Electrical Precipitation of Solids from Flue Gases, J. M. Wauchope. Elec. Rev., vol. 74, no. 19, May 10, 1919, pp. 744-747, 7 figs. Application of Cottrell process to waste gases of smelters. Article dwells particularly on apparatus used, operating conditions, and troubles.

Explosives. Modern Explosives, J. Young. Soc. Engrs., vol. 10, no. 3, 1919, pp. 109-136. Historical sketch of development during last 50 years leads writer to assert that no epoch-making discovery has been made during this time, but he examines the work which has been accomplished in inventing mixtures of old materials and grading them in order to make them suitable for various purposes.

Fertilizers. Sodammonium Sulphate. A New Fertilizer. The Utilization of Nitre Cake in the Fixation of Ammonia, H. M. Dawson. Jl. Soc. Chem. Indus., vol. 38, no. 8, Apr. 30, 1919. Trans. pp. 98T-101T, 1 fig. Diagram illustrating crystallization of solutions containing sodium and ammonium sulphate.

Gas Masks. Effect of Exposure to Weather on Rubber Gas Mask Fabrics, G. St. J. Perrot and A. E. Plumb. Jl. Indus & Eng. Chem., vol. 11, no. 5, May 1919, pp. 439-443, 6 figs. Investigation by Research Division, Chem. Warfare Service.

Gas Mask Absorbents, Arthur B. Lamb, Robert E. Wilson and N. K. Chaney. Jl. Indus. & Eng. Chem., vol 11, no. 5, May 1919, pp. 420-438, 10 figs. Reasons underlying choice of mixtures used by Chemical Warfare Service. Mixture used in canisters contained 60 per cent 6 to 14 mesh coconut-shell charcoal and 40 per cent 8 to 14 mest soda-lime pomanganate granites. Other combination selected was 75 per cent specially impregnated coconut charcoal and 25 per cent of soda-lime containing no permanganate.

Nitrogen Fixation. The Present Status of Nitrogen Fixation, Alfred H. White. Sci. Am. Supp., vol. 87, no. 2264, May 24, 1919, pp. 330-331, 1 fig. Several processes contrasted on basis of recent experience. Address delivered at meeting of Am. Inst. of Chem. Engrs.

How the Nitrogen Problem Has Been solved—III, Henry Jermain Maude Creighton. Jl. Franklin Inst., vol. 187, no. 5, May 1919, pp. 599-610, 2 figs. Outline of principles underlying formation of calcium cyanide from calcium carbide and atmospheric nitrogen. (To be concluded.)

Paints. The White Pigments, S. J. Cook. Can. Chem. Jl, vol. 3, no. 5, May 1919, pp. 145-147. Survey of present practice and magnitude of these paint industries. Address delivered before Ottawa Branch, Soc. Chem. Indus.

Salt. The Salt Industry and the Possibilities for the Future Development in Canada. L. Heber Cole. Can. Min. Jl., vol. 40, no. 19, May 14, 1919, pp. 346-366. 1 fig. Flow sheet indicating method employed in recovery of commercial salt from nature; deposits of British Columbian, Albertan, Manitoban, Ontario and Maritime provinces.

Seaweed Products. Industrial Uses of Seaweed (Sjotang som raastof for Sorindustri). Teknisk Ukehlad, vol. 66, no. 12, Mar. 21, 1919, pp. 172-174, 4 figs. "Norgiu" manufactured from seaweed is used as dressing for cotton and linen fabrics and by painters for the preparation of insde walls and ceilings.

Soda Ash. Huge Industrial Development by Brunner Mond Co. at Amherstburg Ont. Contract Rec., vol. 33, no. 18, Apr. 30, 1919, pp. 403-406, 5 figs. Process to be employed in manufacture of soda ash utilizes as two of prncipal raw materials limestone and salt.

Thallium. Note on Extraction of Thallium from Pyrites Flue Dust, George Sisson and J. S. Edmondson. Chem. News, vol. 118, no. 3078. Apr. 11, 1919, p. 75. Method depends upon solubility of chloride and sulphate, operation being to treat the dust with boiling water acidified with sulphuric acid.

WOOD PULP. The Chemistry of Wood Pulp Production, Arthur Klein. Paper, vol. 24, no. 10, May 14, 1919, pp. 15-19. Theories concerning constitution of cellulose. Paper read before German Assn. of Cellulose and Paper Chemists. (To be continued.)

MINING ENGINEERING

BASE MATERIALS

CLAYS. Ball Clays of West Tennessee, Rolf A. Schroeder. Resources of Tennessee, State Geol. Survey, vol. 9, no. 2, Apr. 1919, pp. 81-180, 13 figs. Investigation covered location, geological relations and economic importance. Laboratory tests were made at Ceramic Laboratory, University of Illinois.

GARNET. Garnet in North Carolina and the Market for Abrasive Garnet, Frank J. Katz. Eng. & Min. Jl., vol. 107, no. 21, May 24, 1919, pp. 903-906. Report of examination of deposits and of canvass of producers and consumers.

COAL AND COKE

ALASKA. The Nenana Coal Field, Alaska, G. C. Martin. Dept. of the Interior, U. S. Geol. Survey, bul. 664, 1919, 54 pp., 12 figs. Geology, geography and general features. Coal is classified as lignite of good grade.

BELGIUM. The Coal Beds of Belgium (Les gisements houillers de la Belgique), Armand Renier, Annales des Mines de Belgique, vol. 20, first issue, 1919, pp. 227-258. Stratigraphy. (Continuation of serial).

CANADA. Coal Resources of Western Canada—II, James White. Coal Age, vol. 15, no. 19, May 8, 1919, pp. 858-862, 1 fig. Government is reported to favor plan to carbonize low-grade coals of Saskatchewan for the purpose of saving freight and by-products.

CARBONIZATION. Some Features of Carbonization and By-Product Recovery J. Thorp. Colliery-Guardian, vol. 117, no. 3044, May 2, 1919, pp. 1015-1016, Beehive vs. patent coke for steel smelting. Paper read before Coke Oven Managers' Assn. (Midland Section).

CARBONIZING PROCESS, LOW TEMPERATURE. G-L Low-Temperature Carbonizing Process. Coal Age, vol. 15, no. 18, May 1, 1919, pp. 810-812, 5 figs. Gases, oil and tars are liberated from coal at maximum temperature within retort not exceeding 1200 deg. fahr.; oils are thus expelled as vapors without being broken down by heat into gases; after removal from retorts they are condensed into liquid oils.

COAL-CUTTING MACHINERY. Comparative Working Costs of Electrical and Compressed-Air Coal-Cutting Machines (Longwall) with Increased Outputs over Hand Hewing. F. A. Hale. Iron & Coal Trades. Rev., vol. 98, no. 2668, Apr. 18, 1919, p. 478. Series of tests is presented in substantiation of writer's objections to installation of longwall coal-cutting machines in collieries. Paper read before North of England Branch Assn. Min. Elec. Engrs.

COAL GAS. Coal; Its Value as a Raw Material for Distillation Products—IV, Coal Gas, J. A. Wilkinson. South African Jl. Industries, vol. 2, no. 3, Mar. 1919, pp. 239-246, 1 fig. Methods of producing coal gas. (Concluded).

COKE OVENS. New Coke Ovens at the Providence Gas Works, Edward H. Bauer. Gas Age, vol. 43, nos. 9 & 10, May 1 & 15, 1919, pp. 461-465 & 516-520, 17 figs. Plant has nominal capacity of 7,500,000 cu. ft. of gas per day and consists of one battery of 40 by-product coke ovens equipped coal-handling conveyors, crushing and mixing apparatus and bins for preparing coal, 750-ton coal-storage bin, quenching station, coke-handling conveyors and both metallurgical and domestic coke-screening stations. Three reversing machines—one damper and air-valve reversing machine and two gas-coke machines (one for coke side and one for crusher side gas coke).

Modern Coke Oven and By-Product Plant, Drummond Paton. Iron & Coal Trades Rev., vol. 98, no. 2668, Apr. 18, 1919, pp. 470-471. In discussing schemes suitable for Lancashire coal, writer remarks on features of low temperature, high temperature or gasification as factors determining successful operation. Paper read before Manchester Geol. & Min. Soc.

COKING LOW-GRADE FUEL. Utilization of Mine Waste and Low-Grade Fuels (Utilisation des déchets de mines et des mauvais combustibles), F. Blache. Bulletin et comptes rendus mensuels de la Société de l'Industrie Minérale, séries 5, vol. 15, first issue of 1919, pp. 5-28, 2 figs. Scheme for coking fuel with recuperation of by-products and purifying coke.

COKING OUTPUT OF COALS. Coking Output of Coals (Quelques notes sur le pouvoir cokéfiant des charbons), annales des mines de Belgique, vol. 19, third issue, 1914, pp. 625-651. Experiments with English, Belgium and German samples to determine agglutinant power as index of quality.

COSTS. Coal-Mining Costs and Output. Times Eng. Supp., vol. 15, no. 554, Apr. 1919, p. 129. Comparison with America.

KENT, ENGLAND. The Evolution and Development of the Kent Coalfield, A. E. Ritchie. Iron & Coal Trades Rev., vol. 98, nos. 2662, 2668, 2669 and 2670, Mar. 7, Apr. 18 & 25, May 2, 1919, pp. 289-290, 476-477, 508-509, and 537-538, 6 figs. From 1901 to 1905; operations in the latter part of 1906 and during 1907; from 1909-1910; comparative sections of pits at Dover and Tilmanstone to show strata between Gault and coal measures are illustrated; from 1911 to 1912; diagramatic section showing general position of Tilmanstone pits. (Continuation of serial.)

METHANE ACCUMULATIONS. Methane Accumulations from Interrupted Ventilation, H. I. Smith and R. J. Hamon. Colliery Guardian, vol. 117, no. 3042, Apr. 17, 1919, pp. 895-896, 2 figs. Tests conducted in three mines—two in Southern Illinois and one in Indiana—showed that Methane may accumulate from (1) sudden liberation from seams, cracks or other feeders, (2) emission from inaccessible and abandoned workings, as a result of either an increase or decrease in pressure of ventilating current and, (3) local accumulations resulting from any interruption of normal ventilating current.

PYRITES. Pyrite Deposits in Ohio Coal, W. M. Tucker. Economic Geolog., vol. 14, no. 3, May 1919, pp. 198-219, 3 figs. Total possible production of pyrite estimated at 250,000 tons yearly.

Recovery of Pyrite from Washery Refuse, E. A. Holbrook. Coal Age, vol. 15, no. 19, May 8, 1919, pp. 848-851, 4 figs. Efficiency of recovery of about 70 per cent is said to be realized by installation and operation of crushing, screening, jigging and sometimes tabling apparatus.

SCREENING PLANT. Thurcroft Main Colliery. Iron & Coal Trades Rev., vol. 98, no. 2662, Mar. 7, 1919, pp. 279-280, 2 figs. & supp. plates. Equipment for an output of 4000 tons daily. Screening plant comprises several units each capable of dealing with 120 tons per hour.

STRIPPING. Coal Stripping in the United States—V, Wilbur Greeley Burroughs. Coal Indus., vol. 2, no. 5, May 1919, pp. 177-182, 2 figs. Differences between systems followed in bituminous and anthracite fields.

RUSSIA. At the Anthracite Mines, South Russia, in the Early Days of the War. A. L. Simon. Min. Mag., vol. 20, no. 4, Apr. 1919, pp. 203-211, 2 figs. Area over which mining rights extend approximates 10,000 acres. Mine water, boiler house, winding engines and labor conditions are discussed from viewpoint of adaptability to special requirements and susceptibility to improvements.

TIPPLE AND WASHERIES. New Tipple of the Granby Consolidated Mining, Smelting & Power Co., F. E. Mueller. Coal Age, nol. 15, no. 18, May 1, 1919, pp. 804-805, 3 figs. General layout of tracks, tipple and proposed washery, and details of solid-body mine car.

COPPER

LEACHING ORES. Leaching of Oxidized Copper Ores with Ferric Chloride, R. W. Perry. Min. & Sci. Press, vol. 118, no. 20, May 17, 1919, pp. 669-674, 2 figs. Patented process based on: $3\,CuO + 2\,FeCl_3 + 3\,H_2O = 3\,CuCl_2 + 2\,Fe(OH)_3$: $3\,CuCl_3 + 3\,Fe = 3\,Cu + 3\,FeCl_2$; and $3\,FeCl_2$ + Electricity = Fe $+ 2\,FeCl_2$.

GEOLOGY AND MINERALOGY

AUSTRALIA. A Geological Reconnaissance of the Country Between Laverton and the South Australian Border (near South Latitude 26 deg.), Including part of the Mount Margaret Goldfield, H. W. B. Talbot and E. de C. Clarke. Geol. Survey, Western Australia, bul. no. 75, 1917, 207 pp. 72, figs.

BRAZIL. Notes on the Geology of the Diamond Region of Bahia, Brazil Roderic Crandall. Economic Geology, vol. 14, no. 3, May 1919, pp. 220-244, 14 figs. Opinions expressed by various explorers.

CHISONE VALLEY. Contribution to the Study of Minerals in the Chisone Valley (Contributo allo studio dei minerali della Valle del Chisone), E. Grill. Atti della Società Toscana di Scienze Naturali, Memorie, vol. 31, 1917, pp. 140-167, 6 figs. Pyrite, albite magnetite, dolomite, apatite, tremolite, actimolite, tourmaline andilmenite.

CRYSTALLOGRAPHY. Crystallography of some Canadian Minerals; 9, Cerussite, Eugine Poitevin. Am. Minerologist, vol. 4, no. 5, May 1919, pp. 56-58, 3 figs. Crystals show three habits: Tabular crystals with large brachypinacoid, pyramidal crystals with well-developed prisms and pyramids and limited domes, and pyramidal crystals having *r* (130) as twinning plane.

Artificial Coloration of Helicoid Spherolites as Means to Determine Polymorphous Modifications (Coloration artificielle des sphérolites à enroulement hélicoidal et distinction des modifications polymorphes par la couleur acquise), P. Gaubert. Bulletin de la Société Française de Minéralogie, vol. 41, no. 7-8, July-Dec. 1918, pp. 198-224, 6 figs. Account of experiments. Coloring matter and colorless substance group themselves so as to form mixed crystals. Asparagine, tartrates and bimalates considered.

GEORGIA. Report on the State Deposits of Georgia, H. K. Shearer. Geol. Survey of Ga., bul. 34, 1918, 192 pp., 24 figs. Geological formations of Appalachian Valley and Cumberland Plateau areas. Only along eastern border, near, Cartersville, are shaly beds considered as commercially valuable slates.

NEW MINERALS. Review of New Mineral Species (Revue des espèces minérales nouvelles), P. Gaubert. Bulletin de la Société Française de Minéralogie, vol. 41, nos. 718, July-Dec. 1918, pp. 224-226, Colerainite, collbranite and gilpinite.

OREGON. The Salient Features of the Geology of Oregon, Warren Dupre Smith and Earl L. Packard. Jl. of Geology, vol. 27, no. 2, Feb.-Mar. 1919, pp. 79-120, 3 figs. Including bibliography of important articles.

TASMANIA. The North Picman and Huskisson and Sherling Valley Mining Fields. A. McIntosh Reid. Tasmania Dept. Mines, Geol. Survey bul. 28, no. B-82381,1918, 132 pp., 13 figs. Geological data, location and area, and typographical details.

TONOPAH DIVIDE. The Divide District, Frank L. Sozer, Min. & Sci. Press, vol. 118, no. 19, May 10, 1919, pp. 631-633, 4 figs. Important geological features of the Tonopah Divide are the pronounced fissuring and the volcanic uplift.

WATER IN ROCK FORMATIONS. Water Expectancy in Tunnels. Mines and Deep Wells in Homogeneous Rocks, Robert F. Horton. Jl. Am. Water Works Assn., vol. 6, no. 2, June 1919, pp. 183-186. Proposes method and formulæ by which data obtained from surface wells can be applied. Method is limited to cases where bedrock is somewhat uniform in character throughout all depths from rock floor down to bottom of tunnel or other structure.

LEAD, ZINC, TIN

LEAD FROM VANADINITE. A Proposed Metallurgical Process for the Treatment of Vanadinite for the Recovery of Lead and Vanadium, J. E. Conley. Chem. & Metallurgical Eng., vol. 20, no. 10, May 15, 1919, pp. 514-518, 2 figs. Vanadinite concentrate is fluxed and reduced with soda ash, caustic and carbon, giving metallic lead; slag is elutriated Si and Mo precipitated with lime; vanadium pentoxide precipitated by boiling in acid solution.

Sintering Zinc Residues. Sintering Zinc Residues, K. Stock. Chem. & Metallurgical Eng., vol. 20, no. 10, May 15, 1919, pp. 525-537, 16 figs. Methods used by Bartlesville Zinc Co. After roasting and retorting, all residues are subjected to additional treatment depending upon amount and nature of metals to be recovered.

MAJOR INDUSTRIAL MATERIALS

Nickel. Canada Controls Nickel Output of the World, W. F. Sutherland. Can. Machy., vol. 20, no. 26, Dec. 26, 1918, pp. 730-736, 13 figs. Plant of International Nickel Co. of Canada at Port Colborne. Reference is made to laboratory and refineries.

MINES AND MINING

Bore-Hole, Diamond. Some Difficulties met with in Putting Down a Diamond Bore-Hole Underground, J. Walker Steele. Iron & Coal Trades Rev., vol. 98, no. 2662, Mar. 7, 1919, p. 292, 1 fig. Account of difficulties met and dealt with in putting down a 2-in. diamond borehole for the proving of underlying seams in faulty and difficult ground.

Cartridges, Safety. Safety Cartridge (Etude d'une Cartouche de Sûreté). Emmanuel Lemaire. Annales des Mines de Belgique, vol. 19, third issue, 1914, pp. 587-590. Mixture of calcium fluoride, sodium chloride, iron sulphate and sand reported found from experimental research to insure safety and permit minimum cartridge diameter. First article.

Concentrate Treatment. New Process for the Mechanical Preparation of Minerals (Nouveaux procédés de préparation mécanique des minérais). Echo des Mines et de la Métallurgie, vol. 47, no. 2620, Apr. 6, 1919, pp. 217-218. Wolfram and cassiterite mixed concentrates treated in Rapid apparatus.

Concentration. Economics of Concentration, A. P. Watt. Eng. & Min. Jl., vol. 107, no. 18, May 3, 1919, pp. 775-779, 3 figs. Evidence offered in substantiation of suggested advisability for operating a separate heat-treatment plant.

Deep Mines, Cooling and Drying. Cooling and Drying in Deep Mines, Sidney F. Walker. Refrig. World, vol. 54, no. 5, May 1919, pp. 23-24. Recommends refrigeration and cold-storage methods to make coal more accessible.

Explosives, Storage. Storage of Powder and Explosives at Coal Mines, E. M. Kimball. Coal Age, vol. 15, no. 18, May 1, 1919, pp. 794-795, 1 fig. Example of magazine built on brick foundation.

Geophone. The Geophone. Eng. & Min. Jl., vol. 107, no. 20, May 17, 1919, pp. 872-873, 2 figs. Invented by French to detect enemy sapping and underground mining operations and for ascertaining position of enemy artillery.

Hoisting. Hoisting in Coal Mines, W. J. Heeley. Can. Min. Inst. bul. no. 85, May 1919, pp. 498-503, 1 fig. Lines which writer believes to be close approximation to economy, from viewpoint of rope, for relative position of drum and pulley, for shafts from 100 to 600 yards winding depth.

Lamp, Safety. The Chance Acetylene Safety-Lamp, William Maurice. Trans. Instn. Min. Engrs., vol. 56, part 4, Apr. 1919, pp. 273-280 and (discussion) pp. 280-284, 9 figs. Combines American type of Wolf lamp with Mueseler principle. It is provided with roof reflector which distributes illlumination sidewise, thus making it unnecessary to tilt lamp.

Safety Lamp Gauzes—V T. J. Thomas. Colliery Guardian, vol. 117, no. 3042, Apr. 17, 1919, pp. 898-899. Compilation of data on uses of nonferrous metals as recorded by various experimenters.

Loading Machinery, Underground. Underground Coal-Loading Machinery, E. N. Zern. Coal Age, vol. 15, no. 18, May 1, 1919, pp. 784-791, 10 figs. Remarks in reference to results obtained in some mines that it is manifestly unfair to put any coal-loading machinery work unless mining haulage and other conditions are made favorable to its operation.

Power Plants. Economies in a Mine Power Plant, J. A. Carruthers. Power, vol. 49, no. 19, May 13, 1919, pp. 720-722, 3 figs. Example is quoted where it is said that power plant effected reduction of 13 to 15 tons of coal per day as result of several changes in equipment.

Queensland Mining Industry. Queensland Mining Industry. Queensland Gov. Min. Jl., vol. 20, no. 226, Mar. 15, 1919, pp. 97-114, 1 fig. Annual report of Under Secretary for Mines for 1918. It includes inspection of mines, state mining and boring operations, geological survey and methods—of mining gold, copper, tin, silver lead, wolfram, bismuth, molybdenite and scheeltie.

Rescue Apparatus. Digest of the First Report of the Mine Rescue-Apparatus Research Committee, David Penman. Trans. Instn. Min. Engrs., vol. 56, part 4, Apr. 1919, pp. 236-260 & (discussion) pp. 260-272, 7 figs. Committee was appointed by Advisory Council to Committee of Privy Council for Scientific and Industrial Research, to inquire into types of breathing apparatus used in coal mines and by experiment to determine the advantages, limitations and defects of the several types of apparatus, their possible improvements and the advisability to standardizing.

Respirator. The Use of the Gas Mask as a Respirator, A. C. Fieldner and S. H. Katz. Chem. Engrs., vol. 27, no. 4, Apr. 1919, pp. 79-83, 3 figs. Directions of uses in chemical and metallurgical industries. Warning is issued against indiscriminate use of gas masks for any and all purposes; it is observed that poisonous gases used in warfare are chemically active and therefore combine readily with absorbents of gas mask; some of the gases, however, immediately penetrate the mask when present in quantities of one or two per cent.

Ties, Steel. Steel Mine Ties, R. B. Woodworth. Coal Age, vol. 15, no. 18, May 1, 1919, pp. 814-816, 6 figs. Gain in headroom, endurance, fire-proofness, scrap value, and simplicity are quoted as some of the advantages of steel tie over wood rest.

Timbering. Safe and Efficient Mine Timbering—V. R. Z. Virgin. Coal Indus., vol. 2, no. 5, May 1919, pp. 175-177, 3 figs. Removing timber from pillar workings, banging canvas and timbering with wire rope.

MINOR INDUSTRIAL MATERIALS

Antimony. Pure Antimony (Reines Antimon), E. Groschuff. Zeitschrift für anorganische & Allgemeine Chemie, vol. 103, no. 3, Jlne 21, 1918, pp. 164-188. Technical refining of metallic antimony; electrolytic refining of antimony; crystallization of metallic antimony; precipitation and purification of antimony sulfide; crystallization of antimony as tartar emetic; analytical examination of antimony; examination of commercial antimony as to impurities; analytica and physical characterization of nominally pure antimony.

Chrome. Maryland Sand Chrome Ore, Joseph T. Singewald, Jr. Economic Geology, vol. 14, no. 3, May 1919, pp. 189-197, 5 figs. Account of Chrome industry in Maryland State. Paper presented before Geological Soc. of America.

Quicksilver. The Anticlinal Theory and Some Quicksilver Deposits, William H. Emmons. Eng. & Min. Jl., vol. 107, no. 21, May 24, 1919, pp. 916-917, 2 figs. Considers theory as applicable to prospecting of areas where structure conditions are favourable.

Vanadium. Treatment of Cuprodescloizite for Extraction and Recovery of Vanadium, Lead and Copper, J. E. Conley. Chem. & Metallurgical Eng., vol. 20, no. 9, May 1, 1919, pp. 465-469. It is held that the inter cake-sulphuric acid extraction is most economical.

OIL AND GAS

Holbrook Area. Study of Oil and Gas Possibilities of the Holbrook Area, Doresy Hager. Salt Lake Min. Rev., vol. 21, no. 3, May 15, 1919, pp. 21-25, 6 figs Determined from examination of general stratigraphic conditions structural characteristics, notably presence or absence of folding or intrusions that might create adverse conditions for oil or gas accumulations. No positive indications of petroleum were found in this Arizona area.

Movement of Oil Through Gas. Movement of Oil and Gas Through Rocks, Victor Ziegler. Petroleum Times, vol. 1, no. 13, Apr. 5, 1919, pp. 275-277. Surface tension of water being greater than that of oil affords explanation for passage of water through smaller openings while oil occupied larger ones. (Concluded from p. 38.)

Natural Gas. Utilization and Conservation of Natural Gas, L. L. Graham. Gas Age, vol. 43, no. 9, May 1, 1919, pp. 477-478. How public-service commissions can control situation. Paper read at conference called by Public Service Commission of Pa.

Domestic and Industrial Use of Natural Gas, John Gates. Gas Age, vol. 43, no. 9, May 1, 1919, pp. 470-471. Conditions in Pittsburgh district.

Texas. The Oil Fields of Northwestern Texas, W. L. Watts. Min. & Oil Bul., vol. 5, no. 5, Apr. 1919, pp. 255-258, and 269. 7 figs. Types of structures and petroleum geology in general. Third and concluding article. Second article appeared in Dec. 1918 issue.

PRECIOUS MINERALS

Gold Situation. Report of a Joint Committee Appointed from the Bureau of Mines and the United States Geological Survey by the Secretary of the Interior to Study the Gold Situation. Dept. of the Interior, Bur. of Mines, bul. 144, Oct. 30, 1918, 84 pp., 4 figs. Decline in gold mining is believed to be due to labor shortage and higher wages, lower efficiency of available labor and higher cost of power.

Santiago River. Gold Deposits of the Santiago River and its Zone (La riqueza aurifera del rio Santiago y de su zoma), Luis Ulboa. Boletin de la Sociedad Geografica de Lima, vol. 34, Dec. 1918, pp. 94-106. Geographical history.

South Africa. Labor and Gold Mining in South Africa, Evelyn A. Wallers. Eng. & Min. Jl., vol. 107, no. 21, May 24, 1919, pp. 918-922. Remedy for labor unrest lies, writer holds, in building, piece by piece, with persistence and patience, upon basis of steadily developing mutual understanding and desire to mutual good will between employer and employees.

TRANSPORTATION

India. The Carriage of Coal by Rail in India, H. Kelway-Bamber. Ry. Gaz., vol. 30, no. 16, Apr. 18, 1919, pp. 689-691, 3 figs. Gross earnings of train weighing 1400 tons and carrying coal a distance of 250 miles. (Continuation of serial). Paper read before Indian Section Roy. Soc. Arts.

Mine Haulage. Efficiency in Mine Haulage Construction, George L. Yaste. Coal Indus., vol. 2, no. 5, May 1919, pp. 199-200. In choice of rails for roadway writer prefers to have them rather heavy than so light that it should become difficult to maintain track on account of low places between ties and at junction of rails.

ORGANIZATION AND MANAGEMENT

ACCOUNTING

Army, U. S. The Cost Accounting System of Construction Division, U. S. Army, C. W. Pinkerton. Eng. & Contracting, vol. 51, no. 21, May 21, 1919, pp. 548-551, 5 figs. Basis is foreman's daily report blank.

Factory Costs. New System Computes Factory Costs, W. A. Rutz. Iron Trade Rev., vol. 64, no. 16, Apr. 17, 1919, pp. 1023-1024. Method used by Am. Multigraph Co., Cleveland. System is based on principle that stock room is a bank.

Production Charges, Indirect. Fixing Indirect Production Charges, M. H. Potter. Iron Trade Rev., vol. 64, no. 18, May 1, 1919, pp. 1148-1149, 1 fig. Chart showing connection between various items offered as preliminary step in classifying indirect charges.

EDUCATION

Apprentices. Theoretical Training for Apprentices—Outline of the Educational Facilities Provided at the British Government Arsenal, E. G. Timbrell. Can. Engr., vol. 36, no. 18, May 1, 1919, pp. 423-425. Apprentices must be between 14-16 years of age. Course of four years covering mathematics, experimental mechanics, chemistry and engineering drawing, given three evenings per week, with addition of one-half day.

Home of the Canadian Ingersoll-Rand Co. Can. Machy., vol. 21, no. 19, May 8, 1919, pp. 451-455, 8 figs. Particular reference is made to apprenticeship systems and practices followed in forging department.

Women, Wireless Workers. Telephone and Wireless Transmission. Elec. Eng., vol. 53, no. 1, Jan. 1919, pp. 15-17. Training given women workers in Westinghouse plant.

FACTORY MANAGEMENT

Boiler Manufacturing. Modern Management in Boiler Manufacturing, Chas. M. Horton. Boiler Maker, vol. 19, no. 5, May 1919, pp. 122-123. Advises systematic continuity in turning out product.

Fornson Assembly Methods. Fordson Assembly Wholly on Progressive Plan—II, J. Edward Schipper. Automotive Industries, vol. 11, no. 18, May 1, 1919, pp. 960-966, 11 figs. Cylinder block and transmission housing assemblies travel along paralel lines until complete.

Haulage, Inter-Shop. Saving $200 a Day in Inter-Shop Haulage, R. M. Kinny. Factory, vol. 22, no. 5, May 1919, pp. 926-929, 9 figs. Minneapolis Steel & Machinery Co. have added a railroad despatching system to the use of ordinary industrial trucks with trailers.

Human Element. The Human Element in the Factory, Hugh K. Moore. Eng. & Indus. Management, vol. 1, no. 2, Apr. 24, 1919, pp. 327-331, 3 figs. Boiler performance curves for various forms are examined and conclusions are derived concerning influence of personal touch between employer and employee in creating research initiative in the latter.

Layout. Continental Plant Layout Facilities Production. Automotive Industries, vol. 40, no. 21, May 22, 1919, pp. 1122-1126. 10 figs. on supp. plate. Engine shipments go out on same tracks on which raw parts enter. (To be continued.)

The Designing of Factory Layouts for the Clay Industries, T. W. Garve. Jl., Am. Ceramic Soc , vol. 2, no. 3, Mar. 1919, pp. 195-207, 4 figs. Interior and selection of machinery as affected by kind and quantity of ware to be made, physical conditions of clay and local conditions and requirements.

Pattern Control. A Simple Pattern Control and Routing System. Foundry, vol. 47, no. 7, May 15, 1919, pp. 292-296, 11 figs. Method worked out at Canton Steel Foundry Co. It is based on five standard forms operated from central office.

Payroll Systems. Installing Accurate Payroll System, Clifford E. Lynn. Iron Trade Rev., vol. 64, no. 20, May 15, 1919, pp. 1289-1292, 9 figs. Maintenance of timekeeping and distribution method by co-operation of superintendent, foremen and workmen.

Production Control. Controlling Production in a Motor Plant, Charles Lundberg. Iron Age, vol. 103, no. 20, May 15, 1919, pp. 1279-1284, 10 figs. Obtainable from methods used by Mechanical Appliance Co., Milwaukee, are determination of comparative production, of labor costs, stage of manufacture each lot has reached at any time, quantity of each piece on hand or in process and deduction of faulty work.

Purchasing. Handling Orders in Steel Plants, Clifford E. Lynn. Iron Trade Rev., vol. 64, no. 15, Apr. 10, 1919, pp. 956-958, 3 figs. General forms by which purchase requirements are received, recorded and executed.

Repair Shop, Automobile. The Scientific Management of the Automobile Repair Shop (Application des principes de l'organisation scientifique à l'atelier central de réparations du service automobile), J. Compagnon. Bulletin de la Société d'Encouragement pour l'Industrie Nationale, vol. 131, no. 2, Mar.-Apr. 1919, pp. 299-328, 29 figs. Based on the Taylor system.

Weighing and Packing. Weighing and Packing by Machinery, Gilbert Balkan. Commercial America, vol. 15, no. 11, May 1919, pp. 41-45, 4 figs. Automatic weighing and packing illustrated by continuous operation applied to flour.

FINANCE AND COST

Appraisal. Advantages of the Engineering Appraisal, Charles W. McKay. Textile World Jl., vol. 55, no. 20, May 17, 1919, pp. 43-45. Discussion of federal tax problems of textile executives.

Appraising and Cost Finding, William F. Worcester. Concrete Age, vol. 30, no. 1, Apr. 1919, pp. 14-16. Address delivered before Am. Concrete Pipe Assn.

Costkeeping System. Manufacturing Non-Ferrous Metal Articles. Iron Age, vol. 103, no. 19, May 8, 1919, pp. 1209-1214, 10 figs. Annealing and pickling machinery and automatic safety devices in plant of Bridgeport Metal Goods Mfg. Co. also costkeeping system.

Costing as Applied to General Engineering, Chas. E. Lewton. Eng. & Indus. Management, vol. 1, no. 10, Apr. 17, 1919, pp. 310-317, 15 figs. Scheme in vogue at general engineering establishment is laid out with considerations on procedure adopted in commercial inspection, labor cost and allocation of predetermined establishment expenses to job; iron foundry costs; material costs and determining establishment expenses.

INSPECTION

Equipment, Inspection and Record. Demobilizing Equipment of Spruce Production Division. Eng. News-Rec., vol. 82, no. 20, May 15, 1919, pp. 967-968, 4 figs. System of inspecting and recording which is said to keep order among 4800 classifications.

Materials Before Acceptance. Inspection of Materials Before Acceptance, Emmanuel Mayaut. Contract Rec., vol. 33, no. 18, Apr. 30, 1919, pp. 417-419. Instances of failures caused by neglect to have concrete, sand and stone properly tested for quality before use.

LABOR

Convict Labor. Convict Labor on Highway Work; Organization, Administration, Camps and Cost Data, Good Roads, vol. 17, no. 18, May 3, 1919, pp. 189-190, 2 figs. Committee report presented at Convention of Am. Road Builders' Assn.

Fatigue, Industrial. Industrial Efficiency from the Psychological Standpoint—II, Chas. S. Myers. Eng. & Indus. Management, vol. 1, no. 12, May 1, 1919, pp. 359-360, 5 figs. Experiments with Krapelin's ergograph. Distinction is established between muscular fatique arising from excessive activity, producing clogging of physiological mechanism with products of that activity, and fatigue due to exhaustion of living substance of the muscles. Lecture delivered before Imperial College of Science & Technology.

Industrial Disputes. Organization in the Settlement of Industrial Disputes, V. Everit Macy. Eng. & Min. Jl., vol. 107, no. 19, May 10, 1919, pp. 825-828. Emphasizes that labor problem is merely a human problem and unless similar methods are employed in dealing with it as have been found effective with other human problems, maximum production and industrial peace cannot be realized.

Industrial Relations. The Status of Industrial Relations, L. P. Alford. Mech. Eng., vol. 41, no. 6, June 1919, pp. 513-516 & 556. Present aspect of labor and employment problems is held to be similar to that presented by these problems immediatcly afger civil war; situation, however, is considered as greatly amplified now. Suggestions to meet present emergency are made.

Industrial Efficiency from the Psychological Standpoint—I, Charles E. Myers. Eng. & Indus. Management, vol. 1, no. 2, Apr. 24, 1919, pp. 332-336, 6 figs. Improving mechanical conditions and sympathetic understanding of standpoint of others are considered far more important factors in determining industrial efficiency than capital or labor.

Industrial Co-operation, Charles P. Steinmetz. Am. Machy., vol. 50, no. 19, May 8, 1919, pp. 893-894. Merging capital and labor interests in one advocated as only way to meet present industrial requirements.

Labor Turnover. Reducing the Labor Turnover, W. C. Nisbet. Ry. Mech. Engr., vol. 93, no. 5, May 1919, pp. 265-268. Discusses advantages of applying employment department idea to railroad shops.

Modern Industrial Plants—VI-b, George C. Nimmons. Architectural Rec., vol. 45, no. 5, May 1919, pp. 450-470, 20 figs. Excessive turnover of labor and influence of employees' welfare work on reducing it. Conditions in various plants are quoted.

Night Work. Medical Argument Against Night Work, Especially for Women Employees, Emery R. Hayhurst. Am. Jl. of Public Health, vol. 9, no. 5, May 1919, pp. 367-368. How night work emphasizes intrinsic factors which bring about chronic fatigue.

Profit Sharing. Willys Profit-Sharing Plan on 50-50 Basis. J. Edward Schipper. Automotive Industries, vol. 11, no. 18, May 1, 1919, pp. 942-944. Provides for division of profits over and above amounts reserved for interest upon capital on a 50-50 basis between workers and employers.

How to Compass Industrial Cooperation, Charles P. Steinmetz. Coal Age, vol. 15, no. 20, May 15, 1919, pp. 904-906. Proposes to give labor dividends based on wages paid and on the amount of excess profits above a certain percentage, the gross returns to labor being made equal to the excess profits allotted capital.

Wages. Uniform Wages for Workmen. Contract Rec., vol. 33, no. 18, Apr. 30, 1919, pp. 403-406, 5 figs. Assn. of Montreal Building and Construction Industries reporting attempting to secure fixed wages and eliminate sub-contract abuses.

Welfare Work. Welfare Work for Employees in Industrial Establishments in the United States. U. S. Dept. Labor, Bur. Labor Statistics, Bul. no. 250, Feb. 1919, 139 pp., 40 figs. Fieldwork of investigation extended over period of twelve months in 1916 and 1917 and 31 states were visited in connection with study.

Women. Female Labour on Line Construction Work, J. B. Taylor. Post Office Elec. Engrs. Jl., vol. 12, part 1, Apr. 1919, pp. 26-31, 6 figs. Although work was hard, and meant exposure to all kinds of weather, experiment is reported as successful.

Women in Electrical Work. Elec. Eng., vol. 53, no. 1, Jan. 1919, pp. 11-13. British methods for training workers in war industries. From bul. issued by U. S. Dept. Labor.

Women as Factory Inspectors. Eng. & Indus. Management, vol. 1, no. 12, May 1, 1919, pp. 368-369. Duties of women in the capacity of assistant factory inspectors in several German states, notably Bavaria and Baden. From Technik & Wirtschaft.

LEGAL

Compensation. Compensation for Occupational Diseases, Riley M. Little. U. S. Dept. Labor, Bur. Labor Statistics, bul. 248, Mar. 1919, pp. 251-257 and (discussion), pp. 258-268. Contends that hazards of industry ought to be borne by society as a whole and not by individual workingman.

LIGHTING

Shop Lighting. Improved Methods of Shop Lighting. Power Plant Engr., vol. 23, no. 10, May 15, 1919, pp. 457-459, 5 figs. Comparison of general and localized system of illumination.

Wall Box Illumination. Lighting Without Hanging Ceiling Fixtures, J. L. Stair. Elec. Jl., vol. 16, no. 5, May 1919, pp. 183-187, 14 figs. Examples of wall box or wall pocket method of illumination.

RECONSTRUCTION

Financial Conditions. Some of Our Post-War Problems, Francis B. Sisson. Am. Mach., vol. 50, no. 20, May 15, 1919, pp. 935-937. Concerning particularly financial conditions resulting from war. Address before Indus. Conference of N. Y. Business Publishers' Assn.

Foreign Trade. Reconstruction Days. Metal Indus., vol. 17, no. 5, May 1919, pp. 207-210. Analysis of present business conditions and forecast of future of foreign trade.
Problems of Our Foreign Trade, G. A. O'Reilly. Am. Mach., vol. 50, no. 19, May 8, 1919, pp. 891-893. Address before Editorial Conference of N. Y. Business Publishers' Assn.

Foreign Trade Policy. The Stabilizing Effect on American Industry of a Definite Foreign-Trade Policy, James W. Hook. Am. Mach., vol. 50, no. 20, May 15, 1919, pp. 938-939. Address delivered before Sixth Nat. Foreign Trade Convention.

Industrial Democracy. Industrial Democracy, Charles A Eaton. Am. Mach., vol. 50, no. 20, May 15, 1919, pp. 933-935. Address before Indus. Conference of N. Y. Business Publishers' Assn.

Wage Problems. After-War Problems. W. L. Hitchens. Machy. Market, nos. 964 & 965, Apr. 25 & May 2, 1919, pp. 19-20 and 19-20. Wage problem in industry. Paper read before Roy. Soc. Arts.

SAFETY ENGINEERING

Accident Prevention. Safety from the Standpoint of Industrial Efficiency, C. W. Price. Official Proc. Ry. Club of Pittsburgh, vol. 18, no. 3. Feb. 27, 1919, pp. 58-71 and (discussion), pp. 71-79. Accident prevention as common ground on which employers and employees can meet, with mutual benefit as result.

Accidents. Comparison of Industrial with Military Casualties, I. M. Rubinow. U. S. Dept. Labour, Bur. Labor Statistics, bul. 248, Mar. 1919, pp. 217-225. Concludes that in peaceful times industrial life creates as many handicapped persons as would an army of 1,000,000 soldiers fighting on the battlefields of Europe.
Some Showing from Accident Records, Lucian W. Chancy. U. S. Dept. Labor, Bur. Statistics, bul. 248, Mar. 1919, pp. 30-37. Statistics of Bur. of Labor including causes of accidents and nature of injuries described as indicating that 58 per cent of accidents could have been prevented by adequate engineering provisions.
Shipbuilding Accidents. Eng. & Indus. Management, vol. 1, no. 12, May 1, 1919, pp. 379-381. Dangers to which workmen are subjected in a shipyard and how these may be minimized or eliminated.

Fire Fighting. Fire Engines and Effective Fire Fighting, Charles H Fox. Mech Eng., vol. 41, no. 6, June 1919, pp. 503-505. Essentials of effective fire fighting and their relation to fire engines as viewed by writer who believes that importance of methods employed in fire fighting is often underestimated by both laymen and engineers.

Fire Prevention. Fire Prevention in the Metal Trades—I. R. E. Swearingen. Metal Trades, vol. 10, no. 5, May 1919, pp. 213-216. A clean, well-managed plant is considered not only a safer risk, but a healthier and more satisfactory place to work in and of wholesome effect on the working force.
The Saskatchewan Fire Prevention Act and the Methods of Its Administration, Arthur E. Fisher. Quarterly of the Nat. Fire Protection Assn., vol. 12, no. 4, Apr. 1919, pp. 334-342. One section appoints local assistants to Fire Commissioner in every place, with practically all powers granted to Commission.

Mechanical Safeguards. Mechanical Safeguards, David S. Beyer. U. S. Dept. Labor, Bur. Labor Statistics, bul. 248, Mar. 1919, pp. 16-26. Emphasizes importance of mechanical guarding in addition to safety education for prevention of accidents. Desirability of standardizing mechanical guards is advocated and an account of work done in this direction by Standardization Committee of Nat. Safety Organization is mentioned.

TRANSPORTATION

Electric Trucks and Tractors. The Field for Industrial Electric Trucks and Tractors. Elec. Rev., vol. 74, no. 20, May 17, 1919, pp. 791-795, 7 figs. Examples of their application in various industries. (First article.)
Electric Vehicles, C. Tunstill Opperman. Surveyor, vol. 55, no. 1421, Apr. 11, 1919, pp. 271-272. Their reliability and economy on short journeys.

Truck Delivery Costs. Cost of Highway Concrete Delivered Wet by Trucks. Eng. News-Rec., vol. 82, no. 18, May 1, 1919, pp. 870-872, 3 figs. Delivery of wet concrete from central crushing and mixing plant to road surface, by motor trucks, over hauls ranging from ¼ mile to 4 miles reported as being satisfactorily accomplished by Maryland State Road Commission.

CIVIL ENGINEERING

BRIDGES

Culverts and Small Bridges. Culverts and Small Bridges, Charles D. Snead. Better Roads & Streets, vol. 9, no. 3, Mar. 1919, pp. 86-88. Examines mixing practice throughout State of Kentucky and lists what he terms faults in procedure.

Maintenance. *See Painting and Maintenance below.*

Military. Military Bridges Built by the English Army (Les ponts-routes militaires de l'armée anglaise), R. Meehin. Génie Civil, vol. 74, no. 15, Apr. 12, 1919, pp. 285-291, 18 figs. and 2 extra plates. Construction, and erection of Inglis, Portal, Dawit and Hopkins types. Organization of engineering corps.

Painting and Maintenance. Recommended Procedure in the Painting and Maintenance of Highway Bridges, Charles D. Snead. Mun. & County Eng., vol. 56, no. 5, May 1919, pp. 171-172. Periodical inspection of structures, particularly of small culverts after very hard rain, is recommended as advisable practice.

A Survey of Electric Railway Bridge Maintenance, R. C. Cram. Elec. Ry. Jl., vol. 53, no. 20, May 17, 1919, pp. 952-959, 11 figs. Specifications of Massachusetts Public Service Commission.

Raising Bridge. Raising Allegheny River Bridge 13 Feet by Jacking. Eng. News-Rec., vol. 82, no. 18, May 1, 1919, pp. 850-854, 9 figs. Increasing by 12.6 ft. the underclearance of a four-track, two-level steel structure at Pittsburgh without interruption of traffic.

Reinforcement. Reinforcement of Bridge by Means of an Eccentric Chord. Eng. News-Rec., vol. 82, no. 19, May 8, 1919, pp. 912-914, 4 figs. Strengthening steel bridge span in Chicago without infringing on underclearing and without using falsework.

Repairs. Repairs to Bridge at Kampen. Holland (Herstellingswerken aan de brug over den Djssel te Kampen), J. C. Pannekoel. De Ingenieur, vol. 34, no. 12, Mar. 22, 1919, pp. 204-205, 8 figs. Collision of steamer with one of the girders damaged bottom flange, plates and angles being torn away. Damaged parts were removed and actual tension on girder determined by calculation and checked by spring balance temporarily inserted.

Small Bridges. *See Culverts and Small Bridges above.*

Superstructure. Design of New Superstructure of Louisville Bridge with 644-Foot Riveted Span. Eng. News-Rec., vol. 82, no. 21, May 22, 1919, pp. 1007-1011, 10 figs., partly on separate plate. Replacement of Pennsylvania's historic Fink-truss bridge over Ohio River at Louisville, Ky., said to have involved design and erection under exceptional conditions.

Wilson Bridge. Wilson Bridge Combines Stone and Concrete. Contract Rec., vol. 33, no. 20, May 14, 1919, pp. 451-453, 4 figs. Six-span arch structure over river Rhone has masonry arches, cutstone trimmings and Hennebique type concrete deck.

BUILDING AND CONSTRUCTION

Army Construction Division. The World's Biggest Building Project, Arthur J. Widmer. Jl. Engrs. Club of St. Louis, vol. 4, no. 2, Mar.-Apr. 1919, pp. 125-141. Work of the Construction Division of the army said to have involved expenditure of $1,200,000,000 for period of 18 months.

Concrete Houses. Housing Project Construction Costs, Charles F. Willis. Concrete, vol. 14, no. 5, May 1919, pp. 185-190, 14 figs. Concrete houses in groups at Tyrone, N. M.

Cottage. The Perfect Double-Flatted Cottage Dwelling, Robert Thomson. Building News, vol. 116, no. 3353, Apr. 9, 1919, pp. 212-213, 1 fig. Structural arrangement of offices housing water-using appliances and their combination with entrance lobby makes each of them independently accessible therefrom.
Stucco-Coated English Type of House. Building Age, vol. 41, no. 5, May 1919, pp. 162-163, 4 figs. Plans, elevations and cross-sections of three-story 35-ft. x 31-ft. design.

Dams. *See Earthwork, Rock Excavation, etc.*

Factory Production of Building Parts. Reducing Construction Costs—II, Theodore F. Laist. Am. Contractor, vol. 40, no. 19, May 10, 1919, pp. 21-22 and 35. Suggests factory production of essential structural parts of dwellings as way to offset high cost of materials.

Floors. Reducing Construction Costs, Theodore F. Laist. Am. Contractor, vol. 40, no. 18, May 3, 1919, pp. 32-34, 10 figs. Reinforced-concrete floors in apartment buildings are suggested as means of decreasing depreciation charges and eliminating loss through obsolescence.

Halifax Ocean Terminals. Reinforced Concrete Building, J. J. Macdonald. Can. Engr., vol. 36, no. 18, May 1, 1919, pp. 427-429, 1 fig. General plan of part of Halifax ocean terminals showing coach-cleaning and storage yard.

Housing Projects. Notes on Grading and Planting Plans for Government Housing Projects, H. V. Hubbard. Landscape Architecture, vol. 9, no. 3, Apr. 1919, pp. 131-140. Concerning projects executed by U. S. Housing Corporation.

Competition for the Design of a Housing Scheme at Bözingen, near Biel (Wettbeewerb für eine Wohnkolonie im Fuchsenried in Bözingen bei Biel), Schweizerische Bauzeitung, vol. 73, no. 7, Feb. 15, 1919, pp. 67-72, 8 figs. Specifications required 60 per cent of dwellings should have 2 bedrooms, living room, kitchen, cellar and attic; 30 per cent 3 bedrooms instead of 2; and 10 per cent 4 bedrooms and in addition a separate kitchen. Schemes of six competitors and report of assessors are given with criticisms and comments.

Industrial Housing. Industrial Housing, C. W. Ruth, Stone & Webster Jl., vol. 24, no. 5, May 1919, pp. 388-392, 2 figs. Believes that the most economical structure is the five- to six-room house, because it allows family to take one or two roomers and boarders.

Reservoirs. Circular Concrete Reservoirs at Leamington, Ont., Edward M. Proctor. Can. Engr., vol. 36, no. 19, May 8, 1919, pp. 433-435, 8 figs. Provide storage of 1,000,000 imp. gal. Low unit stress has been used for steel and walls are entirely separate from floor.
Oil Fuel Reservoir of Rosyth. Engineer, vol. 127, no. 3301, Apr. 4, 1919, pp. 324-325, 2 figs. Concrete structure on rock foundation; walls built in form of retaining walls with average height of 35 ft., and reinforced with steel rods laid in direction of length of wall in layers 3 ft. apart in vertical direction, and spaced from 1 ft. to 4 ft. apart in horizontal direction.

Roofs. Erecting Long-Span Roof over Steel Mill by Rolling Trusses to Place. Eng. News-Rec., vol. 82, no. 19, May 8, 1919, pp. 898-902, 8 figs. Trusses rolled along craneway in groups weighing 800 tons.

School House. Standard School House Equipment and Details. Am. Architect, vol. 115, no. 2263, May 7, 1919, pp. 657-663, 11 figs. N. Y. City practice of forming folding partitions.

Vibrations. Vibrations in Buildings Due to Electrical Machinery, A. B. Eason. Post Office Elec. Engrs. Jl., vol. 12, part 1, Apr. 1919, pp. 32-40, 3 figs. Noise and vibration dealt with is that being due to telephone charging sets and ringing machines. Various reports dealing with conditions in post-office telephone exchanges are mentioned.

Warehouse. Eaton Mail Order Building, Moncton, N. B. Contract Rec., vol. 33, no. 20, May 14, 1919, pp. 449-450, 2 figs. Six-story flat-slab reinforced-concrete warehouse.

CEMENT AND CONCRETE

Car Floats. Construction of Concrete Car Floats for the Government. Concrete, vol. 14, no. 5, May 1919, pp. 181-183, 8 figs. Concrete is pourced in three units: (1) bottom skin, keelsons and frames, and outside skin and frames; (2) bulkheads; (3) stanchions, deck beams, girders and deck slabs.

Concrete Mixes. Correct Proportioning of Concrete Mixes, Duff A. Abrahms. Am. Architect, vol. 115, no. 2265, May 21, 1919, pp. 721-733, 9 figs. Report of investigations covering consistency (quantity of mixing water), size and grading of aggregates, and mix (proportion of cement, conducted during past three years at Structural Materials Research Laboratory, Lewis Institute, Chicago, with co-operation of Am. Inst. of Architects and Portland Cement Assn.

Design of Concrete Mixtures. Duff A Abrams. Concrete, vol. 14, no. 5, May 1919, pp. 191-195, 4 figs. Results of investigations conducted at Lewis Institute, Chicago, covering relation between consistency, size and grading of aggregates and mix.

Iron Portland Cement. Iron Portland Cement in Reinforced Concrete, Edwin H. Lewis. Iron & Coal Trades Rev., vol. 98, no. 2669, Apr. 25, 1919, p. 510. Claims that in properly made iron portland cement there should be no difficulty in keeping sulphur percentage below requirements of British standard specification. Paper before West of Scotland Iron & Steel Inst.

Mortars and Concrete, Physical Properties of. Physical Properties of Mortars and Concretes, H. M. Thompson. Can. Eng., vol. 36, no. 18, May 1, 1919, pp. 415-422 and 429, 18 figs. Tests show that 1:2 mortar without addition of chemicals and cured in a moist closet resists attack by alkali solution, but is disintegrated when steam-cured; addition of soap and aluminum sulphate decreases strength of mortars and renders them more liable to disintegration.

Pneumatic Concreting. Pneumatic Method of Concreting, H. B. Kirkland. Cement & Eng. News, vol. 31, no. 5, May 1919, pp. 23-25, 3 figs. Consist in blowing batches of concrete through pipe from central point of supply to their place into concrete form.

Retaining Wall. New Type of Sectional Concrete Retaining Wall. Ry. Rev., vol. 64, no. 19, May 10, 1919, pp. 690-691, 4 figs. Material in form of 8-in. reinforced-concrete I-beams was secured and laid in form of cribbing or retaining wall.

Rodding. Improving Concrete by Rodding, F. E. Giesecke. Eng. News-Rec., vol. 82, no. 20, May 15, 1919, pp. 957-958, 2 figs. Tests are said to have shown that strength is increased materially by continuous agitation of wet concrete with rods.

Setting Time of Portland Cement. Notes on the Setting Time of Portland Cement, F. Esling. Jl. Soc. Chem. Indus., vol. 38, no. 7, Apr. 15, 1919, pp. 81T-82T. Advocates further revision of standard specification of cement testing in respect to water that should be used in gaging cement-setting-time tests, and for this purpose distilled water is suggested as most readily obtainable standard.

Slag Production. Largest Slag Producer in America. Cement Mill & Quarry, vol. 14, no. 9, May 5, 1919, pp. 11-13, 14 figs. Plant at Ensley designed to produce 4000 tons of basic slag, crushed and screened in seven standard sizes.

Trunking, Concrete. Construction and Use of Concrete Trunking, B. A. Lundy. Ry. Signal Engr., vol. 12, no. 5, May 1919, pp. 169-170, 2 figs. Scarcity of cypress and high cost of sizes required led to development of this type.

EARTHWORK, ROCK EXCAVATION, ETC.

Dams. Sweetwater Dam Enlarged for the Third Time, H. N. Savage. Eng. News-Rec., vol. 82, no. 20, May 15, 1919, pp. 948-952, 6 figs. Construction of siphon spillways and enlargement of weir spillways to take care of maximum flood.

Dredging. Embankments of the Zuider Zee (De dijken in de Zuiderzee), K. dem Tex. De Ingenieur, vol. 34, no. 13, Mar. 29, 1919, pp. 227-228. Advantage claimed for suction dredges with pressure pipes is great output independent of wind and weather.

Filling. Computation of Time Required to Fill a Graving Dock, Eugene E. Halmos Eng. News-Rec., vol. 82, no. 19, May 8, 1919, pp. 920-921, 1 fig. Based on method of filling from upper orifice or from usual gate openings at bottom of dock.

Inspection of Dredging. Inspection of Drainage Ditch Cross-Sections After Contract Dredging, E. S. Blaine. Eng. News-Rec., vol. 82, no. 21, May 22, 1919, pp. 1019-1022, 7 figs. Soundings made by level rod gave way to lead and line following along tape.

Sinking. Sinking a Concrete Pumping Station in a River, Keith O. Guthrie. Eng. News-Rec., vol. 82, no. 21, May 22, 1919, pp. 1013-1016, 6 figs. House consisting of concrete cylinder 30 ft. in diameter lowered while being built from frame controlled by ratchet wrenches tied together for simultaneous movement.

Steam Shovel. A Review of Modern Steam Shovel Practice, with Recommended Procedure, Llewellyn, N. Edwards. Mun. & County Eng., vol. 56, no. 5, May 1919, pp. 176-179, 3 figs. Economy and efficiency of shovel operation believed to be mainly dependent on properly proportioned combination of latent power of machine with skill and experience of operator.

Tunneling. Tunnel Between Denmark and Sweden (Om tunnelbanen Kobenhavn-Malm), Heinrich Ohrt. Ingeniren, vol. 28, no. 15, Feb. 19, 1919, pp. 94-95. Project contemplates connection across harbor dam with Amagar Island. It is proposed to sink shafts at Saltohlm Island from which tunneling will be carried in two directions. Total length to be 31¼ miles of which 11 miles will be below sea level.

HARBORS

Philadelphia. Harbor Developments of the Port of Philadelphia in Progress and Contemplated, W. B. Ladue. Jl. Engrs. Club Philadelphia, vol. 36-5, no. 174, May 1919, pp. 188-193. Forecasts great future for this port, and suggests advertising its present possibilities.

MATERIALS OF CONSTRUCTION

Liquid Air. Liquid Air as an Explosive (Het schieten met vloeibare lucht in de Uederlandsche Kolenmijnen), W. H. D. de longh. De Ingenieur, vol. 34, no. 10, Mar. 8, 1919, pp. 176-179, 2 figs. Experiments with cartridges containing finely powdered soot, charcoal, bituminous coal, paper, cork, reed and sawdust saturated with liquid air. This explosive is said to have been found equal to dynamite.

Roofing Materials. Bituminous Roofing Materials and Construction—II, George Landis Wilson. Chem. & Metallurgical Eng., vol. 20, no. 9, May 1, 1919, pp. 484-486, 4 figs. Comparative tests of thickness, tensile strength, absorption of moisture, pliability, volatility and fillers.

ROADS AND PAVEMENTS

Asphalt. Hot Mix Asphalt Pavements. Francis P. Smith. Can. Engr., vol. 36, no. 21, May 22, 1919, pp. 472-474 & 482. Determining character of drainage and on manner of utilizing existing pavements. Paper read before Sixth Can. Good Roads Congress.

Bituminous Pavements. Defects in Surface of Bituminous Pavement Due to Concrete Base, H. W. Skidmore. Eng. News-Rec., vol. 82, no. 18, May 1, 1919, pp. 878-880. Data collected at Oak Park, Ill., intepreted as indicating that cracks and other objectionable features are a minimum where flexible foundations are used.

Efficiency of Bituminous Surfaces and Pavements Under Motor Truck Traffic, Prevost Hubbard. Am. City, City Edition, vol. 20, no. 5, May 1919, pp. 455-458. Views general opinion as rating increasing efficiency of bituminous types in the order; bituminous surfaces, bituminous macadam, bituminous concrete, sheet asphalt and asphalt block.

Brick. Design and Construction of the Monolithic Brick Road South of Seneca, Ill., A. H. Hunter. Mun. & County Engr., vol. 56, no. 5, May 1919, pp. 161-163, 6 figs. Plans call for alteration of grade by reduction to maximum of 7 per cent, a specification which required heavy excavation on hill.

Brick Pavements in the Middle West, A. T. Goldbeck and F. H. Jackson. Public Roads, U. S. Dept. Agriculture. Bur. Public Roads, vol. 1, no. 10, Feb. 1919, pp. 3-18, 14 figs. Writers conclude from their survey that type and thickness of base should depend upon maximum load or weight to be carried and the bearing value, under all weather conditions, of the underlying soil. Further conclusions applying to special cases were also formed.

General Features of Brick Pavement Construction, A. T. Goldbeck and F. H. Jackson. Eng. & Contracting, vol. 51, no. 19, May 7, 1919, pp. 479-481. From observations made during inspection trip of large number of brick roads in the Middle West. See Note to preceding item.

Present Status of Brick Pavements Constructed with Sand Cushions, Cement Mortar Beds, and Green Concrete Foundation, Wm. M. Acheson. Better Roads & Streets, vol. 9, no. 3, Mar. 1919, pp. 83-84. Paper before Am. Road Builders' Assn.

Concrete Highway Standards. Concrete Highway Construction Standards Raised. Eng. News-Rec., vol. 82, no. 20, May 15, 1919, pp. 955-956. Mississippi Valley State Road Officials recommend tamped concrete and heavier sections.

Concrete Sidewalks. Design of Concrete Sidewalks and Concrete Curb and Gutter at Street Intersections, W. Robert Paige. Mun. & County Eng., vol. 56, no. 5, May 1919, pp. 188-189, 3 figs. Examples of lines of walks and curves, intersected at angle of 78 deg. 14 min. on one side and 101 deg. 46 min. on other side.

Cost Charts. The Cost of a Mile of Road, George A. Duren. Eng. & Contracting, vol. 51, no. 19, May 7, 1919, pp. 485-486, 3 figs. Charts based on prices assumed as averages. Paper presented before Eng. & Road Builders' Congress.

Dixie Highway. Design and Construction of the Dixie Highway from Rockwood to Monroe, Mich., Leroy C. Smith. Mun. & County Eng., vol. 56, no. 5, May 1919, pp. 163-165, 2 figs. Metal top is 18 ft. wide with uniform thickness of 7 in. and 5-ft. shoulders. Grade is uniform, with no heavy cuts or fills, country being low and level and soil a heavy clay the entire length.

Easements and Superelevations. Superelevations and Easements, George Alden Curtis. Good Roads, vol. 17, no. 19, May 10, 1919, pp. 199-201, 5 figs. Field methods of constructing pavements with banked and easement curves.

Guarantees. Pavement Guarantees. Mun. Jl. & Public Works, vol. 46, no. 20, May 17, 1919, pp. 355-356. Practice of counties throughout U. S. A. as to requiring them and opinions of county officials as to their desirability.

Finishing Concrete Roads. The Finishing of Concrete Roads by Machine, E. G. Carr. Am. City, Town & County Edition, vol. 20, no. 5, May 1919, pp. 429-431, 2 figs. Illustrating how entrapped air is removed from concrete by alternating pressure.

Illinois. Illinois Adopts a Uniform Basis of Design for all Types of Rigid Pavement, Clifford Older. Eng. News-Rec., vol. 82, no. 19, May 8, 1919, pp. 905-907. State bond issue of $60,000,000 together with about $24,000,000 of Federal aid appropriation is to be expended for road building. It has been decided to use concrete or brick base or bituminous concrete base for main roads.

Macadam. Bituminous Macadam, A. W. Dean. Can. Engr., vol. 36, no. 21, May 22, 1919, pp. 469-470. Various rules are given for preventing unsatisfactory results with bituminous macadam.

Marker, Standardization. Uniform Markers for Our Highways, Roy E. Berg. Motor Age, vol. 35, no. 20, May 15, 1919, pp. 30-32, 14 figs. Road signs recommended for standardization.

PAVINGS FOR ELECTRIC-RAILWAY TRACKS. Investigation of Pavings for Electric Railway Tracks, H. S. Cooper. Elec. Traction, vol. 15, no. 5, May 1919, pp. 318-328. Advises that in comparing various types and kinds of paving it is well to consider that each has the type of base or foundation best suited to its stability as a whole and that such base or foundation is of ample strength of itself to relieve paving of any stresses or strains other than those which crush, roll or otherwise disintegrate or wear the actual body of the paving itself.

ROAD OIL. The Use of Road Oil. Am. City, Town & County Edition, vol. 20, no. 5, May 1919, pp. 423-427, 2 figs. Costs and tentative specifications prepared for highway engineers.

STATE HIGHWAY MANAGEMENT. State Highway Management,Control and Procedure, M. O. Eldridge, G. G. Clark and A. L. Luedke. Public Roads, U. S. Dept. Agriculture. Bur. Public Roads, vol. 1, no. 10, Feb. 1919, pp. 29-103, 28 figs. Schematic diagram of organization in state highway forces in 28 states.

WASHINGTON (STATE). The Road Building Sands and Gravels of Washington, Morris M. Leighton. Wash. Geol. Survey, bul 22, 1919, 307 pp., 45 figs. Studies covered (1) field examination to determinate nature, extent and manner of occurrence, and (2) laboratory tests to ascertain probably quality for gravel macadam and the various forms of pavement in which sand and gravel are used.

WOOD-BLOCK PAVEMENT. Procedure in Constructing an Open Joint Wood Block Pavement at Toledo, Ohio, Raymond Pierce. Mun & County Eng., vol. 56, no. 5, May 1919, pp. 174-175, 2 figs. Work carried on during winter months. Tractor was used to steam stone and sand and to furnish hot water for concrete mixer.

SANITARY ENGINEERING

COMFORT STATIONS. Comfort Stations Are National Necessities. Domestic Eng., vol. 87, no. 5, May 3, 1919, pp. 186-188 and 223, 2 figs. Need of immediate erection of public conveniences believed to be important part of reconstruction program. Arrangement suggested.

SEWAGE DISPOSAL. Results of Experiments With Miles Acid Process of Sewage Treatment, Edgar S. Dorr. Eng. & Contracting, vol. 51, no. 20, May 14, 1919, pp. 510-513. From experiments conducted at various institutions it is concluded that Miles process will produce a well-disinfected effluent from which 90 per cent. of settleable solids and 99 per cent. of the bacteria have been removed. From Jl. Boston Soc. Civil Engrs.

The Sewage Disposal Problem in Chicago, C. D. Hill. Mun. & County Eng., vol. 56, no. 5, May 1919, pp. 180-181. Dilution process used.

SEWAGE SCREENS. Operation of Fine Sewage Screens at Long Beach, California. Eng. News-Rec., vol. 82, no. 21, May 22, 1919, pp. 1012-1013. Tests reported to have indicated that screens remove 16.3 per cent. of solids.

SLUDGE ACTIVATION. Activated Sludge Experiments at Sheffield—Successful Results by Agitation, John Haworth. Contract Rec., vol. 33, no. 19, May 7, 1919, pp. 438-439, 1 fig. Analysis of samples from experimental aeration plant, Sheffield Sewage Works.

SURVEYING

ASTRONOMICAL MERIDIAN DETERMINATION. Polaris Observations for Azimuth in Northern Latitudes, J. Maughs Brown. Eng. Education, Bul. Soc. for Promotion of Eng. Education, vol. 9, no. 8, Apr. 1919, pp. 305-316, 4 figs. Suggestions intended to simplify field work and computations in determining astronomical meridian.

MAGNETIC MERIDIAN DETERMINATION. A Method of Determining the Magnetic Meridian as a Basis for Mining Surveys, T. Lindsay Galloway. Trans. Instn. Min. Engrs., vol. 56, part 4, Apr. 1919, pp. 222-227 and (discussion), pp. 227-235, 3 figs. Describes theodolite and three tripods, and appliance termed "magnetic reflector," which consists of a small plate-glass mirror to which is cemented a flat magnetized bar, the whole being delicately suspended by a single fiber of unspun silk, which are introduced in writer's method for the purpose of correcting what he terms the deficiencies in Beanland's extension of astronomical methods to underground surveying.

SPIRIT LEVELING. Spirit Leveling, R. B. Marshall. Dept. of the Interior, U. S. Geol. Survey, bulletins 632 to 636 and 638. In W. Va., Me., La., Ga., Ark.; and N. Mex. A separate bulletion for each state.

WATER SUPPLY

FACTORY WATER SUPPLY. What It Pays to Know About Factory Water Supply —III, Charles L. Hubbard. Factory, vol. 22, no. 5, May 1919, pp. 919-923, 7 figs. Contaminated drinking water supplied to workers said to have cost one company $50,000 in death and sickness claims.

FILTERING AT HIGH RATE. Reports on Detroit Waterworks. Mun. Jl. & Public Works, vol. 46, no. 19, May 10, 1919, pp. 334-337. Investigation conducted under auspices of Board of Water Commissioners concerning possibilities of filtering water at high rate.

RESERVOIRS. The High Service Reservoir of the St. Paul, Minn., Water Works, W. N. Jones. Mun. & County Eng., vol. 56, no. 5, May 1919, pp. 165-168, 6 figs. Investigation of proposition relative to securing entire city supply from artesian well and using Mississippi river as source of supply.

Improving Providence Water Supply, John Rositer Hess, Jr. Mun. Jl. & Public Works, vol. 46, no. 20, May 17, 1919, pp. 350-353. Temporary dam and regulating dam with spillway of horseshoe shape. Reservoir is expected to permit elimination of pumping.

TESTING STATIONS, WATER PURIFICATION. Testing Stations for Determining Critical Factors for Water Purification Plant Design, W. T. McClenahan and R. S Rankin. Eng. & Contracting, vol. 51, no. 20, May 14, 1919, pp. 515-516. Purpose of station was to study (1) effect of aeration on odor and taste, (2) kind and amount of chemical to be used and its effect on odor and taste, (3) period of sedimentation and time of contact giving best results, and (4) peculiarities in treatment of water contaminated by oil.

WATER SOFTENING. Water Softening for Municipalities, Milton F. Stein. Jl. Am. Water Works Assn., vol. 6, no. 2, June 1919, pp. 202-214, 5 figs. Essential features of softening plants are held to be mixing chambers in which softening reagents are thoroughly dispersed through the raw water, either by mechanical devices or by baffliug, large settling basins whose capaticy is based upon reaction period as determined for conditions of minimum temperature and means for adding a coagulant solution either at entrance to or near exist from settling basins or at both points.

WATERWAYS

CANAL, ADRIATIC TO SWITZERLAND. From the Adriatic to Switzerland by Canal Boat (Dall' adriatico alla Svizzera per canali navigabili), Guido Po. Rivista Marittima. vol. 52, no. 3, Mar. 1919, pp. 289-308, 11 figs. Venice-Brondola-Pizzighettones, up rivers Po and Adda and industrial canal to Milan. In process of construction.

FLOOD-WATER CONTROL. The Control of Flood Water in Southern California, Edw. N. Munns. Jl. Forestry, Soc. Am. Foresters, vol. 17, no. 4, Apr. 1919, pp. 423-129, 1 fig. Construction of stone ckeck-dams so placed across channel that the water, although able to percolate through them to some extent, collects in a basin behind the dam and then falls vertically, or nearly so, over its front face.

Short-Circuiting Floods in the Big Sioux River. Francis C. Shenehon. Eng. News-Rec., vol. 82, no. 20, May 15, 1919, pp. 961-964, 5 figs. Plan of spillway to guard against flood water in Big Sioux River near Sioux Falls, S. D.

VARIA

STUMP REMOVAL. Methods and Costs of Stump Removal in Land Clearing, F. M. White and E. R. Jones. Eng. & Contracting, vol. 51, no. 21, May 21, 1919, pp. 535-537, 3 figs. Examples of dynamite charges in various cases and stumping records made by crews. Investigations by Agricultural Experiment Station, Univ. of Wisconsin. Pulling with horse puller and then craking with dynamite said to have been found to be the most economical method of stump rem oval.

ELECTRICAL ENGINEERING

ELECTRODEPOSITION

GALVANIZING PLANTS. Planning and Operating a Galvanizing Plant, E. P. Later. Foundry, vol. 47, no. 7, May 15, 1919, pp. 289-291, 5 figs. Analysis of temperature factors and difficulties; remarks on choice of kettles, tanks and cleaning equipment.

ELECTROPHYSICS

CABLES, AERIAL. General Property of Aerial Cables (Sur une propriété très générale des câbles servant aux transport aériens), G. Leinekugel le Cocq. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 15, Apr. 14, 1919, pp. 761-764, 1 fig. Portion of cable between two suspension points considered as beam and deflections at various points determined in terms of horizontal tension at extremities and integral of bending moments to left of section.

CURRENT RECTIFICATION BY VOLTAMETER. Direct Current Generation by Applying Alternating Electromotive Force to Voltameter with Platinum Electrodes (Sur la production d'un courant continu par application d'une force électromotrice alternative *à* un voltamètre a électrodes de platine), P. Vaillant. Revue Générale de l'Electricité, vol. 5, no. 16, Apr. 1919, pp. 593-594. From Comptes rendus des séances de l'Académie des Sciences, vol. 168, Mar. 31, 1919, pp. 687-689.

EMISSION OF ELECTRICITY FROM INCANDESCENT BODIES. Emission of Electricity from Incandescent Bodies (L'émission d'électricité par les corps incandescents), A. Boutaric. Revue Générale des Sciences, vol. 30, no. 7, Apr. 15, 1919, pp. 198-211, 17 figs. Its application in construction of Fleming valve, audion and tudes acting by electronic discharges. The theory of operation of these apparatus is outlined and a mathematical theory of the operation of vacuum three-electrode tubes is presented. Second article.

OSCILLATIONS MAINTAINED. Electrotechnical Analogy of Maintained Oscillations (Sur une analogie électrotechnique des oscillation entretenues), Paul Janet. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 15, Apr. 14, 1919, pp. 764-766. Analogy between maintained oscillations used in wireless telegraphy and reversing motion of separately excited motor when fed by series generator and running on no load.

FURNACES

BOOTH-HALL ELECTRIC FURNACE. The Booth-Hall Electric Furnace, W. K. Booth. Iron & Coal Trades Rev., vol. 98, no. 2671, May 9, 1919, p. 716, 3 figs., also Can. Machy., vol. 21, no. 18, May 1, 1919, pp. 430-433, 7 figs. This conducting-hearth electric furnace has an auxiliary electrode for starting and automatic control. Paper read before Iron & Steel Inst., and Instn. Elec. Engrs. at joint meeting.

CONTROL OF TEMPERATURE. Metal Melting in Electric Furnaces, E. F. Collins. Metal Indus., vol. 17, no. 5, May 1919, pp. 221-224, 3 figs. Some characteristics of the furnace installation treated are control of temperature of heat-generating source and uniform distribution of heat generated.

HEROULT FURNACE. Work of the Electric Furnace. Elec. Eng., vol. 52, no. 5, Nov. 1918, pp. 12-13, 4 figs. Installation at plant of Driver-Harris Co., Harrison, N. J. Furnace is of Héroult arc type featured with automatic regulation; it has capacity of two tons.

NON-FERROUS METAL MELTING. Electric Furnace for Melting Non-ferrous Metals—I, Edgar F. Collins. Foundry, vol. 47, no. 7, May 15, 1919, pp. 284-288, 6 figs. Diagram illustrating principles of carbon-electrode type of furnace. Notes on continuity and dependability of service is melting brass commercially.

Melting of Non-Ferrous Metals and Alloys. Elec. World, vol. 73, no. 21, May 24, 1919, pp. 1110-1114, 5 figs. Data presented to show that saving of 100 per cent or more may be expected from electrical method in brass-melting industry.

SAHLIN FURNACE. A New Type of Electric Furnace, Axel Sahlin. Iron & Coal Trades Rev., vol. 98, no. 2671, May 9, 1919, p. 618, 2 figs. Built as circular ladle with contracted top and dished bottom. Paper read at joint meeting of Iron & Steel Inst. and Instn. Elec. Engrs.

STEEL-FURNACE PRACTICE. Pointers on Electric Steel Furance Practice, H. E. Diller. Foundry, vol. 47, no. 6. May 1, 1919, pp. 239-242, 6 figs. Data on arc-type furnaces based on research work conducted by writer and his experience in various foundries.

STEEL-FURNACE PROGRESS. Electrical Apparatus Development. Elec. World, vol. 73, no. 21, May 24, 1919, pp. 1102-1105, 4 figs. Growth of electric steel furnace indicated by-mentioning that while in July, 1913, there were only about 20 such furnaces in the U. S. A., at the end of 1918 there was a total of 287.

Electric Furnaces, W. E. Moore. Jl. Engrs. Club of St. Louis, vol. 4, no. 2, Mar.-Apr. 1919, pp. 166-183, 4 figs. History of development with remarks on quantity production. Arcetype furnace is considered as best suited type for foundry work.

Developments in Electric Iron & Steel Furnaces, J. Bibby. Iron & Coal Trades Rev., vol. 98, no. 2671, May 9, 1919, pp. 611-617, 23 figs. Remarks confined to development in manufacture of iron and steel by means of electric furnaces. It is emphasized that it is important for electrical engineers to grasp requirements of metallurgists and to be acquainted with working conditions of blast furnaces and steel foundries. Paper read at joint meeting of Iron & Steel Inst. and Instn. Elec. Engrs.

STEEL FURNACES. Large Electric Steel-Melting Furnaces, Victor Stobie. Iron & Coal Trades Rev., vol. 98,no. 2671, May 9, 1919, pp. 618-621, 8 figs. Suggested connnections for various sizes. Paper read at joint meeting of Iron & Steel Inst. and Instn. Elec. Engrs.

GENERATING STATIONS

CENTRALIZATION OF ELECTRIC POWER. The Significance and the Opportunities of the Central Station Industry, R. F. Schuckardt. Elec. Jl., vol. 16, no. 5, May 1919, pp. 166-168. Believing centralization of electric power will come eventually writer urges planning present extensions so that in due time interconnection can be carried out most economically.

The Primaries of Today, the Secondaries of Tomorrow, W. S. Murray. Elec. Jl., vol. 16, no. 5, May 1919, pp. 168-170. Advantages of centralization of electric power illustrated by quoting comparative load factors of central plants and plants otherwise operated.

EASTERN COMPANIES. Promising Outlook for Eastern Companies. Elec. World, vol. 73, no. 20, May 17, 1919, pp. 984-991, 14 figs. Central-station situation outlined for several communities, notably Philadelphia, Baltimore, New Jersey and New York City.

HYDROELECTRIC PLANT, SMALL. Opportunities for and Data on Small Municipal Hydro-Electric Plants, Wm. G. Fargo. Min. & County Eng., vol. 56, no. 5, May 1919, pp. 168-171, 3 figs. Example of rating curve for determining intermediate stream flow based on several flow measurements.

ICE MAKING AND REFRIGERATION. Central-Station Service for Ice Making and Refrigeration, C. J. Carlsen. Elec. Rev., vol. 74, no. 20. May 17, 1919, pp. 783-787, 6 figs. Status and growth of load in New York and Chicago indicating tendency to use synchronous motors.

MIDDLE WEST. Central Station Progress in the Middle West, Elec. World, vol. 73, no. 20, May 17, 1919, pp. 1001-1006, 8 figs. Engineering development of last eighteen months.

PEAT-FIRED CENTRAL STATION. Steam-Driven Central Station at Vasteras, Sweden (La Station centrale thermo-électrique de Västerås), V. Forssblad. Génie Civil, vol. 74, no. 15, Apr. 12, 1919, pp. 296-298, 3 figs. Designed to insure constant feeding of network served by hydroelectric plants. It utilizes peat available in region. From Teknish Tidskrift.

RAILWAY POWER STATION. New Railway Power Station. Southern Engr., vol. 31, no. 3, May 1919, pp. 36-39, 4 figs. Stations generates 2,400 kw. at maximum rating; present equipment consists of horizontal cross-compound Nordberg-Corliss engines driving 1200-kw. direct-current generators.

ROTARY CONVERTERS. An Interesting Rotary Converter Installation at Ilford. Electricity, vol. 33, no. 1485, Apr. 25, 1919, pp. 257-259, 4 figs. Inverted rotary converter with step-up transformer and rotary converter supplying continuous current at substation installed by Ceneral Electric Co., Ltd.,

TOTALIZATION OF LOAD. New Emergency Bus Feature in Brantford Hydro-Electric Station. Elec. News, vol. 28, no. 9, May 1, 1919, pp. 29-30, 3 figs. Scheme provides for totalizing load no matter which way current is fed.

TURBINES. The Year's Electrical Development. Elec. Eng., vol. 53, no. 1, Jan. 1919, pp. 23-28, 2 figs. Concerning particularly turbine unit installations.

GENERATORS AND MOTORS

CONVERTERS. Adapting Automatic Control to Motor-Started Converters, R. J. Wensley. Elec. Ry. Jl., vol. 53, no. 20, May 17, 1919, pp. 948-951. 6 figs. Control developed by Westinghouse Electric & Manufacturing Co. Principle is same as that of automatic control of self-starting machines.

HIGH-FREQUENCY MACHINES. Regulation of High-Frequency Machines (Sur les machines à haute fréquence et leur réglage), J. Bethenod. Bulletin de la Société Française des Electriciens, vol. 9, no. 78, Mar. 1919, pp. 161-176, 2 figs. Technical study. Formulæ derived both in case of a single machine and when two machines are coupled.

INDUCTION MOTORS. Three-Phase Currents in Mining Work. Elec. Eng., vol. 52, no. 6, Dec. 1918, pp. 18-20, 2 figs. Simplicity of squirrel cage for induction motor, absence of commutator in all forms of induction motors, and convenience with which large amounts of power can be transmitted over long distances, and their pressures converted to any figure that may be desired at the points of consumption, are believed to have given three-phase curren preference over continuous-current service.

LIGHT-WEIGHT GENERATORS. Light Weight Electric Generating Sets. Engineering, vol. 107, no. 2782, Apr. 25, 1919, pp. 531-533, 9 figs. Sets made by A. Lyon & Wrench, Ltd., Willesden, London. These have been used by Admiralty, War Office and Air Ministry, supplying power for daylight signaling, X-ray apparatus, battery charging, landing lights for aerodromes and general lighting of huts, dugouts, etc.

RADIOTELEPHONY, GENERATORS FOR. Dynamotors and Wind-Driven Generators for Radiotelephony, R. G. Thompson. Elec. Jl., vol. 16, no. 5. May 1919, pp. 205-210, 12 figs. Single-armature, double commutator, bipolar, ball-bearing, totally-enclosed direct-current machine, 5 in. in diameter and 8.5 in. long, weighing aproximately 15 lb.

SYNCHRONOUS MOTORS. Synchronous Motor Characteristics—II, Theo. Schou Elec. World, vol. 73, no. 18, May 3, 1919, pp 880-883, 12 figs. Compound squirrel-cage winding developed for pulling into step synchronous motors carrying full load.

Utilizing the Time Characteristics of Alternating Current, Henry E. Warren. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 5, May 1919, pp. 629-643, 10 figs. Small self-starting synchronous motor devised for driving timing devices such as clocks, graphic-instrument movements, time recorders, etc., directly from lighting circuits.

WINDING. Rewinding 12,000-Kw. Turbo-Generator Field. Elec. World, vol. 73, no. 18, May 3, 1919, pp. 893-894, 3 figs. Work performed on insulation and damaged coils.

IGNITION APPARATUS

MAGNETOS. Sparking Power of Magnetos, Harry F. Geist. Automotive Industries, vol. 11, no. 18, May 1, 1919, pp. 949-953, 8 figs. Oscillogram showing electromotive force across contact points of breaker and current flowing in ignition circuit for five different points of interruption.

Experiments on the High-Tension Magneto—II, Norman Campbell. Lond, Edinburgh, and Dublin Phil. Mag., vol. 37, no. 220, Apr. 1919, pp. 372-396, 16 figs. Object of experiments was to discover how far the relation between peak potential, primary capacity, and coupling of circuits, which is predicted by theory, is found in experiment. (Continued.)

SPARK PLUGS. The Operation and Design of Sparking Plugs, H. Warren. Automobile Engr., vol. 9, no. 123, Feb. 1919, pp. 59-63, 14 figs. Actual ignition of explosive charge in engine cylinder is particular case with which writer deals, attention being confined to physical conditions under which ignition is effected and operation and design of sparking plugs. (To be concluded.)

LIGHTING AND LAMP MANUFACTURE

LIGHTING CODES. Present Status of Industrial Lighting Codes, G. H. Stickney. Am. Architect, vol. 115, no. 2264, May 14, 1919, pp. 694-698. In four states and in several establishments industrial lighting codes have been adopted for the protection of workers from accidents and eye strain. Specifications deal with intensity, glare limits and distribution. Various texts are discussed and suggestions are offered. (To be continued). Paper presented at joint meeting of Am. Inst. Elec. Engrs. and Illuminating Eng. Soc.

MOTION-PICTURE PROJECTION. Mazda C. Lamps for Motion Picture Projection, A. R. Dennington. Elec. Jl., vol. 16, no. 5, May 1919, pp. 201-204, 6 figs. Westinghouse equipment.

MEASUREMENTS AND TESTS

CAPACITY AND CAPACITANCE. Measuring Capacity in a Three-Phase Armored Cable and Evaluation of the Current of Capacitance (Mesure de la Capacité dans les câbles armés triphasés en vue de l'évaluation du courant de capacitance) Raymond Bouzon. Revue Générale de l'Electricité, vol. 5, no. 18, May 3, 1919, pp. 651-653, 4 figs. Theory and formulæ.

ELECTROSTATIC GLOW METER. The Electrostatic Glow Meter, R. J. Wensley. Elec. Jl., vol. 16, no. 5, May 1919, p. 228, 4 figs. For indicating in high tension switching stations presence of potential, grounded phase or synchronism between two separate high-tension lines.

INSULATOR TESTING. Western Practice in the Testing of Insulators. Elec. Rev., vol. 74, no. 19, May 10, 1919, pp. 741-743. Report of Insulator Committee presented before Pacific Coast Section N.E.L.A. Covers tests used and adopted by various operating companies of Pacific slope together with description of equipment and limitations of the various methods.

Insulating Materials, Dr. Bultemann. Elecn., vol. 82, no. 17, Apr. 25, 1919, pp. 491-492. Their uses, breakdown voltages and preparation. (To be concluded). From Gummi Zeitung, nos 43, 45, 46, 47, 48, 1918.

Methods of Measuring Conductivity of Insulating Materials at High Temperatures, F. B. Silsbee and R. K. Honaman. Jl. Wash. Acad. Sciences, vol. 9, no. 9, May 4, 1919, pp. 252-266, 4 figs. Results obtained by use of alternating-current method on a number of types of samples. Figures show variation in resistance but similarity-in constant *b*, which is a measure of temperature coefficient of their resistance.

MAGNETO, PERMANENT. Note on the Testing of Permanent Magnets, J. D. Morgan. Engineering, vol. 107, no. 2782, Apr. 25, 1919, pp. 525-526, 5 figs. Writer feels that it is undersirable to depart from established practice of specifying in term of Brem *and Hç* but he suggests additional test for determining maximum *B H product*.

TEMPERATURE INDICATORS FOR ALTERNATORS. Temperature Indicators for Alternators, S. L. Henderson. Elec. Jl., vol. 16, no. 5, May 1919, pp. 193-196, 11 figs. Of exploring coil and therm-couplo methods while both are admitted to give satisfactory results still the latter is believed to give results nearer maximum measurable temperature because it is said it indicates temperature at a spot while exploring coil gives average temperature over its length.

VOLTAGE, HIGH. Electrastatic Apparatus for Measuring Vevy High Voltages (Technische elektrostatische Apparate zur Messung sehr hoher Spannungen) A. Imhof. Schweiz. Elektrotechnischer Verein, Bul. no. 3, vol. 10, Mar. 1919, pp. 47-52, 7 figs. Apparatus described by writer is based on principle whereby only part of the voltage passes through "measuring system" (2 electrodes, one stationary the other movable), the remainder of the voltage passing through a series condenser.

POWER APPLICATIONS

Filtration Plant. Electric Filtration Plant, R. U. Steelquist. Jl. Electricity, vol. 42, no. 9, May 1, 1919, pp. 427-438, 5 figs. Electrically pumped electrically filtered water supply of Albany, Ore.

Heat Treatment How the Power House Aids the Forge, L. F. Johnson. Iron Trade Rev., vol. 64, no. 19, May 8, 1919, pp. 1221-1226, 12 figs. How electricity is used for heat-treating guns and other heavy forgings by Inland Ordnance Co.

Heating. Heating Liquids by Electricity—the Past, the Present and the Future, H. O. Swoboda. Proc. Engrs. Soc. Western Pa., vol. 34, no. 8, Nov. 1918, pp. 537-571 and (discussion) pp. 572-574, 26 figs. Examination of several electric circulation water heaters, notably in the West, leads writer to believe that with the establishment of high-power ceotral stations electric heating devices offer sufficient advantages to predict their general adoption.

Plate Mills. Electrically-Driven Plate Mills, G. W. Haney. Elec. Jl., vol. 16, no. 5, May-1919, pp. 188-192, 14 figs. Of Brier Hill Steel Co. Two 66,000 volt lines connect to a main and auxiliary bus which is supported in structural work by suspension insulators; has arrangement allows flexbility in switching to permit any piece of apparatus to be cut out of circuit.

Quarrying. Quarrying and Working Stone by Electricity. Elec. Eng., vol. 53, no. 3, March 1919, pp. 105-107. Applications in Belgium, U. S. A. and Great Britain.

STANDARDS

Motor Rating. The Continuous-Rated Motor and Its Application, L. F. Adams. Elec. World, vol. 73, no. 19, May 10, 1919, pp. 936-939. Reasons for adopting 50-deg. temperature rise for motor rating. Efficiency of economical use of motor material as affected by development of motor design and amelioration of hot spots.

Voltage Standardization. Standardization of Voltage in Switzerland (Zur Frage der Vereinheitlichung der Betriebs-spannungen in der Schweiz), H. Schweiz. Elektrotechnischer Verein, Bul. no. 3, vol 10, Mar. 1919, pp. 43-47. Normal voltage to be fixed on basis of voltage most generally employed lately. Figures on hand show that 90 per cent. of current systems used and motors installed in 1918 were of the three-phase alternating-current type.

STORAGE BATTERIES

Charging. Charging Storage Batteries under Constant Voltage (Charge des accumulateurs sous tension constante), Fernand T'sas. Société Belge des Electriciens, vol. 33, Jan.-Mar. 1919, pp. 41-43, 2 figs. Scheme of connections.

TELEGRAPHY AND TELEPHONY, RADIO

Airplane Telephone Sets. Development of Airplane Radiotelephone Set, H. M. Stoller. Elec. Jl., vol. 16, no. 5, May 1919, pp. 211-214, 10 figs. Transmitting circuit consists of two three-element vacuum tubes connected to an input transformer operated by a microphone telephone transmitter. S. C. R-68 set.

Nomenclature. Nomenclature in Wireless Telegraphy—II, W. H. Eccles. Elecn., vol. 82, no. 17, Apr. 25, 1919, pp. 499-500. Ionic tubes used in radio work. (To be concluded.)

Static Interference. Static Interference and the Wireless, Roy A. Weagant. Elec. Eng., vol. 53, no. 3, Mar. 1919, pp. 117-119, 1 fig. Writer states that other investigators have considered characteristics of signal wave and static wave to be the same. He holds an opposite view and claims to have discovered the nature of the difference and on this knowledge to have based his invention for preventing static interference. Paper read before Joint Meeting of Inst. Radio Engrs. and N. Y. Elec. Soc.

Transatlantic Reception. Transatlantic Radio Reception, Charles A. Culver, Jl. Franklin Inst., vol. 187, no. 5, May 1919, pp. 525-579, 13 figs. In order to provide for transatlantic communication in event of failure of cables, representatives of Navy and War Departments decided to establish six experimental radio stations at Army posts. Conditions, personnel, equipment and results are discussed.

Valves, Ionic. Three-Electrode Lamp Valve (La lampe-valve à trois electrodes), C. Gutton. Revue Générale de l'Electricité, vol. 5, no. 17, Apr. 26, 1919, pp. 629-640, 16 figs. Work undertaken in the laboratories of the Radiotélégraphie Militaire.

TELEGRAPHY AND TELEPHONY, WIRE

Field Telephones. Field Telephone of the German Army (L'appareil téléphonique de campagne de l'armée allemande). Annales des Postes, Télégraphes et Téléphones, vol. 8, no. 1, 1919, pp. 94-102, 6 figs. Electrical scheme and connection for apparatus serving two lines.

Fullerphone. The Fullerphone, A. C. Fuller. Elecn., vol. 82, no 19, May 9, 1919, pp. 536-538, 5 figs.; also Engineer, vol. 127, no. 3301, Apr. 4, 1919, p. 435, 5 figs. Among advantages claimed for its application to civil telegraphy are saving of battery power, simplicity of wiring and manipulation of instruments, covering long distances without relaying and reduction to minimum of maintenance of lines. Paper read before Instn. Elec. Engrs.

Marine Telephone, Anti-Noise. A Successful "Anti-Noise" Marine Telephone. Pac. Mar. Rev., vol. 16, no. 5, May 1919, pp. 121-123, 3 figs. Use of both ears is permitted by special construction of hand set.

Protection of Lines. Systems of Protecting Telephone Lines against Falling on Trolley Wires (Los sistemas de proteccion contra la caida de los hilos telefonicos sobre las lineas aéreas de los tranvias eléctricos), Eug. Aigouy. Energia Electrica, vol. 21, no. 5, Mar. 10, 1919, pp. 58-61. Systems employed in Norway, Switzerland, Russia and Spain. (Concluded.)

Telephone Receivers. On the Determination of the Electrical and Acoustic Characteristics of Telephone Receivers, Louis V. King. Jl. Franklin Inst., vol. 187, no. 5, May 1919, pp. 611-625, 5 figs. Theoretical aspect presented from viewpoint of possible improvements.

Unification of Telegraph and Telephone Facilities. Unification of Telegraph and Telephone Facilities in the St. Louis-East St. Louis Terminal District, Frederick E. Bentley. Official Proc. St. Louis Ry. Club, vol. 23, no. 11, Mar. 14, 1919, pp. 236-246. Suggests unification plan.

TRANSFORMERS, CONVERTERS, FREQUENCY CHANGERS

Insulation. The Insulation of Distribution Transformers, A. C. Farmer. Elec. Jl., vol. 16, no. 5, May 1919, pp. 223-227, 15 figs. Advantages claimed for treatment at Westinghouse plant, which reduced windings to solid mass of copper and insulation.

Parallel Connections of Transformers. Parallel Connection of Transformers Fed by Ooe System or by Two Systems (La pratique de la mise en parallèle des transformateurs alimentés par le même réseau ou par deux réseaux), B. Guerschinovitch. Industrie, Electrique, vol. 28, no. 644, Apr. 25, 1919, pp. 148-153, 13 figs. Possibility of realizing delta or star connection in cases when both primary and secondary windings are at high tension, conditions being assumed to be theoretically perfect as regards connection of phases, etc.

Phase Transformation. Essentials of Transformer Practice—XXII, E. G. Reed. Elec. Jl. vol. 16, no. 5, May 1919, pp. 216-218, 5 figs. Phase transformation with autotransformers.

Scott Transformer Connections. Intensity and Maximum Power of Scott System of Connecting Transformers (Le calcul des intensités dans les transformateurs disposés suivant le montage de Scott et ses conséquences au point de vue de la puissance maximum admissible), E. Baticle. Revue Générale de l'Electricité, vol. 5, no. 17, Apr. 26, 1919, pp. 619-621, 2 figs. The two transformers are found to work under notably different conditions; consequently taking of suitable precautions is recommended.

TRANSMISSION, DISTRIBUTION, CONTROL

Circuit Protecting Devices. Circuits and Their Protecting Devices (in Japanese), M. Shibuzawa. Denki Gakkwai Zasshi, no. 369, Apr. 10, 1919.

Inductive Interference. Inductive Effects of Power Lines on Communication (in Japanese), M. Shibuzawa. Denki Gakkwai Zasshi, no. 369, Apr. 10, 1919.

Line Construction, Medium-Voltage. Construction Developments for Medium-Voltage Lines, D. F. Parrott. Elec. Rev., vol. 74, no. 18, May 3, 1919, pp. 703-708, 9 figs. Data of cost on man-hour basis. Paper read before Minnesota Electrical Assn.

Overload Relays. Overload and Reverse Power Relays, A. E. Hester. Elec. Eng., vol. 53, no. 1, Jan. 1919, pp. 17-22, 9 figs. Induction-type overload relay.

Substations. Outdoor Substations for Intercounty Development. Elec. World, vol. 73, no. 18, May 3, 1919, pp. 884-887, 10 figs. Substation through which small groups of consumers are being served from 26,400-volt circuits.

A Modern Substation, Roy R. Kiine. Power Plant Eng., vol. 23, no. 10, May 15, 1919, pp. 437-440, 5 figs. Substation serving congested district in New York City. Attention is called to limitations imposed upon construction by the necessity of placing substation near center of load, among residences, where real estate is high and where quiet operation and freedom from vibration are essential.

Largest Portable Substation. Elec. Eng., vol. 52, no. 6, Dec. 1918, pp. 11-12, 3 figs. Long Island R. R. Co. emergency substation having normal capacity of 1500 kw.

Voltage Regulation. Voltage Regulation, J. Humphrey. Iron & Coal Trades Rev., vol. 98, no. 2668, Apr. 18, 1919, pp. 472-473, 6 figs. Importance of regulating voltage in collieries and other industrial concerns Methods for securing it and description of Westinghouse system of compounding alternators, invented by Prof. Miles Walker.

WIRING

Hotel. Electric Service in World's Largest Hotel—I, Elec. World, vol. 73, no. 19, May 10, 1919, pp. 940-943, 8 figs. Schematic diagram of feeders in riser shafts extending from basement to roof.

VARIA

Leclanche Cells. Renovation of Leclanché Porous Pots and the Re-use of the Interiors of Spent Dry Cells, W. J. Thorrowgood. Ry. Gaz., vol. 30, no. 18, May 2, 1919, pp. 763-764. Reported that old porous pots were renovated by treatment with solution of one part hydrochloric acid and five parts water. Paper read before Instn. Ry. Signal Engrs.

Statistics. Statistics of the Electrical Industry. Gas Age, vol. 43, no. 9, May 1, 1919, pp. 474-475. Reports upon central stations and street railways issued by U. S. Census Bureau.

MECHANICAL ENGINEERING

CORROSION

Electrolytic Theory of Corrosion. The Effect of Air and Water on Materials Used in Engineering Work, H. E. Yerbury. Electrical Review, vol. 84, no. 2161, Apr. 25, 1919, pp. 484-486. Writer favors electrolytic theory of corrosion and quotes instances which, in his estimation, confirm it.

RUSTPROOFING. Metallic Coating for Rust-Proofing Iron and Steel—I, Henry S. Rawdon, M. A. Grossman and A. N. Finn. Chem. & Metallurgical Eng., vol. 20, no. 9, May 1, 1919, pp. 458-464, 1 fig. Recommendations in regard to rust-proofing metal coatings, with discussion of comparative values of different methods especially of zinc.

WIRE ROPE. The Internation Corrosion of Cables, Wm. Fleet Robertson. Min. & Sci Press, vol. 118, no. 18, May 3, 1919, pp. 589-591, 1 fig. Lack of internal lubrication is believed to have been cause of rope failure at Nanaimo, B. C. Colliery, which resulted in 16 instant deaths.

FOUNDRIES

ALUMINUM CASTING. Progress in Aluminum Casting. Metal Indus., vol. 17, no. 5, May 1919, pp. 211-213, 4 figs. McAdamite Aluminum Co's plant at Detroit said to have been erected with a view to have all operations go in continuous process from unloading of raw material to shipment of finished castings.

BRASS FOUNDRY. Materials and Chemicals Used in Brass Foundry Practice—VI, Charles Vickers. Brass World, vol. 15, no. 5, May 1919, pp. 139-141, 1 fig. Patented processes for producing phosphorus and its compounds. Serial dealing with history, properties, appearance, physiological action and commercial use of substances commonly used in brass founding.

CHAIN STEEL ANCHOR. Molding and Casting Heavy Steel Anchor Chain. Foundry, vol. 47, no. 320, Apr. 1, 1919, pp. 141-147, 13 figs. Development of process; method of assembling individual links in molds preparatory to pouring connecting links.

CRUCIBLES. Behavior Under Brass Foundry Practice of Crucibles Containing Ceylon, Canadian and Alabama Graphites, R. T. Stull. Jl. Am. Ceramic Soc., vol. 2, no. 3, Mar. 1919, pp. 208-226, 2 figs. Experimental research showed that substitution of Canadian graphite up to 25 per cent for Ceylon decreased life of crucible; the crucibles containing 100 per cent Canadian graphite are nearly as good as those containing 25 per cent Canadian and 75 per cent Ceylon, but that substitution of Alabama flake graphite for Ceylon improved crucible's life.

DIE CASTINGS. Die Castings and Their Application to the War Program, Charles Pack. Automotive Eng., vol. 4, no. 4, Apr. 1919, pp. 183-186, 9 figs. Development of industry, early machines and their work. Attempts to avoid blowholes and influence of this on machines. War castings produced.

JOB WORK. Diversified Output at Canton Plant. Foundry, vol. 47, no. 6, May 1, 1919, pp. 243-250, 11 figs. Organization of large foundry which produces castings weighing from 1 lb. up to 100 tons.

PUMP CASING. How a Large Pump Casing was Molded and Cast. Foundry, vol. 47, no. 7, May 15, 1919, pp. 281-283, 6 figs. Green-sand, skin-dried mold used with dry-sand core made on floor with the mold and dried in an oven.

RESEARCH. Application of Physical and Chemical Research to Cast Iron Foundry Practice (Exemples d'utilisation dans la pratique industrielle de la fonderie de fonte des résultats d'essais physiques et chimiques), J. Seigle. Bulletin et comptes rendus mensuels de la Société de l'Industrie Minérale, series 5, vol. 15, first issue of 1919, pp. 127-143, 13 figs. Technical discussion. Reference is made to investigations outlined in Industrie Minérale, second issue, 1918.

SAND BLAST. Application of the Sand-Blast, H. D. Gates. Iron Age, vol. 103, no. 18, May 1, 1919, pp. 1135-1138, 5 figs. also Metal Trades, vol. 10, no. 5, May 1919, pp. 203-206, 4 figs. second article. Relationship between air pressure and abrasion; sand-blast air drier adopted by Emergency Fleet Corp. Barrel, cabinet and table types at sand-blast equipment. Paper read before Newark Foundrymen's Assn.

SAND MOLDING. Ferruginous and Other Bonds in Molding Sands, P. G. H. Boswell. Foundry, vol. 47, no. 320, Apr. 1, 1919, pp. 148-150. European practice: mechanical and chemical analyses of English sands.

SHIP WORK. Making Castings Used in Ship Construction—II. Ben Shaw and James Edgar. Foundry, vol. 47, no. 6-7, May 1-15, 1919, pp. 251-255 and 297-300, 41 figs. Details of making rudder pattern by two methods and description of core-box construction. Ramming, setting and pouring basins.

STEEL CASTINGS. Making Steel Castings by the Best Steel Casting Company. Metal Trades, vol. 10, no. 5, May 1919, pp. 199-201, 5 figs. Lebanon pig iron, to which is added a considerable amount of low-phosphorus and low-carbon plate scrap, is used.

Foundry With Diversified Output. Iron Trade Rev., vol. 64, no. 19, May 8, 1919, pp. 1211-1217, 11 figs. Facilities created for large scale production of steel castings.

WHEELS, TRUCK. Making Quad Wheels in a Tractor Foundry. Foundry, vol. 47, no. 320, Apr. 1, 1919, pp. 157-161, 8 figs. Operation involved in manufacture of four-wheel drive army trucks.

FUELS AND FIRING

COAL STORAGE. The Storage of Coal, Eugene McAuliffe. Ry. Rev., vol. 64, no. 20, May 17, 1919, pp. 712-714, 1 fig. Concerning methods of unloading. Fuel Conservation Circular no. 17 of U. S. Fuel Administration.

PEAT. The Future of Peat as a Fuel—I, J. B. C. Kershaw. Coal Age, vol. 15, no. 20, May 15, 1919, pp. 898-901, 6 figs. Peat being considered as more widely distributed throughout the world than were the original beds of coal-forming materials, its utilization is considered advisable, and reference made to uses in various countries of drying and briqueeting it. (To be continued.)

PULVERIZED FUEL. Instructions for Safe Use of Pulverized Fuel. Engineer, vol. 127, no. 3304, Apr. 25, 1919, pp. 398-399. Prepared by Pulverized Fuel Equipment Co., N. Y.

Use of Pulverized Coal, With Special Reference to Its Application in Metallurgy, L. C. Harvey. Iron & Steel Inst., Ann. Meeting, May 8 & 9, 1919, no. 8, 73 pp., 29 figs., also, slightly abridged, Iron & Coal Trades Rev., vol. 98, no. 2671, May 9, 1919, pp. 590-599, 17 figs., and Colliery Guardian, vol. 117, no. 3045, May 9, 1919, pp. 1081-1085, 5 figs. (To be continued.) Examples of installations, details of burners, curves showing results of operation and operating costs, and bibliography of recent articles on powdered coal.

Pulverized Coal and Its Bearing on the Fuel Situation, H. G. Barnhurst. Am. Fertilizer, vol. 5^, no. 9, Apr. 26, 1919, pp. 48-49. Cost of pulverized coal equipment per boiler per rated boiler hp

GAGES

ERRORS. On Some Principles of Manufacturing Interchangeable Articles to Limit Gauges, G. Gerald Stoney and S. Lees. Engineering, vol. 107, no. 2777, Mar. 21 1919, pp. 361-362, 1 fig. Analytical derivation of error, based on Gauss' theoretical law of distribution of errors.

FLUSH-PIN SLIDING BAR. Flush-Pin Sliding Bar and Hole Gauges. Machy (Lond.), vol. 14, no. 345, May 8, 1919, pp. 163-171, 34 figs. Principles involved and procedure followed by Pratt & Whitney Co. in developing gauging systems for interchangeable manufacture. (Fourth article.)

JOHANNSON GAGES. The Use of Gage Blocks in Inspection, Ernst Mentor. Inspector, vol. 1, no. 1, June 1919, pp. 5-11, 37 figs. Development and uses of Johansson gages.

OPTICAL TESTING OF FLAT SURFACES. U. S. Bureau of Standards' Method of Measuring in Millionths, H. S. Bean. Inspector, vol. 1, no. 1, June 1919, pp. 12-13 & 21, 3 figs. Optical testing of flat surfaces and comparison of size standards.

TOLERANCES. Notes on the System of Tolerance in Mechanical Construction (Remarques sur le système des tolérances dans les constructions mécaniques). Génie Civil, vol. 74, no. 18, May 3, 1919, pp. 353-355, 10 figs. Technical study of limitations, based on principls of symmetrical and unsymmetrical systems.

GAS ENGINEERING

CENTRALIZATION OF GAS SUPPLY. Centralization in Public Gas Supply, J. H. Brearley. Gas World, vol. 70, no. 1812, Apr. 12, 1919, pp. 274-276, 1 fig. Discusses objections generally offered against centralization of gas supply. As example a scheme for Huddersfield (town adjacent to a number of small gas undertakings) is proposed.

DOORS, SELF-SEALING. Fifteen Oven of Michigan Light Company at Kalamazoo Have Capacity of 1,250,000 Cu. Ft. of High-Grade Gas per Day, Louis Resnick. Am. Gas Eng. Jl., vol. 110, no. 18, May 3, 1919, pp. 373-380, 6 figs. Salient features of installation is self-sealing doors which are said to have given satisfaction throughout six months of operation.

GAS FROM WOOD AND PEAT. Manufacture of Gas from Wood and Peat. Gas Jl., vol. 146, no. 2917, April 8, 1919, pp. 83-84. Swiss experience in commercial practice.

GAS PRODUCTION, NEW METHOD OF. New System of Gas Production (Et nyt system for gasfremfremstilling). Teknisk Ukeblad, vol. 66, no. 12, Mar. 21, 1919, pp. 174-175. Combination of present system of externally fixed retorts and water-gas producers, but combustion takes place inside retorts and is arrested when coal is changed to coke.

WATER-GAS. Water-Gas Operating Methods with Central District Bituminous Coals as Generator Fuel—Notes on Experiments on a Commercial Scale, W. A. Dunkley and W. W. Odell. State of Ill., Dept. Registration & Education, Div. State Geol. Survey, Co-operative Min. Ser., bul. 24, 1919, 27 pp. Summary of experiments on commercial scale.

HANDLING OF MATERIALS

BELT CONVEYORS. Coal and Ash Handling Equipment—III, Robert June. Refrig. World, vol. 54, no. 5, May 1919, pp. 25-27, 4 figs. Requirements for installing continuous belt conveyors.

COAL TIPPLES. New Coal Tipple at a Virginia Operation, C. Sharon. Coal Age, vol. 15, no. 18, May 1, 1919, pp. 796-798, 7 figs. Compact design embodying means for obtaining various grades or mixtures of grades.

IRON AND STEEL WORKS. Some Notes on the Handling of Raw Materials for Iron and Steel Works, W. W. McGosh. Jl. West of Scotland Iron & Steel Inst., vol. 26, parts 4 & 5, sessions 1918-1919, January 1919, pp. 68-74 and (discussions), pp. 74-78, 18 figs. on supp. plates, also Iron & Coal Trades Rev., vol. 98, no. 2670, May 2, 1919, p. 532. Illustrating practice in various Scottish plants.

ORE HANDLING. Automatic Ore Handling Plant. Iron & Coal Trades Rev., vol. 98, no. 2670, May 2, 1919, pp. 534-536, 15 figs., partly on supp. p.ate. Design for unloading railway wagons as they come into works with iron ore at a rate of 300 tons per hour.

TELPHERAGE. Power Plant Management; Coal and Ash Handling—III, Robt. June. Power House, vol. 12, no. 6, May 5, 1919, pp. 154-156, 4 figs., also Brick & Clay Rec., vol. 54, no. 9, May 6, 1919, pp. 778-779, 3 figs. (Third article). Installation of Jeffrey telpherage system at plant of Scioto Traction Co. Contents are discharged directly into coal pit from which coal is removed by brab bucket and transferred either to overhead bunker or to storage.

HEAT-TREATING

CARBURIZATION AT LOW TEMPERATURES. The Carburization of Iron at Low Temperatures, Andrew McCance. Iron & Steel Inst., Ann. Meet., May 8 ;& 9, 1919, no. 12, 5 pp., 1 fig. Consideration of variation of equilibrium conditions with temperature leads to assertion that above 550 deg. cent. ferrous oxide is more easily converted into carbide than pure iron.

CASE-HARDENING. Improvements in the Case-Hardening Process, D. Hanson and J. E. Hurst. Iron & Steel Inst., Ann. Meeting, May 8 & 9, 1919, no. 7, 19 pp., 6 figs., also Iron & Coal Trades Rev., vol. 98, no. 2671, May 9, 1919, pp. 573-575. Theoretical and experimental research leads to assertion that ordinary methods of case-hardening at or above 900 deg. cent. tend to formation of hyper-cutectoid layer in the case, which is a frequent source of flaking and grinding cracks.

FURNACES. Metallurgical Furnaces—II. Adolph Bregman. Metal Indus., vol. 17, no. 5, May 1919, pp. 218-220, 5 figs. Advises that in the design and operation of heat-treating plants, efficiency of furnace from standpoint of finished product be estimated from uniformity with which product is heated throughout its entire mass when heat chamber is filled to its full working capacity.

LOW-CARBON STEEL. Heat Treatment of Low-Carbon Steel, W. H. Wilkie. Jl. Am. Steel Treaters Soc., vol. 1, no. 6, Mar. 1919, pp. 194-206, 12 figs. Cautions against placing cold piece of steel into highly heated furnace, and recommends quenching piece with axis vertical in order to prevent excessive warping or cracks due to unequal contraction in cooling.

MEN. Fundamental Principles to be Considered in the Heat Treatment of Steel, R. A. Hayard. Chem. & Metallurgical Eng., vol. 20, no. 10, May 15, 1919, pp. 519-523. Advises encouraging men to think about the work they are handling and exercising creative instinct whenever possible, and developing sense of responsibility by allowing men to visualize their work by using charts and graphs.

STEEL-MILL PRACTICE. Relation of Steel Mill Practices to Subsequent Heat Treating, A. F. MacFarland. Jl. Am. Steel Treaters Soc., vol. 1, no. 6, Mar. 1919, pp. 183-193, 10 figs. Quantity of steel produced and its ability to respond to heat treatment giving superior pysical properties desired, said to depend entirely upon local conditions surrounding its manufacture.

HEATING AND VENTILATION

CENTRAL-STATION HEATING. Central-Station Heating in Detroit, J. H. Walker. Mech. Eng., vol. 41, no. 6, June 1919, pp. 497-503, 8 figs. Complete utilization of heat ordinarily discharged to condensing water in central electric generating station for purpose of heating buildings is held responsible and difficulties in way of even its partial utilization are pointed out with particular reference to conditions existing in Detroit. Paper for Springfield Meeting of A. S. M. E.

EQUIPMENT. Care of Heating and Ventilating Equipment—IX, Harold L. Alt. Power, vol. 49, no. 18, May 6, 1919, pp. 675-679, 9 figs. Several vapor systems are taken up and their characteristics explained, together with information regarding some of the special apparatus used with each.

THEATER VENTILATION. Theater Ventilation From a Health and Business Standpoint, E. Vernon Hill. Domestic Eng., vol. 87, no. 6, May 10, 1919, pp. 237-239 and 270. Mechanical equipment is judged necessary, and its installation profitable to contractor and owner.

HOISTING AND CONVEYING

COMPRESSED-AIR HOISTING ENGINE. Compressed Air Hoisting Engine for a Mine in India. Engineer, vol. 127, no. 3302, Apr. 11, 1919, pp. 356 & 363, 4 figs. Cylinders are 18 in. in diameter by 3-ft. stroke and work at pressure of 60 lb. per sq. in.

CONVEYORS, PORTABLE. Cutting Conveying Costs in the Brick Plant. Brick and Clay Rec., vol. 54, no. 9, May 6, 1919, pp. 765-767, 6 figs. Installation of portable conveyor. Examples of its applications as illustrated.

CRANE BRIDGE. TRANSPORTERS. Handling Devices in British Shell Shops—IV. Eng. & Indus. Management, vol. 1, no. 2, Apr. 24, 1919, pp. 349-355, 13 figs. Material is conveyed through shop by railways and two bridge crane transporters. (Concluded from p. 161.)

CRANES, GANTRY. A New Way of Loading Ocean Freighters. Ry. Elec. Engr., vol. 10, no. 5, May 1919, pp. 153-156, 7 figs. Illustrating how elecrically operated gantry cranes quickly transfer locomotives from cars to ship.

ELEVATOR CONTROL, ELECTROMAGNETIC. Electro-Magnetic Electric Elevator Control, T. Shutter. Elec. Eng., vol. 52, no. 6, Dec. 1918, pp. 36-38, 4 figs Otis Elevator control.

ELEVATORS, MECHANICAL. Mechanical Lifts—Past and Present, J. F. Robbins. Mech. Eng., vol. 41, no. 6, June 1919, pp. 507-512, 9 figs. A new type of lift described has the points of support of two counter-balancing loads so interconnected that movements of supporting elements of structure are synchronized and it is made impossible for supports to get out of level. Applicable to freight-car lifts, lift bridges, canal-lock lifts, etc.

FORDSON METHODS. Handling Parts in the Shop and on the Assembly Floor, J. Edward Schipper. Automotive Industries, vol. 40, no. 19, May 8, 1919, pp. 1009-1012, 5 figs. Conveying apparatus installed in tractor works of Henry Ford & Son plant.

INCLINED PLANE. Inclined Plane of the Union Mining Co., U. U. Carr. Coal Age, vol. 15, no. 19, May 8, 1919, pp. 856-857, 3 figs. Electrically driven hoist was installed in place of inclined-plane machine that proved inadequate to handle increased output.

MECHANICAL HANDLING EQUIPMENT. Seattle's Mechanical Handling Equipment, G. F. Nicholson. Pac. Mar. Rev., vol. 16, no. 5, May 1919, pp. 102-105, 4 figs. Consists partly of shearl-leg derricks, gantry cranes, stiff-leg derricks, 12 miles of railway tracks and eight loading platforms; equipment is electrically operated.

WINDING EQUIPMENT. An Electrically Driven Winding Equipment. Electrical Review, vol. 84, no. 2161, Apr. 25, 1919, pp. 460-461, 2 figs. Induction motor is geared to spur wheel on drum shaft, driving pinton being mounted on extension shaft supported by two bearings, connection to latter shaft being made through flexible coupling. Installed at Kilton Colliery in shaft 720 ft. deep.

HYDRAULIC MACHINERY

BIG CHUTE PLANT. Big Chute Generating Station, W. L. Amos. Can. Engr., vol. 36, no. 19, May 8, 1919, pp. 436-438, 4 figs. Evolution of present power plant at Big Chute on Severn river from 1909 to addition of four generating units in January 1919.

FRENCH PLANT. Hydroelectric Plant of the Loire and Center Electric Co. at Ance (L'usine hydro-électrique de l'Ance de la Compagnie électrique de la Loire et du Centre), Jacques de Soucy. Revue Générale de l'Electricité, vol. 5, no. 18, May 3, 1919, pp. 659-670, 15 figs. Output is 30,000,000 kw-hr. per year. (To be continued.)

GOVERNOR, HYDRAULIC TURBINE. New Hydraulic Turbine Governor (Nouveau regulateur à action indirecte et à indication mixte), Mo. Barbillion and M. Cayere. Houille Blanche, vol. 18, no. 25-26, Jan.-Feb. 1919, pp. 23-25, 4 figs. Advantages claimed are: extra rapid regulation, disappearance of speed oscillations, easy setting, and sensitiveness.

ICE TROUBLES. Design of Hydro-Electric Plants for Combatting Ice Troubles. R. M. Wilson. Jl. Eng. Inst. Can., vol. 2, no. 5, May, 1919, pp. 383-387 and (discussion), pp. 387-395, 2 figs. Classification and discussion of ice troubles. Remarks upon selection of site and design of head and tail-race channels with a view to eliminate trouble and damage both to the outside portion of development and to hydraulic equipment.

WATER HAMMER. Water Hammer in Conduits Made Up of Truncated Cones (Sur les coups de bélier dans les conduite de diamètre variable et formées de parties tronconiques), G. Guillaumin. Comptes rendus des séances de l'Academie des Sciences, vol. 168, no. 14, Apr. 7, 1919, pp. 723-725. Analytical. Concusion is reached that oscillation period is either smaller or greater than $2\theta = l/a$ according as conduit diverges or converges up the stream.

Pressures in Penstocks Caused by the Gradual Closing of Turbine Gates, Norman R. Gibson. Proc. Am. Soc. Civ. Engrs., Papers and discussions, vol. 45, no. 4, Apr. 1919, pp. 173-206, 9 figs. Determined from Professor Joukovsky's theory of maximum water hammer. Solution of problem by trial-and-error method is first given, and then formulæ are derived that cover governor time and relation between stroke and gate movement.

WESTERN CANADA PLANT. The Plant of the Western Canada Power Company, F. C. Perkins. Power House, vol. 12, no. 6, May 5, 1919, pp. 145-146, 1 fig. Hydro-electric plant operating at 125 ft. head.

INTERNAL-COMBUSTION ENGINES

ATMOSPHERIC CONDITIONS. Atmospheric Conditions Affecting Power, A. Johnson. Automobile Engr., vol. 9, no. 123, Feb. 1919, pp. 37-38, 3 figs. Table for estimating probable power and consumption of engine at elevations above sea level. Mathematical reasoning on which it is based is included.

DIESEL ENGINES. Diesel Engines Prove Economical at Lincoln, O. J. Shaw. Elec. Ry. Jl., vol. 53, no. 19, May 10, 1919, pp. 902-905, 9 figs., also Power, vol. 49, no. 19, May 13, 1919, pp. 734-736, 4 figs. Maintenance cost figures obtained at plant where three 350-kw. Diesel units have been in service for more than two years in combination with steam equipment.

War Developments in Marine Oil Engines, Mar. Eng. & Can. Merchants Service Guild Rev., vol. 9, no. 4, Apr. 1919, pp. 140-141, 3 figs. Schneider 2150-i.hp. submarine Diesel engine, as used in French navy.

ENGINE EXPERIMENTS. Engine Experiments, L. H. Pomeroy. Automobile Engr., vol. 9, no. 123, Feb. 1919, pp. 44-50, 11 figs. Influence of valve area, revolution speed, and combustion chamber design upon horsepower and thermal efficiency. Experiments made by Vauxhall Motors, Ltd., upon two 4-cyl. engines identical in design, save in arrangement of valves, which were of side-by-side type in one engine and overhead in the other.

GAS ENGINES. Large Horizontal Gas Engines in Modern Industry, H. Pilling. Gas & Oil Power, vol. 14, no. 164, May 1, 1919, pp. 109-119. Their application and working. Paper read before Cleveland Instn. of Engrs.

HEAVY-DUTY CAR ENGINE. New Golden, Belknap & Swartz Engine for Trucks. Commercial Vehicle, vol. 20, no. 8, May 15, 1919, pp. 32-33, 4 figs. Four-cylinder model, designed to handle low-grade fuel.
The 150 H. P. Ricardo Tank Engine, H. A. Hetherington. Automobile Engr., vol. 9, no. 125, May 1919, pp. 147-153, 27 figs. Cam details, governor arrangement, connecting-rod dismantling diagram, and table of general data. (Concluded.)

OIL ENGINE, MARINE. The Doxford Opposed-Piston Marine Oil Engine. Pac. Mar. Rev., vol. 16, no. 5, May 1919, pp. 106-108, 4 figs. Results obtained in tests on fuel economy and mechanical efficiency, tried out under supervision of chief surveyor of Lloyds.

ROTARY ENGINE. A Novel Rotary Engine. Autocar, vol. 42, no. 1228, Apr. 1919, pp. 572-573, 2 figs. Power controlled by varying mass of charge and combustion space in invention of P. H. Gergasse, Sussex, England.

LUBRICATION

SUBMERGED GOVERNOR PINS. Operation at Holtwood, Charles H. Bromley, Power, vol. 49, nos. 19 & 20, May 13 & 20, 1919, pp. 713-715, and pp. 770 776, 24 figs. Lubrication of submerged pins in governor operating mechanism. Record-keeping forms and follows-ups.

MACHINE ELEMENTS AND DESIGN

BALL BEARINGS. Ball Bearings and Haulage Economics, Arthur Hall. Iron & Coal Trade Rev., vol. 98, no. 2669, Apr. 25, 1919, p. 512, 2 figs. Test made at South African mines.

MACHINE SHOPS

CYLINDER GRINDING. Cylinder Grinding. Machy, (Lond.), vol. 14, no. 343, Apr. 24, 1919, pp. 93-99, 13 figs. Advantages of finishing cylinder bores by grinding; machines and auxiliary equipment used; practice in different plants manufacturing engines for automobiles and airplanes. (First article).

CYLINDER MACHINERY. Operations on the Liberty Motor Cylinders—11, H. A. Carhart. Am. Mach., vol. 50, no. 21, May 22, 1919, pp. 985-991, 14 figs. Information as to speeds, etc., in machining operations.

JIGS AND TOOLS. Jigs, Tools, and Special Machines, with Their Relation to the Production of Standardised Parts, Herbert C. Armitage. Engineering, vol. 107, no. 2778, Mar. 28, 1919, pp. 402-406, 10 figs., also Eng. & Mans. Management, vol. 1, no. 10, Apr. 17, 1919, pp. 301-306, 11 figs. (2d article). Advantages claimed are interchangeability of work, chapening of production, ability to use less-skilled class of lahor, elimination of fitting and introduction of assembling methods. (To be continued).
Templets Jigs and Fixtures, Joseph Horner. Engineering, vol. 107, nos 2777 & 2781, Mar. 21 & Apr. 18, 1919, pp. 367-370 & 493-497, 39 figs. Fixtures for use on plain millers, made by Kempsmith Mfg Co., Milwaukee, Wis. Multiple drilling machines constructed by Moline Tool Co., Moline, Ill. (Continuation of serial).

MILLING AND DRILLING MOTOR PARTS. Machining a Six-Cylinder Motor—I & II, J. V. Hunter. Am. Mach., vol. 50, nos. 18 & 19, May 1 & 8, 1919, pp. 851-853 & 887-890, 17 figs. Milling and drilling operations followed hy Falls Motor Corp. of Sheboygan Falls, Wis. Milling motor parts in Multiple.

THREADS, METRIC. Metric Threads, Theodore Chaundy and T. H. Plummer Engl. Mechanic & World of Sci., vol. 109, no. 2823, May 2, 1919, pp. 172-173. Rules for cutting them on English lathes. From Ministry of Munitions Jl.

TRAYS, WRENCH HOLDERS AND PANS. Arranging Trays, Wrench Holders and Pans on Machine Tools, F. Scriber. Can. Machy., vol. 21, no. 20, May 15, 1919, pp. 487-489, 18 figs. Examples of various types and discussion of their advantages.

MACHINERY, METAL-WORKING

CAST CUTTING TOOLS. Casting Cutting Tools from Crucible Steel, J. E Johnson, Jr. Foundry, vol. 47, no. 320, Apr. 1, 1919, pp. 162-164, 7 figs. Microphotographs made by Dividson process.

CYLINDER BORING AND REAMING TOOLS. Cylinder Boring and Reaming Tools. Machy. (Lond.), vol. 14, no. 342, Apr. 1919, pp. 61-68, 28 figs. Types and designs of cutter heads and reamers used for rough-boring and reaming small engine cylinders.

LATHE TOOLS. Capstan Lathe Tools—I, E. W. Field and A. E. Simpson. Machy. (Lond.), vol. 14, no. 345, May 8, 1919, pp. 173-175, 10 figs. Deals with spring-collet or split-jaw type of chuck, particularly design of H. W. Ward & Co., Brimingham. Paper read before Coventry, Eng., Soc.
Some Fittings and Attachments to a 5-in. S. C. Lathe for Repetition Work, T. W. Averill. Model Engr. & Elecn., vol. 40, no. 938, Apr. 17, 1919, pp. 275-282, 20 figs. Reduction gear and clutch for actuating lead screw to obtain self-acting sliding motion.

LATHES. The New Drummond Lathes. Machy. (Lond.), vol. 14, no. 345, May 8, 1919, pp. 153-158, 13 figs. Special reference is made to manner of testing, truth of fast headstock in relation to center axial line, relative height of center, cam action in chuck, cam action in lead screw and lead-screw pitch.

MACHINE TOOLS. Machine Tools, Alfred Herbert. Engineering, vol. 107, no. 2776, Mar. 14, 1919, pp. 355-358. Their development in recent years, with special reference to present tendencies to standardization. Paper before North East Coast Instn. of Engrs. & Shipbuilders.

MILLING MACHINES. The Becker Model D-1 Vertical Milling Machine, Am. Mach., vol. 50, no. 18, May 1, 1919, pp. 825-827, 3 figs. Designed to permit pieces of work weighing up to 10 tons being carried and machined on work table.
The New Cincinnati No. 5, High Power Milling Machine, John H. Van Deventer. Am. Mach., vol. 50, no. 21, May 22, 1919, pp. 971-976, 14 figs. Tool specially designed for quantity production.

MACHINERY, SPECIAL

COKE-QUENCHING, SCREENING AND LOADING MACHINE. Coke Quenching, Screening and Loading Machine. Gas World, vol. 70, no. 1811, Apr. 5, 1919, pp. 12-13, 1 fig. Machine consists of water-jacketed steel receptahle, slightly larger than the coke oven, and mounted on steel-framed traveling structure running on rails. Endless chain conveyor propels charge of incandescent coke into receptacle without exposure to air.

ROLLS. Design of Rolls for Making Ship and Boiler Plates. Machy. (Lond.), vol. 14, no. 342, Apr. 17, 1919, pp. 68-71, 4 figs. Drafts of slabbing and plate-mill rolls; universal mill; surface speed of rolls; rolling tin plate.

SEPARATOR, CENTRIFUGAL. Continuous Centrifugal Separation Machines. Engineering, vol. 107, no. 2776, Mar. 14, 1919, pp. 354-355, 7 figs. South African type which consists essentially of two bottomless buckets or vertical cylinders, revolving rapidly in a frame, around an upright spindle, each having an independent revolution on its own axis.
The Mauss Centrifugal Separators, E. M. Weston. Eng. & Min. Jl., vol. 107, no. 20, May 17, 1919, pp. 862-863, 6 figs. Type used for separation of colloids from slimes, particularly tin-ore slimes, consists of two bottomless buckets or vertical cylinders revolving rapidly in a frame around an upright spindle at a rate, for treatment of tin slimes, of 700 to 800 r p.m.

MATERIALS OF CONSTRUCTION AND TESTING OF MATERIALS

BRASS. The Effect of Work on Metal and Alloys, Owen Wm. Ellis. Metal Industry, vol. 14, no. 14, Apr. 4, 1919, pp 284-288, 13 figs. Effect of reduction by rolling on alpha-heta brass determined hy subjecting to deformation in the rolls a casting of 61 :39 brass containing traces of impurities and having had no prior treatment.

CEMENT. Why Materials of Construction Should Be Tested Prior to Their Use, Emmanuel Mavant, Mun. & County Eng., vol. 53, no. 5, May 1919, pp. 184-186. Argues that cement should not he considered as standard material hecause there is always a possibility, even though remote, of its coming out too fresh, to high in sulphuric anhydric, in magnesia or too low in specific gravity.

CHINA AND SEMI-PORCELAIN. Impact Tests and Porosity Determinations on some American Hotel China and Semi-Procelain Plates. Homer F. Staley and J. S. Hromatko. Jl. Am. Ceramic Soc. vol. 2, no. 3, Mar. 1919, pp. 227-240, 6 figs. Vitrified hotel china plates tested were not found superior as a class to semi-procelain plates resistance to heavy impact blows; however, they are said not to have chipped with light blows, while semi-porcelain did. No direct relation was believed to be discernible between porosity and resistance to impact.

CLOTH. Notes on the Quantitative Testing of Rainproof and Waterproof Cloth, Geoffrey Martin and James Wood. Jl. Soc. Chem. Indus., vol. 38, no. 7, Apr. 15, 1919, pp. 84T-87T, 2 figs. Six ways of waterproofing are mentioned, and methods of determining which of these has been applied to given cloth are indicated.

COPPER. The Influence of Cold-Rolling upon the Mechanical Properties of Oxygen-Free Copper, F. Johnson. Metal Indus. (Lond.), vol. 14, no. 14, Apr. 11, 1919, pp. 297-302, 14 figs. Method adapted to obtain sound piece of pure copper was to melt copper in graphite crucible under layer of fine charcoal, adding further portions step hy step until crucible was full of molten copper. When solidified, metal was heated to 900 deg. cent. and forged on anvil. Results of tensile tests are tahulated and figures of maximum breaking load. Paper read before Inst. Metals.

DEFORMATION OF CAST IRON IN BENDING. Observations of Elastic and Permanent Deformations in Testing Cast Iron and Steel Bars (Observations de déformations élastiques et permanentes dans les essais de flexion sur barreaux en fonte et en acier), J. Seigle. Bulletin l'Industrie Minérale, series 5, vol. 15, first issue of 1919, pp. 87-126, 30 figs. Characteristics of elastic curves of various specimens. Curves were drawn from values obtained in tests.

FATIGUE OF METALS. The Fatigue of Metals, H. F. Moore. Jl. Engrs. Club, Philadelphia, vol. 36-1, no. 173, Apr. 1919, pp. 138-142, 19 figs. Photomicrographs of specimens hefore and after stressing; proposed formula for failure-stress calculations; test data of repeated-stress tests.

FUEL OIL. Physical Tests of Fuel Oil, John W. Newton and F. N. Williams-Petroleum Age, vol. 6, no. 5, May 1919, pp. 189-191. Discussion of various tests and apparatus required in laboratory with reference to U. S. Navy specifications for fuel oil. Third article.

GALVANIZED SHEETS. Selection of Galvanized Sheets. Raw Material, vol. 1, no. 2, Apr. 1919, pp. 144-146, 5 figs. Concludes that from results of experiments and work done in commercial mill operations, the factors that are active in producing small granular spangles in galvanizing have their origin in the open-hearth process; and these causes can be eliminated only when sufficient care is taken to produce a steel substantially free from oxide.

IMPACT TESTING MACHINE. The Eden-Foster Repeated Impact Testing Machine. Machy. (Lond.), vol. 14, no. 343, Apr. 24, 1919, pp. 105-109, 11 figs. Machine attempts to combine effect of vibration test and impact test by subjecting specimen to both shock and reversal of stress.

MICA. Raw Materials Needed in the Electric Industry. Mica (De quelques matières premières nécessaires à l'industrie électrique. Le Mica), Desiré Pector. Revue Générale de l'Electricité, vol. 5, no. 18, May 3, 1919, pp. 673-678. Location of mica deposits in the world; crystallization of various kinds of mica. (Continuation of serial). Preceding articles appeared in R. G. E., vol. 4, July 20 & 27, 1918, pp. 87 and 121.

PORCELAIN (SEE ALSO CHINA). The Effect of Time and Temperature on the Microstructure of Porcelain, Albert B. Peck. Jl. Am. Ceramic Soc., vol. 2, no. 3, Mar. 1919, pp. 175-194, 15 figs. Petrographic microscopic examination reported as showing that quite dissimilar bodies can be produced by holding porcelain at a constant temperature for lengths of time which lie within variations of commercial practice, clay passing into amosphous silica and sillimanite which in turn passed into crystallized sillimanite.

RESISTANCE OF MATERIALS. The Resistance of Materials—III, G. S. Chiles and R. G. Kelley. Ry. Mech. Engr., vol. 93, no. 5, May 1919 pp. 241-243, 7 figs. Effect of sudden or abrupt changes in section on the distribution of the unit stress. Rubber specimens having cross-ruling in white ink were subjected to stresses; diagrams of resulting distortions in rulings are shown.

RUBBER (SEE ALSO: RESISTANCE OF MATERIALS). The Tensile Strength of Rubber-Sulphur Mixtures, O. de Vries and H. J. Hellendoorn. Jl. Soc Chem. Indus., vol. 38, no. 7, Apr. 15, 1919, pp. 91T-93T, 4 figs. Stress and strain curves on Schopper testing machine.

X-RAY EXAMINATION OF MATERIALS. The Examination of Materials by X-Rays. Engineering, vol. 107, no. 2783, May 2, 1919, pp. 576-578, 1 fig. General discussion held at joint meeting of Faraday Soc. and Rontgen Soc.

MEASUREMENTS AND MEASURING APPARATUS

DILATATIONS, MEASUREMENTS OF. The Use of the Interferometer in the Measurement of Small Dilatations or Differential Dilatations, C. G. Peters. Jl. Wash. Acad. Sciences, vol. 9, no. 10, May 19, 1919, pp. 281-284. Equations for determining changes in length observable with dilatometer originated by Fizeau.

FLOW METERS. Petrol Flowmeters and the Calibration of Jets, G. Smith-Clarke. Automobile Engr., vol. 9, no. 126, May 1919, pp. 140-146, 19 figs., also Automotive Industries, vol. 40, no. 21, May 22, 1919, pp. 1110-1113, 2 figs. Instruments devolved under specifications of standardization, requiring all jets to be calibered under constant head of 100 cm. and stamping number upon jets indicating quantity of gasoline in cubic contimeters passed through in 1 min.

FLUID PRESSURE AND VELOCITY. The Measurement of Fluid Velocity and Pressure, J. R. Pannell. Engineering, vol. 107, nos. 2776, 2777, 2778, Mar. 14, 21 & 28, 1919, pp. 333-334, 364-366, and 394-398, 23 figs. Hotwire anemometers. Direction and velocity meter. Manometers and hydrometers. (Concluded.)

KATA-THERMOMETER. On the Cooling and Evaperative Powers of the Atmosphere, as Determined by the Kata-thermometer, Leonard Hill and D. Hargood-Ash. Proc. Roy. Soc., Series B., vol. 90, no. B. 632, Apr. 1, 1919, pp. 438-444, 3 figs. In observations taken the kata-thermometer was heated in hot water in a thermos flask, being kept in water till the air space at top was about half full of alcohol. For theory and use of kata-thermometer see phil. Trans. (B. vol. 207, 1916, pp. 183-220).

MOISTURE AND GASES. Device for Measuring Small Quantities of Moisture in Gases, A. J. Crockatt and R. B. Forster. Jl. Soc. Chem. Indus., vol. 38, no. 8, Apr. 30, 1919, Trans. pp. 95T-96T, 1 fig. Fiber principle; chardonnet silk used.

OPTICAL METHODS OF MEASUREMENT. Measuring to the Millionth Part of an Inch. Robert I. Clegg. Iron Age, vol. 103, no. 21, May 22, 1919, pp. 1345-1348, 8 figs. Optical method used by U.S. Bureau of Standards and other similar optical methods.

SNOW SAMPLERS. The Measurement of Snow, Robert E. Horton. Can. Engr., vol. 36, no. 18, May 1, 1919, pp. 426-427, 5 figs. Description of various samplers.

SCALES. The Effect of Distance Between the Knife Edges on the Errors of Scales, C. A. Briggs, Scale Jl., vol. 5, no. 8, May 10, 1919, pp. 7-9, 4 figs. Assuming distance between load knife edge and fulcrum knife edge is changed by circumstances of rust or wear, or by error of construction, the resulting error in indication of scale is considered to depend on distance between knife edges and not on nominal multiplication of levers.

SPHEROMETRY. Refinements in Spherometry, G. W. Moffitt. Physical Rev., vol. 13, no. 4, Apr. 1919, pp. 251-271, 8 figs. Precision in mechanical methods is asserted to decrease rapidly as radius becomes larger; by auto-collimating method, up to limit of slide on turntable, precision is said to be high and independent of radius; methods are found to possess high degree of precision of measurement for concave surfaces of any radius, in measurement of convex surfaces, to decrease in precision with increase of radius.

TINTOMETER. Estimation of Cyanogen Compounds in Concentrated Ammonia Liquor, Percy. E. Spielmann and Henry Wood. Chem. News, vol. 118, no. 3077, Apr. 4, 1919, pp. 157-159. Calorimetric method employing the Lovibond tintometer.

VISCOSITY OF GASOLINE. Viscosity of Gasoline, Winslow H. Herschel Technol. Papers of Bur. Standards. no. 125, May 5, 1919, 18 pp., 4 figs. Method of judging volatility and viscosity of gasoline by density is considered as only a rough approximation and measurement of fluidity by Ubbelohde viscosimeter is estimated as a preferable criterion.

MECHANICS

CABLES, SUSPENDED. Laying Aerial Lines (La pose des lignes aériennes). Emile Pierard Société Belge des Electriciens, vol. 33, Jan.-Mar. 1919, pp. 10-40, 10 figs. Cloeren and Barbaret formulæ for determining tension in suspended cable. Writer proposes stretching to one-fourth ultimate strength at — 15 deg. cent.

COLUMNS. Strength of Various Long Columns, William Jackson. Can. Engr., vol. 36, no. 21, May 22, 1919. pp. 467-468, 1 fig. Formulæ said to have been derived from results of a large number of tests on columns.

PLATES. Maximum Tension in Square Plate Carrying Load Concentrated at Center (Valeurs maxima de la tension près de la face inférieure d'une plaque carrée supportant une charge unique concentrée en son centre), M. Mesnager. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 8, Feb. 24, 1919, pp. 392-395. Mechanical theory of plate supported at its periphery, taking into account thickness of plate.

PROJECTORIES. Formulæ of Trajectories (Sur les formules représentatives des trajectoires), M. Risser. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 8, Feb. 24, 1919, pp. 390-392. Parameters of compensating hyperbola.

STRESSES IN BEAMS AND TRUSSES. Ladders. Robt. T. Reddy. Fire & Water Eng., vol. 65, no. 21, May 21, 1919, pp. 1133-1135, 10 figs. On the manner of using a truss ladder of form used by fire departments. Remarks based on theory of stresses in beams and trusses.

STRESSES IN MACHINES. Stresses in Machines When Starting and Stopping—V. F. Hymans. Automative Eng., vol. 4, no. 4, Apr. 1919, pp. 189-190, 6 figs. Energy equations and mathematical calculations developed from consideration of forces on machine-tool parts without assuming that they are either at rest or in motion.

MECHANICAL PROCESSES

BARRELS, STEEL. Manufacture of Steel Barrels. Machy. (Lond.), vol. 14, no. 342, Apr. 17, 1919, pp. 72-76, 12 figs. Blanking barrel heads, bending sheets for bodies; welding, flanging, brazing, bilging, pickling and testing.

BOILERS. How to Design and Lay Out a Boiler—VII, Wm. C. Strott. Boiler Maker, vol. 19, no. 5, May 1919, pp. 137-139, 3 figs. Calculations for design of girth seams; layout of tubes; location of fusible plug and water-gage glass. (To be continued.)

Flues — II, George L. Price. Boiler Maker, vol. 19, no. 5, May 1919, pp. 128-130, 8 figs. Kinds of tools used on flue work and reasons for using them.

CHUCK MANUFACTURE. Universal Chuck Manufacture Machy. (Lond.), vol. 14, no. 343, Apr. 24, 1919, pp. 101-104, 16 figs. Methods employed by F. Pratt & Co., Ltd., Halifax.

CRANKSHAFTS. Manufacture of Crank-Shafts for Aeroplane Engines, Richard Vosbrink. Metal Trades, vol. 10, no. 5, May-1919, pp. 219-221, 10 figs. Specfications require that pins and journals must be to size within plus or minuis 0.0005 in.; other similar examples are quoted to indicate accuracy required.

DRAWING STEEL. Making Cold-Drawn Screw and Shaft Stock. Robert E. Clegg. Iron Age, vol. 103, no. 18, May 1, 1919, pp. 1129-1131, 5 figs. Factory of New England Drawn Steel Co. at Mansfield, Mass. Product is 3/16 in. to 1½ in. shafting and screw stock, rounds, hexagons and other shapes in cold-drawn free-cutting material.

FILES. Some Points in the Manufacture of Files, Geo. Taylor. Iron & Steel Inst., Ann. Meeting, May 8 & 9, 1919, no. 15, 34 pp., 29 figs., also abridged, Iron & Coal Trades Rev., vol. 98, no. 2671, May 9, 1919, pp. 584-588, 12 figs. Pleads for definite and organized systems of working in manufacture of files, such as will insure reliable quality of steel and production of blanks of uniform size and quality.

Gears. Gear Plant Makes War Record Iron Trade Rev., vol. 64, no. 15, Apr. 10th, 1919, pp. 947-952, 12 figs. How Falk Co. of Milwaukee organized for mass production of reduction gear sets for destroyers and cargo boats.

Hosiery Machinery. Manufacturing Banner Hosiery Machine—IV, Robert Mawson. Can. Machy., vol. 21, no. 20, May 15, 1919, pp. 481-483, 6 figs. Manufacturing operations on frames.

Liberty Motor Parts, Production of. Production of Liberty Motor Parts at Ford Plant, W. F. Verner. Mech. Eng., vol. 41, no. 6, June 1919, pp. 517-522 & 556. 11 figs. Describes process of forging cylinders from high-carbon steel tubing; also the 21 machining operations on bronze babbitt-lined crank-shaft bearings. Paper for Spring Meeting of A.S.M.E.

Marine Engine. Building Marine Engines on a Quantity Basis, F. B. Jacobs. Mar. Rev., vol. 49, no. 6, June 1919, pp. 273-282, 13 figs. Hooven, Owens, Rentschler Co. of Hamilton, O., said to be completing four 2800-hp. 3-cyl., triple-expansion, inverted-type marine engines per week, First article of a series, dealing with heavy units such as cylinders, crankshafts, bed plates, connecting rods, etc.

Milling-Machine Manufacture. Special Operations in Milling Machine Manufacture, F. B. Jacobs. Iron Trade Review, vol. 64, no. 14, Apr. 3, 1919, pp. 893-896, 13 figs. Seasoning of castings accomplished by exposing them to weather for a number of weeks, during which time they expand and contract with change in temperature from midday to midnight.

Rolling Mills. 19,000-Hp. Electric Reversing Rolling Mill Equipment. Engineer, vol. 127, no. 3301. Apr. 4, 1919, pp. 334-336, 6 figs. Motor comprises three units rigidly coupled together and mounted on common bedplate.
New Steel Works Built in England, Joseph Horton. Iron Trade Review vol. 64, no. 14, Apr. 3, 1919, pp. 879-883, 5 figs. Arrangement of 36-in. blooming mill and 21 and 18-in. bar mills at Phoenix Special Steel Works, Sheffield.
Pointers on the Designing of Wire Rod Mills, W. S. Standiford. Can. Machy., vol. 21, no. 18, May 1, 1919, pp. 426-429, 4 figs. Design of roll passes developed for manufacture of wire used in entanglements in front of trenches.

Vise Manufacture. How the Reed Vise is Made ,J. V. Hunter. Am. Mach., vol. 50, no. 20, May 15, 1919, pp. 923-926, 14 figs. Machining operations used by Reed Mfg. Co., Erie, Pa., especially in regard to obtaining interchangeability of parts.

MOTOR-CAR ENGINEERING

Daimler. The Daimler 2-3 Tonner Motor Traction, vol. 28, no. 739, Apr. 30, 1919, pp. 373-375, 7 figs. Specifications: 22.4-hp., 4-cyl., sleeve-valve engine; gross loaded weight allowable, 5½ tons four forward and one reverse speeds: overhead worm.

Gazelle. The 8-hp. Gazelle. Autocar, vol. 42, no. 1227, Apr. 26, 1919, pp. 616-618, 6 figs. Four-cyl. French car. Some of specifications are; forced lubrication, 3-speed gear box, and bevel-driven back axle.

Military Trucks. Military Transport Chassis—XI & XIV. Automobile Engr., vol. 9, nos. 123 & 126 Feb. 1919, and May 1919. pp. 39-42 & 137-139, 9 figs. Performance of Kelly Springfield K 40 (3½ ton) and Packard "4D" truck under war conditions.

Tractor Engines. Fuel Limitations of Tractor Engines, H. L. Horning. Automotive Industries vol. 40, no. 19, May 8, 1919, pp. 1001-1003 and 1043. Hints on overcoming common troubles. Paper read before Soc. Automotive Engrs.

POWER GENERATION

Delivery and Relative Fall Determination. Utilization of Hydraulic Energy (Programme d'étude pour l'amenagement des forces hydrauliques), R. de la Brosse. Houille Blanche, vol. 18, nos. 25-26, Jan.-Feb. 1919, pp. 1-5. How to determine delivery and relative fall; their significance in calculation of available energy. Reference is made by way of illustration to region of Pyrenées and central basin of France.

New England. War-Time Service Problems in New England Elec. World, vol. 73, no. 20, May 17, 1919, pp. 1007-1019, 31 figs. Details of plant growth, connected load and enforced economies are presented as factors which have contributed to establish reliability of central station service.

New South Wales. White Bay Power Station of the New South Wales Railways, O. W. Brain. Tramway & Ry. World, vol. 45, no. 18, Apr. 10, 1919, pp. 177-186, 6 figs. Plant supplies traction current for Sydney's tramways and also furnishes electric power for railway and tramway workshops, and various auxiliary services of department throughout metropolis, including signaling system, elevators, conveyors, lifts, pumps, air compressors, etc. Paper read before Elec. Assn. of Australia.

New Zealand. Hydro-Electric Development of New Zealand, E. Parry. Elec. Times, vol. 55, no. 1436, Apr. 24, 1919, pp. 259-260, 1 fig. Report of chief electrical engineer to Minister of Public Works.

Niagara Falls. Niagara Falls a War-Load Center. Elec. World, vol. 73, no. 20 May 17, 1919, pp. 996-1000, 4 figs. How electrochemical and electro-metallurgical loads were helped by interconnection of power.

Norway. Utilization of Water-Power in Norway (Statens forhold til vandkraften). Teknisk Ukeblad, vol. 66, no. 11, Mar. 14, 1919, pp. 156-160. For domestic heating, lighting and power purposes in place of imported coal. Comparison of costs.

Pacific Coast. Pacific Coast Plants Fully Loaded. Elec. World, vol. 73, no. 20, May 17, 1919, pp. 1031-1037, 12 figs. Interconnection of system is claimed to have enabled Western companies to carry increased loads despite lack of hydro-electric development.

Southern States. How the South Handled War-Time Loads, Elec. World, vol. 73, no. 20, May 17, 1919, pp. 1022-1030, 12 figs. Extensions and interconnections of transmission lines, particularly installation of reserve steam plant by Alabama Power Co.

Tennessee. The Larger Undeveloped Water-Powers of Tennessee, J. A. Switzer. State of Tenn. Geol. Survey, bul. 20, 1918, 35 pp. 36 figs. Description of existing plants and scheme for the utilization of available energy. Paper presented before Am. Electrochemical Soc.

United States. The Question of Hydro-Electric Development, D. H. Colcord. Elec. Eng., vol. 53, no. 2, Feb. 1919, pp. 59-63, 4 figs. Estimate of undeveloped resources in the U. S. A. is considered as 60,000,000 hp. Economic and other causes affecting development in various sections are mentioned.

POWER PLANTS

Boiler Efficiency. Graphic Calculation of Boiler Efficiency, Ralph E. Turner. Power Plant Eng., vol. 23, no. 10, May 15, 1919, pp. 450-451. 4 figs. Chart for calculating combined boiler and furnace efficiency when feed water is measured in cubic feet or pounds.

Boiler Room, Air Supply for. The Air Supply to Boiler Rooms, Richard W. Allen. Tran. Inst. Marine Engrs., vol. 30, no. 241, Mar. 1919, pp. 347-387, 38 figs. Report of investigation conducted in various vessels where closed stokehole systems had been adopted.

Boiler Supports. Reinforced Concrete Supports for Horizontal Tubular Boilers, H. E. Dart. Locomotive, Hartford Steam Boiler Inspection & Insurance Co., vol. 32, no. 5, Jan. 1919, pp. 130-142. 4 figs. Reinforced concrete is preferred for supporting suspended boilers because it is said that all of the material used (including reinforcing rods, lumber for forms, cement, sand. stone and water) are much more easily obtainable than structural-steel shapes and cast-iron columns and there is no delay in waiting for any of them to be fabricated.

Condensers. Notes on Surface Condensing Plants, with Special Reference to the Requirements of Large Power Stations, R. J. Kaula. Eng. & Indus. Management, vol. 1, no. 2, Apr. 24, 1919, pp. 342-346, 4 figs.. also Elecn., vol. 82, no. 17, Apr. 25, 1919, pp. 488-490, 3 figs., and Engineering, vol. 107, no. 2781, Apr. 18, 1919, pp. 522-524, 5 figs. Deals with problem of tube erosion. Advantage to be derived on siphonic circulating-water system by adopting parallel-flow principle. Paper presented before Instn. Elec. Engrs.

Hotel Plants. Plant of the Hotel Traymore. Power, vol. 49, no. 20, May 20, 1919, pp. 760-762, 5 figs. Plant comprises six 200-hp. water-tube boilers in three batteries. Building is heating with exhaust steam.
Electric and Elevator Equipment of the Hotel Pennsylvania, Chas. E. Knox. Power, vol. 49, no. 19, May 13, 1919, pp. 708-712, 8 figs. After studying possible methods of supply it was agreed upon to purchase steam and electricity from Pennsylvania R.R. and to install only a single engine-driven 500-kw. electric generator to be run during winter months, exhaust being used for heating and hot-water supply.

Oil-Fuel Plants. Economy of Arizona Power Plants Using Oil Fuel, C. R. Weymouth. Mech. Eng., vol. 41, no. 6, June 1919, pp. 523-526, 3 figs. Tables and curves of operating characteristics of three plants, embodying various similar features, but differing in methods of condensing, are presented. Paper for Spring Meeting of A. S. M. E.

Plants. Power Installation at the Old Hickory Powder Plant near Nashville, Tennessee. Power, vol. 49, no. 20, May 20, 1919, pp. 748-755, 8 figs. Equipment includes sixty-eight 823-hp. boilers, fifty-two 350 hp. engines, 17500-kw. in turbo-generators and 13 ammonia compressors driven by uniflow engine.
Power Plant Installation of the Braden Copper Co. at Rio Pangal, Chile (Instalacion de fuerza motriz para la Brandon Copper Co. en Rio Pangal, Chile), H. L. Cooper. Ingenieria Internacional, vol. 1, no. 2, May 1919, pp. 77-80, 5 figs. Details of hydroelectric plant with special reference to conduits.

Prime-Mover Plants. Tendencies in Prime-Mover Practice. Elec. World, vol. 73, no. 21, May 24, 1919, pp. 1106-1109, 4 figs. Advises that continuous service be safeguarded as steam turbines of great size are adapted.

PULVERIZED-COAL PLANT. Equipment for Using Pulverized Coal. Can. Mfr., vol. 39, no. 5, May 1919, pp. 40-42. Features of distributing system and waste-heat boilers at plant of Armstrong, Whitworth Co. of Canada, Ltd., at Longueuil. P.Q.

STEEL-MILL PLANTS. Steel-Mill Electric Drive—Present Status and Recent Developments, Brent Wiley. Elec. Rev., vol. 74, no. 19, May 10, 1919, pp. 737-740, 6 figs. One of noteworthy features of recent practice described is selection of large-size turbine units and a more liberal policy to provide for general plant electrification; this is approved on the ground that water rate for large-size turbines is materially better than for size of units formerly selected for mill use.

SUPERHEATERS. Superheaters at Collieries, Edward Ingham. Colliery Guardian vol. 117, no. 3045, May 9, 1919, pp. 1084-1085. In order to avoid unnecessary blowing off, writer believes superheater safety valve, which he recommends as a safety measure, should be loaded to pressure a few pounds in excess of that to which boiler safety valve is loaded.

TURBO GENERATORS. A Big Turbine-Generator Equipment, J. P. Rigsby, Elec. Eng., vol. 53, no. 4, Apr. 1919, pp. 156-159, 1 fig. Westinghouse cross-compound double unit, 45,000 kw. type, installed in power station of Narragansett Electric Light Co., Providence, R. I.

Sixty-Thousand-Kw. Turbine Installation, W. S. Finlay. Elec. Jl., vol. 16, no. 5, May 1919, pp. 172-182, 24 figs. Features specially proposed in design of scheme were concentration of auxiliary equipment and piping to provide ready access to machinery, valves, etc., placing auxiliaries within reach of cranes to facilitate dismantling and overhauling during off-peak hours, and avoiding right-and left-hand arrangements in auxiliary units in order to reduce necessary stock of spare parts.

POWER TRANSMISSION

BELTING. Relative Efficiency of Different Kinds of Belting, E. W. Bowman. Wood-Worker, vol. 38, no. 3, May 1919, p. 40, 1 fig. Chart of horsepower slip-curves obtained from comparative tests.

MOTOR LOCATION. Effective Transmission Most Essential to Economy, J. H. Rodgers. Power House, vol. 12. no. 6, May 5, 1919, pp. 147-154, 18 figs. Location of motor drive about midway of shaft length claimed to minimize shaft torque.

PRODUCER GAS

GAS PRODUCERS. Practical Operation of Gas Producers, J. S. M'Climon. Blast Furnace & Steel Plant, vol. 7, no. 5, May 1919, pp. 230-233, 4 figs. Methods of measuring fire. Generating of hot and cold gas; steam requirements. Purpose of article is to offer method for systematizing operating conditions in ordinary plant.

PUMPS

CORROSIVE LIQUORS, PUMPING. Pumping Corrosive Liquors. Engineering Review, vol. 32, no. 10, Apr. 15, 1919, pp. 296-297, 2 figs. Pumps made of "ceratherm." This material is an earthenware composition said to be insensible to sudden changes of temperature.

HYDRAULIC PUMPS. Steel Works Machinery. Engineering, vol. 107, no. 2783, May 2, 1919, pp. 567-569, 5 figs. Typical battery of hydraulic pumps. Features taken up are driving motor, working pressure, single-reduction gear with double helical machine-cut teeth, valve chambers and pump barrels of forged steel with renewable bronze valves and seats arranged for quick removal. (To be continued.)

REFRIGERATION

ETHYL AND METHYL CHLORIDE. Properties of Ethyl and Methyl Chlorides, Charles H. Herter. Refrig. World, vol. 54, no. 5, May 1919, pp. 11-14 and 27-28. Attention is called to possibilities of methyl chloride as refrigerating agent.

ICE PLANTS. Deterioration of Ice Plants, Fred Ophuls. Refrig. World, vol. 54, no. 5, May 1919, pp. 21-22. Advises giving attention to repairs immediately defects are known as means to prevent rapid deterioration.

The Toronto Plant of the Wm. Davies Co., W. F. Sutherland. Power House, vol. 12, no. 5, Apr. 25, 1919, pp. 111-113, 7 figs. Ice plant.

INSULATION, COLD-STORAGE. Cold Storage Insulation: Government Research. Cold Storage & Produce Rev., vol. 22, no. 253, Apr. 17, 1919, pp. 85-86, 1 fig. Report of tests at Nat. Physical Laboratory conducted by immersing large coil of piping in insulating material under test, and obtaining heat transmitted from the observed rise of temperature of the brine stream.

RESEARCH

BUREAU OF MINES, PITTSBURGH STATION. The New Pittsburgh Station of the Bureau of Mines—III & IV, George W. Marris. Coal Age, vol. 15, nos. 19 & 20, May 8 and 15, 1919, pp. 852-855, and 907-911, 11 figs. Analytical apparatus used in analysis of coal. Researches on combustion of coal in furnaces and absorption of heat by boiler.

INDUSTRIAL RESEARCH LABORATORIES. Industrial Physical and Mechanical Research Laboratories (Les laboratoires d'enseignement et de recherches de physique et mécanique industrielles), Jean Villey. Revue Générale des Sciences, vol.30, no. 8, Apr. 30, 1919, pp. 233-240. Scheme of co-operation between universities and industries. Its adoption expected to be important factor in developing French industry.

The Relationship between the Laboratory and the Workshop, W. R. Barclay. Metal Indus. (Land), vol. 14, no. 14, Apr. 11, 1919, pp. 306-309. Likeness of principles of operation and objects of accomplishment in laboratory and in workshops.

Co-ordination of Research in Works and Laboratories, H. R. Constantine. Elecn., vol 82, no. 16, Apr. 18, 1919, pp. 464-466. Scheme for establishing a self-supporting Board of Research. Board is to be treated in a similar way to Boards of Trade and Education. Paper before Instn. Elec. Engrs.

MUNICIPAL TESTING LABORATORIES. The Organization of a Standard Municipal Testing Laboratory, J. O. Preston. Can. Engr., vol. 36, no. 21, May 22, 1919, pp. 480-482. Installation of municipal laboratory for purpose of developing uniform standards and establishing fair basis for purchase of materials as well as securing proper usage of them.

PHOTOGRAPHY. Photography in Research, Arthur G. Eldredge. Chem. & Metallurgical Eng., vol. 20, no. 10, May 15, 1919, pp. 506-510, 14 figs. Examples of applications in industry and their considerations on opportunities of development.

TESTING EQUIPMENT—ARMOUR INST. OF TECHNOLOGY. Armour's Special Testing Equipment. Power, vol. 49, no. 18, May 6, 1919, pp. 670-679, 9 figs. Among other equipment which the Armour Inst. of Technology employs are apparatus for determining horsepower of automobile engines, influence of impact, bearing friction, belt slippage and heat flow through any material that can be prepared in flat slabs.

SPECIFICATIONS

STEEL. Specifications for Steel. Times Eng. Supp., vol. 15, no. 534, Apr. 1919, p. 130. Chemical specifications are not believed to be an expression of physical properties; it is said that much steel has been found serviceable which has been condemned on its chemical specification..

STANDARDS AND STANDARDIZATION

SULPHUR BOILING PLANT. The Standardization of the Sulphur Boiling Point, E. F. Mueller and H. A. Burgess. Jl. Am. Chem. Soc., vol. 41, no. 5, May 1919, pp. 745-763, 4 figs. Importance of sulphur boiling point as defining a standard temperature, and the necessity of obtaining further evidence upon certain questions concerning effect of experimental conditions upon the results obtained in its use, are considered.

STEAM ENGINEERING

BOILER POWER VS. TRACTIVE POWER. Boiler Power Versus Tractive Power—II, Wm. N. Allman. Boiler Maker, vol. 19, no. 5, May 1919, pp. 132-134, 2 figs. Graph showing percentage of boiler pressure for various piston speeds for both saturated and superheated steam, designed for use in calculating tractive power at any desired speed and to determine hp. (To be continued.)

TURBINES, LARGE. The Large Steam Turbine, J. F. Johnson. Jl. Engrs. Club Philadelphia, vol. 36-5,no. 174, May 1919, pp. 174-183, 7 figs. Graph indicating relative steam consumption for units of various capacities designed for equal costs per kw. hour; records of performance of large turbine units; notes on design and construction. Paper read before Phila. Section Soc. Mech. Engrs.

Three-Cylinder, 60,000-Kw. Turbine Installation, W. S. Finlay, Jr. Elec. World, vol. 73, no. 19, May 10, 1919, pp. 933-935, 4 figs. Operating details of three-element turbo-generator fitted with automatic control which enables any two elements to do the work of three in case of trouble.

Interborough Commission's 60,000-Ky Turbo-Generator Unit, W. S. Finlay. Jr. Elec. Ry. Jl., vol. 53, no. 19, May 10, 1919, pp. 906-907, 3 figs. Attention is directed particularly to automatic control features of installation.

TEXTILES

SLASHING OF COTTON WARPS. Slashing of Cotton Warps, Everett H. Hinckley. Textile World Jl., vol. 55, no. 19, May 10, 1919, pp. 61-63, 9 figs. Tests to determine influence of temperature on finer work.

SOAPS, SCOURING AND FULLING. Properties of Scouring and Fulling Soaps, F. Albert Hayes. Textile World Jl., vol. 55, no. 21, May 24, 1919, pp. 21 and 33, 4 figs. Theories as to deterrent power and photomicrographs showing structure of wood fibre.

WELDING

CRANKSHAFT WELDING. Welding Broken Crankshafts, J. H. Deppeler. Iron Age, vol. 103, no. 19, May 8, 1919, p. 1217, 2 figs. Suggestions in regard to methods of lining up broken parts for thermit process.

ELECTRIC WELDING. Electric Welding, W. H. Gard. Times Eng. Supp., vol. 15, no. 534, Apr. 1919, p. 137 Experiences in warships.

Electric Welding; Its Theory, Practice, Application and Economics. H. S. Marquand. Elecn., vol. 82, nos. 16, 17, 18 & 19. Apr. 18 & 25, May 2 & 9, 1919. pp. 468-469; 495-496; 515-517 and 541-543; 16 figs. Deals generally with Thomson process of resistance welding; describes plant used for spot welding, seam welding and butt welding; application of method to chain welding, tire and wire welding; spot-welding curves for equal thickness of sand-blasted plates and butt-welding curves for copper. (Continuation of serial.)

Electric Welding and Welding Appliances—VIII, IX, X, XI, XII. Engineer, vol. 127, nos. 3301, 3302, 3303, 3304, 3305, Apr. 4, 11, 18, 25, and May 2, 1919, pp. 319-332, 352-354, 375-378, 394-396 & 421-422, 36 figs. Resistance welders of Electric Welding Co., Holmes portable generating sets: plant consists of 4-cyl. gas engine of 28 b. hp. coupled to d. c. compound-wound dynamo having output of 250 amperes at 65 volts. Process followed by Steel Barrel Co., Ltd., in manufacture of steel drums.

The Technique of Arc Welding, F. A. Anderson. Jl. Electricity, vol. 42, no. 9, May 1, 1919, pp. 437-439, 23 figs. Methods of preparing work and detecting faults.

A Review of Some Modern Methods of Arc Welding, Thomas H. Heaton. Can. Machy., vol. 21, no. 19, May 8, 1919, pp. 463-465, 3 figs. Comparison of Benardos, Kjelberg and quasi-arc systems. (To be continued.)

Electric Welding, James Caldwell and Henry Bailey Sayers. Engineering, vol. 107, no. 2776. Mar. 14, 1919, pp. 350-351. Developments in Great Britain and U. S. A.; experiments on application of electric welding to large structures; application of electric welding in ship construction and repairs. Abstracts of papers read before Instn. Civ. Engrs.

Equipment Designed for Electric Arc. Welding—III, E. Wanamaker and H. R. Pennington. Ry. Elec. Engr., vol. 10, no. 5, May 1919, pp. 141-146, 14 figs. Types used in different systems, operating characteristics and circuits.

Electric Arc Welding for Repairing of Steel Parts (Soldadura de piezas de acero por medio del arco electrico), O. H Eschholz. Boletin de la Asociacion Argentina de Electro-Tecnicos, vol. 4, no. 12, Dec. 1918, pp. 902-905, 2 figs. Small arc and proper control of flame claimed to insure minimum oxydization of arc vapors and superficial deposits. (Concluded.)

Experiments on the Application of Electric Welding to Large Structures, Westcott Stile Abell. Steamship, vol. 30, no. 359. May 1919, p. 257. Account of experiments carried out on behalf of Lloyd's Register of Shipping. in order to determine possibility of application of electric arc welding to ship construction. Paper read before Instn. Civil Engrs.

Electric Welding and Its Applications. Walter Leonard Lorkin. Tramway & Ry. World, vol. 45, no. 18, Apr 10. 1919, pp. 197-200, 9 figs. Endeavors to show that process is simple, that it can be carried out with ordinary labor and that the welds are efficient and effected at small cost. Paper read before Roy. Soc. Arts.

GAS TORCHES. Modern Welding and Cutting—XII, Ethan Viall. Am. Mach., vol. 50, no 21, May 22, 1919, pp. 977-983, 21 figs. Description of various make of gas torches.

INSPECTION OF WELDS. Inspection of Metallic Electrode Arc Welds. Elec. Traction vol. 15, no. 5, May 1919, pp. 330-334, 7 figs. Graphs indicating approximate arc current and electrode diameter for welding steel plates of various thicknesses, also variation in weld strength with change in arc current.

OXY-ACETYLENE WELDING. Oxy-Acetylene Apparatus and Its Accomplishments in the M. C. T. Reconstruction Camp in France, George N Sieger. Welding Engr., vol. 4, no 5, May 1919, pp. 19-23, 7 figs. Personnel of welding shop. Installation of compression plant.

The Operation of Railways as an Engineering Problem*

By V. I. Smart, M.E.I.C.

In writing this paper I do not wish in any way to belittle the work done by the men who have recruited, almost exclusively, the forces of the Transportation Department. For energy, loyalty to duty, and resourcefullness under most trying circumstances they stand second to none. But I do feel that the Canadian Railways have suffered by not utilizing the services of the trained engineers, who are already in their employ, in connection with the problems which come up in the actual movement of trains. An engineer is fitted by his training to solve these problems in the movement of traffic, which the man who has come up through the train service, the dispatching service, or the clerical staff is not as well qualified to do. To a great extent these men are influenced by what their predecessors have done, and their training has not tended to produce as a general thing an analytical mind. It is only fair, however, to say that men running a high speed machine, like a railway, whose whole attention is concentrated on the necessity of keeping it moving, very often have not the time or opportunity to thoroughly consider ways and means, and often continue to use methods which have been introduced as expedients and which have apparently been satisfactory but which are far from being the most efficient that could be devised, if more consideration had been given, and deductions made from more complete data. I only hope to be able to indicate some of the questions which could be investigated by the engineer with advantage to the train operation. I make no pretense of covering the field but hope to be able to show that the movement of trains is distinctly an engineering problem.

The commodity which a railway has to sell is transportation, or the moving of passengers and freight from one place to another. The possibility of increasing the volume of this commodity is dependent on being able to tie together the greatest number of localities, and transport the most diverse classification of goods at a minimum cost per ton mile. The means employed are: first, the permanent way on which the traffic is moved; second, the vehicles in which it is moved; and third, the locomotive which moves it.

Railway operating expenses are divided into five grand divisions, each of which are again subdivided into numerous sub-heads. The grand divisions are Maintenance of Way, Maintenance of Equipment, Conducting Transportation, Traffic and General. The proportional charges to each of these are about as follows:—

Maintenance of Way	20%
Maintenance of Equipment	20%
Conducting Transportation	52%
Traffic	5%
General	3%

*Read by the author before the Montreal Branch, on April 3rd, 1919.

The design, maintenance and, to some extent, the operation of the cars and locomotives is under the direction and control of the Maintenance of Equipment Department, a department employing engineers. The construction and care of the permanent-way is also under the control of an engineering department. The actual use of these several means of producing transportation, which involves over half the operating expenditures, has been generally considered, in Canada, as outside the purview of the engineer. What I wish to point out in this paper is that the actual use of the means of transportation is just as much an engineering problem as is the design, construction and care of the means of transportation, and that the railways are the losers in not utilizing, in the Transportation Department, the men from these two recognized engineering departments. I feel strongly that a leaven from the engineers would add materially to the efficiency of the train operation and give to the engineer an objective, for which to work, that he at present does not have.

The definition of an engineer is—"one who applies the principles of science to economic use," and his training is such as to cause him to build up only after he has analyzed a problem sufficiently to be sure of his foundations. When he meets a new question, his first instinct is to resolve it into its elements and, having determined the principles involved, builds up his structure to produce an economic result. The problem which confronts the transportation man is the movement of a maximum tonnage with the minimum number of cars and engines, in a minimum of time, with maximum use of permanent-way, at a minimum cost per ton mile. It can hardly be expected that in a paper of this kind a complete analysis can be made of the above problem, but the following will give some idea of its nature.

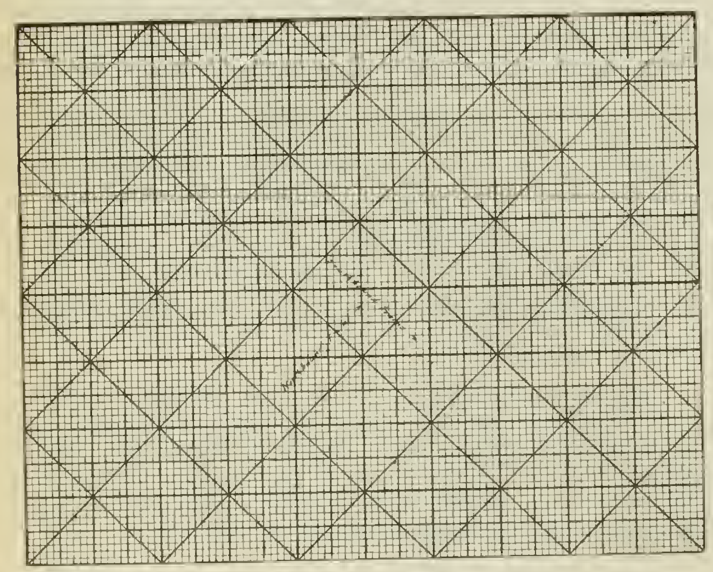

Diagram 1.—Passing tracks equally spaced as to time of running between them, for trains of one class. The leaving times between trains in one direction is the round trip time interval between any two passing tracks.

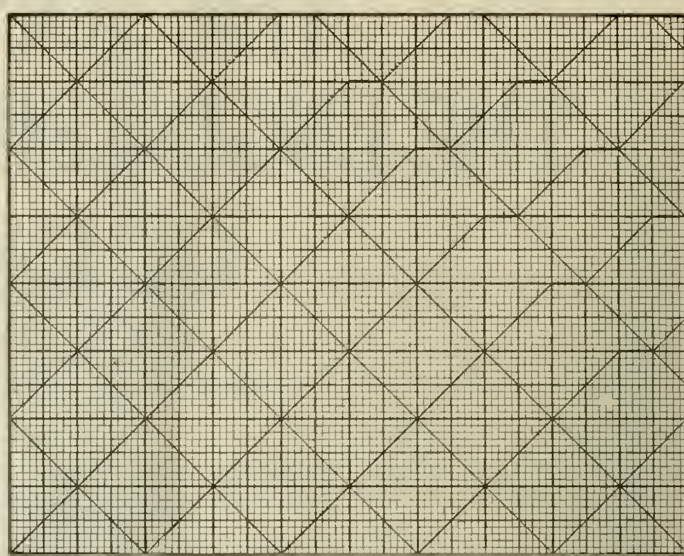

Diagram 2.—Indicates the delay to inferior direction trains, if trains are dispatched from terminals at greater intervals than the round trip time interval. All passing tracks being equally spaced.

Minimum cost per mile.

  - Density.
- Minimum number of cars.............
  - Routing.
  - L.C.L. loading.
  - Car capacity.
  - Car movement.
  - Car service.
  - Demurrage.
  - Fast freight sy.
  - Car loading.
  - Yard facilities.
  - Car distribution.
- Minimum number of engines..........
  - Engine rating.
  - Engine distribution.
  - Engine crews.
  - Terminal delay.
  - Running time.
  - Round house service.
  - Repairs.
  - Density.
- Minimum time.....
  - Schedules.
  - Passing facilities.
  - Dispatching.
  - Coal and water.
  - Yard capacity.
  - Pass. train interference.
  - Freedom from wrecks.
  - Standard code.
  - Average grades.
- Maximum use of permanent-way per unit of time.
  - Single track.
  - Water tanks.
  - Passing tracks.
  - Yards and terminals.
  - Double track.
  - Additional tracks.

As part of the cost of operation is the fixed charges, it is essential that these be kept to a minimum. Expenditures for equipment and facilities, which are not being used to their maximum, is a serious economic waste. It becomes important, therefore, that, before, such expenditures are made for additions, the greatest efficiency has been obtained from the capital already invested. The most expensive improvement, and one which I think has been made in a great many cases without sufficient investigation, is the building of a second main track. Very often double track has been built because the superintendent was having difficulty in getting the trains over the division, and he concluded that if he had a double track these difficulties would disappear; whereas, the real difficulty was insufficient passing facilities, badly spaced passing tracks, badly located water facilities, or insufficient yard capacity. There is nothing in a double track to create new traffic. It gives a road added potentiality to move traffic if the traffic exists but, unlike branch lines into new territory, it does not necessarily bring new traffic to the line. It is therefore possible, or indeed quite probable, that the traffic which would pay the charges on the cost of the single track will not now meet the charges for the double track. It is important then that the maximum capacity be secured from the single track, and any improvements to increase this, which cost less than the second main track, should first be undertaken. There is the question of increased safety which is so often brought up as a justification, but with a modern block signal method of operation this claim loses its strength.

In operation, time is the essence of the contract. The rate of the ruling grade has the most direct effect on the tonnage which a given locomotive can haul, but in the actual operation it becomes necessary to determine the

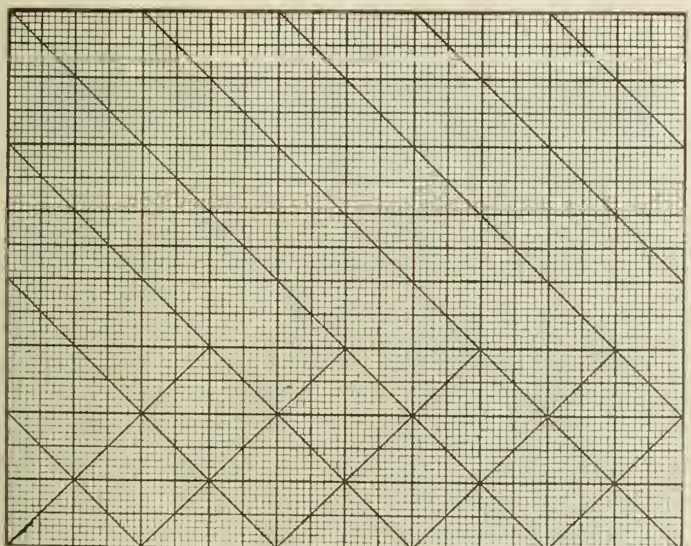

Diagram 3.—Indicates the impossibility of getting inferior direction trains over the road if the leaving times are based on anything but the maximum spaced passing tracks, where the passing tracks are not equally spaced.

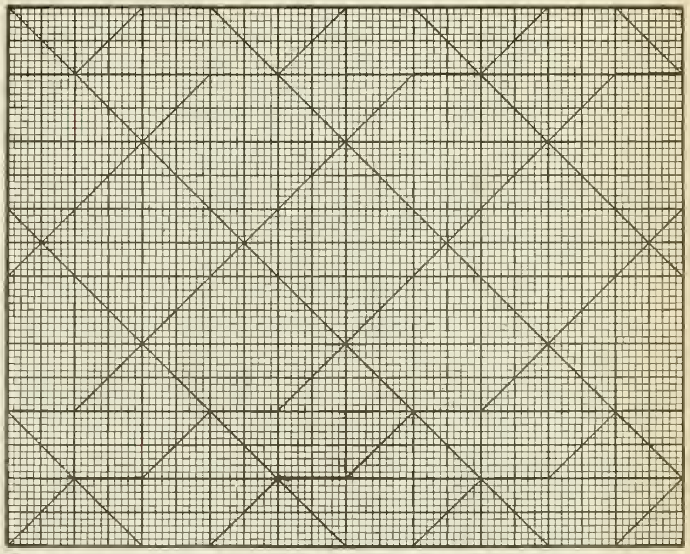

Diagram 4.—Indicates that with unequally spaced passing tracks, the leaving interval must be equal to the round trip time interval of the maximum spaced passing tracks.

speed which will produce a maximum ton mileage at a minimum ton mile cost. This involves a consideration of:—

Speed.
Weight of train.
Ton miles per trip.
Running time between terminals.
Actual time.
Average speed.
Cost of coal, water, lubricants, supplies, repairs and renewals per trip.
Pay of enginemen per trip.
Cost of handling per trip.
Interest allowance per trip.
Cost of train supplies, car repairs per trip.
Pay of trainmen per trip.
Cost of movement per trip.
Cost per ton mile.
Ton miles per month.

The density tends to modify the running time between terminals; therefore, the average speed affects the cost per ton mile and the ton miles per month.

As capital charges are part of the cost of moving the traffic, the fewer the number of cars necessary to handle a given business the lower the capital charges, and this depends on getting a maximum use, under revenue producing load, of the cars. The total loaded car mileage in Canada, in 1917, was 1,402,552,028, and the empty car mileage was 561,127.885. The total number of freight cars was 203,499, and therefore each car moved 6892 miles loaded and 2757 miles empty in the year, or about 20 miles per day loaded and 8 miles per day empty. At an average rate of 10 miles an hour loaded, the freight cars average earning time for the year would be about 30 days, or not quite 8½% of its time in revenue service.

The average capacity of all freight cars in Canada has increased, since 1907, 23%, and the average loading per car has increased 45%, while the ratio of load to capacity has increased only 11%. The net result of the above would seem to be that 5.6% of the earning capacity of the freight cars is obtained. This seems to be very low and would justify some investigation. The question also arises as to whether the increase in capacity of cars is justified when the average capacity has increased 23% and the load to capacity only 11%.

Capital charges are also affected by the number of locomotives needed to handle a given traffic. Summarizing the number of revenue freight locomotive miles of the Canadian railways for 1917, 3490 freight locomotives made 71,610,535 freight locomotive miles which is an average of 56 miles per day. This looks like a very small use of the individual locomotive and has a direct relation to the number of locomotives required to move the tonnage. From a series of reports on one of the American western lines, a study has been made of the average daily performance of locomotives with the following results:—

Roundhouse	6 hours 49 minutes	28.40%		
Running repairs	2 " 41 "	11.18%		
Class repairs	3 " 27 "	14.38%		
Total mechanical dept.			12 hours 57 minutes	53.96%
Terminal delay			4 " 2 "	16.80%
Actual running	4 " 16 "	17.28%		
Lost time between terminals	2 " 45 "	11.96%		
Total time between terminals.			7 " 1 "	29.24%
			24 hours 0 minutes	100%

A locomotive is therefore in the hands of the Mechanical Department, being made ready to move traffic, 12 hours 57 minutes or 53.96%; in the hands of the Transportation Department, ready to move traffic, 6 hours 47 minutes, or 28.3%; and actually moving traffic, therefore earning revenue, 4 hours 16 minutes, or 17.28%. At an average speed of 10 m.p.h. between terminals this would be equivalent to 71 miles per day. The time between terminals would be 7 hours 01 minute, which is 421 minutes, therefore, for every 421 minutes saved on the trains over the division one engine is saved, or the equivalent of one engine. The number of engines necessary to handle a given tonnage on a division in 24 hours would be, when:—

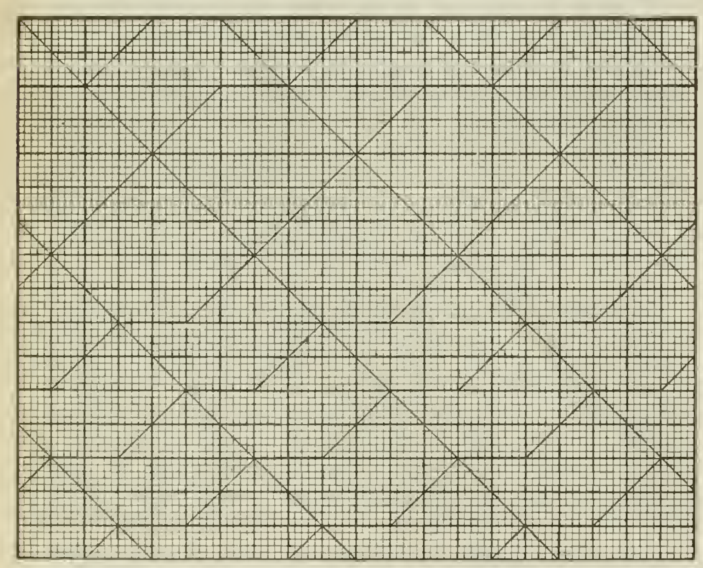

Diagram 5.—Indicates the delay at certain passing tracks due to unequal spacing of passing tracks, and is twice the difference between the maximum spacing and any other spacing.

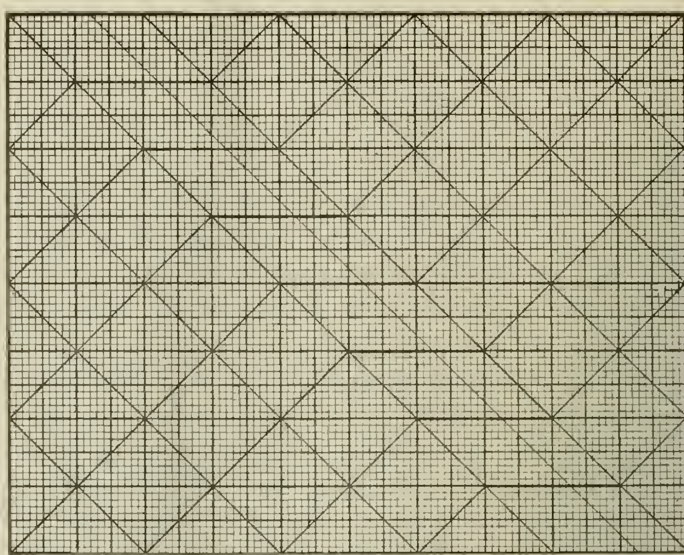

Diagram 6.—The effect of introducing a train into the schedule with less leaving interval than that determined by the passing track spacing.

$T = E.G.$ tons to be moved.
L = Length of division in miles.
E = Number of engines.
R = Average tonnage rating of available engines.
A = Average speed between terminals in m.p.h.

$$E = \frac{T \times L}{7.16 \times A \times R}$$

The delays which add to the total time of a train over a division may be tabulated under the following heads:—

Waiting at terminal for engine.
Waiting at terminal for crews.
Other terminal delays.
Defective roadway.
Defective equipment.
Engine not steaming.
Engine leaking.
Other engine failures.
Waiting for orders.
Meeting and passing trains.
Station work.
Taking coal and water.
Overloaded train.
Waiting for connections.
Miscellaneous.

In making up the schedules for trains, there are certain fundamental principles which cannot be overlooked. There is a distinct relation, on single track, between the schedule and the location of passing tracks, coaling plants, water tanks, yard capacity, and passenger train interference. Diagrams, Nos. 1 to 7, in which the abscissae indicate time, the ordinates represent distance between passing tracks in time of running, the diagonals represent the movement of trains in the two directions on single track, and heavy horizontal lines represent location of passing track, illustrate the relation between schedules and the number and location of the passing tracks, and from these we can lay down the following general principles:—

1. That the minimum time interval between freight trains leaving a terminal is equal to the maximum round trip time interval between two passing tracks.

2. That the maximum number of trains of the same class over a single track division in one direction is equal to 1440 divided by the maximum round trip time interval between passing tracks.

3. That with maximum capacity the delay to trains in the inferior direction at each passing track, other than at each end of the maximum round trip time interval, will be equal to twice the difference between the maximum round trip time interval and the round trip time interval between the passing tracks at which the delay occurs.

4. That passenger trains will have the effect of reducing the number of freight trains.

If L = Leaving time interval between trains from a terminal.

R = Round-trip time interval between maximum spaced passing tracks.

N = Number of trains.

Rl = Round-trip time interval at any other than the maximum spaced passing track.

D = Delay of inferior direction trains.

Then $L=R$

$$N=2\times\frac{1440}{R}$$

$$D=2\ (R-Rl)$$

R in the formulæ will be the sum of the eastbound time and the westbound time, plus the amount of time necessary to head into and head out of a passing track. Letting A represent this latter allowance, then

$$R=E+W+A.$$

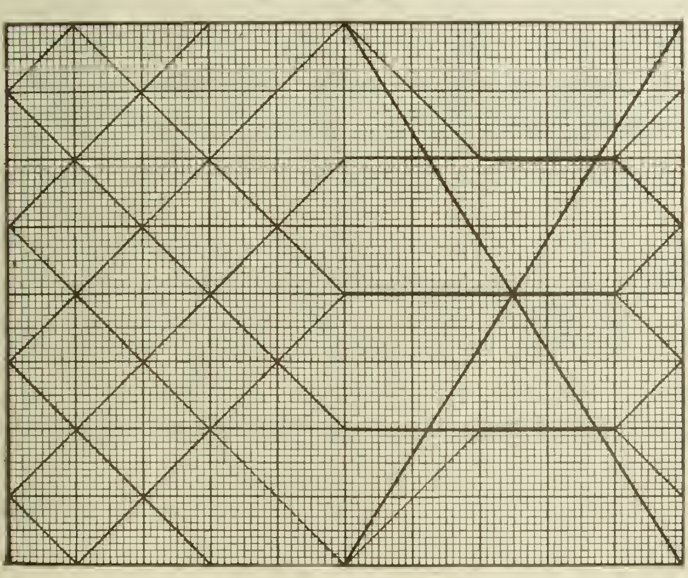

Diagram 7.—The effect of introducing high speed trains into the freight movement, passing tracks equally spaced, and freight train interval based on the passing track spacing.

Table of Running Time Between Sidings for Freight and Passenger Trains

Station	Freight			Passenger		
	East-bound	West-bound	Total	East	West	Total
"A".......						
"B".......	18	25	43	11	12	23
"C".......	15	20	35	7	10	17
"D" (Water)	15	18*	33	12	9	21
"E".......	25	16	41	11	7	18
"F" (Water)	25	15	40	11	12	23
"G".......	20*	22	42	12	12	24
"H".......	15	12	27	7	5	12
"I"........	20	15	35	10	9	19
"J"........	20	10	30	13	7	20
"K" (Water)	20	12	32	11	11	22
"L"........	20	30	50	10	15	25
"M".......	10	11	21	4	4	8
"N".......	15	10	25	6	6	12
"O".......	15	6	21	6	4	10
"P".......	25	16	41	15	9	24
"Q".......	15	10	25	7	8	15

It will be seen that the maximum round-trip time interval between passing tracks occurs between "K" and "L", and is 50 minutes for freight trains, allowing 10 minutes for heading in and heading out. The maximum possible number of trains of one class which could be run over the division would be,

$$N=2880\div 60=48\text{ trains,}$$

and the leaving times between trains in one direction would be

$$L=60\text{ minutes.}$$

There are, however, 10 passenger trains running on this division which would cause a reduction in the number of freight trains, which could be operated, as follows, where t is equal to the number of freight trains eliminated:–

$$t=\frac{(2+e+w+c+a)}{R}.\ C$$

In this formula e = eastbound running time of the passenger train between "K" and "L," w = westbound running time,

No. 1

c = clearance allowance of freight trains over passenger trains, a = time heading in and out of passing track, and C = coefficient depending on the relative schedule of the passenger trains, in this case the value of the coefficient is 0.5. I have assumed a value of 5 minutes as clearance and 10 minutes for heading in and out of passing tracks.

The number of trains eliminated would be,

$$t = \frac{2+(10+15+5+10)}{60} \times .5 = 1.33$$

$$1.33 \times 10 = 13.3 \text{ trains.}$$

This would reduce the number of freight trains over the division to 34.7 trains. By putting in a passing track between "K" and "L," the running time between "A" and "B" would become the controlling element and the number of trains would then be 41, an increase of 20% in the number of trains, due to the addition of one passing track.

The location of the water tanks may modify the capacity materially. In the case of the division cited above, there is a water tank located east of the passing track switch on the main track, at "D," and westbound trains at this station will occupy the main track between "C" and "D" while they are taking water. At "F" there is also a tank similarly situated, except that it is west of the passing track, and eastbound trains taking water would occupy the main track between "F" and "G." The result of this would be, allowing 10 minutes for a train to take water, to increase the westbound time between "C" and "D" 10 minutes, and the eastbound time between "C" and "D" 10 minutes; thus making the round trip time interval R = 52 minutes, so that, in this case, the location of the water tanks becomes the controlling factor.

In a similar manner the effect on the train schedule of other elements may be determined, such as stops for "31" orders, way freight train movement, length and arrangement of passing tracks, terminal yard facilities, adverse grades, helper engines, &c.

It is quite true that we cannot get in practice the results obtained by a calculation based on certain known elements, but we are able to say that no better result than the calculated one can be obtained in practice, and also what are the most important controlling factors, and the percentage value of their modification. From the ratio of actual results to calculated results, we can arrive at an efficiency ratio which will allow a comparison of the operations on different divisions.

Generally it may be laid down as an axiom that no more trains can be operated over a division in a given time than can be operated through the throat of the division, whatever constitutes that throat. It may be the length of time necessary to operate between two passing tracks, or it may be the location of a water tank which requires a stop between passing tracks. It may be that the terminal yard, at one or both ends of the division, is too small to accommodate the arriving trains. Any, or all, of these may be affecting the operation detrimentally, and it is only after an investigation of all of them that economic remedies can be undertaken.

In order to illustrate in a concrete form one of the directions in which the engineer's services might be profitably employed in the Transportation Department, I quote part of a report made in connection with the investigation of an engine division of an American road. Difficulty was being experienced in operating and an investigation was made. The results of the investigation were partly as follows:—

The study was made of the operation on the 28th of December, 1916, which represented a fair average condition for the month. During December on this division, there was made, eastbound, 45,260,068 ton miles, and, westbound, 24,117,555 ton miles; or an average per day of 1,460,002 ton miles eastbound and 777,985 ton miles westbound. The actual ton miles for December 28th were 1,046,634 ton miles eastbound and 1,020,020 westbound. The actual performance was under the average eastbound, and over the average westbound, and slightly below the average for the total ton miles hauled, the average being 2,237,087, as against the actual haulage on December 28th, of 2,066,654. This day was the nearest to the average for the month and was therefore taken as a basis for investigation.

Chart No. 1 was then plotted from the despatcher's train sheet of December 28th, illustrating the movement of the trains on this date. There are, in all, shown on the chart, 17 freight trains each way, one way-freight train each way, one plow extra from "A" to "AC", one plow extra from "AC" to "V," and three passenger trains each way. The actual movement, for the day, of freight trains is equivalent to six freight trains between "A" and "Q" each way, and ten freight trains between "AC" and "Q" each way, trains of the 27th lapping over to the 28th, and trains of the 28th lapping over to the 29th. From this chart it is seen that at "Q" and "AB" there was serious delay, and also that the delays between "Q" and "AC" were greatly in excess of the delays between "Q" and "A." From the conductors' delay reports and wheel reports, the causes for these delays were determined and tabulated.

A table was then made showing the train, engine number, arriving and departing time, time consumed, and the delay. It also shows the number of orders issued to each train, the time during the 28th that each train was on the road, the train miles made by each train, and the cars handled by each train. It will be seen from the table that westbound trains consumed a total of 309 hours 20 min. between terminals, and of this 158 hours 20 minutes was on account of delay, or 52% of the time was non-productive. Eastbound trains consumed 277 hours 30 minutes between terminals, of which 135 hours 7 minutes or 47%, was non-productive. It will also be seen that the time during the 28th consumed by westbound trains was 190 hours and that the mileage made in the time was 1204.74 miles, or an average speed of 6.39 miles an hour, and for the eastbound trains 149 hours 10 minutes with a mileage of 962.79, or an average speed of 6.45 miles an hour. As the overtime for engine and train crews would be measured by the difference between the speed on which the rates are based, or 12.5 miles an hour, and the actual average speed, or 6 41 miles an hour, the overtime for each of the crews would be 6.09 miles per hour, or 48%.

The time allowance on the timetable for freight trains and the actual time made were as follows:—

Westbound

Time-table

"A" to "Q" 6 hrs. 10 min. "Q" to "AC" 3 hrs. 30 min.

Actual time taken

"A" to "Q" 8 hrs. 31 min. "Q" to "AC" 9 hrs. 33 min.

Eastbound

Time-table

"A" to "Q" 6 hrs. 35 min. "Q" to "AC" 4 hrs. 0 min.

Actual time taken

"A" to "Q" 9 hrs. 42 min. "Q" to "AC" 8 hrs. 16 min.

Differences

Westbound

"A" to "Q" 2 hrs. 21 min. "Q" to "AC" 6 hrs. 03 min.

Eastbound

"A" to "Q" 3 hrs. 07 min. "Q" to "AC" 4 hrs. 16 min.

WESTBOUND

No. 2

Our attention is immediately attracted to the very serious discrepancy between the timetable allowance and the actual performance of trains. Referring to the wheel reports we find the following:—

	Pick up	Set out
	Westbound	
"A" – "Q"	0	6
"AC" – "Q"	24	150
	24	156
	Eastbound	
"A" – "Q"	1	2
"AC" – "Q"	56	3
	57	5

Out of 14 trains shown on the chart, westbound, between "A" and "Q", 4 trains picked up or set off cars, and 10 out of 17 trains between "AC" and "Q" picked up or set out cars. Out of 12 trains eastbound between "A" and "Q," 2 trains picked up or set out cars, and between "AC" and "Q" out of 17 trains 11 picked up or set out cars. This is evidently one of the reasons for the great difference in the times. A pick-up engine to handle this work and relieve the through trains would be justified; as the time lost by the trains due to this setting out between "AC" and "Q" amounted to 14 hours 3 minutes or 843 minutes; and, as the value of an engine in minutes is 421, an engine could be put on this service and still leave a balance in its favor equal to the value of an engine.

The delays at "AB," it was found, were due to inability to get into the yard at "AC". A tabulation of the cars handled in and out of this yard disclosed the fact that whenever the total cars exceeded 500 in the day this delay at "AB" occurred. The average delay per day at "AB" was found to be 4 hours 20 minutes, therefore, if this delay could be eliminated, there would be 4 hours 20 minutes of engine time which could be used to make additional earnings. The net earning capacity of this time on this division was found to be $31.50 per day or $9450.00 per annum, which, capitalized at 5%, would amount to $189,000.00 with which to make the improvements.

Chart II is drawn up to show the operation of the trains of December 28th under the Block System. The running time for the trains between stations is exactly the same as made by these trains on the 28th, all stops for switching, break-down of equipment, and delay getting into "AB" yard, are unchanged. The gain in the time over the division and the increase in train miles, is due to the elimination of time lost in the use of "31" orders and making "meets." The passenger trains and way-freights have been put on Chart II, the same as Chart I, it being assumed that the station delay of way-freights was due to necessary station work, which the Block method would in no way affect. The results obtained from Chart II are tabulated in the last two columns of Table I. The total saving in time as between Chart I and Chart II was:— westbound, 21 hours 54 minutes, and eastbound, 29 hours 5 minutes, or a total of 50 hours 59 minutes. With the Signal method the average speed has been increased to 8.45 miles an hour, so that the overtime would now be 4.05 miles, or a reduction of 33%.

It is seen from Table I that there were 112 orders issued on the "/31" form. If we allow an average of 10 minutes for the time necessary to deliver a "31" order to a train, and this seems to be the ordinary allowance made by despatchers, we would have an average per train of 17 min. westbound, and 48 minutes eastbound. Under the Block method the "31" order can be dispensed with: several of the U. S. roads have discontinued their use.

The saving in time of 50 hours 59 minutes should relieve 7.1 road engines. The average results obtained from engines, over a period, is 29.24% in revenue producing service between terminals, or 7.16 hours per day, therefore, 50 hours 59 minutes divided by 7.16 hrs. = 7.1 engines. If the engines cost $30,000.00, the annual charge would be:—

Interest @ 5%	$ 1,500.00
Depreciation @ 10%	3,000.00
Maintenance and Operation	10,000.00
	$14,500.00

$14,500.00 × 7.1 = $102,950.00

The overtime for the month of December averaged $187.54 per day and the saving due to a 33% reduction in the overtime would therefore be .33 × $187.54 = $61.87 per day or $18,561.00 per year.

The total saving due to the reduction of running time would therefore be:—

Engines	$102,950.00
Overtime	18,561.00
	$121,511.00

The Block system was estimated to cost $375,000 to instal; the annual charges would therefore be:—

Interest	$22,500.00
Depreciation, 7%	26,250.00
Maintenance and Operation	18,750.00
	$67,500.00

Therefore the net saving would be $121,511.00 less $67,500.00, or $54,011.00: this saving capitalized at 5% = $1,080,220.00

Is it not fair to conclude that the services of the engineer in the Transportation Department would be a decided advantage to all concerned; and that methods of increasing the loading of cars and engines, the saving of lost time on the road, the prevention of capital expenditures before they are strictly necessary, and the general increase in efficiency in means and methods, would result? It has been by the efforts of the engineering fraternity that the motive power, and the strength and safety of the permanent way has been improved. Is it then too much to say that some of this analytical reconstruction in the Transportation Department would not be beneficial?

The Resources of Western Canada*

By Doctor R. C. Wallis, Commissioner for Northern Manitoba.

You will permit me, before discussing the subject for which I am responsible, to present the greeting and good-will of the Manitoba Branch of the Canadian Mining Institute. We realize that in the constitution and aims, *The Engineering Institute* and the Mining Institute are somewhat dissimilar. We feel, however, that each serves a purpose which the other cannot well fulfill. We feel that there is every reason why there should be the most harmonious co-operation, and that co-operation, we are assured from headquarters, exists and will continue to become more real, in the future. Our local Branch of *The Institute* is relatively youthful, but is undoubtedly vigorous, and can see ahead a future of important service. In so far as it is your desire, and in so far as it is within your power, because of your constitution, to achieve a fuller recognition of the engineering profession and its value in the life of the community, you have the most unqualified support of the Mining Institute and of our local branch. While it is almost self evident that Western Canada has been moulded by the work of the engineers, it is perhaps also no less evident that full recognition will not come until engineers individually and collectively play a larger part in public life and particularly in our legislative assemblies. Unfortunately, the exigencies of the profession and the inadequate remuneration have made it almost impossible for engineers to give their time to this service. They are involved in a vicious circle from which they can extricate themselves only by the real sacrifice of some of their numbers at the altar of political service.

The subject which has been placed against my name is not of my choosing. When your secretary invited me to speak before you he also supplied the text. I protested, as best I could, that the subject was somewhat wide, and that it might be to greater advantage, as well as more to my liking, to handle a smaller corner of this immense vineyard and present to you the fruits thereof. Secretaries of programme committees are, however, somewhat strong minded, and I appear before you under protest, with regard not to myself but to my subject. After reviewing the matter I concluded that it would be unwise to deal with this subject in any great detail. There is a danger that details will overwhelm. With your permission, therefore, I shall discuss, rather, some of the more general considerations in connection with our western public domain, in the hope that some suggestions may be offered which will at least give rise to discussion, and in all probability to difference of opinion.

It may be well, at the beginning, to present a short sketch of the plan on which our western territory was built. A clear idea of the geological and topographical frame work is undoubtedly of asistance in grasping the salient features of our natural resources. On the foundation of a complex of granites, gneisses, greenstones and conglomerates, which are to-day to be seen fringing our Western Provinces, to the east and the north of Manitoba and the north of Saskatchewan and Alberta, were laid down layer by layer, in a horizontal position, first limestone and later shales and sandstones. The traveller passing westwards crosses the exposed edges of higher and still higher beds of these rocks. In the three so called prairie provinces little disturbance has taken place since these beds were laid down. The surface, it is true, has been covered with a silt or till from Glacial Lake or Glacial Sheet, and the rivers, with an easterly or northerly trend, have cut deep into the soft clay rock. Apart from the fact that the metal bearing granite complex is to be found mainly in Manitoba, the differences in the underground resources in the three provinces are due mainly to the depths of the clay rocks in the west and their shallowness and the frequent exposures of their edges in the east. To this is due the extensive coal beds of Alberta, the gas reservoirs, and the possibility of oil in that same province. The surface fertility is as much a matter of topographical features and consequent climatic conditions, as of the soil itself. The north-westerly trend of the wheat belt is due as much to the influence of the Rocky Mountains as to any peculiar virtue in the soil.

At a late geological period in the history of the building of the provinces, a pressure movement set in from the west. There resulted folding and breaking, and an eastward movement of fault blocks over a considerable distance. The movement closed, as is usually the case with intense volcanic activity. Thus were formed the parallel ranges of the Vancouver Coast, Gold and Rocky Mountains, the influence of volcanic action being felt more particularly in the Coast and Gold Ranges. To this activity is to be ascribed the metalliferous deposits which have made it possible for British Columbia to contribute, to so large a degree, in the output of copper, silver, lead and gold within the Empire. And, in the deep sheltered valleys which lie between the parallel mountain ranges, even after the planing down of geological ages, there is being established an important fruit growing industry.

A review of the history of our western territory will assist us to appreciate more fully the present situation and the future outlook. There is little reason to doubt that, but for the resources in fur and big game, the territory would not to-day have formed part of the British Empire. The Hudsons Bay Company confined their attention at first to the coast line of the bay, and were able to induce the Indians to travel from the inland trading grounds to their posts with the furs. The pressure of the competition of the free traders on the Saskatchewan River, later to be known as the Northwest Company, compelled the officers of the company to work towards the interior, and in a very few years the main waterways of the west were dotted with the posts of the company or its rivals. Some names deserve special mention in the story of the expansion of the west. Anthony Henry penetrated into the country of the buffalo and mounted Indians in a journey from Hudson Bay, in the middle of the 18th century. His description of what is now Central Alberta was only in part believed by the traders, but it lead to a new policy of penetration of the fastnesses of the interior.

*Read by the author before the Manitoba Branch on April 17th, 1919.

Samuel Hearne, a few years later, reached to the mouth of the Coppermine River after two unsuccessful attempts, and gave to the world the first description of a copper deposit, the value of which is even yet only imperfectly estimated. Alexander MacKenzie, the founder of the Northwest Company, reached the Arctic Sea by way of the river which bears his name, and later penetrated to the Pacific Coast, thus opening up by discovery an extent of territory such as few men can place to their credit; while David Thompson, of the Hudson's Bay Company and later of the Northwest Company, by his careful mapping, laid the foundation for the work of the topographers, surveyors and geologists of the last half century.

It is noteworthy that the earliest industry, if the fur trade be not considered in that category, was mineral development. A quarter of a century, at least, before the arrival of the Selkirk Settlers on the Red River, the freemen, or former employees of the Hudson's Bay Company who had earned their discharge, extracted salt by evaporation from the salt springs on the shores of Lake Winnipegosis and Lake Manitoba and the industry continued till transportation by rail from the east became effective. In British Columbia, the placer deposits on the Fraser and Thompson Rivers were responsible, half a century later, for the initial movement in the development of the western provinces. Since the time when immigration into the prairie territory became so pronounced, the resources of the soil have been the dominant factor in the development of the prairie provinces. Only in the last decade has the necessity of a wider industrial outlook led to the development of resources which are not strictly agricultural.

There is a certain individuality in the resources of the four western provinces which will doubtless lead to a distinctive industrial development within each area. There are some features common to Manitoba and British Columbia which the other provinces do not possess. Both have a sea frontage, though the strategic value of the Manitoba seaboard will not at any time compare in importance with that of British Columbia. The development of the water power and the fish industry will be the special care of both provinces. In neither case will more than a relatively small percentage of the total area be utilized for agricultural purposes. In both cases important cities have been established, in which the wheels of industry will turn when markets are established and raw materials are supplied at a low price. There the similarity ends. Reckoned in terms of actual production, Manitoba's wealth lies in its soil. In comparison with Saskatchewan, or even Alberta, however, Manitoba is, in terms of arable acreage, to a limited extent an agricultural province, and must look forward to the fostering of her resources if she is to hold her own. The fisheries, already valuable, will become much more important when the whitefish and salmon of Hudson Bay are available for transportation to Winnipeg and the southern markets. The Province is fortunate in the possession of immense water-power, well distributed both for Winnipeg and for future metallurgical operations in the less accessible districts of the Province. It is, however, to the mineral fields of the future that the Province must look for revenues to supplement those derived from wheat, oats, livestock and dairy products. With structural materials, building stone, cement material, gypsum and lime, Manitoba is liberally supplied, and in the precious and other metals the promise of production is good. There may be years of waiting and times of disheartenment but, if the necessary exploration and development work be done, there is little doubt that much of the reward that Ontario already enjoys will be the portion of her sister province.

Saskatchewan is *par excellence* the agricultural province, and it is indeed almost exclusively agricultural. True, there are somewhat extensive areas of lignites in the south and west which, with a successful briquetting system, will become increasingly important, not only for Saskatchewan but for the coalless province of Manitoba. But the wealth lies, and will continue to lie, in the soil. Some thirteen million acres are under cultivation. It is estimated that sixty million acres are capable of cultivation. The whole population of Canada could be maintained in the province at the present moment. When the total available acreage has been placed under cultivation, all wheat farming will have disappeared, and the live-stock industry, already developed in the park country of northern Saskatchewan, will have in a large part replaced the present method. The Province possesses valuable timber north-west of Prince Albert, while there are possibilities in the northern areas in minerals which have not yet been put to the test of systematic exploration.

In Alberta there is a greater variety of wealth. It possesses a remarkably elongated wheat belt, stretching northwards into the Peace River country, and the irrigation works, in which already thirty million dollars have been expended, have displaced the cattle ranch country towards the International Boundary Line. It would nevertheless be erroneous to consider Alberta as a strictly agricultural province. The very extensive resources of lignitic, subbituminous, bituminous and anthracite coals, estimated at somewhat over a million million tons, possess the greatest significance for Alberta's future; the more so because the supply from the United States will sooner or later be cut off from Western Canada. In the gas fields of Medicine Hat, Bow Island and Viking there are possibilities of the development of the industries which follow in the wake of this cheap fuel. Moreover, notwithstanding the comparative non-success of the Calgary and Pincher Creek venture in the search for oil, no one, who has carefully estimated the whole situation, can fail to believe that there is yet a future for Alberta as an oil country. Whether or not the centre of the industry is to be located as far north as the Peace River has yet to be demonstrated. The vast extent of the oil sands—estimated at 5½ cubic miles in volume— are an impressive memorial to the oil resources which have already been lost into the atmosphere.

British Columbia came into being as a mineral country and the mineral wealth is still dominant to-day. While in actual mineral production it cannot compete at the present time with Ontario, it possesses the three largest copper smelters in the British Empire, two of them in the hands of one company, and it is an important source of supply of lead and zinc, apart from the production of gold, on which foundation the province was actually built, and apart from its resources in coal and iron. The coal is well distributed both for industry and for trade, the deposits of coking coal in the southern interior being utilized for the copper smelters at Trail and Grand Forks, while the supplies on Vancouver Island and Queen Charlotte Islands are ideally situated for transportation. But, British Columbia does not now depend on its mineral wealth alone. The annual value of the fisheries is approximately fifteen million dollars, and, while this is mainly salmon, Prince Rupert will yet become the centre not only of an extensive halibut industry but also of an important cod and herring fishing trade. The value of the annual fruit yield is over one million dollars, and the business is only now beginning to reach the state of productivity. It has been estimated that there are three thousand million feet of merchantable timber in British Columbia; with an annual growth much greater than an annual cut. Owing to the deeply indented coast line, the timber is very well placed for water transportation.

Such are some of the distinctive features in the natural wealth of the provinces. At this time when the problem of utilization of all avenues through which wealth may be obtained is so pressing, the fact is not to be lost sight of that, if the total available acreage of wheat growing land in the west produced a crop with an acreage yield equal to that of 1915, Western Canada would practically be in a position to supply the worlds demand; that the vast fuel and power resources are almost untouched; and that it is yet impossible to state how extensive are the metallic deposits, not only of British Columbia, but of Manitoba, Northern Saskatchewan, Northwest Territories and The Yukon. To what extent will the possession of this material wealth facilitate the growth of industrial life throughout the West? It is evident that there is a desire to promote industrial development, and it is equally clear that, with the establishing of industrial life in the west, the misunderstanding between the east and west would in large measure be removed. Today the two sections face different conditions of competition; then they would face similar conditions. The chief centres of industrial development will doubtless be Winnipeg, Vancouver and Calgary; with Lethbridge and Medicine Hat strategically placed, owing to the supply of natural gas. The conditions in Winnipeg and Vancouver are very different. Winnipeg, on the main artery from the west, with the cheapest power and the most abundant water supply, is well placed to develop a variety of industries for which electricity may be used as motive power and for which cheap coal is not essential. Besides, it not an idle dream that the Saskatchewan River may yet be made navigable, and, like the Volga in Russia, be the artery of trade and traffic through a densely populated country, and carry barges laden with coal to the gates of Winnipeg. Only thus will it be possible to supply Winnipeg with the much needed coal at reasonable cost. At Vancouver, so admirably placed with regard to coal, electric power, lumber and transportation facilities, the one desideratum, from the point of view of industrial development, is an iron industry. On coal and iron, nations have risen to industrial greatness. While much energy has been spent in assembling facts with reference to the iron deposits of the coast and the feasibility of an iron smelting industry, the matter rests at present with Dr. Stansfield's conclusion that unless a new process of electric smelting can be perfected it is not possible to establish an iron industry at the Coast. To what extent the substitution of oil for coal as a motive power will affect the industrial future of Alberta and British Columbia, and to what extent the wider use of electric power will shift the balance from the larger cities to the sources of the raw materials, it is not yet possible to say. At any rate, smelteries must be established where the ore bodies are found, even though it be in the far north. This will doubtless lead to the wider use of electric power for the smelting of ores, where fossil fuel is not available. The development of electric power will, in turn, pave the way for the establishing of electro-chemical industries, such as the manufacture of fertilizers by fixation of atmospheric nitrogen, where the question of transportation facilities is relatively of secondary importance. There is no doubt, to take an illustration, that Manitoba should manufacture the fertilizers for the western plains, when such are needed, but it is not necessary, or even probable, that the industries be established in, or near, Winnipeg. For the full development of the varied resources of the west, it is, indeed, very improbable that a few industrial centres will suffice. In view of the wide distribution of water power in Manitoba and British Columbia, and of coal in the central provinces, one may safely prophesy an industrial activity in the future, widely scattered over the provinces.

Two incidents of recent occurrence have served to draw attention to the authority of the state—that is, the people—over the public domain. I refer to the withdrawal of the native copper territory of the Coppermine district from exploration, and the attempts of the Shell Transport and Trading Company to obtain exclusive rights over a large territory in northern Alberta in order to prospect for oil and to develop oil prospects. There have been many mistakes in respect to western resources in the past. A wholesale policy of alienation has led in some cases to the squandering of resources and in other cases to an attitude of refusal to develop, against which the state is helpless. It is, indeed, open to question, whether the state has a moral right to alienate at any time any source of national wealth in its capacity of trustee, not for any single generation, but, for all generations to come. The attitude of the Federal Government, in the direction of a leasehold of resources, is undoubtedly the correct one. The misfortune is that there is a divided control in Canada, and a leasehold system, in certain areas, cannot exist side by side with a freehold system in other similarly situated areas. That has recently been seen in connection with the quartz mining regulations, which place Manitoba at a decided disadvantage, in comparison with British Columbia or Ontario. Such a regulation can only be successful when it can be made applicable to the whole of Canada. It would indeed be very desirable to have a general law governing the public domain throughout Canada; and in handing over the resources to the provinces it would have been well had the Federal Government maintained this jurisdiction. The feeling is growing that the public domain is the property of the people, and that a system which makes possible the amassing of fortune out of the public domain by some, while others go empty handed, can no longer continue. The Federal Government has realized that the Coppermine deposits should be operated for the state and it will, doubtless, also realize that no company, unless directly representative of the people themselves, may obtain exclusive rights over any territory which may yet disclose its riches to the seeker in overwhelming abundance. The lesson has already been learned: there will be no need to repeat it.

When capital again becomes mobile we shall face a period of intensive development of our resources. The necessity for this policy cannot be too strongly emphasized, and a wide vision of the necessary expenditure, in transportation facilities and in equipment, must be cultivated by all thoughtful citizens. To assist development, promotion enterprises are essential. There is a danger, which none will appreciate more keenly than that profession which has to do with the development of the natural wealth and which has had occasion to observe how frequently moneys have been diverted from the development of resources for which they were obtained to the private pocket, that a strong agitation will be directed towards the removal of public safeguards, with no sufficient substitutes introduced in their place. We are facing a time when every dollar invested in developing our domain should have a chance to give a return. Is it not our duty to see that there be maintained an adequate protection for that willing army of investors, whose faith in the wealth of our country is supreme, but, whose knowledge can hardly be expected to equal their enthusiasm? If this is made the public concern of the men who possess an expert knowledge of the situation, the confidence which is in some quarters so sadly lacking will be restored; initiative in development enterprises will be supported on every side; and the west will become, what nature has planned it to be, a great manufacturing community deep-rooted in the stable resources of the soil.

Water-Powers of British Columbia

The report on the water-powers of British Columbia, which is about to be published by the Commission of Conservation, places the total estimated 24-hour horsepower of the water-powers of that province at about 3,000,000 horse-power, in round figures.

This report completes the series of water-power reports which the Commission in 1910 undertook to publish. The investigation of the water-powers of British Columbia, of which the present report is the result, was commenced in 1911 by the engineers of the Commission, as stated in the report.

Referring to the difficulties experienced in obtaining the data in the report, and to the conditions affecting water-powers in the province, the report says:—

"The season available for such reconnaissance water-power investigations as were made in British Columbia is comparatively short. One of the chief difficulties encountered is that it is almost impossible for observers to avoid over-recording in their notes the power possibilities of stream observed during high-water. Young engineers are impressed by the quantity of water coming down the rivers, and have not the advantage of having observed the same streams at their low-water stages, nor have they always the knowledge of measurements of the flow of similar streams to temper their judgment.

"The conditions affecting powers in the province are unique, and do not closely correspond to those existent in other portions of Canada. This is especially true of the mainland Pacific coast. One cannot but be impressed with the fact that coastal water-powers in British Columbia, which to the casual observer appear to be of comparatively small amount, nevertheless may, when economically and fully developed, yield several-fold the estimate of power, if appraised upon the same basis as similar streams in Eastern Canada. Glaciers, snowfields, and heavy rainfall abound, and, with many storage possibilities, constitute unique factors which contribute to enhance the values of powers. These conditions, on the other hand, emphasize the necessity of special and very careful engineering investigation and expert handling."

Power site tables giving summarized data with regard to the water-powers are given in the report, which says, in reference to these tables:—

"Owing to the topography of British Columbia and the relative small extent of territory covered by detailed topographic and hydrometric surveys, it is practically impossible to make anything like a close estimate of many of the water-power possibilities. Both the confines of the watersheds of many of the available streams and their run-off are unknown. In such cases any figure purporting to give the available amount of power is at best only an estimate indicating possibilities.

"The power tables contain summarized statistical data regarding the water-powers. It is not practicable to indicate any details of information upon which the tabular estimates are based, but all available data have been used. Effort has been made to keep on the conservative side, and totals for the province, based on the tabulated estimates, can only fairly be compared with estimates for other large territories by taking into account the conservative character of the deductions. . . . . Estimate quantities are on the basis of 24-hour horse-power 80 per cent efficiency. If comparison is made with other estimates of horse-power giving theoretical quantities, then our estimates should be increased 25 per cent."

The report gives 610,000 24-hour horse-power as the amount available on the Columbia River and its tributaries, 740,000 horse-power for the Fraser River and its tributaries, 270,000 horse-power for the Vancouver Island water-powers, 650,000 for the mainland coast and coastal islands, and 250,000 horse-power for the Mackenzie River and its tributaries. In round figures, the total estimated power, including about 400,000 horse-power not counted in the above estimates, because there are economic reasons against its development for an indefinite time, is placed at about 3,000,000 horse-power.

Quebec's Forest Expenditure

The legislature of Quebec has appropriated $100.000 for the provincial forest service and the inspection of lands for the fiscal year ending June 30, 1920; also $7,000 for the maintenance of the provincial forest nursery at Berthierville. These amounts are very materially supplemented by the expenditures on forest fire protection incurred by the Ottawa River, St. Maurice, Laurentian and Southern St. Lawrence forest protective associations, which patrol the great bulk of the licensed and privately owned timber lands in the province. The expenditures of these four associations on fire protection during the past year total $177,729.

Effects of the Halifax Explosion on the Telephone Plant and Service*

By F. A. Bowman, M.E.I.C.

The following paper is an attempt to record the effects of the explosion of the 6th of December, 1917, at Halifax, on the plant of the Maritime Telegraph & Telephone Company, Limited, and the steps that had to be taken to carry on the service. The best way to do this will be first to describe the plant as it existed in the early morning of the 6th of December; second, to note the traffic conditions and some special conditions that existed; third, the effect of the explosion on the plant; fourth, the traffic conditions that resulted from both the loss of plant and the effect of the explosion on business, relief work, etc.; and last, the measures taken to meet these new conditions and restore the plant and the service.

The telephone system of the Maritime Telegraph & Telephone Company, Limited, covers the whole length and breadth of the Province of Nova Scotia from Sydney to Yarmouth and from the Atlantic Coast to the New Brunswick Boundary, where it connects with the lines of the New Brunswick Telephone Company, and through them with the New England Telephone & Telegraph Company.

The central position of Halifax, combined with the fact of its being the chief business city of the Province, results in its being not only the principal toll centre, but also the most important switching office for connection between the northern, eastern and western lines. The northern and eastern lines meet at Truro and then follow approximately the line of the Intercolonial Railway to Bedford where they are joined by the lines from the Annapolis Valley. From this point they follow the Bedford Road into Fairview to the city limits, from which point they, at that time, followed the Lady Hammond Road, Duffus Street and Barrington Street to Jacob Street, where they went into underground cable to the old St. Paul office on Salter Street. The lines from the south-western shore came in round the head of the North West Arm and along Quinpool Road and Bell Road to Sackville Street and then by cable to the same office. One circuit along the eastern shore came in through Dartmouth, by submarine cable across the harbour, and underground cable to the St. Paul office.

The Halifax exchange consists of three office districts. The St. Paul office served the business sections and the southern and part of the western residence areas. The Lorne office on North Street served the northern and the remainder of the western areas. The Harbour office took in all of Dartmouth and was connected to Halifax by two submarine cables. These cables were each a 25-pair, No. 19 B. & S. gauge, paper insulated, lead covered cable, steel wire armoured, and about 2500 feet long. They were laid from the northern end of the dockyard straight across to the Dartmouth shore.

The plant in Halifax consisted of 8.45 miles of underground conduit containing 39.21 miles of ducts, and 40.09 miles of aerial cables, but the only part that needs to be described here is that affected by the explosion. On Barrington Street from the railway bridge, just north of the North Street railway station, to the corner of Duffus Street there was a pole line occupied jointly by the Telephone Company and the Western Union Telegraph Company. This carried the toll lines, already referred to, and a 50-pair, No. 22 B. & S. gauge, lead covered cable ran on it as far as Rector Street. Another aerial cable lead ran north on Gottingen Street as far as Duffus Street.

The St. Paul office was situated in a building on Salter Street, erected in 1892 and extended in 1904, which housed a 10 section, 28 position, No. 1 switchboard, No. 49 jack type, arranged in a horse-shoe curve. The original set of storage batteries were replaced by a new set in 1905 but these had so nearly reached the end of their life that they required constant charging and really were only used for the night loads.

The Lorne office was situated at 145 North Street on the northern side of the street and a short distance west of Agricola Street. It was an old-fashioned wooden house, two and a half stories high with pitched roof and dormer windows. The switchboard consisted of 6 sections of 2-position, No. 1 switchboard, No. 49 jack type, arranged with 2 sections in a straight line along the back wall and two sections making a turn along the east wall. The Chief Operator's desk was near the front windows.

The Harbour office was a small brick building on Water Street. Dartmouth, much too small for the purpose and equipped with a private branch exchange type of switchboard of 4 sections on the first floor, and the terminal and battery room on the ground floor. The whole equipment was of an inconvenient type and very much cramped.

On Sackville Street, in Halifax, a new and thoroughly up-to-date Central Office had been constructed, equipped with an 11 section, 33 positions, No. 1 switchboard, No. 92 jack type. It is not necessary to give any further details of this except to mention that all the windows in the two sides of the building were metal frames with wired glass. The building and equipment were complete and the latter was undergoing its final tests preparatory to being cut into service on Saturday the 8th of December. In Dartmouth a new Central Office on Wentworth Street was in course of erection but no equipment had been installed.

It will be necessary next to mention some special traffic conditions that existed at this time and which added materially to the difficulties of keeping up service. On the 2nd of December an exceedingly severe storm of wet snow and rain swept the northern shore of the Province from Amherst to New Glasgow and cut off all lines between Truro and New Glasgow. In the old St. Paul office there was absolutely not a spare line on the switchboard and the traffic had risen to 13.48 calls per line. Owing to the limited number of positions the operators were working with an average of 140 lines per position, which is over the standard for good operating under calling rate conditions at that time. In the Harbour office the conditions were equally bad.

*Read by the author before the Halifax Branch on November 14th, 1919.

This was the condition of the plant when at 9.05 A.M. on Thursday the 6th of December the *Mont Blanc* with her cargo of 5000 tons of explosives, of which 3800 was T.N.T., blew up. The joint pole line on Barrington Street from the bridge to the corner of Duffus Street was absolutely destroyed. Not a single pole was left standing and the cables and wires were torn to pieces. Up Duffus Street some poles were left but the wires were destroyed. Some poles and cable were left on Gottingen Street but the wires leading off to the cross streets all went down. In all, 8275 feet of cable, 99220 feet of twin rubber covered wires and 86668 feet of bare wire were destroyed. This cut off all telephone communication with the eastern, northern and more than half of the western part of the Province.

At the Lorne office every window was destroyed, the L was wrenched several inches away from the main building, and the roof and walls were so damaged that probably nothing but the stout old framing saved it from collapsing. The equipment was practically not injured. Simultaneously with the explosion, the switchboard leaped into light, with lamps showing lines out of order. Owing, however, to the destruction wrought in the building and the havoc created, it was some time before the board could be got at for operating purposes. When access to the board was obtained it was found that, notwithstanding some damage done to the battery cells, it was possible to carry on. Service was in operation by 1 P.M. and the operators held to their duties, although the office was not safe and was very far indeed from comfortable. The north wall had to be shored up and canvas had to be stretched beneath the ceiling to minimize, as far as possible, danger from plaster or woodwork that might fall. Picture to yourself what were the conditions in this building during the next day's blizzard.

At the St. Paul office the damage done to the building was comparatively slight, but the windows were blown to pieces and the doors wrenched off their hinges. The shape of the switchboard, which was carried around the room, apparently protected the operators as they escaped with a few small cuts, and prevented any serious injury to the equipment.

In the old Harbour office, in Dartmouth, the windows were smashed and a partition badly wrenched, but no damage occurred that endangered the building, and the injuries to the operators were slight. The two submarine cables were badly damaged but one of them continued to give service for several hours before it finally parted. They were so seriously damaged, that, when taken up and overhauled, only enough good parts were secured from the two cables to make one length and it required eight splices to do this.

The new building on Sackville Street escaped wonderfully. The metal window frames were bent and broken but the wired glass did not fly seriously.

We will now consider the special conditions that resulted from the explosion. Strangely enough the Lorne office, aside from the destruction of the building and the difficulty of protecting the employees and equipment from the inclemency of the weather, presented no very special conditions. About two-thirds of the lines connected to it were put out of operation, but this was more than made up, as far as operating was concerned, by the rush of traffic. The storage batteries were in good condition, were not seriously injured and, fortunately, had just been charged, so that they were able to carry over the period during which the Power Company's lines were down.

At the St. Paul office the operators were returning to the switchboard and service was getting under way, after the explosion, when the military order came to vacate all buildings and go to open spaces, which, of course, necessitated the entire shutting down of the switchboard. The Power Company also shut down their station. It was over an hour before notice was given that all was safe and by that time the employees had scattered to see after their relatives, many of whom were dead, wounded, or missing. However, they came back one by one. The storage batteries in this office, as previously mentioned, were very old and worn, and, consequently, when it was attempted to begin operating again they had not charge enough in them to perform the work. The Power Company could not turn on the power until they received instructions from the City Electrician that it was safe to do so. Automobiles were started out in different directions to find this official, and at 1 P.M. the power was turned on and the operating began. The same condition of rush calls obtained here as in Lorne.

Conditions in the Harbour office were about the same. The batteries were all right but the heavy load soon told on them. The Power Company was serving the Town of Dartmouth from the Halifax station by a submarine cable, which was so badly injured that the service was cut off. The steps taken to recharge the batteries will be noted further on.

Turning now to the toll traffic, it will be remembered that all lines north and east, and half of those west, were cut off. Direct communication with Truro and Amherst was impossible. Points east of Truro were cut off from any service by the damage from the previous storm. The lines along the southwestern shore were all right, and a circuit to Bridgetown, which ran to Bridgewater and across country to Middleton, gave some service to the Valley, and as far as Windsor. Every known method of pushing traffic over these lines was employed.

The first effort towards restoring service was to get the operators back to work on the switchboards. A very large proportion lived, or had relatives, in the devastated area and these, naturally, had to leave for a time at least. Many went and found out the conditions at home and then came back to work. Some had to stay away to lead the search for the missing or to help the injured, but, to their eternal credit be it said, the great majority came back as soon as they could, many of them with very sad hearts. Everyone, man or woman, among the office staffs or other employees who knew anything about operating was called to the boards and somehow the service was kept up, though the traffic in the next two or three days went to 120 per cent. above the normal. A regular commissarial department was organized by the clerical staffs and the working employees were fed and housed in the Central offices. There were 165 operators on the payrolls, two of whom were killed. Their house was right in the center of the blast of destruction and they were never found. No male employee was killed or even seriously hurt. The Chief Operator at the Lorne office was badly cut, but came back to duty the next day.

The first demand for special service came from the railways. The Richmond railway yards were just a mass of debris and dead bodies, and despatching offices had to be established at Fairview, just outside the area of wreckage. Fortunately the cable lead serving Fairview, Rockingham and Bedford was far enough west to escape destruction, which permitted service to be given to the railways at these places and also enabled some of the toll lines north to be worked by connecting the toll lines at Fairview to exchange lines coming in through this cable. By this means one or two toll lines were working on the Friday evening and connection established with St. John and other outside points. O. J. Fraser, General Superintendent of the New Brunswick Telephone Company, came in on the first available train from St. John, and on Saturday, by the co-operation of his company and the New England Telephone & Telegraph Company, a composite telegraph circuit, superimposed on one of the through toll lines, was working to Boston, and the Associated Press was able to send out the first reliable reports of the disaster.

In the Harbour office in Dartmouth a serious situation developed on Friday morning. The batteries were running down and there was no means of recharging them because the Power Company's cable serving Dartmouth was cut. Fortunately a small Delco Lighting Plant, driven by a gasoline engine, was found and set up.

Up to December 16th, 338 line orders, including 135 installations for various relief committees, were handled. Special lines were placed at the City Hall for the relief committees, and were working on the evening of the day of the explosion. Four P.B.X. switchboards were installed during the first week at various relief or transportation offices. Fortunately there was on hand a new 50-pair submarine cable, and work was started at once to get this laid, to give service to Dartmouth. The succession of storms that occurred at this time caused much delay but the cable was successfully laid. On Friday the 7th work was begun erecting a new pole line on Longard Road.

This line was part of a diversion of the main toll line route on Barrington Street previously described, and was intended to carry the toll lines into the new Sackville office. Fortunately, the line had been staked out and material was on hand. Poles and wire were erected as far as North Street and the circuits connected there to spare conductors in the underground cables feeding the Lorne office. These were cross-connected on the Lorne main distributing frame to outgoing underground circuits down North Street to the corner of Barrington Street where they were connected to the undestroyed part of the lead to the St. Paul office. This was completed about December 20th.

In the description of the old St. Paul office we referred to the congestion on the switchboard and the cramped operators' quarters and terminal room space. This condition was bad enough under normal conditions, but when the struggle came to keep up service after the explosion, it was found to be impossible. The cut-over to the new office had been arranged for Saturday night, the 8th of December, so as to give an opportunity to settle down a little before the rush of the Christmas-week traffic came on. The old board was, as has been already stated, of the No. 49 jack type, whereas the new one is No. 92 jack type, which meant that even the most experienced operators would have to relearn much of their work. It is customary in the case of such a change to take the operators in groups to the new board before the cut-over and give them an opportunity to familiarize themselves with it, but owing to the delays in the installation of the new equipment it was not possible to do much of this. It was felt that, in view of the fact that many of the operators were practically homeless and all were more or less under a severe strain from what they and their relatives had suffered and the severity of the work, the best thing would be to get them into comfortable quarters, and that the doing of this would result in a quicker betterment of the service than trying to straighten matters out in the old building and then upset them again by the move later on. The move was made on Saturday night the 21st of December. The result, as was expected, was tremendous difficulties for a few days, but these were battled through and the ultimate result justified the move.

Then came the reaction. Nobly as the staff had stuck to the work in the crisis, they had sooner or later to consider themselves. Some of the operators came from the country and they went back to their homes, while others who were homeless and had relatives outside of Halifax went to them. Other operators broke down and resigned. The situation became very serious and every means had to be taken to get operators. Advertisements were put in the papers asking former operators to come back and help out and many did so. This, however, was only a temporary relief. As previously stated, the operating staff numbered 165 the day of the explosion. Eleven months later it numbered 180 but in the meantime 107 had passed through the school. Of this 107, the increase in the staff took 25; the other 82 represented changes in the original staff.

Much the same difficulty was met among the men in the maintenance staff. Here the call for military service took away a large percentage whose places had to be filled with young and inexperienced boys.

Reference has been made to the faithfullness of the employees, but this paper would not be complete without a tribute to assistance received from outside. The Northern Electric Company, who were installing the Sackville office equipment, placed their whole staff and facilities at the disposal of the Telephone Company and worked night and day on the reconstruction and emergency installation work.

O. J. Fraser, General Superintendent of the New Brunswick Telephone Company, arrived on the scene by the first available train, and by the co-operation of himself and of his company, gave great assistance. The New England Telephone & Telegraph Company sent H. A. MacCoy, one of their District Plant Superintendents, on the relief train from Boston, to do whatever he or they could. The Bell Telephone Company of Canada through their President, L. B. MacFarlane, telegraphed offers of any assistance they could give.

The employees of the Bell Telephone Company of Canada, the New Brunswick Telephone Company, the New England Telephone & Telegraph Company, the Aroostock Telephone Company, and outside districts of the Maritime Telegraph & Telephone Company poured in subscriptions for the relief of the employees bereaved and afflicted.

The Industrial Possibilities of Waterproofed Paper Products*

By Judson A. DeCew, A.M.E.I.C.

The substitution of paper products for wooden products, which is gradually taking place, is a development largely dependent upon the ability to make the paper products as strong and resistant to destructive agencies as the special product requires. Great strides have already taken place in this direction, in spite of the fact that the methods used in imparting the special properties to the paper products are yet in a relatively undeveloped state.

Owing to the increase in cost and lower quality of lumber now obtainable, there is a strong incentive to use the inferior woods and waste papers to make products that will replace the ordinary wooden products with which we are familiar. For example, pasted paper products are used extensively as boxes to replace the ordinary wooden box. Paper barrels are now made, by special machinery, by winding up and pasting a roll of paper into suitable cylindrical shapes and attaching heads to them. Paper pails are made by pressing wet pulp into a solid pail, or by winding the paper into a pail while pasting it together. Wall-board is a product which is made by pasting layers of paper together and which is used for walls, ceilings and interior finishing, in place of high grade lumber. The uses of this product will be greatly extended as soon as the methods of making it waterproof are sufficiently perfected to enable it to be used in places exposed to the weather. Pulp products are now made, in the shape of board, which are fairly water resistant and very light in weight, and these are used as insulating materials.

Waterproof papers have been used recently to a great extent in lining cases, where products are exported. One of these is made of two sheets of thin paper with a layer of pitch between them. Many papers are used either waxed or oiled, because the methods of making paper waterproof on the paper machine are not yet sufficiently well known. Waxing paper is an expensive process for the original paper takes up from 10% to 40% of wax in the process, and the strength of the product is generally reduced about 20%. Oiled paper has a limited use owing to the difficulty of keeping the oil in the paper after it is put there. This paper is used a lot in the packing industry, but its uses are limited as it is an unpleasant product.

Paper Cans

Paper packages which have been waxed after being made are very familiar to all, but such packages are unsuitable for some uses. Waxed containers are not suitable for holding greases such as butter and lard. They are also unsuitable for canning, as they cannot be heated. During the late war there was a great demand for paper cans that could be substituted for metal ones, but a paper can that would stand the heating process, to which the metal can is subject, was not produced.

*Read by the author before the Montreal Branch on April 10th, 1919.

The Engineering Features of Paper Products

The engineering features connected with the future development of paper products may be considerable, and it may be of interest to note some of the tendencies at the present time and the problems that affect their development.

During the rush period of the war, a large amount of paper wall-board and plaster-board was used in government construction for cantonments and other temporary buildings. Perhaps some of the paper-board was, at first, improperly made or improperly used, but, if disappointment occured, it does not follow that satisfactory fibre board products cannot be produced for these many purposes of construction. Pasted board has some properties that make it desirable for special conditions.

Wall-board has also been used as a substitute for lumber when made into forms for concrete, and it may be used in constructions, not only to act as ceiling but also as the bottom of a concrete floor above. At the present time, manufacturers of wall-board seem to be content to develop the markets for interior use only, although it is known that a really waterproof product can be made, as a result of improvements in the present processes. Newer developments and applications, therefore, will follow the production of a standardized product, which will withstand the influences of the weather and which can be safely used by engineers for outside construction. There are manufacturers preparing, at the present time, to produce such a material, and, as it can be made from either ground wood or old paper stock, it is evident that there will be no limit to the possible production of lumber substitutes.

Methods of Production

There are three problems to be solved if it is desired to make the pasted board entirely waterproof. First, the paper, as it comes from the paper machine, must be made thoroughly water resistant by the use of special sizing materials, which are added to the pulp in the beating engine; second, these layers of waterproof paper must be pasted together by means of a water-soluble material, which becomes insoluble on drying; and thirdly, but of less importance, the surface of the pasted board may be coated with a water resistant material. Some manufacturers do not attempt either to size the paper product or to use a waterproof binder, but depend entirely on a small amount of surface coating to retard the penetration of water, in the form of vapor. Other manufacturers do their best to waterproof the original paper product but, like all of the others, paste these layers together by means of silicate of soda, which is a strongly alkaline material, and the manner in which it is used injures the water resistance of the paper itself.

The use of surface coatings is more varied in practice but is limited in its application, owing to the fact that if waxy or oily coatings are applied to any extent then the product, when used for interior decoration, will not take the proper surface sizing before paint is applied.

Owing to the improvements in methods of waterproofing paper, by treating it before it is formed on the machine, and also the development of special organic products for pasting it together, which will become insoluble on drying, we can now safely say that the problem of making a thoroughly waterproof board has already been solved and merely awaits the application of these processes which are now perfected.

With regard to the properties of this new board product, I may say that it is possible to make it sufficiently waterproof so that it will not absorb over 20% of moisture after several hours immersion in water. This means that it will never take up sufficient water to weaken its structure so that it will fall to pieces and, consequently, will be a satisfactory substitute for lumber. We must remember, on the other hand, that lumber is easily wetted until it has doubled its weight by the absorption of water and that under these conditions it loses about 50% of its original strength. While absorbing this water it will expand considerably, and during the drying process will suffer considerable distortion. In considering the properties of paper board, therefore, we must compare it with the more or less unsatisfactory material that we commonly use, whose factors of distortion are greater than the artificial product.

Painting does not keep lumber dry any more than it will be an absolute protection for a lumber substitute. In the manufacture of a paper product, however, it is possible to incorporate waterproofing materials into the fibrous mass so that the product, when dried on the machine, is exceedingly water repellent, which property does not exist in natural woods. In the artificial product the strength factor may be less but it will be subject to less variation under normal conditions.

Waterproof Paper

There are many coming uses for a waterproof wrapping paper which is also strong and pliable in character. The greatest possibilities are in connection with the substitution for canvass and cloth. Such papers are already being made by treating specially strong paper with impregnating or coating materials. These paper products are, of course, expensive but this is due to the fact that valuable products and heavy coatings are required to make paper so that it does not take up any moisture at all. Paper which will hold water for many hours, and in this sense may be called waterproof, can be made on the paper machine and this may also be very strong and pliable in character.

A crimped paper that is waterproofed, by impregnation, and sewed into bags is very serviceable for many purposes and is already on the market in considerable quantities. A similiar paper can be made, with like waterproof qualities, by special sizing materials incorporated in the paper stock during manufacture. Such a product, however, is not yet in general use.

Summary

It is very difficult to make a paper product that will not absorb moisture and thus expand and contract to some extent. Paper and board can, without difficulty, be made so that it will resist the further penetration or absorbtion of water after its fibres have taken up a small quantity of moisture, equal to about one fifth its weight. The manufacture and use of these latter products should greatly increase as they are sufficiently waterproof for most commercial uses.

The Search for Oil in Scotland

The West Calder district of Midlothian, where the Government have authorized a syndicate to search for oil, and where boring operations have been started, contains extensive shalefields which have been worked for a long time by Young's Oil Company. The shale measures in which the bores are being put down, and on which the present oil industry depends, form part of the calciferous sandstone series of Mid and West Lothian.

This calciferous sandstone series forms two subdivisions. The upper, known as the oil shale group, is over 3,000 ft. thick, and contains in its higher parts beds of coal, usually of an inferior quality, and farther down about a dozen seams of oil shale, interstratified with sandstone, marl, limestone, shale and fireclay. The lower or cement stone group, in which no oil shales have yet been found, consists of white sandstones and shales, passing downwards into gray, green, and red shales, sandstone, etc.

Although the calciferous sandstone series is well developed in other parts of Scotland, it has not hitherto yielded any oil shale of economic importance beyond the limits of West Lothian, Mid Lothian and a small area in Fifeshire near Burntisland. Oil shale has been found in other formations, such as the coal measures and the carboniferous limestone series, and has been worked together with seams of coal and ironstone. At present none of these shales is considered workable.

Liquid petroleum or crude oil has been found in the Lothian shale field at different times—on the surface and deep underground. It was found in 1886 at the Sandhole Pit, near Broxburn. While a level was being cut through inclined strata there was a constant oozing of petroleum and brine. A well was made, and the petroleum collected at intervals for over a year, over 200 barrels being obtained in all. On analysis the oil was found to compare favourably with the crude oil obtained by destructive distillation. On another occasion, while a surface drain was being cut on the estate of Niddrie, the workers found oil capable of being filled into barrels. Then again, a dolerite sill of unknown thickness, in the cavities of which liquid petroleum and solid bitumen were found, was discovered at a depth of 16 fathoms under one of the shale seams near the Broxburn Oil Company's Albyn Works. The existence of crude oil has also been proved by bores put down in the same field. At one bore to the north of the Albyn Works the rods were found to be thickly coated with crude petroleum of semi-solid consistency.—*The Times Engineering Supplement.*

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

VOL. II. August 1919 No. 8

Professional Meetings

As announced in the July *Journal*, it was found necessary, on account of conditions existing in the West, to postpone the Western Professional Meeting, planned to be held at Edmonton, July 10th, 11, and 12th, until a later date. The Western Branches are now discussing the question of a suitable date, to be ratified later by Council, and are also considering whether it might be advisable to postpone this meeting until next year. It is expected that a decision will have been reached before the September *Journal* goes to press.

In the meantime the Halifax and St. John Branches are continuing arrangements for the Professional Meeting in St. John, September 11th, 12th, and 13th, and it is anticipated that, at that time, the greatest gathering of engineers ever assembled in the East will be held.

Federal Status of Engineers

Parliamentary activities during the closing days of the last session of Parliament were the center of interest for a large number of the members of the engineering profession in Canada. It was anticipated that the Act under preparation for the past year, dealing with the reclassification of the Civil Service, would be passed, and no small amount of disappointment was expressed when it was learned that the Act had been held over until the next session. The salient features of the Act as effecting the engineering profession are outlined under a separate heading in these columns.

Considering the dissatisfaction that has been expressed over awards to engineers occupying positions of responsibility, it may be fortunate that it was not finally dealt with at the recent session. An opportunity is being given to all, who feel that sufficient consideration has not been given to the importance of their positions, to take up the question with the various heads of the departments, who in turn are being given an opportunity of laying individual cases before their Ministers. While several months will elapse before any definite action can be taken by Parliament, no time should be lost by all concerned, and, in this connection, it is felt that the great majority of the members of the engineering profession in Canada will be affected either directly or indirectly, inasmuch as the recognition of a higher standard of the engineering profession by the Federal Government will enhance the standing of all salaried engineers.

The columns of *The Journal* are open for a free and full discussion of this subject.

The Council of *The Institute* has already taken an active constructive part in assisting the Civil Service engineers, and the work of the splendid committee of the Council is universally appreciated. To enable this committee to do further effective work copies of all memoranda from individual members dealing with their own specific cases should be forwarded to the Secretary. In the meantime members of the profession employed by the Federal Government are assured that the influence of *The Institute* will be used on their behalf and the personnel of the Special Committee is ample evidence that the case is in good hands and will be followed to a satisfactory conclusion.

The Civil Service Bill

Following the Government resolution which is quoted in the July *Journal*, page 511, the Bill to amend the Civil Service Act, 1918, was introduced in the House of Commons and given its first reading on June 10th. The Bill itself is very brief, and is notable principally for the extensive powers which it gives to the Civil Service Commission.

Clause 42 of the amended Act reads in part as follows:

"(1) The classes of positions, including the several rates of compensation in the classification of the Civil Service of Canada signed by the Commission and dated the day of , one thousand nine hundred and nineteen, and submitted to Parliament, are hereby ratified and confirmed, and the Civil Service shall, as far as practicable, be classified in accordance therewith.

"(2) The Commission shall hereafter, as it may from time to time deem necessary, establish additional classes and classify therein new positions created or positions not included in any class established in the said classification and may combine, alter, or abolish existing classes. Each such class shall embrace all posi-

Members having copies of the May number of The Journal, which they do not wish to keep the reference, would confer a great favor by mailing them to the Secretary. About twenty copies are required.

tions similar in respect to the duties and responsibilities appertaining thereto and the qualifications required for the fulfilment thereof, and shall be given a classification title indicative of the character and rank of the employment.

"(3) Where the change in a position is such as in the opinion of the Commission to make it necessary to reclassify it, such position shall be abolished, and the Commission shall create a new position for such duties which shall be classified under this section."

From this it will be seen that changes, which may become necessary, can be made in the classification from time to time without the necessity for having special legislation, and the Civil Service Commission have stated that they do not consider the present classification as final or complete but will gladly receive all pertinent suggestions, either from individuals or groups, and will make such changes as are shown to be necessary.

The classification itself, and the report on it, both prepared by Arthur Young and Company of Chicago, were tabled in the House a few days after the Bill, and should be given careful study by all members of *The Institute* as they effect engineers throughout Canada.

Discussion of the Bill and Classification has been postponed until the next session of Parliament so that ample time is afforded for consideration and suggestions. The report of transmittal should first be studied as it describes the schedules for the classification of positions and the standardization of compensation, explaining their need, basis, use, and the method of their preparation. As a basis for the classification, the following principles were agreed upon:—

"(1) That the duties and responsibilities appertaining to a position should be the criteria for determining the classification of the position because these attributes constitute the fundamental characteristics that distinguish the position from other positions and because all of the purposes of classification will be served by a grouping that will bring together positions involving substantially the same duties and responsibilities.

"(2) That positions involving substantially the same duties and responsibilities call for practically the same qualifications as to education, experience, knowledge, and skill in their incumbents and that for this reason such qualification requirements, dependent as they are on the work to be performed, constitute an auxiliary basis for determining the proper classification of a given position.

"(3) That neither the degree of efficiency with which the duties of a position are being carried out by the person who may be filling it, nor the qualifications such person may possess or lack, nor the pay he may receive, nor any other fact dependent solely on his individuality, shall be considered as having any bearing on the classification of the position in question.

"(4) That the simplest practical grouping of positions should be adopted that will serve the purposes for which the classification is needed; that in conformity with this principle the unit of classification should be a group (called a "class") embracing all those positions in the service, regardless of departmental lines, that involve duties and responsibilities which are substantially the same."

Information as to the duties of an office was obtained by means of questionnaires, and organization charts were prepared to show the general arrangement into branches, divisions and sections. After all the available information regarding a position had been obtained a tentative classification was adopted for each position in the service. At this stage departmental lines were eliminated from further consideration and all classes in the various departments were grouped in general divisions on a basis of the line of work involved. After due consultation these tentative drafts were perfected and the final schedule of positions was drawn, as published. The preparation of the schedules of compensation for each position was then undertaken.

The following are the main principles on which the schedules of compensation are founded:—

"(1) That rates of compensation should be uniform for the same work.

"(2) That rates of compensation should be relatively right for different classes.

"(3) That the pay for each class of employment should be equitable, that is, fair to the employee and fair to the taxpaying public.

"(4) That the schedules of compensation should provide for an absolute minimum and an absolute maximum and intermediate rates in this range.

"(5) That the salaries proposed should not be based on the depreciated value of the dollar of the present time as measured by the abnormally high costs of the necessities of life that have developed as a result of the war.

"(6) That, for certain classes at least, a special war bonus should be paid to employees in addition to the salaries provided by the schedules."

It is important to note that the proposed rates of pay are based on a normal increase in the cost of living and do not take into account the abnormal increase caused by the war. It is for this reason that an annual bonus is recommended to cover this abnormal cost, and to continue until conditions become more stable.

Turning now to the classification, one is struck, at first sight, by the large number of positions enumerated, some 1,600 altogether, and the great diversity in the schedules of compensation, both maximum and minimum. It is noticeable also that technologists when they leave college, armed with their degrees, begin their career at widely differing rates of pay according to the subjects in which they have graduated.

Many classes of engineers are specified, some for particular positions in one department, others applicable to various grades which are uniform throughout the service.

The classification as published has been widely criticised, and there are undoubtedly many changes which should be made. It must be admitted, however, that it marks a great step in advance and if carefully revised in the light of more detailed information and intelligently applied to the personnel, it should greatly improve the status of engineers throughout the Dominion.

Ballot Regarding Legislation

At the first meeting of Council. that of July 22nd, following the closing date for the ballot issued to secure an opinion regarding proposed legislation, scrutineers were appointed, and their report will be made available as soon as an adjourned meeting of Council has been held. It was anticipated that this information would be available for the August number. Pending the announcement in this connection in the September *Journal*, the Branches will all be notified of the result as soon as the returns are officially known.

Winnipeg Engineers' Archievement

Possibly nowhere in the world does the engineering profession occupy a prouder position than at Winnipeg, at the present time, because of the public-spirit and the ability of the members of the Winnipeg Branch of *The Institute*, who, in the dark days of the early stages of the strike, kept the necessary public utilities of the city in operation and thus averted what might otherwise have been a pestilence. As a member of the Executive Committee consisting of fifteen of the Citizens' Committee of fifteen thousand, Geo. L. Guy, M.E.I.C., Secretary-Treasurer of the Branch, loyally assisted by the officers, executive and other members, organized the various departments so successfully that there was no interruption of the water, gas and electric light supply, as was intended by the grim devils who engineered the strike.

So modest are the men in Winnipeg that it has been impossible to secure details of all they did, but it is known that some worked twenty-four and thirty-six hours at a time to ensure the health and safety of the citizens of Winnipeg. Lacking the practical knowledge of engineers no other body of men could have accomplished this and it is hoped that when the full details are secured the story will be told to the entire world.

Lignite Utilization

A Memorandum on the present situation of Lignite Investigation and Development as undertaken by the Lignite Utilization Board of Canada.

R. A. Ross, M.E.I.C., Chairman,
Lesslie R. Thomson, M.E.I.C., Secretary.

1.—Results of Investigatory Trip

At the commencement of the Board's activities on October 1st, 1918, it was decided that every briquetting and coal treating plant in the United States and Canada, where information pertinent to lignite carbonization might be available, ought to be visited by the Board's engineers, in order that the last word on carbonizing and briquetting might be obtained. At that time it was hoped that, as a result of this investigation, the Board's engineers would be able, on their return, to recommend that such-and-such carbonizers be adopted, such-and-such mixers, and such-and-such briquetting presses. It would then have been possible to proceed immediately with the erection of the plant and purchase of machinery. It should be noted that a great deal of published information had led the Board to believe that the carbonization of lignite had advanced further than actual personal investigation proved to be the case. Their expectations, therefore, in regard to carbonizing of lignite were not realized, and it became necessary for the Board to develop a special type of carbonizer that might be suitable for the low grade Saskatchewan deposits.

The results of the investigation of crushers, dryers, mixers and presses were, however, much more encouraging. It became evident that various commercial machines could be obtained in the open market that would be suitable for the Board's needs with but slight alterations. These results are also touched upon under paragraph 4.

2.—Present Programme

The present programme may be briefly summed up as follows:—The Board is developing a special type of carbonizer, and within a couple of weeks the preliminary trials of this apparatus will be made. In the event of success, the Board's plans will permit it to start the erection of a plant during this coming autumn. In the event of this carbonizer not being successful, further designs will be made, but the Board is determined that not one dollar will be spent on large retort equipment until it is absolutely certain of the ground now being explored.

In addition to its own researches, the Board has arranged with a number of investigators in Canada, the United States and Great Britain, to undertake certain experimental programmes. In this way, the Board is sure of having at its command the best scientific information along these lines that can possibly be secured.

3.—Site of Proposed Plant

The Board has collected as much data as possible on the physical characteristics of the whole Souris field. This data includes information on depth, width, quality and ash content of the seams in each mine, the stratification of the whole area, water supply, topographical characteristics, approximate values of land, quantity of slack available in mines, population of the various towns, and railway facilities. In addition, the Board has come to an arrangement with the Department of the Interior whereby no new mining lease within a radius of 20 miles of Estevan will be granted without the Board's certificate that such lease will not conflict with the future operations of the Board. In this way the interests of the public are safeguarded. No immediate decision, however, will be announced as to the exact location of the proposed plant.

4.—Difficulties and Scope of Board's Programme

The main divisions of the process of producing a carbonized and briquetted domestic fuel from raw lignite are as follows:—(a) crushing, (b) drying, (c) pulverizing, (d) carbonizing, (e) mixing, (f) briquetting, (g) waterproofing, and (h) cooling. These steps will be discussed briefly, in order that it may be clearly seen what the Board is attempting to do. It must be noted that the following remarks are applicable specifically to the Saskatchewan lignites.

(a) and (c). Enough information regarding crushing and pulverizing is at hand to know that these processes can probably be carried out by means of some type of standard apparatus at present on the market. In any event only slight changes will be necessary in order to make existing machinery practicable.

(b). Certain technical difficulties exist with the drying. Standard machinery that can be purchased in the open market, however, will probably be suitable.

(d) As mentioned above, the question of the commercial carbonization of lignite is one that presents, at the moment, the most difficulty to the Board. It is also at this point that the Board's objectives differ most widely from those of so many firms in the United States that are retorting coal on a large scale. The latter have in mind the production of the maximum quantity of by-products, while the defined objective of the Lignite Board is the production of the maximum number of heat units in the residue, in order that it may be available as a domestic fuel. These differences are the more marked when it is remembered that the successful coal treating firms of the United States are dealing with a much higher grade of fuel than the Lignite Utilization Board. There is no question that the carbonization of the lignite *can* be accomplished. The only point is, how cheaply can it be done on a commercial scale with commercial apparatus and with commercial quantities. In order to solve this specific problem, the Board, through the courtesy of the Department of Mines, Mines Branch, has been erecting a small experimental plant at Ottawa, which is, however, to be supplied with units that, though small, may still be regarded as commercial. In this plant the new carbonizer is one toward which the Board is looking with great hopes.

Mention has already been made of the fact that the Board has not only its own investigations under way, but has arranged with a number of well-known scientists to undertake special research work on carbonization.

(f) The question of briquetting is one that is practically solved, and the Board's present objective is to discover the minimum quantities of those binders which are available in commercial quantities in the West. It is interesting to note that the amount of binder necessary for carbonizing lignite is very much in excess of the quantity of the same binder necessary for briquetting anthracite. Enough information with regard to briquetting and binding, however, is now in the Board's possession to enable it to state that, for briquetting presses, it will probably be able to utilize existing commercial machinery with but slight alterations.

(g) In order that the briquettes may be smokeless, it will be necessary to subject them to a heat treatment, and it only remains to determine whether this heat treatment can be made sufficiently cheap to warrant its adoption.

(h). Cooling. This is purely a commercial detail.

5.—Probable Schedule of Future Construction

At present the Board wishes to guard against any absolute promises, because future construction is entirely dependent upon the results of the experimental investigations now going on at Ottawa and elsewhere. The Board has plans and layouts sufficiently advanced to proceed at the earliest moment with the letting of contracts, purchase of land, machinery, etc., provided the experiments are successful. The Board hopes that erection of the plant itself may be started by October or November, 1919. If the experiments are not successful the whole matter must wait until success is achieved, because the Board will not under any circumstances spend public funds for one dollar's worth of capital equipment that might afterwards prove unsuitable.

Town Planning Institute of Canada

The Town Planning Institute of Canada held their first general meeting on May 31st, 1919, in the Russell Hotel, Ottawa, at which Thomas Adams, Chairman of the Provincial Council presided. The following members were present: Thomas Adams, Dr. E. Deville, Dr. O. Klots, N. Cauchon, A.M.E.I.C., J. B. Challies, M.E.I.C., F. D. Henderson, C. P. Meredith, H. L. Seymour, R. H. Millson, W. D. Cromarty, D. M. Ewart, B. E. Parry, F. C. Todd, Thomas Fawcett, M.E.I.C., A. H. Hawkins, S. E. Farley, A. Buckley, E. T. B. Gillmore.

Sir Lomer Gouin and Hon. H. E. Rowell were elected Honorary Members and the following were elected Associate Members, subject to the completion of certain formalities in connection with the forming of applications.

Associate Members

Architects: Richard H. Millson, James P. Hynes, William D. Cromarty, David Ewart, George A. Ross, W. Herbert George, Charles H. C. Wright, M.E.I.C., Ramsay Traquair, Percy E. Nobbs, Arthur A. Stoughton, Robert H. Macdonald, Edward Maxwell, Colborne P. Meredith.

Engineers: R. S. Lea, M.E.I.C., William M. Tobey, M.E.I.C., George H. Ferguson, A.M.E.I.C., Horace L. Seymour, A.M.E.I.C., William H. Powell, M.E.I.C., Charles A. Bigger, A.M.E.I.C., John L. Rannie, A.M.E.I.C., Christopher J. Yorath, A.M.E.I.C., Arthur G. Dalzell, A.M.E.I.C., George Phelps, A.M.E.I.C., James A. Walker, A.M.E.I.C., William A. McLean, M.E.I.C., Percival H. Mitchell, A.M.E.I.C., Noulan Cauchon, A.M.E.I.C., James White, M.E.I.C., John B. Challies, M.E.I.C., Lionel C. Charlesworth, M.E.I.C.

Surveyors: Francis D. Henderson, Thomas Fawcett, M.E.I.C., Edouard Deville, Wilbert H. Norrish, Jr. E.I.C., William A. Begg, A.M.E.I.C., Ernest B. Hermon, Thomas A. McElhanney, Albert H. Hawkins, Carl Engler, Athos M. Narraway, S.E.I.C., Sidney E. Farley, Otto Klots.

Landscape Architects and Town Planners: Frederick G. Todd, Alfred F. Hall, H. B. Dunnington-Grubb, Thomas Adams.

Legal Associate Members: Thomas B. McQueston, James A. Ellis.

Associates: G. Frank Beer, Dr. W. H. Atherton, A. Buckley, E. T. B. Gillmore.

The chairman presented a report on some features of the City Planning Conference held at Niagara Falls during the last week of May. The Institute, he said, had been well represented at the conference considering the existing small membership. The conference was called under the auspices of the cities of the Niagara frontier and was international in its purpose and significance. It had fallen to his lot to present a paper on "The Regional Survey as the Basis for Regional Planning and Regional Planning as the basis for Town Planning." The subject dealt with the district twenty miles on either side of the Niagara River covering an area of 1,000 sq. miles and, with the aid of seven or eight diagrams, the paper set forth the basic conditions that require to be considered with regard to the whole district. He thought that the consideration of the subject might lead to the formation, on both sides of the river, of an International Town Planning Commission dealing with the whole of that region. This would mean a big scheme and one of world-wide value. The scheme should have special interest to professional men as it would enlist the services to a large extent of surveyors, engineers and architects.

A discussion took place on the question of the formation of local branches and local representation. Mr. Todd suggested that the provisional council seemed to be largely composed of Ontario men and that Montreal was not very well represented. On that ground he foresaw some difficulty in the formation of a Montreal branch.

The chairman explained that this point had been discussed, that the provisional council was appointed to carry on the work of organization for the first year and that it had seemed necessary that the membership should be largely drawn from Otawa in order to make it possible to conduct business. He also explained that the organization was started in Ottawa and they had no assurance that anyone in Montreal would join them. The council, however, was merely provisional and at the end of the first year it would be easier to elect a wider representation. Local Branches would have to be formed in Montreal and Toronto, and proper representation given on the Council.

The Prospects of a Town Planning Institute in Canada

Thomas Adams addressed the meeting upon "Prospects of Town Planning Institute in Canada." He referred to the progress made in forming Institutes in Britain and the United States, and to the special difficulties Canada had to meet in attempting to create any organization on the basis of conditions in these countries.

In Great Britain there was practically no such thing as a "town planner" prior to 1909. In that year the Town Planning Act was passed by the Government and there arose a need for men as town planners. In 1913, the Town Planning Institute was formed. It consisted of the architects, surveyors and engineers in Great Britain who were prominently identified with town planning.

They have an advantage over us, as Great Britain is a relatively small place and therefore meetings can be held more frequently and they have therefore been very successful. They hold about eight meetings yearly, and they have presented papers which are published and form very interesting and valuable literature on the subject. An annual volume is issued with a subscription of two guineas for members and one guinea for associates.

In Britain, when a town wishes to have a scheme prepared, if it has not an engineer who is also a town planner, then an expert town planner is asked to assist. The city engineers of the chief cities are prominent members of the Institute. It is strictly a professional institute and there has been no difficulty in separating the associate from the professional members. Some of the associates, however, have studied town planning for many years but are not professionally qualified. These include Henry Vivian, Chairman of Copartnership, Ltd., H. R. Aldridge— who has written a very comprehensive book on the subject—and Ewart Culpin, Secretary of the Garden Cities and Town Planning Association. None of these men were eligible as professional members but were elected as associates. The Institute was formally established as a professional organization and has brought into existence a definite scheme of instruction in town planning. An examination syllabus has been issued, and the aim was that no one should become a member without examination. They have also a school of civic design in Liverpool University and a professorship of town planning in London. In regard to professional work they have issued a scale of charges for town planning work. Members of the Town Planning Institute were recently elected Housing Commissioners. Raymond Unwin, an ex-president, is now Chief Architect of the Government in its housing schemes that involve an expenditure of $600,000,000 to $1,000,000,000. G. L. Pepler, a vice-president and first secretary is Town Planning Inspector to the Local Government Board. Professor Abercrombie, Librairian of the Institute, is editor of the Town Planning Review and head of the Liverpool School of Civic Design, and Professor Adshead, the President, is Professor of Town Planning in London, and adviser on town planning to the Prince of Wales.

Starting out with small anticipation the Institute is becoming very much alive and its members are benefitting while contributing their services to their country. In the Institute we had Professor Geddes, as first Librarian, whose collection of town planning material was sunk by on of the German raiders on its way to India. He had collected material costing $12.500 which was all lost. The Institute immediately set to work to collect duplicates as far as possible and these were sent out to him in India. Professor Geddes is not an architect or a surveyor but has high academic qualifications as regional planner. He has done great work in India and has published several large volumes on town planning in India through the Indian Government. His son, Alister, was trained as a town planner. Passing through Edinburgh University, he took up town planning with his father and went across to Dublin to assist in the organization of an exhibition. In 1914, as the holder of a scholarship, he wished to finish his studies in India. When the war broke out he came back to help his country. Owing to his study of topography and his facility in drawing and his acquaintance with regional development he was selected in France as a balloon observer and became one of the most competent on the staff. He was killed in 1915.

The Town Planner in the United States.

The development of the town planner in England has proceeded rapidly. The beginning in the United States was not so satisfactory from a scientific point of view. It came about in a different way. In Britain we started to promote a school of town planning with a view to creating a trained class of professional men. In the United States there has been no deliberate objective of that kind, until very recently.

The National Conference on City Planning in the United States was first held twelve years ago. The Chairman is F. L. Olmsted, who is an able landscape architect and a man whose name is widely honoured. He has been chairman for twelve years. That itself has been a weakness. A chairman should not hold an office more than one year. The organization is weak in its architectural and engineering membership. There has been a tendency, probably quite unconscious, rather to confine town planning to landscape architects and there is now a good deal of lee-way to make up in order to interest the engineer and the architect. Two years ago it was suggested that a city planning institute be formed. This year a step has been taken to separate professional functions from propaganda. But the council of the Institute is the same as the council of the Conference which is engaged in what may be termed propaganda.

In Canada, we have started out in the right way. The chief question to deal with is what prospect is there for those of us who are interested professionally in the subject that there will be sufficient scope for using our knowledge of town planning? We have the great difficulty of planning for a small population in an immense area. Great Britain has about 50,000,000, United States over 100,000,000. We have our 8,000,000 scattered over a larger territory than the United States. We shall have to be content to grow slowly as a profession. A small population means a smaller number of practitioners. There will be the difficulty of getting sufficient reward for professional work in Canada to make it practical for men to train for the profession. But, while we are a small country, we are a growing country and a town planner has to deal with growth. Our Government has promoted the best housing scheme of all the Governments. In Great Britain they are spoon feeding the population with their housing schemes which has dangers and is not so sound economically as ours. Mr. Campbell, a member of the Town Planning Institute and City Engineer of Edinburgh, has just written to say that he is satisfied that the Canadian scheme is based on sounder economic principles than the Scotch scheme which had been made for Scotland by the English Government. Mr. Tayor, of the firm of Mann and MacNeille of New York, says in a letter:—"We wish to express our unqualified admiration for the completeness, practicability and simplicity of the administration methods outlined in the data received from you. We believe this to be the most practicable step toward the provision of good housing by Federal co-operation which has yet been taken in any country."

We have opportunities here because we are beginning at an early stage in the development of the country. On the other hand we have the disadvantage of a smaller population and lack of appreciation of professional capacity.

The other day I was going over the deep cut being laid between the Rapids and Queenston by the Hydro Electric Commission and was informed by the engineer that somebody had applied to him for a job. He had said to him, "Well, I could give you $80.00 a month." The young fellow had looked rather glum. "Well if you thing that is not enough that is the best I can do. Is there anything else you can do?" "I have been accustomed to boring," said the applicant. He was referred to the engineer in charge of the boring. Later the engineer met him and said: "Have you got something?" "Yes," was the reply. "I am boring at $130.00 a month." There was a man with a university training. He had to take the work of a skilled labourer in order to get a decent salary.* What encouragement is there for a youth to go to the university and learn a profession? Railway men are earning up to $3,000 a year. Many of the engineers have to be content with $2,000. If a man is to be a town planner he has to take his four years course in Architecture and Engineering and then a post-graduate course of a year in town planning. You get a man to take a five years course and then you meet this difficulty of having his services valued as a skilled labourer who can learn his job in a few months. But there is no question town planning will come to be appreciated. There are some hopeful signs of this fact. First we have the surveyors who almost to a man are now recognizing that they have to take up the question of topographical survey in a more extended way. Then we have also to consider that regional planning is a thing that has come to stay in England and the United States and that it is one of the things that is very much needed in this country. Many industries are spreading over areas that have no reference to municipal boundaries at all. You cannot town plan even Ottawa with 100,000 inhabitants unless you take in about half a dozen municipalities. If you wish to zone Ottawa or to insist upon proper building by-laws it cannot be done unless Westboro and Eastview have the same restrictions; otherwise people would skip the boundaries and build as they like. In the regional planning, which I hope we may take up as a subject of special study, we require the surveyor and the engineer to prepare the regional survey as the basis for the regional plan. The surveyor should become our chief man in the regional survey. You cannot town plan unless you know what the existing conditions are. You have to find out what is the basis on which you wish to build your town planning. The engineer comes in to assist the surveyor with the collection of data concerning roads, railway transportation, sewage disposal and water supply. For this we need a regional survey in which we shall need specialists in the future. We need the regional survey to present us with the exact data we require to prepare our plan.

We had a survey made in the Niagara district. We wanted the facts and there was need to obtain correct information and the surveyor and engineer supplied us with such information. We have information collected regarding railways, water-ways, high-ways, sewage disposal, power, etc. One municipality may have its sewage disposal on higher level than another and become a water shed sending down polluted sewage to the other. When you have finished with your survey you must bring in the landscape architect. The engineer and the landscape architect present us with the regional plan as the basis for general development. The landscape architect will deal with the park system in a general way. The Niagara district should have a park way from Buffalo right down to Lake Ontario. Along the Niagara River it would touch five or six municipalities.

When the regional plan is prepared, then Town Planning Commissions have to be appointed for the municipal areas within the region. The different towns

* *The engineering job offered in this case was of course wages for a beginner on engineering work, and the applicant might have been able to have obtained a larger salary had there been an opening.*

will each have their own local engineer to fit in his plan with the regional plan. He will know where the other plan touches his. Then the architect will finish the job commenced by the others, fix residential areas, group buildings, arrange the minor street system and bring to a climax a definite scheme, when the lawyer also will appear and an Act of Parliament will follow.

All this needs considerable organization and professional talent of varying degree. There is a field big enough for all the talents. We can bring it to bear if we get the teaching we require in the universities and we can also show that such money is well spent. If the services we are able to give are properly appreciated we shall be able, as we apply courage and vision, to convince the people of Canada that we have a big contribution to make in the application of science to the making of a strong country, and the building of a strong race, living in houses not only comfortable but in right relation to industries, means of recreation and sources of power. Then proper organization and planning will help to give the people the right foundation and build up this country in such a way that there will be less to regret.

* * *

Since the above meeting was held two additional members of the Council of the Institute have been elected. Dr. Emile Nadeau, Director of Housing in Quebec, has been appointed as a representative of the Council of Honorary Members, and J. P. Anglin of Montreal has been appointed as Associate Member of the Council, thus increasing the representation of Montreal. It is hoped to further increase the professional representation from Montreal as soon as an amendment can be made in the rules. The next meeting of the Institute will be held in the second or third week in October at Ottawa. On that occasion a joint conference will be held between the American City Planning Institute and the Canadian Town Planning Institute. The Conference is being called at the instigation of the American Institute, the Chairman of which is, this year, an eminent engineer, Nelson P. Lewis, Chief Engineer of the Board of Estimates and Apportionment, New York. An attractive programme is being prepared, and the subject chosen for discussion is "Principles of Town Planning."

Directory of Chemical Industries

The Dominion Bureau of Statistics has just issued a Directory of the Chemical Industries in Canada, listing the names, addresses and products of nearly five hundred Canadian firms manufacturing chemicals, or other products in which the processes used are essentially dependent upon the agency of chemical change.

This publication will undoubtedly fill a long felt want and should be of considerable value to the general public as well as to the trade. It has come to be a well accepted truth that scientific progress is essential to the true development and material welfare of any country, and in Canada, where many of our natural resources are as yet almost unknown, the importance of laying sound foundations cannot be over-estimated. Some of the possibilities of industrial chemical development were made apparent by the remarkable accomplishments along these lines in Canada during the war, and consequently popular sentiment now favours the idea that this country should, to a large extent, be freed from dependence upon other countries for our chemical needs. In order that this idea might be guided along well advised lines, it was essential that a survey of our chemical industries should be made, and the bulletin now referred to represents the first phase of this work.

The Directory is in two divisions: (1) an alphabetical list of the various concerns, the head office address of each, together with a detailed list of their products, including in the latter chemicals and products resulting from chemical processes; (2) a list alphabetically arranged of the chemical products manufactured in Canada showing the names of the various firms engaged in their manufacture.

The Directory has been published in a limited edition, and as a geat number of requests for copies have already been received, it is probable that the available supply will soon be taken up. Requests from those interested should be addressed to the Dominion Bureau of Statistics, Ottawa.

Commercial Value of Musk-Ox

Following up the proposal of Mr. Stefansson, the Canadian explorer, that musk-ox and reindeer should be raised in the Canadian Artic and sub-Artic regions, making these vast areas of economic value, the Government is likely to establish a station on Melville Island (which is 650 miles north of the Artic Circle) for the domestication of the musk-ox.

In a recent address before a gathering of Members of Parliament and Senators the explorer outlined his plans.

He said that both these animals would furnish a meat and milk supply, and in addition the musk-ox would furnish good quality wool. He pointed out that in the summer there is abundant vegetation, which forms nutritious and good grazing for the animals for winter as well as summer. He estimated that there are at least a million square miles of such grazing grounds in Northern Canada. The winter is too severe for ordinary domestic cattle, but the musk-ox and reindeer can graze there in the open all the year round. In regard to musk-ox meat he said that for a year when he was in the north this meat constituted 90 per cent. of the party's food supply, and that they found it indistinguishable from beef.

In view of these circumstances Mr. Stefansson claimed that the Canadian North can be utilized to help to solve the problem of the present and future food shortage of the world, and in addition the development of this industry would expedite the development of mineral and other resources. He referred to what has already been done in raising reindeer in Alaska by Americans. The Canadian North was much larger and more suitable. In Mr. Stefansson's opinion the development of the musk-ox is more important than that of the reindeer. This is the only important animal of which Canada has a monopoly, as it has been exterminated in the rest of the world. The musk-ox, he said, is three times the size of the domestic sheep and would produce three times as much wool and three times as much meat. It needs neither barns, nor shelter, nor hay. He estimated that some four thousand were left on Melville Island, and perhaps 20,000 on other Canadian Islands. — *The Times Engineering Supplement.*

CORRESPONDENCE

Legislation

Editor, *Journal*:—

It is with very much regret that I find I shall be unable to be present at the meeting of the Branch on Thursday evening next, when the important matter of proposed legislation will be discussed, and I, therefore, hasten to write a few lines giving my personal views on some of the controversial issues raised.

The effect upon the present *Institute* is a point raised by the most prominent members of the Managing Board of the *E.I.C.*, and their views are rather pessimistic in this regard. The intention of the Special Committee in framing the Model Act was to limit as much as possible the activities of the Provincial Associations to the strict business of administering the legislation. It has been said that this cannot in practise be done, and that the Associations will do just as they like once they are formed. The chief safeguard against this is the good sense and intelligence of the members of the profession, who will undoubtedly see the advantage and strength of continuing loyal support to *The Institute*, which is Dominion wide and equally all embracing in its scope. It is said that when members can get all the recognition of their status as engineers from their registration in the provinces that they no longer feel a need for supporting the *E.I.C.*, with its larger annual fee. I venture to say that all those members who have loyally supported it all the years when it was practically no good at all to them will continue to support it in the future when it is, as now, launched upon a large sphere of usefulness by the organization of its Branches and the publication of its *Journal*. The *E.I.C.* will always have by reason of its organization and Head Office Permanent Staff a great advantage over any possible provincial association which might develop in opposition to it. It may be that the present rate of growth in membership of the *E.I.C.* may suffer a check but that will, I think, be but temporary. The young member of the profession will continue to find that membership in the *E.I.C.* will give him increased standing in the profession, according to the grade he occupies, and that for his own advancement in knowledge and experience and for the opportunities it will give for social and professional intercourse with his brother members, his membership will still be desirable. The older members will view the matter in the light that their continuation of membership in the *E.I.C.* is too important and beneficial to both themselves and the profession itself to be lightly thrown up simply because they are obliged to pay a provincial registration fee of very moderate dimensions. All members of the profession will soon realize that the advantages of having obtained a legal status as professional engineers will be really worth the annual fee alone.

Some of the fears and objections set out in the June issue of *The Journal* by members of the Council appear to me to be due to a wrong impression of the proposed intentions of the Model Act and the direct objects in view. It is said that some objections and opposition will be encountered from corporations and Government departments employing engineers, as they will object to being refused the right to employ whom they like. The act in *no way* restricts an *employer*, but only the *employee*. It is I think unlikely that employees would sympathize with any employee who deliberately wished to flout the law by not registering when to do so does not impose any appreciable hardship upon the employee, so long as he is qualified. If the employee is not qualified, then the employer could hardly put up the argument to the Legislatures that they wished to employ him as a professional engineer, in face of his inability to pass by virtue even of his experience alone. Compulsory written examination *is not* required in all cases by the Act. It may be argued that there are many instances of valuable employees who could not pass an examination. It will, I think, be found that in most of these the man is not performing the duties of a professional engineer, as defined in the Act at all, but rather is a superintendent of construction, or is an *operator* of a machine or engine. It should be noted that there is a distinction between operating duties and professional duties, and this distinction is generally not very hard to draw.

Again, the plea is made that the form of legislation proposed is not going to financially benefit any considerable number of the members of the allied engineering professions. This point is made by several influential critics, and is, I think, a very weak argument. I hesitate to believe that any member who has advocated legislation up to the present time has ever had any idea that any such direct result could possibly come about as compulsory increase in wages by legislation, and to tell us that that can not be done is an affront to our intelligence. We all realize that an improved general status will eventually react favourably on our rewards of service, and it is this that we want to effect as soon as possible.

Again, the critics say that the inclusion of all branches of engineering weakens the Act. That the fact that registration is the same for all branches will give the public the impression that any registered man is qualified to practise in all branches. This idea is ridiculous as under no circumstances with or without legislation is a man engaged to perform responsible work without reference to his training or experience, unless it be in some very corrupt circumstances. The fact should be borne in mind that with the vast majority of engineers their immediate superiors are engineers themselves, and it is usually on the recommendation of some superior engineer that they were originally engaged. In the few cases where engineers are engaged by persons who have no knowledge of the extent of the profession, it seems foolish to suppose that they would even then be engaged without any other reference than the fact of their provincial registration as professional engineers. To claim therefore that the public will not be protected for this reason is misleading. There will be an absolute protection to the public from the fact that all registered professional engineers have shown qualifications, and it will then be up to the employer to ascertain that those qualifications are of the kind required by the employment. The public will also be protected by the fact that any registered man has shown evidence of trained intelligence along certain lines and as such can reasonably be expected to know his limitations.

Another criticism of the Bill is that the present *E.I.C.* is not included or made use of. This was considered to be necessary by the Committee in order to overcome the opposition from other organizations, and is, I think, advantageous in other ways. As members living away from Montreal, we wish to have home rule in matters affecting our own livelihood, and I think, that too great power and responsibility would be placed in the hands of a few persons in Montreal if the *E.I.C.* were in sole control of the profession throughout the whole Dominion. It is a fact that representative government is really impossible in an organization such as the *E.I.C.*

The matter of legislation has been under consideration in Canada for over twenty years, and it has been strikingly evident that the management of the *E.I.C.* was never competent to undertake legislation for the profession at large. What attempts have been made have met with disastrous failure, and this is I believe due to the narrow outlook which has been in evidence. Partial legislation is vicious, it must be all or nothing. If legislation is enacted at all, it must be of such a nature that it can not be ignored. It is not right to extract fees from some persons, and then fail to collect from others, and thus fail to give the results for which the fees are paid.

If our critics would endeavour to draw up some legislation along the lines they speak of, such as restriction to public works, and by certain kinds of engineers only, they would soon see the impossibility of any such course. Some critics suggest that the legislation should be to prevent provinces or municipalities from employing engineers who are not members of the *E.I.C.*, or its equivalent. This is not governing the engineering profession at all, but is governing other parties, and cannot help the profession as a whole.

It is suggested that the effect of the Bill would be to enable only one registered engineer to be employed in certain cases, and others be unregistered. This would surely not come about through the collusion of the employer, and it will in no way be advantageous to him. If the engineers encouraged such a situation, then they themselves are at fault, and if the Act cannot be administered by the members of the profession, it is useless for us to attempt it.

As regards the phase of creating "technical clerks" my letter to Mr. Chapman gives my views, as this all hinges on extent of responsibility.

C. C. Kirby, A.M.E.I.C.

Legislation

Editor, *Journal*:—

Whilst the proposed Act respecting the engineering profession, as published in *The Journal* for May, is generally satisfactory, it embraces some features which have already called forth strong protests, particularly from engineers in salaried positions, for whom the Act as drafted would probably be of little or no benefit, and might be to their disadvantage. When it is considered that fully nine-tenths of the Profession belong to this class, it is imperative that its interests should be guarded, in order to obtain united action.

Moreover, the term "Professional Engineer" is undignified and foolish; for all persons who earn a livelihood by any particular vocation or trade are professionals, such as: Professional hair-cutters, professional prize-fighters, professional golfers, etc. A legal definition of the profession of engineering is first required; the public will then learn to distinguish between engineers and "locomotive engineers," " stationary engineers," "sanitary engineers," etc., etc. The term "Registered Engineer" is a sufficient distinction, and it could not be adopted by mechanics who style themselves as engineers and who are really professionals in their particular trade. No claim for originality is made in connection with the definition of engineering, herewith; it is founded upon a definition published in *The Journal* for July, page 509.

The suggested revisions, given below, are intended to meet the objections hitherto raised, and to do away with the objectional term " professional engineer."

First paragraph. Whereas it is considered advisable to establish by legislation the qualifications necessary to permit persons to act or practise in the Profession of Engineering.

Section 2 (a). "Engineering" is the art which applies science and scientific methods to develop and control the resources of nature for the use and convenience of man; it involves ingenuity in directing forces, utilizing materials and organizing human efforts for the fabrication of machines, the erection of structures, the provision of transportation facilities, the invention of processes and the production of articles of commerce. An "Engineer" is any person who practises engineering, as defined herein.

Section 2 (b). A "Registered Engineer" is any person registered as such under the provisions of this Act; and his practice embraces advising upon, making measurements for, designing and supervising of the construction, enlargement, alterations, improvements or repairs of public and private utilities, railways, bridges, tunnels, highways, roads, canals, harbours, harbour-works, river-improvements, lighthouses, wet docks, dry docks, dredges, cranes, floating docks, and other similar works, steam-engines, turbines, pumps, internal-combustion engines, and other similar mechanical structures, air ships and aeroplanes, electrical machinery and apparatus, chemical and metallurgical machinery, and works for the development, transmission, or application of power, mining operations and apparatus for carrying out such operations, municipal works, irrigation works, water-works and water-purification plants, sewerage works, sewage-disposal works, drainage works, incinerators, hydraulic works, and all other engineering works, the value of which exceeds one thousand dollars ($1000.00). The execution as a contractor of work designed by a Registered Engineer, or the supervision of the construction of work as a foreman or superintendent, or as an inspector, or as a road-master, track-master, bridge or building master, or superintendent of maintenance shall not be deemed to be the practice of Engineering within the meaning of this Act.

Section 2 (*c*). "The Association" means the Association of Registered Engineers of the Province of . . . .

Section 7 (*a*). Only such persons who are Members of the Association hereby incorporated and registered as such under the provisions of this Act, or who have received a license from the Council of the Association as hereafter provided, shall be entitled, within the Province of . . . . to take and use the title of Registered Engineer or any abbreviation thereof, or to practise as such.

Section 7 (*b*). Persons residing in the Province of . . . . at the date of the passing of this Act, and who at that date have been for five years previously practising Engineering as herein defined, and Members and Associate Members of *The Engineering Institute of Canada*, as well as members of equivalent rank in recognized engineering societies of other countries, residing in the Province at the time, shall be entitled to be duly registered as Members of the Association, without examination, provided that such persons shall produce to the Council, within one year of the passing of this Act, satisfactory credentials of his having so practised, or of qualifying membership in such recognized engineering societies.

Section 7 (*e*), (*g*) *and* (*i*). Change the term "Professional Engineer," where it occurs in these sub-sections to "Registered Engineer."

Section 7 (*h*). Delete the word "Professional."

Section 8. In the case of two or more persons carrying on an engineering practice in co-partnership, only such members of the firm who are registered or licensed under this Act shall individually assume the functions of a "Registered Engineer." A firm of engineers cannot be deemed to be a Member of the Association or be licensed to practise.

Section 10 (*a*). The Council may, in its discretion, reprimand, censure, suspend or expel from the Association any engineer guilty of unprofessional conduct; for negligence or misconduct in the execution of the duties of his office; for engaging in a branch of the Profession in which he may be proved to be entirely unqualified; or if convicted of a criminal offence by any Court of competent jurisdiction.

Section 11. Delete the word "Professional."

Section 11 (*a*). Practises as an engineer, within the meaning of this Act; or

Section 11 (*b*). Usurps the functions of a Registered Engineer; or

Section 11 (*c*) *and* (*e*). Substitute "Registered Engineer" for "Professional Engineer."

Section 18 (*b*). Candidates for admission to practise who, for any reason, have been unable to take advantage of an academic engineering course must have served at least six years under one or more engineers of recognized standing.

Yours faithfully,

W. Chase Thomson, M.E.I.C.

"Made in Canada"

The Canadian Trade Commission at Ottawa made the following announcement on July 15th:—

"A cablegram from the Canadian Mission requests that Canadian goods shipped to the United Kingdom bearing trade-marks or descriptions should bear words showing the country or origin. Cases have been brought to the Mission's notice where goods from the Dominion have been detained by the customs authorities because they do not comply with the requirements of the Merchandise Marks Act. It is understood by the Commission that the words 'Canada Product' or 'Made in Canada' will sufficiently meet requirements. The Trade Commission points out that such a mark to designate Canadian goods can be made one of the most potent advertising factors for our producers and manufacturers if the quality of material shipped overseas is kept on a high level. For shipments made under the direction of the Commission it has definitely adopted the trade-mark 'Canada Product' as being most distinctive.

"As trading with Germany and German-Austria is now allowed, export permits to these countries will be granted freely by the Trade Commission on the same terms as to other countries. A cablegram received on July 15 from the Canadian Mission states that a 'trading with the enemy license' has been issued in Great Britain and that all goods not on the conservation list are allowed to be shipped without individual export licenses.

"This is supplemented by the information forwarded to the Trade Commission from Washington that a general enemy trade license has been issued by the United States Government enabling 'all persons to communicate and trade with persons residing in Germany' subject to a few specific limitations. Hungary and Bolshevik Russia are not included in the permission.

"Another cable from London to the Commission states that the importation of goods into Great Britain from other former enemy countries is permitted, as it was not found possible to establish working machinery for certifying the percentage of German, Austrian, or Hungarian manufacture in the importation."

United States Iron Ore Production

A decrease of 7.4 per cent. in the production of iron ore in the United States is reported by the Geological Survey in its preliminary estimate for 1918, the quantity being 69,712,000 tons as compared with 75,288,851 tons in 1917. The estimated shipments were 72,192,000 tons last year against 75,573,207 tons in 1917. Disturbed industrial conditions, an uncertain labour supply, and inadequate transport facilities all combined to curtail the output, while the Government control of the steel supply, which became effective in June, 1917, undoubtedly helped to regulate the demand for ore. Stocks at the mines decreased from 10,628,908 tons on December 31, 1917, to 8,139,000 tons on the corresponding date of last year, and the supplies at the lower Lake ports were also reduced somewhat, so that the actual consumption remained at approximately the same figure in both years.—*The Times Engineering Supplement.*

Report of Council Meeting

At a meeting of the Council held on Tuesday, July 22nd, at 8.15 P.M., in addition to other matters, a ballot was opened and the following elections and transfers effected:—

Members

Harold W. Buck, Ph.B. (Yale Univ.), E.E. (Columbia Univ.), of Hewlett, N.Y., vice-president of Viele, Blackwell & Buck; Allison Robert Chambers, B.Sc. (McGill Univ.), of New Glasgow, N.S., assist. manager, ore mines and quarries dept., N. S. Steel Co.; George Percy Cole, B.Sc. (McGill Univ.), vice-pres., Montreal Metallurgical Assn., Montreal; Frank O. White, B.Sc. (C.E.), (Univ. of Maine), of Temiskaming, Que., i/c designs, Kipawa Fibre Co., Limited.

Associate Members

John R. Black, of Sault Ste. Marie, Ont., sr. asst. engr., D.P.W.; John Leslie Charles, Major, D.S.O., of Toronto, Ont., previous to enlistment, res. engr., H. B.Ry., at present, ch. engr., 13th Bn., Can. Ry. Troops; Francis Way Clark, of Niagara Falls, Ont., asst. ch. field engr., Hydro Electric Power Comm'n.; George Andrew Colhoun, S.P.S., of Hamilton, Ont., designing and estimating dept., Hamilton Bridge Works Co.; Clayton Dewitt Dean, B.A.Sc. (Univ. of Toronto), of Toronto, Ont., tech. and process advisor, Imperial Oil, Limited; Lionel Leslie Jacobs, of Sault Ste. Marie, Ont., purchasing agent, Algoma Steel Corp.; Andrew Charles Loudon, B.Sc. (McGill Univ.), of Montreal, acting asst. ch. engr., Locomotive Super-heater Co.; Harry Donald Macaulay, of St. John, N.B., asst. engr., P.W.D., on staff in chg. of St. John Harbor; Joseph Arthur Henri Marchand, B.A.Sc. (C.E.) (Polytechnic School), of Three Rivers, Que., asst. engr., P.W.D.; Ernest Smith Martindale, B.A.Sc. (Univ. of Toronto), D.L.S., of Ottawa, Ont., Topographical Surveys Branch; Herbert Ross McClymont, E.E. and M.E. (Glasgow Univ.), of Toronto, Ont., principal asst., Kerry & Chace, Ltd.; Charles Ross McColl, B.Sc. (Queen's Univ.), O.L.S., of Sandwich, Ont., in private practice, also Town Engr. of Sandwich; William Lawrence McFaul, B.A.Sc. (Univ. of Toronto), of Sault Ste. Marie, Ont., City Engineer; Harry Burton Pickings, of Halifax, N.S., member of firm Pickings & Roland; Frederick Leeds Richardson, B.A.Sc. (Univ. of Toronto), St. John, N.B., res. engr. on construction at Courtenay Bay; Kenneth George Ross, S.P.S., of Sault Ste. Marie, Ont., member of firm Lang & Ross; Herbert Nason Skolfield, B.S. (Univ. of Maine), of New Glasgow, N.S., previous to enlistment with Eastern Car Co., at present with U.S. Army; Francis Stidwill, B.Sc. (Queen's Univ.), of Cornwall, Ont., member of firm Magwood & Stidwill; Charles William Stokes, B.Sc. (E.E.) (McGill Univ.), of Montreal, Que., general manager, Siemens Company of Canada, Limited; George Mason Tripp, of Victoria, B.C., supt., Victoria Branch, B.C. Electric Ry. Co., eng. supt. in chg. of all eng. work on Vancouver Island, Vancouver Island Power Co.; William Daniel Walcott, B.A.Sc. (Univ. of Toronto), of Toronto, Ont., asst. laboratory engr., Hydro Elec. Power Comm'n.; Claude Stafford Whitney, of Niagara Falls, Ont., res. engr., Hydro Electric Power Comm'n.; Dwight Stanley Wickwire, of Halifax, N.S., with Pickings & Roland, on survey of Halifax.

Juniors.

Peter Burton Buckley (Capt.), B.Sc. (McGill Univ.), of Montreal, Que. (military service, 3½ yrs. with R.E. in France and on Italian front.) With Soldiers' Civil Re-Establishment, Montreal; Cecil Roy McCort (Capt.), B.A.Sc. (Univ. of Toronto), of Montreal, Que., i/c professional and business occupations section, Dept. Soldiers' Civil Re-Establishment; Rowland Chapman Moore, B.Sc. (N. S. Tech. College), of Halifax, N.S., asst. engr. Foley Bros., Welch, Stewart & Fauquier; William Henry Stewart Richardson (Capt.), of Belleville, Ont., transitman, G.T.R.; Stanley Oxley Roberts, of Ottawa, Ont., dftsman, in Radio Branch, Naval Service; Bruce Napier Simpson (Lieut.), B.A.Sc. (Univ. of Toronto), of Toronto, Ont., asst. in hydrometric work, Hydro Electric Power Comm'n.; George Oliver Vogan, B.Sc. (Queen's Univ.), of Toronto, Ont., design of hydraulic structures, Hydro Electric Power Comm'n.; Clyde Oliver Whitman, of Sault Ste. Marie, Ont., instrumentman, Algoma Steel Corp.

Transferred from class of Associate Member to Member

Arthur Edward Caddy, of Campbellford, Ont., asst. engr. Dept. of Railways & Canals, Trent Canal; Judson Albert DeCew, B.A.Sc. (Univ. of Toronto), of Mount Vernon, N.Y., President, Process Engineering; Laurie Benjamin Elliot, B.Sc. (Dalhousie Univ.), of Edmonton, Alta., dist. engr., P.W.D.; Burton M. Hill, B.Sc. (Univ. of N.B.), of Fredericton, N.B., Prov. Road Engr., P.W.D.; Sydney B. Johnson, of Ottawa, Ont., asst. engr. i/c Ottawa River Storage, P.W.D.; Norman Berford McLean (Major), (R.M.C.), of Ottawa, Ont., res. engr., Ship Channel; Gilbert Gray Murdoch, of St. John, N.B., in private practice; Augustine V. Redmond, B.Sc. (Queen's Univ.), of Winnipeg, Man., dist. engr., Can. Nat. Rys.

Transferred from class of Junior to Associate Member

Louis Charles Dupuis, of Levis, Que., div. engr., Saguenay div., Can. Nat. Rys., Quebec; Joseph Alexander Keefer (R.M.C.), of Victoria, B.C., asst. engr., P.W.D.; Alexander M. Kirkpatrick, B.Sc. (C.E.) (Queen's Univ.), of Ottawa, Ont., asst. engr., P.W.D.; Allan Gordon McLerie, of Toronto, Ont., res. engr., C.N.R.; John Nichols Stinson, B.Sc. (Queen's Univ.), of Ottawa, Ont., acting first asst. highway engr., Dominion Parks Branch; Lewis Wynne Wynne-Roberts B.Sc. (London Univ.), of Toronto, Ont., Capt., Royal Engrs. in Persia.

Transferred from class of Student to Associate Member

Charles Ruglas Avery, M.A.Sc. (Univ. of Toronto), of Toronto, Ont., Feb., 1915, to Mar. 1st, 1919, on active service; Joseph Henri Arthur Emile Drolet, of Quebec, Que., supt. of Foundry, La Cie F. X. Drolet; Joseph Edmond Heroux, C. E. (Laval Univ.), of Quebec, Que., supervising gen'l. of road constrn., P.W.D.; Rex Phillips Johnson, B.A.Sc. (Univ. of Toronto), of Niagara Falls, Ont., sr. draftsman and asst. office engr., Hydro Electric Power Comm'n.; Paul Chester Kirkpatrick, B.Sc. (C.E.) (McGill Univ.), of Ottawa, Ont., asst. res. engr., Fraser, Brace & Co.; Charles Crawford Lindsay B.Sc. (McGill Univ.) (Capt.), of Quebec, Que., 4 years active service with Royal Engrs., returned and at present unemployed; John Earl Ratz, B.A.Sc. (Univ. of Toronto), of Ottawa, Ont., geodetic engr. and geodesian, Geodetic Survey; William E. Stephens, B.Sc. (Queen's Univ.), of London, Ont., asst. in office, Chipman and Power; Athol Choate Wright (Capt.), of Ottawa, Ont., Captain and adjutant, Can. Engrs., Halifax.

Transferred from class of Student to Junior

Robert Douglas Galbraith (Major), B.A.Sc. (Univ. of Toronto), of Toronto, Ont., professional and business occupations section, Dept. of Soldiers' Civil Re-Establishment; William Brighthelm Redman, B.A.Sc. (Univ. of Toronto), of Toronto, Ont., i/c of all engr. work in Toronto armories and other military buildings.

New Mail Route to Canada

The Canadian Government are being urged to abandon the St. Lawrence route for the transmission of mails and passengers in favour of a new route including Sydney as a port of call. Sydney (Cape Breton Island) lies directly in the line of the ocean highway between Great Britain and Canada. Its harbour is one of the finest on the Atlantic seaboard, large and well sheltered, with deep water and good anchorage, and easy and safe to enter and navigate. As it is also the most easterly port in Canada it would naturally appear to be the logical port of call for Eastern Canada.

Government tests in 1905 and 1907 proved that mails transferred at Sydney and forwarded thence by rail reached their destination a day earlier than by the St. Lawrence route, and that passengers for the Maritime Provinces effected a saving of 48 hours in their journey.

It is apparent that Eastern Canada is no longer content to be treated as a backwater portion of the Dominion in the arranging of routes for the subsidized ocean steamers plying between Great Britain and Canada. It is held that the present arrangements are unfair and prejudicial to Nova Scotia, New Brunswick, and Prince Edward Island. At least one ocean liner, inward and outward, per week, should during the season of navigation in the Gulf of St. Lawrence be required to call at Sydney for the landing and taking on of mails and passengers.

The Sydney Board of Trade is using all its efforts to induce the Government to sanction the new route, and only the superior influence of opposing interests can prevent the granting of this demand. — *The Times Engineering Supplement.*

BRANCH NEWS

St. John Branch

A. R. Crookshank, M.E.I.C., Sec'y.-Treas.

On June 26th, the St. John Branch sent out the following circular letter and salary questionnaire:—

ENGINEERING INSTITUTE OF CANADA
St. John Branch

To all Members of the Engineering Profession in New Brunswick.

Dear Sir:—

The St. John Branch of *The Engineering Institute of Canada* has recently formed a Committee to study and report upon the question of salaries and remuneration for Engineers. This action is following the example of other Branches of *The Institute* throughout the Country who are actively interesting themselves in this very pertinent and vital question.

In order to thoroughly understand the present situation in this Province, the Committee is sending to you herwith a Questionnaire on this subject with the request that you will furnish the information asked for. All information received by the Committee will be treated confidentially and no details will be published..

Kindly address your reply to A. R. Crookshank, Esq., Secy., St. John Branch, *E.I.C.*, Box 1393, St. John, N.B.

Your early attention to this matter will oblige,

Yours sincerely,
C. C. Kirby, Chairman,
G. G. Murdock,
A. R. Crookshank,
Salaries Committee.

ENGINEERING INSTITUTE OF CANADA
St. John Branch
Salary Questionnaire

A. Name......................................
B. Address......................................
C. Name of Employer..............................
D. Official title or position..........................
E. General description of duties and extent of responsability.
....
....
....
F. Present salary...................................
G. Salary of position in August, 1914..................
H. Salary of predecessor in same position..............
I. Year of appointment to present position............
J. Length of service with present employer............
K. What do you consider should be a fair and proper remuneration for the duties of your position?........
....
L. Reason in brief for increased remuneration..........
....
M. Can you give instance in your personal knowledge of apparent discrimination against Engineers in matters of salaries or unfair comparison with other employees?
....
....

A meeting of the St. John Branch of *The Engineering Institute of Canada* was held on July 3rd, A. Gray, M.E.I.C., presiding. The meeting was called for further discussion of the Act Respecting the Engineering Profession so that all the members would have an opportunity to fully discuss and understand the subject before registering their opinion in regard to it.

The matter of legislation has been given a great deal of attention by the engineering profession during the last year, as it is felt that both the engineer and the public should be better protected than at present.

Should the act become law, each engineer in the province will have to apply for registration and prove to the examining board, either by credentials or by examination, or by both, that he is qualified by special education and by practise in one or more branches of engineering to be registered as a "professional engineer." Penalties are provided for those men who are not qualified or who do not register, yet pratise as *professional* engineers.

The committee appointed to confer with the Civil Service Commission have notified the Branch that the Civil Service Act will not be passed this session, as there has been considerable protest from various employees in regard to their classification, which would work unjustly in their cases, and the government, realizing that the preparation of the act has been rushed, has decided to hold it over to the fall session and so give every person who may be discriminated against under the present proposed schedule a chance to state their cases.

The following resolution was passed:

Whereas the people of Canada are confronted with the problem of carrying the very heavy national debt incurred by their participation in the great war for humanity, and

Whereas this burden can be borne only through the greatest thrift and industry on the part of the nation, through the conservation and development of our human and natural resources, so that we may be able to share in the world's markets against the strong competition that we shall have to meet, be it therefore

Resolved that the St. John Branch of *The Engineering Institute of Canada* do hereby declare their heartiest support of the establishment by the Government of Canada of a National Research Institute, which shall carry on and direct research into such industrial, agricultural, commercial and medical problems as will best promote such conservation and development of Canada's resources, and that copies of this resolution be sent to the Council of *The Institute* to be forwarded to the Government.

Montreal Branch

Frederick B. Brown, M.E.I.C., Sec'y.-Treas.

At a meeting of the Montreal Branch Executive, held on July 10th, the matter of a National Research Institute was discussed and the following resolution was passed:—

"The Officers and the Executive Committee of the Montreal Branch of *The Engineering Institute of Canada* do hereby declare their heartiest support of the establishment by the Government of Canada of a National Research Institute which shall carry on and direct research into such industrial, agricultural, commercial and medical problems as will best promote true conservation, use and development of Canada's human and natural resources so that we as a nation may be able to fully share in the world's markets and develop a strong and healthy people in Canada."

Ottawa Branch

M. F. Cochrane, A.M.E.I.C., Sec'y-Treas.

The activities of the Ottawa Branch have recently been engaged chiefly in connection with the new Civil Service Bill and the classification authorized by it. This is a matter of special importance to the local members, as more than 80 per cent of them are directly affected by it.

In order to be in readiness for the bill when it should be presented, a special committee, of which O. S. Finnie, A.M.E.I.C., is convenor, set to work some months ago to lay before members of the House of Commons the value of the work done by the various classes of technical officers employed by the Dominion Government, and the necessity for their more adequate recognition. For this purpose a memorandum was prepared showing, by concrete examples, the importance and value to the country of the work done, the meagre salaries paid as compared to those enjoyed by other classes of the community, and the great increase in earnings received by those who had left the government service for private practice and corporation employment. This memorandum was intended to cover all classes of technical professions so as to secure the support of other technical societies in Canada, and was sent by the General Secretary to about fifty members of Parliament, all of whom had previously been approached by members of *The Institute* and who had expressed themselves as being in sympathy with the general question of placing the engineers in the public service on a better footing.

In this work all the other branches of *The Institute* co-operated most effectively with the Ottawa Branch, and it is felt that good work has been done the results of which will be apparent when the classification is under discussion at the next session of Parliament. Copies of the memorandum were supplied to the press through the Publicity Committee and considerable support has been promised.

Through G. Gordon Gale, M.E.I.C., close contact has been maintained between the committee of the Ottawa Branch and the Committee of Council which has been in touch with the Minister in charge of the Bill and the Civil Service Commission with a view to presenting the just claims of the engineer. The members of *The Institute* will better appreciate the great service rendered the engineers in the Government service, and the profession as a whole, when informed that the members of the Committee of Council came up to Ottawa on short notice several times during the past six months. Now that the bill and classification have been made public it will be possible to made definite recommendations, and for this purpose the Ottawa Branch issued a notice, which is printed on page 524 of the July *Journal*, asking for particulars of omissions and inconsistencies as they effect individuals or classes.

Niagara Peninsula Branch

R. P. Johnson, S.E.I.C., Sec'y.-Treas.

The Niagara Peninsula Branch is vitally interested in the Civil Service re-classification, as many of its members are employed on the Welland Canal. The Branch proposes taking an active stand on behalf of its members employed by the government.

A trip to the Lackawanna Steel Company of Buffalo, is being planned for sometime in August.

Sault Ste. Marie Branch

Newton L. Somers, A.M.E.I.C., Sec'y.-Treas.

The Sault Ste. Marie Branch of *The Engineering Institute of Canada*, at their regular meeting on April 24th, heard the Model Act read, which was proposed by the Special Committee on Legislation, together with the letter of transmittal appended thereto. On account of the difficulty of clearly grasping the importance and co-relation of the different sections without a study of the Act as a whole, it was decided to postpone discussion until the regular meeting of May 29th, before which date each member would have received *The Journal* containing a copy of the Proposed Act.

In the fully attended May meeting the proposed Act was reread and discussion held in which the principle of the Act was kept constantly in view while the details were discussed and analysed. It was the unanimous opinion of the Branch that the Act was correct in principle and with the probable polishing up of a few minor details was very desirable from the standpoint of the professional engineer, and would very soon prove itself to be of great value to the community at large. In view of this complete agreement with the Act, the Sault Ste. Marie Branch put itself on record by the following unanimous resolution:—

"Resolved that the Sault Ste. Marie Branch of *The Engineering Institute of Canada* is in favor of the principle of the Model Act respecting the engineering profession as drawn by the Special Committee on Legislation, at Headquarters, in Montreal, early in April, 1919, that the desire of the Branch is for all possible effort to be put forth to speedily bring this Act before the Legislatures of the several Provinces and that nothing be left undone to insure its passing those Legislatures to become a lasting benefit to the profession of engineering and to the community and State.

"Resolved further that the Sault St. Marie Branch hereby stands ready to do anything in its power to assist in the bringing into operation of this Act as it will be revised for the Province of Ontario and will be glad at anytime to support in any way possible sister Branches in other provinces to attain the same end."

Border Cities Branch

G. C. Williams, A.M.E.I.C., Sec'y.

The regular meeting of the Border Cities Branch was held on April 25th, in the offices of The Canadian Bridge Company, Ltd., Walkerville, Ont., when the Branch By-Laws, as drawn up by the Executive Committee, were adopted with a few minor changes. The meeting was then addressed by W. J. Burns, Chairman of the Committee on Town Planning for the Border Cities Chamber of Commerce. Mr. Burns in his address outlined the ideal which promoted the formation of this committee, and he requested that the Border Cities Branch of *The Engineering Institute* appoint a small committee to work with him on this problem as the subject was a purely engineering one, and he believed that it would be a great help to him and his committee.

The question of affiliate membership in the Branch was discussed at length. It was moved by H. Thorne, M.E.I.C., seconded by A. J. Stevens, M.E.I.C., and carried, that a membership committee of three members be appointed by the chairman, that all canvassing for membership be carried on through and by the direction of this committee, and that nobody be approached or canvassed for affiliate membership without the approval of the Executive Committee.

At the close of the meeting refreshments were served by the ladies of the Canadian Bridge Company's dining service.

* * *

The regular meeting of the Border Cities Branch was held in the rooms of the Border Cities Chamber of Commerce on Friday evening, June 6th, 1919.

The Chairman announced that for a half hour the meeting would be considered informal in order to listen to a Committee from the Border Cities Safety League. This Committee, with G. A. Kuechenmeister as Chairman, called to explain the object of their new league and to ask our assistance in connection with the selection of a business manager or secretary for their Association.

After a lengthy discussion of the matter the Secretary was instructed to take the matter up with the General Secretary of *The Institute* at Montreal, with view to procuring, if possible, a suitable returned Engineer for the position. The Secretary promised to turn over all information procured in this way to the Safety League Committee for their information and use. This Committee, after thanking us for our interest and endeavors in their cause, were excused and the meeting reverted to the formality of *Institute* Branch business.

J. J. Newman and L. T. Venny, two new Associate Members of *The Institute* who were proposed by J. E. Porter, A.M.E.I.C., and A. J. Riddell, A.M.E.I.C., were given a hearty welcome.

At this meeting in accordance with a resolution passed on April 25th, the following membership committee was appointed:—H. Thorne, M.E.I.C., R. A. Carlyle, A.M.E.I.C., and M. E. Brian, A.M.E.I.C. A Town Planning Committee was also appointed consisting of the following members:—A. J. Stevens, M.E.I.C., A. J. Riddell, A.M.E.I.C., and J. J. Newman, A.M.E.I.C., and the Secretary was requested to notify the Border Cities Chamber of Commerce of the appointment of this committee to act with them in this work. A committee consisting of J. S. Nelles, A.M.E.I.C., and L. T. Venny, A.M.E.I.C., was appointed to canvas members for available material and to prepare a list of papers or talks.

In future a portion of the time at each meeting will be devoted to an informal discussion of problems or subjects confronting the different members.

Personals

Chas. E. Henderson, M.E.I.C., has recently been appointed Principal Assistant Engineer of the United States Housing Corporation.

*

Galliot de Cardaillac, Jr. E.I.C., who has been serving with the French Army since September, 1914, has recently returned from overseas.

*

D. G. Calvert, A.M.E.I.C., has severed his connection with the Dayton Wright Airplane Co., and has accepted a position as Executive Superintendent of the Proctor & Gamble Co., Cincinnati, Ohio.

*

Professor E. G. Matheson, M.E.I.C., assistant engineer on the staff of the University of British Columbia and acting head of the Department of Civil Engineering, has been appointed, under A. D. Swan, M.E.I.C., to take charge of the surveys and borings in connection with the contemplated development of the Harbor of Vancouver. This work it is expected will be completed about the middle of August, this year.

*

Robt. H. Parsons, M.E.I.C., who, previous to the war, was in charge of the water works of the City of Edmonton, has been overseas since the early days of the war. Mr. Parsons was with the Royal Engineers and later with The Production of Munitions, and is now in Canada in the interests of John Birch & Company, Ltd., London, with whom he has accepted a position as sales engineer. Mr. Parsons will make his headquarters in London.

*

Geo. K. McDougall, M.E.I.C., announces that he has taken into partnership, Major E. Raymond Pease, D.S.O. The name of the new firm will be McDougall & Pease. They will carry on the business of Consulting Engineers formerly conducted by Mr. McDougall, specializing in industrial applications of electricity, illuminating engineering, electric power stations and high voltage power transmission.

*

J. F. Rowlands, A.M.E.I.C., who previous to the war, where he served for two years, was connected with the Water Rights Branch of the Department of Lands in the Province of British Columbia, has left for England. His address is: "Wakefield," Ballards Lane, Finchley N.12, London, England. Mr. Rowlands is planning to associate himself with commercial activities in representing British industrial firms in Egypt or India.

*

J. Davis Barnett, A.M.E.I.C., has recently moved from Stratford, Ontario, where he has resided many years, to London, Ontario. Mr. Barnett has been a deep student all his life, and has obtained a reputation in literary circles throughout the country. Recently Mr. Barnett has placed his valuable library, containing some rare books on early transportation and all past issues of *The Institute's* publications, in the library of Western University, London, Ontario, and has advised the Secretary that these volumes are available for the use of members of *The Institute.*

*

The many friends of William Archibald Duff, M.E.I.C., throughout Canada, and particularly in the West where he was so well known, will be sorry to know that, at the present time, the condition of his health is giving serious anxiety to his immediate family. About a year and a half ago Mr. Duff suffered from a nervous breakdown, but, after a year's rest, he returned to his office as Western Manager of the Canadian Westinghouse Co. He was, however, able to attend to his duties a short time only. Mr. Duff was, until recently, chairman of the Manitoba Branch.

*

Major Norman Macleod Hall, B.Sc., O.B.E., A.M.E.I.C., received a hearty welcome on arriving at his home in Cornwall, Ont., on July 21st, being the last of four sons of Mrs. John Hall, of Cornwall, to reach home from overseas. Major Hall graduated from McGill University, in 1907, in mechanical engineering and served an apprenticeship course in the G.T.Ry. shops. Going to Vancouver, he became associated with the firm of Ducane, Dutcher & Company, where he was engaged in various engineering work until the spring of 1915, when he proceeded overseas, enlisting with the Royal Engineers as a lieutenant. He went to France in December, 1915, and was with the Royal Engineers throughout the entire war, winning his majority in the field. In January, 1916, he was wounded by shrapnel at Bethune, but shortly returned to the front. At the time of the armistice as a reward for his gallant service he was given the Order of the British Empire.

*

Robert G. Weddell, A.E.I.C., and R. G. Saunders, A.M.E.I.C., have recently formed a partnership and will carry on an engineering and contracting business under the the firm name of Weddell & Saunders, with head office at Trenton, Ont. Their Toronto office is at 312 McKinnon Bldg. They will specialize in harbor work, in which class of work, both partners have had wide experience. Mr. Weddell was formerly connected with R. Weddell & Co., who did a large amount of harbor work on Lakes Erie and Ontario, and also for the Toronto Harbor Commissioners. He is now head of the Weddell Dredging & Contracting Company and the Weddell Bridge and Engine Works, both of Trenton. Mr. Saunders recently returned from overseas, where he was staff captain, 2nd Brigade, Canadian Engineers. At the time of his enlistment he was with the Toronto Harbor Commission as assistant superintendent of construction, and previously had been a partner in the firm of Wilson, Townsend and Saunders, contractors.

*

Lieutenant Edward W. Francis, R.A., S.E.I.C., elder son of Vice-President Walter J. Francis, has recently returned home, having served with distinction in France, Egypt and Palestine. He left Canada, in 1917, at the conclusion of a special preparatory course at the Royal Military College, Kingston, and received an Imperial commission. After serving for some time in England and France, he was sent out to take part in the Palestine campaign in charge of a trench mortar battery. Outside Alexandria his ship was mined and he was the only survivor of his battery, in addition to which all the equipment was lost. Following his convalescence, after an illness brought on by his ten mile swim to the shore, he went through General Allenby's Palestine campaign, attached to the 10th Irish Brigade, up to the capture of Damascus, when he was invalided to Egypt and later to England.

His superior officers speak very highly of him and his record is a most enviable one. He is now well recovered and hopes to re-enter the university in the autumn to complete his education.

OBITUARIES

Word has recently been received by Mr. and Mrs. William Lennox, Owen Sound, informing them of the death of their only son, Victor J. Lennox, S.E.I.C., at the Ontario Military Hospital, Orpington, England, on June 30th, from pleurisy and pneumonia following an attack of influenza.

Late Sapper Victor J. Lennox, S.E.I.C.

Previous to his enlistment for overseas the late Mr. Lennox was instrumentman, under L. J. Devereux, A.M.E.I.C., of the Grand Trunk Pacific Railway with headquarters at Prince George. He was elected to *The Institute* on October 30th, 1917, being then twenty-six years of age.

He was a young man of sterling character and splendid ability, held in the highest esteem by all with whom he came in contact, and had already given promise of a useful and successful career. He was a Presbyterian and a member of the Independent Order of Oddfellows.

* * *

Thomas E. Hillman, M.E.I.C., whose death took place at Whitestone, Long Island, N.Y., from influenzal pneumonia, was born at Worthington, Sussex, England, on October 24th, 1848.

Mr. Hillman was one of the founders of *The Institute*, in 1887, and for 21 years was on the Engineering Staff of the Grand Trunk Railway. From 1889 to 1891 he was Engineer-in-Charge of the St. Clair Tunnel, with supervision of trial borings, location, the construction of the tunnel, approaches and connecting lines of railways. Later, as chief engineer, he located and constructed several electrical railways and hydraulic plants in Ontario, including the hydraulic system from the Welland Canal to DeCew Falls for electrical power, which was known as The Dominion Power & Transmission Co., of Hamilton, Ont. In 1910, he had sole supervision of test borings on the Bow River, Alta., for the foundation of the Canadian Pacific Railway Company's irrigation dam, which is regarded as one of the most important structures of its kind in the Dominion.

Late Thomas E. Hillman, M.E.I.C.

From 1910 to 1912 Mr. Hillman was in private practice as a civil engineer in Hamilton, Ont., and from 1912 to 1914, when he retired from active work, he was in private practice as a consulting engineer in New York city. Mr. Hillman is survived by Mrs. Hillman, one son, and one daughter.

Employment Bureau

Situations Vacant

Civil Service

The Civil Service Commission of Canada hereby gives public notice that applications will be received from persons qualified to fill the following positions in the Civil Service of Canada:—

A Senior Construction Architect for Calgary Public Building, Salary, $250 per Month.

1. A Senior Construction Architect for the Calgary Public Building, Department of Public Works, at a salary of $250 per month. Applicants should be thoroughly competent architects with from 6 to 8 years experience as principal of an architectural firm or should have practised for themselves for a similar period, and should be accustomed to superintendence of construction. Applicants should be residents of the Province of Alberta.

An Assistant Engineer for the Trent Canal, Salary, $2,100 per annum.

2. An Assistant Engineer for the Trent Canal, during the construction of the Trent Canal, with head office in the City of Peterborough, Ont., Department of Railways and Canals, at an initial salary of $2,100 per annum. Candidates should have education equivalent to graduation in engineering from a recognized Canadian University or Engineering College. They should have at least 8 years of experience in general engineering work, including construction of works of considerable magnitude; it is desirable that this experience should have been, to a large extent, in canal and general hydraulic work; it should include surveys, preliminary estimates, construction, final estimates, designing, drafting, and general office work. Candidates should be accustomed to handling men and should be, at least, 30 years of age.

An Assistant Astronomer, Dominion Observatory, Salary, $1.800 per Annum.

3. An Assistant Astronomer for the Dominion Astronomical Observatory, Department of the Interior, at an initial salary of $1,800 per annum. Candidates should be graduates of a university of recognized standing, with specialization in astronomy, in mathematics and in physics. They should have at least three years experience as an observer or as a post-graduate student in astronomical research. They should have enthusiasm in their work, good constitution and good eyesight.

An Investigator, Division of Road Materials, Dept. of Mines, Salary, $1,600 per Annum.

4. An Investigator, Division of Road Materials, Mines Branch, Department of Mines, at an initial salary of $1,600 per annum. Candidates should be graduates in science or engineering of a recognized university and have had special training in highway engineering and the examination of road materials. They must have a practical knowledge, gained by several years of experience, in field and laboratory investigation, of problems in the use of naturally occuring road materials in their relation to factors and conditions affecting the highway construction situation in Canada. Reference to any reports the applicants have written should be given.

Three Forest Assistants, Department of the Interior, Salary, $1,320 per Annum.

5. Three Forest Assistants, Department of the Interior, at initial salaries of $1,320 per annum. Candidates should have education equivalent to a university course at a recognized school of forestry and should be well recommended by the staff of the school or by men who may have employed them in connection with forestry work. They must be between the ages of 21 and 45 and be physically fit for enduring hardships incidental to bush work. The appointees will be assigned to positions in the four western provinces.

A Photographer for the Welland Canal Head Office Staff, Salary, $1,200 per Annum.

6. A Photographer for the Welland Canal Head Office Staff, Department of Railways and Canals, at an initial salary of $1,200 per annum. Candidates should have had a public school or equivalent education. They should have had at least seven years experience in photographic work, and have a thorough knowledge of the use of the camera, developing plates and printing. Preference will be given to candidates who have had experience in taking views of public works for the purpose of recording the progress of the work and in the photographic and blue printing department of a large Railway, Bridge, or Engineering Construction Company's office. Candidates must be at least 30 years of age.

Note

In the case of positions numbers 1, 2, 5 and 6, preference will be given to residents of the provinces in which the vacancies occur.

Application forms properly filled in, must be filed in the office of the Civil Service Commission not later than August the 8th. Application forms may be obtained from the Dominion-Provincial Employment Offices, or the Secretary of the Civil Service Commission, Ottawa.

Ottawa 10th July, 1919.

Second List

A Designing Mechanical Engineer for the Welland Ship Canal, Dept. of Railways and Canals, Salary, $300 per Month.

1. A Designing Mechanical Engineer for the Welland Ship Canal, Department of Railways and Canals, at a salary of $300 per month. Candidates must be graduates in mechanical engineering of a school of applied science of recognized standing and should have at least ten years of experience in the design, estimate and construction of mechanical equipment and apparatus, three years of which shall have been in responsible charge of such work. Candidates should have ability to make thorough examinations, investigations, tests and reports upon various existing or proposed mechanical installations or apparatus.

A Mechanical Draughtsman for the Welland Canal, Dept. of Railways and Canals, Salary, $125 to $150 per Month.

2. A Mechanical Draughtsman for the Welland Canal, at a salary of $125 to $150 per month. Candidates must be, at least, 25 years of age. They should have a High School education or equivalent. They must have had at least four years' practical experience in the work

shops of a recognized engineering construction company, including two years' experience on erectional and outside work supplemented by two years' experience in the drawing office of a large bridge company in the preparation of designs, estimates, plans and specifications. Preference will be given to graduates of a recognized School of Engineering and particularly to applicants with experience in works involved in the construction of canals, harbours and hydro-electric plants.

A Chief, Organization Branch, Civil Service Commission, Salary, $2,800 per Annum.

3. A Chief, Organization Branch, Civil Service Commission, at an initial salary of $2,800 per annum. The duties of this officer are to be responsible, under the Secretary, Civil Service Commission, for the conducting of investigations and surveys and the preparation of plans of organization for the various departments and subordinate units thereof in the Dominion Government; to have charge of the making of investigations in connection with the efficiency of processes or operations or of individuals or groups of individuals within departments; to administer and keep up to date the classification of the Civil Service; to direct the staff of the Organization Branch; and to perform other related investigational and administrative work as required.

Candidates shall be not less than twenty-five and not more than forty years of age and must be of good address, tactful, able to meet the public and departmental officials and to judge people. They must possess education equivalent to graduation from a university of recognized standing in accounting, economics, engineering or science and at least five years of experience in accounting, engineering, shop or business management, or similar work, of which at least two years shall have been in an administrative capacity. Applicants must be familiar with Civil Service administration or the organization and methods of large business concerns. Experience in investigation or organization work is very desirable.

The examination will consist of three parts, rated as follows:—(1) Education and experience, 40; (2) a thesis on a problem in office management, accounting, industrial operation, or organization, to be chosen from a list established by the Commission, 30; (3) Oral interview, 30. Applicants will not be assembled for the statements of education and experience and for the thesis, but may do this work at their own homes. These will be received only from those candidates who show that they possess the minimum qualifications in education and experience. Those successful in the first two parts of the examination will be assembled later at one or more points for oral interview.

An Investigator, Organization Branch, Civil Service Commission, Salary, $2.200 per Annum.

4. An Investigator, Organization Branch, Civil Service Commission, at an initial salary of $2,200 per annum. The duties of this officer will be, under the supervision of the chief, Organization Branch, to make investigations and surveys and to prepare reports thereon in connection with the organization of departments or in connection with the efficiency of processes or operations, or of individuals, or groups of individuals within the several departments of the government; to assist in administering and maintaining the classification of the Civil Service; and to perform other related work as required.

Candidates must possess education equivalent to graduation from a university of recognized standing; two years of business or engineering experience; ability in investigational work, supervisory ability; initiative, tact, and good judgment; good address.

The examination will consist of three parts, rated as follows:—(1) Education and experience, 40; (2) A thesis on a problem in office management, accounting, industrial operation, or organization, to be chosen from a list established by the Commission, 30; (3) Oral interview, 30. Applicants will not be assembled for the statements of education and experience and for the thesis, but may do this work at their homes. Theses will be received only from those candidates who show that they possess the minimum qualifications in education and experience. Those successful in the first two parts of the examination will be assembled later at one or more points for the oral interview.

An Editor and Statistician, Department of Trade and Commerce, Salary, $2,100 per annum.

5. A male assistant to undertake editorial work, chiefly in connection with the Canada Year Book, in the Dominion Bureau of Statistics, at a salary of $2,100 per annum. Applicants should be university graduates of economic and statistical training and should have editorial experience. The appointment will be made on a temporary basis, but the position may eventually be made permanent.

General Directions.

The salaries for the above positions will be supplemented by such bonus as may be provided by Parliament.

Selections for eligible lists of applicants qualified to fill similar vacancies which may occur in future may be made from the applications for these positions.

According to law, preference is given to returned soldier applicants, possessing the minimum qualifications. Returned soldiers must furnish a certified copy of their discharge certificates, or in the case of commissioned officers, a certified statement of their military services.

In the case of positions numbers 1 and 2 preference will be given to residents of the provinces in which the vacancies occur.

Application forms properly filled in, must be filed in the office of the Civil Service Commission not later than August 15th,.

Situations Wanted

Civil Engineers

Civil Engineer—Ex-soldier, seventeen years experience on Investigations, Design, Construction, Sewerage, Sewage Disposal and Water Works. Box 8-P.

Civil Engineer, age 32, married, returned soldier, British Columbia Land Surveyor, fourteen years experience in Hydrographic and Municipal Engineering, Railroad Surveying, etc. Box 9-P.

Civil Engineer, University Graduate, unmarried, desires position in South America. Experienced in construction. Employed at present time by one of the largest Canadian Mining Companies. Reason for advertisement purely personal wish to go to South America. Full particulars of experience upon enquiry and also references from past and present employers. Write Box 10-P.

Preliminary Notice

of Application for Admission and for Transfer

20th July, 1919.

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in August, 1919.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows:—

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course. In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineers' office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the following branches at his option Railway, Municipal, Hydraulic, Mechanical, Mining, or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five years or more years.

Every candidate for election as JUNIOR shall be at least twenty-one years of age, and must have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-five years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects Geography, History (that of Canada in particular), Arithmetic, Geometry Euclid (Books I.-IV. and VI.), Trigonometry, Algebra up to and including quadratic equations.

Every candidate for election as ASSOCIATE shall be one who by his pursuits, scientific acquirements, or practical experience is qualified to co-operate with engineers in the advancement of professional knowledge.

> The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BEAUCHEMIN—JULES ARMAND, of Ottawa, Ont. Born at Montreal, Feb. 5th, 1890. Educ., B.A.Sc., Laval Univ., 1911. Summers 1908-10, student asst. engr. on dredging inspection, Richelieu River improvements, P.W.D.: 1911-12, asst. to res. engr. on same, in chg. of survey and sounding party etc.; 1912-17, engr. in chg. of metering party on St. Lawrence River in connection with Chicago drainage scheme; 1917-19, engr. in chg. of metering and survey party, Ottawa and Quinze Rivers; at present, asst. engr., Upper Ottawa Storage, Ottawa.

CHALMERS—GEORGE HADDON, of Turbine, Ont. Born at Smith's Falls, Ont., Oct. 21st, 1891. Educ., B.Sc. (C.E.) Queen's Univ., 1918. 1911 (7 mos.) rodman, etc., on constrn ; 1911-12, topog'r on prelim. and location surveys; 1912-13, inst'man on constrn., C.P.R.; 1914 (3 mos.) inst'man on constrn. G. & S. Ry.; Apr. 1918 to date with International Nickel Co. as follows:—1918 (5 mos.) inst'man on dam constrn. and land surveys at Bisco, Ont.; 1918-19, asst. to field engr. at Copper Cliff; since Apr. 1919, asst. to E. L. Pettingill on Big Eddy Dam, High Falls, Ont., inspecting concrete, testing cement, etc.

References: W. J. Bishop, J. B. D'Aeth, C. P. Howrigan, C. Luscombe, T. S. Scott, E. A. Stone.

DELORME—L. LUDGER, of St. Leonard Port Maurice, P.Q. Born at St. Leonard Port Maurice, July 16th, 1894. Educ., civil and chem. engr., 1917 and 1918, Poly. School. Summers 1914 to 1917, with F. C. Laberge on municipal and road work; at present, civil and chem. engr., with J. J. Joubert & Co. Ltd.

References: F. C. Laberge, P. LeCointe, C. C. Leluau, A. Surveyer.

DESCHAMPS—ADOLPHE, of Montreal, Que. Born at Montreal, Aug. 24th, 1892. With Quebec Streams Comm. and Structural Steel Co.; 1916-18, steel testing engr., Imperial Min. of Munitions, Montreal; 1918, engr. of tests, U.S. Ordnance Dept., in complete chg. of testing at Dom. Bridge Co., Lachine; at present, on contract for small building.

References: A. Frigon, C. C. Leluau.

DUNCAN—WILFRID EBEN PINKERTON (Major) of Milton, Ont. Born at Glasgow, Scotland, March 2nd, 1891. Educ., B.Sc., Glasgow Univ., 1913. 1910-15. with C.P.R., on gen. survey and constrn. work, later asst. engr., Lake Erie & Northern Ry.; 1915-19, major, Royal Engrs., on ry. constrn., etc.

References: C. W. P. Ramsey, C. Luscombe, R. Mudge, C. T. Delamere, D. Hillman.

FOURNIER—VICTOR A., of Outremont, Que. Born at Coaticook, Educ., B.A., 1911, civil and elec. eng., 1915, Laval Univ. Summers, 1912, surveying; 1913, surveying and triangulation, with Beique & Charton, Town of Lasalle; 1915-16, constrn. engr., with N.Y. Continental Jewell Filtration Co.; 1917 (3 mos.) asst. engr., Superior Board of Health, Que. Prov.; 1917-18, res. engr., R. T. Smith & Co., Aylmer, Que.: 1918 to date, asst. sanitary engr., Superior Board of Health, Prov. of Que., constrn. and testing of filtration plants and inspection of water works and sewerage systems.

References: H. G. Hunter. J. O. Meadows, F. C. Laberge, A. Surveyer.

FULLER—CHARLES HARVEY ROGERS (Capt.) of Toronto, Ont. Born at Toronto, July 3rd, 1893. Educ., B.A.Sc., Toronto Univ., 1914. 1910, on G.T. Ry., grade separation; 1911-13, res. engr., Toronto civic car lines; 1914, asst. engr., Ont. Govt. highway dept.; 1915, asst. engr. on dredging, Can. Stewart Co.; 1915-19, on active service as capt. and adjutant, 216th Batt., later asst. to ch. engr., 10th Can. Ry. Troops; at present, member of firm Fuller & Ferry.

References: J. R. W. Ambrose, H. S. Van Scoyoc, P. Gillespie, C. R. Young, D. W. Harvey.

HAY—ALAN KEITH (Lieut.) of Ottawa, Ont. Born at Ottawa, May 22nd, 1892. Educ., B.Sc. (C.E.) McGill Univ. 1914. 1910 (4 mos.) rodman, Internat. Boundary Survey, St. Croix River, N.B.; 1911, rodman on res. engr's staff, C.P.R., Ottawa; 1912, asst. engr., on city engr's staff, in chg. of constrn. of extensions on water supply systems; 1913 (4 mos.) asst. engr. on constrn. of dam, River Lievre; 1914-16, asst. engr. on roadways, sidewalks, water supply, etc.; 1917, inspector in gauge testing laboratory, Imperial Ministry of Munitions; 1918, lieut., Can. Engrs., at present, res. engr. on northern section of Ottawa-Prescott provincial highway.

References: J. B. McRae, R. J. Durley, N. J. Ker, H. M. MacKay, J. E. Openshaw, W. F. M. Bryce.

HUMPHREY—ALBERT ERNEST (Major, D.S.O.) of Abbotsford, B.C. Born at Rodney, Ont., May 5th, 1884. Educ., honor grad. R.M.C., 1907. 1907 (2 mos.) with Code & Code, O.L.S., Cobalt, Ont.; 1907-09, hydrographic survey, Great Lakes; 1909-11, articled pupil to J. H. Brownlee, B.C.L.S., Vancouver, in chg. of survey parties and responsible for work undertaken; 1912-14, private practice as B.C.L.S., latterly in partnership with Henderson & Taylor; Nov. 1914 enlisted for overseas service, Dec. 1916 to Mar. 1919 in command of Can. Corps Cyclist Batt., France, at present, private practice as B.C.L.S., also engr. on Pacific highway P.W.D.

References: F. Anderson, A. P. Augustine, J. M. Rolston, W. J. Stewart, W. Taylor.

LITTLE—EDWARD CARUTHERS (Lieut.) of St. Catharines, Ont. Born at Ottawa, June 11th, 1893. Educ., B.Sc., McGill Univ., 1915. Summers 1910, rodman, etc. A.C. Ry.; 1913-14, leveller in chg. of party on topography, St. Lawrence Ship Canal; 1915, clerk, town planning branch, Comm. of Conservation; 1916-19, Lieut., Can. Field Artillery, mentioned in despatches and awarded Belgian Croix de Guerre; at present, inst'man, Welland Ship Canal.

References: E. Brown, H. M. MacKay, J. W. LeB. Ross, C. D. Sargent, J. White.

TAYLOR-BAILEY—FRANK WHITHAM, of St. John, N.B. Born at Montreal, Mar. 7th, 1891. Educ., B.Sc. (C.E.) McGill Univ., 1916. 1908-16, with Dominion Bridge Co., as follows:—1908-09, detail drafting; 1909-11, checking structural steel drawings; 1911-16, estimating and designing; 1915, engr. for Ottawa plant since 1916, res. engr. on aerodrome constrn., Dept. of Fortifications & Works, War Office; acting staff captain, etc.; served in France with 3rd Batt., Can. Engrs., at present, res. supt. for N.B. eng. branch, S.C.R.

References: G. E. Bell, E. Brown, G. H. Duggan, H. M. MacKay, E. S. Mattice, P. L. Pratley, F. C. Shearwood, A. R. Sprenger.

VANCE—JAMES ALFRED, of Woodstock, Ont. Born in Oxford County, Ont., May 8th, 1892. Educ., 3 yrs., Faculty of app. science and eng., Univ. of Toronto, 1911-14. Vacations 1910-14, asst. in chg. of erection of steel and concrete Highway bridges, Hamilton Bridge Works Co. Ltd.; 1914 to date, gen'l contractor, designing and erecting steel and concrete highway bridges, dams, etc., with exception of 5½ mos. (in 1917) as structural draftsman, Hamilton Bridge Works.

References: J. G. Jack, C. H. Marrs, J. A. McFarlane, R. K. Palmer, F. J. Ure.

CORRECTION FROM JULY PRELIMINARY NOTICE

BARTRAM—VIVIAN TURNILL, of Toronto. Born at Ottawa, Aug. 2nd, 1878. Education, Public School and Collegiate Institute, Ottawa.

PROFESSIONAL RESPONSIBILITY:—1895-1905, Secretary, General Manager, Canada Atlantic Ry., Ottawa. Chief clerk, purchasing dept., C.P.R., Montreal, 1905-06. Purchasing agent and general storekeeper, T.'N.O. Ry., North Bay, Ont., 1906-09. Was associated with T. S. Scott, C.E., in completing the McRae, Chandler & McNeil contract on T. & N. O. Ry. In 1909 resigned to go into partnership with Mr. Denis Murphy, one of the commissioners of the ry. in construction bunisess; later on bought out Mr. Murphy and continued alone.

HARBOR WORK CONTRACTS COMPLETED :—In Ontario: Port Stanley, Port Bruce, Rondeau, Cobourg. Toronto (western gap). Nova Scotia:—Fourchu, Arichat, Grand Etang. New Brunswick:—Tormentine, Shediac. P.E.I.:—Murray Harbor, Charlottetown, Rustico.

PRESENT ENGAGEMENT:—Vice-President, National Shipbuilding Co. Ltd., Goderich, Ont.; President, Bartram & Ball Lumber Co. Ltd., Montreal; President, Spardon Electric Products Ltd., Ottawa.

References: J. J. Collins, C. H. Keefer, E. D. Lafleur, G. A. Mountain, C. O. Wood.

Monthly Engineering Index

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of the engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies may be obtained of any of the articles listed in this section.

Price of each print (up to 11 x 14 in. in size), 25 cents, plus postage. A separate print is required for each page of the larger-size periodicals, but where possible two pages will be photographed together on the same print. Bill will be mailed with the prints.

Harrisson W. Craver, Director,
Engineering Societies Library,
29 West Thirty-ninth Street, New York, N.Y.

AERONAUTICS

AIRCRAFT

CEMENTED SEAMS. *See Balloon Construction.*

BALLOON CONSTRUCTION. Notes on Cemented Seams and Rubber Cements with Reference to Balloon Construction, J. D. Edwards. Aerial Age, vol. 9, no. 14, June 16, 1919, pp. 688-690, 8 figs. Concluded from tests and examination of microsections of cemented seams that next to a good cement it is necessary to smooth and clean surfaces to be cemented and to apply cement in fine coat of uniform thickness, in order to secure satisfactory results.

BALLOONS AND SOLAR RADIATION. Effect nf Solar Radiation Upon Ballons, Junius David Edwards and Maurice Blaine Long. Technologic Papers of Bur. Stand., Dept. Commerce, no. 128, June 13, 1919, 29 pp., 6 figs. Measurements said to have shown obsorption power of radiation to vary from 45 to 95 per cent.

APPLICATIONS

CAPE-TO-CAIRO AIR ROUTE. Cape-Cairo Air-Way. Flight, vol. 11, no. 24, June 12, 1919, pp. 775-776, 1 fig. Scheme for organizing route.

MAPPING. *See Surveying.*

SPEED. Making the Airplane a Utility, Grover C. Loening. Jl. Soc. Automotive Engrs., vol. 4, no. 6, June 1919, pp. 489-493, 2 figs. Speed considered as element needed to give real sound utility to airplane.

SURVEYING AND MAPPING. The Aeroplane in Surveying and Mapping, E. Lester Jones. Flying, vol. 8, no. 5, June 1919, pp. 438-441, 2 figs., also Science, vol. 49, no. 1277, June 20, 1919, pp. 575-582, and Sci. Am. Supp., vol. 87, no. 2268, June 21, 1919, pp. 386-387 and 391. Value expected chiefly in reconnoissance surveys and maps. Past experiments considered as forecasting successful development of revising charts by airplanes. Address delivered before Second Pan-American Aeronautic Convention.

AUXILIARY SERVICE

HANGARS. The Heating of Hangars (Die Heizung van Flugzeughallen), F. Kaiser. Zeitschrift des Bayerischen Revisions-Vereins, vol. 23, nos. 1, 2 & 3, Jan. 15, 31 & Feb. 15, 1919, pp. 2-4, 11, 13, and 19-22, 8 figs. Compares systems of heating with a stove, by hot air, steam, and a combination of these.

Reinforced-Concrete Hangars for the Hyroplanes of the Port of Algiers (Hangar en béton armé pour les hydravions du centre maritime d'Alger), E. Carret. Génie Civil, vol. 74, no. 21, May 24, 1919, pp. 409-413, 15 figs., partly on supp. plate. Dimensions are 104 ft. free opening by 130 ft. useful depth.

LANDING STATIONS. Finding Aircraft Landing Stations by Means of Audio Frequency Receivers, Earl C. Hanson. Flying, vol. 8, no. 5, June 1919, pp. 442-443, 6 figs. Scheme suggested comprises combination of radio directive transmission system to guide aircraft at high speed in direct course between separated cities or other points, audio frequency signal means to project audio frequency energy to predetermined altitudes, but restricted to area of landing field, and indirectly illuminated zone in center of landing field.

MOTORSHIP. The Seaplant Carrier "Argus," Sci. Am., vol. 120, no. 24, June 14, 1919, pp. 630-631, 7 figs. Ship with 500 ft. starting and landing platform for seaplanes. It carries 20 seaplanes in hangar below deck, and has upper flying deck for launching and landing, which is clear of masts, smokestacks and deck structures. From Engineering, Lond.

RADIO TELEPHONES. The Radio Telephone Equipment of the NC-4, Edgar H. Felix. Aerial Age, vol. 9, no. 13, June 9, 1919, pp. 638-639 & 652, 5 figs. Design is said to permit transmission of three types; (1) voice currents, (2) continuous or undamped waves, (3) damped waves of audio frequency.

DESIGN

AIR MILEAGE. *See Cruising Radius.*

Air Mileage of Aeroplanes Intended for Long Distances and for Transport, J. Dennis Coales. Engineering, vol. 107, no. 2785, May 16, 1919, pp. 621-622, 1 fig. Effect of winds on air mileage. (Concluded).

COOLING SYSTEM. The Loomis Cooling System for Aircraft, Aeronautics, vol. 16, no. 290, May 8, 1919, pp. 479-480, 3 figs. Expansion tank surrounds core and injector is located in water connection between main and booster radiators for keeping constant volume of water in circulating system. From Bul. U. S. Experimental Dept., Aeroplane Eng. Div.

FLYING BOATS. The Construction of the Navy-Curtiss Flying Boats. Jl. Soc. Automotive Engrs., vol. 4, no. 6, June 1919, pp. 439-442, 4 figs. Radical alterations from past designs quoted as distinctive features of N-C boats are shortened hull and mounting of tail surfaces on outriggers.

Design and Construction of Flying Boats, David Nicolson. Engineering, vol. 107, no. 2786, May 23, 1919, pp. 681-686, 16 figs. Deals particularly with larger types known officially as F-2a, F-3, F-5, P-5 and N-4.

LARGE AEROPLANES. Some Considerations of the Design of Large Aeroplanes, Leslie V. Spencer. Aerial Age, vol. 9, no. 16, June 30, 1919, pp. 774-776, 7 figs. Urges that aeronautical engineers prepare their designs along new and original lines, as writer sees that large aerial liner is far from having reached a standard or final stage.

LIFT-ANGLE OF INCIDENCE. The Economies of Flight, H. B. Irving. Automotive Industries, vol. 40, no. 24, June 12, 1919, pp. 1306-1308, 2 figs. Showing variation of lift-drag ratio with angle of incidence and chart for determining most economical speed of flight.

LIFT CHARTS. Chart for Performance Computations, Richard I. Elliot. Aviation, vol. 6, no. 7, June 1, 1919, p. 488, 1 fig. Prepared for solving graphical equations involving lift data.

LOADS. The Loads and Stresses on Aeroplanes, John Case. Aeronautics, vol. 16, nos. 289 and 291, May 1 & 15, 1919, pp. 445-448 and 502-506, 20 figs. Formula for computing loads that come upon machine as a whole under various conditions of flight. Estimation of movement of air forces on wings about center of gravity or other given point. (Continuation of serial).

METAL CONSTRUCTION. Metal Construction of Aircraft. A. P. Thurston. Flight, vol. 11, nos. 21 & 22, May 22 & 29, 1919, pp. 680-684, and 710-714, 29 figs., also Aeronautics, vol. 16, no. 292, May 22, 1919, pp. 534-537. Requirements of metal used for aircraft constructinn and methods of attaching fittings. Boulton and Paul spars; Humber spars; types of struts; methods of design and calculation of girder spars. Preparation and possibilities of steel and duralumin. (Continuation of serial).

STRUTS. Some Useful Fuselage Strut Curves, A. J. Sutton Pippard. Aeronautics, vol. 16, no. 288, Apr. 24, 1919, pp. 426-427, 5 figs. To determine weight of members from a knowledge of their length and the loads in them without determining actual sizes required.

The Effect of a Side-Wind on Interplane Struts, A. J. Sutton Pippard. Engineering, vol. 107, no. 2788, June 6, 1919, p. 727, 1 fig. Formulæ and curves based on Euler's formula.

ENGINES

BASSE-SELVE. The Bassé-Selve 270-300 Horsepower German Airplane Engine. Automotive Engrs., vol. 4, no. 5, May 1919, pp. 222-227, 12 figs., also Automobile Engr., vol. 9, no. 127, June 1919, pp. 178-184, 18 figs. Similar in most of leading details of construction to 260-hp. Mercédes and 230-hp. Benz, on which design is believed to have been based.

CRANKSHAFTS. Airplane Engine Crankshaft Design Glenn D. Angle. Aviation, vol. 6, no. 10, June 15, 1919, pp. 525-528, 2 figs. In its relation to engine design in general.

CURTISS. The Curtiss Model K-12 Aero Motor. Aeronautics, vol. 16, no. 288, Apr. 24, 1919, pp. 428-430, 3 figs. Also Automobile Eng., vol. 4, no. 5, May 1919, pp. 217-220, 7 figs. Form of construction adapted said to give minimum center distance between cylinders. Pistons are of aluminum alloy flat head type. Motor said to develop 400 hp. on fuel consumption of 0.55 lb. per b.hp. hr.

HISPANO-SUIZA. Aviation Motors (Les moters d'Aviation). Aérophile, vol. 27, no. 7-8, Apr. 1 & 15, 1919, pp. 112-114, 6 figs. Carburation, cooling water circulation and lubrication of Hispano-Suiza (150 hp.) motor. (Continued.)

JUPITER. *See Radial Types.*

LIBERTY. The Liberty Aircraft Engine, J. G. Vincent, Jl. Soc. Automotive Engrs., vol. 4, no. 5, May 1919, pp. 383-401, 14 figs. Historical and descriptive account.

MAYBACH. Details of the Maybach 300-Horsepower Airplane Engine—II. Automotive Eng., vol. 4, no. 5, May 1919, pp. 228-233, 13 figs. Connecting rod and valve systems, lubrication, carburation and cooling. (To be continued).

MERCEDES. Mercedes 180 HP. (Le moteur Mercedes 180 hp.). Aérophile, vol. 27, no. 7-8, Apr. 1 & 15, 1919, pp. 114-117, 5 figs. Comparison of horsepower and consumption of the 160-hp. and the 180-hp. at different velocity.

MERCURY. *See Radical Types.*

NAPIER "LION". The Napier "Lion" 450 HP. Aero Engine. Aerial Age, vol. 9, no. 15, June 23, 1919, pp. 730-733, 10 figs. Engine has three groups of four cylinders each, mounted "broad-arrow."

Naval Aircraft. Characteristics of Leading Aero Engines Used in Allied Naval Aircraft. Aerial Age, vol. 9, no. 11, May 26, 1919, pp. 542-543. Supplements tables of characteristics published in issue of Mar. 3, 1919. Forty-five engines are recorded in present set.

Pistons. Elements of Piston Design and Their Particular Application to Airplane Engines, Richard Vosbrink. Pac. Mar. Rev., vol. 16, no. 6, June 1919, pp. 115-119, 10 figs. Particularly in reference to piston design. In this connection investigation and analysis undertaken as preliminary to designing standard piston used by Hall-Scott Motor Co. are referred to.

Radial Types. Some Fixed-Radical Aero-engines. Engineer, vol. 127, no. 3309, May 30, 1919, pp. 530-532, 6 figs. Jupiter and Mercury types.

Renault. Industrial Uses of Renault Motors (Groupes industriels actionnés par moteurs à explosion, système Renault). Génie Civil, vol. 74, no. 20, May 17, 1919, pp. 393-396, 7 figs. Installation of 190-hp. 8-cyl. aviation-type motor given as example.

Sturtevant. The Sturtevant Aeroplane Engines. Aerial Age, vol. 9, no. 11, May 26, 1919, pp. 536-538 & 556, 7 figs. Eight-cylinder "V"-type water-cooled. Made in two models.

Volumetric Efficiency. Increasing the Engine's Volumetric Efficiency — VI, Emil Schimanek. Automotive Eng., vol. 4, no. 5, May 1919, pp. 235-237, 7 figs. Writer expresses reasons why he believes more and less strokes than usual four increase or decrease power development. From Zeitschrift des Vereines Deutscher Ingenieure. (To be concluded).

MATERIALS OF CONSTRUCTION

Balsa Wood. The Properties of Balsa Wood, R. C. Carpenter. Aerial Age, vol. 9, no. 13, June 9, 1919, pp. 640-641, 5 figs. Tabulated results of transverse tests.

Coatings. Tests of Moisture and Water Resistant Coatings, Henry A. Gardner. Aviation, vol. 6, no. 60, June 15, 1919, pp. 539-540. Collodion dopes proved inferior to spar varnish as water excluders.

Metal Construction. *See Design.*

Plywood. The General Properties and Uses of Plywood, B. C. Boulton. Aerial Age, vol. 9, no. 15, June 23, 1919, pp. 724-727, 6 figs. Examples of distortion caused by improper construction.
Waterproof Plywood for Airplanes. Automotive Industries, vol. 40, no. 24, June 12, 1919, pp. 1331-1333 and 1359, 5 figs. Strength tests for ascertaining resistance of glue.

Standards, British. British Standards for Aircraft Materials. India-Rubber Jl., vol. 57, no. 16, Apr. 19, 1919, pp. 1-2 and 5-6, 4 figs. Specifications prepared by British Eng. Standard's Assn. for rubber tubing for use with gasoline, paraffin, lubricating oil or hot water, and for rubber shock-absorber cord for aircraft.

Veneer Construction. Veneer Body Construction. Aviation, vol. 6, no. 7, June 1, 1919, pp. 485-486, 4 figs. Tests of US & B-X bodies. (Concluded).

METEOROLOGY

Barometric Variation Forecast. Forecasting Barometric Variations (Sur la prévision des variations barométriques). Gabriel Guilbert. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 18, May 5, 1919, pp. 899-902. Additional observations to note presented in Comptes rendus, vol. 168, 1919, p. 356.

Physics of Upper Air. Air Navigation, H. A. Wimperis. Aeronautics, vol. 16, no. 290, May 8, 1919, pp. 482-487, 10 figs. Advises supporting in every possible way development in scientific work in meterology in every part of the world, and especially for the study of physics of upper air.

Tides. *See Winds and Tides.*

Weather Forecast. Meteorology and Transatlantic Flight. A. Zaiman. Flight, vol. 11, no. 20, May 15, 1919, pp. 641-642, 3 figs. Necessity of co-operation between various meteorological stations in forecasting weather conditions emphasized.

Winds and Tides. Practical Study of Winds and Tides (Estudio practico de vientos y mareas), Jose Debenedetti. Ingenieria, vol. 23, no. 8, Apr. 16, 1919, pp. 496-515. Comparison of values of harmonic constants obtained by process outlined in Indian Survey with those obtained by Prof. G. H. Darwin, based on period of thirty days.
The Lunar Tide in the Atmosphere, S. Chapman. Nature, vol. 103, no. 2584, May 8, 1919, pp. 185-187. Diagram showing lunar semi-diurnal tide in atmosphere at Greenwich, as determined form Greenwich Records of barometric pressure, 1854-1917.

MILITARY AIRCRAFT

Air Ministry of Great Britain. Great Britain's War Work in the Air. Aeronautic vol. 16, no. 289, May 1, 1919, pp. 456-462. Particularly in regard to co-operation of Air Ministry with army and navy.

Naval Aircraft. Operations of Naval Aircraft, J. H. Towers, Jl. Soc. Automotive Engrs., vol. 4, no. 5, May 1919, pp. 368-371, 7 figs. Statistics quoted as examples of work done.

Tactics, Aerial. Aerial Tactics and Defence Against Airships (La tactique aérienne et la défense contre avions), J. A. Lefranc. Aérophile, vol. 27, nos. 7-8, Apr. 1 & 15, 1919, pp. 102-107, 5 figs. Organization of airplane pursuit: bombarding enemy airdromes; anti-aircraft guns. Experiences during the war are quoted and scientific aspect of these tactics is discussed. Second article.

MODELS

Fuselage. Model Aeroplanes—XXVI, F. J. Gamm. Aeronautics, vol. 16, no. 292, May 22, 1919, pp. 532-533, 20 figs. T-frame of fuselage as it is being used for twin screw canard models. (Continuation of serial).

Lauder Racing Model. Elementary Aeronautics, John F. McMahon. Aerial Age, vol. 9, no. 14, June 16, 1919, p. 697, 2 figs. Dimensions of Lauder racing models.

Loening Monoplane. Elementary Aeronautics and Model Notes, John F. McMahon. Aerial Age, vol. 9, no. 13, June 9, 1919, p. 647, 3 figs. Scale model of Loening monoplane.

Model Results and Full Scale Achievement. Model Experiments in Aeronautics. Engineering, vol. 107, no. 2786. May 23, 1919, pp. 657-658, 5 figs. Mathematical analysis of conditions which must be satisfied to obtain exact correspondence between model results and the full-size achievements in regard to forces brought into play by motion of a body in a fluid medium.

PLANES

Bantam. The B. A. T. Bantam. Flight, vol. 11, no. 21, May 22, 1919, pp. 662-667, 12 figs. Fuselage construction consists essentially of light frame-work, comprising six longitudinal members and a number of transverse formers built up of three-ply wood, the whole covered by a three-ply skin put on in bands some 3 ft. wide, lap-jointed where they meet.

Curtiss Biplane. The Curtiss Model 18-B Biplane. Aerial Age, vol. 9, no. 14, June 16, 1919, pp. 676-677 and 701, 4 figs. Peculiarity of machine is employment of ailerons on lower plane only, which are operated by steel tubes running through lower plane and directly connected to pilot's control stick.

Curtiss Triplane. The Curtiss Model 18-T Triplane. Flight, vol. 11, no. 22, May 29, 1919, pp. 698-700, 5 figs. Some of dimensions are: Wing span (all planes) 31 ft. 11 in.; overall length, 23 ft. 3 3-16 in.; overall height, 9 ft. 10⅛ in.

Graham-White. The Graham-White Sporting Aeroplane. Aerial Age, vol. 9, no. 15, June 23, 1919, pp. 728-729 & 733, 7 figs. Span, upper plane, 20 ft.; lower plane, 18 ft. 4 in.; overall length, 16 ft. 6 in.

Navy, U. S. The U. S. Navy Flying Boat, NC-1. Flight, vol. 11, no. 20, May 15, 1919, pp. 637-639, 8 figs. Flying boat of short-hull type with tail planes carried from hull and top main planes by means of outriggers. Hull 's 44 ft. 8¾ in. overall length with maximum beam across side fins of about 10 ft.
Development of the NC Seaplanes. Aviation, vol. 6, no. 7, June 1, 1919, pp. 468-474, 5 figs. Historial account, with particular reference to technical engineering research leading up to adoption of constructional features as ultimately developed.

Radiators. Aircraft Radiators, Archibald Black. Jl. Soc. Automotive Engrs., vol. 4, no. 6, June 1919, pp. 445-461, 24 figs. Brief description of various types.

Tarrant. The Tarrant Giant Triplane, the "Tabor." Flight, vol. 11, no. 20, May 15, 1919, pp. 626-632, 11 figs. Also Aeronautics, vol. 16, no. 291, May 15, 1919, pp. 507-514, 22 figs. Aero-dynamically striking feature of machine, apart from its great size, are overhanging middle plane, with top and bottom plane of shorter span; span is 131 ft. 3 in., height 37 ft. 3 in., and disposition of various thrust lines in relation to center of resistance. History of Development with notes on principal features of design and construction.
The Tarrant Triplane. Flight, vol. 11, no. 22, May 29, 1919, pp. 702-703, 2 figs. Accident attributed to sudden starting of two top engines after machine had traveled along ground at high speed with four lower engines running.

Vickers-Vimy. The Vickers-Vimy Passenger-Carrying Aeroplane. Engineering, vol. 107, no. 2788, June 6, 1919, pp. 736-738, 8 figs.; also in Engineer, vol. 127, no. 3310, June 6, 1919, pp. 555-560, 7 figs. Machine is built for traffic service differs from design as originally adopted for bomber purposes, principally in greater depth of fuselage, which, in the passanger class, is of elliptical section and stream-line form.

Whittemore-Hamm. The Whittemore-Hamm Model-L Biplanes. Aerial Age, vol. 9, no. 16, June 30, 1919, p. 770, 2 figs. Tractor biplanes using Curtiss, Hall-Scott and Hispano-Suiza engines.

PROPELLERS

Bothezat Theory. General Summary of the de Bothezat Blade-Screw Theory. George de Bothezat Aviation, vol. 6, no. 10, June 15, 1919, pp. 520-524, 6 figs. Expressions for slip and race velocities in slip stream solely in function of dimensions of screw blades, coefficient of fluid resistance of different blade sections and working conditions. From memoir published by Nat. Advisory Committee for Aeronautics.

TESTING

Balloons Fabrics. Use of Ultra Violet Light for Testing Balloon Fabrics, Junius David Edwards and Irwin L. Moore. Aerial Age, vol. 9, no. 15, June 23, 1919, pp. 731-735, Tests made at Bur. of Standards reported to have shown that relative deterioration of fabrics under ultra-violet light is not strictly comparable with deterioration experienced in outdoor exposure.

Metal Parts. Metal Construction of Aircraft, A. P. Thurston. Flight, vol. 11, no. 23, June 5, 1919, pp. 741-745, 12 figs. Testing specimens. Appendix on metal airplane construction. (Concluded).

Wind Tunnel. The New Curtiss Wind Tunnel. Aerial Age, vol. 9, no. 16, June 30, 1919, pp. 768-769, 3 figs. Employed by Curtiss organization as a means of verifying aeronautical design.

TRANSATLANTIC FLIGHT

AIRSHIP VS. AIRPLANE. Airship vs. Airplane for Transatlantic Service (Discorso intoron al dirigibile, all aeroplane ed alla traversata aerca dell-altlantico), Silvio Bassi. Industria, vol. 33, no. 9, May 15, 1919, pp. 263-267, 6 figs. Technical considerations of limitations of each of these types as at present developed.

The Atlantic Flight, G. Greenhill. Engineering, vol. 107, no. 2787, May 30, 1919, pp. 689-691. Airship versus airplane. Technical.

VARIA

AIR-NAVIGATION RULES. The New Air Navigation Regulations, Aeronautics, vol. 16, nos. 290, 291 and 292, May 8, 15 & 22, 1919, pp. 488-491, 516-517 and 538-541. Rules as to lights and signals. Text of order issued by Secretary of State for Air. It deals with general conditions of flying, safety provisions, licensing of personnel, log books, and aerodromes in reference to civil aviation. Rules as to air craft arriving in or departing from United Kingdom. (Continuation of serial).

ASTRONOMICAL DETERMINATION AND DIRECTION. Astronomic Determination of Direction, Edward M. Burd. Jl. U. S. Artillery, vol. 50, no. 4, June 1919, pp. 390-416. Results of comparative observations for determining the azimuth of a line. (Concluded.)

NOMENCLATURE. Nomenclature for Aeronautics. Aviation, vol. 6, no. 10, June 15, 1919, pp. 529-532. From reports issued by Nat. Advisory Committee for Aeronautics.

PHYSIOLOGY OF FLYING. The Physiology of Flying, W. Guy Ruggles. Aerial Age, vol. 9, no. 16, June 30, 1919, pp. 772-773 and 787-788, 6 figs. On the origin of orientation and equilibration with reference to various types of Ruggles orientators.

CIVIL ENGINEERING

BRIDGES

BARRIERS. Yielding Barriers Close Roads at Drawbridges. Eng. News-Rec., vol. 82, no. 24, June 12, 1919, pp. 1168-1170, 2 figs. Impact of vehicles absorbed by traveling gate to stop motor trucks, and by cables to stop automobiles.

BASCULE BRIDGES. New Bascule Bridge at La Seyne. Engineer, vol. 127, no. 3308, May 23, 1919, p. 502, 10 figs., partly on supplement plates. Lifting truss about 138 ft. long is movable around horizontally placed pin, housed in forward feet of trestle-like structure which is so situated that when truss is in vertical position entrance to harbor is entirely unobstructed.

CAISSONS. Pneumatic Caissons with Wooden Cylinders for Sinking Bridge Piers, Eng. & Contracting, vol. 51, no. 22, May 28, 1919, pp. 562-564, 3 figs. Pneumatic caisson of pivot pier was octagon 30 ft. on side, and walls consisted of one width of 10 x 10-in. timbers planked outside and inside.

CONCRETE BRIDGES. Reinforced Concrete Bridges and Their Architectural Treatment, F. G. Engholm. Cement & Eng. News, vol. 31, no. 6, June 1919, pp. 21-23, 2 figs. Writer emphasizes what he terms "error of trying to produce a living structure by using forms associated with other materials."

Safe Stress in Reinforced-Concrete Bridge Arches (Zur Frage der zulässigen Spannungen in Beton-Brückengewölben), A. O. Lusser. Schweizerische Bauzeitung, vol. 73, no. 18, May 3, 1919, pp. 201-205, 4 figs. Compares safe stresses in plain and reinforced concrete. Reference is made to experiments by Bach and Graf. Curves showing breaking load of plain concrete columns and that of columns with 0.5 per cent iron reinforcement.

DELAWARE RIVER BRIDGE. The Placement of the Delaware River Bridge, Warren P. Laird. Jl. Engrs. Club. of Philadelphia, vol. 36, no. 175, June 1919, pp. 209-219, 9 figs. Based upon investigation conducted by writer as consulting architect to Delaware River Bridge and Tunnel Commission of Pennsylvania and Interstate Bridge and Tunnel Commission of New Jersey.

ELECTRICAL EQUIPMENT. Electrical Equipments for Movable Highway and Railway, Bridges, H. H. Vernon. Gen. Elec. Rev., vol. 22, no. 5, May 1919, pp. 373-383, 31 figs. Equipments applicable to various types of movable span bridges are illustrated

GENESEE RIVER BRIDGE. Rebuilding the Genesee River Bridge, Lehigh Valley R.R., at Wadsworth, N. Y. Ry. Rev., vol. 64, no. 25, June 21, 1919, pp. 947-950, 5 figs. Total length of structure, about 1311 ft. Reconstruction work is said to have involved purchase of new steel to the total weight of 3,308,000 lb.

INSPECTION. Points Requiring Special Observation and Investigation in Bridge Inspection, Herbert C. Keith. Eng. & Contracting, vol. 51, no. 26, June 25, 1919, pp. 681-683. Secondary stresses due to large gusset plates, investigation of compression members, decay of timber stringers, corrosion of beams and similar points. Paper presented before Brooklyn Engrs. Club.

PONTOON BRIDGES. Improved Form of Pontoon Bridge for Public Use. Eng. & Contracting, vol. 51, no. 26, June 25, 1919, pp. 689-691, 5 figs. Bridge over Rhine river composed of 14 sections—two draw sections equipped with steam winches, eight regular fixed sections, and at ends two short ramp sections.

SWING BRIDGES. Graphic Study of Stresses in Swing Bridges (Swing Bridges. Analisis racional y grafico de sus resistencias), Rafael Agudelo C. Boletin de la Sociedad Antioquena de Ingenieros, vol. 4, nos. 4-5, pp. 52-63, 13 figs. Illustrates method of Professor F. la Rue by applying it to bridge of 12 spans, each 20 ft. long.

BUILDING AND CONSTRUCTION

BEAMS. How to Find the Proper Size Steel Beams for various Spans. George E. Thackary, and W. A. Giesen. Building Age, vol. 41, no. 6, June 1919, pp. 183-184. Table showing steel beams required for given span.

CHURCHES. A Reinforced Concrete War Memorial Church. Building News, vol. 116, no. 3360, May 28, 1919, pp. 327 and 334-337, 6 figs. Semi-elliptical vaults of uniform thickness and springing directly from floor level take place of walls and roofs. Method is patented.

CONCRETE STRUCTURES. The Fitting of Machinery, etc. to Ferro-Concrete Structures —III. Mech. World, vol. 65, no. 1690, May 23, 1919, pp. 246, 8 figs. Type used in case where it is desired to give light from a floor to a room or compartment below, as in the fore or after peak of vessels. (Concluded.)

COST. Overhead and Time Cost to Erect Elevated Railway, A. P. Roscoe. Eng. News-Rec., vol. 82, no. 24, June 12, 1919, pp. 1164-1166. Nine hours per ton said to have been required to haul, erect, rivet and paint 13,500-ton structure.

FACTORIES. The Building of Factories—IV, Arthur F. Wickenden. Eng. & Indus. Management, vol. 1, no. 17, June 5, 1919, pp. 528-529, 1 fig. Methods of construction; choosing between brick structure with timber or concrete floors and with timber or steel roofs; composite buildings of steel and brickwork, with similar varieties of roofs and floors as above; steel-framed structures; reinforced-concrete buildings.

FOUNDRY. A Model Brass Foundry Building, Charles Vickers. Brass World, vol. 15, no. 6, June 1919, pp. 187-191, 6 figs. Structure providing facilities for comfort of workers both in summer and winter.

PLUMBING. Back Venting versus Simplified Plumbing. Am. Architect, vol. 115, no. 2267, June 4, 1919, pp. 795-804, 6 figs. Various systems are illustrated, notably those in use in U. S. Government buildings and conforming to N. Y. City regulations.

STACKS. Reinforcing Steel Stacks with Gunite Concrete, M. C. Sherman. Power, vol. 49, no. 21, May 27, 1919, pp. 808-809, 4 figs. Work carried out by building reinforcing self-supporting shells around the stacks and then employing cement guns.

STEEL STRUCTURES. The Design of Steel Structures, Albert S. Spencer. Surveyor, vol. 55, no. 1424, May 2, 1919, pp. 326-327. General remarks on various points which writer advises to consider carefully in applying theory of structures. Paper read before Concrete Inst.

TANKS. Tank Construction—XXVIII, Ernest G. Beck. Mech. World, vol. 65, no. 1692, June 6, 1919, p. 270, 6 figs. Side walls of rectangular tanks.

VIBRATIONS. Methods of Preventing the Transmission of Vibrations in Buildings, A. B. Eason. Electrical Review, vol. 84, no. 2168, June 13, 1919, pp. 684-685, 7 figs. Suggests that when different materials are being used for support hard materials, such as iron, be placed next soft ones, such as felt and cork.

WALLS. Wall Construction at Norfolk Army Supply Base by Cement Gun Process. Eng. & Contracting, vol. 51, no. 22, May 28, 1919, pp. 574-575, 4 figs. Over 500,000 sq. ft. of walls, fire stops, roof, etc., are said to have been built by this process.

WIND PRESSURE. Wind Pressure on Arched Roofs (Calcul de l'effort du vent dans les toitures en arcs), F. Grua. Genie Civil, vol. 74, no. 22, May 31, 1919, pp. 441-443, 5 figs. Equations.

CEMENT AND CONCRETE

AGGREGATE TESTING. Concrete in Roads, Bridges and Culverts, H. Eltinge Breed. Can. Engr., vol. 36, no. 22, May 29, 1919, pp. 493-495, 1 fig. Recommends that fine aggregate be tested for (1) organic impurities, (2) gradation, (3) mortar strength, and (4) volume of silt or loam. See also Roads and Pavements, Concrete.

Tests Do Not Bear Out Surface-Aggregate Method, Duff A. Abrams. Eng. News-Rec., vol. 82, no. 25, June 19, 1919, pp. 1203-1207. Research conducted at Lewis Inst., Chicago.

GRADING. The Surface Area and Fineness Modulus Methods of Grading Concrete Aggregates, Duff A. Abrams. Eng. & Contracting, vol. 51, no. 26, June 25, 1919, pp. 673-676. Tests at Lewis Inst., Chicago said to have shown that with given materials and conditions of test, quantity of mixing water determining strength of concrete, so long as (1) concrete is plastic with method of placing used, (2) aggregate not too coarse for quantity of cement used, and (3) mixture not so wet that all water cannot be held by concrete.

GUNITE CONCRETE. *See Building and Construction, Stacks, Walls.*

PIPE. Concrete Pipe Made and Laid for Winnipeg Aqueduct. Concrete, vol. 14, no. 6, June 1919, pp. 209-213, 16 figs. Eighty-five miles of it built of monolithic concrete and 12½ miles of reinforced-concrete pipe.

PORTLAND CEMENTS. Portland Cements (Les ciments Portland), E. Candlot. Chimie & Industrie, vol. 2, no. 4, Apr. 1, 1919, pp. 371-384, 19 figs. Account of manufacture with reference to practices followed at Roche, Switzerland.

PROPORTION IN CONCRETE TESTS. Tests of Two Recent Theories for Proportioning Concrete. Eng. News-Rec., vol. 82, no. 24, pp. 1142-1147 and (discussion) 1147-1149, June 12, 1919, 6 figs. Fineness-modulus and surface-aggregate methods, both of which depend on water-cement ratio, are said to have been found not to insure necessary workability of mix. Tests were made at U. S. Bureau of Standards.

SLAG AGGREGATE. Slag Aggregate in Concrete and Mortar, Em. Mavant. Concrete, vol. 14, no. 6, June 1919, pp. 239-240, 4 figs. Crushing-strength tests made of basic steel slag, limestone and banc rouge as coarse aggregates.

SLAG CEMENT. Manufacture of Cement from Blast-Furnace Slag, Wm. Poole. Proc. Australasian Inst. Min. Engrs., no. 31, Sept. 30, 1918, pp. 81-97 and (discussion) pp. 97-100. Also Queensland Gov. Min. Jl., vol. 20, no. 227, Apr. 15, 1919, pp. 157-161. Processes of manufacturing, (1) puzzolan, (2) slag Portland cement, (3) iron cement, and (4) special varieties of cement.

Tunnel Lining. Concrete Tunnel Lining by Steam Jet. Ry. Rev., vol. 64, no. 23, June 7, 1919, pp. 818-820, 3 figs. Nozzle car mounted on truck carried by ordinary flat car and controlled by two hand winches.

Underground Work. Use of Concrete in Underground Works. Eng. & Min. Jl., vol. 107, no. 25, June 21, 1919, pp. 1071-1073, 4 figs. Swelling ground and consequent crushing of shaft timbers led to experiment of lining section of shaft with reinforced concrete at mine in South Australia. From Chem. Eng. & Min. Rev.

EARTHWORK, ROCK EXCAVATION, ETC.

Aquaduct. Italian Aquaduct (L'Acquedotto Pugliese), Ingegneria Italiana, vol. 3, no. 57, May 30, 1919, pp. 67-70, 7 figs. Total length 2662 kilometers.

Caissons. Pneumatic Caissons Sunk Through Moving Ground. Eng. News-Rec., vol. 82, no. 24, pp. 1160-1162, June 12, 1919, 4 figs. Constant movement of earth forced contractor to face problem of sinking pneumatic caissons in such a way that allowance could be made for possible movement of ground through which they were to be lowered.

Causeways. Construction of New Arch Section of Galveston Causeway. Eng. News-Rec., vol. 82, no. 25, June 19, pp. 1190-1192, 7 figs. Centrifugal and jet pumps mounted on derrick platforms. Old causeway walls used for cofferdam.

Dams. Weighing Concrete Materials Saved Cement on Three Big Dams, H. H. Hunt. Cement & Eng. News, vol. 31, no. 6, June 1919, pp. 36-38, 2 figs. Proportioning by weight claimed to have given better concrete with less cement and without loss of speed.

Excavators. United Fuel & Supply Co.'s Plant. Cement, Mill & Quarry, vol. 14, no. 11, June 5, 1919, pp. 13-15, 6 figs. Arrangement used permits separate operation of excavator and main plant.

Reservoirs. Economies of Reinforced Concrete Walls for Uncovered Reservoirs, H. E. Babbitt. Eng. & Contracting, vol. 51, no. 24, June 11, 1919, pp. 618-620, 16 figs. Designs said to be based on factors of safety of two against overturning. Formulæ used for details of walls are given.

Retarding Basin. Delivering Mixed Concrete by Industrial Railway, Paul Teas. Concrete, vol. 14, no. 6, June 1919, pp. 218-221, 6 figs. Constructing retarding basins to prevent recurrence of Dayton's flood of March 1913.

Tunnels. Proposed Vehicular Tunnel under the Hudson at New York. Ry. Rev., vol. 64, no. 25, June 21, 1919, pp. 929-938, 11 figs. From discussion of "The Proposed New York and New Jersey Vehicular Tunnel" at meeting at Am. Soc. Civil Engrs., proc., May.

Tosas Tunnel, Jose M. Fuster. Revista de Obras Publicas, vol. 67, no. 2275 and 2277, May 1 and 15, 1919, pp. 205-210 and 233-237, 13 figs. Shows methods of timbering.

Utilization of Waste Heat of Tunnels, F. J. Postel. Heat & Vent. Mag., vol. 16, no. 5, May 1919, pp. 26-39, 6 figs. Test made at Chicago State Hospital using hot air from pipe-tunnel system.

The Catskill Tunnels—III Railway Engineer, vol. 40, no. 473, June 1919, pp. 115-118, 6 figs. Bonticou and Eastview tunnels. (Continuation of serial.)

Chicago's Tunnels for Electric Light and Power Cables, G. B. Springer. Elec. Rev., vol. 74, no. 25, June 21, 1919, pp. 1019-1023, 10 figs. Of standard size 6 ft. 6 in. high and 6 ft. wide, top half being semi-circular. Construction methods employed.

Underwater Construction. Underwater Construction of Outshore Launching Ways, E. D. Buel. Eng. News-Rec., vol. 82, no. 23, June 5, 1919, pp. 1121-1123, 3 figs. Speed and economy of work are said to have justified choice of diver method in place of cofferdam construction at Government fabricated shipyard at Bristol, Pa.

MATERIALS OF CONSTRUCTION

Brick, Paving. *See Road Materials.*

Building Materials. Second Report on the Work of the Underwriters' Laboratories. Am. Architect, vol. 115, no. 2268, June 11, 1919, pp. 829-834, 9 figs., also Safety Eng., vol. 37, no. 4, Apr. 1919, pp. 163-170, 8 figs. Committee was appointed at convention of Am. Inst. of Architects "for the purpose of observing tests made on building materials at the Underwriters' Laboratories at Chicago, and reporting to the architects such data and results as might be of value."

Road Materials. Road Material in New Hampshire, J. W. Goldthwait. Good Roads, vol. 17, no. 22, May 31, 1919, pp. 233-234. Report of State Highway Dept. on materials available with discussion of their value.

What Paving Brick Should Be and Do, C. C. Wiley. Brick & Clay Rec., vol. 54, no. 12, June 17, 1919, pp. 1067-1070, 4 figs. Comparative tests made with monolithic brick road having bottom course of 1 : 3 :5 concrete and with concrete slabs proportioned 1 :2 :3, are quoted as having demonstrated that equal strength is possessed by such brick and concrete roads.

RECLAMATION AND IRRIGATION

Drainage System, Moore Park. Drainage System for Moore Park, Toronto, W. G. Cameron and R. W. Dickie. Contract Rec., vol. 33, no. 24, June 11, 1919, pp. 541-544, 6 figs., also Can. Engr., vol. 36, no. 23, June 5, 1919, pp. 510-511, 4 figs. About 2,000 ft. of 4 ft. 3 in. and 3 ft. 9 in. two-ring brick sewer laid. Total length, 2,500 ft. Costs of operations quoted, capacity believed to be required was 173 c. f. s.

Irrigation, Egypt and Sudan. Irrigation Schemes in Egypt and the Sudan—II, II and III. Engineer, vol. 127, nos. 3306, 3309 and 3310, May 23 and 30 and June 6, 1919, pp. 497-499, p. 536, and pp. 556-558, 11 figs. Proposed Sennar dam on the Blue Nile. Scheme to effect combination irrigation and protection works. Irrigation schemes in lower Egypt.

ROADS AND PAVEMENTS

Asphalt. A Treatise on Hot Mix Asphalt Pavements, Francis P. Smith. Contract Rec., vol. 33, no. 23, June 4, 1919, pp. 529-534. Remarks on foundation, sub-grade and mineral aggregate requirements. Construction and properties of various types.

Bituminous Pavements. Hot Mix Bituminous Pavements, F. P. Smith. Eng. & Contracting, vol. 51, no. 23, June 4, 1919, pp. 599-601. General considerations regarding foundations. Paper presented before Can. Good Roads Congress.

Suggestions for Concrete Pavement Construction, Clyde E. Learned. Mun. Jl. & Public Roads, vol. 46, no. 24, June 14, 1919, pp. 434-436, 2 figs. Based on writer's experience on concrete road construction in South West. (To be continued.)

Concrete. Concrete Roads, Bridges and Culverts, H. E. Breed. Contract Rec., vol. 33, no. 24, June 11, 1919, pp. 552-554, also Good Roads, vol. 17, no. 25, June 21, 1919, pp. 261-263, 1 fig. Recommends testing characteristics for (1) organic impurities, (2) gradation, (3) mortar strength, and (4) volume of silt or loam. Paper read before Can. Good Roads Congress.

Drainage. Drainage of Roads and Streets—I & II (Wasserbeseitigung von Strassen und Wegen), Eduard Schneider. Zeitschrift fur Transportwesen & Strassenbau, vol. 35, nos. 19 and 20, July 1 and 10, 1918, pp. 219-220 and 231-232, 3 figs. Writer recommends drainage by means of open ditches where possible, or conduits discharging into a pond built for the purpose.

Financing. Methods of Financing Highway Improvements. Eng. & Contracting, vol. 51, no. 23, June 4, 1919, pp. 608-609. Summary of various methods that have been used in this country. From committee report at convention of Am. Road Builders' Assn.

France. War-time Highways of France, John B. Woods. Power Wagon, vol. 22, no. 175, June 1919, pp. 31-32, 3 figs. How they were maintained.

Grading. Grading with Tractors and Heavy Blade Graders. Am. City, Town & Country Ed., vol. 20, no. 6, June 1919, pp. 524-526, 4 figs. Combination said to have proven satisfactory in Wisconsin county road work.

Gravel Roads. The Place and Possibilities of Gravel Roads, Chas. Talbot. Contract Rec., vol. 33, no. 22, May 28, 1919, pp. 509-511. Writer does not consider advisable to screen or in any way attempt to treat ordinary pit gravel.

Surface Treatment of Gravel Roads with Refined Tar, Philip P. Sharples. Good Roads, vol. 17, no. 22, June 7, 1919, pp. 241-242, 2 figs., also Contract Rec., vol. 33, no. 24, June 11, 1919, pp. 550-551, 1 fig. It is reported that with this treatment State Highway laid between Kittery and Portland has carried as high as 200 to 2,000 vehicles per day during summer months without requiring too high up keep costs. Paper presented before Sixth Can Good Roads Congress

Gravel Roads, Chas. Talbot. Can. Engr., vol. 36, no. 22, May 29, 1919, pp. 499-502, 1 fig. Specifications of gravel road construction employed in building Middlesex roads in 1854. The surfaces of these roads are said to be still maintained in serviceable condition.

Integraph. Predhumeau-Secretan Integraph (Intégraphe Predhumeau-Secretan), M. Predhumeau. Annales des Ponts et Chaussées, partie technique, vol. 48, no. 1, Jan.-Feb. 1919, pp. 54-76, 9 figs. Apparatus which is said to determine directly profile changes to be effected in road project and extent of work required by construction of embankments and cuts.

Level Raising. Road Building—I, II & III (Strassenbau), Curt Merckel. Zeitschrift fur Transportwesen & Strassenbau, vol. 35, nos. 10, 11, 12, Apr. 1, 10, 20, 1919, pp. 111-114, 123-126 and 135-137. 6 figs. Niveau raising. Refers especially to experience of city of Hamburg.

Macadam. Bituminous Macadam Road Construction, A. W. Dean. Am. City Town & Country Ed., vol. 20, no. 6, June 1919, pp. 517-520, 2 figs., also Good Roads, vol. 17, no. 22, May 31, 1919, pp. 231-232, and Contract Rec., vol. 33, no. 25, June 18, 1919, pp. 566-568. Regulations in regard to drainage, subgrade, foundation, using dumping platform and patching holes. It is advised that bottom course should not be less than 4 in. in thickness after rolling, and if heavy loads are to be sustained, a thickness of 6 in. is desirable. Paper read before Can. Good Roads Congress.

Maintenance. Highway Maintenance, J. A. Duchastel. Can. Eng., vol. 36, no. 22, May 29, 1919, pp. 497-499. Advises establishing and continuing system of maintenance beginning from day road has been completed.

Road Machinery. Road Machinery, Arthur H. Blanchard. Good Roads, vol. 17, no. 22, June 7, 1919, pp. 243-245, also Can. Engr., vol. 36, no. 22, May 29, 1919, pp. 502-504, and Eng. & Contracting, vol. 51, no. 23, June 4, 1919, pp. 605-606. Factors on which writer advises selection of equipment. Paper presented at Sixth Can. Good Roads Congress.

Stone Pavement. Building a Stone Road (-ie Herstellung des Steinpflasters), George Klose. Zeitschrift fur Transportwesen & Strassenbau, vol. 35, no. 17, June 10, 1918, pp. 195-197, 2 figs. Writer claims that replacement of stone pavements by compressed asphalt is for purpose of reducing noise and not because stone pavements are not able to carry increased traffic.

Street Cleaning. Street Cleaning (Strassenreinigung), Zeitschrift fur Transportwesen & Strassenbau, vol. 35, no. 10, Apr. 1, 1919, pp. 114-115, 3 figs. The automobile sprinkler and cleaner.

Surfacing. Road Surfacing with Sand Clay from Salt Flats. Eng. & Contracting, vol. 51, no. 23, June 4, 1919, pp. 595-596. Data covering use of sand clay in Aransas County, Tex.

Tarred Roads, Poisoning Streams By. The Poisoning of Fish by Road Washings, W. J. A. Butterfield. Surveyor, vol. 55, no. 1423, Apr. 25, 1919, pp. 307-308. Tarred roads are said to be dangerous to fish life where river runs through valley and is crossed by road which drains from inclines from either side of river.

SANITARY ENGINEERING

Sewer Flushing. The Flushing of Sewers—I, II & III (Die Spulung der Kanäle), W. Schwaab. Zeitschrift fur Transportwesen & Strassenbau, vol. 35, nos. 29, 30 and 31, Oct. 10, 20 and Nov. 1, 1918, pp. 339-342, 351-353, 365-367, 28 figs. Flushing, in order to clean the pipes of slime and mud deposits, requires higher water velocity than that which caused these deposits. Best results are obtained if flushing is done at frequent intervals. In order to keep sewers free of solid waste particles, a constant water velocity of 0.6 to 0.7 m. per sec. is necessary (Concluded).

Sewer Pipe. Ground Water Disintegrates Sewer Pipe, Arthur George Dalzell. Contract Rec., vol. 33, no. 23, June 4, 1919, pp. 522-524. Invertigations into causes of internal incrustation and scale on machine-made pipes. Paper presented at Can. Nat. Clay Products Conv.

Sewers. Chicago's Standard of Sewer Construction, C. D. Hill. Eng. World, vol. 14, no. 11 and 12, June 1 and 15, 1919, pp. 17-23 and 21-23. With 2467 miles of sewer costing $50,000,000, total cost of maintenance is said to have been $79,000,000, which includes expenditures for new manholes, catch basins and similar items. Considerations made in determining location of relief sewers.

SURVEYING

Geometric Leveling. Geometric Leveling by Dr. Wilhelm Seibt's Method (Nivelacion geométrica por el método del Dr. Wilhelm Seibt), Tomas Gonzalez Roura. Ingenieria, vol. 23, no. 8, Apr. 16, 1919, pp. 516-523. Concerning approximate error of single observation. (Continuation of serial).

WATER SUPPLY

Brantford. The Brantford Waterworks, System. Power House, vol. 12, no. 9, June 20, 1919, pp. 240-244, 9 figs. Mechanical features.

Chlorination. Progress of Water Disinfection in Maryland, Robert B. Morse. Mun. Jl. & Public Works, vol. 46, no. 23, June 7, 1919, pp. 405-407, General description of plants and of results of chlorination. Paper presented before New England Water Works Assn.

Cool Drinking-Water Systems. Cool Drinking Water Systems, Charles L. Hubbard. Power Plant Eng., vol. 23, no. 11, June 1, 1919, pp. 489-494, 8 figs. Systems in use and data for computing dimensions of equipment, piping etc.

Factories. What It Pays to Know About Factory Water Supply—IV, Charles L. Hubbard. Factory, vol. 22, no. 6, June 1919, pp. 1165-1168, 7 figs. Concerning amount of water to be heated.

Buffalo Water Supply, with special Reference to the Filtration Problem, H. F. Wagner. Can. Engr., vol. 36, no. 25, June 19, 1919, pp. 551-552 and 559. Contamination by excursion boats passing near intake crib in Emerald Channel necessitates addition of maximum amount of chlorine at all times. Question is whether under such conditions and after reducing waste to minimum, building of filtering plant should be advisable. Paper read before Am. Water Works Assn.

Filters. Desrumaux Drinking Water Filter of Large Capacity and Automatic Cleaning (Filtres à grand débit et à nettoyage automatique pour l'épuration des eaux potables. Système Henry Desrumaux), A. Bidault des Chaumes. Genie Civil, vol. 74, no. 23, June 7, 1919, pp. 460-464, 6 figs. Turbine rotates sand rakes.

Garages. A Typical Complete Water Supply System for Installation in Garage Basements J. Albert Doyo. Am. Architect, vol. 115, no. 2269, June 18, 1919, pp. 861-865, 5 figs. Installation of one 6-ft. by 36-ft. pneumatic tank having working capacity of 5,140 gal.

Hamilton. Hamilton Waterworks; Some Features of Design, F. C. Perkins. Power House, vol. 12, no. 8, June 5, 1919, pp. 203-205, 4 figs. Highhead electric pumping station with four motor-driven units.

Meters. Reduction of Water Consumption by Means of Pitometer Survey and Constant Inspection, George C. Andrews. Can. Engr., vol. 36, no. 25, June 19, 1919, pp. 555-557. Experiences which led Buffalo Bureau of Water to adopt pitometer work as special department. Paper read at convention of Am. Water Works Assn.

Water Meter Data. Mun. Jl. & Public Works, vol. 46, no. 23, June 7, 1919, pp. 407-421. Tables showing data gathered by means of questionnaire sent out to 450 water-works superintendents. Data deals with location, reading, testing and maintenance of meters.

Study of Revenue from Sale of Water to Metered Domestic Consumer, Philip Burgess. Eng. News Rec., vol. 82, no. 23, June 5, 1919, pp. 1116-1119, 3 figs. New England Water Works Assn. form based on service and output charge.

Sooke Lake, B. C. Sooke Lake Water Supply, Victoria, B. C., C. H. Rust. Jl. Eng. Inst. Can., vol. 2, no. 6, June 1919, pp. 446-450, 9 figs. Construction of six siphons and necessary concrete trestles, and temporary wooden trestles to carry track is specially taken up in outline of project for utilizing lake, which is 4 miles long and about half a mile wide.

Tastes and Odors. Coal Tar Derivative Waste Products Cause of Obnoxious Taste of Milwaukee Water Supply. Eng. & Contracting, vol. 51, no. 24, June 11, 1919, pp. 629-630. Investigaton conducted by Water Works disclosed that taste and odor werenot due to use of chlorinealone,but to action of chlorine on some of the organic matter present in polluted lake water, which formed compound that produced taste and odor.

WATERWAYS

Coast Erasion. Lake Michigan's Encroachment on its Coast, Hu Maxwell. Sci. Am., vol. 120, no. 26, June 28, 1919, pp. 687 and 699-700, 4 figs. How currents are stealing land from western shore and giving it back at Southern end.

Flood Waters. Impounding Flood-Waters, E. Parry. New Zealand Jl. of Sci. & Technology, vol. 2, no. 2, Mar. 1919, pp. 121-127, 4 figs., partly on supp. plate. Deals only with rise and fall of water level in lake reservoir as flow in river increases and decreases. Charts of h/h for various cases are presented.

Maas Canalization. The Maas Canalization (Eenige mededeelingen over de Maaskanalisatie), F. L. Schlingmann. De Ingenieur, vol. 34, no. 17, Apr. 26, 1919, pp. 305-313, 5 figs. Canalization started 1915 from Linne to Grave: including the Wessen-Nederweert and Maas-Waal canal,the costs were estimated at about $30,000,000 but in writer's opinion this sum will be materially surpassed on account of general rise in prices.

VARIA

Oversea War Work. Civil Engineering in the War, George K. Scott-Moncrieff. Times Eng. Supp., vol. 15, no. 535, May 1919, p. 156. Work overseas.

Salonika, Rebuilding of. The Rebuilding of Salonika. Times Eng. Supp., vol. 15, no. 535, May 1919, pp. 158-159. 1 fig. Project involves expenditure of $100,000.

ELECTRICAL ENGINEERING

ELECTROCHEMISTRY

Electrolytic Dissociation and Duplex Affinity. The Theory of Duplex Affinity, Samuel Henry Clifford Briggs. Jl. Chem. Soc., vols. 115 & 116, no. 678, Apr. 1919, pp. 278-291. Its application to electrolytic dissociation. It is said that the cause of electrolytic dissociation is combination of solute and solvent by means of unsaturated secondary affinity.

ELECTRODEPOSITION

Metal Plating. Metal Plating, W. G. Knox. Metal Indus., vol. 17, no. 6, June 1919, pp. 269-271. Tables indicating time required to deposit a given thickness of metal.

ELECTROPHYSICS

Electromagnetic Wave Absorption. The Absorption of Electromagnetic Waves on Two Parallel Wires (über die Absorption elektromagnetischer Wellen an zwei parellelen Drähten), W. Arkadiew. Annalen der Physik, vol. 58, no. 2, 1919, pp. 105-138, 12 figs. On two parallel wires writer obtained pure, damped electric waves of 72.7 to 1.27 cm. in length. Energy of waves decreases on account of absorption according to exponential law. Method was worked out for measuring the absorption coefficient. Tables.

Electrostatic and Magnetic Fields. On a Reciprocal Relation Between the Electrostatic Fields of Certain Distributions of Electricity and the Magnetic Fields of Corresponding Uniform Currents, A. Gray. Lond., Edinburgh, and Dublin Phil. Mag., vol. 37, no. 221, May 1919, pp. 472-480, 4 figs. Establishes various reciprocal theorems of coaxial circles.

Oscillations, Electrical. Electrical Oscillations Under the Action of Any Given Forces (Oscillations Electriques sous l'action de forces données de forme quelconque), John R. Carson and J. B. Romey. Revue Générale de l'Electricité. vol. 5, no. 20, May 17, 1919, pp. 715-717. With reference to theory of propagation of current in telephone and telegraph lines, writers show that it is possible to take as fundamental solution either that relating to the case when acting forces are of exponential form or that in which a constant force is suddenly introduced in a circuit.

Overvoltage, Hydrogen. Hydrogen Overvoltage, Duncan A. MacInnes and Leon Adler. Proc. Nat. Acad. Sciences, vol. 5, no. 5, May 15, 1919, pp. 160-163, 2 figs. Concerning fluctuation observed by writer while determining overvoltage of small electrodes of "platinized" platinum.

Parallel Cylindrical Conductors. Electrical Theorems in Connection with Parallel Cylindrical Conductors, Alexander Russell. Proc. Phys. Soc. Lond., vol. 31, part III, Apr. 15, 1919, pp. 111-130, 5 figs. Relations connecting three capacity coefficients when cylinders are external to one another.

Vector Diagrams. Vector Diagrams of Some Oscillatory Circuits Used with Thermionic Tubes, W. H. Eccles. Proc. Phys. Soc. Lon., vol. 31, part III, Apr. 15, 1919, pp. 137-150, 8 figs. Vector diagrams used in study of a.c. circuit applied to assemblage made up of oscillator, the thermionic relay maintaining it in oscillation and the devices linking these two parts.

FURNACES

Booth-Hall Furnace. The Booth-Hall Electric Furnace, W. K. Booth. Can. Foundryman, vol. 10, no. 6, June 1919, pp. 142-145, 7 figs. Conducting-hearth electric furnace having auxiliary electrode for starting and automatic control.

California. Electric-Steel Furnaces in California. Metal Trades, vol. 10, no. 6, June 1919, pp. 245-247, 3 figs. Heroult furnace practice. First article.

Heat-Treating Furnaces. Electric Furnaces for Heat-Treating and Shrinkage A. M. Clark. Metal Trades, vol. 10, no. 6, June 1919, pp. 259-260, 4 figs. Built in sections. Developed by General Electric Company.

Medium Temperature Furnace. How Electric Furnaces are Built. Iron Trade Rev., vol. 64, no. 24, June 12, 1919, pp. 1545-1548, 7 figs. Type developed by Electric Furnace Co., Alliance, Ohio, designed for melting non-ferrous metal, and other work not requiring excessive temperature; claimed to be especially suitable for steel treating.

Sahlin Furnace. A New Type of Electric Furnace, Axel Sahlin. Elec. News, vol. 28, no. 11, June, 1, 1919, pp. 32-34, 1 fig. Designed with view to embodying advantages of both arc and free-burning arc furnaces. Paper read before Instn. Elec. Engrs.

A New Type of Electric Furnace, Axel Sahlin. Electrical Review, vol. 84, no. 2165, May 23, 1919, pp. 591-593, 6 figs. General principle of furnace described is solid hearth which becomes conductive of electricity when hot. Furnace is built as circular ladle with contracted top and dished botton. Abstract of paper read before Instn. Elec. Engrs.

GENERATING STATIONS

Ance, France. Ance Hydroelectric Station of the Compagnie Electrique de la Loire et du Centre (L'usine hydro-électrique de l'Ance de la Compagnie électrique de la Loire et du Centre), Jacques de Soucy. Revue Générale de l'Electricité, vol. 5, no. 19, May 10, 1919, pp. 689-700, 14 figs. Attention is directed to controlling devices which permit connecting 14,800 kw. to network of company, or else dividing it into various units which are separately connected to other steam or hydroelectric power houses. (Concluded).

Brule River. Brulé River Hydro-Electric Development, C. V. Seastone. Power, vol. 49, no. 22, June 3, 1919, pp. 842-845, 4 figs. Three-unit plant generating three-phase 60-cycle current at 6600 volts. Vertical shaft turbines operate under approximate head of 60 ft.

Buenos Aires. Generating and Distributing Stations of Buenos Aires. Les nouvelles installations de production et de distribution d'électricité de Buenos Aires. Bulletin Technique de la Suisse Romande, vol. 45, no. 10, May 17, 1919, pp. 85-89, 4 figs. Three turbo-alternators of 5000 kw. are used. (To be continued).

Denver. New Electric Generating Station at Denver, T. O. Kennedy and H. H. Kerr. Elec. Eng., vol. 53, no. 6, June 1919, pp. 253-255, 3 figs. Enlarged by installing a 12,500 kw. 4000 volt General Electric turbo-generator.

Genoa. Electric Traction in Italy (Lagrande trazione elettrica in Italia). Industria, vol. 33, no. 8, Apr. 30, 1919, pp. 232-236, 4 figs. Central thermo-electric station of the state railways at Genoa.

Individual Stations. Ontario Power Co.'s Plant Extension. H. A. Gardner. Eng. World, vol. 14, no. 11, June 1, 1919, pp. 27-31, 9 figs. Enlargement consisted of installation of third conduit, parallel to the two existing conduits and additional occupational space constructed in old power house.

G. E. C. Plant at the Winchester Corporation Power House. Electricity, vol. 31, no. 1492, June 13, 1919, pp. 367-368, 4 figs. Installation of 450-kw. geared d. c. turbine generator.

Dominion Power and Transmission Co.'s Plant. Contract Rec., vol. 33, no. 21, May 21, 1919, pp. 469-471, 6 figs. Also Elec. News, vol. 28, no. 12, June 15, 1919, pp. 25-27, 5 figs. Designed for ultimate capacity of 75,000 kva. and to deliver its output at 44,000 volts. Special attention is given to coal-handling and boiler-house equipment. Generators are of revolving field type direct-connected to steam turbine and of 12,500 kva. each.

Power Factor. Increasing the Power Factor (Relevement du facteur de puissance), B. Guerschinovitch. L'Industrie Electrique, vol. 28, no. 646, May 25, 1919, pp. 184-187. Transformer. (Concluded.)

Turbo-Electric Stations. Economic Operation of Turbo-Electric Stations.—I. & I. C. T. Hirshfeld and C. L. Karr. Universal Engr., vol. 29, nos. 4 and 5, Apr. and May 1919, pp. 33-37, and 27-33, 5 figs. Graph given shows water-rate curves for various relations of load and steam consumption and different station loads. Asserts that smallest thermal cost of auxiliary power is secured when generated by steam with complete absorption in feedwater.

AUXILIARY EQUIPMENT

Switches. New Features in Switch Construction (Neuerungen im Weichenbau), E. Borst. Annalen für Gewerbe & Bauwesen, vol. 84, no. 4, Feb. 15, 1919, pp. 38-40, 6 figs. Compares advantages and disadvantages of spring tongue and pivot switches.

GENERATORS AND MOTORS

Air Gap and Ball Bearings. The Use of Ball Bearings for Electrical Machinery, H. M. Trumbull. Power House, vol. 12, no. 8, June 5, 1919, pp. 222-224, 10 figs. Points out that ball bearings enable builder to use smaller air gap.

Boosters. On Harada's Booster (In Japanese), K. Harada. Denki Gakkwai Zasski, no. 370, May 10, 1919.

Commutation. How Spacing and Thickness of Brushes Affect Commutation, Warren C. Kalb. Power, vol. no. 25, June 24, 1919, pp. 970-972, 9 figs. How spacing, alignment and thickness of brushes may cause circulating currents to flow in armature windings and thereby develop poor commutation.

Commutation Troubles—II, F. Ashton, Mech. World, vol. 65, no. 1690, May 23, 1919, p. 244. Using copper dampers in rotary converters.

Emocol Motor. The "Emocol" Motor Elecn., vol. 82, no. 22, May 30, 1919, pp. 619-621, 7 figs. Said to provide a greatly increased cooling surface, amounting in some cases to ten times the effective area as compared with the ordinary totally enclosed motor.

Fan Motors. The Development of Fan Motor Windings. E. W. Denman. Elec. Jl., vol. 16, no. 6, June 1919, pp. 257-260, 10 figs. With reference to advantages of split-phase winding.

Fires in Generators. Generator Fires. Power Plant Eng., vol. 23, no. 12, June 15, 1919, pp. 547-550, 4 figs. Means of minimizing occurrence and limiting extent of damage. From report of Committtee on Elec. Apparatus, read before Nat. Elec. Light Assn.

Generators, Large. Reinsulation of Large Generators. Elec. World, vol. 73, no. 25, June 21, 1919, pp. 1316-1318, 1 fig. To provide against interrupted service during period of heavy winter period. Practice of Milwaukee Elec. Ry. & Light Co.

Features of Mammoth Waterwheel Generator. Elec. World, vol. 73, no. 22, May 31, 1919, pp. 1156-1158, 4 figs. Method of construction employed in one of the 32,500-kva. generators which are being built for Niagara Falls Power Co.

Induction-Motor Magnetizing Current. Calculating Induction-Motor Magnetizing Current, C. M. Laffoon. Elec. World, vol. 73, no. 24, June 14, 1919, pp. 1258-1262, 25 figs. Equation connecting magnetomotive force and effective magnetizing current, and magnetizing currents for polyphase induction motors are calculated from relation between counter electromotive force, flux and magnetomotive force.

The Design of Large Induction Motors for Steel Mill Work, H. L. Barnholdt, Elec. Jl., vol. 16, no. 6, June 1919, pp. 251-255, 9 figs. Success in this industry attributed to continuity of service which alone electricity is capable of giving over long periods of time.

Mill-Type Motors. Direct Current Mill Type Motors for Steel Mill Auxiliary Drives, J. D. Wright. Gen. Elec. Rev., vol. 22, no. 5, May 1919, pp. 323-331, 19 figs. Compares details of construction of enclosed-frame and open-frame type motors, and furnishes information concerning ratings, brushes, bearings, and poles of various sizes of motors

Mine-Type Motors. Mine-Type Motors, L. C. Mosley. Gen. Elec. Rev., vol. 22, no. 5, May 1919, pp. 348-351, 8 figs. Distinctive features claimed are: Heavy construction and mounting of back-gear bracket on stator frame.

Rating. The Continuous-Rated Motor and Its Application, L. F. Adams. Sci. Am. Supp., vol. 87, no. 2268, June 21, 1919, pp. 398-400. Interpretation of the A. I. E. E. standardization rules as applied to motors.

Regulation. Regulation Without Loss of Energy of Three-Phase Motors in Rolling Mills (Ueber den derzeitigen Stand der Frage der verlustlosen Regelung von Drenstrom-Walzenzugmotoren), H. Hermans, Elektrotechnisene Rundschau, vol. 36, nos. 3-4, Jan. 22, 1919, pp. 9-10, 2 figs. Refers to various methods of regulation with special reference to the three-phase-commutator motor which can be regulated by changing the turning force of the rotating field, by displacing the brushes on the commutator, or by changing the rotor tension.

Ship-Propulsion Motors. The New Mexico's Motors, A. D. Badgley. Gen. Elec. Rev., vol. 22, no. 4, Apr. 1919, pp. 255-260, 8 figs. Single winding used to give variable poles with 2 :3 speed ratio. Motors are cooled by forced draft. Ratio of rotor diameter to length, largely reduced from usual practice.

Synchronous Motors. The Synchronous Motor as a Means of Reducing Costs, Rob. Treat. Gen. Elec. Rev., vol. 22, no. 5, May 1919, pp. 407-412, 7 figs. It is claimed that under usual conditions where induction motors on a circuit have lowered its power factor, the addition of a properly selected synchronous motor will improve service and increase power capacity.

Thermionic Tubes in D. C. Motor. A Small Direct-Current Motor Using Thermionic Tubes Instead of Sliding Contacts, W. H. Eccles and F. W. Jordan. Proc. Phys. Soc., Lond., vol. 31, part III, Apr. 15, 1919, pp. 151-153, 1 fig. Rotating part is ebonite disk with iron teeth on its periphery and stationary part comprises two electromagnets with their poles close to two teeth.

IGNITION APPARATUS

Bureau of Standards. Ignition Work at the Bureau of Standards, Francis B. Silsbee, Automotive Industries, vol. 40, no. 24, June 12, 1919, pp. 1294-1299. Investigation has included brief study of effects of various types of spark discharge upon power developed by gasoline engine. Conclusions have been drawn in regard to condition of temperature and voltage at which a spark plug is required to operate.

Break. Notes on the "Break" of a Magneto or Induction-Coil, Norman Campbell. Lond. Edinburgh, and Dublin Phil. Mag., vol. 37, no. 221, May 1919, pp. 481-494, 2 figs. Experiments extending over various ranges of speed mentioned as demonstrating that greatest current which can be broken without sparking is independent of speed of separation of contacts.

LIGHTING AND LAMP MANUFACTURE

Argon Lamps. Argon Lamps (Du régime de fonctionnement électrique des lampes au tungstène (en atmosphère d'argon), H. Pecheux. Revue Générale de l'Electricité, vol. 5, no. 19, May 10, 1919, pp. 683-686. Influence of voltage excess on luminous intensity, with study of variations of characteristic coefficient of filaments in terms of nature of filaments and, for a given material, in terms of time during which it is subjected to action of current.

Buildings. The Lighting of Buildings. Eng. & Contracting, vol. 51, no. 22, May, 28, 1919, pp. 568-573. From an architectural point of view.

Colored Lights in Fog. Transmission of Colored Light through Fog, C. L. Utterback. Trans. Illuminating Eng. Soc., vol. 14, no. 3, Apr. 30, 1919. pp. 133-140 and (discussion), pp. 140-145, 2 figs. Measurements made are interpreted as indicating that an automobile light, or any searchlight, will have maximum transmission through fogs if light is composed of wave lengths from 5,300 to 5,900 only.

Engine-Terminal Lighting. Illumination of Toledo & Ohio Central Engine Terminal at West Columbus, O., R. E. Rice. Ry. Rev., vol. 64, no. 23, June 7, 1919, pp. 815-816, 3 figs' Flood lighting system adopted for illumination of adjacent yards.

Industrial Lighting. Selecting Equipment for Industrial Lighting—I, Ward Harrison and H. H. Magdsick. Elec. World, vol. 73, no. 25, June 21, 1919, pp. 1319-1321, 5 figs. Problems of color and elimination of glare. Technical data concerning lamps.

Lamp Operation and Maintenance. Data on Lamp Operation and Maintenance, C. H. Shepherd. Elec. World, vol. 73, no. 23, June 7, 1919, pp. 1215-1216, 2 figs. Data secured of system at Lincoln Park, Chicago, indicate that life of lamps depends greatly on switching in circuit.

LIGHTING CODES. Present Status of Industrial Lighting Codes, G. H. Stickney. Trans. Illuminating Eng. Soc., vol. 14, no. 4, June 10, 1919, pp. 153-171 and (discussion), pp. 172-208, 5 figs. Also Am. Architect, vol. 115, no. 2268, June 11, 1919, pp. 835-836. Writer looks with apprehension on laws or regulations emanating from the professions whose business they affect most directly. He claims that investigation and experience indicate need of Government regulation for factory lighting. Codes adopted in various states and in Federal establishments are discussed. Location of controlling switches. Bibliography.

MERCURY-ARC TUBE Mercury Arc Tube Operation, R. W. Kidd. Jl. Electricity, vol. 42, no. 11, June 1, 1919, pp. 527-528, 3 figs. Diagram of connections and remarks on care required by apparatus.

STREET LIGHTING. A Modern Ornamental Street Lighting System, Wm. O. Kleine. Am. City, City Edition, vol. 20, no. 6, June 1919, pp. 535-537, 5 figs. Cast iron standards about 13 ft. 4 in. high carrying 600 c-p. Mazda C lamps used in Cincinnati.

MEASUREMENTS AND TESTS

ALTERNATOR TESTING. Alternator Testing Under Reduced Power (Essai à puissance réduite des alternateurs), M. Togna. Revue Générale de l'Electricité, vol. 5, no. 22, May 31, 1919, pp. 779-787, 22 figs. Method for determining, magnetization and short circuit diagram by generalization of diagrams of Potier and Blondel.

AXLE GENERATORS. How One Road Tests Its Axle Generators, J. Doernhein, Ry. Elec. Engr., vol. 10, no. 6, June 1919, pp. 169-171, 5 figs. Testing equipment of Grand Trunk Ry., which is said to have been designed to operate under all varying conditions of speed, stop and reversals, the same as in actual operation.

METERS. A Method of Calibrating Meters, H. Gewecke and W. von Krukowski. Elecn., vol. 82, no. 23, June 6, 1919, pp. 644-645, 1 fig. Method by which revolutions of disk are automatically recorded. From Elektrotechnische Zeitschrift, no. 36, 1918.

Installation and Testing of Primary Meters, Halbert R. Thomas. Elec. World, vol. 73, no. 23, June 7, 1919, pp. 1212-1214, 3 figs. More attention is believed to be demanded at present time than formerly because tendency is to supply large consumers with energy at 2,200 volts, metering on the primary side.

PHASE ROTATION. Power Factor and Phase Rotation, Leslie F. Curtis. Jl. Electricity, vol. 42, no. 11, June 1, 1919, pp. 530-533, 8 figs. Suggests laboratory methods for determining phase rotation of voltages, phase position of currents and effective power factor.

RADIOMETER. An Application of the Radiometer to the Measurement of Electric Current, Thomas D. Cope. Jl. Franklin Inst., vol. 187, no. 6, June 1919, pp. 734-744, 3 figs. Experiments are said to have established usefulness of instrument in measuring currents.

VOLTAMETERS. The Richards Form Silver Voltameters, Jûichi Obata. Researches of Electrotechnical Laboratory, Tôkyô, Japan, no. 76, May 1919, 21 pp., 4 figs. Richards voltameters using least permeable porous-cup septum compared with Smith form; latter reported to have given heavier deposit, about 2 parts in 100,000 than Richards. Cause of difference attributed to effect of anode liquid and not to electrostenolysis.

MATERIALS OF CONSTRUCTION

MICA. Raw Materials Needed in Electrical Industries—Mica (De quelques matières premières nécessaires à l'industrie électrique le mica), Désiré Pector. Revue Générale de l'Electricité, vol. 5, nos. 19, 20 and 21. May 10, 17 and 24, 1919, pp. 701-706, 735-740 and 769-771. Deposits in Africa, America and Oceania. Notes compiled from various official publications. (Continuation of serial.) Dielectric properties; extraction and preparation. Combination with various substances for making insulator. Prices quoted at various markets of the world. (Concluded.)

PAPER AND CLOTHES. On Deterioration of Insulating Papers and Clothes (In Japanese), R. Mitsuda. Denki Gakkwai Zasshi, no. 370, May 10, 1919.

POWER APPLICATIONS

AGRICULTURE. Electrical Plowing and Mechanical Agriculture in France. Elec. Rev., vol. 74, no. 24, June 14, 1919, pp. 985-987, 4 figs. Description of equipment and comparison of costs of plowing by gasoline engine and electric motor. From Revue Générale de l'Electricité.

CENTRIFUGAL-MACHINES DRIVE. Centrifugal Machines and their Adaptability to Electric Motor Drive, H. W. Rogers. Gen. Elec. Rev , vol. 22, no. 5, May 1919, pp. 413-420, 9 figs. Formulæ and curves offered as help in selecting proper motor for a given installation.

HEATING. Experience with Electric Heating in the Northwest, J. D. Ross. Jl. Electricity, vol. 42, no. 12, June 15, 1919, pp. 566-568. Data presented as part of testimony before Idaho Public Utilities Commission in connection with study of economical generation of electric energy.

Heating of Buildings by Electricity, V. H. Greisser. Jl. Electricity, vol. 42, no. 12, June 15, 1919, pp. 564-566, 2 figs. Data of possibilities in electric heating for homes and office buildings; prepared by Washington Water Power Co.

Electricity in Household Service, H. C. Hoyt. Gen. Elec. Rev., vol. 22, no. 3, Mar. 1919, pp. 156-195, 55 figs. Illustrating various uses in lighting, supplying power for driving domestic utilities and heating and cooking.

MELTING. Application of Electrical Energy to the Melting of Metals, W. A. Greaves. Eng. & Indus. Management, vol. 1, no. 15, May 22, 1919, pp. 462-464, 8 figs. Induction furnace is not considered as commercially satisfactory, owing to loss in efficiency caused by metal being in form of ring, which is said to bring about extremely high heat losses.

OIL WELLS. The Operation of Oil Wells by Electric Power and the Resulting Gain to the Oil Producer, W. G. Taylor. Gen. Elec. Rev., vol. 22, no. 5, May 1919, pp. 384-394, 20 figs. Safety, reliability and convenience mentioned as advantages. Tables of comparative costs are presented.

PAPER MILLS. Electrification of Paper Mill Finishing-room Machinery, W. T. Edgell, Jr. Gen. Elec. Rev., vol. 22, no. 5, May 1919, pp. 399-406, 13 figs. Results obtained by Strathmore Paper Co., Woronoco, Mass.

ROD AND WIRE MILLS. Electricity in the Making of Copper Wire. Jl. Electricity, vol. 42, no. 12, June 15, 1919, pp. 569-570, 3 figs. Rod and wire mill of Anaconda Copper Mining Co., with capacity of 100,000 lbs. of rods and 50,000 lbs. wire every 8-hour shift.

SOAKING PITS. Electric Soaking Pits and Furnaces, T. F. Bailey. Blast Furnace & Steel Plant, vol. 7, no. 6, June 1919, pp. 264-267, 1 fig. Labor saving, precision of treatment produced and elimination of rejection of parts due to defective heat treatment. Paper read before Am. Iron and Steel Inst.

STEEL MILLS. Electric Drive for Steel Mill Main Rolls, K. A. Pauly. Gen. Elec. Rev., vol. 22, no. 5, May 1919, pp. 308-322, 23 figs. Examples of various installations with tables indicating characteristics of units employed.

TRANSPORTATION. Use of Electrical Equipment on San Francisco Water Front, Charles W. Geiger. Elec. Rev., vol. 74, no. 24, June 14, 1919, pp. 977-981, 4 figs. Methods of operating electric trucks, tractors, conveyors and piling machines to relieve traffic.

STORAGE BATTERIES

LEAD STORAGE BATTERIES. On Lead Storage Batteries (In Japanese), J. Iwashiro. Denki Gakkwai Zasshi, no. 370, May 10, 1919.

TELEGRAPHY AND TELEPHONY RADIO

ANTENNAE. Radiation and Direction of Field of Certain Types of Unenclosed Antennæ (Die Strahlung und Richtwirkung einiger Luftdrahtformen im freien Raum), W. Burstyn. Jahrbuch der drahtlosen Telegraphie und Telephonie, vol. 13, no. 5, Jan. 1919, pp. 362-378. Radiation characteristics of various forms for different directions in space.

Quantitative Experiments with Coil Antennas in Radio-telegraphy, L. W. Austin. Jl. Wash. Acad. Sciences, vol. 9, no. 12, June 19, 1919, pp. 335-339. Equations show that, other things being equal. if an antenna be used, both for sending and receiving, the received current falls off as the wave length, while if one coil be used, it falls off as the square of the wave length and with two coils as the cube of the wave length.

AUDIONS.—*See Vacuum Tubes.*

MEASUREMENTS. A New Method of Using Contact Detectors in Radio Measurements, Louis W. Austin. Proc. Inst. Radio Engrs., vol. 7, no. 3, June 1919, pp. 257-259, 1 fig. Based on use of low-resistance shunt across detector and galvanometer and calibration of arrangement using radio frequency currents which can be measured with hot-wire instruments

MUSICAL SOUNDS. Emission of Musical Sound in Radio Telegraphy (Note sur un problème d'émission musicale en radiotélégraphie), T. Minohara. Revue Générale de l'Electricité, vol. 5, no. 21, May 24, 1919, pp. 747-752, 4 figs. Technical determination of conditions for producing it.

OSCILLATIONS. Electrical Oscillations in Antennas and Inductance Coils, John M. Miller. Proc. Inst. Radio Engrs., vol. 7, no. 3, June 1919, pp. 295-326, 12 figs. After considering theory of circuits having uniformly distributed constants, writer shows graphically frequency-variation of reactance of such circuits and, after further analysis, those of inductance-loaded and capacity-loaded antennas.

POLDHU WIRELESS STATION. Great Wireless Stations, Poldhu. Wireless World, vol. 7, no. 73, Apr. 1919, pp. 1-5, 5 figs. Plant is rated at 75 kw.; normal transmitting wave length is 2,800 meters and the daylight range is given as 1,800 miles.

POULSEN. On the Poulsen Arc and Its Theory, P. O. Pedersen. Proc. Inst. Radio, Engrs., vol. 7, no. 3, June 1919, pp. 293-297, 2 figs. Continuing discussion of sustained oscillation of the first or second type produced by Poulsen arcs (see Proc. Inst. Radio Engrs., vol. 5, no. 4, p. 25) writer derives approximate value of peak voltage required for maintenance of such oscillations.

RECEIVERS. Radiotelegraphic Receivers of the Italian Navy (Ricevitori radiotelegrafici della R. Marina), G. Vallauri and G. de Luigi. Elettrotecnica, vol. 6, no. 13, May 5, 1919, pp. 254-258, 5 figs. Description of three types used by Italian Navy.

The Possiblities of Concealed Receiving Systems, A. Hoyt Taylor. Proc. Inst. Radio Engrs., vol. 7, no. 3, June 1919, pp. 261-266, 2 figs. Closed 3-meter square loop or 16 turns of wire hung about 1.5 meters from ground, said to have given good service for reception from stations as distant as 3,000 miles.

STATIC. Reception through Static and Interference, Roy A. Weagant. Proc. Inst. Radio Engrs., vol. 7, no. 3, June 1919, pp. 207-244 and (discussion), pp. 245-256, 31 figs. Effect produced by static (stray) considered and Eccles classification of static as "grinders," "clicks" and "hissing" adopted.

Weagant's Anti-Static Invention—II, Elmer E. Bucher. Wireless Age, vol. 6, no. 10, July 1919, pp. 11-21, 25 figs. Experiments made with two loops, each consisting of a single turn of wire extending out from station and back again, as measure to overcome troubles incident to use of loops with long low leads, forms of Weagant's antennae.

TELEPHONE TRANSMITTERS. Wireless Telephone Transmitter for Seaplanes. Wireless Age, vol. 6, no. 9, June 1919, pp. 14-19, 7 figs. Flying Boat type S. E. 1,100, developed by American Marconi Co. for navy use during war.

TELEPHONY. Recent Progress of Wireless Telephony (Sur les récents progrès de la téléphonie sans fil), C. Gutton. Bulletin de la Société Française des électriciens, vol. 9, no. 80, May 1919, pp. 323-332, 6 figs. In Europe and in the U. S. A.

TREES. Tree Telephony and Telegraphy, George O. Squier. Jl. Franklin Inst., vol. 187, no. 6, June 1919, pp. 657-687, 13 figs. From experiments it is concluded that a growing tree is a highly organized piece of living each which can be used in the same manner as the earth is used now as a universal conductor for telephone, telegraph and other electrical purposes.

Vacuum Tube. Cascade Amplification by a Single Vacuum Tube. Wireless Age, vol. 6, no. 10, July 1919, p. 23, 2 figs. Principle of operation is: Input e.m.f. is impressed between first section of cathode and its associated input element, and serves to vary discharge from cathode section to another electrode which is maintained positive with respect to cathode section.

The Three-Electrode Audion Lamp as Amplifier in Ordinary Telephony. (La lampada a tre elettrodi (Audion) come ripetitore-amplificatore nella telefonia ordinaria), G. Marchesi. Elettricista, vol. 8, no. 10, May 15, 1919, pp. 73-77, 6 figs. Account of research undertaken by various experimenters.

External-Anode Vacuum Tube, H. P. Donle. Elec. World, vol. 73, no. 23, June 7, 1919, pp. 1204-1206, 9 figs. Filament, control electrode and anode are disposed as follows: Filament is surrounded by control electrode which consists of helical coil of drawn tungsten wire; these two elements are the only ones inside tube, anode being a silver coating applied directly to outside of vacuum tube on that portion surrounding filament and control electrode.

WIRE

Cables. Accelerating Operation of Submarine Cables (Exploitation accélerée sur les longs câbles sous-marins). Revue Générale de l'Electricité, vol. 5, no. 22, May 31, 1919, pp. 802-804, 3 figs. Heurtley amplifier. German account of British apparatus. Translated from Archiv für Post und Telegraph.

Ocean Cable Receiving Instruments. Telegraph & Telephone Age, no. 11, June 1, 1919, pp. 255-258, 4 figs. Wiring diagrams of Gulsted relay, Brown "drum" relay and Heurtley magnifier.

Induction, Self. Regarding the Propagation of High-Speed Telegraph Signals on Lines with Increased Self-Induction (Uber die Fortplanzung schnell-telegraphischer Zeichen auf Leitungen mit vergrösserter Selbstinduktion), Ragnar Holm. Archiv fur Elektrotechnik, vol. 7, nos. 9 and 10, Feb. 17, 1919, pp. 263-292, 6 figs. Discussion of formulæ on hand of curves. The law of reflection of a coil. Main equations for pupinized lines.

Measurements. On Measurement of Signal Strength, W. H. Eccles. Proc. Inst. Radio Engrs., vol. 7, no. 3, June 1919, pp. 257-280, 11 figs. "Shunted telephone" method for measuring audibility of received signals.

Relays. Relays Used in Transoceanic Telegraphy (Relais employés en télégraphie sous-marine), J. B. Pomey. Revue Générale de l'Electricité, vol. 5, no. 22, May 31, 1919, pp. 797-801, 7 figs. With remarks on resonance relays.

Telephones, Service. The Telephone Service of Large Cities, with Special Reference to London, E. A. Laidlaw and W. H. Grinstead. Electrical Review, vol. 84, no. 2165, May 23, 1919, pp. 641-643. While holding as true that subscriber's estimate of telephone service is only criterion of satisfactory service, writer points out, however, certain factors inherent to human deficiencies of operators and concludes that there is a limit in exactness which can be expected from equipments of manual type.

TRANSFORMERS, CONVERTERS, FREQUENCY CHANGERS

Converter, Cabot. The Cabot Converter, Claude F. Cairns. Proc. Inst. Radio Engrs., vol. 7, no. 3, June 1919, pp. 281-291, 4 figs. Describes combination of a few-phase primary and many-phase secondary transformer and a secondary circuit commutator driven by a synchronous motor.

Transformer Connections. Parallel-Running of Transformers Fed from the Same System or from Different systems (La Pratique de la mise on parallele des transformateurs alimentés par le même reseau ou par deux reseaux), B. Guerschinovich. L'Industrie Electrique, vol. 28, no. 645, May 10, 1919, pp. 164-167, 4 figs. Tests required when connecting two systems in parallel. (Concluded.)

The Essentials of Transformer Practice—XXIII, E. G. Reed. Elec. Jl., vol. 16, no. 6, June 1919, pp. 267-268, 3 figs. Curve showing how vector sum of currents in two transformers connected in parallel compares to numerical sum with variable phase angle between currents.

Transformer Costs. Cost Comparison of Transformer Types, B. C. Dennison. Elec. World, vol. 73, no. 22, May 31, 1919, pp. 1152-1155, 5 figs. Comparison between five types of single-phase transformer designed from same specifications. It is concluded that for any type of transformer the design for dimensions that will reveal a given rating at minimum cost should be based upon (1) ratio of core section to coil section, (2) ratio of height of opening to width of opening, and (3) ratio of core depth to core width.

Transformer Dimensions. The Numerical Solution of the Equations of Transformer Dimensions, A. R. Low. Elecn., vol. 82, no. 24, June 13, 1919, pp. 671-673, 3 figs. Reduction of conditions for minimum loss with given output and cost found by application of Lagrange's method and outlined in Elecn., Nov. 15, 1918.

TRANSMISSION, DISTRIBUTION CONTROL

Arresters, Electrolytic. Experiences with Electrolytic Arresters. Elec. World, vol. 73, no. 24, June 14, 1919, pp. 1269-1272, 5 figs. Tests at 110 stations of Southern California Edison Company are interpreted as indicating need of giving particular attention to condition of horn gaps, film and electrolyte, oil, and line and ground connections.

Cable Characteristics. High-Tension Single-Conductor Cable for Polyphase Systems, W. S. Clark and G. B. Shanklin. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 6, June 1919, pp. 663-715, 24 figs. Dielectric, inductive and general line characteristics of three-conductor and single-conductor cable are compared It is asserted that line voltages of 44,000 and 55,000 are perfectly practical and mean a saving in copper over three-conductor cable of as much as 70 per cent.

Cables, Underground and Overhead. Underground and Overhead Alternating Current Maximum Power Cables (Unterirdische und oberirdische Wechselstrom-Hochstleistungskabel), W. Kummer. Schweizerische Bauzeitung, vol. 73, no. 19, May 10, 1919, pp. 213-216, 3 figs. Discusses advantages and disadvantages of ovehead and underground cables, with special reference to advantages of underground cables as per technical data of Dr. Paul Humann.

Condensers, Synchronous. Notes on the Application of Synchronous Condensers to Large Power Systems, G. V. Adendorff. Trans. South African Inst. Elec. Engrs., vol. 10, part 3, Mar. 1919, pp. 33-43, and (discussion) pp. 43-48, 5 figs. and supp. plate. Rotary condenser treatment is held to be necessary only in such cases where original design of generating plant has not been specified to type of demand it has to meet.

Distribution, Factory. The Electrical Equipment of H. M. Factory, Gretna, A. S. Cross. Electrical Review, vol. 84, no. 2167, June 6, 1919, pp. 652-654, 6 figs. Lighting, performance and distribution. High tension supply fed to eight substations extending about 4½ miles from power house over two overhead systems situated 150 ft. apart. (Concluded).

Electrolysis. Electrolysis and Modern Cable Construction, W. W. Walsh. Assn. Iron & Steel Engrs., Apr. 1919, pp. 7-24 and (discussion) pp. 24-32, 1 fig. General conclusions drawn from study of case in which pipe is considered as running parallel to track, in which case potential between rails and pipe is considered as positive at end farthest from power house, polarity being reversed in region adjacent to power house.

Feeders. Losses in Feeders (Pertes dans les feeders), W. Vuilleumier. Bul. Technique de la Suisse Romande, vol. 45, no. 9, May 3, 1919, pp. 7-8 and 80. Graphs for determining ohmic and induction losses. Percentage of losses is considered as varying inversely with square potential and directly with power.

Grounding. Grounding the Neutral of Generating and Transmission Systems, H. R. Woodrow. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 6, June 1919, pp. 745-749, 4 figs. Admitting his experience has shown that stresses on cables are relieved materially by grounding, writer, however, further believes that it is desirable to limit this grounding current as much as possible, thereby, he says, reducing stresses on system and particularly burning of lead sheath on grounding connections.

Interconnection. Interconnection of California Power Systems, P. M. Downing. Power Plant Eng., vol. 23, no. 13, July 1, 1919, pp. 580-582, 2 figs. Divided into a northern and a southern group of connected lines. Map indicating scheme of connections is presented.

Phase. Three-Phase Four-Wire Distribution, G. E. Wagner. Power Plant Eng., vol. 23, no. 11, June 1, 1919, pp. 507-510, 7 figs. Discussion of possible advantages and disadvantages and suggestions in regard to preventing troubles.

The Electrical Properties of Three-Phase Transmission lines, E. Parry. New Zealand Jl. of Sci. & Technology, vol. 2. no. 2, Mar. 1919, pp. 127-150, 3 figs. Tables applicable to sizes of conductors generally employed for transmission-line work.

Power Transmission Practice. Power Transmission, H. B. Vincent. Jl. Engrs. Club of Philadelphia, vol. 36, no. 175, June 1919, pp. 220-227, 9 figs. General study of problems and obstacles confronting operating man whose function is to provide continuity of service on high-tension power transmission lines. Paper read before Assn. Iron & Steel Elec. Engrs.

Relay Protection. Transmission Line Relay Protection, H. R. Woodrow, D. W. Roper, O. C. Traver and P. MacGahan. Proc. Am. Inst. Elec. Engrs. vol. 38, no. 6, June 1919, pp. 631-662, 19 figs. Summary of replies received from 32 operating companies by Protective Device Committee of Am. Inst. Elec. Engrs., in answer to questionnaire asking for their experience and present practice in regard to relay protection.

Substations. 900 Kw. Substation, Installed in 3-phase, 5,250 Volt, 50 Cycle Network of the Compagnie d'Electricité de Marseille (Poste de 900 kw. installé sur les canalisations triphasées, 5,250 v, 50 p: sec. de la Compagnie d'Electricité de Marseille), A. Racapé. Revue Générale de l'Electricité, vol. 5, no. 21, May 24, 1919, pp. 757-768, 7 figs. General plan and details of installation.

A Novel City Substation, Roy R. Kime, Elec. Eng., vol. 53, no. 6, June 1919, pp. 260-263, 4 figs. By reason of station being located in thickly populated New York district, dimensions of floor plan are only 24 ft. x 100 ft., although building is to contain 12,500 kva. of electrical apparatus.

Switchgear. European High-Voltage Switchgear, W. A. Coates, Elec. Jl., vol. 16, no. 6, June 1919, pp. 243-248, 13 figs. Pointing out particularly difference between British designs and those of Continental Europe. While in Great Britain transmission voltages over 15,000 to 20,000 are rarely needed, on the Continent there are in operation systems working at pressures up to 110,000 volts.

Transient Phenomena. The Effect of Transient Voltages on Dielectrics II. The Effect of Lightning Voltages on Arrester Gaps, Insulators and Bushings on Transmission Lines, F. W. Peek, Jr. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 6, June 1919, pp. 717-744, 17 figs. It is concluded that there is a great difference in the relative lightning spark-over voltages of different gaps as well as in the settings imposed by operating conditions, and it is advised that both of these factors be considered in comparing relative protective values.

Transmission-Line Surveys. The Location of Long-Distance Electric Transmission Lines, G. P. Anderson. New Zealand Jl. of Sci. & Technology, vol. 2, no. 2, Mar. 1919, pp. 95-108, 7 figs. Methods which are said to have been found necessary in field and in office in order to expedite work of surveying and of plotting results.

WIRING

Hotel. Electric Servicee in World's Largest Hotel—II, Elec. World, vol. 73, no. 22, May 31, 1919, pp. 1159-1163, 7 figs. Electric laundry installation; details of wiring on portion of a guest-room floor.

Mines. Wiring at Mines, Jack L. Ball. Coal Age, vol. 15, no. 23, June 5, 1919, pp. 1040-1041, 1 fig. It is suggested that wiring of mine be installed with as much care as in a residence, factory or similar building. This, it is said, will contribute to securing better results and large measure of safety.

Pulling Conductors Into Conduits. Pulling Conductors into Conduits, Terrell Croft. Power, vol. 49, no. 22, June 3, 1919, pp. 846-848, 10 figs. Discusses various matters and offers suggestions in regard to precautions to observe during work.

Standardization. Industrial Maintenance and Rehabilitation Methods, E. E. George. Elec. World, vol. 73, no. 22, May 31, 1919, pp. 1167-1170, 2 figs. Arguments for use of 115 volts direct-current supply instead of 230 volts; savings affected by standardization of methods and materials.

Wire, Insulated. Insulated Conductors in Relation to Cheap Wiring. C. Beaver. Elecn, vol. 82, no. 24, June 13, 1919, pp. 679-680, 2 figs. Describes method of manufacturing twin wire for circular section in which a central strip of vulcanized rubber insulates wires.

VARIA

Electromagnets and Solenoids. The Construction of 120 and 240 Volt Electromagnets and Solenoids, Henry W. Townsend. Power vol. 49, no. 23, June 10, 1919, pp. 888-890, 6 figs. Data are given of construction of a number of 120- and 240-volt electromagnets and solenoids.

Lightning Protection. Protecting Oil Storage Tanks from Lightning. Oliver Lodge. Petroleum World, vol. 16, no. 224, May 1919, pp. 198-199: also in Petroleum Times, vol. 1, no. 19, May 17, 1919, pp. 409-410. Attachment of lightning conductors to tanks not considered advisable. It is held that metal tanks, not over-elevated and not specially earthed, with good joints and free from leaks, are safe from lightning. Report of chief of petroleum executive containing views of various owners of petroleum tank installations.

INDUSTRIAL TECHNOLOGY

Ammonia, Oxidation.—*See Nitric Acid.*

Celluloid. Celluloid in the Industrial Field, John H. Stevens. Raw Material, vol. 1, no. 4, June 1919, pp. 227-232, 7 figs. Showing widely differing characteristics, celluloid is capable of possessing.

Chemical Engineering. Chemical Engineering, J. A. Wilkinson. Jl. Chem., Metallurgical and Min. Soc. of South Africa, vol. 19, no. 9, Mar. 1919, pp. 159-165, and (discussion) pp. 165-168. Points out that days of haphazard production, unaided by scientific investigation are past.

Physical Chemistry and Its Bearing on the Chemical and Allied Industries, James C. Philip Chem. News, vol. 118, nos. 3079 & 3082, Apr. 17 & May 9, 1919, pp. 181-183 & 215-222, 2 figs. Apr. 17: Influence of temperature and pressure on ammonia equilibrum. May 9: Review of prominent cases of industrial catalysis. (Concluded).

Fertilizers. The Setting of Mixtures of Superphosphate and Ammonium Sulphate, F. Scott Fowweather. Chem. Industry, vol. 38, no. 9, May 15, 1919, pp. 110T-112T. Experimental. Concluded that rate of setting of such mixtures is increased by reduction of free acid in them.

Gas. Manufacture of Gas from Wood, Adolphe Molin. Gas Jl., vol. 146, no. 2921 May 6, 1919, pp. 301-302, 3 figs. Experiences at Stockholm Gas Works in distillation of wood. From Journal des Usines à Gaz.

Gears. The Attack of Pots for Glass Melting. Engineering, vol. 107, no. 2788, June 6, 1919, pp. 725-727, 10 figs. Results of experiments conducted at Nat. Physical Laboratory.

Divitrification of Glass, N. L. Bowen. Jl. Am. Ceramic Soc., vol. 2, no. 4, Apr. 1919, pp. 261-278 and (discussion) pp. 278-281, 3 figs. Experiment interpreted as indicating that divitrification of glass is result of its tendency to reach stable crystalline conditions and that it takes place whenever glass is held for sufficient length of time within temperature where its cyrstallizing power is great.

Development of Improved Gold Ruby Glass, H. J. Bellamy. Jl. Am. Ceramic Soc., vol. 2, no.4, Apr. 1919, pp. 313-319 and (discussion) pp. 319-322. No conclusive deductions are made from research undertaken, but it is considered that a stable, reliable gold ruby glass can be econmically produced and that the presence of other colors is not a natural phenomenon of gold ruby glass.

Graphite. Refining Alabama Flake Graphite for Crucible Use. Fred G. Moses Dept. of Interior, Bur. Mines, War Minerals Investigation Ser., no. 8, Dec. 1918, 35 pp., 5 figs. Results obtained in finishing crude graphite concentrate are said to be dependent largely on character of crude flake contained in ores.

Kingsport, Tenn. Kingsport, Tennessee, and Its Chemical Industries—II. Chem. & Metallurgical Eng., vol. 20, no. 12, June 15, 1919, pp. 639-644, 4 figs. Coal-tar dyestuffs and intermediates; tannery and tanning extract plant.

Kingsport, Tennessee, and Its Chemical Industries—I. Chem. & Metallurgical Eng., vol. 20, no. 11, June 1, 1919, pp. 565-570, 6 figs. Technical description of ceramic and cement plants; also historical survey of growth of city.

Nitric Acid. Commercial Oxidation of Ammonia to Nitric Acid. Charles L. Parsons. Jl. of Indus. & Eng. Chemistry, vol. 11, no. 6, June 1919, pp. 541-552, 13 figs. Methods and apparatus which have been used or are being used for oxidation of ammonia to nitric oxide which, absorbed in water, yields nitric acid.

The Evolution of the Oxidation of Ammonia, W. S. Landis. Chem. Engr., vol. 27, no. 5, May 1919, pp. 113-117, 5 figs. Contributions made to process by American chemical engiueers in last year of war. (Concluded).

Nitrogen Fixation. How the Nitrogen Problem Has Been Solved, Henry Jermain Maude Creighton. Jl. Franklin Inst., vol. 187, no. 6, June 1919, pp. 705-735, 4 figs. Outline of principles underlying oxidation of ammonia by air in the presence of catalyst. A bibliography of literature on and relating to nitrogen fixation and oxidation of ammonia. Sixth article.

Nitroglycerin. The Behavior of Nitroglycerin When Heated, Walter O. Snelling and C. G. Storm. Dept. of Interior, Bur. of Mines, technical paper 12, 1912, 14 pp., 3 figs. Experiments interpreted as establishing that nitroglycerin begins to decompose at temperatures of 50 or 60 deg. cent., decomposition being accompanied by evolution of heat.

Nitrous Acid. The Decomposition of Nitrous Acid, Joseph Knox and Douglas M. Reid. Chem. Industry, vol. 38, no. 9, May 15, 1919, pp. 105T-108T, 4 figs. Investigation undertaken to determine influence of surface, shaking, excess of air, temperature and other factors on decomposition.

Peat. Distillation of Peat (La distillation de la tourbe). Journal des Usines à Gaz, vol. 43, no. 11, June 5, 1919, pp. 172-173. Description of installation.

Platinum Substitutes. Comparative Tests of Palau and Rhotanium Ware as Substitutes for Platinum Laboratory Utensils, L. J. Gurevich and E. Wichers. Jl. of Indus. & Eng. Chemistry, vol. 11, no. 6, June 1919, pp. 570-573. It is concluded that rhotanium A ware is superior to platinum ware, both of high (2.4 per cedt) and low (0.6 per cent) iridium content in respect to its resistance to loss on heating.

Potash. The Potash Situation, A. W. Stockett. Dept. of Interior, Bur. Mines, War Minerals Investigation Ser., no. 2, Oct. 1918, 13 pp. Summarizes conditions as fellows: Normal requirements of country 250,000 tons of K^2O per year; total production of 1917—32573 tons. Promising sources of permanent supply sufficient for future requirements, brines of Searles Lake and dust from blast furnaces and cement kilns.

Rubber. Effect of Certain Accelerators Upon the Properties of Vulcanized Rubber, G. D. Kratz and A. H. Flower. India-Rubber Jl., vol. 57, nos. 19 & 20, May 10 & 17, 1919, pp. 1-2 and 1-5, 5 figs. Experimental data on activity of certain organic and inorganic accelarators. It is found that magnesia in small amount is less active than certain organic accelarators and does not impart to mixtures the physical improvement characteristic of the latter. (Concluded).

The Manufacture of Synthetic Rubber, H. Duisberg. Chem. Eng., vol. 27, no. 5, May 1919, pp. 111-112. Compound used at Leverkusen works is said to have been dimethlylbutadiene. Paper read before German Busen Soc.

Sugar. The Loss of Moisture from Sugar Samples Under Different Methods of Preservation, C. A. Browne and G. H. Hardin. Sugar, vol. 21, no. 6, June 1919, pp. 294-295. Manner of testing and results obtained at N. Y. Sugar Trade Laboratory. Paper read before Division of Agriculture and Food Chemistry, Am. Chem. Soc.

Sulphuric Acid. The Effects of Cooling Burner Gases on the Catalytic Action of Platinum in Sulphuric Acid Contact Plants, S. T. T. Geary. Jl. Soc. Chem. Indus., vol. 38, no. 10, May 31, 1919, pp. 133T-136T, 1 fig. Claims that an average conversion of 98 per cent is obtained when reaction in platinum chamber is allowed to run its course with no attempt at cooling.

Tar Distillation. The Sulzer Process of Tar Distillation. Gas Jl., vol. 146, no. 2923, May 20, 1919, pp. 433-434, 6 figs. Tar passes constantly through apparatus in successive portions, various constituents of which are removed until final residue of pitch is obtained. From Journal des Usines à Gaz.

Tellurium. A Contribution to the Chemistry of Tellurium Sulphide, Aaron M. Hagaman. Chem. News, vol. 118, no. 3082, May 9, 1919, pp. 217-219, 1 fig. Concludes from investigation that introduction of hydrogen sulphide into an aqueous tetravelent tellurium solution at room temperatures or below causes immediate production of a red-brown precipitate represented by formula $Te\ S_2$. (Concluded).

Zinc Oxide. The Manufacture of Zinc Oxide. Chem. Eng. & Min. Rev., vol. 11, no. 127, Apr. 5, 1919, pp. 190-191, 1 fig. Plant installed by Broken Hill Associated Smelters Pty. Ltd., Port Pirie.

MARINE ENGINEERING

AUXILIARY MACHINERY

Electrical Auxiliaries. The Electrical Division Aboard Ship, Alex M. Charlton, U. S. Naval Inst. Proc., vol. 45, no. 196, June 1919, pp. 987-1008, 2 figs. Organization, routine and tests developed on U. S. S. "Texas."

Electrically Driven Ships' Auxiliaries. Engineer, vol. 127, no. 3307, May 16, 1919, pp. 478-480, 16 figs. Scott-Bentley load-discriminating device for application to deck winch.

Rudders. The Kitchen Reversing Rudder. Engineering, vol. 107, no. 2785, May 16, 1919, pp. 631-634, 22 figs. Consists of two curved deflectors forming parts of a circular cylinder and partly enclosing the propeller.

SHIPS

American Shipping. The Future of American Shipping, Edwin N. Hurley. Universal Engr., vol. 29, no. 4, Apr. 1919, pp. 21-32, 10 figs. Advises not to concentrate too much upon strength of competition with other nations.

Cargo Vessels. *See Freighters.*

Concrete Ships. Design and Construction of Navy Concrete Oil Barges, R. M. Burkhalter. Eng. News-Rec., vol. 82, no. 22, May 29, 1919, pp. 1056-1058, 5 figs. Boats have oil holds protected by air compartments and also may carry deck loads. Concrete poured from trestle at rear of boats.

First British-Built Ferro-Concrete Steamship S.S. "Armistice." Steamship, vol. 30, no. 360, June 1919, pp. 275-277, 4 figs. Dead weight capacity 1150 tons. Built on Mouchel-Hennebique system under survey of Lloyd's Registry.

German Views on the Economics of Ferro-Concrete Ships, Carl Commentz. Shipbuilding and Shipping Rec., vol. 13, no. 20, May 15, 1919, pp. 635-636. Table comparing several sizes of steel and reinforced-concrete vessels for both short and long voyages taking pre-war prices throughout as basis of comparison. From Hansa.

Form Work and Timbering Details in Concrete Barge Construction. Concrete, vol. 14, no. 6, June 1919, pp. 222-225, 10 figs. Boats have overall length of 112 ft., 36 ft. beam and draft of 9 ft.

Electric Propulsion. *See New Mexico.*

FREIGHTERS. Speed, Dimensions and Form of Cargo Vessels. Shipbuilding & Shipping Rec., vol. 13, no. 21, May 22, 1919, pp. 665-668, 2 figs. Theoretical discussion of best speed, which is defined as the one that will give the largest profit per pound of capital invested, per day invested.

Economical Form and Speed. Shipbuilding & Shipping Rec., vol. 13, no. 23, June 5, 1919, pp. 725-727. Comparison of cost of operating five typical merchant ships.

Cargo Steamers with Rateau Geared Turbines. Shipbuilder, vol. 20, no. 106, June 1919, pp. 327-350, 31 figs. Turbines develop 2500 shaft hp. under ordinary service conditions at 3000 r.p.m. Propeller speed, 70 r.p.m.; total ratio of reduction in speed, 43 to 1.

LEPARMENTIER UNSINKABLE SHIPS. Leparmentier System of Building Ships Which Cannot Sink or Capsize (Les Navires inchavriables et insubmersibles Leparmentier), Raymond Lestonnat. Génie Civil, vol. 74, no. 23, June 7, 1919, pp. 453-456, 5 figs. Outlines procedure followed at New Orleans.

MODELS. Some Experiments on Full Cargo Ship Models, James Semple. Engineering, vol. 107, no. 2788, June 6, 1919, pp. 751-754, 9 figs. To determine effect on performances (1) of fullness and (2) of longitudinal distribution of displacement. Wake and thrust deduction investigations were also carried out on a number of models and in addition some comparisons are drawn between results obtained at various establishments.

MOTOR SHIPS. The Motor Ship "Santa Margherita." Engineering, vol. 107, no. 2787, May 30, 1919, pp. 691-693 and 706, 8 figs. partly on supp. plates. Equipped with Diesel engines. Dimensions selected by builders to meet stipulated requirements of British Admiralty in regard to stability, draft and trim, are: length, 440 ft.; breadth, molded, 54 ft.; depth molded (upper deck), 36 ft. 6 in.

Present Position of the Diesel Engine as Applied to Marine Service, Thomas Orchard Lisle. Jl. Soc. Automotive Engrs., vol. 4, no. 6, June 1919, pp. 477-481, 10 figs. Holding that less than 150 hp. per 1000 ton is not of much use as a propelling means, American type of wooden vessel developed during the war is said to have proven unsuccessful because, in addition to other circumstances which are also considered as drawbacks, auxiliary power was insufficient to drive them at a profitable speed without the sails and a favorable breeze and sometimes even with all these.

Motor-Driven Oil-Tank Vessel "Santa Margherita." Shipbuilding & Shipping Rec., vol. 13, no. 23 & 24, June 5 & 12, 1919, pp. 719-721 & 748-750-753, 19 figs. partly on supplement plate. Principal dimensions are: length, 440 ft.; breadth, 54 ft.; depth, 36 fit. 6 in.; draft, normal, 25 ft. 9 in., and maximum, 28 ft. ½ in.; deadweight capacity, 9916 tons. Power supplied by two heavy-oil engines, each of 1250 b.h.p. at 130 r.p.m.

NEW MEXICO. General Characteristics of Electric Ship Propulsion Equipments, E. F. W. Alexanderson. Gen. Elec. Rev., vol. 22, no. 4, Apr. 1919, pp. 221-232, 8 figs. It is said that simplicity and reliability were aimed at for U. S.S. "New Mexico" by elimination of liquid rheostats, and development of new type of squirrel-cage induction motor.

Electric Propulsion for the U. S. S. New Mexico—I, C. S. Raymond, Sci. Am. Suppl., vol. 87, no. 2266, June 7, 1919, pp. 356-358, 5 figs. One feature that differs from land practice is omission of turbine and generator base castings. Turbine casing, generator stator frame and bearing standards are bolted directly to stiff structural-steel foundation which is securely tied in with ship's structure. (To be concluded.)

The Turbines of the U. S. S. New Mexico, E. O. Hunt. Gen. Elec. vol. 22, no. 4, Apr. 1919, pp. 233-243, 10 figs. While resembling in many particulars General Electric Co. types built for lamp operation, they possess, it is said, ability to operate over wide range of speed under control of special design governing arrangement.

The New Mexico's Generators, C. S. Raymond. Gen. Elec. Rev., vol. 22, no. 4, Apr. 1919, pp. 244-254, 23 figs. Special feature is said to be arrangement of stator winding in two coils per phase, connected in parallel for low voltage and in "square" for high voltage operation.

U. S. S. New Mexico, Description and Official Trials, S. M. Robinson and Henderson B. Gregory. Jl. Am. Soc. Naval Engrs., vol. 31, no. 2, May 1919 pp. 345-404, 28 figs. partly on supp. plates. Trials referred to were conducted after ship had been out of dry dock about seven weeks, which is said to have increased by 4000 the shaft hp. necessary to make guaranteed speed of 21 knots.

The Main Control Equipment of the New Mexico, C. T. Hentchel. Gen. Elec. Rev., vol. 22, no. 4, Apr. 1919, pp. 261-271, 16 figs. Construction and interrelationship of units of control apparatus.

Controlling the Propulsion of the New Mexico, H. Franklin Harvey. Gen. Elec. Rev., vol. 22, no. 4, Apr. 1919, pp. 272-292, 10 figs. Refers specially to features permitting inter-connection for obtaining direct-current supply at switchboard for turbine-generator excitation, this interconnection providing for contingencies in case of damage to equipment.

A Review of the Propelling Equipment and Operation of the New Mexico, Eskil Berg. Gen. Elec. Rev., vol. 22, no. 4, Apr. 1919, pp. 293-298, 2 figs. Circulating air, hot-well, and lubricating pumps, ventilating fans and other auxiliaries.

ORE CARRIERS. Geared-Turbine-Engined Ore and Coal Carrier "Conde de Zubiria." Shipbuilding & Shipping Rec., vol. 13, no. 21, May 22, 1919, pp. 659-660, 5 figs. on supp. plate. Principal dimensions are : Length, 314 ft.; breadth, 47.9 ft.; depth, 24.3 ft.; gross tonnage, 3278 tons and net tonnage, 2683 tons.

PATROL BOATS. The "P" Boats. Engineer, vol. 127, no. 3308, May 23, 1919, pp. 512-513, 2 figs. Patrol boats fitted with 4000-hp. Parsons geared turbines.

REMOVABLE PROPELLING MACHINERY. Removable Propelling Machinery for Ships (Mécanismes amovibles pour la propulsion des navires), M. Tayon. Génie Civil, vol. 74, no. 16, Apr. 19, 1919, pp. 308-312, 9 figs. Points out that the propelling machinery of a ship is effective only during actual navigation. More economical navigation is, therefore, obtained. It is concluded, by a system which will permit adaptation of machinery set to various hulls.

TONNAGE. The Tonnage of Modern Steamships, A. T. Wall. Steamship, vol. 30, no. 360, June 1919, pp. 278-280. Effect of recent legislation and modern machinery on tonnage measurement. Paper read before Instn. Naval Architects.

TERMINALS

PORT MANAGEMENT. Some Problems of Port Management, Hamilton Higday. Freight Handling & Terminal Eng., vol. 5, no. 5, May 1919, pp. 186-191. Deals particularly with labor problem, development of industrial areas, and levying of port charges.

PERU. The Ports of Peru, Grosvenor M. Jones. Freight Handling & Terminal Eng., vol. 5, no. 5, May 1919, pp. 170-174. Lobitos, Talara, Callao, Paita, Eten, Salaverry and Chimbote. Description is confined to extent of foreign trade at each.

YARDS

AMERICAN SHIPBUILDING. Shipbuilding Development in the United States and Canada, W. R. Gray and Edward F. Clarke. Trans. Northeast Coast Instn. of Engrs. & Shipbuilders, vol. 35, no. 4, June 1919, pp. 151-162 and (discussion) pp. 162-178. Notes gathered on writer's visit to U. S. A.

American Shipbuilding Costs. Shipbuilding & Shipping Rec., vol. 13, no. 20, May 15, 1919, pp. 630-631 & 633-634, 6 figs. Swedish ship of 440 ft. in length with d.w. tonnage of 9500. Engines are 6-cyl., 4-stroke single-action Diesel motors.

CONCRETE SHIPS. Concrete Shipbuilding at Barrow-in-Furness, W. Noble Twelvertees. Engineering, vol. 107, no. 7285, May 16, 1919, pp. 624-627, 14 figs., partly on four separate plates. Site is adapted for building vessels up to 250 ft. in length.

FORD METHODS. Ford Methods in Ship Manufacture—VI, Fred E. Rogers. Indus. Management, vol. 57, no. 6, June 1919, pp. 456-464, 14 figs. Details of launching scheme and of achievement claimed to have been made in erecting Eagle No. 59 in ten days.

REDESIGNING. Commerce Absorbs Transports Ships. Mar. Rev., vol. 49, no. 7, July 1919, pp. 326-329, 9 figs. Redesigning of thirteen vessels planned for war emergency to carry freight and passengers.

STANDARDIZATION OF SHIP MATERIAL. Standardizes Steel Ship Materials, Fred T. Llewellyn. Iron Trade Rev., vol. 64, no. 24, June 12, 1919, pp. 1549-1551. Remarks on standards adopted by Emergency Fleet Corporation which were modeled after British standards. Paper read before Am. Iron & Steel Inst.

WISCONSIN YARDS. Wisconsin Shipbuilding, Richard S. McCaffery. Wisconsin Engr., vol. 23, no. 8, May 1919, pp. 275-280, 3 figs. Importance of ocean tonnage delivered from Wisconsin shipyards emphasized by remarks that if vessels built at these shipyards during last year were placed in line, the line would be two miles long.

SALVAGE

How the "Lake Weston" was Salved. Shipbuilding & Shipping Rec., vol. 13, no. 24, June 12, 1919, pp. 747-749. Vessel ran ashore in Bristol Channel.

MECHANICAL ENGINEERING

AIR MACHINERY

AIR CONDITIONING. Refrigeration in Relation to Air Conditioning in War Industries, J. I. Lyle. Am. Soc. Refrig. Engrs., vol. 5, no. 5, March 1919, pp. 376-382, 4 figs. Illustrating uses of dehumidifier.

AIR VALVES, COMPRESSOR. Magnetic Air Valve. Iron & Coal Trades Rev., vol. 98, no. 2673, May 23, 1919, p. 702, 2 figs. For unloading automatically a motor-driven air compressor before starting and stopping driving motor. Valve is a combination of electromagnet of contractor type, a two-way valve and a small switch controlled by a dashpot.

Automatic Valves for Motor-Driven Air Compressors. Elecn., vol. 82, no. 24, June 13, 1919, pp. 676-677, 2 figs. Valve patented by British Thomson-Houston Co. is said to insure that air compressor is unloaded before current is switched on to motor as well as throughout starting period.

AIR WASHERS. Air Washer Experiences, Samuel R. Lewis and E. V. Hill. Heating & Ventilating Mag., vol. 16, no. 6, June 1919, pp. 25-31, 4 figs. Suggests scheme with two sets of sprays arranged so that they wet throughly entire surface of front haffles.

AIR WEIGHT AND VOLUME MEASUREMENTS. Air Weight and Volume Measurement—II, Don T. Hastings. Automotive Industries, vol. 40, no. 25, June 19, 1919, pp. 1399-1402, 1 fig. Theory of venturi meter as applied to liquids and also to gases.

COMPRESSORS. Some Recent Improvements in Air Compressor Design. Engineer, vol. 127, no. 3309, May 30, 1919, pp. 538-540, 7 figs. Rotary compressor of crescent type in which blades instead of being forced against bore of stationary casing press against interior of liner which revolves on ball bearings concentric with casing.

FLOW IN PIPES, COMPRESSED AIR. Flow of Compressed Air in Pipes, Johan Sarvaas. Proc. Australasian Inst., Min. Engrs., no. 31, Sept. 30, 1918, pp. 121-130, 1 fig. Tables and equation offered as serviceable in simplifying computations involved in application of Rankine's and D'Arcy's formulæ.

PUMP, MARINE. The Marine Air Pump as a Power Factor, Harold C. Walker. Mar Engr. & Naval Architect, vol. 4, no. 505, June 1919, pp. 270-276, 11 figs. Also Mar. Eng., vol. 9, no. 6, June 1919, pp. 205-208, 12 figs. Discusses wet, Edwards and rotary types and their comparative. Paper read before Inst. of Marine Engrs.

RECEIVERS. The Air Receiver, Frank Richards. Power Plant Engr., vol. 23, no. 12, June 15, 1919, pp. 554-558, 2 figs. Suggestions in regard to determining capacity and avoiding explosions.

USES. Air Uses at Newburgh Shipyards Plant, Francis Judson Tietsort. Compressed Air Mag., vol. 24, no. 6, June 1919, pp. 9155-9160, 10 figs. Plant builds 9000-ton ships.

CORROSION

COPPER AND CORROSION OF STEEL. The Influence of Very Low Percentages of Copper in Retarding the Corrosion of Steel, D. M. Buck. Am. Soc. Testing Materials University of Penna., 22nd annual meeting, June 24, 1919, advance copy, 14 pp., 10 figs. Concluded from tests that very low amounts of copper in steel materially lower corrosion rate.

IRON ALLOYS. The Relative Corrosion of Cast Iron, Wrought Iron and Steel Pipe in House Drainage Systems, F. N. Speller. Plumbers' Trade Jl., vol. 66, no. 12, June 15, 1919, pp. 752 and 754-755, 2 figs. Discussion of paper by Wm. Paul Gerhard presented at Am. Soc. Mech. Engrs. meeting, Dec. 1918.

RUSTPROOFING. Rustproofing Cast-iron Parts. Machy. (N. T.), vol. 25, no. 10, June 1919, pp. 919-921, 5 figs. Process is based on fact that film of magnetic iron oxide is formed on surface of iron castings when heated to temperature of 700 deg. cent. or over in oxidizing atmosphere.

Metallic Coatings for Rust-Proofing Iron and Steel—III. Bibliograph. Henry S. Rawdon, M. A. Grossman and A. N. Finn. Chem. . & Metallurgical Eng., vol. 20, no. 11, June 1, 1919, pp. 591-592. Divided into following sections: Nature of corrosion, miscrostructure, methods of coating, black finishes and similar coatings, "pickling" and its effects, and methods of testing coatings.

Calorizing Process for Protection of Metal from Oxidation at High Temperatures, W. E. Ruder. Jl. Am. Steel Treaters Soc., vol. 1, no. 5, Feb. 1919, pp. 160-170, 14 figs. Notes on various processes and account of tests of report and carbonizing and annealing boxes.

TESTS. Corrosion Tests (Essai de corrosion), H. LeChatelier and B. Bogitch. Revue de Métallurgie, vol. 16, no. 2, Mar-Apr. 1919, pp. 129-139, 16 figs. Chemical heterogeneity of reheated or slowly cooled steels is considered as being due entirely to oxygen.

FORGING

MARINE FORGINGS. Keeps Pace With War Requirements. Iron Trade Rev., vol. 64, no. 25, June 19, 1919, pp. 1616-1617, 3 figs. Describes Camden Forge Co's plant which formerly manufactured railroad forgings and is now turning out marine forgings.

SHELLS. Forgings and Inspecting Ordnance Shells, Stanley A. Richardson. Sibley Jl. Eng., vol. 33, no. 4, May 1919, pp. 40-43 & 45. Particular reference is made to successive steps in inspecting, gaging, checking and testing.

STAMPS. Drop-Stamping. Drop-Forgings, Etc.—III, Joseph Horner. Mech. World, vol. 65, no. 1691, May 30, 1919, p. 259, 6 figs. Illustrating stamps where top tools or dies are not necessary (Continuation of serial.)

FOUNDRIES

ALUMINUM CASTINGS. Casting Aluminum (Das Giessen von Aluminum), H. Stoesser. Metall, no. 5, Mar. 10, 1919, pp. 61-62. Instructions as to kind of sand to be used, construction of molds, and type of crucible.

BRASS CASTINGS, POROSITY OF. Some Principles Involved in Melting Metals—VI, Charles Vickers. Brass World, vol. 15, no. 6, June 1919, pp. 175-176. Cases of porosity in brass castings due to shrinkage of individual crystals made possible by their having grown abnormally large. (To be continued.)

BRASS FOUNDRY. Modern Works of The Mueller Co., Sarnia, Ontario. Can. Foundryman, vol. 10, no. 6, June 1919, pp. 139-141, 6 figs. Production of brass castings.

CUPOLAS. A Cupola With Novel and Interesting Features, J. F. Mullan. Can. Foundryman, vol. 10, no. 6, June 1919, p. 152, 1 fig. Wind jacket is placed inside of shell instead of outside.

ELECTRIC STEEL. Electric Steel Castings made in Chicago Shop. Foundry, vol. 47, no. 324, June 1, 1919, pp. 352-355, 8 figs. Battery of three electric furnaces in use at foundry of Electric Steel Co. at Chicago. Two furnaces are of Schneider type and one of Pittsburgh type.

ENGINE CYLINDERS. Patterns and Moulds for Engine Cylinder Castings—II. Joseph Horner. Foundry Trade Jl., vol. 21, no. 208, Apr. 1919, pp. 215-223, 22 figs. Discusses various practices in process of molding. (Continued.)

ENGLAND. Progress in Metal Casting in England, W. R. Barclay. Metal Indus., vol. 17, no. 6, June 1919, pp. 266-268, 6 figs. Comparison of technique of casting process as carried out by steel and metal casters.

FEEDER-HEAD METHOD. A "Feeder-head" Method in Non-ferrous Ingot Casting, W. R. Barclay. Metal Industry, vol. 14, no. 18, May 2, 1919, pp. 361-364, 6 figs. Draws comparison between general methods adopted in crucible steel ingot casting and those followed in crucible non-ferrous ingot casting.

JARRING MACHINE. The Manufacture of Semi-steel Shells, E. A. Suverkrop. Am. Mach., vol. 50, no. 22, May 29, 1919, pp. 1041-1043, 9 figs. Shockless jarring machine adapted for molding shells.

MOLDING. Steel Castings for Our First Line of Defense, Walter S. Doxsey. Foundry, vol. 47, no. 9, June 15, 1919, pp. 367-372, 14 figs. Additions to foundry of naval gun factory with reference to molding methods and layout of shop.

SAND. Production of Albany Molding Sand. Iron Age, vol. 103, no. 23, June 5, 1919, pp. 1499-1501, 4 figs. Analysis of origin and composition. States that standard specifications based on grain size are difficult to draw up.

SHIP PARTS. Making Castings Used in Ship Construction—III, IV, Ben Shaw and James Edgar. Foundry, vol. 47, no. 8 & 9, June 1 & 15, 1919. pp. 336-339 & 388-392, 27 figs. Building rudder yoke pattern. Suggestions in regard to exercising care to obviate subsequent foundry difficulties. Methods of molding and casting rudder yokes as pursued in English steel foundries.

WASTE. Modern Methods Applied to the Foundry—Ii, W. R. Dean. Metal Industry, vol. 14, no. 17, Apr. 25, 1919, pp. 349-350, 5 figs. Recommends classification of wastes and their causes and suggests methods for establishing a system of classification.

FUELS AND FIRING

ASH, FUSIBILITY. Fusibility of Ash from Pennsylvania Coals, W. A. Selvig and A. C. Fieldner. Coal Age, vol. 15, no. 24, June 12, 1919, pp. 1086-1089. Table giving results obtained. Samples tested are said to have been gathered in accordance with method adopted by Bureau of Mines.

COAL. Utilization of Fuel (Zur Frage der zukünftigen Brennstoff-Ausnutzung), De Grahl. Annalen für Gewerbe und Bauwesen, vol. 84, no. 1, Jan. 1, 1919, pp. 1-8, 7 figs. Characteristics of gasification of bituminous coal at high and low temperatures.

The Gasification of Coal and the Rational Utilization of Fuels (Kohlenvergasung und rationelle Ausnutzung der Brennstoffe), M. Dolch. Montanistische Rundschau, vol. 11, nos. 3, 4, 5 & 6. Feb. 1 & 16, Mar. 1 & 16, 1919, pp. 61-64, 93-97, 125-129, and 162-166. From the economic point of view. Importance and future of by-products. (To be continued.)

COAL, PULVERIZED. Use of Pulverized California Coal, Chas. H. Delaney. Nat. Engr., vol. 23, no. 6, June 1919, pp. 278-279. Discussion of its economical employment as substitute for fuel oil from standpoint of initial cost and comparative operating expense. Paper read before Nat. Elec. Light Assn.

Pulverized Coal Systems in America, Leonard C. Harvey. Elecn., vol. 82, no. 22, May 30, 1919, pp. 616-619, 3 figs. Also in Iron & Coal Trades Rev., vol. 98, no. 2673, May 23, 1919, pp. 704-705. Analysis of costs and efficiency secured leads writer to conclude that advantages of burning coal in pulverized form have been definitely proved and that heat values of coal can be utilized to a far higher degree by this means than by any other process.

The Use of Pulverized Coal, L. C. Harvey. Eng. & Indus. Management, vol. 1, no. 14, May 15, 1919, pp. 423-426, 3 figs. Quigley semi-automatic bin-filling system. It is claimed that by this system coal dust can be readily conveyed to ships in harbor or at sea.

COAL SELECTION. The Economical Use of Coal, T. J. Nelson. Domestic Eng. & Estate Engr., vol. 39, no. 5. May 1919, pp. 62-65. Price delivered at works, suitability to furnaces installed, calorific value and amount of ash suggested as factors governing choice of coal to be used when it has to be brought some distance by rail to works.

COAL WASTE. Utilization of Coal Waste (L'Utilisation des déchets de Houille). L'Echo des Mines et de la Métallurgie, vol. 47, no. 2626, May 18, 1919, pp. 298-300. A committee of the Société de l'Industrie minérale report that their experiments have demonstrated that coal having 40 per cent ash and 23 per cent volatile matter yields tar in greater quantity and of better quality than the kind generally obtained in gas works.

Waste Due to Excessive Ash or Non. Combustible in Coal, W. A. Shoudy. Stevens Indicator, vol. 36, no. 1, Jan. 1919, pp. 11-17, 4 figs. Reduction in heating value due to presence of ash schematically illustrated. Report prepared for Eng. Committee of National Research Council.

Utilizing Mine Waste and Inferior Fuels, F. Blache. Colliery Guardian, vol. 117, no. 3047, May 23, 1919, pp. 1225-1226, 2 figs. Plant of Société de Montrambert comprises set of two gas producers of cylindrical section and about 10 ft. in diameter, with automatic charging and distributing mechanism to spread fuel evenly over entire surface.

COLLOIDAL FUEL. Possibilities of Colloidal Fuel. Power Plant Eng., vol. 23, no. 13, July 1, 1919, pp. 583-585, 2 figs. Methods of preparation and results of boiler tests.

Colloidal Fuel—A Chemist's Dream Come True, Robert G. Skerrett. Rudder, vol. 35, no. 6, June 1919, pp. 271-275, 12 figs. Examples of application of mixtures composed of powdered coal, liquid fuel and "fixateur," and account of uses of this fuel for naval operations.

FUEL CONSERVATION. Electricity vs. Gas in Regard to Coal Conservation, Hugh M. Goody. Elecn., vol. 82, no. 21, May 23, 1919, pp. 595-596. Examines figures on which Sir Dugald Clerk based his conclusion that "There is no case for electricity for the production and distribution of heat energy; there is a case in strong competition with gas for illumination; and as against the average reciprocating steam engine of the country, the advent of the steam turbine of high efficiency shows a distinct advantage."

GASOLINE. Motor Gasoline Properties. Laboratory Methods of Testing, and Practical Specifications, E. W. Dean. Dept. Interior Bur. Mines, Technical paper 214. Petroleum Technology, 52, Feb. 1919, 33 pp., 2 figs. Based on properties which are considered desirable by Bureau. These are absence of too large a percentage of highly volatile products or of heavy or non-volatile constituents, freedom from substances that attack metal either before or after combustion or which leave residue that collects in motor.

HAND FIRING. Standard Practice of Hand Firing, Robert June. Elec. Rev., vol. 74, no. 23, June 7, 1919, pp. 937-939, 3 figs. Of the two methods of hand firing—spreading method and coking method—writer believes that modern practice leans more and more to spreading method, because he says, of its higher efficiency higher CO_2, lower flue gas and more uniform steam generation.

OIL. Oil Gains Importance as Ship Fuel, V. G. Iden. Mar. Rev., vol. 49, no. 7, July 1919, pp. 321-324, 5 figs. What the Government did to standardize oil burning on merchant ships.

PEAT. Peat, Oil and Gas Fuel, B. J. Forrest. Jl. Eng. Inst. Can., vol. 2, no. 6, June, 1919, pp. 439-445, 5 figs. Writer's opinion is that industrialization of peat could be most efficiently brought about by gasifying in gas producers, because, he says, this procedure would render feasible the recovery of several valuable by-products.

The production of Peat Fuel, Ernest V. Moore. Jl. Eng. Inst. Can., vol. 2, no. 6, June 1919, pp. 435-438. General properties, mode of occurrence and present utilization of peat found in vicinity of Montreal.

The Future of Peat as a Fuel—II, J. B. C. Kershaw. Coal Age, vol. 15, no. 21, May 22, 1919, pp. 946-950, 7 figs. Gasification and powdering are believed to be routes of improvement along which future progress in peat utilization may be expected.

STOKERS. Fuel-Burning Equipment of Modern Power Stations, Joseph G. Worker. Power House, vol. 12, no. 7, May 20, 1919, pp. 187-191, 15 figs. Data relative to installations where inclined multiple retort has been completed. With performance curves of a six-retort stoker and a 558-hp. boiler.

Economical Fuel Burning Equipment, J. G. Worker. Blast Furnace & Steel Plant, vol. 7, no. 6, June 1919, pp. 227-280, 8 figs. Steam-cylinder mechanism for operation of forward and rear dumping grates of multiple-retort inclined underfeed stokers.

Surface Combustion. Surface Combustion (La Combustion de surface), M. Desmarets. Revue Générale des Sciences, vol. 30, no. 9, May 13, 1919, pp. 274-278, 5 figs. Historical account of researches and industrial applications. Geological characteristics of deposits and notes on manner of instituting their research.

Tar Oil. Tar Oil as Fuel (Teeröl als Brennstoff). Zeitschrift des Bayerischen Revisions-Vereins, vol. 23, nos. 1 & 3, Jan. 15 and Feb. 15, 1919, pp. 1-2 and 17-19. Evaporation tests.

FURNACES

Grates. Minimum Distance between Grates and Lower Part of Arch Tubes, L. M. Stewart. Ry. Jl., vol. 25, no. 6, June 1919, pp. 19-22. As depending upon grade of coal being used and whether or not firemen have been taught to shake grates and keep fire worked down. Paper before Master Boiler Makers' Assn.

Heat Treating. Heating Furnaces and Annealing Furnaces—VI, W. Trinks. Blast Furnace & Steel Plant, vol. 7, no. 6, June 1919, pp. 294-297, 7 figs. Discusses means by which fuel consumption per unit weight of steel (heated or annealed) can be reduced.

GAGES

Gage Making. Examples of Gauge Making. A. G. Robson. Engineer, vol. 127, no. 3308, May 23, 1919, pp. 499-501, 33 figs. Examples chosen are of straightforward kind. Modus operandi of gauge-maker. rather than extent of calculations required, is indicated.

Hoke Gages. Government Steel Plant, S. W. Stratton. Blast Furnace & Steel Plant, vol. 7, no. 6, June 1919, pp. 268-270, 4 figs. Research work done by Bur of Standards in connection with manufacture of Hoke precision gages.

Plate Gauges. Master and Working Plate Gauges, R. Worthy. Machy. (Lond.), vol. 14, no. 345, May 15, 1919, pp. 185-193, 40 figs. Laying out, testing, hardening and lapping.

GAS ENGINEERING

Distribution Pressures. Distribution Pressures, S. C. Singer. Gas Rec., vol. 15. no. 10, May 28, 1919, pp. 343-344, 1 fig. Experience of rapid growing city. Schematic diagram or distribution system is presented.

Joints, Pipe. Wherein a Joint in the Outlet Pipe from a 2,000,000 Cu. Ft. Holder 18 Ft. from Tank Bottom and a Diver Cleans Out Bottom with Holder Full of Gas, A. H. Harris. Am. Gas Eng. Jl., vol. 110, no. 25, June 21, 1919, pp. 525-536, 7 figs. Leaky joint let in enough ground water to interfere with working of seal and cleaning was necessitated by naphthalene accumulation that tilted lifts to the extent of distorting side-guide rubber shafts.

Natural Gas. Displacing Natural Gas with Manufactured Gas, Kay C. Krick. Gas Age, vol. 43, no. 11, June 2, 1919, pp. 583-585. Anticipates failure of natural gas supply. Paper read before Natural Gas Assn.
Manufactured Gas to Supplement Natural Gas, Kay C. Krick. Gas Age, vol. 43, no. 11, June 2, 1919, pp. 567-568. Advises greater conservation through increased price. Address delivered before Natural Gas Assn.

Retorts. Steaming Retorts, H. J. Toogood, Gas Rec., vol. 15, no. 11, June 11, 1919, pp. 377-378, 2 figs. Proposes connecting retorts in different stages of carbonization to work in series.
Results from Vertical Retorts at Meriden. Gas Age, vol. 43, no. 12, June 16, 1919, pp. 633-634, 4 figs. In regard to labor required.

Standards. Gas Standards. Gas Jl., vol. 146, no. 2920. Apr. 29, 1919, pp. 238-240. Also Gas Age, vol. 43, no. 11, June 2, 1919, pp. 569-572, and Gas World, vol. 70, no. 1814, Apr. 26, 1919, pp. 312-314. Recommendations of Fuel Research Board as to "most suitable composition and quality of gas and the minimum pressure at which it should be generally supplied, having regard to the desirability of economy in the use of coal, the adequate recovery of by-products, and the purposes for which gas is now used."

Water Gas. Water-Gas Plant at Colchester, W. W. Townsend. Gas Jl., vol. 146, no. 2921, May 6, 1919, pp. 296-299 and (discussion), pp. 299-300, a figs. Reconstruction of plant effected by converting two sets, each of capacity of 300,000 cu. ft. per day, to capacity of 500,000 cu. ft. each. Paper read before Eastern Counties Gas Managers' Assn.

HANDLING OF MATERIALS

Ash. *See Coal and Ash.*

Coal and Ash. New Coal Handling Plants for Philadelphia Water Works, Harrison R. Cady. Eng. News-Rec., vol. 82, no. 23, June 5, 1919, pp. 1095-1097, 3 figs. General and detailed design for three systems supplying total of 16 boilers with total boiler capacity of 7400 hp.
Handling Coal and Ashes at the Pusey & Jones Power Plant, Henry J. Edsall. Power Plant Eng., vol. 23, no. 11, June 1, 1919, pp. 483-487, 5 figs. Details of system employing bucket conveyor.

Coal and Ore. The Coal Shortage and Handling by Gravity, George Fred. Zimmer. Eng. & Indus. Management, vol. 1, no. 13, May 8, 1919, pp. 413-416, 3 figs. Gravity-driven band conveyor for loading ore erected by Fraser & Chalmers, Ltd., of Erith and London, and similar installations for handling of concrete, etc.
Handling Plant of the Galveston (Tex.) Coal Co., Chas. Fowler, Jr., Coal Trade Jl., vol. 50, no. 25, June 18, 1919, pp. 737-739, 4 figs. Equipped with Lidgerwood installation, coal being handled by one Hayward 3-cu. yd. clamshell bucket on one transfer and a 2-cu. yd. bucket on the other.
Electricity as Applied to Loading and Unloading Coal and Ore Boats, R. H. McLain. Gen. Elec. Rev., vol. 22, no. 5, May 1919, pp. 352-365, 26 figs. Notably at coal-loading pier of Baltimore & Ohio R. R. Co. at Curtis Bay and at ore docks of Duluth and Iron Range R. R., Two Harbors, Minn. Paper read before Soc. Terminal Engrs.

Conveyors. Economical Handling of Materials. Can. Manufacturer, vol. 39 no. 6, June 1919, pp. 27-28, 6 figs. Uses of portable scoop conveyor.
Belt Conveyors for Ore Handling. Chem. Eng. & Min. Rev., vol. 11, no. 124, January 5, 1919, pp. 95-98, 4 figs. Plan showing general layout of bins and conveyor in connection with handling of charge for blast furnace.

Grain. Mechanical Grain-Loading Devices on the Roumanian Danube, George Frederick Zimmer. Eng. & Indus. Management, vol. 1, no. 15, May 22, 1919, pp. 477-480, 5 figs. Include means for unloading of railway trucks by mechanical shovels. (To be continued.)

Live Stock. Proper Loading and Handling of Live Stock, W. J. Embree. Off. Proc. St. Louis Ry. Club, vol. 23, no. 12, Apr. 11, 1919. pp. 289-296. Disease and injury received by smaller cattle from larger cattle in same car are considered as chief losses from shipment of cattle.

Ore. *See Coal and Ore.*

Truck Loading. Truck Loading Devices Reduce Lost Time, J. Edward Schipper. Automotive Industries, vol. 40, no. 24, June 12, 1919, pp. 1346-1350. 12 figs. Examples of installations of apparatus for handling loose or bulky material.

HEAT-TREATING

Duralumin. Heat Treatment of Duralumin P. D. Merica, R. G. Waltenberg, and H. Scott. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 150, June 1919, pp. 913-949, 26 figs. Experiments carried out in laboratory of Bureau of Standards and partly in co-operation with Aluminum Col of America. Temperature of quenching, it is concluded, should not be above that of the aluminum eutectic which is usually about 520 deg. cent., but should be as near to this as possible without danger of eutectic melting.

Forging, Large. Temperature Observations on Heating, Quenching and Drawing of a Large Steel Forging, O. A. Knight and F. F. Hansen. Chem. & Metallurgical Eng., vol. 20, no. 11, June 1, 1919, pp. 590-591, 3 figs. Experiments conducted at heat-treating plant of Watertown Arsenal.

Furnace. New Features in Heat Treating Plant. Iron Age, vol. 103, no. 23, June 5, 1919, pp. 1493-1495, 4 figs. Car type furnace with chamber 30 ft. by 6 ft. for annealing large parts of automobile frames in plant of Parish & Bingham Co., Cleveland.
See also Furnaces, Heat-Treating.

Quenching. Influence of Quenching Temperature on Structural and Mechanical Characteristics of Steel (Influenza della temperatura di ricottura sulle caratteristiche strutturalo e meccaniche degli acciai), Pietro Forcella. Rivista Tecnica della Ferrovie Italiane, vol. 15, no. 4, Apr. 15, 1919, pp. 144-150, 23 figs. on three supplement plates. Researches undertaken under auspices of Instituto Sperimentalo della Ferrovie.
Quenching Cracks in Carbon Steels, Kôtarô Honda and Tokujirô Matsushita. Science Reports of the Tôhoku Imperial University, vol. 8, no. 1, Apr. 1919, pp. 31-42, 8 figs. Experimental. It is concluded that cause of retarded cracks in quenched carbon steel is neither thermal stress caused by unequal cooling of specimens nor implusive stress due to differential expansion of adjacent parts caused by rapid cooling through a range of the A_1 point. but it is the persistent stress due to differential expansion of adjacent parts caused by different degree of martonsitization.

Steel. Heat Treatment of Steel, C. O. Bannister. Jl. & Trans. Soc. of Engrs., vol. 10, no. 4, 1919, pp. 163-179, and (discussion) pp. 179-184, 9 figs. Suggestions in regard to various accepted practices based on examination of specimens and results obtained in tests.
Heat Treatment of Alloy Steel, K. A. Juthe. Am. Mach., vol. 50, no. 233. June 5, 1919, pp. 1077-1079. Suggestions based on writer's experimental research.

Theory. Some Notes on Heat Treatment Theory, W. F. Edwards. Jl. Am. Steel Treaters Soc., vol. 1, no. 5, Feb. 1919, pp. 141-159, 12 figs. Considerations intended to show that phase law is of little value in explaining phenomena of heat treatment of steel. It is believed that rates of heating, cooling or changes of pressure, etc., are of much more significance than usual interpretations of equation diagram.

HEATING AND VENTILATION

Engine Houses. The Heating and Ventilation of Engine Houses, T. W. Reynolds. Ry. Age, vol. 66, no. 21, May 23, 1919, pp. 1245-1248, 3 figs. Discusses use of underground concrete air ducts as applied to a 30-stall engine house, having concrete floors, brick walls and timber frame and roof.

Mechanics' Liens. Heating and Ventilating Plants and Mechanics' Liens, Arthur L. H. Street. Heat. & Vent. Mag., vol. 16, no. 5, May 1919, pp. 19-23. Review of Appellate Court decision defining circumstances under which security is available. (To be continued).

Radiation, Computation. Standard Rules for Computing Required Radiation. Metal Worker, vol. 91, no. 25, June 20, 1919, pp. 790-792. Also Heat & Vent Mag., vol. 16, nos. 5 & 6, May & June 1919, pp. 23-26 & 36-39. Proposed regulations for figuring steam and hot-water radiation in heating systems. Reprint from Bul. Nat. District Heating Assn.

Radiators, Flow of Water to. Care of Heating and Ventilating Equipment, Harold L. Alt. Power, vol. 49, no. 24, June 17, 1919, pp. 932-933. Discusses various methods of controlling flow of water to radiators.

Steam Heat. Practical Economies in the Use of Steam Heat, Lloyd Howell. Heating & Ventilating Mag., vol. 16. no. 6, June 1919, pp. 22-24. Damages caused by incorrect installation are pointed out.

Workshops. The Heating and Ventilation of Workshops—I. Engineer, vol. 127, no. 3308, May 23, 1919, pp. 504-506, 8 figs. System in plant having reinforced-concrete roof.

HOISTING AND CONVEYING

CRANES. Heavy Shop Framing for 250-ton Traveling Crane. Eng. News-Rec., vol. 82, no. 24, June 12, 1919, pp. 1172-1173, 3 figs. Columns carry double-deck runways with T-section girders for overhead crane handling locomotives.
Electrically Operated Travelling Cranes. Elec. Rec., vol. 25, no. 5, May 1919, pp. 316-321, 17 figs. The different types of modern traveling cranes are defined with idea of bringing out inherent features of each. Included also is a short history of evolution of electric traveling cranes from hand-operated jib cranes.

FREIGHT ELEVATORS. Freight Elevators, Charles H. Weeks. Safety Eng., vol. 37, no. 6, June 1919, pp. 307-313, 4 figs. Statistics of accidents and their causes as collected by Dept. of Labor of New Jersey; also instructions for elevator operators.

HOISTS. Progress in the Electrification of Mine Hoists, R. S. Sage. Gen. Elec. Rev., vol. 22, no. 5, May 1919, pp. 332-341, 17 figs. Brief historical survey and description of modern hoist equipments used at various mines.
Electrically Operated Hoists. Elec. Rec., vol. 25, no. 6, June 1919, pp 386-394, 21 figs. Constructional and operating features of hoists as used in different industries.
A New Electrically-Driven Winding Equipment. Elecn., vol. 82, no. 20, May 16, 1919, pp. 570-571, 2 figs. Designed for 720-ft. shaft. It has cylindro-conical drum 11 ft. to 15 ft. in diameter. (To be concluded).
Steam and Electric Mine Hoists, Frank C. Perkins. Nat Engr., vol. 23, no. 6, June 1919, pp. 264-266, 2 figs. Types used at various plants, especially direct-acting steam type used at Michigan Copper Co. and electric hoist of 1,850 hp. employed by North Butte Mining Co.

OVERSPEED PREVENTION. A New Electrically-Driven Winding Equipment. Elecn., vol. 82, no. 21, May 23, 1919, pp. 593-594, 3 figs. Description of overspeed preventer device. (Concluded).

OVERWINDING. Safety in Winding Operations, J. A. Vaughan. South African Jl. Sci., vol. 15, no. 4, Nov.-Dec., 1918, pp. 205-216. Remarks are confined to question of safe handling of winding engine and particularly statistical records of accidents due to overwinding.

WINCHES. Applications of the Williams-Janney Variable Speed Gear. Engineering, vol. 107, no. 2787, May 30, 1919, pp. 693-695, 10 figs. Advantages claimed for application of this gear to winches. (Continuation of serial).

HYDRAULIC MACHINERY

PIPE LINES. The 25-Mile Gravity Pipe Line of Everett, Washington, W. A. Scott. Eng. World, vol. 14, no. 12, June 15, 1919, pp. 41-46, 14 figs. Pipe line has length of 133,000 ft., and between intake and reservoir there is net head of 252 ft.
Economical Size of Pipe for Given Loss of Head, E. W. Rettger. Cornell Civil Engr., vol. 27, no. 4, Apr. 1919, pp. 83-92, 2 figs. Formulæ derived on Adams principle which writer states as follows. That type is most economically designed for which interest and depreciation on first cost of pipe, plus annual value of power loss due to friction in pipe, is a minimum.

SLUICES. Automatic Sluices (Les barrages automatiques), E. Froté. Génie Civil, vol. 74, no. 22, May 31, 1919, pp. 429-433, 21 figs. Diagramatic representation of various types.

SURGES. Graphical Records of Surge Pressures in Pipe Lines, Ralph Benntee. Eng. News-Rec., vol. 82, no. 22, May 29, 1919, pp. 1048-1050, 9 figs. Tests made for determining effect of varying air-chamber conditions and changing choke-gate area.
The Surge-Chamber Problem, E. Parry. New Zealand Jl. of Sci. & Technology, vol. 2, no. 2, Mar. 1919, pp. 78-86, 2 figs. Derivation of formula when limited in its application to chamber with parallel sides.

WILLIAMS-JANNEY SPEED GEAR. The Williams-Janney Variable Speed Gear. Engineering, vol. 107, no. 2786, May 23, 1919, pp. 662-666, 14 figs. Device consists of two similar hydraulic units, each of which comprises a group of cylinders, mounted upon a shaft revolving in a fixed casing, one unit fulfilling function of pump and supplying fluid to other which acts as motor. (To be continued).

INTERNAL-COMBUSTION ENGINES

CARBURATION. The Carburation of Low-Grade Distillates, H. O. Ensign. Pac. Mar. Rev., vol. 16, no. 6, June 1919, pp. 121-124, 7 figs. Carburetor development in California and having as distinguishing factors, according to writer, that maximum air velocity equals in all cases that of engine manifold, and that fuel is delivered to center of metering chamber at point where velocity is practically zero.

DIESEL ENGINES. Internal Combustion Engines for Submarines. Constructed by Messrs. Franco Togi, Engineers, Legnano, Milan. Engineering, vol. 107, no. 2788, June 6, 1919, pp. 732-734, 8 figs. Results of tests with two types: Two-cycle engine wth six working cylinders and a four-cycle type with eight working cylinders.
An All-American Diesel. Pac. Mar. Rev., vol. 16, no. 6, June 1919, pp. 111-114, 7 figs. Winton 8-cylinder engine.
The Diesel Engine, Charles Day. Automobile Engr., vol. 9, no. 127, June 1919, pp. 169-171, 6 figs. Features and limitatons. Paper presented to Instn. Automobile Engrs.
Vickers High-Powered Submarine "Diesel" Engines. Motorship, vol. 4, no. 6, June 1919, pp. 35-36, 3 figs. Eight and twelve-cylinder, 1,800-b. hp. motors of "solid-injection – type. Cast-steel cylinder heads said to be used successfully.
Slow-Combustion Engines and Their Uses, J. Drosne. Motorship, vol. 4, no. 6, June 1919, pp. 43-45, 1 fig. Together with details of Schneider crosshead type merchant-marine and naval Diesel engines.
An American Diesel Engine. Motorship, vol. 4, no. 6, June 1919, pp. 30-32, 7 figs. Six-cylinder Winton marine engine. Outstanding features are enclosed crankcase, trunk-pistons, and crankshaft bolted up to its bearings.

DORMAN ENGINES. The Dorman Engines. Automobile Engr., vol. 9, no. 127. June 1919, pp. 191-193, 9 figs. Post-war program includes six engines, ranging in power from 10 hp' to 40 hp. Power curves for these types are given.

FLAME PROPAGATION. A New Method of Determining Rate of Flame Propagation, P. M. Heldt. Automotive Industries, vol. 40, no. 24, June 12, 1919, pp. 1256-1258, 3 figs. Based on principle that when flame surrounds pair of spark terminals electrical pressure required to break down resistance of gap is reduced.

FUEL AND PERFORMANCE. Engine Performance, H. L. Horning. Jl. Soc. Automotive Engrs., vol. 4, no. 5, May 1919, pp. 344-345 and (discussion) pp. 345-348, 1 fig. Diagram of power available in a 60-hp. engine with different fuels.
The future of Internal-Combustion Engines (De toekomst fer verbrandingsmotoren), P. Meyer. De Ingenieur, vol. 34, no. 17, Apr. 26, 1919, pp. 313-318. Discusses future from technical as well as from economic point of view. Special attention given to the fuel question.
The Fuel Question of Internal-Combustion Engines (Zur Betriebsstoffrage der Verbrennungsmotoren), Hugo Brach. Oelmoter, vol. 8, no. 3, Mar. 1919, pp. 65-69. Special consideration is given to the automobile motor. Tables.

GAS ENGINES. Installation and Working of Large Horizontal Gas-Engines, H. Pilling. Gas Jl., vol. 146, no. 2919, Apr. 22, 1919, pp. 191-193. Possibility of utilizing 20,700 cu. ft. gas per min. for blowing and power purposes in a supposed blast-furnace installation producing 2,000 tons of iron per week. Paper read before Cleveland Instn. Engrs.

GILE ENGINE. A New Combustion Engine. Mar. Eng. & Can. Merchant Service Guild Rev., vol. 9, no. 5, May-1919, pp. 177-178, 4 figs. Gile engine, Fuel is mixed in cylinder by forcing charge of compression around subpiston head through series of small restricted passages to combustion chamber against cylinder head.

HIGH-SPEED ENGINES. High-Speed High-Efficiency Engines, D. McCall White. Jl. Soc. Automotive Engrs., vol. 4, no. 5, May 1919, pp. 327-334, 18 figs. Fundamentals of high-speed engines, survey of various types manufactured in United States, and uses which have been given to these engines, particularly during the war.

HOT-SURFACE OIL ENGINES. Hot Surface Oil Engines for Industrial Purposes, A. H. Goldingham. Jl. Soc. Automotive Engrs., vol. 4, no. 6, June 1919, pp. 482-485, 1 fig. Engines of horizontal or vertical design arranged for direct connection or by belting to electrical or pumping and other machinery are discussed from viewpoints of reliability, first cost, and economy.

KESSLER SUPER-CHARGE ENGINE. The Kessler Super-Charge Engine Developed for Automobile Purposes, Automotive Industries, vol. 40, no. 24, June 12, 1919, pp. 1289-1293 and 1308, 9 figs. Uses four-stroke cycle with ramming charge of excess air; time compression crankcase employed.

MARINE ENGINES. Automotive Applications of Marine Engines in the War, George F. Crouch. Jl. Soc. Automotive Engrs., vol. 4, no. 5, May 1919, pp. 349-357, 20 figs. partly on supp. plate, particularly of 220-hp. Internal-combustion engine used on United States 110-ft. submarine chaser. Reference is made to British M. L. submarine chasers.

MOTORCYCLE ENGINES. Two-Stroke Engines for Motorcycle, E. Tilston. Automotive Industries, vol. 40, no. 24, June 12, 1919, pp. 1304-1305, 2 figs. also Automobile Engr., vol. 9, no. 127, June 1919, pp. 185-187, 4 figs. Model with distinct type exhaust valve designed by writer. Paper presented to Instn. Automobile Engrs.

STILL ENGINE. A New Prime Mover of High Efficiency and British Origin, Frank E. D. Acland. Jl. Roy. Soc. Arts, vol. 67, no. 3472, June 6, 1919, pp. 463-475 and (discussion) pp. 475-482, 6 figs.; also Engineer, vol. 127, no. 3309, May 30, 1919, pp. 540-541, 2 figs.; Automotive Industries, vol. 40, no. 25, June 19, 1919, pp. 1404-1405, 1 fig.; Elec. Rev., vol. 84, no. 2165, May 23, 1919, pp. 643-646, 4 figs.; Shipbuilding & Shipping Rec., vol. 13, no. 22, May 29, 1919, pp. 697-698, 2 figs., and Eng. & Indus. Management, vol. 1, no. 18, June 12, 1919, pp. 567-573, 6 figs. Engine is said to be capable of using any form of liquid or gaseous fuel and to make use of recoverable heat which passes through surface of combustion cylinder as well as of exhaust gases. Combines features of steam and gas engine.

THERMAL EFFICIENCIES. Recent Developments in the Internal Combustion Field, A. L. Taylor. Utah Soc. Engrs., vol. 5, no. 3, Mar. 1919, pp. 54-61. Thermal efficiency of various types.

VALVES. New Valve Operating System. Autocar, vol. 42, no. 1231, May 24, 1919, pp. 814-815, 4 figs. Rotary reciprocating valve engine with single-sleeve valve in each cylinder which both rotates and reciprocates, dual motion being obtained through action of gears and cams respectively.

VALVES, AIR-FLOW THROUGH. Study of Air Resistance and Air Flow, H. Levy: Automotive Industries, vol. 40, no. 24, June 12, 1919, pp. 1260-1264, 10 figs. Laws of air resistance determined for various air speeds; applications to aircraft and automotile problems.

LUBRICATION

BUREAU OF STANDARDS. Lubricating Oil Program of the Bureau of Standards. Automotive Industries, vol. 40, no. 23, June 5, 1919, pp. 1230-1232. Outline of problems which bureau proposes to solve by experimental research work.

EXPERIMENTS. Notes on Lubrication, S. Skinner. Proc. Phys. Soc., Lond., vol. 31, part III, Apr. 15, 1919, pp. 94-100, 2 figs. Experiments on pressure of air in neighborhood of a flywheel running in contact with a flat, long board are presented as exhibiting properties of a compressible lubricant.

MACHINE ELEMENTS AND DESIGN

BALL BEARINGS. Ball Bearings, H. D. McGuire. U. S. Naval Inst., Proc., vol. 45, no. 196, June 1919, pp. 973-986, 16 figs. Advantages claimed for them.
Ball Bearings' Application in Industry. Raw Material, vol. 1, no. 4, June 1919, pp. 222-226, 14 figs. Application to two machine-shop tools. (Continued).

Cams. Cam Design and Construction—V, Franklin de R. Furman. Am. Mach., vol. 50, no. 24, June 12, 1919, pp. 1123-1126, 5 figs Deals with swinging follower arms, with both roller and sliding contact and method of finding length of shoe of sliding arm.
Cam Profiles, A. Johnson. Automobile Engr., vol. 9, no. 127, June 1919, pp. 166-169, 12 figs. Technical. Types used to operate valves of internal-combustion engines.

Gears. Horse-Power Chart for Spur and Bevel Gears. Machy. (Lond). vol. 14, no. 347, May 22, 1919, p. 232, 1 fig. Plotted from Lewis and-Barth formulæ.
Angles for Spiral Bevels. Machy. (Lond.), vol. 14, no. 349, June 5, 1919, pp. 282-283. Tables giving increment angles for spiral bevel pinions.

Radio-Thrust Bearings. Load Characteristics of Radio-Thrust Bearing, F. W. Gurney. Am. Mach., vol. 50, no. 26, June 26, 1919, pp. 1233-1236, 4 figs. Description of chart for finding capacity of ball bearings of radio-thrust type.

Springs. Tables for Calculating Helical Springs, J. H. Sullivan. Machy. (N. Y.), vol. 25, no. 10, June 1919, pp. 961-964. Showing maximum loads in pounds and corresponding compressions in inches in helical round bar springs.

MACHINE SHOP

Chucks. Collet Chucks—IV, Fred Horner. Mech. World, vol. 65, no. 1690, May 23, 1919, p. 243, 3 figs. Advantages of hinged collet construction. (To be continued).

College Machine Shop. Machine Work at the Ohio State University, W. A. Knight. Eng. Education, vol. 9, no. 10, June 1919, pp. 446-460, 9 figs. Electrical and mechanical engineering students required to take 6 hr. per week in a school year. Of this time 5 hr. per week are spent in shop and 1 hr. in classroom for lectures and recitations. Aim is to bring student in contact with such features in shop production as organization, interchangeable parts, work limits, inspection standard time and progress reports.

Finishing Operations. Finishing Operations on Liberty Motor Cylinders, H. A. Carhart. Am. Mach., vol. 50, no. 25, June 19, 1919, pp. 1197-1201, 11 figs. Various operations involved are taken separately and reference is made to special fixtures used.

Jigs and Tools. Jigs, Tools and Special Machines, with their Relation to the Production of Standardized Parts, Herbert C. Armitage. Jl. Instn. Mech. Engrs., no. 4, May-1919, pp. 213-253 and (discussion) pp. 253-320, 18 figs., also Can. Machy., vol. 21, nos. 22 and 23, May 29 and June 5, 1919, pp. 542-544 and 576-580, 17 figs. and Model Engr. & Elecn. vol. 40, no. 943, May 22, 1919, pp. 393-399, 11 figs. Advantages and disadvantages of use of jigs and special tools in repetition work are discussed from viewpoint of relationship between output and cost of components and study of possible Scheme for securing maximum efficiency from standardization of machines and methods.
Templets, Jigs and Fixtures—XXIV, Joseph Horner. Engineering, vol. 107, no. 2785. May 16, 1919, pp. 622-624. Limitations imposed on jig and fixture work by dimensions, shapes or numbers required. (Concluded).

Metal Finishing. Progress in Metal Finishing, P. S. Brown, Metal Indus., vol. 17, no. 6, June 1919, pp. 274-276, 3 figs. Operations as practiced at Corona Typewriter Co., Groton, N. Y.

Milling. Planer Milling Practice in Automobile Plants, Edward K. Hammond. Machy. (N. Y.), vol. 25 no. 10, June 1919, pp. 965-971, 7 figs. Milling operations on crankcases. (First of two articles).
Methods of Milling and Boring Yoke and Cap. F. Scriber. Can. Machy., vol. 21, no. 25, June 19, 1919, pp. 630-632, 9 figs. Illustrating jigs employed in various operations.

Shafting. Shaft Alignment and Its Importance, J. Y. Dahlstrand. Power, vol. 49, no. 23, June 10, 1919, pp. 882-886, 6 figs. Reasons are presented as to why two or more members of a unit mounted on the same bedplate lose their alignment. Uneven strain on the anchor bolts, incorrect foundation, improper and insecure doweling and wearing are causes for misalignment.

Tinsmithing. What a Tinsmith Can Do in a Machine Shop, Peter F. O'Shea. Am. Mach., vol. 50, no. 23, June 5, 1919, pp. 1067-1076, 21 figs. Example of home-made time and labor savers at tinsmith shop of New England plant.

MACHINERY, METAL-WORKING

Chucks. The Design of Concentric Chucks, A. Clegg. Machy, (Lond.), vol. 14, no. 349, June 5, 1919, pp. 277-281, 11 figs. Concerned with power, truth and durability and strength.
Some Interesting Features of the Massey-Harris Brantford Plant, J. H. Moore. Can. Machy., vol. 21, no. 21, May 22, 1919, pp. 509-511, 8 figs. Among jigs and fixtures described, a quick-action chuck and automatic milling machine are considered as distinctive features of shops.

Counterboring and Reaming. Automatic Machines, H. E. Thomas. Page's Eng. Weekly, vol. 34, no. 769, June 7, 1919, pp. 309-310, 3 figs. Tools recommended for counterboring and reaming. (Concluded). Paper read before Manchester Assn. Engrs.

Milling Machines. The No. 4 Cincinnati Vertical High-Power Milling Machine. Am. Mach., vol. 50, no. 26, June 26, 1919, pp. 1229-1232, 7 figs. Intended for extremely heavy work and patterned after No. 5.
Designs Novel Continuous Miller. Iron Trade Rev., vol. 64, no. 21, May 22, 1919, pp. 1559-1560, 3 figs. Work is carried on a rotary platen which is set at 15-deg. angle to facilitate loading and unloading.
"Ohio" Tilted Rotary Milling Machine. Machy. (N. Y.), vol. 25, no. 10, June 1919, pp. 979-982, 5 figs. Provision is made for employing either continuous rotary method of milling or for applying an indexing principle of operation by which successive pieces of work are brought opposite cutter.
A New System of Thread Milling. Machy. (Lond.), vol. 14, no. 348, May 29, 1919, pp. 271-272, 4 figs. Headstock carries chuck in which work is held and has hollow spindle for accommodating rods that require their ends screwed.
Continuous Rotary Milling. Machy. (Lond.), vol. 14, no. 348, May 29, 1919, pp. 245-252, 14 figs. Davis & Thompson, Kearney & Trecker, and Becker Milling Machine Co. milling machines. Article deals chiefly with design of fixtures, methods of operation and statement of rates of production which are obtained in handling various classes of work.

MACHINERY, SPECIAL

Balancing Machines. Balancing Machines. F. G. Hechler. Jl. Am. Soc. Naval Engrs., vol. 31, no. 2, May 1919, pp. 405-419, 6 figs., partly on supp. plates. Carwen dynamic balancing machine, made by Carlson Wenstrom Co., and combined static and dynamic balancing machine, built by Vibration Specialty Co. examined in reference to requirements writer believes should be fulfilled by ideal balancing machine.

Capstan Lathe Tools. Capstan Lathe Tools—III, E. W. Field and A. E. Simpson. Machy. (Lond.), vol. 14, no. 347, May 22, 1919, pp. 227-231, 11 figs. Recessing tool-holders, centering and facing tools; floating reamers.

Cooling Towers. Natural Draught Cooling Towers, Harold Nielsen. Engineer, vol. 127, no. 3309, May 30, 1919, pp. 526-527, 1 fig. Making transverse free section as large as possible in order, writer contends, to give air proper time to get saturated with vapor. He offers modifications in Rankine's formula to make it apply in determining force of draft for natural-draft water-cooling towers.

Crushers and Pulverizers. Power Requirements of Rock-Crushing Plants, Mark. H. Reasoner. Min. & Sci. Press, vol. 118, no. 24, June 14, 1919, pp. 819-820. Table showing approximate power requirements of various types of crushers and pulverizers.

Evaporators. Modern Commercial Evaporators, W. L. Badger. Mich. Technic, vol. 32, no. 2, May 1919, pp. 77-88, 14 figs. Comparison between horizontal and vertical types. (To be continued.)
Industrial Vacuum Evaporators—VIII, Frank Coxon. Mech. World, vol. 65, no. 1693, June 13, 1919, p. 282, 5 figs. Test figures on use of evaporators.

Piercing and Shearing Tool. An Automatically Indexed Piercing and Shearing Tool, L. L. Dodds. Am. Mach., vol. 50, no. 24, June 12, 1919, pp. 1133-1135, 4 figs. Laminated copper contact brush made up of twelve strips of leaves, all of which are of equal length, but riveted together so as to give each end of brush a beveled appearance.

Pile Drivers. "Daza" Electric Pile-Driver (Machina eléctrica, sistema Daza, para hinca de pilotes), J. Eugenio Ribera Revista de Obras Publicas, vol. 67, no. 2271, Apr. 3, 1919, pp. 157-160, 5 figs. Comparison with "Laeour" machine. Writer prefers "Daza," which he says is designed specially for driving reinforced-concrete piles, but can be also used for driving piles of other materials.

Typewriters. The Principles of Typewriter Mechanism, Nathan Sharpe. Model Engr. & Elecn., vol. 40, nos. 940 and 941, May 1 and 8, 1919, pp. 327, 330-332 and 354-360, 16 figs. Diagram showing various action and details of mechanism. Several American types are considered.

MATERIALS OF CONSTRUCTION AND TESTING OF MATERIALS

Binders. Viscosity and Sticking Strength of Binders, Allen Abrams. Textile World Jl., vol. 55, no. 26, June 28, 1919, pp. 41-45, 6 figs. Stated on basis of experiments that usually full sticking strength of textile binders is obtained only by heating to at least 90 deg. cent.

Brass. Notes on the Influence of Certain Variables Associated with the Anneal of Cold-Worked Alpha Brass, Arthur Phillips and George C. Gerner. Chem. & Metallurgical Eng., vol. 20, no. 12, June 15, 1919, pp. 622-628, 16 figs. Engine tests on annealed samples. Concluded that while grain size before final reduction has some influence on mechanical properties to anneal brass, magnitude of effect is small, especially in metal annealed at high temperatures.
Structural Characteristics of Rolled Sheet Brass, H A. Eatick. Metal Industry, vol. 14, no. 19-20, May 9-16, 1919, pp. 381-383 and 402-404, 8 figs. Study of cumulative hardening effect of cold work by examination of characteristic curves of various alloys. Study of equilibrium diagrams. (Concluded.)

Bronze. Use of Bronze for Valve Snap Rings and Piston Surfaces, and Bull Rings in Large Cylinders, C. E. Fuller. Ry. Age, Daily Edition, June 26, 1919, pp. 1791-1793, 2 figs. Experiments per formed and results obtained by Union Pacific.
See also Copper and Bronze, Copper Aluminum Alloys.

Copper-Aluminum Alloys. Physical Properties of Copper Aluminum Alloys, A. H. Robinson and S. C. Zylstra. Mich. Technic, vol. 32, no. 2, May 1919, pp. 134-140, 9 figs. Tests performed on copper-aluminum-iron and copper-aluminum alloys established, it is reported, that the former is the stronger of the two at ordinary temperatures, but has only a slight advantage at higher temperatures; also that the iron alloy is more free from blow-holes and slag-inclusions than the straight alloy.

Copper and Bronze. Copper and Bronze—a Technological Study Regarding the Effects of Heat Treatment with Special Reference to the Duration of the Tensile Test (Kupfer und Bronze—eine technologische Studie über die Wirkung des Reckens und Glühens unter besonderer Berücksichtigung der Zerreissversuchsdauer), Willy Müller. Forschungsarbeiten auf dem Gebiete des Ingenieurwesens, no. 211, 1918, pp. 3-47, 16 figs. General remarks regarding the behaviour of metals when breaking. Metals tested were copper, manganese bronze and tin bronze.

Elasticity. Note on the Elasticity of Metals as Affected by Temperature, A. Malleck. Proc. Roy. Soc., Series A, vol. 95, no. A671, Apr. 1, 1919, pp. 429-437, 6 figs. It is reported that the ratio of Young's modulus were measured for 15 methods between temperatures of liquid air and 100 deg. cent.

Hemp. Sisal and the Plant for Extracting the Fiber. South African Eng., vol. 30, no. 1, Jan. 31, 1919, pp. 3-4 and p. 8, 4 figs. Size of hemp obtained from leaves of agava as cordage fibre.

MACHINE CONSTRUCTION, MATERIALS FOR. Materials of Machine Construction, G. H. Kendall. Machy. (N. Y.), vol. 25, no. 10, June 1919, pp. 944-947. Properties and uses of principal materials.

STEEL. Influence of Rolling and of Initial Thickness of Ingot on Quality of Steel (Influence du Corroyage et de la grosseur du lingot initial sur la qualité d'une pièce en acier), Andre Pouilloux. Bulletin et comptes rendus de la Société de l'Industrie Minérale, vol. 15, no. 5, 1919, pp. 311-337, 9 figs. Based on experiments conducted at Firminy Steel Works. Forming an article from the smallest possible ingot is advocated principally because larger ingots are said to be necessarily of inferior quality.

Gear Steels, J. Heber Parker. Automotive Industries, vol. 40, no. 23, June 5, 1919, pp. 1220-1221. Classifications of gears according to application, materials and treatment. Methods employed in carbonizing and heat treatment. Paper read before Am. Gear Mfrs. Assn.

The Mechanical Properties of Steel, W. H. Hatfield. Engineering, vol. 107, no. 2785, May 16, 1919, pp. 634-636 & 638, 14 figs. Evidence substantiating occurrence of steels possessing true brittleness. (Continuation of serial.) Paper read before Instn. Mech. Engrs.

STEEL, HIGH-SPEED. The Properties of High Speed Steel, G. J. Horvitz. Iron Age, vol. 103, no. 26, June 26, 1919, pp. 1711-1714, 13 figs. Its metallography and heat-treatment; crucible and electric process in its production; effect of uranium; theory of hardening. Paper presented at New York Chapter of Am. Steel Treaters' Soc.

TOUGHNESS. Static, Dynamic, and Notch Toughness, Samuel L. Hoyt. Iron & Steel of Can., vol. 2, no. 5, June 1919, pp. 126-131, 10 figs. A high degree of notch toughness to insure against failure is recommended because, it is said, that even a hasty examination of such machiney as locomotives, automobiles, stationary gas engines, steam engines, etc., reveals an amazingly large number of notches.

MEASUREMENTS AND MEASURING APPARATUS

ABRASION METERS. The Abrasion Meter, Raymond Francis Yates, Sci. Am. Supp., vol. 87, no. 2267, June 14, 1919, pp. 372-373, 7 figs. Device for determining cutting efficiency of abrasive wheels.

AIR FLOW. The Determination of the Efficiency of the Turbo-Alternator, S. F. Barcay. Jl. Instn. Elec. Engrs., vol. 57, no. 281, Apr. 1919, pp. 293-304 and (discussion), pp. 305-314, 14 figs. Shows that actual losses on load can be deduced conveniently and accurately from measurements of cooling air flowing through alternator. It is further shown, however, that although such methods are sound in principle, misleading results may be obtained unless certain precautions are taken in applying them.

See also Air Machinery.

FLATNESS. Flatness Tests at Bureau of Standards, R. L. Rankin. Am. Mach., vol. 50, no. 26, June 26, 1919, pp. 1218-1220, 3 figs. Optical method based on principle of light interference.

HARDNESS. Methods of Testing for Hardness, Dean Harvey. Elec. Jl., vol. 16, no. 6, June 1919, pp. 264-266, 2 figs. Advantages and limitations of various test methods presented with suggestions for selecting test for given application.

HEAT PENETRATION. Studies on Canning. An Apparatus for Measuring the Rate of Heat Penetration, W. T. Bovie and J. Bronfenbrenner. Jl. of Indus. & Eng. Chemistry, vol. 11, no. 6, June 1919, pp. 568-570, 5 figs. Apparatus consists of constant thermo-junction which is maintained at temperature of 0 deg. cent. and is located just outside of can.

MANOMETER. An Optical Lever Manometer, J. E. Shrader and H. M. Ryder. Physical Rev., vol. 13, no. 5, May 1919, pp. 321-327, 6 figs. Type devised for measuring vapor pressures in range between that which can be measured by Knudsen gage (0.001 mm) and ordinary mercury manometer.

NOTCHED-BAR IMPACT TEST. The Single Blow Notched Bar Impact Test as Used in the American Industry, E. H. Dix, Jr. Am. Soc. for Testing Materials, Univ. of Pa., annual meeting, June 24-27, 1919, 36 pp., 12 figs. Research conducted in effort to standardize tests. It was concluded that striking distance for Olsen and Izod machines should be made 0.866 in., and span of Charpy machine, 40 mm. (1.575 in.); no broad method of converting results of one machine from terms of another was found possible.

PENDULUM METERS. Theory of the Aron Meter; A Note on the Effect of Impulsive Forces on Pendulums, H. G. Rowledge. Elecn., vol. 82, no. 22, May 30, 1919, pp. 622-624. Concludes that such errors as may arise by using a pendulum to measure an irregular attraction are compensatory, and that in a large number of periods the compensation, by the law of averages, tends to become exact, so that the time integral of the attraction is correctly registered by the oscillations of the pendulum.

PITCH, APPARATUS TO DETERMINE BREAKING POINT OF. Apparatus for Determination of Breaking Point of Pitches, H. E. Lloyd and P. P. Sharples. Am. Soc. for Testing Materials, Univ. of Pa., annual meeting, June 24-27, 1919, 8 pp., 3 figs. Metal hinge on which pitch cast in mold is placed, is bent while submerged in cold water at constant rate until pitch is fractured. Temperature of water is then raised and process repeated until no fracture occurs.

PRONY BRAKES. Construction and Dimensions of Prony Brakes (Ueber die Abmessungen und die Bauart von Bremszäumen), W. Wilke. Oelmotor, vol. 8, no. 3, Mar. 1919, pp. 57-65, 9 figs. Calculation of dimensions. Equations and curves. (To be continued.)

PYROMETER. Practical Fundamentals of a Pyrometer, W. A. Gatward. Jl. Am. Steel Treaters Soc., vol. 1, no. 5, Feb. 1919, pp. 172-178, 3 figs. Suggests protecting couple from contamination from furnace gases or fumes and advises that most satisfactory leads are those made from same alloys as couple.

REFRACTOMETER. Refractometers. Nature, vol. 103, no. 2582, Apr. 24, 1919, pp. 145-147, 4 figs. Instrument as construed by firm of Zeiss and other types. such as the Pulfrich and the Bellingham & Stanley refractometers.

SPECTROPHOTOMETER. A New Sector Spectrophotometer, Samuel Judd Lewis. Jl. Chem. Soc., vols. 115 & 116, no. 678, Apr. 1919, pp. 312-319, 2 figs. Apparatus designed with object of combining accuracy and refinement in resulting spectra and also to be able to use instrument alternately with photometer and for other purposes.

STEAM METERS. Reduced Model of Steam Meter (Présentation d'un modèle réduit du compteur de vapeur), H. Parenty. Comptes rendus des Séances de l'Académie des Sciences, vol. 168, no. 17, Apr. 28, 1919, pp. 835-837, 2 figs. Further observations on the apparatus described in Comptes Rendus, vol. 168, 1919, p. 492.

TILE, DRAIN. An Investigation of Tests of Iowa Shale Drain Tile, W. J. Schlick. Off. Pub. Iowa State College of Agriculture, vol. 16, no. 43, Mar. 27, 1919, bul. 49, 71 pp., 18 figs. Object was to determine best method for making actual accelereted freezing, thawing and absorption tests upon drain tile.

MECHANICS

BEAMS, THEORY OF BENDING. The Stresses in Braced Structures with Rigid Joints, John Case. Flight, vol. 11, no. 22, May 19, 1919, pp. 704-706, 7 figs. Extends theory of bending of beam under combined action of lateral distributed load and longitudinal thrust to treatment, as complete unit, of braced structures with stiff joints.

New Method of Calculating Stresses in Continuous Beams (Nouvelle méthode de calcul et propriétés diverses des poutres à travées solidaires), P. Sonier. Génie Civil, vol. 74, no. 16, Apr. 19, 1919, pp. 312-315, 8 figs. Suggested modifications in graphical method.

Lines of Influence of a Continuous Girder on Three Supports (Die Einflusslinien des kontinuierlichen Tragers auf drei Stutzen), Ernst Laube. Schweizerische Bauzeitung, vol. 73, no. 20, May 17, 1919, pp. 225-227, 10 figs. Simple method for determining the lines of influence of continuous girders on three supports at different spans 10 and 11.

JOINTS, PINNED. An Investigation Into the Strength of Pinned Joints, V. C. Davies. Machy. (Lond.), vol. 14, no. 346, May 15, 1919, pp. 194-195, 4 figs. Results of tests on plain shafts.

SHAFTS, WHIRLING. The Whirling of an Excentrically Loaded Overhung Shaft, S. Lees. Lond., Edinburgh, and Dublin Phil. Mag., vol. 37, no. 221, May 1919, pp. 515-523, 3 figs. Derivation of expression of kinetic energy and potential energy of system and subsequent application of Lagrange's equations.

The Whirling of an Airscrew Shaft, J. Morris. Flight, vol. 11, no. 21, May 22, 1919, p. 679, 1 fig. Technical determination of whirling speed in cases of uniform shaft and conically tapered shaft.

MECHANICAL PROCESSES

ADDING MACHINE. A Mechanical Mathematician. Ellsworth Sheldon. Am. Mach., vol. 50, no. 25, June 19, 1919, pp. 1185-1188, 13 figs. Construction and assembling of Monroe machine. Second article.

BEARINGS, ROLLER. Making the Timken Roller Bearing, Edward K. Hammond. Machy. (N. Y.), vol. 25, no. 10, June 1919, pp. 953-956, 20 figs. Methods of heat-treating, machining and inspecting. Second article.

CLOCKS. Clock Escapements. Nature, vol. 103, no. 2582, Apr. 24, 1919, pp. 155-168, 3 figs. Description of various types and manner of overcoming sources of error.

DRILL CHUCKS. Manufacturing a Drill Chuck, Fred R. Daniels. Machy. (N. Y.), vol. 25, no. 10, June 1919, pp. 948-952, 11 figs. "Ettco" drill chuck manufactured by Eastern Tube & Tool Co. Main features are said to be that it may be operated without use of wrench and that it is self-tightening.

ENGINE CYLINDERS. Modern Methods of Making Motor Cylinders, Fred H. Colvin. Am. Mach., vol. 50. no. 23, June 5, 1919, pp. 1099-1103, 15 figs. Cylinder department of Locomobile Co. where, it is said, handling has been reduced to a minimum.

ENGINE, HISPANO-SUIZA. The Hispano Suiza Airplane Engine—I, H. O. C. Isenberg. Am. Mach., vol. 50, no. 26, June 26, 1919, pp. 1213-1217, 16 figs. Process in manufacture followed at New Brunswick plant, Wright-Martin Aircraft Corp., especially in regard to securing accuracy.

ENGINES, MARINE. Efficiency in Marine Engine Production, G. N. Somerville. Pac. Mar. Rev., vol. 16, no. 6, June 1919, pp. 83-87, 6 figs. Illustrating practice of various Pacific Coast Shops.

Building Marine Engines on a Quantity Basis, F. B. Jacobs. Mar. Rev., vol. 49, no. 7, July 1919, pp. 338-343, 7 figs. Manufacturing operations on lighter units such as valve gear, bearings, air pump, crosshead, etc. (Continuation of serial.)

FILES. Some Points in the Manufacture of Files—II, Geo. Taylor. Machy. (Lond.), vol. 14, no. 348, May 29, 1919, pp. 273-276, 14 figs., also Iron Age, vol. 103, no. 25, June 19, 1919, pp. 1631-1636, 9 figs. How to deal with four defects in grinding which are said to exercise a deletrious influence in cutting process. These are: (1) Surface of blank ground slightly concave, (2) slightly convex, (3) wavy appearance giving series of depressions, (4) surface covered with scratches due to course gritstone.

GOLD LEAF. The Manufacture of Gold Leaf and Metal Foil, W. Theobald. Metal Industry, vol. 14, nos. 16 & 17, Apr. 18 & 25, 1919, pp. 321-324 and 341-346, 15 figs. Historical account of beating industry, based on series of articles appearing in Annalen für Gewerbe and Bauwesen.

ROLLING-MILL PRACTICE. Alloy Steels for Helmets and Armor, John A. Coyle. Chem. & Metallurgical Eng., vol. 20, no. 12, June 15, 1919, pp. 618-620, 1 fig. Details of electric furnace and rolling-mill practice.

Rolling of Beams Having Profiles Made Up of Three Elements Converging in a Point (Sur le calibrage des profils à trois branches convergeant en un même point), Norbert Metz. Revue de Métallurgie, vol. 16, no. 2, Mar.-Apr. 1919, pp. 89-127, 38 figs. Analysis of methods given by various writers in France and Germany and exposition or method developed by writer, in which he endeavors to simplify the determination of elongation coefficients.

ROOFING PRODUCTS. Manufacturing Brantford Roofing Products, J. H. Moore. Can. Machy., vol. 21, no. 22, May 29, 1919, pp. 537-541, 6 figs. Plant, building and yard cover area of seven acres. Conan conducts its own forge shop, toolroom and steam-fitting department.

SPHERES. Automatic Machines, H. E. Thomas. Page's Eng. Weekly, vol. 34, no. 768, May 31, 1919, pp. 297-298, 6 figs. Method for producing a sphere. (Continuation of serial.)

SPRINGS. Spring Making on a Quantity Basis, F. B. Jacobs. Iron Trade Rev., vol. 64, no. 21, May 22, 1919, pp. 1343-1348, 13 figs. Methods of Raymond Mfg. Co., Ltd., Corry, Pa., in manufacture of various classes of springs.

WESTINGHOUSE MARINE SYSTEM. Building the Westinghouse Marine System, Edward K. Hammond. Machy. (N. Y.), vol. 25, no. 10, June 1919, pp. 929-937, 28 figs. At Westinghouse plant in South Philadelphia, Pa. Second article.

WRENCHES. Making an Automobile Wrench in Two Operations, Hugo F. Pusen. Am. Mach., vol. 50, no. 24, June 12, 1919, pp. 1147-1148, 3 figs. Valuable feature in follow dies of this nature is system of sliding stops for guidance of stock until regular latch stop comes into action.

MOTOR-CAR ENGINEERING

BRAKES. Correct Location of Brake Levers, Walter C. Baker. Jl. Soc. Automotive Engrs., vol. 4, no. 6, June 1919, pp. 508-511, 2 figs. By means of brake-rod gage which consists of several interchangeable rods of various lengths, graduated every inch and operating through a dial gage that indicates lengthening or shortening of rods when placed by attachments in position of brake rods themselves.

CARBURETORS. The Godward Carburetter. Autocar, vol. 42, no. 1231, May 24, 1919, p. 787, 3 figs. Designed, it is said, to provide easy starting, flexibility, and economical running.

CAR PERFORMANCE. Research of Car Performance, P. W. Steelsmith. Mich. Technic, vol. 32, no. 2, May 1919, pp. 125-133, 9 figs. Tests conducted in accordance with standard rules of Society of Automobile Engineers.

CAR-SPEED CHART. Engine and Car Speed Chart. Motor Age, vol. 35, no. 23, June 5, 1919, p. 45, 1 fig. Chart to determine car speed in miles per hour when engine speed in revolutions per minute, high-gear reduction ratio and wheel diameter are known.

EXHAUST. Odorless Exhaust Gases (Verusche zur Erzielung geruchloser Abgase). Praetorius, Motorwagen, vol. 22, no. 2, Jan. 20, 1919, pp. 28-30, 6 figs. Suggests passing gases through calcium chloride and then through quicklime. Describes apparatus used for this purpose.

FANS. Radiator Cooling Fans, George W. Hoyt. Jl. Soc. Automotive Engrs., vol. 4, no. 5, May 1919, pp. 335-339, 8 figs. Writer observes that no one unit can do all the engine cooling and suggests that manufacturers of motor vehicles co-operate with accessory manufacturers to such an extent that the latter can help to solve mechanical difficulties.

GASOLINE-ELECTRIC CARS. The Stevens Petrol-Electric Vehicle. Electrical Review (Lond.), vol. 84, no. 2164, May 16, 1919, pp. 557-559, 4 figs. Electrical generator of four-pole interpolar type is direct coupled by means of flexible coupling to the gasoline engine which is fitted with centrifugal governor, adjustable as to speed by handwheel on middle of dashboard.

GOVERNORS, SPEED. Variable Speed Governors, W. W. Walls. Jl. Soc. Automotive Engrs., vol. 4, no. 5, May 1919, pp. 375-379, 7 figs. Description of tests made by Clyde Cars Co.

Tractor Engine Governors, G. L. Moyers. Jl. Soc. Automotive Engrs., vol. 4, no. 5, May 1919, pp. 364-366, 1 fig. Centrifugal and vacuum types.

KARDELL. Kardell Utility Tractor. Automotive Industries, vol. 40, no. 22, May 29, 1919, pp. 1162-1163, 3 figs. A two-plow tractor designed to be also suitable for cultivation and other farm work.

SPEEDOMETERS. Temperature Control of A-C Speedometer. Automotive Industries, vol. 40, no. 23, June 5, 1919, pp. 1228-1229, 2 figs. Magnetic instrument fitted with thermostatic compensator.

TRACTIVE RESISTANCE. Tractive Resistances to a Motor Delivery Wagon on Different Roads and at Different Speeds, A. E. Kennelly and O. B. Schwein. Mass. Inst. Technology, bul. no. 10, June 1916, no. 1011-1039, 19 figs. Also Am. Inst. Elec. Engrs., 33rd Annual Convention, June 30, 1916, bul. Investigation with wagon equipped with solid rubber tires; (1) overall efficiency of truck mechanism and (2) tractive resistance of a number of typical urban roads.

TRACTORS. Motor Plows, Tractors, etc., in Switzerland (Erprehung landvirtschaftlicher Maschinen in der Schweiz). Allgemeine Automobil-Zeitung, vol. 20, no. 1, Jan. 5, 1919, pp. 6-12, 5 figs. Competitive tests of American and Swiss makes held at Orbe, Switzerland. Official figures of results.

Small Motors for Agricultural Purposes (Der Klemmotor), Max Apel. Motorwagen, vol. 22, no. 4, Feb. 10. 1919, pp. 62-72, 16 figs. Points or design based on study of nature of work to be performed by machine as tractor, cultivation machine, or machine for driving others.

The Principles of the Wheeled Farm Tractor, Edward R. Hewitt. Gas Engine, vol. 21, no. 6, June 1919, pp. 182-185, 3 figs. Laboratory tests checked with work on machine in the open are said to have demonstrated that the maximum drawbar pull is a definite function of the weight per inch of width, amount available on sandy ground with a smooth metal wheel being about 30 per cent of weight on wheel when soil is dry and about 43 per cent when it is damp.

Farm Tractor Design—I & II, Joseph Jandasek. Automotive Industries, vol. 40, no. 24 & 25, June 12 & 19, 1919, pp. 1265-1273 & 1406-1407, 10 figs. Examples of calculations preceding design. Tabulated data on power requirements, soil packing and other items.

Agricultural Motor Tractors, G. Hildick-Smith. Jl. of Chem., Metallurgical & Min. Soc. of South Africa, vol. 19, no. 10, Apr. 1919, pp. 195-200, 3 figs. Notes on work and organization of Technical Section of Food Production Dept., England.

TRACTOR, DRAWBAR LOCATION ON. The Influence of Hitches and Drawbar Location on Tractor Design, A. W. Scarratt. Automotive Industries, vol. 40, no. 24, June 12, 1919, pp. 1334-1335 and 1359, 2 figs. Method of calculating weight required on front wheels to prevent bearing of tractor under full load on level or steep grades.

TRUCKS. Motor Lorry Design. Times Eng. Supp., vol. 15, no. 555, May 1919, p. 157. Lessons to be drawn from experience under war conditions as to construction of chassis of motor lorries; present article deals with engine and transmission gear.

VOISIN. Voisin's Initial Chassis, W. F. Bradley. Automotive Industries, vol. 40, no. 22, May 29, 1919, pp. 1178-1179, 4 figs. Four-cylinder, 30-hp. Knight engine car, built in small volume with view to increasing quality.

WAR VEHICLES. Utilization of War Vehicles for Industries and Agricultural Purposes (Wrs können die aus dem Kriege zuruckkehrenden Feldkrattwagen für Industrie und Landwirtschaft leisten), P. Sanio. Motorwagen, vol. 22, no. 5, Feb. 20, 1919, pp. 84-85. Directs attention to the fact that rail and railless vehicles of all kinds will have received such rough usage at the front, improper treatment through overloading, and bad handling and use of unsuitable materials in their manufacture that many of them will be unsuitable for civil purposes.

The Employment of Motor Trucks After the War—I & II (Zur Frage der Verwendung von Motorlastwagen nach dem Kriege), Th. Wolff. Zeitschrift für Transportwesen & Strassenbau, vol. 35, nos. 35 & 36, Dec. 10 & 20, 1918, pp. 412-416 and 426-431. Discusses advantages of motor trucks for various industrial purposes.

POWER GENERATION

CANADA. Hydro-Electric Development on Nipigon River. Can. Engr., vol. 36, no. 24, June 12, 1919, pp. 529-531, 8 figs. Reported that Hydro-Electric Power Commission of Ontario will install five units totaling 60,000 hp., at Cameron's Pool. A concrete dam 200 ft. long, 43 ft. high, is to be erected.

FRANCE. Intended Legistation on Water Power in France (Le nouveau projet de loi sur les forces hydrauliques). Houille Blanche, vol. 18, nos. 27-28, Mar.-Apr. 1919, pp. 41-46. Concerning state control of hydraulic energy developments.

GREAT BRITAIN. Electrical Energy from the River Dee. Engineer, vol. 127, no. 3309, May 30, 1919, pp. 524-526, 3 figs. Diagrams and plans of proposed utilisation of river between Llangollen and Chester.

The Supply of Electricity, John Somerville Highfield. Jl. Roy. Soc. Arts, vol. 67, no. 3469, May 16, 1919, pp. 408-420 and (discussion), pp. 420-424. Analysis of reports of Coal Conservation Sub-Committee, Elec. Trades Committee and Elec. Power Supply Committee, with tables showing amounts of capital expenditure and gross profits in various company and municipally-owned electricity undertakings.

ISOLATED PLANT. Effect of the War Upon Isolated Plant Costs. Elec. Rev., vol. 74, no. 25, June 21, 1919, pp. 1024-1027, 2 figs. Comparison of expenses of central station and isolated plant.

NIAGARA FALLS. Structural Details of Plant Extension at Niagara Falls Elec. Rev., vol. 74, no. 25, June 21, 1919, pp. 1028-1033, 9 figs. Addition of 40,000 hp. which involved construction of conduit 13.5 ft. in diameter.

Regional Planning of the Niagara District, Thomas Adams. Contract Rec., vol. 33, no. 25, June 18, 1919, pp. 563-566. Question examined from viewpoint (1) industrial development, (2) economic use and regulation of sub-division of land and character and density of structures in rural and urban areas. (3) housing, sanitation, convenience and amenity. (4) transportation—railways, highways and waterways. (5) sources and distribution of power. (6) water supplies and sewerage. (7) general amenties—including parks and boulevards and development of tourist facilities.

NORWAY. Hydroelectric Power Station near Hardanger, Norway (Storindustrien paa Vestilendet). Teknisk Ukeblad, vol. 66, no. 17, Apr. 25, 1919, pp. 211-212, 3 figs. Project for installing machinery to utilize 25,000 hp. out of 75,000 hp. available at Osa waterfalls.

Industrial Development in Norway (Den nye Toll i Norge. Nogen Track av det industrielle Gjennembrudds Historie). Teknisk Ukeblad, vol. 66, no. 18, May 2, 1919, 223-229, 14 figs. Figures showing effect of harnessing waterfalls.

SPAIN. Water Power Utilization in Spain (Salto de agua " Ribadelago " en el rio Tera), B. Oliver y Roman. Revista de Obras Publicas, vol. 67, no. 2276 May 8, 1919, pp. 218-239, 3 figs. on supp. plate. Project to utilize 1880-ft. waterfall.

UNITED STATES. The Energy Resources of the United States; A Field for Reconstruction Chester G. Gilbert and Joseph E. Pogue. Smithsonian Instn., U. S. Nat. Museum, bul. 102, vol. 1, 1919, 165 pp., 23 figs. Extended discussion of coal and water as sources of power and their present utilization in the U. S. A. Claimed need of (1) provision of common-carrier system for transmission of electrical energy (2) application of constructive economic policy to conditions surrounding petroleum.

WATER-POWER LEGISLATION. Need for and Status of Water-Power Legislation. Elec. Rev., vol. 74, no. 22, May 31, 1919, pp. 893-894. Summary of situation prepared by Nat. Service Committee of Eng. Council.

WISCONSIN RIVER. Hydroelectric Development on Wisconsin River at Stevens Point. William F. Snyder. Elec. Rev. vol. 74, no. 22, May 31, 1919, pp. 881-884, 7 figs. Flow of Wisconsin River is used as effective head of 14 ft. A total of 5700 hp. made up of six 950-hp. hydraulic turbines of the vertical type is comprised.

ZINC INDUSTRIES. Conditions in Electrometallurgical and Electrochemical Zinc Industries (L'état actuel des industries électrométallurgique et électrochimique du zinc), M. Lemarchands. Houille Blanche, vol. 18, nos. 27-28, Mar.-Apr. 1919, pp. 46-53. In England, France and the U. S., both before the war and at present. Opinions of various writers in regard to advantages secured by utilizing hydraulic energy in zinc industries are presented.

PIPE

Concrete. Reinforced-Concrete Pressure Pipe for Hydro-electric Plants (In Japanese), A. Inokuty. Denki Gakkwai Zasshi, no. 370, May 10, 1919. *See also Civil Engineering, Cement and Concrete Pipe.*

Sewer Pipe. *See Civil Engineering, Sanitary Engineering, Sewer Pipe.*

POWER PLANTS

Boiler Operation. The Practical Operation of Industrial Boilers, W. E. Snyder. Porc. Engrs. Soc. Western Pa., vol. 35, no. 2, March 1919, pp. 59-101 and (discussion) 101-116. With regard to safety and economy. A manual of instruction for boiler foremen is suggested.
Boiler Troubles; Their Origin and Remedy, T. H. Fenner. Power House, vol. 12, no 7, May 20, 1919, pp. 183-186, 5 figs. Note on pitting, grooving and external corrosion.

Boiler Room. Improving Operation in Typical Industrial Plant Boiler Room, J. T. Beard, Jr. Power, vol. 49, no. 25, June 21, 1919, pp. 967-969, 6 figs. Replaeing the pinhole grate with grate of proper design for coal to be burned; installing up take dampers and operating them by hand independent of other regulators, and other similar ehanges.
Boiler Furnaces and Boiler Furnace Design, D. S. Jacobus. Stevens Indicator, vol. 36, no. 1, Jan. 1919, pp. 1-10. Recommend avoiding construction in which brickwork is heated on both sides when under too great stress; also torch-like action of flames on walls. Paper presented at Phila. Conv. of Am. Boiler Mfrs. Assn.
Boiler Room of the Sheet Metal Products Co., Ltd., W. F. Sutherland. Power House, vol. 12, no. 9, June 20, 1919, pp. 245-247, 5 figs. With reference to efficiency of operation.

Combustion Control. Combustion Control in Mill Boiler Plant—I, Robert June. Blast Furnace & Steel Plant, vol. 7, no. 6, June 1919, pp. 274-276, 2 figs. Analysis of causes of losses.

Condensers. Parkersburg Station, Monongahela Valley Traction Co. Power Plant Eng., vol. 23, no. 13, July 1, 1919, pp. 575-578, 8 figs. Condenser pit provided in which circulating system operates as a syphon.

Dominion Power Co. Steam Electric Plant of the Dominion Power and Tranmission Company, Hamilton—II. Elec. News, vol. 28, no. 11, June 1, 1919, pp. 28-30, 3 figs. Description of turbines and auxiliary steam equipment.

Electrical Equipment. Electrical Equipment in a Model Y. M. C. A. Building. Elee. Rec., vol. 25, no. 6, June 1919, pp. 365-367, 4 figs. Brooklyn, N. Y. central building. Generating equipment includes two 200-kw. and one 75-kw. dc. machines driven by side-crank reciprocating steam engines. B. & W. water-tube boilers supply steam for operating engine.
Improvements in Industrial Plant Operation, E. F. George. Elec. World, vol. 73, no. 23, June 7, 1919, pp. 1207-1209, 2 figs. Methods of electrical construction and operation at plant of Lodge & Shipley Machine Tool Co., Cincinnati.

Exhaust Utilization. The Contraflo System of Utilizing Exhaust. Mar. Eng., vol. 9, no. 6, June 1919, pp. 209-211, 4 figs. Illustrating various arrangements of system.

Hydraulic Operating Board. Operation at Holtwood—Features of Station Operation and Maintenance. Charles H. Bromley. Power, vol. 49, no. 23, June 10, 1919, pp. 892-896, 9 figs. Hydraulic operating board which indicates operation of pumps, governor valves, etc., is located on turbine-room floor and is visible to switchboard operator.

Ice Difficulties. Operation at Holtwood, Charles H. Bromley. Power, vol. 49, no. 22, June 3, 1919, pp. 850-854, 4 figs. Handling ice difficulties at plant.

Instruments. Boiler and Turbine Room Instruments, Power Plant Eng., vol. 53, no. 13, July 1, 1919, pp. 586-588, 2 figs Their value in maintaining high degree of operating efficiency. From report of Committee on Prime Movers, presented at convention of Nat. Elec. Lighting Assn.

Johns Hopkins University. Mechanical Equipment at Johns Hopkins University, Julian C. Smallwood. Power, vol. 49, no. 21, May 27, 1919, pp. 811-814, 7 figs. Power plant designed with view to providing economical and continued service, and also facility for undergraduate experimentation and means for research, usual and special.

Muscle Shoals Plant. United States Nitrates Plant No. 2, Muscle Shoals. Ala.—Station Heat Balance. Edward R. Wells and H. C. Lockwood. Power, vol. 49, no. 21, May 27, 1919, pp. 802-805, 8 figs. Hotwell water, which varies between 80 and 100 deg. fahr. used for cooling lubricating oil for main turbine. This turbine is of 60,000 kw. continuous capacity and is electrically in parallel with two noncondensing house turbines, which furnish power for driving auxiliaries.

Starting and Stopping Large Units. Operation at Holtwood, Charles H. Bromley. Power, vol. 49, no. 25, June 24, 1919, pp. 973-976, 6 figs. Procedure and precautions used in starting and stopping large main units.

Steam Traps. Notes on Steam Traps, F. G. Hechler. Jl. Am. Soc. Naval Engrs., vol. 31, no. 2, May 1919, pp. 430-437, 1 fig. Insisting upon regular inspection of all traps is advised.

Universal Portland Cement Co.'s Plant. Universal Portland Cement Co.'s Largest Plant, William B. Eastwood. Cement, Mill & Quarry, vol. 14, no. 11, June 5, 1919, pp. 17-19, 2 figs. Waste-heat power plant consists of 12 Babcock & Wilcox boilers, each individually fed with waste gases from rotary kilns.

POWER TRANSMISSION

Belting. Proper Use and Care of Leather Belting, Guy B. Smith, Cement, Mill & Quarry (Belting Section), vol. 14, no. 11, June 5, 1919, pp. 13-15, 1 fig. Contends that slippage is due chiefly to incorrect choice and an improper width of belt, undersized pulleys, poor alignment, insufficient precautions against oil from leaky bearings and use of poor belt dressings.

PRODUCER GAS

Gas Producers. Recent Development in Gas Producers (Ueber Gaserzeuger und ihre neuste Entwicklung), Dr. Markgraf. Technische Blätter, vol. 9, nos. 13-13, Mar. 31, 1919, pp. 60-62, 4 figs. Historical review of use of gas for technical purposes. According to writer, so far the hope to use low-grade fuels has not been realized and the best fuel at present for revolving grates is washed nut eoal. (To be eontinued).

PUMPS

Bilge Pumps. Turbine-Driven Pipeless Salage Bilge Pumps. Engineering, vol. 107, no. 2787, May 30, 1919, pp. 698-700, 8 figs. Vertical standard type with capacity of 1000 tons of water per hour.

Centrifugal Pumps. Steam Turbine-Driven Centrifugal Pumps, Fire & Water Eng., vol. 65, no. 23, June 4, 1919, pp. 1392-1393, 3 figs. Considered as advantageous for city water supply.
Design of Motor-Driven Centrifugal Pumps, A. T. Clark. Can. Engr., vol. 36, no. 25, June 19, 1919, pp. 548-549, 5 figs. Characteristic curves for different types under identical conditions.

Gear Reduction Drive. Helical Gears Solve Cornwall's Pumping Problem R. N. Austin. Can. Engr., vol. 36, no. 23, June 5, 1919, pp. 507-509, 5 figs. High-speed single-stage centrifugal pumps are driven by low-speed hydraulie turbines with pumping efficiency of 73 per cent including gear loss.

Louisville. Louisville's New Pumping Station. Mun. Jl. & Public Works, vol. 46, no. 23, June 7, 1919, pp. 398-402, 8 figs. Latest increase said to be 30,000,000 gal. vertical, triple flyheel pump.

Rotary Fire Pump. New Type Rotary Fire Pump, Fire & Water Eng., vol. 65, no. 25, June 18, 1919, pp. 1546-1547. With lateral intake and discharge and hardened steel pilot gears.

Salvage Pumps. *See Bilge Pumps.*

San Francisco. San Francisco Pumping Stations, Charles W. Geiger. Power Plant Eng., vol. 23, no. 12, June 15, 1919, pp. 527-536, 7 figs. Details of two so-called earthquake-proof salt-water pumping stations.

Toronto Waterworks. Main Pumping Station Toronto Waterworks, W. F. Sutherland. Power House, vol. 12, no. 7, May 20, 1919, pp. 177-182, 10 figs. Present capacity is 200,000,000 gal. per 24 hr.

REFRACTORIES

Dolomite. Experiments in Dead-Burning Dolomite, H. G. Schurecht. Jl. Am. Ceramic Soc., vol. 2, no. 4, Apr. 1919, pp. 291-305, 13 figs. Roll seale reported to have been found very effective in dead-burning delomite without decreasing its refractoriness too much.

Firebrick. Firebrick-Manufacture and Use, W. H. Grant. Can. Manufacturer, vol. 39, no. 6, June 1919, pp. 23-25. Particularly in steel and clay-products industries.

Porcelain. The Comparative Value of Kneading and Pugging in the Preparation of Porcelain Bodies, L. E. Barringer. Jl. Am. Ceramic Soc., vol. 2, no. 4, Apr. 1919, pp. 306-312, 2 figs. Results of tests are claimed to demonstrate that the center of pug-mill blank contains more air than the edge, this being due to greater pressure on blank where it comes in contact with die.
Some Physical Properties of American Commercial Porcelain Bodies, J. W. Wright and S. I. Sewell. Jl. Am. Ceramic Soc., vol. 2, no. 4, Apr. 1919, pp. 282-290, 3 figs. Numerical results obtained from determination made upon commercial bodies.

Zirconia. Fused Zirconia—The New Refractory, A. J. Franklin. Metal Industry, vol. 14, no. 20, May 16, 1919, pp. 401-402. Analysis of various varieties of Brazilian baddelyite and the biography of zireonia including principally articles published in German magazines.

REFRIGERATION

A. E. F. Refrigerating Plant. Refrigerating Plant No. 1, American Expeditionary Forces, John V. Fisher. Power, vol. 49, no. 24, June 17, 1919, pp. 920-922, 7 figs. Capacity of 600-ton.
Refrigeration for the Army, L. R. Phillips. Ice & Refrigeration, vol. 56, no. 6, June 1919, pp. 369-375, 14 figs. Ice-making and cold-storage plants erected in France. Also plants erected at cantonments, notably one with large freezer capacity at Chicago.

Abattoir. The Municipal Abattoir of the City of Reichenberg (Der städtische Scalachthor in der Stadt Reichenberg). Zeitschrift für Eis-und Kälte-Industrie, vol. 11, no. 8, Feb. 1919, pp. 113-116, 3 figs. Total area oecupied is 29,400 sq. m., of which 8,730 sq. m. is used for stock yards.

Code, Refrigerating. Tentative Refrigerating Code. Refrigerating World, vol. 54, no. 6, June 1919, pp. 11-14, 2 figs. For Municipal and State Regulations for refrigerating machines and refrigerants proposed by Refrigerating Regulations Committee and approved by Council of the A.S.R.E.

Marine Refrigeration. Notes on Marine Refrigeration, A. H. Baer. Am. Soc. Refrig. Engrs., vol. 5, no. 5, March 1919, pp. 383-386. Result obtained by the Government.

Williams Refrigerating Machine. The Williams Refrigerating Machine, Wm. L. DeBaufre. Jl. Am. Soc. Naval Engrs., vol. 31, no.2, May 1919, pp. 454-469, 10 figs. Test to determine capacity under various temperatures of refrigeration, also to note general operating characteristics and durability of parts.

RESEARCH

Industrial Laboratories. Lynite Laboratories of the Aluminum Castings Company Embody Most Progressive Ideas and Up-to-Date Equipment in the Field of Industrial Research. Aerial Age, vol. 9, no. 14, June 16, 1919, pp. 678-683, 11 figs. Organization and work undertaken by the three sections—research development and technique—into which laboratory is divided.

Furnace Manufacturer's Research Plant. Metal Worker, Plumber & Steam Fitter, vol. 91, no. 23, June 6, 1919, pp. 727-729, 6 figs. Investigation at University of Illinois Engineering Experiment Station for which Nat. Warm Air Heating & Ventilating Assn. appropriated $8000 at its 1918 convention.

Works Laboratory Organization, J. E. Hurst. Foundry Trade Jl., vol. 21, no. 208, Apr. 1919, pp. 224-227, 1 fig. Chart of principal technical departments of a modern engineering works, showing relationship between scientific and production department. Paper read before Lond. Branch British Foundrymen's Assn.

Municipal Testing Laboratories. The Organization of a Standard Municipal Testing Laboratory. J. C. Preston. Can. Engr., vol. 36, no. 23, June 5, 1919, pp. 520-522, also Eng. & Contracting, vol. 51, no. 23, June 4, 1919, pp. 592-594, 1 fig. It is concluded that standard testing laboratory is an economical investment for any municipality, that its field or service is of almost unlimited expansion. Concluded from May 22 issue.

Naval Research. Naval Research, C. S. McDowell. U. S. Naval Inst. Proc., vol. 45, no. 196, June 1919, pp. 895-908. List of problems in which it is considered desirable to undertake research work and enumeration of advantages.

Norway. Christiania Experimental Testing Station (Kristiania Materialproveanstalt). Teknisk Ukeblad, vol. 66, no. 16, Apr. 18, 1919, pp. 201B-201D Applications for tests on strength of metals, wood, rope and belts, and on building materials totalled 984 for 1917-1918. Instances are quoted indicating nature of tests required. (To be continued).

Switzerland. Mechanical, Physical and Chemical Testing Laboratory of the Engineering School at Lausanne (Le laboratoire d'essais mécaniques, physiques et chimiques de l'école d'ingénieurs de l'Université à Lausanne). Bul. Technique de la Suisse Romande, vol. 45, nos. 9 & 10, May 3 & 17, 1919, pp. 79-81, 489-91, 47 figs. Compression press with capacity of 150 tons built similarly to tension machine described in preceding installment Description of amisler pendulum dynamometer. (Continuation of serial).

STANDARDS AND STANDARDIZATION

German Motor Industry. Standardization and Specialzation in the German Motor Industry (Normalisierung-Spezialisierung), B. von Lengerke, Motorwagen, vol. 22, no. 3, Jan. 31, 1919, pp. 50-51. Although regarding outlook as rathed rak, for motor industry, writer thinks position could be improved by adopting American methods of quantity production.

Plate Industry, Steel. Features of the Steel Plate Industry. Raw Material, vol. 1, no. 4, June 1919, pp. 206-212, 7 figs Guides to specification of various grade of plates and advice concerning specifications necessary to obtain, solid homogeneous metal free from defects.

Quarry Products. Standardization of Quarry Products (Die Normung der Steinbruchserzeugnisse), Freystedt. Zeitschrift für Tranportwesen & Strassenhau vol. 36, no. 7, Mar. 1, 1919, pp. 75-84, From the viewpoint of the quarry operator. Tables of standard sizes.

Threads, Pipe and Screw. New Series of Pipe and Screw Threads. Jl. Soc. Automotive Engrs., vol. 4, no. 5, May 1919, pp. 358-360, 1 fig. Tables giving standards proposed by Nat. Screw Thread Commission.

STEAM ENGINEERING

Boiler Baffling. Suggestions for Correct Boiler Baffling, A. D. Williams. Blast Furnace & Steel Plant, vol. 7, no. 6, June 1919, pp. 283-286, 10 figs. Regulating gas velocity to permit maximum heat transfer.

Boiler Heads. Alignment Charts for Finding the Dimensions and Volumes of Bumped Heads, C. H. Berry. Power. vol. 49, no. 24, June 17, 1919, pp. 926-927, 5 figs. Deals in diameter, radius of spherical surface and height of bump.

Boiler Setting. Suspension and Concrete Setting of Boiler at the Robert Gair Plant, Brooklyn. Power, vol. 49, no. 24, June 17, 1919, pp. 934-935, 2 figs. Building columns and boiler-support columns, will be exposed to furnace temperatures.

Compound Engines. The Design of Compound Engines, F. S. Bauer. University of Colorado, Jl. of Eng., vol. 15, no. 3, Apr. 1919, pp. 25-37, 2 figs.Curves showing relations between absolute boiler pressure and cylinder-volume ratio, total ratio of expansion and receiver pressure of various back-pressures.

Turbines. Westinghouse-Rateau Marine Geared Turbines. Engineering, vol. 107, no. 2786, May 23, 1919, pp. 666-668, 6 figs., partly on two separate plates Turbine consists of independent high and low pressure cylinders, giving 2,500 shaft hp. Steam is supplied from three single-ended marine type boilers, 15 ft. in diameter, and 11 ft. 9 in. long.

Steam Turbine Reviewed Historically—II. Universal Engr., vol. 29, no. 3, Mar. 1919, pp. 29-45, 25 figs. Governor control employed by Westinghouse Co. Arrangement developed for automatic operation of bypass valves to enable turbine to carry heavy overloads

Turbine Blade Fastenings—II. Mech. World, vol. 65, no. 1692, June 6, 1919, pp. 271-272, 7 figs. Blading reaction turbines in segments. (Continuation of serial.)

Uniflow Engines. Modern Advancement in Steam Prime Movers, E. H. Beckstrand. Utah Soc. Engrs., vol. 5, no. 3, Mar. 1919, pp. 45-54. Believes that prime mover best adapted to high pressure end of steam diagram would be Uniflow engine with poppet valves.

The "Uniflow" Pumping Engine, D. A. DeCrow. Can. Engr., vol. 36, no. 25, June 19, 1919, pp. 557-558, 2 figs. Claims simplicity of construction, low cost of production as compared with compound and triple expansion reciprocating pumping engines, and economy in use of steam. Paper read at convention of Am. Water Works Assn.

THERMODYNAMICS

Heats of Fusion, Latent. A Note on Latent Heats of Fusion and their Relation to Molecular Composition, Harbord George Wayling. Lond., Edinburgh, and Dublin Phil. Mag., vol. 37, no. 221, May 1919, pp. 495-497. Expressing Trouton's rule as ratio of product of latent heat of fusion by molecular number, to melting point on absolute scale, writer finds that for several compounds this ratio is equal to number of atoms in molecule.

WELDING

Acetylene Generating Plant. Acetylene Generating Plant for Large Welding Shops. Acetylene & Welding Jl., vol. 16, no. 188, May, 1919, pp. 93-94, 1 fig. It consists of seven generators, gas collector, moisture separator, two condensers, gasometer capable of storing 350 cu. ft. of gas and four large purifiers with bypasses for working in pairs.

Acetylene Welding. Acetylene Welding. Ry. Jl., vol. 25, no. 6, June, 1919, pp. 19-19. Committee report before Master Boiler Makers' Assn.

Great Britain's Acetylene Welding Industry—its Birth, Growth and War Record, Norman MacLeod. Jl. Acetylene Welding, vol. 2, no. 12, June, 1919, pp. 601-603, 8 figs. Founding of Northern Polytechnic Inst., and featuring courses in autogenous welding. Among samples of welding applications, the reconstruction of a bomb dropped in London by a German zeppelin is described.

Shutdown of Great Steel Plant Avoided by Oxywelding, L. M. Malcher. Jl. Acetylene Welding, vol. 2, no. 12, June 1919, pp. 611-614, 5 figs. Repairing wrecked low-pressure cylinder which was cracked at head end in seven different places.

A Difficult Cylinder Block Job, David Baxter. Jl. Acetylene Welding, vol. 2, no. 12, June 1919, pp. 607-610 & 622, 10 figs. Presented as case in which welding operator was handicapped by intense heat radiating against tip at close quarters from every direction and very limited space in which to manipulate.

Notable Repairs on Large Cylinder by Oxy-Acetylene Welding, L. M. Malcher. Pac. Mar. Rev., vol. 16, no. 6, June 1919, pp. 104-105, 4 figs. Cylinder of Allis-Chalmers twin compound reversing engine, 70 in. diameter, badly fractured. Cost of repair estimated about one-third of that of a new cylinder.

Welding by the Oxy-Acetylene Method—III, J. F. Springer, Automobile Eng., vol. 4, no. 5, May 1919, pp. 238-239, 2 figs. Examples of successful welds in cast-iron frames, with remarks on methods of making welding groove and filling it with new metal.

Aluminum Welding. The Vertical Welding of Aluminum. Acetylene & Welding Jl., vol. 16, no. 188, May, 1919, pp. 94 & 99, 2 figs. Tests made on sheet aluminum of 11 and 14 gage.

Boiler Repairs. Repairs to Boilers and Engines by Welding, E. G. Hiller. Can. Machy., vol. 21, no. 21, May 22, 1919, pp. 520-521, 2 figs. Examples such as repairing wrought steel, hot-water boiler which was fractured at fire hole and building up by electric welding flanged seams of flue-tube for Lancashire boiler. Paper read before Instn. Mech. Engrs.

Concrete, Reinforced, Construction. Autogenous Welding in Reinforced-Concrete Construction (Die Flammenverschmelzung im Eisenbetonbau). Autogene Metallbearbeitung, vol. 12, no. 1, Jan. 1919, pp. 26, 12 figs. Description of method of construction, said to be especially suited for concrete vessels and large tanks. (To be continued.)

Cylindrical Bodies. Welding Performed on Cylindrical Bodies, Ernest Schwartz. Can. Machy., vol. 21, no. 22, May 29, 1919, pp. 552-553, 4 figs. Concerning welding of seams and of head and bottom cylindrical bodies.

Dredges. Oxy-Acetylene and Electric Welding on Dredges, H. G. Blankman. Min. & Sci. Press, vol. 118, no. 21, May 24, 1919, p. 716. Also Metal Trades, vol. 10, no. 6, June 1919, p. 257. Can. Klondyke Mining Co. operates three large dredges and has installed in its machine shop an oxy-acetylene welding equipment. Article quotes results obtained.

Electric Welding. Electric Welding: Its Theory, Practice, Application and Economies, H. S. Marquand. Elecn., vol. 82, nos. 20, 21, 23 & 24, May 16, & 23, June 6 & 13, 1919, pp. 535-567, 591-593, 645-647, and 681-683, 19 figs. Best results with Bernados system are said to be obtained with current supplied at about 75 to 80 volts; it is noted, however, that when this potential is obtained from a higher voltage circuit through resistance, there is great loss of energy and quality of work is likely to be impaired. (Continuation of serial.)

Electric Welding and Welding Appliances—XIII. Engineer, vol. 127, no. 3366, May 9, 1919, pp. 444-446, 5 figs. Machines manufactured by Al Manufacturing Co., of Industry Works, Bradford. They produce machines and accessories for resistance welding only.

Electric Welding in Warships, W. H. Gard. Mar. Engr. & Naval Architect, vol. 41, no. 500, May 1919, pp. 238-244, 7 figs. Among various examples of repair work, restoring of cast-steel sternpost of battleship is quoted as significant development of process. Paper read before Inst. Naval Architects.

Electric Welding, Arc. Important Factors for Efficient Arc Welding, E. Wanamaker and H. R. Pennington. Ry. Elec. Engr., vol. 19, no. 6, June 1919, pp. 179-185, 13 figs. Concerning flexibility of installations, location of accessories and eye and body protection.

Relation of Arc Phenomena to Electric Welding, C. D. Fawcett. University of Colorado, Jl. of Eng., vol. 15, no. 3, Apr. 1919, pp. 15-24, 2 figs. Suggestions in regard to welding practice with table giving approximate relation of electrode diameter, plate thickness, etc.

Electric Arc Welder for Portable and Stationary Use. Automotive Industries, vol. 40, no. 23, June 5, 1919, p. 1233, 2 figs. Outfit designed for operation on either direct current or alternating current lines.

Electric Welding, Plastic Arc. The Plastic-Arc System of Welding, J. O. Smith. Coal Age, vol. 15, no. 26, June 26, 1919, pp. 1162-1166, 7 figs. Also Ry. Rev., vol. 64, no. 24, June 14, 1919, pp. 898-900, 9 figs. Description of outfit and examples of repairs effected by this system. Paper presented before meeting of Coal Min. Elecns. and Mechanics Inst.

Engine Cylinders, Liberty. Welding Operations on Liberty Motor Cylinders H. A. Carhart. Am. Mach., vol. 50, no. 22, May 29, 1919, pp. 1019-1025, 13 figs. Mixtures and apparatus used by Lincoln Motor Co.

GAS CUTTING TORCHES. Modern Welding and Cutting. Am. Mach., vol. 50, no. 23, June 5, 1919, pp. 1081-1087, 15 figs. Difference between gas cutting torches and those used for welding; details of various makes of gas cutting torches. 13th articles.

Modern Welding and Cutting—XIV, Ethan Viall. Am. Mach., vol. 50, no. 26, June 26, 1919, pp. 1237-1243, 15 figs. Gas-pressure regulators and working assemblies; directions for lighting of torch; charts showing various flame characteristics with different gas combinations.

PRE-HEATING WORK. Pre-Heating Work for Oxy-Acetylene Welding, J. F. Springer. Ry. & Locomotive Eng., vol. 32, no. 6, June 1919, pp. 184-185, 1 fig. On prevention of cracking.

SHIP CONSTRUCTION. Welding as a Process in Ship Construction, S. V. Goodall. Gen. Elec., Rev., vol. 22, no. 8, Mar. 1919, pp. 213-216. Observes that riveting being greatest single labor item, any improvement in method of binding together whole structure offers fruitful field for economy.

STRENGTH OF WELDS. Electric Welding and Welding Appliances—XIV. Engineer, vol. 127, no. 3307, May 16, 1919, pp. 471-473, 1 fig. Account of tests which have been devised for determining strength of electric welds. (Concluded.)

STRESSES IN SEAMS. Stresses in Seams in Autogenous (Wie wird beim Autogenschwissen die Schweisshaht beansprucht). Autogene Metalibearbeitung, vol. 12, no. 1, Jan. 1919, pp. 6-8. Phenomena observed in welding mild steel.

THERMIT WELDING. Thermit Process Used on Big Welding Job on Northern Pacific. Mar. News, vol. 6, no. 2, July 1919, pp. 96-97, 5 figs. Illustrating repair on cast-steel stern frame which was cracked through just above upper post gudgeon, the break forming roughly a triangle, each side of which was about 2 ft. long.

Restoring Steel Machinery to Service by the Thermit Process. Welding Engr., vol. 4. no. 6, June 1919, pp. 29 and 32-33, 14 figs. Examples of repairs of large pieces of work for Pittsburgh Steel Co.

WELDING JIGS. Some Examples of Welding Jigs and Methods for Overcoming Distortion, C. S. Milne. Acetylene & Welding Jl., vol. 16, no. 187, Apr. 1919, pp. 66-73 33 figs. Illustrates various kinds of defects that are usually remedied by welding and discusses practices in reducing cooling stresses. Paper read before British Acetylene & Welding Assn.

WOOD

GIRDERS, LATTICE. Wooden Lattice Girders (Boltede Gittekonstruktioner of Trae med "Bufobrikker"). Ingeniren, vol. 28, no. 30, Apr. 12, 1919, pp. 196-199, 8 figs. Corrugated steel "Bufo" washers are used between the rod and beams.

SPRUCE, SEASONING. Emergency Seasoning of Sitka Spruce, L. A. Welo. Sci. Am., Supp. vol. 87, no. 2269, June 28, 1919, pp. 404-405, 2 figs. Strength of kiln-dried and air-dried spruce compared.

VARIA

ENGINEERING PROFESSION. The Engineer and the Community, E. H. Sniffin. Elec. Jl., vol. 16, no. 6, June, 1919, pp. 249-251. Writer asks why the engineer who has "made the world more habitable than was even dreamed of by the greatest imaginations of former ages" is not "a more conspicuous member of the community."

Proper Recognition of the Engineering Profession, W. W. K. Sparrow. Ry. Rev., vol. 64, no. 18, May 3, 1919, pp. 668-670. Believes that prime requisites to obtaining greater recognition of engineering profession are organization, licensing and broader education.

METRIC SYSTEM. The Metric System in Engineering, Frederick A. Halsey. Eng. Education, vol. 9. no. 10, June 1919, pp. 491-499. Argues that value of introducing metric system should be measured by results to be expected from its introduction; as no special benefit is seen in changing already standardized mechanical constructions from their present values to metric units, acceptance of metric system in engineering is not considered practical.

NATIONAL DEPT. OF PUBLIC WORKS. The Movement to Establish a National Department of Public Works, Frederic H. Fay, Jl. Boston Soc. Civ. Engrs., vol. 6, no. 6, June 1919, pp. 235-244 and (discussion) pp. 244-264. Prospect of establishing national budget system visualized as sound argument in favor of aiding Nat. Dept. of Public Works.

STEREOAUTOGRAPH. The Stereoautograph, Model 1914, Its Correction and Application (Der Stereoautograph Modell 1914, seine Berichtigung und Anwendung). H. Lüsher. Zeitschrift für Instrumentenkunde, vol. 39, no. 1, Jan. 1919, pp. 2-19, 11 figs. Instrument for mechanical utilization of stereoautographic pictures. (To be continued.)

TANKS, CAPACITY. The Capacity of Cylindrical Tanks. Motor Age, vol. 35, no. 24, June 12, 1919, p. 51, 1 fig. Chart for computing contents of tanks of usual lengths and diameters or size required for desired capacity.

METALLURGY

ALUMINUM

ALUMINUM ALLOYS. Special and Commercial Light Aluminum Alloys, Robert J. Anderson, Dept. of the Interior, Bur. of Mines. Minerals Investigation Series, no. 14, April 1919, 22 pp. Description with chemical analyses and enumeration of physical properties of various alloys submitted to government bureaus. Writer does not feel that the majority of so-called "new" alloys possess properties claimed for them or that it is economical to manufacture them.

BLAST FURNACES

BRITISH 800-TON PLANT. 800-Ton Blast Furnace Plant at the Park Gate Works. Rotherham, and the Staveley Works, Chesterfield. Iron & Coal Trade Rev., vol. 98, no. 2675, June 6, 1919, pp. 759-760, 12 figs. partly on supp. plates. Also Engineer, vol. 127, no. 3310, June 6, 1919, pp. 564-566, 10 figs. on supp. plates. Furnace said to have been designed with a view to secure even distribution around large bell; equal distribution of large and fine, gas-tight top, means for changing bell rods and other gear with minimum loss of time. Internal dimensions are given.

CHARGING. Charging Raw Material into Blast Furnaces, J. A. Mohr. Iron Age, vol. 103, no. 22, May 29, 1919, pp. 1432-1434 and (discussion), pp. 1434-1436, 3 figs., also Iron Trade Rev., vol. 64. no. 22, May 29, 1919, pp. 1413-1415, 1 fig. and Blast Furnace and Steel Plant, vol. 7, no. 6, June 1919, pp. 298-305, 6 figs. On co-ordinating and arranging different phases of charging and mixing of raw material so as to achieve uniformity in their disposition and arrangement that will best suit conditions of individual plant.

ELECTRIC SMELTING. Commercial Feasibility of Electric Smelting of Iron Ores in British Columbia. Alfred Stansfield. Chem. & Metallurgical Eng., vol. 20, no. 12, June 15, 1919, pp. 630-636. Also Iron & Steel of Can., vol. 2, no. 5, June 1919, pp. 132-145. Excerpts from bul. no. 2, 1919, British Columbia Department of Mines. Electric pig iron.

CLEVELAND (ENGLAND) ORE SMELTING. The Smelting of Cleveland Iron-Stone. S. G. Smith. Foundry Trade Jl., vol. 21, no. 208, Apr. 1919, pp. 229-232, General outline of process of converting ore into pig iron, as followed at district embracing coast from Saltburn to Whitby, also Normandy and Eston Hills. Paper read before Lancashire Branch British Foundrymen's Assn.

STEEL TURNINGS. Utilization of Steel Turnings in the Blast Furnace (L'Emploi des tournures d'acier au haut fourneau), M. Tripier. Bulletin et comptes rendus de la Société de l'Industrie Minérale, vol. 15, no. 5, 1919, pp. 275-297. Experience acquired in munition works.

FERROUS ALLOYS

FERRO-ALLOYS. Ferro-Alloys in Alloy Steel Production. Raw Material, vol. 1, no. 3, May 1919, pp. 177-181, 8 figs. Survey of situation, specially of impetus given to alloy industry during the war.

IRON-COBALT ALLOYS. On Some Physical Constants of Iron-Cobalt Alloys, Kôtarô Honda. Science Reports of the Tôhoku Imperial University, vol. 8, no. 1, Apr. 1919, pp. 51-59, 4 figs. Experimental. Measurement of thermal and electrical conductivity, moduli of elasticity and rigidity, and intensity of magnetization.

FLOTATION

COPPER. Recovery of Copper from Flotation by Leaching, Percy R. Middleton. Min. & Sci. Press, vol. 118, no. 23. June 7, 1919, pp. 771-772. Results of roasting and leaching flotation concentrate.

HARDWOOD TAR OILS. Flotation Experiments on Hardwood Tar Oils, L. F. Hawley and O. C. Ralston. Chem. & Metallurgical Eng., vol. 20, no. 11, June 1, 1919. pp. 586-587. Experimental tests. It is concluded that a mixture of different oils is more likely to do good flotation work than any one product alone.

PRACTICE. Flotation for the Practical Mill Man. Frederick G. Moses. Chem. & Metallurgical Eng., vol. 20, no. 11, June 1, 1919, pp. 571-577. Suggestions in regard to overcoming factors tending to produce unsatisfactory results in flotation plant.

SULPHUR. Concentration of Native Sulphur Ores by Flotation, James M. Hyde. Dept. of the Interior, Bur. of Mines, Minerals Investigations Series, no. 18, April 1919, 18 pp. Reported that ores from several districts were treated successfully by flotation. It is claimed that under favorable conditions better than 80 per cent of sulphur should be recoverable as concentrate containing more than 80 per cent of sulphur.

FURNACES

ELECTRIC. Electric Furnace for Melting Non-Ferrous Metals—II, E. F. Collins. Foundry, vol. 47, no. 324, June 1, 1919, pp. 329-333, 4 figs. Statement of melting cost of electric and fuel-fired furnaces.

A New Electric Rotating Brass Furnace, Carl H. Booth. Iron Age, vol. 103, no. 26, June 26, 1919, pp. 1699-1702, 4 figs. Booth in which door has been placed in one end of furnace and tapping hole in other end in order to overcome difficulty which is said to have been experienced in previous models in maintaining lining around combination spout and door.

POWDERED FUEL. Powdered Fuel for Firing Metallurgical Furnaces and Steam Boilers, J. S. Atkinson. Iron & Coal Trades Rev., vol. 98, no. 2672, May 16, 1919, pp. 651-652, 15 figs. on supp. plate Success in burning powdered coal secured, writer believes, by first drying coal down to a point where there is not more than one per cent of moisture left in it, pulverizing to such a degree of fineness, that 95 per cent of coal will pass through a 100-mest sieve and intimately mixing powdered coal with air before admitting it to combustion chamber. Paper read before Sheffield Soc. of Engrs. and Metallurgists.

Use of Pulverized Coal, with Special Reference to Its Application in Metallurgy, L. C. Harvey. Colliery Guardian, vol. 117, nos. 3046 & 3047, May 16 & 23, 1919, pp. 1146-1148 & 1228-1229, 16 figs. "Holbeck" (Bonnot) system, "Quigley," "Fuller," "Bergman," "Covert" and "Stroud" systems. Graphs showing comparison of approximate utilization and waste of fuel supplied to locomotive boiler with hand and powdered-coal firing. taking fuel as delivered to engine tender.

RECUPERATIVE FURNACE. A New Type of Recuperative Furnace, Walter Rosenhain. Engineering, vol. 107, no. 2787, May 30, 1919, pp. 702-704, 8 figs. Recuperator consists of nest or battery of tubes through which incoming air is drawn while products of combustion circulate about interior of tubes.

IRON AND STEEL

AIRCRAFT STEEL. Shop Practice in Respect to Aircraft Steel, H. P. Philpot. Aeronautical Jl., vol. 23, no. 99, Mar. 1919, pp. 112-129, 45 figs. Equilibrium diagrams of solutions of sodium nitrate and water, also iron-carbon equilibrium diagram and graphs indicating variations and physical properties of nickel-chrome steel with varying quenching temperatures.

Allotropy of Metals. The Allotropy of Metals in the Light of Recent Research —II, Clifford W. Nash. Chem. Eng. & Min. Rev., vol. 11, no. 127, Apr. 5, 1919, pp. 192-194. Evidence in favor of existence of allotropic forms of iron. (Concluded.)

Borax. *See Fluxes.*

Cast Iron, Impurities in. Cast-Iron Under Heat Influences, E. Adamson. Jl. of West of Scotland Iron & Steel Inst., vol. 26, part 6, Feb., session 1918-1919, pp. 80-84 and (discussion), pp. 84-88, 2 figs. partly on supp. plate. Experimental tests in regard to separation of impurities.

Cast Iron, Oxygen in. Oxygen in Cast Iron and Its Application, Wilford L. Stork, Bul. Am. Inst. Min. & Metallurgical Engrs., no. 150, June 1919, pp. 951-956. Also Iron Age, vol. 103, no. 25, June 19, 1919, pp. 1636-1637. Purports to give further evidence in support of theories advanced by J. E. Johnson, Jr., in regard to influence of oxygen on strength of cast iron, and to show

Cooling of Hypoeutectic Steels. Effect of Cooling on Micrographic Structure of Hypoeutectic Steels and Alloys of similar Constitution (Effet du revenu sur la structure micrographique des aciers hypoeutectiques et des alliages de constitution similaire), M. A. Portevin. Revue de Metallurgie, vol. 16, no. 2, Mar.-Apr., 1919, pp. 141-148, 16 figs. Examination of photomicrographs of various specimens.

Duplexing. Metallurgical Considerations of Duplexing—II, Richard S. McCaffery. Blast Furnace & Steel Plant, vol. 7, no. 6, June 1919, pp. 287-288 and 297. Suggestion for removal of sulphur and phosphorus.

Fluxes. Boron Derivatives in Relation to Metallurgy. Metal Industry, vol. 14, no. 18, May 2, 1919, pp. 367-369. Uses of borax glass for fluxing purposes at South African, American and Australian gold mines and other applications of borax.

Gathman Process of Ingot Production. Commercial Production of Sound Steel Ingots, Emil Gathman. Raw Material, vol. 1, no. 4, June 1919, pp. 213-216, 5 figs. Gathman process.

Grain Size and Rolling. The Grain Size in Steel as Influenced by Rolling, Iron & Steel of Can., vol. 2, no. 2, Mar. 1919, pp. 42-43, 4 figs. Experiments at Welland Plant of Can. Steel Foundries. It is concluded that composition of all unhardened steel is either pearlite alone, or pearlite associated with ferrite or cementite.

Heat Treatment. Alteration of Steels at Temperatures in the Neighborhood of 500 Deg. Cent. (Sur l'Alteration des aciers aux températures voisines de 500°), M. Grenet. Bulletin et comptes rendus de la Société de l'Industrie Minerale, vol. 15, no. 5 1919, pp. 339-353, 4 figs. These temperatures were found to be particularly harmful to nickel-chrome steels containing carbon and manganese; while not so injurious to other steels, it is nevertheless advised not to keep unnecessarily any steel at this temperature.

Impurities, Non-Metallic. Non-Metallic Impurities in Steel, Henry D. Hibbard. Iron Age, vol. 103, no. 22, May 29, 1919, pp. 1427-1429 & (discussion), pp. 1429-1432. While believing that to forecast effect of sonims on the properties of steel much work is required to be done and interpreted, writer believes that quantity and composition must be ascertained by chemical means, and mode of occurrence as far as possible be by the microscope.

Open Hearths, Cooling Devices for. Cooling Devices for Open Hearths, Wm. C. Coffin. Iron Trade Rev., vol. 64, no. 21, May 22, 1919, pp. 1356-1358, 3 figs. States that furnace life is increased by installing water-cooling equipment having brick covering. Recent developments in door, buckstay, skewback, port and bulkhead coolers are indicated.

Rolling Mills. The New Steel Worm and Rolling Mill at Witkowitz (Die neue Stahl- und Walzwerksanlage des Eisenwerkes Witkowitz.) Montanistische Rundschau, vol. 11, no. 6, Mar. 16, 1919, pp. 156-162, 9 figs. Plant completed in 1916 consists of a 300-ton mixer, three 200-ton Talbot furnaces and thirty-three 60-ton Martin stationary type furnaces. (To be continued.)

Soaking Pit, Electrically Heated. Electrically Heated Soaking Pit, Thaddeus F. Bailey. Iron Age, vol. 103, no. 22, May 29, 1919, pp. 1419-1421 and (discussion), pp. 1421-1422, 4 figs., also Iron Trade Rev., vol. 64, no. 22, May 29, 1919, pp. 1416-1418, 1 fig.
Writer sees coming acceptance of electric soaking pits in commercial operations.

Steel, High-Speed. The Manufacture and Working of High Speed Steel, J. H. Andrew. Engineering, vol. 107, no. 2787, May 30, 1919, pp. 715-720, 36 figs. It is believed that improvement in casting might be made by increasing a thickness of mold walls and lowering the pouring temperature of the metal; also it is recommended that forging temperatures be increased considerably. Similarly other suggestions are speed steel are reviewed and commented on (Concluded). Paper read before Iron & Steel Inst.
High-Speed Tool-Steel Efficiencies, John O. Arnold and Fred Ibbotson. Iron Trade Rev., vol. 64, no. 22, May 29, 1919, pp. 1419-1421, 3 figs. Determined by lathe operations and chemical analyses. Micrographic study of difference between annealed and quenched specimens. Paper presented before Iron & Steel Inst.

Steel, Liquid and Solid. On the Solid and Liquid State of Steel, Cosmo Jones. Engineering, vol. 107, no. 2787, May 30, 1919, pp. 721-722. The properties of an optically clean surface of liquid steel described and similarity to that of polished metallic surface with vitreous film pointed out. Preservation of this surface of liquid steel attributed to presence of atmosphere of iron vaper. Means to determine surface tension qualitatively suggested and it is said that surface tension value varies largely with volume of gases occluded. From lecture delivered to West of Scotland Iron & Steel Inst.

NON-FERROUS ALLOYS

Bronzes, Aluminum. Aluminum Bronzes (L'Etude des propriétés des bronzes d'aluminium), Jean Durand. Génie Civil, vol. 74, no. 16, Apr. 19, 1919, pp. 315-317. Warns against complicating composition of alloy. It is claimed that in all cases a simple alloy can be found of better known properties and possessing advantages equal to those of the complicated alloy.

Bronze and Brass, Inclusions in. Non-Metallic Inclusions in Bronze and Brass G. F. Comstock. Metal Industry, vol. 14, no. 16, Apr. 18, 1919, pp. 330-333. 21 figs. Photomicrographs. Method employed consists in overheating and oxidizing small charge of copper, then cooling it and adding a suitable amount of the element whose oxide it was desired to observe.

Cupro-Nickel, Decarbonization of. Notes on Carbon in 80 :20 Cupro-Nickel Melted in the Electric Furnace, F. C. Thompson and W. R. Barclay. Jl. Soc. Chem. Indus., vol.38, no. 10, May 31,1919,pp. 130T-132T, 4 figs. Account of trouble experienced before decarbonizing process was included in melting.

Gold-Copper Alloys. Hardness and Resiliance of Gold-Copper Alloys (Note sur la dureté et le résilience des alliages or-cuivre), A. Portevin and Jean Durand. Revue de Métallurgie, vol. 16, no. 2, Mar.-Apr. 1919, pp. 149-151, 3 figs. Results of experiments.

Monel Metal. Monel Metal—The Natural Alloy, Hugh R. Williams. Raw Material, vol. 1, no. 4, June 1919, pp. 217-221, 4 figs. Alloy contains 67 per cent nickel and 28 per cent copper and is said to be non-corrodible by ordinary atmospheric agencies and to have unparalleled resistance to chemicals

OCCLUDED GASES

Degasified Steel. Safeguarding Steel Ingot Production. Raw Material, vol. 1, no. 3, May 1919, pp. 172-176, 5 figs. Process outlined consists of production of a "degasified" steel before teeming into mould, by means of ferro-silicon, aluminum or uranium added for purpose of "scavenging" oxides and reduction of size of ingot pipe to minimum by giving lower portion of mold greater heat-absorbing and radiating capacity than top.

METALLOGRAPHY

Non-ferrous Metals. Metallography Applied to Non-ferrous Metals—V & VI Ernest J. Davis. Foundry, vol. 47, nos. 8 & 9, June 1 & 15, 1919, pp. 345-349 & 395-398, 19 figs. Lead alloys and bearing metals discussed from viewpoint of their microstructure; also equilibrium diagram of lead-tin, lead-antimony, copper-lead, nickel-copper and nickel-silver series, and micrographs of various alloys.

Photomicrography. The Study of Alloys (L'Etude des Alliages). Métaux. Alliages et Machines, vol. 12, no. 4, Apr. 1919, pp. 7-12, 9 figs. After discussing what is termed irrational order of conducting investigations of these structures, applications of photomicrograph and the thermic analysis are taken up. Extracts from book published by Witold Broniewski at Librairie Delagrave.

Radio Metallography. Radio Metallography. Times Eng. Supp., vol. 15, no. 535, May 1919, p. 165. Methods of examining metals and various types of material by means of X-ray photography.
The X-ray Examination of Metals, E. Schneider. Engineering, vol. 107, nos. 2784 & 2785, May 9 & 16, 1919, pp. 613-614, and 641-644, 23 figs., also Elecn., vol. 82, no. 20, May 16, 1919, pp. 568-569. Research into industrial X-ray examination of metals at laboratory of Schneider Works are represented as demonstrating that radio-metallography enables visual examinations to be made of ordinary steels, provided their thickness does not exceed 45 mm; this limit in thickness being reduced when steel contains at least one constituent of higher atomic weight. Method developed at Hatfield research laboratory in Sheffield. German work on subject. (Concluded.)

MINING ENGINEERING

BASE MATERIALS

Bauxite. Bauxite Mining in Arkansas, Tom Shiras. Eng. & Min. Jl., vol. 107, no. 25, June 21, 1919, pp. 1074-1075, 5 figs. Ore comes from ground in pieces weighing from few ounces to several hundred pounds and is crushed to a maximum size of 1½ in.

Limestone. The Chart of the Wreford and Foraker Limestones along the State Line of Kansas and Oklahoma, W. H. Twenhofel. Am. Jl. of Sci., vol. 47, no. 282, June 1919, pp. 407-429, claims that observed facts do not harmonize with theories postulating an origin for these charts consequential to weathering, or one of replacement, or of cavity-filling in solid rocks.

Quarries. Modern Methods at McCook Quarry William B. Eastwood. Cement, Mill & Quarry, vol. no. 10, May 20, 1919, pp. 11-14, 4 figs. Plant of U. S. Crushed Stone Co. Output is 500 tons of crushed rock per hour.
Labor Saving in Limestone Quarrying, Oliver Bowles. Dept. of Interior, Bur. Mines, War Minerals Investigation Series no. 1, Sept. 1918, 18 pp. Using labor-saving devices; consideration is given only to methods and type of equipment that are represented as having been tried and approved by quarry operator.
An Electrically-Operated Quarry and Plant for Production of Broken Stone at Gary, Ill. Cement & Eng. News, vol. 31, no. 5. June 1919, pp. 24-26, 5 figs. Electrical operation includes that of loading shovels and haulage system in quarry, and equipment of crushers, rolls, screens and conveyors.

COAL AND COKE

Belgium. Coal Deposits of Belgium (Les Gisements de la Belgique), Armand Renier. Annales des Mines de Belgique, vol. 20, no. 2, 1919, pp. 433-540. Stratigraphic studies of mode of formation. (Third installment).

Boring. Intensive Boring on the Wonthaggi Coal-Field, Victoria, H. Herman. Australasian Inst. Min. Engrs., Proc., no. 32, Dec. 31, 1918, pp. 145-154, 12 figs. partly on 3 supp. plates. Mining under difficulties due to sudden changes in thickness and quality, and presence of dirt bands in seams.

By-Products Plants. Coppee Coal washing and By-Product Coking Installation in Course of Erection at Burnside Colliery. South African Eng., vol. 30, no. 4, Apr. 30, 1919, pp. 66-68, 5 figs. By-product plant designed to deal with gases from 2100 tons of coal per week.

CLAIRION COUNTY, PA. Recovering the Neglected Coal Fields, J. O. Durkee. Coal Industry, vol. 2, no. 6, June 1919, pp. 221-224, 4 figs. Deposits in Clairion County, Pa.

COKE PLANTS. Late Addition to Youngstown Coke Plant. Iron Age, vol. 103, no. 26, June 26, 1919, pp. 1691-1695, 9 figs. Two new batteries, each consisting of 51 Koppers cross-regenerative ovens of 500 cu. ft. capacity.
Mammoth Coke Plant, Frank F. Marquand. Coal Industry, vol. 2, no. 6, June 1919, pp. 224-231, 6 figs. Construction, organization, operation and recovery of by-products at Clairton by-product coke works of Carnegie Steel Co. Paper read before Am. Iron & Steel Inst.

COMPOSITION. The Chemistry and Constitution of Coal, A. C. Fieldner. Coal Age, vol. 15, no. 26, June 26, 1919, pp. 1150-1158, 22 figs. Principally from microscopic investigations carried on in Bur. of Mines Experimental Station.
On the Four Visible Ingredients in Banded Bituminous Coal; Studies in the Composition of Coal, no. 1, Marie C. Stopes. Proc. Roy. Soc., Biological Sciences, vol. 90, no. B-633, May 15, 1919, pp. 470-487, 17 figs. partly on separate plates. Concerning microscopic and microscopic recognition and separation of Fusain, Durain, Clarain and Vitrain bands.

COSTS, MINING. Anthracite Mining Costs, R. V. Norris. Coal Age, vol. 15, no. 25, June 19, 1919, pp. 1124-1128, 5 figs. Based on reports for six months, Dec. 1917 to May 1918 inclusive, as complied by Federal Trade Commission.

ELECTRIC APPARATUS. Routine Examinations and Testing of Colliery Electrical Apparatus, L. Fokes. Colliery Guardian, vol. 117, no. 3043, Apr. 25, 1919, pp. 953-955, 4 figs. Divides general examination under headings of (1) power house, (2) transformers, (3) motors, and (4) cables, and offers suggestions to accomplish each of these.

FORMATION. The Formation of Coal, J. D. Kendall. Can. Min. Inst. Bul., no. 86, June 1919, pp. 600-606, 5 figs. Writer presents arguments in supports of his theory that coal has been produced from woody matter that was drifted into position by water and afterward altered by pressure, heat and chemical change into its present substance. (To be continued).

GEOLOGY. The Geology and Economics of Coal. J. R. Finlay. Eng. & Min. Jl., vol.107 no. 22, May 31 1919, pp. 945-950. Geological aspects of coal formation, occurrence and location of peat swamps, extent of existing deposits and main features of coal-forming period; statistics on coal consumption and distribution.

KENT COALFIELDS. The Evolution and Development of the Kent Coalfield, A. E. Ritchie. Iron & Coal Trades Rev., vol. 98, nos. 2672, 2673 and 2674, May 16, 23 & 30, 1919, pp. 665-700-701, and 735-736, 2 figs. From 1913-1918. From 1907-1918. Establishment and growth of South Eastern Coal Field Extension, Ltd. Plan showing comparative positions of the Greensand and Hastings strata and the "junction" sand bed at three important points of the coalfield.

MIXING PLANT. Coxton Coal Mixing Plant, Lehigh Valley R.R. Ry. Rev., vol. 64, no. 24, June 14, 1919, pp. 885-887, 4 figs. General plan and elevation. Plant mixes bituminous and anthracite silt.

NEW SOUTH WALES. The Coal Industry of New South Wales, A. A. Atkinson. Proc. Australasian Inst. Min. Engrs., no. 31, Sept. 30, 1918, pp. 41-70 and (discussion) pp. 71-80. "Bord and pillar" is adopted method of working, removal of coal effected by aid of electrically-operated coal-cutting machines and ventilation produced by means of exhaust fans.

PREPARATION. Preparation of Bituminous Coal—I, III, IV & V, Ernst Prochaska. Coal Age, vol. 15, nos. 21, 23, 24 & 25, May 22, June 5, 12 & 19, 1919, pp. 943-945, 1030-1033, 1080-1085, and 1118-1122, 19 figs. Writer believes that for best results final screening should be done after washing. Chart showing comparative efficiency of different types of washers. Size of jig screen, comparative size of plunger, length of plunger stroke, rapidity of stroke and thickness of jigging bed considered as factor that influence efficiency in washing. Methods of drives, apparatus for discharge of products and arrangement of jigs.

PYRITES. Coal Pyrite Resources of Tennessee, E. A., Holbrook and Wilbur A. Nelson. Coal Age, vol. 15, no. 24, June 12, 1919, pp. 1077-1079, 3 figs. Experiments are believed to have indicated that pyrite occurring in coal may be commercially extracted.

SEALING UP. Sealing Up Old Abandoned Workings in Gaseous Mines, C. Thompson. Coal Age, vol. 15, no. 25, June 19, 1919, pp. 1110-1111. Method proposed for securing proper ventilation. Paper presented before Ill. Min. Inst.

COPPER

BLAST FURNACES. Exit the Blast Furnace, Oliver E. Jager. Min. & Sci. Press, vol. 118, no. 25, June 21, 1919, pp. 843-844. Disadvantages that have been urged against blast and reverberatory furnaces under Anaconda conditions.

MONEL METAL. Monel Metal and Its Uses, Hugh R. Williams. Iron Age, vol. 103, no. 26, June 26, 1919, pp. 1703-1704, 2 figs. Chemical composition is nickel 67 per cent, copper 28 per cent, and other elements 5 per cent (latter chiefly iron from original ore, and manganese, silicon and carbon added during process of refining metal matte).

NATIVE COPPER. Native Copper and Silver in the Nonesuch Formation, Michigan, Keijiro Nishio. Economic Geology, vol. 14, no. 4, June 1919, pp. 324-334, 6 figs. Their association with carbonaceous matter in sandstone explained by reaction of acetylene gases or like gases upon metallic solutions.
Deposits of Native Copper in Arctic Canada, J. J. O'Neil. Min. & Sci. Press, vol. 118, no. 24, June 14, 1919, pp. 807-811, 5 figs.Outlines conditions to be met in carrying out examination of deposits, such as (1) means of access. (2) amount of time available for actual work, together with time consumed in travel and enforced idleness, (3) climate and general working conditions.

GEOLOGY AND MINES

BRECCIATION. Brecciation in the Niagara Limestone at Rochester, New York, Albert W. Giles. Am. Jl. of Sci., vol. 47, no. 281, May 1919, pp. 349-354, 2 figs. Attributed to irregular cavities distributed through strata.

CHESTER EMERY MINE. Famous Mineral Localities: The Chester Emery Mine, Earl V. Shannon. Am. Mineralogist, vol. 4, no. 6, June 1919, pp. 69-92. Notes on field gathered during writer's expedition.

COLORADO ROCKIES. The Building of the Colorado Rockies, Rollin R. Chamberlin. Jl. Geology, vol. 27, no. 3, Apr.-May 1919, pp. 145-164, 3 figs. By application of method given in Chamberlin and Salisbury's Geology for deducing thickness of earth shell involved in given case of folding. (To be continued).

EARTHQUAKES. The Mechanics of Earthquakes, Carlo Somigliana. Sci. Am. Supp., vol. 87, no. 2269, June 28, 1919, pp. 402-403 & 407. Summary of attempts to explain nature of seismic disturbances. From Scientia.

GEORGIA. Notes on the Geology of Georgia, S. W. McCallie. Jl. Geology, vol. 27, no. 3, Apr.-May 1919, pp. 165-179, 4 figs. Classification of geological system.

GNOMONIC PROJECTION. On the Use of the Gnomonic Projection in the Calculation of Crystals, G. F. Herbert Smith. Mineralogical Mag., vol. 18, no. 86, May 1919, pp. 317-323, 5 figs. Composite gnomonic production suggested.

HYDRATED FERRIC OXIDES. The Hydrated Ferric Oxides, Eugen Posnjak and H. E. Merwin. Am. Jl. of Sci., vol. 47, no. 281, May 1919, pp. 311-348, 4 figs. Compilation of synthetic chemical work leads to assertion that no series of hydrates of ferric oxide exists amoung natural minerals.

MINERALS, DETERMINATION IN ROCK. On the Accuracy of the Rosiwal Method for the Determination of the Minerals in a Rock, Albert Johannsen and E. A. Stephenson. Jl. Geology, vol. 27, no. 3, Apr.-May 1919, pp. 212-220. Repetition of experiments made by Ira A.Williams (Amer. Geol., XXV, 1905, pp. 34-36) in order to compare accuracy of various methods.

MISSOURI. Geology of Missouri, E. B. Branson. Univ. of Missouri Bul., vol. 19, no. 15, May 1918, 172 pp., 58 figs. Compilation of reports of Missouri geological surveys and those of State Bur. of Geology and Mines, including extensive series of references to articles in scientific journals treating various phases of Missouri geology.

PRE-CAMBRIAN. Some Stratigraphic and Structural Features of the Pre-Cambrian of Northern Quebec—II, H. C. Cooke Jl. Geology, vol. 27, no. 3, Apr.-May 1919, pp. 180-203, 12 figs. Detailed areal description. (To be continued).

PYRITE CRYSTALS. Pyrite Crystals from Bald Mountain, Colorado, Herbert P. Whitlock. Am. Mineralogist, vol. 4, no. 6, June 1919, pp. 67-68, 2 figs. Measurements made on a Fuess No. 2 goniometer.

SEDIMENTARY FORMATIONS. The Sedimentary Formations of the Panama Canal Zone, with special Reference to the Stratigraphic Relations of the Fossiliferous Beds. Donald Francis MacDonald. Smithsonian Instn., U. S. Nat. Museum, bul. 103 (extract), 1919, pp. 525-545, 2 figs.
The Biologic Character and Geologic Correlation of the Sedimentary Formations of Panama in their Relation to the Geologic History of Central America and the West Indies, Thomas Wayland Vaughan. Smithonian Inst. U. S. Nat. Museum, bul. 103 (extract) 1919, pp. 547-612. Including tabular statement of age relations to formations.

SEPTARIAN STRUCTURE. On the Origin of Septarian Structure, W. Alfred Richardson. Mineralogical Mag., vol. 18, no. 86, May 1919, pp. 327-338, 9 figs., partly on supplemental plate. Endeavor is made to establish that septarian structure consists of polygonal system of cracks corresponding to a mud desiccation structure and that cracking of nodule is due to desiccation by chemical means of a colloidal center.

TRIDYMITE CRYSTALS IN GLASS. Tridymite Crystals in Glass, N. L. Bowen. Am. Mineralogist, vol. 4, no. 6 June 1919, pp. 65-66, 2 figs. on supp. plate. Formation which took place in French works where, by reason of temporary German occupation and workmen having left fires burning in expectation of returning shortly, glass was maintained at temperature in the neighborhood of 800 deg. cent. for twenty days.

IRON

CANADA. Making Steel in Canada. Can. Machy., vol. 21, no. 23, June 5, 1919, pp. 567-572, 7 figs. With special reference to ore deposits in Eastern section. (To be continued).

LEAD, ZINC, TIN

SPELTER STATISTICS. Spelter Statistics for 1918, W. R. Ingalls. Eng. & Min. Jl., vol. 107, no. 22, May 31, 1919, pp. 958-962. Total production of spelter by ore smelters in 1918 was 525,350 tons against 682,411 tons in 1917.

MAJOR INDUSTRIAL MATERIALS

MANGANESE. Cost of Producing Ferro-Grade Manganese Ores, C. M. Weld. Dept. of Interior, Bur. Mines, Minerals Investigation Series, no. 13, Mar. 1919, 22 pp. Figures compiled with point of view of probable competition between domestic production and Cuba and Brazil.
Uses of Manganese Other Than for Steel Making W. C. Phalen. Dept. of Interior, Bur. Mines, Minerals Investigating Series,no. 16, May 1919, 14 pp. Divided into (1) uses of manganese dioxide ore and (2) uses of manganese bronze.

MINES AND MINING

CYANIDATION AND CHLORINATION. A Metallurgical Journey to Shasta, California—II, Herbert Lang. Min. & Sci. Press, vol. 118, no. 24, June 14, 1919, pp. 812-818, 1 fig. Further historical notes particularly on cyanidation and chlorination.

Drills. Notes on Economies in Hand Drill Steel, H. A. Read. Jl. Chem., Metallurgical & Min. Soc. of South Africa, vol. 19, no. 9, Mar. 1919, pp. 168-177, 6 figs. One of principal losses in hand drilling at Witwatersrand was believed to be that due to shanking of steel under blows of hammer.

Process in the manufacture of Stoping Drills.sEng. & Min. Jl., vol. 107, no. 22, May 31, 1919, pp. 964-966. New designs are said to conform to essentia, conditions required in field which are said to be: Light weight and small size, automatic rotation, satisfactory, regulation of strength of feedwater when drilling in sulphur-bearing ores.

New Type of Stoping Drills. Min. & Sci. Press, vol. 118, no. 23, June 7, 1919, pp. 797-799, 4 figs. Sullivan types.

Drives, Depth. The Increase in the Average Length of a Round in Modern Development, Jas. H. P. Bilbrough. Jl. South African Instn. Engrs., vol. 17, no. 10, May 1919, pp. 211-217. Vertical depth of drives referred to ranged between 5280 ft. below datum for the 24th drive and sea level for the 29th drive.

Explosives. The Use of Explosives in Mines, H. Y. Russel. Can. Min. Inst. Bul., no. 86, June 1919, pp. 589-600. Practices of various mines. Employing special blasters is considered advantageous even in small mines.

Mining Laws. Acquisition of Rights and Powers in Connection with Mines and Minerals Iron & Coal Trades Rev., vol. 98, no. 2674 & 2675, May 30 & June 6, 1919, pp. 730-731 and 770-771. Report of Acquisition and valuation of Land Committee of Ministry of Reconstruction. Committee does not think it is in national interest that question, whether minerals should be worked or not should be left to decision of adjoining owner or mineral worker. (Concluded).

Some Common Violation of the Mining Laws, W. J. Heatherman. Coal Age, vol. 15, no. 26, June 26, 1919, pp. 1159-1160. Recklessness and ignorance believed to be chief obstacles to mine safety. Many mine officials, according to writer, lack proper conception of their responsibility and do not attempt to enforce precautionary measures.

Waste in Working Minerals. Colliery Guardian, vol. 117, no. 3048, May 30, 1919, p. 1290, also Quarry, vol. 24, no. 268, June 1919, pp. 156-159. Recommendations of Land Committee for acquisition and valuation. (Continued).

Prospectors. Returned Soldiers as Prospectors, C. M. Harris. Queensland Government Min. Jl., vol. 20, no. 227, Apr. 15, 1919, pp. 149-151, 7 figs. Scheme arranged jointly by Mines Dept. of Western Australia and Federal Repatriation Board.

Shafts. The Advantages of Circular Shafts—II, H. Stuart Martin. South African Min. & Eng. Jl., vol. 28, part 2, no. 1438, April 19, 1919, pp. 217-218. Effect of area and friction resistance; circular vs. rectangular shafts. First part appeared in issue of January 18.

Shaft Sinking. A Peculiar Experience in Shaft-Sinking, Arthur Jarman. Min. Sci. Press, vol. 118, no. 25, June 21, 1919, pp. 851-854, 4 figs. Sinking made difficult by pocket of mud encountered at depth of 35 ft.

Squeeze Prevention. Method Employed in Working the Crescent Mine, Ralph W. Mayer. Coal Age, vol. 15, no. 23, June 5, 1919, pp. 1028-1029, 3 figs. Prevention of squeeze accomplished through combined use of machine and pick mining.

Timber. Preservation of Mine Timber, Noah Williams. Colliery Guardan, vol. 117, no. 3046, May 16, 1919, pp. 1145-1146. Decay and insects are estimated to cause 50 per cent of loss of timber used in mines; as much of this loss is considered preventable by adoption of preservation treatment. American method of treating wood with sodium fluoride is recommended as efficient and economical.

Ventilation. The Ventilation of Coal Mines, H. W. Chadbourne. Gen. Elec. Rev., vol. 22, no. 5, May 1919, pp. 341-347, 7 figs. Natural, furnace and mechanical methods of ventilation; electric-motor-driven fan equipment and air courses.

Washington (State). A Summary of Mining in the State of Washington, Arthur Homer Fisher. Eng. Experiment Station, Univ. of Wash., bul. no. 4, Nov. 1918, 124 pp. Including bibliography of 547 articles relating to mining and mineral resources in State of Washington.

MINOR INDUSTRIAL MATERIALS

Saltpeter. Saltpeter in Guatemala, Hoyt S. Gale, Eng. & Min. Jl., vol. 107, no. 24, June 14, 1919, pp. 1025-1031, 6 figs. Made from leachings of soils about native villages, work of separating and refining salt being performed mostly by women.

Magnesium. Magnesium Sulphate Deposits at Basque, B. C., George C. Crux. Can. Chemical Jl., vol. 3, no. 6, June 1919, pp. 179-181, 3 figs. Salts occur in solidified masses of various shapes and sizes, surrounded by mud rings.

Natural Deposits of Salts of Magnesium and Sodium near Clinton, B. C., L Reinecke. Can. Chemical Jl., vol. 3, no. 6, June 1919, pp. 182-186, 4 figs. Texture and structure, topographical and geological relations, composition, origin, commercial value. Deposits consist of calcium carbonate, magnesium carbonate, gypsum and epsomite.

OIL AND GAS

Asphaltum. Physical Tests of Asphaltum, John W. Newton and F. N. Williams Petroleum Age vol. 6, no. 6, June 1919, pp. 241-245, 1 figs. Discusses value of such tests as pliability, volatility, penetration, melting point, etc. Fourth article Previous articles detail tests for gasoline, illuminating oils and fuel oil respectively.

California. Proposed Safety Orders for Petroleum Industry in California. Min. & Oil Bul., vol. 5, no. 6, May 1919, pp. 331-332 & 351, 2 figs. As revised by Safety Orders Committee of Industrial Accident Committee.

Crude-Oil Statistics. Summary of the Crude Oil Situation. Oil-dom, vol. 10, no. 6, June 1919, p. 9. Statistics of production during February and March 1919.

Ecuador. Petroleum in Ecuador, Walter M. Brodie. Eng. & Min. Jl., vol. 107, no. 22, May 31, 1919, pp. 941-944, 3 figs. Account of geology and occurrence, together with data as to legal asoects of concessions in that republic.

Florida. Observations of a Florida Sea-Beach with Reference to Oil Geology, J. F. Kemp. Ecomonic Geology, vol. 14, no. 4, June, 1919, pp. 302-323, 7 figs. Tests and surveys conducted in order to explain what appeared to writer puzzling accumulation of land and marine organic remains.

Gasoline. Status of Refinery Practice with Regard to Gasoline Production, E. W. Dean. Jl. Soc. Automotive Engrs., vol. 4, no. 5, May 1919, pp. 372-374. Estimates made by Bur. of Mines apparently indicate that refiner may be able, to augment his production of gasoline from crude petroleum by from 35 to 40 per cent.

Microscope. Petroleum Under the Microscope, James Scott. Petroleum World, vol. 16, no. 224, May 1919, pp. 194-197, 3 figs. In reference to geological aspect of search for oil. (Concluded.)

Natural Gas. Safeguarding the Future Natural Gas Supply, Clifton W. Sears. Gas Age, vol. 43, no. 11, June 2, 1919, pp. 588-590. Discusses effect of price for gas upon quantity consumed. Paper presented before Natural Gas Assn.

Oil Pools. Petroliferous Provinces, E. G. Woodruff. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 150, June 1919, pp. 907-912, 1 fig. Analyses, from regional standpoint, conditions that control presence or absence of oil pools.

Roumanian. Roumanian Oil Fields. Universal Engr., vol. 29, no. 5, May 1919, pp. 37-46, 8 figs. Problems presented to producers by conditions arising from extensive subdivision of fields. Oil produced is of high gravity with paraffine base.

Shales. Value of American Oil Shales, Charles Baskerville. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 150, June 1919, pp. 957-960. Discusses fundamental features concerning economic development of shale-oil industry.

The Winning of Oil from Rocks, Arthur J. Hoskin. Min. & Sci. Press, vol. 118, no. 21, May 24, 1919, pp. 697-707, 10 figs. Practices followed in oil-shale industry in Scotland.

France and Germany are quoted and conclusions drawn as to what writer believes we may and should accomplish with similar shales in this country.

Oil-Shales, Dean E. Winchester. Jl. Franklin Inst., vol. 187, no. 6, June 1919, pp. 689-703. Optimism is expressed concerning capability of furnishing from shales the oil needed for future operation of motors; it is observed, however, that before this raw material can be used some treatment must be devised that will permit efficient and economical elaboration.

Statistics. Statistical Treatise on Petroleum, Fred. A. Lichtenheld. Colorado School of Mines Mag., vol. 9, no. 6, June 1919, pp. 143-150, 1 fig. Stratigraphic distribution of petroleum production and notes on early history. (To be continued.)

Water in Petroleum. The Evaporation and Concentration of Waters Associated with Petroleum and Natural Gas, R. Van A. Mills and Roger C. Wells. Dept. Interior, U. S. Geol. Service, bul. 693, 1919, 104 pp., 9 figs. Conclusion arrived at as result of investigation in regard to association of saline waters with petroleum and natural gas is that brines are result of a complex and long-continued evolution in which waters of sedimentation, together with ground waters from other sources have undergone deep-seated evaporation and concentration accompanied by chemical changes.

Water in Oil and Gas Wells, F. B. Tough. Petroleum Times, vol. 1, nos. 17 & 18, May 3 & 10, 1919, pp. 357-358 & 391, 1 fig. Dump-bailer method for cementing hole. Remarks on tubing method. (Concluded.)

PRECIOUS MINERALS

Gold, British Columbia. Notes on the Placer Mines of Cariboo, British Columbia, J. B. Tyrrell. Economic Geology, vol. 14, no. 4, June 1919, pp. 335-345, 4 figs. Historical account, topograph, conditions and development of drainage.

Gold, Ontario. The Origin of the Gold Deposits of Metachewan District, Northern Ontario, H. C. Coke. Economic Geology, vol. 14, no. 4, June 1919, pp. 281-301, 6 figs. Internal structure of ore bodies, described as pegmatic vein, middle zone of mineralized and altered rock on each side, and outer zone of altered rock without mineralization, which grades into unaltered country rock with irregular and embayed contacts, assumed as evidence that deposits in schist have been formed by alteration and mineralization of country rock by solutions coming up along Central vein.

Silver Mining, Nevada. Revival of Silver Mining at Cherry Creek, Nevada, Geo. H. Ryan. Salt Lake Min. Rev., vol. 21, no. 4, May 30, 1919, pp. 19-22, 4 figs. Geology of ore deposits and remarks as to possibilities of camp.

South Wales. Sulphide Corporation Limited Works, Cockle Creek, S. W. Proc. Australasian Inst. Engrs., vol. 31, Sept. 30, 1918, pp. 2-39, 27 figs. Nine articles covering various phases of treatment and manipulation of ore. Upwards of 200,000 tons of various materials are dealt with annually, there being produced from treatment of this tonnage about 31,000 oz. of gold, 2,500,000 oz. of silver, 28,000 tons of lead and 320 tons of antimonial lead.

TRANSPORTATION

Locomotives Headlights. Headlights for Locomotives in Mines, K. W. Mackall. Coal Industry, vol. 2, no. 6, June 1919, pp. 232-233, 3 figs. Spring suspension claimed as principal feature of new type described.

Mine Haulage. Vesta Coal Co.'s Modern System of Mine Haulage, Ralph W. Mayer. Coal Age, vol. 15, no. 21, June 12, 1919, pp. 1072-1076, 5 figs. System includes electric-motor transportation from coal face to central underground station where motors leave their loads, and tailrope which handles the cars from this point to tipple.

MUNITIONS AND MILITARY ENGINEERING

Army Base Service. Military Stores at Port of New York (Entrepots Militaires du Port de New York), P. Calfas. Génie Civil, vol. 74, no. 20, May 17, 1919, pp. 385-391, 13 figs. Description of Brooklyn Army Base.

Ballistics. A Method for Computing Differential Corrections for a Trajectory, Gilbert Ames Bliss. Jl. U. S. Artillery, vol. 50, no. 4, June 1919, pp. 455-460, 1 fig. To account for disturbances in flight of projectiles of magnitude of of those caused, for example, by wind.

High Burst Ranging, C. H. Birdseye. Jl. U. S. Artillery, vol. 50, no. 4, June 1919, pp. 417-453, 8 figs. Explanation of methods now in use and suggestion in regard to changes which writer deems desirable.

Camps. The Operation and Maintenance of Utilities at Army Camps and Cantonments, George A. Johnson. Boston Soc. Civil Engrs., vol. 6, no. 5, May 1919, pp. 181-224 and (discussion), pp. 224-233. Special reference is made to conditions brought about by shortage of labor and materials and congestion of transportation facilities.

Guns. The British Eight-Inch Howitzer—I, William Chubb. Am. Mach., vol. 50, no. 25, June 19, 1919, pp. 1189-1194, 11 figs. Consists of A-tube, wire-wound over chamber and portion of bore, inner A-tube of practically same length, and jackets shrunk over wire and a portion of A-tube.

Motor-Transport Service. Keeping 40,000 Army Motor Trucks in Operation, G. E. Rundles. Jl. Soc. Automotive Engrs., vol. 4, no. 6, June 1919, pp. 497-499, 1 fig. Floor plan and layout of mechanical repair shop for Motor Transport Corps.

Navy. The New Navy, VI, Mar. Engr. & Naval Architect, vol. 4, no. 505, June, 1919, pp. 265-268, 4 figs. General features of battle cruisers "Renown" and "Repulse."

Railway Artillery. New American Railway Artillery, E. D. Campbell. Ry. Rev. vol. 64 no. 294, June 14, 1919, pp. 869-874, 9 figs. Sixteen-inch howitzer railway mount; sliding railway mount for 12-in. and 14-in. guns; 12-in. seacoast mortar on railway mount.

Railway Engineers. Work of a Regiment of Railway Engineers in France, R. F. Fowler. Nat. Service, vol. 6, no. 1, July 1919, pp. 16-20, 3 figs. 100,000 cu. yards of rock were removed from one cut.

Sanitation. Sewage and Water Disposal for the United States Army, Leonard S. Doten. Proc. Am. Soc. Civil Engrs., vol. 45, no. 5, May 1919, pp. 233-248, 9 figs. Review of work undertaken by Sanitation Section of Construction Division, U. S. Army.

Shells. Manufacturing the 9.2-In-Howitzer Shell—III, S. A. Hand. Am. Mech., vol. 50, no. 23, June 5, 1919, pp 1089-1093, 10 figs. Washing, fitting and riveting base plug, varnishing, baking and final inspection both by shop and government inspectors. Last article.

Shop Trains. Engineer Portable Shop Train, Philip C. Nash. Power Plant Eng., vol. 23, no. 11, June 1, 1919, pp. 511-513, 3 figs. Equipment furnished U. S. Engineering troops in France.

Target Practice Rod. Making the Hollifield Target Practice Rod, Donald A. Hampson. Can. Machy., vol. 21, no. 26, June 26, 1919, pp. 651-658, 8 figs. Device said to give army recruit all of actual rifle practice without either recoil or noise.

Tunneling. Tunneling at the Front, R. W. Coulthard. Can. Min. Inst. Bul., no. 86, June 1919, pp. 606-620. Best arrangement said to have been found was to divide tunnelers into five sections. Every two days a relief was sent into trenches, where it remained for six days, then returned to rest billets for four days.

ORGANIZATION AND MANAGEMENT

ACCOUNTING

Cost Accounting. Cost Accounting to Aid Production—IX, G. Charter Harrison. Indus. Management, vol. 57, no. 6, June 1919, pp. 483-487, 1 fig. Predicts revolution in which retrospective systems will disappear because unfitted to meet demands of an industrial executive who must know before he can do.

Inventory. How We Keep Our Inventory Correct, H. F. Harris. Factory, vol. 22, no. 6, June 1919, pp. 1181-1185, 17 figs. Practice of Republic Motor Truck Co. Record forms are illustrated.

EDUCATION

Cripples. Human Rehabilitation and Its Value, Douglas C. McMurtrie. Min. & Oil Bul., vol. 5, no. 6, May 1919, pp. 325-326 & 328, 4 figs Method of dealing with men followed at Red Cross Inst. for crippled and disabled men at New York City

Electrical Fittings. The Training of the Disabled Man from the Electrical Engineer's Point of View, F. H. Taylor. Electricity, vol. 31, no. 1491, June 6, 1919, pp. 349-352, 5 figs. Example illustrating training given in electrical fitting, installation, maintenance, repair work and similar occupation at various educational centers.

Executives. The New Science, James A. Bowie. Eng. & Indus. Management, vol. 1, no. 17, June 5, 1919, pp. 519-520. Discussing need of training for industrial administration and refers to work in this direction at College of Technology at Manchester.

Shipyard Labor. Intensive Training of Shipyard Labor, Harry H. Tukey. Indus. Management, vol. 57, no. 6, June 1919, pp. 452-456, 4 figs. Methods and results of Submarine Boat Corporation.

FACTORY MANAGEMENT

Committee System. Committee System in American Shops, William Leavitt Stoddard. Indus. Management, vol. 57, no. 6, June 1919, pp. 473-476. Review of acceptance of some form of representative shop committee, with reference to experience in Great Britain. Three types of such committees are differentiated and the relations of trade unionism and shop committees are discussed.

Control Boards. How Control Boards Can Help Manage, B. L. Van Schack. Factory, vol. 22, no. 6, June 1919, pp. 1172-1176, 6 figs. Control boards, it is said, must back up facts with proof without too much detail or they will tend to confuse rather than explain.

Control of Production. Graphic Control on the Exception Principle, Frank B. Gilbreth. Eng. & Indus. Management, vol. 1, no. 14, May 15, 1919, pp. 433-434, 2 figs. No cost system or charge system should be considered as really satisfactory, in opinion of writer, unless it determines (1) what quantities of individual output should be, (2) prompt records of individual outputs, (3) what costs should be, (4) prompt records of costs, (5) causes of fluctuations and deviations of outputs and costs from prophesied outputs and costs.

Dispatching Department. Organization of a Carburetor Plant, Fred H. Korff. Machy. (N. Y.), vol. 25, no. 10, June 1919, pp. 916-918. Work of mechanical and dispatching departments and practice in foundry. Second article.

Employee Co-Operation. Co-operation Profitable to Employer and Worker, Harry Tipper. Automotive Industries, vol. 40, no. 23, June 5, 1919, pp. 1208-1209. Plant of "industrial democracy" as operated at tobacco-pipe manufacturing plant of Wm. Delmuth & Co. at Richmond Hill, Long Island, where 900 men and women are employed.

Employment Management. Employment-Management at the Eagle Mines, Robert Nye. Min. & Sci. Press, vol. 118, no. 24, June 14, 1919, pp. 821-822. Labor turnover said to have dropped from 32.9 per cent to 11.58 per cent after power of hiring and firing of all men was taken from superintendent and foremen and given to employment manager.

Factories. The Design and Construction of Factories—III, Arthur F. Wickenden. Eng. & Indus. Management, vol. 1, no. 16, May 29, 1919, pp. 498-499, 1 fig. Types of structure.

Fatigue. Devices to Prevent Unnecessary Fatigue, James F. Butterworth. Eng. & Indus. Management, vol. 1, no. 18, June 12, 1919, pp. 556-558, 9 figs. Studies in planning out work so as to shorten number of motions that arms and hands should make while under load, arranging materials to be dealt with in sequence of use and placing materials in such positions that it can be grasped, transported and released in shortest possible time and with least possible effort.

Industrial Efficiency from the Psychological Standpoint—III, Charles S. Myers. Eng. & Indus. Management, vol. 1, no. 13, May 8, 1919, pp. 395-397. Investigations of industrial fatigue, particularly Taylor's research of loads a man can carry, also security against danger as psychological factor tending to increase output. Lecture delivered at Imperial College of Sci. & Technology.

Foremen's Co-operation. C. P. R. Shop Production Methods, E. T. Spidy. Ry. Mech. Engr., vol. 93, no. 6, June 1919, pp. 320-325, 9 figs. Establishes that it is absolutely impracticable to get any results from any system unless co-operative effort from all foremen in all departments is secured. Canadian Pacific practice is quoted as instance of efficient co-operation, and how its productive department ties into the shop organization is shown by diagram.

French War Industries. Taylor Methods in French War Industries. Bul. Taylor Soc., vol. 4 no. 3, June 1919, pp. 8-15 and (discussion), pp. 29-35 Circular of the Ministry of War to the Under-Secretaries of State for Aeronautics, for Health and for Military Justice, the Military Governors General of Paris and Lyons, the Generals commanding districts and the General commanding the French troops of North Africa.

Garment Trades. Factor Management in Garment Trades, Mack Gordon. Indus. Management, vol. 57, no. 6, June 1919, pp. 446-451, 10 figs. Purchasing and storekeeping methods.

Layout. The Design and Construction of Factories—II, Arthur F. Wickenden. Eng. & Indus. Management, vol. 1, no. 15, May 22, 1919, pp. 458-459, 1 fig. Arrangement of site and general layout.

Machine-Tool Plant. Organization and Management of a Machine Tool Plant. Machy. (Lond.), vol. 14, no. 317, May 22, 1919, pp. 213-219, 11 figs. Principles, of management discussed in case of medium-size machine-tool manufacturing plant making single line of machines. First article.

Machinery Selection. Continental Plant Layout Facilitates Production—II. J. Edward Schipper. Automotive Industries, vol. 40, no. 22, May 29, 1919. pp. 1168-1173, 11 figs. Exemplifying machines used to facilitate production. Deals with semi-automatic compound machine in piston department, said to be capable of turning and grooving 100 pistons per hour.

Office Management. Application of Scientific Principles to Office Management, Walter D. Fuller. Bul. Taylor Soc., vol. 4, no. 3, June 1919, pp. 8-15 and (discussion), pp. 15-28. Method of procedure adopted by Standardization Division of Curtis Publishing Co. It includes provision for paying employees extra for all production above a determined standard at a fixed rate.

Output Restriction. Industrial Efficiency from the Psychological Standpoint—IV, Charles S. Myers. Eng. & Indus. Management, vol. 1, no. 14, May 15, 1919, pp. 427-429. Factors which may bring about a restriction of output. Question is discussed with reference to causes arising both from side of employer and that of employee. (Concluded.) Lecture delivered at Imperial College of Science & Technology.

PLANNING. High Production Tooling Methods as Applied to the Machine-Gun Tripod, Model 1918, Albert A. Dowd and Donald A. Baker. Am. Mach., vol. 50, no. 22, May 29, 1919, pp. 1029-1036. Planning and organization. First article.

A Planning System for Non-Repetition Work. Machy. (Lond.). vol. 14, no. 347, May 22, 1919, pp. 223-225, 4 figs. Nucleus of system proposed for application to ship machinery assembly consists of car index of items and a series of specially prepared sheets made from arrangement drawings of the various systems of machinery and piping in vessel under construction.

Speeding-up Production, John A. Davenport. Eng. & Indus. Management, vol. 1, no. 13, May 8, 1919, pp. 391-394, 8 figs. Working out a time chart and rearranging it, in order to study possibilities for improvement.

Planning the Industrial Plant—I, Hugh M. Wharton. Indus. Management, vol. 57, no. 6, June 1919. pp. 433-437, 4 figs. Discussion of industrial plants as a whole, including general scheme, design, construction, layout and permanent equipment of buildings and yards. Three types of construction are shown and adaptability of each one pointed out. (To be continued.)

Planning a Machine Tool Shop for Systematized Manufacture. Erik Oberg. Machy. (N. Y.), vol. 25, no. 10, June 1919, pp. 905-913, 20 figs. Discussion based upon ideas embodied in plant of R. K. LeBlond Machine Tool Co., Cincinnati.

PRODUCTION DEPARTMENT. Details of Production Department, M. H. Potter. Iron Trade Rev., vol. 64, no. 22, May 29, 1919, pp. 1410-1412, 7 figs. Method of classifying and checking work at every important stage, with suggested forms of transferring material in course of production.

PROGRESS DEPARTMENT. Planning a Progress Department, I & II. W. J. Hiscox. Eng. & Indus. Management. vol. 1, nos. 15 & 17, May 22 & June 5, 1919, pp. 472-474 & 526-528, 3 figs. Illustrating scope for activities of department afforded in manufacture of airplane engines. Forms of record cards.

PROMOTION. The Three Position Plan of Promotion, Frank B. Gilbreth and L. M. Gilbreth. Eng. & Indus. Management, vol. 1, no. 17, June 5, 1919, pp. 521-523. Emphasizes (1) necessity of attracting desirable applicants, (2) necessity of holding, fitting and promoting those already employed and (3) the interdependence of these two.

Transfer and Promotion of Employees. Iron Age, vol. 103, no. 23, June 5, 1919, pp. 1518-1519. Classifying capabilities and characteristics of workmen for the purpose of effecting transfers and promotions. Report prepared by Transfer and Promotion Committee of Chicago council, Nat. Employment Managers' Assn.

ROUTING. Where Power Transmission Machinery is made. Foundry, vol. 47, no. 324, June 1, 1919, pp. 325-328, 7 figs. Special attention is given to arrangement of plant for routing of material from pattern shop through foundry and cleaning room into machine shop.

SAVINGS. Savings Facilities for Employees make for Stability of Organization, Harry Tipper. Automotive Industries, vol. 40, no. 22, May 29, 1919. pp. 1180-1181. Suggests that plan be without taint of paternalism and that workers be allowed freedom of dealing at will with regularly recognized financial institutions.

SCIENTIFIC MANAGEMENT. The Determination of Standards in Scientific Management, Henry W. Allingham. Eng. & Indus. Management, vol. 1, no. 17, June 5, 1919, pp. 536-540. Claims that much of opposition to scientific management is based upon misunderstanding, and in a measure to manner in which it has been advocated. Paper read before Indus. Reconstruction Council.

Scientific Management, with Especial Reference to Incentives and Motion Study, James F. Butterworth. Eng. & Indus. Management, vol. 1, nos. 16 & 17, May 29 and June 5, 1919. pp. 502-505 and 534-535 (6 figs). 1. Emphasizes particularly adoption of standards throughout works, not only for machinery and tools, but also in method of performance, mnemonic symbols, phrasing on instruction cards, and even standard clothing to be provided by management. II. Henry R. Towne's system of gain sharing, H. L. Gantt's task with bonus system, Gilbreth three rate, with increased rate, F. A. Parkhurst's differential bonus system of compensation and Taylor's differential-rate piece system.

Productive Capacity and Industrial Property, H. L. Gantt. Eng. & Indus. Management, "Idleness expense chart," indicating cost of inefficient management. Based on writer's paper, Efficiency and Democracy (Mech. Eng., Jan. 1919, p. 43), read before Am. Soc. Mech. Engrs.

SKILL OF WORKERS AND PRODUCTION. Modern Methods of Transferring Skill, Frank B. Gilbreth and L. M. Gilbreth. Eng. & Indus. Management, vol. 1, no. 18, June 12, 1919, pp. 559-560. After pointing out that increased productivity is usually attempted from angle of longer hours or more rapid rate of production, writers urge instead fundamental necessity of increasing skill of workers.

TELAUTOGRAPH. The Close Control of Steel Processes. Iron Age, vol. 103, no. 24, June 12, 1919, pp. 1569-1571, 3 figs. Uses of telautograph as substitute for telephone communication and transmitting figures and diagrams.

TOOL STORES. The Modern Tool Stores, Herbert C. Armitage. Eng. & Indus. Management, vol. 1, no. 18, June 12, 1919, pp. 551-553, 6 figs. Arrangement, organization, construction and equipment. (To be continued.)

INSPECTION

CHEMICALS AND EXPLOSIVES. Inspection of Explosives and Chemicals During the War Period, J. Richardson Donald. Can. Chemical Jl., vol. 3, no. 6, June 1919, pp. 187-191. As carried out for Imperial Ministry of Munitions, Can. Address delivered at Convention of Chemists, Montreal.

LABOR

CLUBS. An Employees' Engineering Club, F. O. Wells. Indus. Management. vol. 57, no. 6, June 1919, pp. 443-445. Membership is paid for, dinners are given, speakers are invited in—all for purpose of developing and increasing spirit of organization to deal with technical problems. Plan devised on lines of organization of Am. Soc. Mech. Engrs.

Luxurious Factory Club and Roof Garden. Iron Age, vol. 103, no. 24, June 12, 1919, pp. 1575-1577, 9 figs. All employees are eligible to membership after 30 days in service. Officers and board of directors elected by individual vote of all employees.

DISCONTENT. The Human Side of Engineering, F. Danvers Power. Proc. Australasian Inst. Min. Engrs., no. 31, Sept. 30, 1918, pp. 131-144. Following causes of discontent are analyzed: Desire for better ratio between rate of pay and cost of living: bosses whose idea of efficiency is to speed up work and cut down wages; men put to class of work for which they are unsuited; monotony of work and uncongenial surroundings.

INDUSTRIAL RELATIONS. Relations between Employers and Labour, Evelyn Wallers. South African Jl. of Industries, vol. 2, no. 4, Apr. 1919, pp. 376-380. Question is dealt with more particularly with reference to mining industry. Address delivered before Transvaal Chamber of Mines.

LEAGUE TO ENFORCE INDUSTRIAL PEACE. A League to Enforce Industrial Peace, L. K. Comstock. Elec. World, vol 73, no. 22, May 31, 1919, pp. 1164-1167. Tentative legislative program concerning private industry upon which it is proposed to build league.

RADICALISM. Humanity and Tolerance will solve U. S. Labor Problems, Harry Tipper. Automotive Industries, vol. 40, no. 25, June 19, 1919, pp. 1394-1398. Writer contends that radicals in labor circles have flourished through being opportunists and endeavors to ascertain causes which have produced recent strikes.

RESTAURANTS. Feeding Factory Workers. Iron Age, vol. 103, no. 24, June 12, 1919, pp. 1579-1580, 2 figs. Plan said to be arranged for minimum route from storeroom to serving counters.

Technical Features of Disston Cafeteria, Arthur N. Blum. Safety Engineering, vol. 37, no. 5, May 1919, pp. 247-253, 1 fig. Direct benefits claimed to be derived from industrial restaurants in report drawn by committee appointed by Ministry of Munitions are: (1) marked improvement in health of worker; (2) less sickness; (3) less absence and broken time; (4) less tendency to alcoholism; (5) increased efficiency and output. Plant in Philadelphia is quoted as example of results.

STOCK OWNERSHIP BY EMPLOYEES. Coming Status of the Employee in Industry, Charles F. Lang. Eng. News-Rec., vol. 82, no. 22, May 29, 1919, pp. 1050-1051. Points out advantages of stock ownership by employees, and credits employee with ability to exercise salutary influence upon management of company. From address before Convention of Nat. Machine Tool Builders' Assn.

TEMPERAMENT. Getting the Employee, Ralph Elsman. Am. Gas Eng. Jl., vol. 110, no. 21, May 24, 1919, pp. 437-438. Believes that temperament is important factor, but which neverthless has not received sufficient attention from executives of Utility Companies.

TURNOVER. Principles of Employing Labor, E. H. Fish. Indus. Management, vol. 57, no. 6, June 1919, pp. 478-482. Devoted to non-financial conditions influences and details of shop policy that causes men to leave and seek work elsewhere. (Concluded).

WAGES. Fundamentals of Wage Payment. Ry. Mech. Engr., vol. 93, no. 6, June 1919, pp. 297-299, 3 figs. Equations and graphs aiming to prove that all systems of labor compensation, including piece work and the various bonus systems, as well as the straight time basis, if properly administered, are nearly equally effective.

My Objections to the Piece Rate Method of Wage Payment—I, Harrington Emerson. Indus. Management, vol. 57, no. 6, June 1919, pp. 470-472. Author discusses practical or immediate objections, administrative or proximate objections, and psychological or ultimate objections.

WOMEN. Attendance and Turnover Records of Women Workers. Automotive Industries, vol. 40, no. 23, June 5, 1919, pp. 1222-1224. Comparison of lost-time factors with male and female operators, effects of illness, hours of labor and idle shop time; value of rest rooms and rest periods. Statistical data are quoted from 115 establishments.

LEGAL

COMPENSATION. Computation of Earnings, Chelsea C. Sherlock. Am. Mach., vol. 50, no. 22, May 29, 1919, pp. 1037-1039. Determining for purpose of compensation to injured workman what should constitute annual earning for year preceding accident.

DEPENDENCY. The Riddle of Dependency—I & II, Chelsea C. Sherlock, Am. Mach., vol. 50, nos. 25 & 26, June 19 & 26, 1919, pp. 1174-1176 & 1226-1228. Distinguishing between persons whose dependency is conclusively presumed and who have only to establish their relationship to deceased workman to obtain compensation, and those others who must prove their dependency in order to recover.

FRANCE. Compilation of Laws, Decrees, Devisions and Other Acts Concerning Mines, Quarries, Sources of Mineral Waters, Steam Apparatus and Operation of Railroads, published under authority of Minister of Public Works (Recueil de lois, décrets, arrêtés et autres actes concernant les mines, les carrières, les sources d'eaux minérales, les appareils à vapeur et l'exploitation des chemins de fer). Annales des Mines, 11th series, vol. 7, Oct. 4, 1918, pp. 337-478. Deals with last quarter of 1918.

HEATING AND VENTILATION. Heating and Ventilating Plants and Mechanic's Liens, Arthur L. H. Street. Heating & Ventilating Mag., vol. 16, no. 6, June 1919, pp. 32-35. Review of Appellate Court decisions defining circumstances under which security is available. (Concluded).

MINES AND MINING. Abstracts of Current Decisions on Mines and Mining, J. W. Thompson. Dept. of Interior, Bur. Mines, bul. 179, law serial 18, 1919, 166 pp. Report extends over period from September to December 1918. Including subjects of minerals and mineral lands, quarry operations, damages for injuries to miners, interstate commerce and explosives.

LIGHTING

RECONSTRUCTION PERIOD. Illumination During the Reconstruction Period, S. E. Doane. Trans. Illuminating Eng. Soc., vol. 14, no. 4, June 10, 1919, pp. 209-214. Sees problems for near future as largely educational.

SHOPS. Shop Illumination (L'éclairage deans les usines), Jacques Deschamps. Technique Moderne, vol. 10, no. 9, Sept. 1918, pp. 413-417, 8 figs. Technical study with reference to selection of type of lamp and reflector and determination of total lighting power required in works.

RECONSTRUCTION

MACHINERY, AMERICAN. Business Outlook for American Industry, Frederick H. Payne. Indus. Management, vol. 57, no. 6, June 1919, pp. 465-468. Particularly in machinery building and metal-working.

MUNICIPAL ENGINEERING. Municipal Engineers and Problems of Reconstruction, E. J. Elford. Surveyor, vol. 55, no. 1427, May 23, 1919, pp. 379-380 and (discussion) pp. 380-381. Labor-saving appliances and cost reduction. Paper read before Instn. Mun. & County Engrs.

SOCIAL RECONSTRUCTION. Social Reconstruction. Survey, vol. 42, no. 10, June 7, 1919, pp. 402-409. Proposals for Federal Legislation affecting education, civil rights, probation, insurance and pensions, health, country life, conservation, labor, housing, public works, etc. Report of Committee on Nat. Program.

SAFETY ENGINEERING

ACCIDENTS, INDUSTRIAL. The Prevention of Industrial Accidents, H. M. Vernon. Eng. & Indus. Management, vol. 1, no. 16, May 29, 1919, pp. 494-495, 1 fig. From records of four large industrial plants. Lecture delivered before Roy. Soc. of Medicine.

CHEMICAL COMPOUNDS. The Chlorates, F. M. Griswold. Safety Eng., vol. 37, no. 6, June 1919, pp. 291-295, 2 figs. Dangers of fire and explosion from chemical compounds. Suggestions and references to accidents

DUST. Health Risks from Dust caused by Buffing, Polishing and Grinding Metals, John Roach. Safety Eng., vol. 37, no. 5, May 1919, pp. 236-243, 3 figs. Relation between vitality and normal lung function illustrated by respiration during average workday in terms of expenditure of energy; thus it is said that respitation during average workday corresponds to lifting 7 tons 1 ft.

Grain Dust Explosions and Fires, David J. Price. Safety Eng., vol. 37, no. 6, June 1919, pp. 296-300, 1 fig. Direct appeal to workmen and the results.

FENCING. The Silent Watchman Over Industry. Iron Trade Rev., vol. 64, no. 25, June 19, 1919, pp. 1609-1612, 6 figs. Quotes from experience of protecting industries during war time and considers question of protecting them in peace times in light acquired by experience in war.

FIRE PROTECTION. San Francisco's High Pressure Fire Service. Mun. Jl. and Public Works, vol. 46, no. 25, June 21, 1919, pp. 454-455, 4 figs. Formerly maintained as reserve supply, now used as main fire-fighting system.

Private Fire Protection. Mun. Jl. and Public Works, vol. 46, no. 25, June 21, 1919, pp. 449-451. Report of Committee of Am. Waterworks Assn. giving recommendations for installation of private fire devices.

Fire Prevention in the Metal Trade—II, R. E. Swearingen. Metal Trades, vol. 10, no. 6, June 1919, pp. 261-263. Principles to be observed when installing automatic sprinkler system.

The Fire at Millennium Mill, Victoria Docks Silvertown, London, on January 19th, 1917. A memorandum prepared by Ellis Marsland for "Red Books" of the British Fire Prevention Committee—no. 208, London 1917, 46 pp. 38 figs. Points out that reinforced-concrete frame remained standing throughout fire said to have been of exceptional severity — without material portion collapsing, while all other materials were practically consumed or destroyed.

GAS MASKS. Use of Army Gas-Masks in Atmospheres Containing Suplhur Dioxide, A. C. Fieldner and S. H. Katz. Min. & Sci. Press, vol. 118, no. 23, June 7, 1919, pp. 773-777, 5 figs. Results of tests. Warning is issued against indiscriminate use of gas masks for any and all purposes; poisonous gases used in warfare are chemically active and therefore combine readily with absorbents of mask, but they will easily penetrate mask when present in quantities of 1 or 2 per cent.

HEALTH, INDUSTRIAL. Industrial Health and Efficiency. U. S. Dept. Labor, Bur. Labor Statistics,' bul. 249, Feb. 1919, 374 pp., 20 figs. Final report of the British Health of Munition Workers' Committee, published at request of Council of National Defense, in order to "investigate conditions affecting health and welfare of workers . . . . so that the salient features thereof may be made applicable to conditions pertaining in the U. S. A. . . . "

MINE ACCIDENTS. Metal-Mine Accidents in the United States during the Calendar Year 1917, Albert F. Fay. Dept. of Interior, Bur. Mines, technical paper 224, 1919, 80 pp. Including supplemental labor and accident tables for the years 1911 to 1917, inclusive.

POWER PRESSES. Safety Practice in Power-Press Work. Am. Mach., vol. 50. no. 25. June 19, 1919, pp. 1177-1184, 29 figs. Discussion and illustrations of various types of guards. From pamphlet published by Nat. Safety Council.

SAFETY CODES. National Industrial Safety Codes. Safety Eng., vol. 37, no. 5, May 1919, pp. 231-235. Proposal for an American Standards Association, Report of Committee of Three, appointed by conference on industrial safety codes at Bureau of Standards.

TRANSMISSION MACHINERY. Safety Precautions for Transmission Machinery. Eng. & Indus. Management, vol. 1, no. 13, May 8, 1919, pp. 398-402, 12 figs. Based upon reports by Home office inspectors of dangerous trades.

TRANSPORTATION

ARMY TERMINALS. Army Supply Bases Useful Adjuncts to Railroads. Ry. Age, vol. 66, no. 26, June 27, 1919, pp. 1809-1812, 6 figs. Adapting port and terminal facilities made necessary by war to peace-time conditions.

RURAL MOTOR EXPRESS. Development of Rural Motor Express, F. W. Fenn. Can. Engr., vol. 36, no. 24, June 12, 1919, pp. 539-541. Including statements in regard to motor-truck performances. Paper read at Can. Good Roads Congress.

TRUCKS, ELECTRIC. Electric Trucks and Transportation, E. E. Laschum. Elec. Rev., vol. 74, no. 23, June 7, 1919, pp. 931-933. Operating data of American Railway Express Co.

EXPORT

BRAZIL. Entering the Latin-American Markets, Percy F. Martin. Eng. & Indus. Management, vol. 1, no. 15, May 22, 1919, pp. 474-476. Opportunities offered by Brazil.

EUROPE. American Machine Tools in Many Markets, I. W. Alwyn-Schmidt. Am. Mach., vol. 50, no. 24, June 12, 1919, pp. 1135-1137. Survey of European field.

PAYMENT FOR EXPORTS. Export of Industrial Products, Edward Prizer. Am. Mach., vol. 50, no. 24, June 12, 1919, pp. 1130-1132. Establishes that U. S. A. must learn to take foreign stocks and bonds and share interest in local enterprises, in payment of her exports. Paper read before Sixth Nat. Foreign Trade Convention.

RAILROAD ENGINEERING

DEVELOPMENTS. Railway Developments in Foreign Countries. Ry. Age, vol. 66 no. 23, June 6, 1919, pp. 1371-1375. Materials required for Mexican and Siberian railways, transportation in Italy.

GREAT BRITAIN. Railway Transport in the United Kingdom, H. Kelway-Bamber. Jl. Roy. Soc. Arts, vol. 67, no. 3470, May 23, 1919, pp. 426-438 (discussion) pp. 438-442, 7 figs., also Iron & Coal Trades Rev., vol. 98, no. 2673, May 23, 1919, pp. 696-697. Considering that welfare of a country largely depends upon provision of cheap and efficient system of transportation, writer endeavors to show how, in his opinion, this could best be effected. Statistical data of track mileage, costs and traffic.

SPEEDS, TRAIN. European Train Speeds. Ry. Gaz., vol. 30, no. 20, May 16, 1919, pp. 836-838, 3 figs. Survey of highest, longest and fastest nonstop runs, speed of trains between two places and geographical distribution of important services. German railways. (Continuation of serial).

CONSTRUCTION

TRACK. Using Modern Appliances in Track Construction, W. L. Whitlock. Elec. Ry. Jl., vol. 53, no. 21, May 24, 1919, pp. 995-998, 10 figs. Illustrating how equipment served in Denver construction to increase speed and economy.

ELECTRIC RAILROADS

LOCOMOTIVES. Brown-Boveri Locomotives for the Swiss Federal Railways, J. Buchi. Engineering, vol. 107, no. 2784, May 9, 1919, pp. 589-592, 8 figs. Electric locomotive with single-axle drive, Tschanz system. (Concluded).

Oerlikon Locomotives for the Swiss Federal Railways. Engineering, vol. 107, no. 2788, June 6, 1919, pp. 727-729 and 740, 7 figs. partly on supplement plates. Two types, 2-6-2 and 2-4-4-2, both single-phase. Some of the dimensions are: voltage, 15,000; maximum drawbar pull, 30,000 lb. and 40,000 lb., respectively; maximum speed, 47 m.p.h.; total weight, 91 and 113 tons, respectively.

Electric Locomotives of Moderate Weight and Power, A. B. Cole. Elec. Ry. Jl., vol. 53, no. 24, June 14, 1919, pp. 1152-1154, 4 figs. With reference to freight-handling requirements on electrified steam-road branch lines and interurban electric-railway lines.

New York Central's Latest Motor Cars. Elec. Ry. Jl., vol. 53, no. 24, June 14, 1919, pp. 1134-1138, 10 figs. Design follows steam-railroad standards in so far as electrical equipment permits.

REGENERATIVE BRAKING. Regenerative Direct-Current Electric Railways, E. Austin. Electrical Review, vol. 84, no. 2168, June 13, 1919, pp. 705-707, 3 figs. Principle involved and schematic diagram for connections used in systems installed in locomotives of Chicago, Milwaukee & St. Paul R.R. and on those of the Metropolitain underground, Paris

Regenerating Braking as Applied to Electric Locomotives. What it Really Is, Il. Ry. & Locomotive Eng., vol. 32, no. 6, June 1919, pp. 186-187, 1 fig. Schematic diagram showing single-phase regulation connections.

THIRD RAIL. Types of Third-Rail Used in Railway Electrification. Elec. Ry. Jl., vol. 53, no. 24, June 14, 1919, pp. 1143-1148, 19 figs. Considerations involved in selecting rail section, location and protective covering. Leading types are described and their relative advantages and disadvantages are discussed.

Methods Used in Third-Rail Bonding, G. H. McKelway. Elec. Ry. Jl., vol. 53, no. 24, June 14, 1919, pp. 1154-1156, 8 figs. It is observed that high conductivity is first essential, and ease of installation and maintenance are important considerations.

TRACK CIRCUIT. Some Things Learned About the Track Circuit, A. R. Fugina and J. B. Weigel. Ry. Signal Engr., vol. 12, no. 6, June 1919, pp. 195-199, 1 fig. Ballast leakage, rail bonding and minimum working voltage of battery are some of the factors that require further study.

ELECTRIFICATION

CONTACT SHOES. Electrification Facts and Factors, A. J. Manson. Elec. Ry. Engr., vol. 10, no. 6, June 1919, pp. 189-191, 3 figs. Construction details of contact shoes used on over-running and under-running third rails, FRANCE. Partial Electrification of French Railways; Experience Acquired in France and in Other Nations in Regard to Electrification of Extensive Systems (Programme d'électrification partielle des chemins de fer français; expérience actuellement acquise en France et à l'étranger dans l'électrification des grandes lignes—III & IV. M. A. Mauduit. Bul. de la Société Française des Electriciens, vol. 9, nos. 79 & 80, Apr. & May 1919, pp. 273-303, 333-360, 16 figs. Single-phase, three-phase and monophase-three-phase and direct current systems. Orelikon and Brown-Boveri regenerative braking systems. (Concluded).

FUEL SAVING. Methods for More Efficiently Utilizing Our Fuel Resources—XXVI & XXVII, W. J. Davis, Jr., and F. Parkman Coffin. Gen. Elec. Rev., vol. 22, no. 3, Mar. 1919, pp. 196-199, and 212, 4 figs. Possible saving of fuel by railway electrification. Estimates and comparisons. Problems involved in connection with preparation, handling, and burning of powdered fuels on shipboard.

GREAT BRITAIN. British Railway Electrification, Philip Dawson. Times Eng. Supp., vol. 15, no. 535, May 1919, pp. 153-154. Governing conditions of future extension.

SWITZERLAND. The Electrification of the Swiss State Railways (Die Elektrifizierung der Schweiz Bundesbahnen.) E. Huber-Stockar. Schweizerische Bauzeitung, vol. 73, no. 16, Apr. 19, 1919, pp. 181-184, 5 figs. Writer believes that electrification will hardly reduce fares, since it has become very expensive to electrify roads.

EQUIPMENT

AXLE GENERATORS. A Discussion of Axle Generators and Pulleys. Ry. Elec. Engr., vol. 10, no. 6, June 1919, pp. 175-178, 5 figs. New York Car Lighting Club debates on truck-hung vs. body-hung machines and solid vs. perforated pulleys.

HEADLIGHTS. Care of Locomotive Electric Headlights. Elec. Ry. Engr., vol. 10, no. 6, June 1919, pp. 186-188, 3 figs. Rules, regulations and system of records adopted for maintenance of Big Four Railroad's equipment.

TRAIN LIGHTING. Report on Train Lighting and Equipment. Ry. Age, Daily Edition, June 23, 1919, pp. 1667-1670 and (discussion) pp. 1671-1673, 9 figs. Tests conducted by Committee of Am. R R. Assn. to determine (1) rating of axle generators, (2) method of testing to determine this rating, and (3) relation between capacity as found on the stand test as compared to capacity in actual service.

LABOR

SUITABILITY TESTS. Suitability Tests for Railway Men, A. Schreiber. Eng. & Indus. Management, vol. I, no. 16, May 29, 1919, pp. 491-493, 4 figs. Tests applied at Dresden aim to determine how far individual is endowed with four characteristics—intelligence, decision, tranquility and endurance. From Umschau.

LOCOMOTIVES

BRITISH. New 2-8-0 Type Locomotive for Mixed Traffic, Great Western Railway. Railway Gazette, vol. 30, no. 23, June 6, 1919, pp. 934-935, 4 figs. Coupled wheels have a size of 5 ft. 8 in.

CARBONIZATION IN VALVE CHAMBERS. Carbonization in Valve Chambers and Cylinders of Superheated Steam Locomotives, F. P. Roesch. Ry. Age, daily edition, vol. 66, no. 25e, June 25, 1919, pp. 1762-1765, 4 figs. Review of practices of various railways to remedy effects on lubrication and maintenance.

MAINTENANCE. New Locomotive Maintenance Program Pennsylvania Lines West. Ry. Rev., vol. 64, no. 25, June 21, 1919, pp. 913-922, 24 figs. Work involves many new shop structures and much new equipment.

MALLET. Simple Mallet Locomotive with Short Maximum Cut-Off. Ry. Age, Daily Edition, June 23, 1919, pp. 1675-1681, 11 figs. Boiler in three parts: Conical course with minimum outside diameter at front end of 96 in., straight combustion chamber 110 in. in outside diameter ,and firebox. Two sets of simple cylinders. Longest port opening 50 per cent of stroke. Tractive effort estimated at 135,000 lb.

METER GAGE. New Meter Gauge Locomotives; Bombay, Barode & Central India Railway. Ry. Gaz., vol. 30, no. 21, May 23, 1919, pp. 868-869, 3 figs. Engine are of 4-6-4 and 4-4-4 types and are equipped with superheating apparatus and piston valves, the latter actuated by Walschaerts valve gearing.

PACIFIC. Pacific Type Locomotive, Lehigh Valley R.R. Ry. Rev., vol. 64, no. 22, May 31, 1919, pp. 785-786, 1 fig. Designed to utilize mixed anthracite and bituminous fuel.

THREE-CYLINDER. Three-Cylinder Locomotives, H. Holcroft. Engineer, vol. 127, no. 3307, May 16, 1919, pp. 485-489, 19 figs. General survey of development of locomotives with reference to characteristics in Great Britain. France and America, together with presentation of valve gears for three-cylinder locomotives.

VALVE MOTION AND FUEL CONSUMPTION. Fuel Conservation Section of the United States Railroad Administration Tests of Locomotives for Fuel Losses. Ry. & Locomotive Eng., vol. 32, no. 6, June 1919, pp. 169-172, 2 figs. Concluded that condition of valve motion vitally affects fuel consumption, and irregular steam distribution makes proper adjustment of draft apparatus impossible.

MAINTENANCE

DERAILS. Wide Variety of Practices Shown in Use of Derails. Ry. Maintenance Engr., vol. 15, no. 6, June 1919, pp. 199-203. Tabulation of practice in use on various America railroads.

Derails and Where They Should Be Used. Ry. Age., vol. 66, no. 23, June 6, 1919, pp. 1361-1367, 2 figs. Tabulated data covering practices on 48 representative railroads in United States and Canada in regard to conditions governing installation of derails at other than interlocking plants.

Use of Derails Varies Greatly on Railroads. Ry. Signal Engr., vol. 12, no. 6, June 1919, pp. 203-209, 3 figs. Table showing general practice on various American railroads.

FREIGHT-CAR EQUIPMENT. Maintenance of Freight Car Equipment, H. E. Shipman. Ry. Rev., vol. 64, no. 24, June 14, 1919, pp. 894-896. Recommends more uniformity between roads in freight-car repairs and proposes their classification. Paper read before Western Ry. Club.

LIGHTING. Some Notes on Railway Lighting and Maintenance, A. Cunnington. Illum. Engr., vol. 12, no. 3, Mar. 1919, pp. 59-76 and (discussion) pp. 76-86, 11 figs. Advocates adopting standard minimum of illumination in each class of lighting which shall insure comfort for the passenger, efficient working conditions for the railway man and safety for both.

NEW CONSTRUCTION

BIG FOUR. Big Four Increases Capacity at Congested Points. Ry. Age, vol. 66, no. 25, June 20, 1919, pp. 1545-1548, 8 figs. Concerning construction of 87 miles of second track and reduction of grades.

OPERATION AND MANAGEMENT

BOARD OPERATION. The Operation of Federalized Railways Under War Conditions, Carl R. Gray. Off. Proc. St. Louis Ry. Club, 24, no. 1, May 9, 1919, pp. 14-29. Difficulties which, writer believes, caused congestion of railways. Chaotic conditions are said to have resulted from "Lane Commission" taking men's earningsinstead of their ratings as basis for equitable arrangements and relationships between wages.

BRIDGE RECONSTRUCTION AND TRAFFIC MAINTENANCE. Maintaining Traffic During Erection of Louisville Bridge. Eng. News-Rec., vol. 82, no. 22, May 29, 1919, pp. 1061-1064, 7 figs. By bunching trains to pass over bridge at noon hour or about 4 p.m. and diverting some trains to other bridges at critical stages in work, operation was maintained throughout two years, during which time about one mile of steel superstructure was erected.

CONNECTORS, AUTOMATIC. Train Line Connectors on the Copper Range R.R. Ry. Rev., vol. 64, no. 25, June 21, 1919, pp. 941-943, 4 figs. Report of tests with automatic connectors.

DRAWBAR PULL-CUT-OFF CALIBRATION. Drawbar Pull-Speed-Cut-Off Calibration as an Adjunct to Efficient Locomotive and Train Operation, B. B. Milner. Ry. Age, daily edition, vol. 66, no. 25e, June 25, 1919, pp. 1766-1768, 3 figs. Tests conducted to determine precise cut-off which must be used at various speeds in order to develop maximum drawbar pull.

FUEL ECONOMICS. Locomotive Fuel Losses at Terminals, J. M. Nicholson. Ry. Rev., vol. 64, no. 21, May 24, 1919, pp. 752-754, also Railroad Herald, vol. 23, no. 7, June 1919, pp. 36-37. Suggests when locomotive is brought to terminal that fire be turned down to such a point that it will not be necessary to rebuild it in order to get water level in boiler to proper heat before knocking fire. Points out practices which are said to result in useless waste. Paper read before Int. Ry. Fuel Assn.

Reducing Fuel Combustion, Northern Pacific R.R., M. A. Daly. Ry. Rev., vol. 64, no. 24, June 14, 1919, pp. 868-869. Practice of road in schooling enginemen and others in elementary technology of combustion.

Transportation Department and Fuel Economy, H. C. Woodbridge. Ry. Rev., vol. 64, no. 24, June 14, 1919, pp. 865-868, 8 figs. Recommendations to transportation department officials.

LOCOMOTIVE OPERATORS, INSTRUCTION OF. Locomotive Operation—Uniform Instructions, J. R. Alexander. Ry. Club of Pittsburgh, vol. 18, no. 4, Mar. 27, 1919, pp. 86-128. Suggestions intended to bring about concerted action in eliminating waste.

LUBRICATION. Lubrication and Care of Journal Boxes Under Passenger and Freight Equipment, M. J. O'Connor. Off Proc. Car Foremen's Assn. of Chicago, vol. 14, no. 7, Apr. 1919, pp. 22-32. Suggests establishing standard instructions and practices on all points on any one railroad; for the maintenance of which writer proposes assignation of experienced men to follow up the work exclusively.

OFFICE MANAGEMENT. Mechanical Appliances in Railway Offices. Railway Gazette, vol. 30, no. 22, May 30, 1919, pp. 900-906, 9 figs. Great Western Railway's method for preparing accounts for goods train traffic.

POWER PLANTS. Management of Railway Power Plants, William Olsen. Ry. Rev., vol. 64, no. 24, June 14, 1919, pp. 858-859. Suggestions in regard to securing fuel economy.

STATISTICAL DEPARTMENT. Checking Percentages by Chart, William Wycr. Ry. Age, vol. 66, no. 26, June 27, 1919, pp. 1826-1828, 1 fig. Practice of operating statistical section of Railroad Administration.

Compilation of Operating Statistics Report. Ry. Age, vol. 66, no. 23, June 6, 1919, pp. 1360-1373, 17 figs. Standard forms for all roads and methods used by various roads in gathering figures.

VIADUCTS, SMOKE UNDER. Tests to Free Under Side of Railroad Viaducts from Smoke, Robt. H. Moulton. Eng. News-Rec., vol. 82, no. 24, pp. 1162-1164, June 12, 1919, 2 figs. Special arrangement of ducts, air chambers and fans are believed to promise solution of problem of low head-room.

WIND RESISTANCE. The Wind Resistance on a Train, C. F. Dendy Marshall. Engineer, vol. 127, no. 3307, May 16, 1919, pp. 473-474, 4 figs. Graphs showing ratio of train speed to wind speed, also horsepower requirements for every square foot of transverse surface for various speeds.

PERMANENT WAY AND BUILDINGS

TIES. Reinforced-Concrete Railway Ties (Un nuvvo experimento di traverse in cemento armato). Rivista Tecnia della Ferrovie Italiana, vol. 15, no. 4, Apr. 15, 1919, pp. 134-143, 19 figs. partly on two supplement plates. Enclosed wire frame forming two circular ends connected by series of straight bars constitutes reinforcement. Blocks of wood to which rails are fastened are embedded in circular ends. Patented.

TRACK. The Best Methods of Raising Railway Track. Can. Ry. & Mar. World. no. 256, June 1919, pp. 294-295, 5 figs. Report of committee of Road Masters and Maintenance of Way Assn.

TURNTABLE. A Turntable of Unique Design. Ry. Mech. Engr., vol. 93, no. 6, June 1919, pp. 329-332, 6 figs., also Elec. Ry. Engr., vol. 10, no. 6, June 1919, pp. 193-197, 5 figs., and Ry. Age, vol. 56, no. 24, June 13, 1919, pp. 1415-1418, 6 figs. Pennsylvania 110-ft. turntable designed for three-point support and adjustable center.

PUBLIC REGULATION

A Suggested Plan for Control and Operation. Railroad Herald, vol. 23, no. 7, June 1919, pp. 14-16. Suggestion contemplating private ownership and operation under government control.

RAILS

BONDING. The Importance of Rail Bonding, E. Steck. Coal Age, vol. 15, no. 26, June 26, 1919, pp. 1167-1168. Poor track honding considered as chief difficulty in coal operation, because it cuts down voltage delivered to mine motors.

ROLLING STOCK

DRAFT GEARS. Draft Gear Tests by the United States Railroad Administration. Ry. Rev., vol. 64, no. 18, May 3, 1919, pp. 641-644, 6 figs Testing arrangement consists of piece of straight track on which are operated two 50-ton gondola cars, equipped with draft gears to be tested.
When Freight Cars Bump, Prof. J. Hammond Smith. Sci. Am., vol. 120, no. 23, June 7, 1919, pp. 602&615. Recent tests of draft gears, and the resulting developments.

DUMPERS. Car Dumpers, Jas. A. Jackson. Gen. Elec. Rev., vol. 22, no. 5, May 1919, pp. 366-372, 12 figs. Explains operation of two principal types: Turnover, and lift and turn-over, both of which dump sidewise.

COPPER AND GONDOLA CARS. P. R.R. Maximum Tonnage Hopper and Gondola Cars. Ry. Age (Daily Ed.), vol. 66, no. 24a, June 18, 1919, pp. 1461-1466, 12 figs. Designed for maximum loading of six 6-in. by 11-in. M.C.B. axles. Said to be able to carry 120 tons.

SAFETY AND SIGNALLING SYSTEMS

FLAGGING. Flagging and Its Relation to Railroad Accidents, C. C. McChord. Ry. Age, vol. 66, no. 25, June 20, 1919, pp. 1528-1530. Urges making position of flagman a preferred job investing it with more importance and dignity than is at present the case. Review of American experiences with flagging rule represented as evidencing that most accidents are due to inefficiency and carelessness of flagmen.

GREAT BRITAIN. Signalling at Southport, Lancashire & Yorkshire Railway. Ry. Gaz., vol. 30, no. 21, May 23, 1919, pp. 871-881, 14 figs. Power-operated signal boxes containing 160 levers.
Block Signalling Practice on a British Railway, F. B. Holt and A. B. Wallis. Ry. Signal Engr., vol. 12, no. 6, June 1919, pp. 188-191, 3 figs. Use of track circuits, signal repeaters and lamp indications. Position of arm shown while pyrometer indicates if lamp is lighted. Second of three articles.

SODA CELLS. Testing Soda Cells for Railway Signalling, R. W. Irwin. Ry. Signal Engr., vol. 12, no. 6, June 1919, pp. 201-202, 1 fig. Test consists of discharging a soda cell at one ampere continuously, except during short period each day when a set of intermittent readings are taken.

TRANSMISSION MAINS. Supply and Transmission for Modern Railway Signalling—11, A. E. Tattersall. Railway Engineer, vol. 40, no. 473, June 1919, pp. 127-130, 4 figs. Formulæ to calculate sags and stresses on transmission mains.

SHOPS

AUTOMATIC MACHINERY. Automatics in Railroad Shops, M. H. Williams. Ry. Mech. Engr., vol. 93, no. 6, June 1919, pp. 303-310, 21 figs. Description of typical machines of the three primary types, set-ups for a variety of jobs.

COST—OUTPUT FORMULA. Locomotive Repair Shop Output. Henry Gardner. Ry. Mech. Engr., vol. 93, no. 6, June 1919, pp. 335-337, 6 figs. Proposed formula for measuring and comparing cost of repairs in relation to output.

ENGINE HOUSE DESIGN. Modern Tendencies in Engine house Design, Edwin M. Haas. Ry. Rev., vol. 64, no. 22, May 31, 1919, pp. 787-791, 8 figs. General considerations governing selection of types with illustrations of structures in use by principal railroads. Paper read before Western Society of Engineers.
Rectangular Engine House, Long Island R.R., L. V. Morris. Ry. Rev., vol. 64, no. 22, May 31, 1919, pp. 796-797, 4 figs. Built for rapid handling of equipment. Structure is of reinforced concrete.

ERIE AVENUE SHOP, P. & R. Erie Avenue Engine Terminal, Philadelphia & Reading Ry. Ry. Rev., vol. 64, no. 24, June 14, 1919, pp. 859-865, 13 figs. In conjunction with plant concrete coaling station has been erected, and a system of electric precipitation wherewith to clarify smoke issued from locomotives is to be installed.

GLENWOOD SHOPS, B. & O. Glenwood Shop Improvements, Baltimore & Ohio R.R. Ry. Rev., vol. 64, no. 21, May 24, 1919, pp. 747-752, 8 figs., also Ry. Mech. Engr., vol. 93, no. 6, June 1919, pp. 288-296, 13 figs., and Ry. Age, vol. 56, no. 24, June 13, 1919, pp. 1401-1404, 6 figs. Site selected for new plant is occupied by old shop building and it was required that shop services should be continued in these buildings during erection of new shops. Shop is of longitudinal type with 21 pits and space is provided for storehouse for mechanical stores.

STEEL CAR SHOPS, N. Y. C. New York Central Steel Car Shop. Ry. Mech. Engr., vol. 93, no. 6, June 1919, pp. 315-319, 10 figs. Brick building, 431 ft. 3 in. long and 243 ft. 6 in. wide.

TOOLS FOR LOCOMOTIVE VALVE PARTS. Tools for Locomotive Valve Parts, Frank A. Stanley. Am. Mach., vol. 50, no. 24, June 12, 1919, pp. 119-122, 11 figs. Equipment is made up of box tools, boring tools, valve-seating reamers, taps, dies, etc.

WATER-GAGE FITTINGS. Making Water-Gage Fittings in a Railroad Shop, Frank A. Stanley. Am. Mach., vol. 50, no. 25, June 19, 1919, pp. 1171-1173, 5 figs. Set of tools for turning, boring, facing, threading and otherwise machining various parts entering into construction of gage cocks and fittings, used at California shops of Southern Pacific R.R.

GENERAL SCIENCE

CHEMISTRY

ANALYSIS, AIR. The Estimation of Small Quantities of Acetone, Alcohol and Benzene in Air, Major Elliot and J. Dalton. Analyst, vol. 44, no. 517, Apr. 1919, pp. 132-136, 1 fig. Apparatus consists of four narrow measuring cylinders fitted with Folin tubes. Experiments said to have shown that when air was drawn through at rate of about 10 liters an hour, only one cylinder was necessary for complete absorption in each case.

ANALYSIS, ALCOHOL. Determination of Small Amounts of Benzene in Ethyl Alcohol, F. W. Babington and Alfred Tingle. Jl. of Indus. & Eng. Chemistry, vol. 11, no. 6, June 1919, pp. 555-556. Standard method adopted by Inland Revenue Dept. of Canada.

ANALYSIS, BRASS. The Analysis of Brass Ingots from Swarf, R. H. Deakin. Chem. News, vol. 118, no. 3080, Apr. 25, 1919, pp. 193-194. Process for estimating Cu, Zn, Pb, Sn, Fe, Al, Ni.

ANALYSIS, GAS. The Accurate Determination of Carbon Monoxide in Gas Mixtures, J. Ivon Graham. Colliery Guardian, vol. 117, no. 3043, Apr. 25, 1919, pp. 955-956, 1 fig. Writer suggests improving his apparatus (see Trans. Chem. Soc. 1914, 1915, 1916), by replacing beaker of water, used for heating purposes, by small steam bath.

ANALYSIS, STEEL. Determination of Uranium, Zirconium, Chromium, Vanadium and Aluminium in Steel—II, Charles Morris Johnson. Chem. & Metallurgical Eng., vol. 20, no. 11, June 1, 1919, pp. 588-589. Suggested laboratory methods.

ANALYSIS, WOOD. The Proximate Analysis of Wood, W. H. Dore. Jl. of Indus. & Eng. Chemistry, vol. 11, no. 6, June 1919, pp. 556-563. Methods of analysis of woods are described and analysis of five Californian wood samples by these given. It is said that sawdust was found most satisfactory for analysis.

CHEMICAL CONSTANTS. Speed of Evaporation and Condensation and Calculation of the Chemical Constants from the Density of the Condensate. (Verdampfungs-und Kondensationsgeschwindigkeit und die Berechnung der chemischen Konstanten aus den Dichten der Kendensate), Max Trautz. Zeitschrift für anorganische und allgemeine Chemie, vol. 105, no. 3, Jan. 24, 1919, pp. 97-111. Table of chemical constants. The chemical constant becomes the logartihm of the proportion of maximum values of condensation and evaporation speed; it increases with the increasing molecule diameter, with increasing molar volume and decreasing density of molecules.

EMULSIONS. The Modern Conception of Emulsions, W. Clayton. Jl. Soc. Chem. Indus., vol. 38, no. 10, May 31, 1919, pp. 113T-118T- Emulsion of oil in water is produced according to writer, if emulsifying agent is a colloid soluble in water, or more easily wetted by water than oil.

SELENIUM DERIVATIVES. Selenic Acid and Copper Selenate, L. M. Dennis and J. P. Koller. Jl. Am. Chem. Soc., vol. 41, no. 6, June 1919, pp. 949-970. Separation of selenium from tellurium by crystallization of selenious acid.

STRUCTURE OF MATTER. The Arrangement of Electrons in Atoms and Molecules, Irving Langmuir. Jl. Am. Chem. Soc., vol. 41, no. 6, June 1919, pp. 868-934, 16 figs. Extension of Lewis theory of "cubical atom." ((See Jl. Am. Chem. Soc., vol. 38, 1916, p. 762.)

MATHEMATICS

ANALYTIC FUNCTIONS. On the Analytic Function whose Modulus is a Rational Integral Function of the Imaginary Part of Its Argument, Tsuruichi Hayashi. Science Reports of the Tohoku Imperial University, vol. 8, no. 1, Apr. 1919, pp. 17-30. Theorem concerning form of models of complex variable when its uniform analytic function is defined in a domain containing (0,0) in Argand diagram.

ERRORS, LAW OF. Bravais' Law of Errors (Sur la loi des erreurs de Bravais), A. Guldberg. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 16, Apr. 22, 1919, pp. 815-817. Its derivation in space of P dimensions by method of continuous probabilities.

FRACTIONS, PERIODIC CONTINUOUS. Irrationality of Periodic Continued Fractions (Über irrationalität unedlicher Kettenbruche), Matsusaburo Fujiwara. Science Reports of Tôhoku Imperial University, vol. 8, no. 1, Apr. 1919, pp. 1-10. Basing his work on study of that of F. Bernstein and Szász, writer, agreeing with their point of view, derives some new irrationality formulæ for continued fractions with positive terms.

GREEN'S THEOREM. A General Form of Green's Theorem, P. J. Daniell. Bul. Am. Math. Soc., vol. 25. no. 8, May 1919, pp. 353-357. Form relates to potential Functions which satisfy general integral form of Poisson's equation.

INTEGRALS. True Value of Definite Integrals (Sur la vraie valeur des intégrales définies), Arnaud Denjoy. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 17, Apr. 28, 1919, pp. 848-851. Gives theorem assigning Cauchy's value to function which is measurable and limited to function satisfying various conditions.

LINEAR POINT SETS. A Theorem on Linear Point Sets. Henry Blumberg. Bul. Am. Math. Soc., vol. 25, no. 8, May 1919, pp. 350-353. Theorem is: The relative exterior measure of every linear point set exists and is equal to 1 at every one of its points, with the possible exception of those of a set of measure 0.

SERIES. The Generalization of Tauber's Formula of Series (Uber die Verallgemeinerung des Tauherschen Satzes auf Doppelreihen), Matsusaburô Fujiwara. Science Reports of Tôhoku Imperial University, vol. 8, no. 1, Apr. 1919, pp. 43-50. Writer attempts to prove a generalization of Tauber's formula, using for this purpose a modification of Lanlau's method.

SUMMABILITY, THEORY OF, APPLICATIONS. Application of the Theory of Summability to Development in Orthogonal Functions, Charles N. Moore. Bul. Am. Mathematical Soc., vol. 25, no. 6, Mar. 1919, pp. 258-276. Summary of theory and examples of its application to problems in flow of heat and electricity.

VORTICES. Rotating Cylinders and Rectilinear Vortices, H. Bateman. Bul. Am. Math. Soc., vol. 25, no. 8, May 1919, pp. 358-374. Three cases; (1) Rectilinear vortex and rotating cylinder in a stream of incompressible fluid: (2) two rotating vortices and a rotating circular cylinder in a stream of fluid; and (3) vortices in a compressihle fluid.

PHYSICS

ETHER OF SPACE. On a Possible Means of Determining the Two Characteristic Constants of the Ether of Space, Oliver Lodge. Lond., Edinburgh, and Dublin Phil. Mag., vol. 37, no. 221, May 1919, pp. 465-471. Suggests splitting beam of light and sending each half in opposite directions around closed optical circuit in such a way that when they meet, they shall form interference bands.

KINETICS OF HETEROGENEOUS EQUILIBRIUM. An Electromagnetic Hypothesis of the Kinetics of Heterogeneous Equilibrium, and of the Structure of Liquids, Wm. D. Harkins. Proc. Nat. Acad. Sciences, vol. 5, no. 5, May 15, 1919, pp. 152-159, 1 fig. Indicating general nature of distribution of a component between a set of phases from a knowledge of the properties of only the pure component and of those of the phases before any of this component has heen added to them.

PHOTOELECTRONS. The Passage of Photoelectrons Through Metals, K. T. Compton and L. W. Moss. Physical Rev., vol. 13, no. 5, May 1919, pp. 374-391, 11 figs. Experiments mentioned as indicating that photoelectrons, excited with a metal, lose the initial kinetic energy as results of single and definite collisions rather than by a gradual process or succession of small energy losses.

RADIATION MEASUREMENTS. Radiation Detection in X-Ray Work, R. E. Slade' Chem. Engr., vol. 27, no. 6, June 1919, pp. 131-134, 3 figs. Research of relation between photographic action and wave length of radiation. Paper based on work done in laboratory of British Photographic Research Assn., and read hefore Faraday Soc.

Modification of Fluormetric Method of Measuring X-Rays and Its Application to Measuring Radiation of Coolidge Tubes (Sur une modification à la méthode fluorométrique de mesure des rayons X, et son application à la mesure du rayonnement des ampoules Coolidge), R. Richard. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 17, Apr. 28, 1919, pp. 851-854. Suhstituting 6-mm. screen for series of screens of 0.2 mm. in thickness each.

SOUND MEASUREMENTS. A Complete Apparatus for Absolute Accoustical Measurements, Arthur Gordon Webster. Proc. Nat. Acad. Sciences, vol. 5, no. 5, May 15, 1919, pp. 173-179, 5 figs. Requisites are: source of sound producing a simple tone of known intensity, instrument for measuring in absolute units a constantly maintained simple tone, and series of experiments on propagation of sound from one to other in order to check theory of two instruments. Combinations embodying forms said to have been found suitahle after research work are given.

SOUND, PROPAGATION OF. On the Propagation of Sound in the Free Atmosphere and the Acoustic Efficiency of Fog-Signal Machinery: An Account of Experiments Carried Out at Father Point, Quebec, September, 1913, Louis Vessot King. Phil. Tran. Roy. Soc., Lond., Series A, vol. 218, 1919, pp. 211-293, 26 figs. Tests described as having demonstrated successful use of Webster phonometer for measuring characteristics of pure-toned sound waves of ordinary intensity.

SPECTRA. Measurements of Wave-Lengths in the Spectrum of Neon, Kelvin Burns, W. F. Meggers and P. W. Merrill. Chem. News, vol. 118, no. 3080, Apr. 25, 1919, p. 194. Wave lengths of 55 lines lying in region 3369A to 8495A is reported to have been measured by means of interferometer.

Superposed or Duplicated Spectrum Fringes, Carl Barus. Proc. Not. Acad. Sciences, vol. 5, no. 5, May 15, 1919, pp. 149-152, 2 figs. Experiments showing that fringes (monochromatic) due to differences of inclination of rays and fringes (dispersion) resulting from differences in wave length of rays may be made of nearly equal size by dispacing any mirror of rectangular interferometer normal in itself.

An Approximate Law of Energy Distrihution in the General X-Ray Spectrum, David L. Webster. Proc. Nat. Acad. Sciences, vol. 5, no. 5, May 15, 1919, pp. 163-166. Based principally on graphs of intensity against potential at constant frequency and total energy measurements by R. T. Beatty. (Proc. Roy. Soc., London, A89, 1913, pp. 314-327.

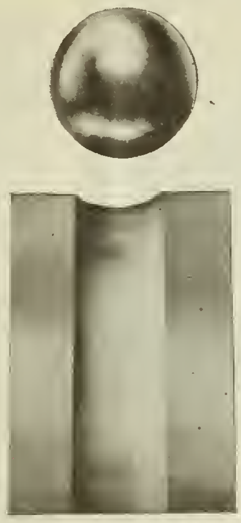
The Logarithmic Law Connecting Atomic Number and Frequency Differences in Spectral Series, Gladys A. Anslow. Physical Rev., vol. 13, no. 5, May 1919, pp. 326-336, 7 figs. Equations derived are considered as indicating that adjustments to Bohr-Sommerfeld theory of atomic structure are necessary in order to extend it so as to predict optical series.

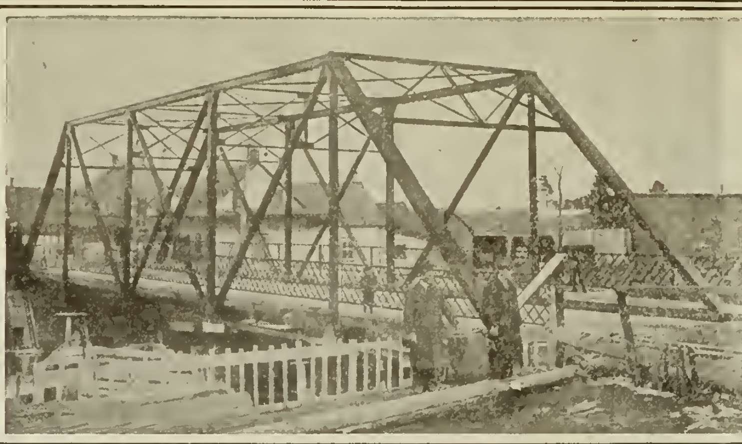
STRUCTURE OF MATTER. Remarks on the Constitution of the Atom and the Properties of Line Spectra (Remarques sur la constitution de l'atome et les propriétés des spectres de bandes), H. Deslandres. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 18, May 5, 1919, pp. 861-868. Bohr's theory, Vegard's calculations and Nagaoka's researches and mathematical analysis are quoted and conclusions are derived in reference to atomic structure as devolved from nature of phenomena of spectra as postulated by these investigators.

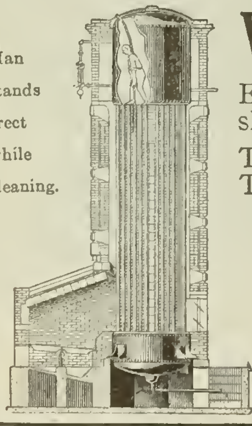
TUNING FORKS. On the Characteristics of Electrically Operated Tuning Forks, H. M. Dadourian. Physical Rev., vol. 13, no. 5, May 1919, pp. 337-359, 12 figs. Experimental determination of changes in period produced by massiveness of base, variation of constants in electrical circuits containing electromagnet increase in length of gaps between contact springs and contact points and temperature changes.

VIBRATION. On the Resultant of a Number of Unit Vibrations. Whose Phrases Are at Random over a Range Not Limited to an Integral Number of Periods, Lord Rayleigh. Lond., Edinburgh, and Dublin Phil. Mag., vol. 37, no. 221, May 1919, pp. 498-515, 7 figs. A number of points is distributed at random in a straight line of finite length. Probability that deviation of center of gravity of points when their number is very great, lies between x and $x+dx$, is found mathematically.

WATER. Temperature Coefficient of Tensile Strength of Water, S. Skinner and R. W. Burfitt. Proc. Phys. Soc. Lond., vol. 31, part III, Apr. 15, 1919, pp. 131-136, 1 fig. Liquid was forced under pressure through a capillary constriction between two limbs of a U-tube.







Man stands erect while cleaning.

Bomb-Proofing the Wimereux Viaduct

By Lieut.-Col. B. Ripley, C.B.E., D.S.O., M.E.I.C.,
Commanding the 1st Battalion, Canadian Railway Troops, in France.

During the spring of 1918 enemy bombing had reached a state where it was necessary to take vigorous steps to preserve not only the bridges and railway structures at the front, but also strategic points on the main railway lines as far back as the very coast itself.

The Wimereux Viaduct was a heavy double track masonry arch viaduct, comprising 3 arches of 50′ each and about 70′ high, at Wimereux, a few miles north-easterly from Boulogne on the Boulogne-Calais Railway. This was a very important double track main line on which the greater part of the Belgian front depended for the getting up of all those supplies, munitions, etc., required in the carrying on of the war. The civil population also of Calais, Dunkerque, St. Omer, Hazebrouck, Bergues and smaller places were dependent, almost solely, on this line for their supplies. There was great use being made of this line as a troop carrier and, generally speaking, the loss of this line to the Allies at that time would have been rather a serious business, considering the extreme tension along the whole front.

The writer, at this time, was at the headquarters of his battalion, the First Battalion, Canadian Railway Troops, at Boubers-sur-Canche, a small town through which the battalion were constructing a new standard gauge cut off line between Hesdin and Frevent. This line, although it might be referred to as a strategic line, we will say little about. It was completed but never used to any advantage for the reason that the Hun, on the other side of the line, failed in his designs, the carrying out of which would have made the Hesdin-Frevent line a very important one and one worthy of considerable mention. The enemy had succeeded in bombing a very important railway bridge not many miles distant from Wimereux and numerous attempts had been made to destroy the Wimereux Viaduct itself. The First Battalion, Canadian Railway Troops, had never anticipated that it would be required to do work of this nature as far back as the coast and certainly never dreamed that it would be called upon in connection with the preservation of the Wimereux Viaduct, a work afterwards carried out by it and which it is now intended briefly to describe.

In order to give the readers a more vivid impression of the carrying out of such a work under war conditions, most of the correspondence, including the very first instructions in connection with the work, is included herein.

On the evening of June 3rd the following telegram was received from Epagnette:—

To 1st Canrail. Boubers-sur-Canche.

Wish you, in conjunction with O.C. 6 Survey Section, Major Boothby, at St. Omer to make reparation to RIPON Viaduct in case of necessity AAA BONNER will explain situation to you this afternoon AAA addressed 1st Canrail, repeated C.R.C.E.*, G.H.Q.*, and No. 6 Survey Section.

From R.C.E. Commns.*

**C.R.C.E.—Chief Railway Construction Engineer.*

**R.C.E. Commns.—Railway Construction Engineer, Lines of Communication.*

**G.H.Q.—General Headquarters.*

Perspective View of the Wimereux Viaduct.

On the evening of June 3rd, the following telegram was also received from Epagnette:—

To 1st Canrail. Boubers-sur-Canche.

In case of necessity detachment 1st C.R.T. will make reparation to RIPON Viaduct AAA Suggest material can be garaged at site, plant and personnel at TERLINGTHUN AAA Unskilled labor to be drawn if required from 264th. Coy. AAA Arrange meeting as early as possible tomorrow with 1st C.R.T. representative at site AAA C.R.T. is obtaining drawings of bridge, you possibly can get these more quickly through BRULARD at Boulogne AAA Addressed 6 Survey Section, St. Omer, repeated C.R.C.E., G.H.Q., and 1st Canrail Boubers-sur-Canche.

From R.C.E. Commns.

The above telegrams were the first intimations received that we were to carry out the work, and the writer, after having his adjutant look up the necessary code words and perceiving that the work was near Boulogne, made arrangements along with his second in command, Major A. R. Ketterson, D S.O., to visit the site of the viaduct and to meet Major Boothby, R.E., there.

R.C.E. Communications. B/79/5.

WIMEREUX VIADUCT

Reference your wires Nos. 95 and 96 of 3rd instant.

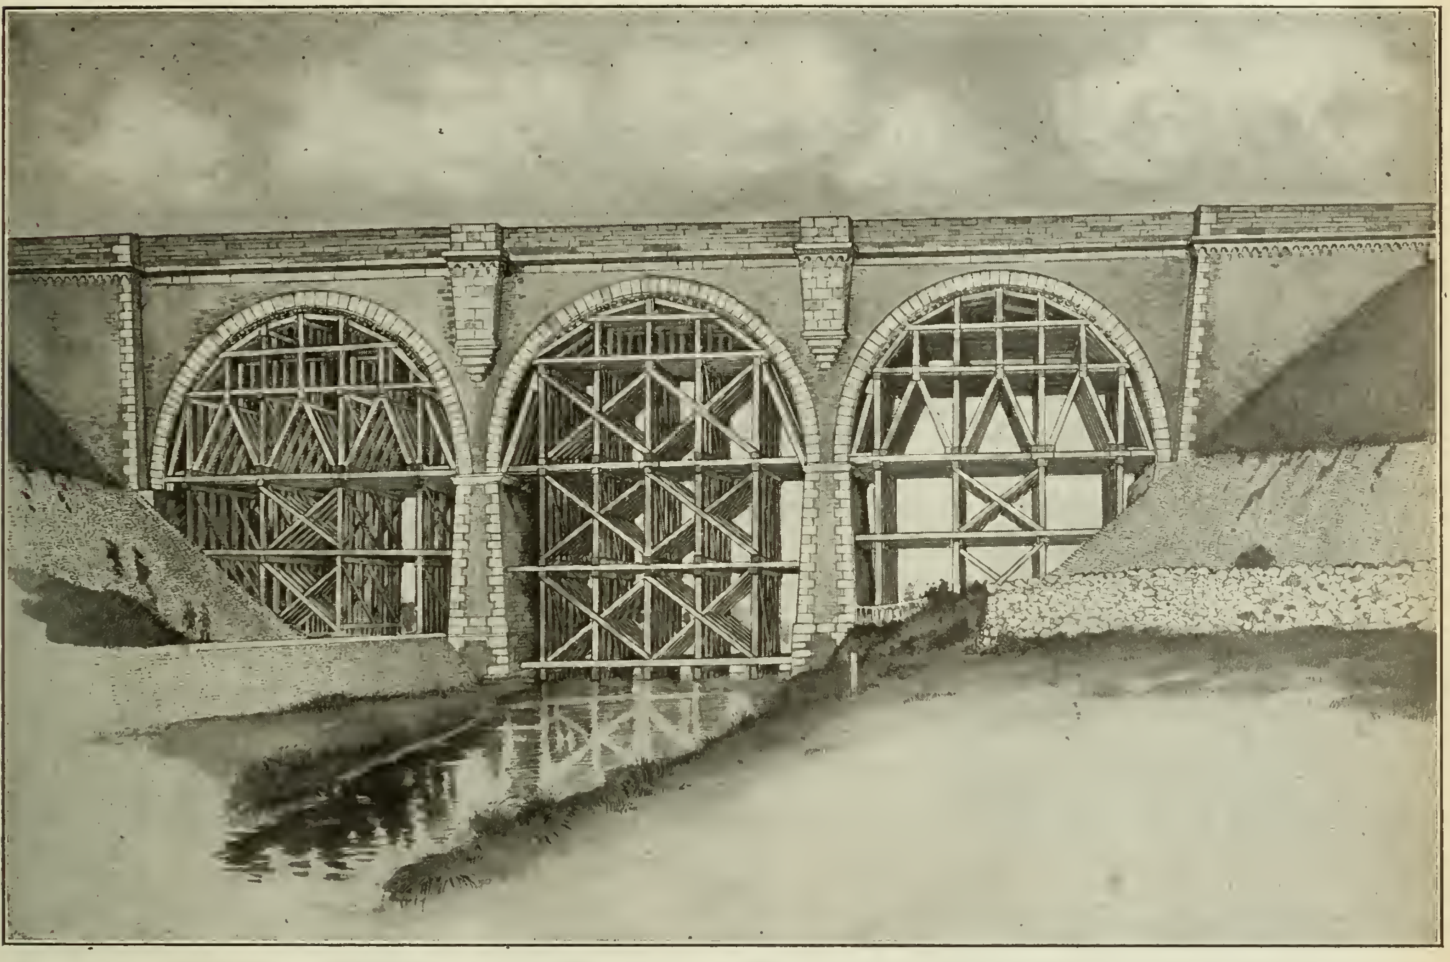
1. I met O.C., 1st C.R.T. this morning at the site and inspected this bridge. The plan had not arrived and M. BRULARD had sent his only remaining copy to C.R.C.E. yesterday, but he was able to supply a sketch plan to scale from which leading dimensions were ascertainable.

O.C., 1st C.R.T. has this sketch plan and will requisition certain material which is bound to be required.

2. O.C., 1st C.R.T. will camp his detachment near the site and material can be unloaded off the dead end siding running back to the viaduct from WIMEREUX station.

3. I am of opinion that it is improbable that the piers themselves will collapse in the vent of the viaduct being struck; also it is not probable than an arch span will be so destroyed as to cause collapse of the pier from the unbalanced thrust of the adjoining arch, and I do not think this contingency should be provided for in advance except by cutting timbers to lengths.

4. C.S.K.P. has steel girder spans up to 60 feet and these might be made use of for carrying track across a damaged arch span between piers. The thrust from the undamaged spans would be taken by timber needle beams if the break was small, but if a large one trestles bedded on the road or invert would have to be erected for the thrust block and struts.



Sketch of the Wimereux Viaduct with Centering in Position.

5. I understand that O.C., 1st C.R.T. is seeing you tomorrow and that you are also sending me in a drawing of the bridge and I will send sketches of these proposals as soon as I receive it.

6. I asked M. BRULARD to dump a turnout at the CALAIS side of the viaduct as probably single track only would be got over at first in the event of a break, and he agreed to do this and said he could also draw on the Nord dumps of rails and sleepers in the vicinity.

7. It seems advisable to send out two 5 ton travelling cranes, one to be stabled at TERLINGTHUN and the other at a dead end at AUBENGUE so that they would be in readiness for handling material at either end of a break.

B. W. B. Boothby,
Major, R.E.,

WIMEREUX BRIDGE

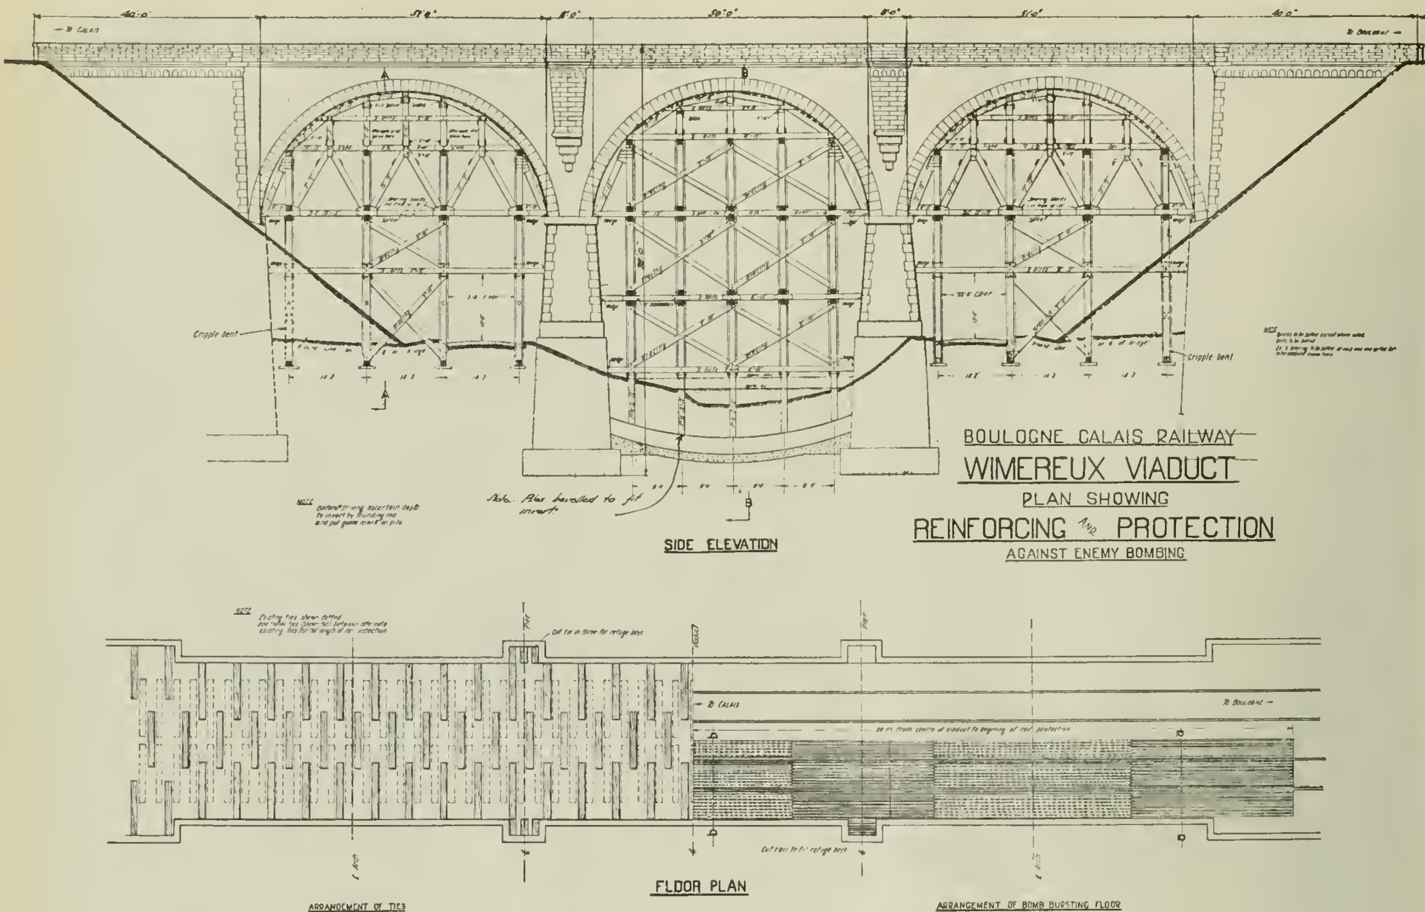
In compliance with your wire of June 3rd, in connection with the marginally noted subject, I visited the site of this bridge yesterday, along with Major Boothby. We did not have a plan of the bridge at the time, and really no method of taking care of the structure was discussed.

This morning I have been placed in possession of a skeleton plan of the structure, and the taking care of the structure is a rather serious proposition, and the importance of keeping the line open between Boulogne and Calais must determine the nature of the work to be undertaken now.

I am rather inclined to think that the keeping of the line open will warrant the re-centering of each of the three arches, as I have shown in red on attached plan. In case an arch were broken it seems to me that this method would have to be adopted anyway, whether or not the floor system was made good by timber stringers or a steel span, the "thrust" has got to be taken care of in any event.

The centre span will very likely be a pile proposition, although on one sketch furnished me by the French Engineer at Boulogne, a masonry invert, from 4½ to 5 feet in thickness was put in, to take certain stresses that were thought might be encountered, on account of the peculiarity of the foundation. This invert might be used to take the loading, which could be put on blocking or crib, but the existence of this invert will have to be taken upon the ground by sounding.

I believe that, with this bridge centered as I have shown on the sketch and treated with a floor of steel rails, (as I have also shown on the sketch), to explode any bombs that might be dropped upon the bridge, it would have a very good chance of remaining in position, although it were bombed. In any event I think that very little of the timber centering would be effected by any bomb that might be dropped on the top of the bridge, and this timber would permit



the making good of the bridge very quickly. The posts could be continued up to the proper height and capped to receive stringers, which would carry the track. The effect of the steel rail floor would be to explode the bomb before it had penetrated. It would distribute the shock over a large area and with the aid of the centering the arch should be able to stand the shock.

Regarding the proposal to stock the material on the ground, to make reparation in case of bombing, this would probably be alright. Provision would have to be made however, in the event of an arch being broken, for the closing of the bridge to traffic. It could not be much less than a week, especially if the centre span was effected.

It might be a good idea to have a double cross-over installed at either end of the bridge, to permit the using of one track, in case the bridge were bombed and only one track put out of commission.

In making the above suggestions and proposals, I quite realize that the importance of the line, the supply of timber, etc., will determine just how elaborate a scheme will be carried out, and I would like to have your decision in the matter, as soon as this is arrived at. In the meantime I have ordered sufficient timber, including stringers, to take care of one of the arches.

I will immediately investigate the supposed existence of the masonry invert, in the centre opening, and if there is no invert, will order a land pile driver on to the ground at once. The piling might be driven in this opening without the doing of any further work if desired, but I do not favour the idea, for the reason that the falling arch would probably render these useless.

I am despatching one Officer and 25 Bridgemen to the site of this bridge, so that they will be there on arrival of the material which has been ordered.

B. Ripley,
Lieut.-Colonel.
O.C., 1st Battalion, Canadian Railway Troops.

E.C. 1011/68.

Secret and Urgent

C.R.C.E.

WIMEREUX VIADUCT

1. In accordance with your wire E.R. 82 of the 2nd inst., (received 3rd inst.), I took steps regarding the methods to be adopted towards this bridge, should it be damaged by enemy action.

Capt. BONNER, R.E., was sent to H.Q., 1st Battn. C.R.T. to explain the situation and request that Lieut.-Colonel RIPLEY should make himself responsible for any repairs that may become necessary, and that he should generally discuss the question with Major BOOTHBY, R.E.

These officers met at WIMEREUX yesterday morning; unfortunately I was unable to get them out the plans in time, so it was impracticable for them to formulate a joint report.

2. I beg to hand you herewith:—

(a) Report and plan from C.O., 1st. Battn., C.R.T.

(b) Report from O.C., No. 6 Survey Section.

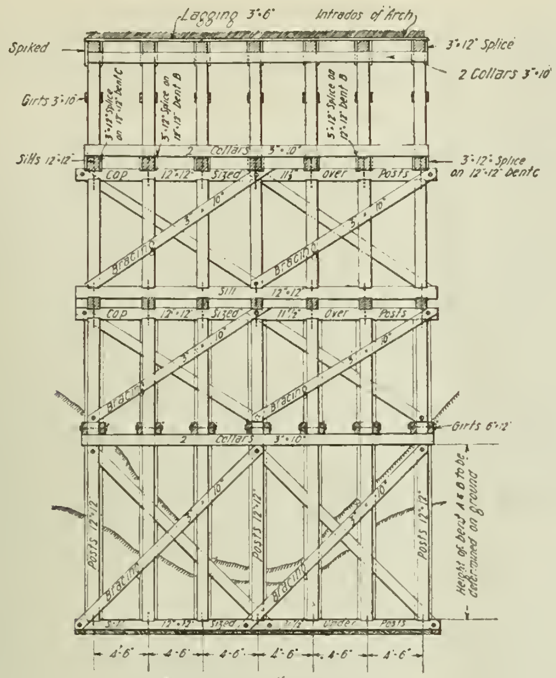
Colonel RIPLEY came in to see me this morning, and at my request prepared the report and plan referred to.

3. The whole affair appears to resolve itself into a matter of policy as to:—

(i) How much one is prepared to risk.

(ii) What are the consequences attached to a lengthy delay in effecting reparations.

I have discussed the matter with Commandant TISSERAND and Capt. VICTOR today, and they are both in favour, as far as possible, of having such remedial work as may be necessary done in advance.



SECTION A-A

In principle, I absolutely agreed, the guiding factor appearing to be as to whether the timber is available and can be spared for the purpose.

4. There are apparently two ways by which damage can occur:—

(A) By a direct hit.

(B) By a bomb falling alongside the structure.

(A) From observation at ETAPLES, it is fairly apparent that the bomb which partially destroyed the arch there exploded after penetration and before percolation. Consequently (I assume that the explosive effect of a bomb is outwards and upwards) no damage would be done to the under-structure except by debris falling by gravity.

(The suggested decking of rails would hasten the explosion). This should do no serious hurt to preliminary timbering. This timbering would act laterally as a counterfort, and should an arch be destroyed, will take up the thrust from the adjoining one; in plan it divides the spans so that it will act vertically as the supports of comparatively light stringers.

(B) I do not think that a bomb falling alongside the bridge would do a great deal of harm: the possible consequences appear to be:—

Undermining of the foundations.
Damage to abutments or piers.
Partial destruction of preparatory false work.

All should be easily remedied.
The headway is such that I do not think the arch would be damaged.

5. Conclusion.

The preparations made should be either:—

(1) On the assumption that a complete span is to be put over a damaged arch.

(2) That false work be built up and a series of short spans subsequently interposed, if necessary.

(1) It will, I think, be a long job to get large girders in position; much masonry would have to be cut away to prevent having to raise the rails abnormally on both sides. There is no room for a centre girder, and consequently both roads would have to be dealt with, even if only one were damaged.

(2) I am entirely in favour of this scheme, which resolves itself into whether the trestling shall be placed in position before (with a possibility that it will hold up the whole structure, and a possibility that it may be knocked out), or after the event.

6. I have wired for the timber asked for by C.O., 1st Battn., C.R.T.

Will you please let me have your instructions in the matter.

W. W. Wilson,
Lieut.-Colonel, R.E.,
R.C.E. Communications.

Enclos. (plan.) Will you kindly send copies of the plan accompanying Col. RIPLEY'S report to Major BOOTHBY, R.E., Commandant TISSERAND, and myself.

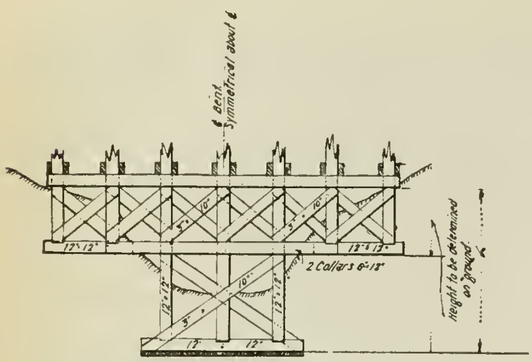
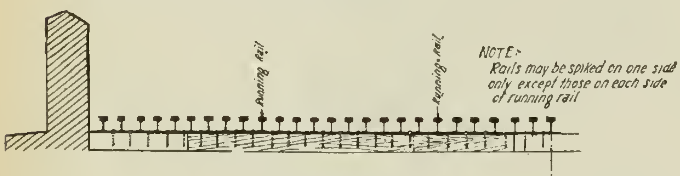
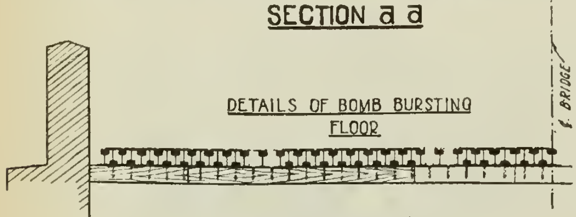
SECTION B-B



DETAIL SHOWING BOTTOM OF CRIPPLE BENTS



SECTION a a



SECTION b b

FOR HALF RAIL LENGTH ON EACH SIDE OF CROWN

In connection with the preparing of the plan and general scheme on which the work was carried out, there was nowhere any precedent to follow, and at the same time the supply of timber available determined to a great extent the dimensions used. At home we would order the various sizes required, but in France we used what we could get; hence, economic considerations scarcely enter into the case at all. The roadways on either side of the stream were important and had to be maintained at their full width. The presence of the concrete invert, at first, was looked upon as an obstacle as it was intended to cut off the piles in the centre span slightly above the water line.

The work in connection with the flanking spans was started first, the bents being placed on substantial blocking or mud sills. On driving the first pile in the centre span it was found that the mud overlying the masonry invert was so dense that the pile would stand vertically unsupported and that the layer of mud next the invert was more like a blue clay than was anticipated. This allayed greatly our fears that the loaded piles would have a tendency to shift or slide on the invert, which is seen from the plan to follow a slight curve. It was then decided to cut off the piles at a considerable height above the water, as is shown on the plan, and to cap them at that point.

On account of the shallowness of the mud and clay overlying the invert and the curved surface of same, it was decided to further insure the stability of the piles by stiffly strutting them, both in the direction of the bridge and transversely, with double 6" x 12" timbers well secured to the piles. The bracing above this line was intended to further secure the position of the piles below the line of the struts, in case there should be any tendency of the piles to shift on the invert.

The second deck of bents was arranged with cut-off, or cap elevation, at such a height as to receive or support 12" x 12" longitudinal sills or struts at the springing line of the arches, in order to take care of the thrust in the event of damage to any of the arches from enemy bombing. The existence of good liberal stone copings at the springing line of the arches facilitated the work considerably and assisted in the support of the 12" x 12" arch ribs.

From the springing line upwards the erection was rather difficult on account of the large amount of framing and fitting, as the arches were not by any means true, and derricks could not be used on account of the overhead obstruction by the masonry structure itself. Strong hooks made from Decauville railway rails were made and secured to the parapet walls above, and the timber was hoisted into place by two hoisting engines operated from below.

On account of a very marked irregularity in each of the arches great difficulty was experienced in the framing and fitting of the arch ribs. This difficulty was accentuated by the small space left for erection.

There was little difficulty in placing the lagging, which was intended to have only a snug or slightly loose fitting in any case.

To Canrail, Boubers.

Please have me wired authority to commence work at Ripon Viaduct AAA French sentinels have no authority about this AAA Wish to dig test pits tomorrow.

From B. Ripley.

To 1st Canrail, Boubers near Frevent.

Authority to commence work given by French AAA Passes will be issued to Colonel Ripley, Major Ketterson and Major Holland.

From R.C.E. Commns. (Epagnette).

While it might appear from the complete correspondence that about two months were occupied in carrying out the work, it might be stated that one month would be more nearly correct. During July, 1918, or the second month, the majority of our C. Company men at Wimereux were building bomb-proof dug outs, or tunnels, for Canadian Nursing Sisters at Boulogne, and the balance of the men were doing such work as placing lagging, which was not considered of utmost importance. There was also a delay of about a week in getting the necessary timber and plant on to the ground. Little time was occupied, however, in rushing these men to Amiens, to join the other three companies of the battalion in their work there, when the Hun gave way early in August.

The placing of steel rails, two deep, on the deck of the bridge was intended to explode any bomb, before the bomb had penetrated, that might be dropped on to the bridge, and to distributed the shock over a greater area. These rails were secured to the ties, additional ties having been placed under and between the tracks as shown on the plan. The first layer of rails were spiked down in the ordinary way, using angle bar splices as the track was on a slight curve, and the second layer was dropped in between, ball down. The rails, used in this bomb-bursting floor would make about 1¼ miles of track.

The bomb-proofing of the Wimereux viaduct was, of course, not a guaranteed piece of work, but, judging from the effect of bombs that had been dropped in the neighborhood especially in the vicinity of Etaples, the writer had confidence in the scheme. With the steadily increasing size of bombs and the terrible effect of the explosives used, the readers, and those who have seen the effects of bombing in the war zone, must judge for themselves as to the merits of the work carried out. The scheme was, however, whole heartedly endorsed by both the British army authorities, and the French army authorities in Paris. It was probably the only attempt, on a large scale, to bomb-proof any structure in the Allied war zone, there being nearly a quarter of a million feet of timber alone in this one bridge.

The work, under the supervision of Major A. R. Ketterson, D.S.O., A.M.E.I.C., (Assistant Engineer, Canadian Pacific Railway, at Montreal,) was carried out by C. Company of the 1st Battalion, Canadian Railway Troops, under the command of Major R. R. Holland, formerly District Engineer, National Transcontinental Railway. Major W. Monds, A.M.E.I.C., Chief Engineer of the Battalion, was engaged on other special work at the time near Etaples and, consequently, was not available for this work. The Honourable, the Minister of Militia, General Mewburn, and other prominent Canadians visiting the front on special missions, viewed this work and expressed themselves as greatly pleased with what seemed to them the boldness of the scheme and the quick and workmanlike way in which it was carried out.

Lt.-Col. B. Ripley, O.C., 1st Bn., C.R.T., B.E.F. — France, June 7th, 1918.

COL. LYELL approves of your scheme for the reparation of the WIMEREUX VIADUCT, near BOULOGNE, and requests that you go ahead with the work immediately.

R.C.E. Comms. will be able to give you detailed instructions and advise you officially.

J. W. Stewart,
Brig.-Gen.,
G.O.C., Corps Canadian Railway Troops.

A.P.O., S 33,
B.E.F.

File X8/1079. A.
In the Field, June 13th, 1918.

R.C.E. Communications.

I am sending you herewith in triplicate, blue prints showing details of the work in connection with the viaduct at WIMEREUX. It may be necessary to make slight alterations on account of variations in material supplied, but there will be no change to upset in any way the purpose for which the plan is intended.

Regarding the submitting of a design for an overhead covering, 15 feet above the rail, carrying bags of stone two deep, for bursting purposes, mentioned in your wire of the 6th, this matter has not yet been fully considered, it has, however, been considered to the extent that it is deemed inadvisable that this, if adopted, should be connected with the work now being done. If the two schemes are both to be carried out, I think that theyshould have entirely independent means of support.

The overhead scheme, if adopted, is going to entail a large amount of work, and my own opinion at this time is, that is if the scheme now being carried out has not the maximum of confidence, that the work and material that would be involved in the overhead scheme, might possibly be added to the scheme shown on the attached plan, which could be still more elaborated.

B. Ripley,
Lieut.-Colonel,
O.C., 1st Battalion, Canadian Railway Troops.

Copy. Secret.

Chief Railway Construction Engineer, E.R. 8233 15-6-18

R.C.E. Comms.

WIMEREUX VIADUCT

Reference your E.C. 1011/57, dated 14/6/18, I approve of the arrangements for timbering shewn on your plan 11-2/2, dated 14/6/18.

I agree with Colonel RIPLEY and overhead cover need not be fixed. The rail cover should take the form of that shewn in the top and bottom sections of your plan, viz.: B.B. and A.A.

I presume that your are sending this plan to Commandants VICTOR and TISSERAND to let them know what we are doing.

(Sgd.) David Lyell,
Chief Railway Construction Engineer

G.H.Q.,
15th June, 1918.

Japanese Lines in Manchuria

Japan is displaying renewed activity in Southern Manchuria which is within her sphere of influence. Six railway schemes have been proposed, one of which is the extension of the Changchun-Kirin line to the Korean boundary at Hoi-yang. This is an important proposal, since the new line will afford a connection between Manchuria (Eastern and Northern) and Chhyong-yin, the new port of North-east Korea, which will be the actual terminus of the line, and which affords good shelter and deep water facilities, allowing 10,000 ton vessels to approach close to the shore. The new railway which will be constructed as soon as possible, is likely to divert a good deal of traffic from the Chinese Eastern Railway in Northern Manchuria, and to make Chhyong-yin a serious competitor with Vladivostock, besides tapping for Japan's benefit, the existing and potential wealth of Inner Manchuria. (*Peking Leader Feb. 11, 1919.*)

The Design and Construction of Reinforced Concrete Covered Reservoirs.

By R. DeL. French, M.E.I.C.

Introduction

Covered concrete reservoirs for water storage are discussed in this paper from the standpoint of structural design only. It does not deal with their location nor capacity.

Primarily, charts are presented by means of which rough estimates of cost may be easily made, and the most economical design quickly selected, having given the required capacity. Secondarily, certain formulas, diagrams and tables are offered, which it is thought will shorten the actual work of detailed design. It has been assumed that the reader is familiar with ordinary reinforced concrete design, so that no explanation of its general principles is given. Finally, a table of data and costs relating to reservoirs of various types and sizes is annexed, together with drawings of typical reservoirs, and a bibliography of the more important recent articles dealing with these structures and with questions relating to them.

Water Storage

Ground water, or water which has been filtered, should be stored in the dark to prevent the growth of light-loving micro-organisms, which, though in themselves innocuous, impart disagreeable tastes or odors, or both, to the water in which they live. Covered reservoirs have also other advantages, although these are of less importance. They keep water cooler in summer and warmer in winter than do open reservoirs, they do not suffer such a large diminution in effective capacity, due to ice formation in cold weather, their contents are better protected against dirt and gross pollution, and their roof areas are available for park, playground or other purposes. The rapid increase in the number of water filtration plants in Canada and the United States during the past two or three decades has, of course, led to a corre ponding increase in the number of covered reservoirs required as adjuncts to these plants.

Construction Materials

The covered reservoirs of Great Britain and the Continent, where filtration became common at a much earlier date than here, have generally been built of brick or stone masonry, and only recently has there been a noticeable tendency toward the use of concrete. In North America, however, the beginning of the period of great activity in filtration practically coincided with the beginning of the present era of concrete. It is not surprising, therefore, that substantially all of the covered reservoirs on this continent have been built of concrete, either plain or reinforced, since this material is peculiarly adapted to the purpose on account of its flexibility in design. The larger structures have very generally been constructed with gravity or semi-gravity walls, groined arch roofs, inverted groined arch floors, and little or no reinforcement. The smaller ones, on the other hand, are almost always of reinforced concrete. The present trend seems to be away from the first type and toward the second, possibly because there have been a number of failures of groined arch roofs, because there is no well accepted method of designing them, and because more economical reinforced concrete design is being rapidly developed.

Economical Dimensions

Covered reservoirs are usually either rectangular or circular, although there is no good reason why they should not be of different shapes, if required by topographical or other considerations. Their capacity is determined by local factors in each case. Having determined this, it remains to decide upon the most economical combination of depth and area. The depth may sometimes be governed by allowable variations in pressure, or by similar factors, and the area by the size of the site, but both may generally be varied within fairly wide limits by the designer. The depth of a reservoir, measured from the under side of the roof to the floor, is always somewhat greater than the depth of water below the level of the overflow. The latter must be less than the former by at least the head required to discharge the maximum inflow through the overflow, if there is to be no upward pressure on the roof. The clearance is usually greater than this.

There is a prejudice on the part of some engineers against allowing water to rise above the soffits of the roof beams. This prejudice does not seem to be well grounded, as, with proper air vents and an adequate overflow, there is no danger of lifting the roof with a rising water level, nor of imposing an excessive atmospheric load upon it with a falling one. Neither is there any reason to suppose that the concrete in the roof will be more subject to damage from alternate wetting and drying than that in the walls, which is unavoidably subject to such conditions.

Attempts have been made to find analytically the most economical depth, and hence the required area for a given capacity, but without much success, since any mathematical treatment must perforce be either very complex or rest upon a foundation of numerous assumptions. The best design for any given case can be most satisfactorily arrived at by the trial and rejection of many tentative ones. To facilitate this process, the charts of Figures 1, 2, 3 and 4 have been prepared, from which the concrete and steel quantities required in rectangular reservoirs may be taken off. Before plotting these diagrams, a large number of designs were carefully made, and the unit quantities in each computed. These quantities were then plotted, as shown by the curves. It may be remarked that, while *all* the points did not fall on the smooth curves given, most of them fell in astonishingly regular order. In selecting permissible stresses, etc., for these designs, the rulings of the Special Committee on Concrete and Reinforced Concrete of

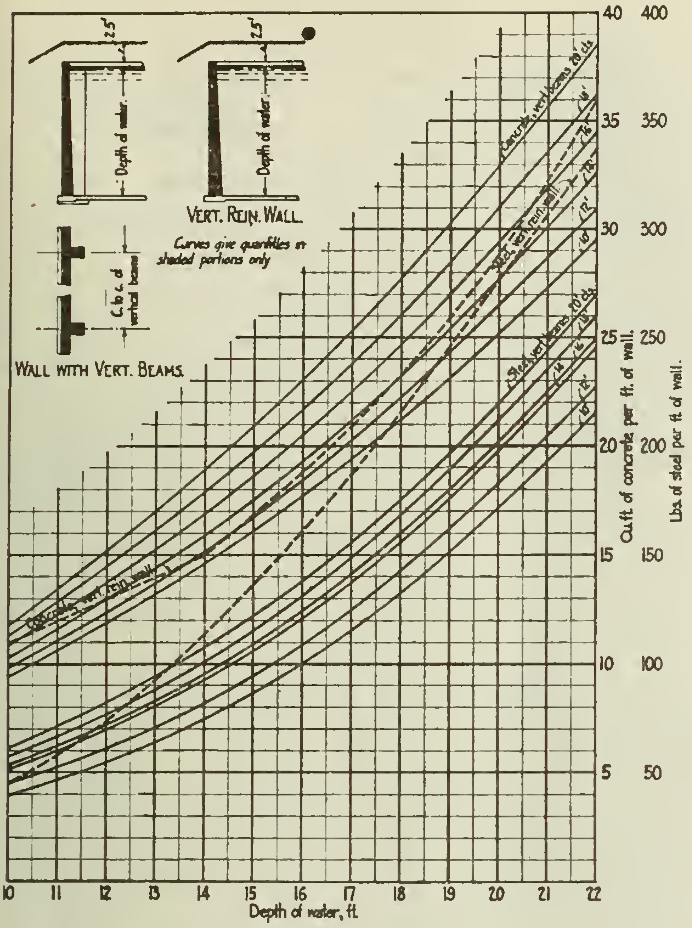

Fig. 1.—Concrete Covered Reservoirs.

the American Society of Civil Engineers were followed, except in the calculations for flat slabs, where the regulations of the Chicago Department of Buildings were adopted.

In the design of walls, as shown in Figure 1, two conditions were investigated. In the first case, with reservoir full, hydrostatic pressure due to the full depth of water was assumed as acting on the inside face of the wall, while earth pressure due to a fill 2.50 ft. lower than the height of the wall acted on the outside face. Earth was taken as having a slope of repose of slightly over 1 to 1 (ϕ = 47°30′), which is equivalent to a fluid weighing 15 lbs. per cu. ft. In the second case, with reservoir empty, the pressure on the outside of the wall was taken as that due to an earth fill 2.50 ft. higher than the top of the wall. Here the slope of repose was taken as approximately 1¾ to 1 (ϕ = 33°00′), which corresponds to a fluid weighing 33 lbs. per cu. ft. In both cases, the vertical height of the wall was assumed as 6 ins. greater than the depth of water, and earth was assumed to weigh 100 lbs. per cu. ft. In calculating the weight of reinforcement required, a liberal allowance was made for lap and bond lengths and for spacing bars.

Although Figure 2 gives quantities for flat slabs only, it is approximately correct for slab and beam roofs, since it was found that there was no marked difference between the quantities for these two types, although there may be in their respective unit costs. The roof was designed for a safe load of 300 lbs. per sq. ft., not including the weight of the slab itself.

Figure 3 gives the safe capacity of square and round columns of different sizes and with various percentages of longitudinal steel. For square columns, this is based on the gross area of the section, while for hooped columns only the area inside the reinforcement was considered. With the help of the small table at the bottom of the figure, the quantities in such columns may be easily calculated. The spiral hooping in the circular columns represents approximately an additional 1% of steel.

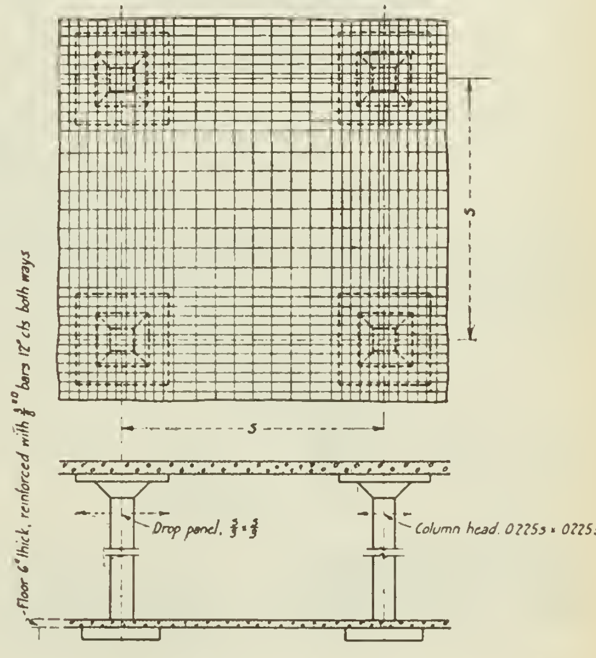

Fig. 2.—Concrete Covered Reservoirs.

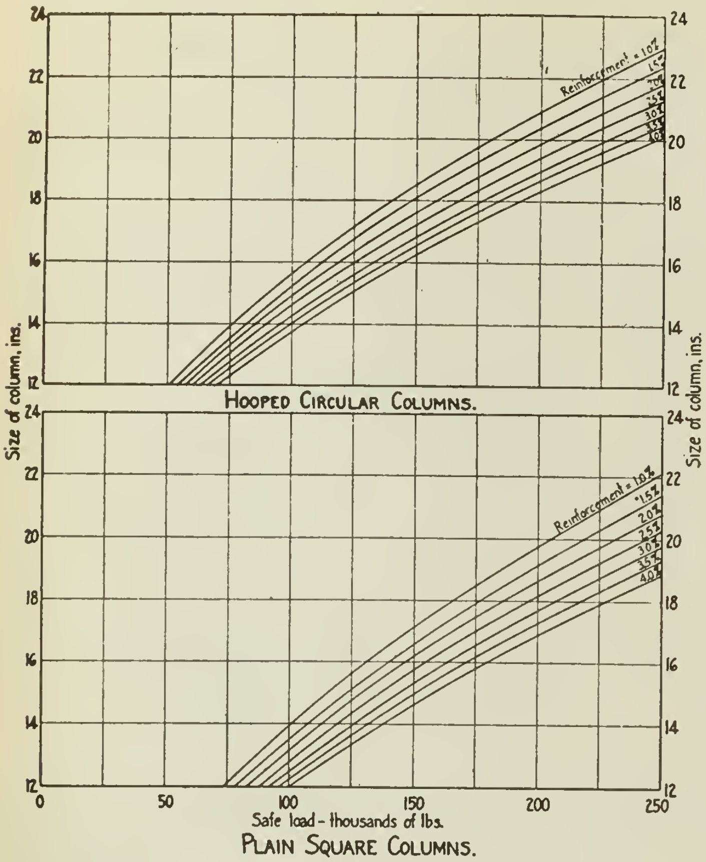

Volume of concrete in columns, cubic feet per lin foot

Size of column, ins	12	14	16	18	20	22	24
Square.	1.00	1.36	1.78	2.25	2.78	3.36	4.00
Circular.	0.79	1.07	1.40	1.77	2.18	2.64	3.14

Hooping in circular columns assumed 1½" from surface of concrete: capacity based on area of core only
Capacity of square columns based on total area

Fig. 3.—Concrete Covered Reservoirs.

Figure 4 gives the quantities of steel and concrete in square footings for various column loads and soil bearing capacities. An approximate estimate of the quantities in wall footings may be easily made, and as these will vary widely, it was not thought practicable to plot curves for them. In any event, they represent only a small percentage of the total quantities in a reservoir, unless it be of very limited capacity, and a comparatively large error here will seldom have much influence on the final result.

Excavation and fill are easily calculated, and vary in each case. If there is no reason for a different procedure, the bottom elevation of the reservoir should be so fixed as to make the cut and fill balance, paying due regard to an allowance for shrinkage. Piping, gatehouses, etc., are not subject to much variation in cost for reservoirs of the same capacity but of different depth and area, and hence may properly be omitted from comparative estimates.

In the case of circular reservoirs, Figures 2, 3 and 4 may be used, and a rough design for the wall worked out by the aid of Formulas 15, 16 and 17. It is well to note, however, that these formulas give a thickness of wall which is greater than that used in many satisfactory designs, hence they are by some considered ultra-conservative.

Basis of Design

There is, naturally, considerable latitude in regard to the assumptions to be made preliminary to the design of a concrete covered reservoir. The stresses to be allowed in the concrete and steel, etc., should conform either to the recommendations of this *Institute*, or to those of some other recognized authority. Some engineers advocate the use of lower stresses than these, on the ground that much of the load is uncertain and cannot be accurately computed, but it is thought to be the better practice to estimate the loads with liberality, and then to use stresses which have proved satisfactory in building construction. Comparatively speaking, a covered reservoir is a simple structure, and it should be possible with ordinary care to get at least as high a quality of materials and workmanship in it as in the case of buildings, which are generally far more complicated.

The preliminary estimates will have established the best spacing of columns. There are practically no limitations to the arrangement of the latter, since no use is made of the floor space in a reservoir. If a slab and beam roof is preferred to a flat slab, the economy of equal column spacings in both directions, and slabs reinforced both ways, should be investigated. Two and a half feet of fill over the roof should be sufficient for most parts of Canada and the northern United States, but in some extreme cases it may be advisable to increase this depth. Five feet was adopted for some small reservoirs in the Rocky Mountains, on account of the intense and long-continued cold there, and the infrequent change of the water stored. Fifty lbs. per sq. ft. live load, in addition to the weight of the fill on the roof, is ordinarily ample. The most severe conditions of roof loading probably occur while the fill is being placed, due to teaming, the use of scrapers, etc. Experience shows that a roof designed for a total load of 300 lbs. per sq. ft., exclusive of the weight of the slab, will safely withstand this test.

Turning to the walls, the type will have been settled by the preliminary investigations, and it remains to determine the probable earth pressure. The whole matter of earth pressure is in such an unsatisfactory state, that reducing it to an *eqivalent fluid* seems to be as convenient and logical as any method of treatment. An *equivalent fluid* is one which will produce the same pressure on the wall at any depth as is given by earth. The unit weight of such a fluid will vary with the assumed weight of earth and with its angle of repose. A curve of equivalent fluid weights, earth being assumed to weight 100 lbs. per cu. ft., is given in Figure 5, which is based on the familiar formula of Rankine. With the reservoir empty, the maximum probable earth pressure should be considered as acting. With the reservoir full, it is safer practice to assume that the internal hydrostatic pressure is resisted by earth pressure from dry material having the lowest conceivable angle of repose. Owing to the possibility that shrinkage cracks may open between the wall and the back-fill, it is also better to omit the resisting pressure of the earth, with full reservoir, for some distance down from the top of the fill. No definite rule can be given for locating the point where this resisting pressure begins to act, but 5 ft. below the surface of the fill should be enough for any ordinary soil.

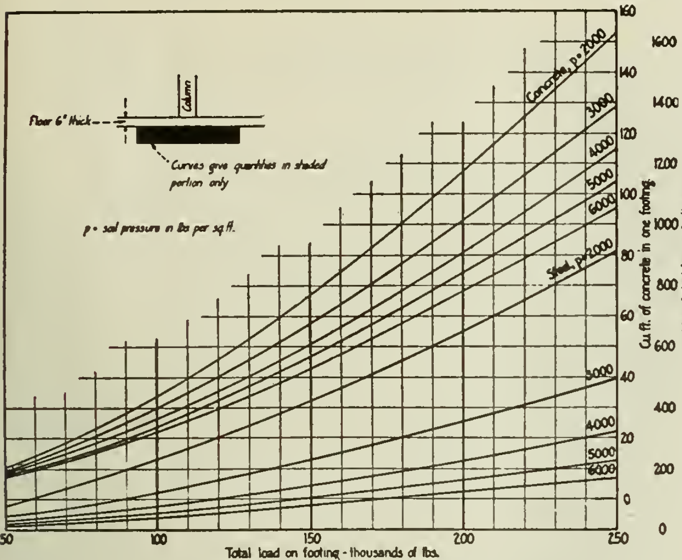

Fig. 4.—Concrete Covered Reservoirs.

If the ground water plane is above the floor of the reservoir, its effect upon the load on the wall must be considered. In Figure 6, let the ground water level be as shown. Assuming a slope of repose for dry earth of 1½ to 1, and a unit weight of 100 lbs. per cu. ft., the equivalent fluid weight, from Figure 5, will be 28 lbs. per cu. ft., and, consequently, $p_1 = 28$ h. If earth under water weighs 70 lbs. per cu. ft., and its slope of repose is 2½ to 1, the equivalent fluid weight is then $46 \times \frac{70}{100} = 32$ lbs. per cu. ft. Hence, that part of p_2 due to a depth h_2 of earth under water is $32\ h_2$. But there are also additional pressures at this point from the earth above the ground water level and from the water below this plane. The former is $46\ h_1$ and the latter is $62.5\ h_2$, so that the total $p_2 = 32\ h_2 + 46\ h_1 + 62.5\ h_2 = 46\ h_1 + 94.5\ h_2$. For example, let $h_1 = 4$ ft., and $h_2 = 6$ ft. Then.

$a = 28\ h_1 = 28 \times 4 =$ 112 lbs. per sq. ft.
$b = 46\ h_1 + 94.5\ h_2 = (46 \times 4) + (94.5 \times 0) = 184$ lbs. " "
$c = 46\ h_1 + 94.5\ h_2 = (46 \times 4) + (94.5 \times 6) = 751$ lbs. " "

Having these unit pressures, it is a simple matter to find the total pressure on the wall and the location of its point of application. The true pressure diagram probably follows some curved line, near the ground water level, shown dotted in Figure 6, rather than the full line, with its abrupt change.

The view to be taken in the design of the floor varies according to the character of the foundation. In ordinary dry soils, it is regarded as a pavement, the function of which is merely to prevent leakage. In wet ground, the assumptions may vary from the view just stated, to regarding the whole reservoir as a box subject to flotation, and hence requiring a heavily reinforced floor to withstand the uplift. In one case of this sort, check valves opening inwards were used to prevent the possibility of an upward pressure on the floor. Obviously, this expedient could not be adopted where the ground water was polluted and unsafe for use, nor without some special provision for cleaning the reservoir, when necessary.

Design of Walls

Reservoir walls may be classed as
(a.) Gravity.
(b.) Semi-gravity.
(c.) Cantilever.
(d.) Counterfort and buttress.
(e.) With vertical beams.
(f.) Vertically reinforced.
(g.) Circular.

(*a*) *Gravity Walls.*

Gravity walls are seldom used for covered reservoirs. Their design presents no difficulties.

(*b*) *Semi-gravity Walls.*

Semi-gravity walls have been frequently used in reservoirs built with groined arch roofs. Their design is a matter of precedent and judgment. The table below gives the ratio of width of base to height of wall for a number of semi-gravity walls.

TABLE I

Semi-gravity Walls

	Reservoir	Ratio of base to height
1.	Tentative design, F. H. Carter....	0.16
2.	Brookline, Mass................	.14
3.	Kamloops, B.C..................	.19
4.	Plumsted, Eng..................	.21
5.	Shooters' Hill, Eng...............	.17
6.	Hornsey Wood, Eng..............	.25
7.	Burton-on-Trent, Eng............	.26
8.	Montreal, Que. (filter plant).......	.20
	Average =	0.20

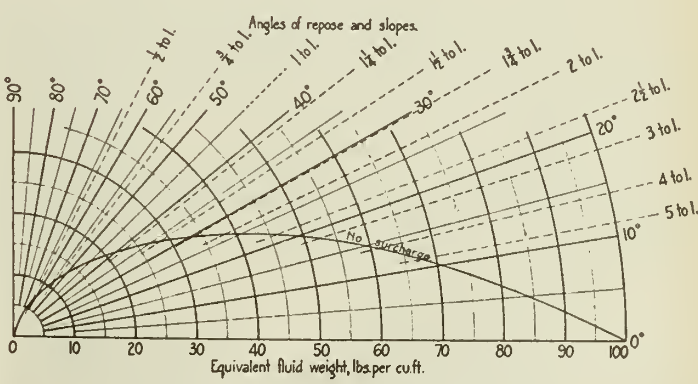

Fig. 5.—Concrete Covered Reservoirs.

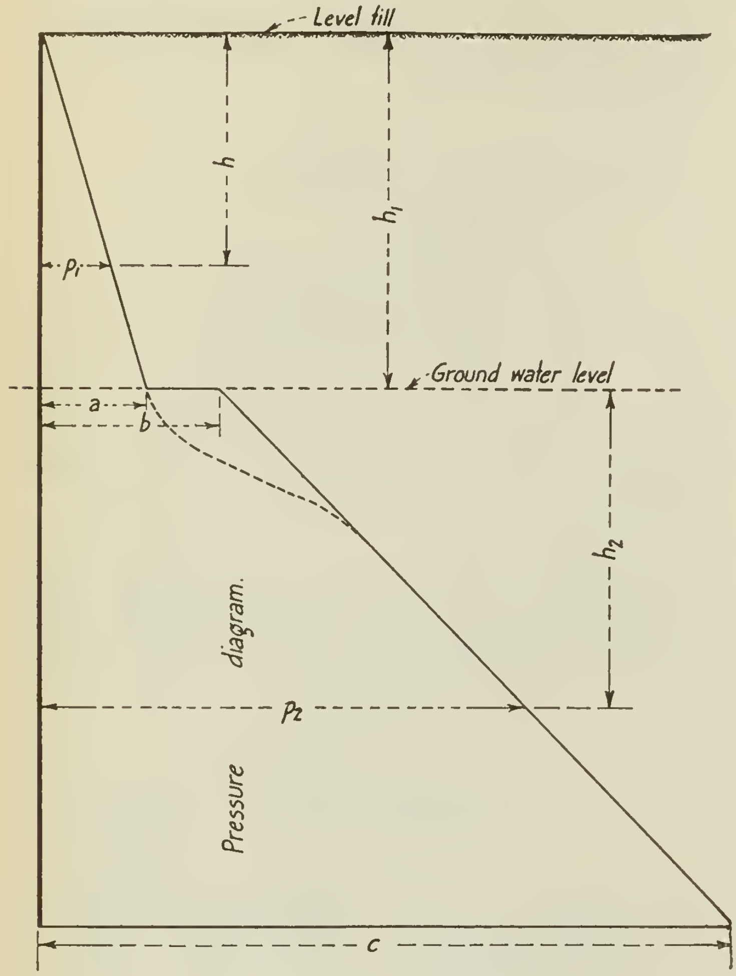

Fig. 6.—Concrete Covered Reservoirs.

It will be noted that this ratio is less than 0.40, a commonly accepted figure for retaining walls. It must be remembered, however, that there are forces, such as the load, and thrust, if any, from the roof, imposed on the wall of a covered reservoir, which are not present in a simple retaining wall, and that therefore the two are not strictly comparable.

(c-d.) Cantilever, Counterfort and Buttress Walls.

Reinforced concrete cantilever, counterfort and buttress walls have been used to some extent. The method of design is not substantially different from that used in the case of simple retaining walls of the same types.

Note.

The five types of walls so far discussed do not take full advantage of the support afforded by the roof and floor, which is an important factor and should not be neglected.

(e). Walls with Vertical Beams.

Walls with vertical beams are horizontally reinforced, and the reactions of the slab are carried by the vertical beams to the roof and floor. These beams are usually located on the center lines of the columns, though there may be intermediate ones. M = WL/12 applies to the intermediate panels of the wall slab, and M = WL/10 to the end panels, if these are restrained at the corners of the reservoir, otherwise, M = WL/8 should be used here.

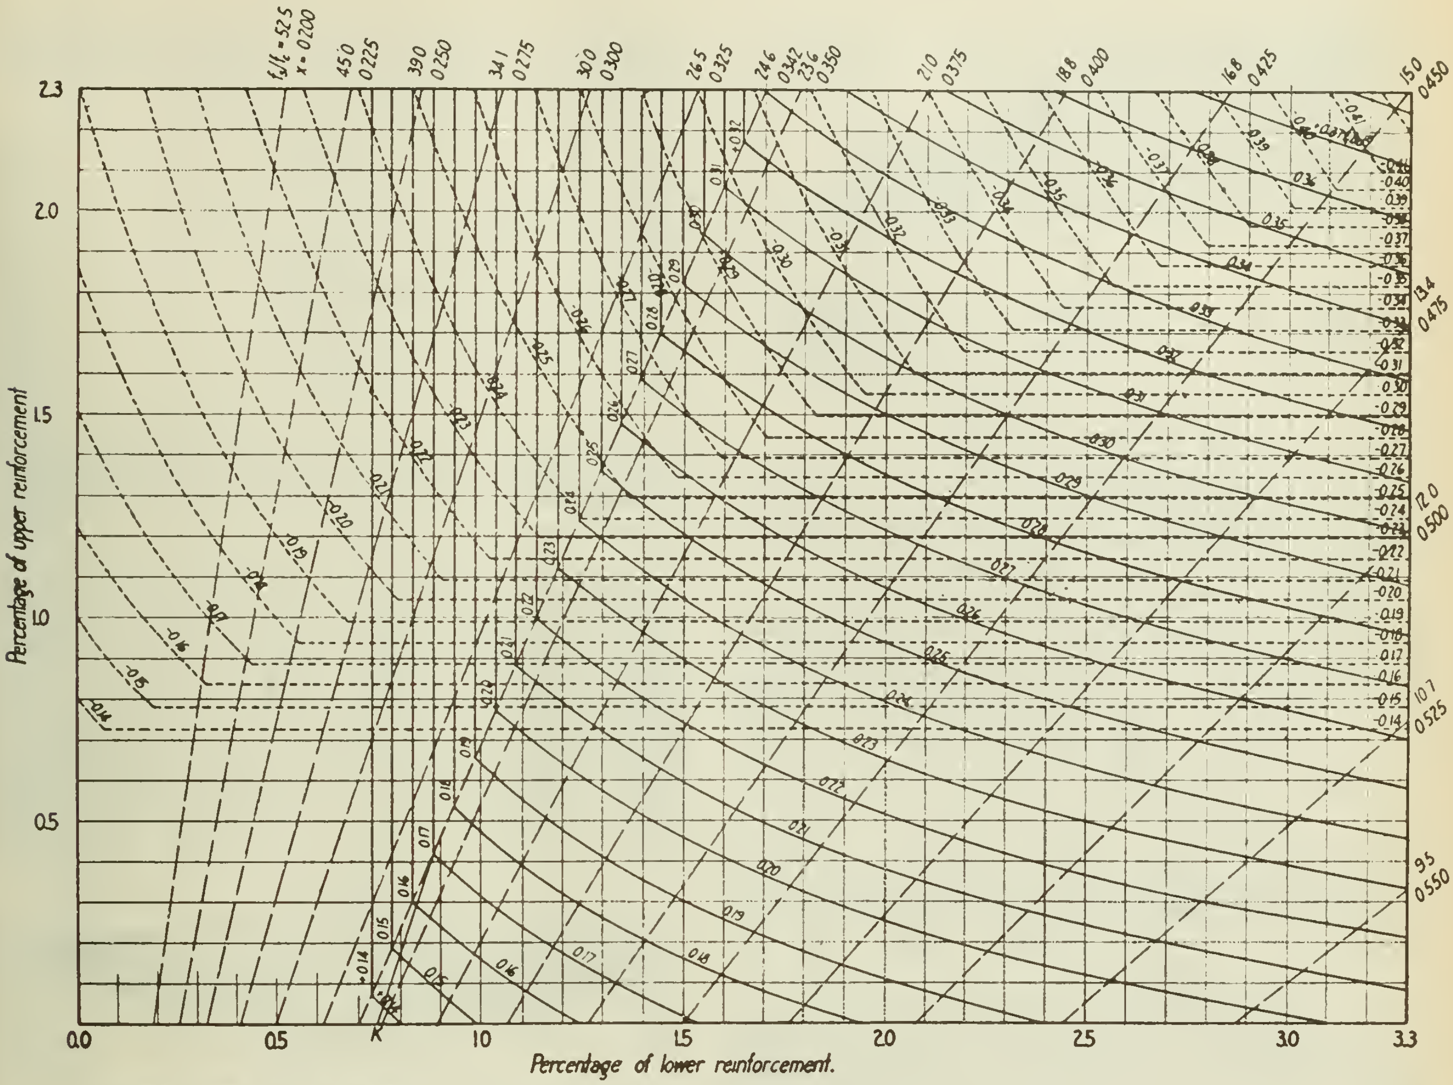
Since this slab is necessarily reinforced on both faces, it might be made thinner than is required by Formulas 1, 2, 3 and 4 for single reinforcement, and also less steel might be used. This is seldom done, although the calculations, which are tedious if performed arithmetically, are greatly simplified by the use of Figure 8. Shear at the ends, and not the moment, will usually determine the theoretical thickness, while the practical thickness is generally fixed from considerations of water-tightness. Five inches is recommended by one writer as the minimum allowable thickness, but most engineers would hesitate to use less than 10 or 12 inches.

Formulas for Horizontally Reinforced Walls (Single Reinforcement).

Having determined upon the earth pressure to be taken, convenient formulas may be derived for the thickness and reinforcement of the wall. Consider a strip one foot wide vertically, and let

L = span of slab, center to center of vertical beams, feet.
k_1 = equivalent fluid weight of earth, reservoir full, lbs. per cu. ft.
k_2 = equivalent fluid weight of earth, reservoir empty, lbs. per cu. ft.
h_1 = " head " of earth on center of strip, reservoir full, feet.

Fig. 7.—Concrete Covered Reservoirs.



This diagram is adapted from Steinman's translation of Prof. J Melan's "Plain and Reinforced Concrete Arches"

Fig. 8.—Concrete Covered Reservoirs.

h_2 = "head" of earth on centre of strip, reservoir empty, feet.
h_3 = head of water on centre of strip, reservoir full, ft.
t = thickness of slab from compression face to center of gravity of steel, inches.
A_s = area of steel required in given strip, sq. inches.
f_s = allowable stress in steel = 16,000 lbs. per sq. inch.
f_c = allowable stress in concrete = 650 lbs. per sq. inch.
n = ratio of moduli of steel and concrete = 15

Then for reservoir full and M = WL/12,

$$t = 0.0278\,L\,\sqrt{62.5\,h_3 - k_1 h_1} \qquad (1)$$

And for reservoir empty and M = WL/12,

$$t = 0.0278\,L\,\sqrt{k_2 h_2} \qquad (2)$$

The coefficients in these formulas become 0.0304 and 0.0340 for M = WL/10 and M = WL/8, respectively. In all cases,

$$A_s = 0.0923\,t \qquad (3)$$

or, if t is greater than is required by the moment,

$$A_s = \frac{M}{14{,}000\,t} \qquad (4)$$

In (4) the effective depth is taken as 7/8 t.

It is highly desirable for convenience in construction to so arrange the spacing of the horizontal bars that as few different sizes will be used as possible. Under the ordinary assumptions as to load, there will be sufficient steel in the compression face of the slab to take care of the negative bending moment over the vertical beams, as the inward and outward moments are usually about equal. If these are radically different, it may be necessary to introduce some extra bars across the beams on the face having the lighter reinforcement. The vertical beams may be considered as free or as only slightly restrained. If they are framed into roof beams, and securely tied into the floor, with possibly a bracket there, 85% to 90% of the calculated bending moment with

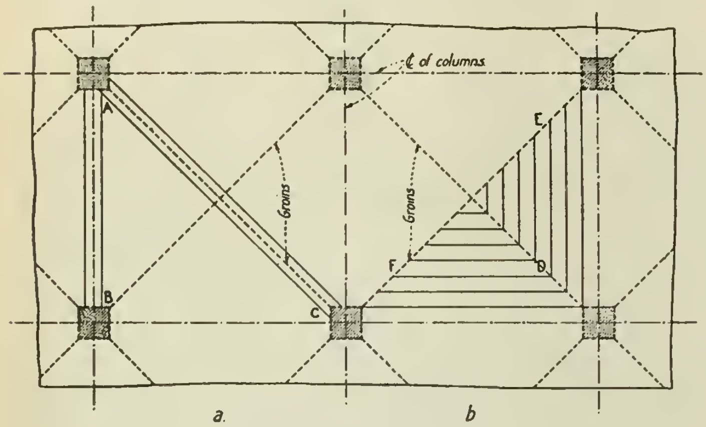


Fig. 9.—Concrete Reservoirs.

free ends is advisable, otherwise the full calculated bending moment should be used. The loading diagram with reservoir empty will be trapezoidal, and may be assumed as triangular for full reservoir without serious error.

The chart of Figure 7 is useful in finding the reactions and point of maximum moment due to a trapezoidal load. The formula for x.h applies, of course, to any portion of the trapezoidal load, as is shown by the following example. Let a = 250 lbs., b = 1,000 lbs. and h = 10 ft. Then a/b = 250/1000 = 0.25. From the curve, x = 0.40, and therefore $R_1 = \frac{0.40 \times 10}{2}(250 + 1{,}000) = 2{,}500$ lbs.

Similarly, $R_2 = \frac{(1.00 - 0.40) \times 10}{2}(250 + 1{,}000) =$ 3,750 lbs. Also y = 0.548 from the curve, and y.h = 0.548 × 10 = 5.48 ft. The unit pressure at the point of maximum moment $= 250 + \left\{\frac{5.48}{10} \times (1{,}000 - 250)\right\} = 661$ lbs. = b′. Now a/b′ for the portion of the load above the point of maximum moment = 250/661 = 0.38, whence x = 0.428 and x.h = 0.428 × 5.48 = 2.35 ft. for this portion of the load. Therefore, M = (2,500 × 5.48) — (2,500 × 2.35) = 2,500 × (5.48 — 2.35) = 7,825 ft. lbs. = 93,900 in. lbs. M should be calculated for the assumed loading, i.e., with ends free. If the construction is such that some fixity at the ends may be counted upon, some reduction may be made in the moment thus found, as suggested in the preceding paragraph, and the reduced moment used in computing the required depth of beam and the reinforcing steel.

For determining the web reinforcement, the most satisfactory method is to plot the shear diagram from end to end of the vertical beam. This is a comparatively simple matter, and easily done if a little system is used in making the necessary computations.

In a beam under triangular load, let

M = maximum positive moment, in. lbs.
M_1 = negative moment at end where intensity of load = 0, in. lbs.
M_2 = negative moment at end where intensity of load = max., in. lbs.
W = total load, lbs.
h = span, ft.
x = distance from end where intensity of load = 0 to point of maximum moment, ft.
y, y_1 = distances from end, where intensity of load = 0, to points of inflection, ft.
V = total shear at any point, z ft. from end where intensity of load = 0.

Then, for a beam with ends free,

$M = 1.540$ Wh. (5)
$x = 0.577$ h (6)
$V = W/3 - Wz^2/h^2$ (7)

and, for a beam with ends fixed,

$M = 0.515$ Wh (8)
$M_1 = 0.800$ Wh (9)
$M_2 = 1.200$ Wh (10)
$y = 0.237$ h (11)
$y_1 = 0.807$ h (12)
$x = 0.548$ h (13)
$V = 3W/10 - Wz^2/h^2$ (14)

The vertical beams may be located either entirely within or entirely without the reservoir wall, or in some intermediate position. Their position with respect to the wall determines whether tee action may be counted upon to resist inward or outward moment. There is not usually much difference between these, although cases may occur in which it is large, depending altogether upon the assumptions made with regard to earth pressure with reservoir full and with reservoir empty. It is, of course, desirable to so place the vertical beams that the larger moment will be resisted by tee action, but this is not the only factor to be considered. From the point of view of the contractor, it is preferable to have the beams entirely within the reservoir, although this decreases the capacity somewhat. If the roof is of the slab and beam type, this location of the vertical beams reduces the

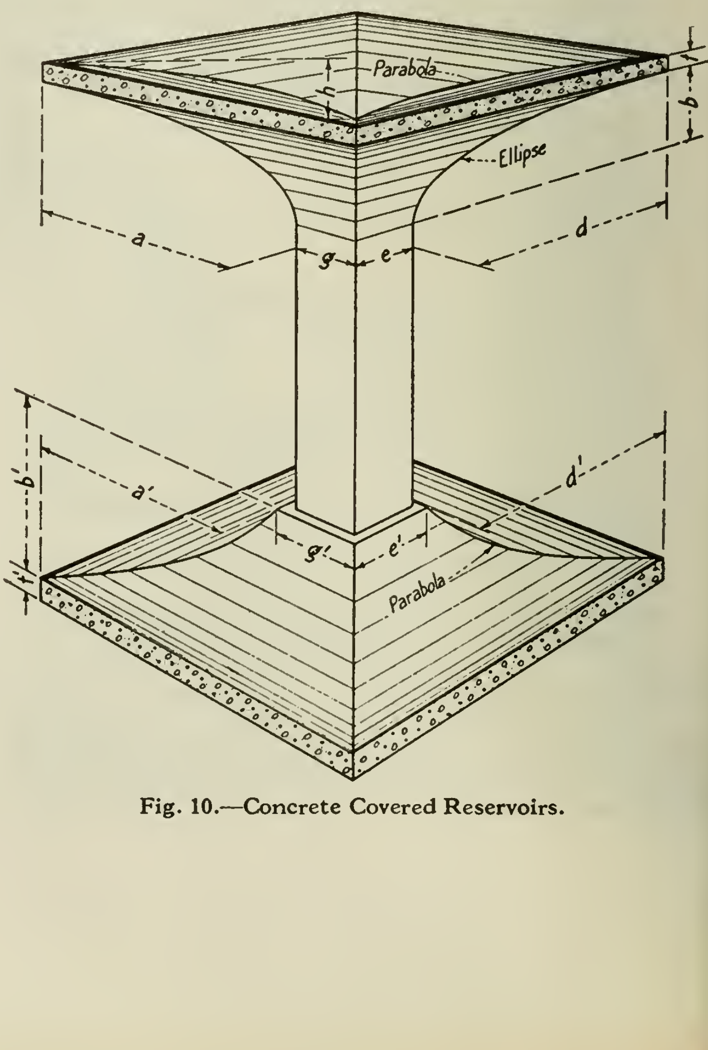

Fig. 10.—Concrete Covered Reservoirs.

span of the end roof beams, which is desirable, since the moment in these beams is larger than in the intermediate ones, the span in the two cases being the same.

Vertical beams must be thoroughly tied into the roof system at the top, and into the floor at the bottom, to take care of the end reactions. This may be accomplished by bending some of the reinforcing steel in these beams into the roof and floor, respectively, or by means of special stirrups. The stress on these bars is direct tension, and is equal to the end shear on the beam. How far it is necessary to embed them in the concrete of the roof or floor cannot be exactly calculated, as there is no data as to how the stress is transferred to the concrete. In one case, ties at the tops and bottoms of the vertical beams were provided clear across the panel next to the wall, and one-half of this area of steel was carried across the next adjoining bays. In another design, the ties projected only 8 ft. into the concrete of the roof and floor.

(*f*). *Vertically Reinforced Walls.*

Vertically reinforced walls dispense with the necessity for vertical beams, and are much simpler as regards form work. The method of design follows that just given for vertical beams. For a considerable height above the floor, their thickness will usually be determined by shear. From 0.15% to 0.35% of horizontal steel is required in these walls to guard against temperature cracks. This should be in the form of small bars, well distributed over the cross section of the wall.

Double Reinforcement.

Formulas 1 to 4, inclusive, do not take account of the double reinforcement in the walls, although some economy may be realized by considering it. While it is a difficult problem to handle analytically, a simple chart (Figure 8) adapted from a diagram published in Steinman's translation of Professor J. Melan's "Plain and Reinforced Concrete Arches", removes most of the tedium.

For example, assume an outward bending moment of + 780,000 in. lbs., and an inward moment of —530,000 in. lbs. Taking f_c = 650 lbs. per sq. in., f_s = 16,000 lbs. per sq. in., and assuming 12 ins. as the width of the beam and 20 ins. as its depth, there results

$$m = \frac{+\ 780.000}{12 \times 20 \times 20 \times 650} = +\ 0.25$$

or

$$m = \frac{-\ 530,000}{12 \times 20 \times 20 \times 650} = -\ 0.17$$

The full curve, m = + 0.25, intersects the dotted curve, m = — 0.17, at the point 2.14 on the axis of abscissas, and 0.89 on the ordinate axis, thus showing that 2.14% of reinforcement is needed on the outer face, and 0.89% on the inner. This is not the most economical combination, however. Moving along the + 0.25 curve to the left, at the break, the co-ordinates are found to be 1.30 and 1.36, respectively, i.e., 1.30% reinforcement in the outer face and 1.36% in the inner. This point falls very close to the — 0.25 curve, that is, the negative resisting moment has been increased by this change in reinforcement in the proportion of 17 to 25, although the total amount of steel has been reduced. From the sloping dotted lines, it is found that the value of f_s/f_c at the point 1.30, 1.36 is 24.6, so that, for a moment of + 780,000 in lbs.,

$$f_c = 650 \text{ lbs. per sq. in.}$$

and

$$f_s = 24.6 \times 650 = 16{,}000 \text{ lbs. per sq. in.}$$

The point 1.36, 1.30 gives f_s/f_c = 23.4. Since the full negative resisting moment is not developed, the stresses for a moment of — 530,000 in. lbs. would be

$$f_s = \frac{17}{25} \times 16{,}000 = 10{,}900 \text{ lbs. per sq. in.}$$

and

$$f_c = 10{,}900 \div 23.4 = 465 \text{ lbs. per sq. in.}$$

The most economical combinations of outer and inner reinforcement will always be found along the line of f_s/f_c = 24.6, except near the bottom of the chart, where they will lie along the line marked K. The above analysis applies, of course, with equal emphasis to walls with double reinforcement.

(*g*) *Circular Walls.*

Walls for circular reservoirs are sometimes designed on the assumption that the circumferential reinforcing steel takes all the stress, which, for a truly circular ring, is pure tension. In this case the concrete is regarded merely as a waterproofing and cover for the steel. If the

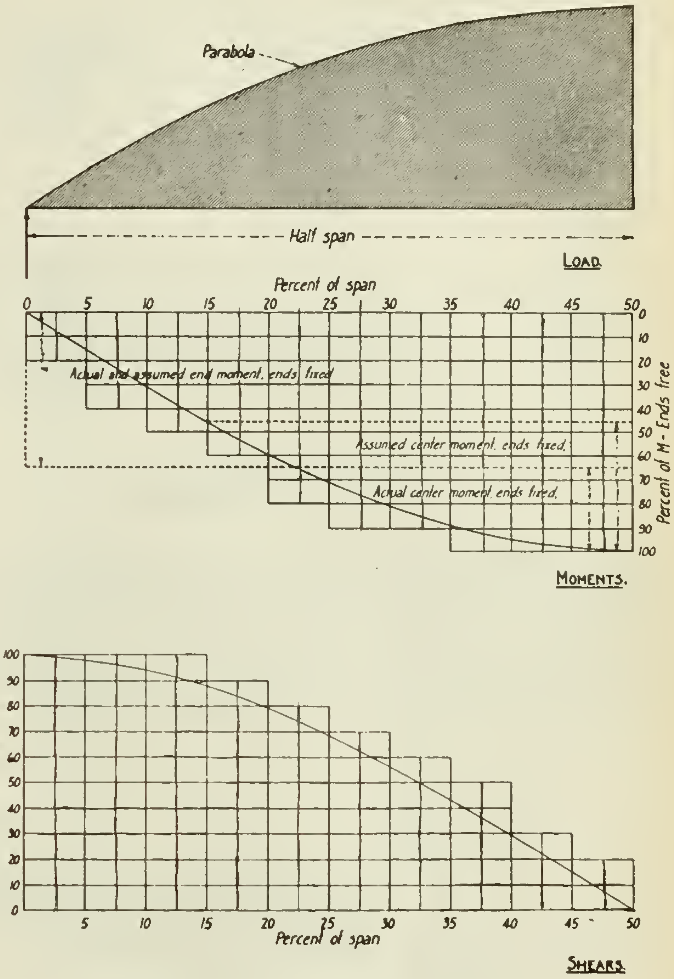

Fig. 11.—Concrete Covered Reservoirs.

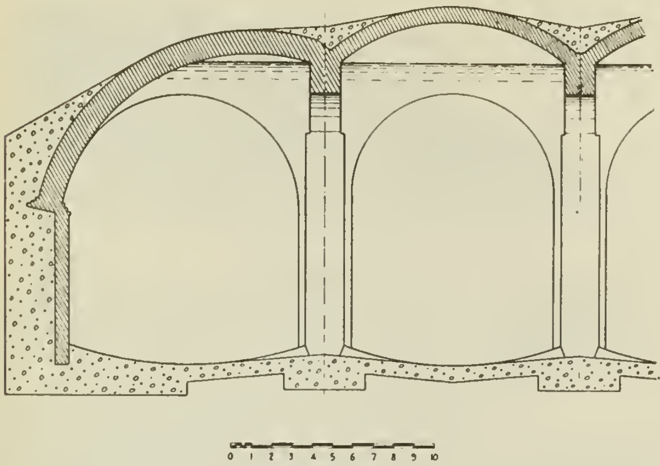

Fig. 12.—Concrete Covered Reservoirs.

steel is stressed, it must stretch, and therefore some tension must be thrown into the concrete, the thickness of which should be calculated with this in mind. Formulas 15, 16 and 17 below were derived by H. B. Andrews. They take into account the tension in the concrete, and give a thickness of wall which is greater than has been used in some reservoirs in satisfactory service.

$$A_s = \frac{pr}{s} \quad (15)$$

$$D = \frac{12a}{A_s} \quad (16)$$

$$t = \frac{pr - (n - 1)\ A_s c}{12c} \quad (17)$$

in which

A_s = area of steel per foot height of wall, sq. inches.
D = vertical distance between two layers of bars at point selected, inches.
t = thickness of wall at point selected, inches.
p = water pressure at point selected, lbs. per sq. foot.
r = radius of reservoir, feet,
s = stress in steel, on assumption that concrete carries no tension, lbs. per sq. inch.
c = allowable tensile stress in concrete, lbs. per sq. inch.
n = ratio of moduli of concrete and steel, = 10, for 1:1:2 mixture.

These formulas are the familiar ones for ring tension, and the debatable point in them is the safe value for c, the allowable tensile stress in concrete. Andrews recommended 290 lbs. per sq. in. as a value for c for a 1:1:2 mixture. This appears to be rather high. Buell and Hill state that the ultimate tensile strength of concrete may safely be taken as 10% of its compressive strength, which would seemingly give from 200 to 300 lbs. per sq. in. as the ultimate tensile strength of the common 1:2:4 mixture.

The connection between the wall and the roof, and the wall and the floor, of a circular reservoir ought either to be heavily reinforced to take care of the moments at these points, or be so designed as to allow the wall to slip when its circumference increases under water pressure. The latter is now considered the better practice, and is a condition easily and naturally met in the case of the connection at the roof. This provision at the joint of the wall and the floor is not so common: it requires the use of some form of construction at the same time elastic and watertight. In the surge tank of the Ontario Power Co. at Niagara Falls, Ont., R. D. Johnson used a smooth and flat floor, upon which the side walls rest, there being a thin layer of clay between the two. Other engineers have developed designs in which graphite is the joint lubricant and asphalt the sealing medium.

Frost Proofing

On account of restricted area, or for other reasons, it is sometimes necessary to omit the customary earth fill against the walls of a reservoir. If the climate be a cold one, it is then desirable to frost proof these walls in some manner. At Regina, Sask., a hollow tile wall was planned to be built outside of the concrete wall. In another case, two brick walls, with air spaces between, were placed outside the concrete. The roof slab was carried out over these, and a low parapet wall was used to retain the roof fill.

Design of Roof

Reservoir roofs may be divided into the following classes:—

(a.) Groined arches.
(b.) Slab and beam.
(c.) Flat Slab.

(*a*) *Groined Arches.*

Groined arches have the advantage that they do not require reinforcement, although a small amount of steel is sometimes used to care for construction stresses, or to provide for the contingency of very unequal loading. The first cost of the forms is relatively high, but, if the roof be of any considerable area, these may be used many times, and thus the unit cost of forms may be low enough to compare favorably with that for reinforced roofs. The thrust from a groined arch roof is considerable,

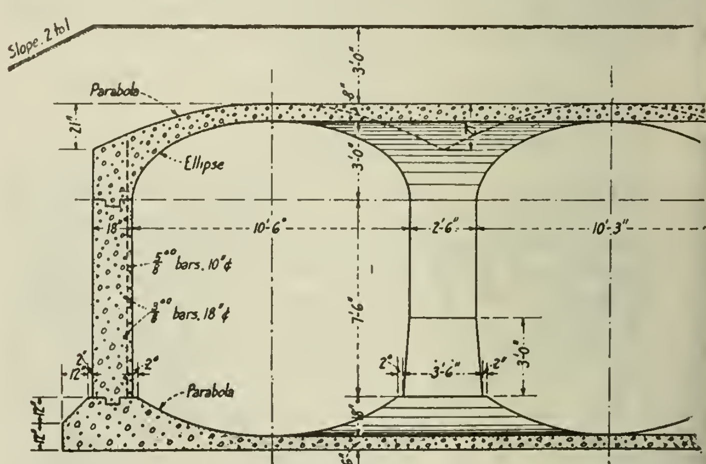

Fig. 13.—Concrete Covered Reservoirs.
Montreal Filter Plant.

and must be provided for in the design of the walls upon which it rests. There have been failures of these roofs, in some cases accompanied by loss of life, and this, coupled with the fact that there is no well-recognized method of designing them, has probably prejudiced many engineers against their use.

by that from an exactly similar one, with its axis at 90° to that of the first, and a reaction along the line of the groin. That is, in Figure 9b, the thrust from DE is balanced by that from DF and an upward force along the groin. Each of the small barrel arches may be analyzed by the usual methods, and the thrusts from the

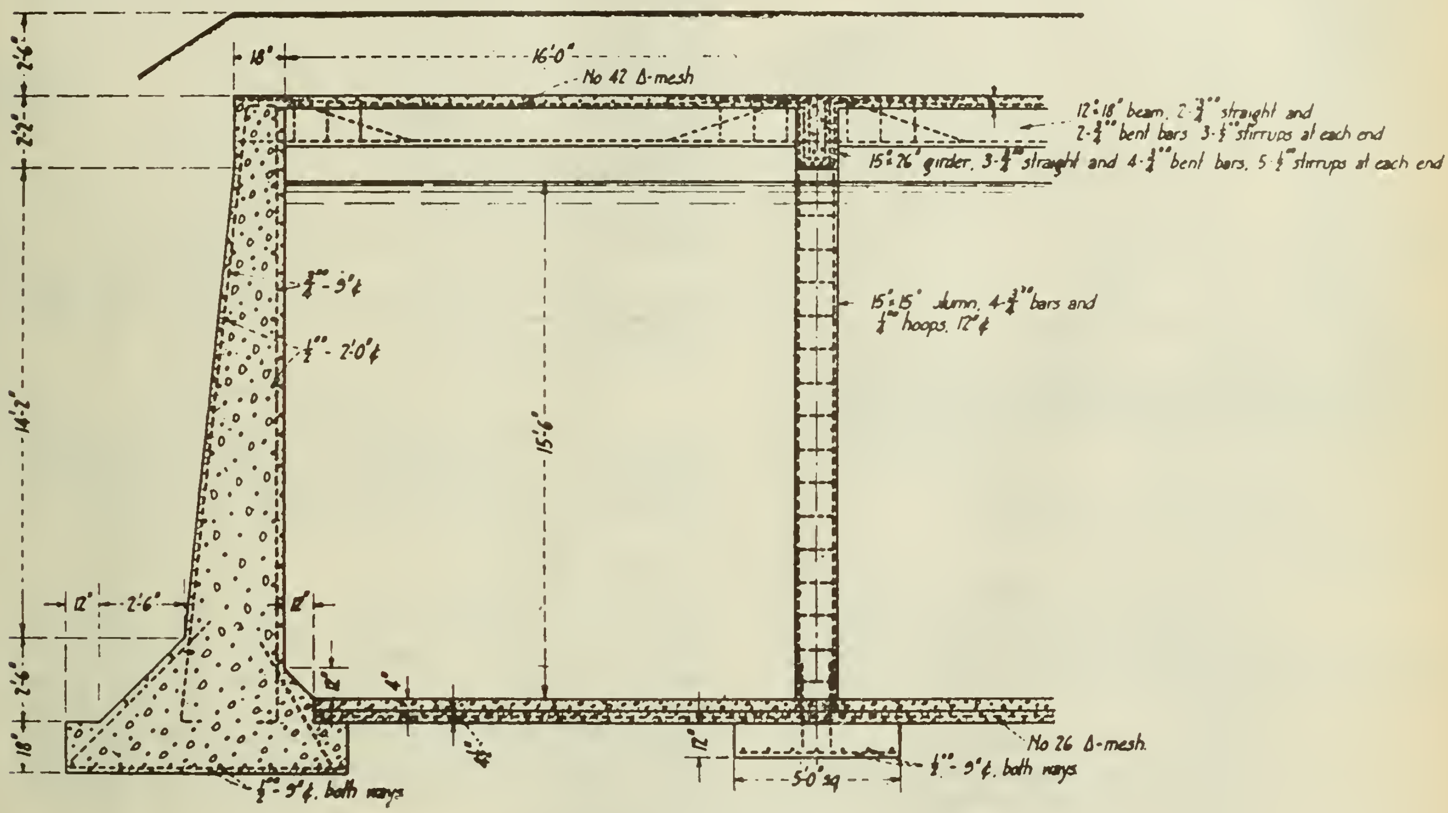

Fig. 14.—Concrete Covered Reservoirs.
Kamloops, B.C.

series combined to give the line of pressure of the groin. The groin itself may then be examined.

Allen Hazen, M.E.I.C., who has built many groined arch roofs for filters and reservoirs, has developed a semi-empirical method of computation, in which the vault is divided into segments, as is shown in Figure 9a. Consider AB: the total crown thrust is equal to the unit load at the crown multiplied by the radius of curvature of the arch axis at the crown. For instance, if the load were 300 lbs. per sq. ft., and the radius of curvature were 20 ft., the total thrust would be 300 × 20 = 6.000 lbs. per foot width of arch. If the crown thickness were 6 ins., the stress at the crown would be 12,000 lbs. per sq. ft., or 83 lbs. per sq. inch, if uniformly distributed over the whole section. On the segment AC, it would be twice this figure. Hazen assumes that the line of thrust passes through the crown joint near the limits of the middle third, and that therefore the maximum intensity of stress is about twice the average. Thus, if an examination of a segment such as AB showed an average stress of 83 lbs. per sq. in., he would consider that the maximum possible stress at the crown of AC would be 2 × 2 × 83 = 332 lbs. per sq. in.

Another way to treat a groined arch is to divide it into barrel arches, the thrust from each being balanced

Formulas for the volume of concrete in groined arch roofs and floors, given by T. H. Wiggin, are as follows:—

$$\text{Volume of roof} = m + n - p \qquad (18)$$

$f = d + e/2 =$ half longer span.

$c = a + g/2 =$ half shorter span.

$$m = 4\,b\left\{cf + \frac{2.n.d}{3} - \frac{(cd + af)}{4}\right\} \qquad (19)$$

$$n = 4\,f\,c\,t \qquad (20)$$

$$p = 2\,fch/3 \qquad (21)$$

$$\text{Volume of floor} = m' + n' \qquad (22)$$

$f' = d' + e'/2 =$ half longer span.

$c' = a' + g'/2 =$ half shorter span.

$$m' = 4.b'\left\{c'f' - \frac{2\,(a'f' + c'd')}{3} + \frac{a'd'}{2}\right\} \qquad (23)$$

$$n' = 4\,f'c't' \qquad (24)$$

In these formulas.

m = volume between a plane through the top of the column and a parallel plane tangent to the intrados at the crown.

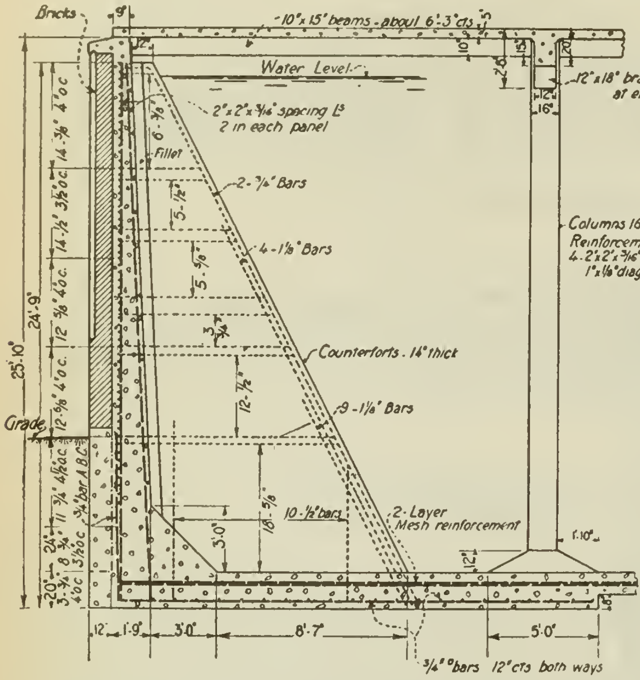

Fig. 15.—Concrete Reservoirs.
City Reservoir, Regina, Sask.

n = volume between a plane tangent to the intrados at the crown and a similar plane tangent to the extrados.

p = volume between the extrados and a plane tangent to the extrados at the crown.

m′ = volume between a plane through the bottom of the columns and a parallel plane tangent to the crown of the intrados of the floor arches.

n′ = volume between a plane tangent to the crown of the intrados of the floor arches and the bottom of the floor.

The significance of the other symbols is given in Figure 10, which is a perspective sketch of one unit of floor and roof, cut out by vertical planes passing through the crowns of the arches. In the case where the column spacing is the same in both directions, the formulas above may be somewhat simplified. If there are no depressions in the roof over the columns, Formulas 23 and 24 may be used for both roof and floor.

(b) Slab and Beam Roofs.

Slab and beam roofs offer no difficulties in the way of design. If the columns are spaced equally in two directions, a slab reinforced both ways may be the best solution. Such slabs may also be used if there is only a slight difference in the column spacings, but their advantages disappear if their length and breadth are not approximately equal. The moment per foot width of slab at the center of a square slab reinforced both ways is generally taken to be

$$M = 7/96\ wL^2 \qquad (25)$$

and if restrained at the edges

$$M = 7/144\ wL^2 \qquad (26)$$

may be used. In Formulas 25 and 26, w = the total unit load on the slab, and L = span of the slab.

Theoretically, the closest spacing of steel should be in the center of the slab, and it should decrease parabolically to the edges. A good practical rule, however, is to use the area of steel per foot width found from the above moment throughout the middle half of the slab, and one-half of this area per foot width throughout the two side quarters. The load on the beams surrounding a square slab reinforced both ways may be considered as parabolic. The moment at the center of a freely supported beam loaded in this manner, and carrying the load from two panels is

$$M = 5/64\ wL^3 \qquad (27)$$

Following the usual practice of considering the center and end moments of a restrained beam as equal

$$M = 1/20\ wL^3 \qquad (28)$$

may be taken as giving the moment in such a beam under a parabolic load. The shear at any point under parabolic loading is given by

$$V = \frac{wL^2}{4} - 3wL^2\left\{\frac{x^2}{2L^2} - \frac{x^3}{3L^3}\right\} \qquad (29)$$

where x is the distance from one end to the point where the shear = V. The diagrams of Figure 11 will help in determining safe points for bending up bars, and for calculating the amount and disposition of the web.

(c) Flat Slabs.

Flat slabs require only simple form work, and straight bars, which are easily and cheaply placed. A complete analytical treatment of their design is very complicated, and hence recourse is had to more or less empirical methods, based partly on theory and partly on the results of tests and experience. The most comprehensive treatise on this subject is probably the ruling of the Chicago Department of Buildings, published in March, 1918.

Design of Columns

Ordinary building practice may be followed in the design of columns, with the exception that no allowance need be made for fireproofing, which is obviously unnecessary in a reservoir.

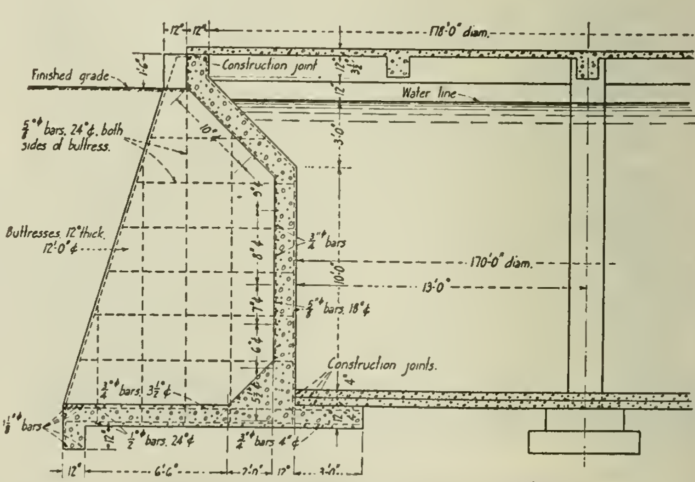

Fig. 16.—Concrete Covered Reservoirs
Fort Dodge, Ia.

Design of Floors and Footings

With groined arch roofs, inverted groined arches are generally used for the floor. In other cases, the floors are ordinarily thin, often not over 6 ins. thick, containing only enough steel to prevent cracking and consequent possible leakage. Sometimes they are laid in two thicknesses and in blocks, the joints in one set breaking with those in the other. This practice is particularly common where little or no reinforcement is used. An expedient sometimes adopted consists in sloping the floor up toward the walls, making this slope as steep as is consistent with safety against sliding, and beginning it, say, at the second line of columns from the wall. While such a procedure lessens the capacity of the reservoir, it also greatly decreases the height of the walls, and thus their cost.

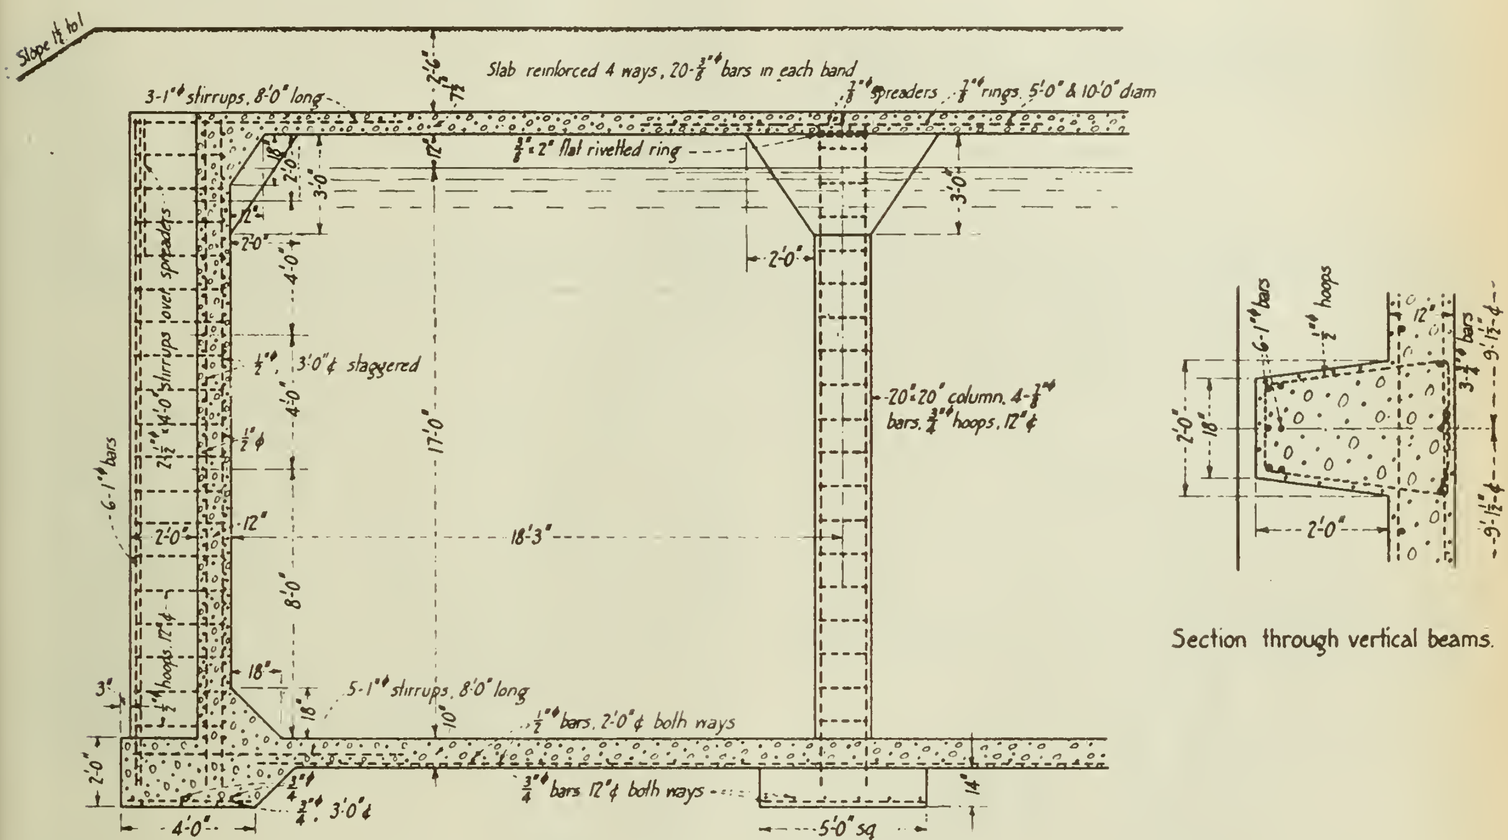

Fig. 17.—Concrete Covered Reservoirs.
Moose Jaw, Sask.—Distribution Reservoir.

Footings follow the usual methods of design. That recommended by Talbot appears to be rational, as well as simple. Let

L = one side of square footing, feet.
a = one side of square column, feet.
c = (L — a)/2
d = thickness of footing from top to center of gravity of steel, ins.
M = moment, in. lbs.
w = safe soil load, lbs. per sq. foot.
b = width of assumed beam carrying moment, ins.
V = shear at face of column, lbs.
v = shear on critical section, lbs. per sq. in.
jd = effective depth, ins.

Then

$$M = (6ac^2 + 7.2\,c^3)w \qquad (30)$$

$$b = 6(a + 2d + L) \qquad (31)$$

$$d = 0.0315\sqrt{\frac{M}{a + 2d + L}} \qquad (32)$$

$$V = (ac + c^2)\,w \qquad (33)$$

$$v = \frac{w}{48} \cdot \frac{L^2 - (a + d/6)^2}{(a + d/6)\,jd} \qquad (34)$$

Formula 32 can be solved only by trial. Use Formula 33 for determining bond stresses and Formula 34 for web reinforcement. Care should be taken that the soil load is reasonably uniform under all the footings since even a slightly unequal settlement will tend to open cracks, which through very small and structurally unimportant, may offer opportunity for leakage.

Expansion Joints and Waterproofing

Reservoirs have been built both with and without special expansion joints. Apparently the results are about the same in either case. With horizontally reinforced walls, there would seem to be little need of them. Theoretically, they should perhaps be used in vertically reinforced walls. As a matter of fact, reservoir walls are usually built in sections of convenient length for continuous concreting, and the construction joints between such sections serve as expansion joints.

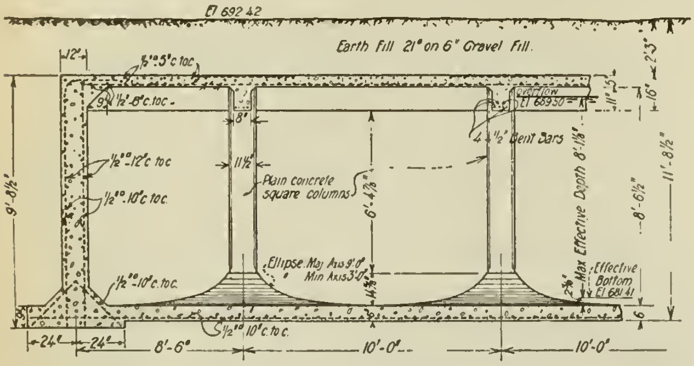

Fig. 18.—Concrete Reservoirs.
Reservoir, Indianapolis, Ind.

Leakage from a reservoir may come through the concrete itself, through cracks and construction joints, or around castings set in the walls or floor, etc. The first sort of leakage may be prevented by making waterproof concrete. Dense concrete can be made by careful proportioning, mixing and placing, and such concrete is as nearly impermeable as that to which some of the proprietary waterproofing compounds have been added. A volumetric analysis of the available aggregates will supply the data on which to base the proportions. Sometimes mixing two or more sands will give a very impervious concrete. In one case, a concrete practically watertight under heads up to 30 ft. was produced by replacing 10% of the regular sand with a very fine moulding sand. Mixing should be thorough, and it is now common to specify the minimum time the batch must remain in the mixer, after all the ingredients have been added. Every precaution should be taken to see that there are no pockets left in the mass during placing.

Cracks of any size are abnormal in concrete reservoirs. They are due to faulty design, materials or workmanship, or to unforseen causes. Construction joints, on the other hand, are necessary. Horizontal joints should be avoided as far as possible. Where they occur, they should be provided with a deep key, and the best possible bond between the old and the new concrete secured. Vertical construction joints should also have a key, and, if practicable, a water stop made of a strip of crimped copper or galvanized iron, one half of which is embedded in the wall on each side of the joint. Castings to be set in the wall or floor should be thoroughly clean when placed. Water-stop flanges can be obtained at slight additional cost on fittings for which the patterns must be specially made, but a watertight joint can be made between smooth cast iron and concrete with ordinary care. The repair of a leaky reservoir at reasonable cost frequently taxes the ingenuity of the engineer to the uttermost. Apparently the only sure method is to cover the leaky portion with a bituminous coat of some sort on the inside, and to protect this coating, perhaps with a course of brick.

Drainage

Some provision for roof drainage should be made. This may be easily done in the case of slab roofs by giving them a pitch. The pockets over the piers in groined arch roofs should be filled with impervious puddle, and these roofs may then be drained in the same manner as slabs.

In damp soils, an open tile drain is often laid at intervals under the floor, and also around the walls. The outlet from such a drain should be so located as to assure a free discharge.

Appurtenances

Manholes.

Every reservoir should be provided with numerous manholes. These may be of any convenient shape, and must be large enough to pass valves, etc., which may need to be removed for repairs. Standard sewer manhole rings and covers are often used, but these are usually heavier and more expensive than is justified. A frame and cover made of plates and angles will generally serve the purpose well enough. An inside cover of 7/8-inch tongue and groove boards, in two layers, with building paper between them will help to prevent freezing. Manhole steps of ¾-inch round galvanized iron, set in the concrete work, are convenient and inexpensive. Sometimes an iron ladder is used instead of the steps, but it has no practical advantages over the former.

Ventilators.

Ventilators are required to provide for the changes in air volume due to the rise and fall in the water level, if for no other purpose. They should extend far enough above the surface of the roof fill so that they will not be sealed by snow in the winter, and should be screened to keep out vermin. They may be of concrete, cast iron pipe — soil pipe does excellently — or of sewer pipe. Both manholes and ventilators should be encased in concrete where they pass through the roof fill. Gravel or broken stone around the outside of these concrete shafts will minimize the danger from heaving due to frost. If the roof is of the beam and slab type, a small pipe, say one inch in diameter, should be placed through each beam just under the slab, to allow the free circulation of air when the water rises above the soffits of the beams.

Overflows.

The overflow may be either a weir, or a vertical pipe inside the reservoir. The latter is usually the simpler and cheaper arrangement. Such an overflow should be provided with a bell mouth, the size of which will depend upon the quantity of water to be discharged, and the allowable variation in head between overflow

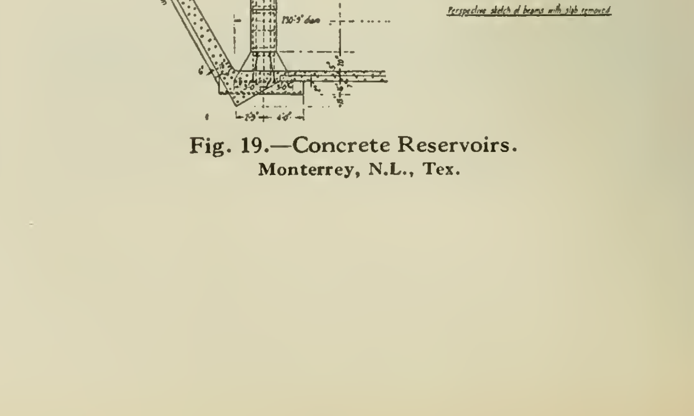

Fig. 19.—Concrete Reservoirs.
Monterrey, N.L., Tex.

level and maximum high water. There appears to be little or no reliable information as to the capacity of an overflow of this type. Provided the capacity of the pipe is great enough to carry away the water faster than it enters, the bell mouth acts as a circular weir, but, as the capacity of the pipe is reached, the flow passes through an intermediate stage, and finally becomes that through a pipe with a specially shaped inlet.

Lawrence and Braunworth conducted a series of experiments on *outward* flow from vertical pipes, and have derived the following formula, when the pipe is acting as a weir:—

$$Q = 5{,}628\,.d^{1.25}.h^{1.35} \qquad (35)$$

in which

Q = discharge, sec. feet.
d = diameter of entrance, ins.
h = head, ins.

This, of course, does not apply exactly to the case in hand, and may be largely in error for such a case, but it seems to be the only available formula.

F. B. Seely has found that the coefficient of discharge for a mouthpiece having a total angle of divergence of between 30° and 60°, and a ratio of end areas of from 1 : 2 to 1 : 4, is about 0.915, provided it is totally submerged. Such a mouth piece can usually be cheaply made by removing one flange from a standard reducer.

Pipe Arrangement.

The arrangement of the piping is determined almost entirely by local conditions. Certain general principles will hold in all cases, however. The inlet should be so placed that a circulation will be maintained. If part of it lies within the reservoir, this part may be made of sewer pipe, as it is called upon to stand a light pressure at most. The outlet is generally taken from a sump, to which the floor is sloped, and from which a drain also leads, but sometimes a swinging pipe is used, so that water may be drawn from any level. If pressure water is available at the site, as is seldom the case, a hose connection inside the reservoir is convenient for

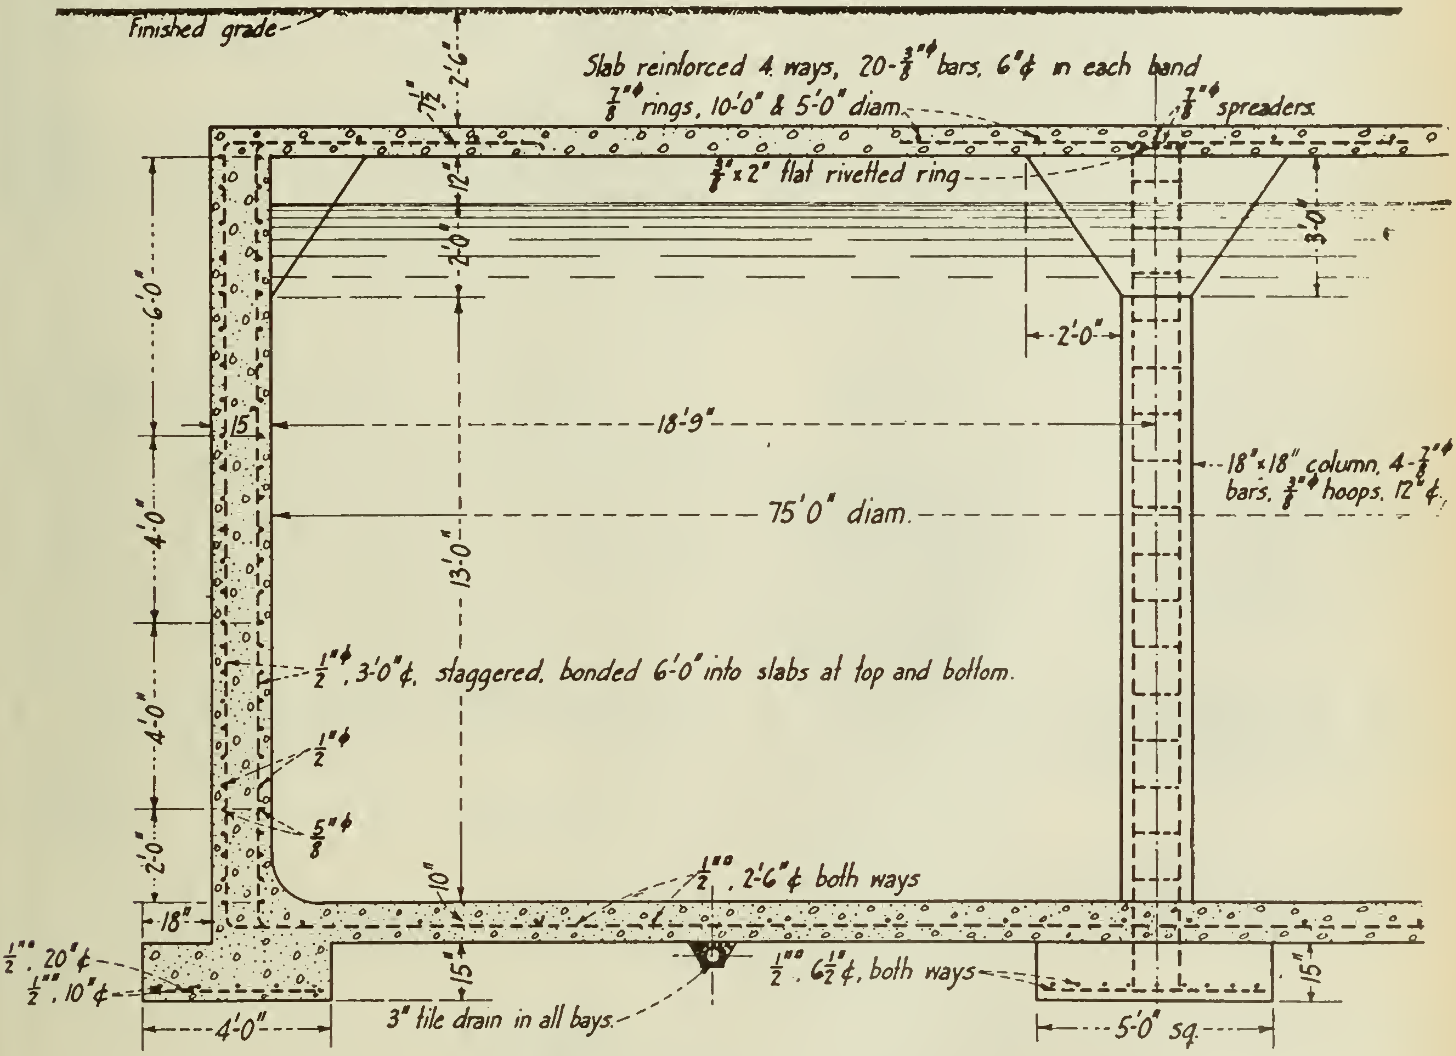

Fig. 20.—Concrete Reservoirs.
Moose Jaw, Sask.—Service Reservoir.

cleaning. All joints which may have to be broken, such as those on each side of valves and fittings, should be flanged.

Costs

There is no common basis upon which the cost of covered reservoirs may be compared, since this is greatly influenced by factors which are rarely the same in any two cases, such as the accessibility of the site, the character of the excavation, etc. Nevertheless, Table II, following, may be of interest. It gives figures for a number of reservoirs, the data regarding which were at hand, and may help somewhat in making the roughest estimates.

Typical Reservoirs

Figures 12 to 20, inclusive, have been selected, not because they are considered to be ideal in all cases, but because they fairly represent reservoirs of various types. Cost figures for most of them are included in Table II. As a matter of interest, Figure 12 is included here, although this reservoir, at Farnborough, England, is principally of brick. It was built in 1877 by William Morris.

Figure 13 shows the construction of the clear water basin of the filter plant of the City of Montreal, P.Q. It has a semi-gravity wall, groined arch roof and floor, and is a good example of this type. The engineers were Hering & Fuller, M.E.I.C.

The Kamloops, B.C., reservoir, shown in Figure 14, also has a semi-gravity wall, with roof supported on beams and girders. The top 4 inches of the floor was placed after all the other concrete work had been completed. This reservoir was designed by DuCane, Dutcher & Co., with R. S. Lea, M.E.I.C., as consulting engineer.

R. O. Wynne-Roberts, M.E.I.C., was engineer for the reservoir of Figure 15, that at the power house, Regina, Sask. The wall here is of the regular counterfort type, and a brick facing was provided for, as there was not room enough for the usual earth fill.

The circular reservoir at Fort Dodge, Iowa, (Figure 16) for which Burns & McDonnell were the engineers, has a buttressed wall in spite of its shape. It was expected that considerable ice would form in the winter, which fact accounts for the outward flare of the wall at the top.

TABLE II.

Details and Costs of Typical Covered Reservoirs

No.	Date	Reservoir	Description	Engineer	Capacity, U.S. gals.	Total cost	Cost per 1,000 U.S. gals.	No.
1.	1902	Waban Hill, Newton, Mass.	Rubble walls, brick piers, concrete floor, steel beams and concrete slab roof.	I. L. Farnham.	2,200,000	$31,225.75	$ 14.20[1]	1.
2.	1904	Fort Meade, S.D.	Vertically reinforced walls, slab and beam roof.	G. K. Hunter.	500,000	17,740.00	35.48	2.
3.	1907	Indianapolis Water Co., Indianapolis, Ind.	Vertically reinforced walls, groined arch floor, roof slab reinforced both ways.	W. C. Maybee.	5,500,000	....	9.33[2]	3.
4.	1908	South, Monterrey, Mex.	Circular, side slopes with concrete paving, precast roof and columns.	G. R. G. Conway, M.E.I.C.	10,000.000	394,000.00[3]	19.70	4.
5.	1908	Obispado, Monterrey, Mex.	Rectangular, same as South.	G. R. G. Conway, M.E.I.C.	10,700,000	375,000.00[3]	17.55	5.
6.	1910	American Paper Goods Co., Kensington, Conn.	Circular, slab and beam roof.	Hall & Bacon.	300,000	5,950.00	19.83[1]	6.
7.	1911	Cabot's Hill, Brookline, Mass.	Circular, gravity wall, flat slab roof.	F. F. Forbes.	4,000,000	80,212.00	20.05[4]	7.
8.	1912	Lowell, Mass.	Groined arch roof, flat floor, semi-gravity wall.	F. A. Barbour, M.E.I.C.	5,000,000	....	Less than 6.00[5]	8.
9.	1912	Kamloops, B.C.	Semi-gravity wall, slab and beam roof.	DuCane, Dutcher & Co.	1,500,000	33,000.00	22.00	9.
10.	1912	Service, Moose Jaw, Sask.	Circular, flat slab roof.	W. J. Francis & Co.	500,000	16,000.00	32.00	10.
11.	1912	Distributing, Moose Jaw, Sask.	Rectangular, walls with vertical beams, flat slab roof.	W. J. Francis & Co.	2,000,000	35,000.00	17.50	11.
12.	1913	La Crosse, Wis.	Vertically reinforced walls, slab and beam roof.	Alvord & Burdick.	5,000,000	74,461.00	14.89[1]	12.
13.	1913	Fort Dodge, Ia.	Circular, buttressed walls, slab and beam roof.	Burns & McDonnell.	2,000,000	25,000.00	12.50	13.
14.	1913	Tor Hill, Regina, Sask.	Circular, steel beams and concrete slab roof.	R. O. Wynne-Roberts, M.E.I.C.	6,000,000	88,000.00	14.67	14.
15.	1914	Power House, Regina, Sask.	Rectangular, counterfort walls, slab and beam roof.	R. O. Wynne-Roberts, M.E.I.C.	6,000,000	94,657.00	15.78[6]	15.
16.	1914	Halifax, N.S.	Circular, slab and beam roof.	F. W. W. Doane, M.E.I.C.	3,900,000	55,000.00	14.10	16.
17.	1915	Hibbing, Minn.	Circular, slab and beam roof.	Burns & McDonnell.	1,100,000	21,784.60	19.80	17.
18.	1916	Lansing, Mich.	Circular, flat slab roof.	D. H. Maury.	3,510,000	36,841.50	10.50[1]	18.
19.	?	?	Horizontally reinforced walls, slab and beam roof.	?	75,000	3,602.52	48.03[7]	19.

1. Based on contract price.
2. Does not include superintendence, equipment, interest and depreciation on equipment or roof drain.
3. Pesos. 4. Includes retaining wall, road and cost of land.
5. Excavation and backfill by day labor, rest by contract.
6. Done by city forces. 7. Includes $1,240 for repairs but no profit.

In Figure 17 is shown the distributing reservoir at Moose Jaw, Sask., designed by Walter J. Francis & Co. The wall is reinforced horizontally, and is supported by vertical beams, which are placed on the center lines of the columns and half way between them. The roof is a flat slab.

The reservoir of the Indianapolis Water Co., Indianapolis, Ind., shown in Figure 18, combines several noteworthy features. It has vertically reinforced walls, a groined arch floor, and a roof of square slabs reinforced both ways. The engineer was W. C. Maybee.

The Moose Jaw, Sask., service reservoir, Figure 19, was also designed by Walter J. Francis & Co. It is circular and has a flat slab roof.

The reservoir at Monterrey, N.L., Mexico, Figure 20, is interesting on account of the fact that the roof beams and columns were precast, that being cheaper than monolithic construction under local conditions. The perspective sketch shows the way in which the beams were bonded to the slab, so as to develop full tee action. The engineer for this work was G. R. G. Conway, M.E.I.C., with J. D. Schuyler as consulting engineer, and the work was done for a concern financed by Canadian capital.

Acknowledgments

The writer desires to acknowledge his indebtedness to Arthur Surveyer, M.E.I.C., for much assistance in the preparation of this paper, and to a number of other engineers who have furnished him with drawings and data, but who are too modest to wish their names to be specifically mentioned.

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

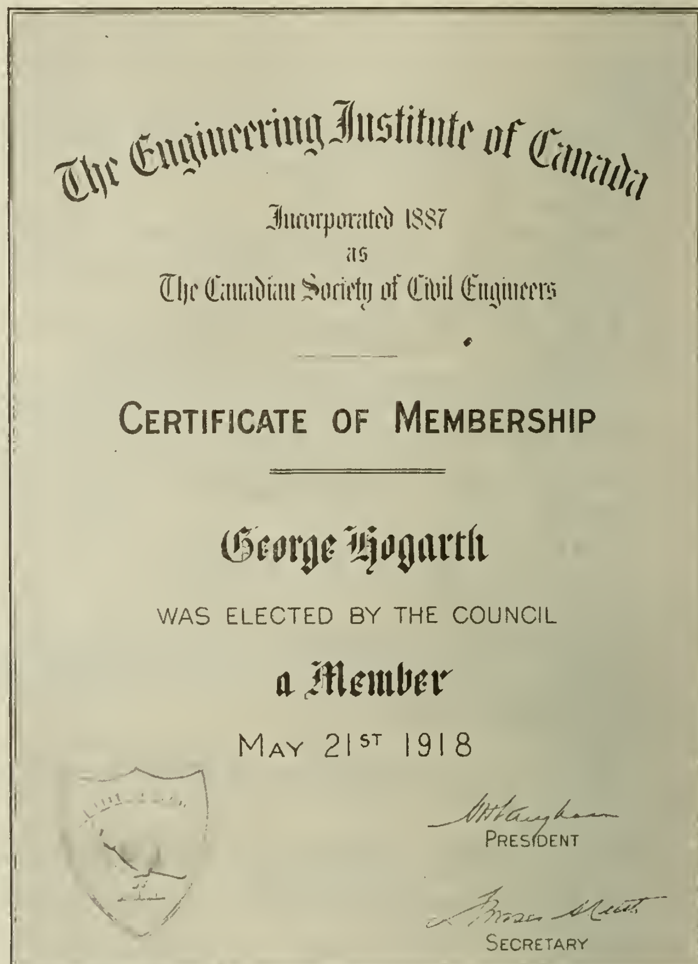
VOL. II. September 1919 No. 9

Ballot on Legislation

Interest in the question of legislation for engineers in Canada has centered in the result of the ballot by which corporate members were given an opportunity of expressing an opinion as to whether they were favourable, or otherwise, to an endeavour to secure legislation along the lines proposed by the Special Committee of *The Institute.* The result of the ballot was presented at the last meeting of Council, and showed seventy-seven percent of the votes cast as being favourable to the proposal. Of a total of six hundred and sixteen, four hundred and seventy-five were in favour, one hundred and thirty-eight were against, and three votes were discarded. No action was taken by Council owing to the importance of the matter and the length of the agenda, but it will come before Council at the next meeting.

New Certificate

Although it has taken some time to secure an approved design and have the necessary certificates engraved, members on looking at the half-tone reproduction of one of the new certificates reproduced herewith, will agree that the result has justified any slight inconvenience experienced on account of the delay. The Council's Committee who not only looked after the designing of the certificate but ordered the engraved plates and certificates have placed *The Institute* under obligation to them, not only for their efforts, but for the result achieved. These are being issued to all corporate members admitted or transferred since the name was changed.



Corporate members possessing the former certificate are entitled to one of the new ones on payment of one dollar and twenty-five cents to cover engrossing and mailing.

New Institute Badge

An illustration of the new badge of *The Institute* is shown herewith. This badge has already received the endorsation of Council and will no doubt receive the approval of every individual member.

Members having copies of the May number of The Journal, which they do not wish to keep the reference, would confer a great favor by mailing them to the Secretary. About twenty copies are required.

The badges may now be had from the Secretary at the following prices: gold, three dollars and seventy-five cents, for Members; silver, two dollars and twenty-five cents, for Associate Members; and bronze, one dollar and fifty cents, for Juniors and Students. Any of these may be had either as a clasp pin with safety attachment, a button or a watch charm. These prices include engraving the owner's name on the back of the shield and the number of the badge. An order has been placed for a quantity of these badges, and will be supplied as orders are received by the Secretary.

Quebec Bridge Transactions

Within a few weeks members of *The Institute* will receive two volumes of Transactions devoted entirely to that monumental engineering achievement, the Quebec Bridge. One of the volumes contains the text and tables together with a number of half-tone illustrations, and the other volume contains over one hundred plates from the original drawings. Three papers are included in the text: The Substructure of the Quebec Bridge by C. N. Monsarrat, M.E.I.C.; Notes on the Work of the St. Lawrence Bridge Company in Preparing the Accepted Design of the Superstructure of the Quebec Bridge by G. H. Duggan, M.E.I.C.; The Design, Manufacture and Erection of the Superstructure of the Quebec Bridge by Phelps Johnson, M.E.I.C., G. H. Duggan, M.E.I.C., and George F. Porter, M.E.I.C.

Thanks to the generosity of the St. Lawrence Bridge Company and the Dominion Bridge Company, these volumes are now available. The finances of *The Institute* would not have permitted their publication this year, but, in order that they might be in the hands of the members as soon as possible, the major portion of the cost has been assumed by the above companies, through Past President G. H. Duggan, for which are due them the hearty thanks of every member of *The Institute*. This fact will be better appreciated when the copies are received by the members.

The volumes themselves are a credit to the engineering profession in Canada and a permanent record, in addition to the bridge itself, of the genius of Canadian engineers.

The Roll of Honour

While it is a trivial tribute to the men, many of whom have made history, and who have demonstrated that Canadian engineers have no superior, the Roll of Honour of *The Institute* with its thousand names with their associated heroism, initiative, and technical ability, and representing for all time the best attributes of the engineering profession in this, or any other country, will be an inspiration and a priceless possession to all future generations of engineers in this country.

Inherent as is the modesty of the engineer, yet when it is combined with that of the soldier and fighting man, it may work to a disadvantage. This has been the case in connection with securing complete details and up to date records to be used in completing the Roll of Honour. For the sake of the profession itself, and for the sake of the men who did so nobly and in order that our records may be complete to the minutest detail, the co-operation of all branches and every member of *The Institute* is earnestly desired. A number of the men with whom the Secretary has been placed in touch have taken it for granted that in their four years' absence, having gone without leaving their addresses, they were dropped from *The Institute*, having taken no steps to be placed on the active list, and there are no doubt others. Every week brings information of men who have returned and are becoming settled in civilian life, yet it is believed that there are a great many now in Canada who have not sent in their addresses. It will require the co-operation of all the membership to see that all the returned men are placed in touch with headquarters in order that they may enjoy the full benefits of *The Institute*.

As a matter of pride in the profession and as a debt of gratitude to the men themselves the members of *The Institute* will no doubt assume a personal responsibility on behalf of returned Canadian engineers who are located in their vicinity.

Dominion Good Roads Plans

The Dominion Government has appointed an Honorary Advisory Board consisting of the Honorable Dr. J. D. Reid, Minister of Public Works, C. A. Magrath, M.E.I.C., J. P. Mullarky, A.M.E.I.C., and R. Holmes Smith. The Advisory Board and A. W. Campbell, M.E.I.C., head of the Highways Branch of the Department of Railways met officials from the Highway Departments of the various provinces on August 22nd, to discuss the method of spending the $20,000,000, which was voted for highway construction last session. The representatives of the Provincial Governments, J. W. Roland, M.E.I.C., Chief Engineer of Highways, Nova Scotia; B. M. Hill, M.E.I.C., Chief Engineer of Highways, New Brunswick; W. A. McLean, M.E.I.C., Deputy Minister of Highways and Geo. Hogarth, M.E.I.C., Chief Engineer of Highways, Ontario; H. Henry, Highway Engineer, Manitoba; Alex M. Macgillivray, A.M.E.I.C., Chief Good Roads Branch, Saskatchewan; H. S. Carpenter, A.M.E.I.C., Deputy Minister of Highways, Saskatchewan; A. E. Foreman, M.E.I.C., Chief Engineer, Department of Public Works, British Columbia, were present and were invited to give their views. Forms prepared by Mr. Campbell to be used in applications for grants were submitted and approved of by the provincial representatives. Various regulations dealing with the amounts of the grants to be allowed were also discussed. L. Charlesworth, M.E.I.C., Deputy Minister of Highways, Alberta, was unable to be present.

Engineering Legislation in Great Britain

It should be of interest to members of *The Institute*, who are now devoting their attention to legislation for engineers, to know that the Council of the Institution of Civil Engineers, one of the old and most conservative of engineering bodies, has recently sent a circular to its corporate members asking for an expression of opinion as to the advisability of the Institution taking steps to secure from Parliament "statutory powers to prescribe the qualifications and to conduct examinations for the admission to the profession of Civil Engineering, to keep a register of Civil Engineers, and to prevent persons who are not duly qualified from holding themselves out as members of that profession."

Should their ballot favour the obtaining of these powers, it will be important to follow the course of events and to note the steps taken by the Institution.

Woodstock, N.B., Appoints Town Manager

R. Fraser Armstrong, B.Sc., A.M.E.I.C., who served overseas as a Lieutenant in the C.E.F., has been appointed Town Manager for the town of Woodstock, N.B., for a period of two years.

The management of the business of the municipality by Town Manager has been tried by many United States municipalities with good results, and Canadian municipalities are now adopting this method of municipal management. The Town of Woodstock is also publishing a monthly statement in municipal transactions and proposed town improvements, for the instruction and guidance of the citizens. The agreement between the Town of Woodstock and Mr. Armstrong is of interest to engineers, in that it shows a decided improvement in the standing and responsibility of municipal engineers, and a growing recognition of the value of engineers to the community.

The agreement is as follows:—

It is Mutually Understood and Agreed between the Town of Woodstock and the Town Manager that the following are the terms and conditions of this contract:—

(a) The Town Manager to be responsible to the Town Council of the Town of Woodstock and to see that all laws and ordinances laid down by the said Town Council are enforced.

(b) The Town Manager to have charged under the said Town Council of all departments and officials of the Town, except the Clerk, Board of School Trustees, Board of Assessors, Police Magistrate and any other officials who may by special ordinance come directly under the said Town Council. The Town Manager to have full authority to appoint and dismiss all employees and officials except those officials directly responsible to the said Town Council.

(c) The Town Manager to exercise control over all departments which may be created by the said Town Council unless by special ordinance the departments so created are to be directly responsible to the said Town Council.

(d) The Town Manager, when possible, to attend all meetings of the said Town Council, with the right to take part in the discussion, but having no vote.

(e) The Town Manager to recommend to the said Town Council for adoption such measures as he may deem necessary or expedient.

(f) The Town Manager to keep the said Town Council fully advised as to the financial condition and needs of the Town.

(g) The Town Manager to submit to the said Town Council each month a report of work carried out during the month with a detail statement of costs and condition of finances in each department.

(h) The Town Manager may, without notice, cause the affairs of any department or employee under his control to be investigated and shall have full access to all town books and records.

(j) The Town Manager shall act as purchasing agent for the town and shall call for quotations on all material and equipment required by the departments under his control. He will submit all quotations to the said Town Council with recommendation for award but shall have the privilege of buying any material or equipment for emergency work submitting report on same at the next meeting of the said Town Council after the purchase aforesaid.

(k) The Town Manager shall organize so as to combine the position of Treasurer and Town Accountant and Collector and Receiver of Town Taxes, Water and Sewer Rates and have this official in his office directly under his control.

(l) The Town Manager for purposes of keeping in touch with general matters will be a supernumerary member of the Board of Assessors of the said Town, shall be notified of the time and place of each meeting, and shall have the privilege of attending same with the right to take part in the discussion but shall have no vote.

(m) The Town Manager shall prepare a yearly report covering all the work and expenditures for the fiscal year with a budget of proposed expenditures for the coming year.

(n) If a dismissal of the Town Manager is contemplated a meeting of the said Town Council must be held, of which meeting the Town Manager must be advised by writing and must have the opportunity of attending. At this meeting an open vote shall be taken as to taking steps for the dismissal of the Town Manager and on a majority vote only of the entire Council, a committee shall be appointed to investigate the cause for proposed dismissal. One member of this committee shall be appointed by the said Town Council, one member by the Town Manager and the third party to be chosen by the other two members of this committee. If this committee finds that the Town Manager has been guilty of dishonesty or mismanagement they can recommend and the said Town Council can confirm his dismissal but he cannot be dismissed until the term of his contract has expired on account of any popular agitation against the Town Manager form of government.

(o) The Town Manager shall have the privilege of resigning upon a month's written notice to the said Town Council providing all the terms of the contract have not been carried out or if his resignation meets with the approval of a majority of the said Town Council; such approval to be signified by an 'open vote at a regularly called meeting' of the said Town Council.

(p) No member of the said Town Council shall interfere in any way with the department of the Town Manager except at a meeting of the said Town Council when the matter can be taken up with the Town Manager.

(q) All applications for employment, privileges from the town of any matters dealing with the departments under the Town Manager, if received by the Town Clerk, will be at once submitted to the Town Manager for action.

(r) The Town Manager shall have the privilege of having called a special meeting of the said Town Council by submitting a written request to the Town Clerk who will take the necessary steps to call the meeting.

(s) All supplies purchased for the departments under the control of the Town Manager must be approved by the Town Manager.

(t) Before the Town Manager assumes responsibility for the accounts and finances an audit of same must be made by an accountant satisfactory to both the Town Manager and the said Town Council.

(u) The said Town Council has the privilege at any time of having an audit made of the departments under the Town Manager's control and will have an audit made at least once a year by a chartered accountant.

IN WITNESS WHEREOF the said Town of Woodstock hath caused these presents to be executed at the Town of Woodstock by its Mayor and its Town Clerk, and its Corporate Seal to be hereunto affixed, and the said R. Fraser Armstrong hath hereunto set his hand and seal, the day and year first above herein written.

Engineers and the American Interstate Commerce Commission.

The following letter, addressed to the President of the United States by the Engineering Council on The Interstate Commerce Commission, shows the efforts being made there to increase the prestige of the engineer, by educating the public to properly appraise the value of his services:—

August 14th, 1919.

The President,
The White House,
Washington, D.C.

Sir:—

The transportation systems of our country are largely the creations of its professional Engineers. This statement can be made without disparagement to the statesmen, the financiers, the manufacturers, the lawyers, the educators, the mechanics, the laborers and many others, who, with the Engineers, have contributed to the development of transportation. Through all stages of preliminary exploration, final survey, construction, upkeep and operation, in financial management, and in adjustment of the relations of transportation to the public, the genius and knowledge of the Engineer are essential. Not only in technical physical matters, but also in determinations of policy, his contributions have supplemented and must ever supplement those of other men. These declarations hold good for all the carriers of commerce, by rail, by highway, by water, by pipe-line, by wire, or by air. Hence, it follows that the body established by Government to regulate the commerce, the carriers and the ways of communication, embracing so many engineering features, should number among its nine members, men of engineering training and experience.

Engineering Council, being aware of a vacancy on the Interstate Commerce Commission, begs leave to request the Chief Executive that in filling this vacancy, he give earnest thought to the selection of a man who, to his other qualifications, adds the training and experience of an engineer familiar with transportation problems.

Engineer members wisely chosen would bring to the investigations and deliberations of the Interstate Commerce Commission not only technical knowledge of great value, but also experience in executive duties, a judicial attitude gained through the direction of work under contracts, minds of analytical habit, familiarity with costs of construction and operation, experience in dealing with employees of many vocations, and integrity of thought cultivated by that inescapable obedience to the laws of Nature involved in the practice of this profession. The Engineer's training fits him for that mode of thinking which is indispensable to impartiality of judgment. One important function of the Commission is valuation of public utilities and another is the determination of relationships and responsibilites of the management of such utilities to the public. No other body of men has given so extensive and so scientific consideration to these matters as have members of the Engineering Profession.

Council's purpose is not to further the interests of any individual or group, but solely to serve the Nation by strengthening one of its most important regulatory bodies. Upon the wisdom, intelligence and courage of this Commission depends in large measure the commercial welfare of the country. It is believed that the Engineering Profession can and should contribute to the country's well-being through the channel of membership in the Interstate Commerce Commission.

Very respectfully,
J. PARK CHANNING,
Chairman.

Resolutions Relating to Andrew Carnegie

American United Engineering Society

Andrew Carnegie's death August 11, 1919, at Lenox, Massachusetts, brought to its close a career which greatly advanced all the engineering arts and sciences. By the introduction into the United States of the Bessemer process for the production of steel and by the establishment and development of steel plants, which became the greatest in the world, he made available for engineers the most useful modern material for engineering construction. In the successful conduct of many industrial enterprises, he amassed great wealth, the possession of which he came to regard with deep seriousness as a public trusteeship. He devoted himself to the distribution of large portions of his fortune to projects for the benefit of Mankind. He distributed his wealth not only in many directions, but also with the exercise of great wisdom based on careful investigation. His munificence provided large funds for the building of a home for the great national engineering societies and many associate societies. He was an honorary member of the American Institute of Mining and Metallurgical Engineers and the American Society of Mechanical Engineers. He was personally known and loved by many engineers. In view of these facts, be it

Resolved, That the American Societies of Civil, Mining, Metallurgical, Mechanical and Electrical Engineers, the United Engineering Society and the Engineers' Club, herein express to the family of Mr. Carnegie and record their sincere appreciation of the great contributions of Andrew Carnegie to the advancement of engineering, and of his friendly assistance in making possible beautiful homes for the Engineering Societies and the Engineers' Club, thus fostering the spirit of unity in the Profession.

Civil Service Classification

Questions from men in the Civil Service, and the replies of the Civil Service Commissioners which are of interest to the engineering profession.

Question: 1. I have studied the printed classification very carefully but cannot tell in what class I belong, in fact the definition of eight different classes with salaries ranging from $600 to $2280 seems to fit my work. How and when can I learn how my position is classified? 2. If I am dissatisfied with my classification when I learn what it is, what steps should I take? No. 1.

Answer: 1 and 2. In many cases employees cannot tell positively from a study of the classification in which class they belong. The Organization Branch of the Civil Service Commission has tentatively indicated on the classification card sent in last fall the class in which each position falls. At the beginning of next week the deputy heads will begin the preparation of lists of employees now in their departments. These lists will be turned over to the Organization Branch and in the proper column the class in which each employee's position has been tentatively classified will be indicated. The Organization Branch and the deputy heads will then confer with regard to the various classes and, where necessary because of a change in duties or lack of sufficient information, changes in the tentative classes made. At this time too the classes for employees who have come into the service since the cards were prepared will be determined. When the Organization Branch and the deputy head of any department have brought up to date the classification for the department and indicated the class for each employee the deputy head will acquaint the employees of his department with the classification of their positions. Any employee who thinks his classification is incorrect may then take up the matter with the deputy head and the Organization Branch and if still dissatisfied may then present it to the Civil Service Commission for final adjudication. The preparation of the lists for some 50,000 employees and the discussions and conferences between the Organization Branch and some 40 deputy heads will naturally consume several weeks. The employees in some departments, however, will be able to tell in what classes their positions have been placed early in August and it is hoped the process will be complete before the end of August.

Question: How can I get a copy of the printed classification? No. 3.

Answer: Only a small number of copies of the first edition were printed because of the expectation that in the early stages numerous changes would be necessary. There is probably no way in which you can get a copy for your own use though every deputy head and the head of every large branch has a copy to which the employees undoubtedly will be given access. After the classification has been ironed out in the next few weeks a much larger edition will be printed either for free distribution or for sale at a nominal price.

Question: The annual compensation for Deputy Minister is given as $4200 to $8000. What is the basis for making the compensation of all deputy ministers the same when the importance of the various positions measured according to the duties and responsibilities varies greatly? No. 5.

Answer: You have failed to take into consideration the note attached to the compensation scale. It is intended that the salary of no deputy head shall be less than $4200 and not more than $8000, and that each deputy head shall receive a flat rate. The amount of this flat rate as between $4200 and $8000 is to be determined by the Governor in Council, as is implied by the note reading as following:—

> *Note:* The compensation of each Deputy Minister shall be determined by the Governor in Council and shall be based upon an appraisal of the duties and responsibilities of the position in relation to the volume and importance of the work of the department.

Question: What is the last date upon which representations with regard to the classification of a position may be made? No. 6.

Answer: There is no last date. The Commission is very desirous of receiving representations with regard to whole classes as early as possible and preferably before July 20. With regard to the classification of individual positions, however, most employees will not be informed until sometime in August and will therefore be in no position to make representations. The Commission intends, however, as far as such is humanly possible, to hear all who think the classification can be improved, up to the time when the material must go to press in order to be ready for Parliament. Even after the classification is adopted by Parliament, the Commission expects to continue to receive representations and to make changes as they are shown to be desirable; in fact, the Organization Branch has the permanent machinery for such hearings already set up. Any classification to be workable, must be subject to change at any time upon a proper showing of need for change.

Question: When I obtained my present position my qualifications were much higher than those prescribed in the classification. I know of many other positions of which the same thing is true. Please find out for me why the qualifications are made so low? No. 7.

Answer: The qualifications as stated in the classifications are the minimum qualifications which any applicant for the position must possess in order to be considered as a candidate and not the qualifications that the average applicant will possess. The fact that Senior Clerks at a salary of $1320 to $1680 are required to have at least three years of office experience does not mean, for instance, that most of those seeking promotion to the position of Senior Clerk will not have five or six or even a greater number of years of clerical experience. The guiding principle in prescribing the qualifications was to bar out all who would be likely to be failures if accepted, and not to bar out any considerable number who would be at all likely to make good employees if appointed.

Purpose of Examples

Question: Why are examples given for some classes in addition to the definition of class? No. 9.

Answer: As a rule examples of the kinds of duties to be performed are given where the classes are large and where it would be impossible to specify the various kinds of work all those included in the class perform. There are more than 500 separate positions, for instance, included in the class Junior Clerk and of course the work performed by the various incumbents of these positions is quite diverse. If all the different kinds of work were specified the definition would become inordinately long. To prevent this the plan has been followed of giving a definition which is both inclusive and exclusive in that it tells the kind of duties which must be included for the position to fall within the class, and then to make clear the definition, examples of the kinds of work required for different positions within the class are given. The examples, however, are neither inclusive nor exclusive; that is, some persons performing work not mentioned in the examples may be included within the class, and some performing work specifically mentioned in the examples but of greater or lesser responsibility than is indicated in the definition will not be included in the class.

Number of Classes

Question: The classification provided in the Civil Service Act, 1918, contains only about 20 classes. Why is it necessary to have 1,700 classes in the new classification? No. 20.

Answer: The classification in the Civil Service Act, 1918, provides for only the Inside Service and has never been found adequate even for that. There are about 1,700 classes in the new classification for the simple reason that about 1,700 different kinds of work were found in the Dominion service. There have been almost no suggestions from departments or employees for the combining of any of the classes set up, but a good many suggestions that additional classes be provided.

Civil Engineer's Classification

Question: I am a bachelor of applied science, a graduate civil engineer, and an associate member of *The Civil Engineer's Institute of Canada.* I have been surveying for six and a half years as an engineer. In what class may I expect to be placed? No. 26.

Answer: Because of the duties you are performing your position has been classified as junior engineer, with a salary of $1680 to $2040. The determining factor, however, was the duties and not the length of service or the qualifications you state. The qualifications, however, have an important bearing upon the assignment of duties to you.

Too High Classification

Question: It is stated that the Civil Service Commission has provided machinery whereby classifications that are considered too low are to be fixed. It also follows that there must be some cases where the classification is too high. Has machinery been provided for such cases? No. 27.

Answer: Exactly the same machinery serves whether the classification is too high or too low, whenever the facts are called to the attention of the Civil Service Commission. Any employee, deputy head, or group may make representations if they regard the classification as being improper in any respect.

Salary of Employees Below Minimum for Class

Question: I understand that an employee whose present salary is less than the minimum for his class will receive the minimum the same as a new appointee in the class, in spite of his greater experience. The fact that his work is graded above his present salary shows that he has not been receiving proper compensation; yet he is to be still further discriminated against by having to start at the bottom while those who have been compensated are several steps above him. Such a state of affairs would also affect many whose promotions have been held back for several years with a promise of adjustment by the new classification. These employees now find that their years of service count against them in spite of promises to the contrary. Please tell me whether this interpretation is correct and whether any steps are being taken or will be taken to remedy such conditions? No. 38.

Answer: Your letter implies that you expect the classification to remedy injustices of the past and even those of several years' standing. Such can hardly be the case. The classification by preventing the beginning of such conditions in the future and the continuation or aggravation of existing injustices will do all that its most ardent proponents claim for it. The bill introduced at the last session of Parliament provided that employees below the minimum should be raised to the minimum, dating back to April 1, 1919, and that the Commission, with the approval of the Governor in Council, should adopt regulations to provide for the compensation of employees receiving the minimum or more for their class but not more than the maximum. As the legislation was was not adopted, regulations were never drawn up and approved. It is, therefore, impossible to tell what might have been done for those who had been receiving for some time the minimum provided for their class.

District Engineers

Question: What is the basis for distinguishing between grade 1 and grade 2 district engineers? No. 42.

Answer: The distinction between grade 1 and grade 2 district engineers is primarily the importance of the work in the various districts. The Organization Branch secured from the Department of Public Works information with regard to the work being carried on. Those districts where important works are now under way or where the construction, upkeep, and maintenance work is of major importance year after year were placed in grade 2. Other districts were placed in grade 1. It is possible that a particular district may change from one grade to the other from time to time as the importance of the work changes.

Means of Promotion

Question: I gather from answers appearing in the question box that an employee's qualifications, office experience, education, and so forth, will not be considered when classifying him, but that only the actual work he is doing at the time will be considered. If therefore an employee had all the qualifications and met the educational standards which would entitle him, for example, to the position of principal clerk but was doing work which would entitle him to be classified only as senior clerk, what opportunities would he have for promotion and would promotion to principal clerk be by seniority or ability or examination? 2. Will an employee with a high school education be given the opportunity to be promoted to a higher rank calling for a university education? 3. In the distribution of the bonus will an employee who is the sole support of his sister be entitled to the full bonus given to "the supporting head of a household?" No. 43.

Answer: 1. Since the classification is of positions and not of persons, it follows that the education, experience and other qualifications of present incumbents cannot be considered as factors. The present incumbents take the classification of the various positions. The matter of selection of future incumbents, which you mention, properly has nothing to do with classification, but since it is of general interest is answered. In selecting persons for appointment in the future, education, experience, and other qualifications will be given great weight, both in entrance to and in promotion in the service. The method of promotion depends on the legislation adopted.

2. An employee with only a high school education would not normally be given the opportunity to be promoted to a higher class for which one requirement is a university education. The decision as to what constitutes the equivalent of a university education always lies with the Civil Service Commission.

3. Your statement of facts is not sufficient upon which to base a positive answer, but if the sister lives under the same roof, earns less than $200 a year, and is supported solely by a full time employee entitled to receive the bonus under the regulations adopted, the employee would be considered the supporting head of the household.

Assignment to Lighter Duties

Question: Stress is being laid on the fact that the application of the classification is to be made along the lines of the duties now being performed and the responsibilities now exercised without taking into account past experience and service, standards of examination passed, or qualifications possessed by those being classified. Will there not be many cases during the period of application where employees will be discriminated against by those higher up through the assigning of less important duties. What precautions are the experts taking against this? 2. What chance has any present employee in the service in obtaining any new position advertised by the Civil Service Commission when no consideration is given to the applications of those already in the service? No. 45.

Answer: 1. It is possible that some employees might be assigned duties of lesser importance during the period of applying the classification and suffer in their status unless such is called to the attention of the Commission. Any employee so treated, however, will have his case considered if he takes advantage of the machinery the Civil Service Commission has set up to prevent just such injustices by calling the attention of the Commission to the facts. The greater danger, however, is that the general public and the tax payers will suffer through the magnifying of duties by both employees and their superiors. 2. Your question implies a state of affairs which does not exist. If you desire to be considered for one of the positions advertised you should file your application just the same as a person not in the service and you will be considered the same as any other person.

Distinction Between Engineers

Question: The definitions of junior engineer and assistant engineer do not seem to me to be exclusive. What is the definite difference between the two classes? No. 47.

Answer: A junior engineer does routine engineering work, such as supervising minor construction or running an instrument, under the direct supervision of the engineer in charge of the party or work. An assistant engineer on the other hand is himself in charge of a party or work and only occasionally—say once a week—confers with or is visited by his superior. The distinction, therefore, is primarily one of responsibility, the junior engineer being able at all times to get a decision from his superior with regard to any doubtful point while an assistant engineer must exercise considerable independent judgment in making his own decisions.

Method of Applying Classification

Question: There is a rather disquieting rumour to the effect that the Civil Service Commission has asked the deputy ministers to classify their own departments. If it is not true it should be given the quietus at once as those members of the civil service who are more concerned with the establishment of the service on a sound foundation than in the attainment of personal ambitions have enough at present to worry about without being disturbed by rumours of this character? No. 50.

Answer: The rumour is without foundation. The deputy ministers have not been asked by the Civil Service Commission at any time to classify their own departments. It is true of course that deputy ministers will be asked to criticise and comment upon the application of the classification to positions in their respective departments.

Annual Increases

Question: 1. If the classification act is passed this September will I lose my annual increase which is due in October? 2. I passed the examination for a second division clerk in May, 1916. When I obtained my position it was with the understanding that I was to go to a maximum of $1600. Now that the classification is eliminating the yearly increase is there any compensation to be given in such cases? The work I am doing now will likely be classified as senior clerk? No. 59.

Answer: 1 and 2. The classification does not propose to eliminate yearly increases but does substitute a somewhat different system. If your position is classified as senior clerk the maximum will be $1680 instead of $1600. If, however, it is classified as clerk the maximum will be $1260. Whether you would be allowed to go to the old maximum of $1600 will depend upon the legislation adopted. Whether you will get another annual increase in October or whether the new act will apply likewise depends upon the terms of the legislation. You may be sure, however, that you will either get an increase according to the old civil service act or will be entitled to such under the new by meeting the requirements.

Equivalent Education

Question: 1. In the definition of many classes the word "equivalent" occurs. What would be considered as "equivalent" to two years of high school education? 2. In case a deputy head does not classify an employee according to qualifications would it be possible to get a transfer and how would one go about it? No 62.

Answer: 1. Any one of many different circumstances might be considered as the equivalent of two years of high school education; among them may be mentioned a sufficient amount of home study, good correspondence courses, private instruction from a tutor, attendance at various schools not called high schools, and attendance at night schools. 2. Neither the deputy head nor any other person classifies employees, as the classification is of positions. The classification of any position is determined by the organization branch and the deputy head, and the employee takes the classification of his position. The method of securing a transfer is governed by the civil service law and the regulations of the Civil Service Commission; in brief, however, it is necessary to secure the approval of both departments and of the Civil Service Commission.

Education for Citizenship

The Convening Committee of the National Conference on Education, which is to be held in Winnipeg, October 20th to 22nd, "is very pleased to have the opportunity of appealing through the columns of *The Journal* to the influential section of the Canadian public among which it circulates."

The general subject which is to be considered at the approaching Conference is "The Relation of Canadian Education to Canadian Citizenship." The promoters of the Conference have no ready-made formula for the evocation of a high type of Canadian citizenship. A fine collective public-spirit, a great national tradition expressing itself in the private and public conduct of individual citizens,—these are not things than can be achieved by sleight-of-hand or in a trice, and yet the element of conscious effort towards a goal is as natural and desirable in the case of a nation as in that of an individual. The idea of the promoters of the approaching National Conference on Education is, that a number of the most competent and disinterested minds of the nation should come together to consider how best the schools can be made to contribute directly to the evolution of the type of nation that we want to be. In addition to the renewed interest in education which will be the inevitable result of a large meeting and a first class programme, it is proposed to submit to the Conference the idea of attempting to found in Canada a Bureau or Board or Faculty of Educational Research, which, while without executive authority, would assist in providing educational leadership and stimulation for national education throughout the whole Dominion.

The Conference is being directed by a Winnipeg committee of fifty men and women headed by the Lieutenant-Governor of the Province. The original promoter of the idea is W. J. Bulman, Past President of the Canadian Manufacturers' Association. The project has been advocated throughout the country during the last year and a half. Sufficient money for the adequate holding of the Convention has been secured, largely through the good offices of various Rotary Clubs under the leadership of E. Leslie Pidgeon, Past International Président. It is desired that public-spirited organizations of all kinds should be represented at this Conference by delegates. *The Institute* has been invited to send delegates, the nominations for which have been referred to the Executive of the Winnipeg Branch. Inquiries addressed to W. F. Osborne, General Secretary, National Educational Conference, 505 Electric Railway Chambers, Winnipeg, will be promptly replied to.

National Industrial Conference

The Minister of Labour is organizing a National Industrial Conference for the purpose of discussing the labour situation in Canada and taking up the various pertinent questions as included in the agenda below.

The Conference will include one hundred and fifty representatives, of whom sixty will represent capital, sixty labour, and the balance will be representatives of various organizations, whose interests lie between the two. *The Engineering Institute* was asked to name one representative, but later the number was increased to three. The three representatives will be appointed by the Council and will represent the engineering profession at this gathering, which convenes on September 15th, at Ottawa.

Proposed Agenda

1. Consideration of the question of the desirability of unifying and co-ordinating the existing labour laws of the Dominion Parliament and of the Provincial Legislatures (see page 107 of the R. C. Report), and the consideration of any new labour laws which are deemed necessary.

2. Consideration of:

(a) employees right to organize (see paragraph 59, also recommendation on page 19 of R. C. Report);

(b) recognition of labour unions (see paragraph 59, also recommendations on page 19 of R. C. Report);

(c) the right of employees to collective bargaining (see paragraph 65, also recommendation on page 19 of R. C. Report).

3. Consideration of:

(a) the recommendations of the Royal Commission on Industrial Relations in favour of the establishment of a bureau to promote the establishment and development of joint industrial councils (see paragraph 99, also recommendations on page 19 of R. C. Report).

(b) the further recommendations of the Royal Commission on Industrial Relations regarding the establishment of joint plant and industrial councils (see paragraph 85 and 98 and recommendations on page 19 of R. C. Report).

4. Consideration of the recommendation of the Royal Commission on Industrial Relations respecting hours of labour (see paragraph 52 and recommendations on page 19 of R. C. Report).

5. Consideration of minimum wage laws (see paragraph 52 and recommendations on page 19 of R. C. Report).

6. Consideration of the recommendations of the Royal Commission on Industrial Relations that the findings of the Commission be put into effect in all work controlled by the Government where the principles of democratic management can be applied (see recommendations on page 19 of R. C. Report).

7. Consideration of resolutions relating to any other features of the Report of the Royal Commission on Industrial Relations referred to on page 19 of the Report.

8. Consideration of the labour features of the Treaty of Peace.

9. Consideration of any other proposals which may be introduced bearing on the relations of employers and employees.

PROGRAMME OF THE FIFTH GENERAL PROFESSIONAL MEETING ST. JOHN, N.B.

FIRST SESSION.

10 a.m., Wednesday, September 10th, 1919

10.00 A.M. Opening of Meeting.
Address of Welcome—His Honour, the Lieutenant-Governor of New Brunswick.

Address of Welcome—His Worship The Mayor of St. John, N.B.

10.30 A.M. Announcements.

Business.

10.35 A.M. to 12.30 P.M. Forestry in New Brunswick—G. H. Prince, B.Sc.,-F., Chief Forester, N.B.
Discussion.

Usefulness of Vegetation in Maritime Engineering—E. T. P. Shewen, M.E.I.C., Consulting Engineer, Department of Public Works of Canada.
Discussion.

New Brunswick Highways—B. M. Hill, M.E.I.C., Chief Provincial Road Engineer.
Discussion.

1.00 P.M. Lunch at the Manor House—Visiting members will be the guests of the St. John Branch.
Address by Hon. P. Veniot, Minister of Public Works, N.B.

3.00 P.M. to 6.00 P.M. Water Powers of New Brunswick—C. O. Foss, M.E.I.C., Chairman, New Brunswick Water Powers Commission.
Discussion.

Proposed Tide Electric Power Development, Petitcodiac and Memramcook Rivers—W. Rupert Turnbull, F.R.A.S.
Discussion.

Construction of Bear River Bridge—A. T. Macdonald, A.M.E.I.C.
Discussion.

SECOND SESSION.

8.00 P.M., Wednesday, September 10th, 1919

8.00 P.M. Paper and Demonstration of Experiments with High Tension High Frequency Electric Currents—F. P. Vaughan, A.M.E.I.C.
Discussion.

THIRD SESSION.

Thursday, September 11th, 1919

9.30 A.M. to 12.45 P.M. Engineering Problems Connected with Use of Telephone Cables—F. A. Bowman, M.E.I.C., Chairman, Halifax Branch.
Discussion.

Heating Problems Produced by Some of the Modern Methods of Building Construction—W. B. MacKay, A.M.E.I.C.
Discussion.

1.00 P.M. Members will be guests of St. John Board of Trade at Luncheon.

FOURTH SESSION.

Thursday, September 11th, 1919

3.00 P.M. Engineering at the Front—R. Fraser Armstrong, A.M.E.I.C.
Discussion.

4.15 P.M. Automobile trip to Hampton.
Tea at Wayside Inn—Visiting members and ladies will be guests of St. John Branch.

FIFTH SESSION

Friday, September 12th, 1919.

10.00 A.M. Sight seeing trip about Harbour possibly up through Falls and back to Partridge Island and Courtenay Bay.

1.00 P.M. Lunch at Courtenay Bay Works as guests of St. John Dry Dock and Shipbuilding Company.

2.00 P.M. Return to city by street car.
Possibly, if time permits trip, to see Falls at high tide.

SIXTH SESSION

Friday, September 12th, 1919

2.30 P.M. Adjourned Discussion.
Construction of Beacon Bar Wharves—A. R. Crookshank, M.E.I.C.
Discussion.

3.30 P.M. Trips to different manufacturing plants and points of interest.

Headquarters will be located at, and all meetings will be held in the rooms of the St. John Board of Trade, 162 Prince William Street.

Canadian Engineering Standards Association

Specifications Now Available

The Secretary of the Canadian Engineering Standards Association, R. J. Durley, M.E.I.C., announces that a stock of a number of the most important publications of the British Engineering Standards Association has now been received, and can be obtained on application. The following list does not include all publications of the British Engineering Standards Association, but covers those of recent issue which have been published under the new regulations. Copies are for sale at the prices stated.

B. E. S. A. Publications

INTERIM MEMORANDUM ON FRENCH METRIC SCREW THREADS FOR AIRCRAFT PURPOSES.

Report No. C L 3750. 15¢ net.

This Memorandum describes the system of screw threads for aircraft purposes used by the French Military authorities and is accompanied by tables showing limits of size, tolerances, etc., for two grades of fit. The form of thread is that of the Systeme International, in which the crest is cylindrical while the root of the thread is curved in section. The finer tolerances are provided for cases where great accuracy is required. The second grade tolerances are suitable for ordinary bolts and nuts.

BRITISH STANDARD TABLES OF PIPE FLANGES.

Report No. 10—1904. Revised July, 1918. 25¢ net.

This report gives the British Standard dimensions for pipe flanges for steam and water piping for low pressures and high pressures, dimensions of welded-on flanges for pipe lines for working steam pressures of 125, 225 and 325 lbs. per square inch, dimensions for short flanged bends and tees of castmetal for pressures up to 325 lbs. per square inch, and dimensions for long bends of wrought iron and steel.

BRITISH STANDARD SPECIFICATION FOR STRUCTURAL STEEL FOR BRIDGES, ETC., AND GENERAL BUILDING CONSTRUCTION.

Report No. 15—1912. Revised August, 1912. 25¢ net.

This report covers process of manufacture, quality of finished steel, tensile tests, bending tests, tests on rivets, chemical analysis, inspection and other conditions.

REPORT ON BRITISH STANDARD PIPE THREADS FOR IRON OR STEEL PIPES AND TUBES.

Report No. 21—1909. Revised November, 1909. 25¢ net.

This report gives definitions and tables of dimensions for British Standard Pipe Threads. In this system the Whitworth form of thread is employed, but fine pitches are used, and both parallel and conical screw ends are provided for.

BRITISH STANDARD SPECIFICATION FOR ELECTRICITY METERS.

Report No. 37—1919. Revised January, 1919. 25¢ net.

This specification is intended to apply to the purchase of new meters, governing their sale by the manufacturer to the purchaser. Requirements for meters up to the largest sizes in use as well as for three-wire and three-phase meters are included. The electrolytic type of meter is not dealt with. The specification gives standard definitions and provisions regarding external characteristics, insulation, labels, standard method of marking, registering mechanism, minimum running current, permissible limit of error and rate of registration, tests, precautions necessary in erection and other particulars.

BRITISH STANDARD SPECIFICATION FOR CAST IRON SPIGOT AND SOCKET FLUE OR SMOKE PIPES.

Report No. 41—1908. 25¢ net.

This specification gives a schedule of dimensions and weights, with full size sections, for light cast iron spigot and socket pipes suitable for flue or smoke pipes.

BRITISH STANDARD SPECIFICATION FOR CAST IRON PIPES FOR HYDRAULIC POWER.

Report No. 44—1909. 25¢ net.

Provision is made for two classes of this pipe together with bends, tees and special castings.

Class A: Working Pressures from 700 to 900 lbs. per sq. inch.

Class B: Working Pressures from 900 to 1,200 lbs. per sq. inch.

The specification covers quality of material, permissible variation of weight, marking, testing, inspection and tables of dimensions and weights.

REPORT ON BRITISH STANDARD DIMENSIONS FOR SPARKING PLUGS FOR INTERNAL COMBUSTION ENGINES.

Report No. 45—1917. Revised September, 1917. 25¢ net.

This report covers external dimensions only, the form of thread used being a metric thread having a 60° angle, tolerances on full diameter, effective diameter and core diameter for the thread on the plug and in the tapped hole are given, together with external dimensions of the complete plug, and standard nomenclature of sparking plug parts.

BRITISH STANDARD SPECIFICATION FOR KEYS AND KEYWAYS.

Report No. 46—1919. 25¢ net.

The specification covers material, tests, definitions and tables of dimensions for three classes of key: (a) Parallel Sunk Key, (b) Taper Key, (c) Taper Sunk Key.

BRITISH STANDARD SPECIFICATION FOR SIZES OF BROKEN STONE AND CHIPPINGS.

Report No. 63—1913. 25¢ net.

This specification was formulated as a result of conferences between the Quarry owners and road authorities and gives standard nomenclature, definitions and methods of measurement for broken stone and chippings.

BRITISH STANDARD SPECIFICATION FOR SALT GLAZED WARE PIPES.

Report No. 65—1914. 25¢ net.

This report contains tables of dimensions and particulars regarding sockets, grooving, glazing, permissible variation in thickness and diameter, methods of testing for strength and absorption.

REPORT ON BRITISH STANDARD DIMENSIONS OF WHEEL RIMS AND TYRE BANDS FOR SOLID RUBBER TYRES FOR AUTOMOBILES.

Report No. 71—1917. 25¢ net.

This report gives standard sizes of wheel rims and corresponding internal dimensions of solid rubber tyres, for sizes of wheel varying from 670 mm. to 881 mm. Metric dimensions are used throughout.

BRITISH STANDARD RULES FOR ELECTRICAL MACHINERY. (Excluding motors for traction purposes.)

Report No. 72—1917. Revised September, 1917. 25¢ net.

This important report is intended to define the conditions which characterize British standard electrical machinery, including transformers, but excluding traction motors and to provide the purchaser and manufacturer with a general specification indicating the information which should be forwarded with an enquiry or an order for an electrical machine. Methods of defining the rating or rated output are formulated, and in this connection are in substantial agreement with the corresponding rules of the American Institute of Electrical Engineers. Enquiries based on these rules will enable the purchaser to compare tenders received from various manufacturers.

BRITISH STANDARD SPECIFICATION FOR CHARGING PLUG AND SOCKET FOR VEHICLES PROPELLED BY ELECTRIC SECONDARY BATTERIES.

Report No. 74—1917. Revised September, 1917. 25¢ net.

This report contains the provisions necessary to secure interchangeability between any charging plug and any socket of the concentric type. Dimensions of the contact portion of the plug and socket, and dimensions of the gauges needed to check these are given.

BRITISH STANDARD SPECIFICATIONS FOR WROUGHT STEEL FOR AUTOMOBILES.

Report No. 75—1916. 25¢ net.

This important report contains definitions of terms used, methods of testing, and specifications for ten grades of carbon, nickel, and nickel-chrome steel, each specification giving chemical composition, tensile and brinell tests.

BRITISH STANDARD NOMENCLATURE OF TARS, PITCHES, BITUMENS AND ASPHALTS, WHEN USED FOR ROAD PURPOSES AND BRITISH STANDARD SPECIFICATION FOR TAR AND PITCH FOR ROAD PURPOSES.

Report No. 76—1916. 25¢ net.

This valuable report defines tars, pitches, bitumens and asphalts for road purposes, distinguishing between the tar products and bitumens and asphalts. In this respect the practice of the B.E.S.A. is not in accordance with that usual in the United States, where the term bituminous is applied in a wider sense than in Great Britain. The specification gives definitions, properties and methods of testing for two qualities of tar, and for pitch suitable for pitch-grouting.

BRITISH STANDARD SPECIFICATION FOR STARTERS FOR ELECTRIC MOTORS. (Face-Plate Type.)

Report No. 82—1919. 25¢ net.

This report covers definitions, pressures, methods of enclosure, standard sizes and ratings, general construction, marking and tests.

REPORT ON BRITISH STANDARD FINE (B.S.F.) SCREW THREADS AND THEIR TOLERANCES.

Report No. 84—1918. 25¢ net.

This report gives revised tables of dimensions for British standard fine screw threads and covers theoretical dimensions and standard sizes and tolerances of bolts and nuts for two grades of fit. The report also contains an appendix dealing with methods of determining and compensating for errors in pitch, form of thread and diameter. Much information is given regarding methods of gauging screw threads.

BRITISH STANDARD SPECIFICATION FOR ELECTRIC CUT-OUTS FOR LOW PRESSURE, TYPE O.

Report No. 88—1919. 25¢ net.

This specification covers dimensions and standard sizes of cut-outs for low pressure and ordinary duty. A separate specification is contemplated for heavy duty cut-outs.

Requests for copies of any of the above should be addressed to: The Secretary,

Canadian Engineering Standards Assoc.,

Room 112, West Block,

Ottawa,

and should be accompanied by money order payable to the Canadian Engineering Standards Association, Ottawa.

Montreal's Reception to General Currie

Montreal surpassed all previous efforts in the welcome which it extended to General Currie on his visit to the city on August 21st. The route which led from the Place Viger Station to the Khaki Club, via Sherbrooke Street, a distance of about two miles was lined with citizens who gave ample demonstration of their appreciation of the work done by General Currie while in command of the Canadian Corps in France.

In the evening General Currie was entertained at dinner in the Ritz Carlton Hotel by Brigadier General Charles J. Armstrong, C.M.G., C.B., M.E.I.C., Acting G.O.C. of No. 4 Military District, and by the officers of No. 4. Military District. General Armstrong proposed the health of General Currie, and in reply General Currie paid a warm tribute to the work of Canadians overseas, especially to the work of General Armstrong, General Sir Frederick Loomis, General G. E. McCuaig, Colonel F. S. Meighen, Lt.-Col. Alex Ritchie, and Lt.-Col. Clark Kennedy, V.C. Speaking of Colonel Clark-Kennedy, General Currie said:—"Nothing was too dangerous for this gallant officer and I had to restrain him often. Luckily he was not killed but lived to win the Victoria Cross, and I can assure you that no V.C. was ever more worthily won than that awarded to Clark-Kennedy." "Some said that Montreal was too largely represented in the field," said general Currie, "but, when you think of the records achieved by the Montreal battalions, you must agree that it would be well if the whole Canadian Corps had been made up of regiments from Montreal."

General Currie then told of the heroic work done by the Canadians at the 2nd battle of Ypres, and said that after that fight General Smith-Dorrien told him that, had it not been for the marvellous defence by the Canadians, it might have been the greatest disaster that had ever befallen British arms.

While at the Khaki Club, General Currie, in response to the urgent requests of the returned officers and men, addressed them as follows:—

"I am very happy to be here this afternoon. You know me well enough to appreciate that I am not a speaker, nor a politician seeking an opportunity to get a vote. I do not know what you would really like me to say, but the welcome I have received in Montreal and the reception tendered me this afternoon, makes this event one of the happiest in my life.

"Nobody knows better than you, boys, that any success with which my name has been associated has been won for me by you on the field. The Canadian corps was one big machine, and it was the spirit of co-operation that won for us success. If there are any problems to be confronted in Canada, or any difficulties to be overcome, the only way to meet them is by standing together again, and if we stuck by one another in the field, we can do the same in civil life; we are all comrades here, as we were all comrades there.

"The rest of my life, so far as I am able, will be devoted first to helping the widows and orphans of those who are not coming back. (Cheers, and "Hear, Hear"), and next, to helping you boys, who exposed your bodies as a living bulwark against the dangers that threatened the world. You are the men who made for Canada her place as a nation, and you are the men to whom Canada owes the greatest debt. I do not know what your problems are, whether you have been able to get work, whether your employers are prepared to take you back, and if you are getting more money than before, but when I become familiar with all these things, I shall not hesitate to speak, and speak very plainly. I have always called a spade a spade. When a man was good, I promoted him if I could, and if he was not good, I fired him."

CORRESPONDENCE

Canadian Engineering Standards Association

Ottawa, Ont.,
June 12th, 1919.

Editor, *Journal*:—

Referring to your letter of May 21st, regarding *The Engineering Institute of Canada* specifications on Steel Railway Bridges, and Steel Highway Bridges, I am directed to inform you that at the meeting of the Main Committee of this Association held on June 4th, it was decided that a Sub-Committee on Steel Railway Bridges should be appointed, the personnel as far as practicable to be the same as that of the Committee of *The Engineering Institute* on Steel Railway Bridges. It is of course understood that when *The Engineering Institute of Canada* specification is complete, a meeting of this Committee will be held in order to take such steps as may be desirable, in order to obtain as wide acceptance as possible for the specification.

I am also directed to ask you to convey to the Council of *The Institute*, the thanks of the Main Committee of this Association and their appreciation of the helpful manner in which the Council has co-operated with this Association.

I may add that at the meeting above referred to, Mr. G. H. Duggan, M.E.I.C., was appointed Chairman of our Sectional Committee on Bridges and Building Construction, and this Sectional Committee will make recommendations as regards *The Engineering Institute of Canada* specification for Steel Highway Bridges when that specification is ready for consideration by this Association.

Very truly yours,
R. J. DURLEY, M.E.I.C.,
Secretary.

July 17th, 1919.

Editor, *Journal*:—

A few evenings ago, in the course of your remarks before the Vancouver Branch of *The Engineering Institute*, I understood you to refer to the difficulty of defining the scope of the engineering profession, and the essential and distinctive qualifications of an engineer.

May I venture to offer, as a contribution to the literature related to the subject, the following proposed definition. If the objects of *The Engineering Institute*, embodying incidentally a definition of the profession of the engineer, in which as you will observe, I have paraphrased portions of the charter of the Institute of Civil Engineers.

A Society for the general *advancement* of *mechanical* and *constructive science* by the production of the *acquisition* of *those branches* of *knowledge* which *constitute* the *foundation* of the *profession* of *the engineer* and *invest* to the *power* to *divert* and *subject* "*the active forces of nature*" to *fulfilment* of the *purposes* and *service* of *man*, through *conversion* of *natural resources* into *appropriable wealth* and the *production* of *embodied utilities* such as *roads, bridges*, etc.

If in the above I have been able to present even a partial solution of any of the difficulties which in the framing of a definition of *Engineer* or *Engineering* or effect any clarification or improvement upon former definitions, I shall be glad.

Yours truly,
A. E. HILL, M.E.I.C.

* * *

Houlton, Maine,
August 14th, 1919.

Editor, *Journal*:—

Your circular with pamphlet describing the Canadian Engineers Standard Association has been received. I am sure there is a good field for the work of the Association.

My personal judgement in this matter leads me to prefer the standardizing of parts of machines or structures, rather than of the assembled whole, for instance, nails, spikes, screws and nuts, wire, rails, joints, etc., can be easily and profitably standardized, while it might be difficult or very uneconomical to do so in the case of locomotives, buildings or bridges, at least in a broad measure. I have never been able to understand why in the case of screw threads, with the excellent Whitworth thread in use, the Sellers thread, which is much inferior, should have been standardized in this Country.

It may not be inopportune to take up the question of universal use of the metric system of measurements. I think its adoption by the English speaking people of the world would have a wonderfully good influence in many directions.

Yours truly,
MOSES BURPEE, M.E.I.C.,
Chief Engineer,
Bangor & Aroostook Railroad.

OBITUARY

David Doyle, A.M.E.I.C.

The Institute has learned with deep regret of the death on May 30th, at Woolwich, England, of David Doyle, A.M.E.I.C.

Mr. Doyle was born at Birkenhead, England, on March 8th, 1874, and received his education at the Liverpool School of Technology and the Birkenhead School of Science. After the completion of his education Mr. Doyle served a two years apprenticeship with the firm of Turner, Son & Evanson, Engineers, Chelsea, London, after which, from 1896 to 1904, he was employed on engineering work in England. In 1904 he went to Chile, S.A., for Messrs. Hardie & Co., Construction Engineers, where he spent four years on railway and waterworks construction. Mr. Doyle left South America in 1908 and went to Oakland, California, where he was engaged in improving the municipal water supply, and then came to Canada where, from 1909 till 1914, he was engaged in hydraulic developments for mining purposes in British Columbia. When war came Mr. Doyle returned to England and spent the remainder of his life in the Building Works Department of the Royal Arsenal, Woolwich, England.

Mr. Doyle is survived by his widow and a brother, Frederick Doyle, of Carlisle, England.

Report of Council Meeting

The regular meeting of Council was held at headquarters, Tuesday, August 19th.

The minutes of the previous meeting were approved.

Secretary's Western Trip: The Secretary reported his visit to the conventions of the American Society of Mechanical Engineers, American Society of Civil Engineers, The Winnipeg Branch, Annual Meeting of the Saskatchewan Branch, meetings at Calgary, Vancouver and Victoria, and an informal meeting at Prince Rupert, where the members expressed a desire for a new branch.

Salaries, Civil Service Reclassification: Letters of the Ottawa, Toronto and Border Cities Branches, urging action in connection with the reclassification of the engineers employed in the Civil Service, were read which were in harmony with what Council has already done and is now doing. The Secretary was instructed to go to Ottawa to secure all possible information and data for the benefit of the Committee of Council in order that this information might be used by the Committee when approaching the Government on behalf of the engineers, which it is proposed to do as soon as the data is available. Letters from various members on this subject were noted.

Salaries Schedule: A letter from H. A. Goldman, Secretary of the Salaries Committee of the Toronto Branch, which he had sent to all branches, was noted.

Presidential Address: The Secretary was instructed to forward a copy of the special edition of President Vaughan's address on the "Manufacture of Munitions in Canada," to each member of the House of Commons and of the Senate, as soon as the session opens.

National Industrial Conference: The correspondence of the President and the Secretary with the Department of Labour in response to an invitation to send a single delegate to the proposed National and Industrial Conference, was noted, and after a complete discussion a letter dictated by the President to the Minister of Labour declining to send a representative, was approved.

Standardizing Association: It was noted from the letter from Major L. W. Gill, M.E.I.C., that the proposal to establish an International Association for standardizing methods of testing materials, was shelved for the time being.

Badges: The result of the work of this Committee was presented in a report from the Chairman together with samples of the badges. The Committee recommended the ordering of Five Hundred (500) badges at once, fifty (50) in gold, two hundred (200) in silver, and two hundred and fifty (250) in bronze, and suggesting a price of: gold badges, $3.75; silver badges, $2.25; and the bronze badges, $1.50, all complete and engraved with the member's name and badge number. The report of the Committee was adopted and the Council's appreciation of its work expressed.

Legislation: Report of Scrutineers: The scrutineers appointed by the Council to count the ballot on legislation reported as follows:—

July 24th, 1919

Council of

The Engineering Institute of Canada.

Gentlemen:—

We, the undersigned scrutineers appointed by Council on July 22nd, beg to report that we have opened the ballot submitted to the corporate members of *The Institute* for an expression of opinion regarding proposed legislation and that the result of this ballot is as follows:—

Votes "yes"	475
Votes "no"	138
Discarded votes	3
Total ballots received	616

Respectfully submitted,
Yours very truly,

LESSLIE R. THOMSON,
J. L. BUSFIELD, Scrutineers.

In view of the lengthy agenda it was decided to postpone discussion and action until the meeting of Council, September 8th. A communication from the Sault Ste. Marie Branch was noted, also a circular from the Institution of Civil Engineers showing that the question of legislation was prominent in the Old Country.

Branch By-Laws: The Border Cities Branch By-Laws were referred to the Executive for approval.

Appointment of Treasurer: It was resolved that Brig.-Gen. Sir Alex Bertram be appointed Treasurer of *The Institute*, and the Secretary was instructed to request General Bertram's acceptance of the office.

Perpetuation of Military Titles: Letters from various members were noted as well as one from Lieut.-Col. R. H. Helmer on this subject, and it was decided that the military titles of all the members be preserved in the records and that the titles be given to the members unless otherwise desired. The Secretary was instructed to address a multigraphed letter to each member enclosing copy of a list of the missing members requesting his personal assistance in supplying addresses and in bringing the Honor Roll up to date with the latest rank and honors of the members on active service.

Specifications: It was decided that although they cost more to produce, standard specifications of *The Institute* would be sold at a nominal price of twenty-five (25) cents.

American Societies Development: The report of the Committee on Aims and Organization of the American Society of Mechanical Engineers and the report of the Committee of Development of the American Society of Civil Engineers presented at their recent respective Annual Meetings, were noted with interest.

A.I.E.E. Convention: The report of John Murphy, M.E.I.C., of his activity in the interests of the engineering profession at the recent Convention of the American Institute of Electrical Engineers at Lake Placid, was read with interest and appreciation expressed of his activities in that connection.

Examinations: The suggestion of F. A. Bowman, M.E.I.C., Chairman of the Halifax Branch, that an examination be included in Schedule "C" covering telephone engineering, was considered and referred to the Board of Examiners with a recommendation that the proposal be accepted.

Specifications for Steel Bridges: The action of the Canadian Engineering Standards Association in appointing a Sub-Committee on Steel Railway Bridges to include the personnel as far as practicable of the Committee of *The Engineering Institute,* was approved.

Dues from Men in Military Service: Consideration was given to several letters received from members in connection with rebating dues to men in military service, but not actually overseas. The Secretary was instructed to write confirming the previous policy, that where a man had not been overseas, but in accepting military service had suffered financial hardship, individual requests for remission would be given consideration.

Education of Canadian Children: The report of the Sub-Committee regarding improvement in the education of Canadian children kindly forwarded by Councillor James White, M.E.I.C., was noted.

Quebec Bridge Transactions: The kind offer of the St. Lawrence Bridge Company and the Dominion Bridge Company through G. H. Duggan, M.E.I.C., to assist very materially in the publication of the Transactions devoted to the Quebec Bridge was noted, and the Secretary instructed to write thanking Mr. Duggan and associates, and also to bring this fact to the attention of the members through *The Journal.*

National Conference on Moral Education: The invitation of W. F. Osborne, General Secretary of the National Conference on Moral Education in the Schools in Relation to Canadian Citizenship was presented, and in view of the distance it was decided that the Winnipeg Branch should be asked to nominate representatives and Professor Osborne notified accordingly.

Chapter of A.A.E.: The action of the Executive of the American Association of Engineers in upholding its previous decision that no chapters of the Association be established in Canada and refusing an application from Toronto and one from Quebec, were noted.

James Watt Centenary: The Secretary was instructed to forward circulars received to the various branches to be distributed as they desired.

American Welding Society: The request from the President of the American Welding Society to *The Institute* to appoint a representative, was considered, and it was decided that it was not feasible to have *The Institute* represented. The Secretary was instructed to so advise.

Public Health Act: A letter from the Chairman of the Montreal Branch to Sir Lomer Gouin suggesting that four engineers be appointed to the Board constituted to give effect to the new Act, was noted.

A ballot was canvassed and the following declared elected:—

Members

Thomas Johnson Locke, B.A., (Acadia Univ.) of Shelburne, N.S., district engineer, Dept. Public Works; Fraser Daniel Reid, B.Sc., (Queen's) of Cobalt, Ont., Manager, Coniagas Mines Ltd; Sven Svenningson (M.E., Christiania Univ., Norway) of Montreal, Que., chief engr., Shawinigan Engineering Co.

Associate Members

John Noel Anderson, of Vancouver, B.C., Lieut., 9th Batt., Can. Ry. Troops, pending release. Prior to enlistment, assistant engineer, Vancouver; Charles Lawrence Archibald, of St. John, N.B., draftsman, Royal Can. Engineers, St. John, N.B.; George Wilfred Beresford, of Ottawa, Ont., officer in C.E.F., prior to enlistment, in charge of construction on Erie & Ont. Ry.; Horace Malcolm Bigwood, of Victoria, B.C., Lieut., Canadian Engineers, C.E.F., prior to enlistment, asst. engr., city engineers dept., Victoria; Rex Elmer Buckley, of Niagara Falls, Ont., with Niagara Falls Power Co., engineer and inspection of substation at Echota, N.Y.; Maurice A. Burbank, of Winnipeg, Man., prior to enlistment, engineer, G.T.P.Ry., on location and construction, two years work in France, chief engineer, 4th Bn., Can. Ry. Troops; Walter Roy Campbell, of Campbellton, N.B., first asst. to res. engr., C.N.Rys., Campbellton; William Bradshaw Crombie, of Niagara Falls, Ont., inst'man, Hydro-Elec. Power Development, Chippawa Creek; Francis Murray Dawson, B.Sc., (N.S. Tech. Coll.) of Westmount, Que., Capt., M.C., Canadian Engineers, at present, member of firm, Monks, Manhard & Dawson, engrs., agents and contractors, Montreal; Charles Henry Ellison, of Firdale, Man., asst. engr., in charge of construction, G.T.P.Ry., Firdale, Man.; Charles Clifford Elliott, of Brooks, Alta., in charge of operation and maintenance of canals and structures, C.P.R.; John Levern Franzen, B.Sc., (C.E.) (Washington State Coll.), Div. Engineer, Canada Land & Irrigation Co., Medicine Hat, Alta. Robert Porter Freeman, B.Sc., (C.E.) (N.S. Tech. Coll.) of Halifax, N.S., prior to enlistment in 1916, instructor in charge of short course land surveying, N.S. Tech. Coll., recently demobilized; Stanley Richard Frost, of Niagara Falls, Ont., chief mechanical engineer, American Cyanid Co., in charge of maintenance and construction in large chemical plant; Lionel Leatham Gisborne, B.Sc., (M.E., McGill) draftsman, Niagara Development in Hydro Elec. Power Comm.; William Harland, of Toronto, Ont., asst., hydraulic dept., Hydro Elec. Power Comm.; Thomas Leo Hughson, B.Sc., (Civil, Queen's) of Niagara Falls, 1917-19, overseas, now with Hydro-Elec. Power Comm., Construction Dept.; Walter Janssen, of Montreal, B.Sc., (Univ. of Wisconsin) operating manager, Can. Steel Foundries, Ltd.; George Harold Lowry, of Niagara Falls, Ont., resident engineer, Hydro. Elec. Power Comm.; William James MacKenzie, of Vancouver, B.C., ch. dftsman in ch. engineer's office, C.N.P.Ry.; James Gladstone MacLaurin, B.A.Sc., (Toronto) of Sault Ste. Marie, Ont., manager, water power dept., Algoma Steel Corp.; Edmund Senkler Malloch, B.Sc., (Queen's) of Ottawa, Ont., asst. tech engr., fuels and fuel testing div., Mines Branch, Ottawa; Norman Mallock, B.Sc., (Queen's) of Niagara Falls, Ont., in office of chief field engr., Niagara Power Development; Joseph Benedict McAndrew, B.A.Sc., (Toronto) of St. Catharines, Ont., 16 months with C.E.F. as officer, 7th Can. Ry. Troops, at present designing engr., Welland Ship Canal; Lyle McCoy, of Montreal West, in charge of all new engineering work and maintenance, Can. Car & Foundry Co., and Can. Steel; Thomas Stanley Mills, B.A., B.Sc., (Queen's, D.L.S.) of Ottawa, Ont., acting chief engineer, Dominion Parks Branch, Dept. of Interior, Ottawa; William George Montgomery, of Peterboro, Ont., asst. engr. surveys, designing plans, etc., Trent Canal; Ralph Carleton Morgan, of St. Catharines, Ont., draftsman, Dept. Railways and Canals; John

Bernard Petrie, of Wabana, Nfld., mech. supt. of Dom. Iron & Steel Co., Wabana; Gerald Mungo Ponton, of Ottawa, Ont., Lieut., Can. Engrs., Tunnelling Co., C.E.F., at present officer with I.M.B., prior to enlistment, in 1916, metallurgist, Phelps Dodge Co., New Mexico, Arizona and Mexico; Othmar Wallace Ross, B.A.Sc., (Toronto) Capt., of St. Catharines, Ont., 3 years on active service, at present asst. engr., section 1, Welland Ship Canal; Harry Roy Silcox, B.Sc., (McMaster Univ.) of Toronto, Ont., field engr., railway dept., Hydro-Elec. Power Comm.; Stewart Troop, of Moncton, N.B., (Lieut., Can. Engrs.) purchasing engr., Kipawa Co. Ltd.; Russell S. Trowsdale, of Calgary, Alta., dist. engr. in Alta., for Can. Gen. Elec. Co. and Can Allis-Chalmers; Ernest Owen Way, of Ottawa, Ont., ch. inspector in full charge of Dominion Standards Branch of weights and measures, and Dominion Inspection Service.

Juniors

Claude Bradley, of Calgary, Alta., asst. surveyor, Dept. Nat. Resources, C.P.R.; Arthur Wesley Crawford, of Hamilton, Ont., dist. vocational officer, Dept. of Soldiers' Civil Re-Establishment; Douglas Bankier Gardner, B.A.Sc., of Toronto, Ont., 1916-19, Lieut., Can. Engrs., at present with Hydro-Elec. Power Comm. as draftsman; Norman Geddes McDonald, B.A.Sc., (Toronto) of Niagara Falls, Ont., at present draftsman, Hydro-Elec. Power Comm., on the Ont. Power Co's extension; Charles Salmon MacLean, B.A., B.Sc., (Univ. of N.B.) of Halifax, N.S., instructor at N.S. Tech. Coll., in re-educ. classes, dept. soldiers' civil re-establishment; William Britton Pennock, B.Sc., (McGill) of Ottawa, Ont., Lieut., Canadian Engineers, C.E.F., France, prior to enlistment, in chg. of sounding party, Sask. river survey, at present vocational officer, Dept. of Soldiers' Re-Establishment of Canada; Joseph Henry Ryan, B.Sc., (C.E., N.S.T.C.) of Halifax, N.S., with Halifax Shipyards, Ltd.; Frank Bennett Young, of St. John, N.B., Major 26th Batt., B.E.F., prior to enlistment, in private practice, Crown Land surveyor for N.B.'

Associates

Jesse Franklin Block, B.S.A., (Univ. of Alta.) of Calgary, Alta., served as non-com. officer in No. 10, Engrs. & Ry. Constrn. Corps, at present asst. to ch. agric. engr., Dept. of Interior, Calgary.

Transferred from Associate Member to Member.

James Roy Cockburn, B.A.Sc., (Toronto of Toronto, Ont., 1916-19, on active service with 58th Bn. in France, Royal Engrs. in France and Palestine, prior to enlistment, asst. professor of descriptive geometry, Univ. of Toronto; George Hendry Ferguson, B.A.Sc., (C.E., Univ. Toronto) of Ottawa, Ont., 1915-18, officer with C.E.F., Can. Engrs., at present, asst. engr., Comm. of Conservation; John Francis Greene, B.Sc., (Boston) of Winnipeg, Man., member of firm C. D. Howe & Co., conslt. engrs., Port Arthur and Winnipeg; Archibald Rettie Holmes, B. Eng., (Kings) of Toronto, Ont., president, Archibald & Holmes, Ltd., engrs. and bldrs.; Irving Heward Nevitt, B.A.Sc., (Toronto) of Toronto, Ont., supt. and asst. engr. in chg. of operation of main sewage disposal works, etc.; Harold Roy Miles, of Lethbridge, Alta., div. engr., C.P.R., Lethbridge div.; George Kinghorn McDougall, B.Sc., (McGill) of Montreal, Consulting engineer, McDougall & Pease; David Bird McLay, B.Sc., (Glasgow Univ.) Captain, R.E., prior to enlistment in 1915, asst. engr., construction and maintenance of roads, city engr's office, Vancouver; Aloys Reginald Sprenger, Major, Canadian Engrs., C.E.F., 1915-19, prior to enlistment, engr., T.C.Ry., St. John, N.B., at present, dist. supt'g engr. for Eastern Canada, Dept. Soldiers' Civil Re-establishment, Ottawa.

Transferred from Junior to Associate Member

Walter Edward Blue, of Ottawa, Ont., Major Canadian Field Artillery, 1914-19, prior to enlistment, res. engr., Chaudiere Dam, Lake Nipissing, at present, asst. Engr., Dept. Public Works, Ottawa; John William Ford, B.A.Sc., (Toronto) of Niagara Falls, Ont., with Niagara Power Development, H.E.P. Comm.; Merritt Henry French, of Calgary, Alta., hydrometric and irrigation engr., Cypress Hills irrigation dist.; Flavius Ivo Cobbett Goodman, B.Sc., (McGill) of Halifax, N.S., res. engr., Halifax, O.T.; Alexander Watson Gregory, of St. Stephen, N.B., Capt., M.C., 26th Infantry Batt., France, 1915-19, asst. engr. in chg., (ch. engr's branch) Dept. Public Works, Ottawa; Robert Bruce Harkness, of Toronto, Ont., active service, commanded 19th Batt., at present, in chg. Niagara dist., Soldiers' Civil Re-establishment; William Wren Hay, B.Sc., (Univ. of Vermont) of Rogers, Mich., U.S.A., served in France with U.S. Army, 1917-19; Bruce Bowers Hogarth, B.A.Sc., (Toronto) of Ottawa, Ont., 1916-19, with C.E.F., Overseas, at present, insp. engr., power development on Winnipeg River, for Dominion Water Power Br.; Russel G. Lye, B.A.Sc., (Toronto) of Toronto, Ont., at present, active pilot for Surveys Dept., Speight & Van Nostrand; John Alexander McGillivray, of Winnipeg, Man., on valuation staff of Man. Public Utilities; Robert Cavan MacLachlan, B.Sc., (McGill), 18 months in France with Canadian Forestry corps, at present, asst. res. engr., Welland Ship Canal, St. Catharines, Ont.; Hugh Mervyn Morrow, B.Sc., (McGill) of Montreal, Que., Lieut., Can. Ry. Troops, France, at present, tech. salesman, Dom. Iron & Steel Co.; Frank O'Brian Nehin, B.Sc., (McGill) of Montreal, Que., asst. engr., Mt. Royal Tunnel & Terminal Co.; James Hillyard Norris, B.Sc., (McGill) of Montreal, Que., partner in firm of Douglas Bremner & Co. Ltd.; Jock Brown Shaw, of Victoria, B.C., asst. engr., Dept. Public Works, Vancouver Island Dist.; James Crossley Stewart, of Ottawa, Ont., Lt.-Col., D.S.O., Canadian Field Artillery, 1914-19, at present time asst. engr. to S. J. Chapleau, Dept. Public Works, Ottawa; Norman Wilson, B.Sc., (Univ. of N.B.) of Ottawa, Ont., Lieut., Canadian Engineers, Overseas, 1916-19, at present, asst. hydrographic survey, Dept. of Naval Service, Ottawa.

Transferred from Student to Associate Member

Jean Edouard Barcelo, B.Sc., and C.E., (Laval) of Montreal, Que., with Quebec Streams Comm'n; E. Raymond Marien, B.A.Sc. (Laval), of Quebec City, at present comm'r of Industries, Quebec.

Transferred from Student to Junior Member

Theodore Dery, of Rimouski, Que., asst. engr., Dept. Public Works; Roy Cecil Ward, B.Sc., (Toronto) of Toronto, Ont., estimating and designing, Toronto Iron Works.

BRANCH NEWS

Halifax Branch

Frederick R. Faulkner, M.E.I.C., Sec'y.-Treas.

Brigadier-General C. H. Mitchell, was in Halifax on July 25th. The notice of his coming and the time of his stay was so short that it was not possible to call a meeting of the Halifax Branch to meet him, but the members of the Executive Committee who were in the city at the time, C. E. W. Dodwell, M.E.I.C., and Professor Sexton entertained the General at an informal supper at the *Green Lantern*, after which a visit was paid to the Nova Scotia Technical College.

Toronto Branch

W. S. Harvey, A.M.E.I.C., Sec'y.-Treas.

At a meeting of the Executive of the Toronto Branch held recently, it was decided to send the following memorandum to the Council of *The Institute:*—

"Inasmuch as the Report on the Proposed Reclassification of the Civil Service of Canada, as issued by the Civil Service Commission in June last, does not, in our opinion, provide for adequate or reasonable rates of remuneration for the higher positions of the Engineering Branches of the Civil Service of Canada, and as, we understand, it is the intention of the Government to present a bill during the coming session, dealing with the Reclassification of the Civil Service, we urgently recommend that the Council of *The E.I.C.* take as energetic action as possible before the next session of Parliament, to induce the Government to make such changes in this proposed Reclassification as are necessary to provide a fair and proper remuneration to all the Engineers now adversely affected.

The Members of the Executive of this Branch very fully appreciate the excellent work that has already been done and the splendid efforts that have been exerted by the parent Society through the Council and Committees in Montreal and Ottawa. They are, however, strongly of the opinion that *The E.I.C.*, through the Council, can continue to exercise great weight and influence with the Government in regard to this question, and that any substantial results obtained will be a very great benefit to the engineering profession in Canada."

Border Cities Branch

G. C. Williams, A.M.E.I.C., Sec'y.-Treas.

A night letter, signed by the Chairman and Secretary of the Branch, was forwarded, on August 20th, to Council, as follows:—

"At a meeting of Executive of Border Cities Branch June nineteenth, for discussion of Government engineers' salaries, a resolution was passed asking that Council of Parent Society strongly urge Government at Ottawa to pass reclassification of engineers in Civil Service as per Arthur D. Young report and memorandum, dated June twenty-fourth, handed to Chief Engineer of Public Works by engineers on his staff."

Vancouver Branch

A. G. Dalzell, M.E.I.C., Sec'y.-Treas.

The following members of the Branch have now returned from overseas:—J. W. B. Blackman, M.E.I.C.; J. R. Grant, M.E.I.C.; R. F. Leslie, M.E.I.C.; C. S. Manchester, M.E.I.C.; H. St. J. Montizambert, M.E.I.C.; C. F. Alston, A.M.E.I.C.; C. R. Crysdale, M.E.I.C.; H. B. Earle, A.M.E.I.C.; R. G. E. Leckie, A.M.E.I.C.; F. O. Mills, A.M.E.I.C.; W. H. Moodie, A.M.E.I.C.; T. E. Price, A.M.E.I.C.; R. Snodgrass, A.M.E.I.C.; W. J. Smart, A.M.E.I.C.; W. G. Swan, A.M.E.I.C.; G. A. Walkem, A.M.E.I.C.; A. E. Humphrey, S.E.I.C.; R. S. Perry, S.E.I.C.

MEMBERS EXCHANGE

Members wishing to acquire or dispose of engineering or scientific books or instruments may insert, under this heading, concise advertisements; free of charge.

For Sale

Transactions of the Institute of Engineers (Scotland), Volume 1, 1st Session, 1857 to 1858. Printed in 1858.

Mechanical Engineers' Proceedings 1872 to 1887—16 volumes.

Engineering (England), 1866 to 1903—75 volumes.

Engineering News (American), 1885 to 1887—6 volumes.

Engineering Record (American), 1889 to 1890—2 volumes.

Scientific American, 1882, 1883, 1884 — 6 Volumes. Full years.
1885—Jan. to June. 1 Volume.
1886—Jan. to June. 1 Volume.
1887— 2 Volumes. Full year.

Leather backs and corners, all but four or five numbers of Engineering in first class order, those damaged have the backs off, a couple of dollars will put them in good order. Anyone wanting to add to their library can have a bargain. Address M.E. No. 1, *The Engineering Institute.*

*

Bound Volumes of Engineering News

A member of *The Institute* has for sale 27 volumes of Engineering News, bound, being 12 volumes 1890 to 1895 and 15 volumes 1903 to 1911. The price asked for these 27 volumes is $40.00, F.O.B., Moncton, or will consider an offer. If any member or Branch desires these kindly address M.E. No. 2, *The Engineering Institute.*

Personals

Lieut.-Col. H. R. Lordly, C.E., M.E.I.C., who has recently returned from overseas, has been elected a Fellow of the Society of Engineers, London. This singular distinction has been granted to Colonel Lordly because of the engineering work which he has accomplished overseas while employed with the Imperial Forces. The Society of Engineers has a restricted membership and amongst its members are many of the most eminent engineers in the Old Country.

Lieut.-Col. H. R. Lordly, C.E., M.E.I.C.

Colonel Lordly is a graduate of Cornell University and is the holder of the Fuertes Gold Medal given by the College of Civil Engineers in memory of its former head Dean Fuertes. *The Institute* has always had the active support of Colonel Lordly, who has served as Honorary Librarian for one year, has twice been a member of the Nominating Committee, and has contributed several papers, the last one being on Subaqueous Concrete, in which class of work he has had extensive experience. Colonel Lordly has been granted two patents in connection with concrete construction, both of which have been successful. One of the patents is for a concrete pile with a jetting and sucking device, and the other is for a concrete block cast around sand cores. Before going overseas Colonel Lordly was for many years in charge of the rebuilding of the Lachine Canal, and will in future engage in consulting engineering practice in Montreal.

Colonel Lordly has had extensive military experience. He is the possessor of both the Long Service Auxiliary Medal and the Officers Long Service Decoration, the latter being awarded while on service overseas. He has been a member of the Executive Council of the Province of Quebec Rifle Association and has won the Governor-General's Medal and the Lieutenant-Governor's Medal for the Special Aggregates Competition. Before the war Colonel Lordly was in command of the Corps of Guides at Montreal, and when war came he organized and took overseas the 5th Pioneer Battalion from Montreal.

*

D. deC. Ross-Ross, B.Sc., Jr. E.I.C., has been appointed instructor in Power Plant Engineering at the Central Technical School, Toronto, in connection with the work of the Soldier's Civil Re-establishment.

*

Capt. K. MacKinnon, M.C., J.E.I.C., of the 2nd Signal Co., Divisional Engineers, returned to his home in New Glasgow on July 17th. Previous to the war Capt. MacKinnon was with the Halifax Power Company.

*

R. E. Weeks, S.E.I.C., has been appointed municipal engineer for the Municipality of Glenwood, with headquarters at Souris, Man. A contract has been let by the Municipality for 28 miles of good roads, the construction of which has been commenced.

*

Gaylen R. Duncan, M.Sc., A.M.E.I.C., of the firm of G.R. Duncan & Co., Fort William, Ont., and President of the Fort William Board of Trade has recently been elected Vice-President of the International Real Estate Association of Atlantic City.

*

Captain L. W. Wynne-Roberts, R.E., son of R. O. Wynne-Roberts, M.E.I.C., of Toronto, who has had some remarkable experiences, in various parts, with the Royal Engineers, is now on his way home from India. It is expected that he will arrive in Toronto next October.

*

Major Roy A. Spencer, M.C., and Bar, J E.I.C., arrived in Halifax early in August on the new White Star liner *Regina* after rendering gallant service for several years at the Front, with the Canadian Engineers. Major Spencer expects to reside in Halifax.

*

Lieut. H. E. Bates, B.Sc., A.M.E.I.C., of Montreal, returned from Overseas on the *Megantic* in August, having served since March, 1916, with the 66th Battery, 14th Brigade, C.F.A., Montreal. Previous to the war Mr. Bates was engaged on the Quebec Bridge under Lt.-Col. Monsarrat, M.E.I.C.

*

Capt. J. A. Knight, S.E.I.C., Canadian Engineers, has recently returned to his home in Toronto after three and a half years at the front. During the early part of Capt. Knight's military career he was an officer in the 2nd Tunnelling Company and later was in the 11th Battalion, Canadian Engineers.

H.R.H. The Prince of Wales, at the request of the Mayor of Cobalt, will visit the Coniagas Mines on September 2nd, where he will be entertained by the Company at luncheon. The President, Lt.-Col. R. W. Leonard, M.E.I.C. will preside. All members of *The Institute*, in the vicinity, are receiving special invitations to be present at this function.

*

A. St. Laurent, M.E.I.C., Assistant Deputy Minister of Public Works, has been appointed Technical Departmental Representative on the Board of Hearing and Recommendations which has been established by the Civil Service Commission to assist in the work of fitting the personnel of the Civil Service to the Classification recently published by the Commission.

*

H. Wyatt Johnston, S.E.I.C., has just returned to Montreal after nearly two years absence on military service, having served with the Canadian Forestry Corps and later with the 8th Battalion Canadian Engineers during the offensive of 1918, and was present at the taking of Mons. He is enthusiastic regarding the magnificent achievements of the Canadian Engineers during the last days of the war.

*

Lieut. G. F. Layne, M.C., S.E.I.C., has recently returned from overseas. While overseas Mr. Layne held the rank of Captain in the Royal Horse and Royal Field Artillery (T), but served in France and Palestine with the Seige Artillery. In June 1917 Mr. Layne was mentioned in despatches and in September 1917 was awarded the Military Cross for gallantry and devotion to duty in action.

*

D. A. R. McCannel, B.Sc., A.M.E.I.C., has recently been appointed City Engineer of Regina, Sask. Mr. McCannel has been a resident of Regina since 1893, and received his early education in the public and high schools of Regina. In 1914, he graduated from Queen's University, Kingston, with the degree of B.Sc. in Civil Engineering. Mr. McCannel has been on the engineering staff of the city of Regina since 1914.

*

Major G. R. Taylor, J.E.I.C., joined the Canadian Expeditionary Forces in February, 1915, at which time he was engaged with the Hydro-Electric Commission. He went to France as Captain of the 10th Batt., C.R.T., and was advanced to the rank of Major in October, 1917. Major Taylor was engaged on light railway work at Nieuport and Ypres for a considerable length of time and after the Armistice on standard gauge reparation work. He returned to Canada in August 1919.

*

Lieut. Walter S. Ford, B.Sc., A.M.E.I.C., who previous to the war was engaged with the Western Canada Power Company, Limited, on power house construction, returned to Canada on July 14th and has gone on to Redlands, California, where he will spend some months. Lieut. Ford enlisted in January, 1915, as Sapper with the Canadian Overseas Railway Construction Corps and spent two years in England, Belgium and France on narrow and standard gauge railway construction. Later he transferred to the Royal Guards Artillery with a commission. He was wounded on February 6th, 1918.

*

Lieut.-Col. Daniel Hillman, D.S.O., M.E.I.C., has returned to Canada after distinguished service in France. Colonel Hillman joined the Canadian Overseas Railway Construction Corps as a Lieutenant in 1915 and served with that unit in France from July 1915, till January 1918, when he was seconded to the Royal Engineers as Assistant Railway Construction Engineer. In March, 1918, he was promoted to Railway Construction Engineer and held this appointment till May 1919, when he was returned to his own unit. Before going Overseas, Colonel Hillman held the position of Divisional Engineer in charge of the double tracking of the C. P. R. line from Sudbury to Port Arthur.

*

The Asphalt Association has appointed Bruce Aldrich as district engineer of the Canadian district, with headquarters at the office of the H. K. McCann Company, Limited, Toronto. Mr. Aldrich was born in England and received his higher education there, but spent his early life and received his primary education in Canada. His experience in connection with testing of asphalts and cement and as organizer of the municipal laboratory of Baltimore eminently fits him for this position in which he will devote his attention to co-operation with officials and engineers in the several provinces with a view to bringing about constructive results in asphaltic highway work.

*

Major Shirley T. Layton, M.C., B.Sc., A.M.E.I.C., returned to Canada on July 12th on the *Carmania* after serving thirty-eight months active field service in France. Major Layton enlisted on November 10th, 1914, and sailed from Canada, June 15th, 1915, with the 2nd Heavy Battery as Lieutenant, going to France three months later. There he was promoted to Captain and transferred to the 2nd Siege Battery. In February 1918, he was promoted to Major in command of the 5th Siege Battery. He was twice mentioned in despatches and was awarded the M.C. in the spring of 1918. He participated in the engagements of Hooge, Vimy, Hill 70, Passchendale, and other Canadian engagements, seeing continuous service through all these without mishap.

*

Lieut.-Col. W. P. Anderson, C.M.G., M.E.I.C., Past President of *The Institute* met the S.S. *Melita* at Montreal, on August 23rd, to welcome back his two sons; Colonel T.V. Anderson, D.S.O., A.M.E.I.C., who has been in command of the Engineering Construction Corps at Seaford since he lost his right hand at Vimy, while in command of the 3rd Divisional Engineers; and Lieut.-Col. W. B. Anderson, C.M.G., D.S.O., who before the war was Assistant Quartermaster-General of the Canadian Corps at Montreal. Past President Anderson's youngest son, Major Alex Anderson, D.S.O., J.E.I.C., who was in command of the 2nd Division Signallers, returned to Canada two months ago and has resumed work with the Public Works Department.

Employment Bureau

Situations Vacant

Contractor's Assistant

Opening for young college graduate who has had some experience on construction work to start with an Engineering Contracting firm in Montreal. Box No. 46.

Building Superintendent

An experienced Building Superintendent, college graduate required for Construction Company. One experienced in taking off quantities and constructing work preferred. Box No. 47.

Supervising Engineer

Position open for a Resident Civil Engineer to supervise the construction, in Eastern Canada, of a Hydro-Electric Power Development, including Dam, Power Station and Transmission Line. Previous experience on similar work absolutely necessary. Box No. 45.

Professor of Mechanical Engineering

Professor of Mechanical Engineering wanted at Nova Scotia Technical College. Must be a graduate of a recognized engineering college with at least six to eight years of practical experience. Salary $200 per month. Box No. 48.

Instructor of Civil Engineering.

Instructor of Civil Engineering wanted at Nova Scotia Technical College. Must be a graduate of a recognized engineering college with at least three years of practical experience. Salary $150.00 per month. Box No. 49.

Draftsmen required

Draftsmen required for position in a New York office having experience in industrial engineering. Apply Box 50.

CIVIL SERVICE COMMISSION

The Civil Service Commission of Canada hereby give public notice that application will be received from persons qualified to fill the following positions on the Superior Staff of the Royal Military College, Kingston, Ont.

A Professor of Engineering. Initial Salary $3,480 per Annum

1. A Professor of Engineering at an initial salary of $3,480 per annum, to have charge under direction, of the Engineering Department of the Royal Military College, to instruct in the several branches of engineering and to direct the work of assistant professors and instructors in engineering and surveying. Candidates should be graduates of a school of applied science of recognized standing, with at least five years of experience in teaching the principles of engineering in some academic institution of higher learning, preferably with some engineering practice in the recent war. They should have a thorough theoretical knowledge of engineering in all its branches.

An Instructor in Chemistry. Initial Salary $1,800 per Annum

2. An Instructor in Chemistry at an initial salary of $1,800 per annum, to assist in the Royal Military College in teaching and instructing in chemistry. Candidates should be not more than 25 years of age, and be graduates in chemical engineering of a school of applied science of recognized standing, or be honour graduates in chemistry with physics as a minor subject, from a university of recognized standing.

An Instructor in Physics. Initial Salary of $1,800 per Annum

3. An Instructor in Physics at an initial salary of $1,800 per annum, to assist in the Royal Military College in teaching and instructing in physics. Candidates should be not more than 25 years of age, and should be graduates in civil, mechanical or electrical engineering, or in honour physics with mathematics as a minor subject from a university of recognized standing.

An Instructor in Civil Engineering. Initial Salary $1,800 per Annum

4. An Instructor in Civil Engineering at an initial salary of $1,800 per annum, to assist in the Engineering Department of the Royal Military College. Candidates should be not more than 25 years of age, and be graduates of a school of applied science of recognized standing, with preferably one or two years of experience in engineering design or construction work. They should have a good theoretical knowledge of civil engineering in all its branches.

Two Instructors in Mathematics. Initial Salaries $1,800 per Annum

5. Two instructors in Mathematics at initial salaries of $1,800 per annum, to assist in the Royal Military College in teaching and instructing in mathematics. Candidates should not be more than 25 years of age, and should be graduates from a university of recognized standing with honours in mathematics.

An Instructor in French. Initial Salary $1,800 per Annum

6. An Instructor in French at an initial salary of $1,800 per annum, to assist in the Royal Military College in teaching and instructing in French. Candidates should be not more than 25 years of age, and should be graduates from a university of recognized standing, with French as an honour subject. They should have a thorough knowledge of French literature.

An Instructor in English. Initial Salary $1,800 per Annum

7. An Instructor in English at an initial salary of $1,800 per annum, to assist in the Royal Military College in teaching and instructing in English. Candidates should be not more than 25 years of age, and should be graduates from a university of recognized standing, with English as an honour subject. They should have a thorough knowledge of English literature.

Applicants should apply in writing on their own paper, to the secretary of the Civil Service Commission, Ottawa, not later than the 6th day of September. Applicants must specify the position for which the apply and must give full particulars as to name, address, age, qualifications, experience and previous employment. Applications should be accompanied by letters of reference from three reputable citizens.

Second List

The Civil Service Commission of Canada hereby give public notice that applications will be received from persons qualified to fill the following positions in the Civil Service of Canada.

A Chief, Organization Branch, Civil Service Commission. Salary $2,800 per Annum

1. A Chief, Organization Branch, Civil Service Commission, at an initial salary of $2,800 per annum. The duties of this officer are to be responsible, under the Secretary, Civil Service Commission, for the conducting of investigations and surveys and the preparation of plans of organization for the various departments and subordinate units thereof in the Dominion Government; to have charge of the making of investigations in connection with the efficiency of processes or operations or of individuals or groups of individuals within departments; to administer and keep up to date the classification of the Civil Service; to direct the staff of the Organization Branch; and to perform other related investigational and administrative work as required.

Candidates shall be *not less than twenty-five and not more than forty years of age and must be of good address tactful, able to meet the public and departmental officials and to judge people.* They must possess education equivalent to graduation from a university of recognized standing in accounting, economics, engineering or science *and at least five years of experience in accounting, engineering, shop or business management, or similar work, of which at least two years shall have been in an administrative capacity.* Applicants must be familiar with Civil Service administration *or the organization and methods of large business concerns.* Experience in investigation or organization work is very desirable.

The examination will consist of three parts, rated as follows:—(1) Education and experience, 40; (2) a thesis on a problem in office management, accounting, industrial operation, or organization, to be chosen from a list established by the Commission, 30; (3) Oral interview, 30. Applicants will not be assembled for the statements of education and experience and for the thesis, but may do this work at their own homes. These will be received only from those candidates who show that they possess the minimum qualifications in education and experience. Those successful in the first two parts of the examination will be assembled later at one or more points for oral interview.

Application forms properly filled in, must be filed in the office of the Civil Service Commission not later than August 29th.

A Junior Engineer, Dept. of Public Works, Prince Rupert, B.C. Salary, $1,680 per Annum.

2. A Junior Engineer for the Department of Public Works at Prince Rupert, B.C., at an initial salary of $1,680 per annum. Applicants should be graduates in engineering from a School of Applied Science of recognized standing with two years of engineering experience, or four years of engineering experience in design, estimate, construction and maintenance work.

Application forms properly filled in, must be filed in the office of the Civil Service Commission not later than August 29th.

Secretary of the Board of Pension Commissioners. Salary $4,000 per annum

3. A Secretary of the Board of Pension Commissioners at an initial salary of $4,000 per annum. Candidates should have a good education, and several years of experience in a secretarial capacity, or in business administration. They should have, in particular, ability to manage, direct and co-ordinate the work of a large staff. Good address, tact, and agreeable personality are desirable qualifications.

Two Resident Architects for Sask. and Alta., Dept. of Public Works. Salaries $2,220 per annum.

4. Two Resident Architects, one for Alberta with headquarters at Calgary, and one at Saskatchewan with headquarters at Regina, Department of Public Works, at initial salaries of $2,220 per annum. Candidates must have education equivalent to high school graduation, and either graduation in architecture from a school of applied science of recognized standing, with three years of experience in architectural design, estimate, and construction work, two years of which shall have been in a position of professional responsibility, or five years of experience in architectural design, estimate, and construction work, two years of which shall have been in a position of professional responsibility. Candidates should have tact, good judgment, and ability to manage men.

A Junior Engineer, Welland Ship Canal. Salary $1,680 per annum

5. A Junior Engineer for the office of the Welland Ship Canal Construction Staff, Department of Railways and Canals, at an initial salary of $1,680 per annum. Candidates must have education equivalent to high school graduation, and either graduation in engineering from a school of applied science of recognized standing, with two years of engineering experience, or four years of engineering experience in design, estimate, construction, and maintenance work. The appointee will be required, under direction, to make surveys, supervise engineering construction and repairs, to make computations in connection with engineering work, and to perform other related work as required. This position was advertised April 16th, and is now re-advertised.

An Irrigation Specialist, Dept. of the Interior, Calgary. Salary $1,680 per annum

6. An Irrigation Specialist for the Reclamation Service of the Department of the Interior at Calgary at an initial salary of $1,680 per annum. Candidates must have education equivalent to graduation in agriculture from a school of recognized standing. They should have

a knowledge of irrigation problems, and at least one year of experience as Irrigation Assistant or in work of equivalent character and standard. They should have ability to plan and lay out works for water distribution over fields. They should have also supervisory ability.

A Junior Seismologist, Dept. of the Interior. Salary $1,500 per annum

7. A Junior Seismologist, Department of the Interior, at an initial salary of $1,500 per annum. Candidates must have education equivalent to graduation from a university of recognized standing, with specialization in mathematics and physics. They should have at least two years of experience with physical apparatus.

A Junior Magnetician, Dept. of the Interior. Salary $1,500 per annum

8. A Junior Magnetician for the Dominion Observatory, Department of the Interior, at an initial salary of $1,500 per annum. Candidates must have education equivalent to graduation from a university of recognized standing, with specialization in mathematics and physics. They must be familiar with problems in terrestrial magnetism. Exactitude is a desirable qualification.

An Assistant Inspector of Electricity and Gas for Hamilton, Dept. of Trade and Commerce. Salary $1,260 per annum

9. An Assistant Inspector of Electricity and Gas for Hamilton, Ontario, Department of Trade and Commerce, at an initial salary of $1,260 per annum. Applicants should have education equivalent to graduation from a technical high school, and preferably university training in science. They should have at least two years of experience in the manufacture or testing of electric and gas meters and equipment, or experience of equivalent character and standard. A qualifying examination in electricity will be held in connection with the filling of this position, and applicants will be informed later of the conditions of the examination. Candidates must be residents of the Province of Ontario.

A Male Junior Examiner, Civil Service Commission. Salary $1,600 per annum.

10. A Male Junior Examiner, Examination Branch, Civil Service Commission, at an initial salary of $1,600 per annum. The appointee will be required to assist in the preparation advertising, conduct and rating of written, oral and practical examinations, both personally and in co-operation with experts in various fields to perform clerical work incident to recording the results of examinations; to maintain Civil Service records; and to perform other related work as required. Candidates must have the equivalent of a high school education and must show such experience as will give reasonable assurance that they can undertake such duties as are listed above; they must be of good address, tactful, possessed of good judgment and able to meet and deal with the public and departmental officials. Initiative and executive and constructive capacity must be shown and integrity and trustworthiness are essential qualifications. Preference will be given to candidates with university training.

The examination will consist of three parts rated as follows:—(1) Education and experience, 40; (2) Questions on problems relating to the duties of the position, 30; (3) Oral interview, 30. The second part of the examination will be given only to those who have shown that they possess the minimum qualifications in education and experience. Those successful in the first two parts of the examination will be assembled later at one or more points for oral interview.

This position was advertised July 16th, and is now re-advertised. Applications received to date are still under consideration, and candidates who have already entered this competition need not duplicate their applications.

In the case of positions numbers, 4, 5 and 6, attention is drawn to the fact that appointments to these positions shall be made, so far as practicable, from bona fide residents of the province in which the position is situated.

Application forms for positions 3 to 10 properly filled in, must be filed in the office of the Civil Service Commission not later than September 15th.

General Directions.

The salaries for the above positions may be supplemented by such bonus as may be provided by Parliament.

Selections for eligible lists of applicants qualified to fill similar vacancies which may occur in future may be made from the applications for these positions.

According to law, preference is given to returned soldier applicants, possessing the minimum qualifications. Returned soldiers must furnish a certified copy of their discharge certificates, or in the case of commissioned officers, a certified statement of their military services.

Attention is drawn to the fact that appointments to these positions shall be made, so far as practicable, from bona fide residents of the province in which the position is situated.

Application forms may be obtained from the offices of the Employment Service of Canada or the Secretary of the Civil Service Commission, Ottawa.

By order of the Commission,

W. Foran,
Secretary.

Situations Wanted

Electrical Engineer

Electrical Engineer having extensive mechanical and electrical experience, as well as a thorough knowledge of business methods, organization, contracts, purchase of materials, etc., is open for immediate engagement. Has been in responsible charge of design and supervision of various engineering works for well known Architects and Consulting Engineer. Until recently, engaged on the purchase of steel and other commodities for an Allied Government. Both languages. Reply Box No. 11-P.

Preliminary Notice

of Application for Admission and for Transfer

26th August, 1919.

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in September, 1919.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows:—

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course. In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineers' office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the following branches at his option Railway, Municipal, Hydraulic, Mechanical, Mining, or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five years or more years.

Every candidate for election as JUNIOR shall be at least twenty-one years of age, and must have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-five years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects Geography, History (that of Canada in particular), Arithmetic, Geometry Euclid (Books I.-IV. and VI.), Trigonometry, Algebra up to and including quadratic equations.

Every candidate for election as ASSOCIATE shall be one who by his pursuits, scientific acquirements, or practical experience is qualified to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

AMES—FREDERICK THOMAS, of Bentley, Alta. Born at Folkestone, England. Sept. 28th, 1887. Educ. Boarding School, Sandwich, England, London College of Preceptors Certificate. 1903-06, Articled pupil with Chris. Jones, borough engr. Hythe, Eng.; 1906-07, asst. in architectural drafting and Bldg. Constrn. with T. Tunbridge, Folkestone, Eng.; 1907-13, inst'man and res. engr. on constrn. G.T.P.; 1913-16, Ry. constrn. and location with R. W. Jones, Edmonton, Alta.; 1917-19, Supt. in chg. of constrn. and operation, Lacombe and N. W. Ry., extending line from Bentley to Rimbrey, Alta.

Monthly Engineering Index

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of the engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies may be obtained of any of the articles listed in this section.

Price of each print (up to 11 x 14 in. in size), 25 cents, plus postage. A separate print is required for each page of the larger-size periodicals, but where possible two pages will be photographed together on the same print. Bill will be mailed with the prints.

Harrisson W. Craver, Director,
Engineering Societies Library,
29 West Thirty-ninth Street, New York, N.Y.

AERONAUTICS

AIRCRAFT (LIGHTER THAN AIR)

Airship Requirements. Lighter-than-Air Craft, T. R. Cave-Brown-Cave. Aviation, vol. 6, no. 11, July 1, 1919, pp. 585 & 588-591, 3 figs. Fabrics, engine requirements, useful carrying capacity, water recovery and use of hydrogen as fuel, mooring, towing and anchors. (Concluded.) Paper read before Roy. Aeronautical Soc.

R-9. The Evolution of the Airship—I. Aeronautics, vol. 16, no. 297, June 26, 1919, pp. 664-665, 3 figs. Construction of R-9.

R-34. British Airship R-34 Described. Aviation, vol. 6, no. 12, July 15, 1919, pp. 629-632, 6 figs.

Rigid Airship. The Tension in the Radial Wires of a Rigid Airship, E. H. Leavitt. Aeronautics, vol. 16, no. 295 and 297, June 12 and 26, 1919, pp. 617-618 and 675, 2 figs. June 12: Derivation of formulæ. June 26: Formula. Reference made to article in Aeronautics of June 12.

Vickers. The Evolution of the Airship—II, Aeronautics, vol. 17, no. 298, July 3, 1919, pp. 15-18, 8 figs. Vickers, Ltd. and their war productions.

APPLICATIONS

Commercial Applications. American Commercial, Tourist and Pleasure Aeroplanes. Aerial Age, vol. 9, no. 20, July 28, 1919, pp. 930-931, and p. 943, 10 figs. Aerial mapping and photography, express and mail delivery, passenger-carrying, fire and police patrol, advertising, exploring, reconnaissance, news distribution, and exhibitions. Details of ten types are briefly reported.

Mail Service. Aerial Mail Service (L'Aviation et la Poste), M. Delfieu. Annales des Postes, Télégraphes et Téléphones, vol. 8, no. 2, June 1919, pp. 216-227. Sees it handicapped at present by three essential deficiencies of aviation—irregularity, insecurity and excessive expense.

AUXILIARY SERVICES

Landing Fields. Municipal Landing Fields for Air Service. Am. City, City Ed., vol. 21, no. 1, July 1919, pp. 20-23, 2 figs. War Department's Specifications.

Parachutes. The Sperry Parachute, H. E. Goodman. Aerial Age, vol. 9, no. 17, July 7, 1919, p. 812, 2 figs. Advantage said to be that aeronaut is able to get out of machine when it is in abnormal position.
The "Guardian Angel" Parachute. Indian Eng., vol. 65, no. 20, May 17, 1919, pp. 276-277, 2 figs. on supp. plate. Automatic and instantaneous opening said to be effected by enclosure in parachute body as it emerges from its case, cylindrical column of air, which under compression of fall is immediately converted into a cushion of air, extending into every direction to periphery. It can be used from height of 200 ft.

Wireless. Wireless Telegraphy Applied to Aviation, W. Knight. Aviation, vol. 6, no. 11, July 1, 1919, pp. 572-575, 7 figs. Principles of transmission and application of invention to air navigation, particularly with reference to its use for communication between airplanes and radio stations on the ground.
Development of Radio Equipment for Naval Aircraft, Edgar H. Felix. Flying, vol. 8, no. 6, July 1919, pp. 536-540, 11 figs. Installation on NC-3.
Wireless Telephone Transmitter for Seaplanes. Rudder, vol. 35, no. 7, July 1919, pp. 332-334, 4 figs. As designed for flying boats of H-16 class of U. S. navy.

DESIGN

Altitudes, Flight at. Theory of Airplane Flight at Various Altitudes. Predetermination of the Ceiling (Théorie du vol. des aéroplanes aux diverses altitudes. Pédétermination de la hauteur du plafond), A. Rateau. Comptes Rendus des séances de l'Academie des Sciences, vol. 168, no. 23, June 10, 1919, pp. 1142-1147. Equations expressing angle of wings, speed of airplane, revolution per second of propeller, and slip of propeller with reference to "effective pitch."

Flying Boats. The Design and Construction of Flying Boats, David Nicolson. Aeronautics, vol. 16, no. 293 (New Series), May 29, 1919, pp. 562-565, 11 figs. For types known officially as F.2A, F.3, F.5, P.5, and N.4. Paper presented before Instn. Engrs. and Shipbuilders in Scotland. (To be continued.)

Load and Stresses. The Loads and Stresses on Aeroplanes, John Case. Aeronautics, vol. 16, no. 293, 294, 295, 296 and 297, May 29, June 5, 12, 19 and 26, 1919, pp. 556-559, 589-592, 619-622, 644-647 and 671-673, 32 figs. May 29: Equations of equilibrium when flying and when alighting with engine shut off; approximate method of calculating loads when turning in horizontal position and when flattening out from vertical dive and looping. June 5: How flattening out of flight path is brought about. June 12: Loads caused by gusts, spiral glides and spinning. June 19: Distribution of load over the planes. June 26: Pressure distribution in spiral glide.

Metal Construction. Metal Construction of Aircraft, A. P. Thurston. Aeronautics, vol. 16, no. 293 (New Series), May 29, 1919, pp. 570-571. Methods of design and calculation of guide spars. Paper read before Royal Aeronautical Soc. (Concluded.)

Rigging. The Rigging of Aeroplanes, R. J. Goodman Crouch. Aeronautical Jl., vol. 23, no. 100, April 1919, pp. 143-178, 21 figs. Based on diagrams published by Roy. Air Force. Application of methods illustrated by various examples.

Struts. Strength of Two Combined Struts, K. Aichi. (In Japanese.) Jl. Soc. Mech. Engrs., Tokyo, Japan, vol. 22, no. 56, Feb. 1919.
Formula Giving the Ultimate Load for a Long Strut of Varying Cross-Section, K. Aichi. (In Japanese.) Jl. Soc. Mech. Engrs., Tokyo, Japan, vol. 22, no. 56, Feb. 1919.
Struts of Conical Taper, H. A. Webb and E. D. Lang. Aeronautical Journal, vol. 23, no. 100, April 1919, pp. 179-186, 3 figs. Strength of wooden struts consisting of parallel center portion with ends of conical taper is considered mathematically. Best results are obtained when parallel portion is half total length of strut, and when taper of ends is such that end of diameter is half of center diameter. Formula for design is offered.

War Developments. Some developments in Aircraft Design and Application During the War, Lord Weir. Engineering, vol. 108, no. 2793, July 11, 1919, pp. 59-61 7 figs. Aerodynamical aspect of design and progress. Applicational aspect taken up in second part of paper. (To be continued.) Read before North-East Coast Instn. of Engrs. and Shipbuilders.

ENGINES

Altitudes, High. Operation of Airplane Motors at High Altitudes (Hohenregelung fur Flugmotoren), R. Krüger. Motor-wagen, vol. 22, no. 6, Feb. 28, 1919, pp. 103-104, 5 figs. Discusses French, American, Swiss and German inventions for insuring proper working conditions for motor even in thin air of high altitudes.

Cosmos. Cosmos "Jupiter" Aero Engine. Aeronautics, vol. 16, no. 297, June 26, 1919, pp. 666-668, 4 figs. Specifications and performance at demonstration at Filton.
The Cosmos Aero Engines. Flight, vol. 11, no. 27, July 3, 1919, pp. 869-871, 7 figs. Radial types constructed by Cosmos Engineering Co., Ltd.

Curtiss. The Curtiss Model K-6 Aero Engine. Aeronautics, vol. 16, no. 295, June 12, 1919, pp. 608-609, 1 fig. Six cylinders en bloc, 4-stroke cycle, rated horsepower 150 at 1,700 r.p.m.

Design. The Design of Aeroplane Engines, pts. 22, 23 and 24, John Wallace. Aeronautics, vol. 16, no. 296 and 297, June 19 and 26, 1919, pp. 638-641 and 660-662 and vol. 17, no. 298, July 3, 1919, pp. 22-24, 9 figs. June 19: Stresses in crankshaft and crankpins; crankshaft bearings; ventilators; oil, water and air pumps. June 26: Requirements of satisfactory carburetor; venturi tube; principle of Zenith carburetor. July 3: Sources of poor efficiency; starting installations.

Hispano-Suiza. The Hispano-Suiza Airplane Engine—II, H. O. C. Isenberg. Am. Mach., vol. 51, no. 2, July 10, 1919, pp. 55-58, 13 figs. Foundry methods used for aluminum and bronze castings at works of Wright-Martin Aircraft Corporation.

Liberty. The Liberty 12A Aircraft Engine. Automobile Engr., vol. 9, no. 128 July 1919, pp. 213-221, 12 figs. Analysis of internal stresses, forces, and pressures on main members.

R-34 Motor Plant. A Technical Study of the R-34 Motor Plant. Automotive Indus., vol. 41, no. 2, July 10, 1919, pp. 81-83, 2 figs. With reference to operation of engines.

Salmson. France's Liberty Engine. The Amazing Salmson, W. F. Bradley. Automotive Indus., vol. 41, no. 2, July 10, 1919, pp. 59-66, 16 figs., partly on supp. plate. Engine is intermediate between rotary air-colled aviation engine and fixed cylinder water-cooled star type. Outstanding features are nine steel cylinders mounted around circular crankcase, crankcase and cylinders being fixed and single-throw crankshaft revolving.

Supercharging. The Value of Supercharging. Aviation, vol. 6, no. 11, July 1, 1919, pp. 577-579, 5 figs. and Aerial Age, vol. 9, no. 19, July 21, 1919, pp. 892-893, 4 figs. Tests conducted at altitude laboratory of Bureau of Standards, said to indicate that net gain in hp. will result even if considerable power is needed to drive blower.

MATERIALS OF CONSTRUCTION

Balloon Fabrics. Notes on Balloon Fabrics, Junius David Edwards. Aviation, vol. 6, no. 12, July 15, 1919, pp. 626-627, 2 figs. Characteristics of fabrics in use and discussion of means along which future development may be expected to take place.

Duralumin. Duralumin in Aviation (Le duralumin en aviation). Aérophile, vol. 27, nos. 9-10, May 1 and 15, 1919, pp. 129-130, 1 fig. Advantages claimed over wood by reason of less sensitiveness to atmospheric changes.

Plywood. The General Properties and Uses of Plywood—III, B. C. Boulton. Aerial Age, vol. 9, no. 19, July 21, 1919, pp. 895-897, 4 figs. Monocoque type of fuselage. (Concluded.)

METEOROLOGY

Aerial Currents, Errors in Determination. Errors Arising from Insufficiency of Knowledge of Meteorological Variations of Aerial Navigation (Sur les erreurs d'estime que peut entraîner la connaissance incomplète du régime aérologique), L. Dunoyer. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 22, June 2, 1919, pp. 1102-1105. Probable errors in estimating effect of crossing on aerial current.

Anticyclones and Depressions. The Origin of Anticyclones and Depressions, John Logie. Proc. Roy. Soc. of Edinburgh, vol. 39, part 1, Session 1918-19, pp. 56-77, 8 figs. Theory based on two postulates—(1) when two portions of air differing slightly in density are adjacent and in the same level, they tend to mingle and so destroy the difference of density; (2) when changes of pressure occur at any level in an extensive layer of air, the surrounding air does not "immediately rush in," but only slowly intrudes into the region of diminished pressure.

Storms. Storm Types and Peculiarities, George S. Bliss. Jl. Engrs. Club of Philadelphia, vol. 36, no. 176, July 1919, pp. 272-274, 8 figs. Bowie and Weightman map studies and summary on their conclusions. Paper read before Am. Soc. Heating & Ventilating Engrs.
See also Anticyclones.

Wind Velocities. Influence of the Vertical Distribution of the Temperature on the Wind Velocity Measured in the Vicinity of the Ground (Influence de la distribution verticale des températures sur les vitesses du vent mesurées au voisinage du sol), C. E. Brazier. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 23, June 10, 1919, pp. 1160-1161. Observations extending over period of ten years alleged to establish that considerable influence is exerted by temperature distribution on ratio of wind velocity to gradient at altitudes at which anemometers are usually placed.

The Pilot Balloon Method of Determining the Direction and Speed of the Upper Winds, Ivan R. Tannehill. Jl. U. S. Artillery, vol. 51, no. 1, July 1919, pp. 1-16, 4 figs. One-theodolite method for sighting baloon compared with two-theodolite and other methods. Rapidity of calculations in one-theodolite method admitted to lead to small errors, but it is observed that atmospheric changes taking place during longer observations required by other methods lead also to errors.

Influence of Seasons and the Periodic Changes in Atmosphere on the Corresponding Variations in Atmospheric Pressure and Wind Intensity (Influence des saisons et des régimes aérologiques sur les variations corrélatives de la pression atmosphérique et de l'intensité du vent), G. Reboul and L. Dunoyer. Comptes rendus des séances de l'Academie des Sciences, vol. 168, no. 19, May 12, 1919, pp. 947-950. As factor for determining coefficient of certitude of rules for forecasting weather conditions.

Various Cases of Diminution of Wind Velocity with Altitude (Sur certains cas de diminution de la vitesse du vent avec l'altitude), Albert Baldit. Comptes rendus des séances de l'Academie des Sciences, vol. 168, no. 24, June 16, 1919, pp. 1211-1214. Instances are quoted to prove that established rule of increasing wind velocity with altitude represents merely average of a great number of cases, but not absolutely constant law.

PRODUCTION

Fittings. Making Aircraft Fittings with Temporary Tools, S. A. Hand. Am. Mach., vol. 51, no. 5, July 31, 1919, pp. 221-225, 22 figs. Tools developed to facilitate production in large quantities.

NC Boats. How the NC Boats were Built Under Pressure of War Need—II, J. C. Hunsaker. Automotive Indus., vol. 41, no. 3, July 17, 1919, pp. 120-123, 2 figs. Guarding against corrosion; glue for laminated construction; building of testing hangar.

MILITARY AIRCRAFT

Blackburd. *See Torpedo-Carrying Aeroplanes.*

British Airships. The Evolution of the British Naval Airship. Eng., vol. 107, no. 2789 and 2790, June 13 and 20, 1919, pp. 757-759 and 797-799, 46 figs., partly on supp. plates. Account of airship work of Vickers concern. Particulars of construction of R-80. (Concluded.)

Torpedo-Carrying Aeroplane. The "Blackburd" Torpedo-Carrying Aeroplane. Engineering, vol. 108, no. 2793, July 11, 1919, pp. 46-48, 5 figs. Weight with torpedo and full tanks, 5,800-lb.; engine, 350-hp. Rolls-Royce Eagle.

Naval Aircraft. Progress in Naval Aircraft, J. C. Hunsaker. Jl. Soc. Automotive Engrs., vol. 5, no. 1, July 1919, pp. 31-44, 10 figs. Notes on development of NC boats, notably manner of guarding against corrosion, protecting wooden and fabric parts and special equipment for transatlantic flight.

MODELS

Electrically Driven Models. Elementary Aeronautics and Model Notes, John F. McMahon. Aerial Age, vol. 9, no. 20, July 28, 1919, p. 941. On models driven by electricity.

Spar Forms. Model Aeroplanes—XXVII (New Series), F. J. Camm. Aeronautics, vol. 16, no. 295, June 12, 1919, pp. 623-624, 27 figs. Spar forms.

PLANES

Ansaldo. The Ansaldo 1 Biplane. Aerial Age, vol. 9, no. 19, July 21, 1919, pp. 890-891, 4 figs. General specifications are: Span, upper plane 25 ft., lower plane 21 ft. 8 in.; overall height 10 ft. 6 in.; engine, S. P. A. Ansaldo 220 hp.

Avro. The Avro "Baby" Sporting Biplane. Flight, vol. 11, no. 26, June 26, 1919, pp. 831-836, 12 figs. Fuselage is of rectangular section and conventional girder type. Machine is a single seater. Span 25 ft.; length overall 18 ft. 6 in.; height 7 ft. 6 in.; weight, loaded, 857 lb.

B. A. T.—340 H.P. A. B. C. (Type F. K. 25—"Basilisk"). Aeronautics, vol. 16, no. 296 (New Series), June 19, 1919, p. 637, 1 fig. Fuselage follows system adopted in Bantam, but machine is somewhat larger.
See also Wasp.

Bristol. The Bristol Passenger Triplane. Aerial Age, vol. 9, no. 20, July 28, 1919, p. 932, 2 figs. Graph of performances of Bristol triplane cargo machine.

The Bristol Triplane Braemar. Aviation, vol. 6, no. 12, July 15, 1919, p. 639, 1 fig. Intended to be used for bombing of Berlin and other interior German towns. Driving power supplied by 400-hp. Liberty engines, fitted tandem, in pairs, on either side of fuselage.

Curtiss. The Curtiss Model 18-B Biplane. Flight, vol. 11, no. 28, July 10, 1919, pp. 902-904, 5 figs. Machine is built around same fuselage and power plant as the triplane, but has lesser over-all height.

Flying Boats. Design and Construction of Flying Boats, David Nicolson. Flight, vol. 11, no. 28, July 10, 1919, pp. 915-919, 7 figs. Hull construction of P. and N. types. (Concluded.)

Lawson. Lawson Aerial Transport. Aerial Age, vol. 9, no. 17, July 7, 1919, pp. 810-811, 3 figs. Fuselage built to accommodate 26 passengers. Designed from commercial point of view for transcontinental service between New York and San Francisco.

Navy Specifications. The New Navy General Specifications for Airplanes, Archibald Black. Aviation, vol. 6, no. 11, July 1, 1919, pp. 592-594, 1 fig. Comments on subject matter which has been added to or changed from that in previous issue. Addition referred to as new is no. 100-A.

Wasp. B. A. T.—170 H.P. Wasp (Type F.K. 23—"Bantam"). Aeronautics, vol. 16, no. 296 (New Series), June 19, 1919, p. 636, 1 fig. Fuselage consists entirely of large sheets of three-ply birch, fixed on oval section formers which are supported on four ash longitudinals.
See also B. A. T.

PROPELLERS

Moisture Proofing. Moisture Proofing Airplane Propellers with Aluminum Leaf, M. E. Dunlap. Aviation, vol. 6, no. 12, July 15, 1919, pp. 636-638, 9 figs. Method of applying aluminum leaf. A diagram is presented showing comparative effectiveness of different coatings in moisture proofing wood as determined by tests.

Wood Propellers. Wood Propeller Construction, Porter E. Stone. Aerial Age, vol. 9, no. 20, July 28, 1919, pp. 934-938, 12 figs. Suggestions in regard to their manufacture in quantity.

TRANSATLANTIC FLIGHT

NC Flight. Precautions That Spelled Success, James L. Breese, Jr. Sci. Am., vol. 121, no. 3, July 19, 1919, p. 55, 2 figs. Engineering features of flight of NC planes across ocean, notably arrangement for maintaining water in radiators and method of hooking up batteries.

R-34 Flight. Transatlantic Voyage of R-34. Aeronautics, vol. 17, no. 298, July 3, 1919, pp. 7-9, 1 fig. Plans considered by Admirality and details of equipment.

VARIA

Altitude Errors. Altitude Errors in Aerial Navigation, J. G. Coffin. Aviation, vol. 6, no. 12, July 15, 1919, pp. 624-626, 5 figs. Form of pressure indicating device suggested for avoiding errors consists in placing instrument inside container, for instance, a sphere, with an opening to outside air and rotating or oscillating container so as to periodically cover the entire 360 deg.

British Regulations for Air Navigation. The British Regulations for Aerial Navigation, Henry Woodhouse. Flying, vol. 8, no. 6, July 1919, pp. 525-533. Governing civilian aeronautics.

Log Books. The New Air Navigation Directions. Aeronautics, vol. 16, no. 293 (New Series), May 29, 1919, pp. 567-569. Instructions for use of log books. (Continued.)

Physiology of High-Altitude Flight. Physiological Aspects of Travel at High Altitudes (Transports à haute altitude des voyageurs en cabine aérienne, Communication faite par le docteur Guglielminetti à la Commission scientifique de l'Aero-Club de France, Séance du 30 avril 1919. Aérophile, vol. 27, nos. 9-10, May 1 and 15, 1919, pp. 132-135, 2 figs. Based on experiments and writer's experience during sojourn on top of Mont Blanc.

Wilbur Wright Lecture, 1919. The Wilbur Wright Lecture, 1919, Leonard Bairstow. Aeronautics, vol. 17, no. 298, July 2, 1919, pp. 12-14. Progress of aviation during period of war. (Concluded.) Paper read before Roy. Aeronautical Soc.

CIVIL ENGINEERING

BRIDGES

Chicago. Problems Encountered in the Design of 12th Street Bridge, Hugh E. Young, Eng. World, vol. 15, no. 1, July 1, 1919, pp. 17-26, 15 figs. Plans for bridge improvement, both involving straightening of Chicago river. Completion will give west side of city a 118-ft. thoroughfare to Lake Michigan.

Concrete Bridge. Calculation of Arched Reinforced-Concrete Bridge of 30 Meters Span (Berekening van een viakke gewelforug van gewapend beton van 30 M. spanning), W. J. Wisselink. Ingenieur, vol. 34, no. 27, July 5, 1919, pp. 496-503, 6 figs. Vertical section of bridge; determination of total constant load per meter; distribution of load.

Foundations. Test of Sandy Foundations at Arch Bridge Pier, Arthur Richards. Eng. News-Rec., vol. 83, no. 5, July 31, 1919, pp. 208-209, 2 figs. Settlement measured by gage at top of timber mast passing through completed concrete base. Stone blocks for load.

Inspection. Points Requiring Special Observation and Investigation in Bridge Inspection, Herbert C. Keith. Can. Engr., vol. 37, no. 3, July 17, 1919, pp. 145-147. Concerning reduction of vibration, investigation of compressing members, preventing decay of timber stringers and similar points. From paper presented before Brooklyn Engrs. Club.

Kansas City. Central Avenue Bridge and Viaduct to Kansas City. Elec. Traction, vol. 15, no. 7, July 1919, pp. 411-416, 14 figs. Design to accommodate both street railway and roadway traffic between Kansas City, Missouri and Kansas City, Kansas.

Pontoon Bridges. The Coblenz Pontoon Bridge, J. W. Skelly. Prof. Memoirs, Corps Engrs. U. S. Army & Engr. Dept., vol. 11, no. 56, March-April 1919, pp. 217-228, 13 figs. Bridge is about 1,050 ft. long and is composed of 14 sections—two draw sections, 98 ft. and 81 ft. in length, eight fixed sections 81 ft. long and at each end two short ramp sections about 50 ft. long. Other sections are held in reserve for use as required.

Railway Bridge Specifications. Comparison of Five Railway Bridge Specifications. Eng. News-Rec., vol. 83, no. 1, July 3, 1919, pp. 33-36. Proposed revised A.R.E.A. specifications compared with Southern Pacific, Pennsylvania, and New York Central accepted practice.

Reinforcement. Historic Shropshire Bridges Strengthened with Ferro-Concrete A. T. Davis. Ferro-Concrete, vol. 10, no. 9, March 1919, pp. 249-262, 21 figs. Bridges in question were constructed with cast-iron arches on masonry abutments about a century ago.

How an Old Masonry Arch Bridge Was Rebuilt. Ry. Maintenance Engr., vol. 15, no. 7, July 1919, pp. 228-230, 5 figs. Bridge consisted of five semi-circular arches of 40 ft. span having a total length of 260 ft. and total height above bottom of footings of 60 ft.

Sectional Bridges. Types of Truss Bridges (Neue Bauarten zerlegbarer Brucken). Rudolf Bernhard. Zentralblatt der Bauverwaitung, vol. 39, no. 15, Feb. 15, 1919, pp. 80-83, 24 figs. Reconstruction of bridges destroyed during war and types developed.

Substructure. Substructure of Michigan Avenue Bascule Bridge, Chicago, Hugh E. Young and William A. Mulcahey. Eng. News-Rec., vol. 83, no. 5, July 31, 1919, pp. 210-213, 4 figs. Cylinder piers sunk to rock and hardpan carry concrete tailpits for double-deck bridge. Steel columns embedded in wall support girders for trunnions and uplift anchorage.

Suspension Bridge. Special Design Features and Erection Methods for 540-Foot Suspension Bridge, William G. Grove. Eng. News-Rec., vol. 83, no. 1, July 3, 1919, pp. 4-8, 8 figs. Designed with varying cable inclinations at towers.

Suspension Bridge and Suspension Ferry in Rio de Janeiro (Hangebrucke und Schwebefahre in Rio de Janeiro). Zentralblatt der Bauverwaitung, vol. 39, no. 28, April 2, 1919, pp. 145-146, 4 figs. Bridge spans branch of the sea 150 meters wide.

Suspension Bridge of Gotteron, Fribourg (Le pont suspendu du Gotteron, à Fribourg). Bulletin Technique de la Suisse Romande, vol. 45, no. 12, June 14, 1919, pp. 112-114, 5 figs. Placing additional cable units so as to reduce maximum working stress to 18 kg. per sq. mm.

Widening. Widening Existing Bridges. Ferro-Concrete, vol. 10, no. 9, March 1919, pp. 268-271, 7 figs. By means of reinforced concrete. Reference is made to actual work.

BUILDING AND CONSTRUCTION

Apartment Houses. Million Dollar Apartment House in Montreal. Contract Rec., vol. 33, no. 27, July 2, 1919, pp. 650-653, 6 figs. Eight-story building on site 253 ft. x 75 ft.; to contain eighty apartments.

Army Supply Base. Building the New Orleans Army Supply Base. Eng. News-Rec., vol. 83, no. 3, July 17, 1919, pp. 122-125, 4 figs. Concentration of equipment, use of 7 miles of temporary railway track, and rapid construction of project. mentioned as notable features.

Concrete-Block Construction. Houses for Halifax Reconstruction Built of Granite-Face Concrete Blocks. Contract Rec., vol. 33, no. 26, June 25, 1919, pp. 603-606, 6 figs. Building hollow walls with hydro-stone units presenting natural stone appearance.

Concrete Floor Surfaces. Concrete Floor Surfaces, W. P. Anderson. Ferro-Concrete, vol. 10, no. 11, May 1919, pp. 322-324. It is stated that in putting down concrete floors satisfactory results can be obtained either by using a top dressing or by finishing the structural concrete itself.

Concrete Substructure. The Construction of a Pumping Station for the Schenectady Works, General Electric Company, Keith O. Guthrie. Gen. Elec. Rev., vol. 22, no. 7, July 1919, pp. 538-544, 10 figs. Indicating method of pouring concrete substructure and lowering it into position.

Constructional Elements. Planning the Industrial Plant—III, Hugh M. Wharton. Indus. Management, vol. 58, no. 2, Aug. 1919, pp. 113-117, 12 figs. Practice in roofs, floors, stairways, windows. (To be continued.)

Cribbing. Sectional Concrete Cribbing Displaces Retaining Walls at Embankments. Coal Age, vol. 16, no. 4, July 24, 1919, pp. 141-143, 4 figs. Details of pillow blocks and fillers used in sectional concrete retaining wall.

Concrete Buildings. Concrete Building Addition Made at Reasonable Cost. Eng. News-Rec., vol. 83, no. 2, July 10, 1919, pp. 75-76, 3 figs. Cost per cu. ft., 15.4 cents. Work done in Boston district during war.

Designs. Cutting Down the Cost of Engineering in Building Design and Construction. E. H. Darling. Contract Rec., vol. 33, no. 26, June 25, 1919, pp. 597-599. Fallacy of free engineering and free designs.

Flagpole Erection. Seventy-Foot Concrete Flagpole Poured Erect in Place, R. C. Hardman. Eng. News-Rec., vol. 83, no. 4, July 24, 1919, p. 173. Construction effected by means of a light tower, similar to a hoisting tower.

Framing. Steel and Concrete Framing Combined for Economy. Eng. News-Rec., vol. 83, no. 4, July 24, 1919, pp. 178-182, 5 figs. Cost and space both saved in Chicago 12-story office building carried over theater auditorium. Design includes special heavy trusses, girders and cantilevers.

Garages. Curved Drive for Automobiles in Six-Story Garage. Eng. News-Rec., vol. 83, no. 4, July 24, 1919, pp. 188-189, 2 figs. Incline between floors claimed to give better facilities than elevators.

Hotels. Palmers' New Hotel and Canteen. Eng. & Indus. Management, vol. 1 (New Series), no. 20, June 26, 1919, pp. 619-620, 2 figs. Hotel composed of three large, three-story buildings. Canteen consists of large dining hall, kitchen, stores, offices and staff quarters.

Housing. A Solution of the Housing Problem in the United States, Robert Anderson Pope. Jl. Am. Inst. Architects, vol. 7, no. 7, July 1919, pp. 305-314, 2 figs. Proposal is made that each head of family and individual worker be provided with enough garden space immediately contiguous to his dwelling to enable him to produce with intelligent direction and co-operation of an agricultural corps of community workers, the larger part of vegetables and small fruits which he and his family consume within the course of a year.

The Plumbing Standards for the Housing Projects of the Emergency Fleet Corporation, William G. Tucker. Architectural Rec., vol. 46, no. 1, July 1919, pp. 47-56, 6 figs. As adopted for various types of housing projects, which are divided into three general classes — (1) bungalows, (2) two-story dwellings, detached, semi-detached or in groups, apartments, and (3) dormitories, hotels, mess halls, kitchens and cafeterias.

The Engineering Aspect of the Housing Problem. Eng. Rev., vol. 32, no. 12, June 16, 1919, pp. 342-344, 2 figs. Alternative method of utilizing bricks with economy of materials in walls to the brick on edge construction. (Second article.)

A Model Housing Plan for Reclaiming a St. Louis District. Am. Architect, vol. 116, no. 2271, July 2, 1919, pp. 8-13, 6 figs. Removing existing buildings in slum sections to make way for more attractive and equitable government housing project.

Inspection. Testing and Inspection as a Means of Safe-guarding Construction, R. Robertson Deans. Contract Rec., vol. 33, no. 26, June 25, 1919, pp. 624-626. Duty of testing engineer in detecting faulty materials. Concrete and steel.

Purifiers. The Application of Reinforced Concrete to Purifier Construction, A. E. Broadberry. Gas World, vol. 70, no. 1819, May 31, 1919, pp. 459-462, and (discussion), pp. 462-463, 14 figs., and Gas Jl., vol. 146, no. 2925, June 3, 1919, pp. 601-603, and (discussion), pp. 604-605, 14 figs. Plan and details of construction. Maximum pressure was assumed to be 48 in.

Reservoirs. Storage and Service Reservoirs in British Waterworks Engineering. Ferro-Concrete, vol. 10, no. 10, April 1919, pp. 297-301, 5 figs. Illustrating construction of reinforced-concrete reservoirs.

Retaining Walls. The Stability of Reinforced Concrete Retaining Walls, F. Zimmerman. Eng. & Contracting, vol. 52, no. 4, July 23, 1919, pp. 94-96, 4 figs. Diagram for solving design equations graphically.
See also Cribbing.

Silos. Grain Silos of Reinforced Concrete (Getreidesilos in Eisenbeton), G. Escher. Beton & Eisen, vol. 18, nos. 2-3, Feb. 5, 1919, pp. 17-20, 10 figs. Type built on Rank system, which aims at cooling grain by propelling air currents through silo walls into it. (To be concluded.)

Stacks. Solving a Stack-Raising Problem, Martin Fishback. Eng. & Min. Jl., vol. 108, no. 3, July 19, 1919, pp. 95-96, 5 figs. Work done in replacing stack 6 ft. in diameter and 75 ft. long.

Steel Mill Buildings. An Investigation of the Stresses in the Transverse Bent for Steel Mill Buildings, C. S. Sperry. Proc. Colorado Sci. Soc., vol. 11, June 1919, pp. 253-268, 5 figs., partly on supp. plates. Accuracy of stresses obtained by various approximate solutions.

Tanks. Tank Construction—XXIX, Ernest G. Beck. Mech. World, vol. 65, no. 1695, June 27, 1919, pp. 306-307, 7 figs. Side walls of rectangular tanks. (Continuation of serial.)

Theatres. Engineering Features of the Modern Theatre—I & II. Am. Architect, vol. 116, no. 2273 and 2274, July 16 and 23, 1919, pp. 91-98 and 123-129, 26 figs. partly on supp. plate. Study of Sam Shubert Theater at Philadelphia, notable feature of which is entire absence of obstructing columns, and of State-Lake Theater in Chicago.
See also Framing.

CEMENT AND CONCRETE

Calcium Chloride in Concrete Mixtures. Construction Work in New York Last Year. Good Roads, vol. 18 (new series), no. 2, July 9, 1919, pp. 14-15 and 22, 1 fig. From report of First Deputy Commissioner on work of Construction Department of State Commission of Highways during 1918. A graphical description of results of tests with calcium chloride in concrete mixtures is presented

Cement Gun. Lining a Reservoir with Concrete by the Cement Gun. E. Court Eaton. Eng. News-Rec., vol. 83, no. 4, July 24, 1919, pp. 167-168, 2 figs. Costs and progress made, given for operations in irrigation district during current high-price period.

Compressing Concrete. Compressing Concrete Increases Its Strength, Frank P. McKibben. Cement & Eng. News, vol. 31, no. 7, July 1919, pp. 22-23, 2 figs. Plain columns of successive layers pressed down, said to average half again as strong as those poured for full length.

Concrete. Concrete in Roads, Bridges and Culverts, H. Eltinge Breed. Mun. & County Eng., vol. 56, no. 6, June 1919, pp. 222-225, 1 fig. Concluded from tests that crushed-stone concrete resists impact better than gravel concrete, and that large-sized material is more durable than the small sizes.

Concrete Blocks. Making Concrete Blocks for Toronto Breakwater, Frederick Phillips. Can. Engr., vol. 37, no. 2, July 10, 1919, pp. 119-120, 3 figs. Collapsible wooden forms for making concrete blocks weighing 10 and 18 tons.
Plant Lay-Out for Making Concrete Blocks. Contract Rec., vol. 33, no. 28, July 9, 1919, pp. 665-666, 2 figs. Large units for breakwater construction cast at plant arranged to facilitate handling of raw materials and product.

Concrete Pipe Manufacture. Speeding up the Manufacture of Concrete Pipe with Compressed Air, F. A. McLean. Contract Rec., vol. 33, no. 29, July 16, 1919, pp. 694-695, 3 figs. Results obtained by installation of compressors and pneumatic rammers.

Cracking in Reinforced Concrete. Crack and Rust Formation in Reinforced-Concrete Constructions (Riss- und Rostbildungen an Tragwerken aus Eisenbeton). Zeitschrift des osterr. Ingenieur-und Architekten-Vereins, vol. 71, no. 1, Jan. 3, 1919, pp. 8-9, 1 fig. Caused by faulty design and construction. (To be concluded.)

Curing Concrete. Curing Concrete. Mun. Jl. & Public Works, vol. 47, no. 3, July 19, 1919, pp. 34-35, 2 figs. Results of tests made to determine effect of curing conditions on strength of concrete and wear from abrasion.

Gravel, Grading of. Proportioning of Pit-Run Gravel for Concrete, R. W. Crum. Can. Engr., vol. 37, no. 4, July 24, 1919, pp. 165-170, 8 figs. Also Concrete, vol. 15, no. 1, July 1919, pp. 3-8, 8 figs. Conclusion resulting from investigation is that grading of pit-run gravel may be measured by percentage of fine aggregate to total aggregate and by weight per cu. ft. measured loose.

Gunite. *See Cement Gun.*
New Concrete Terminals at Norfolk, Cement & Eng. News, vol. 31, no. 7, July 1919, pp. 22-23, 5 figs. With reference to method of attaching wire and method of forming gunite wall.
See also Cement Gun.

India. Ferro-Concrete in India. Ry. Engr., vol. 40, no. 474, July 1919, pp. 154-156. Practice follows British Standard Specification. From technical paper no. 191 of Public Works Dept., Government of India.

Mixing Methods. Bettering Concrete by a New Mixing Method, Nathan C. Johnson. Eng. News-Rec., vol. 82, no. 26, June 26, 1919, pp. 1266-1270, 7 figs. Using as basis motion-picture studies of concrete in mixing. Mixer has been developed in which, it is claimed, cement gets necessary thorough contact with aggregate.
See also Mix Water Removal.
Concrete Mixtures for Ferro-Concrete Work, With Special Reference to the Influence of Voids in the Aggregate, T. J. Gueritte. Ferro-Concrete, vol. 10, no. 2, August 1919, pp. 42-52, 6 figs. Comparison of specifications issued by Joint Committee on Reinforced Concrete of Roy. Inst. of British Architects, the regulations drawn up by London County Council, and the Mouchel-Hennebique standards.
Studies in Surface Area Proportionate Method, R. B. Young. Can. Engr., vol. 36, no. 26, June 26, 1919, pp. 563-566, 6 figs. Surface-area method of proportioning materials of mortars and concretes tested and approved by Ont. Hydroelectric Power Commission.
Tests Do Not Bear Out Surface Area Method, Duff A. Abrams. Can. Engr., vol. 36, no. 26, June 26, 1919, pp. 566-569. Comparison of surface area and fineness-modulus methods. Writer prefers latter method.
The "Sand" Method of Proportioning Pit Run Gravel for Concrete. Eng. & Contracting, vol. 52, no. 1, July 2, 1919, pp. 18-20, 5 figs. Investigation to establish engineering methods for proper use of such material, conducted by Engineering Experiment Station of Iowa State College. Paper read before Am. Soc. for Testing Materials.

Mix-Water Removal. Pressing Out Mix Water Adds to Cement Mortar Strength, C. T. Wiskocil. Eng. News-Rec., vol. 83, no. 3, July 17, 1919, pp. 130-132, 3 figs. Tests at University of California with apparatus which permitted pressures up to 30,000-lb. per sq. in. reported as giving very high compressive values.

Quick-Hardening Concrete. Cements Producing Quick-Hardening Concrete, P. H. Bates. Can. Engr., vol. 37, no. 1, July 3, 1919, pp. 113-115, and 117. Data obtained with "Sorel cement" in course of investigations conducted by Pittsburgh Branch of Bureau of Standards and dealing with various problems relating to Portland cement.

Proportioning Concrete. *See Mixing Methods.*

Reinforced-Concrete Tests. Some Tests on the Properties of Reinforced Concrete, W. A. Slater. Eng. News-Rec., vol. 83, no. 5, July 31, 1919, pp. 217-220, 6 figs. Effect of protecting metal, lapping reinforcing bars and of reversing stress in beams as well as action of diagonally placed rods in slab spans studied for concrete ship. Research of Emergency Fleet Corporation.

Reinforcing Elements. High Tensile v. Mild Steel for Reinforcing Concrete, Arthur W. C. Shelf. Surveyor, vol. 55, no. 1432, June 27, 1919, pp. 495-496, 5 figs. Tests interpreted as proving that ordinary plain mild-steel bars of 28 to 32 tons breaking strain are best to employ for reinforced concrete.

EARTHWORK, ROCK, EXCAVATION, ETC.

Canals. Enlargement of the Yakima-Tieton Main Canal, G. C. Finley. Eng. News-Rec., vol. 82, no. 26, June 26, 1919, pp. 1255-1258, 7 figs. Half circular section of reinforced concrete increased in height. Bonus system said to have proved successful in overcoming great scarcity of labor at favorable cost.
Chippewa Power Development in All Phases is a Higher Efficiency Enterprise. Contract Rec., vol. 33, no. 26, June 25, 1919, pp. 590-596, 18 figs. Building 12¾-mile canal.

Dam. Dam Foundation Placed by Suspended Pneumatic Caissons. Eng. News-Rec., vol. 83, no. 3, July 17, 1919, pp. 108-110, 8 figs. Difficulties encountered in getting footing in deep and swift water in narrow gorge of Spanish River at High Falls in northern Ontario.
Dam Supported by Bascule Bridge Closes Canal Lock. Eng. News-Rec., vol. 83, no. 3, July 17, 1919, pp. 116-118, 4 figs. Steel beams and panels placed from bridge form temporary dam permitting repair work in Trolhattan Canal.
Forms and Dimensions of Large Masonry Dams (Formes et dimensions des grands barrages en maçonnerie), M. Résal. Annales des Ponts et Chaussées, vol. 2, Mar. Apr. 1919, pp. 165-221, 34 figs. Mechanical discussion of stresses and illustration of method of computing them in various practical cases.
The Tata Hydro-Electric Power Plant, Bombay. Indian & Eastern Engr., vol. 44, no. 5, May 1919, pp. 151-154, 6 figs. Dams are 1200, 1500 and 2700 yards long. They were built with lime mortar. (To be continued.)

Drydocks. Carron Dry Docks at Grangemouth. Eng., vol. 107, no. 2789, June 13, 1919, pp. 762-763 & 774, 15 figs. Utilization of disused junction lock for wet dock.

Excavation Methods. Excavation Methods on the Miami Conservancy Project, G. L. Teeple. Eng. & Contracting, vol. 52, no. 3, July 15, 1919, pp. 61-63, 4 figs. Flood-prevention project which involves construction of five large earth dams.

Grading. How to Get Clean-Cut Grading Jobs, F. F. Mengel. Good Roads, vol. 18, no. 5, July 30, 1919, pp. 68-69. Suggestions in regard to methods in light and heavy work.

Percussion Drilling. Percussion Plant for Oil-Well Drilling. Engineering, vol. 107, no. 2791, June 27, 1919, pp. 830-833, 15 figs. Points out differences of rigs in three systems: American, Standard or Californian and Canadian.

Sewers. Sewer-Construction Records Used at Scarsdale, New York, Perry Thompson. Eng. News-Rec., vol. 83, no. 3, July 17, 1919, pp. 111-112, 3 figs. Daily record blank, rock book and sample headings from final estimate book used on 22-miles of sewers.

Shaft Sinking. Sinking and Concreting Mine Shaft 936 Feet Deep. Richard L. Russell. Eng. News-Rec., vol. 82, no. 26, June 26, 1919, pp. 1259-1262, 5 figs. Simultaneous concreting and excavating operations.

Tunnels. Backfilling Tunnel Through Holes Bored from Surface, J. Armstrong. Eng. News-Rec., vol. 93, no. 4, July 24, 1919, pp. 174-175, 2 figs. Concrete poured around 60-in. cast-iron pipe in 10 by 10 ft. rock bore by dropping it 70 ft. from trestle across river.
Pittsburgh South Hills Tunnel and Earlier Projects, Eng. News-Rec. vol. 83, no. 4, July 24, 1919, pp. 166-167, 1 fig. Project for 5500-ft. tunnel.
Conduit Construction Work in Tunnels. Bell Telephone News, vol. 8, no. 12, July 1919, pp. 18-19, 7 figs. Formation of conduit under Chicago River consisting of single-duct tile laid three wide and 8 to 10 ft. high with complete encasement of concrete.
Construction Details on the Marin Water and Power Project, H. M. Bowers. Jl. Electricity, vol. 43, no. 1, July 1, 1919, pp. 22-23. Cost and construction data and description of 8700-ft. tunnel.
Tunnel Construction under Water (Tunnelbau unter Wasser), A. Haag. Zentralblatt der Bauverwaltung, vol. 39, no. 11, Feb. 1, 1919, pp. 57-59, 10 figs. With special reference to tunnels under the rivers Spree and Elbe and under the Kiel canal.
The Catskill Tunnels—IV. Ry. Engr., vol. 40, no. 474, July 1919, pp. 143-147, 4 figs. Alteration of heading during construction of Hunter's Brook Tunnel. (Continuation of serial.)

HARBORS

Docks. Reinforced-Concrete Dock (Travaux-Publics), A. Goupil. Génie Civil, vol. 75, no. 1, July 5, 1919, pp. 7-10, 8 figs. Work done at Dutch Indies, notably extension of ports of Soerabaja and Semarang. From De Ingenieur, Feb. 22, 1919.

Houston, Tex. Harbor Facilities and Development at Houston, Texas. Eng. News-Rec., vol. 83, no. 4, July 24, 1919, pp. 156-159, 7 figs. Wharves, freight sheds, warehouses, railway connections and freight-handling machinery.

Singapore. Singapore Harbour Works. Ferro-Concrete, vol. 10, no. 8, Feb. 1919, pp. 220-28, 11 figs. Refers especially to reinforced-concrete construction.

Suez. Extensions of the Port at Suez (Les travaux d'extension du port de Suez). Génie Civil, vol. 74, no. 26, June 28, 1919, pp. 525-529, 2 figs. Involving extension of docks.

MATERIALS OF CONSTRUCTION

Asphalt. Melting Point of Asphalts, Leland M. Proctor. Chem. & Metallurgical Engr., vol. 21, no. 2, July 15, 1919, pp. 81-83, 1 fig. Comparison of data obtained by various processes for determining melting point.

Road Materials. Proposed Tests and Specifications for Road Building Materials. Good Roads, vol. 18, no. 1 & 2, July 2 & 9, 1919, pp. 3-4 and 13 & 18-19, 3 figs. Recommendations of Committee D-4 on road materials of Am. Soc. for Testing Materials.

Instructions for Field Inspection of Road Materials. Eng. & Contracting, vol. 52, no. 1, July 2, 1919, pp. 16-18. Issued by New Jersey State Highway Dept. for guidance of inspectors.

STONE, CRUSHED. Commercial Sizes of Crushed Stone. Eng. & Contracting, vol. 52, no. 3, July 16, 1919, pp. 72-73. Results of survey of Ohio, Kentucky, Tennessee, North Carolina and Georgia, undertaken by Bureau of Public Roads, for securing data to be used in developing of system of standard sizes and uniform nomenclature for crushed-stone products. From Public Roads.

ROADS AND PAVEMENTS

AMERICAN SOCIETY OF CIVIL ENGINEERS. Highways and Their Construction (Carreteras y su construcion). Ingenieria Internacional, vol. 1, no. 3, June, 1919, pp. 131-140, 8 figs. Final report of special committee on materials for road construction and standards for their test and use, of Am. Soc. Civil Engrs.

ASPHALT PAVEMENT. Asphalt-Covered Napped-Block Pavement. Mun. Jl. & Public Works, vol. 47, no. 3, July 19, 1919, pp. 32-34. Pavement is constructed of old granite block napped and reclipped and laid with a filler of sand and asphalt mixed, novel feature consisting in addition of covering of same sand-asphalt mixture over entire pavement to depth of about ⅜ in.

ASSOCIATION OF DOMINION LAND SURVEYORS. Roads, A. H. Hawkins. Annual Report of Assn. of Dominion Land Surveyors, Jan. 29, 30 and 31, 1919, pp. 91-97. Building of permanent roads is advocated.

BITUMINOUS MATS. Bituminous Mat Protects Texas Roads, James P. Nash. Am. City, Town & County Ed., vol. 21, no. 1, July 1919, pp. 1-5, 2 figs. Process claimed to work satisfactorily in dry climate.

BITUMINOUS ROADS. Bituminous Roads in Great Britain and the United States (Les chaussées bitumineuses en Grande-Brétagne et aux Etats-Unis), R. Feret. Annales des Ponts de Chaussées, vol. 2, Mar.-Ap. 1919, pp. 222-244. Gives particulars regarding work done and practices adopted in these countries.

The Design and Construction of Bituminous Macadam Roads and Pavements, A. W. Dean. Mun. & County Eng., vol. 56, no. 6, June 1919, pp. 206-208. Best and most lasting results believed to be obtained with sizes of stone in second course varying from ¾ in. to 2½ in., with larger sizes predominating.

BRICK PAVEMENTS. A Review of Recent Progress in Brick Pavement Design and Construction, Clark R. Mandigo. Mun. & Country Eng., vol. 57, no. 1, July 1919, pp. 9-11, 2 figs. Includes notes on advantages claimed for asphalt filler.

CONCRETE-ROAD SPECIFICATIONS. Chartered Summary of State Concrete Road Specifications, A. N. Johnson, Eng. News-Rec., vol. 83, no. 4, July 24, 1919, pp. 160-162, 1 fig. Arrangement in chart form.

Constructing Concrete Pavements. Mun. Jl. & Public Works, vol. 47, no. 2, July 12, 1919, pp. 22-23. Standard practice as recommended by Mississippi Valley Assn. of State Highway Departments.

CONCRETE-ROAD STRESSES. Stresses in Concrete Roads. Mun. Jl. & Public Works, vol. 46, no. 26, June 28, 1919, pp. 446-467. Experiments made by Bur. of Public Roads believed to have shown that concrete road under action of traffic or perhaps under influence of frost and different percentages of moisture in subgrades is continually bending so that reaction pressures between subgrade and slab are neither constant nor uniform in intensity.

COSTS. The Cost of a Mile of Road, George A. Duren. Can. Engr., vol. 37, no. 4, July 24, 1919, pp. 161-163, 3 figs. Tabulation of figures compiled by State Highway Engineer of Texas. From paper presented at Eng. & Road Builders' Congress.

Character and Cost of Highways for Motor Truck Use, S. Whinery. Eng. News-Rec., vol. 83, no. 2, July 10, 1919, pp. 77-78. Estimates they will have concrete foundations, will be not less than 20-ft. wide and will cost from $35,000 to $40,000 per mile.

DRAINAGE. *See Subsoil.*

GRANITE-BLOCK PAVEMENTS. The Design and Construction of Granite Block Pavements in Cincinnati, H. F. Shipley. Mun. & County Eng., vol. 57, no. 1, July 1919, pp. 19-21, 6 figs. Presents specifications.

The Design and Construction of Modern Granite Block Pavements with Special Reference to Practice in Borough of Manhattan, C. M. Pinckney. Mun. & County Eng., vol. 56, no. 6, June 1919, pp. 199-202, 11 figs. Specifications and requirements.

IOWA STATE ROAD LAW. The New State Road Law of Iowa. Good Roads, vol. 56, no. 3, July 16, 1919, pp. 25-26. Measure provides for improvement of 6000-mile system of primary highways.

LABOR. Convict Labor on Highways, Good Business. Good Roads, vol. 18, no. 5, July 30, 1919, pp. 65-67, 4 figs. Experiences of highway officials in various states claimed to demonstrate efficiency and economy of prison labor on roads, and physical, mental and moral benefits accruing to convicts.

MAINTENANCE. Macadam and Gravel Road Maintenance, R. C. Heath. Good Roads, vol. 18, no. 2, July 9, 1919, pp. 16 and 22. Practice followed by Kentucky Dept. Public Works.

NIGHT WORK. Road Building Twenty-four Hours a Day, William Ord. Contract Rec., vol. 33, no. 30, July 23, 1919, pp. 709-711, 2 figs. Examples quoted where it is said to have been found that night work effected economies and required less labor.

PIPE LINES, SUBSURFACE. Location of Subsurface Pipe Lines to Conserve Street Pavements, Harry M. Adams. Mun. & County Eng., vol. 56, no. 6, June 1919, pp. 225-226. Policies suggested from conditions in New York City.

ROAD DESIGN FOR MOTOR TRAFFIC. Influence of Motor Traffic on Road Design, Arthur H. Blanchard. Good Roads, vol. 18, no. 4, July 23, 1919, pp. 50-52. Transportation, surveys, laws and regulations, widths, grades, curves, bridges, drainage and foundations, wearing surfaces, detours and other considerations.

Highways and the Duty of Their Builders, S. M. Williams. Good Roads, vol. 18, no. 4, July 23, 1919, pp. 35-37, 5 figs. Observes that modern motor-truck transportation demands durable all-year roads that will make profits.

Highway Requirements for Twentieth Century Transportation, with Special Reference to New Jersey Practice, Wm. G. Thompson. Mun. & County Eng., vol. 56, no. 6, June 1919, pp. 208-210. Address delivered to Nat. Highway Traffic Assn.

RUBBER PAVEMENTS. Rubber Pavements: A Historical Résumé. India Rubber World, vol. 60, no. 4, July 1, 1919, pp. 548-550. Although cost of rubber pavement is estimated at about $25 per sq. yd., it is alleged that experience has shown that it will last much longer than any other and will be less expensive in the long run. Pioneer work in England is quoted.

SIDEWALK SPECIFICATIONS. Some Suggested Changes in Concrete Sidewalk Specifications, Chas. E. de Leuw. Mun. & County Eng., vol. 57, no. 1, July 1919, pp. 16-17. Recommends elimination of cinder foundation unless soil is impervious.

SUBSOIL. Comparison of Road Subgrade and Air Temperatures, C. C. Wiley. Eng. News-Rec., vol. 83, no. 3, July 17, 1919, pp. 128-129, 2 figs. Experiments at University of Illinois claimed to have shown that changes in air temperatures are slow to affect subsoil.

Notes on Road Foundations, Drainage and Culverts, U. W. Christie. Mun. & County Eng., vol. 57, no. 1, July 1919, pp. 17-18. Including table showing height to which capillary water rises in certain soils in 24 hours.

Cleveland Underdrains All New Pavements, Fred R. Williams. Am. City, City Ed., vol. 21, no. 1, July 1919, pp. 9-11, 3 figs. Methods and advantages of artificially draining subsoil.

SANITARY ENGINEERING

AIR DIFFUSES FOR ACTIVATED SLUDGE PROCESS. Test of Air Diffusers for Activated Sludge Process. Eng. & Contracting, vol. 52, no. 2, July 9, 1919, pp. 41-42. "Filtros" plates said to have proved more effective under test than perforated pipe, and basswool blocks.

FACTORY SANITATION. Design and Construction of Factories—VI. Eng. & Indus. Management, vol. 1, no. 19, June 19, 1919, pp. 588-589, Sanitation.

GARBAGE DISPOSAL. Garbage Disposal by Feeding Successfully Practiced at Lansing, Mich. Mun. & County Eng., vol. 57, no. 1, July 1919, pp. 23-25. Comparison of garbage-fed with grain-fed hogs.

INDUSTRIAL WASTES. The Disposal of Industrial Wastes, Jacob L. Crane, Jr. Am. Industries, vol. 19, no. 12, July 1919, pp. 22-24. Fundamentals in solution of problem and remarks on attitude of law and recent developments in this direction.

REFUSE COLLECTION. Organization for Refuse Collection. Mun. Jl. & Public Works, vol. 47, no. 2 & 3, July 12 & 19, 1919, pp. 16-19 & 35-37, 4 figs. Study of operation and efficiency of existing plant at Rochester and recommended oranization of Bureau of Sanitation. (Continued.)

Refuse Collection in Rochester. Mun. Jl. & Public Works, vol. 46, no. 26, June 28, 1919, pp. 464-466, 2 figs. Report of Bureau of Municipal Research. (To be continued.)

SANITATION AND MORTALITY RATES. Reducing the Mortality Rate by Sanitation (Diminucion de la mortalidad por el saneamiento), George A. Soper. Ingenieria Internacional, vol. 2, no. 1, July 1919, pp. 29-32, 4 figs. Illustrating sanitary measures conducted in representative European cities.

SEWAGE. Indianapolis Sewage Purification Plant, Edwin C. Hurd. Fire & Water Eng., vol. 66, no. 5, July 30, 1919, pp. 250-251, 1 fig. Inverted siphon used to convey sewage under river.

The Utilization of Sewage Sludge, John D. Watson. Surveyor, vol. 56, no. 1433, July 4, 1919, pp. 5-8, 1 fig. Diagram illustrating method of purifying sewage at Birmingham. Paper presented at annual meeting of Instn. of Municipal and County Engrs.

Some Unusual Sewerage Problems and How They Were Solved at Ocean Beach, New York, Andrew J. Provost, Jr. Mun. & County Eng., vol. 56, no. 6, June 1919, pp. 203-205, 7 figs. Precautions taken to prevent excessive infiltration of ground water into sewers through joints and at manholes.

SURVEYING

CLASSIFICATION OF LANDS. Classification of Lands, L. Brenot. Annual Report of Assn. of Dominion Land Surveyors, January 29, 30 and 31, 1919, pp. 51-56. Methods of classifying land for soldiers' settlement.

HIGHWAY SURVEYING. Surveying for Highway Improvement, F. G. Phillips. Good Roads, vol. 18 (new series), no. 2, July 9, 1919, pp. 11-12, 1 fig. Advises making thorough survey of road that is to be rebuilt and resurfaced.

MAPS, MILITARY. The Military Mapping Problem in the United States, R. C. Kuldell. Prof. Memoirs, Corps Engrs. U. S. Army & Eng. Dept., vol. 11, no. 56, Mar.-Apr. 1919, pp. 229-244, 2 figs. Advocates making all military maps of the U. S. as complete as A. E. F. found available in France. System of scales for both metric and English systems is suggested.

PHOTOGRAPHIC SURVEYING. New Method in Photogrammetry, Robert Heindl. Sci. Am. Supp., vol. 88, no. 2272, July 19, 1919, pp. 44-47, 21 figs. Offered as accurate and convenient method for photographic surveying with any camera. Translated from Archive fur Kriminal-Antropol. u. Kriminalistik, 1916.

ROD FOR TRIANGULAR WORK. Topographical Surveying on Atacama Desert in Chile, B. L. G. Rees. Eng. News-Rec., vol. 83, no. 5, July 31, 1919, pp. 224-226, 2 figs. Special rod designed for triangulation work.

WATER SUPPLY

ARTESIAN WELLS. Artesian Well Supply at Baton Rouge, La., L. R. Howson. Eng. & Contracting, vol. 52, no. 2, July 9, 1919, pp. 40-41, 2 figs. Consists of 915 ft. of 12-in., 934 ft. of 10-in., 44 ft. of 8-in. casing, and a 70-ft. strainer. Paper, read before Am. Water Works Assn.

CHLORINATION. Chlorination in West Virginia. Mun. Jl. & Public Works, vol. 47 no. 2, July 12, 1919, pp. 20-22. Reported results of disinfection in lowering typhoid rates.

See also Filtration Plants.

Contamination. Contamination of Bello Springs of Mantanzas Aqueduct (La contaminacion de los manantiales de Bello del Acueducto de Matanzas), Jos. M. Cadenas. Revista de la Sociedad Cubana de Ingenieros, vol. 11, no. 6, June 1919, pp. 259-270. Survey undertaken to determine cause of contamination.

Corrosion, Elimination of. The Chemical Treatment of Corrosive Cooling Water, W. O. Andrews. Jl. of South African Instn. of Engrs., vol. 17, no. 11, June 1919, pp. 239-244 and (discussion), pp. 244-246, 5 figs. Forms of rapid corrosion observed by Victoria Falls and Transvaal Power Co. and causes to which they attribute them.

Covering Water Basins. The Need and Cost of Covering the Clear Water Basins of the St. Louis, Missouri Water Works, Cornelius M. Daily. Mun. & County Eng., vol. 57, no. 1, July 1919, pp. 42-44, 1 fig. Typical sections of proposed cover.

Filtration Plant. The Design and Operation of the Water Filtration Plant at Camp Meade, Maryland, C. R. Potteiger. Mun. & County Eng., vol. 57, no. 1, July 1919, pp. 33-38. Design of rapid sand-filter plant.

Point St. Charles Filtration Works, Montreal. Can. Engr., vol. 37, no. 4, July 24, 1919, pp. 155-160, 8 figs. Efficiencies during last nine months claimed to be from 96.2 per cent to 99.1 per cent without chlorination and from 98.1 per cent to 99.8 per cent with chlorination.

Army Water Purification Units, William J. Orchard. Fire & Water Eng., vol. 66, no. 4, July 23, 1919, pp. 185-187, 4 figs. Motor-driven water trucks for chlorinating and filtering supply for A. E. F.

Gallery Collection System. The Gallery Collecting System of the Des Moines (Ia.) Water Co. Eng. & Contracting, vol. 52, no. 2, July 9, 1919, pp. 32-34, 7 figs. Water is obtained primarily from Raccoon River. Drainage area 3677 sq. miles above city.

Madison Water Works. The New Madison Water Works. Power, vol. 50, no. 4, July 22, 1919, pp. 128-133, 8 figs. Building new plant over old one while maintaining service. Choice of artesian or lake water and comparative costs.

Metering. Water Waste Control by House Inspections with District Metering, E. D. Case. Can. Engr., vol. 37, no. 4, July 24, 1919, pp. 163-165. Results obtained by pitometer at various cities. Paper read before Southwestern Water Works Assn.

Pitometer Surveys. Reduction of Water Consumption by Means of Pitometer Survey and Constant Inspection at Buffalo, N. Y., George C. Andrews. Mun. & County Eng., vol. 56, no. 6, June 1919, pp. 236-240.

See also Metering.

Purification of Water. *See Filtration Plants.*

Water Softeners. English and American Water Softeners. Power House, vol. 12, no. 10, July 5, 1919, pp. 278-280, 5 figs. Description of various types.

Water Testing. Water Testing Stations, W. T. McClenahan and R. S. Rankin. Fire and Water Eng., vol. 66, no. 2, July 9, 1919, pp. 63-65, 1 fig. Result of tests at Whiting Testing Station. Paper read before Am. Water Works Assn.

HYDRAULIC ENGINEERING

Spillways. Spillway Capacities Required for Reservoirs in Western United States, John T. Whistler. Eng. News-Rec., vol. 83, no. 1, July 3, 1919, pp. 28-32, 1 fig. Said to be based on a study of the flood discharges of 402 North American and 60 European and Indian records, with curves of probable flood discharges for far-western streams.

Thunderstorms and Storm Sewers. Some Broader Aspects of Rain Intensities in Relation to Storm Sewer Design, Robert E. Horton. Mun. & County Eng., vol. 56 & 57, no. 6 & 1, June and July, 1919, pp. 218-222 & 3-9, 16 figs. Comparative study of rain-intensity formulæ with a view to determining what, if any, general relations exist between rain intensity and the various meterological factors to which it is related. Simpson's theory of thunderstorm.

MUNICIPAL ENGINEERING

City Planning. Actual Accomplishments in City Planning in America, Andrew Wright Crawford. Jl. Engrs. Club of Philadelphia, vol. 36, no. 177, August 1919, pp. 291-299, 11 figs. Examples of improvements at various cities.

Town-Planning and Tramways. Tramway & Railway World, vol. 45, no. 30, June 19, 1919, pp. 309-311, 3 figs. Tramways on special track in parkway free from obstruction as proposed at Dundee.

Bolton's Housing Problems—Past, Present and Future, E. Morgan. Surveyor, vol. 55, no. 1431, June 20, 1919, pp. 462-464, 4 figs. Bolton Corporation Act gives powers to insist upon intersecting street at every 200 ft. and forbids construction of blocks of buildings exceeding this length.

VARIA

Architects, Registration. Model Form of Law for the Registration of Architects. Jl. Am. Inst. Architects, vol. 7, no. 7, July 1919, pp. 335-338. Regulation by State legislation of practice of architecture is proposed at annual convention of Am. Inst. of Architects.

Contract Work, Methods of Letting. Advantages and Disadvantages of Various Methods of Letting Contract Work, J. A. L. Waddell. Eng. & Contracting, vol. 52, no. 4, July 23, 1919, pp. 89-90, 1 fig. Diagram indicating basis for division of profits between contractor and client.

Storage Tanks, Moving. Moving 60-Ft. Oil Storage Tanks 150 Miles by Water, A. J. J. Taylor. Can. Engr., vol. 37, no. 1, July 3, 1919, pp. 107-108, 7 figs. Each tank was moved in one piece.

ELECTRICAL ENGINEERING

ELECTROCHEMISTRY

Bleaching, Electrolytic. Electrolytic Bleach, Anson G. Betts. Paper, vol. 24, no. 18, July 9, 1919, pp. 15-16. Technical details of operation in electrolytic bleach plants.

ELECTRODEPOSITION

Electrochemical Industry. Utilization of Electrical Energy in Electro-chemical and Electrometallurgical Industry (Consommation d'énergie électrique dans la fabrication de divers produits de l'électrochimie et de l'électrométallurgie). Revue Générale de l'électricité, vol. 5, no. 26, June 28, 1919, pp. 913-923. Figures indicating kilowatts consumed in electrolytical processes.

ELECTROPHYSICS

Alternating Current Circuits. Calculation of Alternating Current Circuits Terrell Croft. Nat. Engr., vol. 23, no. 7, July 1919, pp. 338-342, 10 figs. Graphic method of computing wire sizes with Mershon diagram for two- and three-phase circuits. (Continuation of serial.)

Audion. *See Vacuum Valve.*

Cables, Heating. Heating of Underground Cables, A. L. Freret. Jl. Engrs., Club. of Philadelphia, vol. 36, no. 177, August 1919, pp. 301-303, 4 figs. Experiments to determine safe operating intermittent leads on underground cables.

Circuit Breakers. Calculation of Current Intensity Required to Operate a Circuit Breaker and Study of the Effects of a Short-Circuit (Calcul de l'intensité de déclanchement d'un disjoncteur et recherche d'un court-circuit), B. Guerschinovitch. Industrie Electrique, vol. 28, no. 648, June 25, 1919, pp. 224-227, 3 figs. Application of previously derived formula to various examples. (Concluded.)

Electromagnetic Waves. Electromagnetic Waves, T. J. I. Bromwich, Lond., Edinburgh, and Dublin Phil. Mag., vol. 38, no. 223, July 1919, pp. 143-164. General solution of electromagnetic equations of wave propagation.

The Production and Measurement of Short Continuous Electromagnetic Waves, Balth, van der Pol. Lond., Edinburgh, and Dublin Phil. Mag., vol. 38, no. 223, July 1919, pp. 90-97, 4 figs. By means of three-electrode thermionic tube with suitable circuits.

Gyro Compass. The Electrical Gyro Compass, O. B. Whittaker. Elec. Rev., vol. 74, no. 26, June 28, 1919. pp. 1078-1081, 7 figs. Principle upon which it operates is said to be a combination of laws of gravity and of rotation of the earth and the two characteristics of the gyroscope. Lecture delivered before Am. Soc. Mech. Inspectors.

Inductances. Calculating Growth of Current in an Inductance, Carl Hering. Elec. World, vol. 74, no. 4, July 26, 1919, p. 75. Method offered for simplifying computations when plotting curves showing rise in current in induction coils.

Simplified Inductance Calculations, with Special Reference to Thick Coils, Philip R. Coursey. Phys. Soc. of London, vol. 31, no. 4, June 15, 1919, pp. 155-167, 8 figs. Method based on extension of Nagaoka's formula for single-layer coils, to include as well all ordinary forms of thick coils. Rosa's formula for thick coils is put into the same form as Nagaoka's and by it a series of correction factors is calculated for various coil thicknesses.

Kenotron. Thermoelectric Emission and Its Applications: The Kenotron (L'émission thermo-électrique et ses applications: Le kénotron), G. Johannés. Revue Générale de l'Electricité, vol. 5, no. 24, June 14, 1919, pp. 857-864, 5 figs. Technical study of rectifiers operating by electronic discharges. (To be continued.)

Nitrogen Electrode. The Potential of a Nitrogen Electrode, Francis Lawry Usher and Ramavenkatasubbier Venkateswaran. Jl. Chem. Soc., vol. 115 & 116, no. 680, June 1919, pp. 613-618, 1 fig. Evidence in support of assumption that during electrolysis of acid solution substance set free at anode is active form of ordinary nitrogen.

Power Flow. The Flow of Power in Electrical Machines, J. Slepian. Elec. Jl., vol. 16, no. 7, July 1919, pp. 303-311, 23 figs. Definitions and properties of Poynting vector and illustration of its appliction for picturing power flow in reactor, transformer, direct-current generator, alternator, synchronous condenser and induction motor.

Spark Potential. Influence of a Transverse Magnetic Field on the Spark Potential (Ueber die Beeinflussung des Funkenpotentials durch ein transversales Magnetfeld), Edgar Meyer. Annalen der Physik, vol. 58, no. 4, 1919, pp. 297-332, 10 figs. Theory of influence of magnetic field. Dependence from cross-section of spark gap.

Thermionic and Photo-Electric Phenomena at the Lowest Obtainable Pressure, C. F. Hagenow. Physical Rev., vol. 13, no. 6, June 1919, pp. 415-433, 5 figs. Studied specially after illuminated plate had been denuded of occluded gases by continued electric bombardment.

Thermoelectric Equations. The Thermoelectric Equation $P = TdV/dT$ Once More, Edwin H. Hall. Proc. Nat. Acad. Sciences, vol. 5, no. 6, June 15, 1919, pp. 197-198. Questions validity of equation as commonly understood, P being taken as ordinary Peltier effect, and V the Volta effect between any two metals.

Three-Electrode Lamp. Maintenance of Mechanical Oscillations by Means of Three-Electrode Lamp (Sur l'entretien des oscillations mécaniques au moyen des lampes à trois électrodes), Henri Abraham and Eugéne Bloch. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 24, June 16, 1919, pp. 1197-1198. Based on property of audions which permits introducing in electrical circuit an inductive resistance.

Vacuum Valves. Maintaining Electrical Oscillations by Means of a Three-electrode Valve (Entretien des oscillations électriques par une lampe-valve à trois électrodes), G. Gutton. Revue Générale de l'Electricité, vol. 6, no. 1, July 5, 1919, pp. 14-24, 10 figs. Scheme developed by the division of military radiotelegraphy of the French army for the purpose of maintaining oscillations of antennæ. A suggested theory of phenomenon involved is presented. (Properties of valves were treated in R. G. E., April 26, 1919, p. 629.)

The Audion as a Circuit Element, H. W. Nichols. Physical Rev., vol. 13, no. 6, June 1919, pp. 404-414, 5 figs. Functional equations for three-element audion used to deduce actions taking place in any circuit containing the audion.

The Theory of Valve Rectification, W. S. Barrell. Wireless World, vol. 7, no. 76, July 1919, pp. 181-186, 6 figs. Outlines elementary theory of thermionic valve in its application to (1) two-electrode or Fleming valve, and (2) three-electrode valve. (To be continued.)

FURNACES

Bailey Furnace. Electric Furnace Progress, L. F. Bailey. Metal Indus., vol. 17, no. 7, July 1919, pp. 316-317, 2 figs. Bailey furnace.

Booth-Hall. The Booth-Hall Electric Furnace, W. K. Booth. Foundry Trade Jl., vol. 21, no. 209, May 1919, pp. 301-302, 4 figs. Vertical-arc type with conducting hearth.

Brass Furnace. Utilization of Electric Brass Furnaces, H. W. Gillett. Jl. Indus. & Eng. Chem., vol. 11, no. 7, July 1, 1919, pp. 664-668. Development and growth of electric brass furnace applications, and table giving performance of various types of electric brass furnaces.

Design. *See Requirements.*

Great Britain. Electric Furnaces in the United Kingdom, 1918, R. G. Mercer. Foundry Trade Jl., vol. 21, no. 209, May 1919, pp. 295-301. Elecn., vol. 82, no. 25, June 20, 1919, pp. 694-695. Figures quoted indicate that there are installed or being installed 141 electric furnaces with a total capacity of 112,000 kva. Of these, 117 are electric steel furnaces.

Metal Melting Furnaces. Application of Electrical Energy to the Melting of Metals, H. A. Greaves. Engineering, vol. 108 no. 2793, July 11, 1919, pp. 42-43, 8 figs. Suggested connections to enable three-phase or two-phase current to be applied to furnace with an unequal resistance in one of the phases and still maintain balance load as regards both power and power factor on primary phases. Paper read at joint meeting of Instn. of Elec. Engrs. and Iron and Steel Inst.

Moffat Steel Furnace. The New Moffat Electric Steel Furnace, W. F. Sutherland, Can. Machy., vol. 22, no. 4, July 24, 1919, pp. 69-70, 3 figs. Designed, it is said, to overcome troubles frequently encountered by reason of crescent-shaped masses of partially fused raw material found clinging to walls between electrodes. This is claimed to have been accomplished by shaping body to conform to lines of current flow in bath of molten metal.

Morgan Crucibles. Electric Furnace Developments for Non-Ferroua Metals. Metal Industry, vol. 14, no. 22, May 30, 1919, pp. 444-447, 6 figa. Morgan crucibles. New feature said to be that crucible is container and also conductor to be heated.

Records. Operating Records of Electric Steel Furnaces. Elec. World, vol. 74, no. 3, July 19, 1919, pp. 125-127, 2 figa. Characteristica, 1918 energy consumption, maximum demand and steel output of eighteen arc-type furnaces in Milwaukee district, with experience of some uaers in operating them.

Requirements. Large Electric Steel-Melting Furnaces, Victor Stobie. Foundry Trade Jl., vol. 21, no. 209, May 1919, pp. 304-311, 8 figs. Technical requirements formulated from experiments and observations.

Developments in Electric Iron and Steel Furnaces, J. Birby. Foundry Trade Jl., vol. 21, no. 209, May 1919, pp. 311-323, 24 figs. Urges that engineera designing electric furnaces for use in manufacture of iron and ateel fully grasp requirements of metallurgists and be fully acquainted with working conditions of blast furnacea and with ateel foundries.

Sahlin Furnace. A New Type of Electric Furnace, Axel Sahlin. Foundry Trade Jl., vol. 21, no. 209, May 1919, pp. 302-304, 2 figs. Sahlin Furnace. Said to have been designed with a view to embodying advantages of both the direct-arc and the free-burning arc furnaces, at the same time avoiding aa far aa possible the disadvantagea of both. Built aa circular ladle with contracted top and dished bottom.

Steel Making. Electric Furnaces in Steel Making, Victor Stobie. Jl. of West of Scotland Iron & Steel Inst., vol. 26, no. 7, Mar. 1919, pp. 90-94 and (diacussion) pp. 94-103, 9 figs. on 4 supp. plates. Claims following improvements for thorough sealing up of furnace roof; (1) no cold air is drawn into furnace; (2) no flames or highly heated air burn away the electrodes above roof; (3) electrodes can be of smaller diameter for a given current aupply. Also other economic advantages and conveniences in manufacture of various alloys.

Temperature Regulator. A. Furnace Temperature Regulator, Walter P. White and Leason H. Adams. Physical Rev., vol. 14, no. 1, July 1919, pp. 44-48, 1 fig. By making heating coil of an electric furnace one arm of a wheatstone bridge and combining this with galvanometer regulator, thus keeping resistance of coil constant, writers assert it is possible, regardless of variations in current supply, and with no attention, to maintain constant temperature of furnace not too directly influenced by temperature of room.

Automatic Temperature Control. Automotive Indus., vol. 41, no. 3, July 17, 1919, pp. 118-119, 2 figs. Thermo-couple of nickel-chromium alloy installed in electric furnace actuates high tension millivoltmeter; arm depressor depresses pointer at regular time intervals and in doing so pointer forcea two contact pieces carried by table.

GENERATING STATIONS

Buenos Aires. New Generating and Distributing Electrical Installations of Buenos Aires (Les nouvelles installations de production et de distribution d'électricité de Buenos Aires), Bulletin Technique de la Suisse Romande, vol. 45, no. 11, May 31, 1919, pp. 97-99, 3 figs. Sub-stationa where alternating current ia transformed into direct current. (Concluded.)

Busbar, Emergency. New Emergency Bus Feature in Brantford Hydro-Electric. Station. Elec. News, vol. 28, no. 9, May 1, 1919, pp. 29-30, 3 figs. Scheme contemplates use of double-throw single-pole disconnecting awitches, three disconnecting switches being used to each circuit.

Lima. Notes on the Installations of the Associated Electric Enterprises of Lima (Algunas informaciones sobre las instalaciones de las Empresas Electricas Asociadas de Lima), Boletin de Minaa, vol. 11, noa. 1-3, March 31, 1919, pp. 32-45. Characteristics of turbine alternators and transformers.

Load Dispatching. Central Station Load Dispatching, P. B. Juhnke. Power Plant Eng., vol. 23, no. 15, August 1, 1919, pp. 661-666, 6 figs. Methods employed to carry load most efficiently and precautions adopted to safeguard workmen.

Load Distribution. Station Load and Economy, Ths. Norberg Schulz. Elecn., vol. 82, no. 25, June 20, 1919, pp. 700-701, 4 figs. Results obtained by studying distribution of load when several machines or atations are working in parallel.

Operation, Combined. Advantages of Combined Operation of Water and Electric Utilities and Selling Electric Current for Private Use in Springfield, Ill., Willis J. Spaulding. Mun. & County Eng., vol. 56, no. 6, June 1919, pp. 229-230. Net earning said to have been over $92,000 for fiscal year ending Feb. 28, 1919.

Overload Protection. Overload Protection for Electric Motors, O. C. Callow. Power, vol. 50, no. 2, July 8, 1919, pp. 60-62, 3 figs. Discusses various types of overload protection for motors, and suggests arrangements to suit special conditions.

Oxygen and Hydrogen Manufacture. Oxygen and Hydrogen—A New Source of Revenue for the Central Station, F. G. Clark. Elec. News, vol. 28, no. 14, July 15, 1919, pp. 30-32, 1 fig. Electrolytic cell suggested as means of smoothing out rough curve of variable load.

Rates. Central Station Rates in Theory and Practice—I, II & III, H. E. Eisenmenger. Elec. Rev., vol. 75, nos. 2, 3 & 4, July 12, 19, and 26, 1919, pp. 47-51, 94-97, and 138-143, 7 figs. General principles by which service costs can be determined. Cost analysis; energy cost and demand cost; load curve and load factor. Capital charges of central stations and how they effect the demand cost.

Rotherham. The New Power Station at Rotherham. Elecn., vol. 82, no. 26, June 27, 1919, pp. 750-760 and vol. 83, no. 1, July 4, 1919, pp. 6-11, 20 figs. June 27: Total generating capacity has increased from 45000 kw. in 1914 to 70,500 at present time. July 4: Switch-gear and accessories; diagram of connection of synchronizing arrangement.

Selection of Electric System. Selection of an Electric System. Terrell Croft. Coal Age, vol. 16, no. 5, July 31, 1919, pp. 178-184, 5 figs. Formulae and examples of application as applied to electrical problema incident to mine installations are given.

Shanghai. Shanghai Municipal Electricity Undertaking. Elec. Times, vol. 56, no. 1446, July 3, 1919, pp. 3-4, 2 figs. With reference to economical aspect. Electricity Supply at Shanghai. Electrical Rev., vol. 84, no. 2170, June 27, 1919, pp. 747-749, 5 figs. Turbo-generator installation.

Switzerland. The Massaboden Electric Power Plant (near Brig) of the Swiss State Railroads (Das Elektrizitatswerk Massaboden bei Brig der Schweiz, Bundesbahmen). H. Eggenberger and J. Danzer. Schweizerische Bauzeitung, vol. 73, no. 24, June 14, pp. 275-278 and vol. 74, no. 1, July 5, 1919, pp. 301-307, 24 figs. June 14: Reservoir holds 8000 cu. m., thus allowing for considerable height of peak loads. Power is transmitted partly by aerial line and partly by underground cable. July 5: Plant has three 3500 hp. double turbines of Francis type; two of the turbines are coupled with 3300-volt alternator generators; the two aets of transformers consist each of a synchronous motor of 210 hp. and 4000-volt generator.

GENERATORS AND MOTORS

Alternator Characteristics. Experimental Determination of Alternator Characteristics (Méthode d'analyse expérimentale dea propriétéa des alternateurs). A. Blondel and F. Carbenay. Revue Générale de l'Electricité, vol. 5, no. 24, June 14, 1919, pp. 843-855, 12 figa. Illustrating applications to special cases of methods of analyses described in preceding article. (Concluded.)

Armature Conductors Current Distribution. Current Distribution in Armature Conductors, Waldo V. Lyon. Elec. World, vol. 74, no. 2, July 12, 1919, pp. 66-68, 3 figs. Equations are derived showing how alternating current resistance depends upon depth of slot.

Commutator Motors. Graphs of Single-Phase Commutator Motors (Constructions graphiques élémentaires relatives aux moteurs à Collecteur monophasés) Osc. Collard. Société Belge des Electriciens, vol. 33, April-June 1919, pp. 133-145, 5 figs. Based on writer's analytical theory developed in Soc. Belge des Elec., issue Aug. 1906, p. 357.

Mill Motors. A 3000 HP. Mill Motor by the G. E. C. Elecn., vol. 82, no. 25, June 20, 1919, pp. 696-698, 6 figs. Motor is for driving a three-high, non-reversing plate mill and is believed to be the largest non-reversing motor driving a rolling mill in England.

IGNITION APPARATUS

Spark Discharge. Some Characteristics of the Spark Discharge and Its Effect in Igniting Explosive Mixtures, Clifford C. Paterson and Norman Campbell. Phys. Soc. of London, vol. 31, no. 4, June 15, 1919, pp. 168-228, 12 figs. Research to determine relation between electric charactertisics of a spark discharge and its power of igniting explosive mixture. Main experiments of ignition of mixtures of petrol and air are described.

LIGHTING AND LAMP MANUFACTURE

Churches. Lighting Installation for a Church Auditorium, H. O. Stewart. Elec. Rev., vol. 75, no. 1, July 5, 1919, pp. 1-3, 5 figs. Indirect lighting with luminous bowl and urn fixtures.

Gases, Residual. Residual Gases and Vapors in Highly Exhausted Glass Bulbs, J. E. Sharder. Physical Rev., vol. 13, no. 6, June 1919, pp. 434-437, 2 figs. Investigation reported to show that vacuum in sealed vessels deteriorates with time, rapidly at first and then more slowly and that subsequent heating even at temperatures lower than the heat treating temperature results in increase of pressure due to further liberation of gases and vapors from glass.

Industrial Lighting. Industrial Lighting, C. E. Clewell. Jl. Franklin Inst., vol. 188, no. 1, July 1919, pp. 51-90, 18 figs. Engineering details of factory lighting and economical advantages derived from efficient illumination of industrial establishments.

Design of Industrial Lighting System, Ward Harrison and H. H. Magdsick, Elec. World, vol. 74, no. 1 and 4, July 5 and 26, 1919, pp. 7-11 and 184-187, 13 figs. July 5: Analysis of deflecting and diffusing units for lighting industrial plants, giving advantages and limitations of each. Data concerning distribution curves, efficiency and mounting heights. July 26: Table giving present intensity standards in industrial lighting and coefficient of utilization.

Inverted Burners. The Regenerative Effect as Influencing Lighting Efficiency of the Inverted Incandescent Burner, J. S. G. Thomas. Jl. Soc. Chem. Indus., vol. 38, no. 12, June 30, 1919, pp. 168T-171T, 3 figs. Concluded from experimental research that efficiency is increased when gaseous mixture of coal gas and primary air is preheated.

Lenses. Luminous Power of Lighthouse Lenses (Studio sulla potenza luminosa delle ottiche dei fari), A. Coacci. Rivista Marittima, vol. 52, no. 5, May 1919, pp. 195-208, 7 figs. Lambert law considered as giving close approximation. Analytical formula offered for what is believed to be correct estimate of power.

Motion Picture Projection. Mazda Lamps for Motion Picture Projection, L. C. Porter. Gen. Elec. Rev., vol. 22, no. 7, July 1919, pp. 556-559, 11 figs. It is reported that lamp wattage has been increased to 900 and a tubular bulb used in place of spherical bulb, for the purpose of adapting Mazda lamps for motion picture projection.

Searchlights. The Development of Anti-Aircraft Searchlights, James B. Cross. Prof. Memoirs, Corps Engrs. U. S. Army & Engr. Dept., vol. 11, no. 56, Mar.-Apr. 1919, pp. 139-149, 6 figs. Types used (1) for seacoast defense, and (2) battlefield illumination.

Street Lighting. Street-Lighting Reconstruction Problems, L. Gaster. Gas. Jl., vol. 147, no. 2920, July 1, pp. 29-30. Experiences in London during war.

Wartime. Lighting in Wartime, Preston S. Millar. Jl. Engrs. Club of Philadelphia, vol. 36, no. 176, July 1919, pp. 259-265, 2 figs. Work done by Illuminating Society and Lighting Industry in co-operating with government in promoting industrial production, preventing accidents and saving fuel. Paper presented at joint meeting of Phila. section of Am. Inst. Elec. Engrs. and Illuminating Eng. Soc.

MEASUREMENTS AND TESTS

Asynchronous Machines. New Method for Indirect Testing of Asynchronous Machines (Sur une nouvelle méthode d'essai indirecte des machines asynchrones), J. Le Monnier. Revue Générale de l'Electricité, vol. 6, no. 2, July 12, 1919, pp. 35-40, 6 figs. Method of Commuting coefficient necessary for constructing diagram.

Electrodynamometer. An Electrodynamometer Using the Vibration Telescope, Carl Barus. Proc. Nat. Acad. Sciences, vol. 5, no. 6, June 15, 1919, pp. 211-217, 2 figs. Its possible use for finding magnetic field within helix of unknown constants pointed out.

Magnetic Materials, Testing. Rapid Testing of Magnetic Materials, Thomas Spooner. Elec. World, vol. 74, no. 1, July 5, 1919, pp. 4-6, 5 figs. Use of small ring samples and ballistic method of testing.

Meters. Service Tests of Small Capacity Meters, Arthur Horace Bryant. Elec. Rev., vol. 75, no. 4, July 26, 1919, pp. 155-157. Recommends that thorough inspection be made in place of usual 36 months' test and that where inspection raises no question as to accuracy of any given meter, its test be set at 60 months (24 months after inspection.)

Potentiometers. A Rectangular-Component Two-Dimensional Alternating-Current Potentiometer, A. E. Kennelly. Jl. Franklin Inst., vol. 188, no. 1, July 1919, pp. 1-26. 20 figs. Form adapted for telephonic-frequency measurements. Readings are given in two rectangular components of the voltage measured.

Transformers, Instrument. Field Testing of Instrument Transformers—II, H. M. Crothers. Elec. World, vol. 74, no. 3, July 19, 1919, pp. 119-121, 5 figs. Experience with differential methods as applied to voltage and current transformers and to acceptance testing of series transformers for street-lighting circuits. Possible simplifications are suggested.

Voltameters. A Note on the Accuracy of Copper Voltameter), J. Obata (in Japanese. Denki Gakkwai Zasshi, no. 371, June 10, 1919.

POWER APPLICATIONS

Conference Grounds. Electricity at Summer Conference Grounds. Jl. Electricity, vol. 43, no. 1, July 1, 1919, pp. 6-8, 5 figs. Electrical equipment at Y. W. C. A. Conference Grounds.

Heating. High Frequency Induction Heating Today, E. F. Northrup. Chem. Engr., vol. 27, no. 7, July 1919, pp. 167-168 & 174. Recent developments. Paper read before Convention of Am. Inst. of Chem. Engrs.

High Power Factor Induction Heaters, C. Edward Magnusson. Jl. Electricity, vol. 43, no. 1, July 1, 1919, pp. 17.18, 5 figs. Design said to eliminate annoying humming noise.

Hotels. Electricity in the World's Largest Hotel, Wm. H. Easton. Elec. Jl., vol. 16, no. 7, July 1919, pp. 288-294, 18 figs. Pennsylvania Hotel New York City. Distributing system divided into two separate parts: (1) direct current system for motors driving elevators, ventilating fans, and other machinery requiring speed control, and (2) alternating current for lighting, cooking and miscellaneous applications.

Sugar, Beet, Factories. Electricity in Beet Sugar Factories, Joseph P. Collopy. Elec. World, vol. 74, no. 4, July 26, 1919, pp. 178-181, 3 figs. Consideration of manufacturing process in its relation to load characteristics and some suggestions on the choice of electrical equipment.

Textile Mills. Canadian Textile Mill Operated by Central Station Service, V. K. Stalford. Elec. Rev., vol. 75, no. 4, July 26, 1919, pp. 135-137, 7 figs. Remote control and other features of motor service.

STANDARDS

Generators for Electrotyping. Standardization of Generators for Electrotyping, Floyd T. Taylor, Metal Indus., vol. 17, no. 7, July 1919, pp. 323-325, 4 figs. Suggestion in regard to selecting standard.

Polyphase Currents. Two Suggestions to the International Electric Committee (Deux propositions au comité électrotechnique international), E. Pierard. Société Belge des Electriciens, vol. 33, April-June, 1919, pp. 146-151, 3 figs. With reference to a general formula for determining polyphase currents and a symbol for weakening of transmission in long lines.

Transformers. Standardization of Transformers in Germany (Erläuterungen zu den Normen für Einheitstransformatoren), G. Stern. Elektrotechnische Zeitschrift, vol. 40, no. 3, Jan. 16,1919, pp. 33-34. Rules for constructing transformers with aluminum windings, issued by German Standardization Committee. Capacities, voltages, percentage of short-circuit voltages, temperature rise, overload capacity, and structural data are laid down.

STORAGE BATTERIES

Efficiency. On the Efficiency of Storage Batteries, K. Kimura. (In Japanese.) Denki Gakkwai Zasshi, no. 371, June 10, 1919.

TELEGRAPHY AND TELEPHONY

Antenna. Radio Transmission Formulas for Antenna and Coil Aerials, J. H. Dellinger. Jl. Franklin Inst., vol. 188, no. 1, July 1919, pp. 95-96. Derived from electromagnetic theory.

Baudot Quadruplex. Italian Submarine Cables Operated by Quadruplex Baudot (Le baudot quadruple sur les cables sous-marins Italiens), M. Cesaire Albanese. Annales des Postes, Télégraphes et Téléphones, vol. 8, no. 2, June 1919, pp. 228-238, 6 figs. Scheme of arrangement and account of tests performed.

Direction Finders. Aircraft Radio Direction Finding Equipment Developed by the Navy Department, Edgar H. Felix. Aerial Age, vol. 9, no. 18, July 14, 1919, pp. 852-853, 4 figs. Designed by Bur. of Steam Eng. Navy Dept.

Multiplex Operation. High Frequency Currents on Wires, J. O. Mauborgne. Jl. Franklin Inst., vol. 188, no. 1, July 1919, pp. 91-93. Experiments undertaken to examine possibility of adapting existing types of radio-telephone and telegraphic apparatus to multiplex operation.

Perforators, Keyboard. The Story of the Keyboard Perforator, H. H. Harrison. Instn. Post Office Elec. Engrs., no. 71, January 8, 1917, 40 pp., 18 figs. Varieties in design occurring in respect to (1) selection from a gang assembly of punches corresponding to character key operated, (2) propulsion of punches through paper and their retraction to normal, and (3) feed forward of paper by amount in accordance with length of letter plus space element these three conditions being quoted as essential in constructing an automatic keyboard perforator.

Photographs. The Electrical Transmission of Photographs, Marcus J. Martin. Model Engr. & Elecn., vol. 41, no. 949, July 3, 1919, pp. 13-17, 5 figs. Historical account of work done by various experimenters. (To be continued.)

Pupinization. Effect of Pupinization of Short Telephone Lines (Wirksamkeit der Pupinisierung kurzer Fernsprechleitungen), Ludwig Schultheiss. Telegraphen-u. Fernsprech-Technik, vol. 7, no. 21-22, Feb. 15, 1919, pp. 81-83, 1 fig. Tables showing results of tests. (Concluded.)

Relays. The Oscillatory Valve Relay: A Thermionic Trigger Device, L. B. Turner. Elecn., vol. 83, no. 2147 and 2148, July 4 and 11, 1919, pp. 4-5 and 34-35, and (discussion) pp. 35-36, 9 figs. July 4: Distinguishes between relays and amplifiers and explains operation of triode. July 11: Analysis is made of sensitivity and selectivity of the tuned high-frequency valve relay and general limitations on sensitivity and speed of working are discussed.

Static Interference. *See Weagent Static Prevention.*

Telephones, Automatic. The Western Electric Company's Automatic Telephone System, B. O. Anson. Instn. Post Office Elec. Engrs., no. 72, Dec. 4, 1916, 62 pp., 22 figs., partly on supp. plate. Including enumeration of requirement writer considers as essential to a mechanical switching system.

Telephone, Wireless. Wireless Telephone Transmitter for Seaplanes. Telegraph & Telephone Age, no. 14, July 16, 1919, pp. 342-346, 4 figs. Marconi type S. E. 1100 set.

Field Wireless Telephony and Direction-Finding. Wireless World, vol. 7, no. 76, July 1919, pp. 199-205, 7 figs. Account of demonstration.

Wireless Telephony and Directional Wireless. Aeronautics, vol. 16, no. 294, June 5, 1919, pp. 586-588, 2 figs. Features for military and commercial purposes. (Continued.)

Radio Transmitting Sets on the NC Type Seaplanes. Telegraph and Telephone Age, no. 13, July 1, 1919, pp. 330-331, 2 figs. Diagram showing connections and arrangement.

Telephony, Secret. Secret Telephony (Procédé de téléphone secret), M. Poirson. Annales des Postes, Télégraphes et Téléphones, vol. 8, no. 2, June 1919, pp. 239-248, 5 figs. Periodic inversion of currents (without superposition of external current) at starting point and their rectification at receiving point. Scheme evolved by Service d'Etudes des Postes et Télégraphes of France.

Weagent Static Prevention. The Weagent "X-Stopper," Wireless World, vol. 7, no. 76, July 1919, pp. 209-211, 5 figs. Diagrammatic exposition of necessity for spacing two loop aerials comprising this type of receiver. (Concluded.)

TRANSFORMERS, CONVERTERS, FREQUENCY CHANGERS

CONVERTERS, ROTARY. Pulsation of the D.C. Terminal Voltage in Rotary Converters, J. K. Kostoko. Elecn., vol. 83, no. 2147, July 11, 1919, pp. 37-39. Diagrams and formulæ. (To be continued.)

DESIGN. On the Most Economical Design of Transformers, T. Hayakawa. (In Japanese.) Denki Gakkwai Zasshi, no. 371, June 10, 1919.

DESSAUER TRANSFORMER. Dessauer's High-Tension Transformer, E. Walter. Elecn., vol. 83, no. 2146, July 4, 1919, pp. 12-13, 2 figs. Scheme by which high-tension stresses are so controlled that they are removed to position where they can be safely dealt with.

FREQUENCY AMPLIFIER. Theory of Stationary Frequency Doublers (Beitrag zur Theorie und Wirkungsweise des stationaren Frequenzverdopplers), M. Osnos. Elektrotechnik u. Maschinenbau, vol. 37, no. 5, Feb. 2, 1919, pp. 45-48, 7 figs. Argument to demonstrate Epstein frequency doubler is equivalent to two transformers with their primary windings in series and their secondary windings in opposition.

RECTIFIERS. The Tungar Rectifier—Its Theory, Characteristics and Application—II. F. Keith d'Alton. Elec. News, vol. 28, no. 10, May 15, 1919, pp. 30-35, 26 figs. Performance of simple single-phase rectifier is outlined and claimed advantages of different possible combinations of two or more single-phase rectifiers are presented and discussed.
The Use of Mercury Rectifiers at Hirschberg, Silesia J. Obach. Elecn., vol. 82, no. 25, June 20, 1919, pp. 698-699. Three rectifying cylinders mounted side by side on wrought-iron frame work; together with the vacuum pump they occupy as much floor space as a rotary converter, giving 100 kw., whereas they themselves have a capacity of 750 kw. From Elektrotechnische Zeitschrift, no. 42, 1918.

TRANSFORMERS, POWER. Power Transformers, A. F. Berry. Elecn., vol. 82, no. 26, June 27, 1919, pp. 733-739, 8 figs. Variety in requirements that must be met in transformer design. Points in design of building of sub-stations, such as desirability of being able to run a crocodile truck into building and the need for ample head room.

TRANSFORMER PRACTICE. Essentials of Transformer Practice—XXIV, E. G. Reed. Elec. Jl., vol. 16, no. 7, July 1919, pp. 301-303, 8 figs. Polarity.
Operation at Holtwood, Charles H. Bromley. Power, vol. 50, no. I, July 1, 1919, pp. 8-9, 4 figs. How transformers are cleaned and inspected.

TRANSMISSION, DISTRIBUTION CONTROL

ALUMINUM CONDUCTORS. Aluminum Conductors for Overhead Power Transmission Lines, Arthur Jacob. Elecn., vol. 82, no. 26, June 27, 1919, pp. 743-748, 7 figs. Conductivity of aluminum and copper, their relative densities, tensile strength and other qualities are discussed.

CABLES. Varnished Cambric Cable for Underground Service, W. E. Hazeltine. General Elec. Rev., vol. 22, no. 6, June 1919, pp. 442-444. Describes structure of varnished cambric cable and points out features wherein this cable is superior to those of paper or rubber insulated type.

GROUNDING. Grounding (Erdung), Karl Michalke. Dinglers Polytechnisches Journal, vol. 6, no. 334, Mar. 22, 1919, pp. 57-60, 2 figs. Discusses various points which have to be considered in grounding.

HIGH POTENTIAL SYSTEMS. Distribution of Current Intensity and Potential in line of High Tension System (Etude de la répartion de l'intensité et du potential le long d'une ligne de distribution à très haute tension), Léon Drin. Revue Générale de l'Electricité, vol. 6, no. 1, July 5, 1919, pp. 3-12, 14 figs. Graphical study by means of characteristics which are defined as geometrical loci of points corresponding to extremities of vectors of tensions and intensities of each element of network.
The Practicability of Transmission Lines at Highest Voltages in This Country, G. V. Twiss. Elecn., vol. 82, no. 26. June 27, 1919, pp. 732-736. 4 figs. Considerations alleged to have militated against use of overhead lines in England found exaggerated.

INSULATORS. Notes on Suspension Insulator Design, H. L. Garbutt. Jl. Electricity, vol. 43, no. I, July 1, 1919, pp. 19-21, 4 figs. Theories accounting for deterioration of cap-and-pin type suspension insulator.

OVERHEAD LINES. Overhead Net Works (Canalisations aériennes), Ch. Vallet. Industrie Eléctrique, vol. 28, no. 648, June 25, 1919, pp. 232-236. Formula for determining maximum safe distance between consecutive poles. (Continuation of serial.)

POWER FACTOR CORRECTION. Power Factor Correction. Power Plant Eng., vol. 23, no. 14, July 15, 1919, pp. 635-639, 8 figs. From report of sub-committee on power factor correction presented at Convention of Nat. Elec. Light Assn.

POWER TRANSMISSION. On the Limits of Power Transmission by Alternating Currents (Uber die Grenzen der Kraftubertragung durch Wechselstrome), M. Dolivo-Dobrowolsky. Elektrotechnische Zeitschrift, vol. 40, no. 1, Jan. 2, 1919, pp. 1-4, 1 fig. Discusses question whether system of high-tension a.c. will be given preference, as now, for future power transmissions; writer comes to the conclusion that, since the underground cable will be the future means of transmission, high-tension d.c. will be used for future power transmission.

RELAY PROTECTION. Transmission Line Relay Protection, D. W. Roper, H. R. Woodrow, O. C. Traver and P. Mac Gahan. Elec. Rev., vol. 75, no. 1, July 5, 1919, pp. 13-18, 15 figs. Typical application of current and directional relays.

RELAYS, REVERSE-CURRENT. Reverse-Current Relays-Principles of Operation, Victor H. Todd. Power, vol. 50, no. 3, July 15, 1919, pp. 96-99, 15 figs. Schematic diagrams. Construction of features of various types.

SUBSTATIONS. Railway Converter Substations—I. C. F. Lloyd. Power House, vol. 12, no. 11, July 19, 1919, pp. 303-307, 10 figs. Concerning class of equipment to be used and its arrangement in substation buildings.
Canal Substation at Columbus, E. W. Clark. Elec. Eng., vol. 53, no. 5. May 1919, pp. 204-205, 3 figs. Transformers, lightning arresters and other high tension equipment located out-of-doors; oil switches, buses, switchboard and auxiliary equipment placed in small building.
Substations for Y-connected Systems, A. V. Taylor. Elec. World, vol. 74, no. 4, July 26, 1919, pp. 172-175, 7 figs. As standardized by company operating in Northwest States, where light loads and long distances prevail.

SWITCHBOARDS. Developments in Switchboard Apparatus. Gen. Elec. Rev., vol. 22, no. 7, July 1919, pp. 535-537, 8 figs. Plunger type for overload protection.

THREE-PHASE CURRENT TRANSMISSION. Comparative Technical and Economical Study of an Overhead Line and an Underground Line to transmit Three-Phase Current at 50,000 volt and 50 Cycles (Etude comparative, technique et économique, d'une ligne aérienne et d'une ligne souterraine à courant triphasé 50,000 volts 50), P. Yersin. Bulletin Association Suisse des Electriciens, vol. 10, no. 5, May 1919, pp. 141-149, 10 figs. Although in various respects underground lines are found more advantageous, the cost of aerial line is estimated to be less than one-half of that of underground.

TRANSMISSION AT 220 KILOVOLTS. Problems of Power Transmission at 220 Kilovolts, A. E. Silver. Elec. Rev., vol. 75, no. 2, July 12, 1919, pp. 52-55, 4 figs. Design features of line and apparatus. Paper read before A. I. E.E.

TRANSMISSION CIRCUITS. Electrical Characteristics of Transmission Circuits—I, Wm. Nesbit. Elec. Jl., vol. 16, no. 7, July 1919, pp. 279-287, 6 figs. Approximate methods including Mershon and Dwight charts. Resistance of conductors.

TTRANSMISSION COSTS. Transmitting Electric Power at Mines—II, S. W. Farnham. Coal Industry, vol. 2, no. 7, July 1919, pp. 275-279. Computing and comparing cost of a. c. and d. c. and efficiency of locomotives. Paper presented before Ill. Coal Min. Inst.

TRANSMISSION LINE COMPUTATION. An Extension of the Step-by-Step Method of Transmission Line Computation, Frederick Eugene Pernot. University of Cal. Pub. in Eng., vol. 2, no. 4, pp. 131-138, 2 figs. Based on assuming one-sixth of total line admittance at each end of line and the remaining two-thirds in the middle.

TRANSMISSION ROUTES. Selection of Economical Transmission Route, P. O. Reyneau. Elec. World, vol. 74, no. 4, July 26, 1919, pp. 176-178, 1 fig. Equations and curves which are said to simplify choice between several available routes.

VOLTAGE REGULATION OF FEEDERS. Voltage Regulation of Distributing Feeders as a Means of Improving Central Station Efficiency, Frank Hershey. Gen. Elec. Rev., vol. 22, no. 7, July 1919, pp. 544-551, 6 figs. With notes on control of distributing feeders. Paper read before Ohio Elec. Light Assn.

VARIA

HOLLAND. Some Particulars Regarding Inventors in the Electrical Field and Holland's Part in the Development of Electrotechnics (Eenige bijzonderheden over uitvinders op het gebied der electriciteit en het aandeel dat Nederlanders in de ontwikkeling van de electrotechniek hebben gehad), E. J. F. Thierens. Ingenieur, vol. 34, no. 24, June 24, 1919, pp. 446-453, 4 figs. Historical account.

LIGHTNING ARRESTERS. Records and Maintenance of Aluminum-Cell Lightning Arresters, F. S. Piper. General Elec. Rev., vol. 22, no. 6. June 1919, pp. 475-478, 8 figs. Method followed by Manchester Traction, Light & Power Co.

SODA, CAUSTIC.—CHLORINE CELLS. Electrolytic Caustic Soda-Chlorine Cells. Karl Horine. Chem. & Metallurgical Eng., vol. 21, no. 2, July 15, 1919, pp. 69-72, 1 fig. Four classes of cells defined after reviewing patent situation—Diaphragm, mercury, Bell and fused electrolyte. An electrolytic caustic of soda-chlorine cell chart is presented.

WIRE PULLING. Pulling in Conductors with a Crane, Terrell Croft. Power, vol. 50, no. 4, July 22, 1919, pp. 136-137, 7 figs. Suggestions on how to use traveling crane to pull large electrical conductors into conduits.

MARINE ENGINEERING

AUXILIARY MACHINERY

COMPASS. The Navigational Magnetic Compass Considered as an Instrument of Precision, M. B. Field. Jl. Instn. Elec. Engrs., vol. 57, no. 282, May 1919, pp. 349-386, 45 figs. Physico-mathematical study of forces entering in operation of varous types, with reference to British Admiralty practice in regard to effecting corrections and recording measurements.

ELECTRIC AUXILIARIES. First American Full-Powered Motorship Equipped with Electric Auxiliaries, H. W. C. Smith. Motorship, vol. 4, no. 8, August 1919, pp. 31-35, 16 figs. Machinery details of the "Benowa."

HAWTHORNE-COCKBURN VALVES. The Supply of Superheated Steam to Astern Turbines. Shipbuilding & Shipping Rec., vol. 13, no. 25, June 19, 1919, p. 775, 2 figs. Hawthorne-Cockburn patent valves for mixing of saturated and superheated steam.

MARINE TWO-CYLINDER ENGINE SETS. Novel Features in a Two-Cylinder Marine Set. Automotive Industries, vol. 40, no. 26, June 26, 1919, pp. 1449-1451, 3 figs. Engine combined with reverse gear in single unit.

TURBINE DRIVE FOR AUXILIARIES. Turbine-driven Marine Auxiliaries. Eng., vol. 127, no. 3313, June 27, 1919, pp. 636-638, and 640, 10 figs. Equipments for merchant steamers, built by Franco Tosi Company of Legnano, Italy.

SHIPS

CONCRETE SHIPS. Auxiliary Motor Sailing Ship of Reinforced Concrete (Motosegler aus Beton), Beton & Eisen, vol. 18, nos. 2-3, Feb. 3, 1919, p. 32, 2 figs. Danish vessel 112 ft. long provided with screw propeller driven by 80-hp. oil engine.

Advantages, Progress and Permanance of Concrete Sbips, Robert W. Lesley. Concrete Craft, vol. 1, no. 5, June 1919, pp. 119-122 and 126 and 132, 1 fig. Sees concrete ship, both large and small craft, better, cbeaper and of lower upkeep and for many uses essentially superior to any other type of hull.

Barge Building in Scotland. Ferro-Concrete, vol. 10, no. 2, August 1919, pp. 35-38, 4 figs. Construction of 1,000-ton reinforced-concrete barges.

Concrete Coaling Barges. Colliery Guardian, vol. 117, no. 3050, June 13, 1919, p. 1413, 3 figs. Length, 185 ft.; beam, 35 ft.; depth, 18 ft.; hull is of straight-line type.

Concrete Merchant Ships. Concrete Craft, vol. 1, no. 5, June 1919, pp. 123-126, 5 figs. Their chance of development in time of peace.

DESIGN. Suggestions for Increasing Revenue from Cargo Carriers, M. F. Carr. Shipping, vol. 8, no. 2, July 12, 1919, pp. 15-16, 2 figs. Concerning modifications, in design of 8,800-deadweight-ton cargo carrier.

DIESEL. The Diesel Engine in Great Lakes Freighters, R. D. Karr. Motorship, vol. 4, no. 8, August 1919, pp. 28-29, 2 figs. Recommends operating freighters with internal-combustion engine as economical measure and necessity because, "low price of coal heretofore prevailing in the Great Lakes trade will never be reached again."

ELECTRIC PROPULSION OF SUBMARINES. Electrical Equipment Used on Submarines, H. C. Coleman. Elec. Jl., vol. 16, no. 7, July 1919, pp. 295-299, 9 figs. General arrangement of propelling machinery. There are two main motors, each having its own shaft which is connected by heavy clutches to engine shaft at one end and to propeller sbaft at the otber.

LJUNGSTROM SYSTEM. The Ljungstrom System Steam Turbo-electric Marine Propulsion. Pac. Mar. Rev., vol. 16, no. 7, July 1919, pp. 71-80, 10 figs. Plant consists of two turbo-generators of equal power, delivering their power electrically to two motors.

MOTOR SHIPS. Motor Ship Glenapp. Engr., vol. 127, no. 3312, June 20, 1919, pp. 612-613, 1 fig. Alteration as compared with "Selandia" referred to are cooling of piston with water instead of oil, and substitution of water for eight fuel pumps for the eight cylinders in each engine instead of a single pump for eacb set of four cylinders.

PROPELLING MACHINERY TYPE. Crude-Oil Motors vs. Steam Engines in Marine Practice, J. W. Morton. Mech. Eng., vol. 41, no. 7, July 1919, pp. 609-612, 1 fig. Discussion of various factors to be considered, also exposition of advantages and disadvantages, as compared to steam engines, of crude oil motors of constant pressure, constant-volume, four-stroke cycle and two-stroke cycle types.

SPECIFICATIONS FOR MACHINERY. Specifications for Machinery for 8,100 Ton d.w. Steamships for Canadian Government Merchant Marine Ltd. Can. Ry. & Mar. World, no. 257, July 1919, pp. 394-399, 4 figs. Propelling machinery is to consist of one set of inverted, vertical, direct acting, triple expansion, surface condensing engines, having 3 cylinders working on separate cranks placed at angles of 120 deg. with each other, supplied with steam from 3 multitubular boilers at a working pressure of 180 lb. per sq. in.

YARDS

CONCRETE SHIPBUILDING. British Concrete Shipbuilding: Unit System Construction, W. Noble Twelvetrees. Eng., vol. 107, no. 2791, June 27, 1919, pp. 825-826, 17 figs., partly on supp. plates. Developed, it is said, with a view to reduce the absolute minimum amount of timber supports and shuttering required on building berth and arranging and spacing frame members in a manner similar to that generally specified for steel ships.

A New Irish Industry. Concrete Shipbuilding at Warrenpoint. Ferro-Concrete, vol. 10, no. 8, January 1919, pp. 177-187, 12 figs. Yard suitable for construction of concrete ships up to 10,000 tons capacity.

COSTS. Sbipyard Costs and Ship Wages—a Comparison, Winthrop L. Marvin. Pac. Mar. Rev., vol. 16, no. 7, July 1919, pp. 81-86. Comparison of American and British sbip wages.

FABRICATED SHIPS. The Fabricated Ship, Henry R. Sutphen. Universal Engr., vol. 29, no. 6, June 1919, pp. 21-27, 6 figs. Operations at Newark Bay shipyard.

Fabricated-Ship Plant Planned for Later General Use, M. E. Allen. Eng. News-Rec., vol. 83, no. 2, July 10, 1919, pp. 79-83, 5 figs. Mobile Shipbuilding Co. forced to revise steel design to make use of timber at Birmingham shop for fabricating ship material.

FORD METHODS. Ford Methods in Ship Manufacture—VII, Fred E. Rogers. Indus. Management, vol. 58, no. 1, July 1919, pp. 8-11, 10 figs. Outfitting operations and power plant.

FORE RIVER YARDS. Shipbuilding Equipment and Methods at Fore River—I. Hull Construction Plant. Eng. News-Rec., vol. 83, no. 1, July 3, 1919, pp. 19-22, 5 figs. Single type of berth for various kinds of ships. Concrete substructure and bridge crane equipment.

RECONDITIONING WAR SERVICE VESSELS. Refitting War Fleet is Big Job, V. G. Iden. Mar. Rev., vol. 49, no. 8, August 1919, pp. 375-378, 5 figs. Reconditioning vessels used for war service is taxing capacity of repair yards.

REPAIRS. Repair of the "Curaca" a Triumph of Skill and Ingenuity. Shipping, vol. 8, no. 1, July 5, 1919, pp. 15-16, 4 figs. Straightening out bottom of ship sunk during explosion in Halifax Harbor.

See also Welding.

WELDING. Some Experiences with Electric Welding in Warships, W. H. Gard. Eng., vol. 108, no. 2792, July 4, 1919, pp. 25-30, 12 figs. Sketches illustrating such repair work as required by broken cast steel stem of "P" boat, shaft bracket of a large 36-knot destroyer broken through, and lower portion of stern post of a Castle liner broken off, etc.Paper read before Instn. Naval Architects.

Repairing the Broken Stern-Post of the "Northern Pacific"—tbe Biggest Marine Weld in the World. Reactions, Vol. 12, no. 2, Second Quarter, 1919, pp. 23-31, 13 figs. Cast steel stern post was cracked through just above uppermost gudgeon, cross-section of break forming roughly a triangle, each side of which was about two feet in length.

VARIA

GREAT-CIRCLE SAILING. Great Circle Sailing—A Few "Wrinkles" to Save Time, H. G. S. Wallace. U. S. Naval Inst. Proc., vol. 45, no. 7, July 1919, pp. 1197-1199, 2 figs. Marcq Saint-Hilaire metbod.

SOUNDINGS. Sea Sounding on Board a Moving Vessel, Based on Propagation of Sound in Water (Sur un procédé de sondage en mer, à bord d'un bateau en marche, basé sur la propagation du son dans l'eau), M. Marti. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 22, June 2, 1919, pp. 1100-1102. Micropbone fixed to vessel and immersed at convenient deptb registers explosion on surface of water and its reflection from sea bottom.

SURVEYS. The Safeguarding of Our Seafarers, Robert G. Skerrett. Rudder, vol. 35, no. 7, July 1919, pp. 305-311, 19 figs. Work done by U. S. Coast and Geodetic Survey, including illustrations of corrections that bave been made during a single year in chart of New York harbor.

METALLURGY

ALUMINUM

ALUMINUM-COPPER-MAGNESIUM ALLOYS. Constitution and Metallography of Aluminum and Its light Alloys with Copper and with Magnesium, P. D. Mercia, R. G. Waltenberg and J. R. Freeman. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 151, July 1919, pp. 1031-1049, 28 figs. Temperature solubility curves of $CuAl_2$ and of Mg_4Al_3 in aluminum obtained by method of annealing and microscopic examination.

LYNITE. Aluminum Alloy Combines Strength with Toughness. Automotive Indus., vol. 41, no. 3, July 17, 1919, pp. 108-109, 4 figs. Tests on lynite alloy said to have indicated that this material may be applied in parts subjected to shock, such as axle housings and differential carriers.

MECHANICAL PROPERTIES. Mechanical Properties and Resistance to Corrosion of Rolled Light Alloys of Aluminum and Magnesium with Copper, Nickel, and Manganese, P. D. Merica, R. G. Waltenberg and A. N. Finn. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 151, July 1919, pp. 1051-1062, 3 figs. Light aluminum alloys of several compositions belonging to each of three series—aluminum-magnesium-copper, aluminum-magnesium-manganese, and aluminum-magnesium-nickel—were rolled out into sheets and tested in tension as cold-rolled, after annealing and after heat treatment.

BEARING METALS

Researches on Bearing Metals. Antimony, Lead, Tin Alloys, E. Heyn and O. Bayer. Metal Industry, vol. 15, no. 1, July 4, 1919, pp. 1-7, 17 figs. Investigation covered (1) chemical analysis of raw materials for preparation of alloys, (2) behavior during solidification and fusion, (3) influence of rate of cooling and subsequent heat treatment on microstructure and ball hardness, (4) mechanical properties, (5) experiments on effect of additions of copper on microstructure and melting point.

BLAST FURNACES

DESIGN. The Principal Changes in Blast Furnace Lines. Iron & Coal Trades Rev., vol. 99, no. 2679, July 4, 1919, pp. 6-7, 6 figs. Review of developments during past twelve years, especially in regard to capacity leads to conclusion that 1,000-ton furnace will be attained, either along present lines or completely revolutionizing useful designs.

EXPLOSIONS. Blast-Furnace Explosions, B. B. Hood. Eng. & Min. Jl., vol. 108, no. 2, July 12, 1919, pp. 47-49, 2 figs. Disastrous accident occurred wben blowing engine was shut down, believed to have been due to leaky jacket permitting contact of water and hot coke, and consequent generation of water gas.

PULVERIZED COAL. Application of Pulverized Coal in Blast Furnaces, E. P. Matbewson and W. L. Wotherspoon. Can. Min. Inst. Bul., no. 87, July 1919, pp. 737-760, 11 figs. Experiments by various plants, notably Tennessee Copper Co., and International Nickel Co. smelters.

STEEL TURNINGS IN BLAST FURNACE. On the Utilization of Steel Turnings in the Blast Furnace. Engineering, vol. 108, no. 2793, July 11, 1919, p. 58. Practice at iron works in North of France. Translated from Comptes rendus de la Société de l'Industrie Minérale.

COPPER AND NICKEL

ELECTRIC FURNACE SMELTING OF SPEISS. Smelting Copper Speiss in tbe Electric Furnace, P. Papencordt. Metal Industry, vol. 14, no. 25, June 20, 1919, pp. 502-504, 2 figs. Experiments said to have yielded copper matte containing merely traces of arsenic, speiss high in antimony but free from arsenic, slag and sublimate. (From Metall und Erz.)

MONEL METAL. Some Facts About Monel Metal, Hugh R. Williams. Power, vol. 50, no. 1, July 1, 1919, pp. 14-16, 3 figs. Charts comparing behavior of monel metal and nickel steel; also of monel and other metals of high temperature.

FLOTATION

Recent Metallurgical Progress, Hugh K. Picard. Eng. & Min. Jl., vol. 108, no. 2, July 12, 1919, pp. 65-69. Following progress emphasized: that flotation has revolutionized concentration: that zinc metallurgy has slightly advanced in smelting: that in copper, reverberatory practice and ammonia leaching are chiefly to be noted.

CONCENTRATE TREATMENT. Considerations on the Treatment of Flotation Concentrate, Oliver E. Jager. Min. & Sci. Press, vol. 119, no. 20 July 12, 1919, pp. 43-44. States what changes, if any, must be made in smelting process and equipment, and what differences are to be expected in results, when considerable proportion of material to be treated consists of flotation concentrate. The question is taken up by assuming the case of a smelting plant baving a concentrator, the whole being in operation, and tbat the latter is about to install flotation.

Copper Ores. Flotation Concentration of Copper Ores, Chem. Eng. & Min. Rev., vol. 11, no. 123, Dec. 5, 1918, pp. 68-72, 5 figs. Device installed at Wallaroo, Australia, mines concentrating plant to deal with overflow from mine.

Physics of Concentration. Concentration by Flotation (Concentracion par flotacion), Frederico C. Fuchs. Boletin Minero de la Sociedad Nacional Mineria, vol. 31, no. 239, Jan. 1919, pp. 37-49. Experiments said to have established that phenomena taking place in concentration by flotation are principally those of capillarity, surface tension and molecular cohesion.

FURNACES

Booth Electric Brass Furnace. The Booth Electric Rotating Brass Furnace, Carl H. Booth. Metal Indus., vol. 17, no. 7, July 1919, pp. 317-319, 2 figs. Modified by placing door in one end of furnace and having tapping hole in other end, in order to overcome difficulties that have been experienced in maintaining lining around former combination spout and door.

Crucible Furnace. Crucible Furnace with Blower and Detachable Preheater (Gchlase-Tiegel-Schmelzofen mit aufgesetztem und wegnehmbarem Vorschmelzer). Metall-Technik, vol. 45, no. 7-8, Feb. 22, 1919, p. 28, 4 figs. Special feature claimed is arrangement for exhaust gases to escape from side of preheater instead of from center.

Design. Metallurgical Furnaces, A. Bregman. Metal Industry, vol. 14, no. 25, June 20, 1919, pp. 507-509, 5 figs. Conditions that govern size, shape and type of metal-melting furnace. (Concluded.)

Detroit Rocking Furnace. The Detroit Rocking Furnace for Melting Brass and Bronze, H. M. St. John. Metal Indus., vol. 17, no. 7, July 1919, pp. 320-322, 3 figs. Consists essentially of cylindrical steel shell with refractories, and mounted on rollers and ring gears which permit it to be rocked through any desired arc of revolution up to maximum of 200 deg.

Furnace Selection. Melting Process Chosen Depends on Requirements, H. E. Diller. Foundry, vol. 47, no. 326, July 1, 1919, pp. 411-415, 9 figs. Acid open hearth and converter both operated by Detroit Steel Casting Co. Illustration of application.

Pulverized Coal. The Use of Pulverized Coal, L. C. Harvey. Engineering, vol. 108, no. 2793, July 11, 1919, pp. 62-67, 5 figs. With special reference to its application in metallurgy. (To be continued.) Paper read before Iron and Steel Inst.

Reveberatory Furnaces. Continuous Overflow and Its Effect on the Slag Loss of Reveberatory Furnaces, Oliver E. Jager. Min. & Sci. Press, vol. 118, no. 26, June 28, 1919, pp. 875-876. Continuous flow considered as most important factor in reduction of slag-loss (particularly when using pulverized coal as fuel), because, it is argued, there is a better opportunity for any entrained metal to settle out of slag blanket.

Prolonging the Life of the Roofs of Reverberatory Furnaces at Anaconda, Oliver E. Jager. Min. & Sci. Press, vol. 119, no. 3, July 19, 1919, pp. 85-86, 3 figs. Ribs are built on roof; when this is burnt in, space between ribs is filled with brickwork, thus forming new roof on top of old one.

Slag in Electric Furnace. How Slag Influences Electric Steel, J. L. Dixon. Foundry, vol. 47, no. 327, July 15, 1919, pp. 483-484. Removal of first slag and making of second not considered necessary. Superiority of acid steel questioned.

IRON AND STEEL

Differential Crystallization. Differential Crystallization in a Cast-Steel Runner, Francis B. Foley. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 151, July 1919, pp. 1117-1121, 4 figs. Photomicrographs of open-hearth runner metal, 2 in. in diameter, that had been fractured, presented as sample of cast-steel structure.

German Industry. Light on the German Iron and Steel Industry. Iron Age, vol. 104, no. 4, July 24, 1919, pp. 246-247. German views of stipulations of peace terms; study of wartime conditions of iron and steel industry: labor an obstacle to quick resumption of peace-time operations. Discussed in report of May meeting of the Verein Deutcher Eisenhüttenleute.

Graphitization. Graphitization in Iron-Carbon Alloys. Kunichi Tawara and Genshichi Asahara. Foundry Trade Jl., vol. 22, no. 210, June 1919, pp. 398-401, 2 figs. Report of experiments made at Tokio University.

Magnet Steel. Steel for Magnets—III, Carbon. Mech. World, vol. 65, no. 1694, June 20, 1919, pp. 292-293, 1 fig. Magnetic materials and their composition. (Continuation of serial.)

Malleable Iron. Research Work on Malleable Iron. Enrique Touceda. Mech. Eng., vol. 41, no. 7, July 1919, pp. 593-600, 17 figs. Account of work undertaken during four years for American Malleable Castings Assn.

Oxygen in Cast Iron. Oxygen in Cast-Iron and Its Applications, Wilford L. Stork. Metal Trades, vol. 10, no. 7, July 1919; pp. 295-296. Offers evidence in support of theory developed by J. E. Johnson in regard to good effect of oxygen on cast iron. To be presented at September meeting of Am. Inst. Min. & Metallurgical Engrs.

Slag. The Acid Hearth and Slag, J. H. Whiteley and A. F. Hallimond. Eng., vol. 108, no. 2792, July 4, 1919, pp. 852-860, 26 figs. Records of observations and experiments dealing with micro-structure of slag, structure of hearth and reaction occurring in molten slag. Paper presented before Iron & Steel Inst.

Tool Steel. Making High-Grade Tool Steel, John D. Knox. Iron Trade Rev., vol. 65, no. 3, July 17, 1919, pp. 153-157, 7 figs. Care exercised in cooling ingots after they are stripped. Importance of annealing and hardening processes.

Vanadium. Manufacture of Modern High Speed Steel, John A. Mathews. Iron Age, vol. 104, no. 1, July 3, 1919, pp. 17-20. Use of vanadium found as most notable change in recent years. Paper read before Am. Soc. for Testing Materials.

METALLOGRAPHY

Etching, Deep. Deep Etching and Rail and Forging Defects, F. M. Waring and K. E. Hofammann. Iron Age, vol. 104, no. 1, July 3, 1919, pp. 13-14 and (discussion), pp. 14-16, 7 figs. and Ry. Rev., vol. 65, no. 1, July 5, 1919, pp. 11-15. 10 figs. Investigation by means of deep etching with hot acid at Pa. R. R. laboratories said to have disclosed that interior defects appear to be more frequent in rails that had developed a number of transverse fissures than in others which had only a few or no such fissures. Paper read before Am. Soc for Testing Materials.

Non-Ferrous Metals. Metallography Applied to Non-ferrous Metals—VII Ernest J. Davis. Foundry, vol. 47, no. 326, July 1, 1919, pp. 438-439, 3 figs. On deoxidation of metals and alloys by use of elements having strong affinity for oxygen.

MECHANICAL ENGINEERING

AIR MACHINERY

Air Leakage. Determination of Amount of Air Leakage for a System of Pipes and Receivers the Volume of Which Cannot Easily be Measured, P. H. Trout, Jr. Compressed Air Magazine, vol. 24, no. 7, July 1919, pp. 9216-9218, 1 fig. By cutting off compressors after filling system to convenient pressure and taking readings of pressure gage and times, readings are plotted in two curves from which amount of leakage is calculated.

Psychometric Chart. The Psychometric Chart Explained, L. A. Wilson. Sibley Jl., vol. 33, no. 5, June 1919, pp. 68-70, 1 fig. How it can be constructed for any given pressure.

Receivers. The Air Receiver—II, Frank Richards. Engr., vol. 127, no. 3311, June 13, 1919, pp. 573-574. Features of two-stage compressor arrangement.

CORROSION

Calcium Chloride. Corrosion Tests on Commercial Calcium Chloride Used in Automobile "Anti-Freeze Solutions," Paul Rudnick. Jl. Indus. & Eng. Chem., vol. 11, no. 7, July 1, 1919, pp. 668-670, 3 figs. Reported that aluminum was attacked most severely, iron next, and copper least; rate of corrosion increased sharply on eighteenth to twentieth day of immersion. Composition of solutions varied from 28 to 30 per cent. of calcium chloride and from 0.5 to 3.0 per cent magnesium chloride. Paper read before Div. of Indus. Chemists & Chem. Engrs., at meeting of Am. Chem. Soc.

Conduits. Apparatus for the Prevention of Corrosion in Conduits, Flue-Gas Feed Heaters, Superheaters, Boilers and Steam Turbines (Ueber Apparaite zur Verhutung von Anfressungen in Rohrleitungen, Rauchgasyorwarmern. Ueberhitzern, Dampfkesseln und Dampfturbinen), M. R. Shulz. Zeitschrift fur Dampfkessel u. Maschinenbetrieb, vol. 42, no. 8, Feb. 21, 1919, pp. 49-51, 4 figs. Types described are the Steinmuller, Huismeyer and Balcke apparatus and those made by the Deutsche Sanitatswerke at Frankfort, Germany.

Copper. Corrosion of Copper—VI. Metal Industry, vol. 15, no. 1, July 4, 1919, pp. 8-10, 2 figs. Experiment with sea water, one electrode aerated. From 4th report of Corrosion Committee of Inst. of Metals.

Manganese Bronze. Effect of Corrosion on Wrought Manganese Bronze Under Tensile Stress, P. D. Merica and R. W. Woodward. Am. Mach., vol. 51, no. 5, July 31, 1919, pp. 217-220, 3 figs. Tests claimed to have indicated that proportional limit is to be regarded as maximum safe stress for bronzes of harder tempers, but that it is not certain that this limit may not be slightly exceeded in materials which are soft, i. e., free from work hardness.

Paints. Efficient Protection of Iron and Steel Structures Obtained by Properly Selected Paints, John Grieve. Contract Rec., vol. 33, no. 26, June 25, 1919, pp. 617-619. Functions of various coats and factors governing their efficient application.

Rust Prevention. Rust Prevention, Edward T. Birdsall. Jl. Soc. Automotive Engrs., vol. 5, no. 1, July 1919, pp. 55-57. Classification of rust-proofing processes and enumeration of principal requirements of a rust-prevention process as applied to automobiles, aircraft and other machined and hardened parts.

FORGING

Drop-Stamping. Drop-Stamping, Drop-Forgings, Etc.—IV & V, Joseph Horner. Mech. World, vol. 65 & 66, no. 1694 & 1697, June 20 & July 11, 1919, p. 295 & 18, 14 figs. Method of fastening stamps into anvil and top of steam hammer. Manufacturing operations. (Continuation of serial.)

Forge Shops. An Example of Forge Shop Construction. Iron Age, vol. 104, no. 4, July 24, 1919, pp. 219-223, 7 figs. Arrangement providing for high and economical production.

Forging Plants. Equips Plant to Make Forgings. Mar. Rev., vol. 49, no. 8, August 1919, pp. 384-385, 4 figs. Addition to Camden Forge Co.'s plant to enable it to handle marine forgings besides the railroad work in which plant formerly specialized.

Welding. Fusion Welding Applied to Drop Forgings, S. W. Miller. Iron Age, vol. 104. no. 5, July 31, 1919, pp. 287-293. Oxyacetylene and electric welds and their applicability to defective forgings. Paper read before Am. Drop. Forge Assn.

FOUNDRIES

Automotive Cylinders. Making Automobile Cylinders Without Flasks, Pat Dwyer. Foundry, vol. 47, no. 326, July 1, 1919, pp. 421-425, 9 figs. Cylinders are cast in vertical cores at plant of Buda Co., Harvey, Ill.

Brass Foundries. Materials and Chemicals Used in Brass Foundry Practice, Phosphorus—VII, Charles Vickers. Brass World, vol. 15, no. 7, July 1919, pp. 231-233, 2 figs. Series of articles dealing with history, properties, appearance, physiological action and commercial use of substances commonly employed in brass founding.

Bronze Castings. Cupola Metal for Bronze Castings, Charles Vickers. Foundry, vol. 47, no. 327, July 15, 1919, pp. 479-481,3 figs. Methods used in large Canadian plant.

Bronze Statuary. Foundry Trade Jl., vol. 21, no. 210, June 1919, pp. 383-385, 7 figs. Historical account of industry with reference to composition of bronzes used by ancient craftsmen as determined by recent analytical analysis and standard compositions adopted in various nations. From Stahl and Eisen.

Cupola Practice. Notes on Cupola Practice, J. Bagley. Foundry Trade Jl., vol. 21, no. 210, June 1919, pp. 391-395. Based on operating practice and results obtained at various plants. Paper read before Lancashire Branch of British Foundrymen's Assn.

Die Casting. Modern Developments in Die Casting, Adolph Bregman. Metal Indus., vol. 17, no. 7, July 1919, pp. 327-330, 7 figs. Description of plant of Dochler Die-Casting Co.

Use Die. Casting and Eliminate Machining. Can. Machy., vol.. 22, no. 3. July 17, 1919, pp. 46-47, 4 figs. Viewpoint of Franklin Co. as to why die castings should be used in design of machinery to greater extent than they are at present.

Electric Furnace. Employment of Electric Furnace in Foundry Work (Utilisation du four électrique en fonderie). Fonderie Moderne, no. 2, Feb. 1919, pp. 266-267. Result of experiences had with a 6-ton Héroult furnace. Advantage of electric furnace considered to lie chiefly in reducing cost of production.

French Foundry. Modern French Foundry in Suburbs of Paris, H. Cole Estep. Foundry, vol. 47, no. 326, July 1, 1919, pp. 429-431, and p 437, 17 figs. Equipped with hydraulic molding machines. Special machine mentioned is one which fills both cope and drag flasks with sand simultaneously and rams two parts of mold at one stroke.

Layout. Steel Foundry Opened in Wilkes-Barre, Pa. Iron Trade Rev., vol. 64, no. 26, June 26, 1919, pp. 1677-1678, 3 figs. Plan showing location of furnace with reference to molding and pouring-off floors.

Semi-Steel. Semi-Steel and General Foundry Practice, David McLain. Can. Foundryman, vol. 10, no. 7, July 1919, pp. 180-183. Suggestions in regard to various foundry processes. Address delivered at annual Convention of Southern Metal Trades Assn.

Ship Castings. Eastern Plant Makes Ship Castings, E. C. Kreutzberg. Foundry, vol. 47, no. 327, July 15, 1919, pp. 468-471, 9 figs. Castings for stern frames, anchors, rudders and stems.

Making Castings Used in Ship Construction — V. Ben Shaw and James Edgar. Foundry, vol. 47, no. 326, July 1, 1919, pp. 417-420, 22 figs. Solid and skeleton construction contrasted.

Stem-Piece Casting. Castings for Ship Construction—VI, Ben Shaw and James Edgar. Foundry, vol. 47, no. 327, July 15, 1919, pp. 474-478, 17 figs. Difficulties attendant upon molding and casting three common types of stem pieces are described.

Valve Castings. Producing Sound Nonferrous Castings for Valves, R. R. Clarke. Foundry, vol. 47, no. 326, July 1, 1919, pp. 441-447, 4 figs. With reference to practice of Eagle Brass Foundry Co., Seattle.

Zinc Castings. The Production of Zinc Castings, E. H. Schulz and R. Fielder. Metal Industry, vol. 14, no. 23, June 6, 1919, pp. 461-462, 3 figs. Copper and aluminum, preferably together, are believed to form most suitable metals for alloying with zinc for production of castings. From Giesserie Zeitung.

FUELS AND FIRING

Anthracite Burning. Burning Steam Sizes of Anthracite With or Without Admixture of Soft Coal. Bur. of Mines, technical paper no. 220, reprint of eng. bul. no. 5, prepared by U. S. Fuel Administration 1919, 8 pp., 1 fig. Emphasizes that greatest loss in burning fine anthracite is on account of excess air of fire and advises that best way to keep this down to proper minimum is by using uptake damper, throttled as much as possible so as to produce highest CO_2 with formation of unburnt gases.

Coal Combustion. The Economic Use of Coal for Steam-Raising and House Heating, John Blizard. Can. Dept. of Mines, bul. 28, no. 502, Jan. 30, 1919, 21 pp. General principles of combustion of coal and generation and uses of steam.

Gas Fired Furnaces. The Utilization of Gaseous Fuel in Commercial Practice. With Consideration of the Types of Gas-Fired Furnaces and Methods for Their Control, F. W. Epworth. Gas Jl., vol. 146, no. 2927-2928, June 17 & 24, 1919, pp. 755-759 & 804-806, 9 figs. Gas-fired furnaces are grouped under three main headings—(1) natural-draft furnaces, (2) forced-draft furnaces, and (3) compressed gas and air furnaces. A scheme for placing any furnace in its correct group is developed from this classification. (Concluded).

Gas Fuel. Some Considerations with Regard to Fuel Gas, Fred Crabtree. Proc. Engrs. Soc. Western Pa., vol. 35, no. 3, April 1919, pp. 117-125 and (discussion) pp. 126-139, 1 fig. Based on survey of various works. Remarks refer to stages in manufacturing processes, methods of cleaning and costs.

Holbeck System Pulverized Coal. The Combustion of Powdered Fuel, J. S. Atkinson. Elecn., vol. 82, no. 26, June 27, 1919, pp. 730-732, 2 figs. Details of Holbeck system described and importance of proper design of burner emphasized.

Illinois Coal. Characteristics of Illinois Coal and How to Burn It, T. A. Marsh. Power vol. 50, no. 3, July 15, 1919, pp. 93-95. Relative values of steaming coals their characteristics and analysis.

Lignite. Methods for More Efficiently Utilizing Our Fuel Resources. Arthur V. White General Elec. Rev., vol. 22, no. 6, June 1919, pp. 465-474. Steps being taken in Canada toward development of vast deposits of lignite in Saskatchewan and Alberta.

Low-Grade Fuels. Problems in the Utilization of Fuels, Raymond F. Bacon and William A. Hamor. Jl. Soc. Chem. Indus., vol. 38, no. 12, June 30, 1919, pp. 161T-168T. Problems to be found in developing methods for utilizing various low-grade fuels, with notes on work done in this direction both in Europe and America.

Oil Fuel. The Utilization of Oil as Fuel (Neues uber Oelfeuerung), Petroleum, vol. 14, no. 14, Apr. 15, 1919, pp. 658-661, 6 figs. Koerting steam jet sprayer, centrifugal atomizers; oil-fired crucible furnace for melting tungsten; air atomizers.

Powdered Coal. *See Pulverized Coal.*

Pulverized Coal. Firing Boilers with Powdered Coal, L. C. Harvey. Blast Furnace & Steel Plant, vol. 7, no. 7, July 1919, pp. 352-353, 2 figs. Also Elecn., vol. 82, no. 26, June 27, 1919, pp. 740-741, 1 fig. Points out that it is essential to provide sufficient combustion area per pound of coal burned per unit time; otherwise ash is not deposited in slag chamber. " Fuller " powdered coal equipment.

See also Holbeck System.

Pulverized Coal as a Fuel, N. C. Harrison. Mech. Eng., vol. 41, no. 8, August 1919, pp. 645-649. Review of uses in industries. Report of tests of 468-hp. Edge Moor boiler with pulverized-coal equipment is included.

Pulverized Coal for Stationary Boilers. Fred'k A. Scheffler and H. G. Barnhurst. Mech. Eng., vol. 41, no. 8, August 1919, pp. 650-652. Comparison of stoker and pulverized-fuel plants with particular reference to reliability, cost, adaptability and efficiency.

Smoke Prevention. Fuel Economy and Smoke Prevention. Can. Ry. & Mar. World, no. 257, July 1919, pp. 357-361, 3 figs. Report of Mech. Section Committee of Am. R.R. Assn.

Spontaneous Combustion. " Spontaneous Combustion," Especially with Reference to Ships' Cargoes. Coal, Charcoal, Cotton, and Textile Fibres Generally; Hay, Tobacco, and Certain Chemicals; Dyestuffs and Pigments, etc., Watson Smith. Jl. Roy. Soc. Arts, vol. 67, no. 3474, June 20, 1919, pp. 500-507. Study of causes producing it based on records of accidents as reported in various publications.

FURNACES

Brickwork, Coke-Oven. Patching of Jamb Leaks on Coke-Oven Brickwork, R. L. Fletcher. Gas Age, vol. 44, no. 1, July 1, 1919, pp .15-17, 5 figs. Blowing material into crack in just sufficient quantity to insure getting inner part of joint filled while outer part will be covered by hand work.

Gas Burners. The Development of Gas Burners for Industrial Purposes (Zur Entwicklungsgeschichte der Gasbrenner fur industrielle Feuerungsanlagen), Dr. Gwosdz. Feurengstechnik, vol. 7. nos. 9 10, Feb. 1 & 15, 1919, pp. 69-71 and 78-80, 9 figs. Description of burners developed by Gesellschaft Westfälische Maschinenbau-Industrie Gustav Moll & Co. Type described is principally used for heating steam boilers.

Heat-Treating Furnaces. Heating Furnaces and Annealing Furnaces — VII, W. Trinks. Blast Furnace and Steel Plant, vol. 7, no. 7, July 1919, pp. 321-324, 7 figs. Curves are given for finding recuperator surface for any recuperative furnace.

Anchor Chain Heat Treating Furnaces, T. F. Baily. Blast Furnace & Steel Plant, vol. 7, no. 7, July 1919, pp. 329-330. Heat-treating rails in electric furnaces suggested.

Continuous Furnaces for Heating Forgings. Blast Furnace & Steel Plant, vol. 7, no. 7, July 1919, pp. 346-348 2 figs. " Oilgas " type. Advantages claimed are uniform heating, maximum economy and constant production.

Kilns. What to Consider in the Design and Layout of Periodic Kilns, T. W. Garve. Brick & Clay Rec., vol. 55, no. 1, July 1, 1919, pp. 29-35, 19 figs. Comparison of various arrangements.

GAGES

Gage Making. Various Examples in the Art of Gauge Marking, H. G. Robson. Can Machy., vol. 22, no. 1, July 3, 1919, pp. 9-12, 33 figs. Illustrating particularly modus operandi rather than extent of calculations required.

Hoke Gages. A Millionth of an Inch. How the Wave-Length of Light is Used to Detect Errors of This Infinitesimal Amount. Sci. Am., vol. 121, no. 3, July 19, 1919, pp. 62-63, 8 figs. Light-interference method of measuring gages developed by Bur. of Standards. Apparatus for throwing beam of monochromatic light and photograph of interference fringes thus obtained are illustrated.

Thread Gages. Improved Design of " Not Go " Thread Gage, II, L. Van. Keuren and I. H. Fullmer. Machinery, vol. 25, no. 11, July 1919, pp. 1076-1077, 2 figs. Thread form.

GAS ENGINEERING

Carbonizing Plants. Carbonizing Plants of the Future, Having Regard to the Scarcity of Labor, and the Gas Best Fitted to the Consumer, H. D. Madden. Gas. Jl., vol. 146, no. 2928, June 24, 1919, pp. 809-810, and (discussion) pp. 810-811. Gas best suited to consumer is believed to be one having for its basis a heating standard. Paper read before Wales and Monmouthshire District Instn. of Gas Engrs.

Gas Investigating Committee Report. Second Report of the Gas Investigating Committee, Gas World, vol. 70, no. 1819, May 31, 1919, pp. 429-440, 16 figs., and Gas Jl., vol. 146, no. 2925, June 3, 1919, pp. 607-619, 16 figs. Data with regard to performance of gases of relatively low colorific value. Tests were made with ring and incandescent burners of various types. Account of tests on relative efficiencies in use of different grades of gas continued from first report.

Governors. A New Governor for Close Pressure Regulation of Gas Exhausters and Boosters. Chem. & Metallurgical Eng., vol. 21, no. 2, July 15, 1919, pp. 99-100, 2 figs. Two-fold type, provided with compensating return.

PROVIDENCE GAS COMPANY. Manufacturing Plant of the Providence Gas Co. — I & II, Walter M. Russell. Chem. & Metallurgical Eng., vol. 21, no. 1 & 2, July 1 & 15, 1919, pp. 34-39 & 88-95, 19 figs. Water and producer-gas machinery and apparatus. Measuring and recording instruments. Review of gas industry in Providence. Paper read before Am. Inst. of Chem. Engrs.

WATER GAS. Exhaust Steam in Water Gas Machines, Raymond L. Green. Gas Age, vol. 44, no. 1, July 1, 1919, pp. 1-5, 7 figs. Results obtained in actual experience.

HANDLING OF MATERIALS

BUNKERING. *See Coal Handling.*

COAL HANDLING. Coal-Handling Plant at Pembrey. Engineering, vol. 108, no. 2793, July 11, 1919, pp. 38-41 and 50, 29 figs., partly on supp. plate. Equipment designed to permit delivery to be made (1) direct from coal wagon to boiler-house overhead coal bunker, (2) from coal wagon to reserve coal store, or (3) from reserve coal store to overhead coal bunker, leaving clear way for (4) trucking on portable railway or wheeling coal into boiler-house at stoking-floor level, for providing machinery in case of breakdown of mechanical plant.

A British Plant for Handling Domestic Coal, H. Hubert. Coal Trade Jl., vol. 50, no. 28, July 9, 1919, pp. 835-837, 3 figs. Description of tidewater coal plant for handling domestic grades and notes on difference between American and British systems of handling.

Bunkering Big Ships, J. F. Springer. Sci. Am., vol. 108, no. 2, July 12, 1919, pp. 34-35, 3 figs. Conveyor apparatus for moving coal from barge to bunker and distributing it evenly in bunker.

Mechanical Coaling Stage at Hull, North Eastern Railway. Ry. Gaz., vol. 30, no. 26, June 27, 1919, pp. 1027-1029, 5 figs. Coal is emptied from wagons into underground hopper, from which it is mechanically elevated to overhead storage bunkers which are provided with chutes for delivering it to various locomotives as required.

The Atlas Coal Co.'s Plant at Louisville, Ky. Coal Trade Jl., vol. 50, no. 27, July 2, 1919, pp. 806-808. Installation of two 50-ton hoppers.

GRAIN LOADING. Mechanical Grain Loading Devices on the Roumanian Danube, Eng. & Indus. Management, vol. 2, no. 1, July 3, 1919. pp. 28-31, 6 figs. Floating grain elevators and pneumatic unloading plant. (Continuation of serial).

OIL, VEGETABLE, HANDLING. Handling Vegetable Oils at Pacific Coast Port Terminals Eng. News-Rec., vol. 83, no. 5, July 31, 1919, pp. 204-207, 5 figs. Layout of Philippine Vegetable Company's terminal at San Francisco.

ORE, UNLOADING. Unloading Ore Quickly and Cheaply. Elec. Rev., vol. 75, no. 2, July 12, 1919, pp. 56-59, 3 figs. How iron ore is unloaded from lake steamers by means of electrically operated automatic ore unloaders.
See Unloading Machines.

SHELL PARTS, HANDLING. Making Three Million Trench Mortar Shells, E. C. DeWolfe. Iron Age, vol. 104, no. 1, July 3, 1919, pp. 1-7, 12 figs. System of convoyors, belt, roller, gravity and slat, used in transfer of parts from operation to operation, until delivery of completed and boxed shells to freight cars.

UNLOADING MACHINE. A Rapid Unloading Machine. Coal Age, vol. 16, no. 5, July 31, 1919, pp. 188-190, 2 figs. Wellman-Seaver-Morgan Co. Machine consists of main framework mounted on trucks which travel along runway rails. Design is heavy.

Description of Automatic Ore Unloader, Blast Furnace and Steel Plant, vol. 7, no. 7, July 1919, pp. 317-320, 4 figs. Unloader consists of main framework mounted on trucks which travel along railway rails; hoisting mechanism is located in enclosed house at rear end of walking beam.

HEAT-TREATING

CASE-HARDENING. Improved Case-Hardening Process. Iron Age, vol. 104, no. 3, July 17, 1919, pp. 163-165, 5 figs. Slow cooling of nickel-steel gears for automobile and airplane engines prevents flaking and chipping. Paper read before Iron & Steel Inst.

Modern Practice in Case-Hardening, A. Best. Machy. (Lond.), vol. 14, no. 354, July 10, 1919, pp. 436-439, 5 figs. Material suitable for carburizing and notes on selection of carburizing furnace.

CAST IRON, GRAPHITIZATION OF. Graphitization of White Cast Iron Upon Annealing, Paul D. Merica and Louis J. Gurevich, Bul. Am. Inst. Min. & Metallurgical Engrs. no. 151, July 1919, pp. 1063-1072, 7 figs. Annealing ranges of temperatures determined for three different compositions used for car wheels.
See also Metallurgy, Iron and Steel (graphitization).

CAST IRON, GRAY. The Heat Treatment of Grey Cast Iron at Low Temperatures, J. E. Hurst. Eng., vol. 108, no. 2792, July 4, 1919, pp. 1-3, 2 figs. Results of experiments of heat treatment at temperatures of 575 to 600 deg. cent. of a series of commercial cast-iron bars.

CHROME-NICKEL STEEL. Heat Treating Chrome Nickel Steel, with Special Reference to Impact Testing, Mr. Loudenbeck. Proc. Steel Treating Research, vol. 2, no. 5, 1919, pp. 18-24 & 54, and 58, 7 figs. Photomicrographs of pieces tested under both high and low impact.

ELECTRICAL HEAT TREATMENT OF STEEL. Electrical Heat Treatment of Steel, H. P. MacDonald. J. Soc. Automotive Engrs., vol. 5, no. 1, July 1919, pp. 69-74, 10 figs. Processes developed at plant of Snead & Co. Iron Works, Jersey City.

HARDENING STEEL. Modern View of the Hardening of Steel, Haakon Styri. Jl. Am. Steel Treaters Soc., vol. 1, no. 9, June 1919, pp. 286-298, 14 figs. Review of facts occuring when steel is heated and cooled, with reference to what takes place when steel is hardened.

HEAT TREATING PLANTS. A Complete and Modern Heat-Treating Plant, L. A. Danse. Am. Mach., vol. 51, no. 4, July 24, 1919, pp. 149-160, 24 figs. Structural features of building and details of equipment of Lincoln Motor Co. plant.

HIGH-SPEED STEEL. The Heat Treatment of High Speed Steel, C. U. Scott. Jl. Am. Steel Treaters Soc., vol. 1, no. 9, June 1919, pp. 299-301. Recommendations in regard to various operations in process of heat-treating.

MALLEABLE IRON. Experiments in Annealing Malleable Iron, H. E. Diller. Can. Foundryman, vol. 10, no. 7, July 1919, pp. 184-186, 4 figs. While manner in which annealing process is proceeded with is considered of vital importance, it is further observed that proper analysis of raw material must not be neglected.

RAILROAD MATERIALS. Heat Treatment of Railroad Materials, C. B. Bronson. Ry. Rev., vol. 65, no. 2, July 12, 1919, pp. 71-73. Also Iron Age, vol. 104, no. 1, July 3, 1919, pp. 25-27. Practice of New York Central RR., particularly in use and treatment of manganese-steel rails, carbon and alloy steel axles, tires and cast-steel wheels. Paper presented before N. Y. Cap. Am. Steel Treaters' Soc.

SIZE IN HEAT TREATMENT. Relative Size in Heat Treatment, T. G. Straub. Iron Age, vol. 104, no. 3, July 17, 1919, pp. 167-168. Conclusion is drawn from experiments that in actual practice large forgings required considerable judgment regarding heat treatment in order to bring desired results.

STEEL, MEDIUM-CARBON. Effect of Time and Low Temperature on Physical. Properties of Medium-Carbon Steel, G. A. Heinhardt and H. L. Cutler. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 151, July 1919, pp. 1091-1098. Test to determine cause of difference in elongation and reduction of area shown by core tests made directly after drilling and machining and of core tests that had rested after these operations.

HEATING AND VENTILATION

GAS AND ELECTRIC HEATING COMPARED. Comparative Cost of Electric and Gas Heating (Prix de revient comparés du chauffage électrique et du chauffage au gaz). Ach. Delamarre. Revue Générale de l'Electricité, vol. 6, no. 2, July 12, 1919, pp. 45-47, 1 fig. Graph based on assumption that kilowatt-hour and cubic meter of gas are sold at the same price.

SCHOOLS. New Heating and Ventilating System for Chicago Schools, John Howatt. Power, vol. 50, no. 3, July 15, 1919, pp. 109-110, 1 fig. Piping layout designed by Bureau of School Engineering, Chicago.

WORKSHOPS. The Heating and Ventilation of Workshops—II. Engr., vol. 127, no. 3312, June 30, 1919, pp. 599-602 and 608, 12 figs. System employed in works of Austin Motor Co. Ltd.

Heating of Large Industrial Plants (Chauffage des Grands Locaux Industriels, Utilisation du chauffage comme régulateur de charge des centrales électriques), M. A. Beaurrienne, Mémoire et Compte rendu des Travaux de la Société des Ingénieurs Civils de France, Bulletin, vol. 8, no. 1, 2 & 3, Jan.-Mar. 1919, pp. 49-77, 10 figs. Technical study of comparative economy of various systems of heating.

HOISTING AND CONVEYING

BELT CONVEYOR, STEEL. The Steel Belt Conveyor, or How the Rubber Shortage Can be Met by Employing Flexible Steel Bands. Eng. & Indus. Management, vol. 1, no. 19, June 19, 1919, pp. 605-609, 12 figs. Concerning flexible Swedish steel bands known under the name "Sandvik."

BARNARD'S AUTOMATIC GRAB' "Bernard's Automatic Grab," G. F. Zimmer. Eng. & Indus. Management, vol. 2, no. 1, July 3, 1919, pp. 25-27, 6 figs. It works on hlock-and-tackle principle. Light self-weight for given capacity claimed as important feature.

CABLE TRANSPORTATION. Aerial Cable Transportation (Transporte aereo por cable), Walter C. Kretz. Ingenieria Internacional, vol. 2, no. 1, July 1919, pp. 13-17, 7 figs. As auxiliary service in railway and steamship trafic. Application in mines.

CRANES, LADLE, MAIN HOISTS FOR. Main Hoists for Open Hearth Ladle Cranes, W. W. Garrett, Jr. Jl. Engrs. Club of Philadelphia, vol. 36, no. 177, August 1919, pp. 319-321. Tests made on main hoists of two overhead electric traveling open-hearth ladle cranes.

CRANES, PONTOON. Designs Massive Pontoon Cranes. Mar. Rev., vol. 49, no. 8, August 1919, pp. 372-373, 2 figs. Revolving crane of 150-ton capacity recently installed at Navy Yard, Norfolk, Va.

HOISTING BUCKET. Handling Materials in Construction of New York Hotels. Eng. News-Rec., vol. 83, no. 5, July 31, 1919, pp. 222-223, 3 figs. Type of hoisting bucket designed, it is said, to prevent excessive vibration of steel frame. Cost figures.

HOISTING EQUIPMENT, ELECTRIC. Electric Hosting Equipment at the Butte & Superior Mine, Oliver E. Jager. Min. & Sci. Press, vol. 119, no. 1, July 5, 1919, pp. 18-21, 3 figs. Historical account o its installation.

SWING-SPAN BRIDGES. Protecting Platforms and Fenders for Swing Span Bridge. Commonwealth Engr., vol. 6, no. 8, Mar. 1, 1919, pp. 242-244, 2 figs. Particulars of piers.

HYDRAULIC MACHINERY

GOVERNORS, HYDRAULIC TURBINE. The Seewer Universal Governor for High-Pressure-Pelton Turbines (Universal Regulierung System Seewer fur Hockbruck-Pelton-Turbinen), Franz Prasil. Schweizerische Bauzeitung, vol. 73, no. 22, May 31, 1919, pp. 251-254, 8 figs. Details of method of regulating by changing cylindrical jet to one of hollow conical type.

GROUND WATER MOVEMENT. Ground Water Movement Between Canals with a Different Water Level (Grondwaterbeweging tusschen kanalen met verchillende waterstanden), J. Versluys. Ingenieur, vol. 34, no. 24, June 14, 1919, pp. 454 456. Questions to be considered when planning irrigation or drainage canals.

PIPE, WOOD-STAVE. Extension to the Ontario Power Co.'s Plant. Contract Rec., vol. 33, no. 29, July 16, 1919, pp. 685-693, 15 figs. Features particularly remarked are wood-stave pipe 13½ in. in diameter and 6,700 ft. long, dimensions of differential surge tank, and power house with walls designed to withstand 40 ft. rise in tail water.

PIPES. Diagrams for Excess Loss of Head in Pipe Lines, Frank S. Bailey. Eng. News-Rec., vol. 83, no. 4, July 24, 1919, pp. 162-163, 2 figs. For determining losses due to 90 deg. bends, increasers, gate valves, reducers and branches.

PIPE, VELOCITY OF WATER IN. Hexagonal Chart for Finding Velocity of Water in Pipes, C. Warrington Anthony. Eng. News-Rec., vol. 83, no. 4, July 24, 1919, p. 169. Diagram embraces six variable quantities without using a single curve.

SPAIN. Hydro-Electric Central Station at Seros (Spain) Le station centrale de Seros (Espagne). Génie Civil, vol. 74, no. 26, June 28, 1919, pp. 517-521, 8 figs. Illustrating Escher Wyss 14,500-hp. vertical turbines used in installation.

TURBINES, HYDRAULIC. New Kern River Development, G. E. Armstrong. Elec. World, vol. 74, no. 3, July 19, 1919, pp. 116-118, 3 figs. Francis turbines to operate under head of 800-ft. at Southern California Edison plant. Two turbines, each with two runners and distributers, furnisb 32,000-kw. energy of eitber 50 cycles or 60 cycles at maximum efficiency.
See also Governors.
Break in No. 2. Hydraulic Turbine at Wachusett Power Station, Clinton, Mass., William E. Foss. N. E. Water Works Assn., vol. 33, no. 2, June 1919, pp. 143-152, 5 figs. Section of scroll case blew out immediately after pulling out governor clutch to change from automatic to hand control. Accident attributed to sudden closing of gates causing sufficient water ram to break casting.

WATER HAMMER. Water Hammer in Conduits Under Pressure (Note sur le calcul du coup de bélier dans les conduites sous pression), Ed. Carey, Bulletin Tecbnique de la Suisse Romande, vol. 45, nos. 11 & 13, May 31 and June 28, 1919, pp. 102-104, and 122-127, 8 figs. Distribution of force along conduits. In two cases when distributor is open and when sluice is opened suddenly. (Continuation of serial.)

INTERNAL-COMBUSTION ENGINES

ACETYLENE. Acetylene as a Motor Fuel (Das Azetylen als Motorenbetriebsstoff), A. Wimplinger. Dinglers Polytechnisches Journal, vol. 334, no. 5, Mar. 8, 1919, pp. 50-51, 1 fig. Changes necessary in gasoline motor if acetylene is to be used as fuel; automobile using acetylene. Developments along this line in Switzerland.

ALCOHOL. Alcohol as Motor Fuel. Autocar, vol. 43, no. 1237, July 5, 1919, pp. 10-11. Summary of report of Government Alcobol Committee. Report does not specifically advocate modification of engines so as to use alcobol but favors ratber employment of alcohol mixtures in existing engines.

BOLINDER MARINE ENGINE. The Bolinder Crude Oil Marine Engine. Mar. Eng. & Can. Mercbant Service Guild Rev., vol. 9, no. 7, July 1919, pp. 236-238, 5 figs. Fuel is mixed with compressed air before injecting it in cylinder. special nozzle being used for this purpose. Engine is manufactured by Bolinder Co. of Stockholm, Sweden.

CARBURETOR PERFORMANCE STANDARD. Standards of Carburetor Performance, O. C. Berry. Mecb. Eng., vol. 41, no. 8, August 1919, pp. 674-678, 12 figs. List of essential factors to proper carburetion and record of experimental data.

CYCLES, FUTURE. Working Processes of Future Internal Combustion Engines, C. A. Norman. Jl. Soc. Automotive Engrs., vol. 5, no. 1, July 1919, pp. 3-12, 10 figs. Theoretical and practically attainable energy utilization of engines and turbines of the compression, explosion and evaporation types are given.

DESIGN. An Unconventional British Engine. Automotive Industries, vol. 41, no. 1, July 3, 1919, pp. 27-28, 5 figs. Aluminum jackets witb cast-iron cylinder sleeves inserted.

DIESEL-ENGINE REGULATION. Kinematics of Diesel Motor Regulation (Studio cinematico della regolazione nei motori Diesel), Guglielmo Piperno. Industria, vol. 33, no. 10, May 31, 1919, pp. 292-297, 12 figs. Calculations and diagrams for studying operation of valves.

DIESEL ENGINES. A British 400 H.P. Highspeed Diesel Engine. Motorship, vol. 4, no. 8, August 1919, pp. 46-47, 2 figs. Details and trial results of Armstrong-Whitworth type used in British submarines.
Piston and Valve Cooling in Diesel Engines. Motorship, vol. 4, no. 8, August 1919, pp. 36-37, 9 figs. Examples of designs in use. (Concluded.)

DIESEL ENGINES WITH SUPERCOMPRESSED AIR INJECTION. Super-Compressed-Air Applied to Solid-Injection Diesel Engines, Chas. G. Barrett. Motorship, vol, 4, no. 8, August 1919, pp. 43-44, 1 fig. Recommends compressing small portion of air in cylinder walls to pressure considerably in excess of prevailing compression pressure of engine and describes arrangement for effecting this compression.

EXHAUST UTILIZATION. Plan to Use Exhaust Heat in Vaporization of Low Grade Fuels, F. C. Mock. Automotive Indus., vol. 41, no. 3, July 17, 1919, pp. 110-114, 4 figs. Curve claimed to simplify computation of air velocity.

GAS ENGINES. Operation of Large Gas Engines, Frank Foster. Power, vol. 50, no. 3, July 15, 1919, pp. 100-102. Considerations in regard to valve timing, ignition timing, overrating of power and blower engines.

KEROSENE ENGINE RATING. Suggested Formula for Rating Kerosene Engines, D. L. Arnold. Mech. Eng., vol. 41, no. 8, August 1919, pp. 672-673. Suggests tbat piston displacement of 13,000 cu. in. per min., be taken as one brake horsepower.

LUBRICATION. *See Oiling.*

MOTOR-SHIP ENGINES. Internal Combustion Engine on the Pacific Coast, George Dow. Jl. Electricity, vol. 43, no. 1, July 1, 1919, pp. 27-29, 3 figs. With particular reference to motorship installation.

OILING. Accessible Oiling System Features New Allen Engine. Automotive Indus., vol. 41, no. 3, July 17, 1919, pp. 106-107, 4 figs. New engine bas bore of 3½-in. and stroke of 5-in., its four cylinders being cast in block.

STILL ENGINE. A New Prime Mover of High Efficiency, Frank E. D. Acland. Motorship, vol. 4, no. 7, July 1919, pp. 25-27, 6 figs. Still-Acland combination type steam and Diesel engine. Consumption of 0.302 lb. of fuel oil per sbaft bp. said to be obtained. From paper read before Roy. Soc. Arts.

TANK MOTORS. Motors Used in British Tanks (Moteurs Thermiques), Génie Civil, vol. 75, no. 1, July 5, 1919, pp. 14-16, 1 fig. Motors are six-cylinder, of 158 bp. Construction of piston, wbich is provided witb inner structure for gliding in cylinder guide and acting as crosshead, noted as special feature.

TORQUE RECOIL. Torque Recoil and Car Weight, L. H. Pomeroy. Jl. Soc. Automotive Engrs., vol. 5, no. 1, July 1919, pp. 45-47. Factors governing torque recoil, particularly in multi-cylinder engines.

TRACTOR ENGINES. The Royal Agricultural Sbow—I. Engr., vol. 127, no. 3313, June 27, 1919, pp. 627-630, 10 figs. Notes on oil engines and tractors driven by gasoline exhibited at annual show at Cardiff.

TREGO COMPANY ENGINES. Valve-in-Hand and "L" Engines Built of Common Parts, P. M. Heldt. Can. Machy., vol. 22, no. 4, July 24, 1919, pp. 157-161, 10 figs. Twin six-cylinder models being built by Trego Motors Corp. Oil distributing pipes cast in crankcase and arrangement for hot spots in manifold quoted as notable features.

VALVE SETTING. Valve Setting. Automobile Engr., vol. 9, no. 128, July 1919, pp. 231-232, 4 figs. Systems for defining timing.

LUBRICATION

CARBONIZATION. Carbonizing in Valve Chambers and Cylinders, F. P. Roesch. Ry. Rev., vol. 65, no. 1, July 5, 1919, pp. 30-33, 4 figs. With respect to use of relief and drifting valves for overcoming carbonizing troubles in lubrication. Paper read before Am. R.R. Assn.

FRICTION, STATIC. Note on Static Friction and on the Lubricating Properties of Certain Chemical Substances, W. B. Hardy and J. K. Hardy. Lond., Edinburgh and Dublin Phil. Mag., vol. 38, no. 223, July 1919, pp. 32-48. Examining further Lord Rayleigh's experimental research into the reason why "a few drops of water wetting the parts in contact will prevent a cup of tea from slipping about in a saucer." (Phil. Mag., Febr. 1918.)

MITCHELL THRUST BLOCK. *See Pressure-Film Lubrication.*

OIL GROOVES. Arrangement of Oil Grooves (Die Anordnung der Schmiernuten), W. Kucharski. Dinglers Polytechnisches Journal, vol. 334, nos. 1 & 2, Jan. 11 & 25, 1919, pp. 2-4 and 14-16, 7 figs. Critical discussion of Renolds' theory of lubrication friction. Experiments made by writer especially witb reference to temperature changes and thickness of layer of lubricant.

PRESSURE-FILM LUBRICATION. The Michell Thrust Block, J. Hamilton Gibson. Eng., vol. 107, no. 2789, June 13, 1919, pp. 765-768, 19 figs. Application of pressure-film lubrication principle to tbrust bearing. Paper read before Instn. Naval Architects.

VISCOSITY. Lubrication in the Power Plant, J. D. Roberts. Power, vol. 50, no. 4, July 22, 1919, pp. 134-135. Tests suggested to determine viscosity of lubricants.
See also Internal-Combustion Engineering (Oiling).

MACHINE ELEMENTS AND DESIGN

BEARINGS. Ball and Roller Bearings, J. H. Swan. Automobile Engr., vol. 9, no. 128, July 1919, pp. 200-204, 5 figs. Consideration of tbeir behavior when subjected to centrifugal loads. From data compiled in records of Technical Dept., Aircraft Production, Min. of Munitions.
Load-Carrying Possibilities of Angular-Contact Ball Bearings, F. C. Goldsmith. Jl. Soc. Automotive Engrs., vol. 5, no. 1, July 1919, pp. 49-53, 8 figs. Writer analyzes possibilities of angular-contact type of bearing, and tries to determine the load-carrying powers of such bearings, both for axial (thrust) loads as well as for radial loads and to determine tbe law of variation of load-carrying capacity in such a bearing.

CAMS. Analytical Method of Investigating Motion produced by Cams, B. C. Carter. Automobile Engr., vol. 9, no. 128, July 1919, pp. 209-210, 3 figs. Direct-attack cams and flat tappets.
A New Design for a High-Speed Inlet Cam, H. S. Burdett. Automobile Engr., vol. 9, no. 128, July 1919, pp. 224-230, 8 figs. Exemplifying manner of proceeding in actual case. Paper presented to Instn. Automobile Engrs.

CRANKSHAFTS, POWER-PRESS. The Strength of Power-Press Crankshafts, W. J. Smith. Machinery (Lond.), vol. 14, no. 351, June 19, 1919, pp 337-340, 5 figs. Method of determining approximately safe working loads. Following types of crankshafts are dealt with: overhanging, single-throw, double-throw, double-tbrow with central support, and double-throw with two supports. Stresses considered are those caused by actual blow or load on sbaft.

GEAR DESIGN. Involute Gear Tooth Contact, A. Fisher. Machy. (Lond.). vol. 14, no. 354, July 10, 1919, pp. 456-460, 3 figs. Technical study of relation of gear diameters, number of teeth and line of action. Derivation of interference formulæ and contact formulæ.

GEARS, BEVEL. The Correction of Spiral and Straight Bevel Gears. Machinery (Lond.), vol. 14, no. 352, June 26, 1919, pp. 368-369. Table intended to be used in conjunction with a pressure angle of 14½ deg.

MICHELL THRUST BEARING. Development of tbe "Michell" Marine Thrust Shaft Bearing, J. Hamilton Gibson. Shipping, vol. 8, no. 1, July 5, 1919, pp. 17-19, 13 figs. Said to be built on principle of application "pressure oil film lubrication" to thrust bearing. Paper read before Instn. of Naval Arcbitects.
See also Lubrication (Pressure-Film Lubrication).

PISTON RINGS. A Novel Two Part Piston Ring, Ellsworth Sheldon. Am. Mach., vol. 51, no. 5, July 31, 1919, pp. 199-202, 10 figs. Consists of outer part of soft gray iron perfoming usual function of piston rings, and an inner ring of tempered steel which furnishes tension necessary to hold outer part in contact with cylinder walls.

SNAP VALVE RINGS. Use of Bronze for Snap Valve Rings and Piston Surfaces. C. E. Fuller. Ry. Rev., vol. 64, no. 26, June 28, 1919, pp. 992-994, 1 fig. Experience of Union Pacific Ry. in reducing piston and valve ring wear by introducing bronze as-material for those parts. Bronze-faced pistons when worn are built up by autogenous welding processes. Paper read before Am. R.R. Assn.

WILLIAMS-JANNEY SPEED GEAR. Applications of the Williams-Janney variable Speed Gear. Eng., vol. 107, no. 2790, June 20, 1919, pp. 794-796. Examples of application to traction purposes. (Concluded.)

MACHINE SHOP

BROACH. A Special Tension Broach. Machy. (Lond.), vol. 14, no. 354, July 10, 1919. pp. 434-435, 3 figs. Claims that method of slotting may be greatly cheapened by roughly slotting to within 0.02 in. of finished size; then by pulling a series of broaches through the work a fine finish may readily be obtained and of correct size.

CHUCKING. Chucking Methods. Machy. (Lond.), vol. 14, no. 353, July 3, 1919, pp. 424-427, 14 figs. Uses to which Coventry's chuck is put.

CONNECTING RODS, MACHINING. Machining Connecting Rods, A. Thomas. Automobile Engr., vol. 9, no. 128, July 1919, pp. 222-223, 9 figs. Operations in making connecting rod for 4-cylinder motor lorry engine from nickel-steel drop forging.

GRINDING. Latest Practice in Cutter Grinding—I & II. Am. Mach., vol. 51, no. 3 & 4, July 17 & 24, 1919, pp. 135-138 & 185-188, 20 figs. Grinding of modern shank and shell end mills, large face mills, side milling cutters and staggered-tooth slotting cutters, as recommended by Cincinnati Milling Machine Co.

Grinding at the C. L. Best Plant. Metal Trades, vol. 10, no. 7, July 1919, pp. 291.294, 10 figs. Arrangement of machines which is said to permit minimum amount of handling.

Cylinder Grinding. Machy. (Lond.), vol. 14, no. 354, July 10, 1919, pp. 440-443, 11 figs. Advantages claimed for finishing cylinder bores by grinding; practice in plants making automobile and airplane engines. (Second article.)

LATHES. Inspection and Adjustment of Lathes. Machy. (Lond.), vol. 14, no. 354, July 10, 1919, pp. 429-433, 7 figs. Alignment tests between different parts and calculations for determining amount of metal to remove for a given adjustment when fitting carriage or headstock to bed.

Inspection and Adjustment of Lathes, James Forrest. Machy. (N.Y.), vol. 25, no. 11, July 1919, pp. 1039-1043, 7 figs. Alignment tests between different parts and calculations for determining amount of metal to remove for a given adjustment when fitting carriage or headstock to bed.

MICROSCOPE IN THE TOOL-ROOM. The Microscope in the Tool-Room, John Scott. Machy. (Lond.), vol. 14, no. 352, June 26, 1919, pp. 370-373, 6 figs. Application of simple and micrometer type microscopes to precision work on master plates and for cutting screw threads.

MILLING, ROTARY. Continuous Rotary Milling—II, Machy. (Lond.), vol. 14, no. 350, June 12, 1919, pp. 305-309, 10 figs. Work-holding fixtures and methods of setting up parts to be milled.

MOTOR DRIVE. New Plant for Manufacturing Radio Apparatus, W. A. Scott. Elec. Rev., vol. 75, no. 3, July 19, 1919, pp. 103-104, 3 figs. Motor drive throughout a feature of plant.

OPERATIONS. A Plea for Better Harmony Between Theory and Practice. Machy. (Lond.), vol. 14, no. 353, July 3, 1919, pp. 397-402, 35 figs. In casting and machining operations with illustrations of actual cases.

PLANER MILLING. Planer Milling Practice in Automobile Plants, Edward K. Hammond. Machy. (N. Y.), vol. 25, no. 11, July 1919, pp. 1044-1049, 9 figs. Also Machy. (Lond.), vol. 14, no. 352, June 26, 1919, pp. 374-379, 8 figs. Milling operations on cylinder blocks and cylinder heads. Second and last article.

STANDARDIZED PART PRODUCTION. Jigs, Tools and Special Machines. Model Engr. & Elecn., vol. 40, no. 944, May 29, 1919, pp. 422-426, 4 figs. With relation to production of standardized parts. Investigating possibilities of continuous cutting with special machine tools. (Concluded.)

MACHINERY, METAL-WORKING

BROACH-MAKING, MATERIALS FOR. Materials for Broach Making. Machinery (Lond.), vol. 14, no. 351, June 19, 1919, pp. 341-343. Former analysis of bar which is said to have been used in making a successful set of 6 broaches, and note on maintenance of broaches.

CHUCKS, MAGNETIC. Relative Characteristics of Magnetic Chucks, Otis Allen Kenyon. Elec. World, vol. 74, no. 1, July 5, 1919, pp. 11-14, 12 figs. Three general types, neutral-pole, single-pole, and multiplepole, intended for holding work on surface grinders, milling machines, planers, etc.

GORTON PLANING MACHINES. *See Planing Machines.*

LATHES. Notes on Capstan and Turret Lathes—I, Joseph Horner. Mech. World, vol. 65, no. 1695, June 27, 1919, pp. 302-303, 3 figs. Features of construction.

Lathe for Cutting Screw Threads on Gauges. Eng., vol. 107, no. 2790, June 20, 1919, pp. 799-801, 10 figs. Lathe consists of rigid cast-iron cylindrical bed, with a portion cut away to allow work to be placed between centers in the head and tailstocks and for the operator to view the work.

MACHINE-TOOL DEVELOPMENTS. Recent Machine Tool Developments—I, Joseph Horner. Engineering, vol. 108, no. 2793, July 11, 1919, pp. 36-38. First article of a series. Classifies and divides subject.

MILLING CUTTERS. Inserted-Tooth Milling Cutters, Joseph Horner. Machinery (Lond.), vol. 14, no. 351, June 19, 1919, pp. 344-347, 28 figs. Illustrating methods of tool fastening and designs of face mills.

Drop-Forging High-Speed Milling Cutters, J. V. Hunter. Am. Mach., vol. 51, no. 4, July 24, 1919, pp. 165-168, 8 figs. Tests made by Ford Motor Co. on high-speed-steel milling cutters.

PISTON-RING TOOLING EQUIPMENT. Tooling Equipment for an Automobile Piston-ring, Thomas Orchard. Machy. (N. Y.), vol. 25, no. 11, July 1919, pp. 1058-1060, 7 figs. Fixture for holding ring and special multiplespindle milling head having capacity for holding two cutters.

PLANERS. Bement Horizontal and Vertical Wall Planer. Machy. (N. Y.), vol. 25, no. 11, July 1919, pp. 1087-1088, 1 fig. Consists of wall plate on which vertical rail is mounted and is so arranged as to permit horizontal and vertical planing.

PLANING MACHINES. The Gordon Planing Machines, J. V. Hunter. Am. Mach., vol. 51, no. 1, July 3, 1919, pp 1-4, 8 figs. Heavy design intended for use without foundation excepting when placed on soil that is soft and yielding.

THREAD-MILLING MACHINE. Continuous Thread Milling Machine of Unusual Design, Machy. (Lond.), vol. 14, no. 350, June 12, 1919, pp. 317-319, 2 figs. Machine is furnished with means for turning bar down to required diameter ready to start thread-milling operation, thus bringing actual center of bar into accurate alignment with milled threads.

THREADING TOOLS. Description of a New Automatic Threading Tool. Can. Machy., vol. 22, no. 2, July 10, 1919, pp. 26-27, 6 figs. In its assembled state it is in two parts; a tool box and an abutment or stop piece.

MACHINERY, SPECIAL

BREAKING MACHINE. Breaking Machine for Handling Frozen Coal, J. P. Considine. Coal Trade, Jl., vol. 50, no. 28, July 9, 1919, pp. 838-839, 3 figs. Said to be capable of breaking up in a few minutes a car of frozen coal.

CRUSHER, GYRATORY. Largest Gyratory Crusher in the World, William B. Eastwood. Cement, Mill & Quarry, vol. 15, no. 1, July 5, 1919, pp. 13-17, 5 figs. Bulldog crusher said to be capable of producing 2500 tons of material per hr.

DRILLING MACHINE. A Small Sensitive Drilling Machine, C. H. Copeland. Model Engr. & Elecn., vol. 40, no. 947, June 19, 1919, pp. 498-500, 3 figs. Designed to be made for greater part from ½-in. standard pipe fittings, only castings being table and driving and jockey pulleys.

MOLTEN-METAL DISCHARGER. Device for the Uninterrupted Discharge of Molten Metals (Eine Vorrichtung zur ununterbrochenen Ausstossung geschmolzener Metalle). Metall-Technik, vol. 45, no. 11-12, Mar. 22, 1919, p. 42, 1 fig. It is claimed that this device does not require complicated pumping apparatus nor special liquids nor any interruption while recharging.

PERIODIGRAPH. The Periodograph, a Decimal Time-Keeping Machine—II, J. V. Hunter. Am. Mach., vol. 51, no. 4, July 24, 1919, pp. 161-164, 17 figs. Milling drilling and inspecting operations.

SAND BLAST. Application of the Sand Blast, H. D. Gates. Compressed Air Magazine, vol. 24, no. 7, July 1919, pp. 9229-9232, 3 figs. Effect of air pressure on abrasive action. From address before Newark Foundrymen's Assn.

TINNING MACHINE. The Thomas & Davies Tinning Machine, Melingriffith Works, Cardiff. Iron & Coal Trades Rev., vol. 99, no. 2679, July 4, 1919, pp. 4-5, 2 figs. Daigrammatic details of tinning machine.

TYPEWRITER MACHINES. Typewriter Mechanism—Typewheel Machines, Nathan Sharpe. Model Engr. & Elecn., vol. 40, nos. 944 and 945, May 29, and June 5, 1919, pp. 426-429, and 444-447, 12 figs. Features of Block machine. Shift Mechanism of Blick. Third article.

EVAPORATORS, VACUUM. Industrial Vacuum Evaporators—IX, Frank Coxon. Mech. World, vol. 66, no. 1696, July 4, 1919, p. 6, 8 figs. Instrument reliability. (Continuation of serial).

MATERIALS OF CONSTRUCTION AND TESTING OF MATERIALS

ABRASIVE WHEELS, TESTING. Testing Machines for Grading Abrasive Wheels, J. H. Vincent. Am. Mach., vol. 51, no. 4, July 24, 1919, pp. 177-179, 7 figs. Machines for testing the cutting or abrasive factor and for abrasive wheels and their degree of hardness.

BALL BEARINGS, MAGNETIC ANALYSIS OF. Application of Magnetic Analysis to the Testing of Ball Bearing Races, R. L. Sanford and M. F. Fischer. Preprint, Am. Soc. for Testing Materials, University of Pa. Topical Discussion on Magnetic Analysis, 1919, pp. 65-75, 4 figs. It is concluded that magnetic properties and in particular coercive force and rotary hysteresis measurements constitute good criteria of degree of hardness of a ball-bearing race.

COIR. The Mechanical Properties of Philippine Coir and Coir Cordage Compared with Abaca (Manila Hemp), Albert E. W. King. Philippine Jl. Sci., vol. 13, Sec. A, no. 6, November 1918, pp. 285-338, 4 figs. Cocoanut fiber in Philippines is extracted in small quantities entirely by retting and beating process. Retted filaments average 228 mm., and machine-cleaned filaments 245 mm. in lengths. Tensile tests conducted on single filaments averaged, it is said, 832 kg. per sq. cm. for retting and 1208 kg. per sq. cm. for machine-cleaned fiber.

COLUMNS, CONCRETE. Hooped Concrete Columns with Cast Iron Cores, L. J. Mensch. Am. Architect, vol. 116, no. 2275, July 30, 1919, pp. 155-162, 4 figs. Testing machine of U. S. Bureau of Standards at Pittsburgh, Pa., and results obtained with it.

GAS TUBING. Flexible Gas Tubing Tests, R. S. McBride and W. M. Berry. Gas Rec., vol. 15, no. 12, June 25, 1919, pp. 393-400, 2 figs. Scope of investigations made by U. S. Bur. of Standards and tentative specifications proposed for criticism before adoption.

Machinability Tests. Machinability Tests on Copper Alloys, Alex. E. Tucker. Metal Industry, vol. 14, no. 25, June 20, 1919, pp. 501-502, 3 figs. Machine for making tests. Its action consists in measuring comparative depth of holes cut in piece under test and standard piece by same number of revolutions o ¼-in. drill under constant load.

Magnetic Analysis. Magnetic Analysis as a Criterion of the Quality of Steel and Steel Products, Chas. W. Burrows and Frank P. Fahy. Preprint, Am. Soc. for Testing Materials, University of Pa., Topical Discussion on Magnetic Analysis 1919, pp. 1-46, 25 figs. Based upon experimental work conducted by writers at U. S. Bur. of Standards. Among objects examined were steel rails, knife blades, drills, etc. Conclusion is reached that there is a very close relationship between magnetic and mechanical characteristics of steel and that the commercial application of this to shop routine is practicable.

Certain Aspects of Magnetic Analysis, C. Nusbaum. Preprint, Am. Soc. for Testing Materials, University of Pa., Topical Discussion on Magnetic Analysis, 1919, pp. 92-112, 8 figs. Methods based on following propositions which, are termed experimental facts: (1) that magnetic properties of steel are indicative of transformations which it undergoes with heat treatment; (2) that definite relationship exists between magnetic and mechanical properties of a steel product.

See also Steel, Rails, Ball Bearings.

Malleable Iron. What and Why is Malleable Iron. H. A. Schwartz. Proc. Car Foremen's Assn. of Chicago, no. 163, May 1919, pp. 20-42 and (discussion) pp. 42-62. Processes of manufacture followed by National Malleable Castings Co , Indianapolis.

Physical Constants for Malleable, H. A. Schwartz. Foundry, vol. 47, no. 327, July 15, 1919, pp. 462-466, 12 figs. Based upon tests made on material described as complying with present specifications. Curves indicate tensile strength in relation to chemical composition and effect of heat on dimensions and tensile strength.

Monel Metal Sheets. Monel Metal Sheets and Their Characteristics. Metal Worker,vol. 92, no. 4, July 25, 1919, pp. 93-95. Some of physical properties mentioned are: Melting point 2480 deg. fahr.; specific gravity, 8.87; modulus of elasticity, 22,000,000 to 23,000,000 lb. per sq. in.

Nickel Steel Some Fatigue Tests of Nickel Steel and Chrome-Nickel Steel, H. F. Moore and Arthur G. Gehrig. Am. Soc. for Testing Materials, University of Pa. Annual Meeting, June 24-27, 1919, pp., 13 5 figs. Results interpreted as indicating that neither static tension tests nor high-stress short-time fatigue tests are a reliable index of fatigue strength of a material under oft-repeated low stresses.

Plates, Flat Steel, Stress Determination in. Further Experiments on Stress Determination in Flat Steel Plates, J. Mongomerie. Eng., vol. 107, no. 2789, June 13, 1919, pp. 786-790, 13 figs. Investigation to determine condition of walls below elastic limit.

Rails, Magnetic Analysis. Magnetic Surveys on New and Failed Rails, P. H. Dudley. Preprint, Am. Soc. for Testing Materials, University of Pa., Topical Discussion on Magnetic Analysis, 1919, pp. 47-63, 9 figs. Possibility is visualized of developing magnetic apparatus for testing railroad axles, crankpins, connecting, parallel and piston rods, etc., without destruction.

Rubber. The Tensile Strength of Rubber-Sulphur Mixtures, O. de Vries and H. J. Hellendoorn. India-Rubber Jl., vol. 57, no. 26, June 28, 1919, pp. 17-19, 4 figs. Stress-strain curves obtained on Schopper testing machine.

Steel, Electric. Electrically-Melted Steel Castings, John A. Holden. Iron & Coal Trades Rev., vol. 98, no. 2677, June 20, 1919, p. 851, 2 figs. Tests obtained from castings made from Héroult steel.

Steel, Magnetic and Mechanical Properties of. A Systematic Investigation of the Correlation of the Magnetic and Mechanical Properties of Steel, N. J. Gebert. Jl. Am. Steel Treaters Soc., vol. 1, no. 9, June 1919, pp. 302-311, 10 figs. Tests with nickel steel, chrome-nickel steel, straight carbon tool steel, and Swedish chrome file steel.

Steel, Time Factor in Tests. Time is Factor in Tests on Steel, G. A. Reinhardt and H. L. Cutler. Iron Trade Rev., vol. 65, no. 3, July 17, 1919, pp. 164-166. Experiments carried on in laboratories of Youngstown Sheet & Tube Co. said to have indicated that specimens of medium-carbon steel show widely varying tensile strengths, influenced by temperature and time elapsing between moment metal, is tested and time it is machined.

Torsion Testing Machine. A Simple Apparatus for Repeated Torsion Test, F. Yamanouchi, (In Japanese), Jl. Soc. Mech. Engrs., Tokyo, Japan, vol. 22, no. 56, Feb. 1919.

MEASUREMENTS AND MEASURING APPARATUS

Brinell Hardness Testing Machine. A New Brinell Hardness Testing Machine, Automobile Engr., vol. 9, no. 128, July 1919, pp. 211-212, 2 figs. "Avery" machine designed on dead-weight lever system.

Dynamometers. Commercial Dynamometers—XII, P. Field Foster. Mech. World, vol. 65, no. 1695, June 27, 1919, pp. 307-309, 3 figs. Torsion meter type. (Continuation of serial).

Manometer, Glass. Glass Manometer with Elastic Walls (Sur un manomètre en verre, à parois élastiques), Georges Baume and Marius Robert. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 24, June 16, 1919, pp. 1199-1201, 3 figs. For measuring pressure of fluids which attack mercury. Fluid does not come in contact with mercury but acts on bulb of thin glass which, by its change in size, forces mercury along vertical tube.

Meters, Gas-Flow. Gas-Flow Meters for Small Rates of Flow. A. F. Benton. Jl. Indus. & Eng. Chem., vol. 11, no. 7, July 1, 1919, pp. 623-629, 6 figs. Resistance-tube flow meter, developed in Bur. of Mines, and specifications for construction, calibration and operation are included, and influence of temperature and pressure changes discussed.

Meters, Steam and Water. The Measurement of Steam and Water in Power Stations, W. M. Selvey. Elecn., vol. 82, no. 26, June 27, 1919, pp. 721-729, 26 figs. After briefly indicating application of Bernoulli's theorem to meters of steam and water, writer discusses various types which he classifies under headings (1) direct weighing, (2) automatic weighing, (3) automatic volume measurements, (4) flow meters, and (5) motor meters.

Steam Meters. Engr., vol. 127, no. 3311, June 13, 1919, pp. 580-582, 8 figs. Kent meters; they depend for their action on law governing volume of a gas which will pass through an orifice in a plate when impelled by a known difference in pressures on opposite sides of plate.

Minimeter. The National Physical Laboratory, Engineering, vol. 108, no. 2793, July 11, 1919, pp. 33-36, 11 figs. Minimeter for slip gages and electric graphite ring furnace. (Continuation of serial).

Pine, Yellow, Shear Tests. Concentrated Load Tests of Yellow-Pine Beams for Shear, L. R. Manville and C. R. Hill. Eng. News-Rec., vol. 83, no. 2, July 10, 1919, pp. 69-71, 4 figs. Results considered as showing previous horizontal shear values used in design too low, and 50 per cent increase is recommended.

Pyrometers. Thermo-Electric Pyrometers for Plant Use, A. O. Ascman. Chem. & Metallurgical Eng., vol. 21, no. 2, July 15, 1919, pp. 85-87, 3 figs. Illustrating temperature millivolt relation for principal types of couples.

Refractometry. Refractometry and Its Applications in Technical Analysis, James C. Philip. Chem. Indus., vol. 38, no. 11, June 16, 1919, pp. 139T-146T and (discussion) pp. 146T-150T, 5 figs. Plan of Pulfrich's refractometer, which is used in examination of liquids and in commercial testing of optical glass; accuracy control in manufacture of Abbe and Pulfrich's refractometer; use of refractometer in determination of protein content of sera, and in examination of chlorhydrin.

Temperature Indicators. Electric Temperature Indicator, Victor H. Todd. Power, vol. 50, no. 5, July 29, 1919, pp. 180-181, 7 figs. Illustrates various methods of applying temperature indicator.

Temperature Indicating and Controlling Systems, Franklin D. Jones. Machy. (N. Y.), vol. 25, no 11, July 1919, pp. 1015-1023, 16 figs. Types of thermoelectric apparatus for indicating and recording temperatures in heat-treating furnaces and for controlling temperatures by signals and by automatic regulation. First of three articles.

Volumeter. Direct Volume-Determination in a Volumeter of the Pycnometer Type, J. B. Shaw, Jl. Am. Ceramic Soc., vol. 2, no. 6, June 1919, pp. 481-483, and (discussion) pp. 483-487, 2 figs. Experimental error obtained in manipulating writer's pycnometer which is described as similar to type developed by H. G. Schurecht. (See Jl. Am. Ceramic Soc., 1, 556, 1918).

MECHANICS

Beam Committee Report. Report of the Beam Committee (Berich des Trägertypen-Ausschusses). Zeitschrift des Roman österr. Ingenieur-und Architekten-Vereins, vol. 70, nos. 51 & 52, Dec. 20 & 27, 1918, pp. 539-542 and 549-555, 11 figs. Tables and equations for angles with equal and unequal legs, Z-bars, Phoenix column sections, etc. (Concluded).

Columns. Résumé of Study on the Resistance of Columns (Résumé d'une étude sur la résistance des colonnes. H. Lefebvre, Mémoires et Compte rendu des Travaux de la Société des Ingénieurs Civils de France, Bulletin, vol. 8, No. 1, 2 & 3, Jan. Mar. 1919, pp. 78-82. Formula for computing dimensions in case of non-homogeneous reinforced-concrete columns and also in case of homogeneous columns.

Girders, Elastic Curve of. The Elastic Curve of Girders with Double Bend (Die elastische Linie des doppelt gekrümmten Trägers), H. Marcus. Zeitschrift fur Bauwesen, vol. 69, nos. 1-3, 1919, pp. 163-179, 15 figs. Regarding deformation, stresses, center of pressure, etc.

Shafting. Shafting Calculations Simplified, H. N. Trumbull. Belting, vol. 15, no. 2, July 20, 1919, pp. 34-37, 3 figs. Charts giving relations between power, shaft diameter, torsional stress and speed.

Stresses, Combined. Combined Stresses, Victor M. Summa, Machinery, vol. 25, no. 11, July 1919, pp. 1061-1062, 2 figs. Application to square and rectangular bars of Rankine's general equations for composition of tensile or compressive stress and of shearing stress acting simultaneously and normally to each other on the same particle of a strained body.

Vibration, Struts. Vibration and Strength of Struts and Continuous Beams under End Thrusts, W. L. Cowley. Proc. Roy. Soc., Series A, vol. 95, no. A 672, June 4, 1919, pp. 440-457, 1 fig. Method of analysis outlined in Proc. Roy. Soc., A, vol. 94, 1918, p. 405, extended to include general problem of vibration of continuous beam simply supported at any number of non-collinear points, external loading being constant longitudinal end thrust, varying from bay to bay and periodic lateral loading. In addition, supports are assumed in state of periodic vibration. Generalized form of equation of three moments is derived and conditions for resonance and crippling are expressed in determinantal form.

MECHANICAL PROCESSES

Boxes, Packing. Balanced Packing-Box Construction. India Rubber World, vol. 60, no. 6. August 1, 1919, pp. 626-628, 4 figs. Investigations and tests to determine box design conducted during war by Forest Products Laboratory.

Crushing, Stone. Plant of Temescal Rock Company, W. A. Scott. Cement, Mill & Quarry, vol. 15, no. 1, July 5, 1919, pp. 19-21, 4 figs. Equipment which is said to permit attainment of high capacity and speed in handling crushed stone and riprap simultaneously.

Drill Chucks, Ettco. Manufacturing the Ettco Drill Chuck. Am. Mach., vol. 51, no. 5, July 31, 1919, pp. 209-212, 10 figs. Chuck consists of five components—body cone screw, jaws, cap and ball thrust bearing operations on each of these are explained.

FILES. Some Points in the Manufacture of Files—III. Machy. (Lond.), vol. 14, no. 350, June 12, 1919, pp. 322-324, 4 figs. Influence of overcut and upcut to axle of file on efficiency of Tool.

GRINDING WOOD PULP. Groundwood Pulpstones. Paper, vol. 24, no. 20, July 23, 1919, pp. 15-20, 4 figs. Experimentation with Canadian sandstone in connection with mechanical grinding of wood pulp.

LENS MANUFACTURE. Making Lenses for Optical Apparatus—I & II (Die Herstellung von Linsen fur optisches Gerät), Reishahs. Deutshe Optische Wochenschrift, nos. 11-12 and 13-14, Mar. 17, and 31, 1919, pp. 67-69, and 83-84, 12 figs. Describes manufacture of lenses, expecially of very large lenses used in astronomic instruments.

LIBERTY MOTOR. Assembling Liberty Motor Cylinders, H. A. Carhart. Am. Mach., vol. 51, no. 1, July 3, 1919, pp. 27-30, 4 figs. Final minor operations before assembling.

MARINE-ENGINE BUILDING. Building Marine Engines on a Quantity Basis, F. B. Jacobs. Mar. Rev., vol. 49, no. 8, August 1919, pp. 388-392 & 397, 5 figs. Assembly operations at works of Hooven, Owens, Rentshler Co., Hamilton, O.

MOTOR-CAR MANUFACTURE. Manufacturing the Chevrolet Motor Car. J. H. Moore. Can. Machy., vol. 22, no. 1, July 3, 1919, pp. 1-7, 10 figs. Steps in production from framework to finished car, ready for shipment.

PEBBLES FOR TUBE MILLS. Mari's Onyx Pebbles for Tube Mills, William B. Eastwood. Cement, Mill and Quarry, vol. 15, no. 2, July 20, 1919, pp. 11-14, 6 figs. Claimed as results of tests that artificial balls from immense onyx deposit in Nevada prove equal to foreign flint product for efficient grinding service in ore and cement plants.

ROLLING MILLS. Rolling Equipment of the Inland Steel Co. Iron Age, vol. 104, no. 3, July 17, 1919, pp. 155-161, 11 figs. Details of 28-in. 32-in. and 40-in rolling mills, motor room and turbine station.

Tho New Steel Works and Rolling Mills of the Witkowitz Iron Works (Die neue Stahlund Walzwerksanlage des Eisenwerkes Witkowitz). Montanistische Rundschau, vol. 11, nos. 7 & 8, Apr. 1-16, 1919, pp. 198-202 and 228-232, 14 figs. Describes rolling mill running at 160 r.p.m. and used for manufacture of channels, beams, rails; tank-plate rolling mill and preheating furnace; yards for storing rails and beams; employees' cafeteria; kitchen for same. (Concluded).

The Morgan Continuous Wire-rod Rolling Mill. Engr., vol. 127, no. 3312, June 20, 1919, pp. 597-599, 16 figs. partly on supp. plates. Plant at Sheffield built in accordance with system developed by Morgan Construction Co. of Worcester, Mass.

Builds Steel Plant in Far East. Iron Trade Rev., vol. 65, no. 4, July 24, 1919, pp. 230-231, 3 figs. General plans of plate and structural mill for Kiushu Steel Works, Japan, which is expected to cost about $3,000,000.

SHEET IRON. Manufacture of Sheet Iron in Southern Russia (La fabrication des tôles minces dans la Russie méridionale), F. Couleru. Génie Civil, vol. 75, no. 1, July 5, 1919, pp. 10-14, 8 figs. Details of processes in manufacture of sheet iron for use in roofs at various works, particularly at plant of Russian Tube Mfg. Co. (To be continued). From Stahl und Eisen.

MOTOR-CAR ENGINEERING

AUTOVAC GASOLINE FEED SYSTEM. The Autovac Petrol Feed System. Autocar, vol. 43, no. 1237, July 5, 1919, pp. 8-9, 4 figs. Mounted in position above level of carburetter is small cylindrical tank divided into two chambers, and so arranged and connected that it utilizes partial vacuum created in induction pipe of engine for supplying continuous stream of gasoline to carburetter from main storage tank regardless of position of latter.

BIANCHI. The New 12 hp. Bianchi. Autocar, vol. 42, no. 1235, June 21. 1919, pp. 971-972, 7 figs. Four eylinders, 65 x 110 mm.; thermo-siphon cooling; single-disk dry clutch.

CARBURETORS. Tests on the Homa Carburetor (Versuch-sergebnisse mit dem Homa-Vergaser). Ing. Praetorius. Motorwagen, vol. 22, no. 7, Mar. 10, 1919, pp. 114-115, 4 figs. Results of tests made. Lowest consumption at various loads and constant speed. Tests made on motor of passenger automobile.

DESIGN. The Relation of Motor Truck Ability to the Trend of Design, Lewis P. Kalb. Jl. Soc. Automotive Engrs., vol. 5, no. 1, July 1919, pp. 18-22, 1 fig. An ability formula is developed, the purpose of which is said to be to determine a factor of experience from which the proper engine size and gear radius can be calculated.

DIFFERENTIALS. Is the Differential Indispensable? (Ist das Differential unentbehrlich?), W. Rödiger. Automobil-Rundschau, vol. 18, nos. 5-6. Mar. 1919, pp. 54-56. Discusses various attempts to replace the differential, as for instance the belt transmission. Special reference is made to the free wheel mechanism.

ENFIELD-ALLDAY. The 10 hp. Enfield-Allday. Autocar, vol. 42, no. 1234, June 14, 1919, pp. 913-916, 9 figs. Chassis fitted with 5-cylinder air-cooled radial power units.

FUEL PROBLEM. The Engine Fuel Problem, Joseph E. Pogue. Jl. Soc. Automotive Engrs., vol. 5, no. 1, July 1919, pp. 14-17, As situation now stands, writer considers that "most effective means for expanding supply of gasoline is throught rapid development of cracking methods of refining whereby gasolino is made from fuel oil and kerosene."

LIBERTY ENGINE APPLICATIONS. Application of Liberty Engine Materials to the Automotive Industry, Harold F. Wood. Jl. Soc. Automotive Engrs., vol.5, no. 1, July 1919, pp. 23-30. Various materials are considered and it is particularly noted that one of the most important developments during the Liberty engine program was the fact that it is not necessary to use a high-analysis alloy steel to secure a finished part which will give proper service.

LOCKS. Foiling the Car Thief. Autocar, vol. 43, no. 1237, July 5, 1919, pp. 12-14, 6 figs. Locking mechanisms, notably Cowey's patent arrangement which, when actuated, short-circuits to earth high-tension leads from magneto to sparking plugs.

MAUDSLAY. Maudslay Industrial Chassis. Motor Traction, vol. 28, no. 747, June 25, 1919, pp. 550-552, 5 figs. Three-four-five-ton chassis, the three-ton having engine of 32 hp. and other engines of 40 hp.

SPYKER. The 13-30 hp. Spyker. Autocar, vol. 43, no. 1238, July 12, 1919, pp. 43-44, 6 figs. Dutch car with engine-operated-type pump.

TIRES. Important and Neglected Features of Tire Maintenance. A. F. Masury. Eng. News-Rec., vol. 82, no. 26, June 26, 1919, pp. 1262-1264, 5 figs. Effects of overloading, overspeeding, running in car tracks, neglecting cuts and tears, spinning, skidding and sliding, and wheel misalignment.

TRACTORS. Agricultural Tractors (La Motoculture), M. Paul Lecler. Mémoires et Compte rendu des Travaux de la Société des Ingénieurs Civils de France, Bulletin, vol. 8, no. 1, 2 & 3, Jan.-Mar. 1919, pp. 97-124, 14 figs. Classification and description of various types.

TRACTOR, RATING CHART. Tractor Rating Chart Prepared by the S. A. E. Automotive Industries, vol. 40, no. 26, June 26, 1919. p. 1436, 1 fig. Based on formula: Horsepower = $0.7854\ D^2\ LRN/13{,}000$.

TRACTOR TESTS. Class B. Rules for Tractor Tests. Jl. Soc. Automotive Engrs., vol. 5, no. 1, July 1919, pp. 58-60. Compiled and copyrighted by Am. Soc. of Agricultural Engrs. and designed to govern state or national demonstrations conducted by manufacturers, distributors, dealers, etc.

TRUCK, IDEAL. British Idea of a Truck That Will Meet the Widest Demand. Automotive Indus., vol. 41, no. 4, July 24, 1919, pp. 164-166, 6 figs. Truck is of two-ton capacity, has four-speed gear box, medium-speed engine with first speed of 26.5:1, overhead worm drive, three-plate type of clutch, and east-steel wheels with hollow spokes.

Visualizing the Future Truck. Automotive Industries, vol. 40, no. 26, June 26, 1919, pp. 1432-1435. and (discussion) pp. 1435 and 1451. Develops ability formula. Paper read before Soc. Automotive Engrs.

PIPE

CAST-IRON PIPE. Flanges for Light Cast Iron Pipe, John Knickerbocker. Fire & Water Eng., vol. 66, no. 3, July 16, 1919, pp. 122-123, 1 fig. Analysis of proposed standard suggested by Am. Soc. Mech. Engrs.' Committee, and proposal that Am. Water Works Assn. take matter up with other societies. Paper read before Am. Water Works Assn.

CEMENT JOINTS. Successful use of Cement joints for Cast Iron Water and Gas Mains, Stephen E. Kieffer. Mun. & County Eng., vol. 57, no. 1, July 1919, p. 42. Results in construction of U. S. Housing Corporation project at Vallejo, Cal.

CEMENT PIPE. Friction Tests and Capacity Table for Cement Pipe, G. E. P. Smith. Eng. & Contracting. vol. 52, no. 2, July 9, 1919, pp. 37-38. Conducted at University of Arizona. Paper read before Am. Water Works Assn.

CONCRETE PIPE. Concrete Pipe Fails From Unequal Expansion of Shell, G. E. P. Smith. Eng. News-Rec., vol. 83, no. 3, July 17, 1919, pp. 113-115, 3 figs. Longitudinal cracks in non-reinforced pipe conduit believed to be due to differential movement because of partial wetness.

DISCHARGE PIPES. Machinery and Pipe Arrangement—XVIII, C. C. Pounder. Mech. World, vol. 66, no. 1696, July 4, 1919, p. 7, 2 figs. Arrangement of discharge pipes. (Continuation of serial).

METALIUM JOINTS. Experience with Metalium Joints in Water—Pipe Lines in Davenport, Iowa, Thomas Healy. Mun & County Eng., vol. 57, no. 1, July 1919, pp. 47-48. Among advantages claimed is that material is cheaper per joint than lead.

See also Hydraulic Machinery (Pipe, Wood-Stave) and CIVIL ENGINEERING, Cement and Concrete (Concrete Pipe Manufacture).

POWER GENERATION

FRANCE. New Project for Establishing a Law Governing Utilization of Hydraulic Forces (Le nouveau projet de loi sur les forces hydrauliques). Houille Blanche, vol. 18, nos. 29 & 30, May-June 1919, pp. 81-108. Including review of world situation and legislation existing in various countries.

Hydroelectric Power Station at Barberine (Valais) France (Construction de l'usine électrique de la Barberine (Valais). Bulletin Technique de la Suisse Romande, vol. 45, no. 12, June 14, 1919, pp. 109-112, 3 figs. Concerning union of two waterfalls which is expected will furnish an aggregate of 38,500 hp.

Harnessing the French Rhone (L'Aménagement hydraulique du Rhone Français), Auguste Pawlowski. Génie Civil, vol. 74, no. 24, June 14, 1919, pp. 481-487, 3 figs. Projects to make it navigable, of irrigation and of power utilization. Presented to the Congrès de la Houille Blanche (Grenoble, June 1919).

Hydroelectric Energy in France, C. W. A. Vedits. Elec. World, vol. 74, no. 4, July 28, 1919, pp. 182-183. France possesses about 5,857,000 available hydroelectric horsepower. Writer explain that cooperation of American engineers and American financiers would be welcomed in developing natural resources of republic and in reorganizing her war-stricken industries.

GOVERNMENT OWNERSHIP. Government Ownership of Water Power in Relation to Electrochemical Industry, F. A. J. FitzGerald. Chem. & Metallurgical Eng., vol. 21, no. 2, July 15, 1919, pp. 95-98. Claims that arguments advanced by advocates of Government ownership are generally a priori and not based on actual experiences, and presents examples of Government activities in various fields which can be undertaken by private enterprise as offering evidence against public ownership in such cases.

Spain. Spain Plans National Transmission Network. George F. Paul. Elec. World, vol. 74, no. 3, July 19, 1919, pp. 122-123. 1 fig. To connect all industrial centers with power plants at larger waterfalls and coal mines. Contemplated development will harness 2,000,000 hp.

Stand-by Operation. Converting a Steam Plant to Stand-by Operation, L. M. Klauber. Nat. Elec. Light Assn. Bul., vol. 6, no. 6, June 1919, pp. 343-347, 3 figs. Problems met in actual case following tie-in with transmission service.

Water Power. Some Features of Hydroelectric Engineering Practice and Possibilities, H. de B. Parsons. Mun. & County Eng., vol. 57, no. 1, July 1919, pp. 13-16. Advocates nation-wide plan and policy to encourage use of water power to the fullest extent and conserve mineral fuels

Hydraulic Energy (Creacion de la fuerza hidraulica). Boletin Minero de la Sociedad Nacional de Mineria, vol. 31, no. 241, March 1919, pp. 236-254. Notes on legislation relative to utilization of water power in France, England, United States and other nations.

Water Works, Engines for. Engines for Small Water Works, Henry A. Symonds. N. E. Water Works Assn., vol. 33, no. 2, June 1919, pp. 153-169 and (discussion) pp. 169-185. 3 figs. Economical selection.

POWER PLANTS

Boiler Auxiliaries. Boilers and Auxiliaries. Power Plant Eng., vol. 23, no. 14, July 15, 1919, pp. 624-627. From report of Committee on Prime Movers read at Convention of Nat. Elec. Light Assn.

Boiler-House Equipment. Steam-Electric Plant of the Dominion Power and Transmission Company, Hamilton. Elec. News, vol. 28, no. 10, May 15, 1919, pp. 26-29, 6 figs. Coal-handling and boiler-house equipment. (First article.)

Condensers. Particulars of a 56,000 Sq. Ft. Surface Condenser. Power, vol. 50, no. 3, July 15, 1919, pp. 90-92, 5 figs. Condenser is of Worthington type.

Draft Induced. Artificial Induced Draft in Steam Boilers (Kunstlicher Saugzug bei Dampfkesselanlagen), Mr. Nerger. Zeitschrift für Dampfkessel u. Maschinentrieb, vol. 42, nos. 5 & 6, Jan. 31 & Feb. 7, 1919, pp. 25-27 and 33-37, 9 figs. Draft blower with casing governor for Burkhardt Boiler. Writer points out close connection between proper draft and fuel economy and discusses various types of blowers.

Economizers. Economizers and Economizer Practice, Robert June. Power House, vol. 12, no. 10, July 5, 1919, pp. 270-272, 4 figs. Illustrating its usefulness as aid to boiler-room economy.

Power Plant Management, Robert June. Refrigerating World, vol. 54, no. 7, July 1919, pp. 24-26, 4 figs. Claimed advantages and disadvantages of economizers.

Equipment, Moving. New Power Plant for St. Mary's Training School. Power, vol. 50, no. 1, July 1, 1919, pp. 2-6, 8 figs. Difficulty encountered while moving equipment from old to new plant without interrupting service.

Fuel Consumption. Steam and Coal Consumption in Power Stations, R. H. Parsons. Eng., vol. 108, no. 2792, July 4, 1919, pp. 3-4, 1 fig. Record of station having rated capacity of about 6000 kw. presented with view to indicating general possibilities of improvement in economy.

Furnace Patents. New Patents Regarding Steam Boiler Furnaces (Neue Patente auf dem Gebiete der Dampfkesselfeuerung), Pradel. Zeitschrift für Dampfkessel u. Maschinenbetrieb, vol. 42, nos. 1 and 3, Jan. 3 and 17, 1919, pp. 3-5 and 11-15, 19 figs. Stopping device for Babcock-Wilcox traveling grate; regulator for fuel layer on Kropelin traveling grates; safety pressure regulation, Gentrup type; exhaust suction and cleaning apparatus, Simon type.

Soot Blowers. What the Mechanical Soot Blower Accomplishes, Robert June. Power House, vol. 12, no. 11, July 19, 1919, pp. 310-315, 6 figs. Results of tests in power station. Importance of keeping tubes free from soot is emphasized.

Steam-Consumption Charts. Finding the Efficiency Ratio, H. L. Doolittle. Power, vol. 50, no. 4, July 22, 1919, pp. 140-141, 1 fig. Chart, consisting of portion of total-heat-entropy chart with curves superimposed thereon indicating steam consumption per kilowatt-hour.

Stokers. Sudden Peak Loads on Chain-Grade Stokers, H. F. Gauss. Power, vol. 50, no. 1, July 1, 1919, pp. 20-22, 1 fig. Chart for finding airspace area for a given boiler output.

Testing, Boiler and Furnace. Boiler and Furnace Testing, Rufus Strohm. Steam, vol. 23, no. 1, July 1919, pp. 11-15, 2 figs. How to make tests and interpret their results.

U. S. Nitrate Plant No. 2. U. S. Nitrate Plant No. 2, Edward R. Welles and W. A. Shoudy. Power Plant, Eng., vol. 23, no. 14 & 15, July 15, & Aug. 1, 1919, pp. 617-622, & 671-675, 12 figs. Power received from 10,000-kw. steam-generating station. Article deals particularly with efficiency features of steam plant. Turbines and condensing equipment.

Waste Wood, Steam Generation. Electrical Equipment of Clear Lake Lumber Mills, W. A. Scott. Elec. Rev., vol. 74, no. 26, June 28, 1919, pp. 1065-1680, 6 figs. Refuse furnishes steam for dry kilns and turbo-generators.

Water Softening. Water Softening and Purifying Processes, C. E. Stromeyer. Power House, vol. 12, no. 11, July 19, 1919, pp. 300-302, 2 figs. Description of purifying processes used.

POWER TRANSMISSION

Belting. Scientific Methods to Prolong Life of Belting, vs. Careless Methods That Destroy, Edward E. Marbaker. Belting, vol. 15, no. 2, July 20, 1919, pp. 17-20. Tallow-cod oil recommended as best belt lubricant.

Steel-Mill Auxiliaries, Drives for. Hydraulic vs. Electric Drive for Steel Mill Auxiliaries, R. B. Gerhardt. Jl. Engrs. Club of Philadelphia, vol. 36, no. 177, August 1919, pp. 303-308, 5 figs. Also Blast Furnace & Steel Plant, vol. 7, no. 7, July 1919, pp. 330-334. Comparison between hydraulic and electric drive for door, hoists, furnace, covers, elevators, manipulators, lifting tables, middle roll balance, shears and intensifiers. Paper read before Assn. Iron & Steel Elec. Engrs.

PRODUCER GAS

Tar Disposal. Tar Disposal in Ford Producer-Gas Plants. Power, vol. 50, no. 2, July 8, 1919, pp. 66-67, 1 fig. Method for returning tar to, and vaporizing it in producer.

PUMPS

Air-Lift Pumping. Air-Lift Pumping, John Oliphant. Can. Engr., vol. 37, no. 2, July 10, 1919, pp. 121-124, 8 figs. Compressor handling single well pumping at rate of 700 gal. per min. with lift of over 300 ft. Details of operation.

Centrifugal Pumps. Rees Roturbo Centrifugal Pumps. Can. Manufacturer, vol. 39, no. 7, July 1919, pp. 33-38, 10 figs. Single and multiple stage-types illustrated. Venturi principle embodied in shaped contraction in water pipe having a brunt nozzle where water enters contraction, and gradually expanding taper piece after water has passed contraction.

Costs. Calculating oil Conduits. Zentralblatt der Bauverwaltung, vol. 39, no. 19, Mar. 1, 1919, pp. 101-102, 1 fig. Cost of pumping plant, maintenance, fuel.

Pumping Engine Tests. Pumping Engine Tests. Fire and Water Eng., vol. 66, no. 2, July 9, 1919, pp. 66-69, 7 figs. Record of tests at Electric Park, Kansas City, Mo., during convention of International Assn. of Fire Engrs.

REFRACTORIES

Cements. Patching Oven Jamb Leaks, R. L. Fletcher. Gas Rec., vol. 15, no. 12, June 25, 1919, pp. 401-402, 4 figs. Closing cracks between fire-clay jamb bricks and silica shapes by means of Hytempite dissolved in warm water.

Firebrick. Constitution and Microstructure of Silica Brick and Changes Involved Through Repeated Burnings at High Temperatures. Herbert Insley and A. A. Klein. Techn. Papers Bur. Stand., no. 124, July 11, 1919, 31 pp., 20 figs. Petrographic microscopic examinations of commercial silica brick and those which have received repeated burnings by use in kilns, alleged to show three main constitutents—quartz, cristobalite, and tridymite. In addition, small amounts of pseudowollastonite and glass are said to be present.

See also Refractory Material Committee Report.

Refractory Material Committee Report. Report of the Refractory Material Committee on the Crushing Strength of Firebrocks, W. Emery and J. W. Mellor. Gas Jl., vol. 146, no. 2925, June 3, 1919, pp. 619-620, 3 figs. Results interpreted as having indicated that present strength is reduced by increasing grain size of grog when proportion of grog is constant; and also by increasing proportion of grog when grain size is constant. Presented before Instn. of Gas Engrs.

REFRIGERATION

Ammonia Receivers. Watch the Ammonia Receiver, John E. Starr. Power, vol. 50, no. 4, July 22, 1919, pp. 142-143, 2 figs. Advises feeding only liquid to expansion coils, and warns against estimating conditions of feeding by sound made in expansion valve.

Brewery. Remodeling Suction Gas Mains, Anheuser-Busch Brewery, Robert H. Karl. Power, vol. 50, no. 2, July 8, 1919, pp. 48-54, 13 figs. Refrigerating system of brewery occupies 70 city blocks. During growth multiplicity of ammonia-compressor piping demanded remodeling so as to provide means to facilitate operation and to effect greater economy especially by better insulating the piping. Article tells how this was done.

Carbon-Dioxide Machines. The design of CO^2 machines, John E. Starr. Refrigerating World, vol. 54, no. 7, July 1919, pp. 11-12 & 20, 1 fig. Plate illustrating what writer terms disagreement on data of chief properties of carbonic acid gas as given by different authorities.

Code for the Regulation of Refrigerating Machines and Refrigerants. Ice & Refrigeration, vol. 57, no. 1, July 1919, pp. 6-8, 2 figs. Prepared by Commission on Municipal and State Regulations of Am. Soc. of Refrigerating Engrs.

Ice Plants. Re-Modeled Ice Plant, Columbus, Ohio. Ice & Refrigeration, vol. 57, no. 1, July 1919, pp. 10-15, 11 figs. Rated capacity is 250 tons daily, all distilled-water ice. In the transformation effected, about 20 steam-driven pumps and small steam engines have been replaced by electric-motor-driven apparatus.

Largest Ice Plant in the West, Victor J. Azbe. Power, vol. 50, no. 5, July 29, 1919, pp. 168-170, 5 figs. Plant of 350 ton capacity. Features are drum-type copper steam condensers, ammonia condensers made up of 8-in. pipe and ice-making system employing 800-lb. cans.

Shipboard Insulation. Refrigerating Installations on Board Large Steamships (Les installations frigorifiques à bords des grands paquebots). Genie Civil, vol. 74, no. 26, June 28, 1919, pp. 521-525, 1 fig. Assembly plan of installations as laid out in French steamer of 15,000 tons.

Storage, Cold. Cold Storage Accommodation. Surveyor, vol. 55, no. 1432, June 27, 1919, pp. 479-480, 6 figs. Design for building of 120-ton capacity.

RESEARCH

Forest Products Laboratory. Production in Industrial Research, Samuel Moreell. Indus. Management, vol. 58, no. 2, Aug. 1919, pp. 95-99, 5 figs. Management methods applied to Forest Products Laboratory to increase output of results.

INDUSTRIAL LABORATORIES. The Organization of an Industrial Laboratory, A. D. Little and H. E. Howe. Mech. Eng., vol. 41, no. 8, August, 1919, pp. 663-666, 3 figs. Divisions of laboratory are enumerated and discussed, laboratories of A. D. Little being taken as type. Methods of management, rating or reports and commercial organization are also discussed.

Industrial Research Laboratory Organization, K. C. Mees. Mech. Eng., vol. 41, no. 8, August 1919, pp. 667-668, 4 figs. Diagrams illustrating functions of industrial research laboratory.

The Scope of the Works Laboratory. Eng. & Indus. Management, vol. 1, no. 19, June 19, 1919, pp. 581-582. Success of a laboratory said to depend on (1) possession of proper equipment which includes ample number of properly trained scientific workers, (2) mutual existence of right attitude of mind between works and the laboratory, (3) complete confidence and sympathetic assistance of management.

INDUSTRIAL RESEARCH. Industrial Research and National Progress, Frank D. Adams. Min. & Eng. Rec., vol. 24, no. 10 & 11, June 1919, pp. 142-146. With notes on the work being done by governments of United States and Great Britain.

LAUSANNE UNIVERSITY LABORATORY. Mechanical, Physical and Chemical Laboratory of the Engineering School of Lausanne University (Le laboratoire d'essais mécaniques, physiques et chimiques de l'école d'ingénieurs de l'Université à Lausanne). Bulletin Technique de la Suisse Romande, vol. 45, nos. 11, 12 & 13, May 31, June 14 and June 28, 1919, pp. 99-102, 114-116, and 127-129, 13 figs. Martens apparatus for measuring small elastic deformations; machine used to measure tensile and compressive strength of wires, sheets, springs, etc. Charpy apparatus for measuring resilience.

LYNITE LABORATORIES. Evolution of the Lynite Laboratories. Iron Age, vol. 104, no. 3, July 17, 1919, pp. 149-154, 9 figs. General organization of laboratories is laid out to include research along purely scientific lines in the arts of alloying and fabricating non-ferrous metals, the adaptation of this scientific knowledge by means of experiments and development methods and scientific control of foundry practice to secure desired results.

NATIONAL PHYSICAL LABORATORY. The National Physical Laboratory. Engineering, vol. 107, no. 2791, June 27, 1919, pp. 846-848, 2 figs. Worm-gear testing machine. (To be continued).

RESEARCH OUTLOOK. The Outlook for Research, Nevil Monroe Hopkins. Jl. Engrs. Club of Philadelphia, vol. 36, no. 177, August 1919, pp. 309-316. Present status and economic possibilities of research in America and in European countries.

The condition of Research in the United States, Arthur H. Green. Mech. Eng., vol. 41, no. 7, July 1919, pp. 587-592, 13 figs. Writer discusses research in its relation to technical schools and engineering experiment stations, its value when comparatively conducted and as undertaken by various government activities.

WORKS LABORATORY. *See Industrial Laboratories.*

SPECIFICATIONS

MALLEABLE CASTINGS. Technical Specification for the Delivery of Malleable Castings (Spécification technique pour la fourniture des pièces en fonte malléable). Fonderie Moderne, no. 2, Feb. 1919, pp. 43-45. Concerning malleable castings as adopted by railroad companies.

MOTOR TRUCKS. Motor Truck Specifications. Power Wagon, no. 176, July 1919, pp. 49-64. List of major specifications of internal-combustion and electric trucks, grouped according to load rating and arranged alphabetically by brand name.

STANDARDS AND STANDARDIZATION

ENAMELS. *See Lacquers.*

ENGINEERING STANDARDS COMMITTEE. American Engineering Standards Committee, C. B. LePage. Jl. Engrs. Club of Philadelphia, vol. 36, no. 177, August 1919, pp. 321-322. Statement of reorganization activities during period January 1 to June 1, 1919.

HOLLAND. Standardization in Holland (Ontwerp-Standaardvormen der Hoofdcommissie voor de Normalisatie in Nederland). Ingenieur, vol. 34, no. 25, June 21, 1919, pp. 476-477. New Standardization rules of Standardization Committee of the Netherlands.

JAPANS. *See Lacquers.*

LACQUERS. Lacquers, Shellacs, Enamels and Japans. Safety Eng., vol. 38, no. 1, July 1919, pp. 15-22, 2 figs. Tentative safety standards prepared by the State of New Jersey.

PUMPS, LIQUID MEASURING. Specifications and Tolerances for Liquid Measuring Pumps, Tentatively Adopted by the Twelfth Annual Conference of Weights and Measures, May 1919, Scale Jl., vol. 5, no. 10, July 10, 1919, pp. 11-12. Covering definition of liquid-measuring pump, permanence, constancy of delivery, position of stop mechanism, etc.

SHELLACS. *See Lacquers.*

WOOD SCREWS. New Standards for Wood Screws (Neue Einheitsmasse für Holzschrauben). Metall-Technik, vol. 45, no. 7-8, Feb. 22, 1919, p. 29. New uniform measures for wood screws issued by the Standardization Committee of German Industries.

STEAM ENGINEERING

BOILERS. Standard Boilers, Gt. Western Railway. Ry. Engr., vol. 40, no. 474, July 1919, pp. 138-141, 4 figs. Leading particulars of four standard sizes having lengths of 14-ft. 10 in., 11-ft., 10-ft. 3-in., and 11 ft. Details of joints are particularly dealt with.

Design and Construction of Marine Boilers, A. E. Seaton. Mar. Engr. & Naval Architect, vol. 41, no. 502, July 1919, pp. 307-309 Work done by British Marine Eng., Design and Construction Committee. (Concluded). Paper read before Instn. Naval Architects.

Tests of High Efficiency Pre-heater Type Boilers, Josiah H. Rohrer. Universal Engr., vol. 29, no. 7, July 1919, pp. 39-45, 2 figs. Experiences at Ford Motor Company.

NEYCOMEN ENGINES. Two Neycomen Engines. Engr., vol. 127, no. 3313, June 27, 1919, pp. 621-623, and 632, 22 figs. Particulars regarding two engines, one dating back to 1787 and another to 1823, both of which are said to be still working satisfactorily.

TURBINES, BLADE FASTENINGS. Turbine Blade Fastenings—III. Mechanical World, vol. 65, no. 1694, June 20, 1919, p. 294, 8 figs. Methods used on running wheels of Westinghouse Rateau turbine. (Continuation of serial.)

TURBINES, BUCKET EFFICIENCY. Bucker Efficiency of Impulse and Reaction Steam Turbines (Om Skovelverkningsrader vid Aktions- och Reaktions angturbiner), Tore G. E. Lindmark. Teknisk Tidskrift, Mekanik, vol. 49, no. 24-3, Mar. 12 1919, pp. 37-41, 3 figs. Claims that it is frequently stated that the bucket efficiency in a reaction steam turbine must necessarily be lower than the corresponding efficiency in an impulse steam turbine, as long as the ratio between the peripheral velocity and heat drop for the reaction steam turbine does not exceed the most favorable values for the impulse steam turbine.

TURBINES FOR MECHANICAL DRIVES. Turbines for Mechanical Drives, R. R. Lewis. General Elec. Rev., vol. 22, no. 6, June 1919, pp. 438-442, 12 figs. Illustrates selection of standard parts to produce turbine best adapted to conditions of particular application.

TURBO-GENERATOR, 45,000-Kw. The 45,000-Kw. Tourbine-Generator set at Providence. Elec. Rev., vol. 75, no. 3, July 19, 1919, pp. 91-93. Cross-compound unit of Narragansett Electric Light Co., consisting of high- and low-pressure turbines, each connected with through flexible coupling to its own generator.

TURBO GENERATOR, 70,000-Kw. Interborough Rapid Transit Company's 70,000-Kw. Turbo-generator. Elec. Rev., vol. 75, no. 1, July 5, 1919, pp. 4-6, 4 figs. Methods of operating three elements of triple cross-compound turbine.

TURBINE GOVERNING. Turbine Governing for Present Types of Steam Turbines (Zur Regelung der Steuerung der gegenwärtigen Bauarten von Dampfturbinen), Ernst Blau. Zeitschrift des österr. Ingenieur- und Architekten-Vereins, vol. 70, nos. 43 & 45, Oct. 25 and Nov. 8, 1918, pp. 465-466, and 484-487, 10 figs. Throttle governors of the Bergmann steam turbine, oil-pressure valve gears of the Brown, Boveri & Co. turbines; Allegemeine Elektrizitats-Geselischaft system of automatic governing by cutting out nozzles. (To be concluded)

THERMODYNAMICS

EQUATION OF STATE FOR FLUIDS. Direct Determination of the Temperature Exponent in the Equation of State of Fluids (Détermination directe de l'exposant de la température dans l'équation d'état des fluides), E. Ariès. Comptes Rendus des séances de l'Académie des Sciences, vol. 168, no. 19, May 12, 1919, pp. 930-933. Equation solved for exponent of temperature and substitution of values of quantities in second side of equation effected for seven substances.

HEAT CONDUCTIVITY. Heat Conductivity, C. Edwards, A. Rigby and J. W. Mellor. Gas World, vol. 70, no. 1819, May 31, 1919, pp. 448-450, 3 figs., and Gas Jl., vol. 146, no. 2925, June 3, 1919, pp. 620-622, 3 figs. Theoretical. In computation conductivity of air is neglected, and it is assumed that conducitivity of solid does not vary with temperature and that no heat is conveyed across space by convection. Problem is taken up with reference to pore gap. Paper before Instn. of Gas Engrs.

JOULE-THOMSON EFFECT FOR AIR. The Joule-Thomson Effect for Air at Moderate Temperatures and Pressures, L. G. Hoxton. Physical Rev., vol. 13, no. 6, June 1919, pp. 438-439, 8 figs. Joule-Thomson coefficient was found in experiments to have a decreasing linear variation with increasing line pressures.

VARIA

ASTRONOMICAL INSTRUMENTS. An Evening's Journey among the Stars, Frank C. Jordan. Jl. Engrs. Club of Philadelphia, vol. 36, no. 176, July 1919, pp. 253-258, 7 figs. Development of astronomical instruments together with some of records obtained through their use.

CHEMICAL ASSOCIATIONS. Part of Chemical Associations in International Documentation (L'organisation de la Documentation internationale et le rôle des associations de chimie), Paul Otlet. Chimie & Industrie, vol. 2, no. 5, May 1919, pp. 547-554. Proposes that an international federation of chemical societies should be entrusted with documentation of all chemical literature. Discourse pronounced before Interallied Conference.

ENGINEERING PROFESSION, ORGANIZATION OF. A National Organization of the Engineering Profession, F. R. Ewart. Elec. News, vol. 28, no. 10, May 15, 1919, pp. 23-26, 1 fig. Referring to example of Great Britain where with development of various engineering sciences a single society of engineers formerly existing separated in spite of strenuous opposition into present organizations, it appears to writer that best realization of single-society idea would be in developing systematic scheme of cooperation which would leave most complete autonomy for technical purposes to all existing organisations. A system of co-ordinating councils for this purpose is presented.

ENGINEERS. The Engineer—His Opportunities and Responsibilities, John B. Fisken. Jl. of Electricity, vol. 43, no. 2, July 15, 1919, pp. 69-71. Calls attention to the fact that engineer is becoming a more and more important factor in modern would. Still, writer observes, in spite of vast opportunities for service which lie before him, his unnecessarily retiring temperament prevents him from taking the high place which is rightfully his.

PATENT SYSTEM. Proposed Changes in the American Patent System, Wesley G. Carr. Elec. Jl., vol. 16, no. 7, July 1919, pp. 299-300. Recommendations proposed by special committee appointed by Nat. Research Council.

Percentages. Checking Percentages by a Chart, William Wyer. Eng. & Contracting, vol. 52, no. 3, July 16, 1919, pp. 80-81, 1 fig. Methods of U. S. Railroad Administration.

WELDING

Acetylene Generating Plant. Acetylene Generating Plant for Large Welding Shops. Welding Engr., vol. 4, no. 7, July 1919, pp. 27-29, 3 figs. It consists of 7 generators, gas collector, moisture separator, 2 condensers, a gas-meter capable of storing 350 cu. ft. of gas, and 4 large purifiers provided with bypasses for working in pairs.

Acetylene Welding. Oxy-Acetylene Welding of Large Cylinders, L. M. Malcher. Min. & Sci. Press, vol. 119, no. 20, July 12, 1919, pp. 53 and 61-62. Repairing fractured left-hand low-pressure steam-cylinder, 70 in., in inside diameter, of Allis-Chalmers twin-tandem compound-reversing engine.

Arc Welding. Electric Arc Welding in Mines, John G. Kjellgren. Coal Age, vol. 16, no. 2, July 10, 1919, pp. 52-53, 2 figs. Illustrating weld on cast-iron hoisting sheave.

Blowpipes. Improvements in Blowpipes. Acetylene & Welding Jl., vol. 16, no. 189, June, 1919, pp. 121-122, 1 fig. Invention relating to blowpipes in which extension piece can be readily attached between nozzle and handle. Extension piece arranged so as to establish communication between oxygen nozzle and injector, and also between passage for combustible gas and annular space between injector and rear portion of tip.

Concrete Construction. Autogenous Welding in Reinforced-Concrete Construction (Die Flammenverschmelzung im Eisenbetonbau). Autogene Metallbearbeitung, vol. 12, no. 3, Mar. 1919, pp. 38-40, 10 figs. Describe concrete tanks and pipes as made by the Metallindustrie G.m.b.H. at Buhl, Baden. (Concluded.)

Electric Welding. Development of Electric Welding, Howard C. Forbes. Elec. Eng., vol. 53, no. 5, May 1919, pp. 222-223. Emphasized by quoting its application in preparation of depth and gas bombs, construction of Liberty motor, attachment of Otto gear to hulls of ships to protect them from mines, etc.
See also Arc Welding, Spot Welding.
Electric Welding: Its Theory, Practice, Application and Economics, H .S. Marquand. Elecn., vol. 82 & 83, nos. 2144, 2146 and 2147, June 20, July 4 & 11, 1919, pp. 705-707, 17-18, and 40-41, 7 figs. Deals with preparation of welds and then passes on to certain properties of iron and mild steels which have a marked bearing on methods adopted. Examples of various types of welding. (Continuation of serial.)

Firebox Welding. Fire Box Welding, B. K. Smith. Welding Engr., vol. 4, no. 7, July 1919, pp. 42-44, 5 figs. Work done by U. S. Welding Co.

Gas Torch. Modern Welding and Cutting—XVI, Ethan Viall. Am. Mach., vol. 51, no. 3, July 17, 1919, pp. 117-122, 13 figs. Rules for welding with gas torch.
Modern Welding and Cutting—XV, Ethan Viall. Am. Mach., vol. 51, no. 2, July 10, 1919, pp. 61-65, 13 figs. Gas-torch welding and cutting outfits.

Jigs. Welding Jigs and Methods of Overcoming Distortion, C. S. Milne. Welding Engr., vol. 4, no. 7, July 1919, pp. 21-27, 23 figs. Illustrating repair work.
Welding and Cutting, B. S. Milne. Can. Machy., vol. 22, no. 3, July 17, 1919, pp. 48-51, 18 figs. Examples of welding and methods of overcoming distortion. Paper presented before British Acetylene and Welding Assn. (Continued.)
Various Jigs as Applied to the Welding Trade, B. S. Milne. Can. Machy. vol. 22, no. 1. July 3, 1919, pp. 13-15, 17 figs. Illustrating methods for overcoming distortion.

Repair Work. *See Jigs.*

Rolling Mill Engine Repaired by Oxywelding, L. M. Malcher. Blast Furnace & Steel Plant, vol. 7, no. 7, July 1919, pp. 327-328, 5 figs. Repairing low-pressure steam-cylinder fracture on twin-tandem compound reversing engine at Farrell Works of Carnegie Steel Co.
Some Recent Striking Examples of Crankshaft Repairs. Reactions, 1919, vol. 12, no. 2, Second Quarter, pp. 31-36, 13 figs. Such as well made on extension to 20-in. blooming mill crankshaft.

Seam Stress. How the Seam is Stressed in Autogenous Welding (Wie wird beim Autogenschweissen die Schweissnaht beansurucht). Autogene Metallbearbeitung, vol. 12, no. 3, Mar. 1919, pp. 31-36, 18 figs. Heat expansion and upsetting in autogenous welding of mild-steel plates; suggestions for preventing stresses; welding circular seams on cylindrical bodies. (To be continued.)

Spot Welding. A Large Spot-Welding Machine. Engr., vol. 127, no. 3311, June 13, 1919, pp. 588-589, 5 figs. Design for spot welding of tubes 5 ft. long made of ¼-in. steel plates and having an internal diameter of 8-in.

Tank Welding. Tank Welding by the Oxy-Acetylene Process, Charles C. Phelps. Machy. (N. Y.), vol. 25, no. 11, July 1919, pp. 1071-1072, 2 figs. Illustrating application of oxy-acetylene method of welding to duplicate work required in large quantities.

Thermit. Correct and Incorrect Methods of Lining up Broken Crankshafts for Thermit Welding, J. H. Deppeler. Reactions, vol. 12, no. 2, Second Quarter, 1919, pp. 37-38, 2 figs. Placing riser between slabs to prevent shrinkage of thin ribs between heavier parallel members.
Recent Thermit Technique at the Rocky Mount Shops of the Atlantic Coast Line Railroad, D. C. Lewis Reactions, vol. 12, no. 2, Second Quarter, 1919, pp. 39-40, 5 figs. Welding of guide yoke, cast-iron driving wheel, and the like.

Truck Side Frames. Welding Truck Side Frames, Bolsters and Arch Bars. Welding Engr., vol. 4, no. 7, July 1919, pp. 48-50, and (discussion), pp. 50-52. Autogenous welding limits and regulations recommended by Welding Committee of Am. R. R. Assn.

WOOD

Drying Wood. The Phenomena of Drying Wood, Harry D. Tiemann. Jl. Franklin Inst., vol. 188, no. 1, July 1919, pp. 27-50, 8 figs. Analysis of Internal stresses which occur in wood during progress of drying, with discussion of physical properties which affect these stresses.
Kilndrying of Wood in the Airplane Industry, Myron A. Lee. Sibley Jl., vol. 33, no. 5, June 1919, pp 66-67, 3 figs. Results obtained with kiln of hot-air-blast, bake-oven type.

Plywood. The General Properties and Uses of Plywood, P. C. Boulton. Aerial Age, vol. 9, no. 17, July 7. 1919, pp. 813-815, 2 figs. Plywood strength tables. (Continuation of serial.)
See also Aeronautics. Materials of Construction (Plywood.)

Shrinkage. Shrinkage of Interior Trim: Its Cause and Prevention, Lawrence V. Teesdale. Am. Architect, vol. 116, no. 2275, July 30, 1919, pp. 143-145, 5 figs. Examples of shrinkage which occurs when insufficiently kiln-dried material is used. Writer advises obtaining material that has been kiln-dried to proper moisture content.
The Relation of the Shrinkage and Strength Properties of Wood to Its Specific Gravity, J. A. Newlin and T. R. Wilson. U. S. Dept. of Agriculture bul. no. 676, July 16, 1919, 35 pp., 9 figs., partly on supp. plates. Results of over 200,000 tests expressed in form to utilize them for estimating properties of any particular timber and for selecting timber for any given purpose.

Woodworking Industry. Installing Management Methods in the Woodworking Industry, Carle M. Bigelow. Indus. Management, vol. 58, no. 2, Aug. 1919, pp. 124-133, 29 figs. Information in regard to handling lumber, drying lumber, construction and operation of kilns, purchasing and storing; also time study leading up to payment of bonus.

MINING ENGINEERING

BASE MATERIALS

Sands. The Texture of Sands. Nature, vol. 103, no. 2590, June 19, 1919, pp. 315-317, 3 figs. Diameter obtained by plotting great sizes horizontally at distances proportional to their logarithms.

COAL AND COKE

Alaska. Methods for more efficiently utilizing our Fuel Resources—XXIX. The Coal Resources and Transportation Facilities in Alaska, F. P. Coffin. Gen. Elec. Rev., vol. 22, no. 7, July 1919, pp. 517-535, 7 figs. Alaskan coal fields contain the only accessible deposits of high-grade semi-bituminous coal on the shores of Pacific Ocean, as well as extensive deposits of lignite.

Bituminous Coal. A Chemical Investigation of Banded Bituminous Coal. Studies in the Composition of Coal, Frederick Vincent Tideswell and Richard Vernon Wheeler. Jl. Chem. Soc., vol. 115 and 116, no. 680, June 1919, pp. 619-636, 2 figs. In banded Hamstead coal investigated, it is claimed that ingredients show differences which grade them in fusain, durain, clarain and vitrain.
Preparation of Bituminous Coal—VII, Ernst Prochaska. Coal Age, vol. 16, no. 3, July 17, 1919, pp. 96-103, 7 figs. Considers advantageous to drive machines of washery in groups with larger units driven individually. It is noted that buildings should preferably be of steel, although wood and reinforced concrete are often employed.

Bunker Coal. A British System of Unloading, Stocking and Reclaiming Bunker Coal, H. Hubert. Coal Trade Jl., vol. 50, no. 29, July 16, 1919, pp. 865-866, 2 figs. System of bunkering with steam cranes described as being capable of handling 74 tons per hr.

Coal, Geology of. Résumé of Theories of the Origin of Coal, C. W. Hippard. Coal Age, vol. 16, no. 3, July 17, 1919, pp. 104-105. As some theories hold that beds now rest where vegetable matter, from which they were formed originally, grew, while others believe that beds are result of drift, writer, who finds arguments advanced in support of either hypothesis of value, concludes that it is quite probable that all coals were not formed by identical process.
Research on the Constitution and Origin of Coal, A. C. Fieldner. Gas Age, vol. 44, no. 2, July 15, 1919, pp. 45-49, 18 figs. Microphotographs taken at Pittsburgh Bur. of Mines, Research Laboratory, with notes on practical investigation of microcopical examination.
The Formation of Coal, J. D. Kendall. Can. Min. Inst. Bul., no. 87, July 1919, pp. 761-778, 13 figs. Geology of English coal fields. (Continuation of serial.)

Coal Industry Commission. The Coal Industry Commission. Reports on Nationalism. Colliery Guardian, vol. 117, no. 3052, June 27, 1919, pp. 1541-1546. Quoting reasons for State ownership of coal royalties, suggested method of purchase and carrying account of coal mines, and proposed scheme for local administration.

Coal Mining and Rock Structure. The Effect of Coal Mining on the Overlying Rocks and on the Surface, W. D. Lloyd. Tran. Instn., Min. Engrs., vol. 57, part 2, May 1919, pp. 74-95, and (discussion) pp. 95-100. Summary of theories which have been put forward and of opinions which have been expressed by various investigators.

Coke from Illinois Coal. Metallurgical Coke from Illinois Coal, R. S. McBride and W. A. Selvig. Iron Age, vol. 104, no. 5, July 31, 1919, pp. 283-286, 4 figs. Operating test at St. Paul plant of Minnesota By-Product Coke Co. conducted by Bureaus of Standards and Mines.

Coke Ovens. Coke Ovens (Koksöfen), E. Lococq and J. Pieters. Feuerungstechnik, vol. 7, no. 12-13, Mar. 15, April 1, 1919, pp. 95-96 & 101-104, 2 figs. Heat required for distillation; by-product yield; calculation of distribution of gases on walls of coke oven. The development of the coke oven. (Concluded.)

COKE-PLANT EQUIPMENT. Clairton By-Product Coke Plant Equipment—II, Frank F. Manquard. Blast Furnace & Steel Plant, vol. 7, no. 7, July 1919, pp. 340-342 & 358, 1 fig., also Coal Industry, vol. 2, no. 7, July 1919, pp. 284-287, 1 fig. Chart showing operating organization of coke works.

COKING CAPACITY. The Coking Capacity of Coals, A. Meurice. Colliery Guardian, vol. 117, no. 3052, June 27, 1919, pp. 1559-1560, 1 fig. Practical commercial tests said to have proven that value of coking coals is directly proportional to their index limit of agglutination. From Annales des Mines de Belgique.

DEPRECIATION. Depletion and Depreciation of Coal-Mining Properties, D. C. Burdick. Coal Age, vol. 16, no. 5, July 31, 1919, pp. 185-187. Writer's opinion is that charges should be graduated and of such amount that total investment may be extinguished when property is worked out.

FRANCE. The French Coke Problem, N. C. Bercthelot. Colliery Guardian, vol. 117, no. 3050, June 13, 1919, pp. 1415-1416. Suggests as model specification for coking plant attached to works comprising blast furnaces, that surplus gas from the later be used to heat the coke ovens, while coke-oven gas of 4000 calories be utilized in metallurgical furnaces. Translated from Chimie et Industrie.

GAS EXHAUSTERS. Gas Exhauster in Coke-Oven Plants (Gassauger in Koksofenanlagen), B. Shapira. Feuarungstechnik, vol. 7, no. 12, Mar. 15, 1919, pp. 93-94. Special reference is made to the Brown-Boveri and C. H. Jaeger types turbo-gas exhauster and also to the fan gas exhauster of the Berlin-Anhaltische Maschinenbau Gesellschaft.

GAS FROM BROKEN COAL. Effect of Breaking of Coal on the Emission of Gas, Robert Dunn. Coal Age, vol.16, no. 1, July 3, 1919, p. 20. Daily sampling and analysis of mine air at Crow's Nest Pass Mine said to have shown that amount of gas in mine air changes but little and seems to bear no relation whatever to mining operations.

IMPURITIES. Impurities in Raw Coal and Their Removal. Coal Age, vol. 16, no. 4, July 24, 1919, pp. 150-151. Limitations of three methods for removing impurities—hand-picking, mechanical shale pickers and coal washers.

PREPARATION. Preparation of Bituminous Coal—VI, Ernst Prochaska. Coal Age, vol. 16, no. 1, July 3, 1919, pp. 9-15, 5 figs. How, after coal has been washed, it must be freed from adhering moisture before it can be shipped. Draining bins, elevators, conveyors and centrifugal dryers as means for this purpose.

PYRITES. Valuable Pyrite in Illinois Coal Beds, G. H. Cady. Coal Age, vol. 16, no. 4, July 24, 1919, pp. 136-140, 9 figs. Defines various types of pyrite and their modes of occurrence, and shows in what beds and sections these types may be most generally found.

SAAR BASIN. Problem of the Great Saar Coal Basin, Wilhur Greely Burroughs. Coal Industry, vol. 2, no. 7, July 1919, pp. 268-274, 1 fig. With reference to its political, economical and geological value.

SHAFT MINE. Modern Shaft Mine at Amsterdam, Ohio, Jack L. Ball. Coal Age, vol. 10, no. 2, July 10, 1919, pp. 46-47, 2 figs. Coal mine. Capacity of mine is 800 tons a day.

SPLITTING OF COAL-SEAMS. On the Splitting of Coal-Seams, by Partings of Dirt—I, Percy Fry Kendall. Proc. Midland Inst., Min., Civil & Mech. Engrs., vol. 24, no. 4, 1918, pp. 104-119, and (discussion) pp. 119-123, 10 figs., partly on supp. plate. Evidence in support of theory that linear splits in coal-seams that rejoin are erosion phenomena and not, as Bowman supposed, tectonic in origin.

STRIPPING. Operating a Coal-Stripping Plant in Ohio, S. B. Creamer. Coal Age, vol. 16, no. 4, July 24, 1919, pp. 134-135, 3 figs. Overburden handled by shovel entirely. Suggestions are made for stripping by this method.

THICKENER, DORR. Use of the Dorr Thickener and Classifier in Coal Preparation, John Griffen. Coal Age, vol. 16, no. 4, July 24, 1919, pp. 146-148, 2 figs. Principles of construction and operation. Door continuous thickener is used for collection and dewatering of fine solids mixed or suspended in liquid.

WASHING. The Examination of Coal in Relation to Coal Washing, M. Wynter Blyth L. T. O'Shea. Iron & Coal Trades Rev., vol. 98, no. 2677, June 20, 1919. pp. 852-853. Suggests that purity of washed coal to be used for coking should be judged by its ash content as determined by incineration.

WASHINGTON (STATE). The Coal Fields of Southwestern Washington, Harold E. Culver. Wash. Geol. Survey, bul. no. 19, Jan. 2, 1919, 155 pp., 36 figs., partly on supp. plates. General geological features; details of various areas and remarks on utilization of coals.

COPPER

MILLING, LAKE SUPERIOR. Developments in Lake Superior Milling, C. H. Benedict. Eng. & Min. Jl., vol. 108, no. 1, July 5, 1919, pp. 5-10. 8 figs. Two types of copper ore are mined in region—congomeratic ore which is hard, close-grained rhyolite, characteristically composed of pebbles with copper as cementing material, and amygdaloidal ore, in which copper occurs in more massive form. Methods of dressing and leaching as required by these two types are described.

EXPLOSIVES

BLASTING EQUIPMENT. Electric Blasting Equipment, L. D. Rowen. Eng. & Min. Jl., vol. 108, no. 2, July 12, 1919, pp. 45-46, 1 fig. Dependability and conditions under which electric detonating cap can be used.

Electric Priming in Mines (Note sur le tir électrique), MM. Taffanel, Dautriche, Durr and Perrin. Annales des Mines, vol. 7, no. 11, Apr. 1919, pp. 6-124, 13 figs. Composition and properties of powders used for inflammation and electrical features of inflammator. (To be continued.)

PERMISSIBLE EXPLOSIVES. Tests and Comparisons of Various Types of Permissible Explosives, Joseph C. Thompson. Coal Age, vol. 16, no. 3, July 17, 1919, pp. 94-95. Notes tests used by Bureau of Mines to establish permissible explosives. Comparison is made of black powder and some permissible explosives and several classes of permissibles are discussed.

PRIMING. *See Blasting Equipment.*

STORAGE. Regulations Governing Storage of Explosives (Réglementation des dépôts de substances explosives). Comité Central des Houillères de France et Chambre Syndicale Français des Mines Métalliques. Notes Techniques, no. 384, June 1, 1919, pp. 19-63. With provisions in regard to sales and importation of dynamite and other nitroglycerine explosives.

Storing and Handling High Explosives During the War, G. C. Munoz. Eng. News-Rec., vol. 82, no. 26, June 26, 1919, pp. 1242-1246, 9 figs. Methods developed by Ordnance Department.

TNT. TNT as a Blasting Explosive, Charles E. Munroe and Spencer P. Howell. Can. Engr., vol. 37, no. 4, July 24, 1919, pp. 170-172 and 174. Industrial use, general characteristics, solubility and hygroscopicity grade of determination, precaution in packing, and remarks on practical field demonstrations.

GEOLOGY AND MINES

AMBER. Amber and Its Origin, George F. Black. Am. Mineralogist, vol. 4, no. 7 July 1919, pp. 83-85. Geology of Samland peninsula, East Prussia. (To be continued.)

BARITE, STALACTITIC. Stalactite Barite from Madoc, Ontario, T. L. Walker. Am. Mineralogist, vol. 4, no. 7, July 1919, pp. 79-80, 1 fig. on supp. plate. Outer surface formed by projecting ends of small crystals arranged in radial fashion with macro-axis of tiny crystals approximately parallel to axis of aggregate.

COLORADO ROCKIES. The Building of the Colorado Rockies—II, Rollin T. Chamberlin. Jl. Geology, vol. 27, no. 4, May-June 1919, pp. 225-251, 10 figs. System is characterized by open, gentle folding, moderate crystal shortening affecting a zone several scores of miles in depth in its deeper portions by strong uplifting and by extrusion of much lava.

EARTHQUAKES. Surface Reflexion of Earthquake Waves, George W. Walker. Phil. Tran. Roy. Soc. Lond., Series A 567, vol. 218, June 12, 1919, pp. 373-393, 8 figs. partly on two supp. plates. Investigation undertaken to study sharp impulses noted on seismograms, which in Wichert's opinion represent arrival of waves that have undergone one or more reflexions at earth's surface.

FLORIDA. Geology in Florida, E. H. Sellards. Jl. Geology, vol. 27, no. 4, May-June 1919, pp. 286-302, 3 figs. partly on supp. plate. General structural conditions.

FOLIATION AND METAMORPHISM. Foliation and Metamorphism in Rocks, T. G. Bonney. Geological Mag., vol. 6, no. 6, June 1919, pp. 246-250. Pressure-modified gneisses and schists. (Concluded.)

MANGANOTANTALITE. Magannotanalite from Amelia, Virgina, O. Ivan Lee and Edgar T. Wherry. Am. Mineralogist, vol. 4, no. 7, July 1919, pp. 80-83, 1 fig. Physical properties of deep red columbite containing magnese in excess over iron and tantalum slightly in excess over columbium.

METAMORPHISM. *See Foliation and Metamorphism.*

MUD VOLCANOES. Mud Volcanoes in Colombia, South America, Stanley C. Herold. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 151, July 1919, pp. 1025-1027, 2 figs. Their occurrence in faulted localities used as basis of explanation of their origin.

PRECAMBRIAN. Some Stratigraphic and Structural Features of the Pre-Cambrian of Northern Quebec—III, H. C. Cooke. Jl. Geology, vol. 27, no. 4, May-June, 1919, pp. 263-275. Petrographical similarities, geological successions, deformations and relation to older and younger formations as criterion for correlation.

Some Problems of the Adirondack Precambrian, Harold L. Alling. Am. Jl. Sci., vol. 48, no. 283, July 1919, pp. 47-68, 3 figs. Following are some of points brought out as consequence of investigation: That Grenville strata have been isoclinally extensively folded; that individual phases of Saranac serie smay be some one or other of well recognized rock units, and establishment of metagabbro closely following instrusion of Laurentian granite.

ROCK COMPOSITION DETERMINATION. A Planimeter Method for the Determination of the Percentage Compositions of Rocks, Albert Johannsen. Jl. Geology, vol. 27, no. 4, May-June, 1919, pp. 276-285, 6 figs. Based on claimed proportionality of surface measurements to volumes in any uniform, non-banded rock, irrespective of shape of individual components.

IRON

GREAT BRITAIN. Recent Iron-Ore Developments in the United Kingdom, F. H. Hatch. Iron & Coal Trades Rev., vol. 98, no. 2676, June 13, 1919, pp. 795-796, 2 figs. Working of low-grade iron-ore deposits as influencing industrial recuperation. From lecture delivered at Roy. School of Mines.

NOVA SCOTIA. The Iron and Coal Industry in Nova Scotia, F. W. Gray. Iron & Steel of Can., vol. 2, no. 7, July 1919, pp. 152-153. Economical conditions. Paper read before Montreal Metallurgical Assn.

LEAD, ZINC. TIN

LEAD AND VANADIUM. Treatment of Vanadinite for the Recovery of Lead and Vanadium Metallurgically, J. E. Conley. Metal Industry, vol. 14, no. 26, June 27, 1919, pp. 521-524, 2 figs. Results of methods which are said to have proven successful in recovering lead from vanadinite and fusion with caustic soda and soda ash; recovery by solution.

SPELTER. The Spelter Industry in Australia and Britain, F. A. Govett. Steel & Metal Digest, vol. 9, no. 7, July 1919, pp. 344-346. Statistics and account of projected increases of various plants.

VANADIUM. *See Lead and Vanadium*

ZINC. War's Influence on the Zinc Industry, Pope Yeatman. Eng. & Min. Jl., vol. 108. no. 1, July 5, 1919, pp. 19-21. Development of new uses of zinc; cooperation between miner and smelter. See also Spelter.

MAJOR INDUSTRIAL MATERIALS

MANGANESE. Manganese Deposits of the West Foot of the Blue Ridge, Virginia, G. W. Stone, H. D. Miser, F. J. Katz and D. F. Hewett. Virginia Geological Survey, Univ. of Va., Bul. no. 17. 1919, 166 pp., 38 figs. Based on examination of mines and prospects and studies of physiographic and stratigraphic conditions under which manganese deposits of region were formed, and of application of hypothesis proposed by D. F. Hewett for discovery of new ore deposits.
Preparation of Manganese Ore, W. R. Crane. Dept. Interior, Bur. of Mines, Minerals Investigations Series, no. 17, May 1919, 16 pp. Including summary of conditions affecting concentration.

NICKEL. Treatment of Low-Grade Nickel Ores, C. W. Davis. Jl. Indus. & Eng. Chem, vol. 11, no. 7, July 1, 1919, pp. 644-648. No satisfactory concentration of ores was obtained by sizing tests, panning, tabling, magnetic concentration, or flotation. Magnetic treatment of reduced North Carolina ore brought concentration of nickel from 0.97 per cent to 3.6 per cent, recovery being 45 per cent.

MINES AND MINING

APEX LAW. A Phase of the Apex Law, Chas. E. Dutton. Eng. & Min. Jl., vol. 108, no. 4, July 26, 1919, pp. 146-147. Examples quoted in support of contention that its application has operated to thwart development.

CONCENTRATION, MAGNETIC. Treatment of Low-Grade Iron Minerals by Magnetic Concentration (Le traitement des minérais de fer pauvres par concentration magnétique), Henry Louis. Chimie & Industrie, vol. 2, no. 5, May 1919, pp. 511-524, 20 figs. Description of process with illustration of machines employed and diagrammatic sketch indicating order of procedure in successive operations. Paper read before Interallied Conference of Chemistry.

COSTS, MINING. Excerpts from Reports of Mineral Investigations of the Bureau of Mines for June, 1919. Dept. of Interior, Bur. of Mines, 1919, 50 pp., 1 fig. Covering production and cost data and mining situation in regard to labor and mining methods in various industries.

DIAMOND DRILL EXPLORATION. Progress in Methods of Exploration, Hugh M. Roberts. Min. & Sci. Press, vol. 119, no. 20, July 12. 1919, pp. 55-57. Tracing particular claim in increasing effectiveness of diamond-drill as exploring instrument.

FRANCE, MINING LAW. New French Mining Law. Colliery Guardian, vol. 98, no. 3053, July 4, 1919, pp. 29. Provides profit-sharing scheme.

HYDRAULIC MINING. Hydraulic Mining in California With Special Reference to the You Bet Mine, F. A. Goodale. Colo. School Mines Mag., vol. 9, no. 7, July 1919, pp. 167-173, 2 figs. Including example of calculations involved in determining size and grade of sluice.

MILL, BALL AND TUBE DRIVES. Ball and Tube-Mill Drives at the Rochester Combined Mill, K. Freitag. Min. & Sci. Press, vol. 119, no. 1, July 5, 1919, pp. 7-8, 1 fig. Arrangement in two units, each composed of one 6 ft. by 4 ft. 6 in. ball mill and one 7 by 12 ft. tube-mill.

MINE EXAMINATION. Proper and Lawful Examination of a Mine by the Mine Examiner. Steve Gosnell. Coal Age, vol. 16, no. 1, July 3, 1919, pp. 18-19. Calls attention to the fact that an inspection may be entirely legal but not adequate and recommends that examiner while making his daily inspection, should not confine his activities to a perfunctory accomplishment of legal prescriptions.

NEVADA PACKARD. Description of Nevada Packard Mine and Mill, Herbert C. Thomson. Salt Lake Min. Rev., vol. 21, no. 6, June 30, 1919, pp. 21-24, 4 figs. Said to consist of series of rhyolite flows, with several intercalated beds of rhyolite stuff, the latter deposited in water, and grading imperceptibly into true shales; they are probably of Jurassic age.

POWER TRANSMISSION. Electrical Transmission of Power in and About Coal Mines, S. W. Farnham. Coal Age, vol. 16, no. 2, July 10, 1919, pp. 48-51. Types of mine loads to be considered and survey of practice in regard to methods of transmission. Paper read before Ill. Min. Inst.

ROCK DRILLS. Pneumatic-Electric Rock Drill and Some of the Tools Used in Its Construction—I, Frank A. Stanley. Am. Mach., vol. 51, no. 3, July 17, 1919, pp. 107-110, 10 figs. Machine which is claimed to provide for air cushion for minimizing shock on electrical apparatus.

SEALING UP. Sealing Up Old or Abandoned Workings, Joseph C. Thompson. Coal Industry, vol. 2, no. 7, July 1919, pp. 259-260. Suggests method of procedure. Paper presented before annual meeting of Ill. Min. Inst.

SHAFTING SINKING. Sinking and Concreting Deep Mine Shaft. Contract Rec., vol. 33, no. 28, July 9, 1919, pp. 674-677, 4 figs. Lining and walls of four compartment shaft, 936 ft. deep, concreted simultaneously with excavation operations.

MINOR INDUSTRIAL MATERIALS

GRAPHITE. The Graphite Situation, Hugh S. Spence. Can. Chem. Jl., vol. 3, no. 7, July 1919, pp. 213-216. Summary of situation as faced by Canadian producers with review of development of present process of recovery and discussion of market conditions.
Graphite Mining and Milling in Alabama, H. P. H. Brumell. Eng. & Min. Jl., vol. 108, no. 1, July 5, 1919, pp. 17-18. Flotation methods reported as successful.

MAGNESIUM AND SODIUM SALTS. Natural Deposits of Salts of Magnesium and Sodium Near Clinton, British Columbia, L. Reinecke. Can. Chem. Jl., vol. 3, no. 7, July 1919, pp. 209-213, 5 figs. Descriptive and historical. (Continued).

SODIUM. *See Magnesium and Sodium.*

OIL AND GAS

APPALACHIAN. Depletion of Natural Gas in the Applachian Field, J. A. Bownocker. Gas Age, vol. 44, no. 2, July 15, 1919, pp. 57-60, 8 figs. Situation is seen fairly satisfactory for present but is considered as uncertain for future.

CONDUCTING. Irevine Oil District, Kentucky, Stuart St. Clair. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 151, July 1919, pp. 1079-1089, 1 fig. Calls attention to probability that area of production from Irevine sand in eastern Knetucky is a function of the distance from the outcrop of the oil formation and from the major faults.

DRILLING. Percussion Plant for Oil Well Drillings. Eng., vol. 108, no. 2792, July 4, 1919, pp. 830-833, 15 figs. Differences in various systems—American, standard or Californian and Canadian. Paper presented to Inst. of Petroleum Technologists.

GREAT BRITAIN. The Search for Subterranean "Oil-pools" in the British Isles, V. C. Illing. Geological Mag., vol. 6, no. 7, July 1919, pp. 290-301, 1 fig. on supplement plate. Evidence brought forward in favor of possible occurrence of oil pools in Great Britain studied in its geological aspect. Conclusions are generalized in regard to possibility of ascertaining existence of oil in a locality from knowledge of geological formation.
Sections of English Oil Wells. Petroleum World, vol. 16, no. 226, July 1919, pp. 293, 2 figs. Hardstoft where oil is flowing and Brimington where next strike for oil is expected.

OIL ACCUMULATION. Notes on Principles of Oil Accumulation, Alex. W. McCoy. Jl. Geology, vol. 27, no. 4, May-June 1919, pp. 252-262, 6 figs. Experiments are offered to substantiate conclusion that bituminous shales are in close relationship with producing sand of oil field. It is asserted that this bituminous material is in solid form and is only changed to petroleum in local areas of differential movement, accumulation of oil in commercial pools being accomplished by capillary water after such a change is made.

PETROLEUM REFINING. Petroleum Refining, R. W. Cunningham. Jl. Soc. Automotive Engrs., vol. 5, no. 1, July 1919, pp. 78-82 and (discussion) pp. 82-84, 4 figs. Charts showing products obtained in running distallation of oil for petroleum coke and for cylinder stock with notes on oil testing instruments.

WATER SEALING. Sealing Water in California Oil Fields, Seth S. Langley. Eng. & Min. Jl., vol. 108, no. 1, July 5, 1919, pp. 11-16, 4 figs. Formation and cement shut-off methods.

WATER SEPARATION. Separating Water from Petrol. Petroleum World, vol. 16, no. 226, July 1919, pp. 304-305, 2 figs. Device which is said to be more particularly applicable to (1) buried gasoline storage tanks, and (2) portable tanks.

PRECIOUS MINERALS

CARIBOO. Cariboo Placers and Lodes, J. A. Macpherson. Min. & Eng. Rec., vol. 24, nos. 8 & 9, May 1919, pp. 125-129, 9 figs. Concerning conditions, ore treatment and transportation costs.

GOLD. Operations of Round Mountain Mining Company, Charles F. Spilman. Salt Lake Min. Rev., vol. 21, no. 7, July 15, 1919, pp. 23-26, 5 figs. Gold deposits.

OREGON. Placer Mining in Oregon, A. E. Kellogg. Eng. & Min. Jl., vol. 108, no. 3, July 19, 1919, pp. 90-91, 1 fig. Geology of Waldo district.

PLATINUM. The Platinum Situation, James M. Hill, Eng. & Min. Jl., vol. 108, no. 4, July 26, 1919, pp. 131-137, 4 figs. Uses of platinum and possibilities for maintaining supplies. Shortage in platinum and platinum group of metals attributed to disturbances of normal production created by war.

SILVER. Silver Spur Mine, Lionel C. Ball. Queensland Dept. of Mines, Geological Survey, No. 264, 1918, 36 pp., 13 figs. Recent developments and future prospecting.
Silver Volatilization in Smelting, Frederic P. Dewey. Eng. & Min. Jl., vol. 108, no. 3, July 19, 1919, pp. 87-89. Distinguished between volatilization and dusting and points out that mechanical loss due to ebullition has nothing to do with the vapor pressure, or true volatilization.

SAFETY ENGINEERING

FIRES. Use of Inert Gas to Extinguish Mine Fire, Joseph J. Walsh. Coal Industry, vol. 2, no. 7, July 1919, pp. 266-267, 1 fig. Applicability in extinguishing crop fires or those at inaccesible points.

BELGIUM. Underground Transportation (Les transports souterrains), F. Defize. Revue Universelle des Mines & de la Métallurgie, vol. 1, no. 1, Jan. 1919, pp. 70-117, 6 figs. Comparative examination of various systems referring to conditions prevalling in Belgium mines.

QUARRIES. Transportation in Quarries. Daniel J. Hauer. Cement, Mill and Quarry, vol. 15, no. 2, July 20, 1919, pp. 19-20, 3 figs. Illustrating track layouts for inclines in pit quarries that are worked in two or more lifts.

RAILS, MINE, BONDING. Importance of roper Bonding of Mine Rails, C. C. Beck. Coal Age, vol. 16, no. 3, July 17, 1919, pp. 90-93, 22 figs. Type of bond employing terminals welded to rail ends recommended.

VARIA

GERMANY. Economical Situation of the Basic Steel Works in Germany, Belgium and France (Situation économiques des aciéries au convertisseur basique en Allemagne, en Belgique et en France), Fernand Tordeur. Revue Universelle des Mines & de la Métallurgie, vol. 1, no. 1, Jan. 1919, pp. 1-69. Discusses application of modern methods as economical factor for developing industry.

PUBLIC CONTROL. State Versus Private Control of Mines and Minerals. Can. Min. Inst. Bul., no. 87, July 1919, pp. 697-701. Based on evidence presented before British Coal Industry Commission.

MUNITIONS AND MILITARY ENGINEERING

CABLES. Military Uses of Cables (Etude sur l'emploi des cahles aux armées), G. Linekugel le Cocq. Génie Civil, vol. 74, no. 24 & 25, June 14 & 21, 1919, pp. 477-481 and 497-504, 95 figs. partly on supp. plates. Mechanical details and technical study of semi-permanent Gisclard bridges; aerial transport cable and its use in rapid reconstruction of masonry piles and railroad heds. (Concluded).

CAMOUFLAGE. Memoranda on the Camouflage Service of United States Army, Evarts Tracy. Prof. Memoirs, Corps Engrs. U. S. Army & Engr. Dept., vol. 11, no. 56, Mar.-Apr. 1919, pp. 175-184. Including discussion of qualifications of a field camoufleur.

The Principles of Camouflage, M. Luckiesb, Tran. Illum. Eng. Soc., vol. 14, no. 5, July 21, 1919, pp. 234-255. Particularly in reference to marine practice and applicability of art to airplanes.

Camouflage Harold Van Buskirk. Tran. Illum. Eng. Soc., vol. 14, no. 5, July 21, 1919, pp. 225-233, 8 figs. on six separate plates. Outline of progress made inUnited States before and after Navy Dept. took over and organized its camouflage section.

Painting Battleships for Low Visibility, Everett L. Warner. Tran. Illum. Eng. Soc., vol. 14, no. 5, July 21, 1919, pp. 220-224, 2 figs. on four supp. plates. Standard navy gray considered as most suitable shade.

The Science of Marine Camouflage Design, Everett L. Warner. Tran. Illum. Engr. Soc., vol. 14, no. 5, July 21, 1919, pp. 215-219, 10 figs. on four supp. plates. Showing various designs witb reference to principles involved. Paper presented before N. Y. Section Illum. Eng. Soc.

CAMPS. Construction of Camp Meade, R. F. Proctor. Cornell Civil Engr., vol. 27, no. 5, June 1919, pp. 159-167. Camp provides housing for 41,500 men.

CONSTRUCTION DIVISION, U. S. A. Expediting the Engineering Work of the Construction Division of the Army, A. B. McDaniel. Eng. & Contracting, vol. 52, no. 3, July 16, 1919, pp. 77-79, 3 figs. Outlining method for routing work and coordination of various departments.

DESTROYERS. Notes on Handling Destroyers, C. C. Slayton. U. S. Naval Inst. Proc., vol. 45, no. 7, July 1919, pp. 1201-1219, 6 figs. Suggestions to captains.

ENGINEERING IN THE NAVY. The Importance of Engineering to the Navy, Josephus Daniels. Jl. Engrs. Club of Philadelphia, vol. 36, no. 177, August 1919, pp. 299-300. From address at opening exercises of Post-Graduate School at Anapolis.

GERMAN FLEET, SINKING OF. The Sinking of tbe German Fleet at Scapa-Flow (Le Coulage de la flotte allemande a Scapa-Flow), A. Poildoué. Génie Civil, vol. 75, no. 1, July 5, 1919, pp. 1-7, 22 figs. Technical notes on relative values of British and German fleets. Structural features of ships which participated in Jutland battle.

GUN-MOUNT CONSTRUCTION. Building 5-inch Gun Mounts at Brantford, J. H. Moore. Can. Machy., vol. 22, no. 4, July 24, 1919, pp. 65-68, 9 figs. Dealing practically with machine-tool equipment. (To be concluded).

GUN MOUNTS, NAVAL. Making Naval Gun Mounts. Machinery (Lond.), vol. 14, no. 351, June 19, 1919, pp. 349-353, 11 figs. Tools, gages and fixtures used in operations. (Continued).

How the Navy Designed and Built tbe World's Heaviest Field Piece, C. L. McCrea. U. S. Naval Inst. Proc., vol. 45, no. 7, July 1919, pp. 1159-1169, 2 figs. Seven-inch caterpillar mount.

Mounts for Naval Anti-Aircraft Guns, Fred H. Colvin. Am. Mach., vol. 51, no. 2, July 10, 1919, pp. 79-83, 14 figs. Carriage and hall races. First article.

MINES. Bringing in tbe Sheaves, Clarence Nelson Hinkamp. U. S. Naval Inst. Proc., vol. 45, no. 7, July 1919, pp. 1117-1133, 11 figs. Structural details of German mines. Account of mine sweeping.

ORDNANCE BASE. Tbe Ordnance Base of the American Expeditionary Forces. Stone & Webster Jl., vol. 25, no. 1, July 1919, pp. 10-22, 14 figs., on supp. plates. Describes Mebun plant, which was laid out to serve army of two million men in france.

ORDNANCE MATERIALS. Tbe Manufacture of Steel for Ordnance Materials in England and in France, F. F. McIntosb. Proc. Engrs. Soc. Western Pa., vol. 35, no. 3, April 1919, pp. 140-163, and (discussion) pp. 164-170. Observation and impression obtained on inspection of steel mills tbrougb England and France. The method of etching for macrostructure of steel as developed by Mr. J. C. W. Humphreys, Chief Chemist in charge of Naval Inspector of Steels Lahoratory at Sheffied, England, is presented.

PARAVANES. Paravanes, George L. Catlin. U. S. Naval Inst. Proc., vol. 45, no. 7, July 1919, pp. 1135-1157, 8 figs. Types used, manner of applying them, and description of operation.

ZEEBRUGGE ATTACK. Destruction of the Flanders Triangle. Z. W. Wicks. U. S. Naval Inst. Proc., vol. 45, no. 7, July 1919, pp. 1093-1116, 3 figs. Technical consideration involved in planning the Zeebrugge attack.

INDUSTRIAL TECHNOLOGY

ALCOHOL. Etbyl Alcohol from Waste Sulphite Liquor, E. C. Sherrard and Galo W. Blanco. Paper, vol. 24, no. 17, July 2, 1919, pp. 15-21, and 26. Experiments conducted hoth commercially and experimentally said to bave shown production ranging from 0.70 to 1.15 per cent on a lahoratory scale and from 0.53 to 0.79 per cent on a large scale production.

AMMONIA. Manufacture of Ammonia hy .... of Electric Arc. Study of the Influence of a Partial Vacuum (Formation de l'ammoniaque au moyen de l'arc électrique. Etude spéciale de l'influence de la dépression), E. Briner and A. Baerfuss. Jl. Chimie Pbysique, vol. 17, no. 1, March 31, 1919, pp. 71-140, 3 figs. Experiments at chemical lahoratory of Geneva University. The best results obtained were mixture of one to tbree parts of nitrogen and hydrogen respectively.

The Manufacture of Ammonia and Ammonium Compounds, M. Rind, South Africa Jl. of Industries, vol. 2, no. 5, May 1919, pp. 463-466. Sources of production and uses.

BENZENE. Chlorination of Benzene. Analysis of Mixtures of Benzene, Chlorobenzene and Dichlorohenzene, etc., Percy F. Frankland, S. Raymond Carter and Dorothy Webster. Jl. Soc. Chem. Indus., vol. 38, no. 12, June 30, 1919, pp. 153T-155T, 1 fig. Three fractions obtained by interrupting distillation from Engler flask under uniform conditions at 122 deg. cent and again at 142 deg. cent. Percentages of henzene and chlorohenzene obtained from graph constructed from experiments with mixtures of know composition.

CARBON, ARTIFICIAL. The Manufacture of Artificial Carbon in Norway (Herstellung künstlicher Kohle in Norwegen), Sander. Dinglers Polytechnisches Journal, vol. 6, no. 334, Mar. 22, 1919, p. 63. The raw material used for this purpose is the lye drained off in the manufacture of cellulose, this lye heing rich in organic matter. The product obtained can he used either wet of dried.

CAUSTIC SODA. *See Chlorine.*

CHLORINE-CAUSTIC SODA. The United States Government Chlorine-Caustic Soda Plant at Edgewood Arsenal, Edgewood, Maryland, Samuel M. Green. Chem. & Metallurgical Eng., vol. 21, no. 1, July 1, 1919, pp. 17-24, 9 figs. Historical and descriptive account.

CLAYS. Some Properties of Bond Clays for Graphite Crucihles, M. C. Booze. Jl. Am. Ceramic Soc., vol. 2, no. 6, June 1919, pp. 461-476, 6 figs. Result of tests with nineteen domestic clays, one Englisb, and one German clay.

CRUCIBLES. *See Clays.*

The Effect of Electrolytes on the Properties of Graphite Crucible Bodies, H. G. Schurecht, Jl. Am. Ceramic Soc., vol. 2, no. 6, June 1919, pp. 443-450, 5 figs. Addition of NaOH to graphite-crucible hodies containing Dorset bond clay spoiled working properties of hodies, which offect of same electrolyte on on bodies containing Mississippi hond clay was observed to he improvement of their moldability. HCI claimed to have opposite effect.

CYANAMID. Warrior Extension Station for U. S. Nitrate Plant No. 2. Southern Engr., vol. 31, no. 5, July 1919, pp. 36-40, 7 figs. Plant uses cyanamid process.

Notes and Data on Fixed Nitrogen Plants. Chem. & Metallurgical Eng., vol. 21, no. 2, July 15, 1919, pp. 66-67. Cost figures obtained at Government's cyanamide process nitrate plant at Muscle Shoals as presented before Committee on Military Affairs of House of Representatives.

DUST PRECIPITATION. Electrical Cleaning of Blast Furnace Gas, W. H. Gellert. Blast Furnace & Steel Plant, vol. 7, no. 7, July 1919, pp. 334-339, 2 figs. Data concerning electrical precipitation.

DYES. Gas in the Dye Industry, Gilbert Colville Shadwell. Gas Rec., vol. 16, no.2, July 23, 1919, pp. 17-21, 10 figs. Points out possible utilization. (To be concluded).

FERTILIZERS. The World's Supply of Nitrogeneous Fertilizers, George W. Anderson. Gas Jl., vol. 146, no. 2926, June 10, 1919, pp. 695-696. As production of nitrogeneous products in Germany has heen greatly promoted during the war, writer helieves that a strong competition may be expected now that demand for munitions having ceased Germany will not he ahle to absorh total production herself.

GLASS. Glass-Making Before and During the War, Harry J. Powell. Jl. Roy. Soc. Arts, vol. 67, no. 3473, June 13, 1919, pp. 485-493, and (discussion) pp. 493-495. Descriptive account of progress made hy glass industry in England during the war.

Use of Optical Pyrometers for Control of Optical Glass Furnaces, Clarence N. Fenner. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 151, July 1919, pp. 1001-1011, 2 figs. Investigations at the Geophysical Lahoratory, Carnegie Instn. of Washington, and account of results obtained in actual practice.

Glass, with Special Reference to Its Production in South Africa, Percy A. Wagner, South Afriean Jl. of Industries, vol. 2, no. 5, May 1919, pp. 436-449, 2 figs. On selection of sands. (To he concluded).

Procedures in the Manufacture of Optical Glass, W. S. Williams and C. C. Rand. Jl. Am. Ceramic Soc., vol. 2, no. 6, June 1919, pp. 422-442, 6 figs. Account of investigations made by Bur. of Standards.

GREASE EXTRACTION. Extraction of Grease from Sewage Sludge at Morley, F. Turner. Surveyor, vol. 55, no. 1428, May 30, 1919, pp. 401-403. Including cost of operation. Paper read hefore Instn. Mun. and County Engrs.

HELIUM. Bibliography of Helium Literature, E. R. Weaver. Jl. Indus. & Eng. Chem., vol. 11, no. 7, July 1, 1919, pp. 682-688. Articles published in scientific magazines up to January 1, 1919.

HYDROGEN. *See Oxygen.*

LIME. Lime Calcination (Calcinacion de cal), W. D. Mount. Indenieria Internacional, vol. 1, no. 3, June 1919, pp. 154-155, 1 fig. Suggestions in regard to securing economy in production.

OIL, LINSEED. Effect of Exposure on Raw Linseed Oil, E. J. Shepard. Jl. Indus. & Eng. Chem., vol. 11, no. 7, July 1, 1919, pp. 637-639, 3 figs. Thickness of exposed layer thought to affect only rate of change in constants. For any gain in weight over range covered hy experiments described. changes occurring in constants were found to he independent of rate of gain in weight.

OPACIFIERS. Note on the Use of Magnesia as an Opacifier, V. S. Schory. Jl. Am. Ceramic Soc., vol. 2, no. 6, June 1919, pp. 477-480. Experiments to determine whether additions of small amounts of barium and zinc would result in increases transparency of glaze.

OXYGEN. Automatic Electrolytic-Oxy-Hydrogen Plant, Fred. H. Woodhull. Jl. Engrs. Club of Pbiladelphia, vol. 36, no. 176, July 1919, pp. 271-274, 1 fig. Features in connection with electrical operation and control of compressor set. Paper read hefore Assn. Iron & Steel Elec. Engrs.

Paints. Paint Pigments: Their History and Development, S. J. Cook. Chem. Indus., vol. 38, no. 11, June 16, 1919, pp. 137T-139T. With reference to Church's and Toch's methods of classification.

Paper. Waste Paper for Papermaking, Henry Aldous Bromley. Paper, vol. 24, no. 18, July 9, 1919, pp. 18-21. Researches on printing ink in relation to its destructibility.

Porcelain. An American Procelain Containing no Free Silica, Arthur S. Watts. Jl. Am. Ceramic Soc., vol. 2, no. 6, June 1919, pp. 488-489. It is claimed that by clacining or semi-fusing fluxes and flint prior to incorporation in procelain body maturing point can be lowered approximately two cones, color vastly improved, and resistanee to sudden temperature changes improved approximately 200 per cent.

Potash. Non-German Sources of Potash, Arthur Holmes. Geological Mag., vol. 6, no. 6, June 1919, pp. 251-254, 1 fig. Deposits in Alcace, Spain, and Abyssinia, where beds of potassium are associated in workable quantities with saline formations. (To be continued).

Rubber. Prices of Rubber Products, Isador Lubin. India Rubber World, vol. 60, no. 5, Aug. 1, 1919, pp. 614-620, 7 figs. From War Industries Board, Press Bulletin no. 30.

Recent Improvements in Rubber Compounds for Solid and Pneumatic Tires. India-Rubber Jl., vol. 58, no. 1, July 5, 1919, pp. 1-2 & 5. Advantages claimed for using carbon gas black in rubher compounds.

Soap. Colloid Chemical Studies of Soap—I. Martin H. Fisher. Chem. Engr., vol. 27, no. 7, July 1919, pp. 155-162, 8 figs. Hydration capacity of some pure soaps.

Sugar. Better Results by Better Management, L. W. Alwyn-Schmidt. Sugar, vol. 21, no. 7, July 1919, pp. 350-353. Quotes instance in which it is said installation of suitable equipment in sugar factory increased amount of sugar obtained from same quantity of raw material.

The Color of Sugar Cane Products and Decolorization in Factory Practice F. W. Zerban and E. C. Freeland. Sugar, vol. 21, no. 7, July 1919, pp. 354-359b, 2 figs. Results obtained in experiments at laboratory of Louisiana State University said to show that combination of ferric iron and polyphenols plays a very important part in the color of sugar-house products.

ORGANIZATION AND MANAGEMENT

ACCOUNTING, FINANCE AND COSTS

Building Factors in Costs. Fixing Building Factors in Costs, M. H. Potter. Iron Trade Rev., vol. 65, no. 2, July 10, 1919, pp. 97-98. How building and associated factors are apportioned in fixing indirect costs, Fourth article.

Chemical Manufactures. Cost Analysis in Chemical Manufacture—II, Jl. Soc. Chm. Indust., vol. 38, no. 12, June 30, 1919, pp. 224R-226R. Costs and efficiencies of pitric and sulphuric phuric acid production. Based on official reports of English foundries.

Coal-Production Costs. The Cost of Coal Production as Influenced by the Balancing of the Working Organization, F. W. Gray. Iron & Steel of Can., vol. 2, no. 7, July 1919, pp. 159-160. Cost increase since 1913. Unbalanced condition of working forces at collieries due to requirements of military service is quoted as prominent among reasons for increased expenditure required to produce coal.

Manufacturing Costs. A Graphical Analysis of Manufacturing Costs, E. L. Ackerman and L. F. Merritt. Am. Industries, vol. 19, no. 12, July 1919, pp. 20-21, 1 fig. Illustrates with hypothetical case graphical analysis of manufacturing costs of a given contract cancelled prior to completion.

Finding Costs of Manufacture, Clifford E. Lynn. Iron Trade Rev., vol. 65, no. 1, July 3, 1919, pp. 23-25, 5 figs. Recommended forms for keeping record. Fifth article.

Public Utilities. Organization and Methods of Puhlic Utilities Accounting, C. P. Staal. Nat. Elec. Light Assn. bul., vol. 6, no. 7, July 1919, pp. 392-397, 2 figs. Diagrams showing accounting department organization of Southern California Edison Co.

EDUCATION

Accident Prevention. How to Give Illustrated Lectures on Accident Prevention to Workmen, Roy S. Vonsih. U. S. Dept. Labor, Working Conditions Service, 1919, 13 pp. Believes that most effective way to prevent accidents is through lectures with slides and moving pictures, showing reuslts of accidents rather than how to avoid them.

Arc Welders. Training Operators for Arc Welding, E. Wanamaker and H. R. Pennington. Ry. Elec. Engr., vol. 10, no. 7, July 1919, pp. 226-231, 14 figs. Outlining methods said to have been used successfully.

See also Disabled Soldiers.

Colleges. *See Engineering Students.*

Disabled Soldiers. Electrical Occupations for Disabled Soldiers. Universal Engr., vol. 29, no. 6, June 1919, pp. 41-45. In construction, repair, and maintenance work.

Teaching Autogenous Welding to Disabled Soldiers (Lehrwerkstätte des Verhandes für autogene Metallbearbeitung an der staatlichen Maschinenbauschule zu Cöln). Acetylen in Wissenschaft und Industrie, vol. 22, nos. 3-4, Feb. 1919, pp. 15-18, 7 figs. Showing appliances used for various forms of disability.

Engineering Students. Broader Education for Engineers, George B. Pegran. Jl. Engrs. Club of Philadelphia, vol. 36, no. 176, July 1919, pp. 274-277. Preparing students to come into professional engineering course with fair general education on ordinary subjects and definite amount of preparation in fundamental sciences.

"Case System" Changes in Engineering Curricula, and Business Training for Engineers. Eng. News-Rec., vol. 83, no. 4, July 24, 1919, pp. 183-187. Result at Army Engineer School at Camp A. A. Humphreys in applying definite problem method. Radical reorganization in methods of instruction effected at Tufts College and Yale University.

Hawthorne Training Schools. Training Men and Women at Hawthorne, F. W. Willard. Western Elec. News, vol. 8, no. 5, July 1919, pp. 2-6. Theoretical as well as practical instruction.

Higher Positions. Choosing and Training the Man for the High Position, Julian McGill. Jl. Electricity, vol. 43, no. 1, July 1, 1919, pp. 11-12. Suggests rules governing training of men.

Miners. Educational Methods at the Copper Queen, Chas. F. Willis. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 151, July 1919, pp. 1099-1106, 1 fig. Course designed for education of miners to shift-boss position.

Upgrading in Training Department. Upgrading in the Training Department, M. R. Lott. Indus. Management, vol. 58, no. 2, Aug. 1919, pp. 100-104, 4 figs. Method of Sperry Gyroscope Co.

Tin-Plate Mills. Education a Plant Efficiency Factor, J. K. Lamoree. Iron Age, vol. 104, no. 5, July 31, 1919, pp. 296-297. Application in tin-plate mill.

Training. Preparing Industry for Reconstruction Demands, C. T. Clayton. Am. Mach., vol. 51, no. 1, July 3, 1919, pp. 19-22, 2 figs. Points out advantages of training men in manufacturing industry.

Vocational Education. Vocational Education Under the Smith-Hughes Act. Metal Trades, vol. 10, no. 7, July 1919, pp. 297-300. Provisions of the Act as far as industrial education is concerned.

FACTORY MANAGEMENT

Bonus Systems. Bonus System Reduces Coal Consumption at Denver, W. E. Casey and E. Weber. Power, vol. 50, no. 5, July 29, 1919, pp. 174-179, 7 figs, By installation of new turbine and introduction of bonus system, Denver tramway system claims to have reduced coal consumption to less than 2.5 lb. per kw-hr., with saving in operating expenses of about $150,000 per year.

Construction Records. Mastering Service Problems with a Master Sheet—II. Motor Age, vol. 36, no. 3, July 17, 1919, pp. 22-25, 7 figs. Service records for indicating rapair jobs through shop proves a time saver.

Progressive Cards for Shipyards Shipbuilding and Shipping Record, vol. 14, no. 2, July 10, 1919, pp. 41-42, 1 fig. Suggests system of checking progress of construction.

Drawing Office. The Principles of Drawing Office Organization, N. Gerard Smith. Eng. & Indus. Management, vol. 2, no. 1, July 3, 1919, pp. 13-15, 1 fig. Functions of office are believed to be (1) to design product and manufacturing plant and processes. (2) to collect ideas wherever they may be found, and to utilize them to best advantage. (3) to experiment with and demonstrate all new product and processes. (4) to deal with time study, (5) to record all data.

Employment Management. Employment, A. Rowland Entwistle. Eng. & Indus. Management vol. 1, no. 19, vol. 2, nos. 1 and 2, June 19, July 3, and 10, 1919, pp. 590-593, 6-10, 38-41, 1 fig. June 19: Object, scope and functions of the employment manager. July 3: Construction details of employment department. July 10: Qualifications of employment manager.

Physical Examination Previous to Employment, Chas. F. Willis. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 151, July 1919, pp. 1013-1020 Advocated not for the purpose of eliminating the unfit, but for measuring physical fitness and placing men where they can do the best for themselves, for their follow-workers and the company.

Gage Making. *See Management Methods.*

Garment Trades. *See Management Methods.*

Industrical Cooperation. Anti-Social, Militant Methods Condemned, Walter Gordon Merritt. Iron Age, vol. 104, no. 1, July 3, 1919, pp. 9-12. Cooperation of different companies through representatives chosen by employer and employees suggested.

Industrial Democracy—The Leitch Plan. Min. & Oil Bul., vol. 5, no. 7, June 1919, pp. 395-396 and p. 411. Co-operation between executive and operating individuals by means of an industrial democracy house of representatives.

Successful Industrial Democracy, Dale Wolf. Indus. Management, vol. 58, no. 1, Juy 1919, pp. 67-71, 2 figs. Participation board plan of Miller Lock Company.

Industrial Co-operation, W. R. Ingalls. Min. & Sci. Press, vol. 118, no. 26, June 28, 1919, pp. 877-884. Economical aspect. Paper read before Can. Min. Inst.

Industrial Democracy in Operation, B. C. Forbes. Iron Age, vol. 104, no. 4, July 24, 1919, pp. 239-240. Representative plan which has been adopted by a numher of companies.

Industrial Personnel Relations, Arthur H. Young. Mech. Eng., vol. 41, no. 7, July 1919, pp. 581-586. Human factor in organization system intended to promote safety; also account of International Harvester Co.'s plan of employees' representation.

Interchangeable Manufacture. Principles of Interchangeable Manufacturing, Earl Buckingham. Machinery, vol. 25, no. 11, July 1919, pp. 1024-1029. Factors which make possible, or permanent, interchangeable manufacture of mechanical products.

Labor Labels. Organizing an Industrial Republic, A. J. Hain. Iron Trade Rev., vol. 65, no. 4, July 24, 1919, pp. 21-26. Commercial possibilities of label or trade-mark bearing words "Made in an Industrial Democracy," or similar phrase to denote that product originated in factory where labor is given voice in management.

MANAGEMENT METHODS. Installing Management Methods in the Woodworking Industry, Carle M. Bigelow. Indus. Management, vol. 58, no. 1, July 1919, pp. 1-8, 6 figs. Necessity of establishing engineering department in woodworking industry emphasized by reference to writer's experience in several of these plants where lack of this department permitted conditions which encouraged waste and inefficiency. Basis for organizing such department is suggested.

How We Increased Output 1000 Per Cent in an Already Crowded Plant. Factory, vol. 23, no. 1, July 1919, pp. 40-42. Improvements performed in various departments such as giving better tempering to cutting in screw machine that was found to dull quickly. From experiences of Gillette Safety Razor Co.

Efficiency in the Gage-Making Department, C. B. Cole. Machinery, vol. 25. no. 11, July 1919, pp. 1056-1057. Operation and management of gage-making department on time, and money-saving basis.

Scientific Management in Road Construction, A. W. Campbell. Contract Rec., vol. 33, no. 26, June 25, 1919, pp. 634-635. System of cost-keeping for securing greatest possible performance for given outlay.

Modern Management Methods. Applied to Construction, Mean Higher Efficiency, Daniel J. Hauer. Contract Rec., vol. 33, no. 26, June 25, 1919, pp. 585-589. How scientific scheme of planning and organization opens way to greater and more certain profits.

Factory Management in Garment Trades, Mack Gordon. Indus. Management, vol. 58, no. 1 and 2, July and August, 1919, pp. 12-16, and 140-145, 10 figs. July: Functions and methods of planning department. August: Time studies and instructions.

Managing for Maximum Production, L. V. Estes. Indus. Management, vol. 58, no. 1 and 2, July and August 1919, pp. 54-61 and 134-138, 10 figs. July: V—Use of standards and instructions. August: VI—Emphasis is laid upon needed fostering spirit of co-operation, training some one to perpetuate and carry forward betterment work and making an occasional management audit.

Organizing for Work, H. L. Gantt. Indus. Management, vol. 58, no. 2, Aug. 1919, pp. 89-93, 3 figs. Machine-record charts, progress charts and man-record charts.

Organization and Management of a Machine-Tool Plant—II. Machy. (Lond.), vol. 14, no. 353, July 3, 1919, pp. 408-411, 10 figs. Work of planning department in relation to time study and rate setting in medium-sized plant making single line of machines.

System in the Small Works. Eng. Rev., vol. 32, no. 12, June 16, 1919, pp. 340-341. Points out that general shops need have very little fear of total extinction.

ORDERS. The Production Planning System of Heald Machine Company, W. S. Pratt. Am. Mach., vol. 51, no. 5. July 31, 1919, pp. 203-208, 9 figs. General system and writing of orders. (First article.)

PAYROLL COMPUTING. The Periodograph. A Decimal Time-Keeping Machine, J. V. Hunter. Am. Mach., vol. 51, no. 2, July 10, 1919, pp. 49-54, 20 figs. Division of hour into ten parts for purpose of simplifying work of payroll computer. Manufacturing operations at Periodograph shop.

PERIODOGRAPH. *See Payroll Computing.*

PLANNING DEPARTMENT. The Planning Department in Scientific Management—II, James F. Whiteford. Eng. & Indus. Management, vol. 1 & 2, no. 20 & 1, June 26 and July 3, 1919, pp. 632-636 and 23-24. Discussion following reading of paper of that title read before Indus. Reconstruction Council.

PLANT CONSTRUCTION. Planning the Industrial Plant—II, Hugh M. Wharton. Indus. Management, vol. 58, no. 1, July 1919, pp. 47-50, 11 figs. Application for standard types of construction. (To be continued.)

PLANT LAYOUT. Doubles Steelmaking Capacity, G. H. Manlove. Iron Trade Rev., vol. 65, no. 2, July 10, 1919, pp. 87-95, 13 figs. Works of Inland Steel Co., with reference especially to mill equipment and layout for routing of material.

Planning a Progress Department—III, W. J. Hiscox. Eng. & Indus. Management, vol. 1, no. 20, June 26 1919, pp. 621-622, 3 figs. Suggestions in regard to selecting location so as to permit efficient handling of materials and to prevent confusion and overlapping.

PRODUCTION. Increase Production to Reduce Prices. Contract Record, vol. 33, no. 30, July 23, 1919, pp. 713-715. Greater physical production considered as only solution of present industrial difficulties.

RATE SETTING. Time Study and Rate Setting in a Machine Tool Plant, Erik Oberg. Machinery, vol. 25, no. 11, July 1919, pp. 1051-1055, 8 figs. System consists of determining, by actual experiments or performance of work in shop, accurate estimate of time in which it can be done. Bonus time is a certain amount less than "standard" time so determined.

RATING WORKERS. Dangers in Rating Employees, Roy Willmarth Kelly. Indus. Management, vol. 58, no. 1, July 1919, pp. 35-42, 13 figs. Methods used by representative American firms in rating workers for salary advances and promotions. It is recommended that rating divisions be few and questions to be answered precise.

SCIENTIFIC MANAGEMENT. Scientific Management (Wissenschaftliche Betriebführung), Victor Frey. Schweizerische Bauzeitung, vol. 73, no. 21, May 24, 1919, pp. 237-240. With reference to systems of Taylor, Gilbreth-Ross and Gantt.

SHOP COMMITTEES. Shop Committees as Lubricants in Management, William Leavitt Stoddard. Factory, vol. 23, no. 1, July 1919, pp. 37-40, 2 figs. System of representation ordered by War Labor Board at Lynn works of General Electric Co. following strike of workers during June-July 1918.

Representative Shop Committees, Willard G. Aborn and William L. Shafer. Indus. Management, vol. 58, no. 1, July 1919, pp. 29-32. Discusses basis of representation method of election, election procedure, eligibility requirements, committee procedure, relations with labor unions and personnel of shop committees.

How Far Should Shop Committees Go? William Leavitt Stoddard. Indus. Management, vol. 58, no. 2, Aug. 1919, pp. 121-123. Observes that spirit of compromise must prevail else no good can be accomplished.

SMALL SHOP. *See Management Methods.*

SYMBOLIZATION, MNEMONIC. Factory "Nicknames" That Save Time, Henry H. Farquhar. Factory, vol. 23, no. 1, July 1919, pp. 50-53. Basis of mnemonic symbolization.

TAYLOR SYSTEM. An Object Lesson in Efficiency, Wilfred Lewis. Eng. & Indus. Management, vol. 1, no 19, June 19, 1919, pp. 594-596. Illustration of what has been accomplished along lines laid down by F. W. Taylor by the Tabor Mfg.

TOOL STORES. The Model Tool Stores—II & III, Herbert C. Armitage. Eng. & Indus. Management, vol. 1 & 2, no. 20 & 22, June 26 & July 10, 1919, pp. 615-617 and 35-37, 8 figs. Their functions as independent stores investigated chiefly in regard to maintenance of effective stocks of alwearing tools. Arrangement, organization, construction and equipment. (Continuation of serial.)

WAGE SYSTEMS. My Objection to the Piece Rate Method of Wage Payment—II. Harrington Emerson. Indus. Management, vol. 58, no. I, July 1919, pp. 17-20. Lays down physiological laws of work, and discusses manner of estimating task and preparing standard schedule.

See also Bonus Systems, Rate Setting.

WELFARE BUILDINGS. Design and Construction of Factories—17, Arthur F. Wickenden. Eng. & Indus. Management, vol. 1, no. 20, June 26, 1919, pp. 618-619. Welfare buildings.

WELFARE WORK. Co-operation Between Management and Employees, E. O. Davis, Textile World Jl., vol. 56, no. 3, July 19, 1919, pp. 49-51, 5 figs. Emphasizes need of welfare and educational work as means of increasing production and improving quality of manufactured products.

WOODWORKING INDUSTRY. *See Management Methods.*

WORK RECORDS. Machine Repair Records, John A. Davenport. Machy. (Lond.), vol. 14, no. 352, June 26 1919, pp. 365-367, 6 figs. Forms for keeping record of all repair work completed and in progress.

LABOR

FOREMEN. Who Make the Best Foremen? Factory, vol. 23, no. I, July 1919, pp. 63-67, 5 figs. Personnel record forms of Service Motor Truck Co.

GREAT BRITAIN. What I Found the British Employer Thinking About, Samuel Crowther. Factory, vol. 23, no. 1, July 1919, pp. 57-61. Position trade unions held at the beginning of the war; how women workers were affected by close of war.

Royal Commission on Industrial Relations Reports Its Findings on Labor Situation. Contract Rec., vol. 33, no. 28, July 9, 1919, pp. 667-668. Recommends, among other things, establishment by legislation of eight-hour day and recognition of greater rights of workers in control of industry.

INTELLIGENCE TESTS. Intelligence Tests in Industry, J. P. Lamb. Indus. Management, vol. 58, no. 1, July 1919, pp. 21-23, 1 fig. Experience in industrial plant where such tests have been used for three years believed to indicate advisability of conducting them.

INTERNATIONAL LABOR STANDARDS. Enforcement in U. S. of International Labor Standards, George W. Wickersham. Am. Industries, vol. 19, no. 12, July 1919, pp. 11-16 and p. 42. Conclusion derived by writer from analysis of labor program as outlined in recent conferences in Europe and the U. S. A.

LABOR UNREST. Prepare for Labor Unrest While Labor is Content, Harry Tipper. Automotive Indus., vol. 41, no. 2, July10, 1919, pp. 77-79. Points out that even during prosperity and industrial peace and contentment radicals never let their printing presses or propaganda machine lie idle. This, it is said, is lesson for American employees.

LIVING CONDITIONS. Making the Workman's Dollar Bigger, Emerson P. Harris. Indus. Management, vol. 58, no. 2, Aug. 1919, pp. 111-112. By insuring economy and real competition in the purveying of household supplies.

PROFIT SHARING. Fallacy of the Employees' Profit-Sharing as a Reward for Labor, P. L. Buckhard. Indus. Management, vol. 58, no. 1, July 1919, pp. 42-45. It is emphasized as fundamental fact that no profit sharing scheme can be substituted for a proper wage-payment system whereby adequate wages are paid to workers. It is pointed out that profit sharing must always be secondary to a fair, suitable reward for labor.

WOMEN. Women's Work in Engineering and Shipbuilding During the War, Lady Parsons. Engineering, vol. 108, no. 2793, July 11, 1919, p. 62. Statistical data obtained from report of War Cabinet Committee on Women in Industry. Paper read before North-East Coast Inst. of Engrs. and Shipbuilders.

Women in Industry (Die weibliche Hilfskraft im Fabrikbetriebe), Karl Benecke. Dinglers polytechnisches Journal, vol. 334, no. 1, Jan. 11, 1919, pp. 4-6, 3 figs. Writer believes that when properly selected, the number of women suitable for ordinary factory work will be found larger than generally supposed. He also considers training course, as introduced by many large plants in Germany, as best method for selection.

LEGAL

ACCIDENT LEGISLATION. Legislation and the Coal Trade, E. T. Good. Eng. & Indus. Management, vol. 2, no. 2, July 10, 1919, pp. 56-57. How accidents have been reduced.

DEPENDENCY. The Riddle of Dependency—II & III. Chesla C. Sherlock. Am. Mach., vol. 51, no. 1 & 2, July 3 & 10, 1919, pp. 10-12 and 70-72. Effects of desertion, bigamy, divorce and common-law marriages on the making of compensation awards. Question of disposing of compensation in case of death of workman's widow.

DISEASE AND ACCIDENT LIABILITY. Disease and Accident Liability, Chesla C. Sherlock. Iron Trade Rev., vol. 65, no. 3, July 17, 1919, pp. 168-169. It is noted that courts hold employer must pay damages when disease results from injury and when injury hastens fatal consequence of disease.

Explosion of Chemicals. The Explosion of Chemicals—I. Common Law Liability, Chesla C. Sherlock. Chem. & Metallurgical Eng., vol. 21, no. 2, July 15, 1919. pp. 83-84. With reference to court decisions bearing on the subject.

RECONSTRUCTION

Reconstruction Problems, F. R. Todd. Gas Engine, vol. 21, no. 7, July 1919, pp. 213-216. Expresses optimism in viewing readjustment during period of reconstruction.

The Industrial Situation, E. Garcke. Eng. Rev., vol. 32, no. 12, June 16, 1919, pp. 337-339. Pleads for readjustment of economic system in order to repair ravages of war, to inaugurate industrial peace and to prevent famine of capital a few years hence.

Foreign Countries. Readjustment and Reconstruction Activities in Foreign Countries, Grosvenor B. Clarkson. U. S. Council of Nat. Defense, Reconstruction Research Division, Washington, D.C., May 1, 1919, 188 pp. Extracts from and digests of article sconcerning readjustment and reconstruction activities in foreign countries, which have appeared in recent publications. Material selected consists of accounts of governmental activities in organization and administration of readjustment and reconstruction work, and of similar activities of important national industrial, commercial, and welfare organizations.

Great Britain. British Engineers' Reconstruction Problems, E. J. Elford. Good Roads, vol. 56, no. 3, July 16, 1919, pp. 23-35. Development of labor-saving machinery and methods of dealing with labor situation considered as chief problem of municipal engineers. Paper prepared for meeting of Instn. of Mun. & County Engrs.

International Competition. Applying Industrial Efficiency to Readjustment, Charles E. Bedaux. Am. Contractor, vol. 40, no. 29, July 19, 1919, pp. 21-22. Forecasts that future competition will require at least 33 per cent reduction in production costs to meet foreign labor costs.

Machine-Tool Reappraisal. How War Department will Revalue Used Machine Tools. Automotive Indus., vol. 41, no. 2, July 10, 1919, p. 67, 2 figs. Chart for use in appraisal of standard machine tools to determine service value.

Markets. Principle for Stabilizing Prosperity, G. Sumner Small. Indus. Management, vol. 58, no. 1, July 1919, pp. 24-28. Suggests utilization of reserve purchasing power of Government to sustain market, providing employment for idle labor on government work, and equalizing rate of purchase of materials with rate of consumption through governmental regulations.

SAFETY ENGINEERING

Acetylene Apparatus Explosions. Explosions in Acetylene Apparatus (Explosionen von Acetylen-Apparaten). Acetylen in Wissenschaff und Industrie vol. 22, nos. 1-2, Jan. 1919, pp. 4-5. New regulations for cleaning and handling apparatus.

Apparatus Failure. Accidents Due to Structural Defects of Apparatus or Injury to Apparatus, D. Dale Logan. Iron & Coal Trades Rev., vol. 98, no. 2677, June 20, 1919, pp. 850-851. Details of two fatal accidents which happened during rescue operations in France. Paper read before Instn. of Mining Engrs.

Breathing Apparatus. Development and Improvement of Breathing Apparatus, H. H. Sanderson. Can. Min. Inst. Bul., no. 87, July 1919, pp. 730-736. Particularly Gibbs and Paul apparatus.

Electrical Apparatus. Safety Rules for Men Handling Electrical Circuits or Apparatus. General Elec. Rev., vol. 22, no. 6, June 1919, pp. 484-486. Based on experience acquired in electrical field by General Electric Co.

Gas Poisoning. Protection Afforded by Army Gas Masks Against Various Industrial Gases, A. C. Fieldner, M. C. Teague and J. H. Yoe. Jl. Indus. & Eng. Chem., vol. 11, no. 7, July 1, 1919, pp. 622-623. Results of tests against various gases

Kerosene-Lamp Explosions. Kerosene Lamp Explosions, C. E. Worthington. Safety Eng., vol. 38. no. 1, July 1919, pp. 1-13, 9 figs. Lamp explosions are believed to be more properly termed flares. Conclusions are derived in regard to causes producing such explosions and remedies are suggested.

National Electric Safety Code. Is the National Electric Safety Code Suitable for California? Edward B. Rosa. Jl. of Electricity, vol. 43, no. 2, July 15, 1919, pp. 57-59. Standpoint of Bur. of Standards in regard to safety code and institution of code of ethics.

The National Electrical Safety Code, Geo. E. Quinan. Jl. of Electricity, vol. 43, no. 2, July 15, 1919, pp. 54-57. Discussion of problems, aims and the building up of present national code. Paper read before joint meeting of Am. Inst. Elec. Engrs. and Nat. Elec. Light Assn.

Safeguards. Industrial Safety—I, R. J. Young. Power Plant Eng., vol. 23, no. 15, August 1, 1919, pp. 689-690, 1 fig. Design and construction of safeguards. Lecture delivered before Schools for Safety Engr. conducted by Nat. Safety Council.

Safety-First Instructions. Safety First Instruction Through Moving Pictures, Ernest A. Dench. Jl. Electricity, vol. 43, no. 1, July 1, 1919, pp. 15-16. Pictures available and how to obtain them.

Sprinkler Protection. Automotic Sprinkler Protection a Necessity, C. G. Sherman. Contract Rec., vol. 33, no. 27, July 2, 1919, pp. 644-646. Claims that sprinkler have been proved 95 per cent efficient and that consequently they give a guarantee against fire loss that is needed when wastage is so high.

SALVAGE

Warring on Waste. XIII, Johnson Heywood. Factory, vol. 23, no. 1, July 1919, pp. 44-47, 2 figs. Instances showing how material has been saved in factories.

TRANSPORTATION

Industrial Electric Trucks. Use of Industrial Electric Trucks and Tractors by Railroads, Bernard J. Dillon. Elec. Rev., vol. 74, no. 26, June 28, 1919, pp. 1069-1073, 5 figs. Methods of application in handling of freight and baggage.

Motor Transportation. Motor Transportation, J. M. Ritchie. Jl. Engrs. Club of Philadelphia, vol. 36, no. 176, July 1919, pp. 281-282. Its relation to national highway development.

Hauling Over the Highways with Motor Trucks. Good Roads, vol. 18, no. 4, July 23, 1919, pp. 46-49, 14 figs. Examples of services performed by motor vehicles in rural motor express and intercity hauling. Cost data.

Rail and Truck Transportation Compared. The Relative Economy of Freight Transport by Railway and by Motor Truck, Charles Whiting Baker. Eng. News-Rec., vol. 83, no. 2, July 10, 1919, pp. 52-67. Based on figures compiled by Motor Truck Assn. of America and statistical data of railway companies having freight traffic less than 20,000 ton-miles per annum per mile of line.

Refuse Collection. Cost of Motor Truck Operation for Refuse Collection. Eng. & Contracting, vol. 52, no. 1, July 2, 1919, pp. 11-13. Data given by Rochester Bur. of Municipal Research.

Trailers. Trailers and Trucks for Highway Hauling, Harry Wilkin Perry. Good Roads, vol. 18, no. 4, July 23, 1919, pp. 41-44, 7 figs. How trailer solves special hauling problems, reduces road repair and maintenance costs and cuts down cost of highway transportation.

EXPORT

The Future of Industry, F. J. Whiting, Stone & Webster Jl., vol. 24, no. 6, June 1919, pp. 474-484. Considerations on saturation of home markets in the face of present prospects of enlarging our foreign trade.

China. International Engineering Interests in China. Eng., vol. 108, no. 2792, July 4, 1919, pp. 827-829. Advocates reconstruction scheme which should include international supervision of all new loan expenditures and loan allotment and creation of an international railway service, which should control all railway policy.

See also Machine Tools in China.

Electrical Products. Export Conditions for Electrical Products. Elec. World, vol. 74, no. 2, July 12, 1919, pp. 64-65. Summary of information on South American countries emphasizes element of financing sales of manufactured materials for public-utility use and water-power possibilities.

Internal-Combustion Engines. Where is the Foreign Market for Internal Combustion Engines, Lynn W. Meekins. Gas Engine, vol. 21, no. 8, August 1919, pp. 249-252. Possibilities of exporting internal combustion engines. Paper read before Nat. Gas Engine Assn.

Latin America, Rolling Stock. Entering the Latin American Markets, Percy F. Martin. Eng. & Indus. Management, vol. 1 (New Series), no. 20, June 26, 1919, pp. 628 and 630. Opportunities for manufacture of rolling stock.

Machine Tools in China. The Machine Shops of China, Frank A. Foster. Am. Mach., vol. 51, no. 3, July 17, 1919, pp. 99-103, 12 figs. Opportunities of American machine-tool builder.

RAILROAD ENGINEERING

CONSTRUCTION

Gradient, Economical. Technical Study Preliminary to Projecting a Railway (El control têcnico en los proyectos y ahras ferroviarias), César A. Cipriani. Informaciones y Memorias de la Sociedad de Ingenieros del Peru, vol. 21, no. 5, May 1919, pp. 227-232. Formula for determining economical gradient.

Station Rebuilding. Union Station is Rebuilt Without Interrupting Traffic. Eng. News-Rec., vol. 83, no. 2, July 10, 1919, pp. 84-87, 6 figs. Erecting elevated trainshed and rearranging tracks while carrying 165 trains daily.

Track Construction. Constructing a Track Layout in Close Quarters, W. F. Rench. Ry. Maintenance Engr., vol. 15, no. 7, July 1919, pp. 232-234, 1 fig. Difficulties encountered especially because rail was of heaviest section and had to be unloaded and placed by hand.

ELECTRIC RAILROADS

Italy. Electric Traction in Italy (La grande trazione elettrica in Italia). Industria, vol. 33, no. 11, June 15, 1919, pp. 325-329, 3 figs. Features of installation in line of 50 miles.

ELECTRIFICATION

Possibilities of Steam Railroad Electrification, Calvert Townley. Power Plant Eng., vol. 23, no. 14, July 15, 1919, pp. 639-642, 2 figs. Survey of electrified sections of railways, pointing out what are considered as advantages which had been realized in both freight and passenger service.

France and Belgium. Railway Electrification in France and Belgium, Robert E. Thayer. Ry. Age, vol. 67, no. 3, July 18, 1919, pp. 93-94. Plan under consideration involves electrification of 5,220 miles in France, and 147 miles in Belgium.

Main-Line Railroads. Electrification of Main-Line Railroads, W. B. Potter. Street Ry. Bul. vol. 19, no. 7, July 1919. pp. 252-258, 7 figs. Statistical data on power demands for electrical operation of steam railroads in United States. Remarks on design of electric locomotives. Also abstracted in General Elec. Rev., vol. 22, no. 6, June 1919, pp. 430-437, 7 figs.

Single-Phase High-Tension Current. The Shortage of Coal and the Electrification of Railroads (Die Kohlennot und die Elektrisierung der Bahnen), Richard Baecker. Zeitschrift des österr. Ingenieur-und Architekten-Vereins, vol. 71, no. 1, Jan. 3, 1919, pp. 6-8. Writer considers high-tension single-phase alternating current as best suited for standard gage systems of European railroads.

Sweden. Extensive Electrification Proposed for Sweden. Ry. Age, vol. 67, no. 2, July 11, 1919, pp. 61-63, 5 figs. Findings of commission appointed to study question. Of estimated total of 5,000,000 water h.p. available, 1,000,000 has been developed.

Switzerland. Electrification of Federal Railways (Electrification des chemins de fer fédéraux). Bulletin Technique de la Suisse Romande, vol. 45, no. 13, June 28, 1919, pp. 121-122, 2 figs. Hoeter reinforced-concrete piles. (To be continued.)

EQUIPMENT

Standardization. Standardization of Railway Equipment, Frank McManamy. Ry. Rev., vol. 65, no. 1, July 5, 1919, pp. 7-9. What Railroad Administration planned to do and expected to accomplish.

FOREIGN

South America. Railways in the Americas (Ferrocarriles en las Américas), Perciva Ingenieria Internacional, vol. 2, no. 1, July 1919, pp. 1-5, 1 fig. Points out advantages of building trunk lines with easly slopes in diminishing cost of freight and for developing uncultivated and slightly populated sections.

Necessity of Railways for the Development of South America (Ferrocarriles necesarios para la animacion y desrrollo de la América del Sur), F. B. Morris. Ingenieria Internacional, vol. 2, no. 1, July 1919, pp. 7-8, 1 fig. Indicates thre lines which writer believes are necessary for rapid development of South American continent.

Speed, Train. European Train Speeds. Ry. Gaz., vol. 30, no. 24, June 13, 1919, pp. 958-961, 1 fig. Germany and Scandinavia. Survey of highest, longest, an fastest non-stop runs, speed of trains between two places and geographical distrihution of important series. (Continuation of serial.)

LABOR

Suitability Tests. Suitability Tests for Railway Men. Eng. & Indus. Management, vol. 2, no. 1, July 3, 1919, pp. 3-5, 5 figs. Illustrating what are believed to be imperfections in processes devised to test mechanically man's psychological conditions and activities.

LOCOMOTIVE

Design. Problems in the Construction and Operation of Locomotives (Probleme in Lokomotivbau und -betrich), R. Sanzin. Zeitschrift des Osterr. Ingenieur-und Architekten-Vereins, vol. 70, no. 1, Jan. 4, 1918, pp. 1-5, 3 figs. Compares various types and discusses complete utilization of their power.

Engine Calibration. Engine Calibration as Adjunct to Efficient Operation, B. B. Milner. Ry. Rev., vol. 64, no. 26, June 28, 1919, pp. 1000-1004, 8 figs. Tests performed to determine maximum drawbar pull developed at various speeds and similar characteristics, for the purpose of gaining knowledge as to manner in which behavior of locomotives was effected through manipulation of reverse lever.

Fuel Economy. Locomotive Fuel Economy. Ry. Rev., vol. 65. no. 1, July 5, 1919, pp. 27-30, 2 figs. From report of committee on Fuel Economy and Smoke Prevention read at annual convention of Am. R. R. Assn.

Gasoline Locomotive. A New Petrol Shunting Locomotive. Ry. Gaz., vol. 31, no. 1, July 4, 1919, pp. 25-26, 1 fig. Engine is a 40-b. hp. internal-combustion motor having four water-jacketed cylinders working on 4-stroke principle.

Grand Trunk. Grand Trunk 0-6-0 Type Switching Locomotives. Ry. Age. vol. 67, no. 1, July 4, 1919, pp. 7-8, 1 fig. Tractive effort 36,700 lb.; weight in working order 168,000 lb.

Mallet. Simple Mallet Locomotive Pennsylvania R.R. Ry. Rev., vol. 65, no. 3, July 19, 1919, pp. 81-89, 14 figs. Among special features to which particular attention is called are design of firebox and combustion chamber, superheater, float system for water-level indication and multiple stack and exhaust nozzle arrangement. Also in Ry. & Locomotive Eng., vol. 32, no. 7, July 1919, pp. 193-194, 2 figs.

Standard. Standard Light Mountain Type. Ry. Mech. Engr., vol. 93, no. 7, July 1919, pp. 431-437, 9 figs. Total weight, 327,000 lb.; tractive effort, 53,900 lb.

Standardization of Parts. The Standardization of Parts for Half-Inch Scale Model Locomotives, Henry Greenly. Model Engr. & Elecn., vol. 40, nos. 945, 946 and 948, June 5, 12 and 26, 1919, pp. 448-453, 470-473 and 519-522, 18 figs. June 5 and 12: Schemes for types writer classifies into outside-cylinder and inside-cylinder machines. June 26: Method of building up a machine.

Front Ends, Grates and Ash Pans. Ry. Jl., vol. 25, no. 7, July 1919, pp. 19-21. Committee report before International Ry. Fuel Assn.

Stoking, Mechanical. Mechanical Stoking of Locomotives an Economy, W. S. Bartholomew. Ry. Age, vol. 67, no. 4, July 25, 1919, pp. 163-167, 7 figs. Factors determining necessity of applying stokers; operating results secured by stoker firing. Paper presented before Western Ry. Club.

Switching. C.C.C. & St. L. 0-8-0 Switchers, R. W. Retterer. Ry. Mech. Engr., vol. 93, no. 7, July 1919, pp. 411-414, 5 figs. Consolidation type converted with special features to adapt engines for switching service.

MAINTENANCE

Permanent Way. Maintenance of Permanent Way—I. Ry. Engr., vol. 40, no. 474, July 1919, pp. 141-143. Comparison of British and American methods of management. (To be continued.)

OPERATION AND MANAGEMENT

Accounting. Calculating Machine in Railroad Accounting, C. O. Price. Ry. Rev., vol. 64, no. 26, June 28, 1919, pp. 972-976, 5 figs. Contrasting present methods with those of ten years ago.

Allocation of Cars. Rolling Stock Distribution on the Midland Railway. Ry. Gaz., vol. 31, no. 1, July 4, 1919, pp. 9-16, 9 figs., partly on two supp. plates. Method of allocating vehicles which forms an essential part of the Company's train control system.

France. Brief Survey of the Road Organization in France, A. Forbes. Surveyor, vol. 55, no. 1430, June 13, 1919, pp. 439-441, 4 figs. Work done by British army in order to fit French road for war traffic. Paper read before Instn. Mun. & County Engrs.

Fuel Efficiency in Stationary Plants. Fuel Efficiency in Railroad Stationary Plants. Ry. Rev., vol. 65, no. 1, July 5, 1919, pp. 24-25, 1 fig. From report of committee on Fuel Economy and Smoke Prevention, read at annual convention of Am. R.R. Assn.

Interstate Commerce Law. A Comprehensive Revised Interstate Commerce Law. Ry. Age, vol. 67, no. 3, July 13, 1919, pp. 105-108. Suggestion for law which shall correlate laws passed since and including that of 1887.

Transfer Roads. How Operating Capacity Can Be Increased, E. H. Lee. Ry. Age, vol. 67, no. 1, July 4, 1919, pp. 34-36. Suggestions for improving intermediate transfer roads: from an appendix to preliminary report of Yards and Terminals Committee of Am. Ry. Eng. Assn.

PERMANENT WAY AND BUILDINGS

Grade-Separation Work. Extensive Grade Separation Work at Indianapolis. Ry. Age, vol. 67, no. 3, July 18, 1919, pp. 95-101, 16 figs. Improvements embrace a four-track high-level line and additional station facilities.

Track Support, Concrete. Concrete Railway Track Support. Eng. & Contracting, vol. 52, no. 3, July 16, 1919, pp. 65-67. 9 figs. Illustrating types constructed on various American railways. Paper read before Am. Concrete Inst. Also in Ry. Rev., vol. 65, no. 3, July 19, 1919, pp. 92-99, 20 figs.

Water Troughs. New Water Troughs at Langley. Great Northern Railway. Ry. Gaz., vol. 30, no. 25, June 20, 1919, pp. 997-999, 5 figs. Total length is 1,800 ft. of which 1,500 ft. is on level, the ramps at each end being 150 ft. long, graded to correspond with rails.

PUBLIC REGULATION

Government Operation. A New Advocate of Government Operation, Joseph B. Eastman. Ry. Age, vol. 67, no. 2, July 11, 1919, pp. 57-58. Letter to Congress suggesting that modifications pronosed in the Cummins bill be continued "for an appropriate period of time," in order that uncertaintly as to immediate future may be ended and sufficient time gained for deliberate and constructive consideration of entire problem.

RAILS

Electric-Railway Rails. . Notes on the History and Development of Electric Railway Rails, R. C. Cram. Elec. Ry. Jl., vol. 54, no. 3, July 19, pp. 106-112, 11 figs. Takes up practical and theoretical considerations which aregradually leading to rail standardization and simplification.

ROLLING STOCK

Box Cars. Box Cars for Chilean Railway. Ry. Mech. Engr., vol. 93, no. 7, July 1919, pp. 417-420, 5 figs. Steel construction of American type for meter-gage line, including M.C.B. couplers and trucks.

See also Express Cars.

Express Cars. Utility Express Car of the Pennsylvania Railroad. Ry. Rev., vol. 65, no. 1, July 5, 1919, pp. 1-5, 6 figs. Box car fitted with heating and axle lighting equipment, and "semi-passenger" design of trucks to permit of its being run in fast trains.

Hopper and Gondola Cars. High Capacity Hopper and Gondola Cars, Pennsylvania Railroad. Ry. Rev., vol. 65, no. 2, July 12, 1919,pp. 45-50, 11 figs. Bodies fabricated from plates and pressed-steel shapes. Underframe is composed of center sills, consisting of two 10-in. channels, weighing 30 lb. per ft. and two side sills, for which 4 x 6 x ¾-in. angles are used.

Lighting. Report on Train Lighting and Equipment. Ry. Elec. Engr., vol. 10, no. 7, July 1919, pp. 233-240, 9 figs. Relating particularly work done by committee to develop standard ratings for axle generators. Paper presented at Ann. Conv. of Am. RR. Assn.

Vibration. On the Vibration of Railway Cars, N. Fukushima. (In Japanese.) Jl. Soc. Mech. Engrs., Tokyo, Japan, vol. 22, no. 56, Feb. 1919.

SAFETY AND SIGNALING SYSTEMS

Explosives, Transportation of. The Baltimore Tunnel Disaster, Frank H. Kneeland. Coal Age, vol. 16, no. 2, July 10, 1919, pp. 55-58, 3 figs. Judicial inquiry into causes which led to explosion of blasting powder which was being carried in same mined car with workmen.

Fire Prevention. Fire Prevention on Railroads, W. H. Hoyt. Bul. Affiliated Eng. Societies of Minnesota, vol. 4, no. 5, May 1919, pp. 89-94. Methods of reducing fire loss grouped under three heads—(1)fireproof construction, (2) fire-prevention and fire-fighting equipment, and (3) inspection and education. Applicability and value of each of these to fire prevention on railroads is discussed.

Locomotive Failures. Personal Injuries Due to Locomotive Failures, John L. Mohun. Ry. Age, vol. 67, no. 3, July 18, 1919, pp. 113-118, 2 figs. Suggestions for their reduction based on review of Interstate Commerce Commission locomotive inspection reports.

Safety-Signal Repetition. Safety in Operation of Railroads (La sécurité de la circulation des trains de chemin de fer), J. Carlier. Société belge des Electriciens, vol. 33, April-June 1919, pp. 99-132, 3 figs. "Cesar" apparatus installed in locomotives for repeating safety signals.

Switch Machines. The Use of Low Voltage Switch Machines, A. R. Whitehorn. Ry. Signal Engr., vol. 12, no. 7, July 1919, pp. 241-242, 2 figs. Describing why such apparatus has been introduced and the main requirements to be met.

SHOPS

Chile. New Shops of the Chilean State Railways, Ernesto Gusman Donoso. Ry. Rev., vol. 64, no. 26, June 28, 1919, pp. 967-972, 8 figs. Reinforced-concrete sanitary repair plant.

Smoke Jack. An Unusual Form of Roundhouse Smoke Jack. Ry. Age, vol. 67, no. 4, July 25, 1919, pp. 155-157, 7 figs. Smoke jacks that cover entire length of stalls, special form of door construction and reinforced-gypsum roof mentioned as features in roundhouse of Pittsburgh & Lake Erie at Haselton, Ohio.

SPECIAL LINES

Light Railways. Light Railways (Ferrocarriles livianos), Charles F. Lang. Ingenieria internacional, vol. 2, no. 1, July 1919, pp. 9-11, 5 figs. Economic advantages.

Construction and Operation of Light Railways in France, J. H. McKnight. Annual Report of Assn. of Dominion Land Surveyors, January 29, 30 and 31, 1919, pp. 136-139, 1 fig. Types used for military purpose.

A Technical Description of the British Light Railways in France, B. W. Guppy. Prof Memoirs, Corps Engrs. U. S. Army & Engr. Dept., vol. 11, no. 56, March April 1919, pp. 185-216. System was designed to connect broad-gage railways with front. Operating rules and signals are given.

STREET RAILWAYS

. New Cars for Liverpool Corporation Tramways. Tramway & Railway World, vol. 45, no. 30, June 19, 1919, pp. 307-308, 4 figs. Single-truck car with reversed stairway and canopy top.

One-Man Car Operation, S. W. Greenland. Elec. Traction, vol. 15, no. 7, July 1919, pp. 421-423. Types, service, and data secured from their operation. Paper read before Central Elec. Ry. Assn.

.veland. Cleveland Rapid Transit Report. Elec. Ry. Jl., vol. 54, no. 2, July 12, 1919, pp. 71-74, 5 figs. Report of Rapid Transit Commission of the city suggesting means of relief for present congestion and plans for development of rapid transit system.

.pan. Practices and Tendencies In Japanese Electric Railway Transportation, Shiro Sano. Elec. Ry. Jl., vol. 54, no. 1, July 5, 1919, pp. 4-6, 7 figs. Both double and single trolley are used, track gages are far from standard and people seem to lean toward public ownership.

Moving Platforms. Continuous Trains for Forty-Second Street Transit, Henry B. Seaman. Eng. News-Rec., vol. 82, no. 26, June 26, 1919, pp. 1248-1250, 3 figs. Moving platforms recommended. Operation illustrated.

Passenger Traffic, Analysis of. Methods of Observing and Analyzing Passenger Traffic, R. H. Horton. Elec. Ry. Jl., vol. 54, no. 2, July 12, 1919, pp. 75-78, 3 figs. Merits of various methods of obtaining data are pointed out and suggestions are offered in regard to using traffic study data.

Rail Hardening. The Sandberg "In Situ" Rail Hardening Process, Robt. B. Holt. Tramway & Railway World, vol. 45, no. 30, June 19, 1919, pp. 314-315, 1 fig. Experiments carried out by operating a car on an upgradient on a length of track a portion of which had been treated by the "in situ" process, with the front motor cut out and brakes applied to front wheels.

Track Construction. Latest British Street-Railway Track Construction. Eng. News-Rec., vol. 83, no. 2, July 10, 1919, p. 83, 2 figs. Ties generally omitted; bituminous granite chip packing under rails used; standard welding and rail hardening in place.

Bonds for Temporary and Permanent Track Construction, G. H. McKelway. Elec. Ry. Jl., vol. 54, no. 3, July 19, 1919, pp. 114-117, 14 figs. Advantages and disadvantages of various types are discussed from practical standpoint.

Zone Fares. The Zone Fare in Practice, Walter Jackson. Elec. Ry. Jl., vol. 54, nos. 1, 2 and 4, July 5, 12 and 26, 1919; pp. 7-12, 56-61 and 154-157, 27 figs. July 5: Comparative bus and trolley statistics obtained at Leeds, England. July 12: Despite higher fares and cut in service, traffic is said to have fallen off only 3.4 per cent and revenue increased 23.3 per cent. July 26: How British Elec. Traction Co. stimulated riding as close to destination as possible by introducing halp-penny stages on top of maximum penny ride.

TERMINALS

Chicago. Proposed New Passenger Terminal in Chicago. Ry. Rev., vol. 65 no. 2. July 12, 1919, pp. 57-61, 6 figs. Plans of Illinois Central which also involves electrification for all types of service and lake front developments.

Illinois Central Will Build New Chicago Terminal. Ry. Age, vol. 67, no. 2, July 11, 1919, pp. 51-54, 3 figs. Electrification project embracing terminal capable of development to accommodate all railroads at present entering passenger stations east of Chicago River.

Pennsylvania. Engine Terminal Imrpovements: Pennsylvania Lines West. Eng. News-Rec., vol. 83, no. 1, July 3, 1919, pp. 24-28, 5 figs. Heavy travelling crane, circular crane runway, parking tracks with transfer table and turntable and mechanical ashpits.

Northwest Pennsylvania's Newest Station, J. B. Scott. Elec. World, vol. 74, no. 2, July 12, 1919, pp. 60-63, 5 figs. Power house built on unit principle. It is expected that installation will eventually be rated at 120,000 kw.

GENERAL SCIENCE

CHEMISTRY

Air Analysis. A Simple Form of Apparatus for Estimating the Oxygen Content of Air from the Upper Atmosphere, Francis William Aston. Jl. Chem. Soc., vols. 115-116, no. 679, May 1919, pp. 472-475, 1 fig. Watson apparatus modified by measuring difference only in oxygen content between sample and normal air.

Apparatus for the Rapid Analysis of Confined Air and Unhealthy Atmospheres (Appareil pour l'analyse rapide de l'air confiné et des atmosphères insalubres). Génie Civil, vol. 74, no. 24, June 14, 1919, p. 490, 1 fig. Air drawn in through independent Clocz flasks by running water out of large zinc cylinder. Apparatus permits simultaneous examination of various atmospheres.

Allotropy. Theory of Allotropy; Allotropes and Allotropoids, Maurice Copisarow. Chem. News, vol. 118, no. 3086, June 6, 1919, pp. 265-266, Regaros allotropy as function of valency and defines it as "capacity of an element to exist in forms, differing in the mode of their ultra-molecular linkage."

Analysis, Electrochemical. New and Rapid Apparatus for Electrochemical Analyses, J. T. King, Chem. & Metallurgical Eng., vol. 21, no. 1, July 1, 1919, pp. 25-29, 7 figs. Stirring effected by rotating containing beaker. Table showing results of experiments on three different brasses, obtained by this and other methods of stirring and carried out by different operators, is included.
See also under names of materials analyzed.

Analysis, Chemical. Quantitative Analysis of Nickel in Ferro-Nickels and Steels (Dosage du nickel dans les ferro-nickels et les aciers), Paul Nicolardot and Goerges Gourmain. Bul. Société Chimique de France, vol. 25-27, no. 6, June 1919, pp. 338-344. Preference is given to eletrolytic method, which is said to be most exact.

Asphalt Precipitation. Quick Method for Determination of Hard Asphalt (Schnellmethode zur Bestimmung von Hartasphalt), J. Tausz and A. Luttgen. Petroleum, vol. 14, no. 14, Apr. 15, 1919, pp. 653-654, 1 fig. Principal features of method are: Hard asphalt is precipitated with benzine in special small centrifugal containers which may be weighed on the micro scale, and is immediately put into the centrifugal apparatus, where it is said to be completely separated within 10 min.

Calcium Determination. *See Zinc and Calcium Determination.*

Clay Analysis. A Simplified Apparatus for the Determination of Air in Clay, H. Spurrier. Jl. Am. Ceramic Soc., vol. 2, no. 6, June 1919, pp. 490-493, 2 figs. Disengaging gases occluded in clay by use of air-free and nearly boiling water, introduced as simplification in process given as accurate in connection with apparatus described in Jl. Am. Ceramic Soc., 1, 710-715, 1918.

Cyanide Reactions. The Sensitiveness of Some Cyanide Reactions, John B. Ekeley and Icie C. Macy. Proc. Colorado Sci. Soc., vol. 11, June 1919, pp. 269-274, 1 fig. Experiments lead to recommendation that Schonbein tests should be carried out in closed vessels in dark to get trust-worthy results.

Distillation. New Laboratory Alembic and Measure of its Efficiency (Sur une nouvelle colonne à distiller, pour laboratoire et sur la mesure de son efficacité), M. H. Robert. Comptes rendus des séances de l'Académir des Sciences, vol. 168, no. 20, May 1919, pp. 998-1001, 2 figs. For fractional distillation.

Elements. New Periodic Classification of the Chemical Elements (Sur une nouvelle classification périodique des éléments chimiques), Marc Chauvierre. Bul. Société Chimique de France, vol. 25-26, no. 6, June 1919, pp. 297-305, 1 fig. Based on periodicity resulting from atomic weights and presented as applicable to theories of organic evolution and believed to suggest hypotheses ezplaning origin of radioactive phenomenon.

Explosive Reactions, Temperature. Temperature Obtained in Explosive Reactions (Sur la détermination des températures atteintes dans les réactions explosives), Henri Muraour. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 20, May 19, 1919, pp. 995-997. Experiments are said to have proved that the greater part of methane contained in the products of combustion of powders is formed during period of cooling.

Gas Analysis. Computation Tables for Flue and Chimney Gas Analyses (Rechentafeln zur Rauchgas und Auspuffanalyse), Wa. Ostwald. Feuerungstechnik, vol. 7, no. 7, Jan. 1, 1919, pp. 53-57, 12 figs., partly on supp. plate. Endeavors to show the state of dependence to each other of the following variations: (1) proportion of mixture or surplus of air or air factor of exhaust mixture, (2) completeness of combustion or percentage of carbon monoxide, (3) percentage of carbonic acid in flue gases, (4) percentage of free oxygen in flue gases.

Lead Sulphide. The Chemical Equilibrium between Sulphide of Lead and Its Roasting Products (Ueber die chemischen Gleichgewichte zwischen Bleisulfid und seinen Röstprodukten), Rudolf Schenk and Agnès Albers. Zeitschrift für anorganische und allgemeine Chemie, vol. 105, no. 4, Apr. 3, 1919, pp. 145-146, 6 figs. Purpose of Experiments was to determine nature of tension curves and to deduce from these the condition of existence of the various solid phases.

PETROLEUM ANALYSIS. Estimation of Benzene and Toluene in Petroleum, F. B. Thole. Chem. Indus. vol. 38, no. 4, Feb. 28, 1919, pp. 39T-43T, 2 figs. Comparative examination of various methods.

PHOSPHATES, ACID. On Various Properties of Acid Phosphates (Sur quelques propriétés des phosphates acides), A. Joannis. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 24, June 16, 1919, pp. 1202-1203. Experiments said to confirm Berthelot's conclusions in regard to the different values he obtained for the three acid functions of phosphoric acid.

ROCK ANALYSIS. The Determination of Combustible Matter in Silicate and Carbonate Rocks, A. C. Fieldner, W. A. Selvig and G. B. Taylor. Bur. of Mines technical paper no. 212, April 1919, 22 pp., 1 fig. Lissner's method of determining organic carbon and hydrogen found to give abnormally high results for organic hydrogen in rocks containing small amounts of combustible matter.

SCHONBEIN TEST. *See Cyanide Reactions.*

SOIL ANALYSIS. A Simplified Wet Combustion Method for the Determination of Carbon in Soils, D. D. Waynick. Jl. Indus. & Eng. Chem., vol. 11, no. 7, July 1, 1919, pp. 634-637, 1 fig. Said to require about 25 min. total time for determination.

SOLUBILITY. Solubility—III. Relative Values of Internal Pressures and their Practical Application, Joel H. Hildebrand. Jl. Am. Chem. Soc., vol. 41, no. 7, July 1919, pp. 1067-1080. Various methods for calculating solubility of liquids are reviewed and though the values they yield differ considerably, arguments are presented to show that they are closely parallel.

STEEL ANALYSIS. The Determination of Vanadium in Steels by Electrometric Titration. The Selective Oxidation of Vanadyl Salts by Nitric Acid in the Presence of Chromic Salts, G. L. Kelley, J. A. Wiley, R. T. Bohn and W. C. Wright. Jl. Indus. & Eng. Chem., vol. 11, no. 7, July 1, 1919, pp. 632-634. With illustration of application of methods to analysis of synthetic steels.

ZINC AND CALCIUM DETERMINATION. Determination of Zinc and Calcium in the Presence of Lead, Ernest Nyman. Can. Chem. Jl., vol. 3, no. 7, July 1919, pp. 217-218. Based on solubility of lead ferrocyanide and lead oxalate in ammi acetate solution and titration of zinc in ammoniacal solution by using uranylacetate weakly acidified with hydrochloric acid as outside i nicator.

ZIRCONIUM ANALYSIS. Analysis of Zirconium Ores and Alloys. A. Travers. Metal Industry, vol. 14, no. 22, May 30, 1919, pp. 441-444. Chancel's method of separating ZrO_2 and Fe_2O_3 by means of sodium hyposulphite considered as best.

MATHEMATICS

DETERMINANTS. Notes on the Determinant of the Primary Minors of a Special Set of $(n1)$ — by n Arrays, Thomas Muir. Proc Roy. Soc. of Edinburgh, vol. 39, part 1, Session 1918-19, pp. 35-40. Cases in which determinant vanishes.

EQUATIONS. Two-dimensional Solutions of Poisson's and Laplace's Equations, Leonard Bairstow and Arthur Berry. Proc. Ry. Soc., Series A, vol. 95, no. A 672, June 4, 1919, pp. 457-475, 2 figs. Based on theorem stating that "any irrotational acyclic fluid motion can be reproduced by an appropriate choice of simple sources round the fied boundaries." Strength of sources corresponding with given boundaries is determined by solution of an integral equation; in case of double boudaries simultaneous integral equations are solved.

Application of Gibbs-Helmholtz Equation to Monovariant Systems (Sur l'application de l'équation de Gibbs-Helmholtz, aux systèmes monovariants), A. Boutaric. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 19, May 12, 1919, pp. 939-942. Suggests modification in form adapted by Nernst for extending above equation to such systems.

Numerical Integration of Differential Equations, F. R. Moulton. Jl. U. S. Artillery, vol. 51, no. 1, July 1919, pp. 40-55, 1 fig. Examples illustrating application of Picard's method.

On the Numerical Integration of Differential Equations, H. T. H. Piaggio. Lond., Edingburgh and Dublin, Phil. Mag., vol. 37, no. 222, June ,1919, pp. 596-600, 1 fig. Formula for computing order of magnitude of error in final result when Runge's formula (Math. Ann., vol. 46, 1895) is used.

ISOTHERMAL SURFACES. On Isothermal Surfaces (Sur les surfaces isothermiques), C. Guichard. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 24, June 16, 1919, pp. 1185-1188. Solution of equation of system formed by lines of curvature, which is satisfied by the solutions of Laplace, of an equation having equal invariants such that the sum of their equares equals zero.

POLYNOMIALS. Development of Jacobi's Polynomials (Sur les développements de Jacobi), Erwand Kogbetliantz. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 20, May 19, 1919, pp. 992-994. Limiting cases of summation.

RULED SURFACES. On a Certain Class of Rational Ruled Surfaces, Arnold Emch. Proc. Nat. Acad. Sciences, vol. 5, no. 6, June 15, 1919, pp. 222-224. Surfaces considered are those obtained by generatrix moving in such a manner that a fixed point of it moves uniformly along circle, while generatrix in every position passes through directrix line.

SERIES. Summation of Divergent Series (Sur la sommation des séries divergentes), Erwand Kogbetliantz. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 22, June 2, 1919, pp. 1090-1092. Theorem concerning application of method $(R, \bar{n}, y)$ by Riesz typical mean function.

TRIGONOMETRIC SERIES. Trigonometric Series (Sur les séries trigonométriques), Erwand Kognetliantz. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 24, June 16, 1919, pp. 1193-1194. Problem summation $(C, \delta < o)$.

VECTOR ALGEBRA. Further Contributions to Non-Metrical Vector Algebra, L. Silberstein. Lond, Edingurgh, and Dublin Phil. Mag., vol. 38, no. 223, July 1919, pp. 115-143, 6 figs. Theory of vector multiplication.

PHYSICS

ACOUSTICS. The Resonance Theory of Audition subjected to Experiments, E. H. Barton and H. M. Browning. Loud., Edinburgh, and Dublin Phil. Mag., vol. 38, no. 223, July 1919, pp. 164-173, I fig. Reviewing position of resonance theory about audition, writer acknowledges subject to be controversial, but endeavors to throw sidelight upon it by trial of a graduated set of pendulums.

The Function of Phase Difference in the Binaural Location of Pure Tones, R. V. L. Hartley. Physical Rev., vol. 13, no. 6, June 1919, pp. 373-385, 5 figs. In expressing sound images observed when pure tones of same frequency and intensity but of different phase are applied to the two ears, use is made of theoretical curves calculated by Stewart and Fry, giving relation between the position of actual source and the resulting phase difference of sound at the two ears.

The Absolute Measurement of the Intensity of Sound, Arthur Gordon Webster. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 7, July 1919, pp. 889-900, 8 figs. on two supp. plates. Theory of operation of phone (used for measuring output of sound in watts of energy), phonometer (for measuring a sound in absolute units), and phonotrope (designed and used to find direction of a source of sound). A list of various technical papers on sound is apprended.

COLLOID WEIGHING. A New Method of Weighing Colloidal Particles, E. F. Burton. Proc. Roy. Soc., Series A, vol. 95, no. A 672, June 4, 1919, pp. 480-483, 1 fig. Method described as artificial production of settling due to gravitation by superimposing motion produced in electrical field maintained in liquid medium up that due to gravitation.

COLORS. The Persistence of Vision of Colours of Varying Intensity, Frank Allen. Lond., Edinburgh & Dublin Phil. Mag., vol. 38, no. 223, July 1919, pp. 81-89, 5 figs. Method of critical frequency of flicker applied to investigating phenomena of color vision.

CRYSTAL FORMATION. A Method of Growing Large Perfect Crystals from Solution, R. W. More. Jl. Am. Chem. Soc., vol. 41, no. 7, July 1919, pp. 1060-1066, 3 figs. It consists of placing small seed crystals or several in nearly saturated solution of salt, cooling solution until it is very slightly supersaturated, and maintaining a sate of slighy supersaturation by slowly colling solution, with the temperature regulated within very narrow limits.

ELECTRON DISCHARGES. Determining the Velocity of Electron Discharge (Ueber die Bestimmung von Elektronen-Austrittsgeschwindigkeiten), A. Becker. Annalen der Physik, vol. 58, no. 5, 1919, pp. 393-473, 17 figs. Theories: homogeneous field; Cosine law of radiation; practical derivations; special applications.

FLUID FLOW. Flow of Gasoline Vapor (Sur l'écoulement de la vapeur de pétrole). Jean Rey. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 22, June 2, 1919, pp. 1092-1095. Further discussion of equations presented in Comptes Rendus, vol. 168, 1919, p. 509.

FLUIDS. The Spreading of Fluids on Glass—III, W. B. Hardy. Lond., Edinburgh, and Dublin Phil. Mag., vol. 38, no. 223, July 1919, pp. 49-55. Evidence offered in confirmation of Lord Rayleigh's suggestion that complicated secondary composite surface are due to chemical heterogeneity of surface layer.

GRAVITATION. On a Possible Limit to Gravitation, Frank W. Very. Am. Jl. Sci. vol. 48, no. 283, July 1919, pp. 33-46. Conclusion reached in argument is that gravitational vibrations are probably confined within definite volume of universal medium, or magnetic aura and are limited outwardly by form, motion and peculiar properties of this medium exercises general control on all gravitative phenomena.

HEAT MEASUREMENT. The Measurement of Heat and the Scope of Carnot's Principle, Arthur C. Lunn. Physical Rev., vol. 14, no. 1, July 1919, pp. 1-19. What is termed symmetric form of exposition of principle of thermodyanmics is developed through recognizing on a parity from the outset the two kinds of conservation naturally called after Black and Carnot which lead to energy and entropy scales of measurement of heat.

HEAT, MECHANICAL, EQUIVALENT OF. Value of the Mechanical Equivalent of Heat (Ueber den Wert des mechanischen Warme-aquivalents), W. Jaeger and H. von Steinwehr. Annalen der Physik, vol. 58, no. 5, 1919, pp. 487-488. Discussion of value found by Carlton Sutton and table of equivalents obtained in research work of twelve other scientists, during period extending from 1843 to 1915.

LIQUIDS. Vapor Pressure of Thin Liquid films (Pression de vapeur des liquides en lames minces), Felix Michaud. Comptes rendus des séances de l'Academie des Sciences, vol. 168, no. 23 June 10, 1919, pp. 1155-57. Concluded analytically vapor from each films exerts pressure considerably below normal corresponding to conditions of saturation.

The Rotational Oscillation of a Cylinder in a Viscouous Liquod. D. Coster. Lond., Edinhurgh and Dublin Phil. Mag., vol 37, no. 222, June 1919, pp. 587-594, 1 fig. Following method used by Professor Verschaffel in analogous case of sphere. (Comm. Leiden, p. 22.)

MICHELSON'S EXPERIMENT. *See Relativity.*

OPTICS. Scattering of Light by Solid Substances, R. J. Strutt. Proc. Roy. Soc., Series A, vol. 95, no. A 672, June 4, 1919, pp. 476-479, 4 figs., on separate plate. Comparison between . . . . of vibration, (1) parallel to direction of primary beam, and (2) perpendicular to primary beam. Former is given as percentage of meter. Result for Chance's crown glass given as 8 per cent and for ordinary plate glass as 3 per cent.

Velocity of Light in Turbid Media (Sur la vitesse de la lumière dans les milieux troubles), Charles Cheneveau and René Audubert. Comptes Rendus des séances de l'Académie des Sciences, vol. 168, no. 19, May 12, 1919, pp. 957-959. Reflective character of optical phenomena presented by media containing large particles in suspension.

OSMOTIC PRESSURES. On Osmotic Pressures Derived from Vapour-Pressure Measurements: Aqueous Solutions of Cane Sugar and Methyl Glucoside, E. G. J. Hartley and C. V. Burton. Phil. Tran. Roy. Soc. Lond., Series A 565, vol. 218, May 20, 1919, pp. 295-349, 6 figs. Investigations to determine best conditions for making method described in Roy. Soc. Proc., A, vol. 77, 1906, and in Phil. Trans., A, vol. 209, both accurate and of general applicability, and to obtain data for construction of suitable apparatus for determination of absolute vapour denisty of liquids in air or other gas.

Photographic Rendering of Contrast. The Fundamental Law for the true Photographic-Rendering of Contrast, Alfred W. Porter and R. E. Slade. Lond., Edinburgh, and Dublin Phil. Mag., vol. 38, no. 223, July 1919, pp. 187-197, 9 figs. Examination of technical principles assumed in method of treating photographic plates devolved after researches of F. Hurter and V. C. Driffield. (See Jl. Sic. Chem. Industry, May 31, 1890.)

Radioactivity. On the Relation between the K Series and the L Series of X-Rays, William Duane and Takeo Shimizu. Physical Rev., vol. 14, no. 1, July 1919, pp. 67-73, 2 figs. Experiments with tungsten. Graphs are given representing ionization currents as functions of the crystal table angle.

Radioactive Bricks, H. J. Knollman. Jl. Am. Ceramic Soc., vol. 2, no. 6 June 1919, pp. 451-460. Method of manufacturing radioactive clay bricks.

Relativity. Michelson's Experiment and its Interpretation (L'Esperienza di Michelson e la sua interpretazione). Aukusto Righi. Nuovo Cimiento, vol. 16, no. 6, Nov.-Dec. 1918, pp. 213-242, 7 figs. With reference to theory of relativity.

Soap Films. Soap Bubbles and Films, J. Perrin. Sci. Am. Supp., vol. 88, no. 2273, July 26, 1919, pp. 50-51. Examination of black spots which appear just before rupture of bubbles or films of soap. Translated from the French.

Spectra. Modifications in Spectrum of a Spark Obtained Between Two Electrodes of a Given Metal Due to the Nature of the Gas in which Spark is Produced (Sur les modifications apportées au spectre d'étincelle de differénts métaux par le milieu ambiant), M. Bouchetal de la Roche. Bul. Société Chimique de France, vol. 25-27, no. 6, June 1919, pp. 305-309. Experiments with iron, tungsten, molybdenum, nickel, antimony, lead, tin, copper and gold in air, hydrogen andilluminating gas.

The Ultra-Violet Band of Ammonia, and Its Occurrence in the Solar Spectrum. A. Fowler and C. C. L. Gregory. Phil. Tran. Roy. Soc. Lond., Series A 566, vol. 218, June 5, 1919, pp. 351-372, 6 figs., partly on supp. plates. Spectrographs of high resolving power claimed to have established that ammonia band is certainly represented in solar spectrum, and that it accounts for a considerable number of faint lines for which no other origins have been suggested. Attempt is also made to elucidate chief features of structure of this band.

On the Discovery of Four Transition Points in the Spectrum and the Primary Colour Sensations, Frank Allen. Lond., Edinburgh, and Dublin Phil. Mag., vol. 38, no. 223, July 1919, pp. 55-81, 24 figs. Experimental confirmation of existence of only three color sensations which are primarily excited by hues that lie between limits set by four transition points.

Spectrum of Neon (Zur Kenntnis des Neonspektrums), K. W. Meissner. Annalender Physik, vol. 58, no. 4, 1919, pp. 333-374, 5 figs. Fabry's and Perot's interferometric methods were used for determining wave lengths of new lines.

Precision Measurements in the X-Ray Spectra, Manne Siegahn. Lond., Edinburgh, and Dublin Phil. Mag., vol. 37, no. 222, June 1919, pp. 601-6' Angle of reflected rays determined as angle through which same photographic plate has to be turned in order to receive impressions of nth order reflection on both sides of direct ray.

On the X-Ray Absorption Wave-Lengths of Lead Isotopes, William Duane and Takeo Shihizu. Proc. Nat. Acad. Sciences, vol. 5, no. 6, June 15, 1919, pp. 198-200, 1 fig. Experiments with X-ray spectrometer described in Physical Rev., Dec., 1917, p. 624.

The Effect of an Electric Field on the Spectrum Lines of Hydrogen—III, Toshio Takamine and Nohoru Kobuhu. Memoirs of College of Sci., Kyoto Imperial University, vol. 3, no. 9, Mar. 1919, pp. 271-273, 5 figs. on two separate plates. In earlier communications (Mem. Coll. of Sci., Kyoto, 2,137,321, 1917) writers reported on Stark effect on hydrogen lines examined by Lo Surdo's method. Present note gives results found in similar experiments obtained by arrangement in which tantalum cathode was used instead of one of aluminum.

The Effect of an Electric Field on the Spectrum Lines of Helium—III, Toshio Takamine and Nohoru Kokubu. Memoirs of College of Scii. Kyoto Imperial University, vol. 3, no. 9, Mar. 1919, pp. 275-280, 13 figs. on supp. plates. Lines about which report for examination is made in present note are 6678, 5876, 4713, 3889 and 3188.

The Effect of an Electric Field on the Spectrum Lines of Argon. Toshio Takamine and Noboru Kokubu. Memoirs of College of Sci., Kyoto Imperial University, vol. 3, no. 9, Mar. 1919, pp. 281-285, 4 figs. on supp. plates. Employing Lo Surdo's method for examining Stark effect, 16 lines were found to be slightly displaced toward the red in strong electric field.

Structure of Matter. The Size and Shape of the Elecktron, Arthur H. Compton. Physical Rev., vol. 14, no. 1, July 1919, pp. 20-43, 7 figs. Attention is called to what are termed outstanding differences between experiment and theory of scattering of high-frequency radiation based upon hypothesis of a point charge electron.

The Law of Attraction for Molecular Force, Herbert Chatley. Soc. Engrs., vol. 10, no. 5, 1919, pp. 192-197. Claims that at very close proximity molecular forces vary as inverse fifty power of the distance and with appreciable separation they vary as the inverse fourth power.

The Arrangement of Electrons in Atoms and Molecules—I, Irving Langmuir. Gen. Elec. Rev., vol. 22 no. 7, July 1919, pp. 505-516. 1 fig. (To be continued.)

An Extension of the Electron Theory of Metals—I. Thermoelectricity and Metallic Conduction, A. E. Caswell. Physical Rev., vol. 13, no. 6, June 1919, pp. 386-403. Based on fundamental assumptions (1) that number of free electrons in a metal changes with the temperature, (2) that number of positive centers with which electrons collide, wether these centers are atoms, molecules or clusters of molecules, also changes with temperature, and (3) that these positive centers take part in the conduction of heat but not ofelectricity.

The Langmuir Postulates. Ellwood Hendrick. Chem. & Metallurgical Eng., vol. 21, no. 2, July 15, 1919, pp. 73-81, 13 figs. Method of determining physical qualities of chemical compounds from their atomic, ionic and molecular structure. Presented as introduction to theory of chemical reactions developed by Dr. Irving Langmuir.

Sulphur Vapor. The Constitution of Sulphur Vapour, James J. Dobbie. Proc. Roy. Soc., Series A, vol. 95, no. A 672, June 4, 1919, pp. 484-492, 5 figs., partly on two separate plates. Experiment performed by enclosing quantity of metal in closed tube from which air was subsequently drawn out and nitrogen introduced. Sources of light employed were Nernst filament, ultraviolet, and cadmium arc.

Vortices. Vortices of a Fluid (Sur les tourbillons d'une veine fluide), L. Lecornu. Comptes Rendus des séances de l'Académie des Sciences, vol. 168, no. 19, May 12, 1919, pp. 923-926. On Beltrami's researches (Rendiconti del reale Instituto lombardo, 1889), as to whether in movement of fluid curves tangent to veolocities coincide with lines of vortex.

The Perfect Ball

It is a beautiful and wonderful thing. Accurate to the fraction of a ten-thousandth of an inch, not a blemish or flaw on its brilliant surface. Turn it around in any way it is always the same, always supports its load at exactly the same height. Needs no alignment. Its length, breadth and thickness are one and the same. It has but one dimension — diameter. It is absolutely the simplest mechanical element.

The ball bearing would not possess its pregnant meaning for the mechanical engineer if it were not for the fact that we are able to get practically perfect balls.

Due to the achievements of the modern steel maker and metallurgist, the ball has in addition to this marvelous degree of dimensional perfection a remarkable internal or structural integrity, which makes it capable of supporting immense loads. This high degree of structural soundness, their marvelous perfection and uniformity of dimension, give to the balls as grouped in our bearings the enormous load carrying capacity which has attracted such wide attention.

PRODUCTS OF QUALITY

Backed by——

EFFICIENT **SERVICE**

STEEL STRUCTURES
BUILDINGS — Offices, Warehouses and Industrial Plants, etc.
BRIDGES — Railway, Highway, Swing and Bascule, etc.
CRANES — Electric and Hand Power, Travelling, etc.
TOWERS—Transmission Poles and Towers, etc.

Plate and Tank Construction
PLATE WORK—All kinds, Boilers Riveted and Pipe.
STEEL TANKS—All kinds; Water Supply Tanks and Towers, Steel Stand Pipes, Smoke Stacks, Penstocks, Bins and Hoppers, etc.

Forgings
Elevator and Power Transmission Machinery, Upset Rods
Recent installation of Hydraulic Upsetting Equipment capable of upsetting rods up to 4 in. diameter.

Equipment
MINING EQUIPMENT — Mine Cars, Buckets, Melting Pots, Screens, Coal and Coke Handling Equipment, etc.
RAILWAY EQUIPMENT — Turntables, Frogs and Switches, Snow Plows, etc.

Reinforcing Steels
Plain Rounds, Square and Twisted, Bent to Specifications for Beams, Stirrups, etc.

Shipbuilding
Ships' Bolts and Spikes, Plain and Galvanized, General Forgings, Tanks, Tail Shafts, Propellors, Fastenings, etc.

Contractors' Supplies, Castings
Grey Iron, Semi-steel Chilled and Electric Steel.

Miscellaneous
Equipment for Rolling Mills, Pulp and Paper Mills, Oil Refineries, Saw Mills, Packing Houses, Stables, Jails. Tank and Silo Rods and Lugs, Galvanized Pump Rods, Survey Stakes, etc., etc. Ornamental Iron Work, Fire Escapes, etc. Bolts, Nuts, Washers, Spikes, Rivets, etc. Pole Line Hardware, Plain and Galvanized. Pole Saw Frames, Cordwood Saw Frames, Saw Mandrels, Pump Jacks, Single and Double Gear.

Galvanizing Plant, Road Building and Earth Handling Equipment
Cast Iron Culvert Pipe, Gravel Screening Plants, Road Drags and Levellers, Steel Drag Scrapers, Reinforcing Steel for Concrete Work, Highway Bridges, Catch Basin Covers, Sewer Manhole Covers, etc., etc.

Branches:-TORONTO, VANCOUVER, ST. JOHN, N.B.

LAPIDOLITH

TRADE MARK

MAKES concrete floors dustproof and wear-proof and hard as granite by chemical action.

Easily flushed on either old or new floors. Action immediate with no delay to factory routine.

30,000,000 square feet of concrete floors were lapidolized in 1918 alone.

Specified by leading engineers and architects everywhere.

Send for specification form, book of testimonials and sample of hardened concrete.

Fifth General Professional Meeting

Maritime Gathering held in the City of St. John, September 10th, 11 and 12th, a great success.

Thanks to the courtesy of the Board of Trade of the City of St. John, the headquarters of the Fifth General Professional Meeting of *The Institute* were located at and the various sessions held in the rooms of the St. John Board of Trade.

In declaring the meeting open, C. C. Kirby, A.M.E.I.C., Chairman of the St. John Branch, announced that President R. W. Leonard would arrive at noon and would preside for the rest of the Convention. He called upon his Worship, Mayor R. T. Hayes, of St. John, to address the gathering.

Mayor Hayes said that it was with very much pleasure that he accepted the invitation of the local engineers to accompany them to Halifax a year ago to attend the professional meeting of *The Institute*. In company with Mr. Wetmore, Chairman of the Board of Trade, he had spent three enjoyable days in Halifax, where the people headed by Mr. Bowman and others extended their hospitality and gave them a splendid time. Since then he had followed the procedure of the engineers with interest. He spoke of the necessity of having engineers when anything was to be built or constructed in the city. A city needed a good fearless engineer. The experience of St. John was that they had just such men—men in whom they had the greatest confidence. Very much is expected of engineers and they had always maintained a very splendid standard. He referred to the possibilities of St. John and to the harbor which was yearly growing in importance and use. The city was second in amount of import and exports during recent years. It was contemplated that the harbor would be placed under a commission in the near future, and that it would become part of the great national transportation system of Canada. He was glad to welcome the engineers to St. John, stating that he felt sure the Board of Trade and the citizens of St. John would endeavor to return the compliment for the very splendid entertainment they had had in Halifax a year ago. Concluding he said—the city is yours while you are here and all the hospitality that we can offer to you is yours.

The Chairman thanked Mayor Hayes on behalf of the gathering for the very kind address of welcome and for the great interest he had shown and was showing in the welfare of *The Engineering Institute*. His visit to Halifax last year and also that of Mr. Wetmore had been a source of great pleasure to the members, and the interest he had shown was greatly appreciated. After making a few announcements he called on Alex. Gray, M.E.I.C., to read the first paper on the programme of the Fifth Professional Meeting, by E. T. P. Shewen, M.E.I.C. on The Usefulness of Vegetation in Maritime Engineering.

Usefulness of Vegetation in Maritime Engineering

"British engineers have perhaps been somewhat apt to disregard those transformations which are capable of being brought about by vegetation."

This remark is found in the preface to a book recently published, entitled: "Tidal Lands, A Study of Shore Problems" (1918). by A. E. Carey, M. Inst. C.E., F.R.G.S., etc., and F. W. Oliver, F.R.S., Professor of Botany in University College, London.

A convincing illustration of the value of vegetation as a protection against inroads of the sea, was given about ninety years ago in the maritime provinces by the destruction of a fine harbour at Port Hood on the west coast of Cape Breton. The shelter, two miles long and one and a quarter broad, was formed by the junction with the mainland of Smith's (or Port Hood) Island, which constituted the western barrier, presenting on the east a concave side. From Emerson Point, four miles below the harbour, to Dean Shoal abreast the middle of the island, the coast lies north and south, but then trends N.N.W. for a mile and a half to Isthmus Point, there turning due north to Cape Linzee, half a mile away. At Cape Linzee, the shore swings N.N.E., and continues in that direction almost in a straight line for some miles.

C. C. Kirby, M.E.I.C.
Chairman of the St. John Branch.

The connection was made by a sand beach or bar starting from the shore at Isthmus Point and running nearly three-quarters of a mile S.S.W. to the head of the Island. In respect to the littoral drift which made the isthmus, it is worth noting that the line of it, if produced N.N.E., practically coincides with the coast-line for ten miles from Cape Linzee. A deep and capacious haven was thus made between the island and the main, large enough to hold a fleet, and affording at best more than seven fathoms of water. Concerning the holding-ground, there is no present information, for the bottom was covered with sand, and the depth shoaled, when the isthmus was washed away. The harbour was open to the south alone, and in that quarter the fetch is only twenty-one miles to the Nova Scotian coast. The conditions of a good natural harbour were therefore fairly fulfilled.

The isthmus was covered with grass, so long, according to statements made a quarter of a century ago by some of the older people of the place, that the children who had to cross to reach the school, used to play hide-and-seek in it on the way. Unfortunately, cattle were turned out there to graze, and disaster followed. One of the eye-witnesses of the consequent destruction of the sand beach (and from his apparent age, one of the school-children mentioned), said that he considered the greater damage was done by the hoofs of the cattle in uprooting, and that the actual cropping was a minor evil. In any case, the grass was killed by the cattle, and the sand above high-water, no longer held in place by the roots or protected by the stalks, was blown away by the wind until the crest of the beach, formerly several feet above H.W. was soon lowered to that level. A breach, small at first, was shortly after made by the sea.

Seeing an opportunity for making an outlet for their boats, which would save a long sail round the tail of the island in reaching the northern waters, the fishermen enlarged the breach to a size sufficient for a boat-channel. The sea did the rest. Not long afterwards the whole isthmus was swept away, the harbour utterly destroyed, and only an open roadstead left in place of it. The grass which had preserved a harbour for an unknown period by holding the sand composing the northern bulwark was evidently a valuable and hardy species, consequently about twenty years ago search was made to find if any of it had survived in some sheltered nook lower down the shore, where the sand and roots must have been carried (part of the sand lodged on Dean Shoal) since the littoral drift follows that direction. In a cove filled with sand, some distance to the south, grass of the same kind was discovered in quantity, and on being sent to the Experimental Farm for examination, it was pronounced to be *calamagrostis arenaria.* It was then decided to plant some of it at Negro Point in order to stop the dry sand drift at that time being blown over the top of the work into the harbour of St. John, and also in order to assist the increase of the natural face on the weather side of the breakwater, pending the extension of it to Partridge Island. Transportation from Cape Breton did not become necessary, for the resemblance of the grass at the head of Courtenay Bay to the Port Hood specimens was observed, and they were found to be identical. Roots were accordingly transplanted from Courtenay Bay to Negro Point, and the desired effect was produced.

On the sandy eastern coast of New Brunswick, and on the shores of Nova Scotia and Prince Edward Island, opportunities occur for the use of this grass, and wherever accumulation of sand is observed to be taking place alongside a new work, it might be prudent, for the purpose of retarding the formation of dunes, to plant it as soon as the littoral drift collected rises a few feet above tide-level. If erection of the long piers at Cape Traverse in Prince Edward Island, and at Richibucto in this province, did not actually originate formation of the dunes at those

places, it at least contributed to increase their size, because both works caused advance of the foreshore. According to the authors of "Tidal Lands," dunes can be formed as soon as the sand flats of the foreshore rises high enough to allow the surface to become sufficiently dried between tides for the wind to blow the thin dry layer landward.

At Cape Tormentine, on this side of Northumberland Strait, there are wide sand flats dry for a considerable period of each tide, but no dunes; because the prevailing strong wind blowing up the Bay of Fundy and across the low isthmus of Chignecto is off-shore from the New Brunswick coast. Dunes are however found at Cape Traverse on the opposite side of the strait, and nine miles distant, where the same wind is on-shore and where the sand flats as already mentioned, were enlarged by the construction of a long railway pier of solid cribwork. So rapid was the spread of the strand there, that the workmen said the sand came out to the end as soon as the pier was built. Quantities travelled round the end, and lodging under the lee went on, either to make or augment the dunes on the farther side of the cove. At Mabou, ten miles north of Port Hood and on the same coast, dunes have overwhelmed the land, killing the trees and all other vegetation. The dunes at Richibucto are formed on waste or inferior land, and in consequence have so far caused little damage.

In such places, *calamagrostis arenaria* might be cultivated with advantage. No doubt other varieties of shore plants, useful in greater or less degree for holding or protect ng by root or top the dry sand, might be discovered on the shores of these provinces.

The lessons taught by the catastrophe of Port Hood are evidently:—

(1) To preserve the useful shore grasses, in particular by the exclusion of live-stock from beaches.

(2) To plant *calamagrostis arenaria* betimes, when sand-spits or beaches are being denuded by wind action.

Wherever a breach in the numerous dry sand bars found in this region is being made, after restoring the beach to proper height for survival of the roots, the engineer would act wisely in planting bent-grass.

Movement of the dunes on the European and also on the Australian continent, is being prevented by systematically setting, according to prescribed rules, roots of grass as a first step, followed by cultivation of other suitable plants as the dunes become fixed. Botanical investigation of the sandy coasts of Canada, with the view of ascertaining the different kinds of indigenous plants capable of holding sand, which flourish best at varied elevation above H.W. (say from 10 to 60 feet) would furnish information useful to the maritime eng neer in hindering the development of sand dunes, or in arresting their movement when formed.

Discussion

Mr. Gray had provided a number of water color plates illustrating the grasses referred to in the paper he had just read. He mentioned that the plants brought from Port Hood to Negro Point were a different species to the grass at Courtenay Bay. He pointed out the difference in the two on the plates exhibited.

Geoffrey Stead, M.E.I.C., Engineer of Public Works, Chatham, N.B., stated that the same results from the removal of grass as mentioned by Mr. Shewen are in evidence at several of the North Shore points. At Tracadie there is a beach four miles long with a harbor of the same length and one or two miles wide. The inhabitants have been cutting hay on the beach and letting the cattle roam, which resulted in the destruction of the beach. The Department of Public Works had breastworks built of stakes and brush for about four miles, resulting in the beach being built up again. They were now at the stage where they were ready to plant beach grass to preserve the beach and further raise it. At another beach, Port Shubert, they had planted grass for its preservation. He had collected fully thirty species of marine plants native to the beaches. He considered the subject a very pertinent one as it involved an engineering problem to the engineers of the north and eastern shores of New Brunswick. F. G. Goodspeed, M.E.I.C., stated that his experience had been practically the same as Mr. Stead. He recently noted in an article on a harbor on the west coast of the United States which was delivered in 1894, that the author strongly recommended the use of artificial grasses. C. O. Foss, M.E.I.C., said that the paper indicated to his mind the necessity of the Canadian Government securing the ownership of the beaches in the different harbors. He thought it would be cheaper than constructing works to protect them after they had been destroyed. He asked Mr. Gray if he knew if anything had been done at Port Hood, who replied not as far as he knew. It would be a difficult proposition to purchase beaches extending over a distance of fifty miles cut up into hundreds of lots belonging to different owners. In different places the Government had purchased str ps of beaches which were threatened and which were the most necessary. It would have been better if they had never been granted to the people. The Chairman asked what were the common names of these grasses, and received the information from Mr. Stead that they were wild rye and beach grass. They made a poor quality of hay, but on the North Shore the people fed their cattle on it. J. S. Armstrong, M.E.I.C., dealt with the question raised in the paper as one which needed emphasis, because the Magdalen Islands would disappear altogether and the same was true of Sable Island. He believed it was a matter which the Government should take in hand. F. A. Bowman, M.E.I.C., Halifax, believed that the Dominion Government had been doing such work. He thought that one of the difficulties regarding Sable Island is to keep vegetation existing there on account of the severity of the weather. Continuing the discussion Mr. Armstrong was of the opinion that beach grass should be grown on Sable Island and later trees might be grown. In Europe after getting control of the beaches, large areas are planted with pine trees in different places, and considerab'e areas are now growing forests.

It was moved by Mr. Stead, seconded by Mr. Goodspeed that the thanks of the meeting be extended to Mr. Shewen. Carried unanimously.

In the absence of G. H. Prince, B.Sc. F., the author of the paper, who is Provincial Forester, his paper was read by H. C. Kinghorn, on Forestry in New Brunswick.

Forestry in New Brunswick

Forestry Conference of 1907, in Fredericton

The present marked development in forest administration in New Brunswick may be traced largely to a Canadian Forestry Convention held in Fredericton just twelve years ago. At that important gathering of practical and scientific men the many problems of Forestry including Proper Utilization, Fire Protection and Forest Conservation were fully discussed and many far-reaching resolutions were presented to the Government.

Forestry Course Established at University of New Brunswick

The most important and immediate result of that convention was the establishment of a four years' course in Forestry in the University of New Brunswick in the following year.

In all, twenty-nine foresters have since graduated from this university, a small number you will say, but well worth the effort when you consider the great part they have taken and are taking in the development of Forest Conservation in all parts of Canada.

Origin of Forest Survey

Before attempting to describe what the Provincial Government has done, let us consider the progress of Forestry with owners of Crown granted forest land. One company owning over one and one-half million acres of forest land in New Brunwick early started the surveying and cruising of their limits. This forest survey, a task that took over five years, furnished the company with accurate timber maps, timber estimates, reports on the conditions and growth of the timber, etc. This information has had much to do with shaping this company's policy in regard to the disposal of its timber towards an increased income and a perpetual supply. Quite extensive surveys have also been made by two other large owners of private lands in New Brunswick.

The Government of New Brunswick, no doubt realizing, as the private companies have done, that the best results in the management of its greatest resource, the forest, could not be obtained without a full knowledge of that asset, passed the Act which provided for the Forest Survey and classification of the seven and one-half million acres of public forest lands. This survey, commenced in 1916, has been continued as rapidly as possible, consistent with war conditions, and already over one-quarter of the total area has been surveyed and mapped, at a cost of approximately five cents per acre.

The objects of this Forest Survey as defined by the Act are, briefly:—

First—To report with as much detail as possible upon the character and quantity of the lumber, estimating the quantity of timber and reproducing capacity of the forest.

Second—To estimate as accurately as possible the annual growth of timber upon each area or tract. That is, the number of board feet produced each year.

Third—To report upon the accessibility of the timber on each section, estimating cost of logging on the different areas and cost of driving.

Fourth.—To report the location of lands deemed suitable for agriculture, distinguishing them from other lands that might be regarded as suitable for the growth of timber only.

In order to obtain the above information the most modern and scientific methods of timber estimating and mapping have been employed, and this survey is said to be the most extensive of any survey of its kind in regards to area in North America.

Method of Forest Survey

The method of carrying out the above work is technically known as the strip method. This is fully described in the 1917 Report, which may be obtained upon request. Briefly, the method of work is as follows:—

The forest land is held under licenses by our licensees, each division being known as a license or timber block, varying in area from 1000 acres to 12,000 acres. The average timber block contains 4000 acres, or 6 square miles, and is approximately 200 chains square.

Method of Surveying Block Lines

The first work in connection with the survey is the establishing of the boundaries of these timber blocks. In many cases old lines are retraced, while in others entirely new lines are run. The chief difficulty encountered is determining the location of lines between Crown land and granted lands. When these lines are completed it will relieve the stumpage scalers of any difficulty of determining whether the logs are subject to stumpage or not. In accordance with law these lines are run by qualified Provincial Land Surveyors, of which 5 crews have been employed during the present season and some 700 lineal miles of line run. The lines are being thoroughly blazed, stakes or trees being marked with chainage and block numbers every 20 chains and in addition posts are set wherever the lines cross portages, streams, lakes, etc., and marked with their chainage from the nearest corner and proper block numbers. This enables the lumbermen's cruisers, as well as the Government Rangers, to locate themselves quickly wherever they locate a post along a portage by referring to their plans. The lines are plotted and are required to close within a certain limit. All work is being done by compass.

After the lines have been established and quarter mile posts set, the area is cruised. A cruising party usually consists of about 13 men, made up of a chief, camp compiler, 3 cruisers, 3 compassmen, 3 calipermen, 1 teamster, 1 cook. The cruising is done by parties of 3 made up of a compassman, a cruiser, and a caliperman. This cruising crew travels from one quarter mile post across the block 200 chains to the post exactly opposite. The compassman directs the course and acts as head chainman. The caliperman acts as rear chainman and calipers the trees on one side of the chain for a distance of half a chain from it. The cruiser also calipers trees on the opposite side of the chain for the same distance and takes all the notes. No attemp is made to chain accurately on these so-called cruise lines, as the exact distance between the two block lines is known from the former survey. A cruising crew will cross a block twice, thus running 5 miles of cruise line a day or recording the timber standing on a strip 5 miles long and one chain wide or on 40 acres. The cruise lines are run parallel and 25 chains apart.

The types of timber, hardwood, softwood, burned land, etc., are recorded.

The cruiser also takes notes on all topographical features with which he comes in contact—slopes, brooks, streams, lakes, rivers, roads, portages, etc., with description of each, which are afterward compiled.

The notes are kept in loose leaf metal folders and turned in to the camp compiler each night and are plotted the following day, so that any errors or ommissions may be properly detected.

Method of Timber Estimating

Some of you may not understand just how the timber estimate is arrived at. The trees are calipered outside the bank 4½ feet from the ground in order to avoid the swell of the root. They are recorded by species and diameter, so that a tally sheet will show so many spruce trees 8, 10, 12, 14, 16, 18 inches in diameter on the number of acres calipered. All visible defects that can be observed in the standing tree are allowed for when calipering the tree. Hidden defects are covered by a deduction made from the estimate. The contents in board feet is arrived at by what is termed a volume table, which is prepared by following a logging operation and measuring a large number of trees of all diameters (at least 1000 trees in the locality where the work is to be done). The contents of a tree varies directly with its height and diameter, and the average contents of, say a 12 inch tree 80 feet high, may be accurately determined and the average contents of trees of all diameters are secured and compiled in what is known as a volume table. Multiple volume tables are then made up from which the contents in board feet of the trees on the area calipered can readily be determined and the average per acre is applied to the total area of the same class of timber land. In this manner 4 acres out of every hundred are measured, or in other words, the survey is known as a 4 per cent cruise. Check cruises are made after every cruiser twice a month, in addition to the above.

Purposes of Forest Survey

Notes are taken on the soil, rock and slope and other points affecting the possibility of using the land for agriculture. Small shovels are carried and the soil examined to a depth of at least 12 inches or deeper if necessary to determine the nature of the soil and sub-soil.

Results of Forest Survey

The method of carrying out the timber survey and soil examination has been largely the result of conferences and field directions given by experts employed by the Conservation Commission and loaned to the Provincial Government for a few weeks each year. These men visit the field parties and direct the work and initiate improvements in method.

Timber and Soil Maps Prepared

Two plans or maps are prepared, one showing all survey lines, posts, portages, lakes, etc., and the timber types, and one the soil conditions and topographical features. The plans are being prepared in blocks of 42,000 acres, each plan being given a distinctive number. When the work is completed there will be 477 of these plans.

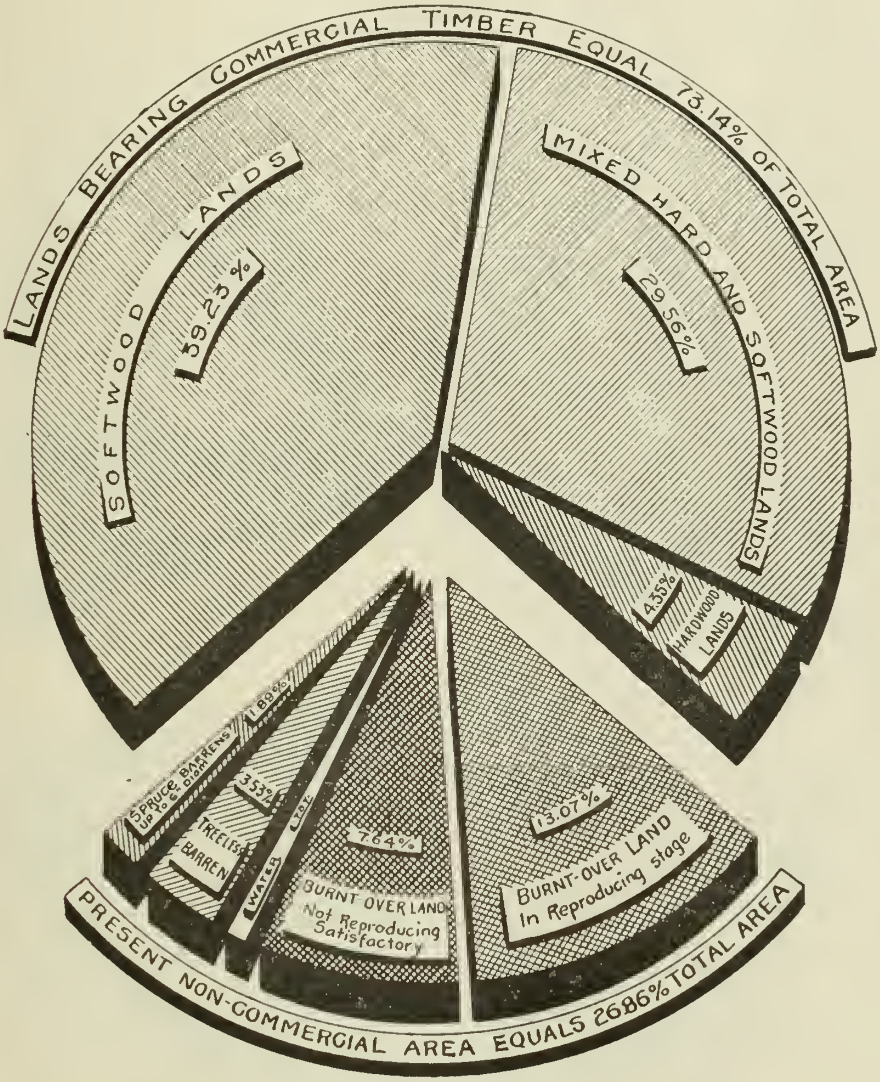
Establishing of Permanent Sample Plots

The permanent establishing and systematic marking of the timber block lines is already proving of much value to the lumbermen's cruisers, as well as to the Government Rangers. The same is true of the timber estimates. One large lumber company holding over 500 sq. miles is contributing half the cost of the survey in order to avail themselves of the maps, reports and notes. Another company owning over 150 sq. miles is also contributing in order to have the survey made this year so as to have the maps and figures with which to plan this season's logging operations. These facts are a clear indication of the value of the survey to the licensee as well as to the Government.

I feel sure that some of you who are connected with the lumbering or pulpwood industry will be interested in some of the figures secured by the tabulation of the timber estimates on 1,400,000 acres of the forests compiled in the 1918 Report. The following figures indicate the percentage of the total area covered by each forest type:—

(a)	Area covered by Softwood Timber..................	549,344	acres	or	39.23%
(b)	Area covered by Mixed hard and soft woods.....	413,878	"	"	29.56%
(c)	Area covered by Hardwood timber.............	60,838	"	"	4.35%
	Total area supporting merchantable timber suitable for saw logs.............	1,024,060	"	"	73.14%
(d)	Area of burnt over land on which there is sufficient reproduction to assure a future timber crop.......	183,411	"	"	13.07%
(e)	Area of burnt over land on which satisfactory reproduction is not yet established...................	107,738	"	"	7.64%
(f)	Area of barrens, treeless land, including caribou barrens, cranberry bogs, swamp areas not supporting commercial growth...	49,395	"	"	3.53%
(g)	Areas of black spruce and jack pine barrens, trees under 6″ in diameter.....	26,255	"	"	1.89%
(h)	Area of lakes and water...	5,505	"	"	.39%
(i)	Area of lands cleared or cultivated..............	4,560	"	"	.34%
	Total area not supporting merchantable timber.....	376,864	"	"	26.86%
	Grand Total of both Timber and Non-Timber Land	1,400,000	"	"	100.00%

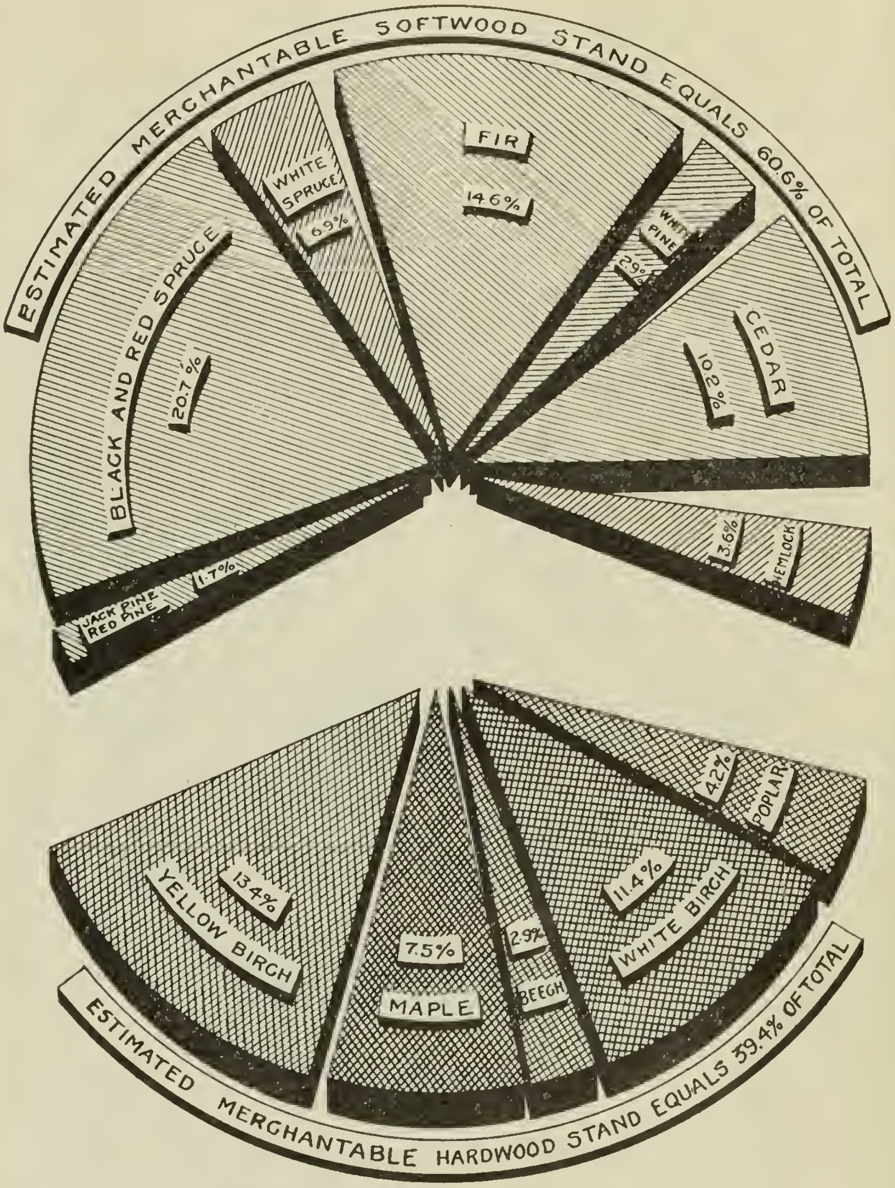
The above is very strikingly set forth on Plate No. 1 which divides the area graphically and from which you can gather at a glance the relative extent of each type of land. Note the very large proportion rendered unproductive by Forest Fires. Note also that the present nonproductive area forms over 26 per cent of the total area.



1,400,924 acres Crown Lands graphically divided into Forest Types.

Note the large area rendered unproductive by Forest Fires, during the last forty years.

J.B.M.



1615000 000 FEET OF MERCHANTABLE TIMBER GRAPHICALLY DIVIDED ACCORDING TO SPECIES. NOTE THE LARGE PROPORTION OF HARD WOODS AT PRESENT FORMING LESS THAN 2% OF THE ANNUAL CUT FROM CROWN LANDS.

B.M. ESTIMATE 1 024 060 Acres

Tabulation of commercial sized timber, that is, spruce over 12 inches and fir over 9 inches, estimated on 1,024,060 acres, showing amount of each species and percentage of the 1,615,000,000 feet occupied by each:—

(*a*) *Softwoods:*				
White Spruce......	111,000,000	ft. or	6.9%	of total
Black and Red Spruce..........	335,000,000	"	20.7%	"
Fir................	235,000,000	"	14.6%	"
White Pine........	46,000,000	"	2.9%	"
Red Pine..........	19,000,000	"	1.2%	"
Cedar.............	165,000,000	"	10.2%	"
Hemlock..........	59,000,000	"	3.6%	"
Jack Pine.........	5,000,000	"	.5%	"
Sub-Total Softwood Stand...........	979,000,000	"	60.6%	"
(*b*) *Hardwoods:*				
Yellow Birch.......	211,000,000	"	13.1%	"
Maple, hard.......	118,000,000	"	7.3%	"
Beech.............	43,000,000	"	2.6%	"
White Birch.......	186,000,000	"	11.4%	"
Poplar............	68,000,000	"	4.2%	"
Other hardwoods....	8,000,000	"	.8%	"
Sub-Total Hardwood Stand...........	636,000,000	"	39.4%	"
Grand Total estimated Soft and Hard woods on 1,024,000 acres of timbered land..............	1,615,000,000	"	100.%	"

or 1577 ft. per acre for the timbered area, 60.6% being softwood and 39.4% being hardwood.

Utilization of Hardwoods Encouraged

The above figures have been graphically shown on Plate No. 2, from which you will see the very large place occupied by hardwoods in our commercial stand. Our annual cut of these species does not amount to two per cent of the total cut and this shows very emphatically the need of further developing the hardwood industries. Something has been accomplished in this regard by one of our largest holders of Granted Forest Land as hardwoods represented 10 per cent of their total cut last year.

The utilization of White Birch and Poplar should be further extended in view of the large quantities of these species on the Crown Lands. A new hardwood industry is just being established in the centre of the Province which will manufacture each year 3 to 6 million feet of Yellow Birch and Maple into shoe lasts. It is expected that a further utilization of hardwood will be developed each year.

The N. B. Government is one of the first in Canada to establish permanent sample plots. Through co-operation with the Conservation Commission and the Bathurst Lumber Company a 600 acre lot will be laid out and various methods of cutting will be tried and measurements made of the results periodically during the next 25 years. The work is being directed by Dr. C. D. Howe for the Conservation Commission.

In order to form an approximate idea of the stand of growing timber, the undersized spruce and fir down to a minimum diameter of 8 inches has been estimated to be equivalent to 838,000,000 feet. Considerable of this is just on the border line between undersized and merchantable sized timber trees, and usually some of these trees are cut in the course of a logging operation, thus increasing to some extent the commercial estimate given above. Thus undersized material represents the growing stock for future timber crops.

The survey parties are also collecting data regarding the spruce bud worm injury in co-operation with the Federal Government Entomological Department, which has had the work in hand for the past 5 years. A comprehensive report will be issued this year.

You will ask of what use is the Forest Survey to New Brunswick. Briefly:—

(1) It will give definite information of the quantity, quality and value of the timber on any area, from which the stumpage value may be determined. It will show the quantity and quality of species now of little commercial importance because of lack of market demand, and possibly it may show that these species can be marketed profitably, or where quantity justifies it, to induce industries utilizing these inferior species to operate within the province, thus profitably utilizing material which is at present going to waste. Something has already been accomplished in the utilizing of hardwood.

(2) The estimate of the annual growth will determine whether or not the annual cut can be increased, or whether to perpetuate the industry and maintain our revenue restrictions should be placed on certain species to regulate the cut.

(3) The information on soils will permit of directing agricultural settlement to districts offering the greatest prospect of success, thus protecting both the future settler and the timber licensee.

(4) Any system of Forestry is useless without Fire Protection, and you are wondering in what way will this Forest Survey benefit Forest Fire Protection in New Brunswick.

Well, first of all we have an excellent base plan from which to build our Forest Protection plan. Our map will show all passable portages, all old portages and trails, all roads passable for wagons, and all roads passable for automobiles; it will show all telephone lines, all canoeable streams, all camps, the location of all green timber, burned areas, bad slashes, and dangerous points; possible look-out stations, area visible from them, possible observation points and areas visible from them. From the network of portages and canoeable streams we can plan an efficient system of control; we can see clearly where the tool caches are most needed, where look-outs will be most beneficial. When fires do occur it will show the Forest Ranger where the heavier timber is, and whether the fire is being blown towards timber, a swamp, a heavy slash, and many of the things he needs to know at once. The plans will also show the areas of most danger, where the most of the recent burns have occurred, etc. Our Chiefs of Party are instructed to collect all local knowledge available regarding all matters of fire protection, and to prepare a plan of patrol whether by auto, saddle horse, canoe or by foot as the case may be, showing the location of possible look-out towers, observation posts, tool caches, where fire permits will be necessary to protect the timber from settlers clearing fires, and where the public opinion is so far advanced as to give excellent fire protection at the present time without further development. Our reports will show where debris has accumulated near public highways, railroads and settlements, which should be burned in order to avoid a great fire risk to even human life as well as property. You will see from this that the Forest map of New Brunswick will undoubtedly be of greatest value in planning a comprehensive and efficient fire protection system.

Passing of Forest Act and Fire Law in 1918

The figures already compiled by the Forest Survey have shown an enormous loss to the Province of New Brunswick by forest fires. This startling fact, together with the active influence of the Canadian Forestry Association and the Commission of Conservation, resulted in the passing of the new Forest Fires law which was designed to assist in preventing the recurrence of so great a national disaster.

The Fire Permit system of regulating settlers burning slash as provided under the new fire law is recognized as one of the most important advances in Forest Protection and although this law was in force for only a short time in New Brunswick it has given excellent results.

The Provincial Government early recognized that without a permanent, properly disciplined and efficient field staff of Forest Rangers, unhampered by the influence of politics, very little could be accomplished by way of fire protection and Forest Conservation, consequently the 1918 Forest Act was passed, providing for a Forestry Advisory Commission of five members, consisting of the Minister of Lands and Mines, Deputy Minister, Provincial Forester and two others—one elected by the Crown Land licensees and one chosen by the Minister to represent the granted forest land owners.

Creation of New Brunswick Forest Service.

This Advisory Board has the power to make all permanent appointments and to supervise all matters in relation to the Forest Act, which includes the scaling of logs from Crown Land, the enforcing of logging regulations, the protection of game, and the protection of the forests from fire.

This Advisory Board has had several meetings and the results obtained have shown the wisdom of its creation. The practical contributions to the deliberations of this Board by the two representatives of the lumbermen of the Province has been invaluable.

Method of Appointment of Forest Rangers by Competitive Examination

Among the Board's first duties was the appointing of an examining committee to carry out the Act in relation to the appointment of rangers by competitive examination on a strictly merit basis.

The Board of Examiners was made up of three members, the Provincial Forester as Chairman, an expert scaler and a practical woodsman and lumberman.

Nature of Examination

The examination consisted of a written test on Woodscraft, Fire Protection, Game Protection and Scaling, an oral test and, most important, an actual scale of a large number of logs by the applicant. The examination was modeled after the U. S. Forest Service Examination, through the kindness of the U. S. Civil Service Commissioners.

Promotion in Forest Service by Merit

It is very interesting to note that of the 179 men examined only 99 qualified. The large number that failed to qualify was due to the fact that many men lacked sufficient experience as scalers. The Government of this Province is entitled to great credit in view of the fact that the appointment of the Forest Rangers and Inspectors is being practically completed from the pass lists on a strictly merit basis, irrespective of any other influence.

The new act, by providing for the consolidation under one staff the work of Game Protection, Scaling and Fire Protection, made possible the employment of men continuously the year round. This renders possible proper disciplining of the staff, which was seldom possible where the men were annually appointed through the patronage system, which system is being rapidly abandoned by all up-to-date organizations in Canada and appointments and promotions are being made strictly on a basis of merit.

It is inevitable that, in spite of a most rigid examination, in appointing a large number of men a few undesirable appointments may be made. This is provided for in the Act by making permanent appointments only after six months of satisfactory service. The Province has been divided into thirty-six districts, each under a Forest Ranger who has one or several assistants during the fire season, as deemed necessary. Five inspectors are employed, who devote their whole time to the supervising and checking of the work of the Rangers. During the scaling season each Ranger will have one or more assistants to assist in the counting and scaling of the logs. In order to give the staff a greater sense of responsibility, they have been placed under bond for the proper performance of their duty. The whole staff coming under the supervision of the Provincial Forester, Chief Scaler and Chief Game Warden. It is hoped to improve the personnel of the Forest Service by weeding out those who fail to measure up to the proper standard of efficiency and by the appointment of more energetic and competent men to fill their places. Of the first 43 men appointed the appointments of 13 were not confirmed and recently another Ranger has been dismissed.

Vacancies to be filled by Returned Men only

It is the policy of the Department to fill all vacancies with returned soldiers, 16 returned men having qualified in the recent examinations.

Furthermore, it is the expressed aim of the Minister of Lands and Mines to keep the administration of the Forest Service entirely free from the influence of politics and to build up a permanent organization on a strict basis of merit alone. He has won the support and approval of deep-thinking men for his adoption of a policy so vital to the success of any business organization.

Fire Protection Needed and Developed

Through the continued co-operation of the New Brunswick Government with the Railway Commission of Canada, the work of fire protection along railway right of ways was continued with beneficial results, and it is worthy to note that last year was the first year that systematic inspection of the fire protective appliances on locomotives was carried out by the Provincial Inspectors in New Brunswick.

The co-operation between the New Brunswick Government and the Canadian National Railways in regard to fire prevention has been considerably extended. The concession of the General Manager of this Railway to the New Brunswick Government's inspectors to examine their locomotives for fire protective appliances, and the issuing of a circular by the General Manager to all employees of the C.N.R., outlining their duties in regard to forest fires along practically the same lines as railways do under the Railway Commission, resulted in considerable improvement in the fire situation; nevertheless it is felt that much better results can be obtained if the Canadian National Railways were placed under the jurisdiction of the Railway Commission of Canada. Considerable improvement in fire protection along private railways in New Brunswick has been secured by close inspection and considerable pressure brought to bear on their managers. Last season one railroad was forbidden to operate trains until engines were properly equipped and fire patrol established.

The necessity of this work and its great importance will be seen when it is stated that a very large percentage of the locomotives examined had serious defects in their fire protective appliances, which were immediately remedied at the request of our Inspector. The seriousness of the forest fire hazard along railroads is easily realized when it is stated that over 770 fires occurring from the smokestacks or ashpans of locomotives operating through the forests were extinguished by our patrolmen during the 1918 fire season.

Considerable improvement in general fire protection throughout the province and a greater interest by the public has been noted, due to a considerable extent to the educative propaganda recently adopted. Over 15,000 attractive and warning posters were placed throughout the Province. The Press was used to a large extent. Through co-operation with the Board of Education, circulars on fire protection were read in 1500 country schools by the teachers, and the children urged to be careful with fire in the woods. Fire protection posters were placed in railway smoking cars through the permission of the railroads. Five thousand circulars on slash burning were distributed. Over 100 various interesting slides on fire protection were distributed and shown in many of the forty motion picture houses in the Province. Envelopes for all correspondence carried fire protection data during the fire season; several thousand pocket whetstones carrying fire protection information were distributed to woodsmen, hunters and fishermen; a course of ten lectures on the Crown lands and Fire Protection was given to the Provincial Normal School students last year. Practical Fire Protection talks were given by the Rangers to 100 Boy Scouts in Camp. 2000 copies of the Fire Act were distributed—the whole tending to create a healthy sentiment regarding the importance of fire protection.

Summary of Fires and Damage of 1918

The need of all this publicity is fully justified when the following brief summary of the fires reported in 1918 is considered:—

Railroads.....	771 fires	......93.5¾	of total
Fishermen.... Campers..... Hunters...... Smokers......	29 "	...... 3.5%	"
Settlers burning slash....	15 "	...... 1.5%	"
Unknown.....	9 "	...... 1. %	"
Industrial operations...	5 "	...... .5%	"
Total......	829 "	......100. %	"

The following statement shows comparatively the amount of damage resulting from fires through each cause:—

Fishermen.... Campers..... Hunters...... Smokers......	$56,100	.....68. %	of damage.
Railroads.....	20,000	.....24.5%	"
Settlers burning slash....	2,100	..... 2.6%	"
Unknown causes......	2,000	..... 2.5%	"
Industrial uses of fire......	1,800	..... 2.4%	"
	$82,000	.....100. %	"

The above tabulations show that over 90 per cent of the damage done was caused by the carelessness of fishermen, campers, hunters and smokers neglecting their camp fires or throwing away burning matches, and by the railroads through defects in the fire protective appliances on their locomotives.

It is, therefore, absolutely essential that carefulness with fire, and a proper appreciation of this our greatest national resource, should be so impressed on the minds of our citizens, especially those whose business or pleasure takes them within the forests, that in the near future the neglected camp fire will become unknown, and forest fires will no longer destroy the people's heritage.

Method of Log Scaling for Collection of Stumpage

One of the main duties of the Forest Service is to secure a correct return of the logs cut from Crown Lands and when it is stated that usually there are 700 or 800 camps and the cut exceeds 200 millions and 500,000 ties, it is seen that it is considerable of a task.

Each Ranger is furnished with complete plans of the Crown Land in the district assigned to him, and he is held responsible for a proper count, scale and return of all material cut from these lands each year. He is furnished with an assistant or counter who assists him during the scaling season. About 5,000,000 feet is considered sufficient work for any one scaler. Each camp is visited every two weeks and the yards of logs counted and scaled, marked and numbered. A report is furnished the Crown Land Office every two weeks on the logs scaled and counted at each of the 700 or 800 camps in operation.

Method of Check Scaling

This report is checked and a duplicate mailed at once to the licensee so that he is properly informed of any infractions of cutting regulations, such as cutting undersized timber, too high stumps. If the licensee disputes the scale the logs are still there and a check scaler is put on and the dispute immediately settled. This system tried out last season has given very satisfactory results, and will be in use again this year, with only slight modifications.

Any Questions

I have endeavored to give you as briefly as possible an outline of the work attempted and being done by the Forest Survey and Forest Service of New Brunswick, and will be glad to answer any questions.

Discussion

In response to some questions asked by the Chairman, Mr. Kinghorn informed those present that in connection with the arrangement of the five rangers acting as scalers, their work does not conflict. He saw no reason why a forest ranger should not act as game warden. He needed the co-operation of all the inhabitants as a fire warden, and their goodwill. He cannot enforce the game laws without antagonizing the inhabitants. Moses Burpee, M.E.I.C., desired to know to what extent there was co-operation between the operators in cutting timber and the railways running through acreage which was being operated upon—whether the responsibility for the slashing and the debris is divided between the two or rests on one or the other of the interested parties, and was informed that while the licensee owned the timber, the Government had to look after the slash and debris which comes under the Railway Commission of Canada on all roads except the Canadian National, the Railway paying the expense. He stated that in Maine there is a law which obliges the timber operator to take care of a strip on either side of the railway fifty feet in width. Mr. Kinghorn said that in New Brunswick the railways are responsible for 300 feet on either side from the centre of the right of way. Mr. Kirby told of the arrangement which the Canadian Pacific Railway had in the State of Maine, where one of the officials is appointed deputy fire warden and has the responsibility put on him of looking after the right of way. They maintain two tank cars at Brownville with enough hose line on these cars to fight a fire two miles from the track. Mr. Kinghorn stated that the railways were willing to live up to the fire law. An inspector makes an inspection of the ash pans and the smokestack of the locomotive. Mr. Burpee asked if any improved appliances were being tried out to equip locomotives. Asked by the Chairman if the New Brunswick Government were doing anything towards replanting forests, Mr. Kinghorn said practically nothing. By keeping out fires and with proper cutting regulations reforestation takes place. J. S. Armstrong, M.E.I.C., pointed out that large areas of land existed in the vicinity of Minto bare of trees, which once were covered with large pine. He thought it would be of great value if they were reforested. F. A. Bowman, M.E.I.C., pointed out that twenty years ago all the tamarack disappeared from Nova Scotia, having been wiped out by an insect. Mr. Burpee advised that in the State of Maine they had their trees only partially destroyed, and they had now as much as existed 25 or 30 years ago. In New Brunswick the destruction of spruce and fir by insects is dealt with by a special branch of the Dominion Government who have a staff at Fredericton.

C. O. Foss moved, seconded by F. A. Bowman, a vote of thanks to Mr. Prince for his paper, and to Mr. Kinghorn for reading the paper and answering questions. Carried unanimously.

The Chairman then announced that a special car would be waiting in front of the Board of Trade in a few minutes to take the party to the Manor House, where the visiting members would be the guests of the St. John Branch, and where the Honorable William Pugsley, D.C.L., LL.D., K.C., P.C., Lieutenant-Governor of the Province would give an address.

Luncheon at Manor House

President R. W. Leonard arrived to preside at this function. After expressing his pleasure in being present and to find such a large attendance and such an excellent programme he invited His Honor the Lieutenant-Governor of the Province to address the gathering. Lieutenant-Governor Pugsley spoke as follows:—

Colonel Leonard and Gentlemen: the remarks of the presiding officer that I am expected to make a few observations certainly were pleasing to me, because it indicates that he will be well satisfied if I make my remarks very brief, and no doubt he is giving your sentiments as well. It affords me the very greatest possible pleasure to be present with you to-day. I have the greatest possible respect for the engineering profession. It was my privilege to be a member of the provincial government and to be in the provincial legislature, in connection with the provincial and Dominion politics, altogether for a period beginning away back in 1885 and ending in 1917. During that time I had a good deal to do with the construction of various public works which were carried on by the provincial government of which I was sometimes a member and sometimes a supporter; and also carried on under my direction during the years that I was Minister of Public Works in the Dominion Government. During that long experience I was led to realize that the welfare of the country so far as the construction of public works was concerned rested very largely with the engineering profession. During my tenure of office in the Dominion Cabinet, I think my Department under my direction expended something like fifty million dollars in public works throughout this vast dominion, and I am happy to be able to say that in no single instance was it ever brought to my notice that an engineer of the Department, whether at the head office in Ottawa or as the head of the various districts throughout the Dominion, ever failed in any single instance in the performance of his duty towards the public. I became, as I have said, thoroughly satisfied that the interests of the country are so far as public expenditures are concerned in the department of public works, largely in the hands of the engineers, and also thoroughly convinced that the confidence which has been placed in the engineering branch of the department has not been misplaced. This, of course, is a very important consideration It testifies to the fact, taken in connection with the important work which has to be performed, it shows how honourable is the profession to which you belong and how much you can do for the advancement of the country in which we live and in whose future we have such great confidence. I would have liked to have been with you this morning to join with His Worship the Mayor in bidding you welcome to this city and to this province. New Brunswick is not a large province and Saint John is not a large city, and while advancement in the past has not been as great as I would like it to have been, let me tell you that I for one have great confidence in the future of this province and the future of this city, which is our chief commercial city. I wish you could go through New Brunswick at this season of the year, travel the valley of the noble Saint John which rises some three or four hundred miles up in the province of Quebec and State of Maine, and flows down over this vast territory, one of the finest sections of country which can be found anywhere in this world. A country filled with beauty; a country rich in agricultural possibilities and a country which before long, I believe, will be regarded as one of the most splendid opportunities for sightseeing which can be found anywhere on the American continent. I wish you could go to our northern rivers and see the splendid opportunities for fishing, catch our trout and noble salmon and then travel our woods and see the opportunities which there are for hunting game. New Brunswick presents attractive opportunities which we trust our friends in the upper provinces of Canada will become more familiar with. We naturally want the people of the Maritime Provinces and Quebec and the West to become better acquainted with each other to recognize the vast opportunities for development which we have and to realize what a splendid people are the people of Canada and how capable they are of doing big things, in order that they may stand shoulder to shoulder to make this a great country and make this Canada the most important of the overseas dominions of the Empire. There is one reason why I am glad to see you with us to-day. No big things can be done in Canada without the assistance and aid of the engineers of this country. It is you who plan what is to be done. You plan for the building of bridges, you plan for the building of canals, you plan for the building of railways, you plan for the mining industries of the country, and it is your advice that the big capitalists must take. There is no profession in this country I think upon which the future of Canada so much depends as upon the profession to which you have the good fortune to belong. You do not believe in talk like we lawyers and politicians do. You believe in work, and, therefore, I must recognize your beliefs and must conform to them and will now take my seat. Thanking you for the opportunity of being present and thanking you for the very patient hearing you have given to me.

Following Governor Pugsley's address, Mayor R. T. Hayes was called upon, making a speech, which he described as being mercifully brief.

At this point an item of business of the St. John Branch was entered into, in which the Chairman of the Branch proposed that Senator Domville, who was present, accept an honorary membership in *The Engineering Institute of Canada*. This was seconded by Mr. Gray. The vote by the members of the Branch was unanimous. In acknowledging the honor that he had received, Senator Domville said it was one of the happiest hours of his life to be connected with the men who had brains and knew science. At the bottom of everything was science, and the country must grow from scientific knowledge. He himself was deeply interested in scientific subjects, and in the engineers who were men of science. He was proud, even though towards the close of his life, to be paid such a compliment. He predicted that the engineering profession was destined to play a great part. Mr. Kirby proposed a toast on behalf of the new member.

President Leonard congratulated the St. John Branch on its new member, whom he had known for many years. He referred to the unrest today in industrial life. Continuing he said: There is a small proportion, estimated at one-eighth of all the industrial world, which is organized and there is a small proportion of men who are employers in the organized sense of the term. But the two together make a very small proportion of the population of this country, and yet they cause between them a very great deal of interest. The engineering profession consists almost exclusively of salaried men. There are very few of us who are classed as capitalists or employers. Neither are we in the class with trades unionists, because we are salaried men. As such, *The Engineering Institute of Canada* is the only organization in Canada which can favourably represent from one ocean to the other the great mass of people who are incidentally interested in all these questions which are before the public today and yet are not partisan on one side or the other. As such my word to you is "be steady."

Second Session

The chair was occupied by the President, Lieutenant Colonel Leonard, who immediately called upon C. O. Foss, M.E.I.C., Chairman, New Brunswick Water Powers Commission, who read his paper entitled Water Powers of New Brunswick.

Waters Powers of New Brunswick

Before going into a description and discussion of the Water Powers of New Brunswick, may I be permitted a few general observations.

The laws governing Hydrostatics and Hydraulics are so simple that the way-faring may readily understand them, yet I think I may safely say that there is no natural law so little understood even by people of high intelligence. There is no engine of equal power which is so simple of construction and installation, so uniformly sure in action and subject to so little wear and tear and depreciation as the modern up to date hydro turbine. I need not say that there is nothing miraculous about water power and that in a comparison of water with other methods of power generation we may easily make the mistake of spending so much money in the purchase, development and transmission of hydraulic power that the output may cost more than power generated in some other way, especially, when the consumption is small and limited. However, these exceptions only serve to prove the very general rule that hydro power is cheaper, surer and more flexible than any other form of power that can be developed in considerable units.

As regards water power possibilities in New Brunswick, it has been considered by the people generally that there are no power possibilities of any value outside of the Grand Falls of the St. John and a very moderate possibility at the Grand Falls of the Nepisguit, and this opinion has been strengthened by statements to that effect by parties who are supposed to be authority on the subject. If this was true the distribution of hydro-electric power in centres of population would be well nigh hopeless, for the cost of developing the Grand Falls of the St. John would be so great and its location is so remote from the centres of population, with the market at present in sight so limited, that the interest and overhead would make the cost greater than power generated by other methods. To make these powers commercially possible of development and use, the output must be used at or near the site in the manufacture of pulp and paper, the logical large industry for this Province. In the case of the Nepisguit power, the Bathurst Lumber Company are having plans prepared for the development and transmission to their pulp and saw mills in Bathurst, and the big power at the Grand Falls of the St. John will be developed in the near future for the same purpose. The parties now controlling the latter power site have a year from the close of the war to start the development, failing which the Provincial authorities will take away the control and arrange for the development by other parties. Then having disposed of the large power possibilities at the two grand falls, the question naturally occurs: where is power to be found for distribution and use in the centres of population?

The centres of population requiring, and not at present supplied with Hydro-electric power, are three:—

First, Fredericton and vicinity; Second, St. John and vicinity; Third, the towns on the North Shore from Chatham to Campbellton.

Moncton and vicinity has cheap power generated from natural gas.

St. Stephen has hydro-electric from the St. Croix.

Edmundston has a municipal plant on Green River. The Frasers have a development on the Madawaska for use in the pulp mill they have lately constructed. The capacity of this site may be considerably increased by storage on the Temiscouata Lake and they will be able to get any additional power they may need when they enlarge their plant, from Grand Falls when that is developed.

Woodstock also has a good hydro plant.

Taking the requirement of Fredericton: There are two streams falling into the St. John North of Fredericton: the Pokiok and Shogomoc, thirty-seven and forty miles respectively, following the highway which parallels the river, and thirty and thirty-three miles in an air line. These streams each drain about 50,000 acres. The Shogomoc falls 300 feet in the last two miles and the Pokiok falls 200 feet in 1½ miles and 100 feet more in about 500 feet. Both these streams have excellent opportunities for storage as they drain a country which is comparatively flat to a point about 2 miles from the St. John River. In other words, the St. John has eroded a valley 300 to 350 feet deep and on this flat country there is opportunity for storing large quantities of water by the building of comparatively inexpensive dams. These two streams if fully developed with all possible storage provided will yield at least 7000—24 hour power or 14000—12 hour power, or assuming that the working day of the future will be 8 hours then 21,000 h.p., if the pondage at the different plants is sufficient to take care of the fluctuations. The plan is to develop a small unit on the lower 100 foot drop of the Pokiok protected by the storage which is already provided by the existing dam at the outlet of Lake George. This will give power enough to cover the present requirements of Fredericton with quite a margin for increase of requirement. When more power is demanded the first unit can be more than doubled by building a new storage dam about 4½ miles from the St. John. When this is outgrown the 200 foot fall can be developed, and when that has been absorbed the Shogomoc can be developed. This should put Fredericton on the map as a manufacturing centre as it already is a Railway Centre.

The second and largest centre of population requiring Hydro power is St. John. All the power generated in St. John is by coal and the N. B. Power Company had to be given a very substantial increase in its rates to meet the greatly increased cost of coal and labor. They have been investigating possible water power for some time and now that the war is over they will have to go ahead with the development very soon. The Lepreaux River empties into the Bay of Fundy about twenty miles from St. John. The drainage is about the same as the Pokiok or Shogomoc but the run-off is nearly twice as much. We have three years continuous run-off records and we are greatly puzzled to account for the phenominal run-off, being 133% of the total rainfall recorded in St. John. The engineer who installed the gauge and took the first two years records explained the phenominal run off by assuming that the stream is receiving a large amount of subterranean drainage from the water shed of an adjoining stream, but we having taken several checks of the run-off of this stream find the same phenominal run-off, which proves conclusively that there must be a much larger rain fall on the water sheds of these streams than there is in St. John, only a distance of a few miles away. There are three power sites on the Lepreaux, two of 90 feet fall and one of 64, and having in mind the very great run-off of this stream, these three sites will produce at least three times the amount of power used by the N.B. Power Company at present. There is one power site known as "big falls" which can be made to generate 40% more power than they used last year. When St. John and vicinity has absorbed and put to use the 5000 to 6000 h.p. that can be developed on the Lepreaux, the Maguadavic, 20 miles further away, can be made to produce as much more. There is no reason why the development of this power should not be put in hand at once.

The third district where hydro power is required is along the North Shore; Bathurst alone has a small and very indifferently developed and distributed system of hydro electric power. Campbellton and Dalhousie drive their plants with gas engines, using gas produced from anthracite coal, and the cost of that makes their power very expensive. Newcastle uses steam at big expense and Chatham uses oil engines. In addition to the requirements of these several towns the Dominion pulp mill at Chatham requires some 400 to 500 h.p. The Tete-a-gouche River which enters Bathurst Harbor a little North of the town drains about 100,000 acres and has an ideal opportunity for very large storage. About 8 miles above its mouth it enters a deep and narrow gorge of nearly perpendicular rock walls. The fall through this gorge admits of four power sites, each created by a dam built to the top of the walls and flowing the water back to the next dam up the stream. At the first or upper site a dam 70 feet high will give a head of 105 feet, there being a sheer fall of 35 feet in the flow of the gorge. This dam will flow the water back about 4½ miles. At the second site a dam can be built to a height of 130 feet; the third 65 feet and the fourth 35 feet, or a total of 335 feet. These four sites will put out 6000—24 hour power or 18000—8 hour power.

So it will be noted that while it was represented to the Provincial authorities only a few years ago that there is no water power in New Brunswick aside from Grand Falls, we have already been able to locate and fairly well prove (apart from Grand Falls) the existence of 23000—24 hour power or nearly 75000—8 hour power, which if all put to work would produce a big change of conditions in this Province. This Commission has only been in existence for a little over a year and is composed of three men busy with their regular work and so are unable to give any considerable amount of time to the matter. Our people in the Maritime Provinces are surely if slowly awakening to the fact that we may overcome to a considerable extent the handicap which the Upper Provinces hold over us in manufacturing, due to their enormous water powers, by developing what we have discovered and looking for more.

Discussion

In the discussion following, which was participated in by Alex. Gray M.E.I.C., J. S. Armstrong, M.E.I.C., C. C. Kirby, A.M.E.I.C., Senator Domville, and the author of the paper, the main point brought out was the necessity for providing adequate storage basins to give continuous power. Mr. Foss stated that K. H. Smith, A.M.E.I.C., who had made a special investigation of the water powers of the Maritime Provinces was present and would no doubt add to the discussion.

Mr. Smith pointed out that the figures used in Mr. Foss's paper was necessarily approximations, since there had not been sufficient time during which records of the rainfall in New Brunswick had been kept to justify an engineer committing himself definitely to the power available figured from the run-off in its relation to the rainfall. Only one year's records have so far been kept, and it requires the records of many years to establish definitely the amount of continuous power available. He considered that storage was not a serious difficulty. Replying, Mr. Foss stated that his figures were based on the records of rainfall during the past year, which was believed to be a particularly dry one.

A hearty vote of thanks, moved by Senator Domville, seconded by Alex. Gray, was tendered the author for his excellent paper.

W. Rupert Turnbull, F.R.Ae.S., then read his paper—

Proposed Tidal Hydro-Electric Power Development of the Petitcodiac and Memramcook Rivers

We should run over first and in a brief manner the tidal developments and proposals of the past, so that you will be led, as I have been, to think that the first large tidal development in the world will probably be carried out at Hopewell, the little village that lies closest to the tidal estuaries, the Petitcodiac and Memramcook, where nature has formed two great natural reservoirs, with the exception of the dams that must be built to complete them.

Old charters show that tidal power was used in England for grinding corn, as early as the 11th century, and tidal mills have been in operation f r the same purpose, from that time to the present day.

The following extracts are ta .en from an excellent article by W. C. Horsnaill, that appeared in "The Engineer," London:—

> "No records exist showing how the earliest tide wheels were arranged, but particulars are available of several mills which were erected in the eighteenth and nineteenth centuries. In the earlier historic mills no attempts were made to produce a fall, the power being obtained from the flow of the water into and out of the pound. To develop power in this way a wheel, similar to the paddlewheels of steamships, was used, but with a reversed action; that is to say, the flow of water drove the wheel. This arrangement entailed the raising and lowering of the wheel to suit the rise and fall of the tide, as only the bottom floats could be immersed if the best results were to be obtained.
>
> A corn mill at one time existed at East Greenwich which was driven by tidal power in the way we have described. The pound had an area of about 4 acres and the wheel measured 11 feet in diameter by 12 feet long. The power was transmitted by a bevel gear at either end of the water-wheel shaft, the pinions being free to slide up and down two square vertical spindles. The water-wheel and bevel gears were mounted upon a frame which was caused to rise and fall to suit the tides, and the power was transmitted by either bevel wheel according to which way the water-wheel was running, the other bevel pinion being thrown out of gear. By these means the machinery in the mill was always driven in one direc-

tion, in spite of the reversal of the water-wheel at each turn of the tide.

The movable frame, with the water-wheel and gear weighed some 20 tons and the bottom of it was extended to form a kind of shutter, which filled up the opening underneath the wheel race, all the water flowing into or out of the pound being thus compelled to pass through the wheel.

Another type of wheel was devised to overcome the drawback of having to move up and down with the tide. This wheel was fitted with hinged floats, which arranged themselves across the stream at the bottom of the periphery, while they travelled through the water edgeways during the remainder of each revolution. With floats of this type the wheel was fixed, and the tide gradually rose over it until in some cases complete immersion took place.

An arrangement of the sluices was also adopted to compel the water to pass through the wheel in the same direction, whether flowing in or out of the pound, thus doing away with the need for reversing gear between the water-wheel and the machinery to be driven.

These wheels must have been very inefficient, as the loss of power caused by the drag of the upper portion when covered was serious, and the design was soon discarded.

Following these earlier mills came the more recent examples, many of which are still in existence, while a few of them may be seen in operation. The older mills aimed at using the current of water caused by tidal action and advantage was taken of the flow in either direction. The more modern tide wheel is arranged to operate with considerable fall, and only develops power when the water is flowing out of the pound.

The undershot wheel with straight radial floats is usually adopted, and the mill is started at half ebb or a little later, work being continued for about five hours, or until the water rises under the wheel and chokes the tail race. These arrangements give only five hours of working during each tide."

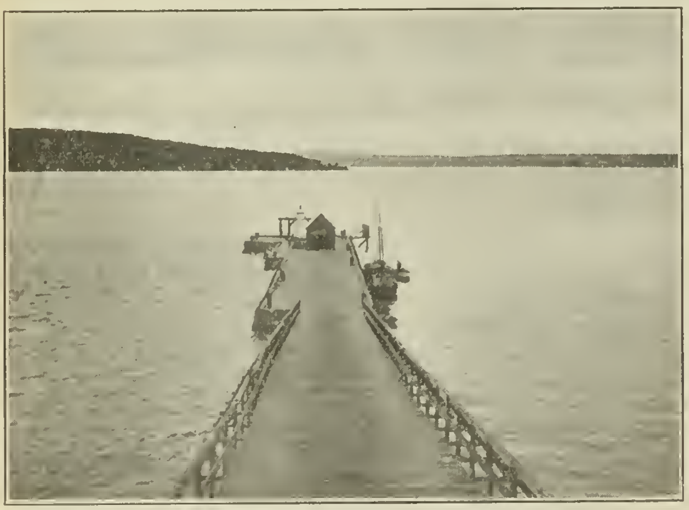


Fig. 1—New Wharf—Hopewell High Water

Fig. 1a—New Wharf—Hopewell Low Water

Listing the tidal mills that actually exist:—we have a mill at Woodbridge of 10 to 12 H.P., one at St. Osythe of 20 H.P., and one at Walton-on-the-Naze of 85 H.P.—these are all small powers, working on a low range of tide, and with only a single, small, natural reservoir—that allows of only a partial use of the tidal power for a comparatively short period of time, but Mr. Horsnaill shows that if modern turbines were installed at the plant at Walton-on-the-Naze and the power was used to develop electricity, instead of grinding corn, it would show up, as a commercial development, somewhat better than Gas Power in spite of a heavy outlay for storage batteries which would be necessary at a plant situated as Walton is.

The number of proposals for tidal plants is very considerable, and while I think I should not take up your time by discussing all of them it is worth while to examine a few of the more serious ones.

Mr. James Saunders discussed, in the Engineering Review of London, three great plants for developments in England, viz.: at Chichester Harbour, at the Menai Straits, and in the Bristol Channel. But in each case either the head of the water was too low, or the cost of forming the artificial reservoirs was too great to make the proposals commercial at the present time. His most promising scheme is that for the Bristol Channel, where the tidal head is quite sufficient for successful operation, but where the cost of forming the great artificial reservoirs, that would be here required, is prohibitive (in view of the power obtained)—the total cost of the plant figured out at $47,000,000 and the H.P. at 240,000 so the cost per H.P. would be $196.00.

C. A. Battiscombe, before the London Soc. of Engineers, also made a tidal proposal for the Bristol Channel, but his cost works out at $237.00 per H.P. and while neither of these figures would be too high for commercial developments *in some localities* they are too high to interest English Capital, for England is still a country of cheap coal, and in examining *any* hydro-electric development we must constantly keep in mind the cost of power from other sources.

Mr. Boving has proposed a tidal plant for the River Dee, but no estimates of costs are given; and coming nearer home, there have been numerous proposals for obtaining power from the tides at Sackville, at Cape Split, and at the Reversible Falls of Saint John.

Now to get *continuous* power at any of these sites, it would be necessary to form large artificial reservoirs, and the formation of such reservoirs is so costly that these proposals are not, at present, commercially feasible.

The three great desiderata for a Tidal Plant are: First; That there should be sufficient height of tide to obtain a good Head. Second; That there should be two natural reservoirs of large size so that continuous power can be obtained; and Third; That the Power plant should be central to the population that would be served.

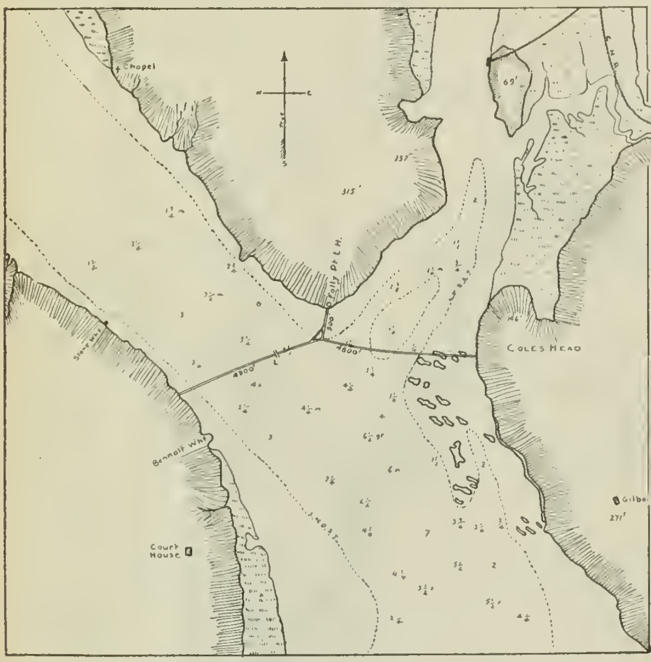
And it is these three desiderata that lead us to suppose that the *first* great tidal development in the World will take place at Hopewell. Here we have two large reservoirs almost completely formed by nature, we have a tide which is exceedingly regular and that ranks among the highest tides in the World, with a Spring Rise of 45 feet, a Neap Rise of 38 feet, and a Normal Neap Range of 32 feet, and we have this power centrally located to a present population of 250,000 who are *literally starving* for cheap electric power with no other hydro-electric developments in sight, except small ones and those that are too distant from the centres of population to make their development commercial at the present time.

Fig 2—Map showing the Watershed of the Petitcodiac and Memramcook Rivers

I have examined many other sites for tidal power, in those parts of the world, where the tides are sufficiently high to make tidal power at all possible, and I am firmly convinced that we have at Hopewell, the site that is most promising at the present time, from a commercial standpoint.

To give you some idea of the height of the tide at Hopewell, I will show some photographs that were taken this summer of the Government Wharf at Hopewell, at high water and at low water. This wharf, which is 55 feet high, is the only one to reach low water at ordinary and subnormal neap tides, it does not reach to low water at Spring Tides, and all other wharves in the neighbourhod are high water wharves, and are only reached when the tide has risen about half its height.

We will now discuss the principle which I have proposed for obtaining continuous power from these great tides, and I will draw your attention to this map of the two tidal estuaries, the Petitcodiac and the Memramcook rivers (Slide No. 2). This map shows the general trend of



Confluence of Petitcodiac & Memramcook Rivers

Fig. 3.

these rivers, and their confluence at Hopewell, and it also shows the freshwater drainage areas of the two rivers—which, although a minor item as compared to the great volume of salt water that flows up and down these rivers, should still be borne in mind in reviewing this proposal.

The dotted lines show the respective drainage areas approximately, and these have been calculated out to show a drainage basin for the Petitcodiac of 784 sq. miles and for the Memramcook of 134 sq. miles or in the ratio of nearly 6 to 1.

At present the flood tide makes up these rivers for approximately six hours and then turns and flows back into the Bay for 6½ hours, and this map also show the approximate limits of this flow, above which points the streams are fresh water.

The next slide (3) shows a scale chart of the confluence of these two rivers, at Hopewell, the proposed location of the dams that will be necessary to control the waters, the depths of water at low tide, etc.

The Western dam would be 4900 feet long, the Eastern dam 4800 feet long and a wing dam of 900 feet would connect the two, and it would, of course, be part of the plan to have a highway and trolley line (operated by the plant) over the tops of these dams connecting up the two main shores and the long peninsula that mades down between the two rivers.

This highway would only be a matter of local benefit but it would be of immense benefit to the building up of this locality. At present Hopewell can only be reached, from Coles Head by a little ferry that can only operate for a few hours near high tide, the Petitcodiac is only bridged at Moncton, 19 miles above Hopewell; the Memramcook was bridged at Upper Dorchester 5 miles above Hopewell, but this bridge is now gone, and the Government are at present making borings for a bridge to take its place that will cost about $1,000,000.

At present Hopewell, Hillsborough, and the big peninsula are hard places to get into, and still harder places to get out of, and yet they are regions of great mineral resources that only require, but still await development. The slide shows a lock in the Western dam, through which vessels could be passed at any suitable time of the tide, on their way up and down the Petitcodiac, and Hillborough and Moncton would be provided with deep water harbours instead of the mud flats which they at present enjoy at every low tide. The gates of the lock would naturally be swung by electric power furnished from the nearby power house.

The proposal provides for making the Petitcodiac a high level basin in which the water would always be high, and be replenished at every high tide, while the Memramcook River would be a low level basin to be partially filled from the high level basin and be always emptied during the latter part of the ebb tide. This arrangement would also admirably suit local conditions for the Memramcook is exclusively a farming district in which much time and money is at present expended in excluding the tides by means of dykes, and I have been informed by farmers of this valley that they would only wish to have the salt water flood their lands, about once in ten years for the purpose of fertilizing them. The navigation of this river is practically nil, so it would hardly be necessary to provide any lock in the Eastern dam—two or three times during a summer a small vessel will lie at the Dorchester Island wharf for the purpose of discharging goods but these could be as well discharged below the dam and the power company could well afford to pay for the short extra haulage.

I will now call your attention to the next slide (No. 4) which illustrates—in scheme but not to scale—the principle that I employ to get continuous power from the tides, with a varying head to be sure, but with the water always passing through the turbines in the same direction and always with a head sufficient to make turbine operation successful. The diagram shows the confluence of the two rivers, with the necessary dams and gates to control the flow—the gates J, J, etc., in the Western dam would be automatic flap-gates opening up-stream, allowing the high level basin (the Petitcodiac) to fill at every high tide and the gates H, H, etc., of the Eastern dam would be automatic flap-gates opening down-stream, and allowing the low level basin (the Memramcook) to empty on every ebb tide.

The gates G, G, etc., and G^1, G^1, etc., would be of the nature of lock-gates, they would be operated by electric motors, driven by the power-plant itself, and be under the control of the attendants who would open them and close them in accordance with the height of the external tide, at stated times that can be fixed for months in advance directly from the tide tables.

The Power House is represented as a long building, with turbines, T, T^1, etc., extending diagonally from the Wing dam to the Western dam, and these turbines discharge continuously from the high level basin into the common, triangular, spillway. Let us now follow through a cycle of operations from low tide to the following low tide, remembering that the high level basin was filled automatically at the last high tide, and that the low level basin has just been emptied during the ebb tide through the gates in the Eastern dam.

Beginning with low tide we may at first leave gates G, G, etc., open and allow the water from the spillway to discharge directly into the tidal supply (Shipody Bay), but the head will gradually decrease as the tide rises, and at about 2½ hours rise the attendants close gates G, G, etc., and open gates G^1, G^1, etc., allowing the discharge from the spillway to enter the low level basin—into this the spillway will continue to discharge for about 6½ hours, or through the last 3½ hours of flood tide and through the first 3 hours of ebb tide—after which time the water in the low level basin will have so risen, and the water of the tidal supply will have so dropped, that it will now be profitable to close gates G^1, G^1, etc., and open gates G, G, and once more allow the discharge to occur directly into the source of tidal supply and give the low level basin time to again drain out on the ebbing tide. I think you will at once grasp from this the simplicity of the system itself, but in order that we should study more fully one of the engineering problems involved, I will call your attention to the next slide (No. 5) the typical tidal cycle, at Hopewell; this curve shows a copy, in per cent of range plotted against time, of an actual tidal record, obtained at the ordinary neap tides by the tide gauge established this summer at Hopewell by the Canadian Tidal Survey, and furnished to me by the courtesy of Mr. H. W. Jones of that department. You will note how exceedingly regular the tide is, and how little affected by estuary flow, and this is one of the great advantages of Bay of Fundy tides, in general. At certain places in the World the diurnal inequality becomes so great that, for several days there is only one tide in 24 hours, and at Southampton there is a second high water occurring about two hours after the first.

In dealing with the question of tidal power at Hopewell, we must remember that although the tide is regular in type, nevertheless the *range* of the tide, and not the *rise* is the limiting factor of our power calculations, and it becomes necessary to establish and work on what might be called a "standard" range. For this purpose I have analyzed approximately, the ranges that will occur in the course of a year. I call spring tides those whose range exceeds 42 feet, they occur about 15 per cent of the time, and I think no attempt should be made to utilize them especially; I call subnormal neap tides those whose range is less than 32 feet, they also occur about 15% of the time, and some means, which are discussed later, would need to be employed to avoid the impairment of our "standard" amount of power.

All other tides I call ordinary neap tides, with a range, at Hopewell, of 32 feet to 42 feet—they occur about 70% of the time, and it is the lower range of 32 feet which I think we should adopt as our "standard" range and the curves and estimates that follow are based on this range of 32 feet.

We will now return to the discussion of the principles involved in the proposed plant, and I will ask you to examine the next slide (No. 6) which shows a tidal cycle, at a

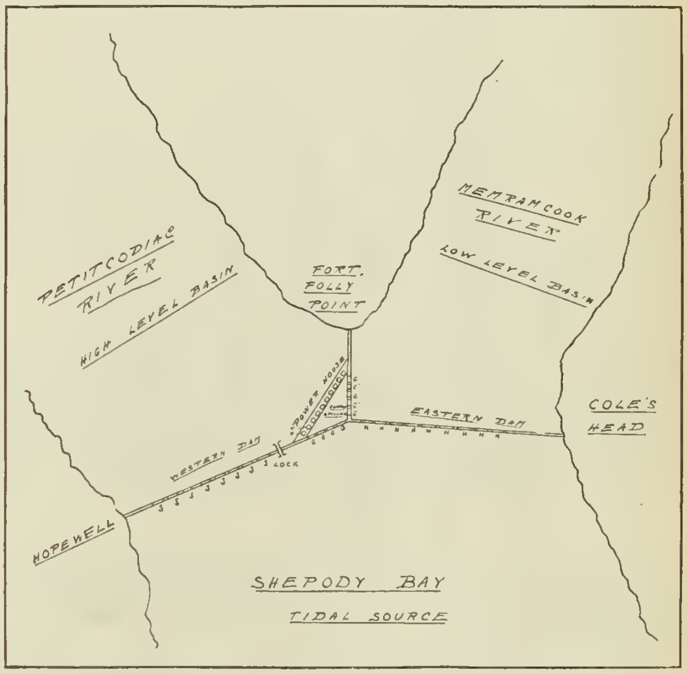


Fig. 4.—Illustration of principle for obtaining continuous power from the tides.

"standard" range of 32 feet, with an assumed drop in the high level basin of 6 inches per hour, and the level changes that will occur in the two basins with the operation of the plant as before described. If the conditions at Hopewell were absolutely ideal, the ratio of effective areas would be as 2 to 1, for the high and low level reservoirs, but unfortunately this is not the case for the Petitcodiac contains an effective area of about 330,000,000 sq. feet, while the Memramcook has only about 60,000,000 sq. feet, so that the ratio is about 5½ to 1—thus, while the water in the Petitcodiac is dropping 6 inches per hour the water in the Memramcook is rising 5½ times this, or 33 inches per hour, and these level changes are illustrated in the diagram on the screen—while the changes in effective head on the turbines is plotted immediately below.

Full lines, above, show the level changes of the high level basin, dotted lines, below, those of the L. L. basin. Starting at low water you will note, that for 2.35 hours, the level of water in the low level basin is unchanged, for the water from the spillway, is discharging into the tidal supply direct, but during this time the head is decreasing from

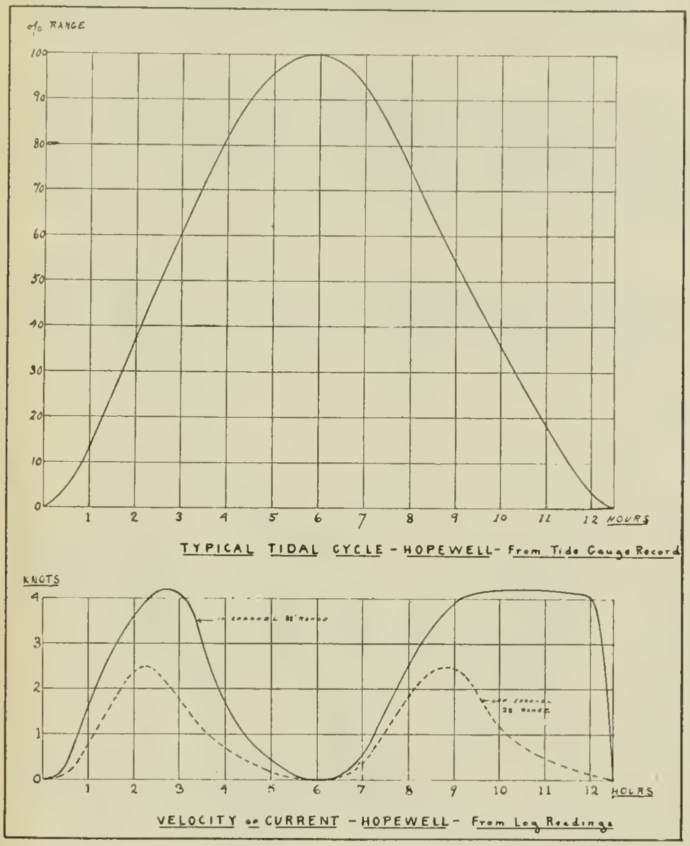

Fig. 5.

28½ feet to 13½ feet when it becomes expedient to discharge into the low level basin, when the head will at once rise to 27½ feet.

After this, for 6½ hours, the L.L. basin will rise, but the high level basin will also rise, after 4.1 hours (as the flood tide will then be filling it for 1.9 hours) and we have the head decreasing from 27½ feet to 22 feet, but afterwards increasing to 23½ at 5.2 hours.

After this the head will gradually decrease to 13½ feet, at 9 hours, when the tide in the external bay having sufficiently ebbed, the water from the spillway will be again discharged into it and the head will steadily rise to its previous maximum of 28½ feet at low tide, as shown by the curve of heads.

The average head, in this case, from low tide to low tide works out at 22¼ feet.

It will now perhaps be asked why I select a drop of 6″ per hour for the high level basin, and what the difference would be if we selected a greater or lesser drop.

It will be noted that up to a certain maximum (not shown on the curve, but which would occur at about 250,000 H.P. and at a 26 inch per hour drop) the available horse power increases with an increase in the hourly drop allowed, however, it must be borne in mind that as the hourly drop increases, the maximum head decreases, and the minimum head decreases more rapidly still, and we soon reach a case that cannot well be met by any ordinary turbines.

To illustrate this, a 4 inch drop in the high level basin gives maximum head of 30¼ feet, minimum of 20 feet, and average of 26½ feet, but 6 inch drop gives 28½ maximum, 13½ minimum and average of 22¼, and this seems to be about the maximum relative range over which we can expect a single turbine to act; we could employ duplex turbines, mounted vertically on the same shaft to the same generator, but with separate draft tubes (as suggested by James Saunders) but this means considerable added cost and is to be avoided if possible.

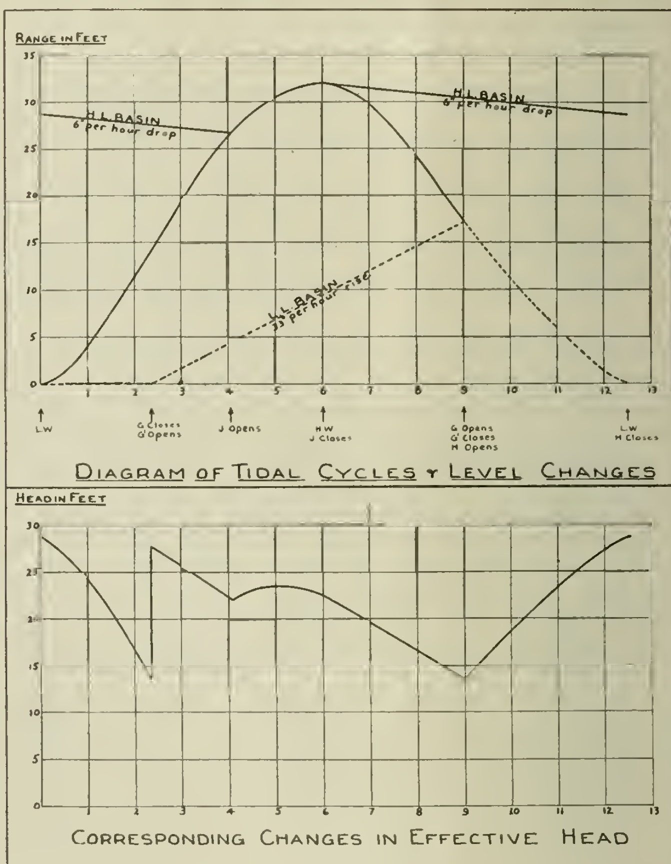

Fig. 6.

We are thus forced to adopt one of those comprises, that are often met with in engineering design, and must adopt a drop in our high level basin that will entail such a range of head that can be successfully met by the turbine designer. I am at present in correspondence with many of the leading turbine manufacturers and have no doubt they can largely overcome this difficulty of the variable head, in a moderate priced turbine, but the whole question of this variable head problem is so novel to them that the correspondence is necessarily lengthy to get them to understand the conditions involved in a tidal plant. However, one maker shows a turbine that gives 5000 H.P. at 120 ft. head and efficiency of 86% and also the same horse power at 220 ft. head and 80% efficiency, all at a constant speed of 300 r.p.m., so I think we can have no doubt that once the conditions involved at Hopewell are understood by the manufacturer and designer, we can obtain turbines that will meet the assumed condition of a 6 inch hourly drop in our high level basin and with a probable average turbine efficiency of about 83%.

and an electric tramway (both operated by surplus power from the initial installation) expropriate, by Government charter, the low-lying farms of the Memramcook valley at a fair and equitable rate, and shovel out the basin according to power requirements, removing the material by the electric railway and dumping it below the Eastern dam where it would be largely carried away by the tide, or could be formed into a useful embankment—wharf, railway terminal, or the like.

The next slide (No. 7) shows the approximate profile of the Western and Eastern dams—since it would not be policy to attempt to get the extra power that spring tides would give, the western dam need only have the height of high water, ordinary neap tides, but the height of the

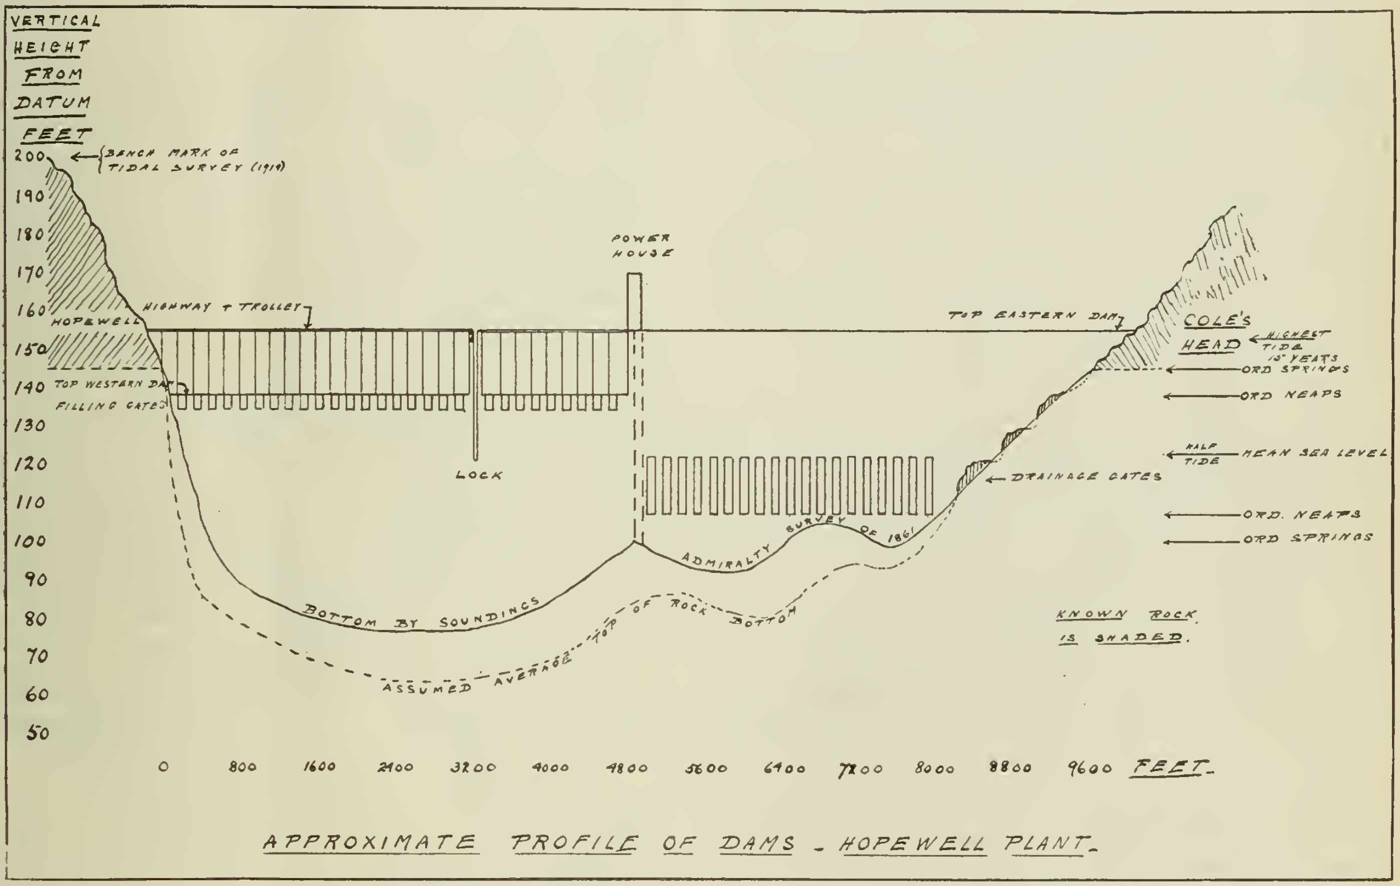

Fig. 7

As a matter of fact the initial installation called for at the present time by the existing population, would be about 90,000 gross horse power, and we note from the last slide that this corresponds to an hourly drop of 4 inches in the high level basin. Now while the population grew and the demand for electricity increased from 90,000 to 120,000 H.P. we could steadily be improving the ratio of the two basins, and thus greatly improve our power output (up to say 200,000 H.P.) and yet never exceed the limit of 6 inch hourly drop, which I have assumed as the present practical limit of single-turbine operation.

To improve this basin-ratio, to the ideal condition in which the Memramcook would have half the effective area of the Petitcodiac, I propose to use electric shovels

Eastern dam would have to be carried up beyond the highest probable spring tides to insure that the low level basin was never flooded at high tide. The slide shows this dam carried 3 feet higher than the highest spring tide that occurred during a period of 15 years. As before mentioned the tops of the dams could be utilized as highways and would thus be of invaluable local benefit, and a light steel structure is indicated on the Western dam for this purpose. The masonry width called for by the calculations would not be sufficient for a roadway, but a light steel structure could be winged out on top of the dams and made of sufficient width to carry a good roadway, an electric tram, and the power transmission lines that would go both west to St. John, and east to Halifax.

The flap-gates for filling the high level basin and emptying the low level basin are indicated in the sketch-profile. They should present no engineering difficulties but they should be designed of sufficient size to readily pass the full volume of water required by the final and maximum development.

We now come to the question of the river bottom and the location of rock for a good dam foundation, and here I must apologize for I cannot give you any exact data; I took the matter of borings up, with the Provincial Government very urgently last winter, but I was met at first with promises, and later with apathy, and I regret I could not undertake the expense of the matter personally. This summer I went twice to Hopewell, but could only obtain indirect evidence as to the depth of the rock under the muddy beds of the two rivers. The full line of the profile shows the depth of the top of the mud, according to the admiralty chart, and there is strong presumptive evidence that the top of the rock does not lie more than 15 to 20 feet below this. Where the "New Wharf" was built at Hopewell the mud soon washed out for a depth of 12 feet, when hard bottom was reached, and the outcropping of ledge rock at the mouth of the Memramcook, as shown on the chart and profiles indicates the rock bottom for a quarter of a mile, is very near the surface. The shores at Hopewell, Fort Folly Point and Coles Head are all rocky and the nature of all rock in this locality is the same, viz.:—shaley sandstone to pure sandstone sufficiently sound for making grindstones.

As to the best type of dam to build at Hopewell I feel that I should offer no opinion, for the question of dam design is an engineering specialty and only an expert in this particular branch of engineering could decide the best type to adopt and he only after a systematic line of borings were obtained along the proposed site. It has been suggested to me that a dam composed of hollow sections of concrete is a satisfactory and cheap type to build, the sections being built in a dry dock, floated into position and then sunk by filling the interior with rock and gravel. However, I doubt if this is a well proven system and, as I say, the question of best type should be decided by an expert of long experience. Such estimates of cost that I have been able to make have been based on the cyclopean concrete type of dam. In considering the best type to build at Hopewell the question of the tidal currents would have to be considered, and while these currents are not very swift, when the great height of the tide is considered, nevertheless they should receive attention. I will ask for slide No. 5 to be put on the screen again and you will there see some currrent measurements that I made this summer by using a ship's log attached to an anchored boat. When the tidal range was 38 feet the channel current reached a maximum of 4.2 knots and you will note that although the flood current soon dies out the ebb persists at near its maximum, until almost the time for the next flood tide to begin. Out of the channel the current runs swiftly for much shorter periods, and the tidal current makes shoreward as the shores are approached until we often have currents at right angles to the main stream. The dotted curve shows some measurements taken rather off the channel, with a tidal range of 28 feet, and the maximum under these conditions was 2.6 knots.

Before leaving the engineering problems that are presented by this novel plant I will mention three other items that should be considered.

The question of subnormal neap tides requires especial attention, for while my calculations are based on the least range, viz.: 32 feet, of ordinary neap tides, nevertheless there are certain tides which occur sometimes three days a month, sometimes five days a month, and sometimes not at all in a month, which have a lower range than 32 feet, and may sometimes have a range as low as 24 to 25 feet.

Now if our plant were built and running at full capacity, with a range of 32 feet, there would be an impairment of the regular capacity whenever these subnormal neaps occurred (which is about 15% of the time), and, I think some provision should be made to deal with them adequately. One method might be to keep the turbines and generators well ahead of the normal demand and use these extra ones only during the subnormal neaps; another method would be to keep the Memramcook shovelled out (as already described) well ahead of the future requirements, and thus improve the average head, and yet another method would be to build a fresh-water dam (say just below Turtle Creek about 5 miles west of Moncton) in which freshwater would be impounded and released only to make up the deficiency in head at subnormal neaps. Still another method would be to employ auxiliary steam power to assist the water-power during the water deficiency. One of the last two devices is nearly always resorted to in the case of ordinary hydro-electric plants situated on fresh water rivers. In nearly all districts the amount of rainfall varies enormously during the different months of the year and the amount of run-off and discharge varies in a direct relation to the rainfall. As an example of this, the discharge at Grand Falls on the St. John River reached a maximum in May, 1909, 50 times greater than the maximum of October 1909, and the mean discharge for the whole month of May was 20 times greater than the mean for October. In freshwater rivers a certain power may run into thousands of horse power in the spring, but be reduced to hundreds in the Fall of the year, unless adequate means are resorted to, to increase the deficiency of head.

In this matter a tidal power scores heavily over a fresh-water power. In the case of the freshwater power neither the time nor quantity of a head deficiency can be predicted, but with a tidal power both the amount and the deficiency are predicted by the tide tables several years in advance and it would thus be much easier to provide for our head deficiency which only, after all, amounts to 25% in quantity and occurs only 15% of the total time.

The best means of making up the deficit, in the case of the Hopewell Tidal plant would be best figured out in the final estimates as that one which would maintain the normal output at a minimum of cost.

The other two engineering items I wish to discuss are sediment and ice.

At the present time the never ceasing current flow up and down the two rivers keeps the river mud stirred up and the waters of both rivers show a considerable amount of sediment, and one would at first jump to the conclusion that this muddy grit (fine though it is) would produce much unusual wear on the turbines. However, what will happen as soon as the mouth of the Petitcodiac is closed by a dam? The mud in the water above the dam will undoubtedly settle, for it will have time to do so, and the water of the Petitcodiac will become clear. At present the water is never still, but with a dam the rise and fall would be reduced to a few feet and the current would be sluggish.

In a similar way the building of the dam would entirely alter the ice conditions, once the dam was built the whole river would freeze over in severe weather, and the sheet of ice would rise and fall with the water just as it does in the St. John and similar rivers. Nevertheless while the building of the dam was in progress, the question of large masses of ice moving with the current should be given every attention and quite likely some special method of cushioning the blows from ice might have to be devised.

We will not turn to a consideration of the method of distributing the power available at Hopewell, and I will ask you to examine the next slide (No. 8) and note how centrally Hopewell is placed with reference to the centres of population of both New Brunswick and Nova Scotia.

The method of transmission carries with it no special problems as we would undoubtedly use step-up transformers at the power house, transmit at about 30,000 volts with 3-phase current, and use step-down transformers at the delivery points. All this system has been so thoroughly thrashed out, and is in daily use all over Canada and under Canadian winter conditions, that it has become practically "standard" and needs no special consideration here. The principle feature that should be considered in laying out the transmission lines would be one of expediency and proper return on the capital outlay of transmission lines and line losses. Undoubtedly a main line should go west to St. John, with power for all intervening towns and villages of any size, and undoubtedly a main line should go east and south to Halifax with power for Sackville, Springhill, Amherst, Truro, etc., and also undoubtedly branch lines should go to Moncton, New Glasgow and Stellarton (as the present population would warrant this). The extension of branch lines to St. Stephen, Fredericton, Newcastle and Chatham is some-

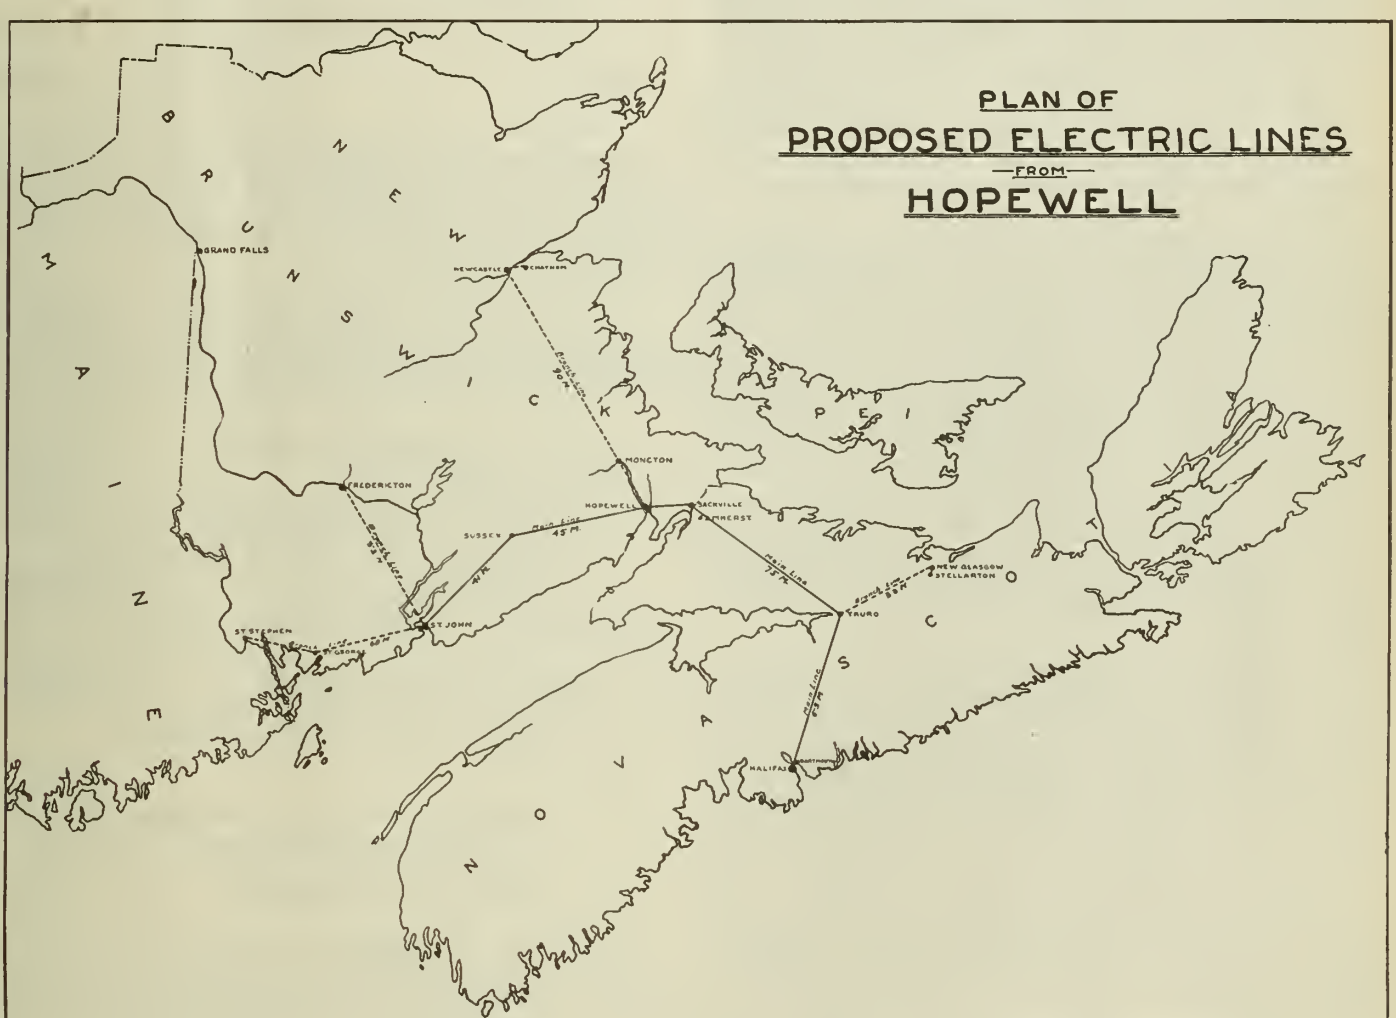

Fig 8

what doubtful at present, but there are railways that well might be economically electrified towards all these points, and I have, therefore included them in the preliminary estimate. I have prepared a table of the population that would be served by these lines, and the total works out at 250,000 inhabitants, with this as a basis we should now estimate the probable per capita use and thus obtain an estimate of the proper size of plant for the initial development at Hopewell.

When I prepared my first report on this subject it was submitted to the well-known firm of Sanderson and Porter of New York (a firm who specialize in the control and management of some sixty hydro-electric developments), and their condensed criticism was as follows:—

> "We think your proposal from an engineering standpoint is sound and it is the only scheme for utilizing tidal power that seems practical, but we are rather in doubt as to whether the population served is sufficiently large to warrant the capital expenditure."

Now this was in 1914, and I presume Sanderson and Porter based their opinion on the per capita use of hydro-electric power in the United States, which works out at 0.10 H.P. per inhabitant according to the text books. On this early report, and on their opinion, I based the letters to the newspapers that were published in St. John and Halifax and in these letters I appealed for Governmental help since it seemed at that time that while my proposal was *almost* a commercial one it was not conclusively so.

Since last January, however, newer data has come to my hand, and if this data is accurate, as I presume it is, the complexion of affairs has changed and the Hopewell plant is a really *good commercial proposition* at the present time, and needs only the Governmental help accorded by a good charter.

The data that I speak of was published in "Saturday Night" about February of this year and is contained in a very interesting table which shows the per capita use of hydro-electric power for every province of Canada and for the Dominion as a whole. It shows that British Columbia uses 0.36 H.P. per capita, Ontario 0.288, Quebec 0.267, and the whole of Canada 0.206 and these figures are for *the total population* and they should be increased at least 30% for the per capita use of *population served.* It will thus be seen that Ontario, per capita served is using about 0.37 and Quebec about 0.35 and I think we may properly assume that 0.36 would be used by the inhabitant of the Maritime Provinces as soon as you could give him really cheap electricity.

On this basis, then, the population of 250,000 would require 90,000 gross horse power, or say 45,000 H.P. at the delivery points, and I think the initial development at Hopewell should be for 90,000 Horse Power, with every provision made for increasing the output as already outlined in this paper up to 200,000 gross horse power as the population and demand increased as they undoubtedly would when cheap power was available.

We now turn to the question of costs and I have made an estimate of this as follows, and in accordance with the text books on the subject:—

Dam Cost in Cyclopean Concrete

Western Dam:	
730 lineal feet @ equivalent height of 38 ft. and $137 per lineal foot.....	$ 97,000
4,100 lineal feet @ equivalent height of 65 ft. and $300 per lineal foot.....	1,230,000
Eastern Dam:	
2,800 lineal feet @ equivalent height of 65 feet and $300 per lineal foot...	840,000
2,000 lineal feet @ equivalent height of 35 ft. and $120 per lineal foot....	240,000
Wing Dam:	
900 lineal feet @ equivalent height of 30 ft. and $94 per lineal foot.....	84,600
Total 10,530 Total Cost	$2,491,600

Now one well-known engineer, who examined my first report, considered this too low a figure and thought $4,000,000 should be allowed for dams, and since we will remain uncertain about the dam cost until borings are made it will be best to allow this higher figure in our preliminary estimates.

The other items of cost can be more accurately estimated from the known cost of equipment in existing hydro-electric developments and we have the following table of total estimated cost, see Figure No. 10:—

Dams, as per preceeding estimate...	$ 4,000,000
Lock, in Western Dam...............	100,000
Sluices, gates, etc....................	300,000
Power House of steel and concrete.....	200,000
Turbines, Generators, etc., @ $40. per gross H.P......................	3,600,000
Transmission Lines, etc..............	1,200,000
Preliminary Dredging, Dam, Trench, etc............................	100,000
Promotion, Engineering Fees, etc......	500,000
Auxiliary Plant to supply Head deficiency at Subnormal Neap Tides, say............................	1,000,000
Total cost of initial development to produce 90,000 gross H.P...	$11,000,000
Or cost per H.P. developed......	$122.50

The cost for subsequent development is much less, relatively, for in the initial development full allowance has had to be made for the final development in all items except turbines, generators and transmission lines, and the cost of a full development of 200,000 gross H.P. would work out at about $16,000,000, or $80 per gross H.P. In this estimate for final development, the cost of shovelling and dredging the Memramcook farming lands (which would be necessary as previously shown) is not figured, for it would be undoubtedly good policy to start this work as soon as the power house was in operation and take the necessary cost out of the annual income.

In considering the charge that could properly be made to the consumer, initially, we must consider the cost of steam power in the provinces, and I have it on good authority that the *actual cost* to the largest producers of electricity, by steam, was $60. per H.P. year before the war and would be about $90. per H.P. year at the present time.

Suppose now we were to charge half this rate, in the average, and place our charge at $45. per H.P. year—this would be the *average* charge, and the charge in special cases would work out about as follows:—

	Charge per K.W.H.
(1) To power users in excess of 1000 K.W. hrs. per month and 24 hour service	¾¢.
(2) To power users, in excess of 1000 K.W.H. per month and ten hour service	1.5¢.
(3) To small power users and 10 hour a day service	2.25¢.
(4) To power users, irregular service	3.0¢.
(5) To small lighting service	4.0¢.

These rates are from one-quarter to one-tenth the rates now charged in the provinces, they would attract population and develop industries, and they could be gradually reduced, as the demand for greater output increased the size of the plant, to about 60% of these rates.

On this basis then, our annual income should be $2,025,000 initially, and this would probably be apportioned about as follows:—

Depreciation and operating expenses @ 6% on cost	$ 660,000
Royalty on patent rights @ 50 cents per gross H.P. produced	45,000
Enlarging Memramcook Valley by shovelling and dredging, the power being supplied by the plant itself, say	200,000
Incidentals	20,000
Interest on Capital Expenditure @ 10% of cost	1,100,000
	$2,025,000

I trust I have now fairly presented the case for a great tidal plant at Hopewell. I believe that it is to-day a good commercial proposition for the Capitalist and it certainly would be an inestimable boon for the people of these provinces. To quote from the Commission of Conservations book on the "Water-Powers of Canada" (1911), it says, in speaking of New Brunswick:—

"The larger rivers for the most part are long and their fall is gradual,"

and again:

"There are comparatively few lakes in the upper portions of the watersheds of the majority of the rivers and, hence, little facility is afforded for the natural storage of waters for the purpose of equalizing the flow during the low water periods."

This is true of New Brunswick and it is also true of Nova Scotia, the upper provinces are steadily forging ahead of us, both industrially and in population and this advance can be ascribed largely to their abundant water-powers, and it behooves us of the lower provinces not to mourn our loss of power but to make full use of that great power that Nature has really placed at our door, viz.:—the Bay of Fundy tides.

Were we able to harness the power that is daily wasted in the two great eastern arms of this Bay, we could have the use of 3,500,000 horse power, but this is a dream for the future and is not a practical proposition for to-day. The theory of the thing is the same as for the Hopewell plant, but the execution and cost would be impossible at present.

The Hopewell plant is to-day a good commercial proposition. special engineering problems are attached to it, but they are only those that attach to any special plant, the difficulties are small in comparison to many recent engineering works that have been successfully carried out, and I trust that the near future will see this great plant in daily operation.

Discussion

In proposing a vote of thanks to Mr. Turnbull for having so kindly, although not a member, prepared such a well-thought-out paper for this professional meeting, C. H. Wright, M.E.I.C., pointed out that what the Maritime Provinces most needed at the present moment was a development of the smaller water powers, of which we had learned in a previous paper there was a very considerable horse power available. This was true of Nova Scotia as well as of New Brunswick, so that by developing these powers without delay cheaper power could be had for lighting and particularly for industrial purposes. He considered Mr. Turnbull's idea an excellent one, and expressed the hope that we should all see it carried out. He thought, however, that the amount of power proposed by the author of the paper was more than the country could absorb for many years. A. R. Crookshank, M.E.I.C., seconded the proposal of the vote of thanks.

Lieutenant-Colonel Leonard outlined the power situation in Ontario, particularly in the Niagara Peninsula, where at the time of the early electric installations twelve miles was too far to carry electric current. After the first large electric installation on the American side it was a matter of five years before any of this energy was used by Buffalo manufacturers. The whole project was considered visionary, and not based on good business. At the time the power at DeCew Falls, near St. Catherines, was developed the promoters did so against the best engineering advice they could procure. Since then 45,000 h.p. had been developed at that point. During the past fifteen years hundreds of thousands of horse power of hydro-electric energy had been developed in Ontario, yet during the war there was an actual power famine. The establishment of manufacturing industries followed as a rule where cheap power was available. He considered that according to the author's figures the cost of developing this project as a source of available power was not prohibitive. The paper was a most valuable one and the scheme not only interesting but possessed great possibilities. He expressed his pleasure in presenting the thanks of the meeting to the author.

Replying to the points raised in the discussion; Mr. Turnbull states in answer to C. H. Wright of Halifax—Regarding the cost of transmission lines at $15,000 per mile, Mr. Wright seems to ignore the fact that I have included in my estimates $1,200,000 for the cost (as per the table of costs already given) of transmission lines and my estimate is based on a cost of $4000 per mile for main lines and a cost of $2000 per mile for branch lines, and these costs should be adequate *in a timber country, with wooden poles.*

Mr. Wright's figure of $15,000 per mile must refer to an expensive type of steel skeleton pole, and it is certainly the highest figure I have ever heard quoted. $3000 per mile for transmission lines, with wooden poles, is the average figure given in text-books of the subject. Mr. Wright quotes a present figure of 4¢. per K.W.H. in Halifax. I can only say we are not so fortunate in St. John where we pay 15¢. per K.W.H. (small users) and 7½¢. per K.W.H. (to largest users) less 10% discount if account is paid in 10 days.

Mr. Wright thinks we should develop the small powers first and with this idea I am absolutely at variance the whole trouble with these Maritime Provinces is that they are unprogressive—they are content to do the *small* things and they remain *small.* In Upper Canada they are not afraid to do things in a *big* way and they grow *big* in consequence. It is a well-known fact that whenever a *big* hydro-electric development has been carried out, the population and industries have gone to it, and there is no reason to think that the Maritime Provinces would prove an exception to this rule.

Replying to Lt.-Col. R. W. Leonard's remarks on an initial charge of $45. per H.P. year, Mr. Turnbull says: I probably did not make it sufficiently clear that the $45 charge was the *average* charge to all users—to large users it would be considerably less than this, down to ¾¢. per K.W.H. for largest users, and to small users it would be more, up to 4¢. per K.W.H. for the smallest users—I did not also make it sufficiently clear, that these would probably have to be the *initial* charge and that, as time went on and the output increased to the full available horse-power, it would be quite possible to reduce the average charge per horse power year to $27 without decreasing the rate of 10% per annum on invested capital.

This matter is figured, as before, in the following table:—

For gross output of 200,000 HP. delivered H.P., 100,000—

Cost of full development		$16,000,000
Annual income from 100,000 H.P. at $27 per H.P. year		2,700,000
Apportioned as follows:		
Depreciation and operating expenses at 6% on cost..	$ 960.000	
Royalty on patent rights at 50¢. per gross H.P. produced	100,000	
Enlarging Memramcook Valley, nil, since work would by this time be completed.		
Incidentals	40,000	
Interest of Capital Expenditure @ 10% on cost	1,600,000	
Total per annum	$2,700,000	

As Lt.-Col. Leonard has pointed out, $45 per H.P. year is not a high figure, and certainly $27 per H.P. year is a figure that can be compared with the rates charged by the most favoured hydro-electric developments in existence.

The afternoon session was brought to a close by the reading of a paper and the following discussion on the Construction of the Bear River Bridge, by A. T. Macdonald, A.M.E.I.C.

The Construction of the Bear River Bridge

Prior to 1912, the Bear River was crossed by the Dominion Atlantic Railway by a bridge consisting of about 750 feet of wooden trestle on pile bents and 5-Howe Truss Spans 150 feet long on concrete piers with pile foundation; the piles being cut off about two feet above the original bed of the river.

This bridge was used for upwards of twenty-five years but the piers were disintegrating rapidly between low and high water marks from the action of the river ice and were also gradually moving down stream.

Condition of Old Bridge

This bridge was what one might call ripe and certain timid souls were known to leave the train at Deep Brook and drive by road to Bear River Station or Digby, continuing their journey the next day, in order to avoid crossing the bridge. These people, no doubt, exaggerated the state of affairs but their nerves were not equal to the strain of travelling over 1600 feet of bridge at the rate of two miles an hour. Our first work therefore was to make the old bridge safe for traffic until it could be replaced by the new one. This in itself was a very costly proceeding. A double row of piles were driven just clear of the footings of each pier and framed bents of 12 x 12 spruce erected on these and braced to form a tower. The bottom chord of the truss was given a bearing on this tower about ten feet away from the end of the truss which was reinforced to suit this new bearing. In this way the old piers which were increasing their down strain movement were largely relieved of their loads. The pier supporting the swing span slid down stream to such an extent, 10½", if I remember rightly, that it became impossible to operate it. This necessitated another opening to permit vessels to pass. Towers on pile bents were therefore erected to support a 40′ plate girder, about 200 feet east of the existing swing span and when everything was in readiness an opening was cut in the bridge and the girders dropped into position, With the aid of the Dominion Bridge Company's derrick car this was accomplished without any hold up to train traffic. This span was operated as a lift span whenever the occasion arose, the derrick car furnishing the power. The clearance for vessels, going through this opening, was just about the minimum and called for expert seamanship on the part of the skippers.

Construction on a new bridge fifty feet down stream and parallel to the old one was begun in June, 1912, and completed in June 1914. The design, starting from the west end, called for 1—50′ D.P.G., 1—100 foot D.P.G., 1—156 foot D.T.G., 1—144 foot D.T. Swing Span, 3—156 foot D.T.G., 6—100 foot D.P.G. and 1—85 foot D.P.G.; the total weight of two and a half million pounds of steel. These spans are carried on concrete piers on pile foundations with the exception of piers 3, 4 and 5, which rest on a bed of coarse gravel and boulders.

Proximity of the Old Bridge

The proximity of the old bridge to the proposed work provided another reason for the expenditure of money to strengthen its foundations. With a distance of only fifty feet between centre lines the noses of corresponding piers on the two bridges lay side by side and as dredging proceeded for the new pier, in some cases being carried below the points of the piles in the old, the tendency was for the old pier to slide bodily into the excavation. This excavation therefore had to be carried on with the greatest care and divers were freely employed to keep the old foundations under close observation. Of course the old bridge in many ways helped in the construction, the contractors being able to utilize it for the running of water lines and trolley lines for conveying material etc., and the engineering party for laying out the work and as a ready means of communication from shore to shore. But it was not an unmixed blessing as the cofferdams during the process of sinking were on several occasions hung up by masses of old timber and odd piles which had been driven in connection with the original work.

Layout

From pier 8 to the west abuttment the bridge is on a 6 degree 10 minute curve to the left with a central angle of 59 degrees 20 minutes. A base line was carefully run over the centre line of the old bridge and permanent hubs set on each bank well clear of the work from which the bridge tangent was located by off-setting fifty feet and marked by permanent hubs, which were used for giving the centre line of all piers on tangent. The transverse centre line of these piers were given from points on the deck of the old bridge. Owing to the movement of the deck, as mentioned above, these points had to be located anew for each day that it was necessary to use them. In order to eliminate as much as possible any chance of error in locating the piers on the curve, it was desided to determine the exact geometric centre of the curve and erect there a sight, which would be visible at all stages of the tide. The transverse centres of the piers being on radial lines could then be located from hubs on the semi-tangent, using the centre of the curve as a foresight.

Fig. 1.—Completed Bridge Across Bear River.

Accordingly the P. I of the curve was found and as it came on the beach at high water mark, a concrete pedestal 18″ by 18″ and two feet high was put in on pieces of 4″ by 4″, 8 feet long as piles and on this the P. I (hub A) was definitely set after repeated checking.

To establish the centre of the curve was more difficult as the water only left it for about two hours each day. With the transit on A and backsighting on T on the west end of the bridge tangent, an angle of 60 degrees and 20 minutes was laid off and the point of intersection found with a line at right angles to the tangent of the curve at the the E. C. Around this point a rock filled crib 6 ft. square and 4 ft. high was built and a 2 in. pipe 24 ft. long was securely guyed there. (Hub O.)

As a check the calculated distance from "P" to "O" was measured on the ground with a 100 ft. steel tape over stakes driven to the same elevation and 100 ft. apart. The distances along the semi-tangent from P where the radial lines for each pier intersected, were then calculated and hubs set.

The distances along the radial line from the hubs to the curve were also calculated and recorded for use when required. A hub was put in at M the mid point of the curve, from which the angles to the centre of each pier could be turned as a check on the above method. All measurements were made with a 100″ steel tape and corrections made for temperature.

Foundations

The west abuttment and piers 1 and 2 were built on solid rock and the concrete poured in the dry; no pumping being necessary. The foundation of the east abuttment is on sand and gravel; the excavation for this was taken down six feet below original ground and piles driven to refusal at a penetration averaging 18 feet..

Piers 12 to 14 were on typical Bay of Fundy mud and dry at low water. Cofferdam at 10 by 10 hemlock were built in place and sunk as the excavation progressed, being loaded with old rails, to a depth of 18 ft. and piling driven.

The penetration averaged 25 ft. The penetration under the last blow was from ½ inch to ¾ inch—a 2400 pound hammer being used with a fall of 25-ft. These cofferdams were pumped out and the piling cut off 2 ft. above the bottom and the concrete poured in the dry.

The foundations of piers 9 to 11, inclusive, were built in the same manner but the penetration and number of the piles used increased as they approached mid stream.

In pier 8—the cofferdam was 21-7 ft. deep and the average penetration of the piles fifty-eight feet. The piles about 90 in number were cut off under water and the concrete deposited with a bottom dumping bucket; the bottom of this pier covers an area of 749 sq. ft. and there are 451 cubic yards of concrete in the footing course. In all the piers the footing course is carried about four feet above low water. Between low water and extreme high water the concrete is sheathed with 4 by 6 Southern Pine with ½ inch iron plates 2 ft. wide on the angles attached by 7-9 galvanized iron bolts 15½ inches long. All concrete below high water mark is 1: 2: 4, mixture and above 1: 3: 6:

The remaining piers 3 to 7, inclusive, were a somewhat different proposition. At extreme low water the depth of water varied from 20 to 27 ft. and with a rise of tide of 28 ft. this meant a depth of 55 ft. at high water for pier 3; borings showed for piers 3 and 4 and 5 a belt of fine sand about 8 ft. thick followed by 8-ft. of mud and then 5 ft. of gravel.

At pier 6—12 ft. of mud, 5-ft. of sand and 60 ft. of mud.

The borings were taken after the work of construction had begun and were very hurried and the information obtained not very dependable. They were taken from a platform or in some cases from a scow moored over the side of the pier. A 3 inch casing pipe was a one inch water pipe attached to a force pump working inside of it, to which the bit was attached, was driven down and the washings examined. A diamond drill was used to penetrate the gravel. At pier 7 a penetration of about 90 ft.

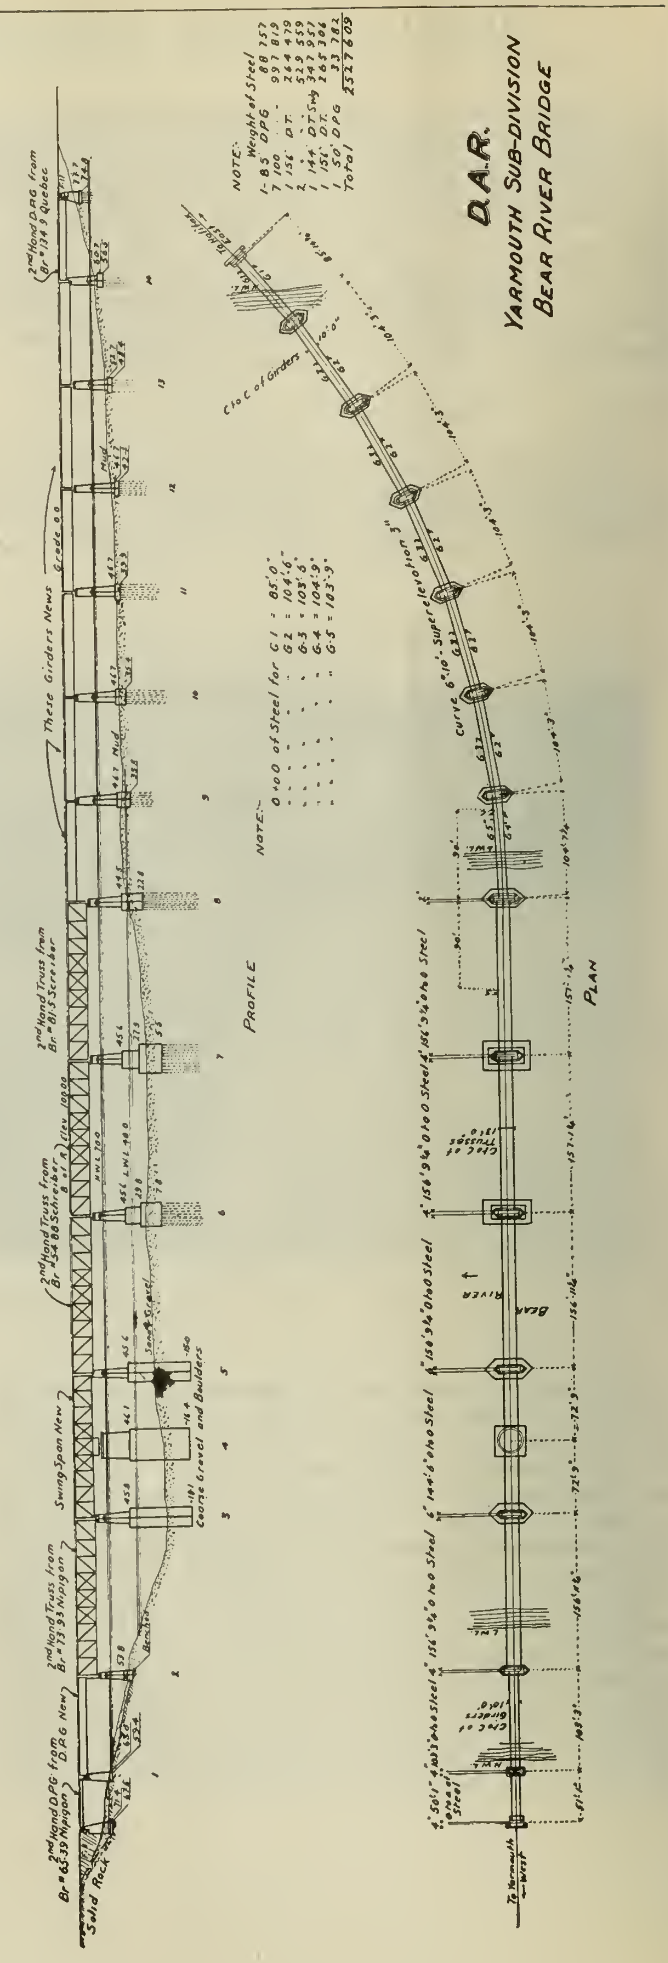

Fig. 2—Bear River, Looking East, Nov. 20th, 1912.

was obtained at which depth solid rock was reported. The platform from which the borings were taken had to be above high water mark that the work might go on continuously, so after penetrating the overlying mud there would be about 70 ft. of casing pipe when the gravel was reached.

Fig. 3.—Bear River, Jan. 1914.

When the inner pipe was raised and allowed to drop on this compact mass of gravel it bounced up again giving the impression that solid rock had been encountered. This idea was strengthened when the drilling made no further progress until the diamond was put on. I may say here that no solid rock was encountered at any of these piers when the work was completed.

It was finally decided to sink foundations for 3, 4, and 5 down to the gravel or about 20 ft. of excavation, by open dredging. Pier 3 was started first; a double wall cofferdam was constructed with a space of 4 ft. between the walls; the inner wall stopped about 12-ft. short of the outer and they were connected by a solid floor of 10 by 10 hemlock forming a cutting edge. Projecting below this was about 16 inch of ½ inch steel plate. The cofferdam about 30-ft. high was floated into position; the space between the walls filled with concrete and old rails piled on; dredging was then begun with an orange peel bucket through a well in the centre of the dam. As the cofferdam went down it was built up to keep the top above low water level. The position of the cutting edge was determined daily by obtaining the levels of four points on the dam equidistant from the cutting edge and the dredging directed accordingly to keep the dam vertical.

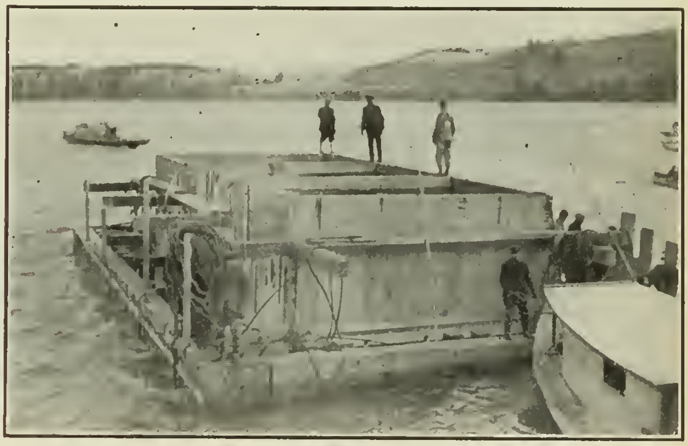

Fig. 4.—Caisson No. 6, Bear River, Feb. 10th, 1914.

This was quite successful until a depth of 12-ft. had been obtained, when one side of the dam got hung up on a large boulder, with the result that the dam took a list of about 15 degrees from the vertical.

Divers were then sent down to direct water jets around the obstructions and dredging was carried on the outside of the dam on the high side, finally the dam was straightened up into its correct position at a penetration of about 28-ft. and resting on a bed of coarse gravel and boulders. The total height of the dam is 62.4-ft. containing 130,000 ft. of timber and 1473 cubic yards of concrete.

Pier 4—the pivot pier, was sunk in similar manner to the depth of 36-ft., and contains 175,000 ft. of timber and 19,000 cubic yards of concrete; pier 5 was sunk to a depth of 40 ft. and contains 142,000 ft. of timber and 1453 cubic yards of concrete.

At pier 6 and 7 where the boring showed a considerable depth of mud it was decided to excavate about 15 ft. and drive piles. After the excavation was complete, there was a depth of 35 ft. of water at low water and the Foundation Company Ltd., who were doing the work introduced their underwater method of driving piles.

Underwater Driving

This method caused considerable discussion on the work, the contractors claiming that it developed at least 85% efficiency as compared with the ordinary method of driving piles with a drop hammer. I may here say that results did not bear this out as the average penetration with the underwater method was only about one half of what was obtained at the same location with the lighter hammer falling through air.

To enable you to form your own opinions of this method, I will describe the equipment used. The guide pile and hammer were handled by a stiff leg derrick operated by a 25 H.P. 3 drum hoist. The guide constructed of four 3½″ steel angles latticed together, was 22″ sq. inside measurements, and all rivets were sunk on the inside. It was made in 15 ft. sections capable of being bolted together to give the required length. Lugs riveted to the top section rested on crossed timbers on the cofferdam and the guide hung there from, just clear of the bottom of the excavation and over the spot where the pile was to be driven. The pile was then inserted in the guide and allowed to drop to the bottom. With heavy piles as much as ten feet penetration was obtained in some cases right at the start. The hammer weighing about 5,000 lbs., was built to give a clearance of about ¼″ all around inside the guide and terminated in a truncated pyramid. The hammer was lowered into the guide after the pile, and driving commenced, a fall of from 12 to 15 ft. being given. The fall was thus limited as it was found that the pile heads broomed badly. The piles used were exceptionally good but many of them failed to stand up under this treatment. The maximum penetration obtained was 46 ft whilst test piles, driven from the same location from a scow with a 24,000 lb. hammer and a dolly gave a penetration of 65 ft. However the big advantage of being able to drive under water was that the work could go on at all stages of the tide and this meant at high water the driving was being done through 70 ft. of water. The condition of the old bridge was such that anything within reason which would hasten completion of the new could not be neglected.

The length of the bridge is 1640-ft.; the total yardage of concrete used was 13,000 cubic yards; the contractors for the abuttments, and piers 1, 2 and 8 to 14, inclusive, were Messrs. Powers and Brewer of St. John and for piers 3 to 7, inclusive, were the Foundation Company Ltd., of New York and Montreal.

G. G. Hare, M.E.I.C., was the engineer for the D. A. R.; the writer being resident engineer.

Discussion

Owing to the late hour the discussion on this paper was limited. George Hare, M.E.I.C., asked the author if he would explain the cause of the brooming of the piles when driving them under water. In reply the author stated that the pile driver in striking the blow forms a cushion of water which is driven into the head of the pile. This not only greatly minimized the driving force of the blow, but was a factor in dissipating the energy, part of which was absorbed in the brooming of the pile.

A vote of thanks moved by Mr. Armstrong, seconded by Mr. Hare was tendered the author, bringing the afternoon session to a close.

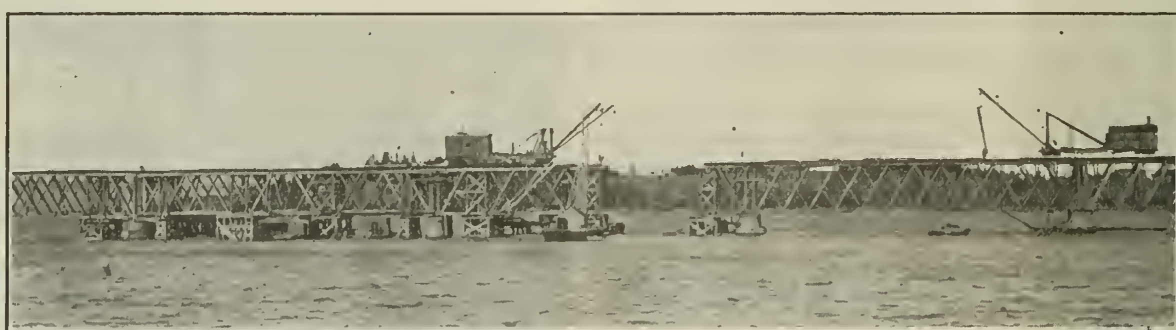

Fig. 5.—Bear River, Nov. 2nd, 1913.

Third Session

The president occupied the chair at the evening session, which was largely attended. The paper for this session, which was by F. P. Vaughan, A.M.E.I.C., accompanying which the author gave a unique and fascinating demonstration of experiments with high tension high frequency electric current.

High Potential, High Frequency Apparatus and Experiments

I take pleasure in presenting to you to-night a few experiments with alternating currents of high potential and high frequency. The use of high frequency currents has ceased to be of academic interest only and are used very extensively to-day in:—

Wireless Telegraphy and Telephony.

The testing of high voltage insulators and Lightning Arrestors.

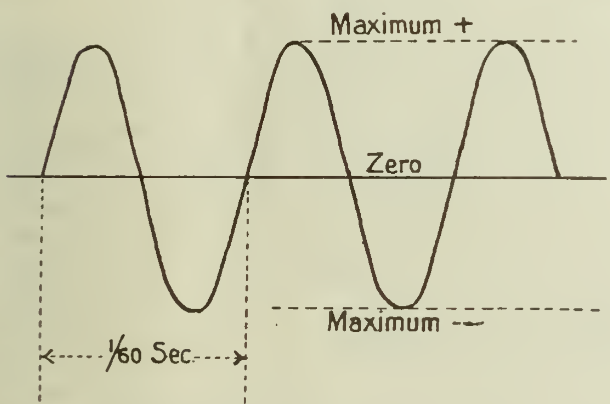
The production of Ozone (0^3) and Nitrogen.

X-ray Work.

The electric-culture of plants.

And when properly used and applied in Electro Therapeutics, have produced some remarkable results.

They have also quite recently been successfully applied to electric high frequency furnaces.



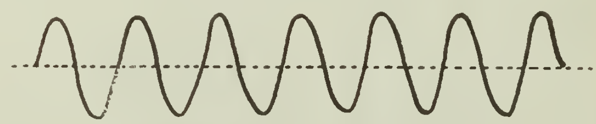
Alternating currents used commercially are, relatively speaking, of low frequency being from 25 to 60 cycles per second. To-night, however, we are dealing with alternating currents with a frequency into the millions, with a voltage of hundreds of thousands of volts. For the benefit of those not familiar with this subject, a few explanations may be necessary.

An alternating current is one that periodically changes its direction of flow a certain number of times per second; it is the reverse of direct current, which is assumed to leave at a positive pole and return by the negative. With an alternating current, the terminals are alternatively positive and negative. The current rising in voltage from zero to a maximum positive. falling again to zero, changes sign and rising to a maximum negative and again falling to zero and repeating this operation. The period of time taken for this operation with 60 cycle current would be 1/60 of a second for a complete cycle of two alternations.

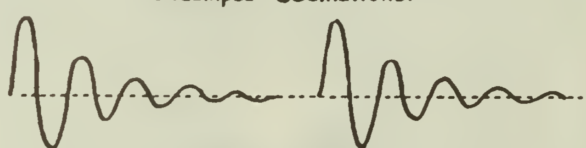
The primary current used to-night, taken from the New Brunswick Power Co's mains, has a voltage of 110 volts and a frequency of 60 cycles a second. As stated before, alternating currents met with in commercial use, are, relatively speaking, of low frequency. If, however, the frequency were from 1,000 to 100,000 they are generally called high frequency currents and when the frequency rises to a value of a million or so, they are generally called electric oscillations.

When an alternating current of very high frequency exists in a circuit, and continues uninterruptedly it is usually called an undamped or persistent electric oscillation (such as are used in wireless telephony and which require to be above 20,000 per second, to be above an audible frequency).

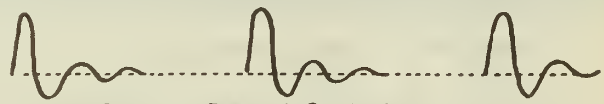
In the experiments to-night, however, we are concerned with an alternating current of very high frequency, which consists of separate groups of alternating currents; each group beginning with the same amplitude but then damping down more or less rapidly to zero, and after a short period of time beginning again. These are known as damped electric oscillations. The rate at which the amplitude dies away in each train is called damping. A train of very few oscillations say four or five, is called a highly damped train and over 100 or more a feebly damped train.



Undamped Oscillations.



Feebly Damped Oscillations.

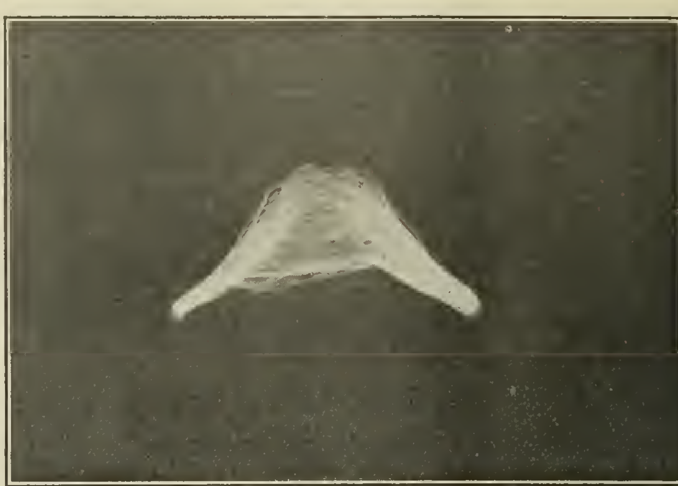


Strongly Damped Oscillations.

These high frequency currents do not follow the same laws as low frequency currents and when using thick copper wires, the effective resistance may be very much greater than it would be for continuous or low frequency currents. For this reason, therefore, stranded wires, made of twisted fine insulated copper wires, should be used. However, if the wire is of small diameter, then even for high frequency current this increase in resistance, due to the concentration of the current at the surface of the wire is not a very serious matter.

There is another point in connection with the above that when a wire is made into a coil of many close turns, its high frequency resistance is very much greater than if the same wire were stretched out straight, and for this reason considerable difference of potential may exist between a few turns of wire when coiled in a helix, and which is conveying high frequency currents. Until quite recently there were but three practical methods by which means, high frequency currents could be generated.

One of these methods employed an alternating current generator of special construction, having a very large number of stator pole pieces and the rotor driven at a very high rate of speed, viz.: 10 to 20,000 R.P.M. The maximum frequency obtainable by this method is about 100,000 cycles per second and includes machines of this type developed by Nikola Tesla, R.A. Fessenden and E. F. W. Alexanderson, whose latest machine is rated at 200 kw., the rotor of which weighs 3½ tons and has a speed of 2,100 R.P.M., the whole machine weighing 12 tons, and has a frequency of 22,000 cycles per second. The results to be obtained by this method are by the means of a very expensive and in some cases a dangerous machine due to the excessive speed, although they possess undoubtedly very great advantages in radio telephony but so far have been used for laboratory experiments only. Another type of high frequency alternator operating on the principale of electrical resonance has been developed by Dr. Goldschmidt, which generates radio currents at frequencies from 30,000 to 75,000 cycles per second.



Twelve inch discharge between two inch brass balls.

Large Oscillation (Instantaneous) discharge.

The second method is by means of the direct current arc. When an ordinary arc is shunted by a suitable inductance and capacity sustained oscillations are set up in the circuit. This method produces a persistent or undamped wave and has been successfully developed by Duddell and Poulsen and is used successfully for wireless telegraphy and telephony and will, I believe, in the near future in the larger installations supersede the spark method for wireless transmission.

The latest development for the generation of undamped oscillations is the vacuum valve tubes, such as the General Electric Pliotion oscillators, same being a highly exhausted two or three element vacuum valve of enlarged dimensions.

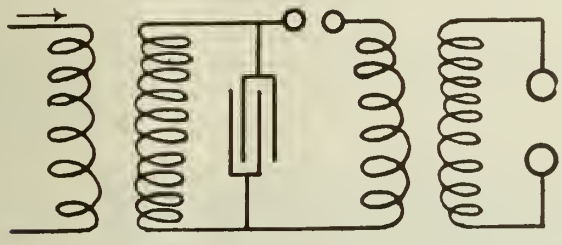
The third and most well-known method of producing high frequency currents, due, I think, to Lord Kelvin, but better known by the striking experiments of Nikola Tesla, is by the discharge of a condenser, same being charged to a high potential and discharged through a circuit having inductance and low resistance; a train of damped oscillations being set up at every discharge of the condenser.

As a mechanical analogy, we can compare the charged condenser to a weight attached to a spring.

To discharge the condenser. we drop the weight and it will oscillate backwards and forwards, finally coming to rest after oscillating backward and forward a number of times. The number of oscillations per second will depend on the mass of the weight and the strength of the spring, which would correspond to the self-induction and capacity in our electrical circuit. The number of oscillations it would make before coming to rest would depend on the friction, which tends to stop the weight, or by the resistance or other losses in the electrical circuit. It is necessary to arrange the circuit for the production of the trains of damped electric oscillations by condenser discharges, so that the inductive circuit is in series with the condenser. This usually consists of one circuit, of a transformer containing no iron, called an air core transformer. Two circuits are wound one over the other and highly insulated from each other, one of these is called the primary, the other the secondary.

Discharge between two glass bottles filled with water.

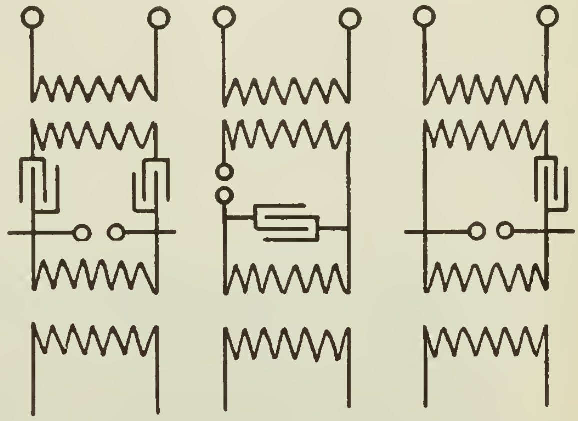
The primary circuit is arranged in series with a condenser and spark gap. This being the circuit in which electric oscillations are set up by the discharge of the condenser. The oscillations in the primary, induce other oscillations in the secondary and if the secondary has a greater number of turns than the primary, the secondary voltage will be greater than that of the primary in the following ratio. If the two circuits, that is the primary and secondary are more or less widely separated or loosely coupled and turned to resonance, the damping be negligible, the ratio of transformation, is determined entirely by the capacities in the two circuits, but when the circuits are close together or closely coupled, but not turned in resonance, the ratio is determined by the relative number of turns in the two circuits.



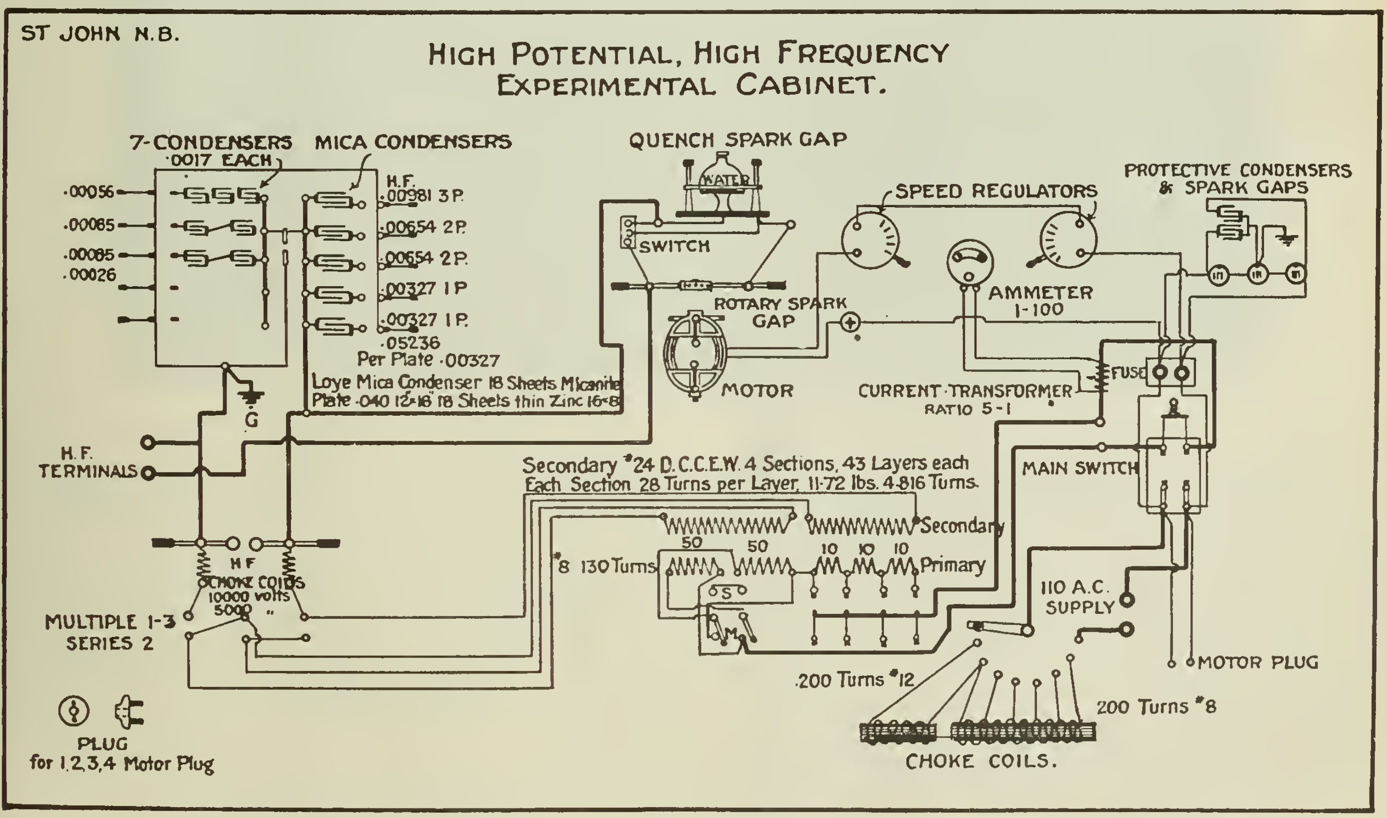
The apparatus may be connected in several ways, although the results obtained differ but little.

The general arrangement of the apparatus are shown on the accompanying diagram.

Current is supplied to the apparatus at a voltage of 110 volts, this first passes through a variable inductance, which is in series with the primary of the transformer and in some cases serves to limit the current supplied, although in some of the experiments is not used. The transformer consists of a core type transformer with silicon steel core and is of the magnetic leakage type, the primary being wound on one leg and the secondary on the other leg.



The voltage of 110 volts supplied to the primary is stepped up to 10 or 12 thousand volts due to the difference in the ratio of the number of turns on the two coils. The secondary circuit is shunted with a variable mica condenser, which is in series with a spark gap and the primary of the oscillation transformer, which sets up oscillations in the secondary of same, increasing the voltage to many



thousands of volts and in some of the demonstrations to-night reaches a value of half a million volts.

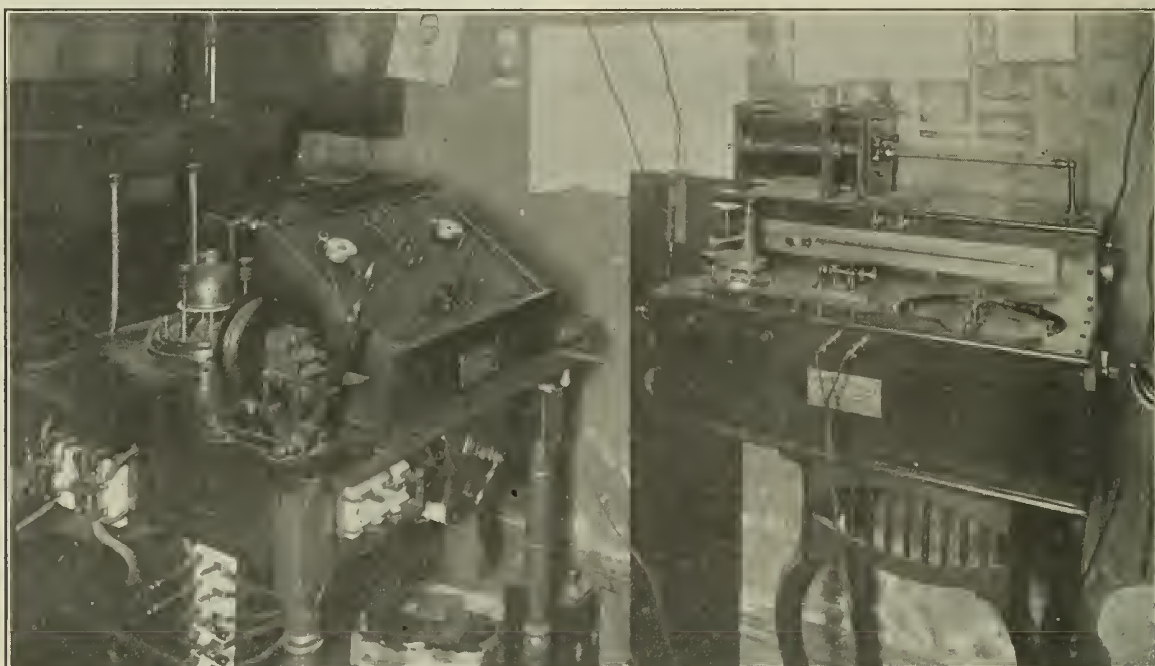
The successful operation of the apparatus depends primarily on the proper disruption of the arc at the spark gap, which in this case consists of a spoked wheel with 12 projections, driven by a small motor at a speed of 1800 to 2400 R.P.M.

There are other forms of spark gaps, which are suitable and give satisfactory results, many types of which I have used successfully but, the one mentioned above has many advantages and is largely used to-day with many of the commercial wireless telegraph installations. The discharge across the spark gap is practically a short circuit; across the secondary terminals of the transformer, and if this arc is not suppressed or broken up, there will not be a true oscillatory discharge in the condenser circuit or only a weak one, for the reason that as the arc discharge holds, the secondary terminals of the transformer are reduced in potential and not until the arc is destroyed that the spark gap can build up a sufficient difference of potential to give a fresh charge to the condenser. each charge. The length of the spark gap is determined by the type of service required. If we require long sparks from the secondary of the high frequency transformer or oscillator the spark gap in the condenser circuit should be long, but when a high effective current is required, the gap should be short. If the gap is made too short a flaming arc will occur in place of a loud bright spark, and no oscillations or only weak ones, are set up, for the reasons as stated before. On account of the exceedingly high frequency of the oscillatory discharge of the condenser, the inductive effects are remarkable, considering the small quantity of electricity stored in the condenser.

According to Sir Oliver Lodge, the rate of oscillations for a pint size Leyden jar or condenser is ten millions per second, but for large capacities the rate is less rapid.

It is very necessary in any of the experiments to have the circuits turned to resonance otherwise, the results obtained are disappointingly small.

In some of the experiments to-night we are using a capacity of .036 m. f. approx. and when charged to a potential of 10,000 volts, the condenser would hold a charge of .00036 coulomb which can do the work of 3.6 joules which with an inductance of 699 C.M. the frequency becomes 1,000,000 cycles per second. This does not imply that this frequency is maintained continuously but during the period of oscillation that the condenser discharges through the primary of the oscillation transformer, when the capacity used is very large the voltage may not be high enough to jump the spark gap, in the first period of the cycle with a long gap only one train may result, while with a shorter gap, several trains may take place during each half cycle.



Another view of apparatus in laboratory showing wireless receiving set in right hand corner.

The inductance and capacity of the secondary systems also influences the number of discharges obtainable during an alternation. The less the inductance and capacity of the conductors connected to any given oscillator, the greater the number of discharges obtainable per second; and likewise, if the inductance and capacity of an oscillator be reduced the rate of sparking will be increased when the spark gap is long, more energy is stored up in the condenser but as it is only charged once or twice per half cycle, the total available energy may be less than when a short gap is used. With a short gap the charging and discharging takes place many more times per half cycle, although not as much energy is stored up in

With a frequency of one million cycles, there would be 2,000,000 alternations per second.

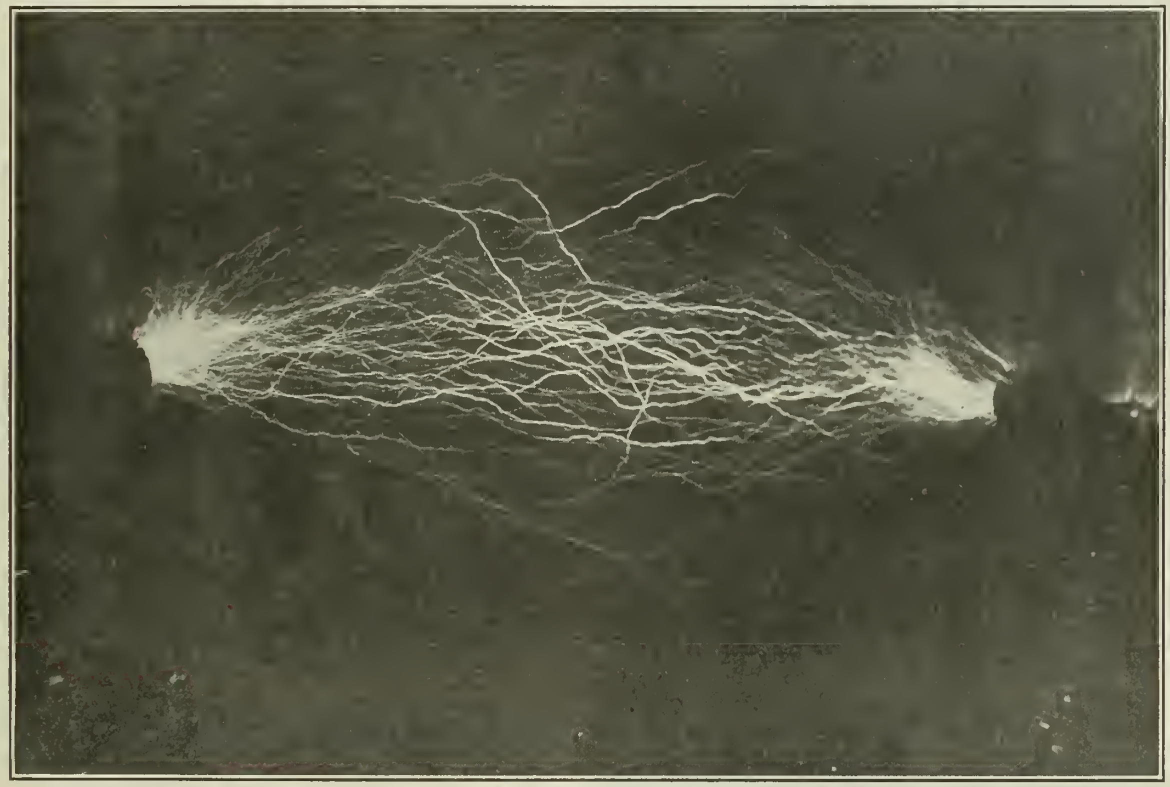
If the condenser is discharged once in every alternation or in 1/2,000.000 of a second, the average current required to discharge .00036 coulomb in 2 millionth of a second, 720 amperes.

If 8 alternations are required before the entire energy of 3.6 joules is dissipated which is at the rate of .000,004 of a second, which is at the rate of 900,000 joules (or watt seconds) or 900 k.w., or 1200 H.P., so that while the energy stored in the condenser is small, the rate of doing work, when released in a short period of time is verv great.

Although the current in the discharge circuit is very large, the heating effect upon the wires is not nearly as great as for direct current, for the reason that during part of the low frequency cycle the condenser is being charged only a fraction of the ampere flows through the secondary of the low frequency transformer and condenser and the wires cool off to a certain extent during the comparatively long period of charging in each of the one hundred and twenty (120) alternations per second.

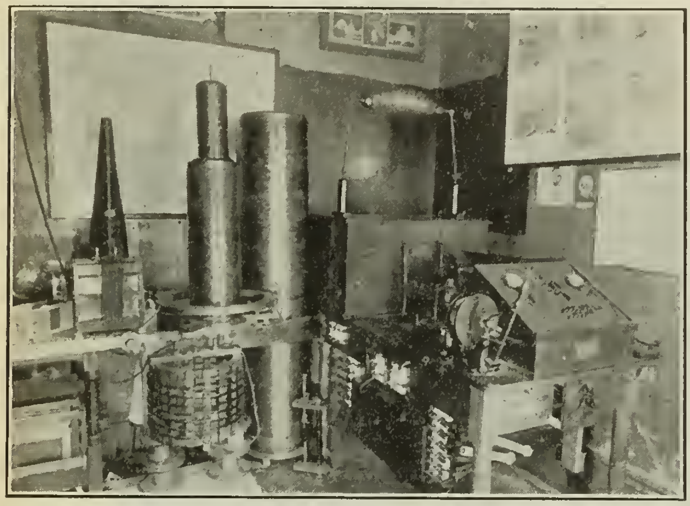
It may be of interest to state that lightning is of an oscillating character, being practically the discharge of a condenser; the charged cloud acting as one plate of a condenser and the earth as the other, or in some cases, different clouds acting in the same respect to one another. (Standard Hand Book Electrical Engineers). If an area on the surface of the earth 100 ft. square is subjected to the discharge of a cloud, also 100 ft. square at a distance of a thousand feet (1000) in this case the capacity is very small being approx. .000027 Microferads the air space separating the cloud and earth, and if the disruptive strength of air is 30,000 volts per C.M. a potential of 912,000,000 volts would exist between the earth and cloud just before the stroke. The amount of electricity stored would be .025 coulombs, a very small value when considered by itself. The energy stored would, however, be very great on account of the high difference of potential and would be 11,200 kw., seconds or joules, being almost equal to the energy of a pound of dynamite, with a lightning discharge, the frequency of the discharge may be from 100,000 to 5,000,000 per second in which case the maximum value of the current is from 15,000 to 750,000 amperes.

The electric culture of plants was like many other discoveries the result of accident. Some years ago a Swedish professor named Lemstrom, while conducting some experiments trying to reproduce the northern lights with electric discharges through vacuum tubes. These experiments being conducted in his greenhouse, noticed incidently that the plants seemed to thrive, due to the electrification thus produced. He also states that he noticed as remarkable, the flourishing development of plants in the Arctic regions, where the sunlight was very weak and he attributed part of this growth to the influence of electric discharges. Since which time experiments along these lines have been repeated and extended and in 1917 and 1918 electric culture experiments at Llantwit, South Wales. The increase production in potatoes electrically treated was 12.6 to 17.2% over those not so treated under similar conditions; also states that in a crop of oats so treated showed a 35% increase in grain, 17% in straw.



Spectacular Miniature Lightning

One of the things of particular interest with regard to high frequency currents is, its effect on the human body, for we can pass a large amount of current through the body with a high frequency current, which would prove fatal if performed with the same current at low frequencv. Two theories have been advanced with regard to the above. One of these is that as the current is oscillating at such enormous frequencies, the nerves do not have time to respond. The other, that as high frequency currents tend to travel on the surface, they do not penetrate deep enough to effect the nerves.



General view of H. F. Apparatus in corner of Laboratory of the writer

It is generally conceded that 1/10 of an ampere of current if passed, through a vital part of the body, would prove fatal, yet in some of the demonstrations to-night, we are passing currents, the effective value of which is in excess of one ampere or more and whose maximum value would be considerably greater. (Viz. 166 Amp.)

The brush discharges from the oscillators are very spectacular. The larger one when properly turned to resonance, giving a free discharge in air 5 or 6 feet long (see photos). The large oscillator consists of a wooden frame covered with cardboard, the height of which is thirty-one (31) inches and being eighteen (18) inches in diameter at the base. It is wound with a single layer of No. 24 D.C.C. Magnet Wire, each wire being separated by a turn of string. The primary winding which is loosely coupled, consisted of three (3) turns of 2″ copper strip wound between turns with a piece of 2″ leather belt. The smaller oscillator is similarly constructed only with a lesser number of turns in the secondary.

Twenty-two inch discharge between two inch balls, long exposure.

If a lamp taking ¾ of an ampere be held between two people, one of them making contact with the oscillator with a metal rod, which is moved toward the grounded end, a point is reached, where the lamp burns up to full candle power or can even be burnt out.

In a similar manner, small wires can be melted and many other striking experiments can be performed, Geisler and Vacuum tubes are brilliantly lighted a considerable distance away, due to the very strong electro static field.

Discussion

The high standing and excellence of the paper on this subject, declared President Leonard, was an evidence of the wisdom of enlarging the scope of the former Canadian Society of Civil Engineers. whereby it represented every class of the engineering profession. He compared the author in the electrical field to his namesake past president Vaughan, and the position he held in the mechanical engineering field. F. A. Bowman, M.E.I.C., after moving a vote of thanks to the author, related an experience of attending a lecture given by Nicola Tesla, the pioneer in the high frequency field, and where the experiments shown did not compare with those the author had just demonstrated. He informed those present that Mr. Vaughan was a pioneer in the field of wireless telephony, and had been the originator of some of the principles which were now adopted in making it effective. The vote of thanks was seconded by C. O. Foss and adopted by the meeting with considerable enthusiasm.

A. R. Crookshank asked several questions which brought out the information from the author that the chief function of lightning rods in addition to providing a path in case a building was struck which might or might not be followed, was to lower the potential between the clouds and the earth. The aurora was an electrical condition made possible by the dryness of the air in northern latitudes due to a difference in potentials between localities. In a lightning discharge the earth might be positive or negative, as conditions varied rapidly. Mr. Crookshank pointed out that Mr. Vaughan was one of the first men in the world to make use of the wireless telephone. During the war Mr. Vaughan had used his valuable knowledge regarding wireless telephony in the interests of the British Admiralty, for which he deserved great credit: Dr. Vaughan's assistant in the demonstrations was Lieutenant Ashley, who is in charge of the wireless telephone installations for the British Government on this side of the water, the meeting being fortunate in having two such authorities present.

Fourth Session

On calling the meeting to order, Mr. Kirby, who presided in the early part of the meeting, asked F. A. Bowman, M.E.I.C., Plant Engineer, Maritime Telephone & Telegraph Company and Chairman of the Halifax Branch, to read his paper Engineering Problems connected with the use of Telephone Cables; of which an abstract by the author follows:—

Engineering Problems involved in the use of Telephone Cables.

To understand the problems involved in the use of telephone cables, it will be necessary first to consider what is to be done; secondly, the nature of the materials that must be used; and thirdly the difficulties that arise in using these materials.

It must be borne in mind that every telephone installed involves the provision of two wires or its circuit from it right back to the switchboard, to which it is connected. In the case of the so-called party-lines, two or more telephones are connected to one circuit, but that does not materially affect the problem. It becomes apparent immediately that where thousands of telephones are installed in a City some means must be taken of getting all these circuits compressed into the smallest possible space. The telephone cable is the result. These cables consist of anywhere from 15 to 1200 pairs of wires, grouped together. The sizes ordinarily used are 15, 25, 50, 100 and 200 pairs for work on poles; and 100, 200, 400 and 600 in underground conduits. 800 and 1200 pair cables are used in the largest cities; the wires in them are No. 24 B. & S. Gauge and their use involves very special conditions and difficulties.

There are distinct electrical limits to the length of the circuit commonly called a "loop" from the switchboard to the subscriber's instrument. Transmission may be very good from one subscriber to another in a city and yet neither of them could carry on a conversation over a toll line of 100 miles. Sooner or later every telephone is used to talk over long distance lines. Consequently, it is necessary that its ability to do so should be the standard. It will be at once realized from this that it is necessary to keep the electrical losses in the subscribers loop down to a minimum. This is one of the several reasons why different exchanges must be established in a city, because by so doing the loss from the subscriber's instrument to the switchboard can be kept low. Even if it is necessary to transmit the conversation from the first switchboard to a second, special devices can be introduced into the comparatively few trunks between the two switchboards, that could not be placed on all subscribers lines.

The unit of transmission is thirty miles of No. 19 B. & S. Gauge paper insulated lead covered cable, and all other circuits and apparatus are measured in terms of this.

The next problem to consider, is the mechanical means of getting these groups of circuits into a reasonably sized cable. The current used by a telephone is so small that a very small wire may be used to carry it a considerable distance before the loss, due to the ohmic resistance of the wire, becomes too great. It must be remembered that a telephone current is an alternating current of very high frequency, varying from 800 to 16000 cycles per second. Consequently the mutual inductances of the two wires of the circuit, and the inductive affect on it of the other telephone circuits near it become very serious. These difficulties are overcome by twisting the two wires of a circuit together and by laying up all the circuits with a special system of twisting in reference to each other. The next difficulty is that of the mutual capacity of the two wires to each other, and to all the other wires in the cable.

We know that the mutual capacity of two wires is proportional to the specific inductive capacity of the insulation or dielectric between them. The insulation that has the lowest specific inductive capacity is dry air; but how can wires, tightly packed together be insulated with dry air? Next lowest on the list of specific inductive capacities comes dry paper. So the wires are insulated by being loosely wrapped with two layers or strips of dry manilla tinsel wound in opposite directions. These loose layers imprison a certain amount of air even when the whole bunch of wires is compressed together in a sheath. It is evident that this mechanically flimsy and highly hygroscopic insulation must be absolutely protected from injury and dampness. This is done by a lead sheath, which is spread over the bunch of wires by the same process of squirting that is used in making lead pipes. The resulting cable is very satisfactory from an electrical standpoint, but is mechanically weak.

The mechanical weakness of the cable and the absolute necessity of keeping every trace of moisture out of it form the difficulties mentioned under our third heading. The first question that arises is as to what shall be done when the individual circuits must leave the cable to be connected to the switchboard at one end, and to the individual telephone at the other. This is accomplished by means of potheads and rack ends and cable terminals.

The sizes of cables most commonly used in what is called "Aerial work," that is, cables suspended from poles, are 25, 50 and 100 pairs. When the wires in them are No. 22 B. & S. Gauge or .025 inch diameter, which is the size ordinarily used, the weight of the three sizes mentioned is respectively .85, 1.20 and 1.97 pounds per foot of length. Let us assume a span of 100 feet between poles and that the cables are allowed to have a sag of two feet in the centre of the span. The tension strain in the cables would then be for 25-pair, 532 pounds; for 50-pair, 750 pounds and for 100-pair, 1230 pounds. It is evident at once that the thin lead sheath would not sustain this strain, and it must be remembered that in our climate, a coating of sleet or wet snow may easily double the load.

It therefore is necessary to support the cable, which is done by attaching it to a stranded steel wire, called a messenger. These messenger wires are of crucible steel, and the sizes ordinarily used are made up of 7 No. 13 B. W. Gauge or 7 No. 12 B. W. Gauge wires. These messengers are erected first and pulled up reasonably tight. From this messenger the cable is suspended.

It wil be seen at once that if cables are erected in summer time, so as to make a very nice looking job, the initial strain may be such that when the strain of wind and ice and contraction from drop of temperature occur, the messenger will fail. It therefore becomes necessary to find out what initial sag must be given if the cable is erected at, let us say, a temperature of 60° F. in order that when carrying a given load of ice, plus wind and a drop of temperature to zero, the strains shall not exceed a safe limit.

These loads on the messenger wires are, of course, horizontal strains on the poles, which are to a large extent balanced at each pole by the span on either side of it, until the end of the line is reached, where the end pole is must take the whole strain. Two difficulties are met here. First the question of the strength of the pole to withstand the horizontal strain; and secondly the securing of it in the ground so that it will not give under the strain. The second difficulty can be partially met by some form of bracing below the ground level or by setting in concrete, but in very soft soils it becomes a serious matter and involves very heavy concrete work. The first difficulty is much more serious. If the extreme loads referred to are met and calculations for them have allowed the factor of safety to be reduced to 2, we have a strain of 5000 pounds in the case of a 7/13 strand messenger. If there are 4 of these on a pole it means a horizontal strain of 20,000 pounds, applied 20 or 25 feet above the ground.

Some form of guying or bracing is therefore absolutely necessary. Bracing is much less used than guying, for several reasons. The principal one is the difficulty of getting a firm setting for the foot of the brace. If the soil is at all soft the brace is forced into the ground by the strain unless some form of plank footing is adopted to distribute the strain over a larger area of ground. Then in the Spring the frost coming out heaves both pole and brace, increasing the heaving of the pole and leaving a space under the foot of the brace that seriously reduces its resistance. Then again the brace is much more unsightly, and on streets and roads may take up too much room. On the other hand a guy anchored to a log or some form of anchor plate carefully set below the frost limit, offers a much greater and an unvarying resistance to the movement of the pole. The action of the guy is also to place the pole entirely in compression.

From the above description it will be seen that a pole line is really a series of structures resembling in many ways a bridge of the suspension or cantilever type. The poles take the place of the towers or piers of the bridge and the stability of the whole is dependant on the proper anchorages at each end.

So far we have dealt with the mechanical strain in the cables and the structures that support them, from which it will be seen that the engineering problems involved are very interesting. The variation in the conditions of ordinary work in Cities and Towns is so limited that tables are available covering practically all of them, so that they do not have to be calculated on each occasion. We now approach another group of problems that call for solution in each individual case. The solutions being dependant on the accumulation of data that calls for engineering, skill and experience of a high order, first to gather it, and then to apply it.

We have shown that as each telephone has to be supplied with two wires, the problem of compressing the immense number of wires into a reasonable space has evolved the telephone cable. Also that these cables are made up in certain standard sizes which have been proved to be those most suitable for the work. Now we must take up the questions involved in the layout of a cable plant. What size cable must be run on a certain street to take care of the existing telephones and provide a reasonable margin for expansion, without erecting too great a capacity and having a large part of the plant lying idle, perhaps for years. So much has been written about the load factor of power stations that it has become a fairly familiar problem and it is generally realized that a power station has to have a generating capacity equal to the largest load it will be required to carry, which load may only come for a day or a few days in the year. It is not as generally known that the telephone engineer is confronted with a similar problem with a form of plant that is much less elastic than a power plant. Primemovers, generators and transformers will carry a material overload for a short time without serious injury and so tide over a load peak, but when a telephone cable has had the last pair of wires in it connected to a subscriber, its limit is absolutely reached, and the only solution is the erection of more cable. The same thing applies in the case of the switchboard.

Let us take a simple illustration. A new street is opened and a few houses built on it. We erect a pole line and put on a 10-pin arm, which will, of course, carry only five circuits, and string open wires as required until it is filled. More houses go up and we put on a second arm. Building becomes more brisk and more telephones are called for and the second arm fills up. Seeing the way things are going we decide that a cable must be put up. As we have ten circuits on the street already there is no use in putting up a 15-pair cable, as our guess is that it will be filled up in a very short time, so we erect a 25-pair. If we guess well and the growth continues, the cable becomes reasonably full and our investment pays for itself. If something happens to stop the growth in that street we may have as much as 50% of that plant idle for years. This would not be a serious matter if it was confined to a street or two, but when you stop to think of the ramifications of a telephone system in the larger cities or even in a good-sized town, it will be seen that the problem of balancing adequate facilities against idle plant becomes a very interesting problem in probabilities. It must also be remembered that it is necessary to reserve 25 pairs of wires right back to the switchboard to feed that cable. While it can sometimes be arranged to utilize some of the wires in the main cables feeding that cable for a time to feed circuits elsewhere, the amount of this that can be done is small and is only a temporary expedient.

Another problem of great importance is to keep the length of the circuits down to the lowest possible limit. This point was touched on from an electrical standpoint earlier in this paper, in connection with transmission, but is equally important from the standpoint of the capital to be invested. One of the great reasons why the cost of giving telephone service increases with the number of subscribers, is due to the fact that as the use of the telephone spreads over a City the length of line per telephone and consequently the capital cost increases. Also the item of idle plant previously referred to materially increases as the area to be served increases.

The way these two problems are met is to make a detailed study of each street, basing its probable telephone requirements on certain probabilities that experience has allowed us to tabulate and then work back towards our office, gathering the branches into mains as we go. At the same time we must determine the point which is the shortest distance from all the expected telephones in that area If a new Central Office is tobe built,it will of course be placed as near as possible to this wire centre. If it is rearranging cables to an existing office, it will mean that a very heavy main lead must be arranged from the office to this centre.

Two points are kept in view in making these studies. The first is the ultimate development that will probably occur in a given number of years, the second is what construction must be carried on at once to take care of the growth for a portion of this ultimate period and how it can be arranged so as to be readily expanded to the ultimate with the minimum of rearrangement and substitution of one size of cable for another.

Underground conduits and cables have two disadvantages. The first is, the high initial cost, and the second is, their lack of flexibility owing to the difficulty of connecting individual circuits to them.

Underground conduits consist of groups of ducts into which the cables are drawn. The ducts are laid in groups and a manhole has to be constructed at frequent intervals. In City work a manhole must be constructed at practically every street intersection. In the case of long distances between cross-streets an intermediate manhole must be made. The mechanical weakness of the lead-sheathed cable limits the length of it that can be drawn in at one time.

In the manholes the lengths of cable are spliced together and it is only here that any branches can be taken off.

Whenever it is known that a certain street is to be paved, an effort is made by the Telephone Company to lay conduit in advance. In such a case it is necessary, if possible, to lay sufficient duct to take care of all future requirements on that street. This involves a heavy capital outlay that may be idle for a long period.

In those parts of a City that are completely built up, provision must be made to get the underground wires into the buildings. If there are large buildings of an apparently permanent type, branch ducts from the nearest manhole are laid directly into them. Where the buildings are smaller, branches are carried through lanes and alleyways to the centre of the block. Branch cables are drawn into these ducts and carried above the ground to a distributing pole or up the side of a building and distribution made by smaller cables or individual circuits as the case may call for.

On outlying streets, where pole lines may still be retained, branch ducts are carried from a manhole to a suitable pole and up the pole far enough to protect the cable from injury. These branches are known as branches, laterals, or risers. A branch always consists of at least two ducts and if of more at least one spare is run so that in case of a cable going back, another can be run in and connected up and the bad one withdrawn.

Discussion

A long and interesting discussion followed the reading of this paper, many questions being asked the author, showing the interest which his subject had aroused. The questions were for the most part answered by referring to the apparatus which he had at the meeting. Mr. Cushing moved, seconded by Mr. Burpee, a vote of thanks to Mr. Bowman for his interesting paper and for the detailed information he had given on the subject. The Chairman asked W. B. MacKay, A.M.E.I.C. to read his paper on Heating Problems Produced by Some of the Modern Methods of Building Construction. Before reading the paper the author stated that heating engineering was one of the newest branches, and the heating engineer suffered from a lack of any data. Heretofore heating had for the most part been in the hands of mechanics and that unscientific knowledge was probably responsible for many of the failures in the past.

* Heating Problems Produced by Some of the Modern Methods of Building Construction.

At the conclusion of the paper the author stated that effective heating has never been fully understood, and that it was under investigation now by three commissions, the result of which might be to change the character of buildings or the character of our heating plants. There were many uncertain and unknown elements entering into the application of a first-class heating plant to a building. He suggested that in the construction of buildings greater care be exercised in choosing materials that are not subjected to much heat loss. After a modern building is completed little is known of what it represents in the way of heating efficiency.

Mr. Kirby stated that the paper just read by Mr. MacKay represented a unique experience as he found that everything he had learned about this subject was now upset. Mr. Stead asked for some information on the humble hot air plant largely used in New Brunswick. Mr. MacKay replied that the system was somewhat the result of trade competition. Plumbing had been handled by plumbers and steam fitters.

*Paper will appear in November issue.

There are two kinds of warm air heating systems. One in which the air is taken from the outside and the other from the inside. I hesitate on many occasions to get mixed up in the argument. One fellow says the only thing that is good is taking the air from the outside and the other says, from the inside and save coal. The heat loss from this room alone is one third of the total heating of the building. You are perfectly safe to take air from the inside and that produces rather good circulation. You say you will heat a house with 100 degrees. That means that heat at seventy and zero outside, the difference between 100 and 70, will give you the net results, or the heat loss from the building. Warm air heat has been the victim of insidious trade practice. Warm air plants have cost more than hot water. Of course there is nothing to freeze up and they have many advantages. In milder climates and in the United States warm air is a very well developed form of heating. The only reason why I avoid the discussion of it here, is that I wish to preserve my life. They look at you and say, who are you that you should talk to me with my 40 years experience. Mr. Kirby: You said that you took the heat loss for glass at 100 and three-inch concrete slab at 200—twice as much as a sheet of glass? Mr. MacKay: Yes. Mr. Armstrong: Three-inch glass would be what? Mr. MacKay: That is an unusual type of building material. I would say that glass would be practically the same as concrete. Dry air is the best insulator. 85% magnesia is the best covering. Any substance which contains minute air cells is good.

Mr. Armstrong: What would you say about a glass window with two panes separated with an air space of one inch? Mr. MacKay: replied that it was a very good step towards preventing heat loss. One had the small air space which was the best insulator. In a granite wall 28 inches in thickness, with and without an air space of two inches, the difference is 20 per cent. The size of the air space made a difference, as too much air space made an eddy of its own. A radiator painted with five coats of enamel paint increased the heat five per cent. Heat conduction is much more rapid through anything that is moist than anything that is dry. Colonel Leonard asked if the author had any information regarind 4 inch studding with metal lath and plaster on both sides, making an air space, and was informed that the ratio was 3.4. Further discussion brought out the point that brick veneer was the best from the viewpoint of low conductivity of heat—it represented the warmest house that could be built for the money. Mr. Armstrong moved, seconded by Mr. Stead, a vote of thanks for the intensely interesting paper, which was carried unanimously.

Fifth Session

Luncheon meeting at Bond's Restaurant

At noon the Board of Trade of the City of St. John were the hosts at an enjoyable luncheon at which about 150 were present, given at Bond's restaurant. R. B. Emerson, President of the Board of Trade, extended a hearty welcome to the visiting and local engineers. He made eulogistic references, stating that no progress could be made without the assistance of the engineer. His field was expanding and becoming greater and greater. Now that the war is over engineers are needed as never before to build up a bigger, better and greater Canada from ocean to ocean.

The President of *The Institute* then thanked the Board of Trade most heartily and the citizens of St. John for their kindness and hospitality being shown to the members of *The Institute* during the present convention. He was pleased to hear from the Chairman of the Board of Trade such an expression of appreciation of engineers and engineering work. He outlined the great growth of engineering services during the past forty years. When the Canadian Society of Civil Engineers was organized, engineering was limited. To-day it was universal. The former Society had grown into a large national engineering organization embracing every class of professional engineer. Members of the engineering profession, now strongly organized in Canada in one body, embracing all branches of the profession, occupied a unique position in their intimate yet unbiased relations with both capital and labor, understanding and sympathizing with the problems of both and were the one body of men organized and in a position to help solve the great problem now confronting the people of Canada. Organized labor represented possibly one-eighth of the workers and the number of employers employing organized labor represented possibly one two-hundredth part of the employers of labor in Canada, leaving the vast majority of the people unrepresented in labor disputes unless it be by the membership of *The Engineering Institute*, who suffer in common with all the people. Engineers were accustomed to solving actual problems and as the labor problem is one in human engineering, the minds of the men in the profession, both on account of their type of mind and their intimate relations with both capital and labor, were the minds that could best solve those questions. He desired the business men of Canada to appreciate the fact that the Engineers of Canada who had so well demonstrated their efficiency in the great war were the men who must develop the material resources of the country and their constructive training will bring them to conclusion that in the labor problem would be of material benefit to the nation.

Engineers, being educated men, trained in practical work, have as a body maintained their steadiness at a time when the contending parties in labor disputes and many others who obtained their knowledge largely from reading, have lost their sense of perspective.

Major Hayes of St. John gave a brief address, followed by C. C. Kirby, A.M.E.I.C. After thanking the Board of Trade on behalf of the members in St. John, he said in part: "The St. John branch of *The Engineering Institute* is taking a very keen interest in local problems, and although we do not wish just now to go on record very strongly—we do not feel that we have yet been organized in St. John sufficiently long to take any very prominent part in local discussions, but we are following them with intense interest and we intend before very long to make ourselves felt. The St. John Branch before long will let you know that it is in existence."

J. K. Ganong spoke briefly regarding the work of engineers. The spirit of the engineer is achievement. The world would profit if we could all become imbued with that same spirit.

F. A. Bowman, M.E.I.C., Chairman of the Halifax Branch, was glad of the opportunity of being present, and emphasized the fact that this meeting was an example of the spirit of co-operation which is growing up all over the world. The evolution of the present *Engineering Institute* from the former Canadian Society of Civil Engineers was a further illustration of this. "We have a branch at Halifax and one at St. John, which join forces in holding professional meetings, besides the respective meetings of the branches. This was the second professional meeting in the Maritime Provinces, called for the purpose of discussing problems peculiar to this section, getting better acquainted, and co-operating for mutual advantage. Mr. Vaughan, who we regret so much is not with us to-day, emphasized that last year in addressing the meeting at Halifax. He was just back from a meeting in the West, and he said how much he had been struck with the peculiar, to a certain extent, local problems that the engineers there had to meet. The papers at that meeting dealt very largely with such questions as the adequate water supply for the Western prairie cities and the effect of that prairie water which is strongly alkali, upon concrete. In these Provinces we also have a problem regarding concrete, being the effect of tidal water on concrete. We are now investigating, and a committee will report on this subject at another session of this meeting. These meetings are a further advantage in giving us an opportunity of meeting the business men, and laying before them our problems which result in our becoming better acquainted and each having a better understanding of one another.

A. H. Wetmore, who last year as President of the St. John Board of Trade attended the professional meeting at Halifax, in a brief well worded address assured the engineers of the pleasure and benefit he drived from associating with them.

The President of the Board of Trade then called upon Colonel Leonard to take the chair, who on doing so extended a cordial invitation to the members of the Board of Trade present to remain to hear the paper on Canadian Corps Engineering Problems during the Advance of 1918, by R. F. Armstrong, A.M.E.I.C., Town Manager of Woodstock, New Brunswick.

Mr. Armstrong, who did such excellent work as an officer in the Engineering Corps, was enthusiastically received upon rising to read his paper.

F. A. Bowman M.E.I.C., Chairman of the Halifax Branch.

Problems of the Canadian Engineers in France, 1918

It is not proposed in this paper to give a technical or detailed discussion on any particular piece of work carried on by the Canadian Corps Engineers but in a general way to describe the organization and the various problems which confronted our engineers, particularly during the advance which started on August 8th, 1918, and continued steadily up until the Armistice day.

Organization

Previous to 1918, the Canadian Engineers were organized on the same basis as the Royal Engineers and with each infantry brigade there was attached, for engineering duties, one field company of engineers. Under this arrangement the sappers were so few in number that they could only act as supervisers and all forward working parties had to be supplied from the Infantry. This was unsatisfactory both to the Infantry and to the Engineers; to the Infantryman because he resented the fact of being under the orders of a sapper of probably lower rank, and to the engineer because his working crew had to be broken in for each job and often there was considerable trouble in arranging details between the two parties. Early in 1918 the new organization was authorized and the engineers were formed into four brigades, each brigade consisting of three battalions of about the same strength as an infantry battalion. Each brigade was responsible to the chief engineer for the entire engineering work of the infantry division with which they worked. Then there was what was known as Corps troops, consisting of troop companies which were used for special works such as heavy bridging, water supply, dam construction, etc. These corps troops were also responsible to the chief engineer. The chief engineer divided his work into five branches—bridging, water supply light railways, roads and defenses, and at the head of each branch placed a field engineer who was held responsible to him for the work of his department.

Defensive Measures, April to July, 1918

April 1918 found the Canadians in the Arras, Roclincourt, Vimy sector and as the dropping back of the Allied troops in the Bethune Area North of Vimy and also in the sector South of Arras left the Canadians in a very prominent salient, plans were immediately undertaken, in case of a withdrawal, to make the advance of the enemy as difficult as possible. Bridges and road intersections were mined and rather a comprehensive scheme of flooding the low land on each side of the Scarpe River was adopted. A topographical survey was made of about five miles of the Scarpe River Valley and the location of dams, sluiceways, dykes, etc., decided upon so as to flood certain areas. The areas to be flooded were then covered with barbed wire entanglements and the construction of the dams at once proceeded with. It was the writer's good fortune to be associated in this topographical survey and in the construction of the dams. The dams were each about 36 feet long, of an average depth of 12 feet and were constructed with a timber crig, rock filled; a core wall in centre being made of clay. The sluice in each dam was built of heavy timber and was about 7 ft. wide, the gate being arranged so as to be dropped in sections when the occasion demanded.

The attached plan shows the part of the Scarpe River Valley between St. Nicolas and Etrum that it was proposed to flood, the portion marked in blue showing area that could be flooded. The dam sites were as follows:—

1.	G. 16 C 95.35	Rock filled timber crib	15′ high,	36′ long.
2.	G. 15 D 90.50	" " "	" 9′	" 36′ "
3.	G. 15 C 40.95	" " "	" 10′	" 35′ "
4.	G. 14 D 35.85	" " "	" 11′	" 37′ "
5.	L. 10 A 45.95	" " "	" 10′	" 33′ "
6.	G. 15 C 50.90	Earth, rock, timber crib	9′ high	32′ long.

These dams were all constructed at the same time and a working crew of about fifteen sappers and seventy men were employed on each job. Work was completed in five days. The estimated flow of the stream was 114 cubic feet per second and the estimated time to flood the areas—72 hours after the closing of the sluice gate. During a period of foggy weather when observation by enemy planes was not permissable, the scheme was tried out and came fully up to expectations, but fortunately, as now history knows, the Canadians, never had to fall back and this inundation scheme, as a defensive measure, never was used and the dams were opened up and dykes torn down.

From May until July there was very little interesting engineering work carried on except the digging of extensive systems of trenches, building of strong points, and machine gun posts, placing barbed wire, etc. The area was divided into defense lines, the idea being in a withdrawal to defend one line as long as possible and then have an organized withdrawal to the next defense point.

Preparation for the Advance

Early in August the Canadians moved South to take part in the famous drive of August 8th, and the engineers immediately started preparations for the work entailed in the attack. In this Amiens push, road construction, tramway construction and water supply works were probably the most important phases of the engineering work but as we passed over a country which for months had been used only as a "No Man's land," and where there was nothing left but a mass of shell holes and the wreckage of old buildings, our engineers were called upon to meet almost all problems expected in military work. In this advance the new engineering organization proved itself to be well adapted to a moving warfare and the work of the engineers was highly commended by the other branches of the service.

The Advance at Arras

On the 23rd of August the Canadian Corps which had been carrying on successfully in the Amiens area since August 8th, was moved again to the vicinity of Arras and the Engineers at once started preparations for the series of operations which commenced with the opening of this attack on August 26th, and lasted up until Mons was reached on Armistice day. In this advance the Canadian Engineers may be said to have come into their own as here was a scope for bridge building, tramway building, road construction and water supply work which was a pleasant change to the old tiresome trench and wire entanglement details.

Bridging Operations

The Germans were very thorough in their demolition work for not only were the girder sections of bridges cut by explosives and dropped into the Rivers or Canals, but the abutments were completely destroyed and large craters blown in the approach roads. These craters had all to be filled, or bridged, before the heavy bridging material could be rushed forward. These points were also subjected to considerable harassing fire for in no way could the enemy better delay our advance than by holding up the bridging work.

The bridging operations may be divided into three phases, viz.:—

1. Crossings for Infantry.
2. Crossings for first line transport, i.e., field guns, horse transport, etc.
3. Heavy bridges to take tanks, heavy guns, lorries, etc.

Infantry Crossings

These consisted of improvised crossings over the damaged structure or by using cork bridges. Sufficient slabs of cork to give the requisite buoyancy were baled together with wire netting and connected at about 8 foot intervals by two light stringers. Slabs were nailed across these stringers and the bridge so formed took infantry across in single file. The German foot bridge was similar in many respects but instead of cork piers he used hollow wrought iron cylinders. These were more easily handled than our cork slabs, but were very easily punctured and put out of commission by fragments of shells.

Crossings for 1st Line Transport

The pontoons and trestle equipment of the ARMY proved itself invaluable for crossing the Canal systems and a bridge of 90 feet span could be erected in one and half hours' time under adverse conditions. Trestle bridges were constructed with whatever material was available from the captured material dumps.

Heavy Bridges

The construction of heavy bridges over the Canals presented many problems. The latest type of tank had a live load of 37 tons and the new six inch gun an axle load of 17 tons. The canals were approximately 90 feet wide and the clear span necessary about 108 feet. Clear span bridges were often necessary as it was impossible to remove the damaged structure and its presence in the bottom of Canal prevented the use of trestles and cribbing, at least for speedy construction.

The British Army had adopted a new bridge called the "Inglis Portable Military Bridge Rectangular Type," and this proved most valuable. It is composed of a number of identical bays, 12 feet long, 12 feet high and 12 feet wide and designed to carry a dead load of 84 tons, distributed over a clear span of 84 feet. It is of the Warren Girder Type; the tension and compression members being mild steel, lap welded tubes, thickened at the ends and pin connected in steel junction boxes. The transoms and transverse stiffeners are I beams, the web being cut out in places by an oxy-acetylene plant, to reduce the weight for handling to a minimum. Each part of the bridge can be manhandled, the weight of one 12 foot bay in skeleton form—that is ready for launching—being 1.735 tons and one bay of the finished structure complete with decking 3.16 tons.

The first bay of the bridge is built on a two wheeled trolley then a long arm, sufficient for the gap to be bridged is built out as a cantilever on one side, and a shorter counter balance is constructed simultaneously on the other side of the trolley. When skeleton bridge is completed the end bay of the counter balance is loaded with road bearers until balance is obtained. The bridge is then pushed forward by hand power over the gap, the trolley moving on a prepared track and the far side of the bridge lowered on its abutments. The counterbalance is first removed, then the trolley, then the near side lowered on its abutment and the decking laid. In September, 1918, a bridge of this type, 108 feet clear span, was erected under heavy shell fire across the Canal du Nord and opened for traffic in 12½ hours. A work party of 200 sappers being employed on the construction of the bridge, abutments and approaches. The bridge at this span was good for a distributed load of 51 tons and after the erection of a trestle, as a centre support, took all classes of transport.

The bridge can be built of any span in multiples of 12 feet but is limited to 120 feet with a distributed load of 41 tons. Immediately this bridge was erected construction was started on a bridge of a more permanent type allowing the Inglis bridge to be removed in preparation for use in another attack.

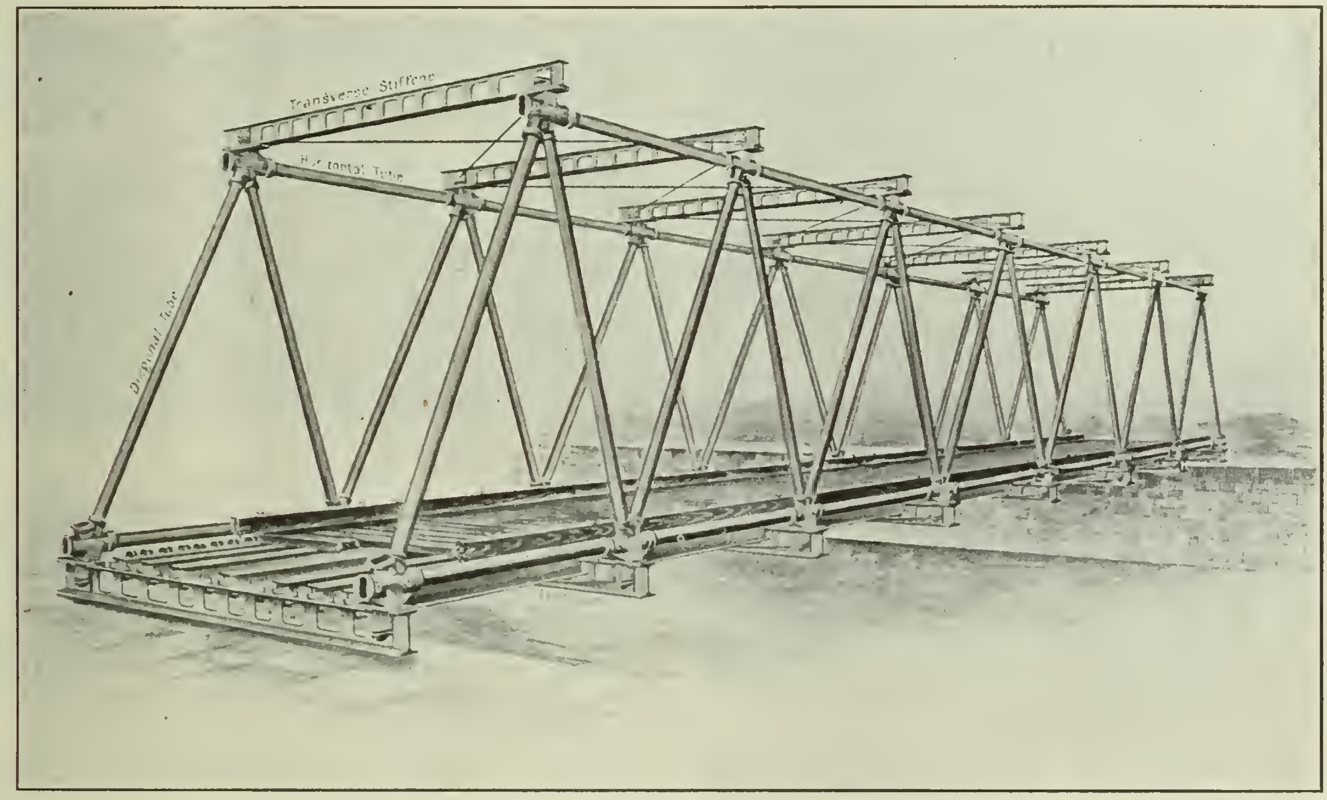


Fig. 1.—"Rectangular" Type Inglis Portable Military Bridge.

The Germans had large dumps of good squared bridging timber and with these I beams, many bridges were constructed, the Canadian sapper being very much in his element with a cross-cut-saw, squared timber and spikes; a welcome change from the old trench warfare days of pick and shovel work.

During the 1918 advance 200 bridges were constructed by the Canadian Engineers, of which 86 were for heavy traffic. In the bridging operations aeroplane observation was a most important element and by a detailed study of aeroplane photographs many points were noted which were taken advantage of in the preparations and much time saved when the construction of the bridge was undertaken.

Tramways

The Canadian Corps Tramways played a most important part in the 1918 advance. They were able to push their rails up after the advancing troops and act as an ammunition supply link between the broad gauge railhead and the forward field guns. The average daily tonnage hauled by the Canadian Corps Tramways during 1918 was 1500 tons, and it can be readily seen from these figures how valuable their work was in relieving lorry and horse traffic and the consequent blocking of traffic.

Roads

An enormous amount of work was also done on roads. In the initial stages of an attack when "No Man's land" was passed over it meant practically the building of a new road and as the enemy retreated at each road intersection he left huge craters which had to be filled. Included in this work was also the searching for delay road mines, which while a dangerous task was the means of saving many lives. During the 1918 advances 773 miles of roads were repaired and maintained for lorry traffic and when you consider that hundreds and hundreds of from two to five ton lorries as well as horse transports are continually moving over these roads, during a show, you can perhaps realize the work which was accomplished. In addition to this there was 290 miles of dry weather track constructed to keep horse transport off the main roads.

Water Supply

In the water supply work a special company was organized in each engineer brigade and worked with the infantry division to which it was attached. A portion of this section went forward with the advancing infantry, taking with them representatives from the C.A.M.C., with apparatus to carry out a quick melatic test for poisoned water. This detail immediately investigated for water points, sending back to another portion of the section information as to what apparatus was required at each definite location to reclaim a supply. This second detail then came forward with the necessary equipment, which was chiefly tools for cleaning the well. Small hand pumping sets, windlasses, buckets, etc. In the meantime the first detail had placed signs at the water points with information as to whether or not water was fit to drink and had pushed forward with the advancing troops. The hand sets were hurriedly put in operation, getting a supply of water to the forward troops, and as soon as source had proved of a fair capacity the hand set was moved to a more forward position and replaced by a small mechanical set which pumped water into canvas reservoirs and troughs. As soon as a source had been proved by these small mechanical sets worth further development Corps Troops came forward and replaced the small sets with larger ones, placed elevated canvas tanks with piping from pump to reservoir and from reservoir to standpipe, dixie fillers and horse troughs, feeding these points by gravity. The small mechanical sets were then moved forward to a more advanced location and the large sets in their turn were replaced by a permanent supply obtained by drilling wells and putting in an air lift or other form of deep well equipment. In this way we kept out equipment constantly in use and as the concentration was in the forward ten miles only the rear country did not require much maintenance except to supply water points for the railway and, as the railway troops came up these rear water points were usually taken over by them.

In the different villages passed through there were numerous small wells from which the Germans in their retreat had removed the pumping equipment and hurriedly filled in. In no cases did we find poisoned water and in most cases we were able to clear sufficient wells and in conjunction with an occasional small spring, stream or a town pumping plant which could be quickly overhauled we were able to care for the troops in perhaps a more satisfactory manner than might be expected when it is realized that a moving force of approximately 100,000 men and 25,000 horses, to say nothing of mechanical equipment, had to be supplied. The hand sets consisted of suction lift pumps and hand chain helice sets, that is sets with a continuous bucket chain bolt. The small mechanical sets were rotary and plunger pumps connected on same base to a four cylinder gasoline engine and had a capacity of from 1500 to 3000 gallons per hour against a 120′ head. The Merryweather Steam Portable Fire Engine Set was also used to good advantage. On deep wells where sufficient diameter was available hand elevator sets were used. These consisted of a canvas continuous belt driven by a gasoline engine and suspended into the water. On coming to the pulleys at the top it was squeezed between rollers and the water collected in an elevated chamber and feeding horse troughs and tanks by gravity. These pumps gave considerable trouble owing to difficulty in regulating speed of engine and level of pulley causing a sway and consequent wearing of belt. When working satisfactorily they had a capacity of 8000 gallons per hour.

The more permanent sets consisted of several types of pumps with capacities up to 9000 gallons per hour against 300′ head, and driven by gasoline or oil engines. When these sets were placed it was customary to place piping to a canvas elevated reservoir, capacity 18,000 gallons, and feed water points from this reservoir. Well drilling sets were used to good advantage and a six inch casing was usually placed and well fitted with air pipe line so as to be connected to a portable air left set which travelled around from well to well in a lorry. These sets pumped up to 12,000 gallons per hour and would fill the elevated canvas reservoirs and then move on to another well.

In addition to the development of these sources in districts where no suitable source could be obtained, water tanks and reservoirs were placed and kept filled by tank lorries hauling water from the most suitable pumping station. Also seven portable sterilizing sets were kept in constant use. These sets were mounted in a lorry and consisted of pump and sterilizing equipment with a small laboratory for testing the water, and had a capacity for treating and delivering 1200 gallons per hour. The water was pumped direct through special filters which removed the organic matter and was then treated with chlorine solution or gas to kill the bacteria.

During August, September and October 42 pumping stations were installed, 85 water points were established and fed by tank lorries, 55,000 feet of pipe was placed or reclaimed, 30 reservoirs of 9000 to 18,000 gallons were constructed, 6000 lineal feet of horse troughing placed, 40 water tank lorries kept in constant use and a daily supply delivery from the various sources of about 1,000,000 gallons which was made to supply approximately 100,000 men and 25,000 horses.

After the Armistice the water supplies in the Canadian Corps Area on the Rhine were investigated. In this area numerous small springs and streams give every opportunity to develop small local supplies and, therefore, few central pumping stations exist outside of the main towns. In the are along the banks of the river Rhine the practice seems to be to sink large shallow collecting wells and draw the water from the water shed on each side of the river. The surface water is naturally filtered through the fine sand in the area and the tests of the water are most satisfactory. No artificial purification is attempted.

In this brief paper, I have endeavoured to outline a few—a very few of the undertakings on land in which the members of the Canadian Engineers were engaged and which played no inconspicuous part, if I may be permitted to say it, in the final result. But it was only a small part of the war game. In the marine service; in aerial undertakings; in the electrical field; in the devising of ways and means to meet the gas and such-like problems which the Hun thrust upon us, and in other ways which may never be recorded, the Canadian Engineer did his part and tried to do it well. Now that the war is over and the arts of peace have taken the place of the arts of war, there is a relatively large field of usefulness in Canada for the members of the profession when events have so shaped themselves as to bring them and their talents into full play.

Discussion

Colonel Leonard congratulated Mr. Armstrong on his excellent paper, stating that the engineering problems of the war were great indeed, the paper giving only a partial idea of what they involved.

C. McN. Steeves, A.M.E.I.C., expressed his appreciation of the paper, as he had come in personal contact with the engineering work described by the speaker and had a knowledge of the good work he had done while there. He moved a vote of thanks to Mr. Armstrong, which was tendered in the form of hearty applause from all present.

As guests of the St. John Branch, the party, including the wives of a number of the local members, motored to Hampton, which is a delightful run of 25 miles on a splendid road, and passing through the charming scenery which the Valley of the Kennebecasis affords. At the Wayside Inn at Hampton the members of the party enjoyed afternoon tea, leaving at five o'clock for Gondola Point. An orchestra had been provided and the evening programme took the form of a dance, which was entered into with enthusiasm and heartily enjoyed by all present.

Sixth Session

At ten o'clock A.M. on Friday, the members assembled in front of St. Andrews Church, where a group photograph was taken, leaving shortly after on a sight-seeing trip about the harbor, ending at Courtenay Bay, where the important engineering work there under way was inspected.

Visit to Courtenay Bay

Here the members were the guests of the St. John Dry Dock and Shipbuilding Company, Limited, whose genial manager, Alex. Dufresne, M.E.I.C., had made elaborate arrangements for the welcoming and the entertainment of his guests. Besides the personal welcome of Mr. Dufresne, who is General Manager of the Company, large banners greeted the visitors proclaiming a welcome to the plant. Throughout the works numerous signs were in evidence conveying a welcome to the members of *The Engineering Institute* from the Bedford Construction Company, Limited who are sub-contractors for the entire work at Courtenay Bay.

Here also one of the most enjoyable functions of the professional meeting took place. In a dining hall especially constructed for the occasion surrounded by evergreens and having at one end a beautifully wrought design in sweet peas bearing the letters E.I.C. about one hundred men sat down to a well appointed banquet board where a meal was provided that would have done credit to the chef of a modern hotel. The chair was occupied by the host, Mr. Dufresne, with Colonel Leonard and Mayor Hayes seated on either side, and at the head table besides officers of *The Institute* a number of civic and county officials. After the toast to the King had been drunk Colonel Leonard addressed the assembly briefly, congratulating the St. John Branch on the excellent manner in which they had planned and carried out all the arrangements to combined to make the fifth professional meeting of *The Institute* such an unqualified success. He thanked the St. John Dry Dock and Construction Company for their lavish hospitality. He proposed a toast to Mr. Dufresne, who learned that he was a jolly good fellow expressed in no uncertain tone. Replying Mr. Dufresne said that it had been a great pleasure to entertain the members of *The Institute.* He was glad that they had an opportunity of seeing the work being carried out at Courtenay Bay, and expressed the hope that at some future date when the dry dock had been completed that he might again have the pleasure of entertaining them.

G. C. Murdock, M.E.I.C., proposed a toast to the city of St. John and the Municipality of the City and County of St. John, coupling with it Mayor Hayes, Warden Golding and Councillor O'Brien, all of whom replied briefly. Mr. Murdock also as Chairman of the Entertainment Committee proposed that the thanks of *The Institute* be conveyed to the Board of Trade for the use of their rooms and their kindness in many other ways, also to the City of St. John and to the Mayor for the assistance rendered to the St. John Branch in making their arrangements, to the St. John Dry Dock and Construction Company, to the owners of the various automobiles loaned to the Committee, to the members who had prepared so many splendid papers, and to the newspapers of St. John to whom the engineers owed a debt of gratitude for the trouble they had gone to in covering the meetings, the liberal amount of space they provided, also to all who in any way assisted in making the Convention a success and the able reporters who attended. This motion was seconded by Mr. Kirby and tendered by Colonel Leonard to those present on behalf of *The Institute.* A vote of thanks to the members of the St. John Branch on behalf of the visiting members for the excellent programme which they had provided and for the generous entertainment which characterized the gathering was proposed by R. Freeman, M.E.I.C., and seconded by W. P. Morrison, M.E.I.C.

Report of Concrete Committee

President Leonard announced that as the only other matter to come up at this professional meeting was the report of the Committee appointed last year to investigate and report on the action of sea water on concrete, rather than adjourn to the assembly rooms advantage would be taken of the occasion to have the reported presented.

THE BEDFORD CONSTRUCTION CO., Limited

WELCOME

The Members of

The Engineering Institute

The Committee of the Halifax Branch, consisting of A. C. Brown, A.M.E.I.C., James McGregor, M.E.I.C., and A. F. Dyer, A.M.E.I.C., through Mr. Bowman, presented the following report:—

In accordance with your instructions, we, having been appointed by your Executive Committee to report upon the action of sea-water on concrete in Nova Scotia, now beg to report as follows:—

As the time at our disposal was too short to allow of any conclusive experiments being carried out, our investigations had to be made on existing concrete structures in contact with sea-water. With this in view we wrote to various engineers stationed in Nova Scotia, likely to have experience of the action of sea-water on marine structures, and whose records or opinions it was thought would be valuable, but we regret to report that we have not yet received any replies or expressions of opinion from them.

Your Committee has therefore been obliged to draw up this report based on the experiences and opinions of its members.

Marine concrete structures in Nova Scotia are subjected to both chemical and mechanical forces tending to disintegrate their mass. In the case of non-reinforced concrete structures the chemical action is generally slight and where the concrete has been well proportioned and made with first-class materials, having the exposed parts dense and the surface smooth with the concrete as nearly as possibly impervious, and where special care had been taken to remove all laitance or defective materials at construction joints, the chemical action is negligible.

On the other hand if sea-water has access to the heart of the mass by way of poorly made construction joints or porous concrete, very serious trouble may result.

Where concrete is continually submerged in sea-water, and in consequence more or less constantly saturated, we find that chemical action does not take place to any noticeable extent, but where there is seepage or percolation of sea-water through concrete, thus allowing fresh supplies of sea-water to come in contact with the inner concrete, chemical action has been found to occur in the walls of such structures as graving docks, canal locks, etc., and it is our experience that it may be expected where the concrete is porous or has defective construction joints.

In general, we are of the opinion that the chemical action of sea-water on mass concrete in Nova Scotia is not serious in itself.

The mechanical forces acting on concrete immersed in or exposed to sea-water, are those of frost and the abrasion of floating bodies, chiefly ice. The results of these forces are apparent in practically every unprotected concrete structure in these waters. These forces, of necessity, act only between tide levels, but where the precaution has been taken of covering the concrete surfaces between tides with insulating or protective material, such as stone masonry, planking, etc., the action of frost and ice upon the concrete appears to have been prevented.

The action of frost and ice on concrete is dependable upon the density and strength of the concrete and some structures may survive several winters without showing signs of such action, but it is our experience that even a dense concrete will eventually succumb, and that the precaution of protecting concrete between tide levels should always be taken.

In the case of reinforced concrete structures the same chemical and mechanical forces acting on the concrete have to be considered, but in addition there is the chemical action of the sea-water on the embedded steel.

Below the level of low water there appears to be little, if any, action on the steel, between tide levels there may be some slight corrosion of embedded steel, but if the concrete covering is dense and it, in turn is protected by sheathing, the action will not be serious, if there be any at all. Above the level of high water the corrosion of the steel, with consequent cracking of the concrete appears to be more rapid. This action is probably due to finely divided particles of salt-water carried by the air which find their way through the covering of concrete to the steel. This action is found to vary with the temperature of the air, and has not been found so serious in Nova Scotia as it has been in warmer climates. Care should be taken that all reinforcing steel in a marine structure be covered with not less than two inches of very dense and smooth concrete.

The practice of leaving in the concrete the steel bolts or tie rods and wires used for bracing the forms, is objectionable and should be avoided for even when these bolts are cut off a distance in from the face, and the hole plastered over, unsatisfactory results are likely to be obtained as these bolts will ultimately prove to be starting points of deterioration.

The belief that a reinforced concrete marine structure will require little or no maintenance does not, in the present limited state of our knowledge, appear to be fully warranted, and it would seem advisable that such structures should be kept under close observation and any defects which may appear should be promptly remedied.

(Sgd.) A. C. Brown,
James McGregor,
A. F. Dyer.

As Chairman of the St. John Committee to investigate this subject, Mr. Gray reported the work that the Committee had done. It was resolved that these committees be continued and be asked to report further at the next Maritime professional meeting.

On behalf of the Halifax Branch, Mr. Bowman extended a hearty invitation to hold the next professional meeting at Halifax.

The singing of the National Anthem brought the Convention to a close.

Registry of Attendance

The following signed the register of the Convention:—

R. W. Leonard, St. Catharines, Ont.; C. C. Kirby, St. John, N.B.; Fraser S. Keith, Montreal, Que.; A. Gray, St. John, N.B.; G. G. Hare, St. John, N.B.; F. A. Bowman, Halifax, N.S.; J. R. Freeman, Halifax, N.S.; J. G. Dryden, Halifax, N.S.; O. S. Cox, Halifax, N.S.; W. P. Morrison, Halifax, N.S.; F. G. Goodspeed, St. John, N.B.; C. H. Wright, Halifax, N.S.; A. T. Macdonald, Halifax, N.S.; K. H. Smith, Halifax, N.S.; C. O. Foss, St. John, N.B.;

C. McN. Steeves, St. John, N.B.; J. S. Armstrong, Fredericton, N.B.; R. T. Hayes, St. John, N.B.; Geo. Ballantyne, St. John, N.B.; S. Guy Ashley, Barrington, N.S.; F. P. Vaughan, St. John, N.B.; John B. Jones, St. John, N.B.; Geoffrey Stead, Chatham, N.B.; Walter T. Earle, St. John, N.B.; C. St. J. Wilson, Halifax, N.S.; J. A. Grant, St. John, N.B.; F. W. Holt, St. John, N.B.; Moses Burpee, Houlton, Me.; Gilbert G. Murdoch, St. John, N.B.; A. G. Tapley, St. John, N.B.; C. S. Bennett, St. John, N.B.; H. M. Hopper, St. John, N.B.; T. E. O'Leary, St. John, N.B.; F. X. Jennings, St. John, N.B.; G. S. Macdonald, St. John, N.B.; A. R. Crookshank, St. John, N.B.; Grover Keith, St. John, N.B.; G. N. Hatfield, St. John, N.B.; Carlo Carneil, St. John, N.B.; H. C. Kinghorn, Fredericton, N.B.; J. A. W. Waring, St. John, N.B.; H. E. Huestis, St. John, N.B.; R. E. Armstrong, St. John, N.B.; H. D. Macaulay, St. John, N.B.; D. W. Burpee, Fredericton, N.B.; H. J. MacKenzie, Minto, N.B.; J. E. Marshall, St. John, N.B.; H. H. Donnelly, St. John, N.B.; G. D. Leonard, St. John, N.B.; C. G. Price, St. John, N.B.; Barry Wilson, St. John, N.B.; Ralph McInerney, St. John, N.B.; Hon. Wm. Pugsley, Lieut.-Governor of N.B., St. John, N.B.; Hon. James Domville, Rothesay, N.B.; A. O. Wolff, Brownville, Me.; D. R. Smith, St. John, N.B.; A. H. Case, St. John Standard; J. J. Hebert, St. John, N.B.; A. R. Dufresne, St. John, N.B.; R. B. Emerson, St. John, N.B.; E. J. Owens, St. John, N.B.; A. V. F. Duffy, St. John, N.B.; W. W. Gerow, St. John, N.B.; D. L. Hutchison, St. John, N.B.; W. R. Turnbull, Rothesay, N.B.; H. D. Needham, St. John, N.B.; J. M. McC. Lamb, St. John, N.B.; John R. Walsh, St. John, N.B.; T. L. Richardson, St. John, N.B.; E. R. Reid, St. John, N.B.; A. H. Wetmore, St. John, N.B.; John Thornton, St. John, N.B.; G. E. Martin, Chatham, N.B.; H. N. Putnam, Halifax, N.S.; J. P. Mooney, St. John, N.B.; B. Allen, St. John, N.B.; Samuel A. Sewell, St. John, N.B.; D. A. Duffy, St. John, N.B.; C. D. McAllister, St. John, N.B.; Chas. W. West, Boston, Mass.; W. B. MacKay, Halifax, N.S.; G. E. Howie, Fredericton, N.B.; H. G. Black, St. John, N.B.; J. W. Duncan, St. John, N.B.; T. J. Nesbit, St. John, N.B.; S. C. Webb, St. John, N.B.; J. O. Winfield, Halifax, N.S.; J. Newlands, St. John, N.B.; R. F. Armstrong, Woodstock, N.B.; R. H. Cushing, St. John, N.B.; C. L. Tracey, Fredericton, N.B.; H. L. Seymour, Ottawa, Ont.; R. J. Sandover Sly, Campbellton, N.B.; G. A. Hilyard, St. John, N.B.; W. J. Pickrell, St. John, N.B.; H. C. Grant, St. John, N.B.; L. S. Benjamin, St. John, N.B.; H. H. Wetmore, St. John, N.B.; J. T. Turnbull, St. John, N.B.; E. G. Cameron, St. John, N.B. A. A. Dodge St. John, N.B.; J. H. McHinney, St. John, N.B.; V. S. Chesnut, St. John, N.B.; Jas. Gilchrist, St. John, N.B.; A. F. Foote, Toronto, Ont.; H. Thorne, Windsor, Ont.; Wm. Golding, Fairville, N.B.; S. M. Telfer, St. John, N.B.

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

VOL. II. October 1919 No. 10

Engineering Legislation

From the minutes of a meeting of the Council held on Tuesday, September 23rd, it will be seen that further consideration was given to the report of the scrutineers regarding legislation and the relation of *The Institute* in connection with proposed legislation. The resolution at the Annual Meeting at Ottawa stated that in the case of a favorable opinion from the members, the Council of *The Institute* should immediately take the necessary measures in co-operation with the Branches to have the legislation enacted.

After a full discussion it was resolved: *That the Council would further in every way the desire of the members regarding legislation, and, inasmuch as the actual application of such legislation is in the hands of the engineers in each province, it is desirable that the Branches and Provincial Divisions in co-operation with other engineering organizations in each province, take the initiative, and in which they are assured of the moral support of The Institute.*

It may be pointed out that legislation as proposed by the special committee recognizes no existing engineering body, and, therefore, all bodies of professional engineers, or bodies composed in part only of professional engineers are on an equal footing in this connection. Engineers in the various provinces will no doubt in making their plans to secure enactment on behalf of professional engineers invite the co-operation of all qualified engineers, whether members of recognized institutions or not.

Classification and Compensation of Engineers

Previous issues of *The Journal* have given the members of *The Institute* information as to the main features of the bill now before the Dominion Parliament relating to the Reclassification of the Civil Service of Canada in as far as this bill affects the engineering profession. Following the work already done by Council in exerting its influence through a special committee in the interests of engineers employed in the civil service, on being advised that the bill would come before Parliament at the short session of Parliament, the Secretary was instructed to meet the various deputy ministers and the chief engineers of departments employing a considerable number of engineers, and also the Civil Service Commission, in order to secure information which would be of advantage to the Council, and enable the members and *The Institute* at large, more effectively to render assistance in this connection.

In an interview with a member of the Civil Service Commission, he stated that representations made by the deputy ministers of various departments had all been considered, and had resulted in many changes amounting to fifty percent of the classification. The reclassification volume was being re-printed, and the new edition would be the one submitted to Parliament. This member of the Commission, and he spoke for the other members thereof, was most emphatic in his attitude towards any concerted opposition to the passing of the bill, stating that if such occurred when the bill was presented to Parliament, that not only would it not pass at this session, but in all likelihood it would never pass. From the various heads of departments and deputies, it was learned, that while many changes had been recommended, although it was not clear that the recommendations would be accepted in full, the general opinion seemed to be that every support should be given the bill in order that it be passed, since the necessary machinery was provided for dealing with individual cases. An advisory board to the Civil Service Commission has been appointed, of which A. St. Laurent, M.E.I.C. is a member, and it is understood that a board of appeal will be constituted whereby any decision of the Civil Service Commission, acting on the advice of the advisory board, or upon representation made by a deputy regarding any classification, may be appealed and given reconsideration.

Inasmuch as the proposed bill elevates engineers employed by the Government from the class of clerks, and gives them a certain status, which they never had in the service, and in the majority of cases gives an increased remuneration, it was decided by Council to give every support to the proposed bill. It is also urged that individuals refrain from expressing any personal dissatisfaction which may exist at the present time, in order that the bill may be passed, and that their individual cases may be considered by the machinery provided.

The interest which the proposed bill has aroused is illustrated by report of the chairman of the Committee on Classification and Compensation of Engineers, and of State and Municipal section of the Engineering Council to Alfred D. Flinn the Secretary under date of August 27th. While the Council of *The Engineering Institute of Canada* is supporting this bill because it marks a step in advance and because it enables *The Institute* to devote its influence on behalf of any individual position, the committee of the Engineering Council objects to the classifications because they do not sufficiently reward those particularly in the higher engineering service, and because the classification proposed inasfar as engineering positions are concerned is not adequately corelated.

The conclusion of Chairman A. S. Tuttle's report to Engineering Council reads:

> "It would seem to the writer that this report is open to serious criticism on the grounds that it fails to group engineering service along orderly lines, that it provides too narrow limits for promotions within a grade, and that the compensation proposed for all grades, in inadequate for the service rendered. The latter criticism seems particularly pertinent in comparison with the rates now being demanded by organized labor. The practicability of properly meeting present day conditions by the addition of a "Special War Bonus" to the proposed rates in order to meet the present high cost of living is also to be questioned on the ground that, and as set forth in the circular letter issued by Council's Committee on Classification and Compensation of State and Municipal Engineers, the "revolutionary change in the cost of living" is one which "unless modified by further economic disturbance is likely to be permanent or to continue for a long time to come."

The above outline illustrates, if nothing else, that the engineering bodies as represented by the national organizations are aroused to the fullest extent to a sense of the inadequacy of the remuneration of engineers at the present time, and it must naturally follow, that with the strength of the organizations directed on behalf of the inadequately paid engineer, within a very short time, a definite improvement in the salary situation, and a pronounced elevation in the standard of engineers must necessarily be realized.

Professional Meeting at St. John

Following the high standard established at Halifax a year ago when the first Professional Meeting of the Maritime Provinces was held, those who attended last year anticipated much from the St. John meeting and none was disappointed. Hospitality is the characteristic feature of the citizens of St. John, and this was manifest in a magnificent manner throughout the three days of the Convention. Particular praise is due to the men who arranged the program, and who were responsible for the social functions which contributed so much to the pleasure and success of this gathering. An optimistic estimate of the number expected placed this at seventy-five. The official register showed one hundred and six names, all of whom, with very few exceptions, are members of *The Institute*.

The meeting besides demonstrating the high engineering standard of the men in the Maritime provinces, exemplified more than anything else could the spirit of fraternity and good fellowship that has permeated the ranks of the engineering profession since the establishment of the Halifax and St. John Branches less than two years ago.

The account of the proceedings of this meeting appear in the general section of this issue and will be read with interest by engineers throughout Canada and elsewhere. The papers were for the most part unique and distinctive and a credit to the ability of the various authors.

In addition to an obligation on the part of *The Institute* to the loyal members who spent so much of their time and energy in arranging the details of this gathering, *The Institute* owe a debt to the City of St. John which was officially represented by Mayor Hayes at all of the gatherings and functions, to the Board of Trade for their generosity in placing their rooms at our disposal and for their enjoyable luncheon at which the members of *The Institute* were their guests, to the owners of automobiles who generously placed them at the disposal of the local branch, to the various companies who extended invitations to visit their works, to the Bedford Construction Company, and particularly to the St. John Dry Dock and Ship Building Company for the munificent manner in which they entertained the delegates at their works.

The general impression that those privileged to attend this gathering received was, that such gatherings within a very few years will do much to consolidate the engineering profession in a body, whose members are well acquainted one with another, who appreciate one another as they never did before, who take a great pride in their profession and who are each and every one working together for a common object, the welfare of the engineering profession.

Officers and Members of Council

In the report of Council published in the current issue will be found under the heading, "Nominations for Ballot," the report of the Nomination Committee as received and approved by Council relating to the election of officers for the year 1920.

In Section 68 of the By-Laws under the caption "Nominees for Officers' Ballot sent to Members," it is required that within seven days after the first meeting of Council in October the Secretary shall mail to each Corporate Member of the Society the list of nominees for the Officers' Ballot. The publication of the list in *The Journal* is according to another clause of the By-Laws equivalent to the requirements above mentioned.

It is further provided that additional nominations for the Officers' Ballot signed by ten or more Corporate Members and accompanied by written acceptance of those nominated, if received by the Secretary, on or before the first day of December, shall be accepted by Council and shall also be placed on the ballot. The title "Special nomination" shall be placed conspicuously near such names, and the names of the members making such nominations shall be shown on some part of the ballot sheet.

National Industrial Conference

Industrial Canada in meeting for a week's conference in the Senate Chamber at Ottawa from September fifteenth to twentieth, at the request of the Government of Canada, through Hon. Senator Gideon Robertson, Minister of Labour, inaugurated a new era in this country in the relations between capital and labour. The conference itself was an epoch in this respect, not so much from what was definitely accomplished, but on account of the fact that for the first time representatives from capital and representatives from labour met on common ground to discuss an agenda designed to promote greater harmony in their mutual relations. The outstanding feature as far as the public of Canada is concerned is that recognition was given for the first time to the position held by what Hon. MacKenzie King describes as the third and fourth groups in the problem, being the managerial and the community.

Due largely to the activities of Wills McLachlan, consulting engineer, Toronto, who, as vice-chairman of the labour sub-committee of the Construction and Development Committee of the Cabinet, has spent a great deal of time and given considerable thought to this subject, the other parties in the discussion were represented by the third group and who, representing neither capital nor labour, did effective work on the various committees, their influence showing the value of such representation. *The Engineering Institute of Canada* was represented in this group by Lieut.-Col. R. P. Rogers, D.S.O., Professor H. M. MacKay and the Secretary of *The Institute.*

What is believed to be the most important result of this conference, in addition to an added respect both on the part of capital and labour for each other and the recognition of the third party, was the decision to recommend to the Government the establishment of industrial councils as may be requested, in various industries and designed to meet the various situations as they may arise.

Professional Engineers of New Brunswick

On Friday September 12th, a meeting of all engineers in New Brunswick was held for the purpose of organizing an association of professional engineers in New Brunswick and to take steps to secure an Act in the Provincial Legislature relating to professional engineers. The question of financing such an application was taken up, and the members present agreed to contribute to the cost which it was stated would be about $150.00. It was proposed to use as a basis with such slight amendments as might be desired, the Act respecting the engineering profession which had been prepared by the committee at Montreal. It was decided to have the headquarters of the Association at St. John. The following officers were appointed: President, C. C. Kirby, A.M.E.I.C., Vice President, Geoffrey Stead, A.M.E.I.C., Secretary, A. R. Crookshank, M.E.I.C. Councillors:—B. M. Hill, M.E.I.C., Fredericton, R. F. Armstrong, A.M.E.I.C., Woodstock, C. B. Brown, M.E.I.C., Moncton, D. F. Maxwell, M.E.I.C., St. Stephen, R. F. Sandover-Sly, A.M.E.I.C., Campbellton, C. O. Foss, M.E.I.C., G. G. Murdoch, M.E.I.C., J. A. Grant, A.M.E.I.C., and A. R. Dufresne, M.E.I.C., of St. John.

Our New Treasurer

There will be universal gratification throughout *The Institute* in the acceptance by Brig.-Gen. Sir Alexander Bertram, M.E.I.C. of the honorary duties of Treasurer of *The Institute.* Sir Alexander is too well known both in the industrial and engineering life of this country to require any lengthy biographical sketch in these columns. His devotion to the work of *The Institute* and to the welfare of the engineering profession are also matters

BRIG.-GEN. SIR ALEXANDER BERTRAM, M.E.I.C.,

Treasurer of the *Institute.*

of general knowledge to those who come constantly in contact with him. In accepting this position the new Treasurer has further demonstrated his willingness and ability to render unselfish service on behalf of the profession in which he has long occupied such an exalted position.

N. S. Water Power Commission

Under the Power Commission Act passed at the last session of the Nova Scotia Legislature, a power commission for the province of Nova Scotia has recently been appointed and is undertaking immediately definite investigations with a view to an early development of certain water powers adjacent to the city of Halifax. The members of the Commission are Hon. E. H. Armstrong, Commissioner of Public Works and Mines, Chairman, R. H. MacKay of New Glasgow and F. C. Whitman of Annapolis. K. H. Smith, A.M.E.I.C., Hydraulic Engineer of the Dominion Water Power Branch who, for some time past has been in charge of hydrometric work and water power investigations in the Maritime Provinces and at the same time has acted as engineer to the Nova Scotia and New Brunswick authorities concerning water power matters, has been appointed Chief Engineer of the Commission and Acting Secretary. It is expected that with the approval of the Director of Water Power, Mr. Smith will be able to continue in his present capacity with the Dominion Water Power Branch as it is thought that such an arrangement will be in the interest of all concerned.

The Commission held its organization meeting on Tuesday, Sept. 9th and is already in consultation with General C. H. Mitchell, M.E.I.C. of the firm of C. H. & P. H. Mitchell, Consulting Engineers, Toronto, with a view to definite action at an early date.

Engineering Standards Association Activity

Under the secretaryship of Captain R. J. Durley, the Canadian Engineering Standards Association is beginning to exercise the influence in the engineering life in Canada, which those, who are responsible for its establishment hoped it would. A meeting of the Association was held at Ottawa on September eighth, at which H. H. Vaughan, M.E.I.C. presided.

New members were appointed as follows: J. M. R. Fairbairn, M.E.I.C., nominated by the Canadian Pacific Ry.; H. G. Kelley, M.E.I.C., nominated by the Grand Trunk Ry.; A. F. Stewart, M.E.I.C., nominated by the Canadian National Rys.; F. A. Gaby, M.E.I.C., nominated by the Hydro-Electric Power Commission of Oatario; A. A. Dion, M.E.I.C., nominated by the Canadian Electrical Association and J. Stadler, the Canadian Pulp and Paper Association.

Chairmen of sectional committees were approved as follows; Electrical sectional committee, Dr. L. A. Herdt, M.E.I.C.; Sectional committee on steel bridges and construction, G. H. Duggan, M.E.I.C.; Sectional committee on wire rope, Prof. H. M. MacKay, M.E.I.C. Recommendations as to membership of the following sub-committees were received, and the committees appointed accordingly: Sub-committee on steel railway bridges, P. B. Motley, M.E.I.C. Sub-committee on incandescent lamps, John Murphy, M.E.I.C. Sub-committee on transformers, A. A. Dion, M.E.I.C.

The secretary reported the progress made with regard to various questions already under consideration, and further reported a number of requests for action on the part of the association. Several of these were approved for further enquiry and report.

The chairman welcomed C. Le Maistre, the secretary of the British Engineering Standards Association, who is now on a visit to Canada and the United States. Mr. Le Maistre described briefly the work of the B.E.S.A., and drew the attention of the committee to certain matters in which his association would welcome the assistance and co-operation of the Canadian Engineering Standards Association, referring especially to proposals which have been made with a view of obtaining some degree of Anglo-American agreement as to screw-thread standards. Mr. Le Maistre further pointed out the desirability of international agreement as to rules affecting electrical appliances and fittings, particularly for interior use. As regards the first suggestion, it was decided to appoint a sub-committee on screw-threads, with instructions to consider and report on Mr. Le Maistre's communication.

Considerable discussion took place on the question of rules for electrical appliances, and the committee agreed that the formulation of a "Canadian Electric Code" was most desirable. The committee then directed that a sub-committee should be called together to enquire and report further as to this point.

Montreal Aqueduct Arbitration

W. F. Tye, M.E.I.C., J. M. R. Fairbairn, M.E.I.C. and Aime Geoffrion, K.C., the Board of Arbitration to adjudicate between the City of Montreal and the Cook Construction Company in connection with the contract work for widening the city aqueduct have presented their decision to the Administrative Commission of Montreal. By this award claims allowed against the city aggregate four hundred and thirty eight thousand dollars and a counter claim of one hundred and thirty thousand dollars is conceded to the city leaving three hundred and eight thousand dollars payable to the Cook Construction Company. Messrs. Fairbairn and Geoffrion submitted the claim by the City of Montreal for damages in connection with the break in the conduit in favor of the city, holding the Company liable in damages for the sum of eighty one thousand, eight hundred and eighty nine dollars. To this Mr. Tye dissented on four points, viz: in regard to the reinforcement of the conduit, as to tamping on the back of the trench, as to the underdrain, and finally the company was not informed of a washout that occurred before the signing of the contract. His opinion was that had the conduit been as represented it would not have broken. The other awards were all unanimous.

Members having copies of the May number of *The Journal*, which they do not wish to keep for reference, would confer a great favor by mailing them to the Secretary. About twenty copies are required.

Civil Service Classification

Questions from men in the Civil Service, and the replies of the Civil Service Commissioners which are of interest to the engineering profession.

Status of Temporaries

Question: Please tell me if the employees in the separation allowance and assigned pay branch of the Department of Militia and Defence who have seen three or more years of service will be made permanent. If not, what standing will they have?—No. 63.

Answer: The mere fact of classification will not make a temporary position a permanent one nor will it give temporary employees, whether in permanent or temporary positions, permanent status. Under classification the status of temporary employees will receive exactly the same as at present; the classification, it should be remembered is of positions, not of persons.

Head of Household

Question: I am married and have three young children; my mother also lives with me. My wife and mother each have a private income of $200 yearly. Am I classed with or without dependents for the forthcoming bonus?—No. 64.

Answer: Apparently a person in the situation described would be entitled to receive the bonus as the head of a household, if otherwise qualified. The order in council provides that where a son, daughter, or wife is employed he or she shall not be considered as contributing to the support of other members of the household dependent on the supporting head. In cases of the receipt of small incomes, as cited above, not sufficient to be considered as contributing substantially to the support of the dependent children, it would appear reasonable to consider the husband the sole supporting head of a household. In such cases the facts should be entered on the declaration form and referred to the department concerned for approval.

Bonus for 1918 Work

Question: I worked in the Separation Allowance and Assigned Pay Branch from July, 1917, to May 31, 1918. On June 1, 1918, I secured a position with a commercial firm in Ottawa and on June 13, of this year enlisted in the Royal Northwest Mounted Police. I understood from the paymaster of the separation allowance and assigned pay branch a few months ago that a certain amount of bonus was payable for service during April and May, 1918, but that having left the service I could not have it. He added that provision was about to be made by Parliament, however, for the payment of such bonuses to those who had left the governmental employ. Can you kindly advise me if I may expect any bonus from the separation allowance and assigned pay branch?—No. 72.

Answer: The payment of any bonus for services rendered before April 1, 1919, is not in the hands of the Civil Service Commission. If you think you are entitled to a bonus for service given before that time you should take up the matter with the department or with the paymaster.

Mechanics and Labourers

Question: 1. Are mechanics who receive a monthly (not hourly) pay to be considered civil servants? 2. Are they considered premanent employees? 3. Are mechanics, helpers, and labourers receiving hourly wages considered civil servants and permanent employees? 4. Are mechanics and foremen mechanics in line for promotion? If so what is the next rank to which a mechanic would be likely to be promoted if qualified? 5. Will seniority be given preference in promotion, other qualifications being equal? 6. Are mechanics (monthly men) receiving from $47 to $68 per month less than local prevailing rates entitled to the $420 bonus? 7. Will there be any material changes in the answers to the above questions if the proposed civil service classification becomes law?—No. 73.

Answer: 1, 2 and 3. The positions in a department depend upon the work to be done. This means that certain positions will be permanent and others temporary A permanent position will normally be filled by a permanent employee, though in some cases a temporary employee may for the time being fill a permanent position; as an example, a permanent position would be filled by a temporary employee if the Civil Service Commission had no list of eligibles when a vacancy occurred. Employees filling temporary positions are of course temporary. Whether a position is permanent or temporary depends upon the organization of the department and whether the employee is temporary depends upon the nature of his appointment. Therefore, the method of payment (whether by the hour, week, or month) is not the determining factor, though as a rule permanent employees are more likely to be paid by the month or year and temporary employees by the hour or day. According to the Civil Service act of 1918 and the proposed amendments mechanics, helpers, and labourers are considered civil servants unless they are employed on the government railways, but whether they are permanent or temporary depends upon the nature of the position and the nature of the appointment. 4. Mechanics are in line for promotion; if you will look in the classification under "Tradesmen," you will find the lines of promotion in part indicated. 5. Seniority is always one of the factors considered in making promotions. 6. So many factors must be taken into consideration that a definite answer to your question with regard to the bonus can not be given until the department's pay lists are submitted to the Civil Service Commission. 7. The proposed classification does not materially change the answers to the above questions but the legislation to make it effective states the governing principles much more clearly than the present law and in fact would make the matter so clear that you would probably not find it necessary to ask questions of this kind. At present the status is determined partly by acts of Parliament, partly by orders in council, partly by long established custom, and partly by departmental rules and civil service regulations, while if the classification were adopted together with the necessary legislation the whole matter would be made clear by the law, the classification, and the regulations of the Civil Service Commission (approved by the governor in council).

Returned Soldier

Question: I received my first permanent appointment as a clerk-stenographer, April 1, 1915. I enlisted in September, 1915, and served in France until May 3, 1919, returning to Canada June 15. On enlistment my salary was $650 per annum and I have received the statutory increases which make my present salary $800 per annum. During my absence five new clerks have been added to the staff and last October four of these were promoted to grade 3A of the third division and are receiving a salary of $1000. I should like to know how I will be affected by the reclassification. Will I be junior to these clerks who have come into the department since my enlistment? Doing the same work as they am I not entitled to the same salary?. Will the fact that I have been overseas for over three years be allowed to retard my promotion, or will this be readjusted in the classification?—No. 75.

Answer: Some of the matters you mention are taken care of by the classification and some are not. Your position will be classified on the basis of the duties you perform and the responsibilities you exercise. If you are doing the same work as new clerks added to the staff after your departure your position will be classified exactly the same as theirs. Where you will fit into the salary scale, however, will depend upon the legislation adopted to make the classification effective and the regulations thereunder drawn up by the Civil Service Commission and approved by the governor in council. If by some chance the salaries of the four promoted should be higher than the maximum for the class under the classification, they would undoubtedly be allowed to retain what they have already secured. Whether you would be junior to these clerks who came into the department later than you did is a matter not covered by the classification, but the general practice has been to allow those who enlisted full credit for the period they were absent on military service. Your absence overseas will certainly not be allowed to retard your future promotion; but the classification is not retroactive with regard to promotion and if under existing law and practice you failed to receive a promotion that you would have received had you not enlisted the classification will not rectify that state of affairs.

Prevaling Rates

Question: 1. What is meant by "prevailing rates" in the classification with regard to mechanics? 2. How many days holiday in the year are the staff of the department of public works entitled to?—No. 81.

Answer: 1. The term "prevailing rates" as used in the classification is interpreted to mean the rates paid to persons doing the same kind of work in the commercial filed in any given neighbourhood or region. 2. The Civil Service Act of 1918, provides that the deputy head may grant to each officer, clerk, or employee a yearly leave of absence not exceeding eighteen days in any one year, exclusive of Sundays and holidays, if they have been at least one year in the service. This section applies to the department of public works.

New and Old Salaries

Question: I would like to know whether the salaries will be increased according to the schedule of the classification, no matter what difference there may be between the present and the reclassified salaries?—No. 82.

Answer: The legislation proposed at the last session of Parliament to make the classification effective provided that persons receiving a salary below minimum for their positions should be raised at once to the minimum and the new salary dated back to April 1, 1919.

Military and Civil Pay

Question: 1. A letter carrier who enlisted was to receive his regular pay of $3 per day, less the military pay of $1.10 per day. He was discharged May 28, 1919, the above pay being from April 30, 1919, until the date of discharge at the old rate of bonus. What pay should he receive? 2. Does the pay of a civil servant, less military pay, mean thirty-one days a month?—No. 83.

Answer: 1 and 2. These are matters to be taken up and adjusted by the department. The only way in which the classification can possibly enter into the matter is the fact that the rates may be retroactive to April 1, 1919. This matter, however, has not yet been decided by parliament and, therefore, the adjustment is entirely one to make with the department.

Salary of Returned Soldier

Question: I am a returned soldier and have been in the railway mail service since February 8, 1917. My salary is now $600 per year, plus mileage, plus $180 western provisional allowance, plus $380 bonus. Under the classification are we to be given an increase in salary? 2. Is there to be any difference in our mileage rates? 3. Will the new salary and mileage rates date back to April 1, 1919? 4. How many hours per week are railway mail clerks supposed to work? 5. Does seniority count in this branch of the service under the new bill?—No. 86.

Answer: 1. According to the legislation proposed at the last session of Parliament every employee's salary will be at least the minimum for his class. The minimum for railway mail clerks is $780 per year; the bonus is taken care of by an order in council which provides that no employee shall have his bonus reduced. 2. The mileage rate provided by the classification is one cent a mile, whether the work is done in the day or at night. 3. According to the legislation introduced at the last session of Parliament, the rates were to be retroactive to April 1, 1919. The legislation for the coming session has not yet been prepared. 4. At present the number of hours of work per week is entirely a departmental matter. The bill introduced at the last session provides that the Civil Service Commission shall, with the approval of the Governor in Council, work out standard working hours for each branch of the service. 5. The new bill makes no provision for seniority although the regulations to be made by the Civil Service Commission and approved by the Governor-in-Council will, undoubtedly, contain some sections on this matter.

Bonus for Husband and Wife

Question: Will you please state whether this year's Order-in-Council re the high cost of living bonus to civil servants precludes both a husband and wife from drawing a bonus ?—No. 89.

Answer: Under the Order-in-Council it is possible for both a husband and wife if legally employed to draw a single person's bonus. If there are children whose earnings do not exceed $200 per year from all sources, the husband may receive the full bonus given to the heads of households. Only one person in the family group, however, is entitled to the head of household bonus.

1918 Bonus

Question: I have been employed in the department of public works for about thirty-five years off and on since I came back from the Nile expedition for the relief of General Gordon in 1884-1885. I worked for a period of five months in 1918. Am I entitled to any bonus for that service ?—No. 90.

Answer: The $10,000,000 bonus the administration of which is under the general direction of the Civil Service Commission is to be paid only for services rendered since April 1, 1919. If you think you are entitled to any bonus for services in 1918, you should take the matter up with the department.

Question: Will the Board of Hearings continue to hear representations after the classification has been made effective by Parliament or will it discontinue its sittings at once ?—No. 92.

Answer: Without question the Civil Service Commission will either retain the present Board of Hearings or some similar body indefinitely. The civil service is a living, growing thing, subject to constant change, with frequent adjustments necessary. The Organization Branch through conference with deputy and branch heads can make most adjustments, but there are many matters that the Commission itself will have to decide. It is too early, however, to say that the board as at present constituted will continue, as this is a matter which must be determined partly by experience and undoubtedly the Civil Service Commission will wish to perfect the procedure as experience shows changes to be desirable.

Application of Classification

Question: It was stated in the question box in July that employees would learn through departmental channels in the month of August how their positions have been classified. I have not yet been able to learn what my classification is. When will the employees get this information ?—No. 93.

Answer: Owing to the moving forward of the date when Parliament met, it was necessary to make a change in the original plans. It is the intention to take up the classification at this session of Parliament, and, therefore, early in August the efforts of the Organization Branch of the Civil Service Commission were centred on getting ready the classification itself and the work of making the application perforce suffered somewhat. Nevertheless the work of applying the classsification has been completed in several departments and approved by the deputy and branch heads. In other departments the work is practically complete, only a few cases being left open for discussion. In some departments, owing to the pressure to getting the classification itself ready, no work as yet has been done, but this will be pushed rapidly in the immediate future. It is the understanding of the Organization Branch that the employees of some of the departments have already been informed of the classification of their positions and that in others, where the work is practically complete, no information will be given out until a few remaining cases are settled.

Set up of Classification

Question: Like many others I find it exceedingly difficult to understand the classification because it is a large book of nearly 700 pages with the classes in alphabetical order. In the new edition would it not be possible to group the classes in some way so that those related to each other will be place together ? This would greatly facilitate the analysis of the classification by everybody interested, and would also make the problem of administrative officers in departments very much easier.—No. 94.

Answer: In the new edition the alphabetical arrangement of classes as at present will be retained by will be supplemented by a list of classes arranged but services in order to show the grouping according to the kind of work performed. Under each service there will not only be the title of the class but also the minimum and maximum salary. In addition there will be an alphabetical list of class titles with salaries. These two additions, it is thought, will facilitate the use of the book and will not add materially to its size.

Present Rights

Question: When will employees know whether the amended Civil Service Act gives them the right to go to the present maximum even if the rates are above the classification rates or whether the provision will be the same as in the bill introduced at the last session to the effect that employees above the maximum shall get only their present salaries ?—No. 95.

Answer: The bill will probably be ready before September 20th. Until the printed bill comes out, there is no means of knowing what the section with regard to present rights of employees will contain.

War Bonus

Question: Why do some people who have never worked on war work receive the bonus, while there are others who have worked on war work and do not receive it.—No. 99.

Answer: The bonus is called a war bonus because it is given to supplement the salaries which would be adequate in normal times but which are too low to meet the abnormal high cost of living which has resulted from the war. The basis for granting the bonus is not employment or non-employment in war work. The Order-in-Council provided for the distribution of ten million dollars appropriated by Parliament states specifically the manner in which the bonus shall be distributed and to whom it shall be paid.

Commission's Powers

Question: Before the reclassification of the civil service can have any possible chance of being a practical success, must not the administrative powers of the ministers and the deputy ministers of the various departments relative to the personnel of the service be curtailed?—No. 100.

Answer: The civil service act of 1908 made the Civil Service Commission in effect an employment agency for the inside service and the act of 1918 extended the Commission's duties to include the whole service. The 1918 act gave the Commission very broad powers—broader perhaps than those exercised by any other civil service commission in existence. Before the Commission can make a really effective attack upon its problems, however, it must have a classification, and the Act must be amended to make effective the classification that has been worked out. This, however, is not really an extension of the Commission's powers but a provision for machinery to enable it to exercise its powers economically.

CORRESPONDENCE

Legislation

Dear Mr. Keith,

I see by the August issue of *The Journal* (P. 561) that at the first meeting of Council — July 22nd — following the closing date for the ballot re Legislation, scrutineers were appointed, and that their report would be made available as soon as an adjourned meeting of the Council had been held.

Of course I am not in a position to say that there has been any unnecessary or purposeful delay in this matter, but it is five months since the Legislation Committee met in Montreal and prepared a draft bill. Of course I am aware that the Council does not usually meet during the two or three summer months, but I hope that there may be no further unnecessary delay.

I am not empowered to speak for the Halifax Branch, but I believe it is the hope of several Members that we may be in a position to bring our draft Bill before the Legislature of Nova Scotia at its next session, (in February, 1920), and before we can take any formal steps in this direction it will be essential that we have some months in advance to organize a campaign of canvassing, and to do a lot of talk.

I suppose you will be at the meeting in St. John on the 10th, 11th and 12th of this month, and I shall look forward to seeing you there, though it is not at all certain that I shall be able to manage it, this being my busy season.

Enclosed I hand you a cutting from the Halifax "Evening Recorder" of the 19th ult. descriptive of the visit of His Royal Highness the Prince of Wales to our little Studley Quoit Club, containing a very full and correct report of my "few but well chosen remarks" on that occasion. I take it that on the occasion of His Royal Highness's Canadian tour very few Engineers will have an opportunity, or the responsibility, of playing host to, or speechifying to, or in the presence of, H.R.H. and therefore it is possible that, if space permits, you may deem my remarks worthy of reproduction in the columns of the next issue of *The Journal.* Naturally this would please me very much.

In several recent issues of *The Journal* I have seen numerous critiques of our draft Bill and I have felt disposed to offer some counter-criticisms for production in the columns of *The Journal,* but, after all, what is the use. The leading idea that occurs to me in connection with these criticisms is that the writers have not given sufficicent credit to the fourteen Members of the Committee for the earnest study, and thorough and careful thought that we gave the matter. There is hardly any point in any of the criticisms that I have seen that was not pretty thoroughly thrashed out in that strenuous week in Montreal early in April. I do not know whether it is the intention to have any discussion, formal or otherwise, on this subject at the St. John meeting, but the prospect of its consideration and the opportunity for further discussion and canvass would be an extra inducement for me to make an effort to attend the Convention. The meeting begins this day week, so you will hardly have time to drop me a line before then and I am sorry I did not write you a week ago, but I have been much away from Halifax and very busy.

Yours very truly,

C. E. W. Dodwell.

Letter to Dr Tudsbery

J. H. T. Tudsbery, Esq., D.Sc., etc.,
Secty. Inst. C.E.,
Great George St.,
Westminster, London.

Dear Dr. Tudsbery,

Presuming that *The Journal of the Engineering Institute of Canada* is regularly sent to you, I would ask you to refer to page 410 of the May 1919 issue, and page 458 of the June issue, by which you will observe that the Engineers of Canada are making an effort to put the profession of Engineering on all fours with those of medicine, law and others, in regard to legal status and recognition by Legislative Enactment.

We began this campaign 23 years ago and we succeeded, not without difficulty, in getting Acts passed by the Legislatures of the Provinces of Quebec and Manitoba.

(Under the Provisions of the British North America Act, 1867, consolidating the Provinces into the Dominion, Federal Legislation of the character desired would be *ultra vires* in the Provinces and therefore Legislative relief must be sought in each of the nine Provinces).

The Quebec and Manitoba Acts have not been unqualified successes, owing to various causes and we are now reviving the campaign on more general lines.

To the Engineers of Canada there seems no valid reason why the noblest of all professions should be the only one lacking status and protection of the law, but we are confronted by many difficulties and by captious and unreasonable opposition from many unexpected quarters.

We admit that the whole matter has its *cons* as well as its *pros*, among the former is the basic fact that in Great Britain, where the profession is on the highest plane, the Engineer has no legal status and the question "why not?" has been asked, and is being asked, of many Engineers, by many Engineers in search of solid foundation for arguments pro and the stirring up of the luke-warm.

May I ask that you will do me the favour of enlightening me as to the attitude of the Inst. C. E. in regard to this whole question.

Has the Inst. C. E. ever considered it, and with what result?

Why is not the profession of Engineering in Great Britain a "closed" or protected profession like Law, Medicine and others?

One answer to the last question would, I suppose, be that the Inst. C. E., being over a century old, and The Engineering Society of the world *par excellence*, Membership therein is practically equivalent to legal status and that an Engineer whose name is not found in its Membership Register has not a look in. This fact, however, does not bear directly on our situation, because our organization, "*The Engineering Institute of Canada*," (of which the title was changed last year from The Canadian Society of Civil Engineers) is only thirty-two years old and it will be many years, perhaps a century or two, before we can attain the commanding influence and status of the Inst. C. E., especially in view of the vast size of Canada, where dozens of Engineering organizations may, and no doubt will, spring up in the future.

I shall be very grateful if you will give me a frank and full reply to this inquiry, with such hints and opinions as will either support our movement or show us good reasons for abandoning it.

Yours very sincerely,

C. E. W. Dodwell.

Dr Tudsbery's Reply

Dear Mr. Dodwell,

Your letter of the 11th June reaches me at the very time when the Council has undertaken to consider the highly important question you refer to, and I think your note, received at such a time, will be much appreciated by the President and other Members of the Council, who are very considerably interested in this question, and will be very serviceable to the deliberations which, speaking personally, I sincerely hope may result in some steps for the improvement of the Civil Engineer's status — and consequently his interests — throughout the whole Empire.

I shall not forget to communicate with you further when the Council have made some definite progress in their consideration of these matters.

Yours very sincerely,

(Sgd.) J. F. T. Tudsbery.

Adopting Institute Specification

Dear Sir:—

I am very much obliged for your letter of the 26th August. As we are making the cement specification of *The Engineering Institute of Canada* an integral part of our specification I think it is probable that we will reprint it on paper of a size to match with our standard specification. Nevertheless I am very much obliged to you for your suggestion that the Council would have this printed for us at cost.

Yours truly,

(Signed) A. F. Stewart, M.E.I.C.
Chief Engineer,
Toronto, Aug. 28th, 19. Can. Nor. Rly. Eastern Lines.
AFS/W Canadian National Railways.

Report of Council Meeting

An adjourned meeting of the Council was held at the rooms of *The Institute*, 176 Mansfield Street, on Monday, September 8th, at eight o'clock in the evening.

Civil Service Reclassification: (a) The report of the Secretary's visit to Ottawa, on August 26th and 27th, regarding Civil Service Reclassification was rceived and noted.

(b) A night lettergram from the Border Cities Branch asking the Council to strongly urge the Federal Government to pass reclassification of engineers in the Civil Service as per Arthur D. Young's report, was received and noted. It was felt that no further action was necessary on the part of the Council at this time.

(c) A circular addressed to the Engineering Council by the Chairman of the New York State Committee on the classification and compensation of engineers was received and noted.

National Industrial Conference: The personnel of the representatives of *The Institute* to the National Industrial Conference at Ottawa, September 15th to 20th was considered. Lieut.-Col. R. P. Rogers, D.S.O., A.M.E.I.C., was nominated by the President and it was left to the Executive to secure the consent of two other delegates to attend this Conference, and to notify the Minister of Labor accordingly. The delegates finally nominated and who attended the Conference were Lieut.-Col. R. P. Rogers, D.S.O., Professor H. M. MacKay, and Fraser S. Keith.

Maritime General Professional Meeting: A circular letter was read from the Secretary of the St. John Branch outlining the General Professional Meeting at St. John, and approved.

New Brunswick Engineers: The calling of a meeting of all New Brunswick engineers for the purpose of organizing the Provincial Institute or Society and for the election of temporary officers thereof, at 4 o'clock in the afternoon on the 12th instant, was noted.

American Welding Society: A letter from Comfort A. Adams acknowledging the Secretary's letter of August 27th, was read and noted.

Treasurership: A letter of acceptance of the office of Treasurer by Brigadier-General Sir Alexander Bertram was read and was noted with pleasure.

Badges: A letter was read from R. Hemsley, Jeweller, stating that he had no record of the former issue of badges of the Society. The contents of the letter were noted.

A letter was read from Caron Freres quoting a price of fifty cents per badge for the necessary engraving. It was decided to accept this offer and the Secretary was authorized to order the necessary badges on this basis.

Western Professional Meeting: A letter was read from the Secretary of the Manitoba Branch suggesting that in view of the conditions in the West no Professional Meeting be held this year. It was decided that the Secretary should write a letter to Edmonton suggesting that the holding of the Professional Meeting be given reconsideration in view of the unsettled conditions in the West.

Suggested Change in By-Laws: (a) The suggestion to change the date of the issuing of the Charter, By-laws and List of Members was discussed and it was decided that the book should be complete as at December 31st of each year.

(a) The suggestion that each Branch be known as the " Engineering Institute of " Toronto " (for example) was discussed, and it was decided that the proposed change is not desirable, at present, especially as it entails radical changes throughout the By-laws, forms and other stationery.

Western Canada Irrigation Association: The receipt of a letter from the acting Secretary of the Western Canada Irrigation Association acknowledging the appointment of our delegates was noted.

Standard Specification for Portland Cement: A communication was read from A. F. Stewart, M.E.I.C. stating that the Canadian National Railways are making our Standard Specification an integral part of their specification. The communication was noted with pleasure.

* * *

The regular monthly meeting of Council was held at the rooms of *The Institute,* 176 Mansfield Street, Tuesday, September 23rd at 8.15 P.M.

Nominations for Ballot: The report of the Chairman of the Nominating Committee, Professor H. M. MacKay, was considered in connection with the acceptances and withdrawals from the ballot. Subject to the acceptance of two from whom no reply had been received, the following was declared to be the ballot for the election of officers for the coming year:—

President: R. A. Ross, Montreal

Vice Presidents: W. G. Chace, Winnipeg; A. S. Dawson, Calgary; Brig. Gen. C. H. Mitchell, Toronto. John Murphy, Ottawa.

Councillors:

District No. 1: Frederick B. Brown, Montreal; J. Duchastel, Montreal; V. I. Smart, Montreal; Julian C. Smith, Montreal.

District No. 2: F. T. Cole, Quebec; A. R. Decary, Quebec.

District No. 3: F. A. Bowman, Halifax; W. P. Morrison, Halifax.

District No. 4: J. B. Challies, Ottawa; Col. Alex. Macphail.

District No. 5: R. K. Palmer, Hamilton; E. R. Gray, Hamilton.

District No. 6: (One Year) W. J. Dick, Winnipeg; B. S. McKenzie, Winnipeg; (Two Years) Guy C. Dunn, Winnipeg; J. M. Leamy, Winnipeg.

District No. 7: J. R. C. Macredie, Moose Jaw; C. P. Richards, Regina.

District No. 8: G. W. Craig, Calgary; F. H. Peters, Calgary.

District No. 9: H. M. Burwell, Vancouver; C. Brakenridge, Vancouver.

The Secretary was instructed to carry out the procedure in this connection in accordance with the By-Laws.

Legislation: Further consideration was given to the report of the scrutineers and the attitude of *The Institute* regarding proposed legislation. It was pointed out that the resolution at the Annual General Meeting at Ottawa stated that in the case of a favourable verdict from the members, the Council of *The Institute* shall immediately take the necessary measures in co-operation with the Branches to have such legislation enacted. It was resolved that the Council would further in every way the desire of the members in this connection and, inasmuch as the actual application of such legislation is in the hands of the engineers in each province, it is desirable that the Branches and Provincial Divisions in co-operation with other engineering organizations in the various provinces, take the initiative therein and in which they would have the moral support of *The Institute.* Messrs. Ross and Vaughan were appointed a Committee in addition to the Executive Committee to draft a letter to be forwarded to the Branches and also a letter to the Canadian Mining Institute dealing with this subject.

Provincial Road Engineers in British Columbia: Inasmuch as no direct word had yet been received from either of the Branches in British Columbia regarding the question which had arisen regarding the proposed non employment of engineers for the building of road work by a prominent politican, it was decided to await definite information before action could be taken.

Badges for Honorary Members: A proposal by a member of Council that the Honorary Members of *The Institute* be presented with badges was considered and approved. The Secretary was instructed to order a gold badge for each of the Honorary Members and have same engraved for presentation.

Suggested Government Standard: The suggestion that *The Institute* request in connection with advertisements for engineers in the Civil Service that membership standing in *The Institute* be included in the qualifications advertised for in engineering positions in the Civil Service, was considered further and the matter left in the hands of the Executive Committee for action.

National Industrial Conference: The Secretary reported that, accompanied by Professor H. M. MacKay and Lieut.-Col. R. P. Rogers, D.S.O., he had attended the National Industrial Conference, as instructed and would present a complete report at a later meeting.

Additional Journals for Universities: Consideration was given to a proposal to print three hundred extra Journals to be sent to the science faculties of the various universities for distribution among the students and the proposal was approved. The Secretary was also instructed to advise the univertities of the Student's Prizes, available each year.

Ballot. A ballot was canvassed and the following elections and transfers affected.

Members

Walter Halcro Boyd, B.A.Sc. (Univ. Tor.), of Ottawa, Ont., chief topographer, Geological Survey of Canada; Clement A. K. Cornwall, B.Sc. (E.E.), M.Sc. (McGill Univ.), of Victoria, B.C., assistant supt. B. C. Electric Railway Co.; David Kyle, M.E. (Royal Tech. Coll.), of Sault Ste. Marie, Ont., Vice President, in charge of operations, Algoma Steel Corp.

Associate Members

Herbert William Ault, of Ottawa, Ont., chief draftsman, Reclamation Service, Topographical Surveys; Harry E. Balfour, of Quebec, P.Q., assistant engr., Jos. Gosselin, Ltd.; Jules Armand Beauchemin, B.A.Sc. (Laval Univ.), of Ottawa, Ont., assistant engr., Upper Ottawa Storage; Victor Stanley Chestnut, B.A.Sc. (post graduate) (Univ. Tor.), of East St. John, N.B., assistant engr., St. John Dry Dock & Shipbuilding Co.; Hugh Walter Frith, of Vancouver, B.C., reclamation and gen. harbor work, Vancouver Harbor Commission; Harold Paul Fuller, of St. James, Man., assistant engr., C.N.R.; Lawrence Ernest Habben, of Shawinigan Falls, Que., assistant designing engr., Can. Electro Products; Lieut. Donald Wilbur Hodsdon, of Nelson, B.C., with C.E.F. 1916-19. At present, assistant district engr., Water Rights Branch; David Wilson Jamieson, of Ottawa, Ont., assistant to district engr., Department of Public Works; William Cole Macdonald, E.E., (Dalhousie Coll.), of Woodman's Point, N.B., engr. and accountant, Kennedy and MacDonald, St. John and Que. Ry.; Major John Gordon MacLachlan, of Kamloops, B.C., (2 years in France). Div. engr. of constr., C.N.R.; Thomas Vincent McCarthy, B.A.Sc. (Univ. Tor.), of Toronto, Ont., (1916-19 with C.F.A.), Assistant laboratory engr., Hydro-Electric Power Commission; James Cecil McDougall, B.Sc., B. Arch. (McGill Univ.), of Montreal, Que., practising architecture; J. F. O'Connor, of Aylmer East, Que., in charge of railway work, United Grain Growers, Hutton, B.C.; Samuel Rutherford Parker, of Regina, Sask., acting constrn. engr., Dept. of Telephones, Regina; Capt. Frank Mortimer Perry, of Sault Ste. Marie, Ont., Inspecting engr. on constrn., Algoma Steel Corp.; Maurice Polet, of Edmonton, Alta., supt. and engr. Edmonton Interurban Ry.; Major Charles Henry Pozer, B.Sc. (C.E.) (McGill Univ.), of Vancouver, B.C., (1917-19 with C.R.T.). Industrial surveyor, vocational branch, Soldiers' Civil Re-Establishment; Capt. Herbert William Racey, of Westmount, P.Q., engineering staff of Dominion Glass Co., Montreal; Arthur Salkeld Runciman, S.P.S., of Montreal, P.Q., on experimental work, Marconi Wireless Telegraph Co.; Harry B. Sherman, of Regina, Sask., traffic supt., Saskatchewan Government Telephones; Sigmund Wang, Chem. Engr. (Coll. of Christiania), chief chemist in charge of laboratories, Riordon Pulp and Paper Co., Ltd., Karl Ewart Whitman, B.Sc., C.E.(N.S. Tech. Coll)., of Halifax, N.S., instructor in surveying and structural drawing and design., Soldiers' Civil Re-Establishment at N.S. Tech. Coll.; Wilfred Arthur Winfield, of Halifax, N.S., general supt. of plant, Maritime Telephone and Telegraph Co.; William Irving Young, B.Sc. (Univ. of N.B.), of St. John, N.B., resident engr., St. John and Quebec Ry.

Juniors

Arthur Leonard Bishop, of St. Catharines, Ont., director, Coniagas Mines, Ltd., Cobalt, Coniagas Reduction Co., Ltd., Thorold, British-American Shipbuilding Co., Ltd. and Electric Steel and Engineering Co., Ltd., Welland; William Elfric Plumber, of St. Catharines, Ont., Assistant engr., section No. 1, Welland Ship Canal.

Transferred from Class of Associate Member to that of Member

Augustus Rowley Archer, B.Sc., (Mining) (McGill Univ.), of Port Washington, N.Y., with Jacobs & Davies, Inc.; John Taylor Farmer, B.Sc., M.Sc. (Liverpool Univ.), B.A.Sc., Ma. E. (McGill Univ.), conslt. engr. in mech. and hydraulic engr., also sales engr. and representative of various engineering concerns; Joseph Pollard Hodgson, (A.M.E.I.C.), of Vancouver, B.C., river protection work on Fraser River for Dominion Government.

Transferred from Class of Junior to that of Associate Member

Joseph Georges Caron, of Montreal, P.Q., engr. for Laboratoire Central, Canadian Aniline Oil Co.; Major George Hutton Kohl, B.Sc. (Elec.) (McGill Univ.), of Hamilton, Ont., 1914-19 with R.E., At present, engineer Spanish River Pulp and Paper Co., Ltd.; Wilbert Henry Norrish, B.Sc. (Queen's Univ.), D.L.S., O.L.S., of Ottawa, Ont., in charge of D.L.S. party in Alberta.

Transferred from Class of Student to that of Associate Member

Lieut. Raymond Gardner Bangs, B.Sc. (McGill Univ.), of St. Catharines, Ont., Assistant engr., Welland Ship Canal; Lieut. Alan Keith Hay, B.Sc. (C.E.) (McGill Univ.), of Ottawa, Ont., resident engr., northern section of Ottawa-Prescott Provincial Highway; Charles Franklin Szammers, S.P.S., of Toronto, Ont., since 1916, chief of constrn. and maintenance of Can. Corps Tramways in France and Flanders; Frank Whitham Taylor-Bailey, B.Sc. (C.E.) (McGill Univ.), of St. John, N.B., resident engr. for N.B. eng. branch, S.C.R.,

Transferred from Class of Student to that of Junior

Ralph Allingham, of Grenville, Que., with Foundation Co., Ltd., as resident engr. on constrn. At present on constrn. of power house at Sydney, N.S.; George Haddon Chalmers, B.Sc. (C.E.) (Queen's Univ.), of Turbine, Ont., asst. to E. L. Pettingill, High Falls, Ont. Capt. Charles Harvey Rogers Fuller, B.A.Sc. (Univ. Tor.), of Toronto, Ont., (1915-19 with C.R.T.). Member of firm Fuller & Ferry; Lieut. Edward Caruthers Little, B.Sc. (McGill Univ.), of St. Catharines, Ont., 1916-19 with C.F.A., At present, instrumentman, Welland Ship Canal; Lieut. John Earle Pringle, B.A.Sc. (Univ. Tor.), of Hamilton, Ont., since 1915 with Allied Armies. Returned to Canada, June 12th, 1919. At present unemployed.

BRANCH NEWS

Halifax Branch

F. R. Faulkner, M.E.I.C., Sec.-Treas.

C. E. W. Dodwell, M.E.I.C., entertains the Prince.

As President of the Studley Quoit Club a prominent member of the Halifax Branch had what is no doubt the unique distinction amongst the engineers of Canada, of entertaining the Prince at the Club of which he is President, and of delivering an address of welcome to His Royal Highness. Those who have had the pleasure of visiting the Studley Quoit Club, and more particularly of being there as guests of President Dodwell will appreciate the enjoyment which the Prince no doubt experienced as a guest of this unique and hospitable Institution. In reply to President Dodwell's address which was followed by singing; of "He's Jolly Good Fellow," the Prince made a happy speech expressing his pleasure with his visit, and stating that he would tell the King on his return, who had also as well as King Edward been guests of the Club, that the Studley Club was still going strong.

After the Prince registered his name in the Club's book, former President Howard Murray called the gathering together and proposed the health of President Dodwell, referring to the splendid speech which he had made, which was a credit not only to himself but to the club, and extending on their behalf the heartiest congratulations on the splendid manner in which he had represented them.

President Dodwell's speech is as follows:—

Our little club has been in existence over threescore years. To be precise, we began playingion these grounds just 61 years and 14 days ago, or on the 4th of August, 1858. But the club was formed some two or three years before. In all that time this is the reddest letter day in our history.

The visit of His Royal Highness, which honors and delights us more than I can express, and for which we offer His Royal Highness our heartiest and most respectful tanks, reminds us that a number of years ago we had the honor of no less than three visits from His Royal father, King George V. Once in 1883, 36 years ago, when he was a midshipman in the Canada, and twice in 1890, when he was in command of the Thrush. But at the time of these visits His Majesty was not the heir to the Throne. Our present distinguished visitor is the heir to the Throne, therefore this is, as I said before, the reddest letter day in our history, Q.E.D.

We also recall with pride and pleasure the visit of His Royal Highness the Duke of Connaught in 1912, and that of His Serene Highness Prince Louis of Battenburg in 1905.

A week or two ago I saw in our papers a long list of His Royal Highness' names and titles prescribed for recital in the preparation of loyal and patriotic addresses. But that list was, after all, but partial and incomplete, for His Royal Highness has many other titles and distinctions. He is a full blown or honorary member of nearly every learned, professional and scientific society in London. For instance, it may not be generally known that His Royal Highness is not only a lawyer, but also a judge; for on the second of last month he was made a barrister, in London, and a few minutes later he was raised to the bench; a progress in legal honors and advancement rarely archieved by even our most brillant legal luminaries.

He is a member of many of the City Guilds; the Patron of many others. But the office or title that must give His Royal Highness the greatest pride and gratification is of a different sort; it is one of such towering eminence as to be beyond the reach of most of us mere mortals. It is apparently of a theological, ecclesiastical or religious character, making His Royal Highness not only the envy and despair of mere Bishops, Archbishops, Cardinals and Popes, but out of sight their superior officer. I refer to an announcement in the London papers of a few weeks ago to the effect that His Royal Highness had been raised to the sublime degree of Elder Brother of the Trinity.

Lest this should shock the religious susceptibilities of those of our members who have Sunday school classes, I hasten to explain that the Trinity Board, of which His Royal Highness was made a member, is a very ancient, honourable and important body, in which is vested the function of the construction, maintenance and operation of all the lighthouses of the coasts of the United Kingdom.

For the omission of all these, His Royal Highness' titles, names and distinctions, I can only throw myself on the Royal clemency and pray that His Royal Highness will hold me and the Club guiltless of the crime of Lese Majeste. In extenuation, I hasten to assure His Royal Highness that we are not going to present him with any loyal and idiotic — beg pardon, I mean patriotic — address.

These few words, so feebly expressive of the honor and pleasure that his visit gives us, are the only address that he will be called upon to suffer here this afternoon.

Nor are we going to ask His Royal Highness to further tax his oviparous talents and energies in the laying of another corner-stone, or to turn a first sod, or to unveil a monument, or to perform any other of those numerous and varied duties that he has so conscientiously been carrying out ever since he set foot on our shores and which await him in such terrifying numbers during the rest of his Canadian tour.

Speaking of corner-stones; a mere hen can lay eggs, but it takes Princes and that sort of people to lay corner-stones.

I trust that some duly constituted body will be prepared to assume the responsibility of hatching out all the corner-stones that his Royal Highness will drop all over Canada in the next few weeks, and that in the fulness of time a vigorous brood of noble public buildings and institutions will result from the incubatory process.

In further extenuation of the informal and unceremonious character of our reception of His Royal Highness, let me say that it is our hope that he will regard his all too brief stay with us this afternoon as a sort of interlude or respite from the numerous and possibly more or less irksome formal duties inseparable from a Royal progress, and which he is so courageously facing. We hope that on his return to England he will be able to relieve His Majesty's anxieties by telling him not only that the Studley Quoit Club is still going strong but that this little function was one, at least, of those at which His Royal Highness was not bored stiff.

Now, gentlemen, charge your glasses, and when we have drained them to the health and happiness of His Royal Highness, we will lift up our tuneful voices and tell him what we think of him; what all the world thinks of him; what he has proved himself to be; a man, a soldier, a gentleman and a jolly goodfellow, in the very best sense of all those terms.

We have heard of His Royal Highness in the trenches. A captain in the Grenadier Guards, the idol of his regiment. Deeply chagrined that obvious considerations of State debarred him from leading his men over the top to share their chances of a German bullet or a Victoria Cross, he had to be content with less brillant, less hazardous, but none the less honorable, important and praise-worthy duties; cheering and encouraging his men; comforting and consoling the wounded in many a hospital, and with a reluctant but dutiful compliance with the precautionary injunctions of the High Command, who, with an overwhelming sense of their responsibility for his safety, realized that even a casual meeting between His Royal Highness and a German bullet might result in an appalling calamity for the vast Empire of which His Royal Highness is the hope.

Gentlemen, I have the honor to propose health, happiness and long life to His Royal Highness the Prince of Wales, the Heir-Apparent to the Throne. God bless him.

ADDRESSES WANTED

The records of *The Institute* show that the present addresses of the following members are missing. It is highly desirable that as many of these addresses as possible be in the hands of the Secretary before the middle of October. Members who know the addresses of any of the men whose names are given will confer a favor on *The Institute* by sending in any information they may have.

Personals

Dr. F. D. Adams, Hon. M.E.I.C., Dean of the Faculty of Applied Science, McGill University, is now acting as Head of the University, and will continue to do so until the new Principal, Sir Eric Geddes, is free to resume the duties of his office.

*

Major Roy A. Spencer, M.C. and Bar, Jr. E.I.C., who was overseas with the 3rd Div. Can. Engineers, returned to Canada in August, 1919, and has accepted a position as Professor of Engineering, Dalhousie University, Halifax, N.S.

*

Lt. H. G. Welsford, S.E.I.C., engineer officer of the No. 1 Reception Park Royal Air Force, France, which is the main supply depot for the R.A.F. in France, returned to Canada in September and is visiting his home in Winnipeg. Lt. Welsford plans to return to London this Fall to become associated with a firm of architects in London.

*

John W. leB. Ross, M.E.I.C. Superintending Engineer Sault Ste. Marie Canal, took a prominent part in entertaining the Prince of Wales during his visit to Sault Ste. Marie. Several published photographs of the Prince inspecting the locks show that His Royal Highness was being directed by the Chairman of the Sault Ste. Marie Branch of *The Institute.*

*

Capt. Charles Antony Ablett, O.B.E., M.E.I.C., who was formerly General Manager and Director of The Siemens Company of Canada, previous to the war, has decided to remain in England, and has formed a partnership with Edward Barrs under the style of Barrs & Ablett, with offices at London, Cardiff and Newcastle-on-Tyne.

*

M. J. Butler, C.M.G., M.E.I.C., past president of *The Institute,* who for many years past has occupied a high position in the engineering and industrial life of Canada, and who more recently has been associated with the Armstrong-Whitworth Company Limited, of Canada, as Managing Director, has retired from business, having left Montreal recently to reside at Oakville, Ontario.

*

A. W. Campbell, M.E.I.C., Dominion Highways Commissioner, attended the meeting of the Union of Nova Scotia Municipalities held at Yarmouth August 27th where he delivered an address on "Federal Assistance in Roads Improvement." At this meeting J. W. Roland, M.E.I.C. Chief Engineer of the Nova Scotia Highways Board spoke on the activities of the Board in connection with the roads of the Province.

L. R. Brown, B.A.Sc., A.M.E.I.C., who was one of the leaders in establishing a Branch of *The Institute* at Sault Ste. Marie, Ont., and who acted as its Secretary-Treasurer, at which time he was engineer and superintendent of the Toronto Chemical Company in that city, has accepted the position of road engineer with the Dominion Tar & Chemical Company, and will devote his entire time to that important branch of engineering service.

*

Professor John N. Finlayson, M.Sc., A.M.E.I.C., who until recently has been engaged as professor in Civil Engineering in Dalhousie University, besides doing

Prof. John N. Finlayson, M.Sc., A.M.E.I.C.

consulting engineering work, has received the desirable appointment to the chair of civil engineering in the University of Manitoba. Mr. Finlayson takes to his new work the qualities and experience which will insure for him a successful outcome in his new field.

*

Lieut.-Col. A. E. Dubuc, D.S.O. and Bar. Chevalier de la Légion d'Honneur, M.E.I.C., whose distinguished career as commander of the Twenty-second Battalion, has been a matter of pride to all of the engineering profession in Canada, has been appointed by the Dominion Government to the position of superintending engineer of canals for the Province of Quebec, which was made vacant by the death by the late Treasurer of *The Institute,* Past President, Ernest Marceau.

A. S. Clarson, A.M.E.I.C., who a few months ago accepted the Secretaryship of the Association of Canadian Building and Construction Industries has resigned his position, J. C. Reilly, B.A. acting as secretary for the Association for the time being. Two representatives of the National Federation of Construction Industries of the United States, attended the National Industrial Conference at Ottawa, Ernest T. Trigg, President, National Federation of Construction Industries of the United States, and Director of Chamber of Commerce of the United States, and John C. Frazee, Executive Secretary, National Federation of Construction Industries of the United States, where they met a number of the officers of the Association and discussed matters relevant to the building industry in America.

*

Prof. R. S. L. Wilson, B.Sc., A.M.E.I.C.

R. S. L. Wilson, B.Sc., A.M.E.I.C., succeeds the late Professor Muir Edwards, M.E.I.C., as head of the Faculty of Engineering in the University of Alberta, the appointment having been recently confirmed by Prof. Tory. In 1913, Professor Wilson was engaged as a General Contractor in Saskatchewan. Later for four years he was with the Department of Railways and Canals engaged in designing on the Welland Canal. Recently he has been associated with McGill University and was consulting engineer for a large firm of contractors in Montreal.

*

At the National Industrial Conference at Ottawa a number of the prominent members of *The Institute* represented various industries and interests:—T. R. Deacon, M.E.I.C., of Winnipeg, representing manufacturers in general; G. Gordon Gale, M.E.I.C., of

Col. T.V. Anderson, D.S.O., A.M.E.I.C., who returned on the SS. Melita, Aug. 23.

Ottawa, the street railway interests of Canada; E. G. Henderson, M.E.I.C., chemicals and allied products; S. J. Hungerford, M.E.I.C., Toronto, railway transportation and telegraphs; David Kyle, M.E.I.C., Sault Ste. Marie, iron and steel industries; D. H. McDougall,

S. J. Hungerford, M.E.I.C.

M.E.I.C., New Glasgow, mining; Hon. Geo. R. Smith, Thetford Mines, Mining; F. L. Wanklyn, railway transportation and telegraphs; F. P. Jones, A.E.I.C., Montreal, clay, glass and stone products; and C. A. Magrath, M.E.I.C., representing the International Joint Commission, was also vice-chairman and was chairman of the problem committee of the conference.

*

Lt.-Col. L. W. Gill, M.Sc., M.E.I.C., has resumed his professorial duties, as head of the electrical engineering department, faculty of applied science, Queen's University. Professor Gill's war service is interesting and highly meritorious. At the beginning of 1915 he enlisted in the Canadian Engineer Services with rank of Lieutenant, being attached to the 5th F.C.C.E. Kingston. On November of the same year he was granted provisional rank of Captain, Canadian Field artillery when he recruited and organized the 46th Battery, C.F.A., being promoted to the rank of temporary Major, February 1916, proceeding overseas in command of the battery. After five months training the battery at Bramshott and Witley, he proceeded to France. After the taking of Vimy Ridge, in which action he was engaged, he was gassed and sent to hospital for three months. He was then given command of a battery of the Canadian Reserve Artillery at Witley Camp. His expert services, however, were required by the Ministry of Munitions, and the greater part of the year 1918 was spent with that board. November 1918 he was appointed director of educational services with the Canadian forces in England, later being promoted to the rank of Lieutenant-Colonel.

C. A. Magrath, M.E.I.C., Chairman, International Joint Commission, Chairman, Honorary Advisory Board, The Highway Branch, Dominion Government, Vice-Chairman, National Industrial Conference, and Chairman of the Organization Committee.

EMPLOYMENT BUREAU

Situations Vacant

Hydro Mechanical Engineer:

Thoroughly competent hydraulic turbine and turbine plant designer, also good experience in design of stoplog winches and heavy transmission machinery. Apply box 56.

Electrical Engineer:

A large industrial concern with several plants in Canada requires the services of an electrical engineer, who has had office and operating experience. Position requires executive ability and experience in the oversight of electrical equipment. Salary $250.00 a month. Address Box No. 51.

Engineering Salesman

Young man required for large industrial organization who has had technical training and experience in mechanical lines to take charge of new department, and develop this department from the sales and manufacturing standpoints. A fair salary and splendid prospects. Apply Box 55.

Junior draughtsman wanted for mechanical manufacturing company for a small industrial centre in Quebec province. Salary $20.00 a week. Apply Box 54.

Licensing of Engineers

According to a circular received from Alfred D. Flinnn, Secretary of Engineering Council eleven states have laws on their statue books for licensing of engineers, viz:—Wyoming, 1907; Louisiana, 1908, (Amended 1914); California, 1909; South Dakota, 1913; Illinois, 1915; Iowa, 1919; Idaho, 1915; Florida, 1917; Oregon, 1919; Colorado, 1919; Michigan, 1919.

As yet Engineering Council have taken no stand on the desirability of licensing or registering of engineers, but the license committee is working on a draft of a typical bill, which, it is intended, can be used if necessary in states proposing new legislation on this subject, or in those proposing revisions, so that laws enacted for licensing engineers may be uniform or nearly so throughout the country.

This same procudure is being carried out in Canada in order that the various provinces may have uniform laws in connection with engineering legislation. This subject will no doubt occupy a very prominent place in the discussions among engineers throughout Canada during the coming winter.

Preliminary Notice

of Application for Admission and for Transfer

20th September, 1919.

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in September, 1919.

FRASER S. KEITH, Secretary.

---

*The professional requirement are as follows:—

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course. In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineers' office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the following branches at his option Railway, Municipal, Hydraulic, Mechanical, Mining, or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five years or more years.

Every candidate for election as JUNIOR shall be at least twenty-one years of age, and must have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-five years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects Geography, History (that of Canada in particular), Arithmetic, Geometry Euclid (Books I.-IV. and VI.), Trigonometry, Algebra up to and including quadratic equations.

Every candidate for election as ASSOCIATE shall be one who by his pursuits, scientific requirements, or practical experience is qualified to co-operate with engineers in the advancement of professional knowledge.

> The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

AITKEN—HAROLD PONSFORD, of London, Ont. Born at London, Ont., Apr. 1st, 1895. Educ., 3 yrs. London Coll. Inst. 1915 (7 mos.) with C.P.R.; 1916-19, rod and inst' work, G.T.R., London, Ont.; Feb. 1919 to date, in city engrs' office, London.

HERRIOT—GEORGE HENRY, of Winnipeg, Man. Born at Centreville, Ont., Feb. 23rd, 1883. Educ., B.Sc. (C.E.) Queen's Univ., 1907. D.L.S., M.L.S., A.L.S. 1907 (8 mos.) transitman in chg. of track centering party, C.P.R.; 1908 (10 mos.) articled pupil and asst. on D.L.S. work under H.S. Holcroft; 1909 (2 mos.) engr. and supervisor of fire protection lines of pipe in Souris, Man.; 1 mo. asst. on subdiv. surveys; 2 mos., computer, Topographical Surveys branch, Dept. of Interior; winter 1909-11, lecturer in applied math., School of Mining, Kingston; summer 1910, in chg. of field party as res. engr. on constrn., G.T.P.; 1911-12, chg. of field party making topog. survey of land and preparing map; 1912-16, on base line and meridian surveys; winter 1917-18, lecturer in app. math. and astronomy and 1918-19, asst. prof. in civil eng., Univ. of Manitoba; at present in chg. of party gathering data for revision of Winnipeg sheet of Dominion Map, etc.

References: L. W. Gill, J. C. Gwillim, A. W. Haddow, J.A.Heaman, A.Macphail, L. A. Thornton.

SWAN—WILLIAM GEORGE (Major) of Vernon, B.C. Born at Kincardine, Ont., Sept. 27th, 1884. Educ., B.A.Sc., C.E., Toronto Univ., 1906. 1903 (6 mos.) asst. engr. Dom. hydrographic survey, Lake Superior; 1905 (5 mos.) transitman C.N.Q. Ry.; 1906 (6 mos.) bridge engr., C.N.R.; 1906-09, res. and div. engr., 1910-15, div. engr., C.N.P.; 1916-19, overseas, as O.C. coy. C.R. Troops and later light rys. engr., 2nd British Army, France; April 1919 to date, dist. engr., C.N.R., in chg. of mainland constrn. for B.C.

References: J. B. Challies, D. O. Lewis, E. W. Oliver, A. F. Stewart, T. H. White.

TAPLEY—FREDERICK BYRON, of Moncton, N.B. Born at St. John, N.B., Onct. 17th, 1876. Educ., private studies, ry. eng. course, I.C.S. 1903-16, with C.P.R. as follows—1903-05, rodman; 1905-07, transitman, maintenance of way; 1907-11, res. engr. Brownville Jct., Me., in chg. of track, bridge work, etc.; 1911-13, res. engr., London, Ont., in chg. of maintenance of way and structures; 1913-16, asst. engr., Montreal, office of gen. mgr.; 1916 to date with Can. Govt. Rys., as follows;—1916-17, asst. engr., ch. engr's office; 1917 to date, asst. engr. of maintenance.

References: C. B. Brown, C. T. DeLamere, J. M. R. Fairbairn, A. L. Hertzberg, C. C. Kirby.

FOR TRANSFER FROM CLASS OF JUNIOR TO HIGHER GRADE

ELLIS—DOUGLAS STEWART (Lt. Col., D.S.O., M.C.) of Kingston, Ont. Born at Cobourg, Ont., Mar. 16th, 1885. Educ., M.A., 1908, B.Sc. (C.E.) 1910, Queen's Univ. D.L.S., O.L.S. 1906-07, asst. geol. survey; 1909, asst. to city engr., Guelph; 1910, asst. to J. R. Akins, D.L.S.; 1910-14, asst. prof. mathematics, School of Mining; 1911, engr. in chg. boundary survey on Detroit and St-Clair Rivers, International Waterways Comm.; 1912, engr. in chg. hydraulic investigation of Livingston Channel, Hydrographic Survey; 1913-14, engr. for Commission, on St-Lawrence Ship Channel; 1915, lieut., 1915-17, capt., 1917, major and O.C., 6th Field Coy. C.E.; 1918, Bde. Maj., Can. Engrs. Training Center, Seaford, Eng., 1918, June 1919, Lt. Col. and ch. instructor, Can. School of Military Eng.; at present, asst. prof. civil eng., Queens Univ.

References: T. V. Anderson, V. F. W. Forneret, A. Macphail, W. L. Malcolm, W. J. Stewart, W. P. Wilgar.

GALLAHER—OSCAR GESNER (Capt.) of Kamloops, B.C. Born in Frontenac Co., Ont., July 16th, 1886. Educ., B.Sc., Queen's Univ., 1910. 1905, with G.T.R.; 1906, N.T.C. Ry.; 1907-08, geological survey; 1910, King Edward Mine, Coblat, also mining development, Porcupine; 1911, party, topographic and magnometric survey, Mines Branch; 1913-16, tech. clerk, townsite planning and instructions to surveyors, Topog. Surveys Branch; 1916-19, capt., 207th Batt., C.E.F.; 1917, seconded for duty with Imperial Ministry of Munitions, asst. inspector of cartridge cases, primers, etc.; at present, asst. to div. engr., constrn. dept., C.N.R.

References: A. L. Cummings, S. C. Ells, J. C. Gwillim, H. W. Jones, W. L. Mal, W. G. Swan.

HIBBARD—FRANCIS HENRY, of Sherbrooke, Que. Born at Ottawa, Ont., Aug. 9th, 1888. Educ., Montreal High School and private tuition. 1907-12, with T.C. Ry. as followes:—1907-08, draftsman, etc.; 1908 (3 mos.) rodman on constrn., and 3 mos., leveller on survey work; 1908-09, asst. engr. on constrn., St. Anselme, P.Q.; 1909-12, asst. engr. on constrn. of Quebec Bridge Yard and Quebec Terminals; 1912 (3 mos.) res. engr. in chg. of constrn.; 1912-13 (8 mos.) with Thomson & Hibbard, contractors, St. John Valley Ry., Fredericton, in chg. of constrn.; 1913 (2 mos.) asst. engr. on constrn., Lake Erie & Northern Ry., Glen Morris, Ont.; June 1913-1916, engr. in chg. of constrn., Que. Central Ry.; July 1916 to date, asst. to ch. engr., Q.C. Ry.

References: A. E. Doucet, A. Ferguson, F. A. Hibbard, E. A. Hoare, H. E. Huestis, J. O. Montreuil, J. T. Morkill.

MacKINNON—KENNETH ROYAL (Capt.) of New Glasgow, N.S. Born at New Glasgow, May 15th, 1888. Educ., B.Sc. (mech.) McGill Univ., 1909. 1903-05, apprentice in boiler and machine shop; 3 mos. on ry. prelim. survey; 6 mos. in mech'l drafting office; 2 mos. on constrn. of steel schooner (all during vacations), 1909, inspector with Smith, Kerry & Chace, Toronto, on hydraulic machinery being manufactured at various works; 1909-11, inspector for same firm in England and Sweden on hydraulic and elec. works; 1911 (3 mos.) testing hydro elec. plants in Ontario, with Smith, Kerry & Chace; 1911 (5 mos.) erecting mach'y in power house, Trenton, Ont., and gen. constrn. work; 1911-13, res. engr. in chg. of constrn. of power plant, Frankford, Ont.; 1913-14, res. engr., Halifax Power Co.; Nov. 1914, enlisted in Can. Engrs., May 1915, overseas, discharged July 1919.

References: W. S. Ford, N. R. Gibson, H. Holgate, J. G. G. Kerry, C. H. Mitchell

SHACKELL—SAMUEL WILLIS (Lieut.) of Lachine, P.Q. Born at Montreal, Sept. 17th, 1884. Educ., private study of civil eng. 1903-08, rodman, leveller and transitman on location, constrn. and maintenance of rys.; 1908-10, inst'man, Hull Elec. Co.; 1910 (6 mos.) res. engr. in chg. of ry. extensions, Hull Elec. Co.; 1910-12, transitman, maintenance of way, C.P.R.; 1912 (5 mos.) res. engr., C.P.R., Chapleau, Ont.; 1913-14, transitman, C.P.R., Smiths Falls and Montreal; Nov. 1914, enlisted in Can. Engrs., Sept. 1915, went to France, Oct. 1916, granted commission Nov. 1917, wounded, 1918, asst. instructor, fieldworks, Can. School of Military Eng., Seaford, Eng., Mar. 1919, returned; at present, short engagements on eng. work.

References: W. W. Benny, J. M. R. Fairbairn, G. G. Gale, F. H. McKechnie, J. W. Orrock.

TAYLOR—GORDON ROBERTSON (Major) of Grafton, Ont. Born at Christchurch, New Zealand, April 29th, 1886. Educ., grad., Central Tech. Coll., London, Eng., 1906, 3 yrs. course, civil and mech'l eng. 1907-08, office asst., A. Drew, conslt. engr., London, Eng.; 1908 (2 mos.) survey, Hamilton Powder Co.; 1908-09, inst'man on location, C.N.R.; 1909-12, res. engr. on constrn. C.N.R.; 1912-13, contracting for installations of private water and elec. light plant and sewage disposal; 1913-14, with Hydro Elec. Power Comm., on radial Eng. location, cost and traffic estimates, etc.; Dec. 1914, lieut. with 33rd Batt., C.E.F.; 1917-19, major in command of coy., 10th Batt., C.R.T., work in France consisted of location, constrn. and maintenance of light ry. and standard gauge lines and bridges, etc.; returned to Canada Aug. 1919, awaiting demobilization.

References: F. L. C. Bond, H. L. Bucke, G. P. MacLaren, R. P. Rogers, A. F. Stewart.

WELLS—ERIC EDWARD, of Toronto, Ont. Born at London, Eng., June 27th, 1884. Educ., Polytech. School of Engr., London, Eng., B.Sc., Oskaloosa, Iowa, 1918. 1900-02, drafting and estimating dept., British Schuckert Elec. Co., London, Eng.; 1903-04, gen. asst. in office and on work, Jas. Mills, contractor, Toronto; 1904-05, gen. asst. in office and experimental workshop, H. Dixon, mech. engr.; 1905-06, gen. fieldwork, Speight & Van. Nostrand, land surveyors; 1906-08, draftsman and land description writer, legal dept., C.N.R.; 1908-09, draftsman, 1909-17, ch. draftsman, dept. surveys and location, C.N.R., in full chg. of office and all field work in Toronto vicinity; 1917, chg. of complete survey of surface and underground workings of Rosedale Coal & Clay Co., Rosedale, Alta., also designing and laying out mine bldgs.; 1918, ry. betterments and gen. development scheme in Que. and northern Ont.; at present, ch. office asst., dept. surveys and location, C.N.R.

References: E. T. Agate, H. T. Hazen, J. R. MacKenzie, H. G. Smith, H. K. Wicksteed.

YOUNGMAN—WALTER (Capt. M.C.) of Winnipeg, Man. Born at London, Eng., Jan. 19th, 1883. Educ., private tuition and Bournemouth School of Science. 1905, on N.T.C. ry. surveys; 1906, rodman, 1907-09, inst'man, N.T.C. constrn. and location surveys; 1909-13, res. engr., N.T.C.; 1913-14, res. engr., C.P.R.; 1914-15, dist. engr., Manitoba Highways; Sept. 1915, joined C.E.F., captain, Can. Engrs., France; 12 mos., instruction of eng. in England, Can. Pioneers Training Depot, returned June 1919; at present, dist. engr., Man. Highways Dept.

Fefereneces: P. Burke-Gaffney, T. W. Clarke, M. A. Lyons, F. A. W. MacLean, N. B. MacTaggart, A. McGillivray, G. C. P. Montizambert.

FOR TRANSFER FROM CLASS OF STUDENT TO HIGHER GRADE

ALBERGA—ALBERT MILLER, of Montreal. Born at Black River, Jamaica, Jan. 1st, 1894. Educ., B.Sc. (C.E.) McGill Univ., 1916. 1916 (5 mos.) inspector, munitions dept., Canada Cement Co.; Sept. 1916-March 1919, No. 2 Constrn. Batt., C.E.F., engaged on light rys. and gen. constrn.

References: E. Brown, D. L. Derrom, A. J. Gayfer, H. M. MacKay, A. C. Tagge.

CAVANACH—ARTHUR LEE (Capt.) of Winnipeg, Man. Born at Elkhorn, Man., Apr. 27th, 1889. Educ., B.E.E., Man. Univ., 1911. Summers 1909, rodman, 1910, inspector and inst'man, and 1911, inspector in chg. of cost work, with Smith, Kerry & Chace; winter 1911, draftsman, bridge dept., C.N.R.; 1912-13, res. engr; and supt. of constrn. on hydro elec. plant at Dryden, Ont., with Harris & Harris' 1913 (6 mos.) head inspector on constrn. of reinforced concrete reservoir, Winnipeg, 1913-16, asst. in city engr's dept., Wpg.; 1916-May 1919, with C.E.F., capt., 3rd Batt., Can. Engrs., at present, asst. engr., in city engr's dept., Wpg., in chg. of waterworks constrn. and all bridge work.

References: W. P. Brereton, E. E. Brydone-Jack, W. G. Chace, E. P. Fetherstonhaugh, C. S. Landon.

EDMONDS—CHARLES WILLIAM, of Toronto, Ont. Born at Simcoe, Ont., Feb. 24th, 1894. Educ., B.A.Sc., Univ. of Toronto, 1919. 1913, with G. R. Marston, Simcoe, on municipal work; rodman, draftsman, irrigation work, Dept. of the Interior, Calgary; 1918, inst'man, in chg. of party on ry. location survey, C.H. & P.H. Mitchell, Toronto; draftsman, Hydro-Elec. Power Comm.; at present, draftsman, C.H. & P.H. Mitchell; was overseas 3 yrs. with Can. Artillery.

References: P. Gillespie, C. H. Mitchell, P. H. Mitchell, W. J. Smither.

KNIGHT—JAMES ARCHIBALD (Capt. M.C.) of Toronto, Ont. Born at Toronto Junction, Sept. 17th, 1892. Educ., B.A.Sc., Toronto Univ., 1914. Vacations 1910-14, asst. to J. J. Knight, contractor, estimating and constrn. of Muskoka Lakes; 1916-18, eng. officer, 2nd Can. Tunnelling Coy., France, driving and sinking in quicksand and heavy clay, etc.; 1918-May 1919, section com'd'r, 11th Batt., Can. Engrs., bridging road bldg. and mine extracting, awarded M.C. Sept. 1918; at present, hydraulic design, Hydro Elec. Power Comm.

References: P. Gillespie, T. H. Hogg, C. H. Mitchell, J. R. Montague, W. F. Richardson, M. V. Sauer.

Monthly Engineering Index

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of the engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies may be obtained of any of the articles listed in this section.

Price of each print (up to 11 x 14 in. in size), 25 cents, plus postage. A separate print is required for each page of the larger-size periodicals, but where possible two pages will be photographed together on the same print. Bill will be mailed with the prints.

Harrisson W. Craver, Director,
Engineering Societies Library,
29 West Thirty-ninth Street, New York, N.Y.

RAILROAD ENGINEERING

FOREIGN

African Railways. African Railway System (La gran red de ferrocarriles africanos), D. Enrique Morales. Revista de Obras Publicas, vol. 67, no. 2283, June 26, 1919, pp. 305-309. Economic significance of establishing direct railway service bertween Europe and Africa through Strait of Gilbraltar. (Concluded). Paper read before Spanish Inst. of Civil Engrs.

British Railway Shops. British Railway Workshops in War Time — IV, Engineer, vol. 128, no. 3318, Aug. 1, 1919, pp. 104-105, 3 figs. Insulated meat van designed for use overseas.

French Railways. The Reconstruction Program for French Railways, II, Robert E. Thayer. Ry. Age., vol. 67, no. 6, Aug. 8, 1919, pp. 251-255, 9 figs. Standards for types of material and equipment used on railroads, developed by Ministry of Public Works.

Venezuela. The Railways of Venezuela, Charles W. Jones. Ry. Rev., vol 65, no. 6, Aug. 9, 1919, pp. 181-185, 7 figs. Survey of adverse conditions to be encountered makes it manifest, in writer's opinion, that Venezuela offers small inducements of investment of foreign capital in new railway lines, except under strict governmental guarantees faithfully fulfilled.

CONSTRUCTION

Bridges. Elevating Illinois Central Tracks and Building the New Bridges, W. T. Christine. Eng. World, vol. 15, no. 3, Aug. 1, 1919, pp. 15-19, 9 figs. Fill necessary aggregated more than 550,000 cu. yd. Bridges are of reinforced concrete construction.

Track Work. Track Special Work of the Municipal Railways of San Francisco, Leslie W. Stocker. Elec. Traction. vol. 15, no. 8, Aug. 1919, pp. 500-503, 3 figs. Development of standards of material and workmanship.

Labor-Saving Devices for Railway Track Work. Can. Ry. and Mar. World, no. 258, Aug. 1919, pp. 421-424, 5 figs. Committee report presented at annual meeting of Roadmasters' and Maintenance of Way Assn.

Track Elevation on the Indianapolis Union Railroad. Eng. News-Rec., vol. 83, no. 6, Aug. 7, 1919, pp. 265-266, 2 figs. Methods necessitated in consequence of traffic of 165 trains daily.

Kanawha & West Virginia. The Kanawha & West Virginia Builds a New Line. Ry. Age, vol. 67, no. 7, Aug. 15, 1919, pp. 297-299, 5 figs. Remarking specially heavy grading involved.

ELECTRIC RAILROADS

Drop in Voltage. Drop in Volts for Track or Steel Conductors, E. Goolding. Tramway & Ry. World, vol. 46, no. 3, July 17, 1919, pp. 16-18, 5 figs. Tables for simplifying calculations.

Generator Suspension. Why One Road Changed Its Generator Suspension, J. H. Burcham. Ry. Elec. Engr., vol. 10, no. 8, Aug. 1919, pp. 271-272, 4 figs. Modifications in method of suspending Bliss truck.

History of Development. Electric Railway Development, H. C. Eddy. Area, vol. 7, no. 12, July 1919, pp. 1187-1194, 19 figs. Historical account.

Locomotives. Electric Locomotives in the Express Service of Trunk Lines (Studien über elektrische Lokomotiven im Schnellzugsdienste der Vollbahnen). Elektrotechnische Rundschau, vol. 36, nos. 5-6 and 7-8, Feb. 5 and 19, 1919, pp. 18-20 and 27-28, 2 figs. Comparison between steam and electric service on line between Tours and Paris.

ELECTRIFICATION

Argentine. Electrification of Central Argentine Railway (La traction électrique sur le chemin de fer central argentin). Revue Générale de l'Electricité, vol. 6, no. 3, July 19, 1919, pp. 77-83, 3 figs. Comprises central station of 15,000 kw. and 60 miles of high-tension transmission lines, 5 sub-stations and electric equipment for 100 miles of single track. A. c. generated at 20,000 volts and converted to d. c. at 800 volts for traction purposes.

Electrification. Railroad Electrification (Electrification de ferrocarriles), Jose Luis Valenti y Dorda. Revista de Obras Publicas, vol. 67, nos 2284 and 2286, July 3 and 17, 1919, pp. 317-321 and 344-349. Technical advantages and comparison with steam operation. Economical advantages.

Railroad Electrification Facts and Factors, A. J. Manson. Ry. Elec. Engrs., vol. 10, no. 8, Aug. 1919, pp. 277-279, 2 figs. Auxiliary apparatus required in the locomotive in addition to the main driving motors.

Electrification of Federal Railways (Electrification des chemins de fer fédéraux). Bulletin Technique de la Suisse Romande, vol. 45, no. 14, July 12, 1919, pp. 133-136, 8 figs. Tests of Hoeter concrete poles. (Concluded).

Great Britain. The Electrification of British Railways, F. W. Carter. Electrical Review, vol. 85, no. 2173, July 18, 1919, pp. 68-69. Included in program of reconstruction drawn up by Minister-designate of Ways and Communications not merely because "of the service it can render or of the saving it can effect," but because "electrical operation can show advantages over all other methods". (To be concluded).

Operation. Some Possibilities of Steam Railway Electrification as Affecting Futur Policies. Ry. Gaz., vol. 31, no. 2, July 11, 1919, pp. 56-57. Electrification is considered as offering a fundamentally different method of train propulsion because it is said limitation of steam locomotive disappears and the strictly limited motive power is replaced by one that is practically unlimited. Consequent modifications in railroad operation are visualized.

Overhead Construction. Overhead Construction in Electric Railways (Elektrische Bahnen). Elektrotechnik u. Maschinenbau, vol. 37, no. 1, Jan. 5, 1919, pp. 11-12, 6 figs. German and Austrian patents relating to catenary suspension.

Sweden. Electrification Work to be Pushed Forward in Sweden. Elec. Ry. Jl., vol. 54, no. 5, Aug. 2, 1919, pp. 225-227. Government aid for water-power development.

EQUIPMENT

Loading Table. A Standard Loading Table for British Railway Bridges, Conrad Gribble. Ry. Gaz., vol. 31, no. 4, July 25, 1919, pp. 116-118, 2 figs. Establishes that a complete loading table for bridges should consist of a series of tables giving (1) equivalent uniformly distributing loads for bending moment, (2) maximum shears at center and end of spans, and (3) maximum concentrations on cross-girders of various spacings.

Turntables. New Turntable for the Pennsylvania Railroad. Ry. Rev., vol. 65, no. 4, July 26, 1919, pp. 117-121, 12 figs. Three-point-supporting turntable with vertical adjustable center bearing.

LOCOMOTIVES

Locomotive Failures. Injuries from Locomotive Failures, John L. Mohun. Ry. Mech. Engr., vol. 93, no. 8, Aug. 1919, pp. 458-463, 2 figs. Suggestions for their reduction based on examination of Interstate Commerce Commission locomotive inspection reports.

Mallet Heavy. Carolina, Clinchfield & Ohio Freight Locomotives. Ry. Age, vol. 67, no. 7, Aug. 15, 1919, pp. 317-319, 4 figs. Mallet heavy 2-8-8-2 type with tractive effort of 103,560 lb. and total weight in working order of 523,600 lb. on drivers.

Heavy Mikado and Mallet Type Locomotives, Ry. Rev., vol. 65, no. 4, July 26, 1919, pp. 122-123, 2 figs. Comparison of Carolina, Clinchfield & Ohio Ry. types with similar ones of the U. S. Railroad Administration standards.

Pensylvania Mallet Compound Locomotive. Ry. Rev., vol. 65, no. 5, Aug. 2, 1919, pp. 157-159, 4 figs. Capable of exerting 100,000-lb. tractive power and designed to operate over maximum grades of 5 per cent and around curves of 18 deg. radius.

Rail Loads. Internal Disturbing Forces and Variations in Rail Load. Ry. Gaz., vol. 31, no. 2, July 11, 1919, pp. 63-65, 3 figs. Forces due to cylinder incline and finite connecting-rod length, with particular reference to three-cylinder locomotives.

Spark Arresters. Prevention of Forest Fire Losses, Smith Riley. Am. Forestry, vol. 25, no. 308, Aug. 1919, pp. 1260-1263, 7 figs. Form of spark arrester which has been employed with success on locomotives in Colorado.

Stoking, Mechanical. Mechanical Stoking of Locomotives, W. S. Bartholomew. Ry. Mech. Engr., vol. 93, no. 8, Aug. 1919, pp. 465-469, 6 figs. Factors determining necessity of applying stokers; operating results secured by stoker firing.

Valve Gears. The Metamorphosis of the Locomotive — II, III, H. Holcroft. Engineer, vol. 128, no. 3318-3319, Aug. 1 and Aug. 8, 1919, pp. 103-104 and 126-129, 6 figs. Valve gears for variable-expansion and compound locomotive

MAINTENANCE

Piles, Creosoted. An Unusual Record for Creosoted Piles. Ry. Maintenance Engr., vol. 15, no. 8, Aug. 1919, pp. 278-280, 1 fig. Over 14 000 creosoted piles said to have been in service in Southern Pacific Long Wharf at Oakland, Cal. for periods ranging from 22 to 29 years. Notes on their condition and treatment they received.

Terminal Tracks. The Correct Maintenance of Terminal Tracks J. B. Baker. Ry. Maintenance Engr., vol. 15. no. 8, Aug. 1919, pp. 275-276, 1 fig. Methods and practice of Pennsylvania Railroad.

Track Chisel. The Use and Abuse of the Track Chisel, Howard C. Mull. Ry. Maintenance Engr., vol. 15, no. 8, Aug. 1919, pp. 264-265, 5 figs. Suggestions in regard to handling so as to prolong life of tools.

OPERATION AND MANAGEMENT

Asphalt Shipping. The Advantages of Tank Car Shipments of Asphalt, Charles E. Murphy. Eng. & Contracting, vol. 52, no. 6, Aug. 6, 1919, pp. 160-161, 3 figs. Claims tank-car shipments have proved to be economical, have reduced labor of transportation and have effected quicker, safer and easier handling of materials. Rules for unloading are suggested.

Engineering Side of Operation. The Operation of Railways as an Engineering Problem, V. I. Smart. Jl. Eng. Inst. Can., vol. 2, no. 8, Aug. 1919, pp. 539-550, 9 figs. Enphasizes that actual use of means of transportation is just as much an engineering problem as is design, construction and care of means of transportation, and suggests that railroads utilize, in Transportation Department, men from these two recognized engineering departments.

Fair Value. Determining "Fair Value." Elec. Ry. Jl., vol. 54, no. 5, Aug. 2, 1919, pp. 222-225. Items to be considered in estimating fair value for rate making, as outlined by Com. of Am. Elec. Ry. Assn.
Principles Underlying Determination of "Fair Value." Eng. News-Rec., vol. 83, no. 9, Aug. 28, 1919, pp. 425-428. Report of Committee on Valuation of Am. Elec. Ry. Assn. defining bases for appraising public-utility properties for rate making.

Junction Operation. Single Line working at Double Line Junctions. Ry. Gaz., vol. 31, no. 2, July 11, 1919, pp. 60-62, 9 figs. Examples of junction working during obstruction.

Passenger Traffic Analysis. Methods of Observing and Analyzing Passenger Traffic, R. H. Horton. Aera, vol. 7, no. 12, July 1919, pp. 1174-1181, 13 figs. Practice of Philadelphia Rapid Transit Co.

PERMANENT WAY AND BUILDINGS

Ashpits. Double-Track Water-Type Ashpit, Pennsylvania Railroad. Eng. News-Rec., vol. 83, no. 9, Aug. 28, 1919, pp. 408-410, 4 figs. Noting special consideration given to safety of men working at pit.

Embankments Sliding. Has the Real Cause of Sliding of Railroad Embankments Been Found? (De eigenlyke eorzaak van den spoorwegdam-afschuiving verklaard), J. M. K. Pennink. Ingenieur, vol. 34, no. 26, June 28, 1919, pp. 488-490. Writer criticizes conclusions arrived at by special committee appointed for this purpose by Dutch Government Dept. of Building and Hydraulics, and states his hypothesis.

Oil-Storage Tanks. The Storage of Railway Fuel Oil. Ry. & Locomotive Eng., vol. 32, no. 8, Aug. 1919, pp. 227-229, 1 fig. Dimensions and location of storage tanks.

Subgrade Construction. Concrete in Subgrade Construction. Ry. Maintenance Engr., vol. 15, no. 8, Aug. 1919, pp. 282-285, 12 figs. Installation in service under steam-railway tracks and results secured.

Terminal Tunnels. Montreal Terminal Tunnel from an Economic Point of View, H. K. Wicksteed. Ry. Rev., vol. 65, no. 5, Aug. 2, 1919, pp. 145-151, 7 figs. Paper read before Eng. Inst. of Canada.

Track Maintenance. War-Time Progress in Maintenance of Way, John B. Tinnon. Elec. Ry. Jl., vol. 54, no. 5, Aug. 2, 1919, pp. 220-221. Writer believes that better track will result if less money is spent on construction and more on maintenance. Paper presented before Illinois Elec. Ry. Assn.
Maintenance of Permanent Way — II. Ry. Engr., vol. 40, no. 475, Aug. 1919, pp. 163-168, 2 figs. Concerning reballasting, relaying, resleepering and widenings. (Continuation of serial).

Track Supports, Concrete. Concrete Track Supports Cut Railway Maintenance Costs, A. C. Irwin. Concrete, vol. 15, no. 2, Aug. 1919, pp. 63-68, 16 figs. Types of construction proposed. Paper presented before Am. Concrete Inst.

RAILS

Rail Fissures. Limiting of Transverse Rail Fissures, Paul Kreuzpointner. Iron Age, vol. 104, no. 6, Aug. 7, 1919, pp. 360-362. Effect of non-diffusion of elements. Factors contributing to formation of fissures.

ROLLING STOCK

Box Cars. C. P. R. Double Sheathed Box Cars, Ry. Mech. Engr., vol. 93, no. 8, Aug. 1919, pp. 475-477, 3 figs. Also Ry. Age, vol. 67, no. 6, Aug. 8, 1919, pp. 257-259, 4 figs. Length is 36 ft.; weight 39,500 lb.; have steel underframe, wood superstructure and metal roof.

Box-Car Reconstruction. Reconstruction of 5-ft. Gauge Box Car Equipment to Suit the Indian State Railway 5-ft. 6-in. Gauge. Ry. Gaz., vol. 31, no. 3, July 18, 1919, pp. 92-94, 4 figs. Quoted as example of possibilities of converting rolling stock from one gage to another.

Instruction Car. New Instruction Car for the Southern Pacific. Ry. Age, vol. 67, no. 8, Aug. 22, 1919, pp. 365-366, 2 figs. Equipmnt includes apparatus for presenting operating problems graphically to employees.

SAFETY AND SIGNALING SYSTEMS

Accident in Holland. Railroad Accident near the Bridge over the Merwede Canal on September 13, 1918 (Het verzakken van den spoorwegdijk by de brug over het Merwedekanaal nabij Weesp op 13 September 1918), van den Thoorn. Ingenieur, vol. 34, no. 30, July 26, 1919, pp. 540-549, and (discussion) pp. 549-577, 11 figs. Report of Commission appointed by State Department of Building and Waterways Construction.

Block-Signaling Practice. Block Signaling Practice on a British Railway, F. B. Holt and A. B. Wallis. Ry. Signal Engr., vol. 12, no. 8, Aug. 1919, pp. 277-280, 2 figs. Use of electrically controlled ground frames, fouling bars, telepohne and telegraph communication, automatic signaling, electrically operated switches and locomotive cab signaling on Midland Railway of England.

Statistics on Signals. I. C. C. Statistics and Tables on Signals. Ry. Signal Engr., vol. 12, no. 8, Aug. 1919, pp. 270-274, 1 fig. Annual report pertaining to block signals and telegraph and telephone transmission of orders.

SHOPS

Firebox Repairs. Jacobs-Shupert Firebox Repairs, H. Louis Hahn. Ry. Mech. Engr., vol. 93, no. 8, Aug. 1919, pp. 485-487, 5 figs. Methods and tools used to repair stay sheets and craked and distorted sections.

Milling Practice. Milling Practice in Locomotive Shops, Edward K. Hammond. Machy, (N. Y.), vol. 25, no. 12, Aug. 1919, pp. 1122-1125, 7 figs. Methods of milling heavy forgings for the side rods, connecting rods and side frames of locomotives.

Repair Shops. The Design of Modern Locomotive Repair Shops, Gustave E. Lemmrich. Ry. Age, vol. 67, no. 6, Aug. 8, 1919, pp. 261-265, 3 figs. Study of considerations entering into an efficient layout for maintenance of engines.

Springfield Shops. New Springfield Shops of the Ohio Electric Railway. Elec. Traction, vol. 15, no. 8, Aug. 1919, pp. 473-478, 18 figs. Reinforced-concrete structures.

SPECIAL LINES

Lines with Steep Gradients. Safety Devices for Lines with Steep Gradients (Sicherungsvorrichtungen an Steilbahnen), Siegfried Abt. Zeitschrift für Kleinbahnen, vol. 26, no. 2, Feb. 1919, pp. 53-63, 26 figs. Anchors and brake tongs for cable railways on trestles, also anchors and guides for rack railways.

Narrow-Gage Railway Statistics. Statistics of Narrow-Gage Railways During 1915-1916. (Statistik der schmalspurigen Eisenbahnen für das Betriebsjahr 1915-1916), F. Zezula. Zeitschrift für Kleinbahnen, vol. 26, no. 2, Feb. 1919, pp. 64-94. Tables showing length of roadbed, capital invested per kilometer, type of railway, capacity and fuel consumption of locomotives (steam and electric) for Norwcian, Swiss, and German railroads.

STREET RAILWAYS

Battery Exchange. Electric Vehicle Standardization, Hilding Lubeck. Jl. Soc. Automotive Engrs., vol. 5, no. 2, Aug. 1919, pp. 131-141, 7 figs. Particularly with a view to establishing system of battery exchange.

Coasting. Coasting Results on the Chicago Elevated, H. A. Johnson. Elec. Ry. Jl., vol. 54, no. 6, Aug. 9, 1919, pp. 277-279, 2 figs. Coasting has been increased to 35 per cent. First year of operation said to have shown saving of 21,162,217 kw.-hr.

Fare Handling. Mechanical Aids in Handling Fares. Elec. Ry. Jl., vol. 54, no. 5, Aug. 2, 1919, pp. 217-220, 6 figs. Detroit United Ry. uses labor-saving device which is said to permit sorting and counting of receipts with 25 per cent of force required for hand operation.

Fare Systems. Revolutionary Change in Public Service Railway Fare System. Elec. Ry. Jl., vol. 54, no. 6, Aug. 9, 1919, pp. 282-284. Mile zones, low initial zone charge and the elimination of transfers are important elements in new system.
Tramway Fares and Services, Wm. L. Magden, Electrical Review, vol. 85, no. 2175, Aug. 1, 1919, pp. 132-134. Discussing conditions in the United Kingdom, writer points out how it appears to him that controlling bodies have considerable responsibility for failure of tramway systems to roduce adequate financial return to proprietors.

Rolling Stock. New Cars for Baltimore, A. T. Clark. Elec. Traction, vol. 15, no. 8, Aug. 1919, pp. 495-497, 3 figs. Arranged to operate in one, two or three-car units.

Telephone Traffic Control. Telephone Traffic Control for Tramways, Tramway & Ry. World, vol. 46, no. 3, July 17, 1919, pp. 9-14, 8 figs. Central control station in telephone touch with officials all over the system.
A System of Railway Traffic Control by Telephone, T. F. Lee, Post Office Elec. Engrs. Jl., vol. 12, no. 2, July 1919, pp. 105-115, 7 figs. System used by one of largest English companies and which is said to be independent of "earth" connections and therefore not to any considerable extent affected by "earth" faults.

Zone Fares. The Zone Fare in Practice. London County Council, I & II, Walter Jackson. Elec. Ry. Jl., vol. 54, nos. 5 and 6, Aug. 2 and 9, 1919, pp. 210-215 and 270-275, 15 figs. Lines said to be earning 40 cents per car mile. Fares were increased in May and June 1918 chiefly by introducing a three-section penny stage, averaging 1.8 miles and by abolishing children's and fractional fare tickets. Forms of Ticket Dept. Works.

TERMINALS

Terminal Power Plants. Power-Plant Operation on an Efficient Basis, Paul R. Duffey. Power, vol. 50, no. 9, Aug. 26, 1919, pp. 330-331. Deals principally with power plant of railroad terminal.

MARINE ENGINEERING

SHIP

Barges. Construction of Steel Barges, Thomas Leach. Proc. Engrs. Soc. Western Pa., vol. 35, no. 5, June 1919, pp. 273-274 and (discussion) pp. 275-282, 24 figs. Details of types being built for U. S. Railroad Administration for Erie Canal service.

Bulkhead Stiffeners. Investigation into Bulkhead Stiffeners — II, Int. Mar. Eng., vol. 24, no. 8, Aug. 1919, pp. 554-557 & 561, 1 fig. Calculation of stresses in bulkheads which form boundaries in trimming tanks, peak tanks or deep ballast tanks.

Cargo Vessels. S. S. Poughkeepsie, Standard 8,800-Ton Deadweight Cargo Vessel built by Newburgh Shipyards, Inc. Int. Mar. Eng., vol. 24, no. 8, Aug. 1919, pp. 531-535, 7 figs., partly on supp. plates. Two-deck, single-screw steamship fitted with water-tube boilers and geared turbines. Arranged for both coal and oil fuel.

New Type American Freighters. Mar. Rev., vol. 49, no. 9, Sept. 1919, pp. 413-414 and 437, 2 figs. Luckenback steamers of 12,500 deadweight tonnage commandeered by U. S. Government.

SS. "Kediri." Shipbuilding & Shipping Rec., vol. 14, no. 3, July 17, 1919, p. 68, 2 figs., partly on supp. plates. Cargo vessel having capacity of 6,300 tons d.w. on 21 ft. 6 in. draft. Built in Holland.

Concrete Ships. The U. S. Shipping Board's Work with Concrete, J. Glaettli. Concrete, vol. 15, no. 2, Aug. 1919, pp. 69-72. In connection with designing concrete ships. Paper read before Am. Concrete Inst.

Concrete Ships, J. W. Sadler. Jl. Electricity, vol. 43, no. 3, Aug. 1, 1919, pp. 122-123, 2 figs. Greater weight of concrete hull, and consequent need for lighter equipment indicate, writer believes, that electrical drive will be preferred for concrete ship.

Structural Action of Concrete Ship Members, W. A. Slater. Contract Rec., vol. 33, no. 32, Aug. 6, 1919, pp. 749-753. Laboratory investigations and problems in design of concrete vessels, undertaken by Concrete Ship Section of Emergency Fleet Corpn. in co-operation with U.S. Bur. Standards. Paper read before Am. Concrete Inst.

Electric Propulsion. A General Description of the Electric Propulsion of the U. S. S. California. Pacific Mar. Rev., vol. 16, no. 8, Aug. 1919, pp. 131-136, 12 figs., partly on supp. plates. Machinery is to consist of two turbo-generators, operating four motors, one connected with each line of shafting.

The Electric Plant of the Battleship Tennessee, R. L. Weber. U. S. Naval Inst. Proc., vol. 45, no. 198, Aug. 1919, pp. 1397-1408, 5 figs. Discussion is confined to ship's propelling machinery.

Freighters. *See Cargo Vessels.*

Mother Ships for Airplanes. H. M. S. "Furious." Engineering, vol. 108. no. 2798, Aug. 15, 1919, pp. 203-204, 6 figs. Partly on two supplement plates, Adopted as floating platform for flying ships. Dimensions and particulars.

Motor Ships. Italian Motorship Ansaldo San Giorgio I, Arthur Benington. Int. Mar. Eng., vol. 24, no. 8, Aug. 1919, pp. 525-529, 7 figs. Vessel is of single-deck type and is designed to leave cargo holes entirely unobstructed by pillars or stanchons.

Motor Tugs. Motor Tug. "Grove Place," Shipbuilding & Shipping Rec., vol. 14, no. 7, Aug. 14, 1919, pp. 181-182, 3 figs. Length, 55 ft.; breadth, 14 ft.; depth, 8 ft. Used for Thames service.

Ore Carriers. Ore Carriers for Ocean Service, V. G. Iden. Mar. Rev., vol. 49, no. 9, Sept. 1919, pp. 420-423, 5 figs. Being built by Bethlehem Steel Corporation. They are 11,669 dead-weight tons each, are equipped with geared turbines capable of 2,400 shaft hp., and are specially designed to facilitate loading.

Oil-Fuel Installation. Oil Fuel Installation in Passenger Steamships. Shipbuilding & Shipping Rec., July 31, 1919, vol. 14, no. 5, pp. 123-124. Instructions issued by British Board of Trade.

Sediment in Marine Boilers. Sediment in Marine Boilers, W. R. Austin. Int. Mar. Eng., vol. 24, no. 8, Aug. 1919, pp. 552-553, 1 fig. Quotes three instances where sediment may cause trouble.

TERMINALS

Motor Trucking. Motor Trucks and the Problem of Efficient Marine Freight Terminal Operation — I, Merrill C. Horine. Int. Mar. Eng., vol. 24, no. 8, Aug. 1919, pp. 518-524, 9 figs. Survey of terminal operation field. Interrelation of carriers, railroads, transfer drays and steamship.

VARIA

Charts. The World's Air and Ocean Routes, B. J. S. Cahill. Pacific Mar. Rev., vol. 16, no. 8, Aug. 1919, pp. 90-92, 2 figs. Illustrating illusion of distance and direction on Mercator's chart.

Japanese Shipbuilding. 1853 — A Brief History of Japanese Shipbuilding — 1919. Andrew Farrell. Pacific Mar. Rev., vol. 16, no. 8, Aug. 1919, pp. 71-79, 19 figs, Particularly as affected by policy of Japanese Government.

YARDS

Concrete Shipyards. Layout and Equipment of Government Concrete Ship Yards, A. L. Bush. Concrete, vol. 15, no. 2, Aug. 1919, pp. 73-77, 4 figs. Noting specially standardized schemes adopted for various structures.

Cost Accounting. Uniform Cost Accounting in Ship Building, J. L. Jacobs, Int. Mar. Eng., vol. 24, no. 8, Aug. 1919, pp. 539-543. Plan adopted by Atlantic Coast Shipbuilders' Assn. for uniform methods of cost accounting in steel shipbuilding.

A Cost System for Shipyards — II, Creighton Churchill. Int. Mar. Eng., vol. 24, no. 8, Aug. 1919, 545-548. Symbols used in collecting cost data.

Fore River. Shipbuilding Equipment and Methods at Fore River II—Shop Routing and Group Labor Systems. Eng. News-Rec., vol. 83, no. 8, Aug. 21, 1919, pp. 362-365, 2 figs. Features specially noted are shop routing system which schedules and keeps track of hull material from mold loft to berth, and special group labor system which has been applied to many of outside departments, chiefly the fitting-out and trial departments.

The Fore River Plant of Bethlehem Shipbuilding Corporation, Ltd., Austin E. Potter. Rudder, vol. 35, no. 8, Aug. 1919, pp. 358-362, 9 figs. Details of organization.

MECHANICAL ENGINEERING

AIR MACHINERY

Air Chambers. Installation and Use of Air Chambers, H. D. Fisher. Power, vol. 50, no. 6, Aug. 5, 1919, pp. 209-210, 6 figs. Arrangement which is said to have the advantage that by throttling valve it can be arranged to deliver just the quantity of air required and that it will work indefinitely without attention.

Air Receiver. The Air Receiver, Frank Richards. Compressed Air Mag., vol. 24, no. 8, Aug. 1919, pp. 9251-9256. Suggestions in regard to design and installation.

Fans. Centrifugal Fans, Frank S. Townsend. Popular Engr., vol. 12, no. 2, Aug. 1919, pp. 13-15, 3 figs. Their application in gas engineering practice. Paper read before Midland Junior Gas Association, England.

Transportation-

The Utilization of Compressed Air in Transportation (Die Verwendung der Pressluft in der Verkehrstechnik). Kasten, Zeitschrift f. komprimierte u. flussige Gase, Vol. 19, no. 11, 1917-18, pp. 97-100, 4 figs. Pneumatic mail tubes in Burlin.

Wind Motors. Wind Motors: Their Possibilities and Limitations, Faville C. Poulton. Jl. Roy. Soc. Arts, vol. 67, no. 3480, Aug. 1, 1919, pp. 590-594. Argues that there is room for wind motor in these days of super-economy because a modern wind motor properly installed gives 15 per cent efficiency while a modern steam plant using coal of 15,000 B.t.u. per lb. gives 13 per cent only.

CORROSION

Copper. Corrosion of Copper — VII, G. F. Bengough and O. F. Hudson. Metal Industry, vol. 15, no. 2, July 11, 1919, pp. 26-28. Tables giving results of immersion tests in both distilled water and sea water. From fourth report of Corrosion Committee of Inst. of Metals.

Earth Currents. Corrosion through Earth Currents from Electric Traction (Die Korrosion durch Erdstrome elektrischer Bahnen). Elektrotechnik u. Maschinenbau, vol. 37, no. 6, Feb. 9, 1919, pp. 56-57. Report of the Swiss Electrotechnical Soc. regarding corrosion of gas and water mains.

Rustproofing. Metallic Coatings for Rustproofing. Brass World, vol. 15, no. 8, Aug. 1919, pp. 242-245. Methods of testing coatings. Recommendations concerning coatings.

FORGING

Drop Stamping. Drop-Stamping, Drop-forgings, etc.— VI, Joseph Horner. Mech. World, vol. 66, no. 1700, Aug. 1, 1919, p. 55, 5 figs. Example in which entire forging must be stamped at one time in order to produce recessed form of web. (To be continued).

FOUNDRIES

Casting Machine. New Casting Machine for Pig Iron (Neue Masselgiessmaschine). Zeitschrift f. die gesamte Giessereipraxis, vol. 40, no. 9, Mar. 1, 1919, pp 109-110, 3 figs. Consists of two turntable holding cast-rion molds; while the specially constructed ladle pours a regulated amount into mould of first table, the second table automatically advances one mold. It is claimed that ingots made by this process are of even size and weight.

Chinese Foundries. Chinese Iron Foundries, F. A. Foster. Am. Mach., vol. 51, no. 8, Aug. 21, 1919, pp. 345-352, 30 figs. Notes the specially remarkable thinness and smooth finish of products in spite of crudeness of method of production.

Condensers. Making and Casting Cylindrical Condensers.— I, Ben Shaw. Mech. World, vol. 66, no. 1700, Aug. 1, 1919, pp. 54-55, 3 figs. Illustrating instances where company built cast-iron condenser "as one means of reducing the work required to be done by riveters."

Electric Casting. Electric Casting and Welding (Elektrisches Giess — und Schweissverfahren). Zeitschrift f. die gesamte Giessereipraxis, vol. 40, no. 7, Feb. 15, 1919, pp. 81-83. With special reference to Dr. Zerener's method.

Engine Cylinder Casting. Marine Gasoline Engine Cylinders, R. H. Palmer. Foundry, vol. 47, no. 329, Aug. 15, 1919, pp. 567-568, 5 figs.Foundry problems encountered in marine-engine shop.

Gating. Method of Gating Test Bars Affects Results, A. W. Sorgenz, Foundry, vol. 47, no. 329, Aug. 15, 1919, pp. 559-560, 4 figs. Double annealing recommended.

Ingot Mold Foundry. Bethlehem's Ingot Mold Foundry. E. C. Kreutzberg. Iron Trade Rev., vol. 65, no. 8, Aug. 21, 1919, pp. 495-498, 7 figs. Capacity is 10,000 tons of ingot molds, stools and bottom plates per month. Attention is particularly called to arrangement for storing and charging coke and method of pouring molds from long platform.

Layout. A Dayton Foundry of Progressive Design. Iron Age, vol. 104, no. 6, Aug. 7, 1919, pp. 355-356, 3 figs. Method of distributing air for heat and ventilation, use of transferable jib crane, and storage of sand in pits below foundry floor level quoted as interesting features.

Malleable Iron. Insure the Integrity of Malleable, Enrique Touceda. Foundry, vol. 47, no. 329, Aug. 15, 1919, pp. 551-552. Writer believes that soundness of metal in castings is secured by eliminating chills and strict adherence to use of feeding heads to furnish metal at proper pressure. Paper presented before American Foundrymen's Assn.

Molding. Long Castings From Short Patterns, R. R. Clarke. Foundry, vol. 47, no. 329, Aug. 15, 1919, pp. 561-564. Hints on molding light and heavy bushings.

Molding Machines. Molding Machine That Throws Sand, Pat Dwyer. Foundry, vol. 47, no. 329, Aug. 15, 1919, pp. 535-538, 6 figs., also in Iron Trade Rv., vol. 65, no. 9, Aug. 28, 1919, pp. 567-579, 6 figs. Device in which projectile principle is employed for ramming sand. Sand is thrown by rapidly revolving head.

Patterns. Gear Patterns, Joseph A. Shelly. Machy. (N. Y.), vol. 25, no. 12, Aug. 1919, pp. 1133-1137, 10 figs. Methods of laying out and constructing patterns for spur and bevel gears and wormwheels.

Ship Castings. Castings for Ship Construction — VIII, Ben Shaw and James Edgar. Foundry, vol. 47, no. 329, Aug. 15, 1919, pp. 540-544, 15 figs. Concerning care necessary in preparing mold for propeller shaft brackets to insure proper allowances for contraction of metal. Writers hold that large flasks are not necessary.

Standardization. Standardization of Foundry Practice, S. W. Wis. Mech. World, vol. 66, no. 1701, Aug. 8, 1919, pp. 69-70. Tabulated records of different conditions under which various foundry operations are conducted are presented as evidence to justify writer's belief that it is well-nigh impossible to approach anything like uniform practice. He suggests idea of a foundry equivalent to National Laboratory. Paper read before Newcastle Branch of British Foundrymen's Assn.

FUELS AND FIRING

Alcohol. Alcohol Motor Fluid. Engineer, vol. 128, no. 3314, July 4, 1919, pp. 17-18. Also in Jl. Soc. Chem. Industries, vol. 38, no. 13, July 15, 1919, pp. 250 R-252 R,, and in Eng. & Indus. Management, vol. 2, no. 3, July 17, 1919, p. 67. Report of committee appointed by British Government to consider and report upon available sources of supply, methods of manufacture and cost of product; suitability, either alone or in admixture with other combustibles, for use in internal-combustion engines, and modifications of existing types of such engines which may be necessary to attainment of efficiency, and question of denaturing alcohol, and alterations to be made in present excise arrangements.

Fuel Saving. Fuel Saving in Industrial Plants. John F. Tinsley. Mech. Eng., vol. 41, no. 9, Sept. 1919, pp. 750-751. Manner in which Worcester, Mass. Fuel Conservation Committee conducted campaign during war.

Gaseous Fuel. Utilization of Gaseous Fuel in Commercial Practice, F. W. Epworth Metal Industry, vol. 15, no. 2, July 11, 1919, pp. 21-25, 9 figs. With consideration of types of gas-fired furnaces and methods for their control.

Low-Grade Fuel. The Production of Steam from Low Grade Fuel and a Chemical Works Power Plant P. Parrish. Chem. Industry, vol. 38, no. 14, July 31, 1919, pp. 234T-239T and (discussion) 239T-241T, 5 figs. Details of Crosthwaite's patent forced-draft air tubes.

Metallurgical Furnaces. Fuel for Metallurgical Furnaces, Rose Demorest. Blast Furnace & Steel Plant, vol. 7, no. 8, Aug. 1919, pp. 386-389. Bibliography of oil fuel for metallurgical furnaces complied from chief sources of technical literature.

Powdered Coal. The Use of Pulverized Coal — II, Leonard C. Harvey. Engineer, vol. 128, no. 3315, July 11, 1919, pp. 26-28, 5 figs. Notes on various types of burners.

Waste-Heat Boilers and Pulverized Fuel in Chemical Factories, C. J. Goodwin. Chem. Industry, vol. 38, no. 14, July 31, 1919, pp. 213T-220T and (discussion) 220T-222T, 6 figs. Typical installations at various English works.

High Efficiency of Powdered Coal as Fuel — I. Coal Trade Jl., vol. 50, no. 33, Aug. 13, 1919, pp. 981-982, 1 fig. Quigley system. (To be continued).

The Use of Pulverized Coal, L. C. Harvey. Engineering, vol. 108, no. 2796, Aug. 1, 1919, pp. 160-164, 13 figs. Systems of Locomotive Pulverized Fuel Co. and Powdered Coal Engineering Co. (Concluded). Paper read before Iron and Steel Inst.

The Use of Pulverized Coal, L. C. Heavey. Engineering, vol. 108, no. 2795, July 25, 1919, pp. 125-128, 11 figs. Particulars of various systems. (Continuation of serial). Paper read before Iron and Steel Inst.

Pulverized Coal as a Fuel for Boilers, Edward R. Welles and W. H. Jacobi. Mech. Eng., vol. 41, no. 9, Sept. 1919, pp. 744-749 and p. 787, 5 figs. General study of its characteristics and the operating conditions met with in its commercial applications; also a discussuon of the nature of flame, types of burners and of a design of pulverized-fuel furnace for a 500-hp. boiler.

High Efficiency of Powdered Coal as Fuel — II. Coal Trade Jl., vol. 50, no. 34, Aug. 20, 1919, pp. 1018-1019, 2 figs. Description of controller and burner. Comparison of other fuels.

FURNACES

Heat-Treating Furnaces. Heat Treating Furnaces for Heavy Artillery, William J. Harris, Jr. Blast Furnace & Steel Plant, vol. 7, no. 8, Aug. 1919, pp. 378-380, 2 figs. Vertical steel shell-type furnace installed at U. S. Government arsenal at Watertown, Mass., for heat treatment of gun tubes and other parts of heavy artillery.

Heating Furnaces and Annealing Furnaces — VIII, W. Trinks. Blast Furnace & Steel Plant, vol. 7, no. 8, Aug. 1919, pp. 390-393, 9 figs. Diagram for determining generator size.

GAGES

Grinding Gages. Producing Screw Thread Gauges by Grinding, C. Edgar Allen. Machy, (Lond.), vol. 14, no. 356, July 24, 1919, pp. 504-507, 9 figs. Method which utilizes disintegration of wheel during grinding to yield ultimate thread form.

Newall Gages Newall Measuring Machines and Gauges, Engineering, vol. 108, no. 2795, July 25, 1919, pp. 104-105, 12 figs., partly on two supplement plates. Details of test room specially noted.

Taft-Pierce Measuring Machine. Taft-Pierce Measuring Machine, E. J. Bryant. Inspector, vol. 1, no. 3, Aug. 15, 1919, pp. 9 and 17, 1 fig. For checking dimensions of plug gages and similar objects.

Tolerances. Tolerances as Affected by Workshop Conditions, A. Whitehead. Engineering, vol. 108, no. 2798, Aug. 15, 1919, pp. 201-203, 1 fig. Article deals with shafts and holes such as occur in motor chassis and smaller works under conditions associated with intensive production.

GAS ENGINEERING

Cleaning Gas. Cleaning Gas By Effective Method, George B. Cramp. Iron Trade Rev., vol. 65, no. 8, Aug. 21, 1919, pp. 506-507, 4 figs. Corrugated baffle plates built on interior of gas washer said to give large cleaning area and uniform condition throughout washer.

Distribution Unner Pressure. Report on the Distribution of Gas under Pressure at a Distance (Rapport sur la distribution du gaz sous pression à distance), M. A. Schmidt. Bulletin de la Société Industrielle de Mulhouse, vol. 84, no. 6, June-July-Aug.-Sept. 1914, pp. 453-460, 1 fig. Question of economical distribution studied with reference to Monnier-Pohl expression. Diameter of conduit, pressure and quantity delivered.

Gas-Main Connection. Standardized Method for Connecting Gas Mains, Duncan D. Randsdell. Gas Age, vol. 44, no. 4, Aug. 15, 1919, pp. 137-139, 2 figs. Experience of Washington Gas Light Co. in cutting in sections of cast-iron gas mains.

Gas Production to Standards. Fuel Economy at the Apedale Works of the Midland Coal, Coke and Iron Company, Limited, William Hill and J. A. Cork. Iron & Coal Trades Rev., vol. 99, no. 2682, July 25, 1919, pp. 106-107. Special attention is said to be given to gas purification, regular heating value of gas, constant pressure of gas at engine stop valves, provision of circulating water at constant pressure and free from impurities, and means to enable foregoing conditions to be automatic. Paper read before North Staffordshire Inst. of Min. Engrs.

Great Britain. Present Conditions in the British Gas Industry, D. Milne Watson. Gas Age, vol. 44, no. 3, Aug. 1, 1919, pp. 97-98. Address delivered to British Board of Trade.

Low-Temperature Distillation. Low Temperature Distillation of Coal, C. M. Garland. Power, vol. 50, no. 7, Aug. 12, 1919, pp. 248-251, 4 figs. Recommends for power plants with constant load burning over 50 tons of coal per day, combination of low-temperature process with by-product gas producer to recover greater percentage of ammonium sulphate. Claimed economical advantages are pointed out.

Measurement of Gas. Electrical Method for Commercial Measurement of Gases, G. A. Sharland. Iron & Coal Trades Rev., vol. 99, no. 2680, July 11, 1919, pp. 37-38, 4 figs. Meter gives in standard units graphic record of actual amount of gas passing during any specific interval of time.

Natural Gas. Methods for More Efficiently Utilizing Our Fuel Resources — XXX, Samuel S. Wyer. Gen. Elec. Rev., vol. 22, no. 8, Aug. 1919, pp. 636-648, 11 figs. Natural gas.

Providence Gas Company. Manufacturing Plant of the Providence Gas Co.— III, Walter M. Russell. Chem. & Metallurgical Eng., vol. 21, no. 3, Aug. 1, 1919, pp. 147-153, 8 figs. Installation and operation of battery of 40 Koppers cross-regenerative, combination, by-products ovens. Coal and coke-handling apparatus. Paper read before Am. Inst. Chemical Engrs.

HANDLING OF MATERIALS

Coal Handling. Insuring Adequate Coal Supply with the Least Expenditure, George E. Wood. Elec. Ry. Jl., vol. 54, no. 7, Aug. 16, 1919, pp. 312-315, 10 figs. Layout of coal-handling equipment and storage facilities of Conn. company at New Haven.

HEAT-TREATING

Steel. Some Remarks concerning the Heat Treatment of Steel and Their Application to the Treatment of Steels Used for Airplane Motors, Albert Sauveur, Jl. Franklin Inst., vol. 188, no. 2, Aug. 1919, pp. 189-197. Distinguishing between three treatments — softening treatment, strengthening treatment and hardening treatment.

Notes on Heat Treatment of Steel, T. D. Lynch. Proc. Engrs. Soc. of Western Pa., vol. 35, no. 5, June 1919, pp. 215-237 and (discussion), pp. 238-242, 11 figs. Materials of design; standardized treatments; results of standard heat treatment.

HEATING AND VENTILATION

District Heating System. The Transmission of Steam in a District Heating System by Means of High-Velocity Feeders, Norman W. Calvert. Heat & Vent. Mag., vol. 16, no. 8, Aug. 1919, pp. 32-35, 3 figs. Notes connection for reducing flow velocity at end of feeder.

Fan Heating System. A Fan Heating System Installed Without the Use of Galvanized Iron, F. B. Rowley and John R. Allen. Heat & Vent. Mag., vol. 16, no. 8, Aug. 1919, pp. 17-23, 11 figs. Temporary work at Univ. of Minn. while preparing building for prospective registration of 5,000 men in S. A. T. C.

Farm-Building Ventilation. Farm Building Ventilation, W. B. Clarkson. Trans. Am. Soc. Agricultural Engrs., vol. 12, Dec. 1918, pp. 51-57. Asserts that there is need for more specialization on subject by those who will assume responsibility for good results.

Homes. Coal and Electricity Compared for the Heating of Homes. Heat & Vent. Mag., vol. 16, no. 8, Aug. 1919, pp. 24-28. From report of Hydro-electric Power Commission of Ontario.

Oil Elimination from Condensation. Removing Oil from Condensation, Charles L. Hubbard. Domestic Eng., vol. 88, no. 7, Aug. 16, 1919, pp. 301-303 and 332. Devices eliminating oil from condensation in steam-heating systems. Their installation and operation.

Radiating Surface. Placing Hot Water Radiators Below Boiler Level, Wm. Hutton. Domestic Eng., vol. 88, no. 7, Aug. 16, 1919, pp. 297-299, 2 figs. Method of proportioning radiating surface to promote circulation at various levels.

SCHOOLS. The Mechanical Equipment of Washington School, Bayonne, New Jersey, Donald G. Anderson. Am. Architect, vol. 116, no. 2278, Aug. 20, 1919, pp. 251-256, 8 figs. Heating, ventilating and electric wiring.

TESTING. Testing Modern Plumbing Installations, Robert J. Gordon. Domestic Eng., vol. 88, no. 8, Aug. 16, 1919, pp. 294-296, 5 figs. How to test sewers, drains, soil, waste and vent piping by water, air and smoke.

HOISTING AND CONVEYING

CONVEYOR CONTROL. The Curtis Bay Pier of the B. & O. R. R.— II. Coal Trade Jl., vol. 50, no. 33, Aug. 13, 1919, pp. 985-986, 3 figs. Automatic control of conveyor and balancing pin described.

CONVEYOR, PORTABLE. Modernizing Freight-Handling Methods. Iron Trade Rev., vol. 65, no. 6, Aug. 7, 1919, pp. 351-355, 6 figs. Illustrating uses of portable conveyors.

CRANE, BREAKDOWN. 35-Ton Steam Breakdown Crane, Great Northern Railway, H. N. Gresley. Ry. Gaz., vol. 31, no. 4, July 25, 1919, pp. 118-119, 3 figs. Locomotive portion and job supported upon ten-wheeled carriage; wheelbase of engine truck is 21 ft.; engine is equipped with two high-pressure cylinders.

CRANE, REINFORCED CONCRETE. Travelling Crane of Reinforced Concrete, Eng. & Contracting, vol. 52, no. 5, July 30, 1919, p. 137, 1 fig. Capacity, three tons; span, 32.8 ft. Translated from Génie Civil.

CRANES, FLOATING. The World's Largest Floating Cranes, Coal Trade Jl., vol. 50, no. 32, Aug. 6, 1919, pp. 956-957, 1 fig. Cranes with lifting capacity of 150 tons at radius of 105 ft. recently completed and installed at Navy Yards at Norfolk, Va., and Mare Island, Cal.

CRANES FOR STEEL WORKS. Special Cranes with Electric Drive for Steel Works (Beispiele neuer elektrisch betriebener Spezialkrane für Stahlwerke), Ernst Blau. Elektrotechnik u. Maschinenbau, vol. 37, no. 9, Mar. 2, 1919, pp. 81-86, 7 figs. Scrap-iron loading crane with lifting magnet and tray arrangement and trough-charging crane of the Ardelwerke, Berlin.

CRANES, QUARRY. Ship Cranes for Quarrying Operations. Rock Products, vol. 22, no. 16, Aug. 2, 1919, pp. 21-24, 13 figs. Features of pit-type quarry and crushing plants in Montreal.

ELEVATORS, ELECTRIC. Future Possibilities of Push Button Control for Electric Elevators, Alexander Marks. Am. Architect, vol. 116, no. 2276, Aug. 6, 1919, pp.187-194, 8 figs. Possibilities opened up by removal of mandatory restrictions against such type of operation, notably at New York City.

GRAIN ELEVATOR. Portable Pneumatic Grain Elevator; Duckham System, George Frederick Zimmer. Engineering, vol. 108, no. 2797, Aug. 8, 1919, pp. 191-192, 7 figs., partly on two supplement plates. Mounted upon railway rolling stock.

Portable Grain Elevator. Engineering, vol. 108, no. 2796, Aug. 1, 1919, p. 145, 5 figs. Consists of hopper supported by three columns from wagon-type body.

GRAVITY RUNWAYS. The Utility of Gravity Runways. Ry. Gaz., vol. 31, no. 3, July 18, 1919, pp. 87-88. Notes on their application and operation.

ORE UNLOADER. An Automatic Iron-Ore Unloader. Eng. & Min. Jl., vol. 108, no. 8, Aug. 23, 1919, pp. 305-307, 3 figs. Wellman-Seaver-Morgan electrically driven machines used for the moving of cargoes from lake steamers to cars or stock-piles ready for shipment to furnaces.

ROCK CONVEYORS. Roe's Patent Rope Conveyor, George Frederick Zimmer. Eng. & Indus. Management, vol. 2, no. 3, July 17, 1919, pp. 89-91, 5 figs. Total length is 1800 ft. It consists of two endless ropes running around a pair of edge sheaves at either terminal, the drive being taken through one pair while the other pair is mounted on a low trolley attached to tensioning arrangement.

TIPPING BUCKET. Refuse Tipping Bucket. Colliery Guardian, vol. 118, no. 3058, Aug. 8, 1919, pp. 373, 3 figs. Consists of bucket supported on angle-iron rings which rest on rollers fixed in frame provided with wheels that run upon track or roller to top of bing.

HYDRAULIC MACHINERY

ONTARIO POWER COMPANY'S PLANT. Extension to the Ontario Power Company's Plant. Elec. News, vol. 28, no. 16, Aug. 15, 1919, pp. 23-30, 15 figs. Features are wood-stave pipe 13½ ft. in diameter and 6700 ft. long, differential surge tank of 60 ft. outside diameter and 78 ft. high, and power house with walls designed to withstand 40 ft. rise in tail water. Added capacity is 30,000 kva.

SEEWER REGULATING SYSTEM. *See Turbine Governors.*

TURBINE DESIGN. Progress in Water-Turbine Design, A. H. Wilson and A. J. McDougall. Can. Engr., vol. 37, no. 8, Aug. 21, 1919, pp. 241-242. From annual report of Can. Elec. Association's Committee on Prime Movers.

TURBINE GOVERNORS. Seewer's Universal Regulating System for High-Pressure Pelton Turbines (Universal-Regulierung System Seewer für Hochdruck Pelton Turbinen), Franz Prasil. Schweizerische Bauzeitung, vol. 73, no. 23, June 7, 1919, pp. 263-267, 9 figs. Curves, tables and tachograms of tests made.

TURBINE TESTING STATION. Turbine Testing Station of Mechanical Works at Vevey, S.A.Bulletin Technique de la Suisse Romande, vol. 45, no. 15, July 26, 1919, pp. 145-150, 2 figs. Built specially for connecting Francis types under all running conditions.

WATER HAMMER. Water Hammer in Conduits under Pressure (Note sur le calcul du coup de bélier dans les conduites sous pression). Bulletin Technique de la Suisse Romande, vol. 45, nos. 15 and 16, July 26 and Aug. 9, 1919, pp. 153-155 and 161-166, 12 figs. July 26: Application of theory to various examples. Aug. 9: Illustrating application of formulæ in actual computations.

INTERNAL-COMBUSTION ENGINES

CARBURETORS. Mathematical Study of Operation of Spray Constant-Level Carburetors (Etude mathématique du fonctionnement des carburateurs à giclage et à niveau constant), M. Carbonaro. Génie Civil, vol. 75, no. 5 and 6, Aug. 2, 1919 and Aug. 9, 1919, pp. 96-99 and pp. 120-124, 7 figs. Laws of flow of gasoline through capillary passages. Relation between gasoline-air ratio and depression caused by motor in admission pipe. (To be continued).

The Zephyr Carburetter Autocar, vol. 43, no. 1240, July 26, 1919, pp. 131-132, 4 figs. Operates on submerged jet principle.

ENGINE TESTS. Some Experiments on a Small Engine. Harry R. Ricardo. Automobile Engr., vol. 9, no. 129, Aug. 1919, pp. 236-240, 6 figs. Tests to investigate performance of Continental engine as fitted to Morris-Crowley car.

HOT SPOT. Accessibility and Hot Spot Device for Vaporizing of Fuel Feature New Gray Truck Engine. Commercial Vehicle, vol. 21, no. 1, Aug. 1, 1919, pp. 28-29, 3 figs. Engine is of valve-in-head type.

MARINE OIL ENGINES. The Ansaldo-San Giorgio Marine Oil Engine. Engineering, vol. 108, no. 2794, July 18, 1919, pp. 80-82, 1 fig. Four-cylinder two-cycle type with valve-controlled port scavenging.

ROTARY AND RADIAL ENGINES. Rotary and Radial Engines, T. L. Sherman. Automobile Engr., vol. 9, no. 129, Aug. 1919, pp. 248-249. Comparative review of dynamic and various minor problems as they effect these two types.

STARTERS. A New Development in Motor Starters. Engineer, vol. 128, no. 3315, July 11, 1919, pp. 32-33, 7 figs. " Navy " type starter designed for submarine work.

TARS, RAW, AS FUEL. The Use of Raw Tars as Fuels for Diesel Engines, Harold Moore. Engineering, vol. 108, no. 2797, Aug. 8, 1919, pp. 167-168. Summary of chemical and physical properties of tar oils and of practical experience of their behavior in Diesel engines.

THERMAL EFFICIENCY, LIMITS. The Limits of Thermal Efficiency in Internal Combustion Engines, Dugald Clerk. Engineering, vol. 108, nos. 2794, 2795, 2796, July 18, 26 and Aug. 1, 1919, pp. 77-79, 130-132 and 157-159, 22 figs. July 18: Technical discussion of present position and future possibilities of obtaining motor power by gas and liquid fuel in most effective manner. July 25: Variation of engine weight with increasing dimensions. Aug. 1: Determination of heat loss and varying specific heat of flame and products of combustion in engine cylinder by Clerk zigzag diagram. Also abstracted in Engineer, vol. 128, no. 3315, July 11, 1919, pp. 40-42, 1 fig.

LUBRICATION

BEARING LUBRICATION. Oiling and Lubricating Devices, Otto Abdt. Machy. (N. Y.), vol. 25, no. 12, Aug. 1919, pp. 1146-1147, 4 figs. Some methods of lubricating inaccessible bearings.

MACHINE ELEMENTS AND DESIGN

CRANK ANALYSIS. An Analysis to Distinguish Between a Crank and an Eccentric as Driving or Driven Elements, H. S. Dickinson. Trans. Am. Soc. Agricultural Engrs., vol. 12, Dec. 1918, pp. 96-124, 18 figs. Formula and diagrams comparing resultant moments.

RIVETED JOINTS. Riveted Joints for Steel Penstocks and Tanks, H. A. Babcock and J. R. Montague, Can. Engr., vol. 37, no. 6, Aug. 7, 1919, pp. 195-200 and 209, 8 figs. Formula and tables of their design. Examples of solution of maximum joint efficiency.

ROLLER BEARINGS. Roller Bearing Types and Applications. Raw Material, vol. 1, no. 5, July 1919, pp. 265-267, 7 figs. Construction features of various makes of roller bearings and their applications to various types of machinery and machine tools. (To be continued).

SCREW GRADING. A Pitch Engagement System of Grading Screws. Machy. (Lond.), vol. 14, no. 357, July 31, 1919, pp. 529-532, 5 figs. Screw threads graded on number of threads in engagement.

MACHINE SHOP

GEAR-CUTTING MACHINES, SETTING OPERATIONS. Setting Operations on Gear-Cutting Machines, Fred Horner. Machy. (Lond.), vol. 14, no. 357, July 31, 1919, pp. 521-527, 29 figs. As practiced at various English shops and at works of Oerlikon Machine Tool Co. of Switzerland.

GRINDING CUTTERS. Latest Practice in Cutter Grinding — III, IV and V. Am. Mach., vol. 51, nos. 6, 7 and 8, Aug. 7, 14 and 21, 1919, pp. 251-254, 323-325 and 369-371, 24 figs. Angular cutter grinding and grinding of form cutters and taps Modern practice in hand and chucking reamer grinding for steel, cast iron and bronze. Tables are included which give vertical adjustment for above-center for both cutting clearance and second clearance. Methods used by Cincinnati milling Co. in grinding hand reamers for steel and also chucking reamers for cast iron, bronze, or steel, both roughing and finishing. Concluding installment.

MOTOR-TRUCK REPAIR WORK. Equipment Required for Upkeep of 54 Gasoline Trucks, George Heron. Commercial Vehicle, vol. 21, no. 2, Aug. 15, 1919, pp. 52-55, 8 figs. Itemized list of machines used for repair work.

PLANO-MILLING PRACTICE. Plano-Milling Practice in Automobile Plants — II. Machy. (Lond.), vol. 14, no. 355, July 17, 1919, pp. 461-465, 9 figs. Milling operations on cylinder blocks and heads of typical American engines.

SMALL-SHOP WORK. General Work in the Small Shop — XXII. Mech. World, vol. 66, no. 1698, July 18, 1919, pp. 26-27, 6 figs. Cutting of wormwheels to suit V-thread worms. (Continuation of serial).

Standardized Part Production. Jigs, Tools, and Special Machines with Their Relation to the Production of Standardized Parts, H. C. Armitage. Mech. World, vol. 66, no. 1699, July 25, 1919, pp. 39-40, 4 figs. Comparative cost results between threes chemes—small production, large production and maximum production. (Concluded).

MACHINERY, METAL-WORKING

Chucking and Turning Machines. Semi-Automatic Chucking and Turning Machine. Machy. (Lond.), vol. 14, no. 355, July 17, 1919, pp. 472-474, 7 figs. Swing of 12¾ in. diameter over bed or 8 in. diameter over cross-slide is possible and turning limit is 8 in. diameter with standard tools supplied.

Crankshaft Lathe. A Record-Smashing Crankshaft Lathe, Ethan Viall. Am. Mach., vol. 51, no. 9, Aug. 28, 1919, pp. 395-399, 8 figs. For machining sides of webs and turning ends of crankpins on all of throws at the same time. Machining time is claimed to be reduced from thirty to two days.

Drill Heads. Novel Portable Electrical Drill Heads, Frank C. Perkins. Can. Machs., vol. 22, no. 7, Aug. 14, 1919, pp. 177-178, 4 figs. Operation of English and German types illustrated.

Grinding Machines. Machine and Fitting Shop Practice, Fred Horner. Mech. World, vol. 66, no. 1699, July 25, 1919, pp. 38-39, 5 figs. Types used in internal grinding machines. (Continuation of serial).

Hand Tools. Portable Motor-Driven Hand Tools for Wood and Metal Working. Elec. Rec., vol. 26, no. 2, Aug. 1919, pp. 91-97, 33 figs. Details concerning construction and operating features.

Lathes. Recent Machine Tool Developments — II and III, Joseph Horner. Engineering, vol. 108, no. 2794 and 2797, July 18 and Aug. 8, 1919, pp. 70-73 and 172-176, 46 figs. Forms or beds, legs, standards, framings, slides, and tool and work supports. Illustrating typical example of longitudinal outlines of lathe beds, legs and equipment.
See also Crankshaft Lathe.
The Design and Construction of a 4½-in. Lathe Tail-stock. Model Eng. & Elecn., vol. 41, no. 951, July 17, 1919, pp. 61-64, 4 figs. Operations required in construction and fitting of tailstock to old lathe. (To be continued).

Milling Machines. Tilted Rotary Milling Machine. Machy, (Lond.), vol. 14, no. 355, July 17, 1919, pp. 481-484, 5 figs. In addition to allowing machine to be used as continuous rotary miller, provision is made for using it as indexing machine.

Tooling Equipment for Piston Rings. Tooling Equipment for an Automobile Piston Ring. Machy. (Lond.), vol. 14, no. 355, July 17, 1919, pp. 475-477, 7 figs. Performing two operations — splitting on each side and peening until strung together — at one time.

Vice. "Fland" Machine Vice. Engineering, vol. 108, no. 2796, Aug. 1, 1919, pp. 140-141, 13 figs. Constructed on "three point of suspension" principle, usually two jaws of vice being replaced by three sliding blocks.

MACHINERY, SPECIAL

Farm Machinery. A Study of the Plow Bottom and Its Action upon the Furrow Slice, E. A. White. Trans. Am. Soc. Agricultural Engrs., vol. 12, Dec. 1919, pp. 42-50, 13 figs. Machine for studying mathematical action of plow bottoms.
See also Equalizers and Hitches.

Draft Tests of Fram Machinery, E. J. Stirniman. Trans. Am. Soc. Agricultural Engrs., vol. 12, Dec. 1918, pp. 9-25. Result of series of drawbar test and power required to operate various power machines.
Plow Bottom Design, C. A. Bacon. Trans. Am. Soc. Agricultural Engrs., vol. 12, Dec. 1918, pp. 26-40, and (discussion) pp. 40-42, 10 figs. It is observed that search for material that would withstand erosive influence of silicon led to manufacture of chilled plow. Reference is made to experiments with different shaped plow bottoms.
Standardization of Farm Machinery, A. B. Dinneen. Trans. Am. Soc. Agricultural Engrs., vol. 12, Dec. 1918, pp. 151-159. Review of accomplishments.

Gimbals. Gimbal Stabilization V. Bush. Jl. Franklin Inst., vol. 188, no. 2, Aug. 1919, pp. 199-215, 9 figs. Analysis of effectiveness of gimbals of various designs for maintaining horizontal platform on shipboard and of gyroscopic stabilizing of such devices.

Gun, Machine, Tripod. High-Production Tooling Methods as Applied to the Machine-Gun Tripod, Model 1918 — II, Albert A. Dowd and Donald A. Baker. Am. Mach., vol. 51, no. 9, Aug. 28, 1919, pp. 401-407, 7 figs. Tools for machining pintle.

Pintle Machining. *See Gun, Machine, Tripod.*

Plow Bottoms. *See Farm Machinery.*

Sine Bars. Universal Sine Bar for the Toolmaker, J. B. Gray. Machy. (N. Y.), vol. 25, no. 12, Aug. 1919, pp. 1159-1162, 8 figs. Also Machy. (Lond.), vol. 14, no. 357, July 31, 1919, pp. 533-535, 8 figs. Method of making, and application to various classes of precision work.

Steam-Hammer Work. Hand Tools for Steam Hammer Work, A. S. Hesse. Am. Mach., vol. 51, no. 6, Aug. 7, 1919, pp. 247-250, 19 figs. Auxiliary equipment needed for such operations as flanging, pressing, stamping, bending, shearing, drop forging, etc.

Tube-Shaping Machine. Forming Machine for Shaping Steel Tubes. Blast Furnace & Steel Plant, vol. 7, no. 8, Aug. 1919, pp. 369-372, 2 figs. Work is spun while applied against nest of three rolls. Machine for forming various shapes of noses in steel cylinders and tanks suitable for commercial transportation of explosive gases and liquids.

Vacuum Evaporators. Industrial Vacuum Evaporators — X, Frank Coxon. Mech. World, vol. 66, no. 1698, July 18, 1919, p. 30, 2 figs. Concerning sizes of steam and vapor pipes. (Concluded.)

MACHINERY, WOODWORKING

Pattern Manufacture. Wood Patterns Made in a Factory. Iron Trade Rev., vol. 65, no. 7, Aug. 14, 1919, pp. 429-431, 4 figs. How shop was organized for quantity production.

MATERIALS OF CONSTRUCTION AND TESTING OF MATERIALS

Boiler Plates. Physical Tests of Boiler-Steel Plates, Frederick Biggam. Power, vol. 50, no. 7, Aug. 12, 1919, pp. 252-253. Instances quoted to show that despite persistence with which bending tests recur in amended rules of inspection societies, "these tests . . . have not the finality that such persistence would seem to imply."

Exposure Tests of Sheeting Material. Exposure Tests of Sheeting Material, Samuel L. Hoyt. Chem. & Metallurgical Eng., vol. 21, no. 3, Aug. 1, 1919, pp. 142-144, 7 figs. Tests are interpreted as indicating that best sheeting material is copper-bearing steel with 0.20 to 0.25 per cent copper.

Fatigue in Metals. Fatigue Phenomena in Metals. Mech. Eng., vol. 41, no. 9, Sept. 1919, pp. 731-738, 7 figs. Summary of available facts and theories relating to fatigue failure and discussion of some unsolved problems. Progress report of Committee on Fatigue Phenomena in Metals, which is acting under joint auspices of Eng. Foundation, and Div. of Eng of Nat. Research Council.
A Fatigue Testing Machine, F. M. Farmer, Am. Mach., vol. 51, no. 6, Aug. 7, 1919, pp. 271-273, 4 figs. Apparatus developed at electrical testing laboratories for Research Sub-Committee of Welding Committee of the Emergency Fleet Corporation. Purpose was to obtain information in regard to relative durability of electrically welded joints in ½-in. ship plates when subjected to repeated reversed stresses.

Firebrick Testing. A Machine for Testing the Hot-Crushing Strength of Firebricks, H. G. Schurecht. Jl. Am. Ceramic Soc., vol. 2, no. 8, Aug. 1919, pp. 602-607, 7 figs., partly on supp. plate. Designed by Bureau of Mines.

Foundry Materials. Foundry Materials (Die Materialien der Giesserei), E. Schutz. Zeitschrift f. die gesamte Giessereipraxis, vol. 40, no. 6, Feb. 8, 1919, pp. 66-68. Vanadium, ferrovanadium. Specific weights and analysis.

Hardness Measurement. Some Recent Advances in the Measurement of Hardness in Metals, F. C. Thompson. Jl. Soc. Chem. Indus., vol. 38, no. 13, July 15, 1919, pp. 241R-243R. Account of recent investigations, noting tendency to modify Brinell best by working with constant deformation.

Malleable Iron. What is Modern Malleable Iron, H. A. Schwartz. Ry. Mech. Engr., vol. 93, no. 8, Aug. 1919, pp. 479-481. Sketch of methods of manufacture and characteristics of material.

Manganin. Manganin, M. A. Hunter and J.W. Baacon, Thirty-six General Meeting of Am. Electrochem. Soc., Sept. 23, 1919, advance copy paper no. 2, pp. 9-21, 3 figs. Experiments for measuring effect of small variations in percentage of manganese, nickel and iron and electrical resistivity and on temperature coefficient of resistivity. Writers conclude that small variations in manganese affect resistance but not its temperature coefficient and that small quantities of iron affect temperature coefficient considerably.

Notched-Bar Resistance. Resistance of Notched Bars to Shock (Sur les essais de flexion par choc de barreaux entaillés), André Cornu-Thénard. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 26, June 30, 1919, pp. 1315-1318. Tests cited as having shown that within limits of testing machines generally used in France, action of velocity may be considered as practically negligible.

Paper, Waterproofed. The Industrial Possibilities of Waterproofed Paper Products, Judson A. DeCew. Jl. Eng. Inst. Can., vol. 2, no. 8, Aug. 1919, pp. 558-559. It is considered as very difficult to make a paper product that will not absorb moisture and thus expand and contract to some extent. It is asserted, however, that paper and board can, without difficulty, be made so that it will resist further penetration or absorption of water after their fibres have taken up a quantity of moisture equal to about one-fifth their weight. This is considered sufficient for commercial uses.

"Stainless" Steels. Corrosion Proof Steels, F. Rowlinson. Sci. Am., vol. 121, no. 7, Aug. 16, 1919, p. 156. Present uses of nickel steels, copper steels, nickel-copper steels and chromium "stainless" steels.

Steel, Mechanical Properties of. The Various Mechanical Properties of Steel, W. H. Hatfield. Can. Machy.. vol. 22, no. 8, Aug. 21, 1919, pp. 204-205, 2 figs. Takes up consideration of question of brittleness, together with investigation of failures of various kinds. (Continuation of serial).
Mechanical Properties of Steel and Iron. Iron Age, vol. 104, no. 9, Aug. 28, 1919, pp. 565-568. Compilation made public by Bur. of Standards to secure criticism for purposes of revision.

MEASUREMENTS AND MEASURING APPARATUS

Acceleration Determination. An Apparatus for the Direct Determination of Accelerations, B. Galitzin. Proc. Roy. Soc., vol. 95, no. A-673, July 15, 1919, pp. 492-507, 8 figs. Instantaneous value of acceleration due to any arbitrary function determined by means of simple pendulum.
See also Accelerogroph.

Accelerograph. Accelerograph (Sur un accélérographe), Auclair and Boyer-Guillon. Comptes rendus des séances de l'Académie des Sciences, vol. 169, no. 1, July 7, 1919, pp. 24-26, 3 figs. For measuring periodic movement without having fixed points of reference, for example, vibrations of a ship's deck.

Air Meters. *See Meters.*

Calibration of Instruments. The Calibration Function in Indicating Instruments, Frederick J. Schlink. Engineering, vol. 108, no. 2798, Aug. 15, 1919, pp. 204-206, 4 figs. The relation of apparent to virtual calibration function.

CALORIMETERS. An Adiabatic Bomb Calorimeter, E. B. Holland, J. C. Reed, and J. P. Buckley. Chem. & Metallurgical Eng., vol. 21, no. 4, Aug. 15, 1919, pp. 190-191, 1 fig. Adapting Berthelot-Mahler-Kroecker calorimeter to control of temperature required in adiabatic work by fitting it with double-walled copper jacket.

COAL WEIGHING. Weighing Methods for Boiler Plants. Coal Trade Jl., vol. 50, no. 34, Aug. 20, 1919, pp. 1015-1017, 2 figs. Descriptions of various methods and devices for use in weighing coal consumed at boiler plants.

DYNAMOMETERS. Commercial Dynamometers — XIII, P. Field Foster. Mech. World, vol. 66, no. 1699, July 25, 1919, pp. 43-44, 8 figs. Bevis and Gibson flash-light meter built on optical principle. (Continuation of serial.)

GAS METERS. *See Meters.*

INDICATORS. Indicator and Indicator Diagram (Der Indikator und das Indikator-diagramm), W. Wilke. Prometheus, vol. 27, no. 30, Apr. 22, 1919, pp. 472-476, 11 figs. Construction of recent types, with special reference to those made by Rosenkranz, Schaffer & Budenberg, Lehmann & Michels and Maihak.

METERS, AIR AND GAS. Differential Pressure Meters for Measuring Air, Gas and Steam Flows, John L. Hodson. Chem. Industry, vol. 38, no. 14, July 31, 1919, pp. 222T-228T, 8 figs. "Curved Tube" manometer developed by writre for use with pitot tube. It consists of reservoir containing oil, which is connected to upstream pressure hole and curved tube connected to downstream pressure hole, and so shaped that equal increments in velocity past pitot tip will cause equal movements of oil meniscus along its length.

MICROMETER, FLUID GAGE. The Prestometer Fluid Gage, Charles E. Coats, Inspector, vol. 1, no. 3, Aug. 15, 1919, pp. 5-8, 10 figs. Liquid micrometer gage. Deflection of center of diaphragm causes liquid to leap up in tubes Least count of instrument said to be 0.001 in.

PRESTOMETER GAGE. *See Micrometer, Fluid Gage.*

PYROMETERS. Temperature Indicating and Controlling Systems, Franklin D. Jones, Machy. (N. Y.), vol. 25, no. 12, Aug. 1919, pp. 1138-1145, 16 figs. Pyrometers for controlling furnace temperatures automatically and for recording the temperature variations in a single furnace or in several furnaces which are successively connected with the recording instrument. Second article.

Devices and Methods for Measuring High and Low Temperatures with Special Reference to Engineering Problems, Herman Henry Albers. Stevens Indicator, vol. 36, no. 2, April 1919, pp. 67-103, 31 figs. Classified and discussed according to basic principles upon which they operate. Recommendations offered for selecting instrument or method best suited for various specific purposes.

SCALES. *See Coal Weighing.*

MECHANICS

ACCELERATION, INFINITE. Infinite Acceleration, A. Johnson. Automobile Engr., vol. 9, no. 129, Aug. 1919, pp. 245-246, 1 fig. Technical illustration of serious character of stresses developed in mechanism notably of kind where operation of cams is involved, when velocity of part is suddenly changed from zero to some finite magnitude.

BEAMS, FERRO-CONCRETE. The Design of Continuous Beams in Ferro-Concrete, H. Brodrick. Soc. Engrs., vol. 10, no. 6, 1919, pp. 199-211, 8 figs., partly on supp. plate. Review of comparison of methods adopted by different designers particularly in dealing with question of minimum deformatioon.

CATENARY. The Catenary in Engineering (Die Kettenlinie im Ingenieurwesen), J. Brunner. Schweizerische Bauzeitung, vol. 74, no. 2, July 12, 1919, pp. 13-14, 5 figs. Practical application in constructions involving long stretched cables, chains or wires.

CENTRIFUGALS, SUGAR, PRESSURE IN. Pressure in Sugar Centrifugals, J. J. Munson. Sugar, vol. 21, no. 8, Aug. 1919, pp. 410-411, 1 fig. Calculation of factors which determine total pressure exerted on top of centrifugal.

COLUMNS, ENGINE. The Design of Engine Columns—I, W. K. Wilson. Mach. World, vol. 66, no. 1701, Aug. 8, 1919, p. 66, 2 figs. Calculation of bending stresses.

CRANKSHAFT, WHIRLING. The Whirling of a Crankshaft J. Morris, Aeronautics, vol. 17, no. 299, July 10, 1919, pp. 45-46, 2 figs. Illustrates method of determining whirling speed by application to case of single-cranked crankshaft.

Graphical Velocity of Shaft (Velocità critiche), P. E. Brunelli. Revista Marittima, vol. 52, no. 6, June 30, 1919, pp. 307-344, 6 figs. Calculations and formulæ.

EQUALIZERS AND HITCHES. Equalizers and Hitches, E. A. White. Trans. Am. Soc. Agricultural Engrs., vol. 12, Dec. 1918, pp. 124-135, 11 figs. Mechanical analysis of distribution of pull between draft animals.
See also Farm Machinery.

HITCHES. *See Equalizers and Hitches.*

KNIFE EDGES UNDER PRESSURE. The Form of Knife Edges Under Pressure, C. A. Briggs. Scale Jl., vol. 5, no. 11, Aug. 10, 1919, p. 7, 3 figs. Experiments made with gelatin cubes placed against gelatin plate interpreted as representing on highly magnified scale what takes place with steel knife edges.

PLANE LAMINA, TWO-DIMENSIONAL MOTION. The two-Dimensional Motion of a Plane Lamina in a Resisting Medium, S. Brodetzky. Proc. Roy. Soc., vol. 95, no. A-673, July 15, 1919, pp. 516-532, 9 figs. Mechanics of problem.

SHAFTS, CRITICAL SPEED. *See also Crankshaft Whirling.*

STRESSES. *See Accelaration, Infinite.*

STRESS, COMBINED, THEORY. Practical Application of the Combined Stress Theory, N. Barnes Hunt. Machy, (N. Y.), vol. 25, no. 12, Aug. 1919, pp. 1171-1172. Formula based upon true stresses in structural members and applicable to cases where an axial tensile or compressive stress acts in combination with a transverse shearing stress. Reference is made to Mansfield Merriman's Mechanics of Materials, and discussion of combined stresses by A. Lewis Jenkins in Jl. Am. Soc. Mech. Engrs. for August 1917.

WET SAND, ANGLE OF REPOSE. On the Angle of Repose of Wet Sand, A. G. Webster Proc. Nat. Acad. Sciences, vol. 5, no. 7, July 1919, pp. 263-265, 1 fig. Experiments gave 33 deg. for dry sand and various other values for moist sand, including 12 deg. for composition of 10 lb. of sand and 5 lb. water.

MECHANICAL PROCESSES

ABRASIVE WHEELS. The Manufacture of Abrasive Wheels, S. C. Linbarger. Jl. Am. Ceramic Soc., vol. 2, no. 8, Aug. 1919, pp. 638-646. Account of process.

DRYING. Drying by Heat in Conjunction with Mechanical Agitation and Spreading, Eustace A. Alliott. Jl. Soc. Chem. Indus., vol 38, no. 13, July 15, 1919, pp. 173T-183T, and (discussion), pp. 183T-185T, 24 figs. Report of experiments performed to determine influence of both initial and final moisture on length of drying and other factors.

GLASS POTS. Note on the Casting of Porcelain Glass Pots, J. W. Wright and D. H. Fuller. Jl. Am. Ceramic Soc., vol. 2, no. 8, Aug. 1919, pp. 659-663. Mixtures used in Pittsburgh Laboratory by Bur. of Standards.

The Equipment of a Casting Plant for the Manufacture of Glass Pots, Frank H. Riddle. Jl. Am. Ceramic Soc., vol. 2, no. 8, Aug. 1919, pp. 647-658, 5 figs. Proposed plans for plant suitable for casting ten 600-lb. glass pots per day.

HOT-ROLLING. Theories of Hot-Rolling (Les théories du laminage à chaud), P. Maringer. Revue Universelle des Mines de la Métallurgie, vol. 1, no. 2, Feb. 1919, pp. 177-308, 105 figs. Physical study of phenomena which takes place in steel. (To be continued.)

INTERCHANGEABLE MANUFACTURE. Principles of Interchangeable Manufacturing—I, Earle Buckingham. Machy. (Lond.), vol. 14, no. 355, July 17, 1919, pp. 466-471. Economy of interchangeable manufacturing. Design as it affects success in interchangeable manufacturing. Manufacturing tolerances. Production problems as related to interchangeable manufacturing.

INTERNAL GEAR, WILLIAMS. The Williams Internal Gear, Reginald Trautschold. Am. Mach., vol. 51, no. 6, Aug. 7, 1919, pp. 255-258, 4 figs. Notes on manufacture of Williams gear and its comparison with other forms in regard to economy and simplicity.

MACHINERY, VARIOUS, MANUFACTURE OF. Manufacture of Machinery at Plant of C. F. Braun & Company. Metal Trades, vol. 10, no. 8, Aug. 1919, pp. 339-343, 18 figs. Company manufactures pumps, both reciprocating and centrifugal, heat exchanges, including condensers, feedwater heaters, oil coolers and heaters, cooling towers, evaporators, and smaller specialties.

MOTORCYCLES. Motorcycle Production has peculiar problems, P. M. Heldt. Automobile Industries, vol. 41, no. 6, Aug. 7, 1919, pp. 259-264, 17 figs. Methods of forming side-car panels and electroplating installation mentioned as peculiar to this industry.

ROLLER BEARINGS. Making Roller Bearings — I. Machy. (Lond.), vol. 14, no. 356, July 24, 1919, pp. 498-503, 13 figs. Methods of heat-treating and inspecting Timken roller bearings.

SHEET MANUFACTURE. Features of the Iron and Steel Sheet Industry. Raw Material, vol. 1, no. 5, July 1919, pp. 255-260, 6 figs. Recommends careful selection of base matal in sheet bars. (To be continued.)

Manufacture of Sheet Iron in South Russia (La Fabrication des tôles minces dans la Russie méridionale). Génie Civil, vol. 75, no. 2, July 12, 1919, pp. 34-36, 2 figs. Scheme showing arrangement of machines at work at Briansk and Taganrog. (Concluded.)

SPROCKET CHAIN. Making Diamond Sprocket Chain, Edward K. Hammond. Machy (N. Y.). vol. 25, no. 12, Aug. 1919, pp. 1165-1170, 9 figs. Operations involved in making no. 9 bicycle chain at works of Diamond Chain & Mfg. Co., Indianapolis. Number corresponds to standards prepared by Chain Standards Committee of Am. Soc. Mech. Engrs. and Soc. Automotive Engrs. First of two articles.

TURBO-GEAR MANUFACTURE. Turbo-Gear Manufacture, E. A. Suverkrop. Am. Mach., vol. 51, no. 8, Aug. 21, 1919, pp. 357-363, 22 figs. By Poole Eng. and Machine Co., of Baltimore. Mechanism is of planet internal-ring gear type and is comparatively light in weight.

TURBINE, SMALL STEAM, MANUFACTURE. Problems in Designing Small Turbines for Industrial Purposes, Sanford A. Moss. Gen. Elec. Rev., vol. 22, no. 8, Aug. 1919, pp. 620-630, 19 figs. Manufacture on quantity basis of type L turbines from standardized and interchangeable parts.

WHEELS, CAST-IRON. The Manufacture of Cast Steel Road Wheels. Engineer, vol. 128, no. 3314, July 4, 1919, pp. 5-6 and 12, 11 figs. Foundry at works of Thwaites Brothers, Ltd., of Bradford, England. It is said that during war material used for casting consisted of some 80 per cent of steel turnings, remainder being scrap.

WILLIAMS INTERNAL GEAR. *See Internal Gear.*

MOTOR-CAR ENGINEERING

ALBION. The Albion 30 Cwt. Chassis. Motor Traction, vol. 29, no. 750, July 16, 1919, pp. 47-48, 5 figs. Disign allowing of alternative gears to suit different purposes.

Austin. The New 20 h.p. Austin. Autocar, vol. 43, no. 1241, Aug. 2, 1919, pp. 161-165, 13 figs. Specifications: Four cylinders, 95 x 127 mm. bore and stroke (3601 cc.); unit construction, light balanced reciprocating parts; single-plate clutch; spiral bevel final drive; semi-elliptic springs.

British Tractors. Originality in Design Shown in New British Tractors. Automotive Industries, vol. 41, no. 6, Aug. 7, 1919, pp. 253-255, 4 figs. Notes on tractor exhibit at Annual Show of Royal Agricultural Society.

Caterpillar Vehicle, Steering, of. Steering of Caterpillar Vehicles (Das Steuern von Raupenfahrzeugen), E. Seiler. Motor-wagen, vol. 22, no. 9, Mar. 31, 1919, pp. 162-164, 4 figs. Difficulties in short curves considered as due to impossibility of entirely cutting out one of caterpillars and braking it efficiently, so that vehicle can turn when other caterpillar chain is accelerated.

Cleveland. Specially Designed Engine and Axle for Cleveland Car. Automotive Industries, vol. 41, no. 7, Aug. 14, 1919, pp. 304-306, 7 figs. Engine is six-cylinder, block-cast, with overhead valve; camshaft is in crankcase and valves in line in head assembly.

Darracq. The New 15 h.p. Darracq. Autocar, vol. 43, no. 1241, Aug. 2, 1919, pp. 177-178, 5 figs. Features of 1919 model of French firm.

Enfield-Allday. Unconventional Design of a British After-War Car. Automotive Industries, vol. 41, no. 7, Aug. 14. 1919, pp. 312-315, 7 figs. Enfield-Allday with five-cylinder, radial, air-cooled engine.

A British Light Car. Engines, vol. 128, no. 3315, July 11, 1919, pp. 40-41, 5 figs. Fitted with five-cylinder, radial air-cooled engine. Chassis weights 7 cwt.

Kerosene for Farm Tractors. Kerosene as a Fuel for Farm Tractors, John A. Secor. Trans. Am. Soc. Agricultural Engrs., vol. 12, Dec. 1918, pp. 171-187. Summary of experiments and research, and conclusions in regard to possibilities and future developments.

Military Transport Chassis. Military Transport Chassis-XVI. Automobile Engr., vol. 9, no. 129, Aug. 1919, pp. 241-244, 5 figs. Performance of 40-hp. Pagefield W. D. type chassis under war condtions. Article refers to development of this type of heavy motor vehicle as interesting example resulting from the war.

Military Trucks, German. Extremely Heavy Frames for German Military Trucks-III, Arthur J. Slade. Automotive Industries, vol. 41, no. 8, Aug. 21, 1919, pp. 360-363, 5 figs. Sketches of most notable of frames handed over by Germans to A. E. F. Writer remarks that there was little effort at standardization and that some unimportant features required special dies.

No Standardization of Parts of the German Army Trucks-II, Arthur J. Slade. Automotive Industries, vol. 41, no. 7, Aug. 14, 1919, pp. 307-311, 12 figs. Tabulation of 47 types as to weight and drives. Attention is called to lack of standardization and difficulty in making repairs. Article based on study of German trucks delivered to A. E. F.

Morris. Morris 1919 Light Cars. Autocar, vol. 43, no. 1241, Aug. 2, 1919, pp. 169-172, 10 figs. Morris-Oxford and Morris-Cowley models. Specifications; 11.9 hp., four cylinders, 69 x 100 mm. bore and stroke (1495 cc.); engine and gear box in one unit; multiplate clutch; three speed and reverse gear box; spiral bevel final drive.

Radial-Engined Car. *See Enfield-Allday.*

Reo. Revised Manifold and Detachable Head among Reo Engine Changes, J. Edward Schipper. Automotive Industries, vol. 41, no. 6, Aug. 7, 1919, pp. 256-258, 4 figs. Changes in design claimed to provide greater vaporization of fuel, increased accessibility of intake valve assembly, increased engine speed and cleaner design.

Standardization. *See Military Trucks, German.*

Steering. *See Caterpillar Vehicle, Steering.*

Tire Substitutes. Tire Substitutes. Autocar, vol. 43, no. 1240, July 26, 1919, p. 120, 7 figs. Emergency spring wheels used by German transport vehicles.

Trailers. Trailer Lessons from the Allied Army Service, W. F. Bradley. Automotive Industries, vol. 41, no. 8, Aug. 21, 1919, pp. 354-359, 13 figs. Writer claims that automobile trailers in use with ordinary trucks having normal capacity of 1.5 to 5 tons proved valuable during war as means of economizing cost of road transportation.

Trucks, Electric. Electric Trucks, J. Humphrey. Iron & Coal Trades Rev., vol. 99, no. 2680, July 11, 1919, pp. 46-47, 2 figs. General features of types made by various firms.

Wheels, Steel Truck. Steel Truck Wheels, P. Klinger. Jl. Soc. Automotive Engrs., vol. 5, no. 2, Aug. 1919, pp. 160-161. Strength of wood and metal wheels compared.

PIPE

Concrete Sewage Pipe. Large Concrete Sewage Pipe, Eng. World, vol. 15, no. 3, Aug. 1, 1919, pp. 40-42, 9 figs. Units are 72 in. inside diameter, 8 ft. long, with wall thickness of 7 in., and are designed to carry sewage at pressure of 20 lb. per sq. in.

Fuel Pipeline. The Admiralty Oil Fuel Pipeline. Petroleum Times, vol. 2, no. 28, July 19, 1919, pp. 53-56, 4 figs. System is divided into three sections each approximately 12 miles in length. Details of line and of pumping stations are given.

Steel Pipe. Machinery and Pipe Arrangement-XIX, C. C. Pounder. Mech. World, vol. 66. no. 1698, July 18, 1919, pp. 31-32, 5 figs. Deciding on pipe lengths when designing steel pipes.

POWER GENERATION

Bavarian System. Central Station of Walchen Lake and Bavarian System of Electric Distribution at 100,000 (La station centrale du lac, Walchen et le réseau bavarois de distribution d'électricité à 100,000 volts). Génie Civil, vol. 75, no. 3, July 19, 1919, pp. 61-62, 2 figs. System extends over 250 miles; aluminum overhead conductors used. From Frankfurter Zeitung (technical supp.) April 18, 1919.

Water Power in Bavaria (Bayerns Wasserkrafte und die deutsche Volkswirtschaft), K. Meyer. Technik u. Wirtschaft, vol. 12, no. 4, April 1919, pp. 195-205. According to writer's calculations the total amount of power that could be used by German industries is around 1,800,000 hp. in Bavaria alone.

Canada. Hydro-Electric Development on the Seguin River. Can. Engr., vol. 37, no. 8, Aug. 21, 1919, pp. 231-234, 11 figs. Municipally-owned plant being constructed for town of Parry Sound Ont., designed to generate from 2200 to 2900 hp. Dam is of gravity type and is made of concrete.

Electric Power Collection. Electric Power Collection, Chas. P. Steinmetz. Gen Elec. Rev., vol. 22, no. 8, Aug. 1919, pp. 565-567. Proposes use of small generator installations with simple switches and fuses to make use of our small water powers and thus conserve our furl resources.

Foreign Water Power. Water Power on the Farm, J. S. Fitz, Trans. Am. Soc. Agricultural Engrs., vol. 12, Dec. 1918, pp. 88-96, 8 figs. Consideratious in regard to choosing a suitable site for water power development.

France, Laws. New Law Regarding Utilization of Hydraulic Energy (Le nouveau projet de loi sur les forces hydrauliques). Industrie Electrique, vol. 28, no. 651, Aug. 10, 1919, pp. 283-290. General conditions of exploitation and classification of hydraulic enterprises.(Continuation of serial.)

Legislation Relative to Utilization of Hydraulic Energy in France (Le régime légal des chutes d'eau en France), G. Tochon. Génie Civil, vol. 75, no. 3, July 19, 1919, pp. 51-56. Project adopted by Chamber of Deputies on July 10, 1919. (Concluded.)

Iowa. Utilizing Old Mills for Hydroelectric Power Plants, F. L. Clark. Elec. Rev., vol. 75, no. 5, Aug. 2, 1919, pp. 181-182, 2 figs. Iowa electric transmission lines supplying farming districts.

Japan. The Undeveloped Water Powers of Japan, Hachiji Higo. Jl. Electricity, vol. 43, no. 4, Aug. 15, 1919, pp. 163-164, 2 figs. Data presented in official report of Director-General of Bureau of Electrical Exploitation of Japan.

New England. New England Hydroelectric Developments. Eng. World, vol. 15, no. 3, Aug. 1, 1919, pp. 46-49, 5 figs. Includes description of expansion joints used at Rumford Falls, Me.

New Hampshire. Potential Waterpower and Coal Saving. Elec. World, vol. 74, no. 8, Aug. 23, 1919, pp. 401-404, 3 figs. U. S. Geol. Survey field investigations and engineering estimates place available utilization of additional storage sites in New Hampshire at 490,000,000 hp-hr. more yearly than is now produced in Connecticut and Merrimac Rivers.

New Zealand. Hydroelectric Development in Canterbury, New Zealand, L. Birks. Jl. Electricity, vol. 43, no. 4, Aug. 15, 1919, pp. 155-156, 2 figs. Outline of scheme to utilize outlet of lake, carrying normally 100 to 200 cusecs of water, at site 500 ft. below lake level.

St. Maurice River. Power Developments on the St. Maurice River, F. T. Kaelin. Can. Chem., Jl., vol. 3, no. 8, Aug. 1919, pp. 245-249, 3 figs. At Shawinigan Falls. Combined generating capacity is 330,000 hp. Further developments are excepted to raise this to over 600,000 hp.

POWER PLANTS

Ash Removal. The Mechanical Removal of Ashes from Power Houses, George Frederick Zimmer. Eng. & Indus. Management, vol. 2, no. 7, Aug. 14, 1919, pp. 217-222, 7 figs. Methods of handling ashes mechanically, independently of use of gravity buckets on similar conveyors.

Boilers, Heat Absorption. Factors Affecting Heat Absorption of Boilers, Robert June. Elec. Rev., vol. 75, no. 7, Aug. 16, 1919, pp. 270-273, 5 figs. Also Cement, Mill & Quarry, vol. 15, no. 4, Aug. 20, 1919, pp. 41-45, 5 figs. Advantages of machanical soot blowers.

Boiler-Plant Data. Exact Data on the Running of Steam Boiler Plants, D. Brownlie. Engineering, vol. 108, nos. 2795 and 2796, July 25, and Aug. 1, 1919, pp. 101-104 and 138-139, table on supplement plate. Working details of 100 typical colliery steam boiler plants in Great Britain presented as contribution to fund of specialized knowledge writer considers it is necessary to accumulate in order to undertake efficiently question of national coal economy.

Coal Analyses. Coal Analyses Made at the Power Plant, E. D. Hummel. Power, vol. 50, no. 9, Aug. 26, 1919, pp. 332-335, 5 figs. Proposed method with Parr standard calorimeter and Parr sulphur photometer.

Condensers. *See Turbines.*

Notes on Surface Condensing Plants, with Special Reference to the Requirements of Large Power Stations, R. J. Kaula. Jl. Instn. Elec. Engrs., vol. 57, no. 283, June 1919, pp. 440-446, and (discussion) pp. 447-464. Suggests use of parallel-flow principle on syphonic circulating-water systems; recommendations also made concerning selection of material for various units and in regard to operating practices.

Culm. The Puget Sound Traction, Light and Power Company's Pulverized Coal Plant. Stone & Webster Jl., vol. 25, no. 2, Aug. 1919, pp. 96-109. Results of tests and availability of culm dump of over 225,000 tons led to decision to use pulverized coal as fuel for plant.

Domes, Manholes and Nozzles. Domes, Manhole and Steam Nozzles, W. H. Wakeman. Power, vol. 50, no. 9, Aug. 26, 1919, pp. 338-339, 11 figs. Writer's experience with various forms in present use.

ECONOMIZERS. Performance Tests of Economizers, B. M. Baxter. Power, vol. 50, no. 8, Aug. 19, 1919, pp. 299-300. Suggested method of making and reporting economic tests.

FEED WATER. Curing Boiler Trouble Due to Impure Water, J. N. Helpenbringer. Elec. World, vol. 74, no. 6, Aug. 9, 1919, pp. 296-297, 2 figs. Experiments made in Kansas City plant that are said to have shown how to prevent priming in water-tube boilers of vertical tube type at an average cost of $645 per boiler.

GRATES. Fletcher's Rolling-Bar Furnace Grate. Engineering, vol. 108, no. 2798, Aug. 15, 1919, pp. 208-209, 3 figs. Intended to obviate difficulties experienced when burning coal containing high percentage of ash.

MANHOLES. *See Domes, Manholes and Nozzles.*

NOZZLES. *See Domes, Manholes and Nozzles.*

PLANT REVAMPING. Making Three Boilers Do the Work of Five, J. J. Spangler. Power, vol. 50, no. 6, Aug. 5, 1919, pp. 206-208, 6 figs. Accomplished, it is said, by revamping plaut.

STEAM ECONOMY. Steam Economy of Power Plants, James M. Taggart. Steam, vol. 23, no. 2. August 1919, pp. 36-37, 1 fig. Curves for efficiency and power equivalent. Initial pressure and back pressure are taken as constants.

STOKERS. The Functioning of the Chain-Grate Stoker, T. A. Marsh. Power, vol. 50, no. 9, Aug. 26, 1919, pp. 342-344, 5 figs. Including analysis showing why ash is always at bottom of fuel bed.

SUPERHEATERS. Superheaters at British Collieries, M. Meredith. Coal Age, vol. 16, no. 7, Aug. 14, 1919, pp. 267-268. Said to have resulted in effecting considerable economy in coal..

TURBINES. Turbines and Condensers. Power Plant Eng., vol. 23, no. 16, Aug. 15, 1919, pp. 718-721, 2 figs. Abstract of report of Committee on Prime Movers read before Nat. Elec. Light Assn.

VACUUM SYSTEM. Vacuum — I. Roger Taylor. Power Plant Eng., vol. 23, no. 16, Aug. 15, 1919, pp. 716-717, 2 figs. Technicalities of vacuum system in power-plant practice.

WASTE HEAT. Fuel Economy in Power Production, W. T. Lane. Proc. South Wales Inst. of Engrs., vol. 35, no. 1, July 18, 1919, pp. 171-210, 11 figs. Also Colliery Guardian, vol. 118, no. 30-38, Aug. 8, 1919, pp. 360-361, 2 figs. Description of Draper washer and discussion of utilization of waste heat in relation to carbonization and generation of steam.

POWER TRANSMISSION

BELTING. WhyBelting is Superior to Individual Electric Drives, Harrington Emerson. Belting, vol. 15, no. 4, Aug. 20, 1919, pp. 21-23. Electric drive described as luxurious magnificence, actual usage being cited to show economy of belting.

ROPE DRIVER. Manilla Rope Drives, H. T. Hesselmeyer. Metal Trades, vol. 10, no. 8, Aug. 1919, pp. 351-354, 3 figs. Advantages claimed care required in installation, and performance obtained.

PRODUCER GAS

SUCTION GAS TRACTION. Suction Gas Traction. Motor Traction, vol. 29, no. 753, Aug. 6, 1919, pp. 122-124, 2 figs. Report of Gas Traction Committee upon results or road tests of different producer-plant systems. Some of tests were conducted in conjunction with War Department.

PUMPS

CALUMET PUMPING STATION. Calumet Pumping Station and intercepting Sewer, W. T. Christine. Eng. World, vol. 15, no. 4, Aug. 15, 1919, pp. 23-27, 11 figs. Steel building with brick and stone finish, 80 x 185 ft. and about 56 ft. high. Pumping arrangement and features of plant outlined.

CENTRIFUGAL-PUMP TESTS. High Efficiency Pumping Units, F. W. Capellen. Power Plant Eng., 23, no. 16, Aug. 15, 1919, pp. 725-726, 2 figs. Official tests of motor-driven centrifugal pumps at Minneapolis are said to have shown high efficiency and low cost, using off-peak current.

History of the Principles of Centrifugal Pumps, J. H. Moore. Can.Machy., vol. 22, no. 6, Aug. 7, 1919, pp. 151-156, 10 figs. Description of Rees-Ro-Turbo type of water pump. Design comprises a single or a series of pressure drums (number depending on nature of work), rotating inside cast-iron casing at high speed.

PUMPING MACHINERY OF A. E. F. Pumping Machinery Used by the Service of Supply of the American Expeditionary Forces in France, W. B. Gregory. Proc. In Eng. Soc., vol. 5, no. 3, June 1919, pp. 208-215, Records of operation.

PUMP TROUBLES. Pump Troubles, Charles Labbe. Eng. & Min. Jl., vol. 108, no. 6, Aug. 9, 1919, pp. 217-222, 1 fig. Suggestions in regard to installation and operation of pumps.

QUARRY PUMPS. Pumps in Quarry Service — II. Stone, vol. 40, no. 8, Aug. 1919, pp. 361-362, 2 figs. Experiences at various quarries.

REFRACTORIES

CLAY. On the Effect of Extraction Upon the Plasticity of Clay, W. A. Homer and H. E. Gill. Jl. Am. Ceramic Soc., vol. 2, no. 8, Aug. 1919, pp. 595-601. It was found experimentally that a certain place after being treated with organic solvents was less plastic than original materials.

A Study of Some Light-Weight Clay Refractories, M. F. Beecher. Jl. Am. Ceramic Soc., vol. 2, no. 5, May 1919, pp. 336-350 and (discussion), 350-355, 3 figs. Experiments established that working prroperties and drying behavior of a fire clay mixture are affected by additions of sawdust in same manner as by additions of grog.

FIREBRICK. Preventable Defects on Fire Brick, C. E. Nesbitt and M. L. Bell. Iron Trade Rev., vol. 65, no. 7, Aug. 14, 1919, pp. 423-426, 9 figs. Illustrating how irregularities in bricks may be detected by careful visual inspection and by other means. Paper presented at meeting of Am. Soc. for Testing Materials.

PORCELAINS. A Study of High-Fire Porcelains, Chi C. Lin. Jl. Am. Ceramic Soc., vol. 2, no.8, Aug. 1919, pp.622-637, 3 figs. Results of investigation to determine effect of composition on strength.

Japanese Porcelains from Chemical Point of View, and How to Improve Them. Chem. & Metallurgical Eng., vol. 21, no. 4, Aug. 15, 1919, pp. 183-185. Indicating ranges of chemical composition both in bodies and glazes, which analyses show to be much wider than has been believed by ceramists.

The Progress of Vitrification and Solution in Some Porcelain Mixtures, Arthur S. Watts. Jl. Am. Ceramic Soc., vol. 2, no. 5, May 1919, pp. 400-409, 7 figs. Microscopic examinations interpreted as indicating that development of sillimanite starts in feldspar grains and progresses as fusion progresses.

Special Spark-Plug Porcelains, A. V. Bleininger and F. H. Riddle. Jl. Am. Ceramic Soc., vol. 2, no. 7, July 1919, pp. 564-575. Experimental tests claimed to have shown injurious quality imparted to electrical porcelains by use of feldspar as flux, and desirability of replacing quartz by minerals or synthetically prepared materials which are more constant in volume when heated.

REFRIGERATION

COMPRESSORS, AMMONIA, RACING OF. Unusual Causes of Racing of Ammonia Compressors, E. W. Miller. Power, vol. 50, no. 8, Aug. 19, 1919, pp. 298-299. Following causes mentioned: Dry compressor valves sticking at extreme of travel; working loose of valve disk in section line shutting off flow of gas; breaking of springs holding false head in place.

ECONOMY. Refrigerating Plant Efficiency, George T. Taylor. Refrig. World, vol. 54, no. 8, Aug. 1919, pp. 27-28 & 35. Helpful rules and information of correct proportioning considered as one of essentials for maximum plant economy.

ICE MACHINES, DENSE-AIR. Experience with a Dense-Air Ice Machine, C. H. Willey. Power Plant Eng., vol. 23, no. 16, Aug. 15, 1919, pp. 732-734, 1 fig. Diagram of dense-air ice machine and suggestions in regard to its operation.

ICE PLANT. Electrically Driven Raw Water Ice Making Plant. Ice & Refrigeration, vol. 57, no. 2, Aug. 1, 1919, pp. 45-50, 8 figs. Plant is of 120 tons daily capacity, using 400-lb. stationary cans. The ice dumps are placed in center of tank room.

See also Ice Machines, Dense-Air; Methyl Chloride Ice Machines.

METHYL CHLORINE ICE MACHINES. Methyl Chloride Ice Machines, Charles H. Herter. Refrig. World, vol. 54, no. 8, Aug. 1919, pp. 12-14. Data concerning chemical action of ethyl and methyl chlorides upon cast iron.

NON-CONDENSIBLE GASES. Non-Condensible Gases, John E. Starr. Refrig. World, vol. 54, no. 8, Aug. 1919, pp. 11-12. Reasons and suggested remedies for troubles experienced with non-condensible gases in absorption machinery.

PACKING-HOUSE REFRIGERATING PLANT. Making a Packing-House Refrigerating Plant Carry Its Load, J. C. Moran. Power, vol. 50, no. 9, Aug. 26, 1919, pp. 328-329, 2 figs. Unable to put more coil surface in the coolers, brine circulation over the direct-expansion coils was provided and the temperatures lowered and maintained.

SHIPS, REFRIGERATOR. Equipped Nine Refrigerator Ships. Mar. Rev., vol. 49, no. 9, Sept. 1919, pp. 417-418, 4 figs. How nine ships of 6400 deadweight tons each, which were commandeered by Shipping Board at outbreak of the war, were fitted out with insulating material and cooling coils.

VAPOR REFRIGERATION PROCESSES. Vapour Refrigeration Processes, P. Ostertag. Cold Storage, vol. 22, no. 256, July 17, 1919, pp. 177-180, 8 figs. Entropy diagrams. From Schweizerische Bauzeitung.

RESEARCH

HIGH VOLTAGE LABORATORY. *See Purdue University.*

LAUSANNE UNIVERSITY. Mechanical, Physical and Chemical Testing Laboratory of Engineering School of Lausanne University (Le laboratoire d'essais mécaniques, physiques et chimiques de l'école d'ingénieurs de l'Université à Lausanne). Bulletin Technique de la Suisse Romande, vol. 45, nos. 14 and 15, July 12 and 26, 1919, pp. 137 and 148-151, 6 figs. July 12: Torsion machine, July 26: Apparatus for taking photomicrographs of metals.

NATIONAL PHYSICAL LABORATORY. The National Physical Laboratory. Engineering, vol. 108, no. 2795, July 25, 1919, pp. 107-108. Thermometer-testing; radium and X-ray work. (Concluded.)

PURDUE UNIVERSITY. High-Voltage Laboratory at Purdue University, C. Francis Harding. Elec. World, vol. 74, no. 6, Aug. 9, 1919, pp. 284-285, 2 figs. Design and layout of equipment intended for investigation and testing with potentials up to 600,000 volts.

RESEARCH WORK RESULTS. How Research Work Brings Results, H. E. Diller. Foundry, vol. 47, no. 329, Aug. 15, 1919, pp. 545-549, 10 figs. Experiments at laboratories of General Elec. Co. undertaken primarily to develop control system for electric furnaces brought benefits in unexpected directions.

WORKS TESTING LABORATORY. Equipment of a Works Testing Laboratory, H. S. Primrose. Metal Industry, vol. 15, no. 3, July 18, 1919, pp. 41-44, 4 figs. Recommendations in regard to selection of equipment and co-ordinating work.

Money Saved by Testing Laboratory, H. R. Simonds. Foundry, vol. 47, no. 329, Aug. 15, 1919, pp. 556-559, 9 figs. Practice of Eastern Malleable Iron Co. in watching compositions of pig iron and of finished product in order to prevent undue irregularity of metal in castings.

SPECIFICATIONS

Plates for Tank-Car Construction. Specifications for Plates for Forge-Welding in Tank-Car Construction. Ry. Mech. Engr., vol. 93, no. 8, Aug. 1919, pp. 477-478. From report of sub-committee II of committee A-1 on steel, presented at annual meeting of Am. Soc. of Heat Treating Materials.

STANDARDS AND STANDARDIZATION

Machine Parts. Standardization of Machine Parts (Die Normalisierung der Maschinenelemente). Zietschrift f. die gesamte Giessereipraxis, vol. 40, no. 10, Mar. 8, 1919, pp. 121-122. Standardization Committee appointed by Soc. of German Engineers has already started to publish standard specifications for such articles as split couplings, flange couplings, wall brackets, boiler rivets, etc.

STEAM ENGINEERING

Alignment Chart for Steam. Alignment Chart for Finding the Properties of Saturated and Superheated Steam, Clinton E. Pearce. Power, vol. 50, no. 6, Aug. 5, 1919, pp. 224-227, 1 fig. Construction of chart explained and its application to various problems illustrated.

Boiler Horsepower Chart. Boiler Horsepower, R. L. Wales. Natl. Engr., vol. 23, no. 8, Aug. 1919, pp. 392-396, 3 figs. Graph for computing horsepower.

Boilers, Surface Combustion. Recent Developments in Surface Combustion Boilers, William A. Bone. Chem. Industry, vol. 38, no. 14, July 31, 1919, pp. 228T-233T and (discussion) 233T-234T, 10 figs. Experiments which led to introduction of Bonecourt system of surface combustion.

Steam Chart. *See Alignment Chart.*

Turbine Machinery for Destroyers. Development of Turbine Machinery for Torpedo-Boat Destroyers. Engineering, vol. 108, no. 2796, Aug. 1, 1919, pp. 139-140 and 148, 4 figs. on two supplement plates. Progress in (1) reduction of weight of plant and space occupied, (2) more economical generation of power, and (3) improvement in manœuvring and sea-keeping capabilities of vessel.

VARIA

Chemical Federation, Inter-Allied. Inter-Allied Chemical Federation, William Pope. Chem. Industry, vol. 38, no. 14, July 31, 1919, pp. 208T-211T and (discussion) 211T-212T. Its motives and objects.

Engineering Societies, Rand, South Africa. Notes on the Closer Working and Joint Housing of Technical and Scientific Societies on the Rand, Percy Cazalet. Jl. of Chem. Metallurgical and Min. Soc. of South Africa, vol. 19, no. 11, May 1919, pp. 228-238 and (discussion) pp. 238-240. Proposed scheme provides freedom of action for each society together with possibility of full amalgamation when time is ripe and evolution of some scheme of federation resulting "from the mere fact of joint and harmonious action over a period."

Engineers in Public Affairs. Civic Duties and Opportunities of the Engineer, Howard C. Parmelee. Eng. & Min. Jl., vol. 108, no. 8, Aug. 23, 1919, pp. 318-320. Value of scientific societies to Government. Advisability of utilizing services of engineers in public affairs.

Engineer's Work in South America. The Engineers' Part in the International Situation, Charles Lyon Chandler. Monad, vol. 4, no. 7, Aug. 1919, pp. 11-13. Examples of successful engineering enterprises in South America conducted by American engineers.

Fractional Notation. Fractional Notation. Automobile Engr., vol. 9, no. 129, Aug. 1919, pp. 246-247, 1 fig. Standard dimensions table suggested for use in conjunction with fortieth scales.

Government Machine Tools, Fixing Prices. Fixing Prices of Government Machine Tools. Iron Age, vol. 104, no. 6, Aug. 7, 1919, pp. 377-379, 3 figs. How selling prices are determined. Method and conditions of making sales of stocks of standard machines, both used and unused.

Instructional Factory, Loughborough Technical College. Loughborough Technical College Instructional Factory. Iron & Coal Trades Rev., vol. 99, no. 2684, Aug. 8, 1919, pp 172-174, 6 figs. Education of institution combining technical with practical training.

Interchangeable Manufacturing,Terminology. Terms Used in Interchangeable Manufacturing, Earle Buckingham. Machy. (N. Y.), vol. 25, no. 12, Aug. 1919, pp. 1118-1121, 5 figs. Definitions of terms and illustration of meaning of some of them.

Patents. Patents in Relation to Industry. Elecn., vol. 83, no. 2151, Aug. 8, 1919, pp. 150-153. Conference held at British Sci. Products Exhibition.

Photometric Scale. The Photometric Scale, Herbert E. Ives. Jl. Franklin Inst., vol 188, no. 2, Aug. 1919, pp. 217-235, 3 figs. Compilation of data and practices relative to definitions, standards and photometric measures, with particular reference to work of Bureau of Standards.

WELDING

Arc Welding. *See Electric Welding.*

Electric Welding. Notes and Regulations for Arc Welding, H. M. Sayers. Eng. & Indus. Management, vol. 2, no. 4, July 24, 1919, pp. 107-109, 1 fig. Regulations for ship building practice drawn up by Admiralty Committee from records of experience in England and communications received by Admiralty from U. S. Research Committee.

Electric Arc Welding Methods, H. L. Unland. Elec. Ry. Jl., vol. 54, no. 7, Aug. 16, 1919, pp. 343-344, 4 figs. Function and practical operation of various types of equipment for carbon and metal-electrode welding.

Electric Arc Welding Equipment, H. L. Unland. Metal Trades, vol. 10, no. 8, Aug. 1919, pp. 355-359, 1 fig. Table showing approximate kilowatt-input required for various systems; also classification of different types of welding equipment and discussion of uses of each.

Electric Welding: Its Theory, Practice, Application and Economics, H. S. Marquand. Elecn., vol. 83, nos. 2149, 2150 and 2151, July 25, Aug. 1 and 8, 1919, pp 91-92, 116-118 and 139-141, 29 figs. July 25: Tests to determine strength of electrically welded flanges. Aug. 1: Examples of welding an anchor and locomotive frames. Aug. 8: Example of repairing main drive wheel of Atlantic type locomotive, in which three of spokes gave way by craking in neighborhood of coupling rod crankpin boss.

Electrodes. Composition of Electrodes. Iron Age, vol. 104, no. 8, Aug. 21, 1919, pp. 503-504, 8 figs. Tests to determine effect of chemical composition on physical characteristics of weld made by Wilson Welder and Metals Co., New York City.

Effects of Chemical Composition of the Electrode on the Welded Material, Decey Welder. Welding Engr., vol. 4, no. 8, Aug. 1919, pp. 42-44, 9 figs. Results of analysis.

Fusion Welding. Fusion Welding as Applied to Drop-Forging, S. W. Miller. Am. Mach., vol. 51, no. 8, Aug. 21, 1919, pp. 378-382, 29 figs. Consideration given to both electric-arc and oxy-acetylene processes. Physical effects that may occur in weld and in adjoining sections of metal due to heat developed and method of application of processes illustrated with photomicrographs.

Hydraulic-Press Cylinder, Welding of. Welding a Badly Broken Cylinder of a 200-Ton Capacity Hydraulic Press, Nels Johnson. Welding Engr., vol. 4, no. 8, Aug. 1919, pp. 34-36, 2 figs. Work done at Soo Line Railroad shops at Minneapolis, Minn.

Liberty Engine Welding Plant. Liberty Engine Welding Plant, Otis Allen Kenyon. Elec. World, vol. 74, no. 8, Aug. 23, 1919, pp. 396-399, 9 figs. Closed-circuit arc-welding system used to eliminate distortion. Description of joints which are adapted to this process. Special control boards and their operation.

Malleable-Iron Welding. Some Considerations Affecting the Welding of Malleable Iron, H. A. Schwartz. Welding Engr., vol. 4, no. 8, Aug. 1919, pp. 21-23, 9 figs. Photomicrographs illustrating various kinds of welds.

Oxy-Acetylene Welding. Filling Cavities and Putting on Parts by the Oxy-Acetylene Process, J. F. Springer. Ry. & Locomotive Eng., vol. 32, no. 8, Aug. 1919, pp. 233-234. Cases in which cavities in castings may be filled and thus save expense of recasting.

Oxy-Acetylene Welding Investigation, J. H. Davies. Can. Manufacturer, vol. 39, no. 8, Aug. 1919, pp. 33-34. Concerning conditions for securing good results; also results of carbon-steel experiments. Paper read before Instn. Mech. Engrs.

Building Special Work with an Oxygen-Acetylene Cutting and Welding Outfit, Montelle C. Smith. Elec. Ry. Jl., vol. 54, no. 7, Aug. 16, 1919, pp. 317-319, 8 figs. Construction of frogs, switches, switchmates, and similar work jobs.

Preparing Work. Preparing Work for Electric Arc Welding E. Wanamaker and H. R. Pennington. Ry. Elec. Engr., vol. 10, no. 8, Aug. 1919, pp. 265-270, 20 figs. Methods used for welds of various kinds, noting precautionary measures taken for expansion and contraction.

Wrought-Iron Welding. Welding Wrought Iron and Steel, H. L. Unland. Welding Engr., vol. 4, no. 8, Aug. 1919, pp. 52-56, 7 figs. Suggestions in regard to operating details. Also Iron Age, vol. 104, no. 6, Aug. 7, 1919, pp. 365-367, 3 figs.

WOOD

Wood Preservative Treatment. Modern Developments and Practical Details in the Preservative Treatment of Wood, Kurt C. Barth. Trans. Am. Soc. Agricultural Engrs., vol. 12, Dec. 1918, pp. 75-87, 5 figs. Details of (1) pressure and (2) nonpressure processes. Also specifications for refined coal-tar creosote oil treatment of U. S. Shipping Board Emergency Fleet Corporation.

MINING ENGINEERING

BASE MATERIALS

Gypsum. Important Developments of Gypsum. Cement, Mill & Quarry, vol. 15, no. 3, Aug. 5, 1919, pp. 36-42. Tentative specifications for crude gypsum and calcined gypsum and for gypsum plasters proposed by Am. Soc. for Testing Materials Committee.

Genesis of the Gypsum Industry. Curtis F. Columbia. Cement, Mill & Quarry, vol. 15, no. 4, Aug. 20, 1919, pp. 27-32, 5 figs. Brief review of the origin, mineralogical properties and geological distribution of gypsum.

Lime. Chicago Union Lime Works Pit Deepest in Country, William B. Eastwood. Cement, Mill & Quarry, vol. 15, no. 3, Aug. 5, 1919, pp. 11-15, 6 figs. Shaft now reaches 320 ft. into dolomite deposit more than 1300 ft. in depth near center of city. Method of qurrrying indicated.

Magnesite. Developments in Magnesite Industry, W. C. Phalen. Cement, Mill & Quarry, vol. 15, no. 3, Aug. 5, 1919, pp. 27-30. Outline of salient features of domestic industry, as noted by writer on recent trip to various plants in California and Washington.

Phosphate Rock. Practice in Preparation of Phosphate Rock, R. W. Stone. Rock Products, vol. 22, no. 16, Aug. 2, 1919, pp. 40-42, 6 figs. Washing, drying and grinding processes.

COAL AND COKE

Allegheny River Mine. A Large Coal Mine on tbe Allegheny River, Ralph W. Mayer. Coal Age, vol. 16, no. 8, Aug. 21, 1919, pp. 316-318, 3 figs. Describing mining operations and various notes of mine. Output is 500,000 tons per year.

Carbon Fuel Company. Nine Mines of tbe Carbon Fuel Company, Black Diamond, vol. 63, no. 6, Aug. 9, 1919, pp. 126-138, 34 figs. Metbods of mining preparing and shipping coal. 1918 production of district approacbed ten million tons.

Classification. Composition and Classification of Domestic Coals, A. C. Fieldner. Gas Age, vol. 44, no. 3, Aug. 1, 1919, pp. 104-106, 3 figs. Conclusions drawn from U. S. Bur. of Mines investigation.

Coal Formation. The Formation of Coal, J. D. Kendall. Can. Min. Inst. Bul., no. 88, Aug. 1919, pp. 877-882, 2 figs. Organic remains found in rocks.

Conditions of Formation of Coke (Sur les conditions de formation du coke), Georges Cbarpy and Gaston Decorps. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 26, June 30, 1919, pp. 1301-1305. Tabulation of experimental results in wbicb effects of preliminary compression and coking temperature were specially studied.

Coke Ovens. New Vertical Coke Ovens — Pintsh-Bolz type — at the Gas Works in Düsseldorf (Die neue Vertikalofenanlage "System Pintsch-Bolz" für 100,000 cbm. Tagesleistung mit zugebörigen Koks — und Kohlentransportanlagen auf dem Gaswerk zu Düsseldorf), W. Schweizer. Journal für Gasbeleucbtung u. Wasserversorgung, vol. 59, no. 16, Apr. 15, 1919, pp. 215-221, 11 figs. (To he concluded.)

Coking. The Coking of Illinois Coal in Koppers Type Oven, R. S. McBride and W. A. Selwig. Cbem. & Metallurgical Eng., vol. 21, no. 3, Aug. 1, 1919, pp. 122-128, 6 figs. Operating test at plant of Minnesota By-Product Coke Company conducted jointly hy Nat. Bur. of Standards and U. S. Bur. of Mines. Test is said to have clearly demonstrated that some of Illinois coals can he coked in "chamber-type" oven without radical cbange in operating metbods for production of coke whicb can be successfully used in hlast furnace. *See also Missouri Camel Coals and Orient Coke.*

Carhonizing Illinois Coal, R. S. McBride and W. A. Selvig. Gas Rec., vol. 16, no. 3, Aug. 13, 1919, pp. 11-17, 6 figs. Results of tests made at St. Paul coke oven plant by U. S. Bur. of Mines.

Drills, Electric. Electric Coal Drills, A. H. Telfer. Iron & Coal Trades Rev., vol. 99, no. 2681, July 18, 1919, p. 79, 1 fig. Suggestions in regard to working of tbin seams.

Electrical Machinery. Electricity Applied to tbe Mechanical Mining of Coal, CS. B. Reed. Assn. Iron & Steel Elec. Engrs., July 1919, pp. 1-13, and (discussion) pp. 13-24. Trend of practice in selecting machine types.

Electrical Operation. St. Vincent Mine of the Mount Pleasant By-product Coal Co., P. B. Rule. Coal Age, vol. 16, no. 7, Aug. 14, 1919, pp. 264-267, 7 figs. Electrically operated mining plant with ultimate capacity of 1,500 tons a day.

Europe. Alarming Sbortage of Coal in Europe, George S. Rice. Coal Industry, vol. 2, no. 8, Aug. 1919, pp. 311-314. Giving coal situation in allied and neutral countries, Germany and Eastern Europe. Writer helieves that countries formerly supplied by England must turn to America.

Extraction. A Problem in Coal Extraction, Coal Age, vol. 16, no. 6, Aug. 7, 1919, pp. 234-235, 1 fig. Account of mining conditions and present practice in coal field where present extraction varies from 40 to 50 per cent. Discussion is invited with view to development and adoption of metbods tbat will premit hetter recovery.

Mining Methods. A Model Illinois Coal Mine, S. Bowles King. Mine & Quarry, vol. 11, no. 3, July 1919, pp. 1172-1185, 24 figs. Mining methods.

A Modern Mine in a Progressive State, Andrews Allen. Coal Industry, vol. 2, no. 8, Aug. 1919, pp. 303-309, 11 figs. Notes on layout and operation of Kathleen mine of Union Colliery Co. located at Dowell, Ill. Holdings consist of approximately 3143 acres of coal. Seam is from 7 to 9 ft. thick at average depth of 200 ft.

Fuel Economy in Power Production, W. T. Lane. Iron & Coal Trades Rev., vol. 99, no. 2683, Aug. 1, 1919, pp. 135-137, 4 figs. How to reduce (1) losses incurred by baving to leave large pillars of coal for various purpose, (2) losses due to unsuitable methods in working seams, (3) losses due to non-working of thin seams of coal and (4) losses due to "gobbing" of small coal. Paper read hefore South Wales Inst. of Engrs.

Winning and Preparation of Coal, John H. Anderson. Trans. Inst. Marine Engrs., vol. 31, no. 243, June 1919, pp. 23-124, 77 figs., partly on 19 supp. sbeets. Account of methods followed at various English mines.. Incidentally writer suggests greater use of mechanical appliances to make it possible to work seams of coal that otberwise could not reacbed.

Missouri Cannel Coals. The Carhonization of Missouri Cannel Coals. Bul. School of Mines & Metallurgy, University of Missouri, Technical Series, vol. 5, no. 1, Aug. 1919, pp. 7-49, 11 figs. Tests in which five different cannel coals were subjected to destructive distillation in gas-fired-horizontal retort and compared with bituminous coal coked under similar conditions, are reported to have shown tbat decomposition temperature of cannel coals is much lower than tbat of bituminous coal.

Orient Coal. Experimental-Retort Tests of Orient Coal, R. S. McBride and I. V. Brumbaugh. Chem. & Metallurgical Eng., vol. 21, no. 4, Aug. 15, 1919, pp. 171-174, 3 figs. Investigation on influence of coking temperature upon quantity and quality of coke produced. Comparison with results obtained when using other coals.

Roof Actions. Graphic Illustrations of Roof Actions, R. Z. Virgin. Coal Industry, vol. 2, no. 8, Aug. 1919, pp. 320-321, 4 figs. Method for using wire rope to strengthen timhers suggested.

Strippino. Coal Stripping in the United States — VI, Wilhur Greely Burrougbs, Coal Industry, vol. 2, no. 8, Aug. 1919, pp. 322-328, 4 figs. Approximate cost and efficiency of operations, care of stripping macbinery, and tables of what bas been accomplisbed.

Timbering. *See Roof Action.*

Washeries. Some Suggestions for the Standardizing of Guarantees for Coal Wasberies, Sherwood Hunter. Colliery Guardian, vol. 118, no. 3056, July 25, 1919, p. 229. How to interpret "free coal" and "free dirt" in terms of speeific gravity.

Washers. Further Improvements on tbe "Draper" Washer, J. M. Draper. Proc. of South Wales Inst. of Engrs., vol. 35, no. 1, July 18, 1919, pp. 21-32 and (discussion) pp. 32-39, 8 figs. It is claimed for this type of coal washer that it effects perfect separation witbout requiring skilled attention by direct upward flow of water at a rate sligbtly exceeding velocity fall of coal, witbout pulsators or mechanical motion.

Waste Utilization. Utilization of Coal Waste (L'utilisation des déchets de houille), H. Copaux. Cbemie & Industrie, vol. 2, no. 6, June 1919, pp. 656-660, Extraction of by-products. Report of special committee appointed by Société de Cbimie Industrielle.

COPPER

Horwood Process. The Horwood Process as Applied to tbe Copper-Zinc Ore of the Afterthought Mine, A. H. Heller. Min. & Sci. Press, vol. 119, no. 5, Aug. 2, 1919, pp. 151-158, 4 figs. Construction of 300-ton plant at California mine wbere tests witb Horwood process are said to bave given very promising results.

Huntingdon Mine. The Huntingdon Copper Mine, Quebec, Reginald E. Hore. Can. Min. Jl., vol. 40, no. 31, Aug. 6, 1919, pp. 582-584, 4 figs. Account of mining operations.

Slag. Metbod of Handling Granulated Slag in Anaconda, Oliver E. Jager. Min. & Sci. Press, vol. 119, no. 4, July 26, 1919, pp. 118-120, 6 figs. Comhination of granulation and haulage methods.

EXPLOSIVES

Detonators. Equipment for Detonation of Explosives by Electricity, Eng. & Contracting, vol. 52, no. 8, Aug. 20, 1919, pp. 220-221, 1 fig. Developed hy U. S. Army during the war.

Permissible Explosives. Permissible Explosives, John E. Miller, Coal Age, vol. 16, no. 6, Aug. 7, 1919, pp. 225-227, 18 figs. Safety rules and suggestions prepared by Bur. of Mines.

GEOLOGY AND MINES

Calcite Crystals. Some Notes on Japanese Minerals, Shimmatsu Ichikawa. Am. Jl. of Sci. (Fourth Series), vol. 48, no. 284, Aug. 1919, pp. 124-131, 3 figs. Concerning natural etchings of ealcite crystals.

Coral-Reef Zone. The Coral-Reef Zone During and After the Glacial Period, Reginald A. Daly. Am. Jl. of Sci. (Fourth Series), vol. 48, no. 284, Aug. 1919, pp. 136-159. Theory explaining tbeir origin hased on geological facts.

Crystallography of Carbonates. Refraction Indices of Rhombohedric Carhonates (Sur les indices de réfraction des carhonates rhomboédriques), Paul Gaubert. Bulletin de la Société Française de Minéralogie, vol. 42, no. 1-3, Jan.-Mar. 1919, pp. 88-120. Measurements on crystals belonging to isomorphous series.

Deep-Level Temperatures. The Maximum Temperature in Large Tunnels and Deep Wells Witb a Trial Empirical Formula, F. Butavand. Eng. & Contracting, vol. 52, no. 5, July 30, 1919, pp. 119-120. Temperatures obtained hy U. S. Geological Survey in wells located about five miles north of Clarksburg, W. Va., found to agree closely with those determined hy suggested metrical formula. Translated from Génie Civil.

Dissociation of Carbonate Rocks. An Apparatus for Studying the Dissociation of Carhonate Rocks, G. A. Bole, Jl. Am. Ceramic Soc., vol. 2, no. 5, May 1919, pp. 410-417, 2 figs. Victor Meyer vapor density apparatus, in wbich steam jacket has been raplaced by an electrical tuhe furnace.

Earthquakes. A Seasonal Variation in the Frequency of Earthquakes, Richard Dixon Oldham. Quarterly Jl. of Geological Soc., vol. 74, no. 294, July 9, 1919, pp. 99-104 and (discussion), pp. 104-105, 1 fig. on separate supp. plate. Records of observations of eartbquakes oceurring at time of great Indian eartbquake of 1917.

Fire Clays. Notes on Fire Clays of the Northern Appalachian Coal Basin, Ellis Lovejoy. Jl. Am. Ceramic Soc., vol. 2, no. 5, May 1919, pp. 374-385 and (discussion), pp. 385-390, 1 fig. Classification into four chief flint fireclays; occurrence and properties of each.

Japanese Minerals. *See Colcite Crystals.*

Mississippi. Mississippi — Its Geology, Geography, Soil and Mineral Resources, E. N. Lowe. Miss. State Geological Survey, Bul. no. 14, 1919, 346 pp., 20 figs. Popular presentations of previous published reports of State Geological Survey.

Pre-Cambrian. Relation of Regional Deformations to the Distribution of Ore in the Pre-Cambrian, Ellsworth Y. Dougherty. Min. & Sci. Press, vol. 119, no. 7, Aug. 16, 1919, pp. 227-230, 1 fig. Concerning hypothesis that ore deposits of hydrothermal and ingneous tynes can be referred to igneous activity of well-marked epochs.

Some Stratigraphic and Structural Features of the Pre-Cambrian of Northern Quebec — IV, H. C. Cooke. Jl. Geology, vol. 27, no. 5, July-Aug. 1919, pp. 367-382, 1 fig. Explorations of northern Quebec show existence of fairly sharp boundary line on one side of which limestone is member of Grenville while on the other it does not appear. From theoretical conditions writer concludes that this line represents an ancient topographic break, either a shore line or a boundary of a submerged plateau.

SEDIMENTATION. Inequalities of Sedimentation E. M. Kindle. Jl. Geology, vol. 27, no. 5, July-Aug. 1919, pp. 339-366. Points out various factors which make for periodic variability in rates of deposition and cites examples on existing lakes and seas to illustrate sharp contrasts in rate at which sediments accumulate at different points near the same coast line.

IRON

CANADA. The Production of Coal and Iron Ore in Canada Considered in Relation to the Iron and Steel Industries, F. W. Gray. Iron & Steel of Can., vol. 2, no. 8, Aug. 1919, pp. 177-179, 2 figs. Based on statistics complied by Dept. of Mines.

LEAD, ZINC, TIN

LEAD MINES, WANLOCKHEAD. The Wanlockhead Lead Mines, John Mitchell. Min. Mag., vol. 21, no. 1, July 1919, pp. 11-20, 3 figs. General description of South of Scotland mining district and account of records of working Leadhills and Wanlockedhead mines.

ZINC IN BELGIUM. Zinc Industry in Belgium, March F. Chase. Dept. of Interior, Bur. Mines, Minerals Investigations Series, no. 18, May 1919, 8 pp. Economical position of industry before the war and statistics of production from 1913 to 1918.

METERING. *See Gas, Natural.*

MISSISSIPPI. Oil and Gas Prospecting in Mississippi, E. N. Lowe. Miss. State Geological Survey, Bul. no. 15, 1919, 78 pp., 2 figs. Condensation of reports of actual investigations and of data presented in publications of various scientific organizations.

MINES AND MINING

AIR IN MINES. Notes on Defective Air in Disused Raises and Backstopes, C. J. Gray. Jl. of Chem., Metallurgical & Min. Soc. of South Africa, vol. 19, no. 11, May 1919, pp. 240-243 and (discussion), pp. 243-246. Result of analysis with Haldane's tube of air at various points in a disused raise in one of Witwatersrand mines.
See also Carbon Dioxide.

APEX LAW. An Unusual Apex Case, R. T. Walker. Min. & Sci. Press, vol. 119, no. 8, Aug. 23, 1919, pp. 262-264, 1 fig. How litigation between two companies led to disclosure of unusual type of vein structure.

CANADA, WESTERN. The Resources of Western Canada, R. C. Wallis, Jl. Eng. Inst. Can., vol. 2, no. 8, Aug. 1919, pp. 551-554. Geological and topographical notes, together with historical account of development of mining industry.

CARBON DIOXIDE. A "Safety First" Method for the Estimation of CO_2 in Mine Air, H. R. S. Wilkes. Jl. of Chem., Metallurgical & Min. Soc. of South Africa, vol. 19, no. 11, May 1919, pp. 246-249. Based on standard method except that quantities used are tenths and operation of titration with oxalic acid is eliminated.

CEMENT GUN. Results Obtained from the Use of the Cement Gun at the Cadogan Mine, Fred Norman. Coal Age, vol. 16, no. 7, Aug. 14, 1919, pp. 269-270, 4 figs. States difficulties in opertion due to bad, friable top rock, and notes how such difficulties were overcome by use of cement gun.

DREDGES. A Platinum Dredger. Engineer, vol. 128, no. 2217, July 25, 1919, pp. 90-91, 4 figs. Consists of large steel-framed and plated pontoon with unusual well for bucket ladder.

DRILLS. Pneumatic-Electric Rock Drill and Some of the Tools Used in Its Construction — II, Frank A. Stanley. Am. Mach., vol. 51, no. 6, Aug. 7, 1919, pp. 263-266, 7 figs. Jigs and fixtures provided for operations involved in finishing of parts.
Modern Rock Drill Practice, David Penman. Min. Mag., vol. 21, no. 1, July 1919, pp. 21-28, 13 figs. Particulars of Holman piston drill, Climax-Britannia hammer-drill and Ingersoll-Rrand jackhammer drill. (To be continued.)

GAS DETECTORS. Gas Detectors for Miners' Electric Lamps, T. J. Thomas. Colliery Guardian, vol. 118, no. 3058, Aug. 8, 1919, pp. 361-362. Possibilities of research. (Concluded.)
See also Carbon Dioxide.

LAWS, MINING. Common Violations of the Mining Laws, W. J. Heatherman. Coal Industry, vol. 2, no. 8, Aug. 1919, pp. 315-316. Failure to set proper timbers, shooting off solid, riding on trips, lack of adequate means of egress and ingress, recklessness and ignorance considered chief obstacles to mining safety. Paper presented before W. Va. Coal Min. Inst.
See also Apex Law.

MAPS, MINE. Conventional Symbols for Mine Maps, Lester C. Uren. Min. & Sci. Press, vol. 119, no. 7, Aug. 16, 1919, pp. 231-234, 4 figs. Used by engineering students in mine mapping at Univ. of Cal.

QUARRIES, IRONSTONE. Stripping and Working Ironstone Quarries, F. H. Match. Quarry, vol. 24, no. 270, Aug. 1919, pp. 211-216, 5 figs. Practice in English mines. Lecture delivered at Royal School of Mines.

ROASTING. Experiments in Magnetizing Roasting, George J. Young. Eng. & Min. Jl., vol. 108, no. 5, Aug. 2, 1919, pp. 176-177, 2 figs. Experimental results of tests made with pyritic concentrate.

SAFETY. Importance of Safety in Mining and Metallurgical Industries, W. R. Plank. Coal Age, vol. 16, no. 6, Aug. 7, 1919, pp. 228-231, 5 figs. Proposes establishment of safety departments,greater co-operation between employer and employee and continued training in first-aid and mine-rescue work,as means of curtailing accidents.

SIGNALINO SYSTEMS. Mine Electric Signaling Practice, Terrell Croft. Coal Age, vol. 16, no. 8, Aug. 21, 1919, pp. 308-312, 11 figs. Particulars of various signaling systems.

SKIP-CHANGE. Skip-Changing Device at the Steward Mine, Oliver E. Jager. Min. & Sci. Press, vol. 119, no. 6, Eug. 9, 1919, pp. 187-190, 5 figs. Device is of hinged guide and crawl type.

U. S. PRODUCTION, 1916. Mineral Production of the United States in 1916, H. D. McCaskey and Martha B. Clark. Dept. of Interior, U. S. Geological Survey, Series I:A, June 28, 1919, 70 pp., I fig. Statistics including comparison with earlier years.

MINOR INDUSTRIAL MATERIALS

TUNOSTEN. Tungsten and Its Importance in Industry (Wolframmetall und seine Bedeutung für die Industrie), Hugo Lohmann. Elektrotechnische Zeitschrift, vol. 25, no. 11/12, Feb.-Mar. 1919, pp. 141-143. As a substitute for diamonds in tool manufacture, for the chemical industry (crucibles, tubes), for the manufacture of electric bulbs, etc.
Tungsten and the Utilization of Slag in the Mining Industry. (Wolframgewinnung und Schlackenverwertung im Bergwerksbetriebe), Zeitschrift f. die gesamte Giessereipraxis, vol. 40, no. 6, Feb. 8, 1919, pp. 65-66. Tungstic acid recovered from some tin slag amounted to from 10 to 15 per cent.

OIL AND GAS

ENOLAND. Oil in England, J. Ford. Iron & Coal Trades Rev., vol. 99, no. 2682, July 25, 1919, pp. 110-111, 3 figs. Account of Derbyshire investigations which led to finding free oil.

GAS, NATURAL. Transportation and Distribution of Natural Gas, H. A. Quay, Gas Age, vol. 44, no. 3, Aug. 1, 1919, pp. 102-103. Improvements obtained by installation of meters.

PROSPECTINO. *See Mississippi.*

SEALING. Sealing Formations by Slime-Laden Fluid, Seth S. Langley. Eng. & Min. Jl., vol. 108, no. 7, Aug. 16, 1919, pp. 268-271, 4 figs. Methods for controlling gas pressure, preventing migration of oil, gas, and water, and preparing wells for abandonment.

SHALES. Oil Shales, Louis Simpson. Chem. & Metallurgical Eng., vol. 21, no. 4, Aug. 15, 1919, pp. 176-187. Suggestions in regard to selecting method of retort.

WELL DRILLINO. The Rotary Method of Well Drilling, Albert G. Wolf. Eng. & Min. Jl., vol. 108, no. 5, Aug. 2, 1919, pp. 171-175, 5 figs. Process of sinking oil and gas wells in unconsolidated strata by means of bits used in alternating hard and soft formations.

PRECIOUS MINERALS

ASPEN. *See Silver Ore.*

ONTARIO. West Shining Tree Gold District, Ontario, L. H. Goodwin. Eng. & Min. Jl., vol. 108, no. 7, Aug. 16, 1919, pp. 261-264, 4 figs. Notable feature of prospects in area is said to be presence of spectacularly rich specimen ore carrying heavy gold.

SILVER ORE. Deep-Level Development in Aspen, Frederick W. Foote. Eng. & Min. Jl., vol. 108, no. 5, Aug. 2, 1919, pp. 178-180, 4 figs. Concentration by jigs and tables. Camp contains silver-ore deposits in sedimentary rocks.

METALLURGY

BLAST FURNACES

BRITISH BLAST-FURNACE PLANT. The Glengarnock Works of David Colville and Sons, Limited. Engineer, vol. 128, no. 3317, July 25, 1919, pp. 75-78, 19 figs. partly on four supp. plates. Arrangement and details of blast-furnace, bessemer, open-hearth, structural and by-product departments.

CHARGER, BLAST-FURNACE. A German Blast-Furnace Charger. Iron & Coal Trades Rev., vol. 99, no. 2680, July 11, 1919, pp. 40-41, 5 figs. Automatic skip for charging furnace in lieu of hand labor. Output capacity of new furnace is 400 tons in 24 hours, involving handling of about 1200 tons of ore and about 500 to 600 tons of coke. From Stahl und Eisen.

COPPER AND NICKEL

SPEISS SMELTING. Melting Copper Speiss in Electric Furnace (Fusion de speiss de cuivre au four électrique), P. Papencordt. Journal du Four Electrique, vol. 28, no. 14, July 15, 1919, pp. 98-100. Experiments to determine economy of recuperating metals contained in speiss.

FERROUS ALLOYS

ELECTRICAL PRODUCTION OF FERROALLOYS. Electrical Production of Ferroalloys (La production électrica de aleaciones férreas), José Maria Navarrete. Energia Eléctrica, vol. 21, no. 12, June 25, 1919, pp. 137-140. Concerning types and sizes of furnaces used in United States, france, England, and Switzerland.

NICKEL-CHROMIUM STEELS. Nickel-Chromium Steels, J. H. S. Dickenson. Jl. West of Scotland Iron & Steel Inst., vol. 26, no. 8, April 1919, pp. 110-123 and (discussion) pp. 123-125, 15 figs. on 8 supplement plates. Account of their commercial development and of results obtained in tests of various samples which were all oil hardened and tempered alike and afterward cooled off at different rates. Tensile and notched-bar test results are given in tabulated form.

FLOTATION

SPAIN. Status of Flotation in Spain. Eng. & Min. Jl., vol. 108, no. 8, Aug. 23, 1919, pp. 316-317. Possibility of utilizing process for recovering mineral content of dumps dating back to early Rome.

FURNACES

ELECTRIC FURNACES. Electric Furnaces for Melting Non-Ferrous Metals — The Baily Furnace. Metal Trades. vol. 10, no. 8, Aug. 1919, pp. 366-370, 6 figs. Of resistance type, its heating element consisting essentially of granular carbon placed in silicon-corbide trough.

ELECTRIC SMELTING. Electric Smelting with Special Reference to Canadian Conditions, Robert M. Keeney. Can. Min. Inst. Bul. no. 88, Aug. 1919, pp. 846-853. Also Colo. School of Mines Mag., vol. 9, no. 8, Aug. 1919, pp. 219-222. Electric furnace is seen not as competitor of combustion furnace, but as means of treating certain ores and of working out certain processes in a more advantageous manner than it is possible to do in a combustion furnace, or treat ores that exist in certain districts in Canada where, owing to local conditions of cheap power and expensive coal and coke, combustion furnaces anr not practicable.

SLAGS. Losses in Furnace Slags, Edward H. Robie. Eng. & Min. Jl., vol. 108, no. 7, Aug. 16, 1919, pp. 265-267, 2 figs. Results of tests at smeltery of International Nickel Co., Copper Cliff, Ont., to determine influence of slag and matte composition and temperature on copper content of slang.

IRON AND STEEL

COBALTCROM STEEL. Making Cobaltcrom Steel Tools. Machy. (N. Y.), vol. 25, no. 12, Aug. 1919, pp. 1173-1174, 2 figs. Interesting feature of this steel is said to be that dies, milling cutters, etc., made from it can be cast to shape, teeth in cutters, for example, being cast directly in blank and requiring no other machining than grinding and boring or sometimes only reaming of hole.

FIBROUS STRUCTURE IN STEEL. Fibrous Structure in High Carbon Steel, A. W. Lorenz. Chem. & Metallurgical Eng., vol. 21, no. 4, Aug. 15, 1919, pp. 203-204. Facts and data in connection with a certain ordnance contract.

FLAKES IN STEEL. Flakes in Alloy Steel, Ernest Edgar Thum. Chem. & Metallurgical Eng., vol. 21, no. 3, Aug. 1, 1919, pp. 145-146. Recapitulation and discussion of various articles on flakes in gun tubes and other large forgings of alloy steels.

FRANCE. Metallurgy of Iron (La métallurgie du fer), Métallurgie, vol. 30, 31 and 33, July 23, July 30 and Aug. 13, 1919, pp. 1935-1936, pp. 2010-2011 and pp. 2162-2164. From general report on conditions in French industry published by Ministry of Commerce.

MAGNET STEEL. Steel for Magnets— V. Mech. World, vol. 66, no. 1700, Aug. 1, 1919, pp. 57-58, 4 figs. Essential physical changes taking place during hardening process in case of magnet steels. (Continuation of serial.)

MALLEABLE IRON. The Manufacture of Malleable Iron, Henry A. Johnson. Machy. (N. Y.), vol. 25, no. 12, Aug. 1919, pp. 1163-1164. With reference to physical and chemical phenomena that take place during process and mention of ordinary limits for chemical analysis for white-iron castings.

METALLURGICAL CALCULATIONS. Modern Steel Metallurgical Calculations, Charles H. F. Bagley. Blast Furnace & Steel Plant, vol. 7, no. 8, Aug. 1919, pp. 373-377. Synthetic method of calculating consumption of materials and technical results of manufacture of steel. Different kinds of pig iron and various standard processes are considered. Paper read before British Iron & Steel Ints.

OPEN-HEARTH PROCESSES. The Yields and Waste in Open Hearth Processes, J. E. Fletcher. Managing Engr., vol. 6, no. 3, July 1919, pp. 59-64, 5 figs. Photomicrographs illustrating progressive refining of white (eutectic) iron containing about 4 per cent carbon. Paper read before Stoke-on-Trent Engrs.' & Eng. Students' Assn. (To be continued.)

SOAKING PITS, ELECTRICALLY HEATED. Electrically Heated Soaking Pits, Re-Heating and Annealing Furnaces, and Automatic Furnaces, for Heat Treatment, as Applied to the Steel Industry, Thaddeus F. Baily. Iron & Steel of Can., vol. 2, no. 8, Aug. 1919, pp. 180-186, 5 figs. Paper read before Iron & steel Inst. of America.

TOOL STEEL. Modern High Speed Tool Steel, John A. Mathews. Ry. Mech. Engr., vol. 93, no. 8, Aug. 1919, pp. 489-492. Origin and development of modern high-speed steel; hardning and tempering qualities. Paper read before Am. Soc. for Testing Materials.

MICROPHOTOGRAPHY

ETCHING. *See Polishing and Etching.*

POLISHING AND ETCHING. Notes on Practical Metallographic Methods, Austin B. Wilson. Blast Furnace & Steel Plant, vol. 7, no. 8, Aug. 1919, pp. 380-386, 15 figs. Methods of polishing and etching for advanced research work.

RADIOMETALLOGRAPHY. Radiometallography Engineer, vol. 128, no. 3317, July 25, 1919, pp. 80-81, 8 figs. Arrangement of Coolidge tube for radiographic examination. Reproduction of various radiographs of castings.
The Examination of Materials by X-Rays. Engineering, vol. 108, no. 2794, July 18, 1919, p. 76, 4 figs. Radiographs of aluminum castings.

NON-FERROUS ALLOYS

ALUMINUM BRONZES. Relation of Microstructure to Phase Changes in Heat-Treated Aluminum Bronzes, L. R. Seidell and G. J. Horvitz. Chem. & Metallurgical Eng., vol. 21, no. 4, Aug. 15, 1919, pp. 179-181, 13 figs. Tests of branze of composition 90 per cent copper and 10 per cent aluminum, and conclusions in regard to adaptability of this bronze for bearing and corrosion-resistant metal.

BRASS MELTING. Melting of Some Non-Ferrous Metals and Their Alloys in the Electric Furnace, E. F. Collins. Jl. Cleveland Eng. Soc., vol. 11, no. 5 & 6, Mar.-July 1919, pp. 293-314 and (discussion) pp. 314-320, 19 figs. Requirements for economical brass-melting furnaces, and comparison of electric melting with fuel-fired furnaces.

MONEL METAL. Monel Metal, Hugh R. Williams. Sci. Am. Supp., vol. 88, no. 2276, Aug. 16, 1919, pp. 98-99, 3 figs. Claimed points of superiority of this new natural alloy in all field for con-corroding steel.

OCCLUDED GASES

Preventing Occlusion of Gases, Robert Hadfield. Iron Trade Rev., vol. 65, no. 8, Aug. 21, 1919, pp. 504-505. Silicon found by Terre Noire Co., France, to assist materially in reduction of unsoundness and blowholes and to tend to rid steel of absorbed gases. From paper presented before Faraday Soc., Lond.

VARIA

SILICON-MANGANESE. Silicon-Manganese from Electric Furnaces, B. G. Klugh. Iron Age, vol. 104, no. 7, Aug. 14, 1919, pp. 438-440. Manufacturing data for various compositions. Manganiferous slags as raw material. Uses for the alloy. Paper read before Am. Electrochemical Soc.

CIVIL ENGINEERING

BRIDGES

ARCHES. Flat Arches on High Piers, South Side Bridge, Fairmont. Eng. News-Rec., vol. 83, no. 6, Aug. 7, 1919, pp. 270-272, 7 figs. Three equal 116-ft. flat-arch spans preferred to other designs because of symmetrical proportion and simplicity, which are said to have resulted in lower cost.

COFFERDAM. Cofferdam Experience at a Bridge in Chicago River, Hugh E. Young and William A. Mulcahy. Eng. News-Rec., vol. 83, no. 6, Aug. 7, 1919, pp. 268-269, 2 figs. Flooding due to inaccurate record of old tunnel. Movement of wall in deep water led to heavier construction.

CONDEMNED BRIDGE. Rondout Creek Bridge Design Condenmed for Excessive Load on Batter Piles. Eng. News-Rec., vol. 83, no. 7, Aug. 14, 1919, pp. 329-332, 3 figs. Outline of design condemned by N. Y. State Highway commissioner because of considered foundation dangers and belief that superstructure design was not adapted to site.

CONCRETING. Concreting the Winnipeg Aqueduct. Contracting, vol. 9, no. 3, Aug. 1, 1919, pp. 69-70, 9 figs. Structure consists of concrete conduit having horseshoe-shape cross-section varying from 5 ft. 5 in. high by 5 ft. 4 in. wide to 9 ft. high by 10 ft. 9 in. wide and containing 310,000 yd. of concrete.

ELECTRIC EQUIPMENT. Utilizing Electric Power at Movable Bridges, Mark H. Reasonu. Ry. Elec. Engr., vol. 10, no. 8, Aug. 1919, pp. 285-287, 4 figs. Methods used in group of five railway bridges built side by side over Calumet river at South Chicago, Ill.

PORTLAND. Cross-River Traffic Problems at Portland, W. A. Scott. Eng. World, vol. 15, no. 4, Aug. 15, 1919, pp. 38-40, 3 figs. Data relative to type and construction of several existing bridges.

REPAIRS. Extraordinary Repairs Made to a 1900-Ton Drawbridge, Thomas D. Fulton. Eng. News-Rec., vol. 83, no. 8, Aug. 21, 1919, pp. 366-369, 7 figs. Turntable, wheels and drum failing. Number of wheels was increased and new upper treads placed. Drum parts restored by heating and jacking.

TIMBER BRIDGES. Timber Bridge Problems on the Alaska Railway. Eng. News-Rec., vol. 83, no. 9, Aug. 28, 1919, pp. 420-422, 5 figs. Standard designs for 121-ft. spans on sheathed pile piers.

VIADUCTS. The Bloor Street Viaduct, Toronto, Ontario, Thomas Taylor. Jl. Eng. Inst. Can., vol. 2, no. 7, July 1919, pp. 485-498, 17 figs. Including practice in grading of sand and testing concrete and other miscellaneous materials.

BUILDING AND CONSTRUCTION

APPEARANCE. Aesthetic Treatment of Plant Structures. Iron Age, vol. 104, no. 7, Aug. 14, 1919, pp. 427-429, 6 figs. Details of buildings erected by Steel & Tube Co. of Am. at its Iroquois and Mark plants, which were designed with a view to meet needs of employees.

BEAMS. Reinforced-Concrete Structures (Construcciones de mamposteria armada), L. Ivanissevich. Ingenieria, vol. 23, no. 10, May 16, 1919, pp. 617-628, 9 figs. Formulæ for designing beams.

BLOCK YARD. Block Yard Cheaply Improvised from Old Equipment. Eng. News-Rec., vol. 83, no. 8, Aug. 21, 1919, pp. 356-357, 6 figs. How contractor is being able to produce output of 60 blocks per man per day.

BRIDGE CONSTRUCTION. Electricity Cuts Construction-Plant Power Costs. Eng. News-Rec., vol. 83, no. 7, Aug. 14, 1919, pp. 311-312, 3 figs. System for handling concrete in large arch-bridge construction.

CAISSONS. Telescopic Foundation Caissons Sunk in Bank Basement, Frank H. Eastman. Eng. News-Rec., vol. 83, no. 8, Aug. 21, 1919, pp. 369-370, 1 fig. Support 275-ton vault of Central Union Trust Co., New York City. Columns rest on brick piers supported on quicksand only one ft. below cellar floor.

CEMENT STUCCO. Practice for Portland Cement Stucco. Contract Rec., vol. 33, no. 31, July 30, 1919, pp. 741-743. Recommendations of Am. concrete Inst. Committee.
See also Finishing.

CHURCHES. Some Principles of Design and Construction in Church Building. Charles H. Moore. Architectural Record, vol. 46, no. 2, Aug. 1919, pp. 115-122. Simple design intended to suit needs of rural community; also considerations in regard to future developments of this branch of architecture in America.

Community Houses. The Community House as a War Memorial, Martha Candler. Am. Architect, vol. 116, no. 2277, Aug. 13, 1919, pp. 195-201 & 205-207, 10 figs. Plans and details of Read Memorial Community House at Purchase, N.Y.
New Principles Governing Planning of Civic Buildings, William Roger Greeley. Am. Architect, vol. 116, no. 2277, Aug. 13, 1919, pp. 208-211, 4 figs. Illustrating various plans for community buildings.

Concrete Foundations. Building Concrete Foundations, Ernest Irving Freese. Building Age, vol. 41, no. 8, Aug. 1919, pp. 250-251, 5 figs. How to proportion mix to make them waterproof.

Cottages. Erect 66 Sea Shore Cottages of Concrete, Concrete, vol. 15, no. 2, Aug. 1919, pp. 51-54, 17 figs. Features of design. Walls are of monolithic construction; cost was 22.4 cents per cu. ft.

Docks. The Building of the Municipal Docks at St. Louis, M. Serkes. Am. City, City Edition, vol. 21, no. 2, Aug. 1919, pp. 113-116, 2 figs. Built with co-operation of city and federal governments.

Factories. Modern Daylight Factories, Albert M. Wolf, Eng. World, vol. 15, no.3, Aug. 1, 1919, pp. 21-26, 8 figs. Economic value of installing modern improvements in factory buildings.

Finishing. Methods of Finishing Cement Stuccos. Contract Rec., vol. 33, no. 32, Aug. 6, 1919, pp. 753-754. Dash, sand-float, and exposed aggregate finishes. From committee report presented to Am. Concrete Inst.

Frame Houses. Bolts in Field Connections of Steel-Frame Buildings; a Study of Data and Experience, R. Fleming. Eng. News-Rec., vol. 83, no. 7, Aug. 14, 1919, pp. 316-321, 4 figs. Experimental investigation to determine whether substitution of bolting for riveting of steelwork can be satisfactorily effected in specifications for steel-frame buildings.

Gardens. Ottawa Housing Commission Has Prepared Ideal Garden Development Plan. Contract Rec., vol. 33, no. 33, Aug. 13, 1919, pp. 775-778, 1 fig. One-eighth of area set aside for open spaces.

Gypsum Construction. Gypsum Construction for Railway Terminals, Curtis F. Columbia. Eng. World, vol. 15, no. 4, Aug. 15, 1919, pp. 33-37, 5 figs. Claimed advantages based on laboratory experiments.

Housing. Keeping the Costs of Building the Government Houses, John C. Prior and Herbert P. Green. Eng. News-Rec., vol. 83, no. 6, Aug. 7, 1919, pp. 252-261, 7 figs. System reporting progress and cost used by U. S. Housing Corporation.
Modern Housing Standards at Dawson, New Mexico, Charles F. Willis. Coal Age, vol. 16, no. 6, Aug. 7, 1919, pp. 220-224, 20 figs. Types of houses erected by Phelps-Dodge Corpn. for use of mine workers.
Workingmen's Houses in Italy-I, Alfredo Melani. Architectural Record, vol. 46, no. 2, Aug. 1919, pp. 176-185, 7 figs. Legislation enacted relative to construction of such dwellings by State.
Solving the Problem of the Low Cost House. Am. Architect, vol. 116, no. 2278, Aug. 20, 1919, pp. 229-234, 14 figs. Typical designs erected by various shipbuilding plants by U. S. Shiping Board Emergency Fleet Corporation.
The Engineering Aspect of the Housing Problem. Eng. Rev., vol. 33, no. 1, July 15, 1919, pp. 9-10. Points out manner of effecting economy in connection with internal woodwork.
The New London Housing Project, Louis L. Tribus. Man. Jl. & Public Works, vol. 47, no. 7, Aug. 16, 1919, pp. 102-104, 4 figs. General plan of procedure in carrying out project involving a million and a quarter dollars.

Japanese Design. The Principles of Japanese Design, Francis Taylor Piggott. J. Roy, Soc. of Arts, vol. 67, no. 3478, July 18, 1919, pp. 555-563 and (discussion) pp. 563-566, 13 figs. Architectural characteristics in their relation to artictic beauty.

Moving Houses. Moving Reinforced Concrete Building to a New Site, Jack L. Schnitz. Concrete, vol. 15, no. 2, Aug. 1919, pp. 60-62, 4 figs. Three-story, 3000-ton structure 60 ft. x 95 ft. moved one city block at Detroit.

Quillet System of Construction. Quillet System of Construction (Système de construction Quillet). Bulletin Technique de la Suisse Romande, vol. 45, no. 16, Aug. 9, 1919, pp. 157-160, 8 figs. Cement bricks are provided with gudgeons which permit them to hold rigidly together, thus making construction quasi-monolithic.

Reservoir. St. Paul Covered Reservoir. Cement & Eng. News, vol. 31, no. 8, Aug. 1919, pp. 24-26, 2 figs. Reinforced-concrete 30,000,000-gal. reservoir built with movable concrete-mixing and spouting plant.

Roofing. Roofing Ordinance Proposed for Indianapolis, Construction, vol. 8, no. 6, June 1919, pp. 273-274. For the purpose of insuring safety against fire in construction.
German Regulations for Reinforced-Concrete Roofs (Der neue Ministerialerlass über ebene Steindecken vom 23 November 1918). Beton u. Eisen, vol. 18, no. 4/5, Mar. 5, 1919, pp. 51-52. Stipulate composition of concrete and strength and bending moment of slabs for flat roofs.
Barn Roof Design, J. L. Strahan. Trans. Am. Soc. Agricultural Engrs., vol. 12, Dec. 1918, pp. 57-75, 6 figs. Observes that Shawver truss is not a true truss in the sense that it is truly rigid. Writer recommends modificatio n to make it so.

Stirrups in Concrete Beams. Diagram for Locating Stirrups in Concrete Beams, M. J. Lorente. Eng. News-Rec., vol. 83, no. 7, Aug. 14, 1919, pp. 310-311, 2 figs. Graphs for spacing vertical stirrups in uniformly loaded beam for two methods of stress distribution.

Tanks. Concrete Fuel-Oil Tank Design and Construction. Eng. News-Rec., vol. 83, no. 7, Aug. 14, 1919, pp. 322-323. Precautions to be observed in building small oil-storage reservoirs for use in industrial plants.
Reinforced Concrete Tanks, F. W. Frerichs. Popular Engr., vol. 12, no. 2, Aug. 1919, pp. 10-12, 3 figs. Details of large storage tanks for ammonica liquors. Paper read before Am. Inst. Chem. Engrs.
Tank Construction — XXX, Ernest G. Beck. Mech. World, vol. 66, no. 1699, July 25, 1919, pp. 42-43, 6 figs. Methods of supporting wall sheeting in tanks of large depth. (Continuation of serial.)

Tile Houses. Damp-proofing Hollow Tile Houses, Perry R. MacNeille. Construction, vol. 8, no. 6, June 1919, pp. 279-284, 3 figs. Account of various practices.

CEMENT AND CONCRETE

Boiler House. Concrete Used in Boiler-House Structure and Fittings, George S. Nobles. Eng. News-Rec., vol. 83, no. 6, Aug. 7, 1919, pp. 262-263, 4 figs. Coal hoppers, forced-draft air ducts, and boiler breeching made of reinforced concrete at Brooklyn Navy Supply Base heating plant.

Concrete-Block Casting. Efficient Plant for Casting Concrete Blocks for Miami River Revetment. Eng. & Contracting, vol. 52, no. 8, Aug. 20, 1919, pp. 214-215, 4 figs. Blocks are molded in small flat cars, 16 blocks per car, remaining on cars from time they are cast till they are unloaded in storage yards.

Gravel. Missouri Sand and Gravel-I. Cement Mill & Quarry, vol. 15, no. 4, Aug. 20, 1919, pp. 11-17, 21 figs. Method of production. From report of Missouri Bur. of Geology and Mines.

Rodding. Effect of Rodding Concrete, F. E. Giesecke. Can. Engr., vol. 37, no. 7, Aug. 14, 1919, pp. 217-218, 2 figs. Tests made at University of Texas to determine physical properties as determined by relative quantity of cement. From University Bul. no. 1815.
Cause of Adherence of Concrete to Steel in Reinforced-Concrete Structures (Sur la cause de l'adhérence du béton au fer dans les constructions en béton armé), Vasilesco Karpen. Comptes rendus des séances de l'Académie des Sciences, vol. 169, no. 1, July 7, 1919, pp. 21-23. Arguments offered in proof that cohesion is due to friction.

Texas, Concrete Aggregate. Texts of Concrete Aggregates Used in Texas, J. P. Nash, Univ. of Texas Bulletin, no. 1771, Dec. 20, 1917, 80 pp., 8 figs. Aggregates were tested by incorporating them in concrete and determining various properties of resultant concrete. Data are given regarding water used, age, crushing strength, number of specimens tested, weight of concrete and amount of cement per cu. yd. of laid concrete.

Waste-Heat Utilization. The Manufacture of Cement at Bellevue, Mich., C. M. Wright. Cement & Eng. News, vol. 31, no. 8, Aug. 1919, pp. 37-39, 1 fig. Practice in shutting down kiln and method of utilizing waste heat.

Wood for Reinforcing Concrete. Wood as Reinforcement for Concrete (Holz und Schilf als Ersatz des Eisens in der Zugbewehrung) v. Emperger. Beton u. Eisen, vol. 18, no. 4/5, Mar. 5, 1919, pp. 46-48, 7 figs. Well-seasoned impregnated wood, completely covered with concrete, said to have given satisfactory results at Vienna.

EARTHWORK, ROCK EXCAVATION, ETC.

Conduits Under Dams. Miami District Completes Conduits Under Dams. Eng. World, vol. 15, no. 4, Aug. 15, 1919, pp. 13-16, 4 figs. Purpose of conduits is to convey normal discharge of respective streams under dams without holding back water of streams, except during flood stages. Conduits were built in sections with both horizontal and vertical joints.

Dams. Protective and Restoration Work at Chaudpatha Dam, Sipri, S. K. Gurtu, Indian Eng., vol. 65, no. 18, May 3, 1919, p. 205, 5 figs. on supp. plate. Examining entire foundation and restoring portion carried away by uplift.
See also Conduits under Dams.

Big Eddy Dam on Spanish River. Contract Rec., vol. 33, no. 34, Aug. 2, 1919, pp. 787-790, 4 figs. Dam is of gravity type, containing approximately 80,000 cu. yd. of slag concrete, 1:3:6 mix. Methods of foundation work with caissons described.
The Construction of the Grand River Roller Crest Dam, O. T. Reedy. Reclamation Rec., vol. 10, no. 8, Aug. 1919, pp. 374-378, 8 figs. Dam consists of six bays, each 70 feet wide.

Foundations in Quicksand. Foundations in Quicksand and Watery Gravel, Eng. News-Rec., vol. 83, no. 9, Aug. 28, 1919, pp. 414-415, 2 figs. Sinking wells for concrete cylinder piers for building foundations for Canal St. viaduct in Chicago.

Hudson River Tunnel. Hudson River Tunnel Problems, Walter C. Parmley. Eng. World, vol. 15, no. 3, Aug. 1, 1919, pp. 31-34, 2 figs. Structural and construction problems of proposed tunnel.

Hydraulicking. Hydraulicking Dam Embankment on Miami Flood-Control Project. Eng. News Rec., vol. 83, no. 8, Aug. 21, 1919, pp. 371-373, 3 figs. Glacial drift excavated by draglines, hauled by train to hog boxes, mixed with water and then pumped to dam.

Piercing. Piercing the Mountain Barrier between France and Spain, F. Honore. Sci. Am., vol. 121, no. 8, Aug. 23, 1919, pp. 186-187, 9 figs. Outline of projects for piercing.

Subways. New Construction Methods in Subway Work Under Philadelphia City Hall. Eng. News-Rec., vol. 83, no. 7, Aug. 14, 1919, pp. 300-309, 15 figs. Subway built from roof downward by continuous underpinning; method determined by poor character of foundation of building.

Tunnels. Chicago's Tunnels for Electric Light and Power Cables, G. B. Springer. Eng. World, vol. 15, no. 3, Aug. 1, 1919, pp. 53-58, 10 figs. Construction methods employed. Relative advantages of tunnels and conduits.
See also Piercing.

Design and Construction of the Telephone and Telegraph Tunnel Under the Chicago River at Harrison Street, William Artingstall. Mun. & County Eng., vol. 57, no. 2, Aug. 1919, pp. 58-59. Tunnel is approximately 500 ft. long and 90 ft. below street surface. Reference is made specially to shaft sinking.

The Austrian Alphine Tunnels. Ry. Engr., vol. 40, no. 475, Aug. 1919, pp. 168-171, 6 figs. Tauern, Karawanken and Wochein. Methods of construction. (Continuation of serial.)

HARBORS

CURTIS BAY PIER, B. & O. R.R. The Curtis Bay Pier of the B. & O. R.R. I, M. A. Long. Coal Trade Jl., vol. 50, no. 32, Aug. 6, 1919, pp. 953-955, 3 figs. General features of pier said to be capable of handling 12 million tons per annum.

DOCK-STONE SHIPPING. Stone-Shipping Dock is patterned after Ore-Bin Type. Cement & Eng. News, vol. 31, no. 8, Aug. 1919, pp. 34-35, 1 fig. Cylindrical steel bins, loaded from cars above, discharge by gravity to steamers. Capacity 7880 tons.

DULUTH ORE DOCK. Duluth Ore Dock is the Largest in the World, W. H. Hoyt. Ry. Age, 67, no. 8, Aug. 22, 1919, pp. 345-348, 9 figs. Dock has length of 2438 ft. and is 84 ft. above water. It has electric-light masts reaching to 120 ft. above water. Reinforced-concrete slab used for foundation.

PEARL HARBOR DRY DOCK. Completion of the Pearl Harbor Dry Dock, A. Russell Bond. Sci. Am., vol. 121, no. 9, Aug. 30, 1919, pp. 202-203, 11 figs. Method of construction necessitated by reason of peculiar geological conditions.
Unique Construction of Pearl Harbor Graving Dock. Contracting, vol. 9, no 3, Aug. 1, 1919, pp. 77-79, 9 figs. Transverse floor sections built and floated to site in dry dock.

PORTSMOUTH NAVY YARD DOCK. World's Largest Dry Dock Completed at Portsmouth Navy Yard at Cost of $4,000,000. Cement & Eng. News, vol. 31, no. 8, Aug. 1919, pp. 42-43, 1 fig. Basin is 1022 ft. in length; width of coping lines is 144 ft. and width of floor bottom 112 ft.

PURFLEET JETTY AND VIADUCT. Purfleet Jetty and Viaduct. Ferro-Concrete, vol. 10, no. 12, June 1919, pp. 355-364, 11 figs. Structure equipped with cranes for discharging collier steamships. Total river frontage is 586 ft. in length.

HYDRAULIC ENGINEERING

FLOOD WATER. Concrete Channel for Stream Over Fractured Mine Outcrop, Harley A. Coy. Eng. News-Rec., vol. 83, no. 7, Aug. 14, 1919, pp. 327-328, 3 figs. Flood water which formerly backed up creek and seeped through into mine below is now carried past broken ground.
See also Storm Water.

RIVER BANKS EROSION. The Causes of Erosion of River Banks, Col. Hoc. Eng. & Contracting, vol. 52, no. 5, July 30, 1919, pp. 123-125, 9 figs. Tendency of river to assume sinuous course explained by analysis that curve of current of liquid is like bending of loaded flexible column. Translated from Génie Civil.

RIVER BANKS PROTECTION. Protecting the Banks of Savannah River Through Augusta, E. C. Garvin. Eng. News-Rec., vol. 83, no. 9, Aug. 28, 1919, pp. 410-412, 1 fig. Development of methods used and data on cost of rock face revetment placed in prewar and war years.

SAND IN SUSPENSION. The Determination of the Amount of Sand in Suspension in Water, G. J. Gibbs. Central (Jl. of Old Students of City and Guilds Eng. Col., Lond.), vol. 16, no. 45, June 1919, pp. 13-20, 2 figs. Method for ascertaining amount of sand carried in suspension by running water, developed as part of problem of dealing with growth and disappearance of sand banks in estuary of river.

STORM WATER. Graphical Method for Estimating Storm-Water Run-Off, Ralph W. Horner. Eng. News-Rec., vol. 83, no. 6, Aug. 7, 1919, p. 282, 1 fig. Graph constructed from formula $Q=ciA$ where Q is total run-off, c run-off coefficient of area, i intensity of rainfall, and A drainage area.

WATER STORAGE. The General Principles of the Development and storage of Water for Electrical Purposes, J. W. Meares. Jl. Instn. Elec. Engrs., vol. 57, no. 283, June 1919, pp. 426-439. 8 figs. Also Engineering, vol. 108, no. 2798, Aug. 15, 1919, pp. 222-224, 5 figs. Examines subject from view point of delivering and continuing to deliver, water to prime mover. Collection, storage and delivery of water on high, medium and low falls are discussed.

MATERIALS OF CONSTRUCTION

GRAVEL. *See Sand and Gravel.*

ROAD MAKING MATERILAS, SAMPLING. Instructions Governing the Sampling and Inspection of Road Making Materials in New Jersey, William G. Thompson. Mun. & County Eng., vol. 57, no. 2, Aug. 1919, pp. 66-69. Prepared by State Highway Engineers.

SAND AND GRAVEL. Properties of Sand and Gravel, A. Ledoux. Cement, Mill & Quarry, vol. 15, no. 3, Aug. 5, 1919, pp. 21-26, 4 figs. Morphological and physical: also tabulated results of granular metric analysis showing difference in percentage of fineness between several grades of sand and gravel.

MUNICIPAL ENGINEERING

BOSTON. Replanning Boston's Most Congested District, Elisabeth M. Herlihy. Am. City, City Edition, vol. 21, no. 2, Aug. 1919, pp. 107-112, 5 figs. Recommendations of Boston City Planning Board for providing right living conditions in " North End."

CITY PLANNING. *See also Portland.*

NIAGARA DISTRICT. Regional Planning of the Niagara District, Thomas Adams' Can. Engr., vol. 37, no. 5, July 31, 1919, pp. 187-189. Future purposes of industrial development, sub-division of land, housing, transportation, sources and distribution of power, water supplied and sewerage, and general amenities. Address at Nat. City Planning Conference.

PORTLAND. City Planning for Portland. Mun. Jl. & Public Works, vol. 47, no. 8, Aug. 23, 1919, pp. 116-118, 5 figs. Zone plans for several districts prepared by City Commission. (To be continued.)

WATER RATES. Water Rates and Fire Protection Charges. Mun. Jl. & Public Works, vol. 47, nos. 5-6, Aug. 2 & 9, 1919, pp. 70-72 & 88-90. Data from several hundred cities of United States; maximum and minimum rates; changes since before the war; receipts for public hydrants and private protection. (To be continued.)

RECLAMATION AND IRRIGATION

DRAINAGE PLANT, CODIGORO. The New Drainage Plant at Codigoro (Die neue Entwåsserungs-Anlage in Codigoro), G. Müller. Schweizerische Bauzeitung, vol. 74, no. 2, July 12, 1919, pp. 14-16, 7 figs. Reinforcing the substructure for the new boiler and machine house; new pumping station. (To be continued.)

LINDSAY-STRATHMORE IRRIGATION DISTRICT. Construction Details of the Lindsay-Strathmore Irrigation District, California, E. Court Eaton. Eng. News-Rec., vol. 83, no. 8, Aug. 21, 1919, pp 348-351, 6 figs. Cement-lined canals and wood and asphaltum-impregnated felt-covered steel pipe lines used.

MIAMI FLOOD WORKS. Miami Flood Works Involve Radical Railway Changes. Eng. News-Rec., vol. 83, no. 7, Aug. 14, 1919, pp. 313-315, 4 figs. Railways crossing flood-retarding basins shifted to high ground. Levees guard stretches crossing lowlying areas.

NACHES-SELAH IRRIGATION CANAL. Reconstruction of the Naches-Selah Irrigation Canal, Elbert M. Chandler. Eng. News-Rec., vol. 83, no. 6, Aug. 7, 1919, pp. 276-279, 4 figs. Parts of old sidehill canal in disrepair replaced, under war conditions, by concrete-lined tunnels, reinforced-concrete flumes, and canal with wire-reinforced concrete.

ROADS AND PAVEMENTS

ASPHALTIC PAVEMENTS. Asphaltic Pavements at Ashokan, R. R. Barrett. Good Roads, vol. 18, no. 8, Aug. 20, 1919, pp. 95-96, 3 figs. Method employed in applying asphalt cement for the seal coat of bituminous-concrete roads.

CANADA. Progressive Method of Road Improvement, Gabriel Henry. Can. Engr., vol. 37, no. 6, Aug. 7, 1919, pp. 203-206. Points out advantages of adopting this method in Province of Quebec. Paper read before Can. Good Roads Assn.

CONCRETE ROADS. Stresses in Concrete Road Slabs from Wheels of Heavy Trucks, A. T. Goldbeck. Eng. & Contracting, vol. 52, no. 6, Aug. 6, 1919, pp. 165-166. Conclusions from tests conducted by U. S. Bur. of Public Roads.
See also Standard Details.
A Study of Aggregates in Concrete Paving, R. W. Scherer. Cement & Eng. News, vol. 31, no. 8, Aug. 1919, pp. 32-33, 3 figs. Opinions expressed by various investigators and engineers having had experience in road building.

CONVICTS. Convicts on Road Work. Mun. Jl. & Public Works, vol. 47, no. 5, Aug. 2, 1919, pp. 64-67, 4 figs. Experience with use of convicts in States of Arizona, Florida, Idaho, Illinois, Louisiana, Maryland, Nebraska, New Jersey, Oklahoma, Rhode Island, Utah, West Virginia and Wyoming.

FRANCE. Some Lessons from French Roads, E. A. Kingsley. Mun. Jl. & Public Works, vol. 47, no. 6, Aug. 9, 1919, pp. 82-85. Bituminous treatment claimed to have proven beneficial.

GRADE CROSSING ELIMINATION. Civic and Engineering Features of Grade Crossing Elimination, Allen L. Golinkin. Mun. & County Eng., vol. 57, no. 2, Aug. 1919, pp. 61-63, 1 fig. Suggested sections for railway track-depression sceneme permits passengers an unobstructed view to original ground level.

GRANITE. Paving of Streets and Aisles, Brooklyn Army Supply Base. Eng. News-Rec., vol. 83, Aug. 28, 1919, pp .400-402. Granite used for heavy traffic, asphalt blocks for medium and special construction, and bitulithic for light traffic.

GUARDS. Steel Paving Guards, Chas. F. Puff, Jr. Am. City, Town & Country Ed., vol. 21, no. 2, Aug. 1919, pp. 141-142; also Am. City, City Ed., vol. 21, no. 2, Aug. 1919, pp. 141-142, 1 fig. Results of two years' experience in Philadelphia mentioned as evidence that guard used as edge protection is direct success.

HIGHWAYS TRANSPORT COMMITTEE. Highways Transport Committee for New York. Good Roads, vol. 18, no. 6, Aug. 6, 1918, pp. 77-78. Text of Reconstruction Commission's report recommending establishment of a State Highways Transport Committee to promote marketing of farm produce by rural motor express.

MACADAM ROADS. Construction of Water-Bound Macadam Roads, A. Paradis. Can. Engr., vol. 37, no. 5, July 31, 1919, pp. 175-178 and 193. Experience of Quebec Province Highway officials, particularly in regard to maintaining roads subject to heavy automobile traffic. Translation of paper read in French before Can. Good Roads Assn.
Recommended Method of Resurfacing an Old Macadam Road that is Filled with Ruts and Holes, William N. Bosler. Mun. & County Eng., vol. 57, no. 2, Aug. 1919, pp. 69-70. Practice in Central Kentucky.
Water-Bound Macadam in Multnomah County, Ore, H. B. Chapman. Am. City, Town & County Ed., vol. 21, no. 2, Aug. 1919, pp. 111-114, 3 figs. Advocates construction of water-bound macadam where travel is not too great.

MAINTENANCE. Maintenance Costs of Primary Highways in Washington for Two-Year Period, George F. Cotterill. Mun. & County Eng., vol. 57, no. 2, Aug. 1919, pp. 51-56. State funds from motor-license revenue apportioned to counties for purposes of maintenance and repairing highways. Rules, regulations and requirements are prescribed by State Highway Board.
See also Patrol System.

High Cost of Maintenance of Light Macadam Highways, Frederick Stuart Greene. Eng. News-Rec., vol. 83, no. 8, Aug. 21, 1919, pp. 353-355. Commissioner's answer to inquiry resulting from published statement that only concrete pavement would be built hereafter in New York State.

Highway Maintenance in Wisconsin — I, II, III, J. T. Donaghey. Good Roads, vol. 18, nos. 7, 8 and 9, Aug. 13, 20 and 27, 1919, pp. 87-89, 97-98 and 105-106 and p. 108, 2 figs. Aug. 13: Plan adopted by Wisconsin Highway Commission for taking care of highways by patrol system. Duties of patrolmen. Aug. 20: Specifications approved by Highway Commission. Concerning use of graders, drags and dragging. Aug. 27: Use of road planers and graders. Methods for sandy and clayey roads.

Methods of Maintaining Highways Systems Prior to Construction by the State or County. Frederic E. Everett. Am. City, Town & County Ed., vol. 21, no. 2, Aug. 1919, pp. 107-110. Particularly experience of New Hampshire.

Material-Handling Plant. Labor Saving Material Handling Plant for Concrete Road Construction, A. R. Losh. Eng. & Contracting, vol. 52, no. 6, Aug. 1919, pp. 172-173, 2 figs. Materials are received at central storage and loading plant and are sent direct to mixer in batch units by means of industrial railway equipment. From Public Roads.

Patrol System. Lessons from 191 Experiences of Patrol System of Road Maintenance in Wisconsin. Eng. & Contracting, vol. 52, no. 6. Aug. 6, 1919, pp. 158-159, 1 fig. Data compiled by State Highway Commission. Maintenance in Wisconsin was carried out under a patrol system, supplemented in practically all counties by small gangs for reconstruction and heavy repair work.

Road Machinery. The Selection and Use of County Road Machinery, J. R. Johnson. Mun. & County Eng., vol. 57, no. 2, Aug. 1919, pp. 64-66. Concerning factors influencing selections and precautions to take for maintaining equipment in good conditions.

Economic Utilization of Labor Saving Road Machinery, Chas. M. Upham. Good Roads, vol. 18, no. 6, Aug. 6, 1919, pp. 75-76, 2 figs. Advantages of central loading method of handling material in construction of cement-concrete pavements in Delaware. Paper presented before Am. Road Builders' Assn.

Rural Roads. Proportion and Reasonable Economy in Rural Road Design, W. G. Hargar. Eng. News-Rec., vol. 83, no. 7, Aug. 14, 1919, pp. 324-327, 1 fig. Discussion of correct alignment grades, surfacing and foundations. Comparison of recent practice with that of 10 years ago.

Recommended Practice of Mississippi Valley State Highway Departments for Concrete Road Construction. Eng. & Contracting, vol. 52, no. 6, Aug. 6, 1919, pp. 166-167. From report of conference of Mississippi Valley Assn. of State Highway Dept., held at Chicago to consider questions relating to rural concrete-road construction.

Standard Details. Standard Details of New Jersey State Highway Departments Minor Features of State Roads. Eng. & Contracting, vol. 52, no. 6, Aug. 6, 1919, p. 163, 6 figs. Standard concrete gutter, standard method of banking on curves, standard method guard rail and standard details for catch basins and culvert pipes.

Monolithic Brick Road. New Mechnical Methods Employed with Marked Success in Building Monolithic Brick Road from Ashtabula to Conneaut, Ohio, F. A. Churchll. Mun. & County Eng., vol. 57, no. 2, August 1919, pp. 57-58, 1 fig. By means of two automatic templets which were used for fashioning concrete foundation of monolithic brick road, constructor is said to have been able to built from 1000 ft. to 1100 ft. of monolithic 16 ft. pavement in a day, including foundation and final grouting.

Standard Sections. Standard Sections of State Highway Department of Pennsylvania for Road Pavements. Eng. & Contracting, vol. 52, no. 6, Aug. 6, 1919, p. 156, 11 figs. For bituminous, concrete telford, macadam, wood-block and stone-block roads; also showing construction of car tracks.

SANITARY ENGINEERING

Cleaning. The Cleaning of Receiving Basins and Grit Chambers by Hydraulic Methods, Charles E. Gregory. Am. City, Town and County Ed., vol. 21, no. 2, Aug. 1919, pp. 151-153. Practice in Borough of Manhattan, N. Y. City.

Grease Interception from Sewage. Grease Interception from House Sewage, H. J. Belmont. Domestic Eng., vol. 88, no. 6, Aug. 9, 1919, pp. 249-251 and 285, 5 figs. Grease traps of various kands.

Grit Chambers. *See also Cleaning.*

Incinerators. Incinerators Used at Cantonments. Mun. Jl. & Public Works, vol. 47, no. 8, Aug. 23, 1919, pp. 120-122, 6 figs. Details of design prepared by Construction Division of army for camp of twenty thousand men.

Receiving Tanks. *See also Cleaning.*

Refuse. Collection and Disposal of Refuse in the Future, F. W. Brookman. Can. Engr., vol. 37, no. 6, Aug. 7, 1919, pp. 207-208. Suggestions in regard to choice of wagons, in view of facilities available in consequence of war. Paper read before Inst. of Cleansing Superintendents, England.

Sewage Tanks. The Cantonment Sewage Tanks. Mun. Jl. & Public Works, vol. 47, no. 4, July 26, 1919, pp. 46-50, 3 figs. Difficulties experienced in operating, reasons therefor in opinion of several experts and means devised for their elimination; sewage of unusual concentration and high grease content.

Sewage Treatment. Electrical Treatment of Sewage: The Landreth Direct Oxidation Process, Henry Germain, Maude Creighton and Benjamin Franklin. Jl. Franklin Inst., vol. 188, no. 2, Aug. 1919, pp. 157-187, 9 figs. Description of million gallon plant erected at Easton, Pann., for demonstration purposes. Account of experimental results.

Results of the Test Run of the Direct Oxidation Experimental Sewage Treatment Plant at Easton, Pa., C. A. Emerson Jl. Mun. & County Eng., vol. 57, no. 2, Aug. 1919, pp. 70-75, 1 fig. Consideration of performance led to conclusion that combined action upon sewage of fine screen, line treatment and electrolytic cell render sewage in such a condition that after sedimentation in properly designed tanks effluent can be discharged into a stream, affording a reasonable dilution of relatively clean water, without danger of creating nuisance.

Sewage-Treatment Works at Langley Field, Virginia, Thorndike Saville and Carl L. Weil. Eng. News-Rec., vol. 83, no. 8, Aug. 21, 1919, pp. 374-377, 6 figs. Imhoff tank with receiving bowls, inlet channels, bar screen, distributing channel with downtakes. Dosing chamber, ventilated springling filters, and final settling tanks to be added.

Town Sewerage. Town Sewerage, Edward B. Savage. Surveyor, vol. 56, no. 1435, July 18, 1919, pp. 40-43 and (discussion) pp. 43-44. Concerning provision of manholes and of ventilation and freezing of sewers.

SURVEYING

Twist in Conformed Mapping. On the Twist in Conformed Mapping, T. H. Gornwall. Proc. Nat. Acad. Sciences, vol. 5, no. 7, July 1919, pp. 248-250. Importance of twist in comparison of maps of different regions.

WATER SUPPLY

Chlorination. *See also Water Treatment.*

Gallery Water-Collecting System. Special Features of the Gallery Water Collecting System of the Des Moines Water Co., Des Moines, Ia., A. F. Luce. Mun. & County Eng., vol. 57, no. 2, Aug. 1919, pp. 75-77, 4 figs. Constructional features of each one of the infiltration galleries, with notes on geology of region.

Metering. Metering and Water Consumption, H. P. T. Matte. Can. Engr., vol. 37, no. 5, July 31, 1919, pp. 181-184. Effective installing of water meters upon onsumption of water. Comparison of usage in various cities. Paper read before Western Soc. of Engrs.

Water-Purification Units, Portable. Motor Truck Mounted Water Purification Units, William J. Orchard. Eng. World, vol. 15, no. 3, Aug. 1, 1919, pp. 35-38, 7 figs. Description and operation of unit developed for A. E. F.

Water Treatment. Water Facilities for Southern at Monroe. Ry. Maintenance Engr., vol. 15, no. 8, Aug. 1919, pp. 270-272, 4 figs. Treatment given to turbid and muddy water in sedimentation basin and coagulating system.

Feed Water Treating and Purifying Plant, S. H. McKee. Blast Furnace & Steel Plant, vol. 7, no. 8, Aug. 1919, pp. 401-405, 4 figs. Treating capacity is 300,000 gal. per hr. It is noted that plant was laid out so that a 25 per cent extension can be made to give ultimate treating capacity of 375.000 gal. per hr.

Chlorination Treatment of London Water Supply Proves Pronounced Success. Contract Rec., vol. 33, no. 33, Aug. 13, 1919, pp. 779-781. Comments on speed and cost.

Action of Sodium Hyposulphite on Hypochlorites (Action de l'hyposulfite de solium sur les hypochlorites), F. Dienert and F. Wandenbulcke. Comptes rendus des séances de l'Académie des Sciences, vol. 169, no. 1, July 7, 1919, pp. 29-30. Experiments to determine quantity of sodium hyposulphite necessary to combine with free chlorine in treatment of water.

INDUSTRIAL TECHNOLOGY

Acetylene. Acetylene, R. A. Witherspoon. Can. Chem. Jl., vol. 3, no. 8, Aug. 1919, pp. 250-253. General properties and its application in industry. *See also Cardide.*

Alcohol. Notes on the Production of Synthetic Alcohol, E. K. Rideal. Chem. Age, vol. 1, no. 1, June 21, 1919, pp. 9-11, 1 fig. Potentialities of wood cellulose as raw material.

Asphalt. The Municipal Asphalt Plant of the District of Columbia, G. B. Hunt. Am. City, City Edition, vol. 21, no. 2, Aug. 1919, pp. 119-120, 2 figs. Record of operation for 1918, with cost data.

Bleaching. *See Cotton Bleaching.*

Calcination. *See Gypsum.*

Carbide. The Canada Carbide Company, Limited, J. C. King. Can. Chem. Jl., vol. 3, no. 8, Aug. 1919, pp. 262-264, 2 figs. Brief history of carbide industry and description of its growth and development at Shawinigan Falls.

Cellulose. Reactions of Cellulose, Florence B. Seibert and Jessie E. Minor. Paper, vol. 24, no. 23, Aug. 13, 1919, pp. 15-20. 4 figs. Study of development of oxycellulose in papermaking.

Chemical Industry, American. The Economic Status of American Chemical Industry, Frederick E. Breithut. Chem. & Metallurgical Eng., vol. 21, no. 3, Aug. 1, 1919, pp. 129-131, 10 figs. Charts based on specifications given in Census of Manufacturers for 1914.

Chemicals, Prices. Prices of Chemicals During the War Frederick E. Breithut. Chem. & Metallurgical Eng., vol. 21, no. 4, Aug. 15, 1919, pp. 174-176, 2 figs. Charts showing movement away from pre-war level.

Chlorine. The Nelson Electrolytic Chlorine Cell, C. F. Carrier, Jr. Chem. & Metallurgical Eng., vol. 21, no. 3, Aug. 1, 1919, pp. 133-136, 4 figs. History, description and record of commercial application. From paper read before American Electrochemical Soc.

Electric Installations of Works Manufacturing Chlorine (Les installations électriques de l'usine "Le Chlore Liquide"), Jacques de Soucy. Chimie & Industrie, vol. 2, no. 6, June 1919, pp. 627-640, 13 figs. Current supplied at 26,000 volts is stepped down to 3200 volts and partly to 1850 volts.

Coal Tar. Continuous Process for Distilling Coal Tar. Gas Age, vol. 44, no. 4, Aug. 15, 1919, pp. 149-152, 11 figs. Description of plant erected at Gas Works of Geneva, Switzerland. From Journal des Usines & Gaz.

Column Apparatus. Column Apparatus in Chemical Industry, Sydney J. Tungay. Chem. Age, vol. 1, no. 1, June 21, 1919, pp. 11-14, 6 figs. Discussion of principles regarding use, of towers, columns and filling materials manufactured from acid-resisting iron. Special reference is made to type to distallation and washing column patented by Kubierschky.

COTTON BLEACHING. Bleaching of Cotton (Blanchiment du Coton), Robert Weiss. Bulletin de la Société Industrielle de Mulhouse, vol. 84, no. 6, Oct.-Nov.-Dec' 1914, pp. 499-506. Experiments with strontium as substitute for lime.

CRUCIBLES. *See Graphite.*

CYANIDES. The Recovery of Cyanides from coal. Chem. Age, vol. 1, no. 4, July 12, 1919, pp. 90-92, 1 fig. Extraction process of hydrocyanic acid resulting from distillation of coal.

GLASS. The Cooling of Optical Glass Melts, Howard S. Roberts. Jl. Am. Ceramic Soc., vol. 2, no. 7, July 1919, pp. 543-563, 7 figs. Conditions to be attained when melt of optical glass is cooled in the pot.

The Volatilization of Iron from Optical Glass Pots by Chlorine at high Temperatures, J. C. Hostetter, H. S. Roberts and J. B. Ferguson. Jl. Am. Ceramic Soc., vol. 2, no. 5, May 1919, pp. 356-372, 5 figs. Experiments said to have indicated beyond doubt that iron can be readily removed from pots by this method.

GLUES. Water-Resistant Glues, F. L. Browne. Crem. & Metallurgical Eng., vol. 21, no. 3, Aug. 1, 1919, pp. 136-138, 3 figs. Including bibliography on casein and casein glues.

GRAPHITE. Structure of Graphite in Relationship to Crucible Making, Reinhardt Thiessen. Jl. Am. Ceramic Soc., vol. 2, no. 7, July 1919, pp. 508-542, 29 figs. Crucibles containing Ceylon graphite were examined; also English crucible containing Madagascar graphite,several American crucibles containing American graphite and one Japanese crucible of unknown graphite origin. They all showed flake formation excepting Ceylon graphite, which evidenced granulars form.

Effect of Variable Pressure and Tar Content on the Briquetting of Alabama Graphite, R. T. Stull and H. G. Schurecht. Jl. Am. Ceramic Soc., vol. 2, no. 5, May 1919, pp. 391-399, 8 figs. Results of experiments.

GYPSUM. Gypsum Wall Plaster of France, C. F. Columbia. Cement, Mill & Quarry, vol. 15, no. 3, Aug. 5, 1919, pp. 17-19. Methods of extraction and account of French process of calcination.

HYDROCYANIC ACID. *See Cyanides.*

JAPANS. Water Japan, Wheeler P. Davey. Gen. Elec. Rev., vol. 22, no. 8, Aug. 1919, pp. 634-635. Characteristics of emulsion. Electric-dip and hot-dip methods for applying it.

LEATHER. Leather from the Sea, Robert G. Skerrett. Sci. Am., vol. 121, no. 8, Aug. 23, 1919, pp. 182-183, 2 figs. Work done in adaptation of skins of sharks, rays, dogfish, backfish, etc., to general purposes of leather worker.

OILS. Suggestions Regarding the Selection of Drying Oils, Henry A. Gardner. Educational Bur., Scientific Section, Paint Manufacturers' Assn. of U. S., no. 66, Aug. 1919, 3 pp. Including contents of specifications for raw, boiled, and refined linseed oils, as recommended by the U. S. Interdepartmental Committee on Standardization of Paint Specifications.

Soya Oil, Henry A. Gardner. Educational Bur., Scientific Section, Paint Manufacturers' Assn. of U. S., no. 67, Aug. 1919, 16 pp. Summary of data regarding composition, physical properties and industrial uses.

Marine Animal Oils in Paints and Varnishes, Henry A. Gardner. Educational Bur., Scientific Section, Paint Manufacturers' Assn. of U. S., no. 68, Aug. 1919, 7 pp. Survey of results obtained and practices developed by various investigators.

Driers for Soya Oil, Henry A. Gardner. Educational Bur., Scientific Section, Paint Manufacturers' Assn. of U. S., no. 69, Aug. 1919, 12 pp. It is concluded as result of experiments that raw soya oil may be dried almost as rapidly as boiled linseed oil. Drier combinations that produce best results are given.

PAPER. Paper Pulp Manufacture in Australia, Gerald Lightfoot. Paper, vol. 24, nos. 23 and 24, Aug. 13 and 20, 1910, pp. 22-23 and 27-30, Aug. 13: Investagation of possibilities of production prompted by shortage of raw materials, Aug. 20: Investigations on pulping qualities of Young Kutri timber.

Paper Mill Bark As Tanning Material, Vance P. Edwardes. Paper, vol. 24, no. 24, Aug. 20, 1919, pp. 18-21, 1 fig. The utilization of waste hemlock bark from pulp mills for tanning purposes. Experiments at Forest Products Laboratory.

EAT-FUEL PROCESS. Willmarth Peat Fuel Process, C. A. Willmarth. Jl. Am. Peat Soc., vol. 12, no. 3, July 1919, pp. 113-122, 5 figs. For making peat coke and extracting by-products.

PHOTOGRAPHY. The Crystallography and Optical Properties of the Photographic Sensitizing Dye, Pinaverdol, Edgar T. Wherry and Elliot Q. Adams. Jl. Wash.Acad. Sci.,vol. 9, no. 14, Aug. 19, 1919, pp. 396-405, 4 figs. This dyestuff, formerly made only in Germany is now being produced in England and the U. S.

POTASH. American Potash, Herbert H. Roe. Min. & Sci. Press, vol. 119, no. 6, Aug. 9, 1919, pp. 195-202, 11 figs. Review of recent achievements.

Potash Recovery at Cement Plants, Alfred W. G. Wilson. Canada Dept. Mines, bul. no. 29, May 6, 1919, 34 pp., 10 figs., partly on supp. plates. Based upon investigations undertaken under instructions from chairman of Committee of Reconstruction and Development of the War Trade Board.

The Alsatian Potash Industry, Frank K. Cameron. Am. Fertilizer, vol. 51, no.14, Aug. 16, 1919, pp. 49-54. Cubic contents of potash estimated as 275,000,000 tons.

The International Potash Situation. Chem. Age, vol. 1, no. 5, July 19, 1919, pp. 131-133, Statistics and war time experience. Pre-war and future cost of production; natural deposits outside Germany; potash from felspars, leucites, etc.

RUBBER. Chemistry of Rubber, S. C. Bradford, Sci. Am. Supp., vol. 88, no. 2275, Aug. 9, 1919, pp. 82-83. Historical account of researches and constitution and inventions relating to process of vulcanization.

Crude Rubber to the Front. Raw Material, vol. 1, no. 5, July 1919, pp. 246-251. Variaties of crude rubber, their trade names,qualities and market forms.

The Nature of Vulcanization, H. P. Stevens. Jl. Soc. Chem. Indus. vol. 38, no. 13, July 15, 1919, pp. 192T-196T. Two theories noted: (1) vulcanization is primarily an absorption process, or (2) a chemical combination, of sulphur with rubber hydrocarbon. Writer quoted experiments undertaken to determine whether or not technical effect of vulcanization can be produced without chemical combination between sulphur and hydrocarbon taking place.

SULPHATE OF AMMONIA. Report of Alkali Works Inspector. Iron & Coal Trades Rev., vol. 99, no. 2683, Aug. 1, 1919, pp. 146-147. Concerning production for 1918 of sulphate of ammonia in bulk as by-product.

TANNIN. Hemlock Bark as a Source of Tannin, Vance P. Edwardes. Chem. Engr., vol. 27, no. 8, Aug. 1919, pp. 178-182, 1 fig. Results of investigations conducted by Forest Products Laboratory.

See also Paper.

TETRACHLORETHYLENE. Preparation of Tetrachlorethylene, H. B. Weiser and G. E. Wightman. Jl. Phys. Chemistry, vol. 23, no. 6, June 1919, pp. 415-439. Survey of results obtained by various investigators and account of experiments undertaken by writers.

WOOD DISTILLATION. A New Method of Distilling Both Green and Seasoned Hardwoods. Chem. & Metallurgical Eng., vol. 21, no. 4, Aug. 15, 1919, pp. 193-194. Chief point of advantage claimed for process used by Kingsport Wood Reduction Company is method of briqueting sawdust or finely divided woodwaste and of distilling wood briquets under controlled conditions of temperature and pressure in multitubular retorts.

MUNITIONS AND MILITARY ENGINEERING

BALLISTICS. Equations of Differential Variations in Exterior Ballistics, W. E. Milne. Jl. U. S. Artillery, vol. 51, no. 2, Aug. 1919, pp. 154-159, 1 fig. Suggested modifications in method of derivation devised by F. R. Moulton.

Trajectories and Their Corrections, A. G. Kirk. U. S. Naval Inst. Proc., vol. 45, no. 198, Aug. 1919, pp. 1375-1395, 7 figs. Method of computation by mechanical integration.

CAMOUFLAGE. The Dazzle Paintings of Ships, Norman Wilkinson. Engineering, vol. 108, no. 2797, Aug. 8, 1919, pp. 192-195, 5 figs. Origin and development, and reasons for its adoption as opposed to painting a ship with a view to acheving invisibility.

CHEMICAL WARFARE. Innovations of the Recent War, William L. Sibert. Jl. Cleveland Eng. Soc., vol. 11, nos. 5 & 6, Mar.-May 1919, pp. 272-281. Chemical work involved, particularly in connection with gas warfare, with notes on policy followed by Chemical Warfare Service.

CHRONOGRAPH. The Aberdeen Chronograph. Sci. Am., vol. 121, no. 6, Aug. 9, 1919, pp. 131 and 145, 5 figs. Device for timing fight of projectile developed by Army Ordnance Dept.

COAST DEFENSE. Coast Defenses Constructed by the Germans on the Belgian Coast, Augustus Norton and Donald Armstrong. Jl. U. S. Artillery, vol. 51, no. 2, Aug. 1919, pp. 160-181, 55 figs. Battery on Belgian coast consisted of four 28-cm. guns.

Discussion of Method of Indirect Firing for Coast Defense (De toepassing Van de methode der indirecte righting bij Kustgeschut), H. D. S. Hasselman and P. Post Ulterweer. Arthleristisch Tijaschrift, no. 8, Aug. 1919, pp. 474-489, 1 fig.

EXPLOSION OF CHARGES AT SEA. Science and Its Application to Marine Problems, J. C. McLennan. Engineer, vol. 128, no. 3317, July 25, 1919, p. 92. Investigations of characteristics of pressure waves generated by explosion of charges in sea. (Concluded). Paper read before North-East Coast Instn. of Engrs. and Shipbuilders.

GUN MOUNTS. Building 5-inch Gun Mounts at Brantford, J. H. Moore. Can. Machy., vol. 22, no. 6, Aug. 7, 1919, pp. 143-145, 7 figs. Mining operations and inspection. Second installmen.t

See also Naval Guns.

GUN OPERATION. Operations on the British 9.2-in. Gun — I, II, III, William Chubb. Am. Mach., vol. 51, nos. 6, 8 and 9, Aug. 7, 21 and 28, 1919, pp. 275-280, 373-377 and 423-427, 26 figs. Aug. 7: Noting particularly difference in production operations from practice on ordnance in United States, British 9.2. army gun is very similar in design and construction to guns of British navy, Aug. 21: Manufacture of various sizes of rings from one forging by combined processes of trepanning, turning and boring. Aug. 28: Mining, bulding and inspection.

ILLUMINATING DEVICES. Illuminating Devices in the Great War — I, II, M. Brayton. Sci. Am. Supp., vol. 88, no. 2277, Aug. 23, 1919, pp. 114-115 and p. 127, 1 fig. Account of areial fighting devices and their development from 1914 to the armistice.

MOTOR TRANSPORT CORPS. The Automotive Industry and the Motor Transport Corps, B. F. Miller. Jl. Soc. Automotive Engrs., vol. 5, no. 2, Aug. 1919, pp. 148-154. Concerning maintenance engineering features of Motor Transport Corps.

NAVAL GUNS. Transportation and Mounting of Naval Guns at the Front (Transporto e montamento del Cannoni navili alla fronte), Guiseppe Floravanzo. Rivista Marittima, vol. 52, no. 6, June 30, 1919, pp. 293-305, 13 figs. Types of both mobile and fixed mountings developed by Italian army.

NAVY, BRITISH. The New Navy — VII. Mar. Engr. & Naval Architect, vol. 42, no. 503, Aug. 1919, pp. 7-11, 4 figs. Details of "Courageous" and "Glorious." These ships are in large light-cruiser category and form unique class.

POWER GASES. On the Possible Form of the Equation of State of Powder Gases, A. G. Webster. Proc. Nat. Acad. Sciences, vol. 5, no. 7, July 1919, pp. 286-288. Examination of most general form possible for equation of state that will permit of variability of specific heats, but maintain constancy of their difference.

PRESSURE MEASUREMENT IN GUNS. A new Instrument for Measuring Pressure in a Gun, A. G. Webster and L. T. E. Thompson. Proc. nat. Acad. Sciences, vol. 5, no. 7, July 1919, pp. 259-263, 4 figs. Apparatus which is said to register pressure at any time while projectile is in barrel.

REPAIR SHOPS. Portable Repair Shops for the Army, Harold S. Lord. Am. Mach., vol. 51, no. 7, Aug. 14, 1919, pp. 317-322, 6 figs. Including lists of tools and accessories carried by (1) machine shop, (2) blacksmith shop and (3) carpenter shop, and also list of regular equipment for material truck.

SALVAGING SUBMARINES. A Salvaging Submarine, Hawthorne Daniel. Sci. Am., vol. 121, no. 7, Aug. 16, 1919, pp. 154-155 & 166-168, 7 figs. Combination of surface vessel and diving bell, so arranged that whether diving bell is submerged or not, surface workmen can readily pass from surface vessel to bell and vice versa.

SHELL MANUFACTURE. Researches in regard to Various Points in the Manufacture of Shells (Recherches sur différents points de la fabrication des obus), Léon Guillet. Revue de la Métallurgie, May 1917, 36 pp., 125 figs., partly on 34 supp. plates. Micrographic examinations and chemical analysis to determine influence of form of punch, rapidity of its wear, process of piercing, temperature of metal and of punch.

SUBMARINE DEFENSE. Science and Its Application to Marine Problems, J. C. McLennan. Shipbuilding & Shipping Rec., vol. 14, no. 5, July 31, 1919, pp. 123-124. Also Engineering, vol. 108, no. 2795, July 25, 1919, pp. 128-130. Development of anti-submarine measures and devices. Paper read before Northeast Coast Instn. Engrs. and Shipbuilders.

TORPEDO-BOAT DESTROYERS. Torpedo-Boat Destroyers in the Making, James Reed. Mech. Eng., vol. 41, no. 9, Sept. 1919, pp. 739-743 and p. 781. Historical review of modern American torpedo craft. Non-technical description of the "Ward," which was launched 64 per cent complete and only 17½ days after laying of keel.

GENERAL SCIENCE

CHEMISTRY

ACETYLENE ANALYSIS. A Modified Method for the Analysis of Mixtures of Ethylene and Acetylene, William H. Ross and Harlan L. Trumbull. Jl. Am. Chem. Soc., vol. 41, no. 8, Aug. 1919, pp. 1180-1183, 3 figs. Gas holder used by writers applying method outlined by Chavastelon (see Compt. rend., 125, 245, 1897), for determination of acetylene in gaseous mixture.

ANALYSIS. A New Method of Chemical Analysis, A. W. Hull. Jl. Am. Chem. Soc., vol. 41, no. 8, Aug. 1919, pp. 1168-1175, 9 figs. Method consists in reducing to power form substance to be examined, placing it in small glass tube, sending beam of monochromatic X-rays through it, and photographing the diffraction pattern produced.

See also Glass, Carbon Bisulphite, Matte and Slag. Rubber, Flue Gas, Gas, Acetylene and Ethylene.

CARBON BISULPHIDE. Estimation of Carbon Bisulphide: A. Critical Examination of the Various Methods Usually Employed, Percy E. Spielmann and F. Butler Jones. Jl. Soc. Chem. Indus., vol. 38, no. 13, July 15, 1919, pp. 185T-188T. With regard to their relative value, conditions of best results, and limits of accuracy of each.

COLLOIDS. *See Soaps.*

ELECTRICAL CONDUCTIVITY OF ELEMENTS. Is the Electrical Conductivity of the Elements Conditioned by the Presence of Isotopes? F. H. Loring. Chem. News, vol. 119, no. 3091. July 11, 1919, pp. 14-16. Table showing proportionate number of isotopes and percentages of higher values in various metals discloses that electrical conductivity is conditioned by proportion of isotopes present.

ETHYLENE ANALYSIS. *See Acetylene Analysis.*

FUEL-GAS ANALYSIS. Combustion Control in Mill Boiler Plant — III, Robert June. Blast Furnace & Steel Plant, vol. 7, no. 8, Aug. 1919, pp. 398-400, 4 figs. Flue-gas analysis.

GAS ANALYSIS. Industrial Analysis of gaseous Mixtures by refractometric Method (Analyse industrielle des mélanges gazeux par la méthode réfractométrique), Marcel Ponchon. Chimie & Industrie, vol. 2, no. 6, June 1919, pp. 647-655, 6 figs. How to use Lord Rayleigh's interferential refractometer.

GAS MEASUREMENT. Apparatus for Measuring Volume of Gas Liberated in a Chemical Reaction (Appareil pour mesurer le volume gazeux dégagé dans une réaction chimique), P. Nicolardot and M. H. Robert. Chimie & Industrie, vol. 2, no. 6, June 1919, pp. 641-646, 1 fig. Modification of apparatus described in Bul. Soc. Chim. de France, vol. II, p. 406, 1912. Change consists in using water instead of mercury.

GLASS ANALYSIS. The Rapid Electrometric Determination of Iron in Some Optical Glasses, J. B. Feugnson and J. C. Hostetter. Jl. Am. Ceramic Soc., vol. 2, no. 8, Aug. 1919, pp. 608-621, 3 fig. Discusses results of application of electrometric determination of iron with stannous chloride and potassium dichromate.

HELIUM. *See Structure of Matter..*

MAGNETITE. Determination of Magnetite in Matte and Slag, F. G. Hawley. Eng. & Min. Jl., vol. 108, no. 8, Aug. 23, 1919, pp. 308-310. Writer holds that qualitative tests are of little significance, and claims that quantitative method has been proved to be sufficiently accurate and is also rapid.

RUBBER. The Use of Hydrometers to Determine the Rubber Content of Latex, O. de Vries. India-Rubber Jl., vol. 58, no. 2, July 12, 1919, pp. 17-18. 1 fig. Explanation for anomalous results obtained with experiments such as metrolac of R. G. A. or Griffin's latexometer. From Archief voor de Rubber-cultur.

SOAPS. Colloid-Chemical Studies on Soaps, Martin H. Fischer. Chem. Engr., vol. 27, no. 8, Aug. 1919, pp. 184-193, 12 figs. Non-aqueous liophilic soap colloids.

STRUCTURE OF MATTER. The Structure of Atoms and the Octet Theory of Valence, Irving Langmuir. Proc. Nat. Acad. Sciences, vol. 5, no. 7, July 1919, pp. 252-259. Concerning extension of Lewis theory of cubinal atom.

The Arrangement of Electrons in Atoms and Molecules — II, Irving Langmuir. Gen. Elec. Rev., vol. 22, no. 8, Aug. 1919, pp. 587-600, 12 figs. Writer points out what he terms uncertainties attached to textbook conceptions of valency, and suggests much more general theory of valence which he subsequently applies in elucidating structure of a number of organic and inorganic compounds. (To be continued.)

Helium Atom According to Bohr's Theory (Sur l'atome d'Helium selon la théorie de Bohr), Franz Tank. Archives des Sciences physiques et naturelles, vol. 1, May-June 1919, pp. 240-241. Table giving $\triangle n$ for neutral heilum.

Ritz's Formula and Theory of Quanta (La formule de Ritz et la théorie des quanta), L. Bloch. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 25, June 23, 1919, pp. 1271-1273. As to whether by slightly complicating structure of atom it is possible by calculations similar to Bohr's to arrive at Ritz's formula.

SULPHIONS. "Sulphions" formed by Sodium, Rubidium and Cassium Iodides (Sur les sulfones formées par les iodures de sodium, de rubidium et de caesium), R. de Forchand and F. Taboury. Competes rendus des séances de l'Académie des Sciences, vol. 168, no. 25, June 23, 1919, pp. 1253-1257. Experiments to confirm accounts reported by various writers relative to transformations of certain salts in presence of sulphurous anhydrites.

TERNARY SYSTEM. The Ternary System, J. B. Ferguson and H. E. Merwin. Am. Jl. of Sci. (Fourth Series), vol. 48, no. 284, Aug. 1919, pp. 81-123, 17 figs. Experimental research of solidus-liquidus relations.

WEIGHING. The Single Deflection Method of Weighing, Paul H. M.-P. Brinton. Jl. Am. Chem. Soc., vol. 41, no. 8, Aug. 1919, pp. 1151-1155. Writer claims to have found method practicable and reliable after critical investigation.

MATHEMATICS

ABELIAN VARIETIES. Real Hypersurfaces Contained in Abelian Varieties, S. Lefschetz. Proc. Nat. Acad. Sciences, vol. 5, no. 7, July 1919, pp. 296-298. Number of algebraically distinct real hypersurfaces which abelian variety of genus p and rank one, if real, may have.

CUBICAL PARABOLAE. *See Parabolic Scales.*

CURVE GENERATION. On a Certain Generation of Rational Circular and Isotropic Curves, Arnold Emch. Bul. Am. Math. Soc., vol. 25, no. 9, June 1919, pp. 397-404. Establishes necessary and sufficient conditions for form of parametric representation of rational circular, in particular of rational isotropic curve, and their generation by rational transformation in a complex plane.

DERIVATIVE OF A FUNCTIONAL. The Derivative of a Functional, P. J. Daniell. Bul. Am. Math. Soc., vol. 25, no. 9, June 1919, pp. 414-416. Concerning definition given by Volterra in Equations Intégrales, p. 12 et seq. Writer establishes that under more general conditions, variation is linear functional in sense of Riesz and, therefore, a Stieltjes integral.

EQUATIONS. The Singularities of Differential Equations and the Summative Series (Les singularités des équations différentielles et les séries sommables), Georges Remoundos. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 25, June 25, 1919, pp. 1265-1268. Theorem establishing case in which analytical function defined by series is integral of differential equation verified by series.

HERMITE'S QUADRATIC FORMS. Hermite's Positive Quadratic Forms (Sur les formes quadratiques positives d'Hermite), G. Humbert. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 25, June 23, 1919, pp. 1240-1246. Cases when $P = 1$ or 2 in formula of measure for given discriminant.

INVARIANTS. Modular Invariants of a Quadratic Form for a Prime Power Modulus, J. E. McAtee. Am. Jl. Math., vol. 41, no. 3, July 1919, pp. 225-242. Invariants of n-ary quadratic form modulo P and polynomial modular invariants of a binary quadratic form.

Invariants of Differential Geometry by the Use of Vector Forms, C. I Rice. Am. Jl. Math., vol. 41, no. 3, July 1919, pp. 165-182. Example illustrating procedure.

OPERATOR GROUPS. Groups Containing a Relatively Large Number of Operator of Order Two, G. A. Miller. Bul. Am. Math. Soc., vol. 25, no. 9, June 1919 pp. 408-413. Generalization of following form: Whenever more than hal of operators of a group are of order 2 this excess is an odd number.

PARABOLIC SCALES. New Construction of Cubical Parabolas (Nouvelle constructio des paraboles cubiques), P. Sonier. Génie Civil, vol. 75, no. 4, July 2 1919, pp. 78-79, 2 figs. With reference to method of drawing by paraboli scales, writer points out theorem which permits determining point of parabol situated on given vertical line.

QUARTICS. Investigations on the Plane Quartic, Teresa Cohen. Am. Jl. Math vol. 41, no. 3, July 1919, pp. 191-211. On undulation of quartic and discr minants of Hessian and other conics.

QUINTICS. The Self-Dual Plane Rational Quintic, L. E. Wear. Bul. Am. Mat Soc., vol. 25, no. 9, June 1919, pp. 405-408. In quintic $2d+3c=15$, whe $d=c=3$.

SALTUS EQUATIONS. On Certain Saltus Equations, Henry Blumberg. Am. Math., vol. 41, no. 3, July 1919, pp. 183-190. Gives solutions in vario cases.

TRIVARIANT SYSTEMS. Theorem on Trivariant Systems (Theorème sur les systèmes trivariants), Félix Michaud. Annales de Physique, vol. 12, May-June 1919, pp. 291-295. Relative to varying volumes jof two phases without changing concentrations.

VECTORIAL SPACES. Vectorial Spaces with Undetermined Asymptotic Directions (Champs vectoriels à directions asymptotiques indéterminées), Axel Egnell. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 25, June 23, 1919, pp. 1263-1265. Case of indetermination of asymptotic directions when tangents of orthogonal trajectors form part of lineal complex.

PHYSICS

ACOUSTICS. Acoustical Impedance, and the Theory of Horns and of the Phonograph, Arthur Gordon Webster. Proc. Nat. Acad. Sciences, vol. 5, no. 7, July 1919, pp. 275-282, 5 figs. Introducing complex ratio defining impedance in study of oscillating system into which a volume of air periodically enters under a given excess pressure.

BENZINE. *See Vapor Pressures.*

CYCLOHEXANE. *See Vapor Pressures.*

GAS LAW ALIGNMENT CHART. Alignment Chart for the Gas Laws, Alan G. Wikoff. Chem. & Metalllurgical Eng., vol. 21, no. 4, Aug. 15, 1919, p. 195, 1 fig. Temperature scales so graduated that scale reading in deg. cent. corresponds to logarithm of absolute temperature.

HEAT TRANSFORMATION INTO ELECTRICAL ENERGY. Direct Transformation of Heat Into Electrical Energy Otherwise Than by Means of Electrothermic Couples (Sur la transformation directe de la chaleur en energie électrique par d'autres voies que les couples thermoélectriques), Albert Perrier. Archives des Sciences physiques et natruelles, vol. 1, May-June 1919, pp. 243-246. Consequences derived from magnetic and electric asymmetries of matter.

MAGNETIC ISOTHERMALS. Ferromagnetism and Characteristic Equation of Fluids (Ferromagnétisme et équation caractéristique des fluides), Pierre Weiss. Archives des Sciences physiques et naturelles, vol. 1, May-June 1919, pp. 169-185, 8 figs. Interpretation of magnetic isothermals of nickel in vicinity of Curie's point.

PHONOGRAPH. *See Acoustics.*

RELATIVITY. On the Theory of Relativity (Sur la théorie de la rélativité), Edouard Guillaume. Archives des Sciences physiques et naturelles, vol. 1, May-June 1919, pp. 246-250. Concerning introduction of single pyrometer to represent time.

SPECTRUM. New Lines in Iron Spectrum (Une nouvelle répartition de raies dans le spectre du fer), Aug. Hagenbach. Archives des Sciences physiques et naturelles, vol. I, May-June 1919, pp. 231-235, 1 fig. Observed by writer in vicinity of 500 *uu.*

VAPOR PRESSURES. Maxima Pressures of Benzine and Cyclohexane Vapors at Mean Temperatures and Calculation of Their Principal Specific Hearts (Pressions maxima des vapeurs du benzène et du cyclohexane aux températures moyennes et calcul de leurs chaleurs spécifiques principales), G. Dejardin Annales de Physique, vol. 12, May-June 1919, pp. 253-291, 7 figs. Values computed from formulæ compared with results of experimental observations.

AERONAUTICS

AIRCRAFT

B-CLASS AIRSHIPS. *See United States.*

BRITISH AIRSHIPS. The British Navy Airship S. R. I, Italian "M" Type. Flight, vol. 11, no. 30, July 24, 1919, pp. 979-981, 10 figs. Semi-rigid type. Dimensions are: Length, 290 ft.; diameter, 58 ft.; overall height, 72 ft.; disposable lift, 7700 lb.
See also R-34.
Lighter-Than-Air Craft, T. R. Cave-Browne-Cave. Jl. Soc. Automotive Engrs., vol. 5, no. 2, Aug. 1919, pp. 167-175, 3 figs. Structural characteristics of British naval types. Paper read before Roy. Aeronautical Soc. of Gt. Britain.

C-CLASS DIRIGIBLE. *See United States.*

R-34. H. M. Dirigible R-34, A. E. Bishop. Rudder, vol. 35, no. 8, Aug. 1919, pp. 353-357, 5 figs. With notes on development of airships.

RIGID AIRSHIPS. General Foundamentals of Rigid Airship Design, R. H. Upson. Jl. Soc. Automotive Engrs., vol. 5, no. 2, Aug. 1919, pp. 117-119, 1 figs. From study of British and German types.
Stresses in a Rigid Airship Due to Bending, E. H. Lewitt. Aeronautics, vol. 17, no. 299, July 10, 1919, pp. 48-50, 5 figs. Technical study leads to assertion that ordinary bending formula $M/I=f/y$ may be applied to rigid airship with diagonal bracing of wire, providing that section of ship can be inscribed in circle and that transverse girders are of equal length, the longitudinals being assumed to take all the bending.
Rigid Airships (Les dirigeables rigides), E. Gouault. Génie Civil, vol. 75, no. 4, July 25, 1919, pp. 69-87, 18 figs. Constructional details of R-34 and other dirigibles.

UNITED STATES. Airship Engineering Progress in the United States, J. C. Hunsaker. Aviation, vol. 7, no. 2, Aug. 15, 1919, pp. 72-76, 7 figs. Development of B class. (To be concluded.)
U. S. Navy Class "C" Dirigible. Aerial Age, vol. 9, no. 24, Aug. 25, 1919, pp. 1095-1098, 6 figs. General specifications. "C" type is 192 ft. long, 43 ft. wide, and 46 ft. high; it has capacity of 180,000 cu. ft.

APPLICATIONS

INDIA. Aviation as Affecting India, Lord Montagu of Beaulieu. Jl. Roy. Soc. Arts, vol. 67, no. 3477, July 11, 1919, pp. 543-551 and (discussion) pp. 551-554, 2 figs. Suggested routes from England to India.

WAR PERIOD. Progress of Aviation in the War Period, Leonard Bairstow. Engineer, vol. 128, nos. 3317 and 3318, July 25 and Aug. 1, 1919, pp. 93-94 and 115-117, 8 figs. July 25: Reference is made to B. E. 2C. In discussing developments during war, writer considers unfortunate that growth has not been accompanied with usual concurrent growth of civil demand. Graph is given illustrating aerodynamic disadvantages of high speed. Aug. 1: Accelerometer records of loads and records of pitching oscillations. Paper read before Roy. Aeronautical Soc., Great Britain.

AUXILIARY SERVICE

HANGARS. Reinforced-Concrete Hangars for the Naval Aviation Center of Algiers, E. Carret. Eng. & Contracting, vol. 52, no. 5, July 30, 1919, pp. 132-133, 2 figs. Translated from Génie Civil.

PARACHUTES. The Smith Parachute. Aerial Age, vol. 9, no. 21, Aug. 4, 1919, p. 974, 4 figs. Of flat type 28 ft. in diameter, with 42-in. patent shock-absorbing vent supported by 40 silk shroud lines of 250 lb. breaking strength.

PHOTOGRAPHY. Photographic Industry and National Defense (L'industrie photographique française et la défense nationale), L. P. Clerc. Bulletin de la Société d'Encouragement pour l'Industrie Nationale, vol. 131, no. 3, May-June 1919, pp. 614-627, 9 figs. Military and civil uses of aerial photography in France.

RESPIRATORY APPARATUS. Automatic Respiratory Apparatus for High-Altitude Flights (L'Appareil respiratoire automatique pour vols à haute altitude), M. Garsaux. Aérophile, vol. 27, nos. 11-12, June 1-15, 1919, pp. 176-179, 6 figs. Showing scheme of installation and manner in which it operates.

TANKS, GASOLINE. The Imber Self-Sealing Gasoline Tank, George F. McLaughlin. Aerial Age, vol. 9, no. 22, Aug. 11, 1919, pp. 1009-1011, 7 figs. Resilient outer covering protects tank so that when inside pressure exceeds a certain point, tank yields and rubber stretches out from side under pressure. This covering also permits self-sealing of tank when struck by bullet.

DESIGN

HORSEPOWER OF RESISTANCE. The Horsepower of Resistance in Aeroplane Design, N. I. Lieberman. Mech. Eng., vol. 41, no. 9, Sept. 1919, pp. 721-727 and p. 792, 11 figs. Summary of experimental results obtained by Langley, Lanchester, Foppl, Prandtl, Reynolds and Zahm in regard to resistance coefficients for various types of fuselages, total panel area required and distribution of horsepower consumption. Article concludes with a theoretical study on the probable size of craft, fuel load and power equipment necessary to accomplish a transatlantic flight.

CEILINGS. Approximate Ceilings of Aeroplanes. Automobile Engr., vol. 9, no. 129, Aug. 1919, p. 259, 2 figs. Charts given as fairly representative of what may be expected from aeroplanes as at present constructed.

LOADS AND STRESSES. The Loads and Stresses on Aeroplanes, John Case. Aeronautics, vol. 17, no. 300, July 17, 1919, pp. 72-74, 4 figs. Lateral distribution of pressure. Distribution of load between front and rear trusses. (Continuation of serial.)

METAL CONSTRUCTION. Metal Construction of Aircraft, A. P. Thurston. Engineering, vol. 108, nos. 2796 and 2797, Aug. 1 and 8, 1919, pp. 142-144 and 176-180. 34 figs. Aug. 1: Notes on comparative advantages of wood and metal. Aug. 8: Details of metal parts.

PERFORMANCE. Analysis of Aeroplane Performance in Relation to Height, S. C. S. Part. Aeronautics, vol. 17, no. 300, July 17, 1919, pp. 75-77, 3 figs. How various alterations may be compared when fullest particulars required for Sorean type of curve are not available.

RADIATORS, NOSE RESISTANCE. Resistance Due to Nose Radiator. Aerial Age, vol. 9, no. 21, Aug. 4, 1919, pp. 972-973, 6 figs. Results of wind tunnel experiments. It is concluded that resistance of fuselage with streamline nose is increased more by removing streamline nose and substituting a radiator than it is by adding equivalent free-air radiator and retaining streamline nose.
Resistance of Nose Radiators. Aviation, vol. 7, no. 1, Aug. 1, 1919, pp. 28-29, 6 figs. Report of Nat. Advisory Committee for Aeronautics.

STRUTS. The Design of Hollow Interplane Struts Armin Elmendorf. Aviation, vol. 7, no. 2, Aug. 15, 1919, pp. 85-86, 2 figs. Effect of modulus of elasticity on strength, position of material to obtain maximum strength, shear stresses and buckling of hollowed struts considered.

TAIL SKIDS. Theory of Sprung Tail Skids on Aeroplanes, Aerial Age, vol. 9, no. 24, Aug. 25, 1919, pp. 1098. Expression for reaction between skid and ground deduced from equation of motion about axle. From Oesterreichische Flug-Zeitschrift, Dec. 1918.

WAR DEVELOPMENTS. Some Developments in Aircraft Design and Application During the War, Lord Weir. Engineering, vol. 108, no. 2794, July 18, 1919, pp. 93-99, 31 figs. Also Flight, vol. 11, no. 30, July 24, 1919, pp. 987-991, 16 figs. General development in wing construction; progress of design and construction of propellers.

WING DESIGN. Elements of a General Theory of Airplane-Wing Design, Walter C. Durfee. Mech. Eng., vol. 41, no. 9, Sept. 1919, pp. 728-729, and (discussion) pp. 729-730 and p. 787, 3 figs. Following subjects considered: Vortex theory of lift; theory of initial motion around wings; vortex theory of shape; hydrodynamic-electromagnetic analogy; action of vortices with reference to each other; action on vortices with reference to their images; influence of local wind; laws of energy content in trailing vortex; friction and head resistance; and explosion of eddies.

ENGINES

B.H.P. The "B.H.P." Aeroplane Engine. Engineering, vol. 108, no. 2796, Aug. 1, 1919, pp. 135-137, 5 figs. Six-cylinder, double-ignition water-cooled type. Output at normal speed of 1400 r. p. m., 240 b.hp.

Carburation, High Altitude. Carburation at High Altitudes (La Carburation aux hautes altitudes), Aérophile, vol. 27, nos. 11-12, June 1-15, 1919, pp. 185-186, 3 figs. Keeping mixture constant by means of turbo-compressors. Scheme of operation.

Maintaining Constant Pressure Before the Carburettors of Aero Engines Regardless of the Altitude, Leslie V. Spencer. Flight, vol. 11, no. 33, Aug. 14, 1919, pp. 1086-1090, 5 figs. Survey of experimental research with notes on supercharger developed by E. H. Sherbonoy for Aircraft Production Bureau. (To be concluded.)

Fuels. An Investigation of Airplane Fuels, E. W. Dean and Clarence Netzen. Jl. Soc. Automotive Engrs., vol. 5, no. 2,.Aug. 1919, pp. 126-130. Conducted by Bur. of Mines to ascertain whether or not selection of proper grade of fuel would materially help training fields in getting maximum service from a limitednumber of planes.

Hispano-Suiza. The Hispano-Suiza Airplane Engine—III, IV, H. O. C. Isenberg. Am. Mach., vol. 51, nos. 6 and 8, Aug. 7 and 21, 1919, pp. 259-261 and 365-368, 23 figs. Aug. 7: System of mounting cylinder blocks. Aug. 21: Preparation and making of complete molds.

Liners, Steel. Aircraft Engine with Steel Liners in Aluminum Cylinder Blocks. Automotive Industries, vol. 41, no. 8, Aug. 21, 1919, pp. 367-369, 8 figs., partly on supp. plate. Puma six-cylinder vertical type witb output of 260 hp. at 1500 r.p.m.

Napier Lion Engine. The Napier Lion Aircraft Engine. Automobile Engr., vol. 9, no. 129, Aug. 1919, pp. 250-258, 29 figs. Said to be lighter per horsepower than any other water-cooled aero-engine yet produced. (Weight per b.hp., less fuel and oil, 2.51 lb.) Engine holds altitude record of 30,500 ft.

Rotary Engines. *See Zeitlin Aero Engine.*

Shock Recorders. Development of an Airplane Shock Recorder, A. F. Zabm. Jl. Franklin Inst., vol. 188, no. 2, Aug. 1919, pp. 237-244. 4 figs. Apparatus consists of many vertical styluses supported individually by springs and recording on a single chronograph drum.

War Developments. Some Developments in Aircraft Design during the War, Lord Weir. Automobile Engr., vol. 9, no. 129, Aug. 1919, pp. 263-266, 10 figs. Also Engineering, vol. 108,no. 2795, July 25, 1919, pp. 108-111, 19 figs. Emphasizes particularly the fact that experience and research work had culminated in production at time of the armistice of various types of machines which represented distinct advance on anything previously used. From paper presented before Northeast Coast Instn. of Engrs. and Shipbuilders.

Zeitlin Aero Engine. The Zeitlin Aero Engine. Aerial Age, vol. 9, no. 22, Aug. 1. 1919, pp. 1012-1014 and 1027, 10 figs. Four-stroke cycle, 9-cyl. rotary type. Fundamental difference with other similar engines is said to be that piston stroke is not of uniform length in each of four movements constituting complete cycle.

MATERIALS OF CONSTRUCTION

Duralumin. *See Steel and Duralumin.*

Pitch Pockets. Pitch Pockets and Their Relation to the Inspection of Airplane Parts, J. R. Watkins. Jl. Franklin Inst., vol. 188, no. 2, Aug. 1919, pp. 245-253, 3 figs. Résumé of theories advanced to account for presence of pitch pockets and results of tests made at Forest Products Laboratory.

Sheets, Metal, Thin. Metal Construction of Aircraft, A.P.Thurston. Engineering, vol. 108, no. 2798, Aug. 15, 1919, pp. 224-226, 5 figs. Influence of cold work on physical properties of thin sheets. (Concluded.) Paper read before Royal Aeronautical Soc.

Steel and Duralumin, Comparison of. Metal Construction of Aircraft, A. P. Thurston. Aviation, vol. 7, no. 1, Aug. 1919, pp. 18-21, 2 figs. Comparative values of steel and duralumin. From paper read before Roy. Aeronautical Soc.

METEOROLOGY

Algue Barocylonometer. *See Barocyclonometer.*

Aneroids. Aneroids (Ueber Aneroide), E. Warburg and W. Heuse. Zeitschrift f. Instrumentenkunde, vol. 39, no. 2, Feb. 1919, pp. 41-55, 2 figs. Experimental work for reducing influence on the instrument of temperature and of after-effects of former pressures which are more pronounced the greater the difference between the previous pressures and those to be measured is.

Atmospheric Pressure Waves. On the Explosion at Okhta, B. Galitzin. Proc. Roy Soc., vol. 95, no. A-673, July 15, 1919, pp. 508-515, 3 figs. Records of atmospheric-pressure wave obtained at various observatories in neighborhood used to compute characteristics of motion of wave.

Barocyclonometer. The Algué Barocyclonometer, Robert G. Skerrett. Rudder, vol. 35, no. 8, Aug. 1919, pp. 368-370, 7 figs. Combination of aneroid barometer and device called cyclonometer or wind disk. Used for foretelling coming of hurricane.

Stratosphere. *See Wind Velosity.*

Wind Velocity. Wind Velocity in the Stratosphere (Sur la vitesse du vent dans la stratosphère), J. Rouch. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 25, June 23, 1919, pp. 1281-1283. Data obtained by aerologic soundings.

MILITARY AIRCRAFT

Bomb Droppino. The Science of Bomb Dropping from Airplanes, A. Wilmer Duff. Jl. Worcester Polytechnic Inst., vol. 22, no. 4, July 1919, pp. 322-338, 2 figs. Technical discussion of principles involved.

Naval Aircraft. Progress in Naval Aircraft—I. J. C. Hunsaker. Am. Mach., vol. 51, no. 7, Aug. 14, 1919, pp. 305-311, 4 figs. Also U. S. Naval Inst. Proc., vol. 45, no. 198, Aug. 1919, pp. 1347-1368, 8 figs. Tells of causes leading up to building of N C boats and gives some details of their design, construction and performance. Paper presented before Soc. of Automotive Engrs.

Torpedoplane. The Torpedoplane—The New Weapon which Promises to Revolutionize Naval Tactics, Henry Woodhouse. Flying, vol. 8, no. 7, Aug. 1919, pp. 597-602, 9 figs. Account of mystery airplanes of British Navy as given by various periodical and in various reports of the Admiralty.

PLANES

Austin "Whippet." The Austin "Whippet." Flight, vol. 11, no. 33, Aug. 14, 1919, pp. 1076-1078, 7 figs. Single-seater tractor biplane with all-steel fuselage, folding wings, and no bracing wires.

B.A.T. The B. A. T. Type F. K. 26 Transport Airplane. Aviation, vol. 7, no. 1, Aug. 1, 1919, pp. 22-23, 2 figs. Machine is tractor biplane fitted with cabin which affords accommodation for either four passengers or their equivalent weight in goods or mails.

Bristol. The Bristol Aeroplanes. Aerial Age, vol. 9, no. 23, Aug. 18, 1919, pp. 1049-1052,8 figs. General features ofdesign and records of performance.

Caproni. *See Liberty Caproni.*

De Havilland. The De Havilland Aeroplanes. Aerial Age; vol. 9, no. 21, Aug. 4, 1919, pp. 969-971 and 982, 3 figs. Comparison of various "Airco" types.

German Machines. The Large Land Airplane in German Practice, ErikHildersheim. Aviation, vol. 7, no. 1, Aug. 1, 1919, pp. 23-25, 5 figs. Notes on development of giant airplane and outline of principal features of Linke-Hoffman machine.

Gosport Flying-Boats. The Gosport Flying-Boats. Flight, vol. 11, no. 31, July 31, 1919, pp. 1006-1009, 12 figs. Drawings and specifications of six commercial types which range from large ten-seater of over 100-ft. span to small single-seater of only 23-ft. span.

Liberty Caproni. The Liberty Caproni Biplane. Aerial Age, vol. 9, no. 24, Aug. 25. 1919, pp. 1089-1091 and 1108, 6 figs. General specifications and performances.

Linke-Hoffman. *See German Machines.*

Nieuport "Night Hawk." The Nieuport "Night Hawk" Single-seater Scout—I. Engineer, vol. 128, no. 3319, Aug. 8, 1919, pp. 132-134, 8 figs. Fitted with 320-hp., nine-cylinder, fixed-radial, air-cooled A. B. C. "Dragon-Fly" engine. Designed to travel at 135 m.p.h. at altitude of 15,000 ft.

Tunnel, Aerodynamic. The Aerodynamic Experimental Tunnel, W. Knight. Aviation, vol. 7, no. 2, Aug. 15, 1919, pp. 77-80, 18 figs. Principles to be followed in designing, with notes of features adopted in tunnel built for Instituto Centrale Aeronautico in Rome.

Vickers Vimy. The Vickers "Vimy-Commercial" Biplane. Flight, vol. 11, no. 29, July 17, 1919, pp. 936-941, 15 figs. Except for fuselage, machine is identical to "Vimy" bomber. Description is confined to fuselage.

War Developments. Some Developments in Aircraft Design and Application During the War, Lord Weir. Flight, vol. 11, nos. 29, 31 and 32, July 17, 31 and Aug. 7, 1919, pp. 955-959, 1013-1016 and 1048-1053, 42 figs. July 17: Aerodynamic features of progress and design. July 31: One-seater and two-seater fighters; progress in engine design. Aug. 7: Navigation and meteorology.

PROPELLERS

Aerodynamic Calculations. Aerodynamical Considerations in the Design of a Propeller, H. Levy. Automotive Industries, vol. 41, no. 7, Aug. 14, 1919, pp. 316-320, 10 figs. Method of calculating required dimensions and probable performance of propeller on basis of airfoil theory.

Wood Propellers. Some Problems in the Design of Wood Propellers, Leslie V. Spencer. Aerial Age, vol. 9, no. 23, Aug. 18, 1919, pp. 1053-1054 and 1059, 5 figs. Relative value of different woods. Advantages and disadvantages of different methods of blade tipping.

VARIA

Government Organization of Industry. Single Government Department for All Aeronautics Urged by Mission, Allen Sinsheimer. Automotive Industries, vol. 41, no. 7, Aug. 14, 1919, pp. 297-303, and pp. 323-327. Industry created by war fast disappearing, declares report of American Aviation Mission which has been studying European aeronautics. They urge establishment of agency equal to war department.

International Air Navigation Convention. International Air Navigation Convention. Flight, vol. 11, no. 31, July 31, 1919, pp. 1029-1032, 2 figs. Annexes dealing with marking of aircraft, rules as to lights and signals, international aeronautical maps and ground markings, collection and dissemination of meteorological information and customs. Additional to account given in issue of May 8.

Time Determination. An Easy Method of Getting the Greenwich Mean Time, Franklin Van Valdenburgh. U. S. Naval Inst. Proc., vol. 45, no. 198, Aug. 1919, pp. 1343-1345, 1 fig. Chart constructed by drawing lines representing loci of all places having same GMT at same time.

ELECTRICAL ENGINEERING

ELECTROCHEMISTRY

COPPER SULPHATE SOLUTIONS. Electrical Conductivity and Other Properties of Saturated Solutions of Copper Sulphate in the Presence of Sulphuric Acid, H. M. Goodwin and W. G. Horsch. Chem. & Metallurgical Eng., vol. 21, no. 4, Aug. 15, 1919, pp. 181-182, 3 figs. Gives specific electrical conductance at 25 deg. cent. of solutions saturated with copper sulphate and containing sulphuric acid ranging in concentration from 0.15 equivalent to 3.6 equivalents per liter.

ELECTRODEPOSITION

COPPER DEPOSITION. Electrolytic Deposition of Copper in the Leaching of Roasted Ore and Concentrate, Percy R. Middleton. Min. & Sci. Press, vol. 119, no. 5, Aug. 2, 1919, pp. 149-150, 3 figs. Results of experimental work.

DEPOSITION OF METAL, TIME ELEMENT. A Compilation of Tables Showing the Time Required to Deposit a Given Thickness of Metal, W. G. Knox. Metal Industry, vol. 15. no. 3, July 18, 1919, pp. 46-48. Table showing time required for thickness of deposit in inches of nickel-cobalt. Calculated on basis of 100 per cent cathode efficiency.

GALVANIZING PLANT. Planning and Operating a Galvanizing Plant, E. P. Later. Metal Industry, vol. 15, no. 2, July 11, 1919, pp. 30-32. Concerning advisability of isolating plant from rest of factory, material to use for kettles, coating tanks used for cold acid solutions, etc.

NICKEL PLATING. The Re-Nickeling of Surgical Instruments, Joseph Haas, Jr. Metal Indus., vol. 17, no. 8, Aug. 1919, pp. 364-365. Results of investigations carried on in Medical Repair Dept. Laboratory established by A. E. F. in France during war.

ELECTROPHYSICS

COILS, ELECTROMAGNETIC. Calculation of electromagnetic Coils (Sur le calcul des bobines des électro-aimants—, Ad. Curchod Revue Générale de l'Electricité, vol. 6. no. 3, July 19, 1919, pp. 74-77. Formulæ for determining dimensions for a required field.

See also Solenoids.

CONDUCTION IN LIQUID DIELECTRICS. Conduction in Liquid Dielectrics, J. E. Shrader. Elec. Jl., vol. 16, no. 8, Aug. 1919, pp. 334-338, 10 figs. Test cup developed at Westinghouse Research Laboratory.

D. C. ARMATURE IN A. C. FIELD. Direct-Current Armature in an Alternating Field (Der Gleichstromanker in wechselfeld), Robert Moser. Elektrotechnik u. Maschinenbau, vol. 37, no. 3, Jan. 19. 1919, pp. 25-28, 2 figs. Deduces general formulæ for any desired position of brushes, any form of field, and any period.

EDDY CURRENTS. Problems of Eddy Currents (Wirbelstrom-probleme), Milan Virmar. Elektrotechnik u. Maschinenbau, vol. 57, no. 8, Feb. 23, 1919, pp. 69-77, 5 figs. Tests made by writer to investigate problems of heat losses in eddy currents, with special reference to turbo-generators and large transformers. Discusses also use of aluminum in construction of electric machinery.

ELECTROMAGNETISM. General Laws of Electromagnetism and Induction in Circuits Having no Resistance (Lois générales de l'électromagnetisme et de l'induction dans les circuits sans résistance), G. Lippmann. Annales de Physique, vol. 12, May-June 1919, pp. 245-253. Theory developed after making $r = 0$ in expression of coefficient of self-induction in terms of resistance, intensity and electromotive force. Since phenomena of electromagnetism and induction are independent of nature of conductor, while resistance depends on this nature, writer considers as more logical to investigate laws of electromagnetism and induction by disregarding resistance.

ELONGATION AND MAGNETIZATION. The Elongation Due to Magnetization, C. Barus. Proc. Nat. Acad. Sciences, vol. 5, no. 7, July, 1919, pp. 267-272, 3 figs. Experiments with contact lever. Interest is chiefly concentrated in continued increase of contractions, due to magnetization obtained in strong fields after magnetization has reached a maximum.

GALVANOMETRY. Contribution to Galvanometry (Contribution à la galvanométrie), D. Germani. Revue générale de l'Electricité, vol. 6, no. 4, July 26, 1919, pp. 99-101, 2 figs. Graph showing "ballistic constant" in times of resistance of galvanometric circuit.

HARMONICS IN ALTERNATING-CURRENT WAVES. Order and Amplitude of Harmonics in Voltage Wave Forms With Indicating Instruments, Leslie F. Curtis. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 8, Aug. 1919, pp. 947-958, 13 figs. Method for determining order and percentage of various components of alternating wave of e.m.f., using indicating meters and other similar apparatus. Oscillograms are included to show various phenomena and to check results of calculations. Value of so-called standards for indication of wave form is questioned.

HIGH-FREQUENCY ELECTRIC WAVES. Production and utilization of Electrical Waves Maintained at High Frequencies (Production et emploi des ondes électriques entretenues à haute fréquence), M. Boutaric. Industrie Electrique, vol. 28, no. 649, July 10, 1919, pp. 250-255, 4 figs. Alexanderson alternator with which it is said to be possible to obtain a frequency of 100,000 periods per second. (Concluded.)

LOADING COILS, INDUCTANCE. Elementary Considerations of the Inductance of Loading Coils and Their Insertion in Cables, E. S. Ritter and A. Morris. Post Office Elec. Engrs. Jl., vol. 12, no. 2, July 1919, pp. 76-87, 9 figs. General requirements of loading coil design.

SOLENOID MAGNETIC FIELD. Magnetic Field of a Solenoid (Champ magnétique d'un solénoïde), O. Billieux. Revue Générale de l'Electricité, vol. 6, no. 3, July 19, 1919, pp. 67-70, 1 fig. Formulæ for determining self-induction, mutual induction, etc.

TRANSMISSION CIRCUITS. Electrical Characteristics of Transmission Circuits—II, Wm. Nesbitt. Elec. Jl., vol. 16. no. 8, Aug. 1919, pp. 314-326, 12 figs. Details for determining reactance of conductor directly from its resistance.

WAVES. *See Harmonics and High Frequency Waves.*

FURNACES

Electric Furnaces (Consideraciones generales sobre hornos electricos), José M. Navarrete. Energia Eléctrica, vol. 21, no. 11, June 10, 1919, pp. 125-130. Comparative study of arc, resistance and induction types.

AJAX-WYATT. Ajax-Wyatt Electric Furnace, C. H. Clamer. Metal Indus., vol. 17, no. 8, Aug. 1919, pp. 362-363, 2 figs. Diagrammatic sketch. Furnace is of induction type. Paper read before Am. Chem. Soc.

CARBONS. Electric Furnace Carbons, Thomas Robson Hay. Raw Material, vol. 1, no. 5. July 1919, pp. 262-264, 4 figs. It is held that while both graphitic and amorphous carbons have their advantages, latter is considered as having superior strength and lasting qualities.

Manufacture and Application of Carbon Electrodes for Electric Furnaces, Thomas Robson Hay. Elec. Rec., vol. 26, no. 2, Aug. 1919, pp. 72-74, 7 figs. Noting particularly improvements in design and practice evolved during war.

EXPERIMENTAL FURNACE. Electric Furnace for Experimental Work, H. A. J. Fitzgerald and Grant C. Moyer. Thirty-sixth General Meeting of Am. Electrochem. Soc., Sept. 23, 1919, advance copy, no. 4, pp. 27-31. Type which has been found convenient and satisfactory for small-scale experiments at Fitzgerald Laboratories of Niagara Falls, N.Y.

HEAT-TREATING FURNACE. Vertical-Cylindrical Electric Furnaces for Heat-Treating and Shrinking. A. M. Clark, Chem. & Metallurgical Eng., vol. 21, paper no. 4, Aug. 15. 1919, pp. 205-207, 5 figs. Types developed by General Elec. Co., notably low-temperature furnaces (up to 950 deg. fahr.) which have been used primarily for shrinking jackets over gun barrels.

OPERATION. Effect of Actions Inside Furnaces on Performance, W. K. Booth. Elec. World, vol. 74, no. 5, Aug. 2, 1919, pp. 236-237, 2 figs. Causes of fluctuation in load, limitations to short-circuit current, stabilization of arc and high-power-factor furnaces from service viewpoint.

RADIANT RESISTOR FURNACE. Radiant Resistor Furnace, H. A. J. Fitzgerald. Thirty-sixth General Meeting of Am. Electrochem. Soc., Sept. 23, 1919, advance copy, paper no. 1, pp. 1-7, 4 figs. Unit built and operated at Fitzgerald laboratories for distillation of low-grade or scrap zinc. It is said that with current of approximately 845 amp. at 65 volts output was about 50 kg. of refined zinc per hour.

TRANSFORMERS. *See Transformers, Converters, etc.*

GENERATING STATIONS

GROUND IN DISTURBANCES. *See Overloading.*

OPERATION IN PARALLEL. Some Problems in the Operation of Power Plants in Parallel, E. C. Stone. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 8, Aug. 1919, pp. 973-996, 6 figs. It is observed that in order to operate two power plants satisfactorily in parallel, the transmission line which ties them together must have sufficient carrying capacity. Factors determining synchronizing power are mentioned and limiting values for synchronizing power of lines under various operating conditions are given.

Paralleling Alternators, J. F. Ashton. Mech. World, vol. 66, no. 1701, Aug. 8, 1919, pp. 61-65, 3 figs. Precautions to take.

OVERLOADING. Recent Progress Made in Preventing Overloading of Electric Installations (Die jüngsten Fortschritte in der Beurteilung und Bekämpfung von Ueberspannungen in elektrischen Anlagen), W. Kummer. Schweizerische Bauzeitung, vol. 74, no. 4, July 26, 1919, pp. 39-41, 4 figs. Grounding disturbances and how to remedy them. (To be concluded.)

PARALLELING. *See Operation in Parallel.*

RATES. Central-Station Rates in Theory and Practice, H. E. Eisenmenger. Elec. Rev., vol. 75, no. 7, Aug. 16, 1919, pp. 266-269. How diversity of demand affects demand cost. Sixth article.

Central-Station Rates in Theory and Practice, H. E. Eisenmenger. Elec. Rev., vol. 75, no. 8, Aug. 23, 1919, pp. 304-307. Consumer cost, what it includes and how it varies. Seventh article.

RICE RIPS STATION. Construction Costs of Rice Rips Station, J. A. Leonard. Elec. World, vol. 74, no. 5. Aug. 2, 1919, pp. 228-230, 3 figs. Hydroelectric power plant of 2000-kva. capacity designed to carry peak loads rather than base loads.

SWISS CENTRAL STATION. Central Station at Massaboden near Brig of the Swiss State Railroads (Das Elektrizitätswerk Massaboden bei Brig der Schweiz. Bundesbahnen), H. Eggenberger and A. Danzeg. Schweizerische Bauzeitung, vol. 73, no. 25, June 21, 1919, pp. 287-291, 10 figs. Pressure pipes during construction; description of water chamber; plan and cross-sections of pressure pipes and reservoir.

SWITCH AIR BREAK. A 5000-Kva., 100,000-Volt New-Type Air-Break Switch, George T. Couthgard, Elec. World. vol. 74, no. 8, Aug. 23, 1919, pp. 407-409, 7 figs. Designed to interrupt charging current drawn by 125 miles of 100,000-volt line, it is said to have broken current of 100-mile line.

SWITCH HOUSE. Layout of Modern Switch House, C. A. Conney. Elec. World, vol. 74, no. 6, Aug. 9, 1919, pp. 286-290, 6 figs. Special consideration given to future requirements, safety of operators, continuity of service, economy of materials and relation to rest of generating station.

TATA POWER PLANT. The Tata Hydro-Electro Power-Plant, Bombay—II. Indian & Eastern Engr., vol. 44, no. 6, June 1919, pp. 187-190, 6 figs. Details of pipe line. Power house is designed for generating total of 108,000 hp.

Vienna Municipal Central Station. Municipal Central Station in Vienna (Die städtischen Elektrizitätswerke in Wien). Elektrotechnik u. Maschinenbau, vol. 37, no. 4, Jan. 26, 1919, pp. 35-40. Has seven substations with 18 steam turbines and 6 water turbines of a total horsepower of 155,095 and 21 reciprocating steam engines of 41,000 hp.

GENERATORS AND MOTORS

Bipolar Diagram. On Some Properties of the Bipolar Diagram of Synchronous Alternators in a Constant-Potential Network (Quelques propriétés du diagramme bipolaire des alternateurs synchrones (moteurs ou récepteurs) sur un réseau à potentiel constant), André Blondel. Comptes rendus des séances de l'Académie des Sciences, vol. 169, no. 1. July 7, 1919, pp. 12-16. Derivation of equation of polar curve of internal power of alternator.

Breakdowns. Some Causes of Breakdown to Electrical Machinery, W. C. Worral. Elec. Rev., vol. 75, no. 8, Aug. 23, 1919, pp. 308-312. Examination of typical examples of breakdowns met in industrial plants.

Generator Plants, French. Uses of Generator Groups During the War (Emploi des groupes électrogènes à la guerre), A. Soulier. Revue générale de l'Electricité, vol. 6, no. 4, July 26, 1919, pp. 111-118, 10 figs. Illustrating general arrangement of Ballot, Aster, and Delieuvin gas engine and dynamo units.

Grounded Neutral. Grounded Neutral on Alternating-Current Generators, S. L. Henderson. Elec. Jl., vol. 16, no. 8, Aug. 1919, pp. 340-343, 10 figs. Method of grounding neutral.

Induction Generator Plants, Automatic. Automatic Induction Generator Plants, E. A. Quinn. Power Plant Eng., vol. 23, no. 16, Aug. 15, 1919, pp. 730-732, 4 figs. Abstract of Eng. Committee report of Pacific Coast Section, Nat. Elec. Light Assn.

Induction Motors. Induction Motors Driving Centrifugal Pumps, Fraser Jeffrey. Power, vol. 50, no. 9, Aug. 26, 1919, pp. 324-327, 11 figs. Adaptability of various types of motors to different kinds of pumping work, with reference to several existing installations.

Rolling-Mill Motors. Regulation Without Loss of Three-Phase Rolling-Mill Motors (über den derzeitigen Stand der Frage der verlustlosen Regelung von Drehstrom-walzenzugmotoren), H. Hermanns. Elektrotechnische Rundschau, vol. 36, nos. 5-6, 7-8 and 9-10. Feb. 5. Feb. 19 and Mar. 5. 1919, pp. 17-18, 25-26, and 33-34, 13 figs. Commutator-motor regulation by brush adjustment, various connection schemes. (Concluded.)

Siemens Machinery. Siemens Electrical Equipment (Equipement électrique Siemens). Génie Civil, vol. 75, no. 6, Aug. 9, 1919, pp. 117-120, 6 figs. At steel works of Skinningrove Iron Co. of Yorkshire. Rolls require 19,000 hp. to operate.

Transient Phenomena. Transient Phenomena of a Polyphase Motor at Starting and Those of a Direct-Current Motor (In Japanese), J. Takeuchi. Denki Gakkwai Zasshi, no. 372, July 10, 1919.

IGNITION APPARATUS

Condensers. Function of the Condenser in High-Tension Magnetos, Harry F. Geist. Automotive Industries, vol. 41, no. 6, Aug. 7 1919, pp. 267-272, 6 figs. Diagram showing difference between induced voltages that occur both with and without condenser.

Magnetos. Aircraft Magneto Adapted to Four Cylinder Car. Automotive Industries, vol. 41, no. 8, Aug. 21, 1919, pp. 364-366, 9 figs. British war product in which aluminum enters very largely into construction. Special feature, makers claim, is use of laminated poleshoes.

LIGHTING AND LAMP MANUFACTURE

Delco. Lighting Plant Capacity Increased to 3 Kw., P. M. Heldt. Automotive Industries, vol. 41, no. 8, Aug. 31, 1919, pp. 370-374, 7 figs. Unit designed for Delco line for use on large estates, hotels and similar plants, has single-cylinder air-cooled engine with anti-friction crankshaft bearings, direct-connected to six-pole generator.

Gas-Filled Lamps. The Gas-Filled Lamp and Its Effect on Illuminating Engineering, Francis W. Wilcox. Illuminating Engr., vol. 12, no. 6, June 1919, pp. 142-161 and (discussion), 161-171, 43 figs. Features of gas-filled lamps that have modified lighting practice and effects of this type of lamp in various fields of lighting, with notes on lighting codes adopted in various parts of U. S.

Incandescent Burners, Inverted. The Regenerative Effect as Influencing the Lighting Efficiency of the Inverted Incandescent Burner, J. S. G. Thomas. Gas Jl., vol. 147, no. 2930, July 8, 1919, pp. 77-78, 2 figs. Experiments interpreted as indicating that increased lighting efficiency is obtained when gaseous mixture of coal gas and primary air is preheated.

Industrial Lighting Systems. Design of Industrial Lighting Systems—II, Ward Harrison and H. H. Magdsick. Elec. World, vol. 74, no. 5, Aug. 2, 1919, pp. 232-234, 5 figs. Concerning selection of correct size and type and location of lighting unit.

Photometers. Extending the Use of the Relative-Photometer (Erweiterte Anwendung das Relativphotometers), L. Weber. Zeitschrift für Beleuchiungswesen, Heizungs- u. Lüftungstechnik, vol. 25, no. 1/2, Jan. 1919, pp. 8-9, 3 figs. For determining intensity of illumination in proportion to the sky, for comparing two illuminating intensities and for comparing two intrinsic brilliances.

Safety Orders, Lighting. General Lighting Safety Orders. Jl. Electricity, vol. 43, no. 4, Aug. 15, 1919, pp. 173-174. Issued by Industrial Accident Commission under Workmen's Compensation Insurance and Safety Act.

Stage Lighting. The Art of Stage Lighting, J. B. Fagan. Illum. Engr., vol. 12, no. 5, May 1919, pp. 118-124 and (discussion) pp. 124-133. Historical account of development of art and notes on practices followed in various countries.

Workshops. Auxiliary Lighting Apparatus for Use in Engineering Workshops, J. Beaumont Harrison. Electrical Review, vol. 85, no. 2175, Aug. 1, 1919, pp. 131-132, 2 figs. Hand lamp-test set. Arrangement consists of bank of connecting sockets, indicator lamps, contactor switch, main fuse and main switch.

MEASUREMENTS AND TESTS

Amplifiers. Use of Amplifiers for Measuring Small Differences of Potential (Emploi des amplificateurs pour la mesure des différences de potentiel faibles), A. Blondel, Revue Générale de l'Électricité, vol. 6, no. 6, Aug. 9, 1919, pp. 163-178, 18 figs. Laboratory methods in which audions may be introduced—thermo-ionic ballance static or deviation bridges, potenionmeter methods and oscillations. (To be continued.)

Condenser, High Voltage. Half-Million-Volt Condenser for Testing. Elec. World, vol. 74, no. 8, Aug. 23, 1919, pp. 404-405, 4 figs. Built for frequencies up to 60,000 cycles and combined with Poulsen arc converter and inductance for the purpose of testing high-voltage insulators.

Frequency Determination. A New Method for the Absolute Determination of Frequency, Ashutosh Dey. Proc. Roy. Soc.. vol. 95, no. A-673, July 15, 1919, pp. 533-545, 1 fig. Principle of method is maintenance of oscillations of sub-synchronous frequency by a periodic field of force.

Hysteresis Curve. The Determination of the Hysteresis Curve, M. Schleicher. Elecn., vol. 83, no. 2148, July 18, 1919, pp. 67, 2 figs. By ring method similar to that used for determining commutating curves. From Elektrotechnische Zeitschrift.

Insulator Tester. The Keokuk Insulator Tester, R B. Howland. Stone & Webster Jl., vol. 110-113, Aug. 1919, 7 figs. on five supp. plates. Said to be specially suited for locating suspension-type insulator units which have become defective, and which can be used to advantage during night hours.

Motors, Railway. Manufacturers' Tests of Materials for Railway Motors, J. S. Dean. Elec. Ry. Jl., vol. 54, no. 7, Aug. 16, 1919, pp. 320-325, 20 figs. Tests, apparatus used and results obtained for determining physical and electrical properties of material entering into construction of railway motors.

Motor Selection. Motor Testing in Industrial Plants, Philip Chapin Jones. Elec. World, vol. 74, no. 6, Aug. 9, 1919, pp. 295-296, 6 figs. Question of selecting motors of correct size to offset their increased cost.

Power Factor Measurement. Measuring Power Factor with Unbalanced Load, Williard S. Wilder. Elec.World, vol. 74, no. 5, Aug. 2, 1919, pp. 239-240, 2 figs. Method of securing permanent record of maximum value and time of occurrence.

Short-Circuit Current Calculation. Calculating Short-Circuit Currents in Networks, W. R. Woodward. Elec. Jl., vol. 16, no. 8, Aug. 1919, pp. 344-345, 4 figs. Testing with miniature networks.

MATERIALS OF CONSTRUCTION

Aluminum Conductors. Aluminum Electrical Conductors (Les conducteurs d'Électricité en aluminium), E. Dusaugey. Supplement to Revue Générale de l'Electricité, vol. 6, no. 4, July 26, 1919, 20 pp. Recent developments in electrical uses of aluminum and mechanical and physical properties of aluminum presented to show that employment of aluminum as substitute for copper is both feasible and economical. Report of Committee of l'Union des Syndicats de l'Electricité.

Cadmium. Cadmium, C. E. Siebenthal. Brass World, vol. 15, no. 8, Aug. 1919, pp. 246-249. Its use as a substitute for tin and in bronze telegraph and telephone wires.

Insulating Materials. Electrical Insulating Materials, R. P. Jackson. Elec. Jl., vol. 16, no. 8, Aug. 1919, pp. 326-333. Classification under two general divisions—organic and inorganic. Characteristic properties of each and of various combinations of several of them.

Industrial Insulators (Etude des diélectriques industriels), Raymond Bouzon. Revue Générale de l'Electricité, vol. 6, nos. 5 and 6, Aug. 2 and 9, 1919, pp. 137-148 and 181-187, 20 figs. Aug. 2: Definition of specific qualities of insulators, description of apparatus used for measuring them, their standardization and application. Aug. 9: Manner of measuring losses in insulators due to alternating currents; results of experiments.

POWER APPLICATION

Construction Work. Largest Use of Electric Power on Construction Work. Eng. News-Rec., vol. 83, no. 9, Aug. 28, 1919, pp. 417-420, 5 figs. How and why Dayton flood protection works use 8000 hp. from central plant, in motors of 5 to 500 hp., for pumps, excavators, concrete mixers and other equipment scattered over 1000 square miles.

Dredges, Hydraulic. Features of Electrically Operated Hydraulic Dredge, Charles W. Geiger. Elec. Rev., vol. 75, no. 7, Aug. 16, 1919, pp. 263-265, 5 figs. Advantages of electric drive and savings effected by its operation by City of Oakland, Cal.

Gold Mining. Notes on the Electrical Equipment at the Circular Shaft, New Modderfontein Gold Mining Company, Ltd., R. H. Copeland. Trans. of South African Inst. Elec. Engrs., vol. 10, no. 5, May 1919, pp. 62-69 and (discussion), pp. 69-72, 6 figs., partly on supp. plate. Energy brought to transformer house at 20,000 volts and there stepped down to 21000 volts and 525 volts for direct motor use; mine transformers get it down again to 200 volts between phases and 115 volts between phases and earthed neutral or to 57½ volts for lighting.

Rice Industry. Electricity Makes Rice Industry Possible, W. E. Camp. Jl. Electricity, vol. 43, no. 3, Aug. 1, 1919, pp. 102-104. 9 figs. Electrical pumps used in irrigation works.

Tube Mills. An Electrically Driven Tube Mill. Iron & Coal Trades Rev., vol. 99, no. 2683, Aug. 1, 1919, p. 139, 3 figs. Principal feature noted is direct driving of two Pilger mills by motor running at speed of mill and driving without fly wheel.

Typewriter Industry. Electric Heat in the Typewriter Industry, A. M. Clark. Thirty-sixth General Meeting of Am. Electrochem. Soc., Sept. 23, 1919, advance copy, paper no. 3, pp. 23-26, 2 figs. Electrically heated oven for baking japan on various parts of typewriters. Comparative tables show better economy and larger capacity of electrically heated oven compared with gas- or oil-heated oven.

TELEGRAPHY AND TELEPHONY

Antenna. Calculation of Antenna Capacity, L. W. Austin. Jl. Wash. Acad. Sci., vol. 9, no. 14, Aug. 19, 1919, pp. 393-396. Table giving observed values of capacity of elongated parallel wire antenna, and comparison of capacities calculated according to Bur. Stand. formula.

Cables, Telephone. Investigation and Examination of Telephone Cables. Telephone Engr., vol. 22, no. 2, Aug. 1919, pp. 70-73, 3 figs. Francke machine for determining damping effect of homogeneous or composite lines; also account of tests performed with it. From Elektrotechnik u. Maschinenbau.

Direction Finders. The Marconi Direction Finder. Elecn., vol. 83, no. 2151, Aug. 8. 1919, pp. 142-143, 4 figs. Installation having components arranged as separate unit.

Duplex Apparatus. Universal Duplex Apparatus—In Use by the Western Union Telegrapb Company. Telegraph & Telephone Age, vol. 15, no. 869, Aug. 1, 1919, pp. 374-377, 2 figs. Circuits of repeater when working differentially on botb west and east sides. (Continuation of serial.)

Electrostatically Coupled Circuits. A Study of Electrostatically Coupled Circuits, W. Orland Lytle. Proc. Inst. Rzdio Engrs., vol. 7, no. 4, Aug. 1919, pp. 427-444, 60 figs. Claims to have found by theory and also by experiment that by one method of tuning, as circuits are coupled closer, one wave length remains constant while other approaches infinity, thereby concentrating and increasing proportion of energy in one wave. It is shown by curves and by Braun tube figures that when ratio of the two wave lengths is a wbole number, the root-mean-square value of the current is a maximum.

French Telegraph Construction. Notes on French Telegrapb Construction, Capt. P. Dunsbeath. Post Office Elec. Engrs. Jl., vol. 12, no. 2, July 1919, pp. 87-91, 7 figs. Comparing French with British methods.

Overland Work. Radio Telegraphy in Competition with Wire Telegraphy in Overland Work, Robert Boyd Black. Proc. Inst. Radio Engrs., vol. 7, no. 4, Aug. 1919, pp. 391-407, 1 fig. Recommends radio duplex circuits; reception with loud-speaking receivers and amplifiers, trunk and way circuits from large radio centers of traffic and relaying stations as means to overcome obstacles in way of successful competition of overland radio service versus wire service. Organization and operation of Pacific coast chain of duplex radio stations of Federal Telegrapb Company are described.

Quenched Gap. On the Multi-Section Quenched Gap, M. Shuleikin and I. Freiman. Proc. Inst. Radio Engrs.. vol. 7, no. 4, Aug. 1919, pp. 417-425, 5 figs. Writers consider relation between breakdown voltage of series of quenched gap sections and that of a single section. Relation of direct proportionality is found not to hold because of electric flux leakage from each plate to nearby plates and neighboring conductors. Limiting value of breakdown voltage of a number of gaps of given length is shown graphically for various values of flux leakage and breakdown voltage of gaps.

A Special Type of Quenched Spark Radio Transmitter, D. Galen McCaa. Proc. Inst. Radio Engrs., vol. 7, no. 4, Aug. 1919, pp. 409-415, 4 figs. Apparatus is so arranged that capacity in highly damped primary circuit is that between a special extra antenna and ground, and primary and secondary circuits are partly capacitively coupled by capacity between special antenna and usual secondary antenna, and partly inductively coupled through common inductance in ground lead.

Radio-Telephones. Radio-Telephone Development in Army, Nugent H. Slaughter, Francis Gray and John W. Stokes. Elec. World, vol. 74, no.. 7, Aug. 16, 1919, pp. 340-343, 7 figs. Historical and technical summary.

Sending and Receiving. Simultaneous Sending and Receiving, Ernst F. W. Alexanderson. Proc. Inst. Radio Engrs., vol. 7, no. 4, Aug. 1919, pp. 363-378, and (discussion), pp. 379-390, 19 figs. System described involves transferring received speech from separate receiving antenna at some distance from receiving antenna to subscriber's line, and transferring speech originating at subscriber's station to radiophone transmitter. A directional combination of aperiodic antenna, with unilateral directional characteristic "barrage receiver" is also described.

Telephone Cable Tunnels. Conduit Construction in Telephone Cable Tunnels. Elec. Rev., vol. 75, no. 8, Aug. 23, 1919, pp. 301-303, 6 figs. Average length is about 700 ft. and depth beneath level of sidewalk varies from 80 ft. to 90 ft. Tunnels are built entirely of concrete.

Telephone Control System. West Ham's Telepbone Control System. Electric Ry. Jl., vol. 54, no. 8, Aug. 23, 1919, pp. 397-398, 4 figs. Introduction of system for control of traffic conditions in London suburb said to have reduced accident costs.

Telephone Exchanges. Comments on Automatic-Manual Consolidation, H. E. Brockwell, Telephone Engr., vol. 22, no. 2, 1919, pp. 55-58. Converting present central manual equipment in Winnipeg exchanges to automatic mechanical operation.

Telephone Line, Current Propagation. Propagation of a Current in a Homogenous Telephonic Line (Propagation du courant sur une ligne téléphonique homogène), J. B. Pomey. Revue Générale de l'Electricité, vol. 6, no. 5, Aug. 2. 1919, pp. 131-134. Formulæ applicable to artificial line formed of identical sections.

Telephone Repeater. The Telephone Repeater. Post Office Elec. Engrs. Jl., vol. 12, no. 2, July 1919, pp. 70-75, 6 figs. Diagram of equal potential system which is used in some cases where Edison difference in circuit has been found unstable. (Continuation of serial.)

Telephone Signalling System. A Modified Common Battery Signalling Telephone System, H. W. White. Post Office Elec. Engrs. Jl., vol. 12, no. 2, July 1919, pp. 115-118, 7 figs. Suggested for use in centers where suitable power supply for charging secondary cells does not exist.

Telephone Systems. Unification of the Manual and Automatic Telephone Systems, D. E. Wiseman. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 8, Aug. 1919, pp. 1011-1026. 10 figs. Operating and construction methods contained in plans for physical union of Bell manual and Automatic Electric telephone systems of Los Angeles, Cal.

Waves, Electric. The Scientific Problems of Electric Wave Telegraphy, J. A. Fleming. Jl. Roy. Soc. Arts, vol. 67, no. 3481, Aug. 8, 1919, pp. 597-605. Theory of generation and radiation of electric waves.

Wireless Telephone Transmitter. Wireless Telephone Transmitter for Seaplanes. Elec. Rev., vol. 75, no. 6, Aug. 9, 1919, pp. 237-241, 5 figs. Light-weight but powerful set developed for use by Navy's flying boats during war.

TRANSFORMERS. CONVERTERS, FREQUENCY CHANGERS

Amplifiers. Amplifiers for Direct Currents and for Currents of Very Low Frequency (Amplificateurs pour courants continus et pour courants de très basse fréquence), Henri Abraham and Eugène Bloch. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 26, June 30, 1919, pp. 1321-1323. Interconnections by means of auxiliary batteries.

Cores and Coils. Cores and Coils for Transformers—I, Arthur Palme. Power vol. 50, no. 6. Aug. 5, 1919, pp. 212-215, 16 figs. Structural details.

Electric-Furnace Transformers. Static Transformers for Use witb Electric Furnaces. Elecn., vol. 83, nos. 2148 and 2149, July 18 and 25, 1919, pp. 69-70 and 89-90, 6 figs. July 18: Characteristics of British Westinghouse types. July 25: Layout of furnace plant. Also in Iron & Coal Trades Rev., vol. 99, no. 2681, July 18, 1919, pp. 71-72, 5 figs. and Electrical Rev., vol. 85, no. 2174, July 25, 1919, pp. 124-126, 7 figs.

Loading. Loading a Bank of Dissimilar Transformers, H. B. Dwight. Elec. World, vol. 74, no. 5, Aug. 2, 1919, pp. 230-231, 1 fig. Calculations proposed for determination of current in each transformer for balanced load.

Phase Changers. Predetermination of Synchronous Phase-Modifier Performance, mance, Hubert V. Carpenter. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 8, Aug. 1919, pp. 997-1003, 4 figs. Reviews method for showing behavior of transmission lines as developed by Perrine and Baum and then shows how it can be used in determining effect of use of synchronous motor operating without load for improving power factor. Effect of losses in motor shown both on line alone and on line with step-up and step-down transformers.

Rotary Converters. Pulsation of tbe D. C. Terminal Voltage in Rotary Converters, J.K.Kostko. Elecn., vol. 83,nos.2148 and 2149,July 18 and 25,1919,pp.61-63 and 86-88, 3 figs. Pulsations due to tbe reverse M.M.F. of armature in single-phase converters. Self-induction coefficient of a distributed winding. (Concluded.)

Secondary Connections. Secondary Connections for Constant-Current Transformers, L. Arnold. Gen. Elec. Rev., vol. 22, no. 8, Aug. 1919, pp. 632-633, 4 figs. Single circuit vs. multi-circuit.

Windings. Cores and Coils for Transformers—II, Arthur Palme. Power, vol. 50 no. 7. Aug. 12, 1919, pp. 254-256, 8 figs. Types of windings in modern transformer practice.

See also Cores and Coils.

TRANSMISSION, DISTRIBUTION, CONTROL

Feeders, Voltage Regulation. Selecting Voltage Regulators for Feeders, Frank Hersey. Elec. World, vol. 74, no. 7, Aug. 16, 1919, pp. 344-346, 2 figs. Recommendations regarding application of single and polyphase regulators for lighting and power loads.

Grounded Neutral Transmission Line. Grounded Neutral Transmission Line, W. E. Richards. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 8, Aug. 1919, pp. 1005-1010, 3 figs. Conditions on system which was originally delta-connected. In order to overcome trouble experienced whenever short-circuit occurred specially with synchronous apparatus connected to line, transmission was changed to Y-system with neutral grounded. Effect of short-circuit witb new connection is alleged to have been decidedly minimized.

Load-Dispatching. Reinforcing System Operator's Memory, Frank Gillooly. Elec. World, vol. 74, no. 7, Aug. 16, 1919, pp. 347-350, 5 figs. Electric chart used in load-dispatching system at Philadelphia Electric Company's plant.

Long-Distance Transmission. Transmission of Electrical Energy at Long Distances (Sur les longues lignes de transmission d'énergie électrique). P. Bunet. Revue Générale de l'Electricité, vol. 6, no. 5, Aug. 2. 1919, pp. 148-158. Comparison of direct-current with alternating-current systems.

Merz-Price System of Cable Protection. The Merz-Price System of Cable Protection. C. W. Marshall. Electrical Review, vol. 85, no. 2176, Aug. 8, 1919, pp. 165-166, 5 figs. Action depends on principle that when feeder is sound the current is the same at both ends; whereas when it is faulty, there is a difference either in magnitude or in phase between currents at two ends.

Network Calculations. Development of Analytical Solutions, Charles Fortescue. Elec. Jl., vol. 16, no. 8. Aug. 1919, pp. 350-352. Suggests separation of network into invariable and variable portions, the latter constituting supply and load circuits.

Analytical Solutions, Robert D. Evans. Elec. Jl., vol. 16, no. 8, Aug. 1919. pp. 345-349, 21 figs. Concerning methods of solving network of power circuits.

Overhead Conductors. Overbead Conductors (Canalisations Aériennes), Ch. Vallet. Industrie Electrique, vol. 28, no. 649, July 10, 1919, pp. 246-247. Formula for computing maximum length of suspended portion of cable. (Continuation of serial.)

Overhead Mains: Some Reflections, S. G. Leech. Electrical Rev., vol.85 ; no. 2174, July 25, 1919, pp. 99-101, 6 figs. Instances of overhead installations presented as proof that such installations can be erected without visual offence.

POLES. Impregnating Poles for Aerial Lines (über gesetzmassige Aufnahmen von Imprägniermit- Elektrotschnik u Maschinenbau, vol. 37, no. 11, Mar. 16, 1919, pp. 105-108, 3 figs.It has been found that wood of the same kind, impregnated by the same process, under the same conditions, shows various degrees of saturation and therefore, of resistance to rotting. Curves given show saturation points of pine poles in tests made by writer.
The Selection of Proper Wooden Poles for Aerial Cables (Uber die wahl geeigneter Holzmaste fur elektrische Freileitungen), Willy Kinberg. Elektrotechnik u. Maschinenbau, vol. 37, no. 2, Jan. 12, 1919, pp. 13-17, 3 figs. Tables showing strength ratio, load ratio, breaking stress ratio, etc., of E and D poles.

POWER-FACTOR CORRECTION. Power Factor Correction, J. Humphrey. Colliery Guardian, vol. 118, no. 3056, July 25, 1919, pp. 228-229, 4 figs. Methods used and advantages claimed for each.

THREE-WIRE SYSTEMS. Three-Wire Systems, Burton McCollum and E. R. Shepard. Elec. Traction, vol. 15, no. 8. Aug. 1919, pp. 504-506, 2 figs. Diagrammatic representation of sectionalized three-wire system.

TRANSIENT PHENOMENA. Problems in High Tension Power Transmission, W. P. Dobson. Sibley Jl., vol. 33, no. 6, July-Aug. 1919, pp. 74-78, 6 figs. With special reference to line transients.

TRANSMISSION-LINE CONSTRUCTION. Analysis of Transmission-Line Construction, D. D. Ewing. Elec. World, vol. 74, no. 8, Aug. 23, 1919, pp. 406-407, 4 figs. Empirical equation and graphs establishing relations between line voltage and line length, service capacity, spacing of conductors and tower height.

WIRING

WIRE CAPACITY. Selecting Conduit Size for Power-Plant Wiring, A. R. Zahorsky. Elec. World, vol. 74, no. 8, Aug. 23, 1919, pp. 399-400, 2 figs. Curves for determining wire capacity of wrought iron in conduit.

WIRE JOINTS AND CONNECTIONS. Various Types of Wire Joints and Connections. Ry. Elec. Engr., vol. 10, no. 8, Aug. 1919, pp. 281-284, 22 figs. With notes on selection of splices according to size of conductors and kind of service required.

VARIA

APPRAISALS. Practice in making Electric Utility Appraisals, Charles W. McKay. Elec. Rev., vol. 75, no. 6, Aug. 9, 1919, pp. 226-230, 4 figs. Methods used in inventory of land, buildings and outside plant.

SWITCHBOARD. A Lighting and Experimental Switchboard, R. Drilhon. Model. Engr. & Elecn., vol. 41, no. 951, July 17, 1919, pp. 49-51, 6 figs. Features of board made for controlling light in a photographic dark room and for providing necessary current for electrical experiments.

THEORY OF PROBABILITIES. Theory of Probabilities Applied to Failures of Suspension Insulators, L. M. Klauber. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 8, Aug. 1919, pp. 959-972, 3 figs. After finding minimum number of insulators pers tring. required for any given operating conditions, writer points out method of determining amount of extra insulation desirable from an insurance standpoint according to law of probabilities. Equations are developed from which probability of failure for any given case or ration between probabilities for any pair of cases may be determined directly.

ORGANIZATION AND MANAGEMENT

ACCOUNTING

COST FACTORS. Arranging Industrial Cost Factors, M. H. Potter. Iron Trade Rev., vol. 65, no. 8, Aug. 21, 1919, pp. 508-510, 6 figs. Charts illustrating relation of machine rates toproduction factors; also forms for tabulating various elements.

COST SYSTEMS. Manufacturing Cost Systems, M. H. Potter. Metal Indus., vol. 17, no. 8, Aug. 1919, pp. 366-368, 4 figs. Author deals with economic production and consequent efficiency in operation of metal shop.

GERMAN COSTING SYSTEMS. Costing Systems in Sulphuric Acid Works, H. J. Bush. Chem. Age, vol. 1, no. 3, July 5, 1919, pp. 58-59. Method pursued at one of large chemical works in South Germany.

OVERHEAD. Overhead and General Costs in Manufacturing, Thomas R. Deacon. Jl. Eng. Inst. Can., vol. 2, no. 7, July 1919, pp. 505-506, 1 fig. Shows importance of overhead expense, and how failure of legitimate business "can be traced to inadequate provision for indirect or overhead expense."

STANDARDIZED ACCOUNTINO SYSTEMS. Standardized Accounting System. Jl. Electricity, vol. 43, no. 4, Aug. 15, 1919, pp. 168-170, 1 fig. Outlined in committee report of Nat. Elec. Contractors and Dealers' Assn.

EDUCATION

APPRENTICES. Recording the Progress of Apprentices. Machy. (N.Y.). vol. 25, no. 12, Aug. 1919, pp. 1155-1156, 3 figs. Plan followed by Westinghouse Elec. & Mfg. Co.
The Training of Engineering Pupils and Apprentices, George Knox. Proc. South Wales Inst. of Engrs., vol. 35, no. 1, July 18, 1919, pp. 59-80 and (discussion) pp. 81-115. Urges establishing junior technical schools for preparatory training of apprentices; also additon of scientific departments in secondary schools for preparatory training of pupils. Scheme for apprentice and tute lage courses is outlined.

ARCHITECTURAL INSTRUCTION. The Need of Architectural Instruction in American Colleges, George C. Nimmons. Am. Architect, vol. 116, no. 2276, Aug. 6, 1919, pp. 169-172 and 175-176. Argument is based on assistance which understanding of arts, particularly architecture, is claimed would be in acquiring of good taste and refinement, and appreciation of and preference for finer and better things of life.

FACTORY TRAININO. An Efficient Training Department in a Large Plant. Am. Mach., vol. 51, no. 9, Aug. 28, 1919, pp. 420-421. Bulletin issued by U. S. Training Service, Washington, D. C.

MACHINE TOOL BUILDERS. Training for the Building of Machine Tools, Edward A. Kraus. Am. Mach., vol. 51, no. 8, Aug. 21, 1919, pp. 353-356. Details of elimination of those undesirable or not suited to fit into production organization; training green workers for simple operations; studying personnel of factory with view to possibility of upgrading and studying to straighten out problem of misplaced help.

VOCATIONAL TRAININO. Vocational Training, A. P. Fletcher. Jl. Cleveland Eng. Soc., vol. 11, nos. 5 and 6, Mar.-May, 1919, pp. 283-289 and (discussion) pp. 289-291. Suggests getting for boys in schools half-time jobs with employers that will pay their way through school the other half of times. Instances of thus placing boys reported.

EXPORT

BRITISH MACHINE TOOL TRADE. British Machine Tool and Metal Industries, Alexander Luchars. Iron Age, vol. 104, no. 9, Aug. 28, 1919, pp. 573-577. Report issued by Am. Trade Commissioner sent abroad by Dept. of Commerce.
The Machine Industry in England and France. A. C. Cook. Am. Mach., vol. 51. no. 7, Aug. 14, 1919, pp. 331-335. Present economical aspect and plans being aid for future development.

CHINA. China's Industrial and Commercial Outlook, Julean Arnold. Jl. Electricity, vol. 43, no. 4, Aug. 15, 1919, pp. 157-158, 1 fig. Writer sees great possibilities in electrical development and railroad building.

CEMENT. International Trade in Cement. Cement. Mill & Quarry, vol. 15, no. 4, Aug. 20. 1919, pp. 19-25. Export opportunities for American producers.

FRANCE. *See British Machine Tool Trade.*

GREECE. Engineering Opportunities in Greece. Engineer, vol. 128, no. 3315, July 11, 1919, pp. 30-31. Calls attention to various engineering projects being contemplated.

LATIN-AMERICAN MARKETS. Entering the Latin American Markets, Percy F. Martin. Eng. & Indus. Management, vol. 2, no. 5, July 31, 1919, pp. 142-143, 1 fig. Opening for farming machinery pointed out.

SIBERIA. Resuming Trade with Siberia. Jl. Electricity, vol. 43, no. 4, Aug. 15, 1919, pp. 153-154, 1 fig. Conditions and possibilities of stable trading. Report of U. S. Bureau of Commerce based on recent investigation undertaken by Sub-Committee on Markets and Supplies of Canadian Economic Commission in Siberia.

SOUTH AMERICA. West Coast Electrical Trade with South America. Jl. Electricity, vol.43, no. 4, Aug. 15, 1919, pp. 150-152, 4 figs. Conditions of market indicating disadvantages and opportunities for business as reported by trade commissioner sent by Bureau of Foreign and Domestic Commerce to investigate field.

SPAIN. American Progress in Spanish Industry. Iron Age, vol. 104, no. 8, Aug. 21, 1919, p. 513. From document prepared by British Department of Overseas Trade concerning conditions and prospects of iron and steel industries and engineering projects in Spain.

FACTORY MANAGEMENT

BONUS SYSTEM. Management of the Power Plant, Robert June. Textile World Jl., vol. 56. no. 5, Aug. 2, 1919, pp. 93-95, 3 figs. Principles and administration of bonus systems in boiler rooms. Fourteenth article.
Bonus System for Boiler Room Employees, Robert June. Refrig. World. vol. 54, no. 8. Aug. 1919, pp. 25-26, 2 figs. Experience of various plants after applying system and suggestions in regard to principles on which to base system.

BUSINESS ORGANIZATION. Visualizing the Management's Part in Business for Employees, Henry Tipper. Automotive Industries, vol. 41, no. 8, Aug. 21, 1919, pp. 378-381, 10 figs. Concerning talks on business organization given by president of American Multigraph Co. to all employees.
Administration of Industrial Enterprises (Pratique de la réorganisation administrative des entreprises industrielles), Paul Legler. Bulletin de la Société d'Encouragement pour l'Industrie Nationale, vol. 131, no. 3, May-June 1919, pp. 540-571, 14 figs. Illustrates with various examples necessity for administrative technique.based on H. Fayol's book, entitled "Administration industrielle et générale."

CONTROL OF MATERIALS. Using Punched Cards for Controlling Materials, A.E. Van Bibber. Am. Mach.. vol. 51, no. 7, 1919, pp. 295-300, 10 figs. Description of system used at Hog Island Shipyard, with reproduction of forms used, matter tabulated and examples of use of system.

EMPLOYMENT MANAGEMENT. Employment Management—IV, V, VI, A. Rowland-Entwistle. Eng. & Indus. Management, vol, 2, nos. 4, 5 and 7, July 24, 31 and Aug. 14, 1919, pp. 102-106. 146-149 and 203-206. 7 figs. July 24: Suggests forms for labor requisition, interview forms, and forms for keeping employment record. July 31: Applications of psychology and the reading of character. Aug. 14: Comparison of labor turnover in America and in England.
Applying Army Methods of Selecting Men for Industry, P. N. Golden. Am. Mach., vol. 51, no. 9. Aug. 28, 1919, pp. 409-411. 7 figs. Experience of army described as having resulted in prevention of much lost motion and expense by sorting out applicants for employment before they get into shop.

Heat-Treating Plant. Methodic Organization of Metallurgical Plant (Essais d'organisation méthodique dans une usine métallurgique). G. Charpy. Bulletin de la Société d'Encouragement pour l'Industrie Nationale, vol. 131, no. 3, May-June 1919, pp. 572-606. 35 figs. How Taylor system was introduced at heat-treating plant of Saint-Jacques of Montluçon.

Industrial Relations. The Works and Products of Messrs. Barr and Stroud, Limited. Engineering, vol. 108, no. 2796, Aug. 1, 1919, pp. 133-134. Administrative methods and industrial relations of works manufacturing range-finders. (To be continued.)

Job Planning. Planning a New Job, Otto Knaak. Am. Mach., vol. 51, no. 7, Aug. 14, 1919, pp. 313-316. 2 figs. Procedure of H. H. Franklin Manufacturing Co., Syracuse, N.Y., noting forms which permit co-operation between designers and shopmen in planning out sequence of operations.

Machinery Handling. Relation of Large Machine Units to Production, Arnold P. Yerkes. Trans. Am. Soc. Agricultural Engrs.. vol. 12, Dec. 1918, pp. 136-150, 1 fig. Urges extending use of efficient machines and methods on farms.

Plant Layout. The Works and Products of Messrs. Barr and Stroud, Limited. Engineering, vol. 108, no. 2798, Aug. 15, 1919, pp. 198-200, 10 figs. Arrangement of buildings. (Continuation of serial.)

Progress Department. Planning a Progress Department—IV, V, W. J. Hiscox. Eng. & Indus. Management, vol. 2, nos. 3 and 6, July 17 and Aug. 7, 1919, pp. 79-80 and 163-166. 7 figs. July 17: For motor car factory. Aug. 7: On plant manufacturing a.c. and d.c. electric motors.

Rate Setting. Time Study and Rate Setting in a Machine Tool Plant. Machy. (Lond.). vol. 14, no. 356. July 24, 1919, pp. 493-497, 8 figs. Review of methods used by R. K. Le Blond Machine Tool Co. in making time studies and setting bonus rates.

Restaurants. Plant Restaurant Managed by Employees. Iron Age, vol. 104, no. 8, Aug. 21. 1919, pp. 489-492, 6 figs. Experiment at Wisconsin Steel Works. To convince men that restaurant was operated solely for service and with no idea of profit. company turned over management of institution to employees. Plan said to have proven great success.

Scientific Management. Scientific Management—I, II, II, Henry Atkinson. Eng. & Indus. Management, vol. 2, nos. 3, 5 and 7, July 17, 31 and Aug. 14, 1919, pp. 71-73, 137-140 and 197-199, 1 fig. July 17. Its meaning and object. July 31: Its rapid rise since Taylor expounded his system before Am. Soc. M. E. an indication of its more recent tendencies. Aug. 15: On Taylor's fundamental principles of management.

Works Management. Eng. & Indus. Management, vol. 2, no. 6, Aug. 7, 1919, pp. 168-169, 2 figs. Suggestions in regard to promoting efficient organization in factory.

Application of Taylor System in large Government Powder Works (Essai d'application du système Taylor dans un grand établissement d'Etat), E. Nusbaumer. Bulletin de la Société d'Encouragement pour l'Industrie Nationale. vol. 131, no. 3, May-June 1919, pp. 495-539, 17 figs. With tables giving detailed statements of manufacturing costs.

Ship Yards. Results of Applying Working Methods in Ship Yard Employing 3,000 Workers (Resultats obtenus par l'application des nouvelles méthodes de travail dans un chantier de 3,000 ouvriers), L. Lavallée. Bulletin de la Société d'Encouragement pour l'Industrie Nationale, vol. 131, no. 3, May-June 1919, pp. 441-494, 24 figs. Noting especially forms used in keeping records of work and workmen and Indicating arrangements by which time was saved in various operations.

Sites. Some factory Sites Not Cheap, Even as a Gift. Can. Machy., vol. 22, no. 6, Aug. 7, 1919, pp. 146-148. Discussion of geographic position in relation to supply of raw material and market for finished product, transportation facilities, labor, supply, health statistics, educational facilities, and cost of land and taxation assessments, as factors for selecting location of factory.

Storeroom. Definitions for Storeroom Material, H. B. Twyford. Iron Age, vol. 104. no. 6, Aug. 7, 1919, pp. 357-359, 2 figs. Method adopted by manufacturing establishment for standardizing material and small articles.

See also Tool Stores.

Stock Parts and Their Routing, Luther D. Burlingame. Machy. (N. Y.), vol. 25, no. 12, Aug. 1919, pp. 1109-1114, 12 figs. Method said to have proven successful in actual practice.

Keeping Record of Iron in Storage, D. C. Kickler. Foundry, vol. 47, no. 329, Aug. 15, 1919, pp. 538-539, 2 figs. Recommendations in regard to taking drillings.

Sugar-Mill Equipment. Better Results by Better Management, L.W.Alwyn-Schmidt. Sugar, vol. 21, no. 8, Aug. 1919, pp. 402-405, 2 figs. Suggestion in regard to selecting equipment in sugar mill. (Continuation of serial.)

Tool Stores. The Modern Tool Stores-IV, Herbert C. Armitage. Eng. & Indus. Management, vol. 2, no. 4, July 24, 1919, pp. 99-101, 4 figs. Arrangement, organization, construction and equipment. (Concluding article).

Track Layout. Ideal Track Layout for Gravel Plant. Rock Products, vol. 22, no. 16, Aug. 2, 1919, pp. 32-33, 2 figs. Yard layout of Western Indiana Sand and Gravel Co. cited as effective design which permits handling large number of cars with minimum switching.

The Toronto Drifting Sand Water Purification Plant

By William Gore, M.E.I.C., M. Inst. C.E., M. Amer. W.W. Assoc. and William Storrie, M.E.I.C., Assoc. M. Inst. C.E., M. Amer. W. W. Assoc.

Introduction

Recently there has been put in operation what is known as the Drifting Sand Water Purification Plant for the City of Toronto. In view of the fact that this System is entirely new to this Continent, its adoption by the City of Toronto has caused wide spread interest to be taken in the principles involved, the design, construction, and operation of the Plant. It is proposed, therefore, to deal in detail with the whole scheme.

The City of Toronto is situated on the northern shore of Lake Ontario near its western end. In front of the city lies a long low-lying horseshoe-shaped island composed entirely of gravel and sand. A maximum distance of two miles separates the island from the mainland, forming a bay with eastern and western entrances 300 feet wide from Lake Ontario. The water purification plants are situated on this island as shown on Fig. 1.

The two intakes supplying the city lie immediately to the south of the island about 3,400 feet from the shore and in water about 120 feet deep, with inlets 80 and 60 feet respectively below the surface of the water. Both intakes are 72 inches in diameter of steel flanged pipe fixed to timber piles and surrounded with concrete. These intakes lead to the pumping stations connected with both the new filtration plant and an earlier slow sand filter plant. After the water is purified it passes to a pure water reservoir and from thence 72 inch and 84 inch steel flanged pipes convey the water across the island to a tunnel shaft at its northern end near Hanlon's Point and from thence across the bay through a tunnel constructed in bedded shale to the main pumping station on the mainland to be there pumped through the city mains (Figs. 1 and 2).

In 1912, the Slow Sand Water Purification Plant was put in operation, having a maximum daily capacity of 48 million gallons. The capacities of the intake pipes, the pipes conveying the water across the island, the tunnel underneath the bay, and the pumps supplying the city mains are approximately 100 million gallons per day. To bring the normal capacity of the water purification system equal to that of the piping and pumping it was decided, in 1914, to install an additional plant. On the recommendation of Commissioner of Works, R. C. Harris, the City Council awarded a contract for the complete design and construction of a plant for 60 million gallons average daily supply with a maximum rate of 72 million gallons on a ten hour period. This plant will be considered in detail.

Preliminary Investigation

In 1913, the officials of the City of Toronto carried out a series of tests on a demonstration plant of the Drifting Sand type having a capacity of 500,000 gallons per day. This plant was erected at West Toronto and was tested on water taken from the Humber Bay district of Lake Ontario (Fig. 1). The results of these tests were such as to satisfy the city officials regarding the system and were the means of finally enabling the Commissioner of Works to recommend to the City Council the adoption of the Drifting Sand Filters.

Reporting on these official tests, Col. G. G. Nasmith, C.M.G., Director of Laboratories to the City of Toronto, stated:—

Note.—Wherever the word 'gallon' is used, the Imperial gallon is meant.

"The official tests of the Experimental Filtration Plant at West Toronto conducted by us, lasted for an actual working period of 33 days. During that time daily analyses of the water before treatment on Standard Agar was 1458 per c.c., while the effluent showed 15 bacteria per c.c., giving a total removal of 99 per cent.

"B. Coli was removed to the extent of 98 per cent, while 99 per cent. of the red colonies growing on neutral red bile salt agar (Dr. Houston's formula) were removed.

"The amount of alum used, varied from .85 grains to 1.5 grains per Imperial gallon. The effluent was invariably bright and sparkling without any trace of turbidity. From these results it is perfectly obvious that this type of filter is capable of rendering any water as safe as any other type of mechanical filter known."

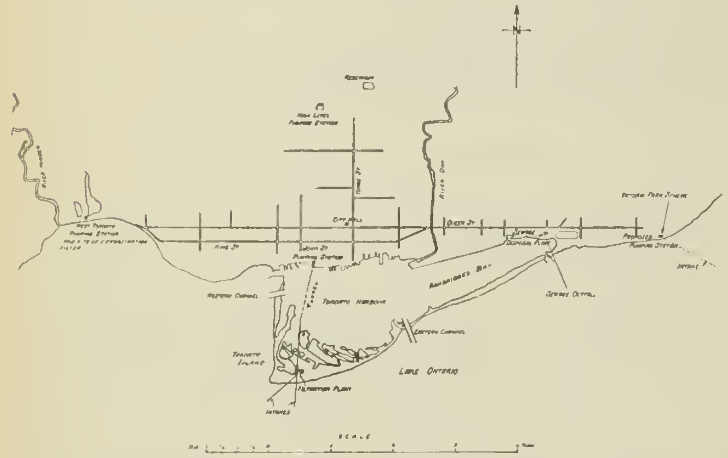

Fig. 1.—Toronto Waterworks System showing the intakes, filters, tunnel and Main Pumping Station; the sewage outfall, the proposed Victoria Park Intake and the site of West Toronto Test Filter.

Commenting on the above report, Commissioner of Works, R. C. Harris, reported to the City Council in part as follows:—

"From the foregoing, you will observe that the result of the test was conclusive, and this when filtering water from Humber Bay of uniformly bad quality, and much worse than that ordinarily found outside Toronto Island at our present intakes.

"During a portion of the time the unit was under test, we increased the turbidity of the water to a point beyond that found in the water at the intake mouth, south of the island, when at its worst. The performance of the unit under these circumstances, never met with in our practice, was remarkab.e."

General Condition

At the end of 1918 the population of the City of Toronto and neighbourhood supplied with water was estimated to be about 500,000.

The average daily consumption of water over 1918 was 63 million gallons, giving a per capita rate of 126 gallons per day.

The maximum daily consumption was 77.49 million gallons and the minimum 45.61 million gallons.

The combined capacity of the Slow Sand and Drifting Sand Purification Plants is 96 million gallons or 18 million gallons greater than the maximum daily consumption during 1918.

The following table shows the estimated population supplied, the water pumped and the per capita rate for a number of years:—

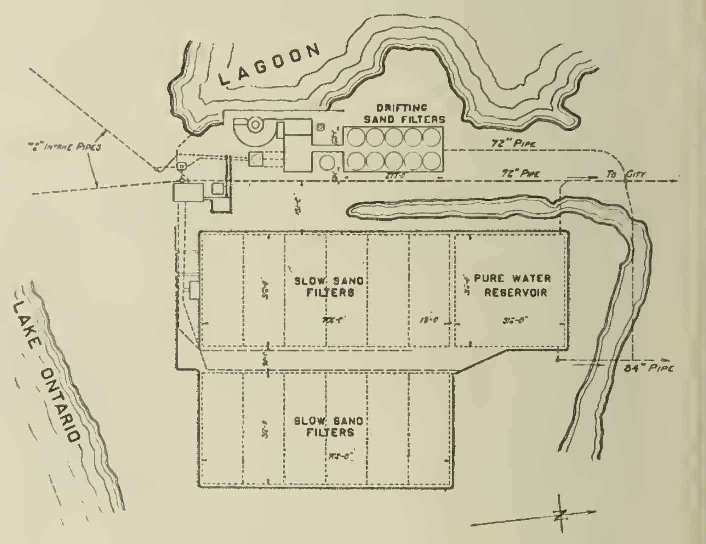
Year	Estimated Population	Daily Average	Maximum Day	Minimum Day	Average per Capita Rate
		Mil.	Imp.	Gallons	Gallons
1890	185,000	14.34	......	......	78.02
1895	190,000	18.19	......	......	95.74
1900	235,000	22.09	......	......	94.01
1905	270,000	25.04	......	......	92.75
1910	360,000	35.03	......	......	97.3
1911	374,667	40.97	60.	......	109.
1912	417,250	47.06	......	......	113.
1913	445,575	48.02	......	......	108.
1914	470,144	50.36	......	......	107.
1915	463,700	48.13	......	......	104.
1916	461,526	49.96	68.84	38.03	108.5
1917	473,829	55.76	70.25	41.8	117.1
1918	500,000	62.41	77.49	45.61	126.

Principle of Drifting Sand Filter

Before considering the Toronto Plant in detail and in order to get an idea of the principles involved in the Drifting Sand Filter, it is considered advisable to describe first of all the design and operation of a typical single unit filter (Fig. 3). The filter is of the rapid or mechanical type requiring a coagulant and is operated at the very high rate of 150 million gallons per acre per day based on plan areas.

Preliminary coagulating or sedimentation basins have not so far been found necessary. The coagulant is introduced as the water goes direct to the filters, invariably on the suction side of the low lift pump supplying the filters where same is necessary. Owing to the operation of the drifting system the sand contained in the filter resolves itself into two bodies—a stationary sand body supported by graded layers of gravel resting on the water collecting system, and a drifting sand body lying between the surface of the stationary sand and the sides of the filter unit. By causing the drifting sand portion to drift

TORONTO FILTRATION PLANTS



PLAN

Fig. 2.—Plan showing the Slow Sand Plant and the Drifting Sand Plant together with the ranging up of the pipes in their immediate vicinity.

across the path of the raw water a large proportion of the impurities are carried out along with a portion of the drifting sand. This drifting sand is washed and returned to the filter, along with the on-going raw water by the constant c rculation of the water and sand. The stationary sand body takes out the remaining impurities. In actual operation the stationary body of sand is found to be hard and compact with a cone shaped-like surface hard to penetrate. On the other hand, the drifting sand body is of a buoyant and spongy nature and offers little or no resistance to penetration. Through time the loss of head in the operation of the filter increases due to the gradual choking of the surface of the stationary sand and as often as conditions determine the whole bed is washed by a reverse flow of filtered water.

The depth of 9 ft. of sand is supported by a 10 inch layer of gravel graded to 3 different sizes. No screens are used between the gravel and sand. Enbedded in the bottom of the gravel layers is a system of sherardised pipes, having round openings in the bottom for the purpose of collecting up the filtered water and also used for bringing the back washwater to the filter.

The treated raw water enters the filter partly by a standpipe running through the centre of the unit, which passes up through a separator or sand-washer in the bottom and delivers above the sand at the top of the pipe, and also partly through a bye-pass. Within the sand-washer the raw water pipe is constructed similar to that of the tube of a Venturi meter and the drifting sand after being collected and washed in the sand-washer is inducted into the raw water at the throat of this Venturi tube. This sand passes up the standpipe with the raw coagulated water and is delivered with it above the top of the sand already there. This sand forms a volcano-like cone that continuously drifts away and is continually being replaced with the washed sand from the sand-washer, leaving a round topped body of stationary sand below, resting upon the filtered water collecting system. This body of stationary sand does the final filtration. The surface of this body is more than twice the plan area of the unit and is the actual filtering surface, thus economising the plan area of the filters. The drifting sand passes down all round the boundary of the stationary sand to a system of slots and continues through a system of converging ports to the outlets on the external extractors and thence by a system of pipes to the sand-washer. At the sand-washer the sand falls to the bottom through a current of raw water and is thus freed from its impurities. It is picked up by the inductor and carried on to the filter as previously described. The dirty water, impurities or suspended matter pass upward and out at the top of the sand-washer by an outlet suitably controlled. In the external extractors sand traps are placed of such a form that the sand is kept out of the piping system except when the inductor is in full operation. That is to say, the sand moves only when there is an abundance of running water to carry it forward to the sand-washer.

The question of sand scour is one of considerable importance. The form of the inductor is such that the sand enters the high velocity water at the centre of the stream and can only come in contact with the sides of the pipe after the sand and water have been reduced to non-scour velocities. The driving head at the inductor or sand-lifter is from 3½ to 5 feet, but the bye-pass arrangement is such that the induction may be varied either at will or automatically in such a way as to suit the amount of the impurities, turbidity and the coagulants in the raw water. In this way the greater the proportion of the total raw water passing up through the stand-pipe the greater will be the rate of flow of the drifting sand so that when the turbidity is very high the sand can be drifted at its maximum rate, while when it is free from turbidity, if necessary, the drifting can be entirely stopped. By doing this, you can physically adapt the filter to sudden changes in the raw water conditions.

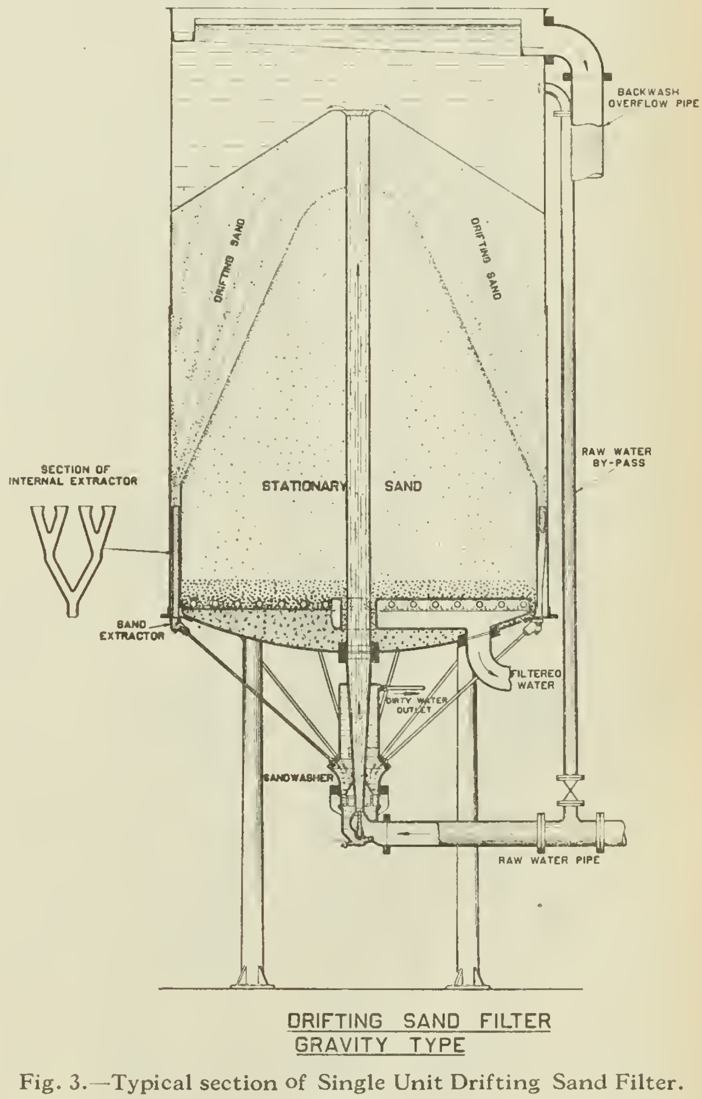


Fig. 3.—Typical section of Single Unit Drifting Sand Filter.

No rate controller is necessary as under average conditions these filters will operate for about one week. Actual practice has shown they will run anywhere from 3 days to 6 weeks without being back-washed. Fig. 5 shows typical rate of filtration and loss of head diagrams of the Toronto Plant and Fig. 6 shows the characteristic curves of the sand circulating system. The largest single unit filter so far constructed is for 500,000 gallons per day.

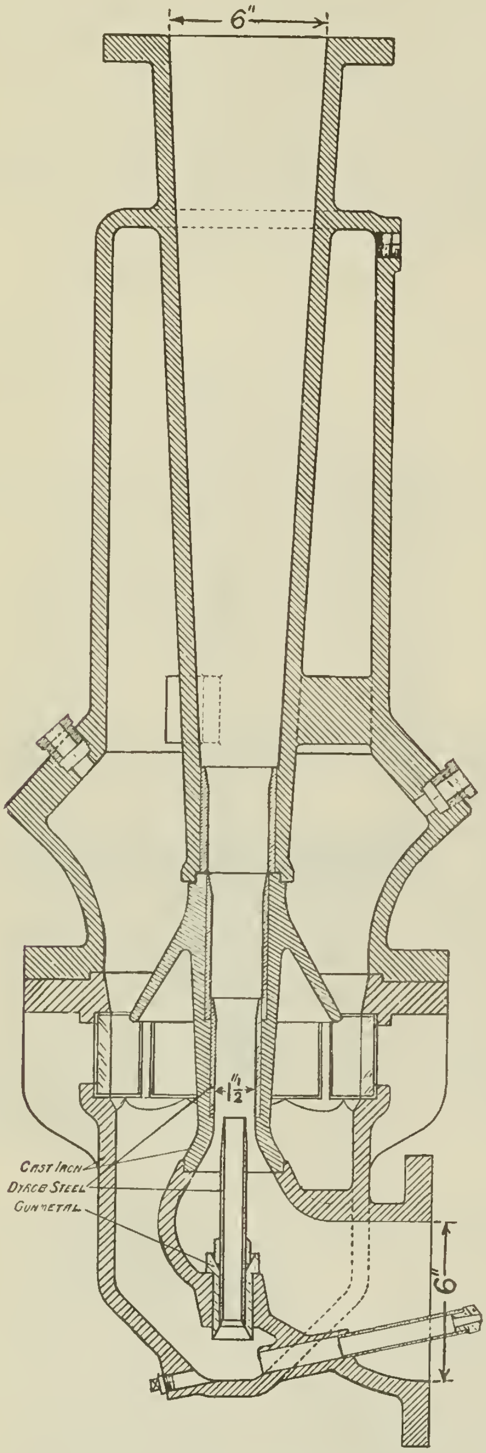

Fig. 4.—Sandwasher section.

In practice it is found that the slope of the drifting surface cone is a minimum of about 32 degrees and the slope of the surface of the cone forming the stationary sand is a minimum of about 64 degrees. These slopes increase with the rate of filtration and the age of the run. There is a minimum depth of stationary sand in each filter of 26 inches. Backwashing the filter takes place when the loss of head in the sand is about 11.0 feet.

Multiple Unit Filter

With the foregoing explanation of the principles involved in the Drifting Sand Filter as shown in a single unit the principles involved in the multiple unit filter as built in Toronto will be more easily understood.

The single unit filter is adopted where the capacities are small. When larger capacities are met with the single unit filter would not be feasible at a reasonable cost. This difficulty is overcome by incorporating a series of these units in one filter. In the Toronto design 30 such units similar generally to the one already described have been incorporated in a filter tank 50 feet in diameter built of steel and supported on cast iron columns. But tanks may be square in plan either of steel or reinforced concrete and containing any convenient number of units.

Each unit has a sand-washer, sand extractor system and inlet and outlet pipes and is separated from the others only in so far as the height necessary for the port openings containing the internal portions of extractors, down which the drifting sand moves. There is no division wall between the sand cones other than that formed by the base. Each filter thus consists when in operation of a number of separate units, containing as many sand cones with square or approximately square bases, but when the back-washing takes place these cones are entirely broken up and have to be formed again once the filter is put back in operation by the drifting of the sand.

General Arrangement at Toronto Plant

The general arrangement of this plant is shown in Figs. 7 and 8. At the south end of the plant is the suction well, to which the 2—72 inch steel intake pipes are connected. To the west of the suction well is the coal and chemical storage building and immediately to the north is the pumping station. The filter house building lying to the north is connected to the pumping station by an underground passage. To the west of the pumping station and coal-chemical house a dock with 10 feet depth of water has been constructed so as to permit of all material being brought by water to the immediate neighbourhood of the plant. A chimney and a wash water tank completes the structures.

The water comes into the suction well through either or both of the 72 inch intake pipes. These intake pipes are controlled by the 72 inch hydraulically operated valves on the end of each within the suction well. After passing through a duplicate row of screens the raw water is treated with alum from the coagulant control apparatus in the chemical house. The alum is conveyed by 2 inch lead pipes laid in a conduit and is distributed over the surface of the water in the vicinity of three 36 inch pump suction pipes in the northern portion of the suction well. From here the alum treated water is conveyed through the

36 inch suction pipes of three 36 million gallon pumps in the pumping station, and after passing through check and stop valves and a 72 inch Venturi meter the water goes into the filter house building and is there distributed to the 10 filters. After filtering the water passes into a bye-pass or inspection tank and from there to the city or to the pure water reservoir and mixes with the filtered water from the slow sand plant.

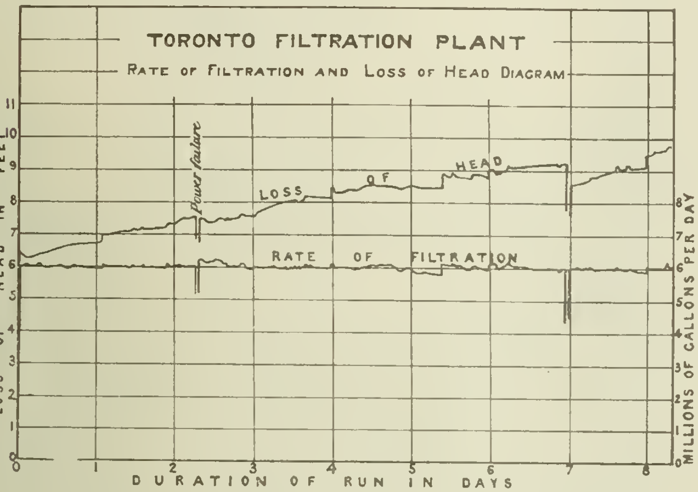

Fig. 5.—Loss of head diagram with rate of filtration diagram accompanying it.

Suction Well

The general arrangement of the suction well building is shown in Fig. 11. The suction well proper consists of a reinforced concrete structure 25 feet in diameter and 24 feet deep. This was sunk as a caisson, being built on the natural ground and having a steel cutting shoe placed around the bottom of the walls. After the concrete to a depth of approximately 7 feet had been placed in the walls and thoroughly set, the forms were removed and by excavating from the interior of the well the same gradually was lowered into position. This was carried out in three successive operations, and after the caisson was sunk to its proper level the floor of the well was placed in position. The building on top of the wall is 36 ft. square in plan and is supported by a cantilever arrangement thrown out from the walls of the caisson.

Across the centre of this well a double row of screens have been placed to prevent any large suspended matter getting from the intake pipes on the filter. These screens are built in sections each 4′ 4″ x 3′ 3″ of 16 L.S.W.G. gauge copper wire, 4 wires to the inch mesh, fixed to oak frames with sherardised corner plates and bolts. A 1 ton hand-operated jib crane 14 feet reach is fixed in the building for the purpose of removing these screens from time to time for cleaning purposes. A washing compartment has been constructed at the west side of the building and there the screens are cleaned from time to time, one set of screens remaining in position while the other is being cleaned. On the end of each of the 72″ pipes is placed a 72″ hydraulically operated valve working under 700 pounds per square inch pressure. To the north of the screens the suction pipes from the main pumps supplying the filters are placed, and at this point the sulphate of alumina from the chemical house is applied to the raw water. At the side of the well at El. 44 a surge overflow is built to take care of the surge caused by any sudden stoppage of the low lift pumps. This surge overflow is connected to the lagoon by a 60″ diameter steel flanged pipe. The type of building is similar to that described for the filter house.

Coal Chemical Building

The coal-chemical building is constructed of reinforced concrete with the western elevation facing the lagoon constructed of buff brick similar to that in the pumping station and other buildings. The coal storage, chemical storage and chemical control apparatus have all been arranged in one group of buildings almost semi-circular in plan with a frontage of 120 feet and a maximum depth of 80 feet. In the centre of this building a 4 ton crane will be operated so as to facilitate the unloading of materials from the wharf and storing same conveniently in the storage portion of the building. A storage capacity has been provided for 1500 tons of coal and 800 tons of sulphate of alumina. General stores are provided in the south-western portion of the building.

The crane will be electrically operated, of the revolving type with a 60 ft. reach, and can dump coal or alum through hatchways provided in the roof of the respective portions of the building. Owing to conditions arising out of the war it has been found impossible to secure anyone to build this crane either in Canada, the United States or Britain, but it is now being put in hand. The roof of the coal storage portion of the building is supported by reinforced concrete columns and down the centre of each column is placed a 2″ pipe branching into 4 near the bottom so that a pipe comes through each face of the column.

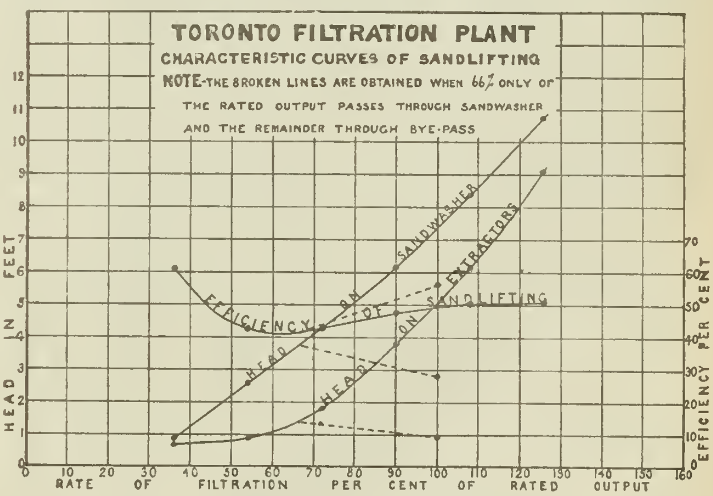

Fig. 6.—Characteristic curves showing the loss of head in the sandwasher, the lead driving the sand between the top of the extractor and the sandwasher and the efficiency of the sandwasher with various proportions of the total water being filtered passing through the sandwasher throat.

This pipe is carried up through the roof and enables the temperature of the coal to be ascertained by placing a thermometer down the 2″ pipe at any time. Spontaneous combustion has already taken place and it is noticeable that at both portions of the storage bin where same was observed that it was due to the coal being placed in storage while in a damp condition.

In the centre of the building the chemical feed supply apparatus is placed in duplicate, which automatically maintain a supply of sulphate of alumina solution proportional to the amount of water to be treated. The strength of this solution can arbitrarily be changed so as to provide any required amount from zero up to 4 grains per gallon.

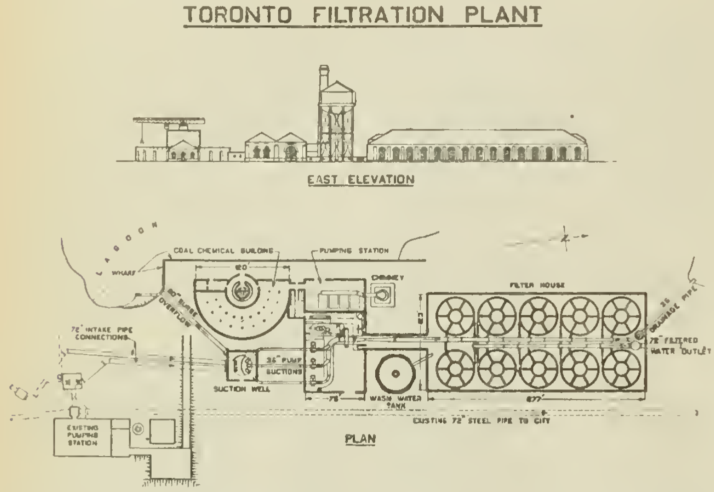

Fig. 7.—General plan and east elevation of the Works as constructed.

The dry sulphate of alumina is allowed to feed down automatically from the storage bin through eight control doors to trays in a dissolving channel maintained full of water by a ballcock in a separate compartment. The solution is fed from the bottom of the dissolving channel into a dilution tank where it is automatically diluted down to the required strength by a hydrometer-like arrangement. From this tank the standard solution is fed into a measuring tank controlled by the 72-inch Venturi raw-water meter in the pumping station through a combined electric and hydraulic relay. From the bottom of the measuring tank the solution gravitates through lead pipes to the suction well and is there distributed over the water as previously described. In the section (Fig. 9) some of the parts have been displaced in order better to illustrate their working. The annular dissolving channel tank is maintained full of filtered water from the wash water tank by a float valve in a separate compartment. From this compartment the water flows freely to the dissolving tank or channel and after dissolving the sulphate of alumina passes through a valve at the top of the hydrometer. At the same time the water also comes from the water tank to a valve at the bottom of the hydrometer. Poised in the solution between the two valves any vertical movement of the hydrometer opens one valve and closes the other. Thus it will let in strong solutions at the top and the diluting water at the bottom. Perfect balance is obtained when the hydrometer just floats. It should be noted that the solution of sulphate of alumina is heavier than water, and it is due to this fact that the apparatus works properly, not only to supply the energy to move the hydrometer, but also to mix the diluting water with the solution already in the chamber. The heavier liquid put in at the top tends to sink rapidly to the bottom, and on the other hand the lighter liquid fed in at the bottom tends to rise rapidly to the top; thus the liquid is maintained in a rapid state of circulation. The hydrometer is suspended through knife-edges from a graduated beam also carried on knife-edges and provided with sliding weights as on a weighing machine. This provides for permanent adjustment and also for altering the density and strength of solution. The scale divisions on the beam are ½ inch apart for each 1/10th grain of coagulant per gallon of raw water being treated and subsequently passing through the main Venturi meter. By simply moving a weight along a beam any desired amount of sulphate of alumina may be added to the water, any change taking place gradually. The hydrometer is very sensitive. It displaces about 6,000 pounds of solution and provides ample energy so that the strength of the solution is maintained to a degree unapproachable by any other means.

The measuring tank (Fig. 10) is of cast iron heavily coated on the inside with paraffin wax. It is circular in plan and provided with a circular opening in the bottom thereof through which passes a hollow trunk or cylinder with a slot at one side through which the alum solution passes. By raising or lowering the slotted cylinder the area of slot exposed above the circular opening may be varied so that the discharges through the slot will be proportional to the indications of the raw water Venturi meter indicator dial. This is done by the double relay, the principle of which is shown by diagram on Fig. 10. Any movement of the meter dial makes an electric contact which lifts by solenoid the supply and exhaust valves of an hydraulic cylinder, the piston of which is directly connected

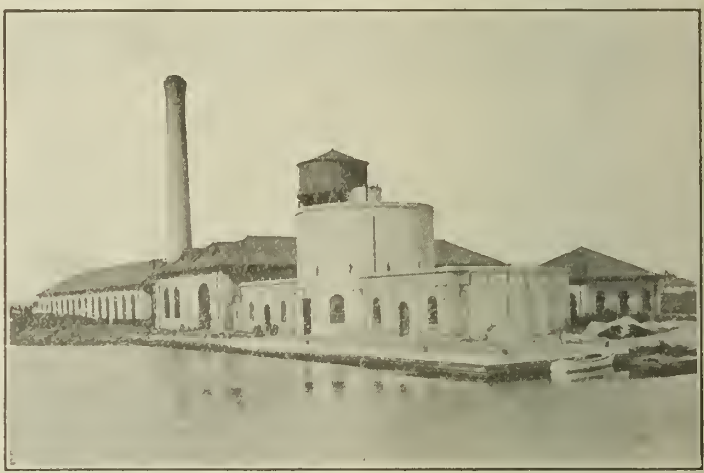

Fig. 8.—Perspective Drawing showing the whole works.

with the measuring slot. This piston moves until by a suitable connection it lifts off the electric contact when all movement ceases. As there is no direct current available a small motor generator working on the lighting circuit and delivering current to a 6 cell storage battery with control apparatus has been provided and mounted on the frame-work of the measuring tank apparatus. The hydraulic pressure of a minimum of about 25 pounds per square inch is obtained from the overhead wash water tank.

Pumping Station

The pump room and boiler room are placed under one roof and are separated by a br ck division wall. The entire bu lding is 142 feet long by 75 'eet wide and the roo is in two equal spans. The boiler room portion is 75 feet by 40 feet long and the pump room 75 'eet by 100 feet 6 inches.

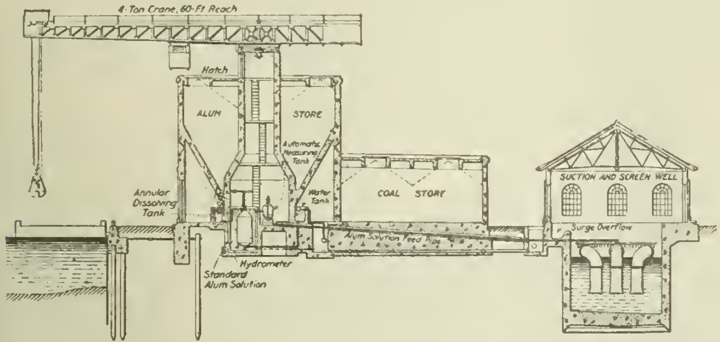

Fig. 9.—Section of the Coal-Chemical Building and Suction Well.

This pumping station is of interest in that while it is designed to operate with electric power supplied from Niagara Falls by the Ontario Hydro Electric Power Commission there has been installed a Steam Turbo-Generator Set which when required supplies electric power for the Drifting Sand Plant, the Slow Sand Plant as well as the Domestic Water Supply of the Island, and on occasion the Domestic Electro Supply of the Island, which has a summer population of approximately 10,000. The need for an uninterrupted service at this point is a real one as the available capacity under normal working conditions of the Pure Water Reservoir which serves for both plants, is under 3 million gallons or less than 1 hour's supply at present maximum rates of pumping in the city. So far as possible the power operations of the Slow Sand Plant have been transferred to and centralized in the pumping station of the Drifting Sand Plant. This has been carried out by transferring most of the auxiliary machinery from the old to the new pumping station and by the provision of the necessary switchboard arrangements in the new pumping station to operate the main pumps in the old. These arrangements make the new pumping station more ambitious than would have been necessary for the Drifting Sand Plant alone, and at the same time the capital cost has thereby been increased but the facilities of the whole system have been greatly improved and the operating costs reduced thereby.

Boiler Room

In the boiler room have been installed 4 dry back return tube Marine type Robb Boilers each of 300 horse power 11 ft. 6 inches diameter 15 feet long, provided with two 50 inch furnaces, and are designed for a working pressure of 150 pounds per square inch. The coal is brought in dump wagons and deposited on the floor and fed to the furnace by hand. The boilers are connected by 6 inch pipes to a 12 inch main header divided at its middle by a stop valve and piping arrangements so that two of the boilers alone may be made to supply steam for the plant, the other two with half the main header being completely isolated. An auxiliary steam pipe to the old pumping station has been put in for the purpose of driving the stand-by steam pump therein. Space has been provided for a fifth boiler.

To supply the boiler feed water a Smart-Turner Steam Duplex Pump 10 inches by 6 inches by 12 inch stroke double acting outside packed, has been provided which delivers through a Cochrane Heater. A 3 inch injector has also been provided.

In the pumping room the following machinery has been installed:—

(*a*) For general power purposes of the whole filter system:—

1.—Delavel multistage impulse turbine of 1800 B.H.P. running at 3600 revolutions per minute with Wheeler jet condenser having centrifugal circulating pumps and Thyssen air pump on the same shaft operated by 50 B.H.P. 550 volt 3 phase 25 cycle induction motor 1450 revolutions per minute.

The turbine is connected by a speed reducing gear of 3600 to 500 to a Lancashire Dynamo Alternator of 1200 Kilowatts capacity 3 phase, 2200 volts, 25 cycle, 500 revolutions per minute, with an exciter of 150 amperes, 110 volts, 500 revolutions per minute. Excitation is also obtained alternatively from a synchronous motor generator sett forming part of the Island Domestic Water Supply system.

All the necessary apparatus has been provided for synchronizing the alternator with the Hydro Electric system, but so far this has not been found desirable and owing to the many miles of line variably loaded and subjected to interferences between the plant and Niagara Falls, the possibility of satisfactorily synchronizing is an open question. Tests of this Turbo-Alternator Sett

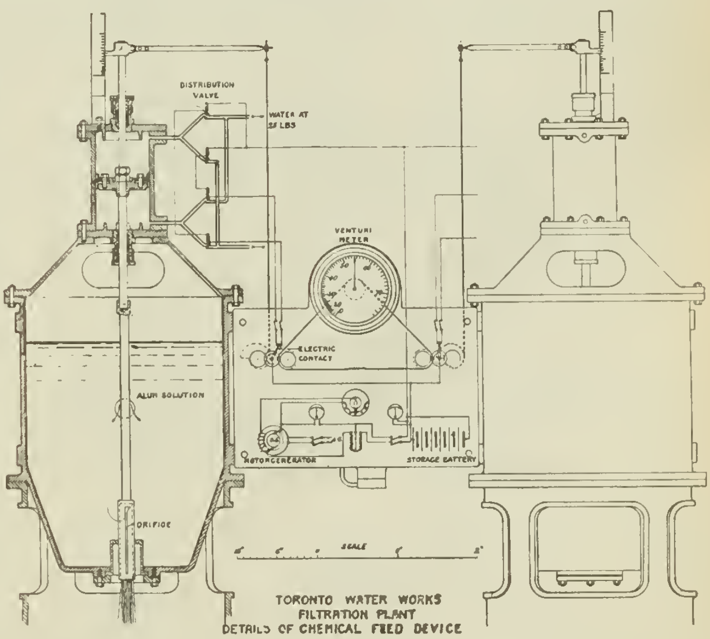

Fig. 10.—Details of chemical feed device.

showed a steam consumption of 17.90 pounds per kilowatt hour at full load with a steam pressure at the turbine of 123.8 pounds per square inch and of 19.94 pounds per kilowatt hour at half load with a steam pressure of 128 pounds per square inch. During the full load test the steam contained 1.94 per cent of moisture of which 1½ per

Fig. 13 shows the characteristic curves of one of the 36 inch pumps, which lift the water from the suction well to the filters It is to be noted that the highest efficiency shown by this pump amounted to 86 per cent, which is remarkable. These pumps are erected upon a floor at a lower leve than the general floor to permit of a low suction lift and direct undershot delivery without vertical bends and enables the 72 inch raw water main and 72 inch Venturi meter placed therein to pass just under the main floor levels. All the centrifugal pumps are without foot valves but check valves and gate valves are provided on the delivery sides. The gate valves on the main 36 inch pumps are operated hydraulically from a switchboard platform either by hand or automatically by a pilot valve device moved by a float riding in a chamber connected up with the water levels of the filters.

The Turbo-Generator platform is raised above the general floor level. Its platform forms a step and a means of access between the general floor level and a raised platform 13 ft. 6 inches wide running along the boiler room end of the pump room and along part of its northern side, which carries the three switchboards and gear, 72 inch Venturi Indicator Recorder Meter and water level and pressure recorders, telephone, office accommodation and pilot valve device for controlling the 36 inch gates on the delivery side of the main pumps. All the high pressure work

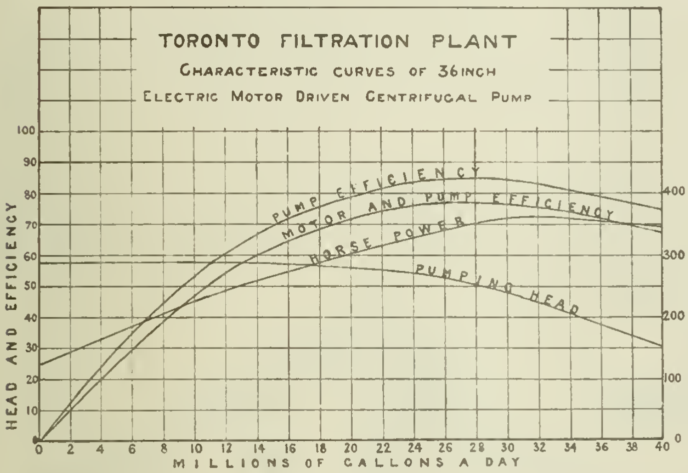

Fig. 13.—Characteristic curves of a Main Low Lift Pump.

(550-2200) volts, busbars, switches, etc., are either mounted at or on the division wall between the pumping and boiler room and the oil immersed switches are operated by remote control with bell crank levers and connections under the Switchboard platforms. The switchboards themselves are in three groups with panels of blue vermont marble. The first group of 15 panels controls the turbo-alternator and the drifting sand pumps. The second group of 10 panels controls the slow sand pumps in both stations, and the starting transformers for all 2200 volt motors. The third of 7 panels controls the domestic water supply of the island and the plant lighting system. These switchboards are accessible with wide spaces on all sides. Underneath the switchboard platform are placed the necessary transformers for the 550 volt motors for starting the 2200 volt motors and for lighting.

Filter House Building

The filter house building is 277 ft. long by 123 ft. wide. It is connected up to the pumping station by a corridor which provides a covered access and serves to carry part of the 72″ Venturi meter and its continuation as a 72 inch raw water main and several smaller mains. The building contains 10 steel filter tanks arranged in two rows, each tank being 50 ft. in diameter and 14 ft. deep with a normal rated output of 6,000,000 gallons daily. Between the two rows of filters is the piping gallery, on top of which is the operating gallery. This operating gallery extends the full length of the building, in the centre and at the same level as the top of the filters. The whole building is divided into 3 spans. The roof over the operating gallery is composed almost entirely of wired glass, which gives it a well-lighted appearance.

The floor and the walls up to within 1 ft. of the finished ground level are built of reinforced concrete. As the building is below lake level and, therefore, subject to upward pressure the foundations had to be designed so as to prevent any lifting of the building due to the water standing around the walls. It was not safe to let the water rise around these walls to lake level until such times as the filters inside were completed and loaded with the filter sand. The load was then of such a nature as to more than counter-balance the upward hydraulic pressure. The building is built of buff coloured pressed brick with steel sash windows and steel trussed roof. On top of the roof boarding has been placed Ludowici-Celadon tiling of a red colour, which gives a very pleasing appearance. The main entrance is at the south end and from this level one stairway leads up to the operating platform and one leads down to each side of the filter house to give access underneath the filters. Somewhat similar but smaller stairways are provided at the north end and midway there are steel ladders on either side of the gallery.

The filter house building is constructed similar to the pumping station and suction well buildings previously described.

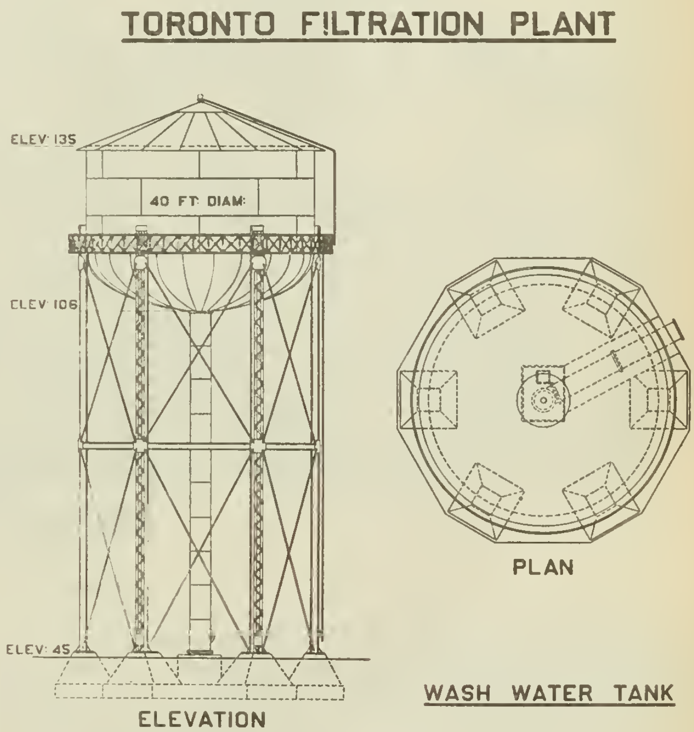

Fig. 14.—Overhead Wash Water Tank.

The 50 ft. diameter filter tanks (Figs. 14 and 15) are constructed of steel plates $\frac{3}{8}$″ thick at the side and $\frac{1}{2}$ inch thick at the bottoms. Each tank has a central opening 16 feet 8 inches diameter, leaving an annular plan area of 1745 sq. ft. between the two vertical cylinders 14 ft. deep. In forming the bottoms of these tanks the annular space is divided up into two rings, the inner ring being again divided by radial lines into 12 compartments and the outer into 18 compartments, making a total of 30. Each compartment has a dished bottom of

½ inch plates and sides of ⅜ inch plates carried to a height of 3 feet. The compartments are all rivetted up together and to the inner and outer tank cylinders at the edges at the bottom, with ½ inch over-lapping strip plates, leaving spaces on all sides of 2¼ inches width. In between these spaces the internal portions of the extractors, that is the converging cast iron ports, are placed and cemented therein The dished bottoms are concreted up level to form a support for the under-drain system, gravel and sand.

Each of the 30 compartments form a separate approximately quadrilateral unit with sand extractors, sand-washer, and filtered water collecting system. Each tank is supported by 120 cast iron columns, one being placed towards the corner of each of the 30 compartments. The columns are of such a height to provide for the necessary piping and proper access under the filters.

Overflow channels 15 inches wide varying in depth from 3 ft. 5 in. to 2 ft. 6 in. are placed all the way round within the 50 ft. and without the 16 ft. 8 in. cylinders together with 6 radial channels and provides a total length of overflow sill of 364 feet. Each has an independent outlet but in addition the channels are carried through from tank to tank to get a more free discharge.

Partly embedded in the concrete in the bottom of each compartment is a cast iron collector for the filtered water. Running out radially from this collecting pipe is a series of 1½ inch W.I. sherardised pipes, having ⅜ inch holes drilled on the underside spaced about 6 inches apart. These pipes have a sherardised cap on the outer end, and the inner end is screwed into the cast iron collector. About these pipes is placed rounded gravel in 3 grades—varying from ¾″ to 3/16″—to a depth of 10 inches and above this the filter sand to a depth of 9 feet. This sand is well rounded water-worn sand containing some limestone, the remainder being mostly quartz; some was obtained from pits in the vicinity but most was obtained in the immediate neighbourhood of the works. It was all passed through screens of 14 meshes per lineal inch; it has an effective size of .35 to .4 mm and a uniformity coefficient of about 2. The sand was prepared on the site, the material too coarse being eliminated by a system of mechanically operated screens working with about one-third of the depth of the screens immersed in water The sand that was too fine for filter purposes was rejected by washing out in the preliminary preparation of the sand or by back-washing after it was placed in the filters. Each filter contains 600 cu. yds. of sand.

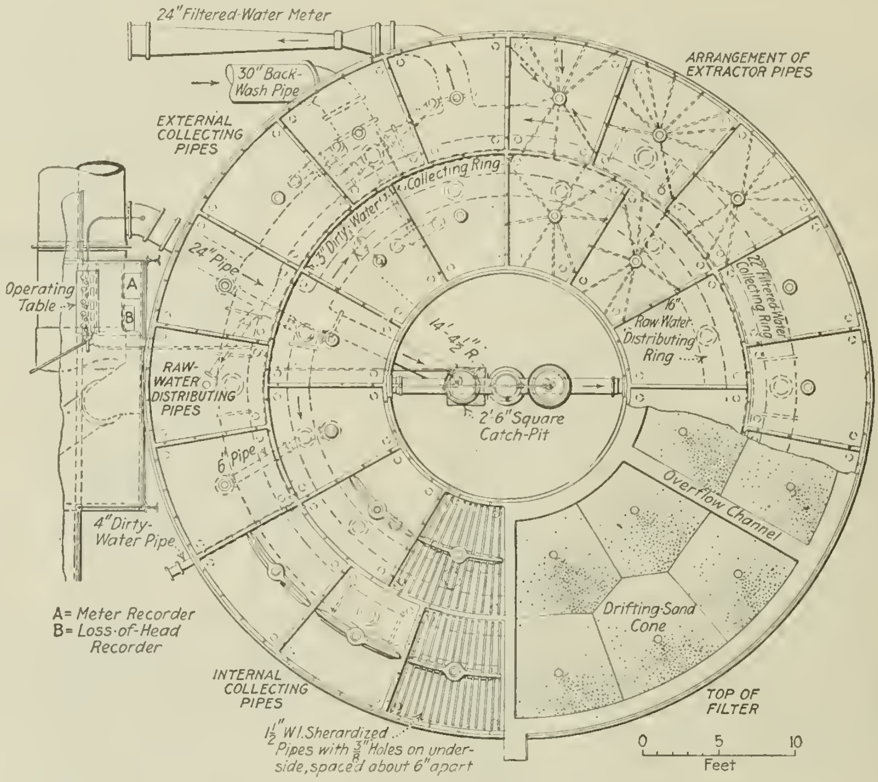

Fig. 15.—Plan of the filter.

The drifting sand is withdrawn from the filter by a system of converging ports of cast iron, termed extractors, down which the drifting sand flows. These extractors pass through the bottom of the filter unit; at this point the port has a vertical kink in it which acts as a sand trap for the purpose of withholding the flow of the sand to the sand-washer when the system is not in operation. At this trap a water jet furnishes the necessary amount of water to carry forward the sand to the washer through internal ½″ actual diameter W.I. pipes, and underneath the part of the sand-washer where each pipe discharges a glass inspection port is provided. In this way the flow of the sand from each can be observed.

The sand-washers are of cast iron as shown on Fig. 4. The throats are relined as shown from time to time with W.I. pipe liners in 3 steps. These liners are hardened right through by the Dyrob process. These last a minimum of four months continuous wear before renewals. Most of the scour observed has been traced to a tail eddy which forms at the back of the sand nozzle by the water passing it and modified sandwasher bases are being installed, from which much longer runs are anticipated.

The raw water goes to the filter partly through the 30 sandwashers and partly through a 16 inch bypass controlled by a water ballast loaded relief valve, which also acts as a float regulator. By increasing the water ballast a larger proportion of the water entering the filter passes through the sandwasher accelerating the drifting of the sand; on the other hand any level of the water is maintained by the float which is carried on the reverse end of the lever, holding down the relief valve by the water ballast tank. This apparatus works with the pilot valve device controlling the main pumps. The filter gate valves are 24″ diameter operated hydraulically from a white marble operating table with nickel plated fittings. A 24 inch Venturi meter is placed in the filtered water main with indicator recorder and register placed together with a loss of head recorder behind the operating table, each apparatus being self-contained. The dirty water from the sandwashers and from the overflow channels pass by independent raised drains to a measuring tank with recorder at the north end of the filter house and away to the lagoon. The backwash rate provided was for 24 inches vertical rise per minute, but 18 inches have been found sufficient to liquify the whole of the sand. As the floor of the filter house and some parts of the other buildings are below the level of the lake drainage pipes are embedded in the concrete floors which discharge to a drainage well in the pumping station, where the water is taken care of by the vertical axis drainage pumps.

Chimney

To carry the flue gases from the four boilers, a circular hollow brick chimney has been constructed 123 feet high and 7 feet inside diameter at the top, all as shown on Fig. 8

The foundation of the chimney is constructed of reinforced concrete, 11 feet deep, with a base of 30 feet square, tapering to 20 feet at the top. On this concrete foundation a rectangular brick structure has been erected, carried up to a height of 25 feet. This rectangular portion of the chimney is faced with buff coloured pressed brick so as to conform with the brickwork in other buildings. On top of this the circular chimney is placed.

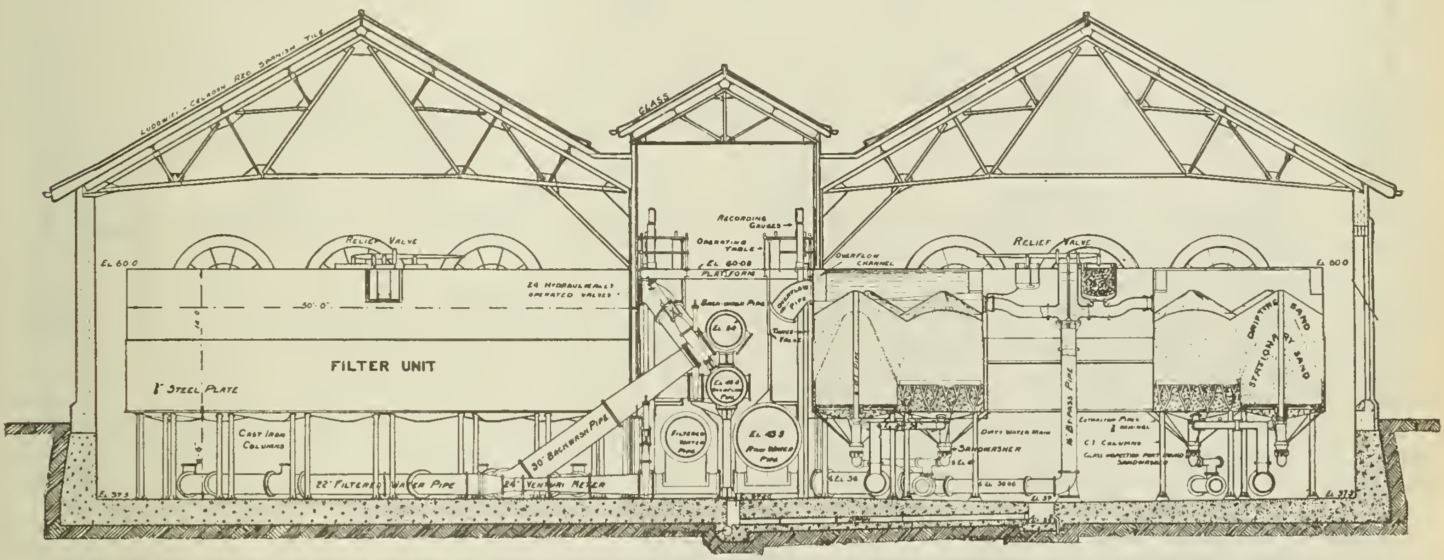
Wash Water Tank

For the purpose of back washing the filters a steel tank has been erected, having a capacity of 200,000 gallons. The tank is 40 feet in diameter with 19 feet sides, an elliptical bottom 10 feet deep, and supported on steel columns. The tank is elevated 60 feet above the ground level. Two pumps each with a capacity of 500,000 gallons per day are provided in the Pumping Station for filling the tank with filtered water. The maximum rate of discharge from the tank is 31.4 million gallons per day and for this purpose a 36″ outlet upstand pipe is provided. A 2″ steam pipe is connected to the 36″ upstand pipe to prevent freezing during cold weather.

The tank foundation consists of a concrete mat on which are erected the concrete pedestals to support the steel columns.

Wharf

On the western side of the plant a wharf, having a total length of 373 feet, has been built. This wharf allows the material necessary for the operation of the plant to be unloaded in close proximity to where it is needed, and also acts as a protection to the coal-chemical



SECTION THROUGH FILTER HOUSE

Fig. 16.—Section of filter house

and pumping station buildings. The face of the wharf is constructed of steel sheet piling 23 feet long, behind which is driven two rows of timber piles 26 feet long for the purpose of supporting the reinforced concrete wall. This wall is 7 ft. high, 5 ft. wide at the base and 2 feet at the top. About 20 feet behind the face of the wharf timber piles have been driven in pairs for the purpose of attaching 2 inch anchor tie rods, which are connected to the face of the steel sheet piling.

A depth of 10 feet of water is maintained in front of the wharf, and in behind the filling is of sand and gravel.

Steam Heating System

All the buildings have a steam heating system installed of the low pressure vacuum type. The steam is obtained from a valve on the boiler header and passes through two reducing valves. The first valve reduces the pressure to 80 pounds and the second to 10 pounds per square inch. No unusual features occur in the lay-out of the system generally, except in the filter house where the large surface of the steel tanks and water area had to be taken into consideration. The glass surface on both sides of this bulding is large and attention had to be given to the matter of wind pressure on the filter house tending to drive the heat to the opposite side of the building, thus causing inequality of temperature. The total amount of radiation provided is approximately 18,000 square feet, most of it being in the filter house where 15,000 square feet is provided. Except in the filter house a temperature of 70° Fahr. is maintained when the outside temperature is zero.

In the filter house the temperature is maintained at 50° Fahr. when the outside temperature is zero. The floor of the filter house is 8 ft. below the surrounding ground level and also on the average 4 ft. below the lake level of the water surrounding the walls on the outside. On the ground floor a system of radiators suspended to the walls under the windows have been provided. Similar radiators are provided on the operating gallery and immediately under the skylight windows of the central roof. Additional heating has been obtained by running a series of pipes attached to the underside of the roof trusses. The heating of the entire building is controlled from a point in the centre of the operating gallery. The main steam line coming from the boiler room is 9 inches in diameter. The control system is such that heat can be cut off from any section.

A 8″ x 10′ x 10″ vacuum pump is installed in the Boiler Room for drawing the returns from the system from under a 10 inches to 15 inches vacuum to a header installed in the boiler room. This pump is controlled by a vacuum governor. All main steam lines are covered with an air-cell covering.

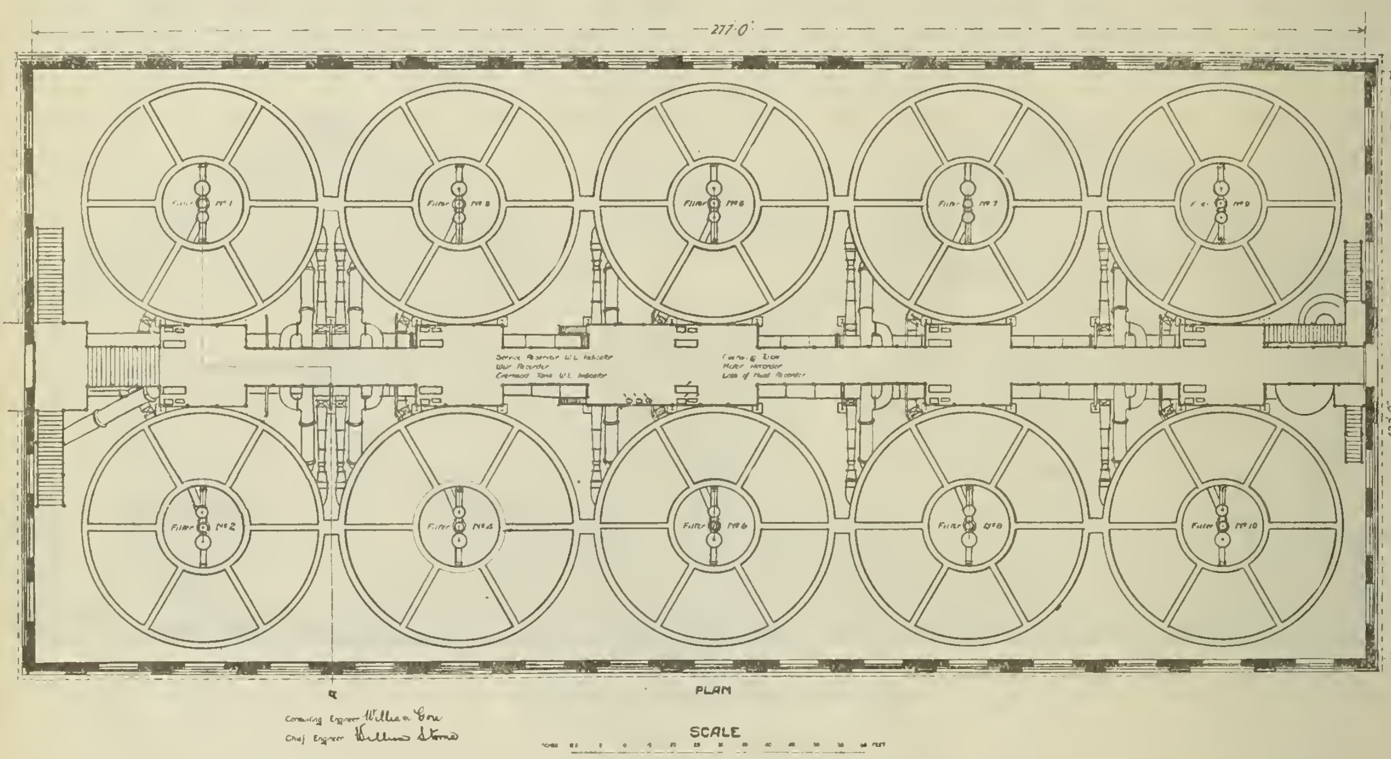


Fig. 17. General arrangement of pipes in filter house.

Lighting System

The lighting is on the 3 wire 110-220 volt single phase distributing system. The main control is on the third switchboard platform in the pumping station and the distributing mains are run from this switchboard to the various buildings. The wires are carried in galvanized conduits. On the whole the lighting system is simple, consisting in most of the buildings of 40, 60 or 100 watt lamps with reflectors The suction well is lighted with a cluster series of 5—100 watt lamps. In the pumping station, besides local lighting, there are 10 wall brackets each with 200 watt nitrogen filled lamps and angle reflectors. In the filter house there is one cluster light containing 5—100 watt lamps over the centre of each filter unit equipped with special reflectors. There is also a system of local lighting over each operating table and along the central gallery, and provision has been made for lamp sockets for use underneath the filters. The wharf is illuminated by a series of 9—300 watt lamps mounted on brackets fixed to the walls of the pumping station and coal-chemical buildings.

Cost of Plant

The contract sum amounted to $1,066,282.00 and the Extras to $11,408.43, making a total cost of $1,077,690.43. It is as well to point out that this includes the complete cost of designing and constructing the plant including all equipment but excludes the cost of the city's engineering and inspecting staff on the works.

Operation of the Plant

The raw water as obtained from the intake pipe varies greatly in chemical content, bacteriological count, turbidity and suspended matter. These fluctuations are relatively sudden, sometimes changing several times from extremes in the course of the day. The direction of the wind and past history thereof determines the nature of these fluctuations. Most of the city sewage is discharged after partial settlement into Lake Ontario at a point about 4 miles to the east of the waterworks intakes. When an easterly wind occurs for any length of time the intake pipe receive considerable pollution from this source. Unless the wind is high and the surface of the lake rough this heavy pollution is accompanied with very litle turbidity except during the spring thaws when the whole lake front may be turbid. When the wind blows strongly from the west or south-west there may be high turbidities without great pollution. The amount of alum to be applied to the raw water is determined largely by the ree ammonia contents which correlate fairly well with the bacteriological contents. At other than laboratory hours a judgment is made from past experiences of the effect of the wind on the water The turbidities from clay brought down by the spring thaws require much less alum than equal turbidities due to fine silica caught up into the water by wave disturbances of the foreshore. A complete scale has not yet been determined. The silica turbidities also choke up the stationary sand in filters much more quickly than the clay turbidities.

Official tests were made during December, 1917, and January, 1918, and the results are given in Appendix 1 attached to this paper. These speak for themselves. In this appendix is also given some particulars of laboratory tests. These tests with Lake Ontario water point to two important conclusions; that the colder the water and the cleaner the alum the better were the corresponding bacteriological efficiencies.

The works described above were designed by the John verMehr Engineering Co. Ltd., and were constructed by that Company jointly with the William Cowlin & Son (Canada) Ltd. The writers acted as Consulting and Chief Engineer respectively for the former Company. R. C. Harris, Commissioner of Works, G. G. Powell, B.Sc., M.E.I.C., Deputy City Engineer, James Milne, M.E.I.C., Mechanical Engineer,in charge of the Water Works System and A. U. Sanderson, B.A.Sc., looked after the City's interests while the official bacteriological and chemical tests were carried out by Col. G. G. Nasmith, C.M.G., Director of Laboratories and N. J. Howard, F.C.S., Bacteriologist and Chemist in Charge of the Filtration Plant Laboratories.

Moisture-proofing Aeroplane Propellers with Aluminium Leaf.

It is well-known that wood is a hygroscopic material. For instance, wood stored out of doors in the northern United States will retain 10 to 12 per cent. of moisture and, in the drier and more arid districts, such as the States along the Mexican border, will possibly retain only 5 to 6 per cent. on the average.

If, then, a propeller is constructed under certain conditions and shipped to localities which are drier or damper, it will absorb or lose moisture according to the new atmospheric conditions. As a result it will lose its balance, and the wood will shrink or swell and otherwise distort the blade.

A moisture-proof coat, therefore, is exceedingly desirable—(1) to produce a propeller unaffected by moisture changes, and (2) to utilize cheaper and more abundant woods such as gum, red oak and other common native hardwoods.

An extensive series of tests on moisture-proofing was made, including tests of many different types of coatings such as spirit, oil and cellulose varnishes, enamels, linseed oil and wax treatments, impregnation treatments, and sprayed and electroplated metal. None of these coatings proved to be entirely satisfactory, but as a result of the tests an exceedingly effective and easily applied coating was developed in the form of a layer of aluminium leaf incorporated between coats of varnish.

A diagram showing the effectiveness of aluminium leaf coating compared with the effectiveness of various other coatings is given. It shows the absorption of moisture to be almost negligible compared with the maximum specified when the U. S. A. entered the war. The tests were made by exposing test penals in an atmosphere of relative humidity 95 to 100 per cent. and taking their weights at regular intervals.

Proceeding, the articles describe in detail, and with illustrations, the method of applying the aluminium leaf, which is exceedingly thin and light, there being about 12,000 to 15,000 leaves per inch. The leaves are in 4 to 5½ in. squares.

For open grained woods a coat of filler should be used, after which an undercoating of shellac varnish should be applied. Next comes the size on which the aluminium leaf is placed when the size has become "tacky". After the application of the leaf two coats of a shellac colour varnish should be applied, followed by a finishing coat of aeroplane spar varnish. The compositions recommended for filler, size, and varnishes are given, and it is suggested that in certain cases it might be desirable to use oil varnishes or enamels in lieu of the shellac. This modification would result in a more durable coating, but would necessitate a longer time for its application.

Heating Problems Produced by some of the Modern Methods of Building Construction

The early history of the modern sciences is more or less legendary and traditional, which leaves much to surmise. The primitive races in the valleys of the Tigris, Euphrates and the Nile, were many decades upon their way towards civilization, as we know it, before we began to learn anything of their history. This we know, however, that as the human family grew, it spread out and there are now branches of the original peoples in every quarter of the globe with remnants of their ancient mythology still observable. Sufficient for our purpose is the fact that we find human beings living under remarkable and severe conditions. The Esquimo in the far north, who is compelled to go without fire for months at a time, and the people of the Tropics who never see snow, and know nothing of frost. The ranges of temperature are from 60 below Zero, to 120 degrees above—a full range of 180 degrees in the extremes.

The civilization of every country has been largely determined by the geographical conditions; the characteristics of the land and climate in which any race dwells, shape the mode of living and thus influence their intellectual culture.

It is said of Egypt that the climate is equable and of warm temperature, snow and frost being wholly unknown, while storm, fog and even rain are rare. This is true in a measure of the other valleys, so that whilst some protection against heat was necessary, there was no necessity to provide against inclement weather, hence the climate developed the qualities of their architecture.

The mention of the use of fire in their history is largely the sacrificial fires of their ancient philosophy. They recognized the part which the sun, the source of heat and light played, recognized it to this extent that it was a large part of their religion. The following extracts from a book on their ancient philosophies serves to show the veneration of that great luminary:—

"The Syrian damsels sat weeping for an Adoni, mortally wounded by the tooth of winter." Adoni was the name of the mythical creature representing the sun. Indeed the worship of the sun was the basis of all ancient religions. Almost every nation in the cradle of the human race had mythical beings whose strength or weakness, virtues or defects more or less described the sun's career through the seasons. To those ancient peoples light and heat were profound mysteries, as indeed they are to us. As the sun caused the day and his absence the night, when he journed north, spring and summer followed him, and when he journed south, autumn, inclement weather, cold and long dark nights ruled the earth. As his influence produced the leaves and flowers and ripened the harvest and brought the regular inundation, he necessarily became to them the most interesting object of the material universe, author of life, heat and ignition. The sun was to them the efficient cause of generation, for without him there was no movement, no existence, no form. He was the inate fire of bodies, the fire of nature. He was to them immense, indivisible, imperishable and everywhere present. It was the need of his light and heat and of his creative energy that was felt by all men and nothing was more fearful than his absence. The sun's influence, so beneficient, caused it to become identified with the principal of all that was good."

North to them was the place of death. The abode of winter and desolation, and naturally so because with such an easy means of livelihood as was provided by irrigation and the fertile land of the valleys mentioned, there was little incentive to explore beyond in the unknown north. But as time marched on and with the development of the present day civilization, we find in the north temperate zone, the place once looked upon with fear and trembling by the simple-minded ancients, the greatest race on the face of the earth, the Anglo-Saxon, whose sons successfully fought the enemy under every sky and in every climate, in peace as well, we can proudly think of the achievements of Scott at the South Pole, Perry at the North, Livingstone and Stanley in the heart of Africa, and countless others, and more intimately to Civil Engineers, Colonel Everest, who, nearly a century ago began the wonderful trigonometrical survey of India. As mentioned before our geographical location has had a great deal to do with the development of that wonderful and mysterious "power of resistance," in fact the medical fraternity has coined the phrase very much as we more generally speak of "the Human factor."

Going over the history of architecture, practically nothing is mentioned about any system or systems of heating, except in isolated cases. Quite evident the earliest race adapted themselves by food and raiment to withstand the extremes of temperature; but there are instances such as the Roman Thermae or Baths of Rome, particular mention is made in a non-technical way to the system, the remains of which are found in the Baths of Caracalla, here is found hot water and warm air heating, but note the difference from the methods employed to-day. The heated air was passed through a system of tile ducts under the floors, and did not enter directly into the room. The hot water was circulated around the rooms in open troughs covered with a bronze grating. These baths served the same purpose as our modern Turkish bath.

An extract from Architectural History on the Wonders of Roman Architecture regarding the use of Fountains, is quoted here. "Additional interest was given to the interiors by the perpetual streams of running water issuing from the mouths of sculptured lions in marble or brightly polished silver falling into capacious marble basins and producing a delicious cooling effect in the hot, sultry weather." The significance of this will be dealt with later.

It, however, remains to be said that the use of brassiers, burning charcoal was more generally the means of heating in cold weather. The remarks often made regarding fine raiment worn by these people refers only to that used while inside, when outside they clothed themselves with coarse heavy garments.

Referring to England in the 14th Century, mention is made of the open fire in the center of the building in that part known as the "great hall," provision being made in the roof by louvers to carry off the smoke. Later on a greater increase of warmth was found necessary, as greater comfort was demanded, and the opening out of the coal industry by cheapening fuel, led to each room having an open fire-place with chimneys, which later on became architectural features carefully treated. In the time of Elizabeth the great hall fireplace was richly carved with the coat of arms of the owner. For physicological effect, huge tapesteries and draperies with their warm colors were hung about the walls and, it is said, that in winter, straw or rushes were strewn over the floors of these great baronial halls.

It will be seen that the open fire has come down through all the ages and still plays a part even to this very day. Much sentiment is attached to this system of heating, the sole benefit of which is derived from the radiant heat of the fire.

Stoves made of cast iron on the principle of an open fireplace improved the effect by the addition of exposed heating surface, making the result obtained more economical and less wasteful.

The advent of steam, and the progress made in the last few generations, have made their demands upon all branches of applied sciences. The demand for more effective and more efficient heating and also the necessity of more applicable methods at the same time minimizing the fire hazard, has brought about the development of the various systems we have to-day. Their modern application is very recent, with their rapid growth on more or les unscientic lines. Briefly and generally we make use of the elements air and water.

The sun is nature's heating plant and accomplished all the things the ancients attributed to it. Man's substitute was the open fire. Your own observations of the effects derived are easily recalled. In both cases it is the application of direct heat of a radiant kind, so intense at times as to blister and burn the parts of the body exposed to it, yet with only minor effect on the surrounding atmosphere.

The systems of heating now involved in engineering problems and applied to our modern buildings are of a vastly different character. We use circulations of water, the vapour of water and air with the application of some of the basic laws of physics.

Applying heat to a building in these days is not only to keep body and soul together, and supply warmth and comfort, but is in reality the attempt to create ideal summer conditions in winter. In fact we might go still further . . . rob winter of its cold and summer of its heat. In other words producing an equable climate, conducive of the best results of maximum attainment or production, with the minimum of stress and fatigue.

Benefited by the experiences of the past we have today efficient and rather wonderfully contrived systems of heating, vastly improved.

Many conditions arise that require special treatment. The adopting of any one particular system to meet all conditions is hardly practicable, therefore a study of the exact conditions as they exist or may come into existence, is the first step in the design of a heating plant. We have for choice heating by hot water, by steam, or by warm air.

Hot water heating is divided into several classes, ordinary open tank gravity circulation, accelerated circulation by putting a system under pressure, and forced circulation by means of circulating pumps. The first is usually applied to residences or small buildings, the second is merely an attempt to create a more rapid circulation and extend the effectiveness to include a greater area. Each have their field, principally where constant heating is required. The wide range of temperatures, available in the heating medium, make these systems flexible enough to meet all the usual winter conditions, and when the piping system is properly installed, give good results. Of course, with such a slight force exerted it is necessary to keep well within the limits laid down by the laws of gravity. Forced circulation combines all the advantages of the ordinary gravity system and at the same time overcomes all the restrictions of the same. It has many commendable features, particularly flexibility, as the water temperature may be varied over a wide degree and even the circulation increased or decreased slightly making it further adaptable. The arrangement of the piping may be anything that will accommodate itself to structural conditions:—pipe sizes are small and the radiating surface need not be so generous as in the case of the gravity system. It is a system well adapted to certain kinds of central heating as the grades of the piping can follow the natural grade. All special apparatus required, in fact everything except piping and radiators can be located at one point, at all times under the observation of the man in charge. Where the waste heat of exhaust steam is available as is generally the case, it is used to heat the water and the condensation is returned to the boiler feed pump, without having to first travel all through the heating system and radiators. It obviates the necessity in underground conduits of having drips and drip traps at low points and inaccessible places. But, like all other systems, has disadvantages and limitations, it must be kept in operation constantly in cold weather to prevent freezing up at the most exposed parts.

The proportinating of the piping system for forced circulation of hot water involves a rather nice, intricate problem in hydraulics, the difficulty experienced is increased by the lack of data on the friction of small piping, steam fittings, valves, etc., at low velocity, all of which must be considered in order that the circulation be adequately equal to and well balanced with centrifugal pumps designed for the exact head, so as to operate noiselessly and without vibration. The motive power is usually direct connected steam turbines with the exhaust steam passed into converters and used to heat the water, a separate live steam heater being provided as a make-up when the exhaust is not sufficient and as a standby.

There are instances where the boilers are used as hot water boilers and the water circulated by motor driven pumps. There are also cases where the jacket water from large gas engines is utilized.

Regarding steam plants, there are also classifications. The simple one-and-two pipe systems, supplied direct from low pressure boilers, or from high pressure lines through pressure reducing valves or, supplied direct from the exhaust side of an engine. The principal weakness of these one-and-two pipe systems is the tendency of air binding and short circuiting, frequently causing the condensation to be held in suspension, giving rise to the annoyances of water hammer.

With the gravity return system, where steam is taken direct from the boiler and the condensation returned back by gravity, the boilers must be set low enough to give clearance between the water line of the boilers and the lowest point of the mains, sufficient to provide against flooding the mains by the deferentials of pressure between the flow and return.

With systems supplied through pressure reducing valves, or from exhaust, the condensation is usually returned, for economy to a hot well or receiver, to be returned to the boilers as feed water.

As mentioned before, air-binding is the chief difficulty. Steam will go anywhere it is piped, without much urging if the air can be easily displaced.

The systems just mentioned are dependent upon automatic air valves to vent the air from each radiator and other parts of the system. The best of these valves are delicate in their parts and adjustment, the orifices in some cases being as small as a needle and are easily put out of commission by the accummulation of dirt or grit, either from inside or outside the system. Two pipe systems with hand operated valves on both flow and return, are easily upset. If some person happens to close either valve and forgets to close the corresponding valve, in some cases requiring a complete shut down to allow the water accummulated, and held back in the system to flow out. Aside from hammering and banging in the system, these vents are liable to sputter and spit water occassionally, or hiss steam, to the decided annoyance of the occupants of the room. These conditions have been slightly improved by the use of an air line system in which all venting valves were coupled to a system of small piping and connected to a vacuum pump or exhauster, of which there are numerous types.

The more improved and the latest development are two pipe vacuum and vapour systems, in which each radiator is equipped with a radiator trap at the return end of the radiator which passes condensation and air only, into the system of the return piping, and closes against the escape of steam. Similar traps of larger capacity are provided to relieve the mains of condensation at the extremities and at intermediate points where necessary.

The most successful radiator trap is the thermostatis disc type, which is actuated by the temperature of the steam. The disc contains a volatile fluid especially compounded to respond to wide ranges of temperature and is hermetically sealed. The disc is always deflated when cold so the trap is always open, except to the passage of steam.

Both vacuum and vapour systems are almost identical in design. Where the magnitude of the plant demands, the condensation and air are pumped out of the system, creating a low vacuum making it possible in the case of exhaust steam heating to do away with any back pressure. In either case they are essentially non-pressure systems, as invariably the piping is designed for a deferential working pressure of from 4 to 16 ounces pressure. These plants will safely carry or operate up to 10 lbs. pressure, or will work on 8 to 10 inches of vacuum, but no advantage is gained; with the increased pressure, a slightly higher temperature is available, but only slight. With the higher vacuum, unless everything is absolutely tight, the vacuum pump is required to do the extra work of pumping the infilitrated air out of the system. Vacuum systems may be extended to include almost any number of buildings requiring to be heated from the one source and is easily made adaptable to overcome any conditions or obstacles. Its general use is the outcome of experience gained, and offers possibly the greatest opportunities of effecting the highest economies. One distinct advantage with vacuum or vapour systems is the fact that when the plant is not in operation no possible harm can be done to either it or the building by freezing up

The first cost of installation is also in its favor.

We now come to warm air heating, laying aside the ordinary domestic installation, there is found in very general use, hot blast systems, in which the heated air is circulated by blowers. Examples of these installations are found in machine shops, foundrys, roundhouses and other establishments in which there are tremendous leakages of air by opening large doors. There are, however, examples of blower heating systems, which have been brought to a very high degree of refinement, in which the air is carefully conditioned, all dust and impurities removed and a stated degree of humidity and temperature maintained under automatic control. These systems are applied to schools, theatres, auditoriums, churches, art galleries, etc., of the more expensive kind, as well as certain factories for special process work.

It may be said that for certain classes of work and certain conditions requiring to be produced, blowing heating offers the greatest advantages. For instance in the Ford Plant, the heating was accomplished by locating the apparatus on the roof with the ducts run along, branching off and passing down through the centres of the columns, discharging air through small openings for each floor, thereby occupying practically none of the cubical contents or floor space of the building.

By the use of air washers it is not only possible to provide clean, pure, humidified air in winter time, but it is also possible to cool the air on hot summer days, making the plant effective both summer and winter. This is particularly true in textile fabric weaving plants, where the necessity of a proper atmosphere brought about the development of the modern air washing apparatus, which, scientifically applied to some of the principles used by the Romans in their fountains. In the air washer, cooling by evaporation is the chief principles.

Time does not permit any lengthy discussion of any particular application of these systems, they are, however, intensely interesting and worked out on rather unique lines. The application of these systems require skilled judgment of a mature and well-reasoned kind being used in order that the economy and the best results are obtained. Combinations of this with other systems are frequently used to obtain certain results.

law of supply and demand which holds the trunk of the tree in place more firmly than it can the branches and if you succeed in raising the trunk above its natural position, you will get the same result as if you had lifted the old apple tree out of its position so that the roots could not take up the nourishment necessary for life. Under present abnormal conditions, machinists are receiving from 60 cents to $1.25 per hour, while house carpenters and painters may be working for 40 to 60 cents, locomotive drivers on fast trains have for years received over twice as much per hour as the Superintendent who was responsible for the passengers, not only on one fast train, but possibly on a hundred other trains. The possibility of artificially increasing the cost of articles produced by skilled labor is my reason for not including more of these articles in the list of those making up the value of navillus.

PART V

How it will Work.

You may say this is alright as a theory, but how could such an idea be put into practice? Not a very difficult matter. All that is necessary is for any Government that has control of the making of contracts to pass laws embodying the following ideas;

> A bill for the equitable equating of the value of letters of credit and promises to pay, which change in value on account of the fluctuation of the value of the dollar.

SHORT TITLE

An Act to Stabilize the Measure of Value Necessity.

People and Governments entering into long time contracts suffer great damege and sometimes financial ruin by their obligations becoming greater on account of the *appreciation of the value of the measure of value.*

Object

To stabilize the measure of value so that no injustice be done the maker or the payee of long time notes or contracts by the fluctuation in the value of money and further to make the average value of a dollar during the past two years the unit of this more stable measure.

Article 1 On and after date of passage of this bill, the unit of value for all time contracts shall be navillus.

Article 2 The value of the navillus shall be as set forth in Schedule "A."

Article 3 All contracts involving the promise to pay a consideration in the future where the time is six months or more shall be written in terms of navillus and the payment of both the principal and interest on same shall be in navillus.

Article 4 In all life insurance policy notes, bonds or other forms of contracts involving the payment of a consideration in the future, which were written since January 1st, 1916, wherever the word dollar or dollars appear it shall be changed to navillus and the interest or premiums on all such contracts shall be payable in navillus.

Article 5 If at any time within the next ten years, the holder of any life insurance policy, bonds or other form of contract involving the payment of a consideration, desires that payment be made in navillus instead of dollars, he may apply to any court having jurisdiction for an order authorizing the change, and t shall be the duty of such court to issue an order that the words dollar or dollars mentioned in the consideration be changed to navillus, unless there be some circumstance or conditions connected with the contract, that in the opinion of the court, would make the issuing of the order an inequitable transaction. After the date of the order all premiums or interests on bonds or other like contracts shall be paid in navillus. All of the above subject to the application for the order being made two years before the date of the expiration of the contract. Once an order has been issued neither party will have the right to ask or have the terms of the contract reverted to the former state, it being the intention of this act that in as far as possible all contracts written with dollars as the consideration shall be changed to navillus, but that under no circumstances shall a contract be written with navillus as a consideration be changed to read dollars.

Article 6 The Government will at once appoint a commissioner of finance, whose duty it will be to keep a daily record of the prices of the various items at the various points mentioned in Shcedule "A." At the end of each three months from the average price during that time he shall announce the rate of exchange between navillus and a dollar. This rate of exchange shall be proclaimed by the Government as the legal rate of exchange for the next three months and during that time all payments of whatever nature, be they premiums on life insurance interest on notes or bonds or final settlements made on account on contracts, the consideration in which is written in terms of navillus shall be made at this legal rate of exchange.

Article 7 By a vote of three in favor to one against the change, changes can be made in Schedule "A" by the Legislative Representatives of the people when legally assembled for the enactment of laws.

Article 8 It will be a criminal offence to be parties to any agreement or contract not in accordance with this bill or having for its object the nullification or evasion of the intent of this bill, and upon conviction of such crime the penalty will be imprisonment for a term not less than five years up to life sentence with any fine that the court may see fit to impose.

PART VI

Discussions of Objections.

It would be utterly impossible to guess at and discuss all the objections that may be made to this proposition, but we will anticipate a few of them:

The most important will be the general claim that such a plan would revolutionize business, demonetize gold or turn business topsyturvy.

Quite the contrary, gold is not demonetized, it is an excellent medium of exchange, no laws are proposed to be changed, 23.22 grains of gold still remains the standard value of a dollar. All business is done in terms of dollars and cents, cheques issued as usual, the only difference in the banking of the country, is that when you give a note to the bank for a period of over six months, at prices it is considered they should sell at the present time so that to start with the Navillus equals the present value of one dollar.

Let it be distinctly understood that what is proposed is *not a new medium of exehange, that is, money or its equivalent.* All business will be transacted exactly as at present only that *The value of promises to pay will be equitably equated by means of the proposed new measure of value, Navillus.*

Sehedule " A "

Typical schedule of proposed navillus, (Unit of Value)

Navillus Equals price of:

- 0.1 parts or .023 grains of gold at New York.
- 0.8 parts or 3.400 grains of Silver at New York..
- 0.1 parts or .004 grains of Platinum at New York.
- 3.0 parts or 2.0 oz. of Copper at New York.
- 3.0 parts or 6.0 oz. of Lead at New York.
- 3.0 parts or 5.0 oz. of Spelter at New York.
- 3.0 parts or 4.0 oz. of Tin at New York.
- 6.0 parts or 3.36 lbs. Steel Rails at Pittsburgh.
- 6.0 parts or 4.44 lbs. Pig Iron at Pittsburgh.
- 5.0 parts or 25.00 lbs. Anthracite Coal, Scranton.
- 5.0 parts or 30.00 lbs. Bituminous Coal, Pittsburgh.
- 5.0 parts or 6.65 lbs. Portland Cement, Mill N.J.
- 10.0 parts or 2.75 lbs. Wheat at Chicago.
- 5.0 parts or 2.50 lbs. Corn at Chicago.
- 4.0 parts or 3.40 lbs. Oats at Chicago.
- 3.0 parts or 1.80 lbs. Barley at Chicago.
- 2.0 parts or 0.33 lb. Flax at Chicago.
- 1.0 part or 0.60 lb. Potatoes at Rochester, N.Y.
- 1.0 part or 0.80 lb. Apples at Rochester, N.Y.
- 6.0 parts or 0.50 lb. Prime Steers at Chicago.
- 4.0 parts or 0.33 lb. Prime Hogs at Chicago.
- 4.0 parts or 0.33 lb. Sheep at Chicago.
- 5.0 parts or 0.33 oz. Wool at Chicago.
- 5.0 parts or 2.5 oz. Cotton at New Orleans.
- 4.0 parts or 8.0 oz. Sugar at New York.
- 3.0 parts or 1.5 oz. Best Coffee at New York.
- 3.0 parts or .75 oz. Best Tea at New York.

100.0

In the above typical example we have a measure of value in the writer's mind a thousand times more stable than 23.22 grains of gold.

The most pessimistic advocate of the gold standard who will admit that the value of gold can vary, will have to admit that there is not an item in this list but what is intrinsically of as much if not more value to the world than gold. If that is admitted, why then is not any item on the list, with the exception of the two perishable ones (apples and potatoes) just as good a measure of value as gold? If that is so, Navillus is at least twenty-five times as stable as 23.22 grains of gold, even that ratio would be a good start towards an improvement. There are a few other features of this example that should be elaborated on, the idea of allotting different proportions to different items is to give the more important of the necessaries of life more prominent positions. Wheat being a universal food and grown over the greater parts of the world, is given the centre of the stage, potatoes and apples being perishable articles, are given a less prominent part. The precious metals being the least essential items on the list are given still less to say in the measure of value. The relative stability of the Navillus (with only 27 items instead of two or three hundred that could be taken) will be appreaciated by a study of this example. You will see that gold would have to appreciate in price a thousand times, that is, 100,000% to make the value of navillus double or increase 100%. Wheat, the most important item would have to increase tenfold or 1,000% to double the value of navillus. It is plain that if the number of items be increased tenfold that the fluctuation of the price of one single item will not appreciably affect the value of navillus. These proportions are only suggestions that would be corrected when a hundred or more other items were added to the schedule, also the prices would have to be given careful study. It would not be right to put steel in at the abnormal price at which it is now selling, something like four times the price of 1896, when we do not believe the value of the dollar has depreciated in that ratio, however, that feature would not be so important, for if a price was taken too high or two low, it would simply have the effect of giving a less or greater part to that item in the determination of the value of navillus. The important thing is to get the total at the start to represent a value of navillus that it is intended it should have. Another feature is that instead of giving one market point, the average price of the market at several centres should be taken, for instance: wheat instead of the price at Chicago, Should be the average price at Chicago, Minneapolis, Duluth, Fort William, etc. Other items should be treated in like manner. It will be noted that finished articles have in general been omitted from the list, the object of this is the uncertainty of conditions that may result from further development of trades unionism. To better illustrate the idea, let us imagine a tree of labor instead of the family tree which is made to appear like the old apple tree. The trunk of such a tree would be common labor, the very top would represent those who had achieved all their ambitions and could go no higher, the rest of the world's workers would be represented by the intervening branches among which would be the skilled laborers. On such a tree you can, by artifical means, raise these branches above their normal level the same as you can those of the old apple tree, but the minute you attempt to raise the trunk you meet with an almost irresistible force which is the

It has been said on good authority:—"The laborer is worthy of his hire" and "Thou shalt earn thy bread by the sweat of thy brow." The writer believes that in free countries like the United States and Canada, governed by the will of the people, that the laborer doing a fair day's work is rightfully entitled to compensation sufficient to support himself and family in comfort and besides have enough to buy some of the so-called luxuries of life. It may occur to some that a fair day's labor could be used as a measure of value (note that the writer has dropped the word "Standard" as he cannot suggest any measure of value that would be worthy of the name "Standard") that would not be such a bad idea if there was any way of determining what is a fair day's labor; the employer would measure it by results, that is amount produced. The unionized idea is to get your name on the pay-roll for as much money as possible for the least amount of time and for the smallest amount of production. Aside from this condition there is the matter of efficiency.

The writer was severely criticized one time by his superior officer because some Swede laborers loading ties on flat cars at piece work were making six times the wages of common Italian laborers. His cation was approved when it was shown that the contract price was one third the cost of loading the ties with common Italian labor. We are not trying to prove that one Swede is as good as eighteen Italians, for the case might have been just reversed if the Italians were working at piece work and the Swedes on time. Another feature is that the efficiency of labor is inversely proportional to the price of labor. Ask any old roadmaster in the United States or Canada how many ties on an average he can put in the track per man to-day when the wages are from $3.00 to $3.50 per day, and how many he was able to put in per man when the wages were $1.50 per day.

There has been enough said to show why this God-approved feature of our economic life is not a good measure of value, but it suggests to the writer's mind a measure of value, that is, make the object of this "sweat" namely, the necessities and luxuries of life the measure of value. Our opponents will say at once why you oppose the free silver idea and that only proposed two standards, while you propose a thousand or more. That is not the case; we only propose one measure of value made up of a hundred or a thousand parts. Remember that there is a vast difference between a thousand armies composed of one man each and one army composed of a thousand men and we know which one you would prefer to face.

Now to develop the idea, if the free silver people had said:—A dollar equals the combined cost of:

11.61 grains of gold
412.5 grains of silver

they would have been, in the writer's mind, a long way on the road to improvement: Note further that the value of silver is placed at commercial value at that time and not at the fictitious value the free silver people would give it, the idea being that it is not advisable to change the value of the measure from what it is at the time you change laws.

Had the would be reformers of that time gone a little further and said:—Value of the dollar shall be ten cents worth of the following ten metals, that is,

One dollar equals the cost of:—
- 2.32 grains of gold at New York
- 82.5 grains Silver at New York
- 100 lbs. of coal at mine
- 11 lbs. of Steel Rail at Pittsburgh
- 3.3 lbs. of Lead at New York
- 1 lb. of Copper at New York
- 2.5 lbs. of Zinc at New York
- 8.3 oz. of Tin at New York
- 16.5 lbs. of Pig Iron Pittsburgh
- 0.5 lbs. of Aluminum at New York

We cannot believe that the dollar of to-day would be worth only 50% of the value of the dollar of 1896. as we must all admit is the fact. If you were asked which metal in the above list could the world best afford to give up if it were necessary to dispense with the use of one, the unanimous answer would be gold. Does that not go to show that gold is the least valuable in the list as a standard? If you were to increase your army ten fold with all better men than the original unit, have you not an army to resist attack more than ten times as strong as the original unit?

PART IV

A Proposed Improvement.

What has been said will illustrate in a general way the writer's idea of how the measure of value can be improved, but instead of taking ten items, take a hundred or a thousand if found advisable, but give more prominence to more important items: That is, make the things that we live for the measure of value. Give the important necessaries of life a larger factor in the making up of the unit of value. What shall we call this unit of value? A dollar? No. That will lead to more confusion. Exchange would be a logical name, but on account of that word having different meanings, depending on the specific use, it might also lead to misunderstanding, so for want of a better word let us call the unit of value "Navillus," it has no significance and means nothing in itself, but it will do for a name and will be used in the remainder of this paper to mean the unit of the measure of value. In order to more clearly illustrate the writer's idea, the following assumed value of Navillus is given, taking only 27 items instead of a hundred or more that a properly constituted investigation commission would doubtless use and further no argument will be put forward for the absolute correctness of the comparative importance given to various items, nor to the price that various items are quoted at, only to explain why more importance is given to some items and less to others. In this example the unit is divided into one hundred parts, if it was thought advisable to divide it into a thousand equal parts all that would be necessary is to move the decimal point one place to the right in the column of parts taken. If it was thought better to have the sum of the parts in unity, all the change to be made would be to move the decimal point two places to the left in the column of number of parts. It will be noted that the figures in the column of parts taken of each item equal the number of cents worth of that article clothing and luxuries of life go up, measured by the gold standard, your wages go up accordingly. The answer to that question is easy. If the business of the world was done on a cash basis, that is, if there were no mortgages, bonds or long time notes, it would not make such a vast difference except to the idle rich or the comparative few living on fixed incomes, but our motto should be:—"The greatest good to the greatest number." As an example: In good times we have what is termed inflated values and money is easy, although strange to say, interest rates are high, in other words credit is good. Most everybody has some credit and that is the time the poor man is tempted to buy a home or use his credit in undertaking some other obligation at inflated values, promises to pay high rate of interest and may, as an example, agree to pay $20.00 per month. He is getting, say, $4.00 per day and with the aid from the family, who are working at good rates, he is able to meet his obligations and live; then comes hard times and his wages are cut to $2.00 per day and that of his family in proportion. What happens? He is now compelled to pay 40% of his month's wages while he only contracted to pay 20%. Mr. Gold Standard Man, do you mean to tell me that this man is only paying what he actually agreed to pay? We cannot believe it, for we see the result every day in hard times, homes of the poor sold under the mortgage or the life insurance allowed to lapse.

Speaking of life insurance reminds us of another example in that line: Some twenty years ago a very popular form of insurance was one payable in a twenty year 5% gold bond with coupons. At that time such a bond was worth from 130 to 140 and the insurance companies charged premiums on that basis, that is such a policy cost 30% to 40% more per thousand than a similar policy payable in cash. What has happened? To-day Government Bonds in the United States bearing 4½% selling less than par, in Canada 5½% bonds are selling less than par. Look at your daily paper for the quotation of gilt edge 5% and 6% bonds. Is the policy holder whose policy expires now getting the value of his money? Most emphatically no. You may state that these examples quoted might have worked in the opposite manner. Yes they might, but they don't. The poor man does not undertake an obligation in hard times and if the insurance companies were to issue such a policy to-day, the chances are that they would look out for such contingencies by placing the rate high enough to protect themselves. However, as was said before, it is the most good to the greatest number that we are after and that brings us to the main issue.

Most Governments of the world are spending money like the proverbial drunken sailor, only more lavishly and with far worse results, the destruction of property and in the taking of human life. Every man, woman and child on earth must help pay for this waste. In what kind of money are we going to pay this debt? Can there be any fault found with the debtor who pays the equivalent of what he received? There is only one way to keep that debt uniform and that is to devise some means of keeping the present purchasing value of 23.22 grains of gold on the same basis as it is to-day. There never was a more opportune time when less hardship would be brought about by such a move for the reason that large manufacturing industries are now adjusted to the high prices if you will it that way or to the reduced value of the dollar as the writer views the case. The transportation interest of the United States and Canada are adjusted or being adjusted. The only large interests that would seriously suffer are street railway companies and the owners of gold producing properties. The rates of the former could be adjusted by the Government and the latter might be compensated in some way by reductions in taxation. Officials working for the Government or Corporations on an annual salary would be adversely effected as they are at present, but that is a minor detail that would soon adjust itself.

PART III

What is the Remedy?

This is a matter that must be carefully through out and no move made without giving due consideration as to what the effect will be of every movement. Let us profit by the experience of the last great movement, having as its object the adjustment of the Standard of Value. As an illustration of the fickleness of public opinion, the writer happened to be on Robert Street, St. Paul, Minn., in the summer of 1894, when a branch of Coxy's Army marched through the street, among that company was one colored gentleman. An old colored woman standing close to the writer called out: "Come out of dat, you nigga, youse no business with dat white trash." At the corner of the street they halted and one of their number harangued the crowd with the usual rot you would hear from such a man. He was hissed by the crowd who gathered there through curiosity. Two years later when the writer attended a public political meeting in Spokane, Wash., and listened to substantially the same arguments that the hobo used in St. Paul, clothed in a little better English by a man who later became a United States Senator and he was cheered to the echo by what appeared to be an intelligent audience.

To-day, only twenty-two years later, a man who would preach "Demonetization of the People's money" "Crime of 73" or "Cross of Gold" would be looked on as a brainless wind bag. Let us take a warning and go cautiously in this matter, but on the other hand fearlessly. If after careful study we come to the conclusion that 23.22 grains of pure gold is not an unalterable and unchangeable standard of value, let us not be put off by the adherents of that standard who may say if driven too hard. Yes we know gold is not an unchangeable standard, but what better can you suggest? This is a fair and reasonable argument and it is the problem that we have to solve. At the present time there does not appear to be any physical thing in nature or anything controlled by natural laws that can be taken as a standard of value, the same as are found for other standards of measure mentioned in the beginning of this article. Therefore, for the present, failing to find any unchangeable standard, the next best thing is to try and improve what we have.

Criticism without constructive ideas is of very little value and in order to start the movement and to bring out discussion, the writer will give you his ideas of how he thinks the standard of value can be improved.

Can the Standard Measure of Value be Improved?

PART I

Existing Conditions.

Now that war conditions are such that people are begining to think the end is in view, it is time that stock be taken and plans made for the future.

Scientific men have long since devised standards for the measuring of time, distance, weight, quantity and other physical features of nature that are measurable with such degrees of accuracy that we can tell to a minute years in advance when an eclipse will take place. If all the yard sticks, clocks, scales and measures of quantity in the world were suddenly destroyed, the standards on which they are based are so scientifically designed that all the measures could be reproduced exactly as they now exist, in other words, all these measures are based on unchangeable standards. On the other hand, have our bankers and financial men succeeded as well in their attempts to make a standard for the measure of value? Have you ever met a thinking man who would even argue that the standard of value gave satisfactory results? This general dissatisfaction with the standard of the measure of value is my excuse for bringing this important matter to your attention in the hopes that with your minds trained along economic and scientific lines, you engineers will not only help to win this war but may help in showing our Government and those of our Allies how to more easily bear the burdens imposed on them by this terrible war.

The writer wishes you to consider carefully the next three or four paragraphs, for therein you will find the basis of all my arguments and as there is no desire or object to be gained by any untrue or misleading assumptions, it is necessary that we approach this subject from a correct point of view and start from a correct base.

The writer's conception of a correct standard is something that is unchangeable by any artifical means: to illustrate by an example:—the circumference of the earth or any definite part of the same, at the equator at the sea level is a fixed distance that man or any laws that man may make cannot change; now the earth's crust may be shrinking or expanding, in that case nature would slightly change the distances mentioned. The basis of the standard of time is the time it takes the earth to make a complete revolution on its axis. No act of man or laws made by man can change that time.

The present so called standards of value are not in a class with those mentioned above, on the other hand, they are subject not only to change by act of man, but they also fluctuate and change from other causes. This last statement will be challenged and by large numbers. Possibly half of the people in the United States and Canada believe that 23.22 grains of pure gold is an unalterable standard of value.

Let us analyze this point:—23.22 grains of pure gold to-day will purchase only 50% or 60% of the necessaries and luxuries of life that it would purchase during the period between 1893 and 1896. The gold standard man will say that is because the prices of everything else has changed. The value of a dollar is the same because it represents 23.22 grains of gold which is an unchangeable standard. Did it ever occur to you that he may be mistaken and that there is a possibility that the value of 23.22 grains of gold has depreciated 40% to 50%? To a thoughtless man the argument of the gold standards advocate appears reasonable and more so from the unfortunate fact that in this case alone the standard is to a certain degree also used as a medium of exchange.

In the United States and Canada the writer would expect to find that over 99% of the business transacted is done through the medium of notes in the shape of paper money and by cheques, which in themselves have no intrinsic value. The use of the standard as a medium of exchange leads at once to confusion, so many are apt to think that they are one and the same thing, while as a matter of fact, *there is no need or necessity why the standard of value should also be used as a medium of exchange.* Suppose for the sake of argument that there was no such thing as gold: the world would go on just the same, there would be the same commerce and business done as at present, and if it were to be decided what would be the standard of value, some might suggest a bushel of wheat; such a suggestion would to-day be met with ridicule and derision, but stop to think a minute, is not wheat a million times more useful to the world than gold? It can be stored and kept for a long space of time. You say no. We must have a precious metal for a standard. Well, what shall it be, iron, lead, zinc, silver, platinum, mercury, coal or what? The gold standard man tells you that none of these would do for a minute because they all change in value. That settles it if they change in value, then we must admit that they are not a standard. But in what particular does any of these vary from gold? None whatever, only that the most of them are more useful than gold and would, therefore, make just as good if not a better standard. Suppose that the dream of the alchemist would come true and he was able to cheaply change clay to gold. What then becomes of your gold standard? You will answer that such a thing is absurd and that even if it should transpire that it would be an unusual occurrence. Even so it proves that 23.22 grains of gold is not an unchangeable standard.

There are gold producing properties that paid well in the past that are idle to-day. If the owners turned the properties over to the miners they could not work them for the reason that although they are producing your standard of value with the same amount of exertion as before, what they would produce would not to-day clothe and feed the producers.

PART II

Why an Unchangeable Value is Desirable.

You may agree that the value of 23.22 grains of gold is a variable measure of value and still ask what real difference does that make? As the cost of living, These are the factors commonly treated to determine the size of the radiators, glass, wall and air changes. Incidently a room of this character would have, in winter weather, a complete air change, due to infitration directly, and from other sources, of approximately once every thirty minutes.

In the process of off-setting these heat losses, the cubic contents of the room in the air contained, must carry the heat content necessary to provide for the loss and leave as a net result, the desired temperature for comfort, usually measured five feet from the floor (the breathing line) at a point near the center of the room, where the average will prevail.

It is easy to imagine still further what the result will be if the barrier between the inside and outside be rendered less effective by increasing the glass area and decreasing the insulating qualities of the wall construction; greater heat must be added to the cubical contents to supplement the extra loss; getting further away from natural atmospheric conditions.

The excessive heating required to meet some of the conditions becoming more common every day, causes a rather serious dispersal of the humidity contents, and this tendency leads to nervous irritability, lassitude, dryness of the throat and nasal passage, additional strain on the glands secreting moisture, also the effect of decomposing the organic matter in the air, giving it that dry, burnt, stuffy sensation; also natural dust robbed of the neutrilizing effect of the humidity, causes irritation.

The amount of moisture contained in a natural atmosphere of 70 degrees, is generally about 5 to 6 grains per cubic foot, corresponding roughly to 50-60 per cent saturation. The amount contained varies considerably, at 32 degrees for instance, 100 per cent saturation will give only 2 grains per cubic foot, and at zero, only .5 grain, so that with air at 30 degrees outside and a natural humidity of 60 per cent. the effect of heating this air up to 70 degrees, reduces the humidity to about 15 per cent, or less than the dryest climate known.

The variations in humidity give rise to the sensible temperatures registered by the body. It has doubtless been observed that certain rooms are comparitively cool at a high relative temperature, while other rooms are warmer at a lower temperature. On examining the psychrometric chart, 58 degrees at 60% humidity corresponds to 75 degrees at 30% humidity, both of these would maintain the same sensible temperature as far as the body is concerned.

The deduction resolves itself in to this: If the character of the exposure and construction produce high transmission losses, we depart far from the natural conditions; the comfort zone creeps higher up the scale, necessitating higher inside temperatures being maintained, increased cost of heating plant, increased expenditure of fuel.

If in designing and constructing our modern buildings, more thought be given to the insulating qualities of the materials used and even if, in the choice, the first cost be slightly increased, there will be good returns on the extra outlay. It will be saved in plant, fuel, etc., and at the same time the effect upon the artificial atmosphere will be less drastic, adhering closer to the natural, lessening the physical strain of adjusting ourselves to the conditions that must, of necessity, be produced that we may carry on.

These remarks are directed particularly to the industrial situation, as there is an earnest desire on the part of everyone to create better working conditions.

The human factor is the vital problem, produced by some of the methods of modern building construction.

In olden days the construction of buildings, and even the furnishings, were made to accommodate themselves to the heating and the limitations were recognized. In these days, in many instances, no thought is given to the various phases of the conditions produced and very sketchily outlined herein.

This subject is very deep, covers a broad field; any part of which would readily enlarge itself into a subject of its own.

*

* Mechanical Equipment of Buildings, Harding and Williard Volume 1.
John Wiley and Sons,
New York

It is recommended that the works of Messrs. Harding and Williard and others who have devoted intense study to the practical side of heating problems, be procured and kept as a reference, as they will provide valuable assistance in determining the proper treatment required, but often overlooked in designing and equipping the modern building.

Molasses Tank Failure.

This article describes the collapse of a riveted steel tank in Boston, 90 ft. diameter and 50 ft. high, which was fully charged with molasses. A flood of 2,300,000 gallons of molasses spread over the adjoining street and filled the cellars of houses. Steel plates from the tank wrapped themselves round the steel standards of the elevated railway, one standard being sheared right through. Many casualties occurred, and the elevated railway was put out of commission for several weeks. The Court of Inquiry found that the tank design was wholly insufficient in structural strength, and this is confirmed by the details of the riveted joints given in the article.

It had been suggested that the accident was caused by an explosion, or by a freight car running into it, or by the vibration of the elevated trains. A description of the locality is given and data relating to the weight of molasses in the tank. Molasses are considered as weighing 11.75 lbs. per gallon, and it was shown that the plates near the tank base were from ½″ to ⅝″ thick, lap-jointed with 1″ rivets. The tank was full up to a height of 48′10″ and the unit stress on the net section of the ½″ plates near the base of the tank would equal 50,000 lbs. per sq in., a figure approaching the ultimate strength of the steel plate. The tank was built on concrete, which was not damaged by the accident.

in the lungs is not dependant upon outside conditions, but is regulated by the amount of carbon dioxide dissolved in the blood, and this in turn acts upon certain nerve centers, which control the depth and rate of breathing. If the carbondioxide falls too low, stimulation of the nerve centers ceases, and the process of respiration does not take place till the proper proportion has again been accummulated. The normal proportion of carbondioxide in the air of the lungs is about 5 per cent, and is automatically kept at this point by the action of breathing.

Under these conditions the effect of " impure air " so called is an unnoticeable increase in the action of the lungs through faster and deeper breathing; thus, the function of breathing is dependant entirely upon internal, rather than external conditions.

The evil smell of crowded rooms has long been accepted as proof of the existence of harmful poisons; as a matter of fact, such odors come from secretions of the skin; from food eaten, decayed teeth, foul breath of dyspepsia, soiled clothes, etc., etc. While such a mixture of odors is offensive and disgusting, it has been proven to be harmless in so far as its direct effect upon health is concerned.

Recent investigations show that the effect usually attributed to foul air and poor ventilation is due to the physical condition of the air rather than the chemical condition.

As mentioned before the body must be relieved of the heat produced and experiments show that an ordinary adult will produce, and must be relieved of enough heat in the course of an hour to raise one thousand cubic feet of air fifteen or twenty degrees. This heat is constantly carried away from the body, partly in the air exhaled, but chiefly through the skin by convection, conduction and evaporation of perspiration. It is evident that the prompt removal of this heat will depend very largely upon the atmosphere surrounding the body: upon the temperature, humidity and the movement of the air.

The physiological effect upon the human body of over-heating is a derangement of the vaso-motor nerve system. For example, a cool wind striking the skin will stimulate through the sensory nerves, the vaso-motor constrictors, which in turn cause the small vessels near the surface to contract and drive the blood deeper in the tissues and so preserves the bodily heat. A warm wind or other source of external heat causes dilation and draws the blood to the surface, thus cooling it more rapidly. It will be seen that with no two human beings alike, with the complicated and intricate nature of the human body, the strain and nerve tension of some classes of work, the tremendous variations, etc., etc., lead us to believe that we are up against hopeless conditions in attempting to produce ideal summer climates inside, during winter weather.

Humidity has a decided effect upon conditions. Too much humidity accompanied by a high temperature, will retard the cooling of the body as is usually the case in a poorly ventilated room, and becomes doubly harmful because of the combination. You have probably observed women in an overcrowded theatre with the temperature high, gasping for breath and almost fainting, fanning themselves to overcome the effects and bring relief (temperature, humidity and movement of air again). Women, on account of an extra layer of fatty tissue, which nature has omitted from man, will show signs of distressing conditions more rapidly than men in the above instances, yet will feel quite comfortable outside, with much lighter clothing.

Due to the alteration of the percentage of humidity in the air in a heated room, a perceptible movement of the air will cause a heavier convection loss from the exposed parts of the body, which frequently causes congestion or colds, due to the uneven cooling of the body. Yet, these conditions could be magnified many times in a natural atmosphere where nature has compensated the temperature and humidity, with the opposite effect and pleasing sense of exhiliration. Such, for instance, as driving in an open automobile.

We are confronted with these facts that the remedy is an exact knowledge of all the factors entering into the problem, not separately, but as a co-relative and collective whole, and what relation each bears to the whole. In this there is room for some valuable research work.

Possibly the best summary of this paper, will be to examine in what manner of means does the construction of our modern buildings effect the occupant.

In the present day, we have some wonderful buildings and further heated by systems the very acme of mechanical perfection. The builder is justly proud of his accomplishment, the engineer has achieved success in the application of mechanical skill, yet that human element frequently called the "Layman," having to perform the daily task of living and working in the atmosphere enclosed by the building, is frequently far from satisfied. Call up to your mind those constant and familiar remarks from all sources and all kinds of people, heard on every side; these questions are logical, but have we the answer ready? It is feared much must be gone through before the answer is unfolded. Let us analyze briefly the room in which this meeting is being held. It is easy to imagine a condition tc begin with, where the temperature inside and outside are equal, the walls and windows are neutral, and there is no transmission of heat: now follow the action as the outside temperature drops, a loss of heat is caused inside as well, the walls transmitting the residual heat to restore the balance inside and outside; as the outside temperature keeps dropping a point is reached, where in order to be comfortable we must resort to supplying artificial heat. Let the outside temperature keep on dropping, we simply supply more artificial heat to maintain the comfortable temperature inside; as the difference between the inside and outside temperatures increases, so is the heat loss increased in a slightly greater proportion, the amount lost has to be added by artificial means.

The walls, windows and other surfaces of this room exposed to the lower temperatures, are the barriers purposely constructed to conserve the heat loss and upon the character of the construction will depend the amount of heat that will be required to maintain the comfort zone inside.

In addition to the heat loss another factor is encountered, namely, infiltration of outside air increasing as the temperature outside drops, displacing air already heated, with air requiring to be heated.

Modern building construction has undergone many changes of which you are all familiar. The following are brief comparisons of heat losses from various materials commonly encountered:—

An equal thickness as far as possible has been taken to more readily compare the relative heat losses expressed in B.T.U's per square foot per degree difference per hour.

Thickness and Character of Walls	(Factor)
12″ Limestone, Furred and Plastered..........	.52
12″ Sandstone or Concrete, Furred and Plastered	.47
12″ Marble or Granite, " "	.40
12″ Marble or Granite–Hollow " "	.30
12″ Ordinary brick wall, " "	.30
12″ Ordinary brick, plastered on the brick......	.29
12″ " " Furred and Plastered......	.24
12″ Hollow brick " "	.22
Brick veneer, sheathing, studs, lath and plaster...	.17
Frame, Sheating, paper, clapboard, no plaster....	.27
" " " " Lath & Plaster	.24
" " " " " " —back plastered....	.21

Miscellaneous

3″ slab of solid concrete....................	2.00
3″ " " cinder "	1.04
3″ " " Gypsum..........................	.40
Glass....................................	1.00

The above factors are compound factors and may vary considerable, for instance porous brick is by virtue of the confined air cells, a better insulator than the more solid and impervious material, but by absorbing moisture will materially change.

Confined dry air is the best insulator as for example the best commercial pipe covering for steam piping is 85% Magnesia, because of the large percentage of minute air cells held in suspension and unable to circulate.

In working out the details of a heating system, it is first necessary to ascertain the heat losses from the various rooms or apartments to be heated, and apply the proper amount of radiating surface to offset the loss for a stated set of conditions, which are usually determined from the local conditions or requirements.

To attempt to give any arbitrary rule is entirely out of the question, as it would prove more misleading than enlightening. There is, however, this statement to be made in the interests of economy:—

All buildings constructed of such materials as are subjected to heavy transmission losses, must be very thoroughly insulated, otherwise the effects on the occupants subjected to the artificial atmosphere produced, often overlooked and not easily understood, is deterimental even beyond our recognition.

The characteristics of the present systems of heating are of an entirely different nature to the radiant heat derived from the open fireplace. With the open fire, as before mentioned, the heat is of a radiant kind, but with direct radiation, in either water or steam heating, the heating effect is derived entirely from the circulation of air collecting the heat from the radiators by convection.

There is a physicological side which must be considered, produced by prevailing conditions, often causing severe strain and enervating fatigue. The purpose of the atmosphere is to keep our bodies in a state of health and areate the blood. The food we eat is chemically changed by the various processes, and with every chemical action heat is generated and the body must lose this heat, if the normal blood temperature is to be kept constant.

In the opening paragraphs of this discourse mention was made of the extremes of heat and cold, not unusually met with, yet the tempeature of the blood remains absolutely constant when a person is in good health.

There is spread over the whole surface of the body, an elaborate nervous system, which nature has saddled with the responsibility of maintaining an absolutely constant blood temperature. The body looses heat by conduction, radiation, evaporation, as well as small quantities being carried off by breathing and the moisture contained in the breath.

Nature has placed in the atmosphere three physical functions, namely, temperature, humidity and movement of air, which are the all-important factors and it is only when we seriously disturb any one of these three factors that we experience trouble, and if persisted in, causes a breaking down of the human system, giving rise to serious disorders. For instance, if a person is so placed that the body is unable to be cooled by the presence of an envelope of stagnant air, the sun's rays will quickly produce sun stroke or heat prostration. In certain cases, under similar conditions, the heat from an open fire place will produce the same effect in a more modified degree.

In order to better understand the effect of the physical properties of the atmosphere, let us examine the chemical characteristics as related to bodily health and comfort. It is necessary to have a clear understanding of the process of respiration or breathing and the changes which take place in the air in the respiratory tract———At the beginning it should be clearly understood that the lungs are never filled with pure air, even under the most favorable conditions, because breathing is only a frequently repeated slight dilution of the air remaining in the throat and larger bronchial tubes after expiration.

The air that is exhaled out of the lungs after being mixed with a certain proportion of outside air is again drawn into the lungs as a mixture which does not even remotely approach chemically pure air. This results in making respiration a continuous instead of an intermittent process and so provides for a constant supply of oxygen, necessary to the life of the tissues.

It will be seen that any changes in the proportion of oxygen and carbon dioxide, which is likely to occur in the air of a poorly ventilated room will have no appreciable effect upon the air within the lungs.

Pure outside air is a mechanical mixture of oxygen and nitrogen with traces of CO_2. The oxygen content is about 21 per cent and hardly ever falls below 20 per cent in the poorest ventilated rooms. As the air in the lungs contains about 16 per cent oxygen under normal conditions, it is evident that any changes which may take place in the oxygen content of the surrounding air will have but slight effect internally. Furthermore, the supply of oxygen the consideration would be navillus and when you put your money in the savings bank it would be put in terms of navillus all at the legal rate of exchange. The bank in loaning Bill Jones, John Smith's money, acts simply as an agent and at the end of five years Bill Jones pays back the equivalent of what he borrowed instead of twice the amount. If the transaction on had been in dollars and the value of the dollar had been doubled in the meanwhile, as it has been known to do, the bank turns over to John Smith exactly what it got from Bill Jones, and who is hurt, John Smith is getting what he put in with his interest, no more or less.

It is not desirable or advisable to do anything that would have the least tendency to upset or disturb business, but on the contrary, if we can devise any means that will stimulate business, that should be our aim and if we can by any possible means get a method of equitably equating the value of time contracts, it appears to the writer that such a scheme would stimulate business, for the reason that it would encourage people to assume liabilities that they would otherwise hesitate in undertaking when they know not even approximately what value the obligation might involve on account of the change in the value of the dollar. It might be said that navillus is a mith or how could a bank keep their accounts in something that has no physical existence? No trouble whatever, all open accounts are kept in dollars as at present the dollar is the medium of exchange in all transactions. If you have a $1000.00 and you wish to place it in a savings account, you go to the bank, they tell you that the legal rate of exchange is 98 and give you credit for 1020.41 navillus, all other payments to or drafts from this account are made in the same manner. As an example, suppose no deposits or withdrawals were made and rate of interest was 3% compounded every six months, at the end of ten years your account would stand to credit 1.34686 for every navillus deposited exactly as if the account had been kept in dollars or a total of 1374.35 navillus, there may have been a great expansion of business and the legal rate of exchange is 120, you can draw out $1649.22 but this is only the equivalent of what you deposited, it has the same purchasing power as the money you invested plus the interest. If on the other hand business has contracted and the purchasing power of a dollar was such that rate of exchange was 80, then you would draw out $1099.48 but the purchasing power of this is the equivalent of what you deposited plus interest. The bank has neither lost or made more than they are legally entitled to. The loans they had out were treated in like manner.

How would this scheme effect life insurance, one of the largest businesses in the world. It is difficult to guess what attitude the companies would take in this case, for regardless of fluctuations, the companies charge such high rates that no matter what the fluctuation in the value of a dollar, they stand to win in any case. Take for instance the case of the 5% twenty year gold bond mentioned previously: The owner of such insurance falling due at this time instead of getting in dollars 70% to 75% of what he paid for, would receive in dollars about 140% to 150% more than the face value of the policy would show in dollars, but the insurance company nor any of the previous or subsequent policy holders would be the loser, as all the company's loans and investments would be treated in like manner, as the case is now, the man who paid out for twenty years, dollars that had from 100% to 200% of the purchasing power of the present dollars will only receive 70% to 75% of what he would had he purchased an ordinary policy and that in money that has only 50% of the purchasing value of the dollars he first paid.

The writer read only yesterday an advertisement in large type in a daily paper advising everybody to get insurance at once while it was cheap, that insurance was the only thing that had not gone up in price. Was there ever a more deceiving statement made or one more at variance with facts. Let us analyze the workings of life insurance: You pay your premium, part of it goes to pay the cost of securing the business usually on a percentage basis, part of it goes to cover the cost of the risk taken that you will die before you come to a given age, a rather small percentage goes to pay expense of conducting the business, the balance goes into loans and investments which creates the funds to pay claims. Most companies do all their figuring on a 3% basis and do business accordingly. In 1896 when money was worth about 3% or sometimes less, they charged you an extra 30% or more when they agreed to pay you in a bond drawing 5% interest, proving that the rate of interest is a dominant factor in determining rates. What do they do to-day? When money is worth from 5% to 10%. Do they reduce their rates accordingly? No, but on the contrary tell you that you should be thankful they have not raised them. The writer has no grievance against or desire to quarrel with any insurance company for they are filling a most essential part in the economic world, nor does he expect the insurance companies to change their rates with every fluctuation of the value of the dollar or rates of interest, realizing that insurance bought and paid for in times like these and coming due in times of depression work to the advantage of the policy holder. This is not the fault of the insurance company, nor can it be controlled by them, it is the fault of our money system. The navillus will equitably adjust that matter and it is the writer's firm belief that business will increase due to the fact that people will assume obligations that they otherwise would not when they see that the value of these obligations will not be increased, this will more than compensate the companies for what they gain by poor people or others who are compelled to drop their insurance on account of not being able to meet their obligations in times of depression when the value of a dollar may be twice what it was then the insurance was written.

The proposed legislation is all self explanatory with the possible exceptions of Articles 4 and 5. The reason that it is not suggested in Article 4, that all existing contracts made in dollars should be changed to navillus, is that all bonds issued prior to 1916 were purchased with money more valuable than at the present time and it would not be equitable to enact laws compelling the holders of these bonds to accept money of the present value. That is really what the adoption of the navillus amounts to. Many may say, what do we care for the bond holder, let us change everything? But, if you will consider a moment, you will see that the policy holder of life insurance has also paid out better money than we have at present and if there is a chance of their getting more value out of their policies than is represented by the present value of a dollar, we must not take that chance from them. On the other hand if for any unforeseen reason, expansion should continue after this war or as a result of other wars and the value of the dollar should become less than it is at present, then bond holders and policy holders alike are protected by Article 5. By taking advantage of the terms in this article they are assured at least the present value of the dollar.

The writer can imagine that he now hears the thunder of the roar that will be let out by the shylocks if such a plan as is here proposed was brought up in congress or parliament, and dear people their protest will not be in form that it was unfair to them. On the contrary it will be put in a form to show that you are going to be the losers, they will probably say, what will your Government do about their finance, what will become of the reserve, will it be subject to fluctuation, etc? My dear people, do not let that worry you for a moment, just consider how insignificant the paltry millions of gold held in reserve is compared with the billions of money you owe. Ask yourselves this question, which is better for us, that there should be a fluctuation in the value of the reserve (which there is now under the present system, only that everybody cannot see it) or that there be a fluctuation in the value of the billions we will pay out in interest and principal on our national debt, which may result in our paying two or more times the actual value of the debt.

As has been said before, let us keep before us the motto, "the greatest good to the greatest number" and where can you find greater number than among the tax payers?

They will also doubtless say that what is proposed is not a fixed value, the very plan of the scheme provides for fluctuation. That brings us back exactly to the starting point. It is our opinion that the value of 23.22 grains of gold is a variable quantity and it is the comparison of the navillus in terms of this variable quantity that makes necessary a variable rate of exchange. How does the gold standard advocate explain why a United States dollar to-day is worth 102 cents in Canadian money and a Canadian dollar is only worth 98 cents in United States money, when they are both based on the same so called unchangeable standard? It will doubtless be claimed that the adoption of this suggestion will be taken advantage of by the changing of securities in navillus to securities in dollars in times of expansion when the rate of exchange would be high and resulting in the hoarding of money until money became more valuable; that may be true, but in the writer's opinion that would not be done to any greater extent than at the present time, when the shrewd man will change all the holding he can that are selling at high price into securities, the value of which is designated in dollars and will reverse the operation in times of depression, taking advantage of the rise and fall in the value of the dollar.

PART VII

Other Means.

It may be argued that there is no necessity of this new law, that we can accomplish the same object through the present organization of the Government with their fuel, food control boards, etc., that is the Government can place a minimum price on common labor, say 30 cents to 35 cents per hour and also a minimum price on articles of food and commerce, the same as they now control prices by placing a maximum. The general idea is that the object of placing a maximum is to keep prices down, as a matter of fact, the real object is to keep the value of the dollar up, that is to keep the purchasing power of a dollar as high as possible, therefore the result of placing a minimum on prices would have the opposite result, namely, keeping the purchasing price and consequently the value of the dollar down. If the Government has the right to keep the value of a dollar up, surely they have the same right to pass laws to keep it down. There are several very serious objections to this plan; in the first place it would cost the Government millions to successfully carry out such a plan, while to adopt the navillus would be the work of a small commission for a short time to adopt a proper schedule and after that a $200.00 a month clerk could keep the records necessary to determine the rate of exchange. In the second place, the placing of a minimum of rates of pay for common labor, would not give the right kind of results, just the minute the minimum becomes maximum, that is, when the supply became greater than the demand, the inefficient man is discharged and the efficient man works harder, becomes more efficient and produces a great deal more than he had previously done and the result is that more men are discharged and the idle become a charge on the public. The employer is not hurt very much, he can get his work done at approximately the same cost as if he employed more men at less salary who would not be as efficient. It is much better for the community to have everybody working at wages they can get, even if they produce only what half their number could produce for the same money.

In the third place it would require the co-operation of almost the entire world to make such a plan a working success, while any country or state can adopt the navillus without regard to the action of any other country or state. The reason for this is that minimum differs from maximum in this feature; one state cannot adopt a minimum without it becoming a hindrance to trade if it is an effective minimum. For instance, take wheat which is a non-perishable article and can be stored for years in Government elevators etc., suppose the present maximum should be adopted as a minimum, what becomes of the wheat of an exporting country when the market price in all other countries is lower than the minimum? If the Government took the surplus and hoarded it, it would only be a question of time when they would be compelled to sell at possibly a great loss and the people would have to make up the deficit by taxes, nothing would be gained. Enough has been said to illustrate the difference between the working of a maximum that is higher than the cost of production and a minimum that is above the selling price of a commodity.

Conclusions.

All the foregoing can be summed up in a few words:—

1st. 23.22 grains of gold is a variable measure of value.

2nd. Great injustice and hardships are the result of the appreciation of the value of the dollar to those who assume liabilities when the value of a dollar is low and the rate of interest usually high.

3rd. It seems impossible at this time to devise a real standard of value, that is, one that will be an invariable standard.

4th. Instead of taking a certain amount of a really unessential article as a measure of value, it would be more advisable to take a certain amount of a hundred or more of the essential and necessary articles of life.

Final.

The writer has had this problem in mind for over twenty years, but never before attempted to work out in detail a solution and at the time of starting this paper it was simply the idea to place the problem before the engineers of this country with a few suggestions, but as interests in detail grew the arguments and suggestions developed to such an extent that the writer now feels that he has placed himself in the same position as the Irish Priest who was a dear friend of a Protestant Clergyman, both of them working among the soldiers in the trenches somewhere in France. One day some evil spirit tempted them to discuss Theology with the inevitable result that the discussion ended in a quarrel and the friends were not on speaking terms. After a few days the Priest wrote as follows:—" My dear friend: I am sorry that we quarrelled, I wish to make up and be friends again, in fact I can see no reason why we should not be friends, we are both working for the same end, doing the work of Christ, you in your way and I in His."

One might get the impression from this paper that there was nothing left for you to do, such is not the case. The writer believes that the problem will never be properly solved until we get a real standard of value. The writer has no axe to grind or personal interest to serve, in fact his personal income is made up of more or less fixed fees and a small interest in a gold producing property, from which the income has fallen from a reasonable sum to almost nothing. It is therefore plain that the writer's personal interest will be adversely effected by any adoption of his suggestions, but believing that the welfare of humanity should come before personal interest, the writer thanks you for the attention you have given to his paper and hoping that you will all do your bit in attempting to solve this problem, having as our motto, " The greatest good to the greatest number."

Winnipeg, October 10th, 1918.

P.S. The above paper was entirely the result of the personal observations and deductions of the writer, who at first thought that there might be some original ideas expressed in the same, but after submitting the same to a number of friends, the writer learned that this is a pretty old subject and that as early as 1825, Lowe & Scrope of England advocated the idea of the " Multiple " Standard and since that time numerous writers have advanced the same idea. Among those were Jevons about 1865, Simon Newcombe, the astronomer, Alfred Russell Wallace, the naturalist and at the present time it is a very live question among political economists of whom the recognized leader is Professor Irving Fisher of Yale University. He has on the press at the present time a book on this subject. In 1918 he issued a phamplet on the same subject called " Stabilizing the Dollar in Purchasing Power," published by E. P. Dutton & Co., 681 Fifth Ave., New York. Professor Fisher's arguments are very similar to those given above. His remedy however, is much bolder and far reaching. In brief he proposed to do away with the coinage of gold into money and legally changing the weight of gold that represents a dollar as the purchasing power of gold varies as is indicated by " Index Number " kept by the department of labor. This plan is endorsed by a large number of college presidents, professors, lawyers, bankers and business men, and has the advantage over the plan suggested by the writer, that it not only remedies the troubles of those who make time contracts but it at once stabilizes the value of fixed incomes, such as salaries of officers and others working for more or less fixed salaries, but more important it stabilizes the incomes of all businesses that receive their income from more or less fixed rates, such as railway, street car companies, telephone and telegraph companies, the only adverse feature that I can see is the effect that the constant changing of the weight of gold in a dollar will have on our foreign exchange. This however, is a small matter compared with the benefits to be gained from having a dollar of uniform purchasing power and I do hope to see this plan endorsed by this Institute in the near future when the members have had time to properly study the question.

Winnipeg, Feb. 1st, 1919.

Shifting a Gas-Holder.

An engineering undertaking, worthy of note by reason of its unusual character, is reported from Portland, Ore., U.S.A. The problem was to transport a complete gas-holder from one location to another — a distance of three miles having to be covered by water-carriage. The holder is 70′ in diameter and 75′ in height, and weighs 300 tons. It was first lifted a height of 15′ and loaded on rollers; then it was moved two blocks of houses north and two east, and lowered from the street to dock-level, a distance of 28′. Here it was rolled on to two barges lashed together, using hardwood rollers with block and tackle, and a large gasoline engine. The barges were then towed three miles to the North-west Steel Shipbuilding plant, where the holder was unloaded and raies 26′, moved across newly made ground a distance of 2,000′, crossing on the way a line of railway, and placed on its new foundations. The whole of this work was done in 71 days.

* *

Reinforced-Concrete Transmission-Poles.

In 1917-18 a high-tension transmission-line of 40 km. length was constructed from Striesen to Dresden for 60,000 volts using reinforced-concrete poles.

The poles were constructed by a centrifugal process by Dyckerhoff and Widmann, of Dresden. Their height varied between 15 and 18m. In the longer poles joints had to be made by iron rings fixed in position by screws. Photographs of the poles are reproduced.

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

Vol. II. November 1919 No. 11

President Leonard's Message

In the Bush, Sept. 16, 1919.

To the Members
The Engineering Institute
of Canada.

Affiliates of Branches

The President desires to call the attention of members of Branches to the desirability at the present time of increasing the number of affiliates.

In the Charter By-Laws etc. 1918 page 15, Sect. 50 under " Membership " is the following:—

" In addition Branches may at their option admit persons not members of *The Institute* who shall be termed " Affiliates of the Branches."

In the proposed standard Branch By-Laws published by headquarters under "Membership," section (b) reads as follows:—

" Any person interested in the engineering profession may become an "affiliate of the Branch." Affiliates shall be elected by vote of the Executive Committee upon nomination by two corporate members of the Branch. The fee shall be per year which shall include the annual subscription of $2.00 for *The Journal* of *The Institute.* Affiliates may attend all meetings of the Branch but shall not discuss or vote upon any matter affecting the administration of the Branch."

The Institute now has seventeen Branches located at the principal industrial centres from Halifax to Victoria and a number more in early prospect.

All engineers who have had actual charge of public works or of industrial establishments realize how much we owe to the individual walking bosses, mine captains, foremen and skilled mechanics for intimate knowledge of many details which is so essential to the successful professional engineer. As individuals we reciprocate by helping them with their problems. Can this mutual assistance not be greatly increased by more generally welcoming these men into our ranks as " Affiliates of Branches ?"

Before *The Institute* had Branches and a *Journal* of its own it had nothing to offer to such a class of membership; but under present circumstances the advantages we have to offer to affiliates are real and apparent.

The advantages to the present membership of *The Institute* are — as stated above — organized and regular interchange of professional and technical knowledge, and greater importance and influence of our *Institute* and of its membership in the national life.

In these times of class controversies it is well for members of the engineering profession to realize the unique position they hold as being members of the only organization, nation wide, which can be considered as representative of the great majority of the population which excludes capitalists and workmen in the Trade Union sense of the term. *The Institute* is almost exclusively made up of salaried men in intimate business relationship daily with " capitalists " and " workmen " understanding from personal knowledge and experience the problems of both and in a position to sympathize with both. From this point of view also there is an added link of interest between the professional engineer and the affiliate which should be made much of for the welfare of Canada as a whole.

Educational Films Available

In order to vary the programme of branch meetings it will be of interest to branch members to learn that films of an educational character are available through the Bureau of Commercial Economics, Department of Public Instruction, Washington, many of which deal with various industries and offer a new source of interest to gatherings of engineers.

The Bureau of Commercial Economics is an altruistic association using the facilities and instrumentalities of governments, manufacturers, and educational institutions in the disseminating of useful information by the graphic method of motion pictures displayed invariably to audiences admitted free. The use of the films are subjected to the following stipulations: payment of transportation charges from and to the distributing center, the films shall be used on standard motion picture projectors handled by competent operators, a report of the films used and attendance shall be mailed after each performance to the distributing center, the films shall be returned immediately after use, no admission fees to the public are permitted to be charged nor are collections during or after the exhibition permissible from the public, and, no fee is charged or accepted for the use of the films of the Bureau.

A list of the visatures available may be had from A. Maris Boggs, Dean of the Bureau.

Engineer Gets Important Diplomatic Appointment

In the language used in Washington last year at one of the Niagara Hearings before the House of Representatives' Committee on Foreign Affairs, a gentleman there described as " a very able engineer," has just lately been appointed to represent Canada in connection with a large and important work which will doubtless soon be actively in hand.

The gentleman in question is W. J. Stewart,M.E.I.C., Chief Hydrographer of the Naval Department, and the work is the preparation, in collaboration with Gen. Keller of the Corps of Engineers of the U. S. Army, of a Reference to be submitted jointly by the Canadian and United States Governments to the International Joint Commission in connection with an investigation into the deep water canalization of the St. Lawrence river, together with the development of power thereon. This reference is being made partly in pursuance of a resolution of last year's Congress asking that the matter be investigated, and partly that one comprehensive scheme of development may be settled upon before any further rights, public or private, are granted for power developments. Obviously the question is one of tremendous importance from every side, engineering, commercial, navigation and power, and it is expected that as soon as the terms of the proposed Reference have been settled and the Reference made, the matter will be gone into very fully from every point of view, so that a complete and final international plan for the navigational and power development of the St. Lawrence may be evolved.

Another recent appointment of Mr. Stewart's is that of Canada's representative in drafting the final agreement with the United States on the Lake of the Woods reference. This reference, which has been recently reported upon by the International Joint Commission, is but one of the many international questions on which Mr. Stewart has acted as Consulting Engineer to the Department of External Affairs.

The Journal and Mr. Stewart's fellow members of *The Institute* extend him their congratulations on the above two appointments.

Ontario Provincial Meeting

At a meeting of the officers of the Ontario Provincial Division held at the University Club, Toronto on Friday, October 24th, it was decided to call a meeting of the Executive of the Provincial Division to be held on Saturday afternoon, November 22nd, at 3.00 P.M., at the Engineers' Club, Toronto. The Executive of the Ontario Provincial Division consists of:—

His Royal Highness the Prince of Wales, Honorary Member of the Engineering Institute of Canada, elected by Council on October 28th whose gracious acceptance of Honorary Membership has been received.

Chairman, J. B. Challies, M.E.I.C.; Vice-Chairman, E. R. Gray, M.E.I.C.; Secretary-Treasurer, Geo. Hogarth, M.E.I.C. Councillors:—President, R. W. Leonard, M.E.I.C.; Vice-President, H. E. T. Haultain, M.E.I.C; Prof. Peter Gillespie, M.E.I.C., Toronto; G. A. McCarthy, M.E.I.C., Toronto; John Murphy, M.E.I.C., Ottawa; James White, M.E.I.C., Ottawa; M. H. Macleod, M.E.I.C., Toronto; G. Gordon Gale, M.E.I.C., Ottawa; W. A. McLean, M.E.I.C., Toronto.

Major W. H. Magwood, A.M.E.I.C., Cornwall; G. R. Munro, A.M.E.I.C., Peterboro; J. L. Morris, M.E.I.C. Pembroke; R. J. McClelland, A.M.E.I.C., Kingston; G. H. Bryson, A.M.E.I.C., Brockville; A. C. D. Blanchard, M.E.I.C., Niagara Falls; T. H. Jones, M.E.I.C., Brantford; J. L. Weller, M.E.I.C., St. Catharines; S. B. Clement, M.E.I.C., North Bay; James A. Bell, M.E.I.C., St. Thomas; R. L. Dobbin, M.E.I.C., Peterboro; L. M. Jones, M.E.I.C., Port Arthur; V. A. Belanger, A.M.E.I.C., L'Orignal.

The latest Honorary Member of the Institute His Royal Highness the Prince of Wales in a characteristic position now familiar to Canadians.

Compensation of Engineering Services

Since the last issue of *The Journal* went to press there has been received at headquarters a memorandum from Alfred D. Flinn, Secretary of Engineering Council, headed Compensation and Classification of Engineers, which deals with the work of the Committee of Engineering Council and also embodies a summary of a report from the chairman of the Council's Committee on this subject. One feature which is of outstanding interest in the report referred to is the reports from the various departments of the railroads, Federal Governments, State and Municipal Governments in respect to the morale of the service.

In the case of 8 services the morale is reported to be good but in most of these it appears that the organization reported is a new one or that radical changes in compensation have recently been effected. In 20 reports no comment is made as to the present morale while in 17 instances the general conditions are said to be as follows:

"Morale would be improved if adequate salaries were allowed."

"Practically all men are clamoring for more pay, but as our budget was fixed while the country was at war we are unable to secure the additional funds necessary to raise salaries further."

"Impossible to hold first class men at these rates. Morale is generally good."

"All want more money. Dissatisfied on account of low pay."

"Our organization is in a condition of unrest and change owing to small appropriation."

"Loyal enough generally, but dissatisfied with pay, and accept better offers readily. Difficult to fill their places at same rates."

"Excellent, but all employees desire increase in compensation over that already granted. New men cannot be obtained at previous salaries."

"Dissatisfied with present compensation."

"Force depleted. Employees leaving to take positions at greater compensation. Men remaining uneasy and dissatisfied."

"I might say that I thoroughly agree with the men in New York City who demand a flat raise of $500. yearly in all classes of the service."

"There is a decided spirit of unrest and dissatisfaction due to the fact that engineering salaries have not been increased in proportion to the advance in the cost of living, and to salaries and wages paid to non-professional men and skilled labor."

"Rate of pay tends to drive more active and self-reliant younger men out of this service — lowering general average."

"Majority of men feel they are underpaid."

"Lack of consideration for services rendered has discouraged the force."

"A general increase of $150. to $400, effective Sept. 16, 1919, has improved the morale of the force, which was affected both by a general reduction of force and the economic situation."

"Increasing restlessness on the part of the entire force due to lack of proper salary increases to meet growing expenses."

"While men for the most part do their work satisfactorily, there is a general feeling of unrest and discouragement as the result of what they consider failure to recognize their efforts."

Impurities and Clinkering in Coal.

Tests made by the Illinois Central Railroad show that when coal is high in sulphur and lime in proportion to the silica, iron oxide and alumina present, the ash fuses at about 2,200 °F., whereas in the converse case no clinkering occurs even at 2,900 °F. However, the clinkering tendency can be counteracted by increasing the draught so as to keep the temperature in the fire bed below the fusing point of the ash. Such coals should therefore be consumed in shunting engines, local freight engines and for other light work.

Toronto Branch Salary Schedule

At the opening meeting of the session of the Toronto Branch the report prepared by the Salaries Committee of the Branch dealing with the Classification of Engineering Organizations and proposed Qualifications and Remuneration for Engineering Services was presented. This Committee has been at work continuously since its appointment on March 5th last and has spent a great deal of time and energy in the consideration of this subject, which at the present time is of vital interest to all members of the profession. The Committee is composed of the following members of the Toronto Branch;— George T. Clark (Chairman), H. A. Goldman (Secretary), A. F. Stewart, Professor Arkley, E. G. Hewson, F. B. Goedike, G. G. Powell, Thomas Taylor, N. L. Crosby, James Milne, Lieut.-Col. H. J. Lamb, and Ex-Officio A. H. Harkness and W. S. Harvey.

It has been stated that this salary schedule is based on the pre-war cost of living and does not take into account the very great increase which has occurred during that period. It represents the advice of many engineers and is presented by the Toronto Branch to the membership in general in the hope that sufficient discussion may be aroused on this subject and that it will result in *The Institute* taking a definite stand regarding the adoption of recommended schedule of salaries for the Engineering profession throughout Canada.

Classification of Engineers Employed in Railway Work

1. Chief Engineer.......... $10,000.00

2. Assistant Chief Engineer.......... 7,200.00

3a. Engineer of Maintenance.

Should preferably be a graduate from an engineering school recognized by *The Institute* and should have 8 to 10 years practical experience in engineering work, or, if not a graduate should have from 12 to 15 years practical experience and should be thoroughly familiar with the mathematics of engineering.......... 6,600.00

3b. Engineer of Construction.

Same qualification as for Engineer of Maintenance.......... 6,600.00

3c. Bridge Engineer.

Same qualification as for Engineer of Maintenance.......... 6,600.00

3d. Principal Assistant Engineer.

Same qualification as for Engineer of Maintenance.......... 6,000.00

4a. District Engineer.

Should preferably be a graduate from an engineering school recognized by *The Institute* and should have 6 to 8 years practical experience in engineering work, or, if not a graduate, should have from 10 to 12 years practical experience and should be familiar with the mathematics of engineering.......... 4,800.00

4b. Signal Engineer.

Should preferably be thoroughly familiar with the theory and practice of signalling and of train operation, and should have had, in addition, at least five years practical experience in mechanical and electrical signal work on railways.......... $4,800.00

4c. Architect or Engineer of Buildings.

Should have sufficient architectural training to design railway stations, shops, round houses, dwellings, etc., of normal types, and should have 6 or 8 years practical experience in responsible design of railway buildings.......... 4,000.00

4d. 1st Assistant Engineer.

Same qualification as for District Engineer. 4,200.00

4e. Assistant Bridge Engineer.

Should preferably be a graduate engineer with from 5 to 6 years practical experience in the office and in the field.......... 4,800.00

5a. Division Engineer.

Should preferably be a graduate engineer with 3 or 4 years experience of practical engineering, or, if not a graduate, should have 8 to 10 years practical experience and should be well grounded in the mathematics of engineering.......... 3,600.00

5b. 2nd Assistant Engineer.

Same qualification as for Division Engineer. 3,000.00

5c. Chief Draughtsman.

Should have a thorough knowledge of general draughting, but not necessarily knowledge of design, and should be able to control a number of subordinates and supervise their work.......... 2,500.00

5d. Designing Engineer in Structural Department.

Should be thoroughly grounded in the theory of design and detail in his particular department, and should be able to control a number of subordinates and supervise their work.......... 3,600.00

5e. Leading Draughtsman in Architectural Department.

Same qualification as given for Leading Draughtsman in Structural Department. 2,400.00

5f. Signal Supervisor.

Should be thoroughly familiar with the mechanical and electrical details of signalling, should have sound elementary knowledge of the principles of signalling and should be qualified to carry out and supervise construction and maintenance of all types of signal plants.......... 2,400.00

6a. Resident Engineer (Construction only).

Should preferably be Graduate Engineers or have 3 or 4 years practical experience in the junior branches of Engineering work. exp. $2,700.00

6b. 3rd Assistant Engineer.

Same qualification as for Resident Engineer. 2,400.00

6c. Draughtsman.

Should be able to plot accurately from field notes or notes and sketches supplied to him by a Senior Officer............... 1,800.00

6d. Inspector — Class A.

Should have a thorough knowledge of the class of work that he is employed to inspect and in the case of steel or reinforced concrete structures, should be a man of sufficient intelligence to understand the elementary principles of design and realize the necessity for close adherence to plans, and must be able to read and interpret plans correctly................. exp. 2,400.00

7a. Junior Assistant or Instrument Man.

Should have sufficient training in the use of level, or transit, or both, to do accurate work at a reasonable rate of speed, and should be thoroughly grounded in the mathematics required for the proper reduction and application of his instrumental work.......................... exp. 1,800.00

7b. Inspector — Class B.

Should have some practical experience in the class of work that he is employed to inspect, and have sufficient intelligence and firmness to enforce the carrying out of specifications....................... 1,800.00

7c. Junior Draughtsman.

Should have passed through his training as a Tracer, and should have working knowledge of the use of draughting instruments.. 1,500.00

8a. Chainman.

No previous experience required........... 1,200.00

8b. Rodman.

No previous experience required........... 1,500.00

8c. Tracer.

No previous experience required........... 1,200.00

Classification of Engineers Employed in Municipal Work

1. Chief Engineer of Municipality.

1a. Cities greater than 300,000.

Should preferably be a graduate from an engineering school recognized by *The Institute* and should have had 15 years practical experience covering two branches in municipal engineering, and should have served for about 5 years in the capacity of Deputy City Engineer, or of First Assistant in municipalities of over 300,000, or as Chief Engineer in municipalities of over 100,000 and should possess proven executive ability...................... 12,000.00

1b. Cities 100,000 to 300,000.

Should preferably be a graduate with 10 years experience covering two branches in municipal engineering, 3 years of his experience should be in the capacity of either one of the following: — Chief Engineer in municipality of over 50,000— First Assistant in municipality of over 100,000 — or Second Assistant in municipality of over 300,000, and should possess proven executive ability........ $8,000.00

1c. Cities less than 100,000 and towns graded according to population into:—

1. 50,000 to 100,000.

Should preferably be a graduate with 8 years experience in municipal engineering, 2 years of which should be in the capacity of any one of the following:— Chief Engineer in city of over 10,000 — First Assistant in city less than 100,000 — or Second Assistant in city under 300,000 and should possess proven executive ability............................... 6,600.00

2. 25,000 to 50,000.

Should preferably be college graduate or licensed Land Surveyor with 5 years experience in municipal engineering and possess proven organizing ability........ 5,400.00

3. 10,000 to 25,000.

Should preferably be college graduate or licensed Land Surveyor with 3 years experience in municipal engineering or should have completed apprenticeship to municipal engineer and subsequently was placed in responsible charge of engineering work, must have ability to handle men................................. 4,200.00

4. Less than 10,000.

Same qualifications as for cities between 10,000 and 25,000 unless work is confined to routine construction and maintenance, in which case he should have had 5 years experience as First Assistant in similar work, and should have ability to handle men................................. 3,000.00

1d. Other Municipal Engineers, (employed part time) Daily Rate.

Land Surveyors — requirements prescribed by law. For routine construction and maintenance, qualification to be same as for Chief Engineer of city less than 10,000. Other casual work probably done by Consulting Engineers................

2. Deputy City Engineer, or Principal Assistant, in cities over 300,000.

Same qualification as for Chief Engineer in city of from 100,000 to 300,000.......... 8,000.00

3. First Assistants, having charge of Roadways, Sewers, Water Works, Light, Transportation, Structures, Testing and Inspection.

3a. Any one of above in cities over 300,000.

Should preferably be a graduate with 8 years experience in municipal engineering, 4 years of which should have been in the capacity of First Assistant in municipality of 100,000 to 300,000, or, as Second Assistant in municipality of over 300,000, should be able to handle office, construction and maintenance forces............ $5,000.00

3b. One or more of above in cities 100,000 to 300,000.

Should preferably be a graduate with 6 years experience in engineering, 2 years of which should have been in the capacity of First Assistant in city of less than 100,000, or, as Second Assistant in city of over 100,000, should be able to handle office, construction and maintenance forces............ 4,000.00

3c. One or more of above in cities less than 100,000.

Should preferably be a graduate with 4 years experience in engineering, 2 years of which should have been in the capacity of Second Assistant, and should be able to handle office, construction and maintenance forces.............................. 3,000.00

4. Second Assistants, reporting to the First Assistants in larger municipalities, and to the Chief Engineer in smaller municipalities. In responsible charge of:—

4a. Design, Drafting and Engineering Records.

1. Cities over 300.000.

Should preferably be a graduate with 6 years experience in engineering, 4 years of which should have been as Second Assistant in city under 300,000 or as Resident Engineer on construction with designing experience, or as Designer, should be able to handle office staff for designing, drafting and keeping of records..................... 3,600.00

2. Cities less than 300,000.

Should preferably be a graduate with 4 years experience in engineering, 2 years of which should have been either as Designer or as Resident Engineer on construction with designing experience, should be able to handle office staff for designing, drafting and keeping of record............... 3,000.00

2b. Surveys.

1. Cities over 300,000.

Should preferably be a graduate engineer or licensed Land Surveyor with 4 years experience as Instrumentman in municipal work, preferably on construction, and should he able to handle several parties and to keep them employed to advantage. 3,000.00

2. Cities less than 300,000.

Should preferably be a graduate engineer or licensed Land Surveyor with 2 years experience as Instrumentman in municipal work, preferably on construction, and should be able to handle several parties and keep them employed to advantage... $2,400.00

2c. Construction, Operation, Maintenance, (one or more).

1. Cities more than 300,000.

Should preferably be a graduate with 6 years experience in engineering, 4 years of which should have been as Inspector or as Resident Engineer on Construction, and should be able to handle construction and maintenance forces................. 3,600.00

2. Cities less than 300,000.

Should preferably be a graduate with 4 years experience in engineering, 2 of which should have been as Inspector or as Resident Engineer on construction, and should be able to handle construction and maintenance forces.................... 3,000.00

5. Resident Engineers on Construction.

Should preferably be a graduate with 3 years experience in municipal work, or should have completed apprenticeship in municipal work. Should have ability to use survey instruments, make calculations arising therefrom, and keep track of quantities and labor.................. 2,400.00

6. Designers.

Should preferably be a graduate with 4 years experience and should be familiar with the mathematics and practice of the branch of work in question.............. 3,000.00

7. Draftsmen.

Should be High School or College graduate and should be able to plot accurately from field notes and produce correct working drawings from designers sketches and computations......................... 1,800.00

8. Inspectors.

Should have a thorough knowledge of the class of work that he is employed to inspect, and in the case of steel or reinforced concrete structures, should be a man of sufficient intelligence to understand the elementary principles of design, and realize the necessity for close adherence to plans, and must be able to read and interpret plans correctly........ 2,100.00

9. Instrumentmen.

Should be High School or College graduate and should have sufficient training in the use of level, or transit, or both to do accurate work at a reasonable rate of speed, and should be thoroughly grounded in the mathematics required for the proper reduction and application of the instrumental work. In case of construction he should understand the special requirement for the class of work in question.............................. $1,800.00

10. Chainmen and Rodmen.

No previous experience required........... 1,200.00

11. Tracers.

No previous experience required........... 1,200.00

Classification of Engineers Employed in Industrial Work

A. Chief Engineer.

1a. Research Engineer.

Should preferably be a graduate from an engineering school recognized by *The Institute*, with from 10 to 15 years experience in his special line............... 10,000.00 down to 3,600.00

2a. Mechanical Engineer.

Same qualification as for Research Engineer.

3a. Electrical Engineer.

Same qualification as for Research Engineer.

4a. Chemical Engineer.

Same qualification as for Research Engineer.

5a. Metallurgical Engineer.

Same qualification as for Research Engineer.

1b. Assistant Chief Engineer in large industries only.

Preferably technical graduate with from 5 to 10 years experience—75% of Salary of Chief Engineer with a minimum of........ 3,000.00

2b. Engineer in general charge of all outside construction.

Preferably technical graduate with from 5 to 10 years experience—75% of Salary of Chief Engineer with a minimum of........ 3,000.00

3b. Efficiency Engineer. — Usually a Consulting Engineer, but occasionally on the permanent staff.

C. Designing Engineers, having responsible charge of all design, in any one of the following branches:—

50% of Salary of Chief Engineer with a minimum of........................... 2,700.00

1c. Mechanical Engineering.

Should preferably be a technical graduate with 5 years practical experience in his special line, or, should be a high school graduate with 10 years practical experience, and should have a good general knowledge of mathematics and the fundamental physical laws used in engineering..

2c. Electrical Engineering.

Same qualification as for Mechanical Engineering.

3c. Structural Engineering.

Same qualification as for Mechanical Engineering.

4c. Heating and Ventilating Engineering.

Same qualification as for Mechanical Engineering.

1d. Engineering in charge of Estimating, Figuring Costs, etc.

Should preferably be a technical graduate with 3 years practical experience in his special line, or, should be a high school graduate with 8 years practical experience, and should have a good general knowledge of mathematics and the fundamental physical laws used in engineering—35% of Salary of Chief Engineer with a minimum of............................ $2,400.00

2d. Testing Engineer, in charge of Tests.

Same qualification as for Engineer in charge of Estimating.

3c. Resident Engineer on Construction.

Same qualification as for Engineer in charge of Estimating.

4d. Chief Draughtsmen, responsible for all working drawings.

To be qualified by training and experience for the special work required of him.

5d. Designers, Assistants to Designing Engineer.

Should preferably be a technical graduate with 2 years practical experience,or should be a high school graduate with 4 years practical experience, and should have a good general knowledge of mathematics and the fundamental physical laws used in engineering..........................

1e. Estimators, Assistants to Engineer in charge of Estimating.

Should preferably be a technical graduate with 2 years practical experience, or should be a high school graduate with 3 years practical experience and should have a good general knowledge of mathematics and the fundamental physical laws used in engineering........................ 2,400.00

2e. Squad Bosses, in charge of small squad of Draughtsmen.

Should be a high school graduate with three years practical experience, 1 year as checker, and should have a good general knowledge of mathematics and the fundamental physical laws used in engineering.

1f. Chief Shop Inspector, in charge of shop inspection.

Should preferably be a technical graduate with 1 year's experience, or should be a high school graduate with 3 years experience as inspector, and should have a good general knowledge of mathematics and the fundamental physical laws used in engineering.......................... 2,100.00

2f. Checkers, responsible for correctness of working drawings.
Similar qualification as for Chief Shop Inspector..............................

1g. Draughtsmen, making detailed working drawings.
Should preferably be a technical graduate or 3 years experience in drawing, tracing, etc.................................. $1,800.00

2g. Shop Inspectors.
Should have some practical experience in the class of work that he is employed to inspect, and have sufficient intelligence and firmness to enforce carrying out of specifications..............................

3g. Field Inspectors.
Same qualification as for Shop Inspectors..

H. Tracers.
No previous experience required........... 1,200.00

Classification of Engineers Employed on Larger Public Utilities

1. Chief Engineer.......................... 12,000.00

1. Assistant Chief Engineer................. 9,000.00

3a. Departmental Engineers having charge of surveys, specifications for and design of Hydraulic structures, drafting and Engineering records, and Hydrometric records.
Should preferably be a graduate from an Engineering School recognized by *The Institute* with from 10 to 15 years experience in his particular work............... 7,500.00

3b. Specifications for, and design of electrical work, substations, powerhouses, and switching stations.
Same qualifications as for *a*............... 7,500.00

3c. Surveys and design of transmission lines—high tension and low tension.
Same qualifications as for *a*............... 5,000.00

3d. Construction.
Should preferably be a graduate from an Engineering School recognized by *The Institute* with from 10 to 15 years experience on construction with requisite executive ability to organize and handle large forces of men on the various works indicated by *a, b, c,* above................. 7,500.00

3e. Research and Tests.
Same qualifications as for *a*............... 5,000.00

3f. Operation and Maintenance.
Same qualifications as for *a*............... 7,500.00

3g. Power Contracts.
Same qualifications as for *a*............... 5,000.00

4a. Deputy Departmental Engineers having charge of surveys, specifications for and design of hydraulic structures, drafting and engineering records, and hydrometric records.
Should preferably be a graduate from an Engineering School recognized by *The Institute* with 8 years experience in his particular work........................ $4,800.00

4b. Specifications for and design of Electrical work, substations, powerhouses and switching stations.
Same qualifications as for *a*............... 4,800.00

4c. Surveys for and design of transmission lines—high tension and low tension.
Same qualifications as for *a*............... 3,000.00

4d. Construction.
Same qualifications as for *a*............... 4,800.00

4e. Research and Tests.
Same qualifications as for *a*............... 3,000.00

4f. Operation and Maintenance.
Same qualifications as for *a*............... 4,800.00

4g. Power Contracts.
Same qualifications as for *a*............... 3,000.00

5a. Assistant Departmental Engineers having charge of:—
Should preferably be a graduate from an Engineering School recognized by *The Institute* with 4 years experience in his particular work........................ 3,600.00

5a. 1. Design of hydraulic structure and records.
5a. 2. Power surveys and field Engineering on construction.
Same qualifications as for *a1*.............. 3,000.00

5a. 3. Hydrometric investigation and records.
Same qualifications as for *a1*.............. 2,400.00

5b. (1) Specifications for and design of electrical work.
Same qualifications as for *a1*.............. 3,600.00

5b. (2) Specifications for and design of buildings.
Same qualifications as for *a1*.............. 3,000.00

5b. (3) Field Engineering on construction.
Same qualifications as for *a1*.............. 2,400.00

5c. (1) Design of high tension lines.
Same qualifications as for *a1*.............. 3,000.00

5c. (2) Design of low tension lines.
Same qualifications as for *a1*.............. 2,700.00

5c. (3) Surveys for and field Engineering on transmission lines.
Same qualifications as for *a1*.............. 2,400.00

5d. (1) Construction of hydraulic structures.
Same qualifications as for *a1*.............. 3,000.00

5d. (2) Construction of electrical work.
Same qualifications as for *a1*.............. 3,000.00

5d. (3) Construction of building.
Should be a High School graduate with 5 years experience in building trades....... 2,400.00

5e. (1) Electrical testing.
Same qualifications as for *a1* $2,400.00

5e. (2) Structural testing.
Same qualifications as for *a1* 2,400.00

5e. (3) Chemical testing.
Same qualifications as for *a1* 2,400.00

5e. (4) Field and shop inspection.
Same qualifications as for *a1* 2,400.00

5f. Operation of District or System.
Same qualifications as for *a1* 3,000.00

5g. Power Contracts of District or System.
Same qualifications as for *a1* 2,400.00

5h. Right-of-way Surveys.
Same qualifications as for *a1*, and should hold his provincial Land Surveyor's certificate. 2,700.00

5i. Cost estimates and Power estimates.
Same qualifications as for *a1* 2,400.00

6. Designers and layout men.
Should preferably be a graduate from an Engineering School recognized by *The Institute* with 2 years experience 2,400.00

7. Draftsmen, Instrumentmen and Inspectors.
Should preferably be a technical graduate or 3 years experience 1,800.00

8. Tracers and Chainers.
No previous experience required 1,200.00

Classification of Engineers Employed in Public Works

1. Chief Engineer.
Graduation in engineering from a school of applied science of recognized standing; at least twelve years of experience in engineering survey, design, estimate, and construction work, seven years of which shall have been in responsible charge of such work; thorough knowledge of Canadian engineering problems, the highest degree of administrative ability. 12,000.00

2. Asst. Chief Engineer.
Graduation in engineering from a school of applied science of recognized standing; at least ten years of experience in engineering design, estimate, construction and maintenance work, five years of which shall have been in responsible charge of such work, thorough knowledge of dredging work and the general engineering problems of Canada; ability to organize, supervise and manage large engineering works.... 8,000.00

3. Supervising District Engineer.
Education equivalent to graduation in engineering from a school of applied science of recognized standing; at least seven years of experience in engineering survey, design, estimate, construction, and maintenance work, four years of which shall have been in responsible charge of such work; considerable knowledge of marine engineering work; ability to make constructive criticisms and reports on proposed works and supervise the construction of large works $6,000.00

4. Senior Engineer.
Education equivalent to graduation in engineering from a school of applied science of recognized standing; at least seven years of experience in engineering design, estimate, and construction work, four years of which shall have been in responsible charge of such work; wide knowledge of public works construction and maintenance work and ability to manage and supervise engineering works of considerable importance 5,000.00

5. District Engineer, (Grade 2).
Education equivalent to graduation in engineering from a school of applied science of recognized standing; five years of experience in engineering estimate, survey, and construction work, two years of which shall have been in responsible charge of such work; preferably thorough knowledge of local conditions and works; firmness, tact, good judgment, and ability to manage men 4,000.00

6. District Engineer (Grade 1).
Same qualifications as for District Engineer (Grade 2) 3,500.00

7. Dredging Engineer.
Education equivalent to graduation in engineering from a school of applied science of recognized standing; at least five years of experience in engineering survey, construction, dredging, and maintenance of a dredging fleet, three years of which shall have been in responsible charge of such work; thorough knowledge of dredging operations; firmness, tact, and ability to manage men... .... 3,500.00

8. Engineer Ottawa River Storage.
Education equivalent to graduation in engineering from a school of applied science of recognized standing; at least five years of experience in engineering survey, construction, and maintenance, three years of which shall have been in responsible charge of such work; thorough knowledge of river regulation works; firmness, tact, good judgment, and ability to manage men 3,300.00

9. Senior Assistant Engineer.
Education equivalent to high school graduation; either graduation in engineering from a school of applied science of recognized standing with three years of experience in engineering design, estimate, and construction work, two years of

which shall have been in a position of professional responsibility, or five years of practical experience in engineering design, estimate, and construction work, two years of which shall have been in a position of professional responsibility; firmness, tact, good judgment, and ability to manage men.......................... $3,200.00

10. Resident Engineer.

Education equivalent to high school graduation; either graduation in engineering from a school of applied science of recognized standing with three years of experience in engineering design, estimate, and construction work, two years of which shall have been in a position of professional responsibility, or five years of practical experience in engineering design, estimate, and construction work, two years of which shall have been in a position of professional responsibility; thorough knowledge of railway and harbour works; tact, good judgment, and ability to manage men................. 3,140.00

11. Chief Draftsmen.

Education equivalent to high school graduation; either graduation in engineering from a school of applied science of recognized standing with four years of experience in an engineering drafting office, three years of which shall have been in responsible charge of such work, or six years of experience in an engineering drafting office, three years of which shall have been in responsible charge of such work; ability to visualize proposed engineering works; familiarity with various types of structures which will best serve local needs; firmness, tact, and ability to manage men.......................... 2,500.00

12. Assistant Engineer.

Education equivalent to high school graduation; either graduation in engineering from a school of applied science of recognized standing with three years of engineering experience, one year of which shall have been in a position of professional responsibility, or five years of engineering experience, one year of which shall have been in a position of professional responsibility; firmness, tact, and ability to manage men................. 2,100.00

13. Chief Inspector.

Education equivalent to graduation in engineering from a university of recognized standing; at least four years of supervisory experience in general construction work; supervisory ability, integrity, tact and good judgment; good physical condition............................. 2,100.00

14. Junior Engineer.

Education equivalent to high school graduation; either graduation in engineering from a school of applied science of recognized standing with two years of engineering experience, or four years of engineering experience in design, estimate, construction, and maintenance work............. $1,800.00

15. Inspector.

Education equivalent to high school graduation; at least two years of experience in building construction work; ability to read and interpret blue prints and to judge concrete mixtures; supervisory ability, integrity.............................. 1,800.00

16. Instrumentman.

Education equivalent to high school graduation; attendance for two years at a school of applied science of recognized standing or passing of the preliminary Dominion Land Surveyors' examination with one year of experience as Rodman or Junior Instrumentman, or three years of experience in a survey party as Rodman or Junior Instrumentman; thorough knowledge of the transit and level and ability to make all adjustments to either instrument 1,800.00

17. Draftsman.

Education equivalent to high school graduation; either attendance for two years at a school of applied science of recognized standing with one year of subsequent experience in a drafting office or three years of experience in a drafting office; ability to make neat, accurate, and complete plans and drawings from notes or sketches..... 1,500.00

18. Junior Instrumentman.

Education equivalent to high school graduation; either a course of one year in engineering in a school of applied science of recognized standing with the passing of the preliminary provincial or Dominion Land Surveyors' examination and one year of training with a survey party, or two years of training with a survey party.......... 1,500.00

19. Engineering Helper.

Preferably primary school education; willingness and energy, in some cases a good sense of direction and locations and ability to handle a boat or canoe; good physical condition.............................. 1,200.00

Large Danish Motor-Ship of Reinforced Concrete.

A new company in Copenhagen specialising in concrete ships has received an order for a vessel of 1,250 tons burden, stated to be the largest of this type yet built in the Scandinavian countries, viz., 193 ft. long by 33 ft. wide. The weight of the hull and machinery is estimated at 1,050 tons, of which 150 tons represents steel required for the reinforcement. It will be propelled by a six-cylinder Diesel motor developing 400 h.p. at 190 r.p.m. Delivery of the vessel is expected this fall.

BRANCH NEWS

Niagara Peninsula Branch

R. P. Johnson, A.M.E.I.C., Sec'y.-Treas.

Dinner, Dance—Clifton Hotel

A very enjoyable social function was held for members and ladies at the Clifton Hotel, Niagara Falls, on Saturday evening, September 20th. Thirty-four sat down to an excellent dinner in a private dining room of the hotel at 7.45 and for an hour and a half, amid the hum of voices and strains of the orchestra, a gay scene was presented. After dinner the party adjourned to the ball room and joined in the regular Saturday evening dance of the hotel. It was felt by all that an unusually pleasant evening had been spent.

Trip to the Welland Ship Canal

Forty members of the Branch gathered at Thorold early in the afternoon of Saturday, October 4th, for a trip over the Welland Ship Canal construction work.

The contractors on the rock work of Section 3 at Thorold had a shot with about three tons of dynamite all in readiness for the members to see. This was greatly admired by the spectators.

The party then boarded a flat car fitted with seats and drawn by a locomotive over the construction railway. An excellent view of the whole work between Thorold and Lake Ontario was obtained from the car and Members of the canal staff explained the various features as they were passed. A stop was made at the large stone crushing plant and this was throughly inspected from the large primary, gyratory crusher, the elevating system, smaller secondary crushers, conveyors, tailing crushers and finally the screens, bins, and stone storage piles. The second stop was on Section 2 where the foundations for two bridges and the canal prism excavated to grade were viewed. The third and longest stop was made at lock one near the lake. This structure is nearly complete and proved of great interest to the members. Considerable time was spent in examining the many features of this gigantic concrete structure and in hearing the explanations of the hydraulic, mechanical and structural problems involved in its design and construction. The train was again boarded and the party taken out on one of the great new earth piers that form the new Lake Ontario harbour. From here the harbour and dredging equipment were inspected along with the piles of sand for use in making concrete.

The party returned to Thorold by the sight-seeing train and all were unanimous in their thanks to the canal engineers for a profitable and instructive afternoon and for providing very effective and enjoyable means of transportation over the work.

Toronto Branch

W. S. Harvey, A.M.E.I.C., Sec'y.-Treas.

Under date of October 15th a circular was sent to the members of the Toronto Branch asking for nominations under Section 1, clause five of the By-Laws of the Branch, for the offices of Chairman, Secretary-Treasurer and three committee men for the coming year, nominations to be in the hands of the Secretary-Treasurer on or before the first day of November. All nominations to be entertained must be made in writing and signed by the least five corporate members. The retiring members of the Executive Committee, all of whom may be re-elected for the year, are:— J. R. W. Ambrose, Professor H. E. T. Haultain and R. O. Wynne-Roberts.

The initial meeting of the session was held at the Engineers' Club on October 16th, with the Chairman of the branch, A. H. Harkness, M.E.I.C., in the Chair. After the reading of the minutes of the previous meeting, which were approved, George T. Clark, M.E.I.C., Chairman of the Salaries Committee presented the report and salary schedules. This report dealt with the classifications, qualifications and proposed salaries for engineers employed in the following organizations, viz;— Railways, Municipal, Industrial, Public Utilities and Public Work, which were discussed in the order mentioned. A few amendments to the Committee's report were made and the report as ammended adopted.

The interest which was shown at the first meeting of the branch is a hopeful augury for the coming series of meetings which the branch proposes to hold. It is noted with pleasure that the younger members of the branch are taking a more active part than ever before in its affairs and they are making their influence felt in many ways in connection with the Branch's activities.

Toronto Branch Committees

The Committees of the Toronto Branch, together with the object of these Committees and the date of their appointment is as follows:—

Object of Committee	When Appointed 1919	Members of Committee
To review and discuss the Toronto Branch By-laws.	Feb. 1st.	A. H. Harkness (Chairman) Professor Gillespie Geo. Hogarth R. O. Wynne-Roberts W. S. Harvey.
To review the City of Toronto Building By-laws.	Feb. 1st.	A. H. Harkness (Chairman) Professor Gillespie Geo. T. Clark.
Finance Committee.	Feb. 1st.	A. H. Harkness W. S. Harvey.
To collect back dues.	Feb. 28th.	E. M. Proctor (Chairman) F. B. Goedike G. R. T. Jack.
Toronto Branch Representative on the Joint Committee of Technical Organizations.	Mar. 5th.	H. G. Acres.
Salaries Committee.	Mar. 5th.	Geo. T. Clark (Chairman) H. A. Goldman (Secretary) A. F. Stewart Professor Arkley E. G. Hewson

		F. B. Goedike G. G. Powell Thos. Taylor N. Leroi Crosby Jas. Milne Col. H. J. Lamb T. H. Hogg Ex-Officio A. H. Harkness W. S. Harvey
Fees Committee.	Mar. 5th.	Frank Barber (Chairman) J. G. G. Kerry E. A. James Geo. Power P. H. Mitchell A. L. Mudge A. H. Harkness W. S. Harvey
Employment Bureau.	Mar. 5th.	E. T. Wilkie (Chairman) Wm. Cross (Secretary) T. H. Hogg A. L. Mudge R. T. G. Jack R. O. Wynne-Roberts
Toronto Branch Representative on Legislation Committee at Montreal.	Mar. 5th.	Willis Chipman.
Toronto Branch Representative on J.C.T.O. sub-committee regarding "status of the engineer."	June 2nd.	Willis Chipman.
To consider the draft Bill concerning Legislation for Engineers.	June 12th.	J. C. Krumm (Chairman) E. T. Wilkie (Secretary) Willis Chipman Professor Haultain H. A. Goldman L. I. Stone Chester B. Hamilton.

Ottawa Branch

M. F. Cochrane, A.M.E.I.C., Sec'y-Treasurer

The luncheon on October 18th, given by the Canadian Club of Ottawa to General C. H. Mitchell, C.B., C.M.G., D.S.O., was attended by many local members of *The Institute* who have followed the General's career at the front with much interest and were anxious to greet him on his return to civil life.

The subject of General Mitchell's address was "Reconstruction and Civic Development," and this luncheon formed part of the program of the Conference on "Town Planning," held in Ottawa on the 17th and 18th of last month.

Another item on the program which was largely attended by branch members was Noulan Cauchon's paper on the "Planning of Ottawa," a subject very near to all our members.

The program for the winter months is now being arranged; the first luncheon meeting being held on November 4th, when J. Grove Smith will address the members on "Fire Prevention."

G. J. Desbarats, C.M.G., Deputy Minister of the Department of Naval Service has authorized the publication of information prepared by Wm. J. Stewart, M.E.I.C., Chief Hydrographer of the Department of Naval Service in connection with the service of hydrographic officers of the Dominion Government with the Admiralty during 1918-1919.

In February, 1918, the Department of Naval Service learned that the Hydrographic Office of the British Admiralty was rather short of surveyors and advised the Hydrographer, Admiral Parry, that if necessary the Department could spare some of its staff from the Hydrographic Survey, for service in connection with the war.

This offer the Admiralty gladly accepted and granted commissions in the R.N.V.R. to Messrs. Robert J. Fraser, John L. Foreman, Lloyd C. Prittie, Murdock A. MacKinnon, Clifford G. Smith and Walter K. Willis, in 1918.

O. R. Parker, who was a Royal Naval Reservist before the war was put in general service and later appointed to H.M.S. "Endeavour" in the Mediterranean. After considerable service there he was transferred to home waters and served in the Straits of Dover on the Surveying Trawler "Esther," and after the armistice to service mine clearing off the Yorkshire coast. He returned to Canada in August 1919.

C. G. Smith originally with the Canadian Expeditionary Force and after transfer to the Surveying Service of the Admiralty was employed at various points off the English and Scottish coasts in connection with harbour improvement and aids to navigation demanded by the war. He also saw service on surveying ships mine laying.

L. C. Prittie was appointed to the H. M. S. "Endeavour" in the Mediterranean, operating in the vicinity of Malta. After the collapse of the Turks they were ordered to the Aegean and later to the Dardanelles where they prepared an anchorage and laid moorings for the Allied fleets off Constantinople. Just previous to this service the Commanding Officer of the "Endeavour" was killed on some special duty. Mr. Prittie also saw service on the Egyptian and Palestine coasts and returned to Canada in the early summer of 1919.

J. L. Foreman was appointed to the H. M. S. "Hearty" engaged in the lengthy and difficult re-survey work in the waters of The Wash on the east coast of England. Later the ship and party were transferred to the Scottish coast working out of Inverness and Aberdeen. He returned to Canada in the spring of 1919.

M. A. MacKinnin went originally overseas with the Canadian Expeditionary Force and was transferred early in 1918 to the Admiralty surveying service employed in the Firth of Forth.

R. J. Fraser was at first attached to the H. M. S. "Osea" Coastal Motor Boat Base on the Essex coast, as Assistant Surveying Officer to Lieut. Commander Maxwell, R. N. During the summer of 1918 he was appointed to the Submarine Boom Defence at Brigthlingsea and put in charge of surveying in the Thames Estuary until the Armistice was signed. In November 1918 he and Mr. MacKinnin were appointed to the newly commissioned surveying ship "Melisande" and worked throughout the winter and spring at Folkestone in the Straits and the Medway river surveying channels and mooring berths for the laying up of the Nore Reserve Fleet and sounding out the Thames Estuary. In June 1919 they were appointed to the H. M. S. "Kellett", the first of the new class of surveying ships designed to replace the ancient vessels still in service. They joined their ship on the Clyde and proceeded to Chatham where the ship was prepared as an exhibit for the visitation of the Inter-Allied Conference of Hydrographers on the 1st, July. They made a survey of the approaches to Chatham Dockyard in connection with the berthing of the " Queen Elizabeth " class of battle ships. They returned to Canada on the completion of this work.

W. K. Willis went overseas in November 1919, there still being a shortage of trained Admiralty surveyors. He was appointed to the H. M. S. "Hearty" and worked off the east coast of England and Scotland in connection with the mine clearance work in these waters, returning to Canada in July, 1919.

Much valuable experience was gained by all the Canadian surveyors whilst employed with those of the Royal Navy. Besides being surveyors they had at all times the many responsibilities of watch-keeping officers, both at sea and in harbour, and quite often were in sole command of their respective ships. The interchange of ideas and insight into the methods of working and the standards of accuracy adopted by the surveyors of the two countries will go far in the future towards a clearer understanding of each others work. Fundamentally the methods are the same, but in the matter of detail and the means employed to obtain the same desired result they naturally differ somewhat.

* * *

Montreal Branch

Frederick B. Brown, M.E.I.C., Sec'y.-Treas.

The Montreal Branch Executive has been working throughout the summer in order to prepare a programme for the present session, to help to increase the efficiency of the meetings and the comfort of the members.

It has had a number of meetings since September and has arranged committees for the ensuing year. These are as follows:— Chairman, Walter J. Francis, Vice-Chairman, Arthur Surveyer, Secretary-Treasurer, Frederick B. Brown; Executive Committee, H. G. Hunter, K. B. Thornton, F. P. Shearwood, J. Duchastel, W. C. Thomson, S. F. Rutherford; Papers and Meetings Committee, John T. Farmer, Chairman; Industrial Section, S. F. Rutherford, H. G. Hunter; Electrical Section, J. A. Burnett, E. T. Mug; Mechanical Section, Fred. Newell, J. W. McCammon; Civil Section, O. O. Lefebvre, G. R. Macleod; Reception Committee, J. L. Busfield, Chairman, P. A. Beique, Jos. Labelle, J. C. Kemp, H. L. Mahaffy; Special Service Committee, F. P. Shearwood, Chairman, G. K. McDougall, V. I. Smart, R. M. Hannaford; Publicity Committee, K. B. Thornton, Chairman, H. G. Hunter, E. S. M. Lovelace with the Chairman and Secretary of the Branch.

The programme for the first part of the session, October to December has been published. The following are the arrangements contemplated:— October 16th, Malleable Iron, by W. G. Dauncey, C. E., (Chairman, Mr. Francis); October 23rd, Grain Dust Explosions; Their Cause and Prevention, by J. A. Jamieson, M.E.I.C., (Chairman, Mr. Surveyer); October 30th, Centrifugal Process of Casting Pipe, by D. deLavaud, (Chairman, Mr. Newell); November 6th, Visit to St. Lawrence Sugar Refinery with Explanatory Talk, by J. J. York, A.E.I.C.; November 13th, Recent Progress in Wireless Telegraphy, by J. O. G. Cann, (Chairman, Mr. Burnett); November 20th, Automatic Fire Sprinkler Systems for Low Temperature Buildings, by Major Percy Sims, (Chairman, Mr. Rutherford); November 27th, Railway Track, Design and Manufacture, by W. E. L. Dyer, A.M.E.I.C., (Chairman, Mr. McCammon); December 3rd, Mechanical Stokers, Illustrated Lecture, by Combustion Engineering Corporation, (Chairman, Mr. Hunter); December 10th, Paint for the Protection of Steel Work, by John Grieve, A.M.E.I.C., (Chairman, Mr. Lefebvre); December 17th, The Modern Tramway Car, by D. E. Blair, A.M.E.I.C., (Chairman, Mr. Mug.)

It is hoped that motion pictures of industrial subjects and of natural resources will be shown at special meetings and arrangements are being made to obtain from the Canadian and United States Governments and industrial firms a number of suitable films.

The Secretary of the Montreal Branch has sent copies of the programme to the Secretary of every other branch and the Branch Executive will be glad to be of any assistance possible in connection with arranging branch meetings elsewhere.

The opening meeting was held on the evening of Thursday, October 16th, at which there were one hundred and ten present. W. G. Dauncey lectured on Malléable Iron and Walter J. Francis, Chairman of the Branch, presided.

In his preliminary remarks, Mr. Francis welcomed the members and the students of McGill University, the latter, he hoped, would become members in due course. The last season of the Branch was very successful and he looked forward to similar success for the current season. He introduced Mr. Dauncey as an eminent English metallurgist, who had done much, in a professional way, to win the war.

Mr. Dauncey in the opening part of his talk, sketched very briefly the history of the iron industry, from the making of the rough implements from meteoric iron, to the building of small forges, and to the construction of blast furnaces. He incidentally mentioned that the manufacture of cast iron was due to a change. Following a description of a modern blast furnace, Mr. Dauncey spoke of the manufacture of pig iron, and the malleable and puddling processes, open hearth, and electric furnaces.

There were, he said, four methods of manufacturing white iron into malleable castings — crucible, cupola, air furnace, and open hearth furnace. The advantages and disadvantages of each were enumerated, together with the precautions necessary to make good castings. The air furnace process was splendid, but was expensive as to upkeep. The iron was very satisfactory, but there was a drawback in this respect, the metal on the top might be hot in the middle comparatively cold. He advocated the use of three tap holes, so that three charges could be tested and drawn off. The open hearth method was admirable for large quantities, but must be in continuous operation.

The annealling process changed completely the chemical form of the iron. The best period of duration of time for the process was sixty hours, while the taking up and down of the temperature were the most important and critical stages of the process.

Mr. Dauncey then contrasted the European and American systems of manufacture, and went to say that the true position of malleable iron was between cast iron and steel. In some respects, notably in standing strains, it was better than steel. If American metallurgists had devoted as much attention to malleable iron as they had to steel, the former would now be in much more extensive use. Wrought iron, cast iron, malleable iron and steel had each the particular field, and these should not be confused. Let men who understood malleable iron design malleable iron for malleable iron purposes.

A discussion followed, in which Messrs. Dyer, R. A. Ross, F. B. Brown, J. Farmer, Mr. Groves and Mr. Fisher took part.

At this meeting the following resolution was passed:—moved by S. F. Rutherford, seconded by Major McKergow and carried: That this meeting of the Montreal Branch of *The Engineering Institute of Canada* record with much pleasure the honor conferred to-day upon our fellow member, Past President G. H. Duggan, of the honorary degree of Doctor of Laws by Queen's University, and that we extend to him our heartiest congratulations upon this signal mark of the high place he has achieved in learned circles in Canada.

* * *

At the meeting held on the 23rd instant there were one hundred and twenty-five present. J. A. Jamieson, M.E.I.C., presented a paper on Grain Dust Explosions, Their Cause and Prevention, dealing with the technical side of dust explosions with its bearing on the Port Colborne disaster which occurred on August 9th, Mr. Jamieson having made an investigation the following day. He gave a detailed description of the Port Colborne elevator, which he himself had designed and also gave the result of his investigations after the explosion.

Mr. Jamieson's paper occupied the entire evening and in view of its excellence it was decided to make a change in the regular programme to allow of a discussion. The meeting on the 30th instant will therefore be a discussion on Mr. Jamieson's paper instead of Centrifugal process of Casting Pipe, by D. deLavaud, which had been scheduled for that day.

REPORT OF COUNCIL MEETING

Owing to the lateness of the Council meeting this month it was impossible to have a full report published.

His Royal Highness, The Prince of Wales was elected to Honorary Membership.

The establishment of a branch of *The Institute* at Peterborough was approved and it was noted that the local engineers desired officers of *The Institute* to be present to make the inauguration on November 6th a notable event. A number signified their intention of attending the opening meeting at Peterborough.

A large number of items of general interest and importance were considered. The membership ballot was canvassed and the following elections and transfers effected:—

Members: four; Associate Members: thirty-three; Juniors: six; Transferred from the class of Associate Member to Member: eight; Transferred from the class of Junior to Associate Member: eleven; Transferred from the class of Student to Associate Member: four; Transferred from the class of Student to Junior: eight.

The list will be published in the next issue of the Journal.

Inasmuch as it was impossible to deal with classifications, the meeting was adjourned to the early call of the Secretary.

A. G. Dalzell, M.E.I.C., who received a hearty vote of thanks from the Vancouver Branch for his excellent work as Sec'y-Treas. on the occasion of his resignation recently.

Personals

Warren C. Miller, S.E.I.C., formerly Assistant Engineer of St. Thomas, Ont., has recently been appointed City Engineer.

*

J. T. Johnston, A.M.E.I.C., Assistant Director of Water Power, attended the National Exposition of Chemical Industries on behalf of the Dominion Government.

*

B. F. Haanel, M.E.I.C., acted as representative of the Dominion Government at the recent dedication of the Engineering Building at Pittsburg, which has been erected by the U.S. Bureau of Mines for research work in Metallurgy and Fuel problems.

*

J. O. Twinberrow, S.E.I.C., who has been serving overseas since May 1915 as Captain and workshop officer of the Mechanical Transport Dept., Royal Army Service corps, has returned to Montreal and is finishing his course at McGill University.

*

J. Blizard, A.M.E.I.C., of the Department of Mines, has for the past two months been conducting an investigation on Powdered Fuel, and has visited the principal sources of information in Canada and United States. His report on this subject will be published by the Department of Mines.

*

Major Cecil Ewart, A.M.E.I.C., has been engaged by the Department of Railways, British Columbia and is at present locating a line from the Pacific Great Eastern Railway at Clinton, B.C. to Ashcroft, B.C. Major Ewart was formerly with the 8th Batt., Canadian Railway Troops.

*

George B. Mitchell, M.E.I.C. who is well known in Montreal where he resided a number of years, and who for the past year and a half has been construction engineer with the Foundation Company at Port Huron, expects to leave for Peru on the sixth of November, in the interests of the Foundation Company.

*

Paul E. Mercier, M.E.I.C., who tendered his resignation as consulting engineer, Public Works of Montreal, will continue in the service of the City, in which capacity, however, it is proposed that he spend only part of his time, as he has accepted professorship in engineering on the staff of l'Ecole Polytechnique.

M. B. Weeks, M.E.I.C., formerly Director of Surveys of the province of Saskatchewan, has been appointed Director of Town Planning, and, W. A. Begg, A.M.E.I.C., formerly town site engineer for the Department of Highways of the province, has been appointed Town Planning Engineer by the Dominion Government.

*

D. Walter Munn, M.Sc., A.M.E.I.C., who for a number of years has been plant engineer for Armstrong Whitworth, Limited, has been appointed Professor of Civil Engineering in the Royal Military College. Professor Munn was for a number of years a member of the faculty of the University of British Columbia.

*

Morris Knowles, M.E.I.C., of Pittsburgh, visited Montreal recently en route to New York to attend a meeting of the Committee of Engineering Council dealing with the proposed Department of Public Works in the United States of which he is Chairman. Mr. Knowles is also President of the Pittsburgh Section of the American Society of Civil Engineers.

*

Lieut.-Col. G. H. Kirkpatrick has been appointed President and Major A. R. McKenzie one of the Board of the Vancouver Board of Harbour Commissioners. It is interesting to note that most of the members of the Board are engineers and returned soldiers with excellent records and that the previous Board of Harbour Commissioners contained no engineers. It is a further sign of the times.

*

Captain E. A. Earl, R.E., A.M.E.I.C. writes from the British Military Mission, Vladivostok, Siberia, expressing himself in favor of legislation for the engineer. Captain Earl is engaged in connection with the work of the Allied Mission in Siberia, and on his arrival at Vladivostok, was appointed D.O.R.E. for the Vladivostok district. He expects, however, that the work will be of a temporary nature.

*

Dr. G. H. Duggan, M.E.I.C., Past President of *The Institute*, has been elected Chairman of the newly appointed Quebec Division of the Canadian Manufacturers' Association. The formation of this Division is in keeping with the recently adopted policy of the Manufacturers' Association to establish branches in the various provinces to more efficiently co-ordinate the work of the Association.

*

J. T. Johnston, B.A.Sc., M.E.I.C., and A. M. Beale, B.Sc., A.M.E.I.C., of the Dominion Water Power Branch, Ottawa, spent the latter part of September in Chicago in attendance at the Fifth National Convention of Chemical Industries, where they demonstrated Canada's possibilities and resources particularly in relation to the enormous possible development of water power in this country.

The former partnership existing between James, Loudon & Hertzberg, Consulting Engineers, Toronto, has been dissolved. Messrs. T. R. Loudon, M.E.I.C., and C. S. L. Hertzberg, M.E.I.C., continuing the partnership of Consulting Engineers, with offices at 402 Excelsior Life Building, 36 Toronto Street, Toronto, where they will continue the practice of their profession in a consulting capacity. E. A. James, M.E.I.C. will also continue to act as Consulting Engineer.

*

H. U. Hart, M.E.I.C., who was Chief Engineer of the Canadian Westinghouse Company of Hamilton, has been appointed General Manager of the Company. Mr. Hart's elevation to this important executive position is evidence of the success of an engineer when given executive responsibility and illustrates further that the engineering profession contains men who from their training, experience and ability are the most logical directors of our industrial affairs.

*

H. L. Bunting, B.Sc., M.C., J.E.I.C., has been appointed Instructor in engineering drafting in the Department of Soldiers' Civil Re-Establishment Retraining School at Winnipeg. Mr. Bunting enlisted in March 1916 with the 200th Batt., C.E.F. and was transferred to the Canadian Engineers in June 1916. He served in France with the 5th Army Troops Co., Canadian Engineers from November 1917 to March 1919 and for his distinguished services was awarded the Military Cross. He was discharged August 23rd, 1919.

*

W. G. H. Cam, A.M.E.I.C., has been appointed to the position of Electrical and Power Engineer for the Canada Cement Company by A. C. Tagge, M.E.I.C., Assistant General Manager and General Superintendent of the Company. Mr. Cam is a graduate of the City and Guilds of London and the Central Technical Institute in Electrical Engineering. Mr. Cam had considerable continental experience before arriving in Montreal in 1909, since which time he has engaged in operation, construction and consulting in connection with a number of the power and lighting systems in Montreal and vicinity.

*

A. M. Robertson, Jr., S.E.I.C., returned from service in France, on September 30th last and is resuming his studies at McGill University. Mr. Robertson enlisted in February 1915 with the 21st Battery, 6th Brigade. In August of the same year he was commissioned in the Canadian Engineers and served in France with the 1st Divisional Engineers from January 1916 to January 1919, during which time he was twice wounded and was decorated with the Military Cross. When the armistice was signed Mr. Robertson was promoted to Captain and transferred to Divisional Pontoon, Bridging Unit and was stationed in London, England until his return to Canada.

*

William F. Drysdale, M.Sc., M.E.I.C., was married at noon, on Saturday, October 4th, at Albany, N.Y. to Miss Louise Adele Miller of that City.

Mr. and Mrs. Drysdale left on a motor trip to Montreal and a short time after sailed by the " Empress of France " from Quebec for Liverpool. They are to reside in Paris, France. Mr. Drysdale whose home was formerly in Montreal, is one of our younger Canadian engineers who have achieved single success in other countries. The high position he holds as European representative of the American Locomotive Works, is an evidence of his ability and gives promise of even greater achievement.

*

Brig.-Gen. C. H. Mitchell, M.E.I.C., Dean of the Faculty of Applied Science of the University of Toronto, gave his inaugural address, at Convention Hall, on October the 8th. General Mitchell stated that a broadening out of the general education of scientifically training a man to include more of the humanities, the bringing into closer relationship of theory and practice and the development of a curriculum suited to the needs of the nation were required. The future of applied science rested with all Canadians not only in the actual process of development but also in the education of the young men who would participate in that development. General Mitchell shows in his inaugural address a clear insight and a keen appreciation of the requirements of technical training.

*

Lieut.-Col. J. A. Hesketh, C.M.G., D.S.O., M.E.I.C., has returned to Winnipeg as assistant to the chief engineer of the Canadian Pacific Railway for the Western Division. Col. Hesketh was formerly Chairman of the Manitoba Branch.

In 1879 Col. Hesketh entered the R.M.C. and obtained his first commission with the Canadian Field Artillery in September 1882. Since then in various times he received promotion to the rank of Lieutenant-Colonel. He served in the North West Rebellion with the 7th Fusiliers. During the late war his services are as follows: From August 6th, 1914 to July 12th, 1919 in France. From May 1915 to December 1918, Major and Lieut.-Col. For these services he was awarded the honours of C.M.G., D.S.O.; mentioned in dispatches and was wounded, which is in all a very enviable record.

*

An Engineer in Parliament

Members will be interested to know that while for the next four years the Province of Ontario will be run very largely by the members elected by the farming interests, there will be at least one engineer sitting in the House. This honor belongs to Major Andrew W. Gray, B.Sc. (Queen's), A.M.E.I.C. of Westport, and will represent North Leeds. Major Gray was born at Morton, Leeds County, Ontario, and was graduated from Queen's University in 1912. He has had twelve years in municipal engineering and highway construction in addition to being overseas two years on active service with the C.R.T. where he was engaged in bridge construction and track laying with the rank of Major. Major Gray deserves all honor from his fellow members in the profession who will watch with interest his career in the House where it is expected he will soon make a name for himself.

Major D. A. White, D.S.O., J.E.I.C., has returned to Ottawa, having gone overseas in September 1914 as Captain of the 2nd Battery, C.F.A., 1st Canadian Division. On August 28th, 1915, he was promoted to Major and commanded the battery until December 1916. He served as Brigade Major of the 1st Canadian Divisional Artillery until December 1917. Later he served as Staff Officer, Royal Artillery, Canadian Corps Headquarters until demobilized in June, 1919. He was awarded the D.S.O., and three time mentioned in dispatches.

*

Colonel A. W. R. Wilby, C.B.E., A.M.E.I.C., has returned to Canada and resumed his work as District Engineer for the Department of Marine, Victoria, B.C. Col. Wilby left Canada in March 1916 with the 62nd Batt., C.E.F. This Battalion was broken up in England and in July 1916, Col. Wilby transferred to the 48th Batt., otherwise known as the 3rd Canadian Pioneers, which was then in France and with which he served with the rank of Major until the Battalion was broken up in France in May 1917. At this time the Canadian Corps were desirous of securing a Deputy Assistant Director for the Corps in connection with the then newly formed Labour Directorate and Col. Wilby was selected for this position. Upon the reorganization of the Labour Directorate in the early part of 1918 Col. Wilby was promoted to Colonel with the title of Labour Commandant, Canadian Corps Headquarters. He was twice mentioned in dispatches and for his services at the front was awarded the Order of Commander of the British Empire.

*

Gore, Nasmith & Storrie is the name of the newly formed partnership of consulting civil engineers and public health specialists, with offices in the Confederation Life Building, Toronto. William Gore, M.E.I.C. has been for some years consulting engineer of the John verMehr Engineering Co., Limited, Toronto, where he has resided for some years being intimately associated with the production of the Ransome drifting sand filter of which he is the inventor an account of which by himself and Mr. Storrie appears in the current issue of *The Journal*. Dr. George G. Nasmith, C.M.G., was formerly director of laboratories, Toronto, and for his services as Sanitary Advisor of the First Canadian Expeditionary Force was awarded the Companionship of St. Michael and St. George. William Storrie, M.E.I.C. was chief engineer and Director of the John verMehr Engineering Co. and has resided in Toronto since coming from Scotland in 1909 with the exception of the period when he was in charge of the Water Works of the City of Ottawa and for the past year until recently when in England taking charge of the construction of re-inforced concrete ships for the Admiralty.

*

Newly appointed Assistant Secretary

At the recent meeting of the Council it was decided that the work of the organization and of the detail at Headquarters had grown to such proportions as to require an addition to the staff of an assistant secretary. It was felt that the Secretary should have more time than was possible under present conditions to devote to the welfare of the branches and to the general executive work of *The Institute* and this decision resulted in the appointment by the Secretary of A. W. Swan, B.A.Sc. (University of Toronto), Jr.E.I.C. to the position of assistant secretary of *The Institute*. Mr. Swan was born in Glasgow on April 4th, 1893, and was educated at George Watson's, Edinburgh and took the engineering course in the University of Toronto where he graduated in mechanical engineering in 1917 with the degree B.A.Sc. Since his graduation Mr. Swan has been with The Canadian Ingersoll-Rand Co. Limited at Sherbrooke. During his first year there he was in the production department on time-study and kindred work and during the past year and a half was in the publicity department in charge of trade-journal section of publicity. Mr. Swan's training, experience and qualifications indicate that he is well fitted for this work.

A. W. Swan, B. A. Sc. Jr. E. I. C.

As is the case with the secretary and the accountant he will be bonded. As general executive assistant he will have charge of the production of *The Journal* and be responsible fot the printing of the Year Book, transactions and other publications of *The Institute* and as office manager he will be responsible for the efficient handling of the routine business of the office.

Mr. Swan's picture is reproduced herewith in order that he may be suitably introduced to the Members.

Lieut. J. M. Gilchrist, R.N.V.R., A.M.E.I.C., whose home is in St. John, N.B., arrived in Montreal early in October on the S. S. Tunisian from England. Lieut. Gilchrist left Canada early in 1916 taking a course in Greenwich Naval College and from there went to Southampton, where he was commissioned to Motor Launch 288, Sheerness, being second in command and engaged in patrolling, mine-sweeping and mine-laying. One year later he was made lieutenant in command of M.L. 525. Shortly after taking command he was sent to Dover for a course in the Zeebrugee blockade. Lieut. Gilchrist had the thrilling experience of taking a hand in one of the most daring exploits of the whole war, if not in the history of all wars, and there acquitted himself in a most creditable manner. As the records show, almost one half of the men who volunteered to engage in this exploit did not return. On volunteering they were warned by their Admiral that possibly ninety-five per cent would be total casualties. The success of this exploit is well known and those who engaged in it have a record of which they may well be proud. Following the blockade, he was sent back to Sheerness, was transferred to M. L. 244 and placed in command at Port Said where he remained until recently, taking part in the policing of the Suez Canal and participating on behalf of the British Forces during the strike last summer in Egypt.

*

Major W. H. Munro, A.M.E.I.C., whose home is in Peterborough, Ont., is now in the wilds of Northern Nigeria as hydro-electric engineer for Vickers, Ltd. of England. Major Munro has been employed making an inspection in detail of the design and progress of a hydro-electric scheme which Vickers, Limited, are installing for the Northern Nigeria Tin Mines, Limited. Writing to a friend in Canada of his experience in that remote country Major Munro writes in part:—

"This is a very interesting trip in the way of seeing new parts of the world. In my tender youth a favorite pastime on Sunday afternoons was to look at the pictures in a huge illustrated volume at home called "Darkest Africa." This is recalled by the actual scenes one sees on every hand here. The country is thickly populated with natives but the only white men are traders, agents, miners, officials, soldiers, missionaries, etc. The country is not open to colonization like Canada, Australia and other temporate countries. By the way, there is a *Canadian* mission station about eight miles from our camp. I met one of them, a chap named Kirke, whose home was on a farm somewhere near Morrisburg He said he knew people in Winchester, but not you, I asked him.

The real natives here are the Pagans, a numerous race of physically big fine looking people whose only clothes are " earrings and bracelets, and a very independent lot — they only work for us when they feel like it, or when they want a little money to pay taxes. Union wages are nine pence a day. Other tribes are emigrants here and are Mohammedans (they wear flowing cotton clothes as a rule) The Pagans are Ju Ju worshippers and late cannibals. The Hausas and Filanis are traders and cattle people and they are our laborers.

Enclosed are a couple of grass arm bracelets much worn by Pagan women. The Pagans are quite polite, they say good-day to you in their own language when you meet them on the native paths, but it is said that if the white men were not here they would clean up the Hausas and Filanis and other strangers in short order: they carry weapons all the time."

OBITUARIES

Robert Weddell, A.E.I.C.

Late. R Weddell, A.E.I.C.

Robert Weddell, A.E.I.C., died at his home in Trenton, Tuesday, September 19th. For nearly half a century, the late Mr. Weddell has occupied the position of an enterprising citizen of Trenton whose activities took him to various parts of Canada in connection with the contracting business in which he was so successful. The late Mr. Weddell was born in Edinburgh in June, 1850 and before leaving the land of his birth, served his apprenticeship in mechanical engineering. As a contractor he had numerous Government and municipal and other contracts, which won for him a wide reputation, in addition to his work in connection with building bridges, constructing railways and dredging waterways. For many years his foundry and machine shops at Trenton has been one of the most important establishments of the town. He was formerly President of the St. Andrew's Society of Trenton and was a Past Master of the A. F. and A. M. In religion he was a Presbyterian. Mr. Weddell is deeply mourned in his adopted city where he has been a leader in all that made for the betterment of the community, for many decades. He is survived by his son, R. G. Weddell, A.M.E.I.C., who has recently assumed full control of his business, and by one daughter.

Henry Gillmor Smith, B.Sc., A.M.E.I.C.

A shocking accident on the Canadian National Railways near Parry Sound, Ont., resulted in the death of H. G. Smith, A.M.E.I.C., popularly known as Harry Smith, while engaged in his duties superintending construction work for the Canadian National Railways in connection with the contract of the Dominion Construction Company. A collision occurred between a freight train and the construction train, the collision resulting in the destruction of the conductor's van in which the late Mr. Smith was riding at the time. The engine of the freight train struck the van which took fire and was soon destroyed with its single occupant who was imprisoned therein.

Henry Gillmor Smith was born at St. Martins, N.B., on May 4th, 1884, graduating in civil engineering from the University of New Brunswick, with the degree of B.Sc., in 1908. Upon graduation he entered the employ of the Canadian Northern Railway where he served in various capacities with increasing responsibility until the time of his death, transferring to the Canadian National Railways when the Canadian Northern Railway was taken over. The late Mr. Smith entered *The Institute* as a Junior on Jan. 13th, 1912 and was transferred to Associate Membership September 19th, 1916. His death occurred on October 10th, 1919.

Flight Lt. Franklin Sharp Rankin, R.M.C., S.E.I.C.

Word has just been received at headquarters of the death of Flight Lieut. F. S. Rankin, S.E.I.C., who was killed in action above Bapaume, on October 26th, 1916. Lieut. Rankin was a graduate of the 1914 class of the Royal Military College and enlisted in the early days of the war at the age of nineteen. He is typical of the huge class of Canadians who engaged with the Royal Air Forces and did so much to make the British Air Forces live in all history. Lieut. Rankin was born in Woodstock, N.B., on July 31st, 1894. In reply to a letter addressed to his father concerning his son's record, he writes that the facts are all summed up by saying " he went and stayed."

The following letter was sent by Colonel G. J. Carmichael, 18th Squadron Royal Flying Corps, to Dr. Rankin: He was one of the pluckiest fellows I have ever had in my Squadron, and I am sure he met the death he would have chosen. He was doing escort to a photographic plane well over the German lines. First they attacked three hostile machines and drove them off. They then attacked three more, sending one down in flames, and the second glided down emitting smoke, evidently having been hit in the engine. He was standing up firing over the top plane, firing at the third machine, when a bullet hit him in the head. It was a grand fight against long odds, and it was a splendid death. I am most awfully sorry to lose him; he had done a long spell of good work and had taken part in a good many scraps. Only two days before he was in a big melee, and shared honours over a machine that fell in our lines. He was always out for a fight, my only apprehension was that he would overstep the mark. His pilot and he together took an awful lot of straffing. He is a great loss." A Flying Corps' communique gives the following account of Lieut. Rankin's last engagement:—" On the 23rd October, 1916, Sec. Lieut. F. L. Barnard, with Lieut. F. S. Rankin, No. 18 Squadron, engaged seven hostile machines near Bapaume. Two of the enemy were hit and one of them went down out of control. During the engagement Lieut. Rankin was killed, and the machine being badly damaged Sec. Lieut. Barnard had some difficulty in returning to our side of the lines." Colonel W. W. Melville, under whose command Lieut. Rankin, went to Europe, wrote as follows:—" Your son was with me eighteen months and I became very much attached to him. Individually he was the soul of honour, absolutely without fear. . . . In all my communications with him he treated me very courteously and with respect, and had he been my own son he could not have given me better support. His work was splendid, and having a splendid physique he was able to do the work of two men, and I regret very much that he has not been permitted to live." Lieut. F. L. Barnard, his pilot, writes to his mother;— "Rankin, was by the far the most daring and reckless man in the R.F.C. that every one without exception was frightened to go with him, his one aim and object was to get German blood and whether he ever returned or not was a mere trifle. He had been shot down three other times, and was truly on the war path. One day we were out together and flew over a German air cadet school, that are so strongly guarded that no one would have a ghost of chance if they were ever attacked, and Rankin was determined to fly low and drop bombs on it, but I would not go, and after that I was even more unwilling to go with him, but the day the Germans attacked with seven planes, though I had hated to go up, yet my first thought when the Germans appeared was, thank Heaven, it is Rankin and no one else, and had anybody else been at the guns neither of us could have lived a minute, as it was, Rankin was as cool as though we were toasting our toes by the fire, and would not leave at all, but kept the place guarding the photographing plane until it got safely away."

EMPLOYMENT BUREAU

Outlook for Positions.

Conditions in the field of civil engineering show a slight improvement but more in relation to proposals for next year's activity than for work in progress. Reports from various parts of the country indicate that municipal activity will see a very material increase over any year for the past five or six. In one province alone it is estimated that over six million dollars of municipal improvements in the rural districts is anticipated, apart from highways. The highway situation in Canada from coast to coast bears evidence of a stimulation in engineering activity along this line. In fact it is to the development of highways that a large number of civil engineers must look for employment during the coming years, as it is anticipated that railway construction will be limited.

It is in the industrial field, however, that the greatest and most hopeful prospects for engineering employment are promised. Already there is a demand from large companies and many of the smaller concerns, particularly in the metal working lines, for draftsmen and junior engineers, preference being given to men who have had electrical and mechanical technical training. It is evident that the supply in this direction is going to fall far short of the demand during the coming season.

Within the past month the engineering faculties of the various universities have made a number of notable appointments from among the engineering profession to their professorships and it is found that the unusually large and unexpected enrolment of students in these faculties requires greater professorial assistance than is available at the moment. The head of one technical school spent some time in Montreal endeavouring to locate a sufficient number of men for his faculty and at the time of going to press, positions have not all been filled.

There is also noticeable a slight and well defined stiffening of salaries being offered. Next year is bound to see a decided improvement in this connection.

Situation Vacant.

Mechanical Draftsman:

Steel corporation desires draftsman who is capable of designing. Box 59.

Technical Instructor:

Instructor in civil engineering in a technical college in Eastern Canada desired. Salary $1800 per annumn. Box 62.

Mechanical Draftsman:

Temporary position for technical graduate who has had some experience in mechanical drafting in an industrial concern. Box 57.

Professor in Mechanical Engineering:

An eastern technical college requires a professor in mechanical engineering. Duties to commence immediately. Salary $2400 per annumn. Box 61.

Municipal Engineer:

Graduate engineer having had experience in the construction of sewers and water works wanted for municipality where considerable work is being undertaken at the present time. Box 58.

Instructor in Physics;

1. An Instructor in Physics, at an initial salary of $1,800 per annum, to assist in the Royal Military College, Kingston, Ont., in teaching and instructing in physics. Candidates should be not more than 25 years of age, and should be graduates in civil, mechanical or electrical engineering, or in honour physics with mathematics as a minor subject from a university of recognized standing. Applications must be filed in the office of the Civil Service Commission not later than November 3. This position was advertised August 14, and is now re-advertised.

Electrical Draftsman:

A power company in Montreal requires the services of an electrical draftsman who has had experience in this work. Box No. 63.

Mechanical Draftsman;

Ten or twelve mechanical draftsmen, experienced in foundation or structural steel or machine design, foundry work, and especially in rolling mill design. Positions open for the above number of mechanical draftsmen who are thoroughly competent and well experienced. Address Box 64.

Ten Ways to Kill a Branch.

An enthusiastic member of one of the branches has sent in the following under the heading of 'Ten Ways to Kill a Branch.'

I Don't come to the meetings.
II. If you do come, come late.
III. If the weather doesn't suit you, don't think of coming.
IV. If you do attend a meeting, find fault with the work of the officers and other members.
V. Never accept office, as it is easier to criticise than to do things.
VI. Nevertheless, get sore if you are not appointed on a committee, but if you are, do not attend the committee meetings.
VII. If asked by the chairman to give your opinion on some matter, tell him you have nothing to say. After the meeting tell everyone how things ought to be done.
VIII. Do nothing more than is absolutely necessary, but when other members roll up their sleeves and willingly, unselfishly use their ability to help matters along, howl that the branch is run by a clique.
IX. Hold back your dues as long as possible, or don't pay at all.
X. Don't bother about getting new members. " Let George do it!"

From " The Popular Engineer."

Automatic Control for Motor-Started Converters.

To synchronise the rotary converter with the line, the motor is cut off when the speed is approximately synchronous, and a reactance is switched on until the machine is in step, whereupon the reactance is short-circuited and the transformer connected directly to the converter rings. The means by which these operations are carried out are described in detail, together with methods for safeguarding the sub-station apparatus against A.C. and D.C. overloads, overspeed, and overheating of the bearings.

Causes of Sharp Wheel-Flanges.

The chief cause of wear on tyres and flanges are: difference of diameter of wheels on the same axle; uneven shoe and wheel wear, when the pivotal point on the brake-beam is slightly out of centre; tendency of a flange to crowd the rail when one wheel has worn smaller than the other; sanding one rail only; running cars always in the one direction; trucks out of square; flanged brake shoes; release springs, and sharp rail curves.

Preliminary Notice

of Applications for Admission and for Transfer

20th October, 1919.

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in November, 1919.

FRASER S. KEITH, Secretary.

---

*The professional requirement are as follows:—

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course. In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineers' office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the following branches at his option Railway, Municipal, Hydraulic, Mechanical, Mining, or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five years or more years.

Every candidate for election as JUNIOR shall be at least twenty-one years of age, and must have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-five years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects Geography, History (that of Canada in particular), Arithmetic, Geometry Euclid (Books I.-IV. and VI.), Trigonometry, Algebra up to and including quadratic equations.

Every candidate for election as ASSOCIATE shall be one who by his pursuits, scientific acquirements, or practical experience is qualified to co-operate with engineers in the advancement of professional knowledge.

> The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

ALLISON—PHILIP LIVINGSTON, of Peterboro, Ont. Born at Jersey City, N.J., Nov. 20th, 1872. Educ., M.E., Stevens Inst. of Tech., 1898. 1 yr. student in Gen. Elec. Co., testing dept., Lynn, Mass. 1899-1902, asst. foreman, Gen. Elec., Lynn; 1902-03, elec. engr., DeLaval Steam Turbine Co., Trenton, N.J.; 1903-04, constrn. foreman, Edison Elec. Co., Los Angeles, Cal.; 1904-09, supt., testing dept. Can. Gen. Elec. Co., and 1909 to date, industrial control engr., works eng. dept.

References: R. L. Dobbin, J. A. G. Goulet, J. Mackintosh, G. R. Munro, R. H. Parsons, R. B. Rogers.

BARNS—BIRD LEE (Capt.), of Peterboro. Born at Smyrna, Mich., Aug. 13th, 1881. Educ., B.Sc., Univ. of Mich., 1906. 6 mos., instructor, elec. eng. dept., Univ. of Mich.; 2½ yrs., sales and estimating engr., Allis-Chalmers Co., elec. and hydraulic power mach'y.; 5 yrs., designer, alternating current mach'y., Can. Gen. Elec. Co.; 20 mos., military service, U. S. Army, rank of capt. of engr., in chg. of distribution of eng. supplies in France; at present, designer, alternators and synchronous motors, Can. Gen. Elec. Co.

References: R. L. Dobbin, J. A. G. Goulet, J. Mackintosh, G. R. Munro, R. H. Parsons, R. B. Rogers.

BOOKHOUT-ALDEN FERRIS, of Peterboro, Ont. Born at Walton, N.Y., Feb. 5th, 1871. Educ., B.E., Union Univ., 1898. 1898-1900, in testing and drafting dept., Gen. Elec. Co., Schenectady, N.Y.; 1900-02, ch. engr., Middleburg & Schoharie Elec. Lt. Ht. & Pr. Co., superintended installation, hydraulic and electrical, etc.; 1902-09, ch. draftsman, Can. Gen. Elec. Co.; 1909-19, in eng. dept., Can. Gen. Elec.; at present, elec. engr., switchboard section.

FOR TRANSFER FROM CLASS OF STUDENT TO HIGHER GRADE

MACDONALD—CHARLES BEVERLEY ROBINSON (Capt.), of London, Eng. Born at Halifax, N.S., Dec. 8th, 1893. Educ., diploma with honors, R.M.C., 1914. 1910-11 (8 mos.), rodman, etc., irrigation dept., C.P.R.; July-Nov. 1914, asst. surveyor, Hydrographic Survey of Canada in Hudson Bay & Straight; Jan. 1915, gazetted 2nd lieut., Royal Engrs.; July 1916, Lieut.; Mar. 1918, capt.; was engaged in regular field eng. works, defences, water supply, etc., and in chg. of location and constrn. of important light rys. in Salonica; as adjutant of engrs., 10th Div., in complete control of all engr. supplies for div., etc.; at present, on Hydro Elec. Power Comm. Canal, Niagara Falls, Ont., with various gangs, at present as runner of submarine drill on land carriage.

References: H. L. Bucke, R. P. Johnson, H. J. Lamb, R. W. Leonard, A. C. Macdonald.

McPHAIL—DONALD STUART (Capt.), of Montreal. Born at Tulloch, Jamaica, May 23rd, 1893. Educ., Oundle School, England; 3 yrs. applied science (civil), McGill; School of Mil. Eng., Chatham, Eng.; summers, 1913, transitman, Jamaica Govt. Ry.; 1914, asst., topog. section, Canada Geological Surveys; Mar. 1915—June 1919, overseas, capt., R.E., design and constrn. of military works; at present student 4th year civil eng., McGill Univ.

References: E. Brown, H. M. Lamb, H. M. MacKay, C. M. McKergow, J. B. Porter.

RYAN—CHARLES WILBERT, of Lisben Falls, Me. Born at Mount Forest, Ont. Aug. 10th, 1892. Educ., B.Sc., McGill Univ., 1916. Summers, 1906-07-15, with Prov. of B.C.; 1914, rodman, Dept. of Mines survey in N.S.; 1916, to date, with Turner Constrn. Co., as follows:—1916-17, engr. on constrn. bldgs.; 1917-19, asst. supt.; Aug. 1919, to date, supt., on Worumbo Mfg. Co., new addition, Lisben Falls, Maine.

References: E. Brown, F. B. Brown, H. M. MacKay, W. McNab. J. B. Porter.

SEABOURNE—ROLFE LESTER, of Quebec, P.Q. Born at Thorndale, Ont., Sept. 25th, 1889. Educ., B.A.Sc. (hons.), Toronto, S.P.S. 1916. 1909 (9 mos.), rodman, exploration and mapping (compass), Laurentide Co., Grand Mere; 1910 (3 mos.), exploration, Q.M.S.Ry.; exploration, cruising, base-line and river trav., topog. survey, Brown Co., LaTuque; pole transmission line, Windsor Mills, Sherbrooke; quarry survey, profile, section, etc., Stanbridge, P.Q.; survey, St. Narcisse, P.Q.; 1916-17, Shaw. Water & Power Co.; May 1917, to date, mgr., Laurentian Forest Protective Ass'n, Quebec.

References: A. C. Fellows, P. Gillespie, H. E. T. Haultain.

WEEKS—ROWLAND EDGAR (Lieut.), of Souris, Man. Born at Winnipeg, Man., May 12th, 1893. Educ., B.C.E., Univ. of Man., 1916. 10 mos., rodman, etc., on C.P.R. constrn. surveys, at Wardner, B.C., and Lauder, Man.; 1913 (5 mos.), levelman, Dom. hydrographic survey on North Sask. River; 1914 (5 mos.), levelman, prelim. surveys in St. Andrews Munic., Man., under Man. Good Roads Dept.; 1916 (6 mos.), Man. Prov. Highway dept., as asst. engr., Wallace Munic., making prelim. surveys, staking out and supt'g. constrn. of good roads; 1916, valuation survey on part of southern lines, C.N.R.; 1917, res. engr. with Wpg. Aqueduct Constrn. Co. supervising excavation of trench, placing of grand foundation, etc.; 1917-18, lieut., Can. Engrs.; 1919 (3 mos.), engr. in chg. of prelim. road surveys in Munic. of Rockwood; July 1919, to date, municipal engr., Munic. of Glenwood, Man., in chg. of all eng. work, bldg. of highways, etc.

References: E. E. Brydone-Jack, F. E. Emery, M. A. Lyons, A. McGillivray, C. N. Mitchell, A. H. O'Rielly, G. L. Shanks.

Monthly Engineering Index

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of the engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies may be obtained of any of the articles listed in this section.

Price of each print (up to 11 x 14 in. in size), 25 cents, plus postage. A separate print is required for each page of the larger-size periodicals, but where possible two pages will be photographed together on the same print. Bill will be mailed with the prints.

Harrisson W. Craver, Director,
Engineering Societies Library,
29 West Thirty-ninth Street, New York, N.Y.

AERONAUTICS

AEROPLANE PARTS

FITTINGS. The Design of Aeroplane Fittings, E. S. Bradfield. Aerial Age, vol. 9, no. 26, Sept. 8, 1919, pp. 1175-1176, 4 figs. Charts for determining dimensions and design of metal fitting.

AIRCRAFT

APPLICATIONS. Future of Airships. (La question du plus léger que l'air et son avenir. J. Sabatier. Aéronautique, vol. 1, no. 1, June 1919, pp. 15-24, 6 figs. Comparison, from commercial viewpoint, with aeroplane.

BALLOONS, OBSERVATION. Observation Baloons. (L'Aérostation d'observation) M. Georges. Aéronautique, vol. 1, no. 3, Aug. 1919, pp. 105-111, 11 figs Their origin and development, notably during the war.

CEILING. Application of Theory of Airships to an Example. Variations of Ceiling and Essential Speed with Characteristic Coefficients. (Application de la théorie des avions à un exemple. Variations du plafond et de la vitesse ascensionnelle avec les coefficients caractéristiques), A. Rateau. Comptes Rendus des Séances de l'Académie des Sciences, vol. 169, no. 4, July 28, 1919, pp. 156-162, 1 fig. In case of airship weighing 1700 kg. fitted with 300-hp. motor.

ELECTROSTATIC EFFECTS. Electrostatic Effects on Airships, Gordon S. Fulcher. Aviation, vol. 7, no. 4, Sept. 15, 1919, pp. 174-176. Results of experiments conducted at Princeton University and in wind tunnel at Navy Yard, Washington, to determine safety precaution in design, construction and operation of airships necessary because of electrostatic effects.

FLIGHT FORMULAE. Calculating the Maximum Continuous Flight of an Airship (La distance maxima de vol d'un avion), E. Dorand. Aéronautique, vol. 1, no. 1, June 1919, pp. 4-10. Formula in terms of quantities usually determine in experimental testing of machine.

LANDING GEAR. Landing and Mooring Gear for Airships. Aeronautics, vol. 17, no. 301, July 24, 1919, pp. 90-92, 3 figs. Vicker's patent masts and their operation.

LIFT. The Available Lift of Rigid Airships, E. H. Lewitt. Aeronautics, vol. 17. no. 306, Aug. 28, 1919, pp. 214, 2 figs. Graphs and formulæ.

LOAD. Calculation of the reduced Useful Load of an Airship. (Berechnung der reduzeirten Nutzlast eines Luftschiffes), C. Eberhardt. Motorwagen, vol. 22, no. 13, May 10, 1919, pp. 221-223. Important from commercial point of view.

MOORING GEAR. *See Landing Gear.*

NAVAL AIRSHIPS. Navail Airships (L'Aérostation Maritime). Génie Civil, vol. 75, no. 7, Aug. 16, 1919, pp. 141-147, 7 figs. Types of the French and Italian navies.

UNITED STATES. Airship Engineering Progress in the United States, J. C. Hunsacker. Aviation, vol. 7, no. 3, Sept. 1, 1919, pp. 123-128, 9 figs. Suspension systems and valve construction; features of C class. (Concluded).

UNITED STATES NAVY. The U. S. Navy B.-Class Dirigible. Aerial Age, vol. 10, no. 1, Sept. 15, 1919, p. 19, 3 figs. Sketch showing arrangement of parts.

VICKERS. " Milestones" (Airships), Vickers. Flight, vol. 11, no. 34, Aug. 21, 1919, pp. 1121-1130, 20 figs. British Admirality types developed from 1913 to 1918.

WIRING, STRESSES. Tensions in Transverse Wiring of a Rigid Airship due to deflated Gas Bag, E. H. Lewitt. Aeronautics, vol. 17, no. 302, July 31, 1919, pp. 121-123, 3 figs. Deflation diagram of circular shape having axial wire passing through center.

APPLICATIONS

COMMERCIAL FLYING. Commercial and Pleasure Flying, Claude Graham-White. Aeronautical Jl., vol. 23, no. 101, May 1919, pp. 231-256, 13 figs. Considerations in regard to safety, reliability and commercial value of flying together with illustrations of various models developed for carrying passengers.

PHOTOGRAPHY, AERIAL. Recent Progress in Aerial Photography, L. P. Clerc. Sci. Am. Supp., vol. 88, nos. 2278 and 2280, Aug. 30 and Sept. 13, 1919, pp. 136-138 and p. 170, 14 figs. Discussion of application of war inventions to peace-time needs. (*Translated from La Science et la Vie.*)

SURVEYING AND MAPPING. Surveying and Mapping from Airplanes, E. Lester Jones. Eng. & Contracting, vol. 52, no. 12, Sept. 17, 1919, pp. 325-326. Application of methods which were used during the war for photographing enemies' lines to mapping of extensive area. Address delivered before Second Pan-American Aeronautic Convention.

AUXILIARY SERVICE

PARACHUTES. Aviation Parachutes (Les parachutes d'Aviation), L. P. Frantzen. Aerophile, vol. 27, nos. 13-14, July 1-15, 1919, pp. 211-217, 8 figs. Particulars of various types developed in U. S., England and France. (To be continued.)

DESIGN

DESIGN. Some Points in Aeroplane Design, F. S. Barnwell. Aeronautical Jl., vol. 23, no. 102, June 1919, pp. 301-325, 10 figs. Concerning form of aerofoil section, optimum position for main spars of aerofoil and question of economic position of points of support.

CEILING. Formulae for practical Calculation of Ceiling of Aircraft (Nährungsformeln aur praktischen Berechnung der Höhenleistung von Flugzeugen), p. Jaray. Zeitschr. f. Flugtechnik und Motorluftschiffahrt, vol. 10, nos. 7-8, Apr. 26, 1919, pp. 73-82, 8 figs. Tables and curves showing altitude and velocity calculations.

LINEAR FLIGHT. Notes on Flying (Indications sur le problème de l'avion), M. Devillers. Aéronautique, vol. 1, no. 2, July 1919, pp. 22-28, 3 figs. Technical study of linear flight; experiments to determine efficiencies of various problems differing in ratio of pitch to diameter. (To be continued.)

PERFORMANCE FORMULAE. Predicting the Performance of an Airplane, V. E. Clark. Aviation, vol. 7, no. 4, Sept. 15, 1919, pp. 168-174, 16 figs. Curves for estimating absolute ceiling, climb and maximum and minimum horizontal speeds at any working altitude.

STRESSES. The Loads and Stresses on Aeroplanes, John Case. Aeronautics, vol. 17, nos. 301, 302, 303, 304 and 305, July 24, 31, Aug. 7, 14 and 21, 1919, pp. 98-101, 115-118, 141-143, 167-169 and 192-193, 34 figs. July 24: Effect of stagger and gap chord ratio on center of pressure movement. July 31: Examples of applications of formulae derived in preceding installments. Aug. 7: Loads on machine turning in horizontal circle. Aug. 14: Spar design; load curves for spars. Aug. 21: Bending moments and shearing forces on freely supported beams.

WAR DEVELOPMENTS. Some Developments in Aircraft Design and Application during the War, Lord Weir. Trans. North-East Coast Instn. Engrs. & Shipbuilders, vol. 35, no. 6, Aug. 1919, pp. 268-333 and (discussion), pp. 333-347, 57 figs. Aerodynamical and applicational aspect of salient features of progress and design.

DYNAMICS

HIGH-SPEED AERODYNAMIC PHENOMENA. Studies in High-Speed Aerodynamic Phenomena, F. W. Caldwell and E. N. Fales. Automotive Industries, vol. 41, no. 9, Aug. 28, 1919, pp. 422-426, 13 figs. Comment on workings of army high speed wind tunnel at McCook field, Dayton, Ohio.

ENGINES

HISPANO-SUIZA. The Hispano-Suiza Airplane Engine—V, H. O. C. Isenberg. Am. Mach., vol. 51, no. 11, Sept. 11, 1919, pp. 515-519, 16 figs. Making of pistons; porosity test of large parts that must be air-or liquid-tight are subjected; inspection gages for rough castings.

NAPIER LION. Napier 450-Hp. "Lion" Engine. Aeronautics, vol. 17, no. 303, Aug. 7, 1919, pp. 138-139, 2 figs. Twelve-cylinder 850-lb. engine.

ROTARY ENGINES. German Type of Double Rotary Aircraft Engine. Automotive Industries, vol. 41, no. 11, Sept. 11, 1919, pp. 514-515, 1 fig. Siemens & Halske power plant which appeared in single seater scout plane near end of war. Cylinders and crankshaft rotate in opposite directions.

SUPERCHARGING. How to Get Maximum Efficiency of Supercharged Motors giving Constant Power at all Altitudes (Emploi des moteurs suralimentés à puissance constante à toutes les altitudes.) Aéronautique, vol. 1, no 2, July 1919, pp. 17-22. Calculation of speed to give propeller at various altitudes.

CONSTANT PRESSURE. Maintaining Constant Pressure Before the Carburetors of Aero Engines Regardless of the Altitude, Leslie V. Spencer. Flight, vol. 11, no. 36, Sept. 4, 1919, pp. 1191-1194, 8 figs. Mechanical details of Moss turbo-supercharger. (Concluded.)

VIBRATION. Airplane Engine Vibration, Glenn D. Angle. Aviation, vol. 7, no. 3, Sept. 1, 1919, pp. 118-122, 6 figs. Technical study of its causes and manner of preventing it.

HISTORY

War Period. Historical Account of Aviation during the War from 1914-1918 (Historique de l'emploi de l'aviation), M. Orthlieb. Aéronautique, vol. 1, nos. 1 and 3, June and Aug. 1919, pp. 9-13 and 112-117, 6 figs. June: Strategic operations. Aug.: Work of aviation corps in battle of Verdun. (Concluded.)

MATERIALS OF CONSTRUCTION

Dope. *See Fabric and Dope.*

Fabric and Dope. Fabric and Dope, with Special Reference to Deterioration of Strength and Tautness, F. W. Aston. Aeronautical Jl., vol. 23, no. 101, May 1919, pp. 213-230, 10 rigs. Sunlight is claimed to be only serious deteriorating agent; a curve is given showing change in rate of strength throughout year, effect being very great in summer and practically negligible in winter.

Plywood. Tests on Thin Plywood as a Substitute for Linen in Aeroplane Construction, Armin Elmendorf. Aerial Age, vol. 9, no. 24, Sept. 1, 1919, pp. 1135-1136, and p. 1147, 4 figs. At Forest Products Laboratories of U. S. Forest Service, Madison, Wisc.

Wood. Selecting Wood for Airplanes, Arthur Koehler. Sci. Am. Supp., vol. 88, no. 2279, Sept. 6, 1919, pp. 148-149, 5 figs. Discussion of considerations necessary in selecting materials and the effects of some hidden defects.

See also Plywood.

Splintering. Splintering of Airplane Woods, G. E. Heck. Sci. Am. Supp., vol. 88, no. 2274, Aug. 2, 1919, pp. 68-69, 4 figs. Tests of different airplane woods to determine relative splintering under rifle fire, conducted at U. S. Forest Products Laboratory, Madison, Wisc.

Spruce, Treatment. Treatment, Seasoning and Working of Spruce for Airplanes (Manutention, Magasinage et entretien des bois de sapin pour aéroplanes). Génie Civil, vol. 75, no. 11, Sept. 13, 1919, pp. 251-253, 2 figs. Account of processes followed and of experiments performed to determine physical properties of various samples.

METEOROLOGY

Atmospheric Sounding. Sounding of Very High Regions of Atmosphere with Long Range Artillery (Sondage de la très haute atmosphère par l'Artillerie à longue portée), A. de la Baume-Pluvinel. Aérophile, vol. 27, nos. 13-14, July 1-15, 1919, pp. 209-210. Concerning requirements which must be possessed by shells capable of being sent to height in neighborhood of 50 miles.

Barometric Variation, Forecast. Utilization of Temperatures in Forecasting Barometric Variations (Sur l'utilisation des températures pour la prévision des variations barométriques), G. Reboul and L. Dunoyer. Comptes Rendus des Séances de l'Académie des Sciences, vol. 169, no. 4, July 28, 1919, pp. 191-193. Following rules are formulated: (1) Rise in temperature precedes barometric depression; (2) falling temperature precedes barometric rise.

Clouds, Measurement of Water. Measurement of Water in Clouds, L. F. Richardson. Proc. Roy. Soc., vol. 96, no. A674, Aug. 1, 1919, pp. 19-31, 3 figs. How to measure diminution by clouds of difference of brightness at edge of sun's disc by special photometer.

Electrical Physics of Atmosphere. The Electrical Physics of the Atmosphere, J. E. Taylor. Instn. Post Office Elec. Engrs., no. 74, Nov. 19, 1917, 60 pp., 7 figs. Compilation of technical information in regard to electrical effects in atmosphere considered as of useful value to telephone and telegraph engineers, with special reference to general character and causes of natural disturbances on telephone and telegraph circuits apart from direct lightning discharges.

Magnetic Storms. Magnetic Storms of March 7-8 and August 15-16 and their Discussion, C. Chree. Proc. Roy. Soc., vol. 96, no. A674, Aug. 1, 1919, pp. 32-35, 1 fig. From records obtained at Kew and Eskdalemuir observatories.

Stirring, Atmospheric Measurement. Atmospheric Stirring Measured by Precipitation, Lewis F. Richardson. Proc. Roy. Soc., vol. 96, no. A674, Aug. 1, 1919, pp. 9-18. Equation for diffusion is investigated in general case in which atmospheric distance and degree of turbulence must both be regarded as varying with height.

United States Army. Some Scientific Aspects of the Meteorological Work of the United States Army, Robert A. Millikan. *Proc. Am. Philosophical Soc., vol. 58, no. 2, 1919, pp. 133-149, 8 figs. Scientific interest seem to center about (1) extension of knowledge of law of motion of pilot balloons, (2) procurement of data and development of methods for preparation of artillery range tables, (3) development of long range propaganda for preparation of artillery range (3) development of long range propaganda balloons, and (4) charting of upper air in United States and overseas, in aid of aviation.

Wind. Diurnal Variation of the Velocity of the Wind (La variation diurne de la vitesse du vent dans l'atmosphère), J. Rouch. Comptes rendus des séances de l'Académie des Sciences, vol. 169, no. 6, Aug. 11, 1919, pp. 293-295. Observations made at top of Eifel Tower (altitude about 1000 ft.)

Wind Velocity in High Atmosphere in Clear Weather (Sur la vitesse du vent dans la haute atmosphère par temps clair), Cu. Maurain. Comptes rendus des séances de l'Académie des Sciences, vol. 169, no. 2, July 15, 1919, pp. 79-82, 1 fig. Based on balloon sondages at altitudes exceeding 32, 800 ft.

PRODUCTION

Aviation Repair Depot. "New Planes for Old"—The Work of the Aviation Repair Depots, William Menkel. Aerial Age, vol. 9, no. 24, Sept. 1, 1919, pp. 1129-1133, and p. 114, 11 figs. Organization system of depot at Indianapolis.

Inspection. Inspection of Airplanes at Romorantin, France, Earl E. Ives. Mech. Eng., vol. 41, no. 10, Oct. 1919, pp. 819-820. DeHaviland-4s American built were shipped to Romorantin in semi-assembled condition and there were uncrated, set up, tested and flown to the battle line. Work of inspectors involved in these operations is taken up.

Standardization. Standardization in Aircraft Construction (Normung in Luftfahrzeugbau). Zeitschr. f. Flugtechnik und Motorluftschiffahrt, vol. 10, nos. 5-6, Mar. 29, 1919, pp. 45-61. Standards for bolts, screws, cables, sheets, tubes, etc.

MILITARY AIRCRAFT

War Period. Historical Account of Aviation during the War of 1914-1918 (Historique de l'emploi de l'Aviation pendant la guerre 1914-1918), M. Orthlieb. Aéronautique, vol. 1, no. 2, July 1919, pp. 49-52, 3 figs. Reconnaissance work by means of airplanes. (Continuation of serial.)

See also History (War Period).

MODELS

Model Tests. From Model to Full Scale in Aeronautics, H. Levy. Aeronautical Jl., vol. 23, no. 102, June 1919, pp. 326-345, 12 figs. Question discussed from theoretical standpoint.

PLANES

B.A.T. The B.A.T. Four-Seater Biplane. Aerial Age, vol. 9, no. 26, Sept. 8, 1919, pp. 1172-1174, 7 figs. Biplane designed either for passenger work or for carrying mail. *From Flight.*

German Giant Aircraft. Development of Giant Aircraft Construction in Germany during the War (Die Entwicklung des deutschen Riesenflugzeugbaues während des Krieges), A. Baumann. Zeitschr. des Vereines deutscher Ingenieure, vol. 63, no. 22, May 31, 1919, pp. 497-504, 10 figs. Description of C, G, R and Lenz types.

See also Hydroaeroplanes, German.

Graham-White. The Graham-White "Aero-Limousine." Aeronautics, vol. 17, no. 305, Aug. 21, 1919, pp. 190-191, 3 figs. Flight, vol. 11, no. 37, Sept. 11, 1919, pp. 1214-1218, 19 figs. Power unit consists of two Rolls-Royce Eagle Mark V engines of 320 hp., one on each side of fuselage, between top and bottom planes; span is 60 ft.; overall length 39 ft. and overall height 11 ft.

Hydroaeroplanes, German. Development of German Hydroaeroplane Construction (Die Entwicklung des deutschen Seeflugzeuges), Werner v. Langsdorff. Schiffabu, vol. 20, no. 16, May 28, 1919, pp. 423-427, 10 figs. Description of Aeg, Ago, Albatross, Friedrichshafen and other types.

Lawson. The "Lawson" Aerial Transport. Flight, vol. 11, no. 37, Sept. 11, 1919, pp. 1220-1222, 6 figs. Power is supplied by two Liberty engines of 400 hp. each. Overall length is 47 ft. 7 in., overall height 14 ft.; speed is 100 m.p.h.

NC. Design and Construction of the NC Flying Boats, G. C. Westervelt. U. S. Naval Inst. Proc., vol. 45, no. 199, Sept. 1919, pp. 1529-1581, 47 figs. Historical and descriptive account.

Nieuport. British Nieuport Aeroplanes. Aeronautics, vol. 17, no. 301, July 24, 1919, pp. 94-95, 6 figs. Economy claimed in manufacture by use of rectangular section struts, streamlining being effected by means of fabric fairing.

The Nieuport "Hight Hawk" Single-Seater Scout—II. Engineer, vol. 128, no. 3320, Aug. 15, 1919, pp. 151-153, 5 figs. Arrangement of controls in cockpit.

Siemens-Schuckert. Enemy Airships (L'Aviation Ennemie), René Bréval. Aérophile, vol. 27, nos. 13-14, July 1-15, 1919, pp. 198-199, 7 figs. Characteristics of Siemens-Schuckert chasing biplane.

Siemens-Schuckert 1800-hp. Giant Airship (L'avion Géant Siemens-Schuckert 1800 hp.), René Bréval. Aérophile, vol. 27, nos. 13-14, July 1-15, 1919, pp. 199-200, 2 figs. Length 71 ft.; height 24 ft.

Westland. The Westland Limousine. Aeronautics, vol. 17, no. 303, Aug. 7, 1919, p. 133, 1 fig. Flight, vol. 11, no. 35, Aug. 28, 1919, pp. 1145-1148, 6 figs. Four-seater commercial biplane; length 28 ft. 6 in., wing span 38 ft. 2 in.; speed at 10,000 ft. 91 miles, fitted with 275-hp. Rolls-Royce Falcon engine.

RESEARCH

Stanford University. The Stanford University Aerodynamic Laboratory, E. J. Baughman. Aviation, vol. 7, no. 4, Sept. 15, 1919, pp. 183-184, 4 figs. With reference particularly to wind tunnel.

TRANSATLANTIC FLIGHT

Airship, Trans-Atlantic Flying. Notes on Long Aerial Flights (En marge des raids aériens), M. Thebault. Aéronautique, vol. 1, no. 1, June 1919, pp. 11-15, 5 figs. Technical study of problem of trans-Atlantic crossing in airship.

VARIA

Air Navigation Regulations. Convention relating to International Air Navigation. Aeronautics, vol. 17, nos. 302, 303, 304 and 305, July 31, Aug. 7, 14 and 21, 1919, pp. 124-127, 145-147, 170-173 and 197-198, 4 figs. July 31: International Convention for Regulation of Air Navigation agreed by representatives of allied and associated powers serving on International Commission dealing with aerial navigation. Aug. 7: Rules as to lights and signals; rules of the air. Aug. 14: International aeronautical maps and ground markings; collection and dissemination of meteorological information. Aug. 21: Customs regulations applicable to aircraft and goods. (Concluded.)

Regulation of Air Navigation in United Kingdom. Automotive Industries. vol. 41, no. 10, Sept. 4, 1919, pp. 453-456. Illustrating to what extent English Government is aiding aircraft industry to get foothold in civil life.

Aircraft Ministry, British. How Britain Has Originated Its Aircraft Ministry. Allen Sinsheimer. Automotive Industries, vol. 41, no. 9, Aug. 28, 1919, pp, 399-401, 1 fig. British and American organizations contrasted.

Department of Aviation. Probable Duties of a Department of Aviation, Allen Sinsbeimer. Automotive Industries, vol. 41, no. 12, Sept. 18, 1919, pp. 553-555. Writer says that within a few years it will be necessary to develop for aircraft all tbat bas been developed in a century for ships.

See also Aircraft Ministry.

A Suggestion for a Federal Aviation Department, Allan Sinsheimer. Automotive Industries, vol. 41, no. 11, Sept. 11, 1919, pp. 503-506, 1 fig. Plan contemplates department under director and advisory board.

Licensing of Engineers. Tbe Licensing of Aeronautical Engineers and the Inspection of Aircraft, G. Edward Barnbart. Aviation, vol. 7, no. 3, Sept. 1, 1919, pp. 128-129. Suggestions in regard to licensing, making inspection reports and maintaining logbooks.

Stars, Identification. The Identification of Stars in Cloudy Weatber, Armistead Rust. U. S. Naval Inst. Proc., vol. 45, no. 199, Sept. 1919, pp. 1597-1606, 2 figs. How to obtain asimuth, without use of compass, from two observed altitudes.

CIVIL ENGINEERING

BRIDGES

Arch Testing. Description of a Machine to Test the Actual Horizontal Thrust of Model Arches, Edward Waller Stoney. Indian Eng., vol. 66, no. 3, July 19, 1919, pp. 38-39, 2 figs. Machine constructed to scale of one-twelfth for 10-ft. span, bricks being made of teakwood, two forms, plain and grooved, being used.

Approach Fill. Concrete Ties Hold Together Walls of Bridge-Approach Fill. Eng. News-Rec., vol. 83, no. 11, Sept. 11, 1919, pp. 522-523, 2 figs. Showing details of reinforced-concrete tie rods between retaining walls of bridge-approacb fill.

Construction. New Railroad Bridge at Schwanden, Switzerland (Neue Linthbrücke der S. B. B. in Schwanden.) Schweizerische Bauzeitung, vol. 74, no. 7, Aug. 16, 1919, pp. 80-84, 14 figs. Air temperature curves; details of construction.

Design. Economic Span Lengths for Simple-Truss Bridges, J. A. L. Waddell. Ry. Age, vol. 67, no. 13, Sept. 26, 1919, pp. 635-636. Showing fallacy of old criterion of equal superstructure and substructure costs.

Erection. Erecting Louisville Bridge Main Span. Contracting, vol. 9, no. 4, Aug. 15, 1919, pp. 97-99, 3 figs. Riveted trusses 644-ft. long assembled on falsework of towers and plate girders by 380-ton gantry traveler 149 ft. higb.

Floors. Highway Bridge Floor replaced after Corrosion. Eng. News-Rec., vol. 83, no. 12, Sept. 18, 1919, pp. 562-564, 2 figs. Noting special details adopted to protect new steel-conerete covering for tops of transverse floor beams, complete encasement of steel at abutments and over peirs.

Hydraulic Resistance of Bridge. A Problem on the Hydraulic Resistance of a Bridge over the Chemung River at Elmira, N.Y., S. C. George and E.W. Rettger. Cornell Civil Engr., vol. 27, no. 4, May 1919, pp. 119-126, 1 fig. Maximum flow in river near Lake Street bridge was found to be about 118,000 cu. ft. per sec.; special reference to Collingwood report on flood of 1889.

Rebuilding. Method of Rebuilding the Genesee River Bridge, Lehigh Valley R.R. Eng. & Contracting, vol. 52, no. 9, Aug. 27, 1919, pp. 249-251, 4 figs. Bridge originally built for 125-ton heavy grade engine was brought up to capacity of Cooper's E. 60 loading, which is present standard used on Lebigb Valley R.R. main line bridges.

See also Strengthening, Floors.

Rebuilding an Old Masonry Arch Bridge. Eng. & Contracting, vol. 52, no. 9, Aug. 27, 1919, p. 238, 3 figs. Strengthening by jacketing it in reinforced conerete.

Reconstruction and Reinforcement of Iron Bridges of the Gotthard Railroad between Erstfeld-Bellinzona (Ueber den Umbau und die Verstärkung der eisernen Brücken auf der Bergstrecke Erstfeld-Bellinzona der Gotthardlinie), A. Bubler. Schweizerische Bauzeitung, vol. 74, no. 6, Aug. 9, 1919, pp. 61-66, 11 figs. This reconstruction was necessary to enable bridges to carry load of new electric locomotives. (To be continued.)

Strengthening. War-Time Economies in Strengthening Old Bridges, E. E. Howard. Ry. Age, vol. 67, no. 11, Sept. 12, 1919, pp. 497-498, 3 figs. Two through spans of unusual type reinforced by doubling up of trusses.

See also Rebuilding.

Swing Bridge. Temporary Swing Bridge over the Suez Canal. Engineer, vol. 128, no. 3321, Aug. 22, 1919, pp. 174-176, 3 figs. There are six separate spans, all of different length, total length of structure being 537 ft.; four of spans are fixed and two are capable of being swung. Translated from Génie Civil.

BUILDING AND CONSTRUCTION

Air Pressure. Design of Structures Subjected to Passive Earth Pressure. (Etude de quelques Constructions sollicitées par la Pression passive des Terres), Keiichi Hayashi. Memoirs of the Coll. of Eng., Kyushu Imp. University, Fukuoka, Japan, vol. 1, no. 5, 1919, pp. 333-394, 41 figs. By passive thrust is understood resistance offered by bank of earth to lateral displacement of wall subjected to external horizontal forces. Tbeory of stresses is developed in sucb cases as a reinforced concrete repair-dock, members bridges, etc., where passive tbrust of earth occurs.

Arches. Reinforced Concrete Arches in Construction of Ships and Hangars for Dirigible Balloons (Les voûtes en béton armé dans la couverture des bâtiments. Le hangar de Montebourg pour ballon dirigeable.) Génie Civil, vol. 75, no. 10, Sept. 6, 1919, pp. 213-224, 32 figs. Design formulae and calculations.

Concrete Surfaces. The Artistic Treatment of Concrete Surfaces, H. Vandervoort Walsh. Architectural Rec., vol. 46, no. 3, Sept. 1919, pp. 237-242, 10 figs. Mecbanical means used to produce variety of texture, either by making pitted surface give valley shadows and peaks of high-ligbts, or by securing same effect with peppering of light and dark aggregates.

Churches. *See Roofs.*

Code, Building, Scotland. National Building Code Adopted in Scotland Uses Quantity Surveying Metbods. Contract Rec., vol. 33, no. 38, Sept. 17, 1919, pp. 878-883. Contracts are standardized by requiring all schedules for building works to adhere to same conditions.

Dams. Reinforced Concrete Dam at Gideabacka, Sweden (Le barrage en béton armé de Gideabacka, Suède). Génie Civil, vol. 75, no. 11, Sept. 13, 1919, pp. 249-251, 14 figs. Noting especially precautions to provide against pressure of ice masses and against contraction of masonry in excessively cold weather.

Construction Features of Grand River Roller Crest Dam. Eng. & Contracting, vol. 52, no. 11, Sept. 10, 1919, pp. 289-291, 10 figs. Dam is steel roller crest surmounting concrete weir with sluiceway and canal intake with capacity of 1425 cu. ft. per sec. at one end.

Erection. Limited Space Contributed to Difficulty of Erecting Massey-Harris Warehouse. Contract Rec., vol. 33, no. 38, Sept. 17, 1919, pp. 876-877, 5 figs. Scheme improvised to substitute ordinary stiff leg or guy derrick.

Foundations. A Concrete Foundation for a Wooden Water Tank. Ry. Age. vol. 67, no. 10, Sept. 5, 1919, p. 473, 2 figs. Design embodies use of concrete tower 10 ft. square inside with walls heavy enough to carry tank load.

Foundations in Quicksand and Watery Gravel. Contract Rec., vol. 33, no. 37, Sept. 10, 1919, pp. 861-862, 2 figs. Sinking wells for concrete cylinder piers built as foundations for Canal Street in Cbicago.

Foundation, Tremied. Finishing a Tremied Foundation Under Air Pressure. Contracting, vol. 9, no. 4, Aug. 15, 1919, pp. 91-92, 3 figs. Pneumatic chambers formed in mass concrete made leaky bottom of cofferdam accessible.

Housing. Government Housing at Home and Abroad, Wm. E. Shannon. Am. Industries, vol. 20, no. 2, Sept. 1919, pp. 25-27. American types of bouses considered as more practical, comfortable and more healthful to live in than European, although latter are said to have a higher architectural standard.

Workingmen's Houses in Italy, Alfredo Melani. Architectura Rec., vol. 46, no. 3, Spet. 1919, pp. 243-250, 12 figs. Plans developed by Institute for Popular Homes.

Selling Homes to Workmen at Cost. Iron Age, vol. 104, no. 11, Sept. 11, 1919, pp. 695-697. Amortization basis selling plan of Clark Equipment Co. of Buchanan, Mich.

Steel Corporation's Alabama Developments. Iron Age, vol. 104, no. 10 Sept. 4, 1919, pp. 627-631, 12 figs. Building of homes for employees.

Reservoirs. *See Roofs.*

Roofs. Calculation of Wind Pressure on Arched Roofs, F. Grau. Eng. & Contracting, vol. 52, no. 9, Aug. 27, 1919, pp. 253-254, 5 figs. Method of determining forces and moments produced in parabolic fixed arches. Translated from Le Génie Civil, May 31.

Tanks. Tank Construction—XXXI, Ernest G. Beck. Mech. World, vol. 66, no. 1703, Aug. 22, 1919, pp. 91-92, 5 figs. Design of supports, stays, and connections for side walls of rectangular tanks. (Continuation of serial.)

Standards. Establishing Standards in Construction, A. B. Segur. Eng. & Contracting, vol. 52, no. 9, Aug. 27, 1919, pp. 242-244, 2 figs. Associated Gen. Contractors of Am., vol. 1, no. 2, Aug. 1919, pp. 9-12, 2 figs. Diagrams showing possibility of shipping labor between local industries. From report prepared for Committee on Methods of Assoc. General Contractors of America. Also abstracted in Contract Rec., vol. 33, no. 37, Sept. 10, 1919, pp. 854-857, 2 figs.

Steel Construction. The Standard Unit System of Steel Construction, R. R. Reid. Contract Rec., vol. 33, no. 37, Sept. 10, 1919, pp. 862-863, 2 figs. Development in England.

Stucco Work. Making a Success of Stucco Work. Building Age, vol. 41, no. 9, Sept. 1919, pp. 284-285, 2 figs. Framing and methods of application that prevent cracks, as recommended in extracts from Committee Report of Am. Concrete Inst.

Reservoirs, Concrete. Groined Arches or Flat Roof for Concrete Reservoirs. Eng. News-Rec., vol. 83, no. 12, Sept. 18, 1919, pp. 566-568. Opinions of various engineers and builders as to relative economy and safety, based on experience with both types through a number of years.

Trusses, Steel Roof. Encasing Steel Roof Trusses in a Church Building, N. Serracino. Am. Architect, vol. 116, no. 2281, Sept. 10, 1919, pp. 357-360, 7 figs. In order to make steel trusses give appearance of timber trusses, steel trusses were encased with 1-in. quartered oak casing.

Silos. On the Design of Silos (Un problema sobre Silos), Fernando D. da Silva. Ingenieria, vol. 23, no. 9, May 1, 1919, pp. 579-584, 2 figs. Expressions for determining relation between cost per unit of volume and dimensions of structure.

Concrete Silo may be built without Contractor. Contract Rec., vol. 33, no. 39, Sept. 24, 1919, pp. 898-902, 7 figs. Suggestions of Portland Cement Association in regard to construction of silos witb home-made equipment.

Snowslide Protection. Viaduct Protected from Snowslides by Concrete Walls, E. E. Adams. Eng. News-Rec., vol. 83, no. 10, Sept. 4, 1919, pp. 470-471, 3 figs. Bases of shore bents incased in concrete to prevent recurrence of accidents due to snowslides.

Underpinning. Underpinning a 6-Storey Iron, Glass and Brick Wall. Contracting, vol. 9, no. 4, Aug. 15, 1919, pp. 107-108, 1 fig. Contract Rec., vol. 33, no. 37, Sept. 10, 1919, pp. 864, 865. Work done in strengthening and extending footings so as to increase their strength and reliability without disturbing them or impairing their stability during operation.

Construction, Essentials. Essentials of Important Construction—XXXV, J. B. Golds-Borough. Contracting, vol. 9, no. 5, Sept. 1, 1919, pp. 123-125. Underpinning old buildings; the Breuchaud method; use of piles.

Walls. Concrete Wall Construction is Continuous Process. Eng. News-Rec., vol. 83, no. 10, Sept. 4, 1919, pp. 454-456, 4 figs. Wall 25 ft. high and running nearly 5¼ cu. yd. per ft. is being completed at rate of 76 ft. per week.

Wind Pressure. *See Roofs.*

Wind Pressure on Cylindrical Structures in Practice, R. Fleming. Eng. News-Rec., vol. 83, no. 11, Sept. 11, 1919, pp. 499-502. Methods applicable to various problems of structural designer in dealing with chimneys, stacks and standpipes.

CEMENT AND CONCRETE

Beams and Slabs. Design of Reinforced Concrete Beams and Slabs—II, L. Goodman. Building Age, vol. 41, no. 9, Sept. 1919, pp. 292-293, 1 fig. Formulae and how to use them.

Bonding. Bonding New Cement Mortar and Concrete to Old in Tests, W. E. Rosengarten. Public Roads, vol. 2, no. 14, June 1919, pp. 26-34, 4 figs. Results of tests carried out in engineering research laboratory of Bureau of Public Roads.

Columns. European Design of Concrete Columns, William Wren Hay. Concrete, vol. 15, no. 3, Sept. 1919, pp. 104. Formulæ.

Concreting. Rapid Concreting a Feature of Big Portsmouth Dry Dock. Eng. News-Rec., vol. 83, no. 11, Sept. 11, 1919, pp. 494-496, 3 figs. Installation of duplicate mixer units of large size made possible placing of 16,000 cu. yd. in one month.

Cracks. The Significance of Cracks in Reinforced Concrete Construction, H. Stanley Harris. Surveyor, vol. 56, no. 1439, Aug. 15, 1919, pp. 103-104. Can. Engr., vol. 37, no. 13, Sept. 25, 1919, pp. 333-334. It is said that cracks are generally due to contraction of concrete in setting, to expansion and contraction caused by temperature changes in concrete; to too early removal of forms; to overloading of structure and to settlement of supports. From Proc. of Roy. Victorian Inst. Architects.

Diagrams, Reinforced Concrete. Calculating Diagrams for Reinforced Concrete, James Williamson. Engineer, vol. 128, no. 3320, Aug. 15, 1919, pp. 149-151, 6 figs. on supp. plates. Two types—one combination of logarithmic alignment chart with ordinary logarithmic graph and adaptable to slabs, beams, shear members, pillars, etc., and the other applicable to cases of doubly reinforced beams and rectangular sections under combined stresses, for which ordinary formulae do not admit of direct solution.

Mixers. Better Concrete—the Problem and Its Solution, Nathan C. Johnson. Jl. Engrs., Club Philadelphia, vol. 36, no. 178, Sept. 1919, pp. 333-341, 16 figs. With microscopic motion picture studies as basis, type of mixer is developed in which it is claimed reaction between cement and water is promoted with greater production of useful "glue."

Mixtures. Good Concrete—Right Materials and Mixtures, Russell Bohrek. Concrete, vol. 15. no. 3, Sept. 1919, pp. 98-100. Typical examples of what has been done with the use of local aggregates and cement on Pierce County paving work.

Reinforcements. Proof that Iron used in Reinforced Concrete is Rustproof (Ein Nachweis für die Rostsicherheit des Eisens bei Eisenbeton), E. Probst. Armierter Beton, vol. 12, no. 5, May 1919, pp 105-107, 3 figs. Cites as example slabs made 33 years ago by Dyckerhoff & Widman, and which were stored in the open most of the time; based on his examination of these slabs writer furthermore concludes that a depth of 1.5 cm. is sufficient to prevent iron from rusting.

Sands. Fine-Grained Concrete Sands, F. E. Giesecke. Can. Engr., vol. 37, no. 10, Sept. 4, 1919, pp. 279-280. Study of their value in concrete construction, made at University of Texas.

Stucco, Portland Cement. Standard Recommended Practice for Portland Cement Stucco. Eng. & Contracting, vol. 52, no. 9, Aug. 27, 1919, pp. 251-252. Recommendations by Committee on Treatment of Concrete Surfaces of Am. Concrete Inst.

See also Building and Construction, Stucco.

Vibration. Effect of Vibration, Jigging and Pressure on Concrete, Duff A. Abrams. Eng. & Contracting, vol. 52, no. 13, Sept. 24, 1919, pp. 352-354, 7 figs. Concrete, vol. 15, no. 3, Sept. 1919, pp 107-111, 7 figs. Effect of vibration produced by electric motor on strength of concrete; effect of consistency on strength of jigged concrete.

EARTHWORK, ROCK EXCAVATION, ETC.

Backfilling. Backfilling Tunnel with Concrete. Concrete, vol. 15, no. 3, [illegible] 1919, pp. 130-131, 2figs. Employed in connection with construction of Winnipeg aqueduct, which is 97 miles long.

Breakwater. Building Toronto's Western Breakwater. Contract Rec., vol. 33, no. 35, Aug. 27, 1919, pp. 807-809, 4 figs. Large concrete blocks and rock bill, keyed together with mass concrete, form structure. Dredge converted for handling blocks.

Breakwater and Piers at Victoria, B.C., C. C. Worsfold. Contract Rec., vol 33, no. 39 Sept. 24, 1919, pp. 891-894, 12 figs. Rock and concrete breakwater and two concrete crib piers built during past six years under direction of Public Works Dept.

Caissons. Reinforced Concrete Caissons built with Compressed Air (Fondazioni ad aria compresa con cassoni di cemento armato). Annali d'Ingegneria e d'Architettura, vol. 34, no. 13, July 1919, pp. 199-204, 5 figs. Details of structures designed for Italian Department of Labor.

Canals. Progress of Queenston-Chippawa Power Canal. Can. Engr., vol. 37, no. 9, Aug. 28, 1919, pp. 249-256, 33 figs. Loading 8500 cu. yd. on cars in 20 hours with one shovel.

Conduits. Winnipeg Circular Concrete Conduit. Contracting, vol. 9, no. 5, Sept. 1, 1919, pp. 127-128, 7 figs. Reinforced pipes 87 to 108 in. in diameter, built with steel forms set on invert in open trench.

Demolition. Safety Measures in Demolition of Buildings. Contract Rec., vol. 33, no. 39, Sept. 24, 1919, pp. 895-897, 1 fig. Suggested precautions to observe when tearing down old structures; protection of eyes; securing of beams before cutting; removal of material.

Excavation. Labor. Piece Work Versus Day Labor in Hand Excavation, Everett N. Bryan. Eng. & Contracting, vol. 52, no. 12, Sept. 17, 1919, pp. 319-320. Instance illustrating advantage of piece work over day rate.

Excavator Work Measurement. Scottish Mode of Measurement for Preparation of Schedules of Quantities. Contract Rec., vol. 33, no. 39, Sept. 24, 1919, pp. 903-907. Standardized methods which are applied to measurement of excavator and mason work in Scottish Nat. Building Code.

Packing. Concrete Packing Stops Settlement over Tunnel, E. E. Adams. Ry. Age, vol. 67, no. 11, Sept. 12, 1919, pp. 509-511, 3 figs. Change in sub-surface drainage conditions said to cause decay of timber lagging, requiring its replacement.

Shovels, Steam. Methods of Moving Steam Shovels, J. R. Sherman. Eng. & Contracting, vol. 52, no. 12, Sept. 17, 1919, p. 318, 4 figs. Methods employed in connection with excavation of material for large earth dam for Braden Copper Co., Cjile, S. A.

Subways. Completion of the Boston Subway. Ry. Rev., vol. 65, no. 8, Aug. 23, 1919, pp. 257-261, 10 figs. Data of Broadway surface and Andrew Terminal stations. From final report of Boston Transit Commission.

HARBORS

Peru. Plans for Harbor Improvements in Peru (Plannen voor verbetering van Peruaansche havens), G. J. van den Broek. Ingenieur, vol. 34, no. 35, Aug. 30, 1919, pp. 638-646, 12 figs. Mollendo, Callao, Camana and Matarani. Paper read before department of Building and Waterways, Holland.

HYDRAULIC ENGINEERING

Flood Hazard. Widened Channel Reduces Flood Hazard at Columbus. Eng. News Rec., vol. 83, no. 11, Sept. 11, 1919, pp. 512-513, 2 figs. Fixtures of spillway levee.

Percolation Water. Stream Flow and Percolation water, Samuel Hall. Can. Engr., vol. 37, no. 12, Sept. 18, 1919, pp. 313-314, 1 fig. Illustrating low and basic curves. (Concluded.)

Rhone. Harnessing of the Rhône by Means of Successive Dams (L'Aménagement du Rhone à l'aide de barrages successifs), L. Mähl. Génie Civil, vol. 75, no. 8, Aug. 23, 1919, pp. 175-180, 5 figs. Details of project presented to the Congrès de la Houille blanche.

River Control Work. Some River Control Work of the C.B. & Q. Ry. Rev., vol. 65, no. 11, Sept. 13, 1919, pp. 365-368, 12 figs. Bundled brush mattresses, revetments of riprap and log rafts, successfully used.

Rochester. Hydro Electric Development at Rochester, N.Y. Southwestern Elecn., vol. 15, no. 3, May 1919, pp. 18-19, 7 figs. Station of 25,000 k.v.a. of Rochester Ry. & Light Co., located in gorge of Genesee.

Scowing of Drainage Channels. Board Mattress for Preventing Scour in Drainage Channel, B. F. Burns. Eng. & Contracting, vol. 52, no. 11, Sept. 10, 1919, p. 299, 4 figs. Plan, section and details.

Siphon Spillway. Dam and Tunnel Construction by the Marin Water District. Eng. & Contracting, vol. 52, no. 11, Sept. 10, 1919, p. 302, 2 figs. For providing daily draft of 15,000,000 gals. Siphon spillway of dam is designed to discharge 4,000 cu. ft. per sec.

Spillway of Dam. Australian Dam Said to be World's Largest. Contract Rec., vol. 33, no. 36, Sept. 3, 1919, pp. 832-833. Spillway operation of dam which is to hold 272,250,000,000 gallons of water.

MATERIALS OF CONSTRUCTION

Wood. "Compression" Wood and Failure of Factory Roof-Beam, G. E. Heck. Eng. News-Rec., vol. 83, no. 11, Sept. 11, 1919, pp. 508-509, 4 figs. Instance in which cause of sagging in roof was found to be yellow-pine beam with wood of peculiar, abnormal growth and wide annual rings.

MUNICIPAL ENGINEERING

City Planning. City Planning for Portland. Mun. Jl. & Public Works, vol. 47, no. 9, Aug. 30, 1919, pp. 133-134. Arguments for narrower roadways in minor streets. (Concluded.)

Street Cleaning. Street Cleaning and Refuse Collection in Newark. Mun. Jl. & Public Works, vol. 47, no. 12, Sept. 20, 1919, pp. 180-182, 3 figs. Appliances, methods and organization in a large manufacturing and commercial city. (To be concluded.)

RECLAMATION AND IRRIGATION

LINDSAY-STRATHMORE IRRIGATION DISTRICT. Operation Methods and Results on the Lindsay-Strathmore Irrigation District, E. Court Eaton.Eng. News-Rec., vol. 83, no. 10, Sept. 4, 1919, ii. 474-478. Well tests and reconstruction; operation results of well and main pumping plants; water-hammer in wood pipe lines; repairs to steel pipes; gravity and pressure consummers' meters.

PUBLIC CONTROL. State and Federal Control of Land Drainage Needed, Arthur M. Shaw. Eng. News-Rec., vol. 83, no. 11, Sept. 11, 1919, pp. 523-524. Cause, writer claims, controlled by districts does not meet larger problems.

RIO GRANDE IRRIGATION PROJECT. Drainage Works of the Rio Grande Irrigation Project, J. L. Burkholder. Eng. News-Rec., vol. 83, no. 12, Sept. 18, 1919, pp. 543-549, 4 figs. Elements of design, methods of ditch construction with dragline excavators on caterpillar tractors and details of cost.

ROADS AND PAVEMENTS

BITUMINOUS PAVEMENTS. Some Practical Points to observe in the Construction of Bituminous Pavements, R. Keith Compton. Mun. & County Eng., vol. 57, no. 3, Sept. 1919, pp. 105-107. Specifications; inspection of hot material; brick gutters; rate of rolling.

BITUMINOUS ROAD MATERIALS. Ultra-Microscopic Examination of Disperse Colloids Present in Bituminous Road Materials. E.C.E. Lord. Jl. Agricultural Research, vol. 17, no. 4, July 15, 1919, pp. 167-176, 3 figs. partly on supplement plates. Investigation undertaken principally to develop method for counting colloidal particles in bituminous solutions.

CANTONMENT ROAD BUILDING. Cantonment Road Building at Camp Lewis—I, U. S. Marshall. Good Roads, vol. 18, nos. 10 and 11, Sept. 3 and 10, 1919, pp. 115-119 and p. 124 and pp. 127-130, 16 figs. Methods and costs of building about 22 miles of gravel road and over 150,000 sq. yd. Warrenite-Bithulithic, with local gravel aggregate, on bituminous concrete foundation.

CLASSIFICATION. Street Classification as an Air to Pavement Design, James W. Routh. Mun. Jl. & Public Works, vol. 47, no. 10, Sept. 6, 1919, pp. 148-149. Relation between character and density of traffic and thickness of foundation. Opinions of several prominent municipal engineers.

The Classification of Highways, Henry G. Shirley. Good Roads, vol. 18, no. 13, Sept. 24, 1919, pp. 149-151, 2 figs. Advantages of improved roads; description of several classes and estimates of costs of improvement.

CRACKING. Does Rich Concrete in Roads Crack More Than Lean? Eng. News-Rec., vol. 83, no. 11, Sept. 11, 1919, pp. 518-520. Replies received from various engineers to questionaire sent out to them by Eng. News-Rec. Answers show that there is no well developed foundation for statement that there is greater tendencies to crack in richer mixes of concrete.

FRESH CONCRETE PAVEMENT PROTECTION. Methods of Protecting Concrete Pavements Laid in Warm Weather. Eng. & Contracting, vol. 52, no. 10, Sept. 3, 1919, pp. 266-267, 2 figs. Suggested design for light frame to hold canvas over newly placed concrete pavement.

GOOD ROADS MOVEMENT. Good Roads, Chas. F. Puff. Jl. Engrs. Club Philadelphia, vol. 36, no. 178, Sept. 1919, pp. 353-360, 3 figs. Discussion of location, construction and maintenance.

GRANITE BLOCK PAVEMENT. Quick Work in Laying Granite Block Pavement, Clarence D. Pollock. Mun. Jl. & Public Works, vol. 47. no. 9, Aug. 30, 1919, pp. 128-130, 3 figs. Composition of working gangs and methods employed in paving half mile of Seventh Avenue, New York. Paving was done in 40 working days; street crossing were closed to traffic three days only.

Experience with Granite Block Pavements in New Orleans, La., John C. Bartley. Mun. & County Eng., vol. 57, no. 3, Sept. 1919, pp. 112-115. Old Belgian block pavements; salvaging old granite blocks.

MACADAM ROADS. Construction of Twelve-Mile Macadam Road is Largely a Haylage Problem. Contract Rec., vol. 33, no. 37, Sept. 10, 1919, pp. 849-850, 3 figs. Caledonia-Jarvis highway in Haldimand County, Ontario, built in two sections; wagons used on one, motor trucks on the other.

Recommended Procedure in the Construction of New Macadam Roads, M. D. Ross. Mun. & County Eng., vol. 57, no. 3, Sept. 1919. pp. 116-118. Characteristics of properly constructed road; equipment used on construction; preparing sub-grade.

MAINTENANCE. Highway Maintenance in Wisconsin—IV, V and VI. Good Roads, vol. 18, nos. 10, 11 and 12, Sept. 3, 10 and 17, 1919, pp. 120 and 124, 136-137 and 139-141, 4 figs. Sept. 3: Methods employed for highways of shale, pit run gravel or crushed and screened gravel. Sept. 10: Practice of building surface-streeted macadam roads; cold patching methods. Sept. 17: Gang maintenance; heavy grading work; equipment and methods; resurfacing stone and gravel roads; bonding.

MISSISSIPPI VALLEY STATE HIGHWAY DEPARTMENT. Recommended Practice of Mississippi Valley State Highway Departments for Concrete Road Construction. Can. Engr., vol. 37, no. 9, Aug. 28, 1919, pp. 260-262. As adopted at conference of Miss. Valley Assn. of State Highway Depts.

NEW YORK STATE. What Has New York State Received for Its $100,000,000 Highway Expenditures, H. Eltinge Breed. Eng. News-Rec., vol. 83, no. 10, Sept. 4, 1919, pp. 450-454. Analysis of work done during 21-year, 1898-1915, study to show economic fallacy of increasing mileage with nondurable types of construction involving high maintenance cost.

OVERHAUL COMPUTATION. Simple Method of Computing Overhaul. Eng. & Contracting, vol. 52, no. 10, Sept. 3, 1919, p. 273, 1 fig. Employed by Minnesota State Highway Commission.

Suggestions for Contractors on Concrete Road Construction, Clyde E. Learned. Public Roads, vol. 2, no. 14, June 1919, pp. 15-17. Concerning overhauling, proportion of subgrade, hauling materials and laying pipe line.

ROAD BEDS. Sizes of Blocks and Construction of Road Beds (Abmessungen der Pflastersteine und Herstellung der Pflasterbahn), Utsch. Zeitschrift für Transportwesen und Strassenbau, vol. 36, no. 13, May 1, 1919, pp. 147-148, 3 figs. Construction of roads designed for heaviest kind of traffic and cold climate.

ROAD MACHINERY. Road Machinery, A. H. Blanchard. Better Roads & Streets, vol. 9, no. 5, June 1919, pp. 187-189 and 214. Factors determining selection of equipment for construction and maintenance of highways.

Pneumatic Tools for Breaking up Pavement, Walter P. Burn. Elec. Ry. Jl., vol. 54, no. 12, Sept. 20, 1919, pp. 583-584, 7 figs. How by using special points a tie-tamping machine was used for cutting asphalt, toothing out paving blocks and breaking up pavement.

RESURFACING. Resurfacing Old Macadam and Gravel Roadways with Special Reference to Adaptability of Old Roadbeds as Foundation for Hotmix Bituminous Surfaces, Hugh W. Skidmore. Mun. & County Eng., vol. 57, no. 3, Sept. 1919, pp. 99-105, 12 figs. General requirements of pavement foundations; suitability of broken stone, stone and gravel macadam pavements as foundations for permanent types of surface; thickness of base; edging for highway pavements.

STANDARD DETAILS. Standard Details of Pennsylvania State Highway Department for Minor Features of State Roads. Eng. & Contracting, vol. 52, no. 10, Sept. 3, 1919, p. 264, 8 figs. Underdrains, plain and grouted rubble gutter, plain cement concrete gutter, concrete curbing, stone curbing.

SURVEY INSTRUCTIONS. Instructions of Arizona State Highway Department for Guidance of its Engineers. Eng. & Contracting, vol. 52, no. 10, Sept. 3, 1919, pp. 271-273. Instructions to engineers on reconnaissance surveys.

SANITARY ENGINEERING

GARBAGE UTILIZATION. Profit in Garbage-Fed Hogs, E. C. W. Schubel. Am. City, City Edition, vol. 21, no. 3, Sept. 1919, pp. 217-220, 3 figs. Experience of Lansing, Mich.

REFUSE COLLECTION. The Trend in Municipal Refuse Collection and Disposal—Estimating Costs, Rudolph Hering. Mun. & County Eng., vol. 57, no. 3, Sept. 1919, pp. 107-109. The Cobwell system; garbage disposal by feeding; incineration.

SEWAGE DISPOSAL. Town Sewage Problems Often Intricate, Edward B. Savage. Contract Rec., vol 33, no. 36, Sept. 3, 1919, pp. 836-840. Sources of trouble and defects and remedial measures. Methods of flushing. Storm water separation.

The Utilization of Sewage Sludge in Birmingham, England. Am. City, City Edition, vol. 21, no 3, Sept. 1919, pp. 213-215, 4 figs. Shallow tanks and thorough furnish sludge without odor with possibility of organic fertilizer.

Sewage-Disposal Difficulties at Madison, Wisconsin. Eng. News-Rec., vol. 83, no. 11, Sept. 11, 1919, pp. 510-511, 1 fig. Improving sludge handling by hoppers and new pipe connections for flat-bottom tanks.

Sewerage Works of Stratford, Conn., Clyde Potts. Mun. Jl. & Public Works, vol. 47, no. 11, Sept. 13, 1919, pp. 160-161, 2 figs. Invert of sewer at plant is three feet below high tide and three feet above low tide; effluent held in tidal chamber during flood tide; Imhoff tanks and chlorination.

SEWAGE TREATMENT. Electrolytic Sewage Treatment. Mun. Jl. & Public Works, vol. 47, nos. 9 and 10, Aug. 30 and Sept. 6, 1919, pp. 131-132 and 151-152. Investigation of Easton plant by committee of Franklin Inst. Chemical and bacterial effect of treatment. Cost of treatment.

Tests of Lime-Electrolytic-Agitation Sewage-Treatment Process at Easton, Pennsylvania. Eng. News-Rec., vol. 83, no. 12, Sept. 18, 1919, pp. 569-573, 1 fig. Laundreth "direct-oxidation" system studied by engineering division of Pennsylvania State Department of Health and for Committee of Franklin Institute.

SURVEYING

RECONNAISSANCE MAPPING. Quick Method of Reconnaissance Mapping, M. L. Fuller. Economic Geology, vol. 14, no. 5, Aug. 1919, pp. 411-423. Method involves among other features taking of compass bearings to nearest five degrees and direct plotting of courses by standard coordinates while in motion.

REGIONAL SURVEY. The Regional Survey as the Basis for the Regional Plan, and the Regional Plan as the Basis for the Town Plan, Thomas Adams. Landscape Architecture, vol. 9, no. 4, July 1919, pp. 173-179. By regional survey is meant investigating and recording of existing physical, industrial, and residential features of a region which needs comprehensive and co-ordinated treatment without regard to arbitrary administrative boundaries; by regional plan is considered general planning of area included in regional survey.

RESURVEY, RAILWAY. Curve Chart for Railway Resurvey, J. G. Wetherell. Eng. News-Rec., vol. 83, no. 11, Sept. 11, 1919, p. 506, 1 fig. Chart shows degree of curve having given angle and external.

WATER SUPPLY

BACTERIA, IRON-DEPOSITING. Iron-Depositing Bacteria and Their Geologic Relations, Edmund Cecil Harder. Dept. of Interior, U. S. Geological Survey, Professional Paper 113, 1919, 89 pp., 37 figs., partly on four supplement plates. Based principally on investigations of crenothrix cultures obtained from city water of Madison, Wis.

BATON ROUGE. Baton Rouge Water Supply, L. R. Howson. Fire & Water Eng., vol. 66, no. 12, Sept. 17, 1919, pp. 104-105 and p. 616, 3 figs. Remarks on usual ground water conditions and apparent connection between river and sand strata.

CHLORINATION. Chlorination and Health of Communities. Fire & Water Eng., vol. 66, no. 10, Sept. 3, 1919, p. 502, 1 fig. Chart showing relation of chlorinated water supplies to typhoid death rate.

DROUGHTS. Method of Constructing a Diagram to show probable Droughts, V. V. Tchikoff. Eng. News-Rec., vol. 83, no. 12, Sept. 18, 1919, p.. 554, 1 fig. Illustrated by study of rainfall during ten-day periods, or decades of days, for 32 years, at Kherson, European Russia.

FILTERS. High-Capacity, Self-Cleaning Filters for Purifying Water. Contract Rec., vol. 33, no. 37, Sept. 10, 1919, p. 857. Arrangement used at waterworks on Desrumaux system, in France. Translated from Génie Civil.

Purification Effected in Toronto's Water Supply by Slow Sand Filtration, N. J. Howard. Contract Rec., vol. 33, no. 38, Sept. 17, 1919, pp. 871-875. Tests of 10,000 samples during 1918 said to show reductions of 99.7, 99.1 and 99.0 per cent b. coli, total bacteria and excremental bacteria respectively.

Operation of Slow Sand Filters at Toronto, Norman J. Howard. Can. Engr., vol. 37, no. 12, Sept. 18, 1919, pp. 317-319. Ten thousand samples tested during year 1918 said to have shown 99.7 per cent average in b. coli, 99.1 per cent in total bacteria, and 99 per cent in excremental bacteria.

FILTRATION PLANTS. New Water Filtration Plant of Whiting, Ind., Renville S. Rankin. Eng. & Contracting, vol. 52, no. 11, Sept. 10, 1919, pp. 292-294, 4 figs. Plant is to have capacity of 4,000,000 gallons.

Plant for Quick Filtering of Water, installed at Altona Water Works (Schnellfilteranlage des städtischen Wasserwerks Altona), Jürgensen. Zeitschrift für Bauwesen, vol. 69, nos. 4-6, 1919, pp. 294-307, 16 figs. Example of close co-operation between architect and engineer.

IPSWICH RIVER. The Ipswich River Water Supply for the City of Lynn, Mass., H. K. Barrows. Mun. & County Eng., vol. 57, no. 3, Sept. 1919, pp. 133-134, 2 figs. Diagram for determining economical size of Ipswich River pipe line.

KANSAS CITY, KANSAS. The Water-Works and Electric Plant of Kansas City, Kansas, H. C. Chapman. Am. City, City Edition, vol. 21, no. 3, Sept. 1919, pp. 199-201, 3 figs. Plant consists of ten Jewell filters, each having capacity of one-half million gallons daily, and nine concrete filters, each having capacity of one and one-quarter million gallons daily.

MUNICIPAL WATER WORKS. Management of Municipal Water-Works, W. M. Rich. Am. City, City Edition, vol. 21, no. 3, Sept. 1919, pp. 209-212. Introduction of budger system metering water waste surveys said to have increased economy of operation of Sault Ste. Marie water-works.

RECONSTRUCTION WATER WORKS. Reconstruction of Water Works at Cobourg, Ont., A. E. Davison. Can. Eng., vol. 37, no. 11, Sept. 11, 1919, pp. 287-288, 3 figs. Installation of four electrically-driven pumping units, each 750 gal. per min. capacity, on domestic service.

SAN FRANCISCO. San Francisco's Auxiliary System, Fred. M. Hyde. Fire & Water Eng., vol. 66, no. 10, Sept. 3, 1919, pp. 497-499 and p. 503, 6 figs. One-high-pressure hydrant claimed to give more water than three fire engines.

STORAGE OF WATER. Development and Storage of Water for Electrical Purposes, J. W. Mearles. Engineer, vol. 128, no. 3321, Aug. 22, 1919, pp. 186-189, 7 figs. Conditions requisite for water power; classification according to head. Paper read before Instn. Elec. Engrs.

WATER WORKS AND FIRE INSURANCE. Relation Between Water Works Improvements and Fire Insurance Rates, Kelsey L. Walling. Contract Rec., vol. 33, no. 36, Sept. 3, 1919, pp. 834-835. Suggestions in regard to reducing fire rates with improvements to water works.

WATERWAYS

INLAND WATER TRANSPORTATION. The Need of Inland Water Transportation, W. E. Joyce. Coal Age, vol. 16, no. 11, Sept. 11, 1919, pp. 437-439, 1 fig. Particularly as means of reducing cost of moving various products, especially bulk freight.

MEANDERS. *See River Beds.*

RIVER BEDS. River Beds and Meanders, Colonel Hoc. Sci. Am. Supp., vol. 88, no. 2278, Aug. 30, 1919, pp. 134-135, 8 figs. Mechanical analysis of forces at work suggests to writer that meanders result from "Buckling." Translated from Génie Civil, Paris.

VARIA

CONTRACT, COST-PLUS. How the Cost-Plus Contract Safeguards Both the Owner and Contractor, A. E. Wells. Am. Architect, vol. 116, no. 2280, Sept. 3, 1919, pp. 309-310. Because, it is said, it removes "gambling element" which is found in lump-sum contract.

RAISING A DREDGE. Raising a Sunken Dredge in Kowno (Hebung eines gesunkenen Baggers in Kowno). Zentralblatt der Bauverwaltung, vol. 39, no. 38, May 7, 1919, pp. 205-206, 5 figs. Cost of raising dredge amounted to 90,000 marks, while the value is 200,000 marks.

ELECTRICAL ENGINEERING

ELECTROCHEMISTRY

POLARIZATION. The Polarization of a Leclanché Cell, Felix E. Hackett and R. J. Feely. Scientific Proc. Roy. Dublin Soc., vol. 15, no. 26, March 1918, pp. 279-288, 4 figs. Recovery of cell from polarization divided into two sections; initial stage of rapid recovery in which about 90 per cent of polarization disappears; in about en minutes; followed by slow return extending over several hours to initial value of e.m.f.

POTENTIAL OF ALUMINUM. The Effect of Amalgamation upon the Single Potential of Aluminum, Louis Kahlenberg and John A. Montgomery. General Meeting of the Am. Electrochem. Soc., paper no. 7, Sept. 23-26, 1919, pp. 45-56, 5 figs. Measuring single potential of aluminum in 1/3 molar solution of aluminum chloride at room temperature, by means of calomel electrode, writers claimed to have obtained much higher values with amalgamated than with unamalgamated aluminum, due to removal of coat of resistant oxide by mercury.

ELECTRODEPOSITION

GOLD AND SILVER. Electrodeposition of Gold and Silver from Cyanide Solutions, S. B. Christy. Dept. Interior, Bur. Mines, Bul 150, 1919, 171 pp., 44 figs. Based on writer's experiments made in laboratories of University of Cal., extending over period of 20 years. Results are expressed in diagrammatic form by curves showing relation between simultaneous variables.

LEAD PLATING. Lead Plating from Fluoborate Solutions, W. Blum, F. J. Liscomb, Zalia Jencks and W. E. Bailey. General Meeting of the Am. Electrochem. Soc., paper no. 11, Sept. 23-26, 1919, pp. 101-122, 12 figs., partly on six supplement plates. From experiments it is concluded that by increasing concentration of lead it is possible to use higher current densities than those ordinarily used without causing treeing of deposits. A range of conditions is recommended as guide for commercial work.

PLATERS' SOLUTIONS. Standardization of Platers' Solutions in Individual Plants, Charles H. Proctor. Metal Industry, vol. 15, no. 7, Aug. 15, 1919, pp. 122-124. As means of increasing efficiency.

SILVER. *See Gold and Silver.*

STRUCTURE OF ELECTRO-DEPOSITED METALS. Factors Governing the Structure of Electro-Deposited Metals, William Blum. General Meeting of the Am. Electrochem. Soc., paper no. 8, Sept. 23-26, 1919, pp. 57-76, 19 figs., partly on ten supplement plates. Experiments said to have shown that Bancroft's "axioms of electroplating" are applicable over wide range of conditions and with variety of metals. It is, therefore, suggested that they may serve as valuable guide in plating research and in practical plating operations.

ELECTROPHYSICS

ARMATURE REACTIONS. Reactions of the Armature of an Alternator. (Sur la réaction d'induit des alternateurs), E. Brylinski. Comptes Rendus des Séances de l'Académie des Sciences, vol. 169, no. 4, July 28, 1919, pp. 174-177. As influenced by magnetic hysteresis.

ALTERNATING CURRENT CIRCUITS. Calculation of Values in A. C. Circuits, A. E. Tattersall. Ry. Engr., vol. 40, no. 476, Sept. 1919, pp. 193-196, 3 figs. Application of hyperbolic functions; method of determining values of equivalent circuit by circular trigonometry; study of Ferranti effect. (Continuation of serial.)

On the Diagrams of Lines of Force Around the Aerial Lines (In Japanese), K. Ogawa. Denki Gakkwai Zasshi, no. 373, Aug. 10, 1919.

The Solution of Circuit Problems. Mathematical Methods of Investigation Resulting from the Application of Fourier's Integral, Thornton C. Fry. Phys. Rev., vol. 14, no. 2, Aug. 1919, pp. 115-136, 6 figs. Expansion of fundamental integral for current in any network in circuit theory effected in Bessel's series and also by (1) using Heaviside(Carson expansion, and (2) using Taylor's series.

Calculation of Alternating Current Circuits, Terrell Croft. Nat. Engr., vol. 23, no. 9, Sept. 1919, pp. 442-446, 12 figs. Graphic method of determining wire sizes. Derivation of formula. (Concluded.)

CABLES. The Magnetic Field Round a Submerged Cable Carrying Alternating Current, H. R. Rivers-Moore. Elec. Rev., vol. 85, no. 2179, Aug. 29, 1919, pp. 259-260, 4 figs. Determined by considering propagation outwards of lines of force during rise of current in conductor.

Heating of Underground Cables, A. L. Freret. Assn. Iron & Steel Elec. Engrs., Aug. 1919, pp. 10-15 and discussion, pp. 15-17, 4 figs. Shows that, Current being intermittent, heating of cable depends upon mean effective current, which is square root of mean squares of current.

ELECTROMAGNETIC FIELD. Mechanical Theories of the Electromagnetic Field—XI. (Mechanische Theorien des elektromagnetischen Feldes), A. Korn. Physikalische Zeitschrift, vol. 20, no. 3, Feb. 1, 1919, pp. 58-61. Quickly changeable Fields.

Notes on Electric and Magnetic Field Constants and their Expression in terms of Bessel Functions and Elliptic Integrals, A. Gray. Lond., Edinburgh & Dublin Phil. Mag., vol. 38, no. 224, Aug. 1919. pp. 201-214, 4 figs. Four cases—(1) Potential produced at any point in a thin disk of matter of uniform surface density; (2) potential produced and component magnetic field intensities at any point in a circular doublet-disk of uniform strength per unit area; (3) potential and field intensities of uniform right circular cylinder; and (4) potential and field intensity of right cylindrical array of equal doublet-disks.

A Report on Electromagnetic Induction, S. J. Barnett. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 10, Oct. 1919, pp. 1151-1169. Historical sketch of fundamental results obtained from days of Faraday to present time in studying electromotive forces ordinarily referred to domain of electromagnetic induction, together with treatment of unipolar induction in both open and closed circuits.

INDUCTION AND CAPACITY. Induction and Capacity of Electric Lines (Induction et capacité des lignes), J. Fisher-Hinnen. Revue générale de l'Electricité, vol. 6, nos. 7 and 8, Aug. 16 and 23, 1919, pp. 203-213 and 233-244, 24 figs. Aug. 16: Computation formulae. From Bulletin de l'Association suisse des Electriciens, Décembre 1917, tome VIII, p. 333. Aug. 23: Formulae giving capacity of lines developed by means of analogy existing between capacity and conductance; with reference to single-phase lines, writer points out that an unconnected conductor may show dangerous difference of potential with respect to the earth.

Additions to the Formulas for the Calculation of Mutual and Self-Inductance, Frederick W. Grover. Bul. Bur. of Standards, vol. 14, no. 4, July 12, 1919, pp. 537-570. Supplementing collection of formula a given in Scientific Paper no. 169.

INTERFERENCE. Interference of Power Circuits with Telephone Circuits, E. Parry. New Zealand Jl. Sci. & Technology, vol. 11, nos. 4-5, July 1919, pp. 308-314, 4 figs. Attempt to co-ordinate result of experience for calculating beforehand effects resulting from any given relative disposition of circuits and from any given method of work.

LEAKAGE. Studies on doubly interlinked Leakage (Beitrag zur doppeltverketteten Streuung), F. Punga. Archiv f. Elektrotechnik, vol. 7, nos. 11-12, May 5, 1919, pp. 337-379, 53 figs. Vectorial derivation of differential leakage for any desired number of groves and any desired position of rotor. Cases where zig-zag leakage and double interlinked leakage are synonymous, as in motors with squirrel cage rotor and motors with an uneven number of groves in the stator and rotor and in those with slip-ring rotor.

MAGNETIC FIELD, MOLECULAR. The Molecular Magnetic Field (El campo magnético molecular), Richard Gans. Contribucion al estudio de las ciencias fisicas y Matematicas, Universidad Nacional de la Plata, vol. 11, no. 36, July 1918, pp. 209-222, 2 figs. Technical derivation of following theorem: At absolute zero all directions of molecular magnetic field may be considered, with respect to determination of magnetism curve, as equally probable.

MAGNETISM. Magnetism and the Theory of Quanta (Teoria de los Quanta y Magnetismo), Richard Gans. Contribucion al estudio de las ciencias fisicas y Matematicas, Universidad Nacional de la Plata, vol. 11, no. 36, July 1918, pp. 195-205, 5 figs. Formulæ expressing Pô magnetism in terms of temperature in order to test whether first or second of Planck's hypothesis is exact. Application of these formulæ to sulphate of anhydrous manganese led to conclusion *how that* energy of magneton could not have any value and consequently second hypothesis of Planck was pronounced inexact.

OSCILLATION DISCHARGE. Oscillation during the Discharge of an Induction Coil, E. Taylor Jones. Elecn., vol. 83, nos. 2152 and 2153, Aug. 13, and 22, 1919, pp. 167-169 and 201-202, 20 figs. Aug. 15: Photographs of spark discharges with secondary condenser. Aug. 22: Photographs illustrating effect of invoice current at break. (Concluded.)

PERMEABILITY, REVERSIBLE. Reversible Permeability in the Ideal Curve of Magnetization (La Permeabilidad reversible en la Curva ideal de imanacion), Richard Gans. Contribucion al estudio de las ciencias fisicas y Matematicas, Universidad Nacional de la Plata, vol. 11, no. 36, July 1918, pp. 147-172, 13 figs. By ideal curve of magnetization is meant, following Steinhaus and Gumlich conception, the curve of maximum irregularity compatible with the existing magnetic field. Apparatus and method of producing this irregularity and measurements taken with tempered and annealed steel soft iron and nickel are described and equations are derived for computing reversible permeability for any degree of magnetization.

REACTANCE COILS. Some New Formulas for Reactance Coils, H. B. Dwight. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 9, Sept. 1919, pp. 1039-1060, 7 figs. Formulæ are derived for mutual inductance of coils with parallel axes, repulsion of coils with parallel axes and self-inductance of long cylindrical coils.

RECTIFIERS. Rectifying High-Tension Alternating Currents, Samuel Cohen. Elec. World, vol. 74, no. 11, Sept. 13, 1919, pp. 573-575, 5 figs. Experiment with high-tension rectifier, consisting of gap between point and plate, for the purpose of determining most favorable gas, gas pressure and electrode construction.

See also Thermionic Rectifiers.

SPARK DISCHARGE. Time-Lag in the Spark Discharge, Norman Campbell. Lond., Edinburgh & Dublin Phil. Mag., vol. 38, no. 224, Aug. 1919, pp. 214-230, 1 fig. Each of two theories of time-lag—that formation of corona must precede spark and that presence of casual ions is necessary—considered as explaining part of facts.

THERMIONIC RECTIFIERS. The Current-Voltage Characteristics of High-Voltage Thermionic Rectifiers, C. L. Fortescue. Phys. Soc. of London, vol. 31, no. 5, Aug. 15, 1919, pp. 319-337, 12 figs. Reference to use of high-voltage of thermionic types for production of high-voltage steady current from an alternating current supply. Curves and approximate methods of calculating them are given for determining best combination of electron current and alternating supply voltage for any prescribed conditions.

THERMOELECTRICITY. Thermoelectric Power and Resistance of Bismuth in a Magnetic Field (Potere Thermoelettrico e resistenza del bismuto nel campo magnetico), M. La Rosa. Il Nuovo Cimento, vol. 18, no. 7, July 1919, pp. 26-38, 1 fig. Experimental. Effect of producing Peltier, Thomson, and Hall phenomena in magnetic field.

TRANSFORMATION LIMITATION. Inherent Limitations on Transformations possible by stationary Apparatus, Joseph Slepian. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 9, Sept. 1919, pp. 1061-1075, 1 fig. Expressions for electro-static and electromagnetic energies, Joulian heat dissipation and power are given in complex quantities.

VACUUM TUBE. The Vacuum Tube as a Generator of Alternating Current Power, John H. Morecroft and H. Trap Friis. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 10, Oct. 1919, pp. 1193-1221, 35 figs. Deals with operation of tube when separately excited and efficiency of tube as generator. Analysis of forms and phases of voltages and currents in different parts of circuit as well as oscillograms showing action of tube under various conditions are given.

VIBRATIONS, DAMPED. A Simple Derivation of the Formulae for the Resonance Curves of a Damped Vibration and Some Properties Thereof, Balth Van Der Pol, Elecn., vol. 83, nos. 2154 and 2155, Aug. 29 and Sept. 5, 1919, pp. 225-228 and 251-252, 4 figs. Aug. 29: Method based principally on assumptons that (1) coupling coefficient of two circuits is small, and (2) spacing of separate discharges, and damping factors are such that each damped oscillation falls off nearly completely before next one sets in. Sept. 5: Bjerknes formula. (Concluded.)

FURNACES

The Electric Furnace—I, II, I. F. Rowlinson. Sci. Am. Supp., vol. 88, nos. 2278 and 2281, Aug. 30 and Sept. 20, 1919, pp. 132-133 and 180-181 and 191, 8 figs. Survey of its development, its scope and its future.

BOOTH-HALL FURNACE. The Electric Furnace in Practice, Carl H. Booth. Jl. Electricity, vol. 43, no. 5, Sept. 1, 1919, pp. 223-224, 1 fig. Mechanical details in operation of Booth-Hall furnace.

DESIGN. The Design of Electric Furnaces, R. C. Gosrow. Chem. & Metallurgical Eng., vol. 21, no. 5, Sept. 1, 1919, pp. 235-241. Consideration of the elements of size and other details in relation to operation and recovery of metal, with special reference to production of ferromanganese.

GREAT BRITAIN. Electric Furnace Operation in United Kingdom, 1918, R. G. Mercer. Elec. News, vol. 28, no. 18, Sept. 15, 1919, pp. 25-26. With reference to general efficiency of electric furnace in steel making.

GREAVES-ETCHELLS FURNACE. Greaves-Etchells Electric Furnace (El horno electrico Greaves-Etchells). Madrid Cientifico, vol. 26, no. 998, Aug. 5, 1919, pp. 342-344, 3 figs. Details of 3-ton Greaves-Etchells electric furnace.

OPERATION. A Square Deal for the Electric Furnace, H. G. Weidenthal. General Meeting of the Am. Electrochem. Soc., paper no. 10, Sept. 23-26, 1919, pp. 95-100. User of electric furnace is urged to acquaint himself thoroughly with electric furnace practice in order that he may "do justice to himself and his business, and at the same time give the electric furnace a square deal."

SAHLIN FURNACE. A New Type of Electric Furnace, Axel Sahlin. Elecn., vol 83, no. 2152, Aug. 28, 1919, pp. 164-165, 1 fig. Designed with a view to embodying advantages of both direct-arc and free-burning arc types. From paper read before Instn. Elec. Engrs.

GENERATING STATIONS

COST OF ELECTRIC SUPPLY. The Cost of Electric Supply, William Woodhouse. Elec. Times, vol. 56, no. 1454, Aug. 28, 1919, pp. 159-160, 1 fig. Relationship between cost, load factor and demand.

HIGH-TENSION SERVICE. Delivery of High-Tension Service to Large Consumers, Rawson Collier. Elec. Rev., vol. 75, no. 10, Sept. 6, 1919, pp. 392-396, 3 figs. General considerations involved; relation of cost to station capacity and revenue; choice of equipment metering.

HIGH-TENSION STATIONS. Large High-Tension Alternating-Current Electric Stations. (Les grands postes électriques à courant alternatif haute tension), A. Hayet. Revue Générale de l'Electricité, vol. 6, no. 9, Aug. 30, 1919, pp. 261-277, 13 figs. Technical study of design and characteristics of central power stations. (To be continued.)

GATUN HYDRO-ELECTRIC STATION. Development of Gatun Hydro-electric Station. Jl. Electricity, vol. 43, no. 5, Sept. 1, 1919, pp. 198-201. 5 figs. Details of recent improvements in power plant which furnishes power for operation of canal.

PARALLELING ALTERNATORS. Paralleling Alternators—II, F. Ashton. Mech. World, vol. 66, no. 1705, Sept. 5, 1919, pp. 112-113, 4 figs. According to writer accuracy of synchronizing connections can be tested by opening neutral point of three-phase generator and closing main-switch,

RATES. Central-Station Rates in Theory and Practice, H. E. Eisenmenger. Elec. Rev., vol. 75, nos. 9, 10, 11 and 12, Aug. 30, Sept. 6, 13 and 20, 1919, pp. 352-355, 388-391, 434-437 and 473-476, 6 figs. Aug. 30: Discussion of principles governing selection of rate system, particularly policies underlying questions of what amount of profit shall be desired and in what proportion shall different classes of customers contribute to that profit. Sept. 6: Comparison of cost-of-service and value-of-service principles of rate making. Sept. 13: Conditions under which reductions are desirable as regards earnings. Sept. 20: Conclusions of mathematical and analysis of conditions in which price splitting or reduction is advantageous as regards earnings of Central Station.

RECTIFICATION. Advantages and Disadvantages of the Various Systems of Rectifying High-Tension Alternating Current. (Advantages et inconvénients des divers systèmes de transformation de courant alternatif à haute tension en courant continu), F. Sarrat. Association des Ingénieurs Electriciens Sortis de l'Institut Electrotechnique Montefiore, vol. 1, nos. 3, 4, 5, 6, 7, Mar., Apr., May, June, July, 1919, pp. 161-236, 29 figs. Figures complied from various power stations in reference to efficiency, cost, maintenance expense, power factor, etc., of various systems, for presentation to Congrès International de Tramways et de Chemin de Fer d'intérêt local, which was to be held at Buda-Pest in Sept., 1914.

UNIT ANALYSIS. Unit Analyses of Industrial Power Business. Elec. World, vol. 74, no. 12, Sept. 20, 1919, pp. 627-629. Records of Massachusetts central stations quoted as proof that desirable revenue is consistent with moderate average yield per kw.-hr.

GENERATORS AND MOTORS

BALANCING ROTORS. Balancing and Alignment of the Alternator Rotor, C. Sylvester. Elec. Rev., vol. 85, no. 2179, Aug. 29, 1919, pp. 260-261, 3 figs. Illustrating method for adjusting balance weights on turbo-alternator rotor.

CONTROL GEAR FOR D.-C. MOTORS. Control Gear for Direct-Current Motors, C. W. Stubbings. Electricity, vol. 31, no. 1504, Sept. 5, 1919, pp. 553-554. Recently constructed switch of the liquid type was so arranged that closing short-circuiting switch for starting resistance automatically opened valve which caused tank immediately to empty.

DYNAMO, D.-C. Direct-Current Dynamo for Constant Current at Variable Speed (Gelijkstroomdynamo voor constanten stroom bij veranderlijk aantal omwentelingen), J. Botermans. Ingenieur, vol. 34, no. 33, Aug. 16, 1919, pp. 603-605, 2 figs. This dyanmo differs from other constructions in that field of dynamo is influenced by currents which circulate in a number of short-circuited bars.

See also Motors, D.-C., Large.

MOTORS, D.-C., LARGE. The Operation of Large Direct-Current Motors Without Starting Resistances, W. Linke. Elecn., vol. 83, no. 2152, Aug. 28, 1919, pp. 170-171. Account of Trettin's conclusions arrived at from mathematical investigations and of tests performed by writer. From Elektrotechnische Zeitschrift.

See also Control Gear.

SYNCHRONIZING. Methods of Synchronizing Alternating-Current Machines, Frank Gillooly. Power, vol. 50, no. 12, Sept. 16, 1919, pp. 456-459, 8 figs. Construction and principles of operation of different types of synchronoscopes are described and various methods of synchronizing alternating-current machines discussed.

IGNITION APPARATUS

SPARK-PLUG TERMINALS. Deterioration of Nickel Spark-Plug Terminals in Service, Henry S. Rawdon and A. I. Krynitzky. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152. Aug. 1919, pp. 1323-1350, 21 figs. Investigation at Bureau of Standards represented as having shown that service deterioration of nickel spark-plug terminals is due to embrittlement of wire by formation of system of intercrystalline network and definite transverse cracks.

TWO-SPARK IGNITION. A Two-Spark Generator Battery Type Ignition. Automotive Industries, vol. 41, no. 11, Sept. 11, 1919, pp. 511-512, 7 figs. Equipment consists of double ignition distributor, two ignition coils and combination lighting and ignition switch.

LIGHTING AND LAMP MANUFACTURE

AERIAL LIGHTING DEVICES. Illuminating Devices in the Great War—II, H. M. Brayton. Sci. Am. Supp., vol. 88, no. 2279, Sept. 6, 1919, pp. 146-147, 155 and 159. Account of aerial lighting devices and their development from 1914 to the armistice.

ARC, LUMINOUS VAPORS. Luminous Vapors Produced in the Arc, with Applications to the Study of Spectral Series and Their Origin (Vapeurs lumineurses distillées de l'arc, avec applications à l'étude des séries spectrales, leur origine), R. J. Strutt. Radium, vol. 11, no. 7, May 1919, pp. 200-204, 4 figs. Brilliant effects similar to those obtained with mercury arc reported to have been produced with other metals.

PHOTOMETRY. Regarding the Photometric Measuring of Searchlights (Ueber das Photometrieren von Scheinwerfern), Gehlhoff. Zeitschrift f. Beleuchtungswesen, Heizungs-und Lüftungstechnik, vol. 25, nos. 7-8, Apr. 1919, pp. 35-41, 12 figs. Claims that in order to eliminate absorption it is necessary to photometer two sufficiently different distances.

SEARCHLIGHTS. Metal Mirrors for Searchlights, R. B. Hussey. Gen. Elec. Rev., vol. 22, no. 9, Sept. 1919, pp. 652-655, 6 figs. Processes used in production of 60-in. mirrors.

See also Photometry.

Adaptation of the High Intensity Arc to the Open-type 60-inch Army Searchlight, John T. Beechlyn. Gen. Elec. Rev., vol. 22, no. 9, Sept. 1919, pp. 655-659, 4 figs. After pointing out characteristics essential to production of high-intensity arc and describing how these are obtained in practice, writer deals successively with mounting and connections, ventilation system, mechanical construction, and feeding mechanism.

Searchlight Air Defence Operations, William F. Tompkins. Gen. Elec. Rev., vol. 22, no. 9, Sept. 1919, pp. 663-667, 7 figs. Method of defence described as requiring placing anti-aircraft guns in bands along entire front especially guarding prominent routes to important objectives in rear. Technique and effect of this method against night raids by enemy aircraft are discussed.

Searchlight Testing, F. A. Benford. Gen. Elec. Rev., vol. 22, no. 9, Sept. 1919, pp. 668-675, 15 figs. Description of instruments employed for testing intensity of lamps, flux values obtained with certain groups of electrodes and effect on efficiency of distribution of light within a searchlight beam.

Distant Control of Projectors for Sea Coast Defence, J. L. Hall. Gen. Elec. Rev., vol. 22, no. 9, Sept. 1919, pp. 676-679, 3 figs. Manner in which remote control is effected and equipment for its performance.

Thirty-inch Open Type Searchlight with Tripod Mount, E. J. Murphy. Gen. Elec. Rev., vol. 22, no. 9, Sept. 1919, pp. 680-682, 5 figs. Deisgn and construction.

Searchlight Production, Langdon Gibson. Gen. Elec. Rev., vol. 22, no. 9, Sept. 1919, pp. 683-684, 1 fig. Notes on production of searchlight on war basis.

Searchlight Electrodes, W. H. Hardman. Gen. Elec. Rev., vol. 22, no. 9, Sept. 1919, pp. 685-688, 8 figs. Special requirements and processes of manufacture.

Searchlight Tower Units, R. S. Hood, Jr. Gen. Elec. Rev., vol. 22, no. 9, Sept. 1919, pp. 689-693, 6 figs. Data concerning telescopic, Bascule bridge and counterbalanced types.

Mobile Searchlight Power Units for U. S. Army, Henry S. Baldwin. Gen. Elec. Rev., vol. 22, no. 9, Sept. 1919, pp. 694-699, 11 figs. Particulars of 6-kw. and 50-kw. units.

Searchlight Developments of the U. S. Army, Chester Lichtenberg. Gen. Elec. Rev., vol. 22, no. 9, Sept. 1919, pp. 700-703, 3 figs. How weight and number of parts have been reduced, power and efficiency increased and mobility vastly improved.

The Lynn 60-inch Open Type Army Searchlight Development, Cromwell A. B. Halvorson, Jr. Gen. Elec. Rev., vol. 22, no. 9, Sept. 1919, pp. 704-713, 17 figs. Impressive features of development are said to be radical departure from conventional design and rapidity of carrying out experimental work, object of which was to produce a powerful light-weight searchlight that would be so mobile and yet so rugged that it would withstand severe conditions of battle service at firing line.

Light Weight Barrel Searchlights, Preston R. Bassett. Gen. Elec. Rev., vol. 22, no. 9, Sept. 1919, pp. 714-717, 5 figs. Problems that had to be met by engineers in adapting 60-in. searchlight to field conditions.

Distant Electrical Controls for Military Searchlights, Theodore Hall. Gen. Elec. Rev., vol. 22, no. 9, Sept. 1919, pp. 718-721, 4 figs. Comparative study of various types.

The General Electric Company in the Great World War—III, John R. Hewett. Gen. Elec. Rev., vol. 22, no. 9, Sept. 1919, pp. 726-740, 20 figs. Ship propulsion, electric heating devises and searchlights.

STANDARDIZED INDUSTRIAL LIGHTING SYSTEM. Standardized Industrial Lighting Systems—II, H. L. Cornelison. Elec. World, vol. 74, no. 9, Aug. 30, 1919, pp. 459-461, 5 figs. Engineering plans of Austin Co., Chicago, for conduit, wiring, panel and fixture arrangements for providing layouts in standard buildings.

MEASUREMENTS AND TESTS

CONDUCTIVITY. Measurements of Electric Conductivity in Free Atmosphere at Altitudes up to 9,000 Meters (Mesures de conductibilité électrique dans l'atmosphère libre jusqu'à 9000 mètres d'altitude), A. Wigand. Radium, vol. 11, no. 7, May 1919, pp. 204-208, 1 fig. Made with Gerdien apparatus modified by replacing needle electrometer for a wulf bifilar electrometer.

Simple Method for Ascertaining the Conductivity Constant in Alternating Current Measurements (Einfache Verfahren sur Ermittlung der Leitungskonstanten aus Wechselstrommessungen), H. Jordan. Telegraphen-u. Fernsprech-Technik, vol. 8, no. 2, May 1919, pp. 17-22, 5 figs. Approximating formula for low and high values of B I.

ELECTROMETER. A Sensitive Modification of the Quadrant Electrometer; Its Theory and Use, A. H. Compton and K. T. Compton, Phys. Rev., vol. 14, no. 2, Aug. 1919, pp. 85-98, 3 figs. Introduction of tilted needle and movable quadrants in design. Advantages claimed are high sensitivity independent of deflection and quick adjustment of sensitivity through great range. It is claimed that by using a small needle 4.5 mm. in radius with a slight tilt, sensitivity as high as 60,000 mm. per volt were obtained.

ELECTROSCOPE, GOLD LEAF. A Method of Measuring the Capacity of Gold-Leaf Electroscopes, A. T. Mukerjee, Lond., Edinburgh. and Dublin. Phil. Mag., vol. 38, no. 224, Aug. 1919, pp. 245-256, 1 fig. Using standardized or (Gerdien) sliding condenser, absolute capacity of quadrant system, including specially designed connecter, is first determined by method of mixtures; gold-leaf system is then charged to known voltage, adjusted so that when charge is shared with quadrant system final potential is not far from one volt; as capacity of quadrant system can be varied by sliding condenser; capacity of electroscope can be measured at different voltages.

GALVANOMETERS. Needle Galvanometers with Recording Mechanism. (Galvanomètres inscripteurs à fer mobile), Henri Abraham and Eugène Bloch. Comtes Rendus des Séances de l'Académie des Sciences, vol. 169, no. 4, July 28, 1919, pp. 171-174. Built for military radio-telegraphy and geographic service of French army.

METERS, CURRENT. Sensitive Alternating Current Meters (Appareils sensibles pour les mesures en courants alternatifs), H. Abraham, E. Bloch and L. Bloch. Comptes rendus des séances de l'Académie des Sciences, vol. 169, no. 2, July 15, 1919, pp. 59-62. Amplifying direct reading voltmeter.

POTENTIOMETER, HIGH-FREQUENCY MEASUREMENTS. Alternating-Current Planevector Potentiometer Measurements at Telephonic Frequencies, A. E. Kennelly and Edy Velander, Proc. Am. Philosophical Soc., vol. 58, no. 2, 1919, pp. 97-132, 16 figs. Principle of potentiometer is the same as that described by Prof. Larson in 1910. (Elek. Zeitschrift, Oct. 13, 1910, vol. 31, pp. 1039-1041; also The Electrical World, vol. 56, Nov. 3, 1910, pp. 1085-1088), to present form worked out in Mas. Inst. Technology Laboratories through thesis studies of A. E. Hanson in "The Design and Construction of an Alternating-Current Potentiometer," Sept. 1918.

SUSCEPTIBILITIES. On the Measurement of Small Susceptibilities by a Portable Instrument, Ernest Wilson. Phys. Soc. of London, vol. 31, no. 5, Aug. 15, 1919, pp. 338-346, 2 figs. Horizontal beam is supported by phosphor-bronze strip attached to torsion head. Specimen, which is held in grip at one end of beam and is counterpoised by a sliding weight, hangs between pole pieces fixed to base of instrument. Magnet consists of two rings of tungsten steel, each of which is magnetized with north and south poles at opposite ends of diameter. By varying azimuths of rings, field between pole pieces can be varied. Method consists of turning torsion head until specimen just breaks away from field between poles.

TRACK CIRCUIT. The Alternating Current Track-Circuit, Douglas C. Gall, Elecn. vol. 83, no. 2155, Sept. 5, 1919, pp. 244-247, 8 figs. Methods used to determine behavior track circuit.

VOLTMETER, SYNCHRONIZING. An Improved Voltmeter for Synchronizing Purposes, G. Keinath. Elecn., vol. 83, no. 2153, Aug. 22, 1919, p. 198, 1 fig. Employing resistance, having high temperature coefficient in series with voltmeter. From Elektrotechnische Zeitschrift, No. 46, 1918.

MATERIALS OF CONSTRUCTION

CABLE WIRE MATERIAL. Aluminum versus Copper Cable Wire, A. J. Smout. Metal Industry, vol. 15, no. 8, Aug. 22, 1919, pp. 146-147, Showing (1) effects of impurities on electrical conductivity of aluminum, (2) physical properties of aluminum and copper wire, and (3) composition and tensile strength of aluminum wire.

CONTACT MATERIAL. Contacts and Contact Material, H. von Fleischbein. Elecn., vol. 83, no. 2154, Aug. 29, 1919, pp. 220-221, 3 figs. Results obtained with tungsten contacts on relays. Translated from Elektrotechnische Zeitschrift.

ERINOID. *See Insulators.*

FIBRE. The Absorption of Water by Vulcanized Fibre and Erinoid on Exposure to Moist Air, and the Consequent Change of Electrical Resistance, R. G. Allen. Scientific Proc. Roy. Dub. Soc., vol. 15, no. 32, Oct. 1918, pp. 405-414. Vulcanized fiber found to be much more hygroscopic than erinoid. After being thoroughly dried and then exposed to moist air, electrical resistance of both, specially fiber, observed to decrease rapidly as time of exposure continued.

INSULATORS. The Porosity of Porcelain, with Special References to High-pressure Insulators for Electric Transmission Lines, C. C. Farr. New Zealand Jl. Sci. & Technology, vol. 11, nos. 4 and 5, July 1919, pp. 302-307, 1 fig. Experiment claimed to have shown that density and porosity have little or no connection with each other.

Cracking of Pin Tupe Corner Porcelain Insulators, S. L. Foster. Jl. Electricity, vol. 43, no. 5, Sept. 1, 1919, pp. 213-215. How problem was solved by painting with shellack by United Railroads of San Francisco.

The Electrical Resistance of Porcelain at Different Temperatures, R. G. Allen. Scientific Proc. Roy. Dublin Soc. vol. 15, no. 27, June 1918, pp. 289-309, 6 figs. Tests of several samples in various forms at different temperatures ranging from 80 to 300 deg. cent. Relation of Rasch and Hinrichsen between insulation resistance and absolute temperature found to remain approximately true.

The Insulating Properties of Erinoid, R. G. Allen. Scientific Proc. Roy. Dublin Soc., vol. 15, no. 29, Aug. 1918, pp. 331-358, 6 figs. Experimental Erinoid found to be good insulator of fairly constant insulation resistance. Of various varieties of erinoid, red was found to be most absorbent of water and generally of lowest resistance.

See also Fibre.

PORCELAIN. *See Insulators.*

POWER APPLICATION

BAKING. Electric Baking Furnaces in Switzerland (Les fours de boulangers à chauffage électrique en Suisse). Industrie Electrique, vol. 28, no. 652, Aug. 25, 1919, pp. 314-316. Comparison of energy consumption in electrically-heated and coal-heated furnaces.

COOKING LOAD. The Use of Electrical Power in Industrial Works, G. W. Stubbings. Eng. & Indus. Management, vol. 2, no. 9, Aug. 28, 1919, pp. 264-265, 2 figs. Writer suggests types of electrical motors suitable for different classes of work. *See also Baking.*

HEATING. Industrial Applications of Electric Heating (Les applications du chauffage électrique dans l'industrie), F. Rutgers. Génie Civil, vol. 75, no. 9, Aug. 30, 1919, pp. 189-194. 18 figs. Illustrating electrically-heated boilers, air-heating apparatus, electric radiators and electric furnaces.

LIGHTERS. An Electrically Equipped Lighter, William H. Easton. Pac. Mar. Rev., vol. 16, no. 9, Sept. 1919, pp. 130-131, 6 figs. Penn. R.R. lighter equipped with electrically-operated winches.

MOTOR SELECTION. The Use of Electrical Power in Industrial Works, G. W. Stubbings. Eng. & Indus. Management, vol. 2, no. 9, Aug. 28, 1919, pp. 264-265, 2 figs. Writer suggests types of electrical motors suitable for different classes of work.

STANDARDS

FRENCH RULES, ELECTRICAL MATERIAL. French Rules for Standardizing Electric Material (Règles françaises d'unification du matériel électrique). Electricien, vol. 49, no. 1235, Aug. 31, 1919, pp. 73-75.Regulations for rating and classifying electric machines adopted by Commission Permanente de Standardisation.

STORAGE BATTERIES

DRY CELLS. Depreciation in Small Dry Cells with Age, A. J. Helfrecht. Gen. Meeting, Am. Electrochem. Soc., Paper no. 5, Sept. 23-26, 1919, pp. 33-40, 4 figs. Writer endeavors to show how closely method of judging cell deterioration, called "flesh test," approaches actual measurements of capacity through discharging cells. Comparative curves for different sizes of cells are given.

LEAD ACID BATTERIES. Factors Affecting the Life of Lead-Acid Storage Batteries, P. L. Rittenhouse. Automotive Industries, vol. 41, no. 10, Sept. 4, 1919, pp. 474-475, 2 figs. Two seemingly contradictory statements, one advanced by manufacturer of house-lighting plants and other by automobile engineer, are discussed. Writer endeavors to demonstrate that apparent difference is one of practice rather than of principle.

Theory of Lead Storage Battery (Sur la théorie de l'accumulateur au plomb), Paul Bary. Revue Générale de l'Electricité, vol. 6, no. 7, Aug. 16, 1919, pp. 195-199. Taking into account electrolysis of lead sulphate dissolved in electrolyte.

TELEGRAPHY AND TELEPHONY

The Scientific Problems of Electric Wave Telegraphy, J. A. Fleming, Jl. Roy. Soc. Arts, vol. 67, nos. 3282 and 3483, Aug. 15 and 22, 1919, pp. 612-616 and 625-631. Aug. 15: Transmission of long electric waves used in wireless telegraphy over surface of earth. Aug. 22: Detection of electric waves sent out from radio-transmitter station and manner in which these are controlled to create intelligible signals. (Cantor Lectures.)

AMPLIFIERS. Recording Amplifiers Used in Wireless Telegraphy. (Application des amplificateurs à l'inscription mécanique des signaux de télégraphie sans fil.), Henri Abraham and Eugène Bloch. Comptes rendus des séances de l'Académie des Sciences, vol. 169, no. 6, Aug. 11, 1919, pp. 282-285. Essays and field work of French Military radiotelegraphy quoted as evidence that lamp amplifiers permit direct reception of signals without any mechanical relays being used.

ANTENNAE. *See Interference Elimination.*

The Natural Constants of Wireless Antennae, A. Meissner. Wireless Age, vol. 7, no. 78, Sept. 1919, pp. 320-323, 6 figs. Empirical formulæ for determining natural wavelength of various form of aerials. Translated from Physikalische Zeitschrift, March 15, 1919.

ARTOM RECEIVER. Artom's Visual Receiver for Directive Wireless Telegraphy. Wireless Age, vol. 6, no. 11, Aug. 1919, pp. 21-22, 3 figs. Built in form of d'Arsonval galvanometer. Movable coil is traversed by rectified high frequency currents fed by directive aerials.

AUTOMATIC SWITCHBOARD. The Operator versus the Automatic, H. C. Townsend. Telephone Engr., vol. 22, no. 3, Sept. 1919, pp. 98-100. Examples in which manual switchboard is said to cope better with traffic.

AUTOMATIC TELEPHONY. Meter and Coin Devices for Automatic, Arthur Bessey Smith. Telephone Engr., vol. 22, no. 3, Sept. 1919, pp. 101-105, 9 figs. Illustrating method of operation. Paper read before Automatic Tel. Engrs.' Conference.

CONDUITS, TELEPHONE. Conduit Construction in Telephone Cable Tunnels. Eng. World, vol. 15, no. 6, Sept. 15, 1919, pp. 33-35, 6 figs. Construction methods employed.

DAMPING OF SIGNALS. The Damping of Wireless Telegraph Signals, G. H. Wood. Wireless World, vol. 7, no. 77, Aug. 1919, pp. 274-277, 2 figs. Investigations in West Indies.

DIRECTION FINDING. Theory and Practical Attainments in the Deisgn and Use of Radio Direction Finding Apparatus Using Closed Coil Antennas, A. S. Blatterman. Jl. Franklin Inst., vol. 188, no. 3, Sept. 1919, pp. 289-362, 69 figs. Summary of investigation carried out in U. S. Signal Corps Radio Laboratories.

DUPLEX APPARATUS. Universal Duplex Apparatus. Telegraph & Telephone Age, no. 17, Sept. 1, 1919, pp. 422-426. Balancing circuit for automatic working at high speeds. (Concluded.)

FIELD WIRELESS SETS. "W-T. R.E.". B. F. J. Schonland. Wireless World, vol. 7, nos. 76, 77, July and Aug. 1919, pp. 174-178 and pp. 261-267, 4 figs. Account of work and development of field wireless sets with armies in France. (Continuation of serial.)

INFRA-RED RADIATION, RADIOTELEGRAPHY. Radiotelegraphy by Infra-red Radiations (Radiotélégraphie par rayonnement infra-rouge), J. Herbert-Stevens and A. Larigaldie. Comptes rendus des séances de l'Académie des Sciences, vol. 169, no. 3, July 21, 1919, pp. 136-137. Experiments said to have given satisfactory results of distance up to 12 miles. Transmitter was arc projector, luminous rays of which were observed through suitable screen; receiver was thermo-electric ouple placed at focus of parabolic mirror.

INTERFERENCE ELIMINATION. The Weagant "X-Stopper," Wireless World, vol. 7, no. 77, Aug. 1919, pp. 271-273. 2 figs. Modified form of three-aerial arrangement. (Concluded.)

OSCILLATIONS. Electrical Oscillations in Antenna and Inductance Coils, John M. Miller. Bul. Bur. of Standards, vol. 14, no. 4, July 12, 1919, pp. 677-696, 8 figs. Application of antenna to theory of circuits having uniformly distributed electrical characteristics such as cables, telephone lines, and transmission lines.

PHOTOGRAPHS. The Electrical Transmission of Photographs, Marcus J. Martin. Model Engr. & Elecn., vol. 41 nos. 952, 953, 954, July 24, 31, and Aug. 7, 1919, pp. 83-86, 102-104, 130-131, 14 figs. July 24: Professor Korn's selenium machines. July 31: Professor Belin's telesteregraph. Aug. 7: Principle of operation of the teletrograph.

RADIO COMMERCIAL OPERATION. Radio Telegraphy in Competition with Wire Telegraphy in Overland Work, Robert Boyd Black. Telegraph & Telephone Age, no. 18, Sept. 16, 1919, pp. 459-464. Operation of radio stations. (Concluded.)

RADIO REMOTE CONTROL. Naval Radio Remote Control, P. H. Boucheron, Sci. Am., vol. 121, no. 10, Sept. 6, 1919, pp. 234 and 244, 1 fig. What the Navy is doing to minimize interference in radio operation.

RECEIVING SETS. Experimental Wireless Telegraphy and Telephony—V, Louis Gerard Pacent and Austin C. Lescarboura. Sci. Am. Supp., vol. 88, no. 2279, Sept. 6, 1919, pp. 152-153, 9 figs. Describing the more advanced types of receiving sets, with particular reference to postbellum practice.

Thermophones or Hot-Wire Receivers. Elecn., vol. 83, no. 2155, Sept. 5 1919, p. 242, 1 fig. Technical note on relationship between watts in wire and diameter of wire. Hot-wire receiver is not considered to be sufficiently developed to be ready to replace electromagnetic receiver for all branches of telephony, but it is said that it has already filled conditions which electromagnetic failed to do.

TELEPHONE REPEATERS. Telephonic Repeaters, A. B. Hart. Instn. Post Office Elec. Engrs., no. 75, Nov. 22, 1918, 46 pp., 10 figs. Review of conditions which have led to evolution of telephonic repeater as at present used in post office service, together with data offered as being of assistance in constructing estimates for telephonic repeater equipments, and suggestions in regard to changes in design, construction and maintenance of telephone lines that writer believes must be introduced if full advantage is to taken of telephonic repeaters.

TELEPHONY, TOLL TRAFFIC. Mathematical Study of Toll Traffic, Carroll O. Bickelhaupt. Telephony, vol. 77, no. 9, Aug. 30, 1919, pp. 12-15, 6 figs. Determination of arithmetic mean, standard deviation and probable error of the mean in analysis of long distance and toll traffic data. Technical statistical method now applied to study of telephone traffic.

TELEPHONY, SECRET. Process of Secret Telephony. (Sur un procédé de téléphonic secrète). Comptes Rendus des Séances de l'Académie des Sciences, vol. 169, no. 4, July 28, 1919, pp. 177-179, 1 fig. Account of how voice or musical air is deformed at other points than receiving station of circuit in which telephonic current is interrupted periodically.

THERMOPHONES. *See Receiving Sets.*

TRANSATLANTIC COMMUNICATION. Transatlantic Radio Communication, E. F. W. Alexanderson. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 10, Oct. 1919, pp. 1077-1093, 15 figs. Account of operation of present transatlantic stations and description of radio transmitting system at New Brunswick, N.J., which comprises special means for generating, modulating and radiating continuous wave energy. Article contains also account of multiple-antenna system of radiation.

TRANSMISSION. Principles of Radio Transmission and Reception with Antenna and Coil Aerials, J. H. Dellinger. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 10, Oct. 1919, pp. 1095-1150, 17 figs. Mathematical study of coil aerial as direction finder, interference preventer, reducer of strays and submarine aerial. Experiments are quoted which verify conclusions reached and formulae are presented for designing aerial for any radio station.

TRANSMITTER. Inductively Coupled Transmitter for Extremely Short Wave Lengths. Wireless Age, vol. 6, no. 11, Aug. 1919, p. 20, 3 figs. Elements arranged summetrically about common axis.

Development of Arc Radio Transmitters, Adrien L. Anderson and Harold F. Elliott. Elec. World, vol. 74, no. 9, Aug. 30, 1919, pp. 452-456, 7 figs. Noting how prevention of eddy current and corona losses and insulation breakdown is effected.

The Marconi Timed-Spark Continuous-Wave Transmitter, Philip R. Coursey. Wireless Age, vol. 7, no. 78, Sept. 1919, pp. 310-316, 6 figs. Noting specially feature for securing correct synchronization of impulse.

Vacuum Valves. The Theory of Valve Rectification, W. S. Barrell. Wireless World, vol. 7, nos. 77 and 78, Aug. and Sept. 1919, pp. 244-246, and 337-340, 7 figs. Aug.: Arrangement for connecting three-electrode valve of simple circuit. Sept.: Study of phenomena taking place in grid-filament circuit.

See also Amplifiers.

The Lamp-Valve in Radiotelegraphy. (La lampe-valve en radiotélégraphie), Henry Janne. Association des Ingénieurs Electriciens Sortis de l'Institut Electrotechnique Montéfiore, Bulletin, vol. 1, nos. 3, 4, 5, 6, 7, March, Apr., May, June, July, 1919, pp. 96-160, 13 figs. Study of its operation for (1) generating electric oscillation, (2) detecting, and (3) amplifying flatened waves. (To be continued.)

Weagant X-Stopper. *See Interference Elimination.*

TRANSFORMERS, CONVERTERS, FREQUENCY CHANGERS

Air-Blast Transformers. Maintenance of Air-Blast Transformers. Elec. Ry. Jl., vol. 54, no. 9, Aug. 30, 1919, pp. 424-426, 4 figs. Practice of United Railways of St. Louis where 63 air-blast transformers are kept in continuous service, noting special cover designed to prevent fires.

Booster Transformers. Principles of Booster Transformers, C. M. Jansky. Elec. Rev., vol. 75, no. 9, Aug. 30, 1919, pp. 341-344, 8 figs. Formulæ for finding percentage of boosting and choking of singlephase and polyphase transformers under different conditions.

Furnace Transformers. Transformers and Connections to Electric Furnaces, J. F. Peters. Elec. Jl., vol. 16, no. 9, Sept. 1919, pp. 397-399, 7 figs. Concerning requirements of leads for large furnaces requiring over 10,000 amperes, especially at 60 cycles.

Large Transformers. Large Power Transformers, A. G. Ellis and J. L. Thompson. Elecn., vol. 83, no. 2155, Sept. 5, 1919, pp. 253-255, 3 figs. Writers refer to progress toward increased size of modern stations, generating units and transformers, and tendencies to higher pressures. Limiting sizes of transformers as effected by handling and cooling are discussed, and prices per kilovolt-ampere in relation to output, voltage and cooling are presented. (To be continued.) From paper presented before Instn. Elec. Engrs.

TRANSMISSION, DISTRIBUTION, CONTROL

Centralization. Centralization of Electrical Energy (Etat actuel des principaux transports d'énergie électrique), Pierre Moutier. Electricien, vol. 49, no. 1235, Aug. 31, 1919, pp. 76-80, 1 fig. Recent progress and consideration of future developments.

Condensers. Synchronous Condensers in High-Tension System, J. W. Andree. Elec. World, vol. 74, no. 11, Sept. 13, 1919, pp. 564-567, 5 figs. 52,500 Kva. of synchronous condenser capacity is used for extensive high-tension system of Southern California Co. Functions of condensers discussed. How equipment is operated for maximum economy.

Insulators. Locating Defective Transmission-Line Insulators, T. F. Johnson, Jr. Elec. World, vol. 74, no. 11, Sept. 13, 1919, pp. 568-572, 5 figs. Details of "Buzz-stick" method that can be used on live high-voltage lines to detect faulty insulators of suspension or pin type, together with construction and use of special tools required.

Interconnection. California 220,000 Volt—1100 Mile—1,500,000-Kw. Transmission Bus, R. W. Sorensen, H. H. Cox and G. E. Armstrong. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 9, Sept. 1919, pp. 1027-1038, 5 figs. Jl. Electricity, vol. no. 5, Sept. 1, 1919, pp. 202-205, 4 figs. Scheme for interconnection of all California power plants.

Layout, Transmission Line. Laying Out a Power Transmission Line, Charles R. Hart. Elec. Ry. Jl., vol. 54, no. 12, Sept. 20, 1919, pp. 561-564, 3 figs. Concerning selection of route, clearances and pole and tower spacing with regard to maintenance as well as construction costs.

Power-Factor Correction. Power-Factor Correction by Use of the Static Condenser, O. C. Roff. Elec. Rev., vol. 75, no. 11, Sept. 13, 1919, pp. 423-427, 8 figs. Characteristics of static condenser installations. Causes of low power factor. Operating costs and purchase price. Paper read before Penn. Elec. Assn.

Substations. Railway Converter Substations—III, C. F. Lloyd. Power House, vol. 12, no. 12, Aug. 5, 1919, pp. 334-337, 4 figs. Information concerning class of equipment to be used and its arrangement in substation building.

The Substations of Electro-Chemical Industries (In Japanese), S. Fukuda. Denki Gakkwai Zasshi, no. 373, Aug. 10, 1919.

The Nisqually Substation at Tacoma, Washington. Jl. Electricity, vol. 43, no. 6, Sept. 15, 1919, pp. 257-258, 3 figs. Description of equipment and operation.

Switches. Automatic Isolation of Faults on High-Tension A. C. System. Iron & Coal Trades Rev., vol. 99, no. 2687, Aug. 29, 1919, pp. 266-267, 10 figs. Particulars of various types of protection gear for tripping switches automatically.

Transmission Circuits. Electrical Characteristics of Transmission Circuits—III, Wm. Nesbit. Elec. Jl., vol. 16, no. 9, Sept. 1919, pp. 385-396, 11 figs. Tables for determining approximate size of conductor corresponding to given I^2R transmission loss for any ordinary voltage or distance.

WIRING

Mine Wiring. Modern Mine-Wiring Practice, Terrell Croft. Coal Age, vol. 16, no. 12, Sept. 18, 1919, pp. 480-485, 21 figs. Particulars of methods and appliances employed at various plants.

GENERAL SCIENCE

PHYSICS

Acoustics. Detection of Submarine by Sound Waves. (Etude des ondes acoustiques, la propagation des ondes vibratoires et l'écoute sous-marine.), H. Brillié, Génie Civil, vol. 75, no. 9, Aug. 30, 1919, pp. 194-199, 10 figs. Technical study of physical questions involved in transmission of sound waves through different media. (Continuation of serial.)

Sound Waves (Etude des ondes acoustiques), H. Brillié. Génie Civil, vol. 75, no. 8, Aug. 23, 1919, pp. 171-175, 5 figs. Technical principles of acoustics involved in submarine detection. (To be continued).

Velocity of Sound in Sea Water (Sur une mesure de la vitesse de propagation des ondes sonores dans l'eau de mer), M. Marti. Comptes rendus des séanees de l'Académie des Sciences. vol. 169, no. 6, Aug. 11, 1919, pp. 281-212. Measurement effected by the French Naval Hydrographic Service at Cherbourg. Value obtained was 1503.5 m. per sec. at temperature of 14.5 deg. cent.

The Speed of Sound Pulses in Pipes, Arthur L. Foley. Phys. Rev., vol. 14, no. 2, Aug. 1919. pp. 143-151, 3 figs. Measured by photographic method modified so as to obtain instantaneous photograph of sound pulse part of which had come through a tube while another part had come through free air.

Sound Emitter and Sound Receiver—II (Schallgeber und Schallempfänger), W. Hahnemann and H. Hecht. Physikalische Zeitschrift, vol. 20, no. 11, June 1, 1919, pp. 245-251, 2 figs. The Electro-mechanical transformer as receiver.

Atomic Structure. A Mathematical Investigation of the Stability of Dr. A. W. Stewart's Atom. Leonard C. Fackson. Lond., Edinburgh and Dublin Phil. Mag., vol. 38, no. 224, Aug. 1919, pp. 256-266, 4 figs. Conditions for equilibrium and stability are obtained and applied to several special cases among simplest atom. It is found in each case that equilibrium cannot be maintained indefinitely for inner ring of negative electrons, even in entire absence of external perturbing forces. Thus, on atomic theory considered, instability is placed to account of those elements which are found to be least unstable in reality.

Cellular Structure. Cellular Solidification (Solidification cellulaire), M. C. Dauzère. Annales de Physique, vol. 12, July-Aug. 1919, pp. 5-106, 57 figs., partly on 12 supp. plates. Study of cellular structure in inanimate solids and determiuation of conditions under which it takes place during solidfication.

Emulsions. Investigations Concerning Oil-Water Emulsion, Alex. W. McCoy, H. R. Shidel and E. A. Trager. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1513-1537, 24 figs. Laboratory experiments conducted to determine compositions and properties of emulsified oil lead to conclusions that permanent B. S. is emulsion of very small water bubbles in oil having diameter generally less than 0.5 mm. Behavior of emulsion on heating is suggested as basis for division into two groups—(1) when water separates from oil rapidly with small amount of heating, and (2) when water can be removed by distillation.

Ionization. Ionization by Collision (Contribution à l'étude de l'ionisation par choc), M. Bianu. Radium, vol. 11, no. 7, May 1919, pp. 195-197, 4 figs. Experiments in air and water vapor.

Luminescence. Electrolytic Luminescence of Certain Metallic Anodes. (Phénomènes de luminescence électrolytique présentés par certaines anodes métalliques), James Lavaux. Comptes Rendus des Séances de l'Académie des Sciences, vol. 169, no. 4, July 28, 1919, pp. 180-182. Anodic polarization of aliminum, magnesium. zinc and bismuth.

Microphones. *See Acousticsr*

Theoretical Basis for the Construction of Microphones (Theoretische Grundlagen zur Konstruction Zweckmässiger Kikrophone), Ph. Broemser. Telegraphen-u. Fernsprech-Technik, vol. 8, no. 1, Apr. 15, 1919, pp. 6-8. Formulæ given for number of vibrations and sensitivity show that it is possible to increase number of vibrations without reducing thereby sensitivity.

Molecular Weights. An Alignment Chart for the Solution of Molecular Weight and Vapour Density Problems, Leslie J. Harris. Chem. News, vol. 119, no. 3094, Aug. 1, 1919, pp. 49-51, 1 fig. Arranged to read molecular weight of vapor density direct from weight and volume.

Optics. To the Theory of Polarization Prisms—III (Zur Theorie der Polarisationsprismen), H. Schulz. Zeitschrift f. Instrumentenkunde, vol. 39, no. 5, May 1919, pp. 154-157, 2 figs. Color dispersion.

Photography. Application of Dicyanin to the Photography of Stellar Spectra, Paul W. Merrill. Bul. Bur. of Standards, vol. 14, no. 4, July 12, 1919, pp. 507-536, 8 figs. Application of certain special physical and chemical properties of matter as means of quantitatively measuring radiant energy.

Radiance. Determination of Fundamental Domain of Automorphous Group (Sur la formation du domaine fondamental d'un groupe automorphe), M. G. Humbert. Comptes rendus des Séances de l'Académie des Sciences, vol. 169, no. 5, Aug. 4, 1919, pp. 205-211. Simplification of formulæ used in method of radiance.

Radio Activity. Volatility and the Active Deposit of Thorium (Volatilité du dépôt actif du thorium), T. Barratt and A. B. Wood. Radium, vol. 11, no. 7, May 1919, pp. 198-199, 2 figs. Writers conclude from experiment that products B and C cannot be separated by heating in the interval from 750 to 1200 deg. cent. Scheme illustrating transformations of thorium is suggested.

New Fluorescent Screene for Radioscopic Experiments (Sur de nouveaux écrans fluorescents pour la Radioscopie), P. Roubertie and A. Nemirovsky. Comptes Rendus des Séances de l'Académie des Sciences, vol. 169, no. 5, Aug. 4, 1919. pp. 233-234. Prepared without platinum, with cadmium tungstate.

The Radio Activity of Rubidium (Uber die Radioaktivität des Rubidiums), Otto Hahn and Martin Rothenbach. Physikalische Zeitschrift, vol. 20, no. 9, May 1, 1919, pp. 194-202, 3 figs. Comparison of various old rubidium salts with each other; penetration of B-rays of rubidium; total activity of B-rays of rubidium as compared with those of uranium.

Structure of Matter. Collision of a-Particles with Light Atoms, E. Rutherford. Nature, vol. 103, no. 2595, July 24, 1919, pp. 415-418. Experimental proofs that ordinary law of force holds for electrified bodies at exceedingly minute distances. Discourse delivered at Royal Instn.

Emission Spectra and Atomic Structure, John William Nicholsou. Jl. Chem. Soc., vol. 115-116, no. 681, July 1919, pp. 855-864. Concerning nature of emission spectra.

The Electron Theory of Metals in the Light of Experiments,—Thermoelectric Power and Resistance of Bismuth as Function of Field (Un confronto fra la teoria elettronica dei metalli e l'esperienza. La relazione fra potere termoelettrico e resistenza del bismuto, come funzioni del campo), M. La Rosa. Il Nuovo Cimento, vol. 18, no. 2, July 1919, pp. 39-55. Technical interpretation of experimental results reported in Il Nuovo Cimento, vol. 18, no. 7, July 1919, pp. 26-28.

Spectrum Analysis. Abnormal Birefringence of Torbenite, N. L. Bowen. Am. Jl. of Sci., vol. 48, no. 285, Sept. 1919, pp. 195-198, 2 figs. It was found that mineral was positive for red end of spectrum, negative for blue end and isotropic in green at about 515 u u.

The X-Ray Spectra of the Elements (Sur les Spectres de rayons X des Sciences, vol. 169, no. 3, July 21, 1919, 1919, pp. 134-136. Measurements of spectrum K of rhodium and absorption spectrum L of radium.

The Quantitative Spectra of Lithium, Rubidium, Caesium, and Gold, A. G. G. Leonard and P. Whelan. Scientific Proc. Roy. Dublin Soc., vol. 15, no. 25, Feb. 1918, pp. 274-278, 1 fig. on supplement plate. Experimental work done with view to facilitating use of spectrograph. Result of experiments.

Measurements of Wave Lengths in the Spectrum of Neon, Keivin Bums, W. F. Meggers, and Paul W. Merrill. Bul. Bur. of Standards, vol. 14, no. 4, July 12, 1919, pp. 765-775. Measurements made with interferometer of 55 lines in region 3369A to 8495A.

Measurements on the Index of Refraction of Air for Wave Lengths from 2218 A to 900 A, W. F. Meggers and C. G. Peters. Bul. Bur. of Standards, vol. 14, no. 4, July 12, 1919, pp. 697-740, 7 figs. By means of Fabry and Perot interferometer. Sections of circular fringes, produced by various radiations from a source of light illuminating parallel plates of interferometer, were photographed either with a grating or a rock-salt prism spectrograph, first when space between plates was evacuated and then when dry air at measured temperature and pressure was present.

Wave Lengths in the Red and Infra-Red Spectra of Iron, Cobalt, and Nickel Ares, W. F. Meggers and C. C. Kiess. Bul. Bur. of Standards, vol. 14, no. 4, July 12, 1919, pp. 637-651. Application of photographic sensitometry of investigations of standard wave lengths and spectrum analysis. Measured lengths are presented in tables.

Spectroradiometric Investigation of the Transmission of Various Substances, W. W. Coblentz, W. B. Emerson, and M. B. Long. Bul. Bur. of Standards, vol. 14, no. 4, July 12, 1919, pp. 653-676, 20 figs. Especially colored fluorite, light filters, and colored glasses.

The L-Series in the Tungsten X-Ray Spectrum, Oswald B. Overn. Phys. Rev., vol. 14, no. 2, Aug. 1919, pp. 137-142, 4 figs. Dershem's results said to have been verified for most part within 1.10 per cent, six new lines reported discovered and two groups of lines suggested.

Spectral Energy Distribution in the Acetylene Flame, W. W. Coblentz. Jl. Franklin Inst., vol. 188, no 3, Sept. 1919, pp. 399-401, Table giving spectral energy transmission of cylindrical acetylene flame, both from observation and computation with Wien's equations.

The Series Spectrum of Helium (Das Serienspektrum des Heliums), A. Lande. Physikalische Zeitschrift, vol. 20, no. 10, May 15, 1919, pp. 228-234, 3 figs. Calculation of eccentric ring displacement *d* in field of valence electron.

The Flash Spectrum, S. A. Mitchell. Proc. Am. Philosophical Soc., vol. 58, no. 4, 1919, pp. 265-268. From observations of sun's eclipses. It is concluded from measurements that flash spectrum is reversal of Fraunhofer spectrum.

Temperature Distribution. Temperature Distribution in Solids during Heating or Cooling, E. D. Williamson and L. H. Adams. Phys. Rev., vol. 14, no. 2, Aug. 1919, pp. 99-114, 4 figs. Equations are derived for following shapes: Rectangular parallelopiped, long rectangular rod, thin slab, cylinder, long cylindrical rod, sphere. A method of measuring thermal diffusivity involving determination of temperature-time relation at center of symmetrical solid whose surface is heated either at uniform rate or very suddenly is outlined.

Viscosity. Viscosity, Nicolas Flamel. Sci. Am. Supp., vol. 88, no. 2278, Aug. 30, 1919, pp. 130-131, 4 figs. Methods and apparatus for estimating aud measuring it. Translated from La Nature, (Paris).

MATHEMATICS

Equations. Irregular Singularities of Lineal Differential Equations (Sur les Singularités irrégulières des équations différentielles linéaires), René Garnier. Comptes Rendus des Séances de l'Académie des Sciences, vol. 169, no. 5, Aug. 4, 1919, pp. 223-226. In Comptes Rendus, t. 168, 1919, p. 142 et 452, writer discussed fusion of close regular singular points and calculation by means of irregular equation of elements of invariants of monodromic group of regular equation. Present note completes producing results and gives new applications.

Harmonics. Zonal Harmonics of High Order in Terms of Bessel Functions, John R. Airey. Proc. Roy. Soc., vol. 96, no. A674, Aug. 1, 1919, pp. 1-8. From consideration of Legendre's equation.

Integration. Rieman's Method of Integration (Sur l'intégration riemanienne), M. Arnaud Denjoy. Comptes rendus des séances de l'Académie des Sciences, vol. 169, no. 5, Aug. 4, 1919, pp. 219-221. How this method leads to Lebesque's definition of the integral.

Polynomials. Euler's Polynomials (Sur les polynomes d'Euler), N.-E. Norlund. Comptes Rendus des séances de l'Académie des Sciences, vol. 169, no. 5, Aug. 4, 1919, pp. 221-223. Properties of polynomials of negative order. Additional to note by some writer in Comptes Rendus of July 28, in which he discussed properties of polynomials of positive order.

Probabilities, Theory. Note on Approximations in the Theory of Probabilities, T. J. I'a. Bromwich. Lond., Edinburgh & Dublin Phil. Mag., vol. 38, no. 224, Aug. 1919, pp. 231-235. Formula for increasing approximation in Bernoulli's theorem, beyond terms of $1/n^2$ order.

Surfaces, Theory. Memoir on the General Theory of Surfaces and Rectilinear Congruences, Gabriel M. Green. Tran. Am. Math. Soc., vol. 20, no. 2, Apr. 1919, pp. 79-153. Study of differential geometry of surfaces from projective point of view, principally with a view to determining projective substitute for normal to surface. Concept assumed as fundamental was the following: At every regular point of a curved surface there exists an osculating quadric, which is cut by the tangent plane of the surface in the asymptotic directions at the point of contact.

CHEMISTRY

Air. New Forms of Instruments for Showing the Presence and Amount of Combustible Gas in the Air, E. R. Weaver and E. E. Weibel. Dept. Commerce, Scientific Papers of Bur. of Standards, no. 334, June 23, 1919, 90 pp., 21 figs. Description of devices developed by Bur. of Standards, principles upon which they operate, results of tests showing their accuracy and reliability, and discussion of their application.

Alloys. *See Ores and Alloys.*

Ammonia Oxination. Analytical Method for Determining Efficiency of Ammonia Oxidation, D. F. Gaillard. Jl. Indus. & Eng. Chem., vol. 11, no. 8, Aug. 1, 1919, pp. 745-747, 1 fig. "Bulb" method of analysis.

Analysis. The Use of Freezing-Point Determinations in Quantitative Analysis, Charles Edward Fawsitt. Jl. Chem. Soc., vol. 115-116, no. 681, July 1919, pp. 801-808. Method of estimating ingredient in substance by finding freezing-point depression of substance in ingredient as solvent and also in some other solvent is found to be applicable only by special cases where it is possible to experiment previously with samples of substance somewhat similar to the one under investigation.

See also Air, Ammonia, Battery Acid, Foods, Gas Mixtures, Lead, Magnesium, Marbles, Ocean Currents, Ores and Alloys, Paper, Starch, Steel.

Battery Acid. Determination of Iron in Battery Acid by the Ferricthiocyanate color, Ernest Nyman. Can. Chemical Jl., vol. 3, no. 9, Sept. 1919, pp. 298-300. As to rapidity and accuracy, method was found to compare favorable to both gravimetric and volumetric permanganate methods.

Catalysis. Some Problems in Contact Catalysis, Wilder D. Bancroft. Gen. Meeting, Am. Electrochem. Soc., Paper no. 6, Sept. 23-26, 1919, pp. 41-43. Concerning reaction of phosgene with water.

On the Oxidation of Phenols by Gaseous Oxygen and the Catalytic Effect of Metals, F. W. Skirrow. Can. Chemical Jl., vol. 3, no. 9, Sept. 1919, pp. 292-294, 1 fig. Account of experiments.

Carbon Activation. The Activation of Carbon, N. K. Chaney. General Meeting of the Am. Electrochem. Soc., paper no. 13, Sept. 23-26, 1919, pp. 157-166. Discussion of general theory of nature of active carbon and its relations to generally occurring forms of carbon.

Chemical Affinity. Chemical Affinity and Atomic Valence, G. Ciamician and M. Padoa. Sci. Am. Supp., vol. 88, no. 2279, Sept. 6, 1919, pp. 154-155. Relation between chemical and thermal energy and modern views of constitution of atom. Translated from Jour. de Chim. Physique (Geneva).

Coagulation. Heat of Coagulation (Ueber Flockungswärme), H. R. Kruyt and Jac. van. der Spek. Kolloid-Zeitschrift, vol. 24, no. 5, May 1919, pp. 145-155, 2 figs. Discussion of Berthelot, Thomsen, Wiedemann and Ludeking, Graham and other methods.

Colloids. Colloidchemical Studies of Kongo Ruby (Kolloidchemische Studien am Kongorubin), Wolfgang Ostwald. Kolloidchemische Beihefte, vol. 10, nos. 6-12, 1919, pp. 179-288, 3 figs. Study on the theory of indicators and the theory of color changes in organic matter.

Enamel Ware. Acid Test on Enamel Ware, W. D. Collins. Jl. Indus. & Eng. Chem., vol. 11, no. 8, Aug. 1, 1919, pp. 757-759. Account of acid tests made on sixty-one samples of enamel ware from twenty-six different manufacturers.

Foods. The Estimation of Sulphates in a Concentrated Electrolyte and the Determination of Sulphur in Foods, Vernon K. Krieble and Autrey W. Mangum. Jl. Am. Chem. Soc., vol. 41, no. 9, Sept. 1919, pp. 1317-1328. Laboratory study of oxidation of foods by sodium peroxide and precipitation of sulphate as barium sulphate in solutions containing large amounts of sodium chloride.

Gas Mixtures. Industrial Analysis of Gas Mixtures by the Refractometric Method. Chem. & Metallurgical Eng., vol. 21, no. 6, Sept. 15, 1919, pp. 392-393, 7 figs. How to use Lord Rayleigh's interferometer and how to interpret measurements effected with it. Translated from Chimie et Industrie, June 1919.

Glucinium, J. S. Negru. Chem. & Metallurgical Eng., vol. 21, no. 6, Sept. 15, 1919, pp. 353-359, 1 fig. Historical account of discovery, uses, treatments of glucinium minerals for glucina, and method of effecting chemical and electrochemical separation of glucinium.

Iron Penetration by Hydrogen. The Penetration of Iron by Hydrogen, T. S. Fuller. General Meeting of the Am. Electrochem. Soc., paper no. 9, Sept. 23-25, 1919, pp. 77-93, 4 figs. Results of experiments showing effect of various conditions on penetration of iron by nascent hydrogen at temperatures from 20° to 100° cent. It was found that velocity of hydrogen penetration is greater for a unit immersed without electrical connections, in 1 per cent sulphuric acid than four units electrolyzed as cathode in like solution, with current densities up to ohe half an ampere.

Lead. Titrometric Determination of Antimony in Lead (Uber die titrimetrische Bestimung des Antimons in Hartblei), A. Wogrinz and R. Gohring. Des Metall, no. 9, May 10, 1919, pp. 117-118. Description and results of tests; analysis of weight; titration.

Magnesium. The Alkalimetric Determination of Small Amounts of Magnesium, P. L. Hibbard Jl. Indus. & Eng. Chem., vol. 11, no. 8, Aug. 1, 1919, pp. 753-754. Suggests changes in Bruckmiller's method for determining magnesium by titration of ammonum magnesium phosphate.

MARBLES. Physical and Chemical Tests on the Commercial Marbles of the United States, D. W. Kessler. Techn. Papers Bur. Stand., no. 123, July 15, 1919, 54 pp., 8 figs. Chemical analyses made on 42 samples for purpose of classification and determination of harmful elements. Volume resistivity determinations made on a number of samples to determine their relative value for electrical insulators and the variation of this value under different conditions of moisture. Carbonic-acid tests also included.

OCEAN CURRENTS. Detecting Ocean Currents by Observing Their Hydrogen-ion Concentration, Alfred Goldsborough Mayor. Proc. Am. Philosophical Soc., vol. 58, no. 2, 1919, pp. 150-160, 1 fig. Observations are said to have established that easterly moving water in Tropical Pacific is commonly less alkaline tban that of general region in which it occurs. Having this and similar established conditions writer suggests detection of currents by testing sea water with a few drops of red dye thymolsulphonephthalein.

ORES AND ALLOYS. A Rapid Method for Determining Nickel and Cobalt in Ores and Alloys—III, W. R. Schoeller and A. R. Powell. Analyst, vol. 44, no. 521, Aug. 1919, pp. 275-280. Application of iodide process to certain ores and alloys.

PAPER. *See Starch.*

PHENOL OXIDATION. *See Catalysis.*

PIEZOCHEMISTRY. Piezochemical Studies; experimental test of Braun's Law—XV (Piezochemische Studien. Experimentelle Prufung des Braunschen Gesetzes), Ernst Cohen and A. L. Th. Moesveld. Zeitschrift für physikalische Chemie, vol. 93, no. 4, 1919, pp. 385-515, 8 figs. Investigations included determination of temperature coefficient of solubility, pressure coefficient of solubility, hypothetical change of volume and hypothetical temperature of solubility.

SOLUTIONS. The Freezing Point of Solutions, with Special Reference to Solutions containing Several Solutes, Charles Edward Fawsitt. Jl. Chem. Soc., vol. 115-116, no. 681, July 1919, pp. 790-801. Writer believes as result of calculations and observations that in freezing-point determinations, there may with advantage be substituted for W, weight of solvent, expression $W = bw$ where w is weight of solute and b is constant which depends both on solute and solvent, and is determinable by experiment.

The Determination of the Rate of o ution of Atmospheric Nitrogen and Oxygen by Water—I, W. E. Adeney and H. G. Becker. Scientific Proc. Roy. Dublin Soc., vol. 15, no. 31, Aug. 1918, pp. 385-404, 9 figs., partly on supplement plates. Experiments conducted by studying influence of thickness of layer of de-aerated water upon rate at which it becomes re-aerated with view to obtaining data by means of which factor of depth of water could be eliminated, when considering question of rate of solution by surface layer of water.

Study of Solutions. (Etudes sur les solutions), A. Reychler. Jl. de Chimie Physique, vol. 17, no. 2, June 30, 1919, pp. 209-265, 5 figs. Technical notes on Perrin's constants, osmotic pressure, vapor tension, cryoscopy and dissociation of dissolved electrolytes.

Complete Review regarding Solutions of Oceanic Salts—I (Vollständige Uebersicht uber die Lösungen ozeanischer Salze), E. Jänecke. Kali, vol. 13, no. 10, May 15, 1919, pp. 161-164, 6 figs. Extract of series of articles published by author in "Zeitschrift fur anorganische Chemie." Studies of oceanic salt deposits. Graphs.

STARCH. The Quantitative Estimation of Starch in Paper, V. Voorhees and Oliver Mamm. Paper, vol. 24, no. 25, Aug. 27, 1919, pp. 15-19. Account of investigations. Suggested experimental procedure.

STEEL. An Electrolytic Resistance Method for Determining Carbon in Steel, J. R. Cain and L. C. Maxwell. Jl. Indus. & Eng. Chem., vol. 11, no. 9, Sept. 1919, pp. 852-860, 6 figs. Method for determining carbon dioxide by absorbing it in barium hydroxide solution and measuring resistance change of solution in relation to its concentration. Absorption vessel with electrolytic resistance cell incorporated is illustrated and described.

STRUCTURE OF MATTER. The Positions of Atoms in Metals, A. W. Hull. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 10, Oct. 1919, pp. 1171-1192, 16 figs. Photographic patterns of concentric circles assumed by particles of metal when X-Ray beam passes through fine powder of it are presented and discussed.

See also Physics (Structure of Matter).

TIN. The Analysis of Alloys of Tin, Archibald Craig. Jl. Indus. & Eng. Chem., vol. 11, no. 8, Aug. 1, 1919, pp. 750-753. Discussion of conditions of greatest accuracy of gravimetric method, based on nitric acid separation.

INDUSTRIAL TECHNOLOGY

ALCOHOL. Alcohol from Sulphibe Waste Liquor, Ralph H. McKee, Paper, vol. 24, no. 15, June 18, 1919, pp. 34 and 36. Results of experiments at Columbia Univ. Paper read before Technical Assn. of Pulp & Paper Indus.

ALKALI. Conditions of British Alkali Works, Chem. Age, vol. 1, no. 7, Aug. 2, 1919, pp. 189-190. Annual report of chief inspector. Also in Chem. Age, vol. 1, no. 8, Aug. 9, 1919, pp. 218-220.

AMMONIA. The Yield of Ammonia in the Distillation of Coal, Friedrich Sommer. Gas World, vol. 71, no. 1828, Aug. 2, 1919, pp. 20-21. Writer claims that a method of determining nitrogen, in which coal is burned in intimate contact with copper oxide, gives excellent results with organic compounds of known composition and with coals. From Stahl and Eisen.

Ammonia in Producer Gas, F. K. Ovitz. Chem. Engr., vol. 27, no. 9, Sept. 1919, pp. 239, 241. Tests made to determine amount of ammonia in gas from producer of Smith type.

Direct and Indirect Ammonia Recovery, Thomas B. Smith. Chem. Engr., vol. 27, no. 9, Sept. 1919, pp. 219-221. Fact of these two methods of ammonia recovered upon by-products of coking process.

CATALYSIS. Recent Developments in Industrial Catalysis, Hugh S. Taylor. Chem. Age, vol. 1, nos. 7 and 8, Aug. 2 and 9, 1919, pp. 186-188 and 212-214. Aug. 2: Effect of promoters. Promoters are agents which, wben added to catalysis, produces large increase in catalytic acceleration. Aug. 9: Attempts to synthesize alcohol from acetylene; alcohol from wood waste.

See also Hydrogen Cyanide.

CHARCOAL. Gas Works Carbonize Cbarcoal for Gas Masks, W. E. Brophy. Gas Age., vol. 44, no. 5, Sept. 1, 1919, pp. 189-192, 5 figs. Illustrating flow sbeet Age, vol. 44, no. 5, Sept. 1, 1919, pp. 189-192. 5 figs. Illustrating flow sheet of charcoal process and materials, and arrangement of carbonizing units.

COLOGNE. Some Chemical Plants in the Cologne Area—II, A. J. Allmand and E. R. Williams. Jl. Soc. Chem. Indus., vol. 38, no. 16, Aug. 30, 1919, pp. 303R-304R. Aluminum and zinc plants of Elektrometallurgische Weke, at Horrem.

COTTRELL PROCESS. Application of the Cottrell Process to the Recovery of Fume from Silver Refining Operations, W. G. Smith and A. A. Heimrod. Chem. & Metallurgical Eng., vol. 21, no. 6, Sept. 15, 1919, pp. 360-363, 3 figs. Construction of header chambers, electrode tubes and electrode system, how operation control of recently installed fume precipitator at works of U. S. Metals Refining Co., at Cbrome, N. J.

DYES. Tungsten and Molybdenum Dyes (Wolfram-und Molybdänfarben), Th. Hertwig. Sprechsaal, vol. 52, no. 24, June 12, 1919, pp. 199-200. Formulae for making orange and red ceramic colors.

HYDROGEN CYANIDE. The Catalytic Reduction of Hydrogen Cyanide, Sydney Barratt and Alan Francis Titley. Jl. Chem. Soc., vols. 115 & 116, no. 682, Aug. 1919, pp. 902-907, 1 fig. Experiments claimed to have shown that platinum catalyses reduction of bydrogen cyanide by gaseous hydrogen above 120 deg. cent. and readily above 180 deg. cent.

LIQUID AIR. Liquid Air and Oxygen in Industry. Engineering Review, vol. 33, no. 2, Aug. 15, 1919, pp. 35-37, 5 figs. Describing properties and manufacture of liquid oxygen indicating purpose to which it bas been put, and some of directions in whicb writer believes it will probably develop.

LIXIVIATION. Continuous Lixiviation in a Counter Current (Kontinuierliches Laugen im Gegenstrom), H. Bueler de Florin, Metall und Erz, vol. 7, no. 7, Apr. 8, 1919, pp. 141-147, 6 figs. Ore extraction apparatus without and witb filter; cascade apparatus with filter; box extractor without filter.

NITRE-CAKE. Utilization of Nitre-Cake, Gilbert T. Morgan. Economic Proc. Roy. Dublin Soc., vol. 2, no. 13, Marcb 1917, pp. 238-247, 1 fig. on supplement plate. Experiments described as having shown that niter-cake can be converted into soda-lime or soda-lead glass witb recovery of not less tban two-thirds of contained sulphur.

NITROGENOUS COMPOUNDS. The Production of Nitrogenous Compounds Synthetically in the United States and Germany. Robert E. McConnell. Jl. Indus. & Eng. Chem., vol. 11, no. 9, Sept. 1919, pp. 837-841, 5 figs. With forecast of military and naval methods of conditions which may prevail five to fifteen years in the future and suggestions to provide means to contend with such conditions.

Effect of Partial Vacuum on the Manufacture of Nitrogen Oxide by Means of the Electric Arc. (Action de la dépression sur la formation de l'oxyde d'azote ay moyen de l'arc électrique), E. Brinner and Ph. Naville. Jl. de Chimie Physique, vol. 17, no. 2, June 30, 1919, pp. 329-363, 5 figs. Although mixture of hydrogen and nitrogen most favorable theoretically for synthesis of ammonia is one volume of nitrogen to three volumes of hydrogen, experiments have shown that best mixture in practice is five volumes of nitrogen to one of hydrogen. Article describes experiments undertaken to determine reason for this apparent anomaly.

PHOTOGRAPHIC MATERIALS. Photoelectric Sensitivity of Bismuthinite and Various Other Substances, W. W. Coblentz. Bul Bur. of Standards, vol. 14, no. 4, July 12, 1919, pp. 591-604, 1 fig. Results of investigation (1) for increase in electrical conductivity caused by action of light upon substances, and (2) for photoelectrical activity when substances were charged to negative potential in evacuated chamber and exposed to light.

POISON GASES. The Manufacture of War Gases in Germany, James F. Norris. Jl. Indus. & Eng. Chem., vol. 11, no. 9, Sept 1919, pp. 817-829, 10 figs. Account of inspection trip made by representatives of American army to investigate chemical factories in occupied zones along Rhine. How various gases were prepared is indicated.

Potash Recovery at Cement Plants, Alfred W. G. Wilson. Canada Dept. Mines, Bul. no. 29, May 6, 1919, 34 pp., 10 figs., on supp. plates. Potash recovery, fuel economy, elimination of dust nuisance, reduction of power costs and more complete utilization of waste heat with consequent reduction of coal consumption are considered as closely related problems that merit careful study. Also in Jl. Soc. Chem. Indus., vol. 38, no. 15, Aug. 15, 1919, pp. 314T-318T.

The Potash Industry of the United States and its Possibilities for future Production, Arthur E. Wells. Bur. Mines, Minerals Investigation, Preliminary Report, Aug. 1919, 20 pp. Potasb from saline lakes; as by-product from cement kilns and blast furnaces; potash from silicate rocks; potash from alunite, from organic sources otber tban kelp and potash from kelp. Brief outline of commercial possibilities.

The Potash Industry. U. S. Tariff Commission, Washington, 1919, 52 pp. Prepared for use of Committee on Ways and Means, House of Representatives

Potash from Kelp: The Experimental Plant of the United States Department of Agriculture. Preliminary Paper, J. W. Turrentine and Paul S. Shoaff. Jl. Indus. & Eng. Chem., vol. 11, no. 9, Sept. 1919, pp. 864-874, 6 figs. One hundred tons of raw kelp per day are subjected to process involving drying, destructive distillation, lixiviation, evaporation, and fractional crystallization. It is confidently believed that by-products, kelp oils, creosote, pitch ammonia, bleaching carbons, salt and iodine, will be made to yield sufficient revenue to enable potash salts to be marked successfully in competition with potasb from foreign sources.

From the Laboratory Practice of a Potash Chemist—I (Aus der Laboratoriumspraxis das Kalichemikers), H. Bokemüller. Kali, vol. 13, no. 8, Apr. 15. 1919, pp. 123-130. Data collected in practice extending over period of 32 years, Tables.

Non-German Sources of Potash, Arthur Holmes, Geol. Mag., vol. 6, no. 8, Aug. 1919, pp. 340-350, 1 fig. Abyssinian deposits; composition of American potash brine.

The Alsatian Potash Industry, Frank K. Cameron. Chem. Engr., vol. 27, no. 9, Sept. 1919, pp. 209-213. Part writer considers deposits and mines of Alsace will play in world market.

Potash Deposits of Alsace (Le champ de potasse d'Alsace), Aimé Witz. Revue Générale des Sciences, vol. 30, nos. 15-16, Aug. 15-30, 1919, pp. 477-488, 1 fig. Geological description and discussion of economical and financial features of their exploitation.

PULP. Manufacturing Paper Pulp from Sawdust. Paper, vol. 24, no. 26, Sept. 3, 1919, pp. 19-20, 1 fig. Specifications of Dutch process. From Paper Making (London.)

Pulp Discoloration, C. L. Bachelder. Paper, vol. 24, no. 25, Aug. 27, 1919, pp. 20-21, 1 fig. Effect of sixteen hours drying at various temperatures on color of different pulps. From research conducted at Forest Products Laboratory at U. S. Dept. of Agriculture.

Paper Pulp Manufacture in Australia, Gerald Lightfoot. Paper, l. vol. 24, no. 25, Aug. 27, 1919, pp. 24-26. Pulping qualities of bamboo grass. (Continuation of serial.)

The Allen-Moore Cell in the Pulp and Paper Mill, F. H. Mitchell. Chem. & Metallurgical Eng., vol. 21, no. 6, Sept. 15, 1919, pp. 370-375, 12 figs. Summaries of operating reports.

RUBBER. Eight Years' Work on Synthetic Rubber. India Rubber Jl., vol. 58, nos. 7 and 8, Aug. 16, and 23, 1919, pp. 17-20 and 16-18. German war time uses described. (Translated from Gummi Zeitung.)

Hard Rubber Manufacture and Markets. Raw Material, vol. 1, no. 6, Aug. 1919, pp. 299-203, 7 figs. Standard market forms and products commonly manufactured.

TANNING. The Chrome Tanning Industry. Chem. Age, vol. 1, no. 6, July 26, 1919, pp. 161-164. Comparative positions of America and Great Britain.

MARINE ENGINEERING

AUXILIARY MACHINERY

GYROSTABILIZER. On Gyrostabilizer for Ships (In Japanese), N. Watanabe. Jl. Soc. Naval Architects, vol. 24, Apr. 1919.

SHIPS

AIR FLOW OVER REAR DECK. Air Flow Over Rear Deck of Battleship Pennsylvania, A. F. Zahm. Jl. Franklin Inst., vol. 188, no. 3, Sept. 1919, pp. 389-397, 11 figs. Tests made with navy model of battleship Pennsylvania, both in natural condition and with shelving deck placed above rear part, in 8 ft. x 8 ft. wind tunnel, to determine aerodynamical and structural conditions suitable for landing light airplanes upon after-deck of full-scale ship.

BARGES. Designs Modern Inland Barges. Mar. Rev., vol. 49, no. 10, Oct. 1919, pp. 461-463, 6 figs. partly on suppl plate. Details of various types of barges and towboats.

CANAL VESSELS. *See River and Canal Vessels.*

CARGO STEAMERS. *See Freight Steamship.*

CHINESE-BUILT STEAMERS. The Chinese-built Passenger and Cargo Steamers "Mylie" and "Gweneth." Shipbuilder, vol. 21, no. 109, Sept. 1919, pp. 135-138, 2 figs. Principal dimensions are, length overall, 261 ft.; length between perpendiculars, 250 ft.; breadth moulded, 40 ft.; depth moulded, 40 ft.; dead weight loaded, 3000 tons.

COMPOSITE SHIPS. Ballin Composite Ships of 4,400 Tons D. W. Mar. Eng., vol. 24, no. 10, Oct. 1919, pp. 680-684, 11 figs., partly on supp. plates. Outstanding feature of hull is steel topside construction in combination with double diagonal planking under fore and aft course of heavier outside planking.

CONCRETE SHIPS. Reinforced Concrete Barges and the Navigation on the Seine during Hostilities (Les chalands en ciment armé et la navigation sur la Seine pendant les hostilités), Ch. Lavaud. Mémoires et Compte Rendu des travaux de la Société des Ingénieurs Civils de France, vol. 72, nos. 4, 5 & 6, Apr.-June 1919, pp. 163-178. From technical considerations as well as statistics of operation it is concluded that industrial value of reinforced-concrete barges has been sufficiently established.

Precast Members Used for British Concrete Barges. Eng. News-Rec., vol. 83, no. 11, Sept. 11, 1919, pp. 507-508, 7 figs. Details of members of precasting concrete bridges of 1,000-ton capacity.

DESIGN. Point of Gravity in Ship Construction (Schwerpunktslagen), Wilhelm Schmidt. Schiffbau, vol. 20, no. 15, May 14, 1919, pp. 389-393, 6 figs. Describes simple method for determining point of gravity of area, outlines of which correspond to parabola or m-th degree.

See also Air Flow.

New Data on Ship Stresses. Eng. News-Rec., vol. 83, no. 12, Sept. 18, 1919, pp. 550-553, 10 figs. Results of strainograph measurements on ships at sea and during launching. Strainograph registers changes in gage length by drawing curve on moving strip of paper.

The Resistance of Ships (In Japanese), N. Yokota. Jl. Soc. Naval Architects, vol. 24, Apr. 1919.

Resistance Tests of Keels Used in Mercantile Vessels. (Essais de résistance des carènes appliqués à des navires de commerce), Ch. Doyere. Bulletin Technique du Bureau Veritas, vol. 1, nos. 2 and 3, July-Aug. 1919, pp. 19-24 and pp. 35-43, 12 figs. Precautions to be taken and reservations to be introduced in interpreting experiments conducted with models. Tests at Grenelle basin discussed and interpreted.

EXTENSOMETER RECORDING. A Recording Extensometer and the Measured Stresses in a Concrete Hull, Franklin R. McMillan. Eng. & Contracting, vol. 52, no. 13, Sept. 24, 1919, pp. 360-362, 10 figs. Strainograph used for measuring stresses in vessel during launching and under actual conditions of service. From paper presented at annual meeting of Am. Concrete Inst.

FREIGHT STEAMSHIP. A Modern Steel Freight Steamship, D. D. Thomas. Int. Mar. Eng., vol. 24, no. 9, Sept. 1919, pp. 592-600, 20 figs. partly on two supplement plates. Factors determining size of vessel and type of propelling machinery; details of 8800 deadweight ton, turbine-driven ship.

Italian Geared Turbine Cargo Steamers, C. E. Spinnler. Pac. Mar. Rev., vol. 16, no. 9, Sept. 1919, pp. 77-82, 13 figs. Details of Franco Tosi turbine installation on 8000-ton cargo steamers.

Skinner & Eddy's 10,400 Ton Freighters. Pac. Mar. Rev., vol. 16, no. 9, Sept. 1919, pp. 97-98, 3 figs. partly on supplement plate. Length overall, 439 ft. 9½ in.; breadth molded, 55 ft.; depth molded to shelter deck, 36 ft.; designed load draft, 26 ft. 6 in.

RIVER AND CANAL VESSELS. Large Program of River and Canal Vessel Construction now under Way. Mar. Eng., vol. 24, no. 10, Oct. 1919, pp. 671-678, 10 figs. Types under construction for Railroad Administration for New York barge canal, Mississippi and Warrior River.

ROLLING OF SHIPS. Experiments on the Rolling of Ships (In Japanese), H. Suyehiro. Jl. Soc. Naval Architects, vol. 24, Apr. 1919.

RUDDERS, KITCHEN, REVERSIBLE. Proposed Method of Maneuvering Vessels. Motorship, vol. 4, no. 10, Oct. 1919, p. 42, 14 figs. "Kitchen" reversible rudders. It consists of two curved deflectors formed of parts of circular cylinder, partly enclosing propeller; by suitable mechanism deflectors are made to turn together in same direction or equally in opposite directions.

TRAWLER AND DRIFTER COMBINED. A Combined Trawler and Drifter. Shipbuilding & Shipping Rec., vol. 14, no. 9, Aug. 28, 1919, pp. 237-239, 7 figs. Principal dimensions are: Length between perpendiculars, 85 ft.; breadth, 19 ft.; depth, molded, 10 ft. 3 in.

Drifters and Trawlers. Mar. Eng., vol. 24, no. 10, Oct. 1919, pp. 665-669, 6 figs. British drifters, for Canadian company, built of wood with length of 84 ft. and breadth of 19¼ ft.

TERMINALS

DRYDOCK, FLOATING. Twenty-Thousand-Ton Floating Dry Dock. Mar. Eng., vol. 24, no. 10, Oct. 1919, pp. 661-665, 7 figs. Put in operation by Bethlehem Shipbuilding Corporation. Dock is of pontoon type, making use of individual wooden pontoons and continuous side wings of steel.

SEATTLE. World's Largest Pier for Seattle, G. F. Nicholson. Freight Handling & Terminal Eng., vol. 5, no. 8, Aug. 1919, pp. 291-292. Length, 2560 ft.; width, 365 ft. Type of construction and mechanical handling equipment.

YARDS

BARGE REPAIRS. Repairing in Four Weeks a 500-Ton Reinforced Concrete Barge, which fell, when being launched, from a Height of Six Feet (Réparation en quatre semaines d'un bateau en ciment armé de 500 tonnes, tombé, au lancement, d'une hauteur de 6 pieds), Ch. Lavaud. Mémoires et compte rendu des travaux de la Société des Ingénieurs Civils de France, vol. 72, nos. 4, 5 & 6, Apr.-June 1919, pp. 179-182. Rigidity of reinforced-concrete construction evidenced by fact that straight lines of vessel in question were not deformed.

BETHLEHEM. Ocean-Going Tugs Built at the Moore Plant of the Bethlehem Shipbuilding Corporation, Ltd. Int. Mar. Eng., vol. 24, no. 9, Sept. 1919, pp. 587-591, 6 figs. Tugs are 150 ft. long overall, 141 ft. 3½ in. between perpendiculars, 27 ft. 6 in. molded beam, and 16 ft. 8 in. molded depth at lowest point of sheer.

CLYDE. Development of a Clyde Shipyard. Shipbuilding & Shipping Rec., vol. 14, no. 8, Aug. 21, 1919, pp. 209-211, 3 figs. Plans involving laying-out of six building berths, four of which will be able to accommodate vessels of about 650 ft. in length, and the remaining two will be made suitable for dealing with ships over 750-ft. long.

KIEL. Second 40,000 Ton Floating Dock at the Imperial Ship Yards at Kiel (Zweites 40,000 Tonnen-Schwimmdock der Reichswerft in Kiel), B. Meyer. Sshiffbau, vol. 20, no. 17, June 11, 1919, pp. 451-458, 13 figs., partly on supp. plate. Total length of dock is 220 m. length of each pontoon 36 m; width 47 m; lifting time for maximum load 2 hours; lowering time 1 hour.

MALCOLM PNEUMATIC TOOLS. A New Adjunct to Pneumatic and Electric Hand-Tools in Shipbuilding. Shipbuilder, vol. 21, no. 108, Aug. 1919, pp. 77-78, 2 figs. Malcolm arrangement for suspension of pneumatic or other portable tools when being used on perpendicular surfaces.

MOBILE. Great Shipbuilding Plant at Mobile, Subsidiary of United States Steel Corporation. Manufacturers Rec., vol. 76, no. 10, Sept. 4, 1919, pp. 115-120, 13 figs. Noting type of town building for white and colored employees.

ROUMANIAN SHIPYARDS. The German-Roumanian Shipyards at Giurgui (Der deutsch-rumanische Werftbau Giurgui), E. Foerster. Zeitschrf. des Vereins deutscher Ingenieure, vol. 63, nos. 23 and 24, June 7 and 14, 1919, pp. 525-531 and 557-561, 39 figs. Details as to economical and technical aspects, size and design of yards; housing of workmen.

STATEN ISLAND SHIPYARD. Staten Island Shipyard Greatly Enlarged to Meet Demands for War Work. Int. Mar. Eng., vol. 24, no. 9, Sept. 1919, pp. 608-617, 17 figs. Addition to concrete ways, 400 ft. by 60 ft. to care for construction of ships of 10,000-tons displacement. Arrangement of space beneath ways for rivet storage. Pneumatic tool storage. Riggers loft and offices for foreman, quoted as unique feature.

William Gray & Co. Shipyard. The War Shipyard of Messrs. William Gray & Co. (1918), Ltd. Shipbuilder, vol. 21, no. 108, Aug. 1919, pp. 79-94, 21 figs., partly on supplement plates. It consists of four building berths, each capable of accommodating a vessel of about 440-ft. long, with necessary shops and fitting-out quay.

VARIA

Crankshaft Repairs at Sea. An Extensive Repair Job at Sea, H. W. Sebreck. Motorship, vol. 4, no. 9, Sept. 1919, p. 42, 4 figs. Temporary repair of crankshaft in single screw motorship "Lidvard" (formerly "Pangan") now belonging to Norwegian Government. Translated from Skibsbygning.

Fueling at Sea. Fueling at Sea, H. C. Dinger. U. S. Naval Inst. Proc., vol. 45, no. 199, Sept. 1919, pp. 1607-1612, 4 figs. Instructions prepared on occasion of oiling destroyers at sea. Destroyers were taken in tow abreast by collier and maintained in that position while oiling.

Navigation. Selection of Terrestrial Points of Reference in Coastal Navigation. (Sul punto rilevato), A. Iachino. Rivista Marittima, vol. 52, no. 7, July 31, 1919, pp. 7-27, 11 figs. Concerning probable error resulting from relative position of points selected and ratio of their distances to ship.

Towing Experiments. New Formula for Towing Experiments (Eine neue Formel für Schleppversuche), Bruckhoff. Schiffbau, vol. 20, no. 16, May 28, 1919, pp. 419-423. Although writer thinks that the opinion may be expressed that by the new formula EPS values are apparently too small, it is exactly the small "effective power" between the EPS calculated by this formula and the IPS which will help to solve the problem of actual efficiency of propeller.

MECHANICAL ENGINEERING

AIR MACHINERY

Air-Operated Tools. The Use of Compressed Air in Modern Industry, A. W. Swan. Can. Machy., vol. 22, no. 10, Sept. 4, 1919, pp. 253-255, 8 figs. Study on use of air operated tools in mining, contracting, foundry, shipbuilding and machine shop.

Centrifugal Compressors. Centrifugal Compressors (Das allgemeine Verhalten der Kreiselverdichter), Gustav Fluegel. Zeitschrift des Vereins deutscher Ingenieure, vol. 63, no. 20, May 17, 1919, pp. 455-460, 5 figs. Basic characteristics of centrifugal compressors both with casing that has no cooling device and with cooled casing. Also translated in Mech. Eng., vol. 41, no. 10, Oct. 1919, pp. 795-799 and p. 858, 5 figs.

Pickling Machine. Compressed Air Operated Pickling Machine. Blast Furnace & Steel Plant, vol. 7, no. 9, Sept. 1919, pp. 442-443, 3 figs. Installation of Mesta pickling machine at Consolidated Expanded Metal Company utilizes compressed air to avoid installing high pressure boilers.

Reciprocating Compressors. Development of Reciprocating Air Compressors, S. T. Nelson, Eng. & Min. Jl., vol. 108, no. 13, Sept. 27, 1919, pp. 533-536, 3 figs. Machines of small capacity were formerly not expected to be efficient; change from steam to electric drive said to have resultc in mant makesbift devices.

Wind Motor. A Six-Foot Experimental Wind Motor, C. Blazdell. Model Engr. & Elecn., vol. 41, no. 955, Aug. 14, 1919, pp. 145-151, 7 figs. Constructed hy writer with intention of utilizing power to drive small dynamos. (To be continued.)

CORROSION

Copper Corrosion. Corrosion of Copper—X, XI, XII, F. Bengough and O. F. Hudson. Metal Industry, vol. 15, nos. 7, 8 and 9, Aug. 15, 22 and 29, 1919, pp. 125-128, 144-145 and 168-170, 4 figs. Aug. 15: Influence of deposits on corrosion of condenser tubes. Aug. 22: Action of varied diluted acid solution on copper and brass. Aug. 29: Causes of condenser tube and ferrule corrosion. (From Fourth Report of Corrosion Committee of Inst. of Metals).

Iron Corrosion. Corrosion of Iron (La corrosion del hierro, Latham Clarke. Boletin de la Sociedad de Fomento Fabril, vol. 36, no. 6, June 1919, pp. 370-374. Suggestions in regard to applying paint as a protection.

Pipe Corrosion. Tests on Deoxidation of Hot Water during the Past Year, F. N. Speller. Jl. Am. Soc. Heat. & Vent. Engrs., vol. 25, no. 2, April 1919, pp. 141-144. Irene Kaufman Settlement pipe corrosion tests conducted at Pittsburg Testing Laboratory.

Selective Corrosion. Selective Corrosion (Die selektiven Korrosionen), F. V. Wurstemberger. Schweizerische Bauzeitung, vol. 74, no. 8, Aug. 23, 1919, pp. 91-94. Causes of development and means for its prevention.

FORGING

Drop Forging. Drop-Stamping, Drop-Forgings, etc.—VII, Joseph Horner. Mech. World, vol. 66, no. 1702, Aug. 15, 1919, p. 79, 10 figs. Examples of provision of gutters for reception of fin.

FOUNDRIES

Alloy Castings. Making Alloy Castings at Cramp's. Foundry, vol. 47, no. 331, Sept. 15, 1919, pp. 641-646, 10 figs. With reference to tests made of metals used and finished products in brass, bronze and alloy foundry.

Brass Foundry. The Manufacture of Brass Products. Metal Industry, vol. 15, no. 9, Aug. 29, 1919, pp. 166-167, 2 figs. Notes on development of brass industry in Great Britain.

Bronze Foundry. Bronze Foundry (La fonderie de bronze), Alex. Legrabd. Fonderie Moderne, vol. 12, no. 3, March 1919, pp. 62-65, 1 fig. Description of a crucible furnace. Suggested remedies against separation of elements in copper-tin alloys.

Castings. On Modern Casting (in Japanese), Nazaro Okajima. Jl. Soc. Mech. Engrs., Tokyo, Japan, vol. 22, no. 58, July 1919.

Notes on Casting (in Japanese), Ninshiro Hayashida. Jl. Soc. Mech. Engrs., Tokyo, Japan, vol. 22, no. 58, July 1919.

Relation between Structure and Strength of Casting (in Japanese), Kuniichi Tawara. Jl. Soc. Mech. Engrs., Tokyo, Japan, vol. 22, no. 58, July 1919.

Centrifugal Casting. Notes on Permanent Moulds and Centrifugal Castings, J. E. Hurst. Foundry Trade Jl., vol. 21, no. 12, Aug. 1919, pp. 558-562 and discussion, pp. 562-563, 4 figs. Principally how to overcome cracking and distortion of cast iron dies. Paper presented before Conference of British Foundrymen's Assn.

Condenser Castings. Making and Casting Cylindrical Condensers—II, III, Ben Shaw. Mech. World, vol. 66, no. 1702 and 1704, Aug. 15 and 29, 1919, p. 78 and 103-104, 5 figs. Aug. 15: Preparing boards so that they can be swept in sections. Aug. 29: Preparation of loam pattern for head.

Core Box. Core Box Construction—I, Joseph Horner. Foundry Trade Jl., vol. 21, no. 212, Aug. 1919, pp. 568-572, 18 figs. Illustrating various types of construction.

Crucibles. The Manufacture and Handling of Crucibles, Jonathan Bartley. Metal Indus., vol. 17, no. 9, Sept. 1919, pp. 414-416, 3 figs. Causes of their failure in metal melting practice.

Drying Chambers. Economical Utilization of Fuels in Drying Chambers of Foundry (Zur Frage der wirtschaftlichen Ausnutzung der Brennstoffe in Giessereitrocknungsanlagen), Wolfgang Mann. Giesserei-Zeitung, vol. 16, no. 7, Apr. 1, 1919, pp. 97-100, 7 figs. Drying chambers with overhead furnace; temperature curves; new drying method of molding sand. (Concluded).

Duplexing Process. New Duplexing Process is Invented, H. E. Diller. Foundry, vol. 47, no. 331, Sept. 15, 1919, pp. 662-665, 9 figs. High-carbon steel is melted in electric furnace and transferred to converter to be finished. Good grade of metal said to be obtained at low cost in this way.

Dust. How to Reduce Dust in Foundries (Die Mittel zur Verminderung des Staubes in Giessereien). Metall-Technik, vol. 45, nos. 19-20, May 17, 1919, pp. 73-74. Describes types suited for various conditions.

Electric Steel Foundry. Experiences in Elec. Steel Foundry Elec. World, vol. 74, no. 12, Sept. 20, 1919, pp. 630-634, 3 figs. Data on steel furnace performance, together with results obtained with electric core baking.

Electrically-Melted Steel Castings, John A. Holden. Foundry Trade Jl., vol. 21, no. 212, Aug. 1919, pp. 584-585. Illustrating with microphotographs coarse structure of badly annealed slowly-cooled casting, and of same steel completely annealed and cooled in current of air.

Examination of Castings. Experimental Examinations of Cast-Iron Castings (in Japanese), Kansei Ono. Jl. Soc. Mech. Engrs., Tokyo, Japan, vol. 22, no. 58, July 1919.

Foundry Management. Hoosier Foundry Seeks Difficulties, D. M. Avey. Foundry, vol. 47, no. 328, Aug. 1, 1919, pp. 505-509, 9 figs. Iron Trade Rev., vol. 65, no. 11, Sept. 11, 1919, pp. 701-705, 9 figs. How Electric Steel Co. of Indiana conducts study of processes for which casting is intended and the properties desired in part to be made before production is attempted.

A Study of Improved Methods in an Iron Foundry, C. S. Myers. Foundry Trade Jl., vol. 21, no. 212, Aug. 1919, pp. 578-580. Movement study, training and instance in which organization material, combined with specially advised system of payment are said to have effected considerable increase of output with reduced hours of work.

Improved Methods in a Foundry. Metal Industry, vol. 15, no. 9, Aug. 29. 1919, pp. 161-162. Quoting instance in which movement study, training and organization of material, combined with specially devised system of payment, it is said, effected considerable increase of output with reduced hours of work.

Production Cost and Profit Control in Non-Ferrous Foundries, Walter Glen Scott. Metal Indus., vol. 17, no. 9, Sept. 1919, pp. 417-420, 1 fig. Method for keeping in touch with cost of a product at any stage of its manufacture.

Making Foundry more Attractive, F. H. Bell. Can. Machy., vol. 22, no. 5, July 31, 1919, pp. 98-100, 7 figs. Emphasizes that better and more wholesome shop and working conditions would do much to make foundry a more attractive place in which to work.

Metal Molds. Using Metal Denseners and Molds, E. B. Brougball. Foundry, vol. 47, no. 328, Aug. 1, 1919, pp. 514-518, 7 figs. Sponginess in connecting sections between thin and thick casting parts, it is stated, may be remedied hy metal denseners properly used. Permanent metal molds are recommended. From paper presented before Birmingham branch of British Foundrymen's Assn. and Staffordshire Iron & Steel Inst.

Model Foundry. Government Builds Model Foundry. Foundry, vol. 47, no. 331, Sept. 15, 1919, pp. 651-653, 7 figs. For making gray-iron and steel castings for the Navy. Plant represents investment of $1,500,000 in building alone.

Molding Machines. Pointers on Molding Car Couplers. Foundry, vol. 47, no. 328, Aug. 1, 1919, pp. 499-504, 11 figs. How molding machines are rigged. System for handling molds.

Special Rig for Continuous Foundry. Foundry, vol. 47, no. 331, Sept. 15, 1919, pp. 654-658, 8 figs. Four machines make molds with green-sand cores for tractor transmission housings; floor space saved hy pouring as soon as molds are finished and shaking out while hot.

Molding Sand. A comparison of British and American Molding-Sand Practice, P. G. H. Boswell. Foundry Trade Jl., vol. 21, no. 212, Aug. 1919, pp. 552-556 and discussion, pp. 556-557. Including table giving advantages and disadvantages of artificial and natural bonds in molding sands. Paper presented at Conference of British Foundrymen's Assn.

Pattern Plates. Pattern Plates for the Production of Light Castings, H. Sherburn. Foundry Trade, Jl., vol. 21, no. 212, Aug. 1919, pp. 564-566 and discussion, 566-567. Advises that range of uses of boxes to he operated be kept down to lowest possible figure. Paper read before Conference of British Foundrymen's Assn.

PATTERNS. Patternmaking Methods—II. Machy. (Lond.), vol. 14, no. 380, Aug. 21, 1919, pp. 620-622, 9 figs. Typical examples of pattern work and methods used in general patternmaking practice.

Cylinder Patterns—I, Jos. A. Shelly. Machy. (N.Y.), vol. 26, no. 1, Sept. 1919, pp. 67-70, 9 figs. Methods of laying out and constructing patterns and core boxes for pump cylinders.

Making the Pattern for a Four-Bladed Propeller, J. A. McEwan. Can. Foundryman, vol. 10, no. 9, Sept. 1919, pp. 250-251, 9 figs. Illustrating manner of preceeding.

PLATE CASTING. A Plate Problem, G. C. Swift. Foundry Trade Jl., vol. 21, no. 211, July 1919, pp. 463-470, 15 figs. Casting oblong plate 37 in. long, 16½ in. wide and 1/16 in. thick. Composition of alloy was 67 parts copper, 11 parts zinc, 1¼ parts tin and ¾ part lead.

POURING DEVICE. Labor is Saved by Pouring Device. Foundry, vol. 47, no. 328, Aug. 1, 1919, pp. 519-520, 3 figs. Iron Trade Rev., vol. 65, no. 10, Sept. 4, 1919, pp 637-638, 2 figs. Device consists of cylindrical ladle mounted on trunnions in such a way that iron may be discharged through nozzles which become submerged when ladle is rotated.

SHIP CASTINGS. Castings for Ship Construction—VII and X, Ben Shaw and James Edgar. Foundry, vol. 47, no. 328 and 331, Aug. 1 and Sept. 15, 1919, pp. 523-527 and 647-650, 50 figs. Aug. 1: Laying out and building patterns for propeller brackets. Sept. 15: Methods for molding and casting large propeller brackets, together with necessary precautions as to drawbacks and shrinkage. Also in Foundry Trade Jl., vol. 21, no. 211, July 1919, pp. 471-476, 30 figs.

SHRINKAGE. Shrinkage of Castings (Du retrait des pièces à la fonte), J. Duponchelle. Fonderie Moderne, vol. 12, no. 3, March 1919, pp. 50-54, 6 figs. Table is presented giving shrinking in length, in surveys and in volume of various metals and alloys used in foundries.

THIN METAL SECTIONS. How Water Shut-Off Boxes are Made. Foundry, vol. 47, no. 328, Aug. 1, 1919, pp. 494-498, 6 figs. Rigging required by reason of thin metal sections.

TURBINE, WATER WHEEL. Molding and Casting a Turbine Water Wheel, F. H. Bell. Can. Foundryman, vol. 10, no. 9, Sept. 1919, pp. 242-243. Noting order in which different parts are placed when ramming up mold.

FUELS AND FIRING

ALCOHOL. Alcohol as Fuel. South African Eng., vol. 30, no. 7, July 1919, pp. 119-120, South Africa as a possible exporter.

BLUE WATER GAS. Blue Water Gas as a Metallurgical Fuel, A. E. Blake. Blast Furnace & Steel Plant, vol. 7, no. 9, Sept. 1919, pp. 443-444. Approximate cost of twin blue water-gas sets with daily capacity of twenty-five million cubic feet. Cost of blue water-gas vs. producer gas per million Btu.

COKE. Coke for the Annular Furnace (Nochmals Koks für den Ringofen), Dr. Loeser. Ziegelwelt, vol. 50, nos. 31-32, 33-34 and 35-36. Apr. 26, May 3 and 10, 1919, pp. 178-181, 192-194 and 205-206. Writer comes to conclusion that coke cannot be recommended as sole fuel, neither in connection with bituminous coal because this latter requires mild normal draft while coke needs strong draft.

FUEL CONSERVATION. Fuel Economy in Manufacturing Works—I, Charles F. Wade Eng. & Indus. Management, vol. 2, no. 8. Aug. 21, 1919, pp. 235-236, 1 fig. General outline of causes which contribute to inefficiency.

FUEL OIL, COAL COMPETITION. The Competition of Fuel Oil with Coal. Coal Trade Jl., vol. 50, no. 37, Sept. 10, 1919, pp. 1109-1111. Analyses of threatened competition of fuel oil with coal.

FURNACE REFUSE. Loss due to Carbon in Furnace Refuse, C. H. Berry. Power, vol. 50, no. 13, Sept. 23, 1919, pp. 500-502, 2 figs. Alignment chart for computing it.

GASEOUS FUEL. The Utilization of Gaseous Fuel in Commercial Practice, F. W. Epworth.Gas World, vol. 71, no. 1827, July 26, 1919, pp. 65-67, 7 figs. Including calculated diagrams giving percentage of total heat contained in fuel product at various temperatures. Paper presented to Soc. of British Gas Industrie.

GASIFICATION OF Coal. Gasification of Coal and Economical Utilization of Fuels (Kohlenvergasung und rationelle Ausnutzung der Brennstoffe), M. Dolch. Montanistische Rundschau, vol. 11, no. 11, June 1, 1919, pp. 327-331. Economic aspects of gasification in comgination with by-product extraction. (To be continued.)

GASOLINE-KEROSENE MIXTURES. The Flash and Burning Points of Gasoline-Kerosene Mixtures, James T. Robson and James R. Withrow. Chem. & Metallurgical Eng., vol. 21, no. 5, Sept. 1, 1919, pp 244-252, 7 figs. Effect of gasoline content on flash and burning points of kerosene; Foster closed cup and Cleveland type open cup methods compared; flash and burning points of kerosene mixed with "low-test" gasoline, "high-test" gasoline and "petroleum ether."

ILLINOIS COAL. Bureau Tests Illinois Coal, R. S. McBride and I. V. Brumbaugh. Gas. Rec., vol. 16, no. 4, Aug. 27, 1919, pp. 17-20, 3 figs. Bureau of Standards experimental tests of Orient coal to investigate influence of temperature on quality of coke produced.

KEROSENE. *See Gasoline-Kerosene Mixtures.*

KILNS. Abnormal Draft Conditions in Porcelain Kilns as the Cause of Various Defects in Burning (Anormale Zugverhältnisse bei Porzellanbrennöfen als Ursache versheidener Brennfehler), Otto Wilhelm. Sprechsaal, vol. 18, no. 16, Apr. 17, 1919, pp. 115-117. According to writer, the chemical constitution of gases is of minor importance, but special care must be taken that combustion in fire box is complete, so that products of incomplete combustion, such carbo-hydrogen, etc., do not reach the kiln and there precipitate on wares of lower temperature.

OIL FUEL FOR SHIPS. Oil Fuel for Ships. Times Eng. Supp., no. 538, Aug. 1919, p. 249. Comparison with coal.

PULVERIZED COAL. The Use of Pulverized Coal, William H. Odell. Steam, vol. 23, no. 3, Sept. 1919, pp. 63-65, 8 figs. Raymond system of pulverizing coal and air separation. (To be continued).

The Use of Pulverized Coal—III. Engineer, vol. 128, no. 3316, July 18, 1919, pp. 50-53, 15 figs. Illustrating its applications to metallurgy.

Pulverized Coal—Some National Considerations, L. C. Harvey. Engineer, vol. 128, no. 3321, Aug. 22, 1919, pp. 173-174. Writer anticipates world-wide interest for burning fuels in powder form. He advises developing further work along lines undertaken by American engineers.

Pulverized Coal in Boiler and Furnace. Iron Age, vol. 104, no. 11, Sept. 11, 1919, pp. 709-710. Comparison with producer gas as fuel for open-hearth furnaces.

FURNACE

HEAT TREATING FURNACES. Heating Furnaces and Annealing Furnaces—IX, W. Trinks. Blast Furnace & Steel Plant, vol. 7, no. 9, Sept. 1919, pp. 423-427, 7 figs. Charts for computing boiler horsepower available from waste heat of furnace.

Heat-Treatment Furnaces at the Sheffield-Simplex Motor Works, Limited. Iron & Coal Trades Rev., vol. 99, no. 2688, Sept. 5, 1919, pp. 299, 3 figs. Producers are fired with gas coke. Consumption is said to be 5 cwts. per 24 hrs. for a pair of the small or one of larger furnaces.

KILN, MULTIPLE STACK. Multiple Stack Kiln Solves Burning Problems, N. Hermes. Brick & Clay Rec., vol. 55, no. 3, July 29, 1919, pp. 214-215. 5 figs. Type recommended for burning of high-grade ware.

OIL FURNACE. Economy in Industrial Fuel Oil Furnaces, Max Sklovsky. Am. Mach., vol. 51, no. 11, Sept. 11, 1919, pp. 495-500, 13 figs. Results of experiments undertaken to determine best method of obtaining high furnace efficiencies.

GAGES

CERTIFICATION OF GAGES. Certification of Gages at Bureau of Standards, H. L. Van Keuren. Mech. Eng., vol. 41, no. 10, Oct. 1919, pp. 800-802, 2 figs. Outline of more important pieces of apparatus used for gage inspection.

GAGE LIMITS. Gage Limits in Interchangeable Manufacture, E. C. Peck. Mech. Eng., vol. 41, no. 10, Oct. 1919, pp. 803-805 and 858. Writer discusses merits of English and metric systems and suggests that 10 inch meter would be a most desirable unit; he also gives explanation of terms allowance and tolerance and outlines method for using gages in strict interchangeable quantity production.

GAS ENGINEERING

BRITISH GAS PLANTS. Financial Status of British Gas Undertakings, Norton H. Humphrys. Gas Age, vol. 44, no. 6, Sept. 15, 1919, pp. 238-239. Price for gas; profits and restrictions are discussed.

GAS AS FUEL. Gas as a Substitute for Petro and Petroleum Products. Jl. Roy. Soc. Arts, vol. 67, no. 3484, Aug. 29, 1919, pp. 639-641. Report of Inter-Departmental Committee appointed by British Government to study possibilities of employment of gas in substitution for gasoline and petroleum products as source of power, especially in motor vehicles.

GASOMETERS. Study of the Large Gasometers (Etude des grands gazomètres), L. Schaffner. Mémoires et compte rendu des travaux de la Société des Ingénieurs Civils de France, vol. 72, nos. 4, 5 and 6, April-June, 1919, pp. 238-277, 24 figs. Design, formulae and calculations.

MANUFACTURING COSTS. Cheaper Gas, R. O. Wynne-Roberts. Gas Industry, vol. 19, no. 9, Sept. 1919, pp. 239-240. Recommending experiments and investigation to the end of discovering cheaper method of manufacture.

OVENS. Kalamazoo Gas Oven Plant, Walter V. Turner. Gas Rec., vol. 16, no. 4, Aug. 27, 1919, pp. 11-14, 7 figs. Mechanical equipment in installation of 15 horizontal slot ovens.

POWER PLANTS, GAS WORKS. Gas-Works Power Plants, H. C. Widlake. Gas Jl., vol. 147, no. 2934. Aug. 5, 1919, pp. 286-287. Concerning advisability of carrying out alterations which involve scrapping of an existing power motor of an electric motor.

PURIFICATION. "The Backward Rotation" System of Purification, Gas. Jl., vol. 147, no. 2933, Aug. 12, 1919, pp. 339-342, 1 fig. Ammonia losses in direct process of sulphate making.

SAFETY LAMPS. Height of Gas in Safety Lamp, C. M. Young. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1207-1211, 2 figs. Experiments to correlate change of temperature of source of ignition with change of height of cap produced.

STAFFORD GAS WORKS. The Stafford Gas Works equipped for New Demands. Gas. Jl., vol. 147, nos. 2936 and 2937, Aug. 19 and 26, 1919, pp. 387-389 and 443-445, 10 figs. Large scheme effecting change in plant and processes. Among new features are vertical retort-house, MacLaurin centrifugal washers, neutral process ammonia plant, gas holder and tank holding one million cubic feet.

STANDARDS. Cheaper Gas by Revising Present Standards. Contract Rec., vol. 33, no. 37, Sept. 10, 1919, pp. 859-860. Use of lignite fuels and relaxation from present high calorific value recommended as means for decreasing cost of production.

HANDLING OF MATERIALS

ASH HANDLING EQUIPMENT. Mechanical Sand and Ash Handling Plant of the Austrian State Railroad at Worgl (Die mechanische Besandüngs-und Ascheabfuhranlage im Heizhause Worgl der d.-o. Staatshahnen). Zeitschr. des oesterr. Ingenieur-u. Architekten-Vereines, vol. 71, no. 17, Apr. 25, 1919, pp. 159-161, 9 figs. Locomotive shed is also equipped with electrically-operated coal loading device.

Chute, Spiral. Speed up Production by Systematic Handling, J. H. Moore, Can. Machy., vol. 22, no. 10, Sept. 4, 1919, pp. 250-252, 5 figs. Illustrating operation of spiral chute between floors.

Coal Handling. Transport and Handling of Coal—II, John H. Anderson. Tran. Inst. Marine Engrs., vol. 31, no. 244, July 1919, pp. 131-218 and discussion pp. 218-219, 89 figs. Methods employed in Great Britain for handling of coal in bulk.

Handling Machinery Application. Machinery to Help Solve the Problem of High Wages, Labor Shortage and Shorter Hours Demand, Zenas W. Carter. Manufacturers Rec., vol. 76, no. 11, Sept. 11, 1919, pp. 103-106, 6 figs. Illustrating material-handling machinery.

Jeffery Equipment. Transferring Your Produce Efficiently, J. H. Moore. Can. Machy., vol. 22, no. 11, Sept. 11, 1919, pp. 277-278, 5 figs. Illustrating uses of Jeffery equipment.

Shop Transportation. Shop Transportation, J. H. Moore. Can. Machy., vol. 22, no. 5, July 31, 1919, pp. 122-131, 24 figs. Handling of materials as one of chief factors in efficient shop operation.

Small Shop. The Handling of Material in the Small Shop. Can. Machy., vol. 22, no. 5, July 31, 1919, pp. 110-111, 2 figs. It is said that solution to handling problem is often very simple matter if thought out seriously.

HEAT TREATING

Case Hardening. Practical Talks on Casehardening, Theodore G. Selleck. Jl. Am. Steel Treaters Soc., vol. 1, no. 10, Sept. 1919, pp. 325-335, 7 figs. Including suggested rules for heat treatment.

High-Speed Steel. American Practice for Hardening High Speed Steel. Proc. Steel Treating Research Soc., vol. 2, no. 6, 1919, pp. 34-36 and (discussion), pp. 36-42 and 45. Methods of treating alloys which conform to generally accepted views relative to composition giving maximum cutting efficiency.

High Speed Steel—Its Metallography and Heat-Treatment, G. J. Horvitz. Jl. Am. Steel Treaters Soc., vol. 1, no. 10, Sept. 1919, pp. 342-348, 13 figs. Illustrating with photomicrograph microstructure of metal at various stages in heat-treatment process.

Rail Material. Heat Treatment as Applied to Railway Materials, C. B. Bronson. Jl. Am. Steel Treaters Soc., vol. 1, no. 10, Sept. 1919, pp. 336-341. Sound steel seem as fundamental basis for successful heat treatment. Process for heat treatment of rail steel of air-cooling method described.

HEATING AND VENTILATION

Battleship. Report of Committee to Co-operate with U. S. Navy Dept.—1. Jl. Am. Soc. Heat. & Vent. Engrs., vol. 25, no. 3, July 1919, pp. 301-322, 4 figs. Investigations in regard to heating, ventilating and humidifying battleships and submarines.

Heating Installations. Heating and Ventilating Systems at the U.S. Government's Smokeless Powder Plant at Nitro, W. Va., G. W. Hubbard. Jl. Am. Soc. Heat. & Vent. Engrs., vol. 25, no. 3, July 1919, pp. 287-293. Steam for manufacturing processes and for heating buildings throughout manufacturing department taken directly from high pressure mains run above ground in wooden bents.

Plumbing Regulations. Recent Amendments to the New York City Plumbing Regulations Discussed, Albert L. Webster. Am. Architect, vol. 116, no. 2281, Sept. 10, 1919, pp. 361-365, 4 figs. Amendments permit restricted use of approved anti-siphon traps. Writer discusses relative merits of vented bend trap and anti-siphon trap.

Radiation, Computations. Standard Rules for Computing Required Radiation. Power Plant Eng., vol. 23, no. 18, Sept. 15, 1919, pp. 822-824. Jl. Am. Soc. Heat. & Vent. Engrs., vol. 25, no. 3, July 1919, pp. 323-328. Standard formulae adopted for computing steam and hot water radiation by Nat. District Heating Assn.

Remodeling a Heating System. Re-Modeling a Heating System, Helen R. Innis. Jl. Am. Soc. Heat. & Vent. Engrs., vol. 25, no. 3, July 1919, pp. 281-285, 1 fig. Detials of all conditions changes made and resultant improvements in plant of Brooklyn Standard Union, daily newspaper.

School Rooms. Heating and Ventilating the Standard School House, J. D. Cassell. Jl. Am. Soc. Heat. & Vent. Engrs., vol. 25, no. 3, July 1919, pp. 261-266. Features of various systems. Writer advocates use of synthetic air chart for determining percentage of perfect ventilation, as originated by Dr. E. Vernon Hill, Chief of Ventilating Division of Chicago Dept. of Health.

Sprinkler System for Hot-Water Heating. Utilization of Automatic Sprinkler System for Hot-Water Heating, A. W. Moulder. Jl. Am. Soc. Heat. & Vent. Engrs., vol. 25, no. 3, July 1919, pp. 273-280, 9 figs. Sketch showing typical combination installation.

Steam Heating. A Discussion of Steam Heating, James A. Donnelly. Steam, vol. 23, no. 3, Sept. 1919, pp. 66-69, 2 figs. Establishment of standard methods of proportioning direct radiation and standard sizes of steam and return mains. (To be continued.)

Ventilation. A Comparative Study of Natural and Mechanical Ventilation for School Rooms, F. Gardner Legg & W. F. Walker. Jl. Am. Soc. Heat. & Vent. Engrs., vol. 25, no. 3, July 1919, pp. 243-252, 8 figs. Investigations of Sanitary Bureau of Detroit Dept. of Health. Object was to determine what qualities must be present in class rooms so that physical well-being, comfort and mental alacrity of pupils may be at as high a standard as possible.

Classroom Ventilation, Konrad Meier. Jl. Am. Soc. Heat. & Vent. Engrs., vol. 25, no. 3, July 1919, pp. 253-261. Discussion of data presented in Bul. no. 68, Reprint Series, Dept. of Health of City of New York.

HOISTING AND CONVEYING

Belt Conveyors. Belt Loading and Carrying System at Cement Mill Quarry, W. A. Scott. Belting, vol. 15, no. 5, Sept. 5, 1919, pp. 15-17, 5 figs. Inclined conveyors with combined capacity of 240 tons of material per hour.

Possibilities of Steel Belt Conveyor. Iron & Coal Trades Rev., vol. 99, no. 2687, Aug. 29, 1919, pp. 261, 3 figs. As competitor with rubber and fabric belts.

Bin Elevators. Special Features in Some Eastern Sand and Gravel Plants. Rock Products, vol. 22, no. 18, Aug. 30, 1919, pp. 18-20, 5 figs. Bin elevators avoid use of elevated bins; pan conveyor takes place of standard belt; skip hoists.

Conveyors, Gravity. The Economical Employment of Gravity Conveyors, J. Edward Schipper. Automotive Industries, vol. 41, no. 10, Sept. 4, 1919, pp. 467-472, 7 figs. Economy of system claimed because it is said not to involve further expense or worry after being installed.

Cranes. The Use of the Crane in Modern Industry, J. H. Moore. Can. Machy., vol. 22, no. 9, Aug. 28, 1919, pp. 217-220, 5 figs. Illustrating its advantage in speeding up work.

A New 250-Ton Hammerhead Crane. Shipbuilder, vol. 21, no. 108, Aug. 1919, pp. 64-67, 2 figs. Constructed in connection with building of Vaterland. It differs from existing cranes in that jib carrying load is adjustable vertically through a certain angle to permit lowering loads on to deck of vessel. From Zeitschrift des Vereines deutscher Ingenieure.

French Firm Constructs Reinforced Concrete Crane. Contract Rec., vol. 33, no. 35, Aug. 27, 1919, pp. 818-819, 1 fig. Crane has capacity of 6600 lb. and span of 32.8 ft. Rolling gear is removable and so attached that it can be adjusted to take care of any warping of crane. Translated from Génie Civil.

Semi-Portable Dock Cranes at Boston Army Base Wharf. Eng. News-Rec., vol. 83, no. 11, Sept. 11, 1919, pp. 516-517, 2 figs. Four hoists with 4-ton maximum capacity travel on tracks outside of wharf shed and load vessels in dock.

Electric Hoisting Machinery. Development of Electric Hoisting Machinery (Die Entwicklung des elektrischen Fordemaschinen-Antriebs). Schweizerische Bauzeitung, vol. 74, no. 8, Aug. 23, 1919, pp. 95-97, 8 figs. Diagrams of machines with various types of drums.

Handling Coal and Ashes with Electric Hoists, James Monroe. Power Plant Eng., vol. 23, no. 18, Sept. 15, 1919, pp. 801-804, 9 figs. Illustrating types of systems and apparatus used in medium-size plants.

Hoisting Rigs. Removing and Replacing Ceiling Motor Armatures, T. H. Fenner. Power House, vol. 12, no. 12, Aug. 5, 1919, pp. 347-348, 3 figs. Heavy rigging designed to handle heavy armatures with minimum of labor and time.

Skip Hoists. Induction Motor Drive for Skip Hoists, F. R. Burt. Elec. Jl., vol. 16, no. 9, Sept. 1919. pp. 381-382, 4 figs. Scheme showing relative positions of equipment and manner in which material is handled; also graphic records of load and speed with buckets empty and when hoisting full bucket.

Winding Drum. Bi-Conical Winding Drum at a Belgian Colliery, A. Bertiaux. Colliery Guardian, vol. 118, no. 3060, Aug. 22, 1919, p. 490, 3 figs. Driven by double-cylinder horizontal engine with cranks set at 90 deg. Translated from Annales des Mines de Belgique.

HYDRAULIC MACHINERY

Discharge Coefficients of Poncelet Outlets. Experimental Determination of Discharge Coefficients of Poncelet-Outlets for Water and Sodium Chloride Brine and Discussion of their Relationship (Die experimentelle Bestimmung der Ausflusskoeffizienten von Poncelet-Oeffnungen für Wasser und Kochsalzsole und Erorterung des inneren Zusammenhanges der Koefficienten), Adolf Schneider. Forschungsarbeiten auf dem Gebiete des Ingenieurwesens, no. 213, 1919, 66 pp., 48 figs. Description of apparatus; measurements; test results; coefficients are given for different heights, temperatures and concentrations.

Gate Closure, Pressure Rise. Pressure Rise Caused by Gradual Gate Closure, Norman R. Gibson. Can. Engr., vol. 37, no. 11, Sept. 11, 1919, pp. 295-299, 7 figs. Derivation of formulae which include friction. (Concluded.)

Generator, 32,500-Kvs. A 32,000-Kvs. Waterwheel Generator, R. B. Williamson. Elec. World, vol. 74, no. 9, Aug. 30, 1919, pp. 456-458, 4 figs. One of three units under way for Niagara Falls. Generator and wheel casing are rigidly connected. Weight, 300 tons.

Governors for Water Turbines. Sewer Universal Governor for High-head Hydraulic Pelton Turbines. (Le régulateur universel système Seewer pour turbines hydrauliques à haute chute, Pelton), A. Strickler. Bulletin Technique de la Suisse Romande, vol. 45, no. 17, Aug. 23, 1919, pp. 169-171, 3 figs. Regulation effected by changing form of jet by means of movable guiding elements within admission nozzle.

Hydroelectric Station, Small. Rebuilding of a Small Hydroelectric Station. Elec. World, vol. 74, no. 9, Aug. 30, 1919, pp. 462-464, 6 figs. Twice as much output obtained from same amount of stream flow when hydroelectric station is rebuilt after washout. Cost per horsepower is about $80.

McClure Hydro-Electric Plant. The McClure Hydro-Electric Plant. Eng. & Min. Jl., vol. 108, no. 11, Sept. 13, 1919, pp. 457-460, 4 figs. Water flows through 13,600 ft. of 7-ft. pipe under 420-ft. head.

Water Hammer. Water Hammer in Conduits under Pressure (Note sur le Calcul de coup de belier dans les conduites sous pression), Ed. Carey. Bulletin Technique de la Suisse Romande, vol. 45, no. 17, Aug. 23, 1919, pp. 174-175, 1 fig. Applications of Michand-Gariel formula. (Continuation of serial).

INTERNAL COMBUSTION ENGINES

Air-Cooling. Air-Cooling for Automobiles. Autocar, vol. 43, no. 1244, Aug. 23, 1919, pp. 271-272, 6 figs. Some details of cylinder design in relation to causes and prevention of overheating troubles.

AKROYD CYCLE ENGINES. Akroyd Engine Cycles, Herbert Akroyd Stuart. Gas Engine, vol. 21, no. 9, Sept. 1919, pp. 275-281, 16 figs. Concerning origin of pure air compression with automatic ignition in crude oil engines. Writer offers arguments in substantiation of his contention that the term "semi-Diesel" is a misnomer.

BENZOL. The Use of Benzol and Benzol Mixtures as Motor Fuel, I. C. Mackie. Can. Chemical Jl., vol. 3, no. 9, Sept. 1919, pp. 295-297. Results of analytical work undertaken to determine effect of various settings of carburetor needle valve and also effect of surrounding temperature both by gasoline and benzol products.

CARBURETORS. Mathematical Study of the Operation of Constant-Level Spray Carburetors (Etude Mathématique de fonctionnement des carburateurs à giclage et à niveau constant). Génie Civil, vol. 75, no. 7, Aug. 16, 1919, pp. 148-152, 5 figs. Conditions for their automatic operation. (Concluded.)
The New Sthenos Carburetor. Autocar, vol. 43, no. 1234, Aug. 16, 1919, pp. 249-250, 6 figs. Based on principle of flowmeter, instrument is designed to regulate delivery of gasoline to give correct mixture at any running speed.
The Asmo Carburetor. Autocar, vol. 43, no. 1244, Aug. 23, 1919, pp. 280, I fig. Instrument creates automatically its own vacuum feed.

DIESEL ENGINES. Official Report on First Shipping Board Diesel Engine. Motorship, vol. 4, no. 9, Sept. 1919, pp. 34-35, 1 fig. Thirty-day non-stop full-power test of McIntosh and Seymour 750-b.hp. marine engine.
Winton Diesel Oil Engine. Power, vol. 50, no. 12, Sept. 16, 1919, pp. 453-455, 5 figs. Details of type built for stationary service for district connection to generators, pumps, etc.
Practical Operation of Marine Diesel Engines, K. Carlsen. Motorship, vol 4, no. 9, Sept. 1919, pp. 40-41, 2 figs. Method of starting engine.
Control of Diesel Engines, David Bruce. Motorship, vol. 4, no. 10, Oct. 1919, pp. 32-36, 13 figs. Particulars of various maneuvering mechanisms.
The Diesel Engine in the Southwest, B. V. E. Nordberg. Eng. & Min. Jl., vol. 108, no. 12, Sept. 20, 1919, pp. 497-500, 3 figs. Economy of power secured from this source compared with that from steam.
Diesel Engines in Mine Power-Plants, C. Legrand. Min. & Sci. Press, vol. 119, no. 11, Sept. 13, 1919, pp. 369-372 2 figs. Reports that two vertical two-cycle engines, each with five cylinders and rated at 1250 b.hp. at sea-level have given satisfactory service at mines situated at elevation of 5950 ft. above sea level.
Some Notes on the Vickers Diesel Engine. Engineer, vol. 128, no. 3322, Aug. 29, 1919, pp. 198-200, 3 figs. Engines dealt with were made in great hurry to meet urgent national requirements during war.
The White Diesel Heavy Oil Engine. Shipbuilding & Shipping Rec., vol. 14, no. 10, Sept. 4, 1919. pp. 263-265, 3 figs. Details of construction and results of tests.

DOXFORD OIL ENGINE. The Doxford Oil Engine. Engineer, vol. 128, no. 3316, July 18, 1919, pp. 64-65, 1 fig. How principle of engine has been transformed to make engine a hot-bulb engine instead of Diesel.

FUEL MIXTURES. The possibilities of New Fuel Mixtures for Internal-Combustion Engines, E. Humboldt. Power, vol. 50, no. 11, Sept. 9, 1919, pp. 418-420. Concerning production of cheap and cleaner substitute for gasoline by mixing with engine distillate a small amount of ether and alcohol.
See also Benzol.

FUTURE OF INTERNAL COMBUSTION MOTOR. The Future of the Internal Combustion Motor (De toekomst der verbrandings-motoren), F. A. Smit Kleine. Ingenieur, vol. 34, no. 33, Aug. 16, 1919, pp. 605-607. With special reference to Professor Meyer's article on this subject published in Ingenieur, no. 17, April 26, 1919.

HEAVY DUTY ENGINE. A Heavy Duty Engine for Tractors and Trucks. Automotive Industries, vol. 41, no. 12, Sept. 18, 1919, pp. 576-577, 4 figs. Valve rods are enclosed and other features of design are introduced to make engine dustproof.

HEAVY OIL ENGINES. Official Test Report De La Vergne Heavy-Oil Marine Engine. Motorship, vol. 4, no. 10, Oct. 1919, pp. 26-27, 6 figs. Consumption of lubricating oil, heat balance and temperature in crank case in 14-day test. (Concluded.)

HOT-PLATE ENGINES. *See Kromhout Engines.*

KROMHOUT ENGINE. A Dutch Marine Oil-Engine Motorship, vol. 4, no. 10, Oct. 1919, pp. 40-41, 5 figs. Kromhout hot-plate ignition two-cycle type engine.

MOTOR CAR ENGINES. Motor-Car Engines. Times Eng. Supp., no. 538, Aug. 1919, p. 253. Claimed advantages for air-cooled type.
Constitutional Defect in Four-Cylinder Engine and Remedy, Laurence H. Pomeroy. Automotive Industries, vol. 41, no. 12, Sept. 18, 1919, pp. 556-558, 6 figs. Discussion of American and European practices in building of motor car engines.

PRODUCER GAS ENGINE. The Gorham Producer Gas Engine. Pac. Mar. Rev., vol. 16, no. 9, Sept. 1919, pp. 149-152, 4 figs. Arranged for running in either direction, reversal being accomplished by use of compressed air furnished by compressor mounted on and forming part of engine.

TURBINE, SANDERS. The Sanders Pressure Turbine. Autocar, vol. 43, no. 1245, Aug. 30, 1919, pp. 317-320, 9 figs. Model of a new form of petrol engine without reciprocating parts, capable of running at 4000 r.p.m. and receiving 40,000 power impulses per minute.

VALVES, EXHAUST, PITTING. What Causes Pitting of Exhaust Valves? Automotive Industries, vol. 41, no. 10, Sept. 4, 1919, pp. 476-477. From investigation undertaken in connection with development of Rolls-Royce aircraft engines. Translated from La Technique Automobile et Aerienne.

LUBRICATION

Lubrication Principles, Robert June. Brick & Clay Rec., vol. 55, no. 7, Sept. 23, 1919, pp. 588-591, 2 figs. Writer contends that through a knowledge of how to save power, power plant operator may save, many times over each year, cost of lubricants; he also considers accurate knowledge of lubricants and lubrication as vitally important.

BALL BEARINGS. The Lubrication of Ball-Bearings, H. R. Trotter. Mech. Eng., vol. 41, no. 10, Oct. 1919, pp. 811-815, 5 figs. Instrument designed by writer for obtaining data regarding lubricants consists of revolving element driven by small motor and stationary element similar to block used in a Mitchell or Kingsbury bearing with suitable means of obtaining readings of inclination angle of block to revolving element.

CUTTING LUBRICANTS. Cutting Lubricants for Machine Tools, Reginald Trautschold. Machy. (N.Y.), vol. 26, no. 1, Sept. 1919, pp. 45-47. Table indicating suggested uses of lard oil compounds, soda water and soluble oils for different machining operations and metals.

MACHINE ELEMENTS AND DESIGN

BEARINGS, MARINE THRUST. Marine Thrust Bearings. Motorship, vol. 4, no. 10, Oct. 1919, pp. 28-30, 6 figs. Phenomena of film lubrication in pivoted-segments type. Paper read before Instn. Naval Architects.

BEARING, MICHELL JOURNAL. The Michell Journal Bearing. Engineer, vol. 128, no. 3322, Aug. 29, 1919, pp. 202-204, 10 figs. Adaptation of principle of bearing which has been employed for thrust blocks of marine engines of more than 10,000,000 hp. to journal bearings.

BEARINGS, ROLLER. Roller Bearing Types and Applications—II. Raw Material, vol. 1, no. 6, Aug. 1919, pp. 304-308, 16 figs. Construction features of principal makes.

CAMS. Cam Design and Construction, Franklin de R. Furman. Am. Mach., vol. 51 no. 12, Sept. 18, 1919, pp. 569-574, 10 figs. Miscellaneous types, minimum sizes and non-interference. (Continuation of serial.)

GEARS, RAWHIDE. The Strength of Rawhide Gears. Machy. (Lond.), vol. 14, no. 358, Aug. 7, 1919, pp. 559-560, 1 fig. Chart empirically devised and said to give same results as Lewis formula with correction for speed introduced by Carl G. Barth.

GEARS, REDUCTION. A War Time Lesson on Reduction Gears. Automotive Industries, vol. 41, no. 11, Sept. 11, 1919, pp. 516-522, 15 figs. From investigations conducted at McCook Field, Dayton, Ohio, it is shown that in considering special gearing, such as propeller reductions, usual limitations of standard pitches and angles of obliquity can be departed from to advantage.
Gearing as Applied to the Marine Steam Turbine. John Houston. Steamship, vol. 31, no. 363, Sept. 1919, pp. 65-67. Note on designing and installing helical spur wheel reduction gear. Paper read before Inst. of Marine Engrs.

SHAFTING. Theory and Practice in Shafting, Robert S. Lewis. Belting, vol. 15, no. 5, Sept. 5, 1919, pp. 27-31, 4 figs. Development formula for calculating weight.

SPECIAL MACHINE DESIGN. Principles of Special Machine Design. Machy. (Lond.), vol. 14, no. 360, Aug. 21, 1919, pp. 616-617. Analysis of Functions of special machines and important points to be observed in their design.

MACHINE SHOP

DRIVES. Converting Machines to Individual Drive. Elec. World, vol. 74, no 12, Sept. 20, 1919, pp. 637-640, 2 figs. Manner in which motors and control were made integral part of old belt-driven machines in plant where central-station service was installed.
Machine Tool Drives: Motors and Controllers, H. W. Tice. Jl. Engrs. Club Philadelphia, vol. 36, no. 171, Feb. 1919, pp. 47-51, 5 figs. Relative merits of a. c. and d. c. motors for planer drives; d. c. performance curves; a. c. performance curves.

ELECTRIC DRIVE. Electrically-Operated Machine Tools, E. Austin. Eng. & Indus. Management, vol. 2, no. 10, Sept. 4, 1919, pp. 292-293, 2 figs. Their advantages.

See also Drives.

FITTING SHOP PRACTICE. Machine and Fitting Shop Practice, Fred Horner. Mech. World, vol. 66, no. 1703, Aug. 22, 1919, p. 86, 3 figs. Chucks in which separate pads or segments are set in place to form gripping jaws. (Continuation of serial.)

FOUNDATIONS, MACHINERY. Making Templets for Machinery Foundations, Bruce Page. Power House, vol. 12, no. 12, Aug. 5, 1919, pp. 325-329, 14 figs. Says that templet drawings should be made for all except the simplest foundations and that drawings should be furnished the man who is to build the templet.

LATHE OPERATIONS. Machining Operations on Cast Iron Cylinders, Richard Vosbrink. Metal Trades, vol. 10, no. 9, Sept. 1919, pp. 406-408, 3 figs. Including diagrammatic sketch of lathe operations.

MILLING. Production Milling on Automatic Machines—I. Edward K. Hammond. Machy. (N.Y.), vol. 26, no. 1, Sept. 1919, pp. 48-55, 14 figs. Describing practice in milling of duplicate parts.

MONEL METAL. Working Monel Metal, Hugh R. Williams. Am. Mach., vol. 51, no. 11, Sept. 11, 1919, pp. 509-511, 3 figs. Curves showing influence of temperature on tensile strength and on torsional strength of metal rods.

OPTICAL METHODS OF COMPARISON. Some Optical Aids for the Engineer—I, Arthur C. Banfield. Machy. (Lond.), vol. 14, no. 360, Aug. 21, 1919, pp. 613-615, 9 figs. Points out advantages in adopting optical methods for comparison and for other purposes.

SHAFT STRAIGHTENING. Straightening Shaft of 45,000-Kw. Turbine, E. E. Cloek. Power, vol. 50, no. 10, Sept. 2, 1919, pp. 377-378, 1 fig. Shaft was straightened by heat-treatment method.

TAYLOR'S "CUTTING METALS." Supplement to Frederic W. Taylor's "On the Art of Cutting Metals"—I, Carl G. Barth. Indus. Management, vol. 58, no. 3, Sept. 1919, pp. 169-175, 1 fig. Reviews historical study of work and outlines engineering subjects that are to be treated in subsequent installments.

Thread Milling. Milling Threads, W. G. Dunkley. Machy. (Lond.), vol. 14, no. 360, Aug. 21, 1919, pp. 631-634, 7 figs. Determination of true form of thread on inclined section.

MACHINERY, METAL WORKING

Boring Machine. Horizontal Boring Machine. Engineer, vol. 128, no. 3320, Aug. 15, 1919, pp. 162-163, 2 figs. Special feature noted is controlling gear which is said to permit manipulation of machine in such a way that operator can have complete control without moving from one position.

Dividing Attachment. Dividing Attachment for 3½-in. and 4-in. Drummond Lathe, C. Young. Model Engr. & Elecn., vol. 41, no. 953, July 31, 1919, pp. 104-107, 8 figs. Attachment fits on lathe mandrel in place of gear used for screw cutting, fork engaging with one of studs in extra quadrant and used for carrying intermediate gears.

Edging Rolls. Using Edging Rolls in Brakdown Emergency, W. S. Standiford. Can. Machy., vol. 22, no. 11, Sept. 11, 1919, pp. 271-273, 2 figs. Illustrating set of edging rolls for edging small flat bars on guide mill.

Lathes. Le Blond Multi-Cut Semi-Automatic Lathes. Am. Mach., vol. 51, no. 12, Sept. 18, 1919, pp. 545-550, 10 figs. Specially valuable feature is said to be multiple use of simple lathe tools for more or less complicated jobs of facing or turning.

Sliding-Head Drop-Rail Lathe. Iron Age, vol. 104, no. 11, Sept. 11, 1919, pp. 720-722, 4 figs. Designed to give extra capacity without employing more than one spindle.

Lathe Tailstock. The Design and Construction of a 4½-in. Lathe Tailstock, G. Gentry. Model Engr. & Elecn., vol. 31, nos. 952 and 953, July 24 and 31, 1919, pp. 76-79 and 111-114, 6 figs. July 24: Scale working drawings. July 31: Machining of spindle. (Concluded.)

Planers. Heavy Machine Equipment at Panama, R. D. Gatewood. Am. Mach., vol. 51, no. 10, Sept. 4, 1919, pp. 463-465, 4 figs.Notably planing machine which handles works 96 in. high by 132 in. wide by 24 ft. long.

Saw, Metal. Vertical Metal Saw. Engineer, vol. 128, no. 3320, Aug. 15, 1919, p. 162, 4 figs. Of heavy and powerful construction, outstanding feature being angular disposition of saw frame and high speed.

MACHINERY, SPECIAL

Breaker, Coal. Rebuilding the Loree Breaker, W. S. Hutchinson. Coal Age, vol. 16, no. 9, Aug. 28, 1919, pp. 352-354, 6 figs. How coal breaker having capacity of 6000 tons per day was erected in 130 days.

Dredges. Floating Dredge at Western Indiana Gravel Plant, Terre Haute, Ind. Rock Products, vol. 22, no. 17, Aug. 16, 1919, pp. 20-22, 8 figs. Used to remove gravel to depth of 40 ft. below water level.

Grinding Machine. Designing a Special Machine, F. E. Johnson. Machy. (N.Y.), vol. 26, no. 1, Sept. 1919, pp. 56-59, 6 figs. Illustrating method of procedure by reference to developing special duplex grinding machine as example.

Lathe and Drill Textures. Quantity Production by the American Coin Register Company. Metal Trades, vol. 10, no. 9, Sept. 1919, pp. 398-400, 9 figs. Lathe and drill fixtures used.

Milling Machine Attachment. Some Labor-Saving Devices that have been developed in the Moore Shops. Metal Trades, vol. 10, no. 9, Sept. 1919, pp. 394-396, 8 figs. Such as attachment for LeBlond milling machine, which is used in making 5⅝-in. cut around corners oil-tight hatch-frame.

Mine Cars. The Quantity Manufacture of Mine Cars. Metal Trades, vol. 10, no. 9, Sept. 1919, pp. 403-404, 4 figs. Special tools developed for manufacturing Matteson car.

Scales. Tapered-Floor Track Scales, Canadian Pacific Railway. Ry. Rev., vol. 65, no. 10, Sept. 6, 1919, pp. 336-338, 7 figs. Rails are elevated and floor sloped to shed water crosswise.

Screen, Mitchell Vibrating. Description of the Mitchell Vibrating Screen. Sale Lake Min. Rev., vol. 21, no. 11, Sept. 15, 1919, pp. 28-30, 4 figs. Screen cloth is agitated at rate of 3600 vibrations a minute and strikes material with an ampact of from 500 to 1000 lb. The motor-actuated vibration is applied continuously to screening area by means of rigid arms or plates, fastened to ends of vibrator casing below.

Trench Machinery. Trench Machinery, A. E. Collins, Surveyor, vol. 56, no. 1435, July 25, 1919, pp. 55-59, 6 figs. Directs attention to machinery applicable to sewer and such-like trenches.

MATERIALS OF CONSTRUCTION AND TESTING OF MATERIALS

The Testing of Materials, Walter Rosenbain. Automotive Industries, vol. 41, no. 11, Sept. 11, 1919, pp. 508-510. Writer, who is connected with Nat. Physical Laboratory in Teddington, England, makes plea for simple tests of materials and for statement of results in definite, certain and understandable terms.

Anchor, Cast Steel. Investigation of the Failure of a Cast-Steel Anchor. Iron Age, vol. 104, no. 12, Sept. 18, 1919, pp. 773-774, 4 figs. How hard interior sections were caused by use of charcoal on the riser in a German foundry. From Stahl und Eisen.

Fatigue. The Fatigue of Nickel and Iron Wires when Subjected to the Influence of Transverse Alternating Fields, William Brown. Scientific Proc. Roy. Dublin Soc., vol. 15, no. 17, Jan. 1917, pp. 163-170, 3 figs. Including also experiments on subsidence of torsional oscillations in wire carrying electric current.

Impact Machines. Experimental Data Obtained on Charpy Impact Machine, F. C. Langenberg. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1471-1499, 21 figs. Results of experiments said to have indicated that material with lower elastic limit, lower tensile strength, slightly higher ductility and lower Brinell hardness has much higher shock strength, as determined by Charpy notched-bar specimen, either tensile or transverse.

Magnetic Field. The Twist and Magnetization of a Steel Tube in a Spiral Magnetic Field, F. E. Hackett. Scientific Proc. Roy. Dublin Soc., vol. 15, no. 33, Oct. 1919, pp. 415-430, 4 figs. Observations on the Wiedemann effect in steel tube in which twist was produced by combination of circular and longitudinal fields, are said to have given a spiral field whose axis coincided with axis of tube. Twist is said to have varied as sine of twice pitch-angle, this verifying Knott's formula.

See also Young's Modulus, Fatigue.

Mahogany. Mahogany, and the Recognition of Some of the Different Kinds of Their Microscopic Characteristics, Henry H. Dixon. Scientific Proc. Roy. Dublin Soc., vol. 15, no. 34, Dec. 1918, pp. 431-486, 138 figs. on 23 supplement plates. Examination covered 40 species of trees which yield mahogany.

Metal Washing. New Processes of Mechanical Testing of Metals (Nouveaux procédés d'essais mécaniques des métaux), Charles Frémont. Comptes Rendus des Séances de l'Académie des Sciences, vol. 169, no. 5, Aug. 4, 1919, pp. 228-231, 5 figs. Tension, compression and impact portable testing machines.

Notched Bar Tests. Impact Tests of Notched Bars (Sur les essais de flexion par choc de barreaux entaillés), A. Cornu-Thenard. Comptes Rendus des Séances de l'Académie des Sciences, vol. 169, no. 6, Aug. 11, 1919, pp. 272-275. It is concluded from tests that it is advisable to give notch (1) sufficiently small diameter, maximum recommended being 2 mm. for a 10×10 mm. bar, and (2) sufficiently large depth, one-half depth of bar being suggested as advisable practice.

See also Impact Machines.

Sheets, Galvanized Steel. Galvanized Steel Sheets. Iron & Coal Trades Rev., vol. 99, no. 2688, Sept. 5, 1919, pp. 289-290, 7 figs. Object of investigation was to study from a physical, chemical, microscopic and mechanical point of view the composition and finish of steel sheets and practice connected with their manufacture.

Steel. Practical Notes on Physical Tests of Steel—I, Austin B. Wilson. Blast Furnace & Steel Plant, vol. 7, no. 9, Sept. 1919, pp. 435-437 and p. 447, 1 fig. Details of testing and testing machines for making tensile and compression tests.

Tile, Drain, Shale. An Investigation of Tests of Iowa Shale Drain Tile, W. J. Schlinck. Iowa State College of Agriculture & Mech. Arts, Bul. 49, Eng. Experiment Station, vol. 16, no. 43, Mar. 27. 1919, pp. 5-55, 16 figs. Scope of investigations covered studies of methods and results of making sodium sulphate tests of pieces from tested drain tile as accelerated tests of resistance to freezing and thawing methods and results of making artificial freezing and thawing tests, effects of natural freezings and thawings upon whole tile; rate of absorption and necessary time of immersion in making absorption tests by immersion.

Tubes, Boiler, Testing. The Commercial Testing of Railway Materials, T. H. Sanders. Mech. World, vol. 66, no. 1703, Aug. 22, 1919, pp. 92-93. Testing of tubes for locomotive boilers. (Concluded.) Paper read before Junior Inst. of Engrs.

Young's Modulus. The Change in Young's Modulus of Nickel with Magnetic Fields, William Brown. Scientific Proc. Roy. Dublin Soc., vol. 15, no. 20, April 1917, pp. 185-192. Results obtained with longitudinal alternating fields and with transverse fields, direct and alternating, and also with longitudinal direct fields, with comparison of their effects on the same wire.

MECHANICAL PROCESSES

Drill Chuck Manufacture. Manufacturing a Drill Chuck, Fred. R. Daniels. Mach. (Lond.), vol. 14, no. 358, Aug. 7, 1919, pp. 553-557, 11 figs. Methods and fixtures developed in manufacture of "Ettco" drill chuck made by Eastern Tube & Tool Co., Brooklyn, N.Y.

Interchangeable Manufacture. Machine Design in Interchangeable Manufacturing Practice, Earle Buckingham. Machy. (N.Y.), vol. 26, no. 1, Sept. 1919, pp. 8-11, 1 fig. Function of machine design in promoting economical manufacture on interchangeable basis.

Locks. The Cylinder Lock—I, Ellsworth Sheldon. Am. Mach., vol. 51, no. 10, Sept. 4, 1919, 3 figs. Features of construction.

Painting and Upholstery. Finishing Bodies for Automobiles, C. A. Marston. Indus. Management, vol. 58, no. 3, Sept. 1919, pp. 207-211, 10 figs. Organizing operations of painting and upholstering.

Roller Chain Manufacture. Making Roller Chain—I. Machy. (Lond.), vol. 14, no. 361, Aug. 28, 1919, pp. 645-649, 8 figs. Special machines and fixtures developed in America for making sprocket chain.

Rolling Mills. Atlas Crucible Steel Increases Capacity for Making and Rolling High Grade Steels, H. Donald Dickinson. Blast Furnace & Steel Plant, vol. 7, no. 9, Sept. 1919, pp. 438-441, 5 figs. Three crucible melting furnaces and two Hercult electric furnaces used for melting steel.

New Structural Mill at Kiushu Steel Works Japanese Increase Steel Production. Blast Furnace & Steel Plant, vol. 7, no. 9, Sept. 1919, pp. 420-422, 4 figs. Rolling mill plant which is to consist of 84-in. plate mill, 35-in. blooming mill and 24-in. structural mill.

Erects Fabricating Shop in South. Iron Trade Rev., vol. 65, no. 10, Sept. 4, 1919, pp. 632-634, 5 figs. Plant containing blooming, bar and structural mills.

Sprocket Chain Manufacture. Making Diamond Sprocket Chain—II, Edward K. Hammond. Machy. (N.Y.), vol. 26, no. 1, Sept. 1919, pp. 25-28, 11 figs. Steps in process of assembling. (Concluded).

Upholstery. *See Painting and Upholstery.*

MECHANICS

CAMS. Technical Study of Mechanisms Operated by Cams (Etude rationnelle des méchanismes commandés par cames), Octave Lepersonne. Revue Universelle des Mines de la Métallurgie, vol. 2, no. 1, Mar.-Apr. 1919, pp. 433-500, 10 figs. Criticism of Prof. Hartmann's theory as presented in issues of Sept. 30 and Oct. 7, 1905, of Zeitschrift des Verein Deutscher Ingenieure; construction of profile necessary to assure permanent contact between parts of mechanism, with special reference to requirements for operation of balance in internal combustion engines (To be continued.)

DEFLECTION OF BEAMS AND RIGID FRAMES. Deflection of Continuous Beams and Rigid Frames, F. E. Richart. Eng. News-Rec., vol. 83, no. 12, Sept. 18, 1919, pp. 564-565, 3 figs. Formulae for computing maximum deflection in case of symmetrical loading and its application value in case of unsymmetrical loading.

ENGINE COLUMS DESIGN. The Design of Engine Columns—II, W. K. Wilson. Mech. World, vol. 66, no. 1704, Aug. 29, 1919, p. 102, 3 figs. Side-thrust curves for case of oil engine. (Continuation of serial).

MOMENTS, COMBINED BENDING AND TWISTING. Combined Bending and Twisting Moments, Victor M. Summa. Machy. (N.Y.), vol. 26, no. 1, Sept. 1919, pp. 41-42, 5 figs. Application of Rankine's formula to types of levers or cranks which are keyed or otherwise attached to shafts.

STRESSES, MATERIAL, EQUATIONS. The Equations for Material Stresses, and their formal solution, R. F. Gwyther. Lond., Edinburgh & Dublin Phil. Mag., vol. 38, no. 224, Aug. 1919, pp. 235-240. Equations based on "Doctrine of Material Stresses" contained in June Phil. Mag., vol. 35, p. 490, 1918, and the solution of these equations in Cartesian co-ordinates.

STRUTS. On the Stability of Long Struts of Variable Section, Akimasa Ono. Memoirs of the Coll. of Eng., Kyushu Imp. University, Fukuoka, Japan, vol. 1, no. 5, 1919, pp. 395-406, 4 figs. Formula for critical load developed from assumption that moment of inertia varies as n-th power of distance of section from free end.

MEASUREMENTS AND MEASURING APPARATUS

BALLS FOR GAGE CHECKING. Use of Balls in Measuring, G. C. Haneman. Machy. (Lond.), vol. 14, no. 358, Aug. 7, 1919, pp. 561-562, 2 figs. Illustrating methods of using finished balls for checking gage measurements.

CONDUCTIVITY OF METALS, THERMAL. An Apparatus for Determining the Thermal Conductivity of Metals, Gordon B. Wilkes. Chem. & Metallurgical Eng., vol. 21, no. 5, Sept. 1, 1919, pp. 241-243. 1 fig. Consists essentially of a heater, guard-ring, two continuous flow calorimeters, and three thermocouples used in measuring temperature of different parts of specimen.

DYNAMOMETERS. Calculating Power Requirements for Small Machinery. Machy. (Lond.), vol. 14, no. 361, Aug. 28, 1919, pp. 662-663, 2 figs. Suggested form of indirect-reading dynamometer.

GAGES. *See Measurements and Measuring Apparatus. (Balls for Gage Checking.)*

HEAT METER. A New Compensated Heatmeter, Charles P. Frey. Chem. Engr., vol. 27, no. 9, Sept. 1919, pp. 215-218, 6 figs. Effect of line and thermo-couple resistance eliminated by means of simple operation. Developed at Bureau of Standards.

A New Compensated Heatmeter, Charles P. Frey. Chem. & Metallurgical Eng., vol. 21, no. 5, Sept. 1, 1919, pp. 259-261, 7 figs. Fundamental principle of Harrison-Foote invention.

HYDROMETERS. Calculation of Hydrometer Degrees, Gravities and Weights with the Slide Rule, Wallace Savage. Chem. & Metallurgical Eng., vol. 21, no. 6, Sept. 15, 1919, pp. 395-397, 2 figs. Formulae reduced to convenient expressions capable of direct calculation by means of slide rule.

INDICATORS. Using Indicator on Internal Combustion Engines, Ralph Miller. Power, vol. 50, no. 11, Sept. 9, 1919, pp. 422-423, 2 figs. Cards taken from 23 x 24-in. four-stroke-cycle oil engines running at 150 r.p.m.

MANOMETER, KNUDSEN'S VACUUM. A Form of Knudsen's Vacuum Manometer, Lewis F. Richardson. Phys. Soc. of London, vol. 31, no. 5, Aug. 15, 1919, pp. 270-277, 2 figs. Instrument as originally devised by Knudsen could only be kept in operation for a few minutes at a time; in form described apparatus can be maintained indefinitely and its range extends up to 2.0 dynes per sq. cm. Force of molecular bombardment is balanced by effect of magnetic field of special form, acting upon electric current attached to vane and temperature difference is measured by thermo-junction e.m.f. of which is balanced against same current in potentiometer.

PYROMETERS. Teaching Pyrometry, O. L. Kowalke. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1425-1427. Suggests introducing exercise that will bring out limitations and sources of error in pyrometer employed.

Optical and Radiation Pyrometry, Paul D. Foote and C. O. Fairchild. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1389-1455, 16 figs. General theory, diagrammatic sketches of various types used both in optical pyrometry and in radiation pyrometry, method of using each, and advantages and disadvantages of radiation pyrometry.

Industrial Applications of Disappearing-filament Optical Pyrometer, F. E. Bash. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1285-1299, 6 figs. In steel, non-ferrous, and glass industries.

Thermo-Electric Pyrometer for Metallurgical Purposes. Metal Industry, vol. 15, no. 9, Aug. 29, 1919, pp. 171 and 173, 2 figs. Indicating methods of maintaining cold junction at constant temperature.

Resistance Thermometry for Industrial Use, Charles P. Frey. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1437-1441, 2 figs. Construction and operation of commercial resistance thermometer.

Tin: An Ideal Pyrometric Substance, E. F. Northrup. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1443-1444. Particularly because of increase of given volume in resistivity with increase in temperature and decrease of given volume in density with increase in temperature.

Thermo-couple Installation in Annealing Kilns for Ootical Glass, E. D. Williamson and H. S. Roberts. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1445-1453, 3 figs. Essential features of system of temperature control evolved at plant at Pittsburgh Plate Glass Co.

Pyrometer Shortcomings in Glass-house Practice, W. M. Clark and Charles D. Spencer. Bul. Am. Inst. Min. & Metallurgical Engrs.. no. 152, Aug. 1919, pp. 1455-1458. Due, it is claimed, to lack of standardization of utilitarian type.

MICROSCOPES. Some Optical Aids for the Engineer—II, Arthur C. Banfield. Machy. (Lond.), vol. 41, no. 361, Aug. 28, 1919, pp. 650-652, 9 figs. Feature of high-grade measuring microscope built by Messrs. Adam Hilger, Ltd. Instrument is of lead-screw type, accuracy of reading being dependent entirely on accuracy of screw, the construction of which is said to make it in all respects the precision screw.

PHOTOMETERS. Computation of Precision Photometer Scales, Gordon Thompson. Tran. Illum. Eng. Soc., vol. 14, no. 6, Aug. 30, 1919, pp. 286-294, 2 figs. Method given consists in computing with logarithms sufficient manor divisions to serve as guiding points and then filling in intermediate points with aid of curves of tangents. Fundamental equation of scale is $I = K/D$ 2 where I is intensity of illumination, D is distance, and K constant.

PRESSURE AND TEMPERATURE SCALES. Absolute Scales of Pressure and Temperature, F. J. W. Whipple. Phys. Soc. of London, vol. 31, no. 5, Aug. 15, 1919, pp. 237-241, 1 fig. Urges general use of new scales of pressure and temperature which have been adopted by meteorologists. In pressure scale fundamental unit is the bar (pressure due to million dynes per sq. c.m.); temperature scale is pseudo-absolute scale, obtained by adding 273 deg. to centigrade scale.

PYRHELIOMETER. Some Characteristics of the Marvin Pyrheliometer, Paul D. Foote. Bul. Bur. of Standards, vol. 14, no. 4, July 12, 1919, pp. 605-635, 8 figs. Calibrating both by usual electrical method and by a radiometric method. In latter method known quantity of radiation from black body was allowed to fall upon pyrheliometer receiver in same manner as when employed for solar measurements.

Pyrometry and Steel Manufacture, A. H. Miller. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1501-1510. Method considered as best adapted for measuring bath temperatue is that of sighting optical pyrometer either on surface of spoonful of metal drawn from furnace or stream poured from spoon. In forge practice best method of measuring temperature is considered to be that of optical pyrometer directly on article to be forged while it is in its heating furnace.

Basis and Methods of Pyrometry (Grundlagen and Methoden der Pyrometrie), F. Henning. Physikalische Zeitschrift, vol 20, no. 2, Jan. 15, 1919, pp. 34-47, 4 figs. Theoretical bases; instruments and methods of measuring.

Temperature Indicating and Controlling Systems—III, Franklin D. Jones. Machy. (N.Y.), vol. 26, no. 1, Sept. 1919, pp. 12-17, 9 figs. Location and protection of thermo-couples; Prevention of errors in pyrometer readings; apparatus for determining hardening temperatures. (Concluded.)

SCALES. Trustworthiness of the Balance over Long Periods of Time, George Dean. Jl. Chem. Soc., vol. 115-116, no. 671, July 1919, pp. 826-828. Variation of 1.6 milligrams detected and attributed to gradual shifting of central knife edge.

SPEED INDICATORS. Electric Speed Indicators. Victor H. Todd. Power, vol. 50, no. 11, Sept. 9, 1919, pp. 421-422, 6 figs. Principle of operations, construction of features, method of gearing and application.

See also Tachometers.

The Waltham Speedometer. Autocar, vol. 43, no. 1245, Aug. 30, 1919, p. 333, 4 figs. New Instrument for which greater accuracy is claimed and which is operated by air pressure.

SPHEROMETER. A Spherometer of Precision, J. Guild. Sci. Am. Supp., vol. 88, no. 2281, Sept. 20, 1919, pp. 184-185, 3 figs. Designed with a view to obtain greater accuracy in determination of exact point of contact of micrometer leg with surface of lens or flat under examination than is usually obtained with spherometers of existing patterns. Paper read before Optical Soc.

TACHOMETERS. The Van Sicklen Chronometric Tachometer, Frank J. Feely. Aviation, vol. 7, no. 3, Sept. 1, 1919, pp. 137-138, 5 figs. Instrument has dial uniformly graduated from zero to 2500 r.p.m. for complete rotation of pointer, and, like other similar chronometric tachometers, its calibration is controlled by time of its watch unit.

See also Speed Indicators.

TEMPERATURE SCALES. *See Pressure and Temperature Scales.*

THERMOCOUPLES. *See Pyrometers.*

THERMOMETERS. *See also Pyrometers.*

VARIANCE OF MEASURING INSTRUMENTS. Variance of Measuring Instruments and Its Relation to Accuracy and Sensitivity, Frederick J. Schlink. Bul. Bur. of Standards, vol. 14, no. 4, July 12, 1919, pp. 741-764, 7 figs. With reference to calibration curves of typical instruments, which are presented to show character of hysteresis loops and nature and amount of various errors as actually determined.

VISIBILITY MEASUREMENT. The Low Visibility Phase of Protective Coloration, Lloyd A. Jones. Jl. Franklin Inst., vol. 188, no. 3, Sept. 1919, pp. 363-387, 7 figs. Theory upon which measurement and specification of visibility is based; description of instrument to measure visibility. (To be concluded.)

MOTOR CAR ENGINEERING

AXLES. Three Designs of LM Double Reduction Truck Axle. Automotive Industries, vol. 41, no. 10, Sept. 4, 1919, pp. 462-465, 10 figs. One recommended particularly for light work up to and including one and a half tons capacity; other two designs to be made in sizes of two to five tons.

Unusual Types of Axles on the German War Trucks—V, Arthur J. Slade. Automotive Industries, vol. 41, no. 10, Sept. 4, 1919, pp. 457-461, 17 figs. Front axles about equally divided between Elliot and reverse Elliot type. No roller bearings are used. From observations made of trucks handed over to A.E.F.

Accessibility and Sturdiness Feature New Line of Axles. Automotive Industries, vol. 41, no. 12, Sept. 18, 1919, pp. 559-561, 4 figs. Noting features which are said to have been adapted from lessons of the war.

Berliet. The Berliet Three Tonner. Motor Traction, vol. 29, no. 755, Aug. 20, 1919, pp. 157-158, 6 figs. Lower part of crankcase base chamber made detachable. Engine has bore of 110 mm., stroke of 140 mm., capacity of 1330 c.c. per cylinder, and is designed for speeds not exceeding 1250 to 1500 r.p.m.; it is rated at 22-hp.

Buses. London's New Motor Buses. Motor Traction, vol. 29, no. 756, Aug. 27, 1919, pp. 182-183, 6 figs. Designed with a view to reduce weight, in order to comply with police regulations, though carrying twelve additional passengers.

Clement-Bayard. The New 8 hp. Clement-Bayard. Autocar, vol. 43, no. 1244, Aug. 23, 1919, pp. 287-288, 9 figs. French light car having side by side valve engine, three speeds and electric lighting.

Connecting Rods. Connecting-Rods for Motor Trucks and Passenger Cars, Fred H. Colvin. Am. Mach., vol. 51, no. 10, Sept. 4, 1919, pp. 467-470, 10 figs. Methods of machine noting especially how concentration of machines eliminates handling of material and fixtures which reduce loss of cutting time

Dawson. The 11.9 h.p. Dawson. Autocar, vol. 43, no. 1245, Aug. 30, 1919, pp. 321-324, 10 figs. Fitted with high-efficiency engine, having special type of valve gear. Engine is of 4-cyl. overhead-valve type.

Garages. Practical Suggestions for the Construction, Equipment and Running of Automobile Garages (Praktische Vorschläge für den Bau, die Einrichtung und den Betrieb von Automobil-Garagen), Albert Neuburger. Automobil-Rundschau, vol. 18, nos. 7-8, Apr. 1919, pp. 60-70. Heating, illumination and ventilation. (To be continued.)

Impact on Road. Motor-Truck Impact on Roads Five Times Dead Load. Eng. News-Rec., vol. 83, no. 12, Sept. 18, 1919, pp. 573-575, 3 figs. Experiment of Bureau of Public Roads said to indicate that force is dependent on speed, power and condition of truck.

Impact Tests of Truck. Effect of Impact of Trucks, E. B. Smith and J. T. Pauls. Mun. Jl. & Public Works, vol. 47, no. 11, Sept. 13, 1919, pp. 162-164, 3 figs. Tests being made by Bur. of Public Roads indicate that there is general tendency of increased impact with higher speeds although relation between speed and impact is not constant; also general increase of impact with increase of height of drop.

Plows. Tractor Ploughing Machine of Unique Design, J. H. Rogers. Can. Mchy., vol. 21, no. 11, Sept. 18, 1919, pp. 293-296, 9 figs. Particular advantage claimed is that a plurality of ploughs can be carried by tractor, entire mechanism of machine being operated by tractor motor located on front end of framework.

Springing Device. A New Springing Device, W. Gorden Aston. Autocar, vol. 43, no. 1234, Aug. 16, 1919, pp. 244-245, 1 fig. Shocks met through variable leverage toggles, by coil springs.

Springs, Auxiliary. Supplemental Springs for Metal Tired German Trucks, Arthur J. Slade. Automotive Industries, vol. 41, no. 9, Aug. 28, 1919, pp. 409-412, 14 figs. Made necessary on account of substitution of steel for rubber tires.

Starters. Electrical Auxiliary Devices for Starting Systems, Fred J. Hoffman. Automotive Industries, vol. 41, no. 12, Sept. 18, 1919, pp. 568-570, 4 figs. Outlines of various types of cutout switches.

Three-Wheel Cars. A Car on Three Wheels. Autocar, vol. 43, no. 1244, Aug. 23, 1919, pp. 289-290, 3 figs. Specifications: 10-hp., 4-cyl. engine; two-speed epicyclic gear; quarter-elliptic front, semi-elliptic rear springs.

Tractors. Automotive Manufacturers Developing French Tractors, W. F. Bradley. Automotive Industries, vol. 41, no. 11, Sept. 11, 1919, pp. 526-529, 5 figs. Influence of war tank design in new tractors developed recently for France.

Wheels. Wheels for Power Vehicles (Das Kraftwagenrad), K. Bilau. Automobil-Rundschau, vol. 18, no. 7-8, Apr. 1919, pp. 71-74, 3 figs. Strength, light weight, resistance to various temperatures, some of their requirements.

PIPE

Wood-Stave Pipe. Kipawa Co's Pulp Mill and Power Development. Can. Engr., vol. 37, no. 12, Sept. 18, 1919, pp. 305-310, 16 figs. Noting details of wood-stave power pipe line 8 ft. in diameter.

Diagram for Computing Band Spacing for Wood-Stave Pipe Willis T. Batcheller. Eng. News-Rec., vol. 83, no. 10, Sept. 4, 1919, p. 472, 1 fig. For pipe 1 to 20 ft. in diameter, under heads of from 10 to 200 ft. and for band diameters of ⅜ to 1¼ in.

POWER GENERATION

Chesapeake and Ohio Power Plant. Chesapeake and Ohio Power Plant, C. L. Humphreys. Nat. Engr., vol. 23, no. 9, Sept. 1919, pp. 423-425, 3 figs. Plant supplies steam, air and electric power for general repair shops employing about 2500 men.

Electrification. The Energy Component in Industry. Elec. World, vol. 74, no. 12, Sept. 20, 1919, pp. 650-652, 9 figs. An analysis of extent to which power enters into manufacturing in United States. Electrification of industry is paralleled by lower unit energy costs and increased absorption of power.

France. Hydro-electric Energy in France, C. W. A. Veditz. Elec. Rev., vol. 75, no. 11, Sept. 13, 1919, pp. 438-439. How America can co-operate in hydro-electric development of France.

New Proposed Law for Controlling Development of Hydraulic Energy in France. (Le nouveau projet de loi sur les forces hydrauliques). Industrie Electrique, vol. 28, no. 652, Aug. 25, 1919, pp. 302-310. Administrative organization. (Concluded.)

Gas Works Power Plant. Gas Works Power Plants, H. C. Widlake. Gas. Jl., vol. 147, no. 2935, Aug. 12, 1919, pp. 336-338, 3 figs. Economical aspect of substituting steam engine for electric motor in gas works.

Government Ownership. Government Ownership of Water Powers and Electrochemical Industry, F. A. J. FitzGerald. Gen. Meeting Am. Electrochem. Soc., Paper no. 24, Sept. 23-26, 1919, pp. 305-317 and (discussion) pp. 317-328. Arguments advanced by advocates of government ownership are judged to be a priori and not based on actual experience. Examples of governmental activities in fields which can be undertaken by private enterprise are considered as offering evidence strongly against public ownership in such cases.

Hydraulic Steam Plants. *See Steam Hydraulic Plants.*

Interconnecting Systems. Developing Hydro-electric Power Sites. Power Plant Engr., vol. 23, no. 18, Sept. 15, 1919, pp. 806-808, 2 figs. Advantages of interconnecting system.s

Steam Hydraulic Plants. Combined Utilization of Steam Central Stations and Hydraulic Power Houses for the Distribution of Energy (L'emploi combiné des stations centrales à vapeur et des usines hydrauliques pour la distribution de l'énergie), E. de Marchena. Mémoires et compte rendu des travaux de la Société des Ingénieurs Civils de France, vol. 72, nos. 4, 5 & 6, Apr.-June 1919, pp. 278-311, 9 figs. Analysis of conditions existing in both types of central stations leads to conclusion that economical distribution of energy can best be effected by suitable combination of these two types.

United States. Growing Demand for Industrial Power, L. W. Alwyn-Schmidt. Power Plant Eng., vol. 23, no. 17, Sept. 1, 1919, pp. 774-776, 2 figs. Statistical gathered in U. S. and their economical significance.

Power Systems of the North Central States, Chester H. Jones. Chem. & Metallurgical Eng., vol. 21, no. 6, Sept. 15, 1919, pp. 342-347, 9 figs. Statistics of present development and estimated figures of possible utilization.

POWER PLANTS

Boiler Rooms. Boiler Room Economy in Small Plants, M. B. Watson. Elec. News, vol. 28, no. 17, Sept. 1, 1919, pp. 27-28. Suggestions in regard to making systematic records. (To be concluded.)

Coal and Wood Furnaces Under Stirling Boilers. Power, vol. 50, no. 11, Sept. 9, 1919, pp. 414-417, 5 figs. Boiler plant where, it is said, $25,000 saving in coal per year is effected.

Boilers, Deterioration. Causes of Deterioration in Water Tube Boilers in Turbine Operation and Its Prevention (Die Ursachen der Zerstörungen an Wasserrohrkesseln im Turbinenbetrieb und die zu ergreifenden Gegenmassnahmen), Siegmon. Zeitschr. ds. Vereins deutscher Ingenieure, vol. 63, nos. 22 & 23, May 31, and and June 7, 1919, pp. 504-510 and 534-539, 12 figs. Causes said to be found in feed water, methods of operation and details of construction. (Concluded.)

Coal Handling. Equipment for Handling Coal and Ashes in Power Plants, Robert June. Elec. Rev., vol. 75, no. 12, Sept. 20, 1919, pp. 481-483, 3 figs. Influence of methods upon plant operation; classification of mechanical methods of handling coal and ashes; power calculations.

Condenser Tubes. Life of Brass Condenser Tubes, Guy D. Bengough and O. F. Hudson. Sci. Am. Supp., vol. 88, no. 2274, Aug. 2, 1919, pp. 75-77, Results of study of actions of certain metals in distilled and sea water, and possible protective measures. Summary of report to Inst. of Metals.

Edgewater Power House. Edgewater Power House in Operation. Power Plant Eng., vol. 23, no. 17, Sept. 1, 1919, pp. 753-760, 11 figs. Source of energy supply for North Central Ohio. Coal and water handling systems and method of reclaiming heat losses described as interesting installation features.

Engineers. Education of Power Plant Engineer, Edward H. Keauney. Nat. Engr., vol. 23, no. 9, Sept. 1919, pp. 426-430. Business methods as factor in power plant engineering. Value of intercourse with other engineers.

Erie Lighting Co. New Power Plant for Erie Lighting Co., Messrs. Day and Zimmermann. Am. Architect, vol. 116, no. 2282, Sept. 17, 1919, pp. 389-397, 18 figs. Structural framework is of steel. Turbine room has clear height of 40 ft. to lower chords of roof trusses, with crane rail located 31 ft. above floor level. Floor arches are of reinforced stone concrete.

Steam Exhaust, Utilization. Conservation of Coal by Saving Exhaust Steam in the Textile Industries, William B. Hoyt. Jl. Am. Soc. Heat & Vent. Engrs., vol. 25, no. 2, Apr. 1919, pp. 119-122. Recommendations for affecting conservation in felt mills, woolen mills and knitting mills.

Feed Water. How to Increase Boiler-Room Efficiency, D. S. Jacobus. Eng. & Contracting, vol. 52, no. 11, Sept. 10, 1919, pp. 306-307. Concerning law of efficiency due to impure feed water and bonusses for operating crews. Paper read before Am. Boiler Manufacturers' Assn.

Firing. Saving Coal in Power Plants. Universal Engr., vol. 29, no. 6, June 1919, pp. 32-37, 1 fig. Chief losses in boiler plant operation are said to be (1) dirty boiler, (2) leaky setting, (3) poor firing.

Oil Burners. Influence of Load on Pressures of Oil and Atomizing Steam in Oil Burners, C. R. Weymouth. Jl. Electricity, vol. 43, no. 5, Sept. 1, 1919, pp. 218-220, 7 figs. Charts showing results of test data in relationship of oil and steam pressures, which results in greatest boiler efficiency.

Records. Boiler-and Engine-Room Record Sheets, P. R. Duffey. Power, vol. 50, no. 12, Sept. 16, 1919, pp. 461-463, 3 figs. Illustrating various forms which are said to have been found serviceable in actual operation.

Stacks. Experiments on Stack Performance, Julian C. Smallwood. Power, vol. 50, no. 12, Sept. 16, 1919, pp. 464-467, 2 figs. Comparison of experimentally-determined temperatures, velocities and pressures with values assumed and results calculated in design.

STAND-BY OPERATION. Converting a Steam Plant to Stand-by Operation, L. M. Klauber. Power Plant Eng., vol. 23, no. 18, Sept. 15, 1919, pp. 815-817, 2 figs. Enumeration of problems encountered following tie-in with transmission service. From paper read before Pac. Coast Section, Nat. Elec. Light Assn.

SUPERHEATED STEAM. Industrial Uses of Superheated Steam, Alexander Bradley. Jl. Am. Soc. Heat. & Vent. Engrs., vol. 25, no. 2, Apr. 1919, pp. 123-132, 6 figs. Including results of comparative tests conducted by Engineering Dept. of Standard Oil Co., on oil pumping engines with saturated and superheated steam.

VACUUM. Vacuum—II, Roger Taylor. Power Plant Eng., vol. 23, no. 18, Sept. 15, 1919, pp. 809-812, 6 figs. Advantages of low pressure; controlling conditions.

PRODUCER GAS

AMMONIA IN PRODUCER GAS. Ammonia in Producer Gas, F. K. Ovitz. Chem. & Metallurgical Eng., vol. 21, no. 5, Sept. 1, 1919, pp. 253-255. Tests made at factory of Hazel-Atlas Glass Co., Washington, Pa., to determine amount of ammonia in gas from producers of Smith type.

SMITH PRODUCER PLANT. Producer Gas Traction. Gas and Oil Power, vol. 14, no. 168, Sept. 4, 1919, pp. 178-180, 5 figs. Description of the Smith Producer Plant.

PUMPS

CONTROL. Automatic Pump Control, B. N. Everett. Power, vol. 50, no. 13, Sept. 23, 1919, pp. 496-499, 14 figs. Illustrating arrangements of automatic pump-control apparatus for motor and belt driven power pumps of both plunger and centrifugal types.

QUARRY Service. Pumps in Quarry Service—I. Stone. vol. 40, no. 7, July 1919, pp. 311-313. General requirements in American Quarries.

TURBINE PUMP, ELECTRIC. Economical Pumping by New Application of Electric Turbine Pump, H. Hughes. Iron & Coal Trades Rev., vol. 99, no. 2685, Aug. 15, 1919, pp. 210-211, 4 figs. Installation at Nantgarw Colliery which is 860 yards deep, for pumping 10,000 gallons of water per hour.

VACUUM PUMPS. A Volumetric Efficiency Test of a Vacuum Pump, George S. Tayman. Mech. Eng., vol. 41, no. 10, Oct. 1919, pp. 823-824. Pump tested was Laidlaw-Dunn-Gordon Duplex dry vacuum pump, size 18 in. by 12 in., when operating under different intake and discharge pressures.

WEIR, TURBO-FEED PUMP. The Weir Turbo-Feed Pump. Iron & Coal Trades Rev., vol. 99, no. 2685, Aug. 15, 1919, p. 203, 4 figs. Of impulse type with one pressure and several velocity stages.

REFRACTORIES

HAYDITE. Prominent Clay Men Organize to Make New Building Material. Brick & Clay. Rec., vol. 55, no. 6, Sept. 9, 1919, pp. 484-487, 2 figs. Historical account of development and outline of physical properties of "Haydite."

REFRIGERATION

BOYLE CURVE. *See Refrigerating Machinery.*

CODE, REFRIGERATING. Proposed Refrigerating Code. Power Plant Eng., vol. 23, no. 18, Sept. 15, 1919, pp. 825-827, 2 figs. As outlined for municipal and State regulations for refrigeration machines and plants. Approved by Council of Am. Soc. Refrig. Engrs.

DEHYDRATION. Dehydration in Absorption Machines, John E. Starr. Refrig., World, vol. 54, no. 9, Sept. 1919, pp. 11-12. Suggests keeping gas between the dehydrator and condenser at temperature 8° or 10° above temperature corresponding to pressure actually existing in condenser.

FOOD STORAGE. Cold Storage of Food—I and II, Ingrar Jorgensen and Walter Stiles. Sci. Am. Supp.. vol. 88, nos. 2279 and 2281, Sept. 6 and 20, 1919, pp. 150-151 and 178 and 192. Sept. 6: Technical considerations involved in developing appropriate types. Sept. 20: Concerning physical changes in meat preserved by cold storage. (From Science Progress, London.)

ICE-MAKING. Ice-Making in Florida. Southern Engr., vol. 32, no. 1, Sept. 1919, pp. 51-53, 5 figs. Main units consist of two 60-ton vertical Frick ammonia compressors, each driven by 15 x 28 x 28-in. tandem-compound Corliss engine.

PACKING HOUSES. Refrigerating Troubles in a Packing House Plant, J. C. Moran. Power, vol. 50, no. 12, Sept. 16. 1919, pp. 459-461, 2 figs. Remedying troubles due to inadequate cooling coil surface.

REFRIGERATING MACHINES. The Compression Refrigerating Machine, Gardner T. Voorhees. Ice & Refrigeration, vol. 57, no. 3, Sept. 1919, pp. 93-95, 1 fig. Construction and significance of Boyle curve. (Continuation of serial.)

See also Testing.

REFRIGERATING PLANTS. Getting a Refrigerating Plant Out of a Critical Situation, J. C. Moran. Power, vol. 50, no. 11, Sept. 9, 1919, pp. 429-430, 1 fig. Additional capacity secured by connecting individual branches to each of three ammonia compressors from top of main line instead of bottom.

TESTING. Rules for Testing Compresssion Refrigerating Plants (Regeln für Leistungsversuche an Kompressions-Kühlanlagen), Karl Fehrmann. Zeitschrift für die gesamte Kalte-Industrie, vol. 26. no. 4, Apr. 1919, pp. 25-28. Testing efficiency of evaporator; power consumption of condenser; water consumption of liquifier; power consumption of pumps, agitator, etc.

STANDARDS AND STANDARDIZATION

ECONOMIES. Industrial Viewpoint on Standardization, E. E. George. Elec. World, vol. 74, no. 12, Sept. 20, 1919, pp. 635-636. Instances emphasizing economies resulting from fixing standards.

ENGINEERING STANDARDS COMMITTEE. Engineering Standards Committee Proposes New Constitution. Eng. News-Rec., vol. 83, no. 12, Sept. 18, 1919, pp. 575-576. New draft provides for taking in other societies on equal basis and association plan for outside financing dropped.

GLASSWARE LABORATORY. Report of the Committee on the Standardization of Laboratory Glassware. Jl. Soc. Chem. Indus., vol. 38, no. 15, Aug. 15, 1919, pp. 280R-285R, 2 figs. Metric dimensions and capacities of accepted standards for cylindrical beakers, flasks, funnels, drying towers and graduated operators.

PYROMETER STANDARDIZATION. Metals for Pyrometer Standardization, Charles W. Waidner and George K. Burgess. Bul. Am. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1511-1512. Summary of work done by Bureau of Standards, with table giving values of freezing points and purity of standard pyrometric metals.

STANDARD DETERIORATION. Standardization, J. Fearn. Managing Engr., vol. 6, no. 4, Aug. 1919, pp. 83-86 and discussion, pp. 86-90. Necessity of conducting research work for determining standards.

STEEL STANDARDS. Foreign Steel Standards Compared to Ours—I, F. F. Macintosh. Blast Furnace & Steel Plant, vol. 7, no. 9, Sept. 1919, pp. 432-434. Although American practice is said to outstrip foreign competition in tonnage and cost, higher quality is considered as predominant characteristic of European Steel.

RESEARCH

CHEMICAL RESEARCH. Research and Application, Wm. H. Nichols. Science, vol. 50, no. 1288, Sept. 5, 1919, pp. 217-224. Illustrating by survey of chemical progress how research work has furthered scientific development. Also notes on appreciation of its importance by associations and organizations, principally Am. Federation of Labor. Paper read before Am. Chem. Soc.

UNIVERSITIES. The New Opportunity in Science, R. A. Millikan. Science, vol. 50, no. 1291, Sept. 26, 1919, pp. 285-297. Argues that universities cannot possibly fulfill their function of selecting and developing scientific men of outstanding ability unless they create within themselves the atmosphere of scientific research.

STEAM ENGINEERING

BLEEDER TURBINES. The Bleeder Turbine, Joseph Y Dahlstrand. Power Plant Eng., vol. 23, no. 17, Sept. 1, 1919, pp. 762-768, 13 figs. Its use, design and construction.

BLOWING BOILERS. An Apparatus for Surface Blowing of Boiler Water (in Japanese), T. Safto. Jl. Soc. Naval Architects, vol. 24, Apr. 1919.

BOILERS. An Improved Steam Boiler. Am. Marine Eng., vol. 14, no. 9, Sept. 1919, pp. 20-21, 3 figs. Primary object of invention is to obtain maximum steaming capacity for given area of grate surface, water passages being so arranged that proper circulation of water is insured and liberation of steam facilitated.

BOILERS, CLEANING. How Much Fuel Does a Clean Boiler Save? W. F. Schaphorst. Blast Furnace & Steel Plant, vol. 7, no. 9, Sept. 1919, pp. 456-457, 1 fig. Chart for determining fuel saved by clean boilers.

BOILER DETERIORATION. Causes of Deterioration in Water Tube Boilers in Turbine Drives and Their Prevention (Die Ursachen der Zerstörungen an Wasserrohrkesseln im Turbinenbetrieb und die zu ergreifenden Gegenmassnahmen), Siegmon. Zeitschrift des Ver. Deutsche Ingenieure, vol. 63, no. 21, May 24, 1919, pp. 473-479, 10 figs. Describes experiments with various methods of prevention and one finally adopted, viz., adding of oil to feed water.

See also Power Plants (Boiler Deterioration).

BOILER FITTINGS. Fittings for Steam Boilers—I, Edward Ingham. Colliery Guardian, vol. 118, no. 3060, Aug. 22, 1919, p. 489. Concerning arrangement of safety valves on large boilers.

BOILER PLUGS, FUSIBLE. Tin Fusible Boiler-Plug Manufacture and Testing, L. J. Gurevich and J. S. Hromatko. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1351-1360, 5 figs. From tests at Bureau of Standards, precautions to be taken in manufacture of fusible plugs are recommended, notable that pig tin should be at least 99.7 per cent pure, containing not more than 0.1 per cent lead, or 0.1 per cent zinc, which are requirements of Steamboat Inspection Service.

BOILERS, LOW-PRESSURE. Code for Testing Low Pressure Heating Boilers. Jl. Am. Soc. Heat. & Vent. Engrs., vol. 25, no. 2, Apr. 1919, pp. 212-214, and (discussion), pp. 215-218. Revision of form accepted by Soc. of Heat. & Vent. Engrs. in Jan. 1918.

Cracking of Cast-Iron Sectional Hot Water Boilers, Charles R. Honiball. Jl. Am. Soc. Heat. & Vent. Engrs., vol. 25, no. 2, Apr. 1919, pp. 133-140. Results of investigations claimed to point out that to avoid cracking it is necessary to provide for easy and equable working avoidance of air locks or steam formation, continuous circulation and avoidance of deposit.

BOILERS, SUPERHEATED-STEAM. Boiler for Compound Superheater Engines, Midland Railway. Ry. Engr., vol. 40, no. 476, Sept. 1919, pp. 186-190, 13 figs. Constructed for working pressure of 225 lb. per sq. in., but safety valves for compound engines are adjusted to blow off at 190 lb. per sq. in. Fire box is of Belpaire type with inclined grate.

BOILERS, WATER-TUBE. The Cross Drum Type Heine Water Tube Boiler. Mar. Eng. & Can. Merchant Service Guild Rev., vol. 9, no. 8, Aug. 1919, pp. 271-273, 3 figs. Particularly as fitted in ships of United States Emergency Fleet.

Powdered Coal. Burning Pulverized Coal under the Boiler, Frederick A. Scheffler and H. G. Barnhurst. Blast Furnace & Steel Plant, vol. 7, no. 9, Sept. 1919, 451-454, 2 figs. Tables showing results of tests on pulverized fuel plants and data regarding installation boilers.

See also Fuel and Firing (Powdered Coal.)

Steam Engines, Single-Acting, High-Speed. A Single-Acting High-Speed Steam Engine, E. F. Truscott. Model Engr. & Elecn., vol. 41, no. 954, Aug. 7, 1919, pp. 121-123, 9 figs. Patented design with twin cylinders having cranks at 180 deg.

Turbines. Low-Pressure Turbines in Forge Shops, H. V. Schoepflin. Power, vol. 50, no. 12, Sept. 16, 1919, pp. 450-453, 6 figs. Economy of utilizing exhaust steam from hammers instead of wasting it to atmosphere. Details of apparatus required and problems to be considered in application.

Refinements in Turbine Design, A. G. Christie. Power, vol. 50, no. 10, Sept. 2, 1919, pp. 362-364, 4 figs. Article deals with forms of throats and mouths of nozzles, polished surfaces for diaphragms and thickness of blade edges.

Steam Turbines and Gears for Marine Service. Power, vol. 50, no. 11, Sept. 9, 1919, pp. 424-426, 4 figs. Greater speed for given weight of power plant, less operating expense, greater reliability, saving in fuel and greater efficiencies claimed as principal advantage of turbine drive with reduction gear for ship propulsion.

Valves, Drop. Notes on Drop Valves for Steam Engines, H. W. Morley. Sci. Am. Supp., vol.88, no. 2280, Sept. 13, 1919, pp. 164-165, 4 figs. Results of experience with slow-speed land engines discussed in their significance to designing other types.

THERMODYNAMICS

Heat Interchangers. Heat Interchangers (Echangeurs de Chaleur), G. Bastein. Mémoires et compte rendu des travaux de la Société des Ingénieurs Civils de France, vol. 72, nos. 4, 5 & 6, Apr.-June 1919, pp. 183-237, 3 figs. Theoretical analysis of phenomena taking place in heat interchangers operating by contact of two fluids with separating medium.

Latent Heat Formulae. Latent Heat and Surface Energy—I, D. L. Hammick. Edinburgh & Dublin Phil. Mag., vol. 38, no. 224, Aug. 1919, pp. 240-245. Expression connecting internal latent heat and surface energy, and discussion of its agreement with available data.

WELDING

Aluminum. New Method for Soldering Aluminum (Ein neues Verfahren zum Löten von Aluminium). Autogene Metallbearbeitung, vol. 12, no. 4, Apr. 1919, pp. 57-62. 12 figs. Using "Foramus" solder, which is made in bars 4, 7 and 10 mm. thick and can be used for soldering sheets, pipes, aluminum with copper, and is also made in a special quality with low melting point for repairing delicate aluminum parts.

Boiler-Welding. Standard Boiler Welding. Welding Engr., vol. 4, no. 9 Sept. 1919, pp. 21-25, 27 figs. Oxy-acetylene and electric welding on the Kansas City Southern Railroad.

Electric Welding. Electric Welding: Its Theory, Practice, Application and Economics, H. S. Marquand. Elecn., vol. 83, nos. 2152, 2153 and 2154, Aug. 15, 22 and 29, 1919, pp. 175-176, 194-196 and 217-219. 14 figs. Aug. 15: Example of welding broken cast-steel crankshaft. Aug. 22: Discusses economics effected by machine welding and describes testing of electric welds. Aug. 29: Economical advantages of machine welding.

Welding by Electricity, Jos. Grine. Ry. Jl., vol. 25, no. 9, Sept. 1919, p. 16, 4 figs. Illustrating repairing of broken cylinder of H-6 type locomotive where front of valve chamber and exhaust port as well as upper half of cylinder were broken.

The Plastic-Arc Welding System. Engineer, vol. 128, no. 3316, July 18, 1919, pp. 56-57, and 60, 8 figs. It was by means of this system that German steamers interned in American harbors were repaired. Article describes system with reference to manner in which it was applied to repairing ships.

The A. C. System of Arc Welding. Engineer, vol. 128, no. 3322, Aug. 29, 1919, pp. 213-214, 4 figs. With exposition of advantages claimed for this system.

Iron and Steel and the Welding of Each, E. Wanamaker and H. R. Pennington. Ry. Elec. Engr., vol. 10, no. 9, Sept. 1919, pp. 305-308, 3 figs. Study of effect of arc and of properties, composition and classification of metals.

Electric Arc Welding as it Stands To-day (Der heutige Stand der elektrischen Lichtbogen-Schweissverfahren), Schimpke. Das Metall, vol. 1919, no. 10, May 25, 1919, pp. 131-133, 3 figs. Discussion of the Benardos, Slavianoff, Zerener, Kjellberg and other methods.

Jigs. Welding Jigs and How to Overcome Distortion, C. S. Milne. Can. Machy., vol. 22, no. 9, Aug. 28, 1919, pp. 228-229, 2 figs. Illustrating welding fracture in rim of cast iron gear wheel to transmit 240 hp. (Concluded.) Paper read before British Acetylene & Welding Assn.

Oxy-Acetylene Welding. Oxy-Acetylene Welding Instruction for Shop Work, Alfred S. Kinsey. Gas Age, vol. 44, no. 5, Sept. 1, 1919, pp. 203-206, 5 figs. Illustrating repair work.

The Judgment of the Oxy-Acetylene Process, Alfred S. Kinsey. Can. Machy., vol. 22, no. 11, Sept. 11, 1919, pp. 280-281. Sees process as engineering success and fine commercial asset.

Oxy-Hydrogen Gas Welding. Oxy-Hydrogen Gas—Its Uses at the J. I. Case Thresbing Machine Company, Manufacturers of Tractors and Farm Implements, Charles Kandel. Am. Gas. Eng. Jl., vol. 111, no. 11, Sept. 13, 1919, pp. 219-222, 5 figs. Purity of gases produced insures maximum efficiency for cutting and welding parts of Case farm implement products.

Weld Production. Some Interesting Welds (Einige interessante Schweissarbeiten). Autogene Metallbearbeitung, vol. 22, nos. 7-8, Apr. 1919, pp. 31-32, 6 figs. High-pressure distributor; cooling aggregate; pressure cylinder; tank car for high-pressure gases.

Repairing Engine Cylinders by Autogenous Welding (Ueber die Ausbesserung schadhafter Motorzylinder mittels der autogenen Schweissung). Autogene Metallbearbeitung, vo. 22, no. 7-8, Apr. 1919, pp. 27-30, 2 figs. Preventing hard seams and dripping of iron from welds. (To be continued.)

Interesting Examples of Welding and Cutting, Frank C. Perkins. Can. Machy., vol. 22, no. 5, July 31, 1919, pp. 135-137, 6 figs. Discussing the oxy-acetylene and oxy-hydrogen methods together with detailed data; American and French torches are described.

Wrought Iron Welding. Welding Wrought Iron and Steel, H. L. Unland. Elec. Ry. Jl., vol. 54, no. 12, Sept. 20, 1919, pp. 581-582. Suggestions in regard to practical procedure.

WOOD

Laminated Wood. Reducing Shrinkage and Swelling in Laminated Wood Construction, J. S. Mathewson. Aviation, vol. 7, no. 3, Sept. 1, 1919, p. 140. Remarks based on experimental research conducted at U. S. Forest Products Laboratory.

VARIA

Atmospheric Pollution. Atmospheric Pollution from the Engineer's Standpoint, John B. C. Kershaw. Engineer, vol. 128, no. 3322, Aug. 29, 1919, pp. 197-198. Information contained in report of Advisory Committee attached to Meteorological Office deals with results obtained by observation of atmospheric pollution in London, Manchester, Glasgow and other towns in the years, 1917-1911.

Bibliographic Classification. Role and Importance of a Universal Bibliographic Classification (Role et importance d'une classification bibliographique universelle.) Bulletin de la Société d'Encouragement pour l'Industrie Nationale, vol. 131, no. 4, July and Aug. 1919, pp. 67-69. Comparative study of decimal classification used by International Institute of Bibliography and numerical alphabetic classification of the International Catalogue of Scientific Literature In former each article is classified with number in which each figure represents standard branches of signs according to adopted scale; in latter classification is made by means of letters and numbers.

Boxes, Packing. On the Packing Box (In Japanese), Katsuzo Okamoto. Jl. Soc. Mech. Engrs., Tokyo, Japan, vol. 22, no. 57, June 1919.

Control of Industries, British. The Control of Industry: Nationalisation and Kindred Problems. Ry. Gaz., vol. 31, no. 8, Aug. 22, 1919, pp. 233-234. Comments and recommendations of a Committee of the Federation of British Industries, representative of some 18,000 manufacturing and producing firms having a united capital of $25,000,000,000.

Diving Suit. Self-Contained Diving Suit Providing Normal Respiration (Scaphandre autonome à respiration normale), A. Boutan. Jl. des Usines à Gaz, vol. 43, no. 15, Aug. 5, 1919, pp. 233-237, 2 figs. Air made to pass through device formed of thin sheets wet with caustic potash solution.

Farm Equipment. What Engineering and Agriculture Can Do to Increase Earning Possibilities in Rural Districts (Aufgaben fur Technik und Landwirtschaft zur Hebung der Erwerbsmöglichkeit auf dem Lande), Kurt Krohne. Zeitschrift des Vereins deutscher Ingenieure, vol. 63, no. 20, May 17, 1919, pp. 449-455, 5 figs. Efficiency of small farming enterprises; requirements of mechanical devices in agriculture; selecting mechanical farm equipment.

Interchangeable Manufacture. Terms Used in Interchangeable Manufacturing, E. Buckingham. Machy. (Lond.), vol. 14, no. 361, Aug. 28, 1919, pp. 653-655, 4 figs. Definitions explaining practical limitations.

Metric System. Not Ten But Twelve! Wm. Benj. Smith. Science, vol. 50, no. 1289, Sept. 12, 1919, pp. 239-242. Against adoption of metric system in United States and Great Britain.

Patent Law, British. Broader Conditions in Proposed British Patent Law. Automotive Industries, vol. 41, no. 11, Sept. 11, 1919, pp. 524-525. As of interest to American manufacturers. Provisions under which any person may apply to controller alleging that there has been abuse of monopoly rights under a patent and asking for relief, are quoted.

Petroleum Engineer's Education. Mid-Continent Section Meeting of A.S.M.E. Mech. Eng., vol. 41, no. 10, Oct. 1919, pp. 816-817. Suggests outlines of course (1) as technical preparation for petroleum field engineering, (2) in petroleum refining engineering, (3) in petroleum production engineering.

Public Works Department. National Public Works Department versus Corps of Engineers, Isham Randolph. Eng. News-Rec., vol. 83, no. 12, Sept. 18, 1919, pp. 561-562. Passage of Jones-Reavis bill urged on ground that great harm would result from injection of military system into activities of civil life.

METALLURGY

ALUMINUM

Alloys. Constitution and Metallography of Aluminum and Its Light Alloys with Copper and with Magnesium, P. D. Merica, R. G. Waltenberg and J. R. Freeman, Jr. Dept. of Commerce, Scientific Papers of Bur. of Standards, no. 337, Aug. 16, 1919, pp. 105-119, 28 figs., partly on eight supplement plates. Temperature-solubility curves of $CuAl_2$ and Mg_4Al_3 in aluminum determined by method of annealing and microscopic examination. Aluminum said to dissolve about 4.2 per cent copper as $CuAl_2$ at 525 deg. cent. and about 12.5 per cent. magnesium at Mg_4Al_3 at 450 deg. cent.

Aluminum Alloys (Quelques Alliages divers d'Aluminium), J. Escard. Métaux, Alliages et Machines, nos. 7-8, July-Aug. 1919, pp. 1-4. Alloys used for making machine parts which are subjected to continuous friction. (Concluded).

Aluminum, Aluminum Alloys and their Strengths (Betrachtungen über Aluminium, Aluminiumlegierungen und deren Festigkeit.), Hugo Rieger. Giesserei-Zeitung, vol. 16, no. 10, May 15, 1919, pp. 151-153. Results of tests made by German Imperial Navy Office. Compositions of various alloys. (Concluded.)

The Effect of Amalgamation upon the Single Potentials of the Binary Alloys of Aluminum with Copper, Zinc and Nickel, Louis Kahlenberg and John A. Montgomery, General Meeting of the Am. Electrochem Soc., paper no. 12, Sept. 23-26, 1919, pp. 123-156, 13 figs. Experiments showed that by amalgamation initial potentials of alloys which contained less than 35 per cent of nickel were much higher than potentials measured upon unamalgamated specimens. Just as in aluminum copper series, there was a break in curve plotted from readings made upon amalgamated alloys of aluminum and nickel.

Studies of technical Aluminum Alloys (Studien über technische Aluminiumlegierungen), E. H. Schulz. Metall und Erz, vol. 7, no. 5, March 8, 1919, pp. 91-101, 30 figs. Aluminum alloys, partly annealed and partly cold worked were tested as to their strength and resistance to corrosion; these alloys contained besides small quantities of manganese and magnesium either 7 per cent zinc or copper up to 4 per cent.

BLAST FURNACES

AIR, PREHEATING. Conditions required for obtaining favorable Results in Preheating of Air in Blast Furnaces (Die thermischen baulichen und betrieblichen Bedingungen für einen günstigen Wirkungsgrad der Winderhitzung bei Hochöfen), Hugo Bansen. Stahl u. Eisen, vol. 39, no. 19, May 9, 1919, pp. 493-497, 5 figs. Amount of air and temperature of air; heating area; size of heater, radiation losses and their dependence on amount of exhaust and its velocity. (To be concluded.)

GAS WASHERS. Increasing Wet Gas Washer Efficiency, George B. Cramp. Blast Furnace & Steel Plant, vol. 7, no. 9, Sept. 1919, pp. 430-432. Suggests use of corrugated sheets for baffles in blast furnace gas washer to more thoroughly clean gas and to increase available cleaning surface.

POWDER COAL. Pulverized Coal in Blast Furnaces. Iron & Coal Trades Rev., vol. 99, no. 2685, Aug. 15, 1919. pp. 204-205, 4 figs. Account of experiments conducted at various places, notably at Tennessee Copper Co.'s Smelter.

COPPER AND NICKEL

NICKEL-COPPER ALLOYS. Magnetic Properties of Nickel and Copper Alloys (Propiedadies magnéticas de las Aleaciones de Niquel y Cobre), Antonio Fonseca. Contribucion al estudio de las ciencias fisicas y matematicas, Universidad Nacional de la Plata, vol. 11, no. 36, July 1918, pp. 175-191, 7 figs. Experimental. It is concluded that contrary to Tammann's supposition solutions of ferromagnetic metals in non-magnetic crystals may produce ferromagnetic alloys; also nickel and copper alloys are placed in type IV of Roozeboom's mixtures.

ROLLING SHEET COPPER. Influence of Preparation and Rolling on Sheet Copper, W. Müller. Metal Industry, vol. 15, no. 6, Aug. 8, 1919, pp. 101-102. Experimental study of influence of degree of rolling, method of preparation and direction of rolling on properties of sheet copper and also effect of pre-treatment on results of annealing. (From Forshungsarbeiten auf dem Gebiete des Ingenieurwesens.)

FERROUS ALLOYS

ELECTRIC FURNACE. The Manufacture of Ferro-Alloys in Electric Furnaces, C. B. Gibson. Elec. Jl., vol. 16, no. 9, Sept. 1919, pp. 366-372, 3 figs. Including commercial uses of the various alloys and manner of computing required power to accomplish smelting reaction.

FLOTATION

COLLOIDS. Notes on Troubles from Colloids in Flotation. Eng. & Min. Jl., vol. 108, no. 12, Sept. 20, 1919, pp. 510-512. Survey of opinions of flotation experimenters, particularly in regard to whether physical or chemical qualities of primary slime are responsible for its action on flotation.

COPPER. The No. 1 Concentrator of the Mountain Copper Company, Lloyd C. White. Min. & Sci. Press, vol. 119, no. 10, Sept. 6, 1919, pp. 331-334, 4 figs. Flow-sheet of mill, which is said to be one of first in California to use flotation.

A Metallurgical Journey to Shasta, California—V, Herbert Land. Min. & Sci. Press, vol. 119, no. 12, Sept. 20. 1919, pp. 397-400. Smelter fume; the Fields and Hall process; flotation concentrate.

FURNACES

Application of Electrical Energy to the Melting of Metals, H. A. Greaves. Elect., vol. 83, no. 2155, Sept. 5, 1919, pp. 256-257, 5 figs. Method said to enable three-phase or two-phase current to be applied to a furnace with unequal resistance in one of phases and still maintain a balanced load as regards both power and power factor on primary phase. From paper read before Instn. Elec. Engrs.

BRASS MELTING, ELECTRIC. Electric Brass Melting—Its Progress and Present Importance, H. M. St. John. Elec. Jl., vol. 16, no. 9, Sept. 1919, pp. 373-380. Advantages claimed for electric melting are metal saving, improved quality, exact temperature control, increased production, elimination of crucible cost, economical operation of large units and better working conditions.

Operating Brass-Making Induction Furnaces, R. N. Blakeslee, Jr. Elec. World, vol. 74, no. 12, Sept. 20, 1919, pp. 642-644, 4 figs. Experience dealing with problems of furnace lining, charging, mixing of zinc and removal of zinc oxide deposit.

CRUCIBLE FURNACES. Electric Furnace Developments for Metals. Metal Indus., vol. 17, no. 9, Sept. 1919, pp. 424-427, 6 figs. Crucible in which heat is produced directly in crucible wall.

ELECTRIC FURNACES, TESTING. Commercial Testing of Metallurgical Electric Furnaces, H. M. St. John Chem. & Metallurgical Eng., vol. 21, no. 6, Sept. 15, 1919, pp. 377-392, 5 figs. Interpretation of collected data, summarizing results, conclusions as to suitability, reliability, production, cost of operation and maintenance and other considerations.

MOFFAT ELECTRIC STEEL FURNACE. The New Moffat Electric Steel Furnace, W. F. Sutherland. Mar. Eng. & Can. Merchant Service Guild Rev., vol. 9, no. 8, Aug. 1919, pp. 288-289, 3 figs. In order to prevent trouble encountered by reason of crescent-shaped masses of partially fused raw material found clinging to walls between electrodes, body of furnace is shaped to conform to lines of current flow in bath of molten metal.

ROSENHAIN FURNACES. Use of Modified Rosenhain Furnace for Thermal Analysis, H. Scott and J. R. Freeman, Jr. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1429-1435, 5 figs. Modification consisted of substituting in place of motor propulsion a gravity drive controlled by hydraulic cylinder with relief valve, the opening of which was regulated to allow of any desired rate of motion.

STEEL FOUNDRIES, ELECTRIC. Electric Furnaces for Steel Foundries, W. E. Moore. Elec. Jl., vol. 16, no. 9, Sept. 1919, pp. 360-366, 3 figs. With historical introduction of development of electric furnaces and table showing comparison of open hearth and electric furnace steel.

STEEL FURNACE. Developments in Electric Iron and Steel Furnaces, J. Bibby. Elecn., vol. 83, no. 2154, Aug. 29, 1919, pp. 214-216, 3 figs. Including graphs showing fuel and energy consumption for electrical reduction of magnetite. From paper read before Instn. of Elec. Engrs.

ZINC, ELECTRIC ROASTING. Electrolytic Zinc. C. A. Hansen. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1247-1281, 16 figs. Description and operation of experimental electric roasting furnace.

IRON AND STEEL

CARBON-FREE ALLOYS. Electrical Production of Carbon-Free Alloys, E. F. Northrup. Chem. & Metallurgical Eng., vol. 21, no. 5, Sept. 1, 1919, pp. 258-259, 2 figs. Scheme of furnace.

CAST IRON. Cast Iron under Heat Influences, E. Adamson. Iron & Coal Trades Rev., vol. 99, no. 2686, Aug. 22, 1919, pp. 239-240, 2 figs. Experiments made by writer and other investigators studied to determine influence of temperature on molecular structure of cast iron.

COMPOSITION. The Effect of Certain Elements on the Properties of Steel, N. J. Gerbert. Jl. Am. Steel Treaters Soc., vol. 1, no. 10, Sept. 1919, pp. 349-359. Shows by means of examples how to proceed in order to obtain a steel complying with specific requirements from a carbon steel containing a known percentage of carbon.

ELECTROLYTIC IRON. Manufacture, Properties and Industrial Utilization of electrolytic Iron (Fabrication, propriétés et utilisation industrielle du fer électrolytique), Jean Escard. Genie Civil, vol. 75, nos. 8, 9 and 10, Aug. 23, 30 and Sept. 6, 1919, pp. 165-171, 199-201 and 225-226, 16 figs. Aug. 23: Historial account of development of manufacturing process; photomicrographs showing structure of various specimens Aug. 30: Curves showing variation of electric resistance, thermoelectricity and expansion of electrolytic iron; also hysteresis curve of ordinary iron compared with that of electrolytic iron. Sept. 6: Comparative graphs showing variation in length of electrolytic iron bars and nickel steel bars under influence of heat. (Concluded.)

FERRITE CRYSTALLIZATION. Inclusions and Ferrite Crystallization in Steel, Edward G. Mahin. Jl. Indus. & Eng. Chem., vol. 11, no. 8, Aug. 1, 1919, pp. 739-745, 33 figs. Technical study and experimental research lead to following conclusions: (1) Recurrence of ferrite ghosts after repeated thermal treatment is due largely to phosphorus banding, and (2) that even after phosphorus distribution has been made uniform, repeated heating followed by slow cooling still leaves inclusions surrounded by ferrite.

FRACTURES. On the Inter-crystalline Fracture of Metals under Prolonged Application of Stress (Preliminary Paper), Walter Rosenhain and Sydney L. Archbutt. Proc. Roy. Soc., vol. 96, no. A674, Aug. 1, 1919, pp. 55-68, 8 figs. partly on three supplement plates. As result of observations theory is put forward that constituent crystals of metal are held together by amorphus inter-crystaline cement, which in some metals is sufficiently mobile to yield to tendency of any applied stress to produce flow.

HIGH-SPEED STEEL. British Practice in High-Speed Steel. Iron Age, vol. 104, no. 11, Sept. 11, 1919, pp. 703-707, 8 figs. Investigation of forging operations of cogging, rolling, etc. It is believed that, for an efficient forging, temperatures must be used which are appreciably higher than those generally accepted as correct.

IMPURITIES. Reducing Non-Metallic Impurities in Steel, L. B. Lindemuth. Blast Furnace & Steel Plant, vol. 7, no. 9, Sept. 1919, pp. 445-447. Selection of runner bricks, temperature control and rate of pouring considered as essential. First quality bricks for ladle lining.

INCLUSIONS. *See Ferrite Crystallization.*

LIME. The Uses of Lime in Ore Dressing and Metallurgy, Paul T. Bruhl. Rock Products, vol. 22, no. 16, Aug. 16, 1919, pp. 33-35. Noting limiting impurities.

MAGNET STEEL. Steel for Magnets—VI. Mech. World, vol. 66, no. 1704, Aug. 29, 1919, pp. 100-101, 2 figs. Magnetic testing. (Continuation of serial).

MANGANESE STEEL. Manganese-Steel Making by the American Manganese Steel Company. Metal Trades, vol. 10, no. 9, Sept. 1919, pp. 387-391, 7 figs. General layout and notes on operation. Three-ton Herould furnace with basis lining of magnesite brick is used.

Metallurgical Calculation. Modern Steel Metallurgical Calculations—II, Charles H. F. Bagley. Blast Furnace & Steel Plant, vol. 7, no. 9, Sept. 1919, pp. 427-430. Bessemer acid process; Bessemer basic process; basic open hearth process with direct molten metal; cold pig and scrap in hot metal open hearth basic practice. Paper read before British Iron & Steel Inst.

Sheet Manufacture. Features of the Iron and Steel Sheet Industry—II. Raw Material, vol. 1, no. 6, Aug. 1919, pp. 290-297, 10 figs. Commercial varieties of sheets and qualities imparted to them by different processes.

Transformations. Effect of Rate of Temperature Change on the Transformations in an Alloy Steel, Howard Scott. Dept. Commerce, Scientific Papers of Bur. of Standards, no. 335, July 10, 1919, 100 pp., 7 figs. Results of previous investigators taken to show that with occurrence of a split transformation on cooling alloy steels from increasingly higher temperatures (1) when higher temperature transformation *Ar'* is observed with low values of *T* maximum, troostite or a decomposition product results and (2) when lower temperature transofrmation *Ar''* is observed with high values of *T* maximum, martensite is resulting product.

NON-FERROUS ALLOYS

Alloys. Alloys and how they are made (Ausgewählte Kapitel aus der Legierungskunde), E. H. Schulz. Das Metall, no. 9, May 10, 1919, pp. 118-120. Influence on the physical properties of method of pouring and time of cooling; combination of alloys with very low melting point; German silver alloy. (To be continued.)

Brass. Thermal Expansion of Alpha and of Beta Brass Between 0 and 600° C, in Relation to the Mechanical Properties of Heterogeneous Brasses of the Muntz Metal Type, P. D. Merica and L. W. Schad. Bul. Bur. of Standards, vol. 14, no. 4, July 12, 1919, pp. 571-590, 15 figs. Measurements showing difference in thermal expansion of alpha and of beta brass of compositions which normally are in equilibrium in such alloys as Muntz metal, naval brass, etc.

Lead Alloys. Lead-Sodium-Mercury and Lead-Sodium-Tin Alloys (Ueber Blei-Natrium-Quecksilber- und Blei-Natrium-Zinn-Legierungen), J. Goebel. Zeitschrift des Vereins deutscher Ingenieure, vol. 63, no. 19, May 10, 1919, pp. 424-430, 32 figs. Constitution, hardness, flexibility.

Zinc Alloys. Study of Copper-Aluminum-Zinc Alloys with high Percentage of Zinc (Studie über die hochzinkhaltigen Kupfer-Aluminum-Zink-Legierungen), E. H. Schulz and M. Waehlert. Metall und Erz, vol. 7, no. 8, Apr. 22, 1919, pp. 170-176, 38 figs., partly on supp. plate. Thermic and metallographic tests; Zn-Cu and ZnAl systems; surface of melting diagram. (To be concluded.)

OCCLUDED GASES

Deoxidation of Steel. Determining Gases in Steel and the Deoxidation of Steel, J. R. Cain. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1309-1322. Report of work at U. S. Bureau of Standards.

Gases, Chemical Effects. Experiments to determine Chemical Effects of Gases on Iron and whether they follow definite Law; also Nature of their Combinations with non-metallic Bodies at Higher Temperatures (Untersuchungen über die Gesetzmässigkeit der chemischen Einwirkungen der Gase auf Eisen und seine Verbindungen mit Nichtmetallen bei höheren Temperaturen), Friedrich Schmitz. Stahl u. Eisen, vol. 39, no. 15 & 16, Apr. 10 & 17, 1919, pp. 373-381 & 406-413, 10 figs. Changeability of dissociation temperatures; practical application of ability of dissociation of chemical combinations. Tempering with hydrogen.

MICROPHOTOGRAPHY

Aluminum Ingots. Metallography of Aluminum Ingot, Robert J. Anderson. Chem. & Metallurgical Eng., vol. 21, no. 5, Sept. 1, 1919, pp. 229-234, 32 figs. Study of microstructure, with notes on influence of quality of ingot on resultant castings and a tentative explanation of differential etching. Extract from forthcoming publication of Bur. of Mines.

Radiometallography. (La radiométallographie.) Revue générale de l'Electricité, vol. 6, no. 8, Aug. 23, 1919, pp. 231-233, 10 figs., on two supplement plates. Account of experiments performed and apparatus developed for applying radiometallography in industry. Paper read before joint meeting of Faraday and Tontgen Societies.

Radiometallography, Robert Hadfield. Jl. Am. Steel Treaters Soc., vol. 1, no. 8, May 1919, pp. 256-269, 12 figs. Account of Professor Bragg's researches in England. Also summary of various contributions to furthering industrial application of radiometallography, which have appeared in various leading journals in America, France, Japan and Germany.

Steel, Galvanized. Metallographical Study on Galvanized Steel (In Japanese), Y. Taji. Jl. Soc. Naval Architects, vol. 24, Apr. 1919.

MINING ENGINEERING

BASE MATERIALS

Gravel. *See Sand.*

Gypsum. Progress of the Gypsum Industry, Curtis F. Columbia. Cement, Mill & Quarry, vol. 15, no. 5, Sept. 5, 1919, pp. 13-16, 3 figs. Prospecting, quarrying and mining, and growth of production.

Magnesite. The Magnesite Industry in the United States, W. C. Phalen. Min. & Sci. Press, vol. 119, no. 9, Aug. 30, 1919, pp. 295-298, 5 figs. Bases on data compiled by U. S. Geological Survey, Div. of Mineral Resources.

The Magnesite Industry. U. S. Tariff Commission, Washington, 1919. 23 pp. Prepared for use of Committee on Ways and Means House of Representatives.

Magnesite: Its Geology, Products and Their Uses, C. D. Dolman. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1193-1202, 2 figs. Notes on magnesite industry in Washington and its possibilities. With abundant water-power available on Spokane, Pend Oreille and Kettle Rivers and with raw materials, such as clays, waste wood and magnesite in large quantities close at hand, writer sees great opportunities for building up important and revolutionizing industries in Northwest.

Magnetite. The Magnetic Properties of Varieties of Magnetite, Ernest Wilson and E. F. Herroun. Phys. Soc. of London, vol. 31, no. 5, Aug. 15, 1919, pp. 299-315 and discussion pp. 315-318, 2 figs. Examination of crystallized, compact specimens and detached particles In each case susceptibility was found to vary with magnitude of magnetizing force after manner of iron, relative variation being much more pronounced in case of specimens having higher susceptibility.

Marble. The Marble of Spitzbergen. Stone, vol. 40, no. 7, July 1919, pp. 317-318. Particulars of deposit.

Sand. Nature, Origin and Properties of Sand. Rock Products, vol. 22, no. 17, Aug. 16, 1919, pp. 23-25, 1 fig. Classification of sand. Physical properties. Second article.

Sand and Gravel in Ontario, A. Ledoux. Report Ontario Bureau of Mines, vol. 27, no. 11, 1918, 138 pp., 47 figs. Including review of characteristic properties of sand and gravel and methods of testing applied.

Stone. The Commercial Sizes of Crushed Stone Aggregates, F. H. Jackson. Public Roads, vol. 2, no. 14, June 1919, pp. 35-40. Survey of present practice in states of Ohio, Kentucky, Tennessee, North Carolina and Georgia.

COAL AND COKE

Anthracite Distribution. Distribution of Anthracite, A. S. Learoyd. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1301-1308. Work done by anthracite division Bureau of Distribution, of U. S. Fuel Administration.

Belgium. The Coal Deposits of Belgium (Les Gisements Houillers de la Belgique), Armand Renier. Annales des Mines de Belgique, vol. 20, no. 3, 1919, pp. 871-875, 9 figs. Tectonic description of deposits; their international relations; theories explaining their formation. (Continuation of serial.)

Carbonization. Carbonization of Coal, W. S. Kirkpatrick. Engr. World, vol. 15, no. 5, Sept. 1, 1919, pp. 39-41. Carbonization of lignite suggested as means of great economic waste.

Coke Ovens. Temperatures in By-Product Coke Oven Practice, R. S. McBride and W. A. Selwig. Gas Age, vol. 44, no. 6, Sept. 15, 1919, pp. 235-237, 5 figs. Account of tests made by chemists of U.S. Bureau of Standards and U.S. Bureau of Mines at Koppers plant at St. Paul.

Coke Plants. New Coke Plant of La Belle Iron Works. Iron Age, vol. 104, no. 11, Sept. 11, 1919, pp. 699-701, 1 fig. Plant has two batteries, each of 47 standard Koppers 12½-ton ovens, and is planned to permit duplication.

Coking. Coking of Illinois Coal in Koppers Type Oven, R. S. McBride. Gas Age, vol. 44, no. 5, Sept. 1, 1919, pp. 197-201, 2 figs. Operating test at St. Paul plant of Minnesota By-Product Coke Co. conducted jointly by Nat. Bureau of Standards and Bureau of Mines.

Handling Machinery. Modern Coal and Ash Handling Plants—II. Coal Trade Jl., vol. 50, no. 37, Sept. 10, 1919, pp. 1112-1113, 3 figs. Handling arrangement at various plants.

Jasper Park Collieries. Mines of the Jasper Park Collieries, Ltd., at Pocahontas, Alberta, J. H. McMillan. Coal Age, vol. 16, no. 13, Sept. 25, 1919, pp. 522-526, 11 figs. Cross-section of strata, showing formation; proposed new method of working No. 2 mine.

Oxidation of Coal. The Oxidation of Coal, Frederick Vincent Tideswell and Richard Vernon Wheeler. Jl. Chem. Soc., vol. 115-116, no. 681, July 1919, pp. 895-902, 2 figs. Preliminary account of investigation on relative tendencies to spontaneous ignition of the several distinct portions into which a banded bituminous coal can be separated.

Pennsylvania. Low-Sulfur Coal in Pennsylvania, H. M. and T. M. Chance. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1459-1468. Description of deposits.

Power Plants. Illinois Coal-Mine Power Plants, E. Steck. Coal Age, vol. 16, no. 9, Aug. 28, 1919, pp. 355-356. Power for operating power-plant equipment purchased in order to bring its cost prominently to notice of management periodically.

Saar Valley. Historical Development and Economical Importance of the Saar Valley (Die geschtichliche Entwicklung und wirtschaftliche Bedeutung des Saargebiets), Hatzfeld and Schreiber. Zeitschr. f. d. Berg-, Hütten und Salinenwessen, vol. 67, no. 1, 1919, pp. 33-80. Tables showing tonnage of bituminous coal mined for years from 1907-1913; coke production; pig iron production; steel and ammonia production.

Tipples. Avoidable Degradation of Coal, Benedict Shubart. Coal Age, vol. 16, no. 10, Sept. 4, 1919, pp. 401-403, 3 figs. In tipple design, gravity is a convenient force to utilize, but careful control is advised.

Union Colliery Company. Union Colliery Co.'s Mine, Dowell, Ill. Electrical Min., vol. 16, no. 3, July 1919, pp. 51-70, 46 figs. Plan, equipment and operation of Kathleen Coal Mine. Reference is made especially to electrical features of mine.

COPPER

Concentrate, Nodulizing. Nodulizing Copper Concentrate, Oscar Lachmund. Can. Min. Inst. Bul., no. 89, Sept. 1919, pp. 950-954. Comparative study of value of briquetting, sintering and nodulizing as methods of putting concentrate in proper physical condition for blast furnace practice.

Health Mining District, Idaho. The I. X. L. Copper Prospect, Robert N. Bell. Eng. & Min. Jl., vol. 108, no. 10, Sept. 6, 1919, pp. 400-402, 4 figs. Property in Heath Mining District, in Adams County, Idaho, described as a possible "porphyry copper" deposit, though evidence of zone surface oxidation is lacking.

EXPLOSIVES

BLASTING. Advantages of Electrical Blasting, J. B. Stoneking. Cement, Mill & Quarry, vol. 15, no. 5, Sept. 5, 1919, pp. 35-37, 5 figs. For igniting blasting powder and detonating dynamite, electrical method is considered superior to others in spite of higher initial cost.

Blasting with Liquid Air in Potash Mines (Das Schiessen mit flüssiger Luft im Kalibergbau), Gropp. Kali, vol. 13, no. 6, Mar. 15, 1919, pp. 95, 6 figs. Technical and economical experience gained at Wintershall and Sachsen-Weimar mines. (Continued from no. 2.)

GEOLOGY AND MINES

AMBER. Amber and Its Origin, George F. Black. Am. Mineralogist, vol. 4, no. 8, Aug. 1919, pp. 97-99. Geological formation.(Continuation of serial.)

CONDUCTIVITY OF EARTH, SPECIFIC. Method for determining specific Conductivity of the Earth (Uber ein Verfahren zur Bestimmung der spezifischen Leitfanigkeit des Erdbodens), M. Abraham, H. R. von Traubenberg and J. Pusch. Physikalische Zeitschrift, vol. 20, no. 7, Apr. 1, 1919, pp. 145-147. Tables showing results of measurements.

CRYSTALS, SPECTRAL DIAGRAMS. Complete Spectral Diagrams of Cyrstals (Vollständige Spektraldiagramme von Kristallen), H. Seemann. Physikalische Zeitschrift, vol. 20, no. 8, Apr. 15, 1919, pp. 169-175, 5 figs. Reflecting structure areas of secondary spectra; direction of secondary spectra.

FLUORITE. Fluorite from Madoc, Ontario, T. L. Walker. Am. Mineralogist, vol. 4, no. 8, Aug. 1919, pp. 95-96, 1 fig.Described as possessing particular brilliance, luster, perfection of crystallization and transparency in relatively large pieces.

"Blue John" and Other Forms of Fluorite, Bertram Blount and James Harry Sequeira. Chem. News, vol. 119, no. 3098, Aug. 29, 1919, pp. 102-103. Experiments with X-rays said to have furnished evidence in support of theory that there is no substantial difference between fluorspar and "Blue John" except in respect to small amount of organic matter which gives color to the latter. From Trans. of Chem. Soc.

GOGEBIC RANGE. Geology of the Gogebic Range and its Relation to recent Mining Developments—I, II and III, W. C. Hotchkiss. Eng. & Min. Jl., vol. 108, nos. 11, 12 and 13. Sept. 13, 20 and 27, 1919, pp. 443-452, 501-507 and 537-541, 24 figs. Sept. 13: Alterations of iron formation have changed iron carbonate to oxide, removed chert from parts of iron-bearing series and caused formation of ore-bodies. Sept. 20: Defining contact between two general sub-divisions of iron-bearing formation. Sept 27: Influence of faults on forming of ore-bodies said to be such that careful study is necessary in planning development work.

HEMATITE MAGNETITE RELATIONS. *See Magnetite Hematite Relations.*

LEADHILLITE. *See Linarite and Leadhillite.*

LINARITE AND LEADHILLITE. Linarite and Leadhillite from Idaho, Earl V. Shannon. Am. Mineralogist, vol. 4, no. 8, Aug. 1919, pp. 93-94. From stopes in Caledonia Mine.

MAGNETITE HEMATITE RELATIONS. Some of the Relations of Magnetite and Hematite, T. M. Broderick. Economic Geology, vol. 14, no. 5, Aug. 1919, pp. 353-366, 10 figs. Based on examination of 40 polished sections of magnetite-hematite ores from widely scattered localities.

MAGNETISM, TERRESTRIAL. The Secular Variation of Terrestrial Magnetism in Siberia, Boris Weinberg. Terrestrial Magnetism and Atmospheric Electricity, vol. 24, no. 2, June 1919, pp. 65-86, 1 fig. Results of investigations and calculations of points and distant epochs of corrections applied to observed values in order to reduce them to standard epochs.

The Vertical Intensity Variometer, George Hartnell. Terrestrial Magnetism and Atmospheric Electricity, vol. 24, no. 2, June 1919, pp. 49-64, 3 figs. Characteristic features of Z-variometer, in which magnet is supported by agate knife-edge or by pair of steel points resting on horizontal plane.

SEA-LEVEL, MEAN. Mean Sea-Level, Rolf Witting. Nature, vol. 103, no. 2599, Aug. 21, 1919, pp. 493-495, 3 figs. Extrinsic and intrinsic fordes which contribute to determine "level" of sea illustrated by reference to mean sea-level in Baltic Sea.

VARIOMETER. See Magnetism, Terrestrial.

IRON

MINNESOTA. Minnesota State-Owned Iron Mines. Eng. & Min. Jl., vol. 108, no. 10, Sept. 6, 1919, pp. 388-389, 1 fig. Administration of commonwealth lands, leased to operators on royalty basis, with minimum yearly shipments specified, vested in state auditor and organized mines department. Official report pronounces system a success.

LEAD, ZINC, TIN

LEAD SMELTERY. A New South Wales Lead Smeltery. Eng. & Min. Jl., vol. 108, no. 10, Sept. 6, 1919, pp. 394-396, 1 fig. Cockle Creek silver-lead works of the Sulphide Corporation, Ltd., treat complex ores by roasting and blast-furnace smelting, followed by refining of base bullions.

ZINC ORES. Zinc Ore. U. S. Tariff Commission, Washington, 1919, 46 pp. Prepared for use of Committee on Ways and Means, House of Representatives.

The Wisconsin Zinc District, W. F. Boericke and T. H. Garnett. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1213-1235, 5 figs. Possibilities of field estimated from rescords of past production which is quoted as having increased from 1900 tons in 1904 to over 250,000 tons in 1917.

MAJOR INDUSTRIAL MATERIALS

MANGANESE. Manganese Ore. U. S. Tariff Commission, Washington, 1919, 28 pp. Prepared for use of Committee on Ways and Means, House of Representatives.

PYRITES. Pyrites and Sulphur Industry. U. S. Tariff Commission, Washington, 1919, 31 pp. Prepared for use of Committee on Ways and Means, House of Representatives.

MINES AND MINING

APEX LAW. New Angles to the Apex Law, John A. Shelton. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1417-1423, 1 fig. Importance of stability of titles in furthering prosperity of community.

CRUSHING. Crushing Practice, New Cornelis Copper Co., W. L. Dumoulin. Bul. Am. Inst. Min. & Meatllurgical Engrs., no. 152, Aug. 1919, pp. 1203-1206. Two crushing plants: Primary plant which consists of one no. 24 Gates, style K, gyratory crusher, followed four Gates no. 8, style K, gyratory crushers; and secondary plant which consists of four units of 48-in. Symons vertical-shaft disk crushers, each unit consisting of three crushers, one coarse Symons and two fine Symons.

DRAINAGE. How the Drainage Problem of Edna No. 2 Mine was Solved, Donald J. Baker. Coal Age, vol. 16, no. 11, Sept. 11, 1919, pp. 434-435, 1 fig. Drainage of two mines lead to central pump and pumped from there with electrically-driven wood-lined triplex pump.

DRILLING. Pneumatic Drilling in Mines of Liege (L'Application des Marteaux Pneumatiques). Annales des Mines de Belgique, vol. 20, no. 3, 1919, pp. 1053-1076, 10 figs. Showing results of comparative experiments on efficiency of Liegeois, Bolide, Thomas, La Bege and Ingersoll hammers.

Sinking the "H" Shaft at the Pabst Mine, A. J. Wagner. Eng. & Min. Jl., vol. 108, no. 12, Sept. 20, 1919, pp. 513-515, 5 figs. Sequence of operations and arrangement of equipment specially noted as factors which are said to have contributed to obtaining high drilling efficiency aud low maintenance cost.

LAMPS, SAFETY. Height of the Gas Cap in a Safety Lamp, C. M. Young. Coal Age, vol. 16, no. 12, Sept. 18, 1919, pp. 486-487, 2 figs. Experiments claimed to have shown that fairly definite relation between temperature of source of ignition and height of cap formed in mixture of combustible gas and air, height of cap increasing with temperature.

LAWS. *See Apex Law.*

MILLING. Mill Operations at United Eastern During 1917 and 1918, Wheeler O. North. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1171-1191, 7 figs. Notable features quoted are absence of filters and use of short peb mills loaded with steel balls for fine grinding.

MINING METHODS. Geology and Mining Methods at Pilares Mine, W. Rogers Wade, Alfred Wandtke and Pilares de Nacozari Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1143-1169, 14 figs. Mine is of pyrite-chalcopyrite type occurring in latite and andesite breccias of early Tertiary age.

ORE CALCULATION. Calculation and Valuation of Ore in Newly Opened up Mines (Ueber die Berechnung und Bewertung der durch Aufschlussarbeiten in Erzgruben festgestellten Erzmengen), Wilhelm Venator. Metall und Erz. vol. 7, no. 8, Apr. 22, 1919, pp. 167-170. Checking up calculations.

POWER SELECTION. Selection of Power for Mine Service, E. Steck. Coal Age, vol. 16, no. 13, Sept. 25, 1919, pp. 534-535. Effectiveness of mine power system as affected by method of distribution selected. Combination of direct and alternating current preferred to all-direct.

SAMPLING. Application of Air Drills to Mine Sampling, John H. Eggers. Eng. & Min. Jl., vol. 108, no. 9, Aug. 30, 1919, pp. 358-360. Making narrow, deep channels by drilling row of shallow holes and cutting out intervening ribs siad to result in saving of both labor and time.

SIBERIA. Siberian Mines, C. W. Purington. Min. & Sci. Press, vol. 119, no. 10, Sept. 6, 1919, pp. 335-338, 3 figs. Development of gold and base-metal deposits under auspices of British capital and technical control of American engineers. Also abstracted in Eng. & Min. Jl., vol 108, no. 10, Sept. 6, 1919, pp. 403-405.

STOPPING. Economy of Machine Stopping, S. A. Min. Eng. Jl., vol. 28, no. 1454, Aug. 9, 1919, pp. 639. Figures relative to operations on narrow tin lode.

TIMBERING. The Preservation of Mine Timber, N. T. Williams. Trans. Instn. Min. Engrs., vol. 57, no. 3, July 1919, pp. 125-133, 4 figs., partly on supplement plate. Survey of various methods of treatment.

MINOR INDUSTRIAL MATERIALS

TUNGSTEN-BEARING ORES. Tungsten-Bearing Ores. U. S. Tariff Commission, Washington, 1919, 47 pp. Prepared for use of Committee on Ways and Means, House of Representatives.

WULFENITE. Notes on the Metallurgy of Wulfenite, J. P. Bonardi. Chem. & Metallurgical Eng., vol. 21, no. 6, Sept. 15, 1919. pp. 364-369. Source and importance of wulfenite; description of its metallurgical treatment, acid leach, alkaline leach, and fusion methods; comparison of these methods; costs of treatment; tabulated results.

OIL AND GAS

ALSACE. Oil in Alsace. (Le pétrole d'Alsace), Aimé Witz. Revue Générale de l'Electricité, vol. 6, no. 8, Aug. 23, 1919, pp. 244-250, 1 fig. Survey of various deposits indicating quality of oil found in each; also economical study of their exploitation.

California. Third Annual Report of the State Oil and Gas Supervisor of California for the Fiscal Year 1917-1918, R. P. McLaughlin, California State Min. Bur. Bul., no. 84, 1918, 617 pp., 28 figs. Covering operations of the Department of Petroleum and Gas of the State Mining Bureau.

Application of Law of Equal Expectations to Oil Production in California, Carl H. Beal and E. D. Nolan. Bul. Am. Inst. Min. & Metallurgical Engrs.. no. 152, Aug. 1919, pp. 1237-1245, 3 figs. Method used in demonstrating truth of law is explained, and in addition several methods by which curves constructed in accordance with this law can be used in a practical way are described.

Farnham Anticline, Carbon County, Utah. The Farnham Anticline, Carbon County, Utah, Frank R. Clark, Dept. of Interior, U. S. Geological Survey, Bulletin 711-A, 1919, 13 pp., 7 figs. Oil Possibilities.

Great Britain. Petroleum and Its Occurrence, John Cadman. Trans. Instn. Min. Engrs., vol. 57, no. 3, July 1919, pp. 118-124. Theory advanced in support of existence of petroleum in Great Britain.

Lamp Oils. Investigation of the Adaptability of a Roumanian Naval Fuel Oil as Lamp Oil, R. von Walther. Petroleum World, vol. 16, no. 227, Aug. 1919, p. 344. Results of distillation tests.

Liquid Fuel. Liquid Fuel for Domestic Purposes, E. Bowden-Smith. Petroleum World, vol. 16, no. 227, Aug. 1919, pp. 326-333, I fig. Apparatus in which heavy oil, with aid of tiny stream of compressed air makes fan-shaped flame. Designed for use in kitchen range or for industrial operations. (To be continued.)

Photomicrographs of Petroleum. Petroleum Under the Microscope, James Scott. Petroleum World, vol. 16, no. 227, Aug. 1919, pp. 342-343, 3 figs. Photomicrographs of emulsions of oil and water.

Storage. The Prevention of Evaporation of Petrol in Storage Tanks and Recovery of Waste Vapour in Oil Depots, T. D. Parr. Petroleum World, vol. 16, no. 227, Aug. 1919, pp. 334-335, 1 fig. Method consists in erecting near storage tank a gas holder the bell of which, to be counter-weighted, produces vacuum of from ½ in. to 1 in. of water. Top of storage tank is connected to interior of holder by pipe.

PRECIOUS MINERALS

Alaska. Mining in Chistochina Basin, Prince William Sound Region. and Kenai Peninsula, Alaska, Theodore Chapin and Bertrand L. Johnson. Dept. of Interior, U. S. Geological Survey, Bulletin 692-C, 1919, pp. 137-176, 3 figs. Including notes on geology of platinum-bearing auriferous gravels.

See also Platinum.

Platinum. Geology of Platinum Deposits—I and II, W. L. Uglow. Eng. & Min. Jl., vol. 108, nos. 9 and 10, Aug. 30 and Sept. 6, 1919, pp. 352-355 and 390-393. Aug. 30: Formations and occurrences; Sept. 6: Occurrences in accosiation with other minerals; production of various districts.

TRANSPORTATION

Cables, Stresses. Stresses in Mine Cables (Sur les efforts dans les Cables) M. E. Dessalles. Annales des Mines de Belgique, vol. 20, no. 3, 1919, pp. 1079-1087, 4 figs. Result of experiment to determine coefficient elasticity and velocity of propagation of stress suddenly applied.

Haulage, Undergound. Efficiency in Underground Haulage, C. E. Bowron. Coal Age, vol. 16, no. 9, Aug. 28, 1919, pp. 360-361. Suggests making someone responsible for each operation or for each department.

VARIA

Research, Non-Metallic Materials. The Need for Research in the Non-Metallic Mineral Field, Raymond B. Ladoc. Chem. & Metallurgical Eng., vol. 21, no. 6, Sept. 15, 1919, pp. 348-352. 11 figs. It is pointed out that mining and milling problems in non-metallics are different from those in metallics and often are not appreciated by metal mining engineers; it is, therefore, suggested that a comparatively untrodden field lies open for consulting mining engineers and industrial chemists.

MUNITIONS AND MILITARY ENGINEERING

Anti-Aircraft Guns. Mounts for Naval Anti-Aircraft Guns—II, Fred H. Colvin. Am. Mach., vol. 51, no. 10, Sept. 4, 1919, pp. 457-461, 17 figs. Making of slide and recoil cylinders, with reference to special fixtures and tools used.

Military Value of Guns Used for Defence against Airplanes (La D.C.A., sa place dans la bataille aérienne), Pierre de la Blanchardière. Aéronautique, vol. 1, no. 2, July1919, pp. 53-62, 18 figs. From records of their operation during the war.

The Technique of Anti-Aircraft Artillery, Glenn F. Anderson. Jl. U. S. Artillery, vol. 51, no. 3, Sept. 1919, pp. 277-284, 7 figs. Concerning determination of altitude, deflection, time of burning of fuse, super-elevation and ballistic corrections.

The Defence of Paris Against Aeroplanes During the War, E. Villaret. Jl. U. S. Artillery, vol. 51, no. 3, Sept. 1919, pp. 330-342. General organization of anti-aircraft defence, with notes on enemy tactics and means of defence developed to meet them. Translated from Illustration, March 22, 1919.

Anti-Submarine Devices. Science and its Application to Marine Problems, J. C. McLennan. Engineer, vol. 128, no. 3316, July 18, 1919, pp. 67-68. Development of anti-submarine measures and devices. Paper presented before North-East Coast Instn. of Engrs. & Shipbuilders.

Ballistics. The Use of Adjoint Systems in the Problem of Differential Corrections for Trajectories, Gilbert Ames Bliss. Jl. U. S. Artillery, vol. 51, no. 3, Sept. 1919, pp. 296-311, 4 figs. Method of computing for known trajectory corrections which do not attain values exceeding three per cent of range.

Camouflage. The Dazzle Painting of Ships. Norman Wilkinson. Trans. North-East Coast Inst. Engrs. & Shipbuilders, vol. 35, no. 6, Aug. 1919, pp. 237-255 and (discussion), pp. 255-267, 5 figs. Origin and development, and reasons for its adoption.

Chemical Warfare. The Research Chemist and the War, Allen Abrams. Chem. Engr., vol. 27, no. 9, Sept. 1919, pp. 233-238, 2 figs. Types of gas masks evolved by Chemical Warfare Service; also account of their experiments to camouflage bleaching powder by introduction of some inert pigment.

Preparedness and Chemical Warfare, William L. Sibert. Chem. Engr., vol. 27, no. 9, Sept. 1919, pp. 205-207. Points out that chemical means of offense and defence will be of great importance in future wars, and calls attention to necessity of taking adequate steps to have U. S. adequately prepared when the next war comes.

Coast Artillery. The Coast Artillery and the Reserve Officers' Training Corps, Harrison Tilghman. Jl. U. S. Artillery, vol. 51, no. 3, Sept. 1919, pp. 262-268. Concerning military training in engineering schools.

Commerce Destruction. "Unrestricted Commerce Destroying, Lyman A. Cotten. U. S. Naval Inst. Proc., vol. 45, no. 199, Sept. 1919, pp. 1494-1516 and 1517-1527. Its military effectiveness discussed from historical viewpoint of efforts made in last war and preceding wars to overcome enemy by destroying its commerce.

Destroyers. The Evolution of the Destroyer, S. M. Robinson. Int. Mar. Eng., vol. 24, no. 9, Sept. 1919, pp. 577-584, 20 figs. Noting specially advances in boiler and turbine construction.

Flame. *See Gas Warfare.*

Gas Warefare. An Artillery Gas Attack, B. C. Goss. Jl. Indus. & Eng. Chem., vol. 11, no. 9, Sept. 1919, pp. 829-836, 10 figs. Comparative study of Allied and German tactics and particulars of various types of German gas shells.

Gas, Smoke and Flame in this War and the Next, William H. Walker. Proc. Engrs. Soc. Western Pa., vol. 35, no. 4, May 1919, pp. 195-214, 11 figs. That gas warfare is particularly humane argued because of 30 per cent of total casualties caused by it only 5 per cent were fatal, while of remaining 70 per cent caused by machine gun and rifle fire, shrapnel and high explosives between 20 and 25 per cent resulted in death. Writer believes that gas warfare has come to stay and advises making adequate provision for it. Gases used in last war are classified and their effects described.

Gas Warfare at the Front, B. C. Goss. Proc. Engrs. Soc. Western Pa., vol. 35, no. 4, May 1919, pp. 181-194, 4 figs. Its practical significance.

Guns. "Berthas," E. M. Blake, J. U. S. Artillery, vol. 51, no. 3, Sept. 1919, pp. 269-276, 2 figs. Notes on bombardment of Paris from Mont de Joie. Gun used was a 380-mm. Krupp Naval re-tubed down to a 22-mm. and firing from the same type platform as the 380.

Mine Layers. German Submarine Mine-Layers. (Les sous-marins allemands mouilleurs de mines). Journal de la Marine, vol. 37, no. 1901, Aug. 9, 1919, pp. 508-509, 2 figs. General features of UC-16.

Mounts. The Field Mount for the 7-in. Navy Gun, C. L. McCrea. Am. Mach., vol. 51, no. 11, Sept. 11, 1919, pp. 523-527, 7 figs. Gun is mounted on tractor.

Powder Bleaching. *See Chemical Warfare.*

Railways. Military Importance of Railways in Warfare. (Importancia militar de los ferrocarriles en la conduccion de las operaciones de guerra de un pais), Antonio Beingolea. Informacionnes y Memorias de la Sociedad de Ingenieros del Peru, vol. 21, no. 8, Aug. 1919, pp. 258-280. Including descriptive account of railway systems of So. Am.

Range-Finders. Modern Single-Observer Range-Finders. Nature, vol. 103, no. 2595, July 24, 1919, pp. 405-407, 2 figs. Details of British naval range-finder, type F. X., with uniform range scale accessories. Base length, 30 ft.; magnetification, 16, 20 and 28; on certainty of observation under good conditions, 330 yd. at 40,000 yd. range.

Searchlights. How Portable Searchlight Equipment Was Used in the War, W. F. Bradley. Automotive Industries, vol. 41, no. 10, Sept. 4, 1919, pp. 478-480, 3 figs. Crochat field illuminating trucks.

Smoke. *See Gas Warfare.*

ORGANIZATION AND MANAGEMENT

ACCOUNTING

Accounting Methods. Importance of proper Accounting in the Maintenance of Way Department in General, I. A. May. Street Ry. Bul., vol. 19, no. 9, Sept, 1919, pp. 329-335, 5 figs. Details as to reports, timeslips, data cards, etc.. used by The Connecticut Co., New Haven, Conn.

Appraisals. Practice in Making Electric Utility Appraisals, Charles W. McKay. Elec. Rev., vol. 75, no. 11, Sept. 13, 1919, pp. 428-433. Discussion of value of unit costs and necessity for care in their preparation.

Unit Costs for Use in Public Utility Appraisals, R. L. Baldwin. Eng. News-Rec., vol. 83, no 11, Sept. 11, 1919, pp. 514-515, 1 fig. Method at present employed by many commissions described as combination of "reproduction cost with unit prices based upon average prices," and "actual cost from records."

Classification of Expenses. Protection of Owners on Cost-Plus Contracts, F. A. Wells. Can. Engr., vol. 37, no. 13, Sept. 25, 1919, pp. 323-326, 4 figs. Practical use of Dewey Decimal System in keeping books on the job; classification of plant expense and field overhead.

Cost Accounting. Uniform Cost Accounting in Shipbuilding—II, J. L. Jacobs, Int. Mar. Eng., vol. 24, no. 9, Sept. 1919, pp. 638-640. Plan adopted by Atlantic Coast Shipbuilders' Assn. for uniform method of cost accounting in steel shipbuilding.

A Cost System for Shipyards—III, Creighton Churchill. Int. Mar. Eng., vol. 24, no. 9, Sept. 1919, pp. 641-642, 1 fig. How the system is operated; practical application in the case of a hull under construction or under contract.

COSTING. Costing in Relation to Scientific Management, J. H. Boyd. Elecn., vol. 83, no. 2152. Aug. 28, 1919, pp. 171-172. Results obtained of various works.

The Necessity of Knowing Manufacturing Costs, Roland H. Zinn. Am. Industries, vol. 20, no. 2, Sept. 1919, pp. 20-21. Points out that unless exact cost of each department is known, waste of materials, inefficient help, or careless supervision in buying will not be reported.

The Philosophy of Costs, C. E. Knoeppel. Indus. Management, vol. 58, no. 3, Sept. 1919, pp. 179-183. Importance of determining hourly performance of labor illustrated by various instances in which efficiency was increased by recording it regularly, notably experience of one company in which efficiency in one department increased production 60 per cent by displaying graphically from day to day actual hourly production against predetermined hourly production.

Do you know exactly what your Product Costs? Can. Machy., vol. 22, no. 5, July 31, 1919, pp. 101-106, 5 figs. Illustrating how planning costs showed up; comparison chart for engines built during 1917-1918.

COST FACTORS. Summarizing All Cost Factors, M. H. Potter. Iron Trade Rev., vol. 65, no. 10, Sept. 4, 1919, pp. 630-631, 6 figs. Suggested method for determining basis for fixing of selling price.

INVENTORIES. Inventorying Materials and Supplies, B. J. Yungbluth. Elec. Ry. Jl., vol. 54, no. 11, Sept. 13, 1919, pp. 518-520, 2 figs. How Pittsburgh Railways Co. inventoried in two days, at cost of $239.85, 8613 different kinds of materials valued at $916,317, without special help of overtime of employees.

EDUCATION

ARMY TRADE TESTS. The Army Trade Tests, William T. Bawden. Dept. of Interior Bur. of Education, Circular no. 4. Apr. 1919, 28 pp., 8 figs. Report of a conference of specialists in industrial education, called by the U. S. Commissioner of Education.

FACTORY SCHOOL. The Factory School as an Americanizing Force, T. A. Levy. Am. Industries, vol. 20, no. 2, Sept. 1919, pp. 23-24. From address at Americanization Congress under auspices of Assn. Industries of Mass.

TRAINING FACTORY HELP. Possibilities in Training Factory Help, James F. Johnson. Indus. Management, vol. 58, no. 3, Sept. 1919, pp. 221-224, 2 figs. Has remedy for labor shortage.

EXPORT

BRITISH MACHINE TOOL AND METAL INDUSTRIES. British Machine Tool and Metal Industries, Alexander Luchars. Machy. (N.Y.), vol. 26, no. 1, Sept. 1919, pp. 19-24, Report of U. S. Trade Commissioner to Great Britain and Continental Europe appointed by U. S. Dept. of Commerce, for purpose of studying conditions affecting sale and use of American machine tools and accessories in European market. Also in Am. Mach., vol. 51, no. 10, Sept. 4, 1919. pp. 478-480.

CEMENT. International Trade in Cement. Cement, Mill & Quarry, vol. 15, no. 5, Sept. 5, 1919, pp. 19-23. Statistics of imports into other countries. Export opportunities for American producers. Third article

CHINA. China as Market for Railway Materials, Frank Rhea. Ry Rev., vol. 65, nos 9, and 11, Aug. 30 and Sept. 13, 1919, pp 289-294 and 371-376, 23 figs. Aug 30. From Far Eastern markets for Railway Materials, Equipment and Supplies, Special Agents' Series no. 180, published by Dept of Commerce, Bureau of Foreign and Domestic Commerce. Sept. 13: Operating methods; track materials and maintenance; general characteristics of rolling stock.

EAST INDIES, DUTCH. Dutch East Indies Offer Many Construction Opportunities, J. W. Evans. Eng. News-Rec., vol. 83 no. 11, Sept. 11, 1919, pp. 497-498. Developments now under way or in prospect in Sumatra and Java include port works, railroads and water-power.

SIGNALLING APPARATUS. Opportunities for American Signalling in Far East, Frank Rhea. Ry. Age., vol. 67, no. 12, Sept. 19, 1919, pp. 557-558. Urges that American firms must recognize differences in operating methods to compete successfully.

FACTORY MANAGEMENT

BAR STEEL, IDENTIFICATION. Identification of Bar Steel. Machy. (N.Y.), vol. 26, no. 1, Sept. 1919, pp. 36-38. Method employed by Rockford Drilling Machine Co., which consists in painting streaks of different colors laterally and transversely on side of bars.

CONSTRUCTION WORK, CHART. A Useful Progress Chart for Construction Work. Power Plant Eng., vol. 23, no. 17, Sept. 1, 1919, p. 769, 1 fig. Employed during construction of Edgewarer power station for determining percentage of work already done on any particular job as well as percentage of work remaining unfinished, and estimated length of time required to complete work.

CONTROLLING PRODUCTION. A System for Controlling Production, Robert H. Wadsworth. Am. Mach., vol. 51, no. 10, Sept. 4, 1919, pp. 451-455, 12 figs. Forms used are illustrated and their functions discussed.

DRAWING OFFICE. Drawing Office and Workshop Organization, N. Gerard Smith. Eng. & Indus. Management, vol. 2, no. 9, Aug. 28, 1919, pp. 259-263, 11 figs. Concerning filing of technical data and routine for tool supply.

EMPLOYMENT DEPARTMENT. Adjusting the Employment Department to the Rest of the Plant, Dwight T. Farnham. Indus. Management, vol. 58, no. 3, Sept. 1919, pp. 201-205, 3 figs. Suggested standard-practice-instructions for employment determined.

FOLLOW-UP PLANTS FOR PRODUCTION. Keeping Production on Schedule, S. P. Keator. Factory, vol. 23, no. 3, Sept. 1919, pp. 510-511, (figs. Suggested follow-up plan for small plants.

FOREMAN. The Foreman in Relation to Workshop Organization, A. Robert Stelling. Eng. & Indus. Management, vol. 2, no. 10, Sept. 4, 1919, pp. 294-295. Comparison of American and English practice in management of workshops.

FOUNDRY. *See Production Methods.*

INDUSTRIAL RELATIONSHIPS. Industrial Relationship, Bass Smith. Am. Mach., vol. 51, no. 10, Sept. 4, 1919, pp. 471-472. Qualifications of industrial management.

Industrial Welfare, Edgar L. Collis. Eng. & Indus. Management, vol. 2, no. 10, Sept. 4, 1919, pp. 309-311. Welfare is considered as "an inevitable development of modern industry, necessary to enable it to do its duty by its employees," and it is pointed out that welfare work must cover outside activities, such as recreation, transport and housing questions."

INSPECTION, ELECTRICAL. Organizing Electrical Inspectiou and Mainteuance, C. A. Cowdery. Elec. World, vol. 74, no. 12, Sept. 20, 1919, pp. 645-649, 4 figs. Method carried out in one of large industrial plants in New England while factory was employed on war work exclusively and operated twenty-four hours daily excepting Sundays.

MACHINE TOOL PLANT. Organization and Management of a Machine Tool Plant—III. Machy. (Lond.), vol. 14, no. 358, Aug. 7, 1919, pp. 565-569, 9 figs. Manufacturing departments and systems recommended for medium size machine tool manufacturing plant making a single line of machines.

MOTOR TRANSPORT BUSINESS. Starting in the Motor Transport Business. Motor Traction, vol. 29, no. 758, Sept. 10, 1919, pp. 219-222. What it costs and what it brings in.

MOTION ANALYSIS. Graphic Methods of Analysing Motions. Eng. & Indus. Management, vol. 2, no. 8, Aug. 21, 1919, pp. 229-232, 2 figs. Charts illustrating simultaneous cycle motiou of lowering pig iron upon a railway truck and action of workman in leaving his work.

PLANNING. The Production Planning System of the Heald Machine Company—II W. S. Pratt. Am. Mach., vol. 51, no. 11, Sept. 11, 1919, pp. 501-508, 11 figs. Planning Board and method of following work.

A Planning Department System in Use in a Machine Shop, John H. Black. Indus. Management, vol. 58, no. 3, Sept. 1919, pp. 225-229, 2 figs. Viewpoint around which planning department is said to be built is necessity of knowing at all times "what is still needed" and how to make up actual or impending shortage.

Planning the Industrial Plant—IV, Hugh M. Wharton. Indus. Management, vol. 58, no. 3, Sept. 1919, pp. 237-241, 5 figs. Material handling, fire protection, toilets and lavatories, power transmission, heating, ventilation and illumination. (Concluded.)

PRODUCTION METHODS. Continuous Movement in the Essex Production Line, J. Edward Schipper. Automotive Industries, vol. 41, no. 9, Aug. 28, 1919, pp. 416-421, 10 figs. partly on supplement plate. Engine, chassis, and body treated as separate units until delivered complete at final assemhly line.

Increased Output with Reduced Hours of Work? Chas. S. Myers. Eng. & Indus. Management, vol. 2, no. 8, Aug. 21, 1919, pp. 227-229, Study of improved methods in an iron foundry.

Installing Management Methods in the Woodworking Industry, Carle M. Bigelow. Indus. Management, vol. 58, no. 3, Sept. 1919, pp. 185-195, 24 figs. Preparing orders, determining upon stock and material, laying out progress of work, making out production orders, preparing standard instructions, using control board, handling job cards and inspection records and computing labor efficiency, are described and illustrated by drawings and forms.

Machinery Versus Trained Brains, Lazarovich-Hrebelianovich. Indus. Management, vol. 58, no. 3, Sept. 1919, pp. 198-200. War experience of company which after losing its trained workers failed to increase its production efficiency even after having spent $200,000 in important machinery for use of new employees.

Factory Management in Garment Trades, Mack Gordon. Indus. Management, vol. 58, no. 3, Sept. 1919, pp. 230-235, 4 figs. Advising acceptance of democratic principle in training and follow-up functions.

Need of Personal Responsibility in Industry, Harry Tipper. Automotive Industries, vol. 41, no. 11. Sept. 11, 1919. pp. 534-535. Points out that employer can do much to solve his labor troubles if he will educate his workers as to their part of whole and himself realizes responsibility to workers.

Getting Ready for the Shop Emergency. Can. Machy., vol. 22, no. 5. July 31, 1919, pp. 118-121, 6 figs. It is said that every well-appointed plant must have the means to deal quickly and efficiently with any mishap that may be encountered. How outfits are made up; accident prevention.

Maintenance of Management, Frank B. Gilbreth. Eng. & Indus. Management, vol. 2, no. 10, Sept. 4, 1919, pp. 296-298, 1 fig. Proposed form for standing orders.

Scientific Management—IV, Henry Atkinson. Eng. & Indus. Management, vol. 2, no. 10, Sept. 4, 1919, pp. 300-304. Points out that in order to establish successfully scientific management in any plant, "It is essential to take the broad view of industry and its relation to the general welfare," without any spirit of trying to "see if there is anything in it."

The Application of Industrial Efficiency, Charles E. Bedaux. Eng. & Contracting, vol. 52, no. 11, Sept. 10, 1919, pp. 311-312. It is important to meet European competition.

Engineering Organization and Routine, George L. McCain. Automotive Industries, vol. 41, no. 12, Sept. 18, 1919, pp. 562-567, 9 figs. Suggested system for keeping all concerned in touch with all of the work and developments at all times.

Eliminating the Stop Watch from Industry, C. E. Knoeppel. Iron Age, vol. 104, no. 12, Sept. 18, 1919, pp. 766-767. Production rates, determined by conferences with workers, and efficient management are essentials.

PRODUCTION RECORDS. Planning and Controlling Production, Ivan R. DeArmond. Machy. (N.Y.), vol. 26, no. 1, Sept. 1919, pp. 60-66, 18 figs. System used by R. K. LeBlond Machine Tool Co., showing records by means of which information concerning progress of work, stock on hand or required, and location of job at any time may he quickly determined.

PURCHASING. Organization for Purchasing and Stores, Henry B. Spencer. Ry. Age, vol. 67, no. 13. Sept. 26, 1919, pp. 617-619. Executive officer should supervise purchasing, selling, storing, handling, protecting and disbursing.

Restaurants. Installing and Operating an Industrial Cafeteria, E. F. Ross. Iron Trade Rev., vol. 65, no. 11, Sept. 11, 1919, pp. 691-694, 6 figs. Information regarding equipment required, method of operating, system of financing and cost of installing a modern lunch room for employees.

Shop Layout. Efficiency in Industrial Planning Illustrated in a New Forge Shop. Am. Architect, vol. 116, no. 2279, Aug. 27, 1919, pp. 283-287, 6 figs. Illustrating general character of buildings in plant of Central Forge Co., Detroit, Mich., and open space provided on all sides by use of rolling doors, also diagrams showing arrangement of equipment.

Shop Papers. The Shop Paper as an Aid to Morale, Peter F. O'Shea. Factory, vol. 23, no. 3, Sept. 1919, pp. 518-522, 10 figs. Experience of writer as editor of factory house organ of Greenfield Tap and Die Corporation.

Tool Repairs. Make the House Organ a Human Interest Organ with a Punch, Robert E. Park. Automotive Industries, vol. 41, no. 12, Sept. 18, 1919, pp. 572-574. Survey of editorial policies followed by various plant journals.

Woodworking Industry. *See Production Methods.*

INSPECTION

Bureau of Standards, Optical Apparatus. Optical Projection Applied to Inspection, H. C. Bean. Inspector, vol. 1, no. 4, Sept. 15, 1919, pp. 25-30, 7 figs. Description of apparatus developed and used by Bur. of Standards.

LABOR

Bonus System. Bonus System for Boiler Room Employees, Robert June. Power House, vol. 12, no. 13, Aug. 20, 1919, pp. 356-357, 2 figs. Its effect upon economy in operation. From answers received by writer and circular letter he sent to various chief engineers of power plants in Canada.

Bonus systems for Chemical Works, Norman Swindin. Chem. Age, vol. 1, no. 9, Aug. 16, 1919, pp. 240-243, 4 figs. Account of research carried on in large chemical works in regard to application of Rowan system.

Employment System. Placing the Right Man in the Right Job—I. W. D. Stearns Machy. (N.Y.), vol. 26, no. 1, Sept. 1919, pp. 30-33. Outline of methods used by Westinghouse Elec. & Mfg. Co., East Pittsburgh.

Health of Man. How to Keep the Human Machine in Working Order, Thomas Darlington. Eng. & Contracting, vol. 52, no. 12, Sept. 17, 1919, pp. 331-332. Noting relation of efficiencies to health.

Labor Unrest. Effect of Labor Unrest on Output and Cost. Eng. & Indus. Management, vol. 2, no. 8, Aug. 21, 1919, p. 250. Report submitted by Industry and Trade Conference to Nat. Assn., outlining result of inquiry as to direct and indirect effects of revolution on conditions of labor and consequently on production and exchange of goods.

One-Man-One-Job System. Fallacy of the One-Man-One-Job System in Industry, Harry Tipper. Automotive Industries, vol. 41, no. 12, Sept. 18, 1919, pp. 580-581. Monotony of system argued as drawback against its effectiveness.

Profit-Sharing. Profit-Sharing and Ownership, Fred. Mills. Eng. & Indus. Management, vol. 2, no. 8, Aug. 21, 1919, pp. 237-239. Memorandum on labor unrest laid by writer before British Coal Commission.

Shop Committees. Labor and the Shop Committee, William Leavitt Stoddard. Indus. Management, vol. 58, no. 3, Sept. 1919, pp. 217-220. Organized labor's position.

Recognizing the Human Side of Industry, A. R. Kennedy. Can. Machy., vol. 22, no. 5, July 31, 1919, pp. 92-96, 6 figs. Industrial council and cafeteria among features adopted.

Steel Industry. The Iron and Steel Situation. Manufacturers Rec., vol. 76, no. 11, Sept. 11, 1919, pp. 107-108. Labor question as it effects iron and steel situation.

Wage System. The Piece Work Pay System, J. A. A. Beaudin. Gas. Rec., vol. 16, no. 4, Aug. 27, 1919, pp. 37-38. How it works in Montreal Light, Heat & Power Co., as applied to meter readers, billers, delivery men and collectors. Paper read before Can. Gas. Assn.

Welfare. Industrial Welfare, Edgar L. Collis. Eng. & Indus. Management, vol. 2, nos. 8 and 9, Aug. 21 and Aug. 28, 1919, pp. 246-249 and 266-268, 1 fig. Aug. 21: Welfare in relation to industrial birth, life and death. Aug. 28: Deals with organization of welfare, and refers particularly to a scheme of welfare supervision for boys.

Women. Women's Work in Engineering and Shipbuilding During the War, Lady Parsons. Trans. North-East Coast Instn. Engrs. & Shipbuilders, vol. 35, no. 6, Aug. 1919, pp. 227-234. Summary of technical work of skilled nature.

Report on the Metabolism of Female Munition Workers, M. Greenwood, C. Hodson and A. E. Tebb. Proc. Roy. Soc. vol. 91, no. B635, Aug. 6, 1919, pp. 62-82. Following conclusions are arrived at from experimental tests and measurements: For light training and forging about 100 calories per sq. m. of body surface per hr. are needed; for tool setting, heavy turning, stamping, finishing copper bands and shell hoisting, about 125 calories per sq. m. per hr.; for gauging, walking and carrying, about 160 calories per sq. m. per hr.; and for labouring, cleaning and drying, about 180 calories per sq. m. per hr.

A Preliminary Study of the Energy Expenditure and Food Requirements of Woman Workers, O. Rosenheim. Proc. Roy. Soc., vol. 91, no. B635, Aug. 6, 1919, pp. 44-61, 1 fig. As results of experiments in which it was intended to measure actual energy of average woman worker during twenty-four hours, it is quoted that an average of 2400-2800 calories may be assumed as a standard for women, the corresponding figure for men being 3000-3500 calories.

LEGAL

Infection Liability. The Liability of Infections, Chesla C. Sherlock. Chem. & Metallurgical Eng., vol. 21, no. 5, Sept. 1, 1919, pp. 252-253. Court interpretations of problems brought by workmen's compensation acts.

Resale Price Fixing. The Fixing of Resale Prices—I, Chesla C. Sherlock. Am. Mach., vol. 51, no. 11, Sept. 11, 1919, pp. 521-522, Legal aspect of question.

LIGHTING

Daylight Measurements. Some Practical Daylight Measurements in Modern Factory Buildings, Emile G. Perrot and Frank C. Vogan. Tran. Illum. Eng. Soc., vol. 14, no. 6, Aug. 30, 1919, pp. 257-277, 10 figs. Photometric readings taken in several buildings.

Industrial Lighting. What Better Industrial Lighting Can Do to Stimulate Production, F. H. Bernhard. Elec. Rev., vol. 75, no. 10, Sept. 6, 1919, pp. 381-384, 2 figs. Based on records of increased production due to efficient lighting at time of war.

The Science of Efficient Shop Illumination, A. W. Swan. Can. Machy., vol. 22, no. 5, July 31, 1919, p. 97, 1 fig. Subject of shop lighting considered as a very vital one, for without proper illumination workmen cannot be expected to produce results either from quality or quantity standpoint.

How Better Industrial Lighting Can Improve Working Conditions, F. H. Bernhard. Elec. Rev., vol. 75, no. 12, Sept. 20, 1919, pp. 469-472, 3 figs. Because, it is said, it adds to welfare of employees and reduces labor turnover and labor disputes.

Shipyards. Shipyard Lighting, H. A. Horner. Tran. Illum. Eng. Soc., vol. 14, no. 6, Aug. 30, 1919, pp. 278-282 and discussion, pp. 282-285. Notes deficiency in present methods and suggests improvement.

Shops. *See Industrial Lighting.*

Windows. What it Pays to Know about Factory Lighting—VII, C. E. Clewell. Factory, vol. 23, no. 3, Sept. 1919, pp. 496-499, 5 figs. Concerning location of windows and selection of sash and glazing.

RECONSTRUCTION

Alsace. Textile Industries of Alsace. (Les industries textiles de l'Alsace.), Alfred Renouard. Bulletin de la Société d'Encouragement pour l'Industrie Nationale, vol. 131, no. 4, July and Aug. 1919, pp. 32-63. History of their development and remarks on their present economic significance.

France. Present Position and the Future of French Industry. (La situation et L'Avenir de l'Industrie Française.), Ch. Vallet. Industrie Electrique, vol. 28, no. 652, Aug. 25, 1919, pp. 301-302. Economical situation in coal industry. (Concluded.)

Germany. Germany's Industrial Position, Richard D. Lucker. Jl. Indus. & Eng. Chem., vol. 11, no. 8, Aug. 1, 1919, pp. 777-780. From before the war to the present time. Compiled from writer's personal observations.

War-Time Activities of Dye Plants in Germany. Chem. & Metallurgical Eng., vol. 21, no. 5, Sept. 1, 1919, pp. 224-225. From report of British mission appointed to visit enemy chemical factories in occupied zone, introduced at Dyestuffs Hearings before House Committee on Ways and Means.

The German Machine-Tool Industry During and After the War. Am. Mach., vol. 51, no. 11, Sept. 11, 1919, pp. 537-539. Writer sees "German national front of business" broken and believes in eventual internationalization of German industry.

Machine Tool Trade. Conditions in the Machine Tool Trade. Machy. (N.Y.), vol. 26, no. 1, Sept. 1919, pp. 75-76, 1 fig. Containing Government price-fixing chart for determining selling price of standard machine tools.

Plant Conversion to Peace Work. Adapting Munitions Plant to Peace-Time Work. Elec. World, vol. 74, no. 12, Sept. 20, 1919, pp. 620-626, 9 figs. Particularly in reference to method employed of making distribution system more flexible.

Trans-Missouri Region. Industrial Development in the Trans-Missouri Region, P. F. Walker. Mech. Eng., vol. 41, no. 10, Oct. 1919, pp. 821-823. Statistical figures relative to agricultural and mineral products, accomplishments in manufacturing and transportation and freight adjustments.

SAFETY ENGINEERING

Accident Statistics. Accident Statistics of German Reinforced Concrete Construction for 1911 to 1918 (Unfallstatistik des Deutschen Ausschusses für Eisenbeton 1911 bis 1918), W. Petry. Beton u. Eisen, vol. 18, no. 7 and 8, May 5, 1919, pp. 73-76. Compiled by German Committee on Reinforced Concrete Construction, appointed by Secretary of Public Works.

Boiler Explosion. The Boiler Explosion at Mobile, Ala. Locomotive Hartford Steam Boiler Inspection & Insurance Co., vol. 32, no. 6, April 1919, pp. 162-165, 2 figs. Suggested explanation for explosion of two water-tube boilers, one Heine and one Stirling.

Dust Explosions. Dust and Dust Explosions (Staub und Staubexplosionen). Rauch u. Staub, vol. 9, no. 7, Apr. 1919, pp. 53-54. Considers best means to prevent explosions ventilation and sprinkler system which has been in use in German mines since 1898.

Cause and Prevention of Dust Explosions. Contract Rec., vol. 33, no. 37, Sept. 10, 1919, pp. 858-859. Recommendations made by Ontario Fire Prevention League.

Fires, Mine. Mine Fires, and the Inert Gas Method by Which They May be Extinguished, Joseph J. Walsh. Jl. Am. Soc. Heat & Vent. Engrs., vol. 25, no. 3, July 1919, pp. 329-331, 1 fig. Arrangement consists of ordinary boiler furnace; gases produced by combustion are conducted through cooling tubes, immersed in water,and then forced into mine. Gasesused are carbon divide and nitrogen.

Fire Protection. Fire Protection for Oil Tanks. Eng. & Min. Jl., vol. 108, no. 9, Aug. 30, 1919, pp. 350-351, 3 figs. Method for extinguishing fires by using bubbles containing carbonic-acid gas to form blanket covering on surface.

Fire Protection for Schools, H. W. Forster. Construction, vol. 9, no. 1, July 1919, pp. 11-21. Importance of providing for it and essential features to secure it. From Nat. Fire Protection Assn. Quarterly.

Water Departments and Private Fire Lines, Dow R. Gwinn. Can. Engr., vol. 37, no. 13, Sept. 25, 1919, pp. 335-337. Proper regulation governing private fire protection lines; contamination of water supply; suggestions for compensations.

Industrial Safety. Industrial Safety—II, C. W. Price. Power Plant Eng., vol. 23, no. 17, Sept. 1, 1919, pp. 784-785. Suggestions in regard to plant conditions, arrangement, order and lighting in and around industrial plants.

Steam Prime Movers. Methods of Guarding Engines and Turbines. Power House, vol. 12, no. 12, Aug. 5, 1919, pp. 330-333, 4 figs. Different forms of safety apparatus as applied to governors, fly wheels and rotors.

SALVAGE

Goodrich Rubber Company. Salvage and Reclamation Department of The B. F. Goodrich Rubber Company, George W. Sherman. Indus. Management, vol. 58, no. 3, Sept. 1919, pp. 176-178, 4 figs. Particularly in reference to organization features of department.

Liberty Engine Materials. Application of Liberty Engine Materials to the Automotive Industry, Harold F. Wood. Am. Mach., vol. 51, no. 12, Sept. 18, 1919, pp. 557-562. Author states reasons for use of certain materials and certain treatments for each part and gives recommendations for their application to problems of automotive industry.

TRANSPORTATION

Automobile Factory Transportation System. Automobile Factory Transportation Systems, Edward K. Hammond. Machy. (N.Y.), vol. 26, no. 1, Sept. 1919, pp. 1-7, 11 figs. Types of equipment used for transporting raw materials and parts of product through plant Willys-Overland Company in Toledo, Ohio.

Motor Trucks at Marine Freight Terminals. Motor Trucks and the Problem of Efficient Marine Freight Terminal Operation—II, III, Merrill C. Horine Int. Marine Eng., vol. 24, nos. 9 and 10, Sept. and Oct. 1919, pp. 632-637 and 696-703, 15 figs. Sept.: Comparison of horse dray with motor carriers; also discussion of value of store-door delivery. Oct.: Emphasizes that weak link of our transportation facilities as applied to overseas commerce is not in railroads or ocean carriers, but in methods and facilities employed for handling freight at marine terminals.

Truck Routing. Routing Trucks by Capacity. Commercial Vehicle, vol. 21, no. 3, Sept. 1, 1919, pp. 99-101, 2 figs. Brooklyn soap manufacturer claims to obtain greatest truck efficiency by this method.

Trucks, Electric. Use of Industrial Electric Trucks and Tractors in Warehouses, Bernard J. Dillon. Elec. Rev., vol. 75, no. 9, Aug. 30, 1919, pp. 345-348, 5 figs. Application of such equipment to handling problems of warehouses and storage places of all types.

Trucks, Garaging. How the American Railway Express Co. Secures Greater Service from Its Motor Trucks. Eng. & Contracting, vol. 52, no. 12, Sept. 17, 1919, pp. 340-341. Features of garaging and maintaining 3,313 motor vehicles.

VARIA

Chicago District. Industrial Resources of the Chicago District, H. B. Pulsifer, Procter Thomson and Ernest Edgar Thum. Chem. & Metallurgical Eng., vol. 21, no. 6, Sept. 15, 1919, pp. 310-319, 7 figs. Metallurgically, Chicago is described as ranking second only to Pittsburg as producing center, while in non-ferrous operations, refining and alloying are represented extensively. Statistics are quoted to show that in Lake County, Ind., and Cook County, Ill., value of stone, lime, sand and gravel, clay products, mineral paint, pigments, cement, coke and steel reached $300,000,000 market in 1917.

Indiana. Natural and Industrial Resources of Indiana, W. N. Logan and F. O. Anderegg. Chem. & Metallurgical Eng., vol 21, no. 6, Sept. 15, 1919, pp. 320-325, 5 figs. Noting specially research work being done in chemical plants.

Michigan. Natural and Industrial Resources of Michigan, R. A. Smith and W. L. Badger. Chem. & Metallurgical Eng., vol. 21, no. 6, Sept. 15, 1919, pp. 326-334, 2 figs. Leading products include; Iron, copper, salt, alkalis, halogens, lime, gypsum, cement, abrasives, silica, sugar, paper, dyes and organic chemicals.

Wisconsin. Natural and Industrial Resources of Wisconsin, W. O. Hotchkiss, O. L. Kowalke and A. M. Plumb. Chem. & Metallurgical Eng., vol. 21, no. 6, Sept. 15, 1919, pp. 335-341, 11 figs. Raw material resources consist of zinc ores, iron ores, granite and mineral waters. Leather and paper industries among most important of state on basis of value of product and number of men employed.

World Trade. The Economics and World Markets. Raw Material, vol. 1, no. 6, Aug. 1919, pp. 282-289, 9 figs. Reviews status of producing centers of the world, traces shipping routes, outlines smelting conditions and indicates present tendencies of market.

RAILROAD ENGINEERING

FOREIGN

England. A New Railway in South Yorkshire. Engineer, vol. 128, no. 3321, Aug. 22, 1919, pp. 171-173, 5 figs. Profile of railway and details of lifting bridge built over Knottingley and Goole Canal.

Sahara Railroad. The Sahara Railroad (Die Sahara-Esienbahn), F. Baltzer. Archiv f. Eisenbahnwesen, no. 3, May-June 1919, pp. 443-453. Its development and present status.

Train Speeds. European Train Speeds. Ry. Gaz., vol. 31, nos. 8 and 9, Aug. 22 and 29, 1919, pp. 235-236 and 263-266, 5 figs. Aug. 22: Fatest non-stop runs in Scandinavia. Aug. 29: Great Britain and Ireland.

CONSTRUCTION

Track Elevation. Elevation of Tracks at Aurora, W. T. Christine. Engr. World, vol. 15, no. 5, Sept. 1, 1919, pp. 17-21, 11 figs. Plans and details of construction.

Train Shed Raising. Raising a Large Train Shed under Traffic. Ry. Age, vol. 67m, no. 13, Sept. 26, 1919, pp. 609-612, 8 figs. Lackawanna lifts entire structure at Hoboken to overcome settlement and restore original clearance.

Large Train-Shed Raised without Traffic Interruption. Eng. News-Rec., vol. 83, no. 10, Sept. 4, 1919, pp. 460-462, 4 figs. Work done in consequence of subsidence of pile foundations of Lackawanna Railroad structure at Hoboken, N.J.

ELECTRIC RAILROADS

Free Wire System. Continuous Current Overhead Systems for Suburban Railway Electrification, E. Goolding. Tramway & Ry. World, vol. 46, no. 8, Aug. 14, 1919, pp. 72-74, 3 figs. Three-wire system using low pressure continuous-current machines in series.

Freight Traffic. Mineral and Goods Traffic Electrically Operated, Theodore Stevens. Electrical Rev., vol. 85, no. 2178, Aug. 22, 1919, pp. 249-251. Comparison between British steam locomotive mineral railway and American electrified mineral railway. (To be continued.)

Locomotives. Electric Freigbt Locomotive of the Pennsylvania Railroad Designed for Use on Heavy Grades. Ry. & Locomotive Eng., vol. 32, no. 9, Sept. 1919, pp. 260-261, 1 fig. One of interesting features is jackshaft gear which is so constructed and rim so connected to center by springs, that the whole power is transmitted through them, while design is such that up to an exertion of 25 per cent of its horsepower gear acts practically as a solid gear.

See also Regenerative Brakes.

New Electric Locomotives for the Hydro-Electric Power Commission, F. A. Gary. Elec. Traction, vol. 15, no. 9, Sept. 1919, 563-567, 2 figs. Description of six new 100,000 lb. electric locomot ives being built for use on Niagara Construction Railway.

Regenerative Brakes. TrialTrips of Alternating Current Locomotive with Electric Regenerative Brakes (Veruschsfahrten einer Wechselstromlokomotive mit elektrischer Nutzbremsung), Hans Behn-Eschenburg. Schweizerische Bauzeitung, vol. 74, no. 7, Aug. 16, 1919, pp. 84-89, 5 figs., partly on suppl. plate. Refers to article published in latter part of 1918 in Schweiz. Bauzeitung concerning new regenerative brake for a.c. locomotives. Present article supplements former and gives data in regard to practical tests, curves, wiring diagram of motor, etc.

West Penn System. The West Penn System. Elec. Traction, vol. 15, no. 9, Sept. 1919, pp. 531-542, 14 figs. Vast system of electric railways, light and power companys serves territory of 2,500 square miles.

ELECTRIFICATION

Current, Types. Single Phase Versus Continuous Current in Railway Electrification, E. Goolding. Tramway & Ry. World, vol. 46, no. 12, Sept. 11, 1919, pp. 137-139. Summary of relative merits and possibilities of different systems.

Europe. Electrification of Railways (Electrificacion de ferrocarriles), D. José Luis Valenti y Dorda. Revista de Obras Publicas, vol. 67, nos. 2288 and 2291, July 31 and Aug. 21, 1919, pp. 365-373 and 419-422. July 31: Notes on development in England, Switzerland, France, Italy and Germany. Aug. 21: Cost figures. (Concluded.)

France. Progress on the Midi Railway Pyrenean Electrification, Lucien A. H. Pahin. Elec. Ry. Jl., vol. 54, no. 10, Sept. 6, 1919, pp. 475-477, 3 figs. Ultimate

France. Progress on the Midi Railway Pyrenean Electrification, Lucien A. H. Pahin. Elec. Ry. Jl., vol. 54, no. 10, Sept. 6, 1919, pp. 475-477, 3 figs. Ultimate electrical mileage of more than 500 involved in development.

Switches. Railroad Electrification Facts and Factors, A. J. Manson. Ry. Elec. Engr., vol. 10, no. 9, Sept. 1919, pp. 311-314, 7 figs. Details of controlling apparatus and construction of electro-pneumatic unit switches.

LABOR

Track Labor. Improving Efficiency of Track Labor. Ry. Rev., vol. 65, no. 12, Sept. 20, 1919, pp. 409-412. Urges construction of good, clean, commodius, comfortable and sanitary quarters for track laborers as means for improving their working efficiency. Paper read before Roadmasters & Maintenance of Way Assn.

LOCOMOTIVE

British Locomotives. The Metamorphosis of the Locomotive, H. Holcroft. Engineer, vol. 128, no. 3320, Aug. 15, 1919, pp. 153-154, 1 fig. Recent innovations to British locomotive design, such as use of three high-pressure cylinders, and carrying circular smoke boxes in saddles. Fourth article.

Carbonization. Carbonization in Valve Chambers and Cylinders of Superheated Steam Locomotives; Its Cause, Effect on Lubrication and Maintenance, and Proper Measures to Overcome it, F. P. Roesch. Can. Ry. & Mar. World, no. 259, Sept. 1919, pp. 475-477, 4 figs. From anlyses of deposits of foreign matter which collect in valve chambers, passages, etc.

Feedwater Heaters. A New Departure in Locomotive Feedwater Heaters. Ry. Age, vol. 67, no. 10, Sept. 5, 1919, pp. 475-476, 3 figs. Combined feed-pump and feedwater heater of open type capable of handling 60,000 lb. of feedwater per hour.

Preheating of Feed Water in Locomotives (Vorwärmung des Speisewassers bei Lockomotiven), H. Igel. Zeitschrift für Dampfkessel u, Maschinenbetrieb, vol. 42, no. 18, May 2, 1919, pp. 130-133, 18 figs. Rieger preheater; flat shaped preheated for locomotive produced by Atlas Works, Bremen; types constructed by Schichau and Vulcan Works; Knorr one-chamber type.

Firebox Repairs. Locomotive Fire-Box Repairs, J. F. Springer. Ry. & Locomotive Engr., vol. 32, no. 9, Sept. 1919, pp. 270-271, 1 fig. By ocy-acetylene welding.

Mallet. Penn Lines Mallet Locomotive. Ry. Mech. Engr., vol. 93, no. 9, Sept. 1919, pp. 513-515, 4 figs. For pusher and hump yard service; 51-in. wheels and 28-in. stroke; 100,000 lb. tractive effort.

Powdered Fuel Equipment. A Pulverized Fue. Equipment for Locomotives. Ry. Age, vol. 67, no. 11, Sept. 12, 1919, pp. 519-520, 3 figs. Consists of fuel tank on tender, fuel-feeding apparatus, special arrangement of combustion chamber, slag or ash pans and smokebox.

Three-Cylinder Engines. Governing of Triple-Cylinder Locomotives (Die Steuerungen der Dreizylinderlokomotiven), F. Meinecke. Zeitschrift des Vereines deutscher Ingenieure, vol. 63, no. 18, May 3, 1919, pp. 409-411, 10 figs. According to writer three-cylinder engines have many advantages over four-cylinder engines, notably that two governing devices are sufficient for them. New simple governing device for triple-cylinder engine is described.

Valve Gear. Types of Valve Gear on French Locomotives, W. G. Landon. Ry. Mech. Engr., vol. 93, no. 9, Sept. 1919, pp. 523, 4 figs. Arrangements of Walschaert valve gear.

Valve Setting. Lame Engines and Their Effect on Fuel Consumption, J. W. Hardy. Ry. Mech. Engr., vol. 93, no. 9, Sept. 1919, pp. 515-516, 1 fig. Chart showing relation of fuel consumption to valve setting.

MAINTENANCE

Brakes, Freight. Maintenance of Freight Brakes, Mark Purcell. Ry. Mech. Engr., vol. 93, no. 9, Sept. 1919, pp. 531-532. Summary of instructions to be published for distribution by Air Brake Assn.

Bunk Cars. Some New Ideas in Bunk Car Facilities, H. F. Haag. Ry. Maintenance Engr., vol. 15, no. 9, Sept. 1919, pp. 305-307, 3 figs. Portable quarters provided for small gangs.

Upkeep of Railways. The "Upkeep" of the Railways under Federal Control. Eng. News-Rec., vol. 83, no. 10, Sept. 4, 1919, pp. 457-459. Analysis of conditions of railway properties now as compared with Jan. 1, 1918, when they were taken over by U. S. Government.

Tank Cars. The Tank Car Maintenance Problem, Paul Bateman. Mech. Eng., vol. 41, no. 10, Oct. 1919, pp. 817-819, 3 figs. Concerning particularly repairing of friction draft gear.

OPERATION AND MANAGEMENT

Explosives, Transportation. The Safe Movement of Explosives, D. J. O'Dea. Ry. Mech. Engr., vol. 93, no.9, Sept. 1919, pp. 533-537. Duties of carinspectors and repairers in respect to shipments of explosives and imflammables.

Fares, Australia. The Graduated Fare at Brisbane, Australia, J. S. Badger. Elec. Ry. Jl., vol. 54, no. 10, Sept. 6, 1919, pp. 481-484, 5 figs. Writer claims that in 1918 collections were 45.15 cents per car-mile with 60 per cent of riders paying only two cents each.

Freight Handling. Freight Handling at Brooklyn Army Base. Eng. News-Rec., vol. 83, no. 12, Sept. 18, 1919, pp. 555-560, 5 figs. Principles and prospective methods which controlled design of huge terminal intended to care for army overseas business at port of New York.

Loading of Cars. The Heavier Loading of Cars and Its Importance to the Transportation and Industrial Life of the Nation, M. J. Wise. Railroad Herald, vol. 34, no. 10, Sept. 1919, pp. 15-17. Concerning manner of conducting campaign for making ships load cars to maximum capacity.

Logarithmic Charts. The Logarithmic Chart in the Analysis of Railroad Operations, F. J. Deesen. Ry. Age, vol. 67, no. 12, Sept. 19, 1919, pp. 570-571, 6 figs. Illustrating uses of logarithmic chart.

Telegraphs and Telephones. I.C.C. Statistics on Telegraph and Telephone. Ry. Signal Engr., vol. 12, no. 9, Sept. 1919, pp. 305-309. Including table showing miles of telegraph and telephone lines being operated by American railways.

The Railway Telegraph, E. L. King. Proc. Pac. Ry. Club, vol. 2, no. 4, July 1919, pp. 3-9. Handling of railroad telegraph business; use and abuse of the telephone.

PUBLIC REGULATION

Good Will. Acquiring Good Will. Elec. Traction, vol. 15, no. 9, Sept. 1919, pp. 548-552, 14 figs. Springfield (Ohio) railways begin all over after granting of new franchise and have succeeded in giving real service that is highly appreciated by public.

Japan. Railway Nationalization in Japan. Ry. Engr., vol. 40, no. 476, Sept. 1919, pp. 196-199. Account of operation under state management from 1907-1917.

Municipal Ownership. Elements of the Cost of Service, Replacements Valuation and Rate of Return, Mortimer E. Cooley. Aera, vol. 8, no. 1, Aug. 1919, pp. 15-18. Arguments against municipal ownership of street railways.

The Advantages of Municipal Ownership and Operation of Street Railways, Glenn E. Hoover. Elec. Traction, vol. 15, no. 9, Sept. 1919, pp. 544-545. Enumerates advantages accruing from municipal ownership and points out that to his knowledge, no city ever reverted from municipal ownership of street railways to private ownership.

Railroad Operation. A plan for Private Operation of Federalized Railways, William J. Wilgus. Eng. News-Rec., vol. 83, no. 11, Sept. 11, 1919, pp. 496-497. Employees would have voice in management and share surplus with operators and public.

Track Supports. Concrete for Railway Track Support. Contract Rec., vol. 33, no. 36, Sept. 3, 1919, pp. 827-831, 2 figs. Four year's experience claimed to show lower maintenance though higher first cost.

Concrete Railway Track Supports. Engr. World, vol. 15, no. 5, Sept. 1, 1919, pp. 25-28, 9 figs. Illustrating various types in operation and suggested designs. Paper read before Am. Concrete Inst.

Track Welding. Track Welding by the Metallic Arc, Cyril J. Hopkins. Electrical Rev., vol. 83, no. 2180, Sept. 5, 1919, pp. 292-293, 5 figs. Current is obtained from motor-generator installed on covered wagon, taking supply from trolley wire. Details of fish-plate welding.

Turn Tables. Recent Examples of Turntable Design. Ry. Maintenance Engr., vol. 15, no. 9, Sept. 1919, pp. 312-314, 6 figs. Two designs illustrated, one with disc bearing center built by N. Y. Central, and one of continuous girder design built by Penn. R.R.

RAILS

Corrugations. Corrugations in Rails (Note sur l'usure ondulatoire des rails et leur fabrication), M. Ch. Thonet. Revue Universelle des Mines de la Métallurgie, vol. 2, no. 1, Mar.-Apr. 1919, pp. 501-539, 8 figs. Summarizing investigations undertaken by various experimenters, writer concludes that these undulations are due to presence of impurities in steel, and that in order to prevent their formation, steel used for rails should possess a high elasticity and prevent homogeneity.

Failures. Maintenance of Permanent Way—III. Ry. Engr., vol. 40, no. 476, Sept. 1919, pp. 188-193. Causes of rail failures.

Selection. Selection of Rails for Electric Railway Service, R. C. Cram. Elec. Ry. Jl., vol. 54, no. 12, Sept. 20, 1919, pp. 556-559, 6 figs. Data required and implements of manufacturing details as factors in determining proper form for a rail. For determining weight of rail rule developed by Baldwin Locomotive Works is recommended.

ROLLING STOCK

All-Metal Cars. Multiple Unit Equipment for English Railway. Ry. Age. vol. 67, no. 13, Sept. 26, 1919, pp. 625-628, 4 figs. Description of all-metal cars offers opportunity for interesting comparison with similar American rolling stock.

Box Cars. Box Cars Built by C. M. and St. P. Ry. Mech. Engr., vol. 93, no. 9, Sept. 1919, pp. 529-531, 5 figs. Underframe has steel center sill and wooden side sills; wooden frame body with steel ends.

Caboose. United States Standard Caboose Cars. Ry. Rev., vol. 65, no. 11, Sept. 13, 1919, pp. 379-380, 6 figs. Designs prepared for both steel and composite construction by Railroad Administration's Equipment Standards Committee.

Grain Elevators, Portable. Portable Pneumatic Grain Elevator, George F. Zimmer. Eng. World, vol. 15, no. 6, Sept. 15, 1919, pp. 36-38, 8 figs. Mounted iron railway rolling stock. Front end is supported on 8-wheel bogie, and rear pair of wheels being of ordinary type, while center pair can be coupled to engine so that truck can travel on its own power at rate of 5 miles per hour.

Lighting. New Developments in Car Lighting Save Money, E. Wanamaker. Ry. Age, vol. 67, no. 12, Sept. 19, 1919, pp. 567-569. Historical review of progress made from 1825 to present time, with notes on reasoned investigations. From paper read before Western Ry. Club.

Mail Cars. Specifications for Steel Full Mail Cars for Canadian Railway Mail Service. Can. Ry. & Mar. World, no. 259, Sept. 1919, pp. 472, 1 fig. Approved by Board of Railway Commissioners.

SAFETY AND SIGNALLING SYSTEMS

Block Signal Working Model. Southern Pacific Builds Instruction Car. Ry. Signal Engr., vol. 12, no. 9, Sept. 1919, pp. 309-311, 3 figs. Automobile Block signal working model installed with other apparatus for presenting operating problems,

Blue Lights, New York Subways. Blue Lights and Their Significance in the New York Subways, Edward A. Poor. Elec. Ry. Jl., vol. 54, no. 12, Sept. 20, 1919, pp. 579-581, 6 figs. Emergency precautions that have been taken to provide for the cutting off of power, the turning in of alarms and the automatic changing over to an emergency source of power for lighting.

Inspectors. Power-Saving Instruments a Long-Standing Success in Great Britain and Ireland. Elec. Ry. Jl., vol. 54, no. 11, Sept. 13, 1919, pp. 521-526, 6 figs. Value of follow-up recognized by maintaining motorman's inspector as permanent official.

Lightning Protection, Telegraph and Telephone. Telegraph and Telephone Lightning Protection. Ry. Signal Engr., vol. 12, no. 9, Sept. 1919, pp. 317-319, 18 figs. Purpose, scope and requirements briefly outlined with rules for applying protector principles.

SIGNALMEN'S CAR. Improved Outfit Cars Produce Good Results, H. F. Haag. Ry. Signal Engr., vol. 12, no. 9, Sept. 1919, pp. 302-304, 4 figs. Layout of four-car outfit designed by Kansas City Southern for use of signalmen.

TRAIN CONTROL SYSTEM. Test of Automatic Train Control System. Ry. Signal Engr., vol. 12, no. 9, Sept. 1919, pp. 312-316, 8 figs. Magnetic-inductive type installed on Western Pacific and Southern Pacific in California.

SHOPS

CYLINDERS, WELDING. Welding Locomotive Cylinders, J. B. Tynan. Ry. Mech. Engr., vol. 93, no. 9, Sept. 1919, pp. 540, 2 figs. Cylinder casting having large section of barrel broken off repaired by gas welding.

ELECTRICAL EQUIPMENT. Electrical Equipment of B. & O. Glenwood Shops. Ry. Elec. Engr., vol. 10, no. 9, Sept. 1919, pp. 297-304, 16 figs. With special reference to facilities for lighting, power and electric arc welding.

ROUND-HOUSE DESIGN. Modern Tendencies in Round-House Design, Exum M. Haas. Ry. Mech. Engr., vol. 93, no. 9, Sept. 1919, pp. 521-522. Modern types divided into three classes—brick wall, wood frame and roof; reinforced-concrete frame and roof; and combination of steel frame and reinforced-concrete structure. From paper presented before Western. Soc. of Engrs.

TIE TREATING PLANT. Pennsylvania Has Novel Treating Plant. Ry. Maintenance Engr., vol. 15, no. 9, Sept. 1919, pp. 315-317, 4 figs. Portable tie treating plant.

WOOD PRESERVING PLANT, PORTABLE. A Complete Wood Preserving Plant Mounted on Cars. Ry. Age, vol. 67, no. 10, Sept. 5, 1919, pp. 453-455, 4 figs. Portable equipment used by Penn. R.R

STREET RAILWAYS

CINCINNATI. Cost of Service in Cincinnati, W. C. Culkins. Elec. Traction, vol. 15, no. 9, Sept. 1919, pp. 570-572, 2 figs. Service-at-cost franchise adopted for solving street railroad problem.

COUPLING MECHANISM, AUTOMATIC. Automatic Coupling Mechanism for Tramways (Autocoupleur pour tramways). Bulletin Technique de la Suisse Romande, vol. 45, no. 17, Aug. 23, 1919, pp. 171-174, 5 figs. Projecting bar operates mechanism which drops weight and engages vertical rod in hole of bar. There are two similar mechanisms, one in each tramway.

DUNDEE. Dundee Municipal Tramways. Tramway & Ry. World, vol. 46, no. 12, Sept. 11, 1919, pp. 131-135, 8 figs. Progressive system with prospects of extensive development.

ECONOMIC FUTURE. Economic Future of Transportation Utilities. Elec. Ry. Jl., vol. 54, no. 11, Sept. 13, 1919, pp. 529-531. Symposium presented at Western Society of Engineers' meeting.

ELECTRIC RAILWAY SITUATION. The Electric Railway Situation of the United States Summarized. Aera, vol. 8, no. 1, Aug. 1919, pp. 8-11. Facts which have been brought out before U. S. Federal Elec. Ry. Commission appointed by the President to investigate urban transportation and its needs.

FARE COLLECTION. The Collection of Odd Street Railway Fares, R. T. Sullivan. Elec. Ry. Jl., vol. 54, no. 13, Sept. 27, 1919, pp. 653-656, 4 figs. Illustrating how design of car facilitates collection.

FARE SYSTEMS. Zones Fares in Springfield. Elec. Ry. Jl., vol. 54, no. 13, Sept. 27, 1919, pp. 628-636, 12 figs. Based on central city zone with outer zone belts and two reduced-rate tickets to points in first outside zone.

Zone System in Portland. Elec. Ry. Jl., vol. 54, no. 13, Sept. 27. 1919, pp. 621-627, 11 figs. System in Portland, Maine, comprises slightly more than 100 miles of track, the population served approximately 100,000 except during summer months when it is increased to 175,000.

The Net Result of the 5-Cent Fare, James R. Bibbins. Elec. Ry. Jl., vol. 54, no. 12, Sept. 20, 1919, pp. 570-571, 1 fig. Instance of large company in which 5-cent fare is said to have produced instability. Paper presented at Western Soc. of Engrs.

Zone Fares have been found Satisfactory in Milwaukee. Elec. Ry. Jl., vol. 54, no. 13, Sept. 27, 1919, pp. 613-620, 11 figs. Present system has been in existence since January 18, 1914.

Discussion of Fare Systems. Elec. Ry. Jl., vol. 5, no. 13, Sept. 27, 1919, pp. 610-612. Present fare systems classified and compared. Fundamentals of scientific system outlined.

SPEEDS. Advantage of Higher Schedule Speeds, John A. Beeler. Elec. Ry. Jl., vol. 54, no. 13, Sept. 27, 1919, pp. 657-660. Claimed to be of benefit to both the company and the public.

TERMINALS

EAST ST. LOUIS. Terminal Improvements in East St. Louis. Ry. Rev., vol. 65, no. 12, Sept. 20, 1919, pp. 405-407, 7 figs. Arrangement to route traffic along water front instead of through to junction points.

MARKHAM YARDS. Markham Yards of Illinois Central, W. T. Christine. Eng. World, vol. 15, no. 6, Sept. 15, 1919, pp. 25-28, 8 figs. For classifying freight, making up trains composed of various commodities and for various industries and destinations to bring freight so classified into Chicago for distribution and to handle outbound freight in an equal manner.

Mixed asphalt and clay mastic cast, excavated at Lagash near the mouth of the Euphrates, which dates back to 2850 B. C.

As Far Back As Knowledge Extends

As early as 3000 B. C., asphalt was used as a cementing medium or binder for attaching small objects or ornaments to sculptures, carvings and pottery.

Later, Nabopolasser, King of Babylon, used asphalt as a filler or mortar for brick pavements. His son, Nebuchadnezzer, next used asphalt as a mortar in the construction of brick walls and foundations.

It is a far cry from an ancient Babylonian roadway to modern and beautiful Fifth Avenue—yet both have been indebted to asphalt for much of the fame, beauty and durability which rank them as leaders in their respective periods of history.

The uses of asphalt are being steadily extended and production and application of the material are being simplified. Through centuries of time asphalt has been subjected to countless tests and uses. It is the inevitable solution of the paving problem.

The Economy of Treating Railroad Ties

By S. B. Wass, A.M.E.I.C.

History of Treatment, Most Suitable Woods, Principal Methods of Treatment, Treatment in Canada, Advantages of Treatment.

Up to the present time wood for all purposes in Canada has been available in such quantities, and at such prices, that very little thought has been given, or care taken to extend the period of its life, or to conserve its use. No accurate estimate is available of the total quantity of timber in Canada, but Senator W. C. Edwards said, while presiding at the tenth annual meeting of Commission of Conservation recently: "The lumber east of the Rocky Mountains is almost exhausted, and every Province overestimates its lumber resources." It is generally conceded that the annual cut of lumber with destruction from forest fires exceeds greatly the annual growth, so that with the greater development of our country during the re-construction period, no greater depletion of our forest reserves must take place unless some prompt action is taken to counteract it.

Several methods at once suggest themselves: Reforestration, Fire Protection, Chemical Preservation, and others. As railway ties form a very large proportion of the requirements for wood it is proposed to deal in this paper with Chemical Preservation as applied to railway ties.

Chemical Preservation of wood is not a new industry. In very early days oil was used to preserve timber, and as far back as 1782 creosote was used in Europe to preserve ship timbers and timbers for dykes.

Chemical Preservation consists of impregnating the pores of the wood with a toxic antiseptic, which poisons the fungi or bacteria which consume and destroy the fibres of the wood. The best and most economical substances are creosote, or dead oil of tar, and zinc chloride solution, or combination of these.

History of the Treatment

Treatment of ties has been carried on in Europe for a great many years. Great care has been exercised in the selection of the timber and seasoning before treatment. Of eighty-seven railroads reporting to the International Railway Congress in 1900, fifty-nine were using treated ties almost entirely and twenty-eight only were using untreated ties, and these latter were of the smaller roads.

In Great Britain the larger portion of ties are of baltic pine imported from Norway, Sweden and Northern Russia, the average life of which, untreated, is eight years. When properly treated the average life is fifteen or sixteen years, thus the life of the tie is doubled. The treatment used is creosote, or zinc chloride and creosote.

In Continental Europe, a great variety of woods has been used, but oak, pine, and beech are the most uniformly distributed and are available in largest quantities. The Report of the International Railway Congress states that from data of fifty-four railways the average life of ties is as follows:—

Oak, untreated, 13.5 years, creosoted, 25 years. Inc. in life, 85%.

Pine, untreated, 7 to 8 years, creosoted, 20 years. Inc. in life, 150%.

Beech, untreated, 2½ to 3 years, creosoted, 30 years. Inc. in life, 900%.

The report goes on to say, "Of all wood in Europe sound beech is the most thoroughly susceptible of impregnation, this fact is due to the circumstance that beech is mostly sap wood, and consequently all the pores, which in their natural condition serve to transmit water, remain permanently open; whereas in the case of oak and pine the creosote penetrates only through the sap portion of the wood, while the heart wood absorbs very little or none. Results reported by certain of the French roads show that Creosoted Beech ties harden with age or service, and eventually surpass oak ties in durability and hardness, so that they are preferably used on lines of heavy traffic. In consideration of the foregoing qualities, and the fact that the first cost of beech is less than that of oak and pine, it is considered by far the most suitable timber for ties."

In the United States experimental work was carried on as far back as 1880, but the first tie-treating plant was constructed by the Atchison, Topeka and Santa Fe Railroad in 1885, followed by one for the Union Pacific, one for the Chicago Rock Island and Pacific in 1886, and one for the Southern Pacific in 1887. For the next ten years during the period of financial depression the development was slow, but commencing in 1897 twelve plants were constructed in very rapid succession for or by American roads in the West and Middle West, where timber is less plentiful than in the Eastern States and the long haul on ties led to greater care and treatment of ties. From that time development has been rapid until 1914, during which year ninety-five tie treating plants treated 43,847,000 ties or 34.26% of the 128,064.000 ties used by railroads in the United States. Since 1914 the production has fallen off owing to extremely high prices of preservative and to other abnormal conditions due to the war.

Types of Wood Suitable for Treatment

In the United States all kinds of wood have been subject to treatment with varying results. The records are not so complete as in case of European roads as the majority of the most successful examples of treatment are still in the track, and their life can only be estimated. Enough is known, however, to prove beyond a doubt that the life of the average first class tie can be increased by 200% to 300% by chemical treatment, that the increase will be proportional, within certain limits, to the amounts and quality of preservative used, that the greatest advantage can be gained by treatment of the harder and more porous woods as red oak, beech, birch, maple and similar species. These species absorb the preservative more readily and uniformly, are stronger to withstand mechanical wear, and provide greater strength to the track generally and great strength is a necessity on account of the heavy loads imposed by up-to-date rolling stock.

Treatment Processes

In general four processes of treatment have been used:

1st. Creosote only.

2nd. Mixture of Creosote and Zinc Chloride.

3rd. Mixture of Zinc Chloride, glue, and tannin.

4th. Zinc Chloride only.

The most economical process for any particular case depends very largely on local conditions such as the price of ties, price of preservative, length of haul, labor conditions, etc. Generally the creosote process gives most permanent results, but since the war the price of creosote has been almost prohibitive and the supply limited. The mixture of creosote and zinc chloride gives good results for timber not exposed to the action of the salt water and is very much cheaper than Creosote alone, the third and fourth processes are cheaper, but the results are less satisfactory due to the antiseptic being dissolved by moisture; also less resistance to electric current is offered by ties treated by the zinc chloride process.

Some difficulty has been experienced on account of the fact that these ties transmit the current in automatic signal territory. This does not occur with creosoted ties. If, however, the price of creosote does not come down these processes will be more largely used, especially by the roads of the Middle West, where the climate is dry.

The combined committee of the American Railroad Engineering Association and the American Wood Preservers Association, after a lengthy report and discussion on processes at their convention in Chicago in last March arrived at the following conclusions:—

I. Creosote is the finest timber preserving agent known for all purposes; its composition is not affected by either rainfall or temperature. it has a lubricating effect on the wood which diminishes the injury due to mechanical wear, which combination of qualities places it at the head of all treating preservatives.

2. Where for economic reasons creosote oil is not available, or other conditions of maintenance will not justify the expense of creosote treatment, the adoption of zinc chloride is without question justified in the treatment of ties. Climatic conditions will go further in determining the economy of this treatment than in any other. One can unquestionably figure on doubling the life of the untreated timber by its use in dry climates.

3. In localities where the rainfall is excessive and the atmosphere is humid the Zinc Chloride treatment is unfavourably influenced by leaching, and in any climate where leaching of the timber is likely to be excessive, and the mechanical abuse of the fibre is extreme it is not considered possible to secure a straight Creosote treatment. The introduction of some lubricating agent with Zinc Chloride has a beneficial effect in retarding the destruction of the timber from the above causes.

In Canada the industry is in its infancy; up to 1910 practically no treated ties were used; since that time the following growth has taken place:—

In 1911, 206,000 ties; in 1912, 1,818,000 ties were treated, the maximum was reached in 1915, with 3,915,000 ties, after which the number decreased to 2,732,000 ties, due to abnormal conditions and prices. This development has taken place principally in the West, and practically no treated ties are being used in the East of Canada. Only the creosote process has been used in Canada, and the treatment in many cases for experimental purposes has been thorough. Judging by present conditions and from estimates of the life of ties made by the Railway Maintenance Engineers, it would seem that the results of treatment will be highly satisfactory, and that the Canadian railways should encourage and develop the tie treating industry.

Advantage of Treatment

From the railroad point of view the advantage to be gained is two fold:—First, Indirect; Second, Direct.

The indirect effect of treating railroad ties would be to reduce the requirements of the railroads to at least 50% of what they would be for untreated ties. Hence the treatment of railroad ties would be an important factor in conserving our forest reserves, the railways are among the heaviest users of timber for up to the present no satisfactory substitute has been found for wood ties. It has been estimated by A. Gibson, Superintendent of the Timber Preservation & Tie Treating plants of the Northern Pacific Railroad, that if untreated ties were used throughout the United States the railroads would require 191,000,000 ties annually for renewals; this would be reduced by 113,000,000, were all ties treated. Hence in Canada we would effect a saving of about 12,000,000 ties annually on our 30,000 miles of railroads by using treated ties. Hardwood is highly suitable for treatment, and hence if the use of treated ties becomes more general, a vast amount of hardwood would be used which is at present, either used for fuel or left standing, becoming frequently a prey to forest fires. The use of hardwood ties would also release a large amount of more valuable soft woods for other purposes.

The principal direct advantages from the use of treated ties are as follows:—

Greater strength of track is afforded by hardwood ties, which are stronger to hold track to gauge, and resist better the mechanical wear of the rail.

The surface is improved as the material under the ties is not disturbed so frequently for renewals. With reference to this, W. M. Camp, says, "Any preservative process which will double the natural life of the tie, at a total cost for the handling and treatment not exceeding the cost of an untreated tie is a paying proposition for any railroad."

The third direct result of treating is seen in reduction of annual cost of ties. The annual cost of maintaining a tie in the track consists of three items: 1st, the interest of the first cost of the tie, 2nd, a sinking fund which will be sufficient to replace the tie when it becomes worn out. 3rd, the annual labor charge for surfacing. A comparison of treated and untreated ties on this basis is interesting. The third item varies greatly under different conditions, and an accurate estimate cannot be made. It is quite safe to assume, however, that the difference if any, will be in favor of the treated tie, we shall, therefore, only consider the first two items.

Untreated Ties

Cost of tie	90c.
Placing in track	35c.
Total	$1.25
Annual Cost:	
Interest on $1.25 @ 5.5% per annum	6.875 cts.
Sinking fund to replace tie after 7 years	15.123 "
Total	21.998 "

Treated Tie

Cost of tie	$1.00
Seasoning and creosoting	.53
Placing in track	.35
Total	$1.88
Annual cost:	
Interest on $1.88 @ 5.5% per Annum	10.340 cts.
Sinking fund to replace tie after 15 years	8,393 "
Total	18.733 "

These tables show an annual reduction of 3.265 cts. per tie or in other words an annual saving in maintenance of $68.20 per mile of railroad by the use of the treated ties.

This saving, like most good things, cannot be had without some expenditure of energy and capital on the part of those interested. The railways and the producers must co-operate in order to replace the present wasteful method of supplying ties with the more methodical, scientific and economic process required for treated ties. This change cannot be affected at once but will require some years to be developed; but the saving will amply repay the expenditure; and it would seem that a start should be made in Eastern Canada.

Editorial Note

The comparison showing costs of treated or untreated ties depends largely on the rate chosen for the sinking fund. The author of the paper has chosen 5½%, and it is possible that this rate is too low for present conditions. It is obvious that the method of calculating sinking fund and the interest charged for the whole amount of money involved has a very important bearing on the subject and a relatively slight change in interest would make the whole difference between whether the treated tie or untreated tie was the proper one to use.

Duty of Water Investigations in Alberta*

By F. H. Peters, M.E.I.C.

"Duty of Water" means the quantity of water required to irrigate one acre of land in each irrigation season; the author describes experiments on duty of water conducted by the Irrigation Branch of the Department of the Interior, and gives tables showing results obtained for different crops.

All surface water in the provinces of Alberta and Saskatchewan belongs to the Crown, and the use of this water for irrigation and every other purpose except for water power, is controlled by the Dominion Irrigation Act. In accordance with the requirements of this Act, the duty of water is fixed by the Minister of the Interior, and this has created the necessity for practical experimental work to determine what the proper duty of water is in Western Canada.

The duty of water means the quantity of water that is required to irrigate one acre of land in each irrigation season, which includes the annual period from May to September, both inclusive, and in certain districts the annual period from April to September, both inclusive. The duty of water fixes the *quantity* that is to be supplied during the irrigation season, but it has nothing whatever to do with the rate at which the water is to be supplied during the season. It is assumed that the total duty is to be supplied throughout the irrigation season at such rates of flow as will make field irrigation a practical success.

It is obvious that the proper duty of water depends on a number of different factors and that it will vary in different localities. The factors which mainly affect the duty of water are the climatic conditions and the soil conditions, and in the same locality different crops will require different quantities of water. The Irrigation Branch of the Department of the Interior has carried on the only investigations to determine the duty of water in Western Canada. It is possible that investigations along this line have been made by other parties, but if so they have never been published and made available for general information. In carrying on these duty of water investigations the Canadian Pacific Railway have assisted by providing land and water to work with, and the Canada Land and Irrigation Company have co-operated by carrying on experimental work under the supervision of government officials at their demonstration farm at Ronalane, Alberta. The two principal duty of water experiment stations are now at Brooks, and Ronalane, Alberta. An experiment station was previously operated at Strathmore, Alberta, and similar work is also being done at the present time in the Coaldale irrigated district near Lethbridge. The work which has been done at these stations gives general results which are typical for the larger irrigated blocks which have already been developed, or are proposed to be developed in the future. Up to the present there has been no opportunity to study very closely the question of local variations.

*To be read before the Western Professional Meeting of the Institute at Edmonton.

The method of carrying on these experiments is such as to give definite and positive results. A piece of land is selected which has consistent characteristics throughout and this is then divided up into a number of smaller plots. To determine the duty of water for wheat for example, perhaps ten of these plots are sown to wheat. They are then all treated exactly alike except that varying depths of water are applied. The first plot is left dry; the next receives four inches; the next eight inches; the next twelve inches, and so on up to a point where so much water is applied that the yield is actually decreased. This method definitely fixes the quantity of water which produces the maximum yield of all the different crops which are experimented with. This work is all checked by determining from soil moisture investigations the quantity of available water in the soils, both in the spring and in the fall of the year. Sometimes with the deeper rooted plants, the plots which do not receive sufficient irrigation water draw on the available moisture which was in the soil in the spring, and conversely with some of the plots that receive large quantities of water, the plants cannot use all of the water supplied and some of it is stored up in the soil. By determining the quantity of water available in the soil in the spring and again in the fall, we can determine definitely just what quantity of water has actually been used by the plants during the growing season.

The experimental work referred to above shows just what results are gained from the different crops by applying different depths of water, and finally shows the depth of water which produces the maximum yield. It does not follow, however, that the quantity which produces the maximum yield should be adopted in fixing the duty of water. In fixing the legal duty of water there are practical considerations which have to be taken into account. It may not pay under practical conditions to supply the quantity of water which will produce the maximum crop yields. It may be much better to fix a duty which can be readily applied and at the same time give a large increase in crop yield. After a certain quantity of water has been applied, it usually takes a comparatively very large quantity of water to produce additional gains in the crop. Another practical point which has to be considered is the desirability of conserving the water supply which is available in our streams. Particularly with low priced dry lands, the value of a certain quantity of water may be much greater if spread over a larger area. That is to say, one and one-half acre-feet of water spread over one acre of land might produce fifty bushels of wheat, while three-quarters of an acre-foot spread over one acre might produce thirty-five bushels. Thus if one and one-half acre-feet were spread over two acres of land, it could be made to produce seventy bushels.

Any full discussion of the definite duty of water in Western Canada requires a mass of detailed information, and anybody who is particularly interested in this question can get all this information by reference to the reports which have been published by the Irrigation Branch. The original duty of water in Western Canada was fixed by requiring a continuous flow throughout the irrigation season of one cubic foot per second for each one hundred acres of land. This figures out to a duty of three acre-feet, giving a depth of three feet of water all over the land. Later the duty was changed requiring a continuous flow of one cubic foot per second for one hundred and fifty acres of land, which is equal to two acre-feet or a depth of twenty-four inches over the land. On March 25th of the present year, the duty was again changed and fixed at one and one-half acre feet for each acre of land, which equals a depth of eighteen inches. The investigations which have been made by the department indicate that with a system constructed so as to give a delivery of water at proper rates for practical use, that one and one-half acre-feet is sufficient under our general conditions in Western Canada, and is a proper general duty of water.

The diagram which is printed below shows at a glance the kind of information that is gained in carrying on the duty of water experimental work. The diagram shows the results actually gained at Ronalane during the season of 1917. The diagram is divided off, to show the various crops on which experiments were made. Above the central horizontal line the columns represent the crop yield, and similar columns plotted underneath the central line show the depths of water which produced the crops. The column below the line representing the depth of water which produced the maximum yield is shown cross hatched with a view to bringirg it more prominently before the eye. It is very evident from this diagram just how the crops increase as the depth of water applied is increased, until one reaches a point where too much water keeps the land wet and cold, and the crop yield begins to fall off again. As an exception, the greatest depth of water applied produced the greatest yield of wheat, but this particular experiment was not carried far enough to prove that an increased quantity would have decreased the yield. It will be noted that in the alfalfa crop the first group of columns shows the application of four inch irrigations, while the second group shows the results from the application of six inch irrigations. Similarly for the wheat, oats, barley and peas, the main group of columns shows four inch irrigations, while the last two in each case show six inch irrigations.

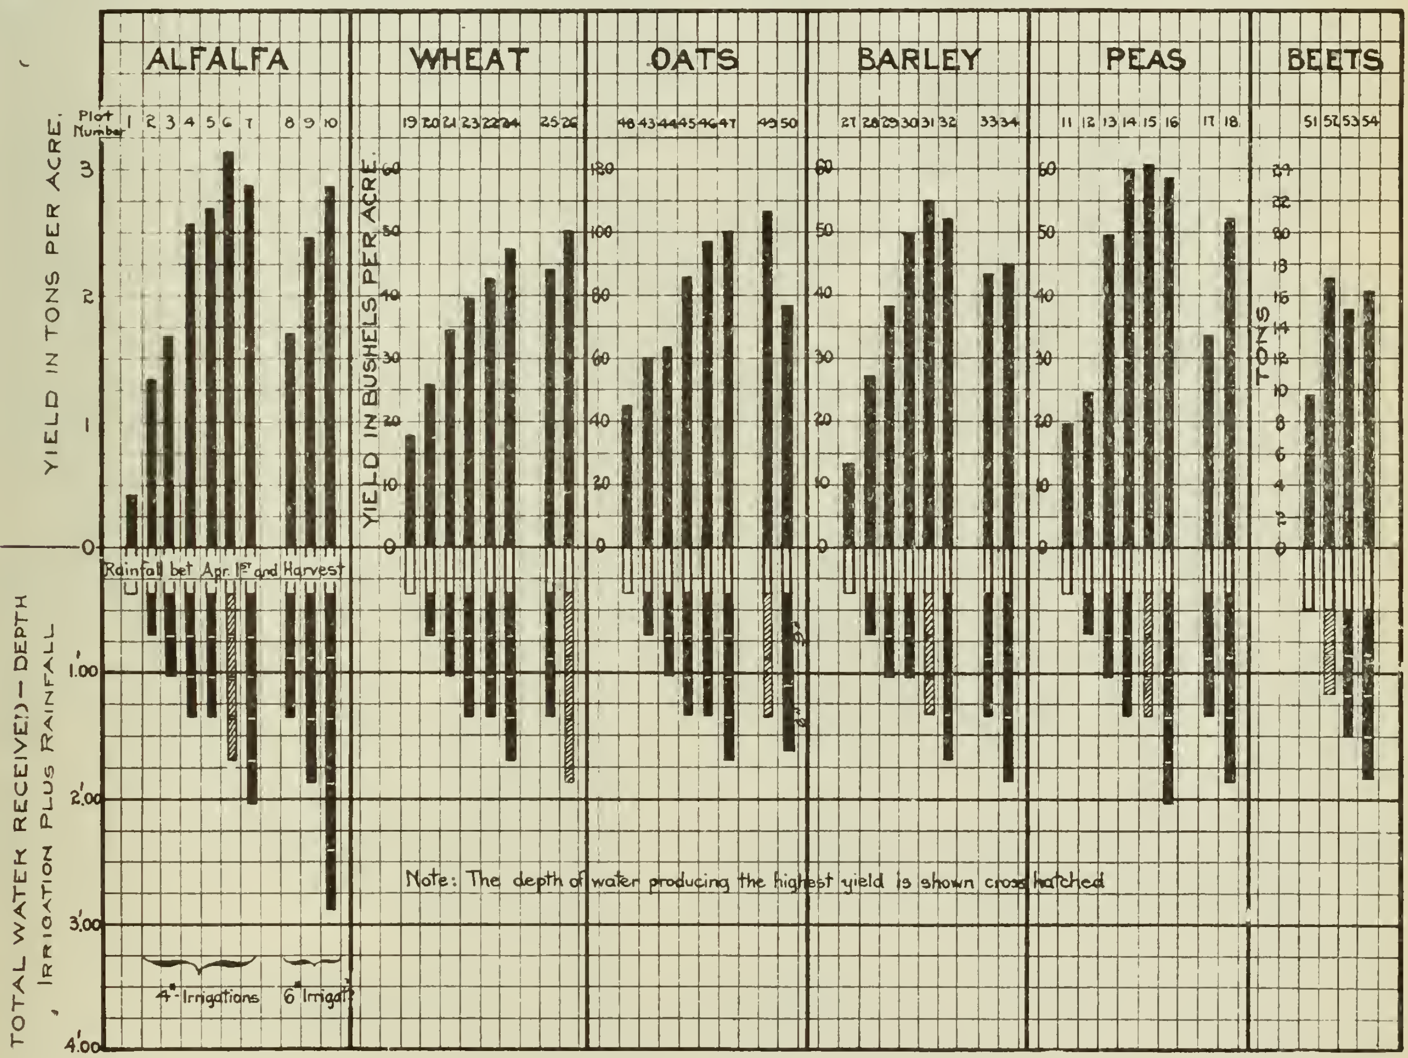

Diagram Showing Yields Produced in Comparison with Irrigation Water Applied, Ronalane, Alberta, 1917.

Coal Briquetting and Conservation

By P. A. N. Seurot, M.E.I.C.

Advantages of Briquetting—Briquette Binders—Description of Presses—Layout of Briquetting Plant.

Coal Shortage and Utilization of Waste.

The high cost of coal is due to several causes, chiefly to trusts, transportation, local and climatic conditions; the shortage of coal may be due to lack of, or to poor, mining resources, to strikes, blockade, etc.

There is another phase of the problem which, so far, in Canada, has not been seriously considered, and that is the waste of coal and by this is meant the waste or non-utilization of the refuse or dust left in barges, in cars, in coal yards, in power plants, in gas plants, the waste of "run-of-mine," dust, or slack left in mines and collieries.

In regard to coal production, Canada was before 1914, very much in the same position as France. This latter country, whose natural coal resources were not sufficient to supply her needs depended on England, getting coal from Newcastle and Cardiff just as Canada depends partly on the Lehigh and Lackawanna fields, on Pennsylvania and on West Virginia.

The production of coal for the years 1912 and 1913 was as follows:—

In 1912:—14,512,829 tons representing a value of	$36,019,044
In 1913:—15,115,089 tons representing a value of	36,250,311
For the two years, a value of	$72,269,355

The imports of coal from the United States into Canada for the same two years amounted to :—

Anthracite Coal.	
In 1912:—4,118,379 tons representing a value of	$19,306,639
In 1913:—4,237,310 tons representing a value of	20,399,279
Bituminous Coal.	
In 1912:—10,500,662 tons representing a value of	20,333,268
In 1913:—11,060,910 tons representing a value of	20,447,587
For the two years, a value of	$80,486,773

It may be seen, therefore, that while the production of coal in Canada amounted to $72,269,355 for the years 1912-1913, the imports of coal amounted for the same years to $80,486,773, i.e., an excess of imports over home production of $8,217,418.

While it is not claimed that the imports of coal could be dispensed with, there is no reason why the manufacture and use of briquettes for commercial and domestic purposes, utilizing run-of-mine slack, breeze, coal dust and waste could not more than redeem this difference of over $8,000,000.

The scarcity of coal and the high cost, particularly during 1917 and 1918 emphasize still more forcibly the necessity of utilizing all wasted coal, slack, and dust to make up in a mesure for lack of adequate supply and to keep prices down.

The Committee on Conservation of our own *Engineering Institute*, the then *Canadian Society of Civil Engineers*, in its report of 1915 quoting W. J. Dick, Mining Engineer to the Commission on Conservation, stated that:—"At our coal mines, from the Atlantic to the Pacific, the waste of coal, and so of potential power, is simply appalling. In Saskatchewan, Alberta and British Columbia, from 10% to 35% of the whole output of coal brought to the surface is waste slack. Some of it is burnt on the prairies; in British Columbia much is thrown into the sea. There is no doubt but that the waste in Eastern Canada is correspondingly great and some attempt to inculcate a little economy on the part of coal mine operators would be in the direct line of the efforts and functions of the Commission.

Mr. Dick states further that there are four briquetting plants in Canada. The limiting output of these 4 plants is only about 1100 tons per day, say 350,000 tons per annum, which is a very small proportion of the total slack coal produced, the rest being sheer waste.

In Germany alone, the manufacture of briquettes amounted to over 20,000,000 tons per annum.

In France, the railway companies, the gas companies, the mine owners, the coal dealers, all manufacture briquettes out of coal breeze and dust and even owners of canal coal barges install on each barge small compact briquetting plants to redeem any waste dust left in the hull of their boats.

Even Newcastle and Cardiff, so rich in coal fields, have briquetting plants to salvage any waste.

As pointed out by Mr. Dick:—

"A large proportion of Germany's briquetting is made from lignite, but as there immense deposits of lignite in Canada, the value of Germany's example is but enhanced.

Revenue from Briquette Manufacture

The following estimate will show what revenue could be derived from the manufacture of briquettes in a yard capable of manufacturing 30 tons per day:

Estimate of coal briquetting for a production of three tons per hour.

Area necessary for plant:—810 square feet, Installation comprises:—

1 Coal feeding screw and hopper.
1 pitch feeding screw and hopper.
1 pitch breaker and pulverizer.
1 steam jacketted mixer.
1 conveyer elevator.
1 cooling table.
1 briquette press.
1 motor using steam for mixer.

Cost of above installation	$8,000.00
Shed, piping and incidental installation	2,000.00
Total	$10,000.00

Interest on equipment at 6%
Amortization........ 6%
Repairs............ 3%

15% on $10,000.00
per year —$1,500.00

Assuming 300 days' work, carrying charges per day are.......... $\frac{1500}{300}$ — $5.00

Cost of manufacturing per diem of 10 hours equivalent to a production of 30 tons per day:—

Carrying charges		$ 5.00
Pitch binder, say 8% on 30 tons:—2.40 tons at $10.00		24.00
Labor, 1 foreman	$ 4.00	
" 6 men at $3.00	18.00	
	$22.00	22.00
Fuel for power and steam mixer 250 H.P.H. at 2 cts		5.00
Waste, oil, etc		.50
Office work		1.50
Total for 30 tons		$58.00

Cost of manufacturing per ton 50÷30=$1.93.

The cost of manufacture would, therefore be $1.93 for briquettes which could easily be sold at $5.00 per ton and be still cheaper than coke to the consumers. If we assume that instead of throwing or giving away the coal screenings the coal dealer had found a buyer for them and could get say $1.00 per ton, it would bring the cost to him to $2.93, still leaving a large margin for profit.

An Actual Example of Saving

One other example will show what saving can be realized by using coal screenings.

In the Hudson and Manhattan tunnels Power House, the amount of coal dust averages 7.5 tons per day. The removal of this coal waste required handling costing the company $10.50 per day for labor of 10 hours, that is $1.40 per ton of coal dust removed. It was decided, a few years ago, to see if this coal dust could be utilized and made into briquettes.

Owing to the fineness of this breeze, it was found that it would require not less than 10% of binder and the following estimate was made:—

200 lbs. of pitch, per ton of coal dust, @ 0.0045.		$0.90
Using a 12 H.P. eggett machine of 1,500 lbs. hourly capacity, running 10 hours per day:—		
Fuel for power		0.05
Oil and Waste		0.02
Labor:—Loading and handling coal dust, running pitch breaker, mixer and press, loading and handling briquettes		1.53
Cost of press, engine and accessories	$3,200	
Interest and amortization per year at 10%—	$320	
Maintenance on part of plant, 3% on $2,300, say	70	
	$390	
cost per ton $\frac{390}{2,475}$ tons per year		.15
Total cost per ton		$2.65

If we deduct from this amount the cost $1.40 per ton of removing the coal dust as given above, it leaves $1.25 to be charged to the manufacture of briquettes which could be used instead of coal. The saving amounted then to the difference between the price per ton of coal and of the cost of briquette manufacturing, multiplied by 8.25 tons, the weight of briquettes obtained every day.

Reasons for Failures

Aside from the selfish motive which may influence some mine owners or coal dealers in Canada to look upon coal briquetting as a competition, the knowledge of the failures suffered in the United-States by some briquetting enterprises may be taken as an excuse.

C. L. Wright in his report to the Washington Bureau of Mines, on Fuel Briquetting Investigations states that the failures were, in a large measure, due to the following causes:—

1st.—"Many of the "plants" represented promoters' schemes, no attempt being made to build the plants.

2nd.—Attempts were made to develope a new binding material or a new press, without proper appreciation of the principles of briquetting.

3rd.—Plants were poorly situated for marketing the briquettes.

4th.—The briquettes produced were inferior.

5th.—Poor salesmanship has been responsible for other failures of briquetting ventures.

6th.—Uncertainty in the supply of raw fuel or binder has caused the failure of many briquetting plants.

7th.—Lack of technical supervision has in some instances been the direct cause of failure.

Advantages of Briquettes

Quoting from articles by Charles L. Wright and from bulletins Nos. 363, 403 and 412, published by the U.S. Bureau of Mines, the briquettes, when properly made and with a suitable binder, possess the following advantages over raw fuel:—

1.—The even size of the briquettes permits of a more regular and thorough combustion in the firebox or furnace as the spaces that exist between adjacent blocks allow of even distribution of air through the fire and the pressure drop through the fire is also less.

2.—A good briquette holds its shape in the fire, so that even when coking coals are used they do not coke together sufficiently to cut off the air for combustion and the gases are burned as fast as distilled off, so that:—

3.—Practically no smoke should be obtained from the combustion of good briquettes.

4.—Briquettes generally burn to a fine ash rather than a clinker, as in the briquetting process the mixing and grinding thoroughly distribute the ash material, which in the raw fuel exists in spots and layers and is fused into clinker instead of falling through the grate.

5. The characteristic fineness of the ash from briquettes allows of keeping a better fire with less attention and poking than is possible with raw fuel under the same conditions.

6.—The evaporation per pound of fuel is greater for the briquette than for the same coal in its natural state. This advantage is maintained at all rates of evaporation.

7.—The capacity of a boiler is considerably increased by the use of briquetted fuel.

8.—The weather-resisting qualities of many coals, and especially lignites, are greatly improved by briquetting.

9.—Briquettes apparently give a longer flame than run-of-mine coal.

10.—It is much easier to raise and to keep up steam with briquettes than with run-of-mine coal.

11.—Higher rates of combustion are possible with briquettes and consequently higher power.

12.—When properly made, there is less loss from breakage during transportation of briquettes than of run-of-mine coal.

13.—The danger of spontaneous combustion in storage piles is eliminated if the fuel is stored in the briquetted form, and this characteristic of briquettes has made briquetted fuel favored for storage by European countries.

14.—The block-shaped briquettes may be piled in regular piles and occupy less space than the run-of-mine or slack from which they were made.

15.—Briquettes, especially those made from lignite, have a higher heat value than the raw fuel from which they were made, this improvement resulting from the higher heat values of the binder being added to bituminous and anthracite coal, and from the evaporation of water from the raw lignite.

Binders

At first it was intended to manufacture briquettes without any binder by a process of physical reconstruction, applying simultaneously heat and pressure to pulverized coal. These briquettes, however, lacked cohesion, disintegrated easily and were expensive to manufacture.

However, the experiments that were made were essentially laboratory tests and could not be applied practically to any advantage; it was also necessary that only the highest grade of soft coal be used. Such coal, however, is used to better advantage in the manufacture of gas and coke and very seldom for manufacturing briquettes. In any case the cost of the machinery would be such as to be prohibitive.

Practically the only fuel used in the manufacture of briquettes without the admixture of binder is peat.

Briquettes have been made in which clay was used as binder. Such briquettes are still manufactured in the Northern part of France. These briquettes, generally called "economical fuel," are sold chiefly for domestic use about $2.80 per ton; they burn slowly and evenly, they have a high radiating power and are very satisfactory.

Pitch

Pitch is really the best and most practical binder used in the manufacture of briquettes. Its use gives a high degree of cohesion to the briquettes, while the high calorific power of pitch lessens the percentage of ash.

Pitch is the residuum of the distillation of coal tar. If the distillation is stopped when the temperature reaches 390° to 430° Fahr., the residuum still contains the anthracene oils and is called soft pitch; it melts at about 122° Fahr. and its specific gravity is 1.18, whilst the specific gravity of tar is 1.17. Soft pitch can only be transported in special tanks and is used for manufacturing briquettes only in plants such as gas plants, where both distillation of coal and manufacture of briquettes are carried on simultaneously.

When the distillation is continued after the temperature reached 430° Fahr. the anthracene oils are then separated and the residuum is the dry pitch. However, in order that this pitch be of good quality not more than 5% of anthracene oil should be extracted. The dry pitch left in the vat should then be about 65% of the tar, in weight. This dry pitch softens at about 158° Fahr., melts between 200° and 250° Fahr. and its specific gravity is 1.19.

In the manufacture of briquettes, the quality of the dry pitch is a very important item. When using soft pitch, the quality of the briquettes merely depends on the percentage of tar in the mixture. When using dry pitch, however, it is necessary that it should answer to certain specifications.

It should remain dry and solid at ordinary temperatures and should be easily transported in cars, waggons or barrows, softening only when exposed to the sun for a long time. When broken, the surface ought to be conchoidal, shiny, and perfectly black. It should not stick to, nor grease, the fingers; its odor ought to be the odor of coal tar. Put in water at a temperature of 167° Fahr. it ought to pull in long, thin, threads without breaking; if such threads are not more than from 12 to 20 inches long the quality of the pitch is poor. When burned, it should give from 45 to 52% of swollen and very solid coke. Incinerated, it should not give more than 0.5% of ash.

It must be the product of the distillation of tar and must not contain any residuum of either petroleum or mineral oil.

A very simple way to test the quality of pitch is to place in the mouth a small piece, about one-eighth of an inch on each side; if the pitch is too dry, it will crumble under the teeth while good quality pitch will soften and become plastic without breaking.

The quality of the pitch to be used necessarily depends on the kind of manufacture, on the machinery, on the method of heating and on the quality of coal. It is advisable that the inspection of pitch be entrusted to the same employee who may thus acquire the necessary practice and judgment as to the requirements under various conditions.

Other Binders

Binders other than pitch have been used in Germany and in the United States.

Köppern, at Hattingen, succeeded in making briquettes from coke breeze and pitch with an admixture of naphthane, the latter apparently giving more consistency to the briquette and making it smokeless. The proportions used being 93% of coke breeze, 6 to 7% of pitch and 0.5. to 1% of naphthane.

In 1909, the United States Consul at Barmen, Germany, in the Daily Consular Reports No. 3361, states that bituminous coals which require from 7 to 10% of pitch for briquetting can be made into briquettes by the use of only 5% of sulphite pitch and that some kinds of coal require only 2 to 3%.

Inasmuch as sulphite pitch burns without smoke or odor, it makes an ideal fuel for household and industrial purposes. This sulphite pitch is said to give excellent results when briquetted with coke breeze. Heretofore experiments for the manufacture of briquettes made of coke breeze and tar pitch had failed. This failure according to the writer's investigation was due to the highly abrasive property of coke breeze which no briquette press could stand for any length of time.

Manufacturing Process—Briquettes with Pitch Binders

The tonnage of briquettes manufactured with pitch binder being far in excess of all other kinds of briquettes containing other binders, this paper will deal specially with the briquette made of coal with admixture of pitch.

The principal points to consider in a briquette are:—the cohesion, the quality and amount of binder, the pressure used in manufacturing the briquette, the amount of water held in the mixture and its bearing on the density of the briquette.

In regard to cohesion, the specifications of the French Navy call for a cohesion of 52% for general use and 58% for torpedo boat use; they also must not soften at 60° Cent. (140° Fahr.)

The manufacture using soft pitch is preferable because the preliminary melting process permits of a more intimate and homogenous mixture. Generally speaking, plants using soft pitch employ about 6% of pitch in their mixture, whereas plants using dry pitch usually employ about 7.5 or 8% of pitch. The use of dry, instead of soft pitch is generally governed by local conditions and quality of coal; it requires greater pressure on the briquette and is said to give less smoke.

The quality of dry pitch may be improved by the admixture of either heavy oil, naphthane or preferably coal tar.

Experiments on Cohesion

Henry de Graffigny, C.E., conducted various tests at Anzin, France, and found that the briquettes have a greater cohesion than both coal and pitch.

He found that dry pitch at 10° C. (60° F.) has a cohesion from 28 to 29.5%. The Anzin coal has a cohesion varying from 20 to 35% and yet the briquettes made with this coal pulverized and 9% of the same dry pitch had a cohesion equal to 52%. Mr. de Graffigny explains this phenomenon by the fact that the cubes of coal tested in the drum have cracks or seams which are really lines of cleavage along which the coal breaks up while the grains of pulverized coal have a greater resistance. The cohesion depends, therefore, on the coal, while the resistance to crushing depends on the pitch. The crushing strength of a briquette was found to be about 42 kilogrammes (597 lbs. per square inch), while the crushing strength of the Anzin coal was 25 kilogrammes (356 lbs. per sq. inch.)and the crushing strength of dry pitch was 75 kilogrammes (1068 lbs. per sq. inch).

The resistance or strength of the briquette increases, up to a certain limit, with the proportion of pitch; there is, therefore, a time when the strength of the briquette is maximum for a certain amount of pitch, but in practice, the percentage of pitch used in the mixture is less than the amount which would give the briquette its maximum strength; this percentage is governed more by the burning qualities it imparts to the briquette than by the additional, and not absolutely necessary strength a greater percentage of pitch would ensure to the briquette.

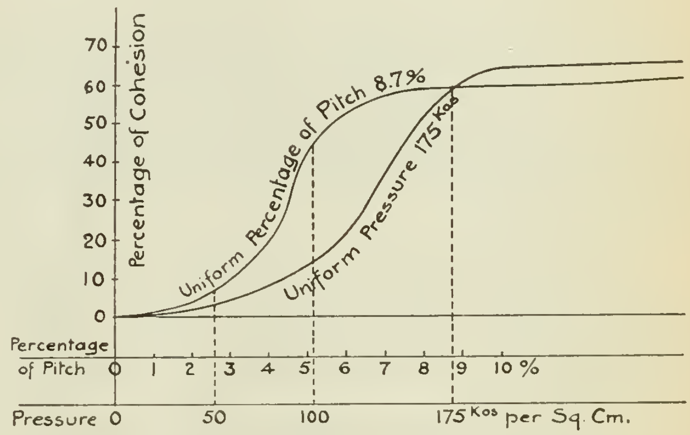

Diagram No. 1.

Diagram No. 1 shows the cohesion obtained by de Graffigny in the tests made by him at the Portes and Sénéchas Mines with briquettes manufactured with a Révollier Press. Diagram No. 2 shows the cohesion obtained with briquettes manufactured with the same press and made of Anzin coal mixed with varying proportions of pitch. With this coal, the cohesion is practically nil if the percentage of pitch is not at least 4 %. It must be noticed that in Diagram No. 1 beyond 7% of pitch, the cohesion increases very little.

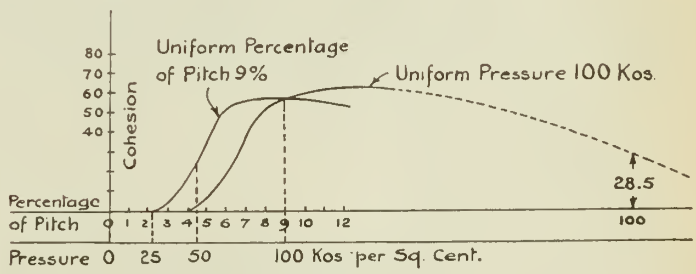

Diagram No. 2.

In Diagram No. 2, after passing 9 % of pitch, the cohesion increases very little; it reaches its maximum at 72% and then decreases to 28.5%, which is the cohesion of the pitch itself.

To quote James E. Mills in his report to the United States Geological Survey on "Binders for Coal Briquettes," the office of the binder is, "to coat the grains, fill up the void spaces between the grains, and by its adhesive and cohesive properties hold the briquette together."

The amount of binder depends, therefore, on the amount of surface to be coated and this surface depends on the size of the grains of coal and on the density of the dry coal.

The surface to be coated varies inversely with the density of the coal and the diameter of the grains. It follows that coals with a low density require a greater amount of binder than coals having a higher density. It follows, also, that the degree of fineness of the coal slack has a great influence on the amount of binder required.

It appears then that crushing coal too fine is not good practice; fine crushing gives the briquette a smoother surface with greater weather resistance, but it increases the amount of binder and therefore, the cost. Moreover, the cohesion of the briquette increases very little after the amount of binder reaches 9%, it is, therefore, useless to go beyond that limit. Voids between large grains of coal should then be filled with coal dust or finer coal rather than with binder.

Theoretically the amount of void space between grains of uniform size is independent of their size. In practice, however, grains of uniform size do not pack so closely as theory tends to show. Experiments made by Clifford Richardson indicate that with shot the percentage of voids reaches 32.

In practice the best results are obtained by breaking the coal to a maximum of 5/16 of of an inch in diameter, or 7 to 8 millimeters, according to French practice; the voids being filled with finer coal and coal dust and the binder.

Coke Breeze Briquettes

At the Paris Gas Company's plant and at the Lyons Gas plant, briquettes made of coke breeze were manufactured for several years and were quite satisfactory, except that the wear on the moulds was rather excessive, the coke breeze acting very much like fine emery.

At the Paris plant, the proportion was 90% of coke breeze and 10% of pitch. The maximum cost of coke breeze was frs. 6.44 per metric ton and the maximum cost of pitch 40 frs. per metric ton. The tons of mixture was then frs. 9.80 per ton made up as follows:—

900 kilos of coke breeze	frs.	5.80
100 kilos of pitch	"	4.00
1000 kilos of mixture	"	9.80

Including delays, 44 tons of briquettes were manufactured per 10 hour day. The labour amounted to frs. 2.55 per ton. The fuel consumed for power to run the press and incidental machinery amounted to 240 kilos of coke per hour, and it took 5 kilos of coke per ton to heat the mixture in the feeding screw, making 2620 kilos of coke per day at a cost of 65 frs. for 44 tons of briquettes or fr. 1.48 per ton. The maintenance amounted to fr. 1.28 per ton and tools to fr. 0.03 per ton. The grand total cost was, therefore frs 15.14 (about $2.91) per ton of coke breeze briquettes, exclusive of interest on capital, amortization and transportation to customers. The above, however, is a maximum price as the prices of coke and pitch are maximum; labour was all hand labour and could be reduced by the use of mechanical appliances. The amount of water in the coke breeze was 18% in weight.

The briquettes were rectangular, measuring $9\frac{7}{16}''$ x $5\frac{1}{8}''$ x $4\frac{1}{8}''$. They weighed 4.639 kilos when leaving the mould and 4.154 kilos one month after being stored, a loss of 0.485 kilos. The pressure used to manufacture these briquettes was 80 kilos per sq. centimeter (1143 lbs. per sq. inch.).

At the Lyons plant the coke breeze was mixed with 7% of pitch and 2.5% of tar. The briquettes weighed 4.3 kilos each and the cost of manufacture frs. 16.27 ($3.12) per ton or, with maintenance and amortization, frs. 17.02 ($3.27) per ton. As stated above, the great difficulty was due to the unusual wear on the metal parts of the machinery coming in contact with the coke breeze which obliged the manufacturers to change the design of several parts of the machines. For instance, the moulds and plungers which had been of wrought iron were made of hard cast iron. The mixer itself, which is ordinarily made of light iron plates, was made of cast iron.

However, the addition of naphthalene to the coke breeze and to the pitch, or the use of sulphite pitch instead of tar pitch as binder is said to do away with this trouble and to give excellent results.

The Pollacsek process consists in mixing coal screenings with a dry powder or a thick syrup obtained, by evaporation, from the waste sulphite liquor of the pulp mills which, previously, was allowed to be discharged in the streams and was a cause of pollution.

Down in Louisiana, sugar factory residues, such as thick molasses or black strap which are thrown away have been used in the manufacture of briquettes as well as starch.

The briquettes are fairly good but do not stand exposure to weather and easily disintegrate.

It is well to mention also the manufacture of briquettes made by Pflieger of Dambach near Schlestadt in Alsace in which coke breeze is mixed with sawdust, tar pitch being used as binder.

Experiments have been made in which crude petroleum, asphaltic petroleums, wax tailings and asphalt tar were used as binders; the results were not very satisfactory.

Correct Use of Binder

The various tests made so far, as well as practice, seem to show that pitch binder is preferable to all others. The choice of any particular binder depends, however, on local conditions, quality and kind of coal available, use for which the briquettes are intended. For instance it is quite possible that a gas plant having coal screenings to briquet would use tar pitch, while a coal yard or a colliery near a pulp mill might use sulphite pitch but generally the binder chosen ought to be the one which will give to the briquette cohesion, retention of shape, and weathering quality.

The briquette should be fairly hard but not so hard as to become brittle. When tar pitch is used dry, brittle pitch makes a hard briquette which can only be brought down to the desired degree of hardness by an additional amount of pitch. The French Navy Specifications require that the briquette should not soften at 140° Fahrenheit.

A good briquette should stand long exposure to weather without deteriorating. If the coal has been imperfectly ground and poorly mixed with the binder, or insufficiently pressed, the briquette will lack homogeneity and cohesion; cracks will appear letting the moisture in and causing deterioration. Briquettes made of lignite do not weather well because of the tendency of the lignite to absorb moisture. Consequently binders which are soluble in water cannot be successfully used except in very dry climates; this precludes to some extent the use of starch, molasses and sulphite pitch as binders unless the briquettes are waterproofed by a baking, or coking process, or by some other method; this waterproofing, however, considerably increases the cost of the briquettes.

The cost of binders seems to be the main factor in determining whether briquettes can advantageously be manufactured in different parts of the United States.

The average of investigations made in France by the writer gave 36 cents per ton of briquettes, exclusive of cost of coal and pitch. J. E. Mills, in his report on binders for coal briquettes estimates that the cost of manufacture per ton of briquettes in the United States, exclusive of binder and of coal, and apparently exclusive also of interest, amortization and overhead charges, amounts to 27 cents in the Western States and to 49 cents in the Eastern States. J. E Mills then states that "considering 30 to 50 cents per ton, therefore, as being approximately the cost of manufacture, it appears that when the difference in price between the slack coal and the first-class lump coal is $1.00, the binder must cost less than 50 to 70 cents per ton."

This, of course, is to assume that slack coal has to be purchased. In case of coal slack, dust or screenings, which in collieries, in coal yards and barges are, or have been, a total waste and loss, bir der may be used even if its cost is much higher than stated above. and yet the manufacture of briquettes in this case, will be an attractive business proposition to the mine owner and the coal dealer and a great help to many consumers.

Pressure

Next to the quality and amount of binder, the pressure exerted in the manufacture of the briquette is an important factor in giving to the briquette its maximum cohesion. There are two things to consider in the pressure; its intensity and the length of the period during which it is applied.

As a rule, the coal used for briquetting has been washed and is more or less wet when used. When it contains more than 5% of water, the excess of water offers a certain resistance to the compression; this excess of water must then be expelled, otherwise the briquettes will crack and have little strength.

With powerful presses in which the pressure is applied to the mixtures for a relatively long time, the mixture may contain a higher percentage of moisture, even as high as 10% as in the case of the Révollier press; there is enough time during the period of uniform and slow comression for the excess water to be expelled when the maximum pressure is reached, in order to obtain a perfect briquette.

In other presses, the Biétrix, for instance, in which the maximum pressure is reached almost instantaneously, the briquettes are perfect also, provided that the percentage of moisture is low; there is not sufficient time in this case during the period of compression to allow the excess water to be expelled. It is necessary, in such cases, to dry the mixture by heating; this is why some plants include as optional equipment dryer-heaters in which the coal is treated before being mixed with the binder.

Effect of Moisture

But all the water must not be expelled and it is usual, in practice, to allow from 1½ to 3% of moisture in the mixture. This moisture renders the mixture more pliable and acts as a lubricant, lessening the friction of the particles passing over one another during the compression. If the mixture be thoroughly dry, the briquettes will have a low degree of cohesion and will crack. The moisture retained in the mixture must increase the cohesion of the briquette when hot and leaving the mould, and must assist in forcing out any air bubbles contained in the mixture.

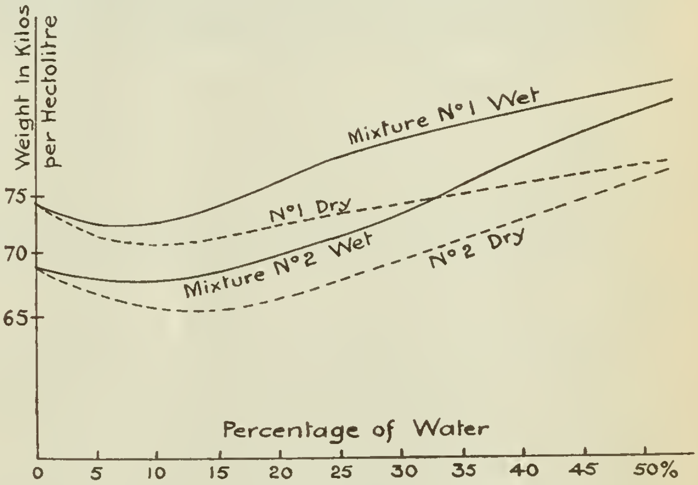

Diagram No. 3.

No matter how high a pressure be applied, there are always some minute voids between the grains. If the mixture is thoroughly dry, these voids contain some compressed air which expands when the pressure stops and the briquette leaves the mould. This expansion impairs the solidity and the strength of the briquette; a small amount of moisture fills these voids and expels the air. The same trouble takes place when the temperature of the mixture is too high during the compression if, for instance, the mixture is compressed when over 194° Fahr., some vapor is formed within the briquette which by expansion, when the briquette leaves the mould, causes surface cracks and irregularities.

Therefore the duration of the compression has not a very great influence on the results, as long as the mixture contains the proper percentage of moisture. Its intensity is more important, because the greater the pressure and the better is the even distribution of binder in the mixture, the better are the air and the excess of water expelled and the closer are the grains to one another.

Diagram No. 1 giving results obtained with Portes & Sénéchas Coal shows that beyond 175 kilos per sq. centimeter, the cohesion increases very little and is very low when the pressure is under 50 kilos.

Diagram No. 2, giving the results of tests made with Anzin coal which is softer than the coal of Portes and Sénéchas, shows that the cohesion does not increase when the pressure reaches 100 kilos.

In plants where the coal is perfectly dry, the proper amount of moisture 2 or 3% necessary in manufacturing the briquette is introduced in the mixture by means of a steam jet.

Another drawback to the larger percentage of moisture is that the specific gravity of the coal screenings is decreased.

Diagram No. 3 shows results of tests made by Henry de Graffigny with two different mixtures.

Mixture No. 1 consisted of coal containing 24% of volatile matters and of coal with 10% volatile matters pulverized in a Carr pulverizer 1 meter in diameter and making 400 revolutions per minute. The hectolitre was weighed after being filled, the filling up being done by hand shovel from an uniform height of 1.30 metre.

Mixture No. 2 consisted of coal containing 10% of volatile matters, passed through a 2 millimeter mesh screen and dropped in the measure from a height of 20 centimeters. The minimum weight of wet mixture No. 1 is 72 kilograms and corresponds to 7% of water. It is only when the percentage of water is over 17% that the wet coal is heavier than dry coal.

Taking the weight of the coal, exclusive of water, the minimum corresponds to 8½% and it is only after 37% that the presence of water begins to increase the density.

With the second mixture, the minimum corresponds to 8½ with wet coal and 11% for dry coal; it is necessary to go beyond 19% and 33% of water, respectively, before the weight of the hectolitre be increased.

From the above it appears that with a mixture containing 6% of water, as is the case with many briquette presses, the mixture is about at its lowest density; with this percentage of moisture the mould is not so well filled up as it would be if the amount of moisture were only 2%. The stroke of the plunger must, therefore be longer before the required pressure is obtained and the weight of the briquette is less than it ought to be.

The Briquette Press

There are two general types of briquette press:—The double compression or plunger type press and the tangential roller press. The first type is used for the manufacture of the large rectangular, prismoidal or cylindrical briquettes, the second one is used for the manufacture of the so-called ovoids or egget briquettes.

Among the plunger or double compression presses are the Révollier press and the Evrard press. The Roux-Veillon press is a double compression machine generally working at a pressure of 2000 to 2850 lbs. per sq. inch; with this pressure a cohesion of 65% to 70% is generally obtained.

In this machine a simultaneous compression is obtained on each side of the briquette by hydraulic power

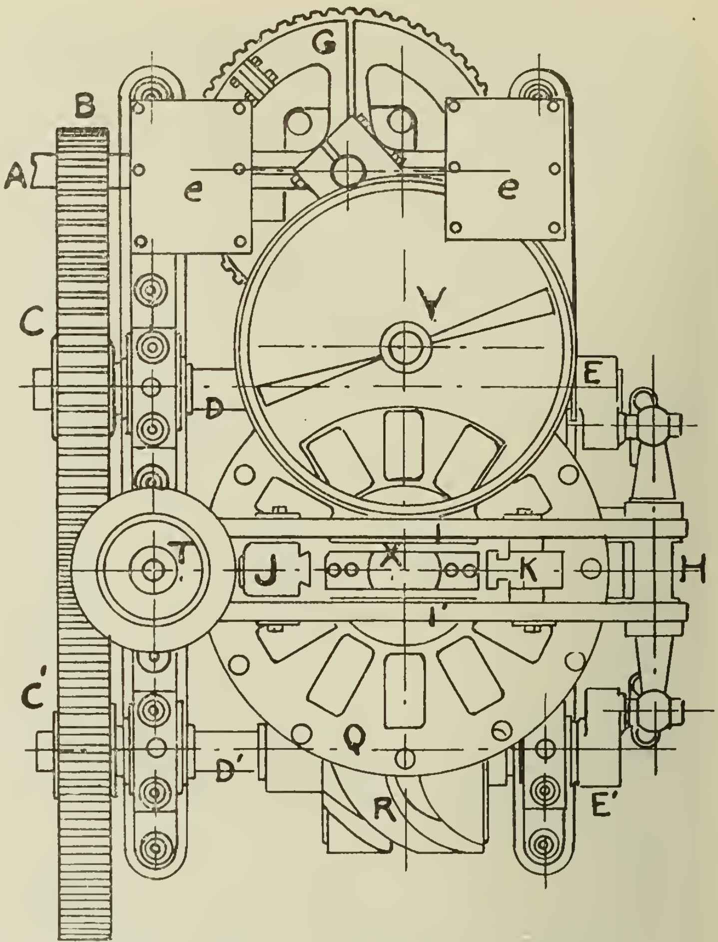

Plate 4.—Biétrix-Couffinhal Press Top View.

which gives a great elasticity to the system. At each turn of a shaft, the moulding table revolves one division, so that a new cell comes in front of the distributor or feeding screw and is filled up; the cells already filled come, one at a time, opposite two compressing plungers; at the end of each compression these plungers are released, the table moves on another division, and the finished briquette comes under another plunger which strikes it out of the mould.

The Mazeline machine which consists of a horizontal circular table turning about its axis, on which are moulds each of which is fitted with a plunger for compressing the mixture and has at the lower face a piston to force the briquette out of the mould. This machine can develop a compression of about 4300 lbs. per sq. inch, and manufactures briquettes weighing 20 lbs. each, measuring 8¾″ x 11¾″ x 4 ⅜″, at the rate of 20 briquettes per minute or 40 for the double tabled press. There are also the Crozet press and the Middleton Press, with a capacity per minute of twelve briquettes, each weighing 14 lbs.

Among the tangential roller machines or egget presses, the best known types are the Dupuy Press and the Horme Press.

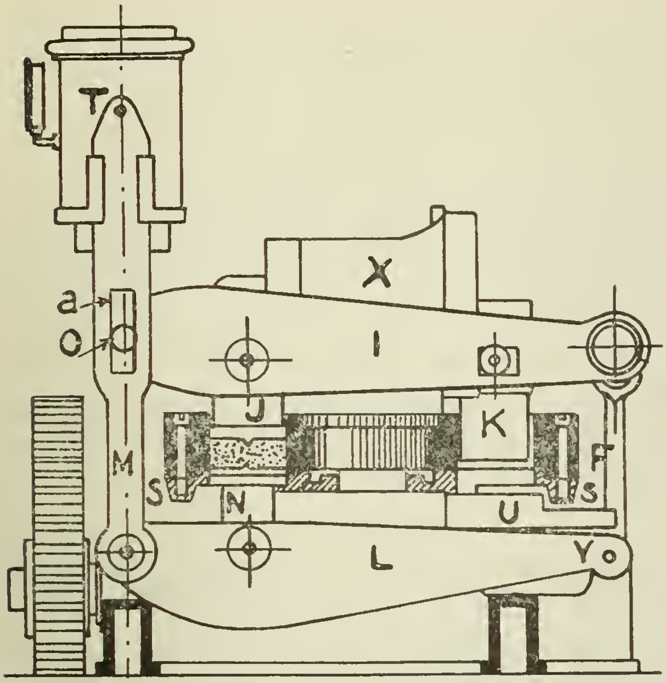

Plate 5.—Biétrix-Couffinhal Press Vert. Cross Section.

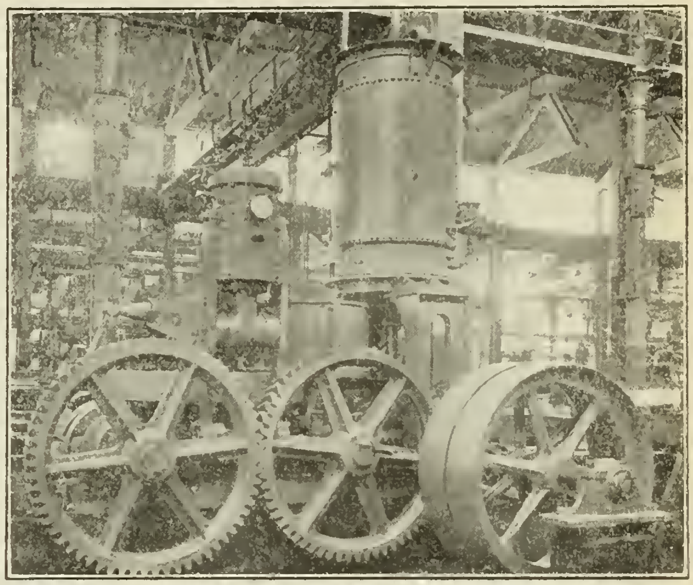

Plate 6.—Leflaive's Couffinhal Press.

Description of the Bietrix-Couffinhal Press

The various double compression presses used in the manufacture of large briquettes are based on the same principle and differ only in minor details or improvements; it will, therefore, be sufficient to describe one of the most widely used machines of this type.

Plates 4 and 5 show, respectively, a vertical cross section and a top view of a Biétrix-Couffinhal Press, manufactured by Leflaive & Cie, of St. Etienne, and which are fully illustrated in plate 6. Referring to Plates 4 and 5, shaft A controls the geared wheels C C′ which in turn control cranks E and E′ and also the connecting rod F. The plunger J compresses the briquette and plunger K forces it out of the moulding table. The compression takes place when the upper lever controlling plunger J is lowered; when the upper face of the briquette reaches its maximum pressure, that is when the upper pressure is equivalent to the pressure of the lower plunger N plus the resistance due to the friction of the briquette against the walls of the mould, then the lower plunger N, connected to the lever L and controlled by the connecting rods M begins to rise until the pressure is equal on both faces of the briquette.

A Hydraulic cylinder T controls the connecting rods M; the axle 0 of the upper beam is free to move in a slot in the connecting rods M. This axle O is connected to the plunger of the hydraulic cylinder T.

The moulding table is controlled by a drum R on which are specially cut grooves engaging bronze cones S turning about steel axles and set under the moulding table; these grooves are so arranged as to cause the moulding table to revolve with a speed which increases uniformly from the start of the movement to a maximum speed and to decrease at the same rate. During the period of compression, the rollers S are engaged in a part of the groove which is in a plane perpendicular to the axis of the drum R, when the moulding table is stationary.

G is a gear controlled by pinion B operating the shaft of the mixer. The briquette is forced downward by plunger K and falls on a tipping scale which throws the briquette on a belt conveyor.

The pressure may reach 4270 lbs. per sq. inch. The moulding table has from 12 to 14 cells. The walls of these cells wear out owing to the friction; when these walls have been worn a thickness of 0.12 inch, at the end of 3 or 4 years, the cells are reamed and bronze linings set in.

This press is made in different sizes with a capacity of 18, 50, 90 and 150 tons per 12 hour-day. The briquettes manufactured with this press weigh as much as 22 lbs.; the usual weight, however is 13 lbs.

Description of a Typical Tangential Roller Press

The Dupuy tangential roller press is manufactured by Dupuy Frères of Paris, consists of a cylindrical distributor receiving the hot mixture and feeding it in the shape of a ribbon between two sets of tangential rollers, on the circumference of which are a certain number of recesses or cells each of the shape and size of half an ovoid or egget briquette. These rollers are so operated as to turn in opposite directions at the same speed; the cells are so placed as always to coincide and cover one another; the hot mixture is then compressed between these cells and formed into eggets which fall on a shaking grate which acts as a chute as well as a screen through which passes the small thin webb formed by the mixture pressed between the eggets. This mahine is made in 4 sizes having

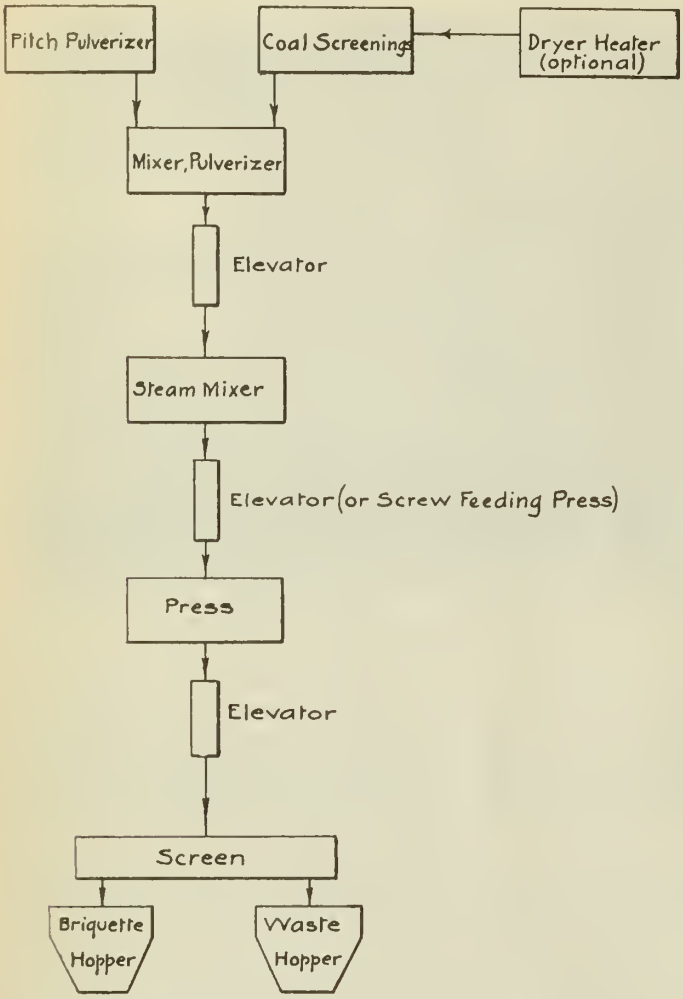

Plate 7.—Flow Sheet of Typical Briquette Plant.

respectively a capacity of three quarters of a ton, two and a half, five and ten tons per hour. The briquettes manu factured weighing 1 ounce, 1½ and 3 ounces. The machine may be fitted with 2 different sets of rollers to manufacture simultaneously briquettes of two different sizes. The rollers wear under the abrasion of the hard particles of coal. This wear and tear is a function of the size and of the quality of the coal. These rollers are made of best quality soft steel; they are milled and machined and then hardened and tempered. For very hard coal, and coke breeze, the tires of the rollers may have to be renewed after manufacturing 8000 tons of briquettes. The rollers of the Dupuy Press are 20 inches in diameter.

Flow Sheet

Plate No. 7 is a flow sheet showing in their sequence the various steps of briquette manufacturing. The pitch pulverized to a proper size is fed by either a feeding screw or a belt to the mixer where it is mixed in the proper amount to the coal screenings. These coal screenings which have been washed are usually passed first through a dryer heater which takes the excess moisture; this however is optional and in many cases the coal after being cleaned and washed is allowed to dry sufficiently to retain from 2 to 5% of moisture before being mixed with the binder. In some plants the mixing of binder and coal, instead of being done by a mechanical mixer, is done by hand, the respective amounts of coal and binder being measured in boxes. The mixture is then brought up by conveyor, elevator or feeding screw to a steam jacketed mixer where the mixture is thoroughly mixed while steam softens it to a required plasticity so that its temperature, when reaching the moulding press, will not be higher than 122° Fahr. From the press the briquettes are elevated to a screen through which all waste falls into a hopper, from which it is brought back to the steam mixer; the briquettes are unloaded into another hopper, ready to be loaded in cars.

Plates 8 and 9 show respectively the elevation and the plan of a typical briquetting plant to which applies the flow sheet shown on plate 7.

Secondary Plant

Under this heading may be classed all that part of the equipment which is independent of the type of press used and some of which is not indispensable.

A briquetting plant aside from the briquette press may include, substantially, the following equipment:—

1st.—Steam generator. 2nd.—Motor. 3rd.—Coal breaker or pulverizer which in some cases is not necessary. 4th.—Dryer heater, optional. 5th.—Pitch breaker or pulverizer or a pitch melting tank. 6th.—Feeding and measuring apparatus. 7th.—Steam mixer. 8th.—Cooling table or cooling and loading endless belt or elevator. 9th.—Baking oven, optional and necessary only to produce smokeless briquettes manufactured with binders which are themselves a cause of smoke.

Steam Equipment

In providing for the steam equipment of a briquette manufacturing plant, it is safe, generally, to figure on a heating surface equivalent to 165 square feet per ton of briquettes to be manufactured in one hour. If the steam used for heating the mixture is taken directly from the boilers it is safer to figure on a maximum heating surface which may reach 270 square feet per ton of briquettes to be manufactured per hour.

The consumption of fuel is generally figured at 100 lbs. per ton of briquettes, although it may be as low as 40 lbs.

The motor or steam engine may be of any convenient design; it is recommended, however, that it be fitted with some automatic safety device and that it be belt driven to insure a certain amount of resilience in case any solid body should happen to find its way in to any part of the machinery.

Coal Breaker

The coal breaker or pulverizer may be of the coffee mill grinder type or, preferably, of the cylinder type, fitted with teeth which break the coal to the required dimension by causing the coal to be projected by a rapid revolution of the cylinder against the steel teeth. One of the best known coal pulverizers is the Carr pulverizer in which 2 rollers of a comparatively large diameter grind between them the coal which is fed by a distributing hopper. The Carr pulverizers used at the Saint-Waast mines have rollers which measure 4 feet in diameter and 12 inches in width; they make 300 revolutions per minute, using 25 H.P. and pulverizing 15 tons of coal per hour.

Coal Dryer

In some installations, the coal after being washed is thoroughly dried in ovens or dry heaters before being fed to the mixer where the mixture of coal and pitch, when dry pitch is used, is made sufficiently plastic and moist by heating and by jets of steam. A type of dryer commonly used is the Hanrez dryer; it consists of a cylinder 4 feet in diameter and 2 feet 6 inches long, turning about an axis, either vertically or horizontally. It is covered with a copper plate three millimeters thick and perforated with holes ½ millimeter in diameter. Inside is a screw having a relative speed of 5 turns per minute. The wet coal is fed at one end and leaves at the other end under the action of the screw. The cylinder revolves at a speed of 350 turns per minute, the water being expelled by the action of the centrifugal force. The power necessary is equivalent to 6 H.P. and the capacity is 50 tons per 12 hour-day.

This drying process while more rapid, is not more effective than the dripping process which consists in loading high vertical towers, generally built of wood, with wet coal which is allowed to drip and to dry naturally.

The dryers are generally cylindrical measuring from 4½ to 5 feet in diameter and 22 to 25 feet in length. A helicoidal gear turns on the axis of this cylinder displacing the coal which moves in a direction opposite to the flames. Wings, 4 inches wide, are placed on the revolving cylinder in order to turn the coal over and bring different layers in contact with the heated surface. The speed is so regulated that the coal remains about 10 minutes in the cylinder losing from 5 to 6% of water; the machine makes from 3 to 4 turns per minute and has a capacity of about 70 tons per hour.

The Leflaive dryer consists mainly of a turning table whose motion is dependent on the operation of the briquette

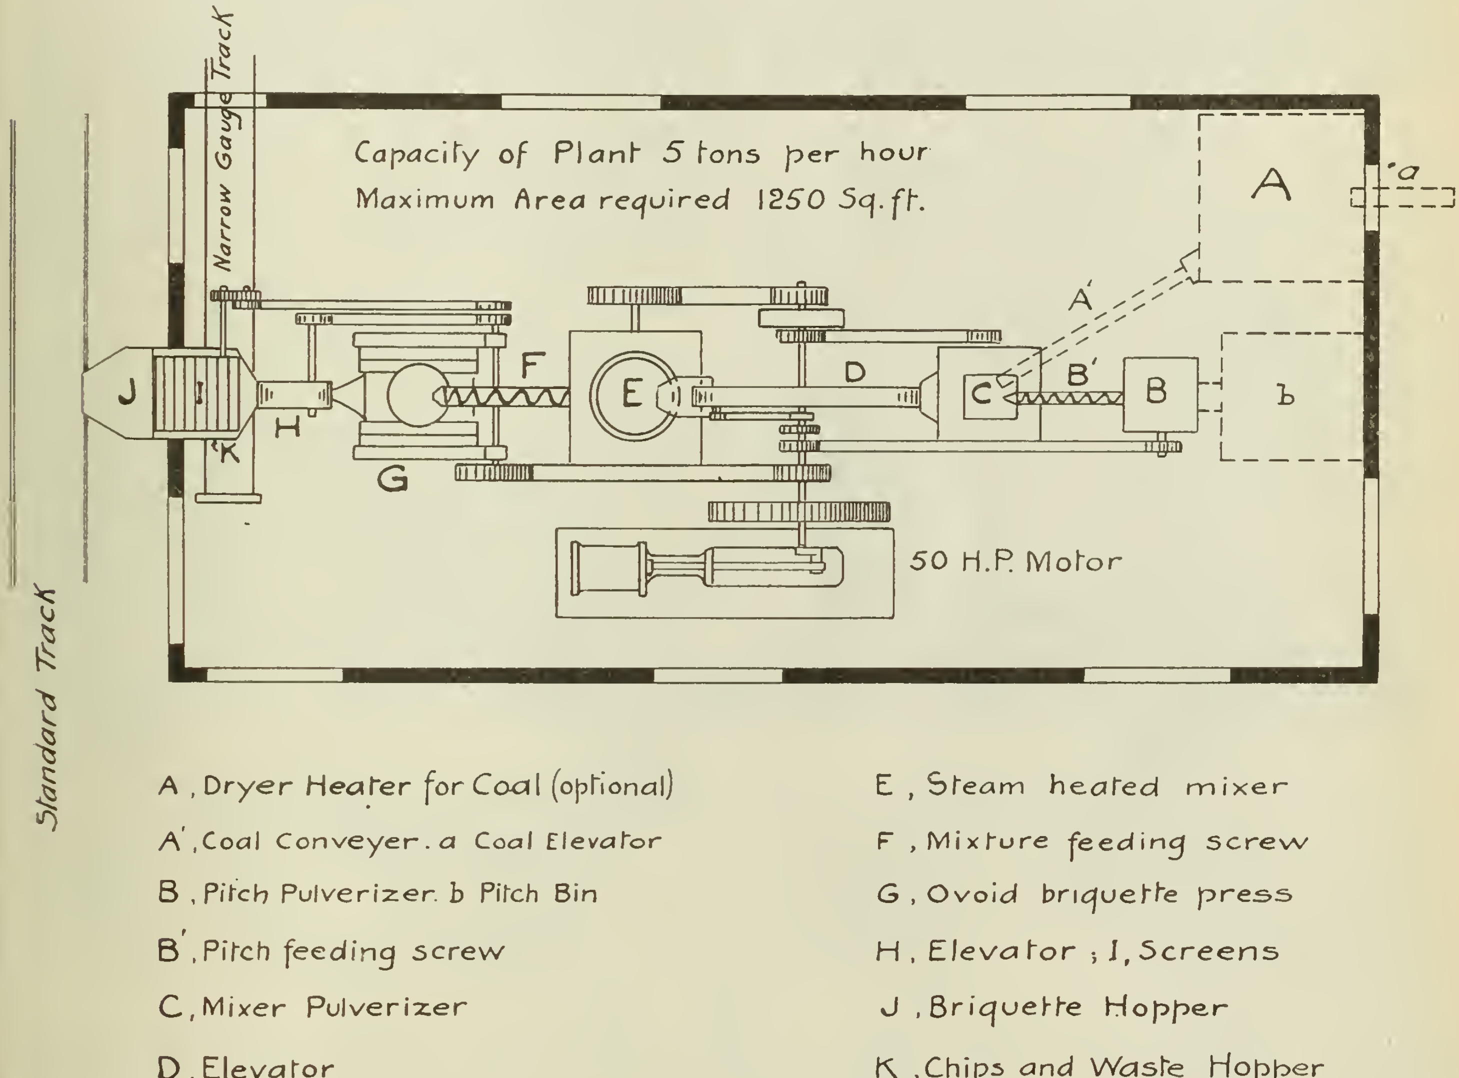

Plate 8.

press. This table is built in masonry which is itself encased in sheet iron and on which rests a spherical hood or cupola in the centre of which passes a cast iron cylinder firted with a vertical axle and paddles.

A lateral firebox with two openings opposite one another control the temperature in the dryer. The flames after licking the upper part of the coal, heat the cupola, which concentrate the heat by reflection, then pass under the table and into the chimney. Around the dryer are six openings; through the four first openings are set radial iron bars with teeth or claws which scrape the coal, turn it over and let it be heated uniformly and throughout. Opposite the fifth opening are two bars which by means of articulated slats regulate the thickness of the layer of coal, and consequently the time the coal will remain on the table, and at the same time slowly shake it, turn it over and bring it from the centre of the table to its circumference, passing thence outside through the sixth opening. The power necessary to operate this dryer is low. It is possible with it to vaporize from 11 to 13 lbs. of water per every 2 lbs. of fuel consumed. When the quantity of water to vaporize is over 10%, the capacity of the dryer is increased by using two tables, one above the other, each working as explained above.

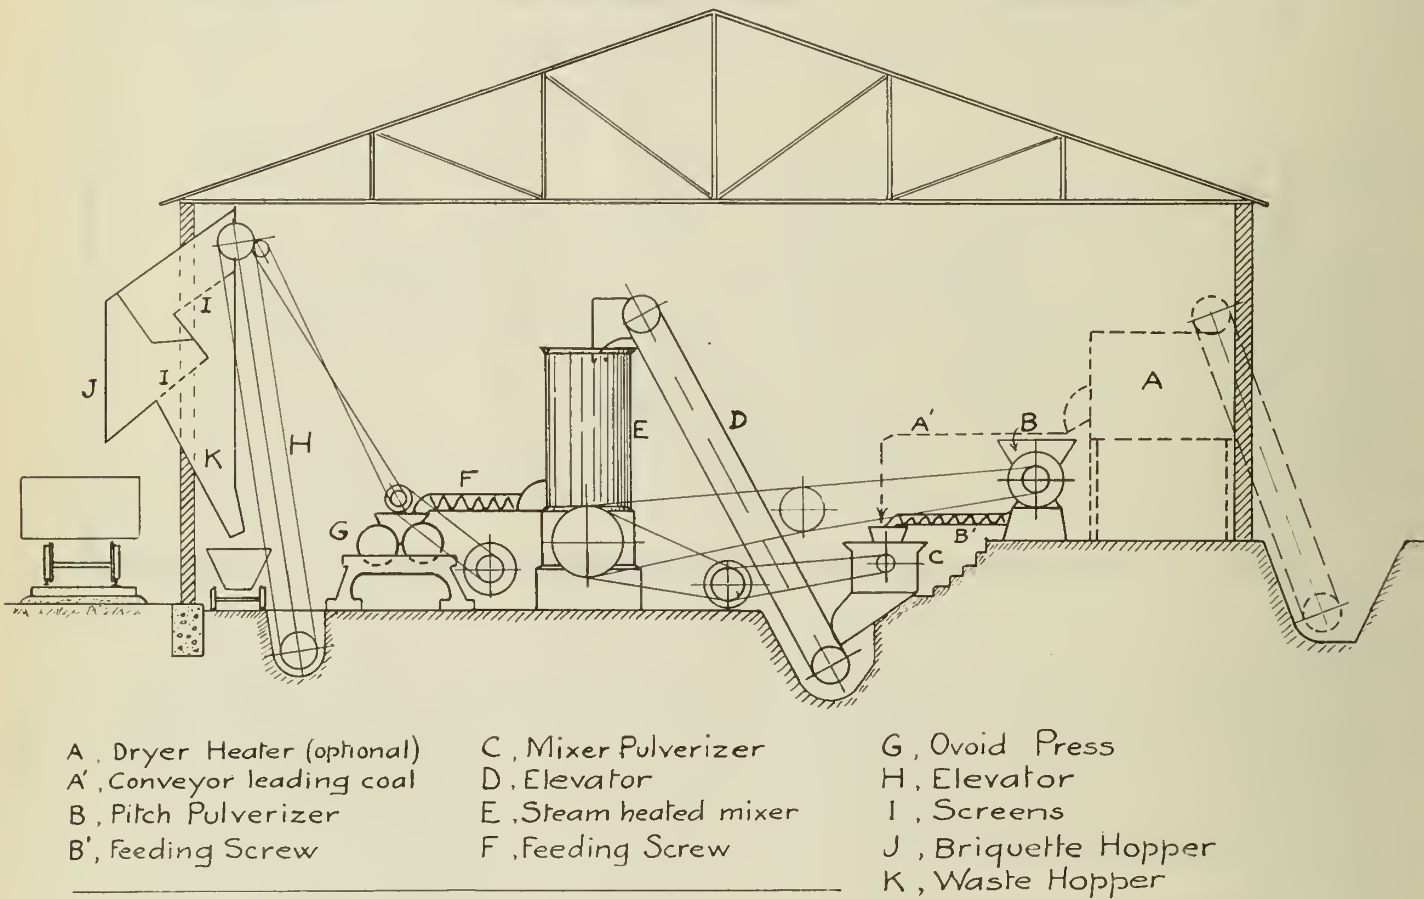

Plate 9.

Pitch Pulverizer

The pitch pulverizer is preferably of the CARR type already described. Care must be taken to keep the supply of dry pitch at as low a temperature as possible, and, in summer, under a water sprinkler, otherwise the pitch becomes soft and is compressed without being broken and pulverized; when too soft it may even stop the pulverizer unless the pitch is mixed, before being pulverized, with 25 or 50% of coal.

The use of melted pitch is, therefore less troublesome; however, to get the best grade of briquettes and particularly smokeless briquettes for domestic use, dry pitch should be used instead of melted pitch.

The melting is done usually in iron tanks heated directly by soft coal. These tanks are about 3½ feet wide, 6 feet deep and 20 feet long, the bottom is slightly sloped towards the gate; the full charge is about 9 tons, it takes about 12 hours to melt and requires 600 lbs. of coal. In the majority of plants using melted pitch, it is customary to mix a certain amount of tar with the pitch in the proportion of 12 to 20%.

Feeding and Mixing

The mixing or proportioning of pitch and coal making the paste or mixture to briquette is better done by hand with shovels, wheelbarrows or hand cars but is practicable only in small plants. In more important installations, this proper mixing of both coal and pitch is done by means of feeding screws or by bucket conveyers which are filled from chutes or hoppers so inclined or so opened as to let the exact quantity of coal and pitch fall in the required time and in the proper volume.

Usually this feeding and mixing apparatus and the briquette press are synchronously operated by the same motor in order that their movements be interdependent. When melted pitch is used, it is necessary that the feeding screw or transporter be heated to keep the pitch from solidifying.

The steam mixer or "Malaxeur" is preferably vertical. It usually consists of a sheet iron cylinder 32 to 48 inches in diameter and 9 or 10 feet high. A central axle revolves at the rate of 20 to 25 revolutions per minute. Arms set on this axle beat the mixture and drive it downwards. The lower arm must be reinforced and very rigidly connected to the axle as it is intended to scrape the bottom of the mixer upon which the mixture has a tendency to stick and harden. The heat is supplied by steam let in through apertures located either in the bottom of the cylinder or at various points on the outer surface. This steam comes either from the engines or from the boilers; in the latter case when it enters into the cylinder there is a sudden expansion and the temperature falls down to 212°F. This expansion is accompanied by a certain condensation which increases the moisture of the mixture by 2 or 4%.

Steam Consumption

Theoretically 8 to 10 lbs. of steam at a temperature of 212° F. are sufficient to heat one ton of mixture to 212° F. In practice, however, if only this quantity of steam were used, it would be entirely condensed and would increase the percentage of moisture by ½%. Inasmuch as the contact of the steam and mixture is not very intimate, it is necessary to let in the mixer a much greater quantity of steam, about 100 lbs. per ton of mixture; therefore, but 10% of the heat contained in the steam is utilized while the moisture is increased from 2 to 4%.

In some plants, superheated steam is used at a temperature of 392° Fahr. It is usual to figure for superheating on 21 square feet of heating surface per ton of briquettes manufactured per hour and on 1% of fuel.

The two principal types of briquettes are the ovoid or egget, specially made in two sizes for domestic use and the typical briquette manufactured for industrial purposes, particularly for firing railway and marine boilers.

Price Comparison

As a basis of comparison, it might be mentioned that in 1910, in Paris, the price of egget briquettes for domestic use, as shown on plate 14, was 52 francs ($10.00) per gross ton, delivered in sealed bags of 100 lbs. whilst the price of Welsh anthracite was 80 francs ($15.40) per gross ton.

Miscellaneous Data

The following table compiled from the catalogue of Messrs. Dupuy Frères gives the capacity in tons per hour in large briquettes from 6 to 20 lbs., and in ovoid or egget briquettes, as well as the force required in H.P., the area occupied by the plant, the number of men necessary to operate the entire plant, as well as the approximate cost of the briquetting equipment and motor, this equipment includes generally shafting, bearings and pulleys, one coal feeding screw and hopper, one pitch pulverizer, one pitch feeding screw and hopper, one dry mixer, one elevator, one steam jacketed mixer, one cooling belt or table, and one or two presses according to plant capacity. The prices are pre-war prices in France. To these prices should be added from 10 to 15% for crating and shipping, ocean rates based on normal prices.

Briquette presses are admitted free of duty in Canada; they are patented and could be manufactured here by arrangement with the various patentees; the rest of the equipment, such as motors, feeding screws, pulverizers, conveyors, elevators is easily available in Canada.

TABLE GIVING DETAILS OF BRIQUETTE MANUFACTURING PLANTS.

Capacity per hour in 6 lb. briquettes.	Capacity per hour in 10 to 12 lb. briquettes.	Capacity per hour in 16 to 20 lb. briquettes	Capacity per hour in egget briquettes.	Force required in H.P. Report of the International Alaska-Yukon Boundary Commission.

A Summary

By J. J. McArthur, M.E.I.C.

The Joint Report of the Commissioners, appointed under the Convention of 1906, for the demarcation of that part of the 141st Meridian of West Longitude, which forms the boundary between Alaska and the Yukon Territory from Mt. St. Elias to the Arctic Ocean, has been transmitted to His Majesty's Government by the Minister of the Interior, and certified copies have been laid before Parliament.

This report, which is illustrated with many fine views, forms a record of a very interesting survey which was carried out under unusual difficulties and called for the highest degree of organizing and technical skill.

Historical

The 141st Meridian became part of the boundary between Russian America and the British possessions in North America by virtue of the Treaty of 1825.

The United States acquired the Russian possessions in 1867, by purchase, and the Territory became known as Alaska.

No effort was made to locate the Boundary along the 141st Meridian until 1887, when the late Wm. Ogilvie, D.L.S., of the Department of the Interior, Canada, was instructed to descend the Yukon, and determine by astronomic observations the location of the Meridian at the crossing of that river. Incidentally he made a micrometer survey from the Coast and Geodetic station at Pyramid Island, up the head of Lynn Canal and over the divide to the Yukon waters which he followed to a point in the vicinity of the boundary, which he reached on September 14; the trip from salt water having occupied one hundred and eight days.

He established his observatory on the north bank, about three miles above the present boundary; his transit stand being the stump of a spruce tree 18 inches in diameter; round which he built his transit house; and a living camp and magnetic observatory were erected close by.

There was no telegraph line, and the journey was too long and too rough to permit of carrying the time by chronometers, and the alternative was the adoption of the methods of moon culminations and the occultations of stars by the moon.

His observations continued during the winter, the temperature seldom rising above thirty below zero; yet notwithstanding the difficulties and inconveniences, he was able to give a location for the boundary which compared most favorably with the final determination made in 1906; until which time his work stood as the accepted boundary. Corresponding observations had been made at Kamloops, B.C., by W. F. King, D. T. S., Astronomer of the Department of the Interior, who later became Chief Astronomer of Canada and His Majesty's Boundary Commissioner.

In 1889, J. E. McGrath of the United States Coast and Geodetic Survey made an independent location of the boundary. He occupied Ogilvie's observatory and also adopted the same method of culminations and occulations The result of his observations so far confirmed the position of the Ogilvie line that it was accepted as the temporary boundary until the final determination in 1906. J. H. Turner of the same staff in this year made a preliminary location of the boundary at the crossing of the Porcupine.

In the Spring of 1895, Wm. Ogilvie was again sent out to produce the 141st Meridian, north and south from the Yukon, in order to furnish a conventional line of jurisdiction, where prospecting and mining operations were being carried on, notably in the vicinity of Forty-mile. Before winter set in the line vista had been opened for a distance of five miles to the north of the river.

During the winter he succeeded in getting ten new determinations of longitude which were later combined with his observations of 1887-88. In February he resumed work on the line and by the middle of April they had reached Sixty Mile river, and work was dicontinued.

In 1902, rumours reached the Department of gold discoveries on the Tanana River, some of whose tributaries were supposed to cross the boundary; and to prevent possible complications J. J. McArthur, D.L.S. was sent to continue the line to the south. He produced it to Scottie creek, sixty miles from where Ogilvie had left off in 1906.

The question of definitely marking the boundary remained "in statu quo" until 1906, when a Convention was signed at Washington, April 26, and ratified August 26 of the same year. It prescribed the use of the telegraph for determining a point on the 141st Meridian, and the extension of a north and south line through the point thus determined.

Use of Telegraph

The refined astronomic observations requisite for the telegraph determinations could not be properly made except during the summer, and the reductions of the observations would require considerable time. O. H. Tittmann and Dr. W. F. King, respectively, the Superintendent of the U. S. Coast and Geodetic Survey, and the Chief Astronomer of Canada, were Commissioners for the Alaska Coast Boundary, and they expected to be, and were later, appointed commissioners under this Convention. In order that full advantage of the season of 1907 could be taken for the running of the line, they, early in 1906, before the ratification of the Convention, decided to make use of the organizations under their direction, namely the Coast and Geodetic Survey, and the Astronomical Branch of the Department of the Interior, to execute the necessary astronomic work during that season.

The point on the meridian at the crossing was in telegraphic communication with Vancouver and Seattle, both by the Canadian Government telegraph line via Dawson and Ashcroft, and the United States land line via Eagle to Valdez, and by cable from Valdez to Sitka and from Sitka to Seattle, thus forming a loop. The difference of longitude between Vancouver and Seattle had been determined by telegraph in 1905, the observers being Assistant Edwin Smith of the Coast and Geodetic Survey, and Dr. Otto J. Klotz of the Chief Astronomer's staff at Ottawa; and later the longitude was carried by assistants Smith and J. E. McGrath by cable to Sitka and Valdez, and thence overland to Fort Egbert. Hence a determination by two telegraphic routes was possible, and Mr. Smith of the Coast and Geodetic Survey was sent to Ft. Egbert, Mr. McDiarmid of the Chief Astronomer's staff to a station near the boundary, and Dr. Klotz of the same staff to Vancouver.

Considerable difficulty was anticipated in obtaining good wire connection between the Boundary and Vancouver. The line in its length of nearly two thousand miles traverses a sparsely settled country; in fact, by far the greater part is wilderness. Through the woods a right of way is cleared, and the wire is supported on trees which have been trimmed and the tops generally sawed off. However, the service proved to be much better than anticipated; the good results being largely due to the solicitous interest of the Superintendent, J. T. Phelan, and of the Chief operator at Vancouver. The correction of 0.0335 between Seattle and the Boundary resulting from the loop closure, was distributed evenly between the stations in the loop.

Two independent computations of the observations were made during the winter, which gave an accurate position for the instrument pier:—9h, 24m. 00.027s, or the pier is 17.62 feet west of the 141st Meridian.

It is interesting to note that this determination of the position of the 141st Meridian, established by the most modern methods under favorable telegraphic conditions, showed that Ogilvie's line of 1887-88 was only 218 feet west of the Meridian, and McGrath's observation 1889-90 gave a position only 477 feet east of the final line. This may be considered a great tribute to the skill of the original observers.

Joint Astronomical Party Expedition in 1907

In 1907, in order to take full advantage of the short working season at this latitude, a small joint astronomical party, with G. C. Baldwin and F. A. McDiarmid, respectively United States and Canadian representatives, were sent out to establish the initial point, and determine the direction of the Meridian. They left towards the latter part of March for Seattle, whence they proceeded by steamer to Skagway, thence by the White Pass and Yukon Railway to White Horse, and by stage line 330 miles to Dawson, where they arrived April 13. From here they travelled by team over the ice to the boundary line which they reached April 20.

Observations were taken by both representatives to determine a true north and south line, which was carefully marked.

The large joint line party arrived June 12, A. J. Brabazon, D.L.S., was in charge for Canada, and G. C. Baldwin assumed charge for the United States. Without delay they proceeded to trace the line to the southward. The first permanent marks placed on the boundary were two large aluminum bronze monuments of pyramidal type, one on either bank of the river.

Duties of the Commissioners

The principal points agreed upon by the Commissioners with regard to the fulfilment of their duties under the Convention were:—

That the final and agreed longitude of the observing pier on the south bank of the Yukon River, as determined by officers of the Coast and Geodetic Survey and officers of the Dominion Observatory, was 9 hours, 24 minutes, 00.027 seconds west of Greenwich, or 17.62 feet west of the true meridian of 141 degrees west from Greenwich, and that the initial point of the boundary line should be located in accordance therewith.

That an accurate azimuth should be observed by a joint party at the initial point, and that a mark should be set determining the direction of the boundary line, which should be produced in this direction north to the Arctic Ocean and south to Mount St. Elias.

That the work should be executed jointly by representatives of the two Governments.

That the boundary line should be produced by the micrometric transit method, representatives of the two Governments observing independently.

That the boundary line should be permanently marked by large and small aluminum-bronze monuments set in rock or concrete foundations at intervals of not more than four miles, and intervisible where practicable, except in the region between Mount Natazhat and Mount St. Elias.

That a vista with a 20-foot sky line should be opened along the boundary through all timber encountered.

That a belt of triangulation should be extended along the boundary line, and the geodetic positions of all monuments determined.

That the computation of the trigonometric determination of the positions of peaks and monuments should be made under the direction of the computing division of the Coast and Geodetic Survey at Washington, and that the results, when obtained, should be submitted to the Commissioners for their final approval and adoption.

That a topographic map, for final drawing on a scale of 1/62,500 with a contour interval of one hundred feet, should be made of the belt of country extending not less than two miles and not more than two and one-half miles on each side of the boundary line; excepting in the region between Mount Natazhat and Mount St. Elias, where it might be made wider if found desirable.

That a line of precise levels should be run from tide water at Skagway, Alaska, to some point on the boundary line for the control of elevations.

That the Alaska Coast Boundary should be drawn from Mount St. Elias to the 141st Meridian on such course parallel to the coast as should be found most equitable in the topographic conditions.

Method of Line Projection

The micrometer transit method adopted in producing the line was with some modifications practically the same as that employed by the U. S. Mexican Boundary Commission of 1893.

The instrument used was a Berger & Sons 6¼ inch repeating theodolite, the telescope being equipped with a micrometer eyepiece magnifying twenty-five diameters. The focal length was 27 cm. and the diameter of the objective, 33 mm. One division of the micrometer head equalled 1″.72 nearly.

Heliotropes of the ordinary pattern mounted on tripods were used as fore- and back-sights and for communication, while the instrument party had a British Army pattern heliograph for communication purposes. A modification of the Morse code was used, together with special code signals relating to various features of the work. The fore-heliotrope party, by reporting on the condition of river crossings, good camping places, available feed and other features of interest, was often able to save considerable time for the parties following.

Points were established on the Meridian at the more or less permanent hills and ridges, seldom less than 10 miles apart, or more than 20 miles. For expeditious work it was necessary that all three heliotropes should be in sunshine at the same time.

The transit having been carefully set over the last point determined on the line, and the rear heliotrope over some other known point on the line, usually the last previously determined point, all was in readiness to determine a new point ahead. Setting the micrometer at collimation, which was easily determined by a short series of direct and reverse readings on the rear heliotrope, and transiting through, the fore-heliotrope man, who was showing his light from the ridge on which the new station was to be set, was instructed by means of the heliograph, which direction, east or west, and about how far, to move so that his light would appear about midway between the two vertical wires of the micrometer. This was usually accomplished in two or three moves, as the first move, though merely an estimate, furnished a scale by which to judge the distance between the heliotrope and the line.

The fore-heliotrope man, on being signalled that he was on approximate line, selected and marked two points

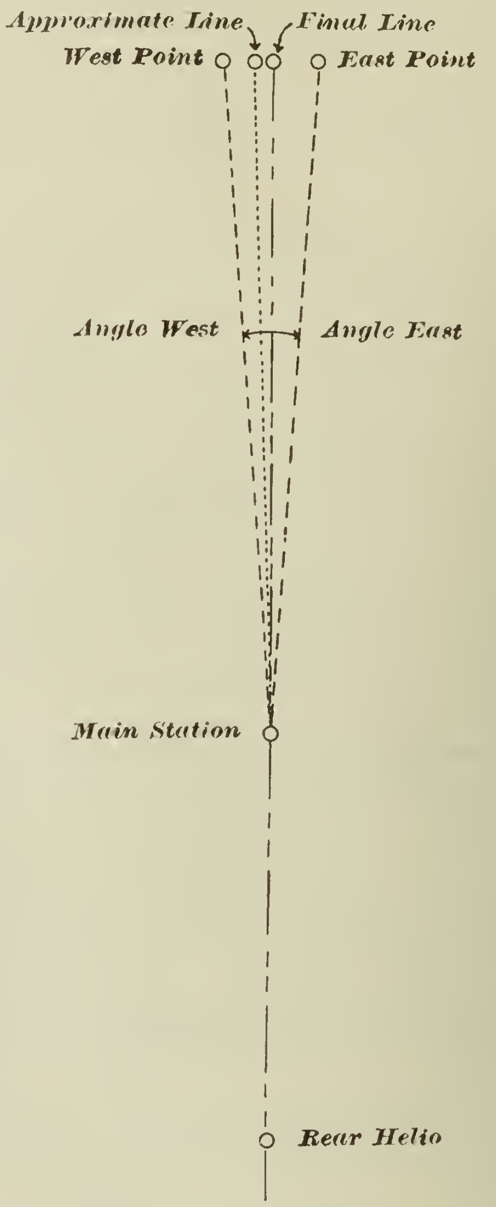


DIAGRAM
ILLUSTRATING
METHOD OF LINE PROJECTION
NOT TO SCALE

about 1.5 meters apart, one on either side of the line, and set his heliotrope over one of them. The readings being completed, the heliotrope was set over the second point which was likewise read on. The distance between the two points had meanwhile been carefully measured by the fore-heliotrope man and was now transmitted to the instrument party and using this as a base and knowing the deflection angles to the two points as read by the micrometer, a simple proportion gave the position of the true line with reference to either point. This position was then communicated to the fore-heliotrope man, who measured the offset to the true line, marked the position and erected a signal in the usual manner.

The observations were made in alternate sets by a United States and Canadian Observer. If the sets did not agree within 5″ (2.8 divisions of the micrometer head) each took another set.

Method used between Mounts Natazhat and St. Elias

The only exception to this method of tracing the line occurred in the region between Mount Natazhat and St. Elias where it was impossible to project the line south in the usual manner, and the only place between these two points where it was found practicable to mark the line was in the vicinity of the Logan and Walsh Glaciers, where the three monuments were set. Here the line was established in accordance with the decision of the Commissioners, who agreed that when a point on the 141st Meridian on Chitina River or Glacier had been determined, the line north and south from that point should be drawn on the azimuth derived from the triangulation. Astronomical observations for azimuth taken at this point or other convenient points were to be used as a check merely.

A base was measured on the south side of the Yukon valley, and a triangulation extended, straddling the boundary line, from which the positions of all measurements were determined. A belt of topography not less than two miles on each side of the line was executed by the plane table, supplemented in places by the photo-topographic method. A 20 foot skyline was opened through timber.

Transport Conditions

Pack-horses, purchased in eastern Washington, and British Columbia, furnished transportation for the parties during the season. The animals, after coming safely through a strenuous season, were to have wintered at Tanana Crossing, Alaska, but all perished in a furious blizzard which overtook them on their way there. The question of wintering the stock used on the survey was a source of much worry and disappointment to those in charge of the work. The horses had to be purchased "outside" and "taken in." The first cost, though comparatively reasonable, was augmented by the heavy freight rates and the cost of feeding while on the long journey to the point where they could be used. As the cost of taking them "outside" again in the fall, wintering them, and returning them again in the spring was prohibitive, they had to be wintered in the country, and, as the survey progressed, the outcome of this plan was found to be more or less uncertain. Some winters all the animals would "come through" looking fit and well in the spring, while again every head perished, and this despite the fact that every likely spot in the whole north district was given a fair trial.

Description of Country Traversed

As conditions met with in 1907 were more or less typical of those throughout the whole work, with the exception of the extreme north and south ends, a short description of them, perhaps, will not be out of place here. The country was undulating to mountainous, generally with deeply eroded stream beds. Heavy timber was usually encountered in the valleys, with the summits bare, or at best covered with a sparse growth of stunted timber or underbrush. Generally, travelling was found to be good along the ridges, except, of course, in the more mountainous portions, where the valleys were found to furnish the best routes of travel, and almost no trail-cutting was necessary except where it was impossible to travel on the ridges, and not always then. The thick moss overlying almost the whole lower country made very tiresome "going" for man and beast, and tended to make the firm, hard ridge-tops the popular lines of communication. The long days of these high latitudes aided the work materially, though at times, particularly on the more northerly portion of the work, many of the men complained that at first they were unable to get their usual quota of sleep owing to the light at night. The majority, however, soon became accustomed to this, and "bed-time" was "bed-time" no matter how light the night.

1908 Expedition

In 1908 a Canadian party under D. H. Nelles, D.L.S., started a line of precise levels at White Horse and carried on by the winter trail to Dawson, and thence west by the Glacier trail to Monument No. 216 of the boundary. Three seasons were occupied in doing this. In 1910, precise levels were brought up from an automatic tide guage at Skagway, by a U. S. party, whence Nelles carried them to White Horse, thus securing a continuous line of precise level from tide water to Mon. No. 216. South of Natazhat the railroad levels of the Copper River and Northwestern Railway from Cordova control the adjustments of all elevations.

The whole survey and demarcation between the Natazhat ridge 15 miles south of White River, and the Yukon a distance of 215 miles was practically completed in the fall of 1909, and a joint party had prolonged the line northward from the Yukon a distance of 40 miles.

1910 Expedition

In 1910 A. J. Brabazon was detailed to conduct the Geodetic Survey of New Brunswick, and J. D. Craig assumed complete charge of the field work, under the British Commissioner, and Thos. Riggs, Jr., under the U. S. Commissioner.

At the close of the season the line tracing had been completed from Mt. Natazhat, the most northerly ridge of the St. Elias Alps, latitude 51° 34, northward to atitude 67° 33, and in 1911 it had reached latitude 69° 20, at which point the Arctic Ocean was plainly visible, but a few miles distant. The triangulation had reached latitude 68° 54′ and the topography latitude 69° 04′.

An epidemic of smallpox had broken out early in the season at Rampart House where the Boundary crosses the Porcupine river, and labor and assistance which had been relied upon, were not available. A small United States party were left to winter at Rampart House to distribute supplies by dog train, and overhaul the launch and take advantage of the spring high water to forward supplies up the Old Crow River.

In 1912 the party reached Dawson May 22, and after a few days delay the outfit of 84 men and 150 horses boarded the steamers "St. Michael" and "Susie" for Circle City, where they transferred to the Steamer "Tanana" and were landed at Rampart House in less than five days from Dawson.

By June 5 all the parties had left for the scene of their summer's work. The fore-heliotrope party arrived at the Arctic Coast on July 12, and found the ice solid except for a narrow lane of water along the shore; but by the 26th the ocean was practically open. Franklin's Demarcation Point proved to be 7 or 8 miles west of the meridian. The topography and triangulation were brought up to the coast, and an area was mapped extending six miles to the east along the coast, and fifteen miles to the west. The triangulation was extended eastward along the coast about twenty-five miles, in an attempt to connect with Herschel Island. Two men had been sent from Rampart House and occupied a heliograph station on the highest point of the island for over a month, but the light was not seen from any of the triangulation stations.

The most northerly monument was set on line, July 18, to the accompaniment of appropriate ceremonies and the unfurling of the standards of the United States and Great Britain. This completed the demarcation of the Boundary from the Yukon river to the Arctic Ocean. The last of the parties left the coast August 6, and on August 30 they boarded the steamer "Delta" at Rampart House en route to Dawson.

Triangulation Work

Also during this season a beginning was made on the section of the boundary between Mt. Natazhat and Mt. St. Elias, a distance of 84 miles, across glaciers and vast ice and snowfields. It was judged practically impossible to project the line directly through this region by the usual method, and it was decided to carry a triangulation from the western end of the White River system of 1909, across the Scolai Pass, south to the Chitini, and up that valley to the line.

As this work would be entirely through United States territory, and would serve other than boundary survey purposes, it was undertaken by the U. S. Commissioner.

In March a party went in from Cordova by railway to McCarthy Station; where they divided into two sections. With horse sleds one section crossed through the Scolai Pass to White River. They recovered four stations of 1909 and carried the triangulation across the pass and down to the Chitini, and effected a junction with the triangulation of the other party which had been working up the valley towards the boundary. They joined forces and measured a base in the Nizina valley and did considerable plane table work on the Chitina and Anderson glaciers. They returned to Cordova about the end of September.

About April 1, 1913, a Canadian triangulation, and photo-topographical party under Fred Lambart, D.L.S., left White Horse over the winter trail to Lake Kluane, and then by pack train to the boundary. They succeeded in extending the triangulation several miles to the south of Mt. Natazhat, and connected with the topography which had been carried up the Anderson Glacier by the United States parties in 1912. Incidentally Mr. Lambart with two assistants succeeded in reaching the summit of Mt. Natazhat.

The general inspection of the work from the Arctic Ocean to Mt. Natazhat, with reference to the alignment, and condition of the monuments was completed this season; Messrs Riggs and Craig the Chief Engineers to the Commission having in person performed the greater part of this task.

Early in March two joint parties had left McCarthy. One completed the triangulation and trigonometrically located the boundary across the Logan Glacier and marked it by the placing of three monuments. A base was measured on a bar below the foot of the Chitina Glacier, and check azimuth observed, which agreed with the computed azimuths brought over the Scolai Pass by triangulation, to within 19″.

The positions of the larger mountains of this region were determined, notably Mt. St. Elias, Mt. King and Mt. Logan. The position of Mt. St. Elias will give a comparison between the Alaska and Yukon datums.

An attempt was made to climb Mt. St. Elias for the purpose of determining the intersection of the 141st Meridian with the line drawn parallel to the coast from the summit of the mountain. After ascending to an elevation of 16,500 feet, a furious storm forced the joint party to abandon the project.

Two hundred and two monuments marked the line from the Arctic Ocean to Mt. St. Elias, a distance of 645 miles, a vista 20 feet wide is opened out through all the timber, triangulation carried north and south from the Yukon controls all positions along the boundary, and a belt averaging 4 miles in width, has been mapped for practically the entire distance.

Thus, the season of 1913 saw the accomplishment of the final acts in connection with the field work of the survey of the 141st Meridian. All the gaps had been filled in, all the "loose ends picked up," and the whole work was complete from the Arctic Ocean to Mount St. Elias, and it was with feelings of genuine regret that all hands from the Chiefs of Party down, said farewell to each other and to the work which had brought them together each season for so many years, and had been productive of such pleasant relationships.

Friendly Relations Between Parties

There can be no doubt that the completion of the work was greatly expedited by the more than friendly relations existing at all times between the parties working under the direction of the Commissioners, and by the remarkable esprit de corps shown by all connected with the work. Everyone, American and Canadian, seemed to successfully grasp the idea that the work was of paramount importance, and it was advanced with the greatest possible speed consistent with good quality, often at the sacrifice of reasonable and legitimate personal comforts on the part of the men, and the disposition of one party to assist ore another in every possible way was quite as apparent between Canadian and United States parties as between parties of the same nationality.

The field work, a great deal of which had to be done in portions of the country hitherto considered practically impassable, was completed under the direction of the original Commissioners, O. H. Tittmann for the United States and Dr. W. F. King for His Britannic Majesty, and constitutes a lasting tribute to their efficient administration and supervision. Practically all the maps had also been prepared under their direction, as sheets 1 to 32, inclusive, had already been signed by them before the resignation of Mr. Tittmann on April 15, 1915, and the death of Dr. King on April 21, 1916.

The work was completed under the direction of E. C. Barnard, appointed Commissioner for the United States, April 30, 1915, and J. J. McArthur, appointed Commissioner for His Britannic Majesty, January 6, 1917; by printing and signing the last six sheets, numbers 33 to 38, preparing and signing the report, and transmitting to their respective Governments, as provided in the Convention, the signed report and duplicate atlases of signed joint maps. The engraved copper plates, original drawings, field sheets, record books and negatives have been stored in a vault of the engraving Division of the United States Geological Survey, Washington, D.C., subject to the order of the Secretary of State.

Thos. Riggs, Jr., having resigned as engineer to the United States Commissioner in May, 1914, the greater part of the work in connection with the preparation of this report devolved upon J. D. Craig, D.L.S., who since 1910 had been in complete charge of the field work under the British Commissioner, and the Commissioners desire to express here their appreciation of the efficient manner in which this arduous task has been accomplished.

Welcome Home

Members of the Saskatchewan branch of th *The Engineering Institute of Canada*, tendered a "welcome home" banquet last night to the members of *The Institute* who have returned from service overseas. Included among the guests were Brigadier-General Alex. Ross, C.M.G., D.S.O., general officer commanding Military District No. 12, and Mrs. Ross; Colonel J. L. R. Parsons, C.M.G., D.S.O., Croix de Guerre, and Mrs. Parsons; Hon. S. J. Latta, minister of highways, and Mrs. Latta; Dr. W. D. Cowan, M.P., Mrs. Cowan and Miss Cowan. The function, which was a very successful one, was held in the Kitchener hotel.

H. S. Carpenter, deputy minister of highways and president of the local branch, acted as toastmaster of the evening. In his address of welcome he referred to the very important role which had been played in the Great War by the engineering fraternity. The members of the Regina organization, he said were proud of the splendid records of the men who had gone from this district, many of whom had acquired fame and honor on the battlefields of France.

Inventions Used

Colonel Parsons in a very interesting address outlined some of the inventions which had been placed at the disposal of the war office by engineers and gave a description of the manner in which these inventions had been utilized by the intelligence branch of the allied armies. As General Staff Officer of the First Canadian Division, Colonel Parsons had a splendid opportunity of learning the history of the plans of the British army chiefs and he gave a graphic account of the Allied advance during the last few weeks of the war.

Major A. P. Linton, O.B.E., gave some reminiscences of the work which had been performed by the bridging company which he commanded in Palestine during the advance of General Allenby against the Turks, resulting in the capture of Jerusalem and the final capitulation of the Moslem empire.

Railway Troops

Lieut.-Colonel A. C. Garner, D.S.O., M.E.I.C., who commanded the 12th Battalion, Canadian Railway Troops in France, explained the organization of the railway troops and the splendid work performed by the corps in France and Flanders. Altogether he said there were thirteen battalions of the Canadian railway troops in France and they constructed thousands of miles of both broad and narrow guage railways. Wherever there was a battery of artillery, the railway builders were to be found laying down their steel and bringing ammunition right up to the gun emplacement. It was only the work of the corps which made the allied advance possible for to it lay the credit of bringing up all the supplies and ammunition necessary to maintain the fight.

During the evening a number of musical items were rendered by local artists and a pleasant evening was brought to a close with a dance.

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

VOL. II. December 1919 No. 12

Authors Names Omitted

An unfortunate omission occurred in two of the papers published in the General Section of the November issue of *The Journal*, whereby the names of the authors and the meetings where they were read were not included.

The first of these papers: "Heating Problems Produced by some of the Modern Methods of Building Construction," was read by W. B. MacKay, A.M.E.I.C., at the St. John Professional Meeting and attracted a great deal of attention. Reference was made to it in the Report of the St. John meeting and some of the discussion published.

The other paper "Can the Standard Measure of Value be Improved," the author of which is John G. Sullivan, M.E.I.C., was read by the author at a meeting of the Winnipeg Branch and is worthy of close study on the part of other members of *The Institute*.

Discussion received on either of these papers will be published in the succeeding issue of *The Journal*.

Domestic Fuel from Low Grade Lignite—The Present Status.

The writer can speak only in this brief note of the work of the Lignite Utilization Board, with which he happens to be connected, although it is by no means the only organization interested in this problem. The United States Bureau of Mines is about to start experimentation on a large scale, and similar work is proceeding in Australia and New Zealand.

The Board's endeavor is to produce a satisfactory domestic fuel from the poor lignites of the Souris field in south-eastern Saskatchewan. No attempts have been made to treat the coals from any other area, nor to produce anything save a domestic fuel from this particular coal. The industrial possibilities of Souris lignite are not included in the investigation, except as they may be studied in the Board's own power plant, nor has any attention been devoted to by-products, such as tar and ammonia. The present value of these is probably low and their ultimate value problematical.

Souris lignite is probably the lowest grade of any now mined, and it is reasonable to suppose that if it can be satisfactorily treated, better grade coals can be treated with at least as much success, and probably much more. A great deal, therefore, depends upon the results of the Board's labors.

Experimental work conducted since October, 1918, has led to the conclusion that pulverizing, drying, carbonizing and briquetting are the logical steps in the process most promising of commercial feasibility. Pulverizing and drying are comparatively simple processes which can be carried on by the aid of methods already well known and time tried. These present no particular difficulties.

Carbonizing, however, is not so simple. The carbonizer which the Board proposes to use is one developed by its own staff. It utilizes, so far as known, an entirely new principle, and is operated by gravity and at a higher rate than any similar machine. The carbonizer itself has no moving parts, is low in first cost, and it is believed it will be correspondingly low in operating expense. It is flexible and easily controlled, so that the quality of the product may be varied without difficulty. Furthermore, it is hoped, with reason, that sufficient gas will be given off in the process to provide the required heat, thus making it in a sense a "perpetual motion machine."

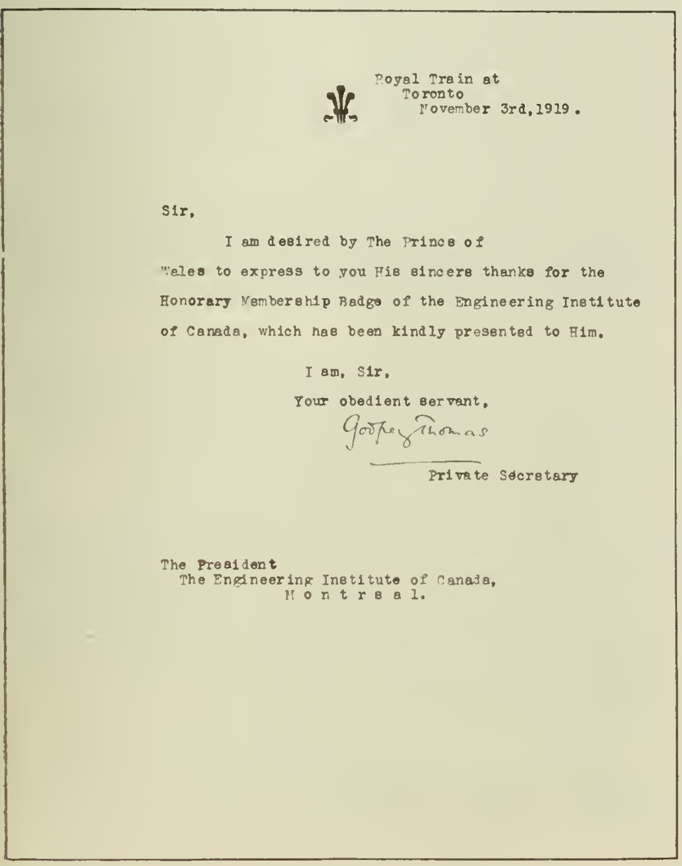
A super-laboratory apparatus, having a capacity of 150 lbs. per hour of product has been in operation for some months with good results. Based on information collected during this period, the designs for an 8000 lb.-per-hour unit are being prepared.

Carbonized lignite is not an easy material to briquette, but the Board feels that its experiments along this line have progressed to the point where ultimate commercial success may be expected. A briquetting plant having a capacity of about 1½ tons per hour has been in operation during the past summer, and a large number of sample briquettes have been made. These have been tested physically and in the fire, and certain of them have proved quite satisfactory. It is now largely a question of dollars and cents, principally with regard to the binder to be used. In addition to the Board's own work, certain commercial briquetting companies are carrying on tests, the results of which are not as yet complete.

The work of the past year has been so encouraging that plans and specifications are being prepared at present for a 100 ton-per-day plant to be erected in the Souris area early in the coming spring. Contracts for the buildings and much of the equipment will probably be placed by January 1st, 1920, and contracts for the balance will follow as rapidly as possible. The requisite "tuning up" may take several months, so that it will probably be the fall of 1920 before the plant is ready to produce on a commercial scale.

Upon the results obtained in this plant, the success or failure of the project can be predicted, since it is of commercial size, and accurate cost records will be an essential part of its operation. If successful, the Board confidently looks for private capital to take up the industry, provide the West with a domestic fuel comparable to Pennsylvania anthractie at less cost, keep more Canadian dollars at home and do a trifle toward reducing the H. C. L.

R. D. L. French.



Royal Train at
Toronto
November 3rd, 1919.

Sir,

I am desired by The Prince of Wales to express to you His sincere thanks for the Honorary Membership Badge of the Engineering Institute of Canada, which has been kindly presented to Him.

I am, Sir,

Your obedient servant,

Private Secretary

The President
The Engineering Institute of Canada,
Montreal.

Research Work in Canada

Two very valuable publications have recently been received by *The Engineering Institute*, the Report of the Special Committee appointed to consider the matter of the Development in Canada of Scientific Research, and Bulletin No. 1 of the School of Engineering Research of the University of Toronto; both of which should be in hands of every member of *The Institute*.

The word research has an unfortunately learned sound, but is very much like calculus to the engineering student. Just when the engineer-to-be is becoming thoroughly convinced that calculus is an invention of the evil one, purely theoretical and of doubtful value, he discovers that it is not merely an instrument of torture in the hands of a professor, but an extremely practical help in the solving of such matter-of-fact problems as the design of steam turbines.

The fact is that research undertaken in connection with purely scientific problems has produced such remarkable results that the larger engineering and chemical firms all over the world have thought it worth while to establish research laboratories and to spend very large sums of money on their upkeep. Canada has lagged behind in this respect to a certain extent, but the Imperial Oil Company spent $240,000.00 annually for research and exploration. The Eastman Kodak Company spend over $2,000,000.00 annually for their research laboratory at Rochester, N.Y., and more than one large industrial Company in the United States spends at least as much.

Now, here in Canada we have a great many problems which can only be solved by concentrated research work. Some of these indicated in the report of the special committee, are:— navigation in fog, the production of a rust resisting wheat, extension of the electro-chemical industry, the utilization of the tar sands of the west, the use of waste liquor from pulp and paper mills, etc. The special committee has recommended the establishment of a central Research Bureau with Government assistance to the extent of $500,000.00 for building purposes, and the fostering of research work in the universities to as great an extent as possible. In this latter connection a curious point emerges from the discussion of the committee. Several of the members were of the opinion that the ordinary university course is not conducive to the atmosphere of pure research, as independence of thought is the outstanding requirement in a research worker, and this is not encouraged in under-graduates. However, it does not follow that independence of thought is so stifled that very effective post graduate work may not be done, and the Bulletin of the School of Engineering Research, of the University of Toronto is strong evidence in support of this. This is a substantial volume of 240 pages and includes a number of investigations in various branches of engineering and chemistry. It is not fair to single out particular papers, but among the longer investigations may be mentioned two, the accounts of which have already been published in this *Journal*, "An investigation on girderless concrete floors," by Peter Gillespie, B.A.Sc., M.Sc., M.E.I.C., and T. D. Mylrea, M.W.S.E., and "Heat Transfer Tests of building materials," by L. M. Arkley, B.A.Sc., M.E.I.C., "A research on a 4" single state turbine pump," by J. H.

Parkin, B.A.Sc., and several investigations on sodium hydroxide and ferric hydroxide, by Maitland C. Boswell, M.A., Ph.D., and J. V. Dickson, B.A.Sc., also a research with a very practical application on "The calculation of transmission line net works," by T. R. Rosebrugh, M.A.

McGill and Queen's are as active in research as Toronto although they have not published results in quite the same form, but without more Government assistance and centralized efforts the work must necessarily be limited in scope. The National Physical Laboratories in England have done a most remarkable work in connection with the war; a great deal of research was done on problems connected with aeroplane design, and relating to anti-submarine problems, and it is only fair to state in this connection that a number of Canadians were called in to help in this work. The British Government founded a Department of Scientific and Industrial Research in 1915 which was granted $5,000,000.00 to begin with. Further, the Admiralty is recommending the British Parliament to provide another $5,000,000.00 for the erection and equipment of a sea experimental station, an engineering laboratory, and a central research bureau, with an appropriation of $1,500,000 per year for the actual conduct of investigations. No one can, therefore, quarrel with the recommendation of the committee that $500,000. be appropriated for similar purposes in Canada, on the score of asking for too much, and the members of *The Engineering Institute of Canada* can do a great deal in spreading the doctrine of efficiency in promoting the furtherance of research in the Dominion.

The Classification of the Civil Service

Readers of *The Journal* are, no doubt, aware that the special committee of Council and the Executive of the Ottawa Branch have taken a deep interest in the classification of the Civil Service and the Act which authorizes it. Their efforts have had a very considerable effect in improving the position of engineers in the service, which in turn will effect engineers throughout the Dominion.

The new classification became law on Nov. 11th last, and will take effect from April 1, 1920. In the meantime the commission will continue to fit the personnel of the service into the various classes.

Patronage in Dominion Government affairs in the past ten years, by two Acts of Parliament has been entirely abolished. The Civil Service Act of 1908 abolished patronage as far as the inside service was concerned and the Civil Service Act of 1918 also brought the outside service under the jurisdiction of the Civil Service Commission. The 1918 Act made it incumbent upon the Civil Service Commission to classify the outside service. To make this classification effective certain amendments to the 1918 Act became necessary, and on November 10th, last, the Civil Service Amendment Act of 1919 received Royal assent. These amendments, together with the 1918 Act, are claimed by those who have studied Civil Service matters to give Canada, if not the best, at least one of the best and most workable Civil Service Acts in any country.

The clause in this 1919 bill which is of most importance is that by which the classification of the Canadian Civil Service is adopted; over 50,000 employees divided into about 1700 classes will receive equal pay for similar duties, responsibilities, and qualification requirements, that is to say, men in Vancouver, Ottawa, and Halifax doing the same work will be placed in the same class and receive the same pay.

It is provided that the Civil Service Commission may prepare new classes, abolish classes no longer necessary, change existing classes as to duties, qualification requirements, lines of promotion, and compensation, provided, however, that changes in compensation must be approved by the Governor-General-in-Council.

Employees are to take the classification of their respective positions, but no temporary employee may be given a permanent position without examination and no permanent employee who has been appointed before the passing of the Act is to have his salary reduced by reason of the classification of his position, and even if the employee is placed in a class where the maximum salary is lower than the maximum salary of the subdivision or grade in which he was before classified, he shall be entitled to go to the maximum of his old subdivision or grade; by this division the Government has recognized a moral obligation that will promote contentment in the service as a result of the adoption of the classification.

Layoffs, an altogether new thing for the Canadian Civil Service, are provided for. When by reason of a completion of any special work or a diminution of work in any branch of the service, those employees who are either temporary or permanent, and are not required, may be laid off, but it is required that their names be placed at the head of the eligible list for the respective class for which they have qualified and they will be appointed to the next vacancy which occurs either in the department from which they were laid off or in any other department in the Government service.

This feature of the bill will be watched with considerable interest, as in the past a man who had a permanent position was considered to have a life job whether there was any work for him or not and was usually only removed when death claimed him.

Working hours for each and all classes and kinds of labour are to be studied and recommendations made by the Commission whereby standard hours will be prescribed for each class and kind of work.

All appointments to the Civil Service are to be made by the Civil Service Commission by competitive examination. The Commission will establish eligible lists for active classes, that is classes from which many appointments are likely to be made. If no eligible lists are in existence for any class, the Commission will hold an examination, and, if the appointment is urgent, fill the position temporarily until a permanent appointee may be selected.

Promotion in the Civil Service is understood to mean a transfer from one class to another class with higher maximum salary. Vacancies are to be filled, as far as is consistent with the best interests of the Civil Service, by promotion, and promotion is to be made for merit upon such examination as the Commission may prescribe. Increases are advances in compensation within a class. They are to be granted for meritorious service rendered and increased usefulness in the Service upon recommendation of the Deputy Head of the department and with the approval of the Civil Service Commission.

In certain cases, for work done outside of prescribed hours, upon the recommendation of the Deputy Head of a department, the Civil Service Commission may grant additional remuneration.

The special committee of Council will closely follow the working of the classification as applied to engineers and will be ready at all times to give their assistance in maintaining and improving the status of the profession.

C. V. PUTMAN.

Engineering Gathering at Peterborough

A Notable Engineering Event. Peterborough Engineers given Charter for the Establishment of a Branch of The Engineering Institute. The Engineers of Peterborough show progressive spirit.

Peterborough, the Electric City, on Thursday, November sixth, distinguished itself in two directions. On that day it reached its Victory Loan objective being the first city in Ontario to win the Prince of Wales' flag and, further, it saw the most important gathering of engineers ever held in the city and the inaugauration of a new era in the engineering life of the community.

When it was decided by the leading engineers there that their progressive city should be placed on the engineering map of Canada, the spirit with which they entered into the proposal and the effective manner in which their plans have been carried out reflects the genius of the men responsible for the new order that has been occasioned. It is also evidence of the spirit of the times when an active body, such as the Engineers' Club of Peterborough, realizes that it is adding prestige to itself and usefulness to its work in becoming a branch of the national organization, which with its eighteen branches is working in harmony in the interest of the engineering profession. It is coming to be more and more realized throughout Canada that the one national organization for the benefit of the profession is the surest means of accomplishing the successful outcome of the requirements of the members thereof.

From the time the Montreal delegation, the first of the out of town guests to arrive, were met at the station at dawn, by G. Reid Munro, A.M.E.I.C., chief engineer of the Wm. Hamilton Co.; Ross L. Dobbin, M.E.I.C., engineer, Public Utilities Commission; Roy H. Parsons, M.E.I.C., city engineer; J. A. G. Goulet, A.M.E.I.C., chief mechanical engineer, Canadian General Electric Co.; James Makintosh, A.M.E.I.C., resident engineer, Hydro-Electric Power Commission; Peter Westbye, vice-president and general manager, Wm. Hamilton Co.; until the last guest departed on the following day, there was no let up to the delightful hospitality which captivated the visitors from start to finish, and which made the non-residents realize more than ever before that Peterborough is an important engineering centre.

At noon an informal luncheon meeting was held for the purpose of becoming better acquainted.

Visits to Engineering Works

About 2 o'clock automobiles kindly supplied by local members took the party to various points of engineering interest in the city; the notable engineering feat, the lift lock of the Trent Canal being the first. After being locked through on board the Government tug following arrangements made by A. L. Killaly, A.M.E.I.C., Supt. of the Trent Canal, the operating mechanism was inspected. The works were familiar to a number of those present, but the lift lock at Peterborough is the source of unfailing interest. It was built from the design made by Walter J. Francis, M.E.I.C.

The Quaker Oats plant which is said to be the finest on the continent was also visited, as well as the pumping station operated by the Peterborough Utilities Commission, the plant of Wm. Hamilton Company, Limited, Peterborough Canoe Company, the Hunter Street Bridge, a superb structure of reinforced concrete now under construction of which Frank Barber, M.E.I.C., is the engineer, attracted considerable attention.

The Dinner

Described by the local papers as one of great importance to the city as a whole, and one that will go down in the chronicles of the history of the city and will for a long time bring pleasant memories to those privileged to be present. It was the inaugural dinner of the Peterborough Branch of *The Engineering Institute of Canada*, and considered from every viewpoint, the large and representative attendance, the enjoyable menu, and the interesting toast list, it was a great success. About one hundred men sat down at this banquet, representing the local engineers, the visitors of the profession and the leading men in the municipal business and professional life in the city.

Formal invitations had been sent out, bearing on the back the names of the officers of the Engineers' Club of Peterborough. Each guest on sitting down found before him a handsome menu card, the cover of which is similar to that of *The Journal*, bearing the words "*The*

The Engineers' Club of Peterborough

request the pleasure of your company at the

Inaugural Dinner of The Engineering Institute of Canada

Peterborough Branch, to be held in the Empress Hotel,

On Thursday Evening, November the Sixth

Nineteen Hundred and Nineteen

At Seven-thirty o'clock

R. S. V. P.

R. L. Dobbin, M.E.I.C.,
Secretary

Engineering Institute of Canada," the crest and "Inaugural Meeting of the Peterborough Branch, November the sixth, Nineteen hundred and nineteen." The interior of the programme consisted of eight pages containing a list of the members of Council for 1919, the objects of *The Institute*, an aeroplane picture of the Trent Canal and lift lock at Peterborough, the programme, scenes of engineering interest at Peterborough, a list of the officers of the Engineers' Club of Peterborough and a definition of the term "engineer."

Toast List

The King:

R. B. Rogers, M.E.I.C., Chairman.

The City:

Proposed by A. L. Killaly, A.M.E.I.C. Responded to by the Mayor.

The Engineering Institute of Canada:

Proposed by G. Reid Munro, A.M.E.I.C. Responded to by:

Lieut.-Col. R. W. Leonard, M.E.I.C.
Professor H. E. T. Haultain, M.E.I.C.
R. A. Ross, M.E.I.C.
James White, M.E.I.C.
Professor Gillespie, M.E.I.C.
Fraser S. Keith, Secretary.

The Branches of *The Engineering Institute:*

Prosposed by C. E. Sisson. Responded to by:

Walter J. Francis, M.E.I.C.
A. Harkness, M.E.I.C.
J. B. Challies, M.E.I.C.
Frank Barber, A.M.E.I.C.

Sister Professions:

Proposed by Wm. Sangster. Responded to by Dr. Morgan (Medical Society); F. D. Kerr (Law Society).

GOD SAVE THE KING

The chair was occupied by R. B. Rogers, M.E.I.C., who has long been identified with the engineering and business life of Peterborough, who proposed the toast to the King, which was fittingly observed. The toast to the City was proposed by A. L. Killaly, A.M.E.I.C., who predicted a bright future for Peterborough; the city was endowed with great resources and possibilities. Mayor Duncan in responding extended the city's welcome and freedom to the visitors, and referred to the fact that Professor Haultain, R. A. Ross, and Walter J. Francis were old Peterborough boys.

In proposing the toast of *The Engineering Institute* the President of the local Branch G. Reid Munro gave a brief sketch of the history of the Engineers' Club of Peterborough from the time of its inception till the time of the decision to join *The Engineering Institute of Canada*. Lieut. Col. R. W. Leonard, President of *The Engineering Institute* then spoke in reply, and in turn reviewed briefly the history of *The Engineering Institute of Canada* from its early days as the Canadian Society of Civil Engineers to the present day when *The Institute* has eighteen branches and a rapidly growing membership, which is at present close on 4,000. Professor Haultain, of Toronto, then spoke, and brought out the point that the present success of *The Institute* was largely due to the untiring efforts of the Headquarters Executive, R. A. Ross, President-elect of *The Institute* made a plea for the widening of the engineers' influence in public life, urging them to form a brotherhood that would be something which would be of potential good for the whole community. Jas. White, Deputy Chairman, of the Conservation Department of Ottawa followed Mr. Ross with a presentation to the Peterborough Branch of the photographs of Col. W. P. Anderson, T. C. Keefer, C.M.G., and G. A. Mountain, Past Presidents of the Canadian National Association of Engineers from which *The Engineering Institute* has sprung. Professor Peter Gillespie of Toronto gave a brief history of the Trent Valley Canal. He also laid stress on public service and on the fact that one of the principal objects of *The Institute* is to increase the usefulness of the engineering profession to the public. Fraser S. Keith, gave a brief history of general engineering from ancient times to the present day giving an idea of the immense influence of the engineer on present day civilization. J. B. Challies, Chairman of the Ontario Provincial Division spoke briefly emphasizing service.

Replying to the toast of "The Branches of *The Institute*," proposed by Mr. C. E. Sisson, of the local branch, Walter J. Francis brought greetings from the Montreal Branch and mentioned the fact that one third of the members of *The Institute* had been at the front, every man having non-commissioned or commissioned rank. Mr. Francis referred to some of Montreal's water works problems in which Canadian Engineers had done good work, one result of which had been that the administration of Montreal had been placed in the hands of an Administrative Commission, of which R. A. Ross, President-elect of *The Institute* was a member. A. H. Harkness then spoke briefly conveying the good wishes of the Toronto Branch. W. Sangster proposed the toast of the "Sister Professions," which was replied to by Dr. J. A. Morgan on behalf of the medical profession.

The very enjoyable meeting concluded with God Save the King followed by Auld Lang Syne.

Aeroplane View of Trent Valley Canal Lift Dock.

Out of Town Guests

The following were present:—President, Lieut.-Col. Leonard, M.E.I.C., St. Catharines, Ont., Vice-Presidents, Professor Haultain, M.E.I.C., of Toronto, and Walter J. Francis, M.E.I.C., of Montreal, President-elect, R. A. Ross, M.E.I.C., of Montreal; Members of Council, Professor Peter Gillespie. M.E.I.C., Toronto, and James White, M.E.I.C., Ottawa; J. B. Challies, M.E.I.C., Ottawa, Chairman of the Ontario Provincial Division; Frank Barber, A.M.E.I.C., Toronto, Edward Francis, S.E.I.C., Toronto, Fraser S. Keith, Secretary of *The Institute*, Montreal, and D. M. Fraser, of Toronto.

The officers and members of the Engineers' Club included the following;—Hon. President C. E. Canfield, President G. Reid Munro, A.M.E.I.C., Vice-President R. H. Parsons, M.E.I.C., Directors, P. L. Allison, H. O. Fisk, G. R. Langley, James Mackintosh, A.M.E.I.C., R. B. Rogers, M.E.I.C., E. R. Shirley, Secretary, R. L. Dobbin, M.E.I.C., W. J. Armstrong, A.M.E.I.C., A. F. Bookhout, F. Bowness, B. L. Barns, J. B. Barness, W. B. Browett, W. M. Cruthers, R. B. Carson, G. O. Cameron, H. J. Dickenson, D. Easson, H. A. Fife, V. S. Foster, A. B. Gates, A. G. Grier, J. A. G. Goulet, A.M.E.I.C., T. E. Gilchrist, R. Grant, S. H. Holden, E. L. Holmgren, R. E. Hinton, J. E. Hess, S.E.I.C., A. L. Killaly, A.M.E.I.C., H. A. Morrow, M.E.I.C., N. C. Mills, W. Munn, A. H. Munro, S.E.I.C., L. D. W. Magie, E. Maybee, D. L. McLaren, W. H. Pretty, G. Perks, C. Rogers, M.E.I.C., W. Rose, J. H. Reid, C. Robertson, W. Sangster, R. E. Stavert, C. E. Sisson, A. W. Spence, N. D. Seaton, A. C. Stensfield, A. L. Sutherland, A. L. Tennyson, S.E.I.C., P. P. Westbye.

New Members of the Institute

The following engineers of Peterborough have recently been admitted to *The Institute:*— P. L. Allison, Industrial Control Engineer, Works Engineering Dept. C.G.E.Co., G. R. Langley, Engineer in charge of Switchboard, Eng. Dept., C.G.E.Co., E. R. Shirley, Electrical Engineer on Engineering Staff of the C. G. E. Co., C. E. Sisson, Engineer in charge of design and supervision of construction in testing of transformers, C. G. E. Co., P. P. Westbye, Vice-Pres. & Gen. Mgr., Wm. Hamilton Co., B. L. Barns, designer, alternators and synchronous motors, C. G. E. Co., A. F. Bookhout, Electrical engr., Switchboard Section C. G. E. Co., A. B. Gates, Asst. induction motor designer, C. G. E. Co., T. E. Gilchrist, Works engr. Dept., on switchboard estimates, C. G. E. Co., D. L. McLaren, Asst. engr. on design of alternating current generators, synchronous motors and condensers, C. G. E. Co., W. G. Perks, Asst. engr. City of Peterborough, C. Robertson, in charge of Trent watershed, hydrometric survey, N. D. Seaton, switchboard section, eng. dept. C. G. E. Co., A. L. Sutherland, transformer drafting and mechanical design, C. G. E. Co., R. E. Hinton, Asst. engr. engineering dept. C. G. E. Co., E. L. Holmgren, transformer design, C. G. E. Co., J. H. Reid, Students engr. course, C. G. E. Co., R. E. Stavert, Test course, C. G. E. Co.

Group Photograph at the Trent Valley Lift Lock.
Opening Meeting, Peterborough Branch E.I.C., November 6, 1919.

BOOK REVIEWS

Motor Vehicles and their Engines

By Fraser and Jones. Published by D. Van Nostrand—Price $2.00

This book is a simple, practical exposition of the internal combustion engine as used in all types of motor vehicles, and is intended for the owner-driver, or for any owner interested in the whys and wherefores of his car. The book is practical throughout and deals in theory only when absolutely necessary, as, for instance, in connection with the theory of the different types of ignition as found in the present day automobile.

An idea of the contents of the book may be gathered from the general arrangement. The early part of the book deals with the principles of operation of two and four cycle gas engines, and goes on to deal with balance, cooling systems, carburetion, ignition systems, clutches, transmission, etc. In every chapter the different types of mechanism found in the leading modern American cars and trucks, are thoroughly described and illustrated; for instance, the chapter on clutches takes up the external cone clutch, the internal cone clutch, and various types of disc and plate clutches. Although the authors of this reference book do not make their subject tedious by delving too deeply into the theory behind automobile design, it is quite evident that they are thoroughly conversant with their subject and one is impressed with the thoroughness of the joint authors.

The latter part of the book describes such features of car and truck construction as balance, differentials, running gears, lighting systems, tires, etc., concluding with two very practical chapters on engine troubles and car adjustment. The book is very thoroughly illustrated, having 280 diagrams of automobile construction features, and has a detailed index.

Lighting from Concealed Sources

By the Engineering Department of the National X-Ray Reflector Company, New York. Price $2.00

Published by the National X-Ray Company of New York primarily as a guide to the correct use of the lighting fixtures manufactured by the Company, this book is nevertheless an authoritative and detailed text-book on Indirect Lighting, and contains several features of value to all interested in correct illumination.

After dealing with the principles of concealed lighting and showing clearly the benefits obtained from this type of lighting both from the point of view of illumination and that of eye-strain, the question of planning and design of indirect lighting is taken up. In this section of the book a number of valuable tables are given by means of which the correct method of lighting can be worked out very simply for any installation. The usefulness of the tables can be gauged from the following list: Efficiency of Utilization, Illumination in Foot Candles and Wattage per Square Foot for Various Requirements; Lumen Data for Mazda Lamps, Chart for quick determination of lighting intensity, spacing of units, proper lamp size and watts per square foot required.

The second section of the book takes up in more detail the application of Indirect Lighting Systems to particular installations such as factories, churches and private residences. In each case described, the details of the installation are given in full.

Although indirect lighting is recommended to be used wherever possible, there are installations where direct lighting is absolutely necessary, and to make the book complete, tables and other details are given similar to those for indirect lighting in the earlier part of the book, making calculation for direct lighting as simple as that for indirect lighting. Practical examples of direct lighting design are given, and these are followed by a section on flood lighting as used for protective and decorative purposes.

The book concludes with a five page glossary of terms used in illuminating engineering, the Standard Wiring Symbols adopted by the American Institute of Architects, and a section of Miscellaneous Data, such as Tables of Absorption, Reflection, Effect of Colored Lights on Various Colors, etc.

It can be seen from the above description of "Lighting from Concealed Sources" that while the book leans distinctly in the direction of the products of the company whose engineering department supplied the information, the book is nevertheless a distinct addition to the library of illuminating engineering. The subject of artificial lighting using the Indirect System is discussed in great detail. The tables given are of considerable value, and direct lighting is also given its fair share of attention.

Asphalts and Allied Substances

By Herbert Abraham, Member, A.C.S., A.S.T.M. Published by D. Van Nostrand Company, New York. Price $5.00

"Asphalts and Allied Substances," is an exhaustive work of 600 pages. After a historical review of asphalts and bitumens the author takes up the chemistry and geology of bitumens. The second part of the book discusses semi-solid and solid native bituminous substances; part three is a valuable section dealing with tars and pitches and goes quite thoroughly into the distillation and manufacture of coal tar, lignite tar, shale tar, water-gas tar and pitch, etc. The fourth section of the book deals with manufactured products, bituminous paving materials, bituminised fabrics for roofing, etc.; the fifth and final section discusses methods of testing; physical, chemical and weathering tests being taken up in detail.

Location, Construction and Maintenance of Roads

By John M. Goodell. Published by D. Van Nostrand Company. Price $1.50

This book on road construction is a reprint from the Good Roads Year Book. The various types of road construction are dealt with in turn, each chapter having been submitted to an authority on that particular subject for criticism. From a discussion of sand-clay and gravel roads the author proceeds to water-bound macadam roads, concrete roads, brick roads, etc. Chapters are included on road-building rocks, specifications for Portland Cement, resistance of roads to traction, and tables are given of the production of broken stone, gravel and paving sand, etc. The subject matter is taken exclusively from the United States, and no mention is made of Canada, although the problems encountered in this country are of the same type as those found in the Northern States. Each chapter includes tables for the use of the highway engineer; for instance in the chapter on bituminous roads a table is given showing the gallons of bituminous material per mile or road for different rates of application. A very useful chapter is that on highway bonds.

Note.—Books reviewed above are to be found in the Library of The Institute, 176 Mansfield Street, Montreal.

CORRESPONDENCE

Editor, *Journal:—*

Dear Sir:

Am much interested in the September Journal.

Will you kindly order and forward to me, new certificate of membership, $1.25, gold badge as watch charm, $3.75.

I would be very much obliged if you could obtain designs and working drawings of frame buildings suitable for farm houses, one, one and half and two storey wooden bungalow buildings in timber from such firms as enclosed advertisements indicate. There is a big movement now taking place to adopt Canadian style of housing. I have delivered many lectures advocating their adoption. I had many plans and models in Canada but have been unable to obtain them and my time is so occupied in lecturing and demonstrating to one hundred and seventy-eight students, that I cannot find time to make fresh drawings. As they are offered for sale I might be able to obtain some drawings (working and designs) through your good offices. If you could make a small selection for me you would greatly assist me.

Also with regard to hot air heating for houses. I would like some trade catalogues with prices. Designs and any statistics available. People cannot realize here how simple and inexpensive such installations are in Canada.

Yours faithfully,

Hilder Daw, M.E.I.C.

South Eastern Agricultural College,
Wye, Kent, England., October 1st, 1919.

REPORT OF COUNCIL MEETINGS

Date: The regular monthly meeting of the Council was held at the rooms of the Institute, 176 Mansfield Street, on Tuesday, October 28th, at 8.15 P.M.

H.R.H. The Prince of Wales: The ballot for the election of His Royal Highness, The Prince of Wales, as an honorary member of *The Institute* was canvassed and was unanimously in favour of his election. The gracious acceptance of His Royal Highness of honorary membership had previously been given. It was left to President-elect Ross to arrange to have His Royal Highness notified and to have a gold badge of *The Institute* presented to him.

National Conference on Moral Education: Walter J. Francis, who, with W. M. Scott, E. P. Featherstonhaugh, J. G. Sullivan, and Geo. L. Guy, of Winnipeg, represented *The Institute* at the National Conference on Moral Education, presented his report. He believed that the gathering had been one of the most notable educational gatherings in the history of Canada, an outstanding result being that a national bureau is to be established under the direction of a national Council of the Conference for the purpose of educational investigations and as a clearing house for educational data, to be maintained by voluntary support and such financial assistance as may be given by Provincial and Dominion Governments without any restrictions as to policy. Mr. Francis advised that a transcription of the stenographic notes of all papers and discussions at the Conference would be sent to headquarters. Mr. Francis' report was received.

Peterborough Branch: An application for the establishment of a Branch of *The Institute* at Peterborough was presented as follows:—

Peterborough, Ont.

The Council of
The Engineering Institute of Canada.

Gentlemen:—

We, the undersigned, corporate members resident in Peterborough, being desirous of establishing a branch of *The Institute* at Peterborough, to be called the Peterborough Branch, request that you issue the necessary orders for that purpose. The area is to include a radius of twenty-five miles from the Peterborough Post Office.

Thanking you, we are,

R. H. Parsons,	C. H. Rogers,
R. B. Rogers,	J. A. G. Goulet,
R. L. Dobbin,	C. S. Whitney,
G. Reid Munro,	James Mackintosh.
W. G. Montgomery,	H. A. Morrow,
A. L. Killaly,	W. A. Logan.

On motion by R. A. Ross, seconded by Walter J. Francis, it was resolved that permission be granted. It was noted that it was proposed by the members in Peterborough to make the inauguration of the Branch on

November 6th an important engineering event in Peterborough, at which time it is hoped that many members of Council and representatives of the various Branches will be present. A number of Councillors signified their intention of being on hand.

Toronto Branch Salary Schedule: The salary schedule prepared by the Salaries Committee of the Toronto Branch and approved at general meeting of the Branch on October 16th, was presented. In view of the importance of this, it was decided that it receive fuller consideration at an early date.

Technical Education: The Secretary was instructed to write to Mr. Corless for information as to the present situation regarding the proposal to approach the Provincial Governments regarding technical education and to ask his opinion as to his idea of the policy which *The Institute* should adopt. Mr. James White's appointment to the Joint Committee in this matter was confirmed.

Branch By-Laws: The By-Laws of the Winnipeg Branch were presented and approved. A Committee consisting of the Chairman of the By-Laws Committee, Professor Brown, and the Secretary, was appointed to scrutinize all by-laws on hand and to be submitted. It was resolved that these be automatically approved if found by the committee to be not contrary to the regulations of the Institute, thus avoiding the delay in having branch by-laws approved. The Secretary was instructed to write immediately to the different Branches who had submitted by-laws advising that action is being taken.

By-Laws-Amendments: A proposed amendment submitted by a member of *The Institute* and signed in accordance with the By-Laws was received, but inasmuch as the By-Laws require that such proposals should be in the hands of the Secretary by October 1st, it was considered necessary that it be held over.

Western Meeting: A letter from the Calgary Branch suggesting that the Secretary and a delegation from Council go West in November to assist in connection with legislation was considered. It was decided that it is impossible for the Secretary or any of the officers to go West at the present time, and the Secretary was instructed to write advising the Western members to take the initiative in educating other engineers to the viewpoint regarding legislation.

Standardization in Municipal Work: A letter from Captain Durley, suggesting action on the part of Council to appoint a committee to co-operate with the Canadian Engineering Standards Association regarding standardizing the various pipes, fittings and equipments used in municipal works, was referred to R. A. Ross for his advice.

Affiliates of Branches: The suggestion of President Leonard that greater encouragement be given to the question of affiliates joining the branches was approved, the same to be published in *The Journal.*

Society of Chemical Industry: Approval was given to the arrangements made by the Secretary with the Secretary of the Society of Chemical Industry whereby the latter shall hold their meetings on the third Friday of each month at the rooms of *The Institute.*

Plummer Medal: The design submitted for the Plummer Medal was considered and the Secretary was instructed to confer with Dr. Stansfield regarding the design of the Plummer Medal and also to take the matter up with Mr. Sharpe of Caron Frères.

Suggested Reclassification: The suggestion from H. M. Morrow, A.M.E.I.C., regarding reclassification of the membership of *The Institute* was considered and held over for further discussion.

Finances: Approval was given to the arrangements made by the Treasurer and Secretary for transferring the account from the Bank of Montreal to the Canadian Bank of Commerce. The Secretary was instructed also to transfer the Savings Account amounting to $2302.81 and to invest same in Victory Bonds, less $296.00 taken from current account chargeable to this account, the balance owing on the Tobacco Fund to be charged to current account.

Honorary Members Badges: Approval was given to the securing of engraved gold badges for each of the honorary members, and the Secretary was instructed to write a letter, in conference with R. A. Ross, to accompany the badges of the honorary members when sent. The disposal of the badge for The Prince of Wales was left to Mr. Ross, to make arrangements, if possible, for presenting it in person.

Railway Bench Marks: The suggestion of W. C. McLaren, A.M.E.I.C., that railway bench marks be established by legislation, was considered, together with a letter from Mr. Fairbairn, and the Secretary was instructed to send Mr. McLaren a copy of the letter suggesting that he bring the matter to the attention of the railway commission if he considered it advisable.

Ballot: The ballot for the election and transfer of members was canvassed and the following elections and transfers affected:—

Members

Frank Lee Butler, of Winnipeg, Man., general supt., Winnipeg Electric Railway; William Laird Ketchum, of Temiskaming, Que., chief engr. of constr., Kipawa Co., Ltd.; Robert Lee Peek, of St. Catharines, Ont., supt. of constr., Coniagas Reduction Co., smelting and ref'g. work, Thorold, Ont.; Ambrose Harding White, C.E., B.C.E., (Univ. of Maine), of Brooklyn, N.Y., chief engr., International Paper Co., New York, and St. Maurice Lumber Co. of Canada.

Associate Members

Alfred Nepean Ball, B.Sc. (C.E.) (Queen's Univ.), D.L.S., S.L.S., of Regira, Sask., since 1916 with 9th Can. Rly. Troops; Francis Mountfort Barnes, D.L.S., of St. John, N.B., asst. engr., Department of Public Works; Harold Frederick Guild Barnjum, of Prince Rupert, B.C., instrumentman, i/c of res. engr's. office; Edward Herbert Beck, of Toronto, Ont., member of firm Beck & Poole, gen. contracting and engineering; Sydney Bowen, of Morrisburg, Ont., first asst. engr. on St. Lawrence River survey for Hydro-Electric Power Comm.; Loren Lewis Brown, Lieut., B.Sc. (C.E.) (Univ. of Idaho), and of Vancouver, B.C. supt., Forest Products Laboratories of Canada, University of B.C.; Alban W. L. Butler, Major, C.M.G., of St. Catharines, Ont., asst. engr., Welland Ship Canal; Neil Campbell, of Ottawa, Ont., production engr., shipbuilding dept., Imperial Munitions Board; Edmund Dean Wade Courtice, B.A.Sc. (Univ. of Tor.), of Chatham, Ont., engr., Dominion Sugar Co., Chatham, Wallaceburg and Kitchener; Haldane Rodger Cram, B.Sc. (McGill Univ.), of Ottawa, Ont., drainage engr., Reclamation Service, Ottawa; Frank A. Danks, C.E. (Univ. of Tor.), of Toronto, Ont., constr. engr., under F. R. Miller, British Forgings, Asbridges Bay, Toronto; Harvey William Lawrence Doane, B.Sc. (C.E.) (N.S. Tech. Coll), Major, of Halifax, N.S., asst. in city engineer's office; John Granville Dryden, of Halifax, N.S., asst. engr., Halifax Ocean Terminals; Roger Louis Fairbanks, Lieut., of Port Arthur, Ont., since 1918 with 11th Batt., C.R.T., demobilized 1919, at present unemployed; Kenneth Cameron Fellowes, of Niagara Falls, Ont., instrumentman, Hydro-Electric Power Commission; Andrew George Graham, C.E. (Royal Tech. Coll.), of Vancouver, B.C., with Vancouver Harbour Commissioners; Byron Hallock, of Winnipeg, Man., chief field engr., and supt. of constrn., under city engr., of Winnipeg; Secor Winslow Johnston, of Niagara Falls, Ont., ch. of party on surveys, Niagara Development, Hydro-Electric Power Commission; Grover Keith, of St. John, N.B., since 1915 with T. McAvity & Sons; Roderick Francis Macdonald, B.A. (St. Francis Xavier Univ.), of Sault Ste. Marie, Ont., field engr., Spanish River Pulp & Paper Mills; Richard H. Mather, B.Sc. (McGill Univ.), of Montreal, P.Q., 1916-19 with Sir W. G. Armstrong, Withworth & Co., Ltd., England, just returned; Harold Wilson McKiel, B.A., B.Sc. (Queen's Univ.), of Sackville, N.B., secretary and registrar, Faculty of Applied Science, Mount Allison University; John William McLelland, of New Glasgow, N.S., surveyor, Acadia Coal Co., Stellarton, N.S.; Douglas A. S. Mutch, B.A.Sc. (Mining) (Univ. of Tor.), works manager, Coniagas Reduction Co., Thorold, Ont.; Walter Frederick Oldham, B.Sc. (Manchester Univ.), of Winnipeg, Man., 1918, overseas with O.M.F.C., discharged July 1919; Edson Raymond Pease, Major, B.A., B.Sc. (McGill Univ.), of Montreal, P.Q., member of firm, McDougall & Pease, consulting engrs.; William Henry Stuart, of Hanna, Alta., resident engr., C.N.R.; Harry Story Tawse, of Aberdeen, Scotland, head of firm Tawse & Allan, civil engrs. and architects; William Caven Taylor, B.S.E. (Univ. of Man.), M.L.S., of Stonewall, Man., with Winnipeg Electric Rly.; Arthur Rivers Whitelaw, M. & E.E. (Univ. of Tor.), of Campbellford, Ont., plant engr., Northumberland Paper & Elec. Co.; James Robert Wood, A.R.T.C. (Royal Tech. Coll.), of Evesham, Sask., dist. engr., Nelson, B.C.; Earle Murray Wynn, of Niagara Falls, Ont., topographical and designing draftsman, Niagara Power Development; Arthur George Young, B.Sc. (C.E.) (Carnegie Inst. of Tech.), of Toronto, Ont., bridge work with Hydro-Electric Power Commission.

Juniors

Edward Willard Gordon Chapman, B.Sc. (C.E.) (N.S. Tech. Coll.), of Halifax, N.S., industrial surveyor, Dept. of Soldiers' Civil Re-Establishment; Leslie Harding Cookson, of Bathurst, N.B., res. engr., i/c of constrn., Bathurst Pulp & Paper Division; Kenneth Lockhart Dawson, B.Sc. (C.E.) (N.S. Tech. Coll.), of Halifax, N.S., chemical engr., and asst. supt., gas dept., N.S. Tramways & Power Co.; William Sutherland McDonald, B.A.Sc. (Univ. of Alta.), of Calgary, Alta., hydrometric engr., Comm. of Irrigation; John Maurice Poole, of Halifax, N.S., with Pickings & Roland, i/c of surveying party ; Edmund Gentry Timbrell, B.Sc. (London Univ.), of Ottawa, Ont., engr., Reclamation Service, Dept. of Interior.

Transferred from the Class of Associate Member to Member

Charles Brakenridge, of Vancouver, B.C., private practice; Philip Piggott Brown, of Vancouver, B.C., in private practice as conslt. & supervising engr.; John Cormack Craig, Major, D.S.O., of Vancouver, B.C., formerly draftsman, P.C.E.Rly., Vancouver. since 1915, Major, chief engr. and 2nd i/c of Rly. Troops (awarded D.S.O., three times mentioned in dispatches.) Awaiting demobilization; Walter Atkyns Ervine Grim, Captain, of Vancouver, B.C., formerly asst. engr., with Geo. H. Webster, consl. engr. and contractor, since 1914 on active service as Captain, Can. Engrs. Awaiting demobilization; John Chiene Holden, of Winnipeg, Man., Grad., R.M.C., engr., Manitoba district, C.P.R.; William Herbert Magwood, of Cornwall, Ont., member of firm Magwood & Stidwill, also town engr., for Cornwall, Alexandria, Maxville and other rural municipalities; Donald Milner Mathieson, Major, B.Sc. (C.E.) (McGill Univ.), of Toronto, Ont., since 1914 with 2nd Field Co., C.E., England & France, wounded, invalided to Canada. At present, O.C., Spadina Military Hospital, Toronto; Reginald George Saunders, Captain, of Toronto, Ont., member of firm Weddell & Saunders, Trenton and Toronto.

Transferred from the Class of Junior to Associate Member

Robert Scott Clemens Bothwell, B.A.Sc. (Univ. of Tor.), of Toronto, Ont., engr. i/c of dredging at Norfolk, Va., for Jas. Stewart & Co., New York.; Arthur Desrosiers, of Detroit, Mich., B.Sc. (McGill Univ.), in private practice as conslt. engr.; Arthur Douglas Fisken, Major, M.C., Grad., R.M.C., of Kerrisdale, B.C., owner of The Marine Garage & Repair Shop, Marpole, B.C.; James MacKendrick Gordon, of Toronto, Ont., supt., Warren-Bituminous Paving Co.; Clarence Earle Hogarth, B.A.Sc. (Univ. of Tor.), formerly of St. Catharines, Ont., since demobilization with The Austin Co., Berthierville, P.Q.; Frederic Carr Knight, B.E. (Dalhousie Univ.), M.Sc. (McGill Univ.), with G.T.P., valuation dept., in connection with U. S. Federal Valuation of railroads; Lawrence Paschal Macrae, of Victoria, B.C., engr. with the Pacific Construction Co., Port Coquitlam; William Paul Murray, Lieut., M.C., of Lachine, P.Q., B.A.Sc. (Univ. of Tor.), on bridge designing, Dominion Bridge Co.; Jean Baptiste Octave Saint-Laurent, B.A. (Laval Univ.), Grad., R.M.C., of Ottawa, Ont., engr. on constrn., The Foundation Co., Ltd.; Roy Aubrey Spencer, Major, B.Sc. (C.E.), M.Sc. (C.E.) (McGill Univ.), of Montreal, profession of engineering, Dalhousie Univ.; Clifford St. John Wilson, B.Sc. (McGill Univ.), of Halifax, N.S., office engr. Pickings & Roland.

Transferred from the Class of Student to Associate Member

Reginald March Calvin, Major, B.A., B.Sc. (Queen's Univ.), of Ottawa, Ont., in waters powers branch, Department of the Interior; Wilfrid Eben Pinkerton Duncan, Major, B.Sc. (Glasgow Univ.), of Milton, Ont., formerly asst. engr., Lake Erie & Northern Ry.; Robert R. Hepinstall, B.Sc. (Queen's Univ.), of New Orleans, La., emergency engr., Board of Port Commissioners for the Port of New Orleans; Albert Angus Richardson, Captain, B.A.Sc. (C.E.) (Univ. of Tor.), of Peterborough, Ont., previous to enlistment with the Canadian Stewart Co., since Mar. 1916, Lieut., Can. Infantry, promoted to Captain, C.E., received O.B.E., and mentioned in dispatches. Awaiting demobilization.

Transferred from the Class of Student to Junior

George Frederick Alberga, B.Sc. (McGill Univ.), of Montreal, P.Q., formerly ch. inspector, Canada Cement Co., 1916-19, on active service as Sergeant, 2nd Can. Construction Coy. Demobilized, at present unemployed; John Francis B-ett, Lieut., formerly with Glengarry Construction Co., Montreal. 1915-19, overseas with C.O.R.C.C., France, C.R.T., Broad Gauge Ry., i/c mechanical workshop with same unit; William McGregor Gardner, B.Sc. (McGill Univ.), Lieut. (McGill C.O.T.C.), of Montreal, P.Q., with Montreal Tramways Co., as track engr.; Bruce Alexander Johnston, B.C.E. (Man. Univ.), of Winnipeg, Man., formerly engr. on Manitoba highways. Overseas since 1916; George William Frederick Johnston, B.A.Sc. (Univ. of Tor.). of Ottawa, Ont., astronomical computer, Dom. Observatory; Geoffrey Francis Layne, B.Sc. (McGill Univ.), of Cheshire, Eng., Lieut., M.C., formerly with the C.P.R., since 1915, Lieut., Royal Field Artillery, instructional duty, at present unemployed; William George Mawhinney, B.C.E. (Man. Univ.), of Selkirk, Man. municipal engr., rural municipality of St. Clements, Selkirk, Man.; David Ewen McPherson, B.C.E. (Man. Univ.), of Winnipeg, Man., draftsman, C.N.R.

Adjournment: The meeting was then adjourned to the call of the Secretary at the earliest possible date.

* * *

The regular monthly meeting of the Council was held at the rooms of *The Institute*, 176 Mansfield Street, on Tuesday, November 25th, at 8 P.M.

Annual Meeting: It was resolved that the coming Annual Meeting be held in Montreal, January 27th, 28th and 29th. Approval was given to the holding of a professional meeting in conjunction with the Annual Meeting under the auspices of the Montreal Branch.

Ballot: It was decided that in sending out the ballot for the Election of Officers and Members of Council, the ballot should be segregated as to districts and the face of the ballot stamped "Vote here only" opposite President, Vice-President and the Councillors for the district in which the member receiving the ballot lives; the return envelope to be stamped on the outside with the number of the district.

Technical Education: Consideration was given to the endorsation of technical education and it was resolved that a letter be drafted by R. A. Ross and Professor Ernest Brown to the National Council of Education, endorsing technical education along the lines proposed by C. V. Corless.

American Waterworks Convention: The Secretary was instructed to write to the Secretary of the American Waterworks Convention, expressing Council's pleasure that their Convention was to be held in Montreal, and extending the use of our rooms and asking for suggestions where we could be of assistance.

Canadian Mining Institute Meeting: It was resolved that the felicitations of *The Institute* should be sent in a night-letter to the Secretary of the Mining Institute at Vancouver.

Joint Meeting with the American Institute of Chemical Engineers: The proposal that a meeting of *The Institute* be held in conjunction with the visit of the American Institute of Chemical Engineers to Canada, was discussed. The Secretary was instructed to write Mr. DeCew and Mr. Haanel stating that a professional meeting is being contemplated in Ontario and that the Ontario Branches are being asked to consider the proposal to hold the Annual Meeting of the American Institute of Chemical Engineers in conjunction with this meeting. The general proposal meets with the approval of the Council.

Peterborough Branch: The successful gathering at Peterborough for the inauguration of the Peterborough Branch was noted. The Secretary was instructed to send a cheque for $50.00 to the Branch as an advance.

Branch Charters: The suggestion that the Branches be presented with a form containing Council's authorization of their establishment was approved and a committee consisting of Messrs. H. H. Vaughan, Arthur Surveyer, Frederick B. Brown and the Secretary, appointed to draw up a form for this purpose and submit same to Council.

Changes in By-Laws: The suggestion of the Ontario Provincial Division that an additional district be added to Ontario was approved and referred to the By-Laws Committee to draft the By-Laws incorporating the suggested change.

(b) The suggestion that Section 60 of the By-Laws be changed, was discussed. It was resolved that Section 60 be changed by the inclusion of the words "and Vice-Chairman" after the word "Chairman."

(c) It was resolved, upon the suggestion of Mr. Decary, that Section 57 of the By-Laws be amended by the deletion of the words "except the Montreal Branch" after the twelfth word "Branch."

Finances: The Secretary presented a financial statement showing the situation and it was resolved that a meeting of the Finance Committee be called and that they be requested to report at the next meting of Council.

Journal: On motion by Mr. Francis it was resolved that an editing committee of three be appointed, H. H. Vaughan, Chairman, with power to complete his committee, and that the Journal be confined to the publication of papers of *The Institute*, news of *The Institute*, employment bureau and an engineering index.

A suggestion that $5.00 per column be allowed to the Branches for accepted Branch news, personals, etc., was approved.

Captain C. N. Mitchell, V.C.: The proposal of the Winnipeg Branch to have a dinner and presentation for Captain C. N. Mitchell, V.C., A.M.E.I.C., was presented and the Secretary was instructed to send the regrets of Council that none of the officers from the East would be present, and to send greetings to Capt. Mitchell and the Branch. It was resolved to ask J. G. Sullivan, past Vice-President, to represent the Council at this function.

Quebec Provincial Division: The request for the formation of a Quebec Provincial Division was received, and, on motion by A. R. Decary, it was resolved that Council approve of the formation of the Quebec Provincial Division, inasmuch as the By-Laws in that connection had been complied with, and that a committee consisting of A. R. Decary, Arthur Amos, B. Normandin, Walter J. Francis, Arthur Surveyer and Frederick B. Brown, be appointed to complete the formation of the Division.

American Society of Mechanical Engineers: The invitation of the American Society of Mechanical Engineers to attend their Annual Meeting, December 2, 3, 4 was presented, and the Secretary was instructed to send a cordial letter of appreciation of this invitation and to state that he personally would be present.

Kingston Branch: Approval was given for the re-establishment of the Kingston Branch of *The Institute*, The Secretary was instructed to lend every effort to that end.

Visit of Secretary to New York: The invitation of the Secretary of Engineering Council to the Secretary to visit New York next week was considered and the Secretary authorized to accept the invitation if his plans would permit.

Ballot

The following elections and transfers were effected:—

Members

Philip Livingston Allison, M.E. (Stevens Inst. of Tech.), of Peterborough, Ont., industrial control engr., works engr. dept., Canadian General Electric Co.; Charles William Dill (grad., S.P.S.), of Regina, Sask., supt of Highways, Saskatchewan; Gordon Russell Langley, B.E. (E.E.) (Union Univ.), of Peterborough, Ont., engr., i/c switchboard engr. dept., Canadian General Electric Co.; William Brodie Macdonald, of St. Catharines, Ont., designing mech. engr., Welland Ship Canal; William Oscar Marble, of Vancouver, B.C., i/c of construction for Hodgson & King, engrs. and contractors; John William Morrison, B.Sc. (M.E.) (Dalhousie Univ.), of Dane, Ont., manager, Argonaut Gold, Ltd.; Percy Bramble Roberts, of London, Eng., surveyer on staff in Royal Arsenal, Woolwich, Eng.; Ernest Roxford Shirley, B.A. (Univ. of N.B.), of Peterborough, Ont., elec. engr., Canadian General Electric Co.; Charles Everett Sisson, grad., S.P.S., of Peterborough, Ont., i/c of estimates, designing and supervision of constrn., Canadian General Electric Co.; Charles Winthrop Tarr, of Windsor, Ont., vice-president & general manager, Morris Knowles, Limited; Peter Pederson Westbye, M. & E. E. (Mittwida & Dresden, Saxony), M.E. (Porsgrund Tech. Sch.), vice-president & gen. manager, Wm. Hamilton, Co., Ltd.

Associate Members

George Benson Anderson, of Ottawa, Ont., asst. engr., Dept. of Public Works; Bird Lee Barns, Captain, B.Sc. (Univ. of Mich.), designer, alternators and synchronous motors, Canadian General Electric Co.; Charles Benjamin Bate, B.Sc. (Queen's Univ.), of Ottawa, Ont., since 1915, on active service as an engr. officer, recently demobilized; Charles Haliburton Blanchard, of Winnipeg, Man., engr. i/c, District No. 2, Public Works Dept. of Manitoba; George Blanchard, of Port Arthur, Ont., asst. and res. engr., C. D. Howe & Co.; Alden Ferris Bookhout, B.E. (Union Univ.), of Peterborough, Ont., elec. engr., switchboard section, Canadian General Electric Co.; John Sutherland Brisbane, Lieut., B.Sc. (C.E.) (McGill Univ.), of Montreal East, P.Q., with Imperial Oil Ltd.; Charles Foster Corbett, Lieut., of Cardston, Alta., district hydrometric engr., Cardston District, Reclamation Service, Dept. of Interior; William Frederick Coutlee, of Ottawa, Ont., i/c of hydrometric parties, Public Works Dept.; John Craig, B.A.Sc. (Univ. of Tor.), of Nelson, B.C., asst. engr., B.C. hydrometric survey; John Willard Crashley, B.A.Sc. (Univ. of Tor.), of Toronto, Ont., temp. Capt. and Adj., 9th Mississauga Horse and secretary of Mississauga Batt'ns., Home Assoc., France; John Bull Croly, of Vancouver, B.C., inspecting engr., Robert Hunt & Co., consulting engrs.; Samuel Laurence Decarteret, Ph. B. (C.E.), Yale Univ., of LaTuque, P.Q., i/c of constrn. of steel tugs, scows, etc., also operation and maintenance of private ry., etc., for Brown Corpn.; Philip Earnshaw, B.Sc. (Queen's Univ.), Major, D.S.O., M.C., of Toronto, Ont., previous to enlistment, first asst. on hydrographic survey, Upper Ottawa conservation, also resident on repair of Temiskaming dam; William Jessimen Fletcher, B.Sc. (Queen's Univ.), O.L.S., Lieut., of Windsor, Ont., while overseas with C.E., had charge of all engr. work, bridges, etc., at Gonostai Barracks, Siberia, at present engr. and surveying officer, on surveys, sidewalks, etc.; John Hunter Forbes, Major, B.Sc. (McGill Univ.), of Smith's Falls, Ont., div. engr., C.P.R.; Charles Allison DeWitt Fowler, B.Sc. (N.S. Tech. Coll.), P.L.S., of Armdale, N.S., asst. ch. engr., Halifax Shipyards, Ltd., Halifax; Archibald Bland Gates, B.Sc. (Queen's Univ.), of Peterborough, Ont., since 1917, asst. induction motor designer, Canadian General Electric Co.; Thomas Ernest Gilchrist, B.Sc. (E.E.), (McGill Univ.), of Peterborough, Ont., engineer's dept., Canadian General Electric Co.; Andrew Jack Gray, B.A.Sc. (Toronto Univ.), of Toronto, Ont., 1918, mechanical engineer and draftsman, Steel Co. of Canada; Erastus Kells Hall, B.A.Sc. (Toronto Univ.), of Edmonton, Alta., division engineer of construction, C.N.R.; Philip Charles Barnard Hervey, of Edmonton, Alta., chief superintendent, Dominion Parks; Thomas Marsden Jones, of Toronto, Ont., chief engineer and manager, Bawden Pump Co., Toronto; Samuel Sinnott Kennedy, of Winnipeg, Man., consulting heating, ventilating and sanitary engineer, Winnipeg; Silvio A. Lauzon, of Toronto, draftsman, Toronto Harbor Commission; J. Omer Martineau, B.Sc. (C.E.) (Queen's Univ.), of Quebec, P.Q., engineer, Dept. of Roads, Prov'l Govt. of Quebec; Duncan Lennox McLaren, B.A.Sc. (Univ. of Tor.), of Peterborough, Ont., since 1916, asst. engineer, Can. Gen. Electric Coy.; Herbert Tom Melling, of Regina, Sask., manager of Canadian branch of Willars Robinson, Rugby, Eng.; Frederick Herbert Palmer, S.B. (N.S. Tech. Coll.), Lieut., M.C., of Halifax, N.S., with N.S. Highways Commission; William George Perks, Lieut., of Peterborough, Ont., asst. engineer, city of Peterborough; William J. Pickrell, of St. John, N.B., district master mechanic, New Brunswick district, C.P.R.; Stanley Douglas Harold Pope, of Victoria, B.C., asst. engineer, Victoria; George Charles Reid, Lieut.,M.M., of Cobalt, Ont., resident engineer in charge of construction, Lucky Lake branch, C.N.Ry.; Charles Robertson, B.Sc. (McGill Univ.), of Peterborough, Ont., asst. engineer on staff of chief engineer, Dept. of Railways and Canals; Herbert Leslie Roblin, (B.A.Sc., Univ. of Tor.), Capt. M.C., resident engineer, C.N.R., construction dept.; Norman Dundas Seaton, B.A.Sc. (Univ. of Tor.), of Peterborough, Ont., switchboard section of eng. dept., Canadian General Electric Co.; Clifford Vier Stout, B.C.E. (Univ. of Man.), of Winnipeg, Man., since 1917, with C.E.F.; Angus Lynn Sutherland, B.A.Sc. (mech. eng.) (Univ. of Tor.), of Peterborough, Ont., transformer drafting and mechanical design, Canadian General Electric Co.; Harry Hollister Tripp, C.E. (Cornell Univ.), of Edmonton, Alta., division engineer, C.P.R.; James Atkinson Willis Waring, of St. John, N.B., draftsman, resident engineer and asst. engineer, C.P.R.; Abel Seneca Weekes, O.L.S., D.L.S., A.L.S., S.L.S., of Edmonton, Alta., in eng. dept. C.N.R.

Juniors

Maurice Cossette, of Montreal, engineer and supt., J. W. Harris Mfg. Co.; Clarence Thorne Evans, of Windsor; Ont., mechanical draftsman, Canadian Steel Corporation, Ojibway; Robert Edward Hinton, B.Sc. (Queen's Univ.), of Peterborough, Ont., asst. engineer, Canadian General Electric Co.; Eric Laurentius Holmgren, B.E.E. (Univ. of Man.), of Peterborough, Ont., transformer designer, Canadian General Electric Co.; Henry Arthur Lynch, Lieut., of Ottawa, Ont., draftsman, Marine Dept.; John Edward Lyon, Lieut., D.L.S., of Ottawa, Ont., 1917-19; Robert Dawson McKenzie, B.C.E. (Univ. of Man.), of Winnipeg, Man., junior asst. engineer and draftsman, highway commissioners office, Dept. Public Works; James Freebairn Patterson, B.Sc. (E.E.) (McGill Univ.), of Montreal, telephone engineer, Northern Electric Ltd.; John Herbert Reid, B.Sc. (McGill Univ.), of Peterborough, Ont., Canadian General Electric Co.; L. deBoucherville Roy, of Ottawa, Ont., 1918, asst. engineer, Dept. of Public Works; Stewart Schofield, of Winnipeg, Man., valuation engineer, C.N.Ry.; Charlie Berford Shaw, of Hawkesbury, Ont., engineer draftsman, Riordon Pulp & Paper Co.; Reuben Ewart Stavert, B.Sc. (McGill Univ.), of Peterborough, Ont., Canadian General Electric Co.; Robert Donald Texton, Capt., of Ottawa, Ont., engineer, eng. branch, Dept. Militia & Defence; Douglas C. Wills, Lieut., of St. Catharines, Ont., junior engineer, Welland Ship Canal.

Associate

George Clifford McAvity, of St. John, N.B., general manager of all manufacturing, T. McAvity & Sons Ltd.

Transferred from the Class of Associate Member to that of Member

John Norison Finlayson, B.Sc., M.Sc. (McGill Univ.), of Winnipeg, Man., professor of civil engineering, University of Manitoba; Seymour Jost Fisher, B.Sc. (McGill Univ.), of Montreal, P.Q., asst. mech. supt., Caron Bros., pistol plant; Alex. R. Greig, B.A.Sc. (McGill Univ.), of Saskatoon, Sask., professor of agricultural engineering, University of Saskatchewan; George Henry Herriot, B.Sc. (C.E.) (Queen's Univ.), D.L.S., M.L.S., A.L.S., of Winnipeg, Man., 1918-19, assist. professor in civil engineering, University of Manitoba, Garnet Burk Hughes, R.M.C., Major-General, C.B., C.M.G., D.S.O., F.R.G.S., of Derby, England, managing director, British Cellulose & Chemical Mfg. Co., Ltd., Spondon, near Derby; William George Swan, B.A.Sc., C.E. (Univ. of Toronto), Major, of Vernon, B.C., dist. engr., C.N.R., i/c of mainland constrn.; Frederick Byron Tapley, of Moncton, N.B., asst. engr. of maintenance, Can. Govt. Rlys.

Transferred from the Class of Juniors to that of Associate Member

J. N. Aggiman, B.Sc. (McGill Univ.), of Port Alfred, P.Q., ch. engr. and asst. supt., Ha Ha Bay Sulphite Co., Ltd.; Francis X. Amoss, of Corinth, Ont., Captain, track engr., C.G.Ry.; Douglas Stewart Ellis, M.A., B.Sc. (C.E.) (Queen's Univ.), D.L.S., O.L.S., Lieut.-Col., D.S.O., M.C., of Kingston, Ont., assistant professor of civil engineering, Queen's University; John McIntyre Gibson, B.A.Sc. (Univ. of Tor.), of Toronto, Ont., Major and chief engr., 2nd Bn., C.R.T.; Francis Henry Hibbard, of Sherbrooke, P.Q., asst. to ch. engr., Q.C.Ry.; George Matheson Hudson, B.Sc. (McGill Univ.), of Montreal, P.Q., asst. engr., Bell Telephone Co.; Basil Llewelyn

Nares, B.Sc. (C.E.) (McGill Univ.), of Montreal, P.Q., bldg. supt., i/c of constrn. for A. F. Byers & Co., Ltd.; Ernest Peden, B.Sc. (McGill Univ.), of Montreal, P..Q., designer, Purdy & Henderson ; P. Oakley Spicer, of London, Eng., 2nd Lieut., Royal Engrs. (Regulars); Gordon Robertson Taylor, Major, of Grafton, Ont., awaiting demobilization; Eric Edward Wells, of Toronto, Ont., ch. office asst , dept. surveys and location, C.N.R.; Walter Youngman, Capt., M.C.,of Winnipeg, Man., dist. engr., Manitoba Highways Dept.

Transferred from the Class of Student to that of Associate Member

Charles Bruce, of Ottawa, Ont., engr., Fisheries Branch, Dept. of Naval Service; Albert Lee Cavanagh, Capt., B.E.E. (Man. Univ.), of Winnipeg, Man., asst. engr., city engr's. dept., i/c of waterwork constrn; Edward Victor Gage, B.Sc. (C.E.) (McGill Univ.), of Montreal, P.Q., gen. asst., A. F. Byers Co.; Eric Percival Muntz. B.A.Sc. (Univ. of Tor.), of St. Catharines, Ont., asst. engr., No. 2. section, Welland Ship Canal; Edward Stanley Smyth, Lieut., B.Sc. (Queen's Univ.), of Kitchener, Ont., dist. vocational officer, Dept. of Soldiers' Civil Re-Establishment.

Transferred from the Class of Student to that of Juniors

Andrew Percival Black, C.E. (Univ. of Tor.), of Toronto, Ont., R. A. Medical Corps, awaiting demobilization; H. H. Bruno Loignon, B.A.Sc. (L'Ecole Poly, Laval), of Outremont, P.Q., with E. Loignon, civil engineer; James Alfred Vance, of Woodstock, Ont., structural draftsman, Hamilton Bridge Works.

BRANCH NEWS

Halifax Branch

F. R. Faulkner, M.E.I.C., Secretary.

Minutes of General Meeting, Halifax Branch, Engineering Institute of Canada, held at the Green Lantern, at 6.00 p.m., October 22, 1919.

Attendance 31, Chairman presiding.

The Chairman introduced new members recently admitted to *The Institute* and several members who have recently taken up their residence in the city.

The Chairman then gave a brief report of the Professional Meeting in St. John and made certain suggestions with regard to the meeting in Halifax next year:—

(a) To defer the meeting until October in order to enable Engineering students to attend.

(b) In view of an attendance of 100 at the meeting held in Halifax, 1918, and an attendance of over 125 at St. John, the object for the next meeting in Halifax should be an attendance of 200.

The Chariman discussed briefly the question of increase in the fee of Branch affiliates, the question of Branch By-laws and the question of legislature.

A paper was then presented by A. C. Brown, A.M.E.I.C., on the results of experiments of the effects of Ironstone on Cement and Lime Mortars. Following the paper a discussion participated in by Messrs. McKay, Dyer, Smith, Bowman, Morrison, Freeman, H. W. L. Doane.

After the discussion a vote of thanks was tendered to Mr. Brown and the meeting adjourned.

Nova Scotia Power Commission at New Glasgow

At the request of the Pictou County Light and Power Committee, a public meeting of the Nova Scotia Power Commission was held in New Glasgow, November 4th, in order that the citizens of Pictou County might have an opportunity of demonstrating to the Commission the necessity of some immediate action in connection with the power situation in Pictou County. It was shown that Pictou County, already a large and industrial community with great possibilities of expansion, was absolutely handicapped in competition with other parts of the country due to the present high cost of power in that vicinity even though it is a large coal mining district. It was further shown that there is at present available a guaranteed market of at least 10,500 h.p. and that the municipality of Pictou County being as it is, free from any bonded indebtedness whatever, is not only ready and willing, but able to undertake the distribution of any power which might be supplied to it by the Nova Scotia Power Commission in bulk either from hydro-electric or central steam plants.

Honourable Mr. Armstrong, Chairman of the Commission, assured the meeting that steps would be immediately undertaken to deal effectively with the situation as presented and pointed out that although the Commission had been in existence only some six weeks, it was already prepared to make a definite recommendation to the Provincial Government and to take immediate action upon receiving the necessary authority in regard to the power situation in the vicinity of Halifax.

St. John Branch

A. R. Crookshank, M.E.I.C., Secretary

The first meeting of the provincial executive of the New Brunswick Association of Professional Engineers took place on November 13th, when the draft of "Act Respecting Engineers" was discussed and arrangements made for the necessary minor revisions and for legal advice and assistance in preparing the bill for submission to the Provincial Legislature at its next session.

The first meeting of the St. John Branch of *The Engineering Institute of Canada* was held on the same evening with a record attendance. The report of the

Secretary showed that the affairs of the Branch are in a very encouraging condition, the total membership of all grades amounting to 62. Geoffrey Stead, A.M.E.I.C., District Engineer, P.W.C., then read a very interesting paper on: "Cape Bald Breakwater." This breakwater is situated on the south shore of the Northumberland Strait, twenty miles east of Point DuChene and is 624 ft. long with a pier-head 100 feet long extending at right angles to it. It is a round timber cribwork structure with the face timbers encased in concrete, which also extends one foot outside them, presenting a smooth wall surface to the frequent high seas occurring at that place and protecting the woodwork from the ravages of the Teredo. Great difficulty was experienced in keeping the forms for the concrete rigid and tight as the wave action is almost continuous. Depositing concrete in winter time from the ice was tried but the results were not uniformly satisfactory for either method and the concrete became eroded at the most exposed places. Repairs by filling the holes with concrete deposited in water were made but also did not give permanent results.

Concrete caissons of 1-2-4 mis, well-tamped, air seasoned and water-tight were built on shore, launched floated to and sunk in place in front of the damaged portions of the wall. The caissons vary in size up to 20 feet in length and 10 ft. in height, the base up to 8 ft. in width. The 8″ face batters at about 1 in 4; the cells are rectangular with 4″ partitions spaced 4 to 5 feet apart; the back is 4″ and the ends are 6″ thick. A concrete slab is secured to the top of the caissons after they have been filled with stone. This type of protection has proved satisfactory and it is expected that this type of construction will be used extensively for piers and breakwaters in this district in the future as it will be cheaper than creosoted timber. The discussion on the paper brought out much information re erosion of concrete in tidal waters.

B. M. Hill, M.E.I.C., Provincial Road Engineer then gave one of the most interesting addresses the Branch has listened to on, "The Highways of New Brunswick."

Mr. Hill took up the history of the development of road building in this Province in recent years and showed how the automobiles had forced the various governments to treat the matter at last from an engineering standpoint. Mr. Hill explained the system of classification adopted by his department for the system of trunk, secondary and by-way roads throughout the Province and told of the principle by which the department was carrying on the work of improvement. In general the plan is to bring all the roads up to a standard so that the rate of wear, expenditure and amount of traffic would give a rought approximate ratio constant for the three classes of roads. The immediate plans are for the gradual construction of about 1,600 miles of trunk roads at an average cost of $5,000. per mile, about 1,800 miles of secondary roads at an average cost of about $3.000 per mile, besides the repair of the numerous by-roads. An improved road was immediately subjected to an increase in automobile traffic, which Mr. Hill estimated would eventually amount to seven or eight times that of the original amount. The St. John-Rothesay road auto traffic increased from 500 to 2,500 cars per day in two years, while the St. Stephen-St. Andrews road traffic increased from an average of 100 to 700 cars per day, after these roads had been improved to allow of an increase in speed of from 15 miles to 40 miles per hour.

The meeting adjourned after a general discussion.

Montreal Branch

Frederick B. Brown, M.E.I.C., Secretary

The meetings of the Montreal Branch have been held regularly every Thursday evening, following out the programme outlined in last month's number of *The Journal.*

On the evening of October 30th a discussion was held on the paper by Mr. Jamieson on "Grain Dust Explosions" during which W. J. Francis, Chairman of the Branch, presided. John Murphy, of Ottawa, was present and took a prominent part in the discussion, showing a number of lantern slides. Among the Montreal members joining in the discussion were Messrs. Cowie, Holgate, James H. Hunter and Colonel Monsarrat. A full account of this discussion will be published in the next number of *The Journal.*

On November 6th, J. J. York, General Works Manager of the St. Lawrence Sugar Refinery, gave a very interesting illustrated talk on the mechanical processes and plant of his refinery, and was followed by Mr. Bardorf who dealt with the chemical processes of sugar refining. Samples of refined sugar and booklets on "The Story of Sugar" were distributed to the members. Mr. Busfield, Chairman of the Reception Committee, presided.

On November 13th, J. O. G. Cann, Chief Engineer of the Marconi Company, gave a very instructive and interesting address on recent progress in wireless telegraphy, which was illustrated with a number of lantern slides and also with various pieces of apparatus and dictaphone records by means of which the author demonstrated the reduction of speed of reception of wireless telegraph messages from seventy or more words per minute to a speed of twenty or twenty-five words per minute, at which rate the dots and dashes were distinctly audible. Mr. Cann dealt with the historical side of the question and then explained the different systems in use to-day, such as the Spark, the Poulsen Arc, the Dynamic, and the Valve. He also dealt with the subjects of direction finding, static elimination and high speed transmission. After his lecture a number of questions were asked by members and guests. Mr. Burnett, of the Papers and Meetings Committee, occupied the Chair. At this meeting also, R. L. Dobbin, Secretary of the newly formed Peterborough Branch, was present and told of the recent formation of this Branch.

On November 20th a paper was read by Major Percy Sims on "Automatic Fire Sprinkler Systems for Low Temperature Buildings," during which the author laid great stress on the very unsatisfactory conditions of fire risks in this country.

A noteworthy feature of the meetings of the Montreal Branch this season has been the very large attendance, in fact, the seating capacity of the hall has been frequently taxed to its limit. It has become a general rule to provide a short interval between a paper and the subsequent discussion in order to enable members to meet and chat with their friends, and occasionally coffee and sandwiches have been served during the intermission.

A special committee formed of members of the Executive Committees of the Montreal and Quebec Branches has been studying the question of the formation of a Quebec Provincial Division, and a ballot of the members resident in Quebec has been held, the result of which will shortly be announced.

Quebec Provincial Division

Some time ago a number of members of the Montreal Branch and the Quebec Branch of *The Institute* suggested the formation of a Province of Quebec Division of *The Engineering Institute of Canada.* Joint, as well as separate, meetings of the Executive Committees of the two Branches were held and a special Committee consisting of A. R. Decary, Arthur Amos and B. Normandin from Quebec, and Walter J. Francis, Arthur Surveyer and Frederick B. Brown from Montreal was appointed to take the necessary preliminary steps leading up to the formation of the Division. To this end a letter ballot was sent out to the 483 Corporate Members recorded at Headquarters as being resident in the Province of Quebec. 298 replies have been received, 278 of which requested the formation of a Quebec Provincial Division, 14 expressed themselves as not in favour of this Division, 6 declined to vote for one reason or another.

Under the by-laws of *The Institute* a majority of the corporate members resident in the Province must be in favour of a Provincial Division before it can be formed. A considerable majority having so expressed themselves, the Special Committee formally requested Council to authorize the formation of a Quebec Provincial Division, suggesting that the above six members forming the Special Committee be appointed by Council to carry out the formation of the proposed Division.

At a meeting of Council held on November 25th, authorization was given for the formation of a Quebec Provincial Division in the manner suggested by the special committee.

Ottawa Branch

M. F. Cochrane, A.M.E.I.C., Sec'y.-Treas.

The success of any Branch of *The Institute* is a function of the activity of its Executive. For all the Executive officers' success means untiring zeal on their part, but in particular the position of Honorary-Secretary must be one of real service.

During the years of 1915 to 1919, J. B. Challies, M.E.I.C., Director of Water Power, Department of the Interior, has held the position of Honorary Secretary-Treasurer. He has been the right man in the right place, bringing to the position his well-recognized ability for co-ordination and management, and much enthusiasm Mr. Challies resigned this year on his election to higher honors in *The Institute*, now being Chairman of the Ontario Provincial Division.

At the first luncheon of the fall session, held at the Chateau Laurier on November 4th his services as Honorary Secretary-Treasurer were recognized by an eulogy from the Chairman, the singing of "For He's a Jolly Good Fellow," and the presentation of a piece of silver plate. His real reward, as Mr. Challies himself expressed it in a brief but feeling reply has been the opportunity for closer association with his brother engineers.

After the presentation had been made J. Grove Smith of the Department of Insurance addressed the members on "Fire Prevention."

The programme for the rest of the year is now complete and will consist of one luncheon and one evening meeting each month.

Ontario Provincial Division

Geo. Hogarth, M.E.I.C., Secretary.

At a meeting of the officers of the Executive Committee of the Ontario Provincial Division in Toronto on the 24th of October, it was decided to call a special meeting of the members of the Provincial Executive in Toronto on November 22nd to consider among other questions the very important matter of the advisability of endeavouring to secure legislation to define the status of the engineers in the Province of Ontario. As the membership of *The Engineering Institute* does not for the moment comprise all the practicing professional engineers in the Province, it was considered essential that any action which *The Institute* may ultimately take should be freely communicated to representatives of other organized engineering bodies having members in the Province and it was also important that members of other engineering organizations be assured that no definite action to obtain appropriate legislation had been taken by *The Institute* or is contemplated to be taken by *The Institute* without consultation and it is hoped co-operation of members of other organized professional engineering bodies.

Letter to Executive, Ontario Provincial Division.

November 12th, 1919

Dear Sir,

In further reference to the letter of the Chairman of October 17th, and to my letter of October 27th, regarding a general meeting of the Provincial Division Executive of the Province of Ontario, I beg to report that the majority of the members of the Executive have signified their hearty support of the proposal to hold a meeting to consider the questions already called to your attention. I am, therefore, to inform you that a meeting will be held in the Engineers' Club, 96 King Street, East, Toronto, on Saturday afternoon, November 22nd, at 3 p.m., to which meeting your presence is particularly desired. The following questions will be considered:—

(a) Adoption of By-laws for the Division.

(b) The question of legislation and the initiation of appropriate action to secure the co-operation in this matter of professional engineers not members of *The Institute.*

(c) Classification and remuneration of engineers.

(d) Suitable action to bring before the undergraduates of the technical and engineering institutions in the Province, the aims and advantages of *The Institute.*

Other matters that may be brought forward by individual members.

Legislation is the most important question to be taken up at the meeting, but, unfortunately, it has not been possible in the brief time available to prepare such a digest, and in lieu thereof, it has been considered advisable to have prepared and sent forward to you, photostat copies of all the references to the question that have appeared in recent issues of *The Journal.*

Your particular attention is called to the resolution of Council passed on September 23rd, which reads as follows:—

> That the Council would further in every way the desire of the members regarding legislation, and, inasmuch as the actual application of such legislation is in the hands of the engineers of each province, it is desirable that the Branches and Provincial Divisions *in co-operation with other engineering organizations in each province,* take the initiative, and in which they are assured of the moral support of *The Institute.*

There are three outstanding phases of this Resolution,—First, the support of the Council of *The Institute* can be relied upon in any appropriate action that may be considered by the Branches and Provincial Divisions to be desirable in the interest of the engineering profession; Second, further action in respect of legislation is up to the Branches and the Provincial Divisions; Third, *co-operation with other engineering organizations* is suggested.

It will, therefore, be realized that further action in connection with legislation in the Province of Ontario, lies with the Provincial Division and the Branches, and so far as Provincial-wide action is concerned, the initiative in the last analysis rests with the Provincial Division. It must further be realized that a necessary preliminary to any action by the Provincial Division is the securing by and with the advice of the Branches, the co-operation of other engineering organizations within the Province.

Such co-operation should be sought in every possible way, and your officers feel that there are two principal methods of securing the advice and assistance of all engineers on the question of legislation,—Firstly, through the Branches, and, Secondly, through the individual members of the Provincial Division.

If at all possible in the limited time available between the receipt of this communication and the meeting of the Provincial Executive at Toronto on November 22nd, it is suggested that either a special meeting of the Managing Committee of each Ontario Branch, or a general meeting of the Branches, be called, to consider the question of legislation, with a view to having definite suggestions made for further consideration at the Provincial Division meeting, respecting the advisability or otherwise of an attempt to secure legislation, and also regarding the methods of securing co-operation of members of the engineering profession who are not now connected with *The Engineering Institute of Canada.*

It is hoped that the members of the Provincial Division will be in a position at the meeting on the 22nd, not only to gauge fairly well the opinion of the engineering profession at large, as to the general question of legislation in the Province of Ontario, but that they will be in a position to take appropriate action to provide suitable means of having the question considered by a General Committee properly representative of *The Institute* and of other engineering organizations in the Province, including, the Canadian Mining Institute, The Institution of Civil Engineers of Great Britain, the American Institute of Electrical Engineers, the American Society of Mechanical Engineers, etc.

It is essential that the question of legislation be considered in a constructive manner, and with a view of securing not only the friendly consultation but the active co-operation of other engineering organizations in the Province.

Yours very truly,

(Sgd.) Geo. Hogarth,

Secretary.

Meeting of Executive

On Saturday, November 22nd, a meeting of the Executive of the Ontario Provincial Division was held at the Engineers' Club at Toronto, J. M. Challies, M.E.I.C., Chairman of the Division in the chair. There were present:—Councillors, G. A. McCarthy, M.E.I.C., Bridge Engineer, Toronto; Peter Gillespie, M.E.I.C., Professor, Dept. of Applied Mechanics, Univ. of Toronto, Toronto; W. A. McLean, M.E.I.C., Deputy Minister of Highways, Toronto; Vice-President H. E. T. Haultain, M.E.I.C., Professor of Mining, Univ. of Toronto, Toronto; Representing the Branches:—J. B. Challies, M.E.I.C., Supt., Dominion Water Power Branch, Ottawa; Geo. Hogarth, M.E.I.C., Chief Engr., Dept. of Highways, Toronto; E. R. Gray, A.M.E.I.C., City Engineer, Hamilton; Frank Perry, A.M.E.I.C., Engr. Staff, Algoma Steel Corpn., Sault Ste. Marie; A. C. D. Blanchard, M.E.I.C., Hydro-Elec. Comm., Niagara Falls, Ont.; M. E. Brian, M.E.I.C., City Engineer, Windsor; G. Reid Munro, A.M.E.I.C., The Wm. Hamilton Co. Non-Resident Members:—

Major W. H. Magwood, M.E.I.C., Town Engineer, Cornwall; R. J. McClelland, A.M.E.I.C., City Engineer, Kingston; G. H. Bryson, A.M.E.I.C., Brockville; T. H. Jones, M.E.I.C., City Engineer, Brantford; J. L. Weller, M.E.I.C., Consulting Engineer, Welland Canal; James A. Bell, M.E.I.C., City Engineer, St. Thomas; R. L. Dobbin, M.E.I.C., Supt. of Waterworks, Utilities Comm., Peterborough. By invitation of officers, J. R. W. Ambrose, M.E.I.C., Toronto. A. H. Harkness, M.E.I.C., Toronto; Willis Chipman, M.E.I.C., Toronto; and Fraser S. Keith, A.M.E.I.C.

An agenda was presented dealing with various important matters to engineers of the Province of Ontario. It was moved by Mr. McCarthy, seconded by Mr. Lambe, and resolved:—"That this meeting of the Provincial Division Executive Committee should suggest to Council that steps be taken at once to form another District in Ontario, the dividing line being suggested as running approximately from Oakville to Owen Sound, the present line between Districts Nos. 4 and 5 being moved so as to put Peterborough in the same District as Toronto, leaving Kingston in District No. 4."

It was agreed that a Professional Meeting be held in Ontario during 1920, the representatives of the Hamilton, Border Cities, Peterborough, Toronto, Ottawa and Sault Ste. Marie Branches all agreeing, and providing the Branch at which the meeting was held was agreeable it should be combined with the proposed Annual Meeting of the Institute of Chemical Engineers.

The relation of *The Institute* to the various Universities was discussed and plans proposed for a closer contact. It was left to the officers to work out a programme of co-operation including drawing out of a plan to carry out affiliation of Student societies.

It was decided to ask the various Branches to exchange notices of meetings and confer regarding their programmes with a view to helping the newer Branches.

The meeting voiced its hearty approval of the constructive action of Toronto Branch in considering Legislation and in convening an informal meeting of representatives of the Toronto organizations of the American Society of Mechanical Engineers, Society of Chemical Industries, Canadian Mining Institute, and the Ontario Association of Architects.

By-laws were left to the officers of the Division to complete and ratify.

The meeting adjourned at 10.30, having discussed many important matters, it being the first time engineers from every part of the province had met to discuss matters of common interest.

Toronto Branch

W. S. Harvey, A.M.E.I.C., Secretary.

An open meeting of the Branch was held in the Lecture Room at the Engineers' Club, 96 King Street West, at 8 p.m., on October 30th, 1919.

The Chairman, A. H. Harkness, presided.

The minutes of the previous meeting were read and adopted.

The Chairman called upon Mr. Wynne-Roberts to read the Standard Branch By-laws as approved by the Council at Montreal together with the amendments as suggested by the By-laws Committee of the Toronto Branch.

Moved by Geo. T. Clark, seconded by Geo. A. McCarthy "that the fee for Branch Affiliates be increased to $10.00 " per annum." *Carried*

After the By-laws and the suggested amendments were read clause by clause it was moved by Mr. Wynne-Roberts, seconded by Geo. Hogarth "that the By-laws as amended by adopted by this Branch."

Carried

The remainder of the evening was given up to a Smoking Concert for which an excellent musical programme had been arranged by Mr. Wynne-Roberts. The evening was enjoyed by the fifty members who were present.

The items of the Smoking Concert were as follows:—

Piano and Violin Duets by Messrs. O'Brien Brothers, University of Toronto; Xylophone Solos by James Milne; Recitations by Linsey Crossley; Pianoforte Solo by Mr. Weicher, University of Toronto; Violin Solo by Mr. Burton from the Hambourg Conservatory of Music; Sleight of Hand Tricks by W. J. Blackburn.

A hearty vote of tanks was tendered by the Chairman to all those who took part and to Mr. Wynne-Roberts for his kindness in undertaking the work of arranging the programme.

Mr. Wynne-Roberts appealed to the younger members of *The Institute* to take an interest in the welfare of the Branch by giving their assistance in every possible way. He would like to see the younger members organizing one meeting every month.

The meeting adjourned at 11 p.m.

Niagara Peninsula Branch

R. P. Johnson, A.M.E.I.C., Secretary

Thirty members of the Branch enjoyed a trip over the Niagara Power Development works of the Hydro-Electric Power Commission of Ontario on Saturday afternoon, November 1st.

Members gathered early in the afternoon at the main construction office near Niagara Falls and listened to a short talk about the work by A. C. D. Blanchard, M.E.I.C., Chief Field Engineer.

After viewing a large general plan and profile of the work the party started out in motor buses furnished by the Commission and were conducted over the main part of the job now under construction. The first stop was made at one of the large electric shovels working in earth and equipped with an eight yard dipper and eighty foot boom. This shovel was loading cars standing on a track sixty feet above the rock surface on which the shovel was working. The next stop was made at a temporary bridge over the canal cut. From this bridge an excellent view of a long stretch of work was obtained. Another of the large type elec ric shovels was here seen working in the rock cut at canal grade and from this point the spectators were able to get a grasp of the dimensions of the finished canal. Batteries of channelers, tripod drills and submarine drills at this point gave the impression of big work.

The party then visited the machine shop, carpenter shop, blacksmith shop, storage yards, train yards, compressor plant, disposal railway junction and a newly completed concrete arch bridge, all of which are located near the Niagara River Whirlpool.

From this point the party proceeded to the forebay and power-house site near Queenston. Here was to be seen the large rock-crushing, conveying and stone storage plant as well as the canal rock cut which widens out to form the forebay. The excavation at this point is practically complete. The members got a good impression of the three hundred foot drop from the forebay to the power house by viewing the site of the latter from the top of the Niagara Gorge.

The gratitude of the members was freely expressed towards the Hydro and to J. B. Goodwin, M.E.I.C., Works Engineer, for providing motor bus transportation and every facility for inspecting the work.

New Minister of Public Works for Ontario

On the suggestion of one of the members that *The Institute* might take up with Premier-elect Drury the appointment of an engineer as Minister of Public Works in his new cabinet, the following wire was sent to the chairman of the Ontario Provincial Division:—

Nov. 8th, 1919

J. B. Challies,
52 McLaren Street,
Ottawa, Ontario.

Niagara Peninsula Branch suggest Ontario Provincial Division take up with E. C. Drury appointment of Engineer Minister of Public Works.

(Sgd.) R. P. Johnson.

Mr. Challies replied as follows:—

Nov. 15th, 1919.

R. P. Johnson,
Sec'y., Niagara Peninsula Branch,
Engr. Institute of Can.,
Niagara Falls, Ontario.

Your telegram Saturday, have conferred with Resident Members Provincial Division, and forwarded following message to Premier elect Drury. As the leader of the farmers interests have always rightly contended that the minister of agriculture should be a successful farmer so we the Ontario Provincial Division of *The Engineering Institute of Canada* point out the advisability of selecting a successful engineer for the portfolio of minister of public works and respectfully submit that such an appointment would not only greatly strengthen your cabinet but that no other should be considered.

(Sgd.) J. B. Challies.

*

A general meeting was held at the Engineers' Club in Thorold on Tuesday evening, November 25th. The meeting was called to discuss three questions of importance: to receive the report of the Salary Committee of the Branch, to receive the report of the Branch Representative of the Meeting of the Ontario Provincial Division held in Toronto on November 22nd, and to receive the report of the Committee on Branch By-laws.

Edmonton Branch

R. P. Graves, A.M.E.I.C., Sec'y.-Treas.

The following gentlemen were duly elected to office in the local Executive for the ensuing year:—

Chairman........R. J. Gibb, M.E.I.C.
Sec'y.-Treas......R. P. Graves, A.M.E.I.C.
D. J. Carter, A.M.E.I.C.
Hon. J. L. Cote, A.M.E.I.C.
L. B. Elliott, M.E.I.C.
A. W. Haddow, A.M.E.I.C.
R. Jones, M.E.I.C.
G. W. MacLeod, A.M.E.I.C.

*

It is proposed to hold a Provincial Conference of engineers on a date to be arranged with other organizations, engineers from other Western Provinces are to be invited. It is the present intention to hold this meeting in Edmonton, and it will be substituted for the proposed Western Professional Meeting ; in view of this proposal the secretary of the Edmonton Branch of the *E.I.C.* has written to the Calgary Branch suggesting co-operation in putting the project into force.

Vancouver Branch

J. N. Anderson, A.M.E.I.C., Sec'y.-Treas.

J. N. Anderson, A.M.E.I.C., has been appointed Secretary of the Vancouver Branch. Mr. Anderson has been assistant engineer of the city, and has had considerable secretarial experience; Vancouver Branch is looking forward to having another successful year.

Vancouver Branch has arranged for a series of papers and lectures during the coming winter session. In order to secure funds to carry on the Branch affairs, it was decided to levy local dues of $3.00 for Members, and $2.00

for Associate Members; Juniors and Students to be exempt. No dues had been levied since 1915 and this step was necessary in view of the depleted condition of local funds. At the last meeting of the Branch Executive it was decided to appoint a committee of four members to meet a similar committee from the British Columbia Technical Association to discuss the question of Legislation.

A. E. Foreman, M.E.I.C., of the Victoria Branch was present and advised the members of the progress made by the special committee on Legislation of the Victoria Branch and asked for the co-operation of the Vancouver Branch in bringing together the engineers of the Province to discuss the Legislation issue. Another special committee was appointed to draft a letter replying to the Hon. W. J. Bowser's letter regarding his attitude towards the employment of technical engineers as against the "good old practical road superintendents."

A hearty vote of thanks was accorded to Mr. Brakenridge and Mr. Dalzell for their splendid work as Chairman and Secretary-Treasurer of the Branch, the members present speaking in the highest terms of praise of the splendid work which these gentlemen had accomplished in keeping the affairs of the Branch going during the trying period of the war.

In response to the vote of thanks to himself for coming over to address the meeting, Mr. Foreman struck a happy note in advocating close co-operation between the Victoria and Vancouver Branches. He promised to attend as many meetings of the Vancouver Branch as possible, and extended a hearty invitation from the Victoria Branch to all members from Vancouver, and the hope was expressed that Mr. Dalzell would soon be among them again to give the Branch the benefit of his advice and activity in directing the affairs of *The Institute.*

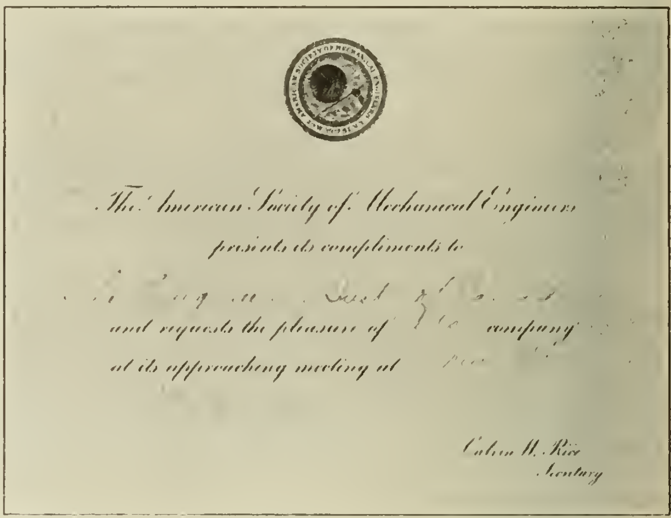
Victoria Branch

Horace M. Bigwood, A.M.E.I.C., Secretary

A. E. Foreman, M.E.I.C., has been travelling on the mainland, and visited the Vancouver Branch of the *E.I.C.* as reported in the Vancouver Branch section. While in Nelson, B.C., Mr. Foreman spoke to the Rotary Club on municipal work,—it is gradually becoming to be better realized that engineers should be more prominent in public affairs. A committee consisting of two members of each of the engineering societies which have members in Victoria met with Mr. Foreman in August and again early in October to discuss the proposed Bill in the British Columbia Legislature, and appointed a sub-committee consisting of D. O. Lewis, M.E.I.C., E. N. Horsey, and A. E. Foreman, M.E.I.C., to redraft the Bill and submit it to the committee of the whole. The intention is that this committee in Victoria will act in conjunction with a similar committee in Vancouver.

Mr. Foreman has recently been re-elected a member of the Executive of Convocation of B.C. University for a further period of three years.

The Victoria Branch had inaugurated steps to secure within its membership all eligible engineers coming within the jurisdiction of the Branch. Recently the Executive of the Branch had adopted the monthly meeting in the form of an informal reception to all engineers and their families. This reception is held on the fourth Monday of each month at the K. of C. Hall on Fort Street, the programme of which includes, dancing, music and refreshments.



A.S.M.E. Invitation to The E.I.C.

OBITUARIES

D. McD. Campbell, M.E.I.C.

The Institute has learned with deep regret of the death of D. McD. Campbell, M.E.I.C., of Halifax, N.S. Mr. Campbell was born near Truro in 1878 and received his early education in the public schools of that town. He then attended Dalhousie University graduating with the degree of B.A. in 1898, he took a Science course, graduating in that with the degree of B.Sc., in 1900, and also took a M.A. degree from the same University in 1904. After leaving Dalhousie he went to Sydney, N.S. and was Assistant City Engineer there for six years, and City Engineer for seven years. In 1913 he removed to Halifax and was in private practice for two years. When Major F. W. W. Doane, M.E.I.C., went overseas he entered the office of the City Engineer as Chief Assistant and was there for about two years. He then went with the Nova Scotia Highway Board and was with them up to the time of his death. He was Secretary-Treasurer of the N.S. Society of Civil Engineers from 1913 until that organization was disbandoned in 1918.

OUR ROLL OF HONOUR

The following members of our Roll of Honour have not reported to headquarters and there is no record on hand either of their definite return or of their present position. Any information that any member can supply regarding any of the names given herewith, will be much appreciated. There is no doubt that many of the men whose names are mentioned are now in Canada, and it is hoped that the members will co-operate most heartily in locating the addresses of all whose names appear on the following list:—

Adams, F. P.
Adams, W. D.
Adamson, E. K.
Adlard, L. S.
Allan, H. D.
Allen, L. E.

PERSONALS

Lieut. J. A. G. Wilson, R.E., A.M.E.I.C., is returning to Vancouver from service in Egypt.

*

F. G. Aldous, S.E.I.C., Lieut. R. E. is returning to British Columbia, and sailed from Liverpool on the "Baltic" on October 31st.

*

Lieut. H. E. Bates, B.Sc., A.M.E.I.C., who returned recently from service overseas, has accepted a position with the Laurentide Company, Limited, Grand Mere, P.Q.

*

Lieut. Thomas Mortimer Montague, A.M.E.I.C., McGill Sc., 1909, who served overseas with the Third Tunnelling Company, Canadian Engineers, has been awarded the Belgian Croix de Guerre.

*

J. A. Duchastel, M.E.I.C., City engineer of Outremont, Que., and past pres. of the Canadian Good Roads Assoc., has been nominated as one of the Vice-Pres. of the American Road Builders' Assoc.

*

Major P. J. Jennings, A.M.E.I.C., has returned from service in German East Africa, and is now in Calgary with the Department of the Interior, Reclamation Service, Irrigation Branch. His address is 513-8th Ave. West, Calgary.

*

Major R. Stephenson Smith, A.M.E.I.C., has returned to Canada from service overseas; his present address is c/o D. E. K. Stewart, Madoc, Ont. Before going overseas Major Smith was with the Transcontinental Railway, Quebec.

*

C. N. Mitchell, V.C., A.M.E.I.C., is being tendered a banquet by the Winnipeg Branch on the evening of December 9th, at which time he will be presented with an address showing the appreciation of his fellow engineers for his glorious record at the front.

*

Messrs F. H. Leonard, Export Manager of Siemens Bros., Co., Limited, and W. B. Hopkins, one of the Company's engineers are at present visiting Canada as part of the final stage of a fourteen months world tour, which has included South Africa, South America, Australia, India and China. These gentlemen report that there is a wide demand for electrical apparatus in practically all of these countries, particularly in South America.

*

Capt. Timothy D. Ruggles, Jr.E.I.C., who returned from service overseas in November 1919, enlisted with the 94th Battalion in 1916 In September 1916 he proceeded to France and was transferred to the Canadian Corps Tramway Co., Canadian Engineers. Previous to enlisting M . Ruggles was employed as Resident Engineer, C.P.Ry. Kenora, Ont., and has again taken employment with the C.P.Ry. as Divisional Engineer with headquarters at Kenora, Ont.

Capt. Gerald M. Hamilton. B.A.Sc., M.C., A.M.E.I.C., was given a commission in the 44th Regiment, Canadian Militia, August 1915, and was transferred the same month to the Engineers Depot at Ottawa. In March 1916, he sailed for England and was in training at Shornecliffe, Kent. In October 1916, Capt. Hamilton crossed the channel with the 7th Field Company Canadian Engineers and was promoted to Captain in the 7th Battalion, C.E., in May 1918. In October 1918, Captain Hamilton was awarded the Military Cross and was placed on the reserve of officers, C.E.F., March 3, 1919.

*

Capt. A. L. Cumming, A.M.E.I.C., who returned to Canada in February 1919, sailed for overseas in March 1916, and went to France in September 1916, being attached to the 3rd Field Company 1st Division, where he served until he was wounded at Passchendale in November 1917. He was then given the acting rank of Captain and was placed on the permanent staff of the 2nd Canadian Engineers Reserve Battalion at Seaford, England. He is now Surveyer in charge of the Dominion Land Survey party subdividing land in the Porcupine Forest Reserve for soldiers' settlement.

*

Cadet F. E. Weir, R.A.F., S.E.I.C., who is at present with the Soldiers' Civil Re-establishment Commission, Brantford, Ont., enlisted in June 1916, in the 67th Battery as a gunner. He sailed for overseas in July 1916 and went to France in September 1916. He served with the 11th Brigade, C.F.A., until that unit was broken up in the spring of 1917. He was then on the strength of the 3rd Artillery Headquarters as Chief Draughtsman until the spring of 1918 when he left for England as a cadet in the R.A.F. He arrived in Canada in January 1919, and was demobilized in February 1919.

*

Gunner E. E. H. Hugli, B.A.Sc., S.E.I.C., enlisted in the 1st Depot Battalion, Volunteer Co., at London, Ont., in December 1917. He was transferred to the 67th Battery, C.F.A., in January 1918, and sailed for England in April 1918. He arrived in France in August 1918, and was put on the strength of the 31st Battery, C.F.A., 9th Brigade, 3rd Division, taking part in the engagements at Arras, Monchey, Canal Du Nord, Bouilon Wood, Cambrai, and Mons, being the first Battery to enter Mons on November 11th, 1918. Gunner Hugli arrived in Canada in March 1919.

*

Major Geo. Alex Walkem, A.M.E.I.C., went to England in the Spring of 1916, was given a commission as Second-Lieutenant and sent to Longmoor in Hampshire. He was given charge of the 2nd half of the 52nd Railway Company. He went to Egypt in September and was gazetted Captain and second in command of the 52nd Company Railway Troops. Lieut.-Col. Walkem stayed in Palestine until the last advance was finished and General Allenby cleaned up the country, when he got a month's leave to Canada, during which time the Armistice was signed, when he returned to England for his discharge.

Major G. W. F. Ridout Evans, M.C., A.M.E·I.C., writes that he has just been demobilized. Like many of our members who have seen distinguished service in the war Major Evans is very reticent about his career in the army. He served for over four years, gained the rank of Major in the Corps of Royal Engineers, that he gained the Military Cross and was mentioned in despatches in November 1918. Major Evans is at present at Newton Abbott, Devonshire, England, taking a well earned holiday. He expects however to take up his profession again shortly.

*

Lieut. L. B. Tillson, M.C., S.E.I.C. enlisted in January 1915 with the Eaton Machine Gun Battery. In March 1915 he was promoted to the rank of bombadier and in June 1915 sailed with the Battery to England. After training with the Eaton Machine Gun Battery at Shornecliffe, Lieut. Tillson was transferred in November 1915 to the Canadian Cavalry Brigade and went to France with them at the end of 1915, when he was promoted to Corporal. In June 1916 Lieut. Tillson gained a commission in the Field Artillery, and after serving as Lieutenant with the 16th Battery, C.F.A. was awarded the Military Cross for service at Lens in August 1917. In March 1918, Lieut. Tillson was sent to hospital on account of internal injuries from an explosion in a dug out. He was finally discharged from hospital in April 1919 after service of four years and three months. Lieut. Tillson has a record in the war of which he can be proud. He worked his way up from Gunner to Lieut. and gained the final honor of the Military Cross, one of the highest honors awarded for valor in war.

*

Capt. L. W. WYNNE-ROBERTS, R.E., A.M.E.I.C.

Capt. L. W. Wynne-Roberts, A.M.E.I.C., has just returned to Canada. Capt. Wynne-Roberts enlisted in England in 1915. In 1916 he was ordered to India and was attached to the 2nd (Queen Victoria's Own) Sappers and Miners at Bangalore, S. India, where he carried out the duties of instructor in military engineering to newly joined officers of the Indian Army Reserve of officers. A few months later he was sent to Mesopotamia and joined No. 9 Field Company of the 2nd (Queen Victoria's Own) working on road reconnaissance and construction on the South Euphrates. In June 1918, Capt. Wynne-Roberts was ordered to North Persia as field engineer on the new road to be constructed from Ruz to Hamadan, an important link in the route to Baku. The R. E. officers were informed that they had from eight to ten weeks in which to make 370 miles of road passable for Ford convoys 24 hours after rain. This work entailed a new alignment, easement of gradients, repair of masonry arches, and the construction of a macadamized road. After this work was completed while Capt. Wynne-Roberts was on his way to England he was detained for four months for sapper work in connection with the Afghanistan Frontier operations, before final demobilization.

EMPLOYMENT BUREAU

Situations Vacant

Electrical Draftsmen

Two electrical draftsmen experienced in transmission line and switchboard detail, desired. Apply Mr. C. H. Speer, Works Engineer, Algoma Steel Corporation, Limited, Sault Ste. Marie, Ont.

Graduate Engineer

Graduate engineer wanted for Eastern College, capable of teaching surveying of the first and second year, freehand drawing, materials of construction, carpentry and wood turning. Apply Box 66.

Position Open in Mexico

Wanted for an oil corporation in Mexico:— One mechanical draftsman, one topographical draftsman, two experienced surveyors. Box 65.

Electrical Engineers

Electrical Engineers required for design and inspection work on wires and cables. Apply W. S. Vipond, Northern Electric Co.

Civil Service Examiner

Engineer who has had practical experience, besides being a graduate in science from a recognized university and who is thoroughly conversant with both French and English, is required to take full charge of the examinations which will include those of all employees of the city, with the exception of medical and legal. Must be able to give highest references. Salary $200 per month. Address box No. 67.

Director of Statistics

Young man, preferably an engineer, required to take charge of the statistical branch of a municipality. Should have had experience in collecting and collating of data. Box No. 68.

An Engineering Clerk, Department of Interior, Calgary

An Engineering Clerk for the Topographical Surveys Branch, Department of the Interior at Calgary, at an initial salary of $1,260 per annum. Candidates must have education equivalent to high school graduation and preferably university graduation in civil engineering. They must have a knowledge of levelling and of the Dominion Lands Survey system, and at least one year's experience in levelling or draughting. The appointee will be required to plot plans from surveyors' field notes and profiles from field notes of levels; to enter elevations on plans; to draw contour lines on plans after plotting elevations; to prepare plans and sketches in connection with levelling work. Candidates should be not more than forty years of age and must be residents of the Province of Alberta.

Candidates will be examined in the following subjects, which have the relative weights indicated: Education and Experience, 400; in this connection a special questionnaire will be sent to the applicants; Theory of Levelling and of the Dominion Lands Survey System, 300; Plotting from field notes, 300. As the work of this office is done to a great extent in English, a knowledge of English is an essential qualification and the examination will be held in the English language only. Candidates will be notified later of date and place of the examination. This position was advertised August 21 and is now re-advertised.

An Inspector in Physics

An Instructor in Physics at an initial salary of $1,800 per annum, to assist in the Royal Military College, Kingston, in teaching and instructing in physics. Candidates should be not more than 25 years of age, and should be graduates in civil, mathematical or electrical engineering, or in honour physics with mathematics as a minor subject from a university of recognized standing.

The examination will be held on Education, Training and Experience along the lines indicated above. An oral examination of the best qualified candidates will be held, if necessary in the opinion of the Commission. This position was advertised August 14, and October 16, and is now re-advertised.

A Custodian of Surveying Equipment, Department of Interior

A Custodian of Surveying Equipment for the Topographical Surveys Branch of the Department of the Interior at an initial salary of $1,320 per annum. Candidates must have education equivalent to high school graduation; perferably a two years' course in engineering at a university of recognized standing or two years of experience in engineering work; thorough familiarity with engineering instruments; knowledge of the methods of receiving, storing, and issuing scientific instruments; good physical condition. The successful candidate will be required to carry on correspondence with surveyors with regard to instrument equipment and with manufacturers and dealers with regard to the purchase of instruments; to equip field parties in the spring with instruments and during the summer to fill requisitions from the field; to supervise repairs, alterations, and improvements to instruments; and to perform other related work as required. Candidates must not be more than 35 years of age.

Candidates will be examined in the following subjects which have the relative weights indicated:— Education and Experience, 300; A written test on the care of Instruments, 200; A written paper on technical correspondence, 200; Oral Examination of the best qualified candidates, if necessary in the opinion of the Commission, 300. As the work of this office is done to a great extent, in English a knowledge of the English language is an essential qualification for the position, and the examination will be held in the English language only. Candidates will be notified later of the date and place of the examination.

ENGINEERING INDEX

On account of the printers' strike in New York the Engineering Index for December has been delayed, and will be published as a special supplement immediately on arrival.

Preliminary Notice

of Applications for Admission and for Transfer

20th November, 1919.

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in December, 1919.

FRASER S. KEITH, Secretary.

*The professional requirement are as follows:—

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course. In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineers' office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the following branches at his option Railway, Municipal, Hydraulic, Mechanical, Mining, or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five years or more years.

Every candidate for election as JUNIOR shall be at least twenty-one years of age, and must have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-five years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects Geography, History (that of Canada in particular), Arithmetic, Geometry Euclid (Books I.-IV. and VI.), Trigonometry, Algebra up to and including quadratic equations.

Every candidate for election as ASSOCIATE shall be one who by his pursuits scientific acquirements, or practical experience is qualified to co-operate with engineers in the advancement of professional knowledge.

> The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BARNES—JOHN, of Peterboro, Ont. Born at Radcliffe, Eng., Aug. 25th, 1884. Educ., Mechanics Inst. and Tech. School, Horwich; 1st class certificate in mech. eng., City & Guilds Inst., London, Eng., 1905. 1899-1905, apprenticeship, Lancashire & Yorkshire Ry., Horwich; 1906-07, with R. Hadfields, Sheffield; 1907-08, Beyer, Peacock, locomotive engrs., Manchester; 1910-11, Allis-Chalmer-Bullock, Montreal; 1911-13, engr. and draftsman with Can. Iron Corp., Midland, Ont., hoisting engine design and gen. eng.; 1913-14, with P. Payette & Co., Penetanguishene, Ont.; 1914-16, asst. to chief inspector of ammunition, Ont. dist.; 1916-17, engr. and supt., Napanee Iron Works, mfg. ammunition; Feb. 1917, to date, designer and draftsman, Can. Gen. Elec. Co., Peterboro.

BETWEEN THE CAR TRACKS, TOO

"Pave the whole of the street with Hot-Mix Asphalt"

IMPERIAL
CANADIAN MADE
ASPHALT

Spadina Avenue, Toronto, 1918.

Spadina Avenue, Toronto, as it now is, showing a continuous stretch of Hot-Mix Asphalt from curb to curb.

"STUDY these two photographs of Spadina Avenue, Toronto. The lower picture, which was taken recently, shows a vast improvement over the old condition."

"For the past seventeen years Spadina Avenue has had Hot-Mix Asphalt pavement, except between the car-tracks, during which time the cost of maintenance has been negligible, while the pavement is still as good as when first laid. Now Hot-Mix Asphalt has been laid between the rails, too, and the whole street presents a smooth, continuous surface, that makes it one of the best-paved streets in the city."

"This change is not an experiment. For over three years Hot-Mix Asphalt has given such complete satisfaction between car-tracks on other Toronto streets as to warrant its universal adoption. Such a test is a real test, for car line thoroughfares carry continuous, heavy, varied traffic, comprising every type of motor-driven and horse-drawn vehicles."

"Hot-Mix Asphalt is the logical choice for city and suburban streets and county highways. Experience proves that the initial cost is less than for other pavements, maintenance is lower, and repair or renewal can be quickly and economically accomplished. It is also dustless, practically noiseless, and gives perfect ease of traction."

"There are three Imperial Asphalts for road purposes:—

(1) Imperial Paving Asphalt for preparing Hot-Mix Asphalt (Sheet Asphalt, Bitulithic, Warrenite or Asphaltic Concrete).

(2) Imperial Asphalt Binders for Penetration Asphalt Macadam.

(3) Imperial Liquid Asphalts for dust-prevention and for increasing the traffic-carrying capacity of macadam, gravel and earth roads."

Principles of the

VAN SICKLEN

Chronometric Temperature Regulated

TACHOMETER

The Van Sicklen Tachometer consists essentially of two parts, a set of gears which moves the indicating hand over the scale, and an accurate watch mechanism which measures off the hand moves. This is merely an application of the simplest type of speed measuring device, a stop-watch and a speed counter.

Essential Features

No. 1. The indicating hand is driven directly, by means of gears, by the shaft whose speed is to be measured.

No. 2. The period of time through which the hand moves is measured off by an Elgin watch movement. A consideration of these two facts makes it plainly evident that the Van Sicklen Tachometer is a precision Tachometer, because its accuracy depends only upon the accuracy of the timing mechanism, and the name ELGIN is a sufficient guarantee of that. A study of these same two facts, in the light of scientific principles of the Chronometric Tachometer designs, reveals the absence of the following defects fundamentally in the design of other types.

Freed from Defects Found in Other Types

No. 1. There can be no lag in oscillation, either positive or negative, in a gear-driven mechanism.

No. 2. Changes in external physical conditions, such as temperature, pressure or mechanical vibration cannot affect the gears. Compensation for changes in temperature, which is the only external influence materially affecting the timing mechanism, is easily effected, as it is an everyday matter in watch manufacture.

No. 3. Fluctuation of the indicating hand is impossible in a gear-driven device.

No. 4. There is no central pivot, the wear of which can displace any of the parts with relation to each other, and thereby affect the accuracy of the readings.

No. 5. The instrument has no period of its own which must accommodate itself to an oscillation impressed upon it.

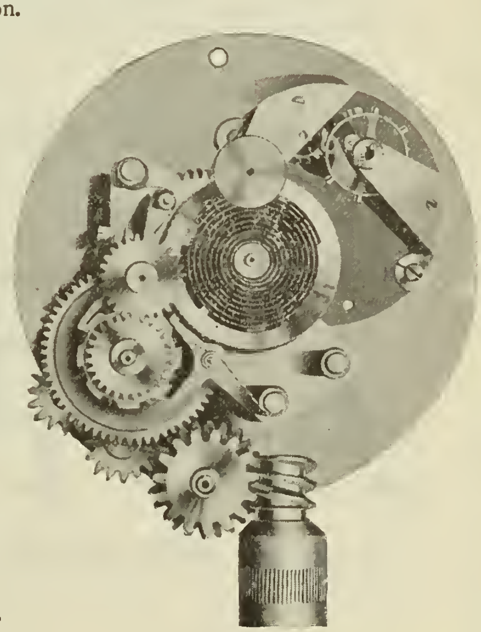
No. 6. Accuracy of the instrument is not affected by external vibration.

No. 6. The instrument is universal in application, being adapted to any purpose for which speed counters are employed.

The first reading is given in one second. The indicating hand is held at its reading point for one second, then released and a new reading is given, showing whether the speed of the moving member has either increased or decreased. When the instrument is taken off the moving member, the indicating hand fall back to zero.

A Brief Description of the Tachometer

The Chronometric Temperature Regulated Tachometer is just what its name implies—a speed-measuring instrument of he highest attainable precision. Its readings are intermittent and check every two seconds. It will measure shaft speed in R. P. M. regardless of direction of drive, and by means of a special adapter which is furnished with outfit supplied to the engineering field, it will measure surface speeds in lineal feet. It registers up to 2500 R. P. M. or 1250 lineal feet per minute. Higher or lower speed ranges can be provided.



Write for Descriptive Booklet

The Van Sicklen Company, Elgin, Ill., U.S.A.

Factory: Elgin National Watch Co. **Standard Equipment on U. S. Government Airplanes**

Branch: 1255 Woodward Ave., Detroit, Mich.,

Canadian Representative: CANADIAN FAIRBANKS-MORSE CO., 38 ST. ANTOINE ST., MONTREAL, P.Q.

Members having copies of the May 1919 issue which they do not require for binding purposes will confer a favor by forwarding them to the Secretary at Montreal.
