stresses as the data sheets call for. Certainly this could not occur at a construction joint. The possibility of loads of material on upper floors could affect average deformations only and not the bending stresses, since the loads resulting therefrom would of necessity be centric. The irregular character of these results is possibly largely due to inaccuracies consequent on using a high clearance instrument in a vertical position and by an observer working in a cramped situation. The consistency in results elsewhere shows that when the instrument is used in the horizontal position flexibility due to high clearance may be overcome by skillful handling.

Community Halls and Athletic Fields

The Ontario Government proposes giving financial aid to the townships for establishing community halls and athletic fields in order to develop community spirit in the province.

* * *

"Trautwine" The Engineer's Pocketbook

Advance sheets have been received covering practically all the new material added in preparing the forthcoming twentieth edition of "Trautwine." The most radical and important change is an improvement in the arrangement of the several articles included, and the modernization and extension of the various articles on certain railroad subjects. In addition, the rules relating to the ellipse have been modernized, extended and re-written, a new isogonic chart is shown and the table of zimuths of polaris has been revised to cover present dates.

B. F. C. HAANEL, M.E.I.C., Ottawa,
Winner of the Gzowski Medal for 1918

* * *

The Provincial Government of British Columbia propose introducing a bill to provide for the borrowing of three and a half million dollars for the important public undertakings in the province during 1919. Part of this amount will be devoted to an emergency fund of one and a half million dollars, for the purpose of providing work for returned soldiers. Practically the whole of this amount will be for capital expenditure on public work in the province, chiefly trunk roads.

Suggested Harbour Improvements for Greater Montreal *

By E. S. M. Lovelace, M.E.I.C.

In what follows the writer does not propose to touch upon any special development in the way of new wharfage accommodation, or on any improvements along the lines of better transportation facilities, or, in fact, to concern himself with any of the matters usually associated with harbour works properly so called.

These can all well be left to the constituted authorities to inaugurate in due course, as the need for such arises, *as it surely will arise*, in the not distant future.

It seemed to the writer, however, that now, when the whole world so to speak, is being re-arranged, is the time to go into, and, with the greater experience that meanwhile has been gained, consider afresh the problems confronting us on every hand.

Montreal, from its geographical position alone, in the future, even more than in the past, must inevitably become the principal gateway from the ocean to the whole continent. That being so, no minor consideration as to cost, should be allowed to stand in the way of improvements from which all Canada would ultimately benefit.

In a broad sense, our harbour as it at present stands, suffers from three great natural drawbacks, and, in proportion to the extent that the effects of such drawbacks may be mitigated or entirely done away with, lies the measure of success attending efforts in the direction of the requirements of a harbour for Greater Montreal.

These three natural drawbacks as they appear to the writer, in order, are:—

1. *Excessively* strong current over the whole of the water front from the canal basin to the foot of the Island opposite Varennes.

2. The amount of dredging necessary to provide sufficient depth at low water for the larger ocean going vessels.

3. The ever present danger of floods occurring each Spring and Fall, with all the consequent inconvenience to, as well as the marked lowering in value of the *lands* in the districts affected on both sides of the St. Lawrence.

These three drawbacks are so well known, that it seems almost superfluous to mention them. They have occupied the attention of the harbour authorities, and, of *commissions*, both civic and federal, and yet, heretofore, no adequate method of dealing with all three, has as yet been brought forward.

Under these circumstances, an idea which occurred some time ago to the writer (an idea the *feasibility* of which such further study as he has been able to devote to the matter has tended to confirm) is now put forward, in the hope, that discussion before the Montreal Branch of *The Engineering Institute of Canada*, may bring out, if such exist, any inherent flaws in the proposal.

Should the criticism of the members prove favorable as a whole, then, the proposal could be brought to the notice of the *Authorities* competent to take action in so large and important an undertaking.

*Read before the Montreal Branch of *The Institute* on March 6th, 1919.

Briefly, *the proposed scheme*, is as follows:—

As indicated on drawings Nos. (1) and (2), and more in detail, on drawing No. (3), a *submerged dam* would be placed across the river opposite Varennes to the foot of the Island of Montreal at Bout de l'Ile.

This dam would be of sufficient height, to raise the level of the river say ten feet above ordinary low water at these points.

The immediate effect of this, would be to back up and drown out the *St. Mary Current* and convert the whole of the river from the foot of Nuns Island to a few hundred feet above the submerged dam into a lake.

This lake would then become the Harbour of Greater Montreal, and under the control of the Harbour Board.

At the same time, the *channel* proper, and, in fact, the whole river between the above mentioned points, would be correspondingly deepened, so that further *dredging operations* in the ocean channel would be quite unnecessary.

Thus, at one stroke, the two first drawbacks would, at a very moderate cost, be done away with.

With regard to the third drawback, there is room for some difference of opinion, as to the effect this damming of the river might have on the flooding of the banks during the taking of the ice each winter, and its breaking up the following spring.

After giving the subject close consideration, and having before him the facts very carefully collected and presented in a report, made many years ago by the "Montreal Flood Commission," the writer is of the opinion that the damming would result in doing away largely, if not entirely, with the menace of these periodical floods.

This aspect of the case is, however, presented more fully further on in the paper, and, it is hoped, that the opinions and experience of other Members (more fully qualified to speak possibly than is the writer) will become available on this point.

Before going into this, however, the paramount importance of the *effect* which the damming back of the river would have upon ocean navigation cannot fail to force itself upon ones consideration, for, upon this point chiefly, if not altogether, must depend the general acceptance of so radical a scheme.

If it can be shown to curtail, in any marked degree, the free passage of vessels into the Harbour, then, in spite of other obvious advantages, it could not possibly be entered upon. If, on the other hand, there is ground for the belief, that in this respect, there would be a marked improvement in the speed and ease with which water so dammed could be traversed by all vessels, ocean going or river steamers, then, at least, the proposal will be worth the closest study and attention.

Looking at the plan on drawing No. 2, it will be noted, that the existing *channel* for both ocean and river going

vessels passes to the *east* of Isle Ste. Therese, that is, on the Varennes side of the river, and this, in connection with other reasons, would seem to indicate that this would be a suitable place for the submerged dam.

As shown on the plan, it is proposed to place two large twin locks, each one thousand feet long (1000) by one hundred feet wide (100), at Varennes, with a depth of, at least, five feet on the sill.

Generally speaking one of these locks would be used for incoming, and the other for outgoing vessels, thus expediting their passage and at the same time doing away with the danger of collision. If one lock, however, should be temporarily out of order, or when repairs are being made, then, for the time being, there would always be one lock available for both up and down stream vessels.

Any slight delay in passing through the lock, would be more than compensated for by the ease with which, having no current to contend with, the vessel would reach its berth further up.

The existing ship channel would, of course,as indicated on the plan, be modified locally, to suit the position of the locks.

On the Montreal side of Ste. Therese Island, at Bout de l'Ile, a small lock, as shown, could be placed for the convenience of pleasure craft desiring to get below the dam or into the Ottawa River.

Wharves could be placed at any desired point, either on the Island of Montreal right down to Bout de l'Ile, or on the South Shore opposite, and, with the increased depth of water all over, due to the placing of the submerged dams, little or no dredging would be required.

On account of the small difference in elevation on the up and down stream side of the lock gates (ten feet or thereabouts) it will be possible to design gates of the type outlined on drawing No. 4 which, in place of opening in the usual way, would be elevated bascule style.

Such gates would have large circular counterbalanced drums, to which water could be introduced from the upper level, or let out at the lower (in the manner indicated on the drawing) so that the raising and lowering would be affected without any power being required other than that provided by the available head of ten feet.

The operator, by simply drawing a lever in one direction, or pushing it in the other, could start, stop, raise or lower a gate with ease and dispatch. There would be no machinery of any kind, and virtually nothing to get out of order.

On the approach of a vessel going say upstream, a gate would be raised into a vertical position, and as the vessel passed into the lock, this gate would close behind it. Immediately this was done, the gate at the upper end of the lock could be made slowly to raise, water from the higher level passing under the gate, at first slowly, and then, more and more quickly, raising the water surface in the lock to the higher level.

So soon as the upper gate was vertical, the vessel would pass out of the lock and continue on its journey.

The actual type of lock gate to adopt, however, is, of course, a mere matter of design with no specific bearing on the scheme as a whole.

Bridge at Varennes

As a detail of the scheme, it is also proposed to have a highway bridge (with provision for the tracks of electric and other railways) connecting Varennes with Bout de l'Ile.

This bridge would be carried on piers built up through the submerged dam, the sloping faces of the piers on the upstream side, serving to protect the dam from the action of ice jams, should such occur.

In crosing the canal locks, bascule bridges, similar in type to the lock gates (but at a higher level and of different design) would be placed, and operated of course in the same manner and in connection with these gates.

Across Ste. Therese Island, the railway tracks would be carried on the viaduct as shown, but the highway and electric railway, could very well, as indicated on drawing No. 3 reach the ground surface by properly designed ramps, thereby effecting a considerable saving in the cost of the bridge proper, and also resulting in a convenience to any inhabitants of the Island. The more especially would this be the case, so far as the latter point is concerned, should the Island (as it well might be now that the shores of Lake St. Louis are nearly filled up) ever come to be considered a desirable summer resort.

The proposed bridge would be of the greatest possible value to the inhabitants of Varennes and vicinity, as they would thus be brought within easy and direct access of Montreal Island.

The line of The Canadian Northern Railway from Quebec (now part of The Canadian Government System) reaches Montreal Island at Bout de l'Ile. Under existing conditions, freight and passenger traffic intended for the South Shore, is obliged to work its way slowly through the Montreal City terminals, eventually reaching its destination by way of the Victoria Bridge.

By having a branch line from Bout de l'Ile crossing over this proposed bridge and connecting in the manner shown with The Quebec, Montreal and Southern Railway at Varennes, all such traffic could be diverted directly to the South Shore.

General

The slack water (produced by the damming back of the river would be ideal for boating, sailing, canoeing, etc., so that all the water front from Montreal right down to Bout de l'Ile, on both shores of the river, would be suitable for summer residences, which now, generally speaking, are necessarily compelled to go to Lake St. Louis above.

So far, however, as the actual details of the proposal are concerned, it must of course be understood that the writer has not gone very fully into these. On further and fuller examination, it might for instance, be found preferable to use lock gates of the ordinary type, and the exact position and size of the submerged dam would require an exhaustive survey and much thought to determine.

The idea, is therefore, only presented in a general and very rough form.

Effect on Flooding

And now with regard to the effect the building of the dams would have on the prevention of flooding each Spring and Fall.

As clearly pointed out in the " report " previously mentioned of the Montreal Flood Commission for 1886-87.

" The St. Lawrence River is not subject to floods in the ordinary sense in which this term is applied to other rivers such as the Ohio and Mississippi. The floods with which we have to deal are not due to excessive quantity of water but of ice, and are entirely local, being confined to a comparatively insignificant extent of the river.

The St. Lawrence is a river of such width and depth that notwithstanding the great volume of water which it carries (its low water discharge above Lake St. Peter being three hundred and fifteen thousand cubic feet per second, (315,000) its extreme range between highest and lowest water marks is only about six feet, or one-tenth that of the Ohio at Cincinnati. Wherever this range is exceeded, as at Cornwall, Beauharnois and Montreal, it is only in winter, and is due to the packing of the ice. High water in the St. Lawrence and Ottawa occurs long after the departure of the ice, and seldom reaches within ten feet of the ice flood level. The river is so large and its banks of such height that when relieved of *ice* the greatest known height of water cannot flood Montreal. Even when covered with ice, it is only when the covering conceals a much larger body of other *submerged* ice that flooding is caused by it."

Plan and Longitudinal Section

(Drawing No. 2)

Drawing No. 2, based on one given in the above mentioned report of the Montreal Flood Commission, gives a plan and longitudinal section of the St. Lawrence river between the foot of the rapids and Varennes. The longitudinal section, taken along the dotted line A, B, C, D, E, ..., indicates the surface and submerged ice present in the river during the winter of 1886-87. This was the winter following the disastrous flood in the Spring of 1886.

The striking and surprisingly large quantity of submerged or frazil ice shown on this longitudinal section as compared with the comparatively small quantity of surface ice is at once apparent, and its consequent effect in the production of floods can easily be imagined. In fact, quoting again from the " report."

" These collections of frazil ice are the most important factor of the flood question, and, indeed, it may safely be asserted that they are the sole cause of them. In other words, if there were only field or bordage ice to deal with, no matter how often *they* were broken up, or broken off by wind or thaw, there would be no floods, because it is inconceivable that in a river over a mile in width, with a channel half a mile wide and thirty feet deep, enough of this ice could be sunk to raise the water to such an extent as to produce a flood. The tendency of field or bordage ice is to float, and it *resists* submersion with great force, while the tendency of frazil and anchor ice is to sink upon the slightest provocation, and follow submerged channels, taking all the windings of the currents until grounded in shallow water or arrested against the underside of the fixed ice, to which it freezes and forms a nucleus for further accessions of the same material, until this spongy downward growth reaches many times the thickness of the surface ice to which it is attached."

And further, " There is no formation (of either frazil or anchor ice) *when and where* the surface is covered with ice, and whereas large formations of both take place in the beginning of winter over the vast surface below the Lachine Rapids, the *further* formation of this ice ceases as soon as and wherever the ice bridge is formed."

It might be urged, even supposing the ice bridge was formed in a natural way (as is now the case in Lake St. Louis above) through the freezing of the slack water due to the proposed dam (which would form the water above Varennes into a virtual lake) that the frazil ice coming down throughout the winter from the rapids above would still, passing underneath the ice, adhere to its under surface and block the channel.

This view, however, in the opinion of the writer, is distinctly not borne out by the actual facts as ascertained by the Flood Commission and illustrated on the longitudinal section of Drawing No. 2.

There it will be seen that these formations of frazil are not continuous, as might naturally be expected, but occur in isolated masses, such masses varying greatly in depth.

There must be some reason for this, and the writer contends that whether or no such accretions of frazil occur underneath the ice surface is entirely a question of the speed of the current at any particular point.

As serving to establish this contention, it might be pointed out that in Lake St. Louis, no frazil was found underneath the ice over the whole extent of its surface with the exception of the one point at the head of the lake near Beauharnois where a swift current enters from the river above. Very little frazil was found in the South Shore channel, opposite the Boucherville Islands, where it has always been popularly supposed that the ice grounded. Below Varennes, where the river begins to widen and deepen, and where in consequence the velocity of the current does not exceed about two and a quarter miles per hour ($2\frac{1}{4}$), scarcely any frazil was found, and below, in Lake St. Peter (as in the case of Lake St. Louis above) none whatsoever.

In the Laprairie Basin on the other hand, which is very shallow and traversed with *strong currents*, large quantities of frazil accumulated. It might be here pointed out that, as stated in the report:

> " The condition under which the ice takes in Lake St. Louis are very different from those which obtain in the Laprairie Basin. Lake St. Louis closes entirely with severe weather, without the aid of drift ice, while the Basin does not close until it is filled up with *running ice*."

The greatest mass of frazil was, however, found in the St. Mary Current between Hochelaga and Longue Pointe, and the strong presumption is that this mass would not form if the current were done away with through the building of the dam.

Just why the frazil should accumulate only at points where the current is strong is hard to say. It may be, however, that the frazil formed all winter, as it undoubtedly is in the rapids above, once it comes into contact with the quiet, undisturbed and possibly slightly warmer water found in slack water underneath a coating of ice becomes disintegrated and returns to its natural state *as* water, whereas, in running and disturbed water, the temperature remaining at the critical point favours its adherence to the surface ice above.

It is possible that experiments might be carried out to determine the point definitely, and such experiments would be well worth while, for if it could be established that these accumulations of frazil will not occur in slack water, then the building of the proposed dam besides producing the advantages already drawn attention to, would remove for all time, from Montreal and vicinity, the necessity for guarding against the occurrence of floods.

Proposed Low Water Level in Harbour

The summer fall in the river from Victoria Bridge to the foot of the St. Mary Current is nine feet in three miles and the velocity of current four to eight miles per hour.

The rise of water which accompanied the closing of the river in December, 1886, as noted by the Montreal Food Commission at the respective points was as follows:

Sorel.........	4	feet	2	inches	above	low	water.
Vercheres.....	10	"	2	"	"	"	"
Varennes.....	11	"	2	"	"	"	"
Longue Pointe.	11	"	5	"	"	"	"
Hochelaga....	15	"	9	"	"	"	"
Lock Sill.....	16	"	11	"	"	"	"
Laprairie.....	9	"	9	"	"	"	"

There are no rapids between Hochelaga and Sorel, but there is a nearly uniform rate of fall and velocity of surface current between these points. The effect of the ice pack is seen in the fact that it raised the river at Hochelaga over three and a half times as much as at Sorel.

A section plotted from data collected by the Montreal Flood Commission showing the highest and lowest levels reached by flood waters in Montreal Harbour (at Lock No. 1, Lachine Canal) over a period of thirty-five years (that is from 1852 to 1887, inclusive) is shown inserted on the longitudinal section of drawing No. 2.

The levels are plotted with reference to the *top* of the revetment wall on Commissioners Street which stands at a height of 21 feet 6 inches above ordinary low water.

Here it will be seen that the lowest level noted in this period of thirty-five years at the taking of the ice was a point 11 feet 1 inch below the top of the revetment wall that is a point 10 feet 5 inches *above* low water, and the lowest level at the breaking up of the ice a point 9 feet 0 inches below the wall or 12 feet 6 inches above low water.

The corresponding points for the *highest* levels reached are 1 foot 0 inches above the top of the revetment wall or 22 feet 6 inches above low water at the taking of the ice, and 5 feet 10 inches above the wall or 27 feet 4 inches above low water at its breaking up.

With the proposed submerged dams in place, the low water level would, as shown, only be raised about six feet (6′ 0″) above *present* low water at lock No. 1.

It is clear, therefore, that in the period referred to there was never a season during which, at one time or another the river was not at least 6 feet 6 inches (12′ 6″—6′ 0″) higher than the proposed level for low water in the harbour and that, consequently, such damming would not necessarily entail any alterations in the heights of the various wharves, etc.

As already stated (and as shown on the longitudinal section) the water in December, 1886, reached a point 16 feet 11 inches above low water at lock No. 1, corresponding to about what might be called *Mean Flood Level.* This level would be 10 feet 11 inches (16′ 11″—6′ 0″) above the proposed low water level.

At Varennes the highest flood level noted by the Commissioners was 20 feet 0 inches above low water, and the lowest, assuming that the drop in the surface of the river retains the same ratio as that shown on the longitudinal section would be about ten feet (10′ 0″) above low water.

Proposed Low Water Level at Varennes

It is, therefore, apparent that, by placing the *submerged dam* where proposed and raising the surface of the river ten feet above low water at Varennes, the level would still be 1 foot 2 inches (11′ 2″—10′ 0″) lower at that point (and at all other points upstream correspondingly lower) than it was in the winter of 1886-87, a non-flood year.

As indicated on the section the St. Mary current would be wiped out completely.

Design of Dam.

A suggested type of dam is shown in section on drawing No. 3 in connection with an elevation of one of the proposed bridge piers, but the design is merely illustrative of the proposal and is not to be regarded as being in any sense final. In this, as in all other respects, suggestions would be welcomed by the writer.

The *upstream* side of the dam would, of course, have to be designed with an easy curve so that the ice in passing out to sea would not encounter an obstruction and lodge there.

Type of Lock Gate

The type of lock gate which the writer has in mind is indicated somewhat in detail on drawing No. 4.

Here it will be seen that the gate would operate much on the principal of a large mill wheel. By introducing into a compartment on the periphery water from the upper level the wheel would commence to turn, lifting at the same time the attached gate.

The rear end of the wheel or drum would be counterbalanced so that only enough water would have to be admitted to overcome friction.

The water would be introduced to the bucket or compartment by way of the axis of the wheel which would be hollow.

In lowering the gate, water would be allowed to escape through this axis which is connected by a pipe with the

Longitudinal Section

lower level below the dam. The weight of the gate would then slowly cause the wheel to revolve in the reverse direction and as the wheel revolves, the gate would slowly fall into sockets along the bottom and sides of the lock entirely closing the opening.

The operator, with a lever, would thus have complete control of the gate, and could cause it to raise, or lower, or remain in any position that he might consider desirable.

As has already been pointed out, however, such gates are only a small detail of the scheme as a whole, and, on further examination it might be found preferable to use the older type opening in two leaves.

The same might be said with regard to the proposed bridge, for a *swing* bridge across both locks could be used in place of bridges opening bascule style as described above.

To Open a Channel Each Spring

The Montreal Flood Commission reported ni favour of attempting to open up a channel from Varennes to the city in advance of the general break up of the ice each Spring, thus providing a channel for the ice coming down from the lakes above, which at times produces a jam with consequent flooding.

With a covering of *natural* ice such as would form once the proposed submerged dams were in position, it would be comparatively easy for a vessel of the modern ice-breaking type to do this, whereas, under existing conditions, with the channel blocked with pack ice and frazil, it would prove a very difficult undertaking.

Such a vessel might also be used each Fall in *keeping* open the channel between the above mentioned points so that an additional two or three weeks would be added to the period of navigation, and, if found to be successful, the practice might ultimately be extended in the direction of making Montreal an all-winter open port.

Canal to Chambly and St. Johns

As shown on Drawing No. 1, it is also proposed at the *upper* end to have on the South Shore a canal connecting Montreal Harbour with St. John via Chambly and the Richelieu River, and then, with New York, by way of Lake Champlain and the American system of canals on the Hudson.

The entrance to the canal would be between St. Lamberts and Laprairie at the point marked " V " on the plan, where there would be a single lock with about an eleven foot lift.

From " V," the canal (based on barometer readings taken by the writer in October, 1918) would follow approximately the line indicated to the Richelieu River at " Z."

In the stretch of about ten miles between " V " and " W," the surface of the canal would be level (no locks being required at all). At " W " there would be a large basin, and from this basin, a branch, still at this same level, would connect the main canal with the Town of Chambly. The branch about a mile long, would join the present canal at the point " X " and from " X " the Chambly Basin could be reached by the three existing locks.

Between the basin at " W " and the point " Y " where the canal would join the present Chambly Canal, there would be a lift of about forty-nine feet (49) requiring, say three locks.

From " Y " to the point " Z " where the canal joins the Richelieu River, the existing canal would be widened and deepened.

Below the entrance to the canal at " Z " a dam would be built across the Richelieu River, raising the water to the level of Lake Champlain, so that from " Z " navigation would follow the Richelieu River itself, and not, as now, the canal to St. Johns.

It may be pointed out in this connection that, in a *report* sent to the Deputy Minister of Public Works in June, 1912, dealing with the *regulation* of the waters of Lake Champlain and the Richelieu River and signed by

Ernest Marceau, Chairman.
P. W. St. George, C.E.
U. Valiquette, C.E.

It was recommended that:—A dam be placed across the Richelieu River (at the very point marked " Z " on plan No. 1) and, that the *existing canal*, from the said point to St. Johns, be abandoned in favour of the utilization of the deepened river itself."

This part of the present *proposed project* has, therefore, already been favorably reported on.

Power Development on Canal

As a detail, it is proposed to adopt the suggestion embodied in a plan prepared by C. L. Hervey and dated Montreal, 22nd February, 1910, for a canal in this same locality.

The suggestion is to place a *power house* at " Y ," and thus utilize for power purposes, the head of about 27 feet between the surface of the river above the dam, and the normal surface where the tail race from the power house would join the river.

To provide sufficient water, that portion of the canal between " Y " and " Z " would necessarily have a larger sectional area than the balance of the canal.

The power development indicated on Mr. Hervey's plan would be between 18,000 and 25,000 H.P. A part of this could be utilized in the lighting and operating of the canal and the balance, for industrial purposes.

As the tail race would be well above the forebay of the *plant* of the Montreal Light, Heat and Power Co. at Chambly, this proposed development would have no effect on the *power* output of this Company, and no infringement of their *water power* rights would result.

Similarly, the Town of Chambly and the other towns and villages on the Richelieu below Chambly could raise no valid objection to the proposed canal, as they would really have an *improved* water way connecting with Lake Champlain over that which now exists. Nor would water have to be diverted from the Richelieu into the St. Lawrence, other than possibly, the small quantity necessary for the operation of the lock at the Montreal end of the canal and even this could be obviated by using water from some of the small streams crossed by the canal on the St. Lawrence side of the watershed.

Profile of Canal

An approximate and preliminary profile of the proposed canal based on the *barometer* readings referred to above, is shown on drawing No. 5.

While the writer does not pretend that this profile is in any sense accurate (an actual survey would be required of course to determine the levels precisely) it clearly indicates the possibilities of the proposal and the comparatively low cost which the building of such a canal would entail.

The writer was much surprised to find so very low a summit between the watersheds of the Richelieu and St. Lawrence Rivers.

The canal as indicated on the profile, would, in fact, be merely a big ditch, for it is not proposed to give to it a greater sectional area than that found on the existing canal system on the St. Lawrence River, nor a depth greater than 14 feet.

Channel on the South Shore

In connection with this proposed canal, the vital importance of raising the level of the harbour at Montreal by building the *submerged dam* at Varennes at once becomes apparent.

Increased several feet in depth as it would be, the channel between St. Helen's Island and the South Shore with little or no dredging would at once become available for the passage of barges and other vessels from the canal to Longueuil and adjoining towns, and, of course, direct passage could also be made between the canal and wharves on Montreal Island.

No Possibility of Pollution

There is one point that might reasonably occur to the minds of those present, and that is, the effect of entering sewage on the pollution of the River consequent on the construction of the proposed dam; that is, to the comparative effect of sewage entering swiftly running water as at present or, into water moving slowly as it would do once the dam were in place.

When preparing the paper originally, the writer did not give much attention to this point for the reason that in so vast a body of water as the St. Lawrence River, it would seem that the varying effect would be too inconsiderable to notice.

It may, however, be of interest in this connection, as completely establishing the above conclusion, to note the following extracts taken from "The Final Report on Charles River Basin, Boston."

Extracts

"Basing its conclusions on the study of these conditions and on the reports of its engineer and special experts, the committee finds as follows:

Fresh water, gallon for gallon, disposes in a normal manner of more sewage than salt water; the tendency of salt water is rapidly to precipitate sewage in sludge at the bottom.

For the proper disposition of ewage in water, it is essential that the water be well supplied with oxygen. This is accomplished by the contact of its surface with the air, and this surface water is carried down by the action of the waves and currents, and *especially* by the vertical movement caused by changes of temperature. Bodies of fresh, nearly still water are well oxygenated to a depth of 25 feet or more in ordinary summer weather, and to much greater depths with the Autumn cold.

A comparatively still body of fresh water with animal and plant growths will dispose of a considerable amount of sewage admitted from time to time, and will tend to purify itself, even if no more fresh water is added.

Such a body of fresh water will dispose of more sewage if comparatively *still* than if in motion.

The popular belief that running water purifies itself more readily than *still* water is fallacious. It is found to be the fact that with oxygen present, and equally good conditions for proper bacterial growth, the still water purification is fully as energetic.

Conclusion

In conclusion, the writer hopes that in presenting this paper before the Montreal Branch, a discussion may be started eventually resulting in increased and improved harbour facilities for an enlarged and Greater Montreal.

The writer desires also to acknowledge his indebtedness to Percival W. St. George, M.E.I.C., for much valuable information as to ice conditions on the St. Lawrence River, and to other eminent members of *The Institute* for the encouragement given in the preparation of this paper.

Discussion

P. W. St. George, M.E.I.C., was surprised that he had not foreseen this scheme notwithstanding his long studies when working with the St. Lawrence flood commission. He would, however, like to hear from Mr. Cowie and Sir John Kennedy. The flood commission made exhaustive studies of ice conditions in the St. Lawrence and he drew particular attention to the fact that the St. Mary's Current was the "hot bed" forming frazil. If all rapids were dammed there would be no flooding, while, at the same time, there would be a magnificent heritage of water powers available. Referring to Mr. Lovelace's proposed canal to the Richelieu River he though that there were numerous advantages in the direct route, particularly in saving the long haul down to Sorel and back to Montreal. He moved a hearty vote of thanks to the author for finding out this scheme.

F. W. Cowie, M.E.I.C., congratulated the author on his original and comprehensive scheme and on the way he had touched upon the essential points in the development of the harbour. The present difficulties in the harbour of Montreal were the floods, currents and depth of water. If anything could be done to improve the present conditions no one would welcome it more than he would. He was afraid that the idiosyncrasies of a great river required life-long study. In the present case the problems had been considered since 1830 by the most eminent engineers and the success at the present time bears out his contention that fewer mistakes had been made in the development of the port of Montreal than in any other works of similar importance. Any engineer who would have courage to put a dam below Montreal would get little consideration, even he dumping of comparatively small quantities of material below Montreal brought forth outbursts of indignation from the municipalities bordering on the river. Mr. Cowie was of the opinion that the proposed dam would not eliminate the current inasmuch as the cross section of the river was only enlarged about twenty-five per cent and correspondingly the current would only be reduced by twenty-five per cent and the troubles would be mitigated and not overcome.

The troubles from the frazil should be taken up at different rapids and Mr. Cowie failed to understand why the development of the Lachine Rapids had not been undertaken.

The development of the port of Montreal has been his hobby for many years. There is no port in the world where such a service has been obtained at the same cost. In the past ten years the development of the port has been a romance. The debt has increased in this period from $10,000,000.00 to $27,000,000.00. Ten years ago the revenue amounted to $500,000.00 whereas today it reaches the sum of $2,000,000.00. With the elevators that were in operation ten years ago the revenue did not pay the interest on their cost and only about half the operating expenses, whereas today all the expenses are paid including operating and overhead charges. There are thirty miles of railway in operation today with a revenue of $500,000.00 compared with $67,000.00 ten years ago.

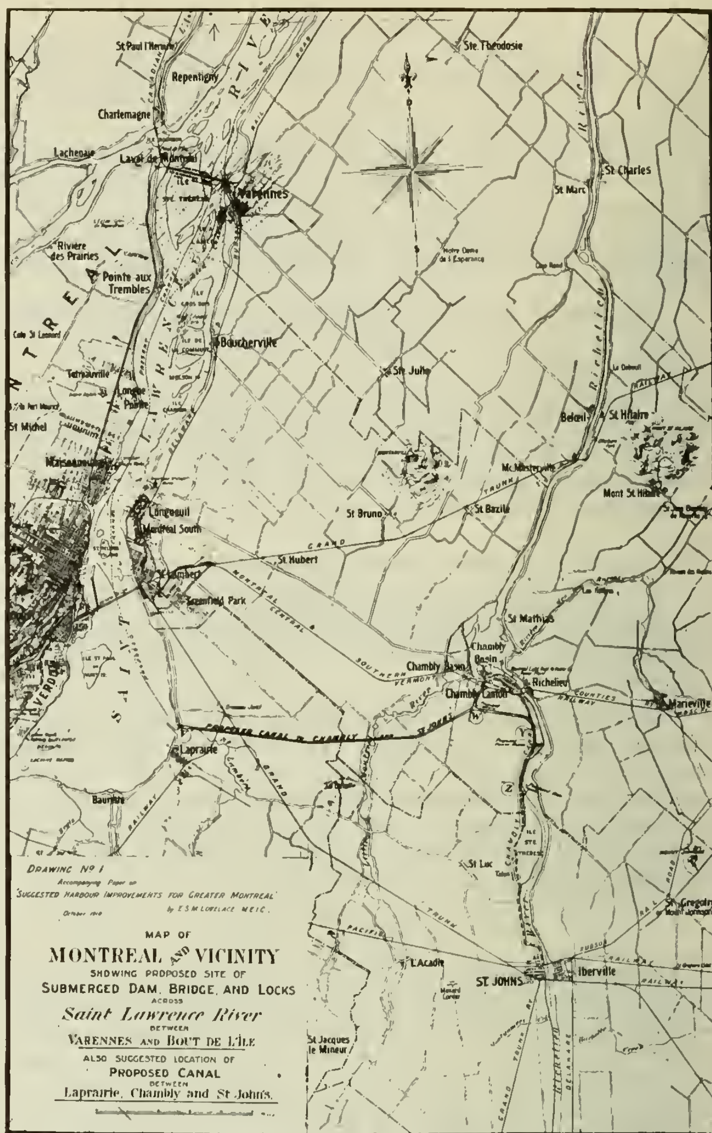
W. F. Tye, M.E.I.C., stated that the paper seemed to be on the right lines and appealed very much to him. Dredging seemed to have reached its reasonable limit. He referred to the tremendous asset the St. Lawrence River forms from the point of view not only of navigation but also of hydro-electric power. There is a lack of coal in Central Canada but the St. Lawrence forms a source of power better than coal. He made reference to the enormous development of the City of Pittsburgh which has been due to the supply of cheap fuel, whereas Montreal should be as favourably situated with regard to the availability of cheap power.

If the large ocean vessels are to continue to come to Montreal the navigation of the St. Lawrence must be improved. *The Engineering Institute of Canada* should interest the Government in the appointing of a commission to study the river as *a whole*. The commission should be composed of the best Canadian engineers. He did not think it necessary to go outside of Canada.

He seconded the vote of thanks to Mr. Lovelace for his exceedingly interesting paper.

K. B. Thornton, A.M.E.I.C., referred to the ice problems and confirmed the author's remarks regarding ice formation. His firm had made investigations and found that Lake St. Francis was absolutely free from frazil. He strongly advocated the canalizing of the river not only for the mitigation of ice troubles but also for the augmentation of hydro-electric power.

J. A. Jamieson, M.E.I.C., thought that the proposal supplied the imagination which is essential for progress



and the scheme should be well worth studying. Everybody is very interested in the progress of our harbour and in the trade by the St. Lawrence routes. He rather regretted that Mr. Cowie is so entirely satisfied over our harbour as this attitude does not look very hopeful for future progress. Montreal is unique in its situation of having the control of the harbour entirely free from commercial interests. There have been many difficult problems to work out and there are yet others.

A. D. Swan, M.E.I.C., stated that we may not all agree with Mr. Lovelace's problem in the question of the placing of locks below the harbour. Apart from their impediment to navigation they would be enormously expensive as they would cost, in his opinion, anywhere from $12,000,000.00 to $14,000,000.00.

E. S. M. Lovelace, M.E.I.C. (in answer to various discussions).

In connection with the discussion taking place after the reading of the above, the writer (*Mr. Lovelace*), would like to claim the privilege of making a few observations.

From some of Mr. Cowie's remarks the inference is, that, in defending the inception and administration of Montreal Harbour as it at present stands, he considers the paper in some sense, a reflection on both. The writer desires, therefore, to assure Mr. Cowie that, in the preparation of the paper, nothing of the kind was either intended or thought of.

We are all proud, and justly so, of what has been accomplished in the direction of making Montreal a terminus for ocean navigation.

Twenty or thirty years ago any proposition to dam the river and introduce locks below Montreal would have been considered so heretical, that, an engineer at that time, could hardly be blamed for not having brought forward a solution of this nature. But, as Mr. Jamieson so well has stated, contentment with what already has been accomplished, is apt to endanger progress in any direction. Conditions have changed, and are fast changing. Already we have seen the larger vessels of the Canadian Pacific Railway unloading at Quebec, so that, if Montreal is to retain its position as the head of ocean navigation, something must be done to give a greater depth of water in the channel.

As Mr. Tye has pointed out, dredging has almost reached its legitimate limit, and the building of dams, therefore, would appear to be the only alternative.

As a *separate* proposition, with only an indirect bearing on the development of Montreal Harbour, the writer is in complete accord with Mr. Cowie so far as the building of a dam at the foot of the Lachine Rapids is concerned, for, having some years ago assisted with the preliminary surveys and estimates of this very proposal, the writer is somewhat familiar with the enormous consequent development of power possible at this point.

When Mr. Cowie suggests, however, that such development at Lachine might well take the place of the proposed submerged dam at Varennes as a means of improving the harbour facilities at Montreal, then, the writer must register himself as being in disagreement with such a contention.

A dam below the Lachine Rapids would not lessen the St. Mary's Current, nor would it increase the depth of the water in the harbour.

It is somewhat doubtful too, as to what effect it might have in the prevention of floods. As Mr. St. George points out, there was a space in he Laprairie Basin above the Harbour, practically free of frazil, indicating, seemingly, that the frazil from the rapids above had been all lodged in the basin *above* this space.

If this were so, then the great mass of frazil found in the St. Mary Current, must have been formed there as a direct result of the current itself.

In fact, in the writer's opinion, a close study of the many cross sections accompanying the report of the Montreal Flood Commission, giving the disposition of frazil in the river, is almost conclusive as showing, that, where there is current there will be frazil, and that where there is slack water no accumulation of frazil will be found.

This opinion seems also to be borne out by the remarks which Mr. Thornton (an advocate of the efficacy of dams as presenting a solution of the question of frazil) was good enough to make.

Mr. Cowie, in concluding his remarks, expressed the opinion that only those who have made a life study, in season and out of season, of the St. Lawrence River, are qualified to speak on the far reaching consequences of a submerged dam below Montreal such as proposed.

To some extent the writer can agree with Mr. Cowie in this, but, in answer, would simply say, that having been brought up on the South Shore, where the formation of an ice bridge each year meant so much to the inhabitants, where the effects of flooding were so very disastrous, and where, in consequence, the discussion of ice conditions was an absorbing topic of conversation, the writer had opportunities of hearing expressed on all sides causes and possible solutions of the ice trouble, opportunities too, of himself observing the action of the ice under ever varying conditions. Having moreover, an intimate and special knowledge of the section of the river under discussion, not gained solely from the study of charts, but from actual first hand experience gained when camping year after year on the various islands, and from having to contend with the many shoals along the South Shore and with the currents in the different channels, the writer fells that his carefully considered opinion, as outlined in the paper, after making every allowance for possible overstatements or omissions, may be of some little value.

With regard to Mr. Swan's statement that the locks alone might possibly cost as much as twelve or fourteen million dollars, while the writer has not made any estimates, he was quite prepared to find that they might cost even more than this.

Twelve millions would not go very far dredging away the shoals, necessary for any harbour development on the South Shore opposite Montreal (and such development the writer understands has already been considered by the Harbour Board), whereas, with the increased depth due to a submerged dam as proposed, such dredging operations would be very largely decreased.

Whether, however, the scheme as a whole would cost twenty or even twenty-five millions, if assurance could be given that put into effect, the benefits suggested would largely be realized, then, in the opinion of the writer, no money ever invested by the country in its public works could be likely to bring a larger return.

* * *

L. M. Jones, M.E.I.C., City Engineer, Port Arthur, Ont., is preparing plans for the development of the City's water front. The front is to be developed so that all railways can secure access to the properties on the water front. These properties are to be improved and served by the dredging of slips for steamship approach.

* * *

It is proposed that the sum of $1,000,000. be expended on construction work in Kingston, Ont. half of which will be done by the federal and provincial Governments.

What The Engineering Institute Can Do

At an open meeting of the Toronto Branch of The Institute held at the Engineers' Club on Friday, February 28th, 1919, a number of papers were presented on the above subject showing the interest that has been aroused, and indicating the trend of thought in connection with immediate future activities of The Institute. The papers are reproduced here under the names of their respective authors.

E. M. Proctor, A.M.E.I.C.

The fundamental aims of *The Institute*, as set forth on the front page of *The Institute's* monthly publication, are as follows:—

1. To facilitate the acquirement and interchange of professional knowledge among its members.

2. To encourage original research.

3. To develop and maintain high standards in the engineering profession.

4. To enhance the usefulness of the profession to the public.

These are the ground work upon which all the activities of *The Institute* are based and I propose to make some suggestions as to what *The Institute* can do in relation to each one of them.

1. What can *The Institute* do to facilitate the acquirement and interchange of professional knowledge among its members?

The method which has been used in times past has been by means of technical papers read before the branches of *The Institute* or published in the Proceedings. This is and will continue to serve a very useful purpose towards the acquirement and interchange of professional knowledge and I believe should be made more general.

Visits and inspections of engineering works and institutions by the members of *The Institute* should be more often carried out. Only in this manner can first-hand information be obtained of many important contracts. If it is possible an evening or so before the inspection to have an illustrated lecture or talk upon the work which is to be viewed, the inspection on the following day would be much more interesting to the members, as they would know what to look for when they went on the work.

A feature which has been neglected to a large extent by engineering institutes is the training of its members in debate and I would suggest that the foremost engineering questions of the day should be debated by the members of *The Institute*. A senior member could be persuaded, I believe, to lead on either side of the debate and one or two junior members to follow up.

Such subjects as the following suggest themselves at once: –

"The advisability of building the Georgian Bay Ship Canal."

"Should the canals on the St. Lawrence be deepened and widened?"

"Should the City of Toronto purchase the Toronto Street Railway?"

"Should municipalities own and operate all public utilities?"

Etc., etc.

These are subjects that are live and very vital to the general public and by discussing them the members of *The Institute* would not only be doing themselves a great good, but would bring the engineering profession before the public and help to form public opinion on these great subjects, which after all are purely engineering problems.

Another way in which *The Institute* could facilitate the acquirement and interchange of knowledge would be for the Local Executive of *The Institute* to pay more attention to the library. There is no catalogue, except the card index at the library available and members do not know what books there are to which they could refer, without going to the library. An effort should also be made to secure the more up-to-date books on engineering subjects, and keep the library so that it is of use to the members.

2. What can *The Institute* do to encourage original research?

This is without question a very wide field and cannot be touched very easily without the expenditure of some money. It might be possible to work up a fund in *The Institute* which could be used to help defray the expenses of members who could find time to investigate problems of interest to engineers at large. The laboratories of the universities might be made available for some of this work and by an organized effort on the part of *The Institute* as a whole something might be done along this line.

3. What can *The Institute* do to develop and maintain high standards in the engineering profession?

The first thing that appeals to one under this heading is the financial remuneration of engineers, for how can an *Institute* whose members are so lowly paid, expect to develop and maintain high standards.

As a suggestion as to how the salaries of the engineers might be raised, I would suggest the following scheme.

Under the new by-laws of the Branch, there is a clause to the effect that the various branches of engineers could form sub-sections in *The Institute* to deal with subjects peculiarly affecting their branch. These branches could study the salary situation and bring in a report as to what they would consider to be a fair schedule of salaries. In the meantime, the Executive of the Branch could appoint a committee, whose duty it would be to collect data as to what engineers are being really paid in the different public services. Then with the reports of the different sections, and the special committee, before them the Local Executive could draw up a suggested schedule of salaries, this in turn being forwarded to headquarters. If each Branch carried out this program, there would be available for Headquarters enough data upon which they could act. A schedule of salaries such as I have suggested would be a very good step towards raising the general salaries of engineers, because the employer would know what to expect to pay and the applicant would know what he should ask.

Of course, in connection with such a scheme the practicing engineers would have their branch organization, which would draw up a suggested schedule of fees, etc.

Another subject, which is too often overlooked by engineers, is the fact that many commissions are being appointed in these days, which deal directly with engineering matters and it is a rare case when an engineer is appointed on one of these commissions. *The Institute* should insist inasmuch as they are able that at least one capable engineer be on each commission so formed.

The Institute should formulate an accepted code of ethics as to the relation of engineers to each other and to the public and when a member is elected to *The Institute*, he should undertake to obey the by-laws and ethics of *The Institute* and in the event of his not doing so, the penalty should be expulsion.

4. How can *The Institute* enhance the usefulness of the profession to the public?

I believe that this last clause includes all the former and if we, as engineers, live up to the three preceding fundamental aims of *The Institute*, we will carry out this last one to perfection.

*H. A. Goldman, C.E., A.M.E.I.C.**

Just twelve months ago tonight, on February 28th, 1918, a group of Toronto engineers came together at the house of one of them, and discussed the economic and social status of the engineering profession. After considering the matter thoroughly they decided to organize a new engineering society under the name of Canadian Association of Engineers, for the purpose of promoting and improving these economic and social conditions. And to work along the same lines as the American Association of Engineers.

Organization work was immediately started and subsequently several meetings were held in the rooms of the Engineers Club. At some of these meetings there were present the officers of the Toronto Branch of *The Institute* of last year, and some members of the council. After these representatives of *The Institute* listened to the arguments brought forward and to the discussions which followed, and after agreeing completely with the principles involved they made the following suggestions. Since the Canadian Society of Civil Engineers has undergone a thorough reorganization, even changing the very name of the society, and since under the new by-laws and constitution the scope of work is considerably widened so as to include such work as outlined by the new organization, they proposed, therefore, that the Canadian Association of Engineers should discontinue its activities until *The Institute* has had a chance to prove that it is willing and desirous to consider the economic problems of the engineer, as well as his technical problems.

At first the organizers of the new society were not inclined to give up their work immediately. But at one meeting held in May of last year, when this question in particular was discussed, several representatives of *The Institute* and a representative of the Canadian Engineer were particularly active in urging upon the organizers that because of the established existence of *The Institute*, because of its recognized standing and its membership of over three thousand, *The Institute* would be in a far better position to secure immediate results than a new organization could accomplish.

The question was taken to a vote and was carried almost unanimously that the Canadian Association of Engineers discontinue its activities until *The Institute* has had a chance to consider and tackle those economic problems.

It is rather an interesting coincidence that just one year later, to the very date, after that first meeting, the Toronto Branch of *The Institute* calls a meeting to discuss these very economic problems and presumably with the intention to start activities immediately to improve the existing conditions.

The coincidence of the two meetings occuring on the same day of the year seemed sufficiently interesting to call attention to it before proceeding with the regular subject matter of the paper.

To one who comes in close and intimate touch with the rank and file of the engineering profession, and who has the opportunity to discuss with them their attitude and feeling towards *The Institute*, it must be quite clear that *The Institute* will have to adopt some important and radical steps for the improvement of the economic and social conditions of the profession. Such steps are necessary in order to dispel the unrest and discontent that exists among engineers at present and in order to retain the confidence of the individual engineer in *The Institute*. One has only to refer to the numerous letters and correspondence that are published constantly in *The Institute Journal* and in other technical magazines to realize that such discontent is by no means confined to only one particular locality or one particular district. Coming as these letters do, from practically all parts of the Dominion, from the east and from the west, from the engineers employed in the government service and from the engineers connected with private concerns, from the superintendent of construction in the field and from the designer and draftsman in the office, these letters must prove conclusively that the trouble is wide spread throughout the Dominion.

The economic and social problems of the engineer can no longer be ignored by *The Engineering Institute*. No longer can the national society remain indifferent to the present position and status of the profession and still expect the support of the individual engineer. In the United States where the older conservative societies could not or would not open their eyes to see the true and exact position in which the engineer finds himself today, where by means of fictitious tables and diagrams they wished to deceive themselves and the rest of the world into believing that the engineer occupies the same financial level as men of other professions, there it became necessary to organize a new democratic national engineering society. And thus the American Association of Engineers was formed for the purpose of tackling these economic problems which had been ignored by the other societies.

Here, in Canada, we are, perhaps, more fortunate in that the existing national society has itself undergone a

*Paper read before the Toronto Branch of *The Engineering Institute of Canada* on February 28th, 1919.

reorganization, and in the face of existing conditions is said to be willing and desirous to adapt itself to present day requirements and assist the individual engineer in the solution of his economic problems as well as his technical problems. In this respect our opportunities to gain successful results are far better than those of our colleagues in the United States. It is far easier to accomplish results when one strong organization is working for the interests of all concerned than when several small groups are working separately, provided, however, that co-operation and action can be secured within that one organization.

The causes which have produced this general feeling of unrest and discontent are nominally two, poor pay and lack of recognition. Actually, however, the removal of one of these causes would gradually also eliminate the other. Give the engineer the proper pay that he deserves, and recognition will come as a matter of course. It is no secret to any one of us that no other thing has contributed so much to the degradation of the engineering profession and no other thing has affected so much the prestige of the engineer as the small financial returns for engineering services. It is idle and useless to blame the public for not giving the engineer the proper recognition. We must not forget that the public at large knows nothing of the amount of training that one has to go through to qualify himself for an engineer. The public has no idea of the nature of the problems that daily confront the engineer and the sound judgement and skill that he must exercise in order to solve these problems. The public knows nothing of these things and, therefore, cannot appreciate the importance of the engineer in terms of these attainments and qualifications. The public has but one method whereby to determine the value and importance of any commodity, or any class of people whose services the community requires and that method is by means of the usual medium of exchange, dollars and cents. The standing, importance and prestige of any class in the community is in direct proportion to the value of the services of the members of that class. If then the engineers themselves establish a low rate of pay for their services, the public can only take them at their own valuation and can only place them in a class and in a position to which such valuation entitles them. It must be evident then, that never will the engineers as a class occupy the same position in the community as the doctor or lawyer, until they raise the value of their services to the same extent as that of the men of other professions.

When speaking of the services of the engineer to the community, Mr. W. H. Finley suggests that the engineer, because of the nature of his education and training, would be the best qualified to solve the difficulties between labor and capital. It is surprising that such suggestion should be made at all, for what class of labor is there that has sufficient confidence in the engineer, as a class, to entrust them with their financial interests, when as a matter of fact, under the present economic condition organized labor consider the engineers inferior to themselves, more than that they consider them as a hopeless economic failure.

As an illustration of what labor thinks of the engineer, the Engineering News Record of New York tells of a well known engineer, of many years experience, in charge of construction work, who had occasion to give some order to a brakeman of a train. The answer of that brakeman was very prompt, "Who the hell are you to tell me how to do things when my pay cheque is bigger than yours?"

Another case is told of a well known railroad engineer, who while discussing with some fireman general railroad conditions was asked if he knew the reason why engineers receive such small pay. When the engineer answered that he did not know the reason, he received a rather unexpected reply. "You see," the fireman said, "the reason that the railroads pay you engineers such salaries as they do is because they are ashamed to pay you any less."

It was the pleasure of the writer to hear a lawyer compare the two professions, law and engineering, "Why," he said, "there is no comparison at all, it takes training, brains and ability to become a lawyer, but any darned fool can become an engineer if he only wants to waste his time."

These instances indicate where the wind blows, and what it is that is affecting the prestige of engineers, and why they are not recognized.

But there is even a more serious aspect to the matter than merely the prestige and the dignity of the profession, and we must not for a moment lose sight of it. The general disturbances in labor circles which are being reported from practically all parts of the globe are surely going to materialize into at least two definite results. In the first place labor in the future will receive a far greater share from the products of the industries than it ever received before. And, secondly, the cost of living is bound to remain high in direct proportion to the increased income of labor, and will never come down to the level of pre-war days. In that event the question naturally presents itself, what is to become of the salaried technical engineers who even before the war had a difficult task to make both ends meet. Organized labor will get a higher standard wage. Manufacturers will get higher profits by charging bigger prices for their commodities. The farmer will get a higher income by selling his products at increased prices. In the face of such conditions how are engineers going to exist. Are engineers to be the only victims of circumstances at whose expense the other classes will improve their material conditions, since they will have to pay the increased cost of commodities, while their own incomes remain the same.

Some remedy must be found to improve these conditions and so far but one feasible, practical and desirable remedy has been suggested, and that is, that *The Institute* should adopt a standard minimum salary schedule to be paid for various degrees and grades of engineering work. Such schedule to be based on the nature and responsibility of the work, and the technical qualifications required in order to perform such services.

It is realized, of course, that the adoption of such dominion wide standards would at first entail some difficulties in the enforcement of same. But on the other hand, we must not forget that the question of pay and salary of engineers is not an issue between engineers and the public, or even between the subordinate and his chief. As a matter of fact it is only a family affair, requiring just a little adjustment among the engineers themselves. Because in nearly all cases the pay and salary of one engineer is usually entrusted to the hands and to the judgment of another engineer, and if that second engineer could only have a guide as to what is actually the value of such services as he requires from his applicant, and since such a schedule would serve as a guide, there should be no difficulty in getting a square deal.

Furthermore the mistake must not be made that the demand for a square deal is confined merely to the younger men or to the juniors as some seem to be inclined to think. The truth of the matter is, that the profession is underpaid all the way down the line, that many men in full charge of departments with great responsibilities are just as much underpaid as their subordinates working under them, and readjustment must be made all the way up. During the last twenty years the economic conditions of this country have considerably changed. Cost of living was gradually mounting upwards and accordingly all classes of labor have demanded, and received, gradual increases of wages. The medical, law and other professions have followed suit and increased their fees to conform to the increased cost of living. Yet we find that in the case of the engineering profession, perhaps the only profession of which the members are receiving the same scale of salaries that they received twenty years ago. We must remember then, that so far as remuneration is concerned engineers are twenty years behind the rest of the world, and the longer we will wait with settling this question, the longer we will postpone it, the farther will we remain behind, and the more difficult will it become to adjust matters, and for this reason it is desirable to take prompt action in tackling this problem.

But there is even a more serious reason why *The Institute* should take prompt action in the matter. It is probably already known to most of us, that in recent months there has been formed in the United States a strong union organization of engineers and draftsmen, affiliated with the American Federation of Labor. That this new organization is making tremendous progress is evident by the fact that at one of the regular half monthly meetings of the Chicago branch, there were 122 new members enrolled at one time.

Whatever the opinion of some engineers may be as to whether or not it is desirable or possible that engineers should form a union, the matter is now an established fact. In the United States, where the engineers are already divided into so many different organizations, such a union will probably do more good than harm. Because at least so far as financial gain is concerned, there can be no doubt but that they will secure it, judging from the accomplishments of other organizations affiliated with the American Federation of Labor. Here in Canada, however, the creation of such a union might cause considerable harm to the profession, in that it would break up the power and strength which it is intended to be concentrated in one organization. If such a union should be formed in Canada, there is no doubt that not only juniors and the younger men would join it, but from the sentiments expressed by some full members of *The Institute* it may be taken for granted that even such would join the union. That that would be to the detriment and against the interest of *The Institute* can well be realized. And it is up to *The Institute* to take immediately such steps as will eliminate the necessity for the formation of such a union here.

I would, therefore, suggest that a salary committee be appointed to-night by this Branch. This committee to study this question thoroughly and prepare a schedule of minimum salaries for engineering services. At the same time the secretary should be instructed to communicate with the other branches and request them to prepare similar schedules. All these schedules to be submitted to the parent institute, who would review them and select from them final schedules for the different Provinces to be adopted by *The Institute*.

J. C. N. B. Krumm, A.M.E.I.C.

Anyone who is requested to write a five minute paper on the question: "What can *The Institute* do?" is confronted with a most difficult task; not because the field is so restricted, but from the fact that it is practically unlimited, and the difficulty is to condense it sufficiently to confine enough of it within that short time limit.

The writer will, however, endeavor to suggest lines; along which *The Institute* can do great work of benefit, not only to the engineering profession, but to the country.

The present and past status of the engineer, we all agree, is far below the level, which his usefulness and talent entitles him to maintain, and the only question, that remains and about which there, for several years, has been considerable discussion, is: "*Can this condition be ameliorated, and if so, what can be done, so as to make it most productive of results?*"

To the first question we can only give the conditional answer, that unless the individualism which has been altogether too prevalent within the engineering profession is rooted out and replaced by absolute solidarity, the engineering profession will forever stay where it is and has been.

This is not the time, however, for criticism of what has been done in the past. *The Institute* must now look forward and as one unit endeavour to successfully tackle the many problems which are ahead.

The first step towards solidarity is to make of *The Institute* a close corporation, and this *The Institute* can accomplish of itself.

It is gratifying to note the resolution in regard to legislation passed on the last annual meeting, and that the government takes immediate action is to be sincerely hoped for.

Should the government shelve the question, *The Institute* is confronted with two alternatives: one is to continue to travel in the same old rut; the other to take action themselves to make *The Institute* a close corporation.

It is the writer's opinion, that this could be accomplished by starting a vigorous campaign for eligible members throughout the Dominion followed by subscription by all members to a pledge, not to work for or with or employ any engineer who is not a member of *The Institute*.

This might to some savor to much to unionism; but, in the first place, it is without doubt the next best proposition; secondly, when considered in the right light, what difference is there in legislation by the government and action by *The Institute* to make it a close corporation. The result is the same.

Solidarity, however, will not be attained by only making *The Institute* a close corporation, as this is only an introductory step to the real work.

Absolute solidarity can be attained only by regulations forbidding the use of *The Institute* as a subterfuge for promotion of personal or corporation interests, of which there might be danger, when *The Institute* gains in power and influence.

The greater the factors the greater the product. This maxim can be applied to the engineering profession as a whole.

In order to become a factor, however, the engineer must have the social standing, to which his special training entitles him, and even demands of him, and as his usefulness depends on the authority he can command, it follows, that to gain a high standing is his economic duty to the country.

In our commercial age, this standing cannot be attained, without giving the engineer a good living wage. He must be placed beyond wants in order to represent the profession and to develop himself.

It is preposterous to exhort the engineer to uphold the dignity of the profession, unless he is provided with the necessary means of doing so, and this is better pay and position.

To expect good work from an engineer, who is worried how to make both ends meet, and who has to deny himself and his family many things, which make life worth living is next to persecution.

In order to be efficient in his work he must have a clear head free of financial worries, as only then can he concentrate his mind on the problems with which he has to contend, and it must be borne in mind, that upon the initiative and ability of the engineer the economic and efficient utilization of our country's resources depends.

Before the war the engineers, although to a certain extent grumbling over the state of affairs, have borne it rather patiently, until the cost of living started to go amounting, on account of the war, while their salary was practically stationary. A movement started, which now seems to have taken concrete form in the States as a union affiliated with the American Federation of Labor and this movement is already spreading into Canada. The formation of a union affiliated with labor would be one of the most deplorable episodes in the history of the engineering profession, and *The Institute* must at once take steps to forego it, by themselves championing the cause of the engineer. The writer would suggest that the branch make the recommendation that a committee be at once formed to prepare a schedule of fees and salaries for engineers.

The Institute can and also should give moral backing to engineers in public service, as city engineers, township and county engineers, whose lot is a sad one having to deal with refractory bodies as councils, etc. *The Institute* schedule of wages would prevent the councils cutting their engineers salary at their pleasure, as has too often been done. The moral backing of *The Institute* will also tend to dampen the energy with which these bodies expose the engineers to indignities of different kinds. In such case the engineer in question should be given opportunity to submit his case before *The Institute* and if he is in the right he should have the *solid backing* of *The Institute.*

Another step, that should be taken by *The Institute* is to endeavour to awaken interest in competitive designs, wherever these are feasible. This will bring the talented engineers to the fore front, while the country will get the best product that the engineering profession can produce. There is no reason why the same cannot be done here as is done in Europe, when a great and difficult project has to be considered.

The duties of the engineers are not only technical, they are also economic and political. The whole engineering profession is awakening to this fact, and their organizations are at last responding to the persistent demands, that greater interest and part should be taken in civic and social activities. As this field is altogether too large to consider in any but a very general way, the writer will only endeavour to point out a few things that *The Institute* can do to help along this great movement.

In this connection I would like to mention W. R. Ingall's recent presidential address before the Mining and Metallurgical Society of America in which he outlines the duties of the engineer to the public, and as this address is very eloquent and especially to the point it should be closely studied by every engineer.

The great problem which the country has to solve at present is re-construction, and in order to carry this to a successful conclusion a careful re-organization of the resources of the country will be necessary. In doing so it should see too, that the engineering profession will become a great factor. To further this *The Institute* should follow the example of the American Society of Civil Engineers and "adopt the principle of becoming an active national force in economic, industrial and civic affairs," and establish offices in Ottawa "to keep fully advised as to all matters in which the engineering profession should have a voice."

The statement has been made by one of our leading papers, that "it would appear, that Canada's total external debt, public and private, at this moment is not less than a quarter billion dollars, and that the eight million people within the Dominion must produce and export yearly goods to the value of over one hundred and sixty million dollars to pay the interest alone."

Now, this is only to pay interest charges, and if the principal is to be reduced, the production will naturally have to be so much more.

It must be borne in mind, that this amount must be over and above all imports for the same period.

If the country shall be able to manage this, the people of the Dominion must work hard and exercise the greatest thrift and economy; and here it again is, where the engineer should play a dominant role. We have got the natural resources and the problem before us is to make the most out of them, with the greatest economy. There is no production, where engineering problems of one kind or other are not involved, and it is *The Institute's* prerogative and duty to the country to endeavour to have this work done under the administration of engineers, so that it can be executed in the economic and efficient way. It is not enough to have engineers in subordinate positions; the head must also be an engineer. The money which has been borrowed, must be most economically expended and in the main on works, which will yield revenue instead of adding to the dead weight of unproductive debt.

As already stated economic reconstruction cannot be realized without the united efforts of the whole nation, and with the present attitude of labor the outlook is not very promising. Shortening of working hours and higher wages are beneficial only up to a certain point, beyond which they become most detrimental.

The writer is, on account of this, very doubtful about any foreign contracts for Canadian or American firms, except in lines, where other countries, for one reason or other, are out of the market.

One trade especially is bound to receive a serious setback, and that is the ship building trade, which most likely will dwindle down to, what it was before the war, and probably less.

As the excessive demands of labor tend to *decrease* production and the engineers problem is to *increase* production, it follows, that the engineer, if he shall successfully carry out his purpose must by all means at his disposal try to counteract any excessive labor policy, and this can be done only by taking a greater interest in and even enter into polictical life.

Could not *The Institute*, as soon as it has succeeded in organizing into a close profession, get in touch with all professional and other bourgeoisie organizations and form a professional congress, which would endeavour to promote harmonious relations between capital and labor, thus acting as a stabilizing factor? Such an organization would be a strong counter weight and—especially if it allied itself with the commercial and agrarian interests—would tend to curb the demands of the trades and labor unions, who, now, apparently do not know where to stop.

The stand, the engineer generally takes, is that it is below his dignity to take active interest in anything but sine and tan, stresses or transits, and this is one of the reasons why his status is low. He must, however, tear himself loose from this idea and develop a higher vision.

We have had several good examples of engineers, who have entered into public life and been highly successful.

In Norway, out of 10 cabinet ministers, 3 were engineers, and of them one of them was Prime Minister and one Minister of Foreign Affairs, holding, what in these times would be two most important portfolios. They guided the country successfully through four years of distress and danger.

This unfortunate war has principally been one of money and engineering and especially have the Canadian Engineers contributed to its successful conclusion, for which we owe them deep gratitude.

The engineering profession has thereby been given a great boost and it is our duty to see that the good work is kept up to the honour of the profession and benefit to the country.

I have here endeavoured to suggest some topics, on which to start discussion, as only this will start a movement in the right direction. There is a great task ahead of us and it will take a long time; but we do this not so much for ourselves as for the future generations of engineers.

George Phelps, A.M.E.I.C.

On the question of what *The Institute* can do for its members I take it that I am expected to confine my remarks as much as possible to some suggestions of a practical nature as to a line along which *The Institute* might with advantage take action.

Such suggestions should naturally have reference as far as possible to the advancement of the members as a whole, but I take it that it is permissible for me to speak from my own particular point of view only, with the hope that whatever may be of value in my remarks may be adapted to the particular requirements of other sections of *The Institute*. Whether or not we eventually get legislation which will make engineering a closed profession (which I may say in passing I hope before long will be the case) there are many things of a helpful nature which we can be doing now.

We are at present undergoing a process of reorganization made necessary by the widening of our scope, by changes which have lately taken place, and one of the first things necessary in any reorganizing process is to have a stock taking to see just where we stand and what we are worth. From the point of view of the municipal engineer then, I would suggest that *The Institute* causes to be prepared a list of all the cities and towns in the Dominion of say 5,000 inhabitants and over, giving the name of the engineer, what salary he is paid, whether he is a member of *The Institute*, what his qualifications are if he is not a member, also giving the number of assistants under him and any other items which may help toward giving a good general knowledge of our present standing. Such a list would, I think, help to make clearer the nest step to be taken; it could probably be best prepared through the branch secretaries; it would doubtless entail quite an amount of work, but I think it would be worth while and we should be prepared to pay accordingly for the information, which would of course be available to all the members.

It would doubtless be in the interest of the general public as well as ourselves if each such city and town had an Engineer to carry out its works whose membership in *The Institute* was a guarantee of his proper qualification for the position, and we should follow up the first step with an appeal to those engineers who are not members but who are duly qualified, asking them to join *The Institute*. Also when a vacancy occurs in any of the listed positions, it would, I think, be quite in order to approach he council of the city or town with the object of persuading them to make membership of *The Institute* a condition of the appointment; at the same time offering the services of *The Institute* in helping to find the right man for their work. In order to carry this out effectually, it would as a matter of course be necessary that membership of *The Institute* should carry with it a guarantee of engineering knowledge and experience in accordance with the grade of the member, and this in turn points to the necessity of entrance examinations for new members.

You will gather from the foregoing that I am in favor of using *The Institute* in the way of an exchange for men more than it has been used in the past, as well as an exchange for ideas, and by following up some system such as I have briefly indicated, I think we might before long arrive at a time when towns in need of engineers would naturally turn to *The Institute* first, for the help and advice which should be gladly given to them. But whatever might be done in this way would not be complete until the existing Municipal Act is amended in such manner that only properly qualified men can be appointed as city and town engineers, for which purpose the status of such engineers should be defined by legislation, and in the final outcome we arrive at the point, at which I think the majority of us are aiming, namely, a closed profession for engineers.

Such a list as I have suggested above might also form a basis for a schedule, fixing minimum salaries for municipal engineers and their assistants, which in itself is a most desirable step towards raising the standard of this section of the profession. It would not of course be feasible to have one fixed salary rate for all town engineers, irrespective of the location and size of town, but after such a list has been compiled and full information gathered as to existing salary rates, the grading of municipal engineers and fixing of their salaries according to grade should not be a very difficult matter. I know it will be objected that we cannot as things are prevent a town from appointing a cheap man if one can be got, and neither can we prevent man seeking a job from selling his services cheaply in order to get employment, but one thing we can do, and I would advocate some such measure as long as it may be found necessary, and that is, after having fixed our schedule, make expulsion from *The Institute* the consequence to any man accepting an appointment at less salary than the schedule rate.

Should some such measures for listing and grading engineers be considered generally advisable, I should imagine that those familiar with other branches of engineering could easily devise for those branches a scheme on similar lines for the same purpose.

* * *

International Commission Safeguards Public Health

Several years ago the Governments of Canada and the United States requested the International Joint Commission to investigate the causes and extent of pollution throughout the boundary waters between the two countries, and to recommend such remedies as would adequately safeguard the public health of the people on both sides of these waters. This investigation naturally fell into two branches. In the first case the Commission brought together and secured the views of representatives of the Federal, State and Provincial Boards of Health. As a result of this conference the Commission was able to outline in a general way the scope of its investigation. It then engaged a corps of sanitary experts, who under the general direction of Dr. Allan J. McLaughlin, of the Public Health Service of the United States, Dr. J. W. S. McCullough, Chief Officer of Health of Ontario, and F. A. Dallyn, A.M.E.I.C., Provincial Sanitary Engineer of Ontario, carried out what has been described as the most extensive bacteriological examination of waters the world has ever known. It embraced in fact the entire system of international boundary waters between the two countries, extending for a distance of some two thousand miles from the St. John River in the east to the Lake of the Woods in the west. One of the most gratifying results of these bacteriological surveys was the assurance that the great bulk of the Great Lakes water remains practically in its original purity, in spite of the fact that eight or ten million people have contracted the very bad habit of dumping all their sewage into these waters, and that the entire shipping of the Great Lakes, carrying in one season not less than fifteen million passengers, has followed the same evil practice. Serious pollution was found at many points along the boundary waters, and particularly in the Detroit and Niagara Rivers, where the cities of Detroit and Buffalo, with a number of smaller communities on both sides of the boundary, have been doing their best to make the water of these rivers unfit for human consumption. Severe epidemics of typhoid fever have for years past warned the lake cities that, while they were spending hundreds of millions of dollars on their streets and buildings, and parks, and in other ways adding to the comfort and convenience of their inhabitants, the most vital consideration of all, that of public health, was being grossly neglected. If the International Joint Commission should achieve nothing more than to awaken the cities of the Great Lakes to the vital importance of protecting their water supplies, it will have more than justified its existence.

Having completed the first branch of its investigation, that is as to the sources and extent of pollution, the Commission took up the very important question of remedies, and as an initial step held a conference in New York with a group of sanitary engineers, including men of international standing such as George W. Fuller, Earle B. Phelps, and George C. Whipple of the United States, and W. S. Lea, M.E.I.C., F. A. Dallyn, A.M.E.I.C., and T. J. Lafrenière of Canada. As a result of this conference and the subsequent deliberations of the Commission it was decided to adopt, at least tentatively, certain fundamental principles for the preservation of public health upon which the experts were in agreement. The most vital of these principles is that, while in certain cases where the ratio of water to sewage is unusually large the discharge of the latter into boundary waters may be made without danger to the public health, " effective sanitary administration requires the adoption of the general policy that no untreated sewage from cities or towns should be discharged into boundary waters." The other principles adopted relate to methods of sewage purification and water purification.

Field work in connection with the second branch of the investigation was carried out by a corps of sanitary engineers under the direction of Earl B. Phelps of the U. S. Public Health Service and F. A. Dallyn, A.M.E.I.C., of the Ontario Board of Health. The elaborate reports of the bacteriologists and sanitary engineers on the two branches of the investigation have already been published. The Commission has now issued its own Final Report to the two Governments, embodying its conclusions and recommendations. In that Report, after setting forth the character and extent of the pollution, and the remedies recommended, it is suggested that the two Governments confer upon the Commission's jurisdiction to regulate and where necessary to prohibit the pollution of boundary waters and waters crossing the boundary. While nothing has yet been done in the direction of conferring upon the Commission jurisdiction to carry out its own recommendations, the two Governments have, within the past few weeks, requested the Commission to draft rules and regulations designed to meet the needs of the situation.

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

VOL. II. APRIL 1919 No. 4

Increasing Remuneration

The branches have already been advised of the proposal of the Government to establish a higher basis of salaries for engineers employed by the Federal Government and have been urged to secure the co-operation of their local members of Parliament towards this end.

The Council strongly urges every member of the Institute to use his influence with his local member of the Dominion Parliament to secure support of this most important movement designed to give the engineers employed by the Government a measure of reward somewhat in keeping with their earning capacity. This means a much higher standing than at present enjoyed.

All the influence we possess should be used in this cause.

Joint Committee on International Affiliation

In his report to Engineering Council, Secretary Alfred D. Flinn, after his return to New York from attending the Annual Meeting of *The Engineering Institute of Canada*, at Ottawa, on February 11th, reported as follows:—

"At a luncheon in the Chateau Laurier attended by about 200 and in private conferences with President H. H. Vaughan and Secretary Fraser S. Keith, of *The Institute*, your Secretary discussed briefly the international affiliation of engineers. Many engineers of Canada desire some form of organized affiliation with engineers in the United States. Membership in Engineering Council is not feasible for a number of reasons, such as expense and fact of separate national governments. Informally it was agreed with President Vaughan that *The Institute* would, as a first step, appoint a few members to a joint committee to which Engineering Council would also appoint members, and that this committee would constitute the bond of affiliation for the present, while studying what mutual services may be rendered and what other arrangements may be made between the *Institute* and Engineering Council. It is recommended, therefore, that Engineering Council appoint members to such a joint committee on international affiliation.

"But the chapter on international affiliation does not end here. Secretary H. Mortimer Lamb, of the Canadian Mining Institute has visited Engineering Council's office, and has expressed the desire of his organization for some connection with Council. While your secretary was in Ottawa he had a call from Secretary Clyde Leavitt, of the Canadian Society of Forest Engineers. This is a very small organization, but it likewise wishes to be associated with Engineering Council, particularly in an international forest conservation committee. Under date of February 14th, a communication was received from Secretary Leavitt making various inquiries and suggestions in relation to this matter. Council should consider what ties it can form with these two societies."

Acting on said Secretary Flinn's suggestion, the Council of *The Institute* appointed the following to act as a committee, in conjunction with a similar committee of the Engineering Council:—H. H. Vaughan, Chairman; John Murphy and G. H. Duggan.

New Year Book

It will be necessary to start at an early date to revise the Charter, By-Laws and List of Members for the year nineteen hundred and nineteen. To make the list more complete and of more service than it has been in the past it is desired that every member send in to headquarters an item giving his present official position as well as his mailing address. You will find on going through the list that a great many members' home addresses are included, and their positions not mentioned due to the fact that there is no record of it at headquarters. On reading this notice would you kindly look in the nineteen hundred and eighteen list, find out if your name appears there in accordance with the above suggestion, and if not a brief letter to headquarters will insure the complete entry.

Schedule of Engineers' Salaries

At the railroad conference held by the American Association of Engineers on March 17th, a schedule of salaries for technical engineers was adopted. As this schedule if of interest to members of *The Institute*, particularly in connection with the movement on foot to assist the salary rating of engineers in this country, it is reproduced herewith:—

Maximum and minimum salaries per annum, depending upon extent and importance of duties

Chief Engineer—

In charge of entire railroad system, responsible for all engineering work and organization, including valuation....	$15.000	$9,000

Assistant Chief Engineer— In charge of portion of line or entire system; reporting to Chief Engineer; responsible for such work as may be assigned	$9,000	$7,200
District Engineer— In charge of two or more divisions; reporting to Assistant Chief Engineer; responsible for all maintenance of way and construction; or, responsible for either maintenance or construction on three or more divisions	6,000	4,800
Assistant District Engineer— Same territory as District Engineer; responsible for such work as may be assigned	5,400	4,200
Division Engineer— In charge of one division; responsible for all maintenance of way and permanent way work	4,800	3,600
Assistant Division Engineer— Same territory as Division Engineer—like responsibilities, reporting to Division Engineer	3,600	2,750
Resident Engineer— In charge of one residency; reporting to Division Engineer. In charge of construction work only. This position not required for maintenance of way.	4,200	3,000
Office Engineer—Field Engineer— Reporting to Asst. Chief Engineer. Duties as assigned	5,400	3,600
Engineer of Bridges— Reports to Assistant Chief Engineer or Chief Engineer; responsible for design, maintenance and construction of all bridges—wooden, steel and concrete.	7,500	6,000
Assistant Engineer of Bridges— Reports to Bridge Engineer, like responsibilities	5,400	4,800
Signal Engineer— Responsible for all signal construction, maintenance and operation on the system	7,200	4,200
Assistant Signal Engineer— Reports to the Signal Engineer, like responsibilities as assigned	4,800	3,000
Building Engineer— In charge of construction and maintenance of buildings as assigned; reports to Asst. Chief Engineer or Chief Engineer	6,000	3,000
Valuation Engineer— Responsible for all valuation work on entire system; reports to Assistant Chief Engineer or Chief Engineer	8,400	7,200
Assistant Valuation Engineer— Reports to Valuation Engineer; has like responsibilities	6,000	4,800
Chief Pilot Engineer— Reports to Assistant Valuation Engineer; responsible for Valuation work on two or more divisions or for a major branch of the work over the entire system	$4,800	$3,600
Pilot Engineer— Reports to Chief Pilot Engineer; responsible for work on one division	3,600	3,000
Engineer Accountant— Qualified to analyze and assemble statistics and prepare reports	3,600	3,000
General Superintendent of Motive Power— In charge of entire mechanical department; responsible for design and repair of all rolling stock and shop equipment	15,000	9,000
Assistant General Superintendent of Motive Power— In charge of a portion of the mechanical department as assigned by the General Superintendent of Motive Power	9,000	7,200
Mechanical Engineer— In entire charge of all design of new equipment and revision of old. In addition he may handle other duties of the department as assigned by the General Superintendent of Motive Power, to whom he reports	7,500	6,000
Assistant Mechanical Engineer— Performs such duties as assigned by the Mechanical Engineer and gives particular attention to the drafting force	4,800	3,600
Engineer of Tests— Inspects all new material and investigates failed material; reports jointly to General Superintendent of Motive Power and Chief Engineer, or better to operating Vice-President	7,500	6,000
Electrical Engineer— Responsible for all electrical construction and repair work in mechanical and building departments	8,000	6,000
District Electrical Engineer— Performs such duties as assigned to him by the Electrical Engineer. Looks after all electrical equipment in the mechanical and building departments	3,600	2,700
Shop Engineer— In charge of all shop lay-out work and machinery equipment. An efficiency man whose duties are to increase production and decrease cost	4,800	3,600
Chief Draftsman— Responsible for all work turned out by the drafting room. Capable of handling all classes of design	3,600	3,000

	Minimum salaries per month.		
*Leading Draftsman or Designer**— Capable of handling complete design in designated department	$200	to	$250
*Draftsman**— Reports to Leading Draftsman or independently as assigned. General drafting work	150	to	200
*Detailer**— Reports as assigned	120	to	150
*Tracer**— Reports as assigned. Qualified to prepare neat tracings	90	to	110
*Engineer Inspectors**— Reporting as assigned	150	to	225
*Instrument Man**— Responsible for technical work of making surveys and of laying out work in field	200	to	225
*Rodman**— Understands technique of making surveys and of laying out work in field	125	to	150
*Tapeman**— Responsible for making accurate measurements as directed	100	to	120

*Rates stated for junior positions cover the length of service in the respective positions. An increase of not less than $5 for each 6 months' service to be granted up to the maximum rate of the position.

The duties of Resident Engineer involve construction work of ordinary magnitude. Where exceptional work is undertaken it is assumed that the Assistant District Engineer, District Engineer or Assistant Chief Engineer will take charge personally.

The duties and qualifications attached to the positions named are generally well understood. Any schedule of rates promulgated should specify that the work actually performed should govern. Thus if a railroad calls a man an Assistant Engineer and he is actually performing the usual duties of a Division Engineer or other position, he should receive the pay of that position.

In the above schedule the rates for the higher positions do not apply to short lines, terminal railroads and roads of similar character.

The rates of pay for the higher positions on the smaller roads to be in proportion to the duties and responsibilities assumed, based upon above schedule.

This schedule not to operate to reduce any salaries now existing.

Expenses away from headquarters or in connection with moving headquarters to be allowed.

No pay for overtime.

Civil service rules to apply as to annual and sick leave.

Steel Bridge Specification

When the report of the Steel Bridge Specification Committee was presented at the Annual Meeting the proposed Specification had already been published in *The Journal*, but the correspondence in connection therewith was omitted from the Annual Meeting report.

In submitting the draft for publication in *The Journal* the chairman of the Steel Bridge Specification Committee, P. B. Motley, M.E.I.C., stated that the suggested Specification expressed the views of the Montreal members of the Committee and he suggested that all the branches discuss the proposed Specification through the medium of *The Journal* before the Specification was finally adopted. The out of town members of the Committee had been provided with copies of the Specification but with one exception, had not taken advantage of the opportunity to discuss it.

It is to be hoped that if there is to be any discussion on this important matter it will take place at an early date.

Memorial to Government

Previous to the Annual Meeting, suggestions had been made that *The Institute* memorialize the Government at the time of the Annual Meeting in the interests of the technical men in this country. A memorial was drawn up, which evoked some discussion and which was finally considered to cover too many points to receive the serious attention either of the Federal or Provincial Governments. As a result of the discussion it was amended and the direct application was limited to point out to the Government the value of technical men and the necessity of appointing trained engineers on commissions involving engineering work.

As the preamble to the memorial covers a number of points which have been suggested by our branches in the way of proposed memorials to the various Governments, this draft has been considered sufficient in breadth to direct the attention of the various Governments to the different points brought up.

The memorial reads:

To The Right Honourable Sir Robert L. Bordon, P.C., G.C.M.G., K.C., LL.D.,

And to The Honourable The Members of the Government of the Dominion of Canada.

This Memorial Humbly Sheweth:

The undersigned, on behalf of *The Engineering Institute of Canada*, consisting of over thirty-two hundred members of the profession in this country and the various industrial and technical interests which they represent, desire to lay before the Government certain considerations.

The war has demonstrated more than ever before the value of technical knowledge, and not its value only, but its absolute necessity. This fact was used to advantage by the Government of the United States on their entering the war by seeking the advice and co-operation of the great engineering organizations in that country. These organizations readily assented to the proposal and the result was a distinct advantage to the nation.

Many of the problems confronting this country to-day are of a technical nature and require, in their solution, the advice and co-operation of men trained to plan and act along definite constructive lines.

The technical men in Canada are one of the country's greatest assets and should be used to the fullest extent. It is known that it costs the country upwards of $2,000 for every man educated in an engineering school and it is also a fact that hundreds of these men after receiving their education leave the country—an economic loss of great importance.

At the present time thirty-six percent of the eligible membership of the engineering profession, as represented by *The Engineering Institute of Canada,* are on active service, ninety-seven percent of whom are officers, and with the plans of demobilization under way, it is anticipated that they will soon return to their own country. The immediate undertaking of national operations which will absorb these men in civil life will at the same time set in motion activity throughout the country in a manner that will tend to solve the entire problem of employment for the soldiers on their return.

It is Desired, Therefore:

That the Federal Government recognize the paramount value as a national asset of her highly educated and trained men and utilize to a greater extent men of engineering knowledge and training, especially in an executive capacity on commissions dealing with all affairs where engineering or construction is involved.

And your memorialists will ever pray.

Signed on behalf of the President and Council of

The Engineering Institute of Canada,
FRASER S. KEITH,
Secretary.

Harbour of St. John, N.B.

Inasmuch as a specific instance has arisen recently in the proposal to place the Harbour of St. John under a Commission it was decided by Council that a letter covering this point be forwarded to the Honourable Minister of Public Works.

The Hon. F. B. Carvell,
Minister of Public Works,
Ottawa, Ont.

Sir:—

The President and Council of *The Engineering Institute of Canada* have been advised that it is the intention of the Government of Canada to place the Harbour of St. John, N.B., under Federal control and under the jurisdiction of a Harbour Commission.

Inasmuch as we represent the opinion for the most part of the engineers in Canada, we beg to suggest to you that this is an engineering matter and, therefore, it is absolutely necessary that the Commission consist of men appointed solely on the basis of their knowledge of harbour work and their engineering and technical qualifications, which are an absolute necessity, to enable them to effectively direct such an important undertaking.

On behalf of the President and Council of *The Engineering Institute of Canada,*

I beg to remain,
Yours faithfully,
FRASER S. KEITH,
Secretary.

CORRESPONDENCE

Transitmen Need Help

Editor, *Journal:*—

I am very pleased to note in our very interesting *Journal* that *The Institute* has been doing something lately with a view of obtaining adequate salaries for engineers.

Being one of the younger members of the profession, I would like to point out the necessity of doing something for the transi man (the man in charge tomorrow) who gets the magnificient salary of $100.00 to $115.00 per month. A transitman receiving $100.00 per month is getting less than a section foreman,or a signalman at an interlocked crossing, while a transitman receiving $115.00 per month is getting less than a section foreman working ten hours per day or a B. & B. foreman working eight hours per day, yet he is expected to lay out work for both of them. He receives only as much or a very little more than some stenographers with two or three years experience.

Would it not be more equitable to pay transitmen better wages and according to their experience or service? In some cases transitmen are doing the work of assistant engineers and are qualified for the position of Resident Engineer at a salary of $200.00 per month, yet are receiving only the minimum rate for transitmen. I admit that $200.00 per month is not too much for the Resident Engineer but cannot see the reason for such a difference in salary. Would it not be logical and just for *The Institute* to try and enforce a minimum rate for each grade in our *Institute?* If this was done, a man would then be paid for his experience and ability.

I regret to say that a few railroad officials and members of the profession are not doing their share by hiring non-members of *The Institute* and are not doing all they could do for the younger members.

An Experienced Transitman.

Adaption of the Hydroplane to Exploration

Editor, *Journal:*—

It has occurred to me that while the Press of our Country has been advocating the use of the hydroplane as a quick and efficient means of forest protection and conservation that there still exists a far larger field for its use than this alone, by this I mean that when a new idea is launched it should cover its uses in general more than in particular, forestry in this case will be only a branch. Knowing the use of this new arm from experience overseas, I naturally am deeply interested in the subject. Incidently as an engineer with a fair experience of conditions in our Great North, I would like to suggest the many other ways in which the hydroplane could be of use insofar as the development of the great resources of our north country are concerned:—

Let us, for instance, consider the question of research, geological, hydrographic and agricultural. The sending of expert engineers by hydroplane, from an established base, say, Lake St. John, with the oblique photograph apparatus in common use in the theatre of war, which on the machine at an elevation of 1000 feet, can take a picture, showing the general lines of the country: lakes, mountains and rivers, with a vertical base of say, 500 yards, extending forward and outwardly for 6 miles, with the possible upper base of 6 miles, giving a very fair idea of the elevation and contours of the country.

The landing can be made upon our numerous lakes in that region which to my general knowledge, are never farther apart than a matter of 10 miles. Tests of soil such, for instance, as planting grain, corn, etc., the exploration of the geological formations, the sizing of water-powers, and the examination of fisheries, etc., can be made all of which would be invaluable data, to the provincial department of research. Also from the lumberman's point of view the examination of valuable timber and protection thereof, and a great many other things too numerous to mention.

The sister province, Ontario, I must say, has given an example of progressiveness insofar as the exploration and exploitation of their north country is concerned. It is a matter of common knowledge the great benefit that has been derived by the building of the Temiscamingue and Northern Ontario Railway, for the Ontario Government; and the projection of the Transcontinental Railway through the Abitibi, and the subsidizing of the Algoma Central, all of which have more than repaid their sponsors by opening up the great mine fields of Cobalt, Porcupine, and the fertile, clay-belt of the Abitibi.

Why could not this Province of ours, in view of the great demands which will be made by all returned soldiers for large public expenditures, not open a new railway for the development of our own north country, which is, no doubt, as rich as that of the sister province. There is very little doubt that such an investment would not only please the public, but would be an investment in the fullest sense of the word, and would bring magnificent results. It is a well-known fact that the credit of the country depends on its natural resources, but these natural resources must be in view and not in imagination. A practical way of proving these resources is by practical development. Heretofore, railway construction in the north, far from its base of supplies, has been a very serious problem; the country being virgin, and more or less, unknown, and distances great. It is obvious that, adapting the hydroplane to this particular branch of engineering would reduce the preliminary cost of survey by 50 p.c. and likewise reduce the duration of these surveys by at least the same amount. For instance, it is proposed to build a line from St. Félicien and Lake St. John, to that lake of mystery, called Mistassini. I roughly calculate the distance at 200 miles. With a base at St. Félicien, and using a small light Curtiss machine equipped with the oblique photograph apparatus (45 degrees), a reconnaissance survey could easily be made; and in the course of a month, with the data supplied by these photographs, a location could be tried, which, I am of the opinion, would fit in. The extent of line generally allotted to each party of engineers on this work, is roughly from 40 to 50 miles long; each working towards the other, so as to join up. On determining the line to be followed, from the reconnaissance survey, how easy it would be to place each party at the desired point where their survey is to commence by means of the hydroplane working from the base. The parties could also be supplied with provisions by the same method. In other words, I believe the aeroplane has arrived to stay, and is bound to revolutionize the old methods of the location engineer.

Again, the outline of our lakes, outlets and inlets in the north are in a large number of cases so imperfectly explored and known, that one can get but a vague idea from Government maps of what really exists there. All these could be quite clearly outlined and recorded, in exact position, by means of the hydroplane at a high altitude, using a photographic apparatus with telescopic lamps.

The machine that could be used for this purpose, would be the Curtiss biplane, carrying two men with a cruising radius of 4 hours, and a speed of 75 miles per hour, minimum, at the cost of $7,000.00 per machine. For transportation purposes, the Caproni triplane, which is manufactured in the United States, can carry 20 men, or 5000 pounds at the speed of 85 miles per hour, with a cruising radius of 5 hours, and costing $17,000.00.

Another advantage which must be considered is the employment of our young men who are returning from overseas, who have qualified as pilots and observers in the Royal Flying Corps. It is needless to say that much time and labor, beside expense, has been devoted to the training and development of these men, which expert knowledge should bring some results for the benefit of the country which has trained them.

In conclusion, I believe that a general idea has been given of the advantages of the aeroplane in the development of new countries, but it has been general more than technical. This is a matter that, if my suggestion should be favorably considered, could be gone into in detail, I am sure, to the satisfaction of interested parties.

Yours truly,

R. de la Bruere Girouard,
Lieut.-Col., A.M.E.I.C.

Action Requested

Editor, *Journal:*—

I feel that it would be wrong not to say a word in favor of the appointment of a Committee by *The Institute* to wait on the Civil Service Commission of Canada, with reference to a salary schedule for engineers.

It is time now that such comparisons of requirements and salaries as appeared in your January issue be corrected by the sheer weight of *The Institute* rather than by any other means. I hope that the committee appointed will realize the force of sentiment behind them, and that they have the support of the majority of the members of *The Institute*. From you, Mr. Secretary, we are looking for a full report from this committee from time to time. There is now being organized throughout the United States a union of engineers and draughtsmen to be affiliated with the American Federation of Labor, and it depends largely on the progress made by your committee whether or not this union will take root in Canada. You who detest the sound of this latter expression, will do well to catch up with the signs of the times, and read " Progress in Engineering Society Organization in 1918 " (See Engineering News-Record, January 23rd, 1919), and note particularly what the editor says with regard to new plans, new machinery, and new men.

Messrs. Committee; dont be afraid to talk salaries. It was part of the code of ethics of The Institution of Civil Engineers of Great Britain, when it was formed on January 2nd, 1818. In 1910, it became a part of the rules. A. B. Warburton and the Hon. Wm. Pugsley spoke at the Eleventh Parliament of Canada on January 17th, 1910, concerning the " Status of Engineers," and, thanks to our lawyer friends, these two men said a lot for us, but evidently they got no support from the then Canadian Canadian Society of Civil Engineers. Mr. Warburton stated: " When the Civil Service Act of 1876 was passed the engineers seemed to have been overlooked and in different acts that have been passed since that time as far as I have been able to see they are still out in the cold." Ye gods, we're out in the cold even yet in 1919, but the signs point to warmer weather soon.

As our friend said in your January issue: " Let us get at it and have a real one and have it over with."

Yours very truly,
THE OPPOSITION.

Employment Bureau

Editor, *Journal:—*

On page 278 of the issue of Engineering News-Record of Feb. 6, 1919, there appears a very good suggestion under the name of " Operating an Employment Bureau for Civil Engineers." It appears to me that the strong recommendation of this scheme is the fact that everyone of the Cornell graduates is included whether he is successful and satisfied or a misfit and carrying a grouch. It must have a tendency to make the successful and influential men take more or less interest in the welfare of the less successful and thereby open up channels by which those unsatisfied ones may attain a field of greater breadth and usefulness. It seems to me that before any great length of time the employers of engineering knowledge would begin to look to this bureau as a reliable place to fill their needs and the demand on it would continually increase. Thus it would be of double value—to the employer and to the employee. Why could *The Institute* not maintain such a bureau and, by so doing, direct desirable men to those positions which they are best suited to occupy?

I would like also to criticize to a greater or less extent your present column "Employment Bureau" in *The Journal*. Throughout the reading matter in *The Journal* we find very commendable pleas for higher salaries and legislation for the engineer. On this we all agree, but why, in the Employment Column, keep on publishing a list of those manifestly inferior position which do not carry enough salary to keep a man properly clothed. I have especially noticed some of the Civil Service openings in this regard. Do you not think *The Journal*, and thereby the profession is being cheapened in the public eye by these glaring inconsistencies. Why not refuse such advertising?

In the above, I have attempted not to knock, but to criticize constructively. If any of the points are worth consideration you are quite at liberty to use this in any manner you may think fit.

Yours truly,
N. L. SOMERS,
A M.E.I.C.

Basis of Legislation

Editor, *Journal:—*

In order to reach a satisfactory basis on which to build up legislation affecting the engineering profession, it becomes necessary to analyze the various lines of activity, and to determine the fundamental elements entering into the complex structure commonly known as engineering. There are three phases common to all branches of professional engineering: (1) Investigation; (2) Design; (3) Management.

Investigation or research consists in making measurements and analyses, in adjusting, compiling and coordinating data and in formulating conclusions or laws.

Design includes the application of the above principles to practical problems according to standardized methods and formulæ as well as individual initiative or invention.

Management covers the realm of executive control of construction and is dependent on the preceding divisions, with the addition of commercial and economic factors.

No one man can hope to master all these various phases. Even the most experienced must rely on the co-operation of his fellow-workers, each in his own respective sphere, and a lifetime may be well spent without attaining to the most lucrative position of manager. Those who occupy executive positions have the power to raise or lower the status of the profession according to their attitude toward those engineers who are associated with them in their work. I do not use the term " subordinate to them," as I believe of all organizations the engineering profession should be the most democratic. No form of legislation can accomplish the end we desire without a proper attitude within our own ranks toward the rights and interests of one another.

Sincerely yours,
G. B. McCOLL, A.M.E.I.C.

Overseas Correspondence

Cigarettes received in good condition. Thanks very much. It is so cheering to know that though we have so long away from home our friends do not forget us.

Lieut. J. R. S. SUTHERLAND, A.M.E.I.C.,
371st Company, R.E.,
B.E.F.,
France.

* * *

I wish to thank you and the Council and members for the gift of cigarettes which I received today.

Your kindness is very much appreciated.

Yours sincerely,
Major A. P. LINTON, A.M.E.I.C.,
1st Bridging Company,
Canadian Railway Troops,
Alexandria, Egypt.

February 18th, 1919.

REPORT OF COUNCIL MEETING

The regular monthly meeting of the Council was held at the rooms of *The Institute*, 176. Mansfield Street, on Tuesday, March 25th, at 8.15 P.M.

Present, Messrs. Walter J. Francis, Vice-President, in the chair; Arthur Surveyer, John Murphy, G. Gordon Gale, J. M. Robertson, R. A. Ross, H. H. Vaughan, A. R. Decary, Ernest Brown, G. H. Duggan.

Previous Minutes:—The minutes of the previous meeting were taken as read.

Secretary's visit to new Branches—Windsor and Niagara Falls:—The Secretary reported on his visit to Niagara Falls, where an enthusiastic meeting of about seventy-five engineers was held, with the result that an application was presented for the formation of a branch to be known as the Niagara Peninsula Branch.

At Windsor a meeting of about 40 took place, following a dinner, at the Chamber of Commerce. Everyone present spoke and it was seen that there was a lively spirit manifested in engineering affairs in the Border Cities.

Recommendations of Executive Committee:—The recommendations of the Executive Committee, which held two meetings since the last meeting of Council, were noted and approved.

Classifications:—Classifications for admission and transfer were considered for the next ballot.

The Secretary requested instructions as to what papers should be sent to the branches when referring applications of residents to the branch executives. It was decided that the record of the applicant when resident at a branch centre be sent in every instance to the Secretary of the branch for the consideration of the branch executive.

Special Legislation Committee:—The following delegates appointed by the branches as a special committee to meet at headquarters on April 5th, were approved:—

Ottawa Branch	R. F. Uniacke.
Montreal Branch	Arthur Surveyer.
Quebec Branch	A. R. Decary.
St. John Branch	C. C. Kirby.
Halifax Branch	C. E. W. Dodwell.
Toronto Branch	Willis Chipman.
Sault Ste. Marie Branch	Newton L. Somers.
Manitoba Branch	J. M. Leamy.
Calgary Branch	F. H. Peters.
Edmonton Branch	R. J. Gibb.
Vancouver Branch	A. G. Dalzell.
Victoria Branch	A. E. Foreman.
Hamilton Branch	E. R. Gray.
Saskatchewan Branch	G. D. Mackie.
Alberta Division Branch	F. H. Peters and R. J. Gibb.

Memorial to Government:—The opinions of Councillors and branches in respect of a proposed memorial were noted and the Secretary instructed to forward the amended memorial to the Federal Government and Provincial Governments.

Soldiers' Civil Re-establishment:—The Secretary's report of the meeting of representatives of *The Institute*, consisting of Lieut.-Col. C. N. Monsarrat, G. Gordon Gale and himself, with three of the Cabinet Ministers, on Saturday, March 1st, at the office of Hon. J. A. Calder, in Ottawa, at which time the letter of the President and Council offering the services of *The Institute* was presented, together with a letter from Col. A. Macphail, was approved. The Secretary outlined the situation in relation to the work being done by the Government in establishing offices to assist in the employment of returned officers. Lieut. F. S. Rutherford, A.M.E.I.C., was appointed by Major Anthes to establish offices, and both he and Major Anthes had expressed their desire for the co-operation of *The Institute*. The matter had also been taken up with the Canadian Mining Institute where co-operation was promised and also in Montreal with the Electrical Luncheon Club. The various branches had been written to with the suggestion that they appoint committees and a number of responses had been received.

The Ministers had expressed their pleasure at the offer of the President and Council and stated that they wished, when the details of co-operation of our *Institute* with the Government were worked out, to have them presented for approval. They agreed with the suggestion made that the Secretary be appointed by the Government in an official capacity in this connection.

Proposed organization of C.I.E.E.—A summary of the situation as outlined in the correspondence received with reference to a proposal to establish a Canadian Institute of Electrical Engineers, was presented, dealing with a proposal that had arisen in Toronto to establish a Canadian Insitute of Electrical Engineers in affiliation with the A.I.E.E. An abstract from the correspondence on the subject from A. A. Dion, A. H. Harkness, Chairman of the Toronto Branch, Professor Peter Gillespie, Member of Council, Toronto, was presented showing that they were strongly of the opinion that Council should take cognizance of the situation and endeavor to make *The Institute* still more attractive for electrical and mechanical engineers. Further correspondence was shown from John Murphy, Member of Council, who outlined his idea of the situation that he felt that the matter should be left with the electrical members of *The Institute*. He presented a suggestion of A. B. Lambe, to the effect that an effort be made to secure the proceedings of the American Institute of Electrical Engineers so that they could be supplied to members at a reduced rate. A similar suggestion was also forwarded by another member of both Institutes together with an outline of his views on the subject. A committee consisting of John Murphy, Chairman, W. A. Bucke and Julian C. Smith, was appointed to confer and make any suggestions in connection with the matter.

Committee on International Affiliation. The suggestion of Alfred D. Flinn, Secretary of the Engineering Council, was acted upon, to the effect that *The Engineering Institute of Canada* appoint a committee to co-operate with the committee already appointed by the Engineering Council, consisting of Charles F. Loweth, Henry A. Lardner and H. C. Parmelee, for the purposes of conferring with the suggested committee of *The Institute*. A committee consisting of H. H. Vaughan, Chairman, John Murphy and G. H. Duggan was appointed.

Date of Western Professional Meeting.—The date of the Western Professional Meeting to be held at Edmonton, as selected by the Western Branches for July 10th, 11th and 12th, was approved.

Reports of Committees:—The suggestions made at the Annual Meeting by the Committees on Roads and Pavements and Steam Boiler Specifications were approved, and the Report of the Committee on Steel Bridges was referred back for any recommended changes.

Advance to Ontario Provincial Division:—The request of Geo. Hogarth, Secretary of the Ontario Provincial Division for a grant of $50 for the Division was granted.

Ontario Provincial Division:—The officers of the Ontario Provincial Division were approved as follows:—

Chairman, J. B. Challies; Sec.-Treasurer, Geo. Hogarth; representing Toronto Branch, Geo. Hogarth; representing Ottawa Branch, J. B. Challies; representing Hamilton Branch, E. R. Gray; representing Sault Ste. Marie Branch, W. S. Wilson.

Non-Resident Members: W. H. Magwood, Cornwall; G. R. Munroe, R. L. Dobbin, Peterboro; J. L. Morris, Pembroke; R. J. McClelland, Kingston; G. H. Bryson, Brockville; A. C. D. Blanchard, Niagara Falls; T. H. Jones, Brantford; J. L. Weller, St. Catharines; S. B. Clement, North Bay; Jas. A. Bell, St. Thomas; L. M. Jones Port Arthur; W. A. Belanger, l'Orignal; and the local Councillors; also that when the By-Laws were amended, that E. R. Gray be Vice-Chairman.

Alberta Division:—The officers of the Alberta Division for 1919. were approved, as follows:—

Chairman, L. B. Elliot; Sec.-Treasurer, R. J. Gibb; representing Calgary Branch, F. H. Peters, S. G. Porter; representing Edmonton Branch, R. Cunningham, A. W. Haddow; non-resident members, E. N. Ridley, C. S. Dewis; and the local Councillors.

St. John Harbour:—Attention was drawn in a letter from C. C. Kirby to the fact that the Harbour of St. John was about to be taken over by the Government. A proposed letter, submitted by the Secretary, addressed to the Minister of Public Works, was considered and after slight amendments was ordered to be forwarded to the Government.

Secretary's Western Trip:—The Secretary was instructed to arrange to visit the Western Branches during June and July, at a time to make it convenient to be present at the Western Professional meeting at Edmonton.

Councillors Visiting Branches:—Approval was given to the proposal that members of Council when in other cities, should make it a point of getting in touch with the officers of the local branch and, if possible, arrange to address the members.

Niagara Peninsula Branch: The application to establish a branch of *The Institute* to be known as the Niagara Peninsula Branch, as follows, was approved:—

March 4th, 1919

To the Council,

The Engineering Institute of Canada,

Montreal, Que.

Gentlemen:

We, the undersigned corporate members of *The Engineering Institute of Canada*, hereby make formal application for the establishment of a Branch to be known as the Niagara Peninsula Branch: A. C. D. Blanchard, H. L. Bucke, Norman R. Gibson, Walter Jackson, John H. Jackson, G. F. Hanning, J. B. Goodwin, F. C. Jewett, W. P. Near, H. D. Dawson, Alex. J. Grant, W. H. Sullivan. J. C. Moyer, F. N. Rutherford, D. H. Fleming, A. S. Cook. R. H. Harcourt, Alex. Milne, H. M. Belfour, D. T. Black.

The following officers were approved: Chairman, A. C. D. Blanchard; Vice-Chairman, W. P. Near; Sec.-Treasurer, R. P. Johnson; and approval was given of an advance of $50 on account of rebates to be sent to the Secretary-Treasurer. It was suggested that electrical men be given full representation on the Executive of this Branch.

Border Cities Branch:—The name "Border Cities Branch" for the new Branch established at Windsor and adjacent cities was approved, and approval given for an advance on rebates of $50 to be forwarded the Secretary-Treasurer.

Miscellaneous Letters. The letter from Calvin W. Rice expressing appreciation of the courtesy extended to the representative of the American Society of Mechanical Engineers at the Annual Meeting of *The Institute* was noted.

Engineering Standards:—The acknowledgment by H. H. Vaughan of a subscription of $200 to the Canadian Engineering Standards Association was noted.

A letter from Gen. Mewburn to Col. Monsarrat in connection with *The Institute's* Roll of Honor was noted.

A letter from R. W. Macintyre with reference to Council matters was read and discussed.

Business to be Transacted at Council Meetings:—It was resolved that the regular monthly meetings of Council take up the more serious business, leaving matters of routine to be dealt with at an adjourned meeting two weeks later, and that the Executive Committee of the Council meet on Monday afternoon between the regular adjourned meetings and on one Monday afternoon preceding the regular Council meeting.

Daylight Saving:—The following telegram was sent addressed to the Acting Prime Minister: "Council of *The Engineering Institute of Canada* most heartily endorses daylight saving bill and strongly urges that Government take action therewith."

Federal Government Salaries:—In view of the resolution of the Manitoba and Quebec Branches, the Secretary was instructed to write each Branch giving the personnel of *The Institute* Committee, outlining the details of the situation and stating that the schedule of increases was not yet available.

Salary Schedule:—A resolution of the Quebec Branch suggesting that every member of *The Institute* take up the question with its local Member of Parliament of securing his support of the measure to be presented to the Government dealing with increased salaries, was read. In view of the importance of this matter, the Secretary was instructed to insert a display notice in *The Journal* bringing this to the attention of all members of *The Institute.*

Electro-Technical Committee:—The suggestion of Dr. L. A. Herdt that the Canadian Committee of the Electro-Technical Committee be continued for the present time was ratified.

Stationary Engineers of Quebec:—Note was made of a letter from the Montreal Branch stating that no bill for the stationary engineers of Quebec was at present before the Provincial Legislature.

Method of Classification:—Letters from three members were presented dealing with the subject of classification of applications and the Secretary was instructed to write giving an outline of the method of classification of such applications.

Availability of Lantern Slides:—It was resolved that lantern slides for various papers be prepared by *The Institute* and preserved for the use of all branches.

Affiliates:—It was resolved that a form for affiliates be designed, copies of which to be sent to the branches.

Resolution of Toronto Branch re reconstruction:—A resolution of the Toronto Branch with reference to reconstruction for the purposes of providing employment, was presented. It was decided that inasmuch as the suggestion outlined in the Toronto Branch is outlined in a Memorial going forward to the Government and, in view of the assurances of the Minister of Public Works, at the Ottawa meeting that every possible aid would be given to public works, it would be inadvisable to forward this resolution to the Federal Government. The Secretary was instructed to pass it on to the provincial divisions for their consideration and action, if considered advisable.

Resolution of Toronto Branch re co-operation regarding Legislation:—The Secretary submitted a resolution from the Toronto Branch with reference to co-operation between the Toronto delegate of the Committee on Legislation, Willis Chipman, and the various technical bodies in Ontario, which was noted.

Board of Examiners and Education:—The Committee of Board of Examiners and Education was re-appointed as follows:—H. M. MacKay, Chairman, Arthur Surveyer, Secretary, Ernest Brown, J. M. Robertson, R. deL. French, R. S. Lea, A. R. Roberts.

Elections and Transfers Effected

Members

Denis, L. G., B.Sc., of Ottawa, since 1910, Hydro-Electric Engineer, Commission of Conservation, Ottawa, Ont.; Gaines, E. C., B.S. (E.E.), of Montreal, in charge of crane and conveyor department, Dominion Bridge Company, Montreal; Hobson, Robert, of Hamilton, Ont., President, Steel Company of Canada, Hamilton; Hungerford, S. J., of Toronto, Assistant Vice-President, C.N.R., Canadian Government Railways, Toronto; Larson, C. H., B.S., of Cabri, Sask., municipal engineer, R. M. Riverside, Sask.; Palmer, R.. K, B.Sc., of Hamilton, chief engineer, Hamilton Bridge Company, Hamilton; Reid, J. A., B.Sc., of Cobalt, Ont., field enginer and mining geologist for M. J. O'Brien, Ltd.,Cobalt, Ont.; Tobey, W.M.M.A., of Ottawa, Assistant Superintendent and Geodesist of the Geodetic Survey, Ottawa; Wardwell, W. H., of Westmount, Que., 1918, Major U. S. Reserve; on special duty in France with the construction depar ment of the Aviation Section of the Signal Corps, Weeks, M. B., B.A.Sc., of Regina, Director of Surveys for the Province of Saskatchewan, Regina.

Associate Members

Bellows, W. S., B.Sc., of Fort William, Ont., member of firm, Fegles-Bellows Engr. Company, Ltd., Fort William, Ont., Brown, G. J., E. E., of Winnipeg, Man., assistant engineer of mechanical services, Province of Manitoba, Winnipeg; Buchanan, C. A., of Levis, Que., at present 4th-year student in civil engineering at McGill University; Duperron, A., B.A.Sc., of Montreal, since 1917, in charge of designing, Quebec Streams Commission, Montreal; Eager, A. H., of Winnipeg, Man., mechanical superintendent, western lines of the Canadian National Railways, Winnipeg; Howarth, C., of Calgary, Alta., since 1915; chief engineer, United Grain Growers, Limited, Calgary, Hubbard, F. W., of Hamilton, Ont., assistant engineer, T. H. & B. Railway on Port Maitland Harbor facilities; Huether, A. D., B.A.Sc., of Niagara Falls, Ont., instrumentman for Hydro-Electric Power Commission, Niagara Falls; MacPherson, A. R., B.A.Sc., of Hamilton, since 1909, with P. H. Secord & Sons, as superintendent and manager on building construction, etc., Hamilton; Milne, W. G., of Hamilton, Ont.; since 1910, with the Hamilton Bridge Company in various capacities, at present occupied with special features of ship construction; Mills, G. A., B.S. (E.E.), of Winnipeg, Man., electrical engineer. in charge of power and transmission with Winnipeg Electric Railway Co., Winnipeg; Morley, J. H., of Wabana, Nfld., since 1915 engineer in charge of Wabana Mines, Nfld.; Munroe, S., of Vancouver, resident engineer, maintenance of way department, C.N.R., Vancouver; Neville, E. A., B.Sc., of Windsor, Ont., assistant to city engineer, Windsor; Robinson, R. C., of Saskatoon, Sask., resident engineer, C.N.R., Saskatoon; Sandover-Sly, R. J., of Saskatoon, Campbellton, N.B., since 1911 town engineer, Campbellton; Sedgwick, A., (S.P.S., Toronto), since 1911 assistant engineer, Ontario Department of Public Highways, Toronto; Smaill, F. H., of Regina, Sask., with Saskatchewan Government as assistant in charge of survey party, at present overseas, Lieutenant in Canadian Expeditionary Forces; Timm, C. H., of Westmount, Que., since 1915 with Dominion Bridge Company, as chief draftsman in charge of mechanical superintendent's drawing office, Montreal; Vaughan, F. P., of St. John, N.B., engineer and manager, the Vaughan Electric Co., St. John; Viens, E., B. A., of Ottawa, Ont., since 1916, director of laboratory for testing materials, Department of Public Works, Ottawa.

Juniors

MacTavish, W. I., S.P.S., Toronto, of Toronto, Ont., since 1912, assistant engineer, Department of Public Works, Toronto; Nesham, L. C., B.Sc., of Ottawa, Ont., draftsman, Department of Railways and Canals, Ottawa; Owens, J. E., B.Sc., of St. John, N.B., since 1916, office engineer, St.J. & Que. Ry., St. John.

Transferred from the Class of Associate Member to that of Member

Armstrong, J., B.A.Sc., of Winnipeg, Man., divisional engineer, Greater Winnipeg Water District, Winnipeg; Bond, F. L. C., Major, B.Sc., of Montreal, serving in France for 2 years as company commander, 10th Batt., Batt., C.R.T., at present chief engineer, G.T.R., Montreal; Leamy, J. M., of Winnipeg, Man., since 1918, member of Federal Lignite Commission, Winnipeg.

BRANCH NEWS

Hamilton Branch

H. B. Dwight, A.M.E.I.C., Sec'y-Treas.

The Hamilton Branch of *The Engineering Institute of Canada* held an open meeting at the Recital Hall, Conservatory of Music, on the evening of January 30th, at which an interesting and instructive address was given by E. L. Cousins, A.M.E I.C., Chief Engineer of the Toronto Harbour Commissioners. His theme, which afforded him great scope for description, was the wonderful development which has, of recent years, transformed Toronto harbor. By a series of lantern slides he showed the plans of the four-mile harbor front and the reclamation of the Island, as well as the Don improvements. The whole scheme was a most comprehensive one. The Toronto Harbor Commission, assisted by large grants from the Dominion Government, have been enabled not only to do much preliminary work, but to put into active operation their well-defined plans for industrial development, and parks and recreation grounds so necessary as breathing spots for the citizens. While the harbor commissioners had many difficulties to encounter, by means of legislation they were able to acquire the riparian rights which were so essential to the completion of their improvements.

The series of slides, accompanied by the technical references to all the engineering work, was not only appreciated by the members of the Hamilton Branch of *The Engineering Institute*, but to the lay mind showed at a glance the results that may be accomplished by having a well-defined plan, with energy and skill to carry it forward, and the necessary Government aid and public support in an undertaking of as great magnitude as the reclamation of land and the advancement of the progressive plans now being perfected in the Toronto harbor. As these various slides were presented on the screen much interest was evinced by the audience in seeing the actual work being done, the construction and launching of steel ships; and learning of all the detail of reclaimed lands, suction dredge filling, concrete blocks, contract work and construction, which the Harbor Commission do by tender, the board with their engineering staff being open competitors.

E. R. Gray, A.M.E.I.C., Chairman of the Hamilton Branch, occupied the chair.

Halifax Branch

K. H. Smith, A.M.E.I.C., Sec'y-Treas.

At the regular meeting of the Halifax Branch, held on March 20th, W. G. Gordon, Transportation Engineer, Canadian General Electric Co., read an interesting and instructive paper on the subject of "Main Line Railway Electrification in Canada," with special reference to the Moncton-Halifax Line of the Canadian National Railways. The address was illustrated with lantern slides, and was largely attended by local and outside engineers and others interested in the subject.

Mr. Gordon is a son of Dr. Gordon, who lately resigned as principal of Queen's University, and formerly resided at Halifax.

In dealing with this subject, Mr. Gordon brought out the following points:—

In considering the electrification of any road which is at present steam operated, we have absolutely reliable data available, the data under steam operation, and we can determine the savings to be effected through electric operation. The latest heavy trunk line electrification to contribute data illustrating successful operation is the Chicago, Milwaukee and St. Paul Railroad. This line has in electric operation, 440 route miles, and has let contracts for the electrification of a further 220 route miles.

On a steam operated trunk line twelve per cent of the entire ton mileage movement of freight and passengers carried is represented in the cars and tenders required to haul the coal supply for the steam locomotive. When such a line is electrically operated from water power stations, it means that the total movement for railway coal and locomotive tenders is eliminated; and, even if partially or wholly operated from steam power stations, the movement for locomotive tenders is eliminated, and the movement for railway coal is greatly decreased. The benefit is self-evident of being able to apply this ton mileage in the movement of revenue tonnage.

The cost of maintenance of the electric locomotive is very much less than that of steam locomotive. The steam locomotive is a power plant which, owing to physical limitations, can attain only a certain capacity and efficiency. On the other hand, the electric locomotive, itself very efficient, can draw any amount of power desired from a system fed either by hydro-electric plants or highly efficient steam electric plants.

The continuous draw-bar pull of the electric locomotive is limited only by the strength of the draft rigging on the cars. Due to the power input available, draw-bar pulls can be maintained at speeds impossible with steam locomotives. This means that over any line trains of a heavier tonnage can be hauled at a much better scheduled speed than with steam locomotives. In the case where a single track steam line has reached its capacity, it would have to be double-tracked to handle increased ton mileage. Electric operation will obviate the necessity of double tracking, and permit of a large expanse in the ton mileage handled.

The cost of operation, as far as sub-station attendance is concerned, has been greatly reduced through the remarkable developments made in the last two years in automatic sub-station control. As to the reliability of the modern electric locomotive for continuous service, the returns just made public for last year show that the large number of electric locomotives operated by the New York Central lines were only inspected after each three thousand miles of running, and that the locomotives average 33,000 miles per detention.

It is of interest to note that in changing to electric operation there is practically no upsetting of the regular steam organization, as the locomotive crews, under instructions, readily become highly efficient in the operation of the electric locomotives. It must also be borne in mind that where the high tension power supply follows the railway line, a continuously increasing load is secured for power and lighting from points along, or near the lines.

With regard to the 187 miles of the present steam operated line of the Canadian National Railways, between Moncton and the Halifax Ocean Terminals, it can be shown that the electrification of this line is economically justified on the basis of sound engineering principles. In Halifax the Ocean Terminals have been laid out with a capacity of several times the present traffic, and with ultimate provision for many times the present tonnage, whereas the present line is a single track railway, with heavy grades. To increase the tonnage capacity of this line, several plans may be considered, including electrification, grade reduction on the present line, double tracking the present line without grade reduction, and construction of low grade single track on new locations.

During winter conditions of extreme cold the steam engine is at its worst, owing to the dissipation of heat, while the traffic conditions are most severe. This condition, instead of being detrimental to the operation of the electric locomotive, increases its service capacity, as the motors can more readily dissipate heat. Further, the tonnage traffic over the line can be largely increasd due to the electric locomotives being able to haul much heavier tonnage at higher scheduled speeds with almost an entire elimination of the failures and delays, at present due to steam operation.

Toronto Branch

W. S. Harvey, A.M.E.I.C., Sec'y-Treas.

Special Meeting

At a special meeting of the Toronto Branch called for Friday, March 28th, addresses will be given by Walter J. Francis, M.E.I.C., Vice-President; Arthur Surveyer, M.E.I.C., member of Council and Frederick B. Brown, M.E.I.C., Secretary-Treasurer, Montreal Branch.

An open meeting of the branch was held in the rooms of *The Institute* at the Engineers' Club, on Feb. 28th, 1919, at 7.45 p.m.

The following members read short papers on the subject, " What *The Institute* Can Do," the papers being followed by discussion:—E. M. Proctor, A.M.E.I.C; H. A. Goldman, A.M.E.I.C.; J. C. Krumm, A.M.E.I.C.; Geo. Phelps, A.M.E.I.C.; J. H. Curzon, A.M.E.I.C., also wrote on the subject, but was unable to be present, his letter, however, was read before the meeting by the Secretary. These papers dealt mainly with the economic and social status of the engineer. Many excellent suggestions were contained therein.

With regard to Mr. Goldman's paper, Professor Haultain volunteered to have a number of copies made to be sent to the various branches for distribution amongst the members. During the discussion Mr. Greigg suggested that the profession should become a university profession, i.e., university graduation should be essential. R. O. Wynne-Roberts, M.E.I.C., suggested that the Branch should take more interest in public affairs and that meetings should be arranged to take the form of debates on local questions.

Hugh Robertson, A.M.E.I.C., suggested that a register be signed by every member attending the open meetings, and no member should be eligible for office in any year unless he has attended a certain percentage of the number of meetings held the previous year.

With regard to the formation of an Employment Bureau, the following motion was moved by Mr. Wynne-Roberts and seconded by Mr. Proctor.

> " Inasmuch as two of the objects of *The Institute* are to promote the professional interests of the members and to enhance the usefulness of the profession to the public, and whereas one important manner in which this might be accomplished is by organizing some method of bringing engineers and employers into more intimate touch, one with the other, and giving engineers facilities of registering their requests for employment, and whereas it is desirable that *The Institute* should encourage each branch to have an employment bureau, working in co-operation with other branches for the above purpose, it is resolved that the Executive Committee of the Toronto Branch of *The Institute* be asked to appoint a small committee of, say, five members who shall consider how best to organize such a bureau, and to report on same to the Executive Committee, so that the matter shall be further discussed at a future general meeting." Carried.

Moved by Mr. Goldman and seconded by Professor Haultain:—

> " That a committee on salaries and fees be appointed to-night by this branch. This committee to study the question thoroughly and prepare a schedule of minimum salaries and fees for engineering services. At the same time the secretary should be instructed to communicate with the other branches and request them to prepare similar schedules. After these schedules are considered and passed by the branches they should be submitted to the parent *Institute* which should review them and select from them final schedules for the different provinces to be adopted by *The Institute*."

The following amendment to the above motion was moved by Mr. Wynne-Roberts and seconded by Mr. Proctor:—

> " That the executive of the branch appoint two sub-committees, one for *employees* and another for *employers*, to prepare schedules of minimum salaries and fees for engineering services. At the same time the Secretary should be instructed to communicate with the other branches and request them to prepare similar schedules. After these schedules are considered and passed by the branches they should be submitted to the parent *Institute*, which should review them and select from them final schedules for the different provinces to be adopted by *The Institute*."

The amendment was carried.

For " employees," *read* " engineers whose remuneration is in the form of salaries. "

For " employers," *read* " engineers whose remuneration is in the form of fees."

Moved by Mr. Proctor, seconded by Mr. Wynne-Roberts:—

"That a sub-committee be appointed to collect back dues of the branch members." Carried.

The following members were appointed to that sub-committee: Messrs. Proctor, Goedike, Phelps and Jack. Mr. Proctor to convene the first meeting.

Moved by Mr. Proctor, seconded by Mr. Wynne-Roberts:—

"That the branch by-laws be adopted as amended by the committee." Caried.

The meeting was well attended and adjourned at 10.30 p.m.

Special Resolution

At a special meeting of the Toronto Branch of *The Engineering Institute of Canada*, held on March 13th, 1919, the following resolution was moved by Mr. Wynne-Roberts and seconded by Mr. Worthington:—

"That whereas it is vital to the peace and welfare of the Dominion that, during the necessary period of reconstruction following the war, the number of unemployed be reduced as much as possible; and whereas the development of transportation, sanitation, power and public utilities generally is necessary to the development and prosperity of the country; and whereas the curtailment of needed public works during the last five years has retarded the development of the country; and whereas the speediest and most effective means to prevent the suffering, distress, and demoralization resulting from unemployment is afforded by public works; and whereas the public welfare and confidence, upon which industry generally depends, require that the construction of public works be vigorously prosecuted; therefore, be it resolved, that the Toronto Branch of *The Engineering Institute of Canada* desires to record its profound conviction that public works should be carried forward to the fullest extent consistent with sound judgment, not only for fundamental economic reasons, but for humanitarian reasons to furnish employment for all who can properly claim employment, especially returning soldiers; and be it further resolved that a copy of this resolution be forwarded to the Council of *The Engineering Institute of Canada*, with a request that copies of same be transmitted to such federal, provincial, and municipal authorities and public corporations as may be able in the opinion of Council, to promote the purposes of those resolutions, and to commend these authorities who already have such schemes in contemplation." Carried.

Alberta Provincial Division

R. J. Gibb, M.E.I.C., Sec'y-Treas.

Minutes of the second annual meeting held at Calgary, February 1st, 1919, in the Board of Trade Rooms.

The meeting was preceded by a luncheon at which twenty-four members were present, including delegates from Edmonton and other parts of the province. S. G. Porter, of Lethbridge, in the absence of Mr. Pearce, was elected to act as chairman of the meeting which started at 2.30 P.M., and called upon the acting secretary to read the minutes of the last annual meeting and of the meeting held in Edmonton, April 27th, 1918.

The minutes were approved as read and signed by the chairman.

The acting secretary then read his report of the work carried out by the division during the year, and on the motion of C. M. Arnold, seconded by Mr. Gibb of Edmonton, the report was approved and adopted.

Communications

Correspondence in regard to the summer professional meeting from L. B. Elliot of Edmonton, and the secretary of the Vancouver Branch was read. In view of representations made by this division, the Vancouver Branch decided to forego their request for this meeting to be held at the coast, and stated they believed the Victoria Branch would unite with them in supporting our claim to the holding of the next western meeting at Edmonton.

It was, therefore, decided to proceed with the necessary arrangements.

On the motion of C. M. Arnold—F. H. Peters seconding, it was resolved:

"That the work of organization of the western summer meeting be delegated by this division to the Edmonton Branch, and that the Calgary Branch be asked to co-operate with that branch, as far as possible." Carried.

A letter from the Edmonton Branch was read, stating that L. B. Elliot had been nominated by them as Chairman of the Alberta Division for the ensuing year, and R. J. Gibb for Secretary-Treasurer.

R. Cunningham and A. W. Haddow were elected to act on the Executive.

Accounts

The Secretary's report showed a balance at bank of $17.13, with one or two small accounts outstanding. In view of the necessity of providing funds for current expenses, it was moved by Mr. Peters, seconded by Mr. Houston, that the Calgary branch contribute a sum of $25.00 and the Edmonton branch $15.00.

Mr. Gibb suggested this motion be left on the table as he wished to raise the question of raising funds for legislative expenses.

The matter was discussed and it was thought this could be better settled at a conference of engineers which it was proposed to call shortly to discuss the question of legislation. Mr. Peters thought it would be preferable to call for a levy as this would show at once the engineers who were favorable to legislation: Mr. Gibb agreed to let the matter rest and the motion to vote the funds first mentioned. Carried.

Reports of Committees—Legislation

Mr. Peters, as chairman of the legislative committee, made a report on what had been done in this matter. The various steps taken were gone into in detail and the ground covered very fully. Opposition had developed from the mining engineers, and the Alberta Land Surveyors were not entirely in favor of the bill as presented to them. Conferences had been held and the mining men had decided to oppose the bill as they claimed they had not been given sufficient opportunity to discuss it. The discussions that had been held, however, led us to believe that a bill could be drafted that would meet with the approval of the opposing parties, and which would also receive more favorable consideration from our own Council who were working upon the draft of a uniform act for all the provinces, so far as this was possible. It had, therefore been decided to withdraw the act incorporating the "Alberta Institute of Professional Engineers" at the coming session of the legislature.

The support of all members was asked for in furthering the movement with the view to an amended act being submitted to the legislature next year.

Mr. Brown, city electrical engineer, was present and was asked to make a statement on legislation as affecting his branch of the profession. He gave it as his opinion that it would be as well to include all engineers. At a meeting recently held it was the consensus of opinion that it would be better if all engineers were included in one organization, as better results could be expected and we would benefit by an exchange of views and by co-operation. They were not opposed to legislation.

Mr. Gibb stated that the electrical engineers in Edmonton would like to be included in any act passed.

Mr. Gibb drew attention to the fact that the Saskatchewan act did not call for registration by branches and as the parent body were taking this act as a basis to work upon, it would be as well if a delegate were appointed to the annual meeting, that he should be instructed to impress the importance of this matter on the Council. The point was considered to be well taken and was left for the Secretary to deal with.

On the motion of Mr. Arnold it was decided to name Mr. Pearce as delegate to the conference on legislation to act for the division and also for the Edmonton Branch as he would be in Ottawa for the meeting representing the Calgary Branch. Agreed.

Mr. Peters drew attention to the large amount of work done by the executives of both the Edmonton and Calgary Branches in the matter of legislation, and would like to hear if the meeting approved of the actions taken.

P. M. Sauder, seconded by A. S. Chapman, moved that the meeting tender thanks to all those who had worked so hard to gain legislation and that the work done be commended. Further that a legislative committee be appointed by the new executive to carry on the work. Carried.

Mr. Arnold read a resolution which had been passed by the Calgary and Edmonton Branches in regard to the decision to defer action in presenting the proposed act to the present session of the Alberta Legislature and which had been transmitted to the parent body.

Mr. Marshall moved that the Alberta Division endorse this resolution and that the parent body be notified accordingly. Carried.

On the motion of Mr. Gibb, seconded by Mr. Houston, the Secretary was requested to ask Mr. Pearce to bring the matter of registration by branches before the annual meeting at Ottawa with a view to a clause of this nature being incorporated in the bill to be drafted. Carried.

Mr. Gibb stated he had been instructed by the Edmonton Branch to introduce the question of pooling of delegates' expenses, when attending general meetings of *The Institute*.

After some discussion it was the sense of the meeting that the idea was not workable, and Mr. Gibb agreed to let the matter rest.

Elections to Executive, 1919

Calgary Branch, F. H. Peters, Calgary; S. G. Porter, Lethbridge.

Edmonton Branch, R. Cunningham, Edmonton; A. W. Haddow, Edmonton.

Non-resident Members, E. N. Ridley, Strathmore; C. S. Dewis, Canmore.

Unfinished Business.

Reference correspondence on representation of engineers on the senate of the University of Alberta, the secretary will follow the matter up and request a reply to our previous letter.

General

Mr. Arnold presented a resolution urging the Provincial Government to proceed in the matter of a School of Technology in Calgary and assuring our support to such a policy, together with any service we might be able to give in the matter. It was decided to forward the resolution and send copies to the press.

Messrs. Craig, Elliot and Carter were nominated as delegates from the division to the Provincial Research Convention at Edmonton. The Secretary was requested to notify them accordingly and advise the Premier of their appointment.

Alberta Division

At a meeting of the Executive Committee of the Alberta Division held in February, L. B. Elliot, M.E.I.C., of Edmonton, member of Council, was appointed chairman and Robert J. Gibb, M.E.I.C., secretary-treasurer. Mr. Gibb is also secretary-treasurer of the Edmonton Branch.

Border Cities Branch

One of the most enthusiastic organization meetings yet held in any part of Canada was that of the engineers in the border cities including Ford, Walkerville, Windsor, Sandwich, and Ojibway following a dinner at the Chamber of Commerce quarters in Windsor at which about forty were in attendance.

At this meeting Alfred J. Stevens, M.E.I.C., presided, and called on the Secretary of *The Institute* to give an account of the aims, objects and activities of our organization. Following the Secretary's address every member present, and a number of non-members spoke, every one of whom expressed his intention of becoming an active supporter of the branch and taking a personal interest in its welfare.

An announcement regarding election of officers will be made at an early date. This branch will cover an important engineering centre, and from the manner in which it was started gives evidence of an active, aggressive, useful existence.

Ottawa Branch

M. F. Cochrane, A.M.E.I.C., Sec'y-Treas.

A meeting of the Ottawa Branch is called for March 27th, when a full discussion of the subject of the proposed provincial legislation defining the status of the engineers throughout Canada will take place.

The report of the Special Legislation Committee approved at the Annual Meeting of *The Institute* in Ottawa, on February 11th, provides:—

" That a Special Committee be formed, composed of one delegate appointed by each branch to meet at headquarters before the 15th of April, 1919, to draw up such sample legislation as it may deem necessary and advisable in order that the members of *The Institute* throughout the different provinces may ask for legislation on the same uniform basis.

" That this Committee be authorized to obtain the necessary legal advice on the matter.

" That this Committee shall submit the proposed legislation to the Council before the 1st of May, 1919."

" That the Council shall then ask by letter ballot, before the 1st of June, 1919, the opinion of all members of *The Institute*, regarding the adoption of the proposed legislation prepared by the said Special Committee of *The Institute*."

The managing committee of this branch have appointed R. F. Uniacke, M.E.I.C., as their delegate and the committee meet in Montreal on April 5th; they have called this meeting for the purpose of obtaining the views of the members and of instructing our appointed delegate on the wishes and suggestions of the branch.

The discussion will be led by A. A. Dion, Col. D. MacPherson, G. A. Mountain, John Murphy, W. S. Smart, Jas. White. As this is a question of such vital importance, especially at this time, it is hoped there will be a large and representative attendance and very full discussion. Members are referred to the following leading articles on this subject:

1.	*The Journal,*	March,	1919	.........page	173
2.	" "	Sept.,	1918	.... "	217
3.	" "	Nov.,	"	.... "	331
4.	" "	"	"	.... "	335
5.	" "	Dec.,	"	.... "	409
6.	" "	Jan.,	1919	.... "	26
7.	" "	"	"	.... "	27
8.	" "	"	"	.... "	32
9.	" "	Feb.	"	.... "	120

The Branch is to be favoured by the presence, on that evening of A. R. Decary, delegate from the Quebec Branch and A. G. Dalzell, delegate from the Vancouver Branch. Mr. Dalzell has recently met the Victoria, Calgary, Edmonton, Saskatchewan and Manitoba Branches and explained to them the attitude of British Columbia in regard to legislation and organization.

J. B. CHALLIES, M.E.I.C.
Chairman, Ontario Provincial Division.

Manitoba Branch

George L. Guy, M.E.I.C., Sec'y-Treas.

On February 28th, a meeting was held at the Engineering Building, Manitoba University. No paper was read, the meeting being confined strictly to clearing up a large amount of business which had accumulated from previous meetings.

Among other business done, the attached resolution pertaining to the centralization and execution of work pertaining to the development of Manitoba's natural resources, was passed and the Executive were instructed to present same to the local authorities.

A motion was passed appointing a committee to enquire into the present condition of engineering education in Manitoba, to make such recommendation to the branch as they saw fit.

G. C. Dunn, M.E.I.C., and J. M. Leamy, A.M.E.I.C., made a report on the annual meeting which they attended, as representatives of the branch.

On March 6th, an interesting paper was read by John Armstrong, A.M.E.I.C., describing the Greater Winnipeg Water District Tunnel under the Red River. The paper was profusely illustrated with lantern slides, and Mr. Armstrong lucidly explained the various difficulties which had arisen during the construction of this work, and the methods taken to overcome them.

It was decided to appoint a committee to co-operate with the Soldiers' Re-Establishment Committee and the Vocational Training Commission to assist them in any way possible, both as to the suitable arrangement of courses and the placing of men in positions upon completion of their course.

A resolution was passed calling upon the Dominion Government to properly remunerate engineers in the employ of the Civil Service, the Secretary being instructed to send a copy of this resolution to all the other branches, requesting that they bring pressure to bear upon various Federal Members to have this matter properly considered.

Local Notes

J. G. Sullivan, M.E.I.C., has been appointed Chairman of the Manitoba Drainage Commission.

W. M. Scott, M.E.I.C., and Harold Edwards, A.M.E.I.C., have been appointed by the Manitoba Public Utilities Commission to make a valuation of the Winnipeg Electric Railway property with a view to revision of their transportation rates, the work being under the direct supervision of George Guy, M.E.I.C., Engineer of the Commission.

Resolution Adopted

The following resolution was adopted by the Manitoba Branch pertaining to the centralization of work relating to the development of Manitoba's Natural Resources:—

Whereas in the Province of Manitoba are found the following:—Large and valuable deposits of gold, silver, copper, coal, iron, clay and building stone, etc.; large areas bearing a growth of wood suitable for pulp; many lakes and streams teeming with valuable food fishes; great stretches of arable land ready for the plough; immense areas of rich land which may be made available for agriculture by drainage or irrigation; and many water powers awaiting development.

D. H. McDOUGALL, M.E.I.C.
Newly elected President of Canadian Mining Institute.

And whereas the population of Manitoba is but a fraction of the number of persons, the resources of the province is capable of supporting.

And whereas it is expedient and wise that immediate plans be made for the economic development of all the aforesaid natural resources, utilizing all that has been done in the past, and keeping in view certain fundamental principles, which may be stated as follows:

1st.—That in order that systematic, orderly, logical and economical development may be carried on, it is necessary to determine the physical features of the provinces.

2nd.—That the information which may be derived from such a determination, can be made in such form as to be useful for the planning of water routes, highways, roads, drainage and irrigation projects, electric transmission lines, or for any other development work wherein a knowledge of such physical features is a necessary factor.

3rd.—That lines of communication interconnecting all parts of the province, by means of highways, roads and water routes is the first requirement in any comprehensive scheme of development, and that the provision and maintenance of these must precede or accompany the development of any or all of the above natural resources.

And whereas the cost of power and its equitable distribution is a primary factor in the development of natural resources.

And whereas the prosecution, completion and maintenance of all the works indicated herein will promote the prosperity and peace of the province, provide employment for many people, prepare for a vastly increased population and make the many problems connected with the redomestication of the soldier easier of solution.

Whereas the Province of Manitoba is about to acquire control over the natural resources within its boundaries. We expect that together with the present administrative commissions there will be formed new bureaus to deal with the development and protection of the different kinds of resources.

Therefore, be it resolved:—

That in this connection the Manitoba Branch of *The Engineering Institute of Canada* would strongly urge the appointment at once of a thoroughly practical scientific non-partisan board, with authority to correlate the economic policies of the above provincial agencies. The means for collection and methods of expenditure of public funds dealing with internal improvements, reclamation and conservation of natural resources should receive the ratification of this board. It should also assist in framing such legislation that might become essential in the developing of these resources to their highest industrial capacity.

Niagara Peninsula Branch

R. P. Johnson, S.E.I.C., Sec'y-Treas.

During the month of February, following a proposal made last year, some of the members of *The Engineering Institute of Canada*, resident at Niagara Falls proposed that a branch of *The Institute* be formed in the Niagara District.

A meeting was called to discuss the proposal and it was unanimously agreed that steps should be taken to form a "Niagara Peninsula Branch," provided that members living in St. Catharines would express themselves similarly. It was, therefore, decided that St. Catharines should be visited and an expression of opinion obtained from members resident there.

On March 3rd, members motored from Niagara Falls to St. Catharines to lay the proposition before the members in that city. The matter was discussed and it was decided to immediately proceed towards the formation of a "Niagara Peninsula Branch."

A general meeting of all engineers in the district was called on the evening of March 11th, with M. V. Sauer, M.E.I.C., of Toronto, in the chair. The General Secretary, Fraser S. Keith, was present and outlined the scope and functions of *The Engineering Institute* and its branches.

A short discussion followed during which questions, relating to the possible activities of the branch were answered.

A formal petition to the Council for a "Niagara Peninsula Branch," signed by twenty corporate members, was presented by the Provisional Secretary. The chairman then called for nominations for Provisional Officers and an Executive. This resulted as follows:

Chairman, A. C. D. Blanchard, M.E.I.C., Niagara Falls; Vice-Chairman, W. P. Near, A.M.E.I.C., St. Catharines; Secretary-Treasurer, R. P. Johnson, S.E.I.C., Niagara Falls.

Executive, N. R. Gibson, A.M.E.I.C., Niagara Falls; W. H. Sullivan, A.M.E.I.C., St. Catharines; A. J. Grant, A.M.E.I.C., St. Catharines; H. M. Belfour, A.M.E.I.C., Welland; H. L. Bucke, M.E.I.C., Niagara Falls.

The business was completed by 10 o'clock when the members adjourned to the dining-room of the LaFayette Hotel for supper and speeches. The newly-elected chairman occupied the chair at supper.

A register was passed around the table and from this it was learned that there was an attendance of sixty-seven.

A visit of four members from the Hamilton Branch: Messrs. Palmer, Darling, Jack and Pacy, was much appreciated, and a short address by Mr. Palmer was enjoyed.

In addition to these gentlemen, the following visitors were present: R. D. Johnson, New York City; J. A. Johnson, Niagara Falls, N.Y.; C. W. Larner, M.E.I.C., Philadelphia; F. H. Martin, Niagara Falls.

The engineers present represented industry, public and municipal works, railroads, power developments, etc.

After drinking to the new branch and singing a verse of "God Save The King," the meeting adjourned.

PERSONALS

W. G. Mawhinney (B. C. E., Man.), S.E.I.C., who returned recently from overseas has been appointed engineer to the Municipality of St. Clements with offices. at Selkirk, Man.

John F. Green, A.M.E.I.C., formerly construction engineer with the Carter-Halls-Aldinger Company of Winnipeg, has entered the firm of C. D. Howe and Company, consulting engineers, Winnipeg and Port Arthur. Mr. Greene who had been bridge engineer for the city of Spokane, Wash., and for the city of Calgary, Alta., will have charge of bridge and structural work while acting as manager for the Winnipeg office.

NORMAN COULSON MITCHELL, V.C., M.C., A.M.E.I.C., Winnipeg, whose thrilling heroism was reported at the Annual Meeting.

Sir Percy Girouard, C.M.G., D.S.O., Hon. M.E.I.C., arrived in Canada on March 17th, on a combined business and pleasure trip. His distinguished work in connection with the South African war is too well-known to require repetition. The part he played in the Great War was equally important and Canadians are proud of the position he occupies and the services he has rendered the Empire. Sir Percy is President of the Armstrong, Whitworth Company of Canada.

In a letter from Capt. J. W. B. Blackman, M.E.I.C., from the Canadian Railway Troops Camp at Liverpool, he advises that the statement contained in a previous issue of *The Journal* to the effect that he had resigned his position as city engineer of New Westminster was incorrect, as he proposes on arriving in Canada to return to New Westminster where his wife and family are at present residing. Capt. Blackman has recently been promoted from the rank of lieutenant as a recognition of the services which he has rendered since going overseas.

Major R. Douglas Galbraith, S.E.I.C., has been appointed superintendent of the professional and business occupation section of the Dominion and Provincial Employment Service in conjunction with the Soldiers' Civil Re-Establishment for the Toronto and Western Ontario district, with offices at 43 King Street, West. This office is one of many to be established and members of *The Institute* will be gratified to learn that already Major Galbraith's splendid success in this connection has definitely established the value of such offices.

Lieut. Ernest Peden, B.Sc., Jr. E.I.C., who went overseas with the 1st University Company and saw active service for eighteen months in France with the P.P.C.L.I., which period included engagements at Ypres in 1916, and at the Somme, returned to his home in Montreal West early in March. Lieut. Peden became a casualty last October, having spent some time previously as an instructor at Seaford, Sussex, England. Before going overseas he was engaged as demonstrator on bridge design and surveying, etc., at McGill University and has planned to engage in his previous profession of structural designing.

Lieut. F. S. Rutherford, A.M.E.I.C., has been engaged on an important undertaking for the Dominion Government for the past two months in the capacity of organizer for the professional and business occupation section for the Department of Soldiers' Civil Re-Establishment. Lieut. Rutherford has established offices at Ottawa and Toronto and is about to establish one in Montreal, for the purpose of assisting returned men in securing positions. In this work he will have the hearty support, sympathy and co-operation of the entire *Institute*. The details for the most effective working out of this co-operation are being consummated. Lieut. Rutherford proposes visiting all the important centres in Canada, where it will be necessary to establish such offices. The branches can, and are prepared to assist very materially in connection with this work and Lieut. Rutherford is assured of the heartiest co-operation of all the members of *The Institute.*

* * *

A. S. Clarson, A.M.E.I.C., who was formerly city engineer of Verdun and more recently been engaged in consulting engineering practice in Montreal, has been appointed, secretarial manager and permanent organizer of Canadian Building and Construction Industries with headquarters at Ottawa. It is Mr. Clarson's intention to make a trip covering the principal cities in the Dominion for the purpose of organizing branches in accordance with local conditions. Mr. Clarson's many years of engineering and business experience will stand him in good stead in his new position, to which he carries the best wishes of his fellow engineers in Canada for success.

In addition to being an Associate Member of *The Engineering Institute of Canada*, Mr. Clarson is a member, National Highway Traffic Association, New York; member, American Road Builders Association; Fellow of the Royal Colonial Institute of London; Member Montreal Board of Trade; Justice of the Peace for the City and District of Montreal; President and Life Member, St. George's Society of Montreal; Chairman of Joint Committee of the National and Kindred Societies of Montreal; President Christ Church Cathedral Men's Club.

A. S. CLARSON, A.M.E.I.C.
Secretarial manager, Association of Canadian Building and Construction Industries.

J. R. W. Ambrose, M.E.I.C., chief engineer of the Toronto Terminal Railway states that the new Union Station in Toronto will be ready for use not later than August. Within the next few weeks the scaffolding will be taken down, and after that the building will require only a little finish work.

* * *

At the inaugural banquet of the Association of Montreal Building and Construction Industries, held at the Windsor Hotel on February 27th, *The Institute* was represented by Walter J. Francis, Vice-President, and Fraser S. Keith, Secretary, who enjoyed the hospitality of the Association as their guests on this occasion. Mr. Francis was one of the speakers of the evening and responded to the toast "our guests."

OBITUARIES

Capt. J. A. Tuzo, A.M.E.I.C.

Details regarding the death on active service of Capt. J. A. Tuzo, A.M.E.I.C.

Captain Tuzo, born in New York, in 1875, was the only son of the late Dr. H. A. Tuzo, of Victoria, B.C., and Warlingham, Surrey, England. He was educated in England, studied engineering at Yorkshire College and was afterwards apprenticed to the Midland Railway Company. He came to Canada some twenty years ago and engaged in railroad construction and mining engineering in British Columbia and the Western States. At the time of the outbreak of war, Captain Tuzo was Assistant Chief Engineer on the construction of the Kettle Valley Lines, in charge of the section between Midway and Penticton, B.C. On completion of this section he returned to England, volunteered for active service and was granted a commission in the Royal Sussex Regiment.

Capt. TUZO, A.M.E.I.C.

He proceeded with his regiment to Bengalore, India, in January, 1916. After some months in India he was seconded for duty in connection with the reconstruction of the railways in German East Africa. In August, 1917, after a severe attack of fever he was invalided to India, but returned to duty in East Africa in November of that year. On completion of the work, Captain Tuzo was returning to rejoin his regiment and while waiting for a steamer to take him to India was attacked by blackwater fever and after an illness of two days died in the military hospital at Dar-es-Salaam.

Captain Tuzo was keenly interested in the development of southern British Columbia and was one of the pioneers in that district. He was a strong believer in its future and had many interests there. His sad death, occurring so soon after the opening of the railway through that section will be a great loss.

Captain Tuzo is survived by his widow, daughter of the late Lt.-Colonel Craufurd, Grenadier Guards and an infant son, by his Mother Mrs. Tuzo, Warlingham, Surrey, England, and his sister Mrs. J. A. Wilson, Ottawa.

* * *

George William Ross, B.Sc., Jr.E.I.C.

George William Ross was born March 26th, 1894, in Montreal and educated at the Westmount schools, graduating from the Westmount Academy,he then matriculated to McGill University from which he graduated B.Sc., 1915.

Each summer season during his course at McGill he spent on outside work, being two years with the Topographical Survey of the Militia Department, Canada, covering particularly northern Quebec, and a section of the United States boundary. For two years he was on construction work of the Transcontinental, especially no bridges. Upon the formation of the British Munitions Company he was engaged for their work in the United States, but was transferred to the local works at Verdun, where he became supervisor of the fuse department. Possessed of a tremendous determination as well as a capacity for work, he was never content, until after being refused for military service five times, he was eventually accepted as a private in the C.A.M.C., with a draft of which service he went to England in August, 1917. There he passed into the Royal Highlanders of Canada, from which unit he was commissioned in the Royal Engineers (Imperials) subsequently being attached to the Royal Air Force. It was while on an indefinite leave pending release from the Air Force and assignment to regular engineering duties that he went as the guest of the admiralty to visit the Grand Fleet, which he was never destined to see, as he died on the "Warspite" the day after his arrival at Scapa Flow, on Sunday, March 2nd, 1919, at the age of twenty-five. He was a junior of *The Engineering Institute of Canada*, Royal St. Lawrence Yacht Club and St. Andrew's Presbyterian Church, Westmount.

Those best qualified to know described him as a true Canadian, with a large useful career in prospect.

He was the third son of H. J. Ross, of Montreal, and Harriet M. Bissett, formerly of St. Johns, Que.

* * *

The following directors of the Canadian Good Roads Association have been appointed, on the nomination of the respective governments:—British Columbia, J. E. Griffith, M.E.I.C., Deputy Minister of Public Works; Saskatchewan, the Hon. S. Latta, Minister of Highways; New Brunswick, Mr. T. P. Regan, president of the New Brunswick Auto Association, St. John.

Dr. COMFORT A. ADAMS,

President, American Institute of Electrical Engineers, who expressed his firm conviction that the right step had been taken in Canada in making the change in our national organization designed to include all branches of engineering.

EMPLOYMENT BUREAU

Following out the principle adopted by the President and Council of *The Engineering Institute* to assist in every way to help returned soldiers and those out of employment to be effectively placed, this department of *The Journal* is open, free of charge, to contain announcements of all engineers and technical men who desire to take advantage of it. It is anticipated that the organization to carry on this work throughout Canada will be effectively completed very shortly. In the meantime those requiring positions should get in touch with the nearest Branch, and also make use of the columns of *The Journal* for this purpose.

At an open meeting of the Toronto Branch, held on February 28th, at the Engineers' Club, Toronto, it was resolved that the Executive Committee of the Branch appoint an Employment Bureau Committee to consider the question of co-operating with the Parent *Institute* and such other Branches as have or may appoint a similar committee.

The Executive Committee of the Toronto Branch, at a meeting held on the 5th of March appointed the following members to be the above mentioned Employment Bureau Committee:—W. Cross, M.E.I.C., E. T. Wilkie, M.E.I.C., T. H. Hogg, A.M.E.I.C., A. L. Mudge, A.M.E.I.C., and R. T. G. Jack, A.M.E.I.C., with power to add. It was found that A. L. Mudge could not attend so R. O. Wynne-Roberts, M.E.I.C., was appointed in his place.

At a meeting of the Employment Bureau Committee held on the 20th of March, E. T. Wilkie was appointed chairman and W. Cross, secretary.

Situations Vacant

Consulting Engineer.

Experienced man required for consulting work in connection with natural gas. Apply Box No. 35.

Engineering Salesman.

Several electrical graduates desired to fill positions open for salesmen with electrical company. Preference given to returned men. Address Box 33.

Engineering Salesman.

Engineer required who is thoroughly conversant with modern steam boiler practice, one who would be able to sell water tube boilers, economizers, stokers, coal and ash handling systems, pumps, etc., and also look after the engineering work in connection with the installation of such plants. This offers a splendid opening with a consulting, sales and contracting engineering firm doing business in the west. Address Box No. 36.

Instrument Man.

Instrument man for six months engagement starting May 1st, experienced man for general railway work, including re-survey, a short job on re-location and staking out concrete culverts—all under the direction of company's engineer. Applicant must have had experience and be competent to pick up and re-center curves, trace old alignment and with some experience on location. Salary $150.00 per month and living expenses. Apply stating experience and references to General Superintendent and Chief Engineer, Algoma Central and Hudson Bay Railway Company, Sault Ste. Marie, Ont.

Employment wanted

Returned soldier, Captain, three years active service, fourteen years experience in construction, desires a permanent position as construction superintendent. Address Box 1 P.

Preliminary Notice of Application for Admission and for Transfer

20th March, 1919.

The By-Laws now provide that the Council of the Society shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in May, 1919.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows:—

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course. In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineers' office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the following branches at his option Railway, Municipal, Hydraulic, Mechanical, Mining, or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five years or more years.

Every candidate for election as JUNIOR shall be at least twenty-one years of age, and must have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-five years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects Geography, History (that of Canada in particular), Arithmetic, Geometry Euclid (Books I.-IV. and VI.), Trigonometry, Algebra up to and including quadratic equations.

Every candidate for election as ASSOCIATE shall be one who by his pursuits, scientific acquirements, or practical experience is qualified to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

ARCAND—CHARLES LOUIS, of Three Rivers, P.Q. Born at Three Rivers, Nov. 22nd, 1880. Educ., Three Rivers Classical Coll. 1901, asst. engr., P.W.D. of Canada, Three Rivers dist.; 1903-07, in chg. of works as principal asst. engr., on constrn.; 1907 to date, asst. dist. engr.

LINDSAY—CHARLES CRAWFORD (Capt.) of Quebec, P.Q. Born at Quebec, Nov. 26th, 1889. Educ., B.Sc., McGill Univ. 1915. 1908-09, rodman, N.T.C. Ry.; 1910 (6 mos.) miner and drill-runner, Little Nipissing Mine, Cobalt; topog. on location, instr'man and asst. res. engr., on constrn., G.T.P. Ry., in Sask. & Alta.; 1911-13, asst. engr. and surveyor with Smith & Keith, also with Hon. J. L. Cote, civil engrs. and surveyors; 1914 (5 mos.) asst. engr. and surveyor, with J. E. Girard; 4 yrs. on active service as captain in Royal Engrs., work included water supplies, railway constrn., etc.; has recently returned and is at present unemployed.

McCRUDDEN—HARRY ELSMERE, of Westmount, Que. Born at Buenos Aires, Argentine Rep. Dec 1st, 1892. Educ. B.Sc. Arts McGill Univ. 1915; 1910 with M. & S C. Ry., later timekeeper with McDonell & O'Brien; 1911 (5 mos.) Asst. dftsman and topog. constrn. dept C P.R; April 1912; Sept. 1914 drftsman, instr, man acting res. engr. on constr. C.P.R.; March 1915-Jan. 1918 on active service as Lieut. C.F.A.; at the present time Asst director's representative, engr. details and Orthopaedic and Surgical Appliances Branch, Soldiers Civil Re-establishment, Montreal.

ENGINEERING INDEX

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of the engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies may be obtained of any of the articles listed in this section. Price of each print (up to 11 x 14 in. in size), 25 cents, plus postage. A separate print is required for each page of the larger-size periodicals, but where possible two pages will be photographed together on the same print. Bill will be mailed with the prints.

Orders should be sent to

Harrisson W. Craver, Director,
Engineering Societies Library,
29 West Thirty-ninth Street, New York, N. Y.

AERONAUTICS

AEROPLANE PARTS

Radiators. The Aeronautical Radiator, S. R. Swenson. Aerial Age, vol. 8, no. 25, Mar. 3, 1919, pp. 1256-1261 and 1286, 14 figs. Types and designs in general. Study of coefficient *D*; the nose radiator.

AEROSTATICS

Airship Operations. British Airship Development and Operations, Aviation, vol. 5, no. 12, Jan. 15, 1919, pp. 758-759, 1 fig. Figures relative to man power required for operating airships, casualties per flight mileage, and non-flying days.

Commercial Airships. Airships for Commercial Purposes. Flight, vol. 11, no. 5, Jan. 30, 1919, pp. 144-148. Relative advantages of airships and aeroplanes; development and potentialities or rigid airships and aeroplanes; commercial considerations relating to airships. Officially issued by Air Ministry.
The report of the Civil Aerial Transport Committee. Flight, vol. 11, no. 4, Jan. 23, 1919, pp. 119-125. Main or terminal aerodrome; intermediate landing grounded; airship for commercial purposes; correspondence relating to fog on the Newfoundland coast. (Continued from p. 27.)

Dirigibles for Transport. Value of Dirigibles for Aerial Transport, Henry Woodhouse. Flying, vol. 8, no. 2, Mar. 1919, pp. 137-143, 7 figs. Relative advantages of airships and airplanes; progress in heavier-than-air and lighter-than-air machines 1914-1918; technical advantages in designs of airships. From report of Civil Aerial Transport Committee.

Military Balloons. Military Aerostatics, H. K. Black. Aerial Age, vol. 8, no. 24. Feb. 24, 1919, pp. 1166-1167, 4 figs. Free ballooning. (Continuation of serial),

AIRCRAFT PERSONNEL

Flying Sickness. Flying Sickness Martin Flack. Aeronautics, vol. 16, no. 272, Jan. 1, 1919, pp. 21-22, 1 fig. Record or experiences of aviators and tests.

Tests for Flyers Medical Aspects of Aviation, L. E. Stamm. Aeronautics, vol. 16, no. 275, Jan. 22, 1919, pp. 111-113, 3 figs. Physical and mental requisites for aviation work. (To be continued). Paper before Roy, Aeronautical Soc.
The Wear and Tear of Flying, T. S. Rippon. Flight, vol. 11, no. 4, Jan. 23, 1919, pp. 108-109. Methods used by French physicians in examining pilots; American tests.

APPLICATIONS

Aerial Ports. Organization of Aerial Ports, Gino Bastoji, Aviation, vol. 6, no. 1, Feb. 1, 1919, p. 35. Future developments. From Rivista die Transporti Aerei.

Commercial Aviation. Commercial Aviation in the Light of War Experience, F. H. Sykes. Aeronautics, vol. 16, no. 274, Jan. 15, 1919, pp. 81-83. Concerning safety, base and repair facilities, operation of flying roads, meteorology and aerodrome management. Abstract of lecture before Lond. Chamber of Commerce. Also in Flight, vol. 11, no. 3, Jan. 16, 1919, pp. 84-88.

Mail Service. Aerial Mail in the United States and Abroad, Otto Praeger. Flying, vol. 8, no. 2, Mar. 1919, pp. 144-147 and 174-177, 5 figs. Programs proposed and in operation; equipment; coöperation in Post Office Dept. and U. S. Army.
The World's Aerial Mail and Passenger Services. Aviation voc. 5, no. 12, Jan. 15, 1919, p. 755. Operating and projected services.

Passenger Traffic. Aerial Travel for Reconstruction, G. Holt Thomas. Aeronautics, vol. 16, no. 272, Jan. 1, 1919, p. 12. Visualization of transaction of business through instrumentality of aerial navigation.

Patrol Work, Forest. Use of Airplanes in Forest Patrol Work, Henry S. Graves. Aviation, vol. 5, no. 12, Jan. 15, 1919, pp. 754-755. Present service.

Regulations. Future Air Traffic and Necessary Regulations to Govern Same, Alan R. Hawley. Flying, vol. 8, no. 2, Mar. 1919, pp. 149-154, 6 figs. Problem of utilizing military airplanes and employing demobilized aviators.
To Regulate Aerial Navigation, Henry Woodhouse. Flying, vol. 8, no. 1, Feb. 1919, pp. 33-42, 70 and 72, 15 figs. Study by British Aerial Transport Committee and Act this committee has drafted for regulation of aerial navigation.

Safety. The Reliability of Aircraft Travel, Mervyn O'Gorman. Aeronautics, vol. 16, no. 272, Jan. 1, 1919, pp. 5-7, 1 fig. Statistics of accidents; question of reliability of engines.
The Report of the Civil Aerial Transport Committee. Flight, vol. 11, no. 5, Jan. 30, 1919, pp. 150-155. Memorandum of research in regard to meteorology; summary of work, prior to war, of Public Safety and Accidents Investigation Committee of Roy. Aero Club & Aeronautical Soc. (Continued from p. 125).

Surveying and Mapping. The Aero Radio Surveying and Mapping, John Hays Hammond. Flying, vol. 8, no. 2, Mar. 1919, pp. 160-161, 3 figs. Writer's system of aerial radio survey.
Topographic Surveying by Aerial Photography, Arthur Broek, Jr., and L. J. R. Holst. Aviation, vol. 6, no. 2, Feb. 15, 1919, pp. 75-78, 9 figs. Use of aerial photography to making contour maps. Inspection of aerial negatives and interpretation of direction by means of them.

Transcontinental Flight. Aerial Transportation, Evan J. David. Flying, vol. 8, no. 1, Feb. 1919, pp. 64, 66, 75-76 and 78, 2 figs. Review of progress. Squadron of four Army training planes is reported to have completed transcontinental flight.

DESIGN

Aeroplane Design. Aeroplane and Seaplane Engineering, H. C. Richardson. Aerial Age, vol. 8, no. 24, Feb. 24, 1919, pp. 1171-1173, 1180 and 1182-1183, 2 figs. Paper presented before Soc. Automotive Engrs.
Report of the U. S. National Advisory Committee for Aeronautics. Aeronautics, vol. 16, no. 275, Jan. 22, 1919, pp. 116-117. Activities of Committee between Oct. 4, 1917, and Oct. 10, 1918. (To be continued).

Cooling System. The Loomis Cooling System for Aircraft. Mech. Eng., vol. 41, no. 3, Mar. 1919, pp. 255-256, 3 figs. System embodies nose radiator, adjustable booster and expansion tank with positive ejection.

German Design. Trend of German Airplane Design. Automotive Industries, vol. 40, no. 5, Jan. 30, 1919, pp. 262-265, 3 figs. Summary of features of captured enemy machines. Issued by Technical Department, Aircraft Production, Ministry of Munitions.

Incidence Wires. Incidence Wires in the Strength Calculations of Wing Structures, John Case. Aeronautics, vol. 16, no. 273, Jan. 8, 1919, pp. 46-51, 4 figs. Discusses accuracy of method outlined in preceding installment. (Continued form vol. 15, p. 607).

Inspection. Some Avoidable Dangers in Airplane Construction, Walter O. Adams. Am. Mach., vol. 50, no. 8, Feb. 20, 1919, pp. 365-366. Points out some avoidable dangers and suggests standardized inspection for elimination of defective small parts.

Research. Full Scale Aeroplane Experiments, W. S. Farren. Aeronautics, vol. 16, nos. 273 and 274, Jan. 8 and 15, pp. 53-56 and 84-86. Scope of experimental research undertaken by Royal Aircraft Establishment. Abstract of paper before Royal Aeronautical Soc.

Rigging. Rigging, F. W. Halliwell. Flight, vol. 11, nos. 4, 5 and 6, Jan. 23 and 30, Feb. 6, 1919, pp. 107, 132-134 and 176-179, 18 figs. Manufacturing particulars in construction and erection.

Struts. Design of Airplane Struts, W. H. Barling and H. A. Webb. Aviation, vol. 6, no. 2, Feb. 15, 1919, pp. 79 and 82-83, 6 figs. Effect of tapering on strength. Paper before Roy. Aeronautical Soc.
The Spacing of Interplane Struts, John Case. Aeronautics, vol. 16, no. 272, Jan. 1, 1919, pp. 18-20, 15 figs. Computations for various types and cases.

Wing Spar Stresses. Wing Spar Stresses, H. A. Webb and H. H. Thorne. Aeronautics, vol. 16, no. 272, Jan. 1, 1919, pp. 8-11, 8 figs. Formulæ and bending-moment diagrams.

ENGINES

Aeromarine Engine. The Aeromarine Type L 6-Cylinder Aero Motor. Aerial Age, vol. 8, no. 24, Feb 24, 1919, pp. 1164-1165, 4 figs. Describes motor designed for training and sporting machines.

American Engines. American Aero Engines, G. Douglas Wardrop. Aerial Age, vol. 8, no. 25, Mar. 3, 1919, pp. 1242-1251 and 1283, 10 figs. General data of Liberty 12, King-Bugatti, Curtis K-6 and K-12, Hispano-Suiza, Duesenberg model H. Lawrence 60-hp. air-cooled engine, Union 6-cylinder aeromotor, Knox 12, Hall-Scott A-8, and 80-hp. Le Rhone.

Carburetors. A New Principle in Carburation. Aerial Age, vol. 8, no. 25, Mar. 3, 1919, pp. 1223, 2 figs. Brown carburetor said to operate automatically at all speeds.

Characteristics. Characteristics of Leading Aero Engines. Aerial Age, vol. 8, no. 25, Mar. 3, 1919, pp. 1252-1254. Tables of dimensions and data.

Curtiss. The Curtiss Model K-6 and Aircraft Engine. Aviation, vol. 6, no. 2 Feb. 15, 1919, pp. 83-84, 1 fig. General design.
The Curtiss Model K-6 and K-12 Aero Motors. Aerial Age, vol. 8, no. 21 Feb. 3, 1919, pp. 1030-1034, 10 figs. Form of construction adopted gives minimum center distance between cylinders, together with placing of accessories and accessibility of various parts for inspection or overhauling.

Design. The Design of Aeroplane Engines—XV, John Wallace. Aeronautics, vol. 16, no. 274, Jan. 15, 1919, pp. 77-80. 6 figs. Cam design; choice of cam; calculations for profile; process of laying out cam; valve-lift diagram; gas velocity; cams for radial engines. (Continuation of serial).

Duessenberg. Duessenberg Sixteen-cylinder Aircraft Engine. Automotive Industries, vol. 40, no. 4, Jan. 23, pp. 214-218, 13 figs. Weight 1250 lb.; 700 hp. on direct drive and 800 on geared. Said to be the largest aeroplane engine produced in U. S.

Liberty. Liberty Engine Tests. Mech. Eng., vol. 41, no. 3, Mar. 1919, pp. 249-253 and 295, 8 figs. Authentic data on performance tests of the standard high-compression army-type 12-cylinder Liberty engine.
The Liberty Aircraft Engine, J. G. Vincent, Automotive Industries, vol. 40, nos. 6 and 7, Feb. 6 and 13, 1919, pp. 323-327 and 378-385, 8 figs. Feb. 6: Chronological history of development, with remarks on incidents and military requirements that affected its design. Paper before Soc. Automotive Engineers. Feb. 13: Discussion of various features of design, with reasons for their adoption; performance of planes equipped with engine.

Magnetos. Standardized Magnetos for Aircraft Engines. Aviation, vol. 6, no. 1, Feb. 1, 1919, p. 37, 1 fig. Features of Dixie types.

Napier. Napier " Lion " Aero Engine G. Douglas Wardrop. Aerial Age, vol. 8, no. 25, Mar. 3, 1919, pp. 1262-1264, 7 figs. English 12-cylinder model used by Capt. Lang in establishing world's altitude record of 30,500 ft.

Rotary. The 80-hp. Le Rhone Airplane Engine. Aviation, vol. 6, no. 2, Feb. 15, 1919, pp. 70-73, 8 figs. Principles of rotary engines; features of design; performance graph; specifications.

Stresses. The Design of Aeroplane Engines—XVI, John Wallace. Aeronautics, vol. 16, no. 275, Jan. 22, 1919, pp. 102-105, 10 figs. Inertia forces; loads on cam and tappet; stresses in camshaft; torsion of camshaft.

Thermal Efficiency. Importance of High Thermal Efficiency in Aeroplane Engine Design and Construction, Charles W. Burrage. Aerial Age, vol. 8, no. 24, Feb. 24, 1919, pp. 1168-1170, 3 figs. Graph showing difference in characteristics of various aeroplane power plants.

Valves. Valve Dispositions in High-Speed Aircraft Engines, John Wallace. Aeronautics, vol. 16, no. 272, Jan. 1, 1919, pp. 34-36, 5 figs. Computations of valve areas in theoretical engine under assumed conditions.

INSTRUMENTS

Ignition Interrupter. Douglas Automatic Airplane Ignition Interrupter. Automotive Industries, vol. 40, no. 7, Feb. 13, 1919, pp. 372-373, 2 figs. Safety device for stopping engine when propeller breaks or other breakage occurs.

MATERIALS OF CONSTRUCTION

Coatings for Boats. Tests of Moisture and Water Resistance of Various Coatings on Small Boat Construction, Henry A. Gardner. Inst. Indus. Research, Washington, D. C., 10 pp., 3 figs. Following coatings conforming to aeronautical specifications of Navy Dept. were tested: Raw linseed oil; acetate dope; oil graphite; spar varnish; and enamel

Fabrics. Properties of Aeroplane Fabrics, E. Dean Walen. Aeronautics, vol. 16, no. 274, Jan. 15, 1919, pp. 87-90, 8 figs. Methods used by Bur. of Standards in developing a cotton fabric as a substitute for linen for aeroplane wing coverings.

MILITARY AIRCRAFT

Airships, British. The Role of British Airships in the War, W. Lockwood Marsh. Aeronautics, vol. 16, no. 272, Jan. 1, 1919, pp. 13-17, 8 figs. Various types and their uses; war incidents.

War Department, U. S. Aeronautics, George O. Squier. Eng. World, vol. 14, no. 2, Jan. 15, 1919, pp. 33-35. Information on work done by Aeronautics Branch of War Dept.

MODELS

Air Screw. Model Aeroplanes—XX, F. J. Camm. Aeronautics, vol. 16, no. 275, Jan. 22, 1919, pp. 109, 4 figs. Designing the air screw.

Motor. Model Aeroplane Building as a Step to Aeronautical Engineering. Aerial Age, vol. 8, no. 21, Feb. 24, 1919, p. 1177. 2 figs. Illustrations of redesigned Ford motor.

Performance. Model Aeroplane Building as a Step to Aeronautical Engineering. Aerial Age, vol. 8, no. 21, Feb. 3, 1919, p. 1045, 1 fig. Checking possible performance of machine. (Continuation of serial).

Power. Model Aeroplane Building as a Step to Aeronautical Engineering. Aerial Age, vol. 8, no. 25, Mar. 3, 1919, p. 1269, 2 figs. Minimum power required for flying.

PLANES

Armored Planes. Armored Aeroplanes, H. A. Webb. Aeronautics, vol. 16, no. 274, Jan. 15, 1919, pp. 74-76, 6 figs. Comparison of vulnerabilities of square and round bodies.
The Fokkers-Junkers Armored Biplane. Aviation, vol. 6, no. 1, Feb. 1, 1919, p. 36, 1 fig. Wing construction.

Bristol. The " Bristol " Machines. Flight, vol. 11, no. 4, Jan. 23, 1919, pp. 100-105, 25 figs. Types developed of monoplane, biplane and triplane design.

Curtiss. The Curtiss Type 18-2 Triplane. Aviation vol. 6, no. 2, Feb. 15, 1919, pp. 74-75, 2 figs. Dimensions and weights.

De Haviland. The De Haviland, or " Airco," Machines, Flight, vol. 11, no. 2, Jan. 9, 1919, pp. 36-45, 40 figs. Development of this type and features of ten models desigend.
The Enclosed D. H. 4. Flight, vol. 11, no. 4, Jan. 23, 1919, p. 111, 2 figs. Views of totally enclosed two-passenger aerial limousine.

Helicopters. The Helicopter, M. A. S. Riach. Aeronautics, vol. 16, no. 272, Jan. 1, 1919, pp. 23-25. Problem of direct-lift flying machine in light of modern airscrew analysis.

Loening. Description of the Loening Monoplane. Aviation, vol. 5, no. 12, Jan. 15, 1919, pp. 759-762, 5 figs. Construction, engine installation and performance.

Martin. The Martin K-III. Scout, Aeronautics, vol. 16, no. 275, Jan. 22, 1919, pp. 106-108, 4 figs. Details and performance. From Aerial Age. Biplane has wing span of 18 ft., weights 350 lb. and is equipped with 40-hp. A.B.C. engine.

Sopwith. The Sopwith Machines. Flight, vol. 11, no. 6, Feb. 6, 1919, pp. 163-174, 56 figs. Stages in evolution; classification, dimensions, weights of the 21 types produced.

Standard. The Standard Model E-4 Mail Aeroplane. Aerial Age, vol. 8, no. 21, Feb. 3, 1919, pp. 1036-1037 and 1034, 7 figs. General dimensions, weights and details.

Sundstedt. Airplanes for the Transatlantic Flight. Sci. Am., vol. 120, no. 9, Mar. 1, 1919, pp. 202 and 215, 4 figs. Sundstedt biplane. Upper plane has a spread of 100 ft., lower plane 71½ ft.: equipped with 2 Hall-Scott engines rated at 220 hp. each: weight 10,000 lb.: estimated speed 80 mi. per hr.

Sundstedt-Hannevig. The Sundstedt-Hannevig Seaplane. Aerial Age, vol. 8, no. 24, 1919, pp. 1162-1163 and 1183, 5 figs. Designed for long-distance flying over sea.

PRODUCTION

Le Pere. Production of Le Père Planes Was Well Started, J. Edward Schipper. Automotive Industries, vol. 40, no. 6, Feb. 6, 1919, pp. 303-304, 4 figs. Manufacturing details.

PROPELLERS

Calculator for Propellers. A Convenient Calculator for Propellers, E. P. King. Aeronautics, vol. 16, no. 272, Jan. 1, 1919, pp. 31-33, 3 figs. Chart intended to simpliy theoretical work on propeller performance by blade-element method.

Torque. Propeller Torque, J. Morris. Aeronautics, vol. 16, no. 273, Jan. 8, 1919, p. 52, 1 fig. How it arises and its action in the case of both geared and ungeared engines.

SPECIFICATIONS, AEROPLANE

Seaplanes. Navy Issues Seaplane Specifications. Aviation, vol. 6, no. 2, Feb. 15, 1919, pp. 73-74. Schedule for furnishing plans, supervisory assistance and construction of seaplanes.

TRANSATLANTIC FLIGHT

Airship vs. Aeroplane. Possibilities of an Atlantic Air Line. Eng. World, vol. 14, no. 4, Feb. 15, 1919, pp. 41-42. Airships versus airplanes.

VARIA

Metric System. The Metric System and the Aeronautical Industry, David Scott. Aeronautics, vol. 16, no. 272, Jan. 1, 1919, pp. 26-27. Plea for adoption of metric system by Great Britain.

National Advisory Committee. National Advisory Committee Report. Aviation, vol. 5, no. 12, Jan. 15, 1919, pp. 750-753. Recommendations regarding future development of American aeronautics; power plants for aircraft; materials for aircraft.

Progress in 1918. Aeronautics, Times Eng. Supp., year 15, no. 531, Jan. 1919, pp. 14-15. Survey of developments in 1918.
Aeronautics in the United States, 1918, George O. Squier. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 2, Feb. 1919, pp. 53-114, 17 figs. Review of development of military aeronautics in United States up to date of armistice.

Wind Velocity, Determination of. Determination of Wind Velocity and Direction by Means of Sound Waves (Sur une méthode de détermination de la vitesse et de la direction des vents, par temps couvert, à l'aide de sondages par le son), M. Bourgeois. Comptes rendus des séances de l'Académie des Sciences, vol. 167, no. 22, Nov. 25, 1918, pp. 769-772. Balloon carries fireworks timed to explode at regular intervals; motion of halloon is recorded at each explosion, which serves to compute height.

RAILROAD ENGINEERING

ELECTRIC RAILWAYS

Center-Rail Traction. Center-Rail Traction for Mountain Railways, C. Noble Fell. Ry. Engr., vol. 40, no. 468, Jan. 1919, pp. 12-14, 5 figs. Electric center-rail permanent way (Fell system.)

Freight Handling. Freight Transportation by Local Electric Railways (Le transport des marchandises sur les voies ferrées électriques d'intérêt local), Lucien Pahin. Revue Générale de l'Electricité, vol. 5, no. 3, Jan. 18, 1919, pp. 114-117. Survey of developments in United States, England and France by congestion of railroads.

Locomotive. An Electric Rail Locomotive. Motor Traction, vol. 28, no. 723, Jan. 8, 1919, p. 26, 1 fig. Equipped with battery of 120 cells of Edison GII type; ampere-hour capacity, 275.

Tie Renewals. Tie Renewal Cost Reduction Deserves Serious Study, R. C. Cram. Elec. Ry. Jl., vol. 53, no. 7, Feb. 15, 1919, pp. 308-315, 6 figs. Place to begin is in specification and maintenance; use of suitable preservatives, provision for good drainage, liberal spacing, prompt removal of defective ties.

ELECTRIFICATION

French Railways. Consequences of the Electrification of French Railways from the Viewpoint of the Exploitation of the Telegraph and Telephone Lines (L'électrification des chemins de fer français; ses conséquences au point de vue de l'exploitation des lignes télégraphiques et téléphoniques), A. Mauduit. Annales des Postes, Télégraphes et Téléphones, vol. 7, no. 4, Dec. 1918, pp. 499-525. Investigations of the Compagnie du Midi lead writer to establish that in electrified lines with small traffic and where current does not exceed 100 amp., usual protective devices will permit successful operation of telegraph and telephone lines running parallel to track; not so, however, when rail current exceeds 1000 amp.-km., in which case soil return is not judged advisable in telephone or telegraph line.

Partial Electrification of a Great Railway System (Electrification partielle d'un grand réseau de chemins de fer), Victor Sabouret. Bulletin de la Société d'Encouragement pour l'Industrie Nationale, vol. 130, no. 6, Nov.-Dec. 1918, pp. 344-363. Project of Compagnie d'Orleans comprising electrification of 3000 km. of railway.

New Zealand. The Electrification of Railways in New Zealand, E. Parry. New Zealand Jl. Sci. & Technology, vol. 1, no. 6, Nov. 1918, pp. 323-328. Relative merits of steam and electric haulage; importance of a comprehensive system of electric-power supply in its bearing upon railway electrification; evolutional process of main-line electrification in New Zealand.

EUROPEAN

Ambulance Trains, British. British Railways Under War Conditions. Engineer, vol. 127, no. 3291, Jan. 24, 1919, pp. 73-75, 11 figs. Ambulance trains. Fifteenth article.

British. Railways. Times Eng. Supp., year 15, no. 531, Jan. 1919, p. 30. Services given to Government by British railways during war; progress in standardization; rolling-stock construction.

LABOR

Camps. Some Modern Camps for Maintenance Men. Ry. Maintenance Engr., vol. 15, no. 2, Feb. 1919, pp. 49-53, 13 figs. Buildings provided by four of the roads in Chicago district.

LOCOMOTIVES

Training of Engineers. The Training of the Locomotive Engineer. Ry. Gaz., vol. 30, no. 1, Jan. 3, 1919, pp. 27-28. Paper before Instn. Locomotive Engrs.

Australian Locomotives. Locomotive Built by Australian Government, J. O'Toole. Boiler Maker, vol. 19, no. 2, Feb. 1919, pp. 40-41, 2 figs. Type 2-8-0. Total heating surface, 2421 sq. ft.; Walschaerts valve gear and Robinson superheater used.

Coal Consumption. The Economical Use of Coal in Locomotives. Ry. Gaz., vol. 30, no. 2, Jan. 10, 1919, pp. 63-64, 2 figs. Abstract of report issued by engineering staff, Univ. of Ill.

Firebox, Thermic-Syphon. New Type of Locomotive Firebox. Ry. Mech. Eng., vol. 93, no. 2, Feb. 1919, pp. 71-73, 2 figs. By introduction of thermic syphons evaporating efficiency of boiler is materially increased.

Pennsylvania 2-10-2. Pennsylvania Lines 2-10-2 Locomotive. Ry. Mech. Eng., vol. 93, no. 2, Feb. 1919, pp. 63-66, 5 figs. General description, drawings and principal data.

Powdered-Fuel Engines. Locomotives. Times Eng. Supp., year 15, no. 531, Jan. 1919, p. 30. Designs developed in 1918, particularly the powdered-fuel engine.

Standard. Standard 2-6-6-2 Type Locomotive. Ry. Mech. Eng., vol. 93, no. 2, Feb. 1919, pp. 74-77, 6 figs. General description, drawings and principal data.

The Standard Heavy Santa Fe Type Locomotive. Ry. Age, vol. 66, no. 7, Feb. 14, 1919, pp. 389-392, 6 figs. General description, principal data and drawings.

Stokers. The Elvin Mechanical Stoker. Ry. Mech. Eng., vol. 93, no. 2, Feb. 1919, pp. 103-106, 4 figs. Description of stoker for locomotives ,made by Elvin Mechanical Stoker Co., New York.

Superheaters. Modern Locomotive Engine Design and Construction—XLIV. Ry. Engr., vol. 40, no. 468, Jan. 1919, pp. 3-12, 24 figs. Considerations relative to design and construction of different types of superheaters for any working temperature. (Continuation of serial.)

Three-Cylinder Engine. Great Northern Railway Locomotive Performance. Ry. Gaz., vol. 30, no. 3, Jan. 17, 1919, pp. 89-98, 18 figs. Haulage of 1300-ton coal trains between Peterborough and London by a three-cylinder engine.

OPERATION AND MANAGEMENT

Fuel Conservation. Recent Papers on Fuel Conservation. Ry. Mech. Eng., vol. 93, no. 2, Feb. 1919, pp. 66-69. Abstracts of several railway club papers prepared by fuel experts and describing methods of saving coal.

Government Ownership. State Ownership and Operation of Railways. Ry. Gaz., vol. 30, nos. 1, 2 and 3, Jan. 3, 10 and 17, 1919, pp. 11-14, 48-51 and 86-88. Digest of evidence given before commission of inquiry in South Africa concerning advantages and disadvantages of state control of railways.

The National Railway Question of To-Day, Francis Lee Stuart. Proc. Am. Soc. Civil Engrs., Papers & Discussions, vol. 45, no. 2, Feb. 1919, pp. 53-60. Facts which led up to Federal control; competition and Government ownership.

To-Day's Railroad Problem in the States, Theodore P. Shonts. Ry. Gaz., vol. 30, no. 2, Jan. 10, 1919, pp. 57-58. Claims that most economical operation can be attained under private ownership.

Loading, Maximum. Maximum Car Loading, William H. McClymonds. Proc. Pacific Ry. Club, vol. 2, no. 10, Jan. 1919, pp. 16-22. Economics of loading a car to its utmost safe carrying capacity.

Speeds, European. European Train Speeds. Ry. Gaz., vol. 30, no. 3, Jan. 17, 1919, pp. 80-85. Survey of highest, longest and fastest non-stop runs, speed of trains between two places and geographical distribution of principal service. (To be continued.)

Stores, Handling. Handling of Stores on the Santa Fé, Charles E Parks. Ry. Gaz., vol. 30, no 2, Jan. 10, 1919, pp. 59-61. Organization to look after waste material.

Train Dispatching. Getting Trains Over the Road. J. A. Shockey. Proc. Pacific Ry. Club, vol. 2, no. 10, Jan. 1919, pp. 10-16. Duties and responsibility of a train dispatcher.

Organization of a Train Dispatcher's Office and Duties of the Chief Dispatcher, C. E. Norton. Proc. Pacific Ry. Club, vol. 2, no. 10, Jan. 1919, pp. 6-10.

PERMANENT WAY AND BUILDINGS

Ballast. Maintenance of Railway Roadbed by Cleaning the Ballast (L'entretien des voies ferrées par le soufflage du ballast). Génie Civil, vol. 74, no. 5, Feb 1, 1919, p. 94, 1 fig. Methods based on maintaining solidity of supporting parts of ballast by removing vegetation, etc., by air jet, to insure percolation of water into roadbed and trenches.

Track Support, Concrete. Concrete Railway Track-Support. Eng. World, vol. 14, no. 2, Jan. 15, 1919, pp. 58-60, 2 figs. Details of proposed continuous concrete slab support.

ROLLING STOCK

Automobile Cars. Forty-Foot Automobile Cars for Illinois Central. Ry. Age, vol. 66, no. 8, Feb. 21, 1919, pp. 440-443, 4 figs. Single-sheathed type with steel end, especially designed for carrying various types of lading; general description and principal data.

Axles. Notes on Railway High Capacity Wagon Wheel Axles, H. Kelway-Bamber. Jl. & Tran. Soc. Engrs., vol. 9, no. 12, Dec. 1918, pp. 189-204 and (discussion) pp. 204-214, 9 figs. British 10-ton wagon axle; methods of ascertaining stresses; method of calculating dimensions, etc.; specifications for axle steel; factors of safety.

Lumber for Car Construction. Lumber for Car Construction. Hermann von Schrenk. Ry. Mech. Eng., vol. 93, no. 2, 1919. pp. 85-88, 3 figs. Selecting proper grades to secure strength and lasting power, increasing service by preservatives. From address before Western Ry. Club.

Standard Cars, U. S. Standard Cars for the United States Railways. Ry. Gaz., vol. 30, no. 3, Jan. 17, 1919, pp. 101-102, 6 figs. Standard design for 70-ton hopper wagon.

Standards for Freight Equipment. Standards for the Maintenance of Freight Equipment, H. L. Shipmen. Ry. Age, vol. 66, no. 9, Feb. 28, 1919, pp. 495-497. Keeping up the condition of cars to meet demands of traffic; uniform classification of repairs. From a paper before the Western Railway Club.

SAFETY AND SIGNALING SYSTEMS

Alternating-Current Signaling. Alternating Current Signaling. Ry. Engr., vol. 40, no. 468, Jan. 1919, pp. 15-17, 7 figs. How system was developed, how it operates, and results that have been obtained. (To be continued.)

Automatic Signaling. Automatic Signals Expedite Freight Movement. Ry. Signal Engr., vol. 12, no. 1, Jan. 1919, pp. 4-7. Study of conditions of Northern Pacific; table showing information.

Many New Conditions Affected Signaling Last Year. Ry. Signal Engr., vol. 12, no. 1, Jan. 1919, pp. 11-23. Review of progress made in automatic block and interlocking construction developments and personnel of signal field.

Signal Lamps, Focusing A Method of Focusing Signal Lamps, S. C. Hofmann. Ry. Signal Engr., vol. 12, no. 1, Jan. 1919, pp. 30, 1 fig. Details of focus tube for focusing R. S. A. semaphore lamps, claimed to have given satisfactory service.

Suggestions for Improvements. Railway Signalling Under Federal Control, A. G. Shaver. Ry. Signal Engr., vol. 12, no. 1, Jan. 1919, pp. 9-10. Writer's reason why signal engineers should report to operating officers' reforms which could be accomplished.

Ties, Zinc-Treated, and Current Leakage. Influence of Zinc Treated Ties on Signal Operation. Ry. Maintenance Engr., vol. 15, no. 2, Feb. 1919, pp. 65-66 Experiences of various engineers. Discussion at convention Ry. Signal Assn.

SHOPS

Boiler Shops. Among Railroad Boiler Shops—VI, James F. Hobart. Boiler Maker, vol. 19, no. 2, Feb. 1919, pp. 49-50 & 60, 5 figs. Devices developed for special work; front-end staging, handling locomotive tenders and special tools.

Canal Zone Shops. Our Canal Zone Dry Docks and Repair Shops, R. D. Gatewood. Am. Mach., vol. 50, no. 8, Feb. 20, 1919, pp. 336-339. General description of Balboa facilities.

Roundhouse, Concrete. An Unusual Concrete Roundhouse at Proctor, Minn., Wm. E. Hawley. Ry. Age, vol. 66, no. 8, Feb. 21, 1919, pp. 428-430, 5 figs. Saw-tooth roof applied to circular building; cantilever beams support walls over entrance doors.

Safety Devices. Safeguards in Railway Shops, Frank A. Stanley. Ry. Mech. Eng., vol. 93, no. 2, Feb. 1919, pp. 93-96, 9 figs. Description of certain safety devices used at various shops of Southern Pacific.

Welding. The Oxy-Acetylene Process in Railroad Shops, W. L. Bean. N. E. R. R. Club, Jan. 14, 1919, pp. 247-261. Development; notes on apparatus selection; accessories; instruction of welders.

TERMINALS

PHILADELPHIA. The Port of Phila., George S. Webster. Jl. Engrs. Club, Phila., vol. 35-12, no. 169, Dec. 1918, pp. 549-551. Administration; recent additions; possibilities.

RICHBOROUGH. The Richborough Transportation Depot and Train Ferry Terminus. Engineer, vol. 127, no. 3291, Jan. 24, 1919, pp. 76-79. 15 figs. The new wharf. Third article.

RICHMOND, VA. A New Passenger Station Completed at Richmond, Va. Ry. Age, vol. 66, no. 7, Feb. 14, 1919, pp. 401-406, 9 figs. Project involves terminal with facilities for two roads and improved main line. Also in Ry. Rev., vol. 64, no. 7, Feb. 15, 1919, pp. 239-242, 9 figs. Description of three-million-dollar structure.

TERMINAL SHEDS. Marine Terminal Shed, H. McL. Harding. Eng. World, vol. 14, no. 2, Jan. 15, 1919, pp. 47-48, 1 fig. Comparison of one-story and two-story sheds in regard to cost and speed of operation.

YARDS, LONDON. Willesden Gravity and Marshalling Yards. Ry. Gaz., vol. 30, no. 1, Jan. 3, 1919, pp. 17-24, 11 figs. and chart. Freight and coal traffic in London district of London & Western Ry.

ELECTRICAL ENGINEERING

ELECTROCHEMISTRY

POTENTIAL SIGNS. The Sign of Potentials, Oliver P. Watts. Brass World, vol. 15, no. 2, Feb. 1919, pp. 37-39, 1 fig. Argues that sign adopted for potential of a metal is of importance to electrochemistry and urges continuing established use of plus sign for potential of zinc.

ELECTROPHYSICS

AIR FILMS, DIELECTRIC STRENGTH OF. The Dielectric Strength of Air Films Entrapped in Solid Insulation and a Practical Application of the Problem for Alternator Coils and Cables, F. Dubsky. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 2, Feb. 1919, pp. 141-161, 7 figs. It was found from experiments that the dielectric strength of air films between insulations was practically the same as the dielectric strength of air films between conductors. Specific examples are given illustrating application of data to design of armature coils and cables.

AMPLIFICATION OF CURRENTS. Amplification of the Photoelectric Current by Means of the Audian, Carl Eli Pike. Phys. Rev., vol. 13, no. 2, Feb. 1919, pp. 102-108, 8 figs. Experiments, it is reported, have demonstrated that photoelectric currents can be amplified by means of the audion from 1600 to 5000 times.

CURRENT, FLOW OF. Propagation of the Current in an Electric Line (Propagation du courant dans une ligne), J. B. Pomey. Revue Générale de l'Electricité, vol. 5, no. 6, Feb. 8, 1919, pp. 204-209. Demonstration of Heaviside formula and derivation of a relation to cover case when variable electromotive force starts from a given condition of motion.

ELECTRIC CIRCUIT, GENERAL EQUATION OF. The General Equations of the Electric Circuit—III, Charles P. Steinmetz. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 3, Mar. 1919, pp. 249-318, 11 figs. Variation of constants r, L, C, and g, and its effects. Equations of line constants as function of equivalent frequency are derived, and applications thereof made to various problems.

ELECTROMAGNETIC FIELDS. On the Flow of Energy in the Electromagnetic Field Surrounding a Perfectly Reflecting Cylinder, T. K. Chinmayan. Lond., Edinburgh & Dublin Phil. Mag., vol. 37, no. 217, Jan. 1919, pp. 9-33, 8 figs. Positions of maxima and minima of illumination and visibility of fringes when plane light waves are grazingly incident in a direction at right angles to axis of cylinder.

ELECTROMAGNETIC PHENOMENA, MECHANICAL REPRESENTATION OF. Mechanical Representations of Electromagnetic Phenomena (Représentations mécaniques des phénomènes électromagnétiques), Artur Korn. Revue Générale de l'Electricité, vol. 5, no. 4, Jan. 25, 1919, pp. 150-151. Considerations on a mechanical representation of an electron, the electric current and a magnet. From Electrotechnische Zeitschrift, vol. 39, Sept. 12 and 19, 1918, pp. 363-375.

ELECTROMAGNETIC OSCILLATIONS. Productions of Electromagnetic Oscillations (Production d'oscillations électromagnétiques), Ricardo Arnô. Industrie Electrique, vol. 27, no. 635, Dec. 10, 1918, pp. 443-444. Produced directly by alternating currents used in industry. Brief abstract of communication to Institute Lombard des Sciences et des Lettres.

GRID CURRENTS IN VACUUM TUBES. Note on the Effects of Grid Currents in Three-Electrode Ionic Tubes, E. V. Appleton. Lond., Edinburgh & Dublin Phil. Mag., vol. 37, no. 217, Jan. 1919, pp. 129-134, 2 figs. Conductance of grid circuit inside tube is treated as high-resistance leak across condenser of oscillatory circuit connected to grid and filament; effect of this leak in amplifying and oscilation circuits is investigated quantitatively.

INSULATION, ELECTRICAL STRESSES IN. Ionization of Occluded Gases in High-Tension Insulation, G. B. Shanklin and J. J. Matson. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 2, Feb. 1919, pp. 163-210, 21 figs. Determination of safe working stress from measurements of stress at which ionization starts in different types of built-up insulation, such as used in cables and coils. Paper brings out importance of reducing gas spaces to minimum size and using materials of lowest possible permittivity, since the higher the permittivity the greater the stress on the gas spaces.

INSULATORS, RUPTURE OF. Mechanism of the Rupture of Electric Insulators (Le mécanismes de la rupture des isolants électriques). Génie Civil, vol. 74, no. 5, Feb. 1, 1919, pp. 92-93, 3 figs. Factors determining rupture; effect with alternating currents.

IRON LOSSES AT RADIO FREQUENCIES. Note on Losses in Sheet Iron at Radio Frequencies, Marius Latour. Proc. Inst. Radio Engrs., vol. 7, no. 1, pp. 60-71, 1 fig. Calculation of power dissipated separately by Foucault currents and by hysteresis in a sheet of iron, assuming constant angle of lag between magnetic induction in sheet and magnetizing field producing it; thickness of iron sheet which will make total power a minimum; angle of lag between voltage and current in circuit of inductance coil.

Hysteresis and Eddy-Current Losses in Iron at Radio Frequencies, Christian Nusbaum. Proc. Inst. Radio Engrs., vol. 7, no. 1, Feb. 1919, pp. 15-26, 8 figs. Review of literature on heat losses per cycle at various frequencies; comparison calorimetric method whereby losses in soft-iron-wire core of a toroid are measured against similarly wounded toroid without iron core.

MAGNETIC FLUX DENSITY. The Natural Frequency of an Electric Circuit Having an Iron Magnetic Circuit, H. G. Cordes, Proc. Inst. Radio Engrs., vol. 7, no. 1, Feb. 1919, pp. 73-82, 2 figs. Following Steinmetz procedure, magnetic flux density in laminated iron core with a.c. current excitation is found; then expressions and tables for determining natural frequency of circuits containing iron-core inductances are given; results obtained are numerically illustrated.

MAGNETISM, KINETIC THEORY OF. On a Kinetic Theory of Magnetism in General, Kôtarô Honda and Junzo Okubo. Phys. Rev., vol. 13, no. 1, Jan. 1919, pp. 6-26, 4 figs. Modifications in Langevin's theories of para-magnetic and dia-magnetic substances in order to account for observed facts.

RESISTANCE MEASUREMENTS, RADIO FREQUENCY. The Measurement of Radio Frequency Resistance. Phase Difference, and Decrement. J. H. Dellinger. Proc. Inst. Radio Engrs., vol. 7, no. 1, Feb. 1919, pp. 27-59, 9 figs. Relations between resistance, phase difference, sharpness of resonance, and decrement; derivation and classification of methods of measurement. Methods are comprised under resistance-variation and reactance-variation. Special direct-reading methods of measuring reactance.

SHORT-CIRCUIT CURRENT CALCULATION. Calculation of Short-Circuit Currents in Alternating-Current Systems, W. W. Lewis. Gen. Elec. Rev., vol. 22, no. 2, Feb. 1919, pp. 140-145, 8 figs. The author describes the use of a calculating table, for solving complicated problems in the determination of short-circuit currents in large power networks.

SINUSOIDAL CURRENT, ACTION OF. Electrical State of a Line Carrying a Sinusoidal Current (Etat permanent sur une ligne parcourue par un courant sinusoïdal), M. E. Brylinski. Bulletin de la Société Française des Electriciens, vol. 8, no. 75, Dec. 1918, pp. 401-420. Formulæ for electrical quantities determined for various cases.

STEEL CONDUCTORS. Resistance and Reactance of Commercial Steel Conductors, H. B. Dwight. Elec. Jl., vol. 16, no. 1, Jan. 1919, pp. 25-27, 15 figs. Curves showing amperes per wire against ohms per mile for different sizes; graphs drawn from results of tests.

TRANSIENT OSCILLATIONS. Theory of the Transient Oscillations of Electrical Networks and Transmission Systems, John R. Carson. Proc. Inst. Elec. Engrs., vol. 38 no. 3, Mar. 1919, pp. 407-489, 22 figs. Theoretical study with view to developing methods of calculation directly applicable to engineering problems. A formula is derived which expresses current in electric network due to suddenly applied e.m.f. in terms of applied e.m.f. as time function and a characteristic function of constants and connections of system.

FURNACES

MANUFACTURE. Furnace Company Completes New Plant. Blast Furnace, vol. 7, no. 3, Mar. 1919. pp. 152-153, 2 figs. Features of electric furnace manufacturing plant.

Plant of the Electric Furnace Co. Brass World, vol. 15, no. 2, Feb. 1919, pp. 61-63, 10 figs. Plant manufactures Baily furnaces for electrical heat-treating and annealing of steel, and melting of nonferrous metals.

RENNERFELT FURNACE OPERATION. Melting Silver, Nickel and Bronze Alloys by Electricity. Eng. & Min. Jl., vol. 107, no. 7, Feb. 15, 1919, pp. 323-324. Results at Phila. mint with 1000-lb. Rennerfelt electric furnace.

RESISTOR-TYPE EXPERIMENTAL FURNACE. Experimenting with the Electric Furnace. Wirt S. Scott. Jl. Electricity, vol. 42, no. 4, Feb. 15, 1919, pp. 173-174. Experimental work on resistor type furnaces for forging.

STEEL FURNACES. Electric Furnaces as Applied to Steel Making, Henry Lawrence Hess. Mech. Eng., vol. 41, no. 3, Mar. 1919, pp. 245-248, 5 figs. Methods of producing electric steel; Héroult type of furnace; cold method of producing electric steel; method of pouring, rolling and other furnace operations practiced in plant operating two 6-ton and four 7-ton Héroult furnaces.

GENERATING STATIONS

CANADA. Statistical Analysis of the Central Electrical Station Situation of Canada. Elec. News, vol. 28, no. 3, Feb. 1, 1919, pp. 26-30, 7 figs. Synopsis of data prepared by Dominion Water Power Branch of Dept. of Interior, in co-operation with Dominion Bur. of Statistics of Dept. of Trade & Commerce.

DIESEL ENGINES. Electric Generation by Diesel Engine, E. J. Richards. Jl. Electricity, vol. 42, no. 4, Feb. 15, 1919, pp. 167-169, 5 figs. Results obtained at large copper mine.

HYDROELECTRIC PLANTS. Michigan's Largest Hydroelectric Development. Eng. World, vol. 14, no. 4, Feb. 15, 1919, pp. 21-24, 6 figs. Layout; co-ordination of turbines installed to water flow; equipment of 140,000-volt transmission line.

SINGLE-PHASE CURRENT GENERATION. The Supply of Single-Phase Power from Three-Phase Systems, Miles Walker, Jl. Instn. Elec. Engrs., vol. 57, no. 278, Jan. 1919, pp. 109-139 and (discussion) pp. 139-148, 49 figs. Methods of obtaining single-phase power, particularly (1) by taking of single-phase current direct from one of phases of a three-phase supply system and use of balancer for balancing phases, and (2) by a rotating balancing transformer which absorbs balanced three-phase power in one winding and supplies a single-phase load from an independent winding. A calculation of a balancing transformer for feeding a 400-kw. electric furnace is worked out; figures obtained in tests of machine at no load and at full load are given.

GENERATORS AND MOTORS

BRUSHES. Application of Brushes to Electrical Machinery, Warren C. Kal, Power, vol. 49, nos. 7 and 8, Feb. 18, and 25, 1919, pp. 241-243 and 276-278, 9 figs. Feb. 18: Various types of brushes used on electrical machinery, their composition, method of manufacture and field of application. Feb. 25: Discussion of effect of conditions of service upon selection of carbon brushes.

COOLING OF MOTORS. Colling of Electric Motors, with Special Reference to Totally-Enclosed Machines, P. A. Mossay. Tran. Instn. Min. Engrs., vol. 56, part 2, Dec. 1918, pp. 103-115 and (discussion), pp. 115-117, 13 figs. Writer's experience and suggestions in regard to present systems of ventilating motors.

DEMAND FACTORS OF MOTORS. Determination of Demand Factors to Save Copper, Henry C. Horstmann and Victor H. Tousley. Elec. World, vol. 73, no. 7, Feb. 15, 1919, pp. 308-310, 3 figs. Methods by which electrical inspectors can more accurately gauge in advance probable demand factors of different types of motor installations.

INDUCTION MOTORS, SPEED-CONTROL OF. Speed Control of Induction Motors on Cranes and Hoists by means of Solenoid Load Brakes, R. H. McLain and H. H. Vernon. Gen. Elec. Rev., vol. 22, no. 2, Feb. 1919, pp. 117-125, 9 figs. Article covers different applications of solenoid brakes and gives a detailed description of a solenoid load brake.

MECHANICALLY CONNECTED MOTORS. The Operation of Mechanically-Connected Direct-Current Motors Permanently in Series or Permanently in Parallel, H. F. Stratton. Popular Engr., vol. 11, no. 2, Feb. 1919, pp. 10-13, 8 figs. Reasons why preference is given to several mechanically connected motors in preference to a single large motor. (To be continued.)

STANDARDIZATION OF MOTORS. Advantages of Uniform Motor Design. Rotary Apparatus. Elec. Power Club, bul. 6010, Jan. 2, 1919, 6 pp. Views of manufacturers and users concerning standardization of electric motors.

SYNCHRONOUS MOTORS, STARTING. Starting Synchronous Motors, E. E. George. Elec. Wld., vol. 73, no. 9, March 1, 1919, pp. 429-430. How to avoid excessive currents and mechanical strains in synchronous motors started as induction machines.

LIGHTING AND LAMP MANUFACTURE

MUNICIPAL LIGHTING. A Study in Municipal Electric Lighting. Stone & Webster Jl., vol. 24, no. 2, Feb. 1919, pp. 104-112. Comparative data showing results of municipal electric lighting in Massachusetts.

POCKET LAMPS. Pocket Electric Lamps (Les lampes électriques de poche), L. Lindet. Bulletin de la Société d'Encouragement, vol. 130, no. 6, Nov.-Dec. 1918, pp. 398-399. Development of industry in France; details of manufacture.

THEATRES. Electric Lighting of Theatres (L'éclairage électrique au théatre), J. Reyval. Revue Générale de l'Electricité, vol. 5, no. 4, Jan. 25, 1919, pp. 133-145, 11 figs. Brief survey of progress in artificial lighting of theatres; description of electric installation of the Théâtre National de la Comédie Française, Paris.

MEASUREMENTS AND TESTS

KENOTRON. Measurement of the Crest Values of alternating Voltage by the Kenotron, Condenser and Voltmeter, J. R. Craighead. Gen. Elec. Rev., vol. 22, no 2, Feb. 1919, pp. 104-109, 8 figs. Arrangement described embodies in one instrument a combination of qualities said not to be possessed by previous devices for the purpose. The theory and construction of the crest meter is described, test of its accuracy recorded and its advantages and limitations set forth.

POWER APPLICATIONS

CALIFORNIA CAMPAIGN. California Co-operative Campaign Progress. Jl. Electricity, vol. 42, no. 3, Feb. 1, 1919, pp. 108-110. Summary of accomplishments in 1918. Object of campaign is better electric service to public.

ELECTROMETALLURGICAL INDUSTRIES. Electrometallurgical Industries in the Scandinavian Countries (Les industries électrométallurgiques dans les pays Scandinaves). Journal du Four Electrique, vol. 28, no. 3, Feb. 1, 1919, pp. 17-19, Statistical figures and notes on various projects.

FLOUR MILLS. Electrical Equipment of New Pacific Coast Flour Mill. Elec. Rev., vol. 74, no. 8, Feb. 22, 1919, pp. 295-296, 5 figs. Mill at Pasco, Wash., is completely equipped electrically; labor-saving methods promote marked economy.

HEATING. Electric Heating as a Profitable Load, Barry Dibble. Jl. Electricity, vol. 42, no. 3, Feb. 1, 1919, pp. 102-105, 2 figs. Data on cost and revenue of electric, heating on Minidoka project, Idaho.

LABORATORIES. Electrically Equipped Laboratories, C. B. Merrick. Jl. Electricity, vol. 42, no. 4, Feb. 15, 1919, pp. 153-154, 2 figs. Installation at parasitology laboratories of Cal. State Board of Health.

OFFICE BUILDING. Electricity in a Large Office Building. Jl. Electricity, vol. 42, no. 4, Feb. 15, 1919, pp. 150-151, 3 figs. General description of electric equipment in Southern Pacific building, San Francisco.

POTTERIES. Electricity in the Ceramic Arts, J. P. Alexander. Gen. Elec. Rev., vol. 22, no. 2, Feb. 1919, pp. 113-116, 4 figs. Describes various processes employed in the pottery industry and the service afforded by electricity in this field.

SHIPBUILDING. Electricity in the Shipbuilding and Shipping Industries. Shipbuilding & Shipping Rec., vol. 13, no. 1, Jan. 2, 1919, pp. 13-14. Concerning efficient development utilization of power as means to face international competition.

SIGNS. Portland Sign Ordinance. Jl. Electricity, vol. 42, no. 3, Feb. 1, 1919, pp. 114-115. Regulations in Portland and Oregon.

STANDARDS

FUNDAMENTAL UNITS, DEFINITIONS OF. International Electrotechnic Commission (La commision electrotécnica internacionale), German Niebuhr. Boletin de la Asociacion Argentina de Electro-Tecnicos, vol. 4, no. 9, Sept. 1918, pp. 807-815, 2 figs. Definitions adopted for the fundamental units. (Continuation of serial.)

STANDARDIZATION. Standardization of Edison Lamp Bases and Sockets (Projet d'unification des filetages des culots et supports de lampes à vis Edison), C. Zetter. Bulletin de la Société d'Encouragement, vol. 130, no. 6, Nov.-Dec. 1918, pp. 405-410, 2 figs. Report of Union des syndicats de l'Electricité.

TELEGRAPHY AND TELEPHONY

AMATEUR RADIO. Amateur Radiotelegraphy of the Future, Alfred N. Goldsmith. Wireless Age, vol. 6, no. 5, Feb. 1919, pp. 11-13. Advocates operating all amateur radio stations of the future on sustained waves between 100 and 300 meters.

The Fire Underwriters' Rules Applied to Amateur Stations. Wireless Age, vol. 6, no. 6, Mar. 1919, pp. 32-33, 2 figs. Advisability of modifying installation to conform to Underwriters' rules and method of doing so.

AUTOMATIC TELEPHONE, WESTERN ELECTRIC. The Western Electric Company's Automatic Telephone System, B. O. Anson. Instn. Post Office Elec. Engrs., paper on 72, pp. 1-47 and (discussion) pp. 48-61, 23 figs. Operation, details of principal apparatus used, schematic connections of various line exchanges, and records of service.

BAUDOT QUADRUPLEX SYSTEM. Paris-London Quadruplex Baudot Communication (Communication Baudot quadruple Paris-Londres), M. Mercy. Annales des Postes, Télégraphes et Téléphones, vol. 7, no. 4, Dec. 1918, pp. 623-624. Condensation is reported to have been overcome in Anglo-French cable by interpolation of differential transmission between cable and aerial line in France. Device used described in Annales, Mar. 1917, p. 144.

BRITISH COLONIES. The Telegraph and the Telephone in the British Colonies (Le télégraphe et le téléphone dans les Colonies britanniques). Journal Télégraphique, vol. 43, no. 1, Jan. 25, 1919. pp. 3-6. Australia and New Zealand. (Concluded.)

CEYLON. Telegraphs and Telephones in Ceylon in 1917 (Les télégraphes et les téléphones en Ceylon en 1917). Journal Télégraphique, vol. 43, no. 1, Jan. 25, 1919, pp. 13-14. Constructions and revenues. From report of Postmaster General.

FRENCH COLONIES. Wireless Telegraphy in the French Colonies (La télégraphie sans fil dans les colonies françaises). Revue Générale de l'Electricité, vol. 5, no. 6, Feb. 8, 1919, pp. 233-234. Present conditions; particulars of the Messimy project. From Economiste français, Jan. 11, 1919.

GOVERNMENT OWNERSHIP. Both Sides of the Government Ownership Question. Wireless Age, vol. 6, no. 6, Mar. 1919, pp. 11-21 and 46, 13 figs. Summary of opposing testimony given in congressional hearing on Alexander bill for Government ownership of wireless.

INTERFERENCE PREVENTION. General Rules Followed in the United States for Protecting Telephone Lines Against Three-Phase Lines (Règles générales suivies aux Etats-Unis pour protéger les lignes téléphoniques contre les lignes triphasées), M. Valensi. Annales des Postes, Télégraphes et Téléphones, vol. 7, no. 4, Dec. 1918, pp. 526-607, 38 figs. Prepared from information obtained in conferences of writer with engineers of Am. Telephone & Telegraph Co. and his perusal of Proc. Am. Inst. Elec. Engrs., notably Interference as a Practical Problem by A. H. Griswold and R. W. Mastick, and the Design and Transposition for Parallel Power and Telephone Circuits by H. S. Osborne.

LLOYD'S SEMAPHORE, RADIO TELEGRAPHY. Wireless Telegraphy and the Safety of Navigation (La télégraphie sans fil et la sécurité de la navigation maritime). Journal Télégraphique, vol. 43, no. 1, Jan. 25, 1919, pp. 6-10. Lloyd's semaphore plan proposed to the Paris International Conference. (To be continued.)

MERCURY-VAPOR RECTIFIERS. Mercury Vapor Rectifiers (Les redresseurs à vapeur de mercure). Revue Générale de l'Electricité, vol. 5, no. 4, Jan. 25, 1919, pp. 146-149, 8 figs. Scheme of connections, efficiency curves and oscillograms of voltages and currents. From Schweizerische Bauzeitung, vol. 72, Sept. 28, 1918, pp. 117-120, 13 figs.

MOLYBDENITE RECTIFIERS. Photoelectric Sensitivity vs. Current Rectification in Molybdenite, W. W. Coblentz and Louise S. McDowell. Phys. Rev., vol. 13, no. 2, Feb. 1919, pp. 154-155. Tests are said to have shown that low-resistance, photoelectrically-insensitive samples of molybdenite are more efficient rectifiers than high-resistance, light-sensitive specimens.

MULTIPLEX TRANSMISSION. Multiplex Telegraphy and Telephony. Wireless Age, vol. 6, no. 6, Mar. 1919, pp. 22-23, 4 figs. Concerning use of radio frequency currents.

Multiplex Telephony and Telegraphy, Frank B. Jewett. Telegraph & Telephone Age, vol. 37, no. 2, Jan. 16, 1919, pp. 45-47, 4 figs. Development and possibilities.

NAVAL RADIO STATIONS. A Brief Technical Description of the New San Diego, Pearl Harbor, and Cavite High Power Naval Radio Stations, Leonard F. Fuller. Proc. Inst. Radio Engrs., vol. 7, no. 1, Feb. 1919, pp. 11-13.

RADIO PROGRESS DURING WAR. Radio Development During the War, Nugent H. Slaughter. Elec. World, vol. 73, no. 7, Feb. 15, 1919, pp. 311-315, 4 figs. Problems with which Signal Corps were confronted when the United States first engaged in conflict; how it placed radio-apparatus production on quantity basis; nature of improvements made.

RESONANCE MEASUREMENTS. Resonance Measurements in Radiotelegraphy with the Oscillating Audion. Proc. Inst. Radio Engrs., vol. 7, no. 1, Feb. 1919, pp. 9-10. The telephone click in an oscillating audion circuit when a coupled circuit is brought into tune with it is utilized to measure quickly and accurately antenna capacity, wave length of distant stations, capacities, inductances and wave lengths.

Rouzet Transmitting System. Rouzet Transmitting System for Increasing Spark Frequencies. Wireless Age, vol. 6, no. 5, Feb. 1919, p. 20, 4 figs. Wiring diagram.

Simultaneous Telegraphy and Telephony. The Van Rysselberghe System of Simultaneous Telegraphy and Telephony, the Marshall Electrical Condenser Etc., Wm. Maver, Jr. Telegraph & Telephone Age, vol. 37, nos. 1 and 4, Jan. 1 and Feb. 16, 1919, pp. 21-23 and 95-97. (Concluded from Sept. 16, 1918.)

Telegraph Lines, Protection Against Lightning. Protection Against Lightning and High Tension Circuits. Telegraph & Telephone Age, vol. 37, no. 2, Jan. 16, 1919, pp. 42-44 Summary of experience of railroad telegraph departments. Presented at convention of Assn. Ry. Telegraph Superintendents. (Concluded.)

Telephone Circuits. Telephone Circuits With Zero Mutual Induction, William W. Crawford. Proc. Am. Inst., Elec. Engrs., vol. 38, no. 3, Mar. 1919, pp. 377-405, 11 figs. Deals with reduction of inductive interference in telephone circuits. Several forms of construction involving various relative positions of two or more circuits, in which mutual inductance is zero, and mutual capacitance unbalance approximately zero, are discussed.

Telephone Relays. Telephone Relays Used by the French Administration. (Les relais téléphoniques employés par l'Administration française). Revue Générale de l'Electricité, vol. 5, no. 4, Jan. 25, 1919, pp. 151-152. 4 figs. Apparatus deviced by Latour. From Annales des Postes, Telégraphes et Téléphones, vol. 7, Sept. 1918, p. 403, 4 figs.

Telephones, Automatic. Automatic Telephone Systems, J. N. Wallace. New Zealand Jl. Sci. & Technology, vol. I, no. 6, Nov. 1918, pp. 331-340, 6 figs. Development and operation.

Telephony, Radio. Magnetic Modulating System for Wireless Telephony. Wireless Age, vol. 6, no. 5, Feb. 1919, pp. 20-21, 3 figs. Modulation effected by subjecting magnetic core to relatively weak and rapidly alternating cross magnetization.
Radio Telephony, E. B. Craft and E. H. Colpitts. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 3, Mar. 1919, pp. 337-375, 43 figs. Development of systems of generation, modulation, transmission and reception of radio telephone systems; work of producing radio telephone and allied apparatus for Army and Navy in late war.

Tone Frequencies. The Production of Tone Frequencies. Wireless Age, vol. 16, no. 5, Feb. 1919, pp. 18-20, 6 figs. Oscar Roos methods of operating wireless system over wide range of tone frequencies.

Vacuum Tubes. War-Time Development of Vacuum Tubes, Ralph Brown. Elec. World, vol. 73, no. 8, Feb. 22, 1919, pp. 358-363, 9 figs. Most important advance in radio engineering; three stages; determining desirable characteristics; designing tubes having these characteristics and capable of being produced in quantities; specifications and test methods.

Wave-Length Standardization. The Standardization of the Wave Lengths of Electro-Magnetic Waves for Radio-Engineering and the Calibration of Wave Meter (in Japanese), K. Nishizaki. Denki Gakkwai Zasshi, no. 366, Jan. 10, 1919.

Weagant Oscillation Valve. The Weagant Oscillation Valve. Wireless Age, vol. 6, no. 6, Mar. 1919, pp. 24-25, 6 figs. Reported improvement on original Fleming oscillation valve. A plate and a filament are enclosed in a vacuum chamber as usual; a metallic electrostatic control element is placed parallel to electron stream so that its field acts at right angles to latter; this position of control is said to be essential characteristic of tube.

TRANSFORMERS, CONVERTERS, FREQUENCY CHANGERS

Phase Transformers. The Engineering Evolution of Electrical Apparatus—XXXVI, Chas. F. Scott. Elec. Jl., vol. 16, no. 1, Jan. 1919, pp. 28-30, 6 figs. Development of two-phase, three-phase transformation.
The Essentials of Transformer Practice—XVIII, E. G. Reed. Elec. Jl., vol. 16, no. 1, Jan. 1919, pp. 31-32, 9 figs Transformer connections for phase transformations.

Voltages, Abnormal. Abnormal Voltages Within Transformers, L. F. Blume and A. Boyajian. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 2, Feb. 1919, pp. 211-248, 21 figs. Mathematical analysis of rectangular wave impinging upon a transformer winding and quantitative values of resulting internal voltage stresses in terms of transformer constants; partial applicability of conclusions to abrupt impulses; difference between operating transformer with isolated and grounded neutral; comparison of theoretical results with impulse and high-frequency tests made in laboratory.

TRANSMISSION, DISTRIBUTION, CONTROL

High-Tension Transmission. For High Tension Transmission Service. Power Plant Eng., vol. 23, no. 4, Feb. 15, 1919, pp. 179-183, 5 figs. Description of new Dixon station of Illinois Northern Utilities Co.; modern coal-handling equipment; novel arrangement of intake prevents dirty screens.

Line Tests. Line Tests in Medium-Sized and Small Offices (Essais de lignes dans les bureaux de moyenne et de petite importance), M. Poirier. Annales des Postes, Télégraphes et Téléphones, vol. 7, no. 4, Dec. 1918, pp. 625-627, 2 figs. How to make simple tests by means of voltmeter.

Phase-Displacement and Power Rates. Phase-Displacement and Its Relation to Methods of Charging for Power, H. Bussmann. Elecn., vol. 82, no. 2122, Jan. 17, 1919, pp. 101-102, 3 figs. Abstract of article in Elektrotechnische Zeitschrift, no. 10, 1918.

Pole Guying. Examples of Pole Guying from Other Fields, Charles Rufus Harte. Elec. Ry. Jl., vol. 53, no. 7, Feb. 15, 1919, pp. 321-324, 5 figs. Deals especially with protection against strains due to storms; refers to subject of pole preservation.

Rectifiers. Connection in Parallel and Voltage Regulation of Mercury-Arc Rectifiers (Marche en parallèle et réglage de la tension des redresseurs de courant à vapeur de mercure). Revue Générale de l'Electricité, vol. 5, no. 6, Feb. 8, 1919, pp. 230-233, 10 figs. Concerning operation of several rectifiers connected in parallel in preference to one single highpower apparatus, where demands call for large supply of power. From Electrotechnische Zeitschrift, vol. 39, Aug. 15, 1918, pp. 321-324.

Substations. A Well-Lighted and Well-Ventilated Substation, S. H. Granton. Elec. Ry. Jl., vol. 53, no 7, Feb. 15, 1919, pp. 326-327, 4 figs. Descriptiou of new substation of Kansas City Railways.

Suspension, Aerial. New Charts for Aerial Suspensions, Joseph N. Le Conte. Jl. Electricity, vol. 42, no. 3, Feb. 1, 1919, pp. 120-122, 4 figs. Graphical representation of relationship of constants involved in suspension design. From paper before San Francisco Section, Am. Inst. Elec. Engrs.

Transmission-Line Computations. Transmission-Line Computations, A. E. Kennelly. Elec. World, vol. 73, no. 8, Feb. 22, 1919, pp. 356-357, 4 figs. Use of hyperbolic functions favored in comparison with alternative methods for calculation of voltage, current and power on long uniform transmission lines.

Wire Sizes. Calculation and Design of Direct Current Circuits, Terrell Croft. Nat. Engr., vol. 23, no. 2, Feb. 1919, pp. 72-75, 3 figs. Determining sizes of wire for distribution of electrical energy; voltage variations for incandescent lamps; apportionment of voltage drop; wiring calculations.

WIRING

Interior Wiring. Approved Interior Wiring Methods, John H. Mayer. Telegraph & Telephone Age, vol. 37, no. 4, Feb. 16, 1919, pp. 83-84. Suggestions in regard to wiring offices for electric light so work will pass inspection.

ACCOUNTING

Graphical Analysis. Graphical Analysis of Accounting, Walter E. Gaby. Min. & Sci. Press, vol. 118, no. 8, Feb. 22, 1919, p. 260, 1 fig. Proposes scheme of representing in form of flow sheet the elements of double-entry bookkeeping.

EDUCATION

Crippled Workmen. Cut Metal Trade's Disability Costs, Douglas C. McMurtrie. Iron Trade Rev., vol. 64, no. 7, Feb. 13, 1919, pp. 445-446. Work of Red Cross Inst. for reeducation of crippled and disabled men, New York City.
Re-education vs. Disability Compensation, Douglas C. McMurtrie. Am. Mach., vol. 50, no. 9, Feb. 27, 1919, pp. 405-406. A plea for the re-education of the disabled worker rather than the pension and his neglect.

Education and Democracy. Industry, Democracy and Education, C. V. Corless. Bul. Can. Min. Inst., no. 83, Mar. 1919, pp. 257-272. Address at joint session Am. Inst. Min. Engrs. and Can. Min. Inst.

Navy Machinists. How the Navy Trains its Machinists Ashore, Willard Connely. Am. Mach., vol. 50, no. 9, Feb. 27, 1919, pp. 397-400, 6 figs. Training comprises courses in machine work, pattern making, molding, blacksmithing, sheet metal working, oxyacetylene welding, boat building and gasoline-engine construction and repair.

Reeducation of Cripples. Disabled Soldiers and Sailors, Douglas C. McMurtrie, Salt Lake Min. Rev., vol. 20, no. 21, Feb. 15, 1919, pp. 29-30. Work of reeducation at Red Cross Inst. for Crippled and Disabled Men, New York City.
L'Hôtel des Invalides, at Avignon, Jules Veran. Am. Jl. Care for Cripples, vol. 7, no. 2, pp. 139-141. Discusses establishment of institution for war cripples. Translated from Revue Interalliée pour l.Etudes des Questions intéressant les Mutilés de la Guerre, vol. 1, pp. 285-289.
Placement of Disabled American Soldiers and Sailors; Agreement Between Federal Board for Vocational Education and United States Employment Service. Am. Jl. of Care for Cripples, vol. 7, no. 2, 1918, pp. 154-156.
The Problem of the Discharged Disabled Man, H. H. C. Baird. Am. Jl. of Care for Cripples, vol. 7, no. 7, 1918, pp. 117-125. Insufficiency of present means of readaptation; conditions resulting from public indifference. From Outlook.
A Record of Practical Experience in Retraining Crippled Ex-Service Men, A. G. Baker, Am. Jl. of Care for Cripples, vol. 7, no. 7, 1918, pp. 109-111. Notes of the Superintendent, Pavillion Military Hospital, Brighton, England.
Re-Education from the Point of View of the Disabled Soldier, Grace S. Harper, Am. Jl. of Care for Cripples, vol. 7, no. 2, 1918, pp. 85-87. Translated from Revue Interalliée pour l'Etude des Questions intéressant les Mutilés de la Guerre, vol. 1, 1918, pp. 254-258.
Should Disabled Men be Re-Educated in Special Schools? L. Alleman, Am. Jl. of Care for Cripples, vol. 7, no. 7, 1918, pp. 100-104. Translated from French address to Inter-Allied Conference on the After-Care of Disabled Men. (Reports pp. 171-178.)
Social Responsibilities in the Rehabilitation of Disabled Soldiers and Sailors, Douglas C. McMurtrie, Am. Jl. of Care for Cripples, vol. 7, no. 7, 1918, pp. 126-132. Duties of the family, of the employer, and of the general public. From Medical Rev.
So Comes the Sacred Work, John Galsworthy. Am. Jl. of Care for Cripples, vol. 7, no. 7, 1918, pp. 88-91. Extent of reeducation work the nations will have to undertake.
The Training of the Disabled South Africa Soldier and Its Lesson, E. N. Thornton. Am. Jl. of Care for Cripples, vol. 7, no. 7, 1918, pp. 105-108, 4 figs. Paper at Inter-Allied Conference on Disablement Problems Arising out of the war.
The Vocational Rehabilitation Act. Am. Jl. of Care for Cripples, vol. 7, no. 2, 1918, pp. 142-144. Text of measure as signed by Preident Wilson.
The Vocational School for Disabled Soldiers at Nantes, France, Emmanuel Chastand, Am. Jl. of Care for Cripples, vol. 7, no. 7, 1918, pp. 92-99, 8 figs. Claims that experience has shown that reeducational school which comprises shops, classrooms, dormitories, and dining rooms is best agency for refitting for work disabled soldiers; training in private shop is considered as ineffective.

Reeducation of Cripples. What the Employers of America Can Do for the Disabled Soldiers and Sailors. Jl. Acetylene Welding, vol. 2, no. 8, Feb. 1919, pp. 381-384 and 398. Coöperation the oxy-acetylene industry can offer. Vocational rehabilitation series no. 3 of Federal Board for Vocational Education.

Research Work by Students. Reforms in the Technical Engineering Education (Ideas sobre la reforma de la ensenanza tecnica), Ramon Salas Edwards. Anales del Instituto de Ingeniros de Chile, vol. 18, no. 9, Sept. 1918, pp. 388-395. Concerning personal research work by engineering students.

Students in Coal Mining. The Training of Students in Coal Mining, With Special Reference to the Scheme of the Engineering Training Organization, F. W. Hardwick, Tran. Instn. Min. Eugrs., vol. 56, part 2, Dec. 1918, pp. 94-100 and (discussion), pp. 119-126. Lays emphasis on practical training of students at collieries.

Training Department', Aircraft Factory. Installing a Training Department, James W. Russell. Indus. Man., vol. 57, no. 3, March, 1918, pp. 175-182, 10 figs. Descriptive of the school for training 400 women weekly for a variety of positions, including clerical, metal-working, wood-working and drafting occupations at the Buffalo factory of the Curtis Aeroplane & Motor Corporation.

EXPORT

Foreign Plant Construction. Americans Build Foreign Plants, V. G. Iden, Iron Trade Rev., vol. 64, no. 8, Feb. 20, 1919, pp. 509-513. Discusses opportunities for American enterprises and capital.

FACTORY MANAGEMENT

Department Heads. Executive Common Sense in the Workshop, Abe Winters. Can. Machy., vol. 21, no. 7, Feb. 13, 1919, pp. 157-159. Circular letter to department heads of Standard Oil Co. Also in Can. Foundryman, vol. 10, no. 2, Feb. 1919, pp. 46-48.

Employment Management. Handbook on Employment Management in the Shipyard, Bulletin II, Tue Employment Building. U. S. Shipping Board Emergency Fleet Corporation, Employment Management Branch, Oct. 1918, 29 pp., 4 figs. General requirement of employment building; recommended plans for employment buildings.

Hiring Methods. Selecting Employees. Natural Gas & Gasoline Jl., vol. 13, no. 2, Feb. 1919, pp. 65-68. Method of Laclede Gas Light Co. Applicant appears separately before five examiners who test him and draw reports on appearance, mentality, native ability, mental alterness and past record, respectively.

Industrial Laws. Managing for Maximum Production, L. V. Estes. Indus. Man., vol. 57, no. 3, March 1, 1919, pp. 169-175, 5 figs. Principles and laws in industry. First of a series of articles.

Labor Saving. Plant for War and Peace. Times Eng. Supp., year 15, no. 531, Jan. 1919, pp. 2-3. Concerning saving of labor.

Labor-Saving Devices. Labor-Saving Devices, George Frederick Zimmer. Eng. Rev., vol. 32, no. 7, Jan. 15, 1919, pp. 189-191. Relative advantages and possibilities of mechanical means for handling.

Management of Employees. Developing Ambition and Confidence in Employces, George Wehrle. Gas Age, vol. 43, no. 3, Feb. 1, 1919, pp. 129-131. Suggestions to general managers of gas works.

Mental Factors in Tests. Mental Factors in Industrial Organization, Thomas T. Read. Bul. Am. Inst. Min. Engrs., no. 146, Feb. 1919, pp. 563-567. Report of chairman of Institute's committee on industrial organization.

Mental Tests in Industry, Robert M. Yerkes. Bul. Am. Inst. Min. Engrs., no. 146, Feb. 1919, pp. 405-419, 16 figs. Brief account of methods for measuring intelligence prepared for use in U. S. Army, of typical results, and of their practical applications.

Office-Building Management. Building Manager and Chief Engineer, Edward H. Kearney. Nat. Engr., vol. 23, no. 2, Feb. 1919, pp. 57-59. Incidents in daily routine of managing an office building; importance of engineering and cleaning departments.

Purchasing. Method of Purchase Expediting, Harry M. Sutton. Indus. Man., vol. 57, no. 3, March, 1919, pp. 230-231, 2 figs. Chart intended to eliminate delay.

Standardization of Methods. The Control of Methods, Processes and Materials in a Manufacturing Plant, H. L. Campbell. Proc. Steel Treating Research Soc., vol. 2, no. 2, 1919, pp. 20-31, 2 figs. Way in which a research department assisted in improvement and standardization of methods, processes and material used in a manufacturing plant.

Stock Room. The Storage of Electric Supplies. Jl. Electricity, vol. 42, no. 4, Feb. 15, 1919, pp. 161-162, 3 figs. General description of office and warehouse of wholesale firm.

Tool Room Organization. Modern Tool Room Organization Machinery, vol.1 3,. no. 331, Jan. 30, 1919, pp. 477-479, 7 figs. Scheme for recording and costing jigs and fixtures.

FINANCE AND COST

Cost Accounting. Cost Accounting to Aid Production, G. Charter Harrison. Indus. Man., vol. 57, no. 3, March 1919, pp. 218-224, 3 figs. Importance of deliberation in introducing changes. Sixth article.

Equipment and Maintenance Factors in Cost Accounting During Transition Period, L. W. Alwyn-Schmidt. Am. Mach., vol. 50, no. 8, Feb. 20, 1919, pp. 366-368. Book value of equipment readjustment equipment for new work, revaluation of all equipment recommended; charges for depreciation; how can each job be apportioned?

Fundamentals of a Uniform Cost Accounting System, G. A. Schonlau. Eng. World, vol. 14, no. 4, Feb. 15, 1919, pp. 58-60. General remarks on standardization and discussion of accounting method for manufacturers of concrete pipe and title. From Proc. Am. Concrete Pipe Assn.

Costing. Accurate Costing in Engineering. Eng. Rev., vol. 32, no. 7, Jan. 15, 1919, pp. 187-188. Selection of proper standard of value is given as first step in scheme for preparing standard cost system.

Costing and Labor. The Workers' Interest in Costing, M. Webster Jenkinson. Iron & Coal Trades Rev., vol. 98, no. 2657, Jan. 31, 1919, pp. 127-130. Attainment of efficiency and progress through taking workers in confidence of management. From paper before Conference of Indus. Reconstruction Council.

LABOR

Contract and Bonus Systems. Day Labor, Force Account Work and Bonuses on Highway Construction, Charles M. Upham. Mun. & County Eng., vol. 56, no. 1, Jan. 1919, pp. 31-33. Pronounces coutract system more economical, than day labor and discusses advantages of bonus system.

Contract vs. Day Labor. Performing Municipal Construction Work by Day Labor in Flint, Michigan, Ezra C. Showcraft. Mun. & County Eng., vol. 56, no. 2, Feb. 1919, pp. 66-67. Volume of day labor; contract vs. day-labor system; opinion as to success.

Construction Projects. City and County Engineers Write of Construction Projects Planned to Provide Buffer Employment for Labor During Readjustment Period. Mun. & County Eng., vol. 56, no. 2, Feb. 1919, pp. 37-46. Reports from 57 engineers.

Distribution of Labor. Distribution of Labor. Times Eng. Supp., year 15, 531, Jan. 1919, pp. 3-4. Discussed from viewpoints of work, skill and direction.

Employee Representation. Steel Plant Industrial Relations Studied. Blast Furnace, vol. 7, no. 2, Feb. 1919, pp. 101-104 and 118. Plan developed and in use by a company, whereby elected employee representatives meet and discuss problems of management and welfare.

Hours of Work. The Eight Hour Day Defined. Nat Indus., Conference Board, Research report no. 11, Nov. 1918, 9 pp. Comparison and analysis of different senses in which word is used and of principles on which demands for each type of a so-called 8-hr. day are based. Also in Eng. & Min. Jl., vol. 107, no. 6, Feb. 8, 1919, pp. 271-273.

Hours of Work as Related to Output and Health of Workers. Wool Manufacturing. Nat. Indus. Conference Board, Research Report no. 12, Dec. 1918, 69 pp. Based upon data gathered by means of schedules of inquiries addressed to members of Nat. Assn. Wool Mfrs., and to other wool naumfacturers and by field investigation.

Shorter Hours. Times Eng. Supp., year 15, no. 531, Jan. 1919, pp. 5 and 7, Expected effects on output.

Housing. The Group House—Its Advantages and Possibilities, Richard Henry Dana. Am. Architect, vol. 115, no. 2249, Jan. 29, 1919, pp. 163-165. Address delivered at Annual Conference of Housings in America.

Housing Construction at Craddock. Mun. Jl., vol. 46, no. 4, Jan. 25, 1919, pp. 61-63, 4 figs. Project to provide homes for 5,000 workers. Central concrete plant serving entire project.

Industrial Fatigue. Reducing Industrial Fatigue. Automotive Industries, vol. 40, no. 4, Jan. 23, 1919, pp. 219-221. Suggestions of Divisional Committee on Industrial Fatigue of Division of Scientific Research, U. S. Public Health Service.

Industrial Relations. Improving Relations of Employer and Empolyee, Elec. Wld., vol. 73, no. 9, March 1, 1919, pp. 418-419. Discussion by Richard H. Rice of ways to bring about a closer and better relationship between employees and the industry.

Labor Agreements. The 47-Hour Week and 8-Hour Day. Ry. Gas., vol. 30, no. 2, Jan. 19, 1919, p. 40. Terms of understanding arrived at between representatives of Engineering and Nat. Employers' Federations, Shipbuilding Employers' Federation, and Amalgamated Soc. Engrs. and Unions Affiliated to Eng. and Shipbuilding Trades and Federations.

Labor Conditions in 1917. Labor Conditions in 1917. S. A. Jl. Industries, vol. 1, no. 15, Nov. 1918, pp. 1426-1433. Abstract of annual report for 1917 of superintendent and chief inspector of white labor union of South Africa.

Labor Conditions in 1918. A Review of the Labor Conditions of 1918. Ry. Maintenance Engr., vol. 15, no. 2, Feb. 1919, pp. 63-65. Measures introduced to secure help on account of shortage of employees.

Labor Market. The Labor Market. New York State Indus. Commission Bul., vol. 4, no. 5, Feb. 1919, pp. 98-99. Employment in N. Y. State factories in Jan. 1919; wages and cost of living in Dec. 1918.

Labor Outlook. The Labor Outlook for the Coming Year, Hugh Reid. Ry. Maintenance Engr., vol. 15, no. 2, Feb. 1919, pp. 43-45. Past and present conditions in relation to future prospect; influence of federal supervision.

Outlook for Labor Generally Improved. Ry. Maintenance Engr., vol. 15, no. 2, Feb. 1919, pp. 68-70. Review of situation in various parts of the country during 1918, and discussion of 1919 prospects.

Productivity of Labor. The Principles of Employing Labor, E. H. Fish. Indus. Man., vol. 57, no. 3, March 1919, pp. 203-207. The author points out two ways of increasing the amount of labor effort in industry; bring out labor that has retired; increase the productive work of each individual employed.

Profit Sharing. How Valuable Are Profit-Sharing Plans? Harry Tipper. Automotive Industries, vol. 40, no. 4, Jan. 23, 1919, pp. 209-210. Claims that any system which attempts to satisfy the physical necessities of the worker without increasing his responsibility must fail.

Rest Periods. Rest Periods for Industrial Workers. Safety Eng., vol. 37, no. 2, Feb. 1919, pp. 77-78. Investigation by Nat. Indus. Conference Board.

Social Surrounding of Labor. Social Surrounding Have Important Bearing on All Labor Questions, Harry Tipper. Automotive Industries, vol. 40, no. 7, Feb. 13, 1919, pp. 366-367. Points out that comfort and home life of worker will modify extent and acuteness of unrest and migration.

Soldier Apprentices. Soldier Apprentices. Times Eng. Supp., year 15, no. 531, Jan. 1919, p. 9. Scheme of state assistance.

Trade Unions. Trade Unions and Production. Times Eng. Supp., year 15, no. 531, Jan. 1919, pp . 4-5. Reports engineers express view that trade unions have not helped production in past and are not likely to help it in future.

Unemployment Statistics. Unemployment Figures Mere Guess. Iron Trade Rev., vol. 64, no. 9, Feb. 27, 1919, pp. 580-584, 1 fig. Claims figures of Federal Employment Service on unemployment are inaccurate.

Wages and Cost of Living. Salaries and the High Cost of Living (Les salaires et la vie chère). Revue Générale de l'Electricité, vol. 5, no. 6. Feb. 8, 1919, pp. 235-236. Proposes increase of salaries on prorata basis of percentage of increase in price of principal commodities. From Moniteur des Intérêts matêreils, Jan. 8, 1919.

Welfare Work. Welfare Work Among Maintenance Men. Ry. Maintenance Engr., vol. 15, no. 2, Feb. 1919, pp. 40-42, 6 figs. Pennsylvania Railroad's educational courses and camps.

Women. Employment of Women Workers in Our Industries. Gas Age, vol. 43, no. 3, Feb. 1, 1919, pp. 123-128, 7 figs. Standards for employment of women issued by U. S. Dept of Labor; costumes in England and Amcrica; experiences of gas companies.

What Women Earn at Work. New York State Indus. Commission Bul., vol. 4, no. 5, Feb. 1919, p. 83. Data and figures complied by Bureau of Statistics.

Women Can Handle Exacting Work, J. Edwards-Schipper. Automotive Industries, vol. 40, no. 5, Jan. 30, 1919, pp. 266-267, 2 figs. Experiences of some manufacturers concerning adaptability of female labor.

Women in Electrical Industry. Safety Eng., vol. 37, no. 2, Feb. 1919, pp. 67-73, 12 figs. Working conditions at Westinghouse plant where 4000 women are employed.

Organization and Management. Women in Industry, Their Work and Their Health, Samuel Semple. Safety Eng., vol. 37, no. 1, Jan. 1919, pp. 17-19. Social effects of employment of women. From Proc. Seventh Annual Safety Congress.

Working Conditions. Works Life. Times Eng. Supp', year 15, no. 531, Jan. 1919, pp. 7-8. Discusses influences affecting workers personally.

Workmen's Compensation. Workmen's Compensation Legislation of the United States and Foreign Countries, 1917 and 1918. U. S. Dept. of Labor, Bur. of Labor Statistics, Workmen's Insurance and Compensation Series, no. 243, Sept. 1918, 477 pp. Enactments, new and amendatory, made by the State legislatures during 1917 and up to July 1918. Some changes in foreign legislation are also noted.

LEGAL

Compensation Acts. The "Coverage" of the Compensation Acts. Chesla C. Sherlock, Am. Mach., vol. 50, nos. 7 and 8, Feb. 13 and Feb. 20, 1919, pp. 319-321 and pp. 354-356. Second and third article. Second article establishes who are employees and when they are entitled to compensation, with an incursion into question of dependents and when they come under protection of compensation laws. Third article makes distinction between accidents occurring "out of" and "in course of" employment and at other times technically construed by citations from American and English courts.

Joint Sales Agencies. Legality of Joint Sales Agencies, A. L. H. Street. Coal Age, vol. 15, no. 9, Feb. 27, 1919, pp. 404-405. Court decisions concerning propriety of forming a pool for sale of members' products. Coal and fuel companies have been involved in cases quoted.

Tools, Laws on Use of. The Law Relating to the Use of Tools, Chesla C. Sherlock. Iron Age, vol. 103, no. 7, Feb. 13, 1919, pp. 427-428. Rule of simple tool and its application; employer's duty of inspection limited; important exceptions.

LIGHTING

Economic Aspects. Economic Aspects of Industrial Lighting, C. E. Clewell. Elec. World, vol. 73, no. 8, Feb. 22, 1919, pp. 371-374, 7 figs. Cost vs. wages; increased production and greater accuracy in workmanship; less eye stain; stimulating effect; comfort of workmen; more neatness.

Office. Modern Office Lighting, A. L. Powell. Elec. World, vol. 73, no. 7, Feb. 15, 1919, pp. 316-320, 4 figs. Lighting system for new office building of Edison Lamp Works was designed by illuminating engineers in advance of construction period; extensive tests indicate importance of careful maintenance of fixture and walls.

PUBLIC REGULATION

Price Regulation. Gas Coke Price Escapes Regulation in Germany. Gas Age, vol. 43, no. 3, Feb. 1, 1919, pp. 140-142. Upon profiteering under war-time conditions. From Journal für Gasbeleuchtung.

Railways, Electric. The Trend of Regulation. Area, vol. 7, no. 7, Feb. 1919, pp. 677-684. Discussions and opinions of courts and commissions concerning electric railways.

Rates. Rate Adjustment, Valuations, and Some of the Problems Incident Theroto, G. M. Garland. Mun. & County Eng., vol. 56, no. 2, Feb. 1919, pp. 74-76. Situation likely to arise in operation and management of public utilities by reason of general opinion.

Utility Valuation. Need of a Revised Principle of Utility Valuation, Robert L. Hale. Gas Age, vol. 43, no. 3, Feb. 1, 1919, pp. 137-139. Discusses decisions of Wis. R. R. Commission.

Water Power, Canada. Water-Power Administration in Canada. H. W. Grunsky. Can. Engr., vol. 36, no. 7, Feb. 13, 1919, pp. 209-211 Summary of existing laws, regulations and practices in Quebec, Ontario, Prairies Provinces and Territories, and British Columbia.

RECONSTRUCTION

Automotive Industry, England. European Expansion Under War Pressure—I and II, David Beecroft. Automotive Industries, vol. 40, nos. 7 and 8, Feb. 13 and Feb. 20, 1919, pp. 345-348 and 403-406. Developments in factory enlargement, features of electric starting and lighting. Problem of reorganization of industry on peace basis.

British Views. The Return to Civil Industry. Problems of Engineering Production. Times Eng. Supp., year 15, no. 531, Jan. 1919, pp. 1-2. Views of leading manufacturers.

Canadian Organization. Canada Organizing for Vast Trade. Iron Trade Rev., vol. 64, no. 7, Feb. 13, 1919, p. 453. List of commodities for which there is an immediate market in Belgium, prepared by Can. Mfrs.' Assn.

Co-operation. Co-operation Vital in Reconstruction. Iron Trade Rev., vol. 64, no. 6, Feb. 6, 1919, pp. 381-382. British business leaders declared at London meeting held jointly with American business paper editors, that new tasks cannot be accomplished unless capital and labor continue teamwork as during war.

Peace Problems Demand Cooperation, G. W. Thompson. Chem. Engr., vol. 27, no. 2, Feb. 1919. pp. 43-44 and 48. Suggests that chemical industries, by means of Webb law, open price associations and through greater cooperation prepare themselves to meet foreign competition and internal conditions.

Engineering Forecast. Engineering and Industrial Forecast, W. T. Christine. Eng. World, vol. 14, no. 2, Jan. 15, 1919, pp. 55-57. Writer's opinion concerning opportunities for profitable business.

France. Economic Organization of the Country After the War (L'organisation économique du pays après la guerre). Echo des Mines et de la Métallurgie, vol. 47, no. 2613, Feb. 16, 1919, pp. 108-110. Report of commission appointed by French senate.

Engineering conditions in France. Mech. Eng., vol. 41, no. 3, Mar. 1919, pp 262-264. Expressions from American engineer-delegates to conference with French engineers on reconstruction problems.

The Rebuilding of Devastated France, John V. Schaefer. Eng. World, vol. 14, no. 2, Jan. 15, 1919, pp. 36-38. Exposition of suggestions that have been offered in regard to the co-operation of U. S. Government with French Government.

Government Sales Plan. Government's Sales Plan Outlined. Iron Trade Rev., vol. 64, no. 6, Feb. 6, 1919, p. 389. Disposal of surplus war products to be effected through co-operation between War Dept's sales division and U. S. Chamber of Commerce

Philadelphia. Reconstruction in Philadelphia After the War, Albert N. Hogg. Jl. Enger.' Club Phila., vol. 35-12, no. 169, Dec. 1918, pp. 553-554. Declares need for a better knowledge of business methods on the part of engineers.

Public Utilities. Maintenance of Public Utility Plants, Robert J. Thomas. Mun. & County Eng., vol. 56, no. 1, Jan. 1919, pp. 14-15. Effect of war conditions.

Selling Prices. Business Dividend on Redfield Plan. Iron Trade Rev., vol. 64, no. 8, Feb. 20, 1919, pp. 495-496. Opinions concerning practicability of plans suggesting prices for basic commodities.

Proper Joint Plan to Lower Prices. Iron Trades Rev., vol. 64, no. 7, Feb. 13, 1919, pp. 456-457. Secretary Redfield's plan to determine fair selling prices in basic industries without lowering wages.

SAFETY ENGINEERING

Co-operation in Accident Prevention. Pull Together to Decrease Accidents, E. B. Van Doren. Elec. World, vol. 73, no. 8, Feb. 22, 1919, pp. 368-369, 3 figs. Co-operation between employer and employee to increase production and efficiency and reduce accidents; safety welfare committees should encourage suggestions.

Education of Workers. Foundry Management from Standpoint of Accident Prevention, G. A. Hart, Safety Eng., vol. 37, no. 1, Jan. 1919, pp. 12-13. Remarks on education of workers concerning safety methods and precautions. From Proc. Seventh Annual Safety Congress.

Employment. Scientific Employment and Its Relation to Accident Prevention, R. W. Inmel. Safety Eng., vol. 37, no. 2, Feb. 1919, pp. 75-76. Suggests character analysis and allocation of individuals to work which they can adequately and safely perform.

Fire-Alarm Systems. Central Fire Alarm Station of San Francisco. Elec. Rev., vol. 74, no. 8, Feb. 22, 1919, pp. 201-204, 7 figs. Unusually complete equipment; special provision to insure reliability of power supply and interchangeability of circuits; method of operating.

Fire Prevention and Fighting. Extinguishing and Preventing Oil and Gas Fires, C. P. Bowie. Dept. of Interior, Bur. of Mines, bul. 170, Petroleum Technology 48, 50 pp., 4 figs. Points out what has been done by operators in the past, and describes various fire-prevention methods and fire-fighting apparatus.

Safety Organization. Safety, Sanitation and Welfare. Safety Eng., vol. 37, no. 2, Feb. 1919, pp. 53-58, 2 figs. Safety organization of U. S. Steel Corporation.

Shipyard Sanitation. Sanitation in Emergency Shipyards, W. L. Stevenson, vol. 6, no. 1, Jan. 1919, pp. 1-18, 8 figs. Work of Department of Health and Sanitation of U. S. Shipping Board.

SALVAGE

Creamery Wastes. Treatment and Disposal of Creamery Wastes, Earle B. Phelps. Mun. Jl., vol. 46, no. 4, Jan. 25, 1919, pp. 68-70, 1 fig. Settling tank and sand bed designed and tested by U. S. Public Health Service. From Public Health Reports.

Metal Waste Reclamation. Reclamation of Waste to Be Extended. Iron Trade Rev., vol. 44, no. 3, Jan. 16, 1919, pp. 220-221. Estimates on reclamation of metals by new division of Dept. of Commerce on waste reclamation service.

SALVAGE ORGANIZATION. Scientific Salvage, H. N. Sessions. Jl. Electricity, vol. 42, no. 3, Feb. 1, 1919, pp. 105-107, 2 figs. How the Southern Cal. Edison Co. directs its salvage work.

SCRAP BUSINESS. Huge Loss of Steel Brings Problem, G. H. Manlove. Iron Trade, Rev., vol. 64, no. 6, Feb. 6, 1919, pp. 371-375, 6 figs. Claims that obliteration of millions of tons of American material on foreign battlefields disrupts normal cycle of scrap recovery.

WASTE PREVENTION. Conservation of Material by the Store Department, J. G. Stuart. Ry. Age, vol. 66, no. 9, Feb. 1919, pp. 497-500. Care in ordering and handling to prevent waste; systematic methods needed in reclamation. From a paper before the Railway Storekeepers' Association. January, 1919.

WASTE UTILIZATION. Instructive Examples of Utilizing Industrial Wastes, H. E. Howe. Indus. Man., vol. 57, no. 3, March, 1919, pp. 225-229. To illustrate the importance of reclaiming and utilizing wastes in industries article quotes a number of examples.

Salvaging Miscellaneous Wastes, W. R. Conover. Gen. Elec. Rev., vol. 22, no. 2, Feb. 1919, pp. 127-133. Deals with such wastes as cables, slings, belting, paper, lumber by-products, oils, power, heat and light.

TRANSPORTATION

COAL TRANSPORTATION, INDIA. The Carriage of Coal by Rail in India, H. Kelway-Bamber. Jl. Royal Soc. of Arts, vol. 67, no. 3454, Jan. 1919, pp. 150-161 and (discussion), pp. 161-164, 6 figs Review of past development in the Indian coal output; forecast of future coal consumption; suggestions for reducing cost of coal transportation.

TRANSATLANTIC RATES. West Blocked on Orient Shipments. Iron Trade Rev., vol. 64, no. 7, Feb. 13, 1919, p. 455. Claims that transatlantic rail rates leave advantage with Atlantic ports by canal route.

VARIA

ECONOMIC DUTIES OF ENGINEERS. The Economic Duties of the Engineer, W. R. Ingalls. Eng. & Contracting, vol. 51, no. 8, Feb. 19, 1919, pp. 193-194. From presidential address before Mining and Metallurgical Soc. of America, Jan. 1919.

FILING SYSTEMS. Uniform Filing System, C. C. Hogan. Jl. Electricity, vol. 42, no. 4, Feb. 15, 1919, pp. 170-172. Based on Dewey decimal system.

HAND FOR CRIPPLES. A Compressed Air Actuated Hand for Crippled Soldiers (Die Pressluft-Hand fuer Kriegsbeschaedigte Industrie Arbeiter), W. Dahlheim. Zeitschrift fuer Komprimierte und Fluessige Gase, vol. 19, no. 2, 1917, pp. 18-19, 1 fig. Togglejoint actuated by compressed air piston, to replace the natural hand, enabling the workman to perform practically all machine shop operations, including filing. Light, simple, inexpensive.

LAND SETTLEMENT. The Present Status of Land Settlement Activities for Ex-Service Men in Great Britain, Hilda A. Fox. Am. Jl. of Care for Cripples, vol 7, no. 2, 1918, pp 133-138. List and activities of a number of organizations, voluntary and otherwise, working for this object.

OCCUPATIONAL THERAPY. Occupational Therapy in Military Hospitals, James E. Russell. Am. Jl. of Care for Cripples, vol. 7, no. 7, 1918, pp. 112-116. Situation at War Department. Address before Nat. Soc. for Promotion of Occupational Therapy.

TELEPHONE CREDIT-CHECK SYSTEM. Telephone System of Credit Checks, Clotilde Grunski. Jl. Electricity, vol. 42, no. 4, Feb. 15, 1919, pp. 152-153, 2 figs. Department-store credit system; uses a central telephone exchange and various stations in different parts of store.

METALLURGY

ALUMINUM

ALUMINUM ALLOYS. Aluminum and Its Alloys (L'aluminium et ses alliages), Walter Rosenhain. Metallurgie, vol. 50, no. 52, Dec. 25, 1918, pp. 1877 and 1879. Their future after the war. Résumé of conference before Roy. Soc at Exposition of British Scientific Products.

BLAST FURNACES

BOSH TUYERES. A Few Notes on Bosh Tuyeres, J. Hollings. Iron & Steel Can., vol. 2, no. 1, Feb. 1919, pp. 11-13, 2 figs. Writer's experience use of bosh tuyeres. Table and sketch illustrate English practice in number, size and position. Paper presented before Iron & Steel Inst.

BLAST-FURNACE PRODUCTION. Ferromanganese in Blast Furnace, P. H. Royster. Iron Trade Rev., vol. 64, nos. 6 and 7, Feb. 6 and 13, 1919, pp. 405-407 and 439-443, 3 figs. From Bur. of Mines' report on investigation of 18 blast furnaces producing ferromanganese.

UNG Furnace Bung Distributes Blast Evenly. Iron Trade Rev., vol. 64, no. 7, Feb. 13, 1919, pp. 446-447, 2 figs. Bung frame is provided with an air cylinder that is cast the full length of the top of the bung; cylinder is closed entirely at one end, but at opposite end an opening is provided for air blast.

DESIGN. Progress in Blast Furnace Design, J. G. West. Iron Trade Rev., vol. 64, no. 8, Feb. 20, 1919, pp. 499-505, 12 figs. Changes in adaptation of mechanical construction; modifications in detail of blast-furnace lines. Abstract of paper presented before Am. Iron & Steel Inst.

SLAG ACTION. Influence of Temperance Upon the Action of Slag Upon Refractory Materials, Raymond M. Howe. Chem. & Metallurgical Eng., vol. 20, no. 4, Feb. 15, 1919, pp. 167-168. Experimental data.

COPPER

BRONZE. Manganese Bronze, P. E. McKinney. Bul. Am. Inst. Min. Engrs., no. 146, Feb. 1919, pp. 421-425. Possibilities of producing manganese bronze without resorting to use of high-grade virgin materials.

COPPER-ALUMINUM ALLOYS. Constitution and Hardness of Copper-Aluminum Alloys Having High Percentage of Copper (Constitution et dureté des alliages cuivre-aluminium riches en cuivre). Metallurgie, vol. 50, no. 52, Dec. 25, 1918, p. 1881, 1 fig. General type of graphs showing percentage of aluminum against Brinell hardness. (Continuation of serial.)

COPPER MELTING. Volatilization of Cuprous Chloride on Melting Copper Containing Chlorine, S. Skowrenski and K. W. McComas. Bul. Am. Inst. Min. Engrs., no. 146, Feb. 1919, pp. 169-179, 1 fig. Experiments are said to have proved that volatilization of cuprous chloride on melting cathode copper takes place almost in its molecular ratio, and that under present copper-refining practice any cuprous chloride present in or on the cathode can be considered for all practical purposes as completely volatilized on melting, and may be the cause of a serious metallurgical loss of copper.

LEACHING. First Year of Leaching by the New Cornelia Copper Co., Henry A. Tobelmann and James A. Potter. Bul. Am. Inst. Min. Engrs., no. 146, Feb. 1919, pp. 449-495, 7 figs. Process adopted consisted of leaching crushed ore 8 days by counter-current system and upward circulation, using sulphuric acid and ferric sulphate; reduction by sulphur-dioxide gas of ferric iron in neutral solutions from leaching tanks; electrolytic deposition of copper from reduced solution; and recovery of copper from discharged neutral solution as cement copper precipitated on iron. Numerical results are quoted.

LEAD IN BRASS. Notes on the Rapid Estimation of Lead in Brass and Alloys, G. H. Hodgson. Chem. News, vol. 118, no. 3067, Jan. 24, 1919, pp. 37-38. Two methods are given, one gravimetric and volumetric.

FERROALLOYS

FERROALLOYS. Ferro-Metallic Alloys (Les alliages ferro-métalliques), Jean Escard. Revue Générale des Sciences, vol. 29, no. 23, Dec. 15, 1918, pp. 673-680, 3 figs. Manufacture of ferrochromium, ferrosilicon and ferromanganese. (To be continued.)

Production of Ferromanganese in the Blast Furnace, P. H. Royster. Bul. Am. Inst. Min. Engrs., no. 146, Feb. 1919, pp. 367-378, 3 figs. Operating data in ferromanganese practice; average practice for ferromanganese furnace and for iron furnace; calculated slag loss; stack loss. From report of research under joint auspices of U. S. Bur. of Mines and Nat. Research Council.

FLOTATION

GALENA. The Flotation of Galena at the Central Mine, Broken Hill, R. J. Harvey. Min. & Sci. Press, vol. 118, no. 5, Feb. 1, 1919, pp. 149-154, 7 figs. Selective flotation of complex silver-lead-zinc sulphide associated in the main with quartz, rhodonite, rhodochrosite, and some garnet-sandstone. Paper before Instn. Min. & Metallurgy.

LEAD ORES. Flotation of Oxidized Ores of Lead, Glenn L. Allen. Chem. & Metallurgical Eng., vol. 20, no. 4, Feb. 15, 1919, pp. 169-175, 1 fig. Process of sulphidizing ores such as cerussite, wulfenite and cerargyrite.

IRON AND STEEL

AGING BREAK. A Volute Aging Break, Henry M. Howe and Edward C. Groesbeck. Bul. Am. Inst. Min. Engrs., no. 146, Feb. 1919, pp. 181-182, 2 figs. Views of volute which developed spontaneously in a hardened and tempered steel helmet between 19 and 38 days after it had been tested ballistically.

BESSEMER PROCESS, ACID. Present American Acid Bessemer Process, Richard S. McCaffery. Blast Furnace, vol. 7, no. 3, Mar. 1919, pp. 140-142. Reversibility of manganese oxidation reaction; eliminating " spitting " by temperature control during blow.

BLUING STEEL. Bluing Steel, W. B. Greenleaf. Mech. Wrold, vol. 64, no. 1668, Dec. 20, 1918, pp. 291-292, 2 figs. Saltpeter process.

CONVERTER CASTING. Converter Steel Casting Practice, Charles M. Campbell. Proc. Steel Treating Research Soc., vol. 1, no. 10, July 1918, pp. 7-20, 15 figs. Description of steel foundry equipped with two cupolas, three 2-ton converters and producing an average of 12 heats per day. Suggestions in regard to molding, casting annealing and heat-treating.

ELECTRIC SMELTING. Electric Smelting of Iron Ores in British Columbia. Alfred Standfield. Iron & Steel Can., vol. 2, no. 1, Feb. 1919, pp. 4-10. Report of investigation to determine commercial possibility. Swedish type of furnace is recommended as most economical for permanent plant, and open pit furnace is suggested as best for temporary plant.

Dr. Standfield's Report on Electric Smelting of B. C. Iron Ores. Can. Min. Jl., vol. 40, no. 4, Jan. 29, 1919, pp. 54-56. Finds that while process is metallurgically feasible, nevertheless, under present conditions and prices for electric energy, its application would not be practical.

Electric Smelting of Domestic Manganese Ores, H. W. Gillet and C. E. Williams. Dept. of Interior, Bur. of Mines, War Minerals Investigations Series, no. 10, Dec. 1918, 48 pp. Tests to investigate whether electric smelting of manganiferous slags and low-grade domestic ores is likely to be profitable at times of normal costs and prices are said to have demonstrated that such smelting is metallurgically possible but practicable only in times of high prices.

ELECTRIC STEEL. Making Electric Steel for Ball Bearings, Arthur V. Farr. Iron Trade Rev., vol. 44, no. 3, Jan. 16, 1919, pp. 211-215, 12 figs. Reviews method of manufacture and calls attention to qualities of steel produced in electric furnace.

The Metallurgy of Electric Furnace Steel Processes, L. B. Lindemuth. Jl. Engrs. Club, Phila., vol. 35-12, no. 169, Dec. 1918, pp. 544-549. History; crucible process; open hearth; electric furnace; duplex and triplex processes; comparison between metallurgical features of electric-furnace process and those of the open-hearth and crucible processes.

FLAKY STEEL. Microstructural Features of Flaky Steel, Henry S. Rawdon, Bul. Am. Inst. Min. Engrs., no. 146, Feb. 1919, pp. 183-201, 27 figs. Summarizes characteristic features of defective steel of flaky type as found from laboratory study of numerous specimens, and aims to show conditions within metal that are favorable to occurrence of this type of defect.

Ingot-Production Statistics. Production of Ingots and Rolled Products. Iron Age, vol. 103, no. 8, Feb. 20, 1919, pp. 497-500. Statistics prepared by American Iron and Steel Institute show new record for steel and some finished forms in 1917.

Iron and Steel Trades. Iron and Steel. Times Eng. Supp., year 15, no. 531, Jan. 1919, p. 17. How iron and steel trades have emerged from war.
Production of Steel Ingots and Castings. Finished Rolled Iron and Steel in 1917. Iron Trade Rev., vol. 64, no. 8, Feb. 20, 1919, pp. 520-521. Statistical tables.
The Production of Iron and Steel in Canada During the Calendar Year 1917, John McLeish. Can. Dept. of Mines, no. 498, 32 pp. Report of Chief of Division of Mineral Resources and Statistics.

Iron-Carbon-Chromium Alloys. On the Structure of Iron-Carbon-Chromium Alloys, Takejirô Murakami. Sci. Reports Tôhoku Imperial Univ., First Series, vol. 7, no. 3, Dec. 1918, pp. 217-276, 124 figs. Report of experimental investigation of alloys containing different amounts of iron, carbon, and chromium with particular reference to structural constitution, changes during heating and cooling, and self-hardening properties. Materials tested were Swedish iron, four different steels, white cast rion, ferrochromium and metallic chromium.

Japanese Iron Industry. The Japanese Iron & Steel Industry. Blast Furnace, vol. 7, no. 2, Feb. 1919, pp. 89-95. Report upon conditions in Manchuria and Korea and upon possibility of Japanese future independence in production of iron and steel

Manganese Alloys. Manganese Alloys in Open Hearth Practice, Samuel L. Hoyt. Blast Furnace, vol. 7, no. 3, Mar. 1919, pp. 142-146. Recommendations for utilization of domestic alloys; molten spiegel mixture practice; use of manganese-silicon alloys in acid practice; electric furnace practice.

Open-Hearth Furnaces. Principles of Open Hearth Furnace Design—III. Charles H. F. Bagley. Blast Furnace, vol. 7, no. 2, Feb. 1919, pp. 11-113, 1 fig. Further considerations of furnace dimensions based on gas port area and hearth area per ton of steel capacity.
Use of Manganese Alloys in Open-Hearth Practice, Samuel L. Hoyt. Bul. Am. Inst. Min. Engrs., no. 146, Feb. 1919, pp. 277-289. It is advanced that there are three practices for utilizing our domestic alloys in open-hearth practice: Use of molten spiegel mixture for deoxidation and recarburation; practice of melting and refining steel bath so as to secure 0.3 per cent manganese alloys containing silicon; use of manganese alloys containing silicon. From report of research under joint auspices of U. S. Bur. of Mines and Nat. Research Council.
Water-Cooled Equipment for Open-Hearth Steel Furnaces, Wm. C. Coffin. Bul. Am. Inst. Min. Engrs., No. 146, Feb. 1919, pp. 497-515, 12 figs. Suggests that water-cooling devices for open-hearth steel furnaces should follow lines used in iron blast furnaces; several devices are illustrated.

Tool Steel. New Tool Steel Developed by Research. Iron Trade Rev., vol. 64, no. 9, Feb. 27, 1919, pp. 576-577, 4 figs. Made of alloys and arranged within critical zones in order to make martensite predominant structure. Said not to diminish in efficiency by overheating.

Transformations in Steel. Effect of Rate of Temperature Change on Transformations in an Alloy Steel, H. Scott. Bul. Am. Inst. Min. Engrs., no. 146, Feb. 1919, pp. 157-167, 7 figs. Previous investigators have laid particular stress on variation of maximum temperature, rate remaining constant, while variation of rate, maximum temperature remaining constant has received little attention. Writer has applied latter method to investigation of an alloy steel and attempts to correlate result of that method with those of the former and to establish relations of several phonomena observed.

NON-FERROUS METALS

Non-Ferrous Metals. Non-Ferrous Metals. Times Eng. Supp., year 15, no. 531, Jan. 1919, p. 18. Advances made in their manufacture during recent years.

OCCLUDED GASES

Steel. Investigation of Gases Occluded in Steel Thomas Baker. Blast Furance, vol. 7, no. 3, Mar. 1919, pp. 156-157 and 163. Experiments to determine composition and volume of occluded gases and their effect upon physical properties of metal, relation between temperature at evolution of gas and electrical point.

ZINC, LEAD AND TIN

Conservation. Metallurgical Work of Bureau of Standards, G. K. Burgess. Blast Furnace, vol. 7, no. 3, Mar. 1919, pp. 130-131, 2 figs. Review of research work concerning welding and tin conservation. (To be continued).

Electric Furnace for Tin. Electrometallurgy of Tin in Electric Furnace (L'électrométallurgie de l'étain au four électrique), Jean Escard. Industrie Electrique, vol. 27, no. 635, Dec. 10, 1918, pp. 444-448. Treatment of minerals; furnaces; recovery of lead; extraction of tin from industrial waste.

Zinc. Zinc Smelting in India, T. R. Wynne. Eng. & Min. Jl., vol. 107, no. 8, Feb. 22, 1919, pp. 356-358. Possibilities of zinc smelting in India; investigation of Burma ores; industrial development in India. Report of chairman at general meeting of Burma Corporation.

HYDROMETALLURGY

Terminology. Defining "Tailings" and "Residues," A. W. Allen. Eng. & Min. Jl., vol. 107, no. 7, Feb. 15, 1919, p. 317. Submits definitions. Third article of series on standardization of terms used in hydrometallurgical operations.

MARINE ENGINEERING

AUXILIARY MACHINERY

Lifting Gear. Marine Steam Turbine Lifting Gear. Mech. World, vol. 65, nos. 1671 and 1673, Jan. 10 and 24, 1919, pp. 18-19 and 43, 5 figs. Brief outline and discussion of various types, giving general method of calculating proportions of principal parts. First and second installments. (To be continued).

Oil Filter. An Efficient Oil Filter for Marine Installations. Pacific Marine Rev., vol. 16, no. 1, Jan. 1919, pp. 130-131, 3 figs. Combination batch and continous oil filter of Paterson marine type.

SHIPS

American Types. American Shipbuilding Practice. Shipbuilding & Shipping Rec., vol. 13, no. 3, Jan. 16, 1919, pp. 63-66, 2 figs. Types of vessels adopted by Submarine Boat Corporation; organization and operation of Hog Island and arrangement of the yards.

American Shipbuilding. The Early History of American Shipbuilding, W. A. Dobson. Jl. Engrs. Club Phila., vol. 35-10, no. 167, Oct. 1918, pp. 455-466, 9 figs. Review of history and practice of shipbuilding in U. S. prior to 1880 as compiled from memoirs of C. M. Cramp, the report by Henry Hall, and the writer's personal experience.

Concrete Ships. Concrete Ships VI. Times Eng. Supp., year 15, no. 531, Jan. 1919, p. 38. Notes on yards at Thornaby-on-Tees, Amble, Whitby, Sunderland, Granton and Faversham, where concrete ships are being built.
A Composite System of Reinforced Concrete Ship Construction, A. S. Holmes. Pacific Marine Rev., vol. 16, no. 1, Jan. 1919, pp. 116-117, 2 figs. System employs a combination of timber, concrete and reinforcing metal.
Ireland's First Concrete Ship. Shipbuilding & Shipping Rec., vol. 13, no. 2, Jan. 9, 1919, p. 42, 1 fig. Account of her launching; general dimensions.

Efficiency. The Economic Efficiency of Merchant Ships, Alexander Urwin. Shipbuilding & Shipping Rec., vol. 13, no. 3, Jan. 16, 1919, pp. 72-74. Table showing factors in a deadweight cargo carrier which operate upon each other and decide efficiency of vessel.

European Shipbuilding. European Marine Notes. Pacific Marine Rev., vol. 16; no. 1, Jan. 1919, pp. 114-115. Model British fabricated ship; concrete barges, German shipping in the war.

Fabricated Vessels. The "N" or Fabricated Vessels, Engineering, vol. 107, no. 2768, Jan. 17, 1919, pp. 69-71, 6 figs. Discussion of "National" standard vessels built according to "d'Eyncourt-Graham" system.

Ford Methods. Ford Methods in Ship Manufacture, Fred E. Rogers. Indus. Man., vol. 57, no. 3, March 1919, pp. 190-197, 10 figs. Division and subdivision of the erecting operations. Third article.

Freighter. SS. "Westerner." Shipbuilding & Shipping Rec., vol. 13, no. 1, Jan. 2, 1919, pp. 8-9, 2 figs. Principal dimensions, plans and details of cargo steamer of 8800 tons d.w. on 24 ft. 1 in. draft. Built by Emergency Fleet Corporation.

Machinery and Pipe Arrangement. Machinery and Pipe Arrangement, C. C. Pounder. Mech. World, vols. 64 and 65, nos. 1668, 1672 and 1674, Dec. 20, 1918, Jan. 17 and 31, 1919, pp. 295, 30 and 55, 11 figs. Typical location in vessels built to Board of Trade requirements. Tenth to twelfth installments. (Continuation of serial.)

Motorships. Motor-Driven Tanker "Hamlet." Shipbuilding & Shipping Rec., vol. 13, no. 2, Jan. 9, 1919, pp. 36-41, 8 figs. 10,055 tons d.w. on 24 ft. 7 in. draft. Propelling machinery consists of two Polar Diesel engines.
Splendid Record of Wooden Motorship. Pacific Marine Rev., vol. 16, no. 1, Jan. 1919, pp. 94-95, 2 figs. Account of travel of "Libby Maine" in voyage through arctic waters.

Propelling Machinery. Notes on Trial Trips, S. H. Cornell. Jl. Am. Soc. Marine Draftsmen, vol. 6, no. 3, Oct. 1918, pp. 41-43, 1 fig. Review of important fundamental theories governing economical operation of boilers and propelling engines; diagram showing approximate temperature for burning fuel oil.

Propelling Power. Economy in Ocean Transportation, A. W. Robinson. Jl. Eng. Inst. Can., vol. 2, no. 2, Feb. 1919, pp. 104-108. Remarks of conservation of fuel, economy in generation and use of propelling power; question of ocean transportation as viewed by a commission appointed by British Government to study relations of Dominions to Empire and to each other.

Standardization. Standardization of Ship Steel. Pacific Marine Rev., vol. 16, no. 1, Jan. 1919, pp. 101-103. Investigation conducted by representative of U. S. Shipping Board Emergency Fleet Corporation; table of structural shapes recommended for ships.

Stresses. Stresses in Ships, Sydney V. James. Jl. Western Soc. Engrs., pp. 356-376, 8 figs. Discussion of kinds of stresses, and of methods of determining principal longitudinal stresses; results of application of such methods to study of Ships of well-known type; question of shearing stresses and of situation relative to transverse-stress calculations.

Terminology. Displacement Deadweight gross and Tonnage, T. H. Fenner. Mar. Eng. Can., vol. 8, no. 12, Dec. 1918, pp. 303-304, 4 figs. Definitions of terms. used in ship's measurements.

Train Ferries. Description of the New C.N.R. Car Ferry "Canora." Mar. Eng Can., vol. 8, no. 12, Dec. 1918, pp. 301-302, 3 figs. General design and accommodations. Main propelling machinery consisft of a four-cylinder triple-expansion surface-condensing engine balanced on Yarrow, Schlick & Tweedy System.
The English Channel Train Ferry. Ry. Age, vol. 66, no. 9, Feb. 28, 1919, pp. 509-510, 3 figs. Brief notice of the Richborough ferry.

Warships. New British Warships, Engineer, vol. 127, no. 3291, Jan. 24, 1919, pp. 71-72, 9 figs. General description of recent British craft, such as Repulse. Renoes, Furious, Courageous, Glorious, Ramillies, Warspite, Erin, and Argincourt.

WATER BALLAST. Improvements in Construction of Ships, E. F. Spanner. Shipbuilding & Shipping Rec., vol. 13, no. 2, Jan. 9, 1919, pp. 44-46, 3 figs. System of dealing with water ballast by means of a duct keel. Abstract of paper before Instn. Engrs. & Shipbuilders in Scotland.

WOODEN SHIP. A Successful Type of Wooden Ship, J. B. C. Lockwood. Pacific, Marine Rev., vol. 16, no. 1, Jan. 1919, pp. 86-88, 4 figs. Survey of objections against wooden ships and comparison of various designs built by different companies.

YARDS

BRITISH PRODUCTION. Shipbuilding and Engineering Output. Shipbuilding & Shipping Rec., vol. 13, no. 1, Jan. 2, 1919, pp. 15-16. Records of vessels launched at British yards during 1918.

EQUIPMENT. Time Saving in Steel Ship Construction, J. H. Anderson. Jl. Engrs. Club Phila., vol. 35-10, no. 167, Oct. 1918, pp. 467-471, 29 figs. Interests affected by application, status of spot-welding in reference to shipbuilding equipment and distribution systems. Third discussion under auspices U. S. Shipping Board Emergency Fleet Corporation.

FABRICATING PLANTS. Inland Ship-Steel Fabricating Plants of the Emergency Fleet Corporation, Leyburn G. Fishhach. Eng. News-Rec., vol. 82, no. 7, Feb. 13, 1919, pp. 332-336, 6 figs. Shops at Pottstown and Leetsdale for fabricating Hog Island material, designed to produce 10,000 tons per month each.

LAUNCHING. Novel Method of Building and Launching, J. H. Rogers. Mar. Eng. Can., vol. 8, no. 12, Dec. 1918, pp. 305-307, 4 figs. Arrangement of transfer tables and launching trucks at Can. Car & Foundry Co. whose launching dock is 1400 ft. from building ways.

PLANNING CONTROL. Planning Control—Applied to the Building of Duplicated Steel Vessels, D. V. Stratton. Pacific Marine Rev., vol. 6, no. 1, Jan. 1919, pp. 107-110, 1 fig. Development work along management lines of Todd Dry Dock & Construction Corporation, Tacoma, Wash.

STEEL CASTINGS. Steel Castings Used in Ship Construction, Ben Shaw and James Edgar. Can. Foundryman, vol. 10, no. 2, Feb. 1919, pp. 34-38, 26 figs. Pattern making, moulding and pouring of steel castings intended to replace forgings in construction of ships.

TERMINAL SHEDS. The Marine Terminal Shed, H. McL. Harding. Pacific Marine Rev., vol. 16, no. 1, Jan. 1919, pp. 123-124, 1 fig. Suggestions in regard to construction and equipment.

THORNYCROFT WORKS. Messers. Thornycrofts' Baisngstoke Works. Engineering, vol. 107, no. 2768, Jan. 17, 1919, pp. 76-79, 10 figs. Illustrated description of works and equipment.

WELDING. The Difficulties of Welding Steel by the Oxy-Acetylene Process, B. K. Smith. Mech. World, vol. 64, no. 1668, Dec. 20, 1918, pp. 297-298. Abstract of paper before North-Western Welding Assn.

The Application of Electric Welding to Ship Construction. Shipbuilding & Shippling Rec., vol. 13, no. 1, Jan. 2, 1919, pp. 5-6. Method adopted by British Admiralty in electric welding of watertight joints for ship structures and oil tanks subjected to heavy stresses.

Welding as a process in Ship Construction, S. V. Goodall. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 3, Mar. 1919, pp. 329-335. Review of what has been done in substituting welding for riveting in shipbuilding. Writer's opinion concerning general adoption of welding.

INDUSTRIAL TECHNOLOGY

ALCOHOL. Future and Sources of Industrial Alcohol, Can. Foundryman, vol. 10, no. 2, Feb. 1919, pp. 41-42. Manufacture from grain and potatoes; synthetic processes: utilization of wood waste; comparative yields.

AMMONIA. Ammonia Plant at the Stockholm Gas Works. Gas Age, vol. 43, no. 3, Feb. 1, 1919, pp. 132-134, 5 figs. Plant was designed to furnish both ammonium sulphate and aqueous ammonia. From Journal für Gasbeleuchtung.

CEMENT, CHEMICAL. Cements for Various Purposes, J. B. Barnitt. Mech. World, vol. 65, no. 1672, Jan. 17, 1919, p. 29. Joints and similar uses in chemical work. From Gen. Chem. Bul.

CHARCOAL. Manufacture of Charcoal as an Economic Measure, Helge Sylven. Sci. Am. Supp., vol. 87, no. 2251, Feb. 22, 1919, pp. 124-126 5, figs. By-product made from lumber-mill waste.

CHLORINE. Future Possibilities of Electrolytic Chlorine, A. H. Hoker. Chem. Engr., vol. 27, no. 1, Jam. 1919, pp. 3-4. Evolution of Mond and Deacon processes; chlorine in refining.

COLORATION, METAL. Chemical Metal Coloration, Emil Haas. Brass World, vol. 15, no. 2, Feb. 1919, pp. 45-46. Describes various processes.

CYANOGEN PRODUCTS. The Manufacture of Hydrocyanic Acid, H. A. Pelton and M. W. Schwarz. Chem. & Metallurgical Eng., vol. 20, no. 4, Feb. 15, 1919, pp. 165-166, 2 figs. Description of semi-industrial apparatus and plans for large scale operations.

Use of Cyanogen and Its Derivatives During the War (L'emploi du cyanigène et de ses dérivés à la guerre), Nicolas Flamel. Génie Civil, vol. 74, no. 5, Feb. 1, 1919, pp. 89-92, Preparation of these chemicals; their toxic effects.

DUST PRECIPITATION. Checking Up on Cottrell Process, N. H. Gellert. Iron Trade Rev., vol. 64, no. 7, Feb. 13, 1919, pp. 448-450, 2 figs. Results obtained in electrical precipitation of impurities from blast-furnace gases; method said to be adaptable to spiegeleisen and ferromanganese furnaces.

ELECTRODEPOSITION. Electrolytic Deposition of Zinc, H. E. Broughton. Chem. Metallurgical Eng., vol. 20, no. 4, Feb. 15, 1919, pp. 155-162, 13 figs. Preparation of cell liquor from fumes collected as sludge in acid chambers; details of theoretical and applied electrochemistry involved; charts and data.

Muriatic Acid in Nikel Solutions, E. W. Heil. Brass World, vol. 15, no. 2, Feb. 1919, pp. 39-40. Discusses advisability of adding muriatic acid to a nickel solution and the chemical phenomena resulting therefrom.

FILTRATION. Utilization of Waste Paper in Filtration, S. L. Jodidi and H. G. Higgins. Chem. Engr., vol. 27, no. 2, Feb. 1919, pp. 45-48. 1 fig. Method of preparing waste and low-grade paper pulp for making filters like those uses in quantitative analysis; results obtained.

GALVANIZING. Modern Processes of Galvanizing Sheet Steel (Procédés modernes de galvanisation des tôles d'acier). Métallurgie, vol. 51, no. 7, Feb. 12, 1919, pp. 334-335, 1 fig. English type of galvanizing machine. (Continuation of serial.)

GAS MANUFACTURE. Chemical Engineering in Modern Gas Plants, William A. Twine. Chem. Engr., vol. 27, no. 2, Feb. 1919, pp. 31-33. Believes process in gas-plant processes can only be made through work of men who are both engineers and chemists.

Steaming Vertical Retorts, L. J. Willien. Gas Rec., vol. 15, no. 4, Feb. 26, 1919, pp. 115-116. Report of tests showing increased gas and ammonia yield, and less formation of carbon in retorts. Paper before N. E. Gas Assn.

Gas Engineering. Times Eng. Supp., year 15, no. 531, Jan. 1919, pp. 22-23. Progress of gas industry in 1918.

Install Improved Apparatus, J. Arnold Norcross. Gas Rec., vol. 15, no. 4, Feb. 26, 1919, pp. 125-128. Recommendation to reduce cost of producing gas by adopting improvements likely to reduce expenses and save labor. Presidential address before N. E. Gas Assn.

GASOLINE. Gasoline from Natural Gas, G. A. Burrell. Gas Rec., vol. 15, no. 4, Feb. 26, 1919, pp. 105-108. Discussion of various types of plants available and some of essential points in their operation.

Gasoline Recovery, E. A. Spencer. Natural Gas & Gasoline Jl., vol. 13, no. 2, Feb. 1919, pp. 51-52, 1 fig. Absorption process described and illustrated.

Natural Gas-Gasoline Plants, G. A. Burrell. Natural Gas & Gasoline Jl., vol. 13, no. 2, Feb. 1919, pp. 57-61. Writer's opinion concerning plant operation and design. Suggestions are given to modify conditions that are termed common and erroneous.

GLASS. Laboratory Glassware in England (La verrerie de laboratoire en Angleterre), A. Livache. Bulletin de la Société d'Encouragement, vol. 130, no. 6, Nov.-Dec. 1918, pp. 411-424. Experimental research of the action of chemical reagents on glass surfaces; comparison of the various types of laboratory glassware. From Jl. Soc. Glass Technology, vol. 1, 1917, p. 153.

The Condition of Arsenic in Glass and Its Role in Glass-Making, E. T. Allen and E. G. Zies. Jl. Am. Ceramic Soc., vol. 1, no. 11, Nov. 1918, pp. 787-790. Writers claim that in all glasses they have tested, both plate and optical glasses, major part of arsenic present exists in pentavalent state and a portion in trivalent state.

Some Aspects of the Scientific Glassware Industry, F. W. Branson. Jl. Soc. Chem. Indus., vol. 37, no. 24, Dec. 31, 1918, pp. 337T-339T and (discussion) pp. 339T-340T. Suggests standardization of hollow scientific glassware.

GRAPHITE CRUCIBLES. Preparation of Crucible Graphite, George D. Dub. Dept. of Interior, Bur. of Mines, War Minerals Investigation Series, no. e., Dec. 1918, 27 pp., 10 figs. Survey of present mining, milling, refining, sampling, and analyzing methods; experimental work on concentration and refining undertaken for the purpose of improving present practice; investigations of crucible manufacture to determine properties of domestic flake and maximum proportions that might be used without impairing quality of crucibles.

HYDROGEN. The British Admiralty Hydrogen Gas Plant. Engineering, vol. 107, no. 2769, Jan. 24, 1919, pp. 102-103, 7 figs. Description of the process and the plant constructed by the Société L'Oxylithe, Paris.

HYDROGENATION OF OILS. Hydrogenation of Oils (L'hidrogénation des huiles), A. Maille. Journal des Usines à Gaz, vol. 43, no. 3, Feb. 5, 1919, pp. 33-36. Survey of patents; choice of nickel, cobalt, iron and copper as catalyzer. (Concluded).

NITROGEN. Nitrogen Fixation. Times Eng. Supp., year 15, no. 531, Jan. 1919, p. 25. Suggests immediate use by British Government of semi-technical research work concerning synthetic production of ammonia and nitrate, which has been carried in past three years.

The Production of Nitrogen Compounds, Jack P. Montgomery. Chem. Engr., vol. 27, no. 2, Feb. 1919, pp. 35-39. Review of sources of nitrogen compounds and processes of utilizing them with special reference to methods employed to meet waste of nitrogenous material.

PICKLING. Removing Oxide Scale by Pickling, E. E. Corbett. Iron Trade Rev., vol. 64, no. 9, Feb. 27, 1919, pp. 564-568. Comparison of steel-cleaning liquors made of nitre cake and sulphuric acid; mode of working solutions and chemical and mechanical reactions which take place in pickling process.

RADIUM. The Radium Industry and Reconstruction, John S. MacArthur. Min. Jl., vol. 124, no. 4352, Jan. 18, 1919, pp. 39-40. Points out some possible uses of low-grade radium residues.

RUBBER. The Ageing of Vulcanized Plantation Rubber—II, Henry P. Stevens. Jl. Soc. Chem. Ind., vol. 37, no. 24, Dec. 31, 1918, pp. 340T-342T, 8 figs. Experiments are said to have proved that vulcanized rubber commences to change in physical properties from the moment vulcanization process is completed.

SILICON PRODUCTS. Metallic Silicides (les siliciures métalliques), Jean Escard. Métaux, Alliages et Machines, vol. 12, no. 1, Jan. 1919, pp. 8-10. Preparation in electric furnace of silicon alloys; their industrial utilization. (To be continued).

WATER GAS. Control of Water Gas Sets, H. Vittinghoff. Gas Rec., vol. 15, no. 4, Feb. 26, 1919, pp. 109-112, 1 fig. Essentials in operation of small plants. Paper before N. E. Gas Assn.

Providence Water Gas Plant, W. M. Russell. Gas Rec., vol. 15, no. 4, Feb. 26, 1919, pp. 119-123. Construction and operation of sets recently installed. Paper before N. E. Gas Assn.

MUNITIONS AND MILITARY ENGINEERING

ARMY BASES. Brooklyn Army Base Is Largest Port Terminal. Eng. News-Rec., vol 82, no. 7, Feb. 13, 1919, pp. 317-323, 15 figs. Description of freight-handling unit designed for overseas service. It has 138 acres of pier and warehouse floor and track space for 1,300 cars.

Camps. The Operation of the Utilities at Camp Devens, Mass., Edward W. Briggs. Jl. Boston Soc. Civ. Engrs., vol. 6, no. 2, Feb. 1919, pp. 25-60, 4 figs. Organization and operation of various departments. Entire reservation contains 10,000 acres, of which 2,000 are occupied by camp proper.

Construction Work, U. S Government War Construction Work in the United States, R. C. Marshall. Proc. Am. Soc. Civil Engrs., vol. 45, no. 2, Feb. 1919, pp. 164-171. Outline of work done by Construction Division of the Army.

Coast Defense. Notes on the Use of the Aeroplane in Coast Defense, John Hays Hammond. Jl. U. S. Artillery, vol. 49, no. 4, Sept.-Dec. 1918, pp. 286-291. Functions of different types of aircraft in coast defense; problems of winter flying; twin-motored aeroplanes in coast-defense work.

Depth-Bomb Throwers. Thornycroft Depth Charge Throwers. Engineer, vol. 127, no. 2391, Jan. 24, 1919, pp. 86-88, 5 figs. Description.

Fire Control. Radio Apparatus for Artillery Fire Control, G. Francis Gray and John W. Reed. Elec. Wld., vol. 73, no. 9, Mar. 1, 1919, pp. 408-412, 6 figs. Development; description of transmission apparatus and air-driven generator.
Artillery Co-Ordinate Computation Charts, S. H. Simpson. Jl. U. S. Artillery, vol. 49, no. 4, Sept.-Dec. 1918, pp. 274-279, 2 figs. Intended to simplify computations involved in trigonometric solutions of triangles.
Probability Chart, George E. Shipway. Jl. U. S. Artillery, vol. 49, no. 4, Sept.-Dec. 1918, pp. 280-285, 1 fig. Devised for determining number of rounds to be provided to destroy target under given conditions of range and gun and also hits that may be expected if a certain number of rounds are fired.

Gas Warfare. Chemical Warfare—A New Weapon, Ellwood Hendrick. Chem. & Metallurgical Eng., vol. 20, no. 4, Feb. 15, 1919, pp. 152-154. Discusses "humanity" and effectiveness of gas warfare.
Mustard Gas. Natural Gas & Gasoline Jl., vol. 13, no. 2, Feb. 1919, pp. 61-62. Part of annual report of Director of Bur. of Mines dealing with this substance.

Gun Forgings. Flaky and Woody Fractures in Nickel-Steel Gun Forgings, Charles Y. Clayton, Francis B. Foley and Francis B. Laney. Bul. Am. Inst. Min. Engrs., no. 146, Feb. 1919, pp. 203-237, 50 figs. Information concerning their nature, their effect, and some of the conditions that favor their development, obtained from metallographic examinations undertaken cooperatively by Ordnance Dept., U. S. A., U. S. Bur. of Mines, and U. S. Geol. Survey. Material studied was from different steel plants throughout the country and consisted both of forgings that had been accepted by Ordnanee Dept. and those that had failed to pass specified physical tests.

Howitzers. How the 155-Mm. Howitzer Is Made, J. V. Hunter. Am. Mach., vol. 50, no. 7, Feb. 13, 1919, pp. 303-306, 22 figs. Operations on breech-block carrier. Sixth article.

Inspection. How Ordnance Is Inspected, Fred H. Colvin. Am. Mach., vol. 50, no. 7, Feb. 13, 1919, pp. 311-316, 7 figs. Work of small-arms group. Second article.

Machine Shop Trucks. Machine Shop Trucks Reclaim Guns. Iron Trade Rev., vol. 64, no. 6, Feb. 6, 1919, pp. 376-380, 9 figs. Shops mounted on trucks for repairing of artillery in field. Designed by Ordnance Dept.

Railway Gun Mounts. Railway Gun Mounts, G. M. Barnes. Am. Mach., vol. 50, no. 8, Feb. 20, 1919, pp. 329-325, 14 figs. Description of railway mounts for 8-in. guns, 12-in. sliding mount, 12-in. mortar, 16-in. howitzer and ammunition cars and locomotives.

Submarines. The Submarine Situation, C. H. Clandy. Sci. Am., vol. 120, no. 9, Mar. 1, 1919, pp. 198-199, 5 figs. British types of submarines, one 340 ft. in length mounting three 4-in. guns and one mounting a 12-in. 50-ton gun.

Transportation. What Our Railway Forces Did in France. Ry. Maintenance Engr., vol. 15, no. 2, Feb. 1919, pp. 55-59, 6 figs. Account of transportation organization and scope of its activities.

MINING ENGINEERING

BASE MATERIALS

Bauxite. Bauxite (La bauxite), Ed. Decamps. Métaux, Alliages et Machines, vol. 12, no. 1, Jan. 1919, pp. 3-8. Patented processes of precipitating aluminum from bauxite, manufacturing artificial emery (crystallized aluminum) and making refractory products.

Black Sand. Notes on the Black Sand Deposits of Southern and Northern California, R. R. Hornor. Department of Interior, Bur. of Mines, tech. paper 196, 42 pp., 14 figs. Investigation conducted by Bur. of Mines in order to determine whether any of deposits are large enough to be profitably exploited, and also possibility of commercial utilization of base minerals.

Clays. Microscopic Examination of Clays, R. E. Somers. Jl. Wash. Acad. Sci., vol. 9, no. 5, Mar. 4, 1919, pp. 113-126. Report of microscopic examinations undertaken in order to determine minerals contained in clays, and study of thin sections of burned samples.

Magnesite. Magnesite and Dolomite in Australia and New Zealand, P. G. Morgan. New Zealand Jl. Sci. & Technology, vol. 1, no. 6, Nov. 1918, pp. 359-372. Reports of mines departments of Australian states concerning supply of magnesite or dolomite; New Zealand occurrences.
Magnesite, Its Occurance and Uses, T. Crok. Min. Mag., vol. 20, no. 2, Feb. 1919, pp. 115-120. Historial account of magnesite applications and utilization in smelting industry. (To be continued). Paper before Swansea meeting of Ceramic Soc.

Rock Quarries. Maori Rock-Quarries on D'Urville Island, J. Allan Thomson. New Zealand Jl. Sci. & Technology, vol. 1, no. 6, Nov. 1918, pp. 321-322, 1 fig. Quarries consist mainly of serpentine, associated in some parts with amphibolites derived from doleritic or gabbroid rocks.

COAL AND COKE

Breakers and Cleaners. Bradford Coal Breakers and Preliminary Mechanical Cleaner. Coal Age, vol. 14, no. 8, Feb. 20, 1919, pp. 352-355, 2 figs. Construction and operation; account of results obtained at various commercial plants.

Canada. Coal Production in Canada—Its National Significancce, F. W. Gray. Can. Min. Jl., vol. 40, no. 5, Feb. 5, 1919, pp. 73-74. Urges that mining industry be represented in federal parliament.
The Production of Coal and Coke in Canada During the Calendar Year 1917, John McLeish. Can. Dept. of Mines, no. 501, 39 pp. Report of chief of Division of Mineral Resources and Statistics.

Coke Ovens. Some Ecomonic Considerations in Coke-Oven Practice, W. Colquhoun. Tran. Inasn. Min. Engrs., vol. 56, part 2, Dec. 1918, pp. 61-79 and (discussion) pp. 79-90, 6 figs. Claims that process of coking cannot be called economically perfect until some inventor devices a more direct application of the heat necessary to dstill the coal.

Costs, Mining. Anthracite Mining Costs, R. V. Norris. Bul. Am. Inst. Min. Engrs., no. 146, Feb. 1919, pp. 249-262, 5 figs. Adjustments of cost from a reported to a price-fixing basis; charts showing cost of production; accounting suggestions. Based on cost reports for 6-months' period, Dec. 1917 to May 1918, as compiled by Federal Trade Commission.

Great Britain, 1918. Coalmining Times Eng. Supp., year 15, no. 531, Jan. 1919, p. 21. Conditions in United Kingdom in 1918 and comparison with conditions in previous years.

Impurities. Impurities in Raw Coal and Their Removal T. J. Drakely. Colliery Guardian, vol. 117, no. 3031, Jan. 31, 1919, p. 245. Three methods of separating impurities from coal; hand picking; mechanical shale pickers; coal washers. Also in Iron & Coal Trades Rev., vol. 98, no. 2657, Jan. 31, 1919, p. 131.

Water Supply. Water Supply at Coal Mines, Carl Scholz. Coal Age, vol. 15, no. 9, Feb. 27, 1919, p. 391, 1 fig. Location of well and pipe line at Valier Coal Co's mine.

Western Europe. Coal Resources of the Western Front, H. H. Stock. Black Diamond, vol. 61, no. 26, vol. 62, no. 1, Dec. 28, 1918, Jan. 4, 1913, pp. 576-578 and 5-7, 10 figs. Maps and statistics of coal and iron fields in Northern France (including Alsace-Lorraine) Belgium and Western Germany.
Lens—The Coal Field of France, Frank Haas. Coal Age, vol. 15, no. 9, Feb. 27, 1919, pp. 392-394, 11 figs. How French coal mining at Lens was conducted before German invasion.

COPPER

Copper Industry. The Position of Copper Analyzed. Min. & Sci. Press, vol. 18, no. 8, Feb. 22, 1919, pp. 243-244. Official statement of Federal Government.
World Production and Consumption of Copper (La production et la consommation mondiales du cuivre). Métaux, Alliages et Machines, vol. 12, no. 1, Jan. 1919, pp. 12-13.

Michigan. The Porphyry Instrusions of the Michigan Copper District, Thomas S. Woods. Eng. & Min. Jl., vol. 107, no. 7, Feb. 15, 1919, pp. 299-302, 3 figs. Relation of fine-grained volcanics to mineralization of Michigan copper-bearing formations.

EXPLOSIVES

Explosives. Explosives, Robert S. Lewis. Min. & Sci. Press. vol. 118, no. 8, Feb. 22, 1919, pp. 245-253, 14 figs. Compilation of data, tables and manufacturing methods. From various Bur. of Mines bulletins.

GEOLOGY

Chanarcillo. The Veins of Chanarcillo, Chile, W. L. Whitehead. Economic Geol., vol. 14, no. 1, Jan.-Feb. 1919, pp. 1-45, 6 figs. Based upon tests of ores in laboratories of Mass. Inst. Technology and supplemented with geological studies of district. Ores contain silver and copper.

Copper Silicates. Planchcite and Shattuckite, Copper Silicates, are not the same Mineral, Waldemar T. Schaller. Jl. Wash. Acad. Sci., vol. 9, no. 5, Mar. 4, 1919, pp. 131-134. Results of investigation of United States Geological Survey.

Earth Structure. On the Internal Structure of the Earth, J. T. Morrison. South African Jl. vol. 15, no. 2, Sept. 1918, pp. 31-44, 3 figs. Discussed from view-point of geophysics. Curves of earth-wave paths, longitudinal vibrations, and transverse vibrations.

Haiti. A Geological Reconnaissance in Haiti. A Contribution to Antillean Geology, William F. Jones. Jl. Geol., vol. 26, no. 8, Nov.-Dec. 1918, pp. 728-752, 10 figs.

Volcanoes. Sancy Volcano: Its Secondary Volcanoes and Lavas (Le Volcan du Sancy. Ses volcans secondaires et ses laves), Ph. Glangeaud. Comptes rendus des séances de l'Académie des Sciences, vol. 167, no. 27, Dec. 30, 1918, pp. 1076-1078, 1 fig. Geological characteristics.
Volcano Model (Un modèle de volcan), Robert W. Sayles. Revue Générale des Sciences, vol. 29, no. 23, Dec. 15, 1918, pp. 661-666, 6 figs. Construction of 12-ft. model of Kilauea volcano in Hawaii.

IRON

Arizona. Magnetic Iron Ore in Arizona, Sydney H. Ball and T. M. Broderick. Eng. & Min. Jl., vol. 107, no. 8, Feb. 22, 1919, pp. 353-354, 2 figs. Geological characteristics of gabbro differentiates in Eureka district.

Chinese Methods. Chinese Blast Furnace Iron Conversion, C. T. Huang. Blast Furnace, vol. 7, no. 3, Mar. 1919, pp. 125-126. Smelting of native white iron into foundry pig iron.

Goodmam Shortwall Machines. Virginia Iron, Coal and Coke Company and Its Goodman Shortwall Machines. Elec. Min., vol. 16, no. 1, Jan. 1919, pp. 3-22, 50 figs. Details of mining operation and electric power house.

Magnetic Concentration. The Magnetic Concentration of Iron Minerals at Mineville, United States (La concentration magnétique des minerais de fer à Mineville (E.-U.). Génie Civil, vol. 73, no. 25, Dec. 21, 1919, pp. 495-496, 3 figs. Equipment of Barton Hill mine.

Statistics. Iron Ore Production for 1918 Decreased. Iron Trade Rev. vol. 64, no. 8, Feb. 20, 1919, p. 514. 72,192,000 tons in 1918; 75,573,207 tons in 1917.

LEAD

Burma. Operations of the Burma Mines, Ltd., A. B. Parsons. Eng. & Min. Jl., vol. 107, no. 6, Feb. 8, 1919, pp. 257-262, 2 figs. Lead-silver-zinc mining in Namtu, Northern Shan States, Upper Burma.

Missouri-Kansas-Oklahoma. Mining and Milling of Lead and Zinc Ores in the Missouri-Kansas-Oklahoma Zinc District, Clarence A. Wright. Department of Interior, Bur. of Mines, bul. 154, 134 pp., 30 figs. Methods used and indication of conditions that affect their efficiency.

MAJOR INDUSTRIAL MATERIALS

Manganese. Manganese Ore Deposits in Cuba, Ernest F. Burchard. Bul. Am. Inst. Min. Engrs., no. 147, Mar. 1919, pp. 591-595. Location, character, quantity, and availability of manganese—and chrome-ore deposits.
Manganese Ore in Uruguay. Min. & Sci. Press, vol. 118, no. 8, Feb. 22, 1919, p. 253. U. S. Consular report from Montevideo.
Problems Involved in Concentration and Utilization of Domestic Low-Grade Manganese Ore, Edmund Newton. Bul. Am. Inst. Min. Engrs., no. 146, Feb. 1919, pp. 379-389. Manganese deposits in U. S.; metallurgical requirements of steel industry; concentration of demestic low-grade manganese ores; characteristics of ore affecting beneficiation.

Manganese and Chromium. Manganese and Chromium in California, Walter W. Bradley, Emile Huguenin, C. A. Logan, W. Burling Tucker and Clarence A. Waring. Cal. State Min. Bur., bul. 76, Aug. 1918, 247 pp., 56 figs. Characteristics of deposits classification and description of mines, and report on economical conditions of mining these two minerals.

MINES AND MINING

Africa. The Mineral Industry of the Union of South Africa and Its Future, P. A. Wagner. South Africa Jl. Sci., vol. 15, no. 2, Sept. 1918, pp. 45-78. Survey of resources; statistics of production; expected future developments.
The Mineral Resources of Rhodesia, F. P. Mennell. S. A. Jl. Industries, vol. 1, no. 15, Nov. 1918, pp. 1411-1417. Asbestos; coal; arsenic; barites; diamonds and other precious stones; corundum; graphite; magnesite; mica; salt; soda; talc. (Second article).

Canada. Mining Development in Northern Manitoba, R. C. Wallace. Bul. Can. Min. Inst., no. 83, Mar. 1919, pp. 287-296. Proposes building of railway along mineral belt.

Caps, Steel. The Crushing of Steel Caps, A. C. Stoddard. Min. & Sci. Press, vol 118, no. 8, Feb. 22, 1919, pp. 258-259, 3 figs. Operations in rearrangement of haulage drifts at Inspiration Consolidated Copper Co.

Cement Gun. Use of the Cement Gun in a Bituminous Coal Mine, M. S. Sloman. Eng. World, vol. 14, no. 4, Feb. 15, 1919, pp. 56-57, 1 fig. Figures showing costs on length of 900 ft. of slope; results obtained.

Co-operation. Co-operation Among Small Mines with a View to Increasing Efficiency of Operation. R. W. Brigstocke. Bul. Can. Min. Inst., no. 83, Mar. 1919, pp. 283-286. Its value in permitting employment of staff of specialists.

Development. Examining and Developing the Mine Prospect, Harry T. Curran. Eng. & Min. Jl., vol. 107, no. 8, Feb. 22, 1919, pp. 343-348. Writer's views concerning what should constitute sufficient information to justify development of a prospect.

Dredoing Areas. Topography and Geology of Dredging Areas—III, Charles Janin. Min. & Sci. Press, vol. 118, no. 4, Jan. 25, 1919, pp. 122-123, 4 figs. Dredgings areas in Colo., Mont., Idaho and Oregon. Abstract from bul. 127, U. S. Bur. of Mines.

Financial Problems. The Banker and Mining, Frank B. Anderson. Min. & Sci. Press, vol. 118, no. 8. Feb. 22, 1919, pp. 254-256. National economy as a solution of financial problems created by war. Claims mere increase of metal will not suffice. Address delivered before Cal. chapter, Am. Min. Congress.

Health Control. Prevention of Illness Among Employees in Mines, A. J. Lanza. Bul. Am. Inst. Min. Engrs., no. 146, Feb. 1919, pp. 435-437. Points out advisibility of securing for underground work employees who are free from organic and anatomical defects and of maintaining working conditions underground on a high plane of sanitation and efficiency.

Humidity. Humidity of Deep Mines, Sydney F. Walker. Eng. World, vol. 14, no. 4, Feb. 15, 1919, pp. 43-44. Suggests that each mine be treated in same manner as cold-storage plants.

Laws. Abstracts of Current Decisions on Mines and Mining, J. W. Thompson. Dept. of Int., Bur. of Mines, bul. 172, law serial 16, 160 pp. Minerals and mineral lands; eminent domain; mining terms; mining corporations and partnerships; mining claims; statutes relating to mining operations; leases and properties; quarry operations; damages for injuries to miners; publications relating to mining lands.
Discharging Water from Mining Plants, Chesla C. Sherlock. Eng. & Min. Jl., vol. 107, no. 7, Feb. 15, 1919, pp. 311-312. Legal aspect of pollution of streams by mining operations. Reference is made to similar discussion in Eng. & Min. Jl. Nov. 16, 1918, p. 861.
Mining Law and Economics—V, David Bowen. Colliery Guardian, vol. 117, no. 3029, Jan. 17, 1919, p. 133. Ownership of minerals in British colonies and other countries.

Longwall. Regarding Longwall, F. A. Pocock. Coal Age, vol. 15, no. 9, Feb. 27, 1919, pp. 395-396, 1 fig. Proposes five-entry system of mining, employing longwall faces both advancing and retreating.

Prospecting. Concreting Prospect Drill Holes, Roy H. Poston. Eng. & Min. Jl., vol. 107, no. 7, Feb. 15, 1919, pp. 309-311, 4 figs. Plugging with concrete exploratory drill penetrations through strata in order to prevent formation of Channels for underground water.

Safety Devices. Safety Lamp Gauzes, T. J. Thomas, pts. II and III. Colliery Guardian, vol. 117, nos. 3029 and 3031, Jan. 17, and 31, 1919, pp. 134-135 and p. 246, 1 fig. Jan. 17: Survey of tests with Davy lamps. Jan. 31: Statements from report of Royal Commission on Accidents in Mines.
The Eudiogrisoumeter Gas Tester, E. Hauser. Colliery Guardian, vol. 117, no. 3031, Jan. 31, 1919, p. 247, 3 figs. Researches to simplify volumetric determination, by combustion, of quantity of inflammable gas contained in a gaseous mixture.

Savoy. The Ore Minerals of Savoy, J. Morrow Campbell. Min. Mag., vol. 20, no. 2, Feb. 1919, pp. 76-88 and (discussion) pp. 88-89, 2 figs. Occurrence; source and method of segregation; origin of veins and how they are filled; order in which minerals developed in wing; decomposition of wolfram.

Shaft Pillars. Removal of a Vertical Shaft Pillar. Eng. World, vol. 14, no. 4, Feb. 15, 1919, pp. 50-52, 1 fig. Account of collapse of shaft pillar and work done to remove it, at Village Main Reef Gold Mine, Witwatersrand.

Shoveling. A Study of Shoveling as Applied to Mining, G. Townsend Harley Coal Age, vol. 15, nos. 7 and 8, Feb. 13 and 20, 1919, pp. 314-322 and 356-364, 36 figs. Series of tests to determine under what condition a laborer would handle greatest tonnage of muck in a given time, both underground and on the surface.

Statistics. A General Summary of the Mineral Production of Canada During the Calendar Year 1917, John McLeish. Can. Dept. of Mines, no. 499, 27 pp. Report of Chief of Division of Mineral Resources and Statistics.
Metal Production for 1918 in Some of the Western States. Min. & Oil Bul., vol. 5, no. 2, Jan. 1919, pp. 87-88. Ariz., Utah, New Mexico and Oregon. From estimates prepared by U. S. Geol. Survey.

Taxation. Principles of Mining Taxation, Thos. W. Gibson. Bul. Can. Min. Inst., no. 83, Mar. 1919, pp. 273-282. Discussion of methods of evaluating mines and of plans of establishing tax rates. Before joint session Am. Inst. Min. Engrs. and Can. Min. Inst.

Timber Handling. Economical Timber-Handling Plant at an Anthracite Mine, Ralph A. Smith. Coal Age, vol. 15, no. 8, Feb. 20, 1919, pp. 350-351, 8 figs. Timber shipped in to plant from a distance is unloaded by haulage transfer system, and cut into lengths suitable to use as props.

Timbering. Inclined-Shaft Timbering and a Method of Alignment, Arthur Neustaedter. Eng. & Min. Jl., vol. 107, no. 8, Feb. 22, 1919, pp. 349-351, 1 fig. Method of inclined-shaft instrumental alignment.
Timbering in English Mines. Coal Age, vol. 15, no. 9, Feb. 27, 1919, pp. 400-403, 8 figs. Methods of timbering in longwall workings. Steel and concrete are used as substitutes in roof support.

Transportation. Linking Up Isolated Mineral Districts by the Loco.-Tractor Transport System, Frank Dutton. Eng. & Min. Jl., vol. 107, no. 7, Feb. 15, 1919, pp. 313-314, 1 fig. System uses trucks running wholly on light rails. From South Africa Jl. of Industries.

Tunnels. The Tintic Drain Tunnel and Its Objects, E. E. Grimes. Salt Lake Min. Rev., vol. 20, no. 21, Feb. 15, 1919, pp. 21-23, 4 figs. Tunnel provides drainage for deeper levels of Tintic mining district and double-track haulage facilities.
Tunnel Driving at Copper Mountain, B. C., Oscar Lachmund. Bul. Am. Inst. Min. Engrs., no. 147, Mar. 1919, pp. 579-583, 1 fig. Details of straight adit 2,900 ft. long.

Ventilation. Effect of the Velocity of Ventilating Current Upon Mine Explosions, G. S. Rice and W. L. Egy. Coal Age, vol. 15, no 7, Feb. 13, 1919, pp. 308-309, 1 fig. Experiments carried on at experimental mine of Bur. of Mines are reported to disprove theory that ventilation should be reduced during firing.

MINOR INDUSTRIAL MATERIALS

Barium. Future of the Barium Industry, William H. Rollin. Chem. & Metallurgical Eng., vol. 20, no. 4, Feb. 15, 1919, pp. 163-164. How industry would be affected by action of Government in raising a protective tariff. Before Am. Inst. Chem. Engrs.
The Barite Deposits of Missouri, W. A. Tarr. Economic Geol., vol. 14, no. 1, Jan.-Feb. 1919, pp. 46-67, 4 figs. Writer advances theory that barite has been deposited by rising thermal solutions which derived their barium and other mineral content from deep-seated igneous rocks.

Electric Power. Oil Production Increased by the Electric Motor. Min. & Oil Bul., vol. 5, no. 2, Jan. 1919, pp. 77-79 and 91, 2 figs. Installation of variable speed 15-30 hp. oil well motor with controller and equipment, used for pumping, swabbing, pulling and cleaning oil wells.

Geology. Magnetic Disturbances and Oil Pools, Hamilton E. Anderson. Oil & Gas Jl., vol. 17, no. 37, Feb. 14, 1919, pp. 52 and 56, 1 fig. Survey of researches undertaken and available data concerning petroleum geology. Work done with a magnetic declinometer of writer's invention.

Graphite. The Graphite Industry, Charles Spearman. Can. Min. Jl., vol. 40, no. 6, Feb. 12, 1919, pp. 87-88. Flotation process of concentration.

Molybdenum. Standard Minerals Molybdenum Mine and Mill. Min. & Oil Bul., vol. 5, no. 2, Jan. 1919, pp. 73-74 and 102, 4 figs. Operations and flow sheet of Standard Minerals Co., Ariz.

Nickel. Nickel in South Africa, T. G. Trevor. Min. Mag., vol. 20, no. 2, Feb. 1919, pp. 120-122. Deposits and their possibilities.
Nickel, T. G. Trevor, S. A. Jl. Industries, vol. 1, no. 15, Nov. 1918. pp. 1385-1394. Occurrences of nickel in Union of South Africa; description of deposits.

Nitrates. The Chilean Nitrate Industry During 1918, Donald F. Irvin. Eng. & Min. Jl., vol. 107, no. 6, Feb. 8, 1919, pp. 265-267. Processes of mining; forecasts of future development.

Tungsten. Experiments Relating to the Enrichment of Tungsten Ores, R. W. Gannett. Economic Geol., vol. 14, no. 1, Jan.-Feb. 1919, pp. 68-78. Data obtained from leaching of tungsten minerals (scheelite, ferberite, wolframite, and hübnerite); data obtained from precipitating tungsten from solution; writer's interpretations of data.
Production and Import of Tungsten Ores. Automotive Industries, vol. 40, no. 5, Jan. 30, 1919, p. 252. Statistics show slight falling off as compared with two preceding years.
Wolfram Mining in Bolivia, G. F. J. Preumont. Instn. Min. & Metallurgy, bul. 173, Feb. 13, 1919, 9 pp. Occurrences and system of mining.

OIL

Maps and Oil Location. Map Making, R T. Wells. Natural Gas & Gasoline Jl., vol. 13, no. 2, Feb. 1919, pp. 53-56, 6 figs. Value of maps in oil location and production.

Mexico. Mexico as Source of Petroleum and Its Products, R. De Golyer. Automotive Industries, vol. 40, no. 8, Feb. 20, 1919, pp. 420-422. Development of Mexican oil fields since 1910.

Oil Refinery. Sidelights on Oil Refinery Practice, E. W. Dean. Automotive Industries, vol. 40, no. 6, Feb. 6, 1919, pp. 315-316. Discussion of four methods of increasing supply of fuels available for use in present types of automotive engines. Paper before Soc. Automotive Engrs. Also in Natural Gas & Gasoline Jl., vol. 13, no. 2, Feb. 1919, pp. 63-64.
Determination of Gasoline in Gas, W. P. Dykema and Roy O. Neal. Chem. Engr., vol. 27, no. 1, Jan. 1919, pp. 5-7. Method of testing natural gas for its gasoline content, evolved at Bartlesville Experimental Station of Bur. of Mines.

United States. Oil in Peace and War, Van H. Manning. Natural Gas & Gasoline Jl., vol. 13, no. 2, Feb. 1919, pp. 73-74. U. S. position in regard to world petroleum situation.
The Unmined Supply of Petroleum in the United States, David White Automotive Industries, vol. 40, no. 7, Feb. 13, 1919, pp. 361, 376 and 385. Estimates vary from 5,763,000,000 to 24,500,000,000 bbl.

PRECIOUS MINERALS

Australia. Gold Mining in Western Australia—IV. Thomas Butement. Chem. Eng. & Min. Rev., vol. 10, no. 120, Sept. 1918, pp. 364-368, 2 figs. Present position and outlook of Kalgoorlie mines.

Dredging. Possibilities of Dredging in the Oreville District, California, Charles H. Thurman. Min. & Sci. Press, vol. 118, no. 8, Feb. 22, 1919, pp. 257-258. Reasons why earlier type of dredge did not recover all of the gold.

Gold Ores. Larder Lake Gold Area, Percy E. Hopkins. Can. Min. Jl., vol. 40, no. 5, Feb. 5, 1919, pp. 68-71, 3 figs. Brief history and geological summary of camp.
Lightning River Gold Area and a Remarkable Series of Lava Flows, A. G. Burrows and C. W. Knight. Can. Min. Jl., vol. 40, no. 6, Feb. 12, 1919, pp. 83-86, 3 figs. Account of gold deposits and general geology of district.

Gold Precipitation. Gold Precipitation on Charcoal with an Accelerator, G. D. Reid. Chem. Eng. & Min. Rev., vol. 10, no. 120, Spt. 1918, pp. 374-375, 2 figs. Describes type of box for charcoal precipitation.

Platinum. The Sources of Placer Platinum in the Tulameen District of British Columbia, R. M. Macauly. Eng. & Min. Jl., vol. 107, no. 7, Feb. 15, 1919, pp. 303-306, 1 fig. Claims that origin of Talameen platinum is due to magmatic differentiation in peridotile and declares commercial extraction of platinum is doubtful.

Silver Ores. The Smelting and Refining of Cobalt Silver Ore, Sydney B. Wright. Eng. & Min. Jl., vol. 107, no. 6, Feb. 8, 1919, pp. 263-264. Operation at Deloro Reduction Co.'s works of high and low-grade silver-cobalt ore in lump form, jig and table concentrate, and ore residues.

Statistics. Graphics of Gold and Silver, M. W. von Bernewitz. Min. & Sci. Press, vol. 118, no. 7, Feb. 15, 1919, p. 223. Production of world from 1889-1918.
Gold Production in the British Dominions, William Frecheville. Min. & Sci. Press, vol. 118, no. 7, Feb. 15, 1919, pp. 220-222. Appendix to Inchcape Commission's Report on status of gold.
Mineral Production of British Columbia for 1918. Eng. & Min. Jl., vol. 107, no. 7, Feb. 15, 1919, pp. 320-322. Official report of gold commissioners and resident engineers of the province.
The Mining and Metallurgy of Cobalt Silver-Ores. R. W. Leonard, Jl. Eng. Inst. Can., vol. 2, no. 2, Feb. 1919, pp. 86-90. Ore treatment in districts of Temiskaming & Northern Ontario Ry.
The Production of Copper, Gold, Lead, Nickel, Silver, Zinc, and Other Metals in Canada During the Calendar Year 1917. Can. Dept. of Mines, no. 497, 71 pp. Report of Chief of Mineral Resources and Statistics.

RARE MINERALS

Rare Metals. Some of the Rarer Metals. Brass World, vol. 15, no. 2, Feb. 1919, pp. 58-59, 1 fig. Characteristics and properties of barium, bismuth, cadmium, calsium, cerium, cobalt, gallium, glucinum, iridium, lanthanum, lithium, osmium and palladium. (To be concluded).

TIN

Concentration. The Comparison of Concentration Results with Special Reference to the Cornish Method of Concentrating Cassiterite, Edwin Edser. Instn. Min. & Metallurgy, bul. 173, Feb. 13, 1919, 17 pp., 5 figs. Mathematical analysis of ratio of assay of tailings increment to assay of concentrate; tests to determine variation of fractional loss of cassiterite or tin in terms of enrichment ratio.

Slime Treatment. Slime Treatment on Cornish Frames: Supplements, S. J. Truscott. Instn. Min. & Metallurgy, bul. 173, Feb. 13, 1919, 31 pp. 5 figs. Further experiments to determine circumstances in which plane and fluted surfaces were respectively better, the one than the other; and to try policy of rapid enrichment against more usual practice of continued retreatment of concentrate; also, results on fine grinding of both sand residue and original ore.

Tasmania. The Giblin Tin Lode of Tasmania. Cyril W. Gudgeon. Instn. Min. & Metallurgy, bul. 173, Feb. 13, 1919, 12 pp., 2 figs. Situation, early history, and description of deposits.

CIVIL ENGINEERING

BRIDGES

Franklin-Orleans Bridge. The Franklin-Orleans Bridge. Eng. World, vol. 14, no. 2, Jan. 15, 1919, pp. 16-18, 7 figs. Plans and details of double-leaf trunnion bascule structure over Chicago river.

Howe Truss Spans. Strengthening Howe Truss Spans. Ry. Maintenance Engr., vol. 15, no. 2, Feb. 1919, pp. 45-46, 3 figs. Designs prepared by Northern Pacific.

Inspection. Periodic Inspection of Bridges. Eng. & Contracting, vol. 51, no. 9, Feb. 26, 1919, pp. 212-216. From a paper by Herbert C. Keith before the Brooklyn Engineers' Club.

Masonry Bridges. Reconstruction of Masonry Bridges Destroyed During the War (La reconstruction des ponts en maçonnerie détruits au cours des hostilités), M. Lutton. Génie Civil, vol. 74, no. 2, Jan. 11, 1919, pp. 24-26, 4 figs. Suggests building of an arched reinforced-concrete segments capable of being conveniently suspended and put in place without necessitating building of heavy falsework.

BUILDING AND CONSTRUCTION

Architects. Post-War Committee on Architectural Practice. Jl. Am. Architects, vol. 7, no. 1, Jau. 1919, pp. 6-8. Announcement of preliminary program for inquiry into status of architect.
The New Architectural Education. Am. Architect, vol 115; no.2249, Jan. 29, 1919, pp. 157-160. Report of Sub-Committee on Education of Reconstruction Committee of Illinois Chapter. Am. Inst. Architects and Ill. Soc. Architects.

Booms. Simple Method for Designing Booms, Arthur Raymond. Eng. & Contracting, vol. 51, no. 9, Feb. 26, 1919, pp. 209, 1 fig. Presents method and solves illustrative problem.

Flat-Slab Construction. Design of Exterior Panels in Flat Slab Construction, Albert M. Wolf. Eng. World, vol. 14, no. 2, Jan. 15, 1919, pp. 27-30, 2 figs. Survey of requirements and rulings by various institutions.

Floors. Test of a Flat Slab Floor, Western Newspaper Union Building at Chicago, U. S. A., Arthur N. Talbot and Harrison F. Gonnerman. Contract Rec., vol. 33, no. 7, Feb. 13, 1919, pp. 127-131, 5 figs. Abstract from bul. 106, Univ. of Il.

Girders. New and Little-Known Methods of Calculation of Girders, Beams and Arches, James S. Martin. Pro. Engrs. Soc. of Western Pennsylvania, vol. 34, no. 9, Dec. 1918, pp. 579-633 and (discussion) pp. 634-639, 22 figs. Survey of literature; graphic determination of rivet pitch in flanges of riveted girders; principles of graphic integration applied to beams and arches graphic integration applied to elastic arches.
Long Girders and High Columns Designed as Rigid Frame, A. E. Wynn. Eng.News-Rec., vol. 82, ne. 7, Feb. 13, 1919, pp. 340-342, 4 figs. Gymnasium requiring 52-foot span and 20-foot clearance in height carried as third story of building.
The Patterns for Crane Girders, Joseph Horner. Mech. World, vol. 65, nos. 1670 and 1672, Jan. 3 and 17, 1919, pp. 7-8 and 31, 12 figs. Details of girders by which main checks of girders are connected. First and second installments. (To be continued).

Roofs. Reinforced Concrete Roof for Craneways in Buildings, Albert M. Wolf. Eng. World, vol. 14, no. 4, Feb. 15, 1919, pp. 18-19, 1 fig. Description of reinforced-concrete trusses used to span craneway and shipping court in Ford Motor Co. service building in Chicago.
Roof Construction for Factories with Excessive Moisture, Frederick J. Hoxie. Am. Architect, vol. 115, no. 2249, Jan. 29, 1919, pp. 181-187, 20 figs. Varieties of wood-destroying fungi; examples of rot formation and destruction of beams; reduction of relative humidity by designing for increased temperature, putting more heating pipes near roof or preventing escape of heat through poorly insulated roof planks.

School Buildings. Construction and Equipment of Portable School Buildings, John Howatt and Samuel R. Lewis. Heat & Ventilating Mag., vol. 16, no. 2, February, 1919, pp. 24-32, 7 figs. Experiences with the use of this type of building with suggestions for its heating and ventilating.

Tanks Tank Construction Ernest G. Beck. Mech. World, vol. 65, no. 1671, Jan. 10, 1919, pp. 18-19, 6 figs. Side walls of rectangular tanks. Twenty-fourth installment. (Continuation of serial).

Trestles. Reinforced Concrete Trestles at North Toronto. Ry. Gaz., vol. 30, no. 1, Jan. 3, 1919, pp. 15-16, 3 figs. Details of structure involving 13,500 cu. yd. of concrete and 670 tons of reinforcing steel.

Viaducts. Design and Construction of Reinforced Concrete Viaducts, at Mileages 0.9 and 1.8 North Toronto Subdivision, of the Canadian Pacific Railway, B. O. Eriksen and H. S. Deubelbeiss. Jl. Eng. Inst. Can., vol. 2, no. 2, Feb. 1919, pp. 93-101, 20 figs. Slabs 36 ft. long were premolded and bulk of concrete cast in forms on the ground.

Walls. Conditions for Economy in Reinforced Concrete Wall Design, George Paaswell. Eng. & Contracting, vol. 51, no. 9, Feb. 26, 1919, pp. 226-227, 1 fig. Develops a method of comparing an "L" or "T" shaped wall with a counterforted wall to determine the height at which the latter becomes the most economical.

Wharves. Construction of the St. Louis Municipal Wharf Ry. Rev., vol. 64, no. 8, Feb. 22, 1919, pp. 275-279, 8 figs. Description of engineering features of construction, with drawings and photographs of details of work in progress.

CEMENT AND CONCRETE

Cement Production. The Production of Cement, Lime, Clay Products, Stone, and Other Structural Materials in Canada During the Calendar Year 1917. Can. Dept. of Mines, no. 500, 44 pp. Report of Chief of Mineral Resources and Statistics.

Gravity Concreting. Placing Concrete by Gravity in Block Frames (La mise en place du béton par gravité dans les chantiers de constructilns civiles ou de travaux publics). Génie Civil, vol. 74, no. 2, Jan. 11, 1919, pp. 21-24, 13 figs. Details of falsework and auxiliary machinery. Schemes of various American builders.

Pneumatic Concreting. The Pneumatic Method of Concreting, H. B. Kirkland. Jl. Western Soc. Engrs., vol. 23, no. 5, May 1918, pp. 319-349 and (discussion) pp. 349-355, 27 figs. Method consists in blowing batches of concrete through a pipe from a central point of supplies to their place in concrete forms; materials for a batch of concrete (1-2 cu. yd.) are proportioned in a measuring device and dropped into the pneumatic mixer without previous mixture.

Progress in 1918. Concrete and Cement. Times Eng. Supp., year 15, no. 531, Jan. 1919, p. 27. New applications given to concrete and reinforced concrete in 1918.

Slag Concrete. Blast Furnace Slag in Concrete and Reinforced Concrete, J. E. Stead. Eng. World, vol. 14, no. 4, Feb. 15, 1919, pp. 36-38. Laboratory tests to determine whether blast-furnace slag has any corrosive action on iron and steel placed in contact with it. (To be continued). From Lond. Eng.

Solubility of Cement. The Solubility of Portland Cement and Its Relation to Theories of Hydration, J. C. Witt and F. D. Reyes. Philippine Jl. Sci., vol. 13, sec. A, no. 4, July 1918, pp. 147-161, 1 fig. It is reported as result of experiments that when cement is shaken with water in a closed vessel large amounts of calcium with relatively small amounts of most other elements present go into solution, and that the factors that effect results are (1) absence of carbon dioxide, (2) method of agitation, (3) fineness of grain, (4) volume of water, and (5) time.

Wasteful Construction. Useless Waste in Concrete Construction Due to Legal Requirements, W. Stuart Tait. Am. Architect, vol. 115, no. 2249, Jan. 29, 1919, pp. 187-189, 1 fig. Criticism of basing design methods on strength for 1-2-4 concrete at 28 days of 2,000 lb. per sq. in. (Continuation of serial).

HARBORS

Seattle. Seattle Starts Large Expansion of Her Public Port Facilities, Frank Carleton Teck. Marine News, vol. 5, no. 9, Feb. 1919, pp. 98-99, 1 fig. Type and equipment of proposed additional pier 2,700 ft. long.

The Port of Seattle, W. A. Scott. Eng. World, vol. 14, no. 2, Jan. 15, 1919, pp. 61-63, 4 figs. Freight-handling equipment.

Shore Protection. Coastal and Shore Protection, H. Colin Campbell. Eng. World, vol. 14, no. 4, Feb. 15, 1919, pp. 11-17, 7 figs. Breakwaters, sea walls, and revetment work in various locations and under various conditions.

MUNICIPAL ENGINEERING

Town Planning. Town Planning, Thomas Adams. Can. Engr., vol. 36, no. 7, Feb. 13, 1919, pp. 215-216. Concerning town development in Quebec. From South Shore Board of Trade Rev.

ROADS AND PAVEMENTS

Brick Paving. Latest Seattle Specifications for Brick Paving Are for the Monolithic Type, W. H. Tiedeman. Mun. & County Eng., vol. 56, no. 1, Jan. 1919, pp. 13-14. Writer prefers cement-grout filler and believes sand-cement "cushion" fails.

The Brick Highways of Ashtabula County, Ohio, Ray N. Case. Mun. & County Eng., vol. 56, no. 2, Feb. 1919, pp. 53-57, 17 figs. County engineer believes slag bed desirable to give stability and gives account of developments and results.

Canada. Federal Aid for Highways, J. D. Reid. Can. Engr., vol. 36, no. 7, Feb. 13, 1919, pp. 223-224. Plans of the Dominion Government.

Good Roads in Lanark County, C. J. Foy. Contract Rec., vol 33, no. 7, Feb. 12, 1919, pp. 141-144, 2 figs. Account of developments. Before convention of Eastern Ontario Good Roads Assn.

Construction. Arching an Underground Roadway With Concrete Blocks, W. Ross Iron & Coal Trades Rev., vol. 98, no. 2657, Jan. 31, 1919, p. 141, 4 figs. Method to conduct excavating and building simultaneously, the packing being done as material is produced at face.

Road Contractor Successfully Employs Portable Charging Bins to Eliminate Dumping and Wheeling on Subgrade in Concrete Road Construction, George A. Burley. Mun. & County Eng., vol. 56, no. 1, Jan. 1919, pp. 11-12, 2 figs. Comparison of bin method and dumping on subgrade.

Utilizing More Mechanical Devices on Road Construction, Frank F. Rogers. Mun. & County Eng., vol. 56, no. 1, Jan. 1919, pp. 18-20. Reports of various county engineers of Michigan.

Earth Roads. Can Earth Roads Be Made Satisfactory? H. S. Carpenter. Jl. Eng. Inst. Can., vol. 2, no. 2, Feb. 1919, pp. 102-104. Suggestions in regard to selection of material, placing it on roadbed and estimates of cost of earth, sand clay, gravel and macadam roads.

Financing. How the Successful Campaign for the $60,000,000 Good Roads Bond Issue was Conducted in Illinois, S. E. Bradt. Mun. & County Eng., vol. 56, no. 1, Jan. 1919, pp. 3-5, 1 fig. Organization chart of workers.

Florida. Lessons Taught by Road Building Experience in Florida, G. Robert Ramsey. Mun. & County Eng., vol. 56, no. 2, Feb. 1919, pp. 73-74. Influence of distance from manufacturing centers, productive area, assessed valuations, etc.

Foundations. Engineers Must Study Road Foundations. Eng. World, vol. 14, no. 4, Feb. 15, 1919, pp. 31-35 Suggests that foundations be constructed with a view to bearing the greatest possible load under all conditions.

Good-Roads Movement. National Highways and Good Roads, J. A. Duchastel de Montrouge. Jl. Eng. Inst. Can., vol. 2, no. 2, Feb. 1919, pp. 91-92. Comparison of situations in U. S. and Canada with reference to act, passed by U. S. Congress, destined to aid several states in road construction.

The Federal Aid Road Law; Experience to Date and Suggestions for Better Co-operation, Logan Waller, Page. Mun. & County Eng., vol. 56, no. 1, Jan. 1919, pp. 20-23, 10 figs. Various federal aid road projects; amendments to law. Written for presentation before Am. Assn. State Highway Officials.

Twenty-Five State Highway Engineers Report Their Plans for 1919. Mun. & County Eng., vol. 56, no. 2, Feb. 1919, pp. 46-51. Letters state funds available and plans in detail.

Highway Pavements. City Pavements for State Highway in Connecticut, Charles J. Bennett. Mun. & County Eng., vol. 56, no. 2, Feb. 1919, pp. 62-63, Sheet asphalt on concrete base.

New Yory. Highway Work in Four New York Boroughs, Good Roads, vol. 17, no. 8, Feb. 22, 1919, pp. 69-71 and 84, 4 figs. Résumé of outstanding features of road and street work in Brooklyn, Bronx, Queens and Richmond.

Roads of New York, E. A. Bonney. Good Roads, vol. 17, no. 8, Feb. 22, 1919, pp. 73-76 and 84, 8 figs. Historical sketch of development of N. Y. State Highway Department with review of its organization and accomplishments.

Street Work in Manhattan. Good Roads, vol. 17, no. 8, Feb. 22, 1919, pp. 67-68 and 78, 3 figs. Historical sketch of development of highway operations.

Sand-Clay Roads. Experience with Sand Clay Road Surfacing in Nebraska, George E. Johnson. Mun. & County Eng., vol. 56, no. 1, Jan. 1919, pp. 9-11, 3 figs. Location of materials and their properties.

Snow Removal. Snow Removal from New York State Highways, Edwin Duffey. Mun. & County Eng., vol. 56, no. 1, Jan. 1919, pp. 23-24. Concerning snow-removal legislation.

Wood-Block Paving, Base for. Method Employed in Minneapolis in Constructing Smooth Surfaced Concrete Base for Wood Block Paving, Ellis R. Dutton. Mun. & County Eng., vol. 56, no. 2, Feb. 1919, pp. 51-52, 2 figs. Concrete surface smoothed over with small roller on templets.

SANITARY ENGINEERS

Drain Pipe. Aligning Drain Pipe, Harry Gardner. Eng Wrold, vol. 14, no. 4, Feb. 15, 1919, pp. 45-46, 1 fig. Method of giving grade and line for pipe sewer construction.

Latrines. A Mine Latrine, William W. Cort. Min. & Sci. Press, vol. 118, no. 5, Feb. 1, 1919, pp. 155-157, 3 figs. Details of latrine and sanitary arrangements connected with it. From bul. 28 of Cal. State Board of Health. Sanitation in Mines for the Prevention and Eradication of Hookworm.

Sanitation. Sanitation in Emergency Shipyards, W. L. Stevenson. Mun. & County Eng., vol. 56, no 2, Feb. 1919, pp. 70-71, 2 figs. Methods of distributing drinking water; collection and disposal of wastes; fly and mosquito extermination.

Sewage Disposal. Sewage Disposal in Kansas, F. M. Veatch, H. P. Evans and L. E. Jackson. Bul. Univ. Kan., vol. 18, no. 18, Dec. 1, 1917, 40 figs. Discussion of practice in certain municipalities, together with instructions to plant operators.

Sewage Disposal at Manchester, Can. Engr., vol. 36, no. 7, Feb. 13, 1919, pp. 222-223. Results of operation and activitated sludge investigations at Withington and Davyhulme works. From Surveyor, London.

Sewage Disposal Works in Reconstruction Period, Harrison P. Eddy. Mun. & County Eng., vol. 56, no. 2, Feb. 1919, pp. 60-62. Data relating to cost of certain sewage disposal projects built under ante-war conditions, and proportion of budget likely to be required to meet annual charges.

Sewers. Some Design and Constructional Features of the Rideau River Intercepting Sewer, Ottawa, Canada, L. McLaren Hunter. Mun. & County Eng., vol. 56, no. 2, Feb. 1919, pp. 63-65, 4 figs. Sewer is 17,900 ft. long with 400-ft. tunnel section under railway tracks.

The Selection of the Value of the Factor "n" in Sewer Design, Paul E. Green. Mun. & County Eng., vol. 56, no. 2, Feb. 1919, pp. 52-53. Attempt to demonstrate that n (in Kutter formula) has wrongly been recommended by experimenters as varying between 0,013 and 0.015 for vitrified-tile pipe sewers. Writer believes construction conditions determine value of n.

Swimming Pools. Keeping Swimming Pools Pure and Wholesome—IV. Metal Worker, vol. 91, no. 3, Jan. 17, 1919, pp. 86-87, 1 fig. Installation of ozoning apparatus. (Concluded.)

SURVEYING

Chains. Metallic Chains Used in Geodic Surveys (Fili e nastri metallici nella misura delle basi geodetiche), G. Cicconetti. Il Nuovo Cimento, vol. 15, nos. 5-6, May-June, 1918, pp. 180-190. Remarks on Jädering's method for obtaining accurate base measurements.

WATER SUPPLY

Conservancy. Water Works Conservancy, Arthur A. Reimer. Mun. & County Eng., vol. 56, no. 1, Jan. 1919, pp. 24-29. Economical utilization and salvaging undertakings.

Electrical Control. Automatic Electrical Control at the Deer Trail, L. Brandenburger. Salt Lake Min. Rev., vol. 20, no. 21, Feb. 15, 1919, pp. 25-26, 3 figs. Diagrammatical sketch. Plant supplies 30,000 gal. water per day to flottation and cyanide mill.

Filter Plant. Need of Certain Investigations for Increasing the Efficiency of Water Filter Plant Design and Operation, James W. Armstrong. Mun. & County Eng., vol. 56, no. 1, Jan. 1919, pp. 5-6. Most efficient mix with least loss of head; time and intensity of agitating; coagulation-basin design.

Hardness. Advantages and Disadvantages of Hard City Water. (Vorteile und Nachteile der Wasserhaerte) Dr. Carl Opitz. Journal fuer Gasbeleuchtung und Wasser-Versorgung, vol. 61, no. 41, Oct. 12, 1918, pp. 482-485. Reviews the relative effects of the water supplied upon the physical condition of 87,617 school children in 158 towns in Germany and finds that the harder the water, the better preserved are the teeth, nervousness and other ills are also diminished.

Purification. Features of Present-Day Water Purification Practice, Milton F. Stein. Mun. & County Eng., vol. 56, no. 2, Feb. 1919, pp. 57-60, 1 figs. Non-technical review written for municipal officials.
Notes on Chlorine Treatment of London, England, Water Supply, A. C. Houston. Mun. & Coun. Eng., vol. 56, no. 1, Jan. 1919, pp. 29-30. From report of Director of Water Examination.
Chlorination of Chicago's Water Supply, John Ericson. Mun. & County Eng., vol. 56, no. 1, Jan. 1919, pp. 68, 2 figs. Diagram indicating operation of Miller aeriostat.

Reservoir. The Water Supply for Montevideo. Eng. World, vol. 14, no. 2, Jan. 15, 1919, pp. 23-26, 16 figs. Design and construction of concrete reservoir at Uruguay capital.
An Interesting Nile Scheme. Elec. Times, vol. 55, no. 1122, Jan. 16, 1919, pp. 35-37, 1 fig. Reservoir project in Sudd region, Paper before Sultanieh Geographical Soc., Cairo.
Waterworks Operation Reservoir Maintenance. Mun. Jl., vol. 46, no. 4, Jan. 25, 1919, pp. 65-67. Methods costs, figures and results.

Water-Works Operation. Effect of War Conditions on the Operation and Maintenance of Water Works. Mun. & County Eng., vol. 56, no. 1, Jan. 1919, pp. 16-17. Cost of principal materials and supplies. 1911-1918: unskilled labor prices per hour.

WATERWAYS

Hudson River. Government Work on Hudson River. Eng. World, vol. 14, no. 2, Jan. 15, 1919, pp. 11-15, 7 figs. Removal of old works and construction work involved in erection of dam in N. Y. State barge canal at Troy.

Niagara. Mapping Niagara at the Brink. Eng. World, vol. 14, no. 4, Feb. 15, 1919, pp. 39-40, 2 figs. Apparatus used in sounding river just above fall.

Saone River. The Navigable System of the Saona River (Le réseau navigable de la Saone). Génie Civil, vol. 73, no. 24, Dec. 14, 1918, pp. 466-468, 1 fig. System consists of five routes disposed in fan shape. Data are given on organization, arrangement and operation.

IRRIGATION AND RECLAMATION

Arid Lands. Post-War Reclamation of Arid Lands, S. O. Andros. Eng. World, vol. 14, no. 2, Jan. 15, 1919, pp. 19-22, 8 figs. Butte project, other Government projects and private projects.

Irrigation Project. Preliminary Project for Irrigating the Chancay Pampas (Proyecto preliminar de irrigacion de las pampas de Chancay), Carlos W. Sutton and Juan N. Portocarrero y C. Boletin del Cuerpo de Ingenieros de Minas del Peru, no. 94, 1918, 21 pp., 2 figs. Involves irrigation of 15,000 hectares.

Irrigation Prospects. Some Financial, Agricultural and Engineering Aspects of Irrigation. Charles Kirby Fox. Mun. & County Eng., vol. 56, no. 1, Jan. 1919, pp. 30-31. Statistics in United States; question of transportation: outlook of future developments.

Preliminary Work. Preparing Six Hundred Acres of Land for Irrigation. F. W. Herron. Eng. News-Rec., vol. 82, no. 7, Feb. 13, 1919, pp. 337-339, 2 figs. Soil studies, surveys, supply and drainage ditches; land levelling and ditch construction operations.

Swamp Lands. Reclamation of Swamp Lands in Dane County. Wisconsin, W. G. Kirchoffer. Mun. & County Eng., vol. 56, no. 2, Feb. 1919, pp. 65-66. Work in straightening and deepening main drainage line of marsh and in providing a main outlet; 129,349 acres drained since 1908.

GENERAL SCIENCE

CHEMISTRY

Antimony Analysis. A Bibliography on the Analysis of Antimony, Elton R. Darling. Chem. Engr., vol. 27, no. 1, Jan. 1919, pp. 11-12 and 21. Articles which have appeared in scientific periodicals arranged alphabetically by authors' names. (Part I, from A to Ke).

Argon. Specific Weight of Argon (Ueber das specifische Gewicht des Argons), Dr. Hugo Schaltze. Zeitschrift fuer Kompruinerte und fluessige Gase, vol. 19, no. 1, 1917, pp. 1-3. Mean specific weight for the pure gas. 0.00178371 at 735 m.m. mercury, or 0,001783 at 760 m.m. Coefficient of compressibility between 0 and 760 m.m., 0.00091 at 0 deg. C. Molecular weight referred to 32 for oxygen—39.945. Communication from the Physikalisch-Technische Reichsanstalt.

Colloids. Metals and Alloys from a Colloid-Chemical Viewpoint, Jerome Alexander. Bul. Am. Inst. Min. Engrs., no. 146, Feb. 1919, pp. 127-130. Regards them as sponge-like structures, the viscosity or stiffness of which at ordinary temperatures is exceedingly great.

Crucibles, Corrosion of. Action of Alkalies on Crucibles of Platinum and Gold Alloys (Action des alcalis sur les creusets en alliages de platine et d'or), Paul Nielardot and Claude Chatelot. Bulletin de la Société Chimique de France, vols. 25-26, no. 1, Jan. 1919, pp. 4-9. Experiments to determine influence of age on resistance of platinum to alkaline attack, also effect of presence of iridium and similar other metals; tests were extended to gold, silver and palladium alloys.

Glass Analysis. A Contribution to the Methods of Glass Analysis, with Special Reference to Boric Acid and the two Oxides of Arsenic, E. T. Allen and E. G. Zies. Jl. Am. Ceramic Soc., vol. 1, no. 11, Nov. 1918. pp. 739-786, 1 fig. Separation of trivalent and pentavalent arsenic in glasses depends on volatilization of trivial arsenic as As_3F_3 when glass is heated with hydrofluoric and sulphuric acids, while pentavalent arsenic remains in residue. For determination of boric acid Chapin's method is recommended as reliable and accurate.

Radiation. Ionization and Excitation of Radiation by Electron Impact in Nitrogen, Bergen Davis and F. S. Goucher. Phys. Rev., vol. 13, no. 1, Jan. 1919, pp. 1-5, 5 figs. From experiments it is found that radiation can be stimulated in nitrogen molecules by electron bombardment without ionizing them up to about 18 volts when ionization sets in.

Structure of Matter. The Conception of the Chemical Element as Enlarged by the Study of Radio-Active Change. Jl. Soc. Chem. Indus., vol. 38, no. 2, Jan. 31, 1919, pp. 19R-20R. Significance of disintegration and the discovery of elements which differ in their radioactive properties but are chemically identical.

Ultra-Violet Light. Ultra Violet Light in the Chemical Arts, Carleton Ellis and A. A. Wells. Chem. Engr., vol. 27, no. 1, Jan. 1919, pp. 19-20 and 11 ad. Conclusions regarding absorption spectra of some aromatic compounds; conflicting views concerning spectra of nitro compounds. (Continuation of serial).

Valence. Valence, William Albert Noyes. Science, vol. 44, no. 1260, Feb. 21, 1919, pp. 175-182. Presidential address before Am. Assn. for Advancement of Science.

MATHEMATICS

Algebraic Surfaces. On Surfaces Containing a System of Cubics that do not Constitute a Pencil, C. H. Sisam. Am. Jl. Math., vol. 41, no. 1, Jan. 1919, pp. 49-59. Classifies types of algebraic surfaces generated by an algebraic system of r of $oo1$ cubic curves so that two generic curves of given system intersect in v z variable points.
The Classification of Plane Iuvolutions of Order (3), Anna Mamye Howe. Am. Jl. Math., vol. 41, no. 1, Jan. 1919, pp. 25-48. Discusses the different algebraic (1.3) point correspondences between two planes.
On plane Algebraic Curves with a Given System of Foci, Arnold Emch. Bul. Am. Math. Soc., vol. 25, no. 4, Jan. 1919, pp. 157-161. Suggests method for finding foci of an n-ic and illustrates it by applying it to a circular cubic.

Continuous Functions. Continuous Sets that Have No Continuous Sets of Condensation, R. L. Moore. Bul. Am. Math. Soc., vol. 25, no. 4, Jan. 1919, pp. 174-176. Establishes theorem; every bounded continuous set of points that has no continuous set of condensation is a continuous curve.
Derivitiveless Continuous Functions, M. B. Porter. Bul. Am. Math. Soc., vol. 25, no. 4, Jan. 1919, pp. 176-180. Proposes simplification of treatment of Weirstrass's and similar functions.

Isoperimetric Problem. An Ipsomeric Problem with Variable End-Points, Archibald Shepard Merrill. Am. Jl. Math., vol. 41, no. 1, Jan. 1919, pp. 60-78, 3 figs. Discusses necessary and sufficient conditions for a maximum (minimum) for a type of problems in the calculus of variations which are related to usual isoperimetric problems and in which both end-points are allowed to vary along a given fixed curve.

Non-Euclidean Geometry. Quadratic Systems of Circles in Non-Euclidean Geometry, D. M. Y. Sommerville. Bul. Am. Math. Soc., vol. 25, no. 4, Jan. 1919, pp. 161-173.

Parabolic Arcs. Comparison of Formulas for Computing Parabolic Arcs, Robert C. Strachan. Eng. News-Rec., vol. 82, no. 7, Feb. 13, 1919, pp. 25-326, 2 figs. Studies limit of applicability of common formula.

Poincare Surfaces. On Poincaré Surfaces of the Sixth Order (Sur les surfaces de Poincaré d'ordre 6), Pierre Humbert. Comptes rendus des Séances de l'Académie des Sciences, vol. 167, no. 22, Nov. 25, 1918, pp. 776-778. Comment on Liapounov's researches on possible number of Poincaré surfaces in vicinity of critical Jacobian.

Spectral Determination of Functions. Spectral Determination of Functions (Détermination spectrale de fonctions), Michael Petrovitch. Comptes rendus des séances de l'Académie des Sciences, vol. 167, no. 22, Nov. 25, 1918, pp. 771-776. Determination of f (z) a region of Z-plane by one numerial datum.

Volterra's Functions. On Function of Lines and a Set of Curves, Soichi Kakaeya. Sci. Reports Tôhoku Imperial Univ., First Series, vol. 7, no. 3, Dec. 1918, pp. 177-196.

Weierstrass Formula. On the Evaluation of the Elliptic Transcendents η_2 and η_2, Harris Hancock. Bul. Am. Math. Soc., vol. 25, no. 4, Jan. 1919, pp. 150-157. Discusses value of Weierstrassian formulæ when applications of general theory are involve or whenever any kind of numerical computation is derived.

PHYSICS

Air. Some Recent Contributions to the Physics of the Air, W. T. Humphreys. Science, vol. 44, no. 1259 and 1260, Feb. 14 and 21, 1919, pp. 155-163 and 182-188, 6 figs. Feb. 14; Temperatures of air at different elevations; isothermal state of upper air; relation of temperatures to barometric pressures both in summer and in winter; law of wind increase with elevation. Feb. 21: Barometric fluctuations; atmospheric electrical phenemona.

Black Body. A New Experimental Determination of the Brightness of a Black Body, and of the Mechanical Equivalent of Light, Edward P. Hyde, W. E. Forsythe and F. E. Cady. Phys. Rev., vol. 13, no. 1, Jan. 1919, pp. 45-48, 4 figs. Set of values of brightness of black body from 1,700 to 2,600 deg,

Corbino Effect. Double Induction Balance to Study the Corbino Effect (Doppia bilancia di induzione per lo studio dell' effetto Corbino), Luizi Puccianti. Il Nuovo Cimento, vol. 15, nos. 5-6, May-June 1918, pp. 249-257, 1 fig. Suggests explanation for electro-magnetic effect in a magnetic field.

Crystals. An Apparatus for Growing Crystals under Controlled Conditions, J. C. Hastetter. Jl. Wash. Acad. Sci., vol. 9, no. 4, Feb. 19, 1919, pp. 85-94, 2 figs. Consists essentially of two thermostats,— saturator and crystallizer; saturator is maintained at a temperature slightly higher than crystallizer and is about one-third filled with crystals which keep solution saturated: liquid is pumped from saturator into crystallizer where excess material is deposited into crystals, after which solution is returned to saturator.

CYCLONES. Prevention of Columnar Crystallization by Rotation During Solidification, Henry M. Howe and E. C. Groesbeck. Bul. Am. Inst. Min. Engrs., vo. 146, Feb. 1919, pp. 361-365, 6 figs. Theory of mechanism of solidification; experiments with strong hot solution of ammonia alum both with quiescent and with rotating solidification.

Reply to Dr. Fulton's Discussion of the Assignment of Crystals to Symmetry Classes, Edgar T. Wherry. Jl. Wash. Acad. Sci., vol. 9, no. 4, Feb. 19, 1919, pp. 99-102.

Sulfur Crystal, F. Russell Bichowsky. Jl. Wash. Acad. Sci., vol. 9, no. 5, March 4, 1919, pp. 126-131, 2 figs. Obtained by mixing a hot alcoholic solution of ammonium polysulfide with a mixture of bonzonitrile, hydroxylamine hydrochloride and ether.

X-Ray Analysis and the Assignment of Crystals to Symmetry Classes, Alfred E. H. Tutton. Jl. Wash. Acad. Sci., vol. 9, no. 4, Feb. 19, 1919, pp. 94-99. Criticism of Edgar T. Wherry's memoir on above subject in Jl. Wash. Acad. Sci., vol. 8, 1918, p. 480.

CYCLONES. On Travelling Atmospheric Disturbances, Harold Jeffreys. Lond., Edinburgh & Dublin Phil. Mag., vol. 37, no 217, Jan. 1919, pp. 1-8. Mathematical study of propagation of a cyclone and specially of the conditions which produce the circularity of its isobars.

DIFFRACTING APERTURES. On the Radiation of Light from the Boundaries of Diffracting Apertures, Sudhansukumar Banerji. Lond., Edinburg & Dublin Phil. Mag., vol. 37, no. 217, Jan. 1919, pp. 112-128, 6 figs. Experimental and theoretical analysis of problem. Finds that in all cases in which apertures in focal plane through which rays pass are symmetrically disposed about center of field, this latter being excluded, image of boundary of diffracting surface appears as a perfectly black line surrounded on either side by luminous bands.

On the Theory of Superposed Diffraction—Fringes, Chandi Prasad. Phys. Rev., vol. 13, no. 1, Jan. 1919, pp. 27-33, 4 figs. Shows how principle of superposition suggested by C. F. Brush (Proc. Am. Phil. Soc., 1913, pp. 276-282) may be formulated mathematically and its validity tested in experiment.

DOPPLER EFFECT. Experimental Demonstration of the Constancy of Velocity of the Light Emitted by a Moving Source, Q. Majorana. Lond., Edinburgh & Dublin Phil. Mag., vol. 37, no. 217, Jan. 1919, pp. 145-150, 1 fig. Experimental verification of Doppler effect with artificial movement of common luminous source.

ELASTIC SOLIDS. Deformation Resulting from the Contact of Two Elastic Solids (Sulla deformazione conseguente al contatto di due solidi elastici), Elena Mannei. Il. Nuovo Cimento, vol. 15, nos. 5-6, May-June 1918, pp. 171-179. Study of Hertz' discussion of problem. (Gesammeldte Werke, vol. 1, pp. 154-169).

ELASTOSTATICS. A Problem in the Elastostatics of a Semi-Infinite Solid, Kwan-ichi Terazawa. Sci. Reports Tohoku Imperial Univ, First Series, vol. 7, no. 3, Dec. 1918, pp. 205-215, 7 figs. Distribution of normal pressure on boundary of a semi-infinte elastic solid.

ELECTROMOTIVE FORCES. Reciprocal Relations Following from Kirchhoff's Laws (Relations de réciprocité découlant des lois de Kirchoff), J. B. Pomey. Revue Générale de l'Electricité, vol. 5, no. 3, Jan. 18, 1919, pp. 83-87, 4 figs. Mathematical equations establishing relations between electrical, mechanical and kinetic magnitudes in network of conductors. Derived for various arrangements and distributions. Supplementary to writer's study of electromotive forces in branches of network. (See R. G. E. vol. 4, Aug. 3, 1918, pp. 131-132.)

ELECTRONS. On the Mechanical and Electrodynamical Properties of the Electron, Megh Nad Saha. Phys. Rev., vol. 13, no. 1, Jan. 1919, pp. 34-44. Investigation if scalor and vector potentials of moving electron, electric and magnetic fields due to a moving electron, Maxwell's stresses, law of attraction between two moving electrons and equations of motion of the electron, by Minkowski's method of fourdimensional analysis.

GAS EQUATIONS. Molecular Attraction and Attration of Mass, and Some New Gas Equations, James Kam. Lond., Edinburgh & Dublin Phil. Mag., vol. 37, no. 217, Jan. 1919, pp. 65-97, 2 figs. Deviations from gaseous laws lead to establishing that cohesive forces are proportional to the square of molecular weight and obey inverse square law; thus an analytical value is derived for the tensile strength of iron which is of same order as experimental value.

The Laws of Perfect Gases in Relation to the Theory of Heat (Sulle leggi die gas perfetti in relazione alla teoria del calore), M. Ascoli. Il Nuovo Cimentol vol. 15, nos. 5-6, May-June 1918, pp. 212-220, 1 fig. Derivation of general differential of thermodynamic changes from the gas equation and also from the first thermodynamic law.

HYDRODYNAMICS. Integral Invariant of Hydrodynamics and Its Application to the Theory of General Relativity (Sur un invariant intégral de l'Hydrodynamique et sur son application à la théorie de la relativité générale), E. Vessiot. Comptes rendus des séances de l'Académie des Sciences, vol. 167, no. 27, Dec. 30, 1919, pp. 1065-1068. Concerning Einstein's hypothesis on nature of fluids.

INDUCTION COILS. The Optimum Secondary Capacity of an Induction Coil, E. Taylor Jones. Elec., vol. 82, no. 2122, Jan. 17, 1919, pp. 99-101. A mathematical article.

INTERFERENTIAL CONTACT LEVER. Interferential Contact Lever Experiments Relating to the Elastics of Small Bodies, Carl Barus. Proc. Nat. Acad. Sci., vol. 5, no. 2, Feb. 1919, pp. 44-49, 9 figs. Apparatus designed by writer in which interferential contact lever measures strain corresponding to stress imparted by pushing springs.

MERCURY-VAPOR LIGHT. The Light From Mercury Vapor, C. D. Child. Lond., Edinburgh & Dublin Phil. Mag., vol. 37, no. 217, Jan. 1919, pp. 61-64, 1 fig. Comparison of writer's experiments with similar experiments by Strutt (Proc. Roy. Soc., 1917, A. 94, p. 88) on the luminous vapor coming from discharge through gases at low pressure.

THERMAL CONDUCTIVITIES. Thermal Conductivity of Various Materials, T. S. Taylor. Phys. Rev., vol. 13, no. 2, Feb. 1919, pp. 150-151. Table of values for hard rubber, white fiber, various species of wood, solid and powdered graphite and lamp black.

TUNING FORKS. A Method of Comparing Tuning Forks of Low Frequency and of Determining their Damping Decrements, Albert Campbell. Proc. Phys. Soc., Lond., vol. 31, part 2, Feb. 15, 1919, pp. 87-89. Method consists in putting windings of maintaining magnets in series with each other and with a sensitive vibration galvanometer: beats are shown by pulsations of band of light on scale.

WELSBACH MANTLE. Physical Study of the Welsbach Mantle. Engineer, vol. 107, no. 2769, Jan. 24, 1919, pp. 100-103. Develops the physical theory of the Welsbach mantle.

X-RAYS. Energy of the Characteristic X-Ray Emission from Molybdenum and Palladium as a Function of Applied Voltage, Benhamin Allen Wooten. Phys. Rev., vol. 13, no. 1, Jan. 1919, pp. 71-86, 5 figs. It was found that in molybdenum ∞ and B radiation appeared at 19.2 kv. and in palladium at 24 kv.; ratio of intensity of ∞ line to that of B line was found to become constant as voltage increased for each metal; absorption coefficients for wave lengths of ∞ and B lines of molybdenum and palladium in glass and in molybdenum and palladium respectively were determined.

MECHANICAL ENGINEERING

MECHANICAL PROCESSES

BAKELITE PRODUCTS. Making Moulded Bakelite Products. Machinery, vol. 13, no. 331, Jan. 30, 1919, pp. 481-485, 9 figs Concerning design and manufacture of dies with provision for heating with steam.

BOILERS. How to Design and Lay Out a Boiler—IV, William C. Strott. Boiler Maker, vol. 19, no. 2, Feb. 1919, pp. 46-47, 2 figs. Size of rivets; efficiency of joint. (Continuation of serial).

BRIQUETTES. Notes on the Manufacture of Briquettes, E. H. Robertson. Colliery Guardian, vol. 117, no. 3029, Jan. 17, 1919, pp. 136-137, 3 figs. Rolls for briquetting; cohesion testing machine and arrangement of bars. From Tran. Min. Geol. Inst. India.

COPPER DRIVING BANDS. The Manufacture of Copper Driving Bands, Wm. J. Reardon. Metal Industry, vol. 17, no. 2, Feb. 1919, pp. 63-68, 6 figs. How wartime needs developed way to produce pure copper castings in large quantities.

CRUSHING. Fine Crushing in Ball-Mills, E. W. Davis. Bul. Am. Inst. Min. Engrs., no. 146, Feb. 1919, pp. 111-156, 17 figs. Theoretical mechanics of fine crushing, ball-wear formulæ and operating tests on siliceous rock comprising 35 per cent magnetite, the remainder being chiefly quartzite and iron silicates.

PRESSES. Manufacturing the Whitlock Pony Press, Robert Mawson. Can. Machy., vol. 21, no. 7, Feb. 13, 1919, pp. 159-161, 9 figs. Jigs and fixtures intended to simplify machining operations.

ROLLING MILLS. Builds Huge Plate Mill for Japan. Iron Trade Rev., vol. 64, no. 6, Feb. 1919, pp. 387-388, 1 fig. 180-in. plate mill recently built by Morgan Eng. Co., Alliance, Ohio.

Novel Plate Turnover for Tandem Mill. Blast Furnace, vol. 7, no. 3, Mar. 1919, pp. 128-129, 2 figs. Arrangement at Youngstown Sheet & Tube Co.'s plate mill.

The Strip Mills of Trumbull Steel Co. Iron Age, vol. 103, no. 8, Feb. 20, 1919, pp. 475-479, 5 figs. Hot mill of wide range of speeds; interesting arrangement of finishing stands; motor speed control a feature.

TRACTORS. Manufacturing the Caterpillar Tractor, Frank A. Stanley, Am. Mach., vol. 50, no. 7, Feb. 13, 1919, pp. 299-302, 7 figs. Cylinders, pistons and crankshafts. Sixth article.

WHEELS, CAR. Slick Machines for Rolling Car Wheels at Johnstown Mill of Cambria Steel Company (Le taminage des roues de wagons par les machines Slick, aux usines de la Cambria Steel Co. à Johnstown, Pensylvanie, E.-U.), P. Calfas. Génie Civil, vol. 73, no. 24, Dec. 14, 1918, pp. 461-466, 18 figs. Description of a process of making car wheels in which they are formed directly from large rolled bars by a rolling-forging process as applied at the Cambria Steel Works.

ABRASIVES

MICROSTRUCTURE. The Microstructure of Abrasives, J. Scott. Mech. World, vol. 64, no. 1666, Dec. 6, 1918, pp. 266-267, 2 figs. Remarks on physical and chemical phenomena in polishing, grinding and sharpening; photomicrographs of emery cloth and tripoli powder.

AIR MACHINERY

BLOWERS. Snow Gas Engine Blower at Parkgate Works. Iron & Coal Trades Rev., vol. 98, no. 2657, Jan. 31, 1919, pp. 132-133, 2 figs. Arrangement of twin-tandem gas-driven blowing engine at Parkgate Iron & Steel Works, Rotherdam.

COMPRESSED-AIR APPLICATION. Compressed-Air in a Shell Plant, R. E. C. Martin and S. B. King. Am. Mach., vol. 50, no. 9, Feb. 27, 1919, pp. 395-396, 3 figs. Illustrates convenience, adaptability and economy of air power for industrial and manufacturing purposes.

COMPRESSORS. Hydraulic Air Compressors. (Hydrokom-pressoren). Engineer Heinrich. Zeitschr, fuel komprimierte und fluessige Gase, vol. 19, no. 5, June 26, 1918, pp. 45-49, 4 figs. Part II. Conclusion to follow. Describes C. H. Taylor's compressor, German types, Pohle's air-lift pump. Gives the theory of hydro-compressors and their efficiency curves derived from tests. Part I in vol. 18, page 33.

FANS. Influence of Blade Inclination in the Power of a Centrifugal Fan (Influence de l'inclinaison des aubes sur la puissance des ventilateurs), M. Karrer. Génie Civil, vol. 73, no. 25, Dec. 21, 1919, pp. 486-489, 6 figs. Mathematical formula for the pressure exerted by blade and graps showing volume against pressure for various inclinations of the blades.

LUBRICATION. Lubrication of Air Compressors, H. V. Conrad. Power Plant Eng., vol 23, no. 5, Mar. 1, 1919, pp. 247-249, and Elec. Ry. Jl., vol. 53, no. 9, Mar. 1, 1919, p. 424. Difficulties encountered; suitable oils; proper quantities.

PNEUMATIC DELIVERY. Pneumatic Postal Delivery Systems. (Die Verwendung der Pressluft in der Verkehrstechnik mit besonderer Beruexksichtigung der Robr-post Anlagen), Baurat Kasten. Zeitschrift fuer Komprinierte und fluessige Gase, vol. 19, no. 3, 1917-1918, part 2, pp. 25-29, 8 figs. Compares the systems in use in the various large cities of the world, and claims more efficient performance for the systems in use in Berlin and Munich. Gives diagrams of air pressure fluctuations and switchboards. (To be continued)

CASE-HARDENING

Shimer's Process. Shimer Case-Hardening Process, Joseph W. Richards. Iron Trade Rev., vol. 64, no. 7, Feb. 13, 1919, pp. 437-438, and Bul. Am. Inst. Min Engrs., no. 146, Feb. 1919, pp. 431-433. Process employes bath of easily fusible non-case-hardening salts (usually a mixture of sodium chloride, calcium chloride, and barium chloride in equal preportions by weight) and fresh calcium cyanide, which latter imparts case-hardening properties.

CORROSION

Rustproofing. Rust-Proofing of Iron and Steel, Elmer S. Whittier. Metal Industry, vol. 17, no. 2, Feb. 1919, pp. 79-82. Description of Parker process.

FORGING

Hollow Forging. Improved Methods of Hollow Forging S. A. Hand. Am. Mach., vol. 50, no. 9, Feb. 27, 1919, pp. 377-382, 20 figs. Methods described were used in France for making the 75-mm. shell. They have been adapted to American practice and it is asserted that they have been found more economical than former methods.

Smithing. The Engineer's Smithy. Joseph Horner, Mech. World, vol. 65, no. 1673, Jan. 24, 1919, pp. 42-43, 6 figs. Drawing-down process in anvil forging. Tenth installment. (Continuation of serial).

FOUNDRIES

Brass Foundry Practice. Materials and Chemicals Used in Brass Foundry Practice, Charles Vickers. Brass World, vol. 15, no. 2, Feb. 1919, pp. 35-37, 1 fig. History, properties, appearance, physiological action and commercial use. Feathered tin; phosphor tin; phosphor copper. Third article.

Cores. Core Mixtures for Large Marine Engine Cylinder Cores, John F. Kellogg. Pacific Marine Rev., vol. 16, no. 1, Jan. 1919, pp. 128-129, 2 figs. Practices followed at various foundries.

Die Casting. Die Castings and Their Application to the War Program, Charles Pack. Bul. Am. Inst. Min. Engrs., no. 146, Feb. 1919, pp. 239-248, 9 figs. Survey of developments in manufacture of metal castings by forcing molten metal, under pressure, into a metallic mold or die, with brief descriptions of several casting machines and of methods used to avoid blowholes.

Ferrosilicon. Ferrosilicon as an Aid to the Iron Foundry, W. F. Sutherland. Can. Foundryman, vol. 10, no. 2, Feb. 1919, p. 39. Manufacture and properties of ferrosilicon.

Foundry Design. Foundry and Shops of Striking Design, Charles Lundberg. Iron Iron Age, vol. 103, no. 7, Feb. 13, 1919, pp. 417-422, 11 figs.Result of studious effort to attain ideal in Michigan plant; storage building contains bins for all materials used.

Manganese-Steel Castings. Manufacture of Manganese-Steel Castings, B. S. Carr, Mech. World, vol. 65, no. 1674, Jan. 31, 1919, pp. 56-57. Physical characteristics; heat treatment; cleaning and machining. From Armour Engr.

Pattern Making. Contraction and Expansion, G. W. Lynes. Mech. World, vol. 65, no. 1673, Jan. 24, 1919, pp. 43-44, 4 figs. As affecting patternmaker. Paper before Sheffield Branch British Foundrymen's Assn.

Substitutes. Meeting the Situation with Substitute Formulæ, R. R. Clarke. Brass World, vol. 15, no. 2, Feb. 1919, pp. 47-48. Conditions in foundry industry.

Tool Casting. New Way to Cast High Speed Tools, J. E. Johnson. Bul. Am. Inst. Min. Engrs., no. 146, Feb. 1919, pp. 353-360, 6 figs., and Iron Trade Rev., vol. 64, no. 7, Feb. 13, 1919, pp. 435-437, 7 figs. Also Iron Age, vol. 103, no. 8, Feb. 20, 1919, pp. 481-483, 5 figs. The Davidson process and its advantages over method of shaping tools from forgings; the structure and its effect.

Waste. Modern Method Applied to the Foundry, W. R. Dean. Metal Industry, vol. 17, no. 2, Feb. 1919, pp. 69-70, 4 figs. Causes of waste; classification and prevention of losses. Second article.

FUELS AND FIRING

Anthracite. Burning Steam Sizes of Anthracite With or Without Admixture of Soft Coal. U. S. Fuel Administration, eng. bul. 5, 8 pp., 1 fig. Furnace equipment required for burning various percentages of steam anthracite and soft coal.

Ash. The Relation Between the Calorific Values and the Ash-Yields of Coal-Samples from the Same Seam, Thomas James Drakeley. Tran. Instn. Min. Engrs., vol. 56, part 2, Dec. 1918, pp. 45-56 and (discussion) pp. 56-60, 3 figs. From experiments and graphs the following formula is suggested, $y = C\ (I\text{-}X)\ S$, where C is a factor for the seam and stands for calorific value of mineral-free coal: S the percentage of ash yielded by impurities; y the required calorific value of sample, and X the percentage of ash yielded by sample.

Blending. The "Sandwich" System of Fuel Blending, E. W. L. Nicol. Colliery Guardian, vol. 117, no. 3030, Jan. 24, 1919, pp. 192-193, 3 figs. Apparatus for mixing various grades of solid fuel as they are fed to burners.

Fuel Blending, E. W. L. Nicol. Times Eng. Supp., year 15, no. 531, Jan. 1919, pp. 40-41. 3 figs. Arrangement of "sandwich" system designed to cause blending of various grades of solid fuels as they are fed to furnace. Working results are given.

Briquetting. Economy of Briquetting Small Coal, J. A. Yeadon. Mech. World, vol. 64, no. 1668, Dec. 20, 1918, pp. 293. Abstract of paper before Min. Inst. Scotland.

Combustion Control. Combustion and Flue Gas Analysis. U. S. Fuel Administration, eng. bul. 4, 12 pp., 5 figs. Combustion-control apparatus; necessity of instructions to firemen.

Control of Combustible and Air in Burning Powdered Coal, W. G. Wilcox. Power Plant Eng., vol. 23, no. 5, Mar. 1, 1919, pp. 237-239. From a paper before the Western New York Section of the American Chemical Society.

Fuel Conservation. Fuel Conservation. Southern & Southwestern Ry. Club, vol. 14, no. 12, Nov. 1918, pp. 10-20 and (discussion), pp. 20-38. Discusses necessity of locomotive maintenance, constant education of enginemen and firemen, co-operation and necessity of complete understanding of importance of fuel conservation by operating officials.

Fuel Utilization. Times Eng. Supp., year 15, no. 531, Jan. 1919, p. 24. Reviews of efforts in coal conservation. particularly pulverizing coal and oil production and gas works.

Methods for More Efficiently Utilizing Our Fuel Resources, C. G. Gilbert and J. E. Pogue, Gen. Elec. Rev., vol. 22, no. 2, Feb. 1919, pp. 149-151. Part 25. The need for a constructive economic policy in developing the coal products Industry. Extract from U. S. Nation Museum Bulletin 102, Part 5; "Power: Its Significance and Needs," 1918.

Worcester's Fuel Saving Campaign, S. E. Balcome. Power Plant Eng., vol. 23, no. 5, Mar. 1, 1919, pp. 236-237, 2 figs. First article of a series on the organization, work of committees and results obtained in industrial plants.

Conservation of Fuel, D. C. Randolph. Proc. Central Ry. Club, vol. 27, no. 1, Jan. 1919, pp. 529-536 and (discussion), pp. 536-554. Contrasts what are termed good and bad railway fuel practices in locomotives, shops, roundhouses, yards and on the road.

Low-Grade Fuels. On the Utilization of Low-Grade Fuels at the Montrambert Collieries (Note sur l'utilisation des combustibles pauvres par la société des houillères de Montrambert. Bulletin de la Société d'Encouragement, vol. 130, no. 6, Nov.-Dec. 1918, pp. 376-378. Materials tested contain 42 to 50 per cent ash and 18 to 20 per cent volatile matter.

Motor-Car Fuel. Gas as Automobile Fuel (l'emploi du gaz dans les automobiles), A. Grebel. Génie Civil, vol. 74, no. 5, Feb. 1, 1919, pp. 81-84, 11 figs. Applications in France and in England; experiments of the Société du Gaz, Paris.

Fuel. Automotive Industries, vol. 40, no. 7, Feb. 13, 1919, pp. 356-357. Possibilities of benzol, alcohol and shale distillate as substitutes for gasoline.

An Interpretation of the Engine-Fuel Situation, Joseph E. Rogue. Automotive Industries, vol. 40, no. 7, Feb. 13, 1919, pp. 357-361, 3 figs. Believes that lesser gasoline output, which writer considers as inevitable, can be met only by modifying engine design so as to secure higher thermal efficiency and to use less specified fuel.

Pacific Coast Problems. Fuel Problems of the Pacific Coast. Mech. Eng., vol. 41, no. 3, Mar. 1919, pp. 264-269 and 292. Possibilities of fuel-oil conservation through its economic utilization and development of hydraulic power.

Peat. Possibilities of Peat, C. C. Osborne. Jl. Am. Peat Soc., vol. 12, no. 1, Jan. 1919, pp. 7-16 and 17-47. General conditions in industry; production in U. S., 1908-1917; manufacture of peat products; occurrence properties and uses; comparative calorific value of peat and other fuels; methods of preparation; peat industry in principal foreign countries. From U. S. Geol. Survey.

Powdered Coal. A Review on the Use of Powdered Coal, W. O. Renkin. Blast Furnace, vol. 7, no. 2, Feb. 1919, pp. 114-116 and 119, 3 figs. Graph showing comparative value and advantages of different fuels; comparison of installation and operating costs of producer gas, natural gas and hand-fired coal; early uses of powdered coal.

Powdered coal as a Substitute for Fuel-Oil. Min. & Sci. Press, vol. 118, no. 7, Feb. 15, 1919, pp. 235-236, 1 fig. Layout of experimental plant using Buell-Sautmyer system.

Pulverized Coal and Its Utilization, H. G. Barnhurst. Eng. World, vol. 14, no. 2, Jan. 15, 1919, pp. 45-46. Developments in pulverized-coal burning; plants using pulverized coal.

Pulverized Coal in an Industrial Plant, C. A. Dille. Power Plant Eng., vol. 23, no. 4, Feb. 15, 1919, pp. 188-189, 1 fig. Its parepration and method of application at plant of Mansfield Sheet and Tin Plate Co.

Characteristics of Powdered Coal, W. G. Wilcox. Brick & Clay Rec., vol. 54, no. 2, Jan. 28, 1919, pp. 127-131. Essentials of good combustion; flame length and air control; mixing coal with air; velocity of combustion.

U. S. Fuel Administration. Distribution of Coal Under U. S. Fuel Administration, J. D. A. Morrow. Bul. Am. Inst. Min. Engrs., no. 147, Mar. 1919, pp. 585-589. Method of controlling directing distrietuion.

Work of National Production Committee of U. S. Fuel Administration, James B. Neale. Bul. Am. Inst. Min. Engrs., no. 146, Feb. 1919, pp. 439-444. Method adopted for increasing production; need of stimulating ambition in workmen; industrial obligations of employers to men.

Wet Coal. Birds-Nesting of Boiler Tubes, James Scott, Nat. Engr., vol. 23, no. 2, Feb. 1919, pp. 66-67, 3 figs. Suggests avoidance of wet coal highly impregnated with sulphur; also suppression of very high temperatures until sulphur has volatilized away. From Practical Engr.

FURNACES

Annealing Furnaces. Heating Furnaces and Annealing Furnaces—II and III, W. Trinks. Blast Furnace, vol. 7, nos. 2 and 3, Feb. 1919, and Mar. 1919, pp. 98-101, 9 figs., and pp. 134-137, 7 figs. Speed of heat transmission and required brick surface; curves showing rate of heat abstraction from exterior of furnace.

Heating Furnaces. Practical Pointers on Heating Furnaces, George J. Hagan. Blast Furnace, vol. 7, no. 3, Mar. 1919, pp. 153-155 and 163. Changes in hearth areas capacities and walls to improve product and reduce losses. Paper before Engrs.' Soc. Western Pa.

Kilns. Ovens and Kilns With a High Thermal Efficiency, A. Bigot. Engineering, vol. 107, no. 2768, Jan. 17, 1919, pp. 80-82, 6 figs. Paper before Refractory Materials Section of Ceramic Soc.

Open-Hearth Furnaces. Open-Flame Furnaces at Government Gun Plant Accomplish Results That Munitions Specialist Believed Possible Only with Muffled Furnace or Electric. Am. Gas Eng. Jl., vol. 110, no. 5, Feb. 1, 1919, pp. 91-94, 4 figs. Large units measuring 37 ft. in depth and 9.5 fit. outside diameter are used to heat-treat big guns.

HANDLING OF MATERIALS

Coaling Station. Coaling Stations of the Philadelphia & Reading Railway. Eng. World, vol. 14, no. 4, Feb. 15, 1919, pp. 47-49, 6 figs. $270,000 locomotive coaling plant arranged to handle both anthracite and bituminous coal.

Coal Yard. An Efficient Chicago Coal Yard. Black Diamond, vol. 62, no. 4, Jan. 25, 1919, p. 65, 3 figs. Operates auto-crane in place of having elevated tracks.

Paper Mill. Handling Material in a Paper Mill, Henry J. Edsall. Indus. Man., vol. 57, no. 3, Mar. 1919, pp. 183-189, 18 figs. Boilerhouse machinery, conveyors for wet and dry pulp, machinery for handling black ash: track hauler, monorails and cranes. (Concluded.)

Steel Works. Handling Fuel and Materials in Iron and Steel Works, Frank Somers Colliery Guardian, vol. 117, no. 3029, Jan. 17, 1919, p. 141. Concerning avoidance of passing materials backwards. Paper before Staffordshire Iron & Steel Inst.

GAGES

Limit Gages. Limit Gages, W. E. Wilson. Mech. World, vol. 65, no. 1672. Jan. 17, 1919, p. 27. Correction of gages for wear. First instalment. (To be continued.) From Commonwealth Engr.

HEAT-TREATING

Critical Points. Critical Points. Proc. Steel Treating Research Soc., vol. 2, no. 2, 1919, pp. 32-40, 1 fig. Discussions held before Detroit section on shrinkage and warpage in hardening steel parts and on development of soft spots in case-hardened parts.

Low-Carbon Steel. Heat Treatment of Low-Carbon Steel, W. M. Wilkie. Mech. Eng., vol. 41, no. 3, Mar. 1919, pp. 239-244, 12 figs. Photomicrographs showing change in grain structure caused by annealing to various temperatures; effect of these structures on quality of steel.

Mass, Effect of. Effect of Mass on Heat Treatment, E. F. Law. Proc. Steel Treating Research Soc., vol. 2, no. 2, 1919, pp. 11-18 and (discussion), pp. 18-19 and 31, 3 figs. Chemical analyses, heating and cooling curves, and mechanical tests of cubes taken from 25-in. square ingot 10 ft. long after it was cogged down to 18 in. square. Paper before Iron & Steel Inst.

Springs. Manufacture, Heat Treatment and Physical Tests of Automobile Springs, N. E. Hendrickson. Proc. Steel Treating Research Soc., vol. 1, no. 10, July 1918, pp. 39-42 and (discussion), pp. 42-44. Calls attention to inconsistency of combining high-grade material with poor workmanship or heat treatment.

Steel Selection. The Composition and Properties of Steels, Howard Ensaw. Mech. World, vol. 65, no. 1671, Jan. 10, 1919, pp. 15-17. Suggests selection of few types of steel in order to avoid error in hardening and tempering. Tests of physical and chemical properties of steel.

Tempering. Phases on Tempering, E. W. Upham. Iron & Steel Can., vol. 2, no. 1, Feb. 1919, pp. 25-27. Discussion of methods of treatment and temperature control. Paper before Steel Treating Research Soc.

HEATING AND VENTILATION

Economics. Engineering Economics of Heating, M. William Ehrlich. Heat. & Ventilating Mag., vol. 16, no. 2, February 1919, pp. 17-23, 6 figs. Containing also a method of predetermining coal requirements for steam and hot water heating systems. Abstract of a paper presented at the annual meeting of the American Society of Heating and Ventilating Engineers, New York, January 1919.

Electricity. Heating Our Homes with Electricity. Elec. News, vol. 28, no. 3, Feb. 1, 1919, pp 23-25 and 30, 7 figs. Pioneer installation in Toronto said to prove that electric heating is practical.

Heating Plants. The Enormous Heating Plant at the Great Lakes Naval Training Station, J. C. Foster. Domestic Eng., vol. 86, no. 7, Feb. 15, 1919, pp. 299-300. Plant supplies heat to 950 buildings covering area of 1210 acres.

Low-Pressure System. Saving Steam in Industrial Heating Systems. U. S. Fuel Administration, eng. bul. 6, 14 pp., 9 figs. Suggests utilization of exhaust steam and discusses chief requirements for a good low-pressure heating system.

HOISTING AND CONVEYING

Conveyors. Conveyors in Relation to Engineering Works, W. W. Atherton. Eng. World, vol. 14, no. 4, Feb. 15, 1919, pp. 27-30, 4 figs. Illustrations showing various types of conveyors.

Floating Cranes. Floating Crane of 75-Ton Capacity. Eng. World, vol. 14, no. 2, Jan. 15, 1919, pp. 63-64, 1 fig. Dimensions and arrangement of auxiliary parts.

Grain Elevators. Some Modern German Grain Elevators (Neuzeitlicher deutscher Getreidespeicherbau), Prof. M. Buhle. Zeitschrift fuer Baumwesen, vol. 68, no. 7 to 9, 1918, pp. 3195-314, 19 figs. Gives views and details of mechanical equipments of a number of grain elevators erected in Germany, Austria, Russia and Holland.

Wall Cranes. Wall Cranes, Ernest G. Beck. Mech. World, vols. 64 and 65, nos. 1669 and 1674, Dec. 27, 1918, and Jan. 31, 1919, pp. 306-307 and 54. Computation of stresses in members. Twentieth and twenty-first installments. (Concluded.)

HYDRAULIC MACHINERY

China. Age-Long Engineering Works of China, Middleton Smith. Engineer, vol. 127, no. 3291, Jan. 24, 1919, pp. 72. A description of some of the ancient hydraulic works in China.

Gates. Automatic Gates a Factor in Safety of Spillway Dams, Robert H. Moulton. Safety Eng., vol. 37, no. 2, Feb. 1919, pp. 58-60, 4 figs. Gates are operated by the water pressure.

INTERNAL-COMBUSTION ENGINES

Diesel Engine. The Diesel Engine on Shipboard, Bruce Lloyd. Jl. Electricity, vol. 42, no. 3, Feb. 1, 1919, pp. 116-119, 5 figs. Discussions of results obtained in trials on vessels built in Pacific Coast. Writer's opinion concerning marine acceptance of Diesel engine. Paper before San Francisco Section, Am. Soc. Mech. Engrs.

The Diesel Engine—I, Herbert Hans. South-Engr., vol. 30, no. 6, Feb. 1919, pp. 48-50, 4 figs. Three general types of liquid-fuel engines; explosion engines having four-stroke cycle; engines having two-stroke cycle.

Junkers Engine. The Junkers Engine, Philip Lane Scott. Pacific Marine Rev., vol. 16, no. 1, Jan. 1919, pp. 112-114, 4 figs. Operation of engine (Diessel type) having two pistons in one cylinder.

Semi-Diesel Engine. Combustion Engines and Their Applications (Les moteurs à combustion et leurs applications), M. Drocsne. Revue Générale des Sciences, vol. 29, no. 23, Dec. 15, 1918, pp. 666-673, 1 fig. Origin and development of semi-Diesel engines; survey of results obtained in France and elsewhere in the construction of Diesel engines of various types.

The Leading Features of Semi-Diesel Oil Engine, James Richardson. Mar. Eng. Can., vol. 8, no. 12, Dec. 1918, pp. 295-300, 10 figs. Definition; nomenclature; classification; compression pressure; effect of compression; cycle of operation.

LUBRICATION

Grinding Lubricants. Proper Care of Grinding Lubricants, Howard W. Dunbar. Iron Trade Rev., vol. 64, no. 6, Feb. 6, 1919, p. 375. Contends that a tank for each machine is best way to handle grinding compounds and lubricants.

Lubricating Oils. Lubricating Oils, G. R. Rowland. Nat. Engr., vol. 23, no. 2, Feb. 1919, pp. 68-71, 1 fig. Physical characteristics and application; selection of oil most suitable for work required; distillation.

MACHINE ELEMENTS AND DESIGN

Bearings, Thrust. Single-Collar vs. Multi-Collar Thrust Bearings for Propeller Shafts, H. G. Reist. Gen. Elec. Rev., vol. 22, no. 2, Feb. 1919, pp. 133-137, 3 figs. From data available author assumes that substituting of single for multi-collar thrust bearings on average merchant ship would result in saving about one-half of one per cent of the total power, coal and size of boilers.

Flywheels. How Much Should a Flywheel Weigh? Rufus T. Strohm. Power, vol. 49, no. 8, Feb. 25, 1919, pp. 269-273, 7 figs. Simple method of calculating approximately weight of flywheel.

Gears. The Properties of Worm Axle Gears. Machinery, vol. 13, no. 331, Jan. 30, 1919, pp. 479-480. Formulæ and calculations.

Springs. Calculation of Helical Springs. (Berechnung zylindrischer Schraubenfedern unter Verwendung von Schaulinien.) Richard Seeman, Dinglers Polytechnisches Journal, vol. 333, no. 11, June 1. 1918, pp. 91-96, 11 figs., 5 tables. Concluded in no 12, June 15, 1918, pp. 99-101. Large diagrams for solving all usual problems occurring with helical compression and tension springs. The second part contains typical examples, considering also the element of time, as in the closing of valves.

MACHINE SHOP

Boring and Lining. War-Time Repairs in the Navy, Frank A. Stanley. Am. Mach., vol. 50, no. 9, Feb. 27, 1919, pp. 383-387, 14 figs. Boring and lining operations. Fifth article.

Control of Tools. The Control of Electrically Operated Machine Tools, F. Ashton. Mech. World, vols. 64 and 65, nos. 1663, 1665, 1668, 1669, 1671 and 1672, Nov. 15, 29, Dec. 20, 27, 1918, Jan. 10 and 17, 1919, pp. 236-237, 259-260, 292-293, 304-305, 20-21 and 28-29, 17 figs. Description of various types in use; remarks on their operation; methods of starting; dangers from overloads.

Drive. Industrial Motor Installation, W. H. Wakeman. Southern Engr., vol. 30, no. 6, Feb. 1919, pp. 56-59, 10 figs. Detail of construction work in changing from belt drive to electric drive.

Grinding. Grinding as a Machine Operation. Ry. Gaz., vol. 30, no. 1, Jan. 3, 1919, pp. 25-27, 3 figs. Suggestions in regard to designing and operating grinding machines.

Grouting of Bases. Grouting Electrical Machinery Bases—I, Terrell Croft. Southern Engr., vol. 30, no. 6, Feb. 1919, pp. 52-55, 3 figs. Function of grouting; mixing the grout; various materials for grout; preparing a machine bedplate for grout.

Hammering. Handier Hammering. Sci. Am., vol. 120, no. 9, Mar. 1, 1919, p. 208, 2 figs. Hammer provided with device to hold nail.

Shaft Pressing. Recent Developments in Shaft Pressing at Destination. N. L. Rea. Gen. Elec. Rev., vol. 22, no. 2, Feb. 1919, pp. 138-140, 3 figs. Description of methods that have been found successful in pressing on shafts at destination.

MACHINERY, METAL-WORKING

Drills. A New Method of Gang Drilling. Iron Age, vol. 103, no. 8, Feb. 20, 1919, pp. 489-492, 7 figs. Radical design based on detachable drill heads and chain drive; cutting cycle automatic; application in boiler shop.

Lathe, Roll. Japan to Have Massive Roll Lathe. Iron Trade Rev., vol. 64, no. 7, Feb. 13, 1919, pp. 451-452, 1 fig. Tool is motor-driven and is provided with several spindle speeds; bed is made in sections to facilitate transportation; total weight, 275,000 lb.

Lathe, Screw-Cutting. High-Precision Screw-Cutting Lathe. Mech. World, vol. 64, no. 1667, Dec. 13, 1918, p. 282, 1 fig. Machine built by Commission of Machine Tool Dept., Ministry of Munitions. Among other features "live" center is "dead," drive being obtained by catchplate revolving about spindle extension.

Milling Machine. Double-Spindle Milling Machine for Wrench Slot in Detonator Socket. Machinery, vol. 13, no. 331, Jan. 30, 1919, p. 495, 2 figs. Described as permitting manufacture of 4000 to 5000 fuse parts per day.

Trimmer. Bliss Flat-Edge Trimmer for Sheet Metal. Am. Mach., vol. 50, no. 9, Feb. 27, 1919, pp. 412-414, 4 figs. Description of a machine that will trim the scrap from metal stampings and leave a smooth, flat edge suitable for soldering, welding, brazing or other operations.

MACHINERY, SPECIAL

Evaporators. Industrial Vacuum Evaporators, Frank Coxon. Mech. World, vol. 65, nos. 1670 and 1673. Jan. 3 and 24, 1919, pp. 5 and 40, 7 figs. Classification and description. First and second installments. (To be continued.)

Reserving Machine. Reversing Value of Water-Sealed Type. Iron Trade Rev., vol. 64, no. 7, Feb. 13, 1919, pp. 452 and 467, 1 fig. Reversal of 36-in. hand-operated furnace valve is accomplished by a balanced hood and counterweights.

Trench-Digging Machine. German Excavating Machine for Tunnels and Mine Galleries (Machine allemande pour le creusement des tunnels et des galeries de mines), Francis Schmitt. Génie Civil, vol. 73, no. 22, Nov. 30, 1918, pp. 421-423, 10 figs. Details of excavator and of shaft with spiral blade for automatic removal of material.

MATERIALS OF CONSTRUCTION AND TESTING OF MATERIALS

Alternating Stresses. Effect of Cold-Working and Rest on Resistance of Steel to Fatigue Under Reversed Stress, H. F. More and W. J. Putnam. Bul. Am. Inst. Min. Engrs., no. 146, Feb. 1919, pp. 391-404, 9 figs. Report of research under auspices of Nat. Research Council.

Cast Iron. Cast Iron in Bending: Variation in Beam Strength, J. Harland Billings. Can. Machy., vol. 21, no. 7, Feb. 13, 1919, pp. 162-163, 2 figs. Tests to determine effect of varying cross section upon strength of beams in bending.

Glass. Strength Tests of Plain and Protective Sheet Glass, T. L. Sorey. Jl. Am. Ceramic Soc., vol. 1, no. 11, Nov. 1918, pp. 801-808, 4 figs. Claims that in both impact and cross-bend tests blown window glass was stronger than plate glass.

Toughness. Static, Dynamic, and Notch Toughness, Samuel L. Hoyt. Bul. Am. Inst. Min. Engrs., no. 146, Feb. 1919, pp. 339-351, 10 figs. Considers toughness as an independent property and proposes quantitative determinations of toughness by notched-bar impact tests (Charpy tests).

MEASUREMENTS AND MEASURING APPARATUS

Dynamometers. Commercial Dynamometers, P. Field Foster. Mech. World, vol. 65, no. 1670, Jan. 3, 1919, pp. 6-7, 2 figs. "Transmission" types. Eighth installment. (Continuation of serial.)

Screw Measurements. A Machine for Measuring Screws, P. E. Shaw. Engineering, vol. 107, no. 2769, Jan. 24, 1919, pp. 104-108, 16 figs. Methods described depend upon a simple point contact in all cases. The machine used deals with the diameters and the pitch and is of a simple type, easy to use.

Spherometers. Mechanical Measure of a Spherical Surface. Spherometers. Mesure mécanique d'une aire sphérique. Les sphérimètres). Paul Vanet. Génie Civil vol. 74, no. 5, Feb. 1919, p. 96, 6 figs. Principle of planimeter applied to measurement of area of closed figure drawn on a spherical surface.

Temperature Measurements. Measuring Gas Temperatures in Boiler Settings. Engineering, vol. 107, no. 2768, Jan. 17, 1919, pp. 75, 1 fig. Abstract of Bulletin 145, U. S. Bureau of Mines, by Messrs. Kreisinger and Barkley.

New Method of Measuring High Temperatures by the Coloration of the Light Emitted by an Incandescent Body (Sur une nouvelle méthode de mesure des températures élevées d'après le coloration de la lumière émise par le corps incandescent). A Boutaric. Revue Générale de l'Electricité, vol. 5, no. 6, Feb. 8, 1919, pp. 210-217, 7 figs. Based principally on researches by Paterson and Dudding. (Phil. Mag., vol. 30, July 1915, p. 34.)

On the Lags of Thermometers with Spherical and Cylindrical Bulbs in a Medium Whose Temperature is Changing at a Constant Rate, A. R. McLeod. Lond., Edinburgh & Dublin Phil. Mag., vol. 37, no. 217, Jan. 1919, pp. 134-144. Gives expressions for steady values of lags when surface conductivity is finite, and for lags at any instant when surface conductivity is infinite. Expression for surface conductivity $h=0.0000515\ V$, where V is miles per hour, is suggested for thermometers moving through air at aeroplane speeds.

MECHANICS

Beams. Theory of the Hyperstatic Beam Théorie de la Poutre Hyperstatique), D. Wolkowitsch. Génie Civil, vol. 74, no. 5, Feb. 1, 1919, pp. 84-89, 7 figs. Simple beam supported at one end and fixed at the other; continuous beams on supports at same level. (Concluded.)

Ropes, Wire, Stresses in. Stresses in Wire Rope, Shortridge Hardesty. Mech. Eng., vol. 41, no. 3, Mar. 1919, pp. 257-260, 4 figs. Development of new formula for determination of bending stresses.

Shafts, Critical Velocity of. On the Critical Velocity of Shafts. Dunkerley's Formula (Note sur la vitesse critique des arbres. Formule de Dunkerley), E. Hahn. Revue Générale de l'Electricité, vol. 5, no. 4, Jan. 25, 1919, pp. 123-130, 3 figs. Demonstration of Dunkerley's formula and calculation of its accuracy.

Struts. Critical Distributed Loads for Long Struts. Arthur Morley and F. F. P. Bisacre. Engineering, vol. 107, no. 2769, Jan. 24, 1919, pp. 99-100, 2 figs. Deals mainly with the compression flange or member of cantilevers or masts, developing a general formula applicable to a wide variety of distributed loads.

MOTOR-CAR ENGINEERING

Axles. Parker Silent Internal Gear Axle. Automotive Industries, vol. 40, no. 6, Feb. 6, 1919, pp. 305-306, 3 figs. Gear is completely enclosed and runs in oil bath.

Carburetors. New Sunderman Carburetor Uses Floating Venturi. Automotive Industries, vol. 40, no. 7, Feb. 13, 1919, p. 377, 5 figs. Employs mushroom jet and air bypass for regulating depression at nozzle.

Design. Effect of Airplane Construction on the Automobile, O. E. Hunt. Eng. World, vol. 14, no. 4, Feb. 15, 1919, pp. 53-55. Claims that most important contribution has been the stimulus to thought of industry.

Possible Effect of Aircraft Experience on Automobile Practice, Howard C. Marmon, O. E. Hunt and Henry M. Crane. Automotive Industries, vol. 40, no. 6, Feb. 6, 1919, pp. 317-322. Comparison of plane and automobile engines; applicability to automobile manufacture of experience gained in producing light-weight results; development of alloy pistons. Paper before Soc. Automotive Engrs.

Engines. Motor Transport Under Difficulties, J. A. L. Gallard. Min. Mag., vol. 20, no. 2, Feb. 1919, pp. 90-91. Service given by sleeve-valve engine under stresses of war conditions.

Continental Adaptation of Class B War Truck Engine. Automotive Industries, vol. 40, no. 4. Jan. 23, 1919, pp. 211-213, 8 figs. Engine has aluminum crankcase and bell housing; designed originally for military use.

Gray Victory Four-Cylinder Engine. Automotive Industries, vol. 40, no. 7, Feb. 13, 1919, pp. 370-371, 5 figs. Block-cast engine of 3½-in. bore by 5-in. stroke, of valve-in-head type. Intended for passenger cars, trucks and tractors.

Récardo Engine "Made Good" in Tanks. Automotive Industries, vol. 40, no. 8, Feb. 20, 1919, pp. 407-410, 7 figs. Piston design; means for cooling piston, for preheating carburetor air, and for preventing unvaporized fuel getting into crank chamber.

Fans. Radiator Cooling Fans, Louis Schwitzer. Automotive Industries, vol. 40, no. 4, Jan. 23, 1919, pp. 202-205. Fan design, mounting and drive; location of fan relative to housing.

Governors. Truck and Tractor Engine Governors, R. B. Shoop. Automotive Industries, vol. 40, no. 7, Feb. 13, 1919, pp. 374-375 and 392, 8 figs. Classification of various types; factors affecting design; adaptation of marine type.

Hotchkiss Drive. An Analysis of the Hotchkiss Drive, Otto M. Burkhardt. Automotive Industries, vol. 40, no. 4, Jan. 23, 1919, pp. 206-208, 5 figs. Resultant of weight carried and torque or brake reaction; effect of torque on spring.

Motorcycles. Harley-Davidson Co. Brings Out Sport Model. Automotive Industries, vol. 40, no. 7, Feb. 13, 1919, pp. 362-364, 6 figs. Design having a two-cylinder opposed engine, multiple-disk clutch and three-speed transmission.

Standards. S. A. E. Discusses Truck Subjects, B. B. Bachman, Cornelius T. Myers and G. E. Randles. Automotive Industries, vol. 40, no. 7, Feb. 13, 1919, pp. 349-351. Pneumatic tires for trucks; recommended inflation pressures.

Tractors. Case 15-27 Hp. Tractor, P. M. Heldt. Automotive Industries, vol. 40, no. 5, Jan. 30, 1919, pp. 256-261, 9 figs. Features of construction. Main frame is single iron casting designed to serve as main part of transmission case, crank-case and rear-axle housing.

Operating a Traction Engine, Thomas G. Thurston. Nat. Engr., vol. 23, no. 2, Feb. 1919, pp. 60-63, 2 figs. What is included in field operations; skill required in making repairs from scant and unsuitable materials.

Principles of the Wheeled Farm Tractor, Edward R. Hewitt. Automotive Industries, vol. 40, no. 6, Feb. 6, 1919, pp. 312-315, 3 figs. Factors determining maximum traction obtainable; results of experiments to ascertain rolling resistance. Paper before Soc. Automotive Engrs.

Valves. Small In let Valves Satisfactory in Overhead Valve Design—I, L. H. Pomeroy. Automotive Industries, vol. 40, nó. 8, Feb. 20, 1919, pp. 432-435, 6 figs. Report of tests made with two engines of approximately same size, one a valve-in-head design and the other an L-head valves side by side in valve pocket. Paper before Instn. Automobile Engrs.

Windshields. A New Windshield for Closed Bodies, George J. Mercer. Automotive Industries, vol. 40, no. 8, Feb. 20, 1919, pp. 416-417, 3 figs. Upper and lower parts in inclined planes cutting each other in line of vision.

PIPE

Standards. Pipe Standards and Their Application to Commercial Work, A. M. Houser and C. C. Bartlett. Power Plant Eng., vol. 23, no. 5, March 1, 1919, pp. 250-252, 8 figs. Theoretical standards; Briggs standard gage; making tight joints'

POWER GENERATION

Argentina. Utilization of Waterfalls (Aprovechamiento de la caídas de aqua), A. Di Ciô. Boletin de la Asociacion Argentina de Electro-Ténicos, vol. 4, no. 9, Sept. 1918, pp. 816-820. Popular discussion of economical aspect of problem.

France. Hydraulic Energy in the Central Group of France (L'énergie hydraulique dans le Massif Central de la France), P. Morin. Revue Générale de l'Electricité, vol. 5, no. 6, Feb. 8, 1919, pp. 219-227, 4 figs. Geographical conditions and study of the water courses which are susceptible of immediate utilization.

Maine. Cost of Hydroelectric Development. Elec. Wld., vol. 73, no. 9, March 1, 1919, pp. 413-417. From a report based on the study of Maine water powers by H. K. Barrows to the Maine Public Utilities Commission. Effect of load factor; costs of water rights, power transmission lines, storage reservoirs; comparative utility of hydraulic and steam power.

Tennessee. The Larger Undeveloped Water-Powers of Tennessee, J. A. Switzer. Tennessee Geol. Survey, bul. 20, 1918, 35 pp., 30 figs. Report of field and office work; general scheme of development. Paper before Am. Electrochem Soc.

United States. Water Powers, O. B. Wilcox. Nat. Elec. Light Assn. Bul., vol. 6, no 2, Feb. 1919, pp. 55-56. Estimate of available water power in U. S. From report of chairman of Committee on Public Service Securities, Investment Bankers' Assn. Am.

POWER PLANTS

Boiler Design. Modern Boiler Practice, F. A. Combe. Jl. Eng. Inst. Can., vol. 2, no. 2, Feb. 1919, pp. 109-119, 9 figs. Outline of principles governing boiler and furnace design, with review of present knowledge of laws related thereto, and trend of modern practice, together with general notes regarding boiler installation and operation.

Boiler Testing. Boiler and Furnace Testing. Rufus T. Strohm. U. S. Fuel Administration, Bur. of Conservation, eng. bul. 1, 20 pp., 3 figs. Suggests tests to be made everyday and apparatus required for making them.

Boilers, Uptakes for. How to Lay Out a Large Uptake for Stationary Boilers, Phil Nesser. Boiler Maker, vol. 19, no. 2, Feb. 1919, pp. 42-45, 7 figs. Method saves job of shearing.

Condensers. Condenser Engineering Practice, D. D. Pendleton. Mech. World, vols. 64 and 65, nos. 1669 and 1673, Dec. 27, 1918, and Jan. 24, 1919, pp. 309-310 and 41. Hotwell of low-type jet machine; air in surface condensers; heat transfer in surface condensers. Abstract of paper presented to Assn. Iron & Steel Elec. Engrs.

Vacuum Trouble in Turbine Condensers. James Brakes, Jr. Power, vol. 49, no. 8, Feb. 25, 1919, pp. 287-288, 4 figs. Discussion of an article " Keeping Up Condenser Performance," Power, Dec. 17, 1919.

Cost. Power Plant Costs Committee. Nat. Engr., vol. 23, no. 2, Feb. 1919, pp. 90-95, 4 figs. N.A.S.E. committee cost and production sheets.

Draft. Mechanical Draft, Charles L. Hubbard. Southern Engr., vol. 30, no. 6, Feb. 1919, pp. 40-43, 2 figs. Rates of combustion; draft pressure; air requirements; diagram of water-tube boiler equipped with mechanical draft.

Feedwater Softening. Boiler Water Treatment, U. S. Fuel Administration, eng. bul. 3, 8 pp. Examples of economies effected by softening water.

Water Softeners, C. E. Stromeyer. Colliery Guardian, vol. 117, no. 3031, Jan. 31, 1919, pp. 248-249, 2 figs. Abstracted from memorandum of chief engineer to Manchester Steem Users' Assn.

Firebox. New Type of Firebox Construction. Boiler Maker, vol. 19, no. 2, Feb. 1919, pp. 33-37 and 61, 4 figs. Customary arch tubes are repalced by "thermic syphons" or tubular sections extending from lower part of throat sheet up to rear end of crown sheet; upper part of tubular section is extended in form of flat plates, spaced 4 in. apart up to crown sheet for nearly entire length of firebox.

Heat Losses. Fuel Economy in the Boiler House—I, John B. C. Kershaw, Chem. & Metallurgical Eng., vol. 20, no. 4, Feb. 15, 1919, pp. 176-178, 3 figs. Study of heat losses and their control.

High Steam Pressures. Use of Higher Steam Pressures and Temperatures in Power Plants, J. H. Shaw. Elec. Rev., vol. 74, no. 7, Feb. 15, 1919, pp. 252-256, 5 figs. Practical and theoretical considerations involved; their effect upon turbine efficiency, design and plant layout. Abstract of paper before the Am. Inst. of Elec. Engrs.

The Use of High-Pressure and High-Temperature Steam in Large Power Stations, J. H. Shaw. Jl. Instn. Elec. Engrs., vol. 57, no. 278, Jan. 1919, pp. 73-82 and (discussion), pp. 82-108, 5 figs. Discussion of economical aspect of question; quotes data of various stations and suggests a schedule showing coal consumption, cost of coal, and amount of capital that can be expended to absorb estimated saving.

Isolated Plant. Saving Coal in Steam Power Plants. U. S. Fuel Administration, eng. bul. 2, 8 pp., 4 figs. Isolated plant vs. central-station power; typical distribution of heat in medium-sized hand-fired plant, chief losses in boiler-plant operation.

Oil Elimination. Oil Elimination, Charles L. Hubbard. Nat. Engr., vol. 23, no. 2, Feb. 19, 1919, pp. 75-79, 16 figs. Discussion of various methods used to eliminate oil from exhaust steam and condensation and their principles of operation; exhaust steam separators; purpose of baffle plates and corrugations; steam filtration; purifying condensate.

Operation. Improving Factory Steam Plants, H. A. Wilcox. Power Plant Eng., vol. 23, no. 4, Feb. 15, 1919, pp. 184-187, 1 fig. Case IV. Putting old plant into condition to finish its years of service efficiently. Sixth article.

Outline of Factors Governing Economical Boiler Operation, Robert June. Elec. Rev., vol. 74, no. 7, Feb. 15, 1919, pp. 257-260, 2 figs. Combustion, loss due to excess air and losses in burning coal; accounted-for and unaccounted-for losses. Second article.

Power Plants. New Philadelphia Power Plant, Walter C. Edge. Nat. Engr., vol. 23, no. 2, Feb. 1919, pp. 53-57, 6 figs. Designed to eliminate three old plants and to provide ample heat for process work from exhaust steam of engines and auxiliaries.

Safety. Placing Valves in Unsafe Positions, V. R. Hughes. Power, vol. 49, no. 9, Feb. 25, 1919, pp. 266-268, 17 figs. Examples of safe and unsafe arrangements.

Service Records. Memoranda of Office Records, Allan W. Cuddeback. Can. Engr., vol. 36, no. 7, Feb. 13, 1919, pp. 217-218, 2 figs. Records of location of service pipes, valves, hydrants and distribution mains of Passaic Water Co.

Stokers. New Travelling Grate Stoker for Forced Draft. Power Plant Eng., vol. 23, no. 5, March 1, 1919, pp. 262-263, 3 figs. Illustrated description of the Harrington stoker.

Design and Construction of Mechanical Chain Grate Stokers, W. H. Grantham. Mech. World, vol. 64, nos. 1668 and 1669, Dec. 20 and 27, 1918, pp. 294 and 307, 7 figs. Laclide-Christie design. Sixth and seventh installments. (Concluded.)

Turbines. Reliable Performance of Large Turbines, Blast Furnace, vol. 7, no. 3, Mar. 1919, pp. 147-148, 3 figs. Turbine generator of 35,000 kw. installed in Commonwealth Edison Co., Chicago.

Steam Turbine Operation, J. B. Wilson. Power Plant Eng., vol. 23, no.5, Mar. 1, 1919, pp. 227-231, 5 figs. Points to be watched and conditions to be sought for best economy.

Waste Heat. The Utilization of Waste Heat from Open-Hearth Furnaces for the Generation of Steam, Thomas B. Mackenzie. Iron & Steel Can., vol. 2, no. 1, Feb. 1919, pp. 14-24, 3 figs. Data obtained from experiments with acid-lined furnaces or ordinary construction. Paper before Iron & Steel Inst.

POWER TRANSMISSION

Mill Drive. Geared Versus Direct-Couple Motors, R. W. Davis. Blast Furnace, vol. 7, no. 3, Mar. 1919, pp. 138-139, 3 figs. Example of 2000-hp., 81-r.p.m., 6600-volt, 3-phase, 25-cycle motor built with direct-coupled tandem plate mill drive.

PRODUCER GAS

Blast Furnace. The Blast Furnace as a Gas Producer, Blast Furnace, vol. 7, no. 3, Mar. 1919, p.127. Concerning German blast furnace practice. From Stahl und Eisen.

PUMPS

Water-Works Pumps. Economic Value of Electrically Driven Pumps for Small Water Works, D. D. Ewing. Mun. & County Eng., vol. 56, no. 2, Feb. 1919, pp. 68-70. Illustrative examples. Figures are of pre-war type.

Electrically Driven Pumps in Small Water-works, D. D. Ewing. Engineering and Concracting, vol. 51, no. 7, Feb. 12, 1919, pp. 170-171. Energy required by electrically driven pumps; power requirements; concrete illustration of motor-application principle;cost of changing to electrically driven pumps. From paper before Indiana Eng. Soc., 1919.

REFRACTORIES

Basic-Refractories. Basic Refractories for the Open Hearth, J. Spotts McDowell and Raymond M. Howe. Bul. Am. Inst. Min. Engrs., no. 146, Feb. 1919, pp. 292-309, 7 figs. Report of laboratory tests, Low-line magnesite showed less tendency to slake, higher refractoriness and greater resistance to attack by firebrick and silica brick than high-lime magnesite; dolomitic materials highest in impurities and lowest in lime were most resistant to slaking; magnesites were more resistant than dolomites to slaking and to action of corrosive Fe_3P. Fe_2O_3 fireclay and silica.

Firebrick. How Slag Temperatures Affect Firebrick, Raymond M. Howe. Brick & Clay Rec., vol. 54, no. 2, Jan. 28, 1919, pp. 143-144. Results of tests indicating effects on life of brick. From Iron Trade Rev.

Great Britain. Refractories. Times Eng. Supp., year 15, no. 531, Jan. 1919, p. 19 Empire sources of supply; possibilities in manufacturing reforms.

REFRIGERATION

Marine Refrigeration. Developments in Marine Refrigeration and Details of Brunswick Apparatus, W. O. Whitney. Jl. Am. Soc. Marine Draftsmen, vol. 6, no. 3, Oct. 1918, pp. 30-40, 6 figs. Features of the various types of refrigerating plants; discussion of their respective applicability.

Meat Industry. The Efficiency of the Frozen-Meat Industry, G. L. D. James New Zealand Jl. Sci. & Technology, vol. 1, no. 6, Nov. 1918, pp. 341-345. Loss of dead weight in railing and droving, freesing and transport.

RESEARCH

Gas Industry. The Place of Research in the Gas Industry S. W. Parr Gas Age, vol. 43, no. 3, Feb. 1, 1919, pp. 135-136. Points out fields of investigation, From paper before Western Soc. Engrs.

Great Britain. Research Progress. Times Eng. Supp., year 15, no. 531, Jan. 1919, p. 31. Work done by Dept. of Sci. & Indus. Research, Great Britain.

United States. American Engineering Research, W. R. Whitney. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 2, Feb. 1919, pp. 115-127. Calls attention to our national condition in relation to engineering research and expresses convenience of crystallizing research work into an acceptable form.

Research in America After the War, R. A. Millikan. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 2, Feb. 1919, pp. 129-140. Suggestions in regard to concerted action between similar committees of the various scientific societies.

STANDARDS AND STANDARDIZATION

Brass and Bronze Foundries. Standards for Brass and Bronze Foundries and Metal-Finishing Processes, Lillian Eskine. Bul. Am. Inst. Min. Engrs., no. 146, Feb. 1919, pp. 263-275. Study of approved practices and equipment to safeguard health of workers.

German Machinery. Standardization in German Machine Building (Vereinheitlichung in deutchen Maschinenbau). Zeitschrift der Deutscher Gesellschaft fuer Mechanik und Optik, nos. 1 and 2, Jan. 15, 1918, pp. 1-6. Standardization to meet competition after the war. This installment contains the first five standard tables intended to be followed by " German Machine Industrie," including sizes of drawings, German standardization, etc.; also list of members throughout Germany engaged in this work. Effective since Feb. 15, 1918. From Zeitschrift ver d. Ing., vol. 61, p. 985, 1917.

Lengths. Industrial Length Standards (Les calibres industriels de longueur), Ch.-Ed. Guillaume. Bulletin de la Société Française des Electriciens, vol. 8, no. 75, Dec. 1918, pp. 383-400, 5 figs. Development of present principles of gaging; comparison of various standards; gaging machines of the Société Génevoise. Writer believes advisability of ascertaining from manufacturers their experience with the various metals used in manufacture of gages and deciding from study of reports on a standard which will satisfy all requirements.

Motor-Car Parts. Standards Committee Acts on Division Reports. Automotive Industries, vol. 40, no. 6, Feb. 6, 1919, pp. 307-311, 8 figs. Ball-bearing electrical, engine, spring, tire and rim S.A.E. recommended standards.

Steel. British Adopt Twenty Standard Steel Specifications. Automotive Industries, vol. 40, no. 8, Feb. 20, 1919, pp. 418-419. Gives chemical and physical properties, together with definitions of terms used.

STEAM ENGINEERING

Boilers. Water Circulation in Boilers, A. D. Williams, Power, vol. 49, no. 8, Feb .25, 1919, pp. 285-286. Notes on water circulation in water-tube boilers. Description of simple experiments by which observer can obtain an idea of flow of steam in tubes of varying pitch.

The Principles of Heat Absorption, Robert June. Brick & Clay Rec., vol. 54, no. 2, Jan. 28, 1919, pp. 133-136, 6 figs. Importance of maintaining clean surfaces inn. boiler.

Turbines. Notes on Large Steam Turbine Design, J. F. Johnson. Elec. Jl., vol. 16, no. 1, Jan. 1919, pp. 33-38, 4 figs. Operating records; load capacities; graph of relative steam consumption of large-capacity turbines; principles of turbine design. Paper before Phila. Section, Am. Soc. Mech. Engrs.

The Assembly and Adjustment of Steam Turbines, J. Humphrey. Machinery, vol. 13, no. 331, Jan. 30, 1919, pp. 486-492. 14 figs. Turbines considered are those working on Parsons principle and having a large number of fixed and moving blades, caulked into casing and on periphery of rotor.

High-Power Steam Turbines (Les turbines à vapeur de grandes puissances), Jean Guerner, Revue Générale de l'Electricité, vol. 5, no. 6, Feb. 8, 1919, pp. 227-230, 3 figs. Development of steam turbines, with reference to American models; economical comparison of the various types, from data obtained in American practice.

WELDING

Acetylene Welding. A Missing Link in Welding Equipment, Arthur W. Dohmen. Jl. Acetylene Welding, vol. 2, no. 8, Feb. 1919, pp. 388 and 392-393, 4 figs. Instrument which indicates flow of gases being used by welder.

Improvements in Guides for Oxy-Acetylene Blowpipes. Acetylene & Welding Jl., vol. 15, no. 183, Dec. 1918, p. 226, 3 figs. Guide consists of rotating plate having eccentrically mounted tube; supporting base for plate is provided with ball race.

Oxy-Acetylene Welding and Cutting. Eng. & Min. Jl., vol. 107, no. 6, Feb. 8, 1919, pp. 268-269. Abstract of bul. 11 of Federal Board for Vocational Education.

Oxy-Acetylene Welding Problems, W. L. Bean. Ry. Mech. Eng., vol. 93, no. 2, Feb. 1919, pp. 97-100, 3 figs. Discussion of flame structure and methods of handling; careful training of operators necessary. From paper before New England Ry. Club.

Oxy-Acetylene Welding. Power Plant Eng., vol. 23, no. 5, Mar. 1, 1919, pp. 244-246, 2 figs. Hints for beginners and pointers on power plant repair jobs. Second article.

Boiler Welding. Boiler Welding, P. F. Willis. Jl. Acetylene Welding, vol. 2, no. 8, Feb. 1919, pp. 393-398, 29 figs. Welding of a half side sheet in a locomotive firebox; welding of simple crack; welding half door sheets. From book on Oxy-Acetylene Welding and Cutting. To be continued.

Cast Iron. Welding Cracked Cast Iron Radiators, David Baxter. Metal Worker, vol. 91, no. 3, Jan. 17, 1919, pp. 83-85, 3 figs. Particulars of work and skill required for job. From Jl. Acetylene Welding.

Covered Electrode Welding. The Covered Electrode Process, E. G. Rigby. Jl. Engrs. Club Phila., vol. 35-10, no. 167, Oct. 1918, pp. 472-482, 6 figs. Its adoption in English shipyards; equipment; conditions required for good welding; its application to ship's deck structures, bulkhead structures, etc. Fourth discussion under auspices of U. S. Shipping Board Emergency Fleet Corporation.

Electric Welding. Electric Welding—A New Industry, H. A. Hornor. Jl. Engrs. Soc. Phila., vol. 35-12, no. 169, Dec. 1918, pp. 537-543, 12 figs. and Elecn., vol. 82, no. 2122, Feb. 17, 1919, pp. 96-97. Present status; review of suggestions offered to develop scientific system of testing; methods of electric welding.

Electric Welding Practice, Comfort A. Adams. Jl. Enger. Club Phila., vol. 35-12, no. 169, Dec. 1918, pp. 531-536, 7 figs. Testing; research; training; ship design and costs; shipyards committee. Seventh discussion under auspices of U. S. Shipping Board, Emergency Fleet Corporation.

Fusion in Arc Welding. Fusion in Arc Welding, O. H. Escholz. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 3, Mar. 1919, pp. 319-327, 16 figs. Characteristics of metallic electrode arc welding, and effect of arc length, welding procedure, electrode material, arc current and electrode diameter upon these characteristics.

Inspection. Inspection of Metallic-Electrode Arc-Welds, O. S. Escholz. Min. & Sci. Press, vol. 118, no. 8, Feb. 22, 1919, p. 26, 7 figs. Methods for indicating fusion, slag content, porosity, and crystal structure.

Mild Steel. Welding Mild Steel, H. M. Hobart. Bul. Am. Inst. Min. Engrs., no. 146, Feb. 1919, pp. 517-561, 17 figs. Investigation undertaken by welding research sub-committee of welding committee of the Emergency Fleet Corporation. Object was to extend use of welding in construction of merchant ships and to provide basis for obtaining the best ecomony and efficiency in employing welding in place of riveting in construction of hulls.

Pressure in Weld. Difficulties Encountered in Welding Steel ,B. K. Smith. Boiler Maker, vol. 19, no. 2, Feb. 1919, pp. 39-40. Pressure of iron oxide in the weld; problems of expansion and contraction.

Pressure Vessels. Oxy-Acetylene Welding as Applied to Pressure Vessels. Acetylene & Welding Jl., vol. 15, no. 183, Dec. 1918, pp. 220-221, 1 fig. Example of welded gas containers. From Revue de la Soudure Autogène.

Radiograph. Radiograph Proves Successful "Jack-of-All-Operations." Jl. Acetylene Welding, vol. 2, no. 8, Feb. 1919, pp. 385-387, 6 figs. Account of exbibition of Davis-Bournonville apparatus.

Ruptures in Welds. Path of Rupture in Steel Fusion Welds, S. W. Miller. Bul. Am. Inst. Min. Engrs., no. 146, Feb. 1919, pp. 311-338, 82 figs. Report of research under joint auspices of Nat. Research Council and Emergency Fleet Corporation.

Thermit Welding. Modern Welding and Cutting Ethan Viall. Am. Mach., vol. 50, nos. 7, 8 and 9, Feb. 13, 20 and 27, 1919, pp. 283-291, 20 figs., pp. 341-346, 10 figs., pp. 389-394, 16 figs. Thermit welding of crankshafts, mill pinions, etc. Second, third and fourth articles.

WOOD AND TIMBER

Veneer Manufacture. The Manufacture of Veneer and Plywood, B. C. Boulton. Aerial Age, vol. 8, no. 25, Mar. 3, 1919, pp. 1240-1241, 1272 and 1285, 7 figs. Methods of cutting preparation of logs for sawing and slicing; slicer cutting; veneer sawing and drying.

VARIA

Engineering Societies. Address at the Annual Meeting, Arthur N. Talbot. Proc. Am. Soc. Civil Engrs., Papers & Discussions, vol. 45, no. 2, Feb. 1919, pp. 29-51. Review of activities of the year and discussion of outlook of Society.

Engineer's Part in Reconstruction. The Engineer's Part in After-the-War Problems, F. H. Newell. Sci. Monthly, vol. 8, no. 3, Mar. 1919, pp. 239-246. How the engineer and organizations of engineers, both individually and collectively, can perform their largest service.

Hotels. Mechanical Equipment of a Modern Hotel. Power, vol. 49, no. 7, Feb. 18, 1919, pp. 230-233, 9 figs. First of series describing mecbanical equipment of Hotel Pennsylvania, New York City.

Latin-American Engineering Conditions. Relation Between Engineering and Agriculture in Latin America, A. M. Shaw. La. Planter & Sugar Mfg., vol. 62, no. 7, Feb. 15, 1919, pp. 106-107. Present conditions in Latin America; opportunities these nations offer.

Licensing of Engineers. The Registration of Professional Engineers. Jl. Electricity, vol. 42, no. 3, Feb. 1, 1919, pp. 125-127. Act for licensing of engineers, prepared by San Francisco local sections of engineering societies.

Nomenclature, Scientific. Note on the Linguistic Nomenclature of Scientific Writers, Albert Campbell. Proc. Phys. Soc. London, vol. 31, part 2, Feb. 15, 1919, pp. 80-81 and (discussion) pp. 81-83. Comments on anglicizing terms from Latin and Greek introduced in the language.

State's Part in Industries. Engineers and the State. Times Eng. Supp., year 15, no. 531, Jan. 1919, p. 8. Opinions concerning part Government should take in problems confronting industry.

Design of Hydro-Electric Plants for Combatting Ice Troubles *

By R. M. Wilson, M.E.I.C.

Nature has provided our fair country with an abundant supply of natural resources; and one, of the many which have only been partly made use of, is its "white fuel." Canada's water powers are of world fame and most of those which have been developed played an important part in the world war of the last four and a quarter years, in that they supplied power for the manufacture of munitions for Great Britain and her Allies.

One of the most difficult problems to be solved in the development of our water powers is the trouble encountered through ice in one or all of its several forms, viz:—sheet ice, frazil, and anchor ice.

When water is sufficiently cooled, it loses its fluidity and becomes filled with thousands of needle-like crystals, which interlace, until the whole mass becomes solidified. The formation of sheet ice begins at the shores, upon reefs, boulders or other obstructions; and with continued cold weather, builds outward and thickens. Unless broken by the wind, or prevented by high water velocity from forming, it gradually covers the whole surface of our rivers or power canals. Where ice forms in bays, around stones, and along the shores of rivers it is known under the name of "Bordage Ice."

Frazil.

Frazil, which is a French-Canadian term, comes from the French for "forge cinders," which it is supposed to resemble. The temperature of the air has only to be lowered a few degrees below the freezing point when the river water is at, or nearly down to, 32°F, to form large quantities upon the surface of open water. With a temperature of 17°F, or even higher, and sufficient wind to create surface agitation, large quantities of this troublesome ice will be formed. Frazil found under these conditions is of a very sticky nature, and, when the same comes in contact with metal exposed to the influence of the outside air, adheres to the metal; from which it cannot be removed unless the temperature of the air is raised two or three degrees, and the water or metal a fraction of a degree above the freezing point.

Frazil that flows down under surface ice does not have the same sticky quality. It is liable, however, to cause just as much trouble for, where the volume is great, it blocks up the openings in the racks and entrance to wheels unless the design of the plant is such as to overcome this trouble.

It will be found that, where frazil has accumulated and consolidated under the surface ice, it will in time raise this surface ice several feet above the elevation of the water surface in the river or power canals. In deep water channels, ice covered, where frazil is attached to the under side of the surface ice in depths varying from 1 to 14 or 15 feet, free from sheet ice, and not consolidated, it has been found that the suspended mass is of a spongy nature and passes a fair volume of water. When this condition exists, a raise of air temperature to 33° or 34°F, lasting two or three days, resulting in the raising of the water temperature between one and two hundredths of a degree F, will cause the greater portion of this suspended mass to disappear.

A great many are under the impression that frazil floats in open water entirely on the surface; this is not true for it will be found floating at depths several feet below the surface.

*Read at Ottawa Professional Meeting, February 12th, 1919; and at the Montreal Branch, February 27th, 1919.

Frazil suspended from the surface ice can be removed by use of electric current. The small quantity of heat generated by the passage of electric current between electrodes, inserted through the surface ice, disintegrates the suspended spongy ice mass very quickly. 2,750 kilowatts will free an area of approximately 4000 sq. ft. of this spongy ice, having an average depth of 7 feet, in about 30 minutes. The voltage required with a spacing between electrodes of 32 feet is 6000 volts.

Anchor Ice.

This form of ice, as its name implies, is attached or anchored to the rough stony bottoms of rivers and rarely forms under a layer of surface ice. The action of the sun's rays, or a rise in the temperature of the water in the river a fraction of a degree, loosens it, when it will rise to the surface. It is very easily distinguished from any other kind of slush ice, as it is usually very much darker in color and floats very high in the water. Where rivers are shallow and the water velocity high, preventing the formation of surface ice, large quantities of anchor ice will be found. From careful observations, we have never found anchor ice forming in water deeper than 16 to 18 feet, even in the very coldest weather and with ideal conditions for its formation.

Anchor ice is very much more dangerous than frazil to a plant for the reason that besides forming, with frazil, under-hung dams under surface ice, it also, when running, carries with it all sorts of water-logged timber, including stumps of trees, as well as large stones.

It has been observed that when the water in rivers in and around Montreal is high during the winter season, greater ice troubles are liable to be experienced. From the middle of December to the end of January is usually the time frazil trouble is at its worst, and from the beginning of February to the middle of March anchor ice is the most troublesome.

Hydro-electric plants in northern climates are more or less affected by ice troubles; and those of early design, in a great many cases, are either completely shut down for short periods during each ice season or their output reduced by a considerable amount. In some cases, the reduction of output lasts for the whole ice season.

Through the knowledge which has been gained by experience and with the improvements in the design of hydraulic equipment, plants can now be designed which will be practically immune from ice troubles; with the possible exception of those whose water supply is obtained through canals running across country where means cannot be provided to mitigate or eliminate the ice difficulty.

Ice troubles may be classified under two heads:—Those which cause trouble and damage to the outside portion of the development, such as erosion of river banks, flooding, damage to dams and other outside structures, and back water; and those which cause trouble to the hydraulic equipment by blocking the racks, wheel chambers and wheels.

To provide against trouble from ice, great care should be exercised in the selection of the site and the design of head and tail race channels. Where the development is one which only makes use of a portion of the flow of a river, and the conditions obtaining during the winter season above and below the plant are such that swift water or rapids exist, resulting in the river not being ice covered care should be taken to ascertain the prevailing wind conditions, for the reason that, with the open water above the plant, frazil and anchor ice will be formed; and, with the prevailing wind direction towards the intake channel, large quantities of this troublesome ice will be forced into the channel, even if the water in the main channel outside of the power canal has a velocity of 5 to 8 ft. per sec., and is almost at right angles to the same. By properly locating the development the trouble from wind conditions can be greatly reduced. A power canal that is narrow and deep is much preferable to one wide and shallow. In any case the average velocity at the entrance should be very low.

When investigating a power site a careful survey of river conditions above the entrance to the power canal should be made to ascertain the presence of reefs, large boulders, or other obstructions; for, with open water conditions, these will become coated with anchor ice to such an extent as possibly to divert the water from the entrance of the power canal sufficiently to cause the lowering of the head by several feet.

The source of another trouble from ice, and one which should be guarded against, is the lowering of the water level in the power canal, due to the temporary blockage of the river above the plant, caused by little ice dams in the open water during extreme cold weather conditions. This is a very important matter and is liable to seriously affect the plant's operation.

An impression seems to exist that, if a large pond can be created by constructing a power canal, ice trouble can be avoided or reduced to a minimum. This is a very wrong impression, where large developments are to be made of the low or medium head class. It is usually assumed that with water velocities in the power canal or headrace as low as 1 to 1½ feet per second surface velocity, surface ice will form as soon as the water temperature has reached the freezing point and the air temperature somewhere between zero and 20°F. This condition may be suitable for the formation of surface ice on the canal in some cases, but not in every case. With conditions such as exist on the St. Lawrence it does not form. What does happen is that sheet ice is formed in the shallow waters and the bays along the shores. The wind breaks up this formation and, with the frazil formed at the same time, the whole mass starts moving, is carried down, and with the aid of the wind enters the power canal coating the whole surface of the same with this conglomerate mass in a very short time. Once the surface of the canal has become coated, the sheet ice is deflected down the main channel, but the frazil, to which has been massed small pieces of sheet ice formed on stones and other obstructions, continues to build under the surface ice on the canal, forming na under-hung dam. This is a very serious condition and unless properly handled will ultimately shut the plant down.

Where rapids exist below the plant care should be taken to see that a suitable wing dam, protecting the tailrace discharge, can be constructed to prevent back water trouble, caused by the formation of anchor ice in the main river channel.

If the development is one involving the damming of the whole of a river with a power house and an overflow dam, a large pond is usually created backing the water upstream for a considerable distance. With a development of this nature, surface ice will undoubtedly form, at times of light load, on the pond. Should there be rapids further up the river which have not been extinguished, considerable trouble will be experienced, for frazil and anchor ice will form and flow down under the surface ice on the pond, cling to its lower side, and form an under-hung dam, contracting the free water area and reducing the capacity of the plant.

The reduction in the capacity of the plant may be serious, if the development is one where the water backed up by the under-hung dam can find another outlet.

When a development has a water storage above its power house and dam, sufficient to carry the plant's peak load over a period of from 1½ to 2 hours daily with a reduction in storage of from 3 to 4 feet or even less, and where the storage water used is built up quickly after the peak load goes off, it will usually be found that the water will rise at such a speed as to over-run the surface ice along the shores and in the immediate vicinity of the dam and power house. This condition results in the surface ice becoming very thick at the locations mentioned, and by the end of the winter season it may be found to be from two to three and a half times as thick as the surface ice in the centre of the river or power canal.

When the spring break-up occurs, more or less damage is liable to be suffered from erosion and scouring of the river banks unless proper means have been provided to take care of same, such as the facing of the river banks with concrete, timber facing, or, where possible, stone rip rap. The ice is liable to be shoved down into the headrace, if the break-up is accompanied by heavy spring freshets, and carried over the dam in layers having a total thickness of as much as 90 inches; and if the overflow is not properly protected, as well as the front portion of the power house raised sufficiently above extreme high water to prevent the ice being carried against the same, considerable damage will be done.

To provide against damage to the apron side of dams and the scouring action to the rear of the apron, tumble ponds will be found very useful, if the design cannot be made to allow the ice to discharge in its normal plane and not on end.

The other troubles from ice are those affecting the operation of the hydraulic equipment, and have been very difficult to overcome with plants of the multi-runner type of design.

The development of high specific speed runners, permitting higher rotational speeds, and the successful results obtained with modern designs of thrust bearings have resulted in the passing away of the multi-runner type of turbine installation, in favor of the vertical shaft, single runner unit.

The majority of developments up to 1912 of low and medium heads consisted of horizontal installations of the multi-runner type, with two, four, six and sometimes more runners on a shaft.

The first plant of the vertical shaft single runner type of unit, to be placed in operation in Canada, was the plant of the Cedars Rapids Mfg. & Power Company, Cedars, Que. The result of four years operation has proved that it is possible to eliminate the ice troubles which have been a bugbear of the multi-runner type of plant.

At the time this plant was designed, careful attention was given to the ice problem, for it was well known that the St. Lawrence River above and below the plant remained open the whole of the winter season, and consequently the ice conditions encountered would be most severe.

Experience gained in the operation of other hydro plants was used to great benefit in this design, to effectively overcome the operating difficulties due to ice, e.g.:— enclosing of the gate house so that the hot air of the generator room enters it, the placing of the screens or racks in such a manner and position as to keep the cold outside air from them, the dividing of the racks into six sections for each unit, the installation of an electric crane for handling them quickly, motor-driven head gates for each unit, and a set of emergency gates permitting the cutting off of the water completely so as to examine racks and motor-driven head gates; have all worked out very efficiently.

Some minor changes have been made in the top rack sections. The original spacing between rack bars was 2½ inches, but this spacing was found too close and every other bar was removed, leaving the spacings 5 inches.

Each of the main units is supplied through three openings of 12′-8″ x 28′-0″. The water enters the openings at approximately 3 feet per sec. and passes to the wheel through spiral concrete casing, entering the wheel at a velocity of approximately 7¼ feet per second.

It has been found that when frazil and anchor ice are running, there is generally mixed with them a certain amount of fine sheet ice, as well as debris of all kinds. When this ice gets on to the racks it coats them so that it blocks off the water from the wheels. By working ordinary rakes up and down the rack bars the ice can be worked through. The procedure, however, is to raise the top section of the racks and hit them a slight blow with a wodden maul when the whole ice coating, which may be from 2 to 3 feet thick, will fall away and go through the wheels. Should the ice show any tendency not to enter the spiral casing by manipulating the head gates, then by changing the velocity of entrance, this trouble may be overcome. This method of operating is only adopted when anchor ice is running heavily. Under ordinary ice conditions the top sections of the racks are allowed to remain up.

Four years of operating with severe winter conditions have demonstracted that no matter how much anchor ice and frazil comes down to the plant, whether before or after the surface of the canal is coated with surface ice, no ice choke takes place in the guide vanes, gates or wheels. The explanation offered for this condition is that the metal parts of the wheel installation are maintained at a temperature just above freezing, thus causing the ice crystals to slip. The difference measured on the thermometric scale is infinitesimal, though the physical results are enormous.

The metal parts are maintained at the slightly higher temperature due, we think, to the following causes:—

1. Power losses in turbine confined to small area.
2. Conduction of heat from steel concrete scroll casing.

3. Conduction of heat along shaft cover plate and gate mechanism.

Operating with the top sections of the racks up when anchor ice has been running heavily has caused some little operating difficulties. Considerable amount of debris has been carried into the runners such as timber, water-logged railroad ties, stumps of trees, stones, etc. One of the stones removed from one of the runners weighed between 600 and 700 pounds. It is estimated that the volume of anchor ice to support the large stone mentioned above, would be between 80 and 90 cubic feet. With this large volume of ice no blocking occurred and the only indication that something was in the runner was a broken gate arm, the unit continuing to develop its power with this large stone in one of its buckets.

The operation of this plant has demonstrated that no trouble from ice shut-downs will be experienced in plants adopting the single runner units and with openings in the guides, gates and wheels as large as the Cedars wheels.

After it had been satisfactorily demonstrated that no matter how large a volume of floating spongy ice entered the power house, it could be put through the wheels, attention was then turned to the headrace. The head-race is slightly over two miles long, at the present time, and about 800 feet wide on the surface of the water.

We found there was a considerable decrease in flow in the canal, due to the ice covering and the reduction of free water area on account of the under-hung dams formed by frazil, anchor ice and sheet ice getting under the surface ice, more particularly at the entrance to the canal. This would be a most serious condition for the plant when the full number of units is installed.

We have, therefore, studied the conditions very carefully and have adopted the method of completely removing approximately half the ice surface from the whole length of the canal, thus operating with open water during the whole of the winter. With this method of operation we have found the sluices, which were originally installed with 16 foot openings for handling ice, were the source of considerable trouble, as they would not handle the large sheets of shore ice 26 to 40 inches in thickness, which are liable to enter the canal when it is kept open.

Last summer we reconstructed our west end sluice-way, erecting two openings of 44 feet each, with from 5 to 6 feet of water flowing over the crest; and, it is our intention to rebuild during the coming summer the sluice-way next to the power house, installing two openings each 60 feet in width.

To close these large openings after the ice season is over, a special stop-log dam has been designed with openings for logs approximately 15½ feet in length. The steel work is lowered into place and the logs inserted after it is in position.

It may be of interest to describe some of the experimental work that was carried out before we found that the only way to operate the plant was to keep open water in the canal the whole year round.

It was thought possible that floating ice could be diverted from the canal by means of a suitable boom stretched at a proper angle from the most westerly sluice-way to the north shore of the canal, but this was found not to be the case. The ice entered the canal in such large volumes that lighter ice, such as frazil and anchor ice, went under the boom and the large sheet ice ultimately broke the boom.

The next method we experimented with was to erect a timber ice deflector at a point about 1500 to 1800 feet above the entrance proper to the canal, the idea being to deflect the large surface ice which breaks away from the shores out into the main channel, as well as frazil and anchor ice.

It was found that this method of protection was not very efficient when the wind conditions were such as to hold all of the ice, floating in the river above the diversion dam, towards the north shore. It was also found that, during extreme cold weather conditions, the reefs in the river channel outside the entrance to the power canal would become heavily coated with anchor ice, and that with these dams and the diversion dam ice coated, the amount of water permitted to enter the canal would only be a small part of what would ultimately be required. We, therefore, removed our experimental diversion dam and are now taking care of whatever ice enters the power canal.

We are still making improvements in our canal entrance in the way of increasing the channels of supply to the power canal by removing some of the reefs, which have been a source of trouble during the ice season, and by the time the remaining units are installed, our canal will be in proper shape at the entrance.

We are thoroughly satisfied, from the experience gained in the plant's operation during the past four years, that with the modifications in the ice sluices which will be completed next summer, and the work completed on the intake, the plant will operate to its maximum capacity the whole year.

One of the most important features in the handling of the ice is to have the proper equipment. When the winter season sets in, the power canal does not freeze over but becomes coated with a rough surface of ice blown in by the wind, the mixture consisting of frazil, sheet ice and sometimes snow. It usually only takes four to six hours with suitable wind conditions to coat the two miles of canal with ice.

We have provided two ice breakers, which are really tugs reinforced for the breaking of ice. It has been found that after the surface of the canal has become coated with the conglomerate mass, it takes several days of extreme cold weather before it becomes consolidated to such an extent that the tugs have difficulty in breaking it up.

With proper ice sluices so as to avoid jamming when the broken surface ice is carried down, a channel one hundred to one hundred and fifty feet can be made from the power house to entrance in from a day to a day and a half, with the two suitable ice breakers.

We have found it necessary at times to resort to the use of explosives in breaking up ice jams, and have experimented with various kinds of explosive to ascertain which would be the most efficient in ice. We have used 60%, 40% and 30% nitro-glycerine dynamite in sticks of 1½ inches in diameter and 8 inches long, made up in charges of 7 to 8 sticks, but they were all too fast and would only pot-hole the ice. With the aid of the Canadian

Explosives Company, we obtained an explosive made from ammonia nitrate, having a strength equivalent to 30% nitro-glycerine dynamite, made up in sticks 3 inches in diameter and 8 inches long. This explosive gives a large gas volume, is much slower in action, and very satisfactory results are obtained. It has the advantage also of not freezing unless the temperature is five degrees or more below zero, and if left in the water an hour or longer dissolves and is not dangerous.

In conclusion, I wish to express my thanks to my assistants, Messrs Read and Cunha and our Resident Engineer at Cedars, Mr. Hawley, for the assistance rendered in the preparation of drawings and photographs, as well as Mr. John Murphy for photographs from which slides have been made.

Discussion

K. B. Thornton, A.M.E.I.C.: The paper presented by Mr. Wilson is of interest particularly to those who are engaged in operating hydro-electric plants. It is of interest not only to engineers but also to business men and investors who have invested capital in hydro-electric enterprises in this country.

In the old days, the advent of winter and frazil troubles was often a nightmare to the operating engineer suggesting strenuous days and sleepless nights; while to the ordinary layman it suggested the stopping of cars, the putting out of lights, the shutting down of waterworks; and, to the business man, it immediately suggested an increase in operating expenses of the hydraulic power company in which he was interested, and a consequent decrease in both gross and net earnings.

The paper of Mr. Wilson, together with papers which have been previously presented on the subject, is another assurance to engineers and the public generally that power plants can be operated successfully here in Canada throughout the winter months. It seems particularly fitting that Mr. Wilson's paper should be read here, in Ottawa, because those of us who are engaged in the hydraulic operation of plants owe a tremendous debt of gratitude to the pioneer investigational work which has been carried on in Ottawa by Mr. Murphy. That work was started about twenty years ago, and the results have been duly recorded from time to time before scientific societies and in the technical journals.

All plants in our northern climate have to contend with ice troubles of one sort or another, but there is no doubt that the contribution of information by Mr. Murphy, Dr. Barnes, and Mr. Wilson, have greatly improved the methods adopted by most companies in handling their ice troubles.

My own opinion is that in the not distant future these methods will be further improved, and that in addition more active steps will be taken to reduce the formation of the ice which causes all the trouble.

In connection, however, with the handling of ice in general at power plants, I would give this word of warning to those who are not specially familiar with such work, that experience has shown that the handling of ice conditions, pertaining to any particular hydraulic development are, as a rule, peculiar to that plant and that it is unsafe, except in a general way, to deduce from results obtained, some general formula for the handling of ice troubles at plants in general.

As to the methods mentioned by Mr. Wilson for the handling of ice at Cedars, they are very interesting indeed. The increasing of the sluiceway openings is, to my mind, a very distinct improvement over the types of openings generally adopted by designing engineers, whose tendency is usually to make these openings far too small.

As regards the protection of the intake, it seems to me that a series of overlapping parallel booms with aprons, not a single boom, would tend to throw the ice farther out into the river and help to prevent its entrance, at least in such large quantities, into the forebay or intake canal.

Mr. Wilson has spoken upon the subject of under-hung dams, and has shown a photograph where sixty per cent of the cross-section was taken up with ice. My own experience has been that such dams will always be formed when rapidly running water reaches a forebay entrance where the velocity in the forebay is low. My experience has been that, where the entrance of the forebay is adjacent to rapid running water, either under condition similar to those at Cedars, or where you have a canal with a forebay at the end of it, as soon as the water adjacent to the forebay, and which has attained a fairly high velocity, comes to the entrance of the forebay, where the velocity is very low, you have an under-hung dam formed. In the plant I am looking after at the present time, this is the one and only source of the trouble that we have; there is a six-mile canal terminating in a large forebay. Where the canal forms the forebay, we have an under-hung dam formed, and every year we have to cut a channel and chop it out.

To digress for a moment, Mr. Wilson referred to the care necessary in the selection of the power site, but my own experience has been that there is little or no latitude in selecting a river power-house site, inasmuch as the site is generally pre-determined by nature, and the conditions must be accepted as they are found. Any small change in location resolves itself into a simple question of the investment involved.

Of course, once a plant is designed and placed in operation, the operating engineer usually finds some improvement that he could make if he were to design the plant all over again. The methods adopted by Mr. Wilson, I have no doubt, are the best, or at least as good as any, that could be designed to combat the conditions under which the Cedars plant has to operate, but, personally, I should not like to make a practice of passing boulders through my water-wheels.

It seems to me, as I have already stated, that some effort should be made to reduce the ice-forming conditions, and I would like to refer to certain statements that have been made in this connection.

In June, 1906, Mr. Wilson, in his article entitled " Influence of Ice on Hydro Development " in the Electrical News, in reference to rapids located above a partially canalized river, states:—

> " Where possible dams should be installed to drown out the rapids and the impounded water drawn from the bottom of the dams by means of sluices or other such openings."

Again, in 1908, before the Undergraduates Society of McGill University, Mr. Murphy delivered a paper entitled: "Ice Troubles in Hydraulic Power Work and Methods of Overcoming them."

In this paper, Mr. Murphy, referring to the reduction of flow due to the blocking of ice, states that the destruction of rapids by the erection of dams is one method of preventing frazil. He says:

> "These troubles can only be removed by the building of dams and thus creating immense storage reservoirs from which an equable, steady flow may be obtained all the year round, the spring floods and the fall and winter droughts will then be unheard of."

Again, in the same year, before the Royal Society, Mr. Murphy said:—

> "The destruction of rapids by the erection of dams will prevent the continuous all-winter formation of ice spicules, or frazil."

I believe the ideal situation is the completely canalized river, or a canal, as opposed to a partially canalized river. I cannot agree with Mr. Wilson that means cannot be provided to mitigate or partially eliminate ice trouble where water is obtained through canals.

A river project, or a partially canalized river, with rapids above, or even below, the site, simply means operating a plant with the foregone conclusion that there will be ice trouble during the winter and that the success in handling the situation will depend largely on the resourcefulness and the ingenuity of the engineer supervising the plant in adopting the best remedial schemes under the circumstances. It seems to me that this field of investigation, covering the reduction in the formation of ice, is one that has been largely neglected.

I am strongly in favour of canals, or completely canalized rivers, as opposed to developments or partially canalized rivers. Attention has been given by numerous boards which have been formed, the Stream Flows Commission in Quebec, the Power Board here in Ottawa, and many other commissions, to the investigation of storage on rivers, with the idea of conserving the water, avoiding floods, and preventing droughts in the fall. If it were realized that by installing these reservoirs and water storage dams, ice conditions will be tremendously improved, I think a good deal more effort would be made to carry on that work in view of the benefits that would accrue from the elimination of the troubles which are due to the blocking of ice, causing floods in the spring and immense losses of time and power in the winter. It is, therefore, my idea that this feature in reducing ice-forming conditions should be given more consideration by engineers, and particularly by government boards that are working on problems of conservation, because it is a field that has been neglected and up to date the efforts of engineers operating plants have been entirely directed to eliminating the ice conditions as they find them at these particular plants.

There are several interesting things that one might refer to in general. Mr. Wilson has referred to the forebay ice being thicker at the edges than in the centre. That always happens whether you vary the forebay level or not. I have seen forebays where we did not vary the elevation a foot, and where, at the end of the winter, at the edge the thickness of the ice was two or three times the thickness of the ice in the centre, which I ascribe to the slow velocity at the banks' edges, and also due to the frost penetrating the banks. I think Mr. Wilson's papee is a very excellent contribution to the discussions that havr taken place at this most excellent Annual Meeting.

John Murphy, M.E.I.C., Ottawa: Mr. Thornton has made complimentary reference to my original or pioneer work on the ice question, and I thank him for his courtesy. I have copies of my various contributions in my hands but I will not read them all to you.

Through the courtesy of the manager of the Chateau, Angus Gordon, and the hearty co-operation of his chief engineer, T. E. McGrail, I have arranged for a demonstration of frazil manufacturing which I think can be made in this room. The engineer has been placing bottles of water in the refrigerator and bringing the temperature of the water gradually down to the freezing point. The water is at that temperature now, and, if he can manage to bring that water up to this room without agitating it and without increasing its temperature, I hope we will be able to show you the creation of frazil in this room. Frazil is instantly formed in water—when water is at the critical temperature—if the water is *disturbed* of if it is even shaken *by the wind;* if the water is agitated by coming into contact with a rack, or with a water-wheel, it turns into frazil. If you went down to the refrigerator plant in the basement of the Chateau I could surely show that to you, but I am quite hopeful of being able to do it in this room. The point I wish to emphasize —the *disturbance* of water and the creation of frazil by such *disturbance* or *agitation*—is so important that it is worthy of special attention. Something spectacular appeals to us all much more strongly than words.

A great deal has been said recently about the damming of rivers, but, if we dam large rivers, such as the St. Lawrence, and do not properly control the water and ice, "where may we land?" "Heat metal and ice will not adhere to it"—that's the whole story of successful frazil combatting which I have preached for 20 years. At this convention where we have representatives of the Quebec Streams Commission, the Commission of Conservation, the Water Powers Branch, the Department of Marine and Fisheries, the International Joint Commission, the Department of Public Works, the Department of Railways and Canals, the Dominion Power Board, the Honorary Council of Scientific and Industrial Research, the Universities, to say nothing of the power companies and corporations which are all intensely interested in the ice question, I think it is advisable to make an appeal so that that question may be taken up and seriously considered by some of those great bodies. When the shutting down of a power plant, or the flooding of a whole district, may depend on whether the wind is, or is not, blowing, it is in my opinion a very serious state of affairs and deserves consideration.

When frazil is about to form or is forming in water, the water is *at* the *critical temperature.* Frazil will be created or formed in water which is *at the critical temperature*—32° F. or 0° C.—under either of two conditions:

first, if the water is *disturbed*, and, second, if the water comes *into contact with anything which has a temperature one ten thousandth (1/10,000)—the most minutely conceivable fraction—of a degree below the freezing point.* When water in the winter time is required to flow uninterruptedly through dams, or over dams, and, when it is needed to operate turbines, it must, of necessity, be disturbed or agitated. Therefore, the edges of the openings in such hydraulic works through which water and frazil are to pass must, it would seem, be *prevented* from having their temperature *lowered* below the freezing point, or otherwise, clogging of these openings will necessarily ensue. Floods will follow because floods are caused by such blockades. Is it not our duty to try to prevent such occurrences? Should we not all join heartily in such a campaign as the one I have been engaged in for many years? Is it not the *duty* of some of the many organizations which I have above mentioned to take up this all-important matter?

I have, many years ago, in a rough but very practical way, shown that the heat from a tons of coal, burned in 24 hours, can prevent 2,000 c.f.s. of water and frazil from shutting down a power house. That demonstration has been repeated many times since, in a number of plants which I can name, but no thorough scientific accurate study has ever been made of: (1) the physical actions involved, or, (2) the actual definite amounts of heat which are required to prevent frazil formation in given quantities of water under various conditions. Had I the personal means of doing this work, I would surely have it done.

Mr. Murphy's remarks were interrupted at this point by the arrival of bottles of water brought directly from the refrigerating plant in the basement of the hotel. These were placed on tables and Mr. Murphy and several members proceeded to demonstrate the process of water crystallization or frazil formation. When the bottles of water left the refrigerator they were absolutely clear. They were clean when handed around the room. Mr. Murphy took some of the bottles up, shook them vigorously, and crystallization, due to agitation, immediately resulted. Other members got similar results.

Mr. Murphy said: The first point I want to make clear is that water, without a trace of ice in it, will crystallize if *disturbized*—frazil will be formed.

The next point I want to make is that if you introduce something that is a little colder than the water, such as any of the chilled vulnerable parts of a water power plant, frazil will be produced.

Mr. Murphy, and others, demonstrated this latter point by inserting in some of the bottles iron rods, the temperature of which had been reduced below the freezing point. Beautiful frazil crystals were formed and clung to the rods like thistles. Continuing, Mr. Murphy said: These natural phenomena have been taught for a generation, but nobody pays any attention to them. Some of you may have seen such demonstrations in laboratories. I often make them at home. E. L. Avery, Ph. D., in his Principles of Natural Philosophy, says:—

> "Touch a pitcher of water standing in a cold room all night, and it turns to ice; or, drop in a particle of ice, and it turns to ice. We may say that liquids, in this condition, *have a tendency to become solid*, and are restrained only by the difficulty of making a beginning."

The "difficulty" as I have shown, is overcome by *agitation*, or by contact with a piece of ice or a cold rod—(an iron rack, a gate or a water wheel.)

Give the frazil-forming a *start*, as when the water is shaken by the wind, or by coming in contact with a rack, or a water-wheel, and the process makes great headway; *prevent it by introducing a little heat and it does not start.* Our esteemed friend, Dr. Barnes, of McGill, in 1906, was good enough to refer to some successful frazil-combatting which I had done before that date. I cannot understand how any McGill graduate can discuss the ice question without praising Dr. Barnes' great work. On page 99 of his book, entitled "Ice Formation," he says:—

> "It is *probable* that crystallization commences on the edges of a stream because of the *continual agitation* always present there. In order to start freezing some *agitation* or *nucleus* must be present, and nothing is so efficient as a minute crystal of ice. These start from the small waves breaking on the shore and freezing to ice by intimate contact with the cold air before it falls back, produces the necessary first ice over which the convection currents of air carry the necessary chill for the ice crystals to spread."

My idea in introducing these demonstrations was to set you all thinking and talking about this important subject.

Mr. Wilson has spoken about the difference between vertical and horizontal wheels and about the difference between the multiple and single-type runner. To my mind, it does not matter whether there be one runner, or a hundred runners, so long as these runners *are kept away from the cold.* If the single runners at his plant did not have the benefit of the heat of the mass of material around them, they would freeze up just as tight as a little exciter wheel, 18 inches in diameter, if there is no heat applied. The latter will run continuously if a little head is applied to it—as I have demonstrated for 15 winters.

In a letter that I sent last year to Mr. Wilson, I told him of a plant in Ottawa which had been frozen up, and stopped completely, at least ten times to my knowledge. *It had to have the ice dug out of it by hand!* I sent him a photograph of it with the following letter:—

"Ottawa, April 18th, 1918.

"Mr. R. M. Wilson, E.E.,
Power Building,
Montreal.

Dear Mr. Wilson:—

"In reply to your letter of April 17th., I beg to say you are welcome to the use of the slide made from my photograph of the Ottawa Electric Railway Company's hydraulic horizontal unit consisting of six 48-inch wheels.

"I may have told you that it *used to be* necessary, several times each winter, to dig the ice out of the unit in question by hand.

"But, since the installation of a boiler with a heating surface of 300 sq. ft., *the operation of that unit has NEVER been affected by frazil.*

Believe me,
Yours truly,
JOHN MURPHY.

To-day he astonishes me with the statement that my picture shows that multirunner wheels are always in trouble. What has the *multirunner* got to do with it? If the water wheels operate while their temperature is 31.999°F. frazil will stick! If their temperature is 32.001°F. frazil will not stick! That's the whole story. An end was put to the frazil clogging in those wheels

Hydraulic Turbine Clogged by Frazil.

shown above by the installation of a little "30 horse power," steam boiler. The steam boiler could only burn a ton of coal in 24 hours, but it enabled the 3000 h.p. hydro-electric plant to give out as much continuous daily power as could have been generated by the use of 150 tons of coal in a steam power plant.

In 1904 a little mutual admiration society, consisting of our esteemed President Col. Leonard, Mr. Kerry, Dr. Barnes, and your humble servant, might have been formed had we happened to meet. But I only learned that fact and what I am going to relate two or three years afterwards. I was in Montreal in 1906, or 1907—in any event a couple of years after I had started up a plant, which had been completely frozen up, with what might be described as "a breath of warm air" (steam) from a boiler, and I was attempting to convert our former esteemed friend, the late Mr. Walbank, the then Vice-President and Chief Engineer of Mr. Wilson's Company, to my view, by telling him what had been actually done over and over again. He said: "you will go crazy if you *think* such things as that!" "But," I said, "I have often done it." "Oh!" he said, "don't talk that way; you will go out of your head!" I told him that on the 30th of November, 1905, there were no electric lights, no cars, and no water services in Ottawa or vicinity, except those electric services supplied from one water power plant where I had installed a little steam boiler. But I could not get either his attention or his interest. He continued:—"Think of a whole river full of ice! It would take millions of horse power to do what *you want* to do." In support of my contention that there was a really good-sized frazil attack in the area which includes Ottawa and Montreal on Wednesday, November 30th, 1905—the time when my steam-heated water-wheels were given a very rigorous test—the three following newspaper extracts are presented:—

"The Montreal Daily Star, Friday, December 1st, 1905.

"*Frazil Tied Up Turbine*

"Electric Light and Car Service Handicapped by Frost.

"Frazil, that dread of all those connected with water power establishments located in climates subject to sudden drops in temperature, caused the Chambly Power House of the Montreal Light, Heat & Power Co. to go out of business yesterday afternoon . . .

"Even the Divine Sarah, playing at the Theatre Francais, was obliged to die in the dark, for electric lights, when they act badly, are no respecters of persons.

". . . . . . minute particles of frost got into the machinery, eventually stopping the turbines and cutting off the 20,000 horse-power ordinarily developed.

"This is the second time this autumn."

"The Gazette" Montreal, Friday, December 1, 1905.

"*Cold Stops Power*

"Sudden Drop in Temperature Knocked out the Chambly Station Temporarily.
"Car Service Affected Too.
"100 Cars Short.

"Ordinarily, the station supplies 20,000 horse-power, but owing to the ice, this power was reduced to about 2,000 horse-power. The Power Company had not anticipated so sudden a change in the temperature, and their steam plants in the city, which are used in such emergencies, were not prepared. The temperature dropped from 45 to 4."

"The Montreal Star," Friday, December 1st, 1905.

"Flurry in Power Was Interesting.
(89½ to 88)

"Yesterday, the rumour got around that there had been a break in the Power Company's dam at Chambly.

"Brokers got to the telephone and began to fire questions at Mr. Walbank.

"He described the accident as 'practically nothing at all.'

"The accident, while annoying for the time being, was not costly.

"It was due to the sudden change in the temperature and the formation of frazil ice."

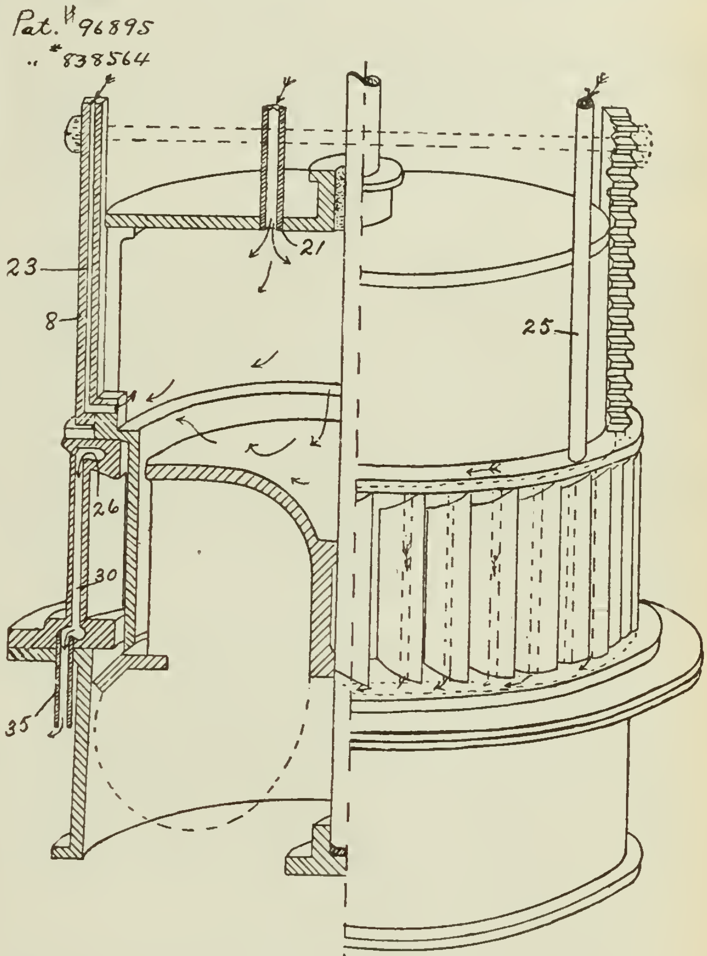
When the official in supreme charge of a public service corporation claims a shutdown of such dimensions is "practically nothing at all" it may be somewhat difficult to interest him or his staff in a scheme which will prevent shutdowns. I found it so.

I do not know whether Mr. Scott, the steam engineer who installed and started up the little ice-combatting steam plant for me, is now here at this meeting or not, but anyway he came down to the power house at two o'clock in the morning, raised thirty pounds of steam, thawed out the frozen wheels, and got the plant running. This occurred long years before I described all this to Mr. Walbank, but he only repeated "You will go crazy if you talk that way!" He proceeded: "I presided at the meeting of the Society a couple of years ago and that kind of thing was all taken up and shown to be wrong." I enquired: "When was that?" He said: "I think last year." I went up to the Society's rooms and got the proceedings—but I could not find anything about a frazil or ice discussion. I saw Mr. Walbank next day and said: "Are you quite sure it was last year?" He said: "Yes." I persisted: "What year was that?" I asked. He said: "Let me see, that was perhaps in 1904." I went back up to the rooms and read all the proceedings for the whole year, 1904,—the index was no good to me—and, as I got pretty nearly through the year's records, I came across a paper entitled "Loss of Heat in Iron Pipes," by R. W. Leonard. Col. Leonard, at that date, had the courage to place hot water in iron pipes, put them out in the cold air and keep a record of the time it took for the heat to be conveyed away from those pipes. He said: "I believe that if power plants were so constructed, ice troubles might be relieved." He said he *thought* it could be done and *I know from experience* that he was correct.

But all the recognized authorities at the meeting, the power men, trampled upon Col. Leonard's suggestion. The late C. B. Smith supplied figures showing how much heat energy must be expended to *heat water* and to *melt ice*—the figures run into hundreds of thousands of horse power—and the proposal was frowned down as well as howled down. I found, however, one line of comfort in the report of those proceedings. It was in Mr. Kerry's contribution to the discussion. He seemed to be the only man at the meeting who grasped the author's point.

Mr. Kerry said: "You have all missed the point; he is not trying to melt ice or heat water; he is trying to warm something to which ice will not then stick." That is the theory and simple fact that I was trying to propound to Mr. Walbank, and that is the message that I have been trying to send out for many years. I trust this little demonstration will set you all believing, thinking and talking. You see that I could go on for quite a long while on this important subject, but I shall not do so—the hour is too late. A *little bit of heat* will work wonders against frazil attacks. D. B. Burke, of the Ottawa & Hull Power Company, who is here, has carried on his operations continuously time and again during the winter since he installed a little steam plant for fighting frazil. His plant could not run on many former occasions without it. Now, it is running without interruption in the winter with the aid of it. There is nothing problematical about the game of frazil-combatting. The Ottawa Electrical Company and the Ottawa Electric Railway Company have had many years of similar experiences of a successful character.

Lt.-Col. R. W. Leonard, M.E.I.C.: The experiments that Mr. Murphy couples my name with were made by me in a crude way in 1904 at St. Catharines. I built the power plant of the Dominion Power and Transmission Company. We had considerable trouble with ice in the racks, and that led me to carry out some very crude



STEAM JACKETED WATERWHEEL

Waterwheels, on the above principle, are in most successful operation at the Ottawa and Hull Power and Manufacturing Company. Several units were built by Wm. Kennedy & Sons, Owen Sound, Ont. The last unit was installed in 1914 and was manufactured by Voith & Sons in Germany. A new one is being made by the Boving Company at Lindsay, Ont.

experiments with the view of preventing the accumulation of ice in the racks. The head was there considered. The wheels were of such a nature that is was not tolerable at all to permit any foreign substance to get into them. After some very crude experiments I arrived at the conclusion that warm water passed through racks made with hollow bars might overcome the difficulty.

John Murphy, M.E.I.C.: Might I interject just one more word? I have heard the statement made time and again by men who ought to know better, that if you build a dam and *destroy the rapids* you will not have any trouble from frazil. That is a bad message to send abroad because it is not true. The Decew Falls plant, to which our esteemed President refers, and which has frazil troubles, gets its water out of the Welland Canal. How far is Decew Falls from Port Colborne, Col. Leonard?

Lt.-Col. R.W. Leonard, M.E.I.C.: The water is taken from the Welland Canal at Allanburg, which is four miles above the plant, and Allanburg is about eight miles above Fort Colborne.

John Murphy, M.E.I.C.: Four miles of reservoir, eight miles of canal, no *rapids* on Lake Erie, no rapids in the Detroit river, Lake St. Clair, the river St. Clair, or in Lake Huron, and you have to go clean up to the Soo, 600 miles away to get rapids! Is anybody going to construct a dam which will make more than 600 miles of clear water without rapids? Dams should alleviate frazil troubles but they will not remove them all.

I would like to add a word about "anchor ice" which forms on the beds of streams on rocks. When rocks are cooled, by radiation, and the water is *agitated* by the presence of these rocks in the path of the flowing water (and the water is at the critical temperature), crystallization takes place and particles of "anchor ice" cling to the rocks. The Century Dictionary says the word "frazil" comes from the French "fraise" meaning a collar or ruff, so called from the manner in which this ice forms around rocks on the beds of streams. So it may be seen from the demonstrations witnessed to-day that *agitation* is at the base or root of all frazil and all anchor ice formation—at least that conclusion seems to me to be a reasonable one in view of the studies and observations I have made.

A review of my own reported positions in regard to combatting frazil may be of interest to-day.

In 1897, before the Canadian Electrical Association, at Niagara Falls, I stated frazil was likely to shut down *any* water power plant. That opinion was based upon 12 years operating experience and personal observation supported by nearly a century's frazil and anchor ice tradition handed down from operators of saw and grist mills, planing mills, foundries and machine shops, etc., etc., on the Gatineau and Ottawa Rivers.

In 1904, before the same organization, I contended that frazil *could* be prevented from shutting down water power plants: (1) if cold air were excluded; and (2) if a small quantity of heat were applied.

In 1905, I was able to report that I had actually succeeded in preventing shut-downs by applying the remedies previously advocated.

Between 1905 and to-day, 1919, such an innumerable number of proofs of the value of my frazil-combatting schemes are available that many honest men actually believed "they were taught by Noah to his sons in the Ark."

To-day I am just about ready to demonstrate that *the prevention of the formation of frazil in a stream can be* successfully carried out.

K. B. Thornton, M.E.I.C.: No, but by the construction of a dam you can reduce ice formation. If you are operating a hydraulic canal you must assist in the formation of surface ice. In our canal, which is six miles long, we have booms stretching across at frequent intervals. These booms are not put across the canal at right angles. We have put them at an angle of forty-five degrees. The ice starts to form in a V-shape from the edge of the canal. Placing booms does help in forming surface ice and consequently reducing the formation of frazil. Mr. Lefebvre tells me, in connection with the La Loutre reservoir built on the St. Maurice River, that, from the general observations they have been able to make the, frazil formation conditions in the river have been very much improved. I believe that ice conditions will always be improved by drowning out rapids. I do not say and have never said that the building of dams will entirely eliminate the formation of ice.

G. Gordon Gale, M.E.I.C.: Our observations regarding frazil may be summarized as follows:—

1. Frazil is seldom formed during the day time, and we have no record of its formation on a bright day.

2. During a cold winter frazil formations are infrequent. Troubles from this source are experienced at the beginning of the winter or after a thaw.

3. Frazil formations are frequent during a mild winter. A thaw followed by a drop in temperature accompanied by a north west wind will surely result in frazil.

Papers presented by Mr. John Murphy and Dr. H. T. Barnes some years ago have shown that the temperature of water after it has reached approximately 32 degrees F., does vary with the temperature of the air, but that this variation is measured in thousands of a degree.

It seems quite evident from our observations that there is a "critical" temperature at which frazil is formed, and also that the formation occurs more frequently when the temperature is dropping.

In previous papers dealing with this question the plant at Deschenes has been referred to as an example of a development which is frequently troubled by frazil although it is located at the foot of a lake twenty-five miles long. This does not accurately describe the Deschenes Plant. As a matter of fact there is a stretch of open water over three-quarters of a mile long, and three hundred feet wide reaching from the bulkhead to the Lake. This power canal is eight feet deep, and for the reasons mentioned in Mr. Wilson's paper it has been found necessary to keep this area open throughout the whole season.

Freshly formed frazil is very sticky and much more difficult to handle than frazil which has passed under the ice. This is probably due to a slight change in the temperature of the floating mass.

Although rapids up stream are not desirable they are probably not so dangerous as open water adjoining the plant.

I have listened to Mr. Wilson's paper, and the discussion which has followed with a great amount of interest as the frazil problem has been with me constantly for a number of years.

Montreal Discussion

At the Montreal Branch Meeting held in the rooms of *The Institute*, 176 Mansfield Street, February 27th, 1919, R. M. Wilson, M.E.I.C., re-read his paper on *The Design of Hydro-Electric Plants for Combatting Ice Troubles*, which was illustrated with lantern slides. Messrs. Murphy and Thornton contributed to the discussion along the lines of theirs at Ottawa, as included in the Ottawa report. The following discussion took place by members who were not at the Ottawa Meeting:—

Chairman: I think that Mr. Wilson is to be congratulated on the excellence of his paper and that *The Institute* is very fortunate in having such a paper presented before the meeting. Mr. Wilson has not chosen to hide any of the difficulties met with but gives a frank and extended address as to how they solved the problem of ice trouble. We will now be glad to hear any discussions on Mr. Wilson's paper. We have with us to-night Sir John Kennedy and would ask him to address a few remarks to us.

Sir John Kennedy, Hon. M.E.I.C.: Mr. Chairman, and Gentlemen: It would be quite impossible for me to take up your time to give a discussion on Mr. Wilson's paper because I was not able to be at Ottawa or to hear the first reading of the paper, I have not had an opportunity to read it since, and it is difficult to discuss a paper on hearing it the first time. I want to say this, however, that it is a very practical discussion and it gives a very liberal account of what has been done regarding the ice proposition, and how it has been done. The difficulty with many papers is that we hear only of success and do not hear of failures, but Mr. Wilson has been quite frank about discussing the failures met with. I will not take up any more of your time, but may at some future time be more capable of discussing this.

Chairman: " We have received letters, regretting their inability to be present, from Mr. Ed. Evans, Mr. H. G. Acres, Mr. J. B. McRae, and Mr. R. L. Dobbin, as follows:—

(The letters were then read; the remarks of Mr. Dobbin being particularly interesting because of his statement that this open winter has caused him a great deal of ice trouble at the Peterborough Water Works Plant on the Otonabee River.)

Chairman: We have with us Mr. Smith, of Shawinigan Falls and Cedars.

Julian C. Smith, M.E.I.C.: Mr. Murphy spoke of the shutting down of several plants about ten or twelve years ago, due to frazil. I am sure Shawinigan is outside of these, and I think it is only fair to mention that the Shawinigan plant was supplying power to Montreal on the date mentioned. I do not want the members to assume that all our plants were shut down on that day.

In considering the paper which Mr. Wilson has just presented to *The Institute*, we should keep clear in our minds the fact that Mr. Wilson has dealt principally with the ice troubles and methods applied at the Cedars plant.

The conditions at the Cedars plant are somewhat exceptional. The huge size of the units, the large amount of water involved, the size as regards both length and width of the canal are all factors that have an important bearing on the ice problem, and are factors that are met with only in part in most plant.

Mr. Wilson is to be congratulated on presenting the problem so clearly, and the fact that the plant has operated so successfully speaks eloquently of the very large amount of work done by Mr. Wilson, and his associates, on this problem. I am sure that he has spent many days and nights under extremely hard weather conditions in bringing this problem to a successful conclusion.

As a general proposition, if Mr. Wilson had been dealing with the problem of operating any plant under all sorts of ice conditions, it would seem natural that he would have given an historical resumé of this subject, in which case he would have no doubt pointed out the pioneer work done by Dr. Barnes, Mr. Murphy, of Ottawa, Mr. Kelsch, and other prominent members of this *Institute* who were engaged on these problems many years ago.

Mr. Murphy, in his part of the discussion, referred to certain interruptions of power which occurred to the Montreal service, November 30th or December 1st, 1905. I think I can say correctly, that the service supplied by the Shawinigan Co., was not affected on that date by frazil ice or other ice troubles.

The ice problem on the St. Maurice River is of quite a different nature from that which has been presented by Mr. Wilson. There, practically, is no trouble from frazil ice and the only difficulties which are experienced at all, either at Grand Mere, at the Laurentide Plant, or at Shawinigan, occur during the few hours when the ice is forming on the river. Occasionally, the first ice which forms on cold nights is broken up next day by wind or fluctuations of water levels. This ice comes down in the shape of small pieces, and would block the racks at these plants, if it was not permitted to come through.

As a matter of fact, the problem of ice in the wheels in a high head plant, that is a plant operating at a head of more than 100′, is principally a mechanical problem. The formation of ice in the wheels is largely prevented by increased pressure, and the blocking of the wheels, if it takes place, is due to the fact that ice which comes down cannot pass through the openings fast enough. It does not, I believe, under these high head conditions, congeal in the wheel case or stick to the metal parts of the wheel unless these metal parts are exposed to low temperatures. In most cases of high head plants, this exposure to low temperatures does not take place, and consequently, the ice difficulties in high head plants are almost entirely limited to troubles at the racks, or in the canal and water passages in front of the racks.

This whole question of formation of ice and the study of ice is only a particular problem in the general study of the different states of matter. We are probably somewhat mislead in our viewpoint in considering ice and water, on account of the conditions of temperature in which we live. Almost every substance has the liquid and solid state, and most substances have a certain crystalline form intermediate or merging into other conditions. Take for example a salt such as magnesium chloride or potassium chloride; in the solid state this consists of a crystalline mass. As the temperature is slowly increased, nothing happens until a melting point is reached at a temperature in the neighborhood of 800° C. This material begins to melt, and at the melting temperature, or near the melting temperature, the material exists in both the liquid state and the solid state. A curious condition, and one which I believe has a parallel in water also, is the fact that the solid material is actually soluble in the liquid material, that is to say that water at or near freezing temperature doubtless does dissolve ice crystals and holds these crystals in the same manner that any solvent holds in solution, the material dissolved.

As the energy contained in water is given up by further lowering its temperature, the ability to carry this dissolved material in solution apparently decreases, and ultimately reaches a critical point beyond which, or at which, a disturbance to the conditions suddenly brings out of solution the material dissolved.

Mr. Murphy, at Ottawa, gave a beautiful illustration of this by showing that water cooled below freezing point was still water, but upon shaking the water the ice crystals began to appear.

The discussion this evening has pointed out that one of the most serious elements in water power development in this country has been, if not entirely solved, at least brought so close to a solution that it is not a serious factor in considering a proposed power development.

Most of the men here remember the fact that, ten or fifteen years ago, there was a great deal of discussion and talk against waterpower developments, particularly on the St. Lawrence River, due to the fact that the ice hazard seems to be an almost prohibitive factor.

Canada necessarily suffers by reason of its climate. The low temperature in the winter adds to the expenditure of every citizen by reason of the need of extra fuel, extra clothing, and the fact that buildings and houses have to be constructed to meet climatic conditions. To compensate for this Providence has located extensive waterpowers in Canada and, now that the ice problems have been so well solved, these water powers should be developed as rapidly as possible in order that citizens of this country may compete, on equal terms at least, with those countries which are more favourably situated as regards climatic conditions.

The true conservation of waterpowers, as has been stated by some of the members of *The Institute* here present, consists in the immediate utilization of these waterpowers.

Chairman: I think everybody will agree with Mr. Smith in the conservation and the utilizing of electricity and our natural resources thus saving fuel that would otherwise be burned. We have with us Mr. Woodyatt, of the Southern Canada Power Co., and I am sure his experience will be very interesting.

J. B. Woodyat, A.M.E.I.C.: As I have not had much ice trouble I do not think I could add anything very much to the discussion.

Chairman: Perhaps Mr. Wm. Kennedy would add something.

William Kennedy, M.E.I.C.: I was very grateful to Mr. Wilson for his paper and for giving us the information that he has. He has dealt with one particular case and has given much detailed information on it, which certainly does not apply in all cases. For instance, he states that in every case the canal must be kept open, whereas in our case the object is to get it frozen over as quickly as possible. I was very interested in the illustrations because it brought to my mind a small mill I was in charge of some forty years ago. We had to close down this mill about 4.p.m. in winter, when the ice was forming, and then cut branches of trees and extend these across the canal in order to get the surface frozen over, otherwise they had to close down every night and remain closed until about 10.a.m. This actually confirms Mr. Thornton's theory, although in another way. The condition of the Peterboro plant is very much the same. They have no trouble whatever when the ice forms; the trouble this year is due to the open winter. They have had more trouble this winter than in twenty-five years. We have been running the new plant now for two or three years without very much trouble. The conditions at Peterboro are not very favorable as regards anchor ice, yet, the plant has been running very regularly without the application of steam and with only a few days shut-down. The DeCew Falls plant had very little trouble, and any that did occur was through carelessness, either because ice blocked the racks or sufficient heat was not on. I may say that the trouble with nearly all the plants is caused by frazil, when we cannot get surface ice formed. Mr. Wilson's case requires that the canal be kept open. The need in most of our plants is to get the canal frozen over, after which we have no trouble with frazil. I do not agree altogether with the statement confidently made that the large single-runner turbine is the best. I think that the application of heat to keep milti-runner turbines in operation is as satisfactory as the installation of single-runners. Mr. Murphy has stated that even a small plant can be run satisfactorily when heat is introduced. This, so far as I know, is a fact and I do not expect to have trouble with the plant now building at Ottawa.

R. M. Wilson: The point I wanted to bring out in the paper was to show that the condition at Cedars is a condition such that, if it can be solved, there need be no more ice troubles. I have been connected with the operation of hydro-electric plants for over twenty-two years. At Cedars we have got a short canal; we have the river partly dammed across; and we have the troubles already stated. The question we have been solving is the keeping of ice from getting in and beyond the sluices and racks and so blocking them up entirely. Mr. Murphy has spoken of heating. The units at Cedars are ten thousand h.p. each, the total installation of which will be 18 units. If we had the same size as Mr. Murphy, 2,500 h.p. each, we would have seventy-two units, and it would be impossible to keep operating. A great number are under the impression that this winter, being a mild one, there has not been very much ice trouble. Our experience has been that where winters are mild ice troubles are greater and more frequent.

Such conditions as those existing this winter never give you an opportunity of getting and keeping the headrace of the plants permanently frozen over. It may be of interest, in conclusion, to state that, on the Richelieu

River, during twenty years operation, conditions have never been as bad as they are this year.

Chairman: I am sorry that we have to cut short the discussion. I think we all agree that we should publish the paper and the discussion in *The Journal.* It is a step gained now that these ice problems have been solved, and that no further fear of winter need be had. I would now ask a vote of thanks from Mr. Ross.

R. A. Ross, M.E.I.C.: Mr. Wilson, I thank you for your paper, and also Mr. Murphy for his discussion. If I may be allowed to say so, I think the paper, with the discussion, is a classic. We have been groping in the dark for a number of years and now it has come down to a stage where any plant, small or large, can be handled effectively. I have not had experience in actual operating, but have been taking up the matter from the side lines, so to speak. I can remember when Mr. Walbank stated that his trouble could be solved in this way, and also Mr. Murphy with his *heresies,* and am struck with the picture of the *doubting Judas* which would illustrate my frame of mind at that time. We have gone over the matter thoroughly and I think that a great number of points were brought up which are of exceptionally great value at the moment. These gentlemen have labored long and well in the ice fields and I sincerely hope that they will be amply rewarded for their labors, and that, in their future state, they will look back on their ice experiences as some of their most pleasant memories.

Frederick B. Brown, M.E.I.C.: May I be allowed to second the vote of thanks, proposed by Mr. Ross. The discussion, to my mind, shows that every plant must solve its own particular ice troubles, if it has any. I know of some plants in Canada that have none. It is clear in this case that what is one man's meat is another man's poison. It reminds me of an old Justice of the Peace who was given a knotty question to decide between the parties before him. After thinking it over he said, "*Both are right—go ahead gentlemen.*" In this case, I think, it is a case of both being right, and *The Institute* is to be congratulated on the paper and the discussion. The whole shows that Canadian engineers can and do successfully solve ice problems, and, as my friend Mr. Thornton has just remarked to me, the answer is—the plants keep running. I, therefore, have great pleasure in seconding Mr. Ross's motion.

Applause and the thanks of the meeting were extended to the speakers by the Chairman

Written Discussion by R. M. Wilson

My object in submitting my paper to the members of *The Institute* was to place before them the experience gained over a number of years in the handling of the ice problem at the Cedars plant, dealing particularly with the open canal and the single runner type of unit. The references to other plants were only casual and illustrative of the points in connection with the Cedars development.

It was not my intention to write a paper on the subject of handling ice under all conditions existing in Canada. If I had presented a paper on this subject the first thing I should have done would have been to refer to Dr. Barnes and the investigation work carried out by him on the St. Lawrence River, and also to his several excellent publications on the subject of ice formation.

It would have given me also great pleasure to have referred to the work done by Mr. Kelsch, Mr. Murphy, Mr. Groat, the engineers of the Shawinigan Company, and other men in Canada, and elsewhere, who have contributed to our knowledge on this subject.

I agree most heartily with Mr. Thornton that an effort should be made to reduce, as far as possible, the ice forming conditions in our rivers, which are responsible for a great deal of trouble to hydraulic plants and the cause of considerable damage being done yearly to property. It would also, in my opinion, be a great help toward earlier navigation in the Spring; an important matter on a river such as the St. Lawrence.

Mr. Murphy has mentioned results he obtained from a small amount of steam, produced by the burning of a ton of coal, in preventing frazil from adhering to parts of wheel installations under water.

Experiments carried out in November, 1904, by Mr. Fleet and some of our operating staff, at one of our hydro-electric plants, demonstrated that the steam produced by the boiler of a small dinkey locomotive, when turned into one of the steel flumes, prevented the unit installed therein from being shut down by frazil; the method of using the steam being a most inefficient one.

Mr. Murphy mentions that on November 30th, 1905, there was a good sized frazil attack in the area which includes Ottawa and Montreal, and quotes extracts from two of the Montreal daily papers of December 1st, 1905. In these extracts mention is made that 20,000 h.p. was cut off. In order to remove any wrong impression which might be created by reading the extracts a statement of facts will serve to set the matter right.

In the first place, there was trouble experienced from ice at the Chambly plant on the day mentioned, but 20,000 h.p. was not cut off. The plant could only develop, at the time, about 7,000 h.p. due to low river flow, which occurs every year during the fall and early winter. In the second place, only 5,000 h.p. out of 7,000 h.p. was affected, and, whilst a part of the trouble was due to frazil in the wheels, the greatest difficulty was from ice on the racks, consisting of frazil and small size shore ice shutting the water off from the units. The trouble was overcome in a few hours.

The other plants serving Montreal with light and power at the time were in no way affected, viz.: the Lachine plant, and the plant of the Shawinigan Water & Power Company, Shawinigan Falls. Inconvenience was caused to some customers for a short time, which could have been avoided had there not been at the time a two-phase system operating in Montreal, and which was in the course of re-construction, as all the load could have been taken care of by the plants not affected.

Railway Electrification

By John Murphy, M.E.I.C.

An entire session of the Ottawa Professional Meeting was devoted to this subject, being that of the morning of Thursday, February 13th. It was introduced by John Murphy, M.E.I.C., electrical engineer, Department of Railways and Canals and Railway Commissioners, and was continued by W. G. Gordon, F.A.I.E.E., Toronto, and F. H. Shepard, A.A.I.E.E., New York.

Enthusiasts on the subject of railway electrification, and, I think, I may also speak for Mr. Gordon and Mr. Shepard, never intend, while advocating electrification, to say a word in disparagement of that great machine, the steam locomotive. It would be folly to do so. The progress and the development of the whole world have been largely dependent upon the steam locomotive. Many, however, who have given the subject of railway electrification serious thought feel that an educational campaign should now be undertaken so that the public at large, as well as all railway men, may the sooner appreciate the real value of its more capable brother, the electric locomotive. In order that one important economic feature of the operation of electric railways may be easily appreciated, I have had officials of the Ottawa Electric Railway Company prepare the following figures: The equipment of the Ottawa Electric Railway consists of 106 cars; and the average horse power of the motor installation on each car is just about 106 horse power. 106 multiplied by 106 is 11,236 horse power. And, if those 106 cars were equipped as steam locomotives, there would, of course, be fires always burning under 106 boilers; and coal would be being consumed continuously, while these 106 cars were out on the road, whether they were or were not moving. But instead of 11,236 h.p. being necessary to operate the Ottawa Electric Railway, the maximum power ever demanded is only 7,000 h.p., and the average power is about 4,500 h.p. Therefore, a power plant having a load-carrying capacity of from 40 per cent to 62½ per cent of the total aggregate capacity of the cars is quite large enough to supply the power demands of all these cars— when they get their power from one or more stationary plants, either steam or water-power.

It is many years since the N.Y., N.H. & H.R.R. cut its coal consumption in two by electrification.

Canada's coal shortage and its transportation difficulties, coupled with Ontario's power shortage during the war, have forced forward the question of railway electrification. It demands attention. Canada's steam locomotives use 30 percent of all the coal consumed in Canada. But what is obtained *at the wheels of the steam locomotives* as the result of the mining, the hauling, the handling and the consuming of some 9,000,000 tons of coal on locomotives each year in Canada? That is surely a pertinent question. The answer is as follows:—Only 3 (or 4) percent of the mechanical energy which is in the coal itself, in the form of heat, becomes available in the form of power at the wheels of the steam locomotive! The 97 percent (or 96%) of the energy in those 9,000,000 tons of coal, *which is lost* every year in the transformation of the heat energy of the coal into the mechanical energy of the steam locomotive, cries out against a continuance of such wasteful procedure, and as engineers who are expected to guide the non-technical public, it is our duty, in my opinion, to industriously advocate the electrification of railways at every advisable opportunity.

The steam locomotive needs on an average 6 lbs. of coal per h.p. hour because it burns coal while in the round house getting ready for its run, while standing on sidings and at stations, as well as while hauling its loads. The stationary steam plant, with its condensers and other fuel-saving apparatus—to say nothing of its better load factor —can produce power *at the switchboard*, which can be transmitted electrically to the *wheels of the locomotive* in such an efficient manner that from one-half to two-thirds of the railways' present coal needs can be saved by electrification.

No argument is required, I think you will agree, to support the contention that eliminating the need for coal at a considerable distance from the mine *is* a greater measure of relief, and of true conservation, than increasing mine production and thereby adding more load to the already overburdened railways. Reducing coal consumption automatically relieves or releases men and apparatus all along the route from the mine to the consumer; it also relieves the route itself from some of its congestion.

So eminent an authority as Mr. E. W. Rice, the President of the American Institute of Electrical Engineers, addressing that body in New York in February, 1918, made the following statement:

> "It is really terrifying to realize that 25% of the total amount of coal which we are digging from the earth is burned to operate our steam railroads—and burned under such inefficient conditions that an average of at least 6 pounds of coal is required per horse-power-hour of work performed. The same amount of coal burned in a modern central power station would produce an equivalent of three times that amount of power in the motors of an electric locomotive, even including all the losses of generation and transmission from the power station to the locomotive."

Here in Canada steam locomotives consumed about 9,000,000 tons—30% of the 30,000,000 tons of coal imported into and mined in this country. Our 9,000,000 tons cover, I believe, wood and oil consumed on steam locomotives; some 49,000,000 gallons of oil are covered by the Canadian record. But, in the United States figures, 40,000,000 barrels of oil, 15% of the total oil output, are not included.

The total conservation of the elimination of the necessity for mining—those great quantities of fuel would be secured if all the railways were operated electrically and if the electrical energy were generated from water power. Modern steam central stations can save from 50% to 66% of the coal now used in steam locomotives if the latter are discarded and electric locomotives used instead.

With such possibilities for fuel conservation in sight may we not soon expect to learn that the fuel controllers in both countries have asked the railways, and that the railway managers have asked their engineers:—" How many of these millions of tons of coal can you save—when will the good work of railway electrification begin?"

It is said our fuel shortages in the years 1917 - 1918 were due to a combination of bad weather and inadequate transportation. Railway electrification will reduce coal consumption, coal haulage and the mining of coal; it will also greatly improve traffic conditions; electrification, therefore, seems to be the solution of the problem.

Railroading in the mountains is the most strenuous kind of railway work, and I have chosen some mountain sections as examples of what can be done to them. The Butte, Anaconda & Pacific Railroad, by electrification, is said to have increased its ton-mileage 35% and at the same time decreased the number of trains, and their incidental expenses, 25%. The time per trip was decreased 27%. It is said their savings in the first year's operation, after electrification, amounted to 20% of the total cost of electrification. That railway buys electrical energy from water power plants.

On the Norfolk & Western Railway electrical energy is obtained from their own steam station. Twelve electric locomotives have replaced 33 Mallets of the most modern and powerful type. The tonnage has been increased 50%, and electrification obviated the necessity for double tracking. The salvage value of the released steam engines was 45% of the cost of electrification. Electric locomotives make 8 times as many miles per train-minute-delay as the steam engines. Their terminal lay-overs average only 45 minutes and they are double-crewed every 24 hours. Pusher engine crews have been reduced from 8 steam to 4 electric. Steam pusher locomotives have been reduced from 7 steam to 2 electric. Steam locomotives used to " fall down " in cold weather—the electrics always " stand up," they are really more efficient, in cold weather. As you all know, during our severe winter weather, trains are delayed by the extreme cold as well as by storms. In conversation with a superintendent of a northern division not long ago, I was told that when the temperature fell to zero he at once reduced his train-loads ten per cent ; that if the temperature went to twenty below zero, he reduced his train-loads twenty-five per cent; and from that on he was in mortal terror of his trains being tied up entirely. With extremely low temperatures and heavy snow storms tie-ups are inevitable on steam railways.

Speaking at the New York Railway Club in March, 1917, the electrical engineers of the Norfolk & Western Railway stated that: " coal wharves, spark pits, water tanks and pumps as well as roundhouses and turntables have disappeared from the electric zone. Our track capacity has been doubled. Our operating costs have been reduced. From an engineering, an operating and a financial viewpoint our electrification has been a success." Speaking of the value of *regenerative electric braking* they went on to say:—" The use of the air brake is practically eliminated, it is only used to *stop* trains; it is regrettable we are unable to put a dollars and cents value on this great asset; to appreciate it properly one must have had experience with the difficulties of handling 90 car trains with air. Trains of 103 cars are now taken over the summit, 12 to 20 times every day, down the 2.4% grade without even touching the air. We never broke a train in two or slid a wheel. It is done so nicely we would'nt spill a drop of water out of a glass in the caboose."

The 440 route miles of the Chicago, Milwaukee & St. Paul Railway which have been electrified will soon be augmented by 450 miles more. Nearly 900 miles of railway and about 33% in addition for passing-tracks, yards, industrial tracks and sidings will soon represent the extent of the world's greatest railway electrification. Among the advantages secured by this railway on its electric sections are the following:—The " cruising radius " of each electric locomotive is twice that of the steam engine. Sub-divisional points, where freight crews and steam locomotives were formerly housed and changed, have been abolished; the passenger crews' runs are now 220 miles instead of 110. For railway purposes, these stations do not now exist; 7 or 8 miles of track at each old station have been taken up. In many months the electrics were not delayed a minute; the latter can do more work in cold weather. Many of the delayed steam trains were double-headers—but never more than one electric is hitched to a passenger train. An entire suspension of freight service, due to steam engines losing their steaming capacity and freezing up, was not an uncommon experience. Electrical energy for the operation of these trains cost considerably less than coal. This latter statement is one of the most interesting in connection with the operation of the C. M. & St. P. Ry. and it is especially interesting because it was made before they had improved their load factor.

The foregoing actual operating experiences on large railway electrification projects show what the electric locomotive is doing every day. As the vice-president of the last mentioned railway said; " electrification has made us forget that there is a continental divide."

The limitations of the steam locomotive are due to the fact that it is a mobile steam power plant of limited capacity; it is compelled to carry its own supply of coal and water; and, it is unable to take advantage of many of the economical refinements of the large modern stationary steam plant. On the other hand the electric locomotive has no such limitations; it merely acts as a *connecting-link* between efficient stationary steam or water power plants of unlimited capacities—because their number may be extended indefinitely—and the train to which it is connected. The Electrical World summed up the situation a short time ago when it said:—"Why continue to haul millions of tons of coal, for and by uneconomical steam locomotives, all over the country, and thus add more loads to the already overburdened railways, when the power which they need so badly can be much more economically and efficiently transmitted to electric locomotives over a wire the size of one's little finger?"

The increasing cost of coal and fuel oil will force railway managers to look more and more carefully into railway electrification. Estimates of a few years ago now need revision. Money may be hard to get but if, at times, fuel cannot be obtained at all some substitute must be obtained—if normal life is to be continued in northern latitudes.

A representative of the National City Bank of New York, writing of the period after the war, referred to the stagnation which may ensue, in all the great industries which were engaged in war work; the multitude of the people thus thrown out of work in addition to the men of the returning armies might create unbearable conditions unless suitable employment will have been arranged for them in advance; he referred to the economic advantages of railway electrification and was of opinion that this work might solve the whole question if soon taken up with vigor. The Minister of Public Works, Hon. F. B. Carvell, M.P., addressing the Ottawa Branch of *The Engineering Institute of Canada* spoke of the necessity of conserving the energy of our water powers—instead of letting them *run to waste*—so that this great store of energy might be employed in assisting to build up our own country and to rebuild other countries. How harmoniously these two ideas, water power development and railway electrification, would work together if properly carried out.

With the view of securing something worthy of presentation on the subject under discussion I wrote to an eminent engineer, a man of international fame and recognized as an authority on railway electrification, requesting him to send me his views. Here is a short extract from his interesting reply:—"Generalization is always dangerous, especially in connection with electrification of railways, where so many factors such as the physical location, character of loads, the power situation, etc., come in to affect the decision if applied locally." From this sober statement it may be seen that my correspondent is an engineer—not a politician. He proceeded as follows: " . . . with present equipment-prices the cost is absolutely prohibitive." This opinion, let me point out, is in connection with the proposal to *Electrify Everything*. Do not let it dampen our enthusiasm. Listen to this also and kindly keep it in mind; it is another extract from the address of Mr. E. W. Rice above referred to. He said:— "I think we can demonstrate that there is no other way known to us by which the railroad problem facing the country can be as quickly and as cheaply solved as by electrification."

While the recent fuel shortage and kindred questions have made us look to railway electrification for relief, such projects, on a large scale, can only follow or go hand in hand with water power plant development and co-operative operation of power plants. The location of a number of plants—large water power plants and perhaps, auxiliary steam plants—so situated and interconnected that a failure at one plant, or the connections to it, will not jeopardize the others or completely cut off and isolate an important railway district is, in my opinion, an essential and a prime necessity in connection with any large railway electrification project.

The 99 year power contract of the C. M. & St. P. Ry. above referred to is worthy of special attention. That railway has a contract with a power company which has a series of plants stretching across the whole country parallel to the railway. The railway owns its sub-stations and secondary lines but it is not concerned with the high tension lines or power plants of the power company. A reasonable rate for power arranged between a willing purchaser and a willing seller—*a contract, in fact, which each party knows the other will respect*—is the basis and the real reason for that great railway electrification. Neither party questions the other's integrity or financial soundness. One delivers the power it has undertaken to supply and the other uses it. The arrangement is ideal in its simplicity and entirely satisfactory to everybody concerned. It will, in my opinion, be necessary to have such attractive power conditions as those outlined above, backed by abundant supplies of power, in order to foster and encourage *railway electrification*.

Railway electrification is a truly economic (financial and engineering) problem—a problem worthy of the best attention of the most highly trained and experienced specialists.

The Economics of Electric Operation of Railways

By W. G. Gordon, Toronto, Transportation Engineer, Canadian General Electric Co., Ltd.

Much has been written descriptive of the different roads now operating electrically, wholly or in part, and of the results as compared with steam operation. I will present some of the latest figures regarding the economies effected by electric operation.

Mr. E. W. Rice stated at the June Convention of the American Institute of Electrical Engineers last year:— "Electric locomotives have been so improved and simplified that they are competent to haul the heaviest train that can be held together with the present train construction; to operate at the highest speed permissible by the alignment of the road and independent of its grades; and that the electric locomotives can meet in the most efficient and adequate manner the transportation problems confronting the country, and offer better results than are now obtained or seem possible with steam locomotives. It should not be forgotten that steam locomotives burn about 25% of the entire coal mined in the United States, and that 12% of the entire ton mileage movement of freight and passengers carried is represented in cars and tenders required to haul coal to supply steam for the locomotives."

This percentage is shown from the following table of one year's ton mile movement:—

	Millions Ton Miles	Percent of Total
Revenue Coal	204,600	12.56
Railway Coal	52,000	4.96
Revenue Freight	372,040	35.60
Railway Freight	5,600	0.55
Locomotives	148,200	14.20
Locomotive Tenders	74,630	7.14
Passenger Cars	186,890	17.90
	1,043,960	100.00

The comparative percentages for the different classifications are very close to those given above for the operation of our steam railroads in Canada.

Where a trunk line is electrically operated from water power stations, it means that the total movement of railway coal and locomotive tenders is eliminated, and even if partially or wholly operated from steam power stations, the movement of locomotive tenders is eliminated and the movement of railway coal greatly decreased.

The benefit is self evident of being able to apply this ton mileage, at present absorbed by steam operation, in the movement of revenue tonnage.

The cost of maintenance of the electric locomotive is very much less than that of the steam locomotive. The following table gives the cost of maintenance in cents per locomotive mile for a number of railroads, these costs being for the years they have been operating electrically to 1917, inclusive.

The costs are given for an average of 5 years for three railroads, an average of 4 years for two railroads and an average of 2 years for the Chicago, Milwaukee and St. Paul R.R. The average locomotive weight in tons is given for each railroad, and in order to obtain a comparison I have given the cost also on the basis of the locomotives weighing 100 tons in each case.

Cost of Maintenance of Electric Locomotives:—

Road	Average Loco. Wt. in Tons.	Average Maint. per Loco. Mile	Average Maint. on basis of Loco. weighing 100 tons.	No. of Years.
Baltimore & Ohio R.R.	98	5 13	5 24	5
Butte, Anaconda & Pacific R.R.	80	5 66	7 08	4
Chicago, Milwaukee & St. Paul R.R.	290	8 94	3 09	2
Michigan Central R.R.	108	4 39	4 06	4
N. Y. C. & H. R. R.R.	118	4 12	3 50	5
Pennsylvania R.R.	156	5 30	3 40	5
General Average		5 59	4 39	

The cost of maintenance per locomotive mile for steam locomotives compared with the above will be from 10 cts. to 20 cts. or higher, depending on the capacity and service of the locomotive.

A very interesting comparison is given in the following table giving comparative results between steam and electric operation on the Butte, Anaconda and Pacific R.R. In 1913 the operation was entirely steam, since then it has been gradually superseded by electric operation. The figures for electric operation are averaged for 3 years, and, as there was still a considerable amount of steam operation during these 3 years, the figures do not show full credit to the benefit of electric operation.

Comparative Results—Steam and Electric Operation.
B. A. & P. R. R.

	Steam, 1913	Electric Average for 3 yrs.	Saving in Amount	Electric Operation Percent.
Fuel and Power	$294,830	$175,165	$119,665	40 59
Loco. Repairs	97,492	57,881	39,611	40 61
Enginemen's Wages	99,611	74,036	25,575	25 67
Engine House Expenses	28,342	16,703	11,639	41 06
Lubricants	9,345	5,444	3,901	41 76
Water	4,491	2,084	2,407	53 59
Other Supplies	5,435	4,308	1,127	20 74
Total	$539,546	$335,621	$203,925	37 80
Revenue Ton Miles Hauled	153,168,648	169,553,405	16,384,757	10 70

The above table shows a saving in electric operation of 37.8 percent, and at the same time an increase in the revenue ton miles hauled of 10.7 percent.

Had these increased ton miles been hauled in 1913. the total cost would have been $597,277, so that the actual saving in electric operation is 44 percent.

On this railroad 17 electric locomotives were in operation in 1914, 24 in 1916 and at present there are 28,

Where mountain divisions are electrically operated, a further marked economy is effected by regenerative breaking. This is obtained by exciting the fields of the motors on the locomotive on down grades so that the counter electro-motive force builds up higher than the line voltage and returns power to the line; this action retarding the train to whatever extent desired without the use of the air brakes, as well as supplying power to other trains running on the level or up grades. This action, of course, reduces the total demand on the sub-stations with consequent reduction in the power demand on the primary source of supply.

The following table showing the saving thus obtained on the Chicago, Milwaukee & St. Paul R.R., and is the result of careful tests just worked up by the engineers of the General Electric Co.

The above results are of extreme interest. It will be noted that the runs were taken in both directions over the total electrified distance of 437.6 miles with trains as high as 2,853 tons trailing load, giving a general average in watt hours per ton mile without regenerative braking of 24.06, and with regenerative braking of 19.72, or a reduction in power due to regenerative braking of 18.04%.

As a direct result of regenerative braking, a large saving is effected in brake shoe wear, apart from the elimination of wrecks caused by overheating of the brake shoes, brake heads and wheels, where heavy trains are handled on long down grades. The air brakes are only required for emergency, as the braking is all done by the locomotive. It has been estimated that on the Chicago, Milwaukee and St. Paul R.R. the saving per year in brake shoe wear alone is close to $200,000. On the 4% grade of

REDUCTION IN POWER DUE TO REGENERATION..........................18.04%

the Denver & Rio-Grande R.R. between Soldier Summit and Tucker, the instructions are, with steam operation, not to exceed 8 to 10 miles per hour, and to stop every 5 to 7 miles, for from 15 to 30 minutes, to cool brake shoes and wheels. Under these conditions the energy dissipated between each brake shoe and wheel may be as high as 20 horse power; so it is readily seen that, even on much easier grades of long extent, the brake shoe wear with steam operation is a serious factor of expense.

The steam locomotive is a power plant which, owing to physical limitations, can attain only a certain capacity and efficiency. On the other hand the electric locomotive, itself very efficient, can draw any amount of power desired from a system fed by hydro-electric plants or highly efficient steam electric plants. The continuous draw bar pull of the electric locomotive is limited only by the strength of the draft rigging on the cars. By series and various series-parallel combinations of the motors a wide range of running speeds can be obtained without rheostatic losses. This range can be further varied by shunting the motor fields. Due to the power input available, draw bar pulls can be maintained at speeds impossible with steam locomotives. This means that, over any line, trains of heavier tonnage can be hauled at a much better schedule speed than with steam locomotives. In the case where a single track steam line has reached its capacity and would have to be double tracked to handle increased ton mileage, electric operation will obviate the necessity of double tracking and permit of a large expanse in ton mileage handled. The curve sheet giving "Typical Locomotive Characteristics, Steam and Electric," shows a comparison of lbs. tractive effort, at various speeds, of two steam locomotives; a Mallet with 190 tons on drivers and a Consolidation with 100 tons on drivers, with an electric locomotive having 160 tons on drivers. It will be noted that the tractive effort of the Mallet drops off rapidly above 8 miles per hour while the tractive effort of the Consolidation drops off steadily, though not so rapidly, above 10 miles per hour. Curves are given for 3 of the 6 running speeds of the electric locomotive. At 16 miles per hour, the continuous tractive effort which the electric locomotive can exert is greater than that of either of the steam locomotives, while at about 35 miles per hour the continous tractive effort of the electric locomotive is more than 3 times the tractive effort of the Consolidation.

With regard to collection of current, experience has shown that with the slider type of pantograph 1000 amperes can be taken sparklessly from a single trolley wire. Using two trolley wires suspended side by side, as on the Chicago, Milwaukee & St. Paul R.R., 2000 amperes can be collected. This at 3000 volts is 6000 K. W. or over 8000 h.p. As there is no sparking, the wear on the trolley wire is exceedingly slight, as may be judged from the fact that here in Canada we are getting a life of from 10,000 to 12,000 miles from a single wearing strip on the pantograph.

As regards the substations, a further decided economy is now credited to electric operation through the perfection of automatic control. One serious operating condition was the flashing over of the generators from some short circuit outside the station. This might be severe enough to necessitate cleaning up the brush rigging and commutators. Continuity of operation required an attendant at each substation while the generating sets were in operation. This trouble has been entirely overcome by the use of a high speed circuit breaker which will open a short circuit of many times the normal full load value of the generators in less than eight thousandths of a second.

With the further use of flash barriers on the commutators, flashing over of direct current generators is absolutely eliminated. With automatic control, the sets are stopped and started through the voltage drop reaching a definite value at any point on the system. In addition to doing away with substation attendants, this also improves the all day efficiency of the generator sets as they are shut down during periods where they are not automatically started up to maintain the line voltage at a fixed value.

With the refinements now available for substation operation, it can be confidently asserted that the substation equipment is 99% efficient.

The question of load factor on the power supply lines of the Chicago, Milwaukee & St. Paul electrification is of considerable importance since the price of energy per kw. hr. is based upon an assumed load factor of 60 per cent. In cases where the ratio of the average to the maximum load is less than this amount, the price is somewhat higher. Because of the desirability for maintaining a relatively high load factor, there has been designed and installed a power limiting and indicating system which automatically limits the maximum load to certain predetermined peaks and also indicates to the dispatcher the exact amount of power which the whole system is receiving at any instant.

This apparatus is installed in the dispatcher's office at Deer Lodge and in each of the substations which are connected to the main office by pilot wires. Two totalizing kw. meters are located over the dispatcher's desk indicating respectively the amount of power being drawn by the 220 miles east and the 220 miles west.

By means of the pilot wire control, acting upon the motor-generator sets in the substations, the trolley voltage is reduced temporaily on the overloaded substations so that the total k.w. consumption on the totalizing meters never exceeds the predetermined maximum. By careful dispatching, it is thus possible to keep the maximum load within reasonable limits without materially slowing up the movement of trains.

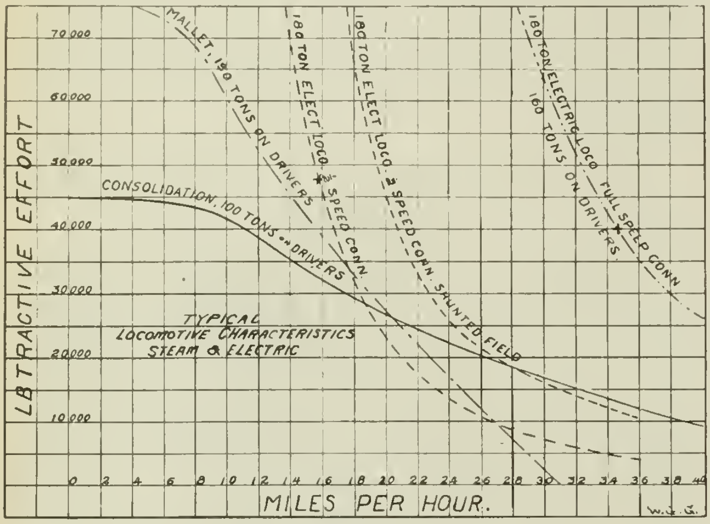
As to the reliability of the modern electric locomotive for continuous service the returns for 1918 just made public by the New York Central Lines show that the locomotives were inspected after each 3000 miles of running and that they averaged 33,000 miles per detention.

In conclusion of this brief review of the present status of electric operation for trunk line railways, it is of interest to note that, in changing to electric operation, there is practically no upsetting of the regular steam organization; as the engine crews, under instruction, readily become highly efficient in the operation of the electric locomotives.

Railroad Electrification

By F. H. Shepard, Director of Heavy Traction,
Westinghouse Electric & Mfg. Co.

The electrification of the railroads is a subject of the greatest importance to all of us. Ours is a continent of great distances, and our growth and prosperity have depended upon our ability to transport ourselves and our goods quickly and easily over these distances. Hence, without our great railroad systems our development would have been insignificant indeed. If, therefore, the use of



Typical
Locomotive Characteristics
Steam and Electric.

electricity can improve our transportation facilities, it will increase the well-being of every inhabitant of the North American continent.

There is no longer in anyone's mind a doubt as to the sufficiency of electric power to accomplish any kind of service, even the most difficult and exacting. This has been amply demonstrated in every case where steam service had been supplanted by electric power; this substitution having been invariably attended by conspicuous betterment in service.

The first use of electricity for heavy haulage was through the Baltimore tunnel on the Baltimore & Ohio Railroad in 1895. This installation, contracted for in 1891, was looked upon by most of the executives and operating staff as a gigantic experiment, and of very doubtful working. This was emphasized to me by the following incident: On one of our early trips with a number of the road's executives aboard, a successful run had been made through the tunnel, trailing one of the road's largest steam locomotives with a full-sized freight train. Stop was made, and then on signal the engineer opened up; the slack had all run out on the grade (this being before the days of air-brakes in freight service); he kept on opening up, without jerk, from a standstill. Before I could stop him, we heard a crash about six cars back in the train—the whole end of a car, loaded with oats, had been torn out on a dead pull. There seemed to be more oats on that track than I had supposed existed in the whole world. By the time we got the car set out, and incidentally smashed two couplings, we had "laid out" the Royal Blue Limited thirty minutes. The following morning this admonition was given me by the general manager in his office: "Shepard, there is no longer any question in mind about the ability of that motor to pull; it could pull anything—this building right off its foundations—but the important thing, and it is serious too, is to get up some way to restrain its tremendous power."

This was before the days of high voltage distribution, the power being furnished direct from the 700-volt dynamos in the powerhouse adjacent to the railroad. There could, obviously, not be any general expansion of this method of electrification, owing to the economic impracticability of low voltage systems of generation and transmission.

The present universal use of alternating current generation, with its great adaptibility for transformation, has led to concentrated generation of power in large amounts and to its wide distribution through large networks of transmission lines. This has enormously expanded the field for electric power, so that now its use is universal for the various railways—street and interurban, elevated and subway—but to a limited degree only on main or steam railroads.

The urgency for steam railroad electrification, until the present time, has not been as obvious as that which determined the electrification of street and elevated railways; although subways and certain railroad terminals were predicated entirely on the use of electricity. An explanation, why railroad electrification is so limited, may be ascribed to that inertia which halts the undertaking of large works; accompanied, as they inevitably are, by such complications as questions of finance, immediate necessity, immediate return, etc.

Grand Trunk Railway
St. Clair Tunnel—Weight, 132 tons—Tunnel Service.

If prevision could have been possible and acted upon, a somewhat general electrification of the railroads would have mitigated the dangerous fuel shortage obtaining during the war, and at a saving to the community not possible to be measured in any mere matter of operating economies. In fact, the propriety may well be questioned, whether as a matter of right, the diversion of fuel for railroad operation from the household or industry should be permitted, when hydro-electric power could be utilized.

Pennsylvania Railroad
Entering New York Terminal—Locomotive weight, 165 tons.

An advantage of railroad electrification rests largely in the east with which large amounts of power can be used for a single train, and in the facility with which electric power can be transmitted, applied, regulated and controlled. These advantages secure fewer and accelerated movements of train units and larger trains as well.

Increased capacity and service, therefore, directly obtains from existing tracks, terminals and equipment. Prominent examples of this are the electrification of the surburban service of the Pennsylvania Railroad at Philadelphia, and the heavy service of the Elkhorn Grade of the Norfolk & Western Railroad.

At Broad Street Station in Philadelphia, congestion due to growth in traffic, required a large increase in terminal facilities under steam operation—one that involved a large expenditure. Increase in capacity was obtained by elecrification of the suburban service of the main line and Chestnut Hill branch, without terminal changes and secured at a lesser investment than for terminal expansion. Moreover, there was a vast improvement in regularity and character of service. In fact, during the rigors of last winter, the electric service was conspicuously the only dependable service into this terminal. Multiple unit equipment is used, each car being a motor car with two motors totalling 450 h.p. Trains of three to ten cars are run.

The growth of traffic on the Norfolk & Western caused so great a congestion on the Elkhorn Grade as to limit the output of the celebrated Pocahontas coal field, from which a great part of the revenue of the whol railroad is derived. The topography of this section i such that either additional tracks or revision of line was practically impossible. Electrification has doubled the capacity of this division and, during the past severe winter, the freedom of movement of traffic over this section was markedly the easiest of the whole railroad. A noteworthy feature of this operation is the large size of trains and the expeditious manner in which they are handled. On the lesser grades, trains of 5000 tons are operated, and on the 2% grades, trains of 3250 tons, at twice the speed of former steam operation, with three large Mallet engines per train. Trains are accelerated to a speed of 14 m.p.h. on the 2% grade in a little over a minute—in fact to quote a brakeman on one of his first trips: " these trains start like a trolley car."

Relatively large amounts of power are used per train, the input during acceleration ordinarily equaling 12,000 h.p. Plans are under way to further increase the size of trains so that inputs as high as 18,000 h.p. will be reached.

The position of the Norfolk & Western Railroad, it should be understood, is somewhat unique, this being due to its being a large coal carrier with a large proportion of heavy steel rolling stock. For its tidewater service, for instance, they have standardized a car which holds 200,000 lbs. of coal. These are the largest cars in regular operation, a single car weighing, complete with load, about 130 tons. Many of the mining operations are adjacent to the heaviest grades, so that the service involves many stops with a full tonnage train. In order to speed up the movement quick starts are necessary.

The curvature of the electrified district is extremely heavy. In fact, there are only about two places in the whole zone where one end of the train may be seen from the other. On the heaviest grades a second locomotive is used as a pusher. On account of the length of train, curvature, and the intervening mountains, it was found to be very difficult to communicate to the pushers at the rear even by whistle, so that it was somewhat of a problem to secure the unison of effort between locomotives at each end necessary to start these large trains. This was finally secured by dropping the slack of the train back against the pusher, the bump being taken as the signal for the pusher

New York, New Haven & Hartford Railroad
High speed express service.

to open up and help start. The manner of operation, on the part of the road engine and pusher, in this service is somewhat interesting. At any fixed speed, the ammeters on the road engine and those on the pusher read alike, each engine taking its share of load. The proper indication is known for the different grades and sizes of trains, so that the road engine, which, of course, controls the movement of the train, shifts to more or less than its share of the load, depending on whether speeding up or slowing down is desired.

The operator of the pusher is thus advised instantly of such desire by the indication on his ammeter so that slow-downs, and stops as well, are negotiated very smoothly. Regeneration is also a very successful feature of this operation.

The financial returns are understood to show a satisfactory profit on the net investment, without taking into account the great value of increase in capacity, and are also understood to be better than the original conservative estimates of the road's consulting engineers.

The ability for service of electrical equipment, as compared with steam, is truly amazing. The reliability of power generation and of electric locomotives is astounding. A very notable example is the service of the Grand Trunk Railway through the St. Clair Tunnel; the first year's operation being accomplished with a total delay of seven minutes. Among other examples may be cited the record of the Pennsylvania-New York Terminal locomotives, which over a term of years averaged approximately 100,000 miles per locomotive detention. The length of time out of service necessary to insure reliable operation is comparatively small—a common schedule for inspection of electrical equipment is at the end of 3000 miles operation, while a much greater mileage is frequent and there are individual records as high as 10,000 to 12,000 miles.

New York, New Haven & Hartford Railroad
Fast freight service.

In heavy haulage particularly, the capacity for service of a single electric locomotive is ordinarily equal to three or four of the heaviest steam locomotives. During an emergency shortage of power, for instance, on the Norfolk & Western Railroad, it was found necessary to retire from service four electric locomotives: sixteen of the heaviest Mallet engines were assigned to the division to take their place. Railroad operation has naturally been built up and determined by the limitations of steam locomotives, involving the necessity for attention at approximately 100 mile intervals. Divisional and terminal points have grown up around these limitations, thus establishing conditions for assignment of train service, as well as engine labor. The absence of such limitation in the use of electric power secures great freedom in the operation of train service, so that it is entirely practicable to eliminate intermediate terminals, with the attending direct and incidental expense. On the Chicago, Milwaukee & St. Paul R.R., two such intermediate terminals on their 440 mile electrification have been eliminated.

The ever present necessity for increased efficiency in transportation has already brought about a very material increase in size of trains. With steam power this has been secured at great increase in size of locomotives, revision of line, reconstruction of bridges, etc. Undoubtedly, had electrification been available, much of this capital expenditure would have been obviated, owing to the flexibility with which electric power can be applied.

The steam locomotive, with its single boiler, of necessity, requires, in large powers, great concentration in weight, this affecting, directly, bridge and track conditions. An electric locomotive, on the other hand, is essentially an aggregation of subdivided power, possessing the capability of increasing the number of driving axles to an unlimited extent. Electric locomotives are now built up to twelve driving axles and a further increase is even contemplated.

In multiple unit service, as is well known, the driving axles are distributed throughout the entire train, control of the individual motors being secured through pilot wires in an electric train line. It is, therefore, obvious that there is no practical difficulty in the extension of an electric locomotive to any length which may be decided upon, resulting in great increase in power, and depending only on the number of driving axles.

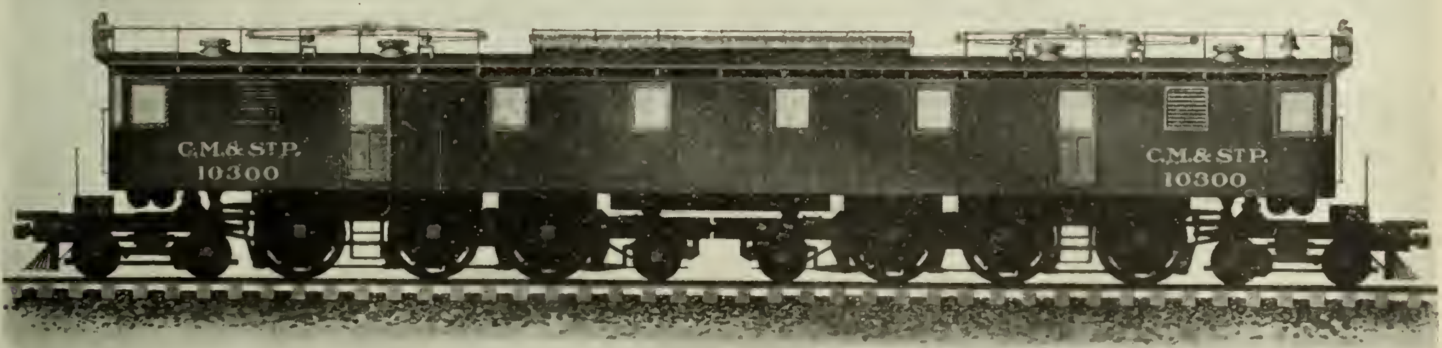
On electric locomotives, whether gearless, geared or of the side rod type, there is an entire absence of reciprocating parts, so that there is not the increase above dead weight on the axles due to reciprocating parts or their counterbalance. This increase, commonly amounting during each revolution to an additional load at the wheel of 50% above the actual weight, is technically termed "the dynamic augment." It should be permissible for the same effect upon track and structures to greatly increase the axle loading on electric locomotives, or, providing this were not undertaken, there should result a material reduction in track maintenance for the same axle weights.

The saving of fuel due to the use of electric power is, of course, complete in the case of hydro-electric supply and is 50% or more from steam-electric generating stations. This considerable saving is due both to the great efficiency of steam generation in large units under the economical arrangements obtaining in modern power-houses and to the avoidance of losses at the locomotive itself. An electric locomotive consumes power in proportion to its load and only when working. A steam locomotive is notoriously inefficient at light loads and large quantities of fuel are consumed in preparation for service and in keeping the engine hot at standstill or when no work is being done. The capacity of a steam locomotive is always dependent upon the grade of fuel used, skill with which the engine is fired, condition of flue and boiler surfaces, fire-box conditions, joints, packing, etc., and very largely upon temperature conditions, the capacity being very greatly reduced at low temperatures.

Generally speaking, a steam locomotive is in prime condition when new, or after a general overhauling, and suffers a progressive reduction in capacity until sent to the shop for general overhaul. On the other hand, with electric locomotives there is no diminution in capacity dependent upon the condition of the locomotive. In other words, if in condition for service, it is a 100% engine and in cold weather, the normal limitations, determined by temperature of the motors, are largely removed.

Along with its increase in size, a steam locomotive has developed far greater complications as a machine and, with very large locomotives especially, the time out of service reaches a high percentage. The difficulty and expense of maintenance are also very greatly increased. The upkeep and maintenance of steam locomotives has proven to be a very great burden, owing to the shortage of labor and particularly of skilled mechanics. The maintenance of electric locomotives, on the other hand, is accomplished with a surprisingly small amount of attention and expense; in fact, the repairs and renewal of the purely electrical equipment are almost insignificant if the apparatus is properly proportioned to the work, and its performance has been restricted to the limitations of its design Apparatus, when operating under such conditions, has service records of years with no expense whatever except that for cleaning, a little paint and a few brushes. For example, the Pennsylvania Terminal locomotives, in New York City, have been in operation for nearly ten years and the only work done on any of the motor windings up to date has been due to damage from a monkey-wrench left in a motor, or some other incident of a similar kind, but, of course, these cases have been most infrequent.

In order to secure this kind of service, discrimination and firm control of the operation of electric locomotives must be assured. The reason for this is that an electric motor is really a transformer; that is to say, it transforms electric power into mechanical work. It possesses the characteristic, however, that the limit to the work a motor will endeavor to perform is determined by the amount of electric power available. At standstill, this would amount to a short circuit condition; so that, between proper load and this condition, there is a wide opportunity for abuse to



Chicago, Milwaukee & St. Paul Railroad
Transcontinental passenger service.—Weight, 267 tons.

electrical equipment in its handling. Any motor is less rugged after such abuse and this is inevitably reflected, although in some cases deferred for a term of years, in ultimate failure of the windings.

The cost of maintenance of electrical equipment is, therefore, very largely determined by the history of its

Pennsylvania Railroad
Suburban service.—All coaches, motor cars.

operation. This limitation does not obtain, in any such corresponding degree, with steam locomotives and, in view of the newness of railroad electrification, has not been given universal consideration in the service exacted of electrical equipment. This, therefore, is a good reason for the disparity which exists in such figures as have developed upon maintenance costs of electric locomotives. However, with the growing appreciation of this condition, we may look to the future for low records of cost of maintenance of electric locomotives generally, equaling, and even surpassing, those which have been made in certain installations up to the present. Thus, it may be assumed that the saving in maintenance of electric locomotives, which is generally taken to be around 50%, will be materially increased as an average condition in the future.

The method of general railway electrification is now universally accepted, on this continent, as an overhead working conductor at high voltage. This is due to our method of working the railways, influenced, of course, by the conditions, as to location of tracks, stations, yard working, etc., obtaining on this continent. There has been a distinct advance in the character of overhead construction and there is promise of still further improvement, all in the direction of a more satisfactory working conductor at lower first cost. This is manifestly important, as affecting the investment, since the mileage of track, including that in yards, is enormous.

In these days of increased costs, that for the supply of electric power is almost alone in having been stationary or even reduced during recent years. This has been due to the economies obtained by the generation and distribution of large amounts of power.

The present seems to be a particularly opportune time for actively undertaking the extension of railway electrification for reasons which might be summarized as follows:—

(1) The necessity for freer movement of traffic over existing track facilities.

(2) The greater strength of rolling stock, permitting the operation of higher tonnage trains.

(3) The availability of large amounts of electric power now produced at advantageous cost.

(4) The greatly enhanced cost of fuel which is believed will remain permanently at a high figure.

(5) The need for more expeditious movement of trains, due to the modified conditions in the employment of labor in train service.

(6) The general shortage of both skilled and unskilled labor available for railroad operation and maintenance.

(7) Recognition of need of increased capacity for movement of traffic, thereby avoiding embargoes and removing the restriction of growth and general prosperity.

The transportation problem is unquestionably one of our major problems of the present. We now realize, better than ever before, the value of planning for our future and this applies with great force to transportation. For its relief, railroad electrification should be one of the most important factors. The problem is a large one and, for its solution, engineering skill and breadth of vision of the highest order should be applied.

Discussion on Railway Electrification

H. H. Vaughan, M.E.I.C.: Mr. President, ladies and gentlemen, owing to the fact that I have not been connected with railway work during the last three years, I feel exceedingly 'rusty' on the question of the electrification of railways. One loses touch with a subject of this kind when he does not think of it to any great extent for a considerable time. But, I have been discussing electrification since about 1900, and, while our electrical friends were prophesying that the steam locomotive would soon be only of historic interest, as Mr. Shepard did to-day—and Mr. Shepard has grown from the slim young man you saw in the picture to what he is to-day—the steam locomotive is

Pennsylvania Railroad
Heavy freight service.—Maximum output during acceleration 7,000 horse power.

still going on. My chief connection with this question came when I was with the C.P.R. I do not mind telling you, now that I am away from the road, that it was always a great ambition with me to electrify some part of the C.P.R. I always had the greatest interest in the designing of electric locomotives. I had the pleasure of knowing several electrical engineers very intimately, and I would naturally have liked to have been connected with some electrification scheme. I would have liked to undertake this work from another point of view, and that is that I always believed, even from the first, that the reliability of the electric locomotive would be very much greater than that of the steam locomotive. One of the curses and troubles of the railroad man is the daily statement of engine troubles. The electrical locomotive has done a great deal to make the lives of railway men happier, on account of the better service given by the electrical locomotive.

We used to discuss the cost of repairs and fuel. I have never believed that, with a normal electrical service,

Norfolk & Western Railroad
Elkhorn Grade Electrification
Coal train of cars weighing 130 tons each with load.

the saving of fuel would be as great as our electrical friends tell us. Figures of coal consumption that are given are very frequently those for a service in which steam locomotives are notoriously inefficient, as on certain portions of the Chicago, Milwaukee and St. Paul Railroad. When we come down to a normal service, such as that from here to Montreal, or from here to Winnipeg, it is not unusual to get down, on fairly level divisions, to from 80 pounds of coal per thousand ton miles, up to 120 pounds of coal on a one per cent ruling grade division. I have seen the figures of the Smiths' Falls section, and they were down to 70 pounds per thousand ton miles. My recollection is that 20 kilowatt-hours per ton mile would be a very good figure on this service, and that means that your kilowatt-hour has to be distributed to the trains at 3½ lbs. of coal per kilowatt-hour on a 24 hour service. There is a saving, but it is not as great in high-grade railway service as it is commonly understood to be. The figures are frequently collected from conditions under which the electrical locomotive is peculiarly efficient.

The item of repairs is another matter that comes in. If you wanted to equip a division of a railway with entirely new locomotives, you would have surprisingly low cost repairs for the first four or five years. In equipping a railway for electrical railway service, the machinery is all new. The steam locomotive is generally very light on repairs for the first three or four years. It then comes to the point where it gets down to a steady, average cost for the next ten or twelve years. It then often requires rebuilding, or partial reconstruction, which sends the cost up again for a short period, after which it comes down again to the normal amount for another ten or twelve years. We have not got to that yet in the development of any high-grade electrical service. It always seems to me that wheels, motors, and the various apparatus, will require renewing, and that the renewals will correspond, more or less, with the renewals of wheels and boilers of steam locomotives, after ten, twelve, or fourteen years service. The tables, which were shown on the sheet, gave four and a half cents per locomotive mile, for locomotives averaging 100 tons. Steam locomotives in the same service would cost 100 to 150 per cent more than that, but the steam locomotive cost would be derived from the average of locomotives and not from entirely new ones. As a matter of fact, the designs of electric locomotives, that are being developed now, follow so closely the steam locomotive wheel arrangement that the only difference is that you are substituting for the cylinders and boilers of the steam locomotive, the motor and drive gear of the electrical locomotive. The boiler and cylinders are not the only things that cost money on the steam locomotive. It is the general maintenance and upkeep of the entire locomotive that costs. However, I do not say that the electrical locomotive will cost as much as the steam locomotive. I do not think it will, but I do not believe that it will be so far below the cost of our steam locomotives as some of the estimates of our electrical friend would indicate.

On the C.P.R. we investigated the question of electrification and, as I was concerned, I know what occurred. I was really quite interested in it. We did not oppose it. We did feel that the contingent advantages, such as smoke avoidance, delays, the increase of suburban traffic in the Rocky Mountains, and things of that kind, made it important that the matter should be very carefully studied. We figured it out for the Quebec section. There was a twenty-five cycle generating set at Shawinigan, and it looked as if we could use the single phase on the Quebec section advantageously. We could have secured the advantages, which Mr. Shepard spoke of, in getting more power out of a given axle load, and in getting the capacity that was required on the Quebec section, while retaining the old bridges and the old construction, by using electrical locomotives. But, when we came to figure it out, we found that we could obtain almost the same practical results by strengthening our bridges and investing in a heavier class of equipment. The management decided to do that, and to put the line in first-class shape, rather than to keep the old line and to make an equal investment in electrification. That is the way we figured it out.

Then, we figured out the Fort William-Winnipeg section, and it was very difficult to show results. Some five years ago the Connaught Tunnel came under our consideration, and we figured up the electrification from Beaver to Albert Canyon. We were unable to show a saving by electrification in that case, even if the traffic should be absolutely doubled. The traffic figures taken were rather greater than we could expect in the future. The result was that that was turned down and steam traction was continued through the Connaught Tunnel. One other thing I figured out was the electrification of the C.P.R. from Smiths Falls to Montreal, including the Montreal terminals. Mr. Shaw and myself figured that out and tried to get the management interested in it. We could have utilized the Cedar Rapids power line which could have been thrown across the Smiths Falls,-Montreal section, and we could have avoided an immense amount of expense in connection with the Montreal terminals. I think the figures will prove that the electrification of this section, with the traffic there is, will be a paying proposition. The great trouble about electrification, and the

New York, New Haven & Hartford Railroad
Trolley construction for six-track line.

one that makes railway men hesitate, is the enormous investment required. Mr. Shepard spoke of the financial trouble. The financial trouble is the biggest trouble in the world. It is not so much opposition on the part of the financial man, as it is the fact that, unless you can really justify the investment of the amount of capital required, it is an unhealthy thing to go into. You have to show a positive saving when you ask a railway company to invest the enormous amount of money that is required for the electrification of any considerable portion of its line.

In connection with that, one of the great disadvantages of electrification is the inflexibility of the system. The most of the arguments in favour of electrification, that apply to the conditions of an electrical drive in a factory, do not apply to the conditions on a railway. In putting an electrical drive in a factory, you can put your motor down at any place and connect it up with a wire. But, when you get a railway electrified, you have a large investment in one district. A railway company must be sure of making money when it invests money. That seems to be becoming more or less difficult, especially in the United States, with the restrictions that have been put on railway profits. If a man has a million dollars to spend and he has bought fifty additional locomotives, they can be swung from one district to another, as necessity arises. In the one case his million dollars is tied up in one particular district where he may make seven and half per cent on the investment, whereas, in the other case, his million dollars is spread all over the whole system, and he may make twenty-five per cent on the additional investment.

I do think, however, that our railway men and financial men do not look at this electrification problem in the right light. They look at it altogether from the dollars and cents point of view now. That is the natural way, and in a sense, is the proper business way to look at any proposition. I would firmly agree with that proposition when it comes to a question of substituting, for the steam locomotive, a steam power plant, and using coal for generating electricity, but in this country, where we have such a magnificent supply of water power, I believe it would be wise foresight for our railway people to invest money in electrification and to utilize that water power, instead of burning up the supply of coal which, in the days to come, will be needed by our descendants and who, if we consume it now, will bitterly regret the wastefulness of which we have been guilty.

We can justify electrification if we take into account its contingent advantages and give it credit for all the saving that it can make. I believe, if that was done, the railways and railway engineers would find that it would pay to go ahead with the work of electrification.

Comments on Mr. Vaughan's Discussion

W. G. Gordon, Transportation Engineer, Canadian General Electric Co., Ltd.: I cannot agree with Mr. Vaughan that the maintenance of steam and electric locomotives over a period of 12 or 14 years could nearly approach each other.

The steam locomotive is a complex moving power plant. Apart from wheel wear, the maintenance of the motors—the new motors being built for this service are gearless—and the control apparatus must remain constantly low on the electric locomotive. All current is broken on arcing metal tips which are replacable at very small cost. How small the matter of wear on the control amounts to has been pointed out in the electric locomotive requiring inspection only every 3000 miles, and operating as high as 33,000 miles per locomotive detention.

Mr. Vaughan's experience, as he admits, with electrification projects is several years old. Much has been done in the last two years to cut down the total operating costs with electrification by the development of the automatic sub-station and quick acting circuit breaker, doing away with sub-station attendance formerly required. Heavy overload peaks are also eliminated by the dual control of the dispatcher over trains and power as described in my paper.

F. H. Shepard. — It is to be regretted that Mr. Vaughan has not been connected with the analysis of railway electrification problems during the past three years.

In his conclusion that railway and financial men do not look at these problems in the right light, I heartily concur. The weak point in the electrification analyses, Mr. Vaughan refers to, has been the limitations under which they were more or less arbitrarily studied. These points are peculiarly those established through practice with the steam locomotive. Electrification is, of course, a major change and involves a large investment not unlike that involved in construction of terminals, second track, and new lines. The justification of these latter is almost never determined by the prospect of immediate return, but rather by that determination which governs the expansion of, and provision for, facilities for a *first-class railroad.*

Electric operation will secure its greatest return when the investment is kept working, and again, electrification increases the ability to get work out of existing railway facilities. These are larger propositions than the question of fuel-saving and engine repairs.

Since Mr. Vaughan's activity on this question, there has come to exist a broader view of the electrification proposition as well as a change in the relationship of labor to traffic movement and maintenance, which materially augments such advantages as were considered during Mr. Vaughan's experience.

There is no disposition to deny the great improvement in steam locomotive practice during recent years or that its field will be one of great extent for many years to come. In the meantime, the electrical art is advancing, the design and efficiency of electric locomotives are improving and, with the necessities due to the growth of business and changing conditions, the advantages fundamental to electrification are continually increasing at an accelerated rate.

I hope Mr. Vaughan will again have substantial interest in this development.

Mineral Springs of Canada Described

Bulletin issued by Mines Branch says Waters equal to Europe's Spas.

In a bulletin issued by the Mines Branch, Department of Mines, and prepared by R. T. Elworthy, B.Sc., on the chemical character of Canadian mineral springs, it is stated that " It is probable that Canadian waters will be found equal in every respect to any of the famous European waters."

" Not more than a dozen mineral spring resorts in Canada are open at the present time," says the bulletin. " Several have been temporarily closed on account of the falling off in business due to war conditions.

" Passing from east to west, Abenakis Springs, Quebec on the St. Francois river, in Yamaska county, is one of the few health resorts in Quebec. The springs yield saline waters and somewhat resemble those of Kissingen or Nauheim spas in Germany. A sanatorium is also established at Potton Springs, in Brome county, Que. Potton sulphur spring is a calcic, alkaline (sulphuretted) water.

" Caledonia Springs is the site of a hotel and sanatorium, under the management of the Canadian Pacific Railway. The hotel is situated close to three of the springs—the Caledonia saline, sulphur, and gas springs.

"A sanatorium is established at Carlesbad Springs, near Ottawa. The springs range from alkaline to strongly saline, with intermediate mixtures of the two types of waters.

" St. Catharines, near Niagara Falls, is one of the oldest of Canadian mineral spring resorts. One spring is reported to have been in use since 1812. Several sanatoria enable visitors to utilize the waters with the greatest benefit. The springs yield strongly saline, bromic, and iodic waters, and resemble the famous waters of Kreuznach, Prussia.

"A sanatorium is also situated at Winnipeg; the Winnipeg Mineral Springs Sanatorium, under the direction of Dr. A. D. Carscallen.

" The most famous of all Canadian springs is undoubtedly the group of hot sulphur springs at Banff, Alta. A sanatorium has been established in Banff for many years, and a modern hydropathic establishment has lately been built, besides the provision made at Banff Springs hotel for many of the special European baths and massage.

" There are seven hot springs in the neighbourhood of Banff. They may be all classified as moderately mineralized, calcic, sulphated, saline (sulphuretted) waters. Save in the Basin Spring water, calcium sulphate forms about 60 per cent, magnesium sulphate 18 per cent, and calcium bicarbonate about 15 per cent of the total solid matter in solution. The waters somewhat resemble those of the famous Bath Hot Springs in England, and would, therefore, be of similar therapeutic value.

" Harrison Hot Springs, famed in the West for their curative properties, have not as yet been examined, nor the noted Halcyon Hot Springs on Arrow Lake, B.C. Hotels are situated at both these springs."

* * *

On April 16th the Ottawa branch of the Canadian Building and Construction Industries was formed in the Chateau Laurier where nearly one hundred Ottawa contractors and supply dealers were present. J. P. Angin, President of the Association, was president and addressed the meeting followed by A. S. Clarson, A.M.E.I.C., general secretary of the association who discussed the reconstruction problem and the aims of the organization. A representative from each line of contractors and supply dealers was appointed on an executive committee to interview the Minister of Labor on the labor question and appoint a council to meet representatives of organized labor to arrange a compromise should any trouble arise.

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

VOL. II. MAY 1919 No. 5

The Salary Situation

Members throughout Canada are eagerly awaiting news regarding what the Dominion Government proposes in connection with increasing the salaries of engineers and technical men employed by the Government. This is a matter which concerns every member of *The Institute*, either directly or indirectly, and is also one in which every member can give assistance. In the last number of *The Journal*, following the direction of Council, a notice was inserted asking every member to use his influence in this connection. From that time up to the present no definite information has been received as to what the Government proposes apart from the fact that an announcement has been made that a Bill is to be brought before the House embodying the recommendation of the experts of the Civil Service Commission.

As an evidence of the interest which this question has aroused, practically every branch has notified headquarters that local members of Parliament have been interviewed and their promise of favorable consideration for support to the engineering profession has been received.

There is still a lot to be done.

Every branch, besides securing influence of the members of the Federal House representing its district, has an opportunity of enlisting the support of the public through the press, for no fair-minded editor, on being presented with the facts, would refuse to lend his support to such a worthy cause.

In connection with this question, the chairman of a committee on salaries in one of the branches writes that he has never seen a committee take up a problem with such earnestness and such enthusiasm, so that successful results are expected.

The problem of increased salaries for technical men involves more than a mere increase in monetary award, as a failure, at this time, to secure such a result means a continuance of the lack of recognition of the value of engineering training and knowledge to the country. It means, further, the continued humiliation of having highly educated, trained, technical men, in positions of responsibility, earning less than the mechanic or foreman under their charge. Surely we are not going to allow this condition to continue.

So strongly do some of the members of Parliament feel on this subject that a number of men have pledged themselves to do their utmost to secure a more equitable basis of remuneration. These supporters are being supplied with information by a committee of the Ottawa Branch and are being well-grounded in the merits of our case.

Whatever differences of opinion members may have on questions of legislation and other subjects, it is universally agreed that here is one problem upon which all can act in hearty accord and to which we should all direct our efforts.

Engineers to the Fore

In an account of an address on water power projects given by K. H. Smith, A.M.E.I.C., Secretary-Treasurer of the Halifax Branch before the Commercial Club of Pictou, Nova Scotia, the *New Glasgow Enterprise*, which devoted several columns to an account of Mr. Smith's address, stated that what most impressed the audience was the fact that people are just beginning to realize that the brainy engineer with a vision will be far more valuable than most other professions during the coming era. The nations of the world are looking forward to material progress to aid them to recover from the losses of the war and no body of men is more greatly needed than engineers to carry on this work.

If, in the face of a tribute such as this, popular appreciation existed to such an extent that the engineer might be enabled to collect at least a reasonable share of the amount he earns, it would give rise to a condition of affairs towards which we have been looking for many years and which it is hoped may before long be attained

AN ACT RESPECTING THE ENGINEERING PROFESSION

In accordance with a resolution passed at the Annual Meeting in Ottawa on the 12th of February, 1919, providing for the formation of a special committee composed of one delegate appointed by each branch, this committee met at ten o'clock on the morning of Saturday, April 5th, with C. E. W. Dodwell, Chairman, and A. Surveyer, Secretary.

The concrete result of the labours of this committee after three sessions daily for five days, is a tentative Bill which is printed below for the information of members of *The Institute.* A ballot will be issued to all the members in accordance with the resolution calling for its approval, or otherwise, by the corporate membership.

THE PROPOSED ACT.

Whereas it is considered advisable to establish by legislation the qualifications necessary to permit persons to act or practise as Professional Engineers.

Now, therefore, His Majesty, by and with the advice and consent of the Legislature of the Province of ...., enacts as follows:—

Short Title

1. This Act may be cited as the "Engineering Profession Act."

Interpretation

2. In this Act, unless the context otherwise requires, the expression:—

(*a*) "Professional Engineer" means any person registered as a Professional Engineer under the provisions of this Act.

(*b*) The practice of a Professional Engineer within the meaning of this Act embraces advising on, making measurements for, laying out and the design and supervision of the construction, enlargement, alteration, improvements or repairs of public and private utilities, railways, bridges, tunnels, highways, roads, canals, harbours, harbour works, river improvements, lighthouses, wet docks, dry docks, dredges, cranes, floating docks, and other similar works, steam engines, turbines, pumps, internal combustion engines, and other similar mechanical structures, air ships and aeroplanes, electrical machinery and apparatus, chemical and metallurgical machinery, and works for the development, transmission or application of power, mining operations and apparatus for carrying out such operations, municipal works, irrigation works, water works, water purification plants, sewerage works, sewage disposal works, drainage works, incinerators, hydraulic works, and all other engineering works. The execution as a contractor of work designed by a Professional Engineer, or the supervision of the construction of work as a foreman or superintendent, or as an inspector, or as a roadmaster, track master, bridge or building master, or superintendent of maintenance shall not be deemed to be the practice of a Professional Engineer within the meaning of this Act.

(*c*) "The Association" means the Association of Professional Engineers of the Province of ....

(*d*) "Council" means the Executive Council of the Association.

(*e*) "President" means the President of the Association.

(*f*) "Registrar" means the Registrar of the Association.

(*g*) "The Secretary" means the Secretary-Treasurer of the Association.

(*h*) "Board" means the Board of Examiners of the Association.

The Association of Professional Engineers of the Province of ....

3. (*a*) All persons registered as Professional Engineers under the provisions of this Act shall constitute the Association of Professional Engineers of the Province of ...., and shall be a body politic and corporate, with perpetual succession and common seal.

(*b*) The seat of the Association shall be at ....

4. The Association shall have power to acquire and hold real estate not producing at any time an annual income in excess of ten thousand ($10,000.00) dollars, and to alienate, mortgage, lease or otherwise charge or dispose of such real estate or any part thereof as occasion may require; and all fees, fines and penalties receivable and recoverable under this Act shall belong to the Association.

5. The Association may pass By-laws not inconsistent with the provisions of this Act for:—

(*a*) The government, discipline and honour of the Members.

(*b*) The management of its property.

(*c*) The maintenance of the Association by levying fees not in excess of $5.00 per annum.

(*d*) The examination and admission of candidates to the study and practice of the profession.

(e) All other purposes reasonably necessary for the management of the Association.

6. All By-laws or amendments thereto shall become effective only after ratification by two-thirds majority of the votes received from the Members of the Association in good standing.

Who May Practise

7. (*a*) Only such persons who are Members of the Association hereby incorporated and registered as such under the provisions of this Act, or who have received a license from the Council of the Association as hereafter provided, shall be entitled, within the Province of ...., to take and use the title of "Professional Engineer" or any abbreviation thereof, or to practise as a "Professional Engineer."

(*b*) Any person residing in the Province of .... at the date of the passing of this Act, who is at that date and has been for five years previously practising as a Professional Engineer shall be entitled to be duly registered as a Member of the Association without examination, provided that such person shall produce to the Council, within one (1) year of the passing of this Act, satisfactory credentials of having so practised.

(*c*) Any person who may come to reside in the Province of .... and who at that time is a duly registered Member of an Association of Engineers similarly constituted of any other Province of the Dominion of Canada, may become a duly registered Member of the Association without payment of fee for that year providing he shall produce to the Council a Certificate of Membership in good standing in such Province, and an application for Transfer of Registry endorsed by the Registrar of the Province in which he lately resided.

(*d*) Any person not otherwise qualified as hereinbefore mentioned, residing in the Province of.......... and who may desire to become a registered member of the Association shall make application to the Council, and shall submit to an examination, or shall submit credentials in lieu of examination, whichever the Council may decide, and shall be admitted to Registry as a Member of the Association on payment of prescribed fees after the Council shall have certified in writing that such examination or credentials have been found satisfactory to it.

(*e*) Any person not residing in the Province of ...., who is a registered member of an Association of Engineers similarly constituted of any other Province of the Dominion of Canada, shall obtain from the Registrar a license to practise as a Professional Engineer in the Province of .... upon production of evidence of his registry in such other Province, and upon payment of a fee of one dollar. In the event of such person being unable, by reason of emergency or neglect on the part of the Registrar or for any other good and sufficient reason, to obtain such license within three (3) months of his making application therefor, he shall be entitled to practise as a Professional Engineer in the Province for such period of three months without holding such license.

(*f*) Any person who is not a resident of Canada, but who is a Member of any engineering or technical organization or society of standing, recognized by the Council, may obtain a license to act in an advisory or consultative capacity to a registered member of the Association.

(*g*) Any person who is employed as a Professional Engineer by a public service corporation, a private corporation, public utilities or Government department, whose business is normally carried on in two or more of the Provinces of Canada, and who is by reason of his employment required to practise as a Professional Engineer in other Provinces than that of his residence, may so practise in the Province of ...., without holding a non-resident license, or payment of fee, providing such person can on demand of the Council produce credentials satisfactory to the Council showing that he is a registered member of an Association of Engineers similarly constituted of some other Province of Canada. It shall be the duty of such person to produce such credentials whenever so required by the Council.

(*h*) Any Professional Engineer who is a resident of some other Province of Canada in which there is no Association of Engineers similarly constituted, may obtain a license to practise, subject to the discretion of the Council.

(*i*) Assistants working under the direct supervision of a Professional Engineer and not taking responsibility for their work other than to their direct superiors shall not be deemed to be practising as Professional Engineers when so engaged.

(*j*) The provisions of this Act shall not apply against any person employed in actual service in His Majesty's Naval, Military or Aerial Service.

(*k*) In the case of Engineers who were practising in the Province of ...., and who have been accepted for overseas service in the present war in the forces of Great Britain, or any of her Allies, shall on their return to Canada be entitled to all the rights and privileges conferred under sub-section "b" of Section 7.

Partnership

8. In the case of two or more persons carrying on practice as Professional Engineers in co-partnership only such members who are registered or licensed under this Act, shall individually assume the function of a Professional Engineer. A firm as such cannot be deemed to be a Member of the Association or be licensed to practise.

Administration

9. (*a*) There shall be a Council of Management of the Association to consist of a President, Vice-President and .... Councillors, to be elected by the Association, and hold office as hereinafter provided. All Members of the Council shall be registered under the provisions of this Act.

(*b*) The President shall be elected annually and shall hold office until his successor is elected. He shall act as presiding officer at the meetings of the Council and of the Association, voting only when the votes are evenly divided. On retirement he shall hold office as Councillor for the next year succeeding.

(*c*) The Vice-President shall be elected annually and shall have all the powers of the President during the absence of the latter.

(*d*) .... Councillors shall be elected for the first year after the coming into effect of this Act; thereafter only .... Councillors shall be elected each year. The .... Councillors receiving the largest number of votes at each annual election, after the first election, shall act for two years.

Suspension for Misconduct

10. (*a*) The Council may, in its discretion, reprimand, censure or suspend or expel from the Association any Engineer guilty of unprofessional conduct, negligence, or misconduct in the execution of the duties of his office, or convicted of a criminal offence by any Court of competent jurisdiction.

The Council shall not take any such action until a complaint under oath has been filed with the Registrar and a copy thereof forwarded to the party accused. The Council shall not suspend or expel an Engineer without having previously summoned him to appear to be heard in his defence, nor without having heard evidence under oath offered in support of the complaint or on behalf of the Engineer. The Council shall have the same powers as the .... Court to compel witnesses to appear and to answer under oath in the manner and under the penalties prescribed by the code of .... The President of the Council or person acting as such in his absence, or the Secretary, is hereby authorized to administer oaths in such cases. All evidence shall be taken in writing or by a duly qualified stenographer.

(*b*) Any Engineer so expelled or dismissed may, within thirty days after the order or resolution of suspension or expulsion, appeal to a judge of the Supreme Court from such order or resolution, giving seven days' notice of appeal to the Council, and may require the evidence taken to be filed with the proper officer of the Court, whereupon such judge shall decide the matter of appeal upon the evidence so filed and confirm or set aside such suspension or expulsion, without any further right of appeal; and if the suspension or expulsion be confirmed, the costs of such appeal shall be borne by the Engineer.

(*c*) Unless the order or resolution of suspension is set aside on such appeal, or the judge or the Council otherwise order, the Engineer so suspended or expelled shall not practise further, except (in case of suspension) upon expiry of the period of suspension. Pending an appeal the Engineer so suspended or expelled shall not practise.

Penalties

11. Any person who not being a registered or licensed Professional Engineer in the Province or who is suspended or has been expelled under the proceedings of the next preceding section:

(*a*) Practises as a Professional Engineer; or,

(*b*) Usurps the functions of a Professional Engineer; or,

(*c*) Assumes verbally or otherwise the title of Professional Engineer, or makes use of any abbreviation of such title, or of any name, title, or designation which may lead to the belief that he is a Professional Engineer, or a member of the Association; or,

(*d*) Advertises himself as such in any way or by any means; or,

(*e*) Acts in such manner as to lead to the belief that he is authorized to fulfil the office of or to act as a Professional Engineer,

shall be liable upon summary conviction to a fine of not less than $100.00, nor more than $200.00, and on failure to pay the same to imprisonment for not more than three months for the first offence, and for any subsequent offence to a fine of not less than $200.00 nor more than $500.00, and on failure to pay the same to imprisonment for not more than six months.

Evidence

12. The certificate of the Registrar under the seal of the Association shall be *prima facie* evidence of registration or license, or non-registration, as the case may be.

Examinations

13. The Board of Examiners shall be nominated and appointed annually by the Council, subject to such approval as the Government of the Province may require.

14. (*a*) Examinations of candidates for registration or license shall be held as often and at such places as the Council may direct.

(*b*) The scope of the examinations and the methods of procedure shall be prescribed by the Council with special reference to the applicant's ability to design and supervise engineering works which shall insure the safety of life and property.

(*c*) The candidate shall submit to examination before the Board on the Theory and Practice of Engineering, especially in one or more of the recognized branches of engineering at his option.

(*d*) As soon as possible after the close of each examination the Members of the Board who shall have conducted such examination shall make and file with the Secretary a certificate stating the result of such examinations, whereupon the Council shall notify each candidate of the result of his examination and of their decision upon his application.

(*e*) A candidate failing on examination may after an interval of not less than one year be examined again.

(*f*) The Council shall, from time to time, prescribe the fees payable by candidates for examination.

Registration Without Examination

15. The Council shall consider an application for registration or license from any person who submits proof of qualifications possessed by such person by virture of experience, training or examination by another examining body of recognized standing.

16. The Council shall have power to establish conjointly with any Council of any Association similarly constituted in one or more of the Provinces of Canada, a Central Examining Board, and to delegate to such Central Examining Board all or any of the powers possessed by the said Council respecting the examinations of candidates for admission to practise, provided that any examination conducted by such Central Examining Board shall be held at least in one place within this Province.

17. The board shall examine all degrees, diplomas, certificates and other credentials presented or given in evidence for the purposes of obtaining registration or license to practise, and may require the holder of such credentials to attest by oath or by affidavit on any matter involved in his application.

18. (*a*) Notwithstanding any other provision of this Act, no person shall be registered unless at least twenty-three (23) years of age, and unless he has been engaged for

eight (8) years in some branch of engineering, except in the case of a graduate from a recognized Engineering College, in which case the period of engagement in engineering work shall be reduced to six (6) years, which may include his term of instruction.

(*b*) Candidates for admission to practise who, for any reason, have been unable to take advantage of an academic engineering course, must serve at least six (6) years under a registered Engineer or under a Professional Engineer of recognized standing, and pass a preliminary examination satisfactory to the Board.

19. The Registrar shall issue a certificate of registration or a license to practise to an accepted candidate upon written instructions from the Council, and upon payment in advance of the prescribed fee by the candidate.

20. The Registrar shall keep his register correct, in accordance with the provisions of this Act, and the rules, orders and regulations of the Council.

21. (*a*) Each person who is registered or licensed to practise shall pay in advance to the Secretary-Treasurer, or any person deputed by the Council to receive it, such annual fee as may be determined by By-laws of the Association, which fee shall be deemed to be a debt due by the practitioner and to be recoverable with the costs of same in the name of the Council in any court of competent jurisdiction.

(b) If any registered practitioner omit to pay the prescribed annual fee within six months of the date upon which it became due, the Registrar shall cause the name of such practitioner to be erased from the register, and such practitioner shall thereupon cease to be deemed to be a registered practitioner; but such practitioner shall, at any time thereafter, upon paying such fee, be entitled to all his rights and privileges as a registered practitioner from the time of such payment.

(*c*) The Registrar shall not be required to issue a license to practise to any non-resident practitioner otherwise entitled to such license unless the fee provided for by the By-laws of the Association shall have been previously paid.

22. Any person entitled to be registered under this Act who shall neglect or omit to be so registered shall not be entitled to any of the rights and privileges conferred by the provisions of this Act so long as such neglect or omission shall continue.

23. In the case of any refusal by the Council to register the name of any person as a Member of the Association, or of refusal to issue a license to practise, the person aggrieved shall have the right to apply to a judge of the Supreme Court, who, upon due cause shown, may issue an order to the Council to register the name of such person, or to grant him a license to practise, or make such other order upon such appeal as may be warranted by the facts, and the Council shall forthwith comply with such order. Such order when so made shall be final.

24. If the Registrar makes or causes to be made any wilful falsification in any matters relating to the register, he shall forfeit a sum of not less than one hundred dollars ($100.00).

25. If any person shall wilfully procure or attempt to procure himself to be registered or licensed under this Act, by making or producing, or causing to be made or produced any false or fraudulent representations or declaration, either verbally or in writing, every such person so doing, and every person knowingly aiding and assisting him therein, shall forfeit and pay a sum of not less than one hundred dollars.

26. All penalties imposed under this Act, or any of them, and all sums of money forfeited shall be recoverable with costs under the provisions of the law respecting summary convictions.

27. Any information for the recovery of any such penalty or forfeiture may be laid by any Member of the Association or by any person appointed by the Council.

28. Any sum forfeited under this act being recovered shall belong to the Association for the use thereof under this Act.

29. No prosecution shall be commenced for any offence against this Act after one year from the date of committing the offence.

30. The following persons are hereby constituted a Provisional Council of the Association:—

President....................................

Vice-President...............................

Councillors..................................

....

....

The duties of the Provisional Council shall be to provide the register called for by this Act, to enter therein the names of those who are entitled to registration and who apply therefor under the provisions of Section 7, clause "b," and to call within six months from the coming into force of this Act the first General Meeting of the Association for those purposes and any other organization purposes of the Association; they shall have the powers conferred in this Act on the Council of the Association. Their powers shall cease on the election of the regular Council of the Association.

31. No provisions of this Act restricting the practise of the profession or imposing penalties shall take effect until one year after the passing of this Act.

32. Every person registered under this Act shall have a seal, the impression of which shall contain the name of the engineer and the words "Registered Engineer, Province of ...." with which he shall stamp all official documents and plans.

33. The activities of the Association are hereby restricted to the functions necessary to the administration of this Act.

Professional Engineers

On another page will be found a copy of the draft act submitted by a special committe of the branches, which is designed to establish a body of professional engineers in Canada. The committee who drew up this act as a result of the resolution of the annual meeting were:—C. E. W. Dodwell, M.E.I.C., Chairman; A. Surveyer, M.E.I.C., Secretary; C. C. Kirby, M.E.I.C.; A. R. Decary, M.E.I.C.; R. F. Uniacke, M.E.I.C.; Willis Chipman, M.E.I.C.; E. R. Gray, M.E.I.C.; N. L. Somers, A.M.E.I.C.; E. E. Brydone-Jack, M.E.I.C.; H. R. McKenzie, M.E.I.C.; F. H. Peters, M.E.I.C.; R. J. Gibb, M.E.I.C.; A. G. Dalzell, A.M.E.I.C.; and A. E. Foreman, M.E.I.C.

The western delegates met at Winnipeg en route to Montreal and spent two days together discussing the broad subject of legislation. No group of men could have worked harder than the men sent by the different branches for this purpose. It is to be noted that the members of *The Institute* are given no preference whatsoever in this proposal, while the expense of this meeting is being borne entirely by *The Institute;* that is, *The Institute* is unselfishly working in the interests of the whole profession. Other organizations in Canada, comprising professional engineers, will no doubt appreciate the work of *The Institute* in this connection.

A ballot will be submitted to the members very shortly and the result of this ballot will doubtless determine what action the various provinces will take in connection with legislative enactments.

Results of Memorial

A memorial published in the April issue of *The Journal*, which was forwarded to the Premier of Canada and to the Prime Ministers of the various provinces, have brought a number of replies, all of which promise consideration to the situation as outlined in the memorial. Space does not permit publishing the various replies. That of Sir Lomer Gouin, Prime Minister of the Province of Quebec is particularly encouraging. It reads:—

Dear Sir:—

I have received the memorial of the Engineering Institute of Canada, dated April 5th instant. Do I need to tell you that I am pleased to recognize the great utility of technicians at all times, but especially during the difficult times through which we are passing. It is because I appreciate their value that I have always tried to encourage both technical and polytechnical education in the Province. You may rest assured that we will always be glad to have recourse to the skill of civil engineers whenever the occasion presents itself.

Yours very truly,

(Signed) LOMER GOUIN.

It was reported that Yarrow Limited will gradually discontinue their great shipbuilding on the Clyde and complete their work at Esquimalt, B.C., due to the better industrial prospects of British Columbia. The Times' shipping correspondent, describing a recent visit to Vancouver, contrasts the activity of Tacama and Seattle to the comparative stagnation of Victoria and Vancouver, and insists on the capacity for development of the latter's shipbuilding plant, including Yarrow's, which was acquired from the British Marine Railway Company five years ago. Yarrow's managing director is at present in Vancouver, it is stated, preparing for its removal.

The Special Legislation Committee of the Institute which drew up the proposed bill for professional engineers during its sessions at the headquarters of the Institute from April 5th to the 10th, reading from left to right:

Arthur Surveyer, M.E.I.C., Montreal, Secretary of the Committe; E. E. Brydone-Jack, M.E.I.C., Winnipeg, Man., R. J. Gibb, M.E.I.C., Edmonton, Alta., F. H. Peters, M.E.I.C., Calgary, Alta., R. F. Uniacke, M.E.I.C., Ottawa, Ont., E. R. Gray, M.E.I.C., Hamilton, Ont., A. R. Decary, M.E.I.C., Quebec, Que., Newton L. Somers, A.M.E.I.C., Sault Ste Marie, Ont., A. E. Foreman, M.E.I.C., Victoria, B.C., H. R. McKenzie, M.E.I.C., Regina, Sask., C. C. Kirby, M.E.I.C., St. John, N.B., Willis Chipman, M.E.I.C., Toronto, Ont. and in the foreground C. E. W. Dodwell, M.E.I.C., Halifax, Chairman of the Committee. A. G. Dalzell, A.M.E.I.C. Vancouver, was present at the early sessions of the committee.

REPORT OF COUNCIL MEETINGS

On April 7th the meeting of the Council adjourned from March 25th was held at headquarters and was attended by nine members of Council.

Soldiers Civil Re-establishment: Major George Reilly, on behalf of the Professional and Business Occupational Section, of the Information and Service Branch of the Department of Soldiers' Civil Re-establishment, was invited to give a summary of the work of his department—which he did. He strongly urged the co-operation of *The Institute* in connection with this work. He was assured that the Montreal Branch would co-operate, and that the other branches throughout the Dominion had been, or were being, organized to assist the Government in placing returned professional men. A Committee for *The Institute* was constituted, consisting of Sir Alexander Bertram, W. F. Tye, H. H. Vaughan, D. H. McDougall, F. H. Peters, A. E. Foreman, George D. Mackie, A. R. Decary, W. G. Chase and A. H. Harkness.

The following committees were approved: Montreal—S. F. Rutherford, W. Winterrowd, W. F. Tagge and Norman Campbell; Quebec—G. K. Addie, P. Joncas, Altheod Tremblay, A. Dick, J. E. Gibault, A. Fraser; Toronto—W. Cross, E. T. Wilkie, T. H. Hogg, R. O. Wynne-Roberts and R. T. G. Jack.

It was resolved that a circular letter be sent out from *The Institute* asking every member to give his assistance towards this laudable work. The Secretary was instructed to further aid in every way, in accordance with the previous policy of Council.

Technical Organization in British Columbia: President Leonard reported visits to Victoria and Vancouver and his attendance at meetings held at both these places where he found a strong feeling, on the part of technical men, for improvement in conditions, and an absolute need of organization towards helping to increase salaries. He stated that *The Institute* must realize the need of supporting such a movement. The President's report opened up a general discussion on the subject of the salary situation in the engineering profession, and ways and means of assisting to remedy same, which took up the major portion of the evening. As a result of the discussion and to show the attitude of Council, a committee, consisting of R. A. Ross, H. H. Vaughan, Julian C. Smith, and G. Gordon Gale, was appointed to enquire immediately as to what the government proposes to do in the way of increasing salaries of technical men, and to report to Council a scheme whereby the most effective method of dealing with the government on this question could be adopted.

Legislation:—President Leonard announced that it was desirable that the Members of Council take congnizance of the meeting of the Special Legislative Committee now in session. He took pleasure in inviting Council and the Committee to luncheon with him on the following day. This Special Committee was entertained at dinner, by the Montreal Branch, immediately preceding this meeting.

Copyrighting:—The Secretary reported that a new copyright act was before Parliament which would protect *The Institute's* papers in a very simple manner. He read a letter from Mr. Budden giving information on this subject and it was decided to await the action of parliament before taking any further steps in this connection.

Certificates:—The committee reported that the certificates were under way, that the engravers had completed the plate for the certificate, and that the proof had been approved, so that the certificates would be available very shortly.

Official seal:—The committee recommended that the offer of Messrs. Walker & Campbell to make one long reed seal at a price of not less than twenty dollars, nor more than twenty-five dollars, be approved.

The Institute Emblem:—On behalf of the committee, appointed to secure an emblem for *The Institute*, Mr. Francis reported, and recommended, the acceptance of the offer from Messrs. Caron Brothers to make a die for seventy-five dollars, for the new badge. It was resolved that the committee be authorized to secure the die at the price mentioned. The price of the badges would depend on whether they were bronze, silver, or gold.

* * *

The regular monthly meeting of the Council was held at the rooms of *The Institute*, 176 Mansfield Street, on Tuesday, April 22nd, at 8.15 p.m.

Present: Lieut.-Col. R. W. Leonard, President, in the chair; G. H. Duggan, Professor, H. E. T. Haultain, Walter J. Francis, Arthur Surveyer, G. Gordon Gale, Alex. Gray, Brig.-Gen. Sir Alexander Bertram, A. R. Decary, Professor Ernest Brown and John Murphy.

Previous minutes:—The minutes of the adjourned meeting held on April 7th, were approved as read.

Legislation:—The major portion of the evening was devoted to a discussion of the report of the Special Legislation Committee, which was before the councillors in printed form, with the letter of transmittal.

It was resolved that the bill submitted should be published in the first issue of *The Journal* and that an immediate opinion be secured from all absent members of Council as to whether, or not, it was considered advisable, or necessary, for Council, in submitting the ballot in connection with proposed legislation, to send a letter of transmittal giving advice to the members. The Secretary was instructed to write the absent Montreal members and wire all out-of-town members asking for immediate expression of opinion. These are to be considered at an adjourned meeting on May 6th.

Uniform Branch By-laws: As a result of a number of suggestions received regarding branch by-laws submitted for approval, these had been referred to a special by-laws committee; Professor Brown, Chairman. The report of this committee consisted of a set of branch by-laws, which, it was proposed by the committee, should constitute a standard branch act. The Secretary was instructed to have this prepared and forwarded to the branches for consideration. It was resolved that the various by-laws of the branches, now before the Council, be held until the reports were received from the branches based on the suggestions submitted.

At a special, adjourned meeting of Council held on Thursday evening, April 24th, the following elections and transfers were effected:

Members.

William Newman, C.E. (S.P.S.), head of W. Newman Co., Ltd., Winnipeg, Man.

Associate Members.

Matthew Balls, asst. engineer, Dominion Government, Hydrometric Survey, Vancouver, B.C. Marius Eugene Bene, App. Sc. (Geneva), engineer superintendent of construction for the Provincial Building & Engineering Co., Montreal. George Philip Frederick Boese, assistant engineer, C.P.R., department of natural resources, engineering branch, Calgary, Alta. John James Newman (S.P.S.), town engineer of Leamington and Amherstburg, and township engineer of Anderson, Sandwich West, Colchester South, Tilbury North and Tilbury West; of Windsor, Ont. George Earl Templeman, chief engineer, Electrical Commission of Montreal.

Juniors.

Erwin Alfred Childerhose, B.E.E. (Univ. Man.), assistant to chief engineer, City of Winnipeg Light & Power Dept., Winnipeg, Man.

Transferred from the Class of Associate Member to that of Member.

Francis Thornton Cole, B.Sc. (McGill), chief engineer of Eastern Canada Steel Company, Quebec, Que. Donald Laird Derrom, B.Sc. (McGill), works manager for Winslow Bros. Co., Chicago, Ill. Frederic Harcourt Emra (Captain), asst. chief engineer, Ministry of Shipping & Extensions Department of the Admiralty, London, England. Franklin McArthur, B.Sc. (Queen's), city engineer, Guelph, Ont. John Alexander McFarlane, B.A.Sc. (Toronto), chief draughtsman, Hamilton Bridge Works, Hamilton, Ont. Bertram Stuart McKenzie, B.A., B.Sc., (McGill), consulting engineer, Winnipeg, Man. Edlin George William Montgomery, acting asst. chief engineer bridge branch, highways dept., Regina, Sask. Harold William Birchfield Swabey, officer in charge of inspection of steel (Canada) for Ministry of Munitions, Ottawa, Ont.

Transferred from the Class of Junior to that of Associate Member.

Frank Chatham Askwith, B.Sc., deputy city engineer, in charge of Works Department, City of Ottawa, Ont. David Gordon Calvert (S.P.S.), engineer in charge of construction, Dayton Wright Airplane Co., Dayton, O. Arthur Dixon, district public works engineer for British Columbia, South Fort George, B.C. William Harold Hunt, B.C.E. (Man.), road engineer, Department of Public Works, Winnipeg, Man. Robert Chesley McCully, B.Sc. (McGill), designer and estimator, Imperial Oil Co., Ltd., Sarnia, Ont. John Earle Porter, B.A.Sc., field engineer, Canadian Steel Corporation, Ojibway, Ont. Michael Joseph Rutledge, B.Sc. (Univ., N.B.), designer with Henry Holgate, Montreal, Que. Gordon S. Stairs, B.Sc. (Dalhousie, N.S.), assistant to Third Division Officer, R.C.E., M.D., Halifax, N.S. Joseph Henri Valiquette, B.A. Sc. (Laval), assistant engineer in charge Department of Surveys & Design, Montreal, Que. McClelland Barry Watson, B.A. Sc., C.E., M.E., assistant engineer Department of Public Highways, Toronto, Ont.

Transferred from the Class of Student to that of Associate Member.

Lieut. George Francis Dalton B.A.Sc., of Ottawa, Ont., 3rd Canadian Engineers, B.E.F., France. Leslie Henry Hornsby, designing draughtsman, Toronto Terminals Ry., Toronto.

Transferred from the Class of Student to that of Junior.

Capt. Wm. F. Hadley (Grad., Honors, R.M.C.), of Hull, Que., Assistant Director of Signalling, Militia Headquarters. Walter George Hunt, B.Sc., (McGill), asst. engineer, Laurentide Co., Grand Mere, Que.

Good Roads Congress

The Sixth Annual Good Roads Congress will be held at the Parliament Buildings in the City of Quebec on May 20th, 21st and 22nd, under the auspices of the Canadian Good Roads Association. This will be one of the most important good roads conventions yet held.

The good roads movement has received great stimulation by the financial assistance from the Federal Government and the active interest the Provincial Governments are taking in this important subject. The Canadian Good Roads Association has carried on an active educational campaign which has a Dominion-wide character and has had much to do with the growth of public sentiment on behalf of good roads.

It is expected that there will be a large attendance of engineers at this Congress and the members of *The Institute* are all heartily invited. The executive officers are: Honorary President, Capt. J. A. Duchastel, M.E.I.C.; city manager, Outremont; President, S. L. Squire, Honorary President, Ontario Roads Association; First Vice-President, A. F. Macallum, M.E.I.C., Commissioner of Works, Ottawa; Second Vice-President, P. E. Mercier, M.E.I.C., Chief Engineer and City Surveyor, Montreal; Secretary-Treasurer, Geo. A. McNamee, 909 New Birks Building, Montreal.

Other executive officers of the Association are : W. A. McLean, M.E.I.C., Deputy Minister of Highways, Ontario; J. E. Griffith, M.E.I.C., Deputy Minister of Public Works, Victoria; and W. G. Yorston, M.E.I.C., formerly Assistant Road Commissioner, Province of Nova Scotia.

* * *

The Naigai Kagakubussan Kabushikikaisha, which being interpretated means The Naigai Chemicals Trading Company of Osaka, Japan, has sent in an inquiry desiring to be placed in touch with exporters and importers of chemicals and dyes and manufacturers of iron and steel and wire cable, etc. This firm gives as reference the Yokohama Specie Bank, and the Sumitomo Bank, which has branches in New York, San Francisco and London.

BRANCH NEWS

St. John Branch

A. R. Crookshank, M.E.I.C., Sec'y.-Treas.

The St. John Branch met on March 27th and April 17th, and sustained interest has been shown by the members in the different lines of endeavor being carried on by *The Institute.* Committees have been appointed and have appealed to all the members in the province to assist with the Soldiers' Civil Re-establishment work for returning engineers, and to enlist support for the passage of the Civil Service Amendment Act to bring into effect the revised schedule of salaries for Government engineers. Another committee has been appointed to work out a definite scheme to assist engineers to obtain positions, and employers to find suitable engineers for their work; this committee will co-operate with the first named committee, and will also act for the present as an employment bureau for all engineers in this locality. Still another committee is gathering information regarding the salaries and fees received by New Brunswick engineers, so as to be able to compare them with those received elsewhere, and to prepare the way for work in making up minimum schedules of remuneration later.

The Branch placed itself on record as favouring the League of Nations Union; this appealed to the members as being a constructive idea, and it was realized that unless the majority of the individuals that form the population of the contracting nations do not personally uphold the larger co-operative ideals that are necessary for world government. the League of Nations cannot be a lasting success.

Considerable time has been devoted to the discussion of the draft of the act for engineers, and to the report of the good work done at the legislation conference by our chairman, who acted as our delegate. Steps will shortly be taken to obtain a list of all the engineers in the province who will come under the act.

An interesting paper, illustrated by reflectoscoped photographs, was read by Geo. G. Hare, A.M.E.I.C., City Engineer of St. John on the "Re-construction of Bridges on the Dominion Atlantic Railway." Mr. Hare was engineer of maintenance and construction on this railway for several years. As this railway parallels the north coast of Nova Scotia for the greater part of its length, along the Bay of Fundy, the water crossings are numerous.

Between the years 1912 and 1915, some 6,500 lineal feet of wooden bridges were replaced by steel bridges on concrete piers and abutments, or concrete arches and fills, totalling some 500,000 cubic yards, besides repairing other structures. This work was part of the renovation of the line which included repairs to roadbed and stations; the building of water tanks, small wharves, branch lines, etc., etc.

The construction of the substructure for the Windsor bridge 1146 feet long, spanning the Avon River, was particularly interesting, on account of the high range of tide—an average of 34 feet—which cut down the working hours to not more than four per tide, for foundation work; the high current— an average rate of 10 miles per hour at half ebb and flood; the shifting nature of the river bottom. such that a new channel would be eroded up to 20 feet deep or an old one filled in during a single tide; and the large amount of greasy sediment deposited by each tide on new concrete or other work. Coffer dams were sunk through the sand and mud to a hard clay substratum, which was blasted to form pockets to take pier foundations and so keep them from sliding. Excavated coffer dams with tops about six feet above low water were several times filled by moving sand banks.

The foundation work for the Shubenacadie River bridge was under somewhat similar conditions, but was placed on rock ledge.

The Gaspereaux, Bridgetown, Allen's Creek, Weymouth and Clementsport bridges each had their difficulties and variations of conditions.

The Hantsport Aboideau was a rather unusual type of structure, built under adverse conditions. The concrete of the several structures was protected by timber sheeting from erosion by frost, and current action, and from abrasion by drifting field ice.

Quebec Branch

J. A. Buteav, A.M.E.I.C., Sec'y.-Treas.

At a meeting of the Quebec Branch held on the 17th of March the following committees were appointed to assist in placing returned engineers:

Employers Committee: G. K. Addie, Quebec; P. Joncas, Beauport; Alth. Tremblay, City Hall.

Employees Committee: A. Dick, Quebec; J. E. Gibault, Quebec; A. Fraser, Quebec.

Ottawa Branch

M. F. Cochrane, A.M.E.I.C., Sec'y.-Treas.

The first meeting of the Ottawa Branch, since the Annual Meeting, was held on March 20th in the testing room of the Naval Radio-Telegraph Service, when Lt.-Com. Edwards read a paper on Radio-Telegraphic Reception. This was illustrated by a number of beautiful experiments in which Commander Edwards was ably assisted by his staff.

Each member of the audience was provided with a telephone receiver and in this way was enabled to listen to some of the high power stations at work, including Arlington sending time signals, Glace Bay, Tuckerton, N.J., and the United States Naval Station at Annapolis, which at the time was in communication with a United States station in the south of France.

Wireless telephony was also demonstrated for the first time in Canada, and, by means of gramophone records connected with the telephone receivers, the audience listened to the characteristic sounds of a submarine running on the surface and submerged as compared with the sounds of other vessels, thus showing one of the most effective methods employed for destroying German submarines in the War.

A meeting of the Branch was held on March 27, to discuss the question of legislation. A. G. Dalzell, A.M.E.I.C., Secretary of the Vancouver Branch, was present and explained the position of the British Columbia members.

Lt.-Col. Peck, V.C., M.P., was the guest of the Branch at luncheon at the Chateau Laurier on April 3, and gave an interesting address on "Some Phases of the Great War."

Toronto Branch

W. S. Harvey, A.M.E.I.C., Sec'y.-Treas.

At an open meeting of the Toronto Branch held on February 28th, 1919, a resolution was adopted to appoint a committee on engineering fees and a committee on engineering salaries. The committee on salaries was to make a thorough and comprehensive study of various engineering organizations, and ascertain the nature of the duties, responsibilities and the qualifications required of the different engineering members of these organizations. This study was to be made with to view to determining the value of the services of these engineers, and accordingly to prepare a schedule of minimum salaries for engineers in all classes and in all grades of engineering work.

The resolution also called upon the Secretary of the Branch to communicate with the other branches of *The Institute* and request them to take similar action in appointing similar committees, and in this way to co-operate with the Toronto Branch in raising the financial status of the engineering profession to a higher level.

The Toronto Branch has already appointed a strong Salary Committee, including some of the most prominent members of this Branch. This Committee has taken up its work quite seriously and energetically and will meet regularly ever two weeks until its work will be completed.

* * *

The following is an extract from the minutes of the meeting of the Salaries Committee of the Toronto Branch held on April 2nd.

A general discussion took place on the classification of engineers for the purpose of the work of this Committee. It was at first suggested that, as a basis to work upon, the engineers should be divided in accordance with the particular line or branch of the profession that they follow, such as Civil, Mechanical, Electrical, etc., and these should then be subdivided into the various branches that they form. After some discussion, however, it was agreed that the most practical procedure of classifying would be to consider each kind of organization that employes engineers, as a division or a unit by itself, such as a railway organization, or a municipal organization. So many different kinds of organizations should be considered, that every engineering employee, no matter what line of work he follows, will find a place in one or more of these organizations. Schedules of salaries should then be worked out for each of these organizations in such a way that similar duties, responsibilities, and qualifications in different organizations will command similar salaries.

The following general divisions of engineers were then suggested:—

1. Engineers employed by Railways.
2. " " by Municipalities.
3. " " on Public Works (Dominion or Provincial.)
4. " " by Public Utilities other than Railways.
5. " " in Industries.
6. " " with Consulting Engineers.
7. " " on Mining Work.

Sub-committees were then appointed and were instructed to secure all available information with respect to the organization, titles, responsibilities and duties of engineers in the particular division to which they were appointed. Progress to be reported at the next Committee meeting.

The Committee then took up the communication from Mr. Keith with respect to the proposed bill which is intended to be submitted to Parliament, asking for a general increase of the salaries of engineers in the Government employ. The Committee decided that no definite action can be taken until a copy of the bill has been received, when this matter will be taken up again.

It was suggested that the Salaries Committee shall meet regularly every 1st and 3rd Wednesday of the month until it will have its work completed and a report ready to submit to the Branch. This suggestion was adopted.

Hamilton Branch

H. B. Dwight, A.M.E.I.C., Sec'y-Treas.

The opening of the new auditorium in the Westinghouse general offices on April 11th was marked by a joint meeting of *The Engineering Institute of Canada* and the Toronto section of the American Institute of Electrical Engineers. E. R. Gray, M.E.I.C., City Engineer of Hamilton and A. H. Hull of Toronto jointly officiated as Chairmen.

G. E. Stoltz, of the Westinghouse Electric and Manufacturing Company of Pittsburgh, gave an illustrated talk on the electrification of steel mills and he described, with the help of many lantern slides, the advantage of electric motors over steam engines and the application of power in the manufacture of steel.

On the following day visitors from Toronto accompanied by a number of local engineers visited the plants of the Dominion Foundries and Steel Limited, the Dominion Power and Transmission Company and the Steel Company of Canada.

On March the 28th, the Hamilton Branch of *The Engineering Institute of Canada*, was privileged to hear at first hand the story of the building of the Quebec Bridge, as told by George F. Porter, M.E.I.C., Engineer of Construction of the St. Lawrence Bridge Co. His clear and interesting description of the work, and the remarkable collection of lantern views, conveyed a strong idea of the record-breaking character of this bridge which is a monument to Canadian engineering. This lecture, which has been given with great success before nearly every branch of *The Engineering Institute of Canada*, was thoroughly appreciated in Hamilton, as was evidenced by the large audience. E. R. Gray, Chairman of the Branch, presided at the meeting, and a vote of thanks was tendered the lecturer by E. H. Darling, M.E.I.C.

Niagara Peninsula Branch

R. P. Johnson, S.E.I.C., Sec'y.-Treas.

Smoker.

A meeting of the Branch was held on the evening of April 1st, in the room of the Clifton Club, Niagara Falls, Ont., with the Chairman presiding.

Many visiting engineers were present.

The minutes of the organization meeting were read and approved.

The Chairman announced that, the formation of the Niagara Peninsula Branch had been approved by Council, also the officers.

The Chairman called upon Lieut.-Col. Leonard, President of *The Institute*, for a short address.

Col. Leonard complimented the Branch upon its formation and upon the large attendance of engineers at the meeting. The speaker told of the great revival and activities of *The Engineering Institute* in the past two or three years and recounted his recent visit to the branches at Winnipeg, Vancouver and Victoria and described the success of the Annual Meeting at Ottawa. The status of engineers, as compared to the trades was reviewed by the speaker and the fact was brought out that the position and standing of the engineering profession must be raised by engineers themselves, through the organized effort of *The Engineering Institute*. The speaker closed with an eulogy of the work of H. H. Vaughan, M.E.I.C., immediate past president of *The Institute*.

The chairman called upon E. W. Oliver, M.E.I.C., of the Toronto Branch, for a short talk. Mr. Oliver told of the recent revisions to the constitution of the Canadian Society of Civil Engineers which had brought about the change of name to that of *The Engineering Institute of Canada*, accompanied by the broadening of the organization to include all branches of the profession. The benefits of the change were already very apparent in the marked rejuvenation of *Institute* affairs. The speaker pointed out the necessity of obtaining, through the channels of *The Institute*, legislation to protect engineers and the public from imposters and incompetent engineering services. The speaker closed by urging the Niagara Peninsula Branch to lend its weight towards this end.

H. S. Baker asked if the meeting was held to advance the legislation proposal to make engineering a closed profession. The speaker opposed the idea of excluding any individual from the engineering profession, stating that many incompetent men would pass the necessary examinations and competent engineers would not.

Col. Leonard answered the question by reading the objects of *The Engineering Institute* as set forth on the cover of *The Journal*.

The chairman announced that the meeting was held as a " Smoker " and that the evening was now given over to cards and billiards.

An enjoyable two hours was spent around the tables, followed with sandwiches and coffee.

The members of the Branch are very much indebted to the members of the Clifton Club for the use of their splendid quarters.

There was an attendance of fifty-three.

Ontario Provincial Division

George Hogarth, M.E.I.C., Secretary

Organization Meeting

On February 13th, 1919, a meeting of the Ontario Provincial Division was held at the Chateau Laurier, Ottawa. There were present at the meeting the following members:—Prof. Peter Gillespie, Chairman; J. B. Challies; G. Gordon Gale; G. H. Bryson; J. L. Morris; W. H. Magwood; R. F. McClelland and E. M. Proctor. Fraser S. Keith, while very busy with the professional gathering kindly consented to be present to explain the by-laws respecting the Division.

In opening the meeting the Chairman referred to a meeting called in Toronto to elect officers, but on account of outside representatives being absent, an adjournment to Ottawa at the time of the Annual and General Professional Meeting was considered advisable.

A general discussion was entered into regarding the objects and activities of the Division. It was felt that the Division because of its constitution should represent the engineers of Ontario in bringing before the authorities matters affecting engineers and engineering. The Division might also arrange for the presentation of papers of interest to the general body of engineers.

Nominations for officers was next taken up. The Toronto Branch representatives pointed out that because of the Division representing all Ontario, it was highly desirable that the officials should be selected from those members not now a member of the larger branches. Other members held the view that, to get prompt action on all matters of business interest in the Division, it was necessary that the officers of the Division should be in a position to travel and meet the members of the various branches. J. B. Challies, M.E.I.C., was then nominated Chairman of the Division and Geo. Hogarth, M.E.I.C., Sec'y.-Treasurer.

In order that official representation on the Division should be from various parts of the Province, E. R. Gray, M.E.I.C., of Hamilton, was nominated as Vice-Chairman, and Council was requested to authorize a revision of by-laws so that a Vice-Chairman for provincial divisions could be elected.

The raising of funds for the ordinary expenses of the Division was discussed and the secretary instructed to ask Council for a grant of $100.00 for that purpose.

A scale of remuneration for engineers was considered. It was moved by Mr. Morris and seconded by Mr. Proctor that Professor Gillespie be a committee of one, with power to add to the number, to report on a recommended scale of remuneration for engineers in Ontario.

By-laws for the Division have been prepared by Mr. Keith and a motion was carried that the existing draft by-laws be accepted but that the chairman and secretary be a committee to amend such by-laws as they think necessary.

The object in publishing this abstract of the meeting of the members of the Provincial Division in *The Journal* is to bring to the attention of all Ontario Members of *The Institute*, the business that was transacted and also to request a discussion by all interested on the objects and activities that should particularly be engaged in by the Division. It is hoped that many of the non-resident members of Branches will be heard from, and that they will take a lively interest in a movement which will undoubtedly prove of value to them.

Manitoba Branch

George L. Guy, M.E.I.C., Sec'y-Treas.

Luncheon was held at the Fort Garry Hotel on March 15th, at which time A. G. Dalzell, A.M.E.I.C., addressed the members on the work of the Vancouver Branch with reference to legislation for engineers.

On March 20th, a meeting was held in the Engineering Building of the Manitoba University, at which meeting T. A. Hunt, Esq., K.C., read a paper on Civic Management. Mr. Hunt gave special attention to the various forms of government which had been tried in the City of Winnipeg, with special reference to the last Board of Control system, pointing out its faults and the reason for its disappearance. He then dealt with the city managership form of government. An interesting discussion took place in which a large number of the members took part.

On April 3rd, a meeting was held in the Engineering Building of Manitoba University, T. R. Deacon, M.E.I.C., read a paper on "Overhead Costs." Mr. Deacon analyzed the various items which enter into the final selling cost of a product, and brought out very plainly the necessity of a proper consideration of the various costs of production other than the labor and material costs.

A committee was appointed at this meeting to draw up a resolution of condolence to be inscribed on the minutes, expressing the sympathy of the Branch with W. P. Brereton, M.E.I.C., city engineer, on the recent loss of his little daughter; and to the family of the late A. T. Fraser, A.M.E.I.C.

* * *

W. P. Brereton, M.E.I.C., City Engineer, who has been seriously ill with influenza, is now recovering.

Water from Shoal Lake was turned into the Winnipeg mains on Saturday morning, April 5th. This completes the Greater Winnipeg Water District project, which was one of the largest on this continent.

Calgary Branch

C. M. Arnold, M.E.I.C., Sec'y.-Treas.

The activities of the Calgary Branch are largely centred on the subjects of legislation and increased remuneration. This Branch has been a leader in the matter of legislation from the start and has contributed a great deal to the discussion thereon. Members here look forward to an early agreement of all engineers of Canada on this subject.

On the question of salaries it is felt very strongly that something should be done and appreciation is expressed of the activity of *The Institute* along these lines.

The following is a copy of a letter on the subject sent to Major Lee Redman, M.P. and T. M. Tweedie, M.P., of Calgary, and Dr. Alfred Thompson, M.P., member for Yukon, expressing the opinions of the Calgary Branch, and is signed by the Secretary-Treasurer.

Dear Sir:—

In further explanation of wire of March 22nd, from the Calgary Branch of *The Engineering Institute of Canada*, to you regarding salaries of engineers in the Government employ, we wish to state that these salaries, as you are aware have always been very low.

During the past three or four years, they have not been increased, in spite of greatly increased cost of living, but on the other hand, in many cases, the salaries paid by the Government for certain specific duties have actually been reduced to an amount equal to from fifty to seventy-five per cent of the salary paid for the same work or position prior to the war.

This means that men, in receipt of such salaries, have been force to try to live and to provide for families on an amount with a purchasing power of about one-third the amount that was paid by the Government for the same work or position four years previous. It is, therefore, evident that many of these engineers in the Government employ have found it an impossibility to live on these meagre salaries and in order to exist have been forced to draw on their savings.

These facts, in regard to several of the engineers in question, who are employed in one of the Government departments in Calgary, are well known to the Calgary Branch of *The Engineering Institute*. Three of the engineers in this Government department are college graduates, have had from ten to twenty years experience, are full members of *The Engineering Institute of Canada*—the leading national engineering society of the Dominion, and which has a high standard of requirement for admission. The salaries paid these engineers are, $1300, $1600 and $1600, per year, respectively.

Another man is an Associate Member of *The Institute* with excellent experience covering twenty years, is a college graduate, and now draws a Government salary of $1200 per year. All the men, above referred to, are considered competent and all are married men with families.

In another of the Government departments three competent engineers have been employed—two for three years and one for two years—at salaries of $1200 per year.

Latterly (within six months) the departments have found it impossible to get men with exactly similar qualifications, for exactly similar duties, to fill other vacancies, at the same salary of $1200 per year, and have been obliged to advertise and to pay salaries of $1500 per year for new men to fill these vacancies. At the same time they have absolutely refused to increase the salaries of the old and well-qualified men, first above referred to, who have served two or three years, from $1200 to $1500 per year. Also, at the same time, these $1200 men, already in the service who knew the work, have had to teach the new $1500 men, coming into the service, much before they could be of value in their positions.

It is understood that the Civil Service Commission has a staff of efficiency experts working on the re-classification of salaries. In this connection the Calgary Branch of *The Engineering Institute* submits through you this earnest recommendation:—

"That the Civil Service Commission causes an examination of all Government offices, in all the cities of Canada, to be made most thoroughly, by representatives of their efficiency experts, as to salaries and as to all questions of unfairness in connection with employment.

Particularly, that such investigation, as it affects engineers in Government employ, should be made in such a way that the Branch of *The Engineering Institute* at the point at which the investigation is taking place will be allowed to make its representations to such representative and to point out any unfair conditions which need to be remedied.

It is the opinion of this Branch of *The Engineering Institute* that the Civil Service Commission and its staff cannot properly make an intelligent re-classification of salaries, or adjustment of unfair conditions, unless all Government offices are visited, conditions in each thoroughly investigated, and representatives of the employees given a chance to be heard.

It is quite apparent that engineers and technical men generally are woefully underpaid at the present time not only by the Governments but by all employers of technical men. In the Government service worse unfairness seems to exist which should first be corrected, and then the salaries of engineers should be considerably raised. The Government demands such high qualifications as a college education and many years of practical training. The various Governments, Dominion and Provincial, are spending money on technical education to enable young men to fit themselves with such training. What encouragement or inducement is there for young men to take up this kind of work with such poor remuneration which hardly provides a decent living for himself and family?

From time to time, the Government advertises for applications for various positions many of which require only mediocre education and experience, but for which a remuneration is offered which is far higher than for engineers, and other technical employments, for which special education and special training are required.

Great dissatisfaction exists over the manner of the payment of the war bonus asked for, and granted in part, for the fiscal year 1918-19. The Civil Servants Federation asked for a war bonus of $350 to be paid to all employees alike, including Deputy Ministers. In partly granting this the Government seems to have given the maximum bonus of $250 to those in receipt of salaries less than $1100 per year, $200 to those with salaries $1100 to $1200, $150 to salaries $1250 to $1500, and $100 to those in receipt of salaries from $1550 to $1880.

In actual practice this has resulted in giving the maximum bonus to stenographers, clerks and office boys, mostly unmarried or with no dependents, while the less bonus has been paid to most of the married men with families. In one case in one of the Government departments in Calgary an unmarried man on salary of $1600 per annum who entered the service in September, 1918, and who left the service April, 1919, received a bonus, for a half year's service, of $109, while married men, at the same salary, who had been in the service continuously for from three to five years, received but $100. An office boy but a short time in the service received a bonus of $109. Stenographers mostly with no dependents received $250, while married men with families who have been in the service for three years, five years, or even longer, engineers of special education and training and with from ten to fifteen or even twenty years experience and who are the backbone of the particular service in which they are employed, have been thus discriminated against in favour of office boys, stenographers, and clerks most all of whom have no dependents.

Since the Government is providing for an extension of the war bonus for the first three months of the fiscal year 1919-20, the Calgary Branch of *The Engineering Institute* particularly requests that you protest against the payment of the bonus by the method followed last year. That you request that in so far as possible this matter be adjusted so that those with dependents may receive a greater total bonus for the fiscal year 1918-19 and the first three months of fiscal year 1919-20 combined, than that received by those without dependents and that as far as possible this adjustment be made out of money provided for bonus for the first three months of the fiscal year 1919-20."

I trust that in trying to set before you the position of the engineers in the Government service you will not find this communication unnecessarily long. The facts contained herein are absolutely true and can be verified. In fact, other unfairness exists which has not been mentioned.

If any further information is required it will be cheerfully furnished.

I attach a copy of memorandum presented to members of the Dominion Parliament from British Columbia, by the Vancouver Branch of *The Engineering Institute* dealing with the same subject.

Yours very truly,
(Signed) C. M. Arnold,
Sec'y.-Treas.

Victoria Branch

J. B. Holdcroft, A.M.E.I.C., Secretary.

The visit which Col. Leonard, President of *The Institute*, paid to the Victoria Branch on March 12th, was very much appreciated, and a special meeting was called to enable the members of the Branch to meet him. Though the notice was necessarily short, a good number gathered, and most interesting discussion on entirely informal lines followed Col. Leonard's description and account of the Annual Meeting at Ottawa. He touched upon many points of present day interest in the course of his remarks, and particularly outlined the present position as regards legislation and *The Institute's* efforts to obtain better recognition in the shape of increased scales of salaries.

It is hoped that such visits may occur oftener in the future than has been the case in the past, for in no other way will a thorough understanding between the far-western branches and the parent body be so well maintained.

The Victoria Branch is initiating a new departure in connection with "reconstruction" work, by appointing a committee to form what is to be called, tentatively, the British Columbia Board of Industry, which committee is to include representatives of various interests, finance, manufacturing, etc., returned soldiers, boards of trade, and such like organizations, with a view to investigating and assisting in the development of industrial propositions and the industrial development of the province generally.

The membership it is proposed should represent engineering, mining, finance, boards of trade, B.C. Manufacturers Association, returned soldiers, labour, etc. The following have signified their approval of the plan and it is expected will form the preliminary membership of the Board: D. O. Lewis, M.E.I.C., member, Board of Trade; Geo. G. Bushby, past-president, B. C. Manufacturers Association; L. W. Hargreaves, manager, Canadian Bank of Commerce; L. A. Gritten, Department of Soldiers' Civil Re-Establishment; C. W. Winkel, Department of Soldiers' Civil Re-Establishment; W. M. Everall, A.M.E.I.C., Captain, C.E.F.; G. P. Napier, A.M.E.I.C., Lieutenant, C.E.F.; N. A. Yarrow, A.M.E.I.C., manager, Yarrow's Limited; R. W. Macintyre, M.E.I.C., Councillor, *The Engineering Institute of Canada;* J. B. Holdcroft, A.M.E.I.C., secretary, Victoria Branch, *The Engineering Institute of Canada;* G. W. Wilkinson, chief inspector of Mines, B.C.

It is intended that the above shall form an expert council for the purpose of investigating and reporting upon proposed developments, conducting an industrial survey of the province, and such other activities as may be determined upon, and more especially to use its influence to secure the actual undertaking of such developments under satisfactory conditions.

The organization meeting was held on April 16th at the rooms of *The Institute,* the objects being to furnish a central body to co-ordinate the efforts of all the existing organizations, boards of trade, etc., for the industrial development of the province.

Peterborough Engineers' Club

A meeting of the Club was held on April 12th, 1919 at which Fraser S. Keith, Secretary of *The Engineering Institute of Canada* was present. The matter of organizing a branch of *The Institute* was discussed and a committee was appointed to bring in a report at the regular meeting in May on the advisability of taking this step. There are already in Peterborough about fifteen corporate members of *The Institute* and at least fifteen more have signified their intention of joining. Mr. Keith addressed the meeting on the aims and scope of *The Institute.*

The annual election of the Club took place at the same meeting with the following results: Honorary President, C. E. Canfield; President, G. R. Munro, A.M.E.I.C.; Vice-President, R. H. Parsons, A.M.E.I.C.; Secretary-Treasurer, R. L. Dobbin, A.M.E.I.C.; Directors: two years, R. B. Rogers, P. L. Allison, H. O. Fish; one year, E. R. Shirley, Jas. Mackintosh, G. R. Langley.

The Border Cities Branch

A. C. Williams, M.E.I.C., Secretary.

The name "Border Cities" as chosen for our branch is derived from the fact that the five cities or towns of Ford, Walkerville, Windsor, Sandwich and Ojibway, adjoin one another and are located in Essex County, Ontario, on the Detroit River, which is the natural border line between the State of Michigan, U.S.A., and the Province of Ontario at this point. The name follows out the idea widely advertised by the Border Chamber of Commerce and the Windsor daily paper, which is called "The Border Cities Star."

The big outstanding feature in the establishment of this branch was the fact that the idea met with no opposition whatsoever but was warmly supported by all engineers and others interested in the profession. The branch idea was first suggested and fostered by Mr. A. J. Stevens, Acting District Engineer, Dominion Public Works Department, Windsor, Ontario, and great credit is to be given him for promulgating the big idea and ably assisting in bringing about the results which we have attained. The first informal gathering was held in Mr. Steven's office on the afternoon of January 17th, for the purpose of ascertaining the expression and spirit, of the local engineers to the proposed branch. Mr. Stevens was unanimously elected Chairman and Secretary *pro tem,* and stated briefly the objects of *The Institute* and the advantages of having a branch established in this vicinity. The Chairman asked each and every member present for an opinion on the subject, and without exception it was given hearty approval and support. The meeting adjourned after the Chairman had called a meeting for the evening of January 23rd for the purpose of crystallizing action.

At the meeting of January 23rd, the Chairman read a communication from Fraser S. Keith, stating that all members residing within a certain radius of Windsor Post Office were members of the Branch. This ruling admitted all members residing in Detroit and neighboring suburbs. It was moved, seconded, and unanimously approved that the Chairman draw up a formal application for the establishment of a local branch, procure as many names as possible, and submit same to Headquarters in Montreal. The formal application went forward from Windsor under date of January 17th, signed by more than twenty members and associate members. Under date of February 25th, Mr. Stevens was advised that, at a meeting of the Council held since the Annual Meeting, our application was favorably acted upon and we were forthwith authorized to proceed with the organization of the Branch.

It was particularly desirous to have Fraser S. Keith, General Secretary, Montreal, present to assist in the organization, and with this in view Mr. Stevens opened negotiations with Mr. Keith, who arrived in Windsor the afternoon of Friday, March 14th. He was met at the

Windsor Ferry and taken by automobile to the offices of the Canadian Steel Corporation, in Ojibway. Here Mr. Keith was welcomed by officials of the Corporation and shown over the extensive grounds, where, some day, is destined to stand the largest steel mills in Canada. The party examined in detail the great coal and ore unloading docks, blast furnace sites, and other points of interest.

In the evening an open meeting of engineers and those interested in engineering was held, to meet Mr. Keith, Secretary, *The Engineering Institute of Canada*, in the Banquet Room of the Border Chamber of Commerce in the city of Windsor, on the 14th day of March, 1919, Mr. A. J. Stevens acting as Chairman.

An informal lunch was held at 6.30 p.m. The following gentlemen were present: E. J. McIntyre, W. G. Mixer, Geo. J. Burgess, F. G. Campbell, J. E. Porter, H. J. Townsend, A. E. Eastman, R. A. Ferguson, R. A. McAllister, L. E. Collins, H. Thorne, J. S. Nelles, all of Canadian Steel Corporation; C. D. Henderson, G. C. Vrooman, D. L. Alexander, F. H. Kester, R. A. Spencer, S. E. McGorman, G. C. Williams, all of Canadian Bridge Company; E. F. Considine and S. G. Newlands of the Great Lakes Dredging Company; Chas. O. Farr, W. R. Rhoads and L. T. Venney, of Morris Knowles, Limited; F. J. Bridges, R. A. Carlyle and A. J. Stevens, of the Public Works Department; R. W. Code, A. H. McPhail, J. R. Sculland, B. A. Rose, S. E. Dinsmore, M. E. Brian, L. McGill Allan, J. J. Newman, C. R. McColl and R. Westcott, of Windsor; E. G. Henderson, Canadian Salt Company; J. Shand, Shand Contracting Company; and John A. W. Brown, Trussed Concrete Steel Company.

After lunch, Mr. Stevens, in a few chosen words, dealt with the value of the engineer to the public, the interest he should take in public problems, and the possibilities of this district from an engineering standpoint. He then introduced Mr. Fraser S. Keith, the guest of the evening.

Mr. Keith then dwelt upon the aims and objects of *The Engineering Institute of Canada*, the necessity of joining such an organization, and the benefits to be derived therefrom.

At the conclusion of Mr. Keith's remarks, a "get-acquainted-movement" was started,—each man present being called upon to tell what his name was, his business, and any statements he would like to make for the betterment of *The Institute*.

A hearty vote of thanks was tendered Mr. Keith upon the motion of E. C. Henderson and seconded by E. E. Brian, for his interest in *The Institute* and the information imparted to the gentlemen present.

Owing to the lateness of the hour, it was decided to postpone to March 21st the formal organization and election of officers.

At the meeting for the purpose of organization, election of officers and other business held on March 21st, the following officers were elected: Chairman, J. A. Brown, A.M.E.I.C.; Secretary, G. C. Williams, M.E.I.C.; Treasurer, F. J. Bridges, M.E.I.C.; Executive Committee, H. J. Thorne, A. J. Stevens and M. E. Brian.

Meetings of the Executive were held, at 4.30 p.m., on March 24th and April 1st, for the purpose of drafting Branch By-laws to be submitted at the next regular meeting for discussion, and, if approved, to be forwarded to Montreal for final approval.

PERSONALS

C. J. Mackenzie, A.M.E.I.C., who recently returned from overseas has resumed his duties as Professor of Civil Engineering at the University of Saskatchewan.

W. M. Everall, A.M.E.I.C., has been appointed by the Victoria Branch as Chairman in place of W. Young, M.E.I.C., resigned, and E. N. Horsey, A.M.E.I.C., has been appointed to the vacancy on the Executive Committee.

Lieut. H. L. Swan, A.M.E.I.C., who served in France with the 3rd Divisional Engineers, has returned to Canada and has resumed his occupation with the Kettle Valley Railway Company at Penticton, B.C.

Lieut. A. J. Lawrence, Canadian Engineers, A.M.E.I.C., recently returned from overseas, has been appointed Sales Engineer in the Storage Battery and Fire Alarm Section of the Northern Electric Company, Limited, with headquarters in Montreal.

W. J. Gale, A.M.E.I.C., who has taken a prominent part in the affairs of the Calgary Branch, enjoys the distinction of being the partner of the acting-mayor of the City of Calgary. Mrs. Gale is the first woman in the history of the British Empire to sit in the chief magistrate's chair of an important municipality.

Major Jas. McGregor, A.M.E.I.C., resident engineer of the Halifax ocean terminals is back after two years' service in the Third Battalion of Canadian railway troops. Major McGregor reached France in time for Vimy Ridge and has been engaged chiefly in building light railways and repairing standard gauge roads destroyed by the Germans.

Brigadier-General McCuaig, C.M.G., D.S.O., A.M.E.I.C., arrived in Halifax on the Olympic on April 21st, which conveyed the first, second, third and fourth battalions of the Canadians. Brig.-Gen. McCuaig was the senior officer aboard the Olympic. His great war record is already well known throughout Canada and to his fellow members in *The Institute*.

J. N. de Stein, M.E.I.C., the enthusiastic secretary-treasurer of the Saskatchewan Branch has joined with R. W. Parsons, M.E.I.C., and Lt.-Col. J. L. R. Parsons, C.M.G., D.S.O., in the Parsons Engineering Company, engineers and surveyers, 1704 Scarth Street, Regina. Lt.-Col. Parsons is President, W. R. Parsons, Vice-President, and J. N. de Stein, Manager. They propose carrying on their business of surveying and engineering work.

Wallace R. Harris, M.E.I.C., who has been connected with the Portland Cement Association in an official capacity has accepted the position of editor of Engineering World, Monadnock Block, Chicago, and assumed the responsibility of his editorship on the 1st of April. Mr. Harris brings to his new position, training, experience and ability, which assure for him an unqualified success in his new field of activity.

Lieut. F. G. Aldous, R.E., A.M.E.I.C., writes from the 7th Field Survey Company, Royal Engineers, Egyptian Expeditionary Force, inquiring as to conditions in Canada and what the prospects will be on his return. It is most interesting to note that Lieut. Aldous is at present on a survey of the country between Damascus and Aleppo. Lieut. Aldous was assured that *The Institute* is prepared to do its utmost to secure positions for men like himself who have been far afield and exiled from their former associations.

A. D. Creer, M.E.I.C., who has been for a number of years chief engineer of the Vancouver District, Joint Sewerage and Drainage Board, left Montreal on April 19th for England on a combined pleasure and business trip. Mr. Creer was secretary of the Vancouver Branch for a number of years and has taken a very active part in *Institute* affairs. On his return he proposes engaging in consulting engineering, having already been appointed consulting engineer to the Vancouver Disrict, Joint Sewerage and Draining Board at Vancouver.

Major C. C. Lindsay, B.Sc., S.E.I.C., of Quebec, returned to Canada from overseas in March and has been appointed Assistant Engineer of the Reclamation Branch of the Department of the Interior. Major Lindsay went overseas in 1915 as a sapper with the Sixth Field Company, Canadian Engineers, and in August, 1915, he was transferred to the Royal Engineers as Second Lieutenant. He won promotion on the field and was finally gazetted a Major. During his military operations he was wounded and received the Belgian Croix de Guerre.

Major A. R. Sprenger, A.M.E.I.C., C.E., returned to Canada recently on a hospital ship, and is at present convalesing at the military hospital, St. Anne de Bellevue. For over a year Major Sprenger was employed in aerodrome construction, in the war office and air ministry, and supervised the construction of over forty aerodromes representing a cost of over thirty-three million dollars. Major Sprenger saw active service with the 1st Division, and was wounded at Cagnicourt in September last, since which time he has been incapacitated. He expects to return to engineering work as soon as his physical condition permits.

Lieut.-Col. Robert Bickerdike, D.S.O., M.E.I.C., as been appointed commanding officer of the Grenadier Guards and will bring the 87th Battalion home when its turn comes. Lieut.-Col. Bickerdike entered military service after his graduation from McGill University. Before the outbreak of war he joined the 58th Westmount Rifles as a Lieutenant. When the 87th Grenadiers were raised he joined as a subaltern and went overseas with that unit. Early in 1916, Lieut. Bickerdike received his captaincy. After being severely wounded in Regina Trench, October, 1916, he received his majority. Now he has been appointed Lieutenant-Colonel in command of the 87th Battalion.

Colonel Alexander McPhail, C.M.G., D.S.O., M.E.I.C., has returned to Canada on the Olympic. Col. McPhail who is a brother of Sir Alexander McPhail, graduated from the Faculty of Applied Science, McGill University, and after winning a scholarship studied for three years in Germany. He took up construction work in the United States and afterwards became lecturer at Queen's University, and from there he went to the Royal Military College. Col. McPhail sailed with the First Division as a Captain and has made a great name for himself as commander of the First Brigade Canadian Engineers, and in carrying on engineering operations in connection with the war.

Dr. John S. Bates, A.M.E.I.C., has resigned his position as Superintendent of the Forest Products Laboratories of Canada, at Montreal, where he had been for the past five years, and has accepted the position of Chemical Engineer with Price Brothers & Company Limited, Kenogami, Quebec. He will undertake special technical work in their pulp, paper, and lumber mills, and other organizations. Dr. Bates is a graduate of Acadia University, Nova Scotia, and Columbia University, New York, having the degrees of Chemical Engineer and Ph.D. For three years of the period when he was Superintendent of Forest Products Laboratories, he occupied the position of chemical representative, Explosives Department, for the Imperial Munitions Board. From the time of its organization, in 1915, to the present date he has been chairman of the technical section of the Canadian Pulp and Paper Association and has taken a leading interest in all matters pertaining to the development of this branch of Canada's natural resources.

New Chief Engineer

Ivan E. Vallée, B.A.Sc., A.M.E.I.C., is a member of the Quebec Branch of *The Institute*, and has recently been appointed Chief Engineer and Director of Railways in the Department of Public Works and Labour of the Province of Quebec, and is also Engineer of the Public Services Commission.

At a recent sitting of the Provincial Cabinet Mr. Vallée was called to fill the important position left vacant through the death of his father, L. A. Vallée, M.E.I.C.

Mr. Vallée was born at Quebec, February 11th, 1887. He completed his engineering course in 1910 at the Ecole Polytechnique, Laval University; when he was granted, with honours, the diplomas of Civil Engineer and Chemical Engineer, and the B.A.Sc. Degree.

From 1910 till recently he has occupied the position of Assistant to the Chief Engineer and Director of Railways.

The Quebec Branch heartily congratulates Mr. Vallée on his promotion.

New Military Organization

Major F. J. O'Leary, M.C., (two bars), S.E.I.C., arrived in Montreal on April 19th, on the Carmania. After graduating from McGill University, Major O'Leary went west where he was engaged in construction work in Saskatoon. He went overseas with the 53rd Infantry Battalion from Winnipeg and Saskatoon and crossed to France with the 142nd battalion as Lieutenant. Shortly afterwards he was put in command of the Canadian Trench Mortar Battery, 11th Brigade Staff, then at Canadian Corps Headquarters on the staff of the D.A.A.G., and later as staff captain with the first Canadian Division Engineers.

Major O'Leary is taking an active interest in the welfare of all the Canadian Engineers and is secretary of an organization composed of the engineers with the First Canadian Division which is organized to look after the interests of the engineers who have seen service. The officers of the new association elected in France are Sir A. C. Macdonell, K.C.B., C.M.G., D.S.O., M.E.I.C., Col. A. Macphail, C.M.G., D.S.O., M.E.I.C., Lieut.-Col. J. M. Rolston, D.S.O., M.E.I.C., Lieut.-Col. E. Pepler, D.S.O., and Major F. J. O'Leary, M.C. (two bars).

Returns from Siberia

Colonel J. S. Dennis, C.M.G., M.E.I.C., Chief Commissioner of the Department of Colonization of the C.P.R., returned from Russia by way of Japan and Vancouver, arriving in Montreal on Tuesday, April 22nd.

Colonel Dennis went to Siberia last fall as Director of Transportation and Information on the General Staff of the Canadian Military Expedition and in addition was chairman of the Canadian Trade Commission, appointed by order-in-council last October, to study trade conditions in Siberia. He was also Canadian Red Cross Commissioner for Siberia.

At the meeting of the Montreal Branch held on April 24th, Colonel Dennis was warmly welcomed. He outlined briefly the situation in Siberia which lead to the decision to withdraw the Canadian forces.

He stated that, for an engineer, Siberia possessed great possibilities and the undeveloped natural resources were possibly the greatest on earth. The great problem, at the moment, from an engineering and national viewpoint, was to resurrect the Trans-Siberian Railway and until that was done there would be little progress. The existing political and transportation conditions there render it impossible to hope for the establishment of trade relations on a satisfactory basis at present.

Railway Construction in France

Major H. B. Muckleston, M.E.I.C., returned to Canada last month after spending several years at the front engaged in the construction of railways, and has returned to Calgary to resume his former duties as assistant chief engineer, irrigation branch, Canadian Pacific Railway.

Going overseas with the 4th Pioneer Battalion, he joined the 1st Canadian Railway Troops in France and was engaged with them on standard gauge work all over France. Major Muckleston was invalided on October 25th, 1918, and spend two months in a London hospital. He returned to Canada on the Scotian, landing at St. John, March 1st.

During a pleasant call at headquarters' office, Major Muckleston outlined some of the work which was carried on by the Railway Troops under the command of Lieut.-Col. Blair Ripley, M.E.I.C. There was included in the same Battalion, Major Thos. Louden, A.M.E.I.C., Major A. R. Ketterson, A.M.E.I.C., and Major F. B. Cross, A.M.E.I.C.

The first piece of work ran to Albert—"The Canadian Pacific"—followed by a 60 c.m. gauge road over the first Somme. After the German retirement in the spring of 1917, the Canadian Railway Troops were placed on the construction of standard gauge lines, including the building of a line from Lechapellette, through and including the yards at Peronne, to Roiselle, and to Epehy. This was a double track standard gauge line and included three bridges over the Somme, and a dozen other bridges. In July, 1917, the battalion moved to Dunkirk and made a division line around Dunkirk. From there the battalions were directed to the International Corner in Belgium where about five miles of line were built under fire, and a bridge over the Yser Canal. The battalion remained there until March of 1917, when they were ordered to Palestine; but were held when the German drive commenced and were immediately engaged in building defences, including a hundred miles of trenches, machine gun pits, etc. Following this a railway line was built from Frevent to Hesdin, a distance of seventeen miles, including a bridge sixty feet high and five hundred feet long.

On August 8th, 1918, when the allied drive commenced the battalion moved to Amiens and rebuilt the line from Amiens through to Marcoing, with the exception of five miles built by the French and by other Canadians, which included a line built in the spring of 1917, with additions at each end. They then moved to Lecateau, east of Cambrai, and from there built into Mons following the drive.

Brig.-Gen. C. H. Mitchell, C.B., C.M.G., D.S.O.

The early anticipated return of Gen. Mitchell to Canada to assume the position of Dean of the Faculty of Engineering and Applied Science of Toronto University, draws attention to the wonderful career which has been his since going overseas with the First Canadian Division on September 22nd, 1914. Immediately on the outbreak of war, Gen. Mitchell enlisted with the First Central Ontario Regiment of the Canadian Overseas Forces and was appointed to the General Staff Intelligence Department as General Staff Officer, third grade, and seconded for Imperial service. On September 13th, 1915, on formation of the Canadian Army Corps, he was promoted as General Staff Officer, second grade, and on October 12th, 1916, was appointed General Staff Officer, first grade, with the Second Army in France as an officer in the Imperial service. On the despatch of the force to Italy on November 10th, 1917, he was again promoted as General Staff Officer at Headquarters with the British forces in Italy and remained in this capacity until January 18th, 1919, when General Headquarters disbanded.

His honours and awards include the following:—Distinguished Service Order, June, 1916; Companion of St. Michael and St. George, June, 1917; and Companion of the Bath, June, 1918. His foreign honours are:—Legion of Honour, Officier (France), February, 1916; Order of Leopold, Officier (Belgium), June, 1917; Croix de Guerre (Belgium), January, 1918; Crown of Italy, Officier (Italy), March, 1918; Croci di Guerre (Italy), December, 1918. In addition to this he was mentioned in despatches January and May, 1916; May and December, 1917; and May and December, 1918.

Gen. Mitchell was engaged in operations as follows: With the First Canadian Division, France, from February 9th to September 12th, 1915; in line—Neuve Chapelle to Bois Grenier— March 1915; Second Battle of Ypres—April 22nd to May 4th, 1915; Battle of Festubert—May 19th to 28th, 1915; Battle of Givenchy—June 15th to 16th, 1915; and Ploegssteert to Wulverghem—June to September, 1915. He was with the Canadian Army Corps, September 13th, 1915, to October 11th, 1916; in line—Ploegssteert to St. Eloi—September, 1915, to March 1916; and—St. Eloi to Hooge—April to August, 1916; Battle of St. Eloi—April 6th to 7th, 1916; Battle of Observatory Ridge—June 2nd to 13th, 1916; the Battle of the Somme—1916; Courcelette—September 15th; Schwaben Redoubt and Hessian Trench—September 26th; and Regina Trench—October 8th. He served with the Second Imperial Army, October 12th, 1916, to November 10th, 1917; line—Neuve Chapelle to Boesindhe (Ypres)—October, 1916, to June, 1917; Frelinghien (Lys) to Hooge—June to August, 1917; Frelinghien (Lys) to Zonnebeke—September to October, 1917; Frelinghien (Lys) to Passchendaele—October to November, 1917; Battle of Messines—June 7th, 1917; Battle of Flanders, Menin Road—September 20th, 1917; Polygon Wood—September

Brigadier-General, Charles Hamilton Mitchell, C.B., C.M.G., D.S.O., M.E.I.C.

26th, 1917; Broodseinde—October 4th, 1917; and Passchendaele— October 12th, 1917, October 26th, 1917, October 30th, 1917, November 6th and 10th, 1917. He served with the British forces in Italy (G.H.Q.), November 10th, 1917, to January 18th, 1919; in line Piave—Montello, November, 1917, to March, 1918; and on Asiago Plateau—April to September, 1918; and Battle Asiago—Austrian "Offensive"— June 15th, 1918; in line on Piave (Grave Di Papadopoli)—October to November, 1918; Battle of Vittorio—Veneto (Piave and Tagliamento Rivers), October to Armistice, November 4th, 1918.

Word has just been received of the promotion of Col. Mitchell to the rank of Brigadier-General while seconded to the Imperial Service, the promotion to date from October last.

OBITUARIES

Louis André Vallée, M.E.I.C.

The City of Quebec lost a valuable citizen; the engineering profession, in the Province of Quebec, one of its leading members; and the Provincial Government, one of its most responsible officials; in the passing away, on the 10th of March, of Louis-André Vallée, M.E.I.C., Chief Engineer and Director of Railways in the Department of Public Works and Labour of the Province of Quebec, and Engineer of the Quebec Public Utilities Commission.

The deceased had attained the age of 67 years and three months, and had had a notable career in this Province. He was born at Beauport, Quebec County, on November 30th, 1851. He was educated at Laval Normal School, Quebec, and entered the employ of the Sherbrooke and Eastern Townships Railway, as an apprentice engineer,

Late L. A. Vallée, M.E.I.C.

in 1869; and remained in that position for one year. From 1870 to 1876, he was employed on the North Shore Railway as rod-man, leveller, and transitman on location and construction work. From 1876 to 1882, he was assistant and divisional engineer in charge of construction and maintenance-of-way on the Quebec, Montreal, Ottawa and Occidental Railway, which was afterwards absorbed by the C.P.R. In 1862, he was appointed Government Engineer and, in 1895, was made Director of Railways for the Province of Quebec, filling both positions to the time of his death. In addition to the above he was, in 1909, appointed Engineer of the Quebec Public Utilities Commission.

Mr. Vallée was a member of the Canadian Society of Civil Engineers of Canada since its formation in 1887, and was appointed to the Council of that body in 1894, in 1903, and again in 1909. He was chairman of the Quebec Branch of *The Society* in 1909. He was also a member of many technical and scientific societies.

On April 20th, 1879, he married Marie Celina Amanda, daughter of the late Charles Boromée Genest, attorney-at-law and member of the Quebec Legislative Assembly for Three Rivers. He is survived by his wife, six sons, four daughters and nineteen grand-children. Amongst his sons is Mr. Ivan E. Vallée, who occupied the position of first Assistant Engineer and Assistant Director of Railways.

The late Mr. Vallée is said to have been the Dean of the Interior Civil Service of the Province, and, in the course of his useful career, he was widely known throughout Canada, but more particularly in this Province, where he planned and directed the construction of many railways and steel bridges.

His death is deplored by the entire community and sincere sympathy is extended to his family in the great loss they have sustained.

N. M. Thornton, M.E.I.C.

N. M. Thornton, M.E.I.C., who was until recently chairman of the Edmonton Branch died on February 23rd, 1919, at the age of 43 years. The late Mr. Thornton was born at Corbridge-on-Tyne and was connected with collieries in Cumberland, Northumberland and Durham, England, maintaining his connection with several of them after his arrival in Canada. He came to this country in 1911 as manager of the Mount Park Coal Company, Alberta. In August last year he resigned his position with the Mount Park Coal Company and opened an office as a general consulting engineer, in the City of Edmonton. He entered *The Institute* in January, 1915, and during his membership evinced a very lively interest in the affairs of the engineering profession.

George Herbert Garden, M.E.I.C.

One of the original members of *The Institute* in the person of George Herbert Garden, passed away at Rouses Point on March 29th, 1919. The late Mr. Garden was born April 5th, 1849, at Woodstock, N.B., and was a resident of Montreal for nearly twenty years. He was one of the older men in the profession and had been in poor health for many months, so that his end was not unexpected. As an engineer and as a man he was held in the highest regard. During the course of his engineering career, which covered different lines of activity, he spent nineteen years with the Canadian Pacific Railway at different periods.

Mr. Garden's engineering career started when he was 16 years of age, as an assistant to his father, who was a land surveyor. At the age of 20 he was appointed assistant engineer on location of the I.C.R. at Newcastle, N.B., He was in charge of part of the location on the Crow's Nest Pass division of the C.P.R. in British Columbia and was in charge of location and construction on the Quebec and Lake St. John Railway, now the Canadian National Railways. He was also in charge of location and construction of the greater part of Laurentian Division of the C. P. Railway and subsequently became Chief Engineer of the Alberta Railway and Coal Co., at Lethbridge, Alta., frcm 1898-1901.

Two years he was in charge of the location of part of the Transcontinental Railway, and his last work before being obliged to retire in 1914, owing to ill health, was in charge of the location of a large part of the C.P. Railway, Montreal--Toronto, (Lake Shore) line.

He is survived by Mrs. Garden and one son, H. Mackie G. Garden, J.E.I.C., of the Imperial Life Assurance Company of Montreal. Charles Garden, M.E.I.C., of Vancouver, is an only brother. The remains were brought to Montreal and were followed from the station to Mount Royal Cemetery by a large number of friends, including a number from the engineering profession.

Allan Travers Fraser, A.M.E.I.C.

Allan Travers Fraser, A.M.E.I.C., chief engineer, in the west, of the Canadian National Railways, whose home was in Winnipeg, but who, up to the time of his appointment as chief engineer, was a resident of Edmonton, Alta., was killed by a snow slide in Ellison Pass about opposite Mount Robson on March 31st. He was born at Pembroke January 13th, 1872, and entered *The Institute,* as an Associate Member, March, 1905, at which time he was divisional engineer, with McKenzie and Mann, in charge of construction on the Canadian Northern Railway. He received his education at the School of Practical Science, Toronto, and his early engineering training was with the Canadian Pacific Railway both in Ontario and during the construction of the Canadian Pacific Railway through the Crows Nest Pass. His whole career was one of promotion and advancement and his passing leaves a blank in the engineering life of the prairies. During his residence in Edmonton he made many friends and took a lively interest in the activities of the Edmonton branch.

* * *

Recommendation has been presented to the Government of Newfoundland that they lay down an 80 pound rail from St. John's to Port aux Basques, the whole length of the railway, which is owned by the Government but leased to the Reid-Newfoundland Company. It is considered probable that when this is done, the guage of the railway will also be changed to the standard guage and that the Colony will then have a railway that will compare with any railway on the American continent. This will enable cars to be ferried from North Sydney, C.B., to Port aux Basques and placed on the Newfoundland railway and transported to their destination on the Island.

Because of the development going on in Newfoundland, through private and governmental enterprise, it is reasonable to expect that not only will the trade of Canada with Newfoundland increase but the trade between Newfoundland and other countries will continue to grow and make the installation of modern means of transportation increasingly imperative.

EMPLOYMENT BUREAU

Situations Vacant

Draftsman:

A. K. Grimmer, engineer of Kipawa Fibre Company, Temiskaming, Que., requires a first-class draftsman and officeman. Will pay $175 a month and travelling expenses to Temiskaming. Apply either direct to Mr. Grimmer or to W. S. Lea of R. S. & W. S. Lea, New Birks Bldg., Montreal.

Mechanical Draftsman:

First class mechanical draftsman required by the Electric Steel and Engineering Company, Welland, Ont. A man able to design machinery. Geo. C. McKenzie, general manager.

Civil Service Commission of Canada

The Civil Service Commission of Canada hereby give public notice that applications will be received from persons qualified to fill the following positions in the Civil Service of Canada:—

A Trade Commissioner: Salary $3,000 per annum.

I. A Trade Commissioner, Department of Trade and Commerce, at an initial salary of $3,000 per annum. Candidates should be, preferable, business men of prepossessing personality, tact, fluency in conversation, facility in writing terse English and ability to investigate and get accurate commercial information. The person nominated for this post may or may not be accepted for the position.

N.B.—This is a corrected notice of the position advertised April 3. Canadidates need not be university graduates and the initial destination may not be Vladivostock, as formerly advertised.

A Deputy Registrar and Law Reporter: Salary $2,900 per annum.

II. A Deputy Registrar and Law Reporter for the Exchequer Court of Canada, Department of Justice, at a salary of $2,900 per annum, Grade B, of the First Division. Applicants must be barristers of at least 5 years standing. They must have a knowledge of both official languages in Canada and must be able to speak them with fluency. They must have a practical experience in sicence of law reporting. Familiarity both with the Common Law and the Civil Law more especially in matters of procedure and practice, will be regarded as a valuable qualification for the office. Credentials in respect of the various qualifications must be produced by candidates for the position.

A Canadian Emigration Agent: Salary $1,800 per annum.

III. A Canadian Emigration Agent for Peterborough, England, Department of Emigration and Colonization, at a minimum salary of $1,800 per annum. Candidates must be not more than 50 years of age. They must have a good education and ability as a platform lecturer. They must be well versed in Canadian matters, and must also have some journalistic ability. They must be able to carry on publicity work, not only by means of public lectures but also by the preparation of articles dealing with the various phases of farming in Canada. Familiarity with prevailing conditions in England and ability to talk intellligently to intending emigrants and also to deal in a businesslike manner with steamship booking agents is essential. Applications for this position will be received until May the 29th.

An Agricultural Engineer: Salary $1,600 per annum.

IV. An Agricultural Engineer for the Reclamation Service at Calgary, Department of the Interior, at a salary of $1,600 per annum. Applicants should be graduates in Agriculture of a university of recognized standing, and should have a practical knowledge of irrigation, and sufficient knowledge of engineering to be able to plan and lay out systems of farm ditches. Preference will be given to residents of the Province of Alberta.

An Accountant for the Welland Canal: Salary $1,500 per annum.

V. An Accountant in the Department of Railways and Canals, for the Welland Canal, at an initial salary of $1,500 per annum. An examination will be held on May the 20th in theoretical and practical bookkeeping and commercial arithmetic. A fee of $8 will be required, except in the case of returned soldiers who are exempt from paying the fee. The examination will be held in the English language only. Candidates will be notified of the examination centres. Applicants must be residents of the Province of Ontario. This position was advertised September 5, and is now re-advertised.

VI. Applications will be received from persons qualified to fill the following positions on the Welland Ship Canal Construction Staff.

A Designing Mechanical Engineer: Salary $200–$225 per month.

1. A Designing Mechanical Engineer at a salary of $200 to $225 per month. Candidates must be not less than 30 years of age. They must be graduates in Mechanical Engineering of a recognized School of Engineering. They must have had ten years' experience in the design and supervision of construction of mechanical works of considerable magnitude and have held for at least three years, a position of professional responsibility in charge of this work. They must be capable of taking charge of all calculations, estimates, preparation of plans and specifications. Preference will be given to applicants with experience on works involved in the construction of canals, harbours and hydro-electric plants.

A Mechanical Draughtsman: Salary $125–$150 per month.

2. A Mechanical Draughtsman at a salary of $125 to $150 per month. Candidates must be at least 25 years of age. They should have a High School education or its equivalent. They must have had at least four years' practical experience in the workshops of a recognized engineering construction company, including two years' experience on erectional and outside work supplemented by two years experience in the drawing office of a large bridge company in the preparation of designs, estimates, plans and specifications. Preference will be given to graduates of a recognized school of engineering and particularly to applicants with experience in works involved in the construction of canals, harbours and hydro-electric plants.

An Office Engineer: Salary $125-$150 per month.

3. An Office Engineer at a salary of $125 to $150 per month. Candidates must be not less than 27 years of age. They must be graduates of a recognized School of Engineering. They must have had at least three years' experience in filed work including experience in connection with ordinary and submarine excavation, foundation work, plain and re-inforced concrete work and timber work, and five years' experience in office work, including the preparation of plans, specifications and estimates on quantities. Preference will be given to those with recent experience on the construction of canals, harbours and hydro-electric plants.

A Chief Cost Data Clerk: Salary $175 per month.

4. A Chief Cost Data Clerk at a salary of $175 a month. Candidates must be at least 30 years of age. They must have had a High School education or its equivalent. They must have at least 7 years' practical experience on large construction works and have been 2 years in charge of cost distribution on works of some magnitude. They must be competent to institute and supervise a system for collecting the information necessary to furnish a reliable and accurate statement showing the total actual cost of various divisions of construction work and the different items entering into each.

A Private Secretary to Engineer-in-Charge: Salary $175 per month.

5. A Private Secretary to the Engineer-in-Charge at a salary of $175 per month. Candidates should be between the ages of 27 and 40. They should have a High School education or its equivalent; other things being equal, preference will be given to a university graduate. They must be expert stenographers and typists. They must have had an extensive experience in correspondence relating to construction contracts involving an appreciation of the legal effect of words. They should have a good working knowledge of the principals of bookkeeping and engineering.

* * *

Application forms, properly filled in, must be filed in the office of the Civil Service Commission not later than May the 13th, except in the case of position number III. Application forms may be obtained from the Dominion Provincial Employment Offices or the Secretary of the Civil Service Commission, Ottawa.

By order of the Commission,
W. FORAN, Secretary.
Ottawa, April 16, 1919 42–1

SECOND LIST

A Superintendent of Forest Products Laboratories; Salary $3,500 per annum.

1. A Superintendent of the Forest Products Laboratories of Canada, Montreal, P.Q., Department of the Interior, at a salary of $3,500 per annum. Applicants must be university graduates in forestry, chemistry or engineering, and must have had at least three years' experience since graduation in (a) research laboratory work in one of the above lines of study; (b) practical work in some industry or work in which wood is used as the raw material, e.g., lumbering, pulp and paper manufacture, wood distillation, etc.; or (c) practical experience in forestry administration or research. Applicants must possess a high grade of scientific ability, and capacity for research work, a broad knowledge of the technical characteristics and uses of Canadian woods, and initiative and ability in organization and administration.

Two Superintendents of Construction; Salaries $350 per month.

3. Two Superintendents of Construction, one for the Toronto Public Building and one for the Federal Building, Montreal, at salaries of $350 per month, Department of Public Works. Applicants should be thoroughly competent architects with from eight to ten years' experience as principal of an architectural firm, or have practised for themselves for a similar period, and should be accustomed to superintendence of construction. The persons appointed to these positions will be required to devote the whole of their time to this work.

A Superintendent of Construction; Salary $250 per month.

4. A Superintendent of Construction for the Hamilton Public Building, Department of Public Works, at a salary of $250 per month. Applicants should be thoroughly competent architects with from 6 to 8 years' experience as principal of an architectural firm, or have practised for themselves for a similar period, and should be accustomed to superintendence of construction. The person appointed to this position will be required to devote the whole of his time to this work.

A Superintendent of Construction; Salary $200 to $250 per month.

5. A Superintendent of Construction for the Educational Block, Royal Military College, Kingston, Department of Public Works, at a salary of $200 to $250 per month. Candidates must be thoroughly competent and experienced in reinforced concrete construction and stone work.

Selections for eligible lists of applicants qualified to fill similar vacancies which may occur in future may be made from applications for these positions.

According to law, preference is given to returned soldier applicants, possessing the minimum qualifications. Returned soldier applicants should furnish a certified copy of their discharge certificates. Preference will also be given to bona fide residents of the Provinces in which the vacancies occur.

Applicants should give full information as to their education, military service in Canada, England and France, their previous experience, the names of their previous employers, together with the nature of the work on which they were employed, and the degree of responsibility exercised.

For positions numbers 3, 4 and 5, applications by letter stating age and qualifications must reach the office of the Secretary of the Civil Service Commission not later than May the 10th. For positions numbers 1 and 2, application forms, properly filled in, must be filed in the office of the Civil Service Commission not later than May the 20th. Application forms may be obtained from the Dominion Provincial Employment Offices or the Secretary of the Civil Service Commission, Ottawa.

By order of the Commission.
Wm. Foran,
Ottawa, April 24th, 1919 Secretary.

Preliminary Notice of Application for Admission and for Transfer

20th April, 1919.

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in June, 1919.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows:—

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course. In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineers' office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the following branches at his option Railway, Municipal, Hydraulic, Mechanical, Mining, or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five years or more years.

Every candidate for election as JUNIOR shall be at least twenty-one years of age, and must have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-five years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects Geography, History (that of Canada in particular), Arithmetic, Geometry Euclid (Books I.-IV. and VI.), Trigonometry, Algebra up to and including quadratic equations.

Every candidate for election as ASSOCIATE shall be one who by his pursuits, scientific acquirements, or practical experience is qualified to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

ANDERSON—GEORGE BENSON, of Ottawa, Ont. Born at Morrisburg, Ont., Dec. 26th, 1891. Educ., 3 yrs. School of Mining Kingston. 1907 (4 mos). on D.L.S. in Alta.; 1907, on O.L.S.; 1908, on D.L.S. in Sask.; 1911, transitman, etc., on traverse and subdiv'n work, on Winnipeg river; 1914-15, in chg. of hydrometric survey parties on Ottawa river, D.P.W.; 1915 (6 mos.) in chg. of Coulonge River survey; 1915 (2 mos.) completing plans on same; 1916 Feb. 1919, with Imperial Forces as flying officer, at present asst. engr., P.W.D.

FOR TRANSFER FROM CLASS OF STUDENT TO HIGHER GRADE

GALBRAITH—ROBERT DOUGLAS (Major) of Toronto, Ont. Born at Toronto, May 28th, 1893. Educ., B.A.Sc., Toronto Univ., 1915. 6 mos., instrument work with Northern Development Branch, Ont. Govt.; 4 mos. instrument work and constrn., Foundation Co., N.Y.; 3 mos. dsgning, Curtiss Aeroplane Co., Toronto; 1915, enlisted in 75th Batt., as lieut. O.C. draft of 250 men, transferred to 23rd Bn., England, Sept. 1915; transferred to 28th Bn., France, April 1916; Aug. 1917, Capt., 2nd Can. Ry. Troops; Major, March 1918. Jan. 1919, awarded Military Cross; in chg. of broad gauge and light railway constrn., reconstrn. of bridges, in Belgium and France, and discharged from C.E.F., March 1919; at present is Toronto representative, Professional and business occupations, section, Dept. of Soldiers' Civil Re-Establishment.

References: T. K. Thomson, C. H. Mitchell, F. F. Clarke, J. M. R. Fairbairn, W. J. Francis, H. E. T. Haultain.

JOHNSON—REX PHILLIPS, of Niagara Falls, Ont. Born at Toronto, Ont., Apr. 22nd, 1892. Educ., B.A.Sc., Toronto Univ., 1914. Summer vacations 1909-10-11, rodman, etc., on railroad location and constrn; 1912, on elec. ry. location as transitman; 1913, on Welland Canal maintenance as dftsman and transitman; 1914-16, degning dftsman., Welland canal; 1916 to date, senior dftsman and asst. office engr., dsgn. of constrn. plant., Hydro Elec. Power Comm., Niagara Falls.

References: J. L. Weller, F. E. Sterns, A. C. D. Blanchard, J. B. Goodwin, H. L. Bucke, W. H. Sullivan, W. P. Near, N. R. Gibson.

JOHNSON—BRUCE ALEXANDER, of Winnipeg, Man. Born at Melita, Man., Sept. 15th, 1891. Educ., B.C.E., Man. Univ., 1915. 1911 (5 mos.) with N.T.R.; 1912-13, dftsman, C.N.R., bridge dept.; 1914 (5 mos.) rodman, hydrographic survey; 1915 (6 mos.) asst. engr. bridge dept., C.N.R.; 3 mos. ,engr. on Manitoba highways; Jan. 1916 on active service, and at present under medical treatment.

Referenees: W. Walkden, A. W. Smith, T. W. White, E. E. Brydone-Jack, G. L. Guy.

KIRKPATRICK—ALEXANDER M., of Ottawa, Ont. Born at Chatham, Ont., April 18th, 1889. Educ., B.Sc., (C.E.) Queen's Univ., 1911. 1908 (6 mos.) rodman, T.C. Ry.; 1910 (6 mos.) recorder, hydrometric survey, Ottawa River storage; 1911-12, asst. engr., Internat. Comm., River St. John; 1912 (6 mos.) asst. engr., P.W.D.; 1912 (3 mos.) chg. of survey at Carlton Point for P.E.I. Car Ferry Terminals; 1912-14, in chg. of hydrometric survey party, Ottawa River regulation; 1914-15, in chg. of survey for location of storage and dam sites, N. Sask. River; 1915 to date, asst. engr., P.W.D., Ottawa, in chg. of hydrometric survey party, etc., with exception of 8 mos., in R.A.F. 1918.

References: C. R. Coutlee, S. J. Chapleau, A. Gray, S. B. Johnson, L. A. Des-Rosiers, R. F. Davy.

MARIEN—E. RAYMOND, of Quebec, P.Q. Born at Montreal, Feb. 17th, 1893. Educ., B.A., 1912, B.A.Sc. (C.E.) 1916, L.Ph., 1916, Laval Univ. 1912, on surveys with Jos. Rielle; 1913, highway eng., Montreal-Quebec highway; 1914-15, eng. and inspecting on plants in Quebec; 1916 (3 mos.) ch. asst. to ch. testing engr., Imperial Ministry of Munitions, at McGill Univ., and Oct. 1916-19, in chg. of testing; Jan. 1919 to date, comm'r of industries, Quebec, to look after expansion and trade development, etc.

References: F. C. Laberge, J. A. Smith, G. R. Kendall, C. J. Chaplin, A. Fraser, A. Lariviere, A. B. Normandin.

MAWHINNEY—WILLIAM GEORGE, of Selkirk, Man. Born at Holland, Man., June 26th, 1892. Educ., B.C.E., Manitoba Univ., 1915. Summer 1910, on C.P.R. location; 1911, with G.T.P. Ry., on maintenance; 1912, Midland Ry. of Man., on maintenance; 1913, Dom. Govt., on N. Sask. river survey; 1916 overseas, returned March 1919, and at present is municipal engr., in chg. of road and bridge constrn., rural municipality of St. Clements, Selkirk, Man.

References: E. E. Brydone-Jack, M. A. Lyons, A. McGillivray, J. A. H. O'Reilly, G. H. Herriot, E. P. Fetherstonhaugh, R. W. Moffatt.

McPHERSON—DAVID EWEN, of Winnipeg, Man. Born at Winnipeg, Sept. 1891. Educ., B.C.E., Man. Univ., 1916. 1909 (4 mos.) with C.N.R.; 1910 (5 mos.), rodman, etc., I.J.C.; 1913 (2 mos.) rodman on topog. survey, Lake of the Woods; 1911 (6 mos.) and 1912 (6 mos.) with C.P.R.; 1913 (3 mos.) leveller and instr'man. on constrn., McColl Bors., Winnipeg; 1913 (3 mos.) levelling for topog.; 1914 (4 mos.) res. engr., E.D. & B.C.; 1915 (4 mos.) res. engr., Man. Govt.; 1916 (2 mos.) transitman, with C.N.R.; 1916-18, office or asst. engr., Winnipeg Aqueduct Constrn. Co., and at present dfting with C.N. Ry., Winnipeg.

References: E. E. Brydone-Jack, W. Smaill, G. F. Richan, J. A. H. O'Reilly, A. W. Smith.

RATZ—JOHN EARL, of Ottawa, Ont. Born at Elmira, Ont., Feb. 14th, 1892. Educ., B.A.Sc., Toronto Univ., 1912, D.L.S., passes 14 subjects for D.T.S. certificate, 1910, asst. in chg. of precise level party; 1911, asst. in chg. of triangulation party; 1912-13, ch. of party on precise levels; 1914-17, asst. in chg. of adjustments, primary triangulations, Ontario; 1917-19, sapper and lieut., Can. Engrs., and at present, geodetic engr., and geodetist, Geodet. survey.

References: N. J. Ogilvie, J. J. McArthur, J. D. Craig, M. F. Cochrane, F. B. Reid, H. F. J. Lambart.

REIDMAN—WILLIAM BRIGHTHELM, of Toronto, Ont. Born at Toronto, July 30th, 1892. Eeuc., B.A.Sc., Toronto Univ., 1915. Lieut. certificate in Mil. Eng. 1914. 1912 (2 mos.) with Toronto Harbor Comm.; 1912 (3 mos.) asst. res. engr., Sea Wall Exhibition Park, Toronto; 1913 (4 mos.) asst. (transit and level) in surveying dept., Can. Copper Co., Copper Cliff, Ont.; 1914 (3 mos.) transitman and dftsman., with E. W. Robinson, D.L.S., The Pas, Man.; Dec. 1914-Oct. 1916, sgt., Can. Engrs.; 1915, on service at the front in chg. of engr. working parties; wounded Nov. 1915, invalided to Canada; comm'd as lieut. in Can. Engrs., Oct. Oct. 1917, appointed camp engr. Exhibition Camp, installing, maintaining, heating, etc.; since Dec. 1918 also in chg. of all engr. work in Toronto armories and other military bldgs., work including structural alterations, wiring, heating systems, etc.

Referenees: T. Loudon, P. Gillespie, A. A. Putnam, F. S. Rutherford, H. N. Gzowski, C. R. Young, N. D. Wilson.

ROSCOE—HAROLD MORTON, of Anyox, B.C. Born at Centreville, N.S., Dec. 3rd, 1894. Educ., B.Sc. (honors M.E.) McGill Univ., 1918. 1913 (4 mos.) rodman, Dom. Atlantic Ry.; 1914 (4 mos.), field asst., geological survey; 1915 (4 mos.) instr'man, topog. party, geolog. survey, Elk River; 1916 (5 mos.) transitman on alignment, submarine slopes, Wabana Mine Nfld.; 1916 (3 mos.), in chg. of plane table party, geolog. survey; 1917 (5 mos.) asst. mining engr., Granby Mining Co., Anyox; Apr. 1918-Feb. 1919, lieut., Can. Engrs.; at present, asst. mining engr., Hidden Creek Mine, Granby Consolid. Mining, Smelting & Power Co., Anyox, B.C.

Referenees: F. B. Brown, J. B. Porter, D. W. Burpee, C. Batho.

STEPHENS—WILLIAM E., of London, Ont. Born at London in 1889. Educ., B.Sc., Queen's Univ., 1916. 1912 (6 mos.) rodman on topog. survey, London, Ont.; 1913, (6 mos.) diftsman and instr'man, city engr's dept., London; 1914-15 (18 mos.) instr'man on gen. municipal work, including sewers and pavements, London; 1916-19, res. eng., in chg. of constrn., of sewers and sewage disposal plant, Chipman & Power, Toronto, at present, asst. in office.

References: E. A. Stone, H. A. Brazier, W. Chipman, W. S. Harvey, G. H. Power.

ENGINEERING INDEX

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of the engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies may be obtained of any of the articles listed in this section. Price of each print (up to 11 x 14 in. in size), 25 cents, plus postage. A separate print is required for each page of the larger-size periodicals, but where possible two pages will be photographed together on the same print. Bill will be mailed with the prints.

Orders should be sent to

Harrisson W. Craver, Director,
Engineering Societies Library,
29 West Thirty-ninth Street, New York, N. Y.

MECHANICAL ENGINEERING

AIR MACHINERY

Compressors. Up-to-date Practice in Compressor Maintenance. Elec. Ry. Jl., vol. 53, no. 12, Mar. 22, 1919, pp. 569-572, 4 figs. Methods of inspection and overhauling. Details of compressor overhauling and testing bench.

Fans. Centrifugal Fans and Their Application to Gas Engineering Practice, Frank S. Townsend. Gas Jl., vol. 145, no. 2906, Jan. 21, 1919, pp. 116-118 and discussion pp. 118-119, 15 figs. Elementary theory of fan; description of two types of centrifugal fan (radial flow and mixed flow); discussion of efficiency of fan, methods of driving and regulation; examples of recent practice in application of fan plants. Paper before Midland Junior Gas Assn.

FORGING

Heavy Forgings. Making and Heat-treating Heavy Forgings, Franklin D. Jones. Machy., vol. 25, no. 7, Mar. 1919, pp. 583-590, 12 figs. General practice of Tacony Ordnance Corporation in production of ingots and forgings for 155 and 240-mm. guns.

Turned Forgings. Making Accurate Turned Forgings. Iron Trade Rev., vol. 64, no. 13, Mar. 27, 1919, pp. 815-818, 8 figs. Details of manufacturing operations at plant of company specializing on finished marine and machine forgings.

FURNACES

Davis "Revergen" Principle of Firing. The Davis "Revergen" Principle of Firing Furnaces with Town Gas. Metal Industry, vol. 14, no. 9, Feb. 28, 1919, pp. 169-171, 2 figs. Demonstrations made of system in annealing steel billets at 870 deg. cent.; billet heating up to 1000 deg. cent and high-temperature test. Also in Gas Jl., vol. 145, no. 2911, Feb. 25, 1919, pp. 385-387, 2 figs.

Industrial Furnaces. Industrial Furnaces (Fours industrials), A. Bigot. Chimie & Industrie, vol. 2, no. 1, Jan. 1, 1919, pp. 30-36, 8 figs. Classification of various types; their uses and equipment.

Oven and Muffle Furnaces. Industrial Oven and Muffle Furnaces and Their Method of Operation, C. M. Walter. Metal Industry, vol. 14, no. 10, Mar. 7, 1919, pp. 183-185. On theoretical maximum temperatures of combustion of different fuel to be obtained in economical operation of furnaces.

FOUNDRIES

Brass Foundry. Materials and Chemicals Used in Brass Foundry Practice — IV, Charles Vickers. Brass World, vol. 15, no. 3, Mar. 1919, pp. 69-71, 2 figs. History, properties, appearance, physiological action and commercial use of the substances commonly used in brass founding.

Some Principles Involved in Melting Metals — IV, Charles Vickers. Brass World, vol. 15, no. 3, Mar. 1919, pp. 73-75. Effect of heat upon metals; action of zinc and copper; casting of yellow brass.

British. British Foundries Undergo Change, H. Cole Estep. Iron Trade Rev., vol. 64, no. 13, Mar. 27, 1919, pp. 819-823, 2 figs. Survey of conditions in Great Britain, with reference to recent improvements in shop methods.

Malleable Foundry. Uses Electric Furnace in Malleable Foundry, F. L. Prentiss. Iron Age, vol. 103, no. 9, Feb. 27, 1919, pp. 537-543, 8 figs. Features of Cleveland plant of Nat. Malleable Castings Co., designed for making castings by Kranz triplex process.

Nickel Alloy Castings. Casting Nickel Silver — a Copper-Nickel-Zinc Alloy, R. V. Hutchinson. Metal Industry, vol. 14, no. 9, Feb. 28th 1919, pp. 161-162 1 fig. Method of packing a crucible with nickel silver.

Patternmaking. Patternmaking Methods, Joseph A. Shelly. Machy., vol. 25, no. 7, Mar. 1919, pp. 631-634, 9 figs. Typical examples of pattern work and methods used in general practice. First article.

Pouring Metal. Foundry Puzzles and Their Solution, J. G. Horner. English Mechanic, vol. 109, 2816, Mar. 14, 1919, pp. 85-86. Remarks on static load and dynamic action at time of pouring due to inrush of molten metal.

Sand. Ferruginous and Other Bonds in Molding Sands, P. G. H. Boswell. Brass World, vol. 15, no. 3, Mar. 1919, pp. 81-84. Foundry practices followed in Great Britain, France, Belgium and Germany. Paper read before Am. Foundrymen's Assn.

The Practical Analysis of Molding Sand, F. Albert Hayes. Iron Age, vol. 103, no. 12, Mar. 20, 1919, pp. 739-741, 2 figs. Selection according to physical qualities and the nature of the work is advocated; sieve tests.

FUELS AND FIRING

Absorption of Gases by Coal. Absorption of Gases by Coal, S. H. Katz. Queensland Govt. Min. Jl., vol. 20, Feb. 15, 1919, pp. 60-62. Experimental research with air and with an atmosphere of nitrogen.

Blending. The "Sandwich" System of Fuel Blending, E. W. L. Nicol. Gas Jl., vol. 145, no. 2906, Jan. 21, 1919, pp. 113-115, 3 figs. Apparatus which premits the mixing of various qualities of solid fuel as they are fed to burners. Also in Natl. Engr., vol. 23, no. 4, Apr. 1919, pp. 161-164, 2 figs.

Chart for Comparing Values of Different Sizes of Coal. Chart for Finding True Value of One Size of Coal. Black Diamond, vol. 62, no. 12, Mar. 22, 1919, pp. 318, 1 fig. Gives value of one size in terms of values of other sizes.

Coal Analysis. Natural Solid Fuels (Contribution à l'étude des combustibles naturels solides), Roger Hartman. Société Industrielle de l'Est, bul. 144, Jan. 1919, pp. 7-18, 3 figs. Method of analyzing a sample of coal and calculating into its calorific value. Based on notes publisbed by The Association Alsacienne des Propriétaires d'Appareils à vapeur.

Coal Problem. Coal and Other Fuels and Substitutes, Alexander Ross. Ry. Gaz., vol. 30, no. 6, Feb. 7, 1919, pp. 202-205. Address before Retired Ry. Officers' Soc.

The Coal Problem, E. G. Bailey. Universal Engr., vol. 29, no. 1, Jan. 1919, pp. 35-49, 10 figs. Abnormal conditions in production and demand brought about by war conditions; question of future of coal industry. Second article.

The Coal Commission. Ry. Gaz , vol. 30, no. 11, Mar. 14, 1919, pp. 487-488. Facts about coal transport saving ,pooling private owners' cars, American coal competition, etc.

The Coal Commission, Iron & Coal Trades Rev., vol. 98, no. 2663, Mar. 14 1919, pp. 313-319. Laboratory tests. (Continuation of serial).

Fuel Conservation. Worcester's Fuel-Saving Campaign — III, S. E. Balcome. Power Plant Eng., vol. 23, no. 7, Apr. 1, 1919, pp. M 315-316. Personal and work of factory committees.

Fuel Conservation in Louisiana, Leo S. Weil. Proc. La Eng. Soc., vol. 4, no. 6, Dec. 1918, pp. 206-223 and (discussion) pp. 224-228. Account of work done and of plans by which it is hoped to secure increased results in future.

Lignites. Combustion of Lignites and High-Moisture Fuels, T. A. Marsh. Power, vol. 49, no. 14, Apr. 8, 1919, pp. 525-527, 5 figs. Types of stoker adaptable to burning lignites containing up to 35 per cent moisture. Predrying is considered impractical. Also in Elec. World, vol. 73, no. 6, Feb. 8, 1919, pp. 265-267, 5 figs.

Notes on Lignite, Its Characteristics and Utilization, S. M. Darling. Universal Engr., vol. 29, no. 1, Jan. 1919, pp. 27-34. Concerns particularly the utilization and storage of lignite.

Peat. Peat, Lignite and Powdered Coal F. Parkman Coffin. Steam, vol. 23, no. 3, Mar. 1919, pp. 71-78. Uses of peat in Europe as fuel; firing boilers with lignite; advantages in carbonizing lignite.

The Utilization of Peat and Its By-Products, L. H. Bacque. Power House, vol. 12, no. 3, Mar. 1919, pp. 62-65, 3 figs. Origin of peat, its properties ,the extent of Canada's deposits, and methods which have been devised for its manufacture.

Powdered Fuel. Powdered Fuel for Hammersmith. Elec. Times, vol. 55, no. 1430, Mar. 13, 1919, pp. 168-169, 2 figs. Layout of Holbeck system of powdered fuel for firing boilers.

Pulverized Coal Burners Versus Stokers, Joseph T. Foster. Elec. World, vol. 73, no. 10, Mar. 8, 1919, pp. 474-475, 1 fig. Comparative freight charges on low and high-grade fuel. Chart showing maximum amount that can be paid for pulverized coal to make it comparable with a given stoker coal..

Success in Combustion of Powdered Coal, W. G. Wilcox. Black Diamond vol. 62, no. 12, Mar. 22, 1919, pp. 328-329. Velocity of combustion; importance of mixing with air.

Smokeless Combustion. Combustion and Smokeless Furnaces, Jos. W. Hays. Steam, vol. 23, no. 2, Feb. 1919, pp. 42-46. Points out what are termed, undesirable features of the various types of smokeless furnace.

Storage. Storage of Fuel and Spontaneous Combustion, S. H. Pudney. Official Proc. Can. Ry. Club, vol. 17, no. 2, Feb. 1919, pp. 15-21 and (discussion) 22-23. Losses due to storage and causes for spontaneous combustion, verified by author's experience. Also in Contract Rec., vol. 33, no. 13, Mar. 26, 1919, pp. 291-293.

Spontaneous Combustion of Bituminous Coal in Storage (La conservation en tas des charbons bitumineux et les dangers de leur combustion spontanée), Ch. Vallet. Industrie Electrique, vol. 28, no. 640, Feb. 25, 1919, pp. 73-76. Experiments, observations and recommendation. From paper before Inst. Mar. Engrs.

Deterioration in Value During Storage, H. C. Porter and F. K. Ovitz. Black Diamond, vol. 62, no. 12, Mar. 22, 1919, pp. 322-324, 10 figs. Summary of tests to determine heat-value losses from various forms of storage.

Wood. The Use of Wood for Fuel. U. S. Dept. of Agriculture, Bul. 753, Mar. 10, 1919, 40 pp., 2 figs. Suggestions as to proper use of wood resources to prevent recurrence of fuel shortage such as occurred during winter of 1917-1918.

This index is being paged separately in order that members may bind it separately if they so desire.

GAGES

Checking. Checking Gages, Herman L. Wittstein. Factory, vol. 22, no. 3, March 1919, pp. 456-457, 3 figs. Forms for keeping gage inspection.

Gage Systems. A Practical Rings, Plug, and Snap Gauge System. Machinery, vol. 13, no. 328, Jan. 9, 1919, pp. 400-401, 10 figs. System designed to meet requirements in interchangeable manufacture.

Profile Gages. Contour of Profile Gauges. Machinery, vol. 13, no. 337, Mar. 13, 1919, pp. 649-655, 31 figs. Principles involved and procedure followed in developing gaging systems for interchangable manufacture, based upon experience of Pratt & Whitney Co. Third article.

Thread-Measuring Wires. The Manufacture of Standard Thread Measuring Wires, Fred. R. Daniels. Machy., vol. 25, no. 7, Mar. 1919, pp. 606-607, 4 figs. Table of values used for determining error in thread angle by the three-wire system.

HANDLING OF MATERIALS

Ash Handling. Raw Material and Ash Handling Equipment, Robert June. Brick & Clay Rec., vol. 54, no. 6, Mar. 25, 1919, pp. 507-509, 3 figs. Principles of power-plant requirements. Ninth article.

Foundry Trucking. Foundry Built around a Shop Truck. Iron Age, vol. 103, no. 10, Mar. 6, 1919. pp. 603-606, 10 figs. Material-handling system at new plant of Peerless Foundry, Cincinnati.

Materials. Handling Materials, F. T. Buell and Edward R. Cole. Factory, vol. 22, no. 3, March 1919, pp. 470-471, 8 figs. Seven plans as used in two plants.

Shell Shops. Handling Devices in British Shell Shops. Eng. & Indus. Management, vol. 1, no. 5, Mar. 13, 1919, pp. 157-161, 20 figs. Handling appliances for conveying objects while suspended from above. Continuation of serial.

HEAT-TREATING

Engine Parts. Heat Treatment of Steel for Small Petrol Marine Engines. Engineer, vol. 127, no. 3294, Feb. 14, 1919, pp. 159-160, 1 fig. On the building of light " chasers " in America.

Gun Forgings. Electric Heat Treatment of Gun Forgings, C. E. Wright Iron Age, vol. 103, no. 11, March 13, 1919, pp. 673-678, 12 figs. Installation at naval gun plant of Tioga Steel & Iron Co., Philadelphia. It is intended to use this plant for commercial use.

Heating Furnaces. Practical Pointers on Heating Furnaces, George J. Hagan Am. Drop Forger, vol. 5, no. 3, Mar. 1919, pp. 142-144. Deals with heating furnaces in general for treatment of both light and heavy stock. Before Engrs. Soc. Western Pa.

Annealing and Heating Furnaces Fired by Town Gas. Engineering, vol. 107, no. 2774, Feb. 28, 1919, pp. 272-276, 8 figs. Leading feature is incorporation of regenerators for heating the air supply before it enters the furnace by means of waste gases from the furnace. Development by Technical Section of the Davis Furnace Co.

Steel. Heat Treatment of Steels (Le traitement thermique des aciers). Métallurgie, vol. 51, no. 12, Mar. 19, 1919, pp. 646-647. Its influence on the quality of products.

HEATING AND VENTILATION

Air Sampling. The Effect of Sunlight on Air, William J. Maurer. Heat. & Vent. Mag., vol. 16, no. 3, Mar. 1919, pp. 27-32, 7 figs. Report on laboratory tests to determine proper technique in handling air samples.

Central-Station — Combination Heating Plants. Advantage of the Combination Central Station Heating Plant, John C. White. Heat & Vent. Mag., vol. 16, no. 3, Mar. 1919, pp. 33-37. Recommendations put forth by Bureau of Mines for combining central-station heating systems with steam-power plants.

Equivalent Temperatures, Steam-Hot Water. Equivalent Temperature of Guaranteed Steam and Hot Water Heat, Henry N. Dix. Am. Architect, vol. 115, no. 2254, Mar. 5, 1919, pp. 358-360, 6 figs. Formula and charts.

Factory Heating. Factory Heating, Alfred G. King. Domestic Eng., vol. 86, no. 11, Mar. 1919, pp. 466-468, 5 figs. Hot-water heating with forced circulation.

Foundry Ventilation. Foundry Ventilation. Iron Age, vol. 103, no. 10, Mar. 6, 1919, p. 610, 3 figs. Effect of roof design and heating systems on air circulation.

Hot-Water Central Heating Plant. Designing Data as Applied to a Large Hot Water Heating Plant, George E. Reed. Heat. & Vent. Mag., vol. 16, no. 3, Mar. 1919, pp. 17-26, 11 figs. Plant for high school of five buildings. " Unit " system followed in design and construction.

Industrial Buildings. The Mechanical Equipment of Industrial Buildings — II. Charles L. Hubbard. Power, vol. 49, no. 10. March 11, 1919, pp. 362-365. Remarks on selections of type of prime mover, systems of power distribution and methods of heating and ventilating.

Laws. Proposed Michigan Law on Furnace Heating. Metal Worker, no. 2360, Mar. 21, 1919, pp. 372-374. Bill to regulate and control the installation o fwarm-air heating plants.

Temperatures, Indoor and Outdoor. Tests for Heating Plants in Mild Weather, Henry N. Dix. Metal Worker, no. 2360, Mar. 21, 1919, pp. 365-367, 7 figs. Charts of temperature indoors with varying outdoor temperatures.

Vacuum Heating. Care of Heating and Ventilating Equipment—VIII, Harold L. Alt. Power, vol. 49, no. 9. March 4, 1919, pp. 306-308, 11 figs. Vacuum-heating systems.

HOISTING AND CONVEYING

Bucket Hoist. Bucket Carrier System (Benne preneuse continue, pour la manutention des matières pondéruses). Génie Civil, vol. 74, no. 9, Mar. 1, 1919, pp. 174-175, 3 figs. Chain belt with buckets moves continuously over material to be handled; buckets discharge on iron channel where material descends by gravity.

Cable Breakage. Breaking of Cable in Protection Shaft, Robert Dunn. Coal Age, vol. 15, no. 11, March 13, 1919, pp. 489-491, 2 figs. Tests said to indicate that breaking of rope was due to inadequate lubrication, particularly in hemp center.

Grab Bucket, Self-Discharging. Barnard's Self-Discharging Grab. Engineering, vol. 107, no. 2772, Feb. 14, 1919, pp. 200-202, 11 figs. Improvements made in design since last description published in issue of April 17, 1914, p. 524.

HYDRAULIC MACHINERY

Flow of Water. The Flow of Water in Large Pipes and Tunnels. Frederick J. Mallett and Alfred A. Barnes. Engineering, vol. 107, no. 2774, Feb. 28, 1919, pp. 288-291, 14 figs. Traces out inconsistencies met with in many of the older formulæ, and sets out the features that in practice determine the ultimate capacity of water mains. Abstracts of two papers read before Instn. Civil Engrs.

Hydroelectric Plants. Data of Hydro-Electric Plants (Sur les données actuelles en matières de construction d'usines hydro-électriques), Denis Eydoux, Annales, Ponts et Chaussées, vol. 5, no. 46, Sept. Oct., 1918, pp. 125-196, 35 figs. Installations where head exceeds 40 meters, (Concluded.)

Pelton Wheels. A Pelton Wheel Driven Centrifuge, F. J. Broadbent. Engineering, vol. 107, no. 2771, Feb. 7, 1919, pp. 161-164, 10 figs. Design based on theory outlined in article entitled Static Torque Experiments on a Pelton Wheel, Eng Sept. 11, 1914.

Tidal Power. " Blue Coal." Sci. Am. Supp., vol. 87, no. 2253, Mar. 8, 1918, pp. 156-157 and 160, 9 figs. Efforts that have been made to utilize energy of waves and tides. From Larousse Mensuel, Paris.

Wave Propagation. Determination of the Velocity of Propagation of Waves in Forced Conduits (Détermination de la vitesse de propagation des ondes dans les conduites forcées), C. Camichel. Technique Moderne, vol. 10, no. 12, Dec. 1918, pp. 537-544, 20 figs. Explains by means of de Sparre formulæ anomalies which have been pointed out by engineers in experimental determination of velocity of propagation of waves; writer believes that the apparent variations of this velocity are explicable and disappear altogether if a correct experimental method is followed.

INTERNAL-COMBUSTION ENGINES

Carburation. The Carburation Temperature of Oil Mixtures, C. A. Norman. Automotive Industries, vol. 40, no. 9, Feb. 27, 1919, pp. 490-491, 1 fig. Method of determining temperature necessary to keep in a permanent state of vaporization any oil fraction contained in a carburized mixture.

Diesel-Engine Injection. Solid-Injection Versus Air-Injection. Motorship, vol. 4, Apr. 1919, pp. 35-37, 6 figs. Technical aspect of subject in its bearing on future design and construction of high-compression marine oil engines for merchant and naval ships. Second installment.

Diesel Engines. McIntosh & Seymour Marine Diesel Engine. Power, vol. 49, no. 14, Apr. 8, 1919, pp. 528-531, 4 figs. Description of a four-stroke-cycle directly reversible engine.

High-Speed Engines. Factors in High-Speed Engine Development — I D. McCall White. Automotive Industries, vol. 40, nos. 12 and 13, Mar. 20 and 27, 1919, pp. 622-627 and 667 and 698-701, 17 figs. Roles played by forced lubrication, high mean effective pressure, valve areas, inertia, valve timing, materials, and piston material and design. Mar. 27: Application of high-speed engines to war uses; construction of Cadillac crankcase, illustrating the method of webbing up for maximum rigidity. (Continued).

New Engine for Trucks and Tractors. Motor Age, vol. 35, no. 12, Mar. 20, 1919, pp. 42-43, 2 figs. Carbureter may be mounted on either side. Main feature of design is accessibility. Golden-Belknap-Schwartz model. Also in Automotive Industries, vol. 40, no. 12, Mar. 20, 1919, pp. 645-647, 6 figs.

Hot-Bulb Engines. The British Two-stroke Motor. Engineer, vol. 127, no. 3295, Feb. 21, 1919, pp. 182-183, 3 figs. Gear of directly reversing hot-bulb engine.

Radial Engines. The Enfield-Allday Five-cylinder Radial Engine. Autocar, vol. 42, no. 1221, Mar. 15, 1919, p. 357, 1 fig. Engine in which air cooling is effected by means of aluminum fins and forced draft.

Truck and Tractor Engines. Three Hinkley Engines Built Around Class " B " Design. Automotive Industries, vol. 40, no. 11, Mar. 13, 1919, pp. 587-589, 6 figs. Models for 4 to 6-ton 1½ to 2½-ton trucks and tractors drawing 1 to 4 plows.

Valves. Small Inlet Valves Satisfactory in Overhead Valve Design — II, L. H. Pomeroy. Automotive Industries, vol. 40, no. 9, Feb. 27, 1919, pp. 471-475, 5 figs. Tests made with two engines of same size, one having a valve-in-head design and the other on L-head with valves side by side in valve pocket. Tests are said to have proven that specific fuel consumption is largely independent of r.p.m. and torque for 50 to 60 per cent of maximum hp. Paper before Instn. Automobile Engrs.

Characteristics of a High-Grade Standardized Engine, J. H. W. Kerston. Automotive Industries, vol. 40, no 10, Mar. 6, 1919, pp. 527 and 549. Effect of increasing valve size on efficiency and smoothness of run.

LUBRICATION

Air Compressors. Correct Lubrication of Air Compressors, H. V. Conrad. Iron Age, vol. 103, no. 12, Mar. 20, 1919, pp. 753-754, 1 fig. Cylinder temperatures and physical tests of oils given as guide for selecting lubricant. Paper prepared for Compressed Air Soc. Also in Eng. & Min. Jl., vol. 107, no. 9, Mar. 1, 1919, pp. 392-394, 1 fig.

Colloidal Phenomena. A Problem in Lubrication, W. B Hardy. Jl. Soc. Chem. Indus., vol. 38, no. 2, Jan. 31, 1919, p. 7T. Colloidal phenomena in lubrication.

Lubricants. Lubrication and Lubricants, G. R. Rowland. Jl. Am. Soc. Naval Engrs., vol. 31, no. 1, Feb. 1919, pp. 97-138, 7 figs. Definition, classification, testing, refining and selection.

MACHINE ELEMENTS AND DESIGN

Bearings. On Proportioning Engine Bearings, Otto M. Burkhardt. Automotive Industries, vol. 40, no. 12, Mar. 20, 1919, pp. 651-655, 10 figs. Analysis of crank-bearing loads in a 4-cylinder, 3-bearing truck engine under different conditions of operation.

Cams. Cam Design and Construction, Franklin de R. Furman. Am. Mach., vol. 50, no. 13, Mar. 27, 1919, pp. 581-586, 13 figs. Introduction; types of cams described. First article.

Gears. Toothed Gearing, Joseph Chilton. Times Eng. Supp., vol. 15, no. 532, Feb. 1919, p. 92. Manufacture and design of spur. helical. bevel, and worm gearing for transmitting motion between shafts the axes of which are either parallel or at right angles to each other. Paper before North-East Coast Instn. Engrs. & Shipbuilders.

Pistons. Pistons and Their Treatment. Motor Traction, vol. 28, no. 733, Mar. 19, 1919, pp. 246-248, 10 figs. Suggestions in regard to detaching the piston; testing the relative truth-of pistons with connecting rods.

Springs. Minimum Number of Combined Springs (Sur le nombre minimum de spiraux associés), Jules Andrade. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 3, Jan. 20, 1919, pp. 139-141. On regulation of pendulums and balance wheels for exact chronometric work.

MACHINE SHOP

Broaches. Determining the Number of Broaches to Use. Machinery, vol. 13, no. 335, Feb. 27, 1919, p. 599, 1 fig. Chart.

Crankshaft Repairs. Recent Crankshaft Repairs. Iron Age, vol. 103, no. 13, Mar. 27, 1919, pp. 812-813, 3 figs. Six-throw crankshaft made from steel billets by thermit process.

Electric Drive. Electric Drive for Punching, Shaping and Slotting Machines, C. E. Clewell. Am. Mach., vol. 50, no. 10, Mar. 6, 1919, pp. 439-444, 12 figs. Discussion on basis of machines in which duty cycle throughout given operations consists of two directions of motion.

Motor Drive as Viewed by Machine Builders and Motor Manufacturers, C. E. Clewell, Am. Mach., vol. 50, no. 11, March 13, 1919, pp. 475-478, 7 figs. Result of canvassing opinions of various machine-tool builders and electric-motor manufacturers.

Machine Tool Drives; Motors and Controllers, H. W. Tice. English Mechanic, vol. 109, no. 2816, Mar. 14, 1919, pp. 88-89, 2 figs. Service records of motors and machine tools controlled in Lehigh plant of Bethlehem Steel Co. (To be continued).

Foundations. Foundations for Various Types of Planers, Terrell Croft. Can. Machy., vol. 21, no. 2, Jan. 9, 1919, pp. 29-34, 16 figs. Suggests use of leveling blocks and recommends concrete as best material.

Grinding and Sizing. Grinding and Sizing Diagrams, Alfred T. Fry. Min. & Sci. Press, vol. 118, no. 10, March 8, 1919, pp. 324-327, 5 figs. Suggests method of drawing curve to compare and use results obtained while making tests of grinding efficiency of a given machine under varied conditions.

Cylinder Grinding, Frinaklin D. Jones. Machy., vol. 25, no. 7, Mar. 1919, pp. 615-621, 12 figs. Discussion of advantages of finishing cylinder bores by grinding; machines and auxiliary equipment used; practice in different plants manufacturing engines for automobiles and airplanes. First article.

Roller Bearings. Roller Bearings for Machine Shop Equipment — III. Machinery. vol. 13, no. 335, Feb. 27, 1919, pp. 604-607, 6 figs. Combination radial and thrust roller bearings; roller bearings with staggered rollers; lubrication.

Splitting Piston Rings. Splitting Piston Rings, Jacob Young, Machy., vol. 25, no. 7, Mar. 1919, pp. 590-591, 1 fig. Chart for determining length of section to be cut from piston ring.

Swivel Machining. Machining Front Axle Swivels, A. Thomas. Automobile Engrs., vol. 9, no. 124, Mar. 1919, pp. 72-74, 10 figs. Manufacturing operations on swivels made from nickel-steel drop-forgings.

Templets. Templets, Jigs and Fixtures, Joseph Horner. Engineering, vol. 107, no. 2772, Feb. 14, 1919, pp. 197-199, 13 figs. Describes various types. Twentieth article.

Test-Piece Manufacture. The Rapid Production of Test Pieces. Can. Machy. vol. 21, no. 9, Feb. 27, 1919, pp. 206-207, 9 figs. Making test pieces from shell.

Workshop Practice. Modern Workshop Practice — VI, W. Wilson. Commonwealth Engr., vol. 6, no. 6, Jan. 1, 1919, pp. 173-180, 15 figs. Science of quick repetition. Deals with modifications in lathes through omission of parts not required for the particular work to be done.

MACHINERY, METAL WORKING

Arresting Motion for Presses. Automatic Arresting Motion for Power Presses. Engineer, vol. 127, no. 3293, Feb. 7, 1919, p. 135, 2 figs. Mechanism can be applied to type of machine in which a flywheel revolves freely on its shaft until a positive connection is established between the two parts by a convenient device.

Die-Sinking Tools. A discussion on Die Room Conditions, F. J. Rau. Am. Drop Forger, vol. 5, no. 3, Mar. 1919, pp. 126-128, 4 figs. Sketches of diesinking tools.

Gear-Tooth Rounding Machine. Walker Automatic Gear Tooth Rounding Machine. Automotive Industries, vol. 40, no. 12, Mar. 20, 1919, pp. 648-650, 5 figs. Design to round meshing edges or to remove burrs left by cutters or hobs.

Lathe. Engine Lathes for Precision Work. Iron Trade Rev., vol. 64, no. 10, Mar. 6, 1919, pp. 633-637, 8 figs. How various lathe parts in the process of making are routed through the grinding, planing, milling, turning and assembling departments of a machine-tool plant in Cincinnati.

Niles Heavy Driving Wheel Lathe at Crewe Works, London & North Western Railway, Ry. Gaz., vol. 30, no. 7, Feb. 14, 1919, pp. 252-253, 2 figs. Turning tires of express passenger locomotives.

Milling and Gear cutting on Lathes. Making Milling and Gear Cutting Attachment — I. Robert Mawson. Can. Machy., vol. 21, no. 3, Jan. 16, 1919, pp. 51-53 and 63, 11 figs. Attachment for lathes which performs milling and gear-cutting operations. Various tools and operations used are shown.

Square Bar for Internal Planing. Square Bar for Internal Planing, W. G. D. Machinery, vol. 13, no. 335, Feb. 27, 1919, pp. 600-601, 2 figs. Formulæ and calculations.

Thread-Milling Cutter. The Cycloid Thread-Milling Cutter. Engineer, vol. 127, no. 3294, Feb. 14, 1919, p. 159, 1 fig. Design to overcome "waves" and "flats" on work.

MACHINERY, WOODWORKING

Woodworking Machines. Apparatus for Woodworking and Their Recent Improvements (Les machines-outils pour le travail du bois et leurs récents perfectionnements), E. Gay. Technique Moderne, vol. 10, no. 12, Dec. 1918, pp. 554-563, 29 figs. French types of machines for finishing patterns. (Concluded).

MACHINERY, SPECIAL

Clock Escapements. Clock Escapements. Engineering, vol. 107, no. 2775, Mar. 7, 1919, pp. 297-298, 2 figs. History of development of present combination. Paper before Roy. Instn.

Drill Sharpener. Drill Sharpener Speeds Up Shipbuilding, Letson Ballict. Mine & Quarry, vol. 11, no. 2, Mar. 1919, pp. 1130-1133, 14 figs. Marking of drift bolts, rivets, grab-iron ends, ball stanchions, etc.

Hammer Drills. Hammer Drills — Their History, Design and Operation, Henry S. Potter. Jl. South African Instn. Engrs., vol. 17, no. 6, Jan. 1919, pp. 86-98, 5 figs. Materials of construction; pistons and valves; general features of modern jack hammers; limitations in use of hammer drills for stoping. Second and concluding installment.

Lapping Machine. A Machine for Lapping Precision Gage Blocks. Am. Mach., vol. 50, no. 13, Mar. 27, 1919, p. 613, 1 fig. Design for producing gage block, of any contour, but having two opposite sides flat and parallel and a definite distance apart.

Routing Machine. Routing Machine of Special Design, Am. Mach., vol. 50, no. 11, Mar. 13, 1919, pp. 491-493, 5 figs. Machine uses tool which is rapidly rotated through several turns in one direction, then reversed and rotated as rapidly and for an equal number of turns in the opposite direction, this cycle of movement being continued so long as may be necessary to complete the operation.

Worm-Wheel Generator. G. & E. 18-In. Worm Wheel Generator. Automotive Industries, vol. 40, no. 14, Apr. 3, 1919, pp. 746-747, 3 figs. Machine designed for producing worms and worm wheels for trucks, tractors, etc., and adapted for production and experimental work.

MATERIALS OF CONSTRUCTION AND TESTING OF MATERIALS

Aluminum. Aluminum: Its Use in the Motor Industry in England, E. Carey Hill. Metal Indus., vol. 17, no. 3, March 1919, pp. 125-127, 2 figs. Application of aluminum in replacing steel and other metals. Second and last article.

Alternating Stresses, Steel. Premature Rupture of Steel Pieces Subjected to Repeated Stresses (Cause de la rupture prématurée des pièces d'acier soumises à des efforts répétés). Ch. Fremont, Génie Civil, vol. 74, no. 3, Jan. 18, 1919, pp. 47-52, 13 figs. Survey of experiments on formation and extension of fissures. Some deductions in Wöhler's theory are held to be inexact. Also in Comptes rendus des séances de l'Académie de Sciences, vol. 168, no. 1, Jan. 6, 1919, pp. 54-56.

Beams, Reinforced-Concrete. Tests Show High Shears in Deep Reinforced-Concrete Beams, W. A. Slater. Eng. News Rec., vol. 82, no. 9, Feb. 27, 1919, pp. 430-433, 4 figs. Preliminary studies made for Emergency Fleet Corporation's concrete ship work. Higher safety units than those now permitted are advocated.

Bearing Metals. Proper Specifications for Bearing Metals, Alfred A. Greene. Iron Age, vol. 103, no. 14, Apr. 3, 1919, pp. 874-875. Functions of a lining alloy; mixing the component metals; electrically hardened lead.

Brass, Rolled Sheet. Structural Characteristics of Rolled Sheet Brass. Metal Indus., vol. 17, no. 3, March 1919, pp. 121-124, 6 figs. Thermal equilibrium diagrams of various alloys; photomicrographs of cast and annealed brass. (To be continued.)

Brickwork. Tests Determine Strength of Brickwork, W. W. Pearse. Contract Rec., vol. 33, no. 8, Feb. 19, 1919, pp. 151-155, 10 figs. Report of tests carried out at Toronto Univ. in co-operation with City Architect's Dept.

Mortars, Cement-Lime. Compressive Strength of Cement-Lime Mortars, F. A. Kirkpatrick and W. B. Orange. Jl. Am. Ceramic Soc., vol. 2, no. 1, Jan. 1919, pp. 44-46, 9 figs. Determination of factors exerting greatest control over strength of cement-lime mortars. Manner of control expressed by mathematical formula and practical application of results indicated.

PAPER TESTER. The Webb Paper Tester — A New Instrument for Testing Corrugated Fiber Boards, J. D. Malcolmson. Jl. Indus. & Eng. Chem., vol. 11, no. 2, Feb., 1919, pp. 133-138, 6 figs. Comparison with Mullen tester decides writer to prefer Webb machine.

RESISTANCE OF MATERIALS. The Resistance of Materials, G. S. Chiles and R. G. Kelly. Ry. Mech. Engr., vol. 93, no. 3, March 1919, pp. 123-126, 6 figs. Review of data relative to effect of abrupt changes of section under "static" and "dynamic" tests published by various authorities and results of experiments conducted by writers. (To be continued).

MEASUREMENTS AND MEASURING APPARATUS

AIR MEASURING INSTRUMENTS. The Determination of the Efficiency of the Turbo-Alternator, S. F. Barclay and S. P. Smith. Elecn., vol. 82, no. 2128, Feb. 28, 1919, pp. 244-246, 3 figs. Suggestions in regard to measuring air volume and temperature; diagrams plotted from pitot tube readings taken at opening of temporary discharge trunk. Before Instn. Elec. Engrs.

BOILER RECORDING INSTRUMENTS. Fuel Economy in the Boiler House — II, John B. C. Kershaw. Chem. & Metallurgical Eng., vol. 20, no. 5, March 1, 1919, pp. 241-245, 7 figs. Principles involved in operation of Sarco, Uehling, Simmance & Abady, Cambridge Bi-Meter, Auto and Mono recording instruments.

COAL-CONSUMPTION METER. Lea Coal-Consumption Meter (Appareil indicateur-totalisateur de la consommation de charbon, système Lea), P. Letheule. Génie Civil, vol. 74, no. 6, Feb. 8, 1919, pp. 101-105, 18 figs. Registers total consumption by system of levers and pinions operated by motion of stoker and controlled by volume of coal fed into burners. Details of construction and application of apparatus to Stirling and Babcock boilers are given.

FLOW METERS. An Automatic Compensating Flow Meter, G. G. Oberfell. Jl. Indus. & Eng. Chemistry, vol. 11, no. 4, Apr. 1, 1919, pp. 294-296, 1 fig. Instrument intended for accurately controlling gas concentration of gas-air mixtures.

FLUID VELOCITY AND PRESSURE. The Measurement of Fluid Velocity and Pressure, J. R. Pannel. Engineering, vol. 107, nos. 2774 and 2775, Feb. 28 and Mar. 7, 1919, pp. 295-297 and 261-263, 14 figs. Robinson cup anemometer; vane anemometer and other "moving part" instruments. (Continuation of serial). Feb. 28; Pressure tube instruments.

OIL-TANK GAGING. Scientific Gauges, B. C. Rinehart. Petroleum Age, vol. 6, no. 3, March 1919, p. 30, 1 fig. Method of gaging oil tanks.
Standards of Temperature and Means of Checking Pyrometers. Am. Mach., vol. 50, no. 12, Mar. 20, 1919, pp. 541-545, 7 figs. Directions for use of standards; chart showing relation between base-metal thermo-couple and net electromotive force.

PYROMETERS. Checking Pyrometers to Get Results. Am. Drop Forger, vol. 5, no. 3, Mar. 1919, pp. 131-137, 6 figs. Various methods are recommended for different sizes of equipment.

THERMOCOUPLES. Calibration of Base-Metal Thermocouples, G. S. Crouse. Eng. & Min. Jl. vol. 107, no. 10, March 8, 1919, pp. 442-444, 1 fig. Describes three methods of calibrating such couples.

VISCOSIMETERS. Standardization of the Saybolt Universal Viscosimeter, Winslow H. Hershel. Department of Commerce, Tech. Papers Bur. Stand., no. 112, 25 pages, 4 figs. Equation for instruments of standard dimensions.

MECHANICAL PROCESSES

BAKELITE PRODUCTS AND DIES. Making Molded Bakelite Products. Machinery, vol. 13, no. 331, Jan. 30, 1919, pp. 481-485, 9 figs. Designing and making dies with provision for heating with steam.

BOILERS. Areas of Segments of Boiler Heads, Power, vol. 49, no. 11, March 18, 1919, pp. 402-404, 2 figs. Table of areas of segments of boiler heads to be stayed.

CHAINS, CAST-STEEL. Malleable Plant Proves Versatility. Iron Trade Rev., vol. 64, no. 10, Mar. 6, 1919, pp. 623-629, 12 figs. Adaptation to manufacture of cast-steel anchor chains of plant designed and constructed for malleable foundry.

GEARS. The Manufacture and Design of Toothed Gearing, Joseph Chilton. Engineering, vol. 107, no. 2772, Feb. 14, 1919, pp. 202-206, 13 figs. Gearing employed in transmission of motion between shafts whose axes are either parallel or at right angles to each other. (To be contiuned). Read at North-East Coast Instn. Engrs. & Shipbuilders.

PUMPS. Manufacturing Rotary Suds Pumps. Machinery, vol. 13, no. 328, Jan. 9, 1919, pp. 406-408, 11 figs. Pump manufactured by Brooke Tool Co. is presented as example of interchangeable manufacture.

ROLLING MILLS. Universal Mill Rolls Strip Steel, Iron Trade Rev., vol. 64, no. 11, Mar. 13, 1919, pp. 691-695. Roughing unit is of massive construction, each housing weighing 42 tons; spring of mill when rolling high-carbon steel is 0.001 in.
Rolling Concrete Reinforcement from Old Rails, W. S. Standford. Can. Machy., vol. 21, no. 3, Jan. 16, 1919, pp. 59-61 and 65, 5 figs. Design and general layout of roughing and finishing rolls.
Large Rolling Mill Plant. Elec. Rev., vol. 84, no. 2185, Mar. 14, 1919, pp. 283-284, 4 figs. Particulars and illustrations of Siemens 19,000 hp. rolling mill motor. (To be concluded).
The Government Rolling Mill Southampton. Engineer, vol. 127, nos. 3296 and 3297, Feb. 28 and Mar. 7, 1919, pp. 191-193 and 217-219, 4 figs. Mill is being employed in melting of scrap metal and is turning out standard Government brass ingots of guaranteed analysis. Mar. 7: Power plant, and gas-producer equipment; facilities for handling coal, coke and raw materials; foundry and rolling departments.

RUBBER GOODS. Railroad Rubber Goods, G. W. Alden. Official Proc. Car Foremen's Assn., Chicago, vol. 14, no. 5, Feb. 1919, pp. 36-71. Growth and properties of crude rubber; manufacture of wrapped ply hose, belting and packings.

SHEET METAL PRODUCTS. Imagination and Sheet Metal Layout Work, F. Scriber. Can. Machy., vol. 21, no. 9, Feb. 27, 1919, pp. 199-202, 10 figs. Examples of bending sheet metal into shape.
Work of Sheet Metal Man in New Industry, W. B. Metzger. Metal Worker, vol. 41, no. 10, Mar. 7, 1919, pp. 302-304, 5 figs. Making apparatus for use in distallation of volatile oils from birch and wintergreen.

TANK LINKS. Machine Tool Adaptations for the Manufacture of Tank Links. Engineer, vol. 127, no. 3293, Feb. 7, 1919, pp. 120-123, 12 figs. Operations performed on stamping pattern of links for moving tracks of tanks.

TUBES, SEAMLESS. Making Seamless Tubes. Iron Trade Rev., vol. 64, no. 4, Jan. 23, 1919, pp. 259-264, 11 figs. Piercing and cold-drawing processes as followed at plant of Standard Seamless Tube Co.

TEXTILES. Back-Filling Process for Sheetings. Textile World Jl., vol. 55, no. 13, Mar. 29, 1919, pp. 29 and 31, 2 figs. Handling goods in finishing department; composition of mixings.

MECHANICS

ANGLES, SECTION MODULI. The Angle as a Beam, R. Fleming. Eng. News Rec., vol. 82, no. 9, Feb. 27, 1919, pp. 433-434, 5 figs. Tables comparing section moduli angles of various sizes.

AXLES, CRITICAL VELOCITY. Critical Velocity of High Speed Axles — II. Industria, vol. 33, no. 4, Feb. 28, 1919, pp. 113-114, 3 figs. On Dunkerley's theorem.

BEAMS. On the Beam of Uniform Strength Taking the Weigut of the Beam Into Consideration (in Japanese), Keiichi Aichi. Jl. Soc. Mech. Engrs., Tokyo, vol. 22, 54, Nov. 1918.

BEVEL GEARS, STRENGTH OF. Distribution of Load on Bevel Gear Teeth and Strength of Bevel Gear Teeth, W. G. Dunkley. Machinery, vol. 13, no. 337, Mar. 13, 1919, pp. 660-662, 4 figs. Investigation of variation of load in bevel-gear teeth; diagram illustrating deflection of teeth under load and graph showing distribution of load on teeth and their strength.

GEAR DRIVES. Dynamics of Gear Drive, N. W. Akimoff. Jl. Am. Soc. Naval Engrs., vol. 31, no. 1, Feb. 1919, pp. 46-52, 1 fig. Designing formula.

PIPE

CORROSION. Health Board Studies Pipe Corrosion in Buildings. Eng. News Rec., vol. 82, no. 10, March 6, 1919, pp. 469-470, 6 figs. Examinations of sewer and vent-pipe systems in buildings of various ages in Chicago business district.

COUPLINGS. Lead Pipe Couplings, John A. Jensen. Can. Engr., vol. 36, no. 1, Jan. 2, 1919, pp. 107-108. Results of examination of street leaks. Paper read before St. Louis Convention Am. Water Works Assn.

POWER GENERATION

APPALACHIAN SYSTEM. The Appalachian Power System, H. S. Slocum. Power, vol. 49, no. 12, Mar. 25, 1919, pp. 438-444, 12 figs. Features of hydroelectric and steam system supplying electric current to a large section of the South. Glen Lyn steam station.

ATLANTIC SEABOARD. Power Supply for Atlantic Seaboard. Elec. World, vol. 73, no. 13, Mar. 29, 1919, pp. 638-639, 1 fig. Scope of plan of Secretary of Interior Lane for development of super-power stations in Boston-Washington district. Paper before Boston section Am. Inst. Elec. Engrs.

AUSTRALIA. Water-Power Resources in Australia, Douglas Mawson. Commonwealth Engr., vol. 6, no. 6, Jan. 1, 1919, pp. 181-182. Figures gathered by writer show that a total of 13,722,000 hp. is available in Australasia; of this he believes 8,500,000 hp. is capable of development is Papua.

HYDRO-ELECTRIC DEVELOPMENTS, COSTS. General Factors Affecting the Cost of Constructing Hydro-Electric Development. Eng. & Contracting, vol. 51, no. 11, March 12, 1919, pp. 271-273. Investigation by Public Utilities Commission of State of Maine.

MASSACHUSETTS. Development of Massachusetts' Water Power. Elec. World, vol. 73, no. 6, Feb. 8, 1919, pp. 272-273, 1 fig. Special commission declares public ownership to be of doubtful value as a water-power policy.

MUSCLE SHOALS. United States Nitrate Plant No. 2 at Muscle Shoals, Ala., Charles H. Bromley. Power, vol. 49, no. 12, Mar. 1919, pp. 424-431, 8 figs. Data on flow and available power of Tennessee River at that point. Table of specifications of plant. First article of series.

NATIONALIZATION. Nationalization of Transport and Electricity Supply. Tramway & Ry. World, vol. 45, no. 13, Mar. 13, 1919, pp. 113-115, Scheme for unification and cheapening of communication.

OIL ENGINE. Place for Oil-Engine-Driven Generators. Elec World, vol. 73, no. 11, March 15, 1919, pp. 519-520. Operating and maintenance expenses; analysis of expenses with old and new types of engines.

SOLAR ENERGY. The Utilization of Solar Energy, J. F. Heffron. Power House, vol. 12, no. 3, Mar. 1919, pp. 56-59, 5 figs. Review of attempts that have been made to utilize sun heat and indication as to what may be accomplished in future.

SWEDEN. The Extension of Hydro-Electric Power in Sweden. Engineering, vol. 107, no. 2775, Mar. 7, 1919, pp. 302-304. Calculations and investigations of Roy. Swedish Waterfalls Board.
Power Conditions in Europe. Power Plant Eng., vol. 23, no. 7, Apr. 1, 1919, pp. 332-334. Developments proposed in Sweden. Data supplied by Roy. Consulate of Sweden.

POWER PLANTS

Air Heaters for Boilers. Boilers Provided with Air Heaters (Les chaudières avec réchauffeurs d'air), J. R. Revue Générale de l'Electricité, vol. 5, no. 7, Feb. 15, 1919, pp. 265-269, 8 figs. Installation by Underfeed Stoker Co. in English plant. Heat contained in the chimney gases of boilers is utilized for heating air entering the furnace.

Ash Disposal. Fast Modern Methods of Ash Disposal. Black Diamond, vol. 62, no. 12, Mar. 22, 1919, pp. 332-335, 6 figs. Comparison of methods; review of book published by Am. Steam Conveyor Corp.
Central Heating Plant of the Colorado State College. Power, vol. 49, no. 10, March 11, 1919, pp. 346-348, 6 figs. Coal and ash-handling equipment.
Power Plant Management; Coal and Ash Handling — I, Robert June. Power House, vol. 12, no. 3, Mar. 1919, pp. 60-62, 3 figs Claims that elimination of hand labor is an important element in power-plant operation. Also in Refrig. World, vol. 54, no. 3, Mar. 1919, pp. 23-25, 3 figs.

Boiler Explosion. Boiler Explosion at Mobile. Power, vol. 49, no. 12, Mar. 25, 1919, pp. 432-436, 11 figs. Particulars of explosion of two Heine boilers at plant of Mobile Electric Co.

Boiler Interconnection. New Boiler Plant of the A. S. & R. Co. at Omaha, R. N. Robertson. Power, vol. 49, no. 14, Apr. 8, 1919, pp. 514-518, 7 figs. Main feature of this underfed stoker plant is interconnection of two boilers which are baffled to utilize radiant energy from fire; superheater is placed behind bridge wall.

Boiler-Tube Ruptures. Water-Tube Boiler Tube Ruptures, Weldon Melroy. Power, vol. 49, no. 9, March 4, 1919, pp. 302-303, 5 figs. Illustrations of ruptures form various causes.

CO_2 Recorders. Fuel Economy in the Boiler House — III, J. B. C. Kershaw. Chem. & Metallurgical Eng., vol. 20, no. 6, March 15, 1919, pp. 291-295, 8 figs. Description of German types of CO_2 recorders which depend on measurements of the physical properties of flue gas.

Coal Consumption. The Consumption of Steam Power Plant, Robert H. Parsons. Elec. Rev., vol. 84, no. 2152, Feb. 21, 1919, pp. 200-202, 4 figs. Charts of coal consumption, steam consumption, coal efficiency and water efficiency.
Saving Coal in Steam Power Plants, Dept. of Interior, Bur. of Mines, Technical Paper 217, 8 pp. 1, fig. Economical principle and method of applying them to power-plant operations.

Condensers. Installation and Operation of Condensers (Remarques sur l'établissement et l'exploitation des installations de condenseurs), G. Oettinger. Revue Générale de l'Electricité, vol. 5, no. 11, Mar. 15, 1919, pp. 419-422, 5 figs. Suggestions to engineer assuming direction of condensing apparatus in steel plant.

Economizers. Economizer Practice, M. E. Alone. Power Plant Eng., vol. 23, no. 7, Apr. 1, 1919, pp. 311-315, 2 figs. Saving materials, cleaning, keeping track of performance, temperatures, gas volume, and air leakage in steam-boiler plants.

Equipment. Modern Steam Power Station Equipment, Joseph G. Worker. Blast Furnace & Steel Plant, vol. 7, no. 4, Apr. 1919, pp. 177-182, and 202, 13 figs. Review of modern steam power-plant equipment installed to meet demand of increased power facilities.

Exhaust Steam. Values of Exhaust Steam, R. L. Wales. Natl. Engr., vol. 23, no. 4, Apr. 1919, pp. 156-161, 5 figs. Discussion of factors to be considered when calculating relative values; distribution of costs between power and heat; charts for computation of comparative values.

Hand-Fired Plants. Saving Coal in Boiler Plants, Henry Kreisinger. Universal Engr., vol. 29, no. 2, Feb. 1919, pp. 45-54, 3 figs. Suggestions given to operators of hand-fired plants.

Power Costs. Saving Coal in Steam Plants, Edward J. Willis. Natl. Engr., vol. 23, no. 4, Apr. 1919, pp. 170-172. Data of costs of production.
Emergency Shop Power and Coal Conservation, C. E. Clewell. Am. Mach., vol. 50, no. 12, Mar. 20, 1919, pp. 533-536, 6 figs. Graph showing how operating costs per unit of energy delivered may vary for different values of percentage of use.
Calculation of Plant Efficiencies and Fuel Costs, J. T. Foster. Power, vol. 49, no. 9, March 4, 1919, pp. 316-318, 2 figs. Charts.

Power-House Economy. Getting Better Economy in the Power House, G. H. Kelsay. Elec. Ry. Jl., vol. 53, no. 10, Mar. 8, 1919, pp. 455-460, 9 figs. Relation of boiler load to efficiency; increase in efficiency of steam turbines and relation of coal used to available supply; curves showing progress of combustion beyond fuel bed and effect of excess air. Abstract of paper read before Central Elec. Ry. Assn.

Power Plants. Power Plants of New Gotham Hotels. Black Diamond, vol. 62, no. 12, Mar. 22, 1919, pp. 321 and 335, 4 figs. Battery of boilers of 15,000 hp.

Stokers. Erith-Riley. Mechanical Stokers. Engineering, vol. 107, no. 2774, Feb. 28, 1919, pp. 268-269, 5 figs. Development of Erith-Riley stoker in conjunction with large boiler plants installed on the unit system.

Valves. Notes on the Repairing and Adjusting of Valves, W. H. Wakeman. Domestic Eng., vol. 86, no. 13, Mar. 29, 1919, pp. 556-559, 12 figs. Suggestions to steamfitters on repairing and adjusting valves of various types.

Water Softening. Water Softening, E. V. Chambers. Chem. News, vol. 118, no. 3066, Jan. 17, 1919, pp. 27-29. Treatment given in North of England to upland surface water intended for use in textile industry.
Water Softening, P. E. King. Chem. News, vol. 118, no. 3065, Jan. 10, 1919, pp. 14-16, Classification and description of methods.

MOTOR-CAR ENGINEERING

Carburetor Testing. Bureau of Standards Carburetor Test Plant, P. M. Heldt. Automotive Industries, vol. 40, no. 12, Mar. 20, 1919, pp. 641-644, 6 figs. Designed to determine metering qualities of different carburetors under varying conditions of atmospheric pressure an pressure drop. Fifth article.
System of Testing Fuel Jets in Zenith Carburetors. Aerial Age, vol. 9, no. 2, Mar. 24, 1919, p. 121, 4 figs. Machinery used in Zenith laboratory.

Carburetors. The Cox "Atmos" Carburator. Autocar, vol. 42, no. 1221, Mar. 15, 1919, pp. 358-360, 7 figs. Results of tests of carburator using only one jet aud having no automatic moving parts.

Fans. Radiator Cooling Fans, George W. Hoyt. Automotive Industries, vol. 40, no. 12, Mar. 20, 1919, pp. 630-633, 8 figs. Problems of design and mounting; large-diameter vs. high-speed fans; magnitude of the end thurst on fans; means for insuring continued dust-proofness of fan hubs.

Fiat. The New Fiat Light Car. Autocar, vol. 42, no. 1221, Mar. 15, 1919, pp. 355-357, 6 figs. Mechanical points in construction of engine, gear box and rear axle.

Fire Apparatus. Motor Apparatus and Equipment. Fire & Water Eng., vol. 65, no. 13, Mar. 26, 1919, pp. 649-653. Motor apparatus at Highland Park Mich., equipped with Sewell cushion wheels.

French Cars. Automotor Design and Construction of 1919. Auto, vol. 24, no. 949, Mar. 13, 1919, pp. 250-252, 5 figs. Six-cyl. 23.9-hp. Delage type being exhibited at Lyons Fair.
A Standardized French Car. Autocar, vol. 42, no. 1221, Mar. 15, 1919, pp. 368-369, 6 figs. Details of 10-hp. 4-cyl. monobloc-engine car.

Headlights. Report of 1917-18 Committee on Automobile Headlighting Specifications. Trans. Illum. Eng. Soc., vol. 14, no. 2, Mar. 20, 1919, pp. 64-77 and (discussion) pp. 77-99, 2 figs. Specificatious are based upon practical considerations and tests, and are selected in a manner to make them applicable to all devices.

Lubrication. Lubricating the Farm Tractor. Motor Age, vol. 35, no. 8, Feb. 20, 1919, pp. 28-29, 2 figs. Suggestion in regard to selection and applicatiou of lubricants.
The Lubrication of Motor Cars — H. G. W. A. Brown. Automotive Industries, vol. 40, no. 14, Apr. 3, 1919, pp. 751-754, 20 figs. Discussion of methods employed in lubrication of steering gears, drag links, rear axles, springs, spring eyes and road wheels; oil and grease-retaining devices.

Mercury. The 10-12 hp. Mercury. Autocar, vol. 42, no. 1221, Mar. 15, 1919, pp. 583-584, 6 figs. Engine and transmission details.

Military Chassis. Military-Transport Chassis — XII. Automobile Engr., vol. 9, no. 124, Mar. 1919, pp. 68-71, 5 figs. Performance under war conditions. Albion 32 H.P. (3 tons) chassis.

Napier Trucks. A New Two-Tonner. Motor Traction, vol. 28, no. 733, Mar. 19, 1919, pp. 240-242, 6 figs. Designed for reliable and inexpensive operation. Napier 40-55 cwt. chassis.

Producer Gas for Tractors. Producer Gas Driven Tractors (Tracteurs à gaz pauvre. Bulletin de la Société d'Encouragement pour l'Industrie Nationale, vol. 131, no. 1, Jan.-Feb. 1919, pp. 185-187, 2 figs. Tests with Cages truck.

Steam Cars. The Doble-Detroit Steam Car. Automobile Engr., vol. 9, no. 124, Mar. 1919, pp. 80-86, 13 figs. Water system, fuel system; engine unit. Accessories on engine.

Talbot. A New 25-50 hp. Talbot. Autocar, vol. 42, no. 1221, Mar. 15, 1919, pp. 352-354, 3 figs. Main features are: Cylinders cast in pairs; pump water circulation; forced oil circulation; electric starting and lighting; cone clutch, with fabric on flywheel.

Tanks. The French Baby Renault Tank, W. F. Bradley. Automotive Industries, vol. 40, no. 9, Feb. 27, 1919, pp. 464-470, 12 figs. Weight 6½ tons with machine gun. Driving sprocket is at rear, endless band passes around pulley at front, and between these is a series of idlers and automatic tensioning apparatus.

Tractor Attachments. The Big Auto Tractor Attachment. Automotive Industries, vol. 40, no. 10, Mar. 6, 1919, pp. 528-529, 3 figs. Conversion unit for converting large touring cars of older models into farm tractors.

Tractors. An Analysis of Tractor Specifications, P. M. Heldt. Automotive Industries, vol. 40, no. 10, Mar. 6, 1919, pp. 522-524, 6 figs. Representation of different features of design on percentage basis. Charts based on count of American-built tractors.
The Austin Farm Tractor. Automotive Industries, vol. 40, no. 9, Feb. 27, 1919, p. 484. British tractor on Fordson lines.
Southern Tractor Requirements, B. M. Ikert. Motor Age, vol. 35, no. 13, Mar. 27, 1919, p. 27. Protection of working parts from dust and sand held to be of greatest importance.
Ball Bearings in Tractor Design, H. M. Trumbull. Can. Machy., vol. 21, no. 8, Feb. 20, 1919, pp. 179-183 and 187, 20 figs. Advocates using high-grade self aligning ball bearing and illustrates its operation under various conditions of tractor service. From Tractor and Trailer.
Novel Frame in S. W. H. Tractor. Motor Age, vol. 35, no. 8, Feb. 20, 1919, pp. 46-47, 4 figs. Housing of gear set and rear axle in single casting.
Fiat Tractor Design Changes, W. F. Bradley. Automotive Industries, vol. 40, no. 10, Mar. 6, 1919, pp. 525-526, 4 figs. Secondary shaft behind axle housing; straight belt drive.

Vulcan. The Eight-Cylindered 20-25 H. P. Vulcan. Auto, vol. 24, no. 949, Mar. 13, 1919, pp. 247-250, 5 figs. Description and discussion with reference to characteristics of "eights" in general.

POWER TRANSMISSION

Belt Transmission. On the Power Transmission by Belt and Pulley (in Japanese), Chido Sugatani. Jl. Soc. Mech. Engrs., Tokyo, vol. 22, no. 54, Nov. 1918.

PRODUCER GAS

Operation. Gas Producers (Les gazogènes), G. Marconnet. Chimie & Industrie, vol. 2, no. 1, Jan. 1, 1919, pp. 6-14, 6 figs. Classification; operating data.

Theory. Elementary Theory of the Gas Producer, W. L. Badger. Mich. Technic, vol. 31, no. 1, Mar. 1918, pp. 13-17, 2 figs. Le Chatelier theorem.

REFRACTORIES

Graphite Ash Fusibility. Fusibility of Graphite Ash and Its Influence on the Refractoriness of Bond Clay, M. C. Booze. Jl. Am. Ceramic Soc., vol. 2, no. 1, Jan. 1919, pp. 65-68, From laboratory tests it is concluded that the softening point of a graphite ash is not a true criterion of its action in a crucible body.

Ovens and Kilns. Ovens and Kilns with a High Thermal Efficiency, A. Bigot. Gas Jl., vol. 145, no. 2905, Jan. 14, 1919, p. 71. Laboratory kiln with waste pipe surrounded by sheet-iron recuperator claimed by author to have increased by 200 deg. cent temperature of interior of kiln. Paper before Ceramic Soc.

Research. Refractory Materials as a Field for Research, Edward W. Washburn. Jl. Am. Ceramic Soc., vol. 2, no. 1, Jan. 1919, pp. 3-31, 1 fig. Survey of scientific aspects of subject. Report drafted under auspices of Section of Indus. Research of Nat. Research Council.

REFRIGERATION

Cold Storage Abroad. Refrigeration Abroad. Ice & Refrigeration, vol. 56, no. 3, Mar. 1919, pp. 174-175. Cold storage accommodations in Great Britain, Australia, and Russia.

Compression Refrigerating Machine. The Compression Refrigerating Machine, Gardner T. Voorhees, Ice & Refrigeration, vol. 56, nos. 2 and 3, Feb. and Mar. 1919, pp. 99-100 and 149-151, 6 figs. Comparison of types; conditions of heat flow. (To be continued).
The Ammonia Compression Refrigerating System XXXVIII, W. S. Doan. Refrig. World, vol. 54, no. 3, Mar. 1919, pp. 30-32, 4 figs. Atmospheric parallel-flow-type ammonia condenser; submerged condenser; shell-type condenser.

Fur Storage. Cold Storage of Furs, B. F. Green. Refrig. World, vol. 54, no. 3, Mar. 1919, pp. 25-26. Suggestions in regard to efficiency and safety.

Hotel Equipment. Refrigerating Equipment of the Pennsylvania Hotel. Power, vol. 49, no. 14, Apr. 8, 1919, pp. 522-524, 3 figs. Equipment has ice-making capacity of 100 tons per hr.

Refrigerating Plant Efficiency. Refrigerating Plant Efficiency, Victor J. Azbe. Mech. Eng., vol. 41, no. 4, Apr. 1919, pp. 362-368, 10 figs. General discussion of refrigerating plant economics. Abstract of paper read at Annual Meeting of A.S.M.E., December 1918.

PUMPS

Centrifugal Pumps. On the Combined Running of Centrifugal Pumps (in Japanese), Iwao Oki. Jl. Soc. Mech. Engrs., Tokyo, vol. 22, no. 54, Nov. 1918.

RESEARCH

Canada. The Canadian Honorary Advisory Council for Scientific and Industrial Research, A. B. Macallum. Can. Min. Jl., vol. 45, no. 2, Jan. 15, 1919, pp. 28-29. Situation which has confronted Research Council since its erection in Dec. 1916.

Chemical Warfare Service. The Research Division, Chemical Warfare Service, U. S. A., George A. Burrell. Jl. Indus. & Eng. Chem., vol. 11, no. 2, Feb. 1, 1919, pp. 93-104. Review of work done by Service, beginning with its inception before U. S. entered war and covering development of Division, including personnel, location of various parts of work and some of the problems attacked and solved.

England. The Government and the Organization of Scientific Research, Frank Heath. Jl. Roy. Soc. Arts, vol. 67, no. 3457, Feb. 21, 1919, pp. 206-215 and (discussion) pp. 215-219. Difficulties encountered by Department of Sci. and Industrial Research, England.
The Organization of Research in Great Britain. Science, vol. 44, no. 1262, March 7, 1919, pp. 239-241. Abstract of report of Committee of Privy Counsel for Scientific and Industrial Research.

Industrial Laboratories. Technical Direction of an Industrial Laboratory (Direction d'un laboratoire industriel au point de vue analytique), Paul Nicolardot. Chimie & Industrie, vol. 2, no. 1, Jan. 1, 1919, pp. 18-24, 5 figs. Concerning standardization of methods of analysis and relations with other laboratories.

Rolling-Mill Research Laboratory. Rolling Mill Research Laboratory Founded. Blast Furnace & Steel Plant, vol. 7, no. 4, Apr. 1919, pp. 183-185, 2 figs. Experimental rolling mill and bureau of rolling mill recently organized in Pittsburgh by leading steel and rolling-mill manufacturers under auspices of Carnegie Inst. of Technology.

SPECIFICATIONS

Leather Belting. Specifications for Leather Belting, Harry A. Iley. Indus. Management, vol. 57, no. 4, Apr. 1919, pp. 271-281, 2 figs. Requirements to control quality from new point of view.

Steel, High-Speed. Specifications for High-Speed Steels, R. Poliakoff. Iron Age, vol. 103, no. 13, Mar. 27, 1919, pp. 827-829. Questions to take into consideration in drafting specifications, with reference to European practice.

STANDARDS AND STANDARDIZATION

Brass and Bronze Foundries. Standards for Brass and Bronze Foundries and Metal Finishing Processes, William Erskine. Metal Indus., vol. 17, no. 3, March 1919, pp. 113-117. Methods and apparatus to protect health of workers.

Marine Engines. Standardization of Marine Engines. Mar. Rev., vol. 49, no. 4, Apr. 1919, pp. 179-182, 2 figs. Composite design embodying approved features of standard types is advocated.

Standards. Standards in Engineering, R. J. Durley. Jl. Eng. Inst. Can., vol. 2, no. 3, Mar. 1919, pp. 174-182. Their importance in limiting costs of manufacture and faciliting production. Notes on attention now being given in England and U. S. to standards.

STEAM ENGINEERING

Boilers. Talbot Boilers and Engines Made in Canada. Power House, vol. 12, no. 3, Mar. 1919, pp. 66-68, 5 figs. Description of contraflow boiler and uniflow engine.

Evaporation Charts. Chart for Finding the Factor of Evaporation, G. H. Sheasley. Power, vol. 49, no. 11, March 18, 1919, p. 406, 1 fig. Chart gives required factor of any given steam-boiler performance.

Rotary Engines. Avery's Rotary Steam Engine. Natl. Engr., vol. 23, no. 4, Apr. 1919, pp. 173-174, 2 figs. Construction details and performance.

Steam-Turbine History. Steam Turbine Progress Reviewed Historically. Steam, vol. 23, nos. 2 and 3, Feb. and Mar. 1919, pp. 33-41 and 63-69, 37 figs. Review of British patent-office records. Mar. 1919: Impulse blading and blade materials Also in Railroad Herald, vol. 23, no. 3, Feb. 1919, pp. 63-65; Universal Engr., vol. 29, no. 2, Feb. 1919, pp. 34-44, 13 figs.

Steam Turbines. The Assembly and Adjustment of Steam Turbines, J. Humphrey. Machinery, vol. 13, no. 331, Jan. 30, 1919, pp. 486-492, 14 figs. Turbines considered are those working on the Parsons principle and having large number of fixed and moving blades, calked into the casing and on the periphery of the rotor.
The Large Steam Turbine, J. F. Johnson. Mech. Eng., vol. 41, no. 4, Apr. 1919, pp. 355-361, 7 figs. Development of large units to meet modern power requirements; records of performance; notes on design and construction.

WELDING

Arc-Welding Regulations. Notes on Regulations for Arc Weldong, H. M. Sayers. Can. Machy., vol. 21, no. 2, Jan. 9, 1919, pp. 39-41. Precautions to be observed for safety of operator; effects of welding load on supply mains of power station.

Blowpipe, Oxy-Acetylene. How to Choose an Oxy-Acetylene Blowpipe, C. Royer. Can. Machy., vol. 21, no. 8, Feb. 20, 1919, pp. 184-187, 1 fig. Writer considers that determining factors are character of work to be done and equipment on hand, and refers to features he estimates as of paramount importance in various classes of service.

Frog Shop. Welding in the Frog Shop, B. K. Smith. Welding Engr., vol. 4, no. 3, Mar. 1919, pp. 19-20. Reclaiming of materials.

Lead Welding. The Autogenous Welding of Lead — II, P. Rosemberg. Acetylene & Welding Jl., vol. 15, no. 178, July 1918, pp. 118-119, 6 figs. Uses of hydrogen and air blowpipe.

Rail Joints. Modern Welding and Cutting, Ethan Viall. Am. Mach., vol. 50, no. 12, Mar. 20, 1919, pp. 529-532, 11 figs. Notes on welding various types of rail joints. Sixth article.

Seam Welding, Electric. Electric Seam Welding, P. T. Van Binber. Am. Mach., vol. 50, no. 13, Mar. 27, 1919, pp. 575-580, 14 figs. Details of welding roller head; lap-seam welding machine and Thomson machine for flange-seam welding.

Thermit Welding. Modern Welding and Cutting, Ethan Viall. Am. Mach., vol. 50, no. 11, Mar. 13, 1919, pp. 479-483, 11 figs. Thermit rail welding for electric systems. (Continuation of serial).
Miscellaneous Thermit Repairs in the Nashville, Chattanooga & St. Louis Shops, Albert L. Seals. Reactions, First Quarter, 1919, pp. 18-20, 7 figs. Splice welded to main frame of engine; repair on a two-throw crankshaft.

Tires, Welded. Microscopic Study of Welded Tires. Acetylene & Welding Jl., vol. 16, no. 185, Feb. 1919, pp. 30-32, 30 figs. Structure of test pieces 3/16-in. form fracture, and tabulation of their characteristic difference according to position relative to fracture. (Concluded).

Tool-Steel and Stellite Welding. Electric Welding of High-Speed Steel and Stellite in Tool Manufacture, P. T. Van Bibber. Am Mach., vol. 50, no. 10, March 6, 1919, pp. 425-437, 80 figs. Stellite used only for vital parts is welded to shank of ordinary steel by butt-welding process. Operations, data and specifications.

WOOD

Applications. The Uses of Wood, Hu Maxwell. Am. Forestry, vol. 25, no. 303, Mar. 1919, pp. 923-930, 18 figs. Fencing materials from forests. Eleventh article.

Drying. English Methods of Lumber Drying, John Young. Wood-Worker, vol. 38, no. 1, Mar. 1919, p. 34, 1 fig. Details of English drykiln.

Seasoning. The Seasoning of Lumber, Bror L. Grondall, Sci. Am. Supp., vol. 87, no. 2253, Mar. 8, 1919, pp. 158-160. Basic facts underlying artificial drying of forest products. From West Coast Lumberman.

VARIA

Drawings, Reproduction of. Reproducing Drawings, F. G. Allen. Univ. Colo. Jl. Eng., vol. 15, no. 2, Jan. 1919, pp. 36-51. Discussion of the various methods of making duplicates of engineering drawings. Photo-chemical methods, lithographic methods, zinc etching, and half-tones, are considered.

Engineers. The Functions of the Engineer: His Education and Training, W. A. J. O'Meara. Elec. Rev., vol. 84, no. 2152, Feb. 21, 1919, pp. 219-221, 1 fig. Diagram of salaries and estimated personal qualifications.

Invention. Efficient Invention Douglas Leechman. Automobile Engr., vol. 9, no. 124, Mar. 1919, pp. 74-79. Writer suggests that if present patent fees were suitably reduced, trade of country would be benefited by increased encouragement of invention. Particular reference to patents affected by the war. Paper presented to Instn. Automobile Engrs.

Licensing Engineers. Comparison of Various Existing and Proposed License Laws, Eng. News Rec., vol. 82, no. 9, Feb. 27, 1919, pp. 423-430. States that have laws regulating practice of engineering and those which contemplate establishing such laws.

Nomography. Nomography, M. J. Eichhorn. Natl. Engr., vol. 23, no. 4, Apr. 1919, pp. 165-169, 13 figs. Reduction tables for pressures, temperatures, etc., and graphical steam tables. (Continuation of serial).

Semi-Logarithmic Paper. The Use of Semi-Logarithmic Paper in the Determination of Empirical Formulas, E. W. Lane. Cornell Civ. Engr., vol. 27, no. 1, Feb. 1919, pp. 3-8, 3 figs. Types of semi-logarithmic curves.

Steam-Distribution Charts. Charts of Steam Distribution (Abaque général pour l'étude des distributions de vapeur). Rodolphe Soreau. Mémoires et Compte rendu des Travaux de la Société des Ingénieurs Civils de France, vol. 71, nos. 11-12, Nov.-Dec. 1918, pp. 551-556, 2 figs. Chart is prepared to indicate any of three quantities, relative piston displacement, ratio of crank to connecting rod. and angle between crank and line of dead centers — when the other two are determined.

METALLURGY

BLAST FURNACES

Charging, Mechanical. Mechanical Charging of Silver-Lead Blast Furnaces, L. D. Anderson. Monthly Jl. Utah Soc. Engrs., vol. 5, no. 1, Jan. 1919, pp. 1-5, 3 figs. Practice of U. S. Smelting & Refining Co. at Midvale, Utah.

Gas Cleaning. New Blast Furnace Gas Cleaning Outfit, Blast Furnace & Steel Plant, vol. 7, no. 4, Apr. 1919, pp. 193-195, 2 figs. Ruddiman scrubber and combined cooler and dryer; cleaning apparatus combines principle of contact type of cleaner with that of scrubber type.

New Dry Cleaner for Blast Furnace Gas, J. C. Barrett. Blast Furnace & Steel Plant, vol. 7, no. 4, Apr. 1919, pp. 185-187, 1 fig. King-Weidlein dry gas clearer developed at Youngstown claims many advantages over wet process; retention of sensible heat of gas; greater steam generation and higher stove temperature.

Hot-Blast Stoves. Forced Draft for Hot Blast Stoves, Oskar Simmersbach. Iron & Coal Trades Rev., vol. 48, no. 2654, Jan. 10, 1919, p. 40, 2 figs. Combats opinion that with natural draft products of combustion are not evenly distributed over whole area of chequer work. From Stahl und Eisen.

COPPER AND NICKEL

Cupro-Nickel Alloys. Cupro-Nickel, H. A. Eastick. Metal Industry, vol. 14, no. 8, Feb. 21, 1919, pp. 141-143, 3 figs. Equilibrium diagram for cupro-nickel alloys; physical properties, tensile strength, elongation curves and characteristic graph of alloy containing 15 per cent nickel.

Nickel Refining. International Nickel Company's Refining Works at Port Colborne, Ontario, W. L. Wotherspoon. Eng. & Min. Jl., vol. 107, no. 10, March 8, 1919, pp. 429-435, 11 figs. Preliminaries incidental to erection and details relating to installation of plant. An annual output of 15,000,000 lb. of nickel is expected.

FLOTATION

Differential Flotation. Differential Flotation of Lead-Zinc (Flottage différentiel de plomb-zinc). Echo des Mines et de la Metallurgie, vol. 47, no. 2616, Mar. 9, 1919, pp. 152-155, 1 fig. Bradford differential process.

Filters. An Electrically Driven Filter E. J. Richards. Jl. Electricity, vol. 42, no. 6, Mar. 15, 1919, pp. 262-263, 2 figs. Oliver filter in use in flotation process, by Arizona Hercules Copper Company.

Wolf Patent. The Wolf Patent on Flotation. Min. & Sci. Press, vol. 118, no. 12, Mar. 22, 1919, pp. 390-392, 1 fig. Separation of metals from their ores. From text of Letters Patent No. 787,814.

IRON AND STEEL

Acid Bessemer Steel. A Technical Study of Acid Bessemer Steel, Iron Age, vol. 103, no. 10, Mar. 6, 1919, pp. 626-627. Action of manganese and its possible conservation; prevention of spitting; effect of bottom of converter. From Wisconsin Engr.

Cast Iron, Corrosion by Acids. Rupture of Cast Iron in Contact with Mixed Acid, A. C. Cumming. Jl. Soc. Chem. Indus., vol. 38, no. 3, Feb. 15, 1919, pp. 31T-32T. Experiments in connection with manufacture of trinotrotoluene.

Classification of Iron and Steel. Plan to Improve Foreign Trade Statistics, Iron Age, vol. 103, no. 11, Mar. 13, 1919, pp. 685-687. Tentative classification of iron and steel products to be used in reporting exports and imports, prepared by a committee of representatives from Bur. of Foreign and Domestic Commerce and other government organizations.

Ferrotitanium. The Beneficial Results Obtained by Introducing 25 per cent Carbonfree Ferrotitanium into Iron and Steel. Reactions, First Quarter, 1919, pp. 15-17, 7 figs. Cast-iron base of 25-ton Browning crane welded with thermit.

Flaky Steel. Observations on So-Called "Flakes" in Steel, Haakon Styri. Chem. & Metallurgical Eng., vol. 20, no. 7, Apr. 1, 1919, pp. 342-351, 41 figs. Examination of nickel-steel and carbon-steel transverse test bars showed that abnormalities in fractures were associated with impaired physical qualities and exhibited more or less minute slag inclusions.

Observations on Flaky and Woody Steel, Federico Giolitti. Chem. & Metallurgical Eng., vol. 20, no. 6, March 15, 1919, pp. 271-273, 2 figs. Discussion of causes of this defect in high-grade alloy steels.

India. The Heavy Steel Industry in India, Andrew McWilliam. Indian & Eastern Engr., vol. 44, no. 1, Jan. 1919, pp. 14a-14b. Account of historical and technical side. (To be continued).

Molybdenum Steel. Molybdenum Steel versus Gun-Erosion, Masatosi Okôchi, Masaichi Majima and Naoski Sato. Jl. Soc. Mech. Enger., Tokyo, vol. 22, no. 54, Nov. 1918, pp. 1-44, 50 figs. Experimental work to determine the resisting power of molybdenum steel against erosion. Investigation was conducted because of a report in which it was stated that steel containing three to four per cent molybdenum was employed as gun material in the German artillery. Writers found no trace in chemical analyses of specimens taken from captured German guns.

Open Hearth. Water Cooled Equipment for Open Hearths, William C. Coffin. Blast Furnace & Steel Plant, vol. 7, no. 4, Apr. 1919, pp. 188-192 and 197, 6 figs. Equipment for preventing distortion of framework and maintaining economy of refractories. Paper read before Am. Inst. Min. Engrs.

Smelting. A New Method for the Smelting of Iron Ores, Jas. W. Moffat. Canadian Min. Jl., vol. 40, no. 13, Apr. 2, 1919, pp. 207-210. Process designed for treatment of Canadian ores.

Tool Steel. The Evolution of a High Speed Tool Steel — II, T. L. Thorne. Am. Drop Forger, vol. 5, no. 3, Mar. 1919, pp. 146-149. Discussion on effects of various elements; methods of handling material when received in during production outlined; selection of furnaces important when treating finished tools.

Trumbull Steel Co. Plant. Valley Plant Produces Own Steel. Iron Trade Rev., vol. 64, no. 10, Mar. 6, 1919, pp. 641-645, 8 figs. General layout of Trumbull Steel Co.'s steel plant which includes seven 100-ton stationary open-hearth furnaces, a 36-in. blooming mill and an 18 and 21-in. bar mill.

Turbine Furnace. The "Turbine" Furnace. Iron & Coal Trades Rev., vol. 48, no. 2658, Feb. 7, 1919, p. 164, 1 fig. Aim is to insure a passage of air which shall be equal over every portion of the grate area. Air enters through fine troughs which extend over whole length.

Zirconium Steels. Zirconium Steels (Les aciers au zirconium). Bulletin de la Société d'Encouragement pour l'Industrie Nationale, vol. 131, no. 1, Jan.-Feb. 1919, pp. 149-155. English patent in regard to uses of zirconium in metallurgy; other practices in various metallurgical works.

VARIA

Bureau of Standards. Metallurgical Work of Bureau of Standards — II, G. K. Burgess. Blast Furnace & Steel Plant, vol. 7, no. 4, Apr. 1919, pp. 195-197. Review of research work concerning welding, tin conservation, bearing metals, protective metallic coatings, sand investigations, etc.

Diseases of Metals. Decomposition of Metals — I, A. I. Krynitzky. Chem. & Metallurgical Eng., vol. 20, no. 6, March 15, 1919, pp. 277-282, 11 figs. Review of various theories which have been advanced to explain so-called "disease of metal."

FERRO-ALLOYS

Manufacture. The Manufacture of Ferro-Alloys — II, Robert M. Keeney. Automotive Eng., vol. 4, no. 3, Mar. 1919, pp. 121-124, Ores and furnaces used and methods followed to produce ferrochrome, ferromanganese, ferromolybdenum, ferrotungsten, ferrovanadiun and ferrouranium.

Testing. Metallurgy and Motor Engineering, J. B. Hoblyn. Auto, vol. 24, no. 949, Mar. 13, 1919, pp. 256-257, 9 figs. Notes on the metallurgical examination and treatment to which materials are submitted in the technical laboratory of Vauxhall Motors, Ltd.

NON-FERROUS ALLOYS

Aluminum and Copper Alloys. Aluminum and Copper Alloys. Machinery, vol. 13, no. 337, Mar. 13, 1919, pp. 656-659, 2 figs. Field for these alloys and difficulties met with in their manufacture.

Copper Alloys of High Tenacity. Copper Alloys of High Tenacity, O. F. Hudson. Metal Industry, vol. 14, no. 9, Feb. 28, 1919, pp. 163-166. Notes on strength of brasses and methods used to obtain brasses having high tensile strength. Paper before Birmingham Metallurgical Soc.

AERONAUTICS

AEROPLANE PARTS

Starters. The Liberty Starter for Aircraft Engines. Aviation, vol. 6, no. 4, Mar. 15, 1919, pp. 221-222, 3 figs. and Automotive Industries, vol. 40, no. 14, Apr. 3, 1919, p. 739, 3 figs. Combines gear reduction for hand cranking with an electric starter with high reduction ratio. Principal features and details of parts.

The Bijur Electric Starter for Aero Engines, Aerial Age, vol. 8, no. 22, Feb. 10, 1919, p. 10, 6 figs. Its application to Liberty motor.

Struts. Dimensions of Steel Tube Struts, E. S. Bradfield. Aerial Age, vol. 9, no. 2, Mar. 24, 1919, p. 112, 3 figs. Charts for computing dimensions.

AEROSTATICS

DIRIGIBLES. Airships for Commercial Purposes. Aeronautics, vol. 16, no. 277, Feb. 5, 1919, pp. 152-154. A comparison of heavier and lighter-than-air machines, and how each type may be utilized.
England's Aerial Effort (L'effort aérien de l'Angleterre). Aérophile, vol. 27, nos. 1-2, Jan. 1-15, 1919, pp. 14-15, 3 figs. Dirigibles developed during war.

MOORING GEAR. The Possibilities of Airship Transport Services. Flight, vol. 11, no. 9, Feb. 27, 1919, pp. 263-267, 2 figs. Vickers patent mooring gear for rigid airships. Concluded from p. 232.

SCHILLINO APPARATUS FOR MEASURING HYDROGEN. Utilization of Schilling Apparatus in Control of Industrial Hydrogen (Sur les conditions d'utilisation de l'appareil de Schilling, pour le contrôle de l'hydrogène industriele), F. Bourion and Ch. Courtois. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 4, Jan. 27, 1919, pp. 232-235. Reasons for preference given to Schilling apparatus over hydrogen balance, in the measure of hydrogen destined for airship service.

AIRCRAFT PRODUCTION

LIBERTY ENGINE PARTS, MANUFACTURE OF. Making Liberty Airplane Motor Parts. Machy., vol. 25, no. 7, Mar. 1919, pp. 636-641, 13 figs. Methods employed in machining cylinder inlet and exhaust elbows for the Liberty airplane motor at plant of Packard Motor Car Co.

NAVAL AIRCRAFT FACTORY. The Naval Aircraft Factory, G. W. Smith. Jl. Worcester Polytechnic Inst., vol. 22, no. 2, Jan. 1919, pp. 91-103, 2 figs. Account of war studies which led to construction and organization of factory.

TRIMMINO AIRCRAFT PARTS. Trimming Aircraft Parts, W. A. Ford. Machinery, vol. 13, no. 335, Feb. 27, 1919, pp. 597-598, 4 figs. Boring holes in metal to secure required degree of lightness.

APPLICATIONS

AERIAL PHOTOGRAPHY. Broad Field for Commercial Aerial Photography, M. A. Kinney. Flying, vol. 8, no. 3, Apr. 1919, pp. 250-255, 7 figs. Outline of possibility in scientific research, commercial endeavor and police work.

AERIAL ROUTES. First Steps in Organizing an Aerial Route, Holt Thomas. Aeronautics, vol. 16, no. 281, Mar. 5, 1919, pp. 248-249, Safety of Commercial Air Service.

CANADA. The Development and Future of Aviation in Canada, M. R. Riddell. Jl. Eng. Inst. Can., vol. 2, no. 3, Mar. 1919, pp. 200-209, 9 figs. Aero 504-k; J N-4, C, 504-K. Visualization of peace development of aeroplane.

COMMERCIAL POSSIBILITIES OF LIGHTER AND HEAVIER THAN AIR MACHINES. Commercialization of Rigid Airplanes (l'Utilisation commerciale des aéronefs rigides)' Génie Civil, vol. 74, no. 9, Mar. 1, 1919, pp. 167-169. Comparison of services given by airplanes and Zeppelines.

FOREST PATROL WORK. Use of Aeroplanes for Forest Patrol Work. Aeronautics, vol. 16, no. 277, Feb. 5, 1919, p. 155. Outlines American scheme for using aeroplanes in forest patrol work.

PREPARING FOR COMMERCIAL FLYINO. Preparing for Commercial and Pleasure Flying, Graham-White. Aeronautics, vol. 16, no. 280, Feb. 26, 1919, pp. 230-234, 2 figs. Forecast of developments and analysis of difficulties.

AUXILIARY SERVICE

RADIO SURGICAL SERVICE. Radio-Surgical Airplane (Avion radio-chirurgical), Foveau de Courmelles. Aérophile, vol. 27, nos. 1-2, Jan. 1-15, 1919, pp. 18-20, 3 figs. Fitted with radiographic and surgical laboratories and power plant which permits speed of 100 miles per hour. Named after designers "Aerochir Némirovski-Tilmant."

DESIGN

AILERONS. Some Points in Aeroplane Design, F. S. Barnwell. Flight, vol. 11, no. 533, Mar. 13, 1919, pp. 345-349, 2 figs. Investigation of controlling power of ailerons. (Concluded.)

BRISTOL FIGHTER DESIGN. Some Points in Aeroplane Design, F. S. Barnwell. Aeronautics, vol. 16, no. 281, Mar. 5, 1919, pp. 260-261. Analysis of Bristol fighters. Paper before Royal Aeronautical Society.

RADIATORS. The Principles of Cooling of Airplane Engine Radiators, H. B. Irving. Automotive Industries, vol. 40, no. 14, Apr. 3, 1919, pp. 740-742. Law of heat transmission from a surface to a fluid flowing over the surface; hp. expended in overcoming head resistance or radiator.

WING SPARS AND STABILITY. Some Points in Aeroplane Design, F. S. Barnwell. Flight, vol. 11, nos. 9 and 10, Feb. 27 and Mar. 6, 1919, pp. 275-280 and 310-313, 9 figs. Graphs and tables in reference to design of wing spars. Comparative data of tail plane required to give longitudinal stability to a monoplane, "square" biplane and "staggered" biplane. (To be concluded.)

DYNAMICS

FLATTENINO OUT FROM GLIDES. Flattening Out of Aeroplanes After Steep Glides, Genjiro Hamabe. Jl. Soc. Mech. Engrs., Tokyo, vol. 22, no. 54, Nov. 1918, pp. 45-96, 8 figs. Theoretical determination of time required to restore a machine from a steep glide and of the "wing loading" set up during this motion.

TORSIONAL LOADS IN FUSELAGE. Torsional Loads in the Fuselage of an Aeroplane, A. J. Sutton Pippard. Engineering, vol. 107, no. 2772, Feb. 14, 1919, p. 195, 1 fig. Suggests method of calculation based on assumption that deformation of fuselage is due to stretch of panel bracing wires, bulkhead bracing wires being considered as inoperative.

ENGINES

BASSE-SELVE. The 200-hp. Basse-Selve Aero Engine. Flight, vol. 11, no. 10, Mar. 6, 1919, pp. 297-305, 25 figs. Report based on examination of engine taken from remains of a German Rumpler two-seater biplane. Issued by Technical Dept. (Aircraft Production) Ministry of Munitions.

BUGATTI-KINO. The King-Bugatti Aviation Engine, G. Douglas Wardrop. Aerial Age, vol. 8, no. 22, Feb. 10, 1919, pp. 1074-1080, 32 figs. Engineering description. (To be continued.)

DESIGN. The Design of Aeroplane Engines, John Wallace. Aeronautics, vol. 16, nos. 278, 280 and 281, Feb. 12, Feb. 26 and Mar. 5, 1919, pp. 174-177, 220-222, and 251-255, 25 figs. Piston design and construction; distribution of side thrust; piston lubrication; piston rings; gudgeon-pin bearing; connecting rods; big-end bolts; twin connecting rods; Anzani arrangement; Canton system. (Continuation of serial.)

HALL-SCOTT. A Marine "Liberty," George F. Crouch. Motor Boat, vol. 16, no. 5, March 10, 1919, pp. 17-20, 10 figs. Hall-Scott 4-cyl. and 6-cyl. airplane motors modified to suit marine conditions.

MERCEDES. 200 Hp. High Compression Mercedes Engine. Aeronautics, vol. 16, no. 279, Feb. 19, 1919, pp. 204-206, 7 figs. Report on running performance, based on examination and tests carried out at R. A. E. on engine taken from Fokker D7 biplane (G/2 B/14). Issued by Technical Dept. of Air Ministry.

GERMAN MACHINES. Thermal Machines. German Aviation Motors (Machines thermiques—les moteurs de l'aviation allemande), Ed. Marcotte. Technique Moderne, vol. 10, no. 12, Dec. 1918, pp. 544-553, 29 figs. The various types are examined in reference to weight per hp., compression space, service given, and details in which they differ from French motors. (Concluded.)

"LE RHONE." The "Le Rhone" 110 H. P. Engine, G. Douglas Wadrop. Aerial Age, vol. 9, no. 3, Mar. 31, 1919, pp. 156-157 and 177, 6 figs. General data; diagrammatic sketches of oiling and ignition systems.

LIBERTY. Mechanical Details of the Liberty Engine—II. Automotive Eng., vol. 4, no. 3, Mar. 1919, pp. 117-120, 6 figs. Drawings and specifications of cast-iron cylinder forms for tank use and of steel cylinder type with sheet-metal water jackets for airplane power plants.

THOMAS-MORSE. The Thomas-Morse Model 8-90 Aero Engine. Aerial Age, vol. 8, no. 26, March 10, 1919, pp. 1348-1349, 2 figs. Characteristics of four-cycle eight-cylinder V-type engine.

UNION. The 125 Hp. Union Aircraft Engine. Aviation, vol. 6, no. 4, Mar 15, 1919, pp. 230-232, 3 figs. Engine is of vertical 6-cyl. water-cooled type with valves in head and develops its rated hp. at 1400 r.p.m. Total weight 485 lb.

INSTRUMENTS

TESTING. Tests of Aeronautic Instruments, P. M. Heldt. Automotive Industries, vol. 11, no. 13, Mar. 27, 1919, pp. 691-692, 2 figs. Mercurial standards and vacuum control of board of aeronautic-instrument test chamber. Sixth article.

MATERIALS OF CONSTRUCTION

DOPE. Fabric and Dope, F. W. Aston. Aeronautics, vol. 16, no. 279, Feb. 19, 1919, pp. 208-209. Rapidity of deterioration at different times of the year; comparison of English and German dope; influence of atmosphere surrounding fibres; methods of protecting fabric from sunlight.

MILITARY AIRCRAFT

AERIAL TACTICS. Aerial Tactics and the Defence Against Airplanes (La tactique aérienne et la défense contre avions), Jean-Abel Lefranc. Aérophile, vol. 27, nos. 1-2, Jan. 1-15, 1919, pp. 6-9. Remarks on significance of air warfare, based on records of past war.

GERMAN WAR AVIATION. Evolution of German Aviation During the War 1914-1918 (Evolution de l'aviation allemande pendant la guerre de 1914-1918). Aérophile, vol. 27, nos. 1-2, Jan. 1-15, 1919. pp. 12-13. Characteristics of reconnoitring planes, bombing and chasing machines, presented in chronological tables indicating time of their development.

LE PERE FIGHTER. The American Built Le Père Fighter. Aeronautics, vol. 16, no. 278, Feb. 12, 1919, pp. 178-179, 4 figs. Dimensions and weights.

MODELS

FORD MOTOR MACHINE. Model Aeroplane Building as a Step to Aeronautical Engineering. Aerial Age, vol. 8, no. 22, Feb. 10, 1919, p. 1089, 2 figs. Fittings for Ford-motored airplane. (Continuation of serial.)

MODEL AERO CLUB. Running a Model Aero Club XXI. Aeronautics, vol. 16, no. 279, Feb. 19, 1919, p. 203. On rulings of club, based on experience of various organizations.

MONOPLANES. A Simple Model Monoplane, J. F. Camm. Aeronatuics, vol. 16, no. 278, Feb. 12, 1919, p. 180, 1 fig. Said to be capable of circular flight 50 yd. and duration of 90 sec.

MOTORCYCLE-DRIVEN MACHINE. Elementary Aeronautics and Model Notes, John F. McMahon. Aerial Age, vol. 8, no. 26, and vol. 9, nos. 2 and 3, Mar. 10, 24 and 31, 1919, pp. 1353, 125 and 171, 4 figs. Describes light seater medium three-cylinder motorcycle-driven machine. (Continuation of serial.)

PLANES

ANSALDO. The Ansaldo Single and Two Seater Airplanes. Aviation, vol. 6, no. 4, Mar. 15, 1919, p. 223. Machine was designed with aim of including minimum head resistance and attaining maximum of efficiency. Italian type.

Bristol. Details of Bristol Aeroplane Types. Aeronautics, vol. 16, no. 280, Feb. 26, 1919, pp. 227-230, 6 figs. Fighter F.2B., with Rolls-Royce engine; triplane Braemer, with four Puma engines; fighter, single-seater scout, F, with Mercury engine; all-metal biplane, with Hispano-Suiza engine; and monoplane, M. I. C., with Clerget engine.

Curtiss Triplane. The Curtiss Model 18-T Triplane. Aerial Age, vol. 9, no. 3, Mar. 31, 1919, pp. 154-155, 5 figs. General dimensions, areas, weights and performances.

F-W-L. F-W-L Navy Flying Boat—I, II, III, S. T. Williams. Automotive Industries, vol. 40, nos. 12, 13 & 14, Mar. 20 & 27, Apr. 3, 1919, pp. 634-637, 703-707 and 755-758, 25 figs. Twin-motored tractor biplane with total flying weight of 7 tons; cruising radius as a fighter, 10½ hours; normal crew four men. Details of hull construction; design and materials of various fittings; panel and strut layout. Details of engine mountings and fuel and oil tanks: gasoline supply system.

Handley-Page. The Handley-Page Type 0-400 Bomber. Aerial Age, vol. 8, no. 22, Feb. 10, 1919, pp. 1083-1083 and 1095, 4 figs. Dimensions, weights and equipment.

NC-1 Naval. The NC-1 Naval Flying Boat. Aerial Age, vol. 9, no. 2, Mar. 24, 1919, pp. 110-111, 5 figs. General dimensions, weights and performances; machine said to be one of largest ever built.

Packard. Packard's Commercial Sport-Type Plane. Motor Age, vol. 35, no. 10, Mar. 6, 1919, pp. 22-23, 4 figs., and Automotive Industries, vol. 40, no. 10, Mar. 6, 1919, pp. 531-534, 9 figs. Specifications of two-passenger biplane Packard company purposes to build and sell at $15,000. Line of three engines; plane designed to take eight-cylinder power plant. Calculated performance charts based on previous similar designs.

Pfalz. The Pfalz Single-Seater Fighting Aeroplane. Engineer, vol. 127, no. 3292, Jan. 31, 1919, pp. 95-97, 14 figs. Official record issued by the Aircraft Production (Technical) Department, Air Ministry.

Phoenix-Cork. Some Notes on the Phoenix-Cork Flying Boat. Aeronautics, vol. 16, no. 279, Feb. 19, 1919, p. 197, 1 fig., and Engineer, vol. 127, no. 3296, Feb. 28, 1919, pp. 194-196, 10 figs. Comparison with F3; performance during war; advantages claimed for this type are lesser weight and lower air resistance.

USD-9A. The USD-9A Airplane. Aviation, vol. 6, no. 4, Mar. 15, 1919, pp. 215-217, 6 figs. Data of machine, which is a two-seater tractor biplane.

Roland. Roland D VI Biplane (Le biplan Roland D VI). Aérophile, vol. 27, nos. 1-2, Jan. 1-15, 1919, pp. 10-11, 6 figs. Principal characteristics.

Siemens. The Siemens Type D IV Single-Seater Fighter. Flight, vol. 11, no. 53, Mar. 13, 1919, pp. 332-339, 14 figs. Elevations and plans; description of Siemens & Halske rotary engine in which cylinders and crankshaft rotate in opposite directions; record of climbing.

Touring. Peace Time Aeroplanes. Flight, vol. 11, no. 10, Mar. 6, 1919, pp. 323-324, 2 figs. Sketches of proposed side-by-side touring aeroplane.

RESEARCH

Altitude Engine Test Laboratory. The Altitude Engine Test Laboratory, P. M. Heldt. Automotive Industries, vol. 40, no. 10, Mar. 5, 1919, pp. 535-539, 8 figs. Installed for Advisory Committee of Bur. of Standards to make tests on aeroplane engines under conditions duplicating those met with when flying at high altitudes.

Atmospheric Conditions. Atmospheric Conditions affecting Power, A. Johnson. Aerial Age, vol. 9, no. 3, Mar. 31, 1919, pp. 166-167, 3 figs. Table showing density and pressure percentage at different heights and its use in calculation of engine power.

Tandem Planes. Experiments with Tandem Planes, Robert Gilbert Ecob. Sci. Am. Supp., vol. 87, no. 2256, Mar. 29, 1919, pp. 204-205, 3 figs. Langley tandem monoplane, Jeansen-Calliex tandem biplane, six-plane tandem models.

PROPELLERS

Graphs of Thrust and Horse-Power. A Method of Approximating the Static Thrust and Brake Horse-Power of Air Propellers, W. Bernard Murphy. Aerial Age, vol. 9, no. 2, Mar. 24, 1919, pp. 114-115, 4 figs. Graphs of 2- and 4-bladed flat-faced sector screws.

TESTING

Radiators. Tests of Airplane Radiators, P. M. Heldt. Automotive Industries, vol. 40, no. 9, Feb. 27, 1919, pp. 479-483, 6 figs. Study by Bur. of Standards, bearing on head resistance, resistance to water flow and weight, all in relation to heat dissipated.

Rib Testing. Experimental Design and Testing of Airplane Ribs, George B. Fuller and Lessiter Milburn. Automotive Industries, vol. 40, no. 9, Feb. 27, 1919, pp. 456-460 and 489, 9 figs. Testing machine designed to distribute load as in flight.

Sand Testing. Sand Testing of Aeroplanes, Albert S. Heinrich. Aerial Age, vol. 9, no. 3, Mar. 31, 1919, pp. 158-160, 9 figs. Tests conducted at McCook Field on Victor advanced-training plane. (To be concluded.)

TRANSOCEANIC FLIGHT

Calculations. Civil Aerial Transport—Flying the Atlantic, G. Greenhill. Engineering, vol. 107, no. 2771, Feb. 7, 1919, p. 161. Calculations based on square sine law of Newton.

Transatlantic Route. A Proposed Aeroplane Route Across the Atlantic, William G. Hobbs. Flying, vol. 8, no. 3, Apr. 1919, p. 243, 1 fig. Via Newfoundland-Groenland-Iceland-Scotland.

Transoceanic Liners. Airships Practical for Commercial Use. Automotive Industries, vol. 40, no. 9, Feb. 27, 1919, pp. 461-463. Opinion is expressed that airships are valuable for transoceanic flight and that they can be supplemented by airplanes for short-haul work.

Possibilities of Airship Transport Services. Aeronautics, vol. 16, no. 279, Feb. 19, 1919, pp. 198-201, 5 figs. Scheme for service of transoceanic airship liners.

VARIA

Health Aspects. Some Health Aspects of Aeronautics As Found in Service Pilots, T. S. Rippon. Flight, vol. 11, no. 10, Mar. 6, 1919, p. 318. Experience of Roy. Air Force in selection of pilots.

Kite Flying. Notes on Kite Flying, Vincent E. Jakl. Sci. Am. Supp., vol. 87, no. 2250, Feb. 15, 1919, pp. 110-112. For meteorological observations. From Monthly Weather Rev., Supp. no. 13.

Nomenclature. Coefficient Nomenclature in Aerodynamics, C. H. Powell. Flight, vol. 11, no. 12, Mar. 20, 1919, pp. 371-373, 2 figs. Suggestions in regard to standard form for moment and force coefficients.

Photography. Taking Photographs from Airplanes and Balloons, J. A. Lefranc. Sci. Am. Supp., vol. 87, no. 2247, Jan. 25, 1919, pp. 60-62, 6 figs. Cameras developed to meet requirements. From La Nature, Paris.

Visibility of Aeroplanes. The Visibility of Airplanes, M. Luckiesch. Jl. Franklin Inst., vol. 187, no. 3, March, 1919. pp. 289-311, 11 figs. Investigation to analyze various aspects of visibility of airplanes and to effect measurements for the solutions of problems involved in obtaining low visibility. (Science and Research Division of Bureau of Aircraft Production.) To be concluded.

Wind Velocity. Influence of Wind Velocity on the Vertical Distribution of the Meterological Elements in the Lower Layers of the Atmosphere (Influence de la vitesse du vent sur la distribution verticale et les variations des éléments météorologiques dans les couches basses de l'atmosphère), C.-E. Brazier. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 3, Jan. 20, 1919, pp. 179-182. Observations made at Eiffel Tower.

MARINE ENGINEERING

AUXILIARY MACHINERY

Compasses. The Navigational Magnetic Compass Considered as an Instrument of Precision, M. B. Field. Engineering, vol. 107, no. 2771, Feb. 7, 1919, pp. 187-192, 16 figs. Problem is studied from point of view of accepted theories concerning sources of error due to magnetic disturbances and the so-called permanent magnetism hammered into the ship in the course of building. Lecture before Inst. Elec. Engrs.

Evaporators. An Improved Method of Operating Evaporators, M. C. Stuart. Jl. Am. Soc. Naval Engrs., vol. 31, no. 1, Feb. 1919, pp. 63-96, 14 figs. Essential feature of method; developed at U. S. Naval Eng. Experiment Station — is production of fresh water at constant rate and in any desired amount within capacity of evaporator.

Luffing Cranes. 4-ton "Toplis" Luffing Cranes for Shipyards. Engineering, vol. 107, no. 2772, Feb. 14, 1919, pp. 208-210, 4 figs. Example of application of this type of crane in a shipyard.

SHIPS

Boiler Mountings. Boiler Mountings, J. Purves, Mar. Engr. & Naval Architect, vol. 41, no. 498, Mar. 1919, pp. 193-195, 2 figs. Recent developments in marine-boiler-mounting design; suggestions for further safeguarding boiler. (To be continued). Paper read before Liverpool Eng. Soc.

Cargo-Vessel Design. Speed, Dimensions and Form of Cargo Vessels, G. S. Baker and J. L. Kent. Engineering, vol. 107, no. 2775, Mar. 7, 1919, pp. 306-310, 4 figs. Economics of cargo-ship propulsion so far as this is affected by speed and design of hull form; propulsive considerations in settling area of midship section; longitudinal distribution of displacement and type of level lines and body sections; notes on straight-frame ships, based upon test work carried out for British Government. Paper read before Instn. Engrs. & Shipbuilders in Scotland.

Cargo Vessels. Standard Sea-Going Cargo Vessel of 3,500-Tons Deadweight Built on the Lakes. Int. Mar. Eng., vol. 24, no. 4, Apr. 1919, pp. 206-207, 2 figs. Single-deck steamer of maximum Welland Canal size.

9,600-Ton Deadweight Cargo Vessel. Int. Mar. Eng., vol. 24, no. 4, Apr. 1919, pp. 200-203, 4 figs. Shelter-deck freighter designed by Federal Shipbuilding Co. for overseas trade longitudinal framing adopted.

Specification for 4,300-Ton Steel, Screw, Cargo Steamships for Canadian Government Merchant Marine, Ltd. Can. Ry. & Mar. World, no. 253, March 1919, pp. 146-151, 5 figs. Dominion Government has ordered 45 steel screw cargo steamships aggregating 263,850 tons d. w. Of these 6 are to be according to specifications given in article.

"Robert Dollar" Type of Cargo Vessel. Int. Mar. Eng. vol. 24, no. 4, Apr. 1919, pp. 204-206, 2 figs. Designed by Skinner & Eddy Corporation, Seattle, Wash, to carry 8800 tons deadweight at sea speed of 11½ knots.

Concrete Ships. Economic Size of Concrete Ships, E. O. Williams. Engineering, vol. 107, no. 2772, Feb. 14, 1919, pp. 195-197, 1 fig. Writer discusses theory that disadvantage of weight of concrete ships compared with steel ships diminishes with increased size of vessels.

Stone Ships cheaper than Steel. Mar. Rev., vol. 49, no. 4, Apr. 1919, pp. 190-191. Comparative costs of constructing and propelling concrete and steel tankers.

DIESEL-ENGINED MOTORSHIPS. American Diesel-Engined Motorship. Int. Mar. Eng., vol. 24, no. 4, Apr. 1919, pp. 208-211, 11 figs. Gear-reduction transmission applied to twin-screw wooden freighter equipped with high-speed Diesel engines.

Some Aspects of Large Diesel Cargo Ships, H. R. Setz. Int. Mar. Eng., vol. 24, no. 4, Apr. 1919, pp. 212-219, 6 figs. Steam and Diesel machinery installations compared.

Diesel Engines and the Merchant Marine Mech. Eng., vol. 41, no. 4, Apr. 1919, pp. 377-378. Review of developments on Pacific Coast.

ELECTRIC PROPULSION. Marine Electric Propulsion. Mar. Engr. & Naval Architect, vol. 41, no. 498, Mat. 1919, pp. 182-184. Development of system and conclusions in regard to operation from records of practice. Paper before Students' Section Instn. Elec. Engrs.

U. S. S. "New Mexico," Henderson B. Gregory. Sci. Am., vol. 120, no. 14, Apr. 5, 1919, pp. 340-341, 4 figs. General arrangement of engines and motor rooms in electrically propelled battleship.

FABRICATED SHIP. "Fabricated" and "Standardized" Ships, N. L. Van Tol. Am. Mer. Engr., vol. 14, no. 3, Mar. 1919, pp. 5-6. Outstanding points of question.

FERRYBOATS. Military French-English Ferryboats (Les ferryboats militaires francoanglais), P. C. Génie Civil, vol. 74, no. 8, Feb. 22, 1919, pp. 141-146, 16 figs. Plans, dimensions and particulars.

GEAR TURBINES, DOUBLE REDUCTION. Double-Reduction Geared Turbines for S. S. "Merida." Engineering, vol. 107, no. 2772, Feb. 14, 1919, pp. 207-208, 2 figs. Vessel is cargo steamer carrying 9100 tons on draft of 25 ft.

MARK BOATS. A Mark Boat That Will Mark, Frederick K. Lord. Motor Boating, vol. 23, no. 4, Apr. 1919, pp. 17-19 and 68, 4 figs. How to build a 10-ft. scow-type boat.

NORWEGIAN FREIGHTERS. 2400-Ton S. W. Norwegian Steamer. Shipbuilding & Shipping Rec., vol. 13, no. 11, Mar. 13, 1919, pp. 311-312, 6 figs. Details of S. S. Modemi, built and engined by Bergens Mekaniske Vaerksted.

OIL TANKERS. Oil Tank Steamer of 10,100 Tons D. W. Int. Mar. Eng., vol. 24, no. 4, Apr. 1919, pp. 196-198, 2 figs. Type of vessel authorized by Shipping Board: cargo space divided up into 18 main and 8 summer oil tanks.

Standard 7,500-Ton Oil Tanker. Int. Mar. Eng., vol. 24, no. 4, Apr. 1919, pp. 198-199, 2 figs. Single-screw vessel designed for 11 knots sea speed.

PARALLEL MIDDLE BODY. Effect of Position of Paralled Middle Body. Shipbuilding & Shipping Rec., vol. 13, no. 11, Mar. 13, 1919, pp. 317-319, 4 figs. Variation of shaft horsepower, propeller revolutions and propulsive coefficient with longitudinal position of parallel middle body in a single-screw cargo ship. Abstract of paper before Am. Soc. Naval Architects and Mar. Engrs.

SHAFT ALIGNMENT. Optical Method of Shaft Alignment, William Norris. Jl. Am. Soc. Naval Engrs., vol. 31, no. 1, Feb. 1919, pp. 56-62, 7 figs. Report of realignment of inboard propeller shaft U. S. S. Mississippi.

STRESSES IN SHIPS. Stresses in Ships, Sydney V. James, Jl. Western Soc. Engrs., vol. 23, no. 5, May 1918, pp. 356-376, 8 figs. Discussion of methods for determining principal longitudinal stresses and statement of results of application of such methods to study of ships of well-known type.

SUBMARINES. On the Equilibrium of a Submerged Submarine (Note sull' equilibrio dei sommergibili in immersione), C. de Feo V. Rivista Maritima, vol. 52, no. I, Jan. 1919, pp. 63-92, 7 figs. Mechanical laws involved in process of submerging and diagrammatic study of systems of forces acting on submarine while submerging and when fuly submerged.

TROOPSHIP. Twin-Screw Troopship of 13,000 Tons D. W. Int. Mar. Eng., vol. 24, no. 4, Apr. 1919, pp. 192-196, 5 figs. Three-deck combined passenger and cargo vessel of 20,900 tons displacement on draft of 31 ft. 9 in.

VIBRATIONLESS BOATS. A Vibrationless Cruiser. Motor Boating, vol. 23, no. 4, Apr. 1919, p. 20, 3 figs. Designed to travel at 24 miles per hour with tremble eliminated at 20-mile speed, and to go 500 miles without replenishing fuel.

YARDS

ALABAMA DRY DOCK CO. A Southern Shipbuilding and Repair Plant, G. F. S. Mann. Int. Mar. Eng., vol. 24, no. 4, Apr. 1919, pp. 251-255, 11 figs. Methods employed in yards of Alabama Dry Dock & Shipbuilding Co.

AUSTRALIA. Australian Shipbuilding. Commonwealth Engr., vol. 6, no. 6, Jan. 1, 1919, pp. 187-190, 5 figs. Shipbuilding at Government dockyards, Walsh Island, N. S. W.

CAROLINA SHIPBUILDING CORPORATION. Carolina Shipbuilding Corporation. Int. Mar. Eng., vol. 24, no. 4, Apr. 1919, pp. 240-245, 7 figs. Yard erected for building Emergency Fleet vessels. Contract calls for twelve 9,600-ton cargo ships.

CONCRETE SHIPBUILDING IN ENGLAND. Concrete Shipbuilding Work in England. Concrete Age, vol. 29, no. 4, Jan. 1919, pp. 12-15. Account of shipyards on South Coast, where eighteen concrete vessels are in course of construction. From Times Eng. Supp.

CONCRETE-VESSEL BUILDING. Shipping and Shipbuilding Indus. Australian & Min. Standard, vol. 61, no. 1580, Feb. 20, 1919, p. 323. Construction of concrete vessels. Developments in the United Kingdom.

DELAWARE WOODEN SHIPYARD. Large Wooden Shipyard on the Delaware, R. R. Shafter. Int. Mar. Eng., vol. 24, no. 4, Apr. 1919, pp. 256-259, 7 figs. Shipbuilding corporation organized to build wooden ships for Emergency Fleet.

FEDERAL SHIPBUILDING CO. Yard of the Federal Shipbuilding Company, Int. Mar. Eng., vol. 24, no. 4, Apr. 1919, pp. 266-270, 10 figs. Steel shipyard with twelve launching ways built by subsidiary of U. S. Steel Corporation.

FORD METHODS. Ford Methods in Ship Manufacture, Fred E. Rogers. Indus. Management, vol. 57, no. 4, Apr. 1919, pp. 289-295, 12 figs. Subassembling and unit erecting. (Continuation of serial).

FOUNDATION CO., NEW ORLEANS. Foundation Company's New Orleans Yard, Int. Mar. Eng., vol. 24, no. 4, Apr. 1919, pp. 237-239, 2 figs. General arrangement of yard.

GREAT LAKES SHIPYARDS. The Great Lakes Engineering Works. Int. Mar. Eng., vol. 24, no. 4, Apr. 1919, pp. 281-288, 14 figs. Details of shipyards and engine-building plant.

GROTON IRON WORKS. Groton Iron Works Shipbuilding Plant. Int. Mar. Eng., vol. 24, no. 4, Apr. 1919, pp. 247-250, 10 figs. Layout, construction of shipyard and methods for handling material.

LAUNCHING. Tides Terrain and Temper Play Important Parts in Launching. Motor Boating, vol. 23, no. 4, Apr. 1919, pp. 28-29, 4 figs. How a small crew can easily and safely launch a heavy cruiser of moderate size.

MANITOWOC SHIPBUILDING CO. Manitowoc Shipbuilding Company. Int. Mar. Eng., vol. 24, no. 4, Apr. 1919, pp. 271-280, 19 figs. Increase of steel shipyards on Great Lakes to meet demands of sea-going tonnage.

MERCHANT SHIPBUILDING CORPORATION, BRISTOL. Fabricated Ship Construction at Bristol Yard. Eng. News Rec., vol. 82, no. 12, Mar. 20, 1919, pp. 557-561, 8 figs. General plan and layout of plate-and-angle shop of Merchant Shipbuilding Corp.

MILWAUKEE. New Shipbuilding Enterprise in Milwaukee, Arthur F. Johnson Int. Mar. Eng., vol. 24, no. 4, Apr. 1919, pp. 262-265, 6 figs. Yard for construction of steel and concrete vessels.

NAVAL ENGINEERING. The Achievements of Naval Engineering in this War, William L. Cathcart. Jl. Am. Soc. Naval Engrs., vol. 31, no. 1, Feb. 1919, pp. 1-45, 19 figs. Achievements of Bur. Steam Eng. during the war. Address at Annual Meeting of Am. Soc. Mech. Engrs., Dec. 1918.

NEW ORLEANS CANAL. Shipyard on New Orleans Canal for Building "Unsinkables." Eng. News Rec., vol. 82, no. 9, Feb. 27, 1919, pp. 434-438, 6 figs. Plan and details. The unsinkable ships being built are of the Le Parmentier (French) type.

NEWBURGH SHIPYARD. Construction of the Newburgh Shipyard. Int. Mar. Eng., vol. 24, no. 4, Apr. 1919, pp. 231-236, 7 figs. Description of shipyards and of accomplishments during past year.

TERMINALS

FRENCH PORTS. French Ports and the War (Les ports français et la guerre). Génie Civil, vol. 74, nos. 4 & 9, Jan. 25 and Mar. 1, 1919, pp. 73-74 and pp. 161-167, 6 figs. Organization of transport of coal across France to Italy. Description of Calais and Boulogne and notes on the traffic of these ports before and during the war.

NEW YORK-NEW JERSEY PORT. United Port of New York and New Jersey, Hjalmar E. Skougor. Freight Handling & Terminal Eng., vol. 5, no. 3, Mar. 1919, pp. 89-92. Recommends that States of New York and New Jersey be consolidated to form one state or that all such parts of these states as are immediately affected by comprehensive plan for port development be joined together to form either a separate state or a federalized district similar to the District of Columbia. Paper presented before Soc. Terminal Engrs.

RICHBOROUGH. The Richborough Transportation Depot and Train Ferry Terminus — IV, V, VI, VII. Engineer, vol. 127, nos. 3292, 3294, 3295 and 3297, Jan. 31, Feb. 14 & 21 and Mar. 7, 1919, pp. 102-104 and 106, pp. 147-150, 169-172, 219-220, 31 figs. Workshops and shipyard cover an area of 47 acres, of which 4½ acres represent the covered-in area. Launching slip for barges; self-propelled oil engined barge. Building of 58-ft. seaplace towing lighters for the Royal Naval Air Service. Design of extreme mobility, in event of enemy attack, shell fire, etc., installations could be readily withdrawn, or moved up again in case of an advance.

SINGAPORE. New Improvements in the Port of Singapore (Amélioration récentes du port de Singapour). Génie Civil, vol. 74, no. 4, Jan. 25, 1919, pp. 61-66, 18 figs. Construction of additional docks and quays.

VARIA

GRAPHIC NAVIGATION. Graphic Navigation, A. C. Knight. Motor Boating, vol. 23, no. 4, Apr. 1919, pp. 32-34 and 60, 8 figs. Determination of position (latitude and longitude) by the Marcq Saint Hilaire method from observations of the sun. Third article.

LAKE STEAMERS IN ATLANTIC. Successful Engineering Feat Opens Board Field for Lake Yards. Mar. Rev., vol. 49, no. 4, Apr. 1919, pp. 174-178, 9 figs. How large lake steamer was sent to Atlantic on beam ends.

PRATT SCHOOL OF NAVAL ARCHITECTURE. Pratt School of Naval Architecture, C. H. Peabody. Int. Mar. Eng., vol. 24, no. 4, Apr. 1919, pp. 220-222, 3 figs. Work of Dept. of Naval Architecture and Marine Engineering at the Massachusetts Inst. of Technology.

MINING ENGINEERING

BASE MATERIALS

CLAY. A Method for the Determination of Air in Plastic Clay, H. Spurrier. Jl. Am. Ceramic Soc., vol. 1, no. 10, Oct. 1918, pp. 710-713 and (discussion) pp. 714-715, 2 figs. Apparatus for quantitative determination of air.

FLUORSPAR. Fluorspar, Percy A. Wagner. South African Jl. Industries, vol. 1, no. 16, Dec. 1918, pp. 1516-1520. Manner of occurrence and sources of supply; dressing, preparation, and commercial uses; position and prospects of the South African fluorspar industry.

Fluorspar in the Ordovician Limestone of Wisconsin, Rufus Mather Bagg. Bul. Geol. Soc. Am., vol. 29, no. 3, Sept. 1918, pp. 393-397, 1 fig. Writer's findings while examining galena limestone quarries at Neenan.

LIMESTONE. Labor Saving at Limestone Quarries, Oliver Bowles. Dept. of Interior, Bureau of Mines, Technical Paper 203, 26 pp. Methods and types of equipment that have been tried and approved by quarry operators.

PHOSPHATES. Industry of Mineral Superphosphates (L'industrie des superphosphates minéraux), Chimie & Industrie, vol. 2, no. 2, Feb. 1, 1919, pp. 123-128, 4 figs. Technical study of French industry which has produced two million tons of superphosphates during the twelve months preceding August 1914.

SILICA. High-Grade Silica Materials, R. J Colony. N. Y. State Museum Bul., nos. 203, 204, Nov. and Dec. 1917, pp. 5-29, 15 figs. From field, laboratory and microscopic studies of high-silicia rock, writer concludes that within the borders of the State of New York there is rock of good quality, easy of access, capable of being readily quarried, and which may be used for glass making, ferrosilicon manufacture, silica refractories and tube mill liners and pebbles.

GEOLOGY AND MINERALS

AGE OF EARTH. The Age of the Earth, Harlow Shapley. Sci. Am. Supp., vol. 87, no. 2246, Jan. 18, 1919, pp. 34-35 and 42-43. Discussion of recent evidence from Geology, Astronomy and Physics. From Publ. Astron. Soc. of the Pacific, no. 177.

ANORTHOSITE, ADIRONDACK. Adirondack Anorthosite, William J. Miller. Bul. Geol. Soc. Am., vol. 29, no. 3, Sept. 1918, pp. 399-462. Structures, relations and origin. References are made to anorthosite of other regions and to Bowen's hypothesis, which latter writer pronounces untenable.

COLUMBIA. The Guamoco District of Columbia — I, S. Ford Eaton. Eng. & Min. Jl., vol. 107, no. 12, Mar. 22, 1919, pp. 513-515. 3 figs. History of mining in Columbia and details of travel and physical characteristics of mineral deposits.

CRYSTALLOGRAPHY. A Laboratory Method of Teaching Elementary Crystallography. Joseph E. Pogue. Am. Mineralogist, vol. 3, nos. 10 and 11, Oct. and Nov. 1918, pp. 179-182 and 193-194. Writer's practice in connection with a course in elementary crystallography at Northwestern University.

Crystallography of some Canadian Minerals. Albite, Titinite, Scapolite and Polycrase, Eugene Poitevin. Am. Mineralogist, vol. 4, nos. 2 and 3, Feb. and Mar. 1919, pp. 11-13 and 22-26, 7 figs. Specimens consisted of cavernous masses composed of association of augite, phlogopite and feldspar.

The Classification of Mimetic Crystals, Edgar T. Wherry and Elliot Q. Adams. Jl. Wash. Acad. Sci., vol. 9, no. 6, Mar. 19, 1919, pp. 153-157. Table showing types of mimetic phenomena, with three prefixtures proposed.

KANSAS CRYSTALLINE ROCKS. Geologic History of the Crystalline Rocks of Kansas, Raymond C. Moore. Bul. Am. Assn. Petroleum Geologists ,vol. 2, pp. 98-113. Material of crystalline mass is described as being for the most part a typical granite containing quartz, porphyry and chlorite schist.

DATOLITE. Famous Mineral Localities: The Datolite Locality Near Westfield, Massachusetts, Earl V. Shannon. Am. Mineralogist, vol 4, no. 1, Jan. 1919, pp. 5-6. General properties of minerals.

EARTHQUAKE WAVES. Earthquake Waves and the Interior of the Earth. Engineering, vol. 107, no. 2774, Feb. 28, 1919, pp. 266-267, 1 fig. Facts revealed by examination of seismograph and experimental work of the motion of compressional longitudinal waves in ropes.

EASTERN PENNSYLVANIA HIGHLANDS. Precambrian Sedimentary Rocks in the Highland of Eastern Pennsylvania, Edgar T. Wherry. Bul. Geol. Soc. Am., vol. 29, no. 3, Sept. 1918, pp. 375-392, 14 figs. Types described as of ultimate sedimentary origin.

GETTYSBURG. Glauberite Crystal Cavities in the Triassic-Rocks in the Vicinity of Gettysburg, Pa., George W. Stose. Am. Mineralogist, vol. 4, no. 1, Jan. 1919, pp. 1-4, 7 figs. Results of petrographic study of specimens.

GLACIAL DEPOSITS AND RESERVOIR SITES. Relation of Landslides and Glacial Deposits to Reservoir Sites in the San Juan Mountains, Colorado, Wallace W. Atwood. Department of the Interior, U. S. Geological Survey, Bul. 685, 38 pages, 25 figs. Mountain canyons and deposits commonly found in them; geological conditions associated with the lakes in the mountains.

KANSAS GEOLOGY. Geological Conditions in Central Kansas, Irving Perrine Bul. Am. Assn. Petroleum Geologists, vol. 2, pp. 70-97. Review of general geology with notes on the structural conditions.

LITCHFIELD, MAINE. Field Relations of Litchfielite and Soda-Syenites of Litchfield, Maine, Reginald A. Daly. Bul. Geol. Soc. Am , vol. 29, no. 3, Sept. 1919, pp. 463-470, 2 figs. Account of field work.

MAINE. Famous Mineral Localities; Mt. Mica, Mt. Apatite and other Localities in Maine, James G. Manchester and William T. Bather. Am. Mineralogist, vol. 3, no. 9, Sept. 1918, pp. 169-174, 5 figs. Observations made by writers in automobile trip through localities.

OOLITES IN SHALE. Oolites in Shale and Their Origin, W. A. Tarr. Bul. Geol. Soc. Am., vol. 29, no. 3, Sept. 1918, pp. 587-600, 2 figs. Oolites in shale constituting Papo Algie beds are believed to be due to direct precipitation of colloidal silica introduced into the saline, shallow waters by streams flowing from adjacent land areas.

PENEPLAINE, APPALACHIAN. Ages of Peneplaine of the Appalachian Province, Eugene Wesley Thaw. Bul. Geol. Soc. Am., vol. 29, no. 3, Sept. 1918, pp. 575-586. Examination of Appalachian peneplains in light of published and unpublished data concerning buried peneplains in Atlantic and Gulf Coastal Plains.

QUARTZ. Fibrous Quartz from Rhode Island, Alfred C. Hawkins. Am. Mineralogist, vol. 3, no. 7, July 1918, pp. 149-151. Writer disagrees with Prof. Emerson's theory concerning origin of fibrous quartz.

RIVER VIRGIN, UTAH. Oil Possibilities of the River Virgin Anticline, W. E. Calvert. Salt Lake Min. Rev., vol. 20, no. 24, Mar. 30, 1919, pp. 21-23, 4 figs. Outline of geological features of region in Southwestern Utah, which is believed possess oil deposits.

TEXAS, LOUISIANA COASTAL PLAIN. Minerals of the Saline Domes of the Texas, Louisiana Coastal Plain, Alfred C. Hawkins. Am. Mineralogist, vol. 3, no. 11, Nov. 1918, pp. 189-192, General data of sixty-three domes mapped to date in Texas and Louisiana.

TRILOBITES. The Facial Suture of Trilobites, H. H. Swinnerton. Geol. Mag., vol. 6, no. 3, Mar. 1919, pp. 103-110, 2 figs. Examination of various evidences lead writer to affirm that trilobites are a compact group, the members of which at first underwent ecdysis along marginal suture.

VIVIANITE. The Color Change in Vivianite and its Effect on the Optical Properties, Thomas L. Watson. Am. Mineralogist, vol. 3, no. 8, August 1918, pp. 159-161. Rapid change of color is said to be due to oxydation and not to inversion.

WASATCH REGION, UTAH. Relation of Ore Deposits to Thrust Faults in the Central Wasatch Region, Utah, B. S. Butler. Economic Geology, vol. 14, no. 2, Mar.-Apr. 1919, pp. 172-175, 3 figs. Writer's detail work in district.

COAL AND COKE

ASH YIELD, CALORIFIC VALUE. The Relation Between the Calorific Values and the Ash-Yields of Coal-Samples from the Same Seam, Thomas James Drakeley. Trans. Manchester Geol. & Min. Soc., vol. 36, part 1, Feb. 1919, pp. 9-20, 3 figs. Plotted calorific values and ash yields of mixtures of coal with calcium carbonate and shale. Equation expressing relation between calorific value and ash percentage.

COAL PYRITES, TENNESSEE. The Coal Pyrite Resources of Tennessee and Tests on Their Availability, E. A. Holbrook and Wilbur A. Nelson. Resources of Tennessee, vol. 9, no. 1, Jan. 1919, pp. 60-70, 1 fig. Co-operative research of State Geol. Survey with U. S. Bur. of Mines.

COAL-WASHING MACHINERY. The Draper Coal Washing Machine. Engineer, vol. 127, no. 3295, Feb. 21, 1919, pp. 180-181, 3 figs. Machine is intended to deal with fine classes of coal which are generally thrown away on account of difficulty in separating coal from its associated dirt; it is said machine will handle dust so fine that it will pass a 60-mesh screen.

COKE HANDLING. Handling of Coke, C. J. Woodhead. Gas Jl., vol. 145, no. 2912, Mar. 4, 1919, pp. 391-394, 2 figs. Figures of Huddersfield coke handling plant. Paper read before Manchester and District Junior Gas Assn.

COKE-OVEN PRACTICE, AMERICAN. Why American Coke Oven Practice Leads the Way, Richard Gunderson. Gas World Supp., vol. 70, no. 1806, Mar. 1, 1919, pp. 12-14. Three reasons are given; Application of scientific research work to industry; location of coke plants at steel works; economical conditions which give U. S. Steel Corporation control over the supplies of raw material, transportation and sales and distribution of their products.

COKE RETORTS, CENTRAL SYSTEM. A New Design of Vertical Retorts—the " Central" System. Gas Jl., vol. 145, no. 2912, Mar. 4, 1919, pp. 455-456, 2 figs. Design of type introduced by Firth Blakeley & Co. of Leeds.

ENGLAND. The Coal Resources of England, H. H. Stock. Black Diamond, vol. 62, no. 11, Mar. 15, 1919, pp. 298-300, 1 fig. Review showing importance and extent of Great Britain's coal deposits.

FATALITIES. Coal-Mine Fatalities in the United States, Albert H. Fay. Dept. of Interior, Bur. of Mines, Jan. 1919, 61 pp. Statistics of coal-mine fatalities in 1918, by states and months; details relating to chief cause of accidents; list of permissible explosives, lamps and motors tested prior to Jan. 31, 1919.

FRANCE. On the Existence of a Deep Coal Deposit at Merville (Nord) Sur l'existence du terrain houiller en profondeur, à Merville (Nord), Pierre Pruvost. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 2, Jan. 13, 1919, pp. 94-96. A sample coming from a depth of 247 meters is described as being made of a black schist of a pyritic inclusion.

The Mines of Bruay, France, Gaston Libiez. Coal Age, vol. 15, no. 12, Mar. 20, 1919, pp. 522-523, 5 figs. Deep colliery shafts tap several coal beds of varying thickness. The thinner measures are worked longwall, while the thicker ones are worked in panels.

GERMAN COAL CLASSIFICATION. The German System of Coal Classification and the Future Economic War—I & II. Colliery Guardian, vol. 117, nos. 3036 & 3037, Mar. 7 & 14, 1919, pp. 535-536 and 593-595, 10 figs. Study of efficiency in utilizing fuel value of coal by partial or complete gasification, direct combustion being reserved for exceptional instances. Utilizing separate products in preparation.

GERMAN INDUSTRIES. The German Coal, Iron and Steel Industries. Iron & Coal Trades Rev., vol. 48, no. 2654, Jan. 10. 1919, p. 39. General information given in German newspapers on conditions in these industries.

KENT. The Evolution and Development of the Kent Coalfield, A. E. Ritchie. Iron & Coal Trades Rev., vol. 48, nos. 2654, 2658 and 2663, Jan. 10, Feb. 7, and Mar. 14, 1919, pp. 35-36, 172-173 and 320-321, 2 figs. Physical characteristics; continuity with Pas de Calais coalfield; development of mining operations from 1826-1866. From 1886 to 1896. Evolution from 1906 to 1912. (Continuation of serial.)

KNOX COUNTY, IND. Knox County Mines and Their Coal. Black Diamond, vol. 62, no. 14, Apr. 5, 1919, pp. 376-377, 11 figs. Activities of Knox County (Indiana) Coal Operators Assn.

NITROGEN IN COAL. Rsearches on Coal (Recherches sur la houille), Aimé Pictet. Annales de Chimie, series 9, vol. 10, Nov.-Dec. 1918, pp. 249-330. Undertaken to determine in what form nitrogen is contained in coal. Samples from Montrambert (Loire) were treated with various acid and neutral solvents, notably boiling benzene.

Philippine Islands. The Mindanao Coal Mines, Monroe Woolley. Coal Age, vol. 15, no. 11, March 13, 1919, pp. 492-493, 3 figs. Operation of fuel beds in the Philippines.

Roll Crushers. Rolls for the Preparation of Coking Coals. Coal Age, vol. 15, no. 14, Apr. 3, 1919, pp. 612-615, 9 figs. Comparison of hammer mill and roll crusher.

Shaft Development. Modern Shaft Development of the Consolidation Coal Company—I & II, George W. Harris. Coal Age, vol. 15, nos. 11 and 12, Mar. 13 and 20, 1919, pp. 480-485 and 527-531, 6 figs. General details and dimensions of mine no 87. Operations involved in mine workings by noting location of old and new gas wells.

Training of Students. The Training of Students in Coal-Mining, with Special reference to the Scheme of the Engineering Training Organization, F. W. Hardwick. Tran. Min. Inst. Scotland, vol. 40, part 8, 1918-1919, pp. 154-162. Maintenance of Central Bureau, where parents and educationalists can obtain accurate and comprehensive information relating to engineering industry and proper course to pursue on behalf of boys who are desirous of making engineering their profession.

Utah. A One-Year Retrospect of the Coal Industry of Utah, A. C. Watts. Coal Age, vol. 15, no. 14, Apr. 3, 1919, pp. 610-611. Growth of industry.

Yellowhead Coal District. The Yellowhead Coal District, S. McVicar. Coal Age, vol. 15, no. 14, Apr. 3, 1919, pp. 608-610, 4 figs. Details of operation of two coal beds on steep pitch worked simultaneously by means of balanced plane.

COPPER

Leaching. Practical Considerations in Ammonia Leaching of Copper Bearing Ores, Lawrence Eddy, Chem. & Metallurgical Eng., vol. 20, no. 7, April 1, 1919, pp. 328-334, 4 figs. Plant installation and operation; leaching tanks; plate joinings, filters and inlets; piping and pumps; evaporators; details of operation; charging and extracting ore; chemical control; cost of leaching; labor, power and ammonia.

Copper Leaching, Percy R. Middleton. Chem. Eng. & Min. Rev., vol. 11, no. 125, Feb. 5, 1919, pp. 133-134, 2 figs. Methods applicable to Australian ores.

IRON

Australia. Australian Iron Ore Resources. Min. Mag., vol. 20, no. 3, Mar. 1919, pp. 150-156, 3 figs. Information relating to iron ore deposits in West Australia, New South Wales and Tasmania.

British Columbia. Utilization of Iron Ores of British Columbia. Canadian Min. Jl., vol. 40, no. 13, Apr. 2, 1919, pp. 212-213. Proposes asking British Columbia Legislature for authority to take from any of the iron ore properties of the Province a quantity of ore, not to exceed 10,000 tons in the aggregate for experimental uses.

Magnetic Concentration. Magnetic Concentration of Pyrrhotite Ores, J. P. Bonardi. Chem. & Metallurgical Eng., vol. 20, no. 6, March 15, 1919, pp. 266-270. Experiments and tests made with a Wetherill type magnetic separator.

Mexico. Iron in Mexico (El fiero en Mexico), Trinidad Paredes. Boletin Minero, vol. 6, no. 3, Sept. 1918, pp. 253-479, 1 fig. Official publication issued by Department of Industry and Labor of Mexican Government. Mining conditions and prospects are considered at length and legislation concerning exploitation of collieries and iron deposits is studied.

LEAD, ZINC, TIN

German Domination of Metal Markets. Report of Alien Property Custodian on the Metal Industry. Chem. & Metallurgical Eng., vol. 20, no. 7, Apr. 1, 1919, pp. 313-317, 3 figs. Regarding German domination of metal markets in Europe, particularly zinc and lead.

Lead, Osotopic. Notes on Osotopic Lead, Frank Wiggleworth Clarke. Chem. News, vol. 117, no. 3062, Dec. 6, 1918, pp. 370-373. Remarks on differences in atomic weight or ordinary lead and lead obtained from radio-active processes.

Northampton (Australia). Lead Ores. The Northampton Lead-Mining District, West Australia, C. M. Harris. Min. Mag., vol. 20, no. 3, Mar. 1919, pp. 140-143. Account of old lead-mining district in West Australia that showed renewed activity during war.

Tin-Bearing Mineral, Pleochroism. Pleochroism in a Tin-Bearing Mineral from Siam, J. B. Scrivenor. Geol. Mag., vol. 6, no. 3, Mar. 1919, pp. 123-124. From examination of heavy concentrate of course grains of dark mineral and finer grains of ilmenite, monazite, tourmaline, zircon, and tapaz.

Tin, Hydraulic Prospecting for. Hydraulic Prospecting at the Rooiberg Tin Mines, E. R. Schoch. South African Jl. & Eng. Rec., vol. 28, no. 1427, Feb. 1, 1919, pp. 501-502. Method of surface prospecting by means of hydraulic jets or monitors.

Zinc Industry. Economics of the Zinc Industry: A Prophetic Discussion, Parker C. Choate. Chem. & Metallurgical Eng., vol. 20, no. 5, March 1, 1919, pp. 237-239. Believes that expansion of zinc industry is to be obtained not alone by advertising and promoting new uses, but in addition metallurgical operations must be perfected and lower costs obtained.

Zinc Tailings, Re-treating. Retreating Zinc Tailings in Wisconsin, W. F. Boericke. Eng. & Ming. Jl., vol. 107, no. 12, Mar. 22, 1919, pp. 524-527, 2 figs. Details of 5-cell jig with settling tank.

MAJOR INDUSTRIAL MATERIALS

Manganese. Preparation of Manganese Ores, W. R. Crane and E. R. Eaton. Resources of Tennessee, vol. 9, no. 1, Jan. 1919, pp. 48-59, 2 figs. Methods employed in dry mining, washing and concentration.

The Mining and Preparation of Manganese Ores in Tennessee, W. R. Crane. Resources of Tennessee, vol. 9, no. 1, Jan. 1919, pp. 32-47, 5 figs. Different forms of deposits. Minerals found in manganese districts are pyrolusite, psilomelane and manganite.

MINES AND MINING

Accidents. Accidents at Metallurgical Works in the United States, Albert H. Fay. Dept. of Interior, Bureau of Mines, Technical Paper 215, 23 pp. Statistics during calendar year 1917.

British Columbia. Reports of British Columbia Government Mining Engineers. Can. Min. Jl., vol. 40, no. 7, Feb. 19, 1919, pp. 100-108. Review and estimate of mineral production for 1918.

Canada. Mineral Production in Canada for 1918. Contract Rec., vol. 33, no. 12, Mar. 19, 1919, pp. 264-266. Report issued by Mines Branch, Department of Mines.

Drill Attachments. The Swift Drill Attachment. South African Min. & Eng., Jl., vol. 28, no. 1430, Feb. 22, 1919, pp. 604-605, 1 fig. Description of device; tests at Van Ryn Deep and Crown Mines.

Dust Sampling. Sampling of Dust in Mine Air, J. Boyd. Eng. & Min. Jl., vol. 107 no. 9, March 1, 1919, pp. 395-396, 1 fig. Air-testing suction pump as used for dust sampling by Chamber of Mines on Witwatersrand.

Excavators. Model Mining Methods (Metodas modelos de minaria), Revista Mineira e Metalurgica, vol. 1, nos. 10, 11 and 12, Oct.-Dec. 1918, pp. 88-90, 3 figs. Experiments by North West Corporation with Lubecker excavator (German type).

Legal. Abstracts of Current Decisions on Mines and Mining, J. W. Thompson. Dept. of Interior, Bur. of Mines, Bul. 174, law serial 17, 136 pp. Reported from May to September 1918.

Uniform Mining Law for North America, T. E. Godson. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 148, Apr. 1919, pp. 653-665. Mining laws of Canada represented as unassimilated to demands of industry.

Laws, Decrees and Decisions concerning Mines, Quarries, Sources of Mineral Waters, Railways in Operation, etc. (Lois, décrets et arrêtés concernant les mines, carrières, sources d'eaux minérales, chemins de fer en exploitation, etc.). Annales des Mines, vol. 7, no. 3, 1918, pp. 263-264. Documents publighed by Ministry of Public Works.

Details of Important Mining Bill Before the British Columbia Legislature. Robert Dunn. Coal Age, vol. 15, no. 12, Mar. 20, 1919, pp. 524-526. Provisions concerning miners' examinations, treatment of hoisting ropes and the practical elimination of all but safety lamps for miners' use.

Mining Law and Economics, David Bowen. Colliery Guardian, vol. 117, no. 3035, Feb. 28, 1919, pp. 479-480' Leases and licenses; definition of terms.

Longwall Mining. Longwall Mining in Illinois, Chester Mott. Mine & Quarry, vol. 11, no. 2, Mar. 1919, pp. 1122-1128. 6 figs. Practice in Illinois Third Vein field.

Mine Supplies. Economies in Mining Engineering Supplies, W. Elsdon-Dew. Jl. South African Instn. Engrs , vol. 17, no. 6, Jan. 1919, pp. 99-119, 18 figs. Account of economies practised in mines of Union of South Africa during years of war; illustrations of various devices intended for simplifying work and installed at some of the shops.

Ore-Dressing Laboratory. The Ore Dressing Laboratory of the Haileybury School of Mines, J. A. McRae. Can. Min. Jl., vol. 40, no. 3, Jan. 22, 1919, pp. 43-44. Summary of tests possible to carry out in plant.

Rescue Training. Rescue Training. Sci. & Art of Min., vol. 29, no. 17, Mar. 22, 1919, pp. 258-259. Fitness to undertake rescue work is said to be possessed by returning soldiers on account of their having been exposed, while in actual service to constant danger.

Respirators. Industrial Use and Limitations of Respirators, Gas Masks and Oxygen Breathing Apparatus. Chem. & Metallurgical Eng., vol. 20, no. 5, March 1, 1919, pp. 220-221. Statement of Bur. of Mines.

Separation Doors. Separation-Doors at the Bottom of the Upcast Pit, Worked Automatically by Tubs attached to Endless-Rope (Undertub) Haulage, Clement Fletcher. Tran. Instn. Min. Engrs., vol. 56, part 3, Jan.-Feb. 1919, pp. 173-175. Design in which operating catch is disengaged from the tub axle when door is fully opened or closed.

Shop Design. Shaft Design; Some Comparisons, W. L. White. South African Jl. & Eng. Rec., vol. 28, no. 1427, Feb. 1, 1919, pp. 503-504. On the various types of shafts with reference to those recently erected at South African mines.

Circular Shafts, H. Stuart Martin. Jl. South African Instn. Engrs., vol. 17, no. 7, Feb. 1919, pp. 136-147, 7 figs. Comparison of circular shafts with other types, particularly square and seven compartment.

Seven-Compartment Rectangular Shafts, C. E. Knecht. Jl. South African Instn. Engrs., vol. 17, no. 7, Feb. 1919, pp. 127-136, 3 figs. Discusses merits in regard to safety in sinking, normal rate of sinking, ability to cope with water and other sinking difficulties, ventilation area, hoisting capacity and cost.

Shovelling. A Study of Shovelling Applied to Mining—II, G. Townsend Harley. Eng. & Ming. Jl., vol. 107, no. 12, Mar. 22, 1919, pp. 520-522, 3 figs. Effect of shape of shovel and length of handle on amount of shoveling done. Influence of system of payment for work perfomed on individual efficiency of miners.

Notes on Rectangular Shafts at Randfontein Central G. M. Co., Ltd., and New State Areas, Ltd., W. L. White. Jl. South African Instn. Engrs., vol. 17, no. 7, Feb. 1919, pp. 148-156, 5 figs. Drawings and figures of two vertical shafts at Randfontein and at New State Area, South Africa.

Shot Drilling. Shot Drilling Around Thetford Mines. J. W. Davis. Can. Min. Jl., vol. 40, no. 3, Jan. 22, 1919, pp. 36-38, 4 figs. Prospecting work in asbestos and chromite iron deposits by Calix shot drills.

Stope Measurement. Cobar Stope Measurement Methods, W. S. Curteis. Instn. Min. & Metallurgy, Bul. 174, Mar. 13, 1919, 20 pp., 6 figs. Analysis of methods employed in measuring the stopes at Great Cobar Ltd., New South Wales, Australia. Methods were devised primarily for measurement for payment purposes.

Taxation. Principles of Mining Taxation, Thos. W. Gibson. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 148, Apr. 1919, pp. 611-620. Analysis of general systems of taxation and their application to mines, which, it is contended, have to spend part of earning in building for workers' conveniences of living in remoted regions.

Temperatures in Deep Mines. High Temperatures in Deep Mines, William Garnforth. Tran. Instn. Min. Engrs., vol. 56, part 3, Jan.-Feb. 1919, pp 127-133. Review of reports issued by various official and scientific committees.

Tunnel Driving. Methods and Cost of Driving a 10 x 12 ft. Mining Tunnel at Copper Mountain, B. C., Oscar Lockmund. Eng. & Contracting, vol. 51, no. 12, Mar. 19, 1919, pp. 286-287, 1 fig. Driving of main haulage level at Copper Mountain Mines of Can. Copper Corp. Presented at Chicago meeting, Am. Inst. Min. Engrs.

Ventilation. Ventilation Methods in Coeur d'Alene Mines, Robert N. Bell. Min. & Sci. Press, vol. 118, no. 12, Mar. 22, 1919, pp. 397-398. Abstract from report of State Inspector of Mines.

Mine Ventilating Plant. Engineer, vol. 127, no. 3292, Jan. 31, 1919, pp. 110-111, 6 figs. Arrangements in installation driven by 300 hp., 2-cyl. tandem compound engine.

MINOR INDUSTRIAL MATERIALS

Salt. Separation of Salt from Saline Water and Mud, E. M. Kindle. Bul. Geol. Soc. Am., vol. 29, no. 3, Sept. 1918, pp. 471-487, 12 figs. Laboratory observations on behavior of salt in evaporation of saline mixtures and discussion of their geological significance.

Zirconia. Zirconia. Metal Industry, vol. 14, no. 10, Mar. 7, 1919, pp. 189-190. Its occurrence and application.

OIL

Cuba. The Geology of Cuban Petroleum Deposits, E. DeGolyer. Bul. Am. Assn. Petroleum Geologists, vol. 2, pp. 133-167. Compilation of several geological stratigraphic and structural data, and comparison with North American Mid-Continent fields.

Gasoline Content in Natural Gas. Testing Natural Gas for Gasoline Content, G. G. Oberfell, S. D. Shinkle and S. B. Meserve. Jl. Indus. & Eng. Chem., vol. 11, no. 3, Mar. 1, 1919, pp. 197-200, 6 figs. Method employs use of solid absorbing medium such as charcoal and is applicable to both lean and rich natural gas.

Geology. Value of Oil Geology in the Mid-Continent Field, Edward Bloesch. Bul. Am. Assn. Petroleum Geologists, vol. 2, pp. 124-132. Value of geology is considered to depend on keeping producers out of territory where there is no chance of production at all.

India. Notes on Structure and Stratigraphy in the North-West Punjab, E. S. Pinfold. Records Geol. Survey India, vol. 49, part 3, Dec. 1918, pp. 137-159. Notes collected while prospecting for oil.

Kentucky. A Résumé of the Past Year's Development in Kentucky from a Geological Standpoint, J. R. Pemberton. Bul. Am. Assn. Petroleum Geologists, vol. 2, pp. 38-52, 1 fig. Wild-cat drilling in 1917 is said to have resulted in the discovery of many new and valuable oil pools; anticlinal structure control and conditions of structures in western Kentucky are described.

Louisiana. The Oil and Gas Fields of Northern Louisiana, Mowry Bates. Bul. Am. Assn. Petroleum Geologists, vol. 2, pp. 61-69. Wells are said to be costly to drill and operate in northern Louisiana and the region is not considered as attractive.

Migration Through Sedimentary Rocks. On the Migration of Petroleum through Sedimentary Rocks, A. W. McCoy. Bul. Am. Assn. Petroleum Geologists, vol. 2, pp. 168-171. Concerning accepted theory that the oil has been formed from various types of animal and vegetable remains, buried in sedimentary rocks.

Santa Clara, Cal. Tectonic Interpretation of Santa Clara Valley Petroliferous Region (Interprétation tectonique de la région petrolifère de la vallée de Santa Clara en Californie), Max Reinhard. Archives des Sciences Physiques et Naturelles, year 124, vol. 1, Jan.-Feb. 1919, pp. 63-78, 4 figs. Theoretical considerations on petroleum deposits, and Eldrige's and Arnold's studies have led writer to suggest interpretation of southern California formations particularly Santa Clara valley.

Storage. Petroleum Oils (Les essences de pétrole), A. Guiselin. Journal du Pétrole, no. 12, Dec. 1918, pp. 1-6, 3 figs. Losses due to storage and methods of preventing them. (Continuation of serial.)

Evaporation Losses of Crude Oil Decreases Gasoline Content, J. H. Wiggins. Natural Gas & Gasoline Jl., vol. 13, no. 3, Mar. 1919, pp. 89-90. Concerning evaporation losses of crude oil.

Texas. A Review of the Development in the New Central Texas Oil Fields During 1918, W. G. Matteson. Economic Geology, vol. 14, no. 2, Mar.-Apr. 1919, pp. 95-146, 7 figs. Stratigraphy, structural geology. and general tectonic relationships.

Venezuela. Caribbean Petroleum's Operations in Venezuela. Oil Trade Jl., vol. 10, no. 4, Apr. 1919, p. 72, 3 figs. Transportation of well casing.

Water. The Distribution of Underground Salt Water and its Relation to the Accumulation of Oil and Gas, Roswell H. Johnson. Bul. Am. Assn. Petroleum Geologists, vol. 2, pp. 174-176. On relative roles of ascending and descending waters in oil accumulation.

PRECIOUS MINERALS

Australia. The Charters Towers Goldfield, J. H. Reid. Queensland Dept. of Mines' Publication no. 256, 1917, 236 pp., 23 figs. Account of ore deposits and geology of goldfield embracing 36.3 square miles. Field has had greatest output of gold in Australia; maximum annual yield was 319,572 oz. fine gold, obtained in 1899.

Diamonds. The Latest Development of Diamond Winning in S. W. Africa. South African Jl. & Eng. Rec., vol. 28, no. 1427, Feb. 1, 1919, pp. 495-496. Search for big mine under the sea; diamond recovery by dredging.

Gold Precipitation. The Theory of the Precipitation of Gold by Charcoal, A. W. Allen. Eng. & Ming. Jl., vol. 107, no. 12, Mar. 22, 1919, pp. 516-519, 2 figs. Abstracted from Bul. 171, I. M. M.

Gold Volatilization. The Volatilization of Gold, Thomas Kirke Rose. Instn. Min. & Metallurgy, Bul. 174, Mar. 13, 1919, 13 pp., 1 fig. Summary of results obtained by various investigators. Writer concludes that true volatilization of gold is so small as to be negligible at temperatures of industrial melting furnaces.

RARE MINERALS

Beryl. Famous Mineral Localities; Beryl Mountain, Acworth, N. H., Edward F. Holden. Am. Mineralogist, vol. 3, no. 12, Dec. 1918, pp. 199-200. Physical features of beryl crystals.

Famous Mineral Localities; Beryl Hill, Grafton, New Hampshire, George M. Flint. Am. Mineralogist, vol. 4, no. 3, Mar. 1919, pp. 21-22, 2 figs. Features of beryl exhibited at various museums.

Radium. Radium Production, Chas. H. Viol. Science, vol. 44, no. 1262, March 7, 1919, pp. 227-228. Output of the Standard Chemical Co. of Pittsburgh from 1913-1918.

Uranium. The Determination of Uranium in Alloy Steels and Ferro-Uranium, G. L. Kelly, F. B. Myers and C. B. Illingworth. Jl. Indus. & Eng. Chemistry, vol. 11, no. 4, Apr. 1, 1919, pp. 316-317. Method for determining uranium in presence of any of the other elements now in common use in the manufacture of alloy steels.

Uranium: Its Extraction from Pitchblende, Gustave Gin. Gen. Meeting Am. Electrochem. Soc., Apr. 3-5, 1919, paper 6, pp. 55-60. Discussion of occurrence and composition of pitchblende; methods of treatment by which uranium oxide is separated from it, both when it contains vanadium and when vanadium is absent; writer's proposed method for purification; involving fusion and electric furnace treatment to convert most of constituents into carbides followed by separation based on differing properties of carbides.

MERCURY

Condensation Losses. Fume and Other Losses in Condensing Quicksilver from Furnace Gases, L. H. Duschak and C. N. Schuette. Dept. of Interior, Bureau of Mines, Technical Paper 96, 29 pp., 8 figs. Report of experiments conducted by Federal Bur. of Mines through its station at Berkeley, Cal.

INDUSTRIAL TECHNOLOGY

Abrasives. Electrothermic Abrasives (Les abrasifs electrothermiques), Jean Escard. Revue Générale de l'Electricité, vol. 5, no. 5, Feb. 1, 1919, pp. 180-190, 5 figs. Origin, manufacture; properties, and uses.

Acetylene. Acetylene and Its Generation. Times Eng. Supp., vol. 15, no. 532, Feb. 1919, p. 75. Risk of explosion; effect of impurities in carbide.

Ammonia. The Synthesis of Ammonia at High Temperatures — III, Edward Bradford Maxted. Jl. Chem. Soc., vols. 115 and 116, no. 676, Feb. 1919, pp. 113-119, 1 fig. Formation of ammonia in single-phase, 50 cycle, 375-volt arc.

Ammonium Nitrate. The United States Ammonium Nitrate Plant, Perryville, Md. Chem. & Metallurgical Eng., vol. 20, no. 7, Apr. 1, 1919, pp. 320-326, 8 figs. Description of manufacture of ammonium nitrate by the double decomposition of Chilean saltpeter and ammonium sulphate; phases, their control and application; plant operations.

Antimony Salts. Antimony in the Textile Industry, E. R. Darling. Textile World Jl., vol. 55, no. 13, Mar. 29, 1919, pp. 31, 33 and 35. Values of the various salts in printing and dyeing.

Benzol. Benzol Recovery. Times Eng. Supp., vol. 15, no. 532, Feb. 1919, p. 72. Problem of distribution from gas works; cost of recovery.

Benzol and Phenols. Separation of Benzol and Extraction of Phenols in Gas Works of Paris and Suburbs (Le débenzolage et l'extradition des phénols dans les usines à gaz de Paris et de la banlieue parisienne), L. Lindet. Bulletin de la Société d'Encouragement pour l'Industrie Nationale, vol. 131, no. 1, Jan.-Feb. 1919, pp. 133-137. Principle of Paul Mallet apparatus consists in washing gas in a liquid less volatile than the one it holds in suspension and distilling resulting mixture.

Carbides, Silicides and Borides. Metallic Carbides, Silicides and Borides (Les carbures, borures et siliciures métalliques), Jean Escard. Revue Générale de l'Electricité, vol. 5, no. 9, Mar. 1, 1919, pp. 339-351. Concerning their industrial utilization, notably in metallurgical and chemical arts.

Charcoal. Manufacture of Charcoal as an Economic Measure, Helge Sylven. Sci. Am. Supp., vol. 87, no. 2251, Feb. 22, 1919, pp. 124-126, 5 figs. Utilization of lumber-mill waste. From West Coast Lumberman.

Chlorine. Commercial Uses of Chlorine, V. R. Kokatnur. Gen. Meeting Am. Electrochem. Soc., Apr. 3-5, 1919, paper 10, pp. 141-155. Classification of direct and indirect ways of possible utilization of chlorine.

Electroplating. Lay-out and Cost of Electro-Plating Plant and Equipment. Metal Industry, vol. 14, no. 10, Mar. 7, 1919, pp. 186-187, 1 fig. Tentative plans prepared for electro-plating and metal-finishing companies.

Enamels. Enamels for Cast Iron, Homer F. Staley. Jl. Am. Ceramic Soc., vol. 1, no. 10, Oct. 1918, pp. 703-709. Tin enamel and antimony enamel compositions.
The Relative Action of Acids on Enamels — III, E. P. Poste. Jl. Am. Ceramic Soc., vol. 2, no. 1, Jan. 1919, pp. 32-43, 9 figs. Tests of acid resistance undertaken by Sub-Committee on Enamels of Committee on Standards of Am. Ceramic Soc. Reference is made to previous investigation.

Fertilizers. Fertilizers, B. de C. Marchand, South African Jl. Industries, vol. 1, no. 16, Dec. 1918, pp. 1521-1529, 1 fig. Attempt to ascertain quantity of fertilizer of all kinds manufactured in the Union of South Africa. Seventh and concluding article.

Galvanizing. The Electro-Galvanizing of Booster Cases, Adapters and Detonator Fuse Components, T. C. Eichstatedt. Metal Industry, vol. 14, no. 10, Mar. 7, 1919, pp. 181-182. Method developed by writer.
Modern Processes of Galvanizing Sheet Steel (Procédés modernes de galvanisation de tôles d'acier). Métallurgie, vol. 51, nos. 4, 5, 6, 8, 10 and 11, Jan. 22, and 29, Feb. 5 and 19, Mar. 5 and 12, 1919, pp. 173-174, 224-225, 279-280, 396, 520, 582-583, 1 fig. Tanks, baths, and manipulation; cleaning and scraping; losses; scheme showing arrangement of apparatus; relative cost of various processes; galvanizing tanks; operation of tanks. (Concluded). From Iron Age.

Gas Industry. The Gas Industry, S. W. Parr. Gas Indus., vol. 19, no. 2, Feb 1919, pp. 50-52. Present and prospective status.
Medium Pressure, A. C. Howard. Gas Indus., vol. 19, no. 2, Feb. 1919, pp. 46-48. Distribution of booster system of citizens Gas & Fuel Co. of Terre Haute.
Operation and Chemical Control, H. Vittinghoff. Gas Indus., vol. 19, no. 3, Mar. 1919, pp. 65-69. Chemical reactions which underlie gas manufacturing process in a water-gas plant.
Springfield Tests Indicate That Retort Life Is Increased by Steaming. Am. Gas Eng. Jl., vol. 110, no. 10, Mar. 8, 1919, pp. 211-213. Test were made in connection with investigation by Mass. Board of Gas & Elec. Commission relative to adoption of calorific standard for gas.
Steaming Horizontal Retorts, R. J. Rew. Gas Jl., vol. 145, no. 2905, Jan. 14, 1919, pp. 69-70. Writer believes it is best to steam very slightly during 8-hour carbonizing period, but to steam fully for an additional 40 hours.
Standard Gas. Engineering, vol. 107, no. 2775, Mar. 7, 1919, pp. 304-306, 3 figs. Tests performed and conclusions arrived at by Research Sub-Committee of Instn. Gas. Engrs.
Gasworks and the Supply of Motor Spirit Engineer, vol. 127, no. 3296, Feb. 28, 1919, pp. 196-197, 1 fig. Wilton benzol rectification plant.
Low-Temperature Carbonization in Relation to the Production of Motor Spirit, Fuel Oils. Smokeless Fuel and Power Gas; Its Aims and Objectives, F. D. Marshall. Gas Jl., vol. 145, nos. 2911 and 2912, Feb. 25, and Mar. 4, 1919, pp. 383-385 and 451-454, 5 figs. Explanation of process in view to stop waste of coal; extent of coal waste in England is given in statistical tables and possible by-product recovery is illustrated by diagrammatic sketch.
Unusual Carbonizing Method. James A. Brown. Gs: Jl., vol. 145, no. 2904, Jan. 7, 1919, p. 28. Difficulties encountered in operation of inclined ovens at Flint and Evansville, Mich. Paper before Mich. Gas Assn.
Principles of Gas Purification and Purifier Design, F. W. Steere. Gas Age, vol. 43, no. 6, Mar. 15, 1919, pp. 285-290, 8 figs. Regarding improvements in apparatus employed in removing sulphur from gas. (Continuation of serial).

Gasoline. Gasoline from Naturel Gas, G. A. Burrell. Petroleum Age, vol. 6, no. 3, March-1919, pp. 101-104. Types of plants; points concerning operation.
Greenstreet Cracking Plant, R. H. Kinnear. Petroleum Age, vol. 6, no. 3, March-1919, pp. 76-78, 5 figs. Details of method for making gasoline by cracking petroleum fractions.
Status of Refinery Practice with Regard to Gasoline Production, E. W. Dean. Automotive Eng., vol. 4, no. 3, Mar. 1919, pp. 114-115. Bureau of Mines suggestions in regard to increasing output of gasoline from a given quantity of crude oil.
Properties of Motor Gasoline — II, E W. Dean. Automotive Eng., vol. 4, no. 3, Mar. 1919, pp. 132-134 and 147. Laboratory methods of testing gasoline and suggested specifications for motor gasoline.

Glass. Welding Glass (Notes sur le sondage des verres), Léon Appert. Bulletin de la Société d'Encouragement pour l'Industrie Nationale, vol. 131, no. 1, Jan.-Feb. 1919, pp. 67-91, 4 figs. History of operation; study of physical characteristics required and of phenomena taking place; classification and description of processes.
The Detection of " Ghosts " in Prisms, T. Smith, Sci. Am. Supp., vol. 87, nos. 2249 and 2245, Feb. 8 and 15, 1919, pp. 92-94 and 108-109, 20 figs. Method for developing optical prisms free from undesirable reflections. Fram Tran. Optical Soc. Lond.

Glues. Properties and Preparation of Glues. Mech. Eng., vol. 41, no. 4, Apr. 1919, pp. 382-386. Data on properties, preparation, classification, grading and testing of glues, strength of glued joints, etc., based on experimental work of Bureau of Aircraft Production.

Helium. Helium in Natural Gas, G. A. Burrell. Natural Gas & Gasoline Jl., vol. 13, no. 3, Mar. 1919, pp. 97-98. How Helium is extracted for use in balloons and dirigibles.

Hydrogen. Hydrogen from Ferrosilicon. Iron Age, vol. 103, no. 10, Mar. 6, 1919, p. 608. French process for filling British dirigible balloons.

Kerosene. Testing Illuminating Oils, John W. Newton and F. N. Williams. Petroleum Age, vol. 6, no. 3, March 1919, pp. 81-84. Discussion of apparatus and specifications required for determining quality of kerosene and similar oils. Second article.

Lead Salts. The Sub-Acetate and Sub-Sulphate of Lead, Henry George Dunham. Jl. Chem. Soc., vols. 115 and 116, no. 676, Feb. 1919, pp. 109-113. Lead sub-acetate obtained by action of acetic anhydride on lead sub-oxide at 195 deg. cent.; physical and chemical properties of substance.

Linoleum. History and Manufacture of Floor-Cloth and Linoleum, M. W. Jones, Jl. Soc. Chem. Indus., vol. 38, no. 3, Feb. 15, 1919, pp. 26T-31T. Account of development of industry in British Empire.

Mustard Gas. Continuous Vacuum Still for " Mustard Gas," Elford D. Streeter. Jl. Indus. & Eng. Chemistry, vol. 11, no. 4, Apr. 1, 1919, pp. 292-294, 1 fig. Apparatus constructed for continuous distallation of " mustard gas."
Development of Mustard Gas. Jl. Indus. & Eng. Chemistry, vol. 11, no. 4, Apr. 1, 1919, pp. 287-291, 3 figs. Commercial production of ethylene apparatus and plant procedure for absorption of ethylene gas and monochloride. Purification of product.

Natural Gas. The Analysis of Natural Gas and the Calculation and Application of Results, R. P. Anderson. Jl. Indus. & Eng. Chemistry, vol. 11, no. 4, Apr. 1, 1919, pp. 299-306, 3 figs. Method consists in passing a sample of natural gas slowly into oxygen in which an electrically heated platinum spiral in glowing, the calculations being made from an observation of the contraction in volume resulting from combustion of volume of carbon dioxide that is formed.

Nitric Acid. Concentration of Nitric Acid (La concentration de l'acide nitrique), M. Kaltenbach. Chimie & Industrie, vol. 2, no. 2, Feb. 1, 1919, pp. 142-152, 6 figs. Theoretical conditions; scheme of apparatus.

Nitrogen Fixation. The Present Status of Nitrogen Fixation, Alfred H. White Jl. Indus. & Eng. Chem., vol. 11, no. 3, Mar. 1, 1919, pp. 231-237, 3 figs. Summary of processes.

Odors. An Investigation of Stenches and Odors for Industrial Purposes, V. C. Allison and S. H. Katz. Jl. Indus. & Eng. Chemistry, vol. 11, no. 4, Apr. 1, 1919, pp. 336-339, 3 figs. Apparatus and procedure. Paper read before Am. Chem. Soc.

Organic Chemistry. Future of Industrial Organic Chemistry, Harold Hibbert. Chem. & Metallurgical Eng., vol. 20, no. 7, Apr. 1, 1919, pp. 335-341, 2 figs. Review of industries depending on organic chemical development, such as food, clothing, fuel, drugs and arts.

Photography. A Wax Medium and Process for the Permanent Coloring of Photographs, A. Vernon Godbold. Sci. Am. Supp., vol. 87, no. 2248, Feb. 1, 1919, pp. 74-75. From British Jl. Photography.
Thd Yellowing of Paper, Alfred B. Hitchins. Sci. Am. Supp., vol. 87, no. 2257, Apr. 5, 1919, p. 222, 3 figs. Study of causes of principal factors producing deterioration. Contribution to Paper from Ansco Research Laboratory.

Pickling. Some experiments with Substitutes for Sulphuric Acid for Pickling, E. S. Thompson. Brass World, vol. 15, no. 3, Mar. 1919, pp. 79-80. Comparative tests on niter cake and sulphuric acid to determine their relative vlues as pickling agents on hot-rolled flange steel.

Porcelain. Note on Certain Characteristics of Porcelain, A. V. Bleininger. Jl. Aml. Ceramic Soc., vol. 1, no. 10, Oct. 1918, pp. 697-702, 1 fig. Tests at Pittsburgh laboratory of Bur. of Standards.

Soap and Candles. The Manufacture of Soap and Candles, M. Rindl, South African, Jl. Industries, vol. 1, no. 16, Dec. 1918, pp. 1487-1495. Raw materials and by-products of industry; development and present condition in South Africa.

Sulphuric Acid. Manufacture of Sulphuric Acid by the Chamber Process, George Crisp. Gas. Jl., vol. 145, no. 2907, Jan. 28, 1919, pp. 173-175. Outline of various operations in plant and chemical reactions in chambers. Paper before Mideland Section of Coke Oven Manager's Assn.

Tar, Dehydration of. Debydration of Various Tars, W. A. Twine. Gas Jl., vol. 145, no. 2912, Mar. 4, 1919, pp. 462-464, 2 figs. Operation of Mond gas-pitch plant and of dehydrating plant for carbureted water-gas emulsion. Paper read before Midland Junior Gas Assn.

Tellurium. A Study of the Preparation of Certain Organic Salts of Tellurium, Aaron M. Hageman. Jl. Am. Chem. Soc., vol. 41, no. 3, March, 1919, pp. 342-346. Method for the preparation of tellurium acid tartaric. Writer asserts that, contrary to the findings of Becker, this salt can not be separated from tartaric acid by crystalization.
A Contribution to the Chemistry of Tellurium Sulfide, Aaron M. Hageman. Jl. Am. Chem. Soc., vol. 41, no. 3, March, 1919, pp. 329-341, 1 fig. Investigation concerning production and stability of a sulfide of tellurium.

Trinitrotoluene Residues. Trinitrotoluene Residues and Their Utilisation, Maurice Copisarow. Chem. News, vol. 118, no. 3065, Jan. 10, 1919, pp. 13-14. Derivation of iso-trolyte ,liquid T.N.T., chloropicrin and sulphide dyes.

Water Gas. Operation and Chemical Control of Water Gas Sets in Small Plants, H. Vittinghoff. Am. Gas Eng. Jl., vol. 110, no. 8, Feb. 22, 1919, pp. 163-164. Concerning economical operation.
Operating a Water Gas Set Without a Relief Holder in Parallel with By-Product Coke Ovens, A. H. Harris. Am. Gas Eng. Jl., vol. 110, no. 9, Mar. 1, 1919, pp. 185-188, 5 figs. General layout of plant.
All-New Water Gas Plant Results at Providence, Wm. Russell. Gas Age, vol. 43, nos. 6 and 7, Mar. 15 and Apr. 1, 1919, pp. 277-282 and 364-366, 8 figs. Buildings consist of generator house, engine and pump house, washer house and purifying house. (To be continued). Before N. E. Assn. Gas Engrs.

RAILROAD ENGINEERING

FOREIGN

Berlin-Bagdad. " Berlin to Bagdad," a Study of Germany's Railway Policy. Ry. Gaz., vol. 30, no. 10, Mar. 7, 1919, pp. 445-447, 3 figs. Diagram of through railway routes between Germany, Austria, Hungary, the Balkans and the Near East.

Channel Tunnel. Railway Developments in Foreign Countries. Ry. Age, vol. 64, no. 14, Apr. 4, 1919, pp. 907-910. Discussion of Channel tuunel project to connect England and France. Condition of railways in Belgium, France, Russia, Portugal and Mexico are quoted.

European Lines After War. War Situation and Service of European Railways, Sanuel O. Dunn. Ry. Age, no. 12, Mar. 21, 1919, pp. 762-764. Physical condition of British and French lines; comparison of European and American service.

Spain. An important Development in the Railways of Spain, F. Lavis. Ry. Age, vol. 66, nos. 13 and 14, Mar. 28 and Apr. 4, 1919, pp. 825-831 and 829-894, 15 figs. General description of project for proposed new trunk line and train service from France to Straits of Gibraltar.

BRAKES

Brake Tests. Report on the Automatic Straight Air Brake. Ry. Age, vol. 66, no. 13, Mar. 28, 1919, pp. 840-842. Tests of air-brake system of Automatic Straight Air Brake Co. of N. Y., conducted by Bureau of Safety.

ELECTRIC RAILROADS

Financial Condition. Electric Railways and Investors, Francis H. Sisson. Elec. Ry. Jl., vol. 53, no. 11, Mar. 15, 1919, pp. 506-608. Discusses financial condition of electric railways, which in writer's opinion is serious and has been aggravated by large wage awards. Paper before Am. Elec. Ry. Assn.

Narrow-Gage Railways. The Electric Railway of 0.60 m. Gage (Le chemin de fer électrique à écartement de 0.60m), L. Esbran. Bulletin de la Société Française des Electriciens, vol. 9, no. 76, Jan. 1919, pp. 53-71, 4 figs. Steam locomotives vs. electric locomotives for 24-in. gage roads; transmission of power; construction of track.
High-Power Electric Locomotives for Narrow Gauge Goods Trains. Elecn., vol. 82, no. 2128, Feb. 28, 1919, pp. 250-252, 5 figs. Comparison of various electrical locomotives. (Concluded).

Single-Phase Locomotive, Swiss. The Single-Phase Locomotives of the Swiss Federal Railways and the New Oerlikon Locomotives (Las locomotoras monofasicas de los derrocarriles federales suizos y nuevos tipos de locomotoras de los taleres de construccion Oerlikon). Energia Eléctrica, vol. 21, no. 2, Jan. 25, 1919, pp. 21-23, 2 figs. General features and dimensions of types — J-C-1 and 1-BB-1. (To be continued).

ELECTRIFICATION

American. Some Possibilities of Steam Railroad Electrification, Calvert Townley. Elec. Rev., vol. 74, no. 12, Mar 21, 1919, pp. 452-454. Plea for greater cooperation between railroad and electrical interests.

French. Partial Electrification of a Great Railway System (L'électrification partielle d'un grand réseau chemins de fer), Revue Générale de l'Electricité, vol. 5, no. 11, Mar. 15, 1919, pp. 422-427, 4 figs. Economic considerations involved in electrification project of Cie. d'Orleans. Supplements article in issue of Nov. 16, 1918, p. 730. Paper before Société d'Encouragement pour l'industrie nationale.

EQUIPMENT

Dynamometer Car. Old and New Dynsmometer Cars, London & North-Western Railway. Ry. Gaz., vol. 30, no. 8, Feb. 21, 1919, pp. 304-305, 4 figs. Mechanism consists of laminated spring having 30 flat plates, each separated from next by rollers; a cast-iron bracket is bolted on the spring and moves with it, so actuating traction pen, which registers amount of pull in tons on paper record.

Motor Inspection Cars. A new Rail Motor Inspection Car. Railway Gaz., vol. 30, no. 11, Mar. 14, 1919, pp. 489-490, 1 fig. Report of tests of Modland Railway Co.

LABOR

British. The Personnel of the Railway Engineer's Department Under State Control. Ry. Gaz., vol. 30, no. 7, Feb. 14, 1919, pp. 249-250. Writer, who claims 20 years' railroad experience, takes gloomy view of British railway nationalization.

LOCOMOTIVES

Adhesion. Locomotive Adhesion, H. C. Webster. Ry. Gaz., vol. 30, no. 10, Mar. 7, 1919, pp. 447-449, 2 figs. Analysis of variation in pressure between tire and rail; graph showing resistance to slipping per wheel against co-efficient of frictiou.

Australian Locomotives. Australian Railways. Indus. Australian & Min. Standard, vol. 61, no. 1581, Feb. 27, 1919, p. 375, 2 figs. Australian types of locomotives.

Balancing. Balancing of Locomotives, S. H. Jenkinson. New Zealand Jl. Sci. & Technology, vol. 2, no. 1, Jan. 1919, pp. 19-28, 2 figs. Equtions for balancing for various defined positions of balance wheels.

Consolidation. Large Consolidation Type Locomotive for the P. & R. Ry. Age, no. 12, Mar. 21, 1919, pp. 760-762, 2 figs. With tractive effort of 61,260 lb. and small drivers, they are adapted to heavy drag service.

Electric Locomotives. See Electric Railroads, above.

History. The Evolution of the High-Speed Locomotive from 1878 to 1914 and the Influence of the Alsatian School (L'évolution de la locomotive à grande vitesse de 1878 à 1914 et l'influence de l'école alsacienne sur cette évolution), M. Herdner. Génie Civil, vol. 74, no. 6, Feb. 8, 1919, pp. 105-111, 6 figs. Development of French locomotives. Abstract of presidential address before the Société des Ingénieurs Civils.

Powdered Fuel. Powdered Fuel Burning Apparatus for an Australian Railway. Ry. Rev., vol. 64, no. 12, Mar. 22, 1919, pp. 457-459, 4 figs. Details of 50-ton, 6-wheel switching locomotive operating on powdered fuel with Fuller engineering equipment.

Standard Heavy 2-10-2. Standard Heavy 2-10-2 Locomotive. Ry. Mech. Engr., vol. 93, no. 3, March 1919, pp. 119-123, 14 figs. Plans, sections and dimensions of heaviest Administration single-unit type.
Heavy Type Locomotive for Rock Island. Ry. Jl., vol. 25, no. 4, Apr. 1919, pp. 17-18, 2 figs. Details of 2-10-2 type, designed for load of 60,000 lb. on each pair of drivers and said to be capable of traversing 16-deg. curves.

MAINTENANCE

Car Inspection. Unified Inspection and Maintenance of Car Equipment, J. J. Tatum. Ry. Rev., vol. 64, no. 13, Mar. 29, 1919, pp. 473-474. Explanation of purposes of railroad administration in its efforts to standardize railway rolling stock and in establishment of uniform rules for maintenance of already existing equipment. Also in Ry. Age, no. 12, Mar. 21, 1919, pp. 773-775.

Labor-Saving Devices. 30 Labor-Saving Devices or " Kinks " for Railway Maintenance of Way Work. Eng. & Contracting, vol. 51, no. 12, Mar. 19, 1919, pp. 288-290. Report of Committee on Labor-Saving Devices at convention of Am. Ry. Eng. Assn.

NEW CONSTRUCTION

Brazil. Railway Developments in Foreign Countries. Ry. Age, vol. 66, no. 13, Mar. 28, 1919, pp. 864-866, 1 fig. Proposed new railway in Para, Brazil.

Hetch Hetchy. The Hetch Hetchy Railroad, Rudolph W. Van Norden. Jl. Electricity, vol. 42, no. 5, Mar. 1, 1919, pp. 202-203, 3 figs. Railroad material and equipment of Hetch Hetchy water and power project. Total length of road, 68 miles.

OPERATION AND MANAGEMENT

Freight Handling. Reducing the Cost of Handling Freight. Ry. Rev., vol. 64, no. 12, Mar. 22, 1919, pp. 453-454, 4 figs. Operation of N. Y. Central freight termiual in Cleveland.

Loading, Train and Engine. Train and Engine Loading, T. H. Williams, Proc. Pacific Ry. Club, vol. 2, no. 11, Feb. 1919, pp. 3-15 and (idscussion) pp. 16-23, Definition and explanation of terms used in connection with train and engine loading.
Maximum Car Loading, Wm. H. McClymonds. Ry. Rev., vol. 64, no. 13, Mar. 29, 1919, pp. 474-475. Discusses advisability of keeping freight-car loads up to the maximum possible and consistent in the circumstances. Paper read before Pacific Ry. Club.

Railroad Problem. Compensation of Railroads Under Federal Control, J. M. Souby. Ry. Age, no. 12, Mar. 21, 1919, pp. 751-754. Writer believes that less than justice has been done by Administration in its interpretation of the law taking over the roads.
A Possible Solution of the Railroad Problem—II, F. J. Lisman. Ry. Age, vol. 64, no. 14, Apr. 4, 1919, pp. 883-889, 3 figs. Maps showing tentative combination of railway systems, indicating possibilities of combiuing strong and weak systems so that strong will easily be able to carry weak.

San Francisco. New Facilities to Eliminate Congestion in San Francisco, C. W. Geiger. Elec. Traction, vol. 15, no. 3, Mar. 15, 1919, pp. 177-180, 4 figs. Construction of extra tracks for relieving congestion at terminals of United R.R. of San Francisco.

Train Speeds, European. European Train Speeds. Ry. Gaz., vol. 30, nos. 4, 5, 7, 10 and 11, Jan. 24, 31, Feb. 14, Mar. 7 and 14, 1919, pp. 125-132, 175-179, 259-264, 450-454, and 501-503, 30 figs. Survey of highest, longest and fastest non-stop runs, speed of trains between two places and geographical distribution of important service. (Continuation of serial.)

U. S. Railroad Administration. General Orders from Railroad Administration. Ry. Jl., vol. 25, no. 4, Apr. 1919, pp. 6-10. Concerning relations between U. S. R. R. Administration and the state railroad and public-service commissions.
The Arithmetic of Railroading, W. J. Cunningham. Official Proc. N. Y. Railroad Club, vol. 29, no. 4, Feb. 21, 1919, pp. 5556-5569. Concerning operation of U. S. Ry. Administration.

PERMANENT WAY AND BUILDINGS

Pearson's Permanent Way. Pearson's Patent Permanent Way, J. D. Pearson Indian Eng., vol. 65, no. 7, Feb. 15, 1919, pp. 96-97, 7 figs. In principle it resembles longitudinal rail formerly used in 7-ft. gage. It provides continuous support for rail without use of transverse ties.

Rail Bonds. Conditions Govern the Choice of Rail Bonds, G. H. McKelway. Elec. Ry. Jl., vol. 53, no. 12, Mar. 22, 1919, pp. 591-592, 5 figs. Discussion of common types of rail bonds and their adaptation to conditions.

Surveys. Railway Right-of-Way Surveys and Descriptions, Ed. Thompson Wilkie. Can. Engr., vol. 26, no. 10, March 6, 1919, pp. 277-279, 1 fig. Suggests method of making right-of-way surveys. Presented at the Meeting of Assn. Ontario Land Surveyors.

Ties, Waterproofing. Waterproofing Railway Ties to Preserve Them. H. K. Wicksted. Ry. Age, vol. 66, no. 13, Mar. 28, 1919, pp. 849-850. Method of treatment involves thorough drying and then sealing against moisture. Paper read before Can. Ry. Club.

RAILS

Conservation. Some Results of Rail Conservation, W. R. Dunham, Jr. Elec. Ry. Jl., vol. 53, no. 12, Mar. 22, 1919, pp. 562-565, 7 figs. Aligning of old rails and elimination of low joints.

Creep. Rail Creep and Expansion, E. Capone. Tramway & Ry. World, vol. 45, no. 13, Mar. 13, 1919, pp. 115-117, 8 figs. Anchors for conductor rails. Method for anchoring sleepers.

Specifications. Change in Rail Specifications Proposed. Iron Age, vol. 103, no. 13, Mar. 27, 1919, p. 819. Results of experiments on gauging and testing rails. Presented at Convention Am. Ry. Eng. Assn.

ROLLING STOCK

Automobile Cars. Automobile Cars for the I. C. Ry. Mech. Engr., vol. 93, no. 3, March 1919, pp. 141-145, 12 figs. Design features of single-sheathed type of 80,000 lb. capacity.

Concrete Cars. Concrete Freight Car. Ry. Jl., vol. 25, no. 4, Apr. 1919, p. 25. Gondola type built for Illinois Central R.R. Claimed that tests of completed cars, both empty and loaded, demonstrated its practicability for rough service.
Gondola Car of Reinforced-Concrete Construction. Ry. Age, no. 12, Mar. 21, 1919, pp. 776-778, 3 figs. Design incorporating steel center sills with concrete floor, sides and ends.
Concrete Freight Car. Ry. Rev., vol. 64, no. 13, Mar. 29, 1919, pp. 475-476, 3 figs. Description of gondola-type car in which the body structure has been made of reinforced concrete resting upon and amalgamated with a steel center sill and body bolster assembly of usual form.

Freight Equipment. Freight Equipment as Handled Under Present-Day Interchange, T. J. O'Donnell. Official Proc. Car Foremen's Assn. Chicago, vol. 14, no. 5, Feb. 1919, pp. 78-87. Conditions, from mechanical standpoint, which determine selection and movement of freight cars.

Lighting, Electric. Electric Lighting of Railway Cars, B. H. Ehringer. Official Proc. Car Foremen's Assn., Chicago, vol. 14, no. 5, Feb. 1919, pp. 29-33 and (discussion) pp. 33-35. Ball bearings vs. brass bearings in lighting equipment, from point of view of maintenance.

Workshop Trains. 60. Cm. Workshop Trains for France. Ry. Gaz., vol. 30, no. 4, Jan. 24, 1919, pp. 135-137, 8 figs. Each train (narrow-gage road) comprises generating car, two machinery cars, tool van, stores van and officers' car. Generating car is filled with gasoline-electric generator sets in duplicate.

SAFETY AND SIGNALING SYSTEMS

Tunnel Signals. An Automatic Audible Warning for Tunnels. Ry. Gaz., vol. 30 no. 4, Jan. 24, 1919, pp. 141-142, 1 fig. Tube slung throughout length of Metropolitan Ry. 2200-ft. tunnel is struck by hammers actuated by electro magnets which train sets in operation on entering.

SHOPS

Forge Work. Buckles for Laminated Springs and Other Forge Work. Ry. Gaz., vol. 30, no. 4, Jan. 24, 1919, pp. 142-144, 5 figs. Manufacturing operation in forge department of a railway shop.

Locomotive Driving Boxes. Machining Locomotive Driving Boxes, M. H. Williams. Ry. Mech. Engr., vol. 93, no. 3, March 1919, pp. 155-159, 8 figs. Applicances designed to obtain accuracy and reduce time.

Superheater Locomotives. Shop Treatment of Superheater Locomotives, A. D. Williams. Railroad Herald, vol. 23, no. 3, Feb. 1919, pp. 67-69. Practice of Southern Pacific in converting saturated locomotives to superheated. From paper before Pacific Coast Ry. Club.

Welding. Spot Welding Railroad Tinware. Ry. Mech. Engr., vol. 93, no. 3, March 1919, pp. 151-153, 3 figs. Equipment used by I. C.

SPECIAL LINES

French Local Railroads. Present Condition and Future of French Local Railroads (L'état actuel et l'avenir de nos chemins de fer d'intérêt local), G. Mangin. Génie Civil, vol. 74, nos. 7, 8 and 9, Feb. 15, 22 and Mar. 1, 1919, pp. 129-131, 146-147 and 169-171, 16 figs. Economical aspect of rural transportation. Three systems are considered: Truck service, normal-gage, and narrow-gage railroads. Feb. 22; Schneider Electric locomotive. Mar. 1: Utilization of war narrow-gage material in agricultural railways.

TERMINALS

Akron. Modern Terminal in Akron. Elec. Traction, vol. 15, no. 3, Mar. 15, 1919, pp. 167-169, 4 figs. Prominent feature in arrangement of train shed with separate subway entrances to boarding platforms located between each pair of tracks.

Cleveland. New Plan for a Union Station at Cleveland, Ohio. Ry. Age, no. 12, Mar. 21, 1919, pp. 755-758, 5 figs. Suggested design for passenger station with a two-level street entrance. Also in Ry. Rev., vol. 64, no. 13, Mar. 29, 1919, pp. 469-472, 6 figs.

Glasgow. North British Railway Improvements at Glasgow, Frederick C. Coleman. Ry. Age, vol. 66, no. 13, Mar. 28, 1919, pp. 843-846, 6 figs. Layout of freight yard and warehouses. Said to be largest terminal in Scotland.

STREET RAILWAYS

Fares. Rate of Return in Service-at-Cost Franchises, Edwin Gruhl. Elec. Ry. Jl., vol. 53, no. 11, Mar. 15, 1919, pp. 502-505. Remarks that while commissions and courts have not established basis for fixing rate of return necessary to attract capital, nevertheless position of company, basis of fair value and various safeguards, all influence investor's demand. Before Am. Elec. Ry. Assn.
How the Public Feels About It. Elec. Ry. Jl., vol. 53, no. 13, Mar. 29, 1919, pp. 639-643. Opinions of representative public leaders of various classes regarding guarantee of return, aid through taxation, municipal vs. state ownership, and indeterminate franchise.

Car Lighting. Urban Rapid Transit Car Lighting, Clifton W. Wilder and Albert E. Allen. Tran. Illum. Eng. Soc., vol. 14, no. 1, Feb. 10, 1919, pp. 24-35 and (discussion) pp. 36-44, 16 figs. Study of problem in New York City, undertaken by writers in behalf of Public Service Commission.

Freight Traffic. Development of Freight Traffic on Interurban Lines, A. B. Cole. Elec. News, vol. 28, no. 6, Mar. 15, 1919, pp. 29-30 and 40. Considered in its relations to the law, the public, shippers, electric-railway operators, the traffic bureau, service, rates and facilities.

Maintenance. Maintenance Problems, Arthur C. Carty. Elec. Traction, vol. 15, no. 3, Mar. 15, 1919, pp. 184-186, 4 figs. Account of endurance of tramway for traveling 750,000 miles in 22 years.
Maintenance Practice of the San Francisco Municipal Railway, N. A. Eckhart. Elec. Ry. Jl., vol. 53, no. 12, Mar. 22, 1919, pp. 559-561, 3 figs. Results of five years of operation with reference to relation of construction to upkeep.
Maintenance of Door Operators, George E. Oakley. Elec. Ry. Jl., vol. 53 no. 12, Mar. 22, 1919, pp. 588-589. Writer outlines methods used for operating and controlling movement of doors and describes general methods used in inspection and overhauling of door apparatus.

Traffic Check. The Traffic Check and What it Showed on the Public Service Railway. Elec. Ry. Jl., vol. 53, no. 13, Mar. 29, 1919, pp. 644-648, 2 figs. Origin to destination check of passenger traffic, conducted during latter part of last year, and study of location of various traffic centers. Third article.

Troughwork. Troughwork and Other Protection, G. H. McKelway. Elec. Traction, vol. 15, no. 3, Mar. 15, 1919, pp. 172-176, 6 figs. Methods of installing various kinds of troughwork and protection for overhead structures and other construction above trolley wire.

Wartime, Europe. Continental Tramways in War-Time—II. Elec. Ry. & Tramway Jl., vol. 40, no. 961, Mar. 7, 1919, pp. 85-90, 2 figs. Repair shops of General Omnibus Co. and Metropolitan Railway.

Zone Systems. Zone System for New Jersey. Elec. Ry. Jl., vol. 53, no. 11, Mar. 15, 1919, pp. 523-528, 2 figs. Details of the petition of public service railways to Public Utility Commission.
How the Public Service Railway Established and Will Collect Its Zone Fare. Elec. Ry. Jl., vol. 53, no. 12, Mar. 22, 1919, pp. 598-604, 9 figs. Company proposes to put a ticket-issuing machine on front platform by which each passenger will receive a check indicating the zone in which he boards the car, then he pays the appropriate fare as he leaves by the rear platform.
The Zone Fare in Practice—Glasgow, Walter Jackson. Elec. Ry. Jl., vol. 53, nos. 10 and 13, Mar. 8 and 29, 1919, pp. 446-453, and 632-638, 15 figs. Layout of tramway system service on different lines as regards speed and headways and application of graded fare. Second article. Mar. 29: Considers standard double-deck car, the make-up of schedules, the hours and rates of pay of transportation employees and the checking and auditing of the differential system of graded fares.

ORGANIZATION AND MANAGEMENT

ACCOUNTING

Cost Accounting. Uniform Cost-Accounting. Ice & Refrigeration, vol. 56, no. 2, Feb. 1919, pp. 101-109, 8 figs. Forms covering cost accounting for production and distribution of ice, worked out by special committee of Na. Assn. Ice Industries.
Cost Accounting to Aid Production—VII, G. Charter Harrison. Indus. Management, vol. 57, no. 4, Apr. 1919, pp. 314-318, 3 figs. Expansion of application of scientific management principles. Theory illustrated by sample of firm entering field of manufacturing automobile trucks.

Inventories. Accurate Inventories Aid Output, Clifford E. Lynn. Iron Trade Rev., vol. 64, no. 13, Mar. 27, 1919, pp. 828-829, 2 figs. Form of keeping complete plant records of finished and semi-finished stocks.

Production Accounts. Systematizing Production Accounts, Ralph E. Butz. Iron Trade Rev., vol. 64, no. 12, Mar. 20, 1919, pp. 757-759. Methods for keeping records of costs in manufacturing plants. It is recommended that accounting be operated on double-entry principle.

EDUCATION

Crew Instruction at Hydroelectric Plant. Operation at Holtwood, Charles H. Bromley. Power, vol. 49, no. 12, Mar. 25, 1919, pp. 450-454, 6 figs. Methods used in instruction of crew at hydroelectric station of Pa. Water & Power Co. First article of series.

Education and Industry. Industry, Democracy, and Education, C. V. Corless. Bul. Am. Inst. Min. & Metallurgical Engrs. no. 148, Apr. 1919, pp. 621-635. Social problems developed from moral forces which found themselves released at termination of war.

Soldiers. Soldiers Civil Re-Establishment, L. Anthes. Jl. Eng. Inst. Can., vol. 2, no. 3, Mar. 1919, pp. 185-187. Notes on responsibility for soldiers' welfare placed on those who did not share their sacrifice.

Women, Training School for. Training Women in an Airplane Plant, James W. Russell. Machy., vol. 25, no. 7, Mar. 1919, pp. 593-595, 7 figs. Experiments and results in Curtiss Aeroplane & Motor Corporation's training school.

FACTORY MANAGEMENT

Credit. Mathematics of Credit Extension, Frederick Thulin. Jl. Accountancy, vol. 27, no. 4, Apr. 1919, pp. 259-267. Question of determining point of limitation to which grant of credit can go and of determining prima facie amount of capital, if any, a business requires from its proprietorship in reference to particular request of credit under consideration.

Employment System. Employment System of Cincinnati Planer Co., A. J. Schneider. Machy., vol. 25, no. 7, Mar. 1919, pp. 622-623, 8 figs. Forms of inquiry cards, record sheets and employment pass.

The Employment Department, G. L. Hostetter. Eng. & Indus. Management, vol. 1, no. 5, Mar. 13, 1919, pp. 142-143. Discusses effect of defective organization upon minds of applicants for employment and shows how first impressions generally influence the worker in the factory.

Selecting and Training Interviewers, Roy Willmarth Kelly. Indust. Management, vol. 57, no. 4, Apr. 1919, pp. 263-270, 9 figs. Analyzes knowledge and training needed by employment interviewer and points out specific information he should secure in regard to his community.

Forge-Shop Maintenance Department. Methods of Increasing Shop Efficiency, J. D. Lannon. Am. Drop Forger, vol. 5, no. 3, Mar. 1919, pp. 117-120. Schemes for sustaining maintenance department in forge shop. First article.

Human Activities, Classification of. Human Parasitism or Service, Harrington Emerson. Indus Management, vol. 57, no. 4, Apr. 1919, pp. 257-262, 1 fig. Classifies human activities into nine elements. Graphs for purpose of aiding each one to know where he belongs and what he is doing.

Human Factor in Efficiency. The Human Factor in Efficiency Methods, E. A. Pells. Elec. Rev., vol. 84, no. 2153, Feb. 28, 1919, p. 228. Social, economic, and hygenic conditions of worker as affecting efficiency.

Industrial Organization. Managing for Maximum Production—II. L. V. Estes. Indus. Management, vol. 57, no. 4, Apr. 1919, pp. 284-288, 5 figs. Theory of functions of industrial organizations. It is advanced that the industrial machine should be so built that routine work becomes compulsorily automatic.

Problems of Industrial Organization, Major Greenwood. Colliery Guardian, vol. 117, no. 3035, Feb. 28, 1919, p. 477. Remarks that while details of production, quantities of goods made, nature and powers of machines are matters which can be adequately described, such is not the case with efficiency of workers. Paper before Roy. Statistical Soc. Also abstracted in Eng. & Indus. Management, vol. 1, no. 5, Mar. 12, 1919, pp. 150-154.

Labor Turnover. Proper Systems Reduce Labor Turnover. Automotive Industries, vol. 40, no. 12, Mar. 20, 1919, pp. 619-621. Statistics of labor turnover and analysis of factory methods for handling it.

Labor Turnover and a Remedy, W. H. Weingar. Am. Mach., vol. 50, no 11, Mar. 13, 1919, pp. 497-499, 5 figs. How a munition plant has handled problem.

Layout of Works. The Thornycroft Motor Works at Basingstoke. Ry. Gaz., vol. 30, no. 5, Jan. 31, 1919, pp. 168-169, 5 figs. Layout of works and views of laboratories.

The Automobile Factory—III. Automobile Engr., vol. 9, no. 124, Mar. 1919, pp. 87-94, 18 figs. Notes on layout, construction and equipment.

Library. The Organization of a Factory Library, W. Barbour. Jl. Soc. Chem. Indus., vol. 39, no. 3, Feb. 15, 1919, pp. 35R-40R. Particulars of a system of indexing books, extracts, periodicals, manuscripts, papers, reports and charts.

Limitation of Output. The Limitation of Output, Andrew Stewart. Engineering Review, vol. 32, no. 9, Mar. 15, 1919, pp. 247-250, 6 figs. Deals with problem of restriction of output of men and machines.

Machine Tool Plant. Organization and Management of a Machine Tool Plant, Oscar Kylin and Erik Oberg. Machy., vol. 25, no. 7, Mar. 1919, pp. 608-614, 10 figs. Principles of organization and details of system used in a medium-size machine-tool manufacturing plant. First article.

Management Systems. Democracy Applied to Shop Management. Iron Age, vol. 103, no. 12, Mar. 20, 1919, pp. 743-745. Describes system adopted by Am. Multigraph Co., said to be based on American form of government.

"Efficiology" a Method of Making Profits by Universal Democracy, W. S. Rogers and Nellie M. Scott. Indus. Management, vol. 57, no. 4, Apr. 1919, pp. 299-301, 3 figs. Method of Bantam Ball Bearing Co. Charts of authority and responsibility.

Milling Calculations. Milling Calculations, Robert S. Lewis. Chem. & Metallurgical Eng., vol. 20, no. 5, March 1, 1919, pp. 224-233, 2 figs. Formulæ for determining extraction of processes, efficiency of machines, density of solids, solutions and pulps; notes on methods of testing and miscroscopic examination; bibliography of articles dealing with calculations.

Profit Sharing. A Profit-Sharing Plan for Executives, A. P. Ball. Indus. Management, vol. 57, no. 4, Apr. 1919. pp. 296-298, 3 figs. Experiment of Square D Company.

Rotation in Jobs. What is the Value of Rotation in Jobs? Harry Tipper. Automotive industries, vol. 40, no. 12, Mar. 20, 1919, pp. 628-629. Discussion whether employer or employee benefits most from shifting workers frequently.

Scientific Management. Seven Common Questions Regarding Scientific Management, Carle M. Bigelow. Indus. Management, vol. 57, no. 4, Apr. 1919, pp. 281-283. Objections that must be overcome in minds of business executives before they will consider the possibility of installing scientific management in their plants.

How I Have Applied the Taylor System (Comment j'ai mis en pratique le systéme Taylor), Serge Heryngiel. Mémoires et Compte rendu des Travaux de la Société des ingénieurs Civils de France, vol. 71, nos. 11-12, Nov.-Dec. 1918, pp. 557-559, 17 figs. Personal experiences in organization work.

Science and Industry (La science et l'industrie). Métallurgie, vol. 51, nos. 1 and 2, Jan. 1 and 8, 1919, pp. 26 and 75. Conductive industrial operations by scientific methods of organization.

Guiding the Creative Instinct, W. R. Basset. Factory, vol. 22, no. 3, March 1919, pp. 449-452. Concerning scientific management and the psychological characteristics of workers.

Shop Routing. Shop Routing System Reduces Handling Costs, F. L. Prentiss. Iron Age, vol. 103, no. 14, Apr. 3, 1919, pp. 867-870, 5 figs. Methods of Cleveland Tractor Co.

Store Room. Distribution of Materials and Supplies, B. J. Yungbluth. Elec. Ry. Jl., vol. 53, no. 10, Mar. 8, 1919, pp. 743-745. Economic aspect of methods followed in storeroom.

Keeping Track of Factory Material, J. C. Hickman. Factory, vol. 22, no. 3, March 1919, pp. 465-469, 16 figs. Remarks on specifying, receiving and inspecting purchase. First article.

Time Study. Six Fundamentals of Time Study, Samuel R. Gerber. Indus. Management, vol. 57, no. 4, Apr. 1919, pp. 308-311. How they must be handled by time-study man.

Tool Room. Modern Tool Room Organization. Machinery, vol. 13, no. 331, Jan. 30, 1919, pp. 477-479, 7 figs. Scheme of the record and costing of jigs and fixtures.

Trucks, Industrial. Conserving Labor in the Mill. Am. Miller, vol. 47, no. 4, Apr. 1, 1919, pp. 319-320, 4 figs. Suggests cutting down overhead by employing industrial truck to do work of many men.

Timken Solving Difficult Production Problem, Edward Schipper. Automotive Industries, vol. 40, nos. 13 and 14, Mar. 27 and Apr. 3, 1919, pp. 685-688 and 748-750, 13 figs. Mar. 27: Methods for scheduling work of Timken-Detroit Axle Co. Apr. 3: Practice of company in departmental communication, by using electric trucks.

Welfare. Welfare in the Factory. Times Eng. Supp., vol. 15, no 532, Feb. 1919, p. 77. Influence of the State.

FINANCE AND COST

Prices. Civil War Price Trends Compared with Those Today, Morris Knowles. Eng. News-Rec., vol. 82, no. 9, Feb. 27, 1919, pp. 414-416, 2 figs. Writer, judging by past, believes high prices will continue.

LABOR

American Conditions. American Workmen During the War (Le travail américain pendant la guerre). Revue Générale de l'Electricité, vol. 5, no. 7, Feb. 15, 1919, pp. 275-278. Survey of organization work in United States, specially of relations between workers and employers.

Crippled Soldiers. Economic Benefit to Mining Industry Illustrated by Experience with Crippled Soldiers, Douglas C. McMurtrie. Colo. School Mines Mag., vol. 9, no. 3, Mar. 1919, pp. 55-57. Studies of Red Cross Inst. for Crippled and Disabled Men.

Dilution of Labour. Dilution of Labour. Times Eng. Supp., vol. 15, no. 532, Feb. 1919, p. 76. Progress and consequences; methods of taining.

Housing. Attractive Homes for Employees, W. F. Sutherland. Can. Machy., vol. 21, no. 10, Mar. 6, 1919, pp. 234-237, 17 figs. Plan of housing development at Chippewa plant of Norton Co.

Westinghouse Village at South Philadelphia, Pa. Am. Architect, vol. 115, no. 2251, Feb. 12, 1919, pp. 223-229. 10 figs. Tract set aside for housing contains about 90 acres.

Town Housing of the Working Classes, Herbert Freyberg. Surveyor, vol. 55, no. 1409, Jan. 17, 1919, pp. 31-32. Experience of administration of part III of act of 1890. Before Soc. Architects.

Housing from the Point of View of Economy in Planning and Construction, Henry Tanner. Jl. Roy. Sanitary Inst., vol. 39, no. 2, Oct. 1918, pp. 79-84. British Government view as to what is proper accommodation to be provided for workers.

The Cost and Construction of Workmen's Dwellings, Roads, Sewers, and Water Supply in Connection with Town Planning, John Parker. Jl. Roy. Sanitary Inst., vol. 39, no. 2, Oct. 1918, pp. 75-78. Conditions and legal regulations at Hereford.

Industrial Councils, Joint. Whitley Plan for improving Labor Status, Contract Rec., vol. 33, no. 13, Mar. 26, 1919, pp. 279-280. Joint standing industrial councils recommended to provide remedy for differences between employers and employees.

The League of Labor and Capital, C. S. Robinson. Iron Age, vol. 103, no. 11, Mar. 13, 1919, pp. 683-684. Concerning co-operation in industry between employer and employee by establishing a basis for representation of workers.

Labor Representation. Labor's Representation in Plant Management the Immediate Problem, Harry Tipper. Automotive Industries, vol. 40, no. 9, Feb. 27, 1919, pp. 476-477, 2 figs. Chart illustrating representation of employees of Bethlehem Steel Corp. and subsidiary companies.

Profit Sharing. The Profit Sharing Plan of the Baker Manufacturing Co., John S. Baker. Wisconsin Engr., vol. 23, no. 6, Mar. 1919, pp. 193-201. Writer advocates plan for increased remuneration of employees with increased production, and illustrates instance of application of plan.

Psychology of Workers. The Human Machine ,Arthur P. Young. Eng. & Indus. Management, vol. 1, no. 5, Mar. 13, 1919, pp. 135-137, 2 figs. Study of psychology of workers.

Unemployment. View of Unemployment from Employer's Side. Iron Age, vol. 103, no. 12, Mar. 20, 1919, pp. 747-748. Opinion of representatives of National Associations connected with metal trades.

Wage Problem. The Wage Problem in Industry, W. L. Hichens. Colliery Guardian, vol. 117, no. 3036, Mar. 7, 1919, p. 536. Suggests ways in which increase of wages may be effective in increasing production. Paper before Roy. Soc. Arts. See also Engineer, vol. 127, no. 3297, Mar. 7, 1919, pp. 231-232, and Jl. Roy. Soc. Arts. vol. 67, no. 3458, Feb. 28, 1919, pp. 224-229 and (discussion) pp. 229-233.

Probable Wages and Supply of Construction Labor During Coming Season. Eng. & Contracting, vol. 51, no. 12, Mar. 19, 1919, pp. 284-286. Committee report of Am. Road Builder's Assn.

Wage Systems (Les différents systèmes de salaires). Métallurgie, vol. 51, no. 11, Mar. 12, 1919, p. 587. Review of systems which have been put into practice in France, America, England and Germany. (To be continued).

Problems and Formulæ for Payment of Wages (Problèmes et formules de paiement des salaires). Technique Moderne, vol. 10, no. 12, Dec. 1918, pp. 571-574, 1 fig. Includes graph for the Benedict-Stronck, Emerson, Halsey, Rowen, Taylor and Gantt systems. From Metallurgical and Chemical Eng., Mar. 1, 1918; Annales des Ponts et Chaussées, Apr.-May 1917 and previous account in Technique Moderne, vol. 10, no. 1, Jan. 1918, p. 17

Different Wage Systems (Les différents systèmes de salaires). Métallurgie, no. 12, Mar. 19, 1919, pp. 649-650, 5 figs. Different wage systems; relation of wage system to effective production. (Continuation of serial).

WOMEN. Women in the Industry, George H. Priest. Gas Indus., vol. 19, no. 3, Mar. 1919, pp. 73-75. Results from questionnaire sent out to 38 gas works.

LEGAL

BOILER LEGISLATION, LOW-PRESSURE. Low-Pressure Boiler Legislation. Official Bul. Heating & Piping Contractors Nat. Assn., vol. 26, no. 3, Mar. 1919, pp. 26-28. Quotes a number of bills now pending before legislatures of several states.

BUILDING CONTRACTS. The Building Contract of the Future, Sullivan W. Jones. Jl. Am. Inst. Architects, vol. 7, no. 3, Mar. 1919, pp. 119-122. Analysis of various forms of existing contracts and suggested changes in policy on building loans. From address before Inst. Elec. Contractors.

DISABILITY. Disability Under the Compensation Acts — I, II, III, Chesla C. Sherlock. Am. Mach., vol. 50, nos. 10, 11 and 13, Mar. 6, 13 and 27, 1919, pp. 445-448, 499-502 and 597-599. Court decisions in casesi nvolving temporary disability.

LIGHTING

GAS LIGHTING. Modern Gas Lighting, Philmer Eves. Gas Indus., vol. 19, no. 3, Mar. 1919, pp. 70-72. Practice in churches, public buildings, etc.

ILLUMINATION INTENSITY. Industrial Illumination, Geo. K. McDougall. Jl. Eng. Inst. Can., vol. 2, no. 3, Mar. 1919, pp. 210-215, 8 figs. Review of general information on subject and data of foot-candle intensity for various classes of work.

LIGHTING AND PRODUCTION. Four Conclusive Tests of Production Value of Good Factory Lighting. Elec. Rev., vol. 74, no. 12, Mar. 21, 1919, pp. 449-451, 4 figs. Details of tests conducted by Testing Department of Commonwealth Edison Company. Average increase of production ranges from 10 to 20 per cent.

RECONSTRUCTION AND EXPORT TRADE

BELGIUM. Reconstruction in Belgium. Times Eng. Supp., vol. 15, no. 532, Feb. 1919, p. 69. Requirements in tools; disorganization of transport; problem of labor.

COAL TRADE. American Opportunities in the Foreign Coal Trade. Coal Age, vol. 15, no. 11, March 13, 1919, pp. 486-488. From Colliery Guardian.

ELECTRICAL GOODS. Electrical Competition in Foreign Markets, Joseph M. Goldstein. Elec. World, vol. 73, no. 10, Mar. 8, 1919, pp. 468-471, 2 figs. How the industry in the United States may compete with Allegemeine Elektrizitaets-Gesellschaft of Berlin, which, it is asserted, has dominated the world.

Electrical Goods in Japan. Jl. Electricity, vol. 42, no. 6, Mar. 15, 1919, pp. 266-267. Possibilities of American trade.

FINANCIAL ASPECT OF RECONSTRUCTION. The Problem of Reconstruction. Southwestern Elecn., vol. 14, no. 11, Jan. 1919, pp. 14-16. Financial aspect of problem.

FRANCE. The Problem of Rebuilding the Devastated Regions of France, Jaen-Paul Alaux. Jl. Am. Inst. Architects, vol. 7, no. 3, Mar. 1919, pp. 115-117. Visualization of extent of reconstruction work to be required.

GREAT BRITAIN. Reconstruction in Great Britain Following the War, H. Babington Smith. Sci. Monthly, vol. 8, no. 4, Apr. 1919, pp. 298-305. Problems of demobilization, vocational instruction of soldiers, and disposal of property in reserve for military purposes.

LATIN AMERICA. Some Agencies in the Development of Closer Relations with the Countries of Central and South America, L. S. Rowe. Sci. Monthly, vol. 8, no. 4, Apr. 1919, pp. 320-322. Effectiveness of international organization based on moral and cultural ties between nations.

Market for Electrical Goods in South America — II, Philip S. Smith. Elec. World, vol. 73, no. 10, Mar. 8, 1919, pp. 479-481. Notes on Bolivia, Ecuador and British Guiana; résumé of South American conditions as a whole; list of central stations in Chile, Urguay, Ecuador and Peru.

NEW ENGINEERING INDUSTRIES (ENGLAND). New Engineering Industries. Chem. News, vol. 118, no. 3070, Feb. 14, 1919, pp. 80-81. Report of Committee of Ministry of Reconstruction, appointed to compile list of articles (suitable for manufacture by those with engineering trade experience) not made in United Kingdom before war.

RAILWAY BUYING. Railway Buying and Industrial Readjustment, E. B. Leigh. Ry. Age, vol. 64, no. 14, Apr. 4, 1919, pp. 879-881, 1 fig. Shows relation of railway purchases to general business conditions. Address delivered before Natl. Indus. Conference Board.

UNION OF INTERNATIONAL ASSOCIATIONS. International Associations and After-War Constructions (Les associations internationales et la reconstruction de l'aprèsguerre), Paul Otlet. Revue Générale des Sciences, no. 4, Feb. 28, 1919, pp. 114-119. Work done by the Union of International Associations organized in 1910. Probable future relations of the Union with Science and Industry.

SAFETY ENGINEERING

ACCIDENT PREVENTION. The Limits of Accident Prevention. Eng. & Indus. Management, vol. 1, no. 5, Mar. 13, 1919, pp. 139-141, 3 figs. Study of accident causes in iron and steel industry based on statistical reports.

The Economies of Safety, Lew R. Plamer. Sci. Mountly, vol. 8, no. 4, Apr. 1919, pp. 350-355, 2 figs. Plant management in relation to accident prevention. As illustration organization of Safety Dept., U. S. Steel Corp., is quoted.

ELEVATOR ACCIDENTS. Elevator Accidents and Their Causes, William J. Picard. Safety Eng., vol. 37, no. 3, Mar. 1919, pp. 117-123, 8 figs. Statistical charts and data.

Increasing Cage Safety, Thomas Price. Coal Age, vol. 15, no. 13, Mar. 27, 1919, p. 570, 2 figs. Scheme for attaching two ropes to each cage, either one of which is capable of sustaining load.

FIRE DOORS AND SHUTTERS. Covering Fire Doors and Shutters — I. Metal Worker, vol. 91, no. 13, Mar. 28, 1919, pp. 395-397 and 399, 16 figs. Infromation on size of sheets to use, method of notching and bending locks, etc., in conformance with underwriters' regulations.

STATISTICS OF ACCIDENTS. Statistics in Accident Prevention, Evelyn M. Davis. Elec. World, vol. 73, no. 10, Mar. 8, 1919, pp. 476-477, 1 fig. Analysis of 1172 cases during two-year period giving data on days lost and division of cost.

Industrial Accidents in the United States Iron and Steel Industry. Engineering, vol. 107, no. 2771, Feb. 7, 1919, pp. 164-167, 7 figs. Statistics giving frequency and severity of accidents.

SALVAGE

MOTOR SHELLS. Saving Motor Shells from the Scrap Heap by Welding. Elec. Ry. Jl., vol. 53, no. 12, Mar. 22, 1919, pp. 581-586, 15 figs. Different steps in thermit method of welding motor shells as used by large electric-railway system; suggestions for relining crucibles and keeping welding tools in proper repair.

TOOL-STEEL SCRAP. Reclaming High-Speed Steel Scrap, Edwin F. Cone. Iron Age, vol. 103, no. 13, Mar. 27, 1919, pp. 805-808, 6 figs. Detection and sorting of steel scrap from nature of sparks from special grinding wheel.

WAR MATERIAL. Salvage of War Material. Times Eng. Supp., vol. 15, no. 532, Feb. 1919, p. 70. Organization and research.

WASTE OF INDUSTRIAL MATERIALS. Common Wastes of Industrial Materials, H. E. Howe. Indus. Management, vol. 57, no. 4, Apr. 1919, pp. 303-307. Suggestions in regard to elimination of waste.

TRANSPORTATION

CRATING. Crating Automobiles for Export, J. H. Teagan. Automotive Industries, vol. 40, no. 11, Mar. 13, 1919, pp. 570-571, 4 figs. Combining security with minimum waste of space.

LIGHT AS AID TO TRANSPORTATION. Light as an Aid to the Transportation of Material, A. L. Powell and R. E. Harrington, Tran. Illum. Eng. Soc., vol. 14, no. 1, Feb. 10, 1919, pp. 1-17 and (discussion) pp. 17-23. Argues that proper lighting of stations, warehouses and piers increases their capacity which depends on speed with which material moves through them.

MINE CARS. Standardized Wagon Designs, J. R. Bazin. Colliery Guardian, vol. 117, no. 3037, Mar. 14, 1919, p. 595. Buffing and drawgear; wheels and axles; axle guards; brakes; body work. Paper read before Inst. Locomotive Engrs.

RURAL TRANSPORT. Rural Transport. Times Eng. Supp., vol. 15, no. 532, Feb. 1919, pp. 67-68. Suggestions being put forward to effect their inprovement.

SHOP HAULAGE. Shop Haulage System of New Design. Iron Trade Rev., vol. 64, no. 12, Mar. 20, 1919, pp. 760-763, 13 figs. Geometric principle employed to enable cars to trail correctly and turn sharp corners without tracks; hauling unit is tractor capable of pulling 15 trucks.

Industrial Electric Tractors (Chariots transporteurs électriques pour manutention), Jacques Deschamps. Revue Générale de l'Electricité, vol. 5, no. 5, Feb. 1, 1919, pp. 171-174, 6 figs. Describes various types and their uses, also the Edison accumulator with which industrial tractors are usually operated.

TRUCK TRANSPORTATION. Concrete Material for Army Base Hauled by Motor Trucks. Eng. News Rec., vol. 82, no. 8, Feb. 20, 1919, pp. 366-368, 4 figs. Analysis of truck performance and delivery cost. Equipment considered was utilized for stevedoring and haulage at South Brooklyn supply unit.

Economical Motor Transport. Iron Age, vol. 103, no. 11, Mar. 13, 1919, pp. 693-694, 1 fig. Experience in operation by large organization employing trucks in freight haulage.

ZONING. Industrial Zoning, Herbert S. Swan. Am. Architect, vol. 115, no. 2258, Apr. 2, 1919, pp. 500-503. Considers method of formulating zoning ordinance and of laying out several business and factory districts, in order to remove congestion in transportation.

ELECTRICAL ENGINEERING

ELECTROCHEMISTRY

ELECTROLYTES. The Effect of Some Simple Electrolytes oil the Temperature of Maximum Density of Water, Robert Wright. Jl. Chem. Soc., vols. 115 and 116, no. 676, Feb. 1919, pp. 119-126, 1 fig. Reported from experiments that lowering of temperature produced by highly ionized binary electrolyte is composed of two separate, independent effects, one due to acid radical and other to basic radical of electrolyte.

Electrolytic Dissociation, S. Arrhenius. Chem. News, vol. 118, no. 3069, Feb. 7, 1919, pp. 61-64. Discussion of analytical-chemistry explanation of dissociation.

Electrolytic Conductivity in Non-Aqueous Solutions, Henry Jermain Maude Creighton. Jl. Franklin Inst., vol. 187, no. 3, March 1919, pp. 313-318. Results of measurements in 13 solvents are discussed with reference to viscosity, degree of association and dielectric constant of solvent.

ELECTROPLATING. Electro-Plating on Iron from Copper Sulphate Solution, Oliver P. Watts. Gen. Meeting Am. Electrochem. Soc., Apr. 3-5, 1919, paper 7, pp. 61-69. Arsenic antimony, bismuth, lead and tin dipping solutions were tried. Arsenic, lead and antimony solutions said to be effective in securing a good subsequent electroplating of copper. Bismuth was electro-deposited on iron using a preliminary arsenic or antimony dip, and nickel on alumimun by using a ferric chloride dipping solution.

Remarkahle Pitting of Electroplating, Oliver P. Watts. Gen. Meeting Am. Electrochem. Soc., Apr 3-5, 1919, paper 5, pp. 51-53, 1 fig. Study of irregular pitting in some lead platings led writer to attribute it to air dissolving in electrolyte while it was resting over night and cooling, which was then expelled as minute air bubbles on work when hath was heated up by passage of current.

STORAGE BATTERIES. Chemical Phenomena in Lead Storage Batteries (Recherches sur le fonctionnement chimique de l'accumulateur au plomb), Ch. Féry. Bulletin de la Société Française des Electriciens, vol. 9, no. 77, Feb. 1919, pp. 85-96. Study of what are termed inconsistencies of double-sulphate theory in the light of lows of electrolysis. Also in Bulletin de la Société d'Encouragement pour l'Industrie Nationale, vol. 131, no. 1, Jan.-Feh. 1919, pp. 92-98.

ELECTROPHYSICS

A. C. WAVES, HARMONICS. Direct Harmonic Analysis of Alternating Current Waves by Mechanical or Electrical Resonance (Sur l'analyse harmonique directe de l'onde des courants alternatifs par résonance mécanique ou électrique), André Blondel. Annales de Physique, series 9, vol. 10, Nov.- Dec. 1918, pp. 195-354, 47 figs. Starting out to measure current measurement of tension is effected hy hranching apparatus to terminals of non-inductive rheostat placed in series in circuit. Writer states that in harmonic analysis mechanical resonance of vibrating galvanometer is less subject to errors than electrical resonance method.

ARC ELECTRODES, TEMPERATURE OF. Temperature of Arc Electrodes (Détermination de la température aux électrodes de l'arc), A. Hagenbach and K. Langhein. Archives des Sciences Physiques et Naturelles, year 124, vol. 1, Jan.-Feb. 1919, pp. 48-54. Experiments apparently show that anodes of metallic arcs (Ag, Cu, Fe, Ni, W) become heated to ebullition temperature hut not the cathodes; when oxidation of metal has taken place, temperature rises to ebullition temperature of metallic oxide.

CIRCUITS. Properties of Electrical Circuits Considered as Having No Resistance (Sur les propriétés des circuits électriques dénués de résistance), G. Lippman. Revue Générale de l'Electricité, vol. 5, no. 5, Feb. 1, 1919, pp. 163-165. Advantages of disregarding resistance in establishing general laws of electric action in long circuits. Writer concludes that the laws thus established are static laws. Before the Académie des Sciences. Also in Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 2, Jan. 13, 1919, pp. 73-78.

CABLE, ARMORED. Effective Resistance, Impedance of Self-Induction and Losses of Power in a Single-Phase Armored Cable (Etude de la résistance effective, de l'impédance de la self-induction et des pertes de pusisance dans un câble armé monophasé), R. Bouzon. Revue Générale de l'Electricité, vol. 5, no. 11, Mar. 15, 1919, pp. 403-404, 4 figs. Indicates that variations of these quantities in a cable armored with steel covering are due to magnetization of steel and therefore cease when saturation is attained. It is thus that hysteresis losses are separated from losses due to Foucault currents and Kelvin effect.

Influence of Insulation on the Effective Resistance and Reactance of Cable Armored for Third Harmonics (Sur l'influence de l'enveloppe sur les résistance et réactance effectives d'un câhle armé pour les harmoniques 3), R. Swyngedaun. Revue Générale de l'Electricité, vol. 5, nos. 5 and 8, Feh. 1 and 22, 1919, pp. 165-166 and 283-284. Experiments on similar cahles, with and without insulation. Feh. 22; Results of tests made on eables havin three conductors. Also in Comptes rendus des séances de l'Académie des Sciences, vol. 168, nos 2 and 4, Jan. 13 and 27, 1919, pp. 87-88 and 230-232.

ELECTROLYTIC SAFEGUARDS AGAINST OVERCHARGE. Electric Discharge on the Surface of a Solid Electrolyte, Was. Sulejkin. Phys. Rev., vol. 13, no. 3, Mar. 1919, pp. 197-208, 5 figs. Theory of electrolytic safeguards against overtension; dependence of value of critical tension upon the concentratiou of the electrolyte for different solutions; photomicrographs; behavior of aluminum anode up to critical tension explained.

HARMONICS. The Determination of Harmonics in Circuits, F. T. Iddings. Elec. World, vol. 73, no. 11, March 15, 1919, pp. 525-526, 1 fig. Method of determining harmonics in alternating-current power circuit which cause inductive interference with a telephone.

OVERHEAD LINES. Electrical Constants of Overhead Lines (Costanti elettriche per il calcolo delle condutture aeree), Renzo Norsa. Elettrotecnica, vol. 5, no. 33 Nov. 25, 1919, pp. 470-477, 10 figs. Diagrams and tables showing values of resistance, impedance and reactance of various circuits.

POLYPHASE CURRENTS. Theory of Polyphase Currents (Théorie des Courants polyphasés), Philippe Banneux. Société Belge des Electriciens, vol. 32, 1915-1916, 1917-1918, pp. 11-91, 8 figs. Generalization of principles involved in investigations with two-phase and three-phase currents. A trigonometric series which permits addition of sines of arcs in arithmetical progression hetween any two limits is introduced in computatious and expressions for electrical quautities are thereby developed.

SELECTIVITY OF CIRCUITS. Process and Device for Increasing the Selectivity of Electric Circuits (Procédé et dispositifs pour accroitre la sélectivité des circuits électriques), M. I. Pupin and E. H. Armstrong. Revue Générale de l'Electricité, vol. 5, no. 7, Feh. 15, 1919, pp. 270-274, 10 figs. No. 485533 and 20499. Object is to increase selectivity of circuits which are the seat of periodically variable electric vihrations, particularly of radio-telegraphic installations.

VACUUM VALVES. Schemes and Brief Description of Apparatus Using the Emission of Electrons from a Hot Filament (Schémas et description sommaire des appareils utilisant l'émission d'électrons provenant d'un filament chaud). Revue Générale de l'Electricité, vol. 5, no. 9, Mar. 1, 1919, pp. 332-334, 6 figs. Describes kenotron, tungar, pliotron, audions, dynatron, pliodynatron and other apparatus.

WEHNELT TUBE. The Relation of Potential Distribution to Hysteresis Effect in the Wehnelt Tube, R. A. Porter. Phys. Rev., vol. 13, no. 3, Mar. 1919, pp. 189-196, 7 figs. Three stages in discharge of vacuum tube with CaO cathode identified and potential distribution curves for one pressure and heating current are obtained for each stage.

FURNACES

AIR-TIGHT FURNACES. English Electric Furnace Developments, F. J. Moffett Blast Furnace & Steel Plant, vol. 7, no. 4, Apr. 1919, pp. 169-170. On high efficiency and high temperature possibilities and reduction of heat losses by air-tight furnances.

ARC FURNACES. Development of the Electric Arc Furnace (Perfezionamenti nei forni elettrici ad arco), E. Thovez. Elettrotecnica, vol. 5, no. 33, Nov. 25, 1918, pp. 477-481, 3 figs. History of various types, particularly Héroult and Bassanese.

STEEL FURNACES. Iron and Steel Electric Furnaces, J. Bibby. Electrical Review, vol. 84, no. 2150, Feb. 7, 1919, pp. 166-167, 2 figs. Writer advocates single arc for steel making. (Continuation of serial). Before Manchester Assn. Engrs.

UNIFORMITY TEMPERATURE. Temperature Uniformity in an Electric Furnace. John F. Ferguson. Chem. & Metallurgical Eng., vol. 20, no 6, March 15, 1919, pp. 283-288, 9 fig. Method of manufacturing laboratory electric furnaces producing uniform temperature from end to end of core.

GENERATING STATIONS

ALTERNATORS IN PARALLEL. Operation of Alternators Connected in Parallel (Etude sur la marche en parallèle des alternateurs), M. de Marchena. Bulletin de la Société Française des Electriciens, vol. 9, no. 76, Jan. 1919, pp. 17-42, 2 figs. Study of conditions under which existing theories, specially the researches of Cornu. Blondel and Boucherot are applicable. Also in Revue Générale de l'Electricité, vol. 5, no. 11, Mar. 15, 1919, pp. 405-415, 2 figs.

CANADA. Statistical Analysis of the Central Electric Stations of Canada. Power, vol. 49, no. 9, March 4, 1919, pp. 309-310. Figures showing amounts of power, capital iuvested, salaries and wages paid, with data on hydroelectric power.

CENTRAL STATIONS IN WEST. Data on Central Stations in the West. Jl. Electricity, vol. 42, no. 5, Mar. 1, 1919, pp. 215-216. Figures issued hy Bur. of Census, on central electric light and power stations in New Mexico, Oregon, Nevada and Utah.

HYDROELECTRIC PLANT. A Small Hydroelectrie Installation, E. P. Hollis. Min. Mag., vol. 20, no. 3, Mar. 1919, pp. 148-149, 2 figs. Plant recently laid down in Yorkshire.

NEW SOUTH WALES. Bulk Supply of Electricity. Commonwealth Engr., vol. 6, Jan. 1, 1919, pp. 185-186. Industrial development at Newcastle, N. S. W.

NEW ZEALAND. Hydro-Electric Power in New Zealand. Commonwealth Engr., vol. 6, no. 6, Jan. 1, 1919, pp. 183-184. Scheme of hjdroelectric development of North Island, involving expenditure of $67,500,000.

GENERATORS AND MOTORS

ARMATURES. Design of Small Direct-Current Armatures, C. R. Wylies. Elec. World, vol. 73, no. 12, Mar. 22, 1919, pp. 571-575, 8 figs. Methods of designing small armatures based upon both test data and theory developed for larger machines.

ASYNCHRONOUS MACHINES. Asynchronous Generators and Converters (Generatrici asincrone e macchine convertitrici), Luigi Lombardi. Elettrotecnica, vol. 6, no. 6, Feb. 25, 1919, pp. 110-114, 1 fig. Characteristic curves of Gadda converters. (Continued).

BALL BEARINGS. The Use of Ball Bearing for Electrical Machinery, H. M. Trumbull. Can. Machy, vol. 21, no. 2, Jan. 9, 1919, pp. 35-38, 12 figs. Argues that ball bearings euable builder to use smaller air gap and enhance efficiency of machines.

COMMUTATION. Phonemena of Commutation (Phénomènes de la commutation), J. Bezalman. Société Belge des Electriciens, vol. 31, Aug.-Dec. 1914, pp. 599-632, 14 figs. Experimental determination of impedance of section fordrum drum armature and its mutual induction with neighhoring sections and the fieldmagnets, under varicus conditions; oscillograms showing shane and simultaneous values of tension betweeu sections and current under hrushes, for various arrangements of brushes and under different ratios b/B.

COOLING OF MOTORS. Cooling of Electric Motors, with Special Reference to Totally-Enclosed Machines, P. A. Mossay. Tran. Min. Inst. Scotland, vol. 40, part 8, 1918-1919, pp. 163-175 and (discussion) pp. 175-177, 13 figs. Classifies and discusses efficiency of (a) cooling-devices external to totally enclosed motor; and (b) self-contained cooling devices. Writer prefers totally enclosed type, of motor for work in mines and chemical factories.

D. C. GENERATORS. Causes of Direct-Current Generators Failing to Build Up Their Voltage, Robin Beach. Power, vol. 49, no. 14, Apr. 8, 1919, pp. 519-521, 5 figs. Mentions various couses why a machine may fail to come up to voltage and proposes remedies.

Effect of Interpoles on Commutation of Direct-Current Machines, R. L. Witham. Power, vol. 49, no. 9 and 10, Mar. 4 and 11, 1919, pp. 303-305 and 358-360, 15 figs. Purpose of interpoles and how they operate to effect commutation. Mar. 11; influence of interpoles on voltage of generators, and on speed of motors.

D. C. MOTORS. The Influence of the Distribution of Losses on the Efficiency Curves of a Continuous Current Motor, Thomas Carter. Elecn., vol. 82, nos. 9 and 10, Feb. 28 and Mar. 7, 1919, pp. 247-249 and 275-277, 8 figs. Graphs of maximum efficiency and corresponding input and output against k, with various percentages of full load efficiency. Mar. 7: Maximum output which can be got from a motor and values of input and efficiency at which it occurs. (Concluded).

The Emcol D. C. Motors. Electrical Review, vol. 84, no. 2153, Feb. 18, 1919, pp. 250-251, 3 figs. General features arrangement of air circulation, and temperature-rise curves of 50-hp. motor.

High Frequency Alternators. High Frequency Alternators (Les alternateurs à haute fréquence), Marious Latour. Bulletin de la Société Française des Electriciens, vol. 9, no. 77, Feb. 1919, pp. 97-114, 18 figs. Design characteristics of machines capable of furnishing directly, without supplementary transformers, the electromotive force necessary for feeding antennæ in wireless telegraphy.

Induction Motors. Speed Regulation of Induction Motors Coupled in Cascades. (Réglage de la vitesse des moteurs d'induction par couplage en cascade), G. Darrieus. Revue Générale de l'Electricité, vol. 5, no. 7, Feb. 15, 1919, pp. 257-265, 13 figs. Survey of present designs. Suggestions to develop a more general process.

Reconnecting Induction Motors, A. M. Dudley. Power, vol. 49, no. 11, March 18, 1919, pp 393-396, 6 figs. Summary of principles brought out in a series of thirteen articles by writer.

Mill Motors. Live Roller Motors in Steel Works, W. W. Wood. Electrician, vol. 82, no. 10, Mar. 7, 1919, pp. 269-272, 4 figs. Graphs of tests made on small mill motors without ingots on the rollers and of approximation for calculating heating effect for large mill motor. From Magnet Mag.

Large Motors for Reversing Mills. Iron & Coal Trades Rev., vol. 98, no. 2663, Mar. 14, 1919, p. 311, 2 figs. Reversing mill motors of Siemens Brothers, Dynamo Works, Ltd.; with peak load of 19,000 hp. Also in Electn. vol. 82, no. 2130, Mar. 14, 1919, pp. 302-303, 4-figs.

Nomenclature. Motors for Electric Installations (Motors primaires pour installations électriques), Société Belge des Electriciens, vol. 31, Aug.-Dec. 1914, pp. 636-643, 7 figs. Hydroelectric Nomenclature proposed by the Commission Electrotechnique Internationale.

Turbo-Alternators. The Determination of the Efficiency of the Turbo-Alternator, S. F. Barclay, and S. P. Smith. Engineering, vol. 107, no. 2775, Mar. 7, 1919, pp. 322-326, 11 figs. Attempting to introduce method for establishing alternator efficiency based on mesurement of actual losses on load. Writer shows that actual losses on load can be deduced from measurements of cooling air flowing to alternator. Paper read before Instn. Elec. Engrs.

Winding Old Armatures. Winding Coils for Old Armatures. Elec. Ry. Jl., vol. 53, no. 12, Mar. 22, 1919, pp. 578-580, 9 figs. Suggests that additional insulation is necessary at corners and between leads where clearance with core is small and large radius bends give greater flexbility for rewinding.

LIGHTING AND LAMP MANUFACTURE

Report of the Committee on Progress. Tran. Illum. Eng. Soc., vol. 13, no. 9, Dec. 30, 1919, pp. 450-511. Gas, incandescent lamps, arc lamps, lamps for projection purposes, street lighting, interior illumination, fixtures, photometry, and physical experiments.

Hotels. Illumination Notes. Hotel Rooms, W. F. Little and A. C. Dick. Tran. Illum. sEng. Soc., vol. 14, no. 1, Feb. 10, 1919, pp. 45-52, and (discussion) pp. 52-59. Survey of light intensities in rooms of Twelve New York City hotels. Data and measurements given in tabular forms.

Incandescent Lamp Manufacture. Present Status of the Industry of Incandescent Lamps (Etat actuel de l'industrie des lampes à incandescence), A. Larnaude. Houille Blanche, no 23-24, Nov.-Dec., 1918, pp. 356-357. Abstract from communication presented before Société Internationale des Electriciens.

Legislation. Report of Committee on Lighting Legislation, L. B. Marks. Tran. Illum. Eng. Soc., vol. 13, no. 9, Dec. 30, 1919, pp. 524-527, Digest of laws on illumination.

Nomenclature. Report of the Committee on Nomenclature and Standards of the Illuminating Engineering Society for the Year 1918. Tran. Illum. Eng. Soc., vol. 13, no. 9, Dec. 30, 1919, pp. 512-523. New and revised symbols, coefficients and definitions.

Searchlights. Searchlights, Hugh M. Gooly. Electrical Review, vol. 84, no. 2153. Feb. 28, 1919, pp. 227-228, 3 figs. Notes on the various designs of projector and control gear.

Spherical Candlepower. Apparatus for the Determination of the Spherical Candlepower of a Source of Light, J. Sahulka. Elecn., vol. 82, no. 2128, Feb. 28, 1919, pp. 255-256, 2 figs. Apparatus intended to simplify usual method by obviating necessity of constructing Rousseau curve. From Elektrotechnische Zeitschrift.

Standards. Illumination and Some of Its Fundamental Considerations, H. A. Tinson. Tran. South African Instn. Elec. Engrs., vol. 9, part 11, Dec. 1918, pp. 192-198. Standards of exterior and interior illumination for various buildings, roadways, thoroughfares, etc.

Street Lighting. Street Lighting in a City of Average Size, C. D. Gray and E. Hagenlocher. Elec. World, vol. 73, no. 12, Mar. 22, 1919, pp. 575-578, 6 figs. Features of ornamental system installed at South Norwalk, Conn., said to be operated with low maintenance expense.

Tungsten Lamps. Characteristic Equations of Tungsten Lamps and Their Application to the Heterochromous Photography. (Equations caractéristiques des lampes à filament des tungstène et leur application à la photométrie hétérochrome), G. W. Middlekauff and J. F. Skogland. Revue Générale de l'Electricité, vol. 5, no. 7, Feb. 15, 1919, pp. 252-256. Investigation conducted by the Bureau of Standards concerning comparison of standards. From Scientific Papers of the Bureau of Standards.

MEASUREMENTS AND TESTS

Insulators. Photographic Study of Porcelain Insulators, Harold G. Tufty. Elec. World, vol. 73, no. 6, Feb. 8, 1919, pp. 268-271, 2 figs. Polarized light employed in examination of thin sections of insulators some of which had been properly fired, while others were underfired, and still others overfired.

Lines. Note on the Tests and Measurements of Electrical Lines (Note sur les essais et mesures relatifs aux lignes électriques), L. Mouchard. Revue Générale de l'Electricité, vol. 5, no. 9, Mar. 1, 1919, p. 352, 1 fig. Arrangement suggested in L. Puget's scheme given in R. G. E. Oct. 19, 1918, pp. 563-565, to eliminate ϵ, which is not considered in that scheme.

Magnetic Testing. Frequency of Current Reversals in Magnetic Testing, A. W. Smith. Mich, Technic, vol. 31, no. 1, Mar. 1918, pp. 18-24, 3 figs. Effect of various methods for demagnetization.

Photometry. Photometric Apparatus for Measuring the Illuminating Value of Fluctuating Sources of High Candlepower (Flares, Parachute Lights, etc.), A. P. Trotter. Illuminating Engr., vol. 11, no. 11, Nov. 1918, pp. 253-259, 3 figs. and (discussion) vol. 11, no. 12, Dec. 1918, pp. 269-276, 1 fig. Method and apparatus devised by society.

Repairmen's Testing Apparatus. Curing Electric Troubles. Motor Age, vol. 35, no. 12, Mar. 20, 1919, pp. 22-24, 11 figs. General testing apparatus for repairmen.

Transformers, Instrument. Field Testing of Instrument Transformers, H. M. Crothers. Elec. World, vol. 73, no. 11, March 15, 1919, pp. 516-519, 2 figs. Experiences with the Agnew method are said to have shown it to be valuable for tests conducted at place of installation.

POWER APPLICATIONS

Heating. Electric Heating in Houses (Le chauffage à l'électricité des maisons d'habitation), Augustin Frigon. Revue Trimestrielle Canadienne, vol. 4, no. 16, Feb. 1919, pp. 371-383, 1 fig. Efficiency and cost.

Difficulties in Electric House Heating, Joseph F. Merrill. Jl. Electricity, vol. 42, no. 5, Mar. 1, 1919, pp. 212-214. Figures showing comparative cost of central steam heating and electric heating. Writer concludes electric house heating is not a practicable load for the average power company.

Principles of Inductive Heating With High Frequency Currents, E. F. Northrup. Gen. Meeting Am. Electrochem. Soc., Apr. 3-5, 1919, paper 8, pp. 71-159, 29 figs. Theory of this method of heating and accounts of methods employed and actual results obtained in tests and experiments conducted at Palmer Phys. Lab., Princeton Univ.

Hospital. Some Electrical Features of New San Francisco Hospital. Elec. Rev., vol. 74, no. 13, Mar. 29, 1919, pp. 493-496, 5 figs. Municipal institution with power plant, silent-call signals, electric elevators, electric clocks, modern laundry and kitchen equipment electrotherapeutic and laboratory apparatus, etc.

Loading Machinery. Electricity as Applied to Bulk Material Handling Boats. Freight Handling & Terminal Eng., vol. 5, no. 3, Mar. 1919, pp. 102-105, 10 figs. History of application of electricity to loading and unloading coal and ore. Paper read before Soc. Terminal Engrs.

Paper Making. Making Paper by Electricity. Jl. Electricity, vol. 42, no. 6, Mar. 15, 1919, pp. 260-261, 3 figs. Outline of reservoir, penstock and power plant.

Quarrying. Quarrying and Working Stone by Electricity. Stone, vol. 40, no. 3, Mar. 1919, pp. 120-122, 2 figs. Detail of Westinghouse quarry equipment.

Steel Plants. Electric Steel Plant; Features of Plant Design, W. F. Sutherland. Can. Machy., vol. 21, no. 10, Mar. 6, 1919, pp. 225-228, 8 figs. Layout of electrical apparatus in a large electric-steel plant.

STANDARDS

Lightning Rods. New Standards of the Swiss Association of Electricians (Les nouvelles normes de l'association suisse des électriciens), S. Frid. Industrie Electrique, vol. 28, no. 640, Feb. 25, 1919, pp. 72-73. Relates to installation and maintenance of lightning rods.

Polyphase Voltages. The Standardisation of Polyphase Voltages, R. Rudenberg. Elecn., vol. 82, no. 10, Mar. 7, 1919, pp. 272-273, 2 figs. Comparison of rcent suggestions for standardized voltages. From Elektrotechnische Zeitschrift, Nov. 24, 1918.

TELEGRAPHY AND TELEPHONY

Amplifiers. The Use of Impedance, Capacity, and Resistance Couplings in High-Frequency Amplifiers, J. Scott-Taggurt. Wireless World, vol. 6, no. 71, Feb. 1919, pp. 628-633, 8 figs. Receiving circuits without intermediary transformers or oscillatory circuits between the valves.

Vacuum-Tube Amplifiers, MacC. Batsel. Elec. World, vol. 73, no. 12, Mar. 22, 1919, pp. 568-570, 9 figs. Detection by use of vacuum-tube amplifiers of weak telegraphic ground currents and stray telephonic currents.

Antenna. Note on the Fundamental Wave and the Harmonics in a Homogenous Antenna and also a Non-Homogenous Antenna (Note sur l'onde fondamentale et les harmoniques dans une antenne homogène et dans une antenne non homogène), L. Dubar. Revue Générale de l'Electricité, vol. 5. no. 8, Feb. 22, 1919' pp. 284-289, 5 figs. Conclusions of the question derived on article R. G. E., vol. 4, no. 11, Sept. 14, 1918, p. 363.

Call Letters. International Wireless Administration. Wireless World, vol. 6, no. 71, Feb. 1919, pp. 609-610. Suggestion in regard to allocation of station call letters.

Direction Finders. Radio Direction-Finding Apparatus, A. S. Blatterman Elec. World, vol. 73, no. 10, Mar. 8, 1919, pp. 464-467, 11 figs. Use of loop antanna in guiding airplane flight and general principles affecting design of receiving loops.

Field Stations. Recent Development is Field Station Apparatus. Wireless World, vol. 6, no. 72, Mar. 1919, pp. 656-662, 7 figs. Technical details of damped and continuous wave transmitters and receivers.

FIRES. Fires Caused by Hertzian Waves (Incendies provoqués par les ondes hertziennes), Georges Le Roy. Génie Civil, vol. 74, no. 7, Feb. 15, 1919, pp. 133-134, 1 fig. Industrie Electrique, vol. 28, no. 640, Feb. 25, 1919, pp. 78-79, and Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 4, Jan. 27, 1919, pp. 224-227, 1 fig. Specially constructed Hertzian resonator with which writer studied possibilities of fire being produced by wireless waves traversing iron bodies accidentally disposed in form of resonator.

GERMAN. German Wireless in Metz. Wireless World, vol. 6, no. 72, Mar. 1919, pp. 672-675, 6 figs. Particulars of a captured enemy installation.

HELIOGRAPH. Donath Electric Signaling Mirror (Miroir de signalisation électrique du Docteur Donath). Société Belge des Electriciens, vol. 31, Aug.-Dec. 1914, pp. 633-635, 3 figs. Morse signals sent out by periodic lighting and extinction of electric lamp provided with reflector, which it is said, permit message to be sent to distance of 7 km.

LAND SETS. Continuous-Wave Land Radio Sets, Paul T. Weeks and Donald G. Little. Elec. World, vol. 73, no. 13, Mar. 29, 1919, pp. 627-630, 7 figs. It is claimed that present development in radio-telegraphy points to usefulness of continuous-wave sets on account of freedom from interference.

MARCONI EQUADOR STATION. Equatorial Wireless, P. Eisler. Wireless World, vol. 6, no. 72, Mar. 1919, pp. 649-653, 5 figgs. Equatorial wireless and Marconi station erected at Sta. Elena, Ecuador.

MILITARY RADIO. Military Radio Communication, A. D. Cameron. Elec. World, vol. 73, no. 11, March 15, 1919, pp. 521-525, 3 figs. Organization of a wireless telephone and telegraph system of the signal corps.

NORWEGIAN STATIONS. Great Wireless Stations of the World, Julius Galster. Wireless World, vol. 6, no. 71, Feb. 1919, pp. 591-595, 6 figs. Norwegian radio station.

PHOTOGRAPHS. The Design and Construction of Apparatus for the Wireless Transmission of Photographs. Wireless World, vol. 6, no. 72, Mar. 1919, pp. 685-690, 16 figs. Details of the various apparatus used. (Continuation of serial).

POULSEN SYSTEM. Poulsen System of Radiotelegraphy (Il sistema di radiotelegrafia "Poulsen"), G. Pession. Elettrotecnica, vol. 6, no. 7, Mar. 5, 1919, pp. 126-134, 18 figs. System is based on property of electric arc to determine electrical oscillations in circuit comprising capacity and self-inductance.

RECEIVERS. Super-Sensitive Receivers. Wireless World, vol. 6, no. 71, Feb. 1919, pp. 598-600, 2 figs. Types 50 and 55 evolved by Marconi Company.

TELEGRAPHS. Ground Telegraphy in the World War, Willis L. Winter. Jl. Electricity, vol. 42, no. 5, Mar. 1, 1919, pp. 210-211, 3 figs. Principles of ground telegraphy and conditions of operation.

TELEPHONES. The Sonority of Telegraph and Telephone Lines and a New Type of Damper (La Sonorita dei Fili telegrafici e telefonici e un nuovo tipo di sordina). Elettricista, vol. 8, no. 4, Feb. 15, 1919, pp. 25-28, 7 figs. Instrument which grips hanging wire at predetermined point in its length.

System Protecting Telephone Lines Against Trolley Wires (Los sistemas de proteccion contra la caida de los hilos telefonicas sobre las lineas de los tranvias eléctricos), Eng. Aigouy. Energia Eléctrica, vol. 21, no. 2, Jan. 25, 1919, pp. 17-20. Answers to questionnaire sent out to railway companies by International Union of Brussels. (To be continued). From Electricien, Paris.

Cricuits with Zero Mutual Induction, William W. Crawford. Telephony, vol. 76, no. 13, Mar. 29, 1919, pp. 15-18, 11 figs. Reduction of inductive interference in telephone circuits; forms of constructions and calculations and tentative design for greatest refinement of balance against induction. Paper before Am. Inst. Elec. Engrs.

The Multiple Interurban Telephone of Strassburg (Le multiple téléphonique interurbain de Strasbourg). Revue Générale de l'Electricité, vol. 5, no. 9, Mar. 1, 1919, pp. 335-339, 2 figs. Schemes of connections and account of construction.

TRANSMITTERS. Radio Transmitters of Synchronous Rotary Spark-Gap Type, Millard C. Spencer. Elec. Rev., vol. 74, nos. 12 and 13, Mar. 21 and 29, 1919, pp. 456-458 and 409-499, 11 figs. Theory of simple transmitter; diagram of equivalent circuit of radio transmitter; use of Vector diagram for analyzing test results. First and second articles.

UNDAMPED OSCILLATIONS. Undamped Electrical Oscillations of Short Wave Length (Oscillations électriques non amorties de courte longueur d'onde), Gutton and Touly. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 5, Feb. 3, 1919, pp. 271-274, 1 fig. and Revue Générale de l'Electricité, vol. 5, no. 11, Mar. 15, 1919, pp. 415-416, 1 fig. Apparatus developed at laboratories of military radio-telegraphy, while examining application of lamp-valves with three electrodes for the generation of long waves employed in wireless telegraphy.

VACUUM BULB. On Reading on Mr. Nozoje's "Vacuum Bulb" (in Japanese), T. Kikuchi. Denki Gakkwai Zasshi, no. 367, Feb. 10, 1919.

TRANSFORMERS, CONVERTERS, FREQUENCY CHANGERS

RECTIFIER. An Electro-Magnetic Alternating Current Rectifier, George F. Haller Sci. Am. Supp., vol. 87, no. 2248, Feb. 1, 1919, pp. 76-87, 15 figs. Type designed for construction in amateur laboratory.

TRANSFORMER CONNECTIONS. Transformer Connections for Power Transmission, Gordon Kribs. Power House, vol. 12, no. 3, Mar. 1919, pp. 69-73, 19 figs. Transformer connections in common use and characteristics of resulting circuits.

TRANSFORMER MOUNTING. Standardization of Transformer Mounting, W. C. Blackwood. Elec. World, vol. 73, no. 12, Mar. 22, 1919, pp. 578-581, 9 figs. Tables and drawings specifying methods of hanging and spacing the units mounted on poles or on consumers' premises.

TRANSMISSION, DISTRIBUTION, CONTROL

ELECTRICITY SUPPLY. A New Era in Power Transmission, Louis Bell. Elec. World, vol. 73, no. 13, Mar. 29, 1919, pp. 631-632. Believes that development of water power, establishment of stations at mines and wider interconnection are necessary for proper industrial development of the country for the social betterment of labor.

The Past, Present, and Future of Electricity Supply. Electrical Review, vol. 84, no. 2150, Feb. 7, 1919, pp. 163-165. Problem dealt with on a national basis. Discussion at meeting of Manchester Assn. Engrs.

Projects of Great Distribution Systems of Electrical Energy in Germany, Holland and Sweden (Les projets de création de très grands réseaux de distribution d'énergie électrique en Allemagne, Hollande et Suède). Revue Générale de l'Electricité, vol. 5, no. 9, Mar. 1, 1919, pp. 353-354. Official communication of the French Government.

Electricity Supply at Birmingham. Elec. Rev., vol. 84, no. 2154, Mar. 7, 1919, pp. 255-257, 4 figs. Installation of additional generating plant of two 5000-kw. B.T.H. turbo-alternators.

LINE. Reliability on a Transmission Line (in Japanese), M. Shibuzawa. Denki Gakkwai Zasshi, no. 367, Feb. 10, 1919.

POLES. Extending the Life of Wood Poles, Charles R. Harte. Elec. Ry. Jl., vol. 53, no. 12, Mar. 22, 1919, pp. 554-559, 13 figs. Description of various methods used and discussion of their relative advantages, based on manner in which different preservatives keep out and destroy germs.

POTENTIAL REGULATORS. Compensated-Typo Poteutial Regulators, Arthur H. Ford, Paul E. Mead and Guy W. Thomas. Elec. World, vol. 73, no. 13, Mar. 29, 1919, pp. 620-623, 13 figs. Connections for using compensated potential regulators for power factor aud voltage correction at load; tests to determine dependence of action of regulator upon influence of line constants.

POWER CIRCUITS. Determination of Econmical Power Circuits, P. O. Reyneau. Elec. World, vol. 73, no. 10, Mar. 8, 1919, pp. 471-473, 3 figs. Method of deriving curves showing when two circuits become more economical than one as load increases. Fixed charges are balanced against saving of line loss when new conductors are added.

SUBSTATIONS. A Year of the Automatic Substation at Butte, E. J. Nash. Elec. Ry. Jl. vol. 53, no. 12, Mar. 22, 1919, pp. 565-567, 6 figs. Maintenance cost of first year.

Static Condenser Installation at the Soughton Sub-Station of the Brockton Edison Company, W. A. Forbush. Stone & Webster Jl., vol. 24, no. 3, Mar. 1919, pp. 195-199, 3 figs. How Edison Electric Illuminating Co. solved the problem of feeding new sections in district supplied by system already loaded to capacity.

IGNITION APPARATUS

IGNITION OF GASES. The Ignition of Explosive Gases by Electric Sparks. John David-Morgan. Jl. Chem. Soc., no 675, Jan. 1919, pp. 94-104, 6 figs. Experiments with low-tension sparks under various magnetic conditions.

PLUGS. Tests of Ignition Apparatus, P. M. Heldt. Automotive Industries, vol. 40, no. 11, March 13, 1919, pp. 578-579, 3 figs. Resistance to thermo-craking and shock and gas-tightness of plugs.

Spark Gaps. Sci. Am. Supp., vol. 87, no. 2256, Mar. 29, 1919, p. 198. Suggestions concerning the construction and use of the plugs. From The Auto.

The Operation and Design of Sparking Plugs — II, H. Warren. Automobile Engrs., vol. 9, no. 124, Mar. 1919, pp. 94-97, 24 figs. Details of manufacture of various types.

VARIA

INTERNATIONAL ELECTROTECHNICAL COMMISSION. The International Electrotechnical Commission (La comision electrotécnica internacional), German Niebuhr. Boletin de la Asociacion Argentina de Electro-Técnicos, vol. 4, no. 10, Oct. 1918, pp. 840-850, 1 fig. History development and work. (Continuation of serial).

PHYSIOLOGICAL EFFECTS OF CURRENTS. Physiological Ability to Stand Alternating Current of High Frequencies Up to 100,000 Cycles per Second (La tolérance physiologique à l'intensité des courants alternatifs iaissé à la fréquence de 100,000 cycles par seconde), A. E. Kennelly and E. F. W. Alexanderson. Société Belge des Electriciens, vol. 32, 1919-1917-1918, pp. 92-100, 2 figs. Tests are reported as indicating that a person can stand 30 milliamperes at 11,000 cycles and increasigly up to 590 milliamperes at 100,000 cycles between 60 and 11,000 cycles no marked difference was found and from 5 to 30 milliamperes are quoted as expressing general results obtained.

MUNITIONS AND MILITARY ENGINEERING

ABERDEEN ORDNANCE PROVING GROUND. History of the Ordnance Proving Ground—III, F. P. Lindh. Am. Mach., vol. 50, no. 13, Mar. 27, 1919, pp. 607-611, 4 figs. Development of railway artillery, meteorological work and airplane bombing. Concluding article.

CONSTRUCTION DIVISION. The Construction Division of Our Army, George W. Fuller. Eng. News-Rec., vol. 82, no. 9, and 10, Feb. 27 and Mar. 20, 1919, pp. 416-419 and 562-564. Organization and work accomplished. Mar. 20: Details of Organization; plea-for continuance as independent unit of military establishment.

TRAINS, ARMORED. Armored Trains for Coast Defense. Engineer, vol. 127, no. 3294, Feb 14, 1919, pp. 150-162, 6 figs. Engine is in middle of traim, infantry vans on either side of engine, and gun carriage at ends.

ENGINEERING ACTIVITIES. Civil Engineering in the War, George K. Scott-Moncrieff. Times Eng. Supp., vol. 15, no. 532, Feb. 1919, pp. 65-66. Rapidity in erecting of construction work.

Engineering Achievements of the Army, Mech. Eng., vol. 41, no. 4, Apr. 1919, pp. 372-374, 5 figs. Activities in railroading bridges, searchlights, map production and forestry operations.

Fire Control. On a New Application of Viscosity (sur une application nouvelle de la viscosité), Georges Claude. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 5, Feb. 3, 1919, pp. 274-276, 2 figs. Apparatus utilizing viscous liquid for regulating firing of projectiles.

Gas Water. The Development Division, Chemical Warfare Service, U.S.A., F. M. Dorsey. Jl. Indus. & Eng. Chemistry, vol. II, no. 4, Apr. 1, 1919, pp. 281-287, 8 figs. How development division developed gas masks for protection of American soldiers.

Production of Gas Defense Equipment for the Army, Bradley Dewey, Jl. Indus. & Eng. Chem., vol. II, no. 3, Mar. 1, 1919, pp. 185-197, 20 figs. Plant, organization, divisions and operations involved in manufacture of gas masks.

Gun Manufacture. How the 155-Mm. Howitzer Is Made — VII, J. V. Hunter. Am. Mach., vol. 50, no. 13, Mar. 27, 1919, pp. 587-593, 23 figs. Methods used in producing breech mechanism, with reference to tolerances permitted.

Making the U. S. 75-Millimeter Field Gun, Erik Oberg. Machy., vol. 25, no. 7, Mar. 1919, pp. 624-630, 27 figs. Methods developed by Wisconsin Gun Co. in producing light field artillery. First article.

Manufacturing the 4.5-inch British Howitzer — III, J. H. Garnett. Machinery, vol. 13, no. 335, Feb. 27, 1919, pp. 589-596, 22 figs. Austin Motor Company's methods of production.

Gunnery. Notes on Gunnery, O. A. Randolph. Univ. Colo, Jl. Eng., vol. 15, no. 2, Jan. 1919, pp. 20-28, 6 figs. Classification of guns and projectiles; interior ballistics; factors which influence the trajectory.

Guns, Long-Range. A 121-Mile Gun, J. Bernard Walker. Sci. Am., vol. 120, no. 13, Mar. 29, 1919, pp. 312-313 4 figs. Theoretical study of a 10-in. gun with a range of 121.3 miles.

Guns, Naval. Heavy Naval Gun is Given Field Mounting, C. M. McCrea. Iron Trade Rev., vol. 64, no. 11, Mar. 13, 1919, pp. 707-709, 3 figs. Caterpillar mounting of 7-in. naval gun.

Illuminating Engineering. The Illuminating Engineer at War, George H. Stickney. Tran. Illum. Eng. Soc., vol. 13, no. 9, Dec. 30, 1918, pp. 439-447. Reviews work of society during war.

Monitors. The British Monitors Engineer, vol. 127, no. 3294, Feb. 14, 1919, pp. 143-145, 7 figs. Purpose and details of ships.

Mounts for Large Guns. Heavy Field Pieces with Mobile Mount C. L. McCrea. Mech. Eng., vol. 41, no. 4, Apr. 1919, pp. 375-376, 1 fig. On design and construction of caterpillar mount of high-power 7-in gun by Navy Bureau of Ordnance.

Railway Mounts for Large Naval Guns. Ry. Rev., vol. 64, no. 13, Mar. 29, 1919, pp. 477-480, 5 figs. History of organization, construction details and work of naval batteries in France.

Making Naval Gun Mounts, Franklin D. Jones. Machy., vol. 25, no. 7, Mar. 1919, pp. 600-605, 12 figs. Special tools, gages and fixtures used at the plant of the Mead-Morrison Mfg. Co. for construction of 1000 complete mounts for 4-in. guns U. S. Navy. Second installment.

Munition Plants. How a Munitions Plant Was Built and Operated in Canada, Using Tons of Copper and Zinc Each Day. Brass World, vol. 15, no. 3, Mar. 1919, pp. 71-73, 3 figs. Organization work of Imperial Munitions Board.

Paravane. The Protection of Ships. Against Mines, Engineer, vol. 127, no. 3297, Mar. 7, 1919, pp. 222-224, 5 figs. Arrangement of Paravanes, or towed devices for cutting mine mooring wires, on a merchant ship. First article.

The Mysterious Paravane, William Washburn Nutting. Int. Mar. Eng., vol. 24, no. 4, Apr. 1919, pp. 289-293, 7 figs. How machine countered German mines.

Projectiles, Special. Curious Projectiles. Sci. Am. Supp., vol. 87, no. 2245, Jan. 11, 1919, pp. 28-29, 6 figs. Specimens of German and Austrian production, such as Gebauer projectile that discharges small shells to rear, Burst projectile for use on masked batteries, etc. From Science et Vie.

Psychological Service. The Measurements and Utilization of Brain Power in the Army. Science, vol. 44, no. 1262, March 7, 1919, pp. 221-226. History of psychological service; methods of measuring intelligence; summary of results. (To be concluded).

Railway Troops. Work of American Railway Forces in France, O. C. F. Randolph. Ry. Age, vol. 64, no. 14, Apr. 4, 1919, pp. 889-890. Review of problems encountered by Sixteenth Engineers in building transportation facilities.

The Canadian Railway Troops' Work on the Western Front, Herbert Forder. Can. Ry. & Mar. World, no. 253, March, 1919, pp. 117-120, 3 figs. Army organization with particular reference to duties and achievements of railway troops.

Shell Manufacture. Manufacture of Steel Shells (La fabrication des obus allongés en acier), Ch. Dantin. Génie Civil, vol. 74, no. 3, Jan. 18, 1919, pp. 41-45, 19 figs. Heat-treating process at Couzon foundry, near Rive-de-Gier (Loire). Other processes in manufacture of shells have been described in Génie Civil, vol. 72, no. 21, Nov. 20, 1915, p. 321.

Sound Detectors. Hunting Submarines with a Sound Detector, Brewster S. Beach. Sci. Am., vol. 120, no. 14, Apr. 5, 1919, pp. 335 and 353-354, 3 figs. Device which permits detection of direction of a sound by shifting it from one ear to the other. Also in Elec. Rev., vol. 74, no. 13, Mar. 29, 1919, pp. 500-505, 5 figs.

Supply Bases. The Boston Army Supply Base.— General Features of Project, Frederic H. Fay. Jl. Boston Soc. Civil Engrs., vol. 6, no. 3, Mar. 1919, pp. 67-76. Historical account of development.

The Boston Army Supply Base.— Construction Features, Charles R. Gow. Jl. Boston Soc. Civil Eng., vol. 6, no. 3, Mar. 1919, pp. 77-113, 31 figs. Warehouse, wharves, wharf shed, pier shed, power plant, administration building, railroads, road and underground work.

The Boston Army Supply Base.— General Data, Charles M. Spofford. Jl. Boston Soc. Civil Engrs., vol. 6, no. 3, Mar. 1919, pp. 125-137. Purpose, location, area of site and buildings.

The Brooklyn Army Base. Freight Handling & Terminal Eng., vol. 5, no. 3, Mar. 1919, pp. 94-97. Considerations influencing selection of site and construction features.

Swords. On Japanese Swords (in Japanese), Kuiichi Tawara. Jl. Soc. Mech. Engrs., Tokyo, vol. 22, no. 54, Nov. 1918.

Training Engineering Officers. Training Officers for the Naval Auxiliary, Gregor S. Affleck. Wisconsin Engr., vol. 23, no. 6, Mar. 1919, pp. 202-205. Outline of six-months course intended for training engineering, officers for auxiliary service in Navy.

Transport. Modern Armies and Modern Transport. Ry. Gaz., vol. 30, nos. 4 and 8 Jan. 24-and Feb. 21, 1919, pp. 123-124 and 295-298, 1 fig. Work of South-Eastern & Chatham Ry. during war Feb. 21; War work of Great Northern and Lond., Brighton & South Coast ralways.

CIVIL ENGINEERING

BRIDGES

Concrete Arch Bridges in Canada. Concrete Arch Bridges in Canada. Contract Rec., vol. 33, no. 14, Mar. 26, 1919, pp. 275-279, 8 figs. Historical review of Canadian bridge building and reference list of reinforced concrete arch spans.

Concrete Slab Bridge. Re-Inforced Concrete Slab Bridge Design, Based on Tests of Full-Sized Slabs, A. T. Goldbeck. Can. Engr., vol. 26, no. 10, March 6, 1919, pp. 280-281, 2 figs. Tests were conducted at Bureau of Public Roads. From Public Roads.

Design. Bridge Engineering Surveyor, vol. 55, no. 1412, Feb. 7, 1919, pp. 129-130. On future loads and dangers of faulty design.

Erection. Cantilever Erection of Draw in Open Position While Old Draw Serves as Fixed Span, Eng. News Rec., vol. 82, no. 12, Mar. 20, 1919, pp. 567-569, 6 figs. Swing-span part of Union Pacific Bridge over Missouri at St. Joseph; old span during work carried traffic.

Bridge Substructure Construction with Concrete Caissons Sunk by Open Excavation Method, L. W. Scov. Eng. & Contracting, vol. 51, no. 13, Mar. 26, 1919, pp. 317-319, 3 figs. Experiences of Chicago, Burlington & Quincy R. R. Paper presented before Western Soc. Engrs.

Highway. Concrete and Steel Bridges, John W. Towle. Better Roads & Streets, vol. 8, no. 10, Oct. 1918, pp. 371-372. Economic advantages of good roads. Address delivered before North Carolina Good Roads Assn.

Painting. Maintenance and Painting of Highway Bridges, Charles D. Snead. Eng. & Contracting, vol. 51, no. 13, Mar. 26, 1919, pp. 306-307. Classification of structures according to structural conditions; maintenance and cost of painting.

Railway and Highway Bridge. Move Bridge Spans 136 Feet Endwise on Car Trucks, Eng. News Rec., vol. 82, no. 11, Mar. 13, 1919, pp. 530-532, 4 figs. Combined railway and highway bridge of the Union Pacific Ry.

Strengthening. Strengthening Railway Bridges, W. J. Doak. Commonwealth Engr., vol. 6, no. 6, Jan. 1, 1919, pp. 191-197, 10 figs. Details of various bridges erected throughout Queensland, Australia. Paper read before Inst. Civil Engrs.

Track-Elevation Bridge. Omaha Track-Elevation Bridges Vary in Type to Meet Local Conditions. Egr. News Rec., vol. 82, no. 8, Feb. 20, 1919, pp. 380-382, 3 figs. Types of bridge superstructure and floor of Missouri Pac. R. R.

Vertical-Lift Bridge. Mechanical Features of Vertical-Lift Bridge, J. A. L. Waddell. Mech. Eng., vol. 41, no. 4, Apr. 1919, pp. 379-381, 4 figs. Details of a 260-ft. double-track lift span at Louisville, Ky.

Viaducts. Design and Construction of Reinforced Concrete Viaducts on North Toronto Subdivision. Canadian Pacific Railway, B. O. Eriksen and H. S. Deubelbeiss. Can. Ry. & Mar. World, no. 253, March 1919, pp. 109-113, 7 figs. Dimensions, details, and method of caluculating moments in towers.

BUILDING AND CONSTRUCTION

Arch Analysis. Arch Analysis by a Method Using Variable, Elastic Weights, F. J. Dulude. Eng. News Rec., vol. 82, no. 10, March 6, 1919, pp. 471-473, 3 figs. Tabular form intended to simpilfy computation of summations required in solution of arch problem by influence lines.

Architects. Does the Architect Function as He Should? Robert D. Kohn. Am. Architect, vol. 115, no. 2253, Feb. 26, 1919, pp. 291-296. Résumé of program of Post-War Committee on Architectural Practice, Am. Inst. Architects.

Automobile Storage Structure. The New Automobile Centre, Social Hall Avenue, Salt Lake City. Am. Architect, vol. 115, no. 2252, Feb. 19, 1919, pp. 281-287, 13 figs. Reinforced-concrete 3-story structure used for storage of automobiles.

Barracks. A Barracks Built in a Hurry, Parker R. Whitney. Univ. Colo. Jl. Eng., vol. 15, no. 2, Jan. 1919, pp. 11-19, 4 figs. Main barracks built for Students' Army Training Corps to accommodate 350 men.

Brick. Shallow Brick Stand Up Well on Cement-Sand Base. Eng. News Rec., vol. 82, no. 8, Feb. 20, 1919, pp. 378-379, 4 figs. Service given by patching bricks on ramps of Pa. Station, N.Y.

Dry Dock. Building a Floating Dry Dock in Well Laid Out Yard. Eng. News Rec., vol. 82, no. 12, Mar. 20, 1919, pp. 552-554, 6 figs. Cableway assisted by whirler and derrick car keeps heavy timbers ready for carpenter crews; large band saws and cutoff's; frame handled on two-way roller system.

Elevators. Floating Pneumatic Grain Elevators. Engineer, vol. 127, no. 3296, Feb. 28, 1919, pp. 206-208, 7 figs. Elevators have a maximum capacity of about 100 tons per hour each, when working in wheat.

Chicago & North Western Ry. Co's Grain Elevator, W. H. Finley. Eng. World, vol. 14, no. 6, Mar. 15, 1919, pp. 15-19, 5 figs. Handling capacity in 1,766,000 bu. per day. Location permits grain to be received and shipped both by rail and water.

ENGINE HOUSE. A Rectangular Reinforced Concrete Engine House. Ry. Age. vol. 64, no. 14, Apr. 4, 1919, pp. 891-892, 3 figs. Design to replace old brick and timber building in location where space for expansion was restricted.

FACTORY. Modern Factory Construction, B. A. Williams. Aeronautics, vol. 16, no. 280, Feb. 26, 1919, pp. 226-227, 3 figs. Example illustrates use of Reliance standard steel sashes.
Building a Home for an Industry. Am. Architect, vol. 115, no. 2257, Mar. 26, 1919, pp. 467-475, 15 figs. Studies and projected design of buildings of dye-manufacturing concern are presented as illustration of procedure in designing an industrial structure.

FLAT-SLAB CONSTRUCTION. Design of Exterior Panels in Flat Slab Construction, Albert M. Wolf. Eng. World, vol. 14, no. 6, Mar. 15, 1919, pp. 11-14, 5 figs. Details of spandrel strips in flat-slab floors; examples of typical interior and exterior panels in accordance with Acme design standards.

FLOORS. Some Pointers on How to Finish a Concrete Floor, William McGinnis. Eng. News Rec., vol. 82, no. 10, March 6, 1919, pp. 477-478. Notes on use of screens and treatment of aggregate and surface.

FONDATIONS. Anchor Bolts for Foundations, Terrell Croft. Natl. Engr., vol. 23, no. 4, Apr. 1919, pp. 175-179, 11 figs. Dimensions and weights of materials used. (To be continued).

HOTELS. The Hotel Pensylvania, New York. Am. Architect, vol. 115, no. 2253, Feb. 26, 1919, pp. 297-306, 14 figs. Said to be largest in world.

HOUSING. Quantity House Production Methods, Construction Branch, Emergency Fleet Corporation. Am. Architect, vol. 115, no. 2254, Mar. 5, 1919, pp. 533-358, 20 figs. Organization of Housing Section. (To be continued).
Suggested Solution of Housing Problem. Contract Rec., vol. 33, no. 6, Feb. 5, 1919, pp. 119-121. Advanced by British Roy. Sanitary Inst.
Tilbury Housing — Present and Future. Surveyor, vol. 55, no. 1415, Feb. 28, 1919, pp. 159-161, 9 figs. Scheme providing for building worker's homes rapidly.
The Preparation of Housing Schemes, A. G. Wheeler. Surveyor, vol. 55, no. 1415, Feb. 28, 1919, p. 162. Suggestions to Municipal engineers and surveyors. (Concluded).
A Chepstow Housing Scheme, William Dunn and W. Curtis Green. Jl. Roy. Inst. British Architects, vol. 26, no. 2, Dec. 1918, pp. 25-38 and (discussion) pp. 38-43, 6 figs. Site is about 28 acres in extent. Details of layout of streets, number of housing per acre and other particulars are given.
Housing: The Architects' Contribution, Raymond Unwin. Jl. Roy. Inst. British Architects, vol. 26, no. 3, Jan. 1919, pp. 49-59 and (discussion) pp. 60-64, 13 figs. Various types of houses are examined from point of view of convenience and comfort.
Financing the Expected Boom in the Building Industry — III. Am. Architect, vol. 115, no. 2251, Feb. 12, 1919, pp. 241-243. Efforts of Government authorities to encourage building construction.
The Preparation of Housing Schemes, A. G. Wheeler. Surveyor, vol. 55, nos. 1412 and 1413, Feb. 7 and 14, 1919, pp. 127-128 and 144. Recommendations to municipal engineers and surveyors. (To be concluded).

MORTAR UNDER PRESSURE. Injecting Mortar Under Pressure (Les appareils pour l'Injection du mortier sous pression), L. Biette. Génie Civil, vol. 74, no. 7, Feb. 15, 1919, pp. 121-126, 15 figs. Features and operation of various types with reference to their utilization in the construction of Paris subway.
Hotel Lincoln, Indianapolis, Ind. Am Architect, vol. 115, no. 2251, Feb. 12, 1919, pp. 238-240, 11 figs. Situated on triangular lot measuring 150 ft. and 187 ft. street fronts.

ROOFS. Zinc as a Roof Covering, William Hutton. Metal Worker, no. 2360, Mar. 21, 1919, pp. 370-371, 5 figs. Suggestions based upon practice in European contries.

SCHOOL. The Scarboro-on-Hudson School, Welles Bosworth. Am. Architect, vol. 115, no. 2258, Apr. 2, 1919, pp. 477-480, 4 figs. Architectural features.
Methods, Economies and Standardization in Preparation of Plans for School Buildings, Clarence E. Dobbin. Eng. & Contracting, vol. 51, no. 13, Mar. 26, 1919, pp. 313-314, 1 fig. Plea for uniform practice. From paper presented before Mun. Engrs. of City of N. Y.

SHEET STEEL. A Structural Material Made of Thin Sheet Steel. Am. Architect, vol. 115, no. 2251, Feb. 12, 1919, pp. 249-254, 12 figs. Describes joists studs, sills and caps made of said material embedded in concrete.

STANDARDIZATION. The Standardization of Building Products, Robert D. Kohn. Am. Architect, vol. 115, no. 2258, Apr. 2, 1919, pp. 498-500. Advocated as means to insure production speed in housing work.

STORAGE TANKS. Storage Tanks made of Reinforced Concrete, F. W. Frerichs. Chem. & Metallurgical Eng., vol. 20, no. 5, March 1, 1919, pp. 234-236, 3 figs. Details of large installation of concrete tanks; tests on permeability for water and ammoniacal liquor; drawings, construction, and costs. Before Chicago meeting, Am. Inst. Chem. Engrs.
Design and Construction Features of Concrete Oil Storage Tanks, C. W. Van Dyke. Eng. & Contracting, vol. 51. no. 13, Mar. 26, 1919, pp. 304-305, 4 figs. Particulars of 182,000-gal. fuel-oil tank of American Brakeshoe Co.

STRUCTURES, THEORY OF. On a New Principle in the Theory of Structures, George F. Swain. Proc. Am. Soc. Civil Engrs., vol. 45, no. 3, Mar. 1919, (paper and discussion), pp. 75-91, 13 figs. Mathematical formula to determine angular rotation at a point, derived by a method analogous to that used for finding the deflection for any point of a structure in any given direction.

SWIMMING POOLS. Swimming Pools for Public Schools, C. E. Dobbin. Am. Architect, vol. 115, no. 2253, Feb. 26, 1919, pp. 319-328, 8 figs. Arrangement and details.

WAREHOUSE. Industrial Building Construction in Trafford Park. Engineer, vol. 127, no. 3292, Jan. 31, 1919, pp. 98-100, 11 figs. Warehouse with capacity of 10,000 tons of frozen produce, erected to comply with the requirements of Ministry of Food.

CEMENT AND CONCRETE

BLENDED PORTLAND CEMENT. An Investigation of Blended Portland Cement, School of Mines & Metallurgy, University of Missouri, vol. 4, no. 4, May. 1918, pp. 1-76, 33 figs. Study of behavior of sand blended cement. From tests at Mo. School of Mines.

CEMENT GUN. Tests on Cement Gun Products, Bryan C. Collier. Contract Rec., vol. 33, no. 10, March 5, 1919, pp. 216-218. Modulus of rupture determined for slabs having various ages.

CONSISTENCY MEASUREMENT. Concrete Consistency Measured by New Device, Herbert A. Davis. Eng. News Rec., vol. 82, no. 13, Mar. 27, 1919, pp. 603-605, 6 figs. Method developed for construction of concrete ships determines amount of water to use in field operations.

FLUE DUST. Double Salts of Calcium and Potassium and Their Occurrence in Leaching Cement Mill Flue Dust, E. Anderson. Jl. Indus. & Eng. Chemistry, vol. 11, no. 4, Apr. 1, 1919, pp. 327-332, 3 figs. Formation of potassium penta-calcium sulfate.

HOLLAND. New Dutch Instructions Relative to Reinforced Concrete Construction (Les nouvelles instructions hollandaises relatives aux constructions en béton armé). Génie Civil, vol. 74, no. 9, Mar. 1, 1919, pp. 171-173, 10 figs. Regulations published by the Roy. Inst. Engrs.

MIXING. Effect of Quantity of Mixing Water and Curing Conditions on the Strength and Wear of Concrete. Eng. & Contracting, vol. 51, no. 13, Mar. 26, 1919, pp. 309-312, 9 figs. Deductions obtained from tests made at Lewis Inst., Chicago.

PNEUMATIC CONCRETING. The Pneumatic Method of Concreting, H. B. Kirland. Jl. Western Soc. Enger., vol. 23, no. 5, May 1918, pp. 319-349 and (discussion), pp. 349-355, 23 figs. Method consists in blowing batches of concrete through a pipe from a central point of supplies to their place in the concrete forms.

PRECAST CONSTRUCTION. Concrete Moulding Plant, Pennsylvania R. R. Ry. Rev., vol. 64, no. 12, Mar. 22, 1919, pp. 425-432, 14 figs. Facilities placed-in operation for the purpose of manufacturing precast reinforced-concrete members for erection of buildings and construction of bridges, and also for turning out concrete fence posts and telegraph.

QUICK-HARDENING CEMENT. The Hydraulic Properties of the Calcium Aluminates, P. H. Bates. Jl. Am. Ceramic Society, vol. 1, no. 10, Oct. 1918, pp. 679-696, 5 figs. Tests are reported to have shown that it is possible to make cements giving 24 hours strengths as high as those developed by Portland Cements in in 28 days. This quick-hardening cement is said to consist of calcium aluminate high in alumina (55 to 75 per cent).

REINFORCED-CONCRETE STRUCTURES. Theory of Reinforced-Concrete Structures (Calculo de estructuras de hormigon armado), Julio R. Castinciras. Universidad Nacional de la Plata, Publicaciones de la Facultad de Cienias Fisicas, Matematicas y Astronomicas, vol. 1, no. 35, May 1918, pp. 373-454, 55 figs. Formulæ and theorems applicable to beams under simple flexure. (Continuation of serial).

REINFORCING ELEMENTS. New Accepted Form of Reinforcing Metal in Concrete (Sur une nouvelle forme canonique des massifs armés), Charles Rabut. Comptes rendus des séances de l'Académie de Sciences, vol. 168, no. 1, Jan. 6, 1919, pp. 50-53. Value of plates in reinforcing; claimed advantages over bars.

SLAG CONCRETE. Blast Furnace Slag in Concrete and Reinforced Concrete, J. E. Stead. Eng. World, vol. 14, no. 6, Mar. 15, 1919, pp. 25-27. Oxidation of sulphides in slag; conditions under which slag concrete has failed; suggestions for production of reinforced concrete.

UNDERGROUND WORK. The Use of Concrete in Underground Work, Chem. Eng. & Min. Rev., vol. 11, no. 125, Feb. 5, 1919, pp. 130-132, 3 figs. Work done by Wallaroo and Moonta Mining & Smelting Co., Ltd.

UNDERWATER WORK. Methods of Depositing Concrete under Water. Eng. & Contracting, vol. 51, no. 13, Mar. 26, 1919, pp. 307-308. Report submitted at convention of Am. Ry. Eng. Assn.

WASTEFUL CONSTRUCTION. Useless Waste in Concrete Construction Due to Legal Requirements, W. Stuart Tait. Am. Architect, vol. 115, nos. 2250 and 2251, Feb. 5 and 12 1919, pp. 211-212 and 254-256. Ruling for column design adopted by Am. Concrete Inst. Feb. 12: Comparison of concrete regulations with Lloyd's factors of safery for ship structures.

EARTHWORK, ROCK EXCAVATION, ETC:

COFFERDAMS. Cofferdam and River Wall Construction, T. E. Thain. Practical Engr., vol. 59, no. 1672, Mar. 13, 1919, pp. 124-127, 16 figs. Particulars of dam designed for dock works, where it is proposed to dam up a dock.

DAMS. The East Canyon Creek Dam, A. F. Parker. Proc. Am. Soc. Civil Engrs., vol. 45, no. 3, Mar. 1919. Papers and Discussions, pp. 93-113, 4 figs. Design and construction of arched concrete dam.
Conditions of Stability and Suggested Design for Wooden Dam Built on Sand. Eng. & Contracting, vol. 51, no. 11, Mar. 12, 1919, pp. 261-262. Dam is to be built on very permeable sand.
Recent Multiple Arch Dams, John S. Eastwood. Jl. Electricity, vol. 42, no. 6, Mar. 15, 1919, pp. 263-266, 3 figs. Data on four structures of this type.

DREDGE, HYDRAULIC. Operating a Hydraulic Dredge Under Difficulties, Albert S. Fry. Eng. News Rec., vol. 82, no. 9, Feb. 27, 1919, pp. 410-414, 7 figs. Excavation used to dig out log-filled earth in channel which had been filled up by slipping of spoil banks.

EXCAVATION, BALANCING. Economic Balancing of Highway Excavation by a Semi-Graphic Method, Dudley S. Babcock. Eng. News-Rec., vol. 82, no. 8, Feb. 20, 1919, pp. 361-364, 6 figs. Device called "trace curve" used in designing Storm King Highway of N. Y. State Highway Dept.

FILLS. Dump Cars and Wagons Enlarge Railway Fills. Eng. News-Rec., vol. 82, no. 9, Feb. 27, 1919, pp. 419-420, 2 figs. Methods of raising and widening fills.

TUNNEL, HUDSON RIVER. Vehicular Tunnels under the Hudson River. Martin Schreiber. Jl. Franklin Inst., vol. 187, no. 3, Mar. 1919, pp. 273-288 9 figs. Necessity of constructing proposed tunnel is emphasized principally by the fact that out of a total of 40,000 miles of terminal railway within the metropolitan area, 29,000 miles are on the Jersey side. Views, details, and location of various projects for tunnel and bridge are given.

TUNNELS. Principles and Scientific Rules for Designing Long Tunnels Under Water Courses (Principes et règles scientifiques pour l'établissement des longs tunnels sous nappe d'eau), Charles Rabut. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no.4, Jan. 27, 1919, pp. 220-221. Subordination of plans, profile, and all other details of project to preventing inundation, or in case it happens, to avoid loss of human life by providing suitable means such as accessory exploration galleries, etc.
Regulations for Constructing Long Tunnels Under Water Courses (Règles à suivre pour l'établissement des longs tunnels sous nappe d'eau), M. Lecornu. Génie Civil, vol. 74, no. 6, Feb. 8, 1919, p. 114. Rules intended to prévent inundation. Read before the Académie des Sciences.

ROADS AND PAVEMENTS

ASPHALTIC CONCRETE PAVEMENTS. Two Types of Hard Surface Roads Successfully Employed in New Hampshire, Frederic E. Everett. Mun. & County Eng., vol. 56, no. 3, Mar. 1919, pp. 80-81. Service given by asphaltic concrete pavement.

BITUMINOUS PAVEMENTS. Efficiency of Bituminous Surfaces and Pavements. Under Motor Truck Traffic, Prevost Hubbard. Mun. & County Eng., vol. 56, no. 3, Mar. 1919, pp. 98-100. Rates increasing efficiency of bituminous types as follows: Bituminous surfaces, bituminous macadam, bituminous concrete, sheet asphalt and asphalt block. Also in Good Roads, vol. 17, no. 11, Mar. 15, 1919, pp. 117-119; Can. Engr., vol. 26, no. 10, Mar. 1919, pp. 117-119.

BRICK PAVEMENTS. Present Status of Brick Pavements Constructed with Sand Cushions, Cement Mortar Beds and Green Concrete Foundation, Wm. M. Acheson. Mun. & County Eng., vol. 56, no. 3, Mar. 1919, pp. 103-105. Changes in design since 1915.

BUREAU OF PUBLIC ROADS. Operations of the Bureau of Public Roads Under the Federal Aid-Road Act, P. St. J. Wilson. Good Roads, vol. 17, no. 9, Mar. 1, 1919, pp. 97-98. What has been done in regard to individual federal aid projects. Presented at convention Am. Road Builders' Assn.

CANADA. Roads in Coleman Township, H. J. Routly. Can. Engr., vol. 26, no. 10, Mar. 6, 1919, pp. 274 and 286-287, 4 figs. History, developments, improvements and organization of personnel. Ontario Land Surveyors.

CHICAGO. Recent Developments in Design and Construction of Pavements in Chicago, H. J. Fixmer. Mun. & County Eng., vol. 56, no. 3, Mar. 1919, pp. 92-94, 2 figs. Layout of central concrete-mixing plant.

COST-KEEPING. Cost-Keeping for Highway Contractors, Albert B. Gillette. Can. Engr., vol. 26, no. 10, Mar. 6, 1919, pp. 282-283. Recommends securing daily reports that show the total unit cost of every item on which contractor has bid a unit price. Before Convention of the Am. Road Builders' Assn.
Some Points to Observe in the Construction of Concrete Roads, William W. Cox. Mun. & County Eng., vol. 56, no. 3, Mar. 1919, pp. 105-106. Concerning drainage, preparation of sub-grade, selection of materials, workmanship and designing.

DUSTLESS ROADS. Smooth Dustless Roads Maintained by Gang System. Eng. News Rec., vol. 82, no. 11, Mar. 13, 1919, pp. 526-528, 3 figs. Bituminous carpet placed on macadam highways said to prove satisfactory metal on such roads.

ENGLAND. Highway Work in Nottinghamshire During the War, J. Cracroft Haller. Surveyor, vol. 55, no. 1410, Jan. 24, 1919, pp. 47-48. Description of reconstruction and maintenance of roads in the county of Notts from 1915-1918.

FINANCING. Efficient Methods of Promoting Bond Issues, S. E. Bradt. Good Roads, vol. 17, no. 13, Mar. 29, 1919, pp. 139-140. Considerations generally taken up in issuing state bonds for highway construction.

DRAINAGE. Drainage Methods for Country Roads. Contract Rec., vol. 33, no. 6, Feb. 5, 1919, pp. 110-114, 2 figs. Discussion of foundations and drainage suitable to various soils found in highway construction.

FOUNDATIONS. Road Foundations, Drainage and Culverts, Geroge Hogarth. Contract Rec., vol. 33, no. 10, March 5, 1919, pp. 197-199, 19 figs. Examples of various constructions. Also in Can. Engr., vol. 26, no. 10, Mar. 6, 1919, pp. 284-285, 6 figs.

GOOD ROADS. The Road: Its Paramount Importance, J. H. A. MacDonald. Better Roads & Streets, vol. 8, no. 10, Oct. 1918, pp. 376-379. Military value of good roads.
The Interrelationship of Highways, Railways and Waterways, George H. Pride. Good Roads, vol. 17, no. 12, Mar. 22, 1919, pp. 127-128. Presented at convention Am. Road Builders' Assn.

GRADE CROSSINGS. Grade Crossing Elimination in New York City, William L. Selmer, Mun. Engrs. Jl., vol. 5, no. 3, Mar. 1919, pp. 1-21, 10 figs. Progress made by Public Service Commission for First District during the 11½ years of its existence.

GRANITE BLOCK PAVEMENTS. Some Suggestions on the Proper Construction of Granite Block Pavements, Albert T. Rhodes. Mun. & County Eng., vol. 56, no. 3, Mar. 1919, pp. 106-110, 7 figs. Suggestions based on differences of production in Northern and Southern quarries.

INDIANA. Provisions of Proposed Indiana Highway Law. Good Roads, vol. 17, no. 7, Feb. 15, 1919, pp. 58-60. Summary of test of bill introduced in Indiana Senate pr viding for establishment of state highway commission, state system of highways and state highway fund.

KANSAS. Some features of Highway Work in Kansas, M. W. Watson. Mun. & County Eng., vol. 56, no. 3, Mar. 1919, pp. 86-88, 3 figs. State Highway Commission created by legislature.

LABOR. Sources of Supply of Unskilled Labor for Highway Work. Good Roads, vol. 17, no. 10, Mar. 8, 1919, pp. 111 and 114-115. From reports of state highway departments, city departments and contractors, it is stated that there will be sufficient supply of unskilled labor for highway projects during coming season and at wages lower than those prevailing during season of 1918. Committee report of Am. Road Builders' Assn. Also in Eng. News Rec., vol. 82, no. 10, Mar. 6, 1919, pp. 466-467.

MACADAM ROAD RECONSTRUCTION. Building New Concrete Shoulders to Preserve the Old Macadam Roads of Marylamd, John N. Mackall. Mun. & County Eng., vol. 56, no. 3, Mar. 1919, pp. 79-80, 3 figs. Preserving old macadam roads constructed before coming of extremely heavy motor traffic of to-day.
The Reconstruction of Worn Out Macadam Upon a State Road in Rhode Island, I. W. Patterson. Mun. & County Eng., vol. 56, no. 3, Mar. 1919. pp. 81-83, 1 fig. Difficulties encountered in reconstructing; imperfect drainage; resurfacing macadam roads built originally with coarse-grained granite.

MAINTENANCE. System Without Red Tape Makes Success of Day Labor Road Maintenance. Eng. News Rec., vol. 82, no. 8, Feb. 20, 1919, pp. 384-386, 3 figs. Weekly return form to show status of each job.
Methods of Maintaining Highway Systems Prior to Construction by State or County, Frederic E. Everett. Good Roads, vol. 17, no. 13, Mar. 29, 1919, pp. 137-138. Practice followed at New Hampshire. Paper presented before Am. Road Builders' Assn.

MICHIGAN. Low Hauling Cost and No Waste of Material on Construction of Michigan Roads. Better Roads & Streets, vol. 8, no. 10, Oct. 1918, pp. 380-381, 1 fig. Layout of Lake Shore road job; number of men required; material-handling system.

REPAIRS. Repairing Pavement Openings. Mun. Jl., vol. 46, no. 12, Mar. 22, 1919, pp. 215-218, 2 figs. Practices of various cities as to methods of restoring pavements.

STREETS. Street System; Their Relation to Highways Outside of Urban Districts, Nelson P. Lewis. Good Roads, vol. 17, no. 9, Mar. 1, 1919, pp. 99-100. Concerning exit from a city to system of roads outside it. Presented at convention Am. Road Builders' Assn.

STREET CLEANING. Recommended Procedure in Cleaning Streets in Rochester, N. Y., James W. Routh. Mun. & County Eng., vol. 56, no. 3, Mar. 1919, pp. 90-91. Criticism of common methods of street cleaning with reference to conditions in Rochester.

SURFACES. Build Permanent Road Surfaces, R. Crawford Muir. Contract Rec., vol. 33, no. 10, March 5, 1919, pp. 200-204, 17 figs. Analysis of methods of constructing the various types of surfaces; importance of gaging amount of future traffic.

TEMPERATURE OF ROAD SURFACES. High Relative Temperatures of Pavement Surfaces, G. S. Eaton. Eng. News-Rec., vol. 82, no. 13, Mar. 27, 1919, pp. 633-634, 3 figs. Observations made by engineer of Universal Portland Cement Co. on surface temperatures of various types of surfacing and variation between these surfaces and adjacent localities.

VIRIFIED BRICK. Vitrified Brick. Construction for Heavy Motor-Truck Traffic, W. M. Acheson. Eng. News-Rec., vol. 82, no. 10, March 6, 1919, pp. 467-468. Advantages claimed for brick pavements of monolithic type.

WIDTH. Wider-Pavements Needed by Motor Vehicles at Curves, G. S. Eaton. Eng. News-Red., vol. 82, no. 10, March 6, 1919, pp. 461-462, 3 figs. Graph of theoretical and recommended widths of lane for various radil.

SANITARY ENGINEERING

CAMP DRAINAGE. Camp Drainage and Sanitation W. H. Beswick. Jl. Roy. Sanitary Inst., vol. 39, no. 2, Oct. 1918, pp. 70-74. Outline of work done at Salisbury Plain Camps.

GARBAGE DISPOSAL. Baltimore Adopts Feeding Method for Garbage Disposal. Eng. & Contracting, vol. 52, no. 11, March 12, 1919, pp. 258-259, 1 fig. Specifications of city of Baltimore garbage Disposal. Also in Mun. & County Eng., vol. 56, no. 3, Mar. 1919, pp. 96-98.
Suggestions for Improvements in Apparatus and Appliances for Dealing with House Refuse, James Jackson. Surveyor, vol. 55, no. 1415, Feb. 28, 1919, pp. 180-181. Concerning the assignation of special charges and daily removal of refuse.

SEWAGE DISPOSAL. Sewage Disposal Works at London, Ontario, Willis Chipman. Can. Engr., vol. 26, no. 10, March 6, 1919, pp. 269-274, 12 figs. Two-story, non-reversible sedimentation tanks and enclosed filters with fixed spray nozzle.
St. Catherine's Relief Sewage System, D. H. Fleming. Contract Rec., vol. 33, no. 8, Feb. 19, 1919, pp. 178-181, 12 figs. Details of tunnels, manholes, etc.
Sewage Disposal at Manchester. Surveyor, vol. 55, no. 1408, Jan. 10, 1919, pp. 17-18. Activated sludge investigations; results of operation.

SEWERS. Rideau River Intercepting Sewer, Ottawa, L. McLaren Hunter. Can. Engr., vol. 36, no. 1, Jan. 2, 1919, pp. 105-106 and 111, 6 figs. Map showing areas drained; method of supporting pipe under fill; operation in laying 40-in. concrete pipe.

STREET CLEANING. Street Cleaning Methods. Mun. Jl., vol. 46, no. 6, Feb. 8, 1919, pp. 101-104, 4 figs. Sweeping by machine and hand, flushing and sprinkling. Report of Rochester Bureau of Municipal Research. (To be continued).

WATER SUPPLY

CONDUCT DESIGN. Economical Section of Water Conduct for Power Development, Cary T. Hutchinson, Mech. Eng., vol. 41, no. 4, Apr. 1919, pp. 369-371, 2 figs. Method of determining economical section of water conduit for supplying water to a power plant.

FACTORY WATER SUPPLY. What It Pays to Know About Factory Water Supply, Charles L. Hubbard. Factory, vol. 22, no. 3, March 1919, pp. 453-455, 3 figs. On insuring against well going dry.

FLOOD CONTROL. Colorado River Flood Control by Storage, E. C. La Rue. Eng. News Rec., vol. 82, no. 10, Mach 6, 1919, pp. 456-461, 7 figs. It is claimed that reservoirs at various sites would so cut flood at Yuma as to control Imperial Valley.

FREEZING OF RESERVOIR. The Freezing of a Reservoir Outlet Works, Gilbert Christie. Surveyor, vol. 55, no. 1408, Jan. 10, 1919, pp. 19-20, 2 figs. Operations to restore supply. Paper before Instn. Water Engrs.

RAILWAY WATER SUPPLY. Modern Water Supply Plant on Southern Railway System. Railroad Herald, vol. 23, no. 3, Feb. 1919, pp. 52-54, 1 fig. Sedimentation basin of 2,500,000 gal. capacity, installed to provide improved water supply for operation of locomotives.

WATER TREATMENT. Results of Application of Chloramine Process to Catskill (Esopus) Water of New York City, Frank E. Hale. Eng. & Contracting, vol. 51, no. 11, March 12, 1919, pp. 262-264, 3 figs. Process consists in combining bleach with ammonia just before applying to the water treated.

Chlorine Absorption and the Chlorination of Water. Abel Wolman and Linn H. Enslow. Jl. Indus. & Eng. Chem., vol. 11, no. 3, Mar. 1, 1919, pp. 209-213, 3 figs. Results of the study of the question of chlorination control in Maryland.

Design and Performance of the Iron Removal Plant for Laundry Water at State School, Sparta, Wis., W. G. Kirchoffer. Mun. & County Eng., vol. 56, no. 3, Mar. 1919, pp. 88-90, 3 figs. Removal of iron from deep-well water by aeration, coke and treated sand filter.

WATER-WORKS OPERATION. Water Works Operation: Reservoir Maintenance. Mun. Jl., vol. 46, no. 6, Feb. 8, 1919, pp. 105-107, 1 fig. Collection of sediment in reservoirs and methods of removing it.

WATERWAYS

CANALS. Construction of a Lateral Canal at Allier (Construction d'un canal latéral à l'Allier), René Travernier. Houille Blanche, nos. 23-24, Nov.-Dec. 1918, pp. 337-338. Study of a joint commission of the Departments of Allier and Puy de Dome.

The Rhone-Rhine Canal (Le canal du Rhône au Rhin). Huille Blanche, nos. 23-24, Nov.-Dec. 1918, pp. 334-336. History of project. From Bulletin Hebdomadaire de la Navigation et des Ports Maritimes, Aug. 4 and 11, 1918.

The Cher Hydraulic System (Contribution à la détermination du régime hydraulique du Cher), P. Moriu. Revue Générale de l'Electricité, vol. 5, no. 11, Mar. 15, 1919, pp. 417-418, 3 figs. Concerning supplying Berry caual at point near bridge from Cher to Montluçon.

FLOODS. On the Gradually Varying Movement and the Propagation of Floods (Sur le mouvement graduellement varié et la propagation des crues), Edmond Maillet. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 5, Feb. 3, 1919, pp. 266-268. Suggests, no. 5, Feb. 3, 1919, pp. 266-268. Suggests modification of Boussinesq's equations.

INLAND WATERWAYS. What the Government Did in Inlaud Waterway Navigation. Eng. News-Rec., vol. 82, uo. 10, March 6, 1919, pp. 480-481. Abstract of Director General of Railroads' report ou progress made during 1918 on waterways taken over by his administration.

MISSISSIPPI RIVER. Revival of Mississippi River Traffic — III. M. von Pagnchardt. Int. Mar. Eng., vol. 24, no. 4, Apr. 1919, pp. 295-297, 4 figs. Structural features of barge terminal at St. Louis; arrangements of cargo-handling machinery.

STREAM FLOW. Stream Flow and Percolation Water, Samuel Hall. Surveyor, vol. 55, nos. 1408 and 1409, Jan. 10 and 17, 1919, pp. 15-16 and 35-37, 5 figs. Sources of supply due to percolation. Paper before Instn. Water Engrs.

STREAM REGULATION. Meteorology aud Stream Regulation, W. F. V. Atkinson. Can. Engr., vol. 36, no. 1, Jan. 2, 1919, pp. 101-103, 1 fig. Chart showing direct effect of weather on flow and indirect effect through protection of forest growth; utilization of data concerning wind, temperature, precipitation and barometer records in fighting forest fires.

RECLAMATION AND IRRIGATION

CONCRETE. Concrete Box Flume Carried Across Gulch ou Trestle, A. W. Collins. Eng. News Rec., vol. 82, no. 10, March 6, 1919, pp. 463-464, 2 figs. Substitution of concrete for steel in irrigation system at Hawaii.

DITCH. Hydraulic Efficiency of a Drainage Ditch for Five Different Channel Conditions, C. E. Ramser. Eng. News Rec., vol. 82, no. 11, Mar. 13, 1919, pp. 522-523, 5 figs. Data of various channels.

DRAINAGE. Land Drainage in Cambridgeshire. Engineer, vol. 127, no. 3295, Feb. 21, 1919, pp. 174-176, 10 figs. Details of work on river and fen improvement.

IRRIGATION CANAL CLEANING. Removing Algæ from a California Irrigation Canal, E. Court Eaton. Eng. News Rec., vol. 82, no. 8, Feb. 20, 1919, pp. 382-383, 1 fig. Rotary screen with water jet and heavy dose of agent.

MOROCCO. The Hydraulic Wealth of Occidental Morocco (Les richesses hydrauliques du Maroc Occidental), P. Penet. Houille Blanche, nos. 23-24, Nov.-Dec. 1918, pp. 338-351, 8 figs. Possible industrial utilization; utilization of waters in agriculture; suggested program of study.

RECLAMATION WORK. Reclamation Work on the Key System, Chas. Christopher. Traction, vol. 15, no. 3, Mar. 15, 1919, pp. 189-190 and 194-195, 4 figs. Installation of electromagnet and Brownhoist for handling scrap material.

SURVEYING

POINT DETERMINATION. Errors in Position of a Point (Sur les erreurs de situation d'un point), Alf. Guldberg. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 3, Jan. 20, 1919, pp. 153-155. Concerning probability of error in position of point determined by rectangular coordinates in series of continuous observations.

GENERAL SCIENCE

CHEMISTRY

ANALYSIS. Notes on Chemical Standards and Their Bearings on the Unification of Analysis, C. H. Ridsdale. Jl. Soc. Chem. Indus., vol. 38, no. 3, Feb. 15, 1919, pp. 15T-25T and (discussion) pp. 25T-26T. General study of discrepancies in chemical analysis, and writer's experiences on the preparation and issue of analytical steel standards, both private and prepared on wider basis.

The Accurate Determiuatiou of Carbon Monoxide in Gas Mixtures, J. Ivor Graham. Jl. Soc. Chem. Indus., vol. 38, no. 2, Jan. 1919, pp. 10T-14T, 2 figs. Methods of determination by means of iodine pentoxide, based on reaction $3CO + I_2 - O_5 = CO_2 + I_2$.

COLLOIDS. The Degree of Dispersion of Colloids and Its Determiuation, George King. Jl. Soc. Chem. Indus., vol. 38, no. 2, Jan. 31, 1919, pp. 4T-7T. Ultramiscroscopic methods of determining dispersion in colloids.

Properties of the Colloid State and Their Application ot Iudustry, W. C. McC. Lewis. Jl. Soc. Chem. Indus., vol. 38, no. 2, Jan. 31, 1919, pp. 1T-4T. Holds Laplace's fondemental assumption in regard to field of attraction round a molecule as ineffective for explaning colloidal phenomena.

ELEMENT. The Classification of the Chemical Elements, Ingo, W. D. Hackh. Sci. Am. Supp., vol. 87, no. 2253, Mar. 8, 1919, pp. 146-149, 3 figs. Presents three arrangements: According to increasing atomic number or atomic weight; a periodic spiral obtained by bending pevodic chain so that elements of similar properties come together; and tabular arrangement representing a "chart of matter" where position of element indicates the properties.

The Conception of the Chemical Element as Enlarged by the Study of Radioactive Change, Frederick Soddy. Jl. Chem. Soc., no. 657, Jan. 1919, pp. 1-26, 2 figs. Transmutational character of radioactive change; history of the analysis of matter; radioactive chauge aud the periodic law; origin of actinium; different varieties of isotopes and hetorotopes.

FLAVORING MATTERS. The Chemistry of Flavoring Matters, François Barral. Sci. Am. Supp., vol. 87, nos. 2251 and 2252, Feb. 22 and Mar. 1, 1919, pp. 114-115 and 134-135. Relationship between constitution of a body aud its taste. From Revue Scientifique.

GAS REACTIONS. The Influence of Temperature on Homogeneous Gas Reactious, George W. Todd. Lond., Edinburgh and Dublin Phil. Mag., vol. 37, no. 218, Feb. 1919, pp. 224-230. Deduction from Maxwell's distribution theory of an expression of the number of gas molecules per cc. having velocities greater than an assumed value.

NITROUS VAPORS. Constitution of Nitrous Vapors (Sur la constitntion fes vapeurs nitreuses), P. Jolebois and A. Sanfourche. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 4, Jan. 27, 1919, pp. 235-237. Laboratory examination of couditions under which NO_2 and air unite to form N_2O_3 and subsequent phenomena following combination.

TUNGSTIC OXIDE. The Reduction of Tungstic Oxide, C. W. Davis. Jl. Indus. & Eng. Chem., vol. 11, no. 3, Mar. 1, 1919, pp. 201-204. Result of experimental work.

WATER ABSORPTION BY GELATINE. Investigations on the Absorption of Water by Gelatine, Edith B. Shreve. Jl. Franklin Inst., vol. 187, no. 3, March 1919, pp. 319-337. Work on imbibitional colloidal pheuomena. It is reported that within the temperature range of 10 to 35 deg. Cent. heat favors the imbibition of water by gelatine, although reaction is exothermic.

MATHEMATICS

CONTINUOUS FRACTIONS. On Two Extensions of Algebraic Continuous Fractions (Sur deux extensions des fractions continues algébriques), M. A. Angelesco. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 5, Feb. 3, 1919, pp. 262-266. Concerning Hermite's generalization of continuous fractions.

DIFFERENTIATION. Differentiatiou with Respect to a Function of Limited Variation, P. J. Daniell. Tran. Am. Math. Soc., vol. 19, no. 4, Oct. 1918, pp. 353-362. Definition of derivative corresponding to Stieltje's integral as generalized by Lebesgue. (Comptes rendus des séances de l'Académie des Sciences, vol. 150, 1910, p. 86). Fundamental property of derivative is proved by means of modification of Vitah's theorem.

EQUATIONS. Irregular Singularities of Linear Differential Equations (Sur les singularités irregulières des équations différentielles linéaires), René Garnier. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 3, Jan. 20, 1919, pp. 142-144. Extends to linear differential equations of any order, propositions established for equations of second order in Comptes rendus, vol. 164, 1917, p. 265 and vol. 166, 1918, pp. 103 and 602.

On Equations with Partial Derivatives (Sur les equations aux dérivées partielles), H. Duport. Comptes des séances de l'Académie des Sciences, vol. 168, no. 1, Jan. 6, 1919, pp. 45-46. Generalization of integration of Laplace's equation.

Linear Integro — Differential Equations with a Boundary Condition, Minfu Tah Hu. Tran. Am Math. Soc., vol. 19, no. 4, Oct. 1918, pp. 363-407. Treated as limit of system of n tinear differential equations of first order.

Concerning The Zeros of the Solutions of Certaiu Dlfferential Equations, William Benjamin Fite. Tran. Am. Math. Soc., vol. 19. no. 4, Oct. 1918, pp. 341-352. Discusses oscillation of solutions of various types of linear equations of second order. Claims that Kneser's conclusions (Mathematische Annaleu vol. 42) hold when m is restricted merely to being less than n.

Algebraic Solutions of Differential Equations of the First Order (Sur les solutions algébriques des équations différentielles du premier ordre), Jules Drach. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 4, Jan. 27, 1919, pp. 212-215. Conditions under which $X\,dy - Tdx = 0$ possesses algebraic particular solutions.

FUNCTIONS. Approximation Polynomials and the Existence of Derivatives (Sur les polynomes d'approximation et l'existence des derivées), Paul Montel. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 4, Jan. 27, 1919, pp. 215-217. Theorem establishing relation between differential properties of function to order of nearest approximation u (n) of this function by polynomial of degree inferior or equal to n.

Fundamental Geometric Magnitudes. Fundamental Geometric Magnitudes of Euclidian Space (Les géométries fondamentales de l'espace euclidien), René de Saussure. Archives des Sciences Physiques et Naturelles, year 124, vol. 1, Jan.-Feb. 1919, pp. 29-47. Study of figures possible in one-dimensional space and of quantitatives of two and three parameters. (To be continued).

Implicit Functions. Implicit Functions (Sur les fonctions de lignes implicites), Paul Lévy. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 3, Jan. 20, 1919, pp. 149-152. Conditions under which inversion of point transformation is constant and uniform.

Integration. On the Analytical Extension of the Integrals of Certain Systems of Equations to the Linear Partial Derivatives (Sur le prolongement analytique des intégrales de certains systèmes d'équations aux dérivées partielles linéares), M. Riquier. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 3, Jan. 20, 1919, pp. 144-147. Considers as illustrative example case of five independent variables in seven arbitrary functions.

Quadries. On the Deformation of Quadries (Sur la déformation des quadriques), C. Guichard. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 4, Jan. 27, 1919, pp. 200-204. Homographic transformation of parametric functional quantic. Determination of integral systems by Laplace's method.

Ruled Surfaces. Trajectories and Flat Points on Ruled Surfaces, J. K. Whittemore. Bul. Am. Math. Soc., vol. 25, no. 5, Feb. 1919, pp. 223-229. Determination of point of ruled surface, with real rulings, where curvature of every normal section is zero.

Spiral Minimal Surfaces. Spiral Minimal Surfaces, J. K. Whittmore. Tran. Am. Math. Soc., vol. 19, no. 4, Oct. 1918, pp. 315-330. Study of Minding parallels and meridians of minimal surfaces with reference to Z axis.

PHYSICS

Acoustics. New Value of Velocity of Sound in Open Air (Sur une nouvelle détermination de la vitesse du son à l'air libre), Ernest Esclangon. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 3, Jan. 20, 1919, pp. 165-167. From various outside measurements under different conditions writer's value reduced to 15 deg. cent. in dry air becomes 339.9 m. per sec., 1115.15 ft. per sec.

Tables of the Zonal Spherical Hermonic of the Second Kind Q_1 (z) and Q_1' (z), A. G. Webster and Willard Fisher. Proc. Natl. Acad. Sciences, vol. 5, no. 3, Mar. 15, 1919, pp. 79-82. Tables prepared in connection with investigations in regard to submarines.

Aggregation. Investigations Dealing with the State of Aggregation. Part IV.—The Flocculation of Colloids by Salts Containing Univalent Organic Ions, S. B. Schryver and Nita E. Speer. Proc. Roy. Soc., vol. 90, no. B631, Feb. 17, 1919, pp. 400-414. Deals with surface tension of solution and relationship between this property and capacity of salts for flocculating colloids.

Critical Phenomena. Critical Phonomena, William R. Fielding. Chem. News, vol. 117, no. 3063, Dec. 20, 1918, pp. 379-383. Attempt to obtain general formula connecting critical temperature of a gas and its critical pressure.

Crystallography. Molecular Orientations in Physics and in Crystallography, Albert Perrier. Sci. Am. Supp., vol. 87, nos. 2245 and 2246, Jan. 11 and 18, 1919, pp. 18-19 and 46-48, 1 fig. Investigations of matter based on fundamental concepts of anisotropy. Address before Helvetian Soc. Nat. Sciences, Zurich. From Minutes of Swiss Soc. Sci. Research, vol. 2, 1917.

Structure of Crystals in Thin Layers: New Experimental Determination of Molecular Magnitudes (Structure des cristaux en lames très minces; nouvelle détermination expérimentale des grandeurs moléculaires), René Marcelin. Annales de Physique, series 9, vol. 10, Nov.-Dec. 1918, pp. 189-194. Principle of measures is as follows: a crystalline filmis compared, in white parallel light, with quartz birefringent plate placed between two nicols; tickness of quartz plate is modified until it present same appearance as first crystal.

Electrons. Movements of Small Particles With and Against Light Rays. Engineering, vol. 107, no. 2771, Feb. 7, 1919, pp. 180-181, 5 figs. Ehrenhaft's investigations with particles of solids and liquids are said to demonstrate that the electronic charge is not the ultimate unit of electricity. From Annalen der Physik, July 12, 1918, pp. 81-132.

Flame Propagation. The Propagation of Flame Through Tubes of Small Diameter — II, William Payman and Richard Vernon Wheeler. Jl. Chem. Soc., no. 675, Jan. 1919, pp. 36-45, 2 figs. Experiments to determine the safety practice in testing miners' lamps.

Gravitation. Experimental Researches on Gravitation (Recherches expérimentales sur la gravitation), V. Crémieu. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 4, Jan. 27, 1919, pp. 227-230, 1 fig. Investigation of electromagnetic field, Hertzian field, and plane of polarization of light, in vicinity of 50-kg. led cylinder rotating 1200 r.p.m., undertaken to examine relation between gravitation and electromagnetism, which theories hold are both properties of ether.

Hail Storms. Atmospheric Electric Effects and Hailstorms, R. T. A. Innes. Tran. South Africa Inst. Elec. Engrs., vol. 9, part 10, Oct.-Nov. 1918, pp. 184-185. On prevention of hail.

Inflammability of Gas Mixtures. The Inflammation of Mixtures of Ethane and Air in a Closed Vessel: The Effects of Turbulence, Richard Vernon Wheeler. Jl. Chem. Soc., no. 675, Jan. 1919, pp. 81-94, 6 figs. Survey of experimental research by other investigators and account of results obtained by writer

Magneto-Striction. Magneto-Striction with Special Reference to Pure Cobalt — I, Howard A. Pidgeon. Phys. Rev., vol. 13, no. 3, Mar. 1919, pp. 209-337, 15 figs. Experimental curves for Wiedemann effect in specimens of pure cobalt wire, and for the purpose of comparison, results are also shown for specimens of iron and nickel subjected to the same heat treatment; hysteresis curves for iron, nickel and cobalt.

The Dilution Limits of Inflammability of Gaseous Mixtures. Part III. The Lower Limits of Some Mixed Inflammable Gaese with Air. Part IV. The Upper Limits of Some Gases, Singly and Mixed, in Air, Hubert Frank Coward, Charles William Carpenter and William Payman. Jl. Chem. Soc., no. 675, Jan. 1919, pp. 27-36, 4 figs. Accuracy of Le Chatelier's formula in calculating lower limits of inflammability; formula of an additive character for the case of upper limits of inflammability.

Oscillation. On a Theorem of Oscillation, William F. Osgood. Bul. Am. Math. Soc., vol. 25, no. 5, Feb. 1919, pp. 216-221. Concerning Bôcher's theorem involving continuous and monotonic functions.

On the Vibrations of Elastic Shells Partly Filled with Liquid. Sudhansukumar Banerji. Phys. Rev., vol. 13, no. 3, Mar. 1919, pp. 171-188, 3 figs. Problem considered in relation to theory of "musical glasses." Principle of method used in similar to that adopted by Lord Rayleigh in treating two-dimensional cases of long cylinder completely filled with liquid.

Radioactivity. Some Photometric Tests of the Brightness of Radio-Active Self-Luminous Materials, W. C. Clinton. Illuminating Engr., vol. 11, no. 11, Nov. 1918, pp. 260-262, 3 figs. Tests consisted in viewing the luminous sample through small slit in while surface illuminated by a glow-lamp maintained at a fixed P. D. and screened by suitable green-glass filter.

Radium and Radio-Activity — I, Charles H. Viol. Sci. Am. Supp., vol. 87, nos. 2256 and 2257, Mar. 29 and Apr. 5, 1919, pp. 194-195 and 214-215. Consideration of physical and chemical aspects. Presented before Phila. Section, Am. Chem. Soc., Apr. 5: Physical and chemical aspects of problem. (To be continued).

Thermodynamics. Formula for Latent Heat of Vaporization of Liquid (Formule donnant la chaleur de vaporisation d'un liquide), E. Ariés. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 4, Jan. 27, 1919, pp. 204-207. Modification of Clausius' equation by entropic relations, co-volumes estering as functions of temperature.

The Thermal Conductivity of Air, E. O. Hercus and I. H. Lady. Proc. Roy. Soc., vol. 95, no. A 668, Jan. 1, 1919, pp. 190-210, 4 figs. Attempt to establish absolute value of thermal conductivity of air by eliminating in experimentation flow of heat by conviction.

Entropy and Probality (Entropie et Probabilité), R. Fortrat. Revue Générale des Sciences, vol. 30, no. 3, Mar. 13, 1919, pp. 135-140. Problem is examined from point of view of statics and the proposition is advanced that the evolution of an isolate physical system (having constant energy involved) follows successive stages of increasing probability.

The Popularity of CONCRETE
ENGINEERING NEWS-RECORD
1008
and vigorous campaign of publicity
Reports, will give the city from 12 to
of up-to-date streets, and there
are preparing
A compilation of the road
contracts let, as reported in
ing News-Record for 10 months
1918, show $68,000,000 worth of work
The kinds of construction were
ported on approximately two-thirds of
this amount, or $43,000,000. The divi-
sions and percentages of this amount
DISTRIBUTION ACCORDING TO MATERIALS OF CONSTRUCTION
Per Cent
Concrete $12,000,000 28
Brick and Granite Block . . 8,500,000 20
Sheet Asphalt 8,500,000 20
Bituminous 7,100,000 17
Water-bound Macadam . . 5,240,000 12
Wood Block 1,000,000 2
Plank Roads 400,000 0.8
Sand-Clay and Earth . . . 95,000 0.2
Total $42,835,000 100
are shown in the accompanying table
and the monthly and geographical
visions in the diagram.
THIS authentic table — reproduced from the November 28th issue of "Engineering News-Record"—indicates clearly how high in favor Concrete is held by engineers, road commissioners and municipal authorities.
It will be noted that 28 per cent. of the total expenditure reported on for the first ten months of 1918 was devoted to Concrete paving—an amount far in excess of that devoted to any other type of pavement.
The figures given are those relating to money expended. While the proportion of Concrete work, in relation to the total, is high, it would be found still higher in actual yardage figures—for the reason that the $12,000,000 expended on Concrete paving must have bought more yardage than an equal amount expended in more expensive types of pavement.

Reduce Your Fuel Costs
FARNSWORTH DUPLEX CONDENSATION PUMP
It can be done by the installation of a
Farnsworth Condensation Pump
The Farnsworth drains lines carrying high vacuum between the engine and the condenser and will discharge the condensate to atmosphere or by the use of a small high pressure steam connection will pump the condensate to any point of use.
Large capacity provides a special service for taking care of any slugs of water that might accumulate in the exhaust line.
When the machine is in a filling position or receiving the condensation, the tank is equalized with the exhaust line and applies either high pressure steam to pump the condensate out of the tank or opens a vent valve to allow the condensation to flow to atmosphere by gravity.
This same machine will handle condensation from the exhaust line if the line should instantly change from a high vacuum to a low pressure and will pump the condensation to any point of use or to atmosphere.

The Production of Peat Fuel*

By Ernest V. Moore, A.M.E.I.C.

The most vital question in connection with peat fuel to-day, in this part of Canada particularly, is—Can a peat fuel be manufactured at a cost that will permit delivery to the consumer at a price that will be attractive alike to him and to the producer? While I cannot answer this question as definitely as I would like to do, at present, I propose to outline to you the reasons why the peat fuel industry is not already established in this country and to tell you what has been accomplished towards this end.

In 1908, I had the privilege of preparing a paper for a meeting similar to this meeting tonight and I would have liked to make this paper a continuation of my previous paper, but, since I anticipate being able to make certain definite announcements at a later date, I will prepare another paper at that time, which will be a supplement to the one already read.

For those who are not familiar with either the raw material or the fuel which has already been produced therefrom, I will endeavour to describe briefly these two materials, and I would like you to follow what I have to say with the idea of asking question for, with the limited amount of time available, this will be the most efficient way of giving you the information which you desire.

Peat is the result of incomplete decomposition, in the presence of water, of vegetable matter, consisting mostly of mosses, grasses and aquatic plants. In appearance it is a brown to black spongy or pasty mass of decayed vegetable matter. It occurs in deposits of from a few acres to many square miles in area, and in depths varying from a few feet to as much as 50 ft. It is found distributed over almost the whole of eastern Canada, but more particularly in Ontario and Quebec, where there is a marked scarcity of any other variety of fuel. A peat bog is a noticeably level tract of country, which is usually covered with a short thick growth of shrubs, and, in some cases, without any other vegetation; but, in other cases, it is more or less thickly covered with small trees, mostly spruce and tamarack. These trees, however, seldom grow to more than 4" to 6" in diameter. Immediately under this covering of shrubbery there is usually found a continuous blanket of moss and grasses, from 12" to 18" thick, which gradually turns from the green growing tops to brown decomposing and decomposed roots. The peat is found below this blanket of moss; and, in an undrained bog, it may be almost semi-fluid, which makes it in some cases dangerous, if not impossible, for a man to cross. After proper drainage, however, it will become sufficiently solid to carry a horse but, under any circumstances, the horse will be able to pull only a very light load. Even after proper drainage peat contains about 85 to 90% water, but it is difficult to believe this on seeing it excavated.

Raw peat at the Alfred Bog, where probably the most extensive operations in Canada have taken place, weighs approximately 66 lbs. per cubic foot. A short distance away from the face of a drain 8 ft. deep, the average of a number of samples of peat taken a year after the drain was made, showed that it contained 87½% water and 12½% of solids. An analysis of this dried material showed, on an absolute dry basis, 68% of volatile and combustable material, 24% to 26% fixed carbon and 5% to 7% ash. Other bogs in Ontario show from 60% to 70% volatile matter, from 18% to 27% fixed carbon and from 3.7% to 20% ash. In no case was the phosphorus content found to be over .09%, while in the majority of cases it was under .03%. In one case .9% of sulphur was found although, generally speaking, it is only about .03%. The nitrogen content in the Ontario bogs runs from 1.13% to 2.7%.

I do not wish to burden you here with more than two or three statements as to the extent and location of peat in Canada. Perhaps it will be sufficient to say that there are over 37,000 square miles of peat known to exist in

*Read at the Montreal Branch meeting, March 20th, 1919.

Canada and, of this area, 58 bogs have been examined by the Canadian Government, Department of Mines. This Department has mapped out about 170,000 acres and has taken samples and soundings over these areas in such a way as to make it possible for one to form a very reliable estimate as to the quantity of fuel a bog will produce and an approximate estimate of the quality of the peat. An acre of peat 1 ft. deep will produce a minimum of 200 tons of air dried peat fuel. Mr. Haanel in his paper, read before this *Society* at the Annual Meeting of 1918, informed you that there were 7 bogs, conveniently situated with respect to Toronto, that can supply that city with 26½ million tons of fuel; and an equal number adjacent to Montreal can supply that city with 23 million tons. Other bogs are situated adjacent to other centers of population, both in Ontario and Quebec. You will readily realize that if a satisfactory fuel is manufactured from the raw material available, practically any part of Ontario or Quebec can be supplied with fuel by a short rail haul.

Raw peat is a peculiar material having certain definite properties some of which have only recently been understood by the majority of those interested in the manufacture of peat fuel. When first excavated, it is usually brown in colour but turns black quite rapidly on exposure to the air. If it is excavated carefully and broken apart, the remains of the mosses and grasses from which it is formed can be seen quite plainly, but if the structure is broken by working up in the hand in the way putty is softened for use, all this structure disappears and you get a soft, black, homogeneous mass, not unlike clay to the touch, although it is very much lighter in weight. This, incidentally, is the most practical test to determine the suitability of peat for the manufacture of fuel. Any peat which, when worked up as I suggest, dries into a hard mass is, generally speaking, suitable for the manufacture of fuel but this will depend, of course, to some extent on the amount of ash present. The quality depends on the completeness of humification and the deeper the bog the better it is for fuel purposes, the lower layers being best.

If such peat when excavated, be thoroughly ground up, well mixed, and left in the open weather to dry, it will shrink to about ⅛ of its original volume when in the bog. If it is not ground up but excavated in bricks or sods as has been done in Ireland for a long time, very little shrinkage takes place. Peat contains a complex gelatenous hydrocarbon compound called hydro cellulose, the quantity varying from a very small amount in a fibrous peat, in which the process of decay has not taken place to any great extent, to as much as 1%, or more, in a well humified black peat. It possesses some remarkable properties; viz., it is capable of increasing its volume enormously through the absorption of water and in raw, well decayed peat it is found as a swollen mass, having the consistency of soft soap. On account of this substance the ground up peat, when dried, is practically non-hydroscopic, has a specific gravity of about 1.1 and, when it contains from 20 to 25% moisture, is tough and will stand the rough handling it necessarily receives in loading on railway cars and in unloading, and delivering in wagons. This gelatenous substance also performs the function of a binder.

Another property exhibited by a good fuel peat is its resistance to any mechanical means for expelling the water content. This is due to the fact that such peat possesses, to a certain extent, the properties of a true colloid and, therefore, the peat mass itself will follow the water in any attempt to get rid of the water by pressure; that is, after a certain amount of *free* water which is in the peat has been expelled.

It has been recognized for years that dried peat can be used as a fuel. At first it was cut out with a spade but later on primitive means were employed to grind it up and mould it. In countries where labor is cheap these primitive methods can be used today; for peat in many cases is the only fuel available and the cost of coal is very high. However, as the demand for peat fuel increased, efforts were made to devise a continuous process of mechanically expelling the water or of driving the water off by heat, and it has been in attempts such as these that most of the money in this country has been spent. Many prominent people lost money in these efforts and the peat industry received a set-back from which it has not recovered even today. At present, in spite of all this experience, ideas are being advanced for getting rid of the water in peat by the use of heat. I would like to emphasize in this connection a fact that should be plain to any man who gives the matter serious consideration. Raw peat contains, as I have pointed out, about 12½% of solids which, in an absolutely dry state, have a maximum heating value of about 10,000 B.T.U's per pound. Theoretically, this is about sufficient, with 100% efficiency, to evaporate the quantity of water with which the one pound of dried material is associated in the raw state; but in practice 100% efficiency cannot be obtained. Even if this was possible there would be no object in carrying on a process where there was no surplus material made. It does not matter whether an attempt is made to evaporate the water in a closed vessel, in a cylinder revolving over fire, or in tunnels through which currents of heated air are passed; for it takes a definite number of heat units to dispose of each pound of water evaporated and these heat units must come from some source. If the plant is run on its own fuel, this heat must be obtained by burning the fuel itself.

It is true that combinations of pressing out a part of the water (which can be done) and driving off a certain quantity of water by heat (which can be done) have been worked out on paper and a surplus of dried peat shown, but this can only be obtained with an expensive and elaborate outfit and at a comparatively high cost. The product so obtained will compare unfavorably, for fuel purposes, with the product I have already mentioned to you, which is obtained by grinding up and air drying the raw peat.

May I repeat that failure to recognize the significance of the following facts has been one of the main reasons why the peat fuel industry is not farther advanced. These facts are:—

(1) That owing to the colloidal properties of peat enough water cannot be successfully pressed out of it to materially aid in making a fuel.

(2) That there are not enough heat units in the dry portion of ordinary raw peat to drive off the water associated with it and leave a surplus for other uses.

(3) That if, by a combination of pressing out water and driving it off with heat, a surplus is produced, it compares unfavorably with the product which may be obtained by grinding the fuel up in its wet state and drying

it in the weather. These operations can be carried on at a very much less cost and with less costly apparatus than can be done with any equipment which has been suggested thus far to carry on the operations of artificial drying.

(4) When the artificially dried peat is obtained it is still in the form of a powder. This powder has to be briquetted before it can be used to advantage and this briquetting operation has been found full of difficulties.

There remains, then, only one process for manufacturing peat fuel, so far as I am aware, in which there are no technical difficulties and which gives promise of ultimate success. This process consists in excavating the raw material, thoroughly grinding and mixing it up and then spreading it out on the adjacent surface of the bog to dry. This process presents only such mechanical difficulties as have to be overcome in every day contracting work, and it is by this process that all the peat fuel, commercially manufactured today, is made. Large quantities are so made in Russia. In Sweden, I have been informed, the output of peat fuel has increased enormously since the war began, and I presume this is the case with other European countries where war conditions did not interfere with its manufacture.

The first attempt to manufacture fuel in this way in Canada, of which I have record, took place on a bog near Farnham, Que., between 40 and 50 years ago. A floating plant was built which excavated the peat by means of revolving knives ahead of the device to form a canal in which it worked. The peat was taken on board, ground up and eventually deposited on the bog surface adjacent to the channel which was being cut. I understand a considerable quantity of fuel was made in this way and that it was used for a time on steam railways. Owing to the increased demand, however, the fuel was delivered to the consumer containing nearly 50% of water which, of course, killed the operation.

The next attempt along this line took place at Victoria Road, Ont., where the writer made an effort to improve the drying conditions by spreading the peat on an artificially prepared drying area raised up off the ground. While a certain element of success was obtained at this plant it had the fundamental drawback that, as its capacity increased, the plant became very cumbersome and proportionately more costly; moreover, the depreciation was very high. This attempt was given up owing to lack of money to continue the work. Between the time the Farnham plant was operated and the time the Victoria Road plant was operated, most of the money which was raised for the artificial drying and briquetting of peat was spent, and lost. About the time of the operations at Victoria Road the Canadian Government Department of Mines sent a commission to Europe to investigate the peat fuel situation there. Acting on the report of this commission, a plant, the duplicate of one in successful operation in Sweden, was purchased by the Government and installed at Alfred, Ont. This plant was operated two seasons and a technical demonstration of the manufacture of peat fuel was made. The operation of this plant showed that the raw material could be made into a fuel that would stand transportation and that it could be conveniently used for certain domestic purposes. No attempt, however, was made to develop the industry in a commercial way; in fact, it was decided that, in order to make the process of manufacture commercially successful in this country, certain alterations would have to be made in the process in order to eliminate the large amount of hand labor necessary.

About this time J. M. Shuttleworth, of Brantford, Ont., who had already spent considerable time and money in connection with peat fuel projects, approached the Department and negotiations were finally concluded whereby Mr. Shuttleworth undertook to finance the construction of an improved plant on the lines suggested by the Government. With a view to encourage Mr. Shuttleworth, the Department of Mines granted him the use of the Alfred property and equipment and, in 1912, investigations were commenced with this new type of plant. A number of difficulties had to be overcome and, in 1913, just about the time that things were beginning to turn over, Mr. Shuttleworth was suddenly called to England and, a short time afterwards, had to sever his connections with this work. In 1914, however, the work was continued, with a small amount of capital then available, but with the expectation that the necessary money could be raised. Sufficient capital was arranged for, but, on account of the war, only a part of it was actually paid in. For the same reason, during 1915, it was not found possible to finance the proposition and it eventually closed down at a time when the only thing necessary to complete a commercial demonstration of the manufacture of peat fuel was the continued operation of a plant for a season.

Before proceeding with the description of the mechanical equipment used to make peat fuel, I would like to say something about the fuel itself.

The peat made in Alfred was approximately rectangular in shape 7″ to 8″ long, about 2¼″ wide and a little under 2″ thick. The blocks warped to a certain extent in drying and were not particularly attractive to look at. 70 to 75 cubic feet of the fuel, when thrown roughly in a pile, weighed a ton but, even with this bulk, it was possible to load the ordinary 30 ton box car with 25 to 28 tons. 250 tons of the fuel manufactured by the Government was left for two years in small piles open to the weather before being sold; but it was found that only the outside layers had deteriorated to any extent. They showed a tendency to break up into smaller pieces, but they could still be used. The blocks are non-hydroscopic and can be immersed in water for a considerable period without any bad effect; and will not, in any case, return to anything resembling the original raw material. The fuel was sold to a large number of customers in Ottawa and was found to be highly satisfactory for the following purposes:—

1. Autumn and spring uses in the furnace;
2. Cooking;
3. Open grate fireplaces;
4. Use in such type of stoves as the Quebec heater.

It is not satisfactory for use in a furnace during the heavy winter months except where constant attention can be paid to the fire. If sufficient fuel is loaded into the fire box to obtain a bed of coals that will give out sufficient heat during the day, for comfort, one of two things will happen: if sufficient air is admitted to promote complete combustion of the volatile matter, which comes off very rapidly, the fire will get beyond control; and, if the drafts are closed down to regulate the fire, the heating value of the fuel goes up the chimney in unburnt gases. In order to permit of its satisfactory use, it is necessary to add fresh fuel to the fire about every two hours. When this is done, excellent results are obtained. This is not the case, however, in the autumn and spring. During these seasons a moderate quantity of fuel can be put in the furnace in the morning and a hot quick fire obtained which will make the house comfortable, and leave sufficient live coals to ignite another fire in the evening. The house may thus be kept comfortable with less inconvenience than with the use of coal; for a coal fire, under similar conditions, if permitted to burn sufficiently vigorously to keep alight, overheats the house and the heat is wasted through having to open the windows. If, in this case, the fire is damped down it will go out with all the attending inconvenience and loss of fuel.

For the open fireplace, it found to compare favorably with cannel coal on account of the long fat flame and the cleanliness of the fuel. There is no spitting; or heavy black smoke; or soot from peat, and actual experience shows that it would replace cannel coal practically ton for ton, although the actual number of heating units available is much less. For cooking purposes peat is found to be highly satisfactory on account of the ease of control.

Although a great deal of experience is not actually available, yet, for the man who is unfortunate enough to have to buy his fuel in 100 lb. lots, peat should be more satisfactory, ton for ton, than coal. Not more than 3 or 4 separate fires can be made from 100 lbs. of hard coal while double this number can easily be made from a like quantity of peat and more useful heat obtained from it than from the coal. For this and similar reasons, although it requires 18 lbs. of peat to be equal to 10 lbs. of coal in actual heat units produced, the difference in favor of coal is not nearly so great in actual practice.

I would like to make one other explanation before closing this paper. From time to time articles have appeared in which various claims, as to the cost of peat fuel, have been made. This word cost has been used in a number of different ways and failure to state definitely what is meant, has been the cause of much misunderstanding and uncertainty. The cost of fuel to the consumer is made up of a number of items—the cost of delivery, the retailer's profit, freight charges from the place of manufacture to the place of consumption and finally the cost of the fuel on the cars at the plant. This latter item may again be subdivided into the production cost, the overheat cost and, so far as the consumer is concerned, the manufacturer's profit. It is necessary to keep all of these factors in mind in order to understand why fuel which is said to cost $1.50 per ton, is offered to the consumer at, say, $6.00 to $6.50 a ton.

By considering these items some reasons why the peat fuel industry is not at present a going concern will be seen. The actual cost of fuel on the cars, I have said, is made up of two items—the production cost and the overhead cost. By production cost I mean the actual cost for labor, fuel and operating supplies; which elements vary, practically, directly as the amount of fuel produced. By overhead cost I mean such items as the superintendent's salary, depreciation, insurance, rents, taxes, etc., which are practically the same whether 100 tons are produced in a season or the plant is run to full capacity. Since none of the plants, which have been operated to date in Canada, have run anything like a full season it has been necessary to estimate this overhead cost as, if it were charged against the actual quantity of fuel made, it would show a cost that would be very misleading and quite prohibitive to the commercial manufacture of peat fuel.

The small quantity of fuel made at any one time has also had a very considerable influence on the costs of the other items I have mentioned above. For instance, the railways have refused to make any special rate for peat fuel until there is a sufficient quantity offered for transportation to make it worth their while to go into the matter. There has never been sufficient fuel offered for sale to warrant the retailer making provision for storage and such other provision as might be necessary for the economic delivery of the fuel to his customer. In fact, there has never been enough fuel offered for sale to enable one to make any businesslike arrangements for its disposal, and, therefore, fuel which has reached the consumer, has been loaded up with maximum costs all around.

Summing up then, the reasons why the manufacture of peat fuel are not farther advanced in Canada are:—

(1) A great deal of money has been wasted in experimental work along improper lines. This has been responsible for a more or less general antagonism on the part of the public towards any further developments.

(2) Investigations, later attempted, toward the adoption of the already tried and proven prccess as used in the old world, have never been carried to completion. They were on too small a scale to warrant the equipment necessary for economic loading on cars; to get the best freight rates; and to make anything like efficient arrangements for delivery to the consumer.

I might add to this the fact that, prior to the war, the cost of hard coal was so low that there was not a big margin in favor of peat even under favorable conditions. The present price of coal and the experiences which we have gone through in the last few years, tend greatly to eliminate this condition.

I have not said anything about the industrial uses of peat. As there has never been a reserve supply of peat fuel available there is little actual data on which to express an opinion, outside of the experiences of the Fuel Testing Branch of the Department of Mines. They have, however, made a number of steam raising tests on their Babcock and Wilcock water tube boiler and also on a portable, locomotive-type boiler. Briefly, their bulletin No. 17 shows that the fuel burnt with a long flame and considerable light coloured smoke. The best results were obtained with a large grate having small air space, and a fuel consumption of 15 lbs. per square foot per hour. The evaporation of about 4 lbs. of water from, and at, 212°F. was obtained per pound of peat fired. The fuel used ran about 30% water, and a thermal efficiency of about 52% was obtained. In no case were any special arrangements made to proportion the fire box to the heating surface, etc., and undoubtedly better results could have been obtained if proper arrangements could have been made.

The production of electrical energy from peat fuel, using a producer with or without bi-product recovery, seems to me to be the ultimate industrial use for peat, but I will not go into this further at present as I understand it is to be treated in another paper, following.

Peat, Oil and Gas Fuel*

By B. J. Forrest, M.E.I.C.

During the past century peat and lignite have been employed in their raw state as fuel in those countries of Europe and America where coal is scarce or costly, and where peat bogs and lignite are abundant. According to Government reports, there are over 37,000 square miles of good peat bogs in Canada, and this is only a fraction of the area which could be turned into light, heat and power in the shape of coke, oil and gas. The object of this paper is to try to point out the best use that might be made of this, up-to-the-present, practically latent resource of our country.

Scientific research is every day making industry less of a gamble and more an exact proposition by eliminating the waste of fuel and useful bye-products; by increasing production; and by finding new uses for the bye-products.

About 5 years ago, at Toronto, Professor Gillespie stated that Canada must plan for decades; as the fuel supply was becoming a serious question and as electricity, which has been so largely developed of late years from hydraulic sources, cannot generally be used for heating purposes at reasonable cost. It might be noted, in connection with this, that peat bogs are not generally situated near rivers. Electric light or power can be developed from peat by means of a gas producer, gas engine, and dynamo. Dr. Haanel, Director of the Canadian Government Department of Mines, stated that the only way to become independent of foreign resources in Canada is to develop our numerous peat bogs; and C. A. Davis, U. S. Bureau of Mines, says that, where coal is scarce or dear and peat bogs abundant, the peat bogs should be exploited.

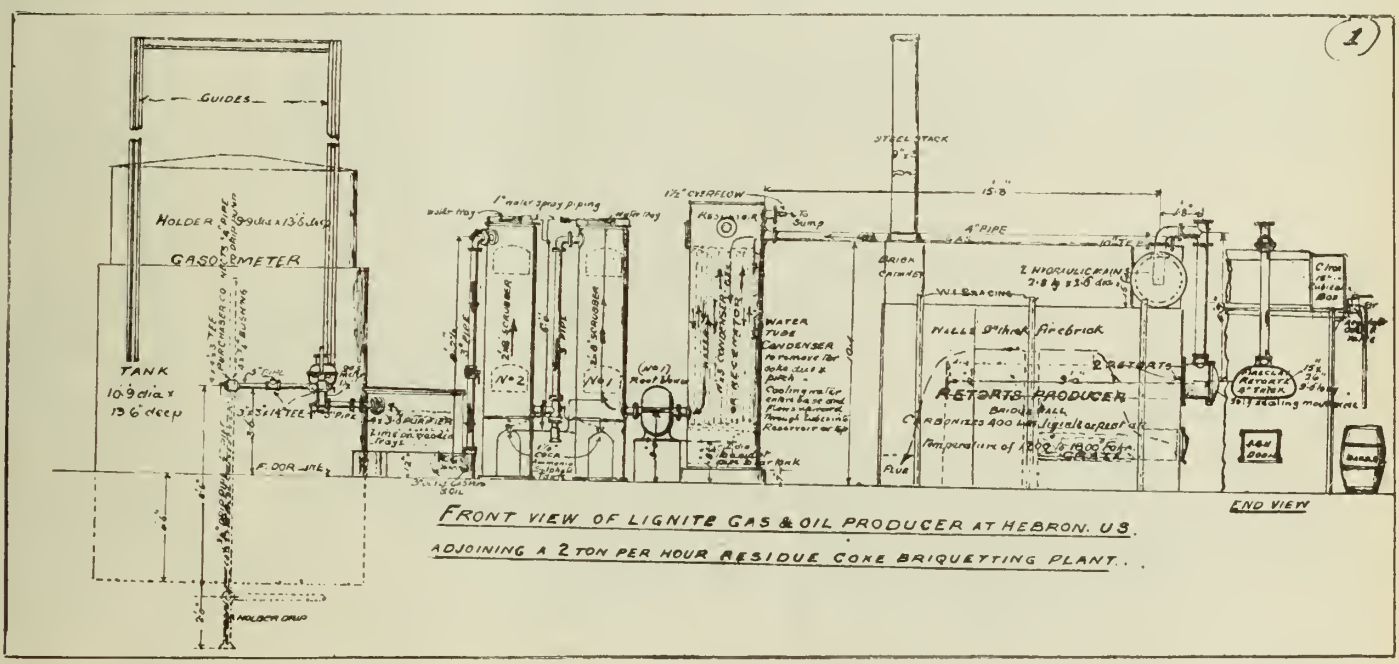

Fig. 1.

The production of commercial products from peat, culm and lignite is now an accomplished fact; for there are about thirty plants in Europe and America making coke, oil, gas and bye-products from peat, lignite, culm, shale and saw mill refuse. Unfortunately, what is true of some mining propositions is also true of industrial undertakings; for many have been ruined by quack engineers, stock jobbers and speculators. Such was the case with a peat company I knew in Ontario. Many experiments have been carried on and improvements made in methods of handling peat fuel during the past ten or fifteen years, but, according to the opinions of Prof. Morgan, C. A. Davis, J. A. Cottrell and Bruning (fuel and gas experts of the British, United States and German Governments and of some of the big steel and industrial corporations) the peat problem has not hitherto been handled logically. In all industrial problems it is necessary to get down to the basis of the chemical composition of the material used. Hitherto peat problems have mostly been attacked with the idea of producing and selling a solid fuel, whereas the industrial value of peat, as shown by chemical analysis, would be greater if sold in the form of gas, oil and bye-products. It contains about 60% of tars, oils, hydrocarbons and gases and only 25% of fixed carbon. One ton of peat containing 50% of moisture—the latest producer plants in Europe are working with 60% moisture, using improved producer gas plants, will produce the following:—

(1) About 20,000 cu. ft. of high grade illuminating gas (160 B.T.U's per cu. ft.); or,

(2) 40,000 cu. ft. of medium grade heating and power gases (130 B.T.U's per cu. ft.); or,

*Read by the author at the Montreal Branch meeting, March 20th, 1919.

(3) 80,000 cu. ft. of low grade heating and power gases (about 100 to 110 B.T.U's per cu. ft.).
The last (3) is the grade of gas the steel corporations in Europe and America are introducing in their plants; it being the most economical per heat unit.

In addition to the above gases, the following bye-products are produced, by retorting, per ton of peat:—about 800 lbs. of coke, 100 lbs. ammonium sulphate, 40 lbs. crude oil, 16 lbs. paraffine, 4 to 8 lbs. pitch, 5 lbs. creosote, benzol, alcohol, toluol and antiseptics. A fertilizer and packing company in the United States says that they can use 3000 tons of peat, moss and litter per annum: this could be shipped straight from the bog. Incidentally, I might state that peat olafines and gases are first-class preservatives, antiseptics and disinfectants. Dr. Miller, of Toronto, has stated that they are good for lint dressings for wounds. There should be no nuisance from, or objection to, fume or smoke from peat gas manufacture.

The manager of the Gas Power Corporation, England, informed a friend of mine that 100 tons of dry peat yielded about 37 tons of gas and volatiles, 30 tons of oils and olafines, 25 tons peat coke or coke powder, and 8 tons of waste and ashes. The following is an approximate valuation of one ton of gasified peat:—(Gas Power Corporation—average from 16 plants).

Gas

40,000 cu. ft. medium or semi-oil gas @ 25c. per 1000 c.f.	10.00
or 80,000 cu. ft. low grade producer gas @ 12½c. per 1000 c.f.	10.00

Bye-products:

750 lbs. coke @ $5 per ton drawn from producer grate	1.50
80 lbs. sulphate of ammonia @ 2c. per lb. (price going up)	1.60
about 100 lbs. tar, asphalts and acids @ 2 c. per lb. (price going up)	2.00
Total value per ton of peat, gasified, about	$15.10

(A recent U. S. Engineer's report gives $15.)

Against this we have producing cost as follows:—

Preparatory work in bog digging, transporting, spreading, drying, decorticating and feeding producer, about	$4.00	per ton.
Superheating, condensing, scrubbing, supplying reagents, lime, gas, steam, gas cooling and blast fans	2.00	"
Repairs, renewal and upkeep of conveyors, producer plant, scrubbers, etc., about	.50	"
Transportation, delivery, piping or storage of finished products, overhead charges, interest, etc	.60	"
Total	$7.10	"
Value of manufactured product	$15.10	"
Cost of manufacture	7.10	"
Approximate profit per ton of peat	$8.00	"

This shows that the bye-products pay most of the operating cost. This estimate also shows that the main value of peat is its gas and bye-product production. The estimate applies to a large and complete *bye-product plant*, running continuously. A plant with no bye-products would give about one half the profit.

The late D. J. Wilson, of Toronto, fuel and gas engineer, showed me, at an experimental plant near Toronto, a number of samples of peat and muck with which he was making trials. He found that the lower and blacker peat and muck gave better results when gasified or olafined than when briquetted. During trials made with a gas engine he found that he was troubled by tarry oil gas clogging the valves. After trying a solvent and after using a special type of vaporizer and injector, he got the engine to work. He was really trying to make a gas engine work on oil. Owing to war work and lack of capital he had to suspend further trials. I may remark that, during reaction tests, he got some fine colored olafine stains, which were no doubt dye bases. He told me that he was also working on briquetting, but found that he was losing most of his oil and gas values thereby. The briquetting plant was later shut down. In an ordinary producer plant there is very little machinery except small water, gas, oil and air pumps to get out of order. Further, the producer plant can deal with semi-dry peat—a saving. Excess of water is not only the civil engineer's but the peat engineer's bugbear.

C. A. Davies, United States fuel and gas expert, states that the cost of the upkeep and operation of an oil gas producer plant is about half that of a briquetting plant, while it is less liable to break down; for there is practically no machinery to get out of order. This is confirmed by Mansfield, Cottrell, and a friend of mine who is the engineer of a Gas Corporation in England. More attention has been paid to bye-products of late years. To handle them requires a more complete and expensive plant, and generally an addition to the generating plant is necessary. Generally, very low grade lignites, shales and peat are gasified in Europe and the United States. Gasifying gives better results; for briquettes often crumble to fine slack or culm (even with binders) when roughly handled in loading, unloading and transportation.

In view of the foregoing facts and what I have seen in Wolverhampton England, Toronto, Thornhill and Montreal, I am of the opinion that there is a good outlook for this industry and especially so in Ontario where coal is dear and scarce. Lower grade producer gases, and cheaper fuels for producing such oils and gas, are in increasing demand by steel mills and factories. Heavy and light oils and gases can be produced alternately or continuously by the same producer plant. The price of the coke powder produced, and especially the bye-products, is rising steadily. These are some of the main reasons why peat should be exploited in Canada.

According to fuel and gas engineers, to whom I have already referred, the points or features to study in connection with the construction of "producers" are as follows:—effective heating and gasifying capacity, poking and charging facilities, uniform distribution of air and steam blast into incandescent zone, water seals, traps and doors around producer to facilitate ashing, poking and inspection of steam and air supply, ease of manipulation while working at full load and charge, visibility of fire and fume space by stoker, which is very necessary for proper control of producer. Air and steam blowers and injectors must be conveniently located and the necessary pressure and pyrometer gauges fixed at combustion and gas zones to insure a maximum reduction of monoxide fumes and to facilitate the formation of olafines and gases. The same authorities state that the maximum heating effect of a producer is obtained when the temperatures of furnace, producer, condenser and regenerators are under direct and proper control; so that the olafines and gases can be delivered hot or cold. All the necessary condensing, regenerating and superheating of olafines, tar oil, liquor gases, steam and air are thereby conveniently and inexpensively accomplished by intercepting, jacketing, trapping and regulating waste heat from the producer, superheater, regenerator, condenser, scrubbers and engine.

(6) A good clean fire is maintained with little trouble.

(7) A steady and regular output is maintained in producer.

(8) Standby losses and upkeep are greatly reduced; for working can be stopped or damped immediately.

(9) A saving of from 20% to 25% on the ordinary boiler and furnace, which can only operate with very dry fuel.

(10) A saving (by actual test) of about 20% to 23% in fuel.

(11) It is generally possible to use a cheaper class of fuel; such as lignite, peat, lumber waste, sawdust, culm, oily or shale refuse.

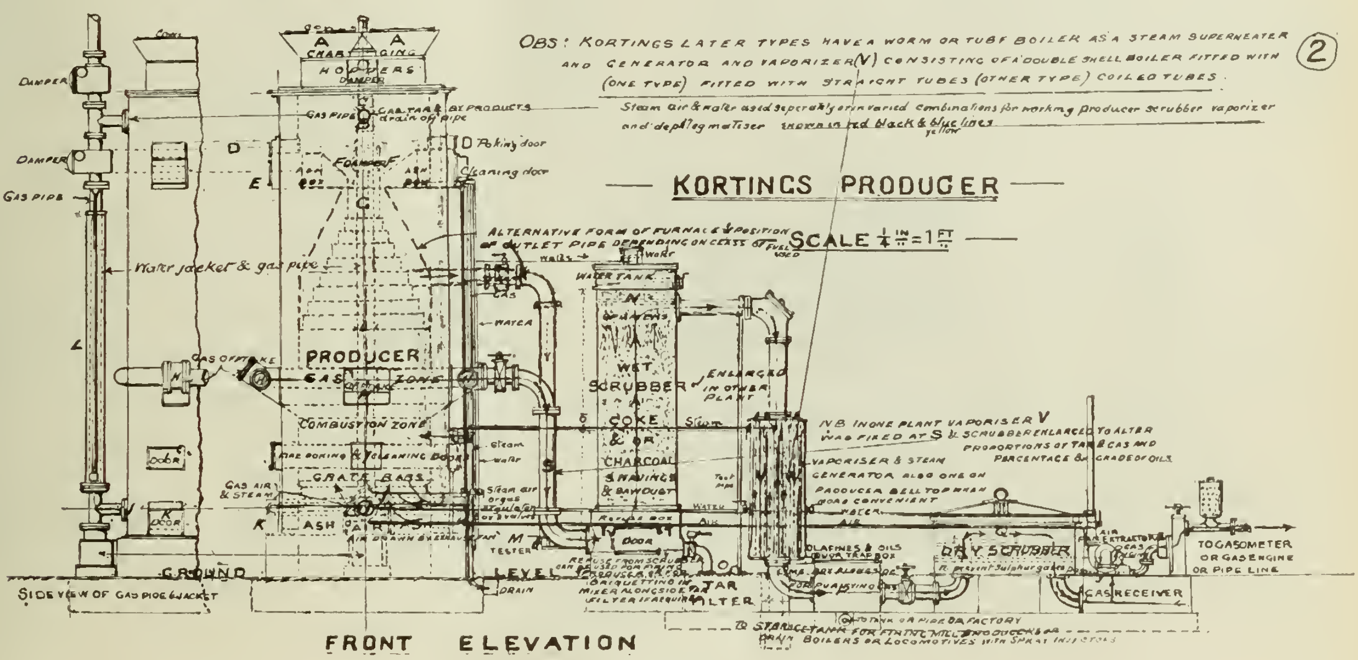

Fig. 2.

The advantages of using Gas Corporation producers are the following:—

(1) Higher temperature and more complete combustion obtainable.

(2) Fire trimming and condensing, and heating and cooling temperatures are under absolute control.

(3) By recuperation a large amount of heat, lost in waste gases, is returned to furnace through the water heater and the air and steam dryer.

(4) Smoke nuisance is eliminated. (Although peat smoke is a disinfectant.)

(5) The labor of handling peat ash is one-third that of coal and what is left is very fine and could be either sucked or blown from the ash-hole by a Koerting or other blower. (Some plants have sold the ash as fertilizer).

Heavy and light peat oils and gases may be used in mills, factories, teelworks, furnaces, gas engines, locomotives (see Fig. 5), or road tractors. The olafines may be piped and tanked and later gasified in the garage, depot, or round house. Storage tanks might be erected opposite plants and alongside railways and the gas or oil pumped into the engine room or locomotive tender and then gasified or vaporized by a suitable vaporizer, the same way as petroleum and heavy oils are used. By this means the pressure in the boiler can be raised very quickly or the fire shut off instantly in case of need, or when a locomotive run is completed. If more convenient, or if required for other services, the heavy olafines could be pressed into blocks, or caked like petroleum "masut" in Russia, and delivered to the locomotives, mills, factories or garages and later by means of condensers or vaporizers could be turned into heavy or light oils or gases, as required, on the spot.

The following extracts and quotations are of special interest:—

The Fuel Problem

Powdered fuel and oil for locomotives has given good results on German, Swedish, Norwegian and Russian railways and is now being tried by some United States railways. Any kind of fuel such as lignite, culm and peat, with two-thirds combustible contents, suitable for steam generating purposes, is used. These are now practically unsaleable. The cost of preparing pulverized coal or peat is about 60 to 80 cents per ton; liquifying and gasifying is done in same operation.

The outfit is simple (See Figs. 1, 2, 4 and 5.), consisting of air, steam and powder blowers or injectors. Fire is started up instantly and a pressure of 200 lbs. per sq. inch is obtained within one hour. Apparatus requires very little attention, and is easy on stoker, as all is regulated by valves. When properly controlled, mixture bursts into a strong flame with very little smoke. A saving of about 20% in fuel account is effected.

Though fuel units of lignites and peats are about half that of coal, their olafines contain a large quantity of gassy oils, which raise its efficiency to nearly two-thirds that of coal and its cost per ton being about one-half or less, its utility is nearly as great. When liquified or gasified, the gas or oils can be cheaply piped from the bog to the tank alongside railway, as the pressure is low. Owing to this, very little leakage results and box piping is preserved. No rust arises in iron piping or tanks.

If more convenient, the tar oil can be tanked direct from plant and piped into tender, from tank, and gasified by a vaporizer injector on locomotive firebox, of the same type as used in petroleum fired engines. There are various types of injectors and vaporizers, Holman, Hornsby-Ackroyd, Tangye and others, suitable for this work.

Extract from Scientific American. March 25, 1916.

Fuel and Power

Canada has by no means wrestled as she should with the fuel and power problem. We are glad that peat and lignite are being considered and trials made. These efforts are certainly a move in the right direction and should be given all possible support which should have been done two years ago. The U. S. are already working on this matter, making a saving of 3,000,000 tons per annum. The advantage of using gas fuels and extracting their bye-products before consuming coal for power purposes will make a saving of about $500,000,000 in the U. S. fuel account.

Extract from article by A. V. White, in the Canadian Engineer, March 12th, 1919.

Summary on Handling Peat

1st. Liquify or gasify in producers saving bye-products which are valuable.

2nd. Turn the large amount of nitrogen into ammonium sulphate, a valuable fertilizer, together with the peat ash containing potash (a fertilizer).

3rd. Fractionate the tar into pitch, tar, candle wax, lubricating and burning oils and powerful disinfectants, greatly exceeding carbolic acid in germicidal strength.

4th. The aqueous distillate contain ethyl alcohol, acetone, pyridine bases and acetic acid are very valuable.

By Dr. Morgan, Cottrell, Lawson and Davis.

Gasoline Shortage

A world shortage of gasoline waits just around the corner for the motor propelled world, according to Mark L. Requa, Standard Oil official, who has been directing the oil division activities of the fuel administration.

The only preventive Requa believes is an engine that will burn crude oil.

The American Society of Automotive Engineers in session here to-day, in considering this problem, put it up to Requa and his associates. J. E. Pogue who has been devoting his attention for the government to oil conservation, is scheduled to tell the engineers that but 50% of the petroleum produced in this country is being utilized, that kerosene burning engines, while a great help in conservation, will not solve the difficulty, and that much higher prices for gasoline are ahead unless the crude oil burning engine comes to the rescue.

Extract from a New York Paper, February 13th, 1919.

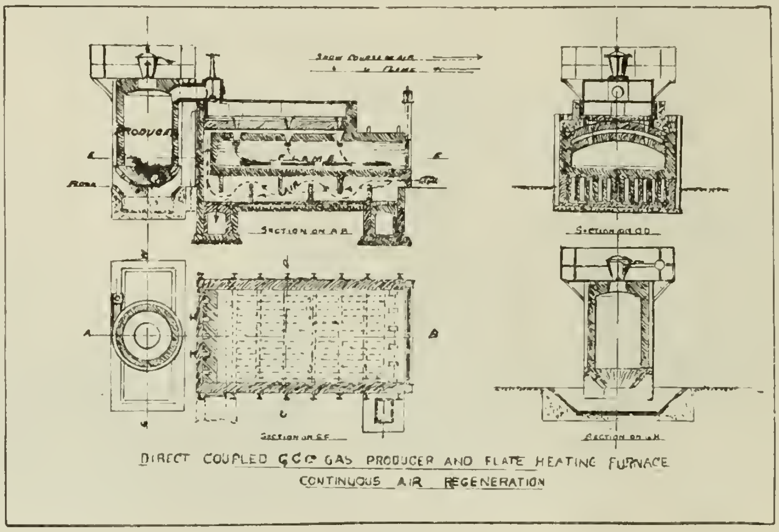

Fig. 3.

To the best of our knowledge there is not a successful peat briquetting plant in operation in the United States or Canada to-day. Peat briquettes only give from 6000 to 8000 B.T.U's per lb. and the cost of manufacture is about twice as much as briquets made from anthracite or bituminous coal and the results obtained from burning peat briquettes is little better than wood."

"We have been recommending for some years the carbonizing of peat in producers, thus saving the bye-products which are valuable and should pay a good profit (Briquetting the peat charcoal residue). These products command in the United States and Canada about $15 per ton.

Extract from Mashek Engineering Company's book on Briquetting Plants, Page 26.

The serious increase in the cost of fuel which has occurred during the past 18 months and the certainty that when the war is over, coal will not return to its former low level of value, is forcing engineers and chemists in all countries to consider the use of other forms of fuel such as peat and lignite for heating and power purposes and the much neglected low grade fuels are at last receiving a fair measure of attention. In Friesland, Weismore, Emjade, Whilhelmshaven, Aurich, Bant, Nolden, Oldenburg, Rustingen, points within 30 miles of these districts are using peat from adjacent bogs and plants; so far they have spent £200,000 ($1,000,000) on these plants, which they are successfully operating up to 5000 H.P. The calorific value of the dried peat briquettes equals 7000 B.T.U. or about half of ordinary coal, giving 73% of efficiency and evaporating 3 lbs. water to one pound of peat. The cost of operation compares favorably with ordinary steam plants—gasification being considered.

Extract from the Scientific American, April 8th, 1916, Page 233.

Peat, Fuel and Gas

Experiments in Europe, notably in England and Germany with ordinary producer gas, as fuel for internal combustion engines and boilers, has shown that the longer the combustion and power, the more the loss decreases. Producer gas although of lower calorific value than illuminating gas, gives better results as it produces little or no back fire.

hydrocellulose will not part with all its water by pressing, but will do so by evaporation and heat; this also releases wet mush, olafines and gases.

Engine power efficiency 70% with gas—about 2 tons air dried peat would run a 100 H. P. Engine for 10 hours with producer.

Above figures show plant is dearer than a steam plant for same horse-power, *but cost of operating with oil or gas fuel is reduced by about one-half and this is the main point.*

Capacities of small plants from 10 to 100 tons peat per day. Gas engineers say it is only a question of deciding type and size of engine, and remark that a 100 H.P. engine worked with natural gas of 800 B.T.U's per cu. ft. will only give 80 H.P. by producer gas (or 20% less) (with 200 H.P.—15% less) (with 300 H.P.—10% less) thus proving that the power of producer gas is much more efficient than the rich one even in an engine designed for using the richer gas, hence preference for it by large factories and steel plants. Numerous trials in Europe with producer gas have shown that it will give two to three times the power obtained by steam. Results in 16 plants were from 28 to 30 cents per effective horse-power hour. Plant can be started in a few minutes and run for a considerable time without attention or shutting down plant; easy to handle and simple in construction.

Extract from the Scientific American, November 20th, 1918.

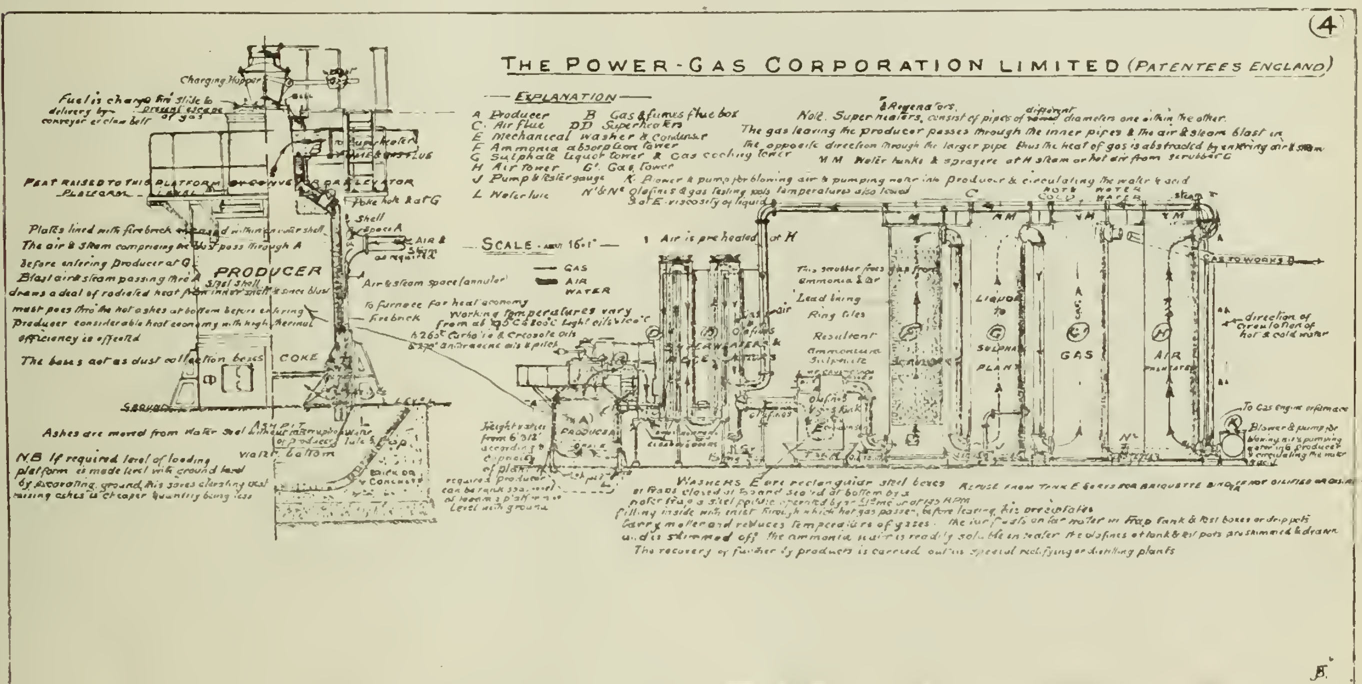

Fig. 4.

Large area of peat near Minnesota Iron Mines is being turned into producing gas for boiler firing, for power plants, the bye-products alone are paying for the installation of plant, and actually getting the producer gas free of cost. Companies say that though B.T.U's lower than illuminating gas it gives better results.

Comparative analysis:— Peat tested 1911

Average moisture.....	33%	coal gas.....	660 B.T.U's per cu. ft.
Dry fuel, carbon......	30%	water gas....140/150	" "
Volatile matter.......	63%	peat gas, about 360	" "
Ash and loss.....	7%	calorific value 9460 B.T.U's per lb.	
	100%	explosive mix. 10 air to 1 gas.	

Flashing points of oil gas 80% to 100% Fahr. according to quality.

Semi-dry peat liberates about 60% of tar oil and gases and 25% coke powder.

Gas can be liquified by high pressure and freezing.

Electrolytical drying of peat—results poor. Eight times the cost of direct firing. Ekenberg & Zieglers processes for peat drying have not been a commercial success. Prof. Morgan says the

The Utilization of Peat—Peat as a Source of Power

The problem of the utilization of peat for industrial purposes is one of perpetually recurring interest, and scientific men in many countries have turned their attention to work out a solution. This is not surprising in view of the fact that the amount of combustible matter in the world's peat deposits exceeds that of all the known coal fields. This represents a vast amount of potential energy awaiting only a practical way of utilizing it.

A new vista of potentialities for peat has opened up in recent years. As the nineteenth century will always be associated with the development of the steam engine, culminating in the steam turbine, so will the twentieth century be able to claim the triumph of the internal combustion engine. The success of the gas engine has led to investigations which resulted in the many forms of producer gas plant, and there are now many thousands of installations of this method of producing power for mechanical purposes.

It is a noteworthy and encouraging fact that an installation at Portadown, Ireland, for utilizing peat in producer gas plants has been found to be entirely satisfactory and to effect a considerable saving over anthracite. This is the more remarkable, as the bye-products are not at present utilized. But these bye-products are of considerable value.

The first of these is the power plant of the Societa per L'Utilazione du Combustibill Italiani, at Orentano, Italy.

The peat excavated by manual labor is fed into Dolberg peat machines which are provided with belt conveyors to transport to the peat macerators. Part of it is air dried and part mechanically treated and dried artificially. The peat delivered to the producers with an average moisture content of 35/42% has an average nitrogen content of 1.04%. The nitrogen is recovered as ammonium sulphate, and the gas is used to drive two engines of 360 metric horse-power, each, which drive a.c. generators—there being a transmission—line to Pontedera ten miles distant.

The second installation referred to is the ammonia recovery power plant of the German Mond Gas Co., situated on the Schweger Moor, the system of Frank and Carlo to utilize peat containing about 60% moisture. The total power capacity is over 3000 H.P. and the gas engines are coupled to alternators running in parallel.

Messrs. Hamilton Robbs, of Portadown, have a weaving industry and about 4 years ago decided to try the experiment of establishing a peat producer gas plant. The fuel used is peat dried in open air by the usual method of stacking, and this is cut from a bog some miles distant. The plant supplies gas to two engines, of 120 b.h.p. and one of 150 b.h.p. By means of the conveyor the peat blocks are elevated and carried to the feed hoppers on the top of the producers, from which they pass into the generators where gasification takes place. It is stated that under working conditions with peat at 5s. a ton, power can be obtained at the rate of one-sixteenth of a penny a horse-power hour, with an extension of this method of utilizing peat, it would be possible to deal in a profitable manner with the bye-products which would thus be produced in a sufficient quantity to allow of their being dealth with in chemical works. We should in this way not only establish an additional industry, but this method of obtaining power from peat would be rendered still more profitable. Where a sufficient demand for power exists, it appears certain that instead of carrying the bulky peat either by road or by water, it would be advisable to instal producer plant on the bog itself and to convert the mechanical powers into electricity and transmit the energy at high pressure to the point where it is required. The efficiency of such conversion and transmission is now very high.

The foregoing development appears to be a practical realization of the view held by many workers on peat in this country, that the most economical use to make of this combustible is to convert it into gaseous fuel in suitable gas producers.

When peat is gasified the products are combustible gas, ammonia, ash, tar and an aqueous distillate containing certain technically important organic compounds. The combustible gas which is generally free from sulphur, consists of carbon monoxide and hydrogen mixed with the non-combustible gases, nitrogen and carbon dioxide.

These plants supplied by the Power Gas Corporation, Ltd., England, who, in 1905, first turned their attention to the method of utilizing peat, have obtained the following extremely favorable results:

Fuel Used	German Peat	Italian Peat	English Peat
Moisture content of fuel.......	40 to 60%	15%	57.5%
Nitrogen "	1.0%	1.58%	2.3%
Quantity of gas produced per ton of theoretically dry peat—cu. ft.	85,000	60,000	90,000
Heat value of gas produced—B.T.U's. per cu. ft.........	150	166	134
Sulphate of ammonia produced per ton of theoretically dry peat.....................	70 lbs.	115 lbs.	215 lbs.

Peat containing 63% of moisture and with a nitrogen content of 2.235% yielded per ton 94,850 cu. ft. of gas (100 B.T.U. per cubic foot) and 168 lbs. of ammonium sulphate.

The ash of peat contains the oxides of aluminum, iron and calcium with a preponderance of potash.

The moisture peat producer tar yielded on distillation 50 to 55% of volatile oils. The fraction of acidic peat oil boiling at 200-240° is seventeen times as active as phenol (carbolic acid).

The neutral oils left after extracting the germicidal acidic oils with alkali could be used as lubricants, as liquid fuel, for example in Diesel engines, and when mixed with the pitch from peat tar would furnish a refined tar.

From article by Professor Morgan, F.R.S., London, in "Nature," March 2nd, 1916.

Producer gas runs about 150 160 B.T.U's per cubic ft. Florida peat gas runs about 170 B.T.U's per cubic ft. Prof. Wyer, Germany, states that the relative heating value of poor gases is more than rich gases, as tests have proven that there is a loss of about 20% with the rich gases. He says the ideal power gas of the future will be one having a heat value of about 100 B.T.U's per cubic foot. These gases are now being used by some of the steel corporations.

The tests made in Europe and the United States with peat gas producers and engines, surpasses in effective horse-power all the various coals used in boiler tests. This proves that the value of peat, as fuel, is greatly increased by the use of the gas producer.

The quantity of peat consumed in producer plants per horse-power hour varies from 2 to 3 lbs. The cost of peat gas works out, therefore, much less than that of coal in steam boilers.

The Peat Gas Company use peat containing about 60% of water and, out of 30 plants, 20 are using this class of peat. They build two types of producer to suit the different percentages of peat moisture and the bye-products extracted. The cost of these plants vary from $40 per h.p. for small plants to $20 per h.p. for large plants. A 30 h.p. gas peat plant costs about $1600 F.O.B. England.

A gas producer plant costs more than a steam engine plant but the cost of operation and maintenance is nearly one-half; on account of its fuel efficiency, the cost of labor and fuel being reduced 50%.

Many gas producer plants in Europe are now being modified so that peat gas may be used and the bye-products recovered. Tars and dyes are only recovered in the larger plants; they are best left alone in small plants.

The approximate cost of a producer, complete, varies from $1,550 for 25 h.p. to $35,000 for 1000 h.p. exclusive of buildings. It was found that 2 tons of air-dried peat unsuitable for boiler fuel would run a 100 h.p. plant 10 hours by employing a P.G. producing plant and engine.

Peat gas is being used in Europe for lighting; firing under steam boilers; brick, pottery and lime kilns; forges; furnaces; and for ore roasting and glass furnaces: peat gas fuel is generally free from sulphur and is cleaner than coal. The class of producer depends on the class of fuel used.

Our large peat deposits can be profitably utilized and the large amount of stored up energy in them recovered, as power, by converting the raw peat into producer gas. The power developed may be used by factories on the spot or used as electrical energy at a distance. Large plants may go in for the distillation of bye-products (sulphate of ammonium and tar) but, even without these, the gas producer presents many advantages, especially for plants of 100 h.p. and upwards. A gas producer admits of wetter peat being used than in direct firing and the economy is greater.

Summary

1. The industrialization of peat could be most efficiently brought about by gasifying it in gas producers; as this procedure would render feasible the recovery of several valuable bye-products.

2. The combined nitrogen of the peat can be economically recovered in the form of ammonium sulphate. The valuable fertilizer, together with the peat ash containing potash and phosphoric acid, could be restored to the land from which the peat has been taken.

3. Peat tar, another bye-product, can be fractionated into the following useful materials:—refined pitch and tar, candle wax, lubricating and burning oils, and very powerful disinfectants greatly exceeding carbolic acid in germicidal strength.

4. The aqueous distillate from the producer contains methyl alcohol, acetone, pyridine bases, and crude acetic acid, all of which are capable of recovery and utilization.

Improvements in Hot-Air Furnaces

The author opens this paper with a general dissertation on hot-air heating, and points out especially the importance of drawing the cold air supply from within the building in very cold weather by means of a suitable inlet, preferably in the first floor landing. Although it may be more conducive to health to draw the air supply from the outside at normal temperatures, in very cold weather the air leakage through door and window cracks has been proved to be ample for ventilation purposes. In the interests of fuel economy the interior air, which is already probably at 60° F., should be used, instead of exterior which may be at zero or even colder. A two-way valve or simple damper will enable the operator to draw the air supply from whichever direction seems best at any particular time.

The author proceeds to describe some improvements which he made to his own hot-air plant, and points out that two of the great advantages of hot-air heating systems are: there are no water pipes or boilers to give trouble in severe weather, and no complicated parts to get out of order if carelessly or ignorantly handled.

If it is found that the air distribution to different parts of the building is not equable, the cause may be traced to the fact that one of the hot-air delivery vents is acting instead as a cold-air suction. This is because the suction inlet pipe in the furnace is not of sufficient size, and the slight vacuum in the furnace has consequently to be relieved through some other direction. To overcome this difficulty the cold-air inlet should be increased until it equals in sectional area the total sectional area of the delivery pipes.

If a strong wind should be blowing into the outside cold-air inlet more air may enter the duct that can pass through the furnace. Unless it is prevented, this cold air will flow through the inside cold-air furnace inlet and thus into the building. To prevent this an automatic check valve may be made by suspending a light framework covered with any light material over the inside inlet, in such a way that it will swing to by its weight, but will open to the slightest suction of the furnace vacuum. The air of the building may be kept properly humid by the installation of a cast-iron evaporating pan immediately over the fire pot in the hot-air chamber, fed by a pipe from a small copper tank outside the furnace, the water supply being controlled by a float-valve in the tank. The water in the tank and in the pan is at the same level.

The author points out the advantages to be derived from placing an electric fan in the cold air supply pipe to act as a blower, and concludes by emphasizing the importance of giving greater attention to the design and construction of the furnaces for these hot-air plants than has been done in the past.

(Baker, U. S. Bureau of Mines, Technical Paper No. 208.)

Gas-Engines of the Future

The effects of the war on engineering generally is yet hardly appreciated. Internal-combustion engines must undergo further development. Already types have been developed which point the way. Higher piston speeds will be demanded, and to get them, increased power per unit of cylinder measurement, approaching 50 per cent, will be required. Hitherto, the weight of reciprocating masses has been such that a piston speed of, say, 800 feet per minute was considered the limit. By the experience gained in aviation, in automobilism, and in "tanks," it has been found possible to obtain with perfect safety piston speeds of 1,200 ft. per minute. The future of gas-power, therefore, may be considered, from a mechanical standpoint, well assured. (American Gas Engineering Journal.)

Sooke Lake Water Supply, Victoria, B.C.*

By C. H. Rust, M.E.I.C.

Victoria, B.C., the capital of the Province of British Columbia, is situated at the south end of Vancouver Island, and has a population of about 50,000. The consumption of water in the summer is 80 Imperial gallons per head; in winter, 50 Imperial gallons per head. All services are metered.

From 1872 to 1913 the City procured its water supply from Elk Lake, situated in a north-easterly direction about five miles from the City. The writer has been informed that the first open sand filter beds constructed in North America were erected at Elk Lake.

Owing to the growth of the City, and to the capacity of Elk Lake being only about 2½ million gallons per 24 hours, the City was compelled to take steps towards procuring a more ample supply.

The lake is about 4 miles in length and its maximum width is half a mile. The area of the lake at 555 ft. above sea level is 978 acres. It was decided to construct a dam at the foot of the lake and rise the level 12 ft. This gives a total area of 1180 acres. The watershed area is 31½ square miles.

In the scheme for the ultimate development, it is proposed to utilize the Leech River Watershed, which has an area of about 31 square miles. This watershed can be used by constructing a 5 mile conduit-line to convey the water to Sooke Lake, and, if it should be necessary to do this, it is proposed to construct a dam at Sooke Lake to a height of 45 ft. It is estimated this will give a daily flow of 100 second feet whilst the reservoir storage will be 17,358,000,000 Imperial gallons. The scheme which has now been completed gives a reservoir capacity of 5,555,000,000 Imperial gallons.

Lower Sooke Lake and Dam. October 28th, 1914.

Negotiations were entered into towards purchasing the works of a private corporation known as the Esquimalt Water Works Company, which supplies Victoria West and the District of Esquimalt, and who procure their water supply from the Goldstream Lakes, but the property owners voted against this proposition. These works have a maximum capacity of 13 million Imperial gallons per 24 hours, and are situated about 17 miles north of the City.

In 1911, Wynn Meredith, western representative of Messrs. Sanderson & Porter, of New York, was called in by the City to advise as to the best method to be undertaken to procure an adequate supply of water. Mr. Meredith undertook a very careful investigation of various projects, and it was finally decided to utilize Sooke Lake, which lies about 18 miles north-west of Victoria.

*Read before the Toronto Branch of *The Institute* on December 10th, 1919.

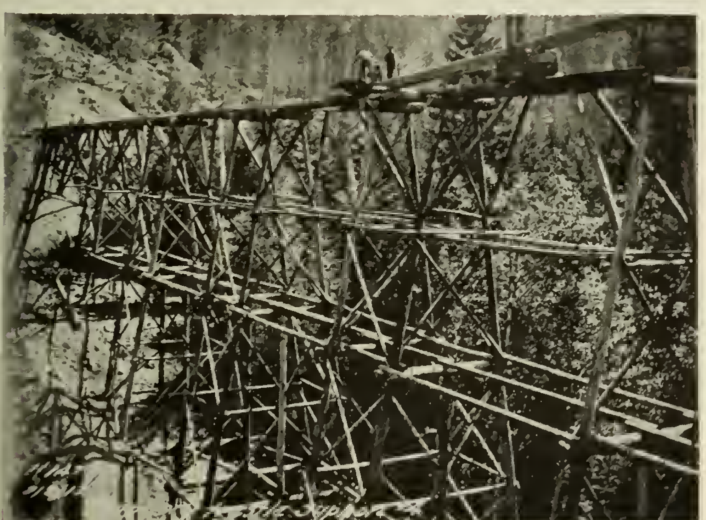
The contract called for the clearing of the land around the lake 15 ft. above low water; the construction of a dam at the foot of the lake, with necessary screen house, intakes etc.; the construction of 27 miles of concrete pipe 40 inches in diameter (this involved the building of 27 miles of railway track 2 ft. guage); the construction of 6 siphons and the necessary concrete trestles, and temporary wooden trestles to carry the track; the construction of a telephone line; the building and clearing of a reservoir site; and the erection of a dam, screen house, valve chamber, venturi meters, etc., at Humpback, which is about 12 miles from the City; the building of 11 miles of 36 inch steel pipe, leading to the City Reservoir, which was awarded to the Westholme Lumber Company of Victoria, and the following are some of their figures:—

The price for earth excavation was from 60 cents to $1.50; for rock excavation from $1.75 to $7.50, the former being the price paid on the concrete pipe-line; the price for concrete, for the dam at Sooke Lake, was $11.00; for the dam at Humpback the price of concrete, Class "C", was $9.00, Class "B", $10.00, and Class "A", $12.50 per cubic yard. The necessary clearing around the lake ranged from $150. to $250. per acre.

View of Concrete Dam.

Tenders were called for three classes of pipe for the flow-line, namely: wood stave, rivetted steel and reinforced concrete. The prices submitted were for the pipe laid and installed. Wood stave pipe was $2.47 per foot, rivetted steel pipe $5.50 per foot, and reinforced concrete pipe $2.53 per foot, and it was finally decided to use concrete pipe.

On the pressure-line tenders were called for lap-welded, rivetted steel and lock bar pipe. The prices quoted by the contractors being as follows: lap-welded $7.00 per foot laid and connected; rivetted steel plate 5/16″ thick $5.25, 3/8″ thick $6.25; lock bar pipe $6.80. It was decided to use rivetted steel plates.



Temporary Trestle.

Siphon No. 4. August 9th, 1913.

The contractors commenced operations early in 1912, but the progress made was not at all satisfactory, and in April, 1913, they abandoned their contract.

The writer, as Water Commissioner, recommended to the Council that the work be proceeded with by day labor. This was approved of and the City immediately put on a large force of men at various camps. The laborers were paid $2.75 per day for 8 hours, one dollar a day being deducted for their maintenance. Free medical attendance was supplied by the City Medical Health Officer.

The City completed the clearing of the land at Sooke Lake; carried out the construction of the dam, head works, etc., at the foot of the lake; and built the dam at Humpback.

It was considered advisable to call for tenders for the concrete flow-line and the pressure pipe-line. The contract for the construction of the flow-line was awarded to the Pacific Lock Joint Pipe Company, and, in place of a 40″ pipe, the contractors, having the necessary forms on hand, agreed to construct a 42″ pipe for the same price, their tender being $2.29 per foot, including laying and installing, but not transportation.

Sooke Dam—Looking West. February 2nd, 1914.

The concrete pipe was made of a shell 3″ thick and in 4 ft. lengths, except the pipe used for siphons which was more heavily reinforced and the shell was 4½″ thick. To save yard space and forms it was decided to steam the pipe. The pipes were first steamed 3½ hours then the forms were stripped and the pipes steamed for another 3½ hours, the temperature of the steam being kept at 135 to 150 lbs.: the pipes were kept about two weeks before being used. The reinforcement was style 6, triangular mesh, made by the American Steel & Wire Co. Square steel bars were used for the ring reinforcements in the siphon pipes and six 1⅜″ square bars were used longitudinally.

Three special bevel pipes were used in laying the curves, made by dropping the spigot ring on one side to give ¾″, 1½″ and 2¼″ taper in the diameter of the pipe.

In the manufacture of the pipe a 1-2-4 mixture was used with the course aggregate limited to ½″ diameter gravel.

Tests made of the pipe with 3″ walls gave a crushing load of 1½ to 2 tons, and a bursting pressure of 20 to 25 lbs. per sq. inch, equal to a head of 53 to 57 feet.

Some copper diaphragm expansion joints were installed with no appreciable effect and were discontinued; hair line cracks developed at every fourth joint. The contractors guaranteed to maintain the pipe for a period of one year.

Steel Pressure Pipe. January 23rd, 1915.

During the winter months when there are sudden temperature variations, ranging from a few degrees below freezing to a few degrees above, leakage, amounting to ½ million gallons in 24 hours on the 27 miles of pipe, has been noticed, but upon a rise in temperature this leakage at once stops.

From 150 to 160 four-foot sections of pipe were made in an 8 hour shift. For laying the pipe, a pipe tripod with a chain block, having a long horizontal pipe laying hook, was used.

Method of Laying Concrete Pipe. May 30th, 1914.

The City awarded the contract for the fabrication and laying of the rivetted steel pipe to the Burrard Engineering Company, of Vancouver, at the following prices: 5/16″ - $5.50 per foot, 3/8″ - $6.25 per foot, but they carried out by day labor the necessary excavating and backfilling.

The following is a general description of the work as constructed:—

The dam at the intake channel at the lake is excavated 4 ft. below low water, where an intake tower is constructed, controlled by seven sluice gates. The openings of these gates are protected by screen cages. From the intake tower, two lines of 40″ rivetted steel pipe are laid to convey the water to the screen house. Only one of these is in service at present. In the screen house is installed a set of 12 screens. The original screens had a mesh of 40 and 60 openings to the inch, but these were found to be too small, and have since been replaced by screens having 16 and 24 openings to the inch. Below these screens are the measuring weir and cascade steps. The screen house is constructed of concrete with a concrete roof. The dam is a composite structure, the west end being an earth embankment with a concrete core wall bonded into the natural rock. From the screen house to the east abutment,

Method of Laying Concrete Pipe. May 30th, 1914.

an o.g. weir section 200 ft. in length is built, which is generally about 15 ft. above the level of the natural rock.

In the construction of the concrete flow-line a right of way 100 ft. wide was secured. All trees were cut down and any tall trees outside this area, which might in falling damage the pipe, were removed. The pipe is not covered except immediately in the vicinity of the Humpback Reservoir, where it was thought slides might occur. At a distance of 2000 ft. apart on the conduit-line, there are open standpipes, and all inverted siphons, of which there are six, have waste outlets at the bottom controlled by 6″ gate valves. The deepest siphon is 600 ft. in length and has a maximum head of 90 ft. The whole of the pipe-line was constructed to a grade of one foot in a thousand feet.

One of the difficulties in connection with this scheme was to secure a reserve reservoir at a proper elevation and

Concrete Trestle No. 41.
Siphon No. 3. June 17th, 1914

in fairly close proximity to the city. A suitable site was finally located at Goldstream on the Humpback Road, about 11 miles from the city. This reservoir has a storage capacity of 136 million gallons and covers an area of 33½ acres. This area was covered with a very thick forest. A portion of the reservoir site had black soil of a peaty nature. It was decided to cover this with a 6″ layer of clean gravel. The dam is 560 ft. long, 60 ft. in height, and contains about 9,000 cubic yards of masonry.

The water flows into the reservoir from the flow-line over a series of concrete steps. There is also constructed a by-pass 24″ in diameter by which the water can be taken direct to the pressure-line. There is in addition a submerged outlet controlled by a butterfly valve. During the summer of 1915, owing to algae in the reservoir, the water was delivered to the city direct through this by-pass. Owing to the great pressure, it was decided instead of delivering the water direct to the city to permit it to overflow into Smith's Hill Reservoir, situated within the city and having a capacity of about 15 million Imperial gallons, and which acts as a standpipe.

It is interesting to record that during the construction of this work, the greater portion of which was of a hazardous nature, no fatal accidents occurred.

The flow-line follows the shoulder of the mountain and the work involved the clearing of a dense forest composed almost entirely of Douglas Fir.

The City, so as to protect the watershed from any possible danger of pollution, has purchased the whole area comprised within it, being about 15,000 acres, for the sum of $12. per acre. The City expect ultimately, if they so desire, to more than compensate themselves for this expense by disposing of the very large amount of valuable timber which is on the watershed.

Concrete Trestle No. 14. April 7th, 1914.

The abandoning of the work by the contractors, the Westholme Lumber Company, led to a protracted litigation. The Company entered suit against the City claiming $500,000. damages. The suit was heard in Victoria and the Judge hearing the case was assisted by two assessors who were *civil engineers*. The trial lasted six weeks and a verdict was given for the City, but the Company appealed to the Supreme Court and finally to the Privy Council, both of which gave decisions in the City's favor.

The system was completed at the end of May and put into use on the 2nd of June, 1915.

Some interesting tests were made on the concrete flow-line. The original contract called for the delivery of 16 million Imperial gallons per 24 hours through the 40″ pipe. As previously mentioned, the contractors, without any additional cost, constructed a 42″ pipe and the maximum flow from tests through this pipe was 22,400,000 gallons in 24 hours, the coefficient being .0106. 55% of the pipe-line is on curves, the longest tangent being 500 ft., and the minimum radius 76.7 ft.

The following is the actual cost of the work carried out by the City:—

Sooke Lake:

Earth excavation in construction of dam at Sooke Lake	$1.42	per cu. yd.
Rock excavation	4.24	" " "
Concrete in foundation of dam	15.68	" " "

All the cement had to be shipped by rail and hauled by teams about ten miles over very rough roads. The gravel and cement were procured from the upper end of the lake, and had to be towed to the foot of the lake. This involved the placing of a tug in the lake which had to be transported from Victoria over the mountain, and the construction of scows.

Concrete Pipe-Line:

Pipe—per lineal ft	$2.32	
Concrete trestles, ft	.18	
Railroad, ft	.53	
Transportation, ft	.33	
Total	$3.36	per lin. ft.

Telephone Line:

Cost per mile	$426.00

Steel Pressure-Line:

Contractors' prices were as follows:—

5/16″	$5.50	per foot.
3/8″	6.25	" "

The City did the earth excavation and backfilling at the following cost:—

Earth excavation	$1.32	per cu. yd.
Backfilling	.56	" " "

Humpback Reservoir:

Earth excavation	$ 2.09	per cu. yd.
Rock "	12.78	" " "
Clearing	605.00	per acre.
Placing gravel in bottom	2.48	per cu. yd.
Concrete foundations for dam	9.00	" " "
Concrete in dam	10.05	" " "

These prices included plant, tools, equipment, supplies, bookkeeping, etc.

As previously mentioned Mr. Meredith, of the firm of Sanderson & Porter of New York, was Consulting and Designing Engineer, and had charge of the construction. He was represented on the ground during the progress of the work by Boyd Ehle, Mem. Am. Soc. C.E.

The following data in connection with this work may be of interest:—

Area of Sooke Lake at 655 ft. elev. (City Datum)	978 acres.
After 12 ft. rise, area	1,180 "
Land clearing around the lake	300 "
Length of concrete flow-line — 42″ in diam	144,040 ft.

First pipe made 20th April.
Commenced laying 16th May, 1914.
Finished on 8th May, 1915.

Length of pressure pipe-line — 36″ in diam., 56,677 ft.

Started to mfg. July, 1914.
Finished laying, Jan., 1915.

Total quantities of earth excavation, 180,342 cu. yds.
" " " rock " 150,517 " "

Cost of construction, including engineering, etc	$2,037,176.00
Cost of land, which includes right of way for pipe-lines, site for Humpback Reservoir, land adjoining Sooke Lake and Sooke Lake draining area	540,000.00
Total	$2,577,176.00

Electric Brass Furnaces

It has long been recognized, and commercial experience in the last few years has confirmed the results of observation, that melting brass by electricity offers many advantages. These are a saving of zinc, high quality of product through freedom from contamination of the melt by oxygen and sulphur, the elimination of crucibles, the ability to melt large charges, and better and safer working conditions. Various types of electric-furnaces have been devised, some of which are suitable only for a narrow range of foundry and rolling-mill conditions, and have certain drawbacks which limit their usefulness. Dr. Gillet and his associates in the experimental work of the U. S. Bureau of Mines, have evolved a rocking-furnace for melting brass that appears fitted for a wider range of conditions than most other furnaces. This furnace has been submitted to commercial tests with highly satisfactory results. Not only does it reduce losses of metal, but it avoids the use of graphite crucibles; and is so economical of electrical power that no more fuel is required for brass melting than if the fuel were used directly in a fuel-fed furnace. The melting cost is reduced below that of pre-war times. This rocking electric-furnace is shown in drawings to scale, and numerous experiments made to test its efficiency are described in detail.

(U. S. Bureau of Mines, Bulletin No. 171.)

Patents and Engineering*

By Hanbury A. Budden, A.M.E.I.C.

On the 5th December, 1912, Russel S. Smart, A.M.E.I.C. of Ottawa, read an excellent paper on Patent Law before the Mechanical Section of the Canadian Society of Civil Engineers. In this paper he discussed the legal aspect of patents in Canada, the formal requirements of patent applications and the maintenance of patents, and gave a brief reference to the question of infringement. Reference was made in the paper, and during the discussion which followed, to a number of defects in the Canadian Patent Act; and the urgent necessity for a thorough re-drafting of the Act was supported by several of the speakers. Unfortunately nothing has been done by the Government to remedy these defects which continue to exist. One of the speakers J. A. Jamieson, M.E.I.C., in supporting the claim that the subject was one of interest to engineers, made the remark that the " the history of patents was the history of progress ". This statement I will take as the text of my remarks to-night, and particularly as applied to engineering.

Now, although the expression Civil Engineering originally covered the whole field outside Military Engineering, in recent times it has come to signify merely a sub-division. This may be seen by reference to the calendar of McGill University. Here we find Civil Engineering is one of the ten courses in Engineering. By the recent change of title of *The Canadian Society of Civil Engineers* to that of *The Engineering Institute of Canada* the scope of the Society has been greatly enlarged, and now covers the whole field.

Engineering is defined in the Standard Dictionary as:—" The science and art of making, building, or using engines and machines or of designing and constructing public works, or the like, requiring special knowledge of materials, machinery and laws of machines."

Now Engineering is a generic term, and includes a variety of branches or sub-divisions.

Thus we have:

Chemical	Sanitary
Civil	Steam
Dynamical of Power	Topographical
Electrical	Industrial
Heating	Research
Hydraulic	Organizing
Marine	Irrigation
Mechanical	Highway
Military	Production
Mining	Efficiency
Municipal	Combustion

We are rapidly approaching the time when these sub-divisions will be further divided. Each one of these branches has grown and developed by improvements that have been the subject-matter of patents. Take, for example, chemical engineering. The apparatus that, in the early days, consisted of simple tanks, vats, pipes and boilers now takes the form of huge specially planned buildings containing elaborate and intricate devices constructed of materials that were then unknown; and employing temperatures, pressures and effects that were scarcely dreamt of even in comparatively recent times.

At a recent meeting we saw in the moving-picture film on Coal how elaborate modern mining engineering had become in one of its branches. Municipal engineering with its sewage treatment, water filtration, incinerators and road making and maintaining apparatus has reached a high degree of development. The same may be said of each of the branches of engineering. This great development has taken place gradually and is largely due to the work of inventors who have recorded the steps of their progress in the patents they have taken out. And, in most of these branches one of the best methods of finding out the latest and highest development, is a search in the recent patent records for improvements relating to the particular subject of the branch concerned.

This may not have occurred to the members of *The Institute* and the means and methods of obtaining such information may be unknown to the majority of the audience. With this end in view my remarks will relate now to the Patent Records.

Patents relate to the invention of useful arts, machines, manufacturers or composition of matters. I do not intend to take up your time in discussing the subtleties of patent law on the question of the distinction between invention and mere improvement. The point I wish to make is that the patent records contain a historical record of the growth and development of practically every branch of engineering. It is not in respect to patents as monopolies that they are to be considered but as a source of information; to be gathered from the vast accumulation of patents which may or may not have become public property. In this respect, the essential point of a patent is its disclosure, i.e., what information it gives to the public.

Disclosure

Disclosure is a statutary requirement in patents. The Canadian Patent Act in Section 13 requires that the specification shall correctly and fully describe the mode or modes of operating the invention as contemplated by the inventor. In the case of a machine, the specification shall fully explain the principle and the several modes in which it is intended to apply and work the same. Drawings are required where the invention admits of illustration. The British Act is very brief on this point. It reads:—" A specification must particularly describe and ascertain the nature of the invention and the manner in which the same is to be performed." The United States Statute is more definite in Section 4888 where it requires:—" A written description of the invention and of the manner and process of making, constructing, compounding and using it in such full clear concise and exact terms as to enable any person skilled

---

*Read at the Montreal Branch Meeting, March 13th, 1919.

in the art or science to which it appertains or with which it is most nearly connected to make, construct, compound and use the same; and in the case of a machine, he shall explain the principle thereof and the best mode in which he has contemplated applying that principle so as to distinguish it from other inventions."

In Great Britain the courts have held that the specification must not be so ambiguous that fresh experiment or research is necessary before the results set forth in the specification can be obtained. It may be interesting here to refer to the recent annulling of a number of chemical patents, taken out by Germans in Great Britain, on the ground that essential steps in the processes had been omitted, purposely or otherwise. In these cases the disclosure was incomplete and useless and the patent was therefore invalid.

The State of the Art, is an expression used in patent law to determine public knowledge on matters relating to an invention. In patent litigation one of the most important questions is to know the State of the Art on a given date. It is often very difficult, in the light of subsequent invention and progress in the art, to solve this question. But that difficulty is not met with when the State of the Art of the present day is the objective. Recent patents will furnish this information most readily. It has been often said that the percentage of patents that are successful is very small, but success in that respect only refers to remuneration. A great many patents, which have failed to reward the inventors, have been very valuable in disclosing means and methods, which by the addition of slight improvements, have made great advances in the art. A record of experimental failures may often be of great value in preventing waste of time and effort in duplicating such experiments. A frequent cause of failure is that inventions are so far ahead of the State of the Art that they are not appreciated at first and it may take years before their real value becomes known. The disclosure of these ideas and devices in patents is however very valuable in directing the development of the art. Another cause of failure is that inventors are frequently entirely lacking in financial knowledge and in the ability to exploit their inventions to advantage. In Canada, a large number of patents lapse before the inventions covered by them have been made use of; owing to non manufacture or failure to renew at the end of six years. In Great Britain, annuities are payable on the fourth year from date of application and failure to pay invalidates the patent. However, in spite of so many failures, patents are issued in increasing numbers and the mine of information continues to expand its field or operations.

Engineers have usually some hobby or subject that they are specially interested in. Frequently these hobbies are the subject of investigation, and a knowledge of the history of the art would be of great advantage to them in supplying a good foundation on which to build their theories and to base their conclusions. As I said before, a knowledge of what has been done in the past will avoid waste of time and effort in repeating such work. Moreover, it may happen that the investigator in examining a patent that has failed to reach success, will hit upon an improvement or slight modification that will change failure to success.

Up to the present date there have been issued in the world nearly four million patents.

In Great Britain	515,000
The United States	1,292,000
France, over	500,000
Germany, over	300,000
Belgium	272,000
Canada	188,000
Italy	140,000

This immense number of patents would be of little value without systematic classification.

Great Britain adopted a system of classification in 1855, which has been readjusted from time to time, and now contains 271 classes. Every six years, since 1855, a series of volumes have been issued covering the patents issued in each class for the preceding six years. The volumes covering 1909-1915 are now available. These volumes contain abridgments of specifications with drawings. It is thus possible to get a complete set of ten volumes covering any class and the cost of the set is only 12 s.

I am glad to say that the library of *The Engineering Institute of Canada* has been receiving these volumes with the exception of the last set, covering 1909-1915. No doubt these have been delayed owing to the war but they should be procured as soon as possible to complete the series. They form a valuable, though but little known and used, section of the library. Complete printed copies of British patents can be purchased at not more than a shilling a piece; before the war they cost 6d. The British Patent Office also issue a weekly Illustrated Official Journal. At present this is not received in any of the libraries in Montreal. Complete copies of all British patents are received at Ottawa and also, I believe, at the Parliamentary Library, Quebec.

The classification adopted by the United States Patent Office consists of 295 classes, each of which is subdivided into numerous sub-classes. A Manual of Classification is published which contains a useful index; cost 25 cents. A volume of definitions of classes and sub-classes is also published from time to time. The latest issue is dated 1912, but this does not as yet include the definitions of all classes. The Official Gazette is published weekly and this contains a recent, valuable addition in the form of a weekly classification of patents. The Annual Index also contains a classification of patents. These classifications give the Class number, Sub-class number and Patent number. By means of these lists it is a simple matter to obtain the numbers of any patents issued in any sub-class. The United States Patent Office sell printed copies at five cents a piece. Coupons, in pads of 20, are obtainable, and make the purchase of copies very easy. They also supply complete sets of all the patents issued under a sub-class at the same rate. It is thus possible, in both Great Britain and the United States, to procure a fairly complete history of the development of any device or process at a moderate expense.

In regard to systems of classification the French publication "Chimie et Industrie" employs the Dewey Decimal System in reference to patents as well as to periodical literature. This system has the advantage of flexibility and an indefinite capacity for extension. It has been adopted in many libraries and by engineers, manufacturers and business concerns for indexing data and information of any description. The University of Illinois publish a bulletin on The Extension of the Dewey Decimal System of Classification Applied to the Engineering Industries, which will be found to explain very clearly the use of the system in this particular sphere. Mr. Arthur Surveyer, M.E.I.C., has referred to this system in an article to be found in the last number of "Revue Trimestrielle."

In contrast to such beneficial systems of classification, Canadian patents are not classified. The Canadian Patent Office does not print patent specifications, and the cost of a typewritten copy of a patent is exorbitant, running from $2.00 upwards. In referring to this system, Sir Robert Hadfield of Sheffield in an address to the British Gas Association made the following remark: "As an example of the antediluvian policy of our Empire on this question, it is difficult to imagine that an Englishman in this country cannot get a copy of a Canadian patent without sending to Canada, and even then only a typewritten one; as patent specifications are not printed there. Fie upon you Canada in this respect! This is only one of quite a number of shortcomings on the question."

The United States Patent Office took in from the sale of printed copies of patents, in 1917, the sum of $127,166 as well as $28,000 for photographic and photostat copies of drawings: they actually issued over 5,000,000 printed copies in the year. Our Patent Office took in $2,500 which would represent about 1200 copies. And, the worst feature of our system is that each year's delay increases the arrears. Our Patent Office has agreed to exchange copies of all patents with the U. S. Patent Office. Printed copies are therefore necessary to carry out this agreement.

The Patent Office Record is now published weekly but so far it contains all the defects of the former monthly issues. Amoung these may be mentioned:—

1. There should be a list of applications filed giving title, name of inventor, date of filing, name of assignee and date of foreign patents issued for such invention, if they exist. Section 8. Para. 1 of the Patent Act makes it necessary to apply in Canada within one year from the date on which the first foreign patent issued. It is therefore important that the dates of applications should be known; as the rights of the public are affected by them. Failure to apply within the year, gives the public the unrestricted use of the invention.

2. A List of Patents subject to Compulsory License should be published from time to time. In Great British all patents are subject to compulsory license but in Canada it is a matter of special application and therefore this information should be published.

3. The Patent Record should record Extensions to Import and to Manufacture under Sections 39 and 40 of the Patent Act.

4. In regard to Renewals. As Patents usually are issued for a term of six years only, it is important to know which have been extended and which have become public property. A list of patents that have lapsed for non payment of renewal fees, or a list of renewals should be published. Such a list was formerly published but it was discontinued in 1897.

5. A List of Reissues. Hitherto reissues have been mixed up with new patents and indexed with them. Reissues are, however, simply continuations of the original patents and continue to date from the original date of issue. They should be numbered in a distinct series and indexed as reissues.

6. All Rules and Orders in Council relating to patents should be published in the Patent Office Record.

7. All Decisions of the Commissioner of Patents and Decisions of the Courts Relating to Patents, Decisions of Arbitrations in Conflicting Cases, etc., should be reported in the Record. It is essential that all decisions of the Patent Office should be published in order to established a uniform practice.

8. The indexes should give title, name of applicant, name of assignee, official number, date and page.

At present the page is not given in the indexes of patents and the title list gives the assignee's name instead of that of the inventor. This makes it difficult to indentify references; as a patent is always cited in reference to the inventor. In indexes which are widely used for reference, the proof reading should be accurately done, but this is far from being the case in the Patent Record indexes. Most of these defects can be easily remedied and are due to the absence of the necessary interest, on the part of the Patent Office, to make the Record as useful and complete as possible.

The financial position of the Patent Office is curious and decidedly interesting. The revenue of the Canadian Patent Office for the year ending March 31, 1918, was $224,051.93, the expenditure $122,531.23; leaving a balance of $101,520.70 which was handed over to the Minister of Finance and merged in the Consolidated Revenue Fund.

In the United States Patent Office, for 1917, the receipts amounted to $2,258,377 and the expenditure $2,048,173: a very different proportion; as there the surplus is under 1/10 of the receipts while in Canada it is 5/11. But even with their large expenditure, Thomas Ewing, the late Commissioner of Patents at Washington, claims, in an article on The Needs of the Patent Office which appeared in the Scientific American on 21st. December, 1918, that the office needs to-day one million dollars beyond what it has. It is receiving $2,000,000. and could use $3,000,000. to great advantage.

In Great Britain the surplus is also turned over to the general funds and the following protest was made against this system by Alan A. Campbell Swinton, F.R.S., Chairman of the Council of the Royal Society of Arts, in an address on Science and its Functions in November, 1917. He states as follows:—"This brings me to another point in connection with invention, and that is the injustice and the inexpediency, from a public point of view, of the present system whereby the Patent Office makes a large annual profit out of the fees paid by inventors. There might possibly be some justification for this were the money thus obtained spent on scientific education, on scientific libraries, or on some other object that would further invention and discovery. The money is, however, merged in the ordinary revenues of the country, and thus becomes a veritable tax on brains. It is, moreover, a tax on the cerebral activity of a class of men who are usually by no means overburdened with wealth. Though all inventors are fortunately not driven by poverty to such expedients as Palliser the potter, who actually had to burn his household furniture in order to provide heat for his furnace, still the majoirty of inventors are undoubtedly poor and find the cost of protecting their inventions by patent, and still more of maintaining these patents when granted, a considerable strain upon their finances. The truth of this may be seen by the frequency with which patents are dropped merely in order to save the renewal fees, and the patentee in some cases deprived of profits to which he is justly entitled."

The Canadian Patent Office has in the past been a milch cow supplying the Government with a large amount of funds annually. This may account for it having been a branch of The Department of Agriculture for so many years. Within the past year it has been transferred to The Department of Trade and Commerce. Let us hope that this is at least a good omen.

Owing to the small number of patent attorneys in Canada it has not been possible to form a strong association such as The Chartered Institute of Patent Agents, London. Individual efforts have been made from time to time to obtain a more efficient organization of the Patent Office and a thorough re-drafting of the Patent Act, but without result.

Reconstruction is now the all important question and our patent system is one that calls for immediate action if we are to take our place among up-to-date nations. We have a Reconstruction and Development Committee and an Hororary Council for Scientific and Industrial Research appointed by the Government. The development of the Patent Office and the assisting of inventors are matters which come within the scope of both Boards. The Honorary Council has already taken up the question of reference libraries and is now consulting the various local authorities, to arrange on some plan of action. If the Patent Office had a fully equipped technical and industrial library with an efficient staff, it would be an ideal centre or headquarters for the organization and development of local libraries. By means of a photostat equipment the Patent Office Library could supply copies of references, drawings, etc., that were not available in the local libraries. At the present we are entirely dependent on foreign libraries. Fortunately the members of *The Engineering Institute of Canada* have available the library of the United Engineering Societies, New York, for scientific and technical literature and the Patent Office Library at Washington, for foreign patents.

As loyal Canadians we cannot look at this state of dependence on foreign aid as a proper condition. We must aim at having our own means of investigation and research. The Patent Office can be made a more useful institution than it is at present. With proper facilities it could become a storehouse of technical information available to the public. At present it is chiefly occupied in granting monopolies to other than Canadians. Last year only 973 patents out of 7233 were granted to Canadians. It would, therefore, appear that an opportunity is offered our new *Engineering Institute* to apply its influence in a direction that would benefit our country, not only from technical and industrial but also from commercial standpoints, by taking a lead in the reconstruction of our Patent System.

In closing let me suggest a few of the features that should enter into an ideal patent system:—

I. A research library containing all current literature on technical matters, properly indexed and kept up to date, and with photostat equipment. Such a library is essential to the efficient work of the examiners of the Patent Office. Under a competent librarian, there should be a staff of research workers who would make searches and prepare reports on questions submitted to them.

II. A Commissioner of Patents who is a real head of his department and who is fully qualified to handle the technical and legal questions of his office as well as administer the same.

III. A sufficient number of competent examiners headed by an Examiner-in-Chief, to whom all appeals from the decisions of examiners should be submitted.

IV. Printed copies of patents to be sold for not more than 25 cents a copy.

V. A Patent Office Record that should be a complete medium of information to the public on all matters relating to patents, patent law and practice.

VI. A list of registered Patent Attorneys: subject to the control of the Commissioner of Patents.

VII. A revised Patent Act.

VIII. And finally, that Canada should become a member of the International Convention.

New Process of Casting Non-Ferrous Alloys

The process consists in pouring the molten alloys into metal moulds and forming or congealing them under pressure. They are really die castings, formed under high pressure. It is claimed that almost any grade of non-ferrous alloy can be handled, the casting being made in a specially constructed automatic machine by which a large number can be produced in a day.

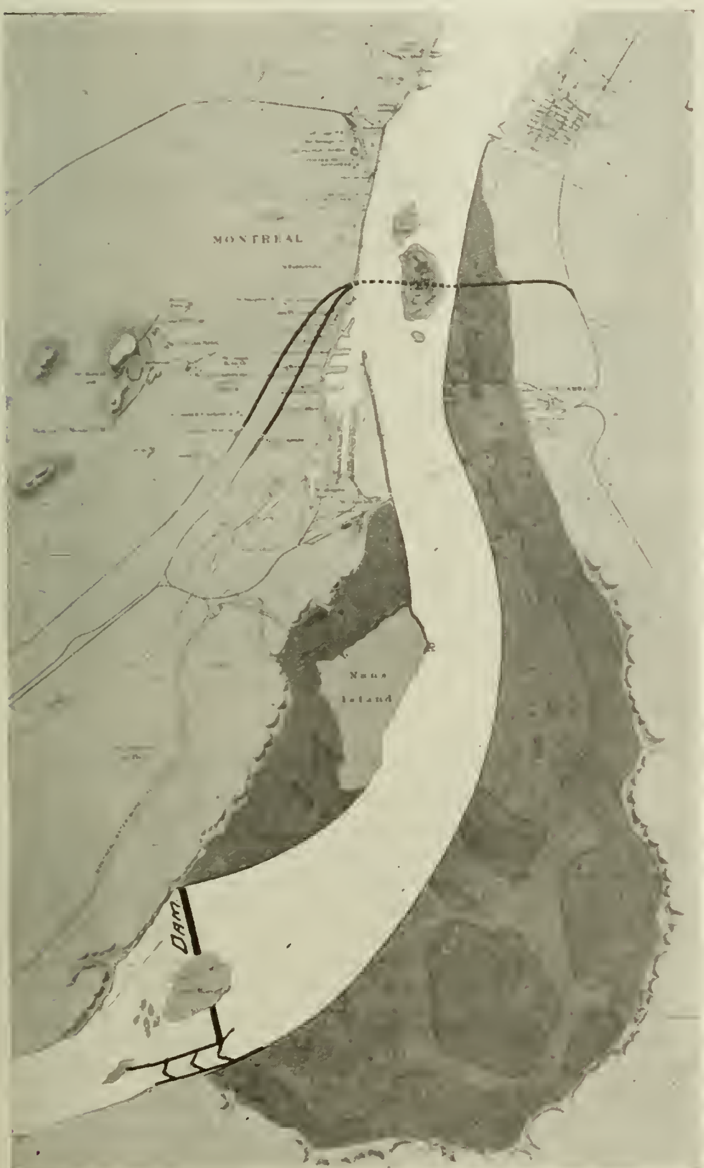
It is possible to use an alloy of aluminium, copper, and iron, which has a low coefficient of expansion. The ordinary piston made of aluminium and copper is said to have too great a coefficient of expansion, but the introduction of iron is regarded as making it possible to produce very large aluminium pistons essential for high-power aircraft engines. *Scientific American, Jan. 18, 1919.*

Discussion on Papers Previously Published in The Journal

Suggested Harbour Improvements for Greater Montreal*

By E. S. M. Lovelace, M.E.I.C.

T. Kennard Thomson, M.E.I.C: The writer has read with much interest the paper by Mr. Lovelace describing his very ingenious, proposed plan for improving the Harbour of Montreal and he is sorry that he did not know of it in time to attend the meeting.



Plan for Improving Montreal Harbour

* Published in Vol. II, No. 4.

The writer begs to take this opportunity of presenting to our *Institute* a plan which he submitted to a number of Montreal and Ottawa gentlemen before the war—in fact as far back as 1911 — in which the writer hopes to solve the problem in a manner directly opposite to that of the author. In other words, it would seem that the easiest way to handle ice is to have deep water and plenty of current, and it would surely be a great advantage if all ocean steamers could reach Montreal without passing any lock whatever. In brief, the writer's plan is to build a dam at or near Isle Heron having locks of at least 40 foot draft, and then to deepen the Channel from Isle Huron to below Montreal so that vessels of 40 foot draft could reach the locks and then pass directly into Lake St. Louis.

In deepening the wide channel (between the shaded portions on the map), there would be reclaimed an area of about ten square miles. The dam would also permit the construction of power plants which could easily develop 1,000,000 horse-power, per annum. The enormous value of this hydro-electric development and of the reclaimed land would pay for all the harbour improvements, dredging, etc., and a very handsome interest on the money expended besides. A glance at the map enclosed will show what an enormously valuable manufacturing site would be added to Montreal, which would be connected by numerous tunnels.

The late Sir Wm. C. Van Horne said that this plant would make Montreal one of the greatest ports, if not the greatest port. on the American Continent.

E. S. M. Lovelace, M.E.I.C., (the author): The very interesting discussion on the above paper contributed by T. Kennard Thomson, M.E.I.C., in which is outlined an *alternative* scheme for the betterment of Montreal Harbour, serves to show that, generally speaking, more than one solution of a problem is possible; the better one to adopt in any given set of circumstances depending largely on some outstandaing factor, or point of view, which may be said to dominate the situation.

While the writer has not had an opportunity of giving any great amount of study to Mr. Thomson's scheme, it would appear that in his proposal, the governing idea is that of *power* and *industrial developments, harbour betterments* being more or less incidental; while 'n the suggestion of the writer, it is the improvement of the *Harbour,* pure and simple, that is kept strongly in the foreground. As has already been pointed out in the discussion, Mr. Thomson's idea of a dam at the foot of the Rapids is not entirely new; as before the war a company was incorporated and surveys made for the development of the Lachine Rapids: the idea being to place a dam at almost the precise point indicated by Mr. Thomson on the plan accompanying his discussion. *Such power development,* therefore, can scarcely be said to have to do with any direct improvements to the Harbour of Montreal. If thought desirable, it could, moreover, be carried out as a separate undertaking in connection with the proposal of the writer.

In making a comparison as to the cost of the two schemes, the cost of this power development could, therefore, be placed to one side; and the cost of the submerged dam and locks, as suggested by the writer, placed against the cost of dredging out a forty foot channel to the foot of the Lachine Rapid, as provided for in Mr. Thomson's proposal. In the opinion of the writer, the submerged dam and locks would cost but a fraction of the amount necessary to do the enormous amount of dredging (a good deal of it in rock) required if the latter proposal were adopted. While, as Mr. Thomson points out, *locks* are not entirely desirable in a river when situated as these would be, at the entrance to the Harbour; yet, having only a small lift to negotiate, they would not, in the writer's opinion, be found as objectionable as the existing strong St. Mary's Current.

In the construction of the Panama Canal it was proposed at one time to have no locks, but ultimately, and very wisely as it now seems, they were introduced.

Other things being equal, apart from the question of cost, a wide open harbour, such as would be created through the building of the submerged dam giving plenty of room for ships to manœuvre and pass, would be preferable to the narrow channel with swift current which would result from the carrying out of Mr. Thomson's proposal. It would further seem to the writer that in carrying out Mr. Thomson's idea, heavy land damages would have to be provided for. Owners with property now facing the river would scarcely care to have such frontage replaced by a maze of factories, however beneficial to the community in general such factories might in the long run prove. While it is likely that such damages could be made up for by the value of the land recovered from the bed of the river, there is, as yet, however, so much *cheap* land, suitable for industrial development, obtainable on the south shore that it would scarcely seem to be worth while, apart from *other* considerations, to go to any very great expense in reclaiming the river bottom.

The whole question is, however, a very large one and the possibilities are so far reaching that it is desirable that all the light possible should be thrown upon it. The writer, therefore, would like to express his personal regret that Mr. Thomson was not present to take part in the discussion when the paper was originally read. Mr. Thomson's *proposal*, focussing attention as it does on at least one aspect of the problem, will doubtless be given the gravest consideration by those who ultimately may be called upon to take action in the matter of improvements to the Harbour.

Limitations to Alternating-Current Transmissions

It is argued that the limits of distance over which it is desirable to transmit electric energy by alternating currents are being approached, and that future developments will be carried out by the high-voltage direct-current system.

The probable great increase in industrial activities will outrun the capacity of the facilities for gaining and transporting coal, and large-scale electric systems of transmission will have to be constructed. Germany may have to draw its electric supply from Norwegian and Finnish waterfalls. It may be possible to increase the transmission voltages to some extent, but when exceeding 100,000 volts the capacity currents flowing in the line become of great importance, and the losses caused by these currents may become high enough to lower the efficiency of transmission seriously. That is to say, above certain voltages it is no longer correct to say that the efficiency of transmission of a given power increases with the voltage. A decrease of frequency below the usual would not be permissible owing to the bad effect on lighting and the increase of cost of motors and transformers.

An examination of the problem shows that for each case there is a maximum voltage giving the best efficiency. If the distance of transmission is L, the voltage E, the power transmitted P, and the capacity of the line C, then the "electric cost of transmission" (percentage line losses x weight of line per kw.) is given by the expression $(L/E)^2$ $(CEL^2/P)^2$. The presence of the second term shows that with alternating current the cost is always greater than with direct current at the same voltage. If the distance is increased n-fold, the first term may be kept constant by increasing the voltage in-fold, but the second term will increase n^6-fold. Thus above certain distances direct current will have to be adopted.

The combination of capacity and inductance sets a further limit to the use of alternating current, and the limit to the use of alternating current will be found at about 200,000 volts, with transmission distances of several hundred km. If cables be used the limit will be much lower.

A further advantage of direct current lies in the fact that safety devices, such as condensers and choking coils, are more effective than with alternating current. Also cables have many advantages as compared with overhead lines, and they are cheaper for direct than for alternating current. (M. Dolivo-Dobrowolsky, Electrotechnische Zeitschrift, Jan. 2, 1919.)

Electron Theory of Thermo-Electricity

Most investigations based on the electron theory of Riecke, Drude and Lorentz make for the calculation of thermo-electric effects the simplifying assumption that the atomic fields of force in metals are rigid and unaltered by temperature. The causes of thermo electric effects are then sought in the variations of the mean energy of the electrons arising from the movements of the electrons and the variations in the number of free electrons. The view of Bohr is followed up, according to which the variations of the atomic fields of force must have an influence on thermo electric magnitudes. An attempt is made to establish the proposition that the movements of the electrons in rigid fields of force exert only a small effect, whereas the phenomena of thermo-electricity are mainly controlled by the changes in the atomic fields of force produced by the thermal expansion and the heat movements of the atoms. (G. Gorelius, Annalen der Physik, No. 19, 1918.)

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

VOL. II. JUNE 1919 No. 6

Western Professional Meeting

July tenth, eleventh and twelfth are the dates and Edmonton is the place of the Western Professional Meeting of *The Institute* for the current year.

The success of the Saskatoon meeting last year stimulated engineering activity in the West to no small extent. Immediately after that meeting plans were started for the meeting this summer and several cities put in applications to be favoured by having this meeting held within their borders. Edmonton was finally selected and the choice was made unanimous.

Three at least of the important subjects discussed a year ago will occupy a prominent place in the programme of the coming meeting. A subject which was discussed at Saskatoon, for the first time at a general meeting of *The Institute*, that of legislation has received more attention during the past twelve months than any other. It is obvious, therefore, that it should occupy a prominent place at this meeting. During the year the whole situation regarding legislation has crystallized and is now focused in the draft Act, with which the western members had much to do.

The committee on a problem which has caused some uneasiness in the West, that of the action of alkali salts on concrete, have done a large amount of investigating and research within that time and their report is being looked forward to with unusual interest.

The good roads movement is not confined to the east as indicated by the lengthy discusssion on this subject last year. The committee appointed to study the situation and bring in recommendations regarding improving the earth roads of the prairies, will have an important announcement to make. The Chairman of the Honorary Council for Scientific and Industrial Research has become interested in this subject and has invited the co-operation of *The Institute* with that body in effecting a solution of the road problem in the West.

Other subjects suggested for the Edmonton meeting are: remuneration of engineers, sewage and water purification, reclamation of lands, natural gas distribution, town planning and the development of aeronautics in the public service; all of them of interest to the entire profession and most of them of particular moment to the West at the present time.

Last year one hundred members of *The Institute* met at Saskatoon, having travelled an average of two hundred miles each, which illustrates how strong the "get together" spirit has grown in the profession. Those who were fortunate enough to be at last year's meeting are now looking forward to Edmonton, and July tenth, eleventh and twelfth. It is certain that many others will attend the Western Professional Meeting this year. It is expected that President Leonard will open the meeting and preside at a number of the sessions.

* * *

Transactions

Inasmuch as some of the members have requested information regarding publication of transactions, showing that the matter is not yet clear in the minds of all our members, it is opportune to state that it is intended that transactions be published yearly as in the past.

In nineteen hundred and seventeen one volume of transactions only was printed, and that volume completed the transactions for that year. There are now in the hands of the printers two volumes, one of these is part two for the year 1918, being devoted entirely to the Quebec Bridge, and will constitute a valuable historic record, by the men who were responsible for the design and construction of this great engineering feat.

Part 1 of 1919 will be the presidential address by H. H. Vaughan, delivered at the annual meeting at Ottawa.

The volumes now under way will be issued in the name of *The Engineering Institute of Canada*, and the size will be similar to those of the transactions already issued, so that members who keep their transactions will have uniformity in their shelves.

Legislation for Professional Engineers

Letter of transmittal of special legislation committee. Individual opinions of members of council. Branch opinions.

In the May issue was published the Act respecting the engineering profession, prepared by the special committee of *The Institute* and forwarded to council under date of April 11th.

It was considered expedient to publish the letter of transmittal, sent by the special legislation committee, in the June issue of *The Journal,* rather than wait to have it sent out with the ballot as was first proposed, in order to give an opportunity for some discussion before the ballot is issued. The issuance of the ballot has been delayed two weeks, with the approval of the majority of the committee, consequently it will be sent out on June 15th.

The letters received, discussing legislation at the time of going to press follow the committee's letter.

* * *

MONTREAL, April 11th, 1919.

To the Council of the Engineering Institute of Canada.

Gentlemen:—

In accordance with a Resolution passed at the Annual Meeting of *The Engineering Institute of Canada* in Ottawa, on the 12th of February, 1919: " that the wishes of the majority of the Members and of the Branches of *The Engineering Institute of Canada* are that Provincial Legislation should be obtained to define the status of Engineers throughout Canada " . . . .

. . . ." that this Legislation should be as uniform as possible throughout the Provinces " . . . .

. . . ." that a Special Committee be formed, composed of one delegate appointed by each Branch to meet at headquarters before the 15th of April, 1919, to draw up such sample Legislation as it may deem necessary and advisable".

A Committee was duly formed, consisting of the following delegates:—

C. E. W. Dodwell, Chairman	Halifax, N.S.
C. C. Kirby	St. John, N.B.
A. R. Decary	Quebec, Que.
A. Surveyer, Secretary	Montreal, Que.
R. F. Uniacke	Ottawa, Ont.
Willis Chipman	Toronto, Ont.
E. R. Gray	Hamilton, Ont.
N. L. Somers	Sault Ste. Marie, Ont.
E. E. Brydone-Jack	Winnipeg, Man.
H. R. McKenzie	Regina, Sask.
F. H. Peters	Calgary, Alta.
R. J. Gibb	Edmonton, Alta.
A. G. Dalzell	Vancouver, B.C.
A. E. Foreman	Victoria, B.C.

The full Committee met at 10 o'clock A.M. on Saturday, April 5th, 1919, Mr. Dodwell of Halifax, being elected Chairman, and Mr. Surveyer, of Montreal, Secretary.

The concrete result of the labors of the Committee, after three sessions daily for the past five days, during which its discussions and deliberations were characterized by the greatest possible thoroughness and unanimity, is a tentative Bill, of which the Committee now has the honor to submit a copy herewith enclosed, for the further action of the Council.

It may be safely assumed that there is no opposition or objection on the part of any Engineer in Canada to the basic principle of Legislation.

Every Branch of *The Engineering Institute of Canada,* from the Atlantic to the Pacific, has expressed itself in no uncertain terms as earnestly desirous of obtaining Legislation.

It requires no arguments or special pleading to establish the proposition that the Engineer has just as good a right and claim to recognized legal status by Legislative enactment as the lawyer, doctor, or other professional man. It will also be generally admitted that the public has just as real a need for protection from the unqualified and incompetent Engineer as from the ignorant and incapable practitioner in other professions.

In the development of the principle of Legislation, and its practical embodiment in the frame-work and details of such an Act, or Statute, as will accomplish the desired result, the Committee has been guided by a few definite ideas:—

(*a*) Before any Legislative body can be reasonably expected to accept or to give serious consideration to any proposed Bill, it must be made apparent, not only to that Legislative body, but to the public, that the Bill, as an enacted law, would redound, directly or indirectly, to the benefit of the community at large.

(*b*) It is eminently desirable that any such Bill, as may finally be decided upon, shall be uniform for all Provinces, so far as is reasonably possible.

(*c*) It is of the first importance that any such Bill shall meet the views of, and be acceptable to, every individual Engineer, and to every Engineering and Technical Organization in the country.

(*d*) It is indispensible, especially with a view to the future, that any such Bill shall be as clear as language can make it, and be also practicable and workable.

With these principles in view, the Committee after consultation with Mr. Aimé Geoffrion, the eminent lawyer, and Legal Advisor to *The Institute,* has drafted and prepared the tentative Bill herewith submitted.

The Council will observe that the outstanding feature of the draft is the creation and incorporation in each Province of the Dominion, of an entirely new body, to be called " The Association of Professional Engineers of the Province of . . . ."

After prolonged and earnest debate this provision appeared to the Committee to be not only imperative and unavoidable, but to offer the only practicable solution of the problem before us. Its special object is to forestall adverse criticism, and if possible, to eliminate jealousy and opposition, that might reasonably exist or arise in Engineering and other technical organizations, by the apparent or attempted assumption of either initiative of movement or ultimate control of the machinery sought to be set up, on the part of either *The Engineering Institute of Canada*, or by any other specific or individual organization.

The Committee would respectfully suggest to the Council that in forwarding this draft Bill to the Membership of *The Institute*, in accordance with the terms of the Resolution of the Annual Meeting above referred to, the Members be informed that at this stage their approval, or otherwise, of the draft should be expressed as in regard to its general spirit and principle, and not as to the details or wording of its sections and provisions.

The Committee requests that a copy of this letter be forwarded to each Member of *The Institute*, with a copy of the draft Bill.

In conclusion, the Committee individually and collectively takes this opportunity of expressing its high appreciation of the hospitality and consideration shown to it during the sojourn of its Members in Montreal, and the fervent hope that its labors, aided, supported and supplemented by the Council, as representing the several thousand Members of *The Engineering Institute of Canada*, may result in lasting and substantial benefit to the Engineering profession in Canada.

On behalf of the Committee,

C. E. W. DODWELL, Chairman.
A. SURVEYER, Secretary.

Individual Expressions of Opinion

President, Lieut.-Col. R. W. Leonard

In response to the request of Council that the various Members should express their views on the proposed Special Legislation, for publication in the June number of *The Journal*, I beg to submit the following:—

(1) I share in what I believe to be the general opinion that the salaried members of the Engineering profession in Canada have for many years past been underpaid and do not receive the recognition from the public which the importance of the profession should ensure;

(2) The salaries of members of other professions, as well as Engineering, have remained practically stationary for many years, while various Trades and Labour organizations have, by co-operation and strikes, been able to obtain recently very much greater remuneration for their services;

(3) The result of these conditions is that the salaried members of the profession generally are looking for some means of organization through which they hope to improve their financial and social status, and the work which *The Engineering Institute of Canada* is doing in this respect is of too recent a date to be fully appreciated by the bulk of the Members as yet;

(4) Apparently realizing that the classification and salaries of employees of the Dominion Civil Service require readjustment, there is being framed at the present time a new Civil Service Act, which it is hoped will be made effective shortly and tend to greatly remedy the conditions complained of;

(5) I believe if the provisions of the proposed Civil Service Act are such as to commend themselves to our Members, and if that Act is put into force during the present Session of the House, that the results to be obtained through the operation of the Act will be deemed by the Members of the profession generally to be of greater advantage than any results which could be obtained through the passage of an Act through the various Provincial Legislatures, as proposed by the Special Legislation Committee;

(6) If, on the other hand, the provisions of the expected Civil Service Act be not favorably received by our Membership, of if the passing of that Act be deferred to another Session, then the majority of the Membership of *The Engineering Institute of Canada* will favor Provincial legislation framed with a view to meeting their desires:

(7) I am of the opinion that a short simple Act of each Provincial Legislature requirirg that all employees of such Province or of Municipalities within such Province, who may be engaged as technical Engineers, should be Members of *The Engineering Institute of Canada*, or possess qualifications sufficient for such Membership, would be of greater value to the Membership and would be more easily obtained than the Act proposed by the Special Committee.

Vice-President, H. E. T. Haultain

Three months ago I did not think any useful legislation was possible, except perhaps in connection with Public Works. After several hours of serious consideration of the work of this Committee I am inclined to think that it very probably is not only practicable, but is good business. It will not succeed in doing what a great many of us expected was required.

It may be possible—I think it probable—that all the different branches of Engineering can get together on this basis, and if we can it will be valuable education, not only for ourselves, but for the Public. It woud be a starting point for much growth to follow.

I cannot see at the present time any serious difficulties or drawbacks. I do not believe it will injure *The Engineering Institute of Canada*. It may hinder perhaps, for a short time, its present rate of growth, but in the long run it ought to be beneficial. *The Engineering Institute of Canada* will have no jurisdiction over the Provincial Associations but it ought to have tremendous influence, and sometimes influence is greater than jurisdiction. These are wonderful get-together days, and in my present frame of mind I believe that this is something that we can all get together on. I know of nothing else so good for that purpose. I consider Clause 33, the closing clause, essential.

William Pearce, M.E.I.C.

I can quite appreciate the sentiments that many engineers have expressed that the proposed legislation appeared to them to be too much along the lines of a trade union. It is not more so than, in fact, in my opinion. it does not approach, the rigidity exercised by the law societies in the various provinces of Canada. The lawyers have assumed, and the public to a considerable extent seems to have acquiesced in the view, that they are pre-eminently the leaders in almost any line of undertaking in the country.

They do not confine themselves to law. All our best public offices, many having no connection with legal points, go to lawyers. Why is that the case? Undoubtedly because of their co-operation which can be enforced by their acts of incorporation and the regulations thereunder. Lawyers live and make their livelihood in centres, and thus possess facilities of co-operation in carrying out thoroughly the schemes of their incorporation. We find medical men are striving to work out along the same lines. The same is noticeable in many other callings or professions.

Engineers on account of the nature of their operations are very much scattered and that is all the more reason they should have incorporation and pull together. The greater the number of the branches of engineering one can get to combine the more beneficial to one and all will be the organization.

It is quite easy to understand and I fully appreciate the feeling of many of the leading members of the profession who believe legislation would be no benefit to them, and it if should be that any odium should arise from such incorporation a certain percentage would no doubt attach to them. From that standpoint they naturally are adverse to such incorporation. That is a condition that will arise at any time in any incorporation of individuals and we must all be ready to sacrifice something to the general good.

At the last annual meeting it was decided to appoint a committee to draw up a draft act. That committee has been appointed and I understand performed the functions assigned to it. Is it not rather late in the day to hark back? From the action that has been taken I think that the time to have taken such action would have been at that meeting or immediately succeeding it.

There is no doubt whatever that the leading members of the profession have in the past and still hold the principle office in the association and it is highly desirable in the interests of *The Institute* that that condition should continue. It would be detrimental, probably fatal, to it if such a condition did not continue. It is I presume a matter of indifference to many of those past or present officials whether we have incorporation or not. Their business either professionally or arising out of their profession is sufficiently assured, so that legislation is a matter of indifference to them at least from a financial, social or any other standpoint. I trust, however, that on reflection they will consider that it would at least be generous if not their duty to the less fortunate members of the profession to assist them in the promotion of their interests. Under the present condition the opinion of the majority must largely rule; any other course would probably be fatal to the interests of the profession and in turn to that of *The Institute;* therefore, I trust that the council will loyally back up the legislation proposed.

There may be, and no doubt, will be, many things in the proposed legislation which will require amendment, but let us make a start: the amendments can come later. If we are to study the matter for a decade it would probably be found that when we came to apply the legislation many weak points would be discovered.

G. H. Duggan, M.E.I.C.

The proposed legislation is, no doubt, the outcome of the widespread feeling that we should bend our energies to our material as well as our professional advancement.

In my view, better pay for all can only come through better and more complete organization of the profession and the education of the public to the value of our services. It cannot be at once reached by any form of legislation except for certain special classes of engineers employed by governing bodies, to be referred to later.

While I am strongly in favor of the introduction of legislation because it can probably be made to immediately benefit some classes and will hasten the better recognition of the profession so that eventually a plan may be worked out by which all will benefit, I think the Act is impracticable in its present scope and if its promoters should happen to be successful in getting legislation in this form that it would almost certainly destroy *The Institute*, segregate the profession and set us back many years.

Admitting, for the sake of argument, that the proposed legislation can be obtained, let us consider its probable effect upon *The Institute* and upon the profession as a whole. The Act provides that a Provincial Association shall be formed in each Province and although it proposes to nominally limit the work of the Association to the administration of the Act and calls upon its Members to pay only moderate dues, it also prohibits any one who is not a member of that Association, regardless of his membership in *The Institute*, from practising any kind of engineering in the Province. It is a foregone conclusion that most of the men who belong to the Provincial Association will not continue to pay double dues and will drop *The Institute* because it will be more efficient and quite easy, notwithstanding the aforesaid limitations of the Act, to substitute the Provincial Association for the Branch; one Association of Engineers being all that is required to do the present work and to administer the Act.

The Act implies that all who are registered under it will be competent to practice as engineers, and then proceeds to cover under the definition of Registered Engineers nearly every branch and grade of the profession.

It is difficult to see the connection between the qualifications requisite for an engineer designing or supervising harbor works or an irrigation scheme with those required for an engineer designing internal combustion engines or electrical machinery, and the lack of parallelism may be multiplied to any extent. No one can hope to be proficient in all branches of engineering and the tendency is towards specialization—the only tie between many of the branches of the profession being the fundamental sciences— and merely being a Registered Engineer without definition would not mean to the employing public or to brother engineers a certificate of general competency.

The Institute has already achieved great influence considering its scattered membership and, under its new Constitution, is apparently in a fair way to include all engineers and become the organization we need. We must recognize, however, that so far we have only included a small number of the mechanical, electrical and other specialized branches of the profession who have not heretofore had any interest in our *Institute* and if we proceed too fast we must expect serious opposition from engineers as well as the Corporations and others to whom we look for employment.

Many other arguments could be set forth to show that the effect of the legislation would be to destroy *The Institute* or, at the very least, to curtail its activities and relegate it to the position of only a technical society.

I recognize that legislation must be Provincial and that associations provincial in name will have to be sponsors for applications to the Provincial Legislatures. Our Branches and Provincial Divisions are naturally the mainstay of *The Institute* and I cannot see why the legislation should be made of such a character that we must dissociate these Provincial bodies from our own division and from *The Institute.*

It has been argued that we cannot apply for legislation through our own Provincial Divisions or through any Associations linked with *The Institute* without serious opposition from the Mining Institute and from other qualified engineers who are not members of our *Institute.* That is no doubt true if it is expected to bring under the Act all who practice engineering in any form and in every capacity, but I believe that if legislation were sought within more reasonable and practicable limits instead of opposition we would have assistance from these other interests.

In my view the fundamental difficulty is in trying to make the Act all-embracing and cover all classes of engineers rather than in defining the character of works which may be designed and supervised only by registered engineers and, for a start, I should make registration necessary only for the designers and supervisors of works built by public money of the character usually called Civil Engineering—that is to say, waterways, harbors, irrigation, roads, railways, bridges, hydraulic works and similar constructions, carefully excluding mining or those works undertaken by private capital or private Corporations.

The Miners might properly be urged to seek legislation at the same time with regard to mines, and we would not suffer if in this legislation they asked that Civil Engineers must join their Institute and pass the mining examinations before being allowed to do work in connection with mines. The surveyors, too, should be safeguarded in the continuation of their present work even to the extent of conducting such engineering works as they have been accustomed to carry out in their Surveying practice.

The Act could provide for admission, without examination, of members of the Institution of Civil Engineers, London, the American Society of Civil Engineers and other recognized Civil Engineering Societies. It would be a simple matter for each Provincial division to collect enough to cover the extra cost of its examinations and registration—thus only the men who benefit by the legislation would be taxed therefor; those who did not care to join *The Institute* would be simply making use of its machinery to handle the legislative enactments benefitting them in the Province, and the Branches would still remain the Associations to which the Members of *The Institute* would owe their first allegiance and would thus become of increased usefulness and be better supported.

I have not touched upon the probable failure of the Act to protect or benefit in any way the very large number of salaried men now designated as engineers but who would be treated under the Act merely as technical clerks. It would seem, in fact, that it is drafted principally with a view to benefitting the consulting engineers or only those who must affix their signatures to plans and documents.

The public has a right to be protected and to know that those in charge of public works are competent. From an economic point of view the public will benefit by paying for the better administration of public expenditures, but there is absolutely no justification for demanding registration for all classes of the profession; it is distinctly contrary to public interest, is sure to arouse the opposition of many corporations and of associations of business men and manufacturers—all tending to lower rather than elevate the engineer in the estimation of the public, and I feel it my duty to oppose legislation of this character and scope.

I am, however, prepared to give whole-hearted support to legislation protecting engineers in the public service and that will not be detrimental to this *Institute,* for I am convinced that in the strengthening of *The Institute* lies the advancement and better remuneration of the Profession.

F. H. Peters, M.E.I.C.

The Model Act published in the May *Journal* I think speaks for itself. I am strongly in favour of gaining legislative enactment. I would suggest to all the members that in determining how to cast their ballot on the matter of legislation that they be not too critical of the minor details of the Act, but rather view it in the broad light as indicating what kind of legislation is desirable. I believe that a large majority of our members will vote in favour of legislation. If this proves to be the case, I think that our members should then take the lead in gaining a full co-operation between all professional engineers in order to get the necessary legislation passed in the several provinces. I think the Model Act as framed by the special committee should prove, once and for all, that *The Engineering Institute* is working for the material advancement of all professional engineers and not for any selfish interest of *The Engineering Institute.*

H. H. Vaughan, M.E.I.C.

I agree that the form of the proposed Act is, in all probability, the only one possible in view of the legal conditions and the position that would be taken by other Societies if it were modified. I consider it unfortunate, however, that conditions should exist which require such an Act being so drafted as to eliminate from its requirements the provision that members of *The Engineering Institute* may, by payment of the local fee, become members of any of the Provincial Associations.

Such a provision would bring together the various provincial associations and the parent *Society* wheras without it *The Institute* must necessarily become a technical society only and gradually lose its influence and the means for improving the status and prosperity of engineers generally.

The proposed Act can only benefit a small number of those who are earning their living as Engineers. It would establish registration, which might be advantageous to men engaged in civil engineering work, in Government or Municipal services or those who are practicing as Consulting Engineers. It is so drafted that it cannot possibly benefit in any way the vast majority of engineers who are salaried employees of firms or corporations manufacturing or contracting for work requiring engineering supervision as employment by such firms of one registered engineer would be sufficient to conform to the requirements of the Act. The majority of engineers must, therefore, understand that in supporting such legislation they will inevitably weaken *The Engineering Institute* which, if properly developed, may evolve into a sufficiently powerful society to be of some substantial use in improving the condition of all, while a series of provincial societies will only be of benefit to the few. Such legislation may react on the younger members of the profession by making it more difficult for them to engage in engineering work in any Province in which they see an opportunity as, before doing so, they would have to become members of the Provincial Association, which might conceivably be rendered quite difficult if any provincial organisation desired to restrict the number of men practising in the territory it controls.

Drafted as this Act is to include as professional engineers men exercising certain classes of supervision over the entire field of engineering work, a large proportion of its requirements are bound to become a dead letter. The admission as a professional engineer carries with it no guarantee of competency; that is to say that the admission of a man on account of his ability in constructing or repairing highways will in no way indicate his fitness as a designer of aeroplanes or floating docks. The consequence will, naturally, be that, while the Act may restrict the employment of men on public or municipal works, it is practically sure to be ignored on mechanical or electrical works or, at the most, will be obeyed by the registration of one engineer in each firm, who would take out his certificate.

I, therefore, consider that if legislation of this kind is to be applied for it would be far wiser to restrict it to civil engineers employed on work involving public funds or public safety so that it might be of some reasonable use as a measure of public benefit.

L. B. Elliot, M.E.I.C.

The Act as proposed by the Special Committee overcomes the principal objections that have been raised against Legislation for Engineers; namely, by providing for similar legislative control in each province, and by placing all engineers on the same basis irrespective of their affiliations. It might also be argued that the creation of the proposed Association of Engineers would encroach on the proper sphere of *The Institute*. I think this objection is more apparent than real, as the function of the Association is restricted solely to the administration of the Act. On the contrary I believe, that once legislation is secured and its benefits become apparent, engineers will take a renewed interest in *The Institute* and its activities.

The Special Committee has I think, succeeded in framing an Act which should commend itself to a large majority of engineers, whether members of *The Institute* or not. While the details of the measure might require to be varied in the different provinces, the general spirit and prinicple of the Act should receive our full support.

A. Gray, M.E.I.C.

In approving of the proposed act, the members of *The Institute* must bear in mind that a new body of engineers is being formed, independent of *The Institute* or any other association now existing.

To have the act successfully passed, will require the co-operation of all engineers throughout the country, including civil, mining, electrical, mechanical, chemical, etc.

As it is hardly likely to find engineers willing to support two engineering associations in Canada working with the same aim, *The Institute* must consider, in the event of the adoption of the proposed legislation, a change in the by-laws, and a wider policy to admit all grades of engineers.

It is the duty, therefore, of the complete membership to support the bill and obtain the co-operation of all other engineering associations in the country. When the act is passed by each province, and carefully complied with, it will greatly redound to the credit and uplift of the Engineering profession throughout Canada.

James H. Kennedy, M.E.I.C.

Though I have in the past never been much in sympathy with the idea of applying for any special Legislation, having viewed the Can. Soc., C. E. from the standpoint of a member outside the Dominion, and possibly over estimating the difficulties to be encountered, I have now arrived at the conclusion that Legislation has become necessary; and should be obtained if possible. I have examined the draft Bill submitted by the Committee and entirely approve of the basic principle of Legislation and the details of the proposed Bill as submitted by the Committee.

J. G. Sullivan, M.E.I.C.

The ideas set forth by the Committee as those which guided them in the forming of the Draft Bill, seem to fully cover the ground, and the draft bill has overcome many of the difficulties that I saw in the way of Legislation. I, therefore, approve of what has been done to date.

L. A. Thornton, M.E.I.C.

Saskatchewan members with whom I have discussed the matter arc in favor of legislation, and of the proposed Bill which embodies the essentials in the Draft prepared by the Saskatchewan Branch. While I concur in this view, I sincerely regret that the identity of *The Institute* and membership thereof will not in any definite way be recognized in Legislation. I feel that there is in this a serious objection since the securing of legislation in the several provinces is liable to cause a flagging of that interest in *The Institute* which of late has been so encouraging.

Branch Opinions

Edmonton Branch

The Edmonton Branch strongly supports the proposed Bill in a general way.

We hope to have a good discussion on it at the Western Professional Meeting and we are writing all Western Branches to present their views, also to find out what the Local Engineers of other Organizations think of it.

We believe it would be advisable for our Headquarters to commence discussion with such organizations as are vitally interested.

Toronto Branch

(Telegram)

At Branch Meeting held May 19th, moved by A. F. Stewart, seconded by C. H. Rust, that this meeting of the Toronto Branch, *Engineering Institute of Canada*, hereby endorse general principles of proposed Act respecting engineering profession, but is of the opinion that there should be a very careful revision of the details before submitting it to the legislature. Carried.

W. S. Harvey,
Sec'y.-Treasurer.

* * *

To Visit Western Branches

Brig.-Gen., Sir Alexander Bertram, who has taken a lively interest in the welfare of *The Institute* in the past and who is now Chairman of the Library and House Committee as a member of Council, has kindly consented to visit the western branches of *The Institute* during the coming summer and be present at the Western Professional Meeting in Edmonton, accompanied by the Secretary, who expects to leave Montreal on or about the 16th of June and attend meetings of the various branches approximately as follows:—Winnipeg, June 19th; Regina Annual Meeting, Saskatchewan Branch, June 21st; Calgary, June 23rd; Vancouver, June 28th; Victoria, June 30th.

Sir Alexander will speak on the activities and welfare of the engineering profession in this country.

Salaries and the Civil Service

Since the last issue of *The Journal* the Ottawa committee has been actively at work compiling information for the benefit of members of Parliament who have promised to speak on behalf or engineers and technical men when this important question comes before Parliament. About seventy members have endorsed the proposal to discuss the matter of increased remuneration, feeling that an injustice has been wrought the splendid men of this class who are in the Government service. The influence of *The Institute* throughout Canada is being brought to bear on this matter in a way that has never before been attempted. If this activity does not bring about the desired result in full measure, the experience gained will have made the profession stronger and in a better position to secure, on behalf of the engineers employed by the Government, what everyone is agreed is rightfully theirs.

Many of the members have been throwing the blame for the salaries advertised by the Secretary of the Civil Service Commission upon that body, but from a letter received from Secretary Foran it is shown that the Civil Service Commission has not yet been able to assume the responsibility of fixing salaries, which still rests with the heads of the various departments. It is proposed, however, under the new Act to have this matter entirely in the hands of the Commission, subject to the regulations laid down in the Civil Service Act.

The subject of remuneration has taken a strong hold of engineering bodies as shown by the activity in the United States. The Engineering Council has taken up this question in an aggressive manner and has appointed a commettee of influential men to report on the whole subject. The American Association of Engineers has been most active in this connection. At its annual convention held in Chicago, May 12th and 13th, the Compensation Committee brought in a report comprising nineteen pages and containing a schedule of salaries covering nearly every line of engineering work. The salary recommendations were on a par with those published in the May issue of *The Journal* and were adopted by the convention.

The suggestion made in some quarters of adopting union methods to increase salaries is an evidence of how keenly the situation is felt by some men. It is, however, unthinkable that *The Institute* should second such proposals and moreover, we cannot in the very nature of things sympathize with the principles of unionism, which demand and threaten, without assuming any responsibility either collectively or individually. Engineers are responsible men and deserve the recognition that men of responsibility should have, and moreover, they are going to receive this recognition by acting together for the common good. The work already initiated will bring about beneficial results and in the near future.

Appreciation from England

Members of *The Institute* will be interested to know the manner in which *The Journal* is appreciated in England, from the following extract of a letter just received:—

> "I was very glad indeed to receive the March copy of *The Journal*, and was interested in the account of the Annual Meeting, which seems, as you said, to have been a very successful one. *The Institute* is in a very live condition, and I look forward with pleasure to the arrival of *The Journal* each month. I have shown it to several members of the British Institute here and they are rather envious".

This is a further tribute to the wisdom of the men who are responsible for *The Journal* being started.

Aims and Ideals of the American Association of Engineers

By F. H. Newell.

Service: Service to the members and through these to the public is the first aim of the American Association of Engineers. This service is rendered directly and in ways where the individual member cannot help himself and where he needs the assistance of a well organized group of men of similar thoughts and habits.

This service takes various forms, but begins with the vital requirement of opportunity for self support. The engineer who is without proper employment cannot perform his duties to his family and to society; to be of the greatest value he must be so placed as to be able to use his abilities to the best advantage. The first aim, therefore, of the Association is to use its resources in trying " to get the square pegs into the square holes and the round pegs into the round holes."

Adequate Compensation: More than this it is obvious that a mere living wage will not permit a highly educated and well trained engineer to do his best for his fellow men. He is " worthy of his hire " and this must be sufficient, not merely to keep his family from privations but to enable him to make choice among opportunities and to express his personality and ideals; not having these crushed out by the daily struggle to make both ends meet.

A fair wage scale, a definition of the training and qualities needed, the terms of employment and the corresponding compensation is being worked out. In the study of these intricate relations it has become apparent that, largely through ignorance, the wages of engineers in subordinate positions often have been kept below those of mechanics and laborers. Out-grown laws and traditions have fixed his low pay rather than the operation of the rules of supply and demand, as usually understood.

It is not to be supposed that every poorly paid engineer is entitled to larger compensation; he may be earning all that he is worth in his present position, but if misplaced he should be enabled to get into a position where his natural or acquired talents will be worth more and where he may be correspondingly remunerated.

Education: The American Association of Engineers is conducting an educational campaign to inform the public not only as to what engineers in general are doing but to enforce the lesson that larger comfort, health, and prosperity to the public will flow from a more complete use of the services of the engineer. This is being done through publicity, through putting in the daily papers and magazines, which are read by the public not the technical journals read by but few, the simple facts in ways which will attract the ordinary readers. These by constant repetition in new forms tend to create a proper appreciation of the services of the engineer and of his value to society.

This publicity is undertaken not to exploit any particular man but on the contracy to let the public know something of engineering achievements and the gain to all which comes from these. For example, millions of dollars are being spent on highways, a considerable part of this,— as in the past,— is being wasted because the public has not yet learned that there is a science in road making and that not every farmer or man out of a job is a born expert in this line. When people in general appreciate that the payment of a liberal salary to a skilled highway engineer will result in saving ten or a hundred dollars for every dollar spent in salary, then our highway construction may be put on a sound basis.

The educational program is also conducted in the local meetings of the American Association of Engineers where the effort is made to bring together all engineers in that vicinity, assembling them in small groups for mutual acquaintance and advancement, not as specialists in some one line or as separate sections of civils, mechanicals and electricals but as engineers concerned in engineering as a profession and with a common background of intellectual activity.

Engineers for Engineering: One of the slogans of the American Association of Engineers is the demand that in all engineering operations engineers be employed in responsible executive positions. Because of defects in their early education and to corresponding indifference to public affairs, the engineers as a whole, as well as the public, have tolerated the designation of men other than engineers to take responsible charge of public works. Lawyers, newspapermen or politicians in general are as a rule put at the head of bureaus or offices having charge of highway construction, water works, sewage, drainage, canals, and innumerable other enterprises; the popular statement being that a cheap engineer can be employed if necessary.

It is one of the aims of the American Association of Engineers to turn the full light of publicity upon such conditions and make it as impossible for the public to tolerate an unskilled man at the head of federal, state or municipal public works as it would be for a doctor to be designated as city attorney.

Mutual Protection: In the same way individual abuses which have been tolerated should be exposed to the purifying sunshine of publicity. Again and again it has happened that the Civil Service laws as they relate to engineers have been violated with impunity, simply because it was known that the existing engineering organizations would make no effective protest. Individual cases of unfair dealing have been all too frequent. In other professions, as of law and medicine, these have been dealt with in a drastic manner, public opinion has sustained the legal or medical fraternity in taking such action. The engineers, however, have gained the reputation of being not merely tolerant but indifferent to such matters, they have rather prided themselves on their individualism, which lets each member sink or swin, or violate ordinary rules of fair competition, or remain subject to requirements of laws such as those which fix the wages of a drainage engineer at $5. a day.

It is not to be supposed that all of these evils can be corrected at once, but a long step forward will be made when it becomes known that a large, well organized body of educated men are ready to take up the just cause of a brother member, even though he may be living remote from any engineering center. Moreover the weaker men in the association will be strengthened to perform better work and more completely discharge their duties if they are aware that their lack of efficiency will be known and will reflect unfavorably upon the standing of all other engineers.

Ethics: Above and beyond these fundamentals of employment, education and protection, comes the larger and more difficult field of ethics, of the preservation and enlargement of that goodwill which is the largest asset of the engineer. Here no hard and fast rules apply: all recognize that the main distinction between the mechanic and the engineer is that the latter seeks as his reward not merely wages but the satisfaction in work well done, and properly appreciated; he needs a certain intellectual reward found in the respect and confidence of his fellow men. Here also as well as in technical achievement the American Association of Engineers is striving for better things.

Town Planning Institute of Canada

Copies of the Provisional Constitution and By-laws of the newly formed Town Planning Institute of Canada are being issued by the Honorary Secretary, F. D. Henderson, Office of the Surveyor-General, Ottawa. The objects of the Institute are termed to be to advance the study of town planning, civic design, and kindred subjects, and of the arts and sciences applying to these subjects; to promote the scientific and artistic development of land in urban and rural districts, and to secure the association of and promote the general interests of those interested in the study of town planning.

The membership of the Institute will comprise residents in Canada, who are architects, engineers, surveyors, landscape architects and barristers, in good standing in their professional institutes or societies, who shall be prepared to qualify themselves to engage in the practice of some aspect of town planning. Provision is also made for associate members, legal members, legal associate members, students, associates and honorary members.

A refreshing feature of the new Town Planning Institute is that there are to be no "Charter" members. Prior to the 31st May, 1920, no members or legal members are to be elected. During that period the membership is to consist only of associate members, legal associate members, students, associates and honorary members. Associate members are elected on probation only for one year. As a condition of their election such associate members must agree to undertake a course of study in town planning, and either pass a qualifying examination, or submit a thesis dealing with an aspect of town planning prior to the above named date, satisfactory to boards of examiners to be hereafter appointed. One of the objects of the Town Planning Institute will be to promote university courses in town planning and some preliminary steps have already been taken in this regard.

An invitation has been sent to a number of architects, engineers and surveyors, who are believed to have sufficient interest in the subject of town planning, and to be willing to become associate members under the conditions set forth in the prospectus. Corporate members of *The Engineering Institute* are invited to offer themselves for probationary membership, and can obtain forms of application from the Secretary. An inaugural meeting of the Institute is to be held shortly at Ottawa.

Of the provisional council elected for the purpose of carrying on the work of the Institute during the probationary period, Mr. Thomas Adams, F.S.I., Housing and Town Planning Adviser for Canada, is Chairman. The engineering members of the provisional council are:— J. B. Challies, M.E.I.C., Director of Water Power, Dept. of the Interior, Ottawa; R. S. Lea, M.E.I.C., Consulting Engineer, Montreal.

Provision is made for the formation of local branches of the Town Planning Institute in the different provinces and cities. The officers of the Ottawa local branch include two engineers: N. Cauchon, A.M.E.I.C., President; H. L. Seymour, A.M.E.I.C., Secretary-Treasurer.

Federal Orders-in-Council have been passed that make some $25,000,000 available to the Provincial Governments for loans for housing at an interest rate of only 5 per cent per annum. The general object as stated in the Order-in-Council of February 18th. (P.C. 374), is to promote the erection of dwelling houses of modern character to relieve congestion of population in cities and towns, to put within the reach of all working men, particularly returned soldiers, the opportunity of acquiring their own homes at actual cost of the building and land acquired at a fair value, thus eliminating the profits of the speculator and to contribute to the general health and well-being of the community by encouraging suitable town planning and housing schemes.

The four general conditions on which the loan will be made are specified and standards are recommended for Provincial Housing schemes. The amount of the loan for the acquisition of the site, the construction of the necessary local improvements and the erection of the dwelling is limited bv the Order-in-Council. The amount of loan varies as the type of house to be erected, the maximum being $4,500. No actual limit is set to the cost of house, land or improvements, but in order to ensure that loans are made only to those who need it, it is recommended that no person in receipt of an income exceeding $3,000 per annum should be eligible as a purchaser or tenant of a house erected with the aid of Government funds in any schemes carried out by Provincial Governments, Municipalities, Housing Associations or owners of lots. The proportion of the cost of land and local improvements to the cost of dwelling is also specified in the recommendations.

A matter of significance to engineers is that the Order-in-Council recognizes that a house is considered to consist of three things: (1) the site—the land on which it stands; (2) local improvements—pavements, sidewalks, sewers, etc., provided for access and drainage; (3) the building. In the first two, and especially the second, the engineer is particularly interested.

According to Orders-in-Council the Housing Committee of the Cabinet is authorized to secure the assistance and co-operation of Mr. Thomas Adams, the Town Planning Expert of the Commission of Conservation, and of any other person or persons specially qualified to advise or assist the said Committee in carrying on its work. To assist in carrying out the general objects in view, the experts of the Federal Government are available for conference with the officers and experts of the Provincial Governments regarding the details of schemes and preparation of general provisions or standards, and any other matters on which the officers of the Provinces may desire to confer. On Mr. Adams' staff are the following Engineers:—

A. G. Dalzell, A.M.E.I.C., formerly Assistant to the City Engineer, Vancouver, B.C. Mr. Dalzell is acting as Engineering Assistant for the Western Provinces, in connection with all housing and town planning schemes.

H. L. Seymour, A.M.E.I.C., formerly Town Planning Assistant to the Commission of Conservation. Mr. Seymour is acting as Engineering Assistant for Eastern Provinces.

C. G. Moon, A.M.E.I.C., of Messrs. Moon & Silverton, Consulting Engineers, Vancouver, B.C. Mr. Moon is compiling statistics, and making researches into municipal conditions of Canadian cities.

G. H. Ferguson, A.M.E.I.C., of the Commission of Conservation staff. Mr. Ferguson is making investigations into engineering matters connected with housing and town planning.

The Architectural section is in charge of W. D. Cromarty, M.R.A.I.C., formerly acting professor of architecture in the University of Alberta.

Attention is drawn to the following recommendations of the Federal Government with regard to matters connected with houses which involve engineering assistance, usually left to be dealt with as something distinct from housing. The engineer is here definitely linked up with the architect in the planning and development of the complete dwelling. This connection is established by introducing town planning as an element in house construction:

"To facilitate proper planning and to secure economy in connection with housing schemes comparatively large sites should as a rule be so chosen as to permit of comprehensive treatment. Such sites should be conveniently accessible to places of employment, means of transportation, water supply, sewers and other public utilities.

"Where Housing Schemes are proposed the sites as well as the buildings should be properly planned to secure sanitary conditions, wholesome environment and the utmost economy.

"In cities and towns, local improvements, comprising necessary sewers, pavements, sidewalks, water-mains and lighting services, should be constructed as far as practicable prior to, or simultaneously with, the building of houses, and no house should be permitted to be occupied until provided with proper means of drainage and means of sewage disposal and an adequate supply of pure water.

"All dwellings erected in cities and towns should face on streets so constructed as to provide dry and convenient means of access to such dwellings, or on approved courts opening on to such streets and in no case on lanes or alleys.

"In cities and large towns, sewers and water-mains should be provided to enable connections to be made as buildings are erected; and in small towns, villages and rural areas where no sewers exist, there should be proper sanitary provision for sewage disposal, to the satisfaction of the Board of Health or Sanitary Engineer of the Province.

All dwellings should have connected to them an adequate supply of pure water before occupation is permitted for purposes of habitation.

"No building should be erected on a site which shall not have been drained of surface water, or which shall have been filled up with any material impregnated with faecal matter, or with animal or vegetable matter, unless and until such matter shall have been removed, and the ground surface under such building shall be properly asphalted or covered with concrete or other dry and hard material to a thickness of six inches at least."

New Canadian Pacific Locomotives

New Canadian Pacific Railway Locomotive No. 5302.

W. H. Winterrowd, M.E.I.C., Chief Mechanical Engineer.

Ten of the largest locomotives ever built in Canada have lately been designed and built in the Angus Shops of the Canadian Pacific Railway under the direct supervision of W. H. Winterrowd, M.E.I.C., Chief Mechanical Engineer.

These locomotives are of the heavy Mikado type and are designed for freight service. The weight of the engine and tender in working condition is 500,000 lbs., the engine along weighing 323,000 lbs. The diameter of the driving wheels is 63 inches. The cylinders are 25½ inches in diameter by 32-inch stroke, which with 200-lbs. boiler pressure makes these locomotives capable of exerting a maximum tractive effort of 36,000 lbs. The diameter of the boiler is 80 inches at the front end and 90 inches at the back end. The fire box is 84 inches wide and 120 inches long, and the grates are moved by steam grate shakers. The tender has a capaticy for 12 tons of coal and 8,000 Imperial gallons of water.

The cab is of the vestibule type, which is the C.P.R. standard, and every effort has been made to make the accommodations for the enginemen as comfortable as possible. One side of the cab is fitted with a clothes locker 14 inches by 20 inches wide, in which clothes can be hung and lunch pails carried.

One of these locomotives No. 5302, was recently inspected by E. W. Beatty, President, and Grant Hall, Vice President, Canadian Pacific Railway.

CORRESPONDENCE

Improving Professional Status

Editor, *Journal:*

In a recent editorial of the Canadian Mining Journal (April 16th, 1919) under the title "Class Legislation for Engineers," certain arguments were presented against the policy of *The Engineering Institute* in the matter of obtaining legal recognition. Now while the futility of these arguments (which I will discuss later) is so apparent to a man of experience that they hardly merit the trouble of refutation, nevertheless on account of the wide circulation that they necessarily obtain, they must be considered as exceedingly pernicious owing to the influence that they have on the public mind, and on the younger and less experienced members of the profession. They are of a type of propaganda which has had a wide dissemination by sundry technical journals, quasi professional organizations, and, I regret to say, by a certain section of engineers who ought to know better. As the fallacies spread in this manner have rarely been openly controverted, they have caused a complete misunderstanding of the aims of *The Institute*, and are largely responsible for the opposition to its efforts to improve the status of the profession. In my undergraduate days, as a result of this propaganda, I received an incorrect idea of the character of the Society, which only the practical experience of years effaced, and no doubt the same thing happened in numberless other instances, so that in my opinion what is badly needed is an organized effort on the part of *The Institute* to combat this evil, so that when a statement of this kind appears, its absurdities will not be allowed to go unchallenged and influence the public mind to the detriment of *The Institute*.

In the editorial above mentioned, the following points are taken. First, that for any society to secure legislation giving it the right to define the status of engineers is to allow it to usurp the functions of government, and hence not to be permitted. It is to be inferred from this that such a privilege conferred on any professional body constitutes an evil, the nature of the evil however is not made clear. Second, that *The Engineering Institute* by its activities is endeavouring to draw professional members away from the Canadian Mining Institute, and hence injure the latter institution. In the course of his article, the editor admits that the technical professions generally are underpaid, and that furthermore they have the right to organize to protect their interests. Such being the case, it appears difficult to escape the implication that an endeavour to obtain legal recognition of their status follows as a natural corollary to their admitted right to organize.

As to the contention that giving an engineering society the right to define the legal status of engineers is allowing it to usurp the functions of Government, that is exactly what is done in the case of the professions which have already a recognized legal standing, such as law and medicine. The Government does not exercise its control directly, but delegates it to a professional society. In view of this fact it appears evident that if this procedure is wrong with respect to engineering the same conclusion equally applies to the other professions mentioned. On this point however the editor is not very clear, and leaves us in some doubt as to whether he is in favor of the introduction of quackery into all the professions, or is content merely to restrict it to engineering. In short, the absurdity and contradictions of the arguments become manifest even on a superficial analysis. As to the inference that *The Engineering Institute* is trying to draw professional members away from the Mining Institute, the incorrectness of such an assumption is obvious, as the two societies, in spite of a certain similarity in their personnel, occupy different spheres of action, and as, furthermore, those who join them do so from distinct and different considerations in each case, there can be no conflict between them except in the imagination of certain parties.

As to mining engineering, from my own experience, having practised that profession for seventeen years, in the three principal political divisions of this continent, I would say, that there is *no* profession more in need of legal regulation, it is overrun with pretenders and imposters who are the curse not only of the profession, but of the industry as well. I have repeatedly seen thousands of dollars squandered on the advice of some plausible quack whose entire stock-in-trade consisted of a smooth exterior, and a glib enunciation of technical phrases. I well remember one of these gentry, who, on the strength of his supposed geological knowledge, succeded in being appointed consulting engineer to a large mining company (still operating) in Mexico; shortly after securing this position, he attempted to make a topographical and geological map of the area adjoining the mine, and in so doing demonstrated his ignorance of the principles governning the use of an ordinary transit. Instances of this sort are without number, and in general, it can be said that the public, including a considerable section directly interested in mining are quite unable to distinguish between the genuine and spurious in the matter of mining engineers. As for the titles of M.E. and E.M., anybody is at liberty to use them, so that they mean nothing. In my own experience I have found a greater number of imposters using them than genuine mining engineers. From consideration of these facts, it is evident that some sort of government supervision of mining engineers is in order, and it is necessary in the interest of the public apart from any benefit it may confer on the profession.

Needless to say, the best way to accomplish this is through a recognized professional society, in good standing, and in this connection two societies come up for consideration, namely, the Canadian Mining Institute and *The Engineering Institute of Canada*. The first-named, however, is, strictly speaking, an industrial, rather than a professional organization, a fact which unfits it to take the leading part in such a matter. The second on the other hand, is the only purely professional engineering body of national importance in the Dominion, and consideration of its ideals, history, and personnel clearly show that it is the one best adapted to bring the matter to a successful conclusion.

Finally, I may say, that it is my opinion that the two societies above mentioned ought to co-operate to achieve this end, as improvement of the status of mining engineers is bound to react advantageously to the industry as a whole.

Yours truly,

Cobalt, April 29th, 1919. J. A. REID.

Congratulations from the United States

Fraser S. Keith,
The Engineering Institute of Canada,
176 Mansfield Street,
Montreal.

Gentlemen:

Referring to your favor of January 30th, we wish to congratulate you and the entire Engineering Profession of Canada on the fact that you have already succeeded in organizing the Profession so well in your Country, and have no doubt you will reap great benefit from your strong and generally inclusive organization.

We are hoping that we may be able to have a similar effective organization to properly represent the entire Engineering Profession in the United States.

Yours very truly,

O. H. Dickerson,

Chairman, Committee on Engineering Unity,
Duluth Engineers' Club,
Duluth, Minn.

April 24th, 1919.

The Status of the Engineer

Editor, *Journal:*

We are living in an age of re-construction, and I trust that the coming years will witness an age of scientific research and of investigations, on sound economic principles, into the development of our natural resources.

To attain this object, however, it behoves us to build our structure on a sure foundation—a foundation of highly educated and qualified men.

In the past century the pivotal figure in man's wonderful material progress has been the engineer who is mainly responsible for the benefits that have been conferred on the human race, but whose achievements have not brought him the appreciation he merits principally due, no doubt, to his abhorrence of self-advertisement and newspaper notoriety.

The time has come, however, when we must all recognize the status of the engineer and the technical expert, and appreciate more fully the services rendered by the engineering profession and the practically trained university graduate.

The engineer has to play an even greater part than ever in the future, and now that the Government is the largest single employer of technical men in the whole Dominion and by having lately taken over two transcontinental railways has become the employer also of a large proportion of all the technically trained workers in Canada it is absolutely necessary to secure the advice of the most competent engineers and scientists if we wish to protect the public from the wilful expenditures of public money, due to incompetent engineering advice or supervision.

But how are we going to procure these trained experts unless we elevate the status of the engineer and encourage scientific pursuits by giving greater remuneration to the technically trained men?

At the present time the engineer in the Government employ has a very precarious standing. If he is on the Inside Service he is usually classified as a clerk and is in the habit of receiving the same annual increase as the messenger. He cannot, as a rule, be promoted unless a clerk (in 90 cases of a 100, a clerical clerk) ahead of him dies, resigns or is superannuated.

Not much inducement is held out to the young men of our Universities to pursue the science and engineering courses, when we see over and over again an advertisement similar to the following, that appeared in the Canada Gazette of June 1st, 1918:—

> " Technical clerk required in the Topographical Surveys Branch, who is a graduate in Applied Science, honour mathematics, or physics. Salary $1300 per annum."

Yet in this same issue of the Canada Gazette appeared advertisements for twenty-five draughtsmen in the Department of Public Works at a minimum salary of $1500 per annum, a law clerk in the office of the Auditor General at $2100 per annum and mark this, a motion picture camera man in the Department of Trade and Commerce at $2400 a year. The picture man whose education probably cost him very little receives the highest salary. The honour graduate in mathematics is offered the least—only $1300 per annum.

Numerous illustrations could be given of such discrepancies between the salaries of the technical and non-technical men in the Government employ. No wonder it is that the Government repeatedly loses the services of some of its most highly trained experts who have gone over to the United States where their work has been fully appreciated and well rewarded. In this way especially have the Geological, the Topographical and the Geodetic Survey branches of the Service suffered. In passing I would like to point out to you the great work carried on by the Geodetic Survey of Canada—work that is but little understood by the public owing to its exceedingly high technical nature and which consequently is not appreciated, but this work nevertheless is absolutely indispensable to the surveys of the Militia Department, the Department of Public Works, the Hydrographic Surveys of the Department of Naval Service, the Irrigation and Water Power Surveys of the Interior Department and for all map making departments of the Federal and Provincial Governments. A country without a geodetic survey has not reached the state of civilization. Yet in this branch of the Federal service there are to be found highly educated engineers receiving salaries considerably less than the average salary* paid to the employees of the United States Steel Corporation.

A little while ago I read a report which brought to my attention the great scarcity of men in Canada who were trained in the science of forestry. This is indeed very serious and very much to be regretted in view of the fact that it is most essential, for the proper administration of our forest resources which are far from being inexhaustible as we were formerly prone to believe, that they should be studied most scientifically if we are going to learn the conditions that control growth and reproduction in our forests and to devise remedies to overcome the diseases that every year ruin acres upon acres of excellent timber. Yet look at the encouragement the Government gives to the student of forestry when it advertises in the Canada Gazette of March 8th, 1919, for an entomological assistant who possesses a university degree and has had training in entomology, expecially of forest insects. Salary $1400 per annum.

In the reorganization of the Civil Service I hope that the engineers of the Service have had adequate technical representation by the Civil Service Commission and I would impress upon the members of the Government that in the interests of the public and the engineering profession a high standard of professional ability should be adopted for the different classes of work embraced in the engineering branches of the Service and that a scale of remuneration be fixed that is high enough to encourage the young men of our universities in industrial and scientific research and to attract and keep men of ability.

Superintendent of a Government Department,
A.M.E.I.C.

Message from India

Editor, *Journal:*

My luck is in at last, and I am about to leave India to spend one month's leave in England. I have been two and a half years in the East and am longing to see the fine green fields of England, or the pine forests of British Columbia—and I am going to have my wish gratified at last.

I leave Bangalore on Friday (to-morrow) and hope to sail from Bombay on Tuesday, 1st April. I do not expect to return to India, although I am only going on leave, as I expect I shall be able to get my demobilization completed soon after I arrive in "Blighty." Please cancel my present address, and direct all correspondence, until further orders, to my old home "Rose Lea," Uddingston, Lanarkshire, Scotland. I may be there for a time after which I hope to return to British Columbia, if conditions there warrant my return. I enclose a copy of an Illuminated Address presented to me yesterday along with a handsome hunter's walking stick. My stay in India has been most agreeable and I have enjoyed training the Indian Sappers. They are wonderfully smart and intelligent and they are as keen as mustard if handled properly. It was a great surprise to me to be so honored as I have been, for one scarcely expects such tangible tokens of esteem for doing one's duty. I shall treasure these gifts highly, and shall always look back with pride to my two and a half years connection with the Corps of Second (Queen Victoria's Own) Sappers and Miners.

All the same, I shall be glad to return to civil life again, and I am looking forward with much pleasure to the free life in Canada. It is hard to knuckle down to red tape and discipline after enjoying the freedom of the West, and I shall be glad when I am at last engaged in the pursuits of a quiet, peaceful life.

Your *Journal* is as greatly appreciated as ever. It is the one link I have with the life and thought of Canada, and I always read it with the greatest of pleasure and appreciation.

Yours faithfully,
D. B. McLay, Capt., R.E.,
Late Commanding 67th Field Co'y., 2nd Q.V.S. & M.
Bangalore, India,
27th March, 1919.

To

Capt. D. B. McLay, R.E.,

Officer Commanding,
No. 67, Field Company,
2nd "Q. Y. O." Sappers and Miners,
BANGALORE.

Honored Sir,

WE, the INDIAN OFFICERS, N.C.O's and Men who serving under your honor's command, beg leave to avail ourselves of this opportunity of your honor's departure home, to express our sentiments of respect and love to your honor and specially to bid your honor "Adieu."

In a word your honor's command is a "Cheerful Command."

If we are not unduly praising, we beg to state that we enjoyed under your honor's "Regime" Even Treatment, Fair Justice and Fair Play in all matters connected with the company Your honor's cheerful appearance mingled with the sense of duty and discipline, enabled us to carry on our work with cheer and pleasure and everything went smooth and soft

The way your honor appreciated the help and advice of the I. O's, the zeal exhibited by N C.O's and the instruction given by them to Sappers in Field Works, other Coy, duties and the neat turn-out of men on Parade is almost like a Good Conduct Medal, awarded to the full Coy

It will not be out of place to state that the advice given by your honor regarding N.C.O's commanding respect from juniors, words of command and improvement in education, is deep seated in our minds.

We duly promise your honor that we will not shrink a bit in the trust to serve under your honor's successor Lieut. W. H. Knox, R.E., with the same zeal and interest and thus work for the honor of the Coy: and keep-up the prestige of the "2nd Q. V. O." Sappers and Miners.

In conclusion we with one heart and one voice proclaim in the major key "Good-bye" and pray for your honor's longevity and prosperity

We beg to remain,
Honored Sir,
THE I. O's, N. C. O's and MEN
of 67th Field Coy.,
2nd (Q. V. O.) Sappers and Miners.

Assaye Lines,
Bangalore,
26th March, 1919

* * *

Many many thanks for the gift of cigarettes and the welcome Christmas Greeting of *The Engineering Institute of Canada.* Both are extremely welcome and I am very grateful for such reminders. I long to be back in dear old Canada, and I do hope I shall be there soon. Best of luck to you.

D. B. McLay, Capt., R.E., A.M.E.I.C.,
O.C. 67th Field Co.,
2nd Q.V.O., Sappers & Miners,
Bangalore, India.

* * *

I wish to thank the Council and members of *The Institute* for their Xmas gift of cigarettes, which have only just reached me.

Yours sincerely,
T. C. McConkey,
(Major, 79th Depot Battery, C.E.F.)
Russia, Dec. 8th, 1918.

REPORT OF COUNCIL MEETINGS

An adjourned meeting was held at the headquarters of *The Institute* on Tuesday May 6th.

Legislation: The Minutes of the previous meeting having been confirmed, the question of legislation was taken up and the list for Members of Council, giving views as to whether a letter should or should not be sent out with the Ballot to the Members, concerning the proposed Act for Professional Engineers.

It was resolved that the letter of transmittal sent in by the Special Legislation Committee with the Draft Act, be printed in the June issue of *The Journal*, and that the ballot should call attention to the Act printed in the May issue, and to the letter in the June issue of *The Journal*.

It was resolved that a Committe of Council, consisting of—Walter J.Francis, Arthur Surveyer, H.H.Vaughan, G. H. Duggan and R. A. Ross, be appointed to draw up a Pro and Con circular, giving the reasons advanced for and against the proposed bill, and that this circular should be printed and sent out with the ballot.

It was resolved, in order to allow of a discussion through *The Journal*, of the proposed Act before the vote was taken, that the ballot be sent out on June 15th.

The Secretary was instructed to advise all members of the Legislation Committee of this action and ask their approval.

Winnipeg Branch: Pending the consideration and approval of By-laws as submitted by the Manitoba Branch, the suggestion made of changing the name to "WINNIPEG" Branch, was approved.

Canadian Mining Institute Proposal: It was resolved that the proposal of the Canadian Mining Institute to urge the Government to send out parties prospecting, calculating to employ mining engineers and others returned from the front, be given hearty approval. The Secretary was instructed to wire Sir James Lougheed approving of the plan and urging immediate action.

Concrete Investigations: A suggestion from the Director of the Bureau of Standards, Washington, that we appoint a member of *The Institute* to join them in a meeting of the Advisory Committee to be held in June in connection with the investigation to determine the effect of alkali salts in soils and waters on cement drain tile and other concrete structures, was considered. The Secretary was instructed to ask the Committee on this subsject to appoint one of their members.

National Railways Commission: A telegram from the Manitoba Branch stating that the Federal Government was about to appoint a commission of six to handle national railways and requesting Council to urge appointment of an engineer, was presented. The Secretary was instructed to ask the Ottawa Branch to advise regarding this commission.

Earth Roads Specifictions: A letter was presented from the Chairman of the Honorary Advisory Council for Scientific and Industrial Research with reference to earth road specifications. The Secretary was instructed to advise Dr. Macallum that the Research Council would have the hearty support of *The Institute* in this matter and to point out that Council was awaiting the report of the committee already appointed on this subject.

Soldiers Civil Re-Establishment: A letter from Col. C. N. Monsarrat, advising that a committee of the Ottawa Branch, consisting of Lieut.-Col. Duncan Macpherson, Major T. C. Keefer, Dr. A. F. Macallum and Lieut.-Col. C. N. Monsarrat, convener, was appointed to assist the Department of Soldiers' Civil Re-Establishment, was considered and the committee approved.

Memorial to Government: Further replies to the memorial to the different Governments, received from T. L. Norris, Premier of Manitoba, and A. S. Barnstead, Deputy Provincial Secretary of Nova Scotia, were noted.

Society of Chemical Industry — 2nd Annual Convention: A letter to the Chairman of the Society of Chemical Industry, offering the members of the Society the privileges of *The Institute's* Headquarters and extending the goodwill of *The Institute*, was approved.

Canadian Engineering Standards Association: In response tc a request from Capt. R. J. Durley for nominees to the Canadian Engineering Standards Association, Messrs. H. H. Vaughan, W. F. Tye and Walter J. Francis were appointed.

The regular monthly meeting of the Council was held at the rooms of *The Institute*, 176 Mansfield Street, on Tuesday, May 20th, at 8.15 P.M.

Legislation: (a) Pro and Con Circular: The committee reported progress. It was understood that a complete report of this committee would be submitted to Council at the adjourned meeting to be held on June 3rd.

(b) Definition of "Professional Engineering." The Secretary submitted a definition of "Professional Engineering," the work of the Legislation Committee of the Engineering Council. It was noted that a copy had been sent by Mr. Surveyer to each member of th Special Legislation Committee.

(c) The letters from Councillors, in response to a request for their views for publication, and from the Toronto and Edmonton Branches, were noted.

Revision of By-laws — Scrutineers' Report: The report of the scrutineers appointed to examine the letter ballot on the adoption of the amendments to the By-laws showed that of four hundred and seventy-six ballots cast, four hundred and six voted "Aye". The report of the scrutineers was accepted and the amendments to the By-laws declared adopted.

Convention A.A.E: The Secretary reported that he attended the convention of the American Association of Engineers, in Chicago and gave an address on the aims and ideals of *The Engineering Institute of Canadal*

Salaries: A letter from the Secretary of the Civil Service Commission was read, pointing out the situation regarding the Civil Service Commission's relations to the present salaries. It was resolved that this letter be published, provided the consent of the writer be given.

In consideration of the request from the Quebec Branch that a committee be appointed to meet the Executive Council of the Province of Quebec, in Montreal, regarding salaries, the Secretary was instructed to ask the Quebec Branch to report to Council a list of the engineering positions, with present salaries and suggested salaries and to prepare a classification of engineering positions in the Government service.

Committee, St. John Branch: A committee appointed by the St. John Branch to act as an employment bureau for New Brunswick was noted, as follows:— G. N. Hatfield, Chairman, F. G. Goodspeed and J. A. Waring, and the Secretary instructed to co-operate with same.

Royal Commission on Industrial Relations: In response to a request from the Halifax Branch for advice, the Secretary was instructed to advise that the Montreal Branch, who had first made the suggestion in connection with the Royal Commission, had decided to take no action at the present time.

Scientific Research: A letter from the Clerk of the Committee on Scientific Research asking if *The Institute* wished to be heard in connection with matters referred to the Committee, was presented, and Professor Ernest Brown and Julian C. Smith were appointed to act with the Secretary in drafting a reply.

Town Planning: The Secretary was instructed to published in *The Journal* information regarding the Town Planning Institute, to keep the members informed on this important matter.

An invitation from the National Conference on City Planning to the Eleventh National Conference to be held in Niagara Falls-Buffalo, May 26th-28th, was presented. It was decided to ask the Niagara Peninsula Branch to send representatives to this Conference.

Draftsmen Union: A photostat copy of a circular describing the draftsmen union, forwarded by Mr. Walter J. Francis was noted. It was further noted in a letter from Toronto that a Canadian draftsmen union was being formed.

Legislation Committee, Quebec Branch: The Legislation Committee of the Quebec Branch was noted as follows: Messrs. A. O. Barrette, A. Fraser, J. E. Gibault, A. Larivière, A. B. Normandin.

Canadian Engineering Standards Association: Two letters from Captain R. J. Durley, M.E.I.C., Secretary of the Canadian Engineering Standards Association were presented, proposing intimate co-operation regarding the issuance of engineering standards. In regard to the Specification for Steel Railway Bridges, it was proposed that the Committee of *The Institute* become a sub-committee on Steel Railway Bridges of the Canadian Engineering Standards Association, together with such other members as might be needed to ensure that all interests concerned had been consulted, it being intended that this sub-committee should consider the E.I.C. Specification and make recommendations to the Canadian Engineering Standards Association regarding its adoption.

Regarding the Specification for Steel Highway Bridges, it was proposed that the Specification already adopted by *The Institute* be considered by the Committee on Steel Railway Bridge Specifications and any important modifications that might be found necessary in the Specification for Steel Railway Bridges be incorporated therein, and the Specification dealt with in a manner similar to that proposed for Steel Railway Bridges.

It was further proposed by the Canadian Engineering Standards Association that other Specifications of *The Institute* be similarly dealt with. These suggestions were heartily approved.

Classifications: Classifications were made for a ballot returnable at the regular meeting in June. The meeting adjourned until Tuesday, June 3rd, at 8.15 P.M.

* * *

Contracting Plants Wanted

A Member in England writes that it would be advantageous for any parties having plant for sale, to advertise them in *The Journal*, as there is a scarcity at the present time.

* * *

Central Station Developments

Progress and developments in the U. S. A., in 1918, are reviewed. In some cases the cost of coal increased 500 per cent. The four largest concerns in North and Central California, comprising 90 per cent of the power business 40,000 sq. ml., were interconnected. Similar schemes were carried out in other States. Agitation is still proceeding for a Federal water-power scheme.

A 25,000 h.p. Francis turbine and a 45,000 kw. impulse steam turbine were placed in service. A 70,000 kw. cross compound unit was ordered for a Government nitrate plant; at the other extreme, high-speed turbines of 7½ kw. are now available for driving auxiliaries. Instruments are being introduced in boiler rooms on an unprecedented scale. Substitutes are being sought for alloy condenser tubes.

Automatic and outdoor substations represent an important development. The inferior quality of coal marketed has hastened the utilisation of pulverised fuel. A number of the smaller stations purchased second-hand plant with satisfactory results, and this policy is likely to be continued. Co-operation between stations in purchasing lamps, etc., effects economy. The elimination of isolated power plant (in many cases on the order of the Fuel Administration) has been an important development; where isolated plant is more economical than central station service during winter months, owing to heating requirements, it is still possible to obtain a valuable off-peak load for the central station during the summer. A number of central station have acquired control of coal mines, the electrification of which has incidentally been hastened. (Electrical Review, Chicago.)

BRANCH NEWS

Halifax Branch

Frederick R. Faulkner, M.E.I.C., Sec'y.-Treas.

At a meeting of the Executive Committee of the Halifax Branch, held in the reading room of the Nova Scotia Technical College on Friday, May 7th, the resignation of K. H. Smith, A.M.E.I.C., as Secretary-Treasurer of the Branch was received, and accepted, with considerable regret, as Mr. Smith has been a leading factor in the activities of the Halifax Branch since its formation.

By virtue of the power conferred upon the Executive Committee at a general meeting held on April 25th, Professor F. R. Faulkner, of the Nova Scotia Technical College, was appointed to fill the vacancy for the remainder of the year.

Montreal Branch

Frederick B. Brown, Sec'y-Treas.

A ballot was recently issued to the membership of the Branch and the following were chosen as Members of the Executive Committee for 1919-21:—

Chariman	Walter J. Francis. (By acclamation)
Vice-Chairman	Arthur Surveyer. (By acclamation)
Sec'y.-Treasurer	Frederick B. Brown. (By acclamation)
Executive	F. P. Shearwood, W. Chase Thomson, H. G. Hunter, K. B. Thornton, de M. J. Duchastel, S. F. Rutherford.

* * *

A questionnaire on Legislation was recently issued to the Branch membership. The replies were as follows:—

Question 1. 146 are in favour of a closed corporation, 18 are against, 3 did not answer.

" 2. 140 are in favour of legislation embracing all engineering works, 17 favour public works only, 10 did not answer.

" 3a. 53 are in favour of entrance through colleges only, while 114 believe otherwise.

" 3b. 140 are in favour of candidates being obliged to pass examinations for admission to study, and 27 believe this is not necessary.

" 3c. 133 are in favour of examinations for admission to practice and 32 are not in favour, 2 did not answer.

" 3d. 139 think candidates should serve a period of apprenticeship and 20 think this is not essential, 8 did not answer.

" 3e. 77 are in favour of the joint board, while 51 prefer the corporation only or other (13) forms of board. 26 did not answer.

" 3f. 110 are in favour of exemption from examinations and 46 are not, 10 did not answer.

" 3g. It is impossible to briefly classify these replies. 78 are in favour of exempting the graduates of engineering colleges from all examinations; 33 are in favour of exempting them from some of the examinations; 44 do not want them exempted from any examinations and 12 did not answer.

" 3h. 140 think it essential that graduates of engineering schools should have experience before taking charge of engineering work, and 18 think this is not necessary. 8 did not answer.

The committee believe it would be in the interests of *The Institute* to publish in *The Journal* the questionnaire sent out to the members, together with the above summary of the answers received, and I, therefore, take pleasure in requesting that this be done.

The questions are given on pp. 26 and 27 of the January *Journal.*

Yours very truly,

Frederick B. Brown,

Secretary-Treasurer.

Ottawa Branch

M. F. Cochrane, A.M.E.I.C., Sec'y.-Treasurer.

The third meeting of the Ottawa Branch was held on April 17th, when Dr. W. Bell Dawson, by request, read his paper on "Mean Sea Level as a General Datum for Canada," which he presented at the Annual Meeting. At the same time Mr. Uniacke made a report to the Branch on the work done at Montreal by the Special Legislation Committee.

The fourth meeting of the Branch was held on May 8th, when Capt. H. W. B. Swadey, the late officer in charge of steel inspection for the Imperial Ministry of Munitions, gave an account of the production and inspection of steel for munitions in Canada during the period of the war.

Capt. Swabey's paper forms a record of the highest importance, and many of the methods described will be of permanent value to all those interested in the production and manufacture of steel.

On the 15th May, James White, M.E.I.C., of the Commission of Conservation, gave an interesting account of the hydro-electric system in course of construction by the Aluminum Company of America, which when completed will be one of the largest in North America.

In order to assist engineers who have served in the military forces overseas to find suitable positions on their return to civil life, a Committee of the Ottawa Branch has been formed to co-operate with the Department of Soldiers Civil Re-Establishment. This Committee consists of:— Col. C. N. Monsarrat, Convener; Major T. C. Keefer; A. F. Macallum; Col. Duncan MacPherson.

Toronto Branch

W. S. Harvey, A.M.E.I.C., Sec'y.-Treas.

An open meeting of the Branch was held in the lecture room of the Engineer's Club, 96 King Street, West, at 8.00 P.M. on Thursday, April 24th, 1919. The evening was spent as a "Smoker," and an enjoyable musical programme was provided. There will be no further regular meetings of the Branch till the autumn.

A *special* general meeting of the Branch was held in the lecture room of the Engineer's Club, 96 King Street, West, at 8.15 P.M. on Monday May 19th, for the purpose of considering and discussing the Draft Bill of the proposed Legislation. The meeting heartily approved of the proposed Act.

The Branch intends to make a revision of its membership list for the purpose of issuing a Year Book for 1919, and has sent out to each of the members a post card to be filled in by him, giving his name, grade, home address, business address, house phone number and business phone number.

Niagara Peninsula Branch

R. P. Johnson, S.E.I.C., Sec'y.-Treas.

A meeting of the Branch was held on May 9th at the Engineers' Club, Thorold, for the purpose of discussing and forming a Branch policy on legislation and ways and means of improving engineering compensation.

Before turning to this matter the chairman called upon two visitors for a short description of the Regional and Town Planning Movements.

H. L. Seymour, A. M. E. I. C., of the Ottawa Branch and Dr. W. J. Donald, Secretary of the Chamber of Commerce of Niagara Falls, N.Y., each outlined these projects, acknowledged their dependence upon engineering skill, and advised the meeting of the forthcoming Regional Planning Conference at Niagara Falls towards the end of May.

As there are a large number of Civil Service employees in the Branch, the discussion on compensation reverted largely to the forthcoming Civil Service Act, and considered the procedure to be taken by the Branch at the time the exact figures of the salary schedule embodied in the Act should become known.

A resolution was passed and a committee appointed along the same lines as that of the Toronto Branch, to draw up a salary schedule for all branches of the profession.

A committee was also appointed to ascertain the salaries which are really being paid for various positions.

The former committee was instructed to be ready to report to a meeting of the Branch to be called on or about July 15 and the latter committee to have its data ready for forwarding to Headquarters along with the approved salary schedule at this time.

It was decided to ask the other Branches to take similar action if they had not already done so.

The subject of legislation was not taken up at this meeting, partly because the hour was late but largely because the speakers who, it was intended, should lead the discussion, were unable to be present. It should be said that the exact nature and progress of *The Institute's* legislation programme is not fully understood by the members of the newly formed Niagara Peninsula Branch and, as yet, no definite Branch policy in this connection has been worked out.

Coffee, sandwichs and 'smokes' provided by the members of the Engineers' Club of Thorold, were much appreciated at the close of the meeting.

The first affiliate of the new Branch has just been elected in the person of F. H. Byrn of the Toronto Power Co., Niagara Falls, Ontario.

Several members of the Branch have signified that they are acting upon the important suggestion in the April *Journal* with regard to interesting members of parliament in connection with the proposed Civil Service Act which embodies a higher schedule of salaries for the engineers of the Civil Service. Members are writing letters to those members of Parliament who are personal friends irrespective of whether they are the members for the local constituencies or not.

A great deal of interest in *The Institute* is being shown by engineers in the Niagara District who are not already connected with *The Institute.* Many have applied for application forms for membership; so much so that the supply has been temporarily exhausted. Fourteen applications for membership in *The Institute* have been made by engineers within the Branch radius since the Branch was organized two months ago.

The membership of the Branch is growing rapidly as the following personal notes indicate.

E. P. Johnson, A.M.E.I.C., formerly resident engineer on the Port Colborne harbor work, has taken up the duties of resident engineer of Section 1 of the Welland Ship Canal.

C. L. Kate, A.M.E.I.C., formerly of Montreal, has joined the staff of the Welland Ship Canal on Section 3 at Thorold, Ont.

E. J. Bolger, A.M.E.I.C., is with Doheny, Quinlan and Robertson, contractors for Section 3, Welland Ship Canal, at Thorold.

C. E. Hogarth, Jr. E.I.C., has returned from overseas and is again on the staff of the Welland Ship Canal on Section 1—Address, St. Catharines.

Gerald M. Hamilton, A.M.E.I.C., has returned from overseas and rejoined the staff of the Welland Ship Canal.

R. C. MacLachlan, Jr. E.I.C., of Ottawa, has returned from overseas and joined the staff of the Welland Ship Canal, Section 1—Address, St. Catharines.

* * *

The following resolution was passed at a meeting of the Niagara Peninsula Branch, held at Thorold.

Whereas there is great need of, and justice in, securing greater remuneration for engineers in all branches of the profession, and

Whereas *The Engineering Institute of Canada* has committed itself to actively take up this matter:

Be it resolved that the Niagara Peninsula Branch appoint a committee to study the salary situation and bring in a report as to what they consider to be a fair schedule of salaries for all the usual positions of all branches of the profession.

This committee to consist, as far as possible, of members representing Civil, Mechanical, Electrical, Chemical and Mining Engineering and with power to add to its numbers.

This committee to be appointed at this meeting by vote of the members present, with instructions to report to a meeting of the Branch to be called on or about July 15, 1919, for the purpose of approving or revising the schedule.

And be it further resolved that a committee consisting of W. H. Sullivan, A.M.E.I.C., and A. C. D. Blanchard, M.E.I.C., be appointed to ascertain the salaries that are really being paid for various positions within the Branch radius. The data gathered by this last committee to be forwarded to Headquarters along with the approved schedule of salaries.

And be it further resolved that copies of this resolution be forwarded to each of the other branches with a request that they take similar action if they have not already done so.

And be it further resolved that Council be requested to use this data as a guide in drawing up a salary schedule to be adopted by *The Institute*, and that the final approved schedule be printed in pamphlet form and copies mailed to each member of *The Institute* for their guidance in engaging assistants or in seeking new positions.

A copy of this resolution was sent to all the Branches of *The Institute*.

Sault Ste. Marie Branch

Newton L. Somers, A.M.E.I.C., Sec'y.-Treas.

At a meeting of the Sault Ste. Marie Branch held on the 24th April, the following officers were elected:— Sec.-Treas., Newton L. Somers, Box 412, Sault Ste. Marie, Ont; Executive, A. G. Tweedie, J. H. Ryckman (for 2 years), B. E. Barnhill, R. S. McCormick (for 1 year).

Two additional committee-men were also elected from the affiliates, these being Thos. R. Wilkes and F. A. Ritchie.

N. L. Somers reported his attendance at the Legislation Committee, and it was resolved to have a discussion on the draft act as soon as the May issue of *The Journal* was received.

The following short paper on Forest Engineering was read by W. F. V. Atkinson, affiliate member of the Branch:—

The Forester

What is a Forester? The Forester has sometimes been called a *Tree Farmer* and failing a more concise description we will let it go at that. The farmer is a producer, so is the forester. The farmer produces at a low cost or he cannot subsist by his labors. To do this requires a knowledge of his work. The more knowledge he has, and the more use he can made of that knowledge in his work, the better success he is. He needs to know his soil, climate, irrigation, drainage and fertilization; the most suitable grains, roots and other crops, including fruits and fruit trees; their various qualities, productiveness and diseases; methods of preparing for them and harvesting; and, lastly, the available markets and how to get his products to them. In all this work he has to deal with human nature, machinery, transportation, trade and its requirements. If he is an idealist he can also grow for his personal use and satisfaction some things not necessarily marketable.

The general lines are somewhat parallel to forestry, but forestry is not, as is frequently supposed, confined to arbor culture or even to silviculture. A forester though often an idealist has from his training been taught that values are the final test whether these are present or future. His whole training has been the apportioning of these values correctly, allotting to each subject its proper place in the scale and expressing these in dollars and cents. For the purposes of this sketch it is not necessary to go into the training and studies required by a forester at the university, but rather to deal with his general work.

A forester is likely to specialize along certain lines and there is plenty of room for such work. Investigations and research are never really absent from his mind although he may be employed most of his time in one district and in dealing with a limited number of tree species and conditions.

Again, he may attain to a position where details must be delegated to assistants, and special conditions to those whom, as I have said, have specialized on these particular points, such as tree diseases and pests, fungi, insects, etc. This brings us to the protection of the forest under his charge, which must be attended to and for which almost continual inspection is necessary, including, amongst other things, protection against man, adverse possession, forest fires, wasteful methods, etc.; against animals grazing and pasturing in some places, and against other mammals, destructive and useful; against insects affecting the trunk and bark, twigs and seeds, leaves, etc.; and against fungi, which like the insects, breed upon waste and dying species; and against erosion, shifting sands, noxious fumes, waters and drainage. There is quite a little scope in these matters alone. Birds are wholly useful.

The chief object of his work is to produce the woods required by trade at the least cost and to continue to do so. Some of the woods now in demand were of little or no market value years ago and some which are at present of no market value will undoubtedly be of value in the future. Thus, the history of forestry, including the wood trade, is essential. The first work required in the practice of his profession is to locate the various species of trees in the district placed under his charge, to learn how these are producing wood and the conditions affecting this production. This necessitates surveys of land, including topography, and of soil. He must also keep climatic records; hence the necessity for accurate history and current records of meteorological conditions. Type maps showing the production of certain species and their inter-relationship is a second step. The availability of woods required relative to the means of transportation, such as roads, streams and railroads, and the respective cost of each method is part of this study. He must also study how to eventually harvest those trees which are not, under present conditions, in situations commercially available. A course in logging practice in the woods, which can only be acquired by personal experience in the actual work both in the camps and on the rivers, is necessary. If the local conditions should necessitate a change of methods when his work takes him elsewhere, his experience and training will most likely enable him after close observation to recommend improvements in road making, tools and camp paraphernalia generally, all tending towards the most economical methods. Thus, logging engineering is one line of a forestry training and includes a certain class of railroad construction, steam and cable hauls in some parts of the country, road and bridge building, as well as the more primitive methods. Stream flow control and improvement, for which actual experience in river driving is necessary, is a further part of this work. The various methods employed in logging, from the tree to the mills, differ in each locality. Custom and the methods employed for many years are retained with a wonderful tenacity by the workman, and new ideas take a long time to appeal to those who are really skilled in local methods. I have seen suggestions made ineffective time and time again, and later, when adopted, become as much the logger's creed as their former methods were.

But if the administrative position is the forester's lot, he will have to leave this most fascinating part of the work for the larger idea. The engagement, control and supply of logging gangs is not the object of his training, but he can assist this work by tactful co-operation with the superintendents and foremen. He should know that the logging outlay is proportionate to the quantity of wood to be produced in each operation and, amongst other matters, that the cost of buildings, and particularly roads and bridges, are proportionate to the required tonnage, both immediate and future. I believe that a great change will be made before many years in the methods of control and direction of logging operations.

One of the forester's first duties is to know if the demand for certain species will be regular and continuous, and whether this demand is not for such quantities and dimensions as are inimical to the best results from the available source of production, that is to say, the forest under his charge, and what percent of loss is entailed in producing the specified timber, in the forest, in transportation, and in the manufacture. This entails inspection at all stages and places of the work.

Measurements at all points therefore are of interest and these are not only of bulk, board measure, cubic feet, cords, or otherwise but also of the weight of the material.

If the demand is fixed as to quantity and quality and defined as to species, then, from his type maps and topography, growth studies and volume tables, he can fix working plans of the areas and for the required quantities, with regulations as to selection methods in sizes and species. The plan of a total clean-up (clear cut) is not usual in this country and thus like other drastic methods must be undertaken only when the whole forest policy is fixed, including tenure, dues, rents, taxes, interest rates and prospective costs at all stages, etc.

If the annual demand is not greater than the area can produce under accelerated and improved growth conditions, he can fix upon rotation cuttings of the required timber; growth increment in untouched forests is not often greater than the natural losses. A rotation of cuttings, under the present conditions in this country, is not a fully accepted idea by the timber owners but it is the ideal, and it is the method accepted in countries where foresters are considered a necessity. Where the cuttings must be annual, as is usual in Canada, and the production required is large, timber areas must be extremely large to establish a rotation, and the protection and assistance to the immature crop becomes an important branch of the work, in this respect, drainage, light by thinnings and protection from fire are amongst the larger issues. On these points many interesting facts which have been noted would surprise the non-technical observer.

Again, the immature crop can be augmented by judicious planting, making a greater yield per acre and per mile of haul. This should only be done for commercial purposes where the soil is suitable and the logging inexpensive. Further, there is the method of acquiring really suitable ground for a new forest of the required species, laying it out in roads and sections for the purposes of cheap logging, and afterwards planting it with the most suitable species, in point of growth rapidity, of the wood required for the purposes in view. Seeding in the forest for this purpose is not sufficiently certain or rapid to be satisfactory.

The introduction and use of new kinds of wood in the different trades is another line of investigation. Our forest products laboratories have helped the forest administration very greatly in this respect. This work is also a line of specialization.

From these remarks it will be seen that forestry opens many avenues for work and study; that it aims like the farmer to produce material required for the use of man. The number of cubic feet of wood used (per capita) is increasing continually. The exact quantity, however, is hard to estimate in a country, like this, which exports large quantities of the manufactured products of the forest and where waste, owing to ignorance of the rapidly diminishing supply, is so great.

The forester is continually in touch with the civil engineer, as these few remarks show, and from his work and accumulated data has special advantages in regulating the waters in the rivers draining his districts, which rivers supply not only the means of transport for such woods as will float, but also supply the power where his 'Civil' confrere has constructed his mills or power-house. The maintenance or change of forest cover are no small factors in stream control. A great deal of the information acquired by the forest engineer should be of use to civil engineers, undertaking new developments, and will generally be found minutely and carefully charted, such as curves for tree growth, volume tables, etc. Speaking for the profession, I may say that co-operation, lucidity and professional etiquette are points on which all foresters are united.

Calgary Branch

C. M. Arnold, M.E.I.C., Sec'y.-Treas.

Minutes of a meeting held in the Board of Trade Rooms on the evening of March 21st, 1919.

The meeting was preceded by a talk given by Brigadier-General McDonald, a member of the Branch, touching upon the work of the Engineers during the war, as seen from the viewpoint of the *fighting man*, his work being with the infantry and with any engineering branch of The Service.

About thirty-five members and friends attended the meeting and, incidentally, Major Muckleston, M.E.I.C., was given a hearty welcome upon his return from overseas.

After the address the business meeting was called to order by A. S. Dawson, A.M.E.I.C., in the absence of G. W. Craig, M.E.I.C., and the secretary read the minutes of the last executive committee meeting, which were adopted upon the motion of A. S. Chapman, A.M.E.I.C., seconded by F. H. Peters, M.E.I.C.

The secretary read the report of the committee appointed to consider the movement introduced by A. G. Dalzell, A.M.E.I.C., of Vancouver, at the last general meeting, and also letter received from the Secretary of *The Institute* on the same matter.

The report which recommended that no action be taken by this Branch as a body was adopted on the motion of M. H. Marshall, M.E.I.C., seconded by B. L. Thorne, M.E.I.C.

In the course of the discussion, the reading of a letter from Secretary Keith brought out the fact that a Bill was to be introduced into the Dominion Parliament this session providing for more adequate remuneration for engineers employed in the service of the Government.

F. H. Peters, M.E.I.C., moved that the Secretary get into communication with the local members of Parliament, and that a wire be sent asking for their support of this measure. Seconded by G. N. Houston, M.E.I.C. Carried.

The meeting adjourned at 10.30 p.m.

* * *

Minutes of a meeting of the Executive Committee in the office of the secretary at 5 P.M., April 14th, 1919.

Present:—Messrs. Craig, Thorne, Dawson, Chapman and the secretary.

The minutes of the general meeting held March 21st were read and approved.

Communications:

Letters from Sec'y Keith and the Edmonton Branch re Summer Meeting. From Sec'y Keith re matter of securing increased salaries for engineers in Government employ. Wire and letter from secretary,Calgary Branch to our Calgary Members of Parliament and to Dr. Thompson sent under instructions of resolution of general meeting of March 21st, were read as well as replies from them acknowledging receipt of same. Letter from Sec'y Keith re employment of returned men who are engineers. It was considered that for the present the secretary do all in his power to aid such men in giving them information, etc. Letter from Mr. Goldman of Toronto Branch re matter of engineering fees and salaries: it was thought that the Sec'y should indicate to Mr. Goldman that Calgary Branch thought that after his Committee had formulated something along this line the Calgary Branch could then take it up and get out schedule of fees and salaries consistent with our conditions in this province. Letter from Sec'y Keith re standard stationery enclosing samples: Secretary stated that Branches would be supplied with stock of letter heads: decided to ask for 1000 letter heads as per sample of Montreal Branch.

It was decided to concur in suggestions of Mr. Gibb re summer meeting except for Calgary Branch taking entire charge of Papers Committee. It was thought control of Papers Committee should be in Edmonton though we would co-operate in every way possible.

Suggested that discussion on Concrete be continued and it was thought that we could again get the attendance of Mr. Williams and Prof. Abrams at the meeting.

Mr. Dawson mentioned the meeting, with Alberta Government, to take up question of good roads. Messrs. Thorne, Dawson and Craig were appointed to represent the Branch at this meeting.

The meeting adjourned at 6.15 P.M.

PERSONALS

E. A. Crawley, B.A.,A.M.E.I.C., who has been overseas as Lieutenant in a Pioneer Battalion, has recently returned to Canada, and has taken up his residence in Wolfville, N.S.

Major William T. McFarlane, Jr. E.I.C., of the Canadian Engineers returned to Canada in April last, and is now employed in the Reclamation Service, Department of the Interior, Ottawa.

M. B. Watson, B.A.Sc., A.M.E.I.C., has resigned his position with the Department of Highways, and has accepted the appointment of Director of Engineering, Central Technical School, Toronto.

Lieut.-Col. H. F. Meurling, D.S.O., M.C., Croix de Guerre, M.E.I.C., has recently returned from overseas on the R.M.S. Scotian. Colonel Meurling went overseas as a Lieutenant in 1915.

Robert H. Harcourt, A.M.E.I.C., has returned to Canada recently from overseas. Mr. Harcourt enlisted in September 1914, and served as Lieutenant with a Divisional Ammunition Column. He has now been appointed Assistant Engineer, Welland Ship Canal.

Leslie S. MacDonald, B.Sc., S.E.I.C., who went Overseas with the P.P.C.L.I., has recently returned and expects to take up his residence in Edmonton. Mr. MacDonald served two years with the P.P.C.L.I. and was later transferred to the R.A.F.

H. A. Dixon, B.A.Sc., O.L.S., M.L.S., A.M.E.I.C., has been appointed chief engineer, western lines, Canadian National Railways, to succeed the late A. T. Fraser, A.M.E.I.C., who was recently killed in a snow slide at Mount Robson. Mr. Dixon was formerly district engineer of the Pacific District with offices at Vancouver.

E. G. Horne, A.M.E.I.C., who for a number of years was a member of the firm of Grant & Horne, engineers and contractors, St. John, N.B., has severed his connection with the firm and will, on July 1st, take over the entire management of Lockwood & Green Company of Canada.

W. B. Hutchison, Jr. E.I.C., Lieut. Canadian Engineers, has returned from overseas after spending eighteen months in Germany as a prisoner of war. Mr. Hutchison has been appointed Inspection Engineer, Department of the Interior, Irrigation Branch, Calgary, with which Branch he was associated before going overseas.

James Fergusson, A.M.E.I.C., whose home is in Perthshire, Scotland, and who has been overseas for the past four years, returned on April 10th, to Canada. Mr. Fergusson went overseas as Sergeant, and was later promoted Lieutenant. He is resuming engineering work with the Engineering Staff of the Canadian National Railways, Montreal.

Major John R. Grant, M.C., M.E.I.C., returned to Canada on the S.S. Corsican, arriving in St. John on April 25th. Major Grant, whose home is in Vancouver, went Overseas in the early days of the War and during the big push of 1918 was O.C. 2nd Field Company Royal Engineers. On May 17th 1918, at the Chemin des Dames, the Germans broke through and he was one of the many thousands taken prisoner at that time. He was a prisoner of war till the Armistice was signed. He proposes returning to Vancouver to resume his engineering practice.

Professor R. F. Faulkner, M.E.I.C., of the Nova Scotia Technical College has accepted the secretaryship of the Halifax Branch of *The Institute*, owing to the resignation of K. H. Smith, A.M.E.I.C., whose present activities require his prolonged absence from the city. Mr. Smith was one of the active organizers of the Halifax Branch and much of its success is due to his untiring efforts. In his successor, Professor Faulkner, the Branch has a secretary who has already shown his interest in the profession in a tangible manner. Through his influence seventy-five per cent of the 1918 graduating class of the Nova Scotia Technical College have joined *The Institute*, while of the 1917 class every one has applied for membership.

Lt.-Col. H. J. Lamb, D.S.O., M.E.I.C., who before the War was Engineer of Public Works at Windsor, Ontario, returned to this country on the S.S. Minnedosa on April 17th, after a distinguished career at the Front. Col. Lamb volunteered for the Expeditionary Force on August 10th 1914, and joined at Valcartier Camp on the 21st August. Going to France with the 1st Contingent, Col. Lamb served as General Staff Officer of the 1st Canadian Division until March 1917, when he was invalided to England. In August 1916, he was awarded the D.S.O., and in January and April 1917 mentioned in despatches. On September 19th he was seconded to the War Office under the Director of Fortifications and Works in the Aviation Department, and later was appointed Deputy Assistant Director in this Department. In January 1918 he was made Staff Officer, 1st grade, and Assistant Director of Works and Buildings, Air Ministry. In October he was appointed Commander Royal Engineers under Major General Twing, D.F.W., on the construction of the American Rest Camp, Knotty Ash, Liverpool, which provided for fifteen hundred men, with a hospital for twenty-five men.

E. R. Marien, S.E.I.C., of the Quebec Branch of *The Institute*, has recently been appointed Commissioner of Industries for the City of Quebec.

Mr. Marien was born the seventeenth of February, 1893. After having taken a commercial course at the Mont St. Louis College, classics at the Montreal College and philosophy at the Seminary, he entered the Laval Polytechnic School from which he graduated in 1916, with the degree of B.A.Sc. in the Department of Civil Engineering. After graduation, Mr. Marien was employed on the testing of materials by the Montreal Western Division of the Imperial Ministry of Munitions, and, in 1917, when all the laboratories in the Montreal district were transferred to McGill University, Mr. Marien had charge of tests.

E. R. MARIEN, S.E.I.C.

On January 22nd, last, Mr. Marien was called by the Quebec Board of Trade to co-operate with them in the industrial progress of the city.

This appointment of a highly educated professional engineer proves the growing recognition of the services of the engineer to the community, and reflects credit upon those responsible for his appointment.

OBITUARY

Ernest Marceau, B.A.Sc. M.E.I.C.

Engineers throughout Canada will regret to learn of the death of Ernest Marceau, Treasurer of *The Institute*, on Friday, May 23rd. Mr. Marceau has been President, Vice-President and Member of Council. Memoir of his career will appear in the next issue of *The Journal*.

EMPLOYMENT BUREAU

Situations Vacant

The Civil Service Commission of Canada hereby gives public notice that applications will be received from persons qualified to fill the following positions in the Civil Service of Canada:—

A Motion Picture Photographer, Salary $2,600 per annum.

1. A Motion Picture Photographer for the Exhibits and Publicity Bureau, Department of Trade and Commerce, at an initial salary of $2,600 per annum. Applicants must have had experience in laboratory and motion studio work on photoplay production.

A Chemist, Department of Mines, Salary $2,100 per Annum.

2. A Chemist for the Explosives Division, Department of Mines, at an initial salary of $2,100 per annum. Candidates must be graduates of some recognized university and must have specialized in Chemistry. They must have had subsequent practical experience in the testing of explosives and if possible, also in inspection work.

A Male Clerk, Department of Trade and Commerce, Salary $1,600 per annum.

3. A Male Clerk for the staff of the Trade Mark and Copyright Branch, Department of Trade and Commerce, at a salary of $1,600 per annum. Candidates should have ability to supervise the work of clerks and give ordinary information to the public, ability to acquire facility in examining indexes and registers, to pass applications and keep registrations indexed. A knowledge of both languages is desirable.

Assistant Chemist, Dept. of Trade and Commerce, Salary $1,300 to $1,400 per Annum.

4. An Assistant Chemist for the Dominion Grain Research Laboratory at Winnipeg, Department of Trade and Commerce, at a salary of $1,300 to $1,400 per annum. Applicants must have education equivalent to graduation in Science from a recognized university, with special training in qualitative and quantative chemical analysis, and a through knowledge of general organic and inorganic chemistry. They must have had experience in chemical analysis, preferably in a commercial laboratory. They must be in good physical condition and not more than 25 years of age. Preference will be given to residents of Manitoba.

Bookkeeper, Department of Indian Affairs, Salary $1,400 per Annum.

5. A Bookkeeper in the Office of the Commissioner for Greater Production on India Reserves in Manitoba, Saskatchewan and Alberta, Department of Indian Affairs, at a salary of $1,400 per annum; the office to be located at Regina. In connection with this position a written examination will be held on June the 12th in Bookkeeping, Commercial Arithmetic and Typewriting. Penmanship and neatness will be considered in connection with the paper in bookkeeping. Applicants must be residents of Manitoba, Saskatchewan or Alberta; they must be between the ages of 18 and 35, except in the case of returned soldiers. A fee of $8.00 will be required from all condidates who are not returned soldiers. Candidates will be notified later of examination centres.

Application forms properly filled in, must be filed in the Office of the Civil Service Commission for positions numbers 1, 2, 3 and 5 not later than May the 27th and for position number 4 not later than June the 10th. Application forms may be obtained from the Dominion-Provincial Employment Offices, or the Secretary of the Civil Service Commission, Ottawa.

By order of the Commission,
W. Foran,
Secretary.

Ottawa, May 1, 1919.

* . * *

The Civil Service Commission of Canada hereby give public notice that applications will be received from persons qualified to fill the following positions in the Civil Service of Canada:—

A Petroleum Engineer, Department of Interior, salary $2,700

1. A Petroleum Engineer for the Mining Lands and Yukon Branch of the Department of the Interior with headquarters in Alberta, at a salary of $2,700 per annum. Candidates must be graduates in Applied Science of a recognized university. They must have had at least 3 years' experience in the study of the geological structure and in the practical development of petroleum and natural gas deposits in the Provinces of Saskatchewan and Alberta. They must have a thorough knowledge of the technology of well-drilling and must be competent to assume responsible charge of and direct the same.

An Officer for Poultry Div., Dept. of Agric., in N.B., Salary $1,800

2. A Representative of the Poultry Division, in the Province of New Brunswick, Live Stock Branch, Department of Agriculture, at a salary of $1,800 per annum. Candidates should be, preferably, graduates of a recognized agricultural college. They should have proven in the past, in Government or private work, ability to organize. They must have practical knowledge of poultry, which will enable them to lecture and demonstrate. They should have the education necessary to prepare news articles and handle the general work of an office.

An Asst. in Cereal Div., at Exp. Farm, Ottawa, Salary $1,700 per annum

3. An Assistant in the Cereal Division at the Experimental Farm at Ottawa; Department of Agriculture, at an initial salary of $1,700 per annum, Grade D of the First Division. Applicants must be graduates of an Agricultural College and must have had special training in regard to cereals. A good knowledge of English and at least a reading knowledge of French are essential.

An Asst. to Superintendent of Exp. Station at Fredericton, Salary $1,400

4. An Assistant to the Superintendent of the Experimental Station at Fredericton, N.B., Department of Agriculture, at a salary of $1,400 per annum. Applicants should be graduates of a recognized Agricultural College.

Assistant Chemist, Dept. Trade and Commerce, Salary $1,300 to $1,400

5. An Assistant Chemist for the Dominion Grain Research Laboratory at Winnipeg, Department of Trade and Commerce, at a salary of $1,300 to $1,400 per annum. Applicants must have education equivalent to graduation in Science from a recognized university, with special training in qualitative and quantitative chemical analysis, and a thorough knowledge of general organic and inorganic chemistry. They must have had experience in chemical analysis, preferably in a commercial laboratory. They must be in good physical condition and not more than 25 years of age.

Selections for eligible lists of applicants qualified to fill similar vacancies which may occur in future may be made from applications for these positions.

Acording to law, preference is given to returned soldier applicants, possessing the minimum qualifications. Return soldier applicants should furnish a certified copy of their discharge certificate.

In the case of positions numbers 1, 2, 4 and 5 preference will be given to residents of the provinces 'n which the vacancies occur.

Application forms, properly filled in, must be filed in the office of the Civil Service Commission not later than June the 10th. Application forms may be obtained from the Dominion-Provincial Employment Offices, or the Secretary of the Civil Service Commission, Ottawa.

By order of the Commission,
Wm. Foran,
Secretary.

Ottawa, May 8th, 1919.

Appointment in Civil Engineering.

The Board of Governors will proceed shortly to appoint a Professor of Civil Engineering to take charge of the department. Initial salary, $3,500. Applications, accompanied by full statement of training and experience, and ten copies of testimonials, will be received up to July 15th, 1919, by

The Secretary,
Board of Governors,
University of Manitoba,
Winnipeg, Canada.

Electrical Engineer.

Operating and construction engineering position for electrical engineer. Salary from $3,00 to $3,600 a year. Box No. 37.

Electrical Engineer—Temporary.

Temporary position for about six months for an electrical engineer. Salary from $200. to $250 a month. Box No. 38.

Engineering Salesman.

Engineer required to manage branch office of engineering concern. Must have had some practical engineering experience, be a good mixer, of pleasing appearance, a man of balance and good judgment, possessing the essential qualifications necessary for a good engineering salesman. He will be responsible for making reports and designs and other operations connected with the engineering staff. Salary depending upon qualifications. Box 39.

Situations Wanted

Civil Engineer.

Civil engineer, age thirty-seven, graduate R.M.C., with experience in surveying, railroad location and railway engineering, is anxious to secure a position in charge of survey work or resident engineer on construction. Box No. 3 P.

Engineer.

Engineer – lately in charge of inspection of steel for munitions for period of four years. Fourteen years previous experience on railway, dock and other engineering and inspection work. Box 2 P.

* * *

Manufacture of Milling Cutters

The use of high-speed tools has almost become general practice, but the carbon steel cutter still has its uses, such as for the cutting of fibre, which can be done better with a tool of carbon steel, than with one of high-speed steel.

The blanks are first cut off to length in specially designed slow speed band saws. The saws leave a comparatively square face and the wastage of metal in the cut is small owing to the use of the thinnest type of paring-off tool. If there is any fear of seams or laminations in the metal, the stock may be turned before the cutting off operation, to give the inspector an opportunity to reject the bar before much labor has been expended upon it.

After cutting off and turning, the blanks are chucked in an ordinary four-jaw chuck on a rigid-type engine lathe, and are bored out near to size, with an allowance left on for grinding. If the steel is valuable and the bore large, it may pay to use a hollow mill for the boring, so that the core can be saved and used for a smaller tool.

The blanks are then mounted on arbors and faced; small blanks are ground, several together, on the magnetic chuck of the surface grinder, which may be either of the vertical or horizontal type. They are then set up on the universal milling machines and the teeth cut. Several blanks may be mounted on one arbor and cut together. Afterwards the side teeth are cut, the blanks being mounted on a special indexing fixture on a plain milling machine for the purpose.

The special cutters required in gun, rifle and sewing machine manufacture are also made in the above-described way, but the backing-off of these irregular contour cutters presents considerable difficulty. By means of cams on the backing-off machine or lathe, the cutting tool is fed inwards as the blank slowly revolves, and as the end of each tool is reached the cutting tool springs back to its original position. The cutters are next hardened and tempered, which is the most important operation of all, and one to which the greatest consideration should be given. After hardening the cutters are sand-blasted and finish-ground.

A factory equipped for milling cutters should provide facilities for the final inspection of the cutters, including testing for hardness. (Jacobs, Iron Trades Review.)

Preliminary Notice of Application for Admission and for Transfer

20th May, 1919.

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in July, 1919.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows:—

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course. In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineers' office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the following branches at his option Railway, Municipal, Hydraulic, Mechanical, Mining, or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five years or more years.

Every candidate for election as JUNIOR shall be at least twenty-one years of age, and must have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-five years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects Geography, History (that of Canada in particular), Arithmetic, Geometry Euclid (Books I.-IV. and VI.), Trigonometry, Algebra up to and including quadratic equations.

Every candidate for election as ASSOCIATE shall be one who by his pursuits, scientific acquirements, or practical experience is qualified to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

ANDERSON—JOHN NOEL, (Lieut.) of Vancouver, B.C. Born at Glasgow, Scot., Dec. 25th, 1884. Educ., Royal Tech. Coll., Glasgow. 1903-05, pupilage with Chas. D. Barker, contractor engr.; 1905-11, asst. engr., Caledonian Ry. Co.; dsgn., constrn. and maintenance, etc.; 1911-16, asst. engr., Vancouver; 1916-19, on active service as lieut., 9th Batt. Can. Ry. Troops, at present pending release.

NORRIS—JAMES HILLYARD, of Montreal, Que. Born at Montreal, Que. Sept. 21st, 1890; Educ., B.Sc. (Mechanical), McGill Univ., 1912: 1909-10, G. T. R. locomotives shops, Stratford, Ont.; 1911, Byers & Anglin Contractors; 1912, in chg. of construction of 24 houses for City Realty Investing Co.; 1913-15, constructed 16 houses on own account; 1916-18, with Imperial Munitions Board in chg. of 18 pd. shrapnel production in eastern div., also construction and layout of storage warehouses; 1919, to date, partner in firm of Douglas Bremner & Co. Ltd., Montreal.

References: E. Brown, H. M. MacKay, D. Bremner, W. S. Atwood, C. M. McKergow.

SHAW—JOCK BROWN, of Victoria, B.C. Born at Berwick, N.S., July 29th, 1885. Educ., 2½ yrs. high school, 1½ yrs. C. E. course, Stanford Univ., Cal. 1905-06, (11 mos.), rodman on T. C. Ry. surveys; 3 mos., tapeman on C. P. R. double tracking; 1906-08, rodman, topographer, etc., on G. T. P. surveys; 1909-10 (5 mos.), rodman. and acting instr-man on residency, G. T. P. constrn., Skeena River; 3 mos., asst. dftsman on V. & B. S. Ry.; 6 mos., transitman on land surveys in Northern B.C., 1911-13, on surveys of Victoria as transitman; 1911-12 (4 mos), transitman on surveys and constrn., Sooke Lake water supply for Victoria; June 1913 to date, asst. engr; D. P. W., Vancouver Island Dist.

References: A. F. Mitchell, E. G. Marriott, E. P. McKie, R. W. Macintyre, D. O. Lewis.

STEWART—JAMES CROSSLEY (Lt. Col., D.S.O.), of Ottawa, Ont. Born at Kingston, Ont., Feb. 17th, 1891. Educ., grad., R.M.C., 1911, Col. Inst. Summer, 1910, on surveys, middle channel, St. Lawrence River; and work in office of S. J. Chapleau, P. W. D.; 1911-14, asst. engr , P. W. D., Ottawa, as follows: 1911-12, res. engr. on constrn., French River Regulation Works and in chg. of surveys; 1913, res. engr. and supt. of constrn. on dam, French River, also reconnaisance surveys, etc.; 1913-14, supt. of removal of shoal, Brockville, surveys and borings, Fort William Harbor; 1914-19, with Can. Field Artillery in Belgium, France and Germany, building pits, mine dugouts, shelters, etc., at present asst. engr. to S. J. Chapleau, P. W. D

References: S. J. Chapleau, W. J. Stewart, C. R. Coutlee, D. MacPherson, J. L. H. Bogart.

FOR TRANSFER FROM CLASS OF STUDENT TO HIGHER GRADE

BARCELO—JEAN EDOUARD, of Montreal, Que. Born at Montreal, Que., Dec 2nd, 1893. Educ., B.S.A. and C.E., Laval Univ., 1916. 2 summers (4 mos. each), asst engr., P. W. D.; 1 summer (2 mos.), inspector munitions plant; June, 1916, to date with Quebec Streams Comm. as follows:—1916, inst'man on Lake Kenogami survey; 1917, gen. office work; 1917-18 on storage dam constrn as concrete inspector and later asst. res. engr.; July, 1918, to date, gen. office work and gauging of rivers.

References: O. O. Lefebvre, J. B. D'Aeth, E. J. Lavigne, F. C. Laberge, L. G. Papineau.

LOIGNON-HILAIRE H. BRUNO, of Outremont, Que. Born at Montreal, Que. Jan. 14th, 1894, Educ., B.A.Sc., L'Ecole Polytechnique (Laval), 1917. Post graduate in industrial chemistry, 1918; 1916 (3 mos.), mech. dftsman at Canada Cement Co. munition plant; 1915, at A. & E. Loignon, Engrs., Montreal; 1917 (5 mos.), asst. engr. constrn. of Pulp & Paper Mills of Mattagami, P. & P. Co., Smooth Rock Falls, Ont; 1918; chemist at Canadian Explosives Co., Beloeil, Que.; 1919, constrn. of Ottawa & Hull Power & Mfg. Co., asst. dsgner of concrete constrn. for Wm. Kennedy, Jr.; at present with E. Loignon, C.E.

References: W. Kennedy, A. Frigon, W. Scott, J. Dick, S. A. Baulne.

RICHARDSON—ALBERT ANGUS (Capt.), of Peterboro, Ont. Born at Lakefield, Ont., June 20th, 1892. Educ., B.A.Sc. (C.E.), Toronto Univ., 1915. Summers, from 1906 to 1911, on constrn., chiefly concrete work on Trent Canal; 1912 (5 mos.), with W. J. Francis & Co., on Moose Jaw water supply as inspector; 1913-15, on staff of supt., Trent Canal, preparing navigation charts, placing buoys, etc.; 1914 (5 mos.) and 1915 (4 mos.) asst. city engr., Peterboro, in chg. of pavements, sewers, etc.; 1915-16, with Can. Stewart Co., as engr. in chg. of operation of hydraulic dredge on Toronto Harbour improvements; Mar. 1916, enlisted as lieut. in Can. Infantry, later promoted to Capt., Can. Engrs., in chg. of constrn. and maintenance of lines, etc., received O. B. E., and mentioned in despatches.

References: W. J. Francis, R. H. Parsons, P. Gillespie, C. R. Young, C. R. Crysdale, E. H. Pense.

WARD—ROY CECIL, of Toronto. Born at Toronto, Ont., Nov. 25th, 1893. Educ., B.A.Sc., Toronto Univ., 1916. 1912, rodman, etc., with Toronto Niagara Power Co , on high voltage elec. transmission; 1916-18, estimator and designer on structural steel and steel plate work, Toronto Iron Works, Ltd., responsible for sll estimating and dsgning; 1918, appointed asst. engr., Leaside Munition Co., directly responsible for dsgn. of foundations for presses, furnaces, etc., location of all machinery and gen. layout, etc., at present estimating and dsgning, Toronto Iron Works.

ENGINEERING INDEX

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of the engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies may be obtained of any of the articles listed in this section. Price of each print (up to 11 x 14 in. in size), 25 cents, plus postage. A separate print is required for each page of the larger-size periodicals, but where possible two pages will be photographed together on the same print. Bill will be mailed with the prints.
Orders should be sent to

Harrisson W. Craver, Director,
Engineering Societies Library,
29 West Thirty-ninth Street, New York, N. Y.

MINING ENGINEERING

BASE MATERIALS

ASBESTOS. Famous Mineral Localities: The Pelham Asbestos Mine, Massachusetts, Earl V. Shannon. Am. Mineralogist, vol. 4, no. 4, Apr. 1919, pp. 37-39. Characteristical feature is granular material, olivine colored dark by magnetite or chromite dust, containing scattered square phenocrysts of bronzy enstatite up to 3 cm. in length, the whole forming a typical fresh saxonite.

BUILDING ROCK. Mineral Deposits and Building Rock Beds of the Argentine Republic (Los yacimientos de minerales y rocas de aplicacion en la Republica Argentina), Ricardo Stappenbeck, Ministerio de Agricultura de la Nacion, Direction General de Minas, Geologia e Hidrologia, boletin no 19, series B, 1918, 107 pp., 1 fig. Summary of notes gathered by various explorers, particularly on genetic formation of ore deposits.

GRAPHITE. Preliminary Report of an Investigation into the Concentration of Graphite from Some Ontario Ores. Can. Min. Jl., vol. 40, no. 12, Mar. 26, 1919, pp. 189-197, 11 figs. Account of experimental work conducted by staff of Dept. of Min. Eng., University of Toronto. From results of tests a system of concentration was outlined.

LIME. The Lime Industry in 1918. Cement & Eng. News, vol. 31, no. 4, Apr. 1919, pp. 35-38. General condition and statistics of production.

COAL AND COKE

ACCIDENTS. Reducing Accidents in Coal Mining, Charles P. McGregor. Coal Indus., vol. 2, no. 4, Apr. 1919, pp. 149-150. Duties of officials with reference to inspections, visits, discipline and machinery.

BY-PRODUCT PLANTS. Some Striking Features of a By-product Coke Plant. Coal Age, vol. 15, no. 15, Apr. 10, 1919, pp. 654-657, 7 figs. Boosters are used to increase pressure of coke-oven gas after by-products are extracted.

Going In for the Production of By-Products Linked with many Important Considerations, L. W. Alwyn-Schmidt. Am. Gas Eng. Jl., vol. 110, no. 15, Apr. 12, 1919, pp. 309-311. Observes that production of by-products can not be neglected by small gas works.

Research and Progress in By-Product Coking in Great Britain—IV, John B. C. Kershaw. Coal Age, vol. 15, no. 17, Apr. 24, 1919, pp. 752-756, 6 figs. Coals are usually crushed and mixed before coking. Arrangement of coke oven plant at Newton Chambers & Co. collieries is given as example of practice followed.

CANADA. Coal Resources of Western Canada—I, James White. Coal Age, vol. 15, no. 17, Apr. 24, 1919, pp. 744-748, 3 figs. Distribution: analysis of coal samples; production of coal in Alberta during 1917. (To be concluded.)

CLASSIFICATION. The German System of Coal Classification and the Future Economic War—III. Colliery Guardian, vol. 117, no. 3038, Mar. 21, 1919, pp. 660-661. It is presumed that future economic war will involve restriction of freedom of mine owner in respect of winning and treatment of coal, by introduction of methods based on communal economics.

COKE-OVEN GAS. Coke-Oven Gas. Colliery Guardian, vol. 117, nos. 30-40, Apr. 4, 1919. pp. 773-774. Future development of coking industry will take place, writer believes, in two main directions; coke-oven plants becoming large heat, light and power producers, or becoming large centers of chemical activity.

CUTTER. Coal-Cutter Invented by a Working Miner. Iron & Coal Trades Rev., vol. 98, no. 2666, Apr. 4, 1919, p. 415, 2 figs. Sketch plan showing details.

GAS. Bumps and Outbursts of Gas in the Crowsnest Pass Coal Field. Coal Age, vol. 15, no. 15, Apr. 10, 1919, pp. 660-665, 5 figs. Field covers 230 square miles and is estimated to contain 845 billion tons of coal. From Bulletin No. 2, 1918, British Columbia Department of Mines.

KENT COALFIELD. The Evolution and Development of the Kent Coalfield, A. E. Ritchie. Iron & Coal Trades Rev., vol. 98, nos. 2661, 2664, 2665, 2666, 2667, Feb. 28, Mar. 21, 28, Apr. 4, 11, 1919, pp. 257-258, 356, 381, 414, and 447-448, 3 figs. From 1897 to 1900.

Mar. 21: Nationalization of Westphalian Coal Syndicate from accounts in German newspapers; Mar. 28: from 1912 to 1918; Apr. 4: from 1901-1905. Apr. 11: Diagram of borings put down by Kent Coal Concessions, Ltd. up to Dec. 1906.

SPANISH INDUSTRY. Geological History of Coal and Its Present Value.—II. Actual Conditions of Spanish Coal Industry: Its Future (La hulla en el pasado geologico y en el presente historico. II. Estado actual de la industria hullera espanola; su porvenir), D. Pablo Fahrega. Revista Minera, vol. 70, no. 2680, Mar. 16, 1919, pp. 129-135. Presentation of various theories concerning origin of coal; comparison of activities in coal industries of various nations. Conference given before Instituto de Ingenieros Civiles.

STRIPPING. Coal Stripping in the United States—IV, Wilbur Greely Burroughs. Coal Indus., vol. 2, no. 4, Apr. 1919, pp. 143-146, 6 figs. Features of stripping and loading shovels and dragline excavators.

Methods of Mining Coal, W. C. Bochert. Pahasapa Quarterly, vol. 8, no. 2, Feb. 1919, pp. 41-52, 7 figs. Practices followed in U. S. A. in connection with stripping or open-cut mining, and mining under ground or under cover.

SURFACE SUPPORT. The Effect of Coal Mining on the Overlying Rocks and on the Surface, W. D. Lloyd. Colliery Guardian, vol. 117, no. 3041, Apr. 11, 1919, pp. 837-839 and (discussion), p. 842. Writer indicates lines on which he believes further observations should be made on the effect mining operations will have on the support of the surface. Paper read before Midland Inst. Min., Civil & Mech. Engrs.

TRANSPORTATION. The Carriage of Coal by Rail in India, H. Kelway-Bamber. Ry. Gaz., vol. 30, no. 14, Apr. 4, 1919, pp. 603-606, 6 figs. Development in Indian coal output and forecast of future coal consumption. (To be continued.) Paper read before Indian Section, Roy. Soc. of Arts.

GEOLOGY AND MINES

ADIRONDACK REGION. Pegmatite, Silextite, and Aplite of Northern New York, William J. Miller. Jl. Geology, vol. 27, no. 1, Jan.-Feb. 1919, pp. 28-54, 8 Figs. Examination of accepted genetic theories in view of phenomena presented by occurrences in Adirondack region.

ALASKA. The Nelchina-Susitna Region, Alaska, Theodore Chapin. Dept. of the Interior, U. S. Geol. Survey, bul. 668, 1919, 67 pp., 14 figs. Location, area and geology of drainage basins of Copper and Susitna Rivers.

AMERICAN GEOLOGY, BIBLIOGRAPHY OF. Bibliography of North American Geology, for 1915, with subject index, John M. Nickles. Dept. of Interior, U. S. Geol. Survey, Bul. 645, 1916, 144 pp. Includes publications bearing on the geology of the Continent of North America and adjoining islands; also Panama and the Hawaiian Islands. Textbooks and papers general in character by American authors are included; those by foreign authors are excluded unless they appear in American publications.

ARGENTINA. Geological and Hydrogeological Studies in the Region between the Mouth of the Rio Negro, San Antonio, and Choele-Choel (Estudios geologicos e hidrologicos en la region comprendida entre Boca del Rio Negro, San Antonio y Choele-Choel), Ricardo Wichmann. Republica Argentina, Anales del Ministerio de Agricultura de la Nacion, Seccion Geologica, Mineralogia y Mineria, vol. 13, no. 3, 1919, 44 pp., 5 figs. Data secured in survey of region.

Contribution to the Geology of the Argentine Republic (Contribucion al conocimiento geologico de la Republica Argentina), Ricardo Wichmann and Franco Pastore. Anales del Ministerio de Agricultura della Nacion, Seccion Geologia, Mineralogia y Mineria, vol. 13, no. 4, 1919, 45 pp., 8 figs. Geology of region between Rio Negro and Arroga Valcheta, with petrographic description of volcanic and metamorphic rocks.

BRITISH COLUMBIA. Was there a "Cordilleran Glacier" in British Columbia? J. B. Tyrell. Jl. Geology, vol. 27, no. 1, Jan.-Feb. 1919, pp. 55-60. Writer's observations had lead him to deny possibility of existence of a great longitudinally moving Cordilleran glacier in latitude 54 deg., and he believes that it was absent as far south as Quesnel in latitude 53 deg.

CRYSTALLOGRAPHY. Crystallography of Some Canadian Minerals: 8. Axinite, Eugene Poitevin. Am. Mineralogist, vol. 4, no. 4, Apr. 1919, pp. 32-36. Analyses made by Geol. Survey of Canada. Give table showing combination of gorms on nine measured crystals.

DAKOTA NORTH. The Geology of North Dakota, A. G. Leonard. Jl. Geology, vol. 27, no. 1, Jan.-Feb. 1919, pp. 1-27, 2 figs. Rocks are classified as being chiefly clays, shales and sandstones belonging to the Cretaceous and Tertiary periods, overlain in most places by the drift deposits of the Pleistocene.

ECONOMIC GEOLOGY. Contributions to Economic Geology (short papers and preliminary reports), part 11. Mineral Fuels, M. R. Campbell and David White. Dept. of Interior, U. S. Geol. Survey, Bul. 621, 1916, 375 pp., 42 figs. Descriptions of occurrences that have economic interest but are not considered of sufficient importance to warrant an extended account; preliminary reports on economic investigations, the results of which are to be published later in more detailed form; apparatus for determining percentage of ash and coal and instructions for its use.

IDAHO. A Preliminary Report on the Mining Districts of Idaho, Thomas Varley, Clarence A. Wright, Edgar K. Soper and Douglas C. Livingston. Dept. of Interior, Bur. of Mines, Bul. 166, 113 pp., 6 figs. Gives localities of mining districts, and nature of present operations and those that have been carried on in the past: geology is discussed in reference to types of ore deposits and character of ores.

Lava. Dacites and Dacitoides, With Reference to Lavas of Martinique (Dacites et dacitoides, à propos des laves de la Martinique), A. Lacroix. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 6, Feb. 10, 1919, pp. 297-302. Composition of volcanic rocks found in Martinique is adduced in support of theory that a number of lavas, which are considered as andesites, are in reality heteromorphic dacites.

Metalliferous Deposits. Original Formation of Metalliferous Deposits (Sur la formation originelle des gisements métallifères). Notes Provincales, (Notes de géophysique), no. 7, Feb. 19f9, pp. 18-21. On the genesis of exogenous deposits. Remarks on Stephen Tabor's paper, The Mechanics of Vein Formation, before Am. Inst. Min. Engrs. See Trans., A. I. M. E., Sept. 1918, pp. 1189-1222.

Nevada. The Yerington District, Nevada, Adolph Knopf. Min. & Sci. Press, vol. 18, no. 14, Apr. 5, 1919, pp. 455-458, 2 figs. Geological records; analysis of lime stone sample taken in district. From Professional Paper 114, U. S. Geol. Survey.

Texas. Geology of North Central Texas Field, Wallace E. Pratt. Oil & Gas Jl., vol. 17, no. 44, Apr. 4, 1919, pp. 54-56, Structure of surface beds; surface relation to subsurface; occurrences of water, oil and gas. Paper before Am. Assn. of Geologists.

Vancouver Island. Sooke and Duncan Map-Areas, Vancouver Island, C. H. Clapp. Can. Dept. of Mines, Geol. Survey, memoir 96, 445 pp., 19 figs. Topography, geology and natural resources.

IRON

Mesabi Range. Iron-Ore Concentration on the Mesabi Range, F. A. Kennedy. Eng. & Min. Jl., vol. 107, no. 16, Apr. 19, 1919, pp. 683-688, 5 figs. Tables and curves relating to performances of washers; suggestions for betterment of present methods.

LEAD, ZINC, TIN

Tin Mining. Tin-Mining in the Dutch Indies (Van het handgrondwerk naar het spuit-en pompbaggerhedrijf), J. C. Moilema. De Ingenieur, vol. 34, no. 5, Feb. 1, 19f9, pp. 68-79, 14 figs. Particulars of a number of installations.

Zinc-Ore Distillation. Refractories for the Zinc Industry, M. Grover Babcock. Jl. Am. Ceramic Soc., vol. 2, no. 2, Feb. 19f9, pp. 81-95. Requirements of clay retors used in distillation of zinc ores.

Zinc-Ore Mining. Operations at the Zinc. Camp, Arkansas, Tom Shiras, Eng. & Min. Jl., vol. 107, no. 14, Apr. 5, 1919. pp. 607-608, 2 figs. Mining confined to removal of siliceous ores.

MAJOR INDUSTRIAL MATERIALS

Manganese. Chrome and Manganese Ores in Cuba, Boletin de Minas, no. 5, 1918, pp. 57-70. Despite handicaps, it is believed that the outlook for a steadily increasing production in 1918 and 1919 is good. Reserves of manganese are estimated at 700,000 to 800,000 tons. The Spanish text for this article appears in pp. 41-56. From U. S. Geol. Survey, bul. 380, Sept. 1918.

Report on the Manganese Deposits of Georgia (Second Report on Manganese), J. P. D. Hull, Lawrence la Forge and W. R. Crane. Geol. Survey of Georgia, bul. 35, 295 pp., 39 figs. Divided into three parts, (1) relation of ore deposits to structural geology, (2) description of individual, properties and mode of occurrence of ore, and (3) methods of mining and cleaning ore. Prepared in co-operation with U. S. Geol. Survey and U. S. Bur. of Mines.

The Mining and Preparation of Manganese Ores in Tennessee, W. R. Crane and E. R. Eaton. Mining Jl., vol. 125, no. 4363, Apr. 5, 1919, pp. 213-214. Minerals found are pyrolusite, psilomelane, and manganite. (To be continued.) From Mag. of Tennessee Geol. Soc.

Manganese, T. G. Trevor, South African Jl. Industries, vol. 2, no. 1, Jan. 19f9, pp. 35-43. Occurrence and appearance of ores; metallurgical and chemical uses of manganese oxides; statistics of manganese production of the world for 1913 and 1916.

MINES AND MINING

Accidents. Quarry Accidents in the United States During the Calendar Year 1917, Albert H. Fay. Dept. of the Interior, Bur. of Mines, tech. paper 213, 62 pp. Tables indicating causes of accidents; safety rules promulgated by Nat. Lime Mfrs. Assn.

Africa, South. The Mineral Industry of South Africa and its Future—IV, V & VI, P. A. Wagner. S. A. Min. & Eng. Jl., vol. 28, parts 1 and II, nos. 1429, 1430 and 1432, Feb. 15, 22 and Mar. 8, 1919, p. 572, 597 and 27. Feb. 15: Iron, kaloin and lead mining. Feb. 22: Zinc, arsenic, magnesite, manganese, mica, soda, talc, tungsten. Mar. 8: Lime, rock phosphate, chert, gypsum, kieselghur, salt, cement, clay products and structural material. Presidential address read before S. A. Assn. for the Advancement of Science. (To be continued.)

British Columbia. History of Mining and Metallurgical Development in British Columbia. Min. & Eng. Rec., vol. 24, no. 1, Jan. 1919, pp. 6-11, 9 figs. From the discovery of gold in 1851 to construction of mill at Allenby, B.C.

Cuba. Historical Sketch of the Mining Industry in Oriente. Cuba (Resena historica sobre la mineria en Oriente, Cuba). Boletin de Minas, no. 5, 1918, pp. 26-40. Iron mining on northern coast. (Continued.)

Doors, Separation. Separation Doors at the Bottom of the Upcast Pit. Worked Automatically by Tubs Attached to Endless-Rope (Under-Tuh) Haulage, Clement Fletcher. Trans. Manchester Geol. & Min. Soc., vol. 36, part II, Mar. 1919, pp. 31-33, & 4 figs. on plate between p. 64 and cover. Doors work vertically in machined gun-metal grooves and are operated by two Hans Renold roller chains.

Drainage. Tapping and Draining a Deep Shaft, J. Fox. Colliery Guardian, vol. 117, no. 3038, Mar. 21, 1919, pp. 659-660, 3 figs. Sketches showing erosive action of water on borehole.

Drilling and Stripping. The Blow of the Drill Bit, Sharp or Dull, Frank Richards. Eng. & Min. Jl., vol. 107, no. 17, Apr. 26, 1919, pp. 735-736, 1 fig. Explanation of failure of steel to stand up under action is found in consideration of forces which act and react in drill-striking operation.

Heavy Drilling at Sacramento Hill, Robert T. Banks. Eng. & Min. Jl., vol. 107, no. 16, Apr. 19, 1919, pp. 690-691, 2 figs. Method adopted provides for series of benches which are operated simultaneously, steam shovels being used to load rock into cars after it has been drilled and blasted.

Stripping. Stripping and Drilling Methods at the Sacramento Hill Copper Mines. Eng. & Contracting, vol. 51, no. 16, Apr. 16, 1919, pp. 389-390, 4 figs. Hill laid off in benches and drilling is effected by Sullivan "Hyspeed" pistol drill with ¾-in. cylinder diameter.

Hoisting Machinery. Electric Cables at Mines. Iron & Coal Trades Rev., vol. 98, no. 2666, Apr. 4, 1919, pp. 405-407, 5 figs. Regulations proposed by various mining engineers in the light of their experience. Discussion of paper published in Iron & Coal Trades Rev., Feb. 21.

Laws. A Uniform Mining Law for North America, T. A. Godson. Can. Min. Inst. Bul., no. 84, Apr. 1919, pp. 399-405. Considers that present mining laws of Canada are not sufficiently adaptable to mining needs.

Revision of Mining Law of April 21, 1810 (Projet de revision de la loi des mines du 21 avril 1810), Couriot. Génie Civil, vol. 74, no. 12, Mar. 22, 1919, pp. 228-232. Modifications in regard to duration of concessions and sharing of profits with the state. Comparisons of French mining law with those of other nations.

Ore Handling. Unloading, Crushing, and Screening at the Arthur Mill of the Utah Copper Company, F. G. Janney. Min. & Sci. Press, vol. 118, no. 14, Apr. 5, 1919, pp. 464-470, 8 figs. Ore comes from mine in trains of 40 cars, which descend on 0.4 per cent grade over 150-ton Strait scale, equipped with Streeter-Amet automatic weighing and recording device, on which ore is weighed while train is moving at rate of two miles per hour.

Ore Reserves. Application of the Theory of Probability in the Determination of Ore Reserves, G. A. Watermeyer. Jl. Chem., Metallurgical & Min. Soc. of South Africa, vol. 19, no. 7, Jan. 1919, pp. 97-107 and (discussion), pp. 107-108, 5 figs. Studies whether there is a law governing distribution of values in determination of ore reserves. Object is to ascertain probability of predicting nature of ore penetrating to various depths from points sampled.

Pillar Supports. Pillar Supports in Fortuna Mines of Braden Copper Co., Chile (Método de explotacion en las minas Fortuna de la Braden Copper Co. de Chile Dejando columnas de sostenimiento), Charles Hollister. Ingenieria Internacional, vol. 1, no. 1, Apr. 1919, pp. 13-15, 2 figs. Results obtained by application of method used in Arizona of Ray Consolidated Copper Co.

Rand. Rand Mining in 1918, A. Cooper Key. Eng. & Min. Jl., vol. 107, no. 16, Apr. 19, 1919, pp. 702-703, 1 fig. Data showing past and present position of gold-mining industry.

Safety. Mine Officials and the Safety Problem, Edwin C. Curtis. Coal Indus., vol. 2, no. 4, Apr. 1919, pp. 141-142. Advises that an official be judged by good accident record rather than by his record of production.

Safety Lamps. Safety Lamp Gauges—IV, T. J. Thomas Colliery Guardian, vol. 117, no. 3039, Mar. 28, 1919, pp. 714-7f6, 3 figs. Velocities established in explosive mixtures: composition of air rendered extinctive by addition of dioxide and nitrogen; influence of inert gases on properties of firedamp mixtures; results of exposing methane and air mixtures to high temperatures without sparking.

Screening. Estimating Screen Efficiency, W. O. Bercherdt. Eng. & Min. Jl., vol. 107, no. 15, Apr. 12, 1919, pp. 651-653, 2 figs. Diagram of screen analysis on feed, undersize and oversize samples made on hand screen clothed with identical screening medium used on a mill screen.

Statistics. Mineral Statistics of Peru in 1917 (Estradistica Minera del Peru en 1917), Carlos P. Jimenez. Boletin del Cuerpo de Ingenieros de Minas del Peru, no. 95, 326 pp. Production of coal, oil, gold, silver, copper, lead, zinc, mercury, antimony, vanadium, molybdenum, tungsten, bismuth and natural salts.

Stripping. See Drilling and Stripping above.

Timbering. Safe and Efficient Mine Timbering—IV, R. Z. Virgin. Coal Indus., vol. 2, no. 4, Apr. 19f9, pp. 138-141, 4 figs. Cribbing, fore-poling under soft roof, timbering high places, inclined seams and using round, notched timber.

Ventilation. Mine Ventilation in the Coeur d'Alenes, Robert N. Bell. Eng. & Min. Jl., vol. 107, no. 14, April 5, 1919, pp. 603-604. Problem presented by air circulation at depth.

MINOR INDUSTRIAL MATERIALS

Barytes. Barytes, Percy A. Wagner. South African Jl. Industries, vol. 2, no. 2, Feb. 1919, pp. 143-146. Mode of occurrence and sources of supply; commercial uses; dressing and preparation; valuation and prices.

Magnesite. Magnesite on the Island of Margarita, Charles F. Z. Caracristi. Eng & Min. Jl.. vol. 107, no. 1, Apr. 12, 1919, pp. 645-647, 1 fig. Geological examination has led writers to believe that there are important magnesite deposits on Venezuelan Island.

Mercury. Quicksilver in 1917, F. L. Ransome. Dept. of Interior, U. S. Geol. Survey, Mineral Resources of U. S. A., 1917—Part I, pp. 367-455, Mar. 18, 1919. Statistics of production, including general review of important quicksilver deposits of the world, section on mining of quicksilver ores, and bibliography.

Saltpeter. Economics of Chile (Chile Economico), Pedro Luis Gonzalez. Boletin de la Sociedad de Fomento Fabril, vol. 35, no. 12, Dec. 1918, pp. 811-821. Special reference is made to mineralogy, metallurgy and saltpeter deposits.

TUNGSTEN. Wolfram Mining in Bolivia, G. F. J. Preumont. Eng. & Min. Jl., vol. 107. no. 14, Apr. 5, 1919, pp. 597-600. Development of industry in recent years. Bolivia is considered by writer as second in importance to Malay States in production.

Cobalt, Molybdenum. Nickel, Titanium, Tungsten, Radium, Uranium, and Vanadium in 1916, Frank L. Hess. Dept. of Interior, U. S. Geol. Survey, Mineral Resources of the U. S. A., 1916—Part I, pp. 775-807, Feb. 25, 1919. Statistics of production, importation and mining conditions.

OIL AND GAS

CALIFORNIA. Structure and Oil Resources of the Simi Valley, Southern California, William S. W. Kew, Dept. of Interior, U. S. Geol. Survey Bul., 691-M, Contributions to economic geology, 1918, part II, Apr. 3, 1919, pp. 323-347, Geology of oil fields.

DRILLING. The Percussion System of Drilling Oil Wells, Maurice A. Ockenden and Ashley Carter. Petroleum Times, vol. 1, no. 2, Mar. 22, 1919, pp. 219-222, 2 figs. Plant used in connection therewith. (To be concluded.) Paper read before Instn. Petroleum Technologists.

GAS TESTING. Testing Natural Gas for Gasoline Content, G. A. Burrell. Water & Gas Rev., vol. 29, no. 10, Apr. 1919, pp. 12-13, 2 figs. Apparatus which condenses gasoline vapor out of gas and measures yield.

GAS TRAPS. Traps for Saving Gas at Oil Wells, W. R. Hamilton. Dept. of the Interior, Bur. of Mines, tech. paper 209, petroleum technology 49, 34 pp. 19 figs. Types of traps; Their use is represented as advantageous in increasing gasoline content of gas and eliminating part of storage losses.

GEOLOGICAL SURVEYING. How a Petroliferous Region is Studied (Come is studia un giacimento petrolifero). Ingegneria Italiana, vol. 3, no. 63, Mar. 13, 1919, pp. 174-177. General examination, geoligical survey and financial study as preliminary steps before prospecting.

MONTANA. Anticlines in a Part of the Musselshell Valley. Musselshell, Meagher, and Sweetgrass Countries, Montana, C. F. Bowen. Dept. of Interior, U. S. Geol. Survey, Bul. 691-F, Contributions to economic geology, 1918, part II, Nov. 22, 1918, pp. 185-209, 1 fig. Previous investigators have asserted that there is an area in this region where the rocks have undergone considerable folding. On basis of this information work was conducted to determine measure and extent of folds and to examine possible occurrence of accumulations of oil and gas in them.

Oil and Gas Geology of the Birch Creek-Sun River Area, Northwestern Montana, Eugene Stobinger. Dept. of Interior, U. S. Geol. Survey. Bul.691-E, Contributions to economic geology, 1918, part II, Aug. 13, 1919, pp. 149-184, 4 figs. Presentation of unquestionable evidence having bearing on oil and gas prospects in specified area, including descriptions of broader features of geology and account of local structural characteristics which have been accounted as possible sources of oil and gas.

OKLAHOMA. New Development for Oil and Gas in Oklahoma during the past Year and Its Geological Significance, Geo. E. Burton. Bul. Am. Assn. Petroleum Geologists, vol. 2, pp. 53-59. From data submitted it is believed that the Pan. is much nearer the surface than it has been supposed.

PETROLEUM STRUCTURE. Petroleum Under the Microscope, no. 21, Spontaneous Ignition of Oil, James Scott. Petroleum World, vol. 16, no. 222, Mar. 1919, pp. 108-110, 3 figs. Showing formation of pyrites capable of inducing spontaneous ignition, owing to the comparatively large amount of space filled with gas.

SHALES. Oil Shales of the Great Uintah Basin, Utah, Don Maguire. Salt Lake Min. Rev., vol. 21, no. 1, Apr. 15, 1919, —. 21-26, 4 figs. Report of Mineralogical Survey. From Mineralogist & Metallurgist.

STORAGE. The Fireproof Storage of Petrol. Petroleum World, vol. 16, no. 222, Mar. 1919, pp. 128-132, 3 figs. Description of Martini and Hüneke pressure-type pumping plant. (To be continued).

TEXAS. Natural Gas Resources of Parts of North Texas. Dept. of Interior, U. S. Geol. Survey, Bul. 629, 1916, 129 pp., 20 figs. Estimates of gas remaining in development pool.

WATER. Water in Oil and Gas Wells, F. B. Tough. Petroleum Times, vol. 1, no. 2, Mar. 22, 1919, pp. 229-231. Formulæ for computing probable collapsing pressure for commercial sizes of casing.

PRECIOUS MINERALS

ARIZONA. Gold, Silver, Copper, Lead, and Zinc in Arizona in 1917, V. C. Heikes Dept. of Interior, U. S. Geol. Survey, Mines Report, Mineral Resources of U. S. A., 1917—Part I, pp. 509-548, Apr. 1, 1919, Figures of output in marketable form as obtained from smelters, refineries and mints; review of industries of entire country; production in terms of recoverable metal in ores and other material sold or treated during calendar year. Information relative to mining industry in respective states, counties and mining districts.

COLOMBIA. The Guamoco District of the Republic of Colombia—II, S. Ford Eaton. Eng. & Min. Jl., vol. 107, no. 14, Apr. 5, 1919, pp. 609-613, 2 figs. Peculiar transportation difficulties in gold mines.

IDAHO AND WASHINGTON. Gold, Silver, Copper, Lead and Zinc in Idaho and Washington in 1917, C. N. Gerry. Dept. of Interior, U. S. Geol. Survey, Mineral Resources of the U. S. A., 1917, part 1, pp. 457-507, Apr. 3, 1919. Statistics of production.

ONTARIO. The Gold-Quartz Lodes of Porcupine, Ontario, Ellsworth Y. Dougherty. Min. & Sci. Press, vol. 118, no. 16, Apr. 19, 1919, pp. 532-536, 8 figs. Occurrence of tourmaline and fledspar with coarsely crystalline and fluid enclosing ore-quartz led to classification of orebodies as high-temperature deposits, formed under great depth and pressure through the agency of igneous activity.

PLATINUM. An Investigation of Certain Canadian Platinum and Manganese Resources' G. C. Mackenzie. Can. Min. Inst. Bul., no. 84, Apr. 1919, pp. 425-434. Recovery from refining of Sudbury copper-nickel matte; report of examination of platinum occurrences in Alberta, British Columbia undertaken by Canadian Munition Resources Commission.

WASHINGTON. *See Idaho and Washington above.*

RAILROAD ENGINEERING

FOREIGN

ARGENTINA. The Railroad Development of the Argentine—I. Ry. Age, vol. 66. nos. 16 and 17, Apr. 18 and 25, 1919, pp. 1001-1005 and 1047-1050, 8 figs. Difficulties railways have been confronted with in the way of Government regulation, labor and taxation. Possible trend of future developments; figure of imports of railway material and discussion of possible markets for such supplies, Apr. 25: Problems in regulation, labor and taxation. Article sets forth that largest market for railway equipment is in South America.

AUSTRALIA. Australian Railways. Indus. Australian & Min. Standard, vol. 61, nos. 1582, 1583 and 1584, Mar. 6, 13 and 20, 1919, pp. 420-421 and 509, 463, 7 figs. General dimensions of Tasmanian and Western Australian types., Mar. 13; Queensland types of locomotives.

ENGLISH CHANNEL TUNNEL. The English Channel Tunnel. Sci. Am., vol. 120 no. 16, Apr. 19, 1919, pp. 398-399 and pp. 416-417, 5 figs. Plans for tunnel, showing its course, geological strata and system of drainage; also plans for tubes and a bridge.

The Channel Tunnel Scheme, A. E. Ritchie. Iron & Coal Trades Rev., vol. 98, no. 2666, Apr. 4, 1919, pp 403-404, 4 figs. Details of proposed scheme.

EUROPE. European Train Speeds. Ry. Gaz., vol. 30, no. 14, Apr. 4, 1919, pp. 607-609, 3 figs. Survey of highest, longest and fastest non-stop runs, speed of trains between two places and geographical distribution of important services. (Continuation of serial).

FOREIGN DEVELOPMENTS. Railway Developments in Foreign Countries, Ry. Age, vol. 66, no. 15, Apr. 11, 1919, pp. 957-962, 2 figs. Problem of unification of railways in China; shortage of railway equipment in Germany; electric railway projected from Stockholm to Goteborg; cross-section of proposed English Channel tunnel.

Railway Developments in Foreign Countries. Ry. Age, vol. 66, no. 17, Apr. 25, 1919, pp. 1056-1059. In Chile, Uruguay and China.

SPAIN. An Important Development in the Railways of Spain—III, F. Lavis, Ry. Age, vol. 66, no. 15, Apr. 11, 1919, pp. 945-949, 3 figs. Proposed direct line from France to Gibraltar through Madrid and its relation to other railways of Europe and those of South America.

URUGUAY. The Railways of Uruguay, William A. Reid. Ry. Rev., vol. 64, no. 16, Apr. 19, 1919, pp. 583-586, 7 figs. Agricultural interests served by three main systems.

BRAKES

STRAIGHT AIR BRAKE, AUTOMATIC. The Automatic Straight Air Brake. Ry. Mech. Engr., vol. 93, no. 4, Apr. 1919, pp. 195-198. Series of tests conducted by Bur. of Safety of the air-brake system of Automatic Straight Air Brake Co. of N. Y.

ELECTRIC RAILROADS

ELECTROPNEUMATIC DRIVING MECHANISM. Westinghouse Electro-Pneumatic Driving Mechanism of the Suburban Locomotives Used by the State Railways. (Equipment Westinghouse pour la commande électro-pneumatique des automotrices de banlieue des chemins de fer de l'Etat). L. Pahin. Industrie Electrique, vol. 28, no. 643, Apr. 10, 1919, pp. 128-131, 6 figs. Scheme of connections and diagram indicating closing order of the thirteen contacts. (To be continued).

RELAYS. A. C. Accessories, A. E. Tattersall. Railway Engineer, vol. 40, no. 471, Apr. 1919, pp. 77-80, 7 figs. Radial polyphase relays. (Concluded).

ELECTRIFICATION

ARGENTINA. Electrification of the Central Railway of Argentina (Electrificacion del ferrocarril central argentino). Ingenieria Internacional, vol. 1, no. 1, Apr. 1919, pp. 9-13, 4 figs. Details of power house.

ECONOMICS. Steam Railroad Electrification Calvert Townley. Can. Engr., vol. 36, no. 16, Apr. 17, 1919, pp. 387-388. Possibilities of electrification as affecting future railroading policies. Also in Proc. Am. Inst. Elec. Engrs., vol. 38, no. 4, Apr. 1919, pp. 541-547; Ry. Rev., vol. 64, no. 17, Apr. 26, 1919, pp. 615-616.

Railroad Electrification, F. H. Shepard. Southwestern Elecn., vol. 15, no. 2, Apr. 1919, pp. 18-19. Urgency of steam-railroad electrification is argued from veiwpoints of economy and service of electrical equipment. Paper presented at Annual Meeting of Eng. Inst. of Canada.

PANTAGRAPH FRAMES. Railroad Electrification Facts and Factors, A. J. Manson. Ry. Elec. Engr., vol. 10, no. 4, Apr. 1919, pp. 115-117, 6 figs. Construction details of pantagraph frames as determined by operating conditions.

WASHINGTON. Railway Electrification in Washington. Jl. Electricity, vol. 42, no. 7, pp. 311-313. Review of present status with description of equipment and construction work.

NEW CONSTRUCTION

BOILER POWER AND TRACTIVE POWER. Boiler Power Versus Tractive Power—I, William N. Allman. Boiler Maker, vol. 19, no. 4, Apr. 1919, pp. 106-108. Expressions for deriving tractive power for single-expansion locomotives.

Feedwater Heaters. Feed Water Heaters and Their Development—II, J. Snowden Bell. Railroad Herald, vol. 23, no. 5, Apr. 1919, pp. 109-112. From 1825-1849. (Continuation of serial.) Paper read before Am. Ry. Master Mechanics' Assn.

LOCOMOTIVES

Firing. Modern Locomotive Engine Design and Construction—XLVII. Railway Engineer, vol. 40, no. 471, Apr. 1919, pp. 69-77, 15 figs. Special methods of boiler firing: Liquid fuel; pulverized fuel.

Flues. Flues, George L. Price. Boiler Maker, vol. 19, no. 4, Apr. 1919, pp. 98-99. Methods employed in installing flues in stationary and locomotive boilers.

Gasoline-Electric Locomotive. Locomotive Notes and News, C. S. Lake. Model Engr. & Elecn., vol. 40, no. 936, Apr. 3, 1919, pp. 225-227, 3 figs. Gasoline-electric locomotive designed to haul 100 tons on the level, and built to run on 2-ft. gage. It is equipped with a 45-hp. four-cylinder gasoline engine, which drives through a flexible coupling, a 30-kw. ventilated-type direct-current generator.

Hanger Levers. General Observations of the Design of Hanger Levers for Locomotives, Victor M. Summa. Ry. & Locomotive Eng., vol. 32, no. 4, Apr. 1919, pp. 103-105, 5 figs. Stresses in a plain flat-bar lever subjected to forces lying in plane of bar.

Mallet. Latest Mallet Type of Locomotive for the Southern Railway—Baldwin's Fifty-Thousandth Engine. Ry. & Locomotive Eng., vol. 32, no. 4, Apr. 1919, pp. 97-99, 2 figs. Articulated type with 2-8-8-2 wheel arrangement in operation on Southern railway. Also in Ry. Jl., vol. 25, no. 5, May 1919, pp. 17-21, 4 figs.

P. & R. 2-8-2. P. & R. Large 2-8-2 Type Locomotive. Ry. Mech. Engr., vol. 93, no. 4, Apr. 1919, pp. 175-177, 5 figs. Tractive effort is 61,260 lb.; boiler has combustion chamber and 2-in. tubes 13 ft. 6 in. long.

French Express Locomotives. The Development of Express Locomotives in France, M. Herdner. Engineer, vol. 127, no. 3299, Mar. 21, 1919, pp. 270-272, 9 figs. From 1878-1918. Presidential address before Société des Ingénieurs Civils de France.

Standard Locomotives. Light and Heavy Standard Pacific Type Locomotives. Ry. Age, vol. 66, no. 15, Apr. 11, 1919, pp 950-954, 10 figs. Railroad Administration Standard designs having details interchangeable with other types.
Standard 2-8-8-2 Type Locomotives. Ry. Mech. Engr., vol. 93, no. 4, Apr. 1919, pp. 187-190, 5 figs. Locomotive is 6000 lb. heavier than that built by the Norfolk & Western; working steam pressure is 240 lb. per sq. in. tractive effort, compound, is 106,000 lb.

OPERATION AND MANAGEMENT

Accounting. Railway Accounting of Carriage Paid Goods Train Traffic, L. C. Webber Reed. Ry. Gaz., vol. 30, no. 13, Mar. 28, 1919, pp. 564-565. Arguments in favor of economies which writer claims would be effected if it were made compulsory that all freight-train traffic should be consigned carriage paid.

Car Equipment, Inspection and Maintenance. Unification of Inspection and Maintenance of Car Equipment, J. J. Tatum, Official Proc. Central Ry. Club, vol. 27, no. 2, Mar. 1919, pp. 575-579 and (discussion); pp. 579-606. Selection of inspectors; their duties and responsibilities.

Lighting. Railway Lighting and Its Maintenance, A. Cunnington. Ry. Gaz., vol. 30, no. 12, Mar. 21, 1919, pp. 525-527. Standardization of lamps; illumination measurements; system of distance control. Paper read before Illuminating Eng. Soc.

Road Motor Vehicle Department. Organization of a Railway Company's Raad Motor Vehicle Department. Ry. Gaz., vol. 30, no. 15, Apr. 11, 1919, pp. 639-645, 16 figs. Practice of Great Western R.R.

San Diego & Arizona Railway. Heavy Railway Construction Along Mexican Border. Ry. Age, vol. 66, no. 15, Apr. 11, 1919, pp. 931-934, 5 figs. Construction of San Diego & Arizona Ry.; seventeen tunnels are being driven in 11-mile gap.

Train Loading. Securing the Maximun Efficiency in Train Loading, T. H. Williams. Ry. Age, vol. 66, no. 17, Apr. 25, 1919, pp. 1051-1053. High ratio of actual tonnage moved to rating of engines. Heavy loading promotes fuel economy. Paper presented before Pac. Ry. Club.
Train and Engine Loading, T. H. Williams. Ry. Rev., vol. 64, no. 14, Apr. 5, 1919, pp. 507-508. Discussion of subject in regard to means for keeping up practice of loading engines up to full rating and losses accruing when such practice is not followed closely.

PERMANENT WAY AND BUILDINGS

Curvature. Effect of Curvature on Railway Maintenance of Way. Eng. & Contracting, vol. 51, no. 16, Apr. 16, 1919, p. 397, 1 fig. Graph indicating relation between wear of rail on straight line as compared with that on curves.

Slip. The Slip at Wembley Cutting, Great Central Railway. Ry. Gaz., vol. 30, no. 12, Mar. 21, 1919, pp. 528-534, 17 figs. Measures for reconstructing embankment and restoring traffic through cutting. Slip occurred in portion of cutting where maximum depth is about 60 ft.

Ties. Zinc Chloride Treatment for Railroad Ties. Eng. & Contracting, vol. 51, no. 16, Apr. 16, 1919, pp. 394-395. Influence of conditions of wood before treatment; leaching of zinc salt. From report of Committee on Wood Preservation of Am. Ry. Eng. Assn.
The Preservation of Railway Ties, H. K. Wicksteed. Can. Ry. & Mar. World, no. 254, Apr. 1919, pp. 174-176. Process based on coating to exlcude moisture.

Track Reclamation. The Reclamation of Electric Railway Track by Welding and Grinding, H. Jackson Tippett. Elec. Ry. Jl., vol. 53, no. 16, Apr. 19, 1919, pp. 773-776, 9 figs. Adaptability of various types of welding and grinding equipment to prevent rapid deterioration of rail joints, particularly of those in paved streets. Paper read before Conn. Soc. Civil Engrs.

Tunnel, Mount Royal. The Mount Royal Tunnel, J. L. Busfield. Jl. Eng. Inst. of Canada, vol. 2, no. 4, Apr. 1919, pp. 267-298, 40 figs. Construction of tunnel and terminal for Canadian railway at Montreal; tunnel is 16,315 ft. long and its construction required the excavation of 422,358 cu. yd. of rock.

RAILS

Stresses in Rails. Stresses in Rails (Détermination des efforts développés dans le métal des rails des voies ferrées), T. Godard and M. Pigeaud. Annales des Ponts et Chaussées, partie techinque, vol. 47, no. 6, Nov.-Dec. 1918, pp. 273-327, 8 figs. Formulæ for determining stresses due to supports not being on same level. Expressions are applicable when loads acting are or may be considered as static. A criticism is offered on Cuard's conclusions in this direction.

ROLLING STOCK

Coal-Hopper Cars. Broad Gauge Steel Coal Hopper Cars Built in Canada for Bengal-Nagpur Railway. Can. Ry. & Mar. World, no. 254, Apr. 1919, pp. 169-170. Some of general dimensions are: Length over buffers, 41 ft. 3 in.; length over end sill, 37 ft. 1 in.; length of body inside, 35 ft.; capacity, 100,000 lb.

Concrete Gondola Cars. Reinforced Concrete Gondola Cars. Eng. World, vol. 14, no. 7, Apr. 1, 1919, pp. 45-46, 2 figs. Design in accordance with U. S. R. R. Administration standards as a 100,000-lb. capacity coal car, plus 10 per cent for overload. Also in Ry. Mech. Engr., vol. 93, no. 4, Apr. 1919, pp. 193-195, 3 figs.

Frame Brake for Cars. Automatically Returning Frame Brake for Railroad Cars (Châssis-frein à retour automatique pour l'arrêt des wagons). Génie Civil, vol. 74, no. 13, Mar. 29, 1919, p. 257, 4 figs. Inclined girders cause car to move up inclined plane to horizontal rails where wheels are locked; motion of car drags frame; when car is moved in opposite direction it drags frame to starting place where buffer stop fastens frame; traction effort releases car.

Lumber for Freight Cars. Treated Lumber for Freight Cars. Ry. Mech. Engr., vol. 93, no. 4, Apr. 1919, pp. 198-200. Method of treating wooden parts of car construction.

SAFETY AND SIGNALING SYSTEMS

Automatic Train Control. Automatic Train Control on the Chesapeake & Ohio R.R. Ry. Rev., vol. 64, no. 14, Apr. 5, 1919, pp. 541-546, 9 figs. System installed is that of Am. Train Control Co. of Baltimore. Description of system and account of tests performed. Also in Ry. Signal Engr., vol. 12, no. 4, Apr. 1919, pp. 131-134, 7 figs.

Signal Failure. I. C. C. Report on the Collision on the Frisco. Ry. Signal Engr., vol. 12, no. 4, Apr. 1919, pp. 126-129, 4 figs. Accident reported to have been caused by dispatcher failing to transmit train order and engineman to obey signal indication.

Specifications. Specification for Electric Motor, Switch Operating and Locking Mechanism. Ry. Signal Engr., vol. 12, no. 4, Apr. 1919, p. 113. Concerns operating requirements, general design, dielectric tests, bearings and paint. Prepared by Committee of Am. R. R. Assn.
Specifications for Power Interlocking Machine. Ry. Signal Engr., vol. 12, no. 4, Apr. 1919, pp. 114-115. Prepared by Committee of Am. R. R. Assn.

SHOPS

Columbus Roundhouse. A Complete Modern Engine Terminal Installation. Ry. Age, vol. 66, no. 16, Apr. 18, 1919, pp. 994-997, 8 figs. Reinforced-concrete 20-stall roundhouse of Toledo & Ohio Central at Columbus.

Re-Boilering of Locomotives. The Re-Boilering of Locomotives. Ry. Gaz., vol. 30, no. 13, Mar. 28, 1919, pp. 575-576, 2 figs. Work done in shops of London & N. W. R.R.

Torrance Shops. New Car Shops at Torrance, Clifford A. Elliot. Elec. Traction, vol. 15, no. 4, Apr. 15, 1919, pp. 234-238, 3 figs. For the repairing and overhauling of equipment and the building of box cars.

Welding. Oxy-Acetylene Welding in Railroad Shops, W. L. Bean. Ry. Jl., vol. 25, no. 5, May 1919, pp. 21-23. Concerning ease and efficiency of operation. Also in Ry. Rev., vol. 64, no. 14, Apr. 5, 1919, pp. 513-515.
Spot Welding Applied to Railroad Tinware. Ry. Elec. Engr., vol. 10, no. 4, Apr. 1919, pp. 127-128, 3 figs. Process followed by Illinois Central.

SPECIAL LINES

Rack Railways. Rack Railways (Ferrocarriles de cremallera), Fabio Gonzalez Tavera. Anales de Ingenieria, vol. 26, nos. 309 and 310, Dec. 1918 and Jan. 1919, pp. 137-147. Weigh of locomotive in terms of total weight of train to be pulled up a given slope. Riggenbach, Bissinger, Abt. Strub, and Locher types of rack.

STREET RAILWAYS

Concrete Stations. Shelters and Stations on Pacific Electric's Interurban Lines, Clifford A. Elliott. Elec. Ry. Jl., vol. 53, no. 15, Apr. 12, 1919, pp. 733-734, 5 figs. Unit-slab concrete structure.

Subway Stations. Philadelphia City Hall Subway Station, Harry Gardiner. Eng. World, vol. 14, no. 7, Apr. 1, 1919, pp. 15-22, 12 figs. Details of supports showing series of I-beams, girders and concrete construction.

ZONE FARES. Zone Tickets Adopted for Portland. Elec. Ry. Jl., vol. 53, no. 15, Apr. 12, 1919, pp. 728-731, 2 figs. Fare system is based on central zone from 2.5 to 4 miles in radius and sub-division of all exterior lines into zones of varying length.

The Zone Fare in Practice—Aberdeen, Walter Jackson. Elec. Ry. Jl., vol. 53, no. 17, Apr. 26, 1919, pp. 814-822, 17 figs. Combination zone and universal fare in city of 165,000 is claimed to stimulate both short-haul and long-haul riding.

TERMINALS

CHICAGO. The Chicago Railway Terminals, E. J. Noonan Eng. World, vol. 14, no. 7, Apr. 1, 1910, pp. 29-35, 4 figs. Report of Chicago Railway Terminal Commission, and work of commission on yards and terminals of Am. Ry. Assn. Problem of transportation in Chicago is presented with illustrations of amount of work it involves.

SAN FRANCISCO. Railway Terminal Improvements on the San Francisco Water Front Charles W. Geiger, Ry. Rev., vol. 64, no. 16, Apr. 19, 1919, pp. 571-576, 9 figs. Spur track connections from piers to state-owned belt line behind water-front.

SEWELL'S POINT VIRGINIAN RAILWAY. The Virginian Ry. Co.'s Pier, Sewell's Point —I. Coal Trade Jl., vol. 50, no. 16 and 17, Apr. 16 and 23, 1919, pp. 404-406, 445-447, 7 figs. Plant includes double car dumper capable of handling two 60-ton railroad cars at the same time, completing cycle in 2 min. Apr. 23: Coal from the mines is dumped into self-cleaning and self-propelling transfer cars of 120 tons capacity for dumping, cars are raised to required level by transfer-car elevator.

ZURICH (SWITZERLAND). Enlargement of the Chief Railway Station at Zürich (Die Erweiterung des Hauptbahnhofes Zürich). Schweizerische Bauzeitung, vol. 72, nos. 22 and 23 and vol. 73, nos. 1 and 8:Nov. 30, Dec. 7, 1918, and Jan. 4.-Feb. 22, 1919, pp. 216-218, 223-225, 5-6 and 77-80, 24 figs. Discusses advantages and disadvantages of various proposals for arranging lines of railways converging on Zürich, some showing it as terminus and others as a through station. (To be continued.)

INDUSTRIAL TECHNOLOGY

ACETYLENE PRODUCTS. Principal Organic Compounds Derived from (Les principaux composés organiques dérivés de l'acetylène), D. Florentin. Génie Civil, vol. 74, no. 12, Mar. 22, 1919, pp. 235-236. Industrial synthesis of alcohol, acetic acid, acetic anhydride and the acetic ethers. (Concluded.)

AMMONIUM NITRATE. Effecting and Controlling Crystallization of Ammonium Nitrate. J. Esten Bolling. Chem. & Metallurgical Eng., vol. 20, no. 8, Apr. 15, 1919, pp. 401-405, 9 figs. Crystallizing process employed at U. S. Ammonium Nitrate Plant. Survey of air conditioning features involved and their relation to entire process of refrigeration.

AMMONIUM SULPHATE. Manufacture of Ammonium Sulphate from Cyanamide (La fabrication du sulfate d'ammoniaque en partant de la cyanamide). Journal du Four Electrique, vol. 28, no. 6, Mar. 15, 1919, pp. 44-46. Cyanamide is decomposed by water under pressure; the ammonia gas is then brought in contact with dilute sulphuric acid.

BENZOL. Manufacture of Benzol in Sestao Iron Works (Fabricaion de benzol en la fabrica de Hierro de Sestao). Revista Minera, vol. 70, no. 2678, Mar. 1, 1919, pp. 105-107. Process followed, with remarks on adaptation of installation to coke furnaces.

BY-PRODUCTS. Importance of By-Products During the War, C. G. Atwater. Gas Age, vol. 43, no. 7, Apr. 1, 1919, pp. 339-343, 5 figs. Light oil stills and accessory plant of Barrett Co.

COAL BY-PRODUCTS. Coal: Its Value as a Raw Material for Distillation Products—II, J. A. Wilkinson. South African Jl. Industries, vol. 2, nos. 1 and 2, Jan. and Feb. 1919, pp. 74-85 and 178-185. Liquid distillation products of coal and processes by which they are obtained. Feb. Distillation of coal tar, oils and pitch.

Coal and Gas-Tar Derivatives of Growing Importance, C. W. Botkin. Colorado School of Mines, Mag. vol. 9, no. 4, Apr. 1919, pp. 78-80, 3 figs. Chart indicating from whence these materials are derived, with description of their nature, properties and method of manufacture.

Carbonizing Processes and Coal Utilization and Conservation, W. A. Bone. Gas Journal, vol. 145, no. 2915, Mar. 25, 1919, pp. 632-635. Uses of coal in the United Kingdom in 1913. Works in which writer believes complete by-products recovery is possible; commercial prospects for low temperature carbonization. Address delivered before Roy. Soc. of Arts.

COATED PAPER. Casin and Coating Mixtures, E. Sutermeister. Paper, vol. 24, no. 7, Apr. 23, 1919, pp. 15-80 & 50. Suggestions for overcoming brush marks and froth pits in manufacture of coated paper.

DECOLORIZING CARBONS. Investigations on Vegetable Decolorizing Carbons, using "Carboraffin"—VI, Stanek. Int. Sugar Jl., vol. 21, no. 244, Apr. 1919, pp. 168-171, 1 fig. Preparation of vegetable carbons from cellulose according to Austrian patent and their use in sugar refineries. "Carboraffin" is said to be so powerful that its effect equals that obtained with 8-15 per cent of annual charcoal. From Tijdschrift der Vereeniging van Beetwortelsuikkerfabrikantem, no. 8, 1919, pp. 116-122.

ETHYLENE. Ethylene, William Malisoff and Gustav Egloff. Jl. Phys. Chem., vol. 23, no. 2, Feb. 1919, pp. 65-138. Collection of data on ethylene, covering physical and chemical properties; formation in chemical reactions by decomposition; decomposition; catalysis; analytical and biological data; research possibilities.

FRANCE. France's Chemical Industries as they are, Camille Matignon. Chem. Engr., vol. 27, no. 3, Mar. 1919, pp. 55-58. France is said to be fully equipped with series of chemical industries competent to supply the most of the republic's chemical needs.

FULMINATE MERCURY. Determination of Impurities in Fulminate of Mercury (Recherches sur le fulminate de mercure et quelques-unes de ses impuretés). Paul Nicolardot and Jean Boudet. Bul. Société Chimique de France, vols. 25-26, no. 3, Mar. 1919, pp. 119-122. Result of utilizing sodium hyposulphite in treatment of residues in manufacture of fulminate.

GALLIUM. The Purification of Gallium by Electrolysis, and the Compressibility and Density of Gallium. Theodore W. Richards and Sylvester Rover. Jl. Am. Chem. Soc., vol. 41, no. 2, Feb. 1919, pp. 133-134. Examination of methods recommended by various writers.

GAS MANUFACTURE. Low-Temperature Carbonization in Relation to the Production of Motor Spirit, Fuel Oils, Smokeless Fuel and Power Gas, F. D. Marshall. Iron & Coal Trades Rev., vol. 98, no. 2661, Feb. 28, 1919, pp. 251-254, 5 figs. Diagram showing heat losses per lb. of coal and low-temperature fuel, also products obtainable by low-temperature system of carbonization and gasification of smokeless fuel; example of results obtained by low-temperature carbonizing at under 1,200 deg. fahr.; installation of Tozer retorts.

GLASS. Optical Glass. Nature, vol. 103, no. 2578, Mar. 27, 1919, pp. 65-67, 3 figs. Developments in manufacture of homogeneous glass, particularly during time of war.

The Technique of Optical Glass Melting, Clarence N. Founer. Jl. Am. Ceramic Soc., vol. 2, no. 2, Feb. 1919, pp. 102-145, 7 figs. Activities of Geophysical Laboratory in its work of co-operation with manufacturers of optical glass.

An Improved Method of Optical Glass Manufacture, George W. Morey. Jl. Am. Ceramic Soc., vol. 2, Feb. 1919, pp. 146-150. Modification of filling operation to prevent surface becoming high in silica.

LIGHT, ULTRA-VIOLET. Ultra-Violet Light in the Chemical Arts—XXIII, Carleton Ellis and A. A. Wells, Chem. Engr., vol. 27, no. 3, Mar. 1919, pp. 73-74. Further conclusions regarding absorption spectra of some of primary alcohols, and of confectionery colors and dyes.

LIGHT OILS. What Can Be Done with Light Oil Plants, W. H. Fulweller. Gas Age, vol. 43, no. 8, Apr. 15, 1919, pp. 415-417, 1 fig. Fifty plants for recovery of tolulene from illuminating gas were built during war. Article discusses possibility of utilizing these plants for recovery of light oils from illuminating gas in competition with gasoline for motor fuel. Paper read before Am. Gas. Assn.

NITRIC ACID. The Theory of Absorption Towers for Nitric Acid Manufacture, J. R. Partington and L. H. Parker. Jl. Soc. Chem. Indus., vol. 38, no. 6, Mar. 31, 1919, pp. 75T-80T, 2 figs. Efficiency of a tower system said to depend on two factors, rapidity and completeness of absorption and concentration of solution produced.

NITROGEN PRODUCTS. How the Nitrogen Problem Has Been Solved, Henry Jermain Maude Creighton. Jl. Franklin Inst., vol. 187, no. 4, Apr. 1919, pp. 377-408, 14 figs. Five methods: Direct oxidation of nitrogen to its oxides with subsequent formation of nitric acid or nitrates, as exemplified in the arc process: direct combination of nitrogen with hydrogen to form ammonia,as typified by the Haber process; absorption of nitrogen by metals in form of nitrides (Sernek process); conversion of nitrogen into cyanides (Bucher process). (To be concluded.)

Oxidation of Nitrogen Bioxide by Dry Air (Sur l'oxydation du bioxyde d'azote par l'air sec), André Sanfourschc. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 6, Feb. 10, 1919, pp. 307-310. Measurement of influence of temperature on speed of oxidation. Temperature was varied from 50 to 525 deg. cent.

PITCH. The Softening Point of Pitch, Percy E. Spielmann and G. Campbell. Petrie Jl. Soc. Chem. Indus., vol. 38, no. 6, Mar. 31, 1919, pp. 68T-70T. 2 figs. Attempt to characterize it by numerical value. Recourse was had to biting test, change of appearance, twisting test, bending and sagging dropping tests.

RUBBER. Effect of Certain Accelerators upon the Properties of Vulcanized Rubber, G. D. Kratz and A. H. Flower. Chem. & Metallurgical Eng., vol. 20, no. 8, Apr. 15, 1919, pp. 417-420, 2 figs. Experimental data on activity of certain organic and inorganic accelerators. It is asserted that magnesia in small amount is less active than certain organic accelerators, and does not impart to mixtures physical improvement characteristic of latter.

RUBBER, SYNTHETIC. Development of Artificial Rubber During the War (Die Entwicklung des Künstlichen Gummis im Kriege), Dr. Duisberg. Kunststoffe, vol. 8, no. 11, June 1, 1918, pp. 121-122. The carbide process: Acetylene obtained from calcium carbide and water is changed into acetaldehyde and this is oxidized into acetic acid; this latter, when blown over a contact substance, yields acetone, carbonic acid being split off during the process.

SALT. The Recovery of Salt from Sea-Water, F. H. Mason. Min. & Sci. Press, vol. 118, no. 16, Apr. 19, 1919, pp. 528-530, 1 figs. Process followed by Western Salt Co. at San Diego, Cal.

SAMPLING (PULP). Sampling Practice at Independence Mill, Claude T. Rice. Eng. & Min. Jl., vol. 107, no. 15, Apr. 12, 1919, pp. 641-644, 6 figs. Some of features are mechanical bucking apparatus and sample mixer and divider, both of which devices are said to have proven satisfactory for final handling of pulp.

SELENIUM. Selenium and Its Present Uses (Le Sélénium et ses applications actuelles), Louis Ancel. Chimie & Industrie, vol. 2, no. 3, Mar. 1, 1919, pp. 245-259, 14 figs. Occurrences and properties of selenium in various allotropic states; its utilization in biological chemistry, glass and caoutchouc industries, electrical apparatus and electrochemistry.

SILICON TETRACHLORIDE. Silicon Tetrachloride, Otis Hutchins. General Meeting Am. electrochemical Soc., Apr. 3-5, 1919, paper no. 18, pp. 245-256. Experimental work undertaken by electrochemical plant in developing commercial process for preparing silicon tetrachloride.

The Role Played by Silicon and Titanium Tetrachlorides During the Past War, G. A. Richter. General meeting Am. Electrochemical Soc., Apr. 3-5, 1919, paper no. 13, pp. 187-195. Physical properties of these chlorides and study of their reaction with moisture, or with ammonia gas, or with both to produce smoke clouds; ship apparatus and trench apparatus used for producing smoke clouds.

Sugar. The Loss of Moisture from Sugar Samples Under Different Methods of Preservation, C. A. Browne and G. H. Hardin. La. Planter & Sugar Mfr., vol. 62, no. 15, Apr. 12, 1919, no. 233-234 Table of changes in moisture and polarization of sugar samples in unsealed tin cans; compiled from data obtained in N. T. Sugar Trade Laboratory. Paper before Am. Chem. Soc.

Sulphuric Acid. The Sulphuric Acid Industry, M. Rindl. South African Jl. Industries, vol. 2, no. 2, Feb. 1919, pp. 125-134. Production, uses, grades, prices, manufacture in Union of South Africa.

Erection of Hugh Sulphuric, Nitric, Mixed Acid and Denitrating Plant under War Pressure, H. E. and C. E. Hollister. Chem. & Metallurgical Eng., vol. 20, no. 8, Apr. 15, 1919, pp. 406-412, 11 figs. Construction of one of the largest acid plants in the country, under adverse climatic conditions and insufficient transportation facilities.

Tanning Materials. Notes on Australian Tanning Materials and the Manufacture of Sole-Leather, F. A. Coombs. Jl. Soc., Chem. Indus., vol. 38, no. 6, Mar. 31, 1919, pp. 70T-74T. Comparative tests conducted at Sydney Technical College to ascertain value of tannins in barks of E sideraphloia.

Tar Distillation. Tar Distilleries (Les distilleries de goudron), W. Solton. Journal des Usines à Gaz, vol. 43, no. 7, Apr. 5, 1919, pp. 97-104. 13 figs. Machines and process of distillation followed by Sulzer Frères of Winterthur. From Bulletin Technique de la Suisse Romande, no. 16, Aug. 11, 1917.

Water Gas. Bituminous Generator Fuel, R. G. Krumrey. Gas Rec., vol. 15, no. 7, Apr. 9, 1919, pp. 217-220, 1 fig. Comparison of operating data and results for coke and coal as generator fuel in a water-gas machine. Paper read at Wis. Gas Convention.

MARINE ENGINEERING

AUXILIARY MACHINERY

Compasses. The Gyroscopic Compass, Pac. Mar. Rev., vol. 16, no. 4, Apr. 1919, pp. 105-106, 1 fig. Sperry gyroscopic compass equipment for merchant vessels.

SHIPS

Concrete Ships. Economic Size of Concrete Ships, E. O. Williams. Eng. & Contracting, vol. 51, no. 18, Apr. 30, 1919, pp. 463-465, 1 fig. Curves showing various comparisons between concrete ships and steel.

Diesel Engine. Diesel Engine or Steam Engine, Shipbuilding & Shipping Rec., vol. 13, no. 13, Mar. 27, 1919, pp. 381-382. Discussion of relative economies in marine-engine practice.

Electric Propulsion. Electric Propulsion as Developed on Battleship New Mexico. Elec. Rev., vol. 74, no. 15, Apr. 12, 1919, pp. 579-584, 6 figs. Electrical features of propelling equipment, specially the two turbine-generators and four induction motors direct-connected to propellers.

Electrical Propulsion of Ships, J. F. Nielson, Elecn., vol. 82, no. 15, Apr. 11, 1919, pp. 432-437. Electrical transmission gears compared with mechanical gears. Emphasis is laid upon greater immunity from total breakdown possessed by electrical method, due to possibility of utilizing a plurality of motor and generator units.

Electric Drive of the U. S. S. New Mexico, Elec. World, vol. 73, no. 16, Apr. 19, 1919, pp. 780-783, 5 figs. Machinery is divided into two parts and ship is said to be able to make 17 knots with half of machinery disabled.

Electrical Equipment. Generating Machinery for Merchant Ships, F. P. Fenton. Elecn., vol. 82, no. 15, Apr. 11, 1919, pp. 451-453, 4 figs. Considered in various aspects, such as pressure of supply and type of current, character of primer mover and generator, type of coupling, position of plant in the ship and requirements of various classes of vessels.

Electric Light and Power Circuits on Board Ship, O. H. Kennedy, Elecn., vol. 82, no. 15, Apr. 11, 1919, pp. 438-443, 8 figs. Diagrams showing system and methods of control.

Propellers. Experimental Research of the Turning Action of a Propeller in a Ship Richerche sperimentali interno all azione evolutiva esercitata dalle eliche). N. Pecoraro. Revista Maritima, vol. 52, no. 2, Feb. 1919, pp. 175-192, 3 figs. Formula for angle to which rudder has to be inclined in order for the ship to maintain a straight course when only one propeller is operated; experimental confirmation of theoretical results.

Graphic Solution of Propeller Formulae, J. S. Redshaw. Shipbuilding & Shipping Rec., vol. 13, no. 15, Apr. 10, 1919, pp. 436-437, 2 figs. Charts for determining diameters for three-bladed propellers by solution of Taylor's formula and Taylor's *p* value.

Smokebox Locks. "Sturdun" Patent Smokebox Locks. Steamship, vol. 30, no. 358, Apr. 1919, pp. 234-235, 2 figs. Invention devised for locking smokebox door.

Standardized Ships. The "Standardized" Ship Schenectady. Am. Mar. Engr., vol. 14, no. 4, Apr. 1919, pp. 5-7, 3 figs. Vessel is designed for deadweight capacity of 7500 tons, total displacement loaded being estimated at 11,200 tons.

Typical U. S. Turbine Driven Carrier. Shipping, vol. 7, no. 4. Apr. 26, 1919, pp. 15-16 and 18, 4 figs. Mechanical equipment of geared-turbine-driven ship "Schenectady."

TERMINALS

Canadian Terminals. The Canadian Government's Ocean Terminals. Mar. Eng. of Canada, vol. 9, no. 3, Mar. 1919, pp. 112-114, 4 figs. Progress on project involving expenditure of $30,000,000.

Charleston. *See Wood Construction below*

Coaling. Coaling Ships Mechanically—I, Wilbur M. Stone. Coal Trade Jl., vol. 50, no. 18, Apr. 30, 1919, pp. 479-483, 5 figs. Mitchener coaling apparatus. Elevator automatically frees itself in case of overload without interrupting operations.

Electrical Equipment. Electrical Service at Great Seaboard Terminal. Elec. World, vol. 73, no. 16, Apr. 19, 1919, pp. 784-787, 4 figs. Electrical agencies include elevators, cranes and industrial tractors and trailers.

Elevators. Concrete Shipside Elevator and Warehouse. Concrete Age, vol. 29, no. 6, Mar. 1919, pp. 10-11, 3 figs. Dimensions and operating equipment.

Mechanical Equipment. The Port of Seattle, G. F. Nicholson. Eng. World, vol. 14, no. 8, Apr. 15, 1919, pp. 11-14, 3 figs. Mechanical equipment for handling miscellaneous freight.

New Orleans. New Orleans Army Base Improves Facilities of the Port, George H. Davis. Eng. News-Rec., vol. 82, no. 17, Apr. 24, 1919, pp. 823-826, 5 figs. Three concrete warehouses tied to 2000-ft. wharfhouse on river by bridges permitting access to all floors.

St. John, N.B. Wooden Shipbuilding Activities at St. John, N.B. Mar. Eng. of Canada, vol. 9, no. 3, Mar. 1919, pp. 110-111. Description of harbor and port.

San Francisco. Port Facilities and Freight Handling. Jl. Electricity, vol. 42, no. 7, Apr. 1, 1919, pp. 294-297, 5 figs. Plans for the improvement of San Francisco Harbor through the adoption of mechanical freight-handling devices.

Seattle. *See Mechanical Equipment above.*

Wood Construction. Wood Construction Feature of Charleston Port Terminal, Hunley Abbott. Eng, News-Rec., vol. 82, no. 15, Apr. 10, 1919, pp. 702-706, 6 figs. Particulars of quartermaster depot for storage and shipment of materials.

YARDS

Castings. Castings Used in Ship Construction, Ben Shaw and James Edgar. Foundry Trade Jl., vol. 21, no. 207, Mar. 1919, pp. 151-156, 17 figs. Preparation of molds for stem pieces.

Concrete Car Floats. Hudson River Shipyard Layout to Build Concrete Car Floats, H. W. Eldridge. Eng. News-Rec., vol. 82, no. 15, Apr. 10, 1919, pp. 732-734, 5 figs. Concrete placed for 1600-ton vessels from stiff-leg chute tower.

Cranes. Modern Shipyard Cranes, Claude M. Toplis. Elecn., vol. 82, no. 15, Apr. 11, 1919, pp. 408-412, 4 figs. Comparison of crane systems; double cantilever crane running on high gantry, overhead bridge traveling crane, jib crane running on high gantry and tower crane system.

Davey Plant at Lauzon, Can. The Davey Shipbuilding Plant at Lauzon. Mar. Eng. of Canada, vol. 9, no. 3, Mar. 1919, pp. 105-107, 6 figs. Installation for building wooden steamers, steel trawlers and large steel steamers.

Electrical Equipment. Electrical Equipment of a Modern Shipyard, A. Henderson. Elecn., vol. 82, no. 15, Apr. 11, 1919, pp. 400-407, 14 figs. Central station containing four 450-kw. Westinghouse rotary converters, which convert the 3300-volt, 3-phase, 50-cycle supply to 240 volts continuous current for distribution through out works.

Ford Method Ford Methods in Ship Manufacture—V. Fred E. Rogers. Indus. Management, vol. 57, no. 5, May, 1919, pp. 367-372, 12 figs. Electric rivet heating and welding, flame cutting and boring propeller-shaft bearings.

Ford Shipbuilding Plant, River Rouge, Mich. Am. Architect, vol. 115, no. 2259, Apr. 9, 1919, pp. 526-529, 9 figs. Operation in assembled shop. Boats are assembled on a line of trucks moving on standard-gage railroad tracks.

Framing, Millar System. SS. "Clan MacWilliam." Shipbuilding & Shipping Rec., vol. 13, no. 13, Mar. 27, 1919, pp. 375-376, 3 figs. Construction on Millar's patent system of framing. Deadweight 10,250 tons, on 26 ft. 10½ in. draft.

German Shipbuilding. German Shipbuilding and the Revolution. Shipbuilding & Shipping Rec., vol. 13, no. 13, Mar. 27, 1919, pp. 373-374. Competition with foreign yards deemed impossible.

Halifax Shipyards. Halifax Shipyards Embraces Old and New Industry. Mar. Eng. of Canada, vol. 9, no. 3, Mar. 1919, pp. 97-99, 3 figs. Plant equipped with graving dock and deep-water wharf, also marine railway.

Vickers, Canadian Plant. Canadian Vickers have Well-Equipped Plant. Mar. Eng. of Canada, vol. 9, no. 3, Mar. 1919, pp. 89-93, 5 figs. Growth of shipbuilding industry on banks of St. Lawrence.

Welding. Electric Welding as Applied to Ship Construction, H. Jasper Cox. Mech. Eng., vol. 41, no. 5, May 1919, pp. 439-444, 11 figs. Variables which affect efficiency of weld. Investigations to determine possibility of application of electric welding to shipbuilding. General scope of experiments included principally determination of modulus of elasticity and approximate elastic limit; ultimate strength and ultimate elongation; application of alternating stresses with (a) rotating specimens, (b) stationary test pieces. Paper presented before Soc. Naval Architects and Mar. Engrs.

Electric Welding Applied to Shipbuilding, J. H. Collie. Elecn., vol. 82, no. 15, Apr. 11, 1919, pp. 421-427, 22 figs. After reference to general systems of welding that are available, writer describes particular systems now mostly in use and then passes on to the question of testing electric welds.

Wooden Ships. Building Wooden Ships for French Government. Mar. Eng., of Canada, vol. 9, no. 3, Mar. 1919, pp. 94-96, 7 figs. General layout of Montreal plant.

MUNITIONS AND MILITARY ENGINEERING

Airdromes. American Combat Airdromes, Charles C. Loring. Architectural Rec., vol. 45, no. 4, Apr. 1919, pp. 311-324, 18 figs. Plans show characteristic irregular grouping necessary to render plants less vulnerable as targets.

BATTLESHIPS. Some Ideas About the Effects of Increasing the Size of Battleships, E. J. King. U. S. Naval Inst. Proc., vol. 45, no. 193, Mar. 1919, pp. 387-406. Argument for increasing size is based on claim that battleships of increased size can carry more fighting power, are protected for more effective resistance, have higher speed under all conditions, greater radius of action and greater cruising life.

H. M. Battle Cruisers "Repulse" and "Renown." Engineering, vol. 107, no. 2780, Apr. 11, 1919, pp. 461-464, 14 figs. High-speed cruisers armed with big guns propelled with low-pressure turbines.

CAMPS. The Army's Utilization of Camp Wastes, F. C. Bamman. Mun. Jl. & Public Works, vol. 46, no. 17, Apr. 26, 1919, pp. 304-308, 2 figs. Results of changing from incineration to utilization. (To be concluded.)

CRUISERS. New Light Cruisers and Flotilla Leaders. Engineer, vol. 127, no. 3300, Mar. 28, 1919, pp. 308-309, 3 figs. Dimensions of H. M. "Sentinel," "Blanche," "Bristol," "Nottingham," "Arethusa," and "Centaur."

GUN MOUNTS. Making Naval Gun Mounts—III, Franklin D. Jones. Machy, (N. Y.), vol. 25, no. 8, Apr. 1919, pp. 745-749, 14 figs. Fixtures for broaching, milling and drilling operations, and testing methods. (Concluded.)

GUN, PHOTOGRAPHIC. The Photographic Gun, Edgar H. Felix. Aerial Age, vol. 9, no. 4, Apr. 7, 1919, pp. 198-199, 13 figs. Mechanism of gun camera showing Geneva movement and shutter mechanism, which automatically continues to take photos as long as trigger is depressed.

GUN SIGHTS. Making Gun Sights for Anti-Aircraft Guns, Fred H. Colvin. Am. Mach., vol. 50, no. 15, Apr. 10, 1919, pp. 681-684, 10 figs. Mechanism consists primarily of a yoke attached to the recoil cyclinder which allows sight to be swung up and down on gun by means of curved rack governed by worm actuated pinion in a case.

GUNS. Making the U. S. 75-Millimeter Field Gun—II. Erik Oberg. Machy. (N Y.,) vol. 25, no. 8, Apr. 1919, pp. 716-721, 27 figs. Methods developed by Wisconsin Gun Co., Milwaukee, Wis.

America's Great Effort in Ordnance—II, Sci. Am., vol. 120, no. 17, Apr. 26, 1919, pp. 432-433 and 444 and 446, 9 figs. Features of proving ground for testing army ordnance at Aberdeen, Md.

MACHINERY, ARMY'S STOCKS. The Army's Foreign Stock of Machinery, John B. Woods. Am. Machy., vol. 50, no. 17, Apr. 24, 1919, pp. 775-777, 3 figs. Possibilities of disposing of millions of dollars worth of American machinery now in France and Belgium.

MINE PROTECTION. The Protection of Ships Against Mines—II. Engineer, vol. 127, no. 3300, Mar. 28, 1919, pp. 293-295, 5 figs. Arrangements for towing projector-type paravanes on war ships and mercantile vessels.

MINES. Floating Mines in the North Atlantic and Arctic Oceans. Sci. Am., vol. 120, no. 16, Apr. 19, 1919, pp. 394-395 and 416, 5 figs. Trend of ocean currents in relation to dangers to navigation from mines which have broken loose from their bearings. Paper read before the Académie des Sciences.

MOTOR-TRANSPORT SALVAGE PARK. M. T. C. Salvage Park in France — I & II, W. F. Bradley. Automotive Industries, vol. 40, nos. 16 & 17, Apr. 17 and 24, 1919, pp. 860-863 and 902-905, 19 figs. Reconstruction plant erected by Motor Transport Corps of U. S. army 120 miles behind front.

NAVAL CONSTRUCTION. Naval Construction During the War, Eustace Tennyson d'Eyncourt. Engineering, vol. 107, no. 2780, Apr. 11, 1919, pp. 482-400, 20 figs. Sketch and general summary of work carried out by British Admiralty. Paper read before Instn. Naval Architects.

NAVY, U. S. Our Newest Navy, David Potter, U. S. Naval Inst. Proc., vol. 45, no. 192, Feb. 1919, pp. 201-222. How its cost is being determined.

PROJECTORS. Projectors—British and German, Byron C. Goss. Nat. Service & Internat. Military Digest, vol. 5, no. 5, May 1919, pp. 276-280, 4 figs. Feature of design and construction.

RAILROAD TRANSPORTATION. Modern Armie and Modern Transport. Ry. Gaz., vol. 30, no. 14, Apr. 4, 1919, pp. 601-602. Work of North-Eastern Railway Co. during the war.

ROADS. Military Roads as Constructed and Projected by the Construction Division, War Department, U. S. A., in 1918, Daniel B. Goodsell. Mun. & County Eng., vol. 56, no. 4, Apr. 1919, pp. 140-142, 10 figs. Typical cross-sections of cement concrete and bituminous pavements?

SUBMARINE DETECTORS. The Wonderful Submarine Detector, Brewster S. Beach. Am. Mar. Eng., vol. 14, no. 4, Apr. 1919, pp. 8-14. Effort made by American scientists to perfect instrument for locating submarines while in a submerged condition.

Listening Devices in U-Boat War. Telephony, vol. 76, no. 15, Apr. 12, 1919, pp. 23 and 26-27. Development of submarine detector by research laboratory experts of General Electric Co.

SUPPLY BASES. Yard Tracks for Brooklyn Army Supply Base. Ry. Rev., vol. 64, no. 17, Apr. 26, 1919, pp. 609-611, 1 fig. Terminal arrangements and water-front development.

AERONAUTICS

AIRCRAFT

AIRSHIP DEVELOPMENTS. The Case for the Airship, Ladislas d'Orcy, Jl. So. Automotive Engrs., vol. 4, no. 4, Apr. 1919, pp. 303-307, 10 figs. Progress made since 1914.

The Development of Airship Construction, C. I. R. Campbell. Engineering, vol. 107, no. 2780, Apr. 11, 1919, pp. 469-472, 3 figs. General particulars of non-rigid, semi-rigid and rigid airships. Paper read before Instn. Naval Architects.

BALLOONING. Free Ballooning, a Notable Factor in the Royal Air Force, Lance Rushbrooke. Flight, vol. 11, no. 13, Mar. 27, 1919, pp. 394-396, 7 figs. Use of free balloons in reconnaissance, transmission of messages, photography and other military purposes.

COMMERCIAL USE. The Commercial Use of Airships. Nature, vol. 103, no. 2575, Mar. 6, 1919, pp. 4-5. Discusses possibilities of use of airships in immediate future, and compares between large airplane and rigid airship.

DESIGN. Lighter-than-Air Craft, T. R. Cave-Browne-Cave. Flight, vol. 11, no. 13, Mar. 27, 1919, pp. 410-416, 1 fig. Matters which influence lift and behavior of airship. Paper read before Roy. Aeronautical Soc.

Aerial Greyhounds of To-Morrow. Sci. Am., vol. 120, no. 16, Apr. 19, 1919, pp. 400-401 and 418, 3 figs. Constructural features of airships for future transatlantic service.

HELIUM. The Use of Helium for Aircraft Purposes. Nature, vol. 102, no. 2573, Feb. 20, 1919, pp. 487-488. On increasing buoyancy of airship by heating gas electrically or otherwise.

TRANSPORT SERVICE. The Posssibilities of Airship Transport Service. Flight, vol. 11, no. 8, Feb. 20, 1919, pp. 230-232, 1 fig. Estimated cost of running Atlantic airship service, London-New York; financial and working arrangements and Government subsidy; general specifications of a proposed airship for transport service. (Continuation of serial.)

APPLICATIONS

BUENOS AIRES-PERNAMBUCO SERVICE. The Buenos Aires-Pernambuco Aerial Service (El servicio aéro Buenos Aires-Pernambuco). La Ingenieria, vol. 23, no. 6, Mar. 16, 1919, pp. 389-398, 5 figs. Project contemplates making total distance of 2700 miles in 38¼ hr. actual flying time. Handley Page, Rolls-Royce and Sunbeam machines will be used.

LANDINGS, MARKING. The Future of the Airplanes in Business, C. B. Merrick. Jl. Electricity, vol. 42, no. 7, pp. 309-310, 3 figs. Marking landing places and guide posts by electricity.

REGULATIONS. Regulations for Air Navigation. Automotive Industries, vol. 40, no. 15, Apr. 10, 1919, pp. 782-785. Project of Int. Convention regarding air navigation.

DESIGN

LANDING. Commercial Feature of Airplanes from an Engineer's Standpoint, G. H. Day. Jl. Soc. Automotive Engrs., vol. 4, no. 4, Apr. 1919, pp. 290-292. Sees as most important development of future that which will enable aeroplanes to land in small field, this to be obtained without too great a sacrifice of high speed.

TYPES, CHARACTERISTIC. Airplane and Seaplane Engineering, H. C. Richardson. Jl. Soc. Automotive Engrs., vol. 4, no. 4, Apr. 1919, pp. 273-285, 12 figs. Characteristics of types devolved and discussion of factors affecting their performance.

DYNAMICS

CURVILINEAR FLIGHT. The Aeroplane in Curvilinear Flight. Aeronautical Jl., vol. 23, no. 97, Jan. 1919, pp. 23-24. Expressions for determining approximately the relation between B and other quantities. From Schweiz. Aero Club Bul. nos. 8 and 9.

STRESSES IN LANDING GEAR. A Theoretical Investigation into the Stresses Arising in the Landing Gear of an Aeroplane, H. H. Thomas. Flight, vol. 11, no. 15, Apr. 10, 1919, pp. 483-484. In relation to probability of machine landing automatically.

TESTS ON MODELS. From Model to Full Scale in Aeronautics, H. Levy. Aeronautics, vol. 16, no. 284, Mar. 27, 1919, pp. 248-352. Technical analysis of following problem: Flying machine or part of one is in motion through the air with a given speed in the region of normal speed of flight; is there a corresponding experiment on a model from which the forces originated on the full scale may be deduced?

ENGINES

A. B. C. The British A. B. C. Aero Engines. Aerial Age, vol. 9, no. 7, Apr. 28, 1919, p. 335, 4 figs. Outstanding feature of these models is copper coating on cooling fins.

BASSE-SELVE. The 270 H. P. Basse-Selve Aero-Engine. Engineer, vol. 127, no. 3298, Mar. 14, 1919, pp. 246-248, 11 figs. also Aerial Age, vol. 9, no. 5, Apr. 14, 1919, pp. 246-248, 253-255 and 262, 26 figs. Report on design based on examination of engine taken from remains of a German Rumpler two-seater biplane shot down and destroyed in France on May 31, 1918.

BRITISH. Current Types of British Aero Engines. Aeronautics, vol. 16, no. 284, Mar. 27, 1919, pp. 329-342, 20 figs. Siddeley-Deasy (Puma) Napier-Lion, Mercury, Lucifer, Hercules, Jupiter, Hnat I, Dragon Fly, "Manitou" Sunbeam-Coatalen, Maori IV, B.R.I. and B.R.2 types.

CRANKSHAFTS. The Design of Aeroplane Engines—XXI, John Wallace. Aeronautics, vol. 16, no 282, Mar. 12, 1919, pp. 272-276, 7 figs. Points on crankshaft design; polar curve of crankpin load.

DUSENBERG. The World's Largest Airplane Engine. Gas Engine, vol. 21, no. 5, May 1919, pp. 162-164, 10 figs. Dusenberg 850-hp. 1575-lb. engine.

HALL-SCOTT. Hall-Scott Type L-6a Aero Engine. Aerial Age, vol. 9, no. 7, Apr. 28, 1919, pp. 346-347, 5 figs. Characteristics of six-cylinder, 495-lb., 200-hp. engine.

King-Bugatti. King-Bugatti 16-Cylinder Aero Engine. Automotive Industries, vol. 40, no. 17, Apr. 24, 1919, pp. 906-910, 7 figs. Consists of two 8-cyl. all-in-line engines, mounted on common crankcase and geared to common propeller shaft. Designed to permit 37-mm. cannon to shoot through hollow propeller shaft. (To be continued.)

Mercedes. 200 H.P. Compression Mercedes Engine. Flight, vol. 11, no. 8, Feb. 20, 1919, pp. 233-236, 9 figs. Report on running performance. Issued by Technical Dept. (Aircraft Production) Ministry of Munitions.

Napier Lion. The Napier Lion Aeromotor. Flight, vol. 11, no. 13, Mar. 27, 1919, pp. 397-402, 12 figs. Twelve-cylinder 450 hp. engine with record of 30,500-ft. altitude.

Siddeley. The Siddeley Aero Engines—"Puma" and "Tiger." Flight, vol. 11, no. 14, Apr. 3, 1919, pp. 429-433, 4 figs. Puma engine has 6 vertical cylinders, 145 mm. bore by 190 mm. stroke; valves are in cylinder heads and are worked by overhead camshaft; Tiger engine has two lines of 6 cylinders inclined at an angle of 60 deg.; valves are worked by two overhead camshafts. These engines were intended for use in aeroplanes making long-distance journeys into Germany.

Supercharging. Maintaining Constant Pressure Before the Carburetors of Aero Engines Regardless of the Altitude, Leslie V. Spencer. Aerial Age, vol. 9, nos. 5 and 7, Apr. 14 and 28, 1919, pp. 244-246 and 264, and pp. 336-337 and 356, 10 figs. Arrangment of Sherbondy turbo-compression as laid out for Liberty 12-cyl. engine. (To be continued.)

MODELS

Slotted Armature. Localization of the Transformation of Energy in a Slotted Armature (Localizacion de la transformacion de la energia en un inducido dentado), Konrad Simons. Boletin de la Associacion Aegentina de Electro Técnicos, vol. 4, no. 11, Nov. 1918, pp. 874-876, 1 fig. Model to demonstrate that forces of magnetic field actuate more on teeth than on conductors.

Motors. Elementary Aeronautics and Model Notes, John F. McMahon. Aerial Age, vol. 9, no. 4, Apr. 7, 1919, p. 213. Motorcycle driven aeroplane.

Elementary Aeronautics and Model Notes, John F. McMahon. Aerial Age, vol. 9, no. 5, Apr. 14, 1919, p. 259, 2 figs. Ford motor rebuilt for aeroplane work.

PLANES

Armstrong-Whitworth. The Armstrong-Whitworth Machines. Flight, vol. 11, no. 14, Apr. 3, 1919, pp. 438, 21 figs. History, development and characteristics of the various types.

Caproni. The Caproni E-3, Night Bomber. Aviation, vol. 6, no. 6, Apr. 15, 1919, pp. 322-325, 3 figs. Outline drawings.

The Caproni Triplane. Aerial Age, vol. 9, no. 5, Apr. 14, 1919, pp. 242-243, 5 figs. Specifications of type CA-4 triple-motored Caproni triplane.

Georges Levy. The Georges Levy Type R Flying Boat. Aerial Age, vol. 9, no. 6, Apr. 21, 1919, pp. 286-288, 3 figs. Directions for rigging and mounting as applied by Georges Levy Co.

Grahame-White. An Interesting Grahame-White Sporting model. Flight, vol. 11, no. 15, Apr. 10, 1919, pp. 468-473, 19 figs. Span is only 20 ft. and overall length 16 ft. 6 in. Machine, however, is said to be capable of making 102 m.p.h. at low altitudes and 93 m.p.h. at 10,000 ft. It is fitted with 80-hp. le Rhone engine.

Navy. F-5-L Navy Flying Boat—IV, S. T. Williams. Automotive Industries, vol. 40, no. 15, Apr. 10, 1919, pp. 809-811, 2 figs. Flying controls and methods of hook-up; weight and percentage of weight of every component.

The Navy HS-IL and 2L Flying Boats, Aerial Age, vol. 9, no. 7, Apr. 28, 1919, pp. 338-340 and 357, 6 figs. General dimensions and data.

TESTING

Sand Testing. Sand Testing of Aeroplanes, Albert S. Heinrich. Aerial Age, vol. 9, no. 4, Apr 7, 1919, pp. 200-202, 10 figs. Test of tail surfaces. (Continued.)

TRANSATLANTIC FLIGHT

British Machines. The Transatlantic Race. Flight, vol. 11, no. 15, Apr. 10, 1919, pp. 476-480, 5 figs. British machines intended to be used for flight.

VARIA

Flying Sickness. Flying Sickness, Martin Flack, Sci. Am. Supp, vol. 87, no. 2260, Apr. 26, 1919, p. 262. Discussion of its cause and means of combating it.

Oxygen Use. Oxygen and the Transatlantic Flight, T. S. Rippon. Flight, vol. 11, no. 13, Mar. 27, 1919, p. 403, 3 figs. Graphs showing normal pulse of aviator during flight without oxygen and when oxygen was used.

Physical Qualities of Aviators. Medical Aspects of Aviation, L. E. Stamm. Aeronautical Jl., vol. 23, no. 97, Jan. 1919, pp. 3-17. Survey of necessary physical qualities to meet special conditions of stress and strain in the air, and of the mental qualities required for aviation.

Visibility of Aeroplanes. The Visibility of Airplanes, M. Luckiesh. Jl. Franklin Inst., vol. 187, no. 4, Apr. 1919, pp. 409-457, 16 figs. Relative brightness of inland water viewed perpendicularly in terms of brightness of zenith blue sky; variation of brightness of zenith sky with altitude of measurements, on a very hazy but cloudless day; reflection factors of various substances; relation between size of image of 50-ft. object and altitude or distance; curves showing brightness of various objects from different angles of observation. (Concluded.)

Wind Charts. Wind Charts for Air Navigation (Les cartes des vents à l'usage des aéronautics), J. Rouch and L. Gain. Revue Générale des Sciences, vol. 30, no. 6, Mar. 30, 1919, pp. 168-171, 5 figs. How knowledge of wind currents may be used for shortening aerial trips in a manner similar to that in which ocean currents are taken advantage of in maritime voyages.

ELECTRICAL ENGINEERING

ELECTROCHEMISTRY

Electromotive Force of Metals. Electromotive Force of Metals (Force électromotrice des métaux), J. A. Montpellier. Industrie Electrique, vol. 28, no. 642, Mar. 25, 1919, pp. 103-104. Ionic phenomena in thermocouples and table of relative potentials of metallic elements.

Importance. Electrochemistry in its Human Relations, F. J. Tone. Chem. & Metallurgical Eng., vol. 20, no. 8, Apr. 15, 1919, pp. 413-415. Electrochemistry can contribute to human progress and raise standard of living by providing cheap fertilizer for increased crop yields, improve sanitation and produce new materials of construction.

Nelson Cell. The Nelson Electrolytic Chlorin Cell, C. F. Carrier, Jr. General Meeting Am. Electrochemical Soc., Apr. 3-5, 1919, paper no. 16, pp. 221-231, 3 figs. History, development, construction and operation of the Nelson cell, including particularly the life of its different parts, ampere efficiency and energy efficiency with which it works.

Sodium Permanganate. An Electrolytic Process for the Production of Sodium Permanganate from Ferromanganese, Robert E. Wilson and W. Grenville Horsch. General Meeting Am. Electrochemical Soc., Apr. 3-5, 1919, paper no. 15, pp. 207-220, 1 fig. Ferromanganese anodes were used in diaphragm cell in soldium carbonate solution, with production of an 8 to 12 per cent solution of sodium permanganate in anode compartment.

ELECTROPHYSICS

Conservation of Electricity. Conservation of Electricity and the Electronic Theory (La conservation de l'électricité et la théorie électronique), L. Décombe. Revue Générale de l'Electricité, vol. 5, no. 12, Mar. 22, 1919, pp. 443-444. Admitting the electric constitution of matter, various experimental researches are presented in support of theory establishing conservation of electrical moment in a dielectric by assimilation of atoms to doublets of variable moment. Paper before la Société française de Physique.

Dielectric Phenomena. Dielectric Phenomena in Dielectric Substances (in Japanese), K. Kamibayashi. Denki Gakkwai Zasshi, no. 368, Mar. 10, 1919.

Electronic Emission. The Emission of Electricity from Incandescent Bodies (l'émission d'électricité par les corps incandescents), A. Boutaric. Revue Générale des Sciences, vol. 30, no. 6, Mar. 30, 1919, pp. 171-183, 6 figs. Survey of experimental research by various investigators, notably O. W. Richardson. Theories offered in explanation electronic emission. First article.

ELECTRODEPOSITION

Copper Plating on Iron. Electro-Plating on Iron from Copper Sulphate Solution, Oliver P. Watts. Brass World, vol. 15, no. 4, Apr. 1919, pp. 108-111. Shows that certain solutions of lead and antimony may be substituted for the arsenic dip, previous to direct-current plating of copper on iron from copper sulphate. Paper read before Am. Electrochem. Soc.

Plating Room Chemicals. Plating Room Chemicals, A. Schleimer. Brass World, vol. 15, no. 4, Apr. 1919, pp. 127-129. Appearance and properties of borax, charcoal, cobalt, copper acetate, copper sulphate, copper carbonate, corrosive sublimate, liver of sulphur, nickel salts, magnesium sulphate, lead acetate, caustic potash, sodium carbonate and cyanide.

FURNACES

Crucibles. Morgan's Patent Electrically Heated Crucibles. Electrical Review, vol. 84, no. 2157, Mar. 28, 1919, pp. 342-344, 4 figs. Designed to prevent volatilization of non-ferrous alloys which takes place when arc is used on account of excessive heat.

Rennerfelt. Types of Electric Furnaces—I; the Rennerfelt, W. F. Sutherland. Can. Machy., vol. 21, no. 14, Apr. 3, 1919, pp. 328-330, 7 figs. Operating characteristics; tilting mechanism and control and wiring diagram of furnace.

Developments in the Rennerfelt Furnace, H. A. de Fries and Jonas Hertenius. Eng. & Indus. Management, vol. 1, no. 8, Apr. 3, 1919, pp. 238-239, 1 fig. Side electrodes tilt ant shape of shell is round in new design.

Resistance Type. Electric Furnaces of the Resistance Type Used in the Production of Essential War Materials, T. F. Baily. General Meeting, Am. Electrochemical Soc., Apr. 3-5, 1919, paper no. 19, pp 257-260, 1 fig. Heat-treating equipment intended for automatical and continuous hardening and tempering of cast-steel anchor chains. Heating is by an electrical resistor granular carbon confined in carborundum fire sand walls, machinery being controlled by pyrometers which allow of hardening and tempering at definite temperatures.

Steel Foundry. The Electric Foundry: Its Introduction into Foundry Practice, W. E. Moore. General Meeting Am. Electrochemical Soc., Apr. 3-5, 1919, paper no. 12, pp. 181-186. Comparison of electric furnace in steel foundry work with open-hearth furnace and small bessemer converter. Writer concludes that it is superior to both, in regard to cheapness of raw material, conservation of alloying metals, waste of lining, temperature obtainable, control of chemical composition and quality of steel produced.

Vom Baur. The Vom Baur Electric Steel Furnace. Iron Age, vol. 103, no. 17, Apr. 24, 1919, pp. 1071-1073, 2 figs. Electrode holders are so constructed that by means of fillers either graphite or carbon electrodes can be used. Tilting mechanism allows furnace to tilt backward 7 deg. so that slag can be taken off at this door instead of from the spout.

GENERATING STATIONS

AUTOMATIC GENERATING PLANTS. Automatic Induction Generator Plants, E. A. Quinn. Jl. Electricity, vol. 42, no. 8, Apr. 15, 1919, pp. 342-344, 7 figs. Description of two small power plants which make use of water normally used in larger plants of a light and power corporation under heads which existed in the flow line but had hitherto not been utilized. Plants are said to be operated without attendants.

BUS AND SWITCHES. Modern Bus and Switch Structures, C. D. Gray and M. M. Samuels. Elec. World, vol. 73, nos. 16 & 17, Apr. 19 & 26, 1919, pp. 788-792 and 831-833, 16. figs Masonry, material, compartment doors and general arrangement. Types of circuit breakers and support of buses used with large generating units.

CANADA. Central Electric Power Station Statistics, Can. Engr., vol. 36, no. 6, Feb. 6, 1919, pp. 203-205. Data gathered by Dominion Water Power Branch and Bureau of Statistics.

Electric Generation in Canada. Can. Eng., vol. 36, no. 9, Feb. 27, 1919, pp. 255-256. Table of control electric generating plants in Canada, showing capacity, ownership and prime movers.

The Present Electric Outlook in Canada, A. S. L. Barnes. Electrical Review, vol. 84, no. 2158, Apr. 4, 1919, pp. 389-390. Figures indicating total amount of power capable of developing and amount of power already developed. (Continuation of serial.)

CONDENSER, STATIC. Economic Use of Static Condenser—I & II, Waldo V. Lyon. Elec. World, vol. 73, nos. 15 & 16, Apr. 12 & 19, 1919, pp. 724-726 and 776-778, 6 figs. Increasing capacity of a generating plant by using static condensers to correct power factor; feasibility of putting less generating equipment in new plant by using condensers. Problems of power-factor correction by static condensers are analyzed for purposes of improving voltage regulation and reducing copper losses.

PROHIBITION. Effect of Prohibition on Lighting Revenue. Elec. World, vol. 73, no. 15, Apr. 12, pp. 736-739. Conditions following prohibition as reported by 75 central stations.

SMETHWICK. Electricity Supply at Smethwick. Electrical Review, vol. 84, no. 2158, Apr. 4, 1919, pp. 368-371, 5 figs. Capacity of plant which was 12,475 kw. before the war has been increased to total of 36,326 kw. by installation of B. T. H. turbo-generators.

SO. PHILADELPHIA WORKS. Power System of South Philadelphia Works, Graham Bright. Elec. Jl., vol. 16, no. 4, Apr. 1919, pp. 126-131, 15 figs. Showing lighting arresters, disconnecting switches, etc.

THEFT OF CURRENT. Detection and Remedy of Current Theft from Central Stations. Thomas Robson Hay. Elec. Rev., vol. 74, no. 15, Apr. 12, 1919, pp. 588-589. Methods employed by Duquesne Light Co. of Pittsburgh.

GENERATORS AND MOTORS

ALTERNATORS. Free Oscillations of Alternators in a Constant-Voltage System (Oscillations libres des alternateurs sur réseau à tension constante), André Blondel. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 9, Mar. 3, 1919, pp. 439-444. Values of K and e which make $\triangle$ a minimum, determined by taking advantage of the fact that changes in rI during oscillations are negligible by comparison to vector $(u + rI)$ when I is constant.

ASYNCHRONOUS MACHINES. Theory of Elliptic-Field Asnychronous Machines (Sur la théorie des machines asynchrones à champ elliptique), W. Genkin. Revue Générale de l'Electricité, vol. 5, no. 15, Apr. 12, 1919, pp. 539-548, 15 figs. General equations derived from Fynn's theory. Equivalent circuit worked out for revolving-field motor, single-phase motor, phase converter and induction meter.

Application of the Diagram of Asynchronous Motors (Applications du diagramme des moteurs asynchrones), L. Lagron. Revue Générale de l'Electricité, vol. 5, no. 14, Apr. 5, 1919, pp. 507-510, 4 figs. How to use writer's diagram published in R. G. E., vol. 4, Dec. 7, 1918, p. 861, to modifying connection of coils, conststructing characteristic curves and the starting of motor.

HEATING. Maximum Power of Electrical Machines Limited by Permissible Heating of Parts (Erude analytique des conditions dans lesquelles, pour un échauffement déterminé, le puissance de certaines catégories de machines électriques est maximum), H. Lajus. Revue Générale de l'Electricité, vol. 5, no. 13, Mar. 29, 1919, pp. 467-471, 1 fig. A d. c. generator or an alternator operating in constant cos (I) theoretically assumed to be heated to the permissible limit can develop maximum power, according to the writer's investigations when frequence is maximum and the sum of hysteresis and Foucault losses equals the Joule losses.

HIGH-FREQUENCY GENERATORS. A High-Frequency Generator for Airplane Wireless Telegraph Sets, A. Nyman. Elec. Jl., vol. 16, no. 4, Apr. 1919, pp. 140-145, 16 figs. Scheme developed by Signal Corps for U. S. Army; requirements were lightness, compactness and reliability.

LUBRICATION. Lubrication of Electric Generators and Motors, Reginald Trantschold. Elec. Rev., vol. 74, no. 16, March 19, 1919, pp. 629-630. Influence of type of apparatus upon choice of lubricant.

RAILWAY MOTORS. Manufacturers' Tests of Railway Motors, J. S. Dean. Elec. Ry. Jl. vol. 53, no. 16, Apr. 19, 1919, pp. 777-778, 9 figs. Chart presenting various detail parts with materials used in their manufacture. (First article of series.)

RHEOSTATS. Starting Rheostats for Shunt Motors. Terrell Croft. Power House, vol. 13, no. 4, Apr. 5, 1919, pp. 90-91, 4 figs. Calculation of size of resistance to be placed in series with armature to prevent excessive current.

SINGLE-PHASE GENERATORS. Armature Reaction and Wave Form of Single-Phase Generator (in Japanese), G. Shimizu. Denki Gakkwai Zasshi, no. 368, Mar. 10, 1919.

SWITCH-GEAR, STARTING AND CONTROLLING. Starting and Controlling Switchgear for Shipyard Machinery, A. P. Pyne. Elecn., vol. 82, no. 15, Apr. 11, 1919, pp. 413-420, 21 figs. Review of working conditions of various motors to be encountered in a shipyard and suggestions in regard to selecting starting and controlling apparatus.

SYNCHRONOUS MOTORS. Synchronous Motor Characteristics—I, Theo Schou. Elec. World, vol. 73, no. 17, Apr. 26, 1919, pp. 828-830, 6 figs. Heyland diagram for induction motor is applied to sycnhronous motors with squirrel-cage windings in order to investigate starting and pull-in torques. Comparison of brass and copper for rotor bars.

IGNITION APPARATUS

CONTACT BREAKERS, SPLITDORF. The New Splitdorf Magneto. Aerial Age, vol. 9, no. 6, Apr. 21, 1919, p. 304, 2 figs. Details of contact breaker.

GENERATORS, MOTOR-CAR. Regulation of Automotive Generators, W. A. Dick. Elec. Jl., vol. 16, no. 4, Apr. 1919, pp. 148-151, 11 figs. Regulation characteristics of generators used for lighting and other purposes on automobiles and kindred machines. Only those types that have been developed and put into commercial use are dealt with.

MAGNETOS, ALUMINUM IN. British-Made Magnetos. Elecn., vol. 82, no. 13, Mar. 28, 1919, pp. 348-349, 6 figs. Uses of aluminum in their manufacture. (Concluded.)

MAGNETOS, EXPERIMENTS. Experiments on the High-Tension Magneto—I, Norman Campbell. London, Edinburgh and Dublin Phil. Mag., vol. 37, no. 219, Mar. 1919, pp. 284-301, 6 figs. Work conducted at Nat. Physical Laboratory under direction of Advisory Committee for Aeronautics. Results were kept confidential during time of war.

LIGHTING AND LAMP MANUFACTURE

DESIGN. Chart to Facilitate the Design of Lighting System. Elec. World, vol. 72 no. 16, Apr. 19, 1919, pp. 778-779, 1 fig. Curves are based on illuminating intensity 3 ft. above floor; portion of diagram determining size of lamps necessary to produce intensified illumination; a depreciation of 30 per cent in light intensity due to dirt in reflector of lamp or deterioration of filament is assumed. From Indus. Lighting Code of Indus. Commission of Wisconsin.

LABORATORIES. Some Special Problems in the Lighting of Laboratories and Technical Institutions. Illuminating Engr., vol. 12, no. 1, Jan. 1919, pp. 13-16. Concerning lighting of blackboards and chemical, electrical and physical laboratories.

OFFICE LIGHTING. Modern Practice in Office Lighting, A. Wise. Illuminating Engr., vol. 12, no. 2, Feb. 1919, pp. 27-39, 17 figs. Choice of methods for lighting and how these can be applied to various types of offices; importance of periodical cleansing of lamps and lighting units; illumination required for various classes of work; typical examples of installations.

SEARCHLIGHTS. The Searchlight Projector as Used in the Mercantile Marine, R. C. Harris. Elecn., vol. 82, no. 15, Apr. 11, 1919, pp. 444-449, 15 figs. Types of lamps, mirrors and lenses and also methods of remote control, both mechanical and electrical.

SNELLENS TYPES. Report on Standard Illumination of Snellens Types Used in Testing the Vision of Candidates for Public Service. Illuminating Engr., vol. 12, no. 1, Jan. 1919, pp. 5-7, 2 figs. Report issued by Council of British Ophthalmologists. From British Jl. of Ophthalmology.

STREET LIGHTING. Simple Lamp-Record System for Street Lighting Circuits, T. D. McDowell. Elec. Rev., vol. 74, no. 17, Apr. 26, 1919, pp. 668-669, 3 figs. Card records for noting type and history of lamps in use on large systems for street, boulevard or park lighting.

MEASUREMENTS AND TESTS

FAULT LOCALIZING. Fault Localizing: A Few Hints, H. Bujama. Electrical Review, vol. 84, no. 2160, Apr. 18, 1919, pp. 432-433, 5 figs. Double-slide wire bridge for use in connection with Murray loop and Varley loop tests.

FUSES. Short-Circuit Tests of Cartridge Fuses at the New York Office. Laboratories' Data, Underwriters' Laboratories, Nat. Board of Fire Underwriters, no. 1, Feb. 1919, pp. 16-19, 2 figs. Fuses were placed in cutout base, covered with thin layer of dry absorbent cotton and enclosed by strongly made protective cage;circuit breaker is now set so that it will not open automatically, but only by the cord, was then closed and finally circuit was closed by switch at back of test frame.

Results of Factory Inspection of Standard Cartridge Enclosed Fuses. Laboratories' Data, Underwriters' Laboratories, Nat. Board of Fire Underwriters no. 1, Feb. 1919, pp. 20-22, 1 fig. Graphs drawn from results of quarterly inspections.

GALVANOMETERS, DIFFERENTIAL. Zero Error in Differential Galvanometers (Uber ein Differentialgalvanometer nebs einer Untersuchung iiber Nullpunktsfehler bei Drehspulengalvanometern), Helmer Backström, Zeitschrift fur Instrumentenkunde, vol. 38, nos. 11 and 12, Nov. and Dec. 1918, pp. 173-179 and 189-195, 8 figs. Magnitude of after effect on zero position as affected by length of time during which deflection is maintained, damping of movement, and variations of current. Bibliography on moving-coil galvanometers covering period 1880-1916.

GROUND AND SHORT-CIRCUIT DETECTION. Phase and Fault Testing by Means of Lamp Signals, Frank Gillooley. Elec. Rev., vol. 74, no. 16, Mar. 1919, pp. 617-619, 4 figs. Methods of using lamps in testing for grounds. short circuits and continuity of underground cables; methods of checking up phases and identification.

HYDROGEN OVERVOLTAGE, MEASUREMENT OF. Hydrogen Overvoltage, Duncan A. MacInnes and Leon Adler Jl. Am. Chem. Soc., vol. 41, no. 2, Feb. 1919, pp. 194-207, 5 figs. Apparatus and method of measurement. It is concluded that hydrogen overvoltage is due primarily to a layer of supersaturated dissolved hydrogen in the electrolyte surrounding an electrode.

INSULATOR TESTING. Pacific Coast Practice in Insulator Testing. Jl. Electricity, vol. 42, no. 8, Apr. 15, 1919, pp. 345-347. Report of Insulator Committee of convention of Pac. Coast Section N. E. L. A.

Peak Potential, Measurement of. Note on the Measurement of the Peak Potential of an Alternating Source. Clifford C. Paterson and Norman Campbell. London, Edinburgh, and Dublin Phil. Mag., vol. 37, no. 219, Mar. 1919, pp. 301-303, 1 fig. Conditions which are considered necessary for accuracy to measuring peak potential by means of a thermionic valve.

Temperature Body, Measurement. Some Notes on Electrical Methods of Measuring Body Temperatures, Robert S. Whipple. Electrical Review, vol. 84, no. 2158, Apr. 4, 1919, pp. 392-393, 5 figs. Adaptation of thermoelectric couples for measuring body temperatures; results of experiments. Paper read before Roy. Soc. of Medicine & Instn. of Elec. Engrs.

Temperature Determination by Weighing. Weighing High Temperatures in an Electric Balance, J. M. Bird. Sci. Am., vol. 120, no. 17, Apr. 26, 1919, pp. 430-431, 442 & 444, 5 figs. Curves for transformation points of two different steels, showing in each case the heating curve and the cooling curve. System of pyrometry based on use of thermocouples for controling heat treating furnaces in steel mills.

Timing. Accurate Timing in Electrical Tests, F. A. Kartack. Elec. World, vol. 73, no. 14, Apr. 5, 1919, pp. 672-675, 9 figs. Tuning-fork timing device found very satisfactory in practice, consists essentially of heavy iron base casting in head block of which are mounted two steel fork legs actuated by magnet; adjustment for rate of vigration is obtained by counterweights. Design was put into operation at Bar Standards Laboratory.

Voltage Test Equipment. A Voltage Test Equipment. Laboratories' Data, Underwriters' Laboratories, Nat. Board of Fire Underwriters, no. 1, Feb. 1919, pp. 26-28, 1 fig. Outfit consists of transformer, the terminals of which are enclosed in glass case large enough to cover the device or sample under test.

Voltmeter, Electrostatic, Ayrton-Mather. New Measuring Instruments (Quelques nouveaux instruments de mesure), A. Tobler and K. Tobild. Journal Télégraphique, vol. 43, no. 3, Mar. 25, 1919, pp. 33-36, 7 figs. Ayrton-Mather electrostatic voltmeter as perfected by R. W. Paul. (To be continued.)

POWER APPLICATIONS

Cooking. Electric Cooking in Hotels, Clubs and Restaurants, C. O. Hard. Nat. Elec. Light Assn. Bul., vol. 6, no. 4, Apr. 1919, pp. 206-208, 3 figs. Section range with connected load of 30 kw.; 30-in. broiler connected load and other electrical features.

Mill Drive. Electrically Driven Plate Mills, G. E. Stoltz. Engrs.' Club of Philadelphia, vol. 36-1, no. 170, Jan. 1919, pp. 7-13, 10 figs. Considerations in selection of size and type of motor, control and flywheel, based on examination of performances of existing mills.

Electric Equipment in Blooming Mill of Steel Company of Canada, Hamilton. Elec. News, vol. 28, no. 8, Apr. 15, 1919, pp. 24-25, 2 figs. Generator set consists of 1800-hp., 2200-volt 3-phase wound rotor induction motor, a 50-ton flywheel and two 1200-kw., 600-volt d. c. generators all mounted on a common shaft.

Mine Service. Selection of the Electrical System. Voltage and Frequency for Mine Service, Terrell Croft. Coal Age, vol. 15, no. 15, Apr. 10, 1919, pp. 658-659. Believes that 500 volts is not an advisable tension to use at a coal mine, and advocates adhering to 250 volts as a standard.

TELEGRAPHY AND TELEPHONY RADIO

Detector, Radio-Frequency Oscillations. A Magnetic Detector of Radio Frequency Oscillations. Wireless Age, vol. 6, no. 8, May 1919, pp. 11-12, 4 figs. Based upon reputed principle that super-position of a high-frequency current upon iron core already excited by low-frequency current reduces hysteresis loop of low-frequency current.

Modulator, Mercury Vapor, Langmuir's. Langmuir's Mercury Vapor Modulator for Wireless Telephony. Wireless Age, vol. 6, no. 8, May 1919, pp. 15-16, 6 figs. Method of controlling output of radio frequency alternator at speech frequencies for radio telephony. Device comprises a glass or quartz envelope containing a body of mercury (constituting the cathode) and main anodes which may be made of graphite, tungsten, molybdenum or other highly refractory material.

Musical Radio-Sending. Notes on a Problem of Musical Radio-sending (in Japaneese), T. Minohara. Denki Gakkwai Zassihi, no. 368, Mar. 10, 1919.

Progress Since 1914. Wireless telegraphy and telephony, J. A. Fleming. Times Eng. Supp., vol. 15, no. 533, Mar. 1919, pp. 97-98. Progress since 1914.

Receivers, Bridge and Barrage. Simultaneous Sending and Receiving, E. F. W. Alexanderson. Wireless Age, vol. 6, no. 8, May 1919, pp. 23-26, 5 figs. Fundamental characteristics of the "bridge receiver" and the "Barrage receiver." Paper read before Inst. Radio Engrs.

Regulations. Wireless Telegraphy and the Safety of Transoceanic Navigation (La télégraphie sans fil et la sécurité de la navigation maritime). Journal Télégraphique, vol. 43, no. 3, Mar. 25, 1919, pp. 36-38. Regulations of International Conference held at London on Nov. 12, 1913. (Concluded).

Vacuum Tube. Negative Resistance Vacuum Tube as an Amplifier and a Beat Receiver. Wireless Age, vol. 6, no. 8, May 1919, pp. 12-13, 2 figs. Scheme using heterodyne principle to secure increased amplification and selectivity in receiving.

TELEGRAPHY AND TELEPHONY, WIRE

European Telephone Practice. European Telephone Practice, Fred W. Scholz. Telephone Engr., vol. 21, no. 4, Apr. 1919, pp. 159-163, 2 figs. Adaptation of telephone exchanges to telephone trafic. From Telegraphen-Versuchsamt. (To be continued.)

Telephone Receiver, Theory. Electromagnetic Theory of the Telephone Receiver with Special Reference to Motional Impedance, A. E. Kennelly and H. Nukiyama. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 4, Apr. 1919, pp. 491-539, 32 figs. Theory, which is stated under definite limitations, takes into account the m.m.f. produced by vibrations of diaphragm in permanent magnetic field; thus motional power is shown to be derived partly from testing alternating current and partly from changes in power of magnetic circuit.

TRANSFORMERS, CONVERTERS, FREQUENCY CHANGERS

Instrument Voltage Transformers. Instrument Voltage Transformers, W. R. Woodward. Power, vol. 49, no. 15, Apr. 15, 1919, pp. 562-564, 11 figs. Westinghouse types.

Rectifiers. Transformation of Direct into Alternating Current, and Vice Versa, without a Commutator (Sur un système de transformaton de courant continu en courant alternatif, et vice versa sans commutateur divisé), O. Li Gotti. Revue Générale de l'Electricité, vol. 5, no. 13, Mar. 29, 1919, pp. 471-484, 10 figs. Louis Magnini patented in 1905 (see Industrie Electrique, May 25, 1905, p. 217) an apparatus for rectifying an alternating current by the periodic alteration of the inductance coils mounted in two groups. In present article writer makes general study of possible transforming devices operating on induction phenomena.

Transformer Practice. Essentials of Transformer Practice — XXI, E. G. Reed, Elec. Jl., vol. 16, no. 4, Apr. 1919, pp. 145-147, 7 figs. Voltage transformations with autotransformers.

TRANSMISSION, DISTRIBUTION, CONTROL

Control. The Control of Large Amounts of Power—III, E. B. Wedmere. Power House, vol. 13, no. 4, Apr. 5, 1919, pp. 97-101, 12 figs. Current-limiting by use of busbar reactance; heating and stresses due to heavy currents; combinations of machines requiring maximum transfer capacity; influence of power factor of machine on output of engine. Paper read before Inst. Elec. Engrs., England.

Cutout Bases. Effect of Cutout Base Design upon Plug Fuse Performance. Laboratories' Data, Underwriters' Laboratories, Nat. Board of Fire Underwriters, no. 1, Feb. 1919, pp. 23-25, 1 fig. Effect differences in cross-section have upon heating and consequently upon performance of plug fuses used in cutout bases.

Distribution, Flexibility. Flexible Distribution for Industrial Plants, L. F. Leurey. Elec. World, vol. 73, no. 17, Apr. 26, 1919, pp. 835-838, 7 figs. Design for meeting changing demands for power. Safety and low operating costs are said to be secured by employment of bus-bar feeders of uniform size.

Interconnection. Emergency Interchange of Power, G. R. Kenny. Jl. Electricity, vol. 42, no. 8, Apr. 15, 1919, pp. 347-349, 1 fig. Interconnection of two 60-cycle with one 50-cycle system. Paper presented by Eng. Committee for Pac. Coast Section N. E. L. A. convention.

Polyphase-Motor Protection. Protecting Polyphase Induction Motors from Single-Phase Operation, B. W. Jones. Power, vol. 49, no. 16, Apr. 22, 1919, pp. 604-606, 3 figs. Comparison of different means generally employed to prevent polyphase induction motors from operating single-phase and also form overheating.

Relays. Alternating-Current Plunger-Type Relays, Victor H. Todd. Power, vol. 49, no. 17, Apr. 29, 1919, pp. 636-639, 14 figs. Schematic diagram and characteristics of overload relay which obtains time limit by means of air bellows.

Relay Protective Systems, G. E. Armstrong. Jl. Electricity, vol. 42, no. 8, Apr. 15, 1919, pp. 349-353, 1 fig. Methods used on system of Southern Cal. Edison Co. From Eng. Report for spring convention of Pac. Coast Section N. E. L. A.

Synchronous Alternators. Stability of Synchronous Alternators in Constant-Potential System (Conditions de stabilité de la marche synchronique des alternateurs accouplés sur réseau à tension constante), A. Blondel. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 12, Mar. 24, 1919, pp. 587-593. Equation not taking into account oscillations induced in circuits of inductors is modified so as to include effect of these oscillations, and conditions necessary and sufficient for stability are obtained by application of Hurwitz' determinant.

Substation. Columbus Railway, Light & Power Co.'s Canal Street Substation, E. W. Clark. Elec. Rev., vol. 74, no. 17, Apr. 26, 1919, pp. 670-671, 6 figs. Switching arrangements and provision for voltage changeover.

Transformer Station, High-Tension. Transmission of Electrical Energy from Bourges to the American Arsenal at Beauvoir (Transmission d'énergie électrique de Bourges à l'Arsenal Americain de Beauvoir), Michel Berthon. Revue Générale de l'Electricité, vol. 5, no. 12, Mar. 22, 1919, pp. 445-449, 3 figs. High-tension (30,000 volts) transforming station presented as example of rapidly established economic installation.

WIRING

City Hall Wiring. The Electrical Installation in San Francisco's City Hall. Elec. Rev., vol. 74, no. 17, Apr. 26, 1919, pp. 661-667, 7 figs. Features of conduit and wiring system for light, power, communication and signalling.

STORAGE BATTERIES

Barium Sulphate Action. Function of Barium Sulphate in Lead Accumulators (Sulla funzione del solfato di bario hegli accumuratori a plombo), O. Scarpa. Elettrotecnica, vol. 6, no. 9, Mar. 25, 1919, pp. 176-179, 3 figs. Experimental research believed to have demonstrated that barium sulpnate acts as negative catalyzer to transformation of lead.

Charging Plant. New Haven Installs Model Charging Plant, Ry. Elec. Engr., vol. 10, no. 4, Apr. 1919, pp. 105-106, 9 figs. Plant is equipped for charging, cleaning and repairing both lead and alkaline batteries and equipment and both 30 and 60-volt systems are taken care of.

Lead Acid Batteries. Characteristics of Starting and Lighting Batteries of the Lead Acid Type, O. W. A. Oetting. Elec. Jl., vol. 10, no. 4, Apr. 1919, pp. 134-139, 15 figs. Considerations in selecting size of starting battery.

Trickling Charge. The "Trickling Charge" as Applied to Lead-Acid Storage Batteries of the Naval Service, Lucius C. Dunn. C. S. Naval Inst. Proc. vol. 45, no. 195, Mar. 1919, pp. 339-343, 2 figs. Methods of applying to a charged storage battery a current just large enough to counteract local action and thus maintain it in a charged condition.

VARIA

Insulation Mica. What Are Safe Operating Temperatures for Mica Insulation? H. D. Stephens. Elec. Jl., vol. 16, no. 4, Apr. 1919, pp. 131-135, 2 figs. Results of tests on twelve 60-cycle turbo-generators ranging in size from 5000 to 20,000 kva.

Insulation, Moulded. Designing Moulded Insulation, W. H. Kempton. Elec. Jl., vol. 16, no. 4, Apr. 1919, pp. 152-157, 19 figs. Suggestions to designers.

Lightning. Lightning-Rod Specifications Required by Italian War Ministry (Conditions à réaliser dans l'installation des paratonnerres, d'arpès le Ministère de la Guerre Italien). Génie Civil, vol. 14, no. 12, Mar. 22, 1919, pp. 236-237. On the uses of Meisens and other systems and provisions for nature and quality of metal in Cables.

Lightning and Its Effects, D. J. McCarthy. Ry. Elec. Engr., vol. 10, no. 4, Apr. 1919, pp. 123-125, 6 figs. Characteristics of discharges as revealed from a study made with a fixed and revolving camera.

METALLURGY

ALUMINUM

Micrography. The Micrography of Aluminum and its Alloys, D. Hanson and S. L. Archbutt. Engineering, vol. 107, no. 2779, Apr. 4, 1919, pp. 450-453, 13 figs. Different microstructural constituents met with in aluminum alloys. and methods by which these may be etched for microscopic examination. Paper read before Inst. of Metals.

Metallography. The Metallography of Aluminum—I & II, Robert J. Anderson. Metal Industry, vol. 14, nos. 12 & 13, Mar. 21 & 28, 1919, pp. 223-228 and 245-247, 20 figs. Discussion of amorphous theory and plastic deformation with remarks on grain growth phenomena; microstructure of various forms of aluminum; annealing and recrystallization of aluminum which has had plastic deformation; polishing and etching of aluminum microsections preparatory to microscopic examination.

COPPER AND NICKEL

Nickel Refining. Some Features of Nickel Refinery. Can. Manufacturer, vol. 39, no. 4, Apr. 1919, pp. 21-24, 8 figs. Features of Int. Nickel Co. of Canada refinery. Plant was erected at cost of $5,000,000.

FERROUS ALLOYS

Chromium-Nickel Steel. Critical Points, L. A. Danse. Proc. Steel Treating Research Soc., vol. 2, no. 3, 1919, pp. 32-38. Discussion of mechanical and thermal treatment of chromium-nickel steel, particularly as used in aircraft production.

FLOTATION

Flotation Experiments. A Device for Flotation Experiments, Will H. Coghill. Min. & Sci. Press, vol. 118, no. 15, Apr. 12, 1919, pp. 495-496, 1 fig. Device consists of two pyrex flasks, one of 250 cc. and the other of 500 cc., fitting in same rubber nipple; to prepare a test, smaller flask is filled with mixture of ore and water of desired consistency and emptied into larger one; flotation reagents are added and test is accomplished by hand agitation.

FURNACES

Air-Volume Regulation. Air-Volume Regulation in Smelting and Refining Furnaces, C. H. Smoot. Eng. & Min. Jl., vol. 107, no. 15, Apr. 12, 1919, pp. 654-656, 3 figs. Type of constant-volume regulator developed by Rateau-Battu-Smoot Eng. Corp.

Gas Heating. Heating of Metallurgical Furnaces (Le chauffage des fours métallurgiques), Louis Lecocq. Chimie & Industrie, vol. 2, no. 3, Mar. 1, 1919, pp. 260-270. Figures indicating advantage of utilizing gas from coke furnaces.

Greene Arc Furnace. The Greene Rolling Cylinder Arc Furnace. Iron Age, vol. 103, no. 16, April 17, 1919, pp. 1005-1007, 3 figs. Principal features are tilting arrangement by use of hydraulic cylinder connected to back of furnace shell and removable roof.

Pulverized Coal. Pulverized Coal in Canadian Steel Plant, C. F. Herington Iron Age, vol. 103, no. 17, Apr. 24, 1919, pp. 1065-1069, 7 figs. Air distributing system supplies powdered fuel for boilers and furnaces at Canadian branch of Armstrong Whitworth Co.

IRON AND STEEL

Gray Iron. Improving the Quality of Gray Iron by the Electric Furnace, George, K. Elliott. General Meeting Am. Electrochemical Soc., Apr. 3-5, 1919, paper no. 11, pp. 173-179. Proposes to use a basic-lined arc electric furnace for refining and superheating gray iron. Cupola is said to be strong on heating and melting, but weak in superheating, carbon regulation waste of alloying metals, and impossibility of refining; consequently, duplex process, using electric furnace in tandem with cupola, is believed will correct and supplement deficiencies of cupola.

Hot Deformation. Hot Deformation and the Quality of Steel, Georges Charpy · Iron vol. 103, no. 17, Apr. 24, 1919, pp. 1079-1881, 3 figs. Experiments determining effect on tensile strength and impact values; gun and hard basic steel weree used. Paper presented before Iron & Steel Inst., London.

Liquid Steel. Paper on "The Solid and Liquid States of Steel," Cosmo Johns. Jl. West of Scotland Iron & Steel Inst., vol. 26, part 3, 1918-1919, pp. 36-41. Properties of an optically clean surface of liquid steel and its similarity to that of a polished metallic surface with a vitreous film. Preservation of surface of liquid steel is attributed to presence of iron-vapor atmosphere.

Malleable Iron. Malleable Iron, What it is, and How it is Made, F. H. Bell. Can. Foundryman, vol. 10, no. 4, Apr. 1919, pp. 85-88, 7 figs. Organization in operation of foundry works.

Manganese. Manganese Alloys in Open-Hearth Steel Practice, Samuel L. Hoyt. Sci. Am. Supp., vol. 87, no. 2261, May 3, 1919, pp. 282-283. Conditions in open-hearth practice that affect conservation of manganese, both during the working of the heat and in making final additions; metallurgical conditions for use of manganese in the form of low-grade or special alloys; effect on finished steel both as to quality and condition of various methods and processes.

Ore Smelting. A New Method for the Smelting of Iron Ores, J. W. Moffat. Can. Machy., vol. 21, no. 14, Apr. 3, 1919, pp. 325-327. Duplex process for making of steel from ores not suitable for blast furnace.

Phosphorus in Steel. The Determination of Phosphorus in Vanadium Steels, Ferro-Vanadium, Non-Vanadium Steels and Pig Iron, Chas. Morris Johnson. Chemical News, vol. 118, no. 3073, Mar. 7, 1919, pp. 113-115. Method for steel containing vanadium up to 2.6 per cent; table showing effect of increasing amount of nitric acid on phosphorus recovery.

Tempering Velocity, Critical. Influence of Various Factors on the Critical Velocity of Tempering of the Carbon Steels (Influence de divers facteurs sur la vitesse critique de trempes des aciers au carbone), I. M. Portevin. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 7, Feb. 17, 1919, pp. 346-348. Duration of temper was determined in the experimental work as the time in seconds for cooling of metal from 700 to 200 deg. cent.

Toronto Electric Steel Plant. World's Largest Electric Steel Plant in Toronto, Goergo T. Clark and Frederick Phillips. Can. Engr., vol. 36, no. 13, Mar. 27, 1919, pp. 327-331, 10 figs. Plant occupies 127,65 acres, and 5000 lin. ft. of concrete docks, accommodating vessels of 24 ft. draft. It was built for manufacture of 6-in. and 9.2-in. forgings from raw material.

NON-FERROUS ALLOYS

Aluminum Alloys. Alloys of Aluminum with Rare or Special Alloys, Jean Escard. Metal Industry, vol. 13, no. 20, Nov. 15, 1918, pp. 333-335. Constitution, properties and preparation of aluminum and manganese, aluminum and chromium, aluminum and tungsten aluminum and vanadium, and aluminum and titanium alloys.

Aluminum Bronzes. Study and Graphical Representation of the Properties of Aluminum Bronzes (L'étude et la représentation graphique des propriétés des bronzes d'aluminum), R. de Fleury. Genie Civil, vol. 74, no. 13, Mar. 29, 1919, pp. 254-256, 9 figs. Triangular diagrams of resistance to rupture and ultimate elongation of bars.

Brass. Notes on Alloys Used in Brass Rolling Mills, A. J. Franklin. Metal Industry, vol. 14, no. 12, Mar. 28, 1919, pp. 241-244, 3 figs. Effect of impurities, casting difficulties, hints on annealing and composition of some of the alloys used in sheet-rolling mill.

Decomposition. Decomposition of Metals—II, A. I. Krynitzky. Chem. & Metallurgical Eng., vol. 20, no. 8, Apr. 15, 1919, pp. 421-424, 6 figs. Application of theory to commercial problem of manufacturing durable alloys containing tin and aluminum, with outline of recommended melting, drawing and annealing practice for certain munitions.

Metallography. Metallography Applied to Nonferrous Metals—II, Ernest J. Davis. Foundry, vol. 47, no. 5, Apr. 15, 1919, pp. 215-218, 15 figs. Predicting microstructure of series of alloys by equilibrium diagram.

OCCLUDED GASES

Occlusion. Occlusion of Gases by Metals (L'occlusion des gaz par les métaux), A. Delesne. Revue Générale des Sciences, vol. 30, no. 1, Jan. 15, 1919, pp. 17-19. Synopsis of discussion at conference of Faraday Soc., London.

VARIA

Etching Solutions. Etching Solutions and their Uses, Ernest G. Jarvis and McNab and Harlin Mfg. Co. Metal Indus., vol. 17, no. 4, Apr. 1919, pp. 170-171. Preparation and uses of seventeen different solutions.

Manganese-Silver Problem. The Manganese-Silver Problem—I, Harry J. Wolf. Colorado School of Mines Mag., vol. 9, no. 4, Apr. 1919, pp. 73-77. Metallurgical experiments performed to determine reason for insolubility in cyanide of silver in certain ores where it is accompanied by manganese oxides.

CIVIL ENGINEERING

BRIDGES

Concrete Overhead Arch Bridges. Four Concrete Overhead Arch Bridges on Toronto-Hamilton Highway. Contract Rec., vol. 33, no. 14, Apr. 2, 1919, pp. 301-306, 6 figs. Governing factor in design of bridges has been long clearances by using parabolic overhead arch ribs braced together by horizontal bracing members.

Canada's Longest Reinforced Concrete Trusses. Can. Engr., vol. 36, no. 14, Apr. 3, 1919, pp. 345-348, 6 figs. Bridges carrying Toronto-Hamilton highway across Etobicoke river and Bronte creek. Each is 119 ft. clear span, with 20-ft. roadway and 16-ft. overhead clearance.

Canadian Reinforced Concrete Arch Bridges, Frank Barber. Can. Engr., vol. 36, no. 11, Mar. 13, 1919, pp. 289-293, 6 figs. Historical review and lists of open spandrel and earth-filled arches with clear span of over 100 ft. or total bridge length of over 200 ft.

Concrete-Pile Trestle Construction. Concrete Pile Trestle Construction, Albert M. Wolf. Eng. World, vol. 14, no. 8, Apr. 15, 1919, pp. 25-27, 6 figs. Economy of concrete pile process is argued by the fact that piles and slabs can be cast in central yard, and then transported to site and erected with comparatively small portable plants in the form of combined derrick and piledriver cars.

Construction. Railway Bridges in the Dutch Indies (Mededeelingen omtrent de verzwaring van den bovenbouw der bruggen in de lign Goendih-Soerabajader Nederlandsch-Indische Spoorweg-Maatschappij), E. C. U. Hartman. De Ingenieur, vol. 34, no. 9, Mar. 1, 1919, pp. 148-161, 35 figs. Dismantling of old bridges and erection of new with aid of portable auxiliary bridges placed under existing structures on temporary pile foundation.

The Construction of Culverts and Small Bridges, Charles D. Snead. American City, Town & County Edition, vol. 20, no. 4, Apr. 1919, pp. 323-326, 2 figs. Methods suggested at Kentucky Road School.

Failures. Are Our Highway Bridges Safe? Mun. Jl. & Public Works, vol. 46, no. 16, Apr. 19, 1919, pp. 276-279. Instances of failures of bridges. County highway officials quoted as saying that 30 per cent of bridges of the country are unsafe for heavy vehicles.

India. Adam's Bridge. Indian Eng., vol. 65, no. 1, Jan. 4, 1919, pp. 10-11, 1 fig. Project for connecting India and Ceylon by railway line.

Lift Bridges. Pretoria Avenue Lift Bridge, Ottawa, L. McLaren Hunter. Contract Record, vol. 33, no. 16. Apr. 16, 1919, pp. 355-356, 3 figs. Two 52½-ft. fixed spans and a central 95 ft. electrically operated direct lift span giving 30 ft. maximum clearance.

Relieving Arches. Relieving Arching in Subway Distribute Stress to Piers. Eng. News-Rec., vol. 82, no. 14, Apr. 3, 1919, pp. 667-669, 7 figs. Feature of design in three-span subway carrying street is said to be arched sidewalk spans seated on haunches of roadway span in order to insure desired distribution of stress.

Strengthening Bridges. Strengthening Bridges for Truck Traffic. Contract Rec., vol. 33, no. 14, Apr. 2, 1919, pp. 318-319, also Good Roads, vol. 17, no. 14, Apr. 5, 1919, pp. 149-151. Report of Committee of Am. Road Builders' Assn. on methods of reconstruction to carry heavy loads.

BUILDING AND CONSTRUCTION

Architectural Practice. Post-War Committee on Architectural Practice. Jl. Am. Inst. Architects, vol. 7, no. 4, Apr. 1919, pp. 174-176. Committee on Education evolved present system of education by measured results as expressed in terms of architects service to client, community and nation; and in degree of honorable livelihood made possible to practitioner by such education.

The Making Habitable of Old Dwellings in Town and Country, M. H. Ballie-Scott. Jl. Roy. Inst. British Architects, vol. 26, no. 4, Feb. 1919, pp. 73-79 and (discussion) pp. 80-81, 1 fig. Contrasts artistic tendencies in olden architectural constructions with modern practice of plain building.

Esthetics of Metallic Constructions (Considérations sur l'esthétique des constructions métalliques), M. Resal, Annales des Ponts et Chaussées, partie technique, vol. 47, no. 6, Nov.-Dec. 1918, pp. 253-272. Architectural development in steel construction, specially bridges, is expected to follow what is established as a general law of artistic development, according to which statical structures are constructed long after a material is first employed in building.

How Can the Electrical Industry Assist the Architect? J. O. Case. Jl. Electricity, vol. 42, no. 8, Apr. 15, 1919, pp. 370-374. Commercial Committee of Pac. Coast Section N. E. L. A. recommends that electrical manufacturers assist architects in specification work.

Chimney, Demolition. Demolishing Tall Brick Chimney, Ralph B. Chandler. Can. Engr., vol. 36, no. 16, Apr. 17, 1919, pp. 383-384, 3 figs. Plans and elevations of chimney, showing preparations for demolition with dynamite.

Coal Bins An Example of Coal Bin Reconstruction, Wm. Joshua Barney. Coal Trade Jl., vol. 50, no. 17, Apr. 23, 1919, pp. 448-451, 7 figs. Reinforced concrete structure built to enlarge capacity. Bins continued in operation while structure was being erected.

Concreting Plant. Efficient Concreting Plant Am. Contractor, vol. 40, no. 17, Apr. 26, 1919, p. 30, 1 fig. Mechanical dumping and distribution in construction of Hotel Fort des Moines the erection of which was demanded by the Government to be urgently terminated.

Dome, Reinforced-Concrete. The Reinforced Concrete Dome at Hippodrome, Copenhagen. Eng. & Contracting, vol. 51, no. 18, Apr. 30, 1919, p. 445, 2 figs. Notes on methods of construction.

Earthquakes. Effect on Structures of Recent Porto Rico Earthquakes, M. L. Vicente and C. F. Joslin. Eng. News-Rec., vol. 82, no. 17. Apr. 24, 1919, pp. 806-808, 5 figs. Investigations are represented as indicating that wood frame proves safest for buildings, with well-built reinforced concrete next, and articulated construction last.

Floor, Girderless. Notes on the Test of a Girderless Floor, Peter Gillespie and T. D. Mylrea. Jl. Eng. Inst. of Canada, vol. 2, no. 4, Apr. 1919, pp. 300-317, 22 figs. Tests conducted on flit slabs in Toronto factory by City Architect's Dept. in conjunction with Dept. of Applied Mechanics, University of Toronto.

Foundations. Mathematical Study of Foundations on an Elastic Soil (Etude mathématique des foundations sur terrain élastique), Keiichi Hayashi. Memoirs of the Coll. of Eng. Kyushu Imp. University, Fukuoka, Japan, vol. 1, no. 4, 1919, pp. 225-267, 18 figs. Three cases are considered; mass is loaded symmetrically with uniformly distributed weight; when there are central elevations; symmetrical loading with two concentric weights.

Flues, Chimney. Notes on Chimney Flues, Henry N. Dix. Am. Architect, vol. 115, no. 2259, Apr. 9, 1919, pp. 530-534, 6 figs. Causes of poor draft.

Houses. Philippine Island Concrete House. Concrete, vol. 14, no. 4, Apr. 1919, pp. 146-149, 14 figs. House is of concrete and steel, the only wood in the structure being used in framing for kitchen roof, window and door frames, for doors and windows, stiar rail cap, dumb-waiter box and shelving in closets.

Recommendations for Inexpensive Houses. Contract Rec., vol. 33, no. 14. Apr. 2, 1919, pp. 308-311. Recommendations of Ontario Housing Committee.

House-Building Machinery. Labor-saving Machinery Used in Building Houses, Samuel H. Lea. Eng. News-Rec., vol. 82, no. 16, Apr. 17, 1919, pp. 753-755, 8 figs. Tractors for dragging plows and hauling concrete cars from central mixing plant to all parts of extended job.

Masonry. Studying the Defects in Masonry Structures. Ry. Maintenance Engr., vol. 15, no. 5, May 1919, pp. 167-168, 2 figs. On defects resulting from instability, disintegration and weathering.

Roofs, Brick-Arch. Thin Tied Flat Brick Arch Roofs, E. W. Stoney. Indian Eng., vol. 65, no. 6, Feb. 8, 1919, pp. 80-81, 16 figs. Experiments to determine strength of various tied arch ribs of 10 to 30 ft. span, 2 ft. 3 in. wide, having rise of one-eighth span.

Schools. Standardization of Plans for Schools, Clarence E. Dobbin. Contract Rec., vol. 33, no. 15, Apr. 9, 1919, pp. 339-340. Points out that uniform practice in preparation of designs reduces office work and produces economies in cost without sacrificing architecture.

Construction and Equipment of Portable School Buildings—II, John Howatt and Samuel R. Lewis. Heat. & Vent. Mag., vol. 16, no. 4, Apr. 1919, pp. 34-39, 7 figs. Double-ceiled construction with paper between.

Skylight. New Type Skylight Saves Maintenance Expense. Contract Rec., vol. 33, no. 17, Apr. 23, 1919, pp. 392-393, 2 figs. Construction designed to make provision for expansion and contraction. Used at Windsor Station, Montreal, Can. Pacific Ry.

Sprinklers. Sprinkler Devices for Building Protection, F. S. Broadfoot. Contract Record, vol. 33, no. 16, Apr. 16, 1919, pp. 363-365. Advises frequent inspection or central station control.

Stairways. The Double Stairway, its Design and Construction. Am. Architect, vol. 115, no. 2260, Apr. 16, 1919, pp. 557-561, 16 figs. Schematic arrangements, dimensions and types of details.

Storage Tanks. Storage Tanks of Reinforced Concrete for Ammoniacal Liquors, F. W. Frerichs. Concrete, vol. 14, no. 4, Apr. 1919, pp. 151-154, 3 figs Tanks were made from cement concrete consisting of one part cement, two parts sand and four parts gravel. Accounting is given of tests to which tanks were subjected with view of ascertaining permeability of concrete by water and ammoniacal liquors.

The Admiralty Oil Fuel Reservoir at Rosyth. Petroleum Times, vol. 1, no. 12, Mar. 29, 1919, pp. 245-246, 3 figs. Reservoir is built of concrete on a rock foundation. Oil is pumped in or out by means of cast-iron oil mains.

Superintendence. Systematic Building Superintendence, Charles F. Dingman. Concrete, vol. 14, no. 4, Apr. 1919, pp. 159-162, 4 figs. Scheduling details of building construction; Flynt Company's "Standard practice instructions" superintendents. (Concluded.)

CEMENT AND CONCRETE

Beams. A Simple Method for Designing Concrete Beams Reinforced for Compression. Arthur Raymond. Eng. & Contracting, vol. 51, no. 17, Apr. 23, 1919, p. 401, 2 figs. Simplifications introduced in general theory by approximating on safe side of formulæ.

Blasting Concrete. Blasting Concrete. S. R. Russell. Du Pont Mag., vol. 10, no. 5, May 1919, pp. 8-10, 5 figs. Suggestions in regard to drilling of holes and locating blasting cap. It is claimed that explosives can be used for breaking concrete with great economy of time and money and with absolute safety.

Concrete Mixtures. Saturation of Concrete Reduces Strength and Elasticity, M. B. Haggard. Cement and Eng. News, vol. 31, no. 4, April 1919, pp. 23-25, 6 figs. Compression tests made in experimental laboratory of Univ. of Minnesota.

The Design of Concrete Mixtures. Eng. & Contracting, vol. 51, no. 17, Apr. 23, 1919, pp. 421-426, 5 figs. Interrelation of consistency. size and grading of aggregates, and the proportion of cement. Experimental research at Structural Material Research Laboratory, Lewis Inst. Chicago.

How to Design Concrete Mixtures, D. A. Abrams. Eng. News-Rec., vol. 82, no. 16, Apr. 17, 1919, pp. 758-763, 7 figs. Theory developed from tests; main principles of theory are: With given concrete materials and conditions of tests the quantity of water used determines strength of concrete so long as mix is of workable plasticity; measurement of aggregate grading on a sieve is of greatest importance in proportioning a mixture.

Depositing in Water. Depositing Concrete in water. Contract Record, vol. 33, no. 16, Apr. 16, 1919, pp. 374-375. Report of sub-committee of Committee on Masonry of Am. Ry. Eng. Assn., presenting its opinion on best practice to be followed.

Design. Use Minimum Steel for Economy in Concrete Design, Albert M. Wolf. Concrete, vol. 14, no. 4, Apr. 1919, pp. 139-142. 2 figs. Tables giving sizes, percentages of steel and cost per foot of height for various columns.

Electrolysis. Electrolysis and Concrete—II. Railway Engineer, vol. 40, no. 471, Apr. 1919, pp. 67-69, 2 figs. Tests made at Mass. Inst. of Technology. Points investigated were : Action of stray currents on unstressed embedded steel: rate of corrosion of steel under stress; and, effect of setting cement on paint films. (Continuation of serial.)

PRESERVATION, CONCRETE. The Preservation of Concrete Structures, Maxmilian Toch. Chem. Engr., vol. 27, no. 3, Mar. 1919, pp. 69-71. Methods in use for protecting concrete against errosion, chemical action, disintegration and decomposition. Address delivered before Am. Inst. Chem. Engrs.

SOLUBILITY OF PORTLAND CEMENT. Solubility of Portland Cement and Its Relation to Theories of Hydration, J. C. Witt and F. D. Reyes. Eng. World, vol. 14, no. 7, Apr. 1, 1919, pp. 39-41. Investigation to determine what constituents of cement will go into solution and the proportion of the total amount of each present in the sample.

DAMS. *See Earthwork. Rock, Excavation, etc.*

EARTHWORK, ROCK, EXCAVATION, ETC.

COFFERDAM. Notes on the Design of a Single-Wall Cofferdam, F. R. Sweeny, Eng. News-Rec., vol. 82, no. 15, Apr. 10, 1919, pp. 708-711, 3 figs. Theoretic and economic considerations in developing size and location of timber wales and braces and steel sheeting.

DAMS. Recent Development of Marin Water District, H. M. Bowers. Jl. Electricity, vol. 42, no. 7, pp. 316-318, 4 figs. Dam making use of siphon type of spillway.

Swift Rapids Dam and Ship Lift Lock. Contract Rec., vol. 33, no. 15, Apr. 9, 1919, pp. 330-333, 7 figs. Generating plant supplies current to Orillia, Ont., lock; plant is part of Trent Valley system.

Construction Methods Used at Drummondville, James Dick. Can. Engr., vol. 36. no. 17, Apr. 24, 1919, pp. 397-400, 7 figs. Damming of river and erection of power house to develop 19,000 h.p.

EXCAVATOR, TUNNELING. The Tunnelling Excavator. Iron & Coal Trades Rev., vol. 98, no. 2667, Apr. 11, 1919, p. 440, 1 fig. It is reported that under actual working conditions this patented machine has cut a tunnel 7 ft. 2 in. in diameter at average rate of 60 ft. in 24 hours.

SUBWAY. Solving Construction Problems in Canal Street Subway, A. J. Mayell. Eng. News-Rec., vol. 82, no. 14, Apr. 3, 1919, pp. 650-652, 4 figs. Pit and drift methods used in construction work under old subway in New York city..

TRENCH DIGGING. Municipal Work in Detroit. Fire & Water Eng , vol. 65, no. 18, Apr. 30, 1919, pp. 977-979, 3 figs. Trench digging and pipe laying by Water Dept. of city.

HARBORS

COPENHAGEN. Extension of Copenhagen Harbor (Forskelligt Jernbetonarbejde i og ved Kobenharns Havn). Teknish Tidscrift, vol. 42, no. 51, Dec. 18, 1918, pp. 6-7, 4 figs. Municipal electric power station adjoining harbor. Buildings and elevated railway for discharging coal to boiler house are of reinforced concrete. Part of quay wall consists of grooved reinforced-concrete piles and reinforced slabs.

DOCK GATES. Reinforced Concrete Dock Gates. Engineer, vol. 127, no. 3299, Mar. 21, 1919, pp. 289-290, 3 figs. Gates are constructed as stress line for uniform water pressure and are circular in shape; they have to stand a water pressure of 14 ft.

MONTREAL. Suggested Harbour Improvements for Greater Montreal, E. S. M. Lovelace. Jl. Eng. Inst. of Canada, vol. 2, no. 4, Apr. 1919, pp. 318-327, 3 figs. To remedy strong current from canal basin to foot of island opposite Varennes; to provide sufficient depth at low water for larger ocean-going vessels; to prevent danger of floods during spring and fall.

SOERABAJA, JAVA. New Harbor Works at Soerabaja, Java (Technische lessen en vraagstukken op het gebied van den Indischen havenbouw), Wouter Cool. De Ingenieur, vol. 34, no. 8, Feb. 22, 1919, pp. 121-141, 35 figs. Building of vertical reinforced-concrete quay walls on large caissons 22 ft. wide with 12 in. thick walls. Bases floated into position and sunk by being filled with concrete in bags.

TIMBER, IMPREGNATED. Impregnated Timber for Harbors (Impraegnering af Havnetommer), A. Collstrop and Edv. Bülow. Ingeniören, vol. 28, no. 11, Feb. 5, 1919, pp. 69-74, 17 figs. Results obtained in Denmark by impregnating pine and beach with tar oil.

VANCOUVER. Improvement of Vancouver Harbor. Contract Rec., vol. 33, no. 17, Apr. 23, 1919, pp. 381-386. Recommendations for development of port.

MATERIALS OF CONSTRUCTION

CLAY. Experiments with Clay in its Relation to Piles, Alfred S. E. Ackerman. Surveyor, vol. 55, no. 1417, Mar. 14, 1919, pp. 213-224 and also Soc. Engrs., Jl. & Trans., vol. 10, no. 2, 1919, pp. 37-80 and (discussion), pp. 80-107. 17 figs. Results of 95 experiments, some extending over period of 40 hours each. Object was to determine relationship between horizontal pressure and depth at any given point in clay. Among other conclusions writer establishes that corrugating as well as tapering piles increases their resistance.

TILE. Strength of Hollow Building Tile. Eng. & Contracting, vol. 51, no. 17, Apr. 23, 1919, pp. 411-413, 6 figs. Tests conducted by Bureau of Standards. From Technologic Paper no. 120.

RECLAMATION AND IRRIGATION

DRAINAGE WORK. Moore Park Drainage System, Toronto, W. G. Cameron. Can. Engr., vol. 36, no. 9, Feb. 27, 1919, pp 251-255, 7 figs. Storm-water outlet; district drained comprises area of 233.5 acres.

Drainage Works on Railway Lands, G. A. McCubbin. Can. Engr., vol. 36, no. 11, Mar. 13, 1919, pp. 295-298. Dominion laws in respect to drainage and examples of their application. Paper read at Annual Meeting of Assn. of Ontario Land Surveyors.

ROADS AND PAVEMENTS

ACCOUNTING. County Highway Books and Bookkeeping, Gordon F. Daggett. American City, Town & County Edition, vol. 20, no. 4, Apr. 1919, pp. 327-330, 3 figs. Forms for county highway departments.

BRICK PAVEMENTS. Present Status of Brick Pavements Constructed with Sand Cushions, Cement Mortar Beds and Green Concrete Foundations, W. M. Acheson. Good Roads, vol. 17, no. 14, Apr. 5, 1919, pp. 147-149, also Contract Record, vol. 33, no. 16, Apr. 16, 1919, pp. 370-371. Comparison of old and new methods of constructing brick pavements with reference to strength and durability.

CHICAGO BOULEVARDS. The Michigan Avenue Improvement is the Most Important Addition to Chicago's Boulevard System, Hugh E. Young. Eng. World, vol. 14, no. 8, Apr. 15, 1919, pp. 15-24, 7 figs. Construction of work to remedy congestion in traffic which will involve expenditure of $7,700,000.

CONCRETE ROADS. Machine Finishing Concrete Roads, E. G. Carr. Mun. & County Eng., vol. 56, no. 4, Apr. 1919, pp. 132-134, 5 figs. Benefit of using machine by reason of compactness resulting from action in concrete mass.

DRAINS. Segment Blocks have Advantages on Larger-Size Drains, D. L. Yarnell. Eng. News-Rec., vol. 82, no. 14, Apr. 3, 1919, pp. 663-664. Report prepared under direction of Bur. Public Roads and Rural Eng. Advantages of lightness, ease of handling and small breakage.

FINANCING. Methods of Financing Highway Improvements for States, Counties and Towns. Good Roads, vol. 17, no. 17, Apr. 26, 1919, pp. 177-179. Committee report presented at Convention of Am. Road Builders' Assn.

GRADE SEPARATION. General Problems and Aspects of Grade Separation. Eng. & Contracting, vol. 51, no. 16, Apr. 16, 1919 pp. 381-384. Report issued by Div. of Grade Separation and Bridges of city of Detroit. It comprises partly an account of progress and partly a study of general and special problems with which city is confronted as it looks forward to an extensive program of construction.

GUARANTEES. Pavement Guarantees. Can. Engr., vol. 36, no. 13, Mar. 27, 1919, pp. 337-339. Report of Committee on "Economic Status of Guarantees of Pavements on Roads and Streets," presented Feb. 28, at the Annual Convention of Am. Road Builders' Assn.

INDIAN ROADS. Metalling Roads in the Punjab, Khan Bahadur M. Abdul Ahad. Indian Eng., vol. 65, no. 9, Mar. 1, 1919, pp. 124-125, 1 fig. Substitutes introduced by Punjab road engineers are: Sarai-Kala limestone, stone boulders, shingle and shale and overburnt brickbats.

MACADAM. Considerations Affecting Designs of Heavy Traffic Highways in Ontario, W. A. McLean. Mun. & County Eng., vol. 56, no. 4, Apr. 1919, pp. 157-158. Table indicating required thickness of macadam road crust to transmit at an angle of 30 deg. from the vertical safe bearing pressure to subgrade of various soils. From annual report of Ontario Dept. of Highways.

NATIONAL ROADS. National Roads, E. A. Kingsley. Mun. Jl. & Public Works, vol. 46, no. 16, Apr. 19, 1919, pp. 293-294. Argument in their favor based on success of Nat. Administration of French Roads.

OIL HEATING PLANT. Road-Oil Heating Plant of Los Angeles County, E. Earl Glass. Eng. News-Rec., vol. 82, no. 15, Apr. 10, 1919, pp. 729-730, 3 figs. Built plant from old equipment in stock. Installation is said to save county $20 per 1,000-gal. tank.

RELOCATIONS. Highway Relocations, Gordon F. Daggett. Wisconsin Engr., vol. 23, no. 7, Apr. 1919, pp. 235-243. In relation to securing a more economical road as regards construction and maintenance features.

SCARIFIER. A New Road Scarifier. Engineer, vol. 127, no. 3298 Mar. 14, 1919, p. 254, 4 figs. A quick-lift toggle action is fitted to frame carrying tines which permits carrying tines to full depth on both sides of an obstruction.

SNOW REMOVAL. Efficient Methods of Snow Removal from Highways Outside of Urban Districts. Good Roads, vol. 17, no. 17, Apr. 26, 1919, pp. 180 & 187. Committee report presented at Convention of Am. Road Builders' Assn.

TRUCK TRANSPORTATION. Hard Surface Roads and the Auto Truck, H. W. Eldridge. Cement & Eng. News, vol. 31, no. 4, Apr. 1919, pp. 28-29, 1 fig. Transportation of war supplies from point of production in interior states to points of shipping on Atlantic Coast.

Bituminous Surfaces under Truck Traffic, Prevost Hubbard. Contract Rec., vol. 33, no. 14, Apr. 2, 1919, pp. 314-315. Firm foundation essential to resist action of heavy motor trucks.

WATERFRONT PAVING. Improvement of the Embarcadero in San Francisco, California, Charles W. Geiger. Good Roads, vol. 17, no. 16, Apr. 19, 1919, pp. 167-168, 3 figs. Bituminous-concrete and basalt-block pavement employed for light and heavy vehicles on waterfront thoroughfare.

WOOD-BLOCK PAVEMENTS. Some Specific Suggestions on the Design and Construction on Modern Wood Block Pavements, E. A. Fisher. Mun. & County Eng., vol. 56, no. 4, Apr. 1919, pp. 129-130, 4 figs. Laying block on pitch cushion applied to smooth concrete base and filling in the remainder with sand.

SANITARY ENGINEERING

NEW ORLEANS SYSTEM. Unique Feature of Unified Operation of Water, Sewerage and Drainage Facilities at New Orleans, La., George G. Earl. Mun. & County Eng., vol. 56, no. 4, Apr. 1919, pp. 121-129, 3 figs. Developments which are said to have reduced death rate of city about one-third.

REFUSE COLLECTION. Efficiency in City Scavenging, Mun. Jl. & Public Works, vol. 46, no. 17, Apr. 26, 1919, pp. 309-311, 3 figs. Suggestions for planning a system of refuse collection.

Refuse Disposal. Refuse Disposal in London. Mun. Jl. & Public Works, vol. 46, no. 15, Apr. 12, 1919, pp. 263-264. Borough of 120,000 population reported to have screened its refuse, recovered paper and other salable materials and used a clay pit for dumping.

Sewage Disposal. Design Features of Sewage Disposal Plant at Industrial Housing Development of the Alan Wood Iron and Steel Co., at Swedeland, Pa., George L. Robinson. Mun. & County Eng., vol. 56, no. 4, Apr. 1919, pp. 135-136, 1 fig. Sections of sliding tanks.

Sewage Disposal in North Dakota, Elwyn F. Chandler. Quarterly Jl. of the Univ. of North Dakota, vol. 9, no. 3, Apr. 1919, pp. 220-230. Lists for North Dakota and the Red River Valley those towns that are on the banks of rivers and that already have (or will shortly have) sewerage systems, and formulate conclusions concerning the population that each may reach before its sewer outfall will transform the stream into a possible nuisance.

Regulating Chlorine Doses. Mun. Jl. & Public Works, vol. 46, no. 15, April 12, 1919, pp. 264-265. Conclusions from experiments by Maryland Health Dept. Five-minute absorption test recommended.

The Disposal of Sewage by Treatment with Acid, Edgar S. Dorr and Robert Spurr Weston. Boston Soc. Civil Engrs., vol. 6, no. 4, Apr. 1919, pp. 145-166 and (discussion) pp. 166-175. Concludes from results of various experiments and studies that the Miles process will produce a well disinfected effluent from which 90 per cent of the settleable solids have been removed.

Sewage Disposal by Dilution, Including Chlorination of Sewage Effluent and Treatment of Sludge, W. C. Easdale. Surveyor, vol. 55, nos. 1418 and 1419, Mar. 21 and 28, 1919, pp. 227-229 and 224-246, 2 figs. also Eng. & Contracting, vol. 51, no. 18, Apr. 30, 1919, pp. 456-459, 2 figs. Concerning removal of maximum percentage of solids in suspension; maintenance of sewage in fresh condition while passing through tanks; treatment of sludge in such a manner as to facilitate its disposal without causing fouling of tank effluent.

Sewage, Measuring Devices for. Sewage System for Essex Border Cities. Contract Record, vol. 33, no. 16, Apr. 16, 1919, pp. 358-362, 3 figs. Regulating chambers and measuring devices.

Sewage Pumping. Milwaukee Sewage Pumping Station, T. Chalkely Hatton. Fire & Water Eng., vol. 65, no. 17, Apr. 23, 1919, p. 938, 3 figs. Automatically controlled system for disposing of maximum combined daily flow of 231,000,000 gal.

Sewage Screening. Grit Chamber and Fine Screens for Part of New York Sewage, Charles E. Gregory. Eng. News-Rec., vol. 82, no. 14, Apr. 3, 1919, pp. 672-674, 5 figs. Screens of revolving-disk type. Plant serves an area of 345 acres of which about 17 per cent is built up with apartment houses.

Sewers. Equipment and Methods Employed in Building Sewers in San Francisco, Cal., H. W. Shimer. Mun. & County Eng., vol. 56, no. 4, Apr. 1919, pp. 136-140, 18 figs. Disposal scheme adopted is to discharge sewerage only at points were there are strong tidal current.

Storm Sewer Extension at Toronto Harbour, George T. Clark. Can. Engr., vol. 36, no. 6, Feb. 6, 1919, pp. 193-195, 4 figs. Drainage problems arising from waterfront improvements and how they are being solved.

Town Planning. Town Planning in Canada, James White, Can. Engr., vol. 36, no. 6, Feb. 6, 1919, pp. 199-200. Outline of work of Commission of Conservation in relation to housing and land problems.

SURVEYING

Azimuth Line. Drawing the Azimuth Line (Tracciamento della retta d'azimut), E. Modena. Revista Maritima, vol. 52, no. 2, Feb. 1919, pp. 169-173, 1 fig. Method is similar to St. Hilaire's for altitude line.

Geometric Leveling. Geometric Leveling by the Method of Dr. Wilhelm Seibt (Nivelacion geométrica par el metodo del Dr. Wilhelm Seibt), Tomas Gonzàlez Roura. La Ingenieria, vol. 23, no. 6, Mar. 16, 1919, pp. 379-388. Probable error of an isolated observation. (Continuation of serial).

Transit. Variations of the Optical Axis of a Transit (Sur l'étude des perturbations de l'axe optique d'une lunette méridienne en direction), Maurice Hamy. Comptes Rendus des Séances de l'Académie des Sciences, vol. 168, nos. 9 and 10, Mar. 3 and 10, 1919, pp. 429-435 and 484-489, 4 figs. Adjustment of telescope by means of collimator placed in line of axis of rotation and two double-reflection prisms placed near ends of collimator and telescope which permit illuminated opening of collimator to be viewed through eyepiece of telescope. Formulæ for corrections. Determination of coefficients entering in equations given in first part of article (Comptes rendus, vol. 168, Feb. 24, 1919).

WATER SUPPLY

Dry Feeding. The Dry Feeding of Chemicals Used in Water Purification, F. B. Leopold. Mun. & County Eng., vol. 56, no. 4, Apr. 1919, pp. 134-135, 1 fig. Main feature of dry-feed apparatus is cast-iron housing, into which is fitted a drum wheel carrying material forward through an adjustable orifice.

Earthquake Protection. San Francisco's High-Pressure Water Supply, Charles W. Geiger. Eng. World, vol. 14, no. 8, Apr. 15, 1919, pp. 29-32, 6 figs. Safeguards to protect system from damage by earthquakes or accidents.

Factory Water Supply. What it Pays to Know About Factory Water Supply—II, Charles L. Hubbard. Factory, vol. 22, no. 4, Apr. 1919, pp. 689-692, 4 figs. Bringing water to the plant.

Filter Plant. Dundas Has New Filter Plant on Gravity Supply, E. H. Darling. Can. Engr., vol. 36, no. 16, Apr. 17, 1919, pp. 379-382, 6 figs. Concrete dam forms conservation reservoir. Plant has capacity of 700,000 imp. gal. a day.

Manzanares River. Embankment and Hygienic Treatment of the Manzanares River (Encauzamiento y saneamento del rio Manzanares), Edwardo Fungairino. Rivesta de Obras Publicas, vol. 67, no. 2268, Mar. 13, 1919, pp. 121-126, 10 figs. Reinforced-concrete structures being erected.

Montana. Treating Montana Waters, C. Herschel Koyl. Ry. Maintenance Engr., vol. 15, no. 5, May 1919, pp. 154-157, 2 figs. Results yielded by installation of Great Northern Railway for treating waters on 1100 miles of main lines.

Purification. Water Purification. Times Eng. Supp., vol. 15, no. 533, Mar. 1919, pp. 104-105. Methods and aims.

Softening. Lime Softening of Water and the Use of Sludge as an Aid, W. A. Sperry. Can. Engr., vol. 36, no. 16, Apr. 17, 1919, pp. 384-386 also Eng. & Contracting, vol. 51, no. 15, Apr. 9, 1919, pp. 364-365. Experience at Grand Rapids with changing seasons and illustrating the relations of time and temperature. Paper read before Illinois Section Am. Waterworks Assn.

Treating Water Reduces Boiler Troubles, C. Herschel Koyl. Ry. Age., vol. 66, no. 17, Apr. 25, 1919, pp. 1053-1056, 2 figs. Great Northern experiences with installation on 1100 miles of main lines.

Water Softening; Investigation; Features of Plant; and Special Problems of Large Installations, M. F. Stein. Eng. & Contracting, vol. 51, no. 15, Apr. 9, 1919, pp. 353-356, 5 figs. Results of investigation for softening Lake Erie water. A diagram shows ultimate composition of water after treatment with various amount of lime. Paper read before Illinois Section of Am. Waterworks Assn.

Under-Water Mains. Water Main Under Copenhagen Harbor (Vandledning under Havnen til Sundbyerne), Ingeniören, vol. 27, no. 101, Dec. 18, 1918, p. 634. Project for increasing water supply to suburb where rapid growth has made present supply insufficient.

Wells. Methods of Drilling and Test Results of Large Capacity Well. Eng. & Contracting, vol. 51, no. 15, Apr. 9, 1919, pp. 362-363, 3 figs. Data secured at University of Illinois Wells.

WATERWAYS

Flood Control. Flood Control Work in Washington, W. A. Scott. Eng. World, vol. 14, no. 7 Apr. 1, 1919, pp. 23-28, 12 figs. Project involving expenditure of $1,000,000.

Hell Gate Channel. Industrial Influence of Waterways, Harry Chapin Plummer. Indus. Management, vol. 57, no. 5, May 1919, pp. 353-358, 5 figs. How improvement of Hell Gate Channel and Harlem River will affect eastern manufacturers.

Rivers. Formation of Sinuosites in Water Courses (Recherches sur la formation des sinuosités des cours d'eau), C. Hoc. Génie Civil, vol. 74, no. 12, Mar. 22, 1919, pp. 233-234, 7 figs. Theory of meander of rivers developed from study of dynamic conditions of moving point in liquid, considered as subjected to system of elastic forces defined by ellipsoid of elasticity. (Concluded).

VARIA

Coast Defence Work. Civil Engineering in the War, G. K. Scott Moncrieff. Times Eng. Supp., vol. 15, no. 533, Mar. 1919, p. 100. Coast-defense work.

Memorials. Observations on Types of Memorials, A. L. Brockway. Am. Architect, vol. 115, no. 2259, Apr. 9, 1919, pp. 511-514. Remarks that the great monuments of the past are expressions of the ideas of the people who erected them; consequently, that it is not fitting for moderns to celebrate their victories by appropriating expressions of ancient nations.

MECHANICAL ENGINEERING

AIR MACHINERY

Compressed-Air Applications. Compressed Air in the Manufacture of Concrete Pipe, D. W. C. Grove. Compressed Air Mag., vol. 24, no. 4, Apr 1919, pp. 9104-9106, 1 fig. Filling and tamping forms with pneumatic rammer.

CORROSION

Chemistry of Corrosion, Non-Ferrous Metals. Fourth Report to the Corrosion Committee of the Institute of Metals, Guy D. Bengough. Iron & Coal Trades Rev., vol. 98, no. 2665, Mar. 28, 1919, pp. 388-389. Nature of actions that take place when zinc, copper, aluminum, 70:30 brass, etc. corrode in neutral or nearly neutral liquids; behavior of condenser tubes in similar liquids, and variations in behavior in different samples of tubes of the same composition. Also in Min. Jl., vol. 124, no. 4362, Mar. 29, 1919, pp. 190-191. Also abstracted in Engineer, vol. 127, no. 3300, Mar. 28, 1919, pp. 300-301.

Rustproofing. Rustproofing Steel. Machy. (N.Y.), vol. 25, no. 8, Apr. 1919, pp. 736-737, 2 figs. Methods used in plant of Hudson Motor Car Co., Detroit, Mich., for rustproofing passenger-car steel bodies preparatory to painting by means of deoxidine process.

Parker Rustproofing Process, Edward K. Hammond. Machy. (N.Y.), vol. 25, no. 9, May 1919, pp. 851-854, 4 figs. Method which is said to be applicable to machine surfaces without changing their shape or size.

Ships. Corrosion of Ships. Am. Mar. Engr., vol. 13, no. 9, Sept. 1918, pp. 8-9. Manner of protection against corrosion. From Liverpool Jl. of Commerce.

FORGING

Dies. Obtaining Maximum Service from Dies, James C. Cran. Am. Drop Forger, vol. 5, no. 4, Apr. 1919, pp. 172-173 and p. 185. Electric steel recommended.

See also Hammer and Dies below.

Engine Cylinders. Operations on the iberty Motor Cylinders—I, Fred H. Colvin. Am. Mach., vol. 50, no. 16, Apr. 17, 1919, pp. 757-758, 6 figs. Method of forging.

Hammer, Bement Steel. Forgings from Forty-Eight-Inch Ingots. Pac. Mar. Rev., vol. 16, no. 4, Apr. 1919, pp. 118-119, 2 figs. Double-arch Bement steam hammer said to be capable of delivering a blow of 150,000 lb.

Hammer and Dies. A Review of Hammer and Die Problems, R. C. Jennings. Am. Drop Forger, vol. 5, no. 4, Apr. 1919, pp. 180-182, 3 figs. Describes machine patented by writer and designed to use either American or English die blocks.

FOUNDRIES

Brass Foundry. Materials and Chemicals Used in Brass Foundry Practice—V. Charles Vickers. Brass World, vol. 15, no. 4, Apr. 1919, pp. 113-115, 2 figs. History, properties, appearance, physiological action and commercial use of substances commonly used in brass founding. Method for making phosphore-tin.

Crucibles. The Use and Abuse of Crucibles, A. C. Bowles. Min. & Sci. Press vol. 118, no. 15, Apr. 12, 1919, pp. 505-506, 3 figs. Alleges that principal cause of failure of crucibles is lack of proper annealing; states that a temperature of 250 deg. fahr. is required to dispel moisture absorbed from atmosphere.

Engine Castings. Inland Plant Sefs Record on Marine Engine Castings, D. M. Avey. Foundry, vol. 47, no. 5, Apr. 15, 1919, pp. 196-204, 23 figs. Rapid production of castings at plant of Hooven, Owen, Rentschler Co., builders of Corliss type engines; foundry said to have turned out heavy castings for a complete engine per day.

Malleable Castings. Malleable Plant to Revert to Destined Work. Foundry, vol. 47, no. 5, Apr. 15, 1919, pp. 221-224, 6 figs. General arrangement of Nat. Malleable Castings Co. foundry where cast-steel anchor chains are being manufactured. Plant was originally designed for production of malleable castings for automobile service and is being refitted to undertake this work.

Patterns. Patternmaking Methods—II, Joseph A. Shelly. Machy, (N.Y.), vol. 25, no. 8, Apr. 1919, pp. 722-726, 7 figs. Examples of pattern work and methods used in general pattern making practice.

Patterns and Moulds for Engine Cylinder Castings—I, Joseph Horner. Foundry Trade Jl., vol. 21, no. 206, Feb. 1919, pp. 90-94, 13 figs. Principles which control the various classes of work, by reason of the double practice of both patternshop and foundry.

Risers. Hot Water Practice in Relation to Risers—I, W. B. Gray. Metal Worker, vol. 91, no. 15, Apr. 11, 1919, pp. 455-456. Method of determining size.

Sand Blast. Application of the Sand-Blast to General Foundry Work, Parts 1 and 2, H. D. Gates. Pt. 1: Metal Trades, vol. 10, no. 4, Apr. 1919, pp. 172-175, 4 figs. Discusses general question of cleaning castings by sand blast and describes various types of hose machines. Pt. 2: Can. Foundryman, vol. 10, no. 4, Apr. 1919, pp. 90-94, 9 figs. Its applicability and advantages for general foundry work together with examples and data of what has actually been accomplished.

Standardization. Standardization of Foundry Practice, S. W. Wise. Foundry Trade Jl., vol. 21, no. 206, Feb. 1919, pp. 95-97. Record of operation of various cupolas and discussion of the possibility of standardizing cupola practice. Paper read before Newcastle Branch, British Foundrymen's Assn.

Steel Castings. Steel Castings from the Engineer's View-point, H. A. Neel, Proc. Steel Treating Research Soc., vol 2, no. 3, 1919, pp. 14-16 and 43-44 and (discussion) pp. 44-50. Developments in molding and metallurgical practice which have made possible to use steel castings in operations formerly undertaken with forgings.

Manufacture of Steel Castings by Various Processes, David D. MacGuffie. Foundry Trade Jl., vol. 21, no. 206, Feb. 1919, pp. 85-89, 3 figs. Remarks on the crucible, Tropenas, Stock oil-fired converter, and electric-furnace processes. paper read before British Foundrymen's Assn.

FUELS AND FIRING

Ash. Fusibility of Ash from Coals Found in the Interior Province, W. A. Selvig, W. C. Ratliff and A. C. Fieldner. Coal Age, vol. 15, no. 16, Apr. 17, 1919, pp. 698-703. Table of softening temperatures of coal ash from coals of interior province obtained at Fuels Chemical Laboratory tests conducted by Bur. of Mines.

Coal, Lignite. Lignite Coals and Their Utilization, C. C. O'Harra. Pahasapa Quarterly, vol. 8, no. 2, Feb. 1919, pp. 15-35, 18 figs. Extent and estimated reserve of coal deposits of the world; developments in industrial recoveries of coal bye-products.

Combustion Experiments with North Dakota Lignite, Henry Kreisinger, C. E. Augustine and W. C. Harpster. Dept. of Interior, Bur. of Mines, tech. paper 207, 44 pp., 13 figs. Tests were made by burning lignite—both as it comes from mine and as corbonized residue from gas retorts—at various rates in experimental furnaces and by studying process of combustion.

Coal, Pulverized. Pulverized Coal and Its Bearing on the Fuel Situation, H. G. Barnhurst. Manufacturers Rec., vol. 75, no. 16, Apr. 17, 1919, pp. 107-108. Table giving cost of preparing coal in plants of various capacities.

The Use of Pulverized California Coal, Chas. H. Delany. Jl. Electricity, vol. 42, no. 8, Apr. 15, 1919, pp. 357-359. Its substitution for fuel oil is discussed from standpoint of initial costs and comparative operating expense. Paper prepared for Spring Convention of Pac. Coast Section N. E. L. A. by Eng. Committee.

Pulverized Coal as the Reconstruction Fuel for all Industrial Heating Operations, C. F. Herrington. Iron & Steel of Can., vol. 2, no. 4, Apr. 1919, pp. 77-83, 4 figs. Equivalent prices of powdered coal and other fuel. Details of powdered-coal plant.

Coal, Southwestern. Burning Coals of the Southwest, W. M. Park. Power, vol. 49, no. 15, Apr. 15, 1919, pp. 574-575, 4 figs. Large furnace volumes, liberal grate area and unusual quantities of refractory material in the ignition arch and bridge wall, are advocated.

Coal, Storage. Storage of Coal and Spontaneous Combustion. Ry. & Locomotive Eng., vol. 32, no. 4, Apr. 1919, pp. 99-100. Analysis of causes and approved methods of suppression.

Coal, Western. Western Coal, R. D. MacLaurin. Can. Chem. Jl., vol. 3, no. 4, Apr. 1919, pp. 124-125. Means taken by Government officials to stimulate development of these resources. (Concluding article.)

Draft. The Securing of Economy in the Burning of Fuel, J. F. Patton. Power House, vol. 13, no. 4, Apr. 5, 1919, pp. 94-95, 3 figs. Influence of draft on burning of coal; use of draft gages; importance of eliminating air leaks.

Firing. Utilization of Fuels in Industrial Furnaces (L'utilisation des combustibles dans les foyers industriels), Roger Hartmann. Société Industrielle de l'Est, Bul. 145, Feb. 1919, pp. 3-21,3 figs. Theoretical study of economical combustion based on chemical phenomena of ignition; means suggested by the governments of England, America and France for efficient utilization of fuels.

Flue-Gas Analysis. Combustion and Flue Gas Analysis. Dept. of the Interior, Bur. of Mines, tech. paper 219, 12 pp., 6 figs. Recommends use of measuring instruments. Reprint of Eng. Bul. no. 4, prepared by U. S. Fuel Administration.

Fuel Conservation. National Saving of Fuel and Power, Arthur V. White. Can. Engr., vol. 36, no. 11, Mar. 13, 1919, pp. 299-303. Activities of Canadian Committee of Conservation.

Gas, Blast-Furnace. Fuel Economy (Economies de combustible dans une aciérie moderne). Métallurgie, vol. 51, no. 14, Apr. 2, 1919, pp. 777-778. Utilization of gases from blast furnaces. (Concluded.)

Grates. Recent Improvements in Sintering Equipment and Practice. Eng. & Min. Jl., vol. 107, no. 17, Apr. 26, 1919, pp. 744-745, 3 figs. Device intended to prevent grates from getting dirty. Designed for use with the straight-slot type of grate.

Oil Firing. Saving the Waste in the Chimney—V, Robert Sibley and Chas. H. Delany. Jl. Electricity, vol. 42, no. 7, Apr. 1, 1919, pp. 318-320, 7 figs. Operating test of steam power plant operated by fuel oil in San Francisco.

Peat. The Utilisation of Peat for Power Generation—I & II, John B. C. Kershaw. Engineer, vol. 127, nos. 3298 & 3299, Mar. 14 and 21, 1919, pp. 239-240 and 265-267. 11 figs. Processes for carbonizing followed at various plants in France, Sweden and Germany.

FURNACES

Davis Furnace for Baking Electrodes. Davis Furnace for Baking Electrodes (Four Davis à cuire les électrodes). Revue Générale de l'Electricité, vol. 5, no. 12, Mar. 22, 1919, p. 458. Installed at Hecla works of Diamond Foundry, Luton, England, where, it is said, 30,000 tons of electric steel are produced per year at average consumption of 11 lbs. of electrode per ton of steel.

Gas Furnaces. Heating Gas Furnaces, O. L. Kowalke. Gas Rec., vol. 15, no. 7, Apr. 9, 1919, pp. 231-234, 6 figs. Tests to determine maximum temperature which can be obtained in a given furnace, using three types of mixers with regulated and unregulated air supply, by burning carbureted water gas in bunsen flame and also under adapted surface combustion conditions. Paper before Wis. Gas Assn

Gas Furnaces as Re-Heaters of Iron Piles, etc Iron & Coal Trades Rev., vol. 98, no. 2664, Mar. 21, 1919, p. 254. Function gas furnace has to perform in smelting steel and in reheating iron.

Heat-Treating Furnaces. Heating Furnaces and Annealing Furnaces—III, W. Trinks. Am. Drop Forger, vol. 5, no. 4, Apr. 1919, pp. 174-180, 8 figs. Method of computing fuel consumption from losses.

The Design of Heating Furnaces from a Practical Standpoint, George J. Hagan. Proc. Engs. Soc. Western Pa., vol. 35, no. 1, Feb. 1919, pp. 31-47 and (discussion) pp. 48-57, 5 figs. On design and method of construction, with reference to furnaces used in sheet and tin-plate industry and to a continuous rotary furnace for wash and heat.

Melting Furnaces. Metallurgical Furnaces. Adolph Bregman. Metal Indus., vol. 17, no. 4, Apr. 1919, pp. 159-162, 7 figs. Conditions that govern size, shape and type of metal-melting furnaces.

GAGES

Hoke Precision Gages. Manufacture of Hoke Precision Gages at the Bureau of Standards, H. L. van Keuren. Am. Machinist, vol. 50, no. 14, Apr. 3, 1919, pp. 625-630, 6 figs. Gage blocks are being produced at the Bureau with an accuracy limit of a few millionths of an inch. Apparatus used in testing flatness and parallelism to one millionth of an inch. Development of process for their commercial manufacture has taken place within period of 6 months. Special reference is made to light-weight interference method for determining accuracy.

Johanssen Tolerances. Johanssen System of Tolerances. Machinery, vol. 13, no. 339, Mar. 27, 1919, pp. 718-719, 1 fig. On Swedish system based on diameter of hole.

Measurement of Gages. The Measurement of Gauges—I & II, E. A. Forward. Engineer, vol. 127, nos. 3300 & 3299, Mar. 21 and 28, 1919, pp. 282-283 and 294-295, 24 figs. Methods used for measuring three classes of gages: (1) plate or form gages the profiles of which are combinations of straight lines and curves; (2) conical plugs, rings and disks, combinations of cones with cylinders and planes, and castellation gages; (3) position gages.

Plug Gages, Angular. Angular Plug-Gage Making, Hugo Pusep. Am. Machinist, vol. 50, no. 14, Apr. 3, 1919, pp. 635-640, 15 figs. Lays emphasis on elimination of errors in preliminary operation, in order to prevent their accumulation and the appearance of serious defects which will be difficult to eliminate in later operations.

GAS ENGINEERING

Distributing Systems. Increasing Capacity of Low-Pressure Mains by Admitting Gas at More Than One Point, A. C. Howard. Am. Gas. Eng. Jl., vol. 110, no. 16, Apr. 19, 1919, pp. 329-331. Using an artificial gas distributing system for natural gas. From Gas & Elec. News.

Flow of Gas. Flow of Gases Under Heavy Pressure (Sur l'écoulement des gaz à très fortes pressions), A. Rateau Comptes rendus des Séances de l'Académie des Sciences, vol. 168, no. 7, Feb. 17, 1919, pp. 330-335. Changes in gas equation to make it applicable to the flow of gases in guns.

Lighting. The Group and Duct System of Lighting Gas World, vol. 70, no. 1810, Mar. 29, 1919, pp. 237-239, 3 figs. Also in Gas Jl., vol. 146, no. 2916, Apr. 1, 1919, pp. 30-32, 3 figs. System is designed to utilize one injector for supplying any number of burners, in place of each individual burner having gas injector and air intake. There are three separate sets of types—one suplying high pressure gas, one carrying air to an injector for mixing with the gas, and one supplying mixture of gas and air from injector to burners.

Mantles, Gas. Influence of Quality of Gas on the Efficiency of the Gas Mantle, Pts. 2 and 3, R. S. McBride, W. A. Dunkley, E. C. Crittenden and A. H. Taylor, Gas World, vol. 70, nos. 1805 and 1810, Feb. 22 and Mar. 29, 1919, pp. 128-130 and 233-236, 10 figs. Pt. 2: Graphs showing effect of gas-pressure variations upon efficiency, gas consumption and candle-power of various lamps. Pt. 3: Lean water gas reported to have shown qualities for mantle lighting superior to those of rich water gas in proportion to total heating values. Section 1 appears in Gas World for Feb. 8.

Production, Gas. Distribution of Light, Heat, and Motive Power by Gas, Dugald Clerk. Gas Journal, vol. 145, no. 2915, Mar. 25, 1919, pp. 637-640 and (discussion) pp. 640-642; also Gas World, vol. 70, no. 1809, Mar. 22, 1919, pp. 210-212. Efficiency of gas production compared with efficiency of electricity generation. Claim to electric superiority over gas in coal economy considered as unjustified. Thermal efficiency of carbonizing gas coal in horizontal retorts. Paper read before Roy. Soc. of Arts.

Purification, Oil Gas. Liquid Purification of Gas, O. B. Evans. Gas Rec., vol. 15, no. 7, Apr. 9, 1919, pp. 215-216. Concluded from tests of Atlantic Refining Co. that cold liquid purification of oil gas may result in a loss of 25 per cent in candle power. Paper before Am. Gas Assn.

Principles of Gas Purification and Purifier Design, F. W. Steere. Gas Age, vol. 43, no. 7, Apr. 1, 1919, pp. 361-363, 2 figs. Review of methods and suggestions regarding improvements in apparatus employed in removing sulphur from gas. (Concluded.)

Water Gas. Gas Machine Factors Involved in the Manufacture of Carburcted Water Gas. Am. Gas Eng. Jl., vol. 110, no. 15, Apr. 12, 1919, pp. 312-316 and 320-324. Fundamentals upon which process is dependent and suggestions toward locating cause of variations in results.

HANDLING OF MATERIALS

Car Dumper. The Biggest Car Dumper in the World. Sci. Am., vol. 120, no. 15, Apr. 12, 1919, pp. 363 and 382, 4 figs. Virginian Ry. installation designed to handle two 60-ton cars simultaneously; cars are tipped sidewise.

Ship Loading. Radical Departure in Loading Ocean Freighters. Ry. Age, vol. 66, no. 16, Apr. 18, 1919, pp. 981-984, 7 figs. Reported that Erie R.R. utilizes existing equipment in handling 50 locomotives direct from pier to ship.

HEAT-TREATING

Brass. Effects of Heat when Annealing Alloys, H. C. H. Carpenter and L. Traverner. Am. Drop Forger, vol. 5, no. 4, Apr. 1919, pp. 193-196, 2 figs. Chart showing ultimate stress after heating various metals, also time required to cause drop of three points in scleroscope hardness in a brass strip. Paper presented before Inst. Metals, London.

Bronze. Results of Heat-Treating Bronze Castings, George F. Comstock. Foundry, vol. 47, no. 5, Apr. 15, 1919, pp. 189-194, 18 figs. Effects of annealing bronze-alloy castings studied with the aid of photomicrographs of test sections.

Case-Hardening. The Application of Heat in Case-Hardening, Theodore G. Selleck. Jl. Am. Steel Treaters Soc., vol. 1, no. 3, Dec. 1918, pp. 87-98, 11 figs. Value of laboratory reports of analysis and specifications under which material was shipped from manufacturer, as a source of information for determining nature and quality of material to be treated.

Case-Hardening of Carbon Steels (Mécanisme de la trempe des aciers au carbone), Pierre Chevenard. Revue de Métallurgie, vol. 16, no. 1, Jan-Feb. 1919, pp. 17-79, 36 figs. Results of micrographic analysis and tests have caused writer to establish that case-hardening results from transformation at low temperatures (150 to 300 deg. cent.) V-a of austenite; when hardening is complete, steel is made up almost exclusively of martensite. Thus the theory announced by Le Chatalier in 1895 appears to have been confirmed.

Notes on the Process of Case-Hardening, J. R. Handforth. Can. Machy., vol. 21, no. 12, Mar. 20, 1919, pp. 277-280, 10 figs. Photo-micrographs of structures produced by case-hardening. From Machine Tool Rev.

Improved Packing Methods for Carburizing, William H. Addis. Am. Mach., vol. 50, no. 15, Apr. 10, 1919, pp. 679-680, 3 figs. Two methods for spacing pieces.

Steel, Low-Carbon. Heat-Treatment of Low-Carbon Steel. W. M. Wilkie. Can. Machy., vol. 21, no. 17, Apr. 24, 1919, pp. 396-401, 12 figs. Characteristic structures found in steel, their formation by heat treatment and effect each has in quality of steel. Paper read before Toronto Section Am. Soc. Mech. Engrs.

Steel, Tool. Heat Treatment of Tool Steel, S. N. Brayshaw. Ironmonger, vol. 167, no. 2369, Apr. 12, 1919, Believes that precision can only be attained by makers and users of steel by carrying out heat treatments in liquids instead of in atmospheric furnaces. Paper read before Birmingham Metallurgical Soc.

HEATING AND VENTILATION

Hot-Water Heating. Designing Data as Applied to a Large Hot-Water Heating Plant, George E. Reed. Heat & Vent. Mag., vol. 16, no. 4, Apr. 1919, pp. 26-34, 13 figs. Western Practice illustrated in layout for Franklin High School, Portland, Ore. (Concluded.)

Industrial Heating. Saving Steam in Industrial Heating Systems. Dept. of the Interior, Bur. of Mines, tech. paper 221, 14 pp., 7 figs. Calls attention to faults of design and operation which lead to uneconomical use of live steam for heating and other purposes. Reprint of eng. Bul. no. 6, prepared by U. S. Fuel Administration.

Steam Flow. Simplifying Calculations for Flow of Steam in Pipes, Heat. & Vent. Mag., vol. 16, no. 4, Apr. 1919, pp. 19-26. 3 figs. Curves based on generally accepted formulæ.

Tunnel, Simplon. The Ventilation Plant of the Simplon Tunnels (Die Ventilationsanlage des Simplon-Tunnels), F. Rothpletz. Schwizerische Bauzeitung, vol. 73, nos. 1, 2, 5 and 7, Jan. 4, 11 and Feb. 1, 15, 1919, pp. 3-4, 14-16, 41-44 and 72, 20 figs. Instead of two fans, one at each entrance, 1913 project provided for one ventilation plant at Brig with two 11½ ft. fans with central suction openings 8.5 ft. in diameter. Arrangement of plant and details of operation of fans as worked out from study of barometric conditions and past experience are mentioned.

HOISTING AND CONVEYING

Conveyor, Cinder. New Type of Cinder Conveyor. Ry. Age, vol. 66, no. 16, Apr. 18, 1919, p. 1017, 1 fig. Conveyor discharges cinders through pipe line by action of steam jet.

Conveyors, Power Requirements of. Power Plant Management; Coal and Ash Handling—II, Robert June. Power House, vol. 13, no. 4, Apr. 5, 1919, pp. 87-89, 4 figs. Power required for various types of conveyors and conditions under which these are operated.

Conveyor, Scoop. A New Type of Conveyor that Reduces the Cost of Handling Coal, Coke, Ashes, Sand, Etc. Popular Engr., vol. 11, no. 4, Apr. 1919, pp. 22-23, 6 figs., also Cement & Eng. News, vol. 31, no. 4, Apr. 1919, pp. 42-44, 7 figs. Distinctive feature is scoop on feeding end, which can be pushed or completely buried into material to be conveyed. Conveyor is equipped with a 16-inch belt and driven by 2-hp. electric motor.

A New Portable Elevator. Coal Trade Jl., vol. 50, no. 16, Apr. 16, 1919, pp. 410-411, 5 figs. Elevator has scoop on feeding end, which can be pushed or completely buried into the material to be conveyed.

Cranes. Lifting Cranes in Shipbuilding Yards (Les appareils de levage dans les chantiers de constructions navales). Génie Civil, vol. 74, no. 14, Apr. 5, 1919, pp. 265-268, 8 figs. Their constructiln and location as affecting economical and rapid transportation of materials. Examples of installations in English yards.

Luffing Cranes. Eng. World, vol. 14, no. 7, Apr. 1, 1919, pp. 55-57, 1 fig. Description of Topils crane used in an English shipyard.

HYDRAULIC MACHINERY

Backwater. New Methods for the Solution of Backwater Problems, H. R. Leach. Eng. News Rec., vol. 82, no. 16, Apr. 17, 1919, pp. 768-770, 6 figs. Suggestions in regard to simplifying reduction of complications by using diagram with only one major variable.

Bernoulli's Formula. On Bernoulli's Formula (Sur la formule de Bernoulli), Emile Cotton. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 11, Mar. 17, 1919, pp. 547-549. Modification by taking into account actual conditions of motions of natural liquid in tube of finite section.

Conduit Protection. Devices for Regulating Automatically the Delivery of a Pressure Conduit (Appareils automatiques d'arrêt du débit des conduites forcées), N. de Schoulepnikow. Bulletin Technique de la Suisse Romande, vol. 45, no. 7, Apr. 5, 1919, pp. 57-59, 3 figs. Bourchayer-Viallet syphon.

Drops. Flow of Liquid Drops Through Cylindrical Pipes (Sur les lois de l'écoulement des liquides par gouttes dans des tubes cylindriques), L. Abonnenc. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 11, Mar. 17, 1919, pp. 556-557. Experimental confirmation of formula developed by Vaillant, in which time between consecutive drops in a parabolic function of weight of drop.

Flood Protection. Panels of Movable Weir Collapse Automatically. Eng. News-Rec., vol. 82, no. 17. Apr. 24, 1919, pp. 818-820, 5 figs. Details of automatic tripping control operated by float in chamber which is filled as flood rises.

Flow. On the Flow of Fluids (Sur l'écoulement des fluides), L. Lecornu, Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 10, Mar. 10, 1919, pp. 481-484. Velocity of fluid in a conduit of variable cross-section.

Ram, Hydraulic. The Hydraulic Ram. Fire & Water Eng., vol. 65, no. 16, Apr. 16, 1919, pp. 873-875, 2 figs. Principle of operation and discussion of its possibilities for small-town installations.

The Hydraulic Ram, W. S. H. Cleghorne. South African Jl. Industries, vol. 2, no. 2, Feb. 1919, pp. 135-142, 6 figs. Principles of action and conditions necessary for successful operation.

Turbines. Economical Operation of Water Turbines, F. H. Rogers. Elec. World, vol. 73, no. 14, Apr. 5, 1919, pp. 680-683, 7 figs. Value of principal losses that may occur and methods of locating their origin; inquiry into effect of losses on output.

Water Economy. Water Economy in Hydroelectric Plants, L. W. Wyss. Elec. World, vol. 73, no. 15, Apr. 12, 1919, pp. 727-728, 1 fig. Claims that output of plant is increased by allowing excess water to run off at night.

Water Hammer. Water Hammer in Conduits of Variable Diameter (Sur les coups de bélier dans les conduites de diamètre variable), G. Guillaumin. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 12, Mar. 24, 1919, pp. 605-608. Theory based on assumption that water travels at uniform speed.

INTERNAL-COMBUSTION ENGINES

ACETYLENE. Acetylene Motors, C. F. Keel. Acetylene & Welding Jl., vol. 16, no. 186, Mar. 1919, pp. 48-49. General summary of actual position in regard to developments accomplisbed during war in utilization of acetylene as a motor fuel. (To be continued.) Translated from paper published by Swiss Acetylene Assn.

BORE-STROKE RATIO. The Problem of Bore-Stroke Ratio, Georges Funck. Autocar, vol. 42, no. 1225, Apr. 12, 1919, pp. 528-532. 4 figs. Study of bore-stroke ratio as dependent on number of cylinders, their disposition and system of cooling, and for the purpose for wbicb engine is intended to be used.

COMPOUND GAS ENGINES. Expansion, Robert Miller. Motor Boat, vol. 16, no. 8, Apr. 25, 1919, pp. 21-24, 5 figs. Possible increase in efficiency of internal-combustion engine by increasing expansion, with reference to compound gas engine, with two jacketed high-pressure cylinders each discharging into a low-pressure unjacketed cylinder.

DESIGN. A Comparison of Airplane and Automobile Engines, Howard C. Marmon. Jl. Soc. Automotive Engrs., vol. 4, no. 4, Apr. 1919, pp. 237-239. Deals particularly with weight in cylinder construction, design of cranksbaft and crank-cases and economy in fuel and oil consumption.

DIESEL-ENGINE PISTONS, SEIZURE. Seizures of Diesel Engine Pistons, Edward Ingham. Electrical Review, vol. 84, no. 2160, Apr. 18, 1919, pp. 451-452. Seizures are attributed to overbeating of piston and resulting expansion of metal, consequently proper lubrication and cooling of piston are advised.

FUELS. More Efficient Utilization of Fuel, Cbarles F. Kettering. Jl. Soc. Automotive Engrs., vol. 4, no. 4, Apr. 1919, pp. 263-269, 10 figs. Distillation curves of various internal-combustion engine fuels; specific gravity fuels. Conclusions obtained from examination of causes which produce cylinder knocks.

An Interpretation of the Engine-Fuel Situation, Joseph E. Poque. Jl. Soc. Automotive Engrs., vol. 4, no. 4, Apr. 1919, pp. 247-252 and (discussion) pp. 252-255, 3 figs. Future of automotive industry is represented as depending on three factors: adaptability of "internal-combustion" engines to use of liquid fuel, supply of crude petroleum, and production of substitute fuel.

Fuel Economy of Automotive Engines, H. C. Dickinson. Jl. Soc. Automotive Engrs., vol. 4, no. 4, Apr. 1919, pp. 227-233, 6 figs. Properties of fuels which are subject to specification test are examined and trend of future development in utilization of new fuels of internal-combustion engines is discussed from viewpoint of expediency in adopting single fuel for all automotive engines.

GAS ENGINES, HIGH-POWER. High-Power Gas Engines, William Stead. Gas and Oil Power, vol. 14, no. 163, Apr. 3, 1919, pp. 93-96. Part large gas engine may play in state control scheme of electric power generation for power and light supply.

MOTORCYCLE. Tbe Engine of the Side Car Motorcycle—II. E. Cauldwell. Automotive Industries, vol. 40, no. 17, Apr. 24, 1919, pp. 911-913, 6 figs. Lift, velocity and acceleration curves for 3000 r. p. m. of crankshaft; lubrication features of 4-cyl. Henderson engine. Paper presented to Instn. Automobile Engrs.

OIL ENGINE. Tbe Oil Engine—Its Economic Position in tbe Marine Field, Theodore Lucas. Pac. Mar. Rev., vol. 16, no. 4, Apr. 1919, pp. 93-98, 3 figs. Advantage of liquid-fuel engines over steam engines is said to consist in reduction of cost and adding to useful carrying capacity of ship. Comparison of methods of mecbanical atomization with reference to arrangement of Lucas engine.

The Higb-Compression Oil Engine, W. G. Gernandt. Gas Engine. vol. 21, no. 5, May 1919, pp. 155-161, 3 figs. Comparison of various methods of injecting liquid fuel into combustion chamber of engine. Opinion is expressed that bigh-compression type of engine is suitable for burning of heavy fuel oils.

PRESSED-STEEL ENGINES. Pressed Steel Engines. Autocar, vol. 42, no. 1225, Apr. 12, 1919, pp. 537-538, 5 figs. Process for stamping from steel sbeets main parts and various details of engines.

RICARDO TANK ENGINES. Tbe 150 H. P. Ricardo Tank Engine, H. A. Hetberington. Automobile Engr., vol. 9, no. 125, Apr. 1919, pp. 116-120, 5 figs. Details of piston, valve and valve gear. (To be continued).

WISCONSIN ENGINES. Liberty Line of Wisconsin Engines. Automotive Industries, vol. 40, no. 15, Apr. 10, 1919, pp. 796-798, 4 figs. Principal characteristics include unit power plant design, aluminum crankcases, pressure lubrication and "all-steel" three-point support.

LUBRICATION

COMPRESSORS, AIR. Lubrication of Air Compressors, H. V. Conrad. Coal Age, vol. 15, no. 16, Apr. 17, 1919, pp. 704-706, 1 fig. Discusses rate of feed and carbon-cutting metbods and concludes with remarks on steam-engine lubrication.

JOURNAL BOXES. Lubrication and Care of Journal Boxes, M. J. O'Connor. Ry. Rev., vol. 64, no. 17, Apr. 26, 1919, pp. 620-621. Directions for preparing oil and waste for packing journal boxes; reclaiming oil packing removed form cars; of inspection of cars so tbat lubricating trouble may be kept down to a minimum.

LUBRICANTS. Lubricants for the Power Plant, Reginald Trautschold. Power Plant Eng., vol. 23, no. 8, Apr. 15, 1919, pp. 353-358, 3 figs. Qualities of a good oil; tests of grade of oil and grades for various uses.

Properties of Representative American Lubricating Oils for Use in Internal Combustion Engines. Aerial Age, vol. 9, no. 6, Apr. 21, 1919, p. 289. Table showing physical properties and percentage of distillation under 300 deg. cent. in vacuum.

MACHINE ELEMENTS AND DESIGN

BELTING. Fiber Belting (Zellstoff-Treibriemen), E. O. Rasser. Kunststoffe, vol. 8, no. 11, June 1, 1918, pp. 122-125. Describes various types such as woven paper belting, paper belting witb clotu filler, paper-yarn belting, knitted paper-yarn belting, plaited belting, paper-yarn belting witb wire filler, and tbe processes of their manufacture. Also type of joints and care of this type of belting.

GEARS. Gears for Tractor Construction, E. J. Forst. Automotive Industries, vol. 40, no. 17, Apr. 24, 1919, pp. 891-892. Importance of using bigh-grade steel on account of resulting compactness of transmission and greater facility of enclosing it.

Worm Gear Efficiency, C. H. Calkins. Automotive Industries, vol. 40, no. 15, Apr. 10, 1919, pp. 786-787, 2 figs. Baush company's worm-wheel testing stand for determining efficiency of worm-and-wbeel rear-axle drives.

Worms and Worm Gears, G. W. Carlson. Am. Mach. vol. 50, no. 17, Apr. 24, 1919, pp. 809-811. Application of this form of gearing is suggested for otber purposes tban automotive drives.

GEARS, MAGNETIC. Magnatic Gears (Engrenages magnetiques), Leopold Reverchon. Industrie Electrique, vol. 28, no. 643, Apr. 10, 1919, pp. 133-135, 4 figs. Escapement wheel rotated by alternative actions of a fixed magnet on one side and a magnet attached to an oscillating pendulum on the other upon magnetic needles placed in periphery of wheel symmetrically witb respect to its center.

JOINTS. The Design of Riveted Butt Joints, Alpbonse A. Adler. Mecb. Eng., vol. 41, no. 5, May 1919, pp. 433-436. Design equations derived from Schwedler's graphical method.

MACHINE SHOP

BABBITTING. Babbitting Higb-Speed Vertical Spindles, Stanley White. Wood-Worker, vol. 38, no. 2, Apr. 1919, pp. 42-43. Cautions against pouring metal before aligning spindle.

BORING, DUDGEON SYSTEM OF. Dudgeon System of Precision Boring. Macby. (N. Y.), vol. 25, no. 9, May 1919, pp. 803-805, 7 figs. Method of boring jigs and similar work by means of simple equipment and without depending upon accuracy of machine used for operating boring bar.

CRANKSHAFT MACHINING. Cranksbaft Macbining. Automobile Engr., vol. 9, no. 122, Jan. 1919, pp. 10-12, 11 figs. Equipment manufactured by Le Blond Co., Cincinnati.

CYLINDER MACHINING. Cylinder Boring and Reaming—I & II. Macbinery, vol. 13, nos. 338 & 339, Mar. 20 and 27, 1919, pp. 681-689 and 713-717, 26 figs. Classification of methods, their application to different kinds of work, and illustrations of actual operations. Description of tools, fixtures and machines used.

Cylinder Grinding—II, Franklin D. Jones. Machy. (N.Y.), vol. 25. no. 8, Apr. 1919, pp. 711-715, 11 figs. On advantages of finishing cylinder bores by grinding; machines used; practice in plants making automobile and airplace engines.

EQUIPMENT LAYOUT. Arrangement of Equipment in Sbops, James Forrest. Am. Mach., vol. 50, no. 15, Apr. 10, 1919, pp. 699-701. Straight-line and contract-sbop layout problems contrasted and cardboard models suggested.

JIGS AND TOOLS. Jig and Tool Design—II, G. H. Hey. Macbinery, vol. 13, no. 338, Mar. 20, 1919, pp. 704-708, 7 figs. Metbod of using drills and reamers in multi-spindle machine; standard wall bandles, knurled nuts and index plungers.

MICROSCOPE. The Microscope in the Tool-room, Jobn Scott. Macby. (N.Y.), vol. 25, no. 9, May 1919, pp. 799-802, 6 figs. Its application to precision work on master plates and for cutting screw threads.

MILLING. Continous Rotary Milling—I & II, Edward K. Hammond. Machy. (N.Y.), vol. 25, nos. 8 and 9, Apr. and May 1919, pp. 687-694 and 842-846, 24 figs. Types of milling machines tbat operate without interruption; work-holding fixtures and methods of setting up parts to be milled.

MOTORS. Planning Efficient Motor Drives and Connections, G. B. Howe. Wood-Worker, vol. 38, no. 2, Apr. 1919, pp. 34-35, 6 figs. Examples of individual motor drive arrangements in wood-working plants.

Metbods of Mounting Motors on Ceilings, Ralpb G. Bradsbaw. Can. Macby., vol. 21, no. 16, Apr. 17, 1919, pp. 373-375, 10 figs. Practice followed at various shops.

MACHINERY, METAL-WORKING

BORING HEADS. Tools for Boring Closed-Bottom Work. Macbinery, vol. 13, no. 339, Mar. 27, 1919, pp. 735-736, 6 figs. Types of blades used in boring heads and methods of grinding and setting the blades.

CHUCK, SPILLMAN AUTOMATIC. Spillman Automatic Cbuck (Maudrin à centrage automatique système H. Spillman). Génie Civil. vol. 74, no. 13, Mar. 29, 1919, pp. 251-254, 5 figs. Description of instrument; characteristic curves determined from measurements effected during actual performance.

CYLINDER-BORING MACHINE. Quadruplex Cylinder-Boring Machine. Engineering, vol. 107, no. 2779, Apr. 4, 1919, pp. 432-434, 7 figs. Model after French enclosed type.

Cylinder Boring and Beaming Fixtures, Franklin D. Jones. Machy. (N. Y.), vol. 25, no. 9, May 1919, pp. 822-825, 11 figs. Designs of fixtures for locating and holding automobile engine cylinder castings during the boring and reaming operations.

JIGS. Jigs, Tools, etc., for the Production of Standardized Parts, Herbert C. Armitage. Engineer. vol. 127, no. 3300, Mar. 28, 1919, pp. 309-310, 1 fig., also Iron & Coal Trades Rev., vol. 98, no. 2665, Mar. 28, 1919, pp. 378-379, 2 figs.; and Engineering, vol. 107, no. 2779, Apr. 4. 1919, pp. 434-437, 8 figs. Advantages derived by use of jigs and tools are claimed to be: interchangeability of work; cheapening of production; ability to use less skilled class of labor on manufacturing work. Effect of war conditions on engineering practice; curves sbowing relation between output and cost of components. Scheme for milling both ends of twenty connecting rods per hours.

LATHES. Italian Lathe for Gun Turning (Di un tornio Italiano per la lavoraxione di pezzi d'artiglieria). Augusto de Marchi. Industria, vol. 33, no. 5, Mar. 15, 1919, pp. 136-143, 26 figs. Description of lathe specially designed for accurate work. Reference is made to tolerances permitted in manufacture of artillery parts.

PLANERS. Cincinnati Open-Side Planing Machines. Am. Mach., vol. 50, no. 16, Apr. 17, 1919, pp. 725-728, 6 figs. Amoung the points of interest cited are power rapid traverse for rail heads, hox-type table, forced luhrication of the V's, patent "tu-speed" drive on 36-in. and 48-in. machines, quick-reverse aluminum pulleys and extra capacity table.

A Combination Machine Tool, Iron Age, vol. 103, no. 16, Apr. 17, 1919, pp. 1001-1003, 6 figs. Planner equipped with tool head and accessory parts designed for performing fundamental machining operations.

THREAD-CUTTING MACHINE. Thread-Cutting and Spindle-Boring Tools, J. H. Moore. Can. Machy., vol. 21, no. 16, Apr. 17, 1919, pp. 371-372, 4 figs. Description of standard lathe for precision thread cutting.

TOOLS, FORMING. Tools for Automatic Machines, H. E. Thomas. Machinery vol. 14, no. 340, Apr. 3, 1919, pp. 16-18, 13 figs. Types of forming tools; diagrams for determining diameter of forming tools. Read before Manchester Assn. of Engrs.

MACHINERY, SPECIAL

BALANCING MACHINES. Dynamic and Static Balancing. Machinery, vol. 14, no. 341, Apr. 10, 1919, pp. 40-44, 12 figs. Machines for balancing high-speed pulleys; aeroplane propeller static balancing machine; combination static balancing and drilling machine; "umbrella" type of balancing fixture. Second article.

CLUTCHES. Automatic Clutch Design, M. H. Sabine. Machinery, vol. 14, no. 340, Apr. 3, 1919, pp. 1-5, 7 figs. Designed for controlling power unit from distant position. Clutch is electro-mechanically operated.

DESIGNS. Developing Designs for Machinery and Tools. Machinery, vol. 13, no. 338, Mar. 20, 1919, pp. 690-791, 5 figs. Example of design evolution of two-wheel construction with traversing wheel slides.

DIVIDING MACHINES. Special Dividing Machines (Maguinas es peciales para granduar), J.V. Hunter. Ingenieria Internacional, vol. 1, no. 1, Apr. 1919, pp. 20-21, 8 figs. Type designed for circular division.

PORTABLE MACHINERY. The Use of Portable Machinery in Ship Construction, G. F. Mackay. Elecn., vol. 82, no. 15, Apr. 11, 1919, pp. 429-431, 9 figs. Features of electric caravan, winches, sawing machines, electric drills, and electric deck planers.

TOOL EQUIPMENT. Principles of Special Machine Design, F. E. Johnson. Machy (N. Y.), vol. 25, no. 9, May 1919, pp. 797-798. Concerning tool equipment of manufacturing machines.

THREAD-MILLING MACHINE. Continuous Thread Milling Machine of Unusual Design, Edward K. Hammond. Machy. (N. Y.), vol. 25, no. 8, Apr. 1919, pp. 727-729, 3 figs. Description of machine designed for use in turning and threading bars of large diameter and indeterminate lenght.

MACHINERY, WOODWORKING

PATTERN-TURNING MACHINE. Pattern Turning—I, Joseph A. Shely. Machy. (N. Y.), vol. 25, no. 9, May 1919, pp. 836-841 12 figs. Equipment required and methods used in turning.

MATERIALS OF CONSTRUCTION AND TESTING OF MATERIALS

BRASS. Structural Characteristics of Rolled Sheet Brass, H. A. Eastick. Metal Indus., vol. 17, no. 4, Apr. 1919, pp. 176-178, 6 figs. Chart showing temperature at which recrystallization of alpha brass of different degrees of hardness commences.

BUILDING MATERIALS. Cheap Building Materials (Die Ausstellung "Sparsame Baustoffe" in der Austellungshalle am Zollogischen Garten). Zentralblatt der Bauverwaltung, vol. 38, nos. 102 and 103, Dec. 18 and 21, 1918, pp. 506-507 and 513-514, 6 figs. Describes exhibits shown at exhibition in Zoological Garden in Berlin, specially two types,— the "Vogt" concrete wall built of thin blocks of channel section interlocked and with certain interstices filled with cement grouting, and the "Ambi," built of thin concrete plates, with projecting ribs which interlock, the key being of cement grouting.

CAST IRON. Properties of Cast-Iron Test Bars, H. J. Young. Foundry Trade Jl., vol. 21, no. 207, Mar. 1919, pp. 157-160, 16 figs. Photomicrographs showing defects in test bars. Paper read before Newcastle Branch British Foundrymen's Assn.

GLUES. Compositions of Glues (Differentes composiciones de cola en la industria). Boletin de la Sociedad de Fomento Fabril, vol. 35, no. 12, Dec. 1918, pp. 834-840. Preparation of glues and allied productions for industrial purposes. (Concluded).

LEATHER. Physical Examination of Leather and Leather Substitutes (Zur physikalischen Prüfung von Leder und Ersatzstoffen für Leder), R. Lauffmann. Kunststoffe, vol. 8, no. 8, Apr. 2, 1918, pp. 85-87, 3 figs. Examination regarding wearing qualities, tearing resistance, elongation, water absorption capacity, water permeation capacity and water resistance, and specific gravity.

RESISTANCE OF MATERIALS. The Resistance of Materials—II, G. S. Chiles and R. G. Kelley. Ry. Mech. Engr., vol. 93, no. 4, Apr. 1919, pp. 181-184, 7 figs. Effect of sudden or abrupt changes in section on the distribution of unit stresses.

STEEL. Dynamic Resistance of Steel (Sur la résistance dynamique de l'acier), Louis Roy. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 6, Feb. 10, 1919, pp. 304-307. Account of theoretical study and experimental verifications with gun bullets.

On the Elasticity of Steel, Akimasa Ono. Memoirs of the Coll. of Eng. Kyushu Imp. University, Fukuoka, Japan, vol. 1, no. 4, 1919, pp. 269-332, 18 figs. Experimental research; effect of elastic hysteresis on indication of load; temperature effect on deformation and effect of mechanical and thermal treatments on the constancy of elastic properties.

WIRE ROPE. Investigation of Wire Rope, J. H. Griffith. Eng. & Min. Jl., vol. 107, no. 17, Apr. 26, 1919, pp. 737-738. Tests on wire ropes having diameter smaller than those of average mine hoisting ropes. Report by Bur. Standards, Pittsburgs.

MEASUREMENTS AND MEASURING APPARATUS

CALORIMETER. An Improved Form of Throttling Calorimeter, W. R. Woolrich. Power, vol. 49, no. 12, Apr. 1, 1919, pp. 495-496, 2 figs. Explains how instrument may be made self-contained by having necessary curves drawn on a metal plate fastened to barrel or calorimeter.

CLINOMETER. A Useful Instrument, H. L. Seymour. Can. Engr., vol. 36, no. 13, Mar. 27, 1919, pp. 335-337, 2 figs. Abney Hand level, pocket altimeter or clinometer and its uses in surveying engineering and architectural work.

COAL METERS. A Coal Meter for Boilers. Engineer, vol. 127, no. 3298, Mar. 14; 1919, p. 261, 2 figs. Lea recorder intended for boilers fitted with chain grates, similar in operation to the well-known V notch recorders and integrators for water measurements.

COLORIMETER. The Numerical Expression of Color Properties, Paul H. Geiger. Michigan Technic, vol. 32. no. 1, Mar. 1919, pp. 36-40, 2 figs. Principle upon which Nutting colorimeter operates.

FLOW IN PIPES, FLUID. Electrical Measurement of Fluid Flow in Pipes, Jacob M. Spitzglass. Mech. Eng., vol. 41, no. 5, May 1919, pp. 429-432 and 487, 6 figs. Theory and development of device embodying ammeter and watt-hour meter in which the electric current flowing is proportional to the quality of fluid passing through pipe.

HARDNESS TESTS. Hardness Tests of Gun-Barrel Steel. William Kent Shepard. Am. Mach., vol. 50, no. 16, Apr. 17, 1919, pp. 739-742, 2 figs. Ultimate strength, yield point, Brinell and scleroscope hardness number. Percentage reduction in area and elongation in 2-in. Brinell diameter and scleroscope hardness number.

INDICATING INSTRUMENTS, RESIDENCE OF. The Concept of Resilience with Respect to Indicating Instruments, Frederick J. Schlink. Jl. Franklin Inst., vol. 187, no. 2, Feb. 1919, pp. 147-169, 2 figs. Deals particularly with instruments of index-and-scale and value-controlling types of class of non-integrating instruments, as distinguished from integrating instruments and those used for comparison purposes strictly.

MICROSCOPE. Usefulness of the Metallurgical Miscroscope to the Engineer, E. D. Fahlbarg Wisconsin Engr., vol. 23, no. 7, Apr. 1919, pp. 255-257, 4 figs. Examples of its uses in examination of carbon steel.

PYROMETERS. Standards of Temperature and Means for Checking Pyrometers. Jl. Am. Steel Treaters Soc., vol. 1, no. 3, Dec. 1919, pp. 99-110, 7 figs. A consideration of sources of error in thermocouple pyrometers leads writer to advise that in order to secure reliable measurements in plant turning out high-grade heat-treated product, following equipment should be available: Standard precision and double range potentiometers with accessories, one mounted and two unmounted platinum thermo-couples, checking furnace with control panel and extra standard cell.

SCALE CONVERSION. Conversion of Uneven into Even Scales (Die Umwandlung einer ungleichmäßigen Teilung in eine gleichmaßige), Hugo Krüb. Zeitschrift fur Instrumentenkunde, vol. 38, no. 12, Dec. 1918, pp. 195-200, 6 figs. Conversion effected by means of two equal bars hinged at one end and constrained to move at the other along a straight line reproducing both scales. When hinged end is moved along a curve, the shape of which depends on nature of uneven scale, the other ends point at corresponding values in the scales.

STEAM GENERATION. Determining Economy of Steam Generation, G. H. Sheasley. Power Plant Eng., vol. 23, no. 9, May 1, 1919, pp. 395-397. Methods of procedure and equipment required.

TEMPERATURES, LOW. The Meeasurement of Low Temperatures with Thermo-couples, Thomas Spooner. Jl. Franklin Inst., vol. 187, no. 4, Apr. 1919, pp. 509-511, 2 figs. Chromel-alumel thermocouple for measuring temperatures below 0 deg. cent.

THERMOMETER, MERCURY, TESTING. Simple Boiling Point Apparatus for Testing Mercury Thermometers at Temperatures over 100 deg. C. (Ein einfacher Siedepunktapparat zur Prufung von Quecksilberthermometern bei Temperaturen über 100 deg. C.), Gottfried Dimmer. Zeitschrift für Instrumentenkunde. vol. 38, no. 3, Mar. 1918, pp. 33-40, 2 figs. Describes tests with thermoelement and mercury thermometer and results. Substances used were aniline of 184.1 deg.; naphthaline at 218 deg.; benzophenone at 306 deg.; and sulphur at 444.6 deg.

TURBO-ALTERNATORS, EFFICIENCY. The Determination of Efficiency of the Turbo-Alternator, S. F. Barclay and S. P. Smith. Engineer, vol. 127, no. 3299, Mar. 21, 1919, pp. 290-291, 2 figs. Determination from measurements of the cooling air and by the "air-heating" method.

WATER LEVEL, DISTANT. Measuring Distant Water Levels, C. G. Brown. Electricity, vol. 33, no. 1482, Apr. 4, 1919, pp. 201-202, 3 figs. Instrument employ relay connected to selenoid resistance in which contract placed alongside is controlled by height of river by means of float. Suitable arrangement records motions of float at hydraulic station

WATER-WASTE TESTING. Devices for Water-Waste Surveys at Oak Park Illinois. Eng. News-Rec., vol. 82, no. 17, Apr. 24, 1919, pp. 829-831, 2 figs. Portable venturimeter to test pipe districts with pitometer inserted in house service.

MECHANICS

ARTICULATED RODS. The Articulated Rod, T. L. Sherman. Automobile Eng., vol. 9, no. 125, Apr. 1919, pp. 102-106, 16 figs. Formulæ for various mechanical quantities and inertia forces curves on articulated-rod system in which two cylinders are fixed in one plane at a certain angle.

BEAMS. Economical Sections of Simple Reinforced-Concrete Beams (Recherche des sections économiques des poutres simples en béton armé travaillant à la flexion), G. Guillaumin. Génie Civil, vol. 74, no. 13, Mar. 29, 1919, no. 249-251. Proposes simplification of calculation and formulæ which have appeared in Eng. News, Feb. & June 1907, and in Technique Moderne, Jan. 1910.

Distribution of Metal in Beams and Levers, Eugene Motchman. Scale Jl., vol. 5, no. 7, Apr. 10, 1919, pp. 13-14, 7 figs. Application of design and formulæ to beams used in scales.

ELASTIC STRESSES. Strains due to Temperature Gradients, with Special Reference to Optical Glass, Erskine D. Williamson. Jl. Wash. Acad. Sciences, vol. 9, no. 8, Apr. 19, 1919, pp. 209-217, 1 fig. General equations for elastic stresses produced by temperature differences in spheres, cylinders and slabs when the temperature distribution is symmetrical about the center axis or central plane, respectively. More specific equations are given for the case of temperature distribution due to uniform surface heating.

FRAMES. Analysis and Tests of Rigidly Connected Reinforced Concrete Frames, Mikishi Abe. University of Illinois Bul. no. 107, vol. 16, no. 8, Oct. 21, 1918, 106 pp., 59 figs. Formulæ for moments and other indeterminate quantities for several types of indeterminate structures. Formulæ have been derived by methods involving use of principle of least work, and their applicability and reliability were tested in frames designed according to them.

IRREGULARITY, COEFFICIENT OF. Coefficient of Irregularity of Steam Engines, Gas Engines and of Electric Generators Running in Parallel (coefficient d'irrégularité des machines à vapeur, moteurs à gaz et marche en parallèle de génératrices électriques), M. Barrusta. Industrie Electrique, vol. 28, no. 642, Mar. 25, 1919, pp. 104-109. Formulæ developed from assomption that fly-wheel possesses two motions, one uniform and one pendular; in the case of electric generators motion is considered as resulting from action of two couples and its regularity is expressed in terms of a parameter in the differential equation of motion.

PENDULUM. Note on the Motion of a Simple Pendulem after the String has Become Slack, W. B. Morton London, Edinburgh and Dublin Phil. Mag., vol. 37, no. 219, Mar. 1919, pp. 280-284, 1 fig. Finds from graphs constructed from theoretical considerations that ultimate motion approaches asymptotical to oscillation between ends of horizontal diameter.

SHAFTS, CRITICAL SPEED OF. Critical Speed in Tapered Shaft Design, Machinery, vol. 13, no. 338, Mar. 20, 1919, pp. 694-695, 1 fig. Diagram for determining critical speed of tapered shafts.

SHAFTS, WHIRLING SPEED OF. The Lateral Vibration of Loaded Shafts in the Neighbourhood of a Whirling Speed—the Effect of Want of Balance, H. H. Jeefcott. London, Edinburgh and Dublin Phil. Mag., vol. 37, no. 219, Mar. 1919, pp. 304-314, 4 figs. Discusses how want of balance causes so-called "whirling speeds" and to what extent it is practical to carry balancing.

SPRINGS. Thermodynamics of Springs (Zur Thermodynamik der Federn), H. Bock. Zeitschrift fur Instrumentenkunde, vol. 38, no. 7, July 1918, pp. 109-115, 3 figs. Method evolved after p-r diagram of Gast theory for presenting thermal processes; application of method to theory of springs makes it possible at least partly to calculate "elastic after effect" by means of entropy theorem.

A New Theory of Plate Springs—III, David Landau and Percy H. Parr. Jl. Franklin Inst., vol. 187, no. 2, Feb. 1919, pp. 199-213, 3 figs. On "nip" stresses and "life" of plates under varying stresses produced in metal when in use.

MOTOR-CAR ENGINEERING

ALUMINUM. The Why of Aluminum in Motor Cars, H. M. Taylor. Motor Age, vol. 35, no. 16, Apr. 17, 1919, pp. 7-9, 3 figs. Feature of 8-cyl. engine built almost entirely of aluminum; welding and machining aluminum parts.

BRAKE LEVERS. Determining Correct Location of Brake Levers, Walter C. Baker. Automotive Industries, vol. 40, no. 17, Apr. 24, 1919, pp. 914-917, 6 figs Attemps to show how braking action may be remedied by changing their loads and their location. Maintains that brakes are not to blame for pedal motion due to torque and spring action.

BENZOL. Benzole as a Motor Fuel, Eric W. Walford. Autocar, vol. 42, no. 1223, Mar. 29, 1919, pp. 439-441, 2 figs. Hints concerning its use, either by itself or mixed with petrol.

DESIGN. Progressive and Retrogressive Designing, Otto M. Burkhardt. Jl. Soc. Automotive Engrs., vol. 4, no. 4, Apr. 1919, pp. Technical considerations on elimination of certain links and members in design of motor vehicle. Elimination of torque and radius rods is one of various examples considered.

Probable Effect on Automobiles of Experience with War Airplanes, O. E. Hunt. Jl. Soc. Automotive Engrs., vol. 4, no. 4, Apr. 1919, pp. 243-245. Holding improvements in airplane engines not suitable for cars, writer believes that the most important contribution which the airplane has made to the automobile is stimulus to thought of industry as a whole that has resulted from study of design and manufacturing problems.

ENGINES. Possible Effect of Aircraft Engine Development on Automobile Practice, Henry M. Crane. Jl. Soc. Automotive Engrs., vol. 4, no. 4, Apr. 1919, pp. 240-242. Writer does not expect any radical change in automobile design. but only a probable increase in number of "valve-in-the-head" engines.

EUROPEAN CARS. Post-War Cars Designed by Europe, W. F. Bradley. Motor Age, vol. 35, no. 15, Apr. 10, 1919, pp. 24-27, 11 figs. Comparison of types shown at Lyons fair with American models.

The Angus Sanderson Car. Automotive Industries, vol. 40, no. 17, Apr. 24, 1919, pp. 888-890, 6 figs. Embodies engine with slipper-type piston, counterbalanced crankshaft, integral cylinder block and top half of crankcase, and forced-feed lubrication.

Automotor Design and Construction of 1919. Auto, vol. 24, no. 15, Apr. 10, 1919, pp. 360-364, 8 figs. Mechanical arrangement of the 16 hp. Panhard.

A New British Quantity-Production Car. Automotive Industries, vol. 40, no. 15, Apr. 10, 1919, pp. 807-808, 4 figs. Austin 20 hp. open touring car.

A New Eight-Cylinder Piecard-Pictet. Autocar, vol. 42, no. 1223, Mar. 29, 1919, pp. 432-434, 7 figs. Franco Swiss high-powered car. Features are front-wheel brakes and single sleeve-valve V engine.

The 20-25 Hp. Six-Cylinder Straker. Autocar, vol. 42, no. 1223, Mar. 29, 1919, pp. 429-431, 5 figs. Car with engine having separate cylinders, aluminum pistons, and overhead valve-operating mechanism.

KEROSENE BURNING. Paraffin as Fuel, Harry R. Ricardo. Automobile Engr., vol. 9, no. 122, Jan. 1919, pp. 2-5, 5 figs. Principle of utilization; type of carburetor required; results of tests.

LUBRICATION. The Lubrication of Motor Cars, G. W. A. Brown. Automobile Engr., vol. 9, no. 125, Apr 1919, pp. 110-115, 34 figs. Suggests improvement in oiling of gear box, universal joints, live axle, steering gear and other components of chassis. Paper read before Instn. Automobile Engrs.

STATE REGULATION. Regulation of the Speed, Weight, Width and Height of Motor Trucks and Trailers, George Graham. Can. Engr., vol. 36, no. 6, Feb. 6, 1919, pp. 200-202. Plan of Am. Assn. of State Highway Officials for uniform truck laws.

STEAM CARS. The Clarkson Steam Chassis Type IX. Automobile Engr., vol. 9, no. 122, Jan. 1919, pp. 17-21, 12 figs. Four-cylinder taudem compound engine, with coke as fuel.

TEMPERATURE CONTROL. Controlling the Water Temperatures, Eric W. Walford. Autocar, vol. 42, no. 1224, Apr. 5, 1919, pp. 471-473, 5 figs. Methods for increasing thermal efficiency and ease of starting and for promoting vaporization of fuel, by reulating effective radiating surfaces.

TIRES, RUBBER-SUBSTITUTE. Substitute for Rubber Tires (Ersatz für Kautschukreifen), Jahr. Kunststoffe, vol. 8, nos. 14 & 15, Jul. 2, and Aug. 1, 1918, pp. 157-160 and 173-175, 26 figs. Substitutes used are principally leather, all kinds of woven materials, felt, paper, vegetable fibres, hair, bristles, etc. Various types of tires and methods of fastening them to rim are described.

Notes on Germau Mechanical Transport, G. F. Randall. Motor Traction, vol. 28, no. 736, Apr. 9, 1919, pp. 305-307, 5 figs. Tires substituted by device consisting of hardwood blocks let into rims of ordinary steel or artillery wheels and held in place by split steel bands bolted up on each side of blocks in such a way as to render the wooden tires easily removable.

TIRES, TRUCK. Pneumatic Tires on Trucks, B. B. Bachman. Jl. Soc. Automotive Engrs., vol. 4, no. 4, Apr. 1919, pp. 298-302. Advantages claimed for pneumatic tires are reduction in mechanical repairs increase in permissible speed, decrease in gasoline and oil consumption, less fatigue for men lessened depreciation of roads and greater tractive ability.

TRACTORS. Twin City 12-20 Kerosene Tractor, P. M. Heldt. Automotive Industries, vol. 40, no. 16, Apr. 17, 1919, pp. 836-839, 5 figs. Three-plow tractor with double intake and exhaust valves enclosed drive, pressure lubrication, thermostatic temperature control, backbone frame construction and front-spring suspension.

The Velie Biltwell Tractor, P. M. Heldt. Automotive Industries, vol. 40, no. 15, Apr. 10, 1919, pp. 799-804, 15 figs. Three-plow machine with kerosene-burning engine, 3-speed sliding-gear transmission and incloses bull-gear drive.

TRUCKS, 4-WHEEL DRIVE. Special Parts for Four-Wheel Drive Trucks, Harry C. Satterthwaite. Am. Mach., vol. 50, no. 15, Apr. 10, 1919, pp. 691-698. 21 figs. Operations on ball-and-socket joint placed on each end of front axle. truck is both steered and driven in front.

WAR EXPERIENCE. Touring Cars on War Service. Automobile Engr., vol. 9, no. 122, Jan. 1919, pp. 13-16, 3 figs. Notes on performance of lighter transport chassis.

Motor-Lorry Design. Times Eng. Supp., vol. 15, no. 533, Mar. 1919, p. 103. Lessons of war service.

PIPE

LAYOUT. A Problem in Piping Layout, James Leslie Lane. Boiler Maker, vol. 19, no. 4, Apr. 1919, p. 93, 1 fig. Mathematical computatio nof angles and lengths of lines.

PIPING. Piping and Pipe Fittings. Southern Engr., vol. 31, no. 2, Apr. 1919, pp. 36-50, 17 figs. Calculations, layout, sizes, bends, traps, and other arrangements of piping.

POWER GENERATION

CALIFORNIA. Water Power in California, Andrew H. Palmer. Sci. Am. Supp., vol. 87, no. 2260, Apr. 26, 1919, pp. 260-261 and 271, 4 figs. Factors on which it depends and the extent to which it might be utilized.

CANADA. The Present Electrical Outlook in Canada, A. S. L. Barnes. Electrical Review, vol. 84, no. 2159, Apr. 11, 1919, pp. 421-423. Councils furthering British electrical trade with Canada. (Concluded.)

COQUITLAM BUNTZEN. The Coquitlam Buntzen Hydro-Electric Plant, F. C. Perkins. Power House, vol. 12, no. 4, Apr. 5. 1919, pp. 83-86, 5 figs. Originally designed for 12,000 hp., plant has grown to 85,000 hp. Growth of project is described and capabilities of economically developing 750,000 hp. are examined.

EASTERN STATES. Hydro-Electric Development in Eastern States, D. H. Colcord. Power Plant Eng., vol. 23, no. 8, Apr. 15, 1919, pp. 362-364, 4 figs. Plants at Niagara Falls, Holtwood and Rochester.

GAS AND ELECTRICITY. Distribution of Heat, Light and Motive Power by Gas and Electricity, Dugald Clerk, Colliery Guardian, vol. 117, no. 3039, Mar. 28, 1919, pp. 713-714. Theoretical efficiency of estimated average performances of gas works and of electric undertakings of United Kingdom. Paper read before Roy. Soc. of Arts.

ILLINOIS. Independent Illinois Power System. Power Plant Eng., vol. 23, no. 9, May 1, 1919, pp. 391-393, 5 figs. Abbott Light & Power Co.'s 45 miles of line supplying lighting and power load of 400 kw. to ten towns.

INTERCONNECTION. Interconnection Reduces Steam Reserve Necessary, L. J. Moore. Elec. World, vol. 73, no. 17, Apr. 26, 1919, pp. 840-842, 4 figs. Results obtained by tying together power systems in Central California.

Muscle Shoals. Features of Muscle Shoal Station, Edward R. Welles and W. A. Shondy. Elec. World, vol. 73, no. 15, Apr. 12, 1919, pp. 729-732, 4 figs. Characteristics of power-plant, particularly boiler, furnace, stoker, condensers and auxiliaries.

Pittsburgh District. Power Production for Electrochemical Purposes, C. S. Cook. General Meeting Am. Electrochemical Soc., Apr. 3-5, 1919, paper no 10, pp. 167-171. Cost in Pittsburgh district, particularly when generated in large stations and when off-peak power is used for electrochemical and electrometallurgical purposes. Writer concludes that this kind of steam power can compete with water power in all except the most favorable cases for developing hydraulic power.

State Aid. State Aid for Water Power Development, Alfred M. Beale. Can. Engr., vol. 36, no. 13, Mar. 27, 1919, pp. 333-334. Complete ownership by Government is not considered essential, but it is suggested that Government furnish capital and control rates.

Swift Rapids Plant. Electric Power from Swift Rapids Plant. Elec. News, vol. 28, no. 7, Apr. 1, 1919, pp. 27-31, 9 figs. Combination generating plant and ship lift lock.

POWER PLANTS

Boiler Mountings. Boiler Mountings. Mar. Engr. & Naval Architect, vol. 41, no. 499, Apr. 1919, pp. 210-214, 5 figs. Blow-out apparatus. (Continued.) Paper read before Liverpool Eng. Soc.

Boiler Room. Saving Coal in the Blackstone Power Plant, W. A. Eberman. Power, vol. 49, no. 17, Apr. 29, 1919, pp. 632-634, 3 figs. Remodeling of boiler furnaces together with co-operation of operating force and intelligent use of instruments is said to have resulted in saving fuel amounting to 12 per cent.

Clinker Grinders. The Clinker Grinder in Modern Boiler Practice, Charles H. Bromley. Power, vol. 49, no. 16, Apr. 22, 1919, pp. 592, 598, 12 figs. Describes various grinders and gives their performance data as obtained in different installations.

Condensers. Surface Condensing Plant for Large Power Stations, R. J. Kaula. Electrical Review, vol. 84, no. 2160, Apr. 18, 1919, pp. 453-455 and (discussion) pp. 455-456, 2 figs. Graph showing lb. of free air at atmospheric pressure against plant capacity in 1000 lb. of steam per hour; arrangement of strainers and pumps on tidal river. Paper read before Instn. Elec. Engrs.

Economizers. Proportioning Fuel Economizers, A. B. Clark. Power, vol. 49, no. 16, Apr. 22, 1919, pp. 613-615, 5 figs. Data showing advantages of contraflow over parallel flow of water and gas.

Equipment. Modern Steam Power Station Equipment, Joseph G. Worker. Coal Indus., vol. 2, no. 4, Apr. 1919, pp. 157-163; 13 figs. Review of equipment installed in various power plants.

Governor. An Electrically-Operated Steam Engine Governor, G. T. Garwood. Model Engr. & Elecn., vol. 40, no. 936, Apr. 3, 1919, pp. 234-236, 2 figs. A throttle actuating solenoid is switched in and out by a centrifugal device similar to an ordinary shaft governor.

Oil Filters. Reducing Cost of Production by Saving Coal and Oil (Die Vermindering der Betriebskosten durch Ersparnisse an Kohlen und Oel), Otto Grumer. Kunststoffe, vol. 8, no. 8, Apr. 2, 1918, pp. 88-92, 10 figs. Recommends counter current preheaters as efficient in reducing coal consumption and repair work and suggests installation of oil filter for steam in order to prevent oil particles from getting into pipe system, thereby reducing efficiency of preheater.

Stand-By Operation. Converting Steam Plant to Stand-by Operation, L. M. Klauber, Jl. Electricity, vol. 42, no. 8, Apr. 15, 1919, pp. 353-357, 3 figs. Problems met in turbine and boiler rooms. From report of Eng. Committee for Spring Convention of Pac. Coast Section N.E.L.A.

Stokers. Influence of Chemistry upon Improvement in Stoker Design, Clyde H. McClure. Elec. Rev., vol. 74, no. 16, Mar. 19, 1919, pp. 620-621. States that from viewpoint of chemical engineer future improvement in mechanical stokers, specially for territory dependent upon Indiana and Illinois coal, lies in combination of chain-grate and underfeed types.

Turbines. United States Nitrate Plant No. 2, at Muscle Shoals, Charles H. Bromley. Power, vol. 49, nos. 13 and 15, Apr. 1 & 15, 1919, pp. 482-488 and 558-561, 14 figs. Description of triple cylinder, pure-reaction, parallel-flow turbine; 60,000-kw. unit has four condensers, each of 25,000 sq. ft. of Muntz-metal tube surface.

Turbo-Generators. Narragansett Company Installs 45,000-kw. Turbo-Generator, J. P. Rigsby. Power Plant Eng., vol. 23, no. 8, Apr. 15, 1919, pp. 349-353, 3 figs. Installation is of cross-compound double-unit type, consisting of a high- and a low-pressure unit, each connected through a flexible coupling to its own generator.

Valves and Fittings. Valves and Fittings in Marine Work, A. G. Christie. Shipping, vol. 7, no. 2, Apr. 12, 1919, pp. 19 and 22. Comments on marine practices from viewpoint of central station man. Paper presented before Baltimore Section, Am. Soc. Mech. Engrs.

Water Treatment. Principles of Boiler Water Treatment. Ry. Rev., vol. 64, no. 14, Apr. 5, 1919, pp. 547-549. Origin, effects and means of removing scale; processes and economies of water treatment.

Boiler Water Treatment. Dept. of the Interior. Bur. of Mines, tech. paper 218, 1919, 8 pp. How a reduction in heat losses may be effected through substitution of softened for hard boiler water. Reprint of Eng. bul. no. 3, prepared by U. S. Fuel Administration.

PRODUCER GAS

Gas-Producer Plant. Details of Operation of a Gas Producer Plant, J. S. McClimon. Gas Age, vol. 43, no. 8, Apr. 15, 1919, pp. 421-423, 4 figs. Recommendations to operators and superintendents.

PUMPS

Cost of Pumping. Cost of Pumping Through Pipe Lines, G. C. Habermeyer. Can. Engr., vol. 36, no. 17, Apr. 24, 1919, pp. 402-403. Table showing cost in dollars per mile per million U.S. gal. of pumping water at various rates through different sizes of cast-iron pipe lines.

Pumping Station Design. Design of New Electric-Drive Water-Pumping Station was Governed by Power Rate, Henry W. Taylor. Eng. News-Rec., vol. 82, no. 14, Apr. 3, 1919, pp. 653-655, 2 figs. Water consumption change in power, power rates and changes in design involved in development of pumping station of water works at Coboes, N. Y.

Pumping Station. Distribution. Vergennes Pumping Station, Henry W. Taylor. Fire & Water Eng., vol. 65, no. 18, Apr. 30, 1919, pp. 984-985, 4 figs. System of distribution.

Submersible Pumps. Submersible Salvage Pumps and Engines. Engineer, vol. 127, no. 3299, Mar. 21, 1919, pp. 274-275 & 278, 9 figs. Means adopted to permit ability of engines to withstand submergence in water are: Every part of mechanism is arranged inside trunk of crank-case and those parts which protrude are of robust construction; all openings, such as inlet and exhaust are provided with easily attached covers, which prevent water from getting into interior of engine.

REFRACTORIES

Zirconia. Zirconia: Its Utilisation as a Refractory Substance, an Opacifier, and an Abrasive, M. A. Granger. Chemical News, vol. 118, nos. 3073 and 3074, Mar. 7 and 14, 1919, pp. 115-118 and 121-123. Mar. 7: Chemical nature of zirconiferous minerals. Mar. 14: Experiments on extraction of zirconia by alkaline carbonate.

REFRIGERATION

Absorption System. Mechanical Refrigeration—III. Southern Engr., vol. 31, no. 2, Apr. 1919, pp. 54-57, 2 figs. Diagram of absorption system and direction diagram showing course of gas and aqua ammonia.

Ammonia Compression. Economical Ammonia Compression, A. G. Solomon. Power Plant Eng., vol. 23, no. 8, Apr. 15, 1919, pp. 370-373. Advises stopping of leaks and regulating pressures.

Compression Refrigerating Machine. The Compression Refrigerating Machine. Gardner T. Voorhees. Ice & Refrigeration, vol. 56, no. 4, Apr. 1919, pp. 257-259. Operation of water and steam cycle; general comparison of refrigerants. (Continuation of serial.)

The Ammonia Compression Refrigerating System—XXIX, W. S. Doan. Refrig. World, vol. 54, no. 4, Apr. 1919, pp. 32-34, 4 figs. Methods of purging permanent gases from condenser without losing a great amount of ammonia. (Concluding article.)

Refrigeration by Steam Compression (Eutwicklungsformen des Dampf-Kälteprozesses), P. Ostertag. Schweizerische Bauzeitung, vol. 73, no. 4, Jan. 25, 1919, pp. 33-35, 8 figs. Schemes of plant operating on this principle, with reference to plant exhibited by Sulzer Bros. at Berne exposition in 1914.

Fruit, Cold Storage for. Cold Stores for Fruit in Denmark (Forsgskleanlæg paa Statens Havebrugs-Forsgsstation ved Blangsted), Erik Holten. Ingeniören, vol. 28, no. 14, Feb. 15, 1919, pp. 89-91, 4 figs. Installation of horizontal double-acting CO_2 machine.

Ice Plants. Deterioration of Ice Plants, Fred Ophuls. Ice & Refrigeration, vol. 56, no. 4, Apr. 1919, pp. 201-202. Advisability of making repairs of any defect as soon as same is discovered.

Competition and Co-operation among Ice Manufacturers T. Robert Appel. Ice & Refrigeration, vol. 56, no. 4, Apr. 1919, pp. 202-205. Co-operation as a remedy for eliminating competition.

RESEARCH

Bureau of Mines, Pittsburgh Station. The New Pittsburgh Station of the Bureau of Mines, Pts. 1 and 2, George W. Harris. Coal Age, vol. 15, nos. 16 and 17, Apr. 17 and 24, 1919, pp. 707-711 and 749-751, 6 figs. Apr. 17: Consists of central administration building and two wings, one containing the chemical laboratories and the other the mechanical laboratory. Apr. 24: During war, station was devoted to assisting in war work. It is now being organized to operate on a peace basis. (To be continued.)

Government Bureau, Heating and Ventilation. Heating and Ventilation a National Issue, Werner Nygren. Domestic Eng., vol. 87, no. 2, Apr. 12, 1919, pp. 47-49 and 86. Advocates Government research bureau.

Laboratory Organization. The Functions of a Research Laboratory, Saul Dushman. Can. Chem. Jl., vol. 3, no. 4, Apr. 1919, pp. 118-121. Internal organizations and results of research laboratory of General Electric Co.

Laboratory Research and Mill Practice. Relations of Laboratory Research to Mill Practice. Metal Indus., vol. 17, no. 4, Apr. 1919, pp. 174-176, 7 figs. Value of metallurgical research and chemical analyses. Illustrated by examples in which the defects in structure were determined by these processes. From Scovil Bul.

The Relationship between the Laboratory and the Workshop, W. R. Barclay, Engineering, vol. 107, no. 2779, Apr. 4, 1919, pp. 456-457. In reference to principles of operation and objects of accomplishment both in laboratory and in workshop. Paper read before Inst. of Metals.

The Scope of the Works Laboratory, Frederick C. A. H. Lantsberry. Engineering, vol. 107, no. 2779, Apr 4, 1919, pp. 437-438. Particular reference is made to service given by research laboratory in metallurgical and chemical works. Paper read before Inst. of Metals.

Municipal Testing Laboratory. The Organization of a Standard Municipal Testing Laboratory, J. O. Preston. Cornell Civil Engr., vol. 27, no. 2, Mar. 1919, pp. 50-65, 1 fig. Reasons for establishing it and fundamentals of design.

ORGANIZATION. The Government and the Organization of Scientific Research—I & II, Frank Heath. Chemical News, vol. 118, nos. 3074 & 3075, Mar. 12 and 21, 1919, pp. 127-129 and 134-137. Policy advocated by Advisory Council is encouraging research workers, organizing research by industries and establishing national research. Paper read before Roy. Soc. of Arts.

STANDARDS AND STANDARDIZATION

CHEMICAL STANDARDS. Chemical Standards in Relation to the Iron and Steel Trades, H. W. Brearley. Jl. Soc. Chem. Indus., vol. 38, no. 6, Mar. 31, 1919, pp. 97R-98R. Claims that advent of regular microscopic examination and what are called metallographic methods has caused a steady decline in the value of chemi-ical analysis as a means of determining specifications for high-class steel material. Comments on Chem. Standards in issue of Feb. 15, p. 15T.

INDUSTRIAL STANDARDS. Engineering and Industrial Standardization. C. A. Adams. Proc. Am. Inst. Elec. Engrs., vol. 38 no. 4, Apr. 1919, pp. 549-559. Machinery proposed by Am. Engrs. Standards Committee to create and regulate industrial standards.

STANDARDIZED PARTS PRODUCTION. The Production of Standardized Parts—I, Herbert C. Armitage. Machinery, vol. 14, no. 341, Apr. 10, 1919, pp. 55-57, 2 figs. Jigs, tools and special machines; formulæ of output to pay for tools. Paper read before Instn. Mech. Engrs.

TURBO-GENERATORS. Standardization of Turbo-Generators (Normalisation des groupes électrogènes à turbines à vapeur). Revue Générale de l'Electricité, vol. 5, nos. 14 and 15, Apr. 5 and 12, 1919, pp. 517-527 and 551-556, 4 figs. Specifications prepared by technical committee of the Chambre Syndicale des Constructeurs de Gros Matériel électrique. Apr. 5: Concerning turbine and coupling. Apr. 12: Relating to electrical part.

STEAM ENGINEERING

BOILER HEADS. Areas of Segments of Boiler Heads, C. H. Berry. Power, vol. 49, no. 17, Apr. 29, 1919, pp. 644-645, 4 figs. Charts based on formulæ quoted in paragraphs 214 and 217 of Am. Soc. Mech. Engrs. boiler code, edition of 1918.

BOILER, HUDSON. The Hudson Patent Cylindrical and Water Tube Boiler. Colliery Guardian, vol. 117, nos. 30-40, Apr. 4. 1919, p. 777, 4 figs. Large water-holding capacity and steam reserve of Lancashire type, combined with quick steaming properties and positive circulation of water-tube type, has been aimed at in design.

CROSS-COMPOUND ENGINES. Checking Up Alignment, George H. Wallace. Power Plant Eng., vol. 23, no. 8, Apr. 15, 1919, pp. 367-368. Procedure in case of cross-compound engine.

SAFETY VALVES. Some Important Points on Boiler Heating Surface, G. J. Wells. Mar. Eng. of Canada, vol. 9, no. 3, Mar. 1919, pp. 120-121 and 70. Report of committee giving regulations for determining size of safety valve of ordinary type required on each boiler. Paper read before Inst. Mar. Engrs.

TURBINES. Some Aspects in Steam Turbine Design. Steamship, vol. 30, no. 358, Apr. 1919, pp. 229-232. Progress of steam turbine as commercial proposition, particularly as applied to marine propulsion. Paper read before Assn. Eng. & Shipbuilding Draftsmen.

THERMODYNAMICS

GASOLINE VAPOR. Physical Properties of Gasoline Vapor (Proprietés physiques de la vapeur de pétrole), Jean Rey. Comptes rendus des séances de l'Académie des Sciences, vol. 167, no. 10, Mar. 10, 1919, pp. 509-513. Deduced from the entropic diagram presented in Comptes rendus, vol. 166, 1918, p. 387.

HEAT FLOW. The Transmission of Heat Through Heavy Building Materials, Eng. & Contracting, vol. 51, no. 18, Apr. 30, 1919, pp. 442-443. Experiments carried out by Dept. of Heating and Ventilating Eng. of University of London.

MECHANICAL EQUIVALENT OF HEAT. Sadi Carnot's Determination of the Mechanical Equivalent of Heat (La détermination de l'équivalent mécanique de la chaleur par Sadi Carnot), L. Décombe. Revue Générale de l'Electricité, vol. 5, no. 12, Mar. 22, 1919, pp. 442, 443. Expressions used by Carnot in his Reflexions on the Motive Power of Fire are quoted to prove that he was the first to establish the two thermodynamic laws. Paper before l'Académie des Sciences, Feb. 3, 1919. (See Comptes rendus, vol. 168, pp. 268-271.)

How Carnot Calculated the Mechanical Equivalent of Heat. An unpublished Document (Comment Carnot a calculé l'équivalent mécanique de la chaleur. Un document inédit), C. Raveau. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 11, Mar. 17, 1919, pp. 549-552. Quotes from Notes Inédites de Sadi Carnot expression writer used in connection with experiments on work done in isothermal expansion of a given volume of gas.

RADIATION. Note on the Coefficient of Total Radiation of a Uniformly Heated Enclosure, W. W. Coblentz. Jl. Wash. Acad. Sci., vol. 9, no. 7, Apr. 4, 1919, pp. 185-187. Experimental verification of writer's previous conclusion in regard to value of Stefan-Boltzmann constant of radiation.

SPECIFIC HEATS OF AQUEOUS SOLUTIONS. The Specific Heat of Aqueous Solutions, with Special Reference to Sodium and Potassium Chlorides, W. R. Bousefield and C. Elspeth Bousfield, Phil. Trans. Roy. Soc. London, Ser. A, vol. 218, no. 562, Feb. 25, 1919, pp. 119-156, 7 figs. Experimental study of contruction of water when a solute is dissolved in it with reference to specified heat of solution. A cylindrical Dewar vessel immersed in water bath as the calorimeter, and a "mercury resistance thermometer" as the electric heater.

WELDING

ACETYLENE WELDING. Oxy-Acetylene Welding in the Railroad Shops, F. Hazeldine. Can. Machy., vol. 21, no. 14, Apr. 3, 1919, pp. 334-335. Facts regarding use of oxy-acetylene welding and cutting torch in railroad shop. Paper read before Instn. Mech. Engrs.

Oxy-Acetylene and the Safety First Movement, A. Cressy Morrison. Jl. Acetylene Welding, vol. 2, no. 11, May 1919, pp. 543-549. Safety in relation to manufacture and transportation of materials and apparatus used in connection with art of welding and cutting. Address delivered before Western Pa. Division of Nat. Safety Council.

The Oxy-Acetylene Torch in the Railway and Locomotive Engineering Field, J. F. Springer. Jl. Acetylene Welding, vol. 2, no. 11, May 1919, pp. 570-576. Principles of gas welding methods and survey of various applications in welding of sheet metal.

Oxy-Acetylene Welding, J. H. Davies. Acetylene & Welding Jl., vol. 16, no. 186, Mar. 1919, pp. 46-47. Experiments in welding of steels for the purpose of determining conditions for securing good results. Paper read before Instn. Mech. Engrs.

Oxy-Acetylene Welding An Important Factor in Poison Gas Manufacture. Jl. Acetylene Welding, vol. 2, no. 11, May 1919, pp. 556 and 558. Work of Chem. Warfare Service.

Welding by the Oxy-Acetylene Method—II, J. F. Springer. Automotive Eng., vol. 4, no. 4, Apr. 1919, pp. 181-183, 3 figs. Details of apparatus used and reasons for the use of each part. Suggestions in regard to adjusting flame. (To be continued.)

ALUMINUM. Improvements in the Autogeneous Welding of Aluminum or Its Alloys. Acetylene & Welding Jl., vol. 16, no. 186, Mar. 1919, p. 60. Object of invention is to obtain a flux having melting point desired with use of no other salts than those of the halogen group.

BLOWPIPES. Improvements in Blowpipes. Acetylene & Welding Jl., vol. 16, no. 186. Mar. 1919, p. 59, 2 figs. Invention relates to welding blow-pipe of the type having an attachment in the form of a tube adapted so as to be readily attached to the blowpipe.

CAST-IRON WELDING. Hard Spots in Cast Iron Welding, S. W. Miller. Welding Engr., vol. 4, no. 4, Apr. 1919, pp. 19-24, 23 figs. Examination of various structures containing different percentages of carbon in the light of accepted metallurgical phenomena taking place in heat treatment, forms basis of suggesting cause of formation of hard spots and proposing remedy for avoiding same.

ELECTRIC WELDING. Electric Arc Welding, F. A. Anderson. Mech. Eng., vol. 41, no. 5, May 1919, pp. 452-454, 8 figs. Its application to expanding pipe into flange, with reference to special instance in which weld was tested in various ways. Paper read before San Francisco Section Am. Sec. Mech. Engrs.

The Application of Electric Welding to Steel Shipbuilding, H. A. Hornor. Proc. Engrs. Soc. Western Pa., vol. 34, no. 10, Jan. 1919, pp. 641-670 and (discussion) pp. 671-676, 35 figs. Survey of extent of employment of electric welding in U. S. Set of Standard symbols and nomenclature prepared by Electric Welding Branch, United States Shipping Board Emergency Fleet Corporation.

Electric Welding: Its Theory Practice, Application and Economics, H. S. Marquand. Elecn., vol. 82, nos. 13 and 14, Mar. 28 and Apr. 4, 1919, pp. 350-352 and 377-379, 7 figs. Mar. 28: Properties of metals considered from welding point of view. Apr. 4: Thomson process of resistance welding; requirements of plants and application of method to chain welding, tire welding and wire welding, electro-percussive method.

Electric Welding and Welding Appliances—V, VI & VII. Engineer, vol. 127, nos. 3298, 3299 and 3300, Mar. 14, 21 & 28, 1919, pp. 241-243, 267-268 and 296-299, 18 figs. Quasi-arc coated-metal-electrode process.

Electric Arc Welding Principles, E. Wanamaker and H. R. Pennington. Ry. Elec. Engr., vol. 10, no. 4, Apr. 1919, pp. 107-110, 1 fig. Practice concerning metals used, their application and electrical characteristics. (Continuation of serial.)

Electric Welding and its Applications, Walter Leonard Lorkin. Jl. Roy. Soc. Arts, vol. 67, no. 3463, Apr. 4, 1919, pp. 304-314 and (discussion) pp. 315-317, 3 figs. Endeavors to show that process is simple, that it can be carried out with ordinary labor and that welds are efficient and effected at small cost.

Fusion in Arc Welding, O. H. Eschholz. Power, vol. 49, no. 12, Apr. 1, 1919, pp. 504-506, 19 figs. Effect of arc length, welding procedure, electrode material, arc current and electrode diameter upon such characteristics as penetration and overlap.

Notes on Electric Arc Welding. Eng. & Min. Jl., vol. 107, no. 17, Apr. 26, 1919, p. 743, 4 figs. Practice in construction of transformer tanks at Pittsfield works of General Electric Co.

Some Recent Applications of Arc Welding, Frank C. Perkins. Can. Machy., vol. 21, no. 12, Mar. 20, 1919, pp. 281-283, 8 figs. Explanation of process and of methods in use; illustrations of work done by aid of arc welder.

Suggestive Applications of Electric Arc Welding. Am. Blacksmith, vol. 18, no. 7, Apr. 1919, p. 177, 9 figs. Welding of locomotive back flue sheet, flanged head and similar operations.

ELECTRIC WELDING MACHINES. Winfield Electric Welding Machines. Can. Machy., vol. 21, no. 15, Apr. 10, 1919, pp. 353-354, 3 figs. Motor-driven spot welder.

EMERGENCY REPAIRS. Trials of an Army Welder in France, Jefferson A. Snyder. Jl. Acetylene Welding, vol. 2, no. 11, May 1919, pp. 566-570. Emergency repairs conducted under handicap of insufficient equipment.

EXPANSION AND CONTRACTION. Making Expansion Outwit Contraction, David Baxter. Jl. Acetylene Welding, vol. 2, no. 11, May 1919, pp. 558-566, 4 figs. Welding 400-lb. gasoline engine flywheel. Fractures consisted of two cracked spokes and a crack full length of the hub; cracks in spokes were near juncture of spokes and hub.

GAS-WELDING APPARATUS. Some Welding Shop Ideas, David Baxter. Am. Blacksmith, vol. 18, no. 7, Apr. 1919, pp. 159-162, 5 figs. Construction details of compound heater gas burner and ladle and preheating torch.

LOCOMOTIVE-CYLINDER WELDING. Welding a Locomotive Cylinder. Welding Engr., vol. 4, no. 4, Apr. 1919, pp. 34-40, 6 figs. Break was caused by cylinder bushing being loose in cylinder and turning around so that cylinder cock hole was plugged up, and piston coming forward pushed out whole front of cylinder including valve-chamber front.

PLASTIC ARC. The Plastic-Arc System of Welding, J. O. Smith. Motorship, vol. 4 no. 5, May 1919, pp. 36-37, 15 figs. Technical discussion of methods employed

PREHEATING. Discussion of the Merits of Both Charcoal and Gas Preheating, Fred J Maeurer. Welding Engr., vol. 4, no. 4, Apr. 1919, pp. 25-27, 8 figs. Recommends use of charcoal in preheating castings where expansion and contraction must be taken into consideration.

STEEL, MILD. Welding Mild Steel, H. M. Hobart. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 4, Apr. 1919, pp. 561-609, 19 figs. Investigations undertaken by Welding Research Sub-Committee of Welding Committee of Emergency Fleet Corporation. General object was to extend use of welding in construction of merchant ships.

THERMITE WELDING. Repairing a Broken Crankshaft by Thermite, W. F. Sutherland Can. Machy., vol. 21, no. 17, Apr. 24, 1919, pp. 404-405, 3 figs. Repair job on a 10-in. upsetting press crank done at Metal & Thermite plant, Toronto.

WELDED MATERIALS, TESTS OF. Tests of Welded Materials, Paul C. Tris, Maurice Kapetensky. Proc. Steel Treating Research Soc., vol. 2, no. 3, 1919, pp. 18-24 and 50, 16 figs. The Metallurgical Laboratory where welded parts of Liberty Engine are tested is operated in three divisions, the chemical, the physical and metallographic laboratories. The experimental data secured in these divisions and the interpretation given to micrographs are exposed.

WELDERS, TRAINING. Training a Welder. Jl. Acetylene Welding, vol. 2, no. 11, May 1919, pp. 550, 552 and 556, 1 fig. On training by apprenticeship. (To be continued.)

WELDING AND CUTTING. Modern Welding and Cutting, pts. VII, VIII and IX, Ethan Viall. Am. Mach., vol. 50, nos. 14, 15 and 16, Apr. 3, 10 and 17, 1919, pp. 641-645, 675-679 and 733-737, 20 figs. Apr. 3, Thermit welding of cast iron and other parts. Apr. 10: History and uses of the gas torch. Apr. 17: Oxygen and hydrogen by the electrolytic method.

WOOD

SEASONING. Practical Rules for the Seasoning of Wood, Harold S. Betts. Ry. Maintenance Engr., vol. 15, no. 5, May 1919, pp. 169-170, 2 figs. Suggestions in regard to uniform drying of timber with minimum exposure to decay.

STATISTICS OF PRODUCTION. Production of Lumber, Lath, and Shingles in 1917, Franklin H. Smith and Albert H. Pierson. U. S. Dept. of Agriculture, bul. no. 768, Apr. 5, 1919, 44 pp. Collection and compilation of statistics. Estimated total lumber production was 36,000,000,000 board feet.

VARIA

BRITISH INDUSTRY DURING WAR. Some Developments in British Industry During the War. Nature, vol. 102, no. 2574, Feb. 27, 1919, pp. 506-508. How British industry surpassed German industry.

COLOR OF WATER. The Color of Water, Wilder D. Bancroft. Jl. Franklin Inst., vol. 187, no. 4, Apr. 1919, pp. 459-485. Analysis of theories proposed by various physicists and investigators. (Concluded.)

ENGINEER AS CITIZEN. The Engineer as a Citizen. Mech. Eng., vol. 41, no. 5, May 1919, pp. 448-450 and (discussion) pp. 450-451 & 496. Symposium on civic responsibility and relation to legislation, to administration, public opinion and production and distribution. Held at Meeting of Engineers of Metropolitan District.

How Shall Proper Recognition of the Engineering Profession be Obtained? W. W. K. Sparrow. Eng. & Contracting, vol. 51, no. 16, Apr. 16, 1919, pp. 387-388. Lack of recognition illustrated by such instances as reported by a Governor of a lawyer as State Highway Engineer. Organization, licensing and broader education believed to be prime requisites for obtaining recognition. Address before R. R. Conference, Chicago.

The Functions of the Engineer: His Education and Training, W. A. J. O'Meara. Jl. Instn. Elec. Engrs., vol. 57, no. 280, Mar. 1919, pp. 225-239 and (discussion) pp. 239-257, 1 fig. Points out that in engineering problems there are six separable and independent aspects, viz., financial, commercial, technical, custodianship, bookkeeping and administrative. On this basis modifications are recommended in the present scheme of education of engineering students.

ENGINEERS, LICENSING. Standard Bill for Licensing of Engineers. Can. Engr., vol. 36, no. 9, Feb. 27, 1919, pp. 257-258 and 263. Draft copy of bill prepared by Am. Assn. of Engrs.

MODEL MAKING. The War Work of Basset-Lowke, Limited— I & II. Model Engr. & Elecn., vol. 40, nos. 934 & 935, Mar. 20 & 27, 1919, pp. 194-200 and 210-215, 21 figs. Models and model making. Making of screw gages.

OPTICAL INSTRUMENTS. Trigonometric Computation Formulæ for Meridian Rays, P. V. Wells, Jl. Wash. Acad. Sci., vol. 9, no. 7, Apr. 4, 1919, pp. 181-184, 1 fig. Formulæ used in design of optical instruments.

PHOTOGRAPHY. Modern Application of Photography, Alfred B. Hitchins. Jl. Franklin Inst., vol. 187, no. 2, Feb. 1919, pp. 129-146, 13 figs. Developments of photography during war, specially aerial, will now permit, in opinion of writer, simplifications and extensions in scientific, commercial and political fields.

MECHANICAL PROCESSES

BELT SHIFTER. Manufacturing a Safety Belt Shifter, Robert Mawson. Am. Mach., vol. 50, no. 16, Apr. 17, 1919, pp. 743-745, 9 figs. Shifting mechanism consists of three rollers, one straight and two tapered; belt is pushed by means of straight roller, and owing to the shape of taper rollers the tendency is for the belt to slide onto the pulley as the shifter slides away.

BENDING, COLD. The Bending and Forming of Brass Rod and Tubes, P. W. Blair. Metal Indus., vol 17, no. 4, Apr. 1919, pp. 172-173, 5 figs. Machines for cold bending.

BOILERS. How to Design and Lay Out a Boiler—VI, William C. Strott. Boiler Maker, vol. 19, no. 4, Apr. 1919, pp. 103-106, 2 figs. Why the longitudinal seam must be stronger than the cirumferential seam; formulas for finding strength of boiler shell.

BRASS RODS. The Manufacture of Brass Rods—I & II, H. Mawson. Metal Industry, vol. 14, nos. 11 & 12, Mar. 14 & 21, 1919, pp. 203-207 and 229-232. 14 figs. Account of processes with reference to specification of Am. Soc. for Testing of Materials. Paper read before Liverpool Eng. Soc.

CARBURETORS. Organization of a Carburetor Plant—I, Fred. H. Korff. Machy. (N. Y.), vol. 25, no. 9, May 1919, pp. 847-850. Functions of different departments and their relation to product.

CHAINS, Cast-Steel. Cast-Steel Anchor Chain, A. E. Crockett. Proc. Engrs. Soc. Western Pa., vol. 35, no. 1, Feb. 1919, pp. 1-25 and (discussion) pp. 26-30, 24 figs. Investigation and trials which finally led to adoption of present method of manufacturing cast-steel anchor chain, and account of dynamic tension tests of cast chains.

CHUCK, UNIVERSAL. Universal Chuck Manufacture. Machinery, vol. 14, no. 341, Apr. 10, 1919, pp. 33-39, 21 figs. Methods employed by A. A. Jones & Shipman, Leicester.

CRUSHERS, STONE. Detroit United Railway Builds Large Stone Crusher Plant. Elec. Ry. Jl., vol. 53, no. 15, Apr. 12, 1919, pp. 726-727, 5 figs. Crushers taken from abandoned quarry used to equip plant of 500 cu. yd. pe rday capacity in salvaging waste materials for ballasting.

EARTHENWARE. Earthenware (Fabricacion de articulos de arcilla o barro). Boletin de la Sociedad de Fomento Fabril, vol. 35, no. 12, Dec. 1918, pp. 825-829, 5 figs. Processes followed and machinery used in manufacture of earthenware.

ENGINES, MARINE. Manufacture of Marine Engines at the Joshua Hendy Iron Works, H. S. Rexworthy. Metal Trades, vol. 10, no. 4, Apr. 1919, pp. 153-157, 10 figs. It is stated that engines weighing 100 tons and developing 2800 h.p. are being delivered at the rate of one every 30 days.

EXTRUSION OF METALS. The Present and Future of the Extrusion of Metals—I & II, A. E. Tucker and P. A. Tucker. Machinery, vol. 14, nos. 340 & 341, Apr. 3 and 10, 1919, pp. 29-30 and 47-48. Effect of a powerful deoxidizer on metal. Paper read before Birmingham Metallurgical Soc. Also abstracted in Ironmonger, vol. 166, no. 2366, Mar. 22, 1919, p. 79.

GAS ENGINES. The Manufacture of Marine Gas Engines, J. V. Hunter. Am. Mach., vol. 50, no. 17, Apr. 24, 1919, pp. 787-791, 20 figs. Manufacture of jigs and fixtures to adapt standard machine tools to rapid production of standard work in order to meet demands for powerful gas engines of comparatively light weight for marine and other powers.

GEAR CUTTING. Commercial Gear Cutting, W. Duckett. Machinery, vol. 13, no. 339, Mar. 27, 1919, pp. 723-725, 8 figs. Basis of machine cut gearing in engineering practice; particularly in manufacture of aero engine and automobile parts.

HOSIERY MACHINE. Manufacturing the Banner Hosiery Machine, pts. II and III Robert Mawson. Can. Machy., vo. 21, nos. 15 and 17, Apr. 10 and 24, 1919, pp. 345-348 and 391-394, 22 figs. Apr. 10: Operations performed on Jones and Lamson machines. Apr. 24: Operation of form milling sinker cams on Briggs milling machine; cutting raised cams; milling fashion cams and clutch cams.

MILLER, FORD-SMITH. Manufacturing the Ford-Smith Miller, J. H. Moore. Can. Machy., vol. 21, no. 12, Mar. 20, 1919, pp. 271-275, 9 figs. Concerning inspection methods involved.

MOTOR PARTS. Making Liberty Aeroplane Motor Parts —I. Machinery, vol. 14, no. 340, Apr. 3, 1919, pp. 8-13, 13 figs. Methods employed in machining cylinder inlets and exhaust elbows.

PRESSED STEEL, REINFORCING. Making Pressed-Steel Reinforcing. Iron Trade Rev., vol. 64, no. 17, Apr. 24, 1919, pp. 1073-1080, 16 figs. How various shapes of beams, plates, studs, concrete bars, etc., are adapted for building purposes.

ROLLER BEARINGS. Making the Timken Roller Bearing—I, Edward K. Hammond. Machy. (N. Y.), vol. 25, no. 9, May 1919, pp. 829-835, 13 figs. Methods of heat-treating, machining and inspecting.

RUBBER GOODS. Railroad Rubber Goods, G. W. Alden. Official Proc. Car Foremen's Assn. of Chicago, vol. 14, no. 6, Mar. 1919, pp. 65-100. Classification of various goods according to process of manufcture, together with exposition of recent developments of rubber industry.

SANDING MACHINE. Building a Sanding Machine, Robert Mawson. Machy. (N. Y.), vol. 25, no. 8, Apr. 1919, pp. 738-742, 15 figs. Methods of machining parts of a sanding machine; describing jigs and fixtures used and general procedure in assembling.

STEEL MILLS. Westinghouse Electric Blooming-Mill (Train bloming à commande électrique système Westinghouse). Génie Civil, vol. 74, no. 12, Mar. 22, 1919, pp. 225-228, 7 figs. Scheme of a. c. instalation developed by British Westinghouse Co. From Engineer, Dec. 13, 1918.

Large Rolling-Mill Plant. Electrical Review, vol. 84, no. 2157, Mar. 28. 1919, pp. 340-342. 7 figs. Electrical equipment for a 38-in. reversing cogging mill designed to roll 3-ton steel ingots 18 x 22 in. to 4 x 4 in. billets, with an output of 60 tons per hour. (Concluded.)

TRACTORS. Turning Out 100 Tractors per Day, P. M. Heldt. Automotive Industries, vol. 40, no. 15, Apr. 10, 1919, pp. 788-792, 7 figs. Machining and assembling methods employed at Milwaukee plant of Int. Harvester Co. (To be continued.)

WESTINGHOUSE MARINE SYSTEM. Building the Westinghouse Marine System. Edward K. Hammond. Machy. (N. Y.), vol. 25, no. 9, May 1919, pp. 789-796, 16 figs. Operations involved in forging, machining, assembling and testing various parts of equipment.

ORGANIZATION AND MANAGEMENT

ACCOUNTING

Brick Plant. Simplified System of Counting Cost, C. F. Mattes. Brick & Clay Rec., vol. 54, no. 7, Apr. 8, 1919, pp. 591-594. Suggested plan for average size brick plants.

Cost Accounting. Cost Accounting to Aid Production—VIII, G. Charter Harrison. Indus. Management, vol. 57, no. 5, May 1919, pp. 400-404, 1 fig. Diagram illustrating use of specification costs in ascertaining profits and losses made by individual salesmen.

Highway Contractors. Cost Keeping for Highway Contractors, H. P. Gillette. Contract Rec., vol. 33, no. 15, Apr. 9, 1919, pp. 336-338. Methods for determining unit costs, obtaining overhead costs and prorating them.

Inventories. How We Prepare for and Take Inventory, H. F. Harris. Factory, vol. 22, no. 4, Apr. 1919, pp. 681-686, 10 figs. Instructions given to men at plant of Republic Motor Truck Co.

EDUCATION

Employment Management. Government Course for Training Employment Managers, Meyer Jacobstein. U. S. Dept. Labor, Bur. Labor Statistics, Bul. 247, Jan. 1919, pp. 19-24. War-Emergency course.

Engineers. Specialization in Education of Engineers (Sulla specializzazione della educazione degl' ingegneri), Giuseppe Astorri. Ingegneria Italiana, vol. 3, no. 63, Mar. 13, 1919, pp. 169-171. High-school courses in italy are found to be insufficiently adaptable to form a basis for subsequent engineering education.

Foundrymen. Industrial Education. Foundry Trade Jl., vol. 21, no. 206, Feb. 1919, pp. 98-102. Considered as means for developing industry, particularly in relation to the operation of a foundry. Address delivered before Scottish Branch British Foundrymen's Assn.

Mining. Mining and the Industrially Disabled, J. C. Murray. Can. Min. Inst. Bul. no. 84, Apr. 1919, pp. 393-398. Work being done by Canadian Government in rehabilitating war cripples.

Telephone Operation. The Cripple in the Telephone Field, Douglas C. McMurtrie. Telephony, vol. 76, no. 17, Apr. 26, 1919, pp. 31-32. Re-education of injured or crippled employee estimated as more profitable to all concerned than disability compensation.

Vocational Training. Army Vocational Training, C. R. Dooley. Eng. Education, vol. 9, no. 7, Mar. 1919, pp. 263-277, 10 figs. Plan for organization adopted by Committee on Education and Special Training during emergency, which necessitated rapid training of 90,000 men for military service.

FACTORY MANAGEMENT

Clerical Work. Systematic Superintendence, Charles F. Dingman. Concrete, vol. 14, no. 3, Mar. 1919, pp. 84-87, 5 figs. Routine covering field clerical work on construction operations.

Co-operation, Internal. Necessary Internal Co-operation between Employer and Employee must be Mutually Evolved, Charles P. Steinmetz. Automotive Industries, vol. 40, no. 16, Apr. 17, 1919, pp. 831-833. Declares that capital and labor are equal necessities in modern industry and must be equally represented in management and distribution of profits.

Employment Management. Handbook of Employment Management in the Shipyard. United States Shipping Board Emergency Fleet Corporation, Employment Branch, Indus. Relations Division, bul. 3, 61 pp. Methods to be followed in process of selection and placement of new worker.

The Principles of Employing Lahour. Eng. & Indus. Management, vol. 1, no. 9, Apr. 10, 1919, pp. 273-276. Factors determining selection of workpeople taking into account suitability of applicant for class of work he is expected to perform.

Employment Problem of the U. S. Naval Aircraft Factory, Frederic C. Coburn. Indus. Management, vol. 57, no. 5, May 1919, pp. 359-365, 9 figs. Organization of employment department.

The Organization of an Employment Department, Charles E. Fouhy. Eng. & Indus. Management, vol. 1, no. 8, Apr. 3, 1919, pp. 231-236, 16 figs. Routine of employment department of Curtiss Aeroplane & Motor Co.

Factory Layout. The Automobile Factory—I. Automobile Engr., vol. 9, no. 122, Jan. 1919, pp. 2225, 9 figs. Layout, construction and equipment.

New South Philidelphia Plant of the Westinghouse Electric & Mfg. Co., H. T. Herr. Elec. Jl., vol. 16, no. 4, Apr. 1919, pp. 114-121, 22 figs. Layout indicating shop arrangement and safety features.

Garment Trade. Factory Management in Garment Trades, Mack Gordon. Indus. Management, vol. 57, no. 5, May 1919, pp. 345-349, 1 fig. Methods of controlling production, economizing materials and expediting manufacture. (To be continued).

Industrial Conferences. The Joint Industrial Conference. Eng. & Indus. Management, vol. 1, no. 8, Apr. 3, 1919, pp. 242-243. Methods of negotiation between employers and trade unions Report of Provisional Joiint Committee appointed by Nat. Indus. Conference.

Machine Tool Plant. Organization and Management of a Machine Tool Plant—II & III, Oskar Kylin and Erik Oberg. Machy., vol. 25, nos. 8 and 9, Apr. and May, 1919, pp. 698-702 and 813-820, 29 figs. On principles of organization and details of system used in a medium-size machine tool-manufacturing plant making a single line of machines.

The New Home of Pratt & Whitney Co., Ltd., J. H. Moore. Can. Machy vol. 21, no. 14, Apr. 3, 1919, pp. 321-324, 8 figs. Description of plant design and arrangement to manufacture small tools on great scale.

Material Keeping. Keeping Track of Factory Material—II, J. G. Hickman. Factory, vol. 22, no. 4, Apr. 1919, pp. 702-707, 12 figs. Forms used in disbursing purchased and manufactured material.

Office Arrangement. The Largest Gas Utility Company in the World. Gas Age, vol. 43, no. 7, Apr. 1, 1919, pp. 335-338, 8 figs. Office arrangement of Consolidated Gas Co. of New York.

Organization in Industry. "Technicracy"— Ways and Means to Gain Industrial Democracy, William Henry Smyth. Indus. Management, vol. 57, no. 5, May 1919, pp. 385-389. Discusses ways and means to develop, guide and direct social organization in industry.

Industrial Cooperation, Charles P. Steinmetz. Eng. & Min. Jl., vol. 107, no. 17, Apr. 26, 1919, pp. 748-749. Systems for developing co-operation between capital and labor. Speech delivered at special session of Editorial Conference.

The Part of Capital and Management in Industry. Stone & Webster Jl., vol. 24, no. 4, Apr. 1919, pp. 289-292. Argues that co-operation is none the less real or mutually helpful because the division of profits is unequal.

Problems of Industrial Organization, Major Greenwood. Quarry. vol. 24, no. 266, Apr. 1919, pp. 106-108. Also Machy, Market no. 916, Apr. 4, 1919, pp. 21-22. Researches on conditions, excluding those determining efficiency of inanimate machines, which help or hinder industrial output, conducted under auspices of Health of Munition Workers Committee and the Welfare and Health Section of the Ministry of Munitions. Paper read before Roy. Statistical Soc.

Pacific Coast. Possibilities of Intensive Manufacturing on the Pacific Coast, G. N. Somerville. Pac. Mar. Rev., vol. 16, no. 4, Apr. 1919, pp. 110-112, 4 figs. Manufacturing activities of Pacific Coast during war are viewed as promising further industrial developments.

Production Control. Keeping Track of Production, Henry A. Noar. Am. Mach., vol. 50, no. 16, Apr. 17, 1919, pp. 745-747, 5 figs. Device designed to provide uniform methods throughout plant.

Production Systems. Turning Out 100 Tractors per day—II, P. M. Heldt. Automotive Industries, vol. 40, no. 16, Apr. 17, 1919, pp. 852-857, 10 figs. Production system employed at Milwaukee plant of Internat, Harvester Co.; details of machining and assembling methods.

Railroad Tracks The U. F. & S. Co.'s Operating Methods. Coal Trade Jl., vol. 50, no. 16, Apr. 16, 1919, pp. 407-409, 5 figs. Arrangement of railroad tracks said to have effected important economies.

Shop Management. Lay-out and Piece-Rate Card System. Machinery, vol. 13, no. 338, Mar. 20, 1919, pp. 692-694, 13 figs. Forms for use in shop management.

Scientific Factory Management—II & III, A. D. Denning. Eng. & Indus. Management, vol. 1, nos. 8 & 9, Apr. 3, & 10, 1919, pp. 246-219 and pp. 278-282. Functions of foremen; functions of workers. Third and concluding lecture of series delivered under auspices of Birmingham Section of Inst. of Metals.

Advances in Industrial Management, John Calder. Am. Mach., vol. 50, no. 17, Apr. 24, 1919, pp. 807-809. Address before Indus. Conference of N. Y. Business Publishers Assn.

Shop Order Origination. Managing for Maximum Production—III, L. V. Estes. Indus. Management, vol. 57, no. 5, May 1919, pp. 379-384, 11 figs. Takes up origination of shop order and shows its connection with the various operations and control of manufacturing.

Standardized Parts. Production of Standardized Parts, Herbert C. Armitage. Eng. & Indus. Management, vol. 1, no. 9, Apr. 10, 1919, pp. 266-272, 8 figs. Development of engineering methods in manufacture of jugs, tools and special machines. (To be continued).

Task Setting. The Human Factor in Task Setting. Eng. & Indus. Management, vol. 1, no. 9, Apr. 10, 1919, pp. 263-265, 1 fig. Suggests that task be not made so small as to prevent cost reduction, nor so large that worker can exceed it by a wide marging and so have it lose its significance.

Tool Rooms. The Tool Room, E. Hayes Page's Eng. Weekly, vol. 34, no. 759, Mar. 29, 1919, pp. 185-187, 4 figs. Interchangeability of tools as factor in economic production of machinery.

FINANCE AND COST

Foundry, Steel. Compiling Cost Data in a Naval Steel Foundry, Walter S. Doxsey. Foundry, vol. 47, no. 5, Apr. 15, 1919, pp. 206-211, 11 figs. System of cross-checked reports as basis for production and cost analyses.

LABOR

Employee Representation. How Industrial Democracy Works at Our Plant. Factory, vol. 22, no. 4, Apr. 1919, pp. 677-681, 2 figs. Evolution from national-government form of management to present-day structure of employee representation in plant of Printz-Biedermann Co.

Housing. The Town of Kipawa, Thomas Adams. Can. Engr., vol. 36, no. 9, Feb. 27, 1919, pp. 260-262, 3 figs. Housing plan for employees of Riordon Pulp & Paper Co.

Miners' Cottages in Kent Iron & Coal Trades Rev., vol. 98, no. 2664, Mar. 21, 1919, p. 354, 2 figs. Particulars and dimensions of accommodation provided.

Good Housing and Labor Turnover, Leslie H. Allen. Am. Contractor, vol. 40, no. 15, Apr. 12, 1919, p. 23. Labor turnover is attributed to poor housing, because, it is stated, good housing has not kept up with healthful factory surroundings.

LABOR POLICIES. Labor Program of the Department of Labor, William B. Wilson. U. S. Dept. Labor, Bur. Labor Statistics, Bul. 247, pp. 160-171. Based, it is said, on experience acquired during war.
Outline of a National Labor Policy. Ordway Tead. U. S. Dept. Labor, Bur. Labor, Statistics, Bul. 247, pp. 148-155. Criticises statements advanced by employers in regard to policy followed by Government during war.
The Principes of Industrial Relations. Eng. & Min. Jl., vol. 107, no. 17, Apr. 26, 1919, pp. 754-756. Statement prepared by special committee of Chamber of Commerce of U. S. A., with a view of furnishing a basis ou which American industry can build a national labor program.

LABOR SITUATION. The Present Labor Situation, Morris L. Cooke. U. S. Dept. Labor, Bur. Labor Statistics, Bul. 247, Jan. 1919, pp. 63-65. Suggestions in regard to activities which writer believes may be assumed by Dept. of Labor in addition to its present work.

NOVA SCOTIA, COLLIERIES. Industrial Relations at the Collieries in Nova Scotia, F. W. Gray. Can. Min. Inst. Bul., no. 84, Apr. 1919, pp. 389-393. Attitude of workers towards proposed affiliation with United Mine Workers of America.

REPEATERS. Is it Wise to Hire the Repeater? Leonard Blakey. Indus. Management, vol 57, no. 5, May 1919, pp. 390-399, 10 figs. Study of turnover with reference to causes for leaving and duration of service on re-engagement.

SALARIES. Classification of Salaries, J. L. Jacobs. Can. Engr., vol. 36, no. 13, Mar. 27, 1919, pp. 341-342. Principles and procedure in standardization of engineering salaries, particularly in regard to railroad positions. Address before Chicago R. R. Conference.

SOLDIERS AND SAILORS. Statement of Policy Relative to Employment of Returning Maryland Soldiers and Sailors, Baltimore, vol. 12, no. 7, Apr. 1919, pp. 15-16, Adopted by Employment Managers' Circle of Merchant & Mfrs. Assn. and other representatives of industry.

WAGE RATES. Cost of Living Studies as a Basis for Making Wage Rates, Royal Meeker. U. S. Dept. Labor, Bur. Labor, Statistics, Bul. 247, Jan. 1919, pp. 43-50. Advocates system in order to reduce dissatisfaction and bases estimates made on what is termed adjustable basis.
The Different Systems of Wages (Les différent systèmes de salaires). Métallurgie, vol. 51, no. 13, Mar. 26, 1919, pp. 714-715, 2 figs. Taylor and Gantt systems. (Continuation of serial).
Analyzing Bonus and Piece Work Systems—I, W. F. Rockwell. Am. Drop Forger, vol. 5, no. 4, Apr. 1919, pp. 162-166. Halsey, Rowan and Taylor plans.

WELFARE WORK. Developing Pride and Interest in the Job, W. R. Basset. Factory, vol. 22, no. 4, Apr. 1919, pp. 693-696, 4 figs. Suggests hiring welfare worker of personnel manager. Third article.
Modern Industrial Plants—VIa George C. Nimmons. Architectural Rec., vol. 45, no. 4, Apr. 1919, pp. 343-355, 12 figs. Influence of employees' welfare work in reducing labor turnover.

WOMEN. Women in Industry, H. E. Miles. U. S. Dept. Labor, Bur. Labor Statistics, Bul. 247, Jan. 1919, pp. 119-129. Opinions of executives concerning efficiency of women and records obtained in countries where they have been engaged in industry.
Standards for Women Employees, Hugh Fullerton. U. S. Dept. Labor, Bur. Labor Statistics, Bul. 247, Jan. 1919, pp. 106-111. Advocates throwing around women in industry an unusual precaution by reason of greater social evils which result from their weakening.
Women in the Lead Industries, Alice Hamilton. U. S. Dept. of Labor, Bur. of Labor Statistics, no. 253, Feb. 1919, 38 pp. Lead industries in U. S.; British records of lead poisoning of women in white-lead industry; degree of susceptibility of women and men to poisoning; preventiou ou poisoning.

LIGHTING

CARBIDE LAMPS. Illumination and the Safety Problem, Charles C. Phelps. Coal Indus., vol. 2, no. 4, Apr. 1919, pp. 153-156. Advocates use of carbide lamp as brightest and safest form of illumination.
Good Factory Lighting vs. Increased Production, H. Leveridge. Elec. News, vol. 28, no. 7, Apr. 1, 1919, pp. 41-43. Discussion of provisions adopted in recent code of lighting for factories mills and other work places, prepared by a Commission of Assn. Elec. Contractors and Dealers.

PUBLIC REGULATION

MUNICIPAL OWNERSHIP. Municipal Ownership Evils, Walton Clark, Gas Record, vol. 15, no. 8, Apr. 23, 1919. pp. 245-250. Holds that municipal ownership of gas plants is contrary to proper theories of democratic government. Paper read before Pa. Gas Assn.

RECONSTRUCTION

CONSTRUCTION PROGRAMS. A Post-War Construction Program—II, Charles C. May. Architectural Rec., vol. 45, no. 4, Apr. 1919, pp. 325-342. 16 figs. Organization and activities of Building Bur. of Int. Committee of Y. M. C. A.

LABOR RELATIONS. A Factor of Industrial Reconstruction, M. Webster Jenkinson. Machy. Market, nos. 961 & 962, Apr. 4 & 11, 1919, pp. 23-24 and 21. Recommends removing fear of workers that cost statistics will mean pressure put on them to work harder.

MACHINE TOOLS. Machine Tools, Alfred Herbert. Machy. Market, nos. 961 & 962, Apr. 4 & 11, 1919, pp. 19-20 and 17-18. Importation into England of American tools developed under conditions of expensive labor, has, in the writer's opinion, been of service in preparing that county to meet similar conditions. Paper read before North-East Coast Instn. Engrs. & Shipbuilders.

TELEPHONE BOOTHS. Market for Telephone Goods in Asia. Telephone Engr., vol. 21, no. 4, Apr. 1919, pp. 137-141, 3 figs. Extracts from Special Agent's series no 172, Department of Commerce.

SAFETY ENGINEERING

BLASTING, QUARRY. Quarry Blasting with Electricity, A. S. Anderson. Cement & Eng. News, vol. 31, no. 4, Apr. 1919, pp. 32-34, 3 figs. Precautions to be observed.

DUST INFLAMMABILITY. Inflammability of Carbonaceous Dusts in Air and in Atmospheres of Low Oxygen Content, H. H. Brown. Jl. Franklin Inst., vol. 187, no. 4, Apr. 1919, pp. 504-506, 1 fig. Research of Grain Dust Explosion Investigation Laboratory, Bur. of Chemistry.

FIRE PREVENTION. Final Report of the Fire Prevention Section of the United States War Industries Board. Laboratories' Data, Underwriters' Laboratories, Nat. Board of Fire Underwriters, no. 1, Feb. 1919, pp. 11-16. Conditions existing in respect to fire hazard in privately owned property where machinery, material or supplies used for war purposes were manufactured, handled or stored.

See also: Sprinklers and Dust Inflammability.

GAS MASKS. Army Gas Masks in Sulphur-Dioxide Atmospheres, A. C. Fieldner and S. H. Hatz. Eng. & Min. Jl., vol. 107, no. 16, Apr. 19, 1919, pp. 693-695 3 figs. Sectional diagrams of type adopted for use in smelters and sulphide roasters.
Respirators, Gas Masks and Oxygen Apparatus. Commercial America, vol. 15, no. 10, Apr. 1919, pp. 39-41. Work of Bureau of Mines in providing industrial workers with means of protection against gases incident to mining, fire, accident and various manufacturing processes.

HUMAN FACTOR. The Human Factor in Accident Occurrence. Eng. & Indus. Management, vol. 1, no. 9, Apr. 10, 1919, pp. 261-262. Inexperience and overwork in their relation to accident rates.

RESPIRATORS. *See Gas Masks, above.*

SPRINKLERS. New Code for Automatic Sprinklers. Am. Architect, vol. 115, no. 2261, Apr. 23, 1919, pp. 588-595, 4 figs. Rules for fire extinguishing appliances (sprinkler system), adopted May 24, 1917, by Board of Standards snd Appeals, as amended May 2, 1918 and Jan. 2, 1919, effective from Feb. 17, 1919.

WELDING. Safety Rules for Oxy-Acetylene Welding. Machy (N. Y.), vol. 25, no. 8, Apr. 1919, pp. 733-735, 3 figs. Adopted by Western Pennsylvania Division of Nat. Safety Council.

SALVAGE

SACKS, CEMENT. The Proper Handling of Empty Cement Sacks, E. V. Aldridge. Ry. Maintenance Engr., vol. 15, no. 4, Apr. 1919, pp. 123-125, 1 fig. Practices of user and manufacturer which affect the salvage of cement sacks.

TRANSPORTATION

TRUCK TRANSPORTATION. Ship-by-Truck Movement Invades South to Prove Great Benefits of Highway Transport, Commercial Vehicle vol. 20, no. 6, Apr. 15, 1919, pp. 19-21 and 29, 6 figs. Georgic demonstration in which 37 trucks delivered 100 tons of goods to cities within 50-miles radius.
Economical Organization of Transport Trucks in a Large City (L'organisation économique des transports industriels automobiles dans une grande ville), Emile Belot. Journal des Usines à Gaz, vol. 43, no. 6, Mar. 20, 1919, pp. 93-95. Analytical determination of number of workmen employed for loading and unloading which will reduce transportation price per ton to a minimun. From Comptes rendus de séances de l'Académie des Sciences, no. 8, Feb. 24, 1919.

TUNNEL, VEHICULAR, NEW YORK-NEW JERSEY. The New York aud New Jersey Vehicular Tunnel, Edward A. Byrne. Eng. World, vol. 14, no. 8, Apr. 15, 1919, pp. 33-37, 6 figs. Reasons for constructing it and plans of various proposed projects. Paper presented before N. Y. Branch Am. Soc. Civil Engrs.

WATER TRANSPORTATION. The Development of American River Traffic—I, Shipbuilding & Shipping Rec., vol. 13, no. 14, Apr. 3, 1919, pp. 406-408, 3 figs. Plans for towing steamers and steam barges on Mississippi and Black Warrior Rivers.

VARIA

MALARIA CONTROL. Malaria Control at Nitrate Plant, W. G. Stromquist. Eng. News-Rec., vol. 82, no. 15, Apr. 10, 1919, pp. 718-720, 5 figs. Mosquito eradication by clearing, drainage and oiling water surfaces.

TABULATING APPARATUS. Visualizing the Coal Needs of the Nation. Indus. Management, vol. 57, no. 5, May 1919, pp. 349-352, 5 figs. Organization of statistical bureau of U. S. Fuel Administration showing mechanical equipment used in tabulating work.

Picking the right kind of tool steel by the aid of the new LUDLUM text-book

Costly tools must be made of the right steel or they are useless. We have **compiled** and published at great expense a complete **book** on this subject—**160 pages.**

Do you wish to know the effect of alloys in steel—the correct method of forging, hardening, tempering, annealing?

Have you use for accurate calculation tables and much valuable information?

We will send you a copy gratis on request, to a buyer or user of tool steel.

Illinois Adopts a Uniform Basis of Design for All Types of Rigid Pavement

Concrete Standardized, Other Types Designed to Equal It in Load-Carrying Capacity—Flexural Strength To Govern—Brick and Bituminous Concrete on Concrete Base Only Other Types Considered for Main Road

By Clifford Older

Chief Highway Engineer, Department of Public Works and Buildings, Illinois

IN VIEW of the rapid development of interurban truck transportation, load-carrying capacity is the logical basis for the design of rigid pavements of different types. In rigid pavements flexural strength is the governing feature, and, having established a standard design for one type, it is sound engineering practice to make all other types conform to it in strength, as nearly as possible. A standard concrete slab, 7 in. at the side and 8 in. at the center for 16- to 18-ft. widths, has recently been developed by a conference of the northern Mississippi Valley states, and this has been adopted by the State of Illinois as the basis for all its rigid surfacings. The only other types considered suitable for the primary road system of Illinois are monolithic brick and bituminous concrete on a concrete base.

fic is well understood. These co... the adoption of rigid ...

A careful analysis of the country road problem indicates that in the future there will be unprecedented conditions to meet. Heavy motor-truck traffic will prevail on all the main improved roads, and this traffic will be confined day after day to the same wheel tracks, because of the limited widths of pavement which can be built with available funds. With these considerations in mind, it seems absolutely justifiable to take this rather drastic stand in the design of pavements for a comprehensive system of roads.

Starting with one well established design of rigid pavement, it is not only feasible but sound engineering practice to design all other principal types of rigid pavement in such manner that, within reasonable limits, each will have the same carrying capacity or transverse strength, under equal subgrade and traffic conditions.

The Bloor Street Viaduct, Toronto, Ontario

By Thomas Taylor, M.E.I.C.

(1). Introduction.

The development of the City of Toronto, and particularly of the eastern part, has, since an early period, been seriously hampered by reason of the Don Valley and River. With the northward growth of that portion east of the Valley, it became clear that another crossing would be required north of those existing, and for many years there has been a growing conviction that the proper course would be to connect Bloor Street with Danforth Avenue, creating a cross town thoroughfare.

By-laws to sanction the issue of debentures for this purpose were submitted to the ratepayers at the annual elections on three occasions, viz:—in 1910, 1912 and 1913. The amounts asked for were $759,000.00, $1,783,000.00 and $2,500,000.00 respectively. The first proposal was decisively defeated, the second barely defeated and the third carried by a large majority. The remarkable increase in these estimates is due to the fact that each of the two latter schemes was greatly superior to its predecessor with respect to capacity and appearance. The verdicts rendered at the three elections indicate, on the part of the Toronto public, a growing appreciation of civic improvements.

The route adopted in 1912, and on which the third proposal was based, is shown in Fig. 1. The three divisions commencing at the east were named Don, Rosedale and Bloor Sections; the outstanding features being a bridge over the Don Valley, a bridge over the Rosedale Ravine, and sidehill construction on the western portion of the Bloor Section, to carry the traffic along the south slope of the Rosedale Ravine. After fuller consideration, the latter was dispensed with in favor of earth fill, for reasons of stability and economy. The balance of the improvement consisted of ordinary grading and street construction. The width adopted was 86 feet and the grade, throughout the whole project (5,267 feet), was nearly level.

(2). Preliminary to Letting Bridge Contracts.

(*a*) Subsurface Exploration.

Early in 1912, investigations were made with hand augers. The results, although inconclusive, confirmed a suspicion that, in a great portion of the Don Valley, the soil for a considerable depth was utterly unfit for the direct support of heavy loads. In places it was so wet that doubts arose as to the advisability of using piles, particularly if arch construction should be adopted.

In order to secure more complete and definite information, it was decided to penetrate to the surface of the rock by wash boring in casing pipe and into the rock by diamond drill. This was done where required under contract at a certain rate per linear foot. The total number of holes drilled on the three sections was 44 and the sum of the depths was 3,405 feet. Of these, 36 were carried into rock; the total rock drilling being 672 feet. Samples of the earth obtained by collecting a portion of the wash water and allowing it to settle, were not entirely satisfactory. They nearly always contained too high a percentage of sand and revealed nothing about underground water conditions. Something was learned by observing the number of blows of the drop hammer required to drive the casing pipe one foot and the number of feet bored per day. The permeability at different depths was also tested by shutting off the water supply and noting the rate at which the water in the casing disappeared. The data thus obtained led to the conclusion that, throughout certain areas, subsurface conditions were fairly constant.

In case soil bearing was proposed for a large pier and any doubt existed as to the ability of the earth to carry the load, a test pit was dug. This not only furnished reliable information for the design of the bearing in question but assisted materially in the interpretation of data obtained from wash borings in that vicinity.

After wash boring in each case had been continued to rock, core drilling commenced and results became more definite. The rock proved to be of the same general character throughout; consisting of layers of hard lime-

It is estimated that the cost of labor and supplies averaged approximately $1.50 per linear foot of boring.

(*b*) Surveys.

The surveys made prior to letting the contracts for the bridges were carried out with three objects in view;—first, to obtain data sufficiently comprehensive and accurate for use in designing and estimating; secondly, to obtain a permanent record of original conditions and thirdly, to establish, with a high degree of accuracy, base lines and bench marks from which the work could be quickly and correctly laid out.

During the first half of 1912, the investigations, relative to selection of route, were based largely on surveys made in 1911. After the route was chosen a thorough survey was made with reference to this route. At this time very little of the land had been acquired and the

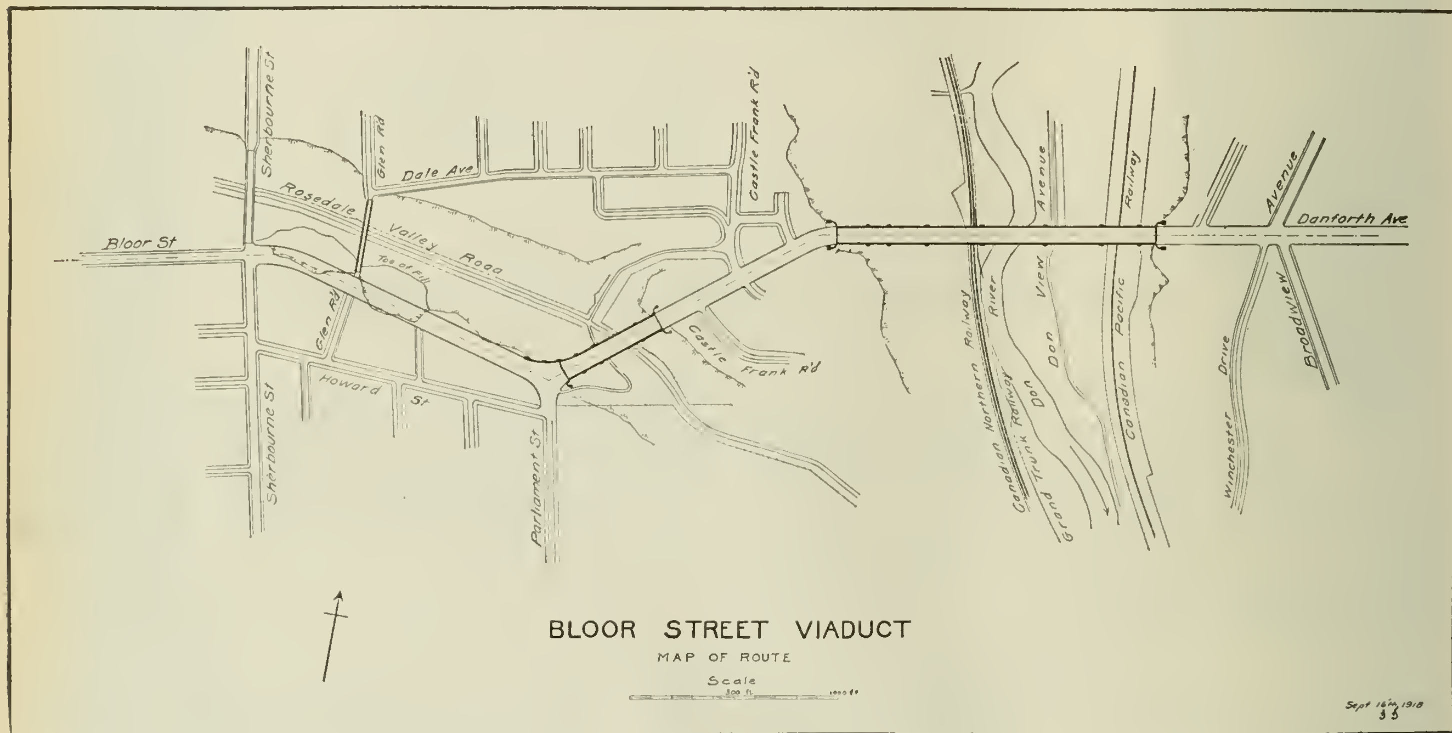

Fig. 1.

stone and layers of soft shale alternately, the latter constituting about 60 per cent of the whole. The cores obtained consisted mostly of the harder material and were found in the core barrel in short pieces mixed with a mud like substance which resembled wet, blue clay. In this were found fragments of soft laminated shale, which bore evidence of having been cut by the diamonds, then split off in the form of discs and partially ground to a paste by the action of the drill and the harder pieces of core. The fact that the drill cut steadily, indicated the solidity of the material; and it seemed likely that the formation was similar to that exposed in various excavations which had been made from time to time in Toronto. When excavation was afterwards made for the rock bearing piers of both bridges, this condition was found in all cases.

survey parties were not permitted to cut the trees and shrubbery that grew thickly over a great part of the site. Considering the short sights and frequent offsets, a fairly good centre line was run and profile on the same obtained. At right angles to this centre line and at intervals of ten feet, cross sections were taken extending on each side of the centre line for varying distances as required. Approximately fourteen thousand elevations were taken for this purpose. These elevations were first recorded in tabular form, then plotted as cross sections and finally a contour plan was made.

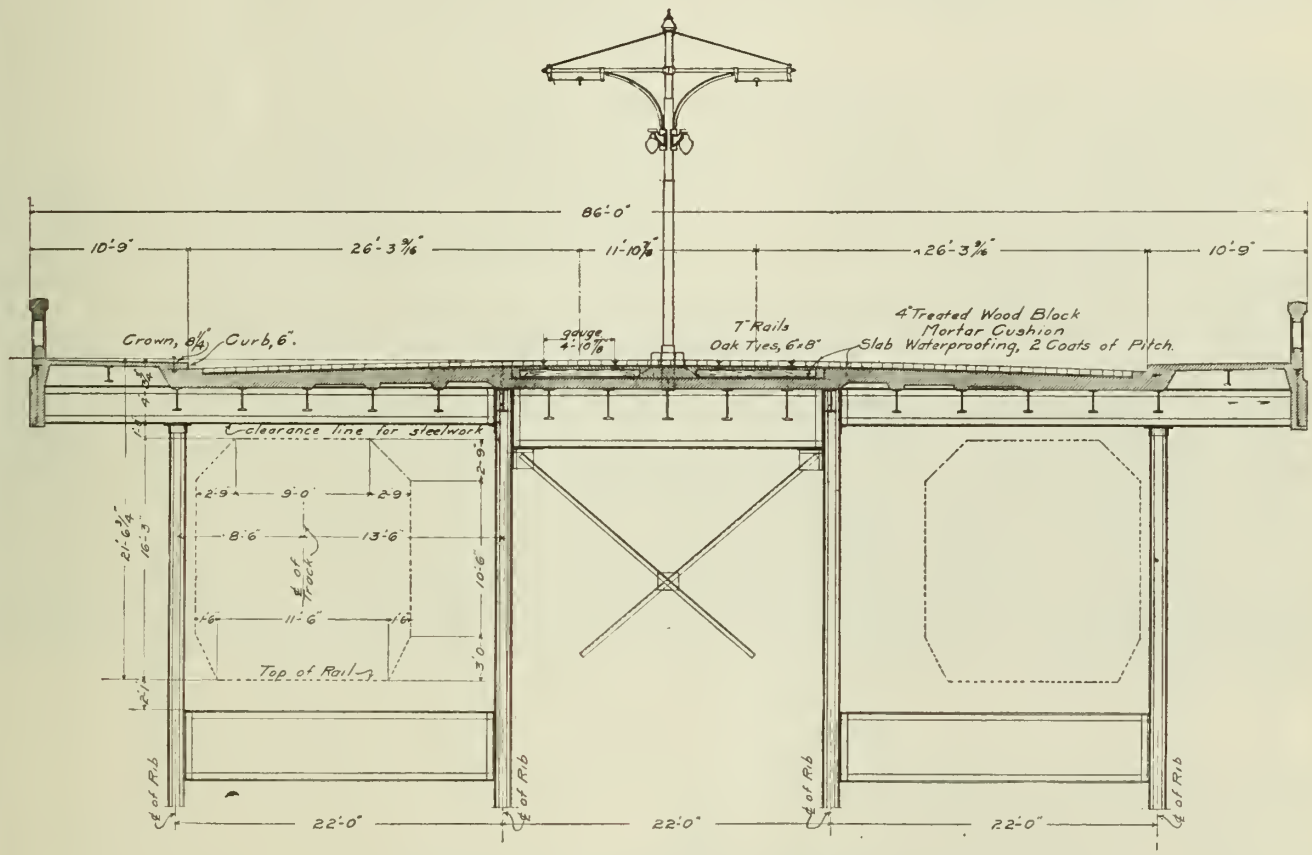
After notice of expropriation had been given in accordance with a by-law passed on May 19th, 1913, the survey parties were, for the first time, free to clear portions of the site. The centre line was then rerun and necessary corrections made. Intersecting and adjacent streets were located with reference to this centre line; houses, fences, etc., on these streets were tied in; and the whole plotted on a plan. Profiles of these streets were also made, showing the houses and the important elevations in connection with each.

An extensive set of photographs was made in order to record in greater detail than was possible on drawings, conditions prior to construction. On a key plan the position of the camera for each picture was shown by a small circle and the direction in which it was pointed by an arrow. In the circle was placed the number of the photograph.

monuments, measurements were made on the slope; the tension of the tape being kept constant while the temperature and the slope measurement were observed. By rearrangement of parties six independent observations were obtained in each case. The distances were corrected for temperature and the average taken as the slope distance. From these and the differences in elevation the horizontal distances between successive monuments were computed.

(*c*) Shale Tests.

The bearing value of the shale on which several



BLOOR STREET VIADUCT

CROSS SECTION OF BRIDGES

Fig. 2.

For use in construction, a liberal number of concrete monuments was placed for each bridge. In each case, these consisted principally of a pair on the centre line, one near each end of the bridge, and a row placed parallel to the centre line, one hundred feet distant, forming a base line. Levels were taken over the base line monuments and back, three times, the parties being rearranged so as to give six independent sets of results. The average of the elevations thus obtained for each monument was used. To determine the horizontal distances between

piers were to rest, being unknown, certain investigations were made.

In the first place, laboratory tests were made on specimens taken from the quarry of the Don Valley Brick Works. These were selected from the softest strata in the quarry face and were considered to be representative of the softest material beneath the piers. Owing to the laminated structure of the shale and its tendency to break down when exposed to air it was impossible to get specimens greater than two inch cubes; and of those obtained,

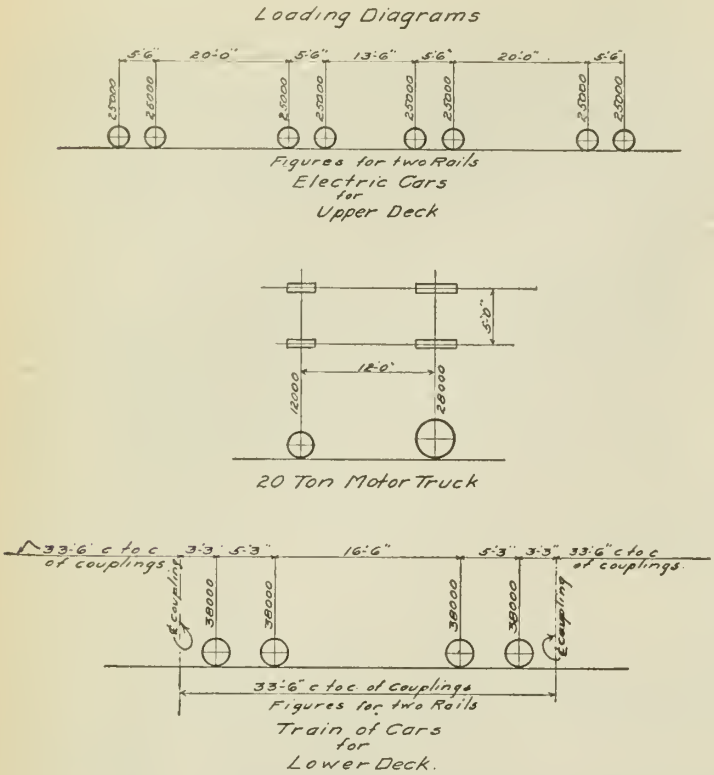


Fig. 3.

only one could be considered perfect. When tested in compression this specimen failed at 1,500 pounds per square inch, while the worst specimen sustained over 500 pounds per square inch, the others giving intermediate values.

As such shale in place has important advantages over small specimens, viz :—exclusion from air and lateral support, it was decided to secure information as to its carrying capacity when undisturbed. In the excavation for an addition to the John Street Pumping Station shale was exposed which was apparently identical in character with that obtained by the core drill in the borings for the Bloor Street Viaduct. With the co-operation of the Waterworks Section of the Department of Works loading tests were made there under favorable conditions, the layers being undisturbed and the surface being covered with water.

As heavy loads were required to give appreciable settlements, a special platform of steel shapes was constructed. After several strata were removed exposing the softer shale, the latter was carefully levelled off for bearing and the platform erected with the foot of the mast resting on a casting 8⅛ inches square, while the top was braced against overturning. Special care was taken to determine settlement and to check results.

On Dec. 10th, 1913, pig iron was gradually loaded on the platform from 1.30 to 4.45 P.M., the total load being 28,670 pounds, causing a gradual settlement of .09 inches during that time and a further settlement of .09 inches before 8.15 on the following morning. Additional pig iron was then added until 2.45 P.M., when the total load was 65,043 pounds or 986 pounds per square inch. The settlement during this period of loading was .12 inches and in the succeeding 24 hours a further settlement of .15 inches took place. Readings were taken on Dec. 13th, at 11 A.M., and Dec. 15th, at 9 A.M., neither of which showed additional settlement.

On removal of the platform the shale beneath was found to be so crushed that it could be rubbed to a paste in the hand. This effect extended for less than three inches in depth and the shale immediately around the loaded area showed no sign of injury. To determine the effect on the shale when loaded less heavily the platform was set up in another place, a few feet from the first location. On Dec. 20th, the loading was commenced but was discontinued at noon. The total load was then 11,320 pounds or 172 pounds per square inch. On Dec. 23rd, at 9.30 A.M., the settlement observed was .06 inches. By noon the total load was increased to 26,540 pounds or 402 pounds per square inch. During this time a settlement of .02 inches was noted. On Dec. 26th, no further settlement could be detected and the load was removed. On removal of the platform no injury to the shale was noticeable.

(*d*) Design of Bridges.

The same conditions of traffic volume and clearance applied to both bridges, the width being 86 feet, with 64 feet 6 inches between sidewalk curbs. It was orignally

Fig. 4. General Perspective, Don Bridge.

intended to use stone ballast under the upper deck tracks and to separate the track allowance from the 20 foot roadway on each side by curbs. This arrangement was discarded during construction in favor of an all paved deck shown in Fig. 2.

The bridges were so designed that, in the future, lower decks might be installed as a part of a subway system should the development of the City render the latter desirable. The clearances for this purpose, shown in Fig. 2, are continuous throughout the entire length of each bridge, openings being left in the pier tops and abutments. These lower deck clearances were obtained through the structural steel work by confining most of the diagonal bracing to the space between the two inner lines of columns and arch ribs.

In abutments and cross walls openings were provided at the lower deck level for two 42 inch water mains and under the sidewalks room was left to place ducts for telephone and other wires.

(iii) Sidewalk loads;

The slab, stringers and posts are designed for a uniform load of 100 pounds per square foot and the arches and foundations for a uniform load of 80 pounds per square foot.

(iv) Lower deck loads;

On each track, a train of cars, Fig. 3.

(v) Wind loads;

50 pounds per square foot of projected area of the unloaded structure. For lower deck construction, posts and arch ribs, the wind was assumed to act on twice the projected area.

In the case of stresses produced by railway loads, the combined dead load stress (D) and live load stress (L) were increased by an allowance for impact (I), using the formula

$$I = \frac{L^2}{D+L}.$$

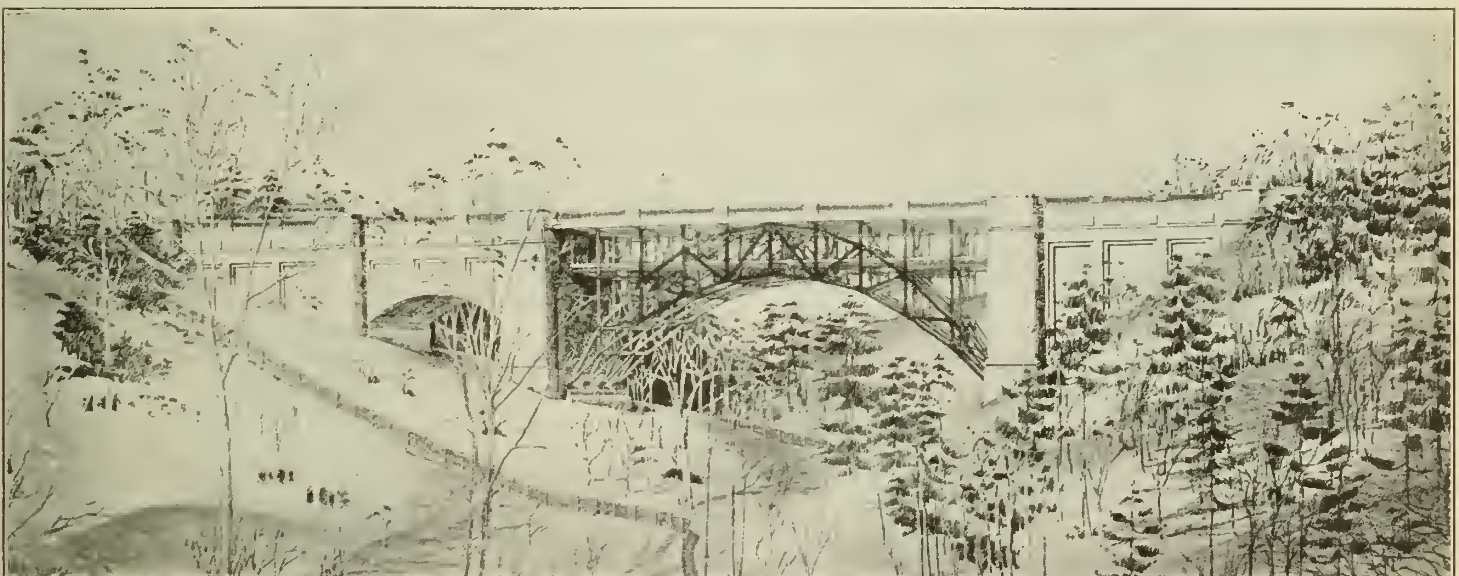

Fig. 5. General Perspective, Rosedale Bridge

The assumed live loads were as follows:—

(i) Upper deck railway loads;

For floor system and posts, two fifty ton electric cars on each track, Fig. 3.

For arches and foundations, a uniform load of 1,600 pounds per linear foot of track.

(ii) Roadway loads;

For floor system and posts, a uniform load of 135 pounds per square foot on the area remaining after deducting a strip 22 feet wide for tracks, or a 20 ton truck, Fig. 3. For arch ribs and foundations, a uniform load of 80 pounds per square foot for spans of 200 feet or over and $80 + \frac{200-S}{5}$ pounds per square foot for spans under 200 feet. S = span in feet.

For spans under 80 feet, the live load stress was multiplied by the factor $(1.40-\frac{l}{200})$, in which "l" is the loaded length in feet producing the maximum stress. This was then considered the live load stress and impact calculated as above.

The allowable stresses in pounds per square inch were as follows:—

Axial tension on net section of rolled plates and shapes, 16,000.

Axial compression on gross section of members,

Both ends fixed........ $16{,}000 \div \left[1+\frac{L^2}{18{,}000\, r^2}\right]$

One end fixed and one end pin........... $16{,}000 \div \left[1+\frac{L^2}{12{,}000\, r^2}\right]$

Both ends pin.......... $16{,}000 \div \left[1+\frac{L^2}{9{,}000\, r^2}\right]$

when L = the length and r = the least radius of gyration of the member expressed in inches.

Bending, on extreme fibres of rolled shapes, built sections and girders, net sect on 16,000
Shearing, shop driven rivets in reamed or drilled holes 10,000
power driven rivets in reamed or drilled holes. 9,000
all other rivets 8,000
lathe turned bolts in reamed or drilled holes. . 8,000
webs of girders, gross area 10,000
Bearing on diameter of rivets, twice the shearing values given above.
Bearing on pins, ... 22,000
Tension in steel reinforcement 15,000
Compression in 1 : 2 : 4 concrete in bending 500
Compression on 1 : 2 : 4 concrete under bearing plates and pad stones 400

to the east of their tracks insufficient. The objection was sustained by the Dominion Railway Board, who fixed the limits of encroachment on the Company's property. This necessitated a rearrangement of the structure, the new design being ratified by the Board under their Order No. 20580, dated October 15th, 1913.

From the beginning it had been felt that in designing a structure of this nature, architectural assistance should be secured and, now that the need had developed, Edmund Burke, of Toronto, was engaged as Consulting Architect. Accepting, as a basis, the cross-section, form and location of the main spans of the two bridges as previously determined, he laid out the general form and surface details of the exposed concrete, collaborating with the designing staff of the Bloor Street Viaduct in order to preserve consistency between these and structural

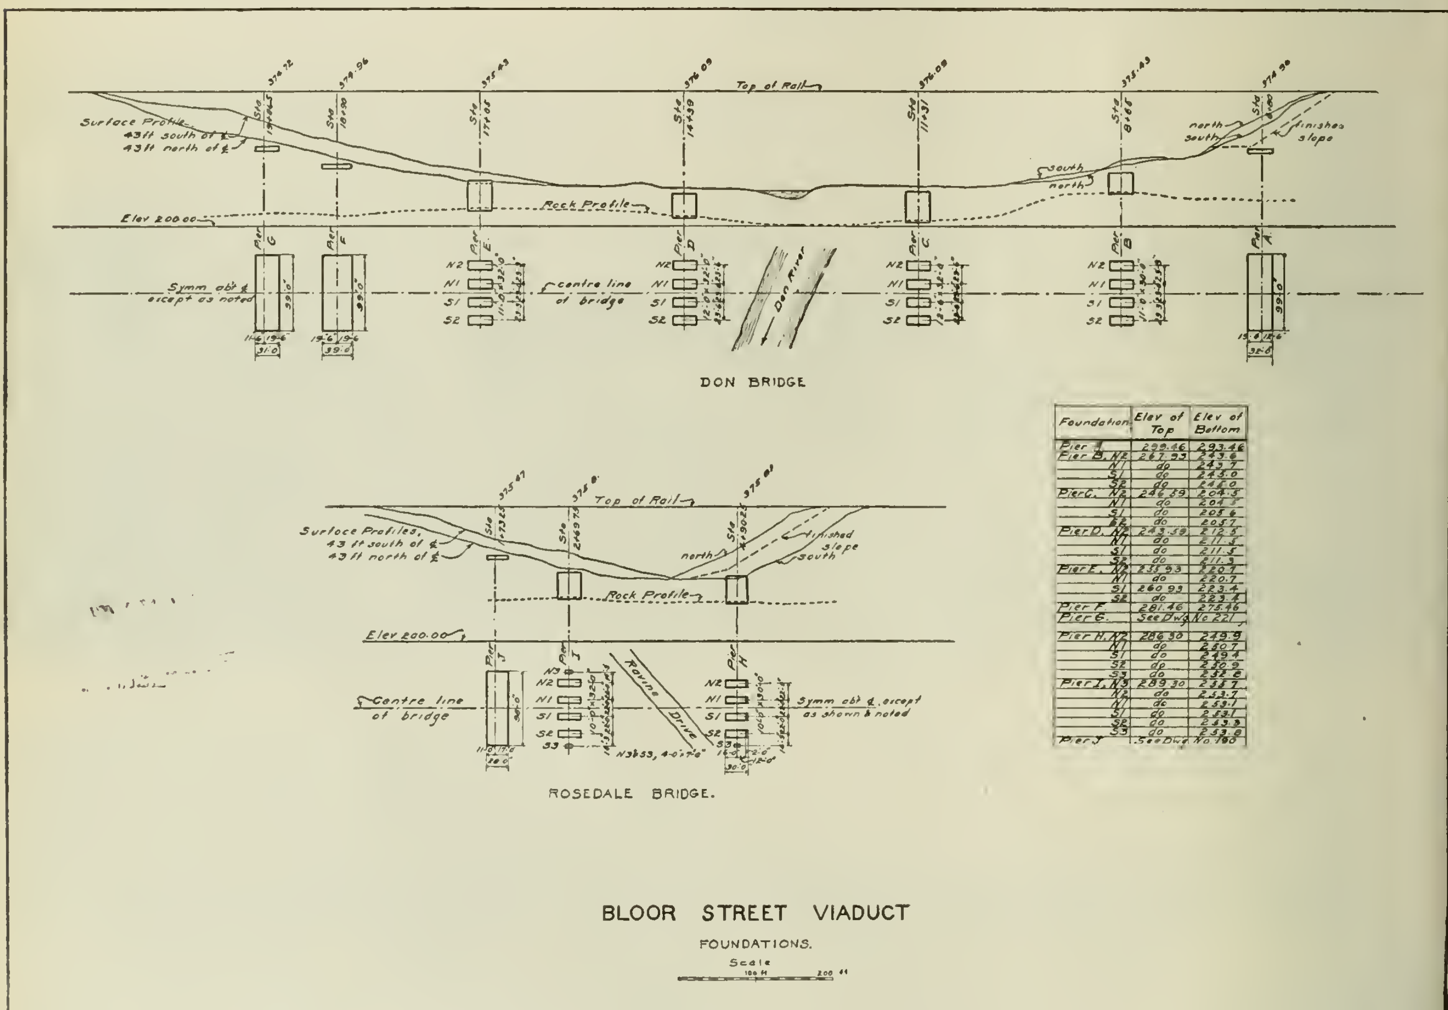

Fig. 6. Foundation Plan, Don and Rosedale Bridges.

In the Don Valley the problem of location of the piers was governed largely by the Grand Trunk and Canadian Northern right-of-way, the Don River, Don View Avenue, the Canadian Pacific right-of-way and a general desire for symmetry in the main spans. The first design met with objection on the part of the Canadian Pacific Railway Company, who considered the clearance

essentials. An idea of the outlines as finally designed may be obtained from Figs. 4 and 5, which show the south side of the Don Bridge and the south-east side of the Rosedale Bridge, respectively. These and other perspectives were carefully prepared from survey data, photographs of the sites and details of design and proved quite as useful to engineers as to laymen.

The Don Bridge, Fig. 4, consists of a central span 281 feet 6 inches long and 130 feet above the river, two flanking spans of 240 feet each and end spans, each 158 feet long. These, with piers and approaches, make a total length of 1,620 feet. For reference the piers have been named A to G inclusive, commencing at the east end. In the west approach, between piers F and G, is an arched opening.

The main feature of the Rosedale Bridge, Fig. 5, is an arch span 190 feet long, crossing the Valley Road at a height of 96 feet. The three piers commencing at the north east end are H, I and J. Between I and J is an arched opening similar to that in the west approach of the Don Bridge. From the far end of the south west abutment a curved retaining wall, of the counterfort type, extends, as indicated in Fig. 1, for a distance of 170 feet.

The two bridges resemble each other in many respects. The crescent shaped steel arches are three hinged, the crown pin being in the upper chord, while the lower chord is provided with a slip joint at the middle. The approaches are hollow, the floor loads being carried by four rows of steel columns in line with the four arch ribs. This steel work is masked by side walls of

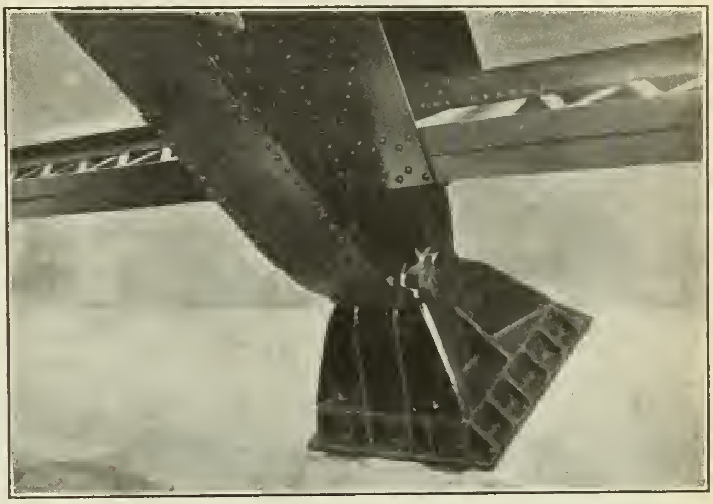

Fig. 7. Cast Steel Shoe, 158 foot spans.

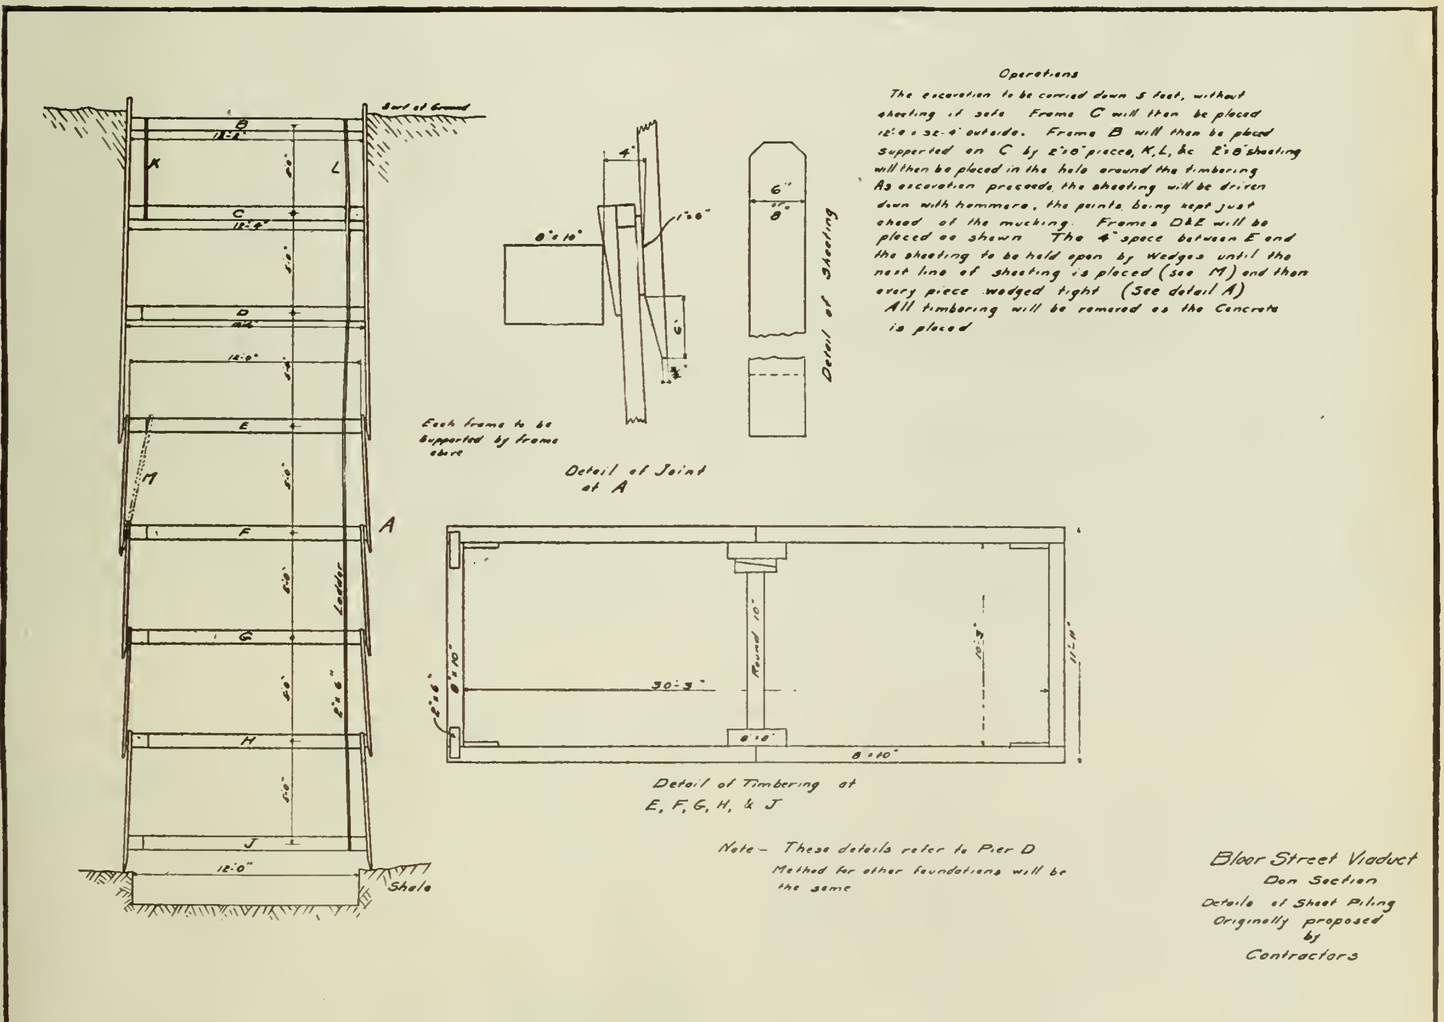

Fig. 8. Sheeting Proposed by Contractors, for Piers B, C, D and E, Don Bridge.

reinforced concrete, which, in general, rest on spread footings. This construction was adopted in order to produce a massive abutment effect in proportion to the size of the bridges.

The arched opening in the west approach of each bridge was introduced principally for the sake of appearance. The contours of the ground in each case make an angle of about 45 degrees with the centre line of the bridge. On the north side of the Don Bridge, west of pier F, the ground is 80 feet below grade and at the corresponding part of the Rosedale Bridge, i.e., on the northwest side, and behing pier I, it is 75 feet below grade. To avoid an excessive expanse of side wall at these places the arched openings were introduced. The main supports over these openings are four trusses, in line with the four arch ribs of the main spans. From these a soffit of reinforced concrete is suspended. The concrete side walls above these openings are supported by steel trusses imbedded in them and are stiffened laterally by struts to the adjacent main trusses.

The main piers, A to J, are hollow, the walls being massive below the bearings of the arches or trusses and considerably lighter above. Piers G and J are soil bearing and resemble each other closely in other respects. Piers A and F are similar to piers H and I respectively, the principal difference being in the foundations. The former are supported by spread footings, while each of the latter rests on rock. These piers are all of massive appearance and assist in producing the effect of substantial abutments. On the other hand, piers B, C, D and E of the Don Bridge have no counterparts in the Rosedale Bridge, their upper portions being proportioned and ornamented to produce a column effect. They also rest on rock. The arrangement of pier foundations is shown in Fig. 6. For each of the six rock bearing piers, a five foot slab of reinforced concrete rests on the foundations shown and on this slab is built the body of the pier.

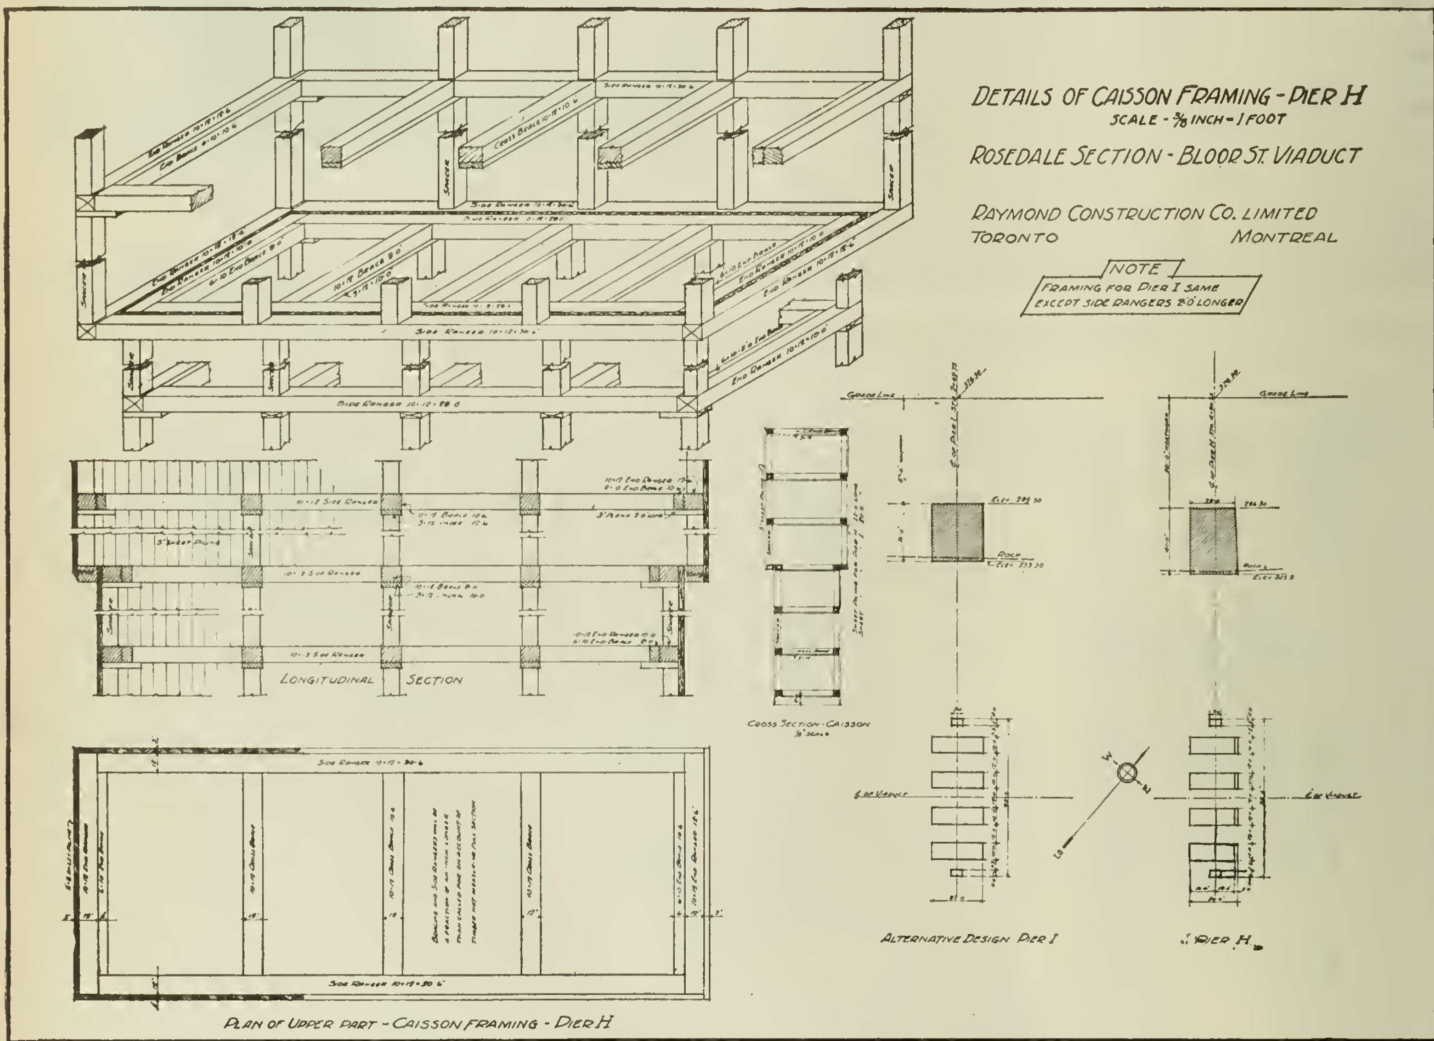

Fig. 9. Sheeting Proposed by Contractors for Piers H and I, Rosedale Bridge.

Neither in the calculation of stresses nor in the proportioning of members were any exceptional problems encountered. In many cases the dimensions of concrete were determined by considerations other than that of stress, an important exception being the floor slab. The steel work, from its nature, permitted a much closer adherence to the requirements of stress.

The lower bearings of the arch ribs are illustrated by Fig. 7, which shows the steel castings used in the 158 foot spans, the bearings for the other spans being somewhat similar. The bearings rest on granite blocks imbedded in concrete. The blocks were set so that they projected above the correct plane and were afterwards dressed to true surface. Sheet lead was placed between the shoes and the granite blocks.

Apart from the general lines of the concrete work, the principal attempt at ornamentation was in connection with the hand rail which, being of concrete, and of a heavy design, has been termed a parapet. The massive portions over the pier tops and at the ends of the bridges were designed to form bases for ornamental clusters of lights should such ever be desired. The spaces between these were subdivided by smaller pediments, each subdivision consisting of a balustrade. The top rail was made continuous between expansion joints, which were located chiefly at the pier tops and at pediments. A scrubbed finish was used for the parapet, in order to secure an interesting surface texture and pleasing color by exposing the particles of selected red granite used as coarse aggregate. This brought the parapet into striking contrast with the rest of the concrete, which was finished with a plain rubbed surface.

(*e*) Contractors.

The general contractors for the Don Bridge were Messrs. Quinlan and Robertson of Montreal, who sublet the structural steel work to the Hamilton Bridge Works Co. The contractors' engineer was T. T. Black, A.M.E.I.C. The contract for the Rosedale Bridge was awarded to the Dominion Bridge Co. of Montreal, who sublet all portions except the structural steel to the Raymond Construction Company. W. F. B. Rubidge, A.M.E.I.C., was the contractors' engineer during the greater part of the construction, his successor being A. Ramsperger.

Fig. 10. 281 ft. 6 in. Span, Don Bridge, during Erection.

(3). Construction of Bridges.

(*a*) Excavation.

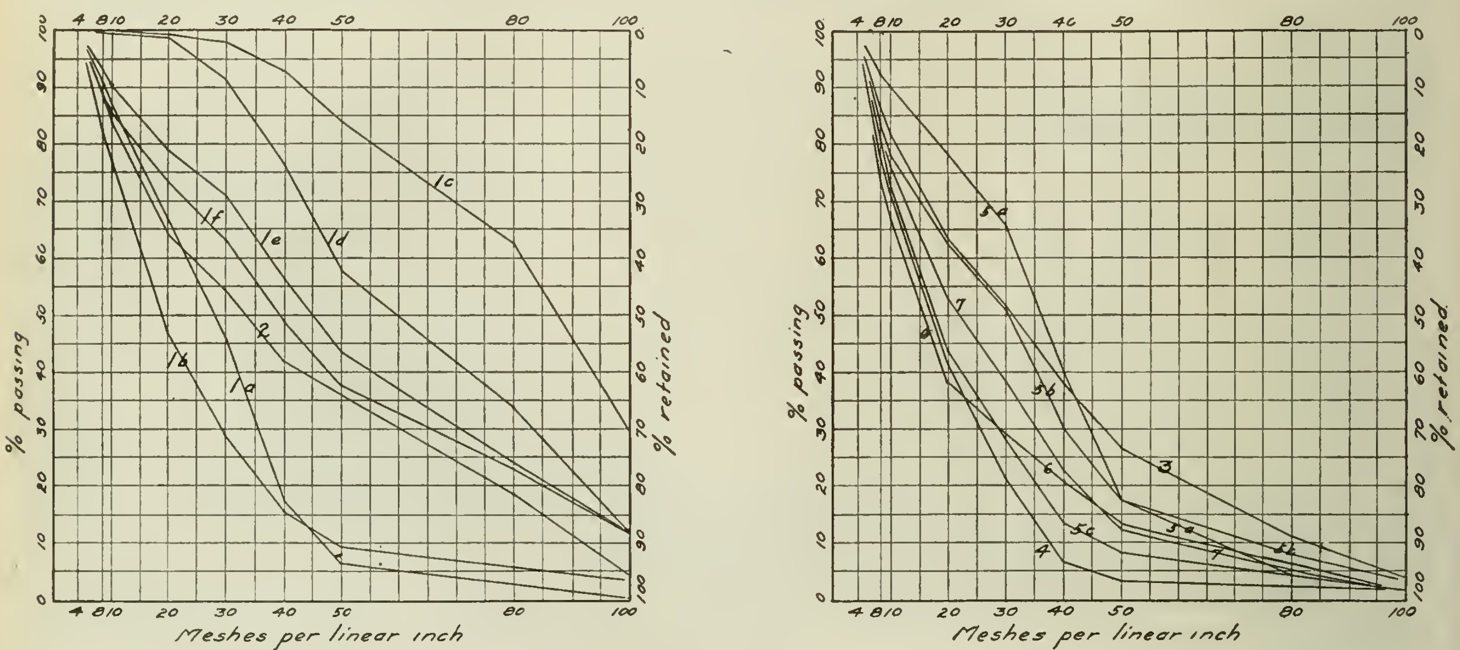
On the Don Section, the contractors commenced work at Pier D, making use of the system of wood sheeting shown in Fig. 8. It was the intention to make the clear space inside very little larger than the required foundation and to fill the space with concrete, leaving the sheeting in place but removing the timbers in advance of the concrete. This sheeting gave trouble by admitting a great deal of water and sand, which released the outside pressure in places, causing distortion. This system was therefore abandoned and the rest of the deep excavations were satisfactorily made by using longer sheeting and adequate timbering. In some cases wood sheeting was used, and in others, steel sheet piling.

On the Rosedale Section sheeting and timbering, as shown in Fig. 9, was used with good results in excavating for Piers H and I.

(*b*) Concreting.

The modes of handling materials for the Don and Rosedale Bridges, were as a result of their locations, radically different. For the former, materials were delivered by rail, unloaded by clam derricks, and stored adjacent to the railway tracks and the site of the bridge; while for the latter, deliveries were made by waggon or motor truck to the two approaches. In general, the and G. As work on the upper part of pier A progressed, a rehoisting tower with chutes was used.

In operating these chutes some trouble was caused by clogging. In time this was overcome by giving the chutes proper slope, keeping the consistency of the concrete uniform, and feeding the mixture evenly from the tower hopper into the chutes. Difficulty also arose from the fact that the mode of supporting the chutes did not permit ready movement of the discharge end, which necessitated too much shovelling of concrete in the forms. This was corrected, and resulted in better and more economical distribution, particularly in the thinner walls. After the steel work of the floors had been placed it was found convenient and satisfactory to hoist the concrete to this elevation and distribute it to the side walls, pier tops and floor slab by wheel buckets.



Grading of Sands.

Fig. 11.

materials used for concrete in Pier B and all portions east of that, were taken from storage beside the C. P. R. tracks, mixed at Pier B, and the concrete distributed from that point. Materials required for Pier C and all parts west of that pier, were taken principally from storage beside the C. N. R. tracks and distributed by cableway to the different concreting plants.

Both contractors placed the most of the foundation concrete by setting mixers as near as possible and using short chutes. Both soon prepared, however, to meet the harder conditions of distributing concrete at considerable heights by placing mixers in permanent locations and erecting elevator towers with lines of steel chutes. For the Rosedale Bridge two such plants were erected, one at each approach; while for the Don Bridge, five were used, being located on the north side of the bridge at piers B, C, D, E

(*c*) Structural Steel Work.

As the details were laid out in conformity with well established methods of fabrication, there is little to attract special attention.

To check the shape of the arch ribs, diagrams of the half ribs were made for the different spans. These showed the distance between the crown and heel pins as well as the perpendicular distances of all upper and lower chord panel points from this line. The members of each half rib were then laid down, the whole levelled up and the joints drawn tight. A piano wire was then stretched across the pin centres and the shape of the half rib checked by means of the diagram. After adjustments had been made, the rivet holes, which had been punched 3/16″ small, were reamed to size. The arches of both bridges were erected on false work. On the Don Bridge erection

was carried on from both ends by travellers, Fig. 10, and the timbering was necessarily heavy. On the Rosedale Bridge it was much lighter as derricks were employed for erection, those used for the greater part of the arch being located on Piers H and I.

The steel received three coats of paint, viz: one shop coat of red lead paint and two field coats known as A. and B. The latter were carbon paints. All paint was manufactured to the Department's specifications, provided by the City, and applied by the contractors.

Concrete Cylinders, Rosedale Bridge.
1915.

Fig. 14.

(4). Tests on Miscellaneous Materials.

(*a*) Sand.

Sources of sand proposed by each contractor were inspected by their engineer in company with a member of the City's staff, the latter taking such samples as were considered by both to be fairly representative. Seven deposits were thus inspected during 1915, six samples, a, b, c, d, e and f being taken from No. 1; three samples a, b and c from No. 5; and one sample from each of the others. Several of these samples were plainly too fine for concrete, but were selected and tested to illustrate the effects of varying degrees of fineness. Of each sample, only that portion passing a No. 4 sieve was considered as sand and tested. The samples were first graded and the results plotted, Fig. 11.

They were then tested for strength in comparison with standard Ottawa sand as follows. In each case a 1:3 mortar was made from a previously tested Portland cement and the sand in question. From this six briquettes were made, three to be tested in tension after seven days and three after twenty-eight days. Also six two inch cubes were made from the same mortar, three to be tested in compression after seven days and three after twenty-eight days. At the same time, using the same tested cement and standard Ottawa sand, six briquettes and six two inch cubes were made to be tested at the same times as the corresponding specimens made from the sand under examination. In each case the strength of the specimens made from the commercial sand was expressed as a percentage of the strength of the corresponding specimens made from standard Ottawa sand, Fig. 12.

Fig. 15. Don Bridge, North Side.

In the case of samples from source No. 1, the order with respect to increasing fineness was b, a, f, e, d and c. The order of decreasing strength was the same in all four classes of tests. In the case of the three samples from source No. 5, a similar correspondence between grading and strength was found to exist. This was true not only in connection with the averages shown in Fig. 12, but among the individual results from which these were compiled, with only a few trifling exceptions. The percentage of voids in each sample was determined but, from the data secured, no relation between voids and strength was apparent. After certain samples had been approved, shipments were judged in comparison with these, being inspected chiefly for grading and cleanness.

Fig. 16. Deck of Don Bridge, Looking Eastward.

(*b*) Steel Castings, in Lower Bearings of Arches.

The material in these was tested in accordance with the specifications for Class B Soft, contained in the 1913 Year Book of the American Society for Testing Materials. The specimens were annealed with the castings with which they had been poured, then cut off, machined and tested. The yield point, ultimate strength, elongation in 2 inches and reduction of area, were considerably in excess of requirements.

The following are the average, maximum and minimum results respectively, of tests from ten melts, taken at random from those made in one foundry for the Don Bridge.

	Yield Point	Ultimate Strength	Elongation, %	Reduction of Area %
Average....	40700	74800	29.8	43.6
Maximum..	43800	79600	32.8	51.8
Minimum..	36150	72400	28.1	32.5

The following are the results similarly compiled from tests of five melts, made in another foundry, for the Rosedale Bridge.

	Yield Point	Ultimate Strength	Elongation, %	Reduction of Area, %
Average....	42900	71600	28.2	41.6
Maximum...	44800	74900	29.0	48.7
Minimum..	40800	68000	27.0	30.0

The following are the requirements of the specifications:—

Yield Point	Ultimate Strength	Elongation, %	Reduction of Area, %
27000	60000	22.0	30.0

The bend tests on specimens machined to 1 inch x ½ inch were satisfactory. They not only stood the prescribed test of bending cold through 120 degrees, around a pin 1 inch in diameter, without cracking on the outside of the bent portion, but in many cases showed no cracking when bent to the same radius through 180 degrees. In some instances no cracking was perceptible even when the specimens were bent flat on themselves by the blows of a steam hammer.

(*c*) Concrete Cylinders.

These were taken at various times, particularly when any important change occurred in the conditions of running, such as change in size or quality of stone, consistency of mixture, or contractors' organization.

The moulds, Fig. 13, consisted of 12 inch lengths of standard 6 inch pipe, bored out, ends trued up, and slit longitudinally. Each mould was provided with two collars. When the bolts through the lugs of the collars were tightened, the slit closed; and, after slacking the bolts to remove the specimen from the mould, the latter would spring open, and separate easily from the cylinder. The bottom of the mould was a smooth steel plate. The concrete for the specimens was taken during the progress of a run, and when practicable from the forms. In order to make the cylinders as nearly as possible representative of the concrete in place, pains were taken to secure a fair proportion and distribution of stone and mortar and to avoid, with equal care, excessive and insufficient tamping. The specimens were kept in a moist condition, both before and after removal of moulds, until required for tes ing. In each case a set of six cylinders was made, two for 30 day test, two for 90 day test and two for test at a still longer period, should such be desirable, or to replace, if necessary, any specimens which might show improper workmanship. Fig. 14 gives the results of all such tests made during 1915 in connection with the Rosedale Bridge.

Explanation of letters in Fig. 14.

(*a*) Specimen not broken, capacity of machine not being sufficient.

(*b*) Poor distribution of material.

(*c*) Excess of large stone.

(*d*) Insufficiently tamped.

Careful examination of the specimens after testing, led to the conclusion that they were too small to do justice to the material in place, particularly when the latter, as in the present case, is massive and contains a fair proportion of the larger sizes of stone. A small irregularity in distribution, the presence of one poorly shaped piece of stone or the unfavorable position of another, particularly if it be large, is sufficient to cause failure of the specimen otherwise than by crushing. A larger specimen would in such cases give better lateral support.

Fig. 17. Rosedale Bridge, Northwest Side.

(5). Work Exclusive of Bridge Contracts.

These contracts included the bridges complete, except drain pipes, paving, electric railway track, overhead and lighting. The drain pipes were placed under separate contracts. The remaining work required to finish the bridges and to carry out the street construction on the balance of the route was performed by the Department of Works by day labor.

The Rosedale Bridge was opened for vehicular traffic on October 29th, 1917, being connected by temporary macadam roads with Parliament Street and Castle Frank Road. During the summer of 1918 the Don Section, including the Don Bridge, and that part of the Rosedale Section east of the Rosedale Bridge were completed and formally opened on October 18th, 1918.

On the Bloor Section temporary construction is necessary as the fill west of Glen Road is incomplete and that already placed will continue to settle for some time. The placing of macadam roadway on this section was discontinued on account of the winter. The temporary track, however, had been placed as near as possible to the south side of the viaduct property, and on December 15th, 1918, the Toronto Railway Company commenced to operate cars regularly over the whole of the improvement.

The following are the Civic officials most closely connected with the Bloor Street Viaduct:—

Commissioner of Works, R. C. Harris.

Deputy City Engineer, G. G. Powell, M.E.I.C.
Engineer of Railways and Bridges,

(prior to July, 1914), C. W. Power.
(since that time), G. A. McCarthy, M.E.I.C.

The design and supervision of construction were carried out by a branch of the Railway and Bridge Section, known as the Bloor Street Viaduct Division, of which the following were members:—

The author, Designing and Construction Engineer.

Geo. Oksvik, Principal Assistant, in charge of designing and drawing.

W. E. Janney, A.M.E.I.C., Engineer of Surveys, in charge of borings, surveys and construction measurements.

Chas. E. Stilson, Field Engineer, with supervision of construction of the Don Bridge.

John H. Ryckman, A.M.E.I.C., Field Engineer, with supervision of construction of the Rosedale Bridge, and charge of City labor on Rosedale and Bloor Sections during 1915, 1916 and 1917.

Fundamentals in the Make-Up of a Concrete Mixture

In the course of a study given before an annual convention of the American Railway Engineering Association, Prof. Talbot, of Illinois University, gave the following fundamentals in the make-up of concrete:—

(1) The cement and mixing water may be considered together to form a paste; this paste becomes the glue which holds the particles of aggregate together.

(2) The volume of the paste is approximately equal to the sum of the volume of the particles of the cement and the volume of the mixing water.

(3) The strength given by this paste is dependent on its concentration; the more dilute the paste, the lower its strength; the less dilute, the greater the strength.

(4) The paste covers the particles of aggregate partially or wholly, and also goes to fill the voids of the aggregate wholly or partially. Full coating of the surface and complete filling of the voids are not usually obtained.

(5) The coating or layer of the paste over the particles forms the lubricating material which makes the mass workable.

(6) The requisite mobility or plasticity is obtained only where there is sufficient paste to give a thickness of film or layer of paste over the surface of the particles of aggregate, and between the particles sufficient to lubricate those particles.

(7) Increase in mobility may be obtained by increasing the thickness of the layer of paste. This may be accomplished either by adding water (resulting in a weaker paste) or by adding cement up to a certain point (resulting in a stronger paste).

(8) Factors contributing to the strength of concrete are, then, the amount of cement, the amount of mixing water, the amount of voids in the combination of fine and coarse aggregate, and the area of surface of the aggregate.

(9) For a given kind of aggregate the strength of the concrete is largely dependent on the strength of the cement paste used in the mix, which forms the binding material between the particles of aggregate.

(10) For the same amount of cement and the same voids in the aggregate, that aggregate (or combination of fine and coarse aggregates) will give the higher strength which has the smaller total area of surface of particles, since it will require the less amount of paste to produce the requisite mobility, and this amount of paste will be secured with a smaller quantity of water. This paste, being less dilute, will, therefore, be stronger. The relative surface area of different aggregates, or combinations of aggregates, may readily be obtained by means of a surface modulus calculated from the screen analysis of the aggregate.

(11) For the same amount of cement and the same surface of aggregate, that aggregate will give the higher strength which has the fewer voids, since additional pore-space will require a larger quantity of paste, and, therefore, more dilute paste.

(12) Any element which carries with it a dilution of the cement paste may in general be expected to weaken the concrete. Smaller amounts of cement, the use of additional mixing water, increased surface of aggregate, and increased voids in the aggregate, all operate to lower the strength of the product.

(13) In varying the gradation of aggregate, a point will be reached, however, when the advantages in the reduction of surface of particles is offset by increased difficulty in securing a mobile mass, the voids are greatly increased, the mix is not workable, and less strength is developed in the concrete. For a given aggregate and a given amount of cement, a decrease in the amount of mixing water below that necessary to produce sufficient paste to occupy most of the voids, and provide the lubricating layer, will give a mix deficient in mobility and lower in strength.

A certain degree of mobility is necessary in order to place concrete in the forms in a compact and solid mass, the degree varying considerably with the nature of the work, and generally it will be found necessary to sacrifice strength to secure mobility.

More thorough mixing not only mixes the paste and better coats the particles, but it makes the mass mobile with a smaller percentage of mixing water, and this less dilute paste results in higher strength.—*Engineering News-Record, May 1, 1919.*

What is the International Joint Commission?

By Lawrence J. Burpee, Secretary, International Joint Commission.

A certain tribunal known as the International Joint Commission has been subjected to severe criticism, by some of the leading newspapers and technical journals of Canada, because of its decision in a recent power case on the St. Lawrence River. This criticism, although both ill-advised and ill-informed, has at least had the advantage of letting a number of Canadians know that such a tribunal exists. Unfortunately it has at the same time given them an entirely wrong idea of the nature and functions of the Commission. This misapprehension, indeed, seems to be widespread because, no doubt, of the fact that the Commission, like most judicial bodies, has a tendency to hide its light under a bushel. However, old ideas, practices and prejudices are being scrapped very rapidly in these iconoclastic days, and it might even be possible to add to the heap the notion that judges or their equivalents must never condescend to answer newspaper criticism, even for the sake of correcting dangerous misstatements. In any event, no exception can very well be taken to a plain statement as to the origin of the Commission and the purposes it is expected to serve.

Genesis of the Commission

As long ago as 1894 the Canadian delegates to the Irrigation Congress at Denver secured the adoption of a resolution urging upon the Governments of Canada, the United States and Mexico, the importance of creating an international commission to investigate questions arising out of the use for irrigation of international streams. A similar resolution was adopted at the Irrigation Congress held at Albuquerque, New Mexico, the following year. The Government of Canada took the matter up with the Government of the United States in 1896, but the latter government was not at that time prepared to create such a commission. It was not, in fact, until 1902 that the two countries by concurrent legislation created what was known as the International Waterways Commission. This body—not to be confused with the International Joint Commission—consisted of three members representing the United States and three representing Canada. Their duties were broader than those recommended in the Denver and Albuquerque resolutions, namely:—"to investigate and report upon the conditions and uses of the waters adjacent to the boundary lines between the United States and Canada, including all of the waters of the lakes and rivers whose natural outlet is by the River St. Lawrence to the Atlantic Ocean, also upon the maintenance and regulation of suitable levels, and also upon the effect upon the shores of these waters and the structures thereon, and upon the interests of navigation by reason of the diversion of these waters from or change in their natural flow; and further to report upon the necessary measures to regulate such diversion and to make such recommendations for improvements and regulations as shall best subserve the interests of navigation in said waters." This Commission was purely an investigating body and possessed no final authority. It submitted, however, to the two Governments a number of very valuable reports covering a variety of subjects. Among other things, it recommended the adoption of certain principles as to the use of boundary waters between Canada and the United States, and the creation of an international body with larger powers than its own. The matter was taken up at Washington by Mr. (now Lord) Bryce, then British Ambassador, and Mr. Root, Secretary of State for the United States. The British Ambassador was assisted at various times and in connection with different phases of the Treaty by George C. Gibbons, of the International Waterways Commission, Dr. W. F. King, the Astronomer Royal of Canada and member of the International Bourdary Commission, and the Honourable J. W. Pugsley, then Minister of Public Works of Canada. After protracted negotiations a Treaty was finally signed at Washington on January 11th, 1909, so comprehensive and far-reaching in its terms that it may fairly be said to mark the birth of a new epoch in the relations of the two great democracies of North America.

Waterways Treaty of 1909

In the preamble of the Treaty its objects are set forth: "to prevent disputes regarding the use of boundary waters and to settle all questions which are now pending between the United States and the Dominion of Canada involving the rights, obligations or interests of either in relation to the other or to the inhabitants of the other, along their common frontier, and to make provision for the adjustment and settlement of all such questions as may hereafter arise."

Special clauses of this Treaty limit the diversion of water from the Niagara River, above the Falls, by either country to a specified quantity; and provide for the equal apportionment between the two countries of the waters of the St. Mary and Milk Rivers in the State of Montana and the Provinces of Alberta and Saskatchewan.

For the purpose of the Treaty boundary waters are defined as "the waters from main shore to main shore of the lakes and rivers and connecting waterways, or the portions thereof, along which the international boundary between the United States and the Dominion of Canada passes, including all bays, arms and inlets thereof; but not including tributary waters which in their natural channels would flow into such lakes, rivers and waterways, or waters flowing from such lakes, rivers and waterways, or the waters of rivers flowing across the boundary."

Boundary waters, as defined in the Treaty, therefore, include the St. Croix River and that portion of the St. John River between New Brunswick and Maine; the St. Lawrence from the point where the international boundary strikes the river to Lake Ontario; Lake Ontario; the Niagara River; Lake Erie; the Detroit River, Lake St. Clair, and St. Clair River; Lake Huron; St. Mary's River; Lake Superior; Rainy Lake, with the smaller lakes and rivers east of it through which the international boundary passes; Rainy River, and the Lake of the Woods. On the other hand, they do not include rivers flowing into these waters, such as the Seneca, Genesee, Sandusky, Grand, Thames, French and Nipigon; or rivers flowing out of them, such as the Winnipeg, Lower St. Lawrence, and Lower St. John; or rivers flowing across the boundary, such as the Red, Souris, Columbia and Kootenay.

It is agreed that the " navigation of all navigable boundary waters shall forever continue free and open for the purposes of commerce to the inhabitants and to the ships, vessels and boats of both countries equally." This right of navigation is also extended to the waters of Lake Michigan and to all canals connecting boundary waters, now existing or which may hereafter be constructed. Tolls may be charged on such canals, but without discrimination against the subjects or citizens of either of the High Contracting Parties. The equal right of navigation therefore extends both to the Canadian and the United States canals at Sault Ste. Marie, the Welland canal and the St. Lawrence canals above the boundary; but not to the Erie or Rideau canals.

It is further agreed that " the waters herein defined as boundary waters and waters flowing across the boundary shall not be polluted on either side to the injury of health or property on the other." As will be seen later, special action has since been taken to carry out the provisions of this clause, at least so far as boundary waters are concerned.

Creation of the Commission

By the terms of Article VII of the Treaty, the High Contracting Parties agreed to " establish and maintain an International Joint Commission of the United States and Canada composed of six commissioners, three on the part of the United States appointed by the President thereof, and three on the part of the United Kingdom appointed by His Majesty on the recommendation of the Governor-in-Council of the Dominion of Canada."

The personnel of the Commission has changed to some extent since its organization. The original members appointed by His Majesty the King, on behalf of Canada, were the Honourable Thomas Chase Casgrain, K.C., Charles A. Magrath, M.E.I.C., and Henry A. Powell, K.C.; and, by the President of the United States, Honourable Thomas H. Carter, James A. Tawney and Frank S. Streeter. Mr. Casgrain resigned in 1914 to become Postmaster-General in the Dominion Cabinet. Paul B. Mignault, K.C., was appointed in his place; but resigned in 1918, on his appointment to the Supreme Court of Canada. On the United States side, Senator Carter died in 1911, and his place was taken by Senator George Turner. Senator Turner resigned in 1914, and his place was taken by R. B. Glenn, formerly Governor of North Carolina. The previous year Judge Streeter had resigned, and Senator Obadiah Gardner of Maine took his place. Under the rules of the Commission no decision can be made except at a meeting of the six members, but a portion of the Commission may act in the taking of evidence or hearings leading up to the final decision. The Commission has two secretaries, one in charge of the offices at Washington and the other in charge of the offices at Ottawa.

Other clauses of the Treaty set forth the powers and provide the machinery and the legal authority, by virtue of which the Commission is to carry out its important duties. The Commission shall have " jurisdiction over and shall pass upon all cases involving the use or obstruction or diversion of the waters with respect to which, under Articles III and IV of this Treaty, the approval of this Commission is required."

Articles III and IV read as follows:—

Article III

" It is agreed that, in addition to the uses, obstructions, and diversions heretofore permitted or hereafter provided for by special agreement between the Parties hereto, no further or other uses or obstructions or diversions, whether temporary or permanent, of boundary waters on either side of the line, affecting the natural level or flow of boundary waters on the other side of the line, shall be made except by authority of the United States or the Dominion of Canada within their respective jurisdictions and with the approval, as hereinafter provided, of a joint commission, to be known as the International Joint Commission.

The foregoing provisions are not intended to limit or interfere with the existing rights of the Government of the United States on the one side and the Government of the Dominion of Canada on the other, to undertake and carry on governmental works in boundary waters for the deepening of channels, the construction of breakwaters, the improvement of harbors, and other governmental works for the benefit of commerce and navigation, provided that such works are wholly on its own side of the line, and do not materially affect the level or flow of the boundary waters on the other, nor are such provisions intended to interfere with the ordinary use of such waters for domestic and sanitary purposes."

Article IV

" The High Contracting Parties agree that, except in cases provided for by special agreement between them, they will not permit the construction or maintenance on their respective sides of the boundary of any remedial or protective works or any dams or other obstructions in water flowing from boundary waters or in waters at a lower level than the boundary in rivers flowing across the boundary, the effect of which is to raise the natural level of waters on the other side of the boundary unless the construction or maintenance thereof is approved by the aforesaid International Joint Commission."

Ruling Principles

In passing upon the cases which come before it under the terms of the above Articles, the Commission is governed by certain rules or principles. It is first laid down that the High Contracting Parties shall have, each on its own side of the boundary, equal and similar rights in the use of boundary waters. Then follows the order of precedence to be observed among the various uses of these waters. Uses for domestic and sanitary purposes are given the preference over all other uses; then uses for navigation, including canals for such purposes; finally, uses for power and for irrigation.

The importance of these principles adopted by the High Contracting Parties for the guidance of their Commission can hardly be overestimated. It must be borne in mind that the boundary waters over which the Commission is given jurisdiction support a population of over 7,000,000 people, American and Canadian, and that this population is rapidly increasing. The governing principles recognize, so far as these people are concerned, the pre-eminence of domestic and sanitary uses, or, in other words, the supreme importance of safeguarding the public health. All other uses of boundary waters must be disregarded in so far as they conflict with or restrain uses for domestic and sanitary purposes.

Then comes navigation. The navigation interests of the Great Lakes are of enormous and rapidly increasing importance. It appears from official reports that approximately 95,000,000 tons of freight, valued at more than $800,000,000 and carried by over 26,000 vessels, pass up and down the Detroit River during the season of navigation; more than three times the freight through the Suez Canal in an entire year. Not only is an enormous capital tied up in navigation or transportation on the Great Lakes, but the communities, large and small, along these waters are, to a considerable extent, dependent thereon, and, to a less degree, communities farther afield but connected by transportation lines with the lakes. The interests of navigation are the common interests of a very large population inhabiting the entire watershed of the Great Lakes. While secondary in importance to those of public health, they are nevertheless superior to the interests of power and irrigation. As a matter of fact, although bracketed together in the Treaty, power and irrigation do not bear at all the same mutual relation to navigation. Broadly speaking, power development along the international frontier belongs to the eastern half of the continent, and irrigation to the western half. Power may come in direct conflict with navigation; irrigation is unlikely to do so.

The relations of power to navigation and sanitation are recognized in the article relating to diversions for power purposes above Niagara Falls. The last paragraph of that Article reads: "The prohibitions of this Article shall not apply to the diversion of water for sanitary or domestic purposes, or for the service of canals for the purpose of navigation."

Use for power, though of less vital or general significance to the Great Lakes communities than uses for sanitation or navigation, are, nevertheless, of very great importance. On the St. Mary's River, the Niagara River, the Upper St. Lawrence and elsewhere along the international boundary, millions of dollars have already been invested in power development and the available power is far in excess of any attempts that have yet been made to utilize it for manufacturing and other purposes.

Leisurely Ways of the Old Diplomacy

It will be seen that in placing in the hands of an international commission, half American and half Canadian, the settlement of questions involving the more or less conflicting interests of sanitation, navigation, power and irrigation, along a 2,000 mile frontier, the Governments of the United States and Great Britain took a very important and significant step. These questions, large and small, have been a fruitful source of irritation in the past to the people living along both sides of the boundary. A question, perhaps a trivial one, arises at some point on or near the international boundary. Some diversion is contemplated or has already been carried out, or some work constructed on one side of boundary waters, affecting the interests of the inhabitants on the other. The local authorities have no powers or jurisdiction. The injured parties (let us assume they are Canadian) appeal to Ottawa. The case, cumbered with red tape, travels deliberately through several of the Dominion departments; rests perhaps for weeks in the file basket of one or other of the various officials; is referred back and forth between the federal authorities and their local officers; finally moves on to the Governor-General's Office, and is sent overseas to the Colonial Office in London. Thence it takes its dignified way to the Foreign Office, and back across the Atlantic to the British Ambassador in Washington. The Ambassador takes the matter up with the Secretary of State of the United States, and the weary process of red tape is repeated in the departments of the Washington government. By this time the original question has probably been more or less lost sight of under its load of official commentary. Eventually the original complaint, or its official version, reaches the source of the trouble. The other side of the question is presented by the people on the United States side of the boundary, and the documents, growing like a snowball as they move, start on their long, roundabout, diplomatic journey back to the local complainants in Canada.

It is no exaggeration to say that such a case may travel backward and forward, not merely for months but for years, and in the end the parties interested may be as far from a settlement of the question at issue as they were in the beginning. It is true that in recent years it has been found possible to cut out, in some cases, the overseas part of the journey and deal directly, or less indirectly, with the United States Government through the Governor-General's Office and the British Embassy, but even so the process has necessarily been exceedingly slow, cumbersome and not always effective. Meanwhile, bitterness of feeling has been allowed to grow between two neighbouring groups of people, separated only by an invisible boundary, and with every reason in the world for a neighbourly attitude toward one another.

That two such countries as the United States and Canada, with the same New World point of view and the same democratic and businesslike way of looking at things, should have submitted for so many years to the ponderous and circumlocutory traditions of diplomacy, is surprising enough. It must, at any rate, be matter for sincere congratulation to every thoughtful Canadian or American that, so far at least as the relations of these two countries are concerned, the shackles have been knocked off, and it is now possible for the citizens of the United States and Canada to settle their differences with as much ease, and perhaps a little more, as if the dispute were confined to one country. The most momentous question for the Peace Conference at Versailles is that of the creation of a League of Nations. However different the magnitude of the interests at stake, the members of the conference have an illustration in this Commission of the efficiency of such an agency for the peaceful settlement of international disputes.

Decisions of the Commission

Of the various cases that have come before the Commission since its organization for final settlement, one of the most important was for approval of a diversion dam on the St. Mary's River at Sault St. Marie. In reality there were two applications, one from the Michigan Northern Power Company, on the United States side, and the other from the Algoma Steel Corporation, a Canadian company. Each applied for authority to build works from its own side to the international boundary, the combined works making one structure across the river. At the hearings, legal and engineering representatives of various municipalities on both sides of Lake Superior, and of railway and other corporations, expressed anxiety lest the proposed works should have the effect of raising the level of Lake Superior and causing serious damage to wharves, buildings and sewage systems in Duluth, Fort William and other towns around the lake. After hearing the testimony of a number of expert engineers, including representatives of the United States and Canadian Governments, the Commission approved of the proposed works upon certain conditions as to construction and maintenance which, instead of being detrimental to the interests of navigation and of the several communities around Lake Superior, would, by maintaining the level of the lake between certain points, be very much to the public advantage. As part of their order of approval, the Commission made it a condition that the works, both during construction and thereafter, were to be under the direct control of an international board of engineers, one member of which was to be appointed by the Canadian and the other by the United States Government. The Canadian member of this Board is W. J. Stewart, M.E.I.C., Chief Hydrographer of the Department of Naval Service. Changes have been made from time to time in the United States representative owing to the exigencies of the war. The present representative of that country is L. C. Sabin. In this way it was found possible to settle, in a very short time, and to the satisfaction of all the very important interests concerned, American and Canadian, public, navigation, and power, a question which might have dragged along for years under the old diplomatic procedure and been the cause of international irritation and material loss on both sides of the boundary.

Among other cases disposed of by the Commission were applications from the St. Croix Water Power Company of Maine, and the Sprague's Falls Manufacturing Company of New Brunswick, for approval of a dam across the St. Croix River, which is a boundary stream. In this case also the Commission in its Order of Approval made provision for an International Board of Control, which has since been appointed, Mr. Stewart being the Canadian representative and C. F. Porter that of the United States. Another application was that of the Greater Winnipeg Water District for permission to divert water for domestic and sanitary purposes from Shoal Lake, a tributary of the Lake of the Woods. This project which involved the construction of a concrete aqueduct nearly 85 miles in length, at a cost of about $13,000,000, was approved by the Commission, which limited the quantity of water to be taken at any time to 100 million gallons per day, provided that the water so diverted must not be used for other than domestic and sanitary purposes, and that the Commission's approval was not to prejudice any claims for damages or compensation arising out of the diversion. Other applications finally disposed of were those of the Government of the United States for the approval of certain contemplated improvements in the St. Clair River at Port Huron; of the Rainy River Improvement Company for a dam at Kettle Falls at the upper end of Rainy Lake*; of the International Lumber Company for certain obstructions in Rainy River at International Falls; and of the Watrous Island Boom Company for a boom in the same river. Two recent applications on the St. Lawrence River are those of the St. Lawrence River Power Company for permission to construct a submerged weir or dam in the south branch of the St. Lawrence River at the Sault; and of the New York and Ontario Power Company for approval of its plans to reconstruct, repair and improve its dam, hydraulic structures and water-power property at Waddington-on-the-St. Lawrence. In the former case the Commission, on the urgent representations of the United States Government that the proposed works were necessary in connection with the production of aluminum for war purposes, issued an interim order approving of the dam for a term of five years. The dam is to be removed at the expiration of that period unless the Company in the meantime applies for its maintenance for a further period, in which case the whole matter will be reopened and all interested parties given an opportunity of being heard. The decision in the case of the New York and Ontario Power Company has not yet been rendered. It will be noted that to a very large extent the cases that have hitherto come before the Commission reflect the prevailing interest in the development of water powers.

In this case the Commission decided that it had not jurisdiction.

Articles IX and X

In addition to the exercise of its jurisdiction under Articles III and IV of the Treaty, in which case it acts as a judicial tribunal, the Commission is also vested with very wide powers under Articles IX and X of the Treaty, which are as follows:—

Article IX

"The High Contracting Parties further agree that any other questions or matters of difference arising between them involving the rights, obligations, or interests of either in relation to the other or to the inhabitants of the other, along the common frontier between the United States and the Dominion of Canada, shall be referred from time to time to the International Joint Commission for examination and report, whenever either the Government of the United States or the Government of the Dominion of Canada shall request that such questions or matters of difference be so referred.

The International Joint Commission is authorized in each case so referred to examine into and report upon the facts and circumstances of the particular questions and matters referred, together with such conclusions and recommendations as may be appropriate, subject, however, to any restrictions or exceptions which may be imposed with respect thereto by the terms of the reference.

Such reports of the Commission shall not be regarded as decisions of the questions or matters so submitted either on the facts or the law, and shall in no way have the character of an arbitral award.

The Commission shall make a joint report to both Governments in all cases in which all or a majority of the Commissioners agree, and in case of disagreement the minority may make a joint report to both Governments, or separate reports to their respective Governments.

In case the Commission is evenly divided upon any question or matter referred to it for report, separate reports shall be made by the Commissioners on each side to their own Government."

Article X

"Any questions or matters of difference arising between the High Contracting Parties involving the rights, obligations, or interests of the United States or of the Dominion of Canada either in relation to each other or to their respective inhabitants, may be referred for decision to the International Joint Commission by the consent of the two Parties, it being understood that on the part of the United States any such action will be by and with the advice and consent of the Senate, and on the part of His Majesty's Government with the consent of the Governor-General-in-Council. In each case so referred, the said Commission is authorized to examine into and report upon the facts and circumstances of the particular questions and matters referred, together with such conclusions and recommendations as may be appropriate, subject, however, to any restrictions or exceptions which may be imposed with respect thereto by the terms of the reference.

A majority of the said Commission shall have power to render a decision or finding upon any of the questions or matters so referred.

If the said Commission is equally divided or otherwise unable to render a decision or finding as to any questions or matters so referred, it shall be the duty of the Commissioners to make a joint report to both Governments, or separate reports to their respective Governments, showing the different conclusions arrived at with regard to the matters or questions so referred, which questions or matters shall thereupon be referred for decision by the High Contracting Parties to an umpire chosen in accordance with the procedure prescribed in the fourth, fifth, and sixth paragraphs of Article XLV of The Hague Convention for the pacific settlement of international disputes, dated October 18, 1907. Such umpire shall have power to render a final decision with respect to those matters and questions so referred on which the Commission failed to agree."

Investigations under Article IX

Three questions have so far been referred to the Commission under Article IX of the Treaty, for investigation and report. One of these related to the construction of a dyke in the Detroit River. The enormous extent and value of the shipping using this waterway has already been suggested. It was found that certain dangerous currents swept across the Livingstone channel in the Detroit River, which were a menace to navigation. A dyke was proposed near the upper end of the channel to intercept these currents. At the hearings, Canadian interests objected to the building of the dyke in the position first proposed, on the grounds that it would have the effect of diverting Detroit sewage on to the Canadian shore, and would in other ways cause serious damage to communities in Canada. The Commission finally recommended to the two Governments that the dykô should be built on the west side of the channel, where it would serve the same purpose, so far as the dangerous cross currents were concerned, and at the same time would meet the objections raised against the dyke on the east side as originally proposed by the engineers.

The second question referred under Article IX related to the levels of the Lake of the Woods and tributary waters. The Commission was asked to report what levels, or range of levels, could be maintained in these international waters, which would be in the best interests of all concerned on both sides of the boundary—navigation, agriculture, fishing, lumbering and power. To give an intelligible answer to the question it became necessary to employ a staff of engineers, as neither government had so far carried out anything more than fragmentary surveys in this district. These engineers were under the direction of two consulting engineers, one an American, Adolph F. Meyer of Minneapolis, and the other a Canadian, Arthur V. White of Toronto. After several years work they submitted a final report to the Commission in 1916. The Commission's Final Report to the two Governments was submitted in 1917.

To most people the Lake of the Woods country is a comparatively unknown region, and the popular impression probably is that it is of little or no importance. As a matter of fact, however, the hearings held by the Commission brought out the facts that navigation, power, and other interests affected by the Commission's decision have invested something over $100,000,000 in the Lake of the Woods district; that the resources of the region are enormous and only beginning to be developed; and that communities as far apart as Duluth and Winnipeg were more or less directly interested in the fixing of a level on the Lake of the Woods and its tributaries which would give the maximum benefit to the people on both sides of the boundary.

The Commission in its final report recommended that it be authorized to exercise supervision and control over the operation of all dams and regulating works extending across the international boundary in these waters, as well as the dam and regulating works at Kettle Falls and at the outlets of the Lake of the Woods; and that it be empowered to appoint two engineers, one from each country, to act as its representatives, under such rules and regulations as it might prescribe for the exercise of the said supervision and control.

Pollution of Boundary Waters

The third question, and by far the most important, referred to the Commission under Article IX, related to the pollution of boundary waters. Such pollution, it will be remembered, is prohibited by the last paragraph of Article IV. With a view to the enforcement of this clause of the Treaty, the Governments of the United States and Canada sent to the Commission the following Reference:—

"1. To what extent and by what causes and in what localities have the boundary waters between the United States and Canada been polluted so as to be injurious to the public health and unfit for domestic or other uses?

2. In what way or manner, whether by the construction and operation of suitable drainage canals or plants at convenient points or otherwise, is it possible and advisable to remedy or prevent the pollution of these waters, and by what means or arrangement can the proper construction or operation of remedial or preventive works, or a system or method of rendering these waters sanitary and suitable for domestic and other uses, be best secured and maintained in order to secure the adequate protection and development of all interests involved on both sides of the boundary, and to fulfill the obligations undertaken in Article IV of the Waterways Treaty of January 11th, 1909?"

This Reference is dated August 1st, 1912. On January 16th, 1914, the Commission sent the two Governments a Progress Report on the first branch of the investigation, that is as to the extent, causes and localities of pollution. This Report embodied the result of exhaustive field investigations, by a corps of sanitary experts, under the general direction of Dr. Allan J. McLaughlin, of the Public Health Service of the United States, with the co-operation of Dr. J. W. S. McCullough, Chief Officer of Health of Ontario, and F. A. Dallyn, A.M.E.I.C., Provincial Sanitary Engineer of Ontario. Throughout the investigation the Commission had the cordial co-operation of the United States Public Health Service, and of the Boards of Health of Ontario, Quebec, New York and Michigan.

The investigation, which covered the examination of the waters of the Great Lakes and their connecting rivers, Rainy Lake, Rainy River, the Lake of the Woods, and the boundary portion of the St. John River in the east, wherever pollution might extend from one side to the other, disclosed the gratifying fact that the great bulk of the Great Lakes water remains in its pristine purity, in spite of the fact that some seven million people have contracted the very bad habit of dumping all their sewage into these waters, and that the entire shipping of the Great Lakes, carrying in one season not less than 15,000,000 passengers, has followed the same evil practice. Serious pollution was found at many points along boundary waters, and particularly in the Detroit and Niagara Rivers, where the cities of Detroit and Buffalo, with a number of smaller communities on both sides of the boundary, have been doing their best to make the water of these rivers unfit for human consumption.

Severe epidemics of typhoid fever in the lake cities have for years past warned these communities that, while they were spending hundreds of millions on their streets and buildings and in other ways adding to the comfort and convenience of their inhabitants, the most vital consideration of all, that of public health, was being grossly neglected. If the International Joint Commission should achieve nothing more than to awaken the cities of the Great Lakes to the vital importance of protecting their water supplies, it would have more than justified its existence.

In 1914, the Commission took up the second branch of the Pollution Investigation, and as an initial step held a conference in New York with a group of sanitary engineers, including men of international standing, such as George W. Fuller, M.E.I.C., Earle B. Phelps, and George C. Whipple.

As a result of this conference and the subsequent deliberations of the Commission, it was decided to adopt, tentatively at least, certain fundamental principles upon which the experts were in agreement. The most vital of these principles is, that while in certain cases, where the ratio of water to volume of sewage is unusually large, the discharge of crude sewage into boundary waters may be without danger, "effective sanitary administration requires the adoption of the general policy that no untreated sewage from cities or towns shall be discharged into the boundary waters." The other principles relate more specifically to methods of sewage purification and water purification.

The field work in connection with the second branch of the investigation was carried out under the direction of Mr. Phelps, who made his report to the Commission in 1916. The Commission's Final Report to the two Governments was submitted in 1918. In that report, after setting forth the character and extent of the pollution and the remedial treatment recommended, it is suggested that the two Governments confer upon the Commission's jurisdiction to regulate and prohibit the pollution of boundary waters and the waters crossing the boundary.*

**The reports and decisions of the Commission in all these cases have been printed and are available for distribution to those interested.*

Miniature Hague Tribunal

No questions have yet arisen in either country which might be brought before the Commission under the terms of Article X of the Treaty. This Article, it will be noted, is extraordinarily broad. It is not limited to questions along the common frontier; in fact, there is no limitation either as to the nature or locality of questions that might be referred under this Article. It will also be noted that, under the conditions stated in the Article, the decision of the Commission is final. In fact, in the language of Justice Riddell, the Commission is constituted under Articles IX and X a "miniature Hague Tribunal" for the final settlement of all questions of difference between Canada and the United States.

It has probably been made clear in what has already been said that Canada and the United States took a big step forward when they negotiated the Waterways Treaty and created the International Joint Commission. The usefulness of that Commission will depend, however, to a very large extent upon the intelligent public support it receives from the two countries. It is important to remember that the Commission has no power to initiate proceedings. It can only act upon applications or references brought before it by, or through, the Governments of Canada and the United States.

Unintelligent or narrow criticism, based upon wrong ideas of the Commission's functions and powers, or upon the hypothesis that its members should think and act as partisans of their respective countries, must inevitably weaken the influence of the Commission, and nullify to a very large extent the effectiveness of its work in removing points of international friction and bringing into permanently friendly relations the peoples of these two neighboring countries.

Cement Joints for Water Mains

For making joints in cast-iron water pipes of all sizes from 6″ to 30″ in diameter, the Bureau of Water Works, Portland, Ore., is employing Portland cement, except in special cases where it has been necessary to put the main in service without leaving sufficient time for the cement to set. This practice was begun about three years ago and has given excellent results. In the past two years, some nine miles of cast-iron mains have been laid, using 19,256 lbs. of cement. The same work would have required 68,390 lbs. of lead at about sixteen times the cost. It was thought at first that the labour of making the joints would be materially less with cement than with lead, but since it is necessary to keep the cement joints wet for thirty-six to forty-eight hours it is about the same. In making a joint a small amount of yarn or oakum is first driven in to keep the cement from passing into the pipe. Neat cement is employed, only sufficient water being added to hold it together while it is being forced into place. To begin with considerable antagonism was displayed by the workmen towards this method, possibly due to a belief that it would lead to a reduced demand for their services, but the opposition has been overcome and the men have become skilled in making the joints. — *The Times Engineering Supplement.*

Overhead and General Costs in Manufacturing

*Thomas R. Deacon, M.E.I.C.**

It is probably not an overestimate to say that 99% of the general public, and especially those who have not had actual experience in business, either mercantile or manufacturing, have any proper conception of what the actual costs of manufacturing or selling goods are. How often you will hear people say, and frequently purely professional engineers too, that the raw material of such and such an article costs so much a pound, or yard, or unit of some kind, the labor of making so much, and there your are. It is the writer's opinion that only in rare cases does this represent more than two-thirds at most of the actual cost, to say nothing of profit. Also in every business, to keep it solvent and profitable, constant provision must be made for unforseen contingencies, such as spoilt material, broken machines and many other things which must be added to the total output of a business.

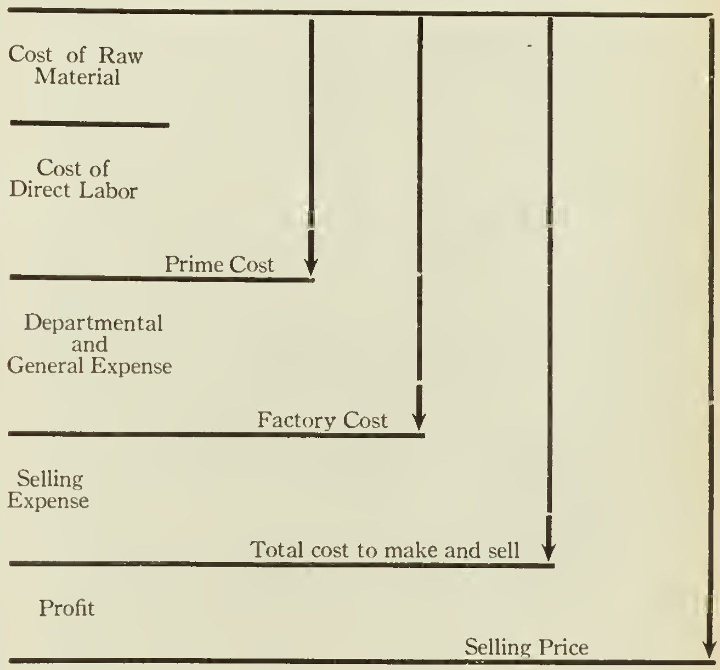
I have no doubt that if a table of business mortality were prepared, showing the average life of all businesses started and the cause of their death, it would be found that the cause of lack of sufficient provision for overhead expense occupied about the same ratio to the total that pulmonary consumption and cancer together do to the human death rate. Every receiver in bankruptcy can tell you stories about facts discovered in business autopsies which were responsible for failures, and which could have been discovered before it was too late, through the aid of good cost systems. Most receiverships, in other words, mean that many a business could easily have been saved by accurate cost accounting.

In a certain garment factory which made four lines of garments including undermuslins, brassieres, night robes and childrens' suits, costs were not departmentalized. Styles changed, petticoats and slips changed and became losing propositions, and profits began to dwindle. Frantic efforts were made to stimulate sales, but the campaign was unintelligent because it worked in the dark. The autopsy showed that two lines were making money while the other two were losing heavily.

A company manufacturing electrical specialties, got out one which it sold to the distributors at $100.00, to be retailed at $150.00. Four thousand of them were sold before an investigation of their actual cost brought out the fact that they were costing $108.00 each to make. That particular guess cost $32,000.00 before it was corrected by an accurate investigation of cost.

A leading foundryman of Pittsburg made the statement that he had offered to install cost systems for all his local competitors at his own expense, as it cost him far more trying to meet their inaccurate estimates, based on inaccurate cost data, than it would cost him to hire cost experts for all of them.

The chief distinction between financial accounting and cost accounting is that the former deals exclusively with money and credit transactions of a business, while the latter deals with the same transactions, but with reference to the cost of products and operations. The kind of costs that a manager of an industry wants to get, vary not only with the type of industry, but within each industry itself, according to the purpose for which they are wanted. In a continuous or tonnage type of industry, the aim is to ascertain the cost per unit of weight or length for each of the comparatively limited number of products, such as tons of castings, or yards or pounds of cloth. A rough summary of the knowledge that is absolutely essential in any manufacturing industry, to be sure of what is being done, may be diagrammatically shewn as follows:—



But, under each of these general headings, there is a long list of subdivisions of costs, every one of which should be known and detailed, otherwise the total cost is not known. It is in the failure to keep an accurate record of the items which come under these subdivisions that the first symptoms of the disease appear, which are ultimately, sooner or later, to prove fatal to the business or enterprise.

It is customary to divide total cost into two main elements—factory cost and selling cost—which, taken together and with the profit added, constitute the selling price. Of course, in a company carrying on a general contracting business or jobbing work, such as the ordinary iron and steel works, it is absolutely necessary, in order to avert disaster, to have an accurate knowledge of what a job has actually cost, so that when a similar job is to be estimated an approximately accurate estimate can be made. I use the word *approximate* advisedly, because, with even a good cost keeping system, so many things can occur between the taking of a contract and its completion, due to changes in market prices and labor conditions, that many a job that promised a good profit at the time the contract was made turns out a heavy loss.

**Read by the author before the Manitoba Branch on April 3rd, 1919.*

I could name now a number of prominent jobs around Winnipeg, taken before the war or in its early stages, where the changed conditions make the original estimates look ridiculous.

Factory costs are again subdivided into prime costs and indirect expense, the latter including all the expenses of administration and supervision. This is also variously known as *overhead, burden* and *non-productive* expense, and comprises all expenditure for labor and materials, which does not enter directly into, nor is sold with, the product. A diagram showing the various subdivisions of costs, actually incurred in producing an article or carrying out a contract, would be about as follows:—

Materials	Direct Expense
Labor	
Administration and Management	Indirect Factory Expense
Supervision, Superintendents and Foremen	
Rent	
Heat	
Light	
Power	
Taxes	
Fire Insurance	
Workmens' Insurance	
Interest	
Telephones	
Telegraphs	
Stationary	
Postage	
Office Salaries, Accounting and Stenographers	
Repairs	
Waste	
Depreciation	
Supplies—Oil, Coke, Sand, Waste, Lumber, Paint, &c.	
Tools	
Freight and Express	
Travelling Expenses	
Legal Advice	
Correction of Errors	
Safety Appliances	
Salaries	Selling Expense
Commissions	
Advertising	
Estimates	
Sketches	
Demonstrations	
Experiments	
Entertainment	
Donations and Subscriptions	
Memberships	

There are other items and subdivisions which might be made, but these are the main ones.

The relative variations in these main items may be seen in the following figures for 1914 and 1919:—

	1914		1919
Material	56.4%	Material	54.0%
Labor	15.3%	Labor	14.7%
Overhead	19.125%	Overhead	18.2%
Selling	9.175%	Selling	13.1%
	100. %		100. %

To find out what these indirect costs are and to get them into the selling price of the product, through which they must ultimately be recovered, with accuracy and justice to the various items of the product is no easy matter. Some firms take the productive labor as a basis and add to that a certain percentage based on the record of some fixed preceding period, usually a year. That is, the total productive payroll for a year is taken and the total indirect expense for the same period (we will say that the indirect expense is 100% or 125% as the case may be), and then, as each job progresses, only the productive labor is kept track of, and this percentage added for indirect expense or overhead. It is obvious that this may be an ever varying percentage, because the overhead will be constant while the productive payroll may decrease, in which case, if the overhead was say 125%, and there was a heavy decrease in the productive payroll, the percenage might rise to say 150% or even 200%. There are industries in which the overhead is as high as 300%, where the value of the individual article is small and the selling expenses very large. It is, therefore, obvious that it is in the interest of every manufacturer to produce as large a volume as possible and have as large a productive payroll as possible, in order to keep down the percentage of overhead costs. This explains to some extent why goods are sometimes sold in a foreign market below the home selling price, because they have helped to keep down the overhead percentage.

I have sometimes seen in engineers' specifications, a provision that in certain cases of extras being ordered, the contractor shall be paid for the cost of labor and material, plus 10% for overhead expenses. Only those who have had some practical experience in manufacturing or contracting can realize, in most cases, the absurdity of such a provision, unless under this head is included all labor, as well as the mechanics' wages.

I have tried to show briefly how important a place overhead expense occupies in any business, manufacturing or otherwise, and I think in many cases, in fact in the majority of cases where a legitimate business is started and fails, the cause of its death can be traced to inadequate provision for indirect or overhead expenses. This largely accounts for the differences seen in tenders for work or goods, one tenders knowing his costs and the other guesses at them.

Water Power of the Empire

The author of articles on the Water Power of the Empire in *The Times Engineering Supplement* suggests that the interests of the Empire as a whole and of the individual countries in which water power exists, can best be served by calling into consultation the financial community, the manufacturers of machinery, prospective power users and the owners of water power rights both privately held or those retained by the Crown. The idea would be to form a central committee representing these interests and its primary duty would be to co-operate hydro-electric enterprises in the British Empire and to bring those interested into close touch with each other. It is claimed that such a body would be in a position to give the soundest advice and should have the confidence of all concerned, and that if suitably composed and with loyal co-operation between its constituents it could do much to further the development of water power and of dependent industries.

Discussion on Papers Previously Published in The Journal

Design of Hydro-Electric Plants for Combatting Ice Troubles *

By R. M. Wilson, M.E.I.C.

R. F. Hayward, M.E.I.C. Along the Coast Range in British Columbia we are exceedingly fortunate in not having the ice question to deal with. All the large power plants are located either at tide water or very close to it and are supplied with power from streams or rivers flowing out of lakes. The Stave Lake power plant is a typical development in this respect. It has a water shed of about 450 sq. miles which consists of a combination of snow fields and glaciers and mountains covered with dense forest of Douglas Fir and Cedar. The Stave Lake has an area of 24 sq. miles or nearly 6% of the total water shed. The Stave River, in its natural state, never froze over at all and even with a week of zero weather no ice was formed even along the banks of the river, although the Fraser River, into which it flows only a few miles distant, has been so thick with ice that a cart could be driven across it. The reason for this is that the principal flow of water in the winter comes from the underflow of the forest and this water never gets very cold. Our screens are all in the open and only about once a week do we have a man remove any small amount of floating trash that may collect.

My experience in the neighbourhood of Salt Lake City was very different. There we were dealing with small quantities of water and high heads and had several different conditions to deal with. All the power plants were located at the mouth of, or within the canyons, of the Wasatch Range and during the winter the temperature in the canyons and around the intakes of the plant would be, during cold snaps, as low as 20 to 30° below zero. In the Bear River plant the water came from a broad valley into which flowed a number of spring fed streams. We had little or no trouble with ice, although the water was conducted through a canal about 2 miles long. In the Ogden plant which was supplied from a comparatively small intake and a 6 ft. wood stave pipe, although the temperatures were very low and there was much wind, we never had trouble with ice. The intake would freeze over solid, but there was sufficient inflow of spring water to prevent any freezing in the wood stave pipe.

In the Cotton Wood plant the stream would freeze up solid, and in the plant at Provo, which was supplied through an open flume, great difficulty with ice was encountered due to the fact that the intake was just below a series of rapids on which slush ice was freely formed, but this difficulty was entirely overcome by conveying into the flume a comparatively small stream of spring water.

My experience in the neighbourhood of Salt Lake, and in British Columbia, go to show that a comparatively small percentage of underground water flowing into a stream is sufficient to prevent the formation of ice during extremely cold weather.

The Production of Peat Fuel *

By Ernest V. Moore, A.M.E.I.C.

Frederick B. Brown, M.E.I.C. I have been following the question of peat production as an interested bystander, and it seems to me there are immense possibilities for the use of this fuel in a general way.

Can Mr. Moore tell us anything about the improvements that have been made in the machinery during the last year, what is the programme for next year's work at Alfred and elsewhere in Canada, and how the proposed type of plant will compare with what we have seen on the screen?

Another point on which I would be glad to have some information is how often the trolley supporting the conveyer buckets and the electric wires has to be moved sidewise in order to make provision for laying out more peat, and whether this moving is very much of an operation.

Ernest V. Moore, A.M.E.I.C. (the author). Answering the last question first, each of those rows represents about 20 tons of fuel, and we made a maximum of 5 rows a day. As soon as the end of a row was reached, the cableway had to be moved in its entirety. There were twelve men altogether operating the plant, six of them spent part of their time in preparing for the moving of the cableway. We could move it in about fifteen minutes. It was done by taking up the strain of the cables on the two trucks which were supported by anchor ties, and kept parallel, and all that was necessary to pull the cableway ahead was to wind in on a winch at either end of the anchor towers. The strain on the cable was sufficient to pull the intermediate towers along. As soon as the cableway had been moved three men moved ahead the anchor ties to the rail that supported the end tower on the outside, and as they came back they moved those little light sections of track back again, and the operation was done right along on an average of from 15 to 18 minutes. On a tryout we have done it in nine minutes.

The other question is more difficult to answer. The Peat Committee is very conservative, and does not want anything said until they can show something definite, holding that there has been too much advertising and nothing much to show heretofore.

Paul A. N. Seurot, M.E.I.C. In 1896 or 1898 they started using peat bricks on some of the railways in Russia, and the consumption was about 90 pounds per mile, as against about 48 pounds of soft coal. This practically agrees with the figures given by Mr. Moore. There seems to be room for improvement on the question of the cost of the peat, and I would like to ask Mr. Moore if he can give us any further information as to the probable cost of peat in Canada.

A man came into my office about two months ago with a fine sample of peat, which burned very well on a match being applied to it. He said he was putting it up in one hundred pound bags, or 500 pound blocks, or by

*Published in Vol. II, No. 6.

the ton, and that the cost was $31,00 or $32.00 per ton. Of course, that is hardly a price which would compete with coal even at $10.50 a ton.

Mr. Moore told us that a good deal of information in regard to peat came from Europe, but it seems to me that the reverse is now the case, and Europe is coming to Canada for information on the same subject. About two years ago when coal began to get extremely scarce in France a syndicate was organized to develop some peat bogs in Brittany and France, and they sent to the Consul here for some information. The communication was handed to me, and I was able to get a great deal of information from Dr. Haanel, which I sent to France and which was very much appreciated. They are very deeply interested in the subject, and with Mr. Moore's permission when his paper is printed, I would like to send it forward to them.

Mr. Moore: As I said in my paper, there has been a great deal of misunderstanding in regard to the word *cost.* In 1914 we were paying at Alfred for labor $1.50 a day, in fact we had some husky boys around 18 or 19 years of age for $1.25, and some yound fellows who could do some work, to whom we paid $1.00. It cost us under 50 cents to lay the fuel down cut, and on a contract basis, it cost us 12½ cents to pile it up in little cubes, and it cost us anywhere from 50 cents to $1.50 to get that old horse to drag them down to the platform and get them on the cars. We knew that was an exorbitant cost, but that was not what we were working for. The work was done originally to develop a satisfactory excavator and a satisfactory method of spreading.

It cost us 90 cents a ton to take that fuel from Alfred to Ottawa, a distance of 45 miles. We paid approximately 50 cents commission to the retailers, and we had to have it delivered under a special arrangement because they did not have the equipment to handle it properly. They took their ordinary coal carts, and put some boards around the tops, so that they could carry a ton of this fuel. They sharged us $1.25 for delivering from the railway car. We delivered from the car to the consumer. Those costs, $1.25, 50 cents and 90 cents were pretty nearly as great as the actual production cost of making the fuel on the ground. It would be ashamed to tell you what the overhead cost was.

A Member: What is the approximate age of the deposits, and the rate at which humufication takes place?

Mr. Moore: I can give you very little information about the age of the bogs, and I do not know a great deal about the rate of humufication. I read an article not long ago about a bog in Germany which had been watched for thirty years, and in that time the surface level came up over 3 feet. Of course, that does not mean there were 3 feet of well humufied peat, but there was a 3 foot growth of moss, which might be, perhaps, one foot of actual peat. I have not any data which would give you any definite idea as to the age of those bogs, or the rate of humufication. Humufication depends on a number of things.

A Member: Mr. Moore has only spoken of drying the peat until it has a water content of about 25 per cent. I would like to ask him if he considers that the commercial point to which it should be dried? I would also like to enquire what the water content was in the peat which he said was piled outside for two years.

Mr. Moore: I mentioned twenty-five per cent water content, but it is possible to dry it down to about eighteen per cent. At from twenty per cent to twenty-five per cent the fuel is tougher, and will stand transportation better. If you get much below twenty per cent, and the fuel is handled in the ordinary stoves, it requires much greater care, because it ignites very much more easily. The piles you saw on the screen contained about thirty per cent when they were piled, and close to that figure when they were shipped. Drying seems to go on in spite of weather conditions.

As we lay the peat out, it is very soft. If a heavy rain storm comes on within an hour, it will wash off perhaps ten per cent of the stuff, which goes down between the blocks, and cements them together. After the material has been out for ten hours on a bright summer day, all the rain we have ever seen will not injure the blocks at all.

We have noticed a very marked shrinkage in the blocks over three or four days of mist. Once the material has dried up it will not go back to its original state. I have seen those blocks immersed in a running stream for a couple of weeks, and burned practically immediately after they were taken out. You can take a piece of peat which has not too many little rootlets in it, and you may immerse it almost indefinitely without damaging it.

A Member: What is the length of the season you can work a peat bog in Canada?

Mr. Moore: The earliest we ever operated at Alfred was April 19th, and on one occasion we operated until October 9th. We have from 100 to 110 days on an average. The important factor is that the frost should be out of the ground sufficiently to permit of the excavation work being done. In the fall the peat has to be dried down until the water content is about 40 per cent or 50 per cent, before the frost comes along, because, if this is not done, and sufficient frost comes along, it will simply destroy the cohesion. If you take a block which has been frozen through the winter without being properly dried, in the spring it would practically go into a powder if you attempted transportation, although you could use it satisfactorily under the boiler on the work.

A Member: Inasmuch as the drying peat takes a fairly extensive area, about what capacity per unit area do you expect out of a bog during the season?

Mr. Moore: I cannot give you any definite figure offhand. The area I showed you was 1000 feet wide and 3000 feet long. I thing we should be able to go over that four times a season.

There is another point which I should, perhaps, mention. I was asked about this 25 per cent water content. There are a number of other things that can be done with peat apart from burning it in the stove. It will be possible later on to make a very much nicer looking fuel, but I do not think there is any way of changing the water content from 90 per cent down to 25 per cent more economically than some such general scheme as I have described. No doubt a number of things may be done with it, but I do not think you can get rid of the great water content more cheaply than by some such general system as I have outlined.

Walter J. Francis, M.E.I.C. If any one ever deserved a reward, it is the speaker of this evening, for the persistent and able manner in which he has followed and dealt with this very interesting subject.

About twenty years ago I burned peat for a whole winter in my house, just as an experiment, and it was one of the most satisfactory fuels I ever handled, so far as heat was concerned. At the same time, we had two troubles, one was that the ordinary grate we were using was not suitable for the fuel, which disintegrated rapidly; the other was the persistent question of every visitor to the house—"What is that smell?" The odor from the burning peat was very much like the smell of a dying bush fire. From the point of view of heat, however, it was a very useful and very convenient fuel, and the price at that time was also very satisfactory.

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

VOL. II. July 1919 No. 7

WESTERN PROFESSIONAL MEETING POSTPONED

Owing to the unsettled labor conditions in Western Canada, the Western Branches consider it necessary to postpone the Edmonton Meeting until early in October. The new date of the meeting, to be arranged later, will be published in the September issue of *The Journal*, after confirmation by Council.

Professional Meeting in St. John, N.B.

The Professional Meeting in St. John, N.B., will be held on September 10th, 11th, and 12th, 1919.

What is a Professional Engineer ?

One of the serious difficulties encountered by the Special Committee of *The Institute*, when drafting proposed legislation, was to arrive at a definition of *professional engineer* that would cover all branches of engineering and yet be terse and to the point. The definition in the proposed Act has not met with universal approval, showing that there is, doubtless, room for improvement.

When in Chicago recently, the Secretary met T. L. Condron, Chairman of the Committee on Licensing Engineers of the Engineering Council, who gave him a copy of a definition, the result of an entire week's work. This definition arrives at the goal by describing the practice of a professional engineer. It reads:—

> "By professional engineering is meant any or all branches of the profession of engineering other than military engineering; military engineering means engineering which is concerned only with such structures, works or processes as have a solely military purpose.
>
> The practice of professional engineering embraces designing and responsible supervision of the construction, operation or maintenance of private or public utilities or works, and designing or responsible supervision of processes of production, means of transportation and methods for the disposal of waste, when such designs or supervision involve and require the intelligent application of the principles of physics, mechanics, hydraulics of thermodynamics in the determination of the proper selection, use, removal or disposition of material for the attainment of a definite purpose.
>
> By professional engineer is meant any person engaged in the practice of professional engineering."

Other definitions have been sent in by Secretary Alfred D. Flinn. These are designed to describe what is meant by engineering. They are:—

> "Engineering is the application of science to development and control of resources of Nature for the use of man, involving ingenuity in directing forces, utilizing materials and organizing human efforts for fabrication of machines, erection of structures, invention of processes and production of articles of commerce."
>
> "Engineering is the art which applies science and scientific methods to develop and control resources of Nature for the use of man; it involves ingenuity in directing forces, utilizing materials and organizing human efforts for fabrication of machines, erection of structures, invention of processes and production of articles of commerce."

These definitions are published for general information, to promote discussion and in the hope that, before a definite definition has been adopted, either by the Engineering Council or by *The Institute*, it will be one which can be universally used on this continent at least.

Salaries and the Civil Service

An editorial, which appeared under this heading in the June issue of *The Journal*, referred to a letter received from W. Foran, Secretary of the Civil Service Commission. The full text of that letter is as follows:—

CIVIL SERVICE COMMISSION
Office of the Secretary,
OTTAWA, May 13th, 1919.

Editor, *Journal*,

In reply to your letter of the 7th instant, I beg to inform you that the Organization Branch of the Civil Service Commission has given very careful consideration to the question of the salaries to be fixed for engineering and other technical positions, and it is hoped that, when the reclassification is approved by Parliament, it will be found that adequate remuneration has been provided for this class of employment, and that the engineering positions have been considered not only in relation to the salaries offered in similar positions outside the Government, but also in relation to other classes of employment in the service itself. In the meantime, it should be clearly understood that the Civil Service Commission is not responsible for the salaries now advertised as attached to positions such as that of private secretary. Hitherto, the salaries have been fixed by the Department, and have had no bearing one upon another. It is hoped that, after the reclassification has been adopted and these matters have been placed under the direct jurisdiction of the Civil Service Commission, the salaries offered in the various positions will be more in accordance with the value of the service to be performed and the remuneration which such service could command in the business world in general.

Yours truly,

W. FORAN,

Secretary.

The following are some of the letters received by the Secretary from Members of Parliament showing their attitude toward the engineering profession:—

House of Commons
Canada

Ottawa, June 4th, 1919.

Fraser S. Keith, Esq.,
Secretary,
Engineering Institute of Canada,
176 Mansfield St.,
Montreal.

Dear Sir:—

I beg to acknowledge receipt of your favor of the 12th ultimo. I have also received a memorandum covering matters referred to in this letter, all of which will receive my attention.

You can rest assured that I will do all I can to place the civil servants on a sound basis.

Yours truly,

T. M. TWEEDIE,

Member for Calgary,

West Riding.

House of Commons
Canada

Ottawa, May 27th, 1919.

Mr. Fraser S. Keith,
Secretary,
The Engineering Institute of Canada,
Montreal, Que.

Dear Sir:—

I beg to acknowledge your favour of the 12th instant also other matter with regard to engineering under separate cover.

I can assure you that I will be glad to render any assistance possible in placing the engineering profession on a better footing in this country and particularly in the Government service.

Yours faithfully,

S. F. TOLMIE,

Member for Victoria City.

House of Commons
Canada

Ottawa, May 29th, 1919.

Fraser S. Keith, Esq.,
Secretary,
Engineering Institute of Canada,
176 Mansfield Street,
Montreal, Que.

Dear Sir:—

I have your communication of the 12th instant and am entirely in sympathy with the views of your association and have already vigorously and persistently supported this and will follow it up with added effort.

I am,

Yours very sincerely,

H. H. STEVENS,

Member for Vancouver, Centre.

House of Commons
Canada

Ottawa, May 26th, 1919.

Mr. Fraser S. Keith,
Secretary,
Engineering Institute of Canada,
176 Mansfield St.,
Montreal, P.Q.

Dear Mr. Keith:—

I have your circular letter of the 12th instant, enclosing facts and figures concerning the engineering profession, for which accept my thanks. It will give me great pleasure to support the aims and objects of your *Institute* when the Civil Service Bill comes before the House.

Faithfully yours,

J. C. McIntosh,

Member for Nanaimo.

House of Commons
Canada

Ottawa, May 26th, 1919.

Fraser S. Keith, Esq.,
Secretary,
Engineering Institute of Canada,
Montreal.

Dear Sir:—

I desire to acknowledge the receipt of your letter of the 12th instant in reference to the greater attention which should be given to the profession of engineers in Canada. It is my pleasure to study your memorandum and you may rest assured that I will give my hearty support to any measure which would recognize the value of engineers in public service with the remuneration they deserve.

Yours faithfully,

O. Turgeon,

Member for Gloucester.

House of Commons
Canada

May 23rd, 1919.

Fraser S. Keith, Esq.,
No. 176 Mansfield St.,
Montreal.

Dear Sir:—

In reply to your favor of the 12th instant I beg to say that I am in entire sympathy with your letter, as I believe that young men to-day who are educating themselves along technical lines are not receiving the consideration they should, as in a great many cases mere clerks and stenographers are receiving as much consideration as highly educated and trained engineers.

When the matter comes up I will look after it you can rest assured.

With best wishes, I am,

Yours very truly,
R. W. Wigmore,
Member for St. John City and
Counties of St. John and Albert.

Hon. A. K. Maclean, acting Minister of Trade and Commerce, who has had particular charge of all matters relating to the civil service, has given notice of the resolution on which the bill providing for the reclassification of the civil service, will be based.

Under the terms of this bill upwards of fifty thousand members of the inside and outside civil service will be reclassified.

The principle underlying the new classification will be that members of the service will be put into classes corresponding with the nature of the work they are doing. Civil servants doing engineering work, for instance, will be classed as engineers and other members of the service doing work calling for special qualifications will be similarly treated.

The new classification will in all likelihood straighten out some of the present difficulties between the Government and the members of the civil service.

Mr. Maclean's resolution is as follows:—

1—That the Civil Service Commission shall consist of not more than five members appointed by the Governor-in-Council; provided, however, that after the expiration of three years from April 1, 1919, no person shall be appointed a commissioner until the number of members of the commission is reduced to less than three, and after such reduction the number of members of the commission shall not exceed three.

2—That the chairman of the commission shall be paid a salary of $7,000, and each of the other commissioners $6,000.

3—That the provisions of the Civil Service Act relating to temporary employment, dismissals,resignations, hours of attendance, annual reports, regulations, examinations, classifications, appointments, promotions, transfers and compensation be amended, and that provision be made for reclassifying the civil service and for any additional expense.

Compensation of Engineers

A Schedule of Engineering Salaries Covering Various Branches of the Profession

At the Annual Meeting of the American Association of Engineers, held in Chicago, May 12th to 14th, an exhaustive report of the Compensation Committee was presented and adopted. It represents a great amount of work on the part of the men engaged on this Committee and is the first definite attempt to arrive at a basis of the classification of salaries of engineers employed in various lines. It does not include those employed in the civil service of the country. The schedule for railway engineers adopted was similar to that published in the April issue of *The Journal.*

The report states that the committee having carefully considered salaries, wages and working conditions as reflected in records and private correspondence, and through personal correspondence and investigation, finds that:

1. No profession can for any length of time continue to attract to its ranks high class ability unless the rewards offered are commensurate with the expense and effort required to attain and maintain a respectable position in such profession. At this time the pay of engineers is out of proportion to the high degree of responsibility required and the money spent to obtain the necessary technical education.

2. The interests of investors as well as the safety of employees and the general public require that the design and execution of engineering work shall be in the hands of competent and highly skilled men. All classes are vitally interested in enforcing a square deal, insuring to engineers such pay as will attract and retain in the profession men of ability.

Summary of Conclusions

1. That the profession of engineering, taken as a whole, is insufficiently paid, or is not paid in proportion to the high degree of responsibility entailed or the technical training required to perform the work.

2. That the principle of a square deal for everybody should underlie all rules of compensation, and that technical men must demonstrate their worth both to their employers and the public before they receive the compensation due them.

3. That this demonstration should be made by individual salesmanship, and by proper methods of publicity directed by this Association to establish co-operation between employers and employees and to insure proper recognition of the services of the engineer by the public.

4. That while salesmanship may produce results in individual cases, it is necessary to operate collectively for the rank and file of engineers and desirable that some forms of grades for engineering services be adopted with a minimum rate of pay for each grade.

5. That the rates suggested herein are not the maximum standards, but rather indicate the rate of pay of anyone who can perform the line of work and that individual effort should be encouraged to the fullest extent and be paid for accordingly.

6. That in the determination of a just compensation, consideration must be given to the effort or cost of the educational training; the years and character of experience in the particular line, as well as total years experience; length of time in employer's service; character and personality; degree of efficiency and special qualifications.

7. That the uncontrolled law of supply and demand is not a just method by which to determine the compensation for valuable services. Therefore, steps should be taken to control its operation so that it may not become oppressive, especially in the lower grades of service.

Specific Recommendations:

1. That the hours of employment for technical men of grades 1, 2, and 3, hereafter defined, should not exceed eight hours per day or forty-four hours per week.

2. That overtime in above grades should be paid for at an increased rate.

3. That no one in charge of engineering or construction forces should be paid less than any man for whose work he is responsible.

4. That when by a superior's orders an employee is shifted to a point requiring him to change his place of abode, the employer should bear the entire expense of moving employee and his family.

5. That employees should be given national holidays and not less than one day's vacation for each month employed during the year, and that provision should be made for disability due to the hazard of employment.

(Grades were recommended, of which the first three are named as showing what was intended in the above recommendations, the rates having been ordered eliminated.)

Grade 1. A position requiring chiefly mechanical skill and little or no experience, but which, however is desirable or necessary for the technical men to do for a short time as preliminary training for higher grades of work; or a position requiring a small amount of technical knowledge, such as may be obtained in a high school or manual training school, but without responsibility.

Grade 2. A position requiring the equivalent of a high school education, as well as the elements of engineering, such as may be obtained in a night school or correspondence school, and demanding a certain amount of proficiency which would ordinarily be obtained with one year's experience, lacking a college education.

Grade 3. A position in which graduation from a recognized college of engineering is desirable for its potential value, and which requires a part of that technical knowledge, or a position requiring as much as Grade 2, with two years experience and demanding additional technical study such as the completion of night or correspondence school courses.

Schedule

NOTE.—Salaries in the following schedules are for continuous positions, positions where employment is continuous throughout the year, and where the employee may look to a steady advancement in rank and pay as a reward for efficient service.

In seasonal employment, where the work continues from year to year and the same opportunities for advancement exist, but where from the nature of the employment there is an idle season, as an inspector of dredging or employee of the Geological Survey, and where the place is open at the commencement of the succeeding season, the pay should be such as to amount to about half pay for the necessarily idle season. Thus, for an eight month working season, where the schedule shows a rate of $2400 per annum, the position should pay $250. per month.

For temporary positions, where there is no developing future to the work, the pay should be 50% above the schedule.

Architectural Engineers

Architect in charge of office	$5,000	to	$8,000
Designing Draftsman	4,000	to	5,000
(Above were eliminated by the Chapter).			
Construction Design Draftsman, by committee	3,000	to	3,600
Rate adopted by the Chapter	4,000	to	5,000
Outside Superintendent, by committee	3,000	to	3,600
Rate adopted by the Chapter	4,000	to	5,000
Senior Draftman, by committee	2,400	to	3,000
Junior Draftsmen, by committee	1,500	to	2,100
Student Draftsmen, by committee	900	to	1,200

Adopted as Amended.

Highway Engineers

The following schedule is suggested for a state where there are from 60,000 to 100,000 miles of roads on which the Highway Department spends not less than $5,000,000 annually.

Chief Highway Engineer— In entire charge of all engineering work for the entire organization	$8,000	to	$10,000
Road Engineer— Responsible for surveys, plans and construction of all road improvements	5,000	to	7,000
Maintenance Engineer— Responsible for maintenance of all engineers	4,500	to	6,000
Bridge Engineer— Responsible for design, construction and maintenance of all bridges	4,500	to	6,000
Engineer of Tests— In charge of tests on all materials used in road and bridge work	3,000	to	4,000
Division Engineer— In charge of one division (usually 7,000 to 10,000 miles of road). Under higher officials, is in charge of all work on division	3,600	to	5,000
Assistant Engineer— Assists Road, Maintenance, Bridge and Division Engineers	2,700	to	3,600
Resident Engineer— In charge of important bridge work, road improvement, etc., under Division Engineer	2,700	to	3,600
Junior Engineer, Class A— In charge of road surveys; does instrument work; prepares plans and profiles for road improvement and does drafting in bridge department	2,100	to	2,700
Junior Engineer, Class B— Leveler on road surveys; works on plans and profiles for road improvements; does drafting in bridge department. (Technical education or experienced in highway work).	1,500	to	1,800
Chief Designing Engineer— In charge of designing and drafting under Bridge Engineer	3,000	to	4,000
Designing Engineer— Independent designing in bridge department	2,700	to	3,300
Inspector— Technical training desirable while not essential, but must have had experience in highway construction if lacking such training	1,320	to	1,800

Adopted by Chapter as submitted.

Municipal Engineers

City Engineer— Annual volume of work, $5,000,000.	$12,000	to	$15,000
City Engineer— Annual volume of work, $2,500,000.	8,000	to	10,000
City Engineer— Annual volume of work, $1,000,000.	6,000	to	7,500
City Engineer— Annual volume of work, $500,000	4,000	to	5,000

Adopted by Chapter as submitted.

Pay should be graded according to responsibility, scope and character of work.

Department Engineers— In charge of departments or bureaus.	$5,000	to	$7,500

Division—		
In charge of several parties or several pieces of work. Considerable responsibility	4,000 to	7,500
Assistant Engineer—		
In charge of party, handling work from standpoint of grades and inspection. Under direction	3,000 to	3,600
Instrumentman—		
Preferably a technical graduate. Running transit and level, giving lines and grades and inspecting. All under direction	2,000 to	2,400
Rodman—		
No educational requirement except high school, second grade	1,080 to	1,500
Inspectors—		
Slight educational requirements for entrance, with acquired experience for higher grades. Paving, concrete work, etc., on routine under direction	1,380 to	1,800
Architect—		
Developing work of standard character	3,000 to	5,000

Above three adopted as submitted.

Designing Engineer—		
Technical graduate. Ten years minimum experience. Responsible.	4,000 to	6,000
Designer—		
Technical graduate with at least five years experience. Able to take responsibility	3,300 to	4,200
Detailer—		
Preferably technical graduates; developing drawings under direction. From little experience to five year	2,000 to	3,000
Tracer—		
Education at least equal to technical high school. Routine copyist	1,200 to	1,800
Draftsmen—		
Using the following titles as commonly understood:		
Architectural	1,800 to	3,000
Map or topographical	1,800 to	2,400
Structural	1,800 to	2,400

Public Utility Corporation Engineers

(Furnishing Light and Power to a population of 50,000.)

General Manager—	
Preferably a technical trained man. Volume of business and special considerations	$5,000 to $8,000
Assistants,	
A. Where employer has been accustomed to demand a technical education and ten years experience and considerable responsibility is assumed	3,900 to 5,000
Assistants	
B. Same education and experience as A, but working under direction	3,000 to 4,200
Assistants,	
C. Where employer has been accustomed to demand a technical education and a minimum of five years experience. Under direction	2,400 to 2,700

Assistants,

D. Office and field positions doing drafting and instrument work to pay same rates as shown for like positions in Municipal schedule.

Railroads Engineers

This schedule of salaries has already been published in Vol. II, No. 4 of *The Journal.*

Railroads Electric

1. A Road with the Equivalent of 60 Miles of Single Track.

Chief Engineer—	
In charge of track, structures and transmission lines	$3,600 to $4,800
Asst. Engr., Field—	
Doing instrument work and inspection, under direction	2,400 to 3,000
Roadmaster—	
Preferably a technically trained man	2,400 to 3,000
Mechanical-Electrical Engineer—	
An engineer trained in both branches, having charge of power house, plant, cars and equipment	4,200 to 5,400
Office Engineer—	
Equivalent to a first class machine draftsman, working under direction	2,400 to 3,000
Line Superintendent—	
Duties not easily described, but quite commonly understood	2,400 to 3,000
Sub-Station Man—	
Duties such as commonly apply to this position	2,400 to 3,000

2. A Road with the Equivalent of 200 Miles of Single Track.

General Manager—	
Responsible for all maintenance and operation. Preferably a technical man	$6,000 to $10,000

Chief Engineer—

Has full charge of construction and maintenance of way and structures	4,000 to	5,400

Assistant Engineer—

Drafting and instrument work in field and office under direction....	2,400 to	3,000

Roadmasters—

Preferably technical men. Usual duties........................	2,400 to	3,000

Mechanical-Electrical Engineer—

Trained in mechanical and electrical engineering. In full charge of power house, transmission and equipment....................	4,500 to	6,000

Assistant Engineers—

Perform drafting and design under direction. Able to turn out finished work....................	2,400 to	3,000

Line Superintendent—

Preferably a technical man. Training for a higher position.........	2,400 to	3,000

Sub-Station Man—

Duties such as commonly apply to this position. Preferably a technical man....................	2,400 to	3,000

Adopted as submitted.

Rural Engineers

County Surveyor—

This is not usually a salaried office, but is of such importance that a sound policy would provide this officer with an office and pay for it being kept open a stated number of days per week, the number depending upon the wealth and population of the county.

The per diem rate for land surveying should be adjusted to correspond with the value of the lands surveyed, as the surveyor is responsible for the accuracy of his work, and may be sued for damages due to or suffered from erroneous work.

Where land is valued at less than $25.00 per acre,	Surveyor........	$12.50
	Assts...........	3.75
Where land is valued at $25.00 per acre, but not over $200.00 per acre,	Surveyor........	18.00
	Assts............	5.00
Where land is valued over $200.00 acre,	Surveyor........	20.00
	Assts............	5.00

Drainage, Levee and Road Work—

Intermittent work of this class should be paid for at the per diem similar to that above for land surveys. A specific number of days should be paid for each month in addition to the actual time in the field, to cover consultation with directors and contractors and correspondence.

Salaried Employees in Rural Engineering—

Deputy County Surveyors, having responsible charge of work and directing same.................	$3,000 to $4,200
Drafting and Instrument work under direction......................	2,100 to 2,700
Subordinate positions as in municipal or slightly lower.	
Generally speaking, drainage and levee work is done on a percentage.	

County Engineer (Good roads organization.)

(For counties spending at least $500,000 annually on highway work.)

County Highway Engineer—

In charge of all bridge and road work in county. May be under State Highway Department...........	$4,200

Assistant Engineer—

Responsible for such work as may be assigned to him.................	3,000

Junior Engineer, Class A—

In charge of road surveys; does instrument work; prepares plans and profiles for road improvements; does drafting............	2,400

Junior Engineer, Class B.—

Leveler on road surveys; does instrument work; works on plans and profiles for road improvements; computes notes; does drafting...	1,800

Inspector—

Technical Training desirable, while while not essential, but must have had experience in highway construction if lacking such training......................	1,500

A similar organization is desirable for levee and drainage work, but must adapt itself to a wider variation than in road work.

Adopted as submitted.

State Public Utility Road

Proposed schedule of salaries for engineering department of a state Public Utility Commission, for a state with a population of 5,000,000.

Chief Engineer—

Charged with the administration of the Engineering Department and engaged in valuation work, standards of service, inspections and investigations having engineering aspects, etc. He may or may not be assigned to the duty of hearing cases, preparing opinions, etc. During his employment by the Commission and for one year thereafter he shall accept no employment from any utility subject to the jurisdiction of the Commission.................... $12,000 to $15,000

Assistant Chief Engr.—

Reports to the Chief Engineer, who assigns his duties............... 9,000 to 10,000

Chiefs of Div. Railroad, Gas, Telephone, Water Works—

These men shall not accept employment from any Public Utility subject to the jurisdiction of the Commission during their employment by the Commission or for six months thereafter. Are engaged in valuation of Public Utilities, within their own division, assisting in formulating standards of service and engaged on investigations and inspections having engineering aspects. They may be assigned the duty of hearing cases, preparing rate schedules, opinions, etc...........................

Railroad	8,000 to 9,000
Gas	6,000 to 7,500
Telephone	6,000 to 7,500
Water Works	6,000 to 7,500

Assistant Engineers—

Reporting to the chiefs of the above departments, graduates of technical schools, or having an equivalent technical knowledge.

Grade 1—

Corresponding in training and ability to a Division Engineer on a railroad...................... $3,600 to $4,800

Grade 2—

Corresponding in training and ability to an Assistant Division Engineer on a railroad.......... 3,000 to 3,300

Grade 3—

Corresponding in training and ability to an Instrumentman on a railroad.......................... 2,400 to 2,700

Grade 4—

Corresponding in training and ability to a junior draftsman or instrumentman on a railroad.......... 1,800 to 2,100

Adopted as submitted.

State Public Improvement Project

(Illinois River Improvement or similar project.)

Chief Engineer—

An engineer of such standing as to command respect for and confidence in the conduct of the work. $15,000

Assistant Chief Engr.—

In personal charge of surveys and construction. A first class executive........................ 9,000

Principal Asst. Engr.—

In charge of investigation and design. A highly technical engineer...................... 8,000

Bridge Engineer—

Equal to the bridge engineer on the strongest railroads.............. 7,500

Office Engineer—

Inside Executive reporting to the Chief or Asst. Chief Engineer.... 6,000

Office Assistants—

Same grades and rates as shown in the Municipal schedule.

Field Engineer—

Outside executive, reporting to the Assistant Chief Engineer........ 6,000

Field Assistants—

Same grades and rates as shown in the Municipal schedules.

Adopted as submitted.

Large Structural or Mechanical Organisation

Chief Engineer—

Having entire charge of the Engineering Department of a given organization................... $12,000

Assistant Chief Engr.—

Duties assigned by Chief Engineer. Performs duties of Chief Engineer during his absence.............. 9,000

Construction Engineer—

In charge of a particular job or jobs of construction. Reports to Chief Engineer..................... 3,600 to 6,000

Inspecting Engineer. Senior Class—

Inspects Engineering materials or workmanship. Reports to Chief Engineer. Minimum of ten years experience required............. 3,000 to 6,000

Inspecting Engineer, Junior Class—

Similar duties to senior class, but with but five years' experience... $1,800 to $2,700

Office Engineer—

In charge of all office engineering, designs, estimates, plans, files, etc., reports to Chief Engineer... 4,800 to 6,000

Engineer of Design— Has charge and supervision of all design. (And estimating). Reports to Office Engineer.........	4,200 to 5,000
Assistant Eng. Design— Makes design drawings, layouts, etc. May have charge of detail drawings. Reports to Engineer of Design or Office Engineer........	2,400 to 3,000
Engineer of Estimates— Has charge of all estimates when they are not under Engineer of Design. Reports to Office Engineer or Engineer of Design.....	3,300 to 4,000
Squad Engineer— In charge of a squad of not more than ten men on preparation of plans of particular job or jobs. Reports to Office Engineer.......	3,300 to 4,000
Assistant Engineers, Class 1— Engineers whose duties require their having a thorough technical training in civil, structural or mechanical engineering, together with four to six years' practical experience to properly prepare the work of drafting, designing, estimating, etc............................	3,000 to 3,600
Assistant Engineers, Class 2— Same requirements as class one, except that but three years' practical experience is required to qualify for duties to which they are assigned...............	2,400 to 2,700
Junior Engineer— Should preferably have a thorough technical education, with or without practical experience. Works under direction only............	1,500 to 2,100
Student Engineer— One pursuing studies leading to an engineering degree by home study or at school and performing field or office work of the lower grades, under direction................	1,000 to 1,400

Adopted as submitted.

Telephone Service

(A company serving a population from 1,500,000 to 2,000,000.)

Chief Engineer— Should be a technical graduate with fifteen years or more experience in the telephone field. Has entire charge of all engineering work in an executive capacity.........	6,000 to 8,000
Equipment— Should be a technical graduate with eight to ten years' experience. Has entire charge of all telephone equipment engineering, such as laying out, estimating and directing; the installation of telephone and power plants. Reports to Chief Engineer.................	4,200 to 5,000
Layout Engineer— Technical man, with three to five years' experience. Makes up plans, layout exchanges, equipment and sometimes supervision of specification writers. Under direction of Equipment Engineer.	2,500 to 3,500
Specification Engineer— Technical man with two or three years' experience. Write specifications and compute apparatus under direction of group heads, from routine instructions........	1,900 to 2,400
Estimating Engineer— Same qualifications as Specification Engineer. Makes up estimates of cost of equipment from specifications written by Specification Engineers. Reports to Equipment Engineers........................	1,900 to 2,400
Inspectors— Technical men or telephone men of experience in telephone equipment. Inspect new equipment under direction of Equipment Engineer......................	1,900 to 2,400
Construction Engineer— Executive position, same qualifications as Equipment Engineer. Work not quite so technical in nature. Has entire charge of plant outside of exchange........	4,200 to 5,000
Assistant Const. Eng.— Same dutes as Construction Engineer.........................	3,000 to 3,600
Specification and Estimating Engineer— Makes up estimates and writes specifications from plans submitted by field men. More or less routine....................	1,900 to 2,400
Inspector— Technical man. No experience required. Make tests of cable and wire plant from routine instructions..........................	1,600 to 1,900
Field Engineer— Technical man with two to five years' experience, or old construction foreman. Must go out on the ground and lay out pole lines and aerial and underground cable lines, and all outside construction......................	2,400 to 3,000
Traffic Engineer— About the same qualifications as Equipment Engineer. More routine work, less technical. Reports to Chief Engineer. Makes up studies of exchange traffic, over specified periods, plans extensions of service and gathers data for basis of equipment extension....	4,000 to 4,500

Layout Engineer—

Technical man with from three to five years' experience. Makes up plans for extensions of service from data furnished by Investigating Engineers $1,900

Investigating Engineer—

Technical man with no experience, or telephone men with four or five years' experience. Make tests of service, investigate probabilities of growth and complete data..... 1,700 to 1,900

Drafting Department—

Usually under Chief Engineer or Equipment Engineer. Nearly all routine work such as requires good tracers or detail men.

Chief Draftsman—

Usually has from twenty to twenty-five men under him .... 2,400 to 2,600

Draftsman—

As above .... 1,500 to 1,800

Adopted as amended.

To cover objections which were made at the Chapter meeting to the use of the words *technical man* in the report, the following explanation is added:

In this report the term *technical man* means a man having that command of technical engineering knowledge which can ordinarily be obtained in any of the ways described below. This definition relates to the amount of knowledge possessed rather than the means by which it may be obtained. The description herein of particular ways by which the amount of knowledge referred to may be obtained is not to be construed as excluding other ways not mentioned or denying that exceptional men may acquire the same knowledge in shorter time.

1. By completion of a four year technical college course leading to a degree.
2. By completing two years of a technical college course and engaging in engineering work for two years thereafter.
3. By engaging in engineering work for four years, accompanying his work by a diligent study of the science relating thereto.

In this report the term senior technical man means a man having a thorough and extended knowledge of exact science relating to engineering and having a thorough knowledge of the technical aspects of engineering; having a knowledge of technical matters in a greater degree than is ordinarily had by engineers other than those engaged in the more technical and exacting branches of engineering.

The terms technical man and senior technical man are not to be construed as terms describing rank or degree of professional skill, but are rather descriptive terms indicating the character and kind of knowledge possessed.

Telegraph Service

The following schedule for Telegraph Service has been submitted, but was not discussed by the full committee.

Gen. Supt. of plant and engineering—

Entirely responsible in an executive capacity for the construction, maintenance and development of plant. Preferably a technical graduate with 20 years' or more experience .... $15,000 to $20,000

General Plant Engineer—

Entirely responsible in an executive capacity for all plant engineering work. A technical graduate with 15 years or more experience...... 8,000 to 10,000

General Construction Engineer—

Responsible for all engineering work in connection with the construction of the outside plant. Technical graduate with 10 years or more experience .... 6,000 to 7,000

Construction Specifications Engineer—

Prepares general plant construction specifications. Technical man with 4 or more years' experience. 2,400 to 3,600

Line Efficiency Engineer—

Engaged in the testing of circuits and devising apparatus to improve their speed; technical man with 4 or 5 years' experience .... 2,400 to 3,600

Materials Engineer—

Handles testing of materials and preparation of specification for their manufacture. Technical man with 4 or 5 years experience...... 2,400 to 3,600

Inductive Interference Engineer—

Handles testing and development work in connection with prevention of inductive interference. Technical graduate with 8 or more years' experience .... 3,000 to 4,000

Electrolysis Engineer—

Handles testing and development work in connection with prevention of Electrolysis. Technical graduate with 5 years' experience .... 2,400 to 3,600

Apparatus Engineer—

Executive position, charge of the development of telegraph apparatus, preferably a technical man with 10 years' or more experience..... 5,400 to 6,600

Assistant—

Develops and prepares specifications for printing telegraph apparatus. Technical man with 5 to 8 years' experience .... 2,700 to 4,000

Assistant (b)—

Develops and prepares specifications covering time service and call circuit apparatus. Technical man with 5 years' experience .... 1,800 to 2,400

Assistant (c)—

Develops and prepares specifications covering Morse apparatus. Technical man with 7 years' experience 2,400 to 3,600

General Equipment Engineer— Responsible for all engineering work in connection with the installation and maintenance of equipment in the telegraph offices. A Technical graduate with 10 years' or more experience	6,000	to	7.000
Equipment Specifications Engineer— Prepares general plant equipment specifications. Technical man with 4 or 5 years' experience	2,400	to	3,600
Building Engineer— Responsible for the design and construction of buildings; technical man with 10 years' experience	4,000	to	5,000
Power Plant Engineer— Responsible for the development of power apparatus. Technical man with 8 years' experience	3,600	to	4,800
Equipment Estimate Engineer— Responsible for the checking of equipment estimates. Preferably a technical man with 5 years' experience	2,400	to	3,600
General Supervisor of Lines— Executive position, general supervision over the construction of the outside plant. Preferably a technical man with 15 years of telegraph construction and engineering experience	7,000	to	8,000
Estimate Engineer— Responsible for the checking of all estimates covering construction of the outside plant. Preferably a technical man with 10 years' experience	4,800	to	5,500
Construction Methods Engineer— Engaged in the development and promulgation of efficient construction methods. Preferably a technical man with 10 years' experience	3,000	to	3,600
Valuation Engineer— Executive position. Entire charge of the valuation of the plant; preferably a technical man with 15 years' experience	6,000	to	7,000
Assistant Valuation Engineer— Duties similar to those of Valuation Engineer	4,800	to	6,000
Div. Plant Supt.— An executive position. Entirely responsible for the construction and maintenance of plant in an area having 40,000 miles of line or 300,000 miles of line wire. Preferably a technical man with 15 years' experience	6,000	to	8,000
Division Engineer— Responsible for all plant engineering in a division such a described above. A technical graduate with 10 years' experience	5,000	to	6,000
Div. Construction Engr.— In charge of engineering in connection with the outside plant. A technical graduate with 10 years' experience	4,200	to	5,000
Asst. Div. Construction Engineer— Assistant to Division Construction Engineer, a technical graduate with 8 years' experience	3,300	to	4,000
Estimating Engineers— Responsible for plans, specifications and estimates for outside construction work. Preferably a technical man with 5 years' experience	2,000	to	3,000
Division Electrolysis Engineer— Responsible for the prevention of electrolysis in the division. A technical graduate with 5 years' experience	2,000	to	3,000
Division Elec. Engineer— Responsible for the prevention of inductive interference on pole lines and in cables. Technical graduate with 8 years' experience	3,300	to	4,200
Division Equipment Engineer— In charge of all engineering and installation work in connection with the inside plant in a division. A technical graduate with 10 years' experience	4,200	to	5,000
Asst. Div. Equipment Engineer— Principal assistant to division Equipment Engineer. A technical graduate with 8 years' experience	3,300	to	4,000
Division Power Plant Engineer— Responsible for the layout out, installing and maintaining of power plants, a technical graduate with 6 years' experience	3,000	to	3,600
District Equipment Engineer— In charge of installation and maintenance of inside equipment in a city of 1,000,000 to 2,000,000 population or in an area having 10,000 miles of line. Technical man with 5 years' experience	2,700	to	3,300
Equipment Layout Engineers— Engaged in preparing layouts specifications and estimates for the installation of inside equipment. Technical man with 3 years' experience	2,000	to	2,600
Equipment Inspectors— Inspect offices and equipment and assist the equipment engineers. Preferably technical men	1,500	to	1,900

Division Val. Engineer—			
In charge of the valuation work in connection with both the inside and outside plant in a division. A technical man with 10 years' experience	3,600	to	4,200
Division Supervisor of Lines—			
Executive position. General Supervision over the construction and maintenance of the outside plant in a division. Preferably a technical man with 15 years' experience	4,800	to	5,500
Assistant—			
Supervision of outside construction. Preferably a technical man with 6 years' experience	2,400	to	3,300
General Superintendent of Traffic—			
Executive position. Has entire charge of the operation of circuits. Preferably a technical graduate with 15 years' experience	14,000	to	18,000
Layout Engineer—			
Has entire charge of the assignments of circuits. A technical man with 12 years' experience	5,000	to	6,000
Assistant—			
Assists the layout engineer. Preferably a technical man with 6 years' experience	2,400	to	3,600
Automatic Engineer—			
Charge of operation of Printing Telegraph circuits over entire system. A technical man with 12 years' experience	5,000	to	6,000
Assistant—			
Assists the Automatic Engineer. Preferably a technical man with 6 years' experience	2,400	to	3,600
Efficiency Engineer—			
Develops the routing of circuits to five maximum speed of transmission. Technical man with 12 years' experience	5,000	to	6,000
Division Traffic Supt.—			
Executive position. Entire charge of the operation of circuits in the division. Preferably a technical man with 15 years' experience	6,000	to	8,000
Div. Layout Engineer—			
Charge of circuit assignments in a division. Technical man with 10 years' experience	4,000	to	4,800
Division Automatic Engineer—			
Charge of operation of Printing Telegraph circuit in a division. Technical man with 10 years' experience	4,000	to	4,800

South Shore Town Planning

The South Shore, as generally understood, comprises the municipalities of Longueuil, Montreal South, St. Lambert and Greenfield Park, lying along the south-east shore of the River St. Lawrence, opposite the city of Montreal.

Last year the South Shore Board of Trade, whose membership is drawn from the above municipalities, appointed a committee of six members under the leadership of Wayland Williams, Esq., to study a Town Planning Scheme for the South Shore. This Board of Trade Committee has now been succeeded by a committee composed of D. F. Kyle, Alex. Thurber, Omer Lecuyer, Edmond Hardy, J. E. Campbell, E. P. Gordon, S. J. Milligan, E. Backhoven, J. W. Oakley, E. Drinkwater, Jas. Ewing, M.E.I.C., W. J. Carmichael, A. Vincent, A.M.E.I.C., R. deL French, M.E.I.C., and two aldermen from each municipality, under the title of The South Shore Joint Town Planning Board. This is the first time in Canada that adjacent municipalities have combined in this way to secure co-ordination of their efforts along reasonable and economical lines for the improvement and beautification of the town and the well-being of the residents.

The South Shore at present is a jumble of sub-divisions each laid out by some land speculator whose only interest was to dispose of the property at a good profit. To remedy this evil the firm of Ewing, Lovelace and Tremblay, Consulting Engineers, has been appointed by the Board to prepare a plan of the South Shore, showing, among other things, the physical features, both natural and artificial, and the public and semi-public buildings. It is expected that this plan will be ready about October 1st when the Board will proceed to lay out a scheme of highways; industrial, business and residential areas; parks; sites for future buildings; railways and harbor facilities; etc. This town plan will then be submitted to the citizens for their discussion and criticism and, if approved, an Act will be introduced in the Provincial Assembly providing for the ratification of the plan, and for the necessary authority to put into effect the improvements shown thereon. The cost of the preparation of the plan is being defrayed by the municipalities concerned.

Messrs. Ewing, Lovelace and Tremblay are all corporate members of *The Engineering Institute of Canada* and the South Shore Joint Town Planning Board may rest assured that the plan submitted will be based on the best engineering practice.

British Trade Fairs

These fairs, representative of the various branches of British industries, will be held concurrently in London, Birmingham and Glasgow early next year according to information received from G. S. Milne, the Senior British Trade Commissioner of Canada & Newfoundland. The London fair will be organized by The Imperial Board of Trade, and the fairs at Birmingham and Glasgow by the municipal corporations and Chambers of Commerce of these cities, but under the auspices of the Board of Trade. Full particulars may be obtained at the office of the Senior Trade Commissioner, 367 Beaver Hall Square, Montreal, and applications by Canadian manufacturers for space will be received by the Senior Commissioner up till the 31st of August next.

CORRESPONDENCE

Legislation

Editor, *Journal:*

Regarding the objections to the proposed Legislation now developing on the part of Students and Juniors certain comments are pertinent.

As I interpret clause 7 (i) of the proposed bill, such a situation as outlined, of employers of engineers filling positions with unskilled instead of skilled employees, would be quite impossible under a live administration of the Act; it would also be improbable as such a proceeding is uneconomical. There are, however, certain duties to be performed in the practice of engineering which do not of necessity call for much skill on the part of the person performing them and to do which any intelligent person may be trained in a very short while. I refer to such duties as holding the chain, tape, picket or rod in field work or even reading a level under certain conditions, also in office work doing such duties as tracing, minor draughting, blueprinting, etc. Under the proposed bill there is nothing to prevent the employment of any kind of person on this work or any kind of a person doing it and I am personnally quite unable to conceive of any type of legislation which would prevent it. There is no existing precedent in any other profession for such restrictions. Any person can act as a clerk to a lawyer and thereby do everything which the lawyer does except appear in court as a lawyer. Any person can assist a doctor in his work as long as the doctor is present and directs the performance of the work, except possibly in acts of surgery, and so on in the other professions of dentistry, pharmacy, etc.

The fact of a young law or medical student being able to obtain legal recognition immediately he has completed his course of studies and passed his examinations should not be used as an analogy for the engineering profession as the conditions of training are not similar. In the other professions theoretical training can be combined with sound practical experience in the confined limits of an office or hospital and university, but with engineering the necessary practical experience can only come after the university training except in very exceptional cases and it was for that reason that the bill proposed to make a period of two years experience necessary in addition to university training. Even at that, a young engineer may become qualified at the age of 23 if he starts his experience early enough by starting in at college at seventeen. The junior engineer will not find himself greatly handicapped as against the other professions if he has the ability to conform to the requirements of the act.

The students and juniors of the profession should be advised to rely upon their ability to perform their work more efficiently than untrained persons, to obtain employment for them in the lower stages of the profession rather than seek protection by legislation, which no other profession enjoys. The greatest help towards the encouragement of engineering students and juniors will be a campaign of education among the public at large in regard to the improved status of the engineering profession as a whole.

Yours truly,
C. C. Kirby,
A.M.E.I.C.

Editor, *Journal:*

After reading the proposed Act respecting the Engineering Profession in the May issue of *The Journal*, and the views of prominent members of *The Institute*, in the June issue; it is very evident to me that the usefulness of *The Institute* will be seriously impaired if not entirely destroyed if the Act as it stands at present, is made law in the different Provinces.

I, therefore, venture to suggest that instead of pressing forward the proposed Provincial legislation that our legal advisors should be instructed to modify it so as to include present Provincial members of *The Institute* as *ipso facto* members of the proposed organization, and members of any other recognized engineering societies, potential members.

We now have Provincial Divisions of *The Institute*. Why not make those Divisions the new bodies to be incorporated and afterwards consolidated under the present *Institute*?

The annual fees and methods of administration could remain the same as at present. It may be necessary to have a registration fee, but annual fees should not be paid to two different associations, as it would inevitably result in joining the one with lesser fees to the detriment of the other.

Yours truly,
Duncan MacPherson,
M.E.I.C.

Belgian Railway Electrification

A commission composed of several Belgian business men, engineers and heads of the Railway Department, with the engineers of the French State Railways and of the Midi Railway and Mr. Philip Dawson, was appointed in 1916 by M. Seghers, then the Minister of Railways, to investigate the advisability of electrifying the Belgian State Railways; and after several sittings had been held in Paris an interim report was issued advocating the electrification of a considerable portion of the lines.

When the Belgian Government was re-instated in its capital a new commission was appointed, with Baron Ancim as president and M. Mazin of the French State Railways, and Mr. Philip Dawson, as vice-presidents, to go over the work of the previous commission and to investigate not only the electrification of the railways, but also the problem of unifying the supply of electricity for all purposes all over the country. This commission has recommended the immediate preparation of a scheme for the electrification of the Brussels-Antwerp line and of the railways in the immediate neighborhood of Brussels, and its next task is to inquire into the question of co-ordinating existing electric supply undertakings and the erection of new super-power stations. — *The Times Engineering Supplement.*

Report of Council Meetings

The adjourned meeting of the Council was held at the headquarters of *The Institute* on Tuesday, June 3rd, at 8.15 P.M., when the following subjects were considered:—

Scientific and Industrial Research: A letter giving the opinion of Council, favouring the encouragement of research by the Dominion Government, prepared by Julian C. Smith and Professor Ernest Brown, in accordance with a request of the last meeting of Council, was approved, with slight changes. The Secretary was directed to forward the letter to Ottawa.

Revision of By-laws—Form "E": The Secretary submitted a draft of Form "E" as required by the revision of the by-laws, which was approved. The Secretary was instructed to send out an additional card and letter to all who had not subscribed to *The Journal.*

Civil Service Salaries: Communications from the Committee of the Ottawa Branch were read, outlining the situation and urging the attendance of a delegation from *The Institute* when the Bill should go forward. In response to this, Col. Leonard came to Montreal by way of Ottawa, spending a day in the interests of engineers in the Civil Service. He reported that the Bill was now being printed, but, inasmuch as the budget was being presented, the Bill would not likely come up for a week or more.

Dedication of Pittsburg Experiment Station: An invitation from the Bureau of Mines, Department of the Interior, to attend the dedication of the Pittsburg Experiment Station of the Bureau of Mines, was presented. The Secretary was instructed to ask members in Pittsburg to attend, as representatives of *The Institute.*

James Watt Centenary: An invitation to the President of *The Engineering Institute* to attend the James Watt Centenary, at Birmingham, was presented. President Leonard agreed to arrange to have one of our members residing in Great Britain attend.

Committee on Deterioration of Concrete in Alkali Soils: The appointment of C. G. MacKenzie to the Committee of *The Institute* investigating the deterioration of concrete in alkali soils was approved and note was made that the University of Saskatchewan had set aside one thousand ($1,000) dollars for this investigation.

Western Professional Meeting: A tentative programme for the Western Professional Meeting, submitted by the Secretary of the Edmonton Branch, was approved.

Maritime Professional Meeting: The suggestion of the St. John and Halifax Branches to hold the general professional meeting in St. John, on September 10th, 11th and 12th was approved. Note was made that both branches have committees investigating the subject of concrete in local sea water.

Bureau of Education, Washington: An invitation from the Chairman of the Conference Committee on Commercial Engineering to a conference on commercial engineering, to be held in the New Willard Hotel, Washington, was presented. The Secretary was instructed to write Eugene Stern, M.E.I.C., of New York, and after receiving suggestions, to forward them to the Chairman of the Conference.

Royal Commission on Industrial Relations: A letter was presented from the Secretary of the Halifax Branch suggesting that the Council arrange that engineers be represented before the Royal Commission on Industrial Relations. No action was taken.

Bureau of Municipal Research, New York: Note was made that R. A. Ross, M.E.I.C., had been appointed a member of an advisory committee of the Bureau of Municipal Research, New York.

Canadian Engineering Standards Assoc'n: A suggested letter to be sent out to the corporate and junior members of *The Institute,* on behalf of the Canadian Engineering Standards Association, was approved and the Secretary authorized to have the same sent out as arranged between himself and the Secretary of the Standards Association.

The late Ernest Marceau: In recording the death of Mr. Ernest Marceau, it was resolved to place on record the loss sustained by *The Institute* in the death of Mr. Marceau who had occupied so prominent a place in the engineering profession of Canada and in the activities of *The Institute.* The Secretary's action in forwarding a wreath in the name of the President and the Council, was approved. It was resolved that a letter of sympathy be forwarded to Mr. Marceau's family.

Legislation—form of ballot: The Pro and Con circular submitted by the committee of Council was approved and the Secretary instructed to send it, together with the letter of the committee and a ballot asking the question "Are you in favour of legislation along the lines proposed in the act published in the May issue of *The Journal,* as prepared by the special committee of *The Institute?*".

Summer Meetings of Council: Owing to the Secretary's proposed absence it was decided that no regular meeting of the Council be held in June and until his return, except for the purposes of opening the ballot.

Finances: The financial situation was discussed. The Secretary presented a statement showing the collections and overhead expenses, which indicated that additional revenue would be required to finance *The Institute* during the current year, unless a greater proportion of arrears of dues are paid. It was decided that the Finance Committee be authorized to make arrangements, if necessary, and the Secretary was instructed to prepare a letter to be sent out to all delinquents.

Miscellaneous: Note was made of considerable correspondence dealing with miscellaneous matters.

Ballot: A ballot was canvassed and the following declared elected:—

Members.

Robert Archer Baldwin, of Toronto, Ont., asst. engr., C.N.R., Richard Lafontaine Haycock, of Ottawa, Ont., B.Sc. (M.E.), McGill Univ., General Supply Company, William Robert Carnac Morris (M.I.C.E.), of Vernon, B.C., since 1915 on munition inspection, Imperial Min. of Munitions, Montreal, Herbert Phillips, of St. John, N.B., div. engr., St. John & Que. Ry., William Nelson Smith, M.E., Cornell Univ., of Winnipeg, Man., consulting elec. engr., Winnipeg Elec. Ry., James W. Tyrell, of Hamilton, Ont., general engineering work.

Associate Members.

Harold Ernest Radclyffe Barnes, A.M.I.M.E., of Dartmouth, N.S., civilian foreman, i/c of gen. constr. works, M. D. Dept., Royal Engrs., 3rd Div. Officer, M.D. 6, Halifax, N.S., George Claxton, of Shawinigan Falls, Que., i/c of constr. and designing, Belgo Pulp & Paper Co., Allan David Watt Cuthbert, of New Glasgow, N.S., sr. transitman, Can. Nat. Rys., James McNaughton Davidson, of Winnipeg, Man., res. engr., Can. Nat. Rys., Cecil Earle Joslyn, B.Sc., Queen's Univ., of Ottawa, Ont., inspector of shell components, Im. Min. of Munitions, Thomas Kearney, B.Sc., B.E., asst. engr., Can. Nat. Rys., Thomas Halder Kirby, B.Sc. (C.E.), McGill Univ., of Winnipeg, Man., asst. engr., Greater Winnipeg Water District, David Kyle, M.E., of Sault Ste. Marie, Ont., Vice-Pres., i/c of operations, Algoma Steel Corp., Joseph Honore Landry, B.A., B.Sc. (C.E.), Laval Univ., of Montreal, sr. asst. engr., P.W.D., Sidney Guy MacDermot, B.Sc., McGill Univ., of Montreal, supt. i/c mechanical and electrical depts., Canadian Johns Manville Co. (Montreal Branch); Peter James MacDonald, of Swift Current, Sask., member of firm, Martyn and MacDonald, consulting engineers, Thomas Douglas Mylrea, B.Sc. (C.E.), Univ. of Ill., ch. engr., Trussed Concrete Steel Co., Toronto, Frederick Thomas Nichol, B.A.Sc., of Toronto, Ont., engr., Archibald & Holmes, Ltd., John Henry Porter, of Hamilton, Ont., designing engr. and estimator, Hamilton Bridge Works Co.; Hugh Goffen Randlesome, of Vancouver, B.C., Lieutenant Canadian Engineers, prior to enlistment, in charge of party, Government Water Rights, Sydney Frank Ricketts, E.E., of Winnipeg, Man., apparatus sales engineer and asst. manager, Canadian General Electric, Winnipeg District, Ernest LeRoy Tait, of New Westminster, B.C., acting engineer of construction and way, B.C. Electric Ry., Leonard Thomas Venney, B.A.Sc., Univ. of Tor., D.L.S., of Windsor, Ont., Canadian Steel Corp., Ojibway, Ont, James Howard Wheatley, B.Sc. (M.E.), McGill Univ., of Westmount, Que., 2 years (1916-18), with British Munitions Co., Verdun, Que., at present unemployed.

Juniors.

Charles Sydney Creighton, B.Sc., (C.E.) Transitman for R. W. McKenzie, Crown Land Surveyor. Atlee James, Transitman, C. P. R., Location Party, Wymark, Sask. Harry W. Patterson, engaged by Owen McKay at Walkerville, Ford and Sandwich in various capacities.

Transferred from Associate Member to Member.

John Davidson Craig, B.A., B.Sc., D.L.S., Engr. with Internat. Boundary Comm., Ottawa, Ont., Ross Leonard Dobbin, B.A.Sc., in full charge of water supply and design, Peterboro Utilities Comm., Peterboro, Ont. William Flockhart Drysdale, B.Sc., Special Engr., Representative in Europe, American Loco Sales Corp., Paris, France. Ernest Vivian Moore, B.Sc., Consl. Engr., Peat Committee of the Ont. and Dom. Govts., Montreal. Emil Andrew Wallberg, C.E., Engr., designer and owner of Hydro Electric Plants, Toronto, Ont.

Transferred from Junior to Associate Member.

William Dalziel, B.Sc., Mechanical Supt., Caron Bros., Longue Pointe. Lawrence James Devereux, Res. Engr., i/c Constn. and Maintenance at different western points, Edson, Alta., Donald Francis McIsaac, B.A.Sc., Engineer, Dominion Iron & Steel Co., Sydney, N.S. Walter Corning McLaren, res. engr., C.N.R. & H. & S.F. Railway, Toronto, Ont. John Evans Milne, Municipal engineer, Corp. of Burnaby, Edmonds, B.C. Stuart Erskine Oliver, B.Sc. (C.E.), res. engr. Quebec & Saguenay Ry., Quebec. John Strachan, Jr., Hudson Bay Junction, Sask. Stanley Roy Turner, B.Sc., engineer, William Hamilton Co., Peterborough, Ont.

Transferred from Student to Associate Member.

Louis Joseph Gustave Boisseau, B.A.Sc., Supvr. of Constn., of Lake Burle Storage Dam, Montreal. Geo. Oliver Thorne, B.Sc., (C.E.), Saskatoon, Sask., awaiting discharge.

Transferred from Student to Junior.

Chas. Albert Boulton, B.Sc., Murphy & Underwood, Consulting Engrs., Saskatoon. William James LeClair, Ottawa, Ont. Harry Elsmere McCrudden, B.Sc., Assistant Director Representative, Soldiers' Civil Re-Establishment, Montreal. Edwin Harry Scott, B.A.Sc., Canadian National Railways, Toronto, Ont. Jack Northmore Williams, B.A.Sc., Foundation Company, Limited, Montreal.

A second adjourned meeting of the Council was held at the headquarters of *The Institute*, on Monday, June 9th.

A.S.M.E. Summer Meeting: Owing to the inability of General Bertram to attend the summer meeting of the American Society of Mechanical Engineers to be held in Detroit, June 16th-19th, in response to an invitation from President Cooley, it was decided that the Chairman of the Border Cities Branch be asked to represent *The Institute*, together with the Secretary, who had planned to go west via Detroit and St. Paul.

Classifications: Classifications were made for a ballot returnable in July.

In accordance with the ruling of the last meeting of Council that no regular meeting be held in the month of June, owing to the Secretary's absence, except for the purpose of opening the ballot for the election of members, the local Members of Council met at headquarters on Tuesday, June 24th at 5 o'clock. The ballot was canvassed and the following declared elected:—

Members.

Watson Lanley Bishop, of Dartmouth, N.S., District Engineer of Highways, Province of Nova Scotia; Thomas Fawcett, D.L.S., D.T.S., O.L.S., of Ottawa, Ont., engineer in charge of Boundary Commission.

Associate Members.

Charles Louis Arcand, of Three Rivers, Que., assistant to District Engineer, Department of Public Works; James G. Campbell, of Windsor Ont., structural engineer, Canadian Steel Corpn., Ojibway; Donald John Fraser, B.A. (Queen's Univ.), D.L.S., of Ottawa, Ont., with

Geodetic Survey of Canada; John William Macleod, B.A., M.A. (St. Francois Xavier Univ.), B.Sc. (McGill Univ.), Director and Secretary, Greenwood Coal Co.; Ralph Clinton Purser, B.A.Sc. (Univ. of Toronto), of Ottawa, Ont., chief on Dominion Land Surveying field work; Edward Green Richards, of Edmonton, Alta., since 1917 with Canadian Railway Troops, France, 2nd in command of "A" Co.; William John Shaw, Jr., of St. Thomas, Ont., Divisional Engineer, Michigan Central Rly.; Phillip Sherrin, of Ottawa, Ont., Supt. Engr., Dept. of Nat. Resources, Intelligence Branch; Barry Wilson, of St. John, N.B., city electrician.

Associate.

Gerald Moffat Christie, D.L.S., B.C.L.S., of Kamloops, B.C., since 1914, engaged in making surveys of right-of-way for C.N.R., through B.C.

Juniors.

Herbert James Freeman, Lieut., of Halifax, N.S., on active service since 1914. At present instructor in England; Percy W. Freeman, of Halifax, N.S., enlisted in 1914, gazetted Captain in March, 1918, awaiting demobilization; John Bevan Walcot, of Montreal, with Can. Engrs., C.E.F., during 1918, since Jan. 1919, with Walter J. Francis & Co.

For Transfer from the Class of Associate Member to Member.

Thomas Richardson Loudon, B.A.Sc. (Univ. of Toronto), of Victoria, B.C., since May, 1916, Major with C.E.F., 2nd in Command, 1st Batt., Ry. Troops, at present, C.R.C.E., Mil. Dist. No. 11; George Albert McCubbin, O.L.S., of Chatham, Ont., municipal engr., for Lambton County; Lesslie R. Thomson, B.A.Sc. (Univ. of Toronto), of Montreal, Que., Secretary, Lignite Utilization Board of Canada; Harvey Thorne, B.A. (Dalhousie Univ.), B.A.Sc. (McGill Univ.), on engineering staff of Canadian Steel Corpn., Ojibway, Ont.

For Transfer from the Class of Junior to Associate Member.

Joseph Marie Hector Cimon, B.A.Sc. (Laval Univ.), of Quebec, Que., engineer for Price Bros. & Co.; Robert D. Innes, of Woodman's Point, N.B., supt., N.S. Construction Co., Halifax.

SPECIAL NOTICE

Civil Service

The Ottawa Branch has sent the following notice to the Branch Membership:—

Members of *The Institute* who are affected by the new classification of the Civil Service are asked to note the information given to the Press as follows: That all suggestions or objections in reference to the classification should be made in writing to the Civil Service Commission through the Head of the Branch or Deputy Minister of the Department.

Particulars of any evident omissions or inconsistancies in the classification as they affect engineers should also be sent to the Secretary of the Ottawa Branch for transmission to the Committee of Council which has been in touch with the Government and has endeavoured to safeguard the interests of the engineers.

BRANCH NEWS

Halifax Branch

Frederick R. Faulkner, M.E.I.C., Sec'y.-Treas.

The regular monthly meeting of the Halifax Branch was held at the Green Lantern on Wednesday evening, June 4th. Following the custom inaugurated this spring, this was a supper meeting.

No papers were presented and the evening was devoted to an informal discussion of the proposed legislation. No objections were offered to the general principles of the Bill and the discussion was entirely on the details. As a result two resolutions were passed, to be transmitted to the Council and to be published in *The Journal.*

Moved by F. W. W. Doane, M.E.I.C., and seconded by F. P. Jennings, A.M.E.I.C.,—That this meeting of the Halifax Branch of *The Engineering Institute of Canada* does hereby endorse the general principles of the proposed act respecting the Engineering Profession, but is of the opinion that after the Act is approved by *The Institute,* another general meeting of the Branch should be called to further consider the details of the Act before submitting the Proposed Act to the local legislature.

Moved by W. P. Morrison, M.E.I.C., seconded by F. W. W. Doane, M.E.I.C.,—That when the local executive receives notice from the Council that the Proposed Act has been accepted by *The Institute,* the executive committee send out notices to this effect to the members of the Branch, requesting them to forward to the secretary of the Branch, any recommendation or objections they wish to make in connection with the details of the Bill and that a general meeting of the Branch be called to discuss these recommendations and objections before the act is submitted to the local Legislature.

Montreal Branch

Frederick B. Brown, Sec'y.-Treas.

Banquet to Brigadier General Charles Hamilton Mitchell, C.B., C.M.G., D.S.O.

The event of the season in Montreal Branch activities was the banquet held at the Ritz Carlton Hotel on June 12th, in honor of Brigadier-General Charles Hamilton Mitchell, C.B., C.M.G., D.S.O.,etc., "on the occasion of his return to civil life, after distinguished service with the Allies during the Great War, and upon assuming the Deanship of the Faculty of Applied Science and Engineering of the University of Toronto."

General Mitchell only arrived in Halifax the day before the banquet, yet by means of wireless and telegraph, his approval of the arrangement had been obtained. The banquet was a great success and the Montreal Branch are to be congratulated on the completeness of their arrangements. A beautifully engraved four leaf menu card was provided, the first two pages of which, reduced to about one third size, are reproduced on the next page.

There was a large assembly of engineers to welcome General Mitchell, including many of the leading men of the profession. The chair was taken by Walter J. Francis, M.E.I.C., President of the Montreal Branch, and with him at the table of honor were General Mitchell; Sir John Kennedy, Hon. M.E.I.C.; Dean Moyse, of the Arts Faculty, McGill University; Lt.-Col. Arthur E. Dubuc, D.S.O., M.E.I.C.; M. H. Ponsot, French Consul-General; J. M. Robertson, M.E.I.C.; Mgr Choquette; Dr. W. H. Ellis, M.E.I.C., Toronto University; Controller R. A. Ross, M.E.I.C.; W. F. Tye, M.E.I.C., and P. H. Mitchell, A.M.E.I.C.

The other members and friends present were as follows:—

Bertram Sir Alexander, M.E.I.C.
Bickerdike, Lt.-Col. Robert, M.E.I.C.
Blaiklock, M. S., M.E.I.C.
Brown, E., M.E.I.C.
Brown, Frederick B., M.E.I.C.
Burgoyne, St. George.
Busfield, J. L., A.M.E.I.C.

Cameron, N.C., A.M.E.I.C.
Campbell, Norman M., A.M.E.I.C.
Caron, J. G., S.E.I.C.
Chadwick, R. F. C., A.M.E.I.C.
Challies, J. B., M.E.I.C.
Cowie, Frederick W., M.E.I.C.

Banquet
in Honour of
Brig.-Gen. Charles Hamilton Mitchell
C.B., C.M.G., D.S.O.
Consulting Engineer
on the occasion of his return to civil life after distinguished service with the Allies throughout the Great War and upon assuming the Deanship of the Faculty of Applied Science and Engineering of the University of Toronto

Given at Montreal
June 12th 1919.
by
The Members of the Montreal Branch of the Engineering Institute of Canada and other Friends in the Engineering Profession

Charles Hamilton Mitchell
Brigadier General
Companion of the Bath
Companion of the Order of St. Michael and St. George
Companion of the Distinguished Service Order
Officier de la Légion d'Honneur
Officier de l'Ordre de Léopold
Croix de Guerre de Belgique
Cavaliere Ufficiale della Corona d'Italia
Croce di Guerra

Wilson, L. R.
Wright, L. A., Jr. E.I.C.
Zunini, Chevalier.

The toast to "Our Guest" was proposed by Walter J. Francis, M.E.I.C., Chairman, who touched upon the earlier work of General Mitchell as a student and engineer, remarking that the whole course of his life had been marked by two watchwords, *duty* and *service*, which he had carried to such conspicuous success during his years at the front with both the Canadian Corps and the Imperial Army.

General Mitchell, when he rose to reply, was greeted with prolonged cheers. It was, he said, a surprise and delight to him to meet so many of his old colleagues of the engineering profession immediately after his return from years of service overseas. This was singularly appropriate, since it was the engineering profession that had carried the great burdens of the war, and to a large extent made its victorious end possible.

General Mitchell, in personal vein, said that for years before the war he had studied problems in connection with the intelligence branch of the work, and the result was that he concluded in time of peace it was a truly patriotic duty to study the possible problems and emergencies of war. "I consider that the studies I made long before the war were not lost, and my experiences at the front showed me their value, in the assistance they gave to my work," he said.

In this connection General Mitchell paid a tribute to the general efficiency and expert knowledge of the British staff officers wherever he had served, declaring that some of the aspersions cast upon them were entirely unfounded.

He, however, pointed out that at the beginning of the war the enemy had been almost uncannily equipped in its intelligence work, learning in apparently mysterious ways everything the British were doing. Later it was found how they used electrical listening devices and other equipment to collect the British signals. The British engineers discovered these, and eventually beat the Germans at their own game, not only on land, but in the air, so that in the final operations the enemy could not do anything or plan anything without the British knowing and preparing for it.

In this work, he said, the Canadians would have a lasting place in the history of the war for the manner in which they devised the plan of raids to secure evidence of what the enemy was planning, and some of his instances of this were rather grim, especially the collection of information from the dead during these raids.

His description of his own work, as intelligence officer, 20 miles behind the lines, at the end of a field telephone, in a battle of wits with a German intelligence officer doing the same thing 20 miles back of their lines, gave a graphic idea of the manner in which information was collected and collated, so that enemy plans could be defeated, and our own attacks made with success.

In concluding General Mitchell gave an account of the operations in which he served with the Allies on the Piave front, leading to the overwhelming defeat of the Austrians and Germans there.

"Now," he said, "I am going to my next war, to resume my duties and work as a civilian, at Toronto University, and I hope, with the assistance of my old friends there, that I shall succeed."

General Mitchell attended in uniform, the rows of ribbon on his breast showing the many honors he had won on various European battlefields.

A full account of General Mitchell's remarkable military career appeared in Volume II, No. 5 of *The Journal.*

St. John Branch

A. R. Crookshank, M.E.I.C., Secretary.

The St. John and Halifax Branch committess have started active work in preparation for the General Professional Meeting to be held in St. John on Sept. 10th, 11th, and 12th, and the tentative programme promises an interesting and enjoyable time for all who attend.

A committee of the Halifax Branch, under the convenership of A. F. Dyer, A.M.E.I.C., is working in conjunction with our committee, under chairmanship of A. Gray, M.E.I.C., in the study of the subject of concrete in sea water, and it is hoped that they will be able to give some interesting and instructive information in regard to the behaviour of concrete in local waters at the meeting next fall.

The employment bureau under the leadership of G. N. Hatfield, A.M.E.I.C., has been doing effective work, in close co-operation with the Soldier's Civil Re-establishment and the Dominion Provincial Labour Bureaus. A circular letter was sent to the employers of engineers in this Province telling of the formation of our Bureau, offering its services and asking for their co-operation. The colleges were also notified and a number of engineering students have been placed in positions. The Branch requests the co-operation of the New Brunswick members, and asks thay they notify Mr. Hatfield, City Hall, St. John, when they hear of any vacancies in engineering positions. Applications for assistance in obtaining employment should also be addressed to him. Nearly all the Branches have offered to co-operate with our Bureau and it is hoped that in time through close organization, and with clearing house at Headquarters, this line of activity will prove most useful to the engineers of Canada. In this connection, the publishing of the up-to-date record of each member in the Year Book would be of material service to the Employment Committees.

The committee appointed to ascertain the salaries and fees received by *The Institute* members in New

Brunswick, so that minimum schedules may be drawn up later, has started work, and hopes to report at the first fall meeting.

The addition of a department of Vocational Training in connection with the High School of the City of St. John is being advocated, and the Branch has appointed representatives to the Committee backing this project.

The last meeting of the Branch was held in the laboratory of Frank P. Vaughan, A.M.E.I.C., who read an interesting paper on Experiments with High Potential High Frequency Electric Currents, and gave a spectacular demonstration of the wonderful effects that can be produced with these currents.

Mr. Vaughan, who is the pioneer in this district in wireless telephony and telegraphy experiments, has built a very complete set of high tension electrical experimental apparatus, the equivalent of which it would be hard to find in Canada. The ordinary 110 volt current of 60 cycles, or 120 frequency, is stepped up by his machines to a maximum of over half a million volts, with a frequency of over one million impulses or vibrations per second. With this apparatus anything in the line of wireless telegraphy and telephony, X-Ray work, therapeutic treatments, and separation of mixed gases as is now being used commercially in the metal industries, is possible.

In 1906, Mr. Vaughan talked by wireless to Partridge Island, three miles away, but as it was found necessary to use damped oscillations with his apparatus, and these would not allow of a high enough spark frequency to give uniform satisfactory results, it was limited to laboratory use. It was not until the discovery of the so-called *valve* in recent years, that allowed the use of undamped oscillations, that wireless telephony became commercially successful.

Among the number of interesting experiments shown was the burning of a 32 candlepower lamp, while held in the hand, the current passing through the body, the wire from the central terminal being held several inches from the machine. Also the passing of a current of electrical sparks from six to eight inches long, requiring a current of up to three-quarters of an ampere with a pressure of from 250,000 to 300,000 volts; the momentary dissipation of energy being at the rate of 500 to 600 horsepower. When it is taken into consideration that only one-tenth ampere at 2,300 volts, at ordinary frequency, is used in the execution of criminals in the United States, the difference between the low and high frequency currents is manifest. Suggested reasons for this partial immunization is that the latter currents tend to remain on the surface of an object, and that the rate of vibration is beyond the capacity of the nerves to respond to. Mr. Vaughan plans on repeating the demonstration at the General Professional Meeting next fall.

At a previous meeting another interesting paper was read by G. S. Macdonald, A.M.E.I.C., Resident Engineer of the Marine & Fisheries Department in this district, on Aids to Navigation in New Brunswick Waters. Mr. Macdonald described the different types of lighthouses, foghorns and buoys, and dealt with the development of the various oil and acetylene burning lamps, with different types of lens, prisms and reflectors attached to both the stationary and flashing lamps. There were, he said, three types of foghorns, the old fashioned steam whistle; the trumpet type, operated by a stream of air acting on a vibratory lip; and the new diaphone type operated by a rapid series of gusts of air blown through slots in the inner circumference of the horn. The diaphone can be heard several miles farther than the other types of the same size. By use of gasoline or oil engines and air compressors, the cost of foghorn operation has been reduced to about one-sixth the cost of the steam whistle.

A marked improvement in buoys has taken place in recent years. Many are lighted by acetylene generated from carbide, but the latest types are operated by compressed gas in cylinders, and will burn for over a year without attention. Some of these are now equipped with light operated automatic valves which shut off the main light during the daylight period, leaving only the small pilot flame burning.

An interesting discussion on the behaviour of the concrete of the various structures described by Mr. Macdonald brought the meeting to a close.

Toronto Branch

W. S. Harvey, A.M.E.I.C., Sec'y-Treas.

A special general meeting of the Toronto Branch was held in the lecture room of the Engineers' Club on June 12th. This meeting was called by special request from several of the younger members of the Branch to continue the discussion of the Draft Bill of the proposed legislation.

Clause 7 (i), dealing with assistants working under a professional engineer, appeared to be the principal clause in the Bill to which objection was taken. J. C. Krumm, A.M.E.I.C., expressed the view that if the Bill were passed with Clause 7 (i) in its present wording it would mean that all engineers other than chiefs of departments would not be considered as professional engineers. H. A. Goldman, Jr. E.I.C., stated that Clause 7 (i) has been defended by some engineers on the ground that other professions do not require assistants to be professional men. He argued such defence cannot be admitted, the very nature of the engineering profession and the magnitude of the engineering organizations not permitting it to be handled in the same way as, for instance, the legal or medical professions. It must be realized that the engineering profession differs from the others in this respect, that while the great majority in the case of the other professions are in private practice dealing directly with the public, in engineering, the great majority are salaried men reporting to superiors and, therefore, any Bill passed on behalf of engineers should be to the benefit of the majority. He believed that in the future greater recognition will have to be given by our engineering societies to the salaried engineer than has been the case in the past. He drew attention to the fact that even the code of ethics of *The Engineering Institute* does not contain a single clause which would apply to a salaried engineer. This was the opinion of those who took part in the discussion.

Frank Barber, A.M.E.I.C., thought that the Bill in its present form does not exclude all salaried engineers from becoming professional engineers.

Willis Chipman, M.E.I.C., read several letters from the members of the Legislation Committee stating that young graduates cannot expect to be considered professional engineers immediately upon graduation. E. T. Wilkie, M.E.I.C., believed that the Committee deserved considerable credit for drafting this Bill, and is of the opinion that it should be supported.

It was moved by J. C. N. B. Krumm, A.M.E.I.C., seconded by Frank Barber, A.M.E.I.C., and carried—"that a committee of five members be elected to carefully consider the Draft Bill, in detail, and to submit recommendations at a general meeting to be called at a later date for that purpose; the committee to meet weekly." The following members were nominated to this committee:—W. Chipman, M.E.I.C., convener; Professor H. E. T. Haultain, M.E.I.C., T. H. Hogg, A.M.E.I.C., J. C. N. B. Krumm, A.M.E.I.C., and H. A. Goldman, Jr. E.I.C.

* * *

Brigadier General Charles Hamilton Mitchell, C.B., C.M.G., D.S.O., after a most distinguished career in France and Italy, having returned to Toronto, was entertained at an informal dinner by the Engineers' Club and *The Engineering Institute of Canada* on the 17th instant, and was given a very hearty welcome home.

* * *

An employment bureau has been appointed in connection with this Branch for the purpose of bringing the members in touch with vacancies in the engineering profession and to assist engineers seeking advancement. The members are asked to notify the Secretary of The Employment Bureau Committee of any vacancies or possible vacancies which come to their notice.

Hamilton Branch

C. F. Whitton, A.M.E.I.C., Sec'y.-Treas.

The Annual Meeting of the Hamilton Branch was held on May 30th. Though one of the newer Branches of *The Institute*, it is nevertheless in a very flourishing condition. The officers elected for the coming year are as follows:—

Chairman	R. K. Palmer, M.E.I.C.
Sec'y.-Treas	C. F. Whitton, A.M.E.I.C.
Executive	E. H. Darling, M.E.I.C.
	J. A. McFarlane, A.M.E.I.C.

Niagara Peninsula Branch

R. P. Johnson, S.E.I.C., Sec'y.-Treas.

A meeting was held at the Engineers' Club, Thorold, on June 12th, 1919, for the purpose of discussing the Act Respecting the Engineering Profession prepared by the Special Legislation Committee, when E. R. Gray, A.M.E.I.C., Chairman of the Hamilton Branch and member of the Special Legislation Committee, outlined the history and context of the Draft Bill. Mr. Gray told of the work of the Special Legislation Committee and of some of the problems confronting them. He explained that the Committee had considered that it would be necessary to form an association of engineers in each province in order to administer the Act in an impartial manner, these provincial associations to be in no way connected with *The Engineering Institute.* This scheme was considered necessary in order to obtain the co-operation of The Canadian Mining Institute and other technical bodies in Canada.

The Draft Bill was then gone over by Mr. Gray, clause by clause, and various points explained and discussed in order of occurrence as follows:—

Section (7)—Clause (e):—

In view of the fact that each provincial association would be at liberty to revise the draft, or any other bill, the question arose as to whether one provincial association might exclude engineers of another provincial association. After some discussion it was decided that there was no way to prevent this, but the consensus of opinion was that this would be so manifestly injurious to the profession that no such situation would ever arise.

Section (7)—Clause (f):—

This concerns American and foreign engineers employed or practicing in Canada.

Some members thought that all foreign engineers should not be excluded from Canada and that, in some cases, it would be extremely difficult to do this, as for instance, the M.C.R. engineers with headquarters at St. Thomas, Ont.

The opinion was expressed that this clause would react upon Canadian engineers in the States. The opinion was expressed that clause (i)—Section (7), left the junior field open to foreign engineers in Canada as it proposed that the act should apply only to chief engineers, consulting engineers and engineers in private practice.

The question arose as to the meaning of the term *resident* as used in the clause.

The acting chairman called for a show of hands as to whether the clause was satisfactory as it stood or should be amended. Four members expressed satisfaction with the clause as drafted. The large majority of those present believed that the term *resident* must be defined before the meaning of the clause is clear.

Section (7)—Clause (i):—

This clause, concerning those to whom the act should apply, provoked considerable discussion and dissatisfaction.

Almost unanimous exception was taken to the clause on account of the narrow application of those to whom the act would apply. As it stands, the clause makes the bill apply to only chief engineers, consulting engineers and engineers in private practice.

The point was made that all members of any one provincial association should come within the application of the Bill.

It was the opinion of the majority of those present that the meaning which was manifestly conveyed in the clause was not intended by the committee which drew the Bill and this belief was confirmed when Mr. Gray explained that the clause was designed only for the purpose of providing that extreme juniors, such as rodmen and chainmen, might be employed on an engineering staff without the necessity of taking membership in the provincial association of engineers.

The suggestion was made that the word *responsibility* used in the clause should be defined and that the difficulty would then be cleared up.

Some members thought that the clause under discussion conflicted with clause (b)—Section 2. The latter set forth the qualifications required of a professional engineer and the former set severe limitations upon those who should be legally constituted professional engineers and is based upon position rather than qualifications.

The suggestion was made that those not intended to come under the Bill should be defined but it was pointed out by Mr. Gray that this would be extremely difficult on account of the great variety of the minor engineering employees.

Some members thought that the clause would be satisfactory if the following words were eliminated :—"other than to their direct superiors."

It was, however, moved by E. P. Johnson, A.M.E.I.C., seconded by F. S. Lazier, A.M.E.I.C., and carried, that:—"in the opinion of the Niagara Peninsula Branch of *The Engineering Institute of Canada* clause (*i*) of Section (7) should be struck out of the Bill."

Saskatchewan Branch

J. N. deStein, M.E.I.C., Sec'y.-Treas.

The third Annual Summer Meeting of the Saskatchewan Branch was held on Saturday, June 21st, at Regina, the preceeding two meetings having taken place at Moose Jaw (1917), and Saskatoon (1918). The date was set this year to coincide with the promised visit of Brigadier General Sir Alexander Bertram, K.B., M.E.I.C., and our members were very disappointed to hear that General Bertram was prevented from joining our General Secretary, Fraser S. Keith, A.M.E.I.C., on his Western trip.

Our Branch has had the privilege of welcoming Mr. Keith at every one of our summer meetings, and the reception committee was present at the station this year, and gave Mr. Keith a very hearty welcome. A luncheon at the Parliament Buildings opened the programme for the day which was followed by an inspection of the buildings, and later by a visit to the Imperial Oil Company's plant, the City power house, and other places of interest. A dinner was served in the evening at which a large number of members were present. Among the guests of the evening were, Hon. W. M. Martin, Premier of Saskatchewan; Col. J. A. Cross, D.S.O., O.C., M.D. No. 12; Col. J. L. R. Parsons, C.M.G., D.S.O., etc; and D. M. Balfour, President of the local Board of Trade. The dinner was followed by a short business meeting, after which a number of the guests delivered addresses.

The Hon. W. M. Martin spoke on proposed legislation and stated that he could not see any reason why engineers should not be protected by legislation, and promised the earnest consideration of his government whenever we deemed it expedient to approach them in this matter.

Mr. Keith gave a short outline of the activities of *The Institute* and of its splendid organization, which is being taken as a model in other countries, and expressed great satisfaction that the government of this Province recognizes the services of the engineer. He also spoke on the subjects of legislation, remuneration and the strained relations existing between capital and labor, and expressed his belief that the engineer is, by virtue of his training, pre-eminently fitted to settle this dispute.

Colonel Cross urged that immediate steps be taken for the betterment of the profession, which he described as one of the most valuable national assets. He was anxious, he said, to see Saskatchewan develop from a shipper of raw material to a manufacturing province, which could be done with the co-operation of the engineering profession.

Colonel Parsons dwelt upon the work done by the Canadian Engineers in the overseas corps, and the great and valuable assistance given by them to the Allies.

Mr. Balfour then addressed the meeting and promised the hearty co-operation of the Board of Trade.

The Chairman, H. S. Carpenter, A.M.E.I.C., extended a hearty welcome home from overseas to Major A. J. McPherson, A.M.E.I.C., Major W. T. Daniel, A.M.E.I.C., Captain R. H. Murray, A.M.E.I.C., Captain H. J. McBean, A.M.E.I.C., and Lieut. Wm. Longworthy, S.E.I.C.

Calgary Branch

C. M. Arnold, M.E.I.C., Sec'y.-Treas.

A meeting of the Executive Committee was held at the Board of Trade rooms at 8.30 P.M., on May 8th, 1919.

The tentative programme of the summer meeting at Edmonton was read by G. N. Houston, M.E.I.C., and was then discussed. It was decided to appoint a committee consisting of G. W. Craig, M.E.I.C., G. N. Houston, M.E.I.C., and C. M. Arnold, M.E.I.C., to act in conjunction with the Edmonton Branch in arranging the final programme. On the suggestion of A. S. Dawson, M.E.I.C., it was arranged to send invitations to the Mining Institute and other allied organizations, and on the suggestion of F. H. Peters, M.E.I.C., the meeting decided to extend an invitation to Sir Alexander Bertram, who would be present at the meeting, to give an address. C. M. Arnold, M.E.I.C., suggested that a paper bearing on the economic side of Irrigation would be of particular interest at the present moment in view of the prevalent skepticism regarding its benefits. The special committee was asked to deal with these matters when considering the final programme.

* * *

A general meeting of the Branch was held on May 15th, 1919, at the Board of Trade rooms, when a very interesting paper was contributed by G. W. Craig, M.E.I.C., and A. S. Chapman, A.M.E.I.C., dealing with the latest developments in Sewage Disposal and was followed by an active discussion.

Vancouver Branch

A. G. Dalzell, A.M.E.I.C., Sec'y-Treas.

The following members were elected to the offices noted at the Annual Meeting:—Chairman, E. G. Matheson; Vice-Chairman, Newton J. Ker; Secretary-Treasurer, A. G. Dalzell; Acting Secretary-Treasurer, C. Brakenridge; Executive Committee, C. Brakenridge, Major W. G. Swan, D.S.O., Major G. A. Walkem, Wm. Anderson.

The following resolution was passed at our last general meeting on Friday, June 13th:—

"At a well attended gathering of professional engineers called by the Executive Committee of the Vancouver Branch of *The Engineering Institute of Canada*, formerly known as the Canadian Society of Civil Engineers, to discuss the attitude to be adopted by the Vancouver Branch in reference to the present industrial situation, the following resolution was heartily endorsed:—

'We, the members of the Vancouver Branch of *The Engineering Institute of Canada* absolutely condemn the sympathetic strike now in progress in the city of Vancouver as being opposed to the true interests of the labouring men, as being opposed to to all the teachings of true unionism and as being absolutely antagonistic to the best interests of the community and that we as a body do pledge ourselves to give our support to the Civic and other authorities if called upon and we offer our services as engineers to assist in keeping the public utilities in operation or to do any other work which may help to protect the lives and food supply of the citizens.' "

Personals

G. H. Duggan, M.E.I.C., past president of *The Engineering Institute of Canada*, has been elected a Director of The Steel Company of Canada.

*

Lieut. J. D. McBeath, A.M.E.I.C., who recently returned from overseas, has been appointed Assistant City Engineer, of Moncton, N.B.

*

J. C. Ball, A.M.E.I.C., has returned from the front and rejoined the staff of the Welland Ship Canal on Section No. 3 at Thorold.

*

C. Collingwood, A.M.E.I.C., has recently returned from overseas. Mr. Collingwood served with the 12th Canadian Railway Troops in France.

*

F. W. Teele, M.E.I.C., has been appointed General Manager, of the Mexican Light & Power Company, Mexico Tramway Co., and allied interests of Mexico City.

*

L. C. Dupuis, Jr., E.I.C., has been appointed Division Engineer, Saguenay Division, Canadian National Railways, with headquarters at Quebec.

*

E. P. Muntz, S.E.I.C., has just returned from the front and rejoined the staff of the Welland Ship Canal on Section No. 2.

*

H. H. Vaughan, M.E.I.C., Past President of *The Engineering Institute of Canada* has been elected a Director of The Armstrong-Whitworth Company.

*

C. H. N. Connell, A.M.E.I.C., has been appointed District Engineer of the Montreal and Saguenay Division of the Canadian National Railways, with headquarters at Quebec.

Eugene W. Stern, M.E.I.C., late Major of Engineers in the United States Army has returned from France and has resumed his practice as consulting engineer with offices at 156 West 45th Street, New York.

*

A. J. Gayfer, M.E.I.C., returned from France on April 8th and has been placed on the retired list with the rank of Major. Mr. Gayfer has been appointed Divisional Engineer of Construction, Canadian National Railways, Hanna, Alta.

*

Lieut.-Col. Blair Ripley, D.S.O., M.E.I.C., who returned to Canada about two months ago and resumed his position with the Canadian Pacific Railway Company, has recently received further recognition of the splendid services he rendered with the Canadian Railway Troops in France by having bestowed upon him the title, Commander of the British Empire.

*

T. Linsey Crossley, A.M.E.I.C., who has been associated for a number of years with Doctor J. T. Donald, of Montreal, and who established the Toronto laboratory of J. T. Donald and Company, consulting chemists, has taken over the Toronto office and laboratory of that firm at 43 Scott Street, and will there carry on the business of consulting chemist and chemical engineer.

*

J. E. Pringle, B.A.Sc., S.E.I.C., has returned to Canada after service in the Canadian Army with the Queen Victoria's Own Sappers and Miners, having seen service both in India and Palestine. In both of these countries he was engaged in engineering work and in Palestine the work of the engineers was devoted largely to water development and securing a constant supply for British purposes.

Captain E. A. Earl, R.E., A.M.E.I.C., who previous to the war was engaged in private practice in Vancouver, and who joined the Canadian Engineers in October 1914, has gone to Vladivostok in the capacity of Army Interpreter. Captain Earl was commissioned in January, 1916, and spent two years in France with the 84th Field Company, R.E. He was wounded in June, 1916, and again in February, 1918. In May, 1918, he was appointed an instructor in engineering, which position he still held on leaving for Vladivostok.

*

Robert L. C. Pinget, A.M.E.I.C., has lately returned from France. Lieutenant Pinget left Canada early in 1914 and was demobilized about two months ago. He won the Croix de Guerre and 5 "citations" from the French Government and the Cross of St. John of Jerusalem from the English Government. He is returning to France but he wishes to keep his connection with *The Institute*. His address will be:

ROBERT PINGET,
17, rue de l'Yvette,
PARIS, 16ième, France.

*

Lieut.-Col. H. J. Lamb, D.S.O., M.E.I.C., who recently returned from overseas has been promoted to the position of Supervising Engineer for the Province of Ontario, in which capacity he will supervise all harbours and rivers in Ontario, with offices in the Equity Chambers, Adelaide Street, Toronto. Colonel Lamb has been

Lieut.-Col. H. J. Lamb, D.S.O., M.E.I.C.

nineteen years with the Government and during the construction of the international tunnel under the Detroit River he represented the Dominion Government as Engineer-in-Charge. An account of Colonel Lamb's military career appeared in the June issue of *The Journal.*

Lieut.-Col. H. L. Trotter, D.S.O., A.M.E.I.C., Officer Commanding the 11th Battalion of Canadian Engineers, arrived with his battalion, on board the liner Olympic, in Halifax on June 11th. Colonel Trotter has had a remarkable career at the front and has brought distinction to himself, his country and his profession.

Lt.-Col. H. L. Trotter, D.S.O., A.M.E.I.C.,
Comanding 11th Battalion,
Canadian Engineers, B.E.F.

The following are some of the engagements in which the 11th Canadian Engineers participated:—The Somme, Sept. to Nov., 1916; Desire Trench, Nov. 17th and 18th, 1916; Vimy Ridge, April 9th to 13th, 1917; Arleux and Fresnoy, April 28th to 30th, 1917; Lens, begun June 11th, 1917; Hill 70, August 15th; Passchendaele, Oct. 25th to Nov. 10th, 1917; second battle of the Somme, March and April 1918; Arras, August 26th-28th; Queant-Drocourt Line, Sept. 3rd-5th; Canal du Nord, Sept. 27th-29th; Denain, Oct. 20th; Valenciennes, Oct. 25th-Nov. 2nd; advance towards Mons, Nov. 11th. The Battalion greatly distinguished itself at Canal du Nord.

The Institute extends to Colonel Trotter a very hearty welcome home.

*

Gordon L. Shanks, A.M.E.I.C., has returned to Canada on the *Royal George*, which arrived at Halifax on June 17th. Mr. Shanks enlisted with the Canadians in 1917, and was later transferred to the Royal Engineers, with which unit he took the road engineering cadet course at Newark and obtained his commission in November 1917. He went to France with G. H. Q. on the strength of the Inundation Section of the R. E., on water defence schemes. Until October 1918 he was attached to the Canadian Headquarters' Staff under

General Lindsay as laison officer on canal work, locks and floods on the Scarpe and Escaut Rivers. After the armistice was signed Mr. Shanks was on the staff engaged in canal reconstruction in British areas.

*

It is gratifying to note that so many of the younger engineers returning from overseas are losing no time in applying for admission to *The Institute*.

Among recent applications are those of Major Harvey W. L. Doane, son of Major F. W. W. Doane, M.E.I.C. Major Harvey Doane was one of the organizers of the famous 10th Siege Battery. He crossed with a draft to England and, unable to get to France, immediately transferred to the Imperial forces. His promotion was rapid and he was sent to Egypt as O. C. 420th Siege Battery. He is at present assistant to the City Engineer of Halifax.

Another applicant is Capt. F. H. Palmer, M.C. He also was one of the organizers of the 10th Siege Battery, and after accompanying his battery to England he reverted to the rank of Lieutenant in order to get to France, and was in the thick of the heavy fighting. He is at present connected with the Nova Scotia Highway Board.

*

Prof. H. E. T. Haultain, M.E.I.C., of Toronto University, was recently presented with a touring car by five hundred members of his vocational staff at the Armoury on the occasion of his retirement from the position of Vocational Officer for Ontario. The presentation was made the occasion of a striking tribute from those who had worked under the Professor and who expressed their keen regret that his active connection with the Ontario Vocational Branch of the Department of Soldiers' Civil Re-Establishment had terminated. It was pointed out that over 92 per cent of the male vocational staff in Ontario were returned officers and men, who had learned to look on the retiring chief as a personal friend.

In presenting the car on behalf of the members of the Ontario Vocational Branch, D. D. Eppes, head of the After-Care Department for Ontario, emphasized that Professor Haultain had earned the confidence of the disabled soldier and the respect and affection of his own subordinates. The speaker recalled that the retiring vocational officer had entered the retraining movement in its early days and had seen it grow to its present-day tremendous proportions. He paid tribute to the part the Professor had played in the development of the retraining movement and lauded his sympathetic handling of the returned men. The staff also presented a gold wrist watch to Professor Haultain's little daughter, and a bouquet of roses to Mrs. Haultain.

Professor Haultain, who was taken completely by surprise, accepted the presentation with a few suitable words.

Professor H. E. T. Haultain, M.E.I.C.

OBITUARY

Ernest Marceau, B.Ap.Sc. M.E.I.C., Past President of The Institute.

The engineering profession lost one of its noted members on May 24th in the death, at his home at Sault aux Recollets, of Ernest Marceau who for the past twenty-five years had occupied a prominent place in its activities.

Mr. Marceau was born at Danville, Que., on December 2nd, 1852, and graduated from the Ecole-

Late Ernest Marceau, B.Ap.Sc., M.E.I.C.
Past President,
The Engineering Institute of Canada.

Polytechnique of Montreal, with honors, in 1877. During his entire engineering career he has been associated with the canals of Eastern Canada, and for the greater portion of that time he has been Superintending Engineer of Canals in the Province of Quebec.

During the years 1897, 1898 and 1899, Mr. Marceau was a Member of Council, in 1901 he was elected Vice-President for three years, in 1905 he was elected President, and in 1909 was appointed Treasurer of *The Institute*, which office he held at the time of his death. The Gzowski Medal was awarded to Mr. Marceau in 1901 for his paper on the Carillon Canal, Dam and Slide.

Mr. Marceau was a member of La Société des Ingénieurs Civils de France. In 1904 he was appointed head of the Ecole Polytechnique of Montreal, and in 1909 went to Europe to engage professors for this institution, now associated with Laval University, in which institution Mr. Marceau was professor of industrial economy. Besides his professional and educational activities, he devoted some time to literature and was a contributor to foreign as well as home periodicals.

In 1879 Mr. Marceau married Miss Elzine Tassé, daughter of the late Dr. F. Z. Tassé, of St. Vincent de Paul, who died in 1909. He had been in weakened health for some years and his death will be regretted by a large circle of professional and personal friends by whom he was held in deserved respect.

The President and Council of *The Institute* sent a floral wreath, and *The Institute* was represented at the funeral by a large number of Members.

Employment Bureau

Situations Vacant

Civil Service

The Civil Service Commission of Canada hereby gives public notice that applications will be received from persons qualified to fill the following positions in the Civil Service of Canada:—

A Seismologist for Dominion Astronomical Observatory, Salary $2,000 per Annum.

1. A Seismologist for the Dominion Astronomical Observatory, Department of the Interior, at an initial salary of $2,000 per annum.

Duties: To perform research work in seismology under direction, in connection with the work of the Dominion Astronomical Observatory; to take readings of seismological instruments and maintain such instruments in efficient working condition; to record, compare, compute, and prepare such readings and the results of seismological research for publication; to correlate microseisms and weather conditions; to test seismological instruments; to carry on investigations with reference to the interior of the earth; and to perform other related work as required.

Qualifications: Graduation from a university of recognized standing with specialization in mathematics and physics; at least three years of experience with physical apparatus and instruments; a knowledge of modern languages is desirable.

Applications for this position will be received until July the 2nd.

An Assistant Astronomer for the Dominion Astronomical Observatory. Salary $1,800 per Annum.

2. An Assistant Astronomer for the Dominion Astronomical Observatory, Department of the Interior, at a salary of $1,800 per annum.

Duties: To assist, under direction of an Astronomer in making telescopic observations for the determination of time, latitude, longitude, and star positions; to assist in research work in solar physics, spectros-copy, and other astronomical and astrophysical work; to make necessary computations in connection with such observations; to assist in comparing and regulating primary clocks of the time service; and to perform other related astronomical and mathematical work as required.

Qualifications: Graduation from a university of recognized standing, with specialization in astronomy, mathematics and physics; at least three years of experience as an observer or as a post-graduate student in astronomical research; exactitude; steady nerves; good eyesight.

Application forms properly filled in. must be filed in the office of the Civil Service Commission not later than June 26th.

* * *

A Power Plant Superintendent, Salary **$200** *to* **$230** *per month.*

3. A Power Plant Superintendent for the power plant at the new Champlain Dry Dock at Lauzon, P.Q., Department of Public Works, at a salary of $200 to $230 per month; to have charge of a steam-electric generating plant; to supervise the employees engaged in operating the plant and the necessary maintenance and repair work; and to perform other related work as required; to supervise the operation, repair and maintenance of steam boilers of different types, automatic stokers, feed pumps, valves, steam turbines, alternating and D. C. generators and motors, electrical controlling apparatus, centrifugal pumps, automatic high pressure valves and other mechanical and electrical equipment found in such plants.

Qualifications: Education equivalent to high school graduation; either graduation in electrical or mechanical engineering from a school of Applied Science of recognized standing with three years of experience with large steam-electric power plants, two years of which shall have been in a position of professional responsibility; or five years of experience in large steam-electric power plants, two years of which shall have been in a position of professional responsibility; a thorough knowledge of the production of electricity by steam power and of the various equipment used in such work ; tact, good judgment and ability to manage men. Applicants must be residents of the Province of Quebec.

Application forms properly filled in, must be filed in the office of the Civil Service Commission not later than June 26th.

General Directions.

Selections for eligible lists of applicants qualified to fill similar vacancies which may occur in future may be made from applications for these positions.

According to law, preference is given to returned soldier applicants, possessing the minimum qualifications. Returned soldier applicants should furnish a certified copy of their discharge certificate, or, in the case of Commissioned Officers, a certified statement of their services.

Application forms may be obtained from the Dominion-Provincial Employment Officer, or the Secretary of the Civil Service Commission, Ottawa.

By order of the Commission,

WM. FORAN, Secretary.

Mechanical Draughtsman

Mechanical Draftsmen wanted, Box 44.

Drawing Instructor

Assistant instructor of engineering and architectural drawing wanted for the Ottawa Vocational School of the Soldiers' Civil Re-Establishment. Returned soldier preferred. Apply H. Etches, Architectural drawing instructor, Soldier' Aid Commission, 327 Wellington Street, Ottawa.

Teacher

Teacher of Physics and Chemistry wanted for Montreal Technical School, duties to commence in September next. Salary $1500 per year. Apply to Mr. McLeish, 1015 Decarie Blvd., N. D. G.

Railway Engineer snd Surveyor

J. C. Broderick, Engineer, 402 Transportation Bldg., Main 8773, requires an experienced engineer and surveyor for railway location work. The Rouge River Railway Co.

Locating Engineer

Engineer and surveyor experienced on railway location work required to locate a new line of railway near the Ottawa. Box 43.

Highway Supervisor

Returned soldier, preferably an engineering graduate, wanted for highway supervision. At present the position is temporary but may lead to permananence. Salary $125 per month. Box No. 42.

Designing Draftsman

Thoroughly competent draftsman for general civil engineering and construction work, capable of designing both steel and concrete to work under the chief draftsman of a large corporation. Address Box 41.

Situations Wanted

Mechanical Engineer

McGill graduate desires position with industrial firm. Good practical and technical knowledge of steam plants and ability for industrial organization. Box 6 P.

Municipal Engineer

Lieut. C. E. (Reserve), A.M.E.I.C., is desirous of securing a position as municipal engineer. Has had splendid contracting, railroad and general engineering experience. Apply Box 4 P.

Mechanical Engineer

Mechanical engineer as general or mechanical superintendent A-1 mechanic, technical graduate, twenty-five years in mechanical industries, steam and petrol marine engines, weaving machinery, reciprocating and centrifugal pumps, fundry practice; sixteen years in electrical machinery construction, good tool designer, and thoroughly up-to-date in every phase of manufacturing. Box 7 P.

Newfounland Railways

The Reid-Newfoundland Company which operates the Newfoundland Railway under contract with the Government, has had one of the most successful years in its history, both from the standpoint of freight and passenger traffic.

When in 1875 the idea of constructing a railway in Newfoundland first assumed shape, a survey was made from St. John's to St. George's Bay by the late Sir Sanford Fleming with the intention of building a railway system across Canada with St. John's, Nfld., as the eastern sea port terminal.

In those early days, even the most optimistic Newfoundlander did not think the railway would be anything more than a line of steel that would help to open the natural resources of the Colony; hence a narrow guage road was deemed adequate for all requirements.

In recent years, however, that narrow guage railway with its light rails, has been forced to carry more traffic than was ever dreamed of by the originators of the scheme. It is hard pressed with its present rolling stock to handle the increased volume of freight, for in the year 1918 it carried approximately 53,000 tons, as compared with 21,000 tons in 1914; that is, more than two and a half times the volume in 1918, as compared with 1914. The surplus not handled by the railway which amounted to 1325 car loads, which are twice as big as the Newfoundland car loads, had to be taken from Halifax and Sydney, Canada, by sea to Newfoundland. A daily railway express service has been run across Newfoundland, in order to cope with the passenger traffic. Thus it has been that freight and passenger records have more than doubled during the past four years and the indications are that a radical change will soon have to be made in the road-bed of the railway itself to accommodate the travelling public and the increasing trade of the Colony.

When the railway was built the contract called for 25 ton locomotives. The Reid-Newfoundland Company found several years ago that it was necessary to have 65 ton engines to do the work, yet this increased weight in rolling stock was imposed on a road-bed and a rail that were originally laid down to do not more than 20% of the traffic that has been done yearly during the past four years.

It is prophesied that the trade of Canada and Newfoundland, which in 1918 had a value to Canada of $11,000,000, will continue to grow in the future and that passenger traffic will also increase. These facts point to the necessity of improvement in the railway rolling stock and road-bed, in order to bring them up to modern requirements.

Judge F. J. Morris, of the Court of Inquiry, that investigated the railway accident that took place in September 23rd, 1918, in a written judgment just published, recommends to the Government of Newfoundland that they relay the railway.

Preliminary Notice

of Application for Admission and for Transfer

20th June, 1919.

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in July, 1919.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows:—

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course. In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineers' office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the following branches at his option Railway, Municipal, Hydraulic, Mechanical, Mining, or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five years or more years.

Every candidate for election as JUNIOR shall be at least twenty-one years of age, and must have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-five years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects Geography, History (that of Canada in particular), Arithmetic, Geometry Euclid (Books I.-IV. and VI.), Trigonometry, Algebra up to and including quadratic equations.

Every candidate for election as ASSOCIATE shall be one who by his pursuits, scientific acquirements, or practical experience is qualified to co-operate with engineers in the advancement of professional knowledge.

> The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

AMIOT—ROMEO SADI, of Chicoutimi, P.Q. Born at New York, June 26th, 1894. Educ., 5 yrs. Rimouski Seminary, 1 yr. Poly. School. 1914, rodman, etc.; 1915, transitman and first asst., with Wm. Tremblay, P.L.S. and C.E.; 1916-17, asst. with ch. engr., Chicoutimi Pulp Co., on constrn. in connection with pulp mills; 1918-May 1919, first asst. with ch. engr., Roberval Saguenay Ry., also municipal engr., county of Chicoutimi; at present, engr. on constrn. of highway, Prov. Govt.

Monthly Engineering Index

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of the engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies may be obtained of any of the articles listed in this section.

Price of each print (up to 11 x 14 in. in size), 25 cents, plus postage. A separate print is required for each page of the larger-size periodicals, but where possible two pages will be photographed together on the same print. Bill will be mailed with the prints.

Harrisson W. Craver, Director,
Engineering Societies Library,
29 West Thirty-ninth Street, New York, N.Y.

MUNITIONS AND MILITARY ENGINEERING

Ammunition, Artillery. The Design of Artillery Ammunition and Some Recent Developments at Frankford Arsenal, J. Wallace Taylor. Jl. Engrs. Club, Philadelphia, vol. 36-4, no. 173, Apr. 1919, pp. 127-137, 8 figs. Pressure-velocity curves of a medium caliber gun; graphs showing travel of projectile against twist torque; table indicating atmospheric resistance to flight of projectile with ogival head or 2-caliber radius.

Artillery, Railway. Railway Artillery, E. D. Camphell. Jl. Engrs. Club of St. Louis, vol. 4, no. 2, Mar.-Apr. 1919, pp. 142-160, 9 figs. Historical sketch and forecast of future types.

Railway Mounted Artillery in the War. Ry. Age, vol. 66, no. 20, May 16, 1919, pp. 1205-1209. Development of mobile guns from 1863 to time of armistice with special reference to American types.

Automobile Service, French French Military Automobile Service (Le service automobile militaire française), Robert Altermann. Génie Civil, vol. 74, no. 15, Apr. 12, 1919, pp. 291-294, 3 figs. Account of its operation during the war.

Battle Cruisers. The Battle Cruiser, E. F. Eggert. U. S. Naval Inst. Proc., vol. 45, no. 5, May 1919, pp. 719-728. Suggests a type which is said to combine high speed of cruiser and fighting ability of battleship. It is to be 650 ft. long with 28 ft. draft, 20,000 tons displacement, 32 knots speed and have power of 100,000 i. hp.

Battleships. United States Battleship New Mexico, S. M. Robinson. Int. Mar. Eng., vol. 24, no. 5, May 1919, pp. 323-334, 26 figs. Description of propelling machinery; trial data.

Camouflage. A System of Camouflage for Railway Mounts, John M. Goodwin. Jl. U. S. Artillery, vol. 50, no. 3, May 1919, pp. 253-267, 14 figs. Two systems: (1) five-color system for concealment of heavy railway mounts in which great mass of solid surface must be broken up into several separate masses and shadow cast by mount must be hidden as well; (2) three-color system which consists principally in an endeavor to hide field piece by blending its form and shadow with landscape, this being accomplished by use of green, yellow and cream.

Camp Wastes. The Army's Utilization of Camp Wastes, F. C. Bamman. Mun. Jl. & Public Works, vol. 46, no. 18, May 3, 1919, pp. 322-325. Form of contract said to secure great economy in use of food, more material from which glycerine can be derived, and larger revenue.

Engineering, Italian. Notes on the Operations of the Italian Engineers, James H. England. Prof. Memoirs, Corps Engrs., U. S. Army & Engr. Dept., vol. 11, no. 5, Jan.-Feb. 1919, pp. 128-133, 5 figs. Deals with waterways and roads, the latter being designed and constructed with a view to accommodating 10-ton power trucks.

Fortifications. The Future of Permanent Fortifications, C. Beard. Prof. Memoirs, Corps of Engrs., U. S. Army & Eng. Dept., vol. 11, no. 55, Jan.-Feb. 1919, pp. 47-64. Author holds that by paying the price it will be possible in the future to construct fortifications capable of withstanding projectiles of large caliber, but remarks, quoting Napoleon, that "like cannon, fortresses are arms which alone cannot fulfill their missions."

Gas Masks. Gas Defense, Oscar E. Stevens. Stone & Webster Jl., vol. 24, no. 5, May 1919, pp. 365-371, 7 figs. Types of gas masks used by various beligerents during war.

Gun Emplacements. Notes on the Field Emplacement of a German Large Caliber Gun, G. P. Pillsbury. Professional Memoirs, Corp Engrs., U. S. Army & Engr. Dept., vol. 10, no. 54, Nov.-Dec. 1918, pp. 846-853, 3 figs. Foundation was wholly of structural steel and forged plates, no concrete being used. It had been prepared by excavating pit of required horizontal dimensions, about 7 ft. deep. No signs of overstrain were found in any part of foundation structure.

Guns, Location of. Listening for the Enemy. Sci. Am., vol. 120, no. 20, May 17, 1919, pp. 510-511, 8 figs. How a gun is located by timing its report as heard at three points.

Mining. The Work of the Miner on the Western Front, 1915-1918, H. Standish Ball. Bul. Instn. Min. & Metallurgy, no. 175, Apr. 1919, pp. 1-53, 32 figs., partly on 19 separate plates. Empirical formulæ by means of which fairly accurate calculations are said to have been made of the size and depth of the crater resulting from an explosion.

Mining in Chalk on the Western Front with Some Notes on the Explosion of Large Charges of High Explosives, L. B. Reynolds. Can. Min. Inst. bul. no. 85, May 1919, pp. 483-493, 1 fig. Diagrammatic illustration of manner in which enemy works were located.

Munitions, Canada. Canada Made a Remarkable Record in Production of Munitions, T. M. Fraser. Can. Machy., vol. 20, no. 26, Dec. 26, 1918, pp. 717-721. Imperial Munitions Board gives figures of total production in various plants.

Stokes Gun. The Stokes Gun and Shell and Their Development, Wilfred Stokes. Professional Memoirs, Corps Engrs., U. S. Army & Engrs. Dept., vol. 10, no. 54, Nov.-Dec., 1918, pp. 765-788, 24 figs. Setting-up mechanism modified by introducing modified leg of heavier design and with only half the traverse. Similar improvements made in mechanism and accessories.

MARINE ENGINEERING

AUXILIARY MACHINERY

Anchors. New Type of Anchor. Iron Age, vol. 103, no. 19, May 8, 1919, pp. 1225-1226, 4 figs. Allison cast-steel product with spoon-shaped flukes.

Compasses. The Gyro Compass. An Essential Navigation Instrument, M. R. Lott. Monthly Jl., Utah Soc. of Engrs., vol. 5, no. 2, Feb. 1919, pp. 28-41, 8 figs. Points of difference between a gyro-compass and a magnetic compass.

Electrical Auxiliaries. Merchant Marine Electrical Auxiliaries, Walter E. Thau. Jl. Am. Soc. Marine Draftsmen, vol. 5, no. 4, Jan. 1919, pp. 55-59, 5 figs. Advantages claimed for electrical appliances over steam appliances are economy, flexibility, lessening of noise and greater reliability.

Propellers. Propeller Patterns. Machy. (Lond.), vol. 14, no. 344, May 1, 1919, pp. 125-129, 8 figs. Methods of laying out propeller patterns, assembling different sections and working blades to required form.

Investigations into the Causes of Corrosion or Erosion of Propellers. Charles A. Parsons and Stanley S. Cook. Engineering, vol. 107, no. 2781, Apr. 18, 1919, pp. 515-519, 21 figs., also Shipbuilding & Shipping Rec., vol. 13, no. 16, April 17, 1919, pp. 494-495, and Engineer, vol. 127, no. 3301, Apr. 4, 1919, pp. 427-428. Result of investigation on nature of surface and state of initial stresses in blades under working conditions; impingement of water at high velocity; cavitation; water hammer produced by vortex cavities. Paper read before Instn. Naval Architects.

SHIPS

Boilers. The Work of the British Marine Engineering Design and Construction Committee, A. E. Seaton. Engineering, vol. 107, no. 2781, Apr. 18, 1919, pp. 519-522, and Shipbuilding & Shipping Rec., vol. 13, no. 16, Apr. 17, 1919, pp. 483-484. Object of committee was unification of all rules which govern design and construction of all marine machinery, especially of that pertaining to boilers. Papers read before Instn. Naval Architects.

Cast-Steel Ship. The Cast-Steel Ship Development, Myron E. Hill. Iron Age, vol. 103, no. 21, May 22, 1919, pp. 1351-1352, 2 figs. Standard units cast in sand, assembled in position and automatically welded.

Coastal Motor Boats. Coastal Motor Boats for the Navy. Engineer, vol. 127, no. 3303, Apr. 18, 1919, pp. 369-371, 3 figs. Design aimed at smallest possible dimensions consistent with carrying of torpedo, speed of at least 30 knots and full capacity for wide radius of action.

The Mysterious "C. M. B.'s" Motor Boat, vol. 16, no. 10, May 25, 1919, pp. 8-9, 4 figs. British 55-ft. coastal motor boat designed to run at high speed and to withstand hard sea work, carries two torpedoes which are discharged over stern.

Compartment Designs of Hull. Italian Two-Floodable Compartment Cargo Steamers, Salvatore Orlando. Engineering, vol. 107, no. 2782, Apr. 25, 1919, pp. 533-537, 9 figs. Design to permit keeping ship afloat after torpedo explosion, according to specifications proposed by engineers and technical men assembled in Genoa on August 18, 1917, to examine from a technical standpoint the urgent question of reconstruction of mercantile fleet and conservation of remaining vessels. Paper read before Instn. Naval Architects.

Protection of Freight Steamers (Per una maggiore difesa del naviglio de carico), Mario Taddei. Rivista Marittima, vol. 51, no. 11, Nov. 1918, pp. 187-206, 2 figs. Technical remarks on compartment designs of hull.

Electric Propulsion. Electric Drive on Merchant Ships, W. L. R. Emmet. Instn-Mar. Eng., vol. 24, no. 5, May 1919, pp. 335-337. Electric propulsion of single-screw cargo vessel proposed.

Electric Drive from a Military Point of View, S. M. Robinson. Mar. Eng. & Can. Merchant Service Guild Rev., vol. 9, no. 4, Apr. 1919, pp. 137-138. Based on technical considerations and performance of S. S. "New Mexico."

Merchant Shipbuilding. Some Recent Developments Towards a Simplification of Merchant Ship Construction, Eustace Tennyson d'Eycourt and Thomas Graham. Engineering, vol. 107, nos. 2781 & 2782, Apr. 18 & 25, 1919, pp. 503-505 and 554-556, 16 figs., also Shipbuilding & Shipping Rec., vol. 13, no. 16, Apr. 17, 1919, pp. 488-493, 17 figs. Design was intended to fulfill three conditions; (1) employment of labor unaccustomed to shipbuilding, (2) construction which would fully avail itself of such labor, and (3) process of obtaining parts of ship from various sources of supply and subsequently assembling such parts at the building berths. Paper read before Instn. Naval Architects.

MODEL EXPERIMENTS. Some Experiments on Full Cargo Ship Models, James Semple. Shipbuilding & Shipping Rec., vol. 13, no. 16, Apr. 17, 1919, pp. 495-497, 5 figs. Results of experiments made in order to determine effect on performance (1) of fullness, and (2) of longitudinal distribution of displacement. Paper read before Instn. Naval Architects.

Model Experiments on the Effect of Beam on the Resistance of Mercantile Ship Forms, J. L. Kent. Engineering, vol. 107, no. 2782, Apr. 25, 1919, pp. 550-553, 11 figs., also Shipbuilding and Shipping Rec., vol. 13, no. 16, Apr. 17, 1919, pp. 501-503. Research on effect upon resistance of change in maximum beam, carried out at William Froude National Tank. Paper read before Instn. Naval Architects.

SPEED, COST OF. On the Great Cost of High Speed, Sidney Graves Koon. Int. Mar. Eng., vol. 24, no. 5, May 1919, pp. 357-359, 1 fig. Analysis of relative costs in power for moderate increases in speed in slow- and high-speed vessels.

STABILITY OF SHIPS. Stability of Ships, George Nicol. Shipbuilding & Shipping Rec., vol. 13, no. 18, May 1, 1919, pp. 562-564, 7 figs. Method of obtaining cross curves of stability by employment of longitudinal sections. Paper read before Instn. Engrs. & Shipbuilders in Scotland.

SUBMARINE CHASERS. The 110-Foot Submarine Chasers and Eagle Boats. J. A. Furer, U. S. Naval Instn. Proc., vol. 45, no. 5, May 1919. pp. 753-767. How British Admiralty solved problem of providing effective patrol boats for war zone and for combating activity of submarine.

United States 110-Foot Submarine Chasers, R. P. Sanborn. Int. Mar. Eng., vol. 24, no. 5, May 1919, pp. 337-343, 10 figs. Construction, equipment and engineering data, also part this type of naval vessel played in the war.

SUBMARINES. Below Deck on a U-Boat, Warren O. Rogers. Power, vol. 49, no. 20, May 20. 1919, pp. 784-787, 5 figs. Notes on engine room and torpedo room.

TANKERS. The World's Largest Oil Tanker. Petroleum Times, vol. 1, no. 14, Apr. 12, 1919, pp. 289-292, 5 figs. Vessel has d.w. carrying capacity of over 18,000 tons.

TONNAGE. The Tonnage of Modern Steamships, A. T. Wall. Engineering, vol. 107, no. 2782, Apr. 25, 1919, pp. 549-550, also Shipbuilding & Shipping Rec., vol. 13, no. 16. Apr. 17, 1919, pp. 479-481. Effect of recent legislation on modern machinery on tonnage measurement. Paper read before Instn. Naval Architects.

TURBINE MACHINERY. Turbine Machinery for Standard Ships. Engineer, vol. 127, no. 3303, Apr. 18, 1919, pp. 371-373, 11 figs., partly on supp. plate. Two Turbines driving one screw propeller through toothed reduction gearing considered as most economical design because it is said that by splitting up power between two units, turbines can be designed to utilize high vacuum without making machines unduly large or adopting inconveniently high speed.

Marine Geared Turbines Have Shown Great Economy and Efficiency, William H. Easton. Marine News, vol. 5, no. 12, May 1919, pp. 110-111, 5 figs. Discussion of relative advantages of turbines and reciprocating engines.

MODERN SHIPS. 3500-Ton D. W. Auxiliary Schooners Built for France. Rudder, vol. 35, no. 5, May 1919, pp. 244-247, 5 figs Built of Oregon fir in long lengths. Machinery consists of two triple-expansion steam engines and two Roberts water-tube boilers with 1800 sq. ft. heating surface.

The Uses of Wood, Hu Maxwell. Am. Forestry, vol. 25, no. 304, Apr. 1919, pp. 973-983, 21 figs. Wooden boats and their manufacture. Twentieth article.

TERMINALS

COALING. Coaling Ships Mechanically—II, Wilbur M. Stone. Coal Trade Jl., vol. 50, no. 19, May 7, 1919, pp. 527-529, 4 figs. Trimming mechanism. driving motor and reduction gearing. Concluding article.

SHANGHAI. The Port of Shanghai, Paul Page Whitman. Pac. Mar. Rev., vol. 16, no. 5, May 1919, pp. 71-77, 17 figs. General description. Maritime customs report for 1917 shows foreign trade of this port to be a little over one-half billion dollars.

WHARF EQUIPMENT. Wharf Equipment, Roy S. MacElwee. Professional Memoirs, Corps Engrs., U. S. Army & Engr. Dept., vol. 10, no. 54, Nov.-Dec. 1918, pp. 820-840, 12 figs. Determining size of transit shed. Reference is made to conditions in several of principal ports in the world.

YARDS

BRITISH COLUMBIA. British Columbia's Part in Ship Programme A. F. Menzies. Can. Machy., vol. 20, no. 26, Dec. 26, 1918, pp. 722-729, 15 figs. Program undertaken by Imperial Munitions Board Wooden Shipbuilding Dept. report completed and to have resulted in addition of 27 wooden steamers of total d.w. capacity of over 75,000 tons.

CASTINGS. Steel Foundry to Cast Ships. E. C. Kreutzberg. Mar. Rev., vol. 49, no. 6, June 1919, pp. 269-271, 4 figs. Methods of Cast Steel Ship Corp., New York, for casting component parts of ships. Parts are afterwards permanently joined by welding.

CONCRETE CAR FLOATS. New Concrete Shipyard on Lake Erie. Int. Mar. Eng., vol. 24, no. 5, May 1919, pp. 352-356, 14 figs. Method of constructing concrete car floats.

CONCRETE SHIPYARDS, BRITISH. British Concrete Shipyards, W. Noble Twelvetrees. Engineering, vol. 107, no. 2776, Mar. 14, 1919, pp. 334-338. 21 figs. partly on separate plates. Two yards are dealt with, (1) Brentford, of limited capacity, as only one vessel not exceeding 150 ft. can be built there at a time; and (2) Rochford, equipment of which provides for simultaneous construction of three vessels up to nearly 200 ft. in length.

HOG ISLAND SHIPYARD. The Electrical Features of Hog Island Shipyard, H. W. Osgood. Jl. Engrs. Club, Philadelphia, vol. 36-5, no. 174, May 1919, pp. 165-173, 8 figs. Problem was to anticipate where and in what amount electric service would be required in yard which was expected to grow up in a few months, at a time when only partial plans were known. Paper read before Assn. Iron & Steel Elec. Engrs.

The Hog Island of Today. Pac. Mar. Rev., vol. 16, no. 5, May 1919, pp. 83-94, 21 figs. and supp. chart. Technical data of engineering features connected with design and construction of ships being built and construction and management of yard.

WELDING. Some Experiences with Electric Welding in Warships, W. H. Gard. Shipbuilding & Shipping Rec., vol. 13, no. 16, Apr. 17, 1919, pp. 485-486. Repairing cast-steel stern post of battleship and similar work carried out during the war. Paper read before Instn. Naval Architects.

Electric Welding in Ship Construction. Elec. Eng., vol. 52, no. 5, Nov. 1918, pp. 14-15. Projects and some experimental results obtained by British Admiralty.

Electric Welding, Thomas T. Heaton. Steamship, vol. 30, no. 359, May 1919, pp. 252-253. Systems applied to welding of mild steel. Paper read before Instn. Mech. Engrs.

GENERAL SCIENCE

CHEMISTRY

ABSORPTION. Absorption of Precipitates, Harry B. Weiser and J. L. Sherrick. Jl. Physical Chemistry, vol. 23, no. 4, Apr. 1919, pp. 205-252, 2 figs. Absorption of following anions by precipitated barium sulphate said to have been determined; Chloride, bromide, iodide, chlorate, permanganate, nitrate, nitrite, cyanide, sulphocyanate, ferrocyanide and ferricyanide. Order of absorption was not in accord with Schulze's law.

ANALYSIS, COKE. Precautions Necessary in Grinding Samples of Coke for Analysis, A. E. Findley. Jl. Soc. Chem. Indus., vol. 38, no. 7, Apr. 15, 1919, pp. 93T-94T. Reports that samples of coke ground in an iron mill were found to be magnetic; consequently recommends placing coke in strong linen bag and grinding it to fine powder in agate mortar.

ANALYSIS, GAS. An apparatus for the Automatic Estimation of Small Amounts of Oxygen in Combustible Gas Mixtures or of Combustible Gases in Air, H. C. Greenwood and A. T. S. Zealley. Jl. Soc. Chem. Indus., vol. 38, no. 7, Apr. 15, 1919, pp. 87T-90T. 3 figs. Principle involved is that of combustion of oxygen or impurity by means of intermittently heated platinum wire.

The Determination of Sulphites, and of Sulphur Dioxide in Gaseous Mixtures, Percy Heller. Jl. Soc. Chem. Indus., vol. 38, no. 5, Mar. 15, 1919, pp. 52T-56T. It is concluded from experimental research that the addition of 5 per cent glycerin to solutions or sulphites, or to caustic soda solutions used in absorbing sulphur dioxide, prevents any loss by spontaneous oxidation to sulphate.

ANALYSIS, PHOSPHORUS. The Estimation of Phosphorus in the Presence of Tungsten, G. Watson Gray and James Smith. Iron & Steel Inst., Ann. Meeting, May 8, & 9, 1919, no. 5, 4 pp. Method devised by writers.

ANALYSIS, STEEL. Determination of Uranium, Zirconium, Chromium, Vanadium and Aluminum in Steel—I, Charles Morris Johnson. Chem. & Metallurgical Eng., vol. 20, no. 10, May 15, 1919, pp. 523-524, 1 fig. Method based on fact that when ammonia is added to iron in the ferrous state the unoxidized iron is first converted to double sulphate of ferrous iron and ammonium and remains in solution. Addition of ammonia forms precipitate.

COLLOIDS. The Colors of Colloids—III & IV, Wilder D. Bancroft. Jl. Physical Chemistry, vol. 23, nos. 3 & 4, Mar. & Apr. 1919, pp. 154-185 and 253-282. Rayleigh's discussion of visibility of polished surfaces; phenomena exhibiting invisibility due to uniform illumination; soap bubbles, oil or tar upon water, tempered steel, the brilliant colors of lead skimmings, Nobili's metallochrome, insects' wings, and other objects exhibiting colors of thin plates. Survey and analysis of various theories.

RUBBER. Rubber as a Colloid, D. F. Twiss. Jl. Soc. Chem. Indus., vol. 38, no. 5, Mar. 15, 1919, pp. 47T-49T and (discussion), pp. 49T-50T. Suspensoid character of rubber is deduced from its behavior in electrolytic process of separating it from latex.

SOLUBILITY. Theory of Solubility (Théorie de la solubilité), Albert Colson. Comptes rendus des séances de l'Academie des Sciences, vol. 168, no. 13, Mar. 31, 1919, pp. 681-684. Thermo-dynamic interpretation of sense of phenomenon, eutectic concentrations, angular points, etc. A formula of solubility is developed from the chemical principle established by Chesneau that the concentration of a solution varies in the same sense as the osmotic pressure.

SOLUTIONS. Sulphur as a Cryoscopic Solvent (Schwefel als kryoskopisches Losungsmittel), E. Beckmann and C. Platzmann. Zeitschrift fur anorganische & allgemeine Chemie, vol. 102, no. 3, Apr. 9, 1918, pp. 201-214. Describes results of series of tests. Adjustment of "natural" melting point; determination of cryoscopic constant; catalytic influences; some applications of cryoscopic constant to anorganic substances.

On the Determination of Boiling Points of Solutions, F. G. Cottrell. Jl. Am. Chem. Soc., vol. 41, no. 5, May 1919, pp. 721-729, 1 fig. Particulars of method described consists in placing thermometed bulb in gas phase as in the case of pure liquid and making the boiling of the liquid itself pump some of the latter mechanically in a thin film over it, thus duplicating as far as possible the same relations of gas, liquid and thermometer which ordinarily obtain in boiling-point determinations of pure substances.

ULTRA-VIOLET RAYS. Use of Ultra-Violet Rays—XXIV. Chem. Engr., vol. 27, no. 4, Apr. 1919, pp. 102 and 20 (adv.). Description of absorption spectra apparatus and ultra-violet light filters.

MATHEMATICS

BESSEL-CLIFFORD FUNCTION. The Bessel-Clifford Function, G. Greenhill. Engineering, vol. 107, no. 2776, Mar. 14, 1919, p. 334. Claims to simplify formula relating to stability, statistical and dynamical of a beam, strut or whirling shaft.

EQUATIONS. Linear Equations with Unsymmetric Systems of Coefficients, A. J. Pell. Trans. Am. Mathematical Soc., vol. 20, no. 1, Jan. 1919, pp. 23-29. Theory for linear equations in infinitely many unknowns. Method followed consists in reduction, by means of biorthogonal system, to system of linear equations with limited symmetric matrix of coefficients.

Solution of Simultaneous Linear Differential Equations and Certain Problems in Mechanics by means of D Symbol (Applications du calcul symbolique à l'intégration des équations différentielles linéaires simultanées et à la résolution de certains problèmes de mécanique), H. Vogt. Revue Générale de l'Electricité, vol. 5, no. 16, Apr. 1919, pp. 581-589. In R. G. E., vol. 2 Sept. 20 and Oct. 13, 1917, pp. 483 and 533, writer applied this system of solution to single differential equations occurring in electrotechnics; in present note application is extended to simultaneous equations and exemplified in various cases of vibratory motion and gyroscopic action.

The General Solution of the Indeterminate Equation: $Ax+By+Cz+\ldots r$, D. N. Lehmer. Proc. Nat. Acad. Sciences, vol. 5, no. 4, Apr. 1919, pp. 111-114. Treats equation in same non-tentative way that is found in continued fraction solution for two variables.

ISOMORPH. A Partial Isomorph of Trigonometry, E. T. Bell. Bul. Am. Mathematical Soc., vol. 25, no. 7, Apr. 1919, pp. 311-321. Isomorph considered as the algebra of sets and parities, and the related properties of functions.

ORTHOGONAL PROJECTION, MODEL. A New Geometrical Model for the Orthogonal Projection of the Cosines and Sines of Complex Angles, A. E. Kennelly. Proc. Am. Academy of Arts & Sciences, vol. 54, no. 5, Apr. 1919, pp. 371-378, 4 figs. on separate plates. Three-dimensional structure constructed to permit verification of sines and cosines of complex angles by two successive orthogonal projections on to X-Y plane, one projection being made from a rectangular hyperbola, and the other from a circle selected among a theoretically infinite number of non-coplanar circles, all concentric at origin.

TRIAD SYSTEM TRAINS. The Trains for the 36 Groupless Triad Systems on 15 Elements, Louise D. Cummings. Bul. Am. Mathematical Soc., vol. 25, no. 7, April 1919, pp. 321-324. Triad system being regarded as an operator, covariants of that operator are deduced. These covariants are called trains or systems.

PHYSICS

ALCOHOL-WATER MIXTURES. The Determination of the Freezing-Point Curves and Densities of Denatured Alcohol-Water Mixtures, Clarke E. Davis and Mortimer T. Harvey. Jl. Indus. & Eng. Chem., vol. 11, no. 5, May 1919, pp. 443-448, 10 figs. A "zone of safety" is proclaimed for several concentrations. Tests were conducted at Chem. Eng. Lab., Columbia Univ., for the purpose of determining means of protecting radiator and cooling system of automobiles, airplanes and trucks from freezing.

DIFFRACTION FIGURES. On the Diffraction-Figures Due to an Elliptic Aperture, C. V. Raman. Physical Rev., vol. 13, no. 4, Apr. 1919, pp. 259-260, 2 figs. on supp. page. Transition from Fresnel to Fraunhofer class of diffraction figure is traced and attention drawn to geometric law to which pattern conforms.

DIAMOND, DISPERSION OF. On the Dispersion of Diamond, L. Silberstein. Lond., Edinburgh, and Dublin Phil. Mag., vol. 37, no. 220, Apr. 1919, pp. 396-406, 2 figs. Applies concept of electrical intersection of atoms (see Refractive and Atomic Interaction, Phil. Mag., vol. 33 (1017), p. 521, especially general formulæ (2), (3) on p. 522) to refractive properties of diamond considered as assemblage of fixed "atomic centers," each containing a single dispersive electron and becoming a doublet in presence of an external electric field.

ELECTRICAL ACTION, LAWS OF. On the Fundamental Law of Electrical Action, Megh Nad Saha. Lond., Edinburgh, and Dublin Phil. Mag., vol. 37, no. 220, Apr. 1919, pp. 347-371, 1 fig. Theoretical study based on electro-dynamic principles as modified by Lorents, Einstein and Minkowski according to the principle of relativity. Method followed is that of four-dimensional analysis as initiated by Minkowski in Mathematische Annalen, vol. 68, p. 472, et seq.

GYROSCOPIC FORCE OF FLUIDS. Gyroscopic Force of Fluids (Sur la force gyroscopique des fluides), E. Faure. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 8, Feb. 24, 1919, pp. 395-398. Forces in system of pipes containing a fluid when subjected to gyroscopic motion.

INOIC MOVEMENT IN ELECTRILYSIS. Movement of Ions in Electrolysis (Sul Movimento degli joni nell'elettrolisi), Carlo Del Lungo. Il nuovo cimento, Series 6, vol. 16, nos. 3-4, Sept.-Oct. 1918, pp. 173-181. Formula for velocity.

LUMINOSITY, ELECTROLYTICALLY PRODUCED. An Application of Electrolytically Produced Luminosity. Forming a Step Towards Telectroscopy, L. H. Walter. English Mechanic, vol. 109, no. 2822, Apr. 25, 1919, pp. 160-161, 1 fig. Attempting to reproduce Johnstone's experiments, writer claims to have succeeded in constructing various luminous devices out of aluminum alloys. Paper read before Roy. Soc.

MATHEMATICAL PHYSICS. Examples of Operational Methods in Mathematical Physics, T. J. I'a. Bromwich. Lond., Edinburgh, and Dublin Phil. Mag., vol. 37, no. 220, Apr. 1919, pp. 407-419, 1 fig. Heaviside's methods (Proc. Lond. Math. Soc., vol. 15, 1916, p. 401, particularly paragraph 3 and 4) to examine whether assumption of uniform rate of descent and unfirom temperature-gradient are sufficient to explain various observations recorded on thermometers carried in aeroplanes.

MATTER AND LIGHT. Matter and Light (Matière et lumière), Jean Perrin. Annales de Physique, vol. 11, Jan.-Feb. 1919, pp. 5-108. Dissociations and combinations, phosphorescence, radioactivity and changes of physical state explained by theory which represents light as immediate cause of chemical reactions and establishes fundamental law governing many physical and chemical phenomena.

PENDULUM, FOUCAULT. On the Irregularities of Motion of the Foucault Pendulum, A. C. Longden. Physical Rev., vol. 13, no. 4, Apr. 1919, pp. 241-258, 20 figs. In brief historical statement emphasis is put on current opinion that Foucault pendulum must be very long and very heavy in order to be successful. It is shown then that the elliptical motion so common in Foucault pendulum experiments is not due to insufficient length or weight, or atmospheric disturbances, but to unequal freedom of motion in different directions.

PIEZO ELECTRICITY. Piezo-Electricity and its Applications. Engineering, vol. 107, no. 2782, Apr. 25, 1919, pp. 543-544, 6 figs. Experiments exhibiting formation of electricity by pressure acting on tourmaline crystals and similar substances. Paper read before Roy. Instn.

RADIOACTIVE LEAD. The Problem of Radioactive Lead—II. Nature, vol. 103, no. 2579, Apr. 30, 1919, pp. 93-96. Comparison of two kinds of lead—the ordinary metal, in non-uraniferous ores, and that apparently produced by decomposition of uranium, radium being one of the intermediate products.

VAPOR TENSIONS OF METALS. The Vapor Tensions of the Metals, J. W. Richards. Jl., Franklin Inst., vol. 187, no. 5, May 1919, pp. 581-598, 4 figs. Vapor-tension curves, straightline equation, Trouton's rule and Richards' rule discussed in their application to physical phenomena taking place in sheardardizing and calorizing.

X-RAY SPECTRA. Researches on the X-Ray Spectra (Recherches sur les spectres des Rayons X), Alex Muller. Archives des Sciences physiques et naturelles, vol. 1, 5th period, Mar.-Apr. 1919, pp. 127-132, 2 figs. Experimental verification of law of Einstein.

RAILROAD ENGINEERING

FOREIGN

EUROPEAN TRAIN SPEEDS. European Train Speeds. Ry. Gaz., vol. 30, no. 16, Apr. 18, 1919, pp. 685-687, 2 figs. Survey of highest, longest and fastest non-stop runs, speed of trains between two places and geographical distribution of important services, Balkan States, Roumania, Germany. (Continuation of serial.)

FOREIGN DEVELOPMENTS. Railway Developments in Foreign Countries. Ry. Age, vol. 66, no. 19, May 9, 1919, pp. 1163-1164. Proposed extension in Peru; suggestions for trading with Greece; South African news.

NORWAY. Transport Conditions on Norwegian Railways During the War (Vore jaernbaners transport forhold under Krigen), Chr. Platon. Teknisk Ukeblad, vol. 66, no. 11, Mar. 14, 1919, pp. 147-156, 15 figs. Development and present conditions. Railways are state-owned. Figures indicating traffic during the war.

CONSTRUCTION

WELDING OUTFITS. Local Building of Railway Special Work with the Aid of an Oxygen-Acetylene Cutting and Welding Outfit, Montelle C. Smith. Stone & Webster Jl., vol. 24, no. 5, May 1919, pp. 402-409, 4 figs. Experience in building frogs, switchmates and switches.

ELECTRIC RAILROADS

BATTERY LOCOMOTIVES. Electric Battery Locomotives. Quarry, vol. 24, no. 267, May 1919, pp. 125-126, 1 fig. Consideration given to Brush type by Ministry of Munitions. These locomotives haul loads of three to four tons on level track.

LOCOMOTIVE DESIGN. The Progess of Electric Locomotive Design, W. B. Potter and S. T. Dodd. Ry. Age, vol. 66, no. 19, May 9, 1919, pp. 1157-1158. States that geared motors mounted directly on the axle will probably be continued for freight and slow-speed passenger work, while locomotives for high-speed passenger work, while locomotives for high-speed passenger service will be preferably of gearless design.

REGENERATIVE BRAKING. The Economics of Electric Operation of Railways, W. G. Gordon. Jl. Eng. Inst. Can., vol. 2, no. 5, May 1919, pp. 398-401. Costs of maintenance of electric locomotive for an average of five years for three railroads, an average of four years for two roads, an average of 2 years for C., M. & St. P. R.R., with figures of saving effected by regenerative braking obtained by this road.

SUBSTATIONS, RAILWAY CONVERTER. Railway Converter Substations, C. E. Lloyd. Elec. Eng., vol. 53, no. 3, Mar. 1919, pp. 108-112, 3 figs. Plan of Taggart Street substation, Pittsburgh Railways Co.

WESTINGHOUSE PNEUMATIC CONTROLLER. Westinghouse Pneumatic Controller of French Suburban Locomotives (Equipment Westinghouse pour la commande electro-pneumatique des automotrices de banlieue des chemins de fer de l'Etat), Lucien Pahin. Industrie Electrique, vol. 28, no. 644, Apr. 25, 1919, pp. 145-148, 1 fig. Scheme of connections and description of operation. (Concluded.)

ELECTRIFICATION

ELECTRIFICATION AND POLICIES. Some Possibilities of Steam Railroad Electrification as Affecting Future Policies, Calvert Townley. RR. Herald, vol. 23, no. 6, May 1919, pp. 133-135. Fundamental difference between electrification and steam propulsion. Emphasizes, among other features, practically unlimited power electricity can furnish as compared to strictly limited motive power of locomotives.

FRANCE. Partial Electrification of French Railways; Experiences Acquired in France and in Other Countries Concerning Electrification of Main Line Roads (Programme d'électrification partielle des chemins de fer français: expérience actuellement acquise en France et à l'étranger dans l'électrification des grandes lignes), A. Mauduit. Bulletin de la Société Française des Electriciens, vol. 9, no. 78, Mar. 1919, pp. 127-160, 8 figs. Figures indicating fuel economy; types of locomotives, particularly three-phase designs used in Simplon tunnel; operating practice.

IOWA. Electrification of Steam Road Results in Service and Success. Elec. Traction, vol. 15, no. 5, May 1919, pp. 290-293, 9 figs. Iowa Southern Utilities Co.'s experience.

LIMITING FACTORS. Main Line Railway Electrification. Times Eng. Supp., vol. 15, no. 534, Apr. 1919, p. 127. Some limiting factors.

LOCOMOTIVE CHARACTERISTICS. Railroad Electrification, F. H. Shepard. Jl. Eng. Inst. Can., vol. 2, no. 5, May 1919, pp. 402-406 and (discussion), pp. 406-409, 10 figs. Examples of track arrangement and details of locomotive design. Graphs indicating comparative steam- and electric-locomotive characteristics.

PANTAGRAPH SHOE DESIGN. Railroad Electrification Facts and Factors, A. J. Manson. Ry. Elec. Engr., vol. 10, no. 5, May 1919, pp. 147-149, 4 figs. Pantagraph shoe design is governed by class of service in which the locomotive operates.

PROGRESS. Steam Railroad Electrification. Calvert Townley. Elec. Eng., vol. 53, no. 4, Apr. 1919, pp. 170-172. Blames electrical men for slow progress during last 20 years.

SWISS RAILWAYS. Electrification of Swiss Railways (Die Elektrifizierung der Schweiz. Bundesbahnen), E. Huber-Stockar. Schweizerische Bauzeitung. vol. 73, no. 15, Apr. 12, 1919, pp. 174-178, 4 figs. Difficulties encountered concerning supply of labor and material. Idea of electrification was suggested and work hastened by steadily increasing shortage of coal. Description of various power stations and single-phase a. c. 15,000/60,000-volt transformer for Riton power station. (To be concluded.) Paper read before Zurcher Ingenieur & Architekten Verein.

LOCOMOTIVES

COMPARATIVE EFFICIENCIES, COMPOUND AND SIMPLE LOCOMOTIVES. Comparative Efficiency of a Compound and a Simple Locomotive Both Using Superheated Steam, C. J. Mellin. Loco. vol. 10, no. 1, May 1919, pp. 3-11, 4 figs. Diagrams worked out from investigation as to ranges in temperatures and expansion of superheated steam.

FEED WATER HEATERS. Feed Water Heaters and Their Development, J. Snowden Bell. RR. Herald, vol. 23, no. 6, May 1919, pp. 143-148, 5 figs. Forms of feed water heaters being applied in the U. S. A. by various locomotive works. (Continuation of serial.)

PULVERIZED COAL. Utilization of Pulverized Coal in Locomotives (L'emploi du charbon pulvérisé sur les locomotives), E. Lasseur. Génie Civil, vol. 74, no. 18, May 3, 1919, pp. 345-349, 7 figs. Present development of this application, notably as practiced by the Locomotive Pulverized Fuel Co., N. Y.

Pulverized Fuel Locomotive. Engineer, vol. 127, no. 330A, Apr. 25, 1919, pp. 400-402, 8 figs. on supp. plate. In order to make fire-box suitable for use of pulverized fuel, grate and ashpan were removed and two openings, each 7½ in. in diameter, were made through the water space; through these openings pulverized fuel with a certain proportion of air is injected. Apparatus located on tender and steam-driven throughout.

STANDARD LOCOMOTIVES. Standard 4-6-2 Type Locomotives. Ry. Mech. Engr., vol. 93, no. 5, May 1919, pp. 230-235, 14 figs. Locomotive is somewhat similar in its proportions to M., K. & T. locomotive, which however, has more heating surface, but a considerably smaller grate and a smaller ratio of firebox heating surface to total heating surface.

The Administration Standard Light Mountain Type. Ry. Age, vol. 66, no. 20, May 16, 1919, pp. 1193-1196, 5 figs. Weight 327,000 lb., tractive effort 53,000 lb. with factor of adhesion of 4.2.

SWISS LOCOMOTIVES. Brown-Boveri Locomotives for the Swiss Federal Railways, J. Buchli. Engineering, vol. 107, no. 2783, May 2, 1919, pp. 562-565, 12 figs. partly on supp. plate. Spur gearing and coupling rods transmit power from motor to driving axles. (To be continued.)

TANK ENGINES. 2-6-4- Tank Engine, Class K. South Eastern and Chatham Railway. Ry. Engr., vol. 40, no. 472, May 1919 pp. 102-103, 2 figs. Design drawings with dimensions.

TESTS. Locomotive Performance—IV, E. G. Young. Loco, vol. 10, no. 1, May 1919, pp. 12-17, 4 figs. Curves obtained in tests made on a Pacific-type locomotive at Pennsylvania laboratory, Altoona.

UNIFLOW. New Express Locomotive with "Uniflow" Cylinders. North Eastern Railway. Ry. Gaz., vol. 30, no. 19, May 9, 1919, pp. 801-803, 5 figs. Boiler has length of 15 ft. 10½ in. and diameter of 5 ft. 6 in.; cylinders, 16½ in. diameter by 26 in. stroke.

MAINTENANCE

CAR TRUCKS. Problems in Design and Maintenance of Car Trucks in Relation to Maintenance of Roadway, W. J. Hyman. Official Proc. Can. Ry. Club., vol. 18, no. 4, Apr. 1919, pp. 15-22 and (discussion), pp. 23-35, 3 figs. Wheel-base trucks in relation to tracks and flat spots from viewpoint of Car Department.

PROGRESS. Progress in Railroad Engineering and Maintenance, as Developed in the Annual Convention of the American Railway Engineering Association, Chicago, March, 1919, J. C. Irwin. New England RR. Club, Apr. 8. 1919, pp. 65-104. Following subjects are touched upon: Flat spots on wheels; economics of railway labor; war emergency yard improvements; umbrella vs. butterfly sheds and screw spikes.

OPERATION AND MANAGEMENT

ACCIDENT PREVENTION. The Prevention of Accidents at Railroad Grade Crossings. Proc. Pac. Ry. Club, vol. 2, no. 12, Mar. 1919, pp. 12-22. Present methods for preventing accidents were discussed as practiced in various parts of the country by different members of the club.

FUEL CONSERVATION. Reduction of Fuel Consumption on the Northern Pacific Railroad, M. A. Daly. Official Proc., N. Y. R. R. Club, vol. 29, no. 6, Apr. 18, 1919, pp. 5632-5636, also Ry. Mech. Engr., vol. 93, no. 5, May 1919, pp. 237-240, 21 figs. Fuel-instruction car employs laboratory demonstrations and moving pictures.

OIL FUEL TRIALS. Oil Fuel Trials: North Western State Railway, India. Ry. Engr., vol. 40, no. 472, May 1919, pp. 90-92, 4 figs. Reports of trials which have been in progress since 1913. Result is said to be that locomotives are to be fitted to burn 60,000 tons of oil per annum Technical paper no 193, Govt. Printing Dept., Calcutta.

PERMANENT WAY AND BUILDINGS

ABUTMENTS. Reinforced Concrete Framed Railway Abutments, Albert M. Wolf. Eng. World, vol. 14, no. 9, May 1, 1919, pp. 23-24, 3 figs. C., M. & St. P. R. R. abutments carry tracks over ends of high embankments, and instead of retaining the embankment, allow it to slope out between and around the abutment posts or piers.

GRADE CROSSINGS. Engineering Treatment of Necessary Railroad Grade Crossings, Rodman Wiley. Mun. & County Eng., vol. 56, no. 5, May 1919, pp. 191-193, 1 fig. Recommend that important crossing be well paved, paving to be level with top of rails, so as to prevent man killing his engine on track.

General Aspects of Grade Separation. Contract Rec., vol. 33, no. 19, May 7, 1919, pp. 440-443. Report issued by Division of Grade Separation and Bridges of city of Detroit. Question is viewed in its relation to city planning and cost of elevating railroads.

RAILS

WEIGHT OF RAIL AND AXLE LOAD. Relation of Weight of Rail to Axle-Load, G. Richards. Ry. Gaz., vol. 30, no. 17, Apr. 25, 1919, pp. 715-716 Reasons for scales of axle loads prescribed in "Schedules of Maximum. Minimum and Recommended Dimensions to be observed on all 5-ft. 6-in., 2-ft. 6-in. and 1-metre gauge railways in India," for 1913 and limitations for spacing of sleepers. From Roy. Engrs. Jl.

ROLLING STOCK

DRAFT GEAR. Freight Car Draft Gear Test Demonstrations. Ry. Age, vol. 66, no. 18, May 2, 1919, pp. 1097-1100, 6 figs., also Ry. Mech. Engr., vol. 93, no. 5, May 1919, pp. 249-252, 6 figs. Method of recording action under impact between cars devised by Inspection and Test Section of Division of Operation, U. S. R. R. Administration.

PERISHABLE-FOOD CARS. On the Design of Railway Wagons for the Carriage of Perishable Foods. Dept. Sci. & Indus. Research. Food Investigation Board, special report no. 1, 1919, 8 pp. Among other suggestions it is advised that doors be laid in two portions, being divided horizontally.

REFRIGERATOR CARS. Report on English Refrigerator Cars. Cold Storage & Produce Rev., vol. 22, no. 253. Apr. 17, 1919, pp. 87-90. Document from Government Research Sub-Committee. Urges among other things, that special attention be directed to airtightness, especially as regards fitting of doors.

SAFETY AND SIGNALING SYSTEMS

BLOCK SIGNALING PRACTICE. Block Signaling Practice on a British Railway. F. B. Holt and A. B. Wallis. Ry. Signal Engr., vol. 12, no. 5, May 1919, pp. 159-161, 3 figs. Electrical equipment used in signal tower on the Midland. First of series of three articles.

LOW FREQUENCY SYSTEM. Supply and Transmission for Modern Railway Signaling, A. E. Tattersall. Ry. Engr., vol. 40, no. 472, May 1919, pp. 92-95, 2 figs. Advantages of low frequency are claimed to be possibility of using standard d. c. apparatus, economy in installation, improvement of power factor and greater variation in operating values of apparatus.

REINFORCED CONCRETE APPLIANCES. Reinforced Concrete for Signal Work in England, A. C. Rose. Ry. Signal Engr., vol. 12. no. 5, May 1919, pp. 152-154, 6 figs. Types of reinforced-concrete signal and telegraph poles, stakes and other appliances.

SHOPS

DIPPING AND BAKING. Insuring Electrical Equipment by Efficient Dipping and Baking, W. G. Lamb. Elec. Traction, vol. 15, no. 5, May 1919, pp. 307-309, 5 figs. Experience with dipping and baking process of Waterloo, Cedar Falls & Northern Railway.

HALIFAX CAR REPAIR SHOPS. Car Repair Building for C. N. R. at Halifax. J. J. MacDonald. Contract Rec., vol. 33, no. 19, May 7, 1919, pp. 427-429, 5 figs. Shell of building consists of plain concrete base wall rising to level of window sills, a series of narrow wall piers between windows and reinforced-concrete entablature and parapet wall above window openings.

OMAHA CAR BARNS. New and Modern Car Barn in Omaha. Elec. Traction, vol. 15, no. 5, May 1919, pp. 293-296, 5 figs. Structure of 100 cars capacity, including single line of columns, giving maximum unobstructed floor space.

ROUNDHOUSE DESIGN. Some Modern Tendencies in Roundhouse Design, Exum M. Haas. Ry. Age., vol. 66, no. 20, May 16, 1919, pp. 1199-1201. Economy in permanent construction. Paper read before Western Soc. of Engrs.

WELDING. Welding Locomotive Drive Wheel. Welding Engr., vol. 4, no. 5, May 1919, p. 29, 3 figs. Pin was broken of flush with wheel, which was performed without removing wheel or preheating.

SPECIAL LINES

NARROW-GAGE REPAIR SHOP TRAINS. Repair Shop Train Used on Narrow Gage in Flanders. F. C. Coleman. Ry. Age, vol. 66, no. 19, May 9, 1919, pp. 1139-1140, 3 figs. Portable machine shop equipped with electric-motor-driven tools and gasoline generator sets.

STREET RAILWAYS

NEW ORLEANS. Suggested Changes in the Operation of the Street Railway System of New Orleans, W. T. Hogg. Proc. Louisiana Eng. Soc., vol. 5, no. 1, Feb. 1919, pp. 25-78, 22 figs. Analysis of present routes from viewpoint of principles said to be scientifically based on geographic relations of commercial, industrial, residential and recreative centers. Present system found inadequate and modifications are suggested.

New York. Six Years of Rapid-Transit Progress in New York, D. L. Turner. Eng. News-Rec., vol. 82, no. 18, May 1, 1919, pp. 865-869, 8 figs. Graphs showing cost of labor, comparison and work accomplished on old and new subway lines.

Rehabilitation Track Standards. Chicago Rehabilitation Track Standards Prove Successful. Elec. Ry. Jl., vol. 53, no. 18, May 3, 1919, pp. 865-869, 5 figs. Five standard types adopted in 1907 and 1909. Study made of rail corrugation as influenced by several types of construction.

Wheels and Axles. Steel-Tired Wheels and Axles, H. Vernon. Elec. Ry. Jl., vol. 53, no. 20, May 17, 1919, pp. 961-963, 7 figs. Practice at tramway sheds of Belfast, Ireland.

TERMINALS

Coaling Station, Lehigh Valley R.R. Modern Railroad Coaling Station, M. V. Bailliere. Coal Trade Jl., vol. 50, no. 19, May 17, 1919, pp. 519-520, 2 figs. Facilities provided for coaling on six different tracks in station built for Lehigh Valley R. R. at Manchester, N. Y.

D. & R. G. Freight Terminal. Novel Features in New D. & R. G. Freight Terminal. Ry. Age, vol. 66, no. 18, May 2, 1919, pp. 1083-1085, 7 figs. Facilities at Salt Lake City include two freight houses, transfer platforms and a team yard.

N. Y. C. Engine Terminal. New York Central R. R. Engine Terminal, Gardenville, N. Y. Ry. Rev., vol. 64, no. 19, May 10, 1919, pp. 677-681, 10 figs. Engine house is equipped with boiler-washing and filling apparatus, portable electric-welding equipment, hoists and trolleys for handling heavy locomotive parts, etc.

AERONAUTICS

AIRCRAFT

Lift of Airships. Lighter-than-Air Craft, T. R. Cave-Browne-Cave. Aeronautics, vol. 16, no. 285, Apr. 3, 1919, pp. 365-371, 4 figs. Technical study of factors governing variation of lift of an airship and its significance in design of envelope. Paper read before Roy. Aeronautical Soc.

Non-Rigid Airships. The Development of Airship Construction, C. I. R. Campbell. Engineer, vol. 127, no. 3303, Apr. 18, 1919, pp. 384-386, 3 figs. General dimensions and dates of three typical non-rigid airships, Zodiac, Parseval and Astra types. Paper read before Instn. Naval Architects.

Rigid Airships. Rigid Airship Design: The Tension in the Diagonal Bracing Wires, E. H. Lewitt. Aeronautics, vol. 16, no. 287, Apr. 17, 1919, pp. 402-403, 2 figs. Formula based on assumption that ship bends about a neutral axis, that longitudinal girders take the bending stresses only, while diagonal bracing wires take all the shear, and that all loads are concentrated at transverse frames.

APPLICATIONS

Air Navigation Regulations. Air Navigation, H. E. Wimperis. Flight, vol. 11, no. 19, May 8, 1919, pp. 600-604, 10 figs. Technical problems in air navigation, similar to those presented by sea navigation and manner of solving same. Paper read before Roy. Aeronautical Soc.
Air Navigation Regulations. Flight, vol. 11, no. 19, May 8, 1919, pp. 608-615, 2 figs. Legislation concerning conditions of flying, aerodromes, safety provisions, licensing of personnel, lights and signals, registration and nationality marks.

Commercial Transportation. Commercial Transportation and High-Speed Services by Air, G. Holt Thomas. Aeronautics, vol. 16, no. 287, Apr. 17, 1919, pp. 404-405. Visualizes trade conditions when "there will be no place on the earth's surface more than four days' journey from London by air."
Air Transports (Aéro-Transports), Ernest Archdeacon. L'Aérophile, vol. 27, nos. 3-4, Feb. 1-15, 1919, pp. 33-37, 3 figs. Analysis of types developed during war which indicate possibilities of commercial utilization for air service.

Latin American Republics. Aviation as a Solution of the Ecnomic and Sociological Problems of Latin American Republics (Lo que puede hacer la aviacion en pro de la solucion de los problemas economicos y sociologicos de las republicas latino-americanas), Henry Woodhouse. Flying, vol. 8, no. 4, May 1919, pp. 350-351 & 374. Argues that lack of adequate means of transportation has prevented growth of Latin America, its development by establishing air routes will solve problem.

AUXILIARY SERVICE

Air Fans. Air Fans for Driving Generators on Airplanes, G. Francis Gray, John W. Reed and P. N. Elderkin. Mech. Eng., vol. 41, no. 6, June 1919, pp. 527-530, 11 figs. Difficulty of problem in designing is represented as having been the production of fan which was turned at constant speed in air streams of widely varying speeds set up by airplane in flight. Paper for June meeting of A.S.M.E.

Navigation Apparatus. Determining True Course in Aerial Navigation (Indicateur-palonneur de route pour la navigation aérienne à l'estime), L. Dunoyer. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 14, Apr. 7, 1919, pp. 728-729. To simplify composition of triangle of velocities a system is suggested which involves placing on pilot's chart at place of departure an indicator having concentric circles whose radii are proportional to distances made under wind of 2, 4, 6 .... miles per sec., and at place terminus of voyage a similar indicator in which the radii of concentric circles are proportional to distances travelled by airplane in calm weather. Their operation is illustrated by examples.

Telephone Apparatus, Radio. Aeroplane Radio Telephone Apparatus, Edgar H. Felix. Aerial Age, vol. 9, no. 8, May 5, 1919, pp. 397-399, 10 figs. Types of microphones, headgear and generators developed by Signal Corps.

DESIGN

Aerofoil Design. Some Future Possibilities of Aerofoil Design, W. E. Astin. Flight, vol. 11, no. 16, Apr. 17, 1919, pp 506-509, 7 figs. Considers possible that rigid wings will not persist, but will in time be replaced by wings which may be of variable area, of variable angle of incidence, variable camber, or again of any suitable combination of these variables.

Commercial Engines. Machines for Commerce and Pleasure. Aeronautics, vol. 16, no. 286, Apr. 10, 1919, pp. 380-381, 3 figs. Graham White Co., Ltd., has decided on seven types: instructional machine, Bantam sporting single-seater, express air-mail machine, four-seater aero-limousine, five seater aero-limousine, 24-seater passenger machine, and Dominions-type machine.

Radius of Action. Air Mileage of Aeroplanes Intended for Long Distances and for Transport, J. Dennis Coales. Engineering, vol. 107, no. 2783, May 2, 1919, pp. 557-560, 6 figs. Technical study of limitations with reference to problem of transatlantic flight. (To be continued.)

ENGINES

Cooling. The Cooling of Aero Engines. Autocar, vol. 42, no. 1227, Apr. 26, 1919, pp. 609-612, 9 figs. Physical conditions of the atmosphere to which engine must adapt itself. Discusses means being adopted for preventing over-cooling of front valves.

Design. The Design of Airplane Engines—V. John Wallace. Automotive Eng., vol. 4, no. 4, Apr. 1919, pp. 166-168, 11 figs. Crank-effort diagram; calculation of inertia forces of reciprocating mass. (To be continued.)

Hispano-Suiza. Hispano-Suiza Motors (Les moteurs Hispano-Suiza). L'Aérophile, vol. 27, nos. 5-6, Mar. 1-15, 1919, pp. 78-81, 8 figs. Five types considered are: 150 hp., 180 hp., 200 hp., 220 hp., and 300 hp. (To be continued.)

King-Bugatti Engine. King-Bugatti 16-Cylinder Aero Engine—II. Automotive Industries, vol. 11, no. 18, May 1, 1919, pp. 956-959, and 986, 7 figs. Consists virtually of two 8-cyl. all-in-line engines mounted on common crankcase and geared to common propeller shaft; designed to permit a 37-mm. cannon to shoot through hollow propeller shaft.

Liberty Engine. Mechanical Details of the Liberty Engine—III. Automotive Eng., vol. 4, no. 4, Apr. 1919, pp. 178-179 and 102. Specifications of both the cast-iron cylinder forms for tank use and the steel cylinder type with sheet-metal water jackets for airplane power plants.

Maybach Engine. Details of the 300-Horsepower Maybach Airplane Engine. Automotive Eng., vol. 4, no. 4, Apr. 1919, pp. 169-173, 10 figs. Mechanical construction and design features. Cylinders, crankcase and shaft pistons and wrist pins. (To be continued.)

Puma Engine. The Siddeley-Deasy "Puma" Aero Engine. Aerial Age, vol. 9, no. 9, May 12, 1919, pp. 441-442 and 453, 4 figs. Engine has 6 cylinders; outstanding features claimed are special construction of cylinders and arrangement of mechanism actuating valves, these features being designed to facilitate dismantling and erection for repairs.

Superchargers. Maintaining Constant Pressure Before the Carburettors of Aero Engines Regardless of the Altitude, Leslie V. Spencer. Aerial Age, vol. 9, no. 8, May 5, 1919, pp. 387-389, 7 figs. Mechanical features of Moss and Sherbondy turbo-superchargers (Concluded.)

Zeitlin Engine. The Zeitlin Aero-Engine. Engineer, vol. 127, no. 3304, Apr. 25, 1919, pp. 408-410, 10 figs. Nine-cylinder rotary 220 hp. engine. Fundamental differs from other motors in that piston stroke is not of uniform length in each of the four movements constituting a complete cycle.

INSTRUMENTS

Anemometers. Design of Pressure Plate Anemometers, C. H. Powell. Aviation, vol. 6, no. 7, May 1, 1919, pp. 374-375, 3 figs. Technical points of design Writer takes up case of constructing instrument to give direct readings without making it necessary to have recourse to trial and error methods.

MATERIALS OF CONSTRUCTION

Glues. The Manufacture and Use of Glues in Aeroplane Construction, B. C. Boulton. Aerial Age, vol. 9, nos. 8 & 9, May 5 & 12, 1919, pp. 390 and 395-396, and 451-453, 2 figs. Based upon technical reports prepared for Bur. Aircraft Production. Factors affecting quality of casein; Bur. of Aircraft Production, specification for glues.

Veneers. Veneer Body Construction. Aviation, vol. 6, no. 3, May 15, 1919, pp. 434-436, 3 figs. Results of investigations conducted at McCook Field in endeavor to develop satisfactory veneer bodies of USC-2 and USXB-1 combat planes. (To be continued.)

METEOROLOGY

Cyclone Compression. Examples of "Cyclone Compression," (Sur quelques exemples de "compression de cyclone"), Gabriel Guilbert. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 13, Mar. 31, 1919, pp. 691-693. Cases quoted in substantiation of rule: Depressed region surrounded with converging strong winds shows maximum barometric compression in center.

MODELS

Aeroplanes. Model Aeroplanes—XXIII, F. J. Camm. Aeronautics, vol. 16, no. 285, Apr. 3, 1919, p. 363, 6 figs. Built-up plane; covered with proofed transparent silk. Illustrations indicate construction details.
Elementary Aeronautics and Model Notes, John F. McMahon. Aerial Age, vol. 9, no. 9, May 12, 1919, p. 457, 1 fig. Model in which regular tested wing curve is used.

Air Screws. Model Aeroplanes—XXIV, F. J. Camm. Aeronautics, vol. 16, no. 287, Apr. 17, 1919, p. 409, 4 figs. Carving model airscrews.

Speed Models. Elementary Aeronautics and Model Notes, John F. McMahon. Aerial Age, vol. 9, no. 8, May 5, 1919, p. 403, 2 figs. Speed model said to have developed speed of 55 miles per hour.

PLANES

B. A. T. The B. A. T. Four-Seater Biplane. Flight, vol. 11, no. 16, Apr. 17, 1919, pp. 494-498, 11 figs. Designed for commercial work—either passengers or carrying mail; provides accommodation for four passengers besides pilot.

Curtis M-F Flying Boat. Curtiss M-F Flying Boat. Aerial Age, vol. 9, no. 8, May 5, 1919, pp. 384-385, 5 figs. Equipped with 8-cyl., 4-stroke cycle water cooled V-type engine, rated at 100 hp. at 1400 r.p.m.; bore and stroke 4½ in. by 5 in.

Halberstadt. The Halberstadt Two-Seater Fighter. Aviation, vol. 6, no. 7, May 1, 1919, pp. 384-386, 11 figs. Constructional features.

Lepere. The Lepere Two-Seater Fighter. Aviation, vol. 6, no. 3, May 15, 1919, pp. 426-429, 8 figs. Belongs to class of DeH.-4 and Bristol type. One peculiarity of design is that there are no incidence or stagger wires in the plane, these being replaced by a system of portal-framed struts.

Pfalz. The Pfalz (D XII) Single-Seater Fighter. Flight, vol. 11, no. 17, Apr. 24, 1919, pp. 528-533, 16 figs. This airplane was brought down near Dury on Sept. 15, 1918. Report covering design and details issued by Technical Dept. (Aircraft Production), Ministry of Munitions.

Tarrant Triplane. The Tarrant Giant Triplane. Flight, vol. 11, no. 19, May 8, 1919, pp. 592-593, 2 figs. Power plant consists of Napier "Lion" engines, four of which are mounted on bottom plane, the other two being placed between the middle and the top plane and driving tractor screws. Warren type of girder has been adapted in regard to wood construction.

Torpedoplane. The Torpedoplane, the New Weapon which Promises to Revolutionize Naval Tactics, Henry Woodhouse. U. S. Naval Inst., Proc., vol. 45, no. 5, May 1919, pp. 743-752. Constructed for dropping torpedoes from airplanes.

PROPELLERS

Variable Pitch Propeller. Pilot Motor Variable Pitch Propeller, Alfred Vischer, Jr. Aviation, vol. 6, no. 7, May 1, 1919, pp. 380-381, 3 figs. SCR-73 synchronous rotary-gap transmitter designed and developed to be adjustable to nine wave lengths supplemented by five notes obtained from interchangeable-gap rotors to prevent interference and to aid in identification.

PRODUCTION

Fire Hazard. Features of Fire Hazard in Airplane Manufacture, W. D. Milne. Quarterly of the Nat. Fire Protection Assn., vol. 12, no. 4, Apr. 1919, pp. 345-352. Notes on prominent fire hazards as observed by writer in various airplane factories; he advocates incorporating in plans for these plants measures necessary for their protection against fire.

National Aeroplane Factory, England. National Aeroplane Factory Near Manchester. Engineer, vol. 127, no. 3301, Apr. 4, 1919, pp. 422-424, 10 figs. on supp. plate. Factory covers area of 15 acres and comprises assembling and erection shop, woodworking shop, timber drying shed for spruce conditioning and two ash-drying plants.

Naval Aircraft Factory, Philadelphia. Aeroplane Construction, F. G. Coburn. Jl. Engrs. Club, Philadelphia, vol. 36-4, no. 173, Apr. 1919, pp. 121-126, 6 figs. Brief account of construction and development of Naval Aircraft Factory at Philadelphia Navy Yard.

TESTING

Engine Trials. The Analysis of Engine Trials. Automobile Engr., vol. 9, no. 126, May 1919, pp. 134-136, 9 figs. Empirical methods of calculation for analyzing results of aero-engine trials, particularly where tests have obviously been faulty or incomplete.

Full-Scale Experiments. Full Scale Aeroplane Experiments, W. S. Farren. Aeronautical Jl., vol. 23, no. 98, Feb. 1919, pp. 34-63, 14 figs. Formulæ derived from model experiments cannot be employed in designing calculations, it is stated, without first testing their validity in full-scale experiments.

TRANSATLANTIC FLIGHT

Navy (U. S.) Fliers. The Navy's Trans-Atlantic Fliers. Motor Boat, vol. 16, no. 10 May 25, 1919, pp. 5-7, 5 figs. Weights and principal dimensions.

Winds. Trans-Atlantic Flight and Meteorology, Willis Ray Gregg. Aviation, vol, 6, no. 7, May 1, 1919, pp. 370-372, 1 fig. Wind velocity and direction as affecting Newfoundland-Ireland and Newfoundland-Labrador-Greenland Scotland routes. Paper read before Phil. Soc. of Washington.

VARIA

Aviators, Physiology. The Physiology of the Aviator, Yandell Henderson. Science vol. 49, no. 1271, May 9, 1919, pp. 431-441. Development of this branch of science during the war and account of the principles laid down from experience.

Aviators. Tests of. Psycho-Physical Tests of Aviators, George M. Stratton. Sci. Monthly, vol. 8, no. 5, May 1919, pp. 421-426. Stress is laid upon two qualifications, viz.: coolness and power to make rapid decisions.

Camera Aero. A New Aero Camera. Aeronautics, vol. 16, no. 286, Apr. 10, 1919, p. 389, 2 figs. Taking photograph, moving exposed plate out of position, resetting camera shutter and moving up of fresh plate into position performed by one movement.

Mapping, Aero. Methods Used in Aero-Photographic Mapping. Eng. News-Rec., vol. 82, no. 21. May 22, 1919, pp. 1000-1004, 8 figs. Outgrowth of experience in use of panoramic camera in Alaska with exposition of principles on transforming camera. From Geographical Rev.

Present Status of Photographic Mapping from the Air, J. B. Mertie. Jr. Eng. News-Rec., vol. 82, no. 21, May 22, 1919, pp. 996-999. Airplane mapping is considered possible and practicable, but it is observed that two great problems horizontalization of camera and effects of surface relief, must be solved.

METALLURGY

ALUMINUM

Alloys. Aluminum and Its Light Alloys. Dept. of Commerce, Circular of the Bur. of Standards, no. 76, Apr. 21, 1919, 120 pp., 27 figs. Deals primarily with physical properties of metal or alloy. Other features, except a few statistics of production and such as methods of manufacture, presence of impurities, etc., are discussed only in their relation to these physical properties.

Aluminum and Magnesium. The Metallurgy of Aluminum and Magnesium, H. B. Pulsifer. Salt Lake Min. Rev., vol. 21, no. 2, Apr. 30, 1919, pp. 21-25, 4 figs. Principles of electrolytic cell for producing magnesium: methods of manufacture.

Micrography. The Micrography of Aluminum and Its Alloys, Hanson and S. L. Archbutt. Metal Industry, vol. 14, no. 14, Apr. 4, 1919, pp. 277-283, 13 figs. Preparation of etchings, especially when metal has been cold-worked, when material is said to exhibit great readiness to become tarnished by formation of adhering coating of oxide of aluminum.

COPPER AND NICKEL

Alloys. The Properties of Some Copper Alloys, W. Rosenhain and D. Hanson. Metal Industry, vol. 14, no. 14, Apr. 4, 1919, pp. 269-272 and (discussion), pp. 272-274, 4 figs. Series prepared by Metallurgy Dept. of Nat. Physical Laboratory. Combination of high tensile strength with great ductility was aimed at in every case.

Brass and Silicon. Some Principles Involved in Melting Metals—V. Charles Vickers. Brass World, vol. 15, no. 5, May 1919, pp. 145-147, 2 figs. Adding silicon to yellow brass in order to increase fluidity of alloy so that it can be poured into thin castings.

Brass for Rolling. Notes on Alloys Used in British Brass-Rolling Mills, A. J. Franklin. Metal Indus., vol. 17, no. 5, May 1919, pp. 225-228, 1 fig. Effects of impurities, casting difficulties, hints on annealing and composition of some of the alloys.

Copper Rolling. The Metallurgy of Copper, Thomas H. A. Eastdick. Sci. Am. Supp., vol. 87, no. 2264, May 24, 1919, pp. 332-333 and pp. 335-336, 5 figs. Graphs showing effect of rolling on tensile strength and elongation under a given stress.

Slag. Copper-Smeltery Slag from the Microscopic and Chemical Point of View, C. G. Maier and G. D. Van Arsdale. Eng. and Min. Jl., vol. 107, no. 19, May 10, 1919, pp. 815-824, 40 figs. Combined miscroscopical and chemical method pursued in investigations indicated that, in slags examined copper existed in two physical forms chemically similar, (1) dissolved copper sulphide, in blast furnace and reverberatory slags and in converter or mixed slags and (2) mechanically suspended particles of sulphide copper varying in composition from matte to Cu_2+X Cu and in amount equal to total copper less dissolved copper.

FERROUS ALLOYS

Ferro-Manganese. Manganese Alloys in Open-Hearth Practice. Iron Age, vol. 103, no. 21, May 22, 1919, pp. 1363-1365. Use of silico-manganese recommended.

FLOTATION

Gold. Notes on Cyaniding, W. B. Blyth. Min. Mag., vol. 20, no. 4, Apr. 1919, pp. 224-226. Effect of arsenic and antimony and position of flotation as regards gold metallurgy.

FURNACES

Heating and Annealing Furnaces. Heating Furnaces and Annealing Furnaces—W. W. Trinks. Blast Furnace & Steel Plant, vol. 7, no. 5, May 1919, pp. 215-217, 6 figs. Heat losses from tongue-hold, from openings around ingots, through roofs partly burned and through incomplete combustion. Examples derived from large furnaces.

IRON AND STEEL

Cast Iron. The Solubility and Stability of Iron Carbide in Cast Iron J. A. Holden. Iron & Coal Trades Rev., vol. 98, no. 2668, Apr. 18, 1919, p. 479, 3 figs. Results of various experimenters compiled and compared.

Duplexing. Metallurgical Considerations of Duplexing—I, Richard S. McCaffery. Blast Furnace & Steel Plant, vol. 7, no. 5, May 1919, pp. 209-212. Operation of large and small Bessemer converters from viewpoint of metallurgical and physical chemistry.

Electric Furnace Steel. Electric Furnace Steel, William K. Booth. Jl. Am. Steel Treaters Soc., vol. 1, no. 6, Mar. 1919, pp. 207-214, 6 figs. Characteristics of Booth-Hall electric furnace. General principle of design is hearth which becomes conductive of electricity when hot, and use of auxiliary electrode which acts as a return for the electric current until the hearth becomes heated and conductive.

Making Electric Steel for Roller Bearings. Machy. (Lond.), vol. 14, no. 344, May 1, 1919, pp. 131-137, 11 figs. Practice of Timken Roller Bearing Co., Canton, Ohio, in operating Héroult electric furnaces forging ingots, rolling billets and cold-drawing steel into solid bars and seamless tubing.

Flaky Fractures. Flaky Fractures and Their Possible Elimination, Haakon Styri. Chem. & Metallurgical Eng., vol. 20, no. 9, May 1, 1919, pp. 478-483, 1 fig. Review of literature bearing upon oxides and other inclusions in steel, together with application of principles of physical chemistry to conditions in a steel melt.

Graphitization. Graphitization in Iron-Carbon Alloys, Kuniichi Tawara and Genshichi Asahara. Iron & Steel Inst., Ann. Meeting, May 8 & 9, 1919, no. 14, 16 pp., 4 figs., also abstracted in Iron & Coal Trades Rev., vol. 98, no. 2671, May 9, 1919, pp. 578-579, 2 figs. View is held that in fluid alloys there exist atoms of free carbon; these free-carbon items may serve as nuclei for the graphitization when conditions are favorable.

Hardening. The Hardening of Steel, H. C. H. Carpenter. Engineering, vol. 107, nos. 2776 and 2777, Mar. 14 & 21, 1919, pp. 340-341 and 386-390, 18 figs. Exposition of various views as to scientific explanation of this property. Discourse delivered at Roy. Instn.

The Experimental Investigation of the Influence of the Rate of Cooling on the Hardening of Carbon Steels, A. M. Portevin and M. Garvin. Iron & Coal Trades Rev., vol. 98, no. 2671, May 9, 1919, pp. 599-607, 25 figs. (Abridged.) Paper read before Iron & Steel Inst.

High-Speed Steel. The Manufacture and Working of High-Speed Steel, J. H. Andrew and G. W. Green. Iron & Steel Inst., Ann. Meeting, May 8 & 9, 1919, no. 1, 32 pp., 40 figs. Also abstracted in Iron & Coal Trades Rev., vol. 98, no. 2671, May 9, 1919, pp. 588-590, 2 figs. Investigation of various forging operations of cogging, rolling, etc., disclosed, in opinion of writers, that for efficient forging temperatures must be used which are appreciably higher than those which are generally accepted as correct. Also photo-micrographs are interpreted as showing that whether reduction is effected by rolling or hammering, or a combination of both, no difference is produced in microstructure of steel.

The Molecular Constitutions of High-Speed Tool Steels and Their Correlations with Lathe Efficiencies, John Oliver Arnold. Iron & Steel Inst., Ann. Meeting, May 8 & 9, 1919, no. 2, 24 pp., 5 figs. Experiments to ascertain compositions of the carbides of chromium, vanadium, tungsten, and molybdenum and to examine electrolytic differential analyses of carbides and tungstide.

Ingot Production. Safeguarding Steel Ingot Production. Raw Material, vol. 1, no. 2, Apr. 1919, pp. 138-143, 6 figs. Indicates how some of methods of ingot production can be improved wherever steel price justifies expense of changing established practice. (To be continued.)

Lime in Open Hearth. Deoxidation, and the Influence of Lime on Equilibrium in the Acid Open-Hearth Furnace, B. Yaneske. Iron & Steel Inst., Ann. Meeting, May 8 & 9, 1919, no. 17, 16 pp. Also in Iron & Coal Trades Rev., vol. 98, no. 2671, May 9, 1919, pp. 576-578. While writer admits that for certain classes of steel such as that required for ship and similar plates it is unnecessary to obtain a very highly deoxidized bath, yet he considers that for special steel, particularly nickel-chrome, which has to undergo severe mechanical tests, forging and machinery operations, it is essential that such a condition of the bath be obtained before the finishing alloyes are added.

Liquidus. Note on the Liquidus in the Iron-Carbon Diagram, G. Cesaro. Iron & Steel Inst., Ann. Meeting, May 8 & 9, 1919, no 4, 9 pp., 1 fig. Based on deduction from experiments by Carpenter and Keeling, writer endeavors to ascertain cause of curve joining points at which molten iron-carbon alloys commence to solidify.

Malleable Cast Iron. Effects of Phosphorus on Malleable Cast Iron, J. H. Teng. Foundry, vol. 47, no. 320, Apr. 1, 1919, pp. 151-156, 9 figs. Curves indicating effect of increasing phosphorus on tensile properties of both the pure-iron series and the common-iron series. From paper presented before Iron & Steel Inst.

Manganese in Open Hearth. The Use of Manganese Alloys in Open-Hearth Steel Practice, Samuel L. Hoyt. Metal Trades, vol. 10, no. 5, May 1919, pp. 227-230, 1 fig. Investigation to determine (1) condition in open-hearth practice that lead to conservation of manganese both during working of heat and in making final addition; (2) satisfactory metallurgical conditions for use of manganese in form of low-grade or special alloys, and (3) effect of finished steel, both as to quality and " condition " of various methods and processes studied. From Bul. no. 11 of War Minerals Investigation Series, U. S. Bur. Mines

Metallurgy. Modern Stool Metallurgy, Chas. H. F. Bagley. Iron & Steel Inst., Ann. Meeting, May 8 & 9, 1919, no. 3, 49 pp. Also Iron & Coal Trades Rev., vol. 98, no. 2671, May 9, 1919, pp. 565-571. Method of calculating consumption of materials and technical results in manufacture of steel from any kind of pig iron by any standard process.

Quenching. The formation of Troostite at Low Temperature in Carbon-Steels and the Influence of the Emersion Temperature in Double Quenching (La formation de la troostite à bassee température dans les aciers au carbone et l'influence de la température d'émersion dans les trempes interrompues), M. Portevin and M. Garvin. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 14, Apr. 7, 1919, pp. 731-733. Concluded from experimental investigations that in vicinity of critical quenching velocity. troostite will form even after cooling to 450 deg. cent., such formation being always accompanied with a pronounced characteristic recalescence.

Slag. The Acid Hearth and Slag, J. H. Whiteley and A. F. Hallimond. Iron & Steel Inst., Ann. Meeting, May 8 & 9, 1919, no. 16, 44 pp., 29 figs. Also abstracted in Iron & Coal Trades Rev., vol. 98, no. 2671, May 9, 1919, pp. 579-583, 3 figs. Microstructure of slags, structure of slowly coled acid slags and reactions occurring in molten slag during process from observations and experiments.

Transformations in Iron. On the Non-Allotropic Nature of the A2 Transformation in Iron, Kôtarô Honda. Iron & Steel Inst., Ann. Meeting, May 8 & 9, 1919, no. 9, 8 pp., 3 figs. Also abstracted in Iron & Coal Trades Rev., vol. 98, no. 2671, May 9, 1919, pp. 575-576. Reported experiments evidenced three transformations, A_2, A_3 and A_4, in the case of pure iron; last two are said to be alltropic transformations, while the first cannot properly be so called.

MICROPHOTOGRAPHS

Macro-Etching and Printing. Macro-Etching and Macro-Printing, J. C. W Humfrey. Iron & Steel Inst., Ann. Meeting, May 8 & 9, 1919, no. 10, 14 pp., 12 figs. Also abstracted in Iron & Coal Trades Rev., vol. 98, no. 2671, May 9, 1919, pp. 607-609, 4 figs. Writer's etching reagent used in course of investigation into flow of steel during process of punching and drawing a shell blank, was prepared by addition of hydrochloric acid to Heyn's reagent.

NON-FERROUS ALLOYS

Metallography. Metallography Applied to Non ferrous Metals—IV, Ernest J. Davis. Foundry, vol. 47, nos. 6 & 7, May 1 & 15, 1919, pp. 263-266 & 304-307, 15 figs. Equilibrium diagram of copper-aluminum, aluminum-Zinc and aluminum-magnesium series, and photomicrographs of various alloys.

OCCLUDED GASES

Hydrogen. The Occlusion of Hydrogen by the Metallic Elements and Its Relation to Magnetic Properties, Donald P. Smith. Jl. Physical Chemistry, vol. 23, no. 3, Mar. 1919, pp. 186-200, 1 fig. From review of literature it is deduced that resulting alloys are to be distinguished from other types of binary hydrogen compounds and that metals which form the alloys probably occupy a definite region in the periodic table of Werner.

INDUSTRIAL TECHNOLOGY

Ammonia Oxidation. The Oxidation of Ammonia, W. S. Landis. Chem. & Metallurgical Eng., vol. 20, no. 9, May 1, 1919, pp. 476-477, 5 figs. Review of early investigations beginning in 1839 with Kuhlman: Ostwald process and apparatus; improvements made in catalyst screens platinum activation to foreign gases such as acetylene and phosphine; cyanamide process at Muscle Shoals. Paper read before Am. Electrochemical Soc.

Boron. The Production of Amorphous Boron (Ueber die Darstellung des amorphen Bors), Wilhelm Kroll. Zeitschrift für anorganiche & allgemeine Chemie, vol. 102, no. 1, Jan. 4, 1918, pp. 1-33, 4 figs. Writer describes experiments made and results obtained by reduction with aluminum, magnesium, calcium, natrium, and by electrolysis. Apparatus for quick distillation of boric acid with methylene alcohol is described.

Cements, Rubber. Notes on Cemented Seams and Rubber Cements, Junius David Edwards and Irwin L. Moore. India-Rubber Jl., vol. 57, no. 15, Apr. 12, 1919, pp. 1-6, 8 figs. Tests and examination of micro-sections. It is concluded that a good seam requires a good cement, smoothing and cleaning of surface.

Dust Elimination. Removal of Dust, Gases and Fumes in Metal-Working Plants, J. J. Rosedale. Metal Trades, vol. 10, no. 5, May 1919, pp. 223-226, 6 figs. Recommended specifications for design, construction and operation of exhaust systems. From Cal. Safety News.
