feels that he should have some measure of protection, such as other countries maintain for the benefit of their industries. That the claims of the tariff reformers in England are reasonable and appeal to the good sense of the English people is manifested by the rapidity with which the protection sentiment is growing amongst them. A policy based upon the principle of conserving for its own citizens all the trade advantages a country possesses is one that must appeal to the common sense of any people who are endowed with that very desirable attribute. As the English people have always been noted for possessing an uncommon amount of common sense, it is to be expected that they will fall in line with the views of the tariff reformers once they have got them fairly before the public. The surprising progress they have already made is an indication of what may be expected in the not distant future. It will be a killing setback to our Canadian friends, who were wont to advocate for Canada a policy of "free trade as they have it in England," to find England adopting a policy of "protection as we have it in Canada." Our public men have stopped talking free trade because they know that such a policy is impossible here. The question with us now is not only the restriction of the importation of foreign manufacturers, but also the necessity of restricting the exportation of our raw materials.

The Tax on Commercial Travellers.

PRINCE EDWARD ISLAND is the only Province in Canada which continues to tax commercial travellers from other provinces. The Provinces of Quebec and British Columbia, in accordance with the agreement arrived at at

the meeting of the Provincial Premiers, in 1907, repealed the tax they had been imposing, but Prince Edward Island, which was a party to the agreement, has so far failed to fulfil its undertaking. The result is that manufacturers in other provinces find it unprofitable to send their travellers into that province, and the people of Prince Edward Island are deprived of the benefits of the low prices at which they could purchase many commodities manufactured in the other provinces. The Legislature which, in theory at least, is supposed to enact laws for the benefit of the whole people of the province, by this antiquated legislation is really doing the very opposite. However great may be the loss of the manufacturers from other provinces who are prevented from doing business in Prince Edward Island, it is only a fraction of what the people themselves have to suffer through being denied the privilege of dealing where they can get the most for their money. Leaving out of the question altogether the moral obligation of the Legislature to carry out the undertaking of its Premier to repeal the tax, the self-interest of the people ought to be sufficient incentive. One of the drawbacks to our system of Government is that it is apt to make us too provincial in our ideas. Our Legislatures, which at best are only overgrown county councils, are apt to get inflated with false ideas of their own importance, and to interfere with matters which they are not big enough to control. We never had a more striking example of this unfortunate narrow-mindedness than was furnished us by the tax on commercial travellers from sister provinces. It should be enough that a traveller is a Canadian to carry him tax-free in any part of Canada. If we are to become the great nation we hope to be, we will have to grow men broad enough to recognize the whole of Canada as our common country, and it is a pity if Provincial politics are going to be allowed to so warp our souls and restrict our visions that we cannot see limits of our own provincial boundary line. It is to be hoped that Prince Edward Island, which has produced some of the broadest-minded and ablest of our public men, will not allow itself to lie much longer under the imputation of being the only narrow-minded member of Confederation.

Want to Run the Factory.

THE employees of the Dominion Textile Company went out on strike recently in one of the company's Montreal factories. The strike was not for more wages or shorter hours, or different conditions—it was simply an attempt on the part of the employees to take over the management of the factory. An assistant foreman appointed by the management did not meet with the approval of the employees and they ordered his discharge. The management refused

to obey orders and the employees went out on strike, and closed down the factory. This is a splendid example of the benefit of unionism to the workingmen. At a time like the present, when they ought to be happy to have employment, and thankful to their employers for keeping the factory in operation, they quit work because they are not allowed to hire their own superiors. These are the very considerate people whom the Toronto Globe suggested should be kept at work at the expense of the manufacturers, whether or not there was any demand for the products they were turning out. It is instances such as this that kill the sympathy of the public for working people, who allow themselves to be led by union agitators into committing all manner of follies, and making such unreasonable demands that no self-respecting management could comply with them. If the management of a factory is not to be at liberty to make its own choice of foremen, then surely it is time to sell out and let the employees find places where they can.

JACK CANUCK :—"Your duty is plain, sir. It is an export duty."

The Insurance Act.

MEMBERS of the Canadian Manufacturers' Association carry at least \$500,000,000 of fire insurance on their various plants, and it can be readily understood of what vital importance insurance legislation is to them. Canada has not had to deal with any vast conflagration, such as devastated various cities of the United States, but our good fortune in the past does not give any guarantee that disastrous fires will not visit us in the future. Insurance is protection against future possibilities, not against expectations. The possibility of a great fire grows as our industrial centres grow, and it is of vital importance to see to it that our insurance companies are in a position to meet their obligations under such circumstances. With this end in view, there are some weaknesses in the insurance law of this country which the manufacturers

throughout the country would like to see remedied. Section 64 of the new Act defines the class of investments Canadian companies may make, and sub-section 2 of this section is entirely new, and reads as follows:

"2. Any company may deposit outside of Canada such portions of its funds and securities as is necessary to the maintenance of any foreign branch or branches: Provided that all other securities of such company shall be held at the Head Office of the company or elsewhere in Canada."

Under this section it is open to our Canadian companies to transfer all their funds, over and above the amount required to be kept at home to meet Canadian liabilities, to foreign countries. The foreign policyholder would thus be getting added protection at the expense of the Canadian, who would have less adequate protection. This section should be revised in such a manner as will ensure to Cana-

dian policyholders the fullest possible protection. In other words, the Canadian Fire Insurance Law should be so framed that the Canadian companies operating under it would have to give the preference to the Canadian people. The Canadian Government is under no obligation to look after the interests of foreigners who have Governments of their own to take care of them.

Policyholders' Security.

THE security of a policyholder is the capital and the surplus of the company in which he holds his policy. The surplus is, of course, the chief gauge to the stability of a fire insurance company, but the way this is made up differs very greatly in the United States and Canada. In the former the capital as to the insured is a liability, and the surplus must be over and above the capital. In Canada the capital is not a liability, and the surplus is merely the difference between assets and liabilities. For instance, a Canadian company with a million dollars capital, and half a million surplus in the United States, would have a half million deficit, because the million dollars capital would be charged as a liability, thus wiping out the half million surplus, and leaving a half million liability unprovided for. In the United States, therefore, a company to continue in business must maintain its capital unimpaired; while in Canada a company can go on showing surpluses after its capital has disappeared altogether. It is clear, therefore, that the safety line of our Canadian companies is much lower than the standard in the United States. Here the mere surplus as between liabilities (made up of all unpaid claims, all unpaid accounts, and reinsurance reserves) and assets, is all the policyholder has to rely upon, while in the United States he has the surplus plus an unimpaired capital. It is true that in this country he has the capital also if there is any capital, but of that he has no assurance, for the insurance laws of Canada do not compel a company to keep its capital intact. If the Canadian insurance law made the capital of a company be taken into account as a liability, the same as is done in the United States, a great many of the companies showing big surpluses now would be placed in a different light before the public. The time has come when there is need of raising the standard of security to the policy-holders of Canadian companies, instead of lowering it by the enactment of such an investment clause as the one quoted in the preceding paragraph.

Limitation of Risks.

ANOTHER matter of importance is the limitation of risks. It is time that some provision were made to limit the amount of insurance a company may take in the congested areas of large cities. In case of a conflagration the sufferers have to look to the insurance companies that carry their risks for the means of re-establishing themselves, and the law should prevent companies contracting for more than they are able to discharge. A company that is not able to pay every claim that may be made on it is really only gambling on the chances of escaping a disastrous fire. If companies are to be permitted to take gambling chances, the security of the policy-holder is reduced to a still smaller margin. The Canadian Manufacturers' Association has asked that returns be made of the insurance in congested districts, and that these latter be defined by a Government commission, and that in such districts a company be not permitted to carry a greater total insurance than the amount of its surplus. This is surely not asking too much, particularly in view of the way in which the surplus is made up in Canada.

Mutual Fire Insurance Companies.

THE manufacturers of this country have recognized for a long time the inadequate security afforded them by the stock companies under the existing laws, and they have felt, moreover, that the premiums exacted were out of all proportion to the risks carried. In an effort to secure fairer rates the Association formed two mutual fire insurance companies, and in this connection they presented the Minister of Finance with statements showing the growth, development and successful operation of such companies in the United States. It was hoped that as a result of this information a section would be added to the Insurance Act dealing exclusively with mutual companies. No such section appears in the new Act, however, and the manufacturers are naturally disappointed. They felt they were making a reasonable request when they asked that the Act should recognize the difference between a number of property-holders co-operating together to protect themselves against loss by fire, and stock fire insurance companies taking premiums in advance and operating for the benefit of the shareholders of such companies. The United States, where the insurance laws are much more rigorous than here, recognizes the difference between the two classes, and does not exact a "deposit" from the Mutual. The new Canadian Act, however, reverses this order of things. It lowers the standard of the Stock company, and raises the standard of the Mutual by the exaction of a "deposit" from the latter the same as from the former. The manufacturers ask that a new section be added to the Act dealing exclusively with Mutual companies, and they suggest:

"That the basis of incorporation should be prior applications on at least 300 separate and distinct risks, with a guaranteed amount of insurance of one million dollars upon which the premium notes shall be at least seventy-five thousand dollars, and of which at least twenty thousand dollars shall be in cash; that in case of a company insuring risks protected by automatic sprinklers, the provision shall be applications for 150 separate and distinct risks, with a guarantee amount of insurance of one million dollars upon which the premium notes shall be at least fifty thousand dollars, and of which at least fifteen thousand dollars shall be in cash."

They ask also that the clause in the bill forbidding individual underwriting should be struck out. It is pointed out that individual underwriting was the basis upon which the system of insurance was founded, and is still being operated to great advantage and with great success in Great Britain and the United States.

The Man Who Knows.

SEND for Johnston, he knows," is the text of a correspondence school advertisement running in some of the magazines, and it has a meaning far deeper than most of our working people realize. The man who knows is the man who is always in demand. For him bad times have no terrors, and cuts in wages no sting. The man who knows is needed so long as a wheel is turning, and he always gets his price. There is no one so interested in the man who knows as the manufacturer. He needs him in his factory, in his office, and on the road. He is the mainspring that keeps the wheels of commerce revolving, and one of the drawbacks of our country, from a manufacturer's point of view, is that there are not enough of his kind to go around. To produce men who know, we are sadly in need of technical schools, where our workmen would have the chance to obtain the knowledge that marks the difference between the man who works with under-

standing and the man who performs his task mechanically, and keeps on in the same old rut all his life. Our system of education is incomplete without technical schools. It is the right of our workmen to have them, as it is in the general interest of Canada to develop a class of workmen who know. We hear the cry every day that what this country needs is population—men and women to develop its resources and turn to account its latent possibilities. Our Government does not hesitate to spend large sums of money annually in bringing in people from other lands to become citizens of this country, on the ground that they are needed for its development. It does not seem to have occurred to them that another way of increasing the effectiveness of our population is by developing the people we already have. Teach our workers how to work and you will double their capacity. A thousand blind toilers are not worth as much to this country as five hundred intelligent workmen, who can be put in the class of men who know. If some of the bonus money that is wasted on incompetents and undesirables from abroad were devoted to the development of men who know at home the return to the country would be vastly greater than it is at present. Give our workmen a chance.

Canada is Strongest.

THE number of large United States corporations that either passed or reduced dividends since the first of the year is ten, and, curiously enough, in Canada the number of corporations that have increased dividends is also ten. There have been a couple of reductions here also, but they are either offsprings of United States concerns or close affiliations of them. The purely Canadian institutions have held up under the stress of the money stringency in a manner that is, to say the least, remarkable. There has been, and there still is, a certain amount of dullness in certain lines of trade in this country, but these are exceptional and the position of the country generally speaking is so strong that there cannot fail to be an early revival that will surpass all past records. Canada is the safest country in the world to-day for the employment of capital, and the one in which the greatest returns are sure to be made in the future. The conservatism of the Canadian, as compared with the gambling spirit of the average business man of the United States, is the thing that tells when the crisis comes.

Unjust Bills of Lading.

IN taking up the question of the bills of lading which Canadian exporters are compelled to sign, the Senate has called attention to one of the greatest injustices under which Canadian manufacturers and merchants suffer. Senator Campbell, in moving the second reading of the bill

dealing with the question, said that its object was to remove succeeded, and to-day the Chicago shippers could get a the handicap placed upon Canadians by the steamship companies. There were unjust and unreasonable provisions in their bills of lading, which relieved the company from responsibility for damages in transit. He instanced a clause in their bills of lading by which a company could disregard marks in the delivery of goods. Under this clause a steamship company could take a consignment of flour for an English firm and make delivery of a different brand from another consignment. Upon Senator Ferguson remarking that he thought a good many of the provisions in the bills of lading were put in for the purpose of bluff, Senator Campbell pointed out that the contracts on the bills declared that the British law governed, and it had been held that if a man accepted such a bill he was subject to all the conditions of the contract. Senator Derbyshire said that this was a very old question. For years commercial bodies in Canada had been trying to get as good a bill for Canadian

good sent from Montreal as was given on United States goods from Chicago sent from Montreal. They had not succeeded, and to-day the Chicago shippers enjoyed a lower rate than Canadian shippers on the same class of goods, and that from steamship companies which Canada had subsidized. Sir Richard Cartwright said the question was engaging the attention of his department, and he suggested that the bill be sent to the Banking and Commerce Committee of the Senate, where all interested could be heard, which was done.

An Important Question.

THIS is a question of very great importance to our manufacturers, and it is to be hoped that it will not be allowed to die in the Committee to which it has been sent. Of equal importance to shippers is the bill of lading which our railway companies have adopted. It has conditions equally as unreasonable and unjust as that of the steamship companies, and is just as much in need of amendment. It was drawn by the railway companies, and is naturally a one-sided contract. It was not all drawn at one sitting either, but as conditions arose from time to time, where the railway found itself compelled to make good some shippers loss through damages to transit, a new clause was added to relieve the railways from responsibility under like circumstances in the future. As it stands to-day, the railway bill of lading is a whole volume of conditions in fine print to which the shipper is asked to subscribe before his goods are forwarded. While the Senate is at work on the bill of lading of the steamship companies, it could very profitably look into that of the railway companies, and see if it is not possible to get out a simple form that will leave a few rights to the shipper, and place a few responsibilities upon the railway companies. A uniform bill of lading,

UNCLE SAM:—"Great Scott! I don't b'lieve that's merely luck. I b'lieve it's the live bait."

embodying a contract fair to both parties, is something to which every shipper is justly entitled.

The Lemieux Act.

PROF. SHORTT, who is acting as chairman of the Conciliation Board enquiring into the dispute between the Dominion Coal Company and its employees, has been praising the Lemieux Act. He says it is highly practical in its operation, and, therefore, useful to a degree not attained by the labor laws of other countries. Its greatest asset, in his opinion, is that it is an alternative rather than a compulsory measure in the matter of results. While parties at variance have to submit to its provisions, it does not prohibit the carrying on of strikes and lockouts in cases where satisfactory terms cannot be obtained. Prof. Shortt has, himself, done a great deal to make the Act a success. In its original intention it was meant to be administered in a formal and public manner, like a court of law. This publicity was a great drawback to it, for neither the employer nor the employee, and more particularly the latter, wanted to air their grievances through the press, where every hasty word would be recorded under a sensational heading. Prof. Shortt recognized this, and he closed the door on the press, stripped the proceeding of all unnecessary formality, and sought to bring the parties together in a spirit of conciliation. The Nova Scotia press demanded admission to the meetings in Sydney, claiming it as a right, but Prof. Shortt very properly shut them out. Administered as Prof. Shortt conducted his enquiries under its provisions, the Act serves a useful purpose as a medium through which both sides to a labor dispute can be brought into touch and given an opportunity of talking their differences over on equal terms. Under less able administration the Act would hardly merit the praise he gives it.

Forest Preservation.

THE question of the preservation of our forests is becoming a very live one, and it is none too soon that the matter should be taken up earnestly. All those who are interested in lumbering are fully aware of the need there is for immediate action. The reckless destruction of our forests has already cost the country millions of dollars, and the time has come when better methods of dealing with this important source of natural wealth are urgently demanded. The forestry associations, which have taken the matter up in the different provinces, are demanding legislation on the subject, and our legislatures cannot act too quickly to meet the needs of the situation. In the past, when the lumber industry was confined to the getting out of square timber and sawlogs, a fair proportion of the smaller trees escaped; but now that the pulpwood industry has grown to such proportions everything falls before the axe of the woodman, and the country, save for the stumps, is left as clean as a field over which a reaper has passed. This wholesale destruction of the forests has much more far-reaching consequences than the ending of the lumber industry. It affects the rainfall, changes the course of the rivers, destroys water powers, and renders large tracts of fertile land barren and unproductive. The forest protects the snows of winter from the awakening rays of the sun in early springtime, so that it melts gradually and is drained down through the rivers at a time when the sprouting crops of the farmers need the invigorating moisture it brings them. It is a well-established fact that a country denuded of its forests has a poorly distributed rainfall, and loses much of its fertility. The first blush of spring melts the snow from the bare earth, swells every little stream into a torrent, floods low lands for a brief period, and in a couple of weeks is all gone, leaving the country to burn up for want of moisture. In some of the older parts of Canada this condition of things has already been experi-

enced, and the time has come when measures will have to be taken to prevent more serious damage in the future. The worst offenders are the people of the United States, who have acquired millions of acres of pulpwood forests, and whose only care is to keep their paper mills in the United States supplied with the raw material from Canada. The jobbers and "fake settlers," who are equally reckless destroyers of young trees, export their entire cut to the United States. It is well known that the United States paper mill is the monster that is destroying our forests in a reckless and shameful manner, and all that Canada gets out of it is \$6.00 or \$7.00 out of every \$40.00 or \$50.00 that every cord of pulpwood is finally turned into. Surely this is not going to be permitted to go on as long as there is a tree left to cut. Are we going to destroy the fertility of our farms and the value of water-powers for the miserable percentage the Americans allow us of the wealth of our forests? It is time for us to wake up and protect our interests. An export duty on pulp and pulpwood would be an effective remedy.

The Budget.

HON. MR. FIELDING, Minister of Finance, delivered his Budget speech on March 17th. While there were no startling tariff changes announced, the speech was, as usual, a very interesting one. It shows that the revenues of the country, like ordinary business institutions, are feeling the depression. The Minister anticipates a heavy falling off in the receipts of the Government during the year, and predicts that the addition to the public debt, as a result of the twelve months' operations, will be some twelve millions of dollars. This money will be expended on the vast enterprises, such as the G. T. P., which the Government has under way, and the excess of expenditure over receipts will be chargeable to capital account. The large sums of money which the Government proposes expending this year will help materially in relieving the shortage from which the country is suffering. For the Government to curtail expenditures at this time would be poor policy, especially as the works on which the money is being spent are necessary, and will be a permanent asset. The falling-off in revenue will be made up almost entirely in a falling-off of custom receipts, indicating that he expects a heavy shrinkage in imports. Both the Post-office Department and the Inter-colonial Railway show a surplus, which is something to be thankful for.

The Tariff on Tobacco.

THE only radical change made in the tariff has to do with tobacco. The tariff has been so arranged as to give a decided advantage to the Canadian-grown leaf. This will hit cigar manufacturers with established brands pretty hard. They claim there is no tobacco grown in Canada suitable for the making of the better class of even five-cent cigars, not to speak of the higher-grade brands. Those who have brands with established reputations built on the superior quality of the imported leaf will be forced to meet a keen competition at a great disadvantage. A cheap cigar selling at possibly as low as \$15.00 a thousand will, no doubt, be manufactured from home-grown stock, and as there is to be no distinction in stamps hereafter, these will come into competition with brands that sell as high as \$35.00 and \$37.00 a thousand, and cannot be turned out for less money. They say that it is impossible to grow suitable tobacco in our climate, and they will have to continue to use the imported leaf or sacrifice the reputation of their cigars. However, if the new regulations result in building up a home industry, there will be no serious objections to them outside those immediate effects.

D. M. COUGHLIN.

The Business Outlook

Confidence Expressed by Leading Manufacturers and Financial Experts in the Situation in Canada for the Present Year.

TO ascertain the business outlook as seen by men who are in close touch with industrial conditions, the demand for goods, the needs of the market, and the possibility for financing the year's output, "Industrial Canada" recently invited Messrs. C. C. Ballantyne, the Sherwin-Williams Co., Montreal; Byron E. Walker, President of the Bank of Commerce, Toronto, and W. H. Rowley, President of the E. B. Eddy Co., Hull, to make a statement on the question. The replies are published below. No commentary is needed on the uniformly optimistic though sane expressions of opinion.

Sturdy Optimism from C. C. Ballantyne.

The Editor "Industrial Canada," Toronto, Ontario:

Dear Sir,—In answer to your favor of a recent date, regarding present business conditions and future outlook, I certainly can see no reason for anyone entertaining any other but the most optimistic views in reference to the continued prosperity and development of our country, with all her diversified interests.

True, during these last few months there has been a temporary cessation in our prosperity and rapid development, due to the serious financial panic suffered by our neighbors to the south of us and reflected in a limited way in Canada. Then, again, the partial failure of the crop in our great West, together with a financial stringency, has had its effect. Thanks to our splendid banking system, Canada has avoided a financial panic, and proven once more the value and soundness of our banking policy.

Business all over the country is rapidly improving, and with a favorable spring, and money easier, trade conditions will soon return to their normal activity. Our great railways are not slackening their efforts any, but are pushing forward their large development schemes with all energy and enthusiasm, for the present and future greatness of our country.

Now is the time in our history for all true Canadians to be imbued with well-directed optimistic enthusiasm, for have we not every reason to be? There is nothing pertaining to the situation from any standpoint in Canada to cause us to feel otherwise. Let us all put our shoulder to the wheels of commerce with greater vigor than ever and make the most of 1908.

Yours very truly,

C. C. BALLANTYNE.

Byron E. Walker Hopeful, Though Cautious.

To the Editor "Industrial Canada":

While there is much in the present situation to cause business men to be unusually careful and prudent, there is nothing to warrant the belief that, provided the crops of 1908 are normal, we shall not before long be again in a quite prosperous position. We have to get over the effects of over-importation, lean crops, and a money market overdone throughout the whole world. Some contraction is not only natural, but desirable, until our next crop has been safely marketed. It, however, looks as if immigration into our North-West is not to be very much restricted by what has happened during the past year, and there will also be a great deal of railroad building, the natural concomitant of such immigration. Apart from this, it is to be hoped that municipal and all other public improvements will be curtailed as much as possible, in the same manner in

which expansion of industrial plants and other private building operations will also be curtailed. It is only by prudence in this respect that we can hope to have matters return rapidly to a normal condition.

BYRON E. WALKER.

Volume of Trade Will be Satisfactory.

The Editor "Industrial Canada," Toronto.

Dear Sir,—I delayed answering your enquiry about the business outlook generally in Canada for the coming spring until I had full details for 1907, and late reports from all over Canada, so as to judge of the outlook for the current year's business from every standpoint, for staple goods and wares of everyday use and necessity.

When clouds were rising in the States last autumn, we all looked for and soon found some little reflection of the trouble.

Mr. Millen, our joint manager, last summer made a tour of the West, visited every branch and agency, and saw most of our customers in the wholesale grocery and jobbing trade, between Hull and Victoria, B.C. On his return, I went to the Eastern Maritime Provinces and visited nearly every city and large town in Nova Scotia and New Brunswick, and saw hundreds of our customers and merchants in all lines of trade. Thus we have talked with many of the leading manufacturers and business men in all parts of Canada, and find that while caution was plainly observed everywhere in the purchase of the wares and supplies required, and while there was an earnest effort, in some cases anxiety, to meet payments and reduce stocks a little so as not to be overloaded, with a well-defined determination to shorten up credits and reduce outstanding indebtedness, there was no panic, no distress, and no real cause for discouragement; there was, however, a little setback for some thirty days last fall, but the slight halt or hesitation noticeable in business in Canada in the latter part of October, and early days of November, was soon got over, and trade has since been good.

We did more business in 1907 than in 1906. January and February of 1908 show larger sales and better payments than in any January or February for seven years past.

Although our sales for 1907 showed a satisfactory increase for the year, there were still some rumblings and murmurings about business falling off, and so on, so we had a conference of our managers, agents, and representatives from one end of Canada to the other, to find out what the actual conditions were during the first six weeks of this year (1908), and what their opinion was of the outlook for the rest of the year. The result of the conference fully justified the information we had gathered, and the view we had held, viz., that while care and caution had been exercised in the purchase of goods, and merchants were anxious and determined to pay off their debts, and although there was some fear in some quarters, there was no cause for anxiety either as to the amount of business or the volume of trade that will be done this year in Canada in staple articles and goods that are in daily use.

About payments, and answering particularly your enquiry, we find them satisfactory in every respect. Out of a very large number of customers on our books, over 95 per cent. in number and nearly 98 per cent. in amount, pay within 30 days, the bulk of them in ten days, from date of invoice.

Yours very truly,

W. H. ROWLEY, President.

The Ocean Port of Montreal

Improvements which are making the Montreal Harbor a fitting terminus to our transportation systems.

ONCE more the season of navigation approaches, and with it comes an interest in the big city which sits at the head of ocean navigation and looks down on a harbour pulsating with life for seven months in the year. Montreal is the great nerve centre from which radiate the nerves of industry, rivers, canals, railways. How far-reaching those nerves are is seen in the movement of grain which sets in in far-off Manitoba, Saskatchewan, and Alberta as soon as the breaking ice permits vessels to ply in the canals and rivers. It is announced that on a certain day the canals will be open, whereby the smaller boats may meet the ocean liners at Montreal. At once the elevators pour their store of wheat into the waiting cars, to be delivered to the grain-carrying fleet at Port Arthur or Fort William, and then carried by stages to the harbours of export. Not a merchant or mechanic in Ontario, not a farmer in the West, but is intimately interested in the harbour of Montreal.

Many transformations have taken place in the harbour

MAJOR G. W. STEPHENS,
Chairman of Harbor Commission.

have been made in carrying capacity and in speed. It is enough to state that of the foreign trade done by Canada in the year 1907, one-third was done through the port of Montreal.

For well on to a century the importance of the St. Lawrence River as a national highway has been recognized by the people of Canada. As soon as the nation found itself it perceived that a ship-waterway whereby the great system of rivers and lakes, which extended from the sea into the very heart of the continent, could be brought into commercial use, must be a part of the nation's work. As early as 1825 the Legislative Assembly of Lower Canada appreciated the expediency of improving the river by means of canals where rapids impeded navigation, or by deepening the channel where such a course was necessary.

That decision marked out Montreal as a commercial metropolis. That was the spot where ocean and lake navigation must meet, and the fertile island grew in population, wealth, and importance.

Montreal Harbor in 1872 in the time of sailing vessels

during the past generation. In appearance alone a story full of interest is unfolded in a comparison of the two views of the port, one in 1872, in the days of the sailing vessel, and the other at the present time. What advances

Whatever value the people of Lower Canada in 1825 put upon the transportation possibilities of the St. Lawrence, the development of the succeeding 83 years has exceeded the imaginations of even the most enthusiastic.

No one of those days could forecast the agricultural expansion of the West, entailing a huge annual export of grain, or the industrial progress of Ontario and Quebec, with its great demand on transportation, much less the awakening

the rapids near the source of the river, opens into the heart of the Montreal Harbour, and is the last artificial link in the system which commences in the harbours of Port Arthur and Fort William and ends in the ocean port of Montreal. Below that improvements to the channel and canalization have made the course to the sea easy.

What is Being Done.

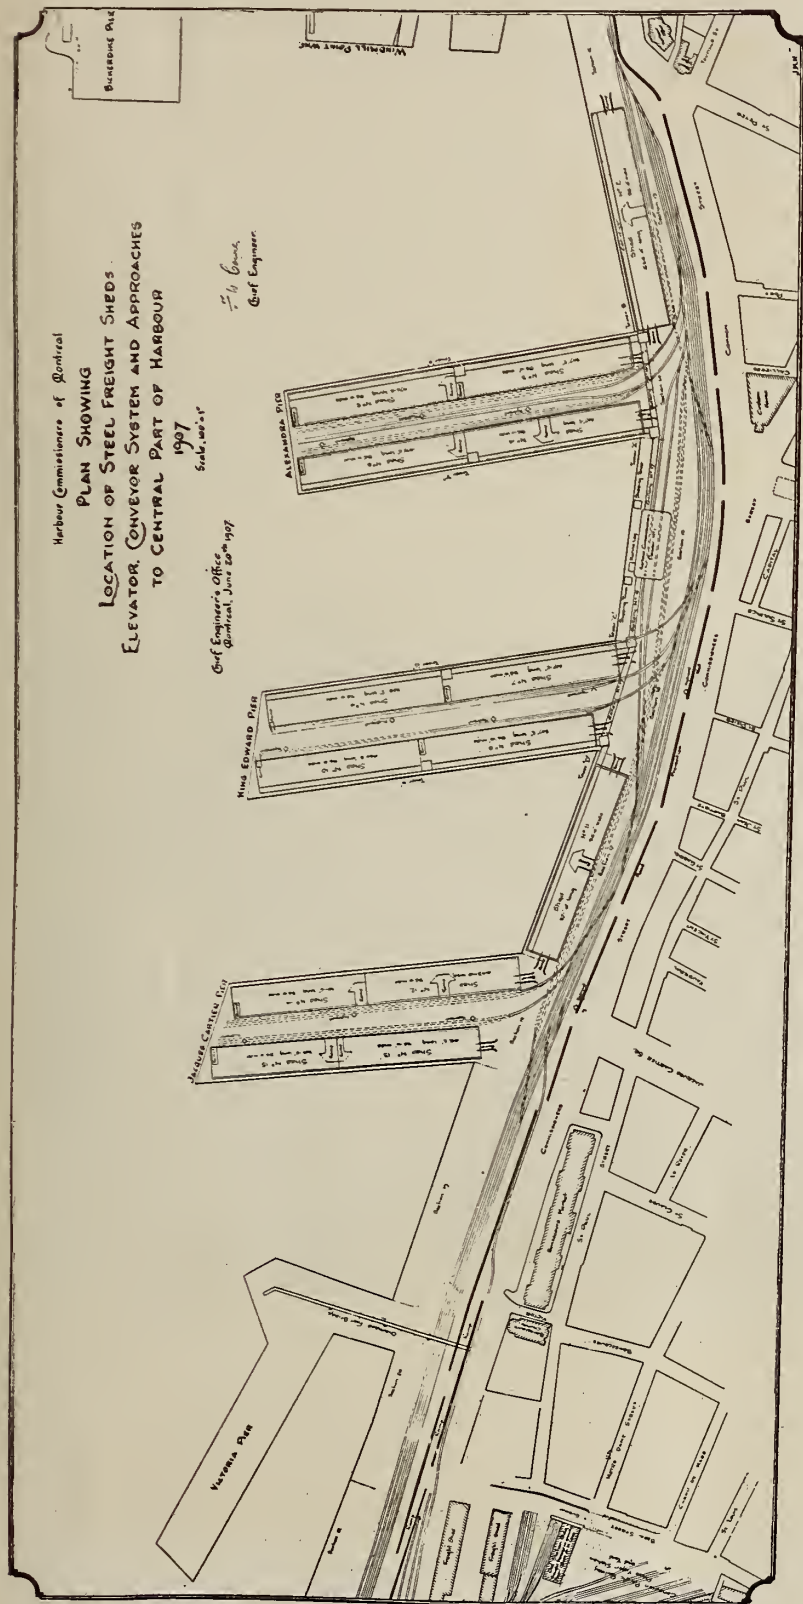

Without referring at length to the work carried on by previous Commissioners, a glance may be taken at the harbour as it is now shaping itself under the care of Major G. W. Stephens, Mr. C. C. Ballantyne, and Mr. L. E. Geoffrion, the present Board of Harbour Commissioners. It should be noted, in the first place, that the whole waterfront is owned by the people and is directly under the control of the Commissioners. This condition, which obtains in Montreal alone of all the great seaports on the Atlantic coast of North America, makes possible large plans for improving the harbour on definite broad principles. The result is seen in the fine concrete piers, in the extensive approaches, and now in the series of permanent steel sheds which are being erected. A plan of the sheds, prepared by Mr. F. W. Cowie for the Board, is reproduced with this article.

Permanent Steel Sheds.

There are fourteen sheds now in various stages of construction, seven of them were almost completely finished at the end of last year, and the remainder will be finished by the end of 1908. They are all steel structures throughout, double-storeyed and surmounted by a grain conveyor, and have sliding doors along the entire length on the lower storey and on every alternate panel in the upper storey. These floors are laid with cement, the upper ones having wire reinforcing. To further facilitate the working of inward cargoes it is purposed to build, at a probable cost of \$3,000,000 to \$4,000,000, an elevated track passing alongside the sheds and extending for a total length of 3 1-2 miles along the harbor front. One contributing cause to this decision was the discovery that any localized system of carting cargoes to and from the upper storey entailed such additional current expense as to add considerably to the ultimate cost of the goods. The grain conveyors are permanent and capable of distributing grain to ten ocean steamship berths; the galleries and towers being for the transmission of power, accommodation of belting, etc. As Montreal handles about one-third of the total grain production of the Dominion, this equipment is none too extensive.

When the details of this general scheme of expansion are completed, the warehousing capacity of the central harbor will be doubled and the lower or eastern end brought into active and ready communication with the central portion. As matters are at present, the great press of work is in the centre of the harbour, almost within a stone's throw of the busiest part of the city, and

while this condition is a permanent one, it will be the aim of the Commissioners to offer sufficient inducement to ship-owners in the matter of harbor facilities to automatically relieve the business congestion. At present, with 10,000 lineal feet of deep water berth space in the central harbour,

of the Orient, with the consequent shipment of merchandise backward and forward between Europe and Asia via Canada. The years have brought these things to pass, and the port of Montreal is fed by canals to the east and west, costing over \$125,000,000. The Lachine, which cheats

practically every inch is requisitioned in the demands made upon it by the rapidly growing trade of the port.

Montreal's share of the total national trade is over 27 per cent., or \$150,000,000 for last year, and in the facilitation of this trade, or at any rate of the shipping portion of it, she has had a similar experience to many other ports in that the astonishingly rapid growth of water-borne tonnage has almost outstripped her efforts to give it adequate port accommodation. In the last five years the tonnage of all steamers entering the harbor of Montreal has doubled and the advances made by the Allan Line, the C. P. R., and other lake lines in their Atlantic services have practically taxed the limits of the port and of the channel. Since the beginning of the year, however, the announcement has been officially made that the channel has been deepened between Montreal and tide-water to 30 feet and widened to 450 feet through the greater part of its length and to

The Men Behind the Work.

The improvements which are either already completed or are now under way prove conclusively the superior advantages of a small, efficient commission over a larger and less compact body. The former board consisted of eleven members; the present one of three. Major G. W. Stephens, the President of the Board, needs no introduction to our readers. As president of the Canadian Rubber Co. of Montreal, he holds a high place among the business men of Canada. Those who were present at the convention banquet in Toronto last October will remember the illuminating address on transportation which he gave at that time. It proved a conversancy with the subject attainable only by close study and investigation.

Associated with Major Stephens are Mr. C. C. Ballantyne and Mr. L. E. Geoffrion. The high estimation in which

Montreal Harbour in 1907

550 to 750 feet at the bends. A further notable fact intimately bearing upon this point is the decrease by 50 per cent. in the past five years of marine insurance rates upon vessels entering the port, a matter of material moment to the shipowner. The new Board's proposals embrace also the construction of a drydock. While the ultimate intention is to make provision for a dock of 1,000 feet in length, the immediate proposition is for one 670 feet long by 100 feet entrance width, with 33 feet on the sills at extreme low water, the average depth in mid-summer being about 35 feet. It will be built of concrete and provided with a temporary head, pending the future extension.

Mr. Ballantyne is held by the manufacturers of Canada is shown by his election to various offices in the association, with the crowning mark of appreciation and confidence in his elevation to the presidency. Of the many qualities which go to distinguish Mr. Ballantyne, the most prominent is undoubtedly his sturdy Canadianism. He stands for a consistent development, which will embrace every phase of the national life. Hence he finds a real satisfaction in the work of bringing to perfection that part of our system of water transportation which is under his charge. By so doing he improves the position of farmer and manufacturer alike, and adds materially to the wealth of the country.

Mr. Geoffrion is the Nestor of the Board in a double sense; he is the oldest in years, and he alone has served on previous Commissions. Consequently harbour problems are old friends to him. Mr. Geoffrion is associated with the wholesale grocery firm of Messrs. C. Chaput et Fils, whose extensive business has brought him into constant practical touch with questions of transportation. He is a man of wide experience, keen intelligence, and practical ability. These three make up the Board.

Nor is the work completed, even in outline. The Commissioners have big ideas of the importance of the task to which they have been set, and what has been planned so far is but the beginning of what is to come. The chairman of the Board is at the present time in England, with the chief engineer, inspecting the best harbours there, searching for ideas for the betterment of terminal facilities at Montreal. In this way it is intended that Montreal

public could not buy. The blame for this condition of affairs was attributable chiefly to the exorbitant and unreasonable demands of labor.

But there was a point beyond which the upward movement could not go. That point was the buying power of the consumers. What is to be done now that the consumer refuses to buy? Evidently reduce the price till he is persuaded. But labor say, "No, there shall be no reduction in wages." As the Journal of Commerce puts it, "All that the Labor Trust has done so far has been to declare that never, never, under any circumstances, can wages be tampered with. The union schedule is sacrosanct. Rather that the streets resound with the tramp of the unemployed than that the bricklayer's \$5.50 per day be reduced to \$5.49. It is nothing that the fortunate—or unfortunate—few who earn the \$5.50 are called upon to support their fellows who live a life of ease and

The Montreal Waterfront.

shall profit by all the experiments and experiences of older countries. Canada may well take pride in the work which is being carried out in her great summer ocean port.

Perverse Folly.

Restoration of business to its former healthy and flourishing condition depends on several elements. In the first place, the buying public must be induced to buy. But how is this to be brought about unless inducements are offered? When products become cheap enough buying will set in once more. After a period of doubt and misgiving, the greatest of all curatives is the establishment of hope and confidence. Previous to the relaxation consequent upon the financial stringency of the winter, prices had soared to such a point that without the influence of the sweep of prosperity no one would dare to build or develop. The cost of materials had risen so high that the

idleness and who might be called upon to work were wages more in harmony with economic conditions. The principle's the thing. Better have 100 men employed at \$5.50 a day and another 100 idle than have them all work for \$4.50 a day. The Labor Trust has so decreed." Such is not the way to restore or perpetuate good times.

Provision for Old Age.

A special committee of the Federal House has been appointed to investigate the subject of old age annuities. This is in line with the bills introduced into the Senate and House of Commons by Sir Richard Cartwright and Mr. Fielding. In neither case is it proposed to give pensions. The scheme in its present form is designed to give Government assurance for small savings. The committee will invite Mr. Archibald Blue, Professor Shortt, and Mr. J. G. O'Donoghue to give information and views.

How Coke is Made

By S. B. Chadsey, B.A.Sc.

COKE is the solid residue remaining after the volatile ingredients of suitable grades of coal have been driven off by heat. It is manufactured either in ovens in which the heat is derived from a partial combustion of the coal, or in specially constructed retorts, which are designed to effect the recovery of the volatile constituents of the coal, and which are heated by burning gases, derived from the coal, in flues adjacent to the coking retorts. This treatment or distillation is carried on commercially with two distinct objects in view, namely: the manufacture of gas usually for illuminating purposes, or

for use in the main metallurgical arts, and in what follows no reference is made to gas coke or its applications.

Before proceeding to consider the properties of cupola and blast furnace coke in detail, we may refer again to the two general methods adopted in its manufacture.

The Bee-Hive Method of Production.

The older, and in America the more extensively practiced, method is that known as the Beehive process, so named on account of the general form of the oven in which the coal is treated. In this process the coal is charged from

Blast Furnace, Hamilton Steel and Iron Co.

the manufacture of coke. In case the production of gas is the main purpose of the manufacture, the choice of coals is made in accordance with that condition; it is subjected to rapid distillation in small charges; and the residue, which is known as "gas coke," is a weak, spongy material, entirely unsuited for use in the blast furnace or the cupola. If, on the other hand, the production of a strong gasless fuel is the main consideration, a more prolonged treatment of the coal is necessary, and the whole process must be regulated with that object in view. In the present article we are concerned only with those cokes that are suitable

cars running on suitably elevated tracks into arched brick chambers or ovens, constructed to prevent too great an access of air from below and at the same time to retain as much heat as possible within the oven space. Doors are provided at the lower part of the ovens for withdrawing the charge, and it is through openings therein that air sufficient for suitable combustion of the gases is admitted by the oven-tender. The interior of the oven being hot from the burning of previous charges, the coal is at once acted upon, and the volatile products begin to be driven off. These, consisting largely of hydrocarbon gases, are

partly burned within the oven dome, but as the combustion is very imperfect, they pass off through the head of the arch in the form of a dull, smoky flame, thus befouling the atmosphere for miles around.

The beehive oven is a development from the earth-covered heaps or "mellers" in which the first coke was produced, and while it represents a great improvement upon the older process, and while it produces an excellent coke, it is nevertheless wasteful to an astonishing degree. All of the volatile constituents are lost, and since towards the end of the burn the gases come off more and more slowly, they become insufficient to protect the residue of coke, which is consequently burned even under the most favorable conditions to the extent of ten or twelve per cent. At the end of a period of from 36 to 72 hours the operation is complete, the coke is withdrawn and quenched with water to prevent further combustion. In these ovens the coking process proceeds from the top downward through the charge, and results in the production of the long columnar pieces with which foundry and furnace men are so familiar. The characteristic bright silvery appearance of beehive coke is due to a deposit of carbon upon the surface derived from the breaking up of hydrocarbon gases coming from the bottom layers toward the end of the burn. This silvery surface, which has come to be regarded by many as an essential feature of good coke, does indeed serve as an indication of the grade of material derived from this process, but is in no way a requisite of that produced in the by-product oven.

An Advanced Method.

The more recent method, which is practically universal in Continental Europe, and which has been developing in America since 1893, is that known as the "by-product" process. In this process the coal is heated in narrow airtight chambers, so constructed as to admit of the collection of the volatile constituents. The chambers or ovens are rectangular in shape and are generally arranged in batteries of about fifty. Their dimensions vary, but for the purpose of illustration we may state that at one of the large American plants they are 17 inches wide, 6 feet 6 inches high, and 33 feet long. No combustion takes place within these chambers, the requisite heat for effecting the distillation being derived from the burning of gases in adjacent flues. In this process not only are the by-products recovered in the form of tar, ammonia, and gas, but as the coal is effectively protected against combustion the yield of coke amounts to about 74 per cent., as against about 63 by the older method.

By-product coke differs very greatly in appearance from that produced in the beehive oven. The cleavage takes place in the ovens in a horizontal direction, and the pieces are more nearly cubical in form. The silvery lustre to which reference has been made is entirely absent, and the dull gray surface has been one of the obstacles against which the makers of this coke have had to contend. In point of quality, however, it must be said that if made from the same grade of coal, the product of the by-product oven is superior to its older rival in density, strength, and chemical stability. Of late this fact has come to be more generally recognized among foundrymen, and in some quarters by-product coke is held in the highest favor.

What Good Coke Should Be.

Turning now from this brief outline of the methods of manufacture to a branch of the subject that is of greater practical interest to the consumer, we will consider, under various headings, certain physical and chemical properties that serve to distinguish a desirable from an undesirable product.

Strength.—Every foundryman has had occasion to complain from time to time of the weakness of his coke. It

has been delivered to him in small pieces, and containing a large percentage of worthless breeze or dust. Consumption in the cupola has consequently been higher, and the percentage loss of fuel very considerable. The coke has been deficient in strength, a state dependent upon the condition of the cell walls, and this in turn is dependent very largely upon the heat conditions of the coke oven. It is not necessary for a coke to be dense to be strong, although a dense coke must be strong if it is to be of any value. A hard coke showing a very small tendency toward friability may not be in the least dense. There are three conditions upon which strength is dependent: First, the general quality of the coal; second, the percentage of ash and its composition; and, third, the temperature of the burn. Coke becomes harder if it is heated for some time after it is formed, and consequently the longer burnings in the beehive ovens, and the narrower widths of the retorts of the by-product ovens tend to produce the stronger grades. This is one of the causes of the favor in which 72-hour coke is held.

Density.—The density of a coke is dependent, not upon the nature of the cell walls, but upon the extent of the pores or spaces between them, and is, therefore, independent of the hardness. As has been already stated, a coke may be porous and yet hard, and up to a certain limit this is the most desirable condition. The points which regulate the hardness also have a direct bearing upon the porosity, namely, the grade of the coal and the duration and method of coking. The greater the percentage of volatile matter in the coal and the more rapid the heating, the more porous will be the resulting coke. Each shipment will contain material varying very considerably in this respect, owing to the fact that in different portions of the ovens different conditions of heat and pressure exist, the upper portions, especially in the by-product ovens, having the greatest amount of cell space. Moreover, the greatest number of pores tend to be produced in the closed retorts and the smallest number in the original melter, a method now practically extinct. The influence of this subject upon the practice of the furnace and the foundry lies in the fact that the denser the coke the larger the pieces that can be used.

Moisture Injurious to Coke.

Moisture.—Coke shows only a slight tendency to absorb moisture from saturated air, the amount taken up by dry coke in this manner not exceeding one-half of one per cent. The conditions of quenching at the ovens is largely responsible for variations in the amount of water held by different shipments, and as the quantity held is of interest to the purchaser some attention should be given to the matter. At certain by-product ovens a quenching machine is used, but in general the coke burner sprays water upon the pile until it no longer appears red; and as the redness is more apparent at night it has been stated that coke quenched at night tends to contain more water than that quenched during the day. However that may be, marketable material should not contain above 3 per cent. An erroneous opinion exists among some foundrymen to the effect that better results may be obtained in the cupola when coke is wet, and some even go to the length of spraying it before charging. There are men of long and successful experience who claim that such practice is of considerable advantage, but it requires but little demonstration to prove the incorrectness of their position. For this reason, coke sheds for protecting the fuel against rain and snow are to be strongly recommended.

Volatile Matter.—Well-burned coke contains only a small amount of volatile material, usually between 1 and 2 per cent. Occasional tests in the experience of the writer have disclosed higher percentages, but they have been the exception.

Sulphur.—This unwelcome ingredient of all cokes is the one with which the foundryman in particular is most familiar, as it is the cause of many of his most positive troubles. Owing to the fact that the molten metal is in direct contact with incandescent coke both in the cupola and the blast furnace under conditions in which the affinity of iron for sulphur comes strongly into play a high percentage of that element is most objectionable. There are means at the disposal of both foundry and furnace man for minimizing the absorption of the sulphur by the metal, but they cannot be intelligently used, unless the percentage present in the coke is known, and in any event it is better to avoid the necessity of their adoption by ensuring the delivery of a low sulphur fuel. It is now universally the practice at blast furnaces to rely upon the protection afforded by analysis, but unfortunately it is not so generally the case in the foundry, and as a consequence no little trouble arises from this source. Hard castings and high shrinkage make their appearance from time to time, and more loss is incurred during a few casts than would pay for a full year's analysis. It is customary to purchase under a specification placing the maximum allowable content of sulphur at one per cent., but deliveries are frequently made in which this percentage is much exceeded—to the extent, indeed, of being more than doubled. One of the great merit of some grades of by-product coke is the very low content of this element, the amount running usually from one-half to three-quarters of 1 per cent.

Ash.—Less attention, as a rule, is given by the foundry man to the amount of ash contained in his fuel than the subject deserves, inasmuch as it has a very direct bearing upon his costs. The blast furnace manager gives it a greater place in his calculations, since he is fully aware of its influence upon the operations of his furnace. The effect of ash upon the quality of coke consists to a great extent in reducing the percentage of carbon, or, in other words, in reducing its heating power. The ash requires limestone to form it into a slag, and the slag requires additional fuel and blast to melt it. It is evident, therefore, that this is a matter calling for consideration. It is true that a certain minimum percentage is required in order to produce the requisite hardness, for supporting the burden of the charges, although this is of less interest to the foundry man than to the blast furnace manager, and the limits of 8 to 10 per cent. may be considered ample. The writer has met with coke delivered for foundry use which have proved to contain from 14 to 18 per cent., and the heating power of which was, therefore, correspondingly diminished. Here again the advantage of analysis becomes at once apparent, as an agent for the detection of an insidious loss that might otherwise pass largely unnoticed.

Heating Power.—In referring very briefly to this part of the subject, it may be explained that the common unit quantity of heat is that amount which will raise the temperature of one pound of water one degree Fahrenheit. This is known as the British Thermal Unit, and is written in abbreviated form B. T. U. Now, it has been pointed out in preceding paragraphs that the available heat from a coke depends to a large extent upon the amount of water and the percentage of ash which it contains. In the analyses which follow may be found the number of British Thermal Units per pound of coke in various samples tested by the writer. For regular foundry purposes, it is not necessary to make frequent tests of this value, as the tests for ash, etc., are sufficient. There are those, however, who wish to know as much as possible about their raw materials, and such may be interested in the figures submitted:

The analyses refer in all cases to the dried sample.

Kinds of Coke.	Volatile		Sulphur.	B. T. U.
	combustible matter	Ash. p. c.		
Beehive	1.38	9.90	.93	12771
"	1.51	10.46	.71	12148
"	1.61	10.56	.78	12104
"	1.03	12.92	.86	11525
By-product	1.38	7.30	.55	13915
"	1.88	7.03	.50	14277
"	1.88	8.63	.81	14161
"	1.76	12.76	.67	14925

In conclusion, it may be stated that close attention to the quality, in comparison with the original cost of their coke, will amply repay those foundrymen who will undertake it.

THE RISING TIDE.

WE are not alone in our growing appreciation of the urgent need of technical education. We know how hard and how constantly we have to fight to meet the competition of the United States at the present time. Yet the United States is even now taking thought how it can manufacture more skilfully, more rapidly, more economically. The competition of Germany's more highly trained workmen is shoving the United States gradually back, until it becomes patent to all that she must increase her efficiency. What will be our position when the United States commands an industrial army as efficient as that of Germany? The question is disquieting. We have no divine right to prosperity, any more than can be wrought out of the rich resources of our country by the labor of our farmers, our miners, and our artisans. We have the resources; are we going to take steps to produce citizens who can develop and refine those resources?

An association has been working in the United States for a year and a half on the subject of technical education. It is making progress, too. At the annual convention, recently held in Chicago, representatives were present from educationalists, manufacturers, and workmen. The objects of the Association are set out as being:

(1) To examine and report upon conditions in respect to industrial training in this country, and to compare them with those prevailing abroad; (2) to recommend types of model trade schools adapted to the needs of particular communities; (3) to propose methods by which these trade schools may be articulated with the existing system of public education.

Nothing is more admirable in the people of the United States than their supreme confidence in education as a cure for the ills of a democracy. The sight of business men who have themselves usually enjoyed few of the benefits of schooling, supporting with unquestioning faith the expenditure of millions of dollars for educational purposes, is inspiring. But if in the past they have done this for education as we now have it, with what enthusiasm may we expect that they will support technical education, which appeals to them practically, directly? The movement has but to get up a little momentum, and the artisans of the United States will have technical school in every hamlet. And the movement is even now under way.

The work of the Association referred to above is not merely of academic interest to us. It indicates the propagation of an idea which will be revolutionary from an industrial standpoint. What is to be our attitude towards it? Shall we adopt the easier part of waiting till the efficacy of industrial training is proved by our untrained workmen being pushed back to the cruder, the humbler lines of unskilled labor? Or shall we educate our citizens to efficiency? The question provides its own answer.

In the Public Eye

A MAN WHO HAS MADE GOOD.

THERE are only a few Government officers at Ottawa with whom the public are brought into close relationship. The estimates for a department are passed and the work is done, but the men who plan, and think and execute, remain in the background.

Some men, however, rise above the confines of the civil service, and by the excellence of their work make themselves

an influence in some phase of the life of the country. Such a man is F. C. T. O'Hara, whose appointment to the post of Deputy Minister of Trade and Commerce, in succession to Mr. Parmalee, has just been semi-officially announced. Mr. O'Hara has for some years had charge of Canada's trade commissioners, and so has been the medium through which all inquiries and investigations on export or import trade have been made. Incidentally he has supervised and directed the publication of the weekly reports of the Department of Trade and Commerce. That he has done well will be gladly acknowledged by all who use those publications.

As will be seen from the accompanying cut, the new Deputy Minister is still a young man. His work shows energy and ability. The promotion of such a man is a practical exemplification of Civil Service reform which will appeal to the business public of Canada. The coming years will call for the keenest intelligence upon the part of those whom we have charged with the development of our com-

merce, whether it be in the way of getting information for Canadian producers as to the requirements of the world's markets or in developing the internal resources of the country. It is no reflection on the Minister, a con-

siderable part of whose time is necessarily taken up in keeping himself in Parliament, to say that the initiative along the lines mentioned must emanate from the Deputy. It is a source of genuine satisfaction to know that Mr. O'Hara is made of the stuff which is not wont to yield under difficulties. The Department of Trade and Commerce will have its work cut out for it in the future. It is well to know that it is in good hands.

F. C. T. O'HARA

Whose appointment to the position of Deputy Minister of Trade and Commerce, at Ottawa, will give great scope to his abilities.

N. D. LEWIS

The pioneer in tin plate making in Canada, who is applying for a bounty on his product.

E. N. LEWIS, M. P.

The adoption of whose resolution favoring an export duty on pulp wood, would bring the rails of the United States to Canada

JOHN GALBRAITH

A member of the commission of three whose report on the Quebec bridge disaster is considered by engineers to be of far-reaching importance.

A PIONEER.

MR. N. D. LEWIS is General Manager of the Canada Tin Plate and Sheet Steel Company of Morrisburg, Ont. The path of the innovator is usually beset with thorns. The experience of Mr. Lewis is not different from others in this respect. He is now asking for a bounty of half a cent a pound on the output of his factory, and has called the Government's attention to imports which he maintains are in violation of the Dumping Clause of the Tariff Act.

The company of which Mr. Lewis is manager is the first, and so far the only, manufacturer of tin plate in Canada. There is a large demand for the goods, much more than the present plant can turn out; hence the application for a bounty rather than for a protective tariff. It is worthy of note that this industry is no more native to the United States than to Canada, yet in that country an immense manufacturing business has been developed under the aegis of an adequate tariff. In the days of the future, when Canada, too, enjoys the benefits of big tin

plate mills, the work of Mr. Lewis as the pioneer, who hewed the first trail, will be recognized. In the meantime the progress of the industry will be watched with no small interest by the manufacturers of Canada.

A CONSTRUCTIVE STATESMAN.

FROM the great mass of chaff which is beaten day after day on the floor of Parliament, here and there a seed of grain is separated out. Such should be eagerly garnered, from its very oddity. In the Hansard report for March 11th, surrounded by questions of privilege, motions for returns, and arguments, which cover up the meagreness of material by a great plethora of words, stands out one speech which has meat in it. Mr. E. N. Lewis, member for West Huron, is constructive. While others were attacking others or defending themselves, he was working out a policy which would mean something to the country. The subject of his speech was a resolution, which he then moved, "That, in the opinion of this House, such a duty should be placed on the export of wood pulp as will be sufficient to induce its manufacture into paper in Canada, and thus save to the labour of Canada the six millions of dollars now lost."

His speech was a clear, cogent argument in support of his position. He quoted the opinions of bank managers, of publicists, of newspapers, both Canadian and of the United States. And ever he got back to the same well-defined proposition: Let Canada make her own paper. It is not necessary to summarize his remarks here. The newspapers throughout the country have featured them, and his point of view has been accepted by the great majority of Canadians as the correct one. It is a matter of dollars and cents; of developing a natural resource. Here is the proposition in a nutshell, to quote from Mr. Lewis' speech: "For every cord of pulp wood leaving Canada, \$6 or \$7 are left in the country. Watch the value grow afterwards. Every cord of wood ground to pulp has a value of \$20. Every cord of wood made into fibre has a value of \$30 to \$32. Every cord of wood made into paper has a value of \$40 to \$45 and up." E. N. Lewis thinks we should keep the \$45 in this country. In that he has pretty general support outside Parliament.

Unfortunately some of those sitting in Parliament depend for their election on the votes of small farmers in a comparatively limited area, who add to the profits from agriculture by selling pulp wood to American dealers. With an election not very far off, these members are most zealous in the interests of their electors. So, in the House there is a tendency to leave the subject severely alone. Public

opinion will force an issue along the lines of Mr. Lewis' resolution.

A BRIDGE EXPERT.

COMMISSIONS have become a rather common adjunct to government of late. It may be because the excellence of the system is becoming more generally recognized than before. Or, again, it may be that there are more things to be investigated. However that may be, the report just presented by the commission which was appointed to investigate the Quebec Bridge disaster, shows by its thoroughness what may be accomplished in this way. Not least of the members of that body is the subject of our illustration, Mr. John Galbraith, Principal of the Faculty of Engineering at the University of Toronto. Mr. Galbraith is an expert on bridge construction. He also has the conscientiousness that is characteristic of the school master. The two qualities combined were just the equipment required for an investigator into the Quebec affair. He could be relied upon to find out all that was worth knowing about the strength or weakness of the structure, most of which now lies, a tangled mass, at the bottom of the St. Lawrence—not to be turned aside by the recriminations of contending engineers, nor overawed by the dicta of experts.

Now that the defects in design have been located and it is worthy of note that such an eminent authority on engineering as the Scientific American accepted as undoubtedly correct the finding of the Commission—tests must be made on a large scale before other works of this kind are attempted. The failure of the con-

struction will necessitate the establishment of new formulae for big bridges. So the work of the present Commission will have its influence wherever big bridges are to be built.

ADVOCATES A COMMISSION.

AT a recent sitting of Parliament, Mr. Hugh Guthrie, M.P., introduced a resolution favoring the appointment of a Commission to investigate and report on technical education. Mr. Guthrie on that occasion justified his reputation of being in the first rank of Ottawa Parliamentarians. His exposition of the subject was clear and forceful. The excellence of a speech may be judged by the influence it has over its hearers. By this stand-

HUGH GUTHRIE, M. P.

Whose motion for the appointment of a commissioner on technical education has been favorably received by all classes.

ard this contribution of Mr. Guthrie to the Parliamentary debates measures up well with anything that has been given this session. There could be no doubt that when he sat down the House was convinced of the necessity of technical training in Canada.

The debate lengthened out, although there was no opposition to the resolution, until adjournment, when the resolution was dropped automatically from the order paper. Had it been possible to bring on a vote at the time, it would have carried easily. As it is, the subject can only come up again by its being substituted for some other motion farther down on the list. Mr. Guthrie has popular sentiment behind him in his advocacy of a commission of enquiry. Technical education will come in Canada before long, just as it has come in the countries which are more advanced industrially. In establishing such a system we should profit by the experience of others. Hence the need of a commission.

WILL INTRODUCE THE FAMILY.

One of the bigger movements within the Empire is marked by the publication of a new journal in England, The Standard of Empire, which comes in the form of a supplement to the London Standard. The Standard of Empire is directed towards a larger field than yet has been attempted by any publication. It embraces all parts of the dominions beyond the seas, and aims at giving the view-point of the various members of the great partnership. No worthier work could be undertaken. To the outsider it would appear that an understanding of the motives and aims of the various units would be impossible on the part of the other, frequently far distant, members of the family. That it is difficult, no one will question. But it is necessary if the Empire is to remain intact, and is to carry to consummation the great work of civilization to which she has been set. There is only one way in which kinship will continue to be strongly felt, and that is through acquaintanceship. By recognizing the problems and aspirations of each other, patience and sympathy will take the place of asperity and criticism. The Standard of Empire will tell the people of Great Britain and Canada how the Australians live, what their attitude is towards the great questions, social and political, with which they are face to face, and how their efforts towards material and spiritual progress are being rewarded. And the people of Great Britain and Canada will begin to place themselves in the position of the Australian, and a bond of sympathy is forged. So with Canada. We will become known to the rest of the Empire. The bigger sister, for geographical, climatic, racial, and other reasons, has had, and continues to have, problems to solve which are not understood by others. Perhaps an understanding of them may explain some national traits which at first glance are repellent. The new publication has great possibilities before it. That it will measure up to those possibilities is the hope of all Canadians.

Trained Consular Service.

The need of special training for trade and consular appointees is being recognized in the United States, and a new department will be added to the University of Washington's course of studies to meet the requirement. The idea is being strongly supported by business men generally.

In the course of an article in the January issue of INDUSTRIAL CANADA, the statement was made that the Pickford & Black Steamship Company supplied a monthly service to the West Indies. As a matter of fact the Pickford & Black Company are supplying a twelve day service from the Maritime Provinces, and the service is one of great regularity, more so indeed than that of any single line running out of New York.

The New Chairman

Judge James Pitt Mabee has accepted the Chairmanship of the Board of Railway Commissioners for Canada. The appointment has met with uniform favor on all sides. The early report that he had declined the office brought forth such a chorus of journalistic regrets that the Government must have felt strengthened to make what arrangements were necessary to secure his services.

The rise of Mr. Mabee into prominence and recognition illustrates one of the advantages of a democratic state. Having the ability, his success was assured. As a practising lawyer in Stratford, he rapidly rose to a high position in his profession, a position which was recognized not alone in his own city and county, but throughout all Western Ontario. When he gave up the emoluments of his large practice to accept a judgeship, he only followed a precedent which has given to the Canadian bench, in spite of the insufficiency of the salaries, the very best men which the

Judge J. P. Mabee

legal profession has produced, and which has gained for the Canadian judiciary the deservedly high name which it has long enjoyed.

Mr. Mabee's work on the bench has been characterized by assiduity, keenness in seizing on the salient points of a case, and good judgment. Such were the qualities which were pre-eminently required in the Chairman of the Railway Commission. During the next few years the Commission will have abundance of work to do. The impending re-organization with an increase in membership will call for new methods of procedure. Meanwhile many important questions are pressing for solution. It will require all Judge Mabee's great organizing ability to get ahead of the work. The public have confidence that he will do so.

Who will be the additional colleagues of Judge Mabee, besides Dr. Mills and Mr. Bernier, the present commissioners, remains to be seen. If they measure up to the standard of the last appointee, they will be satisfactory.

WILL PROTECT SHIPPERS.

THE Railway and Transportation Committee in their last annual report submitted a resolution petitioning the Board of Railway Commissioners to provide and put into effect without delay some plan for penalties against the railway companies for failure, within a reasonable limit — first, to supply empty cars; second, to haul loaded cars to destination; and third, to place cars for unloading after arrival at destination, so as to secure to the public a prompt and adequate service within the meaning of the Railway Act. It was felt that if it is fair and in the public interest that a charge should be made when the cars are detained in loading and unloading, in order that they may be kept available for service, it is reasonable to expect that the railways should be subjected to a similar penalty when they delay cars, entailing serious loss to the public. The Railway Commission has authorized that all freight traffic in carloads or less, which is or is to be loaded or unloaded by the shippers or consignees shall be subjected as follows:—

“When cars are held under load or waiting loads beyond the free time allowed by the rule prescribed, for any reason for which the consignee or shipper is responsible, a toll of \$1.00 per car per day of twenty-four hours or any part thereof, shall be charged to and paid by the shipper, consignee, or other party responsible therefor, in addition to all other tolls paid or payable in respect of the goods carried or to be carried in or on such car.”

The property of such a charge under ordinary circumstances has not been disputed. Shippers recognize that in delaying cars in loading and unloading they are taking from those as well as themselves some of the facilities required by the commerce of the country. The reasonableness of making a just charge for the storage of property in cars, which the consignee fails to unload promptly, is conceded.

Whilst granting the point, we are of the opinion that there should be some reciprocal regulation, not with any desire to be placed in a position to demand \$1.00 per car per day from the carriers in the case of their failure to furnish cars, or move them promptly, or place them for unloading as soon as they arrive at destination, but rather with a desire to be furnished with facilities to do business. With this in view, and believing that the Board was well qualified to recommend such legislation, and at the same time suggest some means for its applications, the resolution above referred to was heartily endorsed.

The Minister of Railways and Canals has recently introduced a Bill, entitled An Act to Amend the Railway Act with respect to Telegraphs, Telephones and the Jurisdiction of the Board of Railway Commissioners, Clause 10 of which provides for demurrage somewhat upon the lines asked for in our resolution. It is suggested that Section 284 of the Railway Act be amended by adding at the end thereof the following sub-section: “The Board may make regulations applying generally or to any particular railway or any portion thereof imposing charges for default or delay by any company in furnishing accommodation, appliances, or means as aforesaid, or not receiving, loading, carrying, unloading, or delivering traffic, and may enforce payment of such charges by companies to any person injuriously affected by such default or delay; and any amount so received by any person shall be deducted from the damages recoverable or recovered by such person for such default or delay; and the Board may, by order or regulation, determine what circumstances shall exempt any company from payment of any such charges.” It may be here observed that at no time has the Association suggested

arbitrary legislation, but has simply asked for, on behalf of shippers, similar protection to that which is given the carriers.

In an argument against the proposals as to the penalties for delay in supplying cars contained in Bill No. 6, An Act to Amend the Railway Act, introduced by Mr. Maclean, of York, prepared on behalf of the railways, which has been sought to convey the impression that the Board now has the authority to impose demurrage. Evidence has been given of this from the fact that rules were promulgated by the Board in March, 1906, providing for additional tolls against the public. Since that time, notwithstanding the demands made for some reciprocal arrangement, the Board has not been clear that it has the authority to impose penalties against the carriers. In order, however, to make this clear the Government has introduced the above amendment. The argument referred to is more or less of a repetition of what has already been given to the public from the carriers' standpoint. The statement is made that large numbers of cars are frequently held at terminals to the order of consignees, causing congestion and delay in placing other cars for loading and unloading, and making it difficult to move trains through terminal yards. In fact, the attempt is made to throw the onus for delays upon shippers and consignees, the statement being made that while the volume of business is doubled and trebled very few merchants and manufacturers have provided adequate additional storehouse and warehouse accommodation and further unloading facilities have in very few cases been improved. This statement is not borne out by facts. The manufacturers have spent large sums in increasing their plants and facilities. It is only necessary to refer to the reports which have been made by the experts of the Railway Commission to show that the railways have not attempted to increase their terminals commensurately to the increased business of the country. The argument was prepared for a special purpose and whether or not it accomplishes its object remains to be seen. In this connection we quote from a recent report of a hearing before the Interstate Commerce Commission, as follows:—

“The time has gone by when the mere statement of a traffic opinion which cannot be supported by some assignable reason can be of much weight with this body. Further, if these traffic gentlemen would bring to that matter a tithe of the fertility of invention which they have exhibited in finding reasons that the order of the Commission cannot be enforced that objection can be overcome.”

The public have not asked for any legislation against the railways which they do not consider justifiable. The only reason that can be assigned for the strong opposition on the part of the railways is probably due to the fact that they have legislated so long for themselves that any further suggested regulation defining their liability and duties to the public must be opposed at all costs.

The following statement from Sir Edgar Vincent, an English financial authority of a high order, who has just spent three months in a tour of this country, is most interesting: “I was especially impressed by the financial soundness of Canadian enterprises, and the thorough, sure way in which that country is developing. I know of no greater tribute to the confidence in Canadian methods than the fact that the Canadian Pacific Railway has been able to borrow \$10,000,000 at a shade less than four per cent. The Government itself pays a little more than three per cent., and by way of comparison we have the New York Central paying a bit more than five per cent.”

All-Year Car Ferries

Boats which ply between Canadian and U. S. lake ports winter and summer.

IN spite of the severity of the past winter, when trains were held up for days at a time by mountains of snow, regular navigation went on on most of the Great Lakes. The ferry service between Canada and the United States is little known, although it is carried on with a steadiness and continuity which would be creditable to a rail system. A glance at a map will show what a great saving in distance can be accomplished by means of ferries. To get from Central and Eastern Ontario to the Eastern States a long detour is necessary by way of Buffalo or Montreal, if an all-rail route is chosen. Yet, in addition to an extensive passenger traffic, there is an immense volume of business originating in the Pennsylvania coal fields on the one side and in the timber and ore fields of Ontario on the other, which calls for a more direct route than by either Montreal or Buffalo.

To accommodate this traffic two lines of passenger and car ferries operate all the year round. Between Prescott

and Charlotte, on Lake Ontario, to connect the Grand Trunk with railway lines in the United States. The big car ferry has made between sixty and seventy trips between Cobourg and Charlotte, port of Rochester, since going into commission, carrying a cargo of 1,500 tons at every trip. It is stated that the duty paid at the Customs House, Cobourg, up to the middle of January amounted to something over \$40,000.

It is expected that this new departure on the part of the railway will be of great convenience to shippers in Eastern Canada and the Middle States, as the saving in time of carrying freight will be considerable. It will obviate the handling of freight from the Pittsburg iron centres and the Pennsylvania coal fields in train loads at terminal points, which, it is admitted, are now much over-taxed. It is expected that cars can be shipped from Pittsburg to Montreal in three days, while at present cars occupy from one to two weeks en route. The same facili-

Ontario No. 1, G. T. R. Ferry, Cobourg, Ont.

Photo by Huston, Cobourg.

and Ogdensburg the Canadian Pacific Car and Passenger Transfer Company are running four ferries. The first is a straight passenger boat, with a capacity of 300. This boat makes ten round trips a day and plies with great regularity all winter. The other three boats are car ferries, the international, with a capacity of 5 cars; the Wm. Armstrong, with a capacity of 3 cars, and the new steel ferries, the International, with a capacity of 5 cars; the Wm. passenger accommodation. The latter vessel has just been completed in the shipyards of the Polson Iron Works, Limited, Toronto, within the last couple of weeks, and showed her ice-fighting abilities by cutting her way through the ice on Toronto Bay when it was at its thickest. These ferries make on an average fourteen trips a day, but frequently during busy seasons they run steadily day and night.

The Ontario No. 1, a cut of which is reproduced herewith, is operated by the Ontario Car Ferry Co., between Cobourg

ties will be afforded the transport of lumber and ore from Ontario. United States visitors to the Kawartha Lakes district will also find the ferry a convenience.

The length of the new boat is 315 feet, beam 54 feet, depth of hold 20 feet, height between decks 17 feet, making her the largest car ferry of Canadian register. Twenty-eight loaded coal cars can be carried at once, while the vessel has been so powerfully designed and built as to enable her to run both winter and summer. Her speed is 15 knots an hour. There is also state-room accommodation for about one hundred passengers on the upper deck. The total cost is about \$375,000.

In addition to these ferries operated in connection with Canadian railway systems, there is the St. Ignace, operated by the Michigan Central Railway, and also a ferry across Lake Erie, operated by the Pere Marquette Railway.

A Producer Gas Plant

The McClary Mfg. Co. of London Have a Gas Power Plant in Satisfactory Operation.

THE McClary Mfg. Co. have recently added to their power plant an interesting gas power installation, which is now in operation in conjunction with their steam plant. The gas is supplied to the engine from a gas producer of the suction type, in which anthracite coal is used as fuel. The engine is of 200 horse-power, and is directly connected to a generator. Anthracite pea coal is used, and the approximate run for a ten-hour day is 2,400 pounds. The gas plant is arranged so that it can be run together with the steam plant, and furnishes power and light to the various parts of the works.

The engine is started with compressed air, which is turned off as soon as the engine gets under way. The compressed air for starting is stored in a tank supplied by a motor-driven air compressor. The speed of the engine is controlled by an ordinary ball governor, which acts on a valve, regulating the quantity of mixture admitted to the cylinders. The water supply for both engine and producer is taken from a large concrete cistern beneath the surface of the ground. Being first pumped up into an elevated tank in the roof of the building. The above-mentioned tank is connected with the city service by an automatic float valve, so that in a case of emergency the tank will be supplied automatically from the city service. The cistern is supplied from a small creek, which runs into the Thames River. Although the power plant is situated close to the Thames River, the water is taken from the above-mentioned creek, since at certain periods of the year there is considerable mud in the river water.

Considerable of the hot water which comes from the engine jackets is sterilized to feed the steam boilers in connection with the steam plant, so that much heat which would otherwise be lost is recovered in this way.

The producer is charged with coal from a hopper in the

usual way, and the coal is elevated to the hopper by means of a specially designed bucket apparatus, so arranged that the fuel can be easily handled by one man. The producer is started by means of a fanblower arranged to discharge

Producer Gas Plant in Operation at the Works of the McClary Manufacturing Company, London, Ont.

air beneath the grate. There is also an exhaustor located in the engine-room, which is used to boost up the fire after it is once started until the proper quality of gas is obtained in the pipes before the engine is started.

Producer Gas Plant

Foreign Market for Canadian Manufactures

AN EXPORT MARKET.

South America Does a Foreign Trade of \$1,500,000,000—
Opportunities for Getting a Share of This Huge Annual
Business is Discussed by Mr. Wm. Johnson.

WHEN travelling through South America, visiting the different commercial centres, and doing business with the leading merchants, manufacturers, and railway companies there, I have often asked myself the question, How could the opportunities which presented themselves to me be so described to Canadian manufacturers that they would realize as fully as do manufacturers from all other parts of the world, the unlimited possibilities for trade with that continent? I felt satisfied that if this were accomplished, in a very short time the Canadian manufacturers products would be well distributed through-

by our own astounding material progress and our home politics, that he has given no heed to the industrial and economic movements, and to the administrative achievements of South America.

Now the whole world is beginning to turn its eyes southward. Europe has been gazing thither longer than the United States, and has results to show for her attitude. Even Japan, China, South Africa, and Australia are discussing more than we appreciate in the United States, the valuable opportunity for the extension of their commerce and trade with that wealthy, resourceful continent, which is so accessible by either the Atlantic or the Pacific. More attention is given by the press of Europe to South America in a week than by all the papers of the United States in a year. There are many signs of increased interest, however, throughout this country."

A Business Street in Sao Paulo.

out the country, and that there would be developed such an export trade from Canada as would call for the enlargement and extension of their manufacturing and shipping facilities.

Already the United States have recognized the importance of the market. Every effort has been made to bring about a closer relationship and to increase the international trade. A department at Washington, with extensive offices, is devoted exclusively to this subject. The Director of this Bureau of South American Republics, at Washington, Mr. John Barrett, in describing what he called the Land of To-morrow, recently wrote to the manufacturers of the United States:

As Others See It.

"South America is a continent of vast and varied possibilities. The traveller and the scholar, or the merchant and the promoter, will find its peoples, problems, and potentialities, of compelling interest. And yet the ignorance prevailing generally throughout the United States in regard to this big southern continent is almost appalling. The average American, with all his close study of Europe and Asia, has neglected the history, growth, and characteristics of our sister republic. He has been so absorbed, moreover,

An Unknown Quantity.

The North American does not stop to think, when he remembers the old geographical story about the beautiful harbor of Rio de Janeiro and the threadbare legends of yellow fever, that this capital of Brazil now has a population of eight hundred thousand, and is growing as fast as any big city on the northern continent; that it spent more money for public improvements last year than any city on the continent excepting New York; and that to-day it is one of the most interesting national centres of civilization, industry, art, literature, and education in the world.

Again, how many North Americans know that Buenos Ayres, the capital of Argentina, is the largest city in the world south of the equator; that it is the second Latin city, ranking after Paris, in all the world; that it now has a population of one million one hundred thousand; and is growing at an enormous rate?

If surprised at this statement, they might be interested to learn that in Buenos Ayres is the finest and costliest structure in the world used exclusively by one newspaper, the home of La Prensa; the most magnificent opera house of the western hemisphere, costing more than ten million dollars, and erected by the Government; the handsomest

and largest clubhouse in the world, that of the Jockey Club; the most expensive system of artificial docks in America, representing an expenditure of fifty million dollars.

Remarkable Railway Construction.

The North American railroad man may be surprised to learn that between Chile and Argentina is being constructed the longest tunnel in the world. The highest points and most difficult construction that have ever been encountered in railway extension are found in Peru.

The Story of Commerce and Trade.

The foreign commerce of South America tells a convincing story. It shows us that the field is of critical importance to our manufacturers and exporters. It proves that South America has awakened to a new life, and is buying and selling like any prosperous part of the world.

The total foreign trade—exports and imports—of the ten independent South American republics—Argentina, Bolivia, Brazil, Chile, Colombia, Ecuador, Paraguay, Peru, Uruguay, Venezuela, and of the British, French, and Dutch Guianas—

wealth and resources alone, especially those of gold, copper, silver, tin, platinum, and nitrate in the Andean States of Colombia, Ecuador, Peru, Bolivia, and Chile will require the investment of North American capital not unlike that already needed in Alaska and Mexico. If, as statistics certify, eight hundred million dollars of North American money have been placed in Mexico, there will be room for eight billions throughout the immense territory of all Latin America, from Mexico and Cuba to Argentina and Chile.

There is no limit to the demands upon capital for legitimate railway building, but the requirements for electric tramways, electric lights, for utilization of water-powers, for the erection of factories, water-supply plants, sewerage works, telephone and telegraph systems, for agricultural extension, stock-raising, and kindred undertakings, offer innumerable attractive opportunities for the personal or combined action and interest of North Americans.

Canada's Opportunities.

If, as stated by Mr. Barrett, the United States manufactur-

View of Rio de Janeiro

exceeded in 1907 the sum of one billion five hundred million dollars.

Wonderful Progress.

Argentina's record in material progress rivals Japan's. With only six million inhabitants, Argentina astonished the world by conducting in 1906 a trade valued at five hundred and sixty million dollars, buying and selling more in the markets of foreign nations than Japan, with a population of forty millions, and China, with three hundred millions. Surely these are figures and results which should make us stop and think!

There are now nearly fifty million people living south of the Panama Canal, or a population equal to that of the German Empire. Immigration is pouring rapidly into Argentina, Brazil, Uruguay, and Chile. Nearly five hundred thousand Italians and Spanish immigrants landed at Buenos Ayres during the past year. The totals of Rio de Janeiro, Montevideo, and Valparaiso were, of course, much smaller, but they indicated a marked increase in the number of people leaving Southern Europe to seek new homes in southern and middle South America, where the climate is not at all dissimilar to that of their home countries.

South America is undoubtedly entering upon a new industrial movement. Its development during the next ten years will arrest the attention of the world. Its mining

ers have been neglecting their opportunities in South America, how much more have the Canadians, who, possessing a decided advantage over their United States competitors by reason of their being a part and parcel of the British Empire, should to-day have, and can have, if the business is undertaken and conducted on broad and progressive lines, an export trade to South America which would in a few years astonish the world. A Canadian travelling in South America requires no better letter of introduction or recommendation than his nationality. He is sure of receiving a cordial reception from one and all on whom he calls, and, by reason of the control exercised by the British communities in the different countries, his representations and efforts to do business will receive a very decided preference. It is only when travelling in foreign countries that we realize the full benefits of our position as part and parcel of the Empire. I look upon it as a great asset, and one which should be taken advantage of at the present time, when the opportunities for establishing an export business are ready and waiting. To the manufacturer, who realizes the possibilities of the business to be done with a population of fifty million people, enough has been said. The question, I take it, reduces itself to ways and means and whether they want any such increased demand for their products.

Among the Industries

A fruit cannery will be established at Chilliwack, B.C., with local capital.

The Selkirk Canning Company, with a capital of \$40,000, has been organized at Selkirk, Man.

The Ottawa Paint Works, the building and stock of which were destroyed by fire recently, will be rebuilt at once.

A company will install a \$100,000 plant to carry on dredging operations in the Fraser River, where gold is supposed to exist.

The Glencoe Knitting Factory, which has been temporarily closed, will be reopened under the management of Messrs. Hamilton and Hewitt, of Arnprior.

The Bell Thread Company will locate in Hamilton, Ont. They will occupy the premises formerly used by the Ontario Canning Company.

Trenton will shortly have a new industry in the shape of a large cooperage manufacturing plant. The company will be known as the Trenton Cooperage Mills.

The plant and buildings of the Canada Brick Company, Medicine Hat, Alta, were destroyed by fire recently. The plant was new and had just been in operation a few days.

It is announced that the litigation in connection with the rolling mills at Belleville has been adjusted, and that as soon as the plant is put in shape operations will be resumed.

The new Wolverine Brass Works, recently erected in Chatham, is now operating all its various departments, with the exception of the foundry, which is not yet completed, but will be in a very short time.

The directors of the British Columbia Agricultural Association of Victoria will have at their disposal, and will spend in new buildings, this year somewhere between thirty-five and forty thousand dollars.

Mr. J. J. Drummond has announced that the Londonderry Iron and Mining Company will spend \$150,000 this summer in enlarging their plant. He expects the foundry will resume operations in the near future.

The Granby Smelter of Trail, B. C., will be enlarged this spring to a capacity of 4,500 tons a day. The smelter already employs 1,000 men, and this number will be materially increased when the changes contemplated are completed.

The Saskatchewan Power Company has been incorporated, with a capital of \$1,000,000, to develop the power of the Saskatchewan River, at Saskatoon. This is in line with the general activity of the city in providing facilities for manufacturers.

The Canadian Brick Company of Medicine Hat will rebuild at once, after suffering a complete loss by fire. The plant had just been completed, and the first kiln of bricks has just been turned out when the fire occurred. Six thousand dollars will be spent on the new plant.

The Ontario Powder Company of Kingston is to build its permanent works at Stony Point, a quarter of a mile further away from Tweed, and will so buttress or barricade the plant as will not only ensure every means of safety in the works, but prevent a recurrence of loss of property in the village.

A plant for the manufacture of wood alcohol will be installed at Fenelon Falls shortly. Toronto capitalists are interested, and operations will be commenced on a large scale.

It is believed that satisfactory arrangements will be made between the city of St. John, N.B., and R. D. Isaacs, for the establishment of the car works, which has been under discussion now for some months.

The largest shipment of silver ever made from Canada has left the Consolidated Mining & Smelting Company's plant at Trail, en route to the Chartered Bank of India, Australia, and China at Hong Kong. The shipment consisted of 140,500.70 ounces, of nearly \$80,000 value. The bullion weighed nearly five tons.

An agreement has been signed by American capitalists and the town of Campbellford, whereby the former, under the name of the Canadian Steel Rolling Mills, Limited, will erect a \$60,000 plant for the manufacture of steel plate. Power will be supplied by the municipality at \$10 per horsepower per year, besides tax exemption.

The Maple Leaf Milling Company of Kenora will rebuild in that city. The mill of this company, which when complete would have had a capacity of 4,000 barrels a day, was one of the largest on the continent. It is proposed to build a new mill as large as the one which was destroyed by fire.

The Ontario Government may erect a smelter at some central point to reduce and refine nickel ore. Now this work is done in the United States, and the small holders in particular are subjected to unfair tolls, and, generally speaking, are under a disadvantage in selling their product. A government smelter would materially improve conditions.

British-Canadian Smelters, Limited, of Toronto, have chosen a site near Chippawa, on the Niagara River, for their plant. They had intended building in Toronto, but suitable terms were not granted. The company will employ 500 men, and will do smelting and refining. The industry will take in the metal works of the J. E. Wilkinson Company of Toronto.

A company has been organized to carry on a ferry business between Brockville and Morristown, the result of an agitation which has been going on for some years on account of the previous poor service. The steamer H. P. Bigelow has been purchased, and the members of the company are Thomas L. Burns, Jr., Brockville; James J. Farrell and Charles E. Russell, Morristown.

The Marine and General Engineering Company, Limited, of Sydney, N.S., has been incorporated, with Messrs. M. B. Dickenson and John V. Calver as organizers. This company will undertake marine repairs in all its branches, the supply and repairs of mining machinery, building and structural work, boiler making, motor and electric fittings, together with the supply of castings and forgings in connection with the several branches above enumerated.

The Brockville Peat Works, where some seven or eight years ago machinery was installed and preparations commenced for using the bog, but which has since lain in a dormant state on account of the absence of a system of drying, is likely to commence operations soon. H. R. Graham, of Chicago, inventor of a quick-drying automatic apparatus, is here influencing capitalists. He has obtained an option on the bog.

An ore-reduction plant is contemplated at Bannock City, B.C.

A twelve-room brick school will be erected in Stratford, Ont., this year.

A large new freight shed will be erected in Victoria, B.C., by the E. & N. Railway Company.

Lymans, Limited, with a capital of \$1,000,000, will manufacture drugs and chemicals in Montreal.

The Canadian Stewart Company, Limited, of Montreal, has been incorporated to do a general engineering business.

A \$40,000 school building will be erected at Rockcliffe, Ont., this summer. The Ashbury College Company of Ottawa are in charge.

The Grau Jewellery Company of Toronto will establish a plant at Guelph. Local capital will be interested in the extension of the business.

The Wilson Carbon Paper Company, Limited, has been incorporated with a capital stock of \$20,000 and chief place of business Montreal.

A second fire station will be built in Regina this summer, at a cost of \$10,000. It will be equipped throughout with hose wagon, ladders, etc.

The New Brunswick Iron Mines Company, Limited, has been incorporated, with a capital of \$49,500, to carry on a general mining business in that province.

The citizens of Medicine Hat will expend \$75,000 this summer on extensions to the water works system, the gas system, and on the erection of a new market building.

The Imperial Locomotive Works, Ltd., have purchased 100 acres of land at Lachine, Que., and will erect a plant to cost \$2,250,000. The number of hands employed will be 2,000.

The Nichols Chemical Co., Limited, have increased their capital from twenty-five thousand to two hundred and twenty-five thousand dollars. It is intended to extend the business largely.

A steam auxiliary plant will be installed in Victoria, B.C., in connection with the proposed high pressure system, instead of a gas plant, as formerly decided upon. The total cost of the high pressure system will be \$70,000.

The business of J. & R. Weir, engineers, boilermakers, and machinists, has been put into a joint stock company, under the name of J. & R. Weir, Limited, with a capital of \$100,000. The new company will add shipbuilding to their other lines of activity.

Tenders have been called for the new Winnipeg union terminal station, for the G. T. P. and the Canadian Northern Systems. It will cost \$2,000,000. Work will be commenced as soon as spring sets in, and it will be pushed to completion as rapidly as possible.

The municipality of Campbellford, Ont., has decided by vote to grant a bonus to the new steel works of the Canadian Steel Company. The company will erect a \$60,000 plant at once. Cheap power and freedom from taxation will be granted by the town.

John Erwin, of Bridgetown, N.S., is organizing a company to build big iron and steel works at Fort Wade, N.S. English capital has been secured, and unless some unexpected discouragement is experienced, large building operations will be undertaken during the next couple of years.

The Robertson Machinery Co., Welland, will be taken over by the Capital Lock Nut Co., Columbus, O., who have decided to enter the Canadian field. It is understood that they will enlarge the plant at a cost of \$100,000.

Gananoque will make additions to its water works system, including the installation of a new pump.

Providing they get a free site, a free building, and a \$5,000 loan from the city, the Canadian Organ Company will establish a plant in London.

The London Concrete Machinery Co., London, will erect an addition to their building, 110 by 38 feet, two storeys high, and of cement construction.

Ketchum and Company have been incorporated with a capital of \$100,000, and head office at Ottawa, to manufacture automobiles, motor boats, bicycles, trucks, etc.

The John Inglis Co., Toronto, have been awarded the contract for the new 15,000,000 gallon pumping engine at a cost of \$147,530, and also the contract for a 6,000,000 gallon engine at a cost of \$52,700, to be installed at the Toronto water works plant.

The American Can Company will establish a branch manufacturing plant in Canada. The intention is to spend a quarter of a million dollars on the initial building and equipment, and to employ 500 hands. The American Can Company is capitalized in the United States at \$82,579,600.

HAVE COMPLETED NEW PLANT.

On July 25th last, Library Bureau of Canada suffered a complete loss by fire. Steps were immediately taken by the company to resume operations, and now buildings have been erected and a plant installed which places Library Bureau in a better position than ever to handle their business. In their new plant the buildings are arranged in the shape of a quadrangle, with an open court in the centre, giving light from all sides. At one corner the lumber enters the cutting-off room on transfer trucks direct from the dry kiln. The first machine through which the stock is put is a roughing planer to take off the rough outer surface and show the color and figure. The boards are then carefully sorted and matched. Two swing saws, a self-feed rip saw, and a 10-inch moulder are also in this room. After the lumber leaves each one of these machines, it is piled on trucks ready to move forward to the next department, where are grouped the rest of the machines. This second room is 60 x 60 feet, and contains two planers, two shapers, two rip saws, two jointers, a chain mortiser, a 60-inch sander, and a single end tenoner. Here the lumber is made ready for the cabinet-makers to assemble. Upstairs over this room is the cabinet room, where the stock goods are made.

Going downstairs again, one enters a room running at right angles to the machine room and 130 feet long by 37 feet wide. Here bank counters and contract work are put together and set up. Eight large skylights make this room as bright as out-of-doors. Just off this room and between it and the machine-room, a glue room has been built, where special glue cookers have been installed, besides large veneer presses. On to the third side of the quadrangle is the finishing room, which contains the varnish room, built so that no draft can touch the work while being coated, thus preventing any chance of the varnish cracking.

The packing and shipping rooms follow this. They lead through a large fireproof door at the end of the building to the tracks of the Grand Trunk Railway, which has a siding into the works.

On the fourth side of this square is the boiler-room and machine shop.

An office building which contains the corporation offices, accounting and cost departments and drafting room, is about 50 feet distant from the main buildings. Besides the factory and a sales office in Ottawa, the company has two branches, one in Toronto and one in Montreal.

Trade Enquiries

NOTE.—For further information regarding any inquiry mentioned under this heading or the names of inquiries, apply by numbers to the Secretary, at Toronto.

- 478 **Agent or Assistant in Manufacturing Establishment.**—Young American with first-class business experience, thorough knowledge of French, is open to take position as selling agent abroad or in Lower Canada for first-class Canadian firm. Would also take position in manufacturing office.
- 479 **Agent.**—A London firm, possessing a connection among brush and broom manufacturers, would be pleased to act as selling agent for Canadian manufacturers who can produce bored boards for brushes; and also broom handles. The firm could also handle large quantities of dowels, and of chair legs cut to specification.
- 480 **Agency for Plumbago.**—An importing and distributing firm in the port of Hull (established 1876), with several representatives continuously covering the country, desire to secure an agency for the sale of plumbago.
- 481 **Agents.**—Inquiry has been made by a London firm for the names of Canadian firms who might be willing to appoint them as buying or shipping agents.
- 482 **Agency.**—A Hull, Eng., firm, dealing in engineers' specialties, seeks the agency of a Canadian manufacturer of metallic packing.
- 483 **Agency.**—A well-known firm of import merchants in the port of Hull have made inquiry respecting the agency for a Canadian firm exporting mica.
- 484 **Agency.**—A London firm desires to secure the representation of Canadian produce exporters.
- 485 **Agency.**—A firm of wholesale produce importers and commission agents, in South Wales, is desirous of securing the agency of a first-class Canadian provision house, on commission.
- 486 **Agency.**—Inquiry has been received from a firm of general commission agents, in Egypt, for the names of Canadian produce exporters who may wish to be represented in that country.
- 487 **Agency.**—A London firm, stated to have a connection among papermakers in the United Kingdom, is desirous of taking up the agency of a Canadian exporter of wood pulp.
- 488 **Agency.**—A Scottish firm desires to secure the agency of a Canadian exporter of mica, molybdenite, etc. They are also interested in pulp wood.
- 489 **Asbestos, Copper, Etc.**—A Glasgow firm would be pleased to hear from Canadian producers of asbestos, copper, chrome, manganese and other minerals in demand. Samples should accompany quotations (with analyses).
- 490 **Asbestos Millboard.**—A Glasgow firm, with branches throughout England, asks for samples and prices of asbestos millboard from Canadian exporters.
- 491 **Asbestos.**—A firm of asbestos importers, manufacturers and merchants, well known to buyers in all parts of England, asks to be referred to Canadian shippers of crude asbestos, and also to manufacturers of asbestos yarns, powder and similar products.
- 492 **Automobiles.**—A report has come from Trinidad, B.W.I., that there is a good opening in that island for Canadian automobiles of the smaller and cheaper makes.
- 493 **Barrel Staves.**—A well-known wholesale fruit agent and importer, in London, England, is in the market to purchase a cargo of staves suitable for Almeria (Spain) grapes; dimensions, 20 in. x 3-20 in. x 3-19 in.; excellent references; prices to be quoted c.i.f., Almeria, Spain. Can be made of any wood but oak or pine.
- 494 **Beeswax.**—A Manchester firm will welcome samples and prices of beeswax from Canadian shippers.
- 495 **Broom Handles.**—A Liverpool firm asks for prices and dimensions of broom handles from Canadian manufacturers.
- 496 **Butter Patties.**—Manufacturers' agent in London, Eng., is in the market to place an order with a Canadian firm for 1-45 gross wooden butter patties. Must be made of clear white wood, and well finished, and packed in 1-gross canvass sacks; delivery to be quoted c.i.f. Manchester, England; price 6s. 6d. to 7s. per gross. These goods are required immediately.
- 497 **Canned Lobsters, Whalebone, Cotton Goods, Leather, Provisions, Etc.**—Well-known commission agent, in Paris, France, desires to hear from Canadian exporters of the above and other lines suitable for French trade, who would be glad to do business through him; has had good experience, and is in touch with the best buyers in his territory.
- 498 **Canned Pears.**—A Manchester firm invites correspondence from Canadian exporters of canned pears.
- 499 **Casein.**—A Manchester firm wishes to correspond with Canadian exporters of casein.
- 500 **Casein.**—Inquiry has been received from a London firm desirous of importing from Canada from two to three thousand tons of casein per annum, for the names of Canadian exporters of this product.
- 501 **Cattle Food Ingredients.**—A firm in the port of Hull, closely connected with the cattle-feeding cake industry, makes inquiry respecting the prospects of securing supplies of bran, sharps, middlings, low-class flour, and such like ingredients, which could be advantageously used by manufacturers in this trade.
- 502 **Carbide.**—A Birmingham firm is open to purchase carbide for acetylene.
- 503 **Cheap Malleable Castings.**—An important Sheffield firm wishes to get into touch with firms in Canada who can supply them with cheap malleable castings.
- 504 **Church Furniture.**—A South African firm of wholesale and retail furniture dealers desire to communicate with Canadian manufacturers and exporters of church furniture.
- 505 **Cider.**—A Birmingham firm inquires for Canadian cider in quantities.
- 506 **Commission Agents.**—Auckland, New Zealand, firm of indent and commission agents, with good Toronto references, desire to hear from Canadian manufacturers of good quality boots and shoes, rubbers, book leather, also stained and grained basils and strapping leather, cotton goods, who could do business in New Zealand market. This is a good opportunity and further particulars may be had at this office.
- 507 **Copper Ingots.**—A Manchester firm wishes to correspond with Canadian exporters of copper ingots or bars.
- 508 **Cordage and Binder Twine.**—A South African firm of general merchants desire to be placed in communication with Canadian manufacturers and exporters of cordage and binder twine.
- 509 **Corn and Potato Starch.**—A Manchester firm asks for prices of corn and potato starch from Canadian manufacturers.
- 510 **Dried Fish.**—Inquiry has been received from a correspondent in Malta for the names of Canadian exporters of dried fish (cod, haddock, etc.)

- 511 **Decorating Mouldings.**—A London firm, possessing a connection in the cabinet-making trade, desires the addresses of Canadian manufacturers of machine-carved or pressed decorating mouldings, and also dowels.
- 512 **Farina.**—A Manchester firm asks for samples and prices of farina from Canadian manufacturers.
- 513 **Fencing.**—A Manchester firm desires to correspond with Canadian manufacturers of woven-wire fencing.
- 514 **Fencing.**—A Manchester firm wishes to correspond with Canadian manufacturers of woven-wire fencing.
- 515 **Fish Oils.**—A firm in the North of England inquires for importers and exporters in Canada of fish oils.
- 516 **Furniture.**—A South African firm of wholesale and retail general furniture dealers desire to communicate with Canadian manufacturers and exporters of household furniture of all kinds.
- 517 **Furniture, Woodenware, Paints and Varnishes.**—Commission agent in Port of Spain, Trinidad, is anxious to hear from Canadian firms who could quote on large orders of the above products; delivery to Port of Spain; payment monthly.
- 518 **Grey-Boards.**—A Manchester firm asks for prices of grey-boards from Canadian manufacturers.
- 519 **Handles.**—A Liverpool firm invites correspondence from Canadian manufacturers of pick and hammer handles.
- 520 **Handles.**—A Liverpool firm asks for prices of pick and hammer handles from Canadian manufacturers.
- 521 **Handles.**—A Midlands manufacturing firm would be pleased to receive quotations from Canadian manufacturers who are in a position to supply regularly broom and brush handles of various sizes and qualities.
- 522 **Handles.**—Lancashire firm, importing broom, tool and implement wooden handles, invites quotations from Canadian manufacturers who are in a position to contract for regular supplies.
- 523 **Harrows and Drills.**—A Liverpool firm asks for catalogues and prices of harrows and drills from Canadian manufacturers.
- 524 **Iron-Working Tools, Wood-Working Tools and Hand-Power Machines, Building, Wall and Writing Papers and Samples, Stationery, Oilcloths, Boots and Shoes, Stoves, Oil Cakes, Ironwork, Post and Lumber Crayons, Picture Frames, Oil-Machine and Petroleum-Wood Turnings and Woodenware.**—A general merchant in Akureyri, Iceland, Europe, is in the market to purchase small quantities of the foregoing articles from Canadian manufacturers. Shipment is his own port; payment in advance.
- 525 **Laths.**—A Lancashire firm asks for prices of plasterers' laths, sawn and split, sizes 1 1/8 in. x 3-16 in., from Canadian manufacturers.
- 526 **Lawn Mowers.**—A Manchester firm asks for catalogues and prices of lawn mowers from Canadian manufacturers.
- 527 **Linseed.**—A North of England firm, in close touch with the seed-crushing industry, invites Canadian exporters of linseed to furnish them with samples, prices and other particulars.
- 528 **Linseed Oil.**—A Manchester firm asks for prices of linseed oil from Canadian exporters.
- 529 **Linseed Oil Cake.**—An Eastern Counties firm asks for the addresses of Canadian manufacturers of linseed oil cake.
- 530 **Machinist Supplies.**—A Manchester firm asks for prices and catalogues of machinist supplies from Canadian manufacturers.
- 531 **Maple Rollers.**—Offers for immediate shipments of good sound quality maple blocks for mangle rollers are invited by an English firm of actual importers.
- 532 **Maple Roller Blocks.**—A Keighley (Yorkshire) firm invites offers from Canadian shippers of maple roller blocks, in the usual standard sizes, for clothes wringers and mangles.
- 533 **Marketable Commodities.**—A Yorkshire firm is desirous of getting into touch with Canadian shippers of such like commodities as hair, spetches, horns, hides, skins, oak bark, etc.
- 534 **Mica.**—A Birmingham firm is in a position to purchase mica from large shippers.
- 535 **Manufacturers' Representative.**—Englishman, who has been living some time in Canada, is anxious to return to his native land and represent Canadian manufacturers. Good Canadian and British references. Would go on commission or salary. Age 30.
- 536 **Manufacturers' Representative.**—Old-established firm of manufacturers' representatives in London, England, are desirous of acting as London agents to manufacturers in Canada. Have good offices, and are prepared to devote any amount of time demanded to the interests of their Canadian clients. Excellent references.
- 537 **Natural Alkali.**—Inquiry has been made by a London firm concerning the production of natural alkali (carbonate of soda) in Canada, and would like to hear from likely exporters of the same.
- 538 **Oak Scantlings.**—A Hull firm, importing large quantities of oak scantlings, inquires into the prospects of securing shipments from Canada, used for the making of wheel spokes.
- 539 **Oats.**—A Manchester produce firm would be glad to get samples and prices of oats from Canadian exporters.
- 540 **Office Furniture.**—A South African firm of wholesale and retail furniture dealers wish to correspond with Canadian manufacturers and exporters of office furniture.
- 541 **Oil Cakes.**—A Hull firm, which imports and distributes large quantities of linseed oil cakes, wishes to turn their attention to Canadian products, and desires to hear from a Canadian manufacturing firm, with a view to taking up their agency. Inquirants are well known to buyers in all parts of England, and can give a good turn-over.
- 542 **Ores.**—Inquiry has been received from a Liverpool firm for the names of Canadian exporters of molybdenite, antimony, lead, zinc, wolfram and other ores.
- 543 **Pine Doors.**—A Hull firm asks Canadian manufacturers of pine doors to state their lowest price for shipments.
- 544 **Pine Planks.**—Manufacturers' agent in London, Eng., has large orders to place for cheap Canadian pine planks, 3 in. x 11 in., x 13 in., suitable for trunk interiors. This is a good opportunity for a firm having some tools to dispose of. Quotations c.i.f. London.
- 545 **Provisions, Lumber, Etc.**—An Egyptian firm has asked for the names of Canadian exporters of provisions, canned lobsters, lumber, etc.
- 546 **Pulleys.**—A Manchester firm wishes to correspond with Canadian manufacturers of wood split pulleys.
- 547 **Ploughs.**—A Liverpool firm asks for catalogues and prices of ploughs from Canadian exporters.
- 548 **Pine Doors.**—A Liverpool firm asks for prices and dimensions of pine doors from Canadian manufacturers.
- 549 **Printing and Other Papers.**—Reliable English commercial man is anxious to hear from Canadian paper manufacturers who could appoint him their selling representative in Great Britain. Has had considerable experience as representative of a good German firm and knows all the large buyers of Great Britain.
- 550 **Plumbago, Mica, Etc.**—A London export, import and commission firm, who possess an established connection among buyers of minerals in the United Kingdom and on the Continent, invites correspondence from Canadian producers of plumbago, mica and other minerals in demand.
- 551 **Round Birch Dowels.**—A Midlands manufacturer of furniture invites quotations from Canadian manufacturers who can supply round birch dowels, 7-8 inch to 1 inch.

and you have the means of checking a fire in its inception whether day or night, it notifying you electrically of the ignition.

THE GENERAL FIRE EQUIPMENT CO., Limited
72 Queen Street East TORONTO

ELEVATOR

Wilson's Rolling Steel Doors

AUTOMATIC HEAT CLOSING FOR ENCLOSING ELEVATOR OPENINGS, SHIPPING DOORS, Etc.

Or for any opening where there is not space enough for an ordinary Tin Clad Fireproof Door. Takes but 1½ inch space on either side of opening; is easily operated, and no matter in what position, **closes automatically when struck by Fire.**

It is one continuous piece of Cold Rolled Steel, Corrugated and rivetted together. **Is very strong** and under severe heat proves a most efficient Fire Stop.

THEY PAY FOR THEMSELVES BY REDUCING YOUR INSURANCE RATES, ENDORSED BY FIRE UNDERWRITERS. Send for illustrated booklet.

Underwood

"FACTS ARE STUBBORN THINGS"

The Underwood has a larger sale in America than any other typewriter. In Canada it is more generally used than all other makes combined.

It is the original visible-writer, after which a score of imitations have been patterned. The attainment of this visibility of the work necessitated a radical change in typewriter design and construction. All the earlier types of writing machines were built upside-down, with the writing out of sight.

Visible writing, combined with the many features of Underwood superiority, results in an increased efficiency of from 25% to 50% in your stenographic department. The economies effected by the Underwood make the cost the very last consideration. You cannot afford not to use the Underwood.

Facts are stubborn things—and these are facts

United Typewriter Co., Limited
Adelaide Street East
Toronto

DIRECTORY OF MANUFACTURERS

Executive Council

MARCH MEETING.

Council Meets at Montreal.—Resolution of Regret at Death of Hon. A. C. Killam.—Fake Publishing Scheme Exposed.—Application of Canada Tin Plate and Sheet Steel Co. for Bounty on Tin Plate.—Discrimination in Duty Imports.—One-sided Tariff Arrangement at Detroit River Tunnel.—New Members Enrolled.—Progress of Industrial Canada.

EXECUTIVE COUNCIL.

The regular monthly meeting of the Executive Council was held in the Board of Trade, Montreal, on Thursday, March 19th, at 3.30 p.m.

The Hon. J. D. Rolland presided, and there were also present: Messrs. John Baillie, Montreal; C. C. Ballantyne, Montreal; Fred. Birks, Montreal; Wm. Cauldwell, Montreal; James Davidson, Montreal; J. S. N. Dougall, Montreal; W. R. Dunn, Hamilton; George Esplin, Montreal; S. W. Ewing, Montreal; Joseph Fortier, Montreal; Robert Gardner, Montreal; T. S. Hetherington, Quebec; J. Hewton, Kingston; Jos. Horsfall, Montreal; J. M. Jenckes, Sherbrooke; J. J. McGill, Montreal; Robt. Munro, Montreal; J. P. Murray, Toronto; L. H. Packard, Montreal; W. H. Rowley, Hull; George W. Sadler, Montreal; J. H. Sherrard, Montreal; Louis Simpson, Valleyfield; Wm. Smail, Montreal; R. J. Whyte, Smith's Falls; W. H. Wiggs, Quebec; R. C. Wilkins, Montreal; Dan Wilson, Collingwood, and W. H. Wyman, Montreal.

COMMUNICATIONS.

Communications were reported as follows:

1. From the following members of the Council, regretting their inability to be present: Messrs. D. Morrice, Ed. Freyseng, J. O. Thorn, Arthur W. White, J. W. Cowan, Jas. McLauchlan, Wm. Stone, J. B. MacLean, Thomas Findley, H. Cockshutt, J. H. Housser, R. McLaughlin, C. C. L. Wilson, W. B. Tindall, George Booth, A. S. Rogers, S. B. Brush, J. C. Casavant, E. G. Henderson, F. E. Leonard, W. K. George, G. A. Vandry, C. H. Waterous, and John Hendry.

2. From the Brunswick-Balke-Collender Co., Toronto, calling the attention of the Association to the growing agitation for license reduction. Their letter pointed out that industries employing over \$28,000,000 of capital were directly affected by the movement. These in turn consumed large quantities of raw material produced in Canada, furnished employment to many thousands of working people, and distributed annually immense sums of money in wages. The letter concluded by suggesting that the Association should appoint a small committee, the members of which might be selected from the interests directly affected, whose duty it would be to bring about a national organization of those engaged in the hotel supply trade.

After a good deal of discussion it was decided to instruct the Secretary to advise the Brunswick-Balke-Collender Company that the Council regretted its inability to act.

3. From the Vancouver Board of Trade, enclosing copy of a resolution favoring the imposition of a duty of \$2.00 per M. on lumber, and asking the Association to endorse same. In the absence of any recommendation from the Tariff Committee, who had not had an opportunity to consider the request owing to the date at which it was received, it was decided to hold the matter over for their consideration and report.

4. From the Lord Mayor of Sheffield, thanking the Association for its assurance that the Sheffield Choir would be accorded a hearty welcome on its visit to Canada.

PRESIDENT.

The President reported that he had attended the Annual Meeting of the Canadian Forestry Association, whose work should appeal to every manufacturer in the country. He referred very briefly to the value of our forests as a means of preserving our water powers, and expressed the hope that the members of the C. M. A. would individually take a deeper interest in the splendid work which that organization was carrying on.

TREASURER.

In the absence of Mr. Booth, the Treasurer's report was presented by the Secretary. It showed receipts for the month of February of \$3,568.32 and disbursements of \$3,638.20, leaving a balance on hand of \$15,077.14. The Secretary quoted from a letter written him by the Treasurer, as follows: "As intimated at our last meeting, our present expenditures are just about equal to our revenue from members' fees, and the proposed expenditure to be incurred through the establishment of a Tariff Department will be provided for out of our surplus."

FINANCE.

The report of the Finance Committee recommended for payment the customary monthly expenditure, totalling \$1,007.49. It endorsed the action of the Montreal Branch in securing a renewal of the lease of their quarters for another year at a rental of \$550, and authorized the Secretary to purchase an improved duplicating machine at a cost of \$275. It further provided for the advance of expense money to officers of the Association when travelling exclusively on Association business. It also suggested that it be made a part of the duty of the Branch Secretaries to furnish "Industrial Canada" with a monthly letter.

PARLIAMENTARY.

Among the matters dealt with in the report of the Parliamentary Committee were the following:

Eight-Hour Day Bill.

A determined fight was being waged against this measure not only by the Association, but by other organizations, with the result that the Committee had satisfied itself that it had not the slightest chance of becoming law. At a previous meeting it had been decided to launch out on a campaign of circularization similar to that followed last year, but this was now considered unnecessary.

Bill Respecting Co-operation.

At the request of the Retail Merchants' Association, the Committee had decided to ask the Senate to refer the above measure on its second reading to a special committee in order that the views of all parties concerned might be heard and the matter thoroughly investigated. The pith of the bill was that seven persons or more might form a society without any cost, simply by filling out a schedule and depositing it with any postmaster in Canada. On being approved by the Minister of Labor, the society was given nearly all the rights of a joint stock company, and could carry on any business or trade, whether wholesale, retail, or manufacturing. The object was to do away with the middleman, and if general advantage were taken

of the Act the business of manufacturers would be seriously encroached upon.

RAILWAY AND TRANSPORTATION.

The Chairman, Mr. W. R. Dunn, presented the report of the Railway and Transportation Committee.

Referring to the death of the Honorable A. C. Killam, it recommended that the Association place itself on record in the following terms:

"The Executive Council of the Canadian Manufacturers' Association desires to place on record its profound regret at the untimely death of the Honorable A. C. Killam, Chairman of the Board of Railway Commissioners for Canada, and its deep sense of the loss thereby sustained by the shipping and transportation interests of the country at large.

"The high order of legal attainments, the unwearied industry, and the absolute integrity which he brought to the discharge of the numerous and arduous duties attaching to his important office render the loss exceedingly great, while his unflinching courtesy adds to the loss a personal tinge that causes it to be keenly felt by everyone who has had occasion to appear before him.

"In recording its appreciation of this splendid devotion to the service of his country, the Executive Council also desires to extend its sincerest sympathy to the widow and family of the deceased in their sad bereavement."

The adoption of this resolution was carried unanimously by a standing vote.

International and Toronto Board of Trade Rate Cases.

An application to the Railway Commission was made by the railways asking that Clause "H" of the order of the Board of July 6, 1907, which reads as follows: "That no special commodity rates now existing, which may be lower than the corresponding class tariff rates herein prescribed, shall be advanced by reason of the changes herein ordered, or without the sanction of the Board," be eliminated. The railways claim that this clause prevents them from making such reasonable changes in the tariffs as are usually found consistent. It was pointed out that in the readjustment of rates nearly all of the winter commodity rates had been automatically cancelled by the new lower class tariff rates. A few remained, however, but they were so close to the new class tariffs that the necessity for their existence seems to have disappeared. It was also considered that the continuance of these rates would constitute undue preference within the meaning of the Railway Act, resulting in a disturbance of the uniform basis of class rates ordered by the Board of Railway Commissioners.

A request was also made for permission to revise the minimum weights in the Canadian Classification, so as to make them as nearly uniform as possible with those in the United States Official Classification. It was represented that this was essential to the success of the international rate plan in the International Rate Case. It was thought that no serious objections would be taken to this as the increased minimums now apply under the Official Classification to all traffic to and from Canada.

The Manager of the Department attended the hearing in Ottawa and protested against the elimination of the above clause, or any change in the Canadian Classification which would bring about an increase in the minimum weights. In view of this the Commission took no action in regard to the elimination of Clause "H," but suggested that the railways, the Chief Traffic Officer of the Board, and the Manager of the Department discuss the matter and endeavor to come to some understanding. Meetings have since been held, and it is expected that a satisfactory conclusion will be come to. It was also stated by the Board that there might not be the same objections to increasing the minimums on purely international traffic, as

the idea of introducing it all over Canada for domestic traffic.

Reorganization of the Railway Commission.

The appointment of a new Chairman and the new members to the Board, as provided for in the legislation now before Parliament, practically means a new Commission. It is desirable in the reorganization of the Board that the procedures of the Commission be kept as informal and free from the formalities of courts as possible. Your Committee suggests the advisability of acting in conjunction with the executive officers to take necessary steps to see that the appointments to the Commission and amendments to the Railway Act are satisfactory to the Association.

Advance in Cartage Charges.

This matter was carefully considered by your Committee, and whilst it fully recognizes the importance of the advance in rates for the service as performed by the railways, as it was a question of local service, and affecting certain sections only, it was felt that the Association could not take any action. The payment of cartage imposed by the railways is optional with the consignee, the Railway Commission having so ruled.

Reciprocal Demurrage.

In view of the recent amendments proposed to the Railway Act, the Government was again communicated with in regard to reciprocal demurrage. Assurance was given which was considered very satisfactory.

Change in Classification.

A number of important changes in classification have been under negotiation with the railways for some time. Certain advances have been suggested to which objection have been taken by the Department. It is expected that they will be disposed of at an early date.

COMMERCIAL INTELLIGENCE.

The report of the Commercial Intelligence Committee, which was regularly adopted, read, in part, as follows:—

Weights and Measures.

In answer to a letter addressed by the Association to the Secretary of the London Chamber of Commerce, enquiring whether any action had ever been taken by His Majesty's Government along the lines of the resolution introduced by the C. M. A. at the Sixth Congress of Chambers of Commerce of the Empire, with respect to a Royal Commission on the subject of Weights, Measures, and Currency, a communication has been received reading as follows:—"I beg to say that, as a result of this and other pronouncements on the subject in influential quarters, the Weights and Measures (Metric System) Bill was introduced into Parliament in March last year, but was thrown out on the second reading. For the moment, therefore, the question seems to be dead. It may interest you to learn that, about the same time, the Association of Chambers of Commerce of the United Kingdom threw out a resolution on the subject after having passed regularly, at its biennial meetings for some years, resolutions in favor of the metric system."

Imperial Cable Service.

Your Committee has looked carefully into the proposal—which is being fathered by the Ottawa Board of Trade—to secure State co-operation and control in the matter of a single globe-girdling system of telegraph lines by sea and land, and has pleasure in recommending that the Association not only place itself on record as being heartily in sympathy with the proposition, but that it aid in giving publicity to the same through the columns of "Industrial Canada."

Festival Album—Quebec Tercentenary.

Since the last meeting the Secretary has had occasion to look into the proposition of one J. O. Leger, New York Life

Building, Montreal, who is going to issue a festival album to commemorate the Quebec Tercentenary. It purports to be gotten out under the auspices of a large number of prominent gentlemen, some of whom have been communicated with, only to state that they know nothing about the publication and never gave permission to use their names. Combined with the exceedingly high advertising rates, this has led our Committee to conclude that the scheme is one which members should look into very carefully before obligation is given in any way. It is proposed that a circular on this subject be issued at the earliest opportunity.

Trade Directories and Books of Commercial Reference.

On account of the steady increase in the number of enquiries that reach the office for information regarding foreign markets, it is suggested that the library be equipped with trade directories and books of general commercial reference on those countries with which Canada is most likely to do business. A partial list of such books has already been drafted by the Secretary, but to cover all probable requirements it is thought that an appropriation of \$100 might be voted, to be drawn on as required.

It is further suggested that a synopsis be published, either in booklet form or in "Industrial Canada," of the regulations regarding the taxation of commercial travellers in the principal countries of the world, as well as of the various provincial statutes imposing taxes on extra-provincial corporations.

Referring to the Quebec Tercentenary Festival Album, the Secretary pointed out that in the "Montreal Star" of March 18th, the questionable methods employed by the publisher had been fully exposed. Under the circumstances, therefore, he presumed it would be necessary to circularize members on the subject.

TARIFF.

The report of the Tariff Committee, as presented by Mr. Munro, read, in part, as follows:

Undervalued Pianos.

Attention has been directed to an effort of the Kruff Piano Company of Fall River, Mass., to dump their surplus production of pianos on the Canadian market. Circulars have been issued broadcast to the music trade in this country advertising mahogany veneered uprights at as low a price as \$81. This matter has been brought to the attention of the Chief Inspector of Customs, who has promised to investigate it promptly.

Bounty on Tin Plate.

A communication has been received from the Canada Tin Plate & Sheet Steel Co. of Morrisburg, asking the Association to endorse its application to the Government for a bounty of ½c per pound on its entire production of tin plate. Your Committee is of the opinion that the policy of granting bounties is one that should only be entered upon with extreme caution, and very careful enquiries will first be made among members of the Association who are likely to be affected, before giving the Morrisburg Company an answer.

Colored Cotton Wool Waste.

Complaints have been received that cotton wool waste of assorted colors is being imported free through certain ports, whereas it is made dutiable when brought in through certain other ports. Your Committee believes that this material which consists of scraps of various colors all mixed in such a way that it would be unprofitable to separate it ought to come in free, but as the tariff now stands it is clearly dutiable. It is recommended that when the new Department is created the services of the Association be lent towards securing an amendment to the Act, which will take care of importations of this kind.

Imitation Horse Hair.

In behalf of one of our members from the Province of Quebec, a complaint has been taken up with the Department regarding the rates of duty applied respectively to an imitation horse hair yarn, and the braid made therefrom. On the strength of a ruling given by the former Assistant Commissioner of Customs, that the yarn would be dutiable at 20 per cent. and the braid at 35 per cent., the firm in question purchased a plant to manufacture this article, only to find after a year's operation that a new ruling had been issued allowing the braid to come in free. Meanwhile, the yarn was continued dutiable at 20 per cent. The matter was gone into personally by the Secretary with officials at Ottawa, with the result that the braid is to be restored to the old duty of 35 per cent.

Detroit Tunnel.

Further investigations into the above matter disclose the fact that the arrangement is even more one-sided than at first supposed. The total importations of United States material coming into Canada free of duty for the purposes of this tunnel amounted to \$148,000 up to the first of March, whereas from correspondence with the Department at Washington, it would appear that not one cent's worth of Canadian material had been taken into Detroit up to the 6th of March free of duty. The regulations in effect by the Customs Department at Washington, under which the Canadian Government claimed it was justified in entering into a reciprocal arrangement, apparently provided only for the free importation of tools and materials entering into the construction of that part of a bridge immediately over the river or of a tunnel immediately under the river. Yet item 596 of the Canadian tariff was interpreted so liberally by the Department that materials entering into the construction of the three-quarters of a mile tunnel between the Canadian portal and the Canadian water's edge were being admitted free of duty. Your Committee will point this out to the Government and press for a cancellation of the present arrangement. The entire contract will amount to about \$12,000,000, of which it is safe to say fully \$3,000,000 will be absolutely on Canadian soil, and when so many of our factories are running short time, and so many of our workmen are out of employment, it is to be regretted that some effort is not made by the Government to direct this business into Canadian channels.

Duty on Brass.

In view of the continued inactivity of the Canada Brass Rolling Mills, in whose interest item No. 349, providing for a duty of 10 per cent. on brass bars, rods, and sheets, was framed, it is recommended that application be made to the Government for the cancellation of the duty on this material.

Tariff Department.

Your Committee regrets that it is not yet able to bring in a final recommendation as to the engagement of a Tariff Officer. The matter has been under consideration on two different occasions, and the applications received have now been narrowed down to two. The parties concerned will be given an opportunity to appear before the Committee at an early date. It is confidently expected that the Committee will be able to bring in its recommendation at the next meeting of the Council.

Technical Education.

The report of the Technical Education Committee referred with satisfaction to the discussion which had taken place in the House of Commons following Mr. Guthrie's resolution favoring the appointment of a Commission of Enquiry. While no decision had been reached, it was known that the proposal was well received, and should there be an opportunity of continuing the debate there was every likelihood that the resolution would carry.

Trade School for Printers.

Members of the Committee had discussed with officials of the University of Toronto a proposal to establish in connection with the University a small printing shop, where all college work could be taken care of. Their idea was that the University should inaugurate in connection with the shop a thorough system of apprenticeship for compositors and pressmen. It could be conducted under the supervision of the Dean of the Faculty of Education, and in that way would serve the double purpose of training a corps of men that could be drawn on to supply the needs of commercial printing shops, and at the same time of testing the practicability of having a curriculum of technical instruction in connection with the Provincial University.

RECEPTION AND MEMBERSHIP.

The report of the Reception and Membership Committee recommended for acceptance the following applications:

"INDUSTRIAL CANADA."

A steady improvement in the paper's finances was the feature of the "Industrial Canada" Committee's report, the revenue for March showing an estimated surplus of \$161, as against \$6.00 in February and only 29c in January. While the surplus was still \$100 less than it was for the corresponding month in 1907, it was evident that the paper was quickly recovering from the loss it sustained by there being no advertising solicitor for several months.

Progress was reported regarding the compilation of material for the special Trade Index Number, which was to appear in June instead of May, as first announced. With the steady improvement of the paper, it was thought that the time was opportune to endeavor to extend the paper's paid circulation, and an effort in that direction would be made at once. Plans were announced for brightening the paper in a number of ways, as, for instance, by the regular insertion of cartoons, by enlarging the department known as "Among the Industries," by the publication of photographs each month of business men prominently before the public, and by the insertion of a regular letter from the Branch Secretaries.

The report of the Montreal and Toronto Branches, as

presented by Mr. Ewing and Mr. Murray, respectively, were received.

On motion of Mr. Rowley, a unanimous vote of thanks was tendered the Montreal Board of Trade for the use of their room, after which the meeting adjourned.

MONTREAL BRANCH.

The opening of the Quebec Legislature has required the usual vigilance on the part of the Montreal branch to watch all proposed legislation in the interest of our manufacturers.

The system of valuation for taxation purposes in the province has been very indefinite, especially in regard to the question whether machinery should be considered as part of the real estate. This matter was given careful consideration, and a deputation from the Montreal and Quebec branches waited upon the Attorney-General on March 5th and urged that the Municipal Code should be amended in such a way as to remove any ambiguity in the present law, and also requesting that the clause of the Municipal Code be enforced which requires that the by-laws of the different municipalities must not contain any provisions inconsistent with the Municipal Code.

Regarding the petition presented last year to the Premier by the Montreal branch regarding the removal of the grievances existing in connection with garnishment of wages for debt, we have received assurance from the Provincial Government that the matter is now under their immediate consideration.

It has been decided to petition the Dominion Government in connection with other commercial bodies of the City of Montreal that a branch line of the Grand Trunk Pacific Railway to Montreal be constructed either before or simultaneously with the building of the Eastern Division of that railway.

At the last meeting of the Montreal Executive, on March 12th, Dr. Howard T. Barnes, of McGill University, came before the committee regarding the work of the British Science Guild, and a unanimous resolution was passed approving of the aims and work of that Guild, and recommending same to the Executive Council for endorsement.

TORONTO BRANCH.

At the regular monthly meeting of the Executive, consideration was given to the new Elevator Inspection By-law which the City Council is considering. This measure proposes to put all factory elevators under the inspection of a special civic inspector, and to permit only experienced operators over 18 years of age to have charge of elevators in all buildings, one operator being required for each elevator, regardless of the extent to which it is used. Heavy penalties are provided for infractions of the by-law, and fees are charged for licenses and transfers of same. As the measure will entail unnecessary expense and trouble for the manufacturer, and as the Factory Inspector's jurisdiction over elevators would conflict with that of the city inspector, the branch will seek to secure modifications in the by-law to cover its objections.

Mr. E. A. DuVernet, K.C., will address the Branch on "The Relations of Labor and Capital in Ontario," following an informal dinner at McConkey's, on Thursday, March 26th. Mr. DuVernet will bring the subject right up to date.

The Executive is co-operating with the Board of Trade and other business organizations in the city in an endeavor to devise a more businesslike system for distributing charitable relief, and thus overcome the overlapping which was so evident in Toronto this winter. It is hoped to have a permanent commission appointed.

TO the General Public the Dunlop Company is best known through its successes with Solid Rubber and Pneumatic Tires and Rubber Heels. This is a good impression to have abroad because the General Public is an unfailing good customer for these lines. But by the trade the Dunlop Company is to be associated with the rubber business in a wider and more general sense. The Mechanical Rubber Goods Department occupies half of the Dunlop Rubber Works.

Model "M," Touring Car

THE
Oldsmobile

FIRST COST
VS.
UPKEEP

In purchasing an Automobile it is well to remember that the cost of upkeep is just as important as the first cost, if not more so.

This same cost of maintenance has discouraged many who would like to enjoy the pleasures of motoring, but there is always some good and some bad in everything and this applies to the motor car. There are some cars which eat up a sum equal to their first cost to keep them running a season but there are also cars where this expenditure is almost nil.

To this latter class belongs the Oldsmobile, which claim you will say is made by every automobile manufacturer, but is he able to back up his assertion and can he prove this claim to your satisfaction? We can. We claim that an Oldsmobile will not cost as much to keep in repair and adjustment as the average man spends for car fare and to fully convince you of the truth of our statement, we take the risk—not you.

Our proposition is as follows :—For one year from the date of your purchasing an Oldsmobile we will undertake the entire responsibility and expense of keeping that car in adjustment and repair for **ONE DOLLAR A WEEK**. Whether your spark coil needs adjusting or your engine overhauled this amount covers your outlay.

Above is only one of the many arguments in favor of the Oldsmobile. If you would learn more about it visit our salesrooms and we will convince you of its superiority as an investment over any other car in the Canadian market. Send for our Catalog, and name of nearest agent.

CANADA LEADS THE WORLD IN TELEPHONE INVENTION

CANADA invented the telephone. In thirty years it has encircled the world, commanding the profitable investment of hundreds of millions of dollars and to-day is one of the great factors in our civilization.

CANADA invented central energy automatic telephony, which in the next ten years will encircle the world, saving vast sums of money both in first cost of installation and in cost of operation and maintenance.

The Canadian Machine Telephone (recommended for exchanges of 200 telephones or more) automatically does the work of the "hello" girl better, quicker, more accurately and more economically and tells no secrets.

Are you interested in telephones? Write us for full information.

We are building up a great Canadian industry and will appreciate an enquiry from you.

THE FOUNDATION OF A GOOD BED

The foundation is the most important part of a building. It is on the foundation that the whole weight of the structure rests. A fault in the foundation means the entire building at fault.

\$8 - A "BANNER" SPRING BED - \$8

is the foundation of a good bed. A "BANNER" Bed is the right principal to begin with, because spiral springs are the only ones which will not sag in the middle—will not stretch out of shape—will not lose their springiness.

The "BANNER" is the perfect spiral spring bed. It is made of best quality 100 spiral springs. These are oil tempered, like a razor blade—japanned to prevent rust—and rigidly attached to flat steel bands, which in turn are riveted to angle iron sides. This method of construction also enables the "BANNER" to fit any iron bed without the use of slats.

If you want a bed that is noiseless—that will hold its shape—that will always be easy and comfortable—and that is guaranteed for a lifetime—you should certainly buy the "BANNER" Spring Bed. The price is \$8.—anywhere. This trademark is your guarantee of satisfaction.

IF YOUR DEALER WON'T SUPPLY YOU, WE WILL. WRITE TO OUR MONTREAL OFFICE.

The ALASKA FEATHER & DOWN CO. Limited

Factories at Montreal, Toronto, Winnipeg.

THIS IS A "QUALITY BED"

and built on light, graceful lines, it looks well and wears better. Examine the joints and the bending carefully; that's a test for a brass bed. "Quality Beds" will stand that test.

THE EDITORIAL VIEW-POINT.

The Outlook.

NOW that the winter, which was a hard one, is over, business people are asking what the spring and summer have in store for them. The trade depression of the winter came on with a suddenness unknown in former times of stress. As one manufacturer put it, "Business dropped from prosperity into stagnation over night." Will the return of prosperity come with equal suddenness? That is something everyone would like to know, but no one can tell. Everything points to a return of good times and increased business activity in the near future, but caution has got such a firm hold on the business community that there is no one brave enough to discount the prospects of the future by launching out at the present time. The orders which travellers are booking at present are mostly of the hand-to-mouth kind, and very few are getting large placing orders for full delivery. This holding back of orders is a great hardship to manufacturers, who are unable to estimate what the requirements of the trade will be when the time comes when demands for immediate shipment will be made upon them by their customers who are afraid to order now. It also means that many merchants throughout the country will be disappointed next fall when they will be unable to obtain the goods their trade demands.

That there will be a demand for all kinds of merchandise in the near future no one can doubt who is at all familiar with present conditions and prospects. Since the beginning of the year upwards of \$100,000,000 has been secured in Europe for expenditure in Canada. Most of this is going into railway construction and within a couple of months it will begin to be distributed in wages to workingmen and for supplies. In the West seeding has commenced and the crops will be in a full month earlier than they were last year, which promises an early and abundant harvest. An early harvest means one that is saved in good order and in time to be marketed under the most favorable conditions. In addition advices from the West tell us that the acreage under crop this year will be very much in excess of that of last year. Immigration, too, is coming in in a steady stream, and of a better class, so far, than in former years. Seldom indeed have the prospects for a prosperous year been brighter than they are at present, and the holding back of orders in the face of this cannot be explained in any other way than that caution has grown into cowardice. The few who have the nerve and the foresight to make preparations now to meet the demands which will be made upon them within a comparatively short time will reap a rich harvest.

Other People's Money.

SOME people take the view that the large loans which we have been negotiating in foreign countries are not a good thing for Canada. A prominent business man, discussing this phase of the question the other day, pointed out that, with the balance of trade against us, these loans became a mortgage upon our future, and that the interest charges would eventually become a heavy drain upon our resources. Under certain conditions this reasoning is sound enough; but the money that is coming into Canada at the present time is for investment, and does not come under the head of an ordinary loan. Money that is put to work in developing the country earns its own interest without taxing any enterprise that existed before its coming. The more money that we can induce to come here for judicious investment, the better for all of us. That a portion of the profits made on the development of our latent resources has to be paid out in interest is no hardship, since without the capital there would have been no profits at all. Some people have a habit of looking on borrowed money as an obligation that has to be repaid with interest. When money is borrowed on the credit of some established enterprise, and invested in some other undertaking that turns out a failure, it becomes a burdensome charge; but it is an altogether different proposition

when it goes into an enterprise on the successful development of which it has to depend for its return with profit. The millions that are coming into Canada are for the development of the country, and all of us will be made richer by their employment here.

The Grand Trunk Board.

AT the meeting of the Grand Trunk in London recently, someone proposed that the Grand Trunk Board should be moved to Canada. Sir Rivers-Wilson, the chairman, vehemently rejected the idea. Nothing could be more insane, he said, than for the English shareholders to lose control of the concern. The half-yearly meeting would consist of paid officials and no one else. It would be a mere bogus Board, and the change would be deadly to the credit of the company. Most Canadians think it is insane on the part of the Grand Trunk shareholders to keep the Board in London. However, that is a matter for themselves to decide. So long as they are satisfied to play a losing game, it is no one's business but their own. The C.P.R. shareholders, however, prefer a Canadian Board of capable Canadians, who earn dividends for them. Possibly the Grand Trunk shareholders consider that the fun they get out of the semi-annual meeting in London more than compensates them for the loss they sustain through not turning the Board over to Canadians, who would run it on a dividend-earning basis.

The Advertising Grafter.

THERE is possibly no calling that breeds so many schemes as the advertising business. Every manufacturer has had a host of schemes brought to his attention whereby he was to be immediately made a millionaire. It is safe to say that ninety-nine per cent. of these are utterly worthless. In the United States this class of grafters got to be such a nuisance that the manufacturers who were larger advertisers got together and formed an association for their mutual protection. This association recognized as legitimate three mediums, namely: regular publications, such as newspapers, magazines, and trade journals; street cars; and bill-boards. With this pronouncement came the death-knell of many time-honored schemes, and the big advertisers of the United States ceased to be marks for the grafter. In Canada, unfortunately, the grafter still finds profit in his schemes, and he brings a new one forth on every conceivable occasion. No event of national importance is allowed to escape these industrious gentlemen, and it is not surprising to learn that the celebration of the Tercentenary of the Foundation of Quebec is to be commemorated by the publication of an album, in which a limited number of only the important firms will be permitted to purchase advertising space. The circular which has been going to leading manufacturers and business men all over Canada soliciting advertisements, promises that the work "shall be above all other publications the most artistic and literary which have been published up to the present day." Dr. R. Villecourte, Laureate of the Academy of Medicine, of Paris, "one of the most learned writers that we possess in Canada," has the publication under his direction, and J. O. Leger, with offices in the New York Life Building, Montreal, signs the circulars as general agent. The work is to "contain a synopsis of the history of Canada from Jacques Cartier down to our day," together with innumerable pictures and unpublished documents. This is certainly a big programme to get into one book, but the promoters were not satisfied with making their promises unbacked by a liberal supply of patrons for the work. The list of patrons would occupy too much space for publication here. It is

headed with Earl Grey, Governor-General of Canada, Sir L. A. Jette, Lieutenant-Governor of the Province of Quebec, and the Rt. Hon. Sir Wilfrid Laurier. Then follows in order a list of the Federal Cabinet Ministers, the Ministers of the Quebec Legislature, a contingent of Senators from Quebec, the mayors of Quebec, Montreal, Ottawa, and Toronto, a bunch of M.P.'s and prominent citizens of Quebec, and winds up with the Roman Catholic Archbishops of Montreal and Quebec, and the Anglican Lord Bishop of Montreal. That there are some errors in the list, such as describing the Speaker of the Senate as the "President of the Senate," does not seem to shake the general agent's confidence in the accuracy of the history he promises. But there is a still more striking inaccuracy in the list, which will shake the confidence of the public in the whole scheme. This inaccuracy consists in the names themselves. Earl Grey says that the use of his name was unauthorized; the Lieutenant-Governor of Quebec says he never consented to be a patron; Sir Wilfrid Laurier says he has no connection with it; the Archbishop of Montreal says he is not a patron; the Anglican Lord Bishop of Montreal never heard of the work; the Minister of Marine & Fisheries says that he cannot discover that he ever gave his consent; the Minister of the Interior says he has not consented to be a patron; the Postmaster-General never authorized the use of his name, likewise the Minister of Railways and Canals. The Archbishop of Quebec has been out of the country for five months, and the Consul-General of France left Canada for good a year ago, and his successor has not yet arrived. This wholesale use of the most prominent names in Canada seems a daring stroke for even a man with an advertising scheme, and it called for some explanation. Mr. Leger has given it. He says he had written each of the personages mentioned in the prospectus. "I informed them that if they had any objections to serving as patrons they might write me to that effect. If they had no objections I would use their names without further notice. As they did not inform me that they objected to the use of their names, I have gone ahead and put their names down as patrons." This left-handed method of securing patrons ought to be sufficient warning to manufacturers and business men generally, who have been invited to purchase advertising space in the work. The promise that it will have a circulation of 100,000 copies is not guaranteed by anything more substantial than the circular itself, which contains the names of the prominent people who have thought it prudent to repudiate such use being made of them. Manufacturers who have money to spend on advertising will do well to spend it on the recognized mediums. Programs, souvenir publications and a host of other schemes take thousands of dollars annually out of the pockets of manufacturers and merchants that might with equal profit be thrown into the street.

Labor Union Labels.

CLASS legislation is abhorrent to a free people, and as Canadians claim to be the freest people on earth, Parliament should hesitate before it gives its sanction to any act that places any one class in the community on a higher plane legally than any other. Mr. Ralph Smith, M.P., has introduced a bill into the House of Commons of Canada, the object of which is to place the products of approximately one-eighth of the working people of Canada on a higher plane than that of the other seven-eighths who are equally as skillful. The bill is entitled "An Act Respecting Labor Union Labels," which aims to give a legal recognition to Trade Union labels, and to vest the absolute control of the same in legally irresponsible associations. If this Act once passed into law, the labor unions would have a weapon which would enable them to coerce and even ruin employers. The uses

to which a legalized Union label could and would be put, are so far-reaching and dangerous that Parliament should hesitate long before giving its sanction to any such legislation as that proposed by Mr. Smith. He very plausibly explains that it is a harmless little thing, that the manufacturer employing union labor is at liberty to accept or reject it when offered its use by his employees. It is merely a permissive act, there is nothing compulsory about it. If all this be true, why then pass the act at all? Surely it is only wasting the time of Parliament to occupy it with matters of such indifference. No one is going to be led astray by smooth talk of this kind. The purpose of the Union label is to place a mark upon the products of unionism, to the disadvantage of all others. It is not a guarantee of quality, of workmanship, or of anything in which the purchaser is interested. Its sole purpose is to advertise the fact that unionism has got control

of the factory from which the product that bears it is turned out. With this distinguishing mark upon the products of unionism, the way is made easy to carry on a boycott against the products of independent labor. Why should Parliament take sides in the dispute between unionism and independent workmen? By passing this act it would be ranging it self on the side of unionism and aiding it to drive independent labor into a corner, where it would be crushed. Without this label the products of the open shop and the union shop are placed on the counters of the merchant side by side, and quality makes the sale. While the label does not guarantee quality, still it can be used as a means of forcing the merchant to refuse to carry a line of products that does not have it, by threatening to boycott his store. That this would be done, we cannot doubt, in the light of what has already been attempted. We have before us a circular issued by the Label

Committee of the Winnipeg Typographical Union No. 191, and addressed to advertisers generally. The circular contains a resolution passed by the Canadian Society of Equity, said to represent 5,000 farmers of Western Canada, which, after naming several publications, concludes "all of which are published in Winnipeg, Manitoba, do not carry the label of the International Typographical Union, and are the products of non-union labor. Therefore, we, as loyal union farmers, and desiring to co-operate with organized labor, do hereby resolve not to patronize any of the above non-union publishing houses." This circular has been mailed broadcast to advertisers, with a view of injuring the business of the publications it names. And this is the kind of thing Mr. Smith asks Parliament to aid by passing an act to legalize the label that makes it possible.

What the Act Really Means.

MR. SMITH'S bill can in no sense be said to be in the general interest of Canada, and that is the interest in which Parliament is supposed to legislate. On the contrary, it is an act in the interests of a comparatively small proportion of the people of Canada, and against the interests of the vast majority. It is dangerous to our industries, to our foreign trade, and to the thousands of skilled workmen who are fighting to maintain their independence of action. To pass such an act would be an offense against the liberty of the independent workmen, of the merchants, of the manufacturers and of the public generally. It is scarcely conceivable that Parliament could be guilty of such a great blunder as to place the seal of its approval upon the instrument, innocent as it ap-

pears, which unionism has invented for the coercion and oppression of all who refuse to bend before it.

Woolen Manufacturers and the Tariff.

THE preferential tariff was a hard blow to the woolen manufacturers of this country. Some mills were forced to close down as a result of it, and others have struggled along under the most unfavorable and unfair conditions. In addition to the hardship which our manufacturers have to bear by reason of the preferential tariff, they have also to face the unfair competition of the British exporters, who have been "dumping" woollen goods into Canada at much lower prices than are obtained in the British market. The average customs appraiser is not competent to pass judgment on the qualities or value of woollen goods, and the "dumping" goes on unchecked. This state of affairs

has been borne by the woolen manufacturers with as much patience as possible; but the time has now arrived when the Government must give them some relief, or see one of our most important industries wiped out. A deputation, representing the woolen manufacturers of Canada, waited upon the Government last month, and laid the whole case before the Ministers. They asked for a reasonable increase in the present duties, which would ensure a fair amount of protection. They also asked that the Government add to the staff of the customs department men familiar with both woolens and cottons, and competent to detect under-valuation in these lines, and stop the "dumping" that is now going on. The request is a reasonable one, and if the Government realizes what a vital matter it is for this branch of industry, they will surely see the justice of the demand and accede to it.

HARD ON THE WOOLLENS.

MISS CANADA:—Ch, dear me, Mr. Fielding, this will never do. Look at the way it has shrunk.

Cotton Duties and the Farmer.

ONE of the favorite complaints of the farmers of this country is that they, as the chief consumers, pay out of their pockets the whole duty levied on cotton goods. That this is one of the wildest statements made by opponents of protection, is well known to those familiar with the trade. While the duty is 25% nominally, the actual protection to Canadian cotton is not more than 10%, which is all the Canadian consumer is out of pocket by reason of the duty. To illustrate this we have before us an actual transaction which makes the situation clear. The Canadian Cotton Company was asked to quote a price on Turkey red cotton cloth to compete with an English line which is being imported. The English goods are being laid down, paying a duty of 25%, at 5.60c. a yard, and to meet this the Canadian company quoted a price at 5¼c. The English price is a cut one made by the largest manufacturer of Turkey reds in the world, in an effort to secure the Canadian market with a view to future profits. The Canadian price is also a cut one to meet the English, plus a protection of about 16%. At regular prices, that is, if the English firm were not cutting prices, the price at which the Canadians would have to sell would show a protection of only 10%. The consumer, therefore, instead of paying the whole duty, as he claims, pays only a small fraction of it, and this is made up to him many times over by reason of the larger home market which the factories ensure him.

Touching the Farmer.

THE farmer is himself the beneficiary of the protective tariff both directly and indirectly. A striking instance of how closely his interests are bound up in those of the manufacturer was brought to the notice of the Government recently, through a statement laid before them by the pickle manufacturers. Like the woollen men the pickle manufacturers of Canada have been seriously handicapped by the workings of the preferential tariff. There are some twenty pickle factories in Canada, in which upwards of half a million dollars is invested. These factories furnish a ready and profitable market for the vegetables grown in this country, and if they were forced out of business through the unfair competition which they have to meet from the large importations of cheap British pickles, the farmers would be the ones to suffer most severely. The Canadian manufacturer of pickles has to pay a high price for his glass, labels, corks, spices, and cases, all of which are protected by the tariff. In England all of these come in free. Besides, in Canada vinegar is an excise article, paying an excise duty of 4c. per proof gallon, and in addition each factory has to pay a license fee and officer's salary amounting to \$650.00 per annum. In England, vinegar is not an excise article, and is therefore free of the tax. Labor in England is also cheaper, and the result is that the Canadian pickle manufacturer is up against a terrible handicap. England gets her vegetables from Holland, Germany, and France, and her glass from Germany. The result is that what are known in this country as English pickles are really Dutch, German and French vegetables, packed in German glass and shipped out to this country in Norwegian-made cases. The only thing British about them is the vinegar, and that is allowed to escape the customs duty of 10c. per proof gallon, because it is allowed in under the classification of pickles. It was not the intention of the framers of the preferential tariff to extend its benefits to the Dutch, German and French farmers, to the detriment of our own farmers, but that is the way it has worked out, for it is the products of these countries that are really enjoying it under the name of British pickles. Moreover, vinegar is the only excise article that is allowed to come in under the preferential

tariff, and then only when it comes in as a part of a consignment of pickles. It will be readily seen from the foregoing that the manufacture of pickles in Canada under existing conditions must be unprofitable, and cannot last unless the Government puts on a duty large enough to offset some of the disadvantages it is under at present. A petition signed by more than twelve hundred farmers has been sent to the Government asking that the duty on British pickles be raised to 40%, and that the duty on those from other countries be made correspondingly higher. If this is not done they realize that they will lose the market for one of their most profitable crops. It is gratifying to find the farmers joining with the manufacturers to ask for protection. It shows that they are beginning to realize that the preservation of Canada for Canadians is the policy that benefits the whole community. We understand that the Government has been asked to act in this matter forthwith, and that if action is not taken at once, some of the largest factories in the country intend calling the farmers together and explaining that they cannot carry out their contracts, and advising them to find some other use for their land. They feel that it is only fair to warn the farmers before seeding time not to plant vegetables for which there will be no market, if the Government fails to come to the relief of the pickle manufacturers. In addition to the farmers, the glass and vinegar manufacturers, the distillers, the lithographers, printers, cork cutters and box manufacturers will all be losers, for everything about Canadian pickles is Canadian except the spices, which have to be imported, and pay a duty of 12½%.

At the Expense of Canada.

PRESIDENT Roosevelt sent a short message to Congress recently which contained this significant paragraph: "I am of the opinion, however, that one change in the tariff could, with advantage, be made forthwith. Our forests need every protection, and one method of protecting them would be to put upon the free list wood-pulp, with a corresponding reduction upon paper made from wood-pulp, when they come from any country that does not put any export duty upon them." This is a pretty plain indication that the President's idea of preserving the forests of the United States is to do it at the expense of Canada. He also recognizes that if we are alive to our own interests we will immediately put an export duty on wood-pulp and pulp-wood, and he provides against this contingency, or perhaps he thinks to scare us out of protecting ourselves. It is to be hoped that we will have the common sense to take measures to prevent our forests being sacrificed for the protection of our neighbors. All we have to do is to close the door against our raw material going out, and before long we will be supplying our neighbors with paper. Let us not lose sight of the fact that it will not be long till we have the whole press of the United States campaigning for us. They must have paper and if we do not give them the raw material to make it out of they will have to come to us for the finished product. We have it all in our own hands.

The Responsibility of Directors.

HOW many men have joined the boards of banks and other financial institutions with a full realization of the responsibilities they assume? It is safe to say that very few of those whose names appear on boards of directors gave the serious consideration they should have given to the responsibilities of the position. The honor, and in some cases, possibly, the fees, were the only consideration taken into account. Acting as a director was looked upon as a mere formality. In the case of a bank everything was left

to the manager. He submitted reports and made suggestions, and everything he proposed was carried and that was all there was to it. It was something to be proud of to have one's name on the board of directors of a prominent bank, and the honor was eagerly sought by men of prominence and ability. In future, however, the serious side of a directorship is not likely to be lost sight of. The Court of Appeal of Nova Scotia has just handed down a decision in connection with the failure of the Yarmouth Bank that is calculated to set the directors of banks everywhere in Canada thinking. The judgment holds that, in addition to the double liability on their stock, the directors of a wrecked bank are also responsible to the shareholders for losses which are directly traceable to negligence in the administration of the bank's affairs. The judgment points out further that, while under ordinary circumstances, a director is not obliged to examine the books, when anything occurs to arouse his suspicions it becomes his duty to investigate and take prompt action in the matter. It is no defence to plead that everything has been left to the manager, and that his word was taken as to the condition of the bank's affairs. This decision will bring home to the directors of the banks, and of other institutions in which the public have invested money, that a directorship carries with it duties of a serious and responsible character, and that neglect to perform these duties renders the directors liable. Men of substance will not be so eager to go on boards in the future, and having done so, they will keep a close eye on the affairs of the institution which they are supposed to direct.

Unjust Freight Rates.

COLONEL J. S. PARK, of the Allan Line, according to a London cable, has been defending what is known amongst shipping men as the deferred rebate system adopted by the Canadian lines. He admitted that there were lower rates for goods sent to the interior than to Montreal. These rates, he explained, were the result of excessive competition. The reason for the rates is of little interest to the Canadian manufacturer. What interests him is the fact that his British rival can ship goods from London to the West for less money than he can have his goods shipped to the same points from Montreal to Toronto. Taking the average the year round the British manufacturer has decided advantages in freight over the Canadian manufacturer. He can ship his goods into the Maritime Provinces cheaper than the manu-

facturers of Quebec, Ontario or Manitoba, and he can ship into these provinces cheaper than the Maritime Province manufacturer can. Taking Winnipeg as the centre of Canada, the British manufacturer can get, in summer, sometimes, a through rate of freight from Liverpool, London or Glasgow to Winnipeg cheaper than the Province of Quebec or Ontario manufacturer can; and in British Columbia the British manufacturer, using tramp steamers, gets a freight rate that is far cheaper than any Canadian manufacturer can obtain. Shipping men contend that these rates are necessary to secure traffic for their lines, but it is hard to make the Canadian shipper understand the justice of a freight rate which carries goods from Liverpool to Winnipeg

cheaper than from Montreal to Winnipeg. It is unnecessary to point out how this hampers the Canadian manufacturer. His protection under the preferential tariff is so small that it requires only a very slight difference in freight rates to leave him without any at all. The Railway Commission should see to it that goods delivered to the railways from steamships are not carried to the West for less than goods delivered to them from Eastern factories. With rates for the rail haul the same, the Canadian would have the advantage of the ocean rate, which would make it worth while to have his factory in Canada. As it is to-day, so far as freight charges are concerned, he might as well, and in many instances he might better have his factory located in England. The shipping men say the railway and express companies are to blame for quoting rates without consulting them. If this is so, surely the Railway Commission has the power to stop it, by ordering that Canadian goods get the same rate over the Canadian lines as are granted to manu-

facturers from abroad. It is an injustice to our manufacturers to allow this discrimination to continue.

South African Manufacturers.

IN South Africa they have a manufacturers' association called the Natal Manufacturers' Association, the report of the second annual of which, reprinted from the *Natal Mercury*, of February 12th, is before us. The report makes interesting reading, and indicates that the same problems confront the manufacturers of that far-off sister colony as confront ourselves. The most of the report deals with the custom tariff of 1906—the first attempt at a protective tariff made by

A THANKFUL HEART.

UNCLE SAM:—I hate to lose my children, but I'm glad they're going to a country with such a low tariff wall that I can step over and furnish 'em with all the goods they need.

the colony. It is declared to have proven a great benefit in as much as it has placed the industries on a more solid footing. It is pointed out that while the two years' experience they have had of protection has been useful in showing what can be accomplished under favorable circumstances, there is still much to be desired. One of the stock arguments of the Free Traders, the report says, is that the manufacturers are never satisfied but are always asking for more, which reminds us of arguments we have heard in Canada. It is pointed out that the only manufacturers who are complaining are those who ask for 25% protection, and got only 10%, and their continued demands are not for more, but for the full amount of what they originally asked. One of the most immediate benefits of the tariff was the relief it brought during the depression following the war. It enabled the industries to expend over three million pounds sterling per annum in wages and local raw material, and to afford employment for 7,000 Europeans, who would otherwise have been destitute. The Chairman, in moving the adoption of the report, said that it would be readily admitted that the backbone of any country was its industries, and the seconder of the motion added, that it took the public a long time to learn a lesson thoroughly, but he thought that they were learning the lesson that they had only themselves to thank for the depression and its evils. The carrying trade was an inelastic quantity, and they could not expect to go on importing their supplies without exhausting the capital they had made by the development of the mines and by the war. If they had conserved that capital earlier—if a protection tariff had been imposed when times were good in 1903—he questioned whether the depression would ever have been experienced. The pinch of poverty had driven the lesson home.

The British Preference.

A CURIOUS idea, judging by some recent English speeches and press comments, is taking hold of the British public with regard to preferential trade with the colonies. The idea is that the colonies are only waiting for Britain to give them a tariff preference before throwing down the tariff wall which bars out British goods. How this idea ever came into being is as impossible to say as it is unlikely ever to be carried out. The policy of Canada, backed by the vast majority of the people of this country, is to build up our own manufacturing industries, and no country, not even Great Britain, can hope to cater to this market on even terms with our own people. On goods which we cannot make, and are therefore forced to purchase from outsiders, British manufacturers already have a preference in this market of 33 1-3%, and if they cannot control it with that advantage, the fault is with themselves, and is of such a serious nature that no legislation can cure it. We have been frequently reminded by speakers in England that the British preference has proved a failure. Our answer to that is, if the preference has not been a success the fault is not ours. Our Government certainly cannot go any further in forcing the people to purchase British goods, which they evidently do not want. Canada has already done all that can fairly be expected from her for the British manufacturer, and if a preference for Canadian products in the British market depends upon further concessions from Canada, it is to be feared that there will never be a preference. The preference already given has been a serious blow to some lines of Canadian manufactures, as pointed out in a preceding article, and the chances are all in favor of its being wiped out so far as these lines are concerned. Preference, like charity, should begin at home.

The French Treaty Revised.

WHEN the House of Commons went into committee on the bill to amend the Ocean Steamship Subsidies Act, so as to provide for a total subsidy of \$200,000 per annum to a line of steamers making 36 trips yearly between Canada and France, Mr. Henderson raised the question whether French goods reaching Canada via Great Britain would be admitted at the minimum tariff the same as if imported direct from a French port. The Finance Minister replied that it had been thought wise to have it so arranged. It will be remembered in this connection, that, when the French Treaty was before the House, a great deal of stress was laid on the fact that the provisions of the treaty made it necessary for goods to be imported direct from a French port in order to enjoy its benefits. This was held up as one of the best features of the Treaty, as it meant the building up of a direct trade with France that would greatly benefit Canada. It is, to say the least, somewhat surprising to find the Government making a concession to France so soon, on what they recently proclaimed as one of the best features of the Treaty. France is making no such concession to Canada, and will impose a surtax on indirect importations from this country. It does not seem a very wise policy to pay \$200,000 per annum to a steamship line to establish a direct service between Canada and France, and at the same time remove the inducement which would have made it worth while for the French shipper to patronize the line. The Finance Minister says the Government has thought it wise to have it so arranged; but how they argued themselves into such a belief is beyond the reasoning powers of the rest of us.

Uniform Bill of Lading.

MR. JUSTICE MABEE, Chairman of the Railway Commission, has promised early consideration of the question of a uniform bill of lading. The Canadian Manufacturers' Association have been agitating for this very necessary reform, and are now asking the Shippers' Association and the Boards of Trade throughout Canada to join with them. It is important that all interests affected should be represented before the Railway Commission when it takes this matter up, in order that a decision which will be final and satisfactory to all may be arrived at. Whatever form of contract is adopted now is likely to become permanent, and it is important to have it satisfactory to everyone concerned. It is to be hoped, therefore, that the Shippers' Association and the Boards of Trade will make their views known. By endorsing the action of the Canadian Manufacturers' Association and giving support to the two forms of contract, one for order shipments and the other for straight shipments which have been submitted for their consideration, they will greatly strengthen the case and serve their own best interests.

Union Rules Are Not Law.

MR. JUSTICE LEBEUF gave an important decision in the Montreal Circuit Court recently. The case arose out of the unloading of the Dominion liner, Englishman. Two gangs of 16 men each, under two foremen, were engaged at two different hatches, and were changed to suit the working of the ship. The men took action, claiming \$23.00 each on the ground that the rules of the union were that when a gang started on a hatch they should finish it, whether or not the full complement of sixteen was needed. The secretary stated that this was the custom of the port. The judge overruled the custom and dismissed the action. He also held that the men were engaged by the hour and could be dismissed or could leave without notice. The union will, no doubt, have a grievance because the court refused to recognize its rules as law.

D. M. COUGHLIN.

PROSPECTS OF EMPLOYMENT FOR LABOR.

By James G. Merrick

Secretary of the Employers Association, Toronto

The general curtailment in manufacturing which followed the refusal of the banks to support industries as they had been doing threw many men out of employment during the winter. These men are becoming absorbed now that navigation and farm work has been resumed. While a renewal of normal conditions must come gradually, conditions are now showing a marked improvement.

THE decline in industrial activity which made its first appearance last October has caused a very great deal of distress, not only to industrial workers, but in nearly every other occupation which has been sympathetically affected. In order to estimate the chances for a renewal of activity and of the employment of labor, both skilled and general, it is necessary to ascertain the causes which lie at the root of the present so-called depression, and to see what prospects there are for their early removal.

It has been generally conceded that our halt in industrial progress has been caused largely as a reflex from the money stringency in the United States. Their difficulty was almost entirely produced by a lack of confidence of the general mass of the people in their banking institutions, which resulted in a very large amount of the currency of the country being removed from deposit and retained in the homes of individuals.

What Induced the Trouble.

In Canada our depression has not been due to the causes in the United States, but has followed from their results. For several years the growing needs of the country required many more hands than were available. Not only was skilled help urgently needed to man our factories, but there was a constant cry from our farmers for labor to cope with and extend the area of cultivation. For several years there has been a far greater demand for manufactured goods than our factories were able to produce, and expansions in all branches of industrial life took place. In addition, large quantities of foreign goods were imported to satisfy the needs of our growing population. The wages of labor steadily mounted upwards. In many industries the hours of work were reduced until the manufacturers of the country were producing goods at a cost greater than the same goods could be imported and offered for sale on local markets. Two results were bound to follow from the increasing cost of manufactured products. One was the substitution of less expensive lines, and the other was the greater increase in foreign imports, both of which had a tendency to curtail manufacturing operations under normal conditions, with the consequent lessening of the opportunities for the employment of labor.

This result was rapidly taking place when the financial reflex from the United States struck Canada, and immediately caused a greater distress than would have occurred if our industries had been manufacturing well within the protection of the Dominion tariff. The disinclination of the banks to support industry to the same extent as before and the gradually calling in of loans deemed hazardous, forced a general curtailment in manufacturing conditions which was first evidenced in the discharge of large numbers of workmen, the reduction in wages, or the working of a short-time schedule.

A Lack of Winter Employment.

At the same period, the cessation of navigation, the closing of the building season, and the general stopping of agricultural work threw on the labor market a very large number of unemployed who are, as a rule, in expectation of being out of employment during the winter months. Owing, however, to the great demand for labor during the past few years, most

of these men had been working on forced employment, or had been taken up in the general occupations of the country. This year, however, the opportunities for extra work were not present, and a number have been in a state of enforced idleness for long periods at a time.

With the opening of navigation and the resuming of farm work, a large proportion of the unemployed outside of the city population will be absorbed in active occupations. It will take some time for the surplus of skilled labor to obtain employment, until a normal condition has been restored in manufacturing. The awakening of the building trades will soon engage all the men in that class of work who have been out of employment more largely this season than during past years, but for which they are compensated by larger wages than are paid to factory hands.

The Real Problem.

The chief difficulty with the employment situation is to find occupation for the unskilled and physically unfit workmen who have come to Canada in large numbers, and who, under progressive conditions, would be unable to obtain other than the most temporary employment. Where emigration has been pouring into Canada, and particularly into the industrial centres, as rapidly as it has within recent years, it is to be wondered at that there has not been greater distress due to the difficulty of ready assimilation. Besides the indigent class of immigrants, there are a number who have followed trades in the old country not practiced in Canada, for whom there is the initial difficulty of obtaining ready and continuous employment.

It is estimated that there will be twenty per cent. more land under cultivation in the west than last year, which will take up that proportion more of labor. The steady flow of agriculturists from the United States into the North-West means a greater degree of prosperity for the whole of Canada, as they are skilled in our methods of farm development, and more valuable as producers than a much larger number of general labor. Owing to the larger proportion of our emigration coming from the settled centres of Great Britain there has been a steady drifting to the cities and towns, which has been further augmented by the greater attraction of high wages than in the country districts. This has caused a glut of labor which could not be used in factory work owing to lack of skill, which could not be used in general labor owing to physical unfitness, and which has become a charge on the charitable organizations of nearly every locality. For this class of labor there does not seem to be any prospect for work except in the highest occupations, and it is this class that is the most noisy in their demand for occupation, while at the same time being the most unfitted for productive work.

With regard to industrial employment, the prospects look much brighter than they did a few months ago. The situation in the money market has been somewhat relieved, and although industry has not been expanding, there is a more hopeful tone apparent in nearly every department of trade, and a general expectancy that with the opening up of out-door occupations almost a normal condition will once more be established.

A CRISIS IN THE WOOLLEN INDUSTRY

At a meeting recently held in Montreal the woollen situation was thoroughly canvassed. By the evidence of manufacturers from one end of Canada to the other it was shown that the industry could not exist under present conditions. If the woollen industry is to continue it must be protected.

○ NCE more the representatives of the woollen industry have presented their case at Ottawa. Their claim was the story of a native industry being gradually starved to death through eminently unfair competition from abroad. A final appeal has been entered for a measure of protection which will give the Canadian manufacturer and the Canadian workman an even chance for the home market. Failing that, there seems to be nothing that will save the situation. The story of closed mills and unemployed artisans will pass from chapter to chapter until the end.

A powerful argument was presented to the Ministers, of whom Sir Wilfrid Laurier and Hon. Messrs. Fielding, Graham, Pugsley and Sir Frederick Borden were present. It was pointed out that importations show an average of \$18,-

The population of Canada in 1902 was estimated at 6,000,000, in 1907 6,500,000, showing an increase of 2 per cent., while the importation of textiles increased ten per cent. The per capita consumption of imported goods in 1902 was \$3.28, and in 1907 \$4.35, an increase of 35 per cent. Allowing an increase of 15 per cent. as the limit in purchasing power this shows a loss to Canadian mills of from \$8,000,000 to \$10,000,000 a year.

In regard to wages in the woollen trade in England a recent report by the Bradford Board of Trade (Chamber of Commerce), after first increases had been allowed, showed the following scale:—

Sorters, all male, 30s. a week.
Combers, 40 per cent. male, 27s. a week.

The buildings of the Canada Woollen Mills in Hespeler. They represent a large investment of capital, which has been without earning power for the past five years through the insufficiency of the tariff.

000,000 a year for the past five years. It would take an approximate investment of \$10,000,000, with an employment of 9,000 people, and a payroll of \$5,000,000 a year to take care of that business. The following table is instructive :

	Importations of Woollen Goods.	Increase.
1902	\$12,623,107	
1903	15,130,302	\$2,507,195 over 1902
1904	16,854,931	1,724,629 " 1903
1905	17,563,514	708,583 " 1904
1906	19,381,666	1,818,152 " 1905
9 months of 1907	16,136,308	
3 months (estimate to make make up year)	5,378,736	2,133,378 " 1906
	<u>\$21,515,044</u>	

Combers, 60 per cent. female, 18s. a week.
Dyers, all male, 22s. a week.
Spinners chiefly female, 9s. to 12s. 6d. a week.
Weavers, 20 per cent. male, 29s. to 35s. a week.
Weavers, 80 per cent. female, 12s. 6d. to 18s. a week.

Wages in Canada are governed by those in the United States, and are from 60 to 150 per cent. higher than those of Great Britain.

The Department of Manufactures of Washington last year, through the consuls in Germany, procured figures of wages and hours in that country, from which the following figures are taken:

Before the latest rise the operatives, both sexes, divided into four classes, earned as follows:

Woollen Mills at Almonte which no longer keep a busy staff of employees working.

Up to 16 years of age	\$2.47 a week.
16 to 21 years	3.08 a week.
22 to 55 years	3.83 a week.
Over 55 years	3.18 a week.

In some cases wages are now as high as \$4.28, and some as low as \$1.67 a week. Families are really small, and subsist on from 16 to 18 marks (1 mark = 25 cents) per week.

which includes rent, clothing, food, fuel and other necessaries. They generally live in two rooms (a kitchen and one other room), in which all the family cook, eat and sleep. Working hours in Germany are 10½ hours a day, or 63 hours per week.

From these statements, which are amply borne out by figures, it is shown what the competition from abroad means. There is no class of the Canadian people now which does

The wheels are no longer turning in many of the woollen mills of Canada. A native industry is being strangled by unfair competition from abroad. There will be many others in a similar predicament unless the tariff is adjusted.

not appreciate the necessity of manufacturing industries to the welfare of the nation. Of these none seems to be comparable in importance with that which provides the nation with clothing, textiles. It is the first and essential complement to agriculture. It should be fostered with all possible care, that Canada may be as far as possible self-supporting in the necessaries of existence.

To establish this condition the Government is urged to raise the duty on woollens. Under the protection given by the old National Policy the woollen industry spread out. The small mills were strengthened and increased in size. New mills were established. The condition is shown at a glance by the subjoined table, which gives the number of mills, looms and spindles in operation at different times:

	1885.	1899.	1907.
Number of mills	240	270	217
Sets of cards	515	624	579
Looms	1,885	2,645	2,034
Spindles	107,870	194,086	188,254

The Wylie Woollen Mills at Almonte which are now lying idle, as a result of the unfavorable conditions under the present customs tariff.

The figures are taken from the Canadian Textile Directory. The growth from 1885 to 1899 is just as favorable as the decline after 1899 is unfavorable. The cause is easily explainable. It is not the result of any falling off in use. On the contrary, the import figures show an enormous increase in Canadian purchases. The disappearance in eight years of 53 mills, representing 45 sets of cards, 611 looms and 5,832 spindles, instead of an increase of that amount, is directly attributable to the granting of the preference to Great Britain. The British manufacturers manufacture much more cheaply than we can do. The duty against them does not offset the advantage they have in cheaper labor and material. Hence, Canadian mills are put out of business and Canadian workmen are scattered to the textile centres of the United States.

The next move rests with the Government. It remains for them to say whether the industry will stand or fall. The situation has become critical.

MARKING AND ADDRESSING FREIGHT.

SHIPPERS will recognize the great importance of the subject discussed in the following circular, recently issued by the Freight Traffic Department of the C.P.R. The correct and legible marking of packages is absolutely essential to the expeditious handling of freight. An observance of the recommendations contained in the letter will operate to the interest and satisfaction of shippers no less than to the efficiency of the railways. The circular is as follows:

The attention of all concerned is again directed to the necessity of fully marking all freight.

1. Each package or piece of less than carload freight forwarded all rail, also each package or piece of carload and less than carload freight forwarded "lake and rail" must be plainly marked with the name or initials of the consignee and the destination in full, so as to ensure prompt delivery, even if separated from the waybill.

2. Marks on packages should be compared with the bill of

lading, and correction, if necessary, made by the shipper or his representative. Old marks must be removed or effaced.

3. Tags should not be used when the nature of the goods will permit of the address being stencilled on packages. If this be not possible, some distinguishing mark or brand must be placed upon the goods, and must be shown in the bill of lading. Agents must transfer such mark or brand to the waybill, which must describe the goods fully. For example, in the case of a shipment of canned goods, the bill of lading (and also the waybill) must show so many cases of tomatoes, so many cases of pears, so many cases of corn, etc., as well as the brand and the mark indicating the consignee and destination.

4. The marks on the packages must correspond with those shown in the bill of lading. For example, on a shipment to Winnipeg the packages must be marked "Winnipeg," and not some other destination for which the goods may be ultimately intended. If packages are intended for redistribution beyond,

a special designating mark may be used for the guidance of those attending to the redistribution, but only the destination given in the bill of lading must be shown on the goods.

5. Frequently, in connection with lake and rail shipments, there is on the same boat more than one consignment for one

These buildings are the Canada Woollen Mills plant, closed 5 years ago.
A 20 set Woollen Mill, fully equipped with fine machinery.

consignee. In order to prevent such consignments from becoming mixed, it will greatly facilitate their correct handling if shippers will also show on packages their name or trade mark. Consignments can then be delivered complete, and errors avoided.

6. Freight consigned to a place of which there are two or more of the same name, must not be forwarded unless the name of the county and province be given.

7. When a shipment is destined to a point beyond the line of the Canadian Pacific Railway which can be reached by more than one route, either rail or water, agents must be particular to have shippers specify via what route the goods are to be forwarded.

8. If freight is consigned to a point not reached by any railway line, shippers must specify the railway station at which delivery is required, and the route, or if destined to a place reached by a water line, the name of the railway station at which delivery is to be made to such water line.

The proper marking and addressing of freight is as much in the interest of the shipper as of the carrier. Neglect in the proper addressing of packages may result in the loss or miscarriage of the goods.

TRAFFIC ON GRAND TRUNK PACIFIC.

THE appearance during the month of freight tariffs on the Grand Trunk Pacific Railway is interesting as marking the opening of some sections of this transcontinental line to commerce. As yet, provision is only made for handling settlers' effects, seed grain, etc. This is done on construction trains for the benefit of settlers who are already seeking land along the new line. The tariffs which have been issued cover the line from Portage la Prairie to Rea, Man., which is all that has been passed so far by the Board of Railway Commissioners.

CANADIAN CONSTITUTIONAL DEVELOPMENT.

This is the title of an interesting volume of 472 pages, just issued by the Professor and the Lecturer in Colonial History in Oxford, Mr. H. E. Egerton and Mr. W. L. Grant. (John

Murray; price, 10s. 6d.). The book gives the essential portions of selected speeches and despatches, with explanatory notes, and offers for the first time to any one interested in the history of our Government a reliable and illuminating resume of matter scattered in many places, some of them inaccessible.

Canada's constitutional history is a history of mingled motives and tangled influences. To ponder over it is well worth while; for from a study of it we come back to the public duties of the present with feelings of greater patience, wider toleration, and more assured hope. The new Oxford Chair in Colonial History has performed a valuable service to Canadian and Imperial thought in this work. We trust that the editors will now carry their review further, into the field of Local Government, into the field of Federal orders-in-council, and day-to-day political practices, and into the domain of the operation of our Governmental machinery. That, of course, means a big contract; but the problems of the present call for energetic, impartial investigators, who will go to the heart of things, and give their diagnosis to the public, already growing restive.

MR. JOHN TORRANCE DEAD.

Mr. John Torrance, President of the Canada Horse Nail Co., Montreal, died in that city on April 6th, at the age of 73, after a short illness. Mr. Torrance was prominently connected with the business life of his city. For half a century he had been engaged in the ocean steamship business in Montreal, as an active member of the firm of D. Torrance & Co. He will be greatly missed by the wide circle of acquaintances which he had gathered around him during his long and busy life.

DEATH OF MR. JOHN COWAN.

With regret we record the death, during the past month, of Mr. John W. Cowan, of the Cowan Co., Toronto. Mr. Cowan had won exceptional success as a manufacturer, having established a business the products of which were known

The Late Mr. John Cowan.

from one end of Canada to the other. He was a prominent member of the Canadian Manufacturers' Association, of the Executive of which he was a member for several years and up till the time of his death. His death removes a prominent figure in Toronto's business world.

WHAT A COST SYSTEM WILL ACCOMPLISH

By L. E. Bowerman

Of Copeland-Chatterson-Crain, Limited, Toronto

A cost system covers the following points: It is a record and check of material and supplies It is a record of the day's work of each producing workman It is a true division of the general expense by departments It is a sub-divided comparison of all expense and units of cost.

WHILE it is generally recognized by all manufacturers that a knowledge of the cost of manufacture is necessary to the successful prosecution of a business, it is a matter of question whether the average manufacturer actually possesses this most essential knowledge, or has arrived at a crude apology for it from a series of deductions, rather than from an actual practical basis.

Now, a practical Cost System, when carefully planned and applied to any industry, means the saving of both time and money; and in connection therewith, the first essential is to acquire an intelligent grasp of factory conditions and requirements, so as to enable an expert accountant to devise the System and to arrange for the thorough and economical operation of it.

In Canada it has been our experience that a Cost System devised for one firm in any particular line of business will seldom successfully fit the needs of another firm in the same business. In other words, we find it poor policy to try to install and operate a System devised for one furniture factory in any other furniture factory. This means that the conditions governing the manufacturing done by each concern must be studied out carefully and taken care of individually.

The expense connected with the operation of a Cost System is probably the greatest reason for lack of adoption of up-to-date cost methods by some of our largest manufacturing concerns. This is certainly holding a ten-cent piece so close to the eye that a \$10.00 bill cannot be seen beyond it, as many firms who have introduced Cost Systems have been so greatly surprised at the results, loss and gain considered, that certain articles manufactured at a loss have either been discontinued or brought up to a paying basis, while exorbitant prices for other items have been adjusted in a way that has resulted in increased consumption.

Many efficient Systems of Cost-Keeping, in all lines of manufacture, are frequently valueless, owing to the failure to keep in mind the fact that a good System is but the means to an end, not an end in itself. If properly operated, it should be as much a direct influence towards increased profits as a perfect mechanical organization or any selling improvement.

An essential point in connection with the operation of a Cost System is that all detail should be kept strictly up-to-date. This brings every activity of a factory down to the smallest detail, promptly before the management, and thus prevents leakage. It also assures a close check on all material and labor, and shows the condition of every order in the factory.

In the cost of all manufactured articles there is a distinct combination of three elements: Material, Labor and General Expense.

Material is that which is used in making the article, and which enters into and becomes part of it.

Labor is the work directly put upon an article, turning the raw material into the finished product ready for the market.

General Expense is made up of such labor and other ex-

pense which in an indirect way enter into the making of an article, and is commonly called Over-head Expense. Of course, non-productive labor is kept track of separately in the department in which it occurs.

Material, the first element, calls for thorough Purchasing and Stock-Keeping Systems, and these are the first requisites of an up-to-date Cost System.

Stock should be so kept that all materials can be easily traced, both coming in and going out of the factory, as well as Tools and Supplies of all kinds. On this point carelessness is shown in many factories. All material coming in should be properly recorded on a Stock Record, and nothing whatever should be withdrawn from stock without a requisition properly signed, showing exactly what the goods are for.

The Stock Clerk enters this withdrawal on his Loose Leaf Stock Sheets, and, of course, naturally charges all material to the department which has used it. The foremen thus be-

L. E. Bowerman

come economical, using as few supplies as possible and making up the product from the smallest amount of raw material.

Provision should be made for recording the spoilage of material at the process where the loss occurred, so that the loss may be charged to the department which is responsible for it.

A System of this kind enables the stock clerk to account for all material. The purchasing department can work with him in buying exactly what the factory needs, and this, of course, throws a safeguard around the factory production against delays and losses which naturally follow negligence and faulty information.

Productive Labor is gathered from the record of work done by each workman. This he keeps on a daily time sheet, which is generally made up on the Loose Leaf style. From

these Time Sheets it is an easy matter for the Cost Clerk to trace from hour to hour and job to job the time taken by the workmen. These time sheets should be so arranged that the workman will not be called upon to take too much time in writing them up. He should not have to write a single word, but simply put down in figures the order number, and by a series of strokes across the face of the sheet, indicate the number of hours worked on each order. This saves time, eliminates possible errors, and gives the Department Manager a complete check and an intelligent understanding of exactly how long the workman took for each job, and also whether or not all of each workman's time is clearly accounted for. This, of course, should be checked up daily. Each morning new time sheets are placed in the hands of the workmen, which must be filled out as each job is completed during the day, not at quitting time, unless the job be unfinished.

Workmen's time sheets are really the foundation stone of Cost accounting, and an accurate record of cost cannot be made unless each and every workman or some competent employee in the factory keeps a correct record of the time spent on each job or order. This is nothing more or less than a series of tabulated costs made out step by step as the work passes through the factory from the rough state to the finished article.

Nearly all factories keep track of their costs by departments. A regular ledger account would sometimes answer for each job or order provided it is of sufficient importance, and takes an appreciable number of days for completion. Other jobs of a lighter nature are bulked and the cost reckoned from the workman's time sheet.

Each workman, whether at bench or machine, should be furnished with time sheets, and this brings up another point, viz., that the workman at the bench does not cost as much as the workman at the machine because there is the wear and tear on the machine to be taken into consideration, and also the fact of the initial outlay.

Therefore, when these time sheets come to the cost clerk they must not merely show the labor cost of an article but also the machine cost.

A certain standard is established as the cost of different operations in the factory. The standard is set at one hundred per cent. All duplications of every operation are figured against this basis.

Suppose \$1.00 is the standard cost for the finishing of a parlor chair. The workman who puts five hours and fifteen minutes into the work at 20c. per hour, or \$1.05 in cost—in other words, one-twentieth more than the standard cost—is given a percentage of 105. If he performs the operation in four hours and forty-five minutes at 20c. per hour, this brings the percentage down to 95c. Now, with this percentage this workman has saved 5 per cent. on five hours. The skill of this workman should be taken into account, and suggestions passed along by the department head to his other men, so that his department could be bettered all along the line.

The general expense should be classified according to departments. The factory should be considered a collection of small factories; each separate from the other. If an article, during its making, passes through several departments, it is not right to charge the same percentage for each process. The amount of general expense should be analyzed by departments and charged to them individually, as far as possible, or, at least, pro-rated as near as a cost clerk can determine.

Chargeable directly to the departmental expense are these items:

Floor rent, taxes and insurance.—The proportion of rent which shall be charged to any department is determined by dividing the monthly rent by the number of square feet in the plant, then multiplying the rent per foot by the number of feet in the department. The proportion to charge for taxes and insurance can be ascertained in much the same way.

Machinery rent.—Each department is charged with 6 to 7 per cent. of the valuation of all machines as interest on investment in annual depreciations.

Heat.—Each department is charged with heat according to the proportion of its space to the entire area of the plant.

Light.—Each department is charged with light expense according to the number of lights it has in proportion to the other departments.

Power.—When an individual motor is used for each machine, or set of machines, the amount of power to be charged can be accurately determined by the reading of the motor. When the mechanical equipment will not allow this, each department is to be charged with a proportion of the power expense according to the number of machines they operate.

Supplies.—All tools, supplies and materials used are charged to that department by the store-keepers as they are drawn out on requisitions.

Time-keeping expense is pro-rated according to its percentage of the total pay roll.

This classification takes care of every expense outside of selling, and enables the Cost-Keeper to determine an accurate general expense percentage for each department. The general expenses to be charged to each department are totalled monthly, and the percentage to the productive labor determined.

The sum of material, productive labor and departmental general expense, therefore, gives the total manufacturing cost of a product. To assemble the total cost of production of an article, the materials used, as reported from the stock-room, are figured into money; material cost includes the purchase price, transportation charges, and expense of buying, and handling, as shown by the expenses of the purchase department. Then from the workmen's daily time sheets, as they come in, there is taken off the number of hours of productive labor put in on the article, figured in money, in departmental groups. Next the machine rates are added. Then all repairs and special work on parts are brought in. And, finally, there are added the various department overhead percentages.

Summing it all up:—

A Cost-System covers the following points:

It is a record and check of material and supplies.

It is a record of the day's work of each producing workman.

It is a true division of the general expense by departments.

It is a sub-divided comparison of all expense and units of cost.

THE MACHINE.

By Margaret Ashmun.

Who calls this shape a dull, insentient thing—

A blind device for mere and stupid gain?

He has not watched with wonder in his brain

Its rhythmic process, heard it whir and sing,

And, inly thrilling, felt the fateful swing

That moves its rods with grim, tremendous strain;

He has not seen the marvel, subtly plain,

In silken slide of band and wheel and spring;

Else would he cry, "Behold, there labors here

A visible intelligence—a mind

Made up of many minds, that, year by year,

Have thought and dreamed, resolved to seek and find,

Till now stands this—clean, exquisite and sheer—

The concentrated genius of mankind!"

—The Technical World.

IS A RAILWAY FROM WESTERN CANADA TO HUDSON'S BAY FEASIBLE?

Several conditions peculiar to this route should be carefully considered before the project is undertaken by the Government. The extremely short season, the lack of return traffic, and the dangers besetting vessels in the Straits, are the chief obstacles.

MR. W. E. KNOWLES, M.P., is urging upon the Federal Government the advisability of building a railway to Hudson's Bay, connecting with the transcontinental lines somewhere in the Middle West. Such an undertaking should be assumed only after careful consideration. We take it as a self-evident truth, with Mr. Knowles, that what will benefit the farmers of the west will in the long run benefit all Canada. The only question to be decided is, will such a road be of material benefit to the west? That is a question that requires a consideration of many conditions, a consideration which it can scarcely be claimed has been given to the project yet, or if it has, it has not been communicated to the public in a convincing manner.

A report of Mr. J. A. McKenna is cited by Mr. Knowles as follows:

"The freight upon grain from the wheat belt to Hudson's Bay would approximate ten cents a bushel, the same as to Port Arthur; the additional fifteen cents from Port Arthur to the Atlantic seaboard would be saved to the farmer, and this of itself represents a fair profit to the wheat-grower. Assuming an export trade of 20,000,000 bushels, which can easily be handled in two months of the season by the proposed railway, the saving of fifteen cents a bushel would amount to \$3,000,000."

The building of the proposed railway should depend upon its being able to give a cheaper service than is now possible. Hence it is particularly important that we should have correct figures upon which to base our conclusions. As a matter of fact, it costs to carry wheat from Winnipeg to Fort William, on the average, six cents a bushel; from Fort William to Montreal or New York, six to seven cents a bushel by lake and rail, or five to six cents a bushel by the all-water route. The average rate for a number of years on wheat from the head of the lakes to Buffalo has been 1.56 cents a bushel; from Buffalo to New York, all rail, 4c. to 4½c.; and via canal, 3.15 cents a bushel. At one stroke the cost of the existing route, as quoted by Mr. McKenna, is reduced from fifteen cents to about six cents a bushel.

The initial cost of building the road would not be less than \$20,000,000, which is less per mile than the estimate for the new transcontinental line. (Fifty thousand dollars per mile has been set down for that.) The cost of terminals, elevators, etc., would approximate \$4,000,000, and if extensive harbor works are necessary would run much more than that. Of rolling stock there would be needed seventy-five locomotives and three thousand cars. This estimate is arrived at by figuring the number of trains of normal size that it would take per day to carry 20,000,000 bushels of wheat during the season. At \$14,000 for a locomotive and \$1,000 for a freight car, these items would involve a further expenditure of \$4,000,000. We have thus an original capital expenditure of \$28,000,000, upon which an annual interest would have to be paid of \$980,000 at 3½ per cent.

On the old-established roads, with complete organization, the cost of handling business is 70 per cent. of the gross revenue. It now costs, at the outside, twelve cents a bushel to carry wheat from Winnipeg to Montreal. The Hudson's Bay road would have to give at least as good a rate. This would give a maximum revenue of (on 20,000,000 bushels) \$2,400,000. Seventy per cent. of this for operation would be \$1,680,000; leaving \$720,000 for general charges. But the bare interest on bonds, at a most conservative estimate, would amount to \$980,000. Where would the \$260,000 come from?

The chief difficulty is that the road would be capable of being used only for a single purpose, during a limited period of the year. It would be dependent for its income upon the transportation of wheat and cattle during the short time while navigation is open in the straits. Not more than six or eight weeks at the outside would be open after the harvesting of the crop. Hence abnormal rates would necessarily have to be charged for what freight it did handle to pay interest on the investment and operating expenses.

The lowest cost at which freight can be carried by an old road, with a complete organization, is half a cent a ton a mile. This is what the railways figure when they are hauling material for their own use. For the 470 miles this would be 2.35 a ton for the length of the road, or seven cents a bushel. But the train would have to return the full distance for a second load, and as far as has been shown, it would have to make this return trip empty. So the cost would be doubled, as the cost of the return trip would have to be met by the charges on the original load. Thus the lowest possible charge, so as to meet the bare cost of operation, would be fourteen cents a bushel, as against a maximum of twelve cents by the lake route.

A most peculiar situation would arise, also, from the fact that a large staff of men, from despatchers and train crews, down to ordinary laborers, would be employed for only two or three months in the year. It is no argument to say that one of the other companies might operate the road, and would absorb both rolling stock and employees. As a matter of fact, when the Hudson's Bay Railway closed for the year, the main rush would be over on the other lines, and they would be laying up part of their own equipment rather than adding to it by taking over that of other roads. If the railway was to be of any real benefit, it would be by supplementing the service now rendered. This it could not do except by providing rolling stock over and above what the transcontinental companies owned.

The proposition is further complicated by the conditions surrounding the ocean traffic, with which it is bound up. A large fleet of boats would be necessary, as any congestion at Fort Churchill would be ruinous. These boats would have to be heavily subsidized. They would be operating under most unadvantageous conditions. The admittedly dangerous nature of the route would entail extraordinary marine insurance. Only a fraction of the boats' capacities would be taken up by return cargoes. Shipping charges on the east-bound traffic would have to cover the cost of the return trip. Thus, on the ocean end of the traffic, also, the charges would necessarily be abnormal.

The conditions which would militate against the success of the scheme are, in brief, the absence of any appreciable amount of local traffic, with small prospects of an improvement in this direction; the lack of return loads, making the charges on the original traffic abnormal; the shortness of the season, whereby the whole cost for investment and operation would have to be met out of a few weeks' business; the difficulty of getting adequate shipping facilities for conveying grain from Fort Churchill to Europe, and the extraordinary cost of the same.

These are some of the questions which should be investigated before such a large project is undertaken. If satisfactory answers can be given, by all means let us have the road.

THE WHEELS OF INDUSTRY

Tracks are now renewed without much interruption to traffic. This cut shows the method of operation in Toronto. Temporary tracks are laid on each side of the street and cars are operated on these, leaving the centre of the road free for work.

A Shipping Scene at Toronto. As summer comes on the harbours become alive with boats which enter into competition for the freight which is offering. The view given was taken in the ship-yards of the Polson Iron Works

A TARIFF DEPARTMENT ORGANIZED

Members Can Now Get Expert Assistance in Tariff Difficulties

A STEP of far-reaching importance to the Association is marked by the establishment of a department which shall be devoted entirely to the assistance of members where difficulties in tariff matters arise. Every manufacturer has his own tariff problems. In most cases it is impossible for the individual to have these satisfactorily settled. It will be the work of the new Department to go into these questions thoroughly and seek a remedy only when the justice of the request is clearly shown.

The need of expert assistance has long been felt. The tariff has grown increasingly complicated from year to year. From a single scheme it has become most complex, embracing a general, an intermediate, and a preferential scale, and these, with surtaxes, favored-nation treaties, dumping clauses, leeways, fines and drawbacks, have made it practically impossible for the ordinary business man to know where he is at. It requires a specialist to follow the intricacies of the

R. W. Breadner

customs system. It was felt that the expert assistance which has proved of such immense value to the members in the case of Transportation and Insurance should be supplemented by similar assistance in tariff difficulties.

The Association is fortunate in having secured the services of Mr. R. W. Breadner as Manager of the new Department. Mr. Breadner has a thorough knowledge of the tariff and the way it is administered. At the present time he is a member of the Board of Customs and holds the offices of Dominion Appraiser and Inspector of Customs. He is consequently closely in touch with actual conditions under which the tariff is operating. His intimate acquaintance with the situation will enable him to adjust difficulties with the utmost despatch.

As has been found to be the case in the other departments much can be done by the man who knows just how to go about it. The individual is not in a position to make an

effective fight. He is handicapped by an unfamiliarity with the methods of carrying on business. Many of the small things, the petty annoyances, which during the year may result in considerable inconvenience and loss, he is unable to remedy. In these cases, and they are many, the tariff expert will be able to render valuable assistance.

Again, when it becomes necessary to present a case at Ottawa, Mr. Breadner will be of inestimable service. His previous experience will suggest to him what facts are essential and how the case should be handled. Industries are so interwoven with one another that changes in the tariff may have an effect extending far beyond what was originally anticipated. A previous investigation of the conditions will obviate many later difficulties.

It goes without saying that the work of the new department will not be confined to urging claims for increased protection. In fact this may prove a minor part of Mr. Breadner's duties. As has been indicated above, the complexity of the tariff gives rise to innumerable difficulties of classification, appraisement, etc. There is ample along these lines alone to make necessary the appointment of a tariff expert. Some industries are sufficiently protected by the existing tariff and make no request for more. Others which are seeking further aid are suffering from disabilities which no tariff would remove. Others again have legitimate grievances. It will be the work of the new Department to sift these out, to get at the actual conditions, and to advise the Association on the fairness of the demands.

The value of any department of the Association's work depends largely on the use the members make of it. The new Department will be in operation during the present month. Members should make their difficulties known and seek a remedy through the offices of the Association.

FOREIGN MAILS.

Mails for the East, including Australia, New Zealand, China, Japan, and smaller states, will be sent during May as follows:

Mails leave Vancouver, B.C.—For China and Japan, 11th.

For Australia, except the colony of West Australia, which are sent by England, New Zealand, Fiji, and Hawaiian Islands, 22nd.

Mails leave San Francisco.—For Japan, Korea, Shanghai, Hong-Kong, and dependent Chinese ports; and for the Philippine Islands, also specially addressed correspondence for the East Indies, including British India, Straits Settlements, Siam, Cochin China, and Dutch East Indies, 19th, 26th and June 2nd. For Hawaii, 2nd, 5th, 9th, 15th, 19th, 23rd, 26th and 29th. Guam and the Philippine Islands, 5th; Tahiti and Marquesas Islands, 20th. For New Zealand and Australia, except Western Australia, which are sent via England, 8th.

Mails leave Seattle, Wash.—For Japan, Korea, Shanghai, Hong-Kong, and dependent Chinese ports, and for the Philippine Islands; also specially addressed correspondence for the East Indies, including British India, Straits Settlements, Siam, Cochin, China, and Dutch East Indies, 12th, 15th and 26th. Specially addressed correspondence for and via China and Japan, 9th.

Mails leave Tacoma, Wash.—For China and Japan, 13th.

To insure connection, correspondence for China, Japan, Korea, Australia, New Zealand, Sandwich Islands and Fiji should be posted in Toronto five days before the dates of sailing from Vancouver and six days before the dates of sailing from San Francisco, Seattle, or Tacoma.

THE BASIS OF MANUFACTURING INDUSTRY

By Thos. R. Deacon

President, the Manitoba Iron Works, Winnipeg

Industrial life is like a game of chess. The world is the chess-board; the natural resources and phenomena are the pieces. To win requires a knowledge of the rules and the possibilities of the game. That is what technical education means. It supplies the necessary knowledge.

WHENEVER we enter upon the discussion of any subject, it is well to have a clear and concise idea of what the subject actually means, and so, after casting about in my mind for such a definition of technical education, it seemed to me that it might be described as "a correct knowledge of those natural laws which govern the results of the operations of man or material substances." As the life of man becomes more complex and the members of the human family continue to multiply, it becomes a necessity that all forms of waste should be curtailed, whether of force or of matter, and that all forms of labor and material should be made as fully effective for our requirements as possible. And as all forms of force, energy and matter, move always in obedience to natural law, it becomes at once apparent that to be equipped to utilize these forces in attaining the results we desire, and to guide and direct them in our own work, we must be acquainted with their fundamental principles.

Suppose it were perfectly certain that the life and fortune of every one of us would one day or other depend upon his winning or losing a game of chess, do you not think that we should all consider it a primary duty to learn at least the names and moves of the pieces, to have a notion of the game and a keen eye for all the means of giving and getting out of check? Do you not think we should look with a disapprobation amounting to scorn upon the father who allowed his son, or a state which allowed its citizens, to grow up without knowing a pawn from a knight? Yet it is very plain that the life, the fortune and the happiness of every one of us and those connected with us, do depend upon our knowing something of the rules of a game infinitely more difficult and complicated than chess. It is a game that has been played for untold ages, every man and woman of us being one of two players in a game of his or her own. The chess board is the world, the pieces are the natural phenomena of the universe, and the rules of the game are what we call the laws of nature. The player on the other side is hidden from us. We know that his play is always fair and just and patient, but we also know to our cost that he never overlooks a mistake nor makes the smallest allowance for our ignorance. To the man who plays well, the highest stakes are paid with that sort of overflowing generosity with which the strong delights in his strength, and the one who plays ill is checkmated without haste and without remorse. The learning of the rules of this game is technical education.

The Working of Natural Laws.

As men began by experiment and by deduction to learn something of the great code of natural law, it soon became necessary to classify these laws and group them in such a manner as to be easily referred to, and thus we know them under the names of various sciences, such as Mathematics, Physics, Statics, Dynamics, Chemistry, and these again subdivided under many heads, as Arithmetic, Algebra, Geometry, Trigonometry, Differential and Integral Calculus, Astronomy, which is really a combination of all kinds of mathematics and chemistry, which is subdivided into innumerable divisions,

but through all which the same universal laws obtain, whether applied under the head of metallurgy, mineralogy, or of organic chemistry; and it is the understanding of these laws which has enabled man to accomplish his marvels on the planet. There has never been a time in the history of the world, when it was more necessary than it is now, that the citizens of any country which hopes to hold its own in the advancement of the world where competition is so keen, should be thoroughly equipped for the game by a comprehensive and accurate knowledge of its laws so that they may make no mistakes and that all forms of energy and material shall be conserved. It am glad to see that the Provincial Government of Manitoba has recognized this fact, and that while our lands are still young and the soil vigorous, they have pro-

T. R. Deacon

ceeded to place the greatest of our present industries, agriculture, on a scientific basis and have established an Agricultural College. This is much better than waiting until the land had become lean, and then endeavoring to devise means by artificially assisting nature to refertilize the soil.

Must be Supplemented by Manufactures.

But we do not find that history records a single instance of any nation achieving permanent greatness based solely on agricultural or pastoral pursuits. We must have manufactures and other lines of commerce, and as the agricultural interests are, in the last analysis, the purchasers of all kinds of manufactures, it becomes evident that if we of the West are not always to remain dependent on the older lands for our manufactured goods, we must set about learning how to manufacture them ourselves. And how can we do this unless our young

men have facilities for acquainting themselves with the natural laws which govern these things.

As at present agriculture seems to tower in importance over all other interests, we are apt to overlook or neglect many of the sources of wealth, and year by year vast quantities of raw material are allowed to go to waste, simply because we have not yet learned how to use them. We have the example of Germany, who, finding the population growing, and no chance for territorial expansion in Europe, deliberately set herself with a new energy to discover by scientific investigation methods of increasing her natural wealth by supplementing her resources by new processes of using hitherto unemployed material, and we find her in a very short time becoming one of the greatest manufacturing nations in the world, holding the blue ribbon of the Atlantic for the fastest ships that ride the seas, and producing goods so cheaply as to be regarded by other nations as a menace to their trade. Japan, also, by a systematic investigation and adoption of technical knowledge, has astonished the world with her progress.

What the Boy Should Learn.

It has for some years seemed to me that as Chemistry is of such paramount importance in all the affairs of life, whether we recognize it or not, that it ought to be studied by every boy and girl in the public school from the very first. What is chemistry, or what is its object? Chemistry has for its object the investigation of all those properties of matter which are the result of, or which lead to the transmutation of matter, whether wood, stone, air, or water or flesh or grass. It investigates all the material properties of every kind of matter and every combination of the sixty-seven elements. There is not a single industry that is not based on and dependent upon chemistry. One branch of industry may be based upon the exact knowledge by some one of the chemistry of foods; another the chemistry of fuels, heating and lighting; another on the chemistry of dye stuffs and the materials to be colored; another on the chemistry of iron and steel; another on the chemistry of explosives, and so on. And yet we, who are not acquainted with the details of these processes, accept only the results of their operations without thinking how useful it is to us that some one somewhere understand these chemical laws.

So in the realm of mathematics, we scarcely pause to think how deeply we are indebted to those who have applied the investigation of this and the allied sciences of statics and dynamics, to the removal of mountains of difficulties; who have turned back the sun in its course, metaphorically, by the annihilation of space; who have made the dark places of the earth light, and who, by giving to the thirsty lands rivers of water, have made the desert to blossom as the rose.

And the era of the West has but just dawned. Railroad building has only begun. Many cities are yet to be built between the lake and the mountains. Very probably, many sources of wealth we yet do not suspect are here concealed awaiting our discovery. We must have trained minds to grapple with these problems. The pioneers have done their duty to the full. With the tools at their disposal they accomplished wonders, but so much more is required now in the same time that we must have men whose minds are trained in the habit of thinking right, so that they will come to the correct conclusion in the same manner as the woodman's hand automatically guides the axe.

The Requirements of the Age.

It is said that the age is utilitarian, materialistic, commercial. If so, it is all the more necessary that each man should be the better equipped for the utilization of all the forces at his disposal. But there is another side as well as the strictly utilitarian. There is the development within the man himself of a deep and everlasting pleasure in the know-

ledge of natural laws, even though it might not be called extensive, that wealth and place even cannot give, and which forms an anchor to the mind and raises and enlightens the whole man, so that the state as a whole benefits by his citizenship. It is said that the principles of carpentry depend upon the two branches of the science of statics, and it is that which makes carpentry a liberal art. So is the art of working iron; so is every art, when guided by scientific principles. Every structure or design that evinces the guidance of science is to be regarded not only as an instrument for promoting convenience and profit, but as a monument and testimony that those who made and planned it had studied the laws of nature, and this renders it an object of interest and value, no matter how small its bulk, or how common its material.

For a century, there has stood in a room in Glasgow University a small, rude model, of appearance so uncouth, that when an artist introduced its likeness into an historical painting, those who saw it, and did not know its meaning, wondered what the artist meant by painting an object so unattractive. But he was right, for a man had taken that model and applied to it his knowledge of natural law and made it into the first of those steam engines which now cover the land and sea, and have been the means of making light the darkest parts of the earth. And ever since, in reason's eye, that small and uncouth mass of wood and metal shines with imperishable beauty as the earliest embodiment of the genius of James Watt. Thus it is that by science the commonest objects are rendered precious, and in a like manner the engineer and mechanic who plans and works with a correct understanding of the laws that regulate the results of his operations rises to the dignity of a sage.

Applied Science in the West.

In conclusion, let me express the hope that at an early date, there may be established in the west, under Government control, an institution devoted exclusively to the various branches of applied science. If we have railroads to build, structures and machines to be designed, natural sources of wealth to be developed, there is no need to import foreign brains, we have a homegrown variety of first-class quality, but it is essential that the young men be trained in the branches of mathematics, chemistry, geology, mineralogy, astronomy, and the other natural sciences, so that they more readily assist in the development of the country. The establishment of these institutions at Montreal and Toronto has assisted enormously in the upbuilding of the commercial and manufacturing life of Ontario and Quebec, and even of Western Canada, and similar institutions will be of immense assistance to the west as soon as they are properly established here.

It is a great mistake to suppose that the momentous discoveries that are being made from day to day, such as X-rays, radium, wireless telegraphy, new heavenly bodies, high speed steel, etc., are the results of ignorant men, blindly stumbling on to these great truths, or that they spring from phenomenal intuitive knowledge of the laws of nature. They are in every case the fruit of highly trained minds, skilled by long years of patient study in the grouping, balancing, arrangement and experiment of natural phenomena, and in most cases, are arrived at step by step by logical deduction, as well as the ability to recognize and detect where a wrong move has been made and to go back to the proper point of departure, and thence proceed, avoiding the previous error. It is the ability to do this that constitutes one of the great advantages of a technical education.

Victoria, B.C., will make extensive additions to its water-works system, including the building of a reservoir and the installation of pumps and pipes. \$100,000 will be expended on the work. Tenders will be called for.

THE EFFECT OF PROTECTION

Mr. Chas. McDonald discusses in a letter to *Industrial Canada* the effect of protection on a country's prosperity. He suggests that the recent depression in the United States and the abounding prosperity in Great Britain during recent years, may be significant.

St. John, N.B., April 20th, 1908.

To the Editor of *Industrial Canada* —

Sir:—In "The Editorial View Point" of your April issue, under the heading, "Protection in England," you say, among other things—"For years free traders in Canada have held up England as an example of the wonderful things free trade can accomplish, but it looks at present as if the day was fast approaching when they will not have that peg on which to hang their arguments."

The following editorial, from the "St. John Globe" of April 11th, gives figures and statistics that make one wonder if your view of this matter is correct. It says:—

Free Trade England.

"The pre-eminent position of Great Britain in the world of commerce is strongly set forth in some figures recently issued by the British Board of Trade. For the year 1907 the imports of Great Britain were valued at £553,932,000, compared with £522,786,000 in the previous year. Germany has a far larger population, and its imports were valued at £422,707,000, compared with £394,410,000 in 1906. The population of the United States is over eighty millions, and her imports in 1907 were worth £296,519,000, compared with £275,105,000 in the previous year. France had imports to the value of £241,906,000 in 1907, and £225,090,000 in 1906. A glance at the domestic exports of these countries tells a tale. Great Britain heads the list, with exports in 1907 valued at £426,205,000, compared with £575,575,000 in 1906. The United States came next, with exports of £394,859,000, compared with £275,105,000 in the previous year. Germany had third place, with exports valued at £337,222,000 in 1907, and £312,657,000 in 1906, and France was next with exports of £221,681,000 in 1907, and £210,068,000 in 1906. It will be noted that the increase in British exports in twelve months amounted to over fifty million pounds—an increase far greater than can be shown in any of the countries under protective tariffs. British progress has been unexampled in recent years, and the trade figures furnish the most convincing answer to the statements of the tariff reformers. The British public thoroughly understands the situation, and has shown no indication of a desire to change its fiscal policy. Recent bye-elections have been taken to mean that the Liberal trade policy has been condemned, but that is not a correct conclusion to draw from these contests. The liberal losses, which, after all, have been comparatively few, were due almost entirely to the strenuous fight made against the Licensing Bill, the Education Act, and other progressive legislation."

With these figures staring them in the face, and with the recent sudden and far-reaching depression in trade and manufacturing in the United States, with its boasted high protective policy, is it at all likely that the English people, with "their uncommon amount of common-sense," will change a trade policy which makes such a magnificent showing in comparison? I cannot conceive that they will, nor can I see they would gain much if they did. If "tariff reform" is the panacea for loss of trade by the manufacturers, why do not our neighbors to the south, under the prevailing depression existing in the United States, increase their duties, stick on a little more "tariff reform," and bring good times out of bad?

I am not prepared to say to what extent the Canadian manufacturer is benefited by tariff legislation. When attending conventions of the Canadian Manufacturers' Association, I have often thought if the "higher tariff" ideas of the group of manufacturers who do most of the talking in that body, were to come in force, no class of people in this country would suffer more than the manufacturers themselves. I hope, however, that this group of "Haman's gallows tariff reformers" does not embrace as many of the manufacturers as their utterances would make it appear. No doubt they are earnest and sincere in their beliefs, but among the great rank and file of the Association's members throughout Canada, there must be many who hold views of a more moderate and business-like nature. There is an old Spanish proverb that says—"If you go with lame people one year, you will limp the next," and it may be that if you present only one side of this question to the manufacturers, month in and month out, some of them may grow narrow and contracted in their ideas of trade questions. It is well occasionally to have the other side presented, even in such an imperfect way as this. These observations are not made in a controversial spirit, but with the hope that there are many of kindred thought among the Association's members.

I may be in a hopeless minority, but if there are nine other members besides myself who embrace these views, I will feel there is hope for the Association. I will be buoyed up with the remembrance if ten good men had been found in the wicked cities of Sodom and Gomorrah, the wrath of the Lord would have been averted, and the inhabitants spared to ultimately become respectable citizens of the country to which they belonged.

Yours truly,

CHARLES McDONALD.

EXPORT QUOTATIONS.

Manufacturers exporting to the continent of Europe, South America, or other sections of the world, where the metric system prevails, will be interested in the following comment on the necessity of Canadian methods being adapted to the requirements of the purchaser. The words are taken from a letter of one of the Canadian Trade Commissioners, recently received, and are well worthy of attention.

Speaking generally, however, I might mention that if Canadian manufacturers propose catering for continental trade, they must be prepared to adapt themselves to the requirements of the country, and quote in the particular measures and weights which are in vogue in that particular country.

The metric system is in force practically everywhere on the continent of Europe, and many business houses have no knowledge whatever of feet and inches. Such frequent reference is made in Canada to the failure of British and other interests seeking trade in the Dominion to adapt themselves to Canadian conditions by quoting in Canadian currency and measures, that Canadian business men should also realize that this applies equally to themselves in seeking trade in outside markets,

J. H. Plummer

James Ross

J. P. Murray

MEN OF THE MONTH

GIANTS IN CONFLICT.

MR. J. H. PLUMMER and Mr. James Ross have held the stage during the past month, but the drama which was being acted by them and around them has been carefully concealed from the public. The fight which has now been under way for many months between the giant interests which control the Dominion Coal Co. and the Dominion Steel and Iron Co. has been most spectacular. Big men have been in control of both industrial forces and the stakes were large. Hitherto all that had come to the surface besides much jockeying for position was the legal conflict which has been carried from court to court till nothing now remains but the final court of appeal in England.

The present negotiations, which for days were carried on in Toronto and then were shifted suddenly to New York, give great promise of having some result. Not that anything in the way of an adjustment has yet been arrived at, but pressure seems to have been brought to bear to make a settlement necessary. As a matter of fact, the companies have been spending a good deal of money in the conflict. The public know this and they also know that the Steel Company has been drawing liberal bounties for years. Putting two and two together they have begun to figure that perhaps they are the ones who are paying the piper.

It would be an uncomfortable thing if the bounty were removed. Hence, even to win may prove disastrous to the Steel Company, if victory brings with it a change of Government policy. So the big men have come together, and somewhat hopeful statements have been handed out from time to time.

The question is of national importance. The companies interested represent great industries, upon which the welfare of very many people depend. So much is this the case that all Canada is keeping its eye on the outcome, and popular opinion may settle what it sometimes takes law courts a long time to decide.

WOULD SAVE THE WOOLLEN INDUSTRY.

THE woollen industry has an aggressive advocate in the person of James P. Murray, of the Toronto Carpet Company. As chairman of the woollen section of the Canadian Manufacturers Association this year, it fell to him to initiate some action towards mending the unfavorable conditions which have long been affecting this class of manufacture. He is not wont to be found wanting when work is to be done. One result of his efforts was the gathering of woollen manufacturers in Montreal during the past month. It was a representative meeting, and one which bids fair to have a marked influence on the whole situation.

Mr. Murray is thoroughly conversant with the subject which he has taken in hand. His association with the Toronto Carpet Company has brought him into close and active touch with the industry in all its forms. He has for years made a close study of the elements entering into the manufacture, both here and in other countries. Hence his statement that the Canadian woollen industry needs more protection can always be supported by him with facts and figures.

It is worthy of note that the manufacturers feel more hopeful as a result of their interview with the Government than they have for years. The ministers appear to have seen a new light on the subject. If these hopes be realized, we may yet see a flourishing industry where now we find mills closed or struggling along in an up-hill fight. When this time comes Mr. Murray's efforts will be consummated.

AN EXPERT CHEMIST.

Mr. S. B. Chadsey, B.A.Sc., who for several years past has been chief chemist for the International Harvester Co., Hamilton, has joined the staff of Canadian Laboratories, Ltd., Melinda St., Toronto. Mr. Chadsey has had a wide experience in the chemistry of industry. He is a graduate of the University of Toronto, both in chemistry and practical science, and his work with the International Harvester Co. has brought him into close touch with the practical phases of his subject. He will specialize on all classes of testing in future.

NEWS LETTER

Vancouver, B.C., April 20th, 1908.

To the Editor of Industrial Canada:—

Dear Sir:—In view of the early starting by the Grand Trunk Pacific of railway work at Prince Rupert, the subject of the amendment of the Canadian Coast Regulations is exciting considerable interest in the minds of British Columbia manufacturers and shippers alike. The Vancouver Board of Trade is moving actively in the matter, and has addressed the following petition to the Dominion Government in regard to same:

"Whereas in the Dominion Statutes, Chapter (7) 2, Edward VII. of May 15th, 1902, intituled 'An act respecting the Coasting Trade of Canada,' and in Clause 3 thereof, it is provided that 'No goods or passengers shall be carried by water from one port in Canada to another except in British ships';

"Whereas, it has been ruled by the Commissioner of Customs, in his letter to this Board of Trade (No. 33,699, of December 3rd, '07), that the foregoing clause does not prohibit the carrying by water of such Canadian goods in transit from one port in Canada to another by a foreign vessel from a foreign to a Canadian port should they be routed through a foreign country;

"Whereas, in corresponding United States Act of February 17th, 1898, it is provided as follows: 'Be it resolved by the Senate and House of Representatives of the United States of America in Congress assembled, that no merchandise shall be transported by water under penalty of forfeiture thereof from one port of the United States to another port of the United States, either directly or via a foreign port, or for any part of the voyage, in any other vessel than a vessel of the United States';

"Whereas, the discrepancy in these acts results most unfavorably for the owners of British vessels, and

"Whereas, in the opinion of this Board the inter-Canadian carriage of goods by water should be preserved for British vessels:

"Be it resolved, that the Dominion Government be and is hereby strongly petitioned to amend Clause 3, Chapter 7, 2 Edward VII., 1902, so as to provide that no goods shall be carried by water from one port or place of Canada to another port or place of Canada, either directly or via a foreign port, or for any part of the voyage, except in British ships."

It will be seen that under the present regulations the owners of British vessels are at a great disadvantage, and it is for the purpose of placing them on a more equal footing with United States vessels, and also for the upbuilding of our coast-carrying trade that the amendment is sought.

The proposed amendment does not seek to prevent a shipper, say, in Eastern Canada, routing his goods via a United States port if he so desired, but it would make it necessary, should the goods be consigned to a Canadian port, that same must be carried by British ships to their destination.

The granting of the petition by the Government would be the means of building up a large coasting trade, as for the next few years all goods destined for Prince Rupert will have to be water borne, and it is the feeling that the inter-Canadian carriage of goods by water should be preserved for British vessels.

The decision of the Customs Department to impose the "dumping duty" on tin plate has been strenuously opposed by the British Columbia salmon canners, and a request made by them to the department that the enforcement of the "dumping clause" be delayed until after 31st December of this year.

The canners have already purchased the tin plate necessary for this season's pack, and have also made sales based upon

prices partially governed by the cost of tin plate, and as the same is now en route from England and cannot arrive until next June, the enforcement of the "dump" on 1st May will work a serious loss. It is understood that the department claims it has no power to defer action, on the ground that as soon as a manufactory was established, the act provides that a "dumping duty" should be enforced, and it is thus automatic in operation.

Further representations will no doubt be made by the canners, as the subject is too serious to be allowed to drop.

Wholesale condemnation is heard on all sides on the announced intention of the Department of the Interior to enforce Clause 12 of the Dominion Timber Regulations at the present critical state of the lumber industry. In view of the facts that large stocks of lumber are piled in the yards of the manufacturers throughout British Columbia, for which there is at present no sale, that logs are a glut on the market, so much so that the Provincial Government saw fit to suspend for a time the enactment prohibiting the export of logs, in order to aid the lumbermen financially and to save a large portion of the logs now in the salt water from destruction by the teredo, that ninety per cent. of mills in the interior of British Columbia have been closed for the past six months, that at least seventy-five per cent. of the British Columbia coast mills have also been closed for the past five months, that practically all logging is suspended,—in view of these facts, it is considered a great hardship that holders of Dominion licenses should be compelled to log their limits at the present time, and forced to dispose of their products at unremunerative prices. As has been remarked by a recent writer on the subject, the idea of forcing the cutting of the forests is in these later days somewhat unique. The whole tendency of timber legislation in almost every civilized country is to conserve rather than to hasten the utilization of their timber resources, so much so that it seems like stepping backwards thirty or forty years to be combatting the contrary policy. In the United States there is a movement in fully three-fourths of the lumber producing states to secure legislation that will favor forest conservation. There are laws on the statute books of at least a dozen states, the object of which is to encourage timbermen to hold rather than cut their timber. These states have in view the prosperity of their citizens twenty, thirty and fifty years hence, and it is hoped that the Dominion authorities may be induced to take the broader and more statesmanlike view.

Petitions, praying that the enforcement of the regulation may be delayed until the market conditions warrant are being circulated and extensively signed.

Yours very truly,

A. H. H. ALEXANDER.

Quebec, April 24, 1908.

To the Editor of Industrial Canada—

Sir:—The principal event which has happened in our city lately, and which has interested the local manufacturers particularly, has been the series of lectures given to the public under the auspices of Laval University by some of our most prominent local manufacturers. Upon the suggestion of Mgr. Mathieu, C.M.G., Rector of the University, we have had this advantage for the last few weeks. You can imagine that with the prestige of the University, these lectures delivered by industrial leaders were very highly appreciated, not only by business men, but also by the best class of our professional and educational men.

The lectures were given on different trades and industries, the one with which the lecturer was particularly connected. One evening Honorable Mr. N. Garneau, President and General Manager of the Chicoutimi Pulp Co., made his audience familiar with all the interesting details of the pulp industry, and concluded by expressing his opinion that undoubtedly the administrators of the public domain would soon have to open their eyes to the necessity of assuring more protection to our extensive but not inexhaustible timber limits. Then in the following week, Mr. V. E. Beauvais, local Manager of the Ogilvy Milling Co., developed the very attractive subject of the history of the flour milling industry in the world, and particularly in Canada. He was followed by another active member of our Association, Mr. Jos. Pickard, of the Rock City Tobacco Co., who, after speaking on Canadian tobacco and the development of the industry in Canada, left his audience altogether in sympathy with the practical conclusion he had reached, that is: to use nothing else than what is grown and is made in Canada, when it is so easy to secure as good if not better articles than the imported ones.

These lectures, well attended as they have been, can only make all classes of our population more familiar with the importance of industry in Canada, and, under the auspices of Laval University, they will certainly help the cause of technical and high commercial education as well.

We are informed that many other manufacturers have accepted the kind invitation of Mgr. Mathieu, and will soon place before the general public the results of their experience on some other interesting subjects connected with the business and industrial world.

In the Legislature a bill was introduced by Dr. Lacombe, the opposition to which was so strong that it was killed in Committee. Its object was to do away with the pay-on-installment principle. By it, when goods were repossessed because of irregularity in meeting payments, three-quarters of the amount already paid must be returned to the person giving up the article. The bill got practically no support.

The Government have decided to keep an Agent-General for the Province of Quebec resident in Great Britain. It is felt that the special advantages of Quebec as a home for settlers and as a place for investment have not been placed before the people of Great Britain with sufficient force. The new official will receive a salary of six thousand dollars and a maximum allowance for expenses of five thousand dollars per year.

The Government grant to the Polytechnic School in Montreal has been increased from \$3,000 to \$5,000.

The opening of navigation makes business in Quebec take on an air of activity and life. Yours truly,

L. A. MOISAN.

Halifax, April 25, 1908.

The varied resources of the Maritime Provinces make them less susceptible to trade depression than any other part of the country. So in the period of short money and relaxed activity in the United States and elsewhere, the provinces by the sea have maintained a steady trade, and have enjoyed consistent prosperity. At the present time manufacturers are well supplied with orders. The field of their operations have extended, too, so that the products of the Maritime Provinces are known right to the Pacific coast.

The Silliker Car Works Co., Ltd., of Halifax, have already expended over \$180,000 on their new plant, and have now drawn \$65,000 of the bonus granted by the city. When this goes into construction, Halifax will have an industry of great value to itself and to the province at large. It is expected that by May 1st work will commence on cars.

The Halifax Glass Works is a new industry which is being

organized by Capt. Watts. It is the intention of the company to manufacture bottles of all kinds, gem jars, lamp shades, etc. A site is under consideration near the Silliker works.

In a recent interview, C. M. Crockett, secretary of the I. Matheson Co., New Glasgow, spoke of the activity in their shops. He commented, however, on a noticeable effort among people at large to curtail expenditure. This was the only reason for quietness among store-keepers. As a matter of fact, all workmen were busily employed, and the shops had orders in advance.

Such is the story of the Maritime Provinces.

WILL PAY ACCORDING TO MERIT.

"As one official remarked, the company is paying both competent and incompetent men the same wage. It declined to do this any longer, and would henceforth pay according to an employee's worth." This is a striking statement on the labor problem. It is part of a newspaper item announcing that on May 1 the C. P. R. will allow all contracts with unions to lapse, and will in future run an "open shop." This is to obtain in all the shops on their system.

The decision of the C. P. R. should be of exceptional interest to workmen in every line of employment, and if they are wise they will not at once assume an attitude of truculent defiance without considering the reasons for the change. The unions have been enjoying the system which they themselves advocate. Workmen in general will recognize that the system of labor, the method of production, must be satisfactory to the employer, or he won't manufacture. Therefore, there is much solid food for reflection in the decision of the C. P. R. that the system advocated by the unions is not, after a fair trial, satisfactory.

One does not have to search long to see the reason. The official put his finger on one fundamentally weak spot, the minimum wage and the foisting of incapables on a foreman. The minimum wage, or union scale, is preposterous so long as the union does not insist on any adequate standard of efficiency in its members. Had the unions been led by wiser heads, they would have seen themselves that this element would in time be subversive to their scheme of closed shops. A principle which is based on an unfairness can never hold for very long.

The open shop is not inimical to the welfare of the efficient worker. On the contrary, it gives all men equal opportunities, and divides the rewards according to the work actually done.

WESTERN TRADE REPRESENTATIVES.

A Canadian traveller, who has charge as sales manager for one of the largest firms in Ontario, and who is going to locate in the West, would like to get in touch with some manufacturers who do not send travellers out west of Winnipeg, or would like to have him call on their clients or prospective customers.

The idea is to represent several firms and in that way reduce the cost of selling. He would appreciate the privilege of a personal interview, so as to be able to discuss terms, references, etc. His address may be procured through the Secretary, Toronto.

DEATH OF MR. CASSIDEY.

Mr. J. J. Cassidey, for many years prior to 1900 Secretary of the Canadian Manufacturers' Association, died in Toronto during the past month. Mr. Cassidey reached the advanced age of seventy-five. He was widely known among the manufacturers of Canada.

AMONG THE INDUSTRIES

Lethbridge, Alta., will build a new fire hall, at a cost of \$25,000.

The Borden Condensed Milk Co. may build a large plant at Tillsonburg, Ont.

Portage la Prairie will install an auxiliary water system, at a cost of \$50,000.

The Marvel Street Lighting and Novelty Co. will erect a factory in Montreal.

The Canadian Axminster Co. will increase their capital from \$50,000 to \$75,000.

A new theatre will be erected in Brantford this summer. Manager Johnson is in charge.

The City of St. Thomas, Ont., will erect three bridges this summer, at a cost of \$24,000.

W. J. Mable, Victoria, B.C., will erect a carriage factory in that city during the present summer.

The Maple Leaf Milling Co. are contemplating the erection of a mill in the vicinity of Welland.

The Ogilvie Flour Mills Co., Ltd., have increased their capital stock from \$3,250,000 to \$4,500,000.

The name of the Union Brass Goods Co., Ltd., has been changed to Brass and Steel Goods, Limited.

The Brown, Boggs Company, Limited, Hamilton, will increase their capital from \$50,000 to \$150,000.

C. P. Walker, of the Walker Theatre, Winnipeg, will erect a new hotel in that city, at a cost of \$140,000.

The Illinois Car Wheel Works are considering the establishment of a Canadian branch at Sydney, C.B.

The Ontario Bridge and Pipe Co. of Yale, Mich., will establish their Canadian branch at London, Ont.

Calgary is considering an increase in its water works system which would double its present capacity.

W. E. Sandford Manufacturing Co., of Hamilton, have increased their capital from \$300,000 to \$1,000,000.

The British Consolidated Mills, of London, Eng., may erect a string of forty elevators in the Canadian West.

A \$25,000 mill and elevator will be erected by a Duck Lake, Sask., company, of which A. Baynton is secretary.

The School Board of Winnipeg will spend \$600,000 in new buildings. Work will be put in hand as soon as possible.

The Canadian Northern will build a depot at Brandon, at a cost of \$50,000. It is intended to do the work at once.

The name of the Pre-Payment Electric Meter Company has been changed to the Peterborough Meter Co., Limited.

The Manitoba Rolling Mills, Winnipeg, have re-opened, after being closed temporarily for repairs and extensions.

Toronto will vote on a by-law to spend \$700,000 on a seawall, extending from the Western gap to the Humber river.

The basket factory of W. T. Glover, at Burlington, Ont., was destroyed by fire recently. The loss is estimated at \$7,500.

St. Jerome's College, Berlin, will install two 60 h.p. tubular boilers, a 30 h.p. steam engine and a 300 light electric dynamo.

The name of the Featherbone Novelty Manufacturing Co., of Toronto, has been changed to the A. T. Reid Company, Limited.

Edmonton is considering tenders for the installation of an electric light system, to be operated by producer gas engines.

The City of Winnipeg will spend approximately \$250,000 this year on the erection of new hospital buildings and their equipment.

M. F. Beach, of Iroquois, Ont., has purchased the factory and plant of the Cornwall Furniture Co., Limited. He will put it in operation at once.

Griffin & Company are building a meat packing plant in Edmonton, Alta. It will be equipped throughout with electricity for light and power.

The C. P. R. have under way the replacing of all their wooden bridges with steel structures. This will be carried out throughout their system.

The Manchester Cereal Mill, of Ingersoll, Ont., was destroyed by fire recently. The loss will amount to \$26,000, with about \$15,000 insurance.

The Superior Portland Cement Co. of Orangeville have resumed operations and will run night and day from now till next January, with a staff of 50 men.

The Bank of Nova Scotia will erect a building in Winnipeg at a cost of \$250,000. Thomas Kelly & Sons have the contract. Darling & Pearson are the architects.

Cuthbertson & Joseph, Victoria, are considering the establishment of a large planing mill this summer. The mill will be of a capacity of 100,000 shingles per day.

The sawmill of Sumner & Co., located at St. Peter's, N.B., was destroyed by fire recently, entailing a loss of \$40,000, three-quarters of which was covered by insurance.

Geo. A. Archibald & Co., Kenora, Ont., have secured the contract to rebuild the mills of The Maple Leaf Milling Co. at Kenora, which were destroyed by fire some months ago.

A company to manufacture cement bricks by the Pierce method is said to be being organized in Hamilton. H. H. James and J. McLean are mentioned as being interested in it.

The City of Calgary is offering for sale the franchise to build and operate a street railway system in that city.

The Winnipeg Theatre Co. will erect a \$150,000 building this summer. The interior fittings will be complete and expensive.

It is reported that the Royal Distillery Company of Hamilton will spend \$500,000 on a new five-storey building and equipment.

A new hospital will be erected this summer at Regina, Sask., to cost \$100,000. Debentures to cover the cost have already been sold.

A new Presbyterian church will be built in Hamilton this summer, at a cost of \$46,000. Walter Stewart, Hamilton, is the architect in charge.

The Sovereign Metal Ware Co., Ltd., has been incorporated, with a capital stock of \$1,500, to manufacture metal ware, novelties and household utensils.

The Quatsino Power and Pulp Co. of Quatsino, B.C., have completed plans for the construction of a large pulp mill. It is intended to commence work at once.

The Grand Trunk Pacific have given the contract for a 2,000,000 bushel elevator to be built at Fort William. It will cost \$3,000,000, and will be finished by 1909.

The C.P.R. are planning extensive improvements at Grand Forks, B.C., including a round-house to cost \$70,000, a station, and office building, at \$49,000, and yard extensions at \$40,000.

The C. P. R. will spend \$2,000,000 on new buildings in Montreal. J. S. Paynter, of Montreal, has prepared the plans for the new structures, which will be built on Frontenac St.

The plant of the Northern Industrial Co. has been taken over by the Standard Mills, Limited, who will carry on the business of lumber and flour millers. Montreal is the head office.

The Gibb Evaporator Co. will get a free site for their factory from Exeter, Ont. The Connor Machine Co. will get a free site and exemption from taxation from the same municipality.

A reinforced concrete bridge will be built by the City of Brandon across the Assiniboine river. The city engineer, W. H. Shillinglaw, will be in charge of the work. The estimated cost is \$60,000.

The Standard Mackintosh Company, Ltd., will operate in London, Ont., with \$40,000 capital, and will manufacture men's and women's clothing and dry goods. J. C. Butler, of London, is a director.

The Niagara Paper Box Co., Ltd., which has just been incorporated, will carry on the line of manufacturing suggested by its title. Its capital is \$20,000. W. L. Doran, Niagara Falls, is a director.

The Building Stone and Brick Manufacturing Co., Ltd., has been incorporated, to manufacture cement, stone and brick. The capital is \$60,000, and head office, Ottawa. The provisional directors are A. Tracy, W. Nicholson, R. A. Nesbitt and E. Viens.

A new library building will be built and equipped by Victoria College, Toronto. Sproatt and Rolph, architects, have prepared plans. The building will be of stone and will cost \$75,000.

The Willis Piano Company, Limited, have been incorporated, with a capital stock of \$100,000, for the manufacture of pianos. A. P. Willis, of Westmount, P.Q., is the organizer of the new company.

The Western Fireclay Products, Limited, a company capitalized at \$600,000, have definitely decided to locate in Weyburn, Sask. They will engage in the manufacture of fireclay, tile, sewer-pipe and other kindred lines.

The Ever-Safe Horseshoe Co., Ltd., has been incorporated, with a capital of \$100,000, to manufacture a patent horseshoe. The company will operate in Midland, Ont. F. W. Grant, Midland, is solicitor for the new company.

The Defiance Handle and Turning Co., Ltd., have been incorporated, with a capital of \$40,000, to do a general wood-working business. The chief place of business is Holstein, Ont. A. G. Brebner is a director of the company.

The Queen City Motor and Dynamo Co., Ltd., has been incorporated in Ontario, with a capital of \$40,000. The company will operate in Toronto. The provisional directors are Thos. Patterson, J. M. Fernley and H. J. Ingram.

The Arcade Printing Co. have been incorporated, with a capital of \$40,000, to do printing, lithographing, binding, etc. H. E. Livingstone, W. D. Livingstone and Frederick Stokes are the directors. Toronto is the place of business.

The Foley and Gardner Manufacturing Co. have opened a Canadian branch factory in Toronto. They manufacture meat and band saw filing and jointing machines. They have been doing a considerable business in Canada for some time from their United States factory.

The Wright Piano Co., Ltd., has been incorporated; with a capital stock of \$40,000. Strathroy is the headquarters, and the provisional directors are E. J. Wright, J. W. Cameron, H. E. Mihell, S. M. Smyth and W. P. Dymont, of that town.

Canada Glass Mantels and Tiles, Limited, have been incorporated, with a capital of \$150,000, to manufacture and sell glass mantels, tiles, etc. Toronto is to be the chief place of business. C. W. Thompson, solicitor, Toronto, is organizing the company.

La Compagnie Artistique de Quebec, Limitee, have been incorporated, with a capital stock of \$20,000, to deal in and manufacture paints, mirrors and decorated glass. The place of business is Quebec. J. P. Beland is a director of the new company.

The Special Machinery Manufacturing Co., Ltd., Montreal, have been incorporated to take over the business heretofore carried on under a similar name. It is intended to extend the plant and enlarge the operations generally. The capital stock is fixed at \$49,000.

The Reeder Electrical and Manufacturing Co., Ltd., has been incorporated, with a capital of \$60,000, to manufacture electric, gas and other heating and lighting fixtures and appliances; brass, iron and copper articles, etc. Toronto is the headquarters of the company and A. W. Reeder, R. Gowans, A. E. Bowen and E. H. Wilson are the directors.

A new armoury will be built at Durham, Ont., to cost \$8,000.

Moose Jaw, Sask., will build a high school, at a cost of \$100,000.

A new school building will be erected in Halifax, N.S., this summer.

Prince Albert, Sask., will spend \$180,000 in new school buildings this summer.

Fairview, B.C., will have a new normal school, to cost \$50,000 for building and equipment.

The new high school which will be erected by the Regina Board of Education will cost \$120,000.

An auxiliary water system will be put in by the City of Portage la Prairie, at a cost of \$50,000.

The International Portland Cement Co. of Hull, Que., are building a large new wing to their plant.

An \$80,000 court house will be built at Brandon, Man., this summer. Plans are now being prepared.

The Provincial Government will erect a normal school at Victoria, B.C., at a cost of \$80,000, this summer.

London will build a new isolation hospital, at a cost of \$30,000, and a sanitarium, at a cost of \$10,000, this summer.

Willis & Cosgrove, of Calgary, Alta., will erect a theatre in that city at a cost of \$25,000. The work will be done this summer.

The Deloraine Engine and Machine Works are applying for certain concessions in the form of tax exemption from Deloraine, Man.

An offer of \$50,000 by Andrew Carnegie towards the cost of a library in Calgary, Alta., makes it probable that a building will be erected this year.

The Ontario Legislature has granted Peterborough power to give certain assistance in the way of fixed tax assessment to the Wm. Hamilton Mfg. Co.

The National Manufacturing Co. are contemplating the establishment of a Western branch. Regina and Saskatoon are both mentioned as the site.

\$140,000 will be spent this summer by the city of Edmonton in the extension of the present water system, and \$40,500 for the new Decarie incinerator.

The Marine and General Engineering Company are negotiating for a site and will proceed at once with the erection of a plant. They will likely locate in Sydney, N.S.

It is reported that a company will establish a brewery in Hamilton at a cost of \$250,000. H. Bollinger, Fulton Building, Pittsburg, has been instructed to prepare plans.

It is definitely stated that the Imperial Locomotive Works, Limited, will commence building operations this spring at Lachine, Que. Col. L. Edey, of the Trust & Loan Company of Canada, is authority for the statement that \$2,250,000 will be expended on the plant alone.

The Boston Carriage Co. have secured premises in St. John, N.B., and will open a large carriage factory there on May 1st.

The Sunbeam Incandescent Lamp Co. are negotiating with the City of Toronto for the purchase of a site for a factory. They intend spending about \$75,000 on buildings.

New York capitalists and G. W. Brinkerhoff, an expert paper maker, have been in Fort Frances, Ont., looking at the water power there, with a view to starting a large paper mill.

It is reported that a four-story office building, the ground floor of which will be occupied by the Dominion Bank, will be erected on the corner of King and McNab Streets, Hamilton.

The newly formed National Rolling Mills, Halifax, are contemplating the establishment of a plant at Sydney, N.S. Construction would be commenced at once. C. V. Wetmore is interested.

The Standard Implement Co. will build a big plant at Port Stanley, Ont. They have purchased thirteen acres of land beside the Pere Marquette tracks. J. B. Donald is president of the company.

The Red Cliff, Alta., Brick Works are now in operation and will produce 40,000 bricks a day. It is expected that the output will be doubled inside a month. Provision has been made for the larger amount.

Two bridges will be built over the Don in Toronto if the by-laws to be submitted to the people carry. The two will cost over \$550,000. Contracts will be let as soon as possible after the passing of the by-laws.

The Blackwell Varnish Works Company proposes to erect a brick factory, 40 feet by 100 feet, on Wallace Avenue, Toronto. About twenty hands will be employed. It is said that the plant itself will cost about \$40,000.

The Illinois Solid Forge Car Company are negotiating with the Council, with a view to the location of a plant in Sydney, N.S., and the offer of a free site and exemption from taxes for ten years has already been made.

Construction on the big Swift packing plant, four miles north of Edmonton, will be commenced at once. Work on the plant ceased when winter set in and the news of the resumption of operations has met with great favor.

The Garry, Brock Co. have undertaken to erect a \$30,000 malleable iron plant and to employ 40 men in Pembroke, Ont., if the town will furnish a site and give a low assessment for 20 years. It is probable that the offer will be accepted.

The Standard Car Company, Durham, Pa., capitalized at \$1,500,000, are negotiating with the City Council of Sydney, N.S., with a view to establishing a Canadian branch there; estimated cost of plant, \$400,000. J. R. Shirley, of Charlotte-town, P.E.I., is president.

Egerton Proctor, M. M. Stone and Thos. Moore, of Sandusky, Mich., propose establishing a factory in Stratford, Ont., to manufacture corrugated iron sewer pipe. They have secured a temporary building and will erect a factory during the coming summer. Operations will be begun very shortly.

Trade Enquiries

NOTE.—For further information regarding any inquiry mentioned under this heading or the names of inquiries, apply by numbers to the Secretary, at Toronto.

- 565 **Agent.**—A Birmingham firm wishes to hear from a Canadian manufacturer of agricultural implements open to appoint an agent.
- 566 **Agency.**—A Scottish firm, claiming to have an old-established connection among wholesale grocers and provision dealers throughout Scotland, desires to obtain the agency of some first-class Canadian canned apple exporters. A member of the firm is visiting the Dominion in June, and would be pleased to call on interested parties.
- 567 **Agency.**—A London correspondent, possessing a connection among buyers, wishes to secure the representation of Canadian manufacturers of printing and general papers.
- 568 **Agency.**—A Cape Town firm of wholesale general merchants desire to communicate with Canadian manufacturers of paper, with a view to an agency for the sale of all kinds of paper goods in South Africa.
- 569 **Agency.**—A London firm desires to secure the agency of reliable Canadian packers of canned salmon and lobster.
- 570 **Agency.**—A London firm of general merchants is desirous of securing the agency of Canadian exporters of the following: Grain, evaporated apples, tallows, greases, paraffin wax, minerals, nickel and copper matte, mica, phosphates, canned goods, etc.
- 571 **Agency.**—A firm of manufacturers' agents in the North of England are open to handle an original quick-selling specialty of Canadian manufacture.
- 572 **Asbestos.**—A firm of felt manufacturers in Yorkshire is desirous of getting into touch with producers of asbestos in Canada.
- 573 **Asbestos.**—Inquiry has been made by a Lancashire firm for the names of Canadian exporters of asbestos to the United Kingdom.
- 574 **Agency for canned goods.**—An old-established Leeds firm of import merchants, with ample storage accommodation, are desirous of communicating with a firm in Canada anxious to open up trade of any kind of canned goods.
- 575 **Agency for manganese ore.**—A firm in the North of England is open to take up the agency for a Canadian firm exporting Canadian ore.
- 576 **Agency for graphite.**—An importing and distributing firm in the Port of Hull (England) desire to get into communication with Canadian exporters of coiled wood hoops, which should measure from four up to fifteen feet.
- 577 **Agency for specialty.**—A Hull firm of commission merchants are desirous of handling some good-selling line of Canadian manufacture, preferably a household specialty.
- 578 **Agency.**—A London firm desires to obtain the agency of Canadian exporters of copper and nickel matte, copper phosphates, mica, and other minerals; greases, tallow, paraffin wax, etc.; grain, beans, peas, and general produce.
- 579 **Ash Handles.**—A Manchester firm asks for prices and dimensions of ash handles for hay forks and hay rakes from Canadian manufacturers.
- 580 **Bags for Sugar.**—A Barbados firm, handling jute sugar bags, 45 x 26 inches, and weighing $1\frac{3}{4}$ lbs., desires to find a Canadian manufacturer of similar bags for sugar.
- 581 **Barrel Staves.**—A firm of import merchants in the port of Hull are open to hear what prices Canadian firms can offer for shipments of cask staves for cement barrels.
- 582 **Box Shooks.**—A Manchester firm asks for sizes and c.i.f. prices of box shooks from Canadian manufacturers.
- 583 **Box Shooks.**—A Lancashire firm, now buying in the United States, asks for sizes and c.i.f. prices of box shooks from Canadian manufacturers.
- 584 **Broom Handles.**—A Manchester firm asks for prices of broom handles from Canadian manufacturers.
- 585 **Broom Handles.**—A London firm can supply polished broom handles to Canadian buyers.
- 586 **Bungs.**—A Manchester firm asks for samples and prices of compressed and other bungs from Canadian manufacturers.
- 587 **Boots and Shoes.**—A firm in Barbados handling boots and shoes desires catalogues and prices from Canadian manufacturers.
- 588 **Canned Fruit.**—An old established produce firm desires to undertake the sole buying or selling agency in the North of England for canned apples and other canned fruit.
- 589 **Canned Lobster, Provisions, Fish.**—An Egyptian firm desires to represent Canadian exporters of canned lobster, provisions, fish, etc. Can supply first-class reference.
- 590 **Canned Apples.**—A well-connected produce broker, established in Leeds and Hull, would like to hear from a Canadian canning company, supplying apples in one-gallon tins, who are not represented in England. Shipments could be arranged c.i.f.
- 591 **Carbide of Calcium.**—The largest importer of carbide of calcium in Australia is desirous of obtaining quotations upon a c.i.f., etc., Melbourne and Sydney, basis, for carload quantities of carbide packed in iron drums, enclosed in crates, of medium lump down to electrolite sizes. Quotations should be at least for parcels of not less than 15 tons in one shipment.
- 593 **Canoes, Collapsible Furniture, Hardware, etc.**—Well-known manufacturers' agent and importer in Hamburg, Germany, would be glad to receive catalogues and prices from Canadian manufacturers of the above lines who could ship to the West African coast.
- 594 **Canned Apples.**—Englishman, shortly visiting Canada, is anxious to call on exporters of these goods who could do business with him. Canadian references. Firms interested should write this office.
- 595 **Chair Seats.**—One of the largest Australian importers of chair seats is anxious to obtain samples and quotations for carload quantities of seats, upon the basis of f.o.b. steamer, New York. The usual United States specifications are required. This offers an exceptional opportunity for Canadian makers of chair seats to secure a first-class Australian connection.
- 596 **Cereals.**—A London firm wishes to handle Canadian cereals.
- 597 **Clothes Pegs.**—A Manchester firm asks for c.i.f. prices of clothes pegs from Canadian manufacturers.
- 598 **Condensed Milk.**—An Amsterdam firm would like to get in touch with Canadian handlers of condensed milk.
- 599 **Copper Ore.**—A Manchester firm asks for prices, c.i.f. Liverpool, of copper ore from Canadian exporters.
- 600 **Confectionery and Picture-frame Moulding.**—A Barbados firm, handling confectionery and picture-frame moulding, desires to correspond with a Canadian firm manufacturing these articles.
- 601 **Cider.**—A well-known firm of cider merchants in the North of England are prepared to consider prices and samples of Canadian cider, and desire to hear from manufacturers, with suggestions as to business terms, preferably cash on delivery.
- 602 **Coiled Wood Hoops.**—A firm of import and distributing merchants in the North of England desire to get into communication with Canadian exporters of coiled wood hoops, which should measure from four up to fifteen feet.

- 603 Crank Shafts and Valves for Gasoline Engines.—Western Canada firm inquires for makers in Canada of these goods.
- 604 Cupolas, Foundry Equipment, Conveyors.—An inquiry has been received from an Ontario firm manufacturing bedsteads for the above goods. Will purchase for cash.
- 605 Dextrine.—A Manchester firm wishes to correspond with Canadian manufacturers of dextrine.
- 606 Flour.—A broker and commission merchant and millers' agent, of St. John's, N.F., wishes to obtain the agency of a Canadian flour mill.
- 607 Flour, etc.—A general importer and exporter of St. John's, N.F., wishes to be put in communication with Canadian firms dealing in the following articles: Flour, canned goods, fruits, vegetables, etc.; cattle feeds and hay, also oats and corn, horseshoes, soaps, syrups; also with Canadian buyers of the following articles: cod and seal oil, refined cod liver oil, dry codfish, and pickled fish, lobsters and salmon tinned.
- 608 Farina.—A Manchester firm asks for prices of farina from Canadian exporters.
- 609 Furniture.—A London firm of general merchants and importers wishes to hear from Canadian exporters of furniture (particularly bent-wood chairs) and timber.
- 610 French Trade.—Canadian exporters of various lines can have inquiries inserted in the monthly circular of the British Chamber of Commerce, Paris, France, by writing this office. This circular reaches 1,100 importers throughout France, and should prove an excellent means for advertising Canadian goods.
- 611 Glues.—A Manchester firm asks for prices and samples of glues, in cakes and powder, c.i.f. Liverpool or Manchester.
- 612 Harris, Saddlery, Hardware, Photo Goods, Stationery, Sanitary Goods, Cycle Goods, etc.—A well-known firm of manufacturers' agents covering all the Orient twice a year, are anxious to form connections with reliable exporters of the above and other lines which could be handled advantageously in that market. Have excellent references, experience and connection, second to none, and are prepared to push the goods of any firm which gives them their agency.
- 613 Hammer Shafts.—A Leeds firm dealing in hammer shafts of the large sizes, asks Canadian manufacturers to state their lowest prices for shipments to Liverpool. Terms, cash on delivery.
- 614 Hides.—A Leeds firm of hide and skin auctioneers wish to make arrangements with Canadian exporters for shipments of hides, to be sold on a commission of 2 1-2 per cent. Payment for goods sold made promptly every week, together with an annual bonus. Best references furnished.
- 615 Hides and Skins.—A North of England firm is desirous of hearing from exporters in Canada of hides and skins, with a view to receiving consignments.
- 616 Leatherboard.—A fancy box manufacturing firm asks for prices of leatherboard from Canadian manufacturers.
- 617 Leatherboard and Whiteboard.—A Liverpool firm requiring in the near future leatherboard and whiteboard for fancy box-making, wishes to obtain prices and samples of same from Canadian manufacturers.
- 618 Lawn Mowers.—A Manchester firm desires to obtain prices and catalogue of lawn mowers from Canadian manufacturers.
- 619 Linseed Oil.—A Manchester firm desires to obtain prices of linseed oil from Canadian exporters.
- 620 Low-grade Flour.—Inquiry has been made by a Hull, England, firm respecting the prospects of securing supplies of low-grade flour for animal feeding meals, which must be of the whitest color possible.
- 621 Lumber.—A South African firm of furniture dealers and manufacturers desire to communicate with Canadian manufacturers and exporters of hemlock lumber.
- 622 Leather.—A Leeds firm, largely interested in the import and export of all kinds of leather, inquires for Canadian ex-

Write

Chas. F. Roland, (Commissioner) Winnipeg, Can.

- porters of chrome glazed kid. Suggested terms: Cash on delivery, after examination.
- 623 **Lumber.**—A Belgian firm desires to be placed in touch with Canadian lumber firms able to supply pit props of fir wood, fully stripped of bark. (Length, 1 metre 60, 1m, 80, 2ms 2m. 20, 2m. 50 3ms. Circumference at the small end, 35 to 54 centimetres). They desire quotations, c.i.f., Calais or Dunkirk, or the Belgian ports.
- 624 **Lumber.**—A Rhodesian timber merchant desires to correspond with Canadian exporters of lumber. Catalogues and price list required.
- 625 **Lumber—Spruce, Pine and Cypress.**—A large lumber dealer in San Juan, Porto Rico, seeks connection with manufacturers only of rough and dressed lumber of the above kind, who can ship in cargo lots to the three ports of Porto Rico. Will purchase or sell on commission, paying cash or time. Good references.
- 626 **Manufacturers' Representative.**—A reliable manufacturers' agent in Varsovie, Russia, is open to represent Canadian firms interested in the Russian market. Will handle any lines and has excellent references.
- 627 **Manufacturers' Agent.**—Well-known Montreal business man is open to represent Canadian manufacturers of mechanical supplies, iron and steel tools and general hardware in Montreal and surrounding territory. Can give good Canadian references, long experience and can command some capital. This is a good opportunity for a firm to get a satisfactory representative.
- 628 **Manufacturers' Agent.**—Halifax, N.S., manufacturers' agent of long experience and good references is open to represent Western manufacturers in the Eastern Provinces.
- 629 **Manufacturers' Agent.**—Port of Spain, Trinidad, agent is open to represent Canadian firms in that district.
- 630 **Maple Block Floorings, etc.**—Inquiry has been received from a Lancashire firm for the names of Canadian exporters of maple block floorings. They are also interested in mangle rollers and other timber goods.
- 631 **Marketable Commodities.**—An old established Leeds firm, with large storage accommodation and with travellers continuously covering the country, is open to handle some additional lines in produce, specialties and manufactured goods, and invites catalogues, samples and prices from Canadian firms interested.
- 632 **Maple-wood Blocks.**—Inquiry has been received from a firm in Holland for the names of Canadian exporters of maple-wood blocks.
- 633 **Machinery.**—A South African firm of wholesale importers and commission merchants desire to be placed in communication with Canadian manufacturers and exporters of machinery and requisites for the dairy trade.
- 634 **Machinery.**—A South African firm of wholesale importers and commission merchants would like to correspond with Canadian manufacturers and exporters of machinery and requisites for the bakery trade.
- 635 **Machinery.**—A South African firm of wholesale importers and commission merchants desires to be placed in touch with Canadian manufacturers and exporters of machinery and requisites for the meat trade.
- 636 **Metals.**—A London firm of metal refiners and merchants wishes to get into touch with Canadian firms who are prepared to ship scrap metals, such as old copper, brass, gun-metal, nickel, zinc, etc., to this country in considerable quantities.
- 637 **Mica.**—A London firm desires to get into touch with Canadian exporters of mica who may be seeking a market in the United Kingdom.
- 638 **Mica.**—A Glasgow firm, claiming to have an extensive connection with electrical engineers throughout the United

- Kingdom, desires to be placed in touch with Canadian firms in a position to export a good quality of mica.
- 639 Mica.—Inquiry has been received from a London firm for the names of producers of mica in Canada who may wish to export to the United Kingdom.
- 640 Mica.—A London firm wishes to handle Canadian cereals.
- 641 Oak Planks.—A timber firm in the North of England is open to receive lowest prices from Canadian manufacturers of waggon-oak planks and cabinet-oak planks, two inches thick and upwards.
- 642 Oil Cakes.—Inquiry has been received from a firm of merchants in the North of England for the names of Canadian manufacturers of oil cakes.
- 643 Office Furniture, etc.—A Manchester firm of cabinet-makers desires to get into communication with Canadian manufacturers and exporters of roll-top desks and general office furniture. They are also in a position to do trade in turned wood (chair legs, dowels, mouldings, etc.).
- 644 Oak.—A firm in Rotterdam, Holland, wishes to hear from Canadian shippers of oak.
- 645 Paper Textiles.—A Bradford firm wishes to get into communication with Canadian manufacturers of paper textiles and similar specialties, and will be pleased to receive samples, prices and other particulars.
- 646 Provisions, Fruits, etc.—A West of England firm desires to hear from Canadian exporters of butter, cheese, bacon, oatmeal, dried apples, canned meats, chemicals and oils, etc., who may wish to form connections on this side.
- 647 Pianos.—A firm of musical instrument importers in the North of England would like to have catalogues and prices from Canadian firms making pianos to English standards.
- 648 Scrap Steel.—A Scottish firm makes inquiry for the names of shippers of scrap steel and malleable iron in Canada.
- 649 Slate Battens.—A Manchester firm desires to obtain from Canadian manufacturers c.i.f. prices of slate battens. Sizes, 1 1-2 x 5-8 inches, 2 x 5-8 inches and 2 x 3-4 inches.
- 650 Smokers' Requisites.—A Barbados firm, selling cigars and cigarettes, would like to receive catalogues and prices from manufacturers and jobbers in Canada of pipes and smokers' requisites.
- 651 Sole Leather.—A well-connected firm of leather factors in the North of England are prepared to receive and accept responsibility for consignments of sole leather suitable for the English market, and invite correspondence from exporters interested.
- 652 Specialties.—A London merchant desires to be placed in touch with Canadian firms who are desirous of making shipments of their specialties to the English market.
- 653 Small Saw-mills.—The address of a gentleman who desires to purchase small saw-mills in Sao Paulo, Brazil, can be obtained at this office. Good references.
- 654 Sulphate and Sulphite.—The general manager of three paper mills in Australia is anxious to obtain samples and quotations for sulphate and sulphite, bleached and unbleached, pulp. The total quantity required is at present about 700 tons per annum. Quotations must be upon a c.i.f., etc., Melbourne basis.
- 655 Tanning Extracts.—A firm of factors in the North of England, having an old-established connection among leather manufacturers, wish to get into touch with Canadian manufacturers of tanning extracts.
- 656 Tanning Extracts and Material.—A Leeds firm of importers, possessing an established connection in the leather and tanning trades, invites correspondence from Canadian manufacturers of tanning material or extracts (such as hemlock extracts), or any specialties used in tanning. Prices to be based c.i.f., Hull or Liverpool.
- 657 Timber Pit Props.—A Belgian firm desires to purchase mine

GLOBE TIME RECORDERS

Rapid — Durable — Legible — Reliable

Register consecutively on the one sheet in clear type to the minute. No Keys. No Cards. No checks. No Pin-holes. No Lines.

WHEN considering Time Recorders don't overlook ours. There is nothing "just as good" on the market, either domestic or imported. We can save you money and give you a machine, made in this country, recommended by many satisfied users, that will give you the best protection and will last a business life-time. ☐ They are the well-known and extensively used Drum-Dial registers, made in four sizes, viz., for 50, 100, 150 and 200 numbers, and in various styles (dailies and weeklies) either automatic or handshift. ☐ Prints in clear type to the minute and the records not being handled by employees are proof against tampering. ☐ Our Recorders are adaptable to any business, built to your order to meet your particular conditions and we guarantee satisfaction. ☐ Let us know your time-keeping conditions, viz., number of employees, hours of labor, your pay periods and sample ruling of your wage book and we will submit a specimen sheet from a Recorder that will give you the best results with the least trouble.

HEAD OFFICE AND FACTORY :

W. A. Wood, 15 Bleury Street, Montreal

SALES OFFICES :

Ontario — D. Fleming, 116 Stair Bldg., Toronto
Manitoba — F. H. Brydges & Son, Northern Bank Bldg., Winnipeg
British Columbia — Frank Darling, Molsons Bank Bldg., Vancouver
New Brunswick — Tilley & Fairweather, St. John

- timber or pit props, of the following dimensions: 1.60, 1.80, 2.00, 2.20, 2.50 and 3 metres; circumference at the thin end, 35 and 54 centimetres. They desire an offer c.i.f. at Calais, Dunkirk or any Belgian port.
- 658 Tobacco.—A Barbados firm dealing in tobacco desires to correspond with manufacturers of smoking tobacco in Canada.
- 659 Toilet Soap and Confectionery.—A Barbados firm of druggists wishes to receive catalogues and price lists from Canadian manufacturers of toilet soap and confectionery, with the view of placing orders.
- 660 Timber Goods.—A London firm of general merchants and importers desires to be placed in touch with Canadian exporters of timber goods (flooring, wood excelsior, wood handles, wood mantels, door sashes, turned wood, etc.).
- 661 Trade.—A London firm of merchants, with connections throughout the world, are desirous of developing import and export trade with the Dominion, and would like to open up correspondence with Canadian merchants, manufacturers and importers.
- 662 Twines.—A Cape Town firm of wholesale general merchants would like to be placed in communication with Canadian manufacturers of twines.
- 663 Veneer Stock.—A requisition for veneer stock, which is now supplied by some United States firms. It is for three-ply stock, mostly used by picture-frame makers, and in large quantities, mostly ash, on account of the very decided grain in this timber. They also use plain and quartered oak and a small quantity of fancy woods. The size of the panels mostly imported range from 22 x 26 inches up to 60 x 30 inches, but the bulk would be in the smaller size, whilst the thickness is either 3-16 inch or 1-4 inch, principally 3-16 inch.
- 664 Vegetables in Brine.—A Liverpool firm asks for samples and prices of vegetables in brine from Canadian exporters.
- 665 Wood Pulp.—An Osaka, Japan, firm of general importers

and exporters are in the market to purchase all sorts of wood pulps for the paper industry of Canadian manufacturers. Want lowest quotations, c.i.f., Japan ports, with time of delivery and terms. This is a good opportunity.

SPECIALS.

Engineering Profession.—Young, well-educated Englishman, with thorough technical training and some years' practical experience at mechanical and electrical engineering, is anxious to come to Canada if he can find work in his profession. References.

Peruvian Electric Railway.—Full particulars of an opportunity for a good firm of railway contractors to obtain a profitable contract in Peru can be obtained at this office. The proposition is the electrification of a street railway system in the city of Arequipa, of 40,000 population. The Secretary would be glad to hear from any Canadian firms interested in this.

Glue Business.—A well-known English manufacturer of glue, with over 20 years' experience as the manager of large English works, making a high-grade quality of glue and gelatine, is anxious to find position as manager or superintendent of a good Canadian factory engaged in this business, or he would act as manager for a new concern if capital to the extent of \$25,000 could be secured. Excellent references, and thorough knowledge of the business.

BUSINESS FOR SALE.

Metallic Skylights

The acme of Skylight perfection!

We make them from hollow bars of Copper or Galvanized Steel—in styles and sizes to suit all kinds of roofs.

They are very strong, and unaffected by cold or heat, as there is neither contraction nor expansion—and, if glazed with our fire-proof wired glass, they are absolutely fire-proof.

METALLIC ROOFING CO., Limited,
Wholesale Manufacturers,
TORONTO, CANADA.

Don't Wait Till the Horse is Gone to Lock the Stable

Many a progressive factory-owner has been ruined by a hot bearing, a falling cinder, or a grass-fire. They paid dearly for their indifference to Fire-Risk. Wooden roofs, skylights, cornices, doors or windows are very inflammable, and while falling a prey to the flames themselves, lead the way to adjoining surfaces. Galvanized Steel not only defies Fire and Lightning, but is *six times as durable*, and half as heavy as wood, *easier to erect* and less expensive. Look over this list and let us quote you on your requirements.

“Galt” Corrugated Sheets

Flat or curved, any gauge, painted or galvanized.

“Galt” Fire-proof Doors and Windows

Latest and most approved constructions. Do not swell, warp or lose their shape.

“Galt” Steel Skylights

Light, strong and glazed with fire-proof glass.

An Instructive Catalog free upon request. Use the “Galt Kind” and save half your Insurance Premium.

THE General Fire Equipment Co'y Limited
72 Queen St. East Toronto

ELEVATOR

IN A NORTH BAY FIRE

In 1906, Purvis Bros., North Bay, purchased some of our **Fireproof Windows**. They reduced their fire risk, also their insurance rates. In August, 1907, the building adjoining them was burned to the ground. They say—

The Window did all that was claimed for it

—and our claim is they are really fireproof and give you actual tangible returns. Send for a copy of this letter.

A. B. Ormsby, Limited, Queen and George Streets, TORONTO
677-9-81 Notre Dame Ave. w, WINNIPEG
Manufacturers and Contractors of Fireproof Windows, Doors, Skylights and Partitions, Cornices, Corrugated Iron, Metal Ceilings, Asbestos, Slate, Felt and Gravel Roofers.

WOOD AND STEEL TANKS

For Sprinkler Systems, General Fire Protection, Municipal Water Supply and Other Purposes.

OUR TANKS are made from the best white pine, air-dried, and carefully made, and we absolutely guarantee them when properly erected. Our hooping is arranged to carry safety loads, and based on careful calculation. We do not compete with a cheap grade of tanks made by local coopers who are unable to design and calculate proper material and construction. A poor tank is N. G.

Steel Substructures, Transmission Towers, etc.

Underwood

The Underwood Unit Order System consists of Office copy, Order-book copy, Requisition copy and Shipping instructions copy. Copies for other purposes or departments may be added as desired, but these four are essential in the working out of the system.

It provides an automatic check upon itself and all entries made therefrom. An error in any department is instantly detected.

Information about the Underwood system of mechanical bookkeeping will be sent you upon request. It costs you not more than 2c.; may save you thousands of dollars.

EXECUTIVE COUNCIL

APRIL MEETING.

THE regular monthly meeting of the Executive Council was held in the Board of Trade, Toronto, on Thursday, April 16th, at 2 p.m.

In the absence of the President, who had telegraphed his regrets, the chair was occupied by Mr. Harry Cockshutt, of Brantford.

Among those present were: Messrs. Henry Bertram, Dundas; Geo. Booth, Toronto; P. H. Burton, Toronto; H. Cockshutt, Brantford; W. R. Dunn, Hamilton; J. F. Ellis, Toronto; P. W. Ellis, Toronto; Atwell Fleming, Toronto; H. W. Fleury, Aurora; Jas. Goldie, Guelph; Sam Harris, Toronto; J. H. Houser, Toronto; J. B. MacLean, Toronto; C. R. McCullough, Hamilton; R. McLaughlin, Oshawa; W. K. McNaught, Toronto; Robt. Munro, Montreal; W. C. Phillips, Toronto; A. S. Rogers, Toronto; Alex. Saunders, Goderich; Henry Stroud, Paris; R. L. Torrance, Gueph; C. H. Waterous, Brantford; R. J. Whyte, Smith's Falls; S. Morley Wickett, Toronto; Dan Wilson, Collingwood; W. H. Wyman, Montreal.

The minutes of the March meeting, as published in "Industrial Canada," were taken as read.

COMMUNICATIONS.

Communications were reported as follows:

(a) From members of the Council unable to be present.— J. D. Rolland, Arthur W. White, S. W. Ewing, Louis Simpson, R. J. Younge, Edward Gurney, Wm. Robins, W. H. Rowley, J. M. Taylor, J. J. McGill, Ed. Freyseng, J. A. Coulter, and Wm. Small.

(b) From the Guelph Board of Trade inviting the Council to hold its June meeting in that city.

(c) From the Harbor Commissioners of Montreal, extending to the Association an invitation to be their guests some time during the convention in Montreal on a trip around the harbor.

These two communications were allowed to stand over, to be considered in connection with the report of the Reception and Membership Committee.

(d) From Mrs. Minnie Killam conveying to the Council her sincere thanks for the resolution of sympathy extended to her on the death of her husband, the late Judge Killam.

(e) From Mr. James McLauchlan, Owen Sound, requesting permission on behalf of himself and some thirteen others to organize a biscuit and confectionery section. By unanimous consent it was decided to grant the necessary authority.

(f) From the Vancouver Board of Trade urging the Association to support its representations regarding, first, the Canadian coasting laws; second, the Alaska Yukon Exposition; and third, a bounty on lead. It was decided to leave the first over to be considered in connection with the report of the Railway and Transportation Committee, and to refer the second and third to the Commercial Intelligence and Tariff Committees respectively.

(g) From the Toronto Branch calling attention to a suggestion which had been made by one of its members with regard to the investment of British capital in Canadian securities. It was pointed out in this letter that the existing facilities were entirely inadequate to care for the expansion of Canadian enterprises, except at such high rates of interest as made borrowing unprofitable. While sympathy was expressed with the proposal, it was felt that the Association was scarcely in a position to take up a matter of this kind. The letter was accordingly ordered to be filed.

SECRETARY.

The secretary reported that, in company with the president, he expected to visit the members in New Brunswick and Nova Scotia during the month, holding meetings in Halifax and St. John.

TREASURER.

The treasurer, Mr. Geo. Booth, presented a statement of receipts and disbursements for the month, showing a balance on hand March 31st of \$10,863.98. He stated that, in accordance with authority given him, he had invested \$4,231.38 in city of Toronto debentures, at prices which would yield the Association 4½ per cent.

FINANCE.

In the absence of the vice-chairman, Mr. Tindall, the report of the Finance Committee was read by the secretary. It recommended for payment the accounts of the month totalling \$1,631.42. It reported the receipt of a letter from the Furniture Section objecting to its ruling to the effect that the 10 per cent. of the revenue of the sections should be non-cumulative. In answer to this, it pointed out that it would be unsafe for the Association to operate on any other principle, though by reason of the special circumstances surrounding the work of the Furniture Section, any demand they might make for extra funds would always be considered on its merits.

It was recommended by the committee that a box be rented in the safety deposit vaults of one of the Trust Companies for keeping the Association's valuable papers, that the treasurer and secretary both be placed under bonds, and that a rearrangement of the office should be made to accommodate the new Tariff Department.

RAILWAY AND TRANSPORTATION.

The report of the Railway and Transportation Committee, as presented by the chairman, Mr. W. R. Dunn, read in part as follows:

The special committee appointed at the last meeting of the Executive Council to consider what steps should be taken to protect the Association's interests in the reorganization of the Board of Railway Commissioners for Canada, met on March 31st, 1908.

After careful consideration it was agreed that it would be entirely inconsistent with the principles laid down by the Association, to encourage any action which would savor of class legislation. It was pointed out that the Association had gone on record at the last annual convention urging upon the Government the reorganization of the Railway Commission. This resolution was duly filed with the Premier, the Right Honorable Sir Wilfrid Laurier, and the responsible Ministers of the Government. It was afterwards presented and endorsed in person to the Premier and the Minister of Railways and Canals by a delegation who waited upon the Government for that purpose. In the Association's representations the Government was asked to consider at an early date the reorganization of the Board, and incident thereto to give careful consideration to the business interests of the country.

In view of this, your committee recommends the adoption of the following resolution:—

"The Canadian Manufacturers' Association commend the action of the Government in appointing His Hon, Justice Mabee, to the Chairmanship of the Board of Railway Com-

missioners for Canada, and feel assured that the selection of the other members to the Board will receive the same careful consideration."

We again submit the resolution passed by this Association at the last convention, as setting forth fully our views in regard to the reorganization of the Board.

"Whereas, the Parliament of Canada have, during the last two years, enlarged the duties of the Board of Railway Commissioners for Canada much beyond those mentioned in the Railway Act of 1903; and

"Whereas, in our opinion, the duties devolving upon the present Commissioners have become so numerous and so diversified that it is impossible to render the service required in the interests of the public; be it

"Resolved,—That the Canadian Manufacturers' Association, now in convention, place upon record its recognition of the valuable services which the Board of Railway Commissioners has been rendering in the public interest, and in order to provide for the continuance of this important work, respectfully suggests the advisability of increasing the membership and reorganizing the Board under a plan to be devised or approved by the Board, which would divide and specialize the work of the Commissioners."

We are utterly opposed to class legislation of any kind whatsoever, as we believe that such will result in impairing to some extent the good legislation already enacted. One of the important duties of the Railway Commission is to deal with traffic conditions. The manufacturing interests supply the largest percentage of the tonnage and freight earnings of the railways. The freight rate which applies to manufactured products may be considered the unit or base rate upon which rates on all other products are founded. The regulation of freight rates ranks equally with the tariff, as being of the utmost importance to Canadian manufacturers.

We submit that the public will be best served by the Government appointing to the Board men who will not be looked upon as representing any particular class or interest; the requisite qualifications being a wide business experience, coupled with sound judgment and a broad spirit of equity, which may be depended upon to deal fairly with all interests."

The regular meeting of the Railway and Transportation Committee was held on Wednesday, April 8th.

Uniform Bill of Lading.

Our application to the Board of Railway Commissioners for a simple form of bill of lading has again been renewed. A circular has also been sent out to the Boards of Trade and Shippers' Associations setting forth our views, and asking for their endorsement. Replies received so far heartily endorse the action taken by the Association.

Reduction in Rates to Points in the North-West.

Your committee reported some time ago that the railways had re-issued their tariffs, class and commodity, reducing rates generally to the West, effective December 23rd, 1907. A further reduction has been made, principally on 6th class, applying on agricultural implements, machinery, iron work, household goods, vehicles, etc., effective March 10th, 1908, as follows:—

Regina	former rate \$0 97.....	new rate \$0 87
Moose Jaw	" " 1 00.....	" " 0 92
Medicine Hat	" " 1 16.....	" " 1 14
Calgary	" " 1 24.....	" " 1 16
Saskatoon	" " 1 06.....	" " 1 00
Edmonton	" " 1 24.....	" " 1 18

Renewal of Mixed Carload Arrangement in Connection With Agricultural Implements to the West.

In the re-issue of the commodity tariff from the East to Manitoba points, the railways did not renew the mixed carload arrangement in connection with agricultural implements. On calling their attention to this, a supplement to the tariff was issued at once, effective March 28th.

Freight Classification to Apply to International Traffic via the Detroit and St. Clair Frontiers.

As stated in our last report, the railways made application to the Railway Commission for permission to adopt the official classification carload minimum in connection with the international rate case. It was represented that this was essential to the success of the international rate plan in this case. The manager of the department protested against any change in the Canadian classification, which would bring about an increase in the minimum weights. In this connection your committee recommends the adoption of the following resolution:

"Whereas, the Railway Act provides that the Board of Railway Commissioners shall endeavor to have a classification uniform throughout Canada as far as may be, having due regard to all proper interests;

"And whereas, this point was urged before the Board by the railway interests at the hearing in the international rate case, in support of their suggestion for the application of the Canadian classification instead of official U. S. classification on international traffic;

"And whereas, the international rate case was adjusted by compromises by the shipping interests accepting the Canadian classification for international traffic, notwithstanding that the ratings are, generally speaking, higher than the official classification formerly prevailing;

"Resolved, that this Association vigorously protests against the recent proposal of the railway interests to adopt a separate classification for international traffic, using Canadian classification ratings and official classification minimums, and look upon the proposal to introduce a third classification as one with the ultimate object of having it adopted throughout the Dominion, and thereby securing increased minimum weights on all domestic as well as international traffic. The Association here records its emphatic disapproval of any attempt to disturb the international rate adjustment as originally suggested by the railways, accepted as a compromise by the shippers, and provided for in the order of the Board, No. 3,258."

Supplement 1 to Classification 13.

This supplement is still under negotiation. Certain advances proposed by the railways have been objected to, and meetings have been held with a view of coming to some satisfactory understanding without the necessity of a hearing before the Railway Commission.

Ocean Bills of Lading.

Your committee recommends the adoption of the following resolution in support of the bill introduced into the Senate of Canada by the Honorable Mr. Campbell, cited as "The Water Carriage of Goods Act":

"The Canadian Federation of Steamship Lines impose conditions in their bills of lading to which the shipper must subscribe, and which are intended to relieve the carrier from damage to goods whilst in transit. No such conditions are imposed by steamship lines operating from Eastern United States Atlantic ports:

"Canadian exporters via Canadian routes are thus being outrageously discriminated against:

"Therefore, be it resolved, that the Canadian Manufacturers' Association heartily endorse the bill now before the Senate of Canada, cited as 'The Water Carriage of Goods Act, 1908,' by which it is made illegal for the carriers to insert in their bills of lading conditions which are intended to exempt them from responsibility for loss resulting from their own negligence or omission, and which they are justly entitled to assume as public carriers."

French Steamship Subsidy.

The question of freight rates in connection with the contract to be entered into by the Government with some company for a regular steamship service between Canada and France was left over for further consideration.

Canadian Coasting Regulations.

A resolution passed by the Vancouver Board of Trade, and endorsed by the British Columbia branch, affecting the Canadian coasting regulations, was carefully considered by your committee. The manager was instructed to obtain some further information from the British Columbia branch, particularly as to how it is proposed to overcome the difficulty which apparently presents itself in shipping via the alternate route to the Pacific coast, namely, via Seattle, and submit it to the next meeting.

PARLIAMENTARY.

The report of the Parliamentary Committee, as presented by Mr. Atwell Fleming, read in part as follows :

General Inspection Act.

Owing to the objections raised by the Ontario tanners, as represented by the Tanners' Section of the Toronto Board of Trade, and the further protests of the hide dealers of the west, as voiced by the Winnipeg Board of Trade, it has been decided to take no part as an association in amending the General Inspection Act, to provide for the compulsory inspection of green hides, in order that the Association might have an opportunity of expressing its views on certain clauses which, regarded purely from a business standpoint, seemed to be unwise. At the first hearing the discussion had been entirely of a general character, but when details were reached, after the Easter recess, the Association would make its objections known.

Union Label.

Mr. Ralph Smith, M.P., has again introduced his Union Label resolution, but as the Government has already appropriated the time of private members for its own business, there is no possibility of the resolution being reached this session. Your Committee is informed, however, that Mr. Smith intends to press it to a vote next year.

Ontario Legislation—Conditional Sales Act.

At the urgent request of the threshing machinery and agricultural implement manufacturers, an effort was made in the closing days of the session of the Ontario Legislature to have an amendment to the Conditional Sales Act introduced, restoring things to the position they were in prior to the Lucas amendment of 1906. The Ministry, however, refused to take the matter up, claiming that it would be strenuously opposed by the rural members. It was accordingly decided to revert to the original plan of collecting as much evidence as possible, with the idea of submitting it to a committee of the Legislature early next session.

Franchise for Incorporated Companies.

The above measure has duly passed the Committee and will be incorporated in the Ontario Revised Statutes next

year. This means that commencing with 1910 all incorporated companies will have a vote on money by-laws.

Quebec Legislation, Lacombe re Movables.

The above measure was introduced as an amendment to P. H. Burton, read in part as follows :

"In the case of sale of movable property with reserve of the right of ownership therein, the seller shall not recover possession of the property sold, upon default of payment of the purchase price in whole or in part, without restoring to the buyer a sum equal to three-fourths of what the latter has paid him."

While originally designed to protect poor families in their purchases of furniture, it was calculated to work great hardship on manufacturers and others by having goods thrown back on their hands after they were worn out. It was actively opposed by the Montreal and Quebec Branches, with the result that it was thrown out in Committee.

These branches were also successful in defeating an amendment to the Quebec Insurance Act, whereby it was proposed to make it illegal to place insurance with any company not licensed to do business in the Province. This would have proved a serious blow to those whose business is handled by the New England Mutuals. It will be further referred to in the report of the Insurance Committee.

Poole Publishing Co., Limited.

In connection with the assignment of the above company a dispute arose between the creditors and the holders of certain gold bonds, which were issued as a first charge on all the assets of the company, with the understanding that no mortgage had ever been given either on the real property or the chattels of the company securing the issue. It transpired on investigation that these bonds had been issued only a few days before the assignment, presumably for the purpose of placing the general unsecured creditors in a position whereby they would realize nothing.

The assignee contested the preference claimed by the holders of the bonds over the other creditors. The action was tried before Justice McMahon, who delivered judgment against the assignee, holding that the security was perfectly good as against ordinary creditors, notwithstanding the fact that the bond issue had not been registered.

This judgment is of a most vital character, over-riding as it does the Chattel Mortgage Act, and it can be seen with what disastrous results the principle can be manipulated at the expense of manufacturers and others giving credit to incorporated companies.

The case is now under appeal, with every prospect that the judgment will be reversed, but should it not, an amendment to the Mortgage Act will be introduced next session, compelling the registration of gold bonds of this kind.

INSURANCE.

The report of the Insurance Committee, as presented by Mr. P. H. Burton, read in part as follows :

Without entering into any unnecessary details, the Committee is glad to report that a number of large and somewhat complicated cases, which have been in progress for some months, have been brought to successful conclusion during the past few days. In each case substantial benefits have been secured for the members, while what is equally, if not more, important, conditions affecting Fire Insurance contracts have been brought into proper shape.

In the last week of March the Manager paid a visit to Winnipeg, when the opportunity was presented of meeting a large number of the members in that city. Advantage was also taken of the Annual Banquet of the Branch on March 26th to convey the greetings of the Association, and of speaking to a large gathering on modern Fire Insurance methods

and principles. The visit will, it is believed, develop the business of the Department in a section of the country where, owing to distance and rapidly changing conditions, we have not up to the present had the opportunity of rendering service to our members.

Quebec Legislation.

The Manager of the Department visited Quebec on the 28th and 29th ult., with an important delegation from the Montreal Branch, to protest against certain sections of the new Insurance Act, designed to prevent the placing of business in unregistered companies. The opposition of the Montreal Branch, supported by equally powerful opposition from the Montreal Board of Trade, has been successful to a large extent, and we are informed that an agreement has been reached with the Government, whereby the Act will be amended to provide that any commercial or manufacturing person or company may insure with any underwriter, association of underwriters or foreign mutual insurance company, not registered in the Province, on making a return to the Provincial Treasurer, and paying the tax that would have been paid by the company if the risk or risks had been insured in a registered company. We shall make further report on this subject to the next Council meeting.

Dominion Legislation.

The report of the Committee, which, in accordance with instructions of the last meeting, has been sent to every member, embodying the views of the Association on various aspects of the proposed Dominion Insurance Act, has been presented to and discussed before the Banking and Commerce Committee at Ottawa, and we were accorded a patient and sympathetic hearing. The Government is giving special consideration to the views expressed before that Committee and it is expected that various amendments will be brought down some time after the Easter holidays. Owing to the technical and difficult nature of the subject dealt with, more than ordinary care is evidently being taken by the Government, and profound secrecy seems to be the order of the day. The Committee will, however, keep the matter before them, and will report as occasion may require.

Following this report, which was moved by Mr. Burton, seconded by Mr. Ellis, the accompanying resolution was unanimously adopted by a standing vote:—

Resolution of Condolence.

"The Executive Council of the Canadian Manufacturers' Association have learned with deep regret of the death of Mr. J. W. Cowan, who for many years was a regular attendant at their meetings, and a faithful worker on the Insurance Committee since its organization. In his removal they feel they have suffered a distinct loss. His manly aggressiveness and sound business judgment always proved a valuable aid in advancing the interests of the Association, while his sterling qualities of heart and mind gained for him a high place in the esteem of his fellow-manufacturers. Both as a counsellor and as a friend he will be sorely missed by his business associates, who, in recording this expression of their regret, desire to extend to the widow and family of the deceased their sincerest sympathy."

RECEPTION AND MEMBERSHIP.

The report of the Reception and Membership Committee, as read by the secretary, recommended for acceptance the following twenty-nine applications:—

The Reception and Membership Committee beg to recommend the acceptance of the following applications for membership:—

WAKEFIELD, ONT.

Alexander Maclaren—Tweeds and jerseys.

WINNIEPEG, MAN.

Hooper's Marble & Granite Co.—Granite and marble.

TORONTO, ONT.

Standard Contracting Co., Limited—Plumbers' specialties.
The General Brass Works, Limited—Plumbers' supplies.
Henry Disston & Sons, Ltd.—Lumbering saws.
Gundy-Clapperton Co., Limited—Cut-glass ware.
Gundy-Clapperton Co., Limited—(H. G. Clapperton, 2nd member.)

The Thorne Manufacturing Co.—Picture mouldings.

The Reg N. Boxer Co., Ltd.—Wall paper.

The Reg N. Boxer Co., Ltd.—(F. M. Holbig, 2nd member.)

The Reg N. Boxer Co., Ltd.—(F. C. Hanson, 3rd member.)

ARNPRIOR, ONT.

Philip Dontigny—Tweeds, blankets, etc.

PORT DOVER, ONT.

The Port Dover Evaporating Co.—Vinegar and evaporated fruit.

INGERSOLL, ONT.

M. T. Buchanan, Ltd.—Haying tools.

Thos. Waterhouse & Co., Ltd.—Woollen underwear.

Ontario Fruit Package Co., Ltd.—Baskets and crates.

LONDON, ONT.

T. W. Hastings Cap Mfg. Co.—Hats and caps.

London Fence Machine Co., Ltd.—Fencing and fence-machines.

CHATHAM, ONT.

The Blonde Lumber & Mfg. Co., Ltd.—Builders' supplies.

SARNIA, Ont.

The Cleveland-Sarnia Saw Mills Co., Ltd.—Lumber and lath.

Doherty Manufacturing Co.—Stoves and special castings.

Standard Brass Mfg. Co., Ltd.—Plumbers' brass goods.

Standard Chain Company of Canada, Ltd.—Chains.

In compliance with the wishes of the Montreal Executive, it concurred in the suggestion that the convention be held at the Windsor Hotel, Montreal, from Wednesday to Saturday, September 16th to 19th, and that during the convention advantage be taken of the very kind invitation of the Montreal Harbor Board to take a trip around the harbor for the purpose of viewing the improvements which were being carried on.

Dealing with the invitation of the Guelph Board of Trade, the committee were, for various reasons, doubtful as to the advisability of accepting it, but on motion of Col. MacLean, seconded by Mr. P. W. Ellis, it was decided to accept, and to take advantage of the opportunity to pay a visit to the Agricultural College.

TECHNICAL EDUCATION.

While there was no report from the Technical Education Committee, the chairman, Mr. S. Morley Wickett, moved the adoption of the following resolution, which was unanimously carried:—

Resolution re Technical Education.

Whereas, the memorial of the Canadian Manufacturers' Association made to the Dominion Government jointly with organized labor for the early appointment of a Commission of

Inquiry on Technical Education came before the House of Commons in the form of a resolution, and although cordially endorsed by both sides, did not go to a vote by reason of special circumstances ;

And whereas, the need of such an inquiry in the interest of labor and business generally is urgent ;

And whereas, the Government has appropriated for the transaction of its own business the days formerly set apart for private members, thus making it impossible for our resolution to be voted on this session ;

And whereas, the memorial has the enthusiastic support of all interests,—Labor and Capital, Boards of Trade, Educational Institutions and the Press ;

And whereas, all the provinces have expressed themselves as agreeable to a federal inquiry in the interest of the country at large ;

Be it resolved, that this Council express its pleasure at the intimation recently given to a labor deputation by Sir Wilfrid Laurier that the Government was favorably considering the early appointment of the desired commission ;

Further be it resolved, that this Council express the hope that definite action will be no longer deferred ;

Further be it resolved, that a copy of this resolution be forwarded to Sir Wilfrid Laurier.

“INDUSTRIAL CANADA.”

On behalf of the Industrial Canada Committee, Mr. McCullough reported verbally that the paper continued to make satisfactory progress financially. The special Trade Index Number, which was to be issued in June, was already certain to pay for itself. He referred to the improved character of the editorials and the sprightliness of the paper in general, expressing the hope that the improvements were finding favor with the members of the Council.

IMPERIAL NEWS SERVICE.

On behalf of the special committee, appointed at the November meeting to consider the establishment of an Inter-Imperial News Service, Col. MacLean reported that he had presented the matter at the annual meeting of the Canadian Press Association, together with a letter and number of pamphlets sent him by Sir Sanford Fleming. The Association had adopted a resolution asking the Government to continue the subsidy in aid of the Imperial News Service. With regard particularly to the resolution of the Victoria Board of Trade, Mr. John Ross Robertson, proprietor of The Evening Telegram, Toronto, who had been most active in promoting the news service with the United Kingdom, had presented a special report, which contained a great deal of information on the whole subject, a copy of which Col. MacLean attached to his report for incorporation in the Association's records.

TARIFF.

The report of the Tariff Committee was presented by the chairman, Mr. P. W. Ellis, and read as follows :

Your Tariff Committee begs to report the holding of its regular monthly meeting on Tuesday last, when consideration was given to the following matters

Cases of Dumping.

A number of instances of attempts at dumping were reported as a result of complaints received from various members. In the matter of pork products, it is suggested that as soon as the manager of the Tariff Department enters upon his duties it would be well for him to make a study of this case and offer the farmers the assistance of the Association in pressing for relief at Ottawa. Undervaluation in connection with the importation of malleable iron castings has been referred to the Chief Inspector of Customs, and is now under investigation. The same officer has also been advised of

alleged instances where false representations have been made in connection with the importation of threshing machine parts, and a strong effort will be made to have abuses of this kind stopped.

Collections Under Dumping Clause.

Inquiry made of the department at Ottawa shows that for the nine months ending March 31st, 1907, the total collections of special duty under the dumping clause amounted to only \$72,683.31. When it is considered that this covers the whole of Canada, and when it is recalled how keenly Canadian business has suffered from the competition of undervalued importations from across the border, your committee feel that the figures themselves are a condemnation of the department for its lax enforcement of the regulations.

Fusel Oil.

It is recommended that the application of the Canadian Bronze Powder Works, Montreal, for a cancellation of the excise of 15 cents per gallon on fusel oil be endorsed when this oil is to be used in the manufacture of amyacetate. Under present conditions, all the fusel oil turned out by Canadian distillers is being shipped to the United States, where it is made into amyacetate and re-imported into Canada. By removing this excise, and placing possible Canadian manufacturers on a par with the manufacturers in the United States, it is almost certain that a new industry will be gained to the country.

Detroit Tunnel.

Following the instructions given by the Council at its last meeting, a strong letter of protest has been sent to the Minister of Customs regarding the continued free admission of United States material for use in the construction of that portion of the Detroit River Tunnel lying between the portal and the water's edge on the Canadian side of the river. It has been pointed out to him that while the arrangement was understood to be reciprocal, the instructions given the Collector of Customs at Detroit by the department at Washington are so worded that he would be quite within his rights in holding up any Canadian shipments for duty unless they were for use in that portion of the tunnel lying immediately under the river bed. As the item in the tariff under which Canadian officers admit foreign material free plainly states that it is to apply only when similar materials are admitted free under similar circumstances into the United States, the department has been urged to take advantage of this technicality to cancel the privileges accorded, and thus to give Canadian interests a fair deal.

Manager of Tariff Department.

A special meeting of the committee was held on March 28th to review the various applications for the position of manager of the Tariff Department, and after the most careful consideration it was decided to offer the appointment to Mr. R. W. Breadner, Dominion Appraiser, Ottawa, at a salary of \$3,000 per year. Mr. Breadner is a man of long experience and thorough practical training in tariff matters. He is also an indefatigable worker, and has the reputation of being the best informed man on tariff matters generally that the Customs Department has in its employ. It is felt that in his hands the Association's new department can be of great immediate benefit to the membership at large. By his intimate knowledge of the manner in which the business of the department is transacted, it is confidently expected that he will be able to handle all matters entrusted to him by members of the Association with the utmost satisfaction and dispatch.

A letter has been received from him stating that if the Council endorses the report of this committee, so far as relates to his appointment, he will report for duty on or about the 11th of May. In leaving the service of the Government for a yearly engagement with the Association, he forfeits his right to the superannuation allowance which would be coming to

him in the course of another eleven years. He is, therefore, sacrificing a future which is assured him for what he considers the wider opportunities offered by the Association. Your committee has not hesitated to urge him to make the change, feeling certain that if he has the ability they believe he has he will make a permanent position for himself with the Association.

Discussing the clause relating to the issue of gold bonds, Mr. Waterous stated it had been represented to him that under the present law one incorporated company could sell out to another, which might practically be the same company so far as the shareholders were concerned, before the creditors of the first company could secure control of the assets. This opened the door to all kinds of dishonest practices, and he thought that something should be done to make such action illegal. He was requested to submit a case for the consideration of the Parliamentary Committee.

In moving the adoption of the report, Mr. Ellis reviewed with considerable detail the situation which had confronted the present Tariff Committee on commencing its work last fall. Its members felt that the Association had not been as successful in its tariff campaign as it might have been for the reason that the Tariff Committee was not sufficiently informed as to tariff details. They had felt that to make themselves of practical use they must take up specific cases, but in doing so they soon found themselves saddled with more work than they could handle, and the Secretary found himself called upon to undertake work which his lack of technical knowledge prevented him from doing justice to. The only solution seemed to be to follow the course marked out by the Insurance and Transportation Committees, viz., by engaging a tariff secretary. He then reviewed the negotiations with the Finance Committee culminating in the vote of the Council appropriating \$5,000 for the establishment of a tariff department for a period of one year.

Dealing with the applications for the position, and the considerations which had influenced the committee to make its present recommendation, he took occasion to refer in the highest terms to the splendid qualifications possessed by Mr. Breadner. He cited a number of instances where the expert knowledge possessed by that gentleman had been of great value to members of the Association, and predicted that with his services continually at their disposal, a great deal of practical good could be accomplished.

The report was seconded by Mr. Burton, who expressed the belief that if the new officer could be instrumental in checking the undervaluation which was being carried on so extensively, he would be doing the members a splendid service. On motion the report was carried unanimously and with great satisfaction.

BRANCHES.

The reports of the Montreal and Toronto branches were taken as read, and ordered to be published in "Industrial Canada."

Under the head of new business, Mr. Dunn inquired, as chairman of the Railway and Transportation Committee, whether it was the wish of the Council that the Association's views regarding appointments to the Board of Railway Commissioners, should be presented to the Government by letter or in person. Upon a vote having been taken, it was decided to forward the recommendations by letter.

Mr. Torrance expressed pleasure as a manufacturer from Guelph that the Council had decided to meet in that city in June. He assured them that their visit to the Agricultural College would be most instructive, and on behalf of his fellow-manufacturers he promised that everything possible would be done in other ways to make the visit enjoyable.

The meeting then adjourned.

TORONTO BRANCH.

At the regular monthly meeting of the Executive a letter was read from the Young Women's Christian Association, asking the Branch to give its active assistance to them in their efforts to provide suitable homes for the girls who are employed in Toronto factories, shops and offices. While the Executive is thoroughly in sympathy with this work, and is satisfied that the objects of the Y. W. C. A. deserve the support of every employer of girls, it did not see its way clear to lend any assistance in the name of the Association, as to do so would inevitably lead to similar requests from organizations with equally worthy objects. Several members of the Executive will, however, in their individual capacity do all they can to help the movement along, and the Executive appeals to every Toronto manufacturer to do likewise.

Technical School Site.

The agitation the Branch Technical Education Committee has carried on to have the site for the new Toronto School situated west of Spadina instead of on Bloor St. East, near Jarvis, as at first decided, is resulting successfully, and the Board of Education are applying to the city for additional funds to purchase a suitable site where the different interests of the city desire it.

British Loan Companies in Canada.

As the result of a report received from London, England, the Branch has decided to make no recommendations with regard to the suggestion made some time ago that it should endeavor to induce British Loan Companies to open branches in Canada.

Annual Meeting.

The annual meeting of the Branch will be held the fourth Thursday of June this year, three weeks earlier than usual. The change was made because the attendance has been small in the past owing to many members being away on vacation in July. It is sought to avoid this condition this year.

All of which is respectfully submitted.

MONTREAL BRANCH.

The session of the Quebec Legislature, now nearing a close, has required more careful attention on the part of the Montreal Branch than any for some years past. The Insurance Bill introduced by Hon. W. W. Weir contained a clause which was designed to prohibit insurance being placed outside the country. Whether this was within the power of the Quebec Legislature or not was a disputed point, but rather than trust to this being the case the Branch took this matter up, and at a meeting of some twenty-five manufacturers interested it was decided to engage the services of Mr. A. J. Brown, K.C., and make representations to Quebec to have the bill amended. Two large delegations waited upon the Provincial Treasurer, the second one having the opportunity of arguing the matter in the presence of representatives of the stock insurance companies. Mr. Brown also attended before the Legislative Council, and we are happy to report that the bill was so amended that no restrictions will be placed upon manufacturers insuring outside the country except that they will have to report all such insurance to the Provincial Treasurer.

It being reported that the Quebec Government would put through a bill reducing the hours of labor for women and children in factories, one of our delegations had an interview with the Minister of Labor, and obtained the assurance that the matter would not be pressed this session.

Opposition was made to the dangerous bill regarding the sale of movables, and we are happy to report that this bill was thrown out.

The different convention committees are now meeting and making preparations for the September gathering of the Association in Montreal.

FORD CARS

Sometimes we meet a man who refuses to believe that the Ford runabout is everything we claim for it, until he sees it all with his own eyes. It is the exacting scrutiny of this kind of man we especially wish. Because the Ford runabout is built to stand the closest scrutiny, there are to-day more of these staunch little cars in actual use than any other make.

- Where else will you find a perfectly balanced, vibrationless four-cylinder motor, except in high-priced touring cars?
- Where else but in Ford Cars will you find the exclusive use of Vanadium Chrome steel, the strongest automobile steel that engineering science has produced?
- Where else will you find 15 H.P., and 35 to 40 miles an hour speed in a car anywhere near its price?
- Where else will you find a light runabout car of whatever price built to last, simple yet strong, and capable of giving efficient service for an indefinite period of time?

If you are a user of Acetylene in any form, stop and consider the quality and intrinsic value of **S** brand carbide.

This carbide is manufactured exclusively by us in the largest carbide plant in Canada. Our recently remodelled plant is the most modern in existence, and has a present annual capacity up to 15,000 tons.

We are one of the few independent carbide manufacturers, and our aim is to make the best quality of carbide it is possible to turn out.

S brand carbide will always show a maximum of gas yield and a minimum of impurities.

The packing of **S** carbide, illustrated here-with, is an important point that you should also consider. The round drum of special soft annealed steel which we are now using exclusively, is absolutely the best carbide package that has ever been put on the market in any country. It guarantees safe delivery in the original package.

We cater particularly to export trade, and foreign buyers are requested to place their enquiries with us.

The PLANT and The PRODUCT

The New Plant

A BIRD'S eye view from the architect's drawing of the new Corroding Plant, Paint and Dry Color Factory of Brandram-Henderson, Limited, now nearing completion at St. Louis de Mile End, Montreal, P.Q. The property on which these buildings are situated has a track frontage of about 1,000 feet, directly on the main line of the C.P.R.

The main building, 300 feet long, and 150 feet wide, is a massive structure of pressed brick and grey stone trimmings. It is practically fire-proof and has a frame of steel and floors of reinforced concrete.

The Main Product

BRANDRAM'S B. B. Genuine White Lead corroded at these new works, is the standard of the market, unequalled for fineness, whiteness, body, covering capacity and durability. To thousands of people all over Canada, the word "Brandram" suggests White Lead, and the words "White Lead" mean Brandram's. The new works are constructed with facilities to produce 3,000 tons of White Lead annually, with provision to increase when required.

GREATEST AGRICULTURAL IMPLEMENT MANUFACTURING PLANT ON BRITISH SOIL

Works of the International Harvester Company of Canada, Ltd., Hamilton, Ont.

The center of the Canadian agricultural machine industry is at Hamilton, Ont., where the great International Harvester Company Works is located. This plant consists of a series of modern buildings, designed to produce harvesting machines and implements from start to finish. The plant occupies one end of a 200-acre tract lying two miles east of the City of Hamilton, on the banks of Hamilton Bay, a part of Lake Ontario. In this immense plant are built by Canadian workmen on Canadian soil the famous McCormick and Deering tillage implements, seeding and harvesting machines. These machines are the favorites of the Canadian farmer because they meet every requirement of the harvest field. The International line also includes cream separators, manure spreaders, wagons, hay presses, gasoline engines, feed grinders and threshers. The product is distributed by thousands of local agents found in every part of the country and by branch houses located at all important trade centers in both Eastern and Western Canada.

International Harvester Company of Canada, Ltd., Hamilton, Ont.

Library Bureau's New Factory

ISABELLA STREET, OTTAWA

OUR new factory in Ottawa with 31,000 square feet of floor space is now running full blast. It is the most complete hardwood working plant in Canada, in machines, in power, in light, and in facilities for producing the finest cabinet work. It will enable us to turn out a more distinctive grade of business furniture, card and filing cabinets, bank and library equipment than ever before.

The product of this factory will supply both our Canadian and English branches.

THE STANDARD HARD WHEAT FLOURS OF THE WORLD

are milled by us in the largest, newest, and best equipped mill in the Dominion—our new Keewatin mill. We are millers of Manitoba Hard Wheat exclusively; and Manitoba Hard Wheat is recognized as the best grain grown anywhere.

Our brands have obtained a reputation for purity and uniformity which is worth investigation by anyone who uses or handles flour. If you are in the market for high grade flours we will tell you why our brands will pay you better than ordinary brands. May we send you this information, or a trial shipment to-day?

GLOBE TIME RECORDERS

Rapid — Durable — Legible — Reliable

Register consecutively on the one sheet in clear type to the minute. No Keys. No Cards. No checks. No Pin-holes. No Lines.

YOUR payroll is the largest single item expenditure in your establishment and is the one expenditure most profitable to keep a good check on. ¶ You are buying this labor every day, every week, every year. Are you getting all that you pay for? The experience of many firms is that before they had a good mechanical time register, they did not. ¶ We can reduce your payroll by compelling employees to be on time and to work until quitting time. We show you the exact time your employees arrive and depart and do it in clear, legible TYPE to the MINUTE. ¶ It enforces punctuality and eliminates all time disputes. The machine shows no partiality. These machines, made in Montreal by W. A. Wood, have stood the test for years and many firms throughout the country cheerfully recommend them. We have saved them money: we can do the same for you. ¶ Let us have your time-keeping particulars, i. e., hours of labor, your pay periods, number of employees, and we will submit specimen sheet from the machine best suited for your requirements. Our experience in this line is at your service.

Agencies Throughout Canada

Numerous branch agencies in Drug Stores, etc., convenient to business and residential districts, open early and late.

SIGHT-
FEED

STEAM LUBRICATOR

Why they are Best

They are easier to operate and have fewer working parts than any other lubricator.

They are equipped with disc-shaped sight-feed and gauge glasses. These glasses are ground plate glass, heavy and clear. No danger of breaking them as with the old style long glasses.

The amount of oil in the cup can be gauged to the last drop, as the filler arm which contains the gauge-glass is located at the top of the cup.

The cup can be filled quickly and without waste of oil.

The price is consistent with the quality of the goods.

THE SAFETY RAZOR

MADE TO SHAVE—NOT TO STROP

SOME safety razors are like perpetual motion—perfect in theory but impossible in practice.

They seem to be made only to strop. Their "strong point" is the fact that they can be stropped.

That is just what most men don't want to be bothered with.

The GILLETTE Safety Razor is made to shave. It does away with the necessity of honing and stropping. It is the one razor that means shaving comfort.

No man ever writes his name twice exactly the same. How can he put the same microscopic edge on a razor? That is why cut faces are the rule with hand-stropped razors.

The Gillette Safety Razor is sharpened by machinery—regularly, evenly.

Every one of the millions of Gillette blades are identical in sharpness. Gillette blades are hardened by an improved automatic process which makes them only 20 per cent. less hard than the hardest known substance—the diamond.

Thus unusual hardness is possible because of the paper thinness of the blades, 6-1,000 of an inch. This paper-thin blade is an exclusive feature of the Gillette and is found in no other razor.

Over 2,000,000 men now use the Gillette. Their opinion is that the Gillette will do all that is claimed for it, and will do more than any other shaving device on the market today—that it is a time saver and a money saver—that it is instantly adjusted to suit any and every beard—and that you can shave yourself at any time and in any place, in from 3 to 5 minutes.

Back of the Gillette Safety Razor is a solid business organization—with factories in the United States, Canada, France, Germany and England. The business is firmly established. The Gillette has proved its claims and has come to stay. Retail

prices are fixed by the company and there is no price-cutting.

If you operate a Jewelry, Drug, Hardware, Cutlery, Sporting Goods or Department Store, you can handle the Gillette with satisfaction to your customers and profit to yourself.

Write us for booklets, prices and name of wholesaler in your line who will supply you.

THE EDITORIAL VIEW POINT.

An Old Acquaintance.

ALL of us who took an interest in Canadian politics in the days when Unrestricted Reciprocity with the United States was the principal plank in the platform of one of our political parties, remember that the chief argument urged against that policy was that it would lead Canada into annexation with the republic to the South, and was for that reason unpatriotic. A tariff wall, it was claimed, was our last protection against encroachments from our powerful neighbor. The Unrestricted Reciprocity advocates made light of these objections, declaring them to be the wild ravings of the imagination. However this might have turned out, the mass of the Canadian people felt that the best way to build up this country was to hold its trade as far as possible for its own people, and any one who has appreciated the vast strides we have made in the past few years, will readily acknowledge that time has vindicated the choice then made by the people.

On the other hand, there are still people in the United States, and amongst them some nationally prominent politicians, who think that the throwing down of the tariff wall would eventually lead to the entry of Canada into American Union. Governor Johnson, of Minnesota, who is a candidate for the Democratic nomination for President of the United States, recently made a speech on trade relations between the two countries, in which he expressed this belief: "The flag," he said, "would follow the trade of the United States and, before many years, would float over Canada if the tariff wall were torn down between the countries." If this man's arguments are sound, it is clear that we have to thank our tariff wall for more than the building up of our factories—we have to thank it for our very existence as an independent country. At this late day there is no possible chance of Canada entering into any such trade relations with our neighbor. Our hold on the future is too strong and our prospects too bright, to allow strangers to come in and take them from us.

Protection in England.

A CORRESPONDENT in last month's issue of "Industrial Canada" took exception to some remarks we had in the April issue on "Protection in England," pointing out that England has the greatest foreign trade of any country in the world, surpassing all the high tariff countries. He called attention to the depression in the United States, and wanted to know why it is that the high tariff there does not cure the case. He carefully avoids pointing out that the depression in the United States is identical with the depression in England, that the money stringency and falling off in business is world wide, striking all alike. There is nothing in this argument whatever. But the fact that does stand out above and beyond all others, is that the United States with its high tariff has, in a single century, developed what was a mere colony in a wilderness into one of the most powerful as well as one of the greatest manufacturing countries in the world.

The one predominating feature of all trade legislation in the United States has been and is "America for the Americans," and it has won. It is impossible to conceive any greater success, from a purely commercial point, than they have made; but if our correspondent is right, we would have to conceive of a free trade nation eclipsing it. To say that England's trade is greater is only saying that the nation that started several centuries ahead is not yet overtaken. The point in our former article was that while England's trade in the past has been growing under a free trade policy, the belief is gaining ground over there that the time is near at hand when protection will have to be resorted to in order to retain what has been won. The British market is free to every nation, but the British manufacturer has to pay for the privilege of selling his products abroad. In the past, when he had some advantages in methods and in shipping this did not greatly handicap him; but now that other countries have adopted or improved on his methods, and have got shipping facilities equal to his own, he naturally feels that he cannot much longer continue to give everything, and get nothing in return. It is this awakening that has given rise to the tariff reform movement, which has already grown strong enough to carry bye-elections and send one cabinet minister down to defeat.

How the Tariff Helps.

WHY does the British capitalist invest his money all over the world; why not put it into manufacturing at home, if the Free Trade Policy is such a great advantage to the industries of the country? The answer is that the British capitalist, in order to overcome the tariff restrictions in, say the United States, puts his capital into manufacturing there, which gives him two free markets instead of only one. He has the United States market because his goods are made in the United States, and he has the British market on just as good terms as if he had built his factory at home. The Free Trade Policy of England is really an inducement to British manufacturers to put their money into foreign factories. On the other hand, what a good thing the high tariff is for the United States? It is the magnet that draws foreign capital to it. Canada is in exactly the same position, and we are seeing every day how the tariff benefits, not merely the manufacturer, but every one of us. The very pen with which this article is written is an evidence of what the tariff is doing for Canada. It is the product of the L. E. Waterman Company, of Canada, a company that owes its existence to the tariff. The parent company, the L. E. Waterman Company, of New York, found that the only profitable way to supply pens to the Canadian people was to make them in Canada. For three years they had tried to bring them in despite the duty, and while they have built up the largest trade in their line in this country, as it is in every other country, still the item of duty represented such a large margin of the profit, that they

concluded that the pen for the Canadian people must be "made in Canada." To-day they are busy erecting, close to Montreal, a modern factory to turn out pens for Canadians, and when it starts operations in the fall, several high class mechanics will be added to our population. This is only one instance of what the tariff does. Another is the Cudahy Packing Company, of Omaha, who are already turning out one of their products from a factory in Toronto, and their Canadian manager, Mr. Dix, told the writer a few days ago that within a comparatively short time they would have an immense soap factory in operation in this country, as it is impossible to import their laundry and toilet soaps, and compete with the excellent lines already made here. The International Harvester Company, of Hamilton, the Westinghouse Company, of the same city, the Quaker Oats factory at Peterboro, and a host of others already here bear witness to what the tariff can and does do. As stated in a former issue of "Industrial Canada," since the first of January more than \$100,000,000 of British money has come to Canada for investment, and it can be demonstrated that the most of it is coming here because of our protective policy. If we had free trade, the United States manufacturer would ship his goods in here from his United States plant, and the British investor would use his money to enlarge his manufacturing plants at home. There is no sentiment in business; it is all a matter of profit and loss figured out in percentages. A 25 per cent. duty does more to establish factories on Canadian soil, furnish employment for Canadian workingmen, and create a market at home for Canadian farmers, than a million tons of sentiment could do in as many years.

The Strike Mania.

THE regular spring epidemic of strikes is raging at the present time. The building trades in several cities are seriously hampered by the refusal of workmen to accept employment on reasonable terms. A few weeks ago the same men were crying out for work to do, and in some instances even marching on civic authorities and demanding employment. The wail of the unemployed was raised in several of the larger cities, and the public asked to sympathize with the hard lot of the man who had no work to do. No sooner, however, was work available than the tune was changed, and the supplicant became a dictator. Mr. Agitator, who was helpless to aid the workman in his time of need, and kept in the background, is now very much in evidence, working as hard as ever at his old game of making trouble between employers and employees. Meantime the days are passing into weeks and months, and the harvest time of the building laborers and mechanics is passing in idleness. The workingmen fail to appreciate that conditions are not as they were, or if they do appreciate it, they are not willing to stand their fair share of the reduction in prices which have come with the depression. When times were unprecedentedly prosperous, as they were twelve months ago, the working-

man was not slow in demanding his full share in the profits. Wages were increased until they reached a point where it became impossible to pay them. The depression which followed was in no small measure due to the prohibitive scale of wages demanded by the workingmen. To expect, under the changed conditions, that the old scale can be maintained, is ridiculous. If the employers could not pay them and make a profit in boom times, they certainly cannot afford to pay them at all in times of depression. In every commodity in general trade there are fluctuations in price; it is ridiculous to think that the commodity which the workingman has to sell—his labor—can possibly remain either fixed at the highest figure of the past, or be increased indefinitely. Supply and demand determine the price of labor. Unionism cannot change the natural laws of commerce, and the sooner the man with labor to sell realizes this, the sooner will a proper understanding be arrived at.

stead of by the ton, as for the laborer to make time the standard of value for his services. Time belongs to no man, and no man has a right to sell what he does not own. The trouble between the building trades and the unions is in a large measure due to this dogmatic doctrine of value. When the bricklayers wages were 35 cents an hour, the average workman laid 1,200 bricks a day; last year with wages at 50 cents an hour the average number of bricks laid per day was only 800, yet the union demands that 50 cents per hour be the fixed rate of wages for all bricklayers

regardless of how much work they are capable of performing. The employers offered to pay the old rate of 50 cents per hour for the men who were able to earn it, and for less capable men less wages. But the unions would not hear of it. Every man who belonged to the union had to have the same rate of pay per hour. In effect, what they demand is that the man be paid for his time and not for his work. They want to sell hours not labor. It is scarcely necessary to point out what a killing effect this has on capable and ambitious workmen. If the lazy or incompetent man is to be placed on an equality with the capable, industrious workman, what inducement is there for the latter to exert himself? It is certainly one of the most unfair and unreasonable propositions ever laid down, but it is quite in keeping with unionism. That the vast ma-

AS THE REIGN OF PROSPERITY BEGINS

HARD TIMES: "I think it's about time to get out of here."

majority of the most capable workmen fight shy of the unions is not to be wondered at when one considers that unionism is antagonistic to capacity, in as much as all its effort is in the direction of securing for incompetency the rewards that justly belong to proficiency.

The Man and His Hire.

ONE of the most unreasonable positions taken by the unions is that all union men are equal. Equality is nowhere else set down in such dogmatic fashion, except in the United States Declaration of Independence, and there it is confined to infancy, and in the pronouncement that the grave makes all men equal. All through the rest of life there is inequality. Nature abhors equality. Unionism alone maintains the doctrine in the face of everything. All union men in any given calling are to be paid equally for their time. That there is a difference in the quality or amount of work they perform does not enter into the calculations of unionism. They insist on selling time, and they fix its value by the hour or by the day. What the employer wants to purchase is labor, and he has a perfect right to insist on fixing its value according to quality and amount. As well might the farmer insist on selling his hay by the time it took to grow, in-

The Stock Market.

SOME one has described the stock market as a business barometer. The manipulators of the market are said to have a species of second sight, or foresight, by which

they are able to detect disaster before it arrives, and discover an approaching boom in advance of ordinary mortals. Whether or not there is anything in this, certain it is that they discover every change in the business world in advance of its becoming effective. The great slump in the market last fall came well in advance of the depression in manufacturing and general trade. At the present time, while general trade has shown but slight improvement, the stock market is booming, which is taken to indicate that the sagacious brokers have already sighted returning prosperity on the approach.

A New Railway Rule.

THE Government is to be congratulated on the stand it has taken with regard to the granting or extending of railway charters. The Minister of Railways, Hon. G. P. Graham, announced in the Railway Committee of the House of Commons the other morning, that the day of granting charters to railways that did not do work was ended. This declaration was made during a discussion in the committee of the bill respecting the Manitoulin and North Shore Railway, which was ordered to expend \$25,000 on the Manitoulin section before July 15 next, and at that date satisfy the Board of Railway Commissioners of its financial ability to complete the road within two years. This is a stand that should have been taken long ago with regard to railway charters, many of which were obtained for the sole purpose of speculation. There is still another important feature of railroading in this country on which the Government should take a stand, and that is in the matter of equipment. Once a road is built it should be refused any further charters either for the extension of the main line or for branches, until the portion covered by the original charter is thoroughly equipped. A road without sufficient rolling stock to handle its traffic promptly is worse than no road at all, for it shuts out other companies that would be glad of the opportunity to supply the service demanded by the traffic. In the past our manufacturers have had all kinds of difficulties in getting cars, and even when they did get the cars the delays in transit were often such as to entail serious losses. A company that is granted a charter, carrying as it does many special and valuable privileges, should be compelled to maintain a reasonable service, both for freight and passenger traffic. There should be some fixed standard of equipment, and it should be insisted on in every instance. Perhaps now that the Government has decided to wipe out one evil it will turn its attention to this other and find a remedy for it.

A Good Suggestion.

HON. J. D. ROLLAND, President of the Canadian Manufacturers' Association, in a recent interview at Halifax, threw out a suggestion to our friends down by the sea, which they would do well to take into their most serious consideration. The Maritime Provinces enjoy

some advantages over the rest of Canada, which will eventually give them the importance in the Confederation of provinces to which their geographical position entitles them. Hon. Mr. Rolland struck the right note when he said: "Your natural resources should be developed, and I would like to see a great shipbuilding plant in your province. There is no reason why such an industry should not prosper with a little Government assistance at the outset. All the big steamers that go on the Great Lakes should be turned out of Canadian yards, instead of coming from other ports. I feel that the Manufacturers' Association would endorse any project for the establishment of steel ship building, and I think that the Province of Quebec would give it most hearty support." There is no reason why such an industry should not be a great success in the Maritime Provinces. In the days of the old wooden sailing vessels, the Maritime Provinces had their shipyards, and the prosperity that went with them. There is no reason why they should not have shipyards turning out steel vessels now that the other kind have gone out of fashion. They have everything that nature can give them to make such an enterprise a success, and if it were once undertaken it is safe to predict that the money needed would be forthcoming. "Made in Canada" steamships would find a hearty welcome from every part of the country.

The Pulp and Paper Problem.

WHAT has come to be known as the "Pulp Problem" is one of the most discussed questions in Canada to-day, and it is a satisfaction to note that the daily press is devoting so much attention to this important issue. From Washington recently came the information that assurances were given from a high source in Ottawa, that Canada would not put an export duty on pulpwood, if the United States removed the tariff against it entering that country. Senator Edwards, one of Canada's lumber kings and the owner of vast areas of pulp forests, as well as a leading member of the Liberal Party and a close friend of the present Government, in a recent interview said that it was his opinion that the best thing Canada could do would be to let matters drift along in their natural course without trying to improve them by legislation. The paper mills of the United States were getting old, he said, and as the raw material they had at home was fast approaching exhaustion, the chances were that the plants over there would not be replaced, but new ones built in Canada instead. Can it be possible that the Senator has been giving out this interview for the purpose of seeing how the people would receive a policy of inaction in order that the Government might be able to judge in advance whether they would resent its failure to protect their rights? If this was the object that he had in view he has had his answer from the country. He has been told pretty plainly that the people of this country fully understand the situation, and are in no doubt whatever as to the best means of forcing the manufacture of

our raw material into paper in our own country. The sooner the supply of Canadian pulpwood is stopped going to United States' mills, the sooner will their own forests be exhausted and the mills either forced to go out of business or move over here. So long as we continue to supply them with raw material they will remain where they are, but once we shut off the supply and their own is exhausted, they must come of necessity. There is nothing else to it.

One Reason for High Freight Rates.

THE Government has appointed a commission to investigate the charges made by Major A. S. Hodgins, C.E., a former district engineer in charge of a 400-mile section of the National Transcontinental Railway. Broadly put, the Major charges that millions of dollars are being wasted or stolen in the construction of the Government portion of the Grand Trunk Pacific. The accounts are padded and the Government are millions out on the transaction. This is a matter of very great importance to manufacturers who furnish the chief source of revenue to the railways. If a road costs more than it should cost, and interest has to be earned on capital that never actually went into it, the freight rates are bound to be higher than they should be. The chief argument that the advocates of the road used to get the bill through parliament was that it would give the West competition in freight rates, and would mean the movement of the western crops eastward, and of eastern manufactures needed by the farmers westward on more favorable terms than can now be obtained. If, however, the road is going to cost millions more than it should cost, the chances for any improvement in freight rates are very remote. It will be interesting to follow the investigation into Major Hodgins' charges.

Labor and the Law.

LABOR leaders are great advocates of legislative enactments which restrict the liberties of employers, and hamper them in dealing with their employees. When, however, the courts interpret an act in any way restricting the freedom of labor to coerce and hamper employers, they cry out at once and want to be exempted from its operation. In New York a couple of weeks ago a labor mass meeting, which was one of several held throughout the United States, was called for the purpose of publicly demanding that Congress pass a labor amendment to the Sherman Anti-Trust Law, which would exempt labor organizations from the provisions against combinations in restraint of trade. The judges of the Supreme Court of the United States had decided that the Anti-Trust Law was, as it should be, applicable to labor as well as to capital, and in what is known as the *hatters' case* they held organized labor to be a trust and a monopoly, and that its agreements were conspiracies. When decisions of this kind are handed down against large corporations, the unions applaud the wise and learned judges, but when they applied the same law to labor, they were described by Mr. Samuel Gompers, President of the American Federation of Labor, as behind the times, and their decision was declared to be unjust and unconstitutional, and Congress was told by

A LARGE ISSUE

SIR WILFRID: "It's gaining in size and weight very fast."

the meeting that it was its duty to so amend the law as to remove any possibility of any such future constructions. The only way apparently of satisfying these gentlemen is to make two sets of laws—one for the employer, which must be harsh and ironbound, and another for labor, which must be elastic enough to be stretched to the utmost limit labor wants to go. Congress so far has refused to be stampeded by the labor leaders.

Steamship Bills of Lading.

MR. A. D. WATT, of the Allan Line of steamships, was heard recently before the Senate Committee on Banking and Commerce, with regard to steamship bills of lading. Asked by Sir Mackenzie Bowell why an ocean carrier should not be subject to the same liability for damage as was imposed on railways and all inland carriers, Mr. Watt replied that railways were common carriers, but that no nation in the world which had built up any tonnage had treated the ocean shipping company as a common carrier, but as a carrier by contract. Mr. Watt went on to tell what a very injurious thing it would be to Canadian shipping if the lines running out of Canada were forced to assume responsibilities for damages they might do to goods entrusted to them for carriage. He also stated that the United States was the only country that treated steamships as common carriers. This being the case, will Mr. Watt or someone else who is interested, enlighten us on how Canadian shipping could possibly be injured by passing an act that would give the shippers via Canadian ports the same guarantee against loss through bad handling as is enjoyed by shippers via a United States port? If the United States did not treat the steamship as a common carrier, there might be some grounds for his claim, but the Canadian line cannot possibly be hurt by being put on the same basis as the United States line, and surely the Canadian shipper is entitled to as much consideration as the shipper from United States ports. It seems to us that it would help rather than retard the business of our ports. To be sure the companies would have to handle goods entrusted to them with greater care, but as the companies are paid not merely to carry freight, but to carry it safely, this is no more than the shipper has a right to expect. Mr. Watt also explained that the reason the bill of lading specified that English laws should apply to damages under bills of lading was because the Canadian steamship companies wanted all actions under one system of laws and had, therefore, chosen England. Asked if he would have the shippers who have goods damaged go to England to recover damages, he replied that he would have damages assessed where damage could be seen, and he would not have the steamship companies compelled to go to Toronto, Chicago, Winnipeg, Kansas City and everywhere else on the continent to defend suits. All through his evidence Mr. Watt seemed to take the position that the only interest to be considered was the steamship company. Everything should be in its favor. As far as the shipper was concerned he could protect himself with insurance, and he would find it much easier to collect damages from insurance companies than from the shipping companies. In short, the whole tenor of Mr. Watt's argument was that the steamship companies should have a free hand to deal with the shipper as they saw fit, and if the latter suffered through the treatment he received he should have it so arranged that he could get satisfaction out of the insurance companies. The shipping companies are perfectly justified in taking this stand. They are in business to get the most they can out

of it, but the business of Parliament is to see justice done, not to legalize jug-handled contracts for the particular benefit of one class at the expense of another class.

The Bonusing of Immigration.

THERE was a long discussion in Parliament a couple of weeks ago on the question of bonusing immigration. It was contended that the payment of a bonus to booking agents was really an inducement to them to ship out to Canada any and every kind of immigrant that they could induce to purchase a ticket, regardless of his fitness to become a good and useful citizen of this country. It was pointed out that of the three hundred and odd thousand who came to Canada last year, only twenty thousand were bonused, indicating that the bonus was not needed to induce people to come here. The thousands who came on their own account came with a purpose; the 20,000 who were bonused came because they were coaxed into coming. As between the immigrant who comes of his own accord, and the one who has to be specially induced at the public expense to come, the chances are all in favor of the former turning out the more desirable citizen. If the 20,000 specially induced immigrants were cut out, the voluntary additions to our population as indicated by the returns, would of themselves make a very respectable showing, and the country would be populated as fast as perhaps it is desirable it should be. The money which the government would save by abolishing the bonus system, which it is contended is no longer necessary, could be spent to much better advantage. It would, for instance, go a long way towards establishing technical training schools, where our mechanics would have an opportunity of acquiring that special knowledge without which they cannot hope to compete with the trained workmen of other countries. If this use for the money now spent on bringing in more people had been suggested to the government during the debate, perhaps they would have seen the advantage of the change, and turned the appropriation over for that purpose. All the critics did was to attack the expenditure, and the government decided to continue it.

Work for Thousands.

IT is announced that by July 1st the Grand Trunk Pacific will require at least nine thousand men on construction work. The C. P. R. will have probably as many more at work on their extensions and improvements, and all the other roads will add their share. With all these men drawing big pay all summer, and the crops promising better than they have at this season for years, the prospects for lively times this fall are certainly very bright. Merchants throughout the country who want to share in the good times that are so near at hand should get their orders in without delay. Held back orders do not improve the situation, and in the end mean a loss of trade to the merchant.

D. M. COUGHLIN.

Parliament Buildings, Ottawa

WHAT CANADA IS DOING TO EXTEND HER EXPORT TRADE

By F. C. T. O'Hara,

Acting Deputy Minister of Trade and Commerce.

The Department of Trade and Commerce at Ottawa can be of great assistance to manufacturers, through the work of trade commissioners. These representatives are in close touch with conditions in the various countries with which Canada does business. They will investigate the market for any class of goods on request

It is a pleasure for me to comply with the request of INDUSTRIAL CANADA to contribute an article upon the facilities offered by the Department of Trade and Commerce to the business man of Canada. Too frequently the voice of the critic has been heard when for various good reasons it has not been expedient to reply. While fair criticism is and should be an incentive to greater efforts, many times it has been born of ignorance of the Department's labors, and has been discouraging to those who have made an honest attempt to improve its usefulness. Occasionally when a departure is made in untrodden paths and perhaps under extreme difficulties, the voice of the critic, to whom, perhaps, the idea had never occurred, is again leveled at the administration of the department for not having acted years before. To such criticism there is no reply.

Before proceeding to deal directly with that part of the work of the Department more particularly defined in the name of Trade and Commerce, I may perhaps be permitted to refer briefly to the other important branches of the public service administered by the Department which necessarily must divide that time and attention which otherwise would be devoted to the extension of Canada's trade. The average business man has no idea of the work of the Department. He thinks it compiles trade statistics, answers trade enquiries

and publishes reports from Trade Commissioners and there its work ends. But what are the facts?

Steamship Services.

The Department enters into nearly 60 contracts for steamship services, some wholly within Canada, others to British and foreign countries. Among the more important of the latter are services to Great Britain, France, South Africa, the West Indies, Mexico, Australia, New Zealand, China and Japan. The fulfillment of the terms of the contracts must be watched, the claims for subsidy checked and paid. A subsidized ship in some part of the world goes on the rocks, or misses some port of call, the company may be charged with discriminating in rates or a steamship fails to make the necessary speed, etc., etc. British or foreign governments in some instances pay a portion of some of the subsidies. Communication by letter or cable with some of them is therefore under way at all times. All these matters entail a large amount of correspondence and an expenditure on behalf of Canada during the year of over \$1,000,000.

Inspection of Grain.

The Department administers the Act respecting the Inspection and Sale of Staple Commodities. This includes the inspection of hides and skins, pot and pearl ashes, flour, fish

D. P. Ross

Canadian Trade Commissioner, Melbourne, Australia.

and fish oils, hay, etc., etc., and lastly and of vast importance, that of grain. The chief inspector of grain, with headquarters at Winnipeg, and 125 other officials and employees of various grades, are engaged in this important work of grain inspection. The revenue from grain fees amounts in a year to over \$100,000, and the expenditure for this service amounts to more than that sum annually. During the last crop year over 100,000,000 bushels of grain were inspected and no one with a knowledge of this service doubts that it will be a very short time before this quantity is trebled and quadrupled. This must be kept in mind at all times—anticipated, and preparations made to handle the great volume of grain which at no distant date will pour through the Gateway of the West—Winnipeg.

Rival Interests.

Meantime the rival interests must be considered—possible clashing must be rendered less likely. The farmer must get his grain to market, the elevators must fill and empty their bins with despatch, the railways must supply cars to both without undue favoritism to either, the grain dealers must be able to buy and sell without restraint and unless the cogs move smoothly the banks cannot finance the situation and the fabric becomes lined with discord and harmful to the whole Dominion. Through the Inspection Act and the Manitoba Grain Act the Department of Trade and Commerce must grasp the problems which arise with each succeeding year—amending the Act where possible or refusing to make changes where they appear impracticable.

Chinese Immigration.

It is a far cry from matters of grain to the administration of the Chinese Immigration Act. A file containing a Chinese puzzle awaiting consideration may be side by side with a problem in the transportation of grain—both may involve instructions by wire to distant points of the Dominion.

During the fiscal year ended March 31st last, 2,197 Chinese entered Canada. Of these, 715 were exempt, and 1,482 had to pay Capitation Tax of \$500 each. The revenue, therefore, from this source was \$741,000. Refunds in many cases have to be made: Rumors of forged documents must be investigated: A railway must be penalized for permitting a Chinaman in transit to escape: A Chinaman is arrested for having smuggled himself into the country: A Chinaman may be in the Sarnia tunnel or on an international ferry refused

admittance by the customs officials on both sides of the line: Is San Teek the wife of Hong Woy and therefore exempt from the payment of the capitation tax as the wife of a Chinese merchant? To say the least, the administration of the Chinese Act is interesting. The tax of \$500 serves to increase the number of evasions and therefore requires increased vigilance.

Bounties.

During the last twelve months the Department paid more than \$2,000,000 in bounties on iron, steel, lead, crude petroleum and manilla fibre used in the manufacture of binder twine. Inspectors in all these articles are on the spot from British Columbia to Cape Breton and constant questions arise as to the manufacture of some of the articles and whether the claims made comply with the act. Progress, for instance, in the metallurgy of iron and steel were not anticipated in the Act, nor does it appear at times as if legislation can keep pace with the changes and improvements constantly introduced at the big iron and steel plants in Canada.

Facilities for Assisting Trade.

COMING to the question of the facilities offered by the Department to assist the commercial interests of Canada, it seems difficult to approach the subject with sufficient brevity to conform to the limited space of a magazine article. The Department has its limitations; but the writer claims that so far as systematic organization of the Department itself is concerned there is little to be desired. The staff at its disposal and the funds appropriated for the work are utilized to the greatest advantage. Not including the Minister, there are 19 persons only, 14 male and 5 female, engaged in the Department at Ottawa. They are all employed in the divers services administered by the Department. The total outside service numbers 207.

Publications.

The publications issued by the Department are the Annual and Monthly Reports, which contain principally trade statistics, and the Weekly Report, containing the reports of Trade Commissioners, Commercial Agents, and such other information as may be considered of sufficient importance to warrant speedy publication. All these are mailed free to applicants. Of the latter, 2,600 copies are mailed from Ottawa every Monday evening.

J. B. Jackson

Canadian Trade Commissioner, Leeds, Eng.

Special Statements.

Scarcely a day passes without a request for a special statement of statistics, which may not be clearly indicated in any of the trade publications of the Departments of Trade and Commerce or Customs. These are turned over to the Chief of the Statistical staff and the statement is prepared and forwarded by return mail.

Foreign Merchants.

The Department is able to give correspondents by return mail the names and addresses of merchants and manufacturers of any commodity in every country in the world.

Trade Enquiries.

A card index is kept of every enquiry for Canadian goods which may be received from any part of the world. Complete lists of addresses of such enquiries can be forwarded to applicants by return mail. This feature, however, has not proved altogether a success, for the requirements of such foreign houses may be fulfilled and still their address remains on the departmental list, as in many instances they do not notify the Department until they write and ask that their address be removed from our list, as they have been "besieged with letters from Canada."

Value of Trade Enquiries.

To the ordinary man, and even to those possessing but a passive interest in the Canadian Trade Commissioner Service, the trade enquiries which appear in the Weekly Report of the Department of Trade and Commerce are of little value. They are regarded as an unknown quantity—a sort of outlet for an enquiry which it is too much trouble to answer, or a good way to get rid of a question which cannot be answered; it is a mere adjunct, they think, for many commercial publications. But those little trade enquiries begin a tremendous volume of correspondence with an ultimate value of hundreds of thousands of dollars—yes, in the aggregate, millions of dollars. Through them one commercial man informed the writer he had formed connections with an English firm which netted him profits of more than \$2,000 a month for nearly three years. Only a few days ago the writer received an unsolicited letter stating that a certain firm had sold 20,000 gallons of cider through answering one of them; but these examples fade before the record of the number of trade enquiry addresses furnished Canadian correspondents by the Department. During the calendar year

P. B. Ball

Canadian Trade Commissioner, Birmingham, Eng.

1907, 1816 trade enquiries were received, and 9,594 addresses were furnished applicants. Each enquiry, therefore, was sent out on an average of five times. Year after year these trade enquiries are increasing. Five years ago only 132 trade enquiry addresses were furnished applicants, so there must be business in them, and profits, too.

Trade Commissioner Service.

HUNDREDS of trade enquiries pass through the Department to-day with despatch where none were received only a few years ago. This, of course, is largely by reason of the extension of the Trade Commissioner Service. The writer can state with perfect truth that Canada has some good men in her Trade Commissioner Service. Some of them would do credit to any country in the world. It is true their work is not diplomatic, as that term generally implies, but does not the extension of a nation's trade lend itself to the highest possibilities and offer work to the keenest minds? In some instances the Canadian Trade Commissioners have been engaged in important matters of a semi-diplomatic nature, and have been recognized in a way identical to that recognition which any nation might accord to its highest official in a foreign country.

Canadians Only.

The writer believes that Canadians only should be appointed to this service. It is obvious that one who may have been born and brought up in Canada is eminently more fitted to represent Canada abroad, than another who may have even exceptional qualifications without being a native of Canada. A Canadian of reasonable intelligence is equipped for active and useful service the moment he enters upon his work in the foreign field. He knows his own country; he lives in and sees the other; he sees what it wants; he sees what it produces. No matter how well the foreigner may know his own country, how is he at a distance to gain a useful knowledge of Canada to enable him to be of service to her? He may make periodical visits to Canada—that will assist him—but as an all-round representative he is at a disadvantage. He can answer trade enquiries, but he will possess little or no initiative in the interests of Canadian business men. That is not the man Canada wants.

Information in Foreign Fields.

The Department's usefulness in obtaining information in foreign fields is not limited to those countries wherein a Canadian Trade Commissioner or Commercial Agent may be

Alex. McLean

Canadian Trade Commissioner, Yokohama, Japan

J. S. Larke

Canadian Trade Commissioner, Sydney, Australia.

established. Correspondents are sometimes given the address of the British Consul, at the point where information is desired, or the Department communicates direct to that official, and in not one single instance has it ever come to the knowledge of the Department that the enquiry has not resulted in the most courteous reply with the fullest possible information. Special pains have been taken by the Department to provide the principal British Consuls in the United States with commercial and official publications from Canada, and in answer to a special enquiry some little time ago, with one voice they declared themselves always willing to assist Canadians in obtaining commercial information, but regretted that Canadians never called upon them nor communicated with them.

Foreign Trade Publications.

The Department has on file the trade publications and miscellaneous bulletins of almost every country in the world from which, for special purposes, information is readily obtainable and frequently of value.

Suggestions Welcome.

The Department welcomes suggestions. Some of those received are promptly put into operation, but many are of a hopelessly impractical nature and usually the Department is able to prove to the satisfaction of its correspondent the impossibilities attending his suggestion.

Unfair Criticism.

There is one great cause of frequent criticism of the Government and the Department. I refer to the fact that a far greater number of Canadian trade officials abroad are not appointed. Many people are too prone to hold up as a standard the accomplishments of the United States, a nation of eighty or ninety millions, and expect that a people of six millions can perform the same work, appoint huge staffs and spend the same number of millions of dollars. This is all forgotten, and because the United States can do these things the vapid corollary is that Canada should do the same.

Cost of U. S. Consular Service.

Canada has 13 Trade Commissioners and 5 Commercial Agents. The service costs, roughly, \$70,000. The United States has 57 Consuls-General, 235 Consuls, and 341 Consular Agents. The total cost for the year ending June 30, 1907, was \$1,777,635. But the most surprising statement is that the consular fees received for official services during that year amounted to \$1,672,803, making the net cost of one of the finest consular or trade service in the world, \$104,832. Business men well know that these fees are required to be paid to the U. S. Consuls in the country of shipment upon all goods destined to the United States—for consular certificates.

Internal Trade Statistics.

There is another point with reference to which certain criticism has been directed toward the Department of Trade and Commerce. I refer to the compilation of Internal Trade Statistics. Everyone concedes that it would be a most excellent feature. But those who advocate this idea have not considered the subject. They think it is done in the United States, but it is not done there to any considerable extent, but resting under the false impression that it is, the Department of Trade and Commerce is criticised for not performing this work in Canada, a work which the United States does not do with its millions of people, nor the Government of Great Britain, with its forty million. What some evidently have in mind is this: In recent years in the United States, certain Boards of Trade and Chambers of Commerce have gathered internal trade statistics. The United States Government has merely incorporated this information in its official reports.

Board of Trade Compilations.

The report more especially referred to is the Monthly Summary of Commerce and Finance of the United States. In this report there appears a special section known as the "Internal Commerce of the United States." In this section it will be found that nine-tenths of the so-called Internal Trade Statistics are gathered from Boards of Trade, Chambers of Commerce, Trade Journals, etc., etc., and the compilation credited to these various associations and publications. The collection of this information in Canada would be immensely expensive.

A. W. Donly

Canadian Trade Commissioner, Mexico City.

UNFAIR SWITCHING CHARGES.

THE right of railways to make a charge for interswitching is being contested by the Canadian Manufacturers' Association on behalf of shippers in various industrial centres of Canada. The principle on which the Association bases its claim is that a shipper is entitled to a through rate from the point of shipment to destination. The Railway Act provides that where a shipment to reach its destination has to pass over the tracks of two or more railways, the railways who join in the service may arrange for a through rate to cover the entire distance, a proportional amount going to each. Where such an arrangement is not reached, the Railway Commission is empowered to fix a rate. The system of through rates is now definitely established. It consists of less than the sum of the two local rates, and does not take into account any charge for transferring cars from the tracks of one railway to those of another. All rates include a consideration for the terminal work at the point of loading and unloading. There is none, however, for the transferring from one road to another. The railways, however, have set up an arbitrary claim for interswitching charges where the siding constituting the destination belongs to a railway other than the contracting carrier. This only applies to consignments which are made from non-competitive points. For instance, a manufacturer in Stratford, which is served only by the Grand Trunk, ships goods to a firm in Toronto, the firm having a C. P. R. siding into its plant. The Stratford shipper would be charged the regular freight rate from Stratford to Toronto plus a charge of five dollars a car, because the car had to be taken from the G. T. R. tracks and switched onto the C. P. R. siding. But if a manufacturer in some other city equi-distant from Toronto, but served by both railways, were to ship similar goods over the G. T. R. and also have them delivered onto the same C. P. R. siding at Toronto, he would be charged the same freight rate, but would be exempt from payment of the switching charge.

This condition entails a double injustice. It discriminates against the shipper who has just one line of railway accessible, although the railways encourage manufacturers to establish their plants along their lines. It is unjust, also, from the fact that there is no essential difference between the cases where a switching charge is made, and where a through rate is granted. If a shipment is carried fifty miles along one line and is then handed over to another railway to carry thirty miles, there is no question about a through rate being granted. There is no charge for switching. But where a similar shipment is made and it is two miles to the siding of the second company an additional tax is levied. In either case the destination is specifically shown. The cars are to be taken from one point to some other point. Whether the use of a second road extends over two miles or twenty miles is immaterial to the principle. The total distance travelled is the sole point to be considered.

To quote from an argument before the State Commission of Wisconsin:

We do not understand why the switching of a car for a mile or two miles within the incorporated limits of the city of Janesville, is not a transportation service just as much as the hauling of a car for a like distance between two stations in a regular freight train would be a transportation service. By transportation we mean the movement of a commodity or an article between two points not necessarily railway stations. That this service is performed by a switch engine and switching crew cannot change the fact that the article is transported. The service may be less expensive than if performed by a regular train crew, but this does not change the fact that the article is carried.

The railways in this matter have taken up an untenable position. It would seem as if they were making an effort to offset certain decreases in rates which they have been forced to grant, by tacking on an additional charge for handling. Even on their own contention that they are entitled to payment for the service rendered, they put themselves out of court by the extortionate amount of the charge. Terminals have to be provided and kept up if the railways are to do business. They are as necessary as rolling stock and stations. It would be as reasonable to ask a toll for car rental in addition to the freight charges as it is to say that an extra charge must be made to pay for the cost of terminals. In Peterborough, six dollars a car is charged for this service; in Toronto, five dollars. Shippers are looking for early relief from existing conditions.

PROPER MARKING OF FREIGHT PACKAGES.

LAST month INDUSTRIAL CANADA published, with comments of approval, a circular letter recently issued by the freight traffic department of the C. P. R., in which the necessity of properly marking packages was set forth. The advice cannot be repeated too often. Where packages are insufficiently marked there will undoubtedly be delay and perhaps loss. The additional handling and correspondence is an unfair burden to put upon the carriers and it results in an unsatisfactory service. The same subject is being discussed in the United States, and we quote from *The Railway Age* of a recent date:

It is officially announced that, effective July 1, all railways east of the Mississippi River operating in the territory covered by the "Official Classification" will refuse to receive for transportation all shipments in less than carload lots which are not plainly marked with the name of the consignee and the station, city and state of destination. For many years past it has been customary for a large number of shippers to mark their packages with an initial or some hieroglyphic, the key to which would be on the bill of lading. It was the theory that this saved time and also prevented competitors from observing the names of a shipper's customers on the outside of the packages.

Great abuses have resulted from this practice. When a large number of packages are intended for the same consignee, shippers often only mark one or two, the others having no marks at all. If the shipments become mixed with others at transfer points, there is no way of identifying them. The consequence has been great delay, vexation on the part of both shippers and consignees, and claims against the railroad.

The Pennsylvania Railroad, on its lines east of Pittsburgh, last year paid \$342,520 for claims for goods "lost in transit," an increase of 34 per cent. over 1906. Of this amount \$176,260 was traced to the fact that shippers had marked their goods improperly. Likewise, during 1907, the Pennsylvania Railroad sent to its unclaimed freight station at Downingtown 18,000 packages on which there were no marks to enable the company to forward the freight to proper consignee and destination.

Some 416 railroads will participate in the enforcement of the new rule. The companies are to give very strict instructions to their agents, placards will be posted conspicuously in all stations, and every effort will be made to impress shippers with the importance of heeding the new rule. In fact, the campaign of education which is planned by the railroads along this line is almost unprecedented in its thoroughness. It is the belief of the carriers that the enforcement of the new rule will be of great value to the public in the removal of such a prolific source of delays and losses.

The Span ready to be carried across the French River

Photo by Gillespie

MODERN BRIDGE CONSTRUCTION

INDUSTRY has its difficulties and its triumphs no less than war. Day after day imagination and daring ingenuity and skill, which the public knows little of, are called into play. To the man who is carrying on his routine business or pursuing a methodical profession, the demands which are made on the intelligence and inventiveness of the engineer are little understood. Yet, at any moment, his work is likely to reveal some unforeseen difficulty, some unexpected condition, calling for new treatment and quick methods. The man on the job must be ready to unravel the knot, to meet new situations with new methods.

An interesting example of the adoption of novel methods for the accomplishment of a desired end is illustrated in the photographs reproduced herewith. The bridge over the French River shown in the cuts is an important engineering feat, having, as it does, the longest single track span in Canada, and indeed the longest and heaviest one ever erected and placed by the end launching method. It was erected by the Bridge Department of the Canadian Pacific Railway, and is located on a branch line of that railway about 43 miles south of Romford, Ont.

The peculiar condition which made difficult the erection of the bridge was the great depth of water in the main part of the river. For three-fifths of the crossing the water is

90 feet deep. In order to avoid the great expense of building a pier in the deep water, the first pier was built 415 feet south of the north abutment and a smaller one 67 feet south of this again. The width of the river is approximately 550 feet. Hence, an exceptionally wide span had to be thrown across from the north bank of the river to the first pier, 415 feet away.

The steel work was erected on the embankment. The construction was difficult, as some of the parts weighed as high as 40 tons. However, by means of derricks and cranes and other accessories the work was completed. In order that the scow, which was to be brought into use later, might be available, the span was built projecting out over the bank 103 feet. This end rested on the scow, which was specially built for the occasion.

When the assembling of the parts on the bank was completed, the work of getting the span in place began. The method of operation was to slide the whole structure along greased rails, out over the river. The scow in the meantime was supporting the projecting end and floating it over to the pier. Hydraulic jacks were used to launch the structure along the rails. The accompanying cuts show the span in various stages of the progress.

The Span carried across the River by a Scow and resting on pier

Photo by Gillespie

HOW CAN THE COST OF PRODUCTION BE REDUCED?

As competition at home and abroad grows keener it becomes of increasing importance to bring the cost of production down to the minimum. The elements that enter into the cost of all products. Where economics may be introduced.

In most cases a manufacturer has little control over the selling price of the articles he manufactures. Competition sets the mark on that. But the cost of production he does control, and the reduction of this cost to the minimum is the most important problem which he has to solve. Give two men equal opportunities and how often will one win a notable success, while the other drags on till failure overtakes him. One man, the world will say, was fortunate; luck was with him. But if the facts were closely scrutinized it would be discovered generally that whereas the two sold their products at the same price, one succeeded in producing his at a considerable percentage less than the other. In that lower cost of production rested his profit, his success.

Even among successful manufacturers, success is a mat-

for customs tariffs, we are approximating more and more to a world price for goods. This, of course, is already the case in such products as wheat.

Two Essential Sources of Cost.

When the price is fixed, there are two elements which decide whether a nation or an individual will continue to exist as an industrial unit or not. One is a protective tariff; the other is the cheapness with which he can produce. A protective tariff puts all manufacturers of one line in a country on an equality, and will preserve the home market for the home factories if the duty is high enough to offset special advantages enjoyed by foreigners, such as cheap labor, longer hours of work, etc.

But among the manufacturers of a country there will

The Span being carried out to Second Pier.

Photo by Gillespie

ter of degree. Few are making great profits. Less still are making all that their business is capable of producing. It requires but a glance to see proofs of this. One man overhauls his system of fire insurance and, as a consequence, effects a reduction of hundreds of dollars annually on premium payments. Another institutes a new system for handling material whereby the wages of a number of men is saved. These are instances which we see in isolated cases. How many similar changes could be made in your plant? Yet every dollar so saved makes a reduction in the cost of production. It puts you in a better position to compete with your rival. It gives you just that much to work on.

A World Price.

The cost of production is of more vital importance now than it ever was before. Formerly Great Britain almost alone entered the markets of the world and contested with the local manufacturers for the trade offering. In some cases she succeeded in capturing the market. In others where conditions of manufacture or the supply of raw material was more favorable the local factory found a ready demand for all it could turn out. During recent years, however, industrialism has spread over the whole world, and every nation to a greater or less extent is not only striving for its own market, but is actively competing for foreign business. The natural result is that, making due allowance

always be competition and where the price is equal success must go to him who manufactures the cheapest.

The Saving of Bye-Products.

A few years ago gas works were operated for the manufacture of gas and for no other purpose. But the immense wastefulness of the process forced itself on the attention of some operators. It became a subject of study to discover some means of utilizing the bye-products which formerly brought no returns, but on the contrary cost money to have removed. To-day the whole cost of operation is met in some cases by the sale of these same bye-products. The ammonia has many uses; coke has a limitless market, even the cinders are turned into paving material. Another noticeable instance of economical methods is found in the meat packing houses. The age of wastefulness has passed. Small volume with large profits has given place to large volume with a slender margin of profit. That is the lesson which has been taught by the amalgamations and absorptions of recent times, which have tended to favor the big manufacturer at the expense of the smaller one.

Where Economics Must be Made.

Four elements, roughly sneaking, go to make up the cost of any article, whether it be an axe or an automobile. These are raw material, labor, overhead expenses, and opera-

ting expenses. These vary greatly in importance for different manufactures, but they are always present. It becomes a question, then, how each of all of these elements in the total cost can be reduced. It is a truism to say that the raw material must be bought right. Yet the man who knows this perfectly well frequently fails to organize his buying department so as to be sure of getting the best prices. A proper system will show what has been paid for similar material in the past; it will show, also, where it was procured and such other details as will place the buyer in complete touch with the situation. Not only that, but the quantities bought will be shown. Can better terms be secured by buying in larger quantities? Does the consumption justify such an increase?

Waste must be eliminated wherever it occurs. Stock should go into a stock-room as soon as it enters the factory. A record of it should be taken by the stock-keeper and he should be made responsible for all that he receives. This is of prime importance. It means everything to get started right. The stock-keeper's card shows that Department A received ten of a certain article. It is up to Department A to show where the ten were used. A system which follows up stock carefully will soon induce a habit of care and economy in the foremen. When they get to know that they will be expected to account for what material they draw out of stock, there will be less waste by workmen and fewer things lost.

The Efficiency of Labor.

The cost of an article has a close relationship to the efficiency of labor. Nothing but a mere indication of the

breadth of this subject is permissible here. The time that a man works is not of so much importance to the employer as the amount he accomplishes. In few cases does the employer feel that he is getting the best service of which he is capable out of a workman. How to improve this condition is worthy of the consideration of all manufacturers. The conflict between capital and labor has been accepted by many as an unfortunate but necessary evil. Such is a cynical view to take. It is one of the trite phrases which are tossed backward and forward between disputants so often that they come to have the force of maxims. No one but a pessimist is yet ready to admit that a sympathetic relationship is impossible between employer and employee.

But aside from this, much can be done to increase the efficiency, or in other words to decrease the cost of labor. It rests with the foreman to see that the work is properly organized, that there is no delay between the completion of one job and the starting of another, that a high-priced man is not doing work that could be done just as well by a boy, which depends on the foreman. He can run his department economically or extravagantly. Only by a good shop system can his work be checked up accurately.

Then there are the possibilities for economy in the cost of power, in the facilities for transportation, in the judicious laying out of the factory, etc. Would it decrease the cost of production to install a sprinkler system and thus save on insurance charges?

These are all phases of one great question. INDUSTRIAL CANADA will publish in succeeding numbers articles taking up the various points in detail.

A LESSON IN MUNICIPAL CONTROL

WHEN Chicago invited an eminent Glasgow authority on municipally-owned street railways to investigate the local condition and give a report on it, general surprise was expressed at the result. It was known that the expert was strongly in favor of municipal ownership. Yet his report came out uncompromisingly against the system for Chicago. The people were not in a position to operate a system to advantage. Political methods were of such a kind that successful management of a utility like the street cars would be impossible. The system would become immensely expensive and at the same time it would suffer in efficiency. Such in brief were the criticisms.

Now Cleveland has been experimenting with municipal control and the results, after a few short weeks, are not such as to encourage other cities to follow her example. The car system of Cleveland came under municipal control as a result of a long fight by Mayor Tom L. Johnson, to secure a three-cent fare. It may be added that it is the only city in the United States which operates its own cars.

The inauguration of the new system was celebrated by suitable festivities, and the gala-day was made notable by granting free rides for twenty-four hours. Everything was auspicious. But it was soon shown that industrial peace was not among the gifts contained in the Pandora's box of municipal ownership. Before the sound of the acclamations at the dawn of the new era had died away, the angry demands of the workmen for more money arose. The workmen had votes and their employers were elected by themselves and their fellows. The unions naturally assumed that the city corporation would yield to their importunities. When their demands were refused, a strike was declared.

The situation was novel. Strikes against private corporations had been numerous. But here we have a small section of the people trying to extort from the people at large pay in excess of what the work had formerly brought and out of proportion to what similar work was then bringing. When

the people refused to accede to the greedy demands, the workmen resorted to violence and much public property was destroyed.

Although the strike is still on, the city has succeeded in restoring a fair service throughout the city. The question will arise in the minds of students of economics, what would have been the results had there been in effect a general system of municipal ownership such as is advocated by Socialists? What would have happened had the street car employees been able to buy the support of the workmen in other lines by pledging them reciprocal support when their turn came to hold up the city council? The experiment in Cleveland is not without its lesson.

Alcohol from Peat.

A Copenhagen Company declare that they have developed a process for extracting alcohol from peat. By this process it is said that from one ton of dry peat 165 quarts of alcohol may be produced, besides 66 pounds of sulphate of ammonia. The company, which has been experimenting for two years, place the cost of alcohol, made in this way, at ten cents per gallon, which is much below the price at which the product can be derived from potatoes.

Canada will be much interested in this statement, for a double reason. We have extensive peat beds, scattered widely over the country. Hitherto there has been considerable difficulty in working them to advantage. The problem of pressing out the moisture, so as to make peat serviceable as a fuel, has proved almost unsurmountable. However, if it becomes possible to make alcohol from it cheaply enough to make it a commercial possibility as a fuel, its value will be assured. Alcohol can be used for most of the purposes for which gasoline and petroleum are now used. The production of it in large quantities and at low rates in this country would be a great stimulus to industry.

THE WHEELS OF INDUSTRY

A typical scene in Western Canada, showing a delivery of farm implements.

A scene of activity in the St. John, N.B., Harbor.

WESTERN CANADA'S WIRE FENCE INDUSTRY

What the Western Market means to the Manufacturers of Canada. The biggest order ever placed on the American Continent. The area to be fenced.

WITH the spring opening of the wire fencing trade in Western Canada comes the announcement from Winnipeg that one of the six factories operating in that city has booked a single order for the fencing in of the tract of land set aside in the Province of Alberta by the Dominion Government as a Buffalo Park reserve, containing 2,600 acres. The contract calls for 72 miles of special woven fence 86 inches high, that will weigh twenty-five pounds to the rod and is the heaviest fence ever manufactured in Canada, the contract price is \$1,000 per mile. Another of the Winnipeg wire fence industries has entered into a contract

pastures, where herds of cattle and sheep shall outline and make rich the country in which they live.

Those who have not studied the problem of fencing in such a vast area of land as Western Canada contains have yet to realize what can be absorbed in the way of material in this important industry at Winnipeg. The average travelling business man who has the opportunity of going through a Winnipeg warehouse at this season of the year and see the enormous stacks of wire piled from ceiling to floor on every flat can readily understand why wire fence factories are being established in Western Canada.

Corner in a shipping yard of one of the six fence factories operating at Winnipeg

with a large jobber there to supply 50 tons of wire fence product per day for the season of 1908. The Grand Trunk Pacific Railway Company have placed an order with an Eastern Canada wire fence manufacturer for 2,000 miles of fence, this being the largest single contract for fencing ever placed on the American continent.

The demand for wire fencing is keeping the factories working at high pressure, the season has opened six weeks earlier this year, and those who are engaged in the trade are of the opinion that this year's output will surpass that of former years.

An Attractive Market.

In 1906 the five wholesale hardware jobbing houses of Winnipeg handled 1,100 cars of barbed wire, exceeding in value the sum of \$500,000. In the same year the four factories then manufacturing consumed 600 cars of coil and woven wire in their manufacturing establishments.

In the three provinces of Manitoba, Saskatchewan and Alberta there are 357,016,778 acres of land, and of this land at least one-half, or 178,508,389 acres, is good for farming. Of this vast quantity of productive soil, the comparatively insignificant area of 8,327,970 acres, or less than one-twentieth, has been brought under cultivation, an amount so comparatively small beside that which remains for the work of the farmer to fence and convert into fields of growing grain and

OBJECT TO NEW SYSTEM.

The Montreal Board of Trade have protested to the Department against the rule recently put in force in the Customs House whereby refunds are being paid in cash instead

Part of the fence which will encircle the big buffalo reserve.

of by cheque, as was formerly the case. The new system, it is held, places an unnecessary temptation in the way of the young clerks who are usually entrusted with this work. Representations will be made to the Minister of Customs to have the old system restored.

AMONG THE INDUSTRIES

Montreal will spend \$30,000 on rebuilding a fire station.

The Peterboro Cereal Co. suffered a loss by fire recently.

Dundas will vote on a by-law to raise \$16,000 for a new high school.

The washing plant of the Dominion Coal Co., which was destroyed by fire at Glace Bay, N.S., recently, will be rebuilt.

A large pulp and paper mill is to be erected at the mouth of the Clowholm River by the British Columbia Wood Pulp and Paper Co., of Vancouver, providing that they can obtain a record for the water required to generate the power for their plant.

It is reported from Sandwich, Ont., that a pulp mill will be erected near there at a cost of \$500,000, providing the United States Congress removes the import duty on pulp. F. T. Ranney, of the Detroit Real Estate Exchange, and R. Loveland, of the Saginaw Salt and Timber Co., are interested in the proposition.

Messrs. J. D. Whipple, Henry F. Dalley and Dr. C. O. Robinson, of Omaha, Neb., have organized a horse collar stock company, with headquarters in Hamilton, and will open a factory in the old Gompf brewery for the manufacture of horse collars for the Canadian trade. It is expected that this will give employment to about 25 hands.

The Canadian Crocker-Wheeler Co. has been organized to manufacture in Canada the products of the Crocker-Wheeler Co., of Ampere, N.J. The head office of the new company is in the Street Railway Chambers, Place d'Armes Hill, Montreal. F. E. Lovell, President of the new company, is a member of the lumbering firm of H. Lovell and Sons, Coaticooke, Quebec.

The Canadian Antimony Co., Ltd., incorporated last year with a capital of \$250,000, is planning within the next few months to start up an extensive development of the antimony mines at Lake George, York County, N.B., which they recently bought from the old New Brunswick Antimony Company, which some years ago operated them. It is the intention of the company to install a ten drill air compressor and a concentrator to concentrate low grade ore. The company does not intend operating a smelter.

EMPLOYERS' ASSOCIATION DINNER.

A successful dinner was given by the Toronto Employers' Association on May 19th, at which Mr. Sayle, of Cleveland, was the chief guest. McConkey's was the scene of the festivities and nothing was left undone to make the occasion enjoyable. The menu was good; the musical programme was well arranged and excellently rendered, and the address of Mr. Sayle was a fine presentment of an important subject. Mr. Sam Harris presided and with him at the head table, besides Mr. Sayle, were a number of men who are most prominent as employers of labor in Toronto.

The subject of Mr. Sayle's address was technical education. No other problem of industrial life would have brought out such a large and interested gathering. Mr. Sayle, after speaking of the increasing need for industrial training, reviewed the work which was being done in various trade schools and technical institutes in the United States. Of these the most striking example was the Winono Institute. Here the boys received theoretical and technical instruction while working under the actual conditions obtaining in the shops into which they would later graduate. The equipment and method of operation as explained by the speaker were models.

Mr. Sayle was thanked heartily at the conclusion of his address for his courtesy in coming to Toronto as the guest of the Employers' Association.

WILL INTEREST BRITISH CAPITAL.

In a recent issue of Britannia, a paper widely circulated in Great Britain, Mr. C. F. Just has an excellent article on Canada, from the industrial standpoint. Mr. Just gives an adequate outline of Canada's early progress and later development, and sets forth in a convincing manner the special reasons why the country is suitable for the investment of British capital. We in Canada do not need to be told these facts. We have grown up with them. But with the British public taking the interest in Canada which is manifested in the migrations of recent years, such information as is given in Mr. Just's article is most timely. We credit the Mother Country with an appreciation of our wheat lands. That our cattle are known is shown by the fear of competition with them which brings about the restrictions about killing them upon entry. We are not so sure, however, that our other resources, our market, our manufacturing facilities, are recognized as they should be, and as they are being recognized by capitalists of other countries.

The signs are favorable for a fuller appreciation, however. The party of British journalists who toured Canada last year have contributed many hundreds of columns of reading matter for the British reader. Mr. Richard Grigg, who spent almost a year in the country as the Commissioner of the British Board of Trade, has reported in a way that must stir up the interest of British merchants and manufacturers. Mr. Just, in his present article, has added much to the general campaign of publicity. The result should be the turning of the tide of British gold from the United States to the younger country with its development still in the growing stage.

EXPERT SOAP MAKER.

Young Englishman with a thorough technical training in the manufacture of soaps, oils and kindred products is anxious to come to Canada and secure a position with a good Canadian firm in this capacity. Splendid testimonials and should make a good man for a Canadian firm. Original letters and testimonials can be seen at this office.

TRADE ENQUIRIES

NOTE.—For further information regarding any inquiry mentioned under this heading or the names of inquiries, apply by numbers to the Secretary, at Toronto.

- 671 **Agent.**—Gentleman. Thirty years of age, ten years' connection in **United Kingdom** best wholesale and retail grocers and provision merchants, is open to negotiate with principals for agencies or sole representation and is prepared to share expenses out for interview, highest references, has experience in organizing and advertising.
- 672 **Agents.**—A **London** firm desires to be placed in communication with Canadian firms who might be prepared to appoint them as agents for the sale or purchase of produce, etc. They are also desirous of importing consignments of mica from Canada.

- 739 **Pianos.**—A Yorkshire firm of musical instrument importers would like to have catalogues and prices from Canadian firms making pianos to English standards.
- 740 **Picture Mouldings.**—A firm in Yorkshire will consider prices for shipments of picture-frame mouldings (preferably oak) in all widths up to 4 inches, by 3-8 and 7-8 inch thick.
- 741 **Pig Lead.**—A Hong Kong firm of commission merchants want to purchase in large quantities pig lead. This is imported extensively into China.
- 742.—**Picture Moulding.**—A Barbados firm doing business in picture framing desires prices and catalogues of picture moulding and material for framing from manufacturers in Canada.

- 743 **Picture Moulding.**—A dealer in picture frames and moulding in Barbados desires prices of cheap moulding and picture frame materials.
- 744 **Pine Sidings.**—A Lancashire firm now buying in United States wishes to obtain c.i.f. prices of pine sidings, sizes 1 inch, 1¼ inch, 1½ inch, and 2 inch, unassorted best seconds and thirds from Canadian manufacturers.
- 745 **Plywood.**—A firm of timber importers, making a specialty of 3-ply wood, wish to hear from Canadian shippers, with samples, full particulars and prices c.i.f. Hull.
- 746 **Preserved Provisions.**—A merchant firm in the North of England, dealing largely in preserved provisions for supplying ships, would like to hear from Canadian exporters of goods suitable for this trade.
- 747 **Potato Starch.**—A Manchester firm desires to obtain samples and prices of potato starch from Canadian manufacturers.
- 748 **Produce.**—Inquiry has been received from a firm of commission merchants in London claiming to have connections in the largest markets for the names of Canadian exporters of various kinds of produce who might desire to place consignments in their hands for sale.
- 749 **Reapers and Binders.**—A South African firm of wholesale general merchants desire to be placed in communication with Canadian manufacturers of reapers and binders.
- 750 **Ropes and Twines.**—A well-connected merchant firm desires to secure the sole agency for the North of England and Norway and Sweden for a Canadian firm manufacturing ropes, twines, binder twine, etc.
- 751 **Rushes.**—A Hull importing firm inquires into the prospects of securing supplies of coopers' rushes from Canada, imported in bundles of about 12 pounds, in average loads of 63 bundles. They also inquire for rushes as used by chair and horse collar manufacturers.
- 752 **Saw-Mill Machinery.**—A company in Berbice, British Guiana, desires catalogues of saw-mill machinery from Canadian manufacturers.
- 753 **Semi Steel Castings.**—Old firm, member of C. M. A., is in the market to purchase semi steel castings.
- 754 **Slate Battens.**—A Manchester firm asks for prices of slate battens, length 2 feet 6 inches to 4 feet 6 inches by 2 inches by 3-4 inches and 2 inches by 5-8 inches from Canadian manufacturers.
- 755 **Skewers.**—A Salford firm now buying in United States asks for c.i.f. prices of sample skewers packed in barrels, sizes 4 1-2 inches by 5-32 inches, 5 1-2 inches by 7-32 inches, and 6 inches by 1-4 inch from Canadian manufacturers.
- 756 **Squares.**—A Manchester firm wishes to obtain prices of maple and birch squares from Canadian manufacturers.
- 757 **Split Peas.**—A Manchester firm seeks for samples and prices of split peas from Canadian shippers.
- 758 **Starch.**—A Manchester firm asks for samples and prices of starch from Canadian manufacturers.
- 759 **Specialty.**—A merchant firm in touch with the colliery, ship-building and ship-repairing trades in the north of England would like to hear of any Canadian specialty they could handle to advantage in supplying these trades.
- 760 **Steel Rails.**—A Tyneside firm of engineering agents are desirous of negotiating with a Canadian firm manufacturing tramway and other rails with a view to actively representing their interests among corporations and other purchasers.
- 761 **Soap, Perfumery, Etc.**—A druggist in British Guiana desires correspondence with manufacturers of soap, perfumery, chocolate and confectionery in Canada.
- 762 **Single Switches, Battery Wire, Terminal, Round Wires, Etc.**—Manitoba firm, member of C. M. A., are in the market to purchase the above material and other equipment used in the manufacture of gasoline engines.
- 763 **Straw Boards.**—A Manchester firm asks for samples and prices of straw boards from Canadian manufacturers.
- 764 **Timber Specialties.**—An English firm of timber importers wish to get into communication with Canadian firms exporting any specialties in the timber line with a view to possibly taking up their agency.
- 765 **Timber.**—A Manchester timber merchant desires to hear from Canadian firms who cut spruce or other soft wood on the rotary principle, 1-8 inch thick, 6 inches to 9 inches wide, and 3 feet 6 inches, to 5 feet 3 inches in length.
- 766 **Trade.**—A North-East coast (England) firm of import and export merchants are open to push the sale of some good selling commodity of Canadian production, preferably a manufactured article.
- 767 **Timber of all Kinds, Barrel Staves, Cereals and Seeds, Cod Fish, Fine Skins, Canned Fish, Etc.**—Bilbao, Spain, wholesale commission merchant will be glad to hear from Canadian exporters of the above lines with a view to securing their agency for his neighborhood. References later.
- 768 **Tool and Broom Handles, Woodenware, Hardware, Etc.**—Well-known manufacturers' agent in Birmingham, England, with wide connection among the best buyers, will visit Canada during the next few months with a view to establishing connections with reliable firms who can export the above lines to Great Britain. Will be pleased to call on any firms who desire to see him. Has done business for Canadian and American houses in the past. Good references.
- 769 **Tool and Broom Handles, Dowels, Mouldings, Screwers, Office Furniture, Tables, Chairs, Brackets, Wheel Barrows.**—One of the largest wholesale firms dealing in all kinds of wood turnery and joinery is in the market to purchase the above articles from Canadian manufacturers. Excellent references and will buy in large quantities.
- 770 **Veneer.**—A Manchester firm asks for samples and prices of 3-ply alder veneer, 3-16 and 1-4 inch, from Canadian manufacturers.
- 771 **Veneer Seats and Backs.**—A South African firm of general merchants desire to be placed in communication with Canadian manufacturers of perforated veneer seats and backs for chairs.
- 772 **Washboards.**—A Scottish company would be pleased to receive quotations from Canadian manufacturers of washboards who seek export trade.
- 773 **Wools.**—A merchant firm in close touch with the Yorkshire woollen industry asks for samples and prices from Canadian shippers of all kinds of wool, suitable for the Bradford blanket and woollen trades.
- 774 **Woodenware.**—A London firm importing turnery and domestic woodenware of all kinds would be pleased to hear from Canadian manufacturers seeking export trade in such goods as fork, rake, pick and sledge hammer handles; fork, spade and shovel trees, skewers, dowels, wheelbarrows; also roll-top desks and office furniture.
- 775 **Wood Spiles.**—A Manchester firm asks for samples and prices of wood spiles, all sizes, from Canadian manufacturers.
- 776 **Wood-Pulp, Etc.**—A London firm of steamship brokers desires to hear from parties in Canada to whom they might be able to be of service. They are also prepared to handle shipments of wood-pulp, pulp-wood and other Canadian products.
- 777 **Waggon Tongue Ends.**—Ontario firm, member of C. M. A., inquires for manufacturers of iron for ends of tongues for waggons.
- 778 **Washed Cow and Goat Hair.**—Glasgow, Scotland, wholesale firm desires quotations and samples of hair, suitable for builders and plasterers, from Canadian manufacturers. Will purchase two ton lots and upwards, paying monthly or as may be arranged. Quote to Glasgow.

List of Articles Manufactured in Canada

BY THE MEMBERS OF THE
Canadian Manufacturers' Association
 (Incorporated)

ARRANGED ALPHABETICALLY

An Asterisk (*) indicates that the firm so marked carries on an export trade.

A

Lista Alfabética de los Artículos Fabricados

Por los Miembros

A.	
Abonos de carnicería	965
Abonos de tierra, hueso mineral y guimicos	964
Abrazadoras de hierro y de acero	1106
Abridores de cajas de lata	1738
Acabadores de artículos de latón y bronce	973
Acabadores de telas de algodón	979
Accesorios de funeraria	2661
Accesorios de latón para muebles	2610
Accesorios de lechería	2608
Accesorios para estufas	2614
Accesorios para tapiceros	2615
Aceite combustible, petróleo	1722
Aceite de alquitran de maderera	1730
Aceite de lardo (tocino)	1723
Aceite de maíz	1720
Aceite de pescado	1721
Aceite de pié de vaca	1726
Aceite ó grasa de algodón	687
Aceite, oleo	1727
Aceites para la cocina y para ensaladas	1719
Aceite para lubricar	1725
Aceiteras para maquinas	1733
Aceite para preservar maderera	1729
Aceite para quemar en calderas	199
Acero en barras	2413
Acero estirado á frio	2415
Acero, para construcciones	326
Acero pulido para maquinas	2416
Acero y alambres para corsés	2418
Acetato de cal	1437
Acidos	2
Acidos, acético	3
Acidos, fenico	4
Acidos, sulfúrico, muriático y nítrico	5
Acopladoras automáticas de aire y vapor	696
Acopladoras con desenganche automatico	698
Acopladoras de carro de ferrocarril	697
Acopladoras para conductos de caucho	700
Acumuladores, hidráulicos	1
Adornos, para el empedrado de calles	172
Adornos para abrigos de pieles	1082
Adornos para edredones	1081
Adornos para modistas trages y militares	1746
Afiladores de sierras	2228
Agentes de patentes	2344
Agotadores para maquinas de acepilliar maderas	918
Agua, purificadores y ablandadores	2746
Aguardiente, de vino	281
Aguardiente, "whisky"	2777
Aguas de tocador	2748
Aguas gaseosas	2744
Aguas minerales	2745
Agujero del hombre para calderas	1593
Agujetas de zapato	1335
Aire, aplicaciones	37
Aisladores de vidrio y porcelana	1303
Aisladores eléctricos	75
Alabeo de algodón	2733
Alacenas	2272
Alambiques de cobre	2424
Alambiques (vease alcohol)	796
Alambre con puas para cercados	2797
Alambre de acero	2811
Alambre de acero muy duro "High Carbon"	2805
Alambre de latón cobre y chapado	2799
Alambre de oro y de plata	2803
Alambre en rollos	2800
Alambre encerado y destemplado	2808
Alambre enderezado y cortado	2812
Alambre estañado	2813
Alambre galvanizado	2802
Alambre para encuadernadores, fabricantes de escobas y para embotellar ..	2798
Alambre para enfardar leno y cortado en medidas determinadas	2804
Alambre para hacer resortes y colchones de alambre ..	2810
Alambre sin costura cubierto de oro	2809
Alambre tejido para cercas ..	958
Alambre templado y no templado	2796
Alambres de seguridad para corrientes eléctricas	1077
Alambres eléctricos con forros aisladores y sin forros ..	2801
Alambres para fabricantes de sombreros de señoras ..	2806
Alambre para hacer clavos y roblones y para atar	2807
Alarmadores, Rociadores eléctrico y automático	13
Albayaalde	2779
Albayaalde, molido en aceite ..	1401
Albayaalde y almagre	1400
Alcohol	15
Alcohol, demadera	16
Alfarería	1933
Alfareros, efectos para	302
Alfileres	1847
Alfileres de tocador	1854
Alfombras artísticas pequeñas ..	2382
Alfombras grandes de todas clases	2782
Alfombras impermeables	2133
Alfombras, Artísticas cuadradas "Ingrain," Lana "Union"	42
Alfombras de fieltro	417
Alfombras, muestras de	1815
Alfombras para carruages	2132
Alfombras, para coches ferrocarriles, vapores salas de asamblea, etc.	420
Alicates	1894
Almidón de maíz, para lavandera, culinario	2404
Almohadas y traveseros	746 y 1844
Almohadillas de aire	173
Alquitran y productos de alquitran	2517
Altares	20
Alumina, sulfato de	21
Amianto	43
Amianto cemento	44
Amianto Lana mineral	1645
Amoniaco, en polvo	25
Amoniaco y productos amoniacales	24
Amoniaco, sulfato de	26
Angulos de acero para construcción	29
Angulos de hierro para cantoneras de cajas	938
Arpas	30
Anillos de bauprés	2087
Anillos de caucho	2088
Antimonio	32
Antimonio, ganga de	1740
Antiphlogistina medicamento que sirve para impedir la inflamación	33
Antitoxicos	34
Aparagafuegos automáticos ..	921
Aparatos crematorios para desperdicios	720
Aparatos de alarma de incendio	980
Aparatos de laboratorio	1363
Aparatos eléctricos	862
Aparatos eléctricos para aumentar la corriente en baterías	613
Aparatos eléctricos para cocinar	657
Aparatos en donde enciendan las bombillas de luz eléctrica	2328
Aparatos para alimentar maquinas trilladoras	947
Aparatos para arrancar pilotes	831
Aparatos mecanicos para llenar sacos	69
Aparatos para medir	1094
Aparatos para blanquear paredes	2780
Aparatos para cavar hoyos de poste	792
Aparatos para fijar gomas en llantas de coches	2219
Aparatos para la ignición de metales	1286
Aparatos para manejar hielo ..	2559
Aparatos telegraficos para hacer señales en los barcos	2521
Aparatos químicos	531
Aparatos surtidores de mineral	946
Aparejos para levantar pesos fuertes	1321
Aparejos para vagones y carruages	1100
Aparejos usado en las fabricas de aserrar maderas para sujetar lamisma	1322
Apartaderos de hierro y hachero	2273
Apartaderos de madera	2274
Apisonadores hidráulicos	2049
Apoyos de caldera	2397
Araños	1895
Araños con asiento al estilo "sulkey"	1902
Araños de discos	1896
Araños mecánicos para jardines y huertas	2199
Araños para contratislas y cosechar raíces	1897
Araños para hacer caminos carreteros	1900
Araños para quitar la nieve ..	1901
Araños para terrenos inclinados	1899
Araños sembreros y para cosechar papas	1898
Arañas para luz electrica ..	866
Arboles de transmisión	2223
Archivadores de oficinas	967
Arquilla, para hacer vajilla ..	555
Arcos de carruage	246
Argamasa, mezcla de cal y arena	1658
Arganos ó malacates	2788
Armarios metálicos	1460
Armazones de acero para tejados	2118
Armazones de muebles	1041
Armazones de tejado	2627
Armonios pequeños provistos de lenguetas de latón y Tambien lenguetas de maderera	1745
Arneses	1201
Aros de alambre	1263
Aros, de hierro, maquinas para hacerlos	142
Aros para barriles	1262
Arrancadores de lana	2829
Arrancadores de remolacha ..	1987
Arroz y productos de	2083
Arpas	50
Arsenico, Blanco de	41
Artesas para amasar elpan ..	1776
Artesones para carbón	1239
Artículos de acero fundido ..	481
Artículos de adorno de metal para bovedas	2695
Artículos de alambre	2817
Artículos de aluminio fundido ..	463
Artículos de arcilla para el fuego	556
Artículos de cobre	670
Artículos de cobre fundidos ..	469
Artículos de fundición para calderas, llamados agujero del hombre	476
Artículos de fundición para vapores	480
Artículos de goma para electricidad	865
Artículos de hierro colado para maquinas agricolas ..	468
Artículos de hierro curvados ..	143
Artículos de hierro fundido para la construcción de fachadas	467
Artículos de hierro galvanizado	1311
Artículos de hierro gris	995
Artículos de hierro para cocheras	997
Artículos de hierro para el servicio de aguas	432
Artículos de hierro para garfios de madereros	2329
Artículos de hilo y de algodón, tejido de media	1270
Artículos de hojalata	1312
Artículos de hojalata estafiados, pintados, litografiados y lisos	2551
Artículos de latón fundidos ..	464
Artículos de madera curvada para poleas de transmisión ..	247
Artículos de madera, para oficinas, bancos y tiendas ..	999
Artículos de madera torneados	2645
Artículos de metal plateado ..	1003
Artículos de paja	2454
Artículos de papel	1806
Artículos de papelería	2405
Artículos de papelería	2405
Artículos de pluma	942
Artículos de semi-acero fundido	478
Artículos diversos, de goma y moldeados	2127
Artículos fundidos de bronce ..	466
Artículos fundidos de hierro gris	471
Artículos fundidos para la construcción de puentes ..	465
Artículos fundidos para ferrocarriles	477
Artículos livianos de fundición	474
Artículos musicales	1676
Artículos nikelados de cocina ..	1698
Artículos para bancos oficinas y tiendas	996
Artículos para cafés y cervecerias	993
Artículos para curtidores de cuero	2509
Artículos para dentistas	774
Artículos para droguitas y farmacéuticos	833
Artículos, para el alumbrado á gas	1086
Artículos para fábricas de calzado	2251
Artículos para gas agua y vapor	998
Artículos, para ingenieros ..	885
Artículos para juegos de goma	2366
Artículos para moldeadores ..	1663
Artículos para ópticos	2351
Artículos para recordos	2346
Artículos para salas de baños ..	994
Artículos para tintoreros	847
Artículos pesados de fundición	473
Artículos plateados	2289
Artículos tapizados	2677
Artículos y equipos para juegos	2365
Asbestos	2828
Ascensores	869
Ascensores de mano	871
Ascensores domesticos para elevar objetos de la cocina á los pisos altos	2730
Ascensores para fábricas almancen y para pasajeros ..	869
Ascensores para grano	870
Ascensores para trituradoras de piedra	873
Ascensores portátiles	872
Accesorios eléctricos	863
Asfalto	45
Accesorios	863
Asfalto, fieltro y otros materiales (preparados) para tejados	2119
Asientos cóncavos para sillas ..	603
Asientos de excusado	2205
Asiento de jardín	2206
Asientos para carruages	2204
Asientos para coches de ferrocarril	2203
Asientos suspendidos para vagones	2208
Asientos y espejos de vestíbulo	2207
Astas de banders de acera galvanizado	2386
Atabales chinos, usados en las fondas, para llamar a la mesa	1136
Ataúdes	460
Ataúdes metálicas	461
Ataúdes, féretros	1222

Carretones fuertes para transportar mercancías	2618	Cerraduras para vidrieras que suben y bajan	1462	de horquilla para ejes pequeños	1848	Confiterías	651
Carretones juguetes	2762	Certificados de acciones en blanco	307a	Clavitos de zapatero	2494	Confiteros, artículos para	650
Carretones mecánicos	2624	Cervecedores	298	Clavos avellanados y de zapatero	1680	Conmutadores	637
Carretones para acarreo de teja, madera, etc.	2619	Cervecedores, efectos para	294	Clavos cortados de todas clases	1631	Conmutadores eléctricos	2471
Carretones para fábricas de conservas en latas	2620	Cerveza "Ale," y "Lager"	17	Clavos de acero	1655	Conos de bicicleta y para patines de ruedas	649
Carretones para llevar escaleras	2623	Cerveza "Lager"	126	Clavos de hierro, cobre y bronce para caños	273	Conos para bicicletas y carruajes sulky	1277
Carretones para minas	435	Cerveza negra	2440	Clavos de remachar bifurcados y en forma de horquilla	2094	Conos y cañoncitos giratorios para cables de alambre	2473
Carritos	443	Cerveza negra "Porter"	1923	Clavos de ramachar de hierro y hachero	2093	Conservas	1955
Carritos á mano para obreros de ferrocarril	433	Cestas canastas	99	Clavos galvanizados	1682	Contadores de agua	1635
Carritos de descarga	444	Cestas de mimbre, rotén y caña	100	Clavos grandes	2355	Contadores de gas	1634
Carritos de mano	445	Cestas, de alambre	102	Clavos grandes para buques y ferrocarriles	2356	Contadores de metal	694
Carritos para niños	2720	Cestos, para botellas, garras, etc.	101	Clavos para botes	1678	Contadores de revoluciones	695
Carros de acarreo muy pesados	1465	Chalecos	2711	Clavos para cañoe de cobre y acero	1679	Contadores para medir el grado de la fuerza electromotriz	2749
Carros de ambulancia y para transportes militares	2719	Champagne	523	Clavos para herraduras	1684	Contrafuertes de botas y zapatos	2423
Carros de descarga automática	430 y 2722	Chandelios	2128	Clavos para herrar	1264	Contrafuertes para talones de calzado	693
Carros de rociar calles	2728	Champagne	522	Clavos pequeños	2498	Contrafuertes de caucho para muletas, sillas, etc.	2553
Carros eléctricos tranvías	431	Chandelios	2128	Clavos remachados de cobre y latón	2092	Copias, artísticas para premios	245
Carros expresos automóviles	2721	Chandelios de caucho	1751	Cloruro de hierro	1306	Copiadore	841
Carros ligeros para distribuir mercancías	446	Chapas de fundición para cubrir objetos	930	Cloruro de zinc	2845	Corbatas de señora	2537
Carros lijeros para equipage, etc. (con muelles)	2726	Chapas de latón (Memoriales)	289	Cobre en lingotes	665	Cordeage de jeniquen y fibra de Manila	677
Carros oscilatorios para mover maderos en las fábricas de aserrar (al cortarles)	426	Chapas de maderas finas para sillas, cepillos, etc.	2703	Cobre en planchas	666	Cordeles borlas y flecos	678
Carros para conducir flete, tozas, carbón y madera	2725	Chapas de madera para cajas de cigarrillos	204	Cobre, moldes de cobre para panaderos, confiteros y Artículos para cervecedores, fabricantes de vinagre, azucar, etc.	668	Cordones para corsés y zapatos	1365
Carros para conducir mangueras de incendio y máquina química combinadas	2724	Chapas en forma de U, con extremos puntiaguados	2401	Cobre semi-beneficiado (Matte)	664	Corindón	638
Carros para haciendas	2723	Chapas en forma de D, galvanizados y cobrizados	2402	Cobre níquel (matte)	663	Cornisas de hierro galvanizado	681
Carros para heno, pienso y grano	428	Chapas metálicas para perros	2495	Cochecitos á mano para niños	1131	Corpiños	2729
Carros para lodc	437	Chapeletes de lata	526	Cochecitos para niños y muñecas	427	Correas de algodón	133
Carros para mineral	2727	Chaquetas para señoras	1320	Coches, de ferrocarril ordinarios, salón, cama así como vagones para carga y refrigerantes para el transporte de carnes	439	Correas de cuero	134 y 2451
Carros para transportar, madera, teja, etc., en last fábricas	434	Chimeneas	2314	Cochecitos para niños y muñecas	1131	Correas de goma	135
Carros-tanque de ferrocarril, para conducir petroleo	438	Chirches, insecticida, materias para destruirlos	323	Cocinas económicas de acero para casas	2052	Correas largas	2450
Carruages	424	Chocolate	541	Cocinas económicas para hoteles	2051	Conservas para comidas	1952
Carruage, partes para	422	Chocolate de leche	542	Cocinitas á gas gasolina y aceite	2442	Conservas para huevos	1953
Carruages "Buggies"	323	Cielos-rasos de madera	488	Cocos, pulpa de o'carne preparada para pasteles, etc.	608	Corsés	682
Carruages, cajas para	192	Cielos-rasos de metal, acero	487	Codillos de unión de bronce	861	Cortadores de hueso	752
Carruages "Concords"	645	Cigarreras de bolsillo	1908	Codos para tubos de estufa y cocina	860	Cortadores de hulla	754
Carruages para niños, de mimbre, rotén, etc., de todas clases	425	Cigarrillos	549	Cojines para botes	748	Cortadores de raíces	757
Carruages, sin pintar	421	Cigarrillos ("puros")	550	Cojinetes de bolas de acero	111	Cortaza, pulpa de madera	88
Carruages, Victorias y Broughams	309	Cilindros de bomba, latón hierro y porcelana	765	Cojinetes de lubricación automática	113	Cortinas, automáticas de tela para ventanas	166
Carteles	1926	Cilindros de cobre y bronce	761	Cojinetes de rodillos	112	Cortinas de algodón (chenille)	742
Cartillas para niños	1972	Cilindros de goma para máquinas secadoras de lavar ropa	2117	Cojinetes para ejes de maquinaria	253	Cortinas de caucho	744
Cartón	411	Cilindros de gramofono	2062	Cojinetes para mesas de billar	747	Cortinas de encaje	743
Cartón acamulado (de paja)	2452	Cilindros de tintorero	763	Coladores de latón	2448	Cortinas para buques y coches de ferrocarril	745
Cartones, estuches para joyas	413	Cilindros de tintorero	763	Colchones para camas	2026	Crema de leche, condensada	717

THE CHILD AND ITS FUTURE.

It may be stated fairly that not enough consideration is given to the up-bringing of at least four-fifths of the children of Canada. This statement applies as much or more to the country and small towns as to cities.

For children who should, but do not, attend the public school we have the truant officer to enforce the parents or guardians instructions for attendance, but when once the child enters a factory, except under the apprenticeship system, little or no control of the child can be or is enforced.

The age of a child going into a factory should not be less than fourteen years. But employers are often deceived by parents who find it imperative to use every and all means to earn money. As a rule such instances are caused by the serious and continuous illness of a parent who has been the breadwinner. Instances, though, are frequent when it is nothing but parents' avariciousness; sometimes the blame is on the man who employs them.

In cases where the child leaves school before the fourteenth year, a system of following the child's interests should be instituted and some system adopted where relief, if necessary, may be given without subjecting the receivers to be wards of charity, even for a moment. It is very rare when an employer will willingly engage a child under fourteen, and generally in even these few cases, he is importuned by the circumstances urged by parents. Yet there is no municipal or provisional officers whose duty it is to follow the child so forced into a premature responsibility, and learn the circumstances which apparently warrant it.

A remedy must be found, and may it not be in a trade school? One of the complements of the trade-school should be the Apprenticeship Indenture, and a system of remuneration for work. This remuneration, as well as the up-keep of the school, should be a part charge on the Government and partly on the employers, whose apprentices are deriving special benefits from the attendance at the school. The Government's allowances would be legitimate, because it will reduce costs now necessary, in part, for prisons, reformatories, children's homes, asylums, etc., and increase the revenue, by the developments which will follow the growth and expansion of industrial education.

The underlying principle which should always be kept in evidence, is that of proper self-reliance. This will generate the further principle that earnings will be governed by ability, earnestness and perseverance.

One of the doctrines which should meet with general acceptance is, that every boy-workman is entitled to a level start. In the fundamental education of a child, preparation for him to take his place on an equality with any other child is essentially necessary. To have this there must be hand-work as well as brain-work. Then as the hand becomes familiar with instruments by which to construct, the mind suggests which line of industry will offer the best opportunities for the skill of its trained hands, and so, ambition born of a desire for greater achievement leads the coming mechanic and foreman in embryo to the technical school, and here his intelligence is guided to think and act so as to become a unit in the development of the country's commerce, industry and welfare.

This Government allowance should find its way to the trade-school through the University. The buildings and equipment might be provided by the municipality. The raw material for University graduates are the children who enter the kindergarten, and as a manufacturer cares for his raw material through all its phases, until the finished article is completed, so, too, should the University; and the greatest of care should be taken of this the most valuable of all raw materials. The children of the workman, mechanic or craftsman is entitled to his share of this suggested watchfulness

and care by the University. He pays his share of taxes from which are drawn the funds for University support and expansion.

The management and operation of trade schools should be under the guidance of men who have had practical experience of management in a factory or trade. The school should represent the actual conditions of industrial life.

During the last term in the school, every alternate day or week should be in the factory, and in this way no time will be lost in becoming accustomed to the new conditions. It may be found necessary to continue apprenticeship for the boy for a time after he enters the factory workshop. Immediate freedom from restraint may be injurious to discipline.

Employers are necessarily bound to give this subject their time, thought and support. The education of industrial workers is receiving attention throughout the English-speaking world. Canada must not be behindhand.

The Manitoba Iron Works, Limited, have just completed the installation of electric motors throughout their shops, having discarded steam except for heating purposes. They have installed approximately 200 horse power, distributed amongst twelve motors, and the whole plant is now operated by electricity purchased from the Winnipeg Street Railway Co. A fine new compound duplex intercooler air compressor, Rand make, has been placed, and a new Allen riveting machine and several large air hoists for the boiler and structural shop have been installed, which, with many minor improvements, leaves this fine plant in a high state of efficiency for the season's business. The company has already booked a large number of orders for execution this season.

FUSIBLE LINK

FIRE-PROOF GLASS WINDOWS.

They give absolute security—resisting intense fire heat, as well as the action of water.

Arranged to open with this "fusible link" attachment, they close and lock automatically if a fire occurs—150° melts the link—thus giving complete and perfect protection.

This "wired glass" admits the light as freely as plain glass—is rather ornamental in effect, and greatly lessens insurance rates.

Full information if you write

We do **NOT** make any "cheap trash."

COPY OF TESTIMONIAL.

The METALLIC ROOFING CO. OF CANADA, Limited.
TORONTO.

Lucknow, Ont., April 9th, 1908

Dear Sirs:—"I take great pleasure in testifying to the good qualities of your "Eastlake" Shingles. We put your painted shingles on our Town Hall here in 1885, 23 years ago, and although they have only been painted twice since that time they are in good condition yet. I consider the lock on the "Eastlake" the very best, and believe that a roof covered with the galvanized "Eastlake" will last forever.

Our Classified Metal Ceilings

give the most handsome, durable and economical finish for any kind of building. They never crack or warp like plaster or wood ceilings, and when dirty, they can be readily cleaned with soap and water. They admit of decoration in unlimited variety, and this is very cheaply done, as the paint spreads easily over the metal without any loss from absorption.

Our CLASSIFIED METAL CEILINGS are more easily erected than any others. The joints fit together perfectly, making no break in the general design. Any mechanic can erect

our ceilings, by following the careful plans which we send out with every order.

Our "Herringbone" Expanded Steel Lath

is positively the most rigid expanded metal lath on the market. It is the easiest to apply on the studding, and the easiest to plaster. Takes fewer studs and less plaster than any other lath. Its edges are absolutely uniform, and there is no waste from overlapping. Write for our literature and free samples.

We make everything in the line of Sheet Metal Building Goods.

We cheerfully send our catalogues free to any part of the world. Upon receipt of measurements either in feet or in meters, we will submit an estimate on any job in which Sheet Metal Building Goods may be required. We give special attention to export orders.

PHILLIPS Manufacturing Co. Limited

Carlaw Avenue

TORONTO - ONT.

Important to Canadian Manufacturers

One of the main necessities of your manufacturing progress is the finding of new buyers for your output.

As most manufactured goods reach the consumer through the medium of jobber and retailer, the more the jobbers and retailers know about you and your goods the better are your prospects of obtaining new customers and holding old ones.

The best and most inexpensive way for any manufacturer to keep his proposition constantly before the jobbers and retailers who sell—or ought to sell—his goods, is to talk to them unceasingly through the trade paper which most of them read.

For twenty-three years the Maclean Publishing Company, Limited, have been successfully building up several trade newspapers, which are now regarded as trade authorities. The firm grip which these papers have upon their readers is maintained through an unequalled organization of highly trained editors and correspondents. All that is of interest to the trade is collected, sifted and published while it is fresh and vital. We maintain resident managers in Toronto, Montreal, Winnipeg, Vancouver, Chicago, New York, and London, Eng. Besides which we have paid correspondents in all the larger centres of Canada from ocean to ocean. We have in all 56 salesmen.

Our corps of circulation canvassers cover every province in the Dominion. The circulation of every one of our papers is thus kept right up to the mark.

Our Trade Newspapers are :

**HARDWARE AND METAL THE CANADIAN GROCER
BOOKSELLER AND STATIONER AND CANADIAN NEWSDEALER
CANADIAN MACHINERY AND MANUFACTURING NEWS
PRINTER AND PUBLISHER PLUMBER AND STEAMFITTER
DRY GOODS REVIEW**

We also publish :

Busy Man's Magazine

The Mutual Fire Insurance Companies

ORGANIZED BY THE
CANADIAN MANUFACTURERS' ASSOCIATION

ARE now carrying a portion of the insurance of the leading manufacturers throughout the Dominion. These Companies are operated at a small cost. The usual profit from underwriting realized by Stock Companies is saved to the manufacturer. The principle of security is clearly established by all insurance being written on the Premium Note Plan. There is, therefore, no fluctuating or speculative securities to be paid for out of the insurance premiums. The principle of isolated risks is rigidly adhered to. These Companies will never have an accumulation of risks in congested districts of the cities. We estimate that the manufacturers have been carrying a useless burden of from 25 to 40 per cent.

The Stock Companies' arguments against Mutual Fire Insurance as carried on by *Purely Manufacturers' Mutuals* have been entirely overcome by the wonderful record of the New England Mutuals, both in the great improvement they have made in the risks and the great reduction in rates.

Why should not all Canadian Manufacturers who have a well constructed and well cared for factory be able to secure mutual insurance in thoroughly reliable Manufacturers' Mutual Companies, which is now acknowledged to be the most economical and by far the safest fire insurance system in the world.

Particulars will be gladly furnished if you apply to the Secretary.

The Twenty Thousand Club

OF PORTAGE LA PRAIRIE, MANITOBA.

*Office of the Secretary:
Twenty Thousand Club and Board of Trade.*

Portage la Prairie, Man., June 1908

To Members Manufacturers' Association,
Industrial Canada.

Gentlemen :—

Please permit me to call your attention once again to Portage la Prairie, Manitoba.

No other point in Western Canada can possibly offer the same inducements to **MANUFACTURERS, WHOLESALERS and JOBBERS**; to **CAPITALISTS** and others seeking gilt-edged investments as Portage la Prairie and district.

Portage la Prairie, Manitoba, is positively the only city on the North American continent where **FOUR** great transcontinental railway systems—Grand Trunk Pacific, Great Northern, Canadian Northern and Canadian Pacific—intersect, providing railway distributing and shipping facilities to be found at no other point in Western Canada.

FREE SITES and other concessions are granted to **INDUSTRIES** under conditions, whilst land for residential purposes is undeniably cheaper here than at any other place in all of this great western country.

If you wish to participate to the fullest possible extent in an era of wonderful prosperity which is about to set in throughout this great, rich agricultural heritage, you must come where excellent railway facilities and equitable freight rates, together with an interchangeable transfer system and lowest rate of expenses, will prove the most beneficial.

It will give me particular pleasure to supply all desired information promptly.

Trusting that you are interested, and awaiting your commands, I beg to remain,

Very respectfully yours,

HERBERT W. BAKER, Sec'y,

Twenty Thousand Club and Board of Trade,

Portage la Prairie, Manitoba.

CANADA LEADS THE WORLD IN TELEPHONE INVENTION

CANADA invented the telephone. In thirty years it has encircled the world, commanding the profitable investment of hundreds of millions of dollars and to-day is one of the great factors in our civilization.

CANADA invented central energy automatic telephony, which in the next ten years will encircle the world, saving vast sums of money both in first cost of installation and in cost of operation and maintenance.

The Canadian Machine Telephone (recommended for exchanges of 200 telephones or more) automatically does the work of the "hello" girl better, quicker, more accurately and more economically and tells no secrets.

Are you interested in telephones? Write us for full information.

We are building up a great Canadian industry and will appreciate an enquiry from you.

GUARANTEED INDEPENDENT TELEPHONES

WE ARE BUILDING UP A NEW CANADIAN INDUSTRY, MANUFACTURING TELEPHONES ESPECIALLY FOR PEOPLE WHO ARE OPERATING INDEPENDENT OF THE TELEPHONE MONOPOLY

We are giving to the people the very latest and best inventions in the telephone art, at prices that are reasonable.

All Canadian Independent Telephones are fully up-to-date, fully guaranteed for ten years and fully satisfy.

A telephone saves time and money and in a dozen ways has proven itself to be a practical necessity, especially to people living in rural districts.

We are making special lines particularly applicable to the needs of Farmers and persons residing in cities and towns and rural districts.

You can have telephone supplies of all kinds shipped promptly from stock.

Write for particulars and we will furnish full information and prices, and our suggestions for your purpose.

OFFICE, 14 ST. HELEN STREET - FACTORY, 182-186 SHEARER ST.

MONTREAL, CANADA

We export to-day to all the principal cities of the world the major portion of our output in the two lines of our manufacture:

Enamelled Jewelry

For purity of color, exclusiveness of design, perfection of finish and moderate price, we claim to be without competition from any source.

We invite correspondence, and are ready at all times to manufacture designs specially suitable for souvenirs in any locality.

Silver Deposit Ware

Made by a new and secret process by which the pure silver is, by fire, embedded into the glass or china, thus ensuring cleanliness, strength and durability.

This line is specially suitable for high-class jewelry trade, and is eagerly sought after for wedding presents, Xmas gifts and presentation purposes, being useful, handsome and unique.

CORRESPONDENCE IS SPECIALLY REQUESTED

The Auto-Strop Safety Razor

This Razor stands alone to-day as the most perfect shaving instrument the world has ever known.

Being a "Safety Razor" one can shave at any speed, on a train or boat, with or without a mirror, and without injury to the skin.

By a clever mechanical attachment the blade can be stropped to a keen edge in a few seconds, thus giving the user a constantly sharp razor, and the blades an indefinite life.

Can be stropped and cleaned after shaving in less than a minute, without unscrewing, removing blade or otherwise taking apart.

The standard outfit sells at retail for \$5.00 and consists of: One Quadruple Silver Plated Razor, 12 AutoStrop Blades, and One Genuine Horsehide Strop, all put up in neat leather case.

LIBERAL DISCOUNT TO THE TRADE. SHIPMENTS TO ALL PARTS OF THE WORLD.

TO THE General Public the Dunlop Company is best known through its Successes with the Detachable Bicycle Tire, Automobile Tires, Solid Rubber Tires and Rubber Heels.

This is a good impression to have abroad because the General Public is an unfailing good customer for these lines. But by the trade the Dunlop Company is to be associated with the rubber business in a wider and more general sense. The Mechanical Rubber Goods Department now occupies half the Dunlop Rubber Works and at the present rate of expansion will soon constitute a good sized factory in itself.

Replace a wooden or enameled bedstead with a *Brass Quality Bed*—the improvement in the attractiveness of your room will be really astonishing. The reason:—the refinement and solidity of design, the golden elegance of the finish of the *Brass Quality Bed*, were entirely absent in your wooden or enameled bedstead. *Brass Quality Beds* can be obtained at all first-class furniture dealers.

Underwood

The leading typewriters of pre-Underwood times have been sold in Toronto for thirty years; the Underwood for ten years.

There are now used in Toronto more Underwoods than all other makes combined—and their name is legion, the exact figures being: Underwoods, 2544; all others, 2518.

We have said that the Underwood is the best typewriter, but let it pass. If you are an Underwood user you know it; if you are not, you will know it, because no matter what machine you have used or are using, the typewriter you will ultimately buy is the Underwood.

Don't Wait Till the Horse is Gone to Lock the Stable

Many a progressive factory-owner has been ruined by a hot bearing, a falling cinder, or a grass-fire. They paid dearly for their indifference to Fire-Risk. Wooden roofs, skylights, cornices, doors or windows are very inflammable, and while falling a prey to the flames themselves, lead the way to adjoining surfaces. Galvanized Steel not only defies Fire and Lightning, but is *six times as durable*, and half as heavy as wood, *easier to erect* and less expensive. Look over this list and let us quote you on your requirements.

"Galt" Corrugated Sheets

Flat or curved, any gauge, painted or galvanized.

"Galt" Fire-proof Doors and Windows

Latest and most approved constructions. Do not swell, warp or lose their shape.

"Galt" Steel Skylights

Light, strong and glazed with fire-proof glass.

An Instructive Catalog free upon request. Use the "Galt Kind" and save half your Insurance Premium.

"UNDERWRITERS" FIREPROOF WINDOWS (TRADE MARK) DOORS AND SKYLIGHTS

These Fireproof Goods are not a side line with us, they are a specialty. We are in close touch with every phase of this business. No matter what the conditions are, we can give you satisfactory Fire Protection.

Our Windows are made on heavy power presses, are absolutely accurate as to size and add to, not mar, the appearance of your buildings.

Our Tin Clad Doors are fitted with "Adjustable Hangers" which permit adjustment any way, up or down, in or out. This saves time in hanging, and you can, without any trouble, keep your doors in perfect working order.

Our Kalameined Clad Doors, for Office Buildings and Warehouses, are very artistic, made in any design, with wired glass in upper panel if desired. We make these by special machinery, the wood and Kalameined iron become practically one, no bulging seams, nail heads or joints.

Our Skylights are Dust, Air, and Waterproof. When glazed with wired glass they are fireproof.

Send us along sizes of openings. We will give you an interesting figure, and the best of goods.

Manufacturers and Contractors of Fireproof Windows, Doors, Skylights, Partitions, Adjustable Firedoor Hangers, Firedoor Hardware, Oily Waste Cans, Fire Extinguishers, Cornices, Metal Ceilings, Corrugated Iron, Blow and Vent Piping. Asbestos, Lumber, Siding and Sheathing Slate, Felt and Gravel Roofers.

The Gourlay-Angelus Piano

MAKES YOU A PIANIST

This does not mean merely that you play the notes of a composition—any player-piano will enable you to do that. The GOURLAY-ANGELUS does more—By means of its patent inventions, the MELODANT and PHRASING LEVER, you will be able to give any composition your individual reading, as though you were playing by hand after years of patient study. Even the non-musician may play artistically, for the tempo, the degrees of tone and instrumentation, copied from the composer's score are plainly marked on the music roll. The Melodant, Phrasing Lever and other expression devices are so easily controlled that a very little practice will make you proficient.

If you have listened to other player-pianos that are mechanical, come and hear how artistic and human is the GOURLAY-ANGELUS.

RUSSELL

☞ "MADE IN CANADA" means more and carries more weight when applied to an automobile than any other manufactured product.

☞ Suppose you purchase a motor car and learn to operate, drive and manoeuvre it—there are mechanical points concerning which you frequently seek expert advice and assistance, and when the information is ever at hand and always available, you are never at a

loss to know "the why". But the man who relies on the foreign maker suffers delay and disappointment—worse still, he goes blindly ahead and takes "chances"—?

☞ Any Canadian familiar with machinery knows what it means to wait for foreign-made parts.

☞ The Russell Car is Canadian by birth not by adoption. Each and every part used in its construction is made in the Russell Factory. The Russell guarantee, therefore, covers not only every minute and individual part in its make-up, but the completed car itself.

REAL RELIABILITY

“A chain is as strong as its weakest link”—an automobile’s Reliability is based, not on the strength of this or that part, but on the AMPLE strength of every part.

Claims are easy, but positive SERVICE in the hands of inexperienced owners on all kinds of roads, in all kinds of weather, has led experienced buyers to demand the Oldsmobile for Reliability.

Every desire, from a speedy roadster to a palatial limousine, is fulfilled in the 1908 product—every car is a “Car with a Pedigree”—an Oldsmobile through and through. Prices range from \$625.00 to \$4750.00—and there’s dollar-for-dollar in every car.

Surely if you are contemplating the purchase of a car you could not be induced to buy without first having so famous a car as the Oldsmobile demonstrated for you.

Our catalogue will post you on the points to look for in buying an automobile; we will gladly mail it.

OLDSMOBILE COMPANY OF CANADA, LIMITED

4 Cyl. 15 H.P.
\$800 f.o.b. Walkerville

FORD CARS

Perhaps some day some other automobile manufacturer will produce a four-cylinder runabout as strong and reliable as the Ford for \$800—perhaps.

But until that time, this sterling little car offers the greatest automobile value on the market—a whole year ahead of any other light

car built. The four-cylinder idea is here worked out to its perfection. Extreme light and simple construction, total absence of vibration, and a freedom from that trouble and complication which almost invariably accompanies the type of engine possessing fewer cylinders.

London Machine Tool Co., Limited, - Hamilton, Canada

CANADA LEADS THE WORLD IN TELEPHONE INVENTION

CANADA invented the telephone. In thirty years it has encircled the world, commanding the profitable investment of hundreds of millions of dollars and to-day is one of the great factors in our civilization.

CANADA invented central energy automatic telephony, which in the next ten years will encircle the world, saving vast sums of money both in first cost of installation and in cost of operation and maintenance.

The Canadian Machine Telephone (recommended for exchanges of 200 telephones or more) automatically does the work of the "hello" girl better, quicker, more accurately and more economically and tells no secrets.

Are you interested in telephones? Write us for full information.

We are building up a great Canadian industry and will appreciate an enquiry from you.

**CANADIAN MACHINE

GUARANTEED INDEPENDENT TELEPHONES

WE ARE BUILDING UP A NEW CANADIAN INDUSTRY, MANUFACTURING TELEPHONES ESPECIALLY FOR PEOPLE WHO ARE OPERATING INDEPENDENT OF THE TELEPHONE MONOPOLY

We are giving to the people the very latest and best inventions in the telephone art, at prices that are reasonable.

All Canadian Independent Telephones are fully up-to-date, fully guaranteed for ten years and fully satisfy.

A telephone saves time and money and in a dozen ways has proven itself to be a practical necessity, especially to people living in rural districts.

We are making special lines particularly applicable to the needs of Farmers and persons residing in cities and towns and rural districts.

You can have telephone supplies of all kinds shipped promptly from stock.

Write for particulars and we will furnish full information and prices, and our suggestions for your purpose.

OF PORTAGE LA PRAIRIE, MANITOBA.

*
*Office of the Secretary:
Twenty Thousand Club and Board of Trade.*

Portage la Prairie, Man., June 1908

To Members Manufacturers' Association,
Industrial Canada.

Gentlemen :—

Please permit me to call your attention once again to Portage la Prairie, Manitoba.

No other point in Western Canada can possibly offer the same inducements to MANUFACTURERS, WHOLESALERS and JOBBERS; to CAPITALISTS and others seeking gilt-edged investments as Portage la Prairie and district.

Portage la Prairie, Manitoba, is positively the only city on the North American continent where FOUR great transcontinental railway systems—Grand Trunk Pacific, Great Northern, Canadian Northern and Canadian Pacific—intersect, providing railway distributing and shipping facilities to be found at no other point in Western Canada.

FREE SITES and other concessions are granted to INDUSTRIES under conditions, whilst land for residential purposes is undeniably cheaper here than at any other place in all of this great western country.

If you wish to participate to the fullest possible extent in an era of wonderful prosperity which is about to set in throughout this great, rich agricultural heritage, you must come where excellent railway facilities and equitable freight rates, together with an interchangeable transfer system and lowest rate of expenses, will prove the most beneficial.

It will give me particular pleasure to supply all desired information promptly.

Trusting that you are interested, and awaiting your commands, I beg to remain,

Very respectfully yours,

HERBERT W. BAKER, Sec'y,

Twenty Thousand Club and Board of Trade,

Portage la Prairie, Manitoba.

NO. 20
Planer, Matcher and Moulder
COMBINED

A MACHINE that will do a wide range of work. Designed and perfected specially to meet Canadian conditions. It is strongly constructed, of excellent workmanship, and is unequalled by any machine of its class in the market.

Planes 24 inches wide, 9 inches thick.

Matches 14 inches.

Four charges of feed: 46, 38, 31 and 23 running feed per minute.

THE EDITORIAL VIEWPOINT.

A Stern Lesson.

REFERENCE was made last month to the strike then in force among the bricklayers of Montreal, who refused to accept a reduction in wages made necessary by the stress of the times. As was pointed out in the former article, the employers offered to pay the full price demanded to those who were able to earn it, and a less price to less capable men. The union would not hear of this. Every union man was entitled to as much pay for his time—regardless of the amount of work he performed—as every other union man, and the price they named was the highest ever paid to this class of mechanic. Rather than accept any but their own dictatorial terms the union ordered a strike, assuring its dupes that they would be looked after. The International Union, they were told, would pay them for striking. Married men were to receive \$10.00 per week and single men \$7.00 per week while the strike lasted. It will be observed that when it

came to paying wages, the union itself made a distinction between its members. In its view every union man was not as good as every other union man. It was quite proper to demand that the employer pay everybody alike for the "time" they spent on a job; but when it came to pay them for striking, other considerations than mere "time" were taken into account. However, the men were willing to accept from the union terms they would not accept from their employers, and they quit work, happy in the delusion that the union would keep them. When the time came, however, the union failed them. The money was not forthcoming, and want entered the homes of the strikers. For a time the leaders were able to keep them in line with promises and explanations, but all the while hunger was driving home the truth that unionism was, after all, only a rotten reed and could not be relied upon to support them over the crisis. One by one they began to fall away from their leaders and return to their employment. It was a hard lesson, sternly taught, but if they have learned it their time and efforts will not be wholly lost.

The New York Sun on Canada.

IN a recent editorial the New York *Sun* discussed the growth of trade between the United States and Canada. For years the *Sun*, in common with the majority of the United States' papers, ignored us. Canada was a place on the map north of New York State, where the hunting and fishing was good, but for people who enjoyed civilization it was of no importance whatever. Now and again they printed wild yarns of bears running through the streets of our principal cities, and on one occasion, not so very long ago, the writer had the pleasure of winning a wager from the editor of an important New York newspaper, who backed his assertion that Canada was no larger than the State of New York. What a change has come over them! The *Sun* tells its readers that west of Winnipeg there is a thousand-mile strip of fine wheat land. In Western Canada alone there are five million acres under cultivation, and one hundred and seventy-five million acres waiting for the plough and the reaper. In 1897 Canada

took goods from the United States to the value of \$72,000,000, and ten years later she bought nearly \$187,000,000 worth of United States' products. By 1915, the *Sun* predicts, Canada's trade will exceed \$1,000,000,000 annually. The country, it has discovered, is being gridironed with railroads, and business for these lines is made by the arrival of hundreds of thousands of settlers, most of them of the English-speaking race. All these things seem to have come to the *Sun* suddenly, and it is inclined to get excited over it, and tell its people what they must do. It is no longer "The Call of the Wild" it hears, but Wisdom speaking in a loud voice. At any rate, this is how it ends its editorial:

"Wisdom calls to American business men to learn as much as possible about this rapidly developing neighbor, and to demand from their legislators every possible facility for the extension of trade, import as well as export. We have much to gain by a huge reduction in or even the total removal of our present tariff barriers."

Wisdom is doing more than calling to American business men to prepare for the capture of Canadian trade—it is warning the Canadians to hold the trade for themselves. The day has passed when the legislators of the United States can put up or throw down the tariff barriers between the two countries. They can, of course, do what they like with their own line fence, but they cannot touch ours, which is up to remain up. The manufacturers and producers of Canada have not struggled through the pioneer days of this country to have it thrown open to strangers now that it is getting to be worth while. Canada is for the Canadians, and the fact that imports from the United States have grown to such an enormous proportion in ten years, indicates that there are some weak spots in the tariff wall which require strengthening.

The Elections.

THE politicians had the centre of the stage in the Provinces of Ontario and Quebec during the latter part of May and the early part of June. In both provinces the elections turned out as most people expected they would—both governments being sustained. Ontario is overwhelmingly Conservative, and Quebec just as strongly Liberal. The professionals are trying to figure out all sorts of things for the Dominion Government as a consequence, but it is hard to see the connection. The Provincial Legislatures are more local than they are themselves willing to admit, and a great many voters do not take the interest in them that they do in a Dominion contest. It does not make such a great difference which party rules in the province, since their powers are very limited and very local. In the Dominion, however, the government of the day has the power to completely upset the whole course of business and to so change conditions that trade and commerce are disorganized. Fortunately, both the great parties are now pretty well committed to a protective policy, and violent business eruptions are not now to be so greatly feared as was once the case. At best, political

contests, whether provincial or federal, have an unsettling effect on the business world while they are in progress, and there is a feeling of relief when they are over. With the campaigns in Ontario and Quebec out of the way, those who engaged in them will be able to get back to their usual pursuits and attend to business.

Nova Scotia and Shorter Hours.

NOVA SCOTIA has appointed a commission to inquire into and report upon the economical effect of a shorter working day with special reference to production, wages, employment, export trade and Canadian industries. This is a pretty large order and a very large subject for a province to undertake. The Legislature of Nova Scotia could not adopt any surer way of killing its industrial growth than by passing an Act to shorten the working day in that province. Every manufacturer in the province would be placed under a handicap as compared with his brother manufacturers in the other provinces, and he would soon be forced out of business or out of the province. No one province of the Dominion can afford to pass legislation of this kind. Nor can the Federal Government undertake it either, for the reason that a shorter working day in Canada would place the industries of this country at a disadvantage compared with their foreign competition. But there are other reasons why the "eight-hour day," of which there has been so much talk in recent years, would be a fatal mistake. The cost to the people of Canada would run into the millions, and the cost of living would become so high that it would be next to impossible for any but the very wealthy to remain in the country. The farmer would be hit so hard by the increased cost of his supplies that farming would cease to be the profitable calling it is to-day. The shortening of the working day would increase the cost of production in our factories all the way from 10 to 20 per cent., and the consumer, both in the city and on the farm, would have to pay it. The advocates of the shorter day say there would be just as much work done in eight hours as there is now in nine or ten hours. The men would work faster and better because they would not have to work so long. They would come to work better rested and more fit to give a good account of themselves. That is all very well as a theory, but it does not work out in practice. It has been tried and those who made the experiment were not long in finding out that they had a loss in production exactly equal to the loss in time. Moreover, in factories where men are employed attending automatic machines, they cannot increase the capacity of the machine because they feel more fit, nor can they lessen its output during the last hour of the present day. There are millions of dollars invested in machinery in the factories throughout Canada, and if the working day were shortened by an hour these costly plants would be compelled to lose a month in time every year, or say about one-twelfth of their capacity. Advocates of the shorter day do not figure on this loss, which would add another large percentage to

the cost of production. It is safe to say that in the majority of cases the manufacturer does not have one clear hour of profit-making in the day as it is, and if an hour were taken from him, he would have to readjust his prices on a higher scale. If such a thing were possible, the manufacturer would like to see everyone living well without working, but as the world is constituted men must work to live and we in Canada cannot expect to live on less work than the people in other competing countries. And if Canada as a whole cannot afford to do less work than the rest of the world, Nova Scotia alone is certainly less able to attempt it.

The Shorter Day and the Farmer.

THERE is another objection to the shorter working day in the cities which deserves special mention, and that is its tendency to depopulate the farms. We have all heard it deplored that the tendency of farmers' sons is to quit the old home and crowd into the cities and towns as soon as they are old enough to shift for themselves. The long hours and hard work on the farm are said to be responsible for this flocking to the cities. The shorter hours and big pay to be made in the cities attract the

young men from the plough and the harvest field, and, it might be added, from independence. Is it desirable to place a still larger premium on city life by making the hours of toil shorter and more attractive than at present? The Government pays a premium for farmers from abroad, because it recognizes that the great need of this country is men to till the soil. Would it not, then, be the height of folly to offer a premium in the form of a legalized eight-hour day to farmers' sons to quit the farm and come into the city? In the case of miners working under ground and in a few dangerous and unhealthy employments, there is some excuse for legislative interference in the matter of working time, but in the vast majority of cases it is much better to let the employer buy and the workingman sell labor on such terms as they agree upon between them-

selves. The farmer can ask what he likes for his hay or grain, and the consumer need only pay as little as he can get it for, and they can deal in it in as small or as great quantities as they like. There is no law limiting them in any way. Why should not labor be bought and sold in the same way? If Parliament passed an Act saying that 1,500 lbs. made a ton worth just as much as 2,000 lbs., it would be as sensible as for Parliament to pass an Act saying that eight hours made a working day just as valuable as nine or ten hours. There are some things that Parliament cannot improve by legislation, and are better left alone. The working day is one of them.

Taxation in Winnipeg.

THERE is a good deal of dissatisfaction with the rate of taxation in Winnipeg. Manufacturers, mer-

chants and others have been appealing for lower taxation and have brought so much pressure to bear on the local legislature to make some improvement in the present system, that steps are now being taken looking to a change. The legislature told the city to appoint a commission and gather evidence covering the whole question, and when they had arrived at what they desired and agreed upon it, it would be

The Decline of the Woollen Industry.

The Sheep: "Baa! What's the use?"

embodied in the city charter. One of the arguments in favor of a reduction of taxation is that it would help to build up the industries of the city, and some go even so far as to claim that manufacturers are entitled to special treatment. While we sympathize with the desire of the Prairie City to build up its industries, we think the principle of special treatment in the matter of taxation, whether in the form of exemptions or of fixed assessment, is indefensible. It is manifestly unfair to established industries to grant special favors to new-comers in order to induce them to locate in the city offering these inducements. By the constitution of many of the States of the American Union, and by the laws of many others, exemptions are absolutely forbidden, and in some of the older provinces of Canada the offering of such inducements to

manufacturers is illegal. The practice of granting exemptions is liable to lead to all manner of abuse. Bonuses, tax exemptions and fixed assessments are all the playthings of promoters. The legitimate manufacturer locates his factory at the point most suitable for his business, and would much sooner not have his judgment influenced by the bribery of a municipality. When, however, a municipality offers a special inducement large enough to make it worth while, he is often compelled to locate at some less desirable point in order to forestall competition that would be ruinous to both. In starting out Winnipeg should begin right, and it should not accord to any individual, or any class, treatment which it is not prepared to give to all alike—the old established industry as well as the newcomer. It strikes us that the real trouble in Winnipeg is a heritage of the boom. Land values of a few years ago reached a height that made visitors from the older parts of Canada gasp in astonishment. Assessments based on these values and still in force are, no doubt, burdensome, and should be readjusted. To go further than that in the direction of getting legislative sanction for the granting of special favors in the form of exemption or fixed assessment to be offered as inducements to manufacturers to locate in the city, would be a mistake, and one that the city would regret in the future. All the city wants is an all-round reduction in assessment. Certain lines of manufacturing would thrive better in Winnipeg than in any other city in Canada, and these it will get in good time and without bribery; meanwhile it should not offer inducements to promoters that it is not prepared to give to those already established, and to all who may later on come in to compete with the favored ones.

The Coasting Laws in British Columbia.

THE coasting laws of Canada provide that goods shipped from one Canadian port to another port in Canada must be carried in British bottoms. This is the law in general; but a special privilege was granted in so far as British Columbia ports were concerned, which permitted goods shipped in bond from points in Eastern Canada, over American railroads to Seattle, being carried the balance of the distance in foreign vessels. The reason for granting this privilege was that it gave the people of British Columbia the advantage of competition in railway rates. When the Canadian Pacific was the only road entering British Columbia, these special coasting privileges were valuable, as otherwise the people would have no alternative, as there were not enough of British Columbia boats to carry on the trade. Now, however, there are two other lines of railway entering the province, and the new transcontinental will be there in a comparatively short time. The situation is therefore changed, and the time has come for the repeal of the special coasting privileges, and the application of the same regulations as obtain in the other ports of Canada. Besides there are now more British bottoms available, and many vessels

ready to be transferred to the service as soon as the present privileges are cancelled. The foreign vessels that carry on the trade under the present ruling are mostly American, and outfit at the American ports. This means a heavy loss to Vancouver merchants, who would get the bulk of this trade if British vessels were placed on the route. Besides, when the Grand Trunk Pacific gets into operation to its Pacific terminal, the trade offering between that port and the other coast cities and towns of British Columbia is bound to be important, and it should not be allowed to fall into the hands of foreign vessel owners, who purchase all their supplies outside of Canada. The people of British Columbia feel that the time has arrived when the coasting laws in force in other parts of Canada should be put in operation on the Pacific coast.

The Tin Plate Industry.

A PECULIAR and somewhat embarrassing situation has developed with regard to the manufacture of tin plate in Canada. The tin plate factory recently established at Morrisburg is making demands on the Government for the enforcement of the dumping clause against their United States rivals, and they seem to have a good case. United States manufacturers are selling tin plate in Canada at 70 to 80 cents a box less than it can be bought for in the United States, and as this is a direct violation of the Dumping Act, it would seem that the Canadian manufacturers of tin plate are within their rights in the demands they are making. On the other hand, the tin plate manufacturers of Wales, the home of the tin industry, are selling their product in Canada in competition with the slaughter prices of the Americans, and making a profit. Enforcing the Dumping Act against the United States would, therefore, result in the Wales manufacturers putting up their prices, which are already high enough to enable them to do a profitable business. The users of tin plate in Canada, who include all our canning factories, would have to pay higher prices for their packages once United States competition in the market was removed. Before the Government consents to the application of the Dumping Act against the United States it should be satisfied that the Morrisburg plant is manufacturing in substantial quantities, otherwise the users of tin plate will be at the mercy of the Wales producers. Should this occur as a result of the enforcement of the Dumping Act, and the inability of the Morrisburg people to meet the demand, the Government would have to come to the rescue of the users of tin plate by increasing the protection on their products. The situation is certainly a peculiar one, and will have to be handled with great caution. In the opinion of a great many, Canada is not yet ripe for the establishment of a tin plate industry, as the demand in the country is scarcely such as would justify the operation of a plant on a sufficiently large scale to make it profitable at a reasonable price for its products. Industries that come ahead of their time should not ask

to be supported at the cost of those already established. This is more particularly true of an industry that has to import its raw material. Everyone who has the future welfare of the country at heart should be willing to make all reasonable concessions to such industries as are natural to it and aid in the development of its latent resources. The canning industry is of the utmost value in furnishing a ready and profitable market for the products of the farm and of the fisheries, and it should not be handicapped for the benefit of the tin mines of Wales.

The Canadian New Zealand Steamship Line.

OUR New Zealand correspondent, whose letter appears in another part of this issue, calls attention to the fact that the contract for the steamship service between Canada and New Zealand runs out in a few months, and he has been informed by the Premier and the Minister of Marine of the latter colony that the question of its renewal has not yet been considered, but that it will not be continued on the present basis. He says that commercial men generally are of the opinion that the line will never pay unless a monthly service, with regular sailing dates and at

least 500 tons of refrigerator space is established, and the rates will have to be reasonable. He points out that a larger subsidy will possibly be necessary to secure an efficient service, but, as he truly remarks, it is much better to pay a little more for an efficient service than to continue the smaller amount for a service utterly unfit for the trade. There is a profitable trade to be had by a line properly equipped with refrigerator plant, and there is no reason why such a line should not be provided. If we are to extend our trade with our sister colonies, we must have proper transportation facilities. An inefficient line is as bad, if not worse, than no line at all. Paying a subsidy, however small, to a line that does not meet the requirements is a waste of money. The subsidy should be made sufficiently large to ensure an efficient service,

which, judging from what our correspondent has to say of the trade prospects, would soon result in a respectable volume of business being done between the two countries.

Patent Rights in England.

THE British Government has made a ruling regarding patent rights in Great Britain which will have a far-reaching effect. Henceforth, in order to protect a patent in Great Britain the holder of it must establish a factory for the production of the article thus protected within the United Kingdom. It is understood, however, that the colonies are to be exempted from this regulation, so that the production of any patented article in any colony where it enjoys patent rights will serve as a protection for these rights in Great Britain. That is, if the article is

patented both in the colony where it is produced and in Great Britain, its manufacture in the colony will be sufficient to protect the British patent. It is said that between twenty-five and thirty millions of pounds sterling are already going into new plants in Great Britain in order to protect patents there. The new regulation should prove a great help to certain lines of Canadian manufacture.

Through the Rapids in Safety.

Jack Canuck: "Well! we're past the bad spot and there's no damage to the canoe."

The Woollen Industry.

THAT the Preferential Tariff is killing off the woollen industry in this country is only too painfully apparent to all who have taken the trouble to compare what it was before the adoption of that tariff with what it is now. In 1900 there were 157 establishments in Canada employing five hands or more. These were capitalized at \$10,486,198 and employed 6,795 hands turning out products to the value of \$7,359,541. Five years later, in 1905, the number of establishments had been reduced to 103, the capital to \$6,808,233, the employees to 4,587, and the value of the product to \$5,717,735. When this falling off in the woollen industry is compared with the rapid in-

crease in the population of the country, amounting to 35 per cent. in the twelve years from 1896 to 1908, it becomes more impressive. If an industry that stands still in a growing country like Canada is considered to be going behind, what, then, is to be said of an industry that goes behind at about the same rate as the country goes ahead? It is certainly dying out. As to the cause we have only to look at the record of woollen imports to discover that the Preferential Tariff is the blight that is killing off our woollen industry. The value of woollen manufactures imported into Canada in 1897 was \$7,094,909, and ten years later, in 1908, they had increased to \$21,213,234, an increase of \$14,118,325, or 199 per cent. To further illustrate the effect of the preference, compare the prices of wool and of the finished product both before and after the Preferential Tariff went into effect. In 1898 English blankets made from wool costing 14 3-10 cents per pound sold in Canada for 35 3-8 cents per pound, and in 1907, under the Preferential Tariff, English blankets made from wool costing 23 1-2 cents per pound sold in Canada at 30 1-8 cents per pound. These figures do not call for any comment. They tell too plainly the story of why the woollen industry of Canada does not prosper as it should prosper under fair conditions.

The Port of Montreal.

THE agents of the ocean steamships in New York have been hard hit by the general depression in the freight traffic to Europe. The laying off of five freight steamers by the White Star Line in June was attributed in a large measure to the diversion of grain shipments from the port of New York to that of Montreal, and the reason for this diversion makes interesting reading. It is all a matter of cost and the Montreal route is the cheaper by nearly 3 cents a bushel, due to the fact that our unrivalled canal system furnishes an all-water route for grain shipments all the way from Duluth to the seaboard, whereas the bulk of the grain exported via New York has a rail haul from Buffalo to that port. The agents point out that the rate from Duluth and Fort William to New York via Buffalo is 7.40 cents, which includes delivery free on board the steamers. The rate from the same points of shipment, free on board, is 4 1-2 cents a bushel, and from Toledo to Montreal 3 3-4 cents. With this advantage in Montreal's favour it is useless to expect that shippers will bill their goods via New York. A few months ago we called attention to the great economy of water transportation, and pointed out that the Government would be justified in going to almost any expense to develop and improve our waterways. Here we have the very strongest kind of proof of what cheap water transportation can and will do for the country. The Americans are going to spend an immense amount of money on the Erie Canal to bring it up-to-date, and when that is done Montreal's advantage will certainly not be so great as at present, if there is any advantage at all. While our friends across the line are improving their Erie Canal, however, we can,

if we will, put them at a still further disadvantage by constructing the Georgian Bay Canal, which would shorten the distance between Chicago and Montreal by about 800 miles, avoid the dangers of lake navigation and cut down the present freight charges to a figure with which it would be impossible for any other route to compete. Nature has given Montreal an advantage as the ocean port for the great West, both American and Canadian, and the fault will be our own if we fail to profit by our position.

The Voting Power of Unionism.

THE National Association of Manufacturers of the United States has issued some figures which show what a myth the so-called "labor vote" in that country is, that is the "labor vote" as represented by unionism and paraded by noisy demagogues to frighten timid politicians. It is pointed out that there are 32,000,000 wage earners in the United States, and the total membership of the American Federation of Labor, according to its own showing in its latest report, is only 1,538,970, and these include women and children as well as men, and aliens as well as voters. A large number of the names on the rolls are those of workers who reside and work in Canada. In short, when the "labor vote" with which unionism threatens politicians is analyzed it fades into insignificance. As we have often pointed out, the same is true in Canada.

Refused the Farmers Protection.

A DEPUTATION of farmers from the district of Montreal waited on the Government last month and asked that the duty on pickles be raised to a figure which would afford them some protection against the cheap Dutch, French and German vegetables which are being shipped into this country in tons under the name of British Pickles. The duty against vegetables, as vegetables, is 40 per cent., which prevents the Canadian manufacturer importing the cheap ones; but when they are shipped into England free and pickled they come into Canada at a rate that figures out under the preference at about 15 per cent. The result is that Canadian pickle manufacturers cannot stand the competition, and pay the price which the Canadian grower has to get for his vegetables, and the farmers realize that something must be done or their market will be gone. They placed the matter before Sir Wilfrid Laurier and his colleagues, but he has refused to do anything for them. The manufacturers, while they will have to suffer some loss, will be able to find some other use for their capital and their factories, but the farmers will have a hard time finding use for their land which will bring them anything like the same returns. Some farmers in the vicinity of Montreal got as much as \$4,000 a year from their vegetables, and they naturally feel that they are entitled to a fair measure of protection against the farmers of Holland, France and Germany.

D. M. COUGHLIN.

THE BUILDING SITUATION.

Prospects for building operations. The cost of building is twenty per cent. less now than it was this time last year. Indications are that the low level has been reached. High money rates retard operations. Other conditions are favorable.

THE cost of building has decreased materially since this time last year. Tenders of contractors are now 20 per cent. lower than on similar work at this time last year. A number of elements are responsible for this reduction. First, there is the price of material, which has suffered a decided drop. Only the materials which go into the construction of houses are of real interest at present, since the general policy of a curtailment of expenditures among manufacturers has resulted in practically a total cessation of construction work in the line of factory or warehouse extensions.

In the class of buildings which are being tendered on, brick is the most important material. A year ago brick cost twelve dollars a thousand. Now it can be bought at \$9 to \$9.50 per thousand. This represents a reduction of between 20 and 25 per cent.

Lumber has also shown a noticeable reduction, though not so much as brick. A year ago it sold for \$32 per thousand; now it can be procured at \$28 per thousand. This represents a decline of over 12 per cent. Building hardware, consisting of locks, handles, and fixtures of various kinds, has also dropped in price. During the year prior to May, 1907, there were a number of sensational advances in this class of building equipment. At short intervals of a few months four different advances of 10 per cent. were made, making the cost of these materials over 40 per cent. higher within the year. This high cost has dropped about 10 per cent. up to the present time, which, while it shows up well in comparison with the prices of a year ago, is still very high compared to the prices quoted in the spring of 1906.

The cost of labor is almost if not quite as important as the cost of material. In spite of the slackness of work this year there has been no apparent reduction in the price of labor. There has, however, been an actual reduction, in that more work is being accomplished for the same price. The rate per hour has remained unchanged. The amount of work done in the hour has generally increased.

This condition is experienced in all times of industrial depression. When only a portion of the available supply of labor is employed, employers can pick out the most competent and efficient. The advantage of having only the best of mechanics is added to by another consideration. Where a man knows that someone else is waiting to step into his position, he immediately takes thought how he can do his work so satisfactorily that he will hold his place. If in quality or quantity he falls down, he knows he will be dropped and one of the unemployed will be taken on in his stead.

This condition has developed this year. The shortness of work which began at the close of last year and has continued, though with decreasing severity, up to the present, has resulted in a distinct improvement in the quality of labor

supplied. An estimate by a prominent builder places the increased efficiency resulting from this source at 10 per cent.

The Important Elements.

The contractor bases his tenders on three conditions. He figures on the price of material, the price of labor, and the demand for buildings. The first two are external to himself and cannot be controlled by him. He knows approximately how much material at a certain price, and how much labor at a certain price, will be required to erect the building. He cannot accept less than the sum of these two for the job. How much more than the sum of the two, that is, how much profit, he can get for himself, is determined largely by the third consideration. If there is a large amount of building going on, and the contractors are busy, they will tender high.

There is plenty of work to go around, and if they miss one job they will get another. The law of supply and demand is in operation. Thus last year contractors wanted a good percentage of profit. This year there is a small volume of building going on and consequently there is keener competition for it. Contractors will accept a smaller percentage of profit. Hence the cost is reduced to the man who is having the work done.

As a result of these conditions buildings are being erected for 80 per cent. of what similar work cost a year ago. Indications now are that the cost has reached a minimum. There

has been no further decline since the beginning of May, and now there is a distinct increase of interest by intending builders. This is shown by the numerous enquiries which are coming in to the architects' offices and the greater amount of work which is being actually done. While the latter does not bulk very large yet, it is sufficient to strengthen prices and to prevent any further decline. There is no likelihood of the cost of building advancing this summer, but the brighter prospects in construction work will successfully prevent any further decline.

Slowness on the part of the public to take advantage of present prices is largely the result of high money rates. The majority of houses are put up either by speculative builders or by men who are prepared only to put up a portion of the cost in cash. For some years there was no difficulty in getting accommodation at reasonable rates. This year it is so difficult to raise money on real estate or buildings, and the interest is so high, that intending builders are scared off. An easing in these conditions should result in a considerable amount of building.

The Wallaceburg, Ont., Sugar Co. will spend \$40,000 this year on improvements and extensions to their plant.

Members of the Association were entertained at the Commercial Club in Hamilton during the Convention last September. In commemoration of the event which marked the opening of the Club, the Association has presented a brass tablet, a miniature of which is shown above.

FILING SYSTEMS FOR GENERAL OFFICE USE.

By D. P. Cruickshank,

General Manager Library Bureau of Canada, Ltd.

When a subject comes up for discussion or review, all correspondence and papers bearing on it are wanted. They are not only wanted, but they are wanted at once and in one file. By means of vertical filing folders this result is accomplished efficiently and economically.

WITHIN the last ten or fifteen years, business methods and office equipment have been struggling through a period of revolution. The amalgamation of interests of various manufacturing concerns, and the consolidation of commercial houses have forced every man, in order to keep pace with the times, to look about him for better methods to carry on the internal routine of his office. Men have spent hours in scheming and planning labor-saving devices, and new ones are being discovered every year. No doubt, most

How the vertical filing system is operated.

important next to the typewriter is the system of filing papers vertically; on end—not flat. To those who have not adopted this system, the above may seem a broad statement, but explained by the following description the uninitiated may be convinced.

The fundamental principle of Vertical Filing is to reduce the classification of papers to a unit basis. That unit may be either represented by a number signifying some name or subject, or the name or subject may become the unit itself.

A brief description of the numerical system will illustrate the point. Tough manilla folders of uniform size are numbered from 1 upward and filed numerically. In each folder all letters *to* and *from* one correspondent or concerning one subject are placed in order of date; those of the latest date in front. Guide cards with projecting tabs are inserted between every ten folders to facilitate handling. To this numerical arrangement of folders, a card bearing name or subject is filed in an index tray alphabetically; one card for every name or subject, and once made out serves as an index forever. The index has great additional value as a complete list of addresses of all persons or firms with whom business is

transacted. Then comes the chance for cross referencing. A letter covering more than one name or subject is filed in a numerical folder under the most important. Cards are then made out under as many names or subjects as necessary, and are filed alphabetically, but all referring, however, to the one numeric folder. By this means any letter may be located, no matter whose name it bears or under what subject it has been filed. One folder wanted is thus lifted from the file without disturbing the others.

So far, we have only dealt with a numerical file, but, as previously stated, the name or subject may become the unit, and by this is meant the alphabetical arrangement. No card index is used. All letters pertaining to one name or subject are grouped in one folder, on which the name or subject is plainly written, and dropped behind the proper guide. These guides bear the letters of the alphabet, subdivided as required.

Compare this modern rapid-fire method with the old style of searching through letter books, hunting up pamphlet boxes, wading through flat files. There is only one possible place to file a letter, and only one place to look for it. Any single name or entire correspondence to or from any firm, or the complete history of any transaction, laid before you in proper order instantly, all in one compact unit folder.

How to File Catalogs.

Carry this general idea into your purchasing department. Arrange your catalogs in numerical order; then with your card index you can put your hand on the catalog of any firm or look up the price of any article instantly. All the catalogs of one firm can be brought together under one number, or all articles of one line can be classified accordingly. This system not only provides an index to the catalogs, but to every important subject and article in each catalog. A card record filed by name or article can be used to collect and classify quotations from various vendors. Here the card acts as the unit on which the story about each article is told. This, however, is getting down to a discussion of more complicated systems which need individual study, and the writer was asked to make this article general.

One or two other suggestions manufacturers in the Association may find of interest. Credit reports may be filed numerically, and the cards used as a summary of important information taken from each report. At a glance, then, you can size up the standing of any man or firm.

Duplicate invoices filed by account number bring together all the dealings you have had with any party, showing date of purchases, articles sold, and amounts. The whole story is in one neat folder without going to the ledgers, order books or correspondence file. Requisitions, vouchers, cancelled checks, freight receipts, in fact any paper or collection of papers in an office can be arranged, classified and handled with less cost, less space, less worry, by adopting the Vertical Filing System than by any other means.

Mr. J. B. Tudhope
Whose election adds strength to the new legislature

Hon. Adam Beck
A member of the Association who has a place in the Cabinet of the Ontario Government.

Mr. W. F. Vilas
A member of the Association who was elected to the legislature of the Province of Quebec.

MANUFACTURERS IN THE NEW LEGISLATURES.

MANUFACTURERS have played a prominent part in the deliberations of the Ontario Legislature during past sessions. It is satisfactory to know that the new Parliament will contain men who in the past have shown their ability to initiate measures of the utmost benefit to the people of the Province, and new members whose business careers mark them out as fit associates of those who were already there.

In the last Legislature there was no more interesting figure than Hon. Adam Beck, whose popular title of Minister of Power, indicates in a phrase his particular sphere of activity. When the Cabinet slate was made up on the accession to office of Mr. Whitney, Mr. Beck appeared as a Minister without portfolio. In other words he had to carve out a line of work for himself. This he succeeded in doing with a success which has seldom fallen to men in similar position. With all the chief fields covered—agriculture, finance, forests and mines, public works—it would indeed appear that nothing remained but the always thankless task of offering general advice. But as a manufacturer, Mr. Beck recognized the importance of power, and the possibilities of a cheap hydro-electric supply. He made this field his own. What he has accomplished already is known to all. What the investigations which he set on foot will accomplish in the future will be the measure of his success. By the policy which he inaugurated the water powers of Ontario will remain the property of the people of Ontario, to be developed in the manner which will best bring about the desired end of cheap power.

Mr. W. K. McNaught has been for years so closely connected with the Canadian Manufacturers' Association that his career in the Legislature has been watched by the members of the Association with particular pride and satisfaction. The time and ability which he has brought to the service of the Province have resulted in his initiating much new legislation, and in tempering and improving many acts which contained in their original form elements that might have proved dangerous to the welfare of the Province. So wise and straightforward was his course throughout the life of the

last Parliament, that he attained a position approximating to that of a Cabinet Minister in the public estimation.

It would be impossible to review in detail the legislation with which he has been associated. When the power question was up for discussion in Toronto last Fall, however, he was the most effective exponent of the government policy. His work at that time was particularly arduous, his self-imposed duty impelling him to carry on a campaign of speech-making which was not limited by any means to one address an evening. He is a member of the Hydro-Electric Commission and has had the satisfaction of seeing the policy of the Commission seconded by most of the municipalities interested. Mr. McNaught was returned practically without opposition at the recent elections.

Mr. J. B. Tudhope, who will represent the constituency of Simcoe, in the new Legislature, will add materially to the strength of that body. He has had a successful business experience extending over many years. In the Association he represents the Tudhope Carriage Co. of Orillia. The advent into public life of substantial business men such as Mr. Tudhope augurs well for the good government of the Province.

The kind of citizenship one meets with in New Ontario is nothing if it is not youthful and vigorous, and it is only natural that the men it contributes to the public life of the Province should evidence the same characteristics.

Mr. J. J. Carrick, the newly-elected member for Port Arthur, is typical of the man from up north who has "made good." Ever since he started in as a university graduate in 1897 to travel for the Queen City Oil Co., he has been setting his own pace in the field of business enterprise. Where others have failed he has succeeded, not so much by reason of his native ability or capacity for work, though he possesses both to a high degree, but simply because of his iron determination. When he makes up his mind to get a thing he usually gets it. Three years ago he wanted some streets opened up in Port Arthur. The Council refused to do it for him, so he had himself elected alderman. After that everything was

easy. This year he was returned as mayor with the largest majority the city has ever given.

In view of his past achievements, it seems safe to predict that Mr. Carrick will prove somewhat of a surprise party to

Mr. W. K. McNaught

Who has been responsible for much good legislation in the legislature.

the august front benchers in the Legislature, who naturally expect the new-comer, for the first session at any rate, to take his seat away over in the corner and say nothing.

A Representative in Quebec.

The Province of Quebec, with its big manufacturing interests centred in the cities of Montreal, Quebec, Sherbrooke, and a few others, has of recent years been legislating on the most important of industrial problems. During the past session it has had under consideration legislation dealing with insurance, compensation to workmen who suffer injuries, and other far-reaching subjects. Since the great majority of the members represent rural constituencies, it is essential that the manufacturing interests have some voice in the councils of the Province. This they have had since 1906 in the person of Mr. W. F. Vilas, member for Brome.

Mr. Vilas is a manufacturer of school furniture and farm implements at Cowansville, P.Q. He is a member of the Council of Arts and Manufactures of Quebec and of the Canadian Manufacturers' Association. His prominence in the manufacturing field and in civic affairs, made him the successor, by acclamation, to Hon. J. C. McCorkill, when the latter retired in 1906. Again at the recent election he was returned to represent Brome. Mr. Vilas is a Liberal in politics. The manufacturers of the Province should profit from the presence of one of their number in the Legislature during a time when strong influences are at work to secure the enactment of legislation inimical to their welfare.

Mr. James Beveridge, who has been looking over several sections of the Miramichi for a paper mill site since last fall, has decided to locate at Millerton, N.B. The properties of Messrs. Allan Knight and Morris Tulip have been secured. The Knight brook, which runs through the property, will furnish sufficient water to run an extra large mill. A siding will be built to connect with the Indiantown branch. When the mill is completed Mr. Beveridge expects to employ 160 hands, running day and night. The mill will probably be completed about September.

IMPORTANT RULING.

AN important ruling has just been made by the Board of Railway Commissioners in the interswitching case. Substantial relief has been granted shippers as a result of the aggressive fight which has been made by the Transportation Department of the Canadian Manufacturers Association against these charges. By the present order carriers are required to reduce their tolls for switching within terminals. Where instructions for delivery on a second road are given subsequent to shipment, a charge not exceeding 20 cents a ton is allowed. For ordinary interswitching, where business originates at a non-competitive point, the charge shall not exceed 10 cents a ton. Moreover, in the latter case the contracting carrier must absorb half of the switching charge. This decision will mean a saving to practically every shipper in Canada.

THE SUPPLY OF CARS.

We are on the eve of the biggest crop movement in our history. The stocks, too, in the stores of Western Canada are depleted. Simultaneous with the movement of grain to the market this autumn will set in a great movement of merchandise to the distributing centres of the west. It is not too soon to ask: In what condition are the railways to handle this traffic? Three years ago, and again two years ago, there was a lamentable failure on the part of the railways to supply adequately the demand for cars. Last year we were saved from a still greater shortage by the partial failure of the crops and the depression in trade. During the present year there has been practically a cessation of car-building or repairing. It is currently stated that a considerable per cent. of the rolling stock of one company is unfit for

Mr. J. J. Carrick

A member of the Association who will sit in the next legislature of Ontario

service. Repairs should be rushed with all speed, so that every possible car and locomotive may be available when the grain is ready for shipment. This year, especially, it is desirable that the crops be marketed promptly and the money set in motion in the regular channels of business.

WATER CURTAINS FOR FIRE PROTECTION.

A WATER CURTAIN is intended to prevent the building on which it is installed from taking fire from outside sources. In the ordinary brick or stone building the only way in which fire can enter is through the window and door openings and the roof. Water curtains are designed to prevent the possibility of this, and consist of a system of piping running along the tops of the windows and cornices,

and this fact is ample proof of the efficiency of this system. The Insurance Companies believe in it, and on page 635 of our March issue, in suggesting remedies for the prevention of conflagrations, we recommended the freest use of the water curtain as an effective fire-drop. The accompanying illustration shows such a curtain in operation on the building occupied by the Gazette Printing Co., in Montreal.

The above illustration shows a water curtain in actual operation. By protecting the windows it makes the building practically proof against fire from without.

with one or more outlets over each window. These outlets are fitted with specially designed sprinklers, which throw the water, under pressure, over the glass and frames of the windows, forming a curtain of water through which it is impossible for the fire to pass. The water supply for these curtains is taken from the city water mains, and is controlled by a valve located in a convenient place in the building. In case of a fire in an adjacent building or across the street, this valve is opened and allows the full pressure in the city mains to play on the windows and cornices of the building. A secondary supply is also provided through a Siamese connection, to which the Fire Department may connect their steam engines and thereby increase the pressure of water.

A substantial reduction in rates is granted by the Insurance Companies on buildings protected by these water cur-

The exposure on the side being operated is a lumber yard, that on the rear a manufacturing building.

DEATH OF MR. A. R. MUNROE.

The death occurred on June 10th of Mr. A. R. Munroe, manager and chief shareholder in the Munroe Wire Works, New Glasgow, N.S. Mr. Munroe was one of the most energetic and successful business men of the Maritime Provinces, and his death at the early age of 44 has caused intense regret to all those with whom he had come in contact. About nineteen years ago he organized the business in a small way, which has since grown to be one of large proportions. He represented the company in the Canadian Manufacturers' Association.

RAILWAY AND SHIPPING NEWS.

THE QUESTION OF ELEVATORS.

HON. FRANK OLIVER and Hon. Geo. P. Graham announced that it is the intention of the Government to build or have built a railway from western Canada to Hudson Bay. Since the project has been taken up as a definite Government proposition we may suppose that the details have been worked out with some degree of accuracy.

It may not be out of place to enquire what provision is going to be made for elevator service? The situation is briefly this: The chief grain crops are not harvested and threshed before the middle of September. At about the same time the Straits leading from Hudson's Bay to the Atlantic become frozen and impassible. Hence practically all the grain which is to go out by this route will have to be stored in elevators either at Fort Churchill, or where the farmer delivers his grain to the railway.

The construction of the railway is justifiable only on the assumption that a large amount of grain will go by that route. The chief advocates of the road place 20,000,000 bushels as the initial quantity, and this, they maintain, would increase greatly in a comparatively few years.

Now, to get back to our original question, what provision is being made to store twenty, or thirty, or forty million bushels of grain? This is not grain which will come one day and go the next. There must be elevator accommodation for this amount for a straight period of nine months. Will the Hudson's Bay Railway, whoever builds it, have this accommodation at Fort Churchill?

MONTREAL LEADS IN GRAIN SHIPMENTS.

GREAT perturbation has been caused in grain and steamship circles in New York over the fact that Montreal has been walking away from her bigger rival in the quantity of grain which is being shipped through the two ports. Up to the present, since the opening of navigation, Montreal has booked 8,000,000 bushels against 2,000,000 bushels for New York. As a result five boats have been taken off the New York route by the White Star line alone, and there is a prospect of many others being retired unless conditions show a marked improvement.

It is, of course, a straight matter of cost of transportation. The all-water rate from Duluth and Fort William f.o.b. steamer at Montreal, including extra insurance, is 4.25 cents per bushel, and from Chicago and Toledo not over 3.75 cents per bushel, whilst the rate from the same ports via Buffalo to New York is 7.40 cents per bushel—a difference of practically 3½ cents to 4 cents a bushel.

The lake and rail rate from Georgian Bay ports f.o.b. steamship at Montreal, is 4.75 cents against 7.40 cents via Buffalo to New York or Boston, a difference of 2.65 cents a bushel.

The interested ones in New York have passed resolutions and have appointed committees, all with the intention of reducing the railway rates from Buffalo east. The railways, according to them, are the offending members who are driving business from New York to Montreal.

That no possible reduction by the United States roads can turn the flow of business back to New York is shown by a freight broker of Montreal. "No railway," he pointed out, "or combination of rail-and-water routes, can compete with the all-water route from the head of the lakes to Montreal, under present conditions; that is, when freight is scarce. Any

number of lake boats have been laid up for want of freight, but as no owner likes to see all his vessels lying idle, if they can be made to pay bare expenses or even do not show too great a loss, these lake carriers are accepting cargoes of grain, big or little lots, it doesn't matter for them, from Fort William to Montreal, at the same rate that the railways are asking from Georgian Bay ports to Montreal. The railways have got that rate down to rock bottom, and the quotations that the lake carriers are giving, knock the rail-and-water routes out of the running, as they leave nothing to pay the railway boats for their part of the journey from Lake Superior to the Georgian Bay. The United States roads and United States ports are naturally away out of the running if even the Canadian railways cannot compete."

WILL LIMIT DIVERSION OF WATER.

THE principles upon which the natural flow of water in international waterways can be altered were set forth in a report to Parliament by the Canadian section of the International Waterways Commission recently. The sections representing Canada and the United States were unanimous in their findings. The report dealt specially with the Chicago Drainage Canal and the power development plants at Niagara Falls.

In reference to the Chicago Drainage Canal the joint commission recommends that the Government of the United States prohibit the diversion of more than ten thousand cubic feet of water per second for the canal, that amount being considered sufficient for the sanitary purposes of the city for all time and providing for the largest navigable waterway from Lake Michigan to the Mississippi River which has been considered by Congress. The amount by which the mean level will be lowered by the discharge of ten thousand cubic feet through the canal is estimated at about six inches in Lakes Huron and Michigan and about five inches in Lake Erie and four inches in Lake Ontario.

Any further diversion, the commissioners say, would mean the expenditure of a very large amount of money to restore depth in both United States and Canadian harbors and to maintain a uniform draft of 14 feet in the Canadian canal system.

After exhaustive investigations it was decided that the maximum of water which could be drawn from the Niagara River without destroying the scenic beauty of the Falls was 36,000 cubic feet per second on the Canadian side and 18,500 cubic feet per second on the United States side. The commission, therefore, recommended that the diversion of water be limited to these amounts respectively. The Canadian section, however, recommended that any treaty which should be made in accordance with their findings, should be limited to twenty years.

The position of the three companies now operating on the Canadian side was also discussed. The Canadian section advised that all future companies be compelled to distribute all the electrical energy developed in Canada. The present companies are under obligation to supply Canadian consumers up to half the amount generated. As they are permitted under their charter to generate 400,000 horse power, one-half of the production would satisfy Canadian demands for a long time to come. The necessity, however, of the government controlling the export in the interests of Canadian users was strongly urged.

THE HARBOR OF ST. JOHN.

IT now seems certain that a harbor commission will be placed in charge of the deep-water facilities of St. John, N.B. Civic authorities have been in consultation with the federal government, and the result has been an agreement whereby a commission will be appointed to take over all the water front and city wharfs, and the government will guarantee the bonds of the commission so that it will be able to borrow money at a considerably lower rate than the city could.

The city of St. John has done notable work in improving its harbor. With the increase in the number and tonnage of

with considerable favor, but the many calls which would be made on the government for similar favors, if the principle was once admitted, prevented the adoption of that plan. Something of the kind may come in the future.

Under the present plan the commission will pay back to the city all money spent heretofore on improvements, and will take over the harbor and water front. To meet the cost it will borrow money under the guarantee of the Dominion Government. In this way the interest charges, which the citizens will have to pay in either case, will be greatly reduced. The commission will be able to borrow at the lowest rate.

This seems like a reasonable proposition. With an efficient board of commissioners the harbor can be managed in

The head of inland navigation. The picture shows a part of the Fort William harbour, with the big C. P. R. elevator pouring its store of grain into the lake vessels. In the distance are seen other elevators.

the vessels coming to its wharfs, it has had to make proportionate improvements at a great cost. The city is not large in population, considering the business that is done through it, and the consequence is that the money which has had to be spent has proved a heavy burden on its resources. The city felt that it had reached the limit of its borrowing power.

Yet much remained to be done to keep the harbor up to the standard required by the vessels which made it their Atlantic terminus. Various plans have been put forth to make the traffic pay for the necessary work. The nationalization of the port, whereby the Dominion Government would take it over and keep it up as a national undertaking, met

a thoroughly businesslike manner. The cost of the work can be kept down to a minimum, and the traffic can bear the expense without unloading the heaviest part of the burden on to the back of the St. John's citizens.

The admirable work carried on by the harbor commission of Montreal gives an excellent prospect that this is the correct method of handling the problem.

The Crane Co., whose main plant is in Chicago, and who recently purchased the business of the Boyd-Burns Co. of Vancouver, B.C., will build an addition to their Canadian branch.

MEN OF THE MONTH.

JOINS C. P. R. DIRECTORATE.

A SEAT on the board of directors of the Canadian Pacific Railway is to the business man of Canada what membership in the Royal Academy is to the artist. The magnificent extent of the company's interests, its national character, and the high standing which has uniformly characterized its directorate, makes the board a guarantee of the business standing of its members.

Consequent upon the recent death of Sir Robert G. Reid of Newfoundland, Mr. Robert Meighen, a close personal friend of the deceased gentleman, was given a seat on the board of directors of this company. Mr. Meighen has enjoyed an honorable career. Essentially a self-made man, a class, by the way, of which Canada can produce many notable examples, he has attained the highest success in the business world, without deviating from the path of strict integrity and fair dealing. As president of the Lake of the Woods Milling Co. he has directed the policy of one of Canada's best known industries. His work in this connection, and as president of the New Brunswick Railway, has brought him into intimate relations with the conditions affecting both eastern and western Canada. His appointment to succeed Sir Robert Reid has been most favorably received by business interests.

Mr. Robert Meighen

President of the Lake of the Woods Milling Co., who has been chosen to the directorate of the Canadian Pacific Railway.

ciation, they play an important part in the deliberations of that body. During the month of June this Association held its annual convention in Toronto. As a tribute to the fine work of Mr. L. L. Anthes, of the Toronto Foundry Co., both in his previous official position of vice-presi-

Mr. L. L. Anthes

Of the Toronto Foundry Co., who was elected President of the American Foundrymen's Association, at the recent convention in Toronto.

dent, and in the excellence of the convention arrangements, for which he was to a large extent responsible, he was elected president for the coming year.

The new president belongs to the younger generation of Canadian business men. He combines in an exceptional degree the qualities of clearness of thought and facility of expression. These vitalized by abundant energy make him a man to be reckoned with in the industrial world.

The body which he will preside over for the coming year embraces foundrymen from all over the United States and Canada. At the recent convention over two thousand delegates were registered.

In his statesmanlike speech before the Toronto Board of Trade recently, Sir Thomas Shaughnessy urged the importance of keeping the channels of Trade running east and west.

OUR TRADE ROUTES.

WHEN it comes to a discussion on transportation matters, Sir Thomas Shaughnessy is entitled to every consideration. He knows his subject as few if any other men in Canada know it. His address at the Toronto Board of Trade banquet recently was a statesmanlike exposition of the object at which Canada should aim in developing her transportation facilities.

"We must establish," he said, "such relations between the merchants and manufacturers of Eastern and the merchants and consumers of Western Canada as will make the trend of traffic and social

PRESIDENT AMERICAN ASSOCIATION.

ALTHOUGH Canadian foundrymen do not figure in large numbers in the membership of the American Foundrymen's Asso-

intercourse in Canada east and west. If we succeed in doing that we shall not only make these strangers, these colonists who have come here to build up homes for themselves and their families, good Canadian citizens, but we shall be able to make them strong advocates of every policy calculated to advance the material interests of the country, and bring the various Provinces into closer connection, and thus more firmly establish the original idea and intention of Confederation."

This is a policy which has everything to support it. If we fail to adopt and carry it out, a homogeneous national life will be impossible. Sir Thomas, with the large outlook that the trans-continental railway over which he presides, gives him, recognizes the diversity of our interests, our occupations, and our original nationalities. He shows his constructive statesmanship in not for a moment admitting that this diversity presents an insoluble problem, but in grasping

The new chairman is managing director of one of Toronto's oldest and most important industries, the engraving and lithographing firm of Rolph & Clark, Ltd., with whom he has acquired an extensive business experience. He has lived in Toronto all his life, and among his fellow-citizens is exceedingly well and favorably known. He is a prominent club man, being director of the National and Royal Canadian Yacht Clubs, and a member of several other social organizations. As a sportsman he enjoys the reputation of being one of the best amateur sailors in Toronto, and has served as a judge in the Canada Cup trial contests on several occasions. He is also a noted angler, his holidays being usually devoted to the ancient but fascinating sport.

Bringing such a ripe experience in business and social affairs to his new position, the members of the branch can rest assured that their interests will be safe in the hands of an

Mr. Frank A. Rolph

Chairman of the Toronto Branch of the Canadian Manufacturers' Association for 1908-1909.

Ald. Geo. W. Sadler

Chairman of the Montreal Branch of the Manufacturers' Association for 1908-1909.

the one big idea upon which a community of life and interests must be built, the intercourse of trade and travel by national routes. Canada stretches across a mighty continent. Her highways must traverse her territory from east to west.

MR. ROLPH ELECTED CHAIRMAN.

A WELL-merited honor was bestowed on Mr. Frank A. Rolph by his fellow-members when they elected him Chairman of the Toronto Branch at the annual meeting, held on Thursday, June 25th. That the office went to him by acclamation speaks the more strongly for his sterling qualities and fine executive ability which ensure beyond a doubt a continuance of the good work and wise policy which characterized the regime of the retiring Chairman, Mr. Freyseng. The deep interest Mr. Rolph has always taken in the work of the Association as a member of the Technical Education Committee and of the Executive Council, and particularly the energetic and capable manner in which he discharged his official duties as Vice-Chairman of the Branch last year, richly deserved the recognition they obtained, and there is no doubt the choice made is a wise one.

executive presided over by Mr. F. A. Rolph during the coming year.

ALD. GEO. W. SADLER ELECTED.

Ald. Geo. W. Sadler is one of the earliest members of the Canadian Manufacturers' Association, and has served for a number of years on the Executive Council and on the Montreal Executive Committee. Mr. Sadler was born in Montreal in 1852, and has been connected with the tanning and leather belting business since 1876, first with Robin & Sadler, and from 1895 as senior partner of the firm of Sadler & Haworth.

Mr. Sadler has been a member of the Montreal City Council since 1896, and for the past ten years has held a seat on the Finance Committee, which is the most important branch of the civic administration. Mr. Sadler is prominent in all matters pertaining to the welfare of his native city, and is a governor of several hospitals and public institutions. The election of Mr. Sadler, by acclamation, to the chairmanship of the Montreal Branch, ensures a year of activity and progress for that part of the Association.

A LARGE SAVING IN CUSTOMS DUTY.

SINCE the organization of the tariff department of the Canadian Manufacturers' Association, it has been discovered that many manufacturers have been unaware or neglectful of the drawback clauses of the customs tariff. As a consequence one company has lost fifteen hundred dollars in the past three years, others have lost similar amounts.

It would be well for all manufacturers who do an export trade to become thoroughly conversant with the terms of the drawback clause. The essential feature of it is that where goods are imported as raw or partly finished material, and having been manufactured are re-exported, a drawback of

on the part of the customs officer. A form, copies of which may be had from the department at Ottawa, or from the Association offices, must be filled out and a declaration made as to the correctness of the statement. From the above clause it will be seen that all articles are subject to a drawback, provided they are used for manufacture and are then exported.

Drawback on Materials for Home Consumption.

Provision is also made for a drawback on materials for home consumption. The articles thus subject to a drawback

Apropos of the continuation of the bounty on lead for a further period of five years, the above picture illustrates the electrolytic lead refinery of the Consolidated Mining and Smelting Co. at Trail, B. C. The bounty has enabled this company to work the lead ores of British Columbia and has added materially to the value of the minerals of that Province.

99 per cent. of the original duty paid is granted by the government.

Subjoined is the clause in full. A close perusal of it is recommended.

When imported materials on which duties have been paid are used, wrought into or attached to any article manufactured in Canada, there may be allowed on the exportation of such articles beyond the limits of Canada a drawback of ninety-nine per cent. of the duties paid on the materials used, wrought into or attached to the articles exported; provided, however, that such drawback shall not be paid unless the duty has been paid on the materials so used as aforesaid within three years of the date of the exportation of the Canadian manufactured article, nor unless the claims as presented at any one time aggregate ten dollars.

The following sections set forth the method of procedure

are contained in schedule B of the customs tariff. The purposes for which they must be used to get the benefit of the drawback, and the amount of the same, are specified in that schedule.

Finally goods upon which duty has been paid on importation, may be sold to a second party who manufactures them further and exports the manufactured products. A drawback of 99 per cent. of the duty paid by the importer, may be secured by the one to whom he sold the goods, providing only that proper forms are made out setting forth the facts.

A fire causing damage to the extent of \$16,000 to the C. Wilson & Son Scale Works, Toronto, occurred recently. The company, who own as well as occupy the building, report a loss of \$3,000 to the three-story frame and iron-clad building and \$13,000 to contents. This is fully covered by \$40,000 insurance.

IN THE LABOR WORLD.

THE LABOR SITUATION.

A CLASH of legal decisions, during the past month, gives an apparent doubt to the question of the legality or illegality of picketing by strikers. In Winnipeg the case of the plumbers who went on strike two years ago has at last been adjudicated upon finally. The action was taken by the master plumbers in consequence of the interference to their business caused by the systematic picketing of their establishments. Judge Mathers, who sat on the case, has handed down a decision granting the employers \$2,000 damages against the union and giving judgment for that amount against individual members. He also issued a perpetual injunction against picketing and interference with men at work. In his decision he stated that the men were within their rights in striking themselves, but they had done wrong in picketing the works of their former employers, and in inducing the men they brought there under contract to desert their employment.

Shortly after this decision was given the men who were picketing the Buck Stove Co.'s plant in Brantford came up for trial before Judge Hardy. In this case the Judge stated that picketing, or, in the words of the Act, "the besetting of works with the object or purpose of the restraint or compulsion of men engaged in lawful labor," was illegal. But he dismissed the case on the ground that in the particular instances before him it had not been shown that the picketing had been for the purpose of restraining or compelling the men who were at work.

In discussing these two cases it might be pointed out that the Winnipeg case has been before the courts for two years and has been thoroughly threshed out in every detail. The decision was the result of a full investigation into every aspect of the situation. It was in no sense a snap verdict. In Brantford, on the contrary, the prosecution was extremely mild. There was no evidence introduced to show the effect of the picketing on the workmen who stayed on duty, nor the motive of such picketing. There was, in truth, no evidence produced to justify the judge in sending the case to the jury.

Yet the law remains the same. The decision of Judge Hardy does not legalize picketing any more than does that of Judge Mathers. Judge Hardy merely passed on the cases before him, holding that in those instances sufficient evidence as to compulsion or restraint had not been presented. Had the picketing been accompanied by any act or word which would influence a workman in the discharge of his duties, it would clearly have come under the meaning of the Act.

The only question of difference in the interpretation of the law by the two judges was as to what constituted compulsion or restraint. The Winnipeg judge held that picketing in itself constituted compulsion or restraint. This was a reasonable assumption. There is no doubt that the surrounding of a plant by strikers is for the one purpose of preventing others from taking their places. Any other motive suggested is a trivial sham. Moreover, under the most peaceful circumstances the work of the picketers partakes of intimidation. The ostentatious approach of a number of strikers, followed by a series of impertinent questions, most certainly tends to scare off the man who is otherwise inclined to go to work. Men who picket a shop have one main object in view, to restrict the operations of the plant, to injure the business carried on therein. This is an offence against the common law. It is unfortunate for the right understanding of the law on this point that the prosecution in Brantford did not bring out the evidence which assuredly existed.

THE METHODS OF UNION STRIKERS.

M R. T. L. MOFFAT, of the Moffat Stove Company, Weston, while going home from church on the evening of June 21st, with six moulders who were employed in his shop, was brutally attacked by strikers, and the whole party were more or less seriously injured. Previous to last May the company had a working agreement with the union, but on the termination of the agreement it was decided to run an open shop. The union men went on strike, but their places were readily filled by non-union moulders. Since the strike began the plant has been picketed and people entering the establishment have been subjected to all kinds of impertinent questions as to their business. However irritating this was to the company, its clients or its workmen, it had no effect on the working of the plant. The shop was fully manned and production has gone on practically unimpeded.

The assault which took place was a natural consequence, however, of the picketing. The strikers were out to stop work in the shop. If they could do it by the peaceful intimidation of pickets, by scaring or persuading or ridiculing those who wanted to work, all right. If not, they were ready to take more strenuous action. The first method failed, and recourse was had to the second. In view of the course of events at Weston, the ruling of Judge Mathers of Winnipeg that picketing is illegal and criminal will meet with general approval.

MILD COERCION.

D IRE indeed is the threat made on behalf of the Paris restaurant waiters that, if their employers do not yield to their demands, they will bring their tyrants to their knees by disclosing the secrets of the kitchen, telling the public the conditions under which the food is cooked, even in best restaurants; how sauces are made, and other dreadful revelations, says the *Witness*. The Parisian stomach is fastidious, fond of mysterious compounds that tickle the palate. How it must revolt at the bare suggestion that there are secrets in the preparation of food that may not be told. The threat alone is so horribly suggestive that should it have the desired effect, the fact will be regarded as proof that the restaurateurs dare not face exposure. The great Soyer said that the making of sauces was the most sublime of culinary mysteries and, therefore, not to be revealed to those who dine. Shut your eyes and open your mouth would seem to be a vulgar translation of his dictum. To all people who partake of food provided for public delectation, it is a wise admonition. They must not be too nice if they would escape qualms.

LABOR CASE IN FINAL APPEAL.

T HE action of the Metallic Roofing Co., of Toronto, against the sheet metal workers' union, and the individual members thereof, for injury to business through their boycott of the products of the company, is now up for trial on appeal before the Judicial Committee of the Privy Council of Great Britain. The case has been dragging its weary length through court after court for the past seven years. In every hearing judgment has been given in favor of the company. The company now has a judgment for seven thousand dollars against the union. When the Privy Council gives its decision, which will be final, an end will be made to one of the most interesting fights which have ever taken place in the Canadian courts. The principle at stake is all-important. Even a tacit admission of the legality of the boycott would have jeopardized Canadian industry. The fight, as far as it has gone, has established the illegality of this engine of oppression, which the unions have ever been ready to employ to coerce manufacturers.

CONVENTIONS

THE AMERICAN FOUNDRYMEN'S ASSOCIATION.

TORONTO entertained the delegates to three conventions during the past month. Foremost of these was the American Foundrymen's Association, with its allied bodies. A prominent feature of this convention is the display of foundrymen's supplies which are on exhibition throughout the meeting. The buildings of the National Exhibition were utilized for the meetings and exhibits, and for the latter especially the fine Process Building and Machinery Hall were peculiarly adapted.

At the business sessions papers were read on a wide variety of subjects. These aroused general discussion, which served to bring out a great mass of useful information for the foundrymen present.

The exhibits, however, attracted the chief attention. Among the Canadian exhibitors were the Ontario Wind Engine & Pump Co., Toronto; Goldschmidt Thermit Co., Toronto; Jules de Clercy, Montreal; the Canadian Pneumatic Tool Co., Montreal; the Canadian Laboratories, Ltd., Toronto; and the Reid Foundry Co., of Ingersol.

There were a great variety of molding machines shown in actual operation. Of general interest was the gravity molding machine made by the Ontario Wind Engine & Pump Co. The sand was carried up to the top of the machine by a rotary process, and dropped on the core with uniform weight. The result was a perfect mold.

The Goldschmidt Thermit Co. gave exhibitions of their welding process in operation.

Jules de Clercy had in operation a Baillot crucible, such as he manufactures in Montreal. The melting of the metal and the pouring of it into molds was one of the most interesting of the exhibits. The metal was drawn off twice a day.

The Hamilton Facing Mills had a large exhibit of their foundry supplies. Canadian Laboratories, Ltd., in charge of Mr. S. B. Chadsey, B.A.Sc., illustrated their testing methods. They carry on general expert testing of metals and chemicals, with head office in Toronto.

The Canadian Pneumatic Tool Co. were represented by a satisfactory exhibit of drilling machinery and tools.

In attendance and general attractiveness the convention was the best which the Foundrymen have ever held. The delegates were entertained in admirable fashion by the city of Toronto, the local foundrymen, and the Canadian Manufacturers' Association. At the last business session Mr. L. L. Authes, of the Toronto Foundry Co., was elected President for 1908-9.

THE CANADIAN ELECTRICAL ASSOCIATION.

THE convention of the Canadian Electrical Association, held in Toronto on June 17, 18 and 19, was in every way a success. The attendance was good, and the interest taken in the papers and exhibits was most encouraging. The Secretary's report showed an increase in membership for the year of almost thirty-three per cent., and also drew attention to the widening of interest among private lighting companies.

Some of the papers read were: "Power Rates, and Factors Which Influence Them," by Mr. W. N. Ryerson; "Hydro-Electric Power Development in Europe," by Mr. C. H. Mitchell; "Methods of Increasing the Station Load," by Mr. George Williams; "Modern Street Lighting," by Mr. A. E. Fleming; "Electric Franchises: Their Legal Status and Basis of Valuation," by Jas. Bicknell; "The National Elec-

tric Code," by Mr. H. F. Strickland; and other excellent but more technical subjects.

In addition to these, Mr. Saul Dushman, of the University staff, gave a demonstration of the reduction of iron ore to pig iron. This was done by electro-metallurgical apparatus, which is part of the equipment of the University. Mr. Mitchell's paper on electric power development was illustrated with a fine series of lantern slides. Interesting discussions took place over several of the addresses.

The exhibits were particularly interesting. Among those showing electrical appliances were:

The Canadian General Electric Co. exhibited flaming arc lamps, a mercury arc rectifier, a two-ton electric hoist, some of their new Tungsten lamps, a line of electric heating and cooking apparatus, and a full line of electrical specialties. Their electric horseback exerciser created a good deal of amusement and interest. To illustrate the use of the electric motor in household economy, they exhibited a motor-driven sewing machine.

The Canadian Westinghouse Co. exhibited Nernst lamps, a full line of integrating wattmeters, volt meters and ammeters, a lighting arrester, a line of portable instruments, circuit breakers, fan motors and small power motors. A feature of their exhibit was a Westinghouse metallic flame arc lamp. They also showed a motor-driven washing machine.

Canadian Fairbanks Co. showed a full line of small Fairbanks-Morse motors.

Electrical Specialties, Ltd., 12-16 Shuter St., Toronto, showed a line of XCELL Canadian dry batteries, which they manufacture.

The Philip Carey Mfg. Co. exhibited their roofing, cement, and pipe coverings, asbestos materials for different purposes.

Joyner-Greene Co., Stair Bldg., Toronto, showed a line of electrical specialties for which they are agents.

The Oneida Community, Niagara Falls, Ont., exhibited their chain for suspending arc lamps.

The Hamilton Anchor Co., Hamilton, exhibited a full line of Swan and Atlas anchors.

The Allis-Chalmers-Bullock Co. illustrated their manufactures by means of booklets.

THE INTERNATIONAL ASSOCIATION OF FACTORY INSPECTORS.

FACTORY INSPECTORS from the United States and Canada gathered in convention during the month to discuss methods of improving factory conditions. Several papers were read on subjects of interest not only to inspectors, but no less to manufacturers and workmen. The exchange of views should, if the suggestions be applied rationally and with due consideration for local needs and conditions, result in many improvements. The subjects discussed included child labor, sanitation, safety appliances, and others of like interest.

Mr. James Burke, head of the Ontario Factory Inspectors, was elected President for the ensuing year.

Toronto Exhibition.

The Executive of the Canadian National Exhibition announce that application for space is necessary immediately. Allotment is now being made and the applications to date are largely in excess of previous years. The Manager, J. O. Orr, will be pleased to furnish any information desired on addressing him, City Hall, Toronto.

A REVIEW OF INDUSTRIAL CONDITIONS

Mr. E. J. Freyseng, in his annual address to the Toronto Branch of the Canadian Manufacturers Association, reviews the progress of the past year and discusses the prospects for the future.—Some criticisms of objectionable regulations.

BEFORE beginning a review of the work of the past year, or directing your attention to some of the important questions which your incoming officers will have to deal with, permit me to extend to you my heartfelt thanks for the honor you bestowed on me a year ago in electing me to preside over you, an honor which I assure you was deeply appreciated, and to express the pleasure I feel in welcoming you to our annual meeting to hear the account of my stewardship. I sincerely hope you will find it to your satisfaction.

A year ago our retiring Chairman, Mr. John Firstbrook, devoted his opening remarks to congratulations upon the prosperous conditions which confronted the farmer, the manufacturer, the financier, the professional man, the railway magnate and the artisan. To-day we meet under conditions somewhat different from those of a year ago. Up to November last many of our factories were working overtime, but to-day there are some manufacturers who cannot give work to their whole staff at full time. I will not take up your time by attempting to disclose the causes which led to the crisis which came on last fall. It is known to us all that an industrial depression did strike us then, arising from a complication of causes, and up to a couple of months ago business was quiet, and even yet is hardly normal, although steadily improving.

Trade Returns.

Indications of the slackening up are patent on all sides, but trade statistics show it most conclusively by decreased imports and reduced revenues. The total imports and duties collected in March 1907 were \$36,842,076 and \$5,911,820 respectively as against \$30,052,232 and \$4,988,355 in March 1908. Corresponding decreases have been taking place during April and May and will likely do so for the next few months while conditions are improving. Other figures could be quoted to show how the crisis has affected trade in Canada. The exports, as it is to be expected amid dull conditions at home, show an increase during the past few months compared with the corresponding months last year. The figures for March 1908, the last month available, were \$18,572,085 as compared with \$16,130,005 in 1907. The aggregate trade for the 12 months ending March 1908 still shows an increase over the year ending March 1907, however, of \$16,000,000, but a few more lean months will make a favorable comparison such as this is impossible.

Prospects.

But the future is brightened as we look around us and

see on every hand abundant evidences of good crops, which only require a continuance of fine weather we have been enjoying, to ensure the realization of a bountiful harvest. It is true we cannot regain the high level of 1906 and the early part of 1907 as quickly as we lost it, but without being unduly optimistic I think I am safe in predicting a gradual recovery in business, which will cause us to forget the worries of the past few months in the busy whirr of our factory wheels in the months to follow. Already the crop prospects are restoring confidence, money is easier, and business in many lines of manufacturing is improving. Let us hope that prospects for good harvests in the west, on which so much depends, will be realized.

Dumping.

Before leaving this subject there is one matter which calls for some comment from us as manufacturers, namely, the slaughtering of foreign goods in Canada, particularly by United States manufacturers, which followed the panic. It only needed a sudden industrial depression, such as we have unfortunately experienced, to prove the force of the manufacturers' arguments for increased protection on certain lines, by showing how inadequate were the present duties to keep the home market for Canadians. The dumping clause was of some assistance in stopping the slaughter which made conditions even more onerous for Canadian manufacturers, but it is necessarily slow in action, and while the government showed commendable activity whenever called on to enforce it, it was clearly demonstrated that machinery will have to be devised to make under valuation of goods more easily detected and so prevented. The engagement by the Association of a special tariff officer will be instrumental in making dumping more difficult, but there is no doubt that a re-arrangement of the duty on many articles is also a necessity if the practice is to be altogether prevented.

Conditions in Toronto.

The clogging of the wheels of industry in the Fall was soon felt in such a great industrial centre as Toronto. The partial closing of many factories, the cessation of work on farms and railroad construction with the coming of winter, filled Toronto with an unprecedented number of unemployed which was further augmented by the headline advertising which the vigorous relief measures obtained in our papers. Looking back on the past winter's experiences with unemployed poor in Toronto, it would appear that the relief measures were slightly overdone, and there were numerous

Mr. Ed. J. Freyseng
Chairman Toronto Branch, 1907-8

stances of overlapping. In any event those in charge should endeavor, if we have to face a similar situation in the future, to prevent advertisements going broadcast throughout the land, that Toronto is very generous in its treatment of the poor. A big city is naturally an attraction for the unemployed, but there is no reason to make it more so by advertising our charity.

While Toronto experienced a hard winter, industrially speaking, it is with great satisfaction that I comment on the progress which has been made by our city council with the big permanent improvements which last year's chairman mentioned as requiring immediate attention. After years of delay Toronto's harbor at last is to be partially improved by the construction of a new western channel by the Dominion Government. This good work will be enhanced by the construction of a proper sewage disposal system which will prevent Toronto harbor being filled up by sewage discharge if the by-law for that purpose carries on June 27th, as we hope it will. This general improvement is to be further supplemented from a sanitary standpoint by the building of a water filtration plant. All these improvements, delayed long beyond their time, seem at last to be of immediate accomplishment, and the citizens and their officers are to be congratulated on the general progress that has been made. Then, too, it should be noted that the power question is much nearer solution than it was a year ago, due to the passage of the by-law by the people in January last.

Fire Protection.

Other improvements that might be noted are the completion of the high pressure water mains, which, coupled with the construction of the water tunnel under the bay nearly completed, and the installation of the new high pressure pumping engines, contracts for which were recently let, will be of great benefit to all classes, and to manufacturers in particular, from an insurance standpoint. The much involved and long drawn-out problem of separating the grades on the Esplanade has at last reached a point when a decision may shortly be expected, and I have hopes that this decision will be quite in accord with the views of your executive as expressed in their resolution of a year ago. It is satisfactory to know too, that the city fathers and the Board of Trade, to whom great credit is due in connection with this project, will see that no time is lost in carrying out this vast undertaking.

All of these improvements, while entailing the expenditure of large sums of money are essential to the continued progress of our city, and as such your executive has been active in promoting all of them. It is to be regretted that in these general improvements something has not been done to provide an Eastern entrance into the Exhibition grounds which has been an urgent need for several years past. However, the city council cannot be responsible for this omission which, it is hoped, will be remedied before we meet again.

Toronto Manufacturers Hampered.

But while I think the city council are deserving of some praise for the manner in which they have conducted the business of the city this year, there should be impressed on them the necessity for giving manufacturers more favorable consideration if Toronto is to have steady progress as a manufacturing centre in the future. No other city in Canada is so hampered by unduly severe restrictions on manufacturers as is Toronto, and the proof of it is seen in the moving of several industrial concerns to other centres in Ontario during the past year, and the failure of the Department of Industries and Publicity to have numerous large firms just starting, locate in Toronto. The department is in no way to blame for this lack of success however. It is almost entirely

due to labor and other legislation on the statute books of this city which hampers the Toronto manufacturers severely.

It is true Toronto has made some progress as a manufacturing centre during the past few years, but her rate of progress is far behind that of many other cities and towns of Canada, as will be seen from the following figures taken from Bulletin II of the Dominion Census Bureau's statistics of manufactures issued last year. The figures show the value of manufactured products in the different centres for the years 1900 and 1905 with the percentage of increase for the five years period:

	Value of Product.		
	1900.	1905.	Increase P.C.
Toronto	\$51,415,498	\$85,714,278	47
Winnipeg	8,616,248	18,983,290	120
London	8,122,185	12,626,844	55
Peterborough ...	3,789,164	11,566,808	205
Vancouver	4,990,152	10,067,556	102
Calgary	599,444	2,303,617	284
Amherst, N. S. ..	1,551,907	4,174,929	169
Belleville	558,950	1,658,112	196
Berlin	3,307,513	5,449,012	64
Brampton	248,915	819,658	229
Campbellford	354,087	714,652	101
Kingston	2,045,173	4,329,607	103
Meaford	228,025	641,154	181
Niagara Falls	422,728	774,142	83
Stratford	1,935,176	3,824,586	100

These figures prove conclusively that Toronto is not getting her proper share of the increased production of the past few years, and I have no hesitation in saying that this is attributable in great part to the unwise restrictions which surround manufacturing here. Toronto has far more general advantages than any of the places mentioned, but she lacks the paramount advantage of being free from restrictive by-laws. The manufacturers of this city, I am sure, sympathize with the Commissioner of Industries in his efforts to secure new industries, and I think his success is remarkable in the face of the great handicaps he works under. The Toronto manufacturer is broad enough to support anything which is going to confer a benefit on the community, but he does not see why he should suffer at the expense of his competitors in Montreal, Amilton, London, or other places in Canada, as is now the case, as a result of several restrictive city by-laws. It is to be hoped the council will go slowly in introducing further measures of this nature.

Falling Off in Building Operations.

Naturally the industrial depression is manifest in the statistics of Toronto's commerce, banking, and building operations. Without wearying you with figures I would point out that the building permits for the first five months of 1908 as compared with the same period in 1907 fell off 190 in number and nearly \$3,600,000 in value. It should be borne in mind, however, that last year was a record breaker as to value of buildings erected which totalled \$14,325,800, and that the supply of houses for artisans and others, the dearth of which was commented on last year, seems now to equal the demand, so that a decrease in building was to be expected. Even yet there is considerable building activity in the city, particularly on dwellings. Bank clearing returns, customs entries, railroad traffic all show a falling off compared with the 12 months ending June 1907, but there is no occasion for us to lose confidence in the growth of our city on this account, for the present situation is admittedly temporary, and has the further consolation that it prevails all over the world, and in many countries is entailing far greater hardship. We

should bear in mind, too, that Toronto's population is still increasing, and the total assessment for 1908 is \$206,385,253 as compared with \$185,713,845 in 1907, an increase of over \$2,000,000 in a year.

Gentlemen, we have a city here of which we may truly be proud, and one whose expansion in wealth and population is certain. What we have been experiencing during the past few months is only a breathing spell devised by Providence for our own good to enable us to find time to review the past in order to profit for the future. We have every reason to keep our confidence, more so as we read of the bountiful harvest soon to be reaped in the West as well as in Ontario.

Association Work.

From an Association standpoint the past has been a very eventful year, particularly as far as Toronto is concerned. In September nearly 500 delegates met here as our guests for the annual convention. It was the biggest and most successful in the history of the organization, and, thanks to the enthusiasm and executive ability of the tireless workers who constituted the entertainment committees, and the generosity of the members at large, the reputation of Toronto as an hospitable city did not suffer. In October the Mutual Insurance Companies were successfully launched under the auspices of the Insurance Department. Their career has been highly satisfactory thus far, and it is to be noted with satisfaction also that the work of the Insurance and Transportation Departments continues to be administered capably in the interests of our members. The great reduction in freight rates which went into effect in January 1st to all points east of Port Arthur marked the close of a long campaign the department has been carrying on. This one matter meant the saving of thousands of dollars annually to our members. Another important innovation which took place quite recently was the organization of a separate Tariff Department with an expert in charge. Although in operation only a few weeks this department has already justified its inception, thanks in great measure to the experienced officer the committee were fortunate enough to secure. The installation of a free translation bureau to attend to the foreign letters of the members, the improvement of the foreign credit report service, and the increase in the facilities for giving assistance to those interested in export trade, have all contributed to making the Association more valuable. As usual Dominion and Provincial legislation has been carefully watched, and measures inimical to the interests of the members strenuously opposed and I may add with more than the usual amount.

In fact, gentlemen, the Association is of greater value to-day to you, its members, than ever previously in its history. I have no hesitation in stating that it is the cheapest investment, with the best paying dividends, any of us are interested in, and I therefore appeal to each of you to go out and get a new member so that next year we will be able to report that we represent every firm in Canada. As it is, there are only some 300 firms outside the Association really eligible. In spite of a bad year with many failures our membership now stands at 2,165 as compared with 2,185 a year ago, while in the Toronto branch we have made a net gain of 8 as appeared from the Secretary's report. As already pointed out, only in exceptional cases have good going concerns been struck off.

Toronto Work.

The report of the Executive read by the Vice-Chairman has dealt in detail with the work of your Branch, so that it will be unnecessary for me to say anything beyond expressing the opinion that I consider that the organization we possess for dealing with local questions answers the purpose

quite well, and that every member can rest assured that his interests will be looked after in the best possible manner.

Before concluding I wish to record my appreciation of the loyal co-operation and enthusiasm of the members of the Executive whose cordial support made my task an easy one during the year. Particularly pleasing to me was the tangible expression of their good will when I was compelled through ill-health to ask leave of absence from my official duties last March. I sincerely hope that my successor in office will enjoy the same support from his Executive as it has been my good fortune to enjoy. Nor must I forget the debt I owe the members of the Branch individually and collectively for the valuable advice and assistance they have rendered the Executive from time to time. Their efforts contribute materially to the successful work of the Association, and the knowledge that the members at large are always ready to respond to the slightest demands makes the work of your Executive a pleasure instead of a task.

This report would be incomplete without particular mention of our indebtedness to every officer and member of the staff for their intelligent and zealous devotion to the interests of our Association.

MR. BURKE HONORED.

At the recent convention of the International Association of Factory Inspectors, held in Toronto during June, Mr. James Burke, Chief of the Ontario Inspectors, was elected President for the ensuing year. Mr. Burke has been a Factory Inspector now for several years, and his face will no doubt be familiar

Mr. James Burke

Inspector for Ontario who was recently chosen to the presidency of the International Association of Factory Inspectors

to all manufacturers of the Province, whose factories he has visited in the course of his duty. The work of his department has been carried on with an aggressiveness which was to be expected from a man who has opinions of his own and has the courage of his convictions. He is to be congratulated on the recent recognition of his worth by his fellow inspectors.

FOREIGN MARKETS.

A FIELD FOR DEVELOPMENT.

The business of the Latin-American countries, that is, the countries of South and Central America, and Mexico, is being watched closely by the more far-sighted of the manufacturers of the United States. How much they are interested in it is shown by the establishment, at Washington, of a Bureau for the South American Republics, the tour of these countries by the Secretary of State, and the frequent discussion of the trade possibilities in the trade and commercial papers.

Of no less interest is the subject to Canada. We are well situated to get a share of the trade; our relations are cordial; and we need foreign markets to consume our surplus products. The whole of Latin America includes twenty different Governments, with a population of approximately sixty-five millions, and a total annual foreign trade of nearly \$2,000,000,000. The imports of these people amount to \$897,128,563, and their exports \$1,070,660,724 in one year. Of these amounts Canada supplied them with goods to a value of \$4,479,235; and bought from them in return to the value of \$2,764,552. The following tables show our trade for the year 1907 with the individual countries:

	Exports from Canada.	Imports into Canada.
Argentina	2,266,783	872,026
Bolivia	1,222
Brazil	969,001	350,138
Central American Rep.	85,457	84,916
Chili	274,008	117,806
Ecuador	2,509	2,035
Mexico	477,119	919,932
Panama	92,318
Peru	118,505	51,431
U. S. of Colombia	53,130	277,040
Uruguay	111,196	24,787
Venezuela	27,987	64,441
	<hr/> \$4,479,235	<hr/> \$2,764,552

These figures go to show the field there is open to Canadian enterprise. Enough has been done to show that more is possible.

MAIL SERVICE TO HONG KONG.

A new arrangement will go into force this autumn in reference to mails to Hong Kong and China. Heretofore the Liverpool to Hong Kong mail service was given by the C. P. R. under an annual subsidy of \$350,000, of which Great Britain contributed \$300,000 and Canada \$50,000. The British Government was unwilling to contribute this grant, and as a consequence a rearrangement has taken place. The C. P. R. will continue to give the service, but the total subsidy will be reduced from \$350,000 to \$225,000. Of this Canada will contribute \$125,000 and Great Britain \$100,000. The service given by the Canadian railway and steamship company has been very satisfactory and efficient, and in view of the rapid opening up of the Asiatic countries to the commerce of the West the continuance of the service is highly important. Canada should gain much in the next few years through a close connection with China.

TRADE WITH NEW ZEALAND.

The satisfactory growth of Canada's trade with the Antipodes is shown in the reports received by the Department of Trade and Commerce. Trade Commissioner J. S. Larke, of Sydney, who reports upon a visit to New Zealand, shows that despite the lack of direct transportation between Canada and the new dominion, Canada's sales to New Zealand increased from \$261,870 in 1902 to \$785,440 in 1906, and to \$1,032,680 in 1907, while purchases from New Zealand rose from \$36,830 in 1902 to \$149,075 in 1906, and to \$390,075 in 1907. This growth is ascribed altogether to the reciprocal agreement between the two dominions, and is likely to continue to develop steadily.

MARKET FOR BRITISH COLUMBIA COAL.

A large market for British Columbia coal may be found in Mexico, when the coaling station which is to be constructed is completed. Col. E. K. Smoot has received a concession from the Mexican Government, by the terms of which he is to build suitable piers at Manzanillo, alongside of which vessels of ordinary draught will be able to moor for direct bunkering. The coal which has already been brought from British Columbia has been very satisfactory, and it is now only a question of the price at the collieries, whether the Canadian product can compete successfully with the Australian coal or not. Just what the establishment of this big coaling station will mean to British Columbia and to the Canadian-Mexican line of steamships it is hard to estimate at present, but should the negotiations with the colliery companies result in rates being fixed that will allow of competition with the coal brought over from Newcastle, Australia, in sailing vessels and with that carried by tramp colliers from Japanese coaling ports, a large business should ensue.

WOULD EXEMPT CANADA.

The following press despatch is of interest. It deals with the new Patent Law, which has recently been passed in Great Britain:

"Right Hon. Winston Churchill is being urged to see whether as President of the Board of Trade he cannot make a reciprocal arrangement with Canadian manufacturers of agricultural machinery and other patented articles to secure exemption from compulsory manufacturing clause of British Patents Act, which comes into force on August 1. United States, German and other foreign exporters expect to be heavily hit. Indeed, it is estimated the Germans are now spending 25 million pounds in erecting factories here to secure British protection for their patents. Mr. Churchill is most anxious to score in his new post, as Mr. Lloyd-George did before him, and it is believed he might be willing to grant Canada the concessions if properly approached."

UNIFORMITY OF PATENT LAWS.

Uniformity of patent laws within the Empire was suggested at the last Imperial conference. The question was again raised, this time in the British House of Commons, when it was urged that some action be taken to bring about a reciprocal arrangement with Canada. Mr. Winston Churchill stated that the subject would have to be referred to all the self-governing colonies before anything definite could be done. It is now a year since the conference took the matter up, but nothing has so far materialized from it.

INDUSTRIAL PROBLEMS IN MONTREAL

The industrial situation, technical education, and the need for improvements in civic government are discussed by Mr. S. W. Ewing, in his address to the Montreal Branch of the Canadian Manufacturers' Association.

IN many respects this has been one of the most important years in the history of the Association. Early in the autumn of 1907, financial clouds commenced to gather and since then we have passed through a most trying time, but I am glad to say that the manufacturing interests of Montreal have once again shown their stability and comparatively few failures have taken place. Our Montreal membership since 1904 has increased from 308 members to 425, and in this connection I may say that we have with few exceptions every manufacturer of importance in Montreal in our ranks, and I feel convinced that we have the good will of those who see fit not to ally themselves actively with us. Consequently we can hardly expect to increase in number as rapidly as in the past.

Development of Skilled Workmen.

Mr. Cameron has already presented his able report which has covered fully in the time at his disposal the different activities of your Executive during the past year, and I propose to confine my remarks to practically two subjects only. I find on looking over the annual addresses of my esteemed predecessors for the last three years that the question of technical education or its lack is strongly commented upon. It is therefore peculiarly fitting that I should have the pleasure of announcing the arrangements which have been completed by the Montreal Technical Institute with the Protestant Board of School Commissioners for the opening of evening classes by the Institute in the Commercial and Mercantile and Technical High School on Sherbrooke St. about September 15th next.

The course of instruction will cover mechanical, geometrical and freehand drawing, designing, chemistry, physics, metal working, wood working, electricity, domestic science, cookery and primary subjects, comprising English, Arithmetic, Algebra and Geometry.

The school will have a machine shop, equipped with machines and tools of the most modern design and of the highest quality. There will also be a complete outfit of electrical appliances. These rooms will be in addition to those now in use during the day in other departments of technical education. The combination will therefore embrace a very thorough and complete series of subjects.

Instruction will be under supervision of a principal, assisted by a superintendent and staff, all of whom will be selected on account of their fitness as teachers in the different subjects.

It is hoped that the manufacturers of Montreal will

heartily endeavor to make this Institute a success, and the officers of the Technical Institute desire that the Canadian Manufacturers' Association should co-operate as much as possible with them, as the Institute will depend for support, apart from the pupils' fees, which would only be nominal, upon the voluntary contributions of the manufacturers and their active interest in inducing their employees to avail themselves of the facilities offered.

To Mr. Alexander McFee, the President, and the Honorary Secretary, Mr. Robert Munro, the credit of having finally accomplished the aims of some years of hard work is fully due. I am also glad to note that a much more ambitious Technical Institute is being established by the Provincial Government, and feel convinced there is room for both.

Machinery of City Government.

The time is fast approaching when the city of Montreal will have to face the necessity of improving our municipal government. We have now an unwieldy council of over 40 members. Municipalities are growing up around the city at a very rapid rate and it is only right that they should in course of time become part of Montreal itself. Up to date several of these suburbs have been annexed to the city, each having two aldermen which in nearly all cases gives a representation quite out of proportion to their importance in either population or civic value. If this continues we may have in a very short time a council numbering sixty or more members. The present

council apparently realizes this and now proposes to form a board of control consisting of city officials, but I feel convinced that this will not be an adequate remedy.

The bane of our municipal as well as other governments on this continent is without question the patronage system, and under conditions at present prevailing, our city council cannot get away from this system. There are men in our council who despise patronage, but unfortunately there are others—and they are frequently in the majority—who use the power delegated to them, for their own personal advancement or for purely selfish interest of the ward they represent, and the patronage system is more or less the handle which they employ. These men take advantage of indifference on the part of the public, and I regret to say that most of our leading citizens do not show the interest in civic matters that they should.

Need of High Pressure Water System.

As you are aware, certain citizens of the West Ward were forced by the Fire Insurance Companies refusing risks and

Mr. S. W. Ewing
Chairman of Montreal Branch, 1907-8.

cutting down insurance, to start a canvass to have a high pressure system installed. A large majority of the proprietors signed a requisition asking the city council to install such a system in the business district without delay. It is absolutely vital for the business interest of the city that this work should be accomplished at an early date. Our city council have moved very slowly, notwithstanding the fact that they have been written to more than once by the chairman of that committee. At the present moment the citizens of West Ward are paying about \$100,000 a year in higher insurance premiums and apparently will continue to do so for an indefinite period. This means that the business men of Montreal are paying a much higher insurance rate than the neighboring city of Toronto.

I have not time at my disposal to cite many cases of civic mismanagement to back my statement, nor do I wish to single out any particular department for censure. However any citizen can take a walk to the Point St. Charles wheel house and there see a building with the brick work practically falling down, the settling basin close to the civic incinerating department, the water which the citizens drink running along an open duct beside an almost indescribable place of filth, which in their wisdom our civic fathers have picked upon as a proper situation for a burning vault. I am told that the effluvia from this sink hole is at times too awful for words. Outside of the city of Jerusalem there was, as no doubt you will all remember, a place of this description. It is true that a covered conduit is now being built which will to a certain extent protect our drinking water, but in the opinion of good engineers it will be very little improvement on present conditions, on account of the lack of a filtering plant which has not been provided in the scheme.

The Remedy for Bad Government.

We do not need to leave Montreal to find the remedy I would suggest, and in my mind the only solution of the question.

We have in our midst a commission formed on the proper lines namely, the Harbor Commission of Montreal, consisting of three well-known citizens, one of whom is a past president of our Association. Those of us who follow such matters closely can testify to the extraordinary changes which have been made in the port of Montreal in a very short time. These men were not appointed as transportation experts, but the government was particular in selecting them. The success of the present Harbor Board in Montreal has definitely proved the value of a small commission to look after public undertakings.

I believe that we have in Montreal many other good men who are capable of forming a commission, and our Association should start seriously to work to bring the desired results. I feel convinced that if we could have an untrammelled civic commission consisting of independent, fearless and energetic business men, in five years the citizens of Montreal would look back with astonishment at the conditions they once put up with. We would have good pavements and lanes, a proper water system and a highly developed sanitary system. The natural situation of the city lends itself admirably to these and many other improvements, impossible of present attainment, not for want of money, but for lack of judgment in spending it. I trust that the members here present will seriously consider the matter, and as our coming chairman has had great experience in civic affairs, I feel sure that he will do what he can to work along the lines suggested.

On retiring from the Chairmanship of this Branch, I cannot too strongly express my appreciation of the kindness of the different members of the executive; never at any of our meetings has there been one jarring note. Men that I

respected before I have now come to regard as good friends. To my successor I can only wish the same success and loyal support from his committee in conducting his meetings which I have received.

Mr. Cameron, your able Secretary, deserves a special meed of praise. He has not only been my right-hand supporter, but by his urbanity and savoir faire kept everything running smoothly. In fact, I cannot look back on one unpleasant moment in connection with the work of the Association during the past year in which you were good enough to elect me your Chairman.

NEWS LETTERS.

Winnipeg, June 29th, 1908.

To the Editor of "Industrial Canada":

Most of the employers of labor in Winnipeg are running short time or resorting to all sorts of plans to retain their full staff in spite of the dulness of trade that at present is on us; the central idea being, that with the promise of a splendid harvest, it is better to retain, if possible, the men, than look for them when the financial return from the crop breaks the present chain that the monied interest have tied to the wheel of our (in their idea) rapid progress.

The West generally being a new country, it is of necessity a borrowing country, and, of course, is paralyzed when it cannot borrow, not so badly now as twenty years ago, when no one had any savings in the banks, for to-day branches of the large banks are scattered all over the West, and some farmers have good balances. In a few years it will read, many farmers have, and in a few more it will be as in the Middle Western States, nearly all farmers have.

The Winnipeg manufacturers are trying to get a more favorable rate of taxation, and expect the Commission will advise some relief. The strange condition being, that while the law in Winnipeg and the law in Montreal are about the same, yet the business concerns in Winnipeg pay about double the taxes. This appears to come about by an assessment being made as high as possible, while Montreal assesses manufacturing plants as light as possible; in fact, this appears to be the general plan all over the States and Canada, excepting only Winnipeg, and then it is the limit of the letter of the law, without regard to public policy, or the development of industry, or justice or fair play. The last two reasons are sound, for it is the general practice to let factories off light in taxes, or give them exemption or even bonuses, in all other cities and towns. Is it justice to soak the unfortunate ones that happened to make their start in Winnipeg?

A large number of the members of the Branch were invited by the Mayor, Council, and Board of Trade of Saskatoon to pay them a visit, and with representatives of the other business organizations of our city, made the trip of 530 miles, and were entertained right royally, both on the train, with drives about the city, and, lastly, with a banquet, at which about 300 sat down. The country through which the train passed, on this new C. P. R. Kirkella branch (for this was the second passenger train to go over), was by all passed upon as wonderfully rich, and soil and crops, wherever seen, were doing well.

W. J. BULMAN.

Halifax, N.S., June 30th, 1908.

To the Editor of "Industrial Canada":

Although the general depression which has visited the continent has to some extent affected this part of the

Dominion, on the whole our manufacturers have been favored with orders sufficient to keep running full time.

A little more than one year ago the Silliker Co. were not in existence in the city of Halifax, but on Wednesday of last week they made their final opening to the public by throwing their works open for inspection, when between three and four hundred persons took advantage of seeing the plant in all its departments, and where they saw the first car from the plant go out to do service over the lines of railway.

The plant at the present time is composed of the following buildings: General Wood Working Mill, Car, the Foundry, Machine Shop, Blacksmith Shop, Car Erecting, Warehouse, Dry House, Power House, Office.

The directors of the firm are: C. J. Silliker, President; Elmore E. Silliker, Robert C. McMann, G. A. Fowler, W. J. Clayton, A. M. Bell.

At the present time more than 200 persons are employed, and the number will soon exceed 300.

The Wood Working Mills has all the orders it can keep up with, and a good start has been made on the contract which they have with the I. C. R. for freight cars and colonist sleepers.

Under the presidency of Mr. Silliker, assisted by such a practical board of directors, success for this enterprise is assured.

Another industry which has taken a very important stride towards success is the Sutherland Rifle Sight Co., situated on the banks of the East River, about ten miles walk from the post-office at New Glasgow. It consists of a brick building containing about 7,000 square feet of floor space, the main building being about 150 x 40. There are fifty-four different machines in the plant.

The work is now in full swing, making a supply of 40,000 rifle sights for the Militia Department, and supplying orders for several thousands from individual marksmen and dealers throughout the British Empire. The sight is patented in Great Britain, United States, France, Germany, Australia and New Zealand. They have been requested by the governments of Great Britain, United States and New Zealand to send them samples, and appear to be favorably impressed with the invention from descriptive circulars.

The future prospects are promising, as they now have orders in hand which will keep the factory at work continuously for two years.

At present about fifty hands are employed, and it is expected another will be added within a few months.

M. McF. HALL.

WELLINGTON, NEW ZEALAND, June 4th, 1908.

Your readers will be aware of the death of Mr. R. A. Alley, contractor with the Canadian and New Zealand Governments for the maintenance of a direct cargo service between Canada and New Zealand, known as the "Alley" line. On hearing the news the writer called on the Premier, Sir Joseph Ward, and the Minister for Marine, Mr. J. A. Millar, in order to ascertain in how far Mr. Alley's death would affect the continuance of the line. Both Ministers informed me that the existing contract had still to run for some time and would in no way be affected. When I asked if the line would be continued after the expiration of the present contract, I was informed that the Government had not yet considered the matter, but that most certainly it would not be continued on the present lines.

In my opinion, which is shared by all commercial men, the line will never pay its way unless a monthly service is established, with regular sailing dates by steamers which have at least 500 tons of refrigerator space, and last, but not least, reasonable rates. The subsidy probably will have to be in-

creased, but it is better to pay a little more for an efficient service than a smaller amount for a service which is utterly unfit for the trade.

If the first steamers had been equipped with refrigerator plant, by this time a nice business would have been worked up in perishables. That this is not a mere assertion will be proved by the fact that one Sydney firm has taken up all the available refrigerator space of all the steamers engaged in the Australian-Canadian service.

Before this was done a few tons could be had in the steamers leaving Auckland for Suva connecting with the above line. Mr. J. B. McFarlane, a prominent Auckland merchant, made regular use of this opportunity to ship butter during four months of the year, and was constantly complaining that he could not extend the business for want of space.

After the Sydney firm has taken up all the available space there is no chance to send any perishables from New Zealand to Canada or *vice versa*.

Mr. McFarlane, however, was not to be beaten. He sent a shipment by the New Zealand Shipping Co. to Liverpool, from there across the Atlantic and the continent of America to Vancouver. On comparing expenses he came to the unexpected conclusion that the round-the-world route was a shade cheaper than the direct route. Naturally it would be impossible to build up a regular trade in this round-about way.

Mr. McFarlane's experience proves one thing without a doubt and that is, that the rates charged by the Canadian-Australian line are prohibitive and not calculated to foster trade.

As up to a certain date the management of the Alley line quoted practically the same rates as the C. A., it is small wonder that no business came their way. In fact, their rates were higher, as their boats run direct to New Zealand, whereas the Canadian-Australian line has to tranship in Sydney and has to bring such transhipments to New Zealand ports, a distance of at the least 1,100 miles. As soon as the steamers offer refrigerator space trade will spring up from this side in perishables and will gradually extend to other lines such as flax, tow, wool, hides, tallow, etc.

The new steamers now employed in the service are far superior to the *Pondo* and *Bucentaur*, and particularly the *Den of Ruthven* would be an ideal ship for the trade if fitted with refrigerator plant. There are no stanchions in the hold, which make her a splendid timber carrier. I have not yet seen the *Indravelli*, which steamer, I am informed, is also very suitable, but has the same drawback as the other steamer of having no refrigerator space.

I am glad to be able to state that there is no lack of cargo, mostly timber, from the Canadian side. Lately every steamer was booked up far ahead of the sailing date. The timber trade will steadily increase, as native timbers are getting scarce.

Trade Commissioner, Mr. J. S. Larke, paid one of his periodical visits to this Dominion recently. Mr. Larke had a very good reception, and the Chambers of Commerce in all the centres convened meetings to give Mr. Larke an opportunity to meet the leading merchants. I attended the Wellington meeting, where Mr. Larke spoke at some length on the possibilities of trade expansion between the two Dominions. He laid particular stress on the necessity of better steamer connections, and at the end of his interesting and able speech was met with a hearty round of applause. The Chairman, after thanking Mr. Larke, put before the Chamber a motion in agreement with Mr. Larke's views and promising to support any attempt for a closer connection between the two Dominions, which motion was carried unanimously.

I understand that Mr. Larke is leaving for Canada by the steamer *Manuka* on the 11th instant.

COSMOPOLITAN.

AMONG THE INDUSTRIES.

ONTARIO.

The city of West Toronto will erect a new school at a cost of \$20,000.

Elmira, Ont., will spend \$25,000 on extensions to their waterworks system.

A large canning factory will be erected at Ridgetown by the Canadian Canneries.

A Presbyterian Church will be erected in Fort William, Ont., at a cost of \$60,000.

The Louis A. Fisher Company of Dryden, Ont., will erect a large sawmill at that place.

Mr. McKelvey states that he has the capital provided for the erection and equipment of a factory.

The expanded Metal and Fireproofing Co. of Toronto will build a cement factory at a cost of \$20,000.

The Eureka Refrigerator Co. have purchased a site in Toronto, on which they will erect a factory.

Stockwell, Henderson & Co., dyers, have acquired a site in Toronto, on which they will build this Fall.

Listowel, Ont., will spend \$18,000 for the erection of an electric light works, and \$6,000 for waterworks.

The Brabant's Brass Works, of Detroit, are considering the establishment of a branch in Windsor, Ont.

A. A. Barthesmes will build a factory of reinforced concrete in Toronto for the manufacture of piano actions.

Galt is negotiating with Mr. McKelvey, of Stratford, for the establishment in the former place of a furniture factory.

The Canada Mill Stock and Metal Co., Toronto, have purchased property on which an addition to their factory will be built.

The building of the Standard Chain Works, at Sarnia, Ont., was damaged in a recent storm. The loss was about \$10,000.

Oakville, Ont. will install a waterworks and lighting system. Willis Chipman, engineer, Toronto, is in charge of the work.

The Rainer Lumber Co. will erect a saw and lath mill at Rainer, Ont. The saw mill will have a capacity of 50,000 feet a day.

The Morris, Ont., township council will erect a new steel bridge. It will have cement abutments and a steel superstructure.

The Incandescent Lamp Co. has awarded contracts for the erection of a \$79,000 factory in Toronto. Work on excavations has begun.

A large sawmill may be erected at Fort Frances, Ont. The Rainy River Lumber Co. are reported to have decided upon its construction.

Forest, Ont., is in negotiations with the Percy and McPherson Brass Works Co., who are considering the establishment of a plant there.

Another bridge across the Niagara river is being discussed. It would be used as a connecting link for the proposed Toronto to Buffalo electric line.

Wm. Harland & Sons, London, Eng., have purchased the Victor Varnish Works, Toronto. They will spend considerable money on improvements.

United States capitalists have applied to the corporation of Niagara Falls, Ont., for a free site, on which they will erect a \$10,000 steel rolling mill.

It is reported that the University of Toronto will build a central heating plant at a cost of \$250,000, from which heat will be transmitted to all the buildings.

The Victoria, B.C., ship depot was destroyed by fire recently, with a loss of \$180,000. This was one of the two biggest ship-building yards in Victoria.

A company is being organized with a capital of \$200,000, for the manufacture at Fort Frances, of brick, tile and sewer pipe. J. C. Sullivan, Mason City, is the organizer.

The Electric Meter and Stamping Company, New Hamburg, Ont., have decided to move to London, and are now reported to be about to purchase a site for a factory.

The Horlick Malted Milk Co. of Racine, Wis., are reported to be considering the advisability of establishing a branch plant in Canada. London, Ont., is said to be favored as a location.

A big canning factory is under construction at Stony Creek, Ont. The factory will be built in two sections, each of which will be 100 feet long, and combined will have a capacity of 1,000 cases per day.

The MacLean Cream Separator Co. of Sarnia may move to St. Thomas. Negotiations are now on between the company and the St. Thomas city council, and it is believed that the deal will go through satisfactorily.

Johnston, McConnell and Allison, London, Ont., are interesting English capitalists in a company to manufacture brick. The company will be capitalized at \$250,000. St. Thomas and Dorchester, Ont., will be the sites of the works.

The North American smelter which has been built at Thorold, Ont., to refine the output of the Coniagas mine, is now in operation. A staff of from 40 to 60 men are kept employed. The plant in all its tests has been working perfectly.

Mr. McAllister's stave and heading factory at Hawkesville was burned to the ground a few days ago, just after the men had quit work for the day. The lumber and logs were saved. The loss will be a heavy one, as only \$2,000 insurance was carried.

A scheme is under way for the amalgamation of the furniture manufacturing establishments of Morlock Bros. of Guelph and the J. A. Cline Co., of Stratford. The amalgamated company would capitalize their business at \$150,000. Guelph will be the site of their operations.

Mr. Andrew Anderson, Winnipeg and New York, has submitted to the council on behalf of the capitalists represented by him, an outline of an immense pulp and paper industry which they propose to establish in Kenora, providing certain encouragements are given by the town in the shape of exemption from taxation for a period of ten years and a fixed assessment of \$3,000 for a further period of fifteen years.

The company proposes to acquire the water power and lands of the Keewatin Power Company and to erect an immense paper and pulp mill, with a capacity of 300 tons per day.

The plant will cost in the neighborhood of \$3,800,000 and operations will commence on or about the first of October next.

About \$1,000,000 is to be expended the first year. When in operation this immense industry will employ from 750 to 900 skilled workmen, and 300 to 400 laborers. In addition from 3,000 to 4,000 men will be employed in the woods.

QUEBEC.

A hotel will be erected at Ville Marie, Que., this summer, at a cost of \$20,000.

Shirley & Company, St. Andrews, P.Q., will extend their plant, and will build a new warehouse.

The C.P.R. has ordered twenty new engines from the Locomotive Company of Montreal, to be delivered by September 15.

Sherbrooke, Que., has granted aid to the Improved Paper Machinery Co. to purchase a site, and also exemption from taxes for a term of ten years.

The Montreal Cotton Company's mills at Valleyfield have resumed work at practically their full capacity, between 2,000 and 2,500 operators being engaged.

The Improved Paper Machine Company will receive tax exemption at Sherbrooke, Que. The city will also assist the company in the purchase of the site.

The Saraguay Electric and Water Company will install a new steam plant of 2,000 horse power. Charles Brandeis, engineer, Montreal, is preparing specifications.

The return to prosperity is marked by the increased activity of leading industries. The C.P.R. Angus shops at Montreal are reported to be taking on more men, and the freight and passenger car shops re-opened on July 2nd. The Sault Ste. Marie rail mill has also resumed operations.

MARITIME PROVINCES.

Lunenburg, N.S., will expend \$25,000 on extensions to its waterworks system.

St. John, N.B., wants a bridge across the harbour. Its construction would cost \$500,000.

The Stanley Railway and Manufacturing Company will erect a woodworking factory at Ryan's Brook, N.B.

Dartmouth, N.S. will spend about \$59,700 on extensions to its water and sewage systems, and in erecting a new school building.

Halifax, N.S. may add a glass works to its other industries. C. E. Silliker, with a number of other capitalists, is promoting the enterprise.

J. B. Beveridge, of Newcastle, N.B., is building a paper mill at that place. He will erect twenty-five dwelling houses in connection with the enterprise.

It is expected that construction will soon be undertaken for the plant of the National Rolling Mills at Sydney, N.S., which F. A. Crowell is promoting.

THE WEST.

A courthouse will be erected at Arcola, Sask. Tenders have been called for.

The W. E. Cooke Lumber Co. will build a shingle mill near Poplar, B.C.

The Phoenix, B.C. brewery will be increased to three times its present capacity.

It is reported that A. J. McArthur of Calgary, Alta., will build a tile works in that city.

The B. C. Sugar Refining Co. will erect a \$60,000 steel and concrete filter building at Vancouver.

The Dominion Government will build a post office at Dauphin, Man. The estimated cost is \$36,000.

Tenders are now being considered for a building for the British Canadian Pulp and Paper Co., Vancouver, B.C.

The Enamel Concrete Co. of Des Moines, Iowa, will build an extensive Canadian branch at Vancouver, B.C.

A rival gas company may establish a plant at New Westminster, B.C. The proposition is now before the city council.

A complete sewage system and sewage disposal works will be installed by the town of Vernon, B.C. at an estimated cost of \$57,500.

F. Remer and A. Quaedfleig, of Vienna, Austria, are reported to be considering the establishment of a tannery in Vancouver.

The Brandon Generator and Carbide Co. will establish a plant at Brandon, Man. They will manufacture gas machines and supplies for same.

The Nicola Valley Lumber Co. have erected a large saw mill at Petit Creek, and have started sawing timber. The mill is equipped with the best modern machinery.

The Creston B.C. Electric Light and Telephone Co. have engaged C. H. Mitchell, consulting engineer, Toronto, to report on a water power which they intend to develop.

Life is Far Too Short

to wear out a "GALT" Galvanized Steel Roof. It will wear as long as the roof frame will support it. That's not its only advantage either.

- It protects your building from Fire.
- It cannot be injured by Lightning.
- It is light in weight and therefore does not require a heavy roof-frame.
- It requires absolutely no attention—never needs painting.
- In appearance it is unsurpassed and therefore large'y used on schools, colleges, churches, residences, etc.
- It is remarkably cheap and can be easily erected without any soldering.

What is most important to you is—it makes a satisfactory roof—this we guarantee.

We also manufacture the following Fire proof Building Goods:

- "GALT" Fire-proof Windows, Cornices, etc.
- "CLASSIK" Steel Ceilings.
- "GALT" Steel Siding.
- "GALT" Expanded Steel Lath.

We are anxious to send you our handsome Illustrated Catalogs illustrating these goods, if you are interested. Drop us a card to-day. We'll do the rest.

COPY OF TESTIMONIAL

THE METALLIC ROOFING CO. OF CANADA, Limited
TORONTO.

Sincee, Ont., April 9th, 1908.
Dear Sirs:—"We have handled your "Eastlake" Shingles for nearly a quarter of a century. They have been on the Court House, Free Library, and other public buildings in this town for 18 years. We have used very large quantities during the past 25 years, and they have always given first-class satisfaction, and have never required any repairs."

"WHAT EXHIBITIONS ACCOMPLISH."

To illustrate the influence of exhibitions, Mr. Samuel May, of Toronto, tells a story of his visit to the New Orleans Exposition, in 1885. While there he noticed considerable attention being paid to a patent split pulley, which the inventor was trying to persuade the exhibitors in Machinery Hall to use. Some were willing, while many were sceptical, and in many cases the pulleys had to be provided without charge and put on and their merit actually demonstrated before Mr. Dodge could make even good mechanics admit that there was anything in the new idea. Mr. May was a power user at home and recognized at once what a revolution such a pulley would make. He thereupon negotiated with Mr. Dodge for the patent rights for Canada paying a good round sum for same, also paying a substantial royalty for many years after. That Mr. May's judgment was sound is amply proven by the extent of the plant of the Dodge Mfg. Co., Toronto, where the pulleys are now made for the Canadian market.

A Book on Mechanical Stoking.

No subject is of more consistent interest than that of fuel. By now most users are convinced that under ordinary conditions a large part of the heating qualities of coal is lost. A book just issued by the Jones Under-Feed Stoker Co., Montreal and Toronto, contains a discussion of the merits of the mechanical stoker manufactured by them. The book is well illustrated and contains a lucid explanation of the elements entering into economical stoking. A copy will be sent to any address on application.

- 816 Puncheon Staves.—A merchant in Antigua now purchasing oak molasses staves wishes to find Canadian prices on same or cheaper substitute.

GLOBE TIME RECORDERS

Rapid — Durable — Legible — Reliable

Register consecutively on the one sheet in clear type to the minute. No Keys. No Cards. No checks. No Pin-holes. No Lines.

YOUR payroll is the largest single item expenditure in your establishment and is the one expenditure most profitable to keep a good check on. ¶ You are buying this labor every day, every week, every year. Are you getting all that you pay for? The experience of many firms is that before they had a good mechanical time register, they did not. ¶ We can reduce your payroll by compelling employees to be on time and to work until quitting time. We show you the exact time your employees arrive and depart and do it in clear, legible TYPE to the MINUTE. ¶ It enforces punctuality and eliminates all time disputes. The machine shows no partiality. These machines, made in Montreal by W. A. Wood, have stood the test for years and many firms throughout the country cheerfully recommend them. We have saved them money: we can do the same for you. ¶ Let us have your time-keeping particulars, i. e., hours of labor, your pay periods, number of employees, and we will submit specimen sheet from the machine best suited for your requirements. Our experience in this line is at your service.

TORONTO - MONTREAL

The Head that has stood the Test.

**Manufacturers' Non-Corrosive
Automatic Sprinklers**

Are acceptable to the Underwriters at the present time and have been for the past twenty years. During that time none of our appliances have been found ineffective, but have been found by actual test to be positively reliable.

The
GENERAL FIRE EQUIPMENT Co., Limited
72 Queen Street East : : TORONTO, ONT.

IN A NORTH BAY FIRE

In 1906, Purvis Bros., North Bay, purchased some of our **Fireproof Windows**. They reduced their fire risk, also their insurance rates. In August, 1907, the building adjoining them was burned to the ground. They say—

The Window did all that was claimed for it
—and our claim is they are really fireproof and give you actual tangible returns. Send for a copy of this letter.

A. B. ORMSBY, Limited,

FACTORIES:
Queen and George Streets, TORONTO
677-9-81 Notre Dame Ave., W., WINNIPEG

Manufacturers and Contractors of Fireproof Windows, Kalameined Clad Doors, Tin Clad Doors, Skylights, Fire Door Hardware, Adjustable Fire Door Hangers, Oily Waste Cans, Fire Extinguishers, Cornices, Corrugated Iron, Metal Ceilings, Piping Work, Asbestos, Slate, Felt and Gravel Roofers.

WOOD AND STEEL TANKS

For Sprinkler Systems, General Fire Protection, Municipal Water Supply and Other Purposes.

OUR TANKS are made from the best white pine, air-dried, and carefully made, and we absolutely guarantee them when properly erected. Our hooping is arranged to carry safety loads, and based on careful calculation. We do not compete with a cheap grade of tanks made by local coopers who are unable to design and calculate proper material and construction. A poor tank is N. G.

Steel Substructures, Transmission Towers, etc.

Underwood

¶ We sell the Underwood—the best typewriter. We frequently take in exchange machines of other makes. Once a year we clean them out at bargain prices, for quick disposal.

These prices are for June only. Here they are :

- Remingtons No. 6 - - - \$25
- Smith-Premiers Nos. 2 and 4, 35
- Empires - - - - - 40
- Monarchs - - - - - 40
- Olivers, Yosts, Barlocks,
Blicks - - - - - 15

Out-of-town orders receive our special care. The machines are in first class condition. If the one you get is not exactly as represented, send it back at our expense.
