Suggested Branch By-Laws

At the meeting of the Council held on December 17th, Branch By-Laws were submitted which were the result of several months' deliberation on the part of the Legislation Committee of the Council and a special committee of the Montreal Branch. These By-Laws have been submitted to the various Branches in the hope that they will receive consideration for adoption, unless there are local reasons why changes should be made.

Object

Section 1. The Branch shall promote the objects and interests of *The Institute* and shall encourage the preparation of papers and addresses on engineering subjects, or on subjects of scientific or engineering interest, both for presentation at meetings of the Branch and for publication by *The Institute*.

Membership

Section 2. (a) The members of the Branch shall consist of the Members of *The Institute* of all classes who reside within a distance of twenty-five miles of the headquarters of the Branch, and of those residing at a greater distance who, desiring to join the Branch, so notify the Secretary-Treasurer, who in turn shall notify the Secretary of *The Institute*.

The Branch may, at the option of the Executive Committee, admit persons, not members of *The Institute*, who shall be termed "Affiliates of the Branch."

(b) Any person interested in the engineering profession may become an "Affiliate of the Branch." Affiliates shall be elected by vote of the Executive Committee upon nomination by two corporate members of the Branch. The fee shall be five dollars per year, including the annual subscription of two dollars for the *Journal* of *The Institute*.

Affiliates may attend all meetings of the Branch but shall not discuss or vote upon any matter affecting the administration of the Branch.

Management

Section 3. The Branch shall be managed by an Executive Committee consisting of a Chairman and a Secretary-Treasurer, or a Secretary and a Treasurer, and six committee men, all of whom shall be elected by letter ballot of the corporate members of the Branch. A Vice-Chairman may be similarly elected at the option of the Executive Committee. The immediate Past Chairman of the Branch and the members of the Council of *The Institute* resident within the jurisdiction of the Branch, shall be ex-officio members of the Executive Committee. All members of the Executive Committee shall be corporate members of *The Institute*. Five members shall constitute a quorum.

Tenure of Office

Section 4. The Chairman, Vice-Chairman and Secretary-Treasurer shall hold office for one year. Other members of the Executive Committee shall hold office for two years, three being elected each year. Elections shall be held each year during the first two weeks of May and members so elected shall take office the first of June following.

Nominations for Executive Committee

Section 5. On or before the fifteenth day of March in each year, the corporate members of the Branch shall be called upon by the Secretary to nominate, by letter, candidates for the offices of Chairman, Vice-Chairman, Secretary-Treasurer and three Committee men. Each nomination shall be signed by at least five corporate members of the Branch, and shall reach the Secretary on or before the first day of April.

Letter Ballot for Executive Committee

Section 6. The Secretary shall mail to each Corporate Member of the Branch, before the end of April, a letter ballot stating the name and class of membership of each nominee. Instructions for voting shall be printed on the ballot, which shall be returned to the Secretary by a date fixed by the Executive Committee. All ballots shall be enclosed within two sealed envelopes. The outer envelope shall bear the signature of the voter, but the inner envelope containing the ballot shall have no identification mark upon it.

The ballot shall be counted by scrutineers appointed by the Executive Committee. All ballots which do not comply with the printed instructions shall be rejected.

The scrutineers shall report the result of the ballot to the Annual Meeting, and the nominee receiving the highest number of votes for any office shall be declared elected to that office. Should a tie result between two or more nominees for the same office, the corporate members present shall elect by ballot, the officer from those nominees. In case a tie again results, the Chairman of the Meeting shall give a casting vote.

The Chairman shall announce the names of the officers duly elected.

Sections of Branches

Section 7. At the request of ten corporate members of the Branch, made in writing to the Secretary and approved by the Executive Committee, sections of the Branch shall be established, corresponding to any of the generally recognized branches of the engineering profession, such as chemical, civil, electrical, mechanical, mining, industrial, etc.

The Chairman of the Branch shall be ex-officio the Chairman of each of the sections and each section shall have as executive officer, a Vice-Chairman, who shall be appointed by the Executive Committee at its first meeting after the Annual Meeting of the Branch, or on the authorization of any section of the Branch. He shall hold office until the thirty-first day of May following the date of his election.

Meetings of the Branch

Section 8. Ordinary meetings shall be held on alternate Thursdays from October to April inclusive, or on such other days as the Executive Committee may determine.

Special meetings may be called by the Secretary on resolution of the Executive Committee, or on the written request of seven corporate members, stating the objects of the meeting. The notice stating the object of the meeting shall be mailed at least five days before the date of the meeting.

The Chairman may call a special meeting without such formalities for any purpose other than the transaction of business.

Annual Meeting

Section 9. The Annual Meeting shall be held at the headquarters of the Branch on or before the second Tuesday in May, or on such other date in May as the Executive Committee may determine. Notice of the meeting shall be mailed to each member at least seven days before the date of the meeting. The Executive Committee shall submit a report of the operations of the Branch, and shall determine the order of business of the meeting.

Annual Report to the Institute

Section 10. The Branch shall submit an annual report of its proceedings and of its finances to the Secretary of *The Institute* who shall present it to the Annual General Meeting of *The Institute*. The report shall cover the operations of the calendar year and shall be approved by the Executive Committee and signed by the Chairman and Secretary-Treasurer of the Branch.

Alterations of By-Laws

Section 11. By-Laws may be adopted, amended or repealed by letter ballot only. Such alterations may be suggested either by the Executive Committee, or, in writing, by any ten corporate members, and the proposed alterations must reach the Secretary on or before the first day of April.

Alterations shall only be made at the Annual Meeting, and the ballot for such alterations shall be issued with the ballot for the elections of members of the Executive Committee. An affirmative vote of two-thirds of all valid ballots shall be necessary for the alteration of by-laws.

The votes shall be counted by the scrutineers appointed for the election of members of the Executive Committee.

General

Section 12. Where not otherwise provided for, the Branch shall conform in rules of order and general procedure to the methods and rules adopted by *The Institute*.

The Montreal Tunnel From an Economic Point of View*

By H. K. Wicksteed, B.A.Sc., M.E.I.C.

In response to your very kind invitation, I have come before you to-night to give you something of interest in connection with the history of the Montreal tunnel — What were the considerations which led up to it, and made it seem a practical scheme? As the Canadian Northern Passenger Department has put it in its window dressing "Why was the Tunnel built?" And I have given my dissertation the title of "The Montreal Tunnel from an Economic Point of View."

With the actual construction of the Tunnel I do not propose to deal with to any greater extent than is necessary to enable you to understand the problem,— not because there were not a great number of intensely interesting points about it, and not because I was not in the Tunnel a great many times during its progress,— but because the construction side has been dealt with very ably by my colleague Mr. Brown, and I believe is to be dealt with further by one of his assistants, Mr. Busfield, and they are both better posted in details of it than I. Mr. Brown has made tunnelling a specialty, and his whole soul was in his work, and I may say that it is a pretty large and comprehensive soul.

Economic Side of Engineering Problems

Both by temperament and training, it is the "economic" side of things which has always appealed to me most. Railways are commercial concerns, and the Tunnel is an essential part of a great railway. If it can not be justified in a commercial sense, if it can not pay interest on its cost, it has no right to exist.

This economic aspect of engineering works has come into great prominence of late years, and notably since the introduction of railways. Nearly all our great tunnels have been built to carry railways past or under obstructions of one kind or another, so that the history of tunnelling is almost altogether confined to the last 70 or 80 years, and most of the great tunnels are much younger than that.

Difference between English and American Roads

Railroad construction started on a large scale first in England, where population was already dense, and traffic was waiting to be carried in large volume. A railway once built even on what we should now consider very crude lines, was practically sure of paying its way from the very start, and the cost was a minor consideration as soon as the potentialities of the steam railway came to be understood.

It was when the building of railways extended to this continent of great distances and at the same time sparse population that it was found that not only were fixed charges a very heavy drain on railway earnings, but that capital was very hard to get in any case, and had to be brought in from outside, hence the difference in cost between the early American roads and the English ones, and the expedients of sharp curvature, heavy grades, and cheap construction, which were used to reducé the capital cost; and hence the fact that so much English capital went into American roads.

*Read before Toronto Branch, December 3rd, 1918.

Effect of Competition

As time went on, and the traffic became heavier, and as, too, other lines were built between the same termini and competition became keen, there came the era when the balancing of cost against more perfect location and construction began to be a regular study, and while I think a good many of the earlier engineers, Latrobe for instance, had thought a good deal about these matters (their works shewed that they did) it was Wellington who first committed his ideas to paper and his writings are still useful as well as monumental.

Classification of Tunnels

The element of location which conduces more than any other to reduce the cost of haul is, of course, that of gradients, and in reducing gradients in rough country there is very often a strong temptation, less often an absolute necessity, to resort to tunnelling. Hence nearly all our tunnels are in the two great mountain ranges of the continent, one east and the other west of the Mississippi River. There are a few, however, on this continent, for the construction of which there are other or contributing causes; and a great many on the other side of the Atlantic — cases where property damage was to be avoided at almost any cost, or where navigation interests were paramount, and a tunnel was more practicable than a high level bridge. The Detroit-Sarnia and Hudson River Tunnels are instances of the latter class, and the Baltimore & Washington tunnels are instances of the former, and to this class our own Montreal Tunnel also properly belongs.

Canadian Northern Location Considerations

Towards the close of 1906, more than twelve years ago, I was instructed to commence surveys and location for the Canadian Northern Railway from Montreal westward, primarily to the Georgian Bay and eventually, as it turned out, to Port Arthur to connect with the western system which had already developed to very considerable proportions. My headquarters were at that time in Montreal, so that it was natural that a great deal of my spare time was devoted to what was in any case the problem of greatest interest and best worth studying out. Montreal and its problems and growth were not a new matter to me, for I had spent three years of my earlier life at McGill, had geologized on Montreal Mountain with Sir William Dawson, and one of my closest friends was a prominent business man and an ex-mayor of Westmount.

Acquired Roads

The Canadian Northern two or three years before had purchased and completed the Chateaugay & Northern Railway from Hochelaga to Joliette, and about the same time the Great Northern Railway of Canada, extending from Hawkesbury to Rivière à Pierre on the Quebec & Lake St. John, which constituted a sort of overflow system by which part of the grain brought from Parry Sound by the Canada Atlantic found its way to an elevator in Quebec.

Ocean Terminal

The superintendent of this Eastern System was offered one of the farms near Longue Pointe and we combined to purchase this for the railway, and by this means secured an approach to the river front, and within a very short time thereafter, a connection with the Harbor Commissioners' tracks.

Freight Entry

This had already secured for the road an ocean terminal, and it developed later that from this farm, now the Longue Pointe Yard (and a very busy yard indeed), there extended a very marked depression clear across the Island to the Rivière des Prairies, and the only one of its kind between Lachine and Bout de l'Ile. Everywhere else there was a high broad-backed ridge of limestone to the north of the Mountain itself, and to the south a long talus slope of sand and glacial drift.

The Northern Colonization, afterwards Quebec Montreal & Occidental, and now C. P. R., climbed over the top of the limestone at Mile End at an elevation of 200 feet above the River and down again with a very strenuous grade of 90 feet to the mile, to Hochelaga. The Ontario & Quebec, the C. P. R.'s entry from the southwest, climbed over the talus debris and dropped similarly although not so viciously, to the Windsor Station.

Our discovery gave us an entry somewhat circuitous, it is true, but with a short maximum grade of 30 feet to the mile.

Development of Transcontinental Route

This then was the obvious route for a freight line from the West to the harbour of Montreal, and it must be remembered that the C. N. R. was at that time purely a granger road and interested almost exclusively in the hauling of wheat to the seaboard. Here, therefore, was the starting point of the survey to Port Arthur, and we still hope to see this line built at a very early date. The surveys West shewed that an excellent line could be had north of the Great Lakes to Port Arthur at moderate cost; in proportion to cost probably the best long distance line in the world. The Pacific coast extension also gave wonderful results, and the System promised to be easily the best of all the Transcontinental lines on this continent or any other.

Terminal

While, however, this arrangement was entirely satisfactory as regards through freight traffic to and from the West, it did not meet the requirements of the local traffic, both passenger and freight, of the City itself. Moreover, a transcontinental such as that described must of necessity have a suitable terminal in the Eastern Metropolis to make it complete and well-balanced, and this became the new study of the location staff.

Montreal Topographically

Montreal proper, as everyone knows and many have said, is wedged in between the River and the Mountain on a narrow strip of territory consisting first of a river flat half a mile wide, and farther back a terrace 70 feet higher, and of about the same width, extending to the Mountain Slope.

Up to thirty years ago the site was an ideal one for a city of moderate size although even then it was remarkable among American cities for its density of population. While Toronto was building up with detached houses with lawns and gardens, Montreal adhered to long terraces of houses of gray limestone built right up to the street, and extending for miles almost without a break. Only on the slopes of the Mountain the "Seats of the Mighty" of the Allans, the Redpaths, the Angus, and other merchant princes shewed more attractive surroundings, even if built on a sharp slope. Westmount was then in its infancy and was deterred in its growth by the long distances from the commercial centre of the City.

Growth due to C. P. R. Entry

Thirty years ago was marked by the advent of the C. P. R. and the selection of Montreal as its headquarters. Montreal began to grow very rapidly indeed, and is said to be increasing in population nearly 10% per annum, and has now a population of over 800,000.

Congestion

Montreal a few years ago had an area of 19 square miles, and a population of 580,000. Cleveland, with about the same population occupied 45 square miles, Boston with 670,000 — 43 square miles. Between 1900 and 1910 Montreal added 10,000 people to each square mile. New York only 4,000 and Chicago only 2,500.

Montreal, to use the words of a writer in an American paper was "choking to death for want of room". In its efforts to find this it has extended down the River almost to Bout de l'Ile, and upwards almost to Lachine, and answers much more closely even than Duluth itself to the Eastern Yankee's description of that City as being "25 miles long, 1 mile wide, and pretty nearly one mile high."

Schemes for Expansion

The long-sighted men, my business friend for one and Sir William Van Horne for another, had repeatly cast wistful and prophetic eyes towards the "hinterland" "the Great Beyond" on the other side of the Mountain. The Montreal Tramways built a line around it and Sir William suggested a tunnel of about 1,000 feet to reduce the extreme summit of the Cote des Neiges Hill. Only at one point had any actual expansion taken place, and this was largely due to the C. P. R. Mile End Station and the Tramways' extensions to it. This was along the extensions of St. Lawrence Main, St. Denis and later of Park Avenue.

This question of city expansion was one consideration which led to the conception and inception of the Montreal Tunnel, but it was not by any means the only, or the principal one.

Topography

To most Canadians the mention of the St. Lawrence suggests a river running east and west. It carries east and west commerce, and Sault Ste. Marie is pretty nearly due west of Montreal, and Port Arthur only three degrees further north; but the St. Lawrence proper from Lake Ontario to the sea flows northeast, and at Montreal it runs almost due north and south.

It is the Ottawa which is the east and west river, and it is the Ottawa Valley which has been in the past the great highway of commerce, and which has resumed its place as the route of the two transcontinental roads. The result is that the direct route from the heart of Montreal to the West lies directly through the Mountain, and almost at right angles to the River and the great thoroughfares of St. Catherine, St. James and Notre Dame, which parallel it. As grade separation was an essential feature of any terminal scheme this was a very important consideration.

Existing Railways

Three railways had already entered Montreal from the West.

The Grand Trunk had entered it when the problem was a comparatively simple one. The Victoria Bridge was located at what was considered the best point for a bridge, as was the St. Anne's Bridge over the Ottawa. The intermediate line was built as directly as possible between them, and one of the pioneer roads of Canada, the Lachine Portage Railway, was used as an approach to a dead end station in the outskirts of the city at that time. The main line did not touch Montreal as it then existed.

Thirty years later the Northern Colonization was built from Ottawa, and it climbed over the northern toe of the Mountain as already described, and entered the extreme northern end of the city, and after absorption by the C. P. R., the Place Viger Station.

Ten years later still came the Ontario & Quebec, which paralleled the Grand Trunk from Vaudreuil to Dorval, and then rose over the terrace and followed along its edge to the present Windsor Street Station. What the governing ideas were in selecting this location I can only guess, having never met the designer, but a desire to eliminate property damages and grade crossings as far as possible is evident, and the solution has been accomplished in a very clever way. It is on the whole a very satisfactory entry, but the C. P. R. is under the disadvantage, with the double approach, of having to keep up two separate terminals and a great number of passengers have to travel across town from one to the other — in coming, for example, from Quebec to Toronto. It may almost be said that there are three terminals for the Mile End Station is getting to be very popular with short distance passengers to and from the north and west. The Windsor Street approach is very interesting not only as a very good piece of work, but as shewing the development of railway ideals, and the demands of the Public in respect of abolition of crossings and concealment and suppression of smoke and noise.

Advent of C. N. R.

Nearly thirty years after the C. P. R. comes the Canadian Northern. Thirty years makes a great difference in a problem of this kind. Land values have grown prodigiously in the meantime due to the ever increasing congestion. And the education of the Public assisted by a Railway Commission anxious to please it has gone on apace. Grade separation has become absolutely essential and the absolute abolition of smoke and noise almost so.

At the same time, and from the railway point of view, passenger trains have become longer and heavier and harder to haul, so that grades must be flattened to the utmost, especially in regard to starting and stopping. Maintenance of way and operating expenses have been increasing in a much faster ratio than the corresponding passenger rates and receipts. Only the increasing volume of traffic offsetted the growing discrepancy and served to stave off the bankruptcy of the railways.

Local Freight

The passenger business alone was not the only thing to be considered. The Grand Trunk during its 60 years of occupancy, and the C. P. R. during its shorter term of existence had surrounded and honey-combed Montreal with a network of industrial spurs, sidings, and yards, in every direction. The Canadian Northern had only one small yard in the extreme north end, and its connection on the same terms as the other lines with the Harbour Commissioners' tracks for overseas business. But business to and from the local industries, the wholesale houses, cold storage plants, etc., etc., has to be hauled from three to five miles by motor trucks to Moreau Street. The handicap is altogether too great. In the district bounded by McGill Street, the Lachine Canal, Windsor Street produced, and Lagauchetière St. alone there are something like 150 of these smaller industries and plants, and a great many more within a mile radius of the Haymarket Square.

Passenger business may perhaps be described as the spiritual and intellectual function of the railway body coporate, but freight is the wholesome and nourishing food which enables it to do its work and carry on its functions. The passenger service is the side which appeals to the ordinary layman passenger just as a man's face and bearing does to a new acquaintance, but he can't keep up the prepossessing appearance unless he has his stomach full, and some little money in his pocket.

Financial

We have here a number of essentials to be provided for and a still greater number of desiderata, also many things to avoid. The most important necessity of all at the moment perhaps was the finding of the necessary capital.

Railway terminals are expensive things at the best, and this was an era of extravagance in this respect. The Pennsylvania had spent all kinds of millions on its New York entry. The New York Central was following suit with a magnificent scheme, better balanced financially, but still enormously expensive. Kansas City was building a joint 45-million terminal, and St. Paul was considering a scheme which involved encroachment on the rights of its very respectable and oldest citizen, the Mississippi River — almost as old and respectable as the Montreal Mountain itself although somewhat dirtier.

But these were all in connection with roads of long standing and financial strength. They were improvements and consolidations rather than new schemes.

The Canadian Northern while it had been earning at a great rate was also extending and building equally fast, and had largely discounted its future in its borrowings. Even in a growing North West it takes some months before a new piece of road can earn its own living, and some of the C. N. R. construction was of a nature and through such country as could not be expected to yield any adequate income except as part of the completed system.

Selection of Route

The most obvious route was to parallel the two older roads and it was very seriously proposed, but the writer for one never took to the proposition. It was neither the inexpensive route of the older Grand Trunk, nor could the very neat grade separations which the C. P. effected thirty years ago be repeated and duplicated.

The line of the C. P. had been badly bent in order to effect its entry. Everything pointed to the north instead of the south shore of the Ottawa as being the proper route of the Canadian Northern, and in this case the bend would become a right angle elbow. The right-of-way would be absolute destruction for two miles or more, and grade separation could be effected only by a continuous track elevation for the same distance. It would have been plagiarism of the worst and most expensive type.

It was proposed to join the Grand Trunk but this would merely have mitigated some of the evils of parallelism, not removed them, and the C. N. would have lost its identity and its independence at a most important point, and neither of these propositions would have been any solution of the freight problem.

Tunnel the Obvious Solution

The Tunnel was the obvious solution of the whole question, and it was adopted by the writer at a very early stage, but how was the money to be found?

The Model City

Here came in the question of expansion, of a Greater Montreal. The piercing of the Mountain, the inauguration of a fast and frequent electric service through it, would vastly enhance the value of the inaccessible lands beyond. Thousands of acres sloping gently towards the Back River were available, if they were once brought within easy reach of the business and shopping district.

As soon as the programme was announced real estate men would quickly absorb all the available land, subdivide it and sell at enormous profit. Why should not a syndicate be formed which would take this part of the business out of the hands of the real estate men, buy up the land and out of the prospective profits finance the construction of the Tunnel?

The idea once suggested took root, and some of the great financiers of the world became directly interested in it, and the idea of the tunnel entrance became an established one.

Construction Considerations

But this merely fixed the *principle* of the Tunnel, not the *line* of it, and there were several lines suggested other than that adopted. A line just south of Park Avenue was strongly advocated, the reason given being that it would be closer to the surface and much of it could be built by the cut-and-cover method.

It was pointed out in rebuttal that this would disorganize all the underground economy of the district, sewers, water pipes, and gas, and that the streets would be impassable and the abutting property uninhabitable during the whole time of construction, unless the enormously costly methods of the New York Subways were adopted. So far from being an extravagance, the bold line under the highest part of the Mountain was the cheapest in that it avoided all property damage except for a couple of thousand feet on the City end.

Selection of Western Portal

This argument prevailed finally and the bolder line was adopted, but there was still a good deal of latitude in the choice of line.

At the West end a long strip of property was offered reaching nearly to the Back Rvier. It so happened that on this property was the best point at which to cross the C.P.R.'s Atlantic and North Western line, so this end was promptly and satisfactorily settled.

Selection of Eastern Portal

The east end was the subject of longer debate and some warmth of argument. Most English-speaking people think of Montreal as extending from the Mountain to Dorchester, and from Park Avenue to the confines of Westmount, with an addition for business purposes extending east and south for half a mile from the Place D'Armes, and of St. Catherine Street as being the main and only important artery. This is only a small part of Montreal in reality but the conviction in the Anglo-Saxon mind that this is Montreal, the whole of Montreal, and nothing but Montreal is almost as fixed and ineradicable as the Englishmen's idea that the whole world is centred about his own tight little island.

As a result of this obsession, it was difficult to get any site off of St. Catherine Street even seriously considered. A line near University Street was actually adopted and abandoned only when it was shewn that this was of no use except for purely passenger business, that there was no chance for extension eatward, and that it must for all time to come remain a dead end branch 6 miles in length, and worse in this respect than either the C. P. R. or the Grand Trunk.

Connection with Harbor Tracks

Finally, the present line was adopted mainly for the reasons that it gave a continuous line from the Mountain to the water front with opportunity to connect with the Harbor Commissioners' tracks, and through them with the system extending to Quebec and Chicoutimi; that in doing this it passed through some of the best freight producing district in Montreal, and that it did all this with a minimum of property damage and with an absolute avoidance of grade crossings or even distortion of street grades.

There is, further, an avowed intention on the part of the Commission to build a dam across the River to St. Helen's and a bridge from it to the east shore which will furnish a route for such roadways and railways as care to avail themselves of it. It is more than probable that the Quebec Montreal & Southern and the Intercolonial will avail themselves of the chance, for the Grand Trunk's great bridge is already congested and overcrowded, but this is a matter for the future.

Station Site

The choice of a station site on this route was another matter of debate, which it is somewhat irrelevant to go into now. The choice for the present at any rate is that I am shewing you on Lagauchetière, within easy reach of Dorchester, but not so far below the surface as the latter.

Grades Through Tunnel

Closely allied to the question of alignment and in some respects even more important is that of grades. I have already alluded to the increasing length and weight of passenger trains. The C. P. standard transcontinental train averages 11 coaches, and with this their Pacific type engines get over the 1% grades of the Lake Superior division with reasonable ease. An extra car is liable to make them lose time. On the other hand, if the grade is flattened too much, on a long tunnel and approach such as this, trouble with drainage is apt to occur, expecially in winter.

The grade through the tunnel is 6/10 of 1%, or 32 feet per mile, and is continuous from end to end; the West Portal being thus 100 feet higher than the East.

From the West Portal the same rate of grade carries us down through the Model City for nearly the same distance. The long cutting on the west approach was introduced with a purpose, viz.: to allow the civic expansion to go on overhead without too much distortion of street grades.

Headroom

In consideration of the electrical operation the headroom required under the bridges was reduced from the regulation 22½ feet to 16½ feet, and the problem of grade separation rendered so much the easier of accomplishment.

Near Cartierville the Park & Island Railway and a mainroad alongside it have been carried underneath.

Absolute grade separation is thus secured, not only through the City itself and its transmontane annex, but for the entire length of the electric zone, nearly 9 miles, and Cartierville, a promising suburban settlement on the bank of the Rivière des Prairies, is now brought within 18 or 20 minutes of the heart of the City.

Description of Tunnel

The Tunnel itself is a very interesting one and ranks among the great tunnels of the world, being 3.25 miles in length. Only the three great Alpine Tunnels, the Mount Cenis, the St. Gothard and the Simplon, completely eclipse it in length, and there is only one in Canada which is longer, the Rogers Pass Tunnel of the Canadian Pacific.

Difficulties

It was predicted beforehand that the difficulties would be comparatively few, and so it turned out.

Very little water was met with, and this where it was expected, near the West Portal at the contact between the limestone and the older rocks on which it rests unconformably.

The core of the Mountain was almost exclusively Essexite a basaltic volcanic rock, somewhat hardtodrill, but otherwise quite unobjectionable.

Lining

It was at first thought that most of it would not require lining, and had it been a steam operated road in the open country, it is still probable that very little lining would have been put in, but its nearness to the terminal and the adoption of the trolley system, which meant support from the roof, made even a small fall a very serious matter, as it would both delay and endanger the traffic. Some little seaminess and disintegration shewed itself after exposure to the air, and in the end it was all lined with a thin sheeting of concrete, except for about 1,000 feet. This applies to the rock section.

Use of Shield

For something over half a mile at the City or East end, the roof ran into clay, although the bottom and most of the wall remained in limestone. This clay was known beforehand to exist, and it is of a very plastic and semifluid formation and contains numerous shells such as now exist in Northern seas. On account of its semi-fluid nature, and because this section led under streets and close to the foundations of buildings, it was decided to take this out under a shield protection, the shield being followed up with an arch of concrete blocks pre-cast in voussoir shape.

Practically no leakage even of water was ever visible during the progress of the work, and yet considerable settlement of the street overhead took place. Probably the moisture evaporated and escaped as invisible vapour. A great many of the houses had been set down on this soft clay and had suffered from settlement before the work was started; the further settlement was therefore of less consequence than it would otherwise have been.

Separate Tunnels

Through this section the individual tracks are carried in separate tunnels with a thin wall between them. The same is true of a few hundred feet at the West Portal. but the body of the tube is a single opening.

Heading and Speed

The heading was a " bottom " one 8′ x 12′ and was put through with very good speed. For a time in fact the American record for hard rock tunnelling was broken by an average advance of 26 ft. per day for a whole month.

As soon as a sufficient advance had been made the enlargement to full section was commenced. the arch being taken out first, and the two " benches " afterwards.

As the east end was in the City and there was no means of getting rid of large quantities of material except by means of teaming for several miles, this work had to be done from the West end, and for this reason the heading was driven faster from this end and this meant working down hill. Under these circumstances the small flow of water was particularly fortunate as the amount of pumping was small.

Shafts

In order to expedite the work a shaft was sunk 250 ft. one mile from the west end. This made it possible to follow up with the enlargement on the westerly mile without interference from the heading from the shaft, but as a matter of fact the rapid progress of the heading was to a large extent wasted because the war intervened and work on the enlargement was impeded by the difficulty in finding the necessary capital to carry it on.

Instrumental Work

The shaft was, however, designed to carry an elevator in the future to a substation at its foot, and with this in view was sunk to one side of the centre line of the tunnel. This, as may be imagined, greatly increased the difficulty of alignment of the tunnel. To offset a line on the surface to two plumb lines only some 12 feet apart and 250 feet long, and then offset this line again at the bottom of the shaft, was an operation requiring care and patience, but it was accomplished without appreciable error by H. T. Fisher and his staff.

Other Shafts

A second shaft was sunk some 70 feet just to the north of Sherbrooke Street and at the bottom of this the shield was put together.

A third shaft was projected at Pine Avenue but considerable opposition was met with from the wealthy residents of the neighbourhood and it was abandoned, and undoubtedly to advantage for it would merely have expedited the driving of the heading, not of the completed tunnel.

A fourth shaft was sunk on Dorchester Street and it was from this that a large quantity of material was removed because there happened to be a very large and almost vacant piece of property at this point on which material could be wasted for the time being, until the Tunnel became available for hauling it away.

Reasons for Electrification

As mentioned above, the Tunnel was planned from the beginning for electric traction. No effort was made to avoid the inevitable in this respect. It was felt that while very much cheaper in initial cost, a steam service through such a long tunnel would not be popular with the Public, and there would have to be installed fans and artificial ventilation, and that even outside the tunnel, on the City end, there would be a strong opposition to steam operation over the streets, and justly so, for Montreal is already more saturated with coal smoke than even Toronto.

Some of you will remember the fatal disaster in the St. Clair Tunnel when it was operated by steam locomotives, although this is not much more than one-third the length of the Montreal one. Some minor mishap necessitated a stop at the lowest point in the tunnel, and some of the train hands were asphyxiated by the waste gases from the locomotive before help could be got to them. Even on a passenger train, although the trip lasted a very few minutes, there was a certain sense of suffocation and a feeling of relief when the trip was over.

This accident precipitated the inevitable change to electric traction and in the case of the Pennsylvania and Detroit tunnels, electricity was installed from the very first.

Air Current in Montreal Tunnel

In the Montreal Tunnel, in actual experience, the air is just as fresh as it is outside and there is quite a marked natural circulation through it. The air at the City end is nearly always warmer than that at the West or country end, and rises from the terminal excavation, causing a strong draught of cool air from west to east. With the West end warmed up by a westerly sun, while the East is in shadow, the current will very probaly be reversed, but the normal conditions seem to be as above.

The electrification work is a very interesting study in itself, and was under the very able charge of W. A. Lancaster.

POWER

St. Ursule Falls

A study was made for developing power at St. Ursule Falls on the Canadian Northern line some 60 miles east of Montreal, and transmitting to Montreal, but the power was not very reliable and to make it so meant a lot of interference with vested rights and privileges which threatened to raise the capital cost and resultant interest charges to a point which meant that it would cost more per H. P. than it could be obtained for from the Montreal Light Heat & Power, and an arrangement was made with them to supply the necessary power.

Description of System

The system is a direct current of 2,400 volts, much higher than we have been accustomed to up to the present. The locomotives take the current by means of a pentagraph from a trolley wire, and weigh eighty tons.

The third rail system was considered but on account of the heavy snowfall about Montreal and occasional accumulations of ice, it was not considered desirable.

In actual test these locomotives haul a seven or eight car train against the adverse 6/10% grade through the Tunnel in 7 minutes, or practically thirty miles per hour.

Electric Zone

The electric zone extends at present only to Cartierville, which on account of its being a convenient point at which to establish a divisional yard with engine house and shops, was considered the best point at which to make the change.

Extension and Route to Ottawa

It is altogether probable that as the intermediate country gets settled up with suburban residences, a movement which has already commenced, it will be extended to St. Eustache, a very prosperous town with beautiful surroundings, and we hope eventually to Ottawa. Only the heavy cost of installation prevented this being done in the first place.

The route to Ottawa lying as it does along the banks of the River, and generally within sight of it and of the Laurentian Hills beyond, is quite the most attractive of the four existing ones, and within a mile of being the shortest. It has already made a good start in popularity, and with the additional attraction of electric traction, it should pretty nearly monopolize this business.

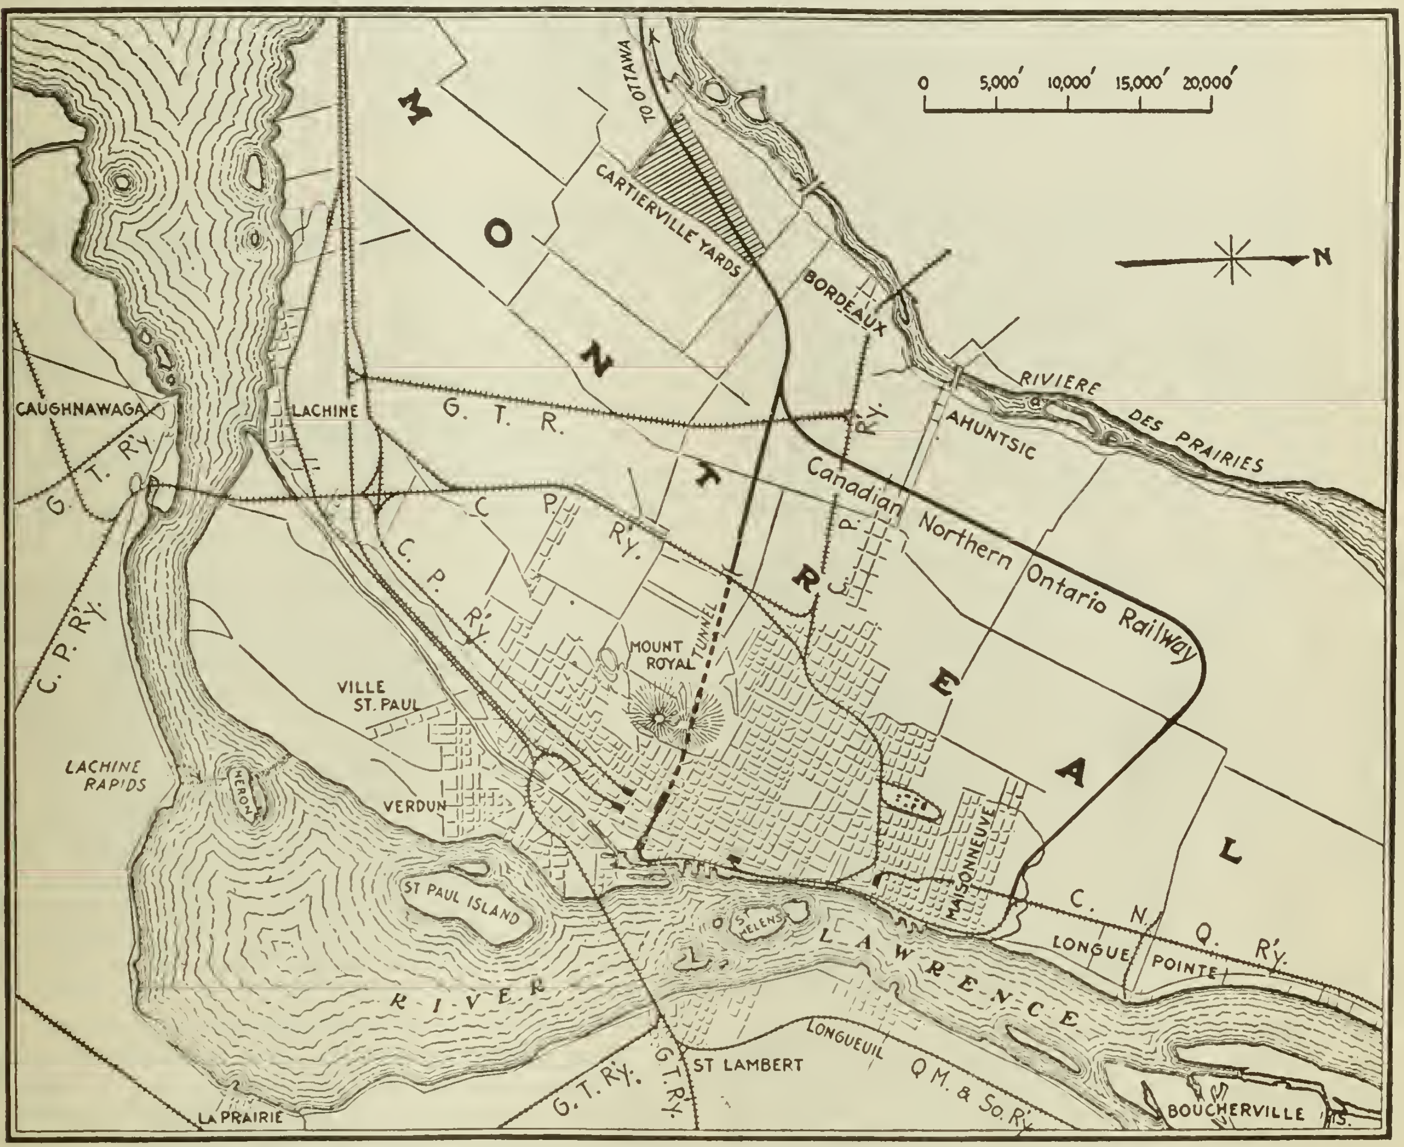

Fig. 3.—Canadian Northern Railway Terminal Lines in Montreal, with Tunnel under Mount Royal to Central Passenger Station.

Remarks Regarding Rural Roads*

By J. N. deStein, M.E.I.C.

You may have noticed that the Manitoba Motor League intend to petition the government of their province to take over the control of main highways, and a Manitoba weekly expresses itself in this connection as follows:

> "The present system of municipal roads is a howling farce. The great majority of rural councils know even less about building and maintaining roads than the daily press of Toronto knows about farming in Manitoba."

I thought it unfortunate that a man likely without any engineering qualifications, as the editor of said weekly, should express an opinion, which properly should have originated in some engineering body.

We are leaning back in our chairs and enlarging at length upon small theoretical points, perhaps how many inches to crown our main roads or whether to use eight or ten percent maximum grades, while annually tens, yes even hundreds of thousands of dollars of public monies are wasted through the present faulty system of supervision of our rural roads. Our duty — it seems — should be first to devise a proper organization in this connection.

There are plans on foot for provincial highways, linking up the various cities and towns of importance in our province, and even a possible federal interprovincial highway is being contemplated — but our rural travel will still use mainly our market roads, as heretofore under the supervision of the rural councils.

Just a few words about the present organization. Our municipalities comprise as a rule from nine to twelve townships and are governed by a reeve (elected annually) and six councillors (elected by a ward system), three councillors retiring every year, keeping thereby the individual councillor in office for two years. The councillor has the immediate supervision over the roads in his ward (1½ to 2 townships), which consists of about 80 to 110 miles of road. The annual portion of the taxes devoted to road purposes is divided amongst the councillors and forms the appropriation at their disposition for road construction and maintenance in their respective wards, usually called divisions.

The trouble seems to be firstly in the continuous change of officials. Our aim should be to devise some more permanent form of rural government, after the commission form in our cities or in the form of a municipal manager, aided by an elected reeve and council. All executive work, especially in connection with road planning, construction and maintenance should be left in the commissioner's or manager's hands.

There might be an objection raised on account of the increased financial outlay in salaries etc., but the ratepaying farmer would soon realize that their "investment" is not only earning a very high rate of interest indeed, but probably showing a considerable saving on Capital account.

The second remedy should be a change in our Municipal Act, whereby a more adequate remuneration should be allowed for municipal reeves and councillors. The honors are all theirs — but that is about all! — We find a large number of public spirited men in our rural communities, who devote their time in the best interests of their electors — but let us admit the fact: are not quite a few tempted to seek an adequate remuneration for their services in improving the roads in the vicinity of their farms, sometimes even beyond the importance of such road.

Even the small rural division is again split into districts. One year the south end are trying to get their man in, another year the north end, mainly in order to get roads. "Roads" is the issue in the campaign! Every councillor looks in many instances upon his division as a little kingdom of its own. I could mention instances where some councillor in the past developed, in a very remote portion of the municipality, a splendid net-work of roads, but only a few miles in the immediate vicinity of his farm and entirely disconnected with any market road. In the future they are left without necessary upkeep, as the next councillor refuses to spend any more money in that corner, with the result that the original, often large, expenditure is wasted eventually.

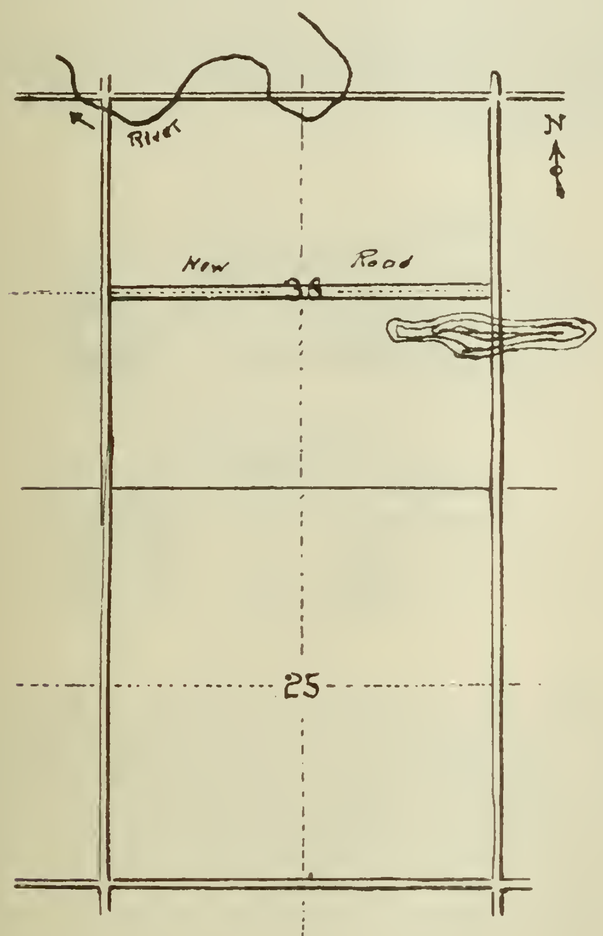
Recently our provincial government is requesting the rural municipalities to submit plans showing a proper system of main roads. Some very queer documents must reach our highway department in this connection. I know of some intances, where in one division nearly every road was shown as a main road, in another division a main road was contemplated — to suit the requirements of the councillor in question — every mile of which involved an outlay of about one thousand dollars for earthwork alone, besides being topographically entirely unsuitable for its purpose. The main road system as at present is a variable item, directly proportionate to the council, that is with every change of council the main road system used to change as a rule. It should therefore be our duty to compel the municipalities legally, not only to adopt a comprehensive system of main roads, but to adhere to it!

What difficulties does the local councillor encounter in this respect? Mainly the objection of the ignorant rate payer, who figures that his taxes should be expended on the piece of road immediately adjacent to his property. He seems to loose sight of the fact, that he travels sometimes many miles over expensively constructed road, upon which the expenditure of a frontage tax, sometimes even on maintenance alone, would result in an entirely impassable roadway. He overlooks the fact, that the heaviest tax he has to pay, which never shows up in his tax notice is the "Poor Road Tax" which however takes its heavy toll in depreciation of implements, waggons, cars and more especially in loss of valuable time. Perhaps a main road assessment could be worked out, similar to drainage assessments, taxing the direct benefits.

*Read before Saskatchewan Branch, E.I.C., December 12th.

This might overcome some of the objections. Amongst others a wheel tax has been suggested, which would most adequately distribute the expense.

I found an instance, where a municipality intends to try and set aside annually a certain sum for the development of their market roads. But there again the divisional method of road supervision has its great disadvantages. Perhaps a contemplated market road is situated right on the boundary between two divisions, and one councillor fails to understand why he should spend some of his appropriation on a road used by rate payers living in another division. May I cite an example of this kind on the hand of a sketch.



The councillor in the west division did not want to incur the expense necessary in order to open up a new road through Section 36. The main road had to go to the north and was coming from the south, west of Section 25, but had to jog a mile east, before continuing to the north. The west councillor suggested to jog it east on the south side of Section 25, thence to carry it north, there being no river crossing provided. He reckoned, this would give him 1½ miles of mainroad less to build or maintain at the expense of the councillor to the east of him. His suggestion would have necessitated the crossing of a large slough, the cost of which alone was estimated at about $1,000, while the total expense in connection with opening up the new road through Section 36 was about $350 (including necessary right-of-way), besides giving topographically a road much superior to the other solution.

The municipality in question, like several others, adopted the form of road committee, in order to overcome the autocratic tendencies of some councillors and to consult with the individual councillor on road questions. That is, the reeve has the power to call upon any councillor to form a committee in each individual division to decide upon questions of policy and expenditures in connection with road work, the decision of which committee is binding upon the councillor.

A worse case even is the boundary between two municipalities, where often the settlers in one municipality can hardly reach the market town, if the market road is situated on the boundary between the two municipalities and is under the supervision of the other municipality, the ratepayers of which do not use it at all.

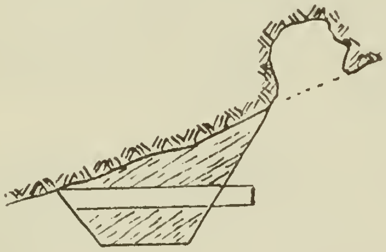
I pointed out already that unfortunately sometimes the councillor in deciding upon his road work is governed by anything but altruistic motives. I can however mention one instance where it was the custom of the councillor to call annually a meeting of his divisional ratepayers and let them decide on a road program, which he tried to execute to his best ability with the means at his disposition.

Let us turn now from mistakes in road policy in the present form of administration of rural roads to engineering errors made in this connection. H. R. Mackenzie very ably showed in a preceeding paper the necessity for engineering supervision in this connection. May I be permitted to add a few examples picked at random, even the work of a common road grading machine requires some knowledge and judgement, especially as to the necessary width of road. An instance came to my notice where a councillor personally operated the grader over several miles of mainroad, spending considerable time going up and down. Fortunately the road allowance is only 66 feet wide, so that his activity had to reach a limit. He made a regular boulevard without crown and in very poor shape, at double the expense necessary.

Running the grader continuously through cuts and over-fills, as it is sometimes done, creates a grave danger to the surface of the fill. The cut ditch is being continued unto the fill, instead of being turned off at the mouth of the cut. This means that the water, accumulated in the cut, is being drained right unto the fill. Mostly however the cut ditch is conspicuous through its absence, creating as much danger as in the former case.

Why should a councillor, who might be a very successful farmer, have to decide on engineering questions for which a special training is required. Naturally errors involving the loss of considerable money will often occur.

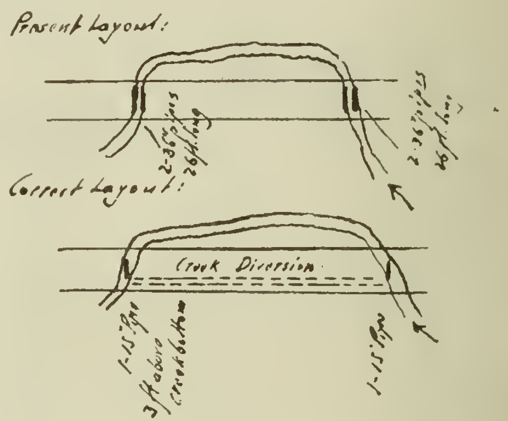
I would call your attention to sketch No. 2, depicting a section on a creek crossing east of Regina. The fill on the upper side was about ten feet, on the lower side about 18 feet. A 36″ pipe about 24 feet long was stuck through the fill as indicated. What happened last spring? Half of the fill washed out with the spring freshet and when inspected by the writer the damage to the road bed had been repaired, but a large hole had been created at the foot of the lower slope. A 36″ stream of water dropping about 8 feet has naturally some force. What remedy did the councillor suggest? He reckoned that by placing another 36″ pipe of the same length at the same elevation, he should be able to improve conditions. What would have happened? Two 36″ streams dropping without an apron straight down would have at least doubled the cavity at the lower end, besides still creating a considerable head of water in the spring. From information gathered I judged that about 45 sq. feet of area were required to carry the spring flow, while provision would have been made for only 14 sq. feet. Another washout with a likely damage to the pipes would have occurred and the hole at the bottom would have gained such dimensions, that the whole crossing might have had to be shifted. Fortunately I persuaded the councillor to desist from placing the additional pipe and after taking out the pipe he had in at present, we constructed a small wooden bridge, about 10 feet wide and 6 feet high, leaving enough room inside of this



structure for a permanent concrete culvert of the necessary water carrying capacity.

In my sketch No. 3 I show a piece of an east-west road allowance which a coulee crosses twice in about 600 feet. What had been the solution in this case? Two 36″ pipes had been placed at each crossing, necessitating an outlay of nearly 700 dollars. The whole piece of road allowance was low and had been filled about 4 feet high, the material being taken from the west end. What should have been done? The coulee should have been diverted and kept on the south side of the road allowance entirely. The proposed diversion would not have involved any additional expenditures, as the material from same would have made the adjacent fill. An objection was raised, that the water would have been shut off from the settler north of the road, who used his land for pasture. A remedy could have been easily provided by placing a 15″ pipe at the bottom end of the stream (Point A) and another 15″ pipe about 3 feet above the lower end (Point B), thereby creating a reservoir for the landowner and supplying him with more water, than he ever had before, as at the time of my inspection — about July — the creek was dry. The total expenditure for pipes in this connection should have been about 120 dollars, as against 700 dollars actually spent.

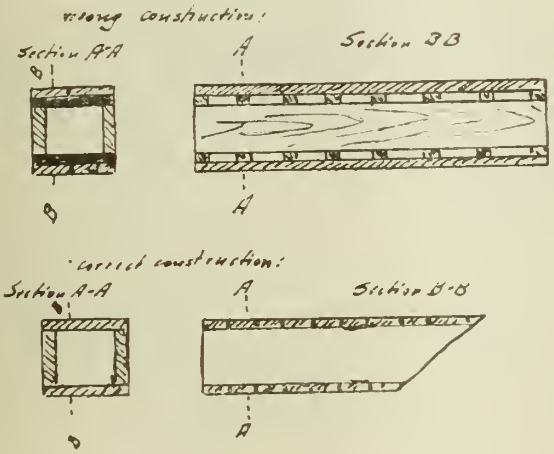
Time after time a councillor will insist on opening up a market road on the road allowance, where topography would only permit the construction of a fairly good pack trail. After spending considerable time and money on this impossible problem, it is eventually abandoned and a road diversion substituted. But on the other hand there are numerous instances, where the road should have been kept on the road allowance but a diversion made instead. The councillor seems to dread to have to build a grade through water, no matter how small a pool he encounters. The rate-payer's horseflesh is likely unwilling to tackle this moist problem. This consideration of having to do the work by day labor calls often for execution against all proper rules of earthwork construction. As already pointed out by me at out Saskatoon meeting: "As long as we do not abolish day-labor, as long we shall cause the taxpayer's money to be wasted without providing roads." A large number of municipalities are already doing contract work, though in most cases the work is laid out by the contractor himself and measured by the councillor with results far from correct and satsifactory.



Most sins are however committed in connection with bridges and culverts. It is nearly criminal how little consideration is paid to the required size of the opening. We find streams in which originally only a 12″ pipe was placed, because it might have happened to have been on hand. Let the next man take care of it is often the rule. In the spring after that a 48″ pipe was placed on top of it, the year after another large pipe was put in a couple of hundred feet away at a place over which the spring flow had gone, because as very often happens the fill at the bridge or culvert is considerably higher than the rest of the grade. Creek diversions or corrections are mostly unknown. No matter how little work is necessary to straighten a run so as to bring it at right angles to the road and save length of structure and damage to the fill, invariably the culvert or bridge are placed at an angle. Some of our roadbuilders got so used to this way of placing pipes or boxes, that I found several cases where pipes in sloughs had been placed at an angle without any reason whatsoever.

For structural errors let me call your attention to the simplest possible instance, the small wooden box, which you see on my sketch No. 4. The top is nearly always placed at right angles to the road. Taking a 12″ plank of 3″ stuff (the dimension which should be recommended for this class of work) a maximum width of only 6 inches can be obtained this way. Where an increased width was necessary, the roadbuilder tried to overcome the difficulty by nailing strips across the top. I looked at a newly built culvert placed about two weeks prior to my inspection. The same was already half full of earth coming in naturally through the large holes. The most natural solution would be to lay the top of bottom pieces parallel to the road, enabling the use of a span up to about 20 inches without any bottom support, besides meaning a considerable saving in maintenance. by having to renew only the few short pieces generally worn in the line of the rut.

But when it comes to larger culverts and bridges, it is certainly astonishing what structures a lay-mind will produce in this connection. Our Highwgy Department has prepared a set of standard plans, covering various



openings and though — especially their plan for wooden bridges — is not entirely above criticism, yet, if their standards were adhered to, some useful structures might result. The necessity for mudsills, the importance of obstructing the watercourse as little as possible, the fact that wood will not stick together by mere friction, the building of the structure with a view for easy inspection and maintenance are nearly always overlooked. I could cite numerous examples of not only faulty construction, but of actual waste of monies spent for this purpose by building culverts and bridges entirely unfit to serve their purpose and which will require a very early renewal, besides calling for continuous maintenance expenditures. Even the lack of expert inspection of bridges and culverts built in the past by the municipalities or the government will necessitate early renewals where a comparatively small sum spent at present might prolong the life of the structure considerably.

Several municipalities have experimented in the past with concrete structures. I found archculverts the generous dimensions of which would have made me think they were some old Cyclopean walls, if I had not been assured that they were built in our generation. One type of structure we should recommend however, which is more permanent, easily built and maintained if properly designed and constructed, that is culverts and small bridges with concrete abutments and timber deck, which concrete abutments should only be recommended when there is no sign of alkali in the soil. Any carpenter can make the necessary forms for the abutments. In the last few years this type of structure is gaining popularity, but again the layman makes gross errors, mainly putting in a centre supporting pier, when his stringers would have carried the entire length between abutments, bedding his wooden stringers solid in the concrete, keeping his abutments straight, never thinking of reinforcements, not providing enough foundation area, etc. I saw even concrete abutments resting on a pile of fairly large, but loose boulders over two feet high above the ground.

I could enlarge upon this subject *ad libitum*, but think it is time to summarize some of my statements.

Firstly: The executive organization of our rural municipalities especially as far as the road planning, construction and maintenance are concerned should be placed on a more permanent basis. It should further be more centralized than the divisional work is at present. The rural municipality is a small enough unit!

Secondly: Road engineering is a recognized branch of our great profession, requiring considerable training and education. Why let the ratepayer's money be wasted by amateur attempts at road-building. Make it independent of local petty politics and put it in the hands of an engineer Many councillors in rural municipalities agree with the engineer most heartily in this respect.

Thirdly: Make the position of reeve and councillor more attractive, especially in reimbursing them more adequately for the time spent on their public duties, of which the superintendence of the road-work, as at present, is the most strenuous. You will receive more cheerful attention and less resignations.

Fourthly: Abolish the entirely unsatisfactory day-labor system by substituting contract work

In conclusion I might state, that it was my aim in this paper to show the fallacy of our present system in letting the rural councils, with their continuous change in policy and composed mostly of lay men in our profession, handle the important problem of providing rural roads. I hope that our road-committee and more especially our representative on the road-committee of western branches of our *Institute* will work out some organization in this respect to be embodied in our Highway Act.

If my modest contribution has furnished even one of the small pebbles of the future foundation of this structure, I shall be more than satisfied with my work in this connection.

Doubly Reinforced Beams

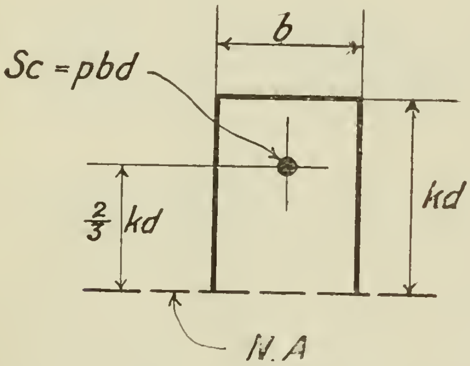
By E. G. W. Montgomery, A.M.E.I.C., Saskatchewan Branch.

There is at present no simple method of analysis by which the requisite section of a doubly reinforced concrete beam can be determined, and it has occurred to the writer that a method used by him might prove of use to others.

If the position of the centre of compression in a concrete section, having compression reinforcement, be known, the analysis of such a section is simple. The obvious thing therefore is to know where the centre of compression falls.

The figure shows the compression area of a beam having steel in compression. If the centre of gravity of the steel be placed at $\frac{2}{3}$ kd above the neutral axis, the centre of compression will also lie at that height. For the height of the Centre of Compression above the N.A. =

$$\frac{\frac{b\,(kd)^3}{3} + nSc\,\frac{(2\,kd)^2}{3}}{\frac{b\,(kd)^2}{2} + nSc\,\frac{(2\,kd)}{3}} = \frac{2}{3}\,kd$$



By thus placing the compression steel, the length of the couple arm is the same as for beams with single reinforcement, and the percentages of compression and tension reinforcement are easily determined for any given working stresses.

Consider stresses of 600 and 15,000 with n = 15.

$$\frac{\text{Ht. of section above N.A.}}{\text{Depth of section below N.A.}} = \frac{nfc}{fs} = \frac{600 \times 15}{15{,}000} = \frac{3}{5}$$

$$\frac{\text{Distance of compression steel from N.A.}}{\text{Distance of tension steel from N.A.}} = \frac{2}{5}$$

$\therefore \frac{Sc}{S_{tl}} = \frac{2}{5}$; S_{tl} being the excess steel in tension required to balance the steel in compression.

The percentage value of St (ordinary tension reinforcement) required for the given stresses =

$$\frac{kfc}{2fs} = \frac{3}{8} \times \frac{600}{30000} = .0075$$

and the total tension reinforcement required viz.,

$$S_T = St + S_{tl}$$

If now any percentage value, say, .0075, be assigned to Sc then

$S_{tl}\ \% = \frac{2}{5}\,Sc\% = .003\%$; and $S_T\% = (.0075 + .003)\% = .0105\%$.

It is known, and will appear from a preceding result, that, $k = \frac{3}{8}$ and $\therefore\ j = \frac{7}{8}$, and as this completes all the data required,

$$\text{B.M.} = S_T \times 15000 \times j\,d = .0105\,bd \times 15000 \times \frac{7}{8}\,d$$

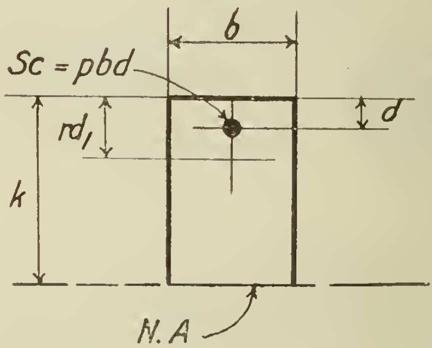
$$\therefore d = 0.0852\sqrt{\frac{\text{B.M.}}{b}}$$

This determines the concrete section and the areas of tension and compression steel required are obtained from percentages above stated.

The reader will notice that the values for k, j, and St are the same as for beams having tension reinforcement only; while the value for S_T varies with the choice of a value for Sc as does the equation to d. It is therefore, a matter of current practice as to what percentage value shall be assigned to Sc and therefore as to what the equation to d shall be. The writer's purpose is only to show how simply, percentage values and an equation to d (or b) can be obtained, for any assigned stresses.

It might be urged against this method that it sets the compression steel too low in the section and is therefore extravagant. Such an objection would be debatable, but it can be met by showing that the centre of compression can be set at any point in a section and percentage values and an equation to d be derived therefor.

The figure shows the compression area of a beam containing steel.



If k denotes the depth of concrete in compression, and the modular ratio is assumed to be 15, and if rd_1 = depth to centre of compression, it can be shown that $k^2 = \frac{k - d_1}{k - 3rd_1} \times 90\,pd \times (rd_1 - d_1)$. Then if $d_1 = \frac{1}{4}\,k$ and $rd_1 = \frac{5}{16}\,k$, $k^2 = \frac{k\,(1-\frac{1}{4})}{k\,(1-\frac{15}{16})} \times 90\,pd \times \frac{k}{16}$ $\therefore\ k = \frac{135\,pd}{2}$

For any given stresses k (the usual kd) is known in terms of d. Thus for stresses of 600 and 15000 in concrete and steel respectively $k = \frac{3}{8}\,d\ \therefore\ \frac{3}{8}\,d = \frac{135\,pd}{2}$

$\therefore$ p (percentage value of Sc) = .0055; like value for $S_{tl} = \frac{3}{4} \times \frac{3}{5} \times .0055 = .0025$ $\therefore$ percentage value for $S_T = .0075 + .0025 = .01$.

$$j = \left(1 - \frac{5}{16} \times \frac{3}{8}\right) = .883 \text{ and } d = .0869\sqrt{\frac{\text{B.M.}}{b}}$$

In conclusion it might be said that doubly reinforced T beams can be as simply analysed as rectangular beams.

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

VOL. II. JANUARY 1919 No. 1

Nineteen Hundred and Nineteen opens a new year on the calendar, a new epoch in the history of the world and a new hope in the hearts of mankind. In this new era towards which we look forward with confidence, let us resolve that as members of a great profession, we will do all in our power to bring the profession to its rightful exalted position.

May the members of this Institute enjoy during the coming year, a period of blessing greater than any in the past, with health, happiness and prosperity in full measure.

Annual General Meeting

Remember the dates of the Annual General Meeting and the General Professional Meeting. On January 28th, the Annual Meeting will be held in Montreal, at which time auditors will be appointed and scrutineers named to count the ballots, after which adjournment will take place to meet at the Chateau Laurier, Ottawa, on February 11th. The General Professional Meeting will continue February 12th and 13th.

Canada's Need

Under the above heading, Julian C. Smith, M.E.I.C., member of Council, whose established position places him in a position of authority, has written a symposium of the situation in Canada in relation to requirements for the future. After speaking of the heavy debt, he outlines what it is desirable to accomplish, as follows:—

1. We desire that all the industries of this country as nearly as may be, shall operate successfully, and that all workers in Canada shall have work to do, and proper recompense therefor.

2. We desire to accomplish the first item without increasing the burden of our own country, and passing along a greater debt to our successors.

3. In order to accomplish the two conditions above, we desire that the taxation levied by the Dominion, Provincial and Municipal Governments shall be kept to the minimum requirements, and yet shall be sufficient so that proper sinking funds may be established to the end that within a reasonable time the debts which have accrued may be substantially reduced.

4. The above points all resolve themselves into the problem of increasing the available wealth of this country as rapidly as possible.

Following a discussion of the question of increasing wealth by economy, he states that the most important increase of wealth is by means of agriculture which should be increased in every way possible. Mining also should be developed with a view to encouraging the production of minerals so that the burden of mining companies may be kept within reasonable bounds.

This would lead to an increase of the export and the sale of mineral products. The policy should be pursued and the encouragement of such industries as that of paper and pulp and the development of water power. In connection with this important matter Mr. Smith says:

Canada is fortunate in possessing a large number of valuable waterpowers. It is unfortunate in possessing apparently a large number of people who are anxious to prevent the development of these waterpowers.

Although in the muck-raking literature of the last ten years, the development of waterpowers has come in for an undue share of attention, few people realize that after all some 90 per cent of the total amount of power utilized on the continent of North America is developed from coal by means of steam plants, and that only about 10 per cent is developed from waterpower.

This overwhelming use of steam power, as against waterpower, is due altogether to the economic reason that it was cheaper to put in the steam plants and operate them, than to develop waterpowers under the conditions surrounding the development of these waterpowers.

Waterpowers have important uses. The principal economic use of waterpowers to-day is to serve these industrial purposes where the load is practically continuous. Such loads include the grinding of wood pulp, the operation of large industrial plants which operate continuously, and principally the operation of electric furnaces where, combined with the continuous use of power, is to be had a further advantage in the high temperature of the electric arc.

Canada is similar to some other northern countries, such as Norway, in having waterpowers. The coal which Canada possesses is limited and located in the extreme East and West of the country, so that the expense of getting the coal is now, and probably will be higher than in countries like England and the United States. It is therefore essential that the waterpowers be utilized to the maximum extent possible, so as to decrease the amount of coal which is purchased from abroad. By using one of our own resources instead of buying the material outside the country, a distinct economic gain accrues, always provided that the expenditure for the waterpower itself, the method of development etc., are undertaken and carried through in such a fashion that there really be a saving by its operation.

The total amount of energy used for lighting purposes, and for the small user, that is the home user or the minor factory, does not exceed 25 per cent of the total energy developed for electric power purposes. The other 75 per cent is used for industrial purposes by a relatively small number of consumers, namely — the capitalists who have been held in such scorn.

The Dominion of Canada, and particularly the Province of Quebec, has a great opportunity in the next few years of establishing a vast series of waterpower developments. Such developments will lead to the investment of large amounts of money, the employment of many men during the construction period, and the establishment of huge industries to use the electric power when developed.

With the creation of these industries will come the ability to export from this country the products made with electric power; and we will thus be turning into money natural resources which are now being wasted, and bringing that money back into this country to add to our wealth.

From this brief summary of the conditions which are going to face us, it seems obvious that those natural resources which exist in this country should not be kept for our distant successors. We will find the natural conditions such, that however great may be our haste, the development of our resources must take much time, so that we need not worry over their too rapid exhaustions.

We have in Canada the best sources of wealth in the shipping of our agricultural products, our mining products, and the possibility of obtaining products from our waterpowers. We are rich in potential things, and we must convert these potentialities into actualities. A policy of expansion and development of such resources must be carried out, and it must be recognized that in order to carry out such a policy, the promoters of the desired enterprises must be granted proper compensation for their efforts. The cry for conservation of our resources which one has heard so much for the last few years, should be toned down, until it means for the greatest benefit of Canada, an immediate development of all of our available resources so that we can become more powerful, more wealthy and pay the debts we have incurred.

Canada's Maps Catalogued

Engineers will learn with interest that a catalogue of maps has been published by the Geographic Board of Canada by which it is possible to tell at a glance whether a certain area of the Dominion has been mapped, what the maps of this area are and by whom published.

A map is the representation of surveys; usually, it originates in a survey department. The survey may be an elaborate topographical survey or a more or less superficial one; hence there are maps of many different kinds.

In Great Britain, a detailed topographical survey of the whole country has been executed by one organization, the Ordnance Survey. The results are published in a few series of maps, each series on a suitable scale. It is a simple matter to select any sheets of a series that may be required for any particular purpose; these sheets give all the information that can be looked for in a topographical map, and so there is no need to search elsewhere for anything better. The same work is carried out in France by the Service Géographique de l'Armée, an organization corresponding to the Ordnance Survey of Great Britain. Italy, Austria, Germany and other European countries have similar organizations and publish regular series of topographical maps.

A small beginning has been made in Canada but only a few topographical sheets have been issued and they include but a very small portion of the Dominion. With this exception, the maps available, where there are any, are more or less rudimentary. For the outlying regions, rough exploratory maps are the only ones in existence.

Many government organizations are engaged in mapping. The federal services who are executing surveys for that purpose are the Geological Survey, the Topographical Surveys (Surveyor General's), the Hydrographic Survey and the Military Survey. The Geological Survey has the greatest number of maps to its credit; our knowledge of the geography of the outlying portions of the Dominion is almost entirely due to its explorers. The Surveyor General comes next; the sectional maps issued by his office cover the western provinces with the exception of British Columbia, and his publications include many topographical and other maps. Charts of the sea coasts and inland navigable waters are issued by the Hydrographer. The Military Survey is a topographical survey; some sheets in Ontario and Quebec have been completed.

The lands and mines departments of the several provinces are also making surveys and issuing maps The British Admiralty, the U.S. Coast and Geodetic Survey, the U.S. Hydrographic Office, the U.S. Lake Survey, the

French Service Hydrographique, are publishing charts which include parts of Canada. Other maps of Canada are found in the bulletins or journals of geographical societies and in books of travel and exploration.

After their publication by the survey organizations, the maps are frequently copied, re-arranged, compiled, or put in a different shape, by other services or editors of geographical publications. Some of these compilations may be the work of persons unskilled in surveying and may actually be misleading.

Among such a multiplicity of maps and variety of origin, it was somewhat difficult for anyone but an expert to ascertain what maps of any particular region or locality had been published, and where they could be obtained. This difficulty is removed by the "Catalogue of the Maps in the Collection of the Geographic Board."

The nature of the work of the Geographic Board requires as large and comprehensive a collection of maps of Canada as can be obtained. The collection, which on the 1st January, 1918, consisted of 1258 maps, may be considered as fairly complete. With few exceptions, it includes all the important maps issued during the last fifty years and many earlier ones. Generally, plans on a scale greater than one mile to the inch have been left out but a few were included for special reasons.

A graphical index of eleven sheets accompanies the list of maps. The outlines of each map are shown in blue on the index sheet, the catalogue number of the map being inserted in the upper right hand corner.

The catalogue is divided into five parts, the first one, "Dominion," containing all maps of more than 400 miles in length or breadth; these are shown on sheet No. 1 of the index. The other parts are Maritime Provinces,— Quebec, Ontario, Manitoba, Saskatchewan, Alberta and the Northwest Territories,— British Columbia and Yukon. Any map less than 400 miles in extent is outlined on the index sheet, or one of the index sheets of the province in which the greater part of the map lies; generally it is not shown on the sheet of the adjoining province.

Copies of the Catalogue can be obtained from the Secretary of the Geographic Board of Canada, Royal Bank Building, Ottawa.

New Certificates

Many corporate members who have been elected within the past nine months have been wondering why they have not received their certificates of membership. The delay has been due to the fact that a new certificate has been under consideration and was given final approval at the meeting of Council on December 17th. It is intended that the certificates will be prepared as soon as possible and forwarded to those who have been elected since the change of the name has been effected.

A number of inquiries have been received regarding changing the old certificate, and this question will rest entirely with the members. All who desire, may receive one of the new certificates by paying the regular rate.

Institute Fraternity

On December 4th, a letter was forwarded by the Council of *The Institute* to the Council of the American Society of Civil Engineers, which is reproduced below and a similar letter to the Councils of the American Institute of Electrical Engineers, American Institute of Mining Engineers and the Institution of Civil Engineers of Great Britain. As the American Society of Mechanical Engineers was holding its Annual Meeting at that time, a telegram of good will was forwarded which was read at one of the sessions and received with enthusiasm. The letters in question were as follows:

Gentlemen:—

Taking advantage of the occasion offered by the signing of the armistice terms imposed by the Allies and the United States, we desire to extend to the Council and Members of the American Society of Civil Engineers, our cordial greetings of felicitation and good will.

It is with unusual satisfaction that we find ourselves banded together in having helped to achieve a common purpose. Members of our respective organizations have played no small part in the world events, which, we believe, should lead to a greater recognition of the part the engineer plays in the world's development.

Assuring you of our highest regard and cordial good will and expressing the hope that in our common aim to work for the elevation of the engineering profession we may be drawn closer together in our mutual endeavours.

On behalf of the Council of
The Engineering Institute of Canada,
Yours faithfully,
FRASER S. KEITH,
Secretary.

Replies to this letter show how cordial is the feeling which exists between ourselves and our sister engineering societies in the United States. Quite recently the question has come up of closer co-operation between the two branches of the American societies, which have been established in Canada and ourselves, leading to affiliation or amalgamation, which has been discussed but as there is nothing in our By-Laws which will enable us to admit corporate members, except inasmuch as the individual is qualified, it is not possible to adopt such a procedure. In the new By-Laws the Branches have power to establish sections representing the main divisions of engineering and through these sections a member interested in any particular line may receive the greatest benefit. The suggestion has been received that members of other engineering societies in good standing be admitted with a lower entrance fee.

The Presidents and Secretaries of all our sister societies have been invited to attend our Annual General Meeting and it is expected that several will accept the invitation. Already the President of the American Institute of Electrical Engineers, Comfort A. Adams, has intimated that he will be in attendance, and also Alfred D. Flinn, Secretary of the Engineering Council. The attendance of men prominent in other societies will give an opportunity of discussing matters of mutual interest.

The following letter has been received from the Secretary of the American Institute of Electrical Engineers:

Dear Sir:—

Your communication of December 4th was presented to the Board of Directors of this *Institute* at a meeting held in Philadelphia, December 13th.

The Board directed me to convey to you its sincere appreciation of the sentiments expressed in your letter, which are heartily reciprocated, and to advise you that this Institute is in full accord with your organization in the belief that the coming economic, social, and technical developments impose obligations upon and afford opportunities to the engineering profession which demand the close co-operation of all engineering societies.

This Institute will be glad at all times to work with your organization of our brother engineers in Canada in the interests of the entire profession.

Very truly yours,
F. L. HUTCHINSON, Secretary.
American Institute of Electrical Engineers.

Branches Memorialize Government

On December 18th a deputation representing the Ottawa, Hamilton and Toronto Branches, in all fifteen members of *The Institute*, presented a memorial to the Honourable the Provincial Secretary of Ontario, which included the recommendations made by the Committee on Sewage Disposal of the Toronto Branch consisting of Professor Peter Gillespie, Fred A. Dallyn, William R. Worthington, Irving H. Nevitt and Willis Chipman. The report forwarded by the chairman of the Committee, Willis Chipman, to Geo. Hogarth, Secretary of the Toronto Branch, and which constituted the memorial to the Provincial Secretary, is as follows:

Dear Sir:—

The committee appointed by the Toronto Branch re Sewage Disposal has held five meetings since September last, at which many questions connected with Sewage Disposal were discussed and considered, and at a final meeting held on the 14th instant, it was decided to submit the following recommendations to the Branch for submission to the Parent Institute:—

1. That the Provincial Public Health Acts of the different provinces should provide that two or more members of each Provincial Board of Health shall be engineers and corporate members of *The Engineering Institute of Canada.*

2. That the Provincial Public Health Acts should provide that all reports, plans, etc., respecting schemes for sanitation and sewage disposal required to be filed by Provincial authorities, shall be prepared, signed and submitted by an engineer, a corporate member of *The Engineering Institute of Canada.*

3. That Dominion Legislation should be enacted respecting the pollution of International and Inter-Provincial Waters, and that Provincial Legislation in the different Provinces respecting stream pollution be made uniform as far as practicable.

4. That the Public Health Acts of each Province should give to the Provincial Boards of Health some measure of control over the operation of municipal water purification plants and sewage disposal works.

5. That all Provincial Public Health Acts should stipulate that no municipality can submit to the votes of the electors any by-law providing for the raising of money for the construction, alteration or extension of any water works system or water purification works, or of any sewage system or sewage disposal works, without having had the approval of the Provincial Board of Health, based on plans, reports and designs submitted by engineers.

6. That the keeping of accurate and up-to-date records of all extensions and services added to sewer and waterworks systems, should be required of municipalities by the Provincial Board of Health. Where municipalities have no system of their own for keeping such records the adoption of a method endorsed by the Provincial Board might be insisted upon.

7. That where Provincial Boards of Health maintain laboratories for the investigation of problems in public sanitation, such laboratories might, under reasonable conditions, and with much advantage to the country, the engineering profession and the Boards themselves, be placed at the disposal of this *Institute* and through it, of its members who have problems in municipal sanitation for which they desire solutions

The Provincial Secretary promised full consideration by his colleagues of the memorial as presented by the Ontario Branches. The action of the Branches in this connection is worthy of the highest praise as it is by such public spirited action that a better appreciation of the profession is to be obtained.

Salaries of Engineers

Correspondence on this subject, published in this and previous issues of *The Journal*, shows how acute is the feeling respecting remuneration being received by engineers, particularly those employed in the Government service. In many cases salaries received by men doing responsible engineering work have been distressingly low, so much so in some cases, as to be an affront to the profession.

For many years members of our profession, of whom C. E. W. Dodwell, M.E.I.C., of Halifax, is noteworthy, have made earnest efforts to the end that engineers in the Government service should receive recognition as such, and not as clerks, the accomplishment of which would not only give a standing to the engineer in his technical capacity, but would also increase his monetary reward. A number of years ago a bill was submitted to the then Prime Minister, Sir Wilfrid Laurier, by a committee of this organization, and the promises made at that time led members of *The Institute* to believe that an Act would be passed placing engineers in the Government employment on a proper basis. Shortly after, the Government experienced difficulties and went out of power. In 1917 the question was revived and a strong committee of men in the civil service was appointed to go into the subject thoroughly and make recommendations which would raise the standard of the engineer in the civil service. At that time the hearty co-operation of Council was promised and given. However a change made by the Government in appointing a Civil Service Commission, designed to remove all appointments from the realm of politics, has presented a further opportunity for the engineer to receive recognition. A strong committee of the Council has been appointed, consisting of W. F. Tye, chairman, President H. H. Vaughan and President-elect, Lieut.-Col. R. W. Leonard, to represent *The Institute* in securing more adequate recognition and remuneration from the Government for engineers. This committee has made an appointment with the Civil Service Commission, at which time its members will, no doubt, prove to the Commission that the standard of reward for the technical men in the Government service should be raised by a very considerable amount. In meeting the representatives of *The Institute* the Commission has shown a willingness to be educated in this connection, and the education they will receive from the committee will work to the advantage of every engineer employed in the Government.

In the reclassification that will take place shortly it is expected that a very substantial increase will be accorded to engineers in the Civil Service.

Legislation Situation

Nearly every branch of *The Institute* has had this important subject under discussion during the past two months. A résumé of the situation throughout Canada from the viewpoints of the various branches will be published in the Februaıy issue of *The Journal.*

Programme of Meetings

At the time of going to press a complete programme of the Annual Meeting and the General Professional Meeting is not available. Below is published a tentative programme for Tuesday, Wednesday, and Thursday, February 11th, 12th and 13th, forwarded by the Secretary of the Professional Meeting Committee, G. Blanchard Dodge, M.E.I.C.

Tuesday

Morning, 10 a.m.	President Vaughan, presiding. Business session.
Luncheon and Addresses	His Excellency, the Duke of Devonshire, Hon. M.E.I.C. C. A. Adams, President, A. I.E.E. A. D. Flinn, Secretary, United Engineering Council on International Engineering Affiliation.
Afternoon, 4 p.m.	Business session. President's Address (invitations)
Evening	Informal dinner and smoker.

Wednesday

Morning	Unfinished business of annual meeting (if any). " Standards in Engineering," by Capt. R. J. Durley, M.E.I.C. "Soldiers Re-establishment," by Major Anthes. "The Development and Future of Aviation in Canada," by M. R. Riddell, Chief Engineer, Canadian Aeroplanes Ltd.
Luncheon and Address	Dr. Ira N. Hollis, representing American Society of Mechanical Engineers.
Afternoon	National Highways and Good Roads, by J. Duchastel, M.E.I.C. Hon. President, Canadian Good Roads Association. Frazil, by R. N. Wilson, M.E.I.C. Chief Engineer, Montreal Light, Heat & Power Company, Ltd. Standard Datum Planes in Canada, by W. Bell Dawson, M.E.I.C., Supt. of Tidal Survey, Department of Naval Service.
Evening	Formal gathering. Reception by President: Ladies, Music, Refreshments, Dancing.

Thursday

Morning	(1) Topical discussion on the Economics of Railway Electrification, opened by John Murphy, M.E.I.C., Dept. of Railways and Canals, and Railway Commission. (2) Mining and Metallurgy of Cobalt Silver Ore, by Lt.-Col. R. W. Leonard, M.E.I.C. President, Coniagas Mines.
Luncheon and short address	by Hon. F. B. Carvell, Minister of Public Works, to be followed by a visit to the New Parliament Buildings, Ladies.
4.30 p.m.	Motion Pictures, by B. E. Norrish, A.M.E.I.C.

Luncheon—Tuesday 11.00 - 1.00 p.m., at Chateau Laurier. Complimentary tickets to visiting members.

Informal Dinner and Smoker—
Tickets $2.50, to be obtained on registering.

Luncheon—Wednesday and Thursday, Feb. 12th and 13th, 1.00 p.m., at Chateau Laurier. Tickets $1.00 to be obtained on registering.

In connection with the arrangements for hotel accommodation which may constitute somewhat of a problem, visiting members are earnestly requested to make their own arrangements, concerning which mention was made in the December Journal. If when arranging for reservations a copy of the letter is also forwarded to G. Blanchard Dodge, M.E.I.C., Topographical Surveys, Department of the Interior, Ottawa, the Reception Committee will assist in securing reservations.

REPORT OF COUNCIL MEETINGS

Special Meeting

A special meeting of the Council was held at headquarters on Tuesday evening, December 3rd, at 8.15 P.M., at the call of the President, to discuss an urgent request received from the Saskatchewan Branch, that approval be given for the submission of an Act to the Saskatchewan Legislature, immediately.

The Secretary presented a draft just received from the Saskatchewan Branch which was presumed to be similar to the one submitted by Council to the Branch. It was found, however, to contain radical points of difference.

The minutes of the meeting of a special committee of *The Institute* and the Canadian Mining Institute were read, in which it was pointed out that as far as the draft Act regarding legislation published in the November issue of *The Journal* was concerned, it did not contain any points that could be classed as objectionable by the Mining Institute, from the viewpoint of working to the disadvantage of its members. This meeting further recommended that legislation should have the careful consideration and approval of the majority of the Canadian engineers before being enacted. The members of the Mining Institute would recommend to their Council that legislation be opposed until it had more mature consideration but that the Mining Institute would co-operate with *The Engineering Institute* towards securing legislation.

After general discussion it was decided that Council had no power to authorize the Saskatchewan Branch to proceed to secure legislation, as such an important matter should be laid before the entire membership. The Secretary was instructed to send a nightlettergram to the Saskatchewan Branch as follows:—

> " At a special meeting of Council held at your request I was instructed to advise the Saskatchewan Branch that it does not lie within the power of the Council to approve an act for submission to a legislature without the mandate of the membership at large. My communication of October second was intended to convey to your Branch that Council

is sympathetic towards the endeavours of your Branch to draft suitable legislation and would assist in framing and submitting a suitable Act for the consideration of the membership. The action of other Branches in submitting to the Council drafts of proposed Acts and discussion of the general question subsequent to the submission of your first draft, strengthen the feeling of Council that action should be deferred until all the Branches have had an opportunity of expressing their views."

Regular Monthly Meeting

The regular monthly meeting of the Council was held at headquarters on Tuesday, December 17th, at 8.15 P.M.

When the minutes of the previous meeting had been approved the report of the Executive Committee was presented and their recommendations approved as follows:

Co-operation for National Reconstruction: It was decided, in view of the letters received from the Toronto and Ottawa Branches, that meetings be held by all the Branches to obtain expression of opinions and suggestions from Branch members in regard to the co-operation of *The Institute* for national reconstruction.

Legislation: Correspondence from various Branches, giving their opinions regarding legislation was noted, it being intended, when the view points of all the Branches are received to publish same in *The Journal.*

Co-operation with the Canadian Branches of the A.I.E.E. and the A.S.M.E.: A letter was received from Professor Peter Gillespie of Toronto, suggesting co-operation with the American Institute of Electrical Engineers and the American Society of Mechanical Engineers. A lengthy discussion took place and it was decided that there was no way in which the Toronto Branch of the American Institute of Electrical Engineers or the Ontario Branch of the American Society of Mechanical Engineers could be affiliated. A committee, consisting of Walter J. Francis, Julian C. Smith, President H. H. Vaughan and the Secretary was appointed to meet Mr. Alfred D. Flinn, when in Ottawa in attendance at the Annual General Meeting, to discuss the question of *The Institute* joining the Engineering Council, at which time the question of branches in Canada of the United States societies could be discussed. The Secretary was instructed to communicate with Mr. Flinn in this connection.

Annual General Meeting: The following replies to invitations to attend the Annual General Meeting were presented; C. A. Adams, President, American Institute of Electrical Engineers, F. L. Hutchinson, Secretary, American Institute of Electrical Engineers, Bradley Stoughton, Secretary, American Institute of Mining Engineers, A. D. Gresham, for President, American Institute of Mining Engineers, D. B. Dowling, President, Canadian Mining Institute, H. Mortimer-Lamb, Secretary, Canadian Mining Institute, C. T. Main, President, American Society of Mechanical Engineers.

Annual Meeting, A.S.M.E.: Note was made of the telegram sent to the American Society of Mechanical Engineers on the occasion of their Annual Meeting as follows: " The President and Council of *The Engineering Institute of Canada* extend to the Council and members of the American Society of Mechanical Engineers cordial good wishes for the success of your Annual Meeting and express the hope that with the close of the world war we may be drawn in closer co-operation in our mutual endeavours for the welfare of the profession" and of the cordial reply received from Secretary Rice.

Joint Committee of Technical Organizations: The consideration of Council was asked in connection with a suggestion received, that the Joint Committee of Technical Organizations was not worthy of further support or recognition. It was resolved that the principle of scattering the energies of the members of the branches was detrimental to their strength, and, consequently, further recognition or support of the Joint Committee of Technical Organizations was withdrawn. The Secretary was instructed to so advise the branches.

Professional Meeting, Ottawa: The minutes of a meeting of the Special Professional Meeting Committee of the Ottawa Branch were received and noted.

Resolution of the Quebec Branch: A resolution received from the Quebec Branch regarding representation of the engineering profession on commissions was received and a copy passed on to Mr. Tye, chairman of a special committee appointed to look into and recommend regarding the Civil Service Commission.

New Certificates: Approval was given to the revised certificate which had been previously submitted to Council and in which Council desired a slight alteration. It was further confirmed that the title of the certificate be the form used on the official stationery of *The Institute,* and the Secretary was instructed to publish a cut of the certificate in *The Journal* and have new certificates prepared, the Committee to choose the paper upon which they shall be printed. As to new certificates, it was decided that they should be issued to any members who desired them.

Journal Postal Privileges: It was decided, in view of a report made by the Secretary in regard to his interview with the Post Office authorities, including Dr. R. M. Coulter, Deputy Post Master General, that a letter be sent to the members of *The Institute* requesting subscriptions to *The Journal.* The President and the Secretary were appointed a Committee to draft the letter.

Branch By-Laws: The By-Laws drawn up by the Special Committee of the Council and a Committee of the Montreal Branch, were submitted and the Secretary was instructed to send a copy to each Branch for discussion and approval.

Co-operation re Civic Development: A letter from Frederick Wright, Editor of the Canadian Municipal Journal, asking the co-operation of *The Institute* in a movement for civic development, was submitted. Full approval was given to the proposal and the Secretary was instructed to advise Mr. Wright that the Council would be pleased to appoint delegates to attend the suggested meeting.

Classifications: Classifications were made for a ballot returnable January 21st, 1919.

A ballot was canvassed and the following elections and transfers effected:—

Members

Angus Daniel Campbell, B.A.Sc., M.E. of Cobalt, Ont. Since 1911 mining engineer of the O'Brien Mine. George James Jeffrey, of Vancouver, B. C. (Since deceased). William Frederick McLaren, M.E., of Hamilton, Ont. With the Westinghouse Company since 1901 and since 1905 chief draftsman with the Canadian Westinghouse Company. Mr. McLaren has seen active service at the front, being a Captain in the 164th Batt. C.E.F., during 1916 and 1917. Walter Taylor Moodie, of Winnipeg, Man. With the Canadian Northern Railway since 1908. At the present time district engineer. Harold Allison Russell, of Dartmouth, N.S. Member of the contracting firm Russell & McAulay. James Alfred Stairs, of Wayne, Mich. General superintendent, ordnance department, Harroun Motors Corporation, Wayne, Mich.

Associate Members

Kenneth Carling Berney, B.Sc., of Hamilton, Ont. Electrical engineer for Canadian Westinghouse Company since 1909. Joseph George Cameron, B.Sc., of Finch, Ont. Since 1917 County roads superintendent and engineer for the Counties of Stormont, Dundas and Glengarry. Walter Francis John Cosser, of Schumacher, Ont. At the present time mechanical superintendent in charge of plant for the McIntyre Porcupine Mines. James Simpson Galletly, B.A.Sc., of Oshawa, Ont. Since 1912 in charge of parties on Dominion Land Surveys. Harvey Wilfred Harris, B.Sc.. of Winnipeg, Man. Engineer for Thomas Kelly & Sons, general contractors, of Winnipeg, since 1916. Frederick Innes Ker, B.Sc., of Montreal. Since 1912 chief engineer and general superintendent, Cook Construction Company. Albert Ernest Kerr, B.A.Sc., of Hamilton, Ont. Electrical draftsman, Steel Company of Canada, in complete charge of electrical drafting. Albert Levvy, of Winnipeg, Man. Managing Director of the Levvy Electrical Company, Limited, Winnipeg. Donald Lewis, of New Glasgow, N.S. Since 1915 with the Nova Scotia Steel & Coal Company. Since 1917 has occupied the position of chief draftsman. Edwin Markham, B.C.E., of Regina, Sask. Assistant to Stewart Young, district surveyor, Highways Department, Saskatchewan. Emerson Hibbert Morse, of Norwood, Winnipeg, Man. Draftsman with the G.T.P.Ry., Winnipeg. Christopher Anthony Newton, of Magnolia, Maryland. At the present time progress and resident engineer on construction of water works for the United States Government chlorine plant, Edgewood Arsenal, Maryland. Roland Foster Palmer, of Winnipeg, Man. Member of the firm of Palmer & Hobson. Francis William Bertram Scholefield, of Winnipeg, Man. With the J. McDiarmid Company Limited, general contractors, as chief engineer. William James Stuart, of Vancouver, B.C. At the present time on active service as lieutenant with the Third Field Company, Royal Engineers. Before enlisting he was resident engineer on construction of permanent pavements and roadways, Vancouver. Isaac Joseph Tait, of Montreal. Associated with J. T. Farmer since 1917. Previous to this he was chief engineer in charge of mechanical equipment for the C.P.R.

Associates

William McNeill, of Vancouver, B. C. Since 1908 assistant general manager of the Western Canada Power Company. Gerald Steele Roxburgh, B.A.Sc., of Winnipeg, Man. Since 1905 with Fetherstonhaugh & Company as Western manager, headquarters, Winnipeg.

Juniors

Henry Donald Holland, B.Sc., of Montreal, superintendent of construction for M. J. Stack, contractor. Thomas Earl Gordon Sissons, of Montreal. Engineer on construction for the Abitibi Power & Paper Company, Iroquois Falls, Ont. Hercules Smart, of Ottawa, Ont. American Gauge Production representative, Imperial Ministry of Munitions. Albert William Swan, B.A.Sc., of Sherbrooke, Que. Has been in the production department of Canadian Ingersoll-Rand Limited, Sherbrooke, on time-study and kindred work from May 1917 till March 1918, since then he has been in charge of preparation of all technical publicity for the company.

Transferred from the Class of Associate Member to Member

William Harvey Carson, C.E., of Ottawa, Ont. Since 1913 district engineer for the Province of Ontario, Department of Marine, Ottawa. Claude Vernon Johnson, of Quebec, Que. Since 1914 engineer in charge of construction and engineering for Joseph Gosselin Limited, General Contractors & Engineers. George Douglas Mackie, of Moose Jaw, Sask. (Chairman of the Saskatchewan Branch, and Member of Council). City Commissioner, Moose Jaw.

Transferred from the Class of Junior to Associate Member

Seth Wilson Crowell, B.A., of Yarmouth, N.S. Town Engineer, Yarmouth. Harry Wendell Mahon, B.Sc., of Great Village, N.S. Since 1917 with the C.C.H.A. Headquarters, B.E.F., France. Before going overseas was assistant engineer, Water Power Branch, Department of the Interior, Halifax. Major Alan Bretell McEwen, B.Sc., M.C., of Montreal. At the present time principal assistant to R. S. & W. S. Lea, Montreal. Major McEwen served with the C.E.F., from 1914 to 1918. Peter Scott, of Glasgow, Scotland. Since the outbreak of the War, senior assistant inspector of the munitions areas, Glasgow. Previously, with the C.P.R., Eastern Lines. Briton Oliver Smith, B.Sc., of London, Eng., formerly of Montreal. At the present time mechanical engineer with Vickers Limited, England.

Transferred from Class of Student to Junior

Captain John Frederick Harkom, M.C., of Melbourne, Que. Has been overseas since 1914, with the Royal Field Artillery, B.E.F., France, in command of the 57th Medium Trench Mortar Batteries. Joseph Ovila Rolland, C.E., Ch.E., of Montreal. At the present time chief analyst, Canadian Explosives Limited, Belœil, Que.

BRANCH NEWS

Victoria Branch

J. B. Holdcroft, A.M.E.I.C., Secy.-Treas.

The November meeting of the Victoria Branch was held on the 25th inst. with a representative attendance of members, and nominations were received for officers to guide the destinies of the Branch during the coming year. Every position brought forward enough applicants to necessitate a ballot, except that of Sceretary, to which J. B. Holdcroft, A.M.E.I.C., will be elected by acclamation.

A resolution was passed that the Branch volunteer to co-operate with the local Government representatives and authorities, in the work of returning demobilized soldiers to civilian life and fitting disabled men for employment. The committee appointed to report on this matter promptly proceeded to interview Major Livingstone, vocational officer, with most satisfactory results, which will be presented to the Branch at next meeting.

It was suggested that the Council at Montreal take similar action by offering the support of our *Institute*, as a national body, in this most important problem, to the Cabinet at Ottawa; also that each Branch take similar steps with the local authorities in charge of this work. Further, the question of public works to provide employment and develope the country should be taken up by our Institute without delay, and on sound scientific lines.

The annual meeting of the Victoria Branch, of *The Engineering Institute of Canada*, was held on the 11th inst., the principal business of the evening being the election of officers for the ensuing year.

The following were elected:— Chairman, W. Young; Vice Chairman, R. A. Bainbridge; Treasurer, E. Davis; Secretary, J. B. Holdcroft; Executive, W. Everall and N. A. Yarrow. These, with Messrs. D. O. Lewis and R. W. MacIntyre, past chairmen, form the executive committee. Auditors, F. Knewstubb and W. Stokes.

Following the taking of the chair by Mr. Young a hearty vote of thanks was tendered the retiring chairman, Mr. R. W. Macintyre, and general appreciation was expressed for his untiring efforts towards the furtherance of the interests of the profession as a whole, and of the Victoria branch in particular.

Among other new business which will engage the attention of the branch during the coming year is the problem of the returning soldiers and the provision of sufficient and suitable employment and training. A discussion was opened on this subject, and it is hoped that the branch, by suggestion and influence, may be able to take a useful part in the work of re-establishing our soldiers in civilian life.

Toronto Branch

W. S. Harvey, A.M.E.I.C., Secy.-Treas.

On Tuesday, December 3rd, a well attended meeting of the Branch was held in the Chemistry and Mining Building of the University of Toronto, when H. K. Wicksteed, M.E.I.C., gave an interesting illustrated address on the Montreal Tunnel from an Economic Point of View. This paper is published in another part of *The Journal.*

On Tuesday, December 10th, C. H. Rust, M.E.I.C., gave a paper on the Water Supply of the City of Victoria, B.C., which was illustrated and which was enjoyed by the members present. This paper will be published in a future issue of *The Journal.*

Minutes of an open meeting of the Branch held at the Institute's Rooms, Engineers Club, at 8 p. m., Tuesday, December 17th, 1918.

The meeting was called to canvass the ballot for the election of members for the 1919 Executive.

The meeting was called to order at 8.15 p. m., with G. A. McCarthy in the Chair.

The scrutineers appointed by the meeting to canvass the ballot were Geo. Clark, R. E. W. Hagarty and A. F. Stewart.

While the scrutineers were preparing their report a discussion was entered into by the members present regarding a copy of a communication issued by the Civil Service Commission of Canada and dated November 21st, 1918, regarding an opening for a position as assistant engineer on the staff of the British Columbia Hydrometric Survey at a salary of $1,500.00 per annum. The discussion was very lively and Messrs. Proctor, Hewson, Cross, Goedike, Phelps and Hogarth took part in it.

The scrutineers reported that the following members were elected to office for 1919 by the ballot just received:— Chairman, A. H. Harkness; Secretary, W. S. Harvey; Committee men, H. G. Acres, Willis Chipman and W. A. Bucke.

The members of the Committee elected in 1918 for a two-year term, and therefore, members of the 1919 Executive are Professor H. E. T. Haultain, J. R. W. Ambrose and R. O. Wynne-Roberts.

The retiring Chairman, Professor Gillespie, is also a member of the Executive. Members of Council at Montreal are also members of the Executive of the Toronto Branch.

The report of the scrutineers was received and confirmed.

Mr. Chipman addressed the meeting and urged on the members that they should attend the meetings of the Branch and thus encourage the Executive, who are endeavouring to create a greater interest in the affairs of *The Institute.* Mr. Wynne-Roberts spoke on the subject of the members becoming acquainted with manufacturing industries in the city, and urged that the Branch should make inspection trips to various plants of interest. The meeting adjourned at 10 p. m.

Calgary Branch

C. M. Arnold, A.M.E.I.C., Secy.-Treas.

Christmas Happiness and New Year Prosperity.

The Calgary Branch extends a Hearty Greeting to all members of *The Institute,* wishing them

A Happy Christmas and Prosperous New Year.

G. W. CRAIG, Chairman.
C. M. ARNOLD, Sec.-Treas.

At the Annual Meeting of the Calgary Branch, held in the Board of Trade rooms on the afternoon of Saturday, December 7th, the following officers were elected for the coming year: Chairman, S. W. Craig, Secretary-Treasurer, C. M. Arnold, Executive, Wm. Pearce, A. S. Dawson, F. H. Peters, B. L. Thorne, A. S. Chapman, Executive Alberta Division, F. H. Peters, S. G. Porter, Auditors, J. S. Tempest, R. C. Gillespie.

Mr. Craig was given a hearty reception upon assuming his new duties and made a short address, dealing with the desirability of publicity on engineering matters. The full report of this meeting will be published in the February issue.

At the general meeting of the Branch held on November 30th, with F. H. Peters in the chair, there were present fifteen members and Messrs. L. B. Elliott and R. G. Gibb of the Edmonton Branch were the guests of the Branch.

The purpose of the meeting was to discuss the draft of the proposed act governing the practice of professional engineering in Alberta. Edmonton representatives who had attended especially for this purpose were introduced by the Chairman. Mr. Peters drew attention to the fact that the preliminary advertisement dealing with the proposed legislation had already appeared in the Alberta Gazette. The executives of both branches had decided to proceed in the matter, as no time was to be lost if the Bill was to be presented this coming season. The Branch would be asked to confirm the action of the Executive in this matter. It would be necessary for the draft to be approved by both branches and the Alberta Division and it was proposed to send a delegation to Edmonton to interview the Premier, if this could be arranged, to obtain his views.

The Secretary was then called upon to read the minutes of all previous meetings since the last annual meeting and on the motion of Mr. Craig seconded by Mr. Houston these were approved and the minutes of the last meeting held were signed by the Chairman. Mr. Peters then asked Mr. Gibb to read the draft bill on legislation. Mr. Gibb stated that the draft had been prepared largely by the late Professor Muir Edwards and had been gone over by the executives of eachbranch and was now considered to be in shape to go before Parliament. Mr. Côté, a prominent engineer of Edmonton who was also in the Provincial Cabinet, had promised to do all in his power to forward the passage of the Bill, provided it received the approval of the Premier. He had therefore suggested that a delegation wait on the Premier to learn his views on the matter. Mr. Gibb then read the draft Bill, which was discussed at length clause by clause, and all points that were at all debatable were fully explained to the satisfaction of the meeting by the Chairman and Mr. Gibb. Mr. Peters stated that the Bill had been framed on broad lines and details had been avoided as far as possible. Any imperfections found to exist after the Bill had been enacted could be dealt with in the future by amendments. The delegation would consist of two members from each Branch and two non-resident members of these could be obtained. Mr. Craig moved that the draft Bill as submitted be approved by this meeting — seconded by G. N. Houston. Carried. Mr. Houston moved that delegates be appointed to wait on the Premier, to learn his disposition towards the proposed legislation, and that a report be submitted to the branch — seconded by C. M. Arnold. Carried.

It was decided to provide the Councillors of the Alberta Division and Executive of each branch with copies of the draft bill and also that a copy should be forwarded to the Saskatchewan Branch.

Mr. Peters moved a vote of thanks to the Edmonton members present for the work they had done in connection with the preparation of the draft bill and steps taken to present it to the proper authorities. Carried.

Mr. Craig, seconded by Mr. Peters, moved that a message of condolence be sent to Mrs. Sidenius, widow of the late Mr. H. G. Sidenius. The Secretary was requested to do this by vote of all present.

The meeting adjourned at 10.40 p.m.

Sault Ste. Marie Branch—Proposed

In keeping with the increased interest in Institute affairs, and as a result of a desire on the part of members of the profession resident at Sault Ste. Marie it is expected that a strong branch of *The Institute* will be in existence there at an early date. On Thursday, December 19th, a meeting of the local members of *The Institute* was held at the Y.M.C.A. at which time it was decided to apply for permission to form a Sault Ste. Marie branch.

An application was consequently prepared and submitted to the Council as follows:—

"We the undersigned hereby beg to apply for permission to form a local branch, to be known as the Sault Ste. Marie branch of *The Engineering Institute of Canada.*

R. S. McCormick
B. E. Barnhill
N. L. Somers
William S. Wilson
F. F. Griffin
A. G. Tweedie
L. R. Brown
C. H. E. Rownthwaite
J. W. LeB. Ross
W. J. Fuller.

At this meeting a temporary executive committee was formed consisting of:

J. W. LeB. Ross, Chairman, B. E. Barnhill, C. H. E. Rownthwaite, J. H. Ryckman, N. L. Somers, L. R. Brown, Secretary.

A second meeting has been called for January 9th, at which time the Secretary of *The Institute* is expected to be present to give all the assistance he can to the members at Sault Ste. Marie in the establishment of a strong enthusiastic branch.

Ottawa Branch

J. B. Challies, M.E.I.C., Secy.-Treas.

Good Roads

The widespread demand for constructive consideration by the Dominion Government of a practicable good roads policy has resulted in definite action that portends much for the future. The rapid advance in recent years, especially during the war, of motor transportation, both passenger and freight, and the important factor the automobile bears to rural development has proven, even to the most skeptical, the absolute necessity for good roads. The following item from the editorial columns of the Ottawa Journal will be welcome information to the engineering profession, and an assurance that at last the question of good roads will be given adequate attention by the Federal authorities:—

" The good roads movement, which must be one of the leading factors in the reconstruction and development of the country, is given a great lift forward through the Dominion Government's having availed itself of the experience and ability of Archie W. Campbell, M.E.I.C., in connection with it. Mr. Campbell has been appointed to advise the Government as to what its position should be in the matter of roadway improvement and construction, and it is probable, as it should be — that he will be retained permanently to supervise the carrying out of all plans.

No better choice could have been made. Mr. Campbell was an outstanding champion of good roads a quarter of a century ago, and as the result of work he did then, in co-operation with the late Andrew Patullo, of the Woodstock Sentinel Review, he was appointed Ontario Good Roads Commissioner, subsequently becoming Provincial Deputy Minister of Public Works. It was a serious loss to the better highways programme when he was taken from that position and made Deputy Minister of Railways and Canals at Ottawa. Better highways are for him almost a religion, and in the field to which he has returned he can serve the country better than anyone else we can think of. It is well that Mr. Campbell's exceptional experience and interest in the subject are to be turned to the advantage of the country as a whole. The good roads development must be carried out on an orderly and progressive programme, and Mr. Campbell's appointment will insure this.

Mr. Campbell is now preparing for submission to the Government, a report on the subject of highway construction in the Dominion. In it he will advise as to the best methods of obtaining the required co-operation between the Federal and Provincial authorities, and will recommend the adoption of legislation necessary to secure greater uniformity.

Nailacrete — An Important Discovery

Engineers generally, will be interested to learn of the important discovery made by one of the Affiliates of the Ottawa Branch, E. Viens, Director of the Public Works Laboratory for Testing Materials. A well-deserved tribute from the editorial page of the Ottawa Citizen to Mr. Viens' discovery, under the caption, " A Civil Sérvant's Good Work," follows:—

" Faithful work in the Civil Service has been so seldom noticed outside, many people have little appreciation of it. When the new parliament buildings were being inspected by a party of visiting engineers last Saturday, many were surprised to learn for the first time of the flooring material, called " Nailacrete," a discovery made by Mr. E. Viens, director of the Public Works Laboratory for Testing Materials.

"Nailacrete has a strength greatly exceeding wood, with a durability of concrete. It has the resilience of wood, a nail may be driven into it, and it will hold with greater firmness than in wood. Carpets can be tacked on Nailacrete, and desks or other furniture screwed down to it. But Nailacrete does not need a carpet covering. It can be given a surface finish as smooth as hardwood, glossy and more durable. It is fireproof, waterproof, and sanitary. It is lighter than concrete, can be laid without forms on a sloping surface — such as for roofing. It is an insulator.

" The Chief Architect of the new parliament buildings, John A. Pearson, has proven the reliability of Nailacrete by severe tests before adopting it for the floors in the main building. Credit is due to the Chief Architect for being sufficiently without prejudice to adopt Mr. Viens' discovery. The public should know, however, when a public servant by patient research, carrying out experiments in the first instances after work hours, at his own expense in the purchase of experimental materials, has contributed something apparently so valuable to the community as Mr. E. Viens' discovery of Nailacrete."

Branch Visits New House of Commons

Tangible evidence of the splendid progress made in the construction of the new home of the Canadian Parliament, according to the *Evening Journal*, was displayed on Saturday, December 7th, to the members of the Ottawa Branch of *The Engineering Institute of Canada* who, after doing full justice to the first luncheon served in what will be the House of Commons dining-room, were given an opportunity to inspect the buildings under the guidance of the staff in charge of the reconstruction, G. Gordon Gale, chairman of the Ottawa Branch, presided at the luncheon, and about 135 members and their friends were present.

The trip through the buildings proved of unusual interest. On every side could be seen evidence of the amount of work already done, and an attempt to visualize the buildings as they will be when completed framed so compellingly a mental appraisal of the work still to do that the assurance of the architect that the buildings will probably be ready for occupancy by January, 1920, was almost doubted.

The cornerstone of the new buildings was laid on September 1st, 1916, but for practically nine months thereafter little or no work was done and the buildings as they now stand represent about 17 months of actual labor, conducted for at least part of that time under a serious handicap due to difficulty in securing workmen.

In external appearance the buildings convey a much stronger inpression of solidity, massiveness and dignity than did those they replace. While the frontage is the same as formerly the new structure contains much more accommodation due to the fact that a solid block has been built in at the rear or north side. The general plan is of one great structure, in part divided by three light courts or wells into five smaller buildings. The Commons chamber is situated in the western end, then alternate light courts and offices, with reading and smoking rooms, to the Senate chamber on the eastern end. Ample main corridors, broad and stately, run east and west through the entire building with cross corridors, but little narrower, connecting the various units. In all there are more than two miles of corridors in the building — ample opportunity for corpulent statesmen to exercise while pondering questions of national import.

Possibly the feature of the entire structure that, when completed, will attract most attention and Dominion-wide interest, is the splendid hall or "Court of Honor." As planned, this leads directly from the main entry through the width of the building to the Library, and will be in every way worthy of its name. Even on Saturday, while complete comprehension of its majestic spaciousness was prevented by the spidery scaffolding which fills most of the space, it was evident that when finished it will stand alone in Canada as an example of the dignity and beauty that can be attained in interior architecture of the Gothic school. As it is, it is reminiscent of the sublimity of a vaulted cathedral, and when the windows, and statuary, silently eloquent testimonials of the men who made Canada, are in their positions the effect will be imposing in its majesty.

The Commons chamber is spacious and lofty, gallery accommodation will be in excess of that contained in the former House, while a new feature will be the provision of private boxes for visitors to whom it may be desired to extend signal honor. As might be expected, ample arrangement has been made for the press gallery and the rooms in which the newspaper workers record the achievements or errors of Canada's statesmen will be more commodious and convenient than heretofore. The Senate chamber in general lines, follows that set aside for the members of the elected branch of Parliament.

The office accommodation for ministers and the various grades of private members will be much superior to similar arrangements in the former building. The individual offices will be larger and better appointed. Nothing will be spared that will make for the comfort and convenience of those who devote a large portion of each year to the business of the country.

But it is the wonderful wealth of detail, already commencing to show, that will make the new Parliament buildings one of the show-places of Canada. Carvings, typifying events in Canadian history, broad sweeping effects representing Canadian life and industry, delightful miniature bits characterizing and, in some cases — caricaturing — men prominent in Canadian public life, present or past, will afford days of pleasant occupation to students of art as revealing character. The entire building will be alive and vibrant with such delights; few of them are as yet in position, but numbers are to be seen, completed, waiting only to be placed in their respective niches.

From the artistic and sublime to the practical brings one to consideration of the arrangements made for heating the building — a most necessary feature in this latitude. The heating plant is situated in the power house at the foot of Cliff street, several hundreds of yards from the buildings themselves. Forced circulation of hot water will provide sufficient heat to serve the new buildings, the Supreme Court building and the Langevin block, and the plant is so constituted that it can be made to heat additional buildings in that vicinity which it may be necessary to construct.

Dealing more particularly with the progress made on the building within the last year it may be said that in the summer of 1917 it was but rising from its four foundations. Now the walls and roof are completed, many of the inner walls run, basic floors laid and in some portions work has started on the floor tiling. Practically the body of the entire structure has been completed, the interior fitting is yet to be done. This, it is expected, will consume another year.

Of the architect in charge, John A. Pearson, who already has a national reputation as one of Canada's master builders, it need only be said that nothing he has ever done will surpass his work in the provision of a beautiful and fitting home for Canada's Parliament. A man might well study and labor for a life-time to produce but one such monument to his genius.

Address on Ceramics

One of the most interesting evenings held by the Ottawa Branch for the year 1918, was an address on "Clay and Clay Products in Canada," by Joseph Keele, chief engineer of the Ceramic Division of the Department of Mines. Mr. Keele is the recognized authority on this subject in Canada, and succeeded in conveying a great deal of exceedingly valuable information respecting one of the most important and little appreciated industries in the Dominion. So important is this industry to Canada generally, and of such immediate interest to all branches of the engineering profession, that it is hoped Mr. Keele may be able, in the near future, to prepare a similar paper for presentation to *The Institute*, in order that all of its members may enjoy the advantage of those who attended the meeting in Ottawa.

Transferred to Dept. of Trade of Commerce

The Electrical Standards Laboratory, Ottawa, O. Higman, M.E.I.C., Chief Engineer, has sent out notice that the administration of the following Acts of the Federal Parliament has been transferred from the Inland Revenue Department to the Department of Trade and Commerce; the Electrical Units Act; the Electrical Inspection Act; the Electricity and Fluid Exportation Act; and the Gas Inspection Act.

Dominion Power Board

The Government has added to the personnel of the Power Board, W. A. Bowden, M.E.I.C., Chief Engineer of the Department of Railways and Canals; and Arthur Amos, M.E.I.C., Chief Engineer of the Hydraulic Service of Quebec and a member of the Quebec Streams Commission.

The Government has consented, at the request of the Dominion Power Board, to have A. B. Lambe, A.M.E.I.C., Asst. Chief Engineer of Gas and Electricity of the Department of Inland Revenue; and A. J. Matheson, M.E.I.C., Chief Engineer of the Montreal Water Levels Commission, attached to the Board for special work.

Hamilton Branch

H. B. Dwight, A.M.E.I.C., Secy.-Treas.

It was with considerable regret to the members of the Hamilton Branch that Geo. F. Porter's lecture on the Quebec Bridge had to be cancelled because the prohibition of all meetings was suddently renewed by the Board of Health. The Health Officer had intimated several times that matters were not serious and that the meeting could be held as scheduled. However, outside pressure was brought to bear, as matters really were more serious than most people supposed, and the ruling was made on a few hours' notice. The unfortunate part was that there was no time to telegraph Mr. Porter. The members of the Branch had a very enjoyable visit with him, however, and he was most agreable about the misfortune.

Montreal Branch

F. B. Brown, M.E.I.C., Secy.-Treas.

A discussion of the subject of legislation has occupied two meetings of the Montreal Branch held on November 28th, and December 19th, where it was given consideration in an exhaustive manner. At the meeting of the Branch held on December 19th, Lieut.-Col. Dubuc was present and in addition to being welcomed by the chairman, Walter J. Francis, one of his classmates, Arthur Surveyer, voiced the sentiments of those present in well-chosen words of appreciation. Lieut.-Col. Dubuc was given a reception in keeping with his distinguished services and made a happy speech in reply to the reception accorded him.

The following resolutions passed by the Montreal Branch embody the result of the two meetings on the subject of legislation. It was moved by W. F. Tye, seconded by G. H. Duggan and carried:—

WHEREAS it seems advisable that legislation should be sought defining the statuts of engineers throughout Canada, AND

WHEREAS the widespread activities of the engineering profession, the great difference in the interests and occupations of the individuals, the necessity of getting satisfactory legislation in the different provinces, the unsatisfactory result of such legislation as has already been obtained and the dangers and difficulties certain to be encountered by *The Institute* as a whole during the time period of passing of Canadian engineering from an open to a closed or a partially closed profession, make it inadvisable and inexpedient to ask for any further legislation in any province until the whole question has been thoroughly studied, reported upon and submitted in concrete form to the full corporate membership of *The Institute.*

BE IT RESOLVED:

THAT the Executive of the Montreal Branch be instructed to ask the Council to arrange for the appointment of a Committee representing all provinces and all branches of the profession to inquire into, study, and report upon the whole question of legislation, including a report upon the best method of getting such legislation as will ensure a satisfactory and uniform status of engineers throughout Canada, also to draw up such sample legislation as it may deem necessary and advisable in order that the member of *The Institute* in the different provinces may seek legislation on some uniform basis.

That before the final adoption of any proposed Act it shall be the duty of the Committee to co-operate as far as possible with similar incorporated technical bodies with a view to harmonizing clauses which might contain points of contention.

That the Secretary of the Montreal Branch be instructed to forward a copy of this resolution to the Secretary of *The Institute* and to the Secretaries of the Provincial Divisions and the Branches, and to request the Executive of the Provincial Divisions and the Branches to assist the Council in securing the appointment of a strong and representative committee."

It was further moved by Arthur Surveyer, seconded by F. B. Brown and carried:—

" *THAT* the Executive of the Montreal Branch take immediate steps to obtain, in co-operation with the Quebec Branch and by letter ballot, the views of the members of *The Institute*, residing in the Province of Quebec, on the question of licensing engineers, AND

THAT the following questions for this letter ballot be suggested to the Executives of the Montreal and Quebec Branches for their consideration:

Question 1. Are you in favour of a closed corporation for engineers having responsible charge of engineering works?

Question 2. If so, do you favour legislation embracing all engineering works, or only public works?

Question 3. In the event of the majority of the members of *The Institute* residing in Quebec, declaring in favour of a close corporation, what are your opinions on the following questions:

(a) Do you consider that the only method of entrance into the engineering profession should be through the engineering colleges?

(b) If no, do you think that candidates who do not follow college engineering courses should be obliged to pass an examination for admission to study somewhat along the lines of the matriculation examination required for university entrance?

(c) Do you think that candidates should be required to pass an examination for admission to practice, similar to the examinations required by the Bar and Medical Associations?

(d) Should candidates be obliged to serve a period of apprenticeship or employment under an engineer, before being allowed to take the final examinations for admission to practice? (The word practice is understood to mean taking responsible charge of engineering works).

(e) If in favour of examination, do you consider that these should be held by the corporation only or by a joint board of the members of the corporation and representatives of the McGill and Laval faculties of applied science?

(f) Do you consider that graduates of engineering schools should be exempted from any or all the examinations?

(g) If so, from what examinations should they be exempted?

(h) Do you think that graduates of engineering schools should be required to prove that they have had experience under some engineer before being admitted to take charge of engineering work?

AND THAT the results of this letter ballot be passed on to the committee appointed under Mr. Tye's motion for their information irrespective of any action that the members of *The Institute* in Quebec may wish to take."

Gallant Officer Returns

Lieut.-Col. Dubuc, C.M.G., Croix de Guerre, Cross of the Legion of Honor, D.S.O., M.E.I.C., commander of the famous 22nd Battalion of Montreal, which has added so much to the lustre of Canadian arms, arrived at his home in Montreal recently where he was accorded a reception in keeping with the distinguished services he has rendered. This gallant officer, who has seen so much of actual fighting, has been three times wounded, including the loss of an eye from machine gun bullet, the last time so dangerously that his life was dispaired of. Going to the front as a Captain after three years on the fields of many battles he returns to us a Lieutenant-Colonel, commander of his old battalion and bearing decorations which prove him a warrior of great courage.

Of the engagement in which he was wounded the last time, he said that out of 23 officers and 625 other ranks, there were 23 officers casualties (every one was killed or wounded) and 505 of the other ranks either laid down their lives or will hereafter wear the scars of battle. This all happened in 24 hours. It was on August 27th, in front of Cherisy, in the attack on Cambrai and the start of the great Arras battle, that was the beginning of the end, that Lieut.-Col. Dubuc was hit, by a machine gun-bullet, and was given up for dead. The command of the 22nd automatically passed to Major Vanier at 2.30 that day, and he carried on until he lost his leg.

At a meeting of the Montreal Branch, held on December 19th, Lieut-Col. Dubuc was accorded a rousing reception and he gave a brief address to the members present, which, coming from one who occupied such a proud position in the great engagements of the war, was highly enjoyed. Every member of *The Institute* will feel a personal sense of pride in the distinguished part which Lieut.-Col. Dubuc has taken in the mighty conflict.

CORRESPONDENCE

Legislation for the Engineer (A Western View Point)

Editor *Journal*:—

"These engineers were priests of a sort, albeit they did not preach or pray. It was a new world. Has it ever struck you that with every victory over Nature won by the human spirit a fragment of their omnipotence is wrested from the hands of the gods? I always feel as if we were using fire and steel, mechanical energy and human thought, as weapons of revolt against the Heavenly tyranny." Bojer.

In consideration of the present essential effort upon the part of engineers to obtain legislative support and recognition as a class, with a long delayed but necessary acknowledgement by the public of their services and merits let us make clear to each other that this "object" is what we aim at and that a successful issue is of much greater importance than the "method" by which this result may be attained. As a Westerner from Alberta I view the position so, and feel that whilst pleas for unanimity and possible similarity of action are insistent from many sources, it does not appear at all possible to achieve this, or even desirable to attempt uniformity for the following amongst other good reasons, especially affecting the West.

We have four Legislatures, Manitoba, Saskatchewan, British Columbia and Alberta, each with a differing outlook and history, a varying practice and local conditions and an independent legislative personnel distinctly enamoured of their own principles and practice, so much so that the chance of common action is of very remote possibility and to spend time and effort upon a futile aim such as uniformity of practice, must be under the circumstances of urgency, misplaced energy much to be regretted.

The objects to be attained are in each Province exactly similar, what does it matter about the plan of the road by which the goal is to be reached, its grade or the make and variety of its bridges, these may vary as does the topography of these Provinces but if the same successful result be reached why worry? Manitoba has had a plan since 1896, why this has not been travelled is not self evident and having had all these years of experience of the "lions in the way" one would assume they should be best prepared and armed to take action immediately, so that their claim for delay to secure uniformity does not seem to rest upon sufficiently definite grounds as to warrant suspension of effort on the part of other Western Provinces. Saskatchewan has a plan which doubtless meets its members' requirements and it is to be hoped also those of its legislators and whilst some of its features would not pass through the Alberta House, we are not so placed that we dare ask them to await general agreement upon forms and procedure, their duty is to secure from their legislature the best terms and conditions for effective legislation protecting engineers and the method by which this is gained is to them a domestic problem containing factors of which outsiders cannot judge.

B. C. we have no doubt with last years experience to guide, are now well aware of the lines of least resistance and likely success and formulating a plan for submission to their Legislature, we wish them well. Montreal can but express a parental solicitude that its children whilst struggling with varying conditions and doing the best they can for themselves shall do their utmost to maintain the family credit and its highest traditions. We in Alberta are in a measure the most happily situate of all in that a well travelled road has been cleared for us by other professions with lines of uniformity laid down by the Legislature, satisfactory to them and to us, achitecture, law, medecine, dentistry, chemistry, surveying and other public services have a common, accepted and satisfactory system of public control to which we must conform in any legislative proposals we may submit.

In technical matters the Legislature of Alberta has always taken the stand that public control of such services had best be exercised by the first body of educational standing in the Province, i.e. the Senate of the University of Alberta, a doctrine of economy of effort on the part of the Legislature and of success from the viewpoint of such technical services already so associated and of satisfaction from the public point of view, as being a simple, effective and desirable curb upon any close corporation practices likely to injure the freedom of its best interests. Having but one university and that in the nature of a state institution we are most favorably situated and we hope it will shortly be possible to submit the draft act proposed to be submitted to the next session of the Legislature, this follows most carefully along the lines of preceding acts governing technical and professional services and will we hope secure the approval of our legislators as well as that of our fellow engineers in this and other Provinces.

May attention be called to one danger, that of overloading an act with matter more properly belonging to by-laws as items of internal government and the relations of Institute members with each other do not require to appear in the Act, this should be explicitly confined to the delimitation of relations between the public and the service in question.

This is not a plea for delay but a call for action, engineers are usually associated with realities and dealing with matters of material or force and facing the reality of an unrecognized profession of legally indefinite status without protection, and the presently heavy barrage of the H. C. L., action definite, direct and decided cannot occur any too soon.

By independent action but free co-operation to the desired end we shall secure for some, or more happily we hope, for all, the legal status and recognition which the talents and services of our members deserve and to this end it is essentially necessary that all without exception shall sink their differences and with enthusiasm enter into all measures or methods devised to secure this long delayed but no less patiently earned reward, giving full support and countenance to all who in any measure or position endeavour to solve the attendant difficulties.

Lo: a cloud's about to vanish
From the day
And a brazen wrong to crumble
Into clay.
Lo: the Right's about to conquer;
Clear the way.
With the Right shall many more
Enter smiling at the door;
With the giant Wrong shall fall
Many others, great and small,
That for ages long have held us
For their prey.
Men of thought and men of action,
Clear the way.
Mackay.

—DONENZ.

Move for a Raise

Editor *Journal*:—

I have to congratulate you and the other executive officers on the success of *The Journal* which along with the other matters contains an employment bureau. The salary paid to civil engineers to-day is ridiculously small and one remedy which occurs to me is for the profession to take every advantage of any new position offering a larger salary. This shuffling would force many raises in salary in order to hold men who to-day may not be in touch with other positions which are available and pay more money. This *move for a raise* policy would I think improve the situation as there are too many of our men to-day holding down positions at practically the same salary which they received five, yes and ten years ago, thus making the engineering profession the greatest rut in existence.

I would respectfully suggest that you give more attention to the employment bureau and endeavour to give the readers of *The Journal* the benefit of all positions which are open in Canada and as many as practical of those in foreign countries as well. I have noticed that heretofore you have not even included all the appointments which the Civil Service of Canada have to make.

I am,
Yours faithfully,
District Engineer.

* * *

Error re Diving Bell

Editor *Journal*:—

With reference to my letter of October 24 to you. Mr. MacDonald has called my attention to an error in my letter on page 2.

In my letter, I have, by an error of dictation, misplaced the relative positions of the metre centre and centre of gravity of the device under discussion, and I did not notice the error until my attention was called to it. The mistake is an obvious one, otherwise the outfit would not have been stable when afloat. I will be obliged if you will correct this error in my letter.

Yours very truly,

JOHN TAYLOR, A.M.E.I.C.

Education Through Journal

Dear Editor:—

I am in receipt of a copy of your letter of November 29th to the Secretary of the Civil Service Commission, which should cause their officers to reflect upon the salaries being paid engineers as compared with those made for other work.

I think the whole trouble is with the engineers themselves. If they are in a position to demand better pay for one another, they don't do it. If engineers will accept positions at $1,500 per year, the Civil Service Commission will feel that it is quite justified to continue offering that salary. I think a campaign of education carried out through the columns of *The Journal* would be the best method of crusading at the present time for better salaries for Government engineers.

Yours faithfully,

GOVERNMENT, M.E.I.C.

Grand River Conservation

Editor *Journal*:—

The water shed of the Grand River (Urse River on map of 1763, later " Ouse or Grand " River) the central part of the peninsula of South Western Ontario, comprises about 2,600 square miles, parts of the Counties of Grey, Dufferin, Perth, Oxford, Wentworth and Haldimand and practically the whole of Wellington, Waterloo and Brant. The highest part of the peninsula may be called an irregular plateau, 1,400 to over 1,700 ft. in elevation above sea level, and having an area of about 1,100 square miles, the northerly edge closely approaching Georgian Bay. Apparently one half or more of this area was originally dense swamp, the headwater source of most of the considerable rivers of the peninsula.

A marked topographical feature is the Niagara escarpment extending from Queenston on the Niagara River, and there marking the difference in water level between Lakes Erie and Ontario, more or less definitely across the peninsula to Georgian Bay. For a considerable part of its length this abrupt break in the surface forms practically the easterly limit of the Grand River water shed.

The Grand River rises on the highest part of the plateau, in Melancthon Township, within 25 miles of Georgian Bay, has a length along its windings of about 160 miles, flows in a general southerly direction, has a total fall of over 1,100 ft. and empties into Lake Erie at Port Maitland. Principal tributaries in their order from up stream are the Conestogo River from the west, rising near the source of the main river, the Speed from the east and the Nith from the west.

The water shed is wide in the headwater area, becomes narrower further down, and more so in the flat country toward Lake Erie, where smaller streams flow directly to the lake. Declivity of the stream bed is greatest after it leaves the plateau, is considerable further along and small toward the outlet. What may appropriately be called the upper river extends to about the 1,150 ft. contour, and the lower river from there on.

The importance of the Grand River water shed, particularly of the lower river, is well known. In fertility of soil, in density of population, in agriculture and in manufactures, it is one of the best sections in the Dominion of Canada. Numerous cities and towns, manufacturing cent es noted throughout the Dominion and beyond, Brantford, Galt, Kitchener, Paris, Guelph, Preston, Hespeler, New Hamburg, etc., are directly on the river banks.

The spring floods are a constantly increasing menace, both in the cities and towns and generally along the valley, and summer flow of the river has become very small.

Original conditions, forestation, and particularly the large swamp areas on the head watershed, which effected natural regulation, restraining floods and maintaining dry weather flow, by retarding snow melting, by better holding back of water on the surface and by greater volume of ground water, are impossible of restoration.

There are various methods of flood alleviation, such as: confining the channel by means of walls or dykes, as has been done in Brantford on the Grand River, and to some extent in Galt; deepening and correction of the river channel; elevation or filling in of ground subject to overflow; detention or retardation reservoirs, as now under construction in the Miami Conservancy District, Ohio. Preferable to any of these methods, and constituting true conservation, are storage reservoirs, where practicable. A storage reservoir of ideal capacity and performance retains the surplus flood flow and releases the stored water for equalization of flow during periods of small yield from the watershed.

Conservation by storage has been found to be to large extent practicable on the Grand River. The Hydro Electric Power Commission of Ontario by surveys made mainly in 1912 and 1913 established the fact that sufficient storage can be obtained to give good control. In the township of Pilkington on the main river, about at the foot of the upper river, storage capacity of about 2¾ billion cubic feet in one basin has been found to be available. Further storage, on the Conestogo tributary, would give a total of nearly 4 billion cubic feet of capcaity with watershed area above the basins of about 600 square miles, constituting on the whole fairly unique and very favorable conditions for true conservation. There remains to be done, as to investigation, definite exploration of sites for dams and ascertaining of their practicability and estimates of cost. No estimates or investigation as to cost of reservoir sites, land condemnation, highway changes etc., has as yet been made either.

The benefit of such conservation would in the first place be elimination of flood danger. The sustained summer flow, which on the above storage could be over four hundred cubic feet per second in addition to the present flow, eight to ten times the present flow for a good part of the river affected, would be a great benefit in sanitation and water supply. Evaporation from the surface of the storage reservoirs an area of six square miles or over, is a feature to be considered. During the hot summer months, June, July, and August this may be assumed to total from 15 to 20 inches, or possibly a little more. Rainfall during this season is extremely variable.

Local observation (Waterloo County) shows a total for the three months ranging, in a short period of four years, from 22.11 to 4.99 inches. Evaporation is greatest during drouth, but considering even a net evaporation, after deducting direct rainfall, of 15 inches or more, it is negligible against the yield from the contributary watershed, of which every accretion would be held in the storage reservoirs. Existing developed water powers on the river would also gain greatly. The heights of fall of such water powers are: at Galt, 8½ ft.; at Paris, 14 ft.; at Brantford, Upper Dam, 16 ft., Lower Dam, 33 ft.; at Caledonia, 7 ft.; at Dunnville, 6½ ft.

A promising use of the conserved water has been recently proposed. (by N. Cauchon, A.M.E.I.C.) This is to make a diversion canal, probably from below Galt — where, along the old Great Western Railway branch, there is a lateral depression toward the east — to the escarpment, drop the water over this, with fall of 500 ft. or more, enabling development of large power, and make further use of the water for irrigation throughout the lake shore district. Irrigation, once the flood danger is removed, will also find extended and valuable application in the immediate valley floor of the river.

W. H. Breithaupt, M.E.I.C

Government Salaries

Editor *Journal:—*

I have been following with a certain amount of interest and a much greater amount of disappointment the semi dignified movement on behalf of the engineers of *The Institute* regarding a fair wage for the profession.

Some even go so far as to give the remuneration received for our work the high sounding name of a salary — which it is not — in fact the average wage of the Canadian engineer is hardly more than the wage paid the most ordinary and uneducated class of mechanic or make-believe tradesman in practically all parts of the country. Why, most men are paying their chauffeurs from $100.00 to $125.00 per month; we even in this small town have several instances of workmen being paid better than so called professional men; one in particular — a man who files saws draws $7.50 per day, and a foreman in charge of a small construction job $10.00 per day. When employing a foreman over a dozen men this summer I was asked to pay within 75c. per day of my own wage.

It is all very well to be dignified when one has something to be so over, or when one can be dignified at all times; when, however, the baker and butcher, etc. have to be treated with something else besides dignity, and the life of an intelligent man has to be ordered so that his main thoughts, after the execution of his work, are taken up with the problems of how to make last years suit do again or the roast from yesterdays dinner do the rest of the week, etc., it is quite time that he got his thinking cap on again after hours for his own benefit.

If our profession is worth anything it is worth at least a good fight to make it appreciated, and if it is necessary to have a fight to gain recognition let us get at it and have a real one and have it over with, and if we cannot succeed let us get out like men.

We have the weapons and they are not of German manufacture either. Hadn't we better get busy and use them?

I do not see why a committee of hustlers should not be appointed by *The Institute* to get after this end at once, and arrange a campaign that will bring results.

Yours sincerely,

A poor Government Engineer.

* * *

Protest Against Engineers' Salaries

Editor *Journal:—*

I wish to call the attention of the Council, through you, to the great difference in salaries offered clerical help, such as stenographers, clerks, etc., and that of engineers.

One has only to take up the Civil Service Bill, which passed through the Federal House last spring and glance at the salaries which are paid to first, second and third class clerks (we are not even allowed the title of engineers) to see my point of view. This state of affairs reflects very unfavorably on the future welfare of *The Institute.* This matter will receive very serious attention at our next Branch meeting, and I trust this will be the case in every Province throughout Canada.

Yours truly,

A Manitoba Associate Member.

* * *

Editor *Journal:—*

Herewith are announcements of the Civil Service Commissioners' Bulletin applications for positions, which should be noted by the engineering profession, as to me they appear to be more or less an affront to the profession:—

1. A *Secretarial Clerk* for the permanent staff of the President of the Council, Grade D. of the First Division, at an initial salary of $1,800.00 per annum. Candidates must have secretarial ability, capacity in office management and special shorthand reporting ability.

2. A *Female Clerk* in the Employment Division of the Department of Labour at a salary of *$1,600.00* per annum. Candidates must be university graduates with training in economics and some practical experience in social work. Some experience in office management is desirable with particular reference to statistical work. A good working knowledge of French is required.

3. An *Assistant Engineer* on the staff of the British Columbia Hydrometric Survey at a salary of *$1,500.00* per annum. Candidates should not be more than forty-five years of age, and should be graduates in engineering of a recognized university. They should have at least two years field and office experience in engineering.

Yours very truly,

An Associate Member.

Diving Bell, Halifax, N. S.

Editor *Journal:* —

The writer has just received by mail a copy of the "Canadian Engineer" of 31st October, 1918, in which are published extracts from a letter to you from John Taylor, of Hamilton, Ont., regarding a paper read by J. J. Macdonald on the Floating Caisson or Diving Bell used in preparing foundations for quay walls at Halifax, N.S.

The writer has not yet seen Mr. Macdonald's paper or his statements, but Mr. Taylor's letter and especially his concluding statement that "he feels it is only just that the facts should be made known to the engineers of Canada as a whole and he fully expects this to be done" causes him (the writer) to write to you in this matter, as he is probably the one best personally acquainted with all the facts.

The Halifax Ocean Terminals quay walls were designed for the Canadian Government Railways by F.W. Cowie, M.E.I.C., of Montreal, as consulting engineer, and the writer, as superintending engineer, in 1912-1913. Many designs and schemes were studied before the type (of original design) finally adopted was decided upon early in 1913, and needless to say, much detailed consideration was given to the foundation work and to the new types of plant and appliances that would be required for the proposed works, including rock drilling, dredging and concreting plants, helmet and bell diving outfits, block setting cranes and lifting tongs, etc.

The writer had in 1911-1912, with Foley, Welch & Stewart as contractors, successfully used as diving bells, the large pneumatic foundation caissons designed by him for the river piers of the Skeena River bridge on the G.T.P. Railway in B.C., for removing large boulders and obstructions in fast flowing deep water on the sites of the piers, by working in the working chambers with the caissons grounded or afloat and made moveable as desired by displacing or pumping out water. Other people, he believes, have done the same with other caissons. The writer discussed this with Mr. Cowie, and together they developed and sketched out the Floating Caisson or large mobile Diving Bell idea for their foundation work. The doubtful elements of the scheme were cost and rate of progress. It was therefore decided that in letting the docks contract the choice of methods should be left to the contractors, subject to stipulated rates of progress and qualities of finished work.

In November, 1913, the contract for the first unit of the Halifax docks was let to Foley, Welch, Stewart & Fauquier, who brought to Halifax as their superintendent James Taber, a well known Canadian expert with wide experience in deep foundation and compressed air work. The floating caisson or diving bell method was then again taken up, and was thoroughly examined by Messrs. R. B. Porter and Fauquier of the contracting company, Mr. Taber, Mr. Cowie, and the writer, further detailed sketches of the bell and estimates of cost of construction being made. It was felt by all these parties that better work could be done, with better inspection and more certainty, with the large diving bell than by other methods, though not at less cost.

The contractors, with a spirit and enterprise for which they deserve great credit, decided to adopt the Diving Bell method, and in view of the advantages to the work, the writer, with the approval of Mr. Gutelius, general manager, Canadian Government Railways, prepared the working drawings for the bell in his office at Halifax. Mr. Macdonald was then the writer's assistant and office engineer there, and he, along with the late Lieut. C. S. DeGruchy, M.C., and other assistants, did excellent work on the completion of the design and of the working drawings.

The tender scow with its air compressors, etc., and the air locks, etc., of the Bell were designed and constructed, or supplied and fitted by the contractors, mostly under Mr. Taber's direction and supervision.

The general plan and details of the Halifax Bell were certainly original in that they were designed for a definite purpose on scientific first principles and from practical personal experiences, and were not copied from any other plans or plant. The designers, were, however, aware of, and were naturally supported in their decisions by the knowledge and precedents of the large Bells or floating Caissons that had been successfully used in dock works in years past at Marseilles, Antwerp, Rotterdam, Bilbao, etc.

In the winter of 1913-1914, when the Halifax Bell was designed in its present form, none of those responsible had, so far as the writer knows, any knowledge of Mr. Taylor's scheme, plans, or plant. Unlike Mr. Taylor's apparatus, the new Halifax Bell of new design and working under new conditions in fairly open tidal waters, for the first few days, as was to be expected, was the cause of some little anxiety and revealed some minor defects. The skill and energy, however, of J. P. Porter, who had then taken charge for the contractors, rapidly overcame these troubles, and the writer may safely say that the Bell for two years without mishap did excellent work under his personal supervision and made steady progress and good time.

Writing from the Field in France, the writer is at the disadvantage of having no notes or means of reference at hand, but the principles and applications of compressed air in working chambers of Caissons, Diving Bells, etc., for subaqueous work must be familiar to many members of *The Institute*, and he thinks that they will agree that Mr. Taylor unduly flatters himself if he claims to be the sole anticipator, originator or inventor of large Diving Bells of the Halifax type.

The writer regrets he has never had the privilege of seeing Mr. Taylor's plant, but he has a hazy recollection of having heard, probably in 1914, about an outfit, which he thinks may have been Mr. Taylor's, for cutting off and capping piles on the lakes a foot or two below water level in still water, subject to no rise or fall or range of tide; that is, for application to work and conditions quite different to those at Halifax.

JAMES McGREGOR, Major.
C.E. 3rd Bn. Can. Rly. Troops.
In the Field, B.E.F., France,
3rd December, 1918.

Thoughtful Suggestions

Editor *Journal* :—

I think an occasional letter from individual members, in appreciation of what you are doing in our behalf, may serve to encourage you in your future efforts. The work of getting out a monthly "Journal" is in itself no mean task, and the numbers I have received are a credit to *The Institute*. The influenza epidemic has retarded progress in our local branch as public meetings were out of the question. There are important matters to be discussed, particularly that of legislation affecting the engineering profession. I think the draft act submitted by the Saskatchewan Branch illustrates one of the great dangers to be avoided by *The Institute* in Canada.

The idea that competition among members of the profession is the cause of the unsatisfactory conditions of employment and remuneration is entirely erroneous. Engineering work is not a fixed quantity in any community, nor can it be reckoned as a percentage based on population. There is room for unlimited growth and expansion, one successful enterprise making way for another. It is a case of "work makes work" and the benefit is not limited to any one line. The lack of definite knowledge that a certain undertaking can be carried through successfully often exerts a retarding influence on other lines of development. Likewise research work, exploration and the collecting and tabulating of data have a marked influence in increasing demand for engineering services. To-day an engineer must specialize, consequently he must be able to move in the widest possible field to keep steady employment. This prohibits local protection. There is no surer way of producing stagnation in the profession than by forming closed corporations. It is true that congestion is bound to occur in certain centres from time to time which re-acts most unfavorably on those who are permanently located there. Better organization and more mutual consideration among members would do much to obviate this difficulty.

One good feature embodied in the Saskatchewan draft was that of registration, but such a measure should require merely a nominal fee. This would enable the local branches to keep tab on irresponsible individuals who were practising engineering to the detriment of the profession. I am not here referring to competition, but to the injurious effect of incompetent work. The failure of an undertaking, excessive cost, reports which are unreliable, all make for a decreased demand for engineering services.

With the seasons's best wishes.

Sincerely yours,

G. B. McColl, A.M.E.I.C.

Some Salary Offers

Editor *Journal* :—

Owing to my position here as district engineer, I am in receipt each week of a Government publication called the "Canadian Official Record." In reading over this paper I have come across some items which I believe should be brought to the notice of Council for action.

On page 4 of the issue of November 5th, 1918, there is a notice of positions vacant in the Civil Service, I quote therefrom as follows:—

"2. A Clerk in the Statistical and Research Branch of the Department of Labor at a salary of *$1,800.00* per annum. Candidates should be graduates of a recognized university with training in economics and research work and some knowledge of office routine.

3. A Photographer for the Exhibits and Publicity Bureau of the Department of Trade and Commerce at an initial salary of *$1,600.00* per annum. Candidates must have a complete knowledge of photography, etc.

5. *An Assistant Engineer in the office of the Water Power Branch at Winnipeg, Department of the Interior, at a salary of $1,500.00 per annum. Applicants should be British subjects,* not more than 35 years of age. They should be graduates in engineering of some recognized university and should have at *least two years field and office experience in engineering.*"

Here is another, in the issue of December 3rd, as follows:—

"1. A secretarial clerk for the permanent staff of the President of the Council, Grade D. of the First Division, at an initial salary of $1,800.00 per annum. Candidates should know shorthand and have office ability.

2. A female clerk in the Employment Division of the Department of Labour at a salary of *$1,600.00* per annum. Qualifications as in paragraph 2 above."

3. An assistant engineer on the staff of the British Columbia Hydrometric Survey at a salary of *$1,500* per annum." Qualifications as for the other engineering position vacant."

Is *The Institute* interested in its members? Is it taking any notice of the fact that the Civil Service Commission is at present working on the reorganization of the outside service and the question of the remuneration for a great many members of *The Institute*.

It would look as though it were better to be a "female clerk" than an engineer.

Yours sincerely,

One Affected, A.M.E.I.C.

UNCLASSIFIED

Eye, Sensibility. The Sensibility of the Eye to Light of Different Colors. Sci. Am. Supp., vol. 86, no. 2236, Nov. 9, 1918, p. 301, 1 fig. Results of measurements carried out at Bureau of Standards.

Rolling Mills. Diagonals for Designing Rolls for Billet Mills, A. R. Mitchell Iron Age, vol. 102, no. 20, Nov. 14, 1918, facing page 1198. Tables for determining dimensions of passes when width and corner radii of billets are given.

Spark Plugs. Note on the Effect of Temperature on the Resistances of Spark Plug Insulations, J. D. Morgan. Engineering, vol. 106, no. 2758, Nov. 8, 1918, pp. 513-514, 3 figs. Description of an investigation.

PERSONALS

Gunner W. G. Mawhinney, B.C.E. (Man.) S.E.I.C., returned to Canada, December 20th, on the SS. "Regina," and is spending a furlough at his home in Tuelon, Manitoba.

Among the many members of *The Institute* who have been rewarded for their bravery during the War, will be noted with great satisfaction the name of Lieut. Frederick Alport, A.M.E.I.C., who was recently decorated with the Military Cross.

E. L. Cousins, A.M.E.I.C., chief engineer and general manager, Toronto Harbour Commissioners, who has been for the past six months acting as assistant fuel controller for Ontario, has recently accepted the position of industrial commissioner for the city of Toronto, in which capacity his services will be gratuitously given.

Lieut. W. D. Stavely, is still another member of *The Institute* to receive recognition for conspicuous bravery while on active service, having recently been awarded the Military Cross. Lieut. Stavely is a graduate of McGill University and became an associate member of *The Institute* in 1913. Before going overseas he was with Thomas Kirk, A.M.E.I.C., Q.L.S.

Major A. Douglas Fisken, M.C., J.E.I.C., of Toronto, was welcomed home recently after many months of active service at the front. Major Fisken who is an R.M.C. man, was in the thick of the fighting with the Canadians, was gassed and severely wounded. He plans to go to Victoria at an early date, pending his discharge from the army, and anticipates residing at the Coast.

Boris A. Bakhmeteff, M.E.I.C., Russian Ambassador to the United States, is now in Paris with other Russian diplomats seeking to preserve a United Russia. In an announcement to the Associated Press Mr. Bakhmeteff stated that Russia has been granted a respectful hearing by the Allies in her request for representation at the Peace Conference.

V. I. Smart, M.E.I.C. formerly Professor of Railway Engineering and Transportation, McGill University, and J. A. Burnett, A.M.E.I.C., formerly Electrical Engineer, Grand Trunk Railway System, are now associated as Consulting Engineers, located at, 821 New Briks Building, Montreal. The lines handled will be civil, electrical and mechanical engineering.

H. T. Eaton, who is a student member of *The Institute*, has received his commission as a lieutenant in the Canadian Engineers. Lieut. Eaton has been with the Canadian Expeditionary Force since 1914 when he went overseas with the 1st Field Troop. He is a graduate of Queen's University and was practicing as a civil engineer in Controller Tyrrell's office, Toronto, before enlistment.

Howard G. Kelley, M.E.I.C., President of the Grand Trunk Railway System, in his New Year's Greetings to the officers and employees said in part:—

"At the close of this eventful year, in which peace has been restored to the world, I desire personally to thank all officers and employees for the part they enabled the Grand Trunk to play in winning the war by their loval and efficient service."

The Dominion Government has appointed A. W. Campbell, M.E.I.C., to report on the action which should be taken by the Government in connection with the construction and improvement of roads, for which it is being asked to give its aid. Mr. Campbell was greatly interested in the subject while Deputy Minister of Public Works for Ontario about eight years ago before becoming Deputy Minister of Railways and Canals, which position he has lately resigned.

G. J. Lamb, Jr., J.E.I.C., has resigned his position as acting engineer of the city of Port Arthur and accepted an engineering appointment with the Kipawa Fibre Co., Temiskaming who are constructing a new town site in connection with their plant, with housing accommodation for about 7,000 people. R.S. & W.S. Lea and H. S. Ferguson, members of *The Institute*, are the consulting engineers for this work, the contract for which is held by The Fuller Construction Co.

Brigardier-General Charles J. Armstrong, C.M.G., M.E.I.C., is receiving the congratulations of his many friends on the honor bestowed on him by the King at the New Year in being created a Companion of the Bath. At the outbreak of the war he was one of the first to volunteer and went over with the First Contingent as Colonel in Command of the Engineers. He became Brigadier-General and after receiving severe injuries in a railway accident which kept him in hospital nineteen months, he was attached to the Imperial forces. He is now Chief Engineer of the Seventh Army Corps, and in charge of the repair and reconstruction of canals in Belgium and France. He also saw service in South Africa.

Captain Geo. H. Ferguson, M.C., B.A.Sc., A.M.E.I.C., of Toronto, has recently retired from the army and expects to resume his former occupation at an early date. Enlisting in the early days of the war Captain Ferguson was in the thick of the fighting in the forward area during the Somme, Vimy and Paschaendael engagements and was continuously under fire during the German advance in the spring of 1918 and remained unhurt until the end of June, when his leg was broken. Due to continuous exposure he suffered from complications, which necessitated his returning home for a rest, where he was convalescing when the armistice was signed. Captain Ferguson's many friends in the profession wish him a speedy recovery to enable him to continue his successful engineering career.

Major F. L. C. BOND, A.M.E.I.C.

Major F. L. C. BOND, A.M.E.I.C.

Chief Engineer, Grand Trunk Railway

Major F. L. C. Bond, A.M.E.I.C., has been appointed by the Executive of the Grand Trunk Railway as chief engineer of the System to succeed H. R. Safford, M.E.I.C., who resigned recently to become regional director of the Central Western District, United States Railroad Administration. Major Bond has just returned from overseas after two years' service with the 10th Battalion Canadian Railway Troops. He was born in Montreal in 1877, was educated at Montreal High School, the Collegiate Institute and McGill University. Upon graduating from McGill in 1898 he entered the service of the Grand Trunk as Assistant Resident Engineer of the Eastern Division, and in 1901 was appointed engineer in charge of double track construction. In 1902 he was night superintendent on the construction of the Park Avenue tunnel, of the New York subway, but returned to the Grand Trunk as Resident Engineer, Eastern Division, a position which he held until 1913. From 1913 to 1916, when he went overseas, Major Bond was Division Engineer,. Eastern Lines, Grand Trunk Railway System. He holds a high reputation in railway and engineering circles, and his work with the Canadian Expeditionary Force won the highest commendation.

+ + OBITUARIES + +

Henry Martyn Peck, S.E.I.C.

News of the death but no particulars have been received concerning Henry Martyn Peck, Student member of *The Institude,* who died of wounds in France, September 28th, 1918. The late Mr. Peck was twenty-six years of age and was educated at Moncton College, England and Toronto University. His home was at 324 Glen Road, Toronto.

* * *

Leonard Oswald Clarke, A.M.E.I.C.

On November 22nd, Leonard Oswald Clarke, A.M.E.I.C., O.L.S., succumbed to an attack of influenza-pneumonia at the age of thirty-seven years. He entered *The Institute* as a Student member in 1903, and became an Associate Member in 1906, at which time he was town engineer of North Bay, Ont. During this time the present water and sewer systems, including large storage reservoirs, were designed and constructed. Previous to this he was connected with F. W. Farncomb, of London, Ont., and afterwards with the late Jos. Cozens, at Sault Ste. Marie, Ont. For a number of years the late Mr. Clarke engaged in private practice in North Bay, following which he was engaged in contracting, mainly on the Lake Superior Division of the Canadian Pacific Railway.

Mr. Clarke was well know in the north country, having laid out many of the town sites along the T. & N. O. Railway, including Cobalt, Ont. He was a prominent Mason, being Past District Grand Prior for Algoma District. For the past three years Mr. Clarke has made his home in Toronto, where he was buried on November 23rd, at Mount Pleasant Cemetery. His family will make their home in Aurora, Ont.

* * *

Walter Kendall Greenwood, B.A.Sc., A.M.E.I.C.

After a brief illness from pneumonia, Walter Kendall Greenwood, A.M.E.I.C., engineer of the Orillia Water, Light and Power Commission, died at his home in Orillia at the age of thirty-seven years. Born in Toronto on June 1st, 1881, he entered the Upper Canada College in 1894 and later attended the University of Toronto, graduating with honours in 1905. During his summer holidays he occupied positions as draftsman with Canadian General Electric Company, draftsman and engineer with Hamilton Gas Light Company, assistant to superintendent Toronto Niagara Power Transmission Line. For a year he was manager and superinendent of the Bowmanville Electric Light Company and later occupied a position with the Producer Gas Company of Toronto. In 1907 he was resident engineer of the Simcoe Water Works construction and in 1908 occupied a similar position at Thorold, Ont., later securing the position which he occupied at the time of his death.

The late Mr. Greenwood was elected an Associate Member of *The Institute* in 1908 and took an active interest in its affairs. At the time of the Professional Meeting held in Toronto last spring, he took an active part in the discussion of several of the papers. He was a son of Russell Greenwood, of Toronto, and was held in the highest esteem by all who knew him.

* * *

William John Galbraith, B.Sc., A.M.E.I.C.

An illness of only two weeks from influenza which developed into pneumonia, caused the death of William John Galbraith, B.Sc., A.M.E.I.C., at his home, 4145 Dorchester Street, Westmount, on Saturday, December the 21st, at the age of 32 years. The late Mr. Galbraith was a Montreal boy, having attended high school in this city, graduating from McGill University in 1909. In the statement of his engineering career, he mentioned that he was engaged as a draftsman with the Dominion Bridge Company, in 1902, previous to his entering McGill. On his graduation he was with the Geological Survey in British Columbia; about two years later, he was assistant engineer on caisson work on the sub-structure of the Quebec Bridge. As a contractor on his own account he undertook a number of important works, including the Government dock at Berthier, Que.; dam and power house at Ingles Falls, Ont.; two railway bridges at St. Hyacinthe; reinforced concrete rib arch bridge over the Speed River at Guelph, the wireless station at Newcastle, N.B., and the dam and power house over the Severn River, for the Hydro-Electric Power Commission, Ontario.

In 1916 the late Mr. Galbraith joined the Foundation Company as superintendent of construction, and devoted his attention to the erection of shipbuilding plants at Victoria, Seattle, Tacoma and Savannah, and at the time of his death was engaged in construction of a ship canal and shipyards at New Orleans. He had been called to Montreal in connection with the valuation of a shipyard for the Dominion Government.

An energetic, capable, construction engineer and typically Canadian, at an early age engaged on some of the largest construction works on the Continent, he had already achieved success and his career promised to be one far beyond the average.

He is survived by Mrs. Galbraith and one daughter.

* * *

Laurence Anable Darey, M.E.I.C.

Laurence A. Darey died suddenly at his home in Sherbrooke, on November 29th, and was buried at the Mount Royal Cemetery, Montreal, on December 2nd. He was widely known in Canada in connection with railway engineering.

In later years he had been mainly connected with the building of the Transcontinental Railway, though in the western construction camps of the Canadian Northern and on various lines in the western United States, "Larry" Darey was equally well known and widely popular.

He was born in Montreal on May 8th, 1865, the second son of the late P. J. Darey, Professor of French at McGill University. He was educated at McGill University and Union College Schenectady. He early entered the profession of railway engineering some years in Georgia, a year in Chili four years in the Panama and a period in the western States were among his early railroad experiences. In 1902 he married Ardella E. Murphy of Decorah, Iowa. He was later with the Canadian Northern in Saskatchewan and afterward with the G.T.P. at Winnipeg. For a few years he was chief engineer for the St. Maurice Construction Company at Three Rivers and for nine years prior to the outbreak of war he was divisional engineer on the Transcontinental Railway above La Tuque, Que.

For the past four years the late Mr. Darey had resided in Sherbrooke where he held the post of chief engineer for the Good Roads movement. Ill health had prevented him from engaging in active work for the last two years but his death came unexpectedly. Disappointed at the fact that his health prevented him from joining a construction unit for overseas service, he went last spring to the Rockies and spent two months at the Yellowhead Pass in connection with the taking up of steel for shipment to France.

He is survived by Mrs. Darey, who is at present residing in Sherbrooke.

Albert James Hill, M.E.I.C.

One of the original members of *The Institute* passed away on November 26th, at his home in New Westminster, B.C., in the person of Albert James Hill, at the ripe age of eighty-two years. He is survived by Mrs. Hill, one daughter and two sons, F. T. Hill, of New Westminster and E. B. Hill, M.E.I.C., of Vancouver.

The late Mr. Hill was born at Sydney, Cape Breton, on April 7th, 1836, his parents being John Lewis and Margaret Hill, the latter a daughter of Dr. Joseph Whyte, R.N., of Banff, Scotland. His early education was acquired at home and he spent several years associated with his brothers in the building and launching of two schooners. In 1860 he entered Horton Collegiate Academy, where he completed his education, and in 1866 married Agnes Lawrence, the youngest daughter of Alexander Lawrence of St. John, New Brunswick. After spending two years as a member of the faculty of Horton Academy, Mr. Hill accepted an appointment on the European & North American Railroad, assisting in locating the line to Winn on the Penobscot River. During the next six years he was connected with different railroad companies in their exploration, survey and construction departments. After that he turned from railway building to the development of the coal resources of the country. He carried on a geological survey of the eastern Cape Breton coalfields, afterward embodied with the plans of the Dominion geological survey and published by order of the government. On January 1st, 1880, Mr. Hill was ordered to British Columbia on the construction on the Canadian Pacific Railroad, on the contract from Yale to Savona.

He continued in that work until October, 1882, when he was removed to Port Moody, closing his connection with the government service in December, 1884. He then engaged in the private practice of his profession in New Westminster. He was at one time engineer for the Municipality of Surrey. He has rendered efficient service both in public and private capacities to geological research in his native province and in British Columbia. His life work has been a valuable contribution to those labors which figure as factors in civilization and general improvement and he had a wide acquaintance among those who are prominent in scientific and professional circles throughout the country.

Professor William Muir Edwards, M.Sc., M.E.I.C.

The Edmonton Branch, and, in fact, the entire Institute, suffered a severe loss in the death, on Thursday, November 14th, of Professor William Muir Edwards, of pneumonia following influenza. His death will cause the deepest regret among a very wide circle of friends and admirers, not only in the city of Edmonton, where he was professor in civil and municipal engineering in the University of Alberta, but throughout Canada. Few men have the combined ability and devotion to public service that were his. Following a brillant career at McGill University, where he graduated with the degrees of B.Sc. in mining engineering, and M.Sc., he was for two years in charge of municipal engineering and mathematics, also hydraulic engineering, at McGill University. When the University of Alberta was organized in 1907 he was appointed to the professorial chair which he occupied at the time of his death.

Late Professor W. M. Edwards

In university circles he was a leading member of the Faculty, having held the Presidency of the Faculty Club for five years. His interests in student welfare were of the most varied character and always sustained with unflagging energy. He took an active part in athletics and trained the Varsity team in 1914 which carried off the senior Provincial championship. He was President of the Soldiers' Comfort Club and editor of the "News Letter" which was sent every week to every student of the University on active service. His public spirit and citizenship was shown in his being the prime mover in establishing the south side branch of the Young Men's Christian Association and for two years he served as officer commanding the 101st regiment.

He was also actively connected with Knox Presbyterian Church of which he was an elder as well as a member of the board of managers.

The following tribute to the late Professor Edwards appeared in an editorial of the Edmonton Journal on November 15th.

"Many devoted Edmonton men and women have literally sacrified their lives in fighting the scourge which has played such havoc here in the past few weeks and in seeking to alleviate the suffering of those already stricken down. Professor W. Muir Edward, of the University of Alberta, belonged to that heroic band. The volunteer work which has been done in this city during this period of great affliction has been of the kind that gives one a new faith in humanity. Whether, like him, they have given the last full measure of devotion or whether they have come safely through the dangers of their self-imposed tasks, we cannot begin to render to them the tribute that is their due.

Apart from this, the loss of Professor Edwards to the city and the province is a most serious one. One of the original members of the University staff, he did most excellent work in his department both in the days of small things for the institution and after it had attained a large development. His engineering advice was often sought and highly valued in connection with civic and other undertakings.

Few men have a wider range of interests. He was as active in church and Y.M.C.A. work as in the promotion of athletics. Nothing which went to the building up of clean, virile young manhood failed to attract his interest and his energies. He had nothing whatever in common with the ordinary notion of a university professor, living in a world of abstractions apart from the world of men. It is because the provincial seat of higher learning has, in all that it has done, kept so close to the everyday life about it that it has made such a place of usefulness for itself and has made such a growth in its comparatively short time of existence.

In the great years ahead of us, men like Professor Edwards will be needed as never before and his death, with all its attendant circumstances, is a most poignant tragedy."

In the engineering profession in which he occupied a high place his interest was constant. When the Edmonton Engineering Society was in existence he took an active interest in the organization and when elected President arranged a re-organization as the Edmonton Branch of the Canadian Society of Civil Engineers, which gave Edmonton engineers better status. Shorty before his death he helped the Edmonton Branch to take a prominent part in provincial legislation and the draft Act which the Branch has submitted is largely his work.

The late Professor Edwards was born in Montreal, November 14th, 1879 and is survived by Mrs. Edwards and a small family.

Preliminary Notice of Application for Admission and for Transfer

The By-Laws now provide that the Council of the Society shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in January, 1919.

FRASER S. KEITH, Secretary.

---

*The professional requirements are as follows:—

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course. In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineers' office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the following branches at his option Railway, Municipal, Hydraulic, Mechanical, Mining, or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five years or more years.

Every candidate for election as JUNIOR shall be at least twenty-one years of age, and must have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-five years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects Geography, History (that of Canada in particular), Arithmetic, Geometry Euclid (Books I.-IV. and VI.), Trigonometry, Algebra up to and including quadratic equations.

Every candidate for election as ASSOCIATE shall be one who by his pursuits, scientific acquirements, or practical experience is qualified to co-operate with engineers in the advancement of professional knowledge.

> The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BALFOUR—HARRY E., of Quebec, Que. Born at Emerson, Man., Jan. 22nd, 1884. Educ. Vancouver high school, I. C. S., graphic statics and proportioning materials, reinforced concrete construction. International Library of Tech. With National Transcontinental Ry., as follows: 1906-07, draughtsman, Ottawa; Jan. 1907 to June 1907, draughtsman and topographer on location; 1907-09, asst. engr. on constr. Resy. 21B (2 mos. acting res. engr.); 1909-10, draughtsman dist. office, North Bay; Mar. to Nov. 1910, res. engr. Resy. 23, D; 1911-12, draughtsman in Winnipeg Car Shops (3 mos. asst. engr. constr.); 1912-13, draughtsman on design, Quebec Loco. Shops; 1913-16, asst. engr. of constr., Quebec shop plant; 1916 to date, asst. engr. Jos. Gosselin Ltd.

V. White, consulting engr. International Joint Comm'n, hydrographical and topographical surveys and hydraulic engr. studies; 1916 to date, Lieut. C.E., asst. to Third Division officer, R.C.E., M.D. 6, Halifax, N.S.

References: J. F. Pringle, R. W. McColough, T. S. Scott, F. J. Dawson, K. H. Smith.

STRACHAN—JOHN, JR., of Hudson Bay Junction, Sask. Born at Halifax, N.S., March 31st, 1883. Educ. Acacia Villa School, N.S., St. Andrews Coll., Toronto. With T.C.Ry., as follows: 1905-08, rodman; 1908-09, topographer and levelman on location; 1909-11, instrumentman on constr.; 1912-14, res. engr.; 1915-18, res. engr., Hudson Bay Ry., Dec. 1918, supervisor "Pasquia Forest Reserve."

References: A. E. Doucet, J. W. Porter, A. D. Porter, F. P. Moffat, W. T. Jamieson, D. S. Scott, A. Dick, E. J. Bolger.

TURNER—STANLEY ROY, of Peterboro, Ont. Born at Peterboro, Mar. 22nd, 1888. Educ., B.Sc., Queen's Univ., 1916. 1904-08, mech. shop work, pattern and mach. shops and foundry, with Wm. Hamilton Co., Peterboro; 1908-09, asst. supt. of steel constr., bldgs. and penstock, Structural Steel Co., Montreal; 1909-12 (3½ yrs.), draughting, checking and designing of steel bldgs. and bridges, Can. Foundry Co., Toronto; 1913 (6 mos.), draughtsman on Quebec bridge, St. Lawrence Bridge Co., Montreal; 1914 (4 mos.), C.E.F.; 1915 (5 mos.), water power design, Wm. Hamilton Co., Peterboro; 1916 (7½ mos.), in chg. of installation and erection of machinery of power development at Bala, Ont., Wm. Hamilton Co.; 1916-18, mill engr., Riordon Pulp & Paper Co., Hawkesbury, Ont.; 1918, engr. Spanish River Pulp & Paper Co., Espanola, Ont. (5 mos.); 1918 (3 mos.), C.E.F. At present engr., Wm. Hamilton Co., Peterboro, Ont.

FOR TRANSFER FROM CLASS OF STUDENT TO HIGHER GRADE

BOULTON—CHARLES ALBERT, of Saskatoon, Sask. Born at Ayr., Ont., Jan. 3rd, 1893. Educ. commercial course, Galt Business Coll., 1913, B.Sc., Queen's Univ., 1917. 1914-18, staff-sergeant on the engineering staff of Military dist. No. 3, Kingston, Ont., at present with Murphy and Underwood, consulting engrs., Saskatoon, on municipal engineering work.

References: J. E. Underwood, A. A. Murphy, E. A. Stone, J. C. Gwillim, J. B. Harvey, G. Hemmerick, G. L. Guillet.

DALTON—GEORGE FRANCIS (Lieut.) of Ottawa, Ont. (now on Active Service). Born at Ottawa, Ont., July 6th, 1891. Educ., B.A.Sc. (structural engr. option), Toronto, 1914, Summers 1908-10-11-12, with Geodetic Survey of Canada, field work, triangulation and precise levelling, 1913-15, with Geodetic Survey precise levelling and triangulation in chg. of work. At present Lieut. 3rd. Can. Engr. Battn., B.E.F., France.

References: N. J. Ogilvie, J. J. McArthur, J. D. Craig, J. L. Rannie, L. O. Brown.

GIGUERE—EUDORE, of Montreal, Que. Born at Lachine, Que., Jan. 13th, 1895. Educ., commercial course, Civil Engr., Laval, 1917, and Chemist Engr., Laval, 1918. Summers of 1912-13-14, with E. Desaulniers, C.E., on survey work; 1915, with Geological Survey; 1916, with Roads Material Survey. At present time chemist analyst with The Canadian Explosives Ltd., Bel-Oeil.

References: E. Marceau, P. Lecointe, C. Leluau, S. A. Baulne, A. Frigon.

WELSFORD—HUBERT GRAY, of Winnipeg, Man. (now in France). Born at Los Gates, Cal., U.S.A., July 16th, 1894. Educ., 2 yrs. private tuition in math. and engr. With Dominion Bridge Co., Winnipeg, Man., as follows: 1911-13, draughtsman on structural steel work; Jan.-Oct. 1913, asst. to shop supt.; 1913-1916, in engr. office. designing, estimating and contracting; 1916, to date, engr. officer in R.A.F.; Feb.-Nov, 1917, asst. officer in chg. of engines No. 1 Aircraft Depot; 1917, to date, officer in chg. of engines, Reception Park, B.E.F., in command of 120 mechs. (man supply depot for France). Experience includes care and tuning of engines and 100 hrs. flying as engr. observer on air tests.

References: G. E. Bell, J. G. LeGrand.

ENGINEERING INDEX

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to the engineering profession and to every branch of the profession.

PHOTOSTATIC PRINTS

Photostatic copies may be obtained of any of the articles listed in this section. Price of each print (up to 11 x 14 in. in size), 25 cents, plus postage. A separate print is required for each page of the larger-size periodicals, but where possible two pages will be photographed together on the same print. Bill will be mailed with the prints.

Orders should be sent to

Harrisson W. Craver, Director,
Engineering Societies Library,
29 West Thirty-ninth Street, New York, N.Y.

AERONAUTICS

AEROPLANE PARTS

STICK CONTROL. The Warner Duplex Stick Control. Aerial Age, vol. 8, no. 13, Dec. 9, 1918, p. 661, 3 figs. Brief description of hand and knee grips for use of pilots.

TAIL. A Gotha Biplane Tail. Flight, vol. 10, no. 40, Oct. 3, 1918, pp. 1107-1108, 1 fig. Design consisting of two horizontal approximately triangular planes, top plane being supported on cabine of steel tubes, while sides of bottom plane are bolted to sides of body.

AEROSTATICS

MILITARY. Military Aerostatics, H. K. Black. Aerial Age, vol. 8, nos. 6, 7 and 9, Oct. 21 and 28, and Nov. 11, 1918, p. 325, 1 fig., 371, 1 fig. and 475, 2 figs. Oct. 21 : Balloon baskets. Oct. 28 and Nov. 11 : Equipment of basket. (Continuation of serial.)

AIRCRAFT PRODUCTION

U. S. NAVY. Naval Aircraft Factory at Philadelphia, Indus. Management, vol. 56, no. 6, Dec., 1918, pp. 465-470, 13 figs. Story of great industrial achievement of United States Navy.

APPLICATIONS

EXPLORATION. The Possibility of Aerial Reconnaissance in the Himalaya. A. M. Kellas. Aeronautics, vol. 15, no. 257, Sept. 18, 1918, pp. 275-277. Fundamental facts and requirements of undertaking. Paper before Roy. Geog. Soc.

AUXILIARY SERVICE

TRUCKS. Building for the Aviation Service, M. E. Hoag. Am. Mach., vol. 49, no. 23, Dec. 5, 1918, pp. 1043-1044, 7 figs. Building a 3 ¼-ton special truck for U. S. Aviation Signal Service. First article.

DYNAMICS

CEILING. Elementary Considerations on the Ceiling of an Airplane (Données élémentaires sur le plafond d'un avion), André Lainé. l'Aérophile, year 26, nos. 17-18, Sept. 1-15, 1918, pp. 264-265. Points out convenience of high ceiling and means of attaining it.

On an Experience of the Flyer Gilbert (Sur une expérience du pilote Gilbert). F. Roux. l'Aérophile, year 26, nos. 17-18, Sept. 1-15, 1918, p. 236, 1 fig. How it happened that Eugène Gilbert maintained his plane stationary in air while machine was running at full speed.

STABILITY. Lateral Stability in Aeroplanes, C. Levick. Aerial Age, vol. 8, no. 13, Dec. 9, 1918, p. 660, 3 figs. Computation of effect of a roll on a machine in terms of dihedral angle of aerofoils. Also in Flight, vol. 10, no. 42, Oct. 17, 1918, p. 1165, 3 figs.

ENGINES

DESIGN. The Design of Airplane Engines (II), John Wallace. Automotive Eng., vol. 3, no. 9, Oct., 1918, pp. 415-417 and 401, 3 figs. Comparison of rotary and fixed radial; trend of modern design; cooling of cylinders; indicator diagram; compression ratio. From Aeronautics. (Continuation of serial.)

HISTORY. Outline of History of Aviation Engine Production, H. H. Emmons. Aerial Age, vol. 8, no. 13, Dec. 9, 1918, pp. 662-665, 2 figs. Elementary training engines; development of Liberty, 12; methods of production. Also in Motor Age, vol. 34, no. 23, Dec. 5, 1918, pp. 18-19 and 30, 3 figs.

LIBERTY. American Liberty Motor (Le moteur Américain Liberty). l'Aérophile, year 26, nos. 17-18, Sept. 1-15, 1918, p. 271. Abstract of description authorized by War Department. Also in Sci. Am., vol. 99, no. 23, Dec. 7, 1918, pp. 455 and 466, 4 figs.

MAYBACH. The 300-Hp. Maybach Aircraft Engine, Automotive Ind., vol. 39, nos. 18, 20 and 21, Oct. 31, Nov. 14 and 21, 1918, pp. 755-759, 8 figs., 840-842, 9 figs., 882-887, 5 figs. Technical description of largest German Aircraft engine model. Issued by Tech. Department, Aircraft Production, Ministry of Munitions; Nov. 14 : Lubricating system; details of oil pumps; cooling and ignition systems; carburetor and fuel feed system; details results of horsepower and fuel consumption tests; table of engine dimensions; general analysis of weights; chemical and physical analysis of material in various parts. Also in Automobile Engr., vol. 8, no. 119, Oct. 1918, pp. 285-295, 27 figs.; Flight, vol. 10, no. 39, Sept. 26, 1918, pp. 1084-1087, 2 figs.

The 200-Hp. Austro-Daimler Aero Engine. Engineer, vol. 126, nos 3279 and 3280, Nov. 1 and 8, 1918, pp. 376-379, 10 figs, 393-394, 7 figs. Description of details, with principal data and illustrations. Also in Flight, vol. 10, nos. 44 and 45, Oct. 31 and Nov. 7, 1918, pp. 1217-1222, 10 figs., and 1255-1259, 12 figs.; Engineering, vol. 106, no. 2757, Nov. 1, 1918, pp. 488-492, 17 figs.; Aeronautics, vol. 15, no. 263, Oct. 30, 1918, pp. 403-417, 27 figs.

PANHARD. The Panhard—300 Hp. (Direct Type Aviation Motor), E. H. Sherbondy. Aerial Age, vol. 8, no. 6, Oct. 21, 1918, pp. 308-309, 5 figs. Motor with two rows, each of six cylinders, set at an angle of 60 deg. from each other.

GLIDERS

An Interesting Biplane Glider, F. J. Camm. Aeronautics, vol. 15, no. 262, Oct. 25, 1918, p. 393. Chief dimensions and process of construction.

HISTORY

LANGLEY. What Langley Did for the Science of Aviation (II). Automotive Ind., vol. 39, no. 17 and 18, Oct. 24 and 31, 1918, pp. 714-718 and 728, 10 figs., and 761-765, 7 figs. Experiments with rubber-driven models and others using compressed air, carbonic acid, gas and electric batteries; adoption of steam as source of power. Oct. 31: Experiments with quarter-size and man-carrying aerodromes. (To be continued.)

INSTRUMENTS

BAROGRAPH. German Barograph No. 1623, Range o to 8000 m. Flight, vol. 10, no. 42, Oct. 17, 1918, pp. 1167-1168, 6 figs. General remarks on details of construction. Also in Aeronautics, vol. 15, no. 262, Oct. 23, 1918, pp. 382-384, 6 figs.

Instruments for Air Use, W. A. Robson. Sci. Am. Supp., vol. 86, no. 2235, Nov. 2, 1918, p. 285. From Flight.

MATERIALS OF CONSTRUCTION

STEEL TUBES. Steel Tubes, Tube Manipulation, and Tubular Structures for Aircraft, W. W. Hackett and A. G. Hackett. Flight, vol. 10, no. 44, Oct. 31, 1918, pp. 1233-1235. Tapered tubes; tubular liners or reinforcements; tests on soldered joints; brazing; welding; rust prevention. (Concluded.) Also in Automotive Eng., vol. 3, no. 9, Oct. 1918, p. 396 and (discussion) pp. 397-398.

METEOROLOGY

Meteorology in Relation to Aeronautics (1), W. H. Dines. Sci. Am. Supp., vol. 86, no. 2239, Nov. 30, 1918, pp. 351-352. Review of data required by an aviator when in the air. Paper before Aeronautical Soc. of Gt. Britain. From Aeronautical Jl.

MILITARY AIRCRAFT

BRITISH. Some Recent Types of Allied Military Planes. Automotive Ind., vol. 39, no. 17, Oct. 24, 1918, pp. 706-707, 4 figs. General features of Spad single-seater tractor scout, Vickers F B-14, long-distance reconnaissance tractor biplane, Sopwith "Hippo" two-seater fighter, and Avro training machine.

GERMAN. German Aircraft. Times Eng. Supp., no. 527, Sept., 1918, p. 198. Abstract of five reports of Technical Department, Aircraft Production, Ministry of Munitions, describing Maybach engine, Rumpler two-seater biplane. Hannoveraner biplane, an armored machine, and Pfalz scout.

MODELS

MODEL CONSTRUCTION. Model Aeroplane Building as a Step to Aeronautical Engineering. Aerial Age, vol. 8, nos. 6, 7, 8 and 9, Oct. 21, 28 and Nov. 4, 11, 1918, p. 377, 7 figs., 389, 1 fig., 433 and 483, 1 fig. Oct. 21: Construction vertical stabilizer. Oct. 28 : Design and building of a man-carrying aeroplane. Nov. 4 and 11: Calculation of sustaining power and resistance of wings and explanation of table giving aerodynamic laboratory tests. (Continuation of serial.)

Model Aeroplanes (XVI). F. J. Camm. Aeronautics, vol. 15, nos. 258 and 261, Sept. 25, Oct. 16, 1918, p. 300, 1 fig., 369, 2 figs. Details of a tractor monoplane. Oct. 16: Notes on attaching elastic and on manner of flying model.

MODEL TESTING. The Theoretical Basis of Model Strength Tests for Aeroplane Structures, W. L. Cowley and H. Levy. Aerial Age, vol. 8, no. 6, Oct. 21, 1918, pp. 322-323. Application of principle of homogeneity of dimensions to determination of strength of structure.

PLANES

A. E. G. A. E. G. Armoured Aeroplane. Engineering, vol. 106, no. 2754, Oct. 11, 1918, pp. 416-417, 15 figs. Principal data and description, with details of construction illustrated.

The Fokker Biplane, Type D VII. Flight, vol. 10, nos. 40, 41 and 42, Oct. 3, 10, and 17, 1918, pp. 1109-1116, 1142-1144 and 1161-1164, 23 figs.

Data relating to performance and detailed particulars of weights. Issued by Technical Department, Aircraft Production, Ministry of Munitions. Also in Aerial Age, vol. 8, no. 8, Nov. 4, 1918, pp. 424-427, 20 figs.; l'Aérophile, year 26, nos. 17-18, Sept. 1, 1918, pp. 257-262, 10 figs.: Aeronautics, vol. 15, no. 259, Oct. 2, 1918, pp. 310-316, 23 figs.

A. R. The French A. R. Biplane. Aerial Age, vol. 8, no. 7, Oct. 28, 1918, pp. 374-375 6 figs. Particulars of two-strutter biplane of 13.3 m. span wihich has its fuselage supported between planes on ash struts.

Berg. The Austrian Berg Single-Seater. Flight, vol. 10, no. 44, Oct. 31, 1918, pp. 1225-1227, 7 figs. Mounting of 200-Hp. Austro-Daimler engine with which plane is equipped; tanks; instruments; control; undercarriage. (Continuation of serial.)

Continental. The Continental Kb-3T Training Tractor, John F. McMahon. Aerial Age, vol. 8, no. 6, Oct. 21, 1918, pp. 316-317 and 345, 4 figs. General specifications of machine designed for cheap construction by the Continental Aircraft Corporation.

Halberstadt. Report on the Halberstadt Fighter. Flight, vol. 10, no. 41, Oct. 10, 1918, pp. 1133-1141, 38 figs. Details of performance and construction. Issued by Technical Department Aircraft Production, Ministry of Munitions. Supplementing brief description given in issue of Aug. 1. Also in Engineer, vol. 126, no. 3276, Oct. 11, 1918, pp. 302-304, 25 figs.

Pfalz. Report on the Pfalz Single-Seater (G141). Aeronautics, vol. 15, no. 257, Sept. 18, 1918, pp. 270-274, 22 figs. Particulars and performance of German scout with streamline-shaped fuselage. By Technical Department. Aircraft Production, Ministry of Munitions.

Roland. The Roland Chaser D II, G, Douglas Wardrop. Aerial Age, vol. 8, no. 6, Oct. 21, 1918, pp. 310-312, 9 figs. Construction of fuselage, planes, tail, engine and undercarriage.

Siemens-Schuckert. A New German Chaser. Flight, vol. 10, no. 39, Sept. 26, 1918, p. 1083, 2 figs. Characteristics of Siemens-Schuckert biplane.

Sopwith. The Sopwith "Camel." Automotive Ind., vol. 39, no. 19, Nov. 7, 1918, pp. 790-791, 6 figs. Description of late model of British scout plane. Translated from German aircraft publication.

Zeppelin. The Zeppelin Biplane, Jean Lagorgette. Sci. Am. Supp., vol. 86, nos. 2237 and 2238, Nov. 16 and 23, 1918, pp. 316-319 and 334-335, 8 figs. Description of German bombing machine 134 ft. long. From Aeroplane.

PRODUCTION

Standardization. Effect of Changes on Airplane Output, Ind. Man., vol. 56, no. 5, Nov., 1918, pp. 375-377. Manufacturers must abandon idea of standardized production.

PROPELLERS

Analysis. Notes on Airscrew Analysis (III), M. A. S. Riach. Aeronautics, vol. 15, no. 257, Sept. 18, 1918, pp. 265-266. Outlines process by which experimental results on airscrews are analyzed and compared with their respective calculated performances. (Concluded.)

Calculations. Calculating Airplane Propeller Strength and Efficiency (II), F. W. Caldwell. Automotive Eng., vol. 3, no. 9, Oct., 1918, pp. 402-405. Limit of ceiling, comparison of conventional designs; calculations of efficiency during climbing; calculations for propeller chart. (Concluded.)

SPECIFICATIONS, AEROPLANE

U. S. Navy. Navy Department Airplane Specifications. Jl. Soc. Automotive Engrs., vol. 3, no. 5, Nov. 1918, pp. 325-329. Issued for use in connection with contracts and submission to Navy of new and undemonstrated designs.

TRANSATLANTIC FLIGHT

Transatlantic Flight, Frithiof G. Ericson. Jl. Soc. Automotive Engrs., vol. 3, no. 5, Nov. 1918, pp. 319-321. Favorable routes; requirements of airplane; flight endurance. From Aviation.

CIVIL ENGINEERING

BRIDGES

Concrete Bridges. Bridging the James River at Richmond, Va. Cement & Eng. News, vol. 30, no. 11, Nov. 1918, pp. 15-16. General dimensions of structure consisting of 18 reinforced-concrete arch spans.

Reinforced Concrete Bridges and Their Architectural Treatment, F. G. Engholm. Contract Rec., vol. 32, no. 45, Nov. 6, 1918, pp. 880-883, 6 figs. Recommends considerations of fitness, proportion and adaptability in design, and moderate use of decorations.

Reinforced-Concrete Trestles. Sci. Am. Supp., vol. 86, no. 2238, Nov. 23, 1918, p. 324, 3 figs. Viaducts recently constructed by Can. Pac. Ry.

Design. New Impact Formulas Needed in Designing Bridges of Various Types, J. A. L. Waddell. Eng. News-Rec., vol. 81, no. 21, Nov. 21, 1918, pp. 924-928, 2 figs. Scarcity of experimental knowledge of impact shown by review of tests and studies; group of formulas proposed; lower impact allowances for solid-floor bridges and concrete arches.

The Principal Bridges of the World. Sci. Am. Supp., vol. 86, nos. 2235 and 2236, Nov. 2 and 9, 1918, pp. 286-288 and 294. Comparison of their size, importance and principles of design.

Highway Bridges. Standardization of Detail in Highway Bridge Design, M W. Torkelson. Cement & Eng. News, vol. 30, no. 11, Nôv. 1918, pp. 33-34. Practice of Wisconsin Highway Commission.

Lift Bridges. Scherzer Lift-Bridge at Keadby (Ponte levatoio tipo Scherzer a Keadby). Ingegneria Italiana, vol. 2, no. 37, Sept. 5, 1918, pp. 131-134, 7 figs. Plans, dimensions and details of mechanism. From Génie Civil, Jan. 10, 1918.

Railroad Bridges. Special Foundation Work for a Railroad Bridge, J. H. Merriam. Ry. Age, vol. 65, no. 22, Nov. 29, 1918, pp. 951-953, 6 figs. New Burlington structure over Platte River is supported entirely on concrete piles.

Wilson Bridge. The Wilson Bridge at Lyons. Engineer, vol. 126, no. 3280, Nov. 8, 1918, pp. 387-388, 9 figs. Drawings, illustrations and description of le pont Wilson, formally opened at Lyons, July 14, 1918, and named in honor of President Wilson.

BUILDING AND CONSTRUCTION

Churches. Steel Construction Characterizes Chicago Church. Eng. News-Rec., vol. 81, no. 19, Nov. 7, 1918, pp. 860-863, 5 figs. Cantilever trusses carry front wall and gallery; dome trusses are supported by girders on tall four-post tower having no interior bracing.

Concrete Pedestal Pile. The McArthur Concrete Pedestal Pile. Contract Rec., vol. 32, no. 42, Oct. 16, 1918, pp. 830-831, 2 figs. Processes followed in construction of pile consisting of a 16-in. cylindrical shaft, with an enlarged base.

Fire-Resistive Construction. Fire Resistive Construction Committee Report. Eng. & Cement World, vol. 13, no. 10, Nov. 15, 1918, pp. 13-14, 1 fig. Specifications drawn by joint conference of representatives from ten American technical societies and the Can. Soc. of Civil Engrs.

Railroad Station. Toronto's Union Station Nears Completion. Contract Rec., vol. 32, no. 41, Oct. 9, 1918, pp. 805-808, 9 figs. Water-proofing; roof; elevators.

Reservoirs, Oil. Circular Earth Embankment Lined with Concrete Forms Oil Reservoir, E. D. Cole. Eng. News-Rec., vol. 18, no. 21, Nov. 21, 1918, pp. 932-936, 3 figs. Type originated in California; introduced into Texas fields on account of lack of steel; concrete roof carried on wood frame also because of lack of steel.

Reinforced Concrete Fuel-Oil Tanks. Can. Engr., vol. 35, no. 17, Oct. 24, 1918, p. 376, 2 figs. Dimensions and process of executing work.

Reservoirs, Water. Newton, Mass., Water Reservoir, Edwin H. Rogers, Eng. Cement World, vol. 13, no. 10, Nov. 15, 1918, pp. 9-12, 3 figs. Details of its four rectangular sections and circular gate chamber at centre, in which are installed a steel distributing tank and pipes from force main to different sections and overflow pipes and drains. From Proc. Boston Soc. Civil Engrs.

Reinforced Concrete Reservoirs, Montevideo. Engineering, vol. 106, no. 2756, Oct. 25, 1918, pp. 453-455, 43 figs. Description of two 6,500,000-gal. reservoirs constructed for City of Montevideo, Uruguay, R. C. Parsons, Engineer. Drawings of principal features.

Scaffolds and Falsework. Safe Construction of Scaffolds and Falsework, T. F. Foltz. Contract Rec., vol. 32, no. 42, Oct. 16, 1918, pp. 826-829. Outlines general construction of pole, suspended, outrigger, carpenters' bracket and painters' scaffolds, and indicates their general construction requirements. Paper before Nat. Safety Council.

Submerged Structures. Essentials of Proper Construction, J. W. Rollins. Contract Rec., vol. 32, no. 44, Oct. 30, 1918, pp. 870-873. Requirements of Concrete for submerged structures.

EARTHWORK, ROCK, EXCAVATION, ETC.

Blasting. Drilling and Blasting in Construction of Halifax Ocean Terminals Railway Eng. & Contracting, vol. 50, no. 21, Nov. 20, 1918, pp. 480-481. Description of some features of work. From paper by B. H. Smith before Eng. Inst. of Canada.

Quarry Blasting with Electricity. A. S. Anderson. Du Pont Magazine, vol. 9, no. 6, Dec., 1918, pp. 26-27, 3 figs. Ways of producing current and precaution to be observed.

Park Construction. Construction Plans Developed for the Bronx River Parkway Reservation, L. G. Holleran. Eng. News-Rec., vol. 81, no. 20, Nov. 14, 1918, pp. 899-903, 4 figs. Designs of Park Commission contemplate development of 1400 acres by grading and planting; numerous structures proposed; work to be done by day labor.

HARBORS

Concrete Construction. The Use of Reinforced Concrete Construction in Harbor Work, A. F. Dyer. Jl., Eng. Inst. Can., vol. 1, no. 6, Oct. 1918, pp. 242-251, 11 figs. Descriptions derived from articles and papers published in technical journals and proceedings of technical societies. Also in Eng. & Contracting, vol. 50, no. 21, Nov. 20, 1918, pp. 483-485.

Piers. Compression Strengths of Large Brick Piers. Eng. & Cement World, vol. 13, no. 10, Nov. 15, 1918, p. 25. Summary of conclusions based on past records and recent investigation by Bureau of Standards, composed of tests on piers 2 ft. 6 in. sq. by 10 ft. high in which three grades of brick were used.

Ports. Railway Construction in Connection with the Halifax Ocean Terminals, R. H. Smith. Jl. Eng. Inst., Can., vol. 1, no. 6, Oct. 1918, pp. 281-288. Methods employed and difficulties overcome in construction operations which necessitated considerable excavation work and presented other difficulties.

St. John Harbor, Alex. Gray. Jl. Eng. Inst. Can., vol. 1, no. 6, Oct., 1918, pp. 273-278, 15 figs. Outstanding features in habor and type of construction used in wharves.

The Port of Honduras. Times Eng. Supp., no. 527, Sept. 1918, p. 193. Projected improvements.

Sea Walls. Drive Inclined Precast Concrete Slabs for Sea Wall. Eng. News-Rec., vol. 81, no. 20, Nov. 14, 1918, pp. 897-898, 3 figs. Account of new type of beach protection replacing vertical concrete wall at Long Beach, Cal.

Pneumatic Caisson Method of Quay Wall Construction at Halifax Eng. & Contracting, vol. 50, no. 21, Nov. 20, 1918, pp. 489-490, 2 figs. From paper by J. J. MacDonald before Eng. Inst. of Canada.

MATERIALS OF CONSTRUCTION

TIMBER. Decay in Mill-Roof Timber, R. J. Blair. Textile World Jl., vol. 54, no. 23, Dec. 7, 1918, pp. 95-101, 4 figs. How it occurs and how it can be prevented. (To be continued.)

ROADS AND PAVEMENTS

CANADA. Canadian Highway Construction, Harry Stewardson. Contract Rec., vol. 32, no. 46, Nov. 13, 1918, pp. 899-901. Considers how to distribute cost of construction and maintenance so that necessary money can be secured and necessary expense fairly placed upon people who use roads and communities which receive benefits.

Highway Work in Ontario. Good Roads, vol. 16, no. 20, Nov. 16, 1918, pp. 185-186 and 191. Progress made in Canadian Province.

Roadway Improvements in Ontario, W. A. MacLean. Contract Rec., vol. 32, no. 41, Oct. 9, 1918, pp. 813-819, 10 figs. Extracts from annual report of Department of Public Highways for 1917.

CONCRETE. Concrete Road Construction, William W. Cox. Good Roads, vol. 16, no. 18, Nov. 2, 1918, pp. 165-166 and 169, 1 fig. Precautions and care to be observed. Paper before Mich. State Good Roads Assn.

Vertical Movements in Concrete Pavements and a Suggestion Towards Their Elimination, J. W. Lowell. Eng. & Contracting, vol. 50, no. 19, Nov. 6, 1918, pp. 441-443, 4 figs. From paper before Am. Concrete Inst.

COST KEEPING. Better System of Highway Cost Keeping, J. J. Tobin and A. R. Losh. Contract Rec., vol. 32, nos. 44, 45 and 46, Oct. 30 and Nov. 6 and 13, 1918, pp. 866-869, 886-888 and 903-906, 4 figs. Study of principles governing cost keeping and application of these principles to highway work. Detail of cost accounts and necessary codes.

FRANCE. Principles Upon Which the French Highways Are Built, Frank W. Harris Eng. News-Rec., vol. 81, no. 21, Nov. 21, 1918, between strategic points followed; great attention is given to drainage.

LOCATION. Putting the Right Road in the Right Place, Rodman Wiley. Am. City, vol. 19, no. 5, Nov. 1918, pp. 356-358, 4 figs. European practice in locating road; importance of exercising good judgment in grading and surfacing. Paper before Ky. Highway Engrs. Assn.

MACADAM. Capacity of Macadam Roads for War Business Increased. Eng. News-Rec., vol. 81, no. 22, Nov. 28, 1918, pp. 990-992, 5 figs. Three-foot concrete shoulders added at each side without closing highways to traffic; war labor conserved by using convicts for construction.

Oiled Macadam Roads Resurfaced with Concrete, E. A. Burt. Eng. News-Rec., vol. 81, no. 21, Nov. 21, 1918, pp. 942-944, 3 figs. Los Angeles County, Calfornia, builds roads in two sections to keep traffic moving; centre joint keeps autos on own side; cost figures.

Tar-Macadam v. Granite Macadam. Ellis W. Jones. Surveyor, vol. 54, no. 1399, Nov. 8, 1918, p. 220. Author's experience and recommendation that roads which have to carry from 600 to 1,000 tons a day should be main tained wich tar-macadam.

MAINTENANCE. Motor Vehicles and Their Influence Upon Road Construction W. A. Maclean. Surveyor, vol. 54, no. 1399, Nov. 8, 1918, pp. 221-222., Record of Deputy Minister of Public Highwys for Ontario.

Road Maintenance Methods and Devices Effect Saving of Material Labor and Fuel. Eng. News-Rec.,vol. 81, no. 22, Nov. 28, 1918, pp. 981-984 5 figs. Bureau of Maintenance and Repair, New York State Highways Department, working through nine division engineers' endeavors to keep, war-time traffic roads open still conserve material.

MIXERS. Direct Charging of Concrete Mixers. Mun Jl., vol. 45, no. 20, Nov. 16, 1918, p. 392. Feature of construction of concrete pavement in ten-mile section of Delaware road.

Two Mixers on Variable Road Work. Eng. & Cement World, vol. 13, no. 10, Nov. 15, 1918, pp. 31-32, 2 figs. Methods followed in construcion of a Western road.

SNOW REMOVAL. Snow Removal on Trunk Line Highways, Chas. J. Bennett. Good Roads, vol. 16, no. 20, Nov. 16, 1918, pp. 188-189. Study of the problem and suggestion for its solution. Before conference On Snow Removal from Trunk High ways Automobile Club of America.

SURFACING. How to Get Best Surface on a Concrete Road, A. H. Hunter. Cement & Eng. News, vol. no. 11, Nov. 1918, pp. 25-28, 2 figs. Suggestione in regard to application of forms, building of expansion joints and use of roller and ball.

Resurfacing Part of Buffalo-Albany Turnpike with Concrete, A. S. Hinman, Cement & Eng. News, vol. 30, no. 11, Nov., 1918, pp. 35-36, 3 figs. Method of carrying on work without closing traffic.

WOOD ROADS. Gasoline Consumption Tests Demonstrate Value of Hard, Smooth-Surfaced Roads, A. N. Johnson. Eng. News-Rec., vol. 81, no. 19, Nov. 7, 1918, pp. 843-850, 8 figs. Gasoline saving which would pay for construction of hard surface in few years is indicated between earth and smooth concrete, where daily motor traffic of 500 can be expected. Results of some tests and description of methods employed.

Paved Roadways Aid Plant Efficiency, H. Colin Campbell. Indus. Management, vol. 56, no. 6, Dec., 1918, pp. 471-472, 4 figs. Plea for better roadways around factory buildings.

The Measure of a Good Road, Robert C. Barnett. Eng. & Contracting, vol. 50, no. 19, Nov. 6, 1918, pp. 438-440, 3 figs. Mathematical treatment of thesis. Assumptions of good road; 1. A straight line is shortest distance between two points; 2. A plane of uniform slope is best grade between two points; 3. A hard, smooth surface offers less tractive resistance than rough or yielding one.

The Vital Importance of the Highway, S. M. Williams. Am. City, vol. 19, no. 5, Nov. 1918, pp. 354-355, 1 fig. Plea for establishment of Federal Highway Commission.

WATER SUPPLY

CONSUMPTION. Water Consumption in New York State Cities and Its Effect on Coal Consumption. Am. City, vol. 19, no. 5, Nov. 1918, pp. 376-378. From a report compiled by the State Bureau of Municipal Information of the New York State Conference of Mayors.

MAINS IN WINTER. Waterworks Operation. Mun. Jl., vol. 45, no. 21, Nov. 23, 1918, pp. 408-410. Methods of thawing water mains and services.

POLLUTION. Sanitary Aspects of Water Supplies at Army Cantonments, James T. B. Bowles. Eng. & Contracting, vol. 50, no. 20, Nov. 13, 1918, p. 460. From Sept. Jl. of Am. Waterworks Assn.

RAILWAY WATER SUPPLY. New Water Treating Plants for the Burlington. Ry. Rev., vol. 63, no. 19, Nov. 9, 1918, pp. 661-666, 10 figs. Use of reinforced-concrete tanks on Casper division; various conditions of water supply: different types of construction.

Railway Water Supply from Wells. Ry. Rev., vol. 63, no. 19, Nov. 9, 1918, pp. 669-671. From report of committee on sources of railway water supply, to Am. Ry. Bridge and Building Assn., Chicago, Oct. 15, 1918, by C. R. Knowles, chairman.

SAND FILTERS. Coagulants Versus Sand Filters as Aid to Water Purification in the Field, H. S. Briggs and E. R. Marle. Contract Rec., vol. 32, no. 46, Nov. 13, 1918, pp. 906-908. Description of installation embodying alum process. From Roy. Engrs. Jl.

Drifting Sand Filter, Toronto Island, Geo. G. Nasmith and N. J. Howard. Can. Engr., vol. 35, no. 17, Oct. 24, 1918, pp. 359-364, 6 figs. Report of bacteriological and physical tests performed on section comprising five filter units.

Toronto's Drifting Sand Filter. Mun. Jl., vol. 45, no. 20, Nov. 16, 1918, pp. 390-392. Construction and operation: bacteriological and physical tests; conclusions as to efficiency of plant.

WATERWAYS

DAMS. High-Pressure Gates in Dams for Water-Works and Irrigation Reviewed. D. W. Cole. Eng. News-Rec., vol. 81, no. 20, Nov. 14, 1918, pp. 880-884, 5 figs. From sluice gates in Sudbury Dam of Boston Water-Works through various stages of gate development in high dams of U. S. Reclamation Service. From paper presented at Idaho conference of engineers in 1918.

Modifications in the Character of a Water Stream Produced by Construction of a Dam (Modifications apportées au régime d'un cours après l'établissement d'un barrage), K. Zorayan. Revue Générale de l'Electricité, vol. 4, no.7, Aug. 17, 1918, pp. 226-229, 5 figs. Chart for tracing output curve knowing the declivity of a water course and the height of water in dam.

GATES. Some Experiences with Large-Capacity Reservoir Outlets, James M. Gaylord. Eng. News-Rec., vol. 81, no. 21, Nov. 21, 1918, pp. 945-950, 2 figs. Specially designed gates control discharge of immense volumes of water under pressures above 200 ft.; difficulties and how they have been overcome. Paper before Colorado Assn. of members of Am. Soc. of Civil Engrs.

RUN-OFF. Progress Report of Committee on Run-Off. Jl. Boston Soc. Civil Engrs., vol. 5, no. 9, Nov., 1918, pp. 387-422, 3 figs. Use of the current meter in stream gaging; 0.2 and 0.8 method in power canals; precipitation, evaporation and run-off; effects of ice on river discharge; methods to be used in compilation of data.

STREAM REGULATION. Stream Regulations in Quebec Province, Olivier Lefebvre. Can. Engr., vol. 35, no. 19, Nov. 7, 1918, pp. 399-402 and 411, 5 figs. Account of increase in water power by using Lakes St. Francis and Aylmer as storage basins and indications of possible developments. From Annual Report of Quebec Streams Commission.

ELECTRICAL ENGINEERING

ELECTROCHEMISTRY

REDUCTION OF METALS. Electric-Furnace Reduction of Certain Metals Susceptible of Industrial Utilization (Sur la préparation au four électrique de quelques métaux susceptibles d'utilisation industrielle), Jean Escard. Revue Générale de l'Electricité, vol. 4, no. 11, Sept. 14, 1918, pp. 375-386, 3 figs. Notes on reduction of barium, calcium, glucinum, cobalt, nickel, titanium, manganese, chromium, molybdenum, tungsten, vanadium.

ELECTROPHYSICS

DISTRIBUTION, ELECTROSTATIC. The Electron Theory of Metallic Conductors Applied to Electrostatic Distribution Problems, L. Silberstein. Lond., Edinburgh & Dublin Phil. Mag., vol. 36, no. 215, Nov., 1918, pp. 413-420. General expression for equilibrium distribution in terms of total charge and potential of external field, and application of general formula to cases of full spherical conductors and hollow sphere.

PERIODIC CURRENTS. Oscillating Energy (Energie oscillante), G. Szarvady. Revue Générale de l'Ectricité, vol. 4, no. 12, Sept. 21, 1918, pp. 411-422, 2 figs. Application of Ohm's law and Kirchoff's laws to watt currents and wattless components of electromotive forces and intensities of periodic currents.

SATURATION. On the Calculation of Magnetic and Electric Saturation Values, J. R. Ashworth. Lond., Edinburgh & Dublin Phil. Mag., vol. 36, no. 214, Oct., 1918, pp. 351-360. Deduces $I_o = \sqrt{(R/R^1)}$ where I_s is limiting intensity of magnetization, R the gas constant and R^1 the reciprocal of the product of susceptibility into absolute temperature; also ($i_o = \sqrt{(R/S)}$, where i_o is maximum current density a conductor can carry, S ratio of resistivity to absolute temperature and V the velocity of electron as it passes along conductor.

VACUUM PHENOMENA. Rectification by Vacuum Discharge, T. Kujirai. Denki Gakkwai Zasshi, no. 361, Aug. 31, 1918.

Theory of Coolidge Tube (Sur la théorie du fonctionnement du tube Coolidge à radiateur), A. Dauvillien. Revue Générale de l'Electricité, vol. 4, no. 13, Sept. 28, 1918, pp. 443-445. Explains increase in resistance by presence of large quantity of oxygen liberated at focus and by partial oxidation of filament, together with formation of double layer which diminishes electronic emission.

Vibration, Mechanical Generating Electrical Energy. Experiments on the Effect of the Vibration of a Stretched Wire Forming Part of a Closed Electric Circuit, Henry Jackson. Proc. Roy. Soc., vol. 95, no. A665, Sept. 2, 1918, pp. 51-57. Experiments with sensitive telephone detector which in author's judgment confirm Marran's suggestion that a mechanical vibration or note produces electricity.

GENERATING STATIONS

Alternators in Parallel. Synchronizing Alternators Coupled in Parallel (La mise en phase dans le couplage en parallèle des alternateurs). Elvind Styff. Revue Générale de l'Electricité, vol. 4, no. 13, Sept. 28, 1918, pp. 460-465, 11 figs. Schemes of connections and diagrams of electromotive forces. From Elektrotechnische Zeitschrift, vol. 38, Sept. 20, 1917, p. 461.

Turbo-Alternators. Accidents to Steam Turbo-Alternators (Au sujet des accidents aux turbo-alternateurs à vapeur), P. Boucherot. Revue Générale de l'Electricité, vol. 4, no. 13, Sept. 28, 1918, pp. 457-460. Report of Sub-Committee of Union of Electrical Syndicates proposing as a result of studies: (1) modifications in present designs of turbo-alternators, (2) modifications in usual specifications, and (3) dispositions to reduce loss when accident occurs.

The Production of Electricity by Steam Power, Alex. Dow. Elecn., vol. 81, no. 2111, Nov. 1, 1918, pp. 555-557. Abstract of address before Am. Electrochemical Soc.

GENERATORS AND MOTORS

Direct Current Motors. Weight of Direct Current Motors, A. Brunt. Elec. Eng., vol. 52, no. 2, Aug., 1918, pp. 28-29, 2 figs. Requirements of direct-current motors and graphs showing relation between weight and torque for commutating-pole and non-commutating-pole motors, and also between weight and torque for various-makes of apparatus.

Induction Motors. Changing Speed of Induction Motors. Power Plant Eng., vol. 22, no. 22, Nov. 15, 1918, pp. 926-928, 2 figs. Possible speed changes of induction motors to suit conditions in power plants.

Rolling-Mill Motors. Standardizing Large Rolling Mill Motors, K. Pauly. Blast Furnace, vol. 6, no. 10, Oct. 1918, pp. 411-414, 1 fig. Suggests motors be rated on continuous capacity at some particular temperature in order to avoid present difficulties of users of large rolling-mill motors. Paper before Assn. Iron & Steel Elec. Engrs.

Single-Phase Generators. Armature Reaction and Wave Form of a Single-Phase Generator (in Japanese), G. Shimizu. Denki Gakkwai Zasshi, no. 362, Sept. 10, 1918.

Starting Resistances. Method for Determining Resistance Used for Starting Various Types of Motors, B. W. Jones. Power, vol. 48, no. 21, Nov. 19, 1918, pp. 740-744, 6 figs. A simple method for determining the ohmic value of resistance used for starting series, shunt and compound-wound direct-current motors and wound-rotor induction motors under various load conditions.

Synchronous Motors. For and Against Synchronous Motors, Will Brown. Elec. World, vol. 72, no. 21, Nov. 23, 1918, pp. 982-984.4 figs. Four objections that that have been frequently made to using synchronous motors; discussion showing how conditions have changed; synchronous motors and unity power factors.

Temperature Rise. Guarantees for Temperature Rise in Electrical Machinery, with Special Reference to Large Turbo-Generators, A. E. Du Pasquier. Tran. South African Inst. Elec. Engrs., vol. 9, part 7, July 1918, pp. 127-137 and (discussion) pp. 137-140. Urges that there is no good reason for restricting temperature rises, providing suitable materials are obtainable for withstanding the heat conditions that may arise.

LIGHTING AND LAMP MANUFACTURE

Arc-Lamp Globes. Renovation of Discolored Arc-Lamp Globes, Alfred Herz. Elec. World, vol. 72, no. 20, Nov. 16, 1918, pp. 935-936, 2 figs. Description of a system of removing stain by heat treatment.

Need for Improved Lighting in the Leather Industry, F. H. Bernhard. Elec. Rev., vol. 73, no. 20, Nov. 16, 1918, pp. 759-765, 7 figs. Tenth of series of articles on lighting in industries.

Lighting (General). Daylight vs. Sunlight in Sawtooth-Roof Construction, W. S. Brown, Jl. Am. Soc. Mech. Engrs., vol. 40, no. 12, Dec. 1918, pp. 1025-1029, 5 figs. Empirical research of amount of direct sunlight and intensity of daylight to be admitted on working plane in sawtooth construction; equation to determine time of admission of direct sunlight and number of hours of its duration with given orientation of sawtooth buildings and slope of lighting area; influence of size and slope of sawtooth lighting area on relative intensity of daylight from northern sky; examples illustrating manner of computing amount of diffused light entering building under several conditions. Presented at annual meeting of the Soc.

Elements of Illuminating Engineering (III), Ward Harrison. Elec. Eng., vol. 52, no. 2, Aug. 1918, pp. 30-34, 4 figs. Essentials in illumination design—coefficients of utilization, location of light sources, and recommended minimum spacings and minimum heights above plan of illumination for various units.

Lighting in Its Relation to the Eye, C. E. Ferree and G. Rand. Proc. Am. Phil. Soc., vol. 57, no. 5, 1918, pp. 440-478, 9 figs. Report of work of sub-committee on Hygiene of the Eye of Am. Medical Assn., involving an extensive experimentation on effect of different lighting conditions on eye, and investigation of factors in lighting situation causing eye to lose in efficiency and experience discomfort.

Some Modern Methods of Lighting, Geo. H. Stickney. Nat. Engr., vol. 22, no. 10, Oct. 1918, pp. 469-477, 7 figs., and (discussion), pp. 477-479. Analysis of elements of lighting systems required by factories, offices and stores. Paper before Nat. Assn. of Stationary Engrs.

War Time Lighting Economics, Elec. World, vol. 72, no. 19, Nov. 9, pp. 885-887. Salient features of report prepared by War Service Committee of Illuminating Engineering Society for U. S. Fuel Administration; falacies to be avoided; making maximum use of daylight.

Reflecting and Diffusing Light. Reflecting and Diffusing Light, Ward Harrison. Textile World Jl., vol. 54, nos. 18, 20, 21 and 22, Nov. 2, 16, 23 and 30, 1918, pp. 61 and 71, 4 figs., 25-27, 1 fig., 59-63, 5 figs., and 33, 5 figs. Properties of accessories necessary for good industrial illumination.

Steel Mills. Better Lighting of Iron and Steel Mills and Fabricating Plants, F. H. Bernhard. Elec. Rev., vol. 73, no. 22, Nov. 30, 1918, pp. 841-845, 7 figs. Eleventh of series of articles on improvement of lighting in industries.

MEASUREMENTS AND TESTS

Galvanometers. The Einthoven Galvanometer, Samuel D. Cohen. Wireless World, vo.. 6, no. 68, Nov. 1918, pp. 437-438. Special simple construction of Einthoven type used by writer for measuring radio receiving currents. From Elec. Experimenter.

Insulation Measurement. Electrolytic Method of Measuring Electrostatic Field of Insulators (La mesure du champ électrostatic dans les isolateurs d'après la méthode électrolytique), W. Estorff. Revue Générale de l'Electricité, vol. 4, no. 12, Sept. 21, 1918, pp. 433-434, 1 fig. A small line is placed between electrodes in electrolyte and ratio of resistances of distances between line and each electrode is determined by Wheatstone bridge operating circuit with alternating current; correction coefficient for air values is determined in similar manner. From Elektrotechnische Zeitschrift, vol. 39, Feb. 7, 14 and 21, pp. 53, 62 and 76, 28 figs.

Some Notes on Leakage Indicators, G. W. Stubbings. Electricity, vol. 32, no. 1451, Aug. 30, 1918, pp. 453-454, 1 fig. Principle of instruments measuring state of insulation of a complete electrical system.

Meters. The Demand-Meter Situation, C. F. Mathes. Elec. World, vol. 72, no. 22, Nov. 30, 1918, pp. 1024-1026. Critical discussion of demand meters, pointing the advantages that are gained through use of well-known types of these instruments and remedies for some of the troubles encountered in their practical application.

Official Testing Laboratories. British Electrical Proving House. Times Eng. Supp., no. 527, Sept. 1918, p. 197. Essentials of schemed testing institution, with authoritative credentials, to deal with types of apparatus rather than with individual specimens.

Test Ring Method. Test Ring Method for Determining Transformer Ratio and Phase Error, H. S. Baker. Elec. Rev., vol. 73, no. 20, Nov. 16, 1918, pp. 766-769, 6 figs. Use of special watt meter and current transformer for current transformer testing. From paper before Am. Inst. of Elec. Engrs.

POWER APPLICATION

Cement Industry. Electric Motors in the Cement Industry. R. B. Williamson. Proc. Am. Inst. Elec. Engrs., vol. 37, no. 11, Nov. 1918, pp. 1237-1273, 9 figs Outline of various kinds of machinery used, and data as to power requirements; description of types of motor best suited to each application together with starting characteristics, overload capacity, torque and other features. Also in Elec. Rev., vol. 73, nos. 20 and 21, Nov. 23 and 26, 1918, pp. 770-771 and 813-814.

Coal Mining. Explosionproof Equipments of Colliery Motors and Accessories (in Japanese). Denki Gakkwai Zasshi, no. 363, Oct. 10, 1918.

The Use of Electric Power in the Mining of Anthracite Coal, J. B. Crane. Proc. Am. Inst. Elec. Engrs., vol. 37, no. 10, Oct. 1918, pp. 1197-1202, 7 figs. Power cost and current consumption of anthracite mines, also of bituminous mines; estimates of additional coal obtainable by electrification of anthracite mines, illustrations showing representative installations of electric drive.

Furnaces. Notes on Electric-Furnace Problems, J. L. McK. Yardley. Bul. Am. Inst. Min. Engrs., no. 142, Oct. 1918, pp. 1593-1598, 4 figs. Analysis made to determine maximum capacity and approximate performance of a new furnace designed to operate at 160 volts on a 60-cycle current.

Power Factor of the Electric-Arc Furnace -Fattore di potenza dei forni elettrici ad arco', O. Scarpa. Revista Tecnica d'Elettricita, no. 1891, Oct. 25, 1918, pp. 105-106. Presents formula for power factor of arc including power factor of furnace and ohmic resistance of electrodes.

Technical Analysis of Industrial Electric Furnaces; Classification, Choice of Apparatus, Installation and Operation (Considérations techniques sur les fours électriques industriels; classification choix des appareils, installation mode d'emploi et conduite) Jean Escard. Revue Générale de l'Electricité, vol. 4, no. 16, Oct. 19, 1918, pp. 575-591, 31 figs. Electric arc furnaces; electric resistance furnaces; induction furnaces; electrothermotic and aluminum furnaces.

The Electric Furnace After the War, Francis A. J. Fitzgerald. Elec. Rev., vol. 73, no. 19, Nov. 9, 1918, pp. 726-727, 2 figs. Effect of the war upon electric furnaces; new uses to replace war's needs; tendencies in furnace design.

Heating. Electric Heat for Drying and Baking, George J. Kirkgasser. Indus-Management, vol. 56, no. 6, Dec. 1918, pp. 489-495, 11 figs. Types of industrial apparatus that have had rapid development during past five years.

Electric Thermal Storage Heaters for Rooms, English Mechanic & World of Sci., vol. 108, no. 2796, Oct. 25, 1918, pp. 155-156. Summary of report used by Committee of Swiss Electrotechnical Union. From Schweizerischer Elektrotechnischer Verein, Bul., June 1918.

Electrically Heated Industrial Appliances and Devices, George J. Kirkgasser. Indus. Management, vol. 56, no. 5, Nov. 1918, pp. 417-423, 32 figs. Outlines most important applications classified for 18 different industries and shows many of simpler devices.

Iron Ore Mining. Central Station Service Used in Operation of New Jersey Iron Ore Mines, L. R. W. Allison. Elec. Rec., vol. 24, no. 4, Oct. 1918, pp. 24-26, 5 figs. Installation where energy generated at steam station is transmitted to mines at 33,000 volts for operation of pumps, air compressors, hoists, etc., involving consumption of 600,000 kw-hr. per month.

Lime Plant. A Modern Motor-Driven Lime Plant. Cement & Eng. News, vol. 30 no. 11, Nov. 1918, pp. 19-20, 4 figs. Processes in electrically driven plant utilizing waste marble.

Pumping. Electricity Supersedes Steam in Los Angeles, Eng. & Cement World, vol. 13, no. 10, Nov. 15, 1918, pp. 18-19, 3 figs. Electrical operation of pumping plants, it is said, will effect an annual saving of 18,000 bbl. of fuel oil. Also in Elec. Rev., vol. 73, no. 19, Nov. 9, 1918, pp. 723-725, 3 figs.

High Efficiencies Shown by Motor-Driven Water Works Pumps, Geo H. Gibson. Can. Engr., vol. 35, no. 19, Nov. 7, 1918, pp. 412-413, 2 figs. Data on two 12-in. centrifugal pumps.

Rolling Mills. Electrically Driven Mills at Bethlehem, J. T. Sturtevant. Blast Furnace, vol. 6, no. 10, Oct. 1918, pp. 417-419, 10 figs. Layout, equipment, power consumption and tonnage on eleven installations at Lehigh plant, where G. E. induction motors are used.

Ship Propulsion. Electricity's Part in Buildiug and Navigating of Ships, H. A. Hornor. Elec. Eng., vol. 52, no. 2, Aug. 1918, pp. 15-22, 20 figs. Considerations entering into selection of propulsion; commercial angle, first cost, efficiency, safety, upkeep, cost of operation, etc.; propelling machinery of various ships. (Concluded.)

Silk Industry. Electric Drive Applied to Silk Industry, Charles T. Guilford, Elec. Rev., vol. 73, no. 22, Nov. 30, 1918, pp. 855-857, 4 figs. Advantages of central-service for this work; selection of motors and drives; interesting data on present installations.

Sugar Mills. Complete Electrification of Sugar Mills, Clarence G. Hadley. Elec. World, vol. 72, no. 22, Nov. 30, 1918, pp. 1022-1024, 2 figs. Extensive application of motors in this industry of recent origin; satisfactory results obtained in new Cuban mills, showing possibilities that may arise in this field as it is developed.

TELEGRAPHY AND TELEPHONY

Radio Telegraphy and Telephony. A Combiuation Circuit for Tube and Crystal. Wireless Age, vol. 6, no. 2, Nov. 1918, p. 21, 1 fig. Combined or individual use of vacuum tube and crystal rectifier.

A New Protective Condenser. Wireless Age, vol. 6, no. 2, Nov. 1918, p. 34, 1 fig. Designed to protect electrical transmission lines from effect of high-frequency disturbances.

A Novel Radio Telegraph Aerial. Wireless Age, vol. 6, no. 2, Nov. 1918, p. 20, 1 fig. Type having series of coils inserted in antenna from earth to free end.

A Thermionic Valve Slopemeter, E. V. Appleton. Wireless World, vol. 6, no. 68, Nov. 1918, pp. 458-460, 3 figs. Derives formula to compute slopes of grid voltage-anode current and plate voltage-anode current curves at any particular operating plant.

Marconi's Improved Radio Transmitter. Wireless Age, vol. 6, no. 2, Nov. 1918, pp. 19-20, 3 figs. Method of producing continuous oscillations by overlapping wave trains.

Method for Exhausting Vacuum Tubes. Wireless Age, vol. 6, no. 2, Nov. 1918, pp. 20-21, 1 fig. Apparatus which provides for heating anode by vigorous bombardment of electrons without endangering filament, this being method to drive gases from plate.

Propagation of Electric Currents in an Antenna (Propagation des courants électriques dans une antenne), H. Chireix. Revue Générale de l'Electricité, vol. 4, no. 11, Sept. 14, 1918, pp. 363-374, 9 figs. Formulae (1) in general case of non-homogenous antennae, (2) when antenna consists of one branch, (3) when it consists of two, and (4) when it consists of three branches having different self-inductances and different capacities.

Solid-Contact Detectors (Contribution à l'étude des détecteurs à contacts solides). René Audubert. Journal de Physique, vol. 7, May-June 1918, pp. 127-128. Study of physical phenomena which probably take in the action of crystal detectors used in wireless telegraphy. (To be continued.)

Some Aspects of Radio Telephony in Japan, Eitaro Yokoyama. Wireless World, vol. 6, no. 68. Nov. 1918, pp. 430-435, 8 figs. Account of recent discoveries: Evolution of a rarefied gas discharger. (To be continued.)

The Radioelectric Installation at Stavanger, Norway (Stavanger Radio), Olaf Moe. Teknisk Ukeblad, year 65, no. 43, Oct. 25, 1918, pp. 595-514, 23 figs. (To be continued.)

Telephony (Wire). How to Locate Telephone Troubles. J. Beruard Hecht, Telephony, vol. 75, nos. 21, 22 and 23, Nov. 23, 30 and Dec. 7, 1918, pp. 32-34, 3 figs.: 13-16, 10 figs. and 16-18, 2 figs. Rural line telephones and their circuits. Suggestions to managers, wire chiefs and troublemen of local battery exchanges. (Continuation of serial.)

Wave-Length and Weakening of Telephone Circuits (Longueur d'onde et affaiblissement des circuits téléponiques), Pomey. Revue Générale de l'Electricité, vol. 4, no. 8, Aug. 24, 1918, pp. 251-253. Simplification of author's formula for constant B given in Aug. 3 issue.

TRANSFORMERS, CONVERTERS, FREQUENCY CHANGERS

Transformers, A. C. Study of the Calculations Involved in the Design of Large Capacity Transformers for Use with Electric Furnaces (Etude sur le calcul de transformateurs à forte intensité pour fours électriques), R. Jacquot. Revue Générale de l'Electricité, vol. 4, no. 15, Oct. 12, 1918, pp. 523-536, 9 figs. Explains sudden variations in efficiency and voltage drop by conditions of varying load and suggests practical and economical modifications. (To be continued.)

Rectifiers. Three-Phased Current Rectifier (Convertitore di correnti trifasi in correnti continue). O. M. Corbino. L'Elettrotecnica, vol. 5, no. 28, Oct. 5, 1918, pp. 392-394, 3 figs. Apparatus operating by rotary mercury jet.

Substations. Electric Railway Substations for Automatic Transformation (Sottostazioni di trasformazione automatiche per l'alimentazione de ferrovie elettriche), A. Gusmano. L'Elettrotecnica, vol. 5, no. 31, Nov. 5, 1918, pp. 444-446, 6 figs. Principles of system followed in America.

Transformers, D. C. Size and Working Cost of Machines for Continuous-Current Transformation, Thomas Carter. Elecn., vol. 81, no. 2108, Oct. 11, 1918. 4 figs. Methods of continuous-current transformation; differences between three schemes; conclusions in regard to cost and method of operation; curves of overall efficiency of transformer: schemes for variable-speed motors.

Frequency Changer. Radio Frequency Changers, E. E. Bucher. Wireless Age, vol. 6, no. 2, Nov. 1918, pp. 10-13, 8 figs. Reported progress in their application to wireless telegraphic and telephonic communication. (To be continued.)

TRANSMISSION, DISTRIBUTION, CONTROL

Distribution, Three-Phase. Economic increase Made in Distribution Capacity, S. Bingham Hood. Elec. World, vol. 72, no. 22, Nov. 30, 1918, pp. 1030-1032, 7 figs. Saving of copper and transformers by replacing old overloaded 2300-volt system with 2300-2400-volt star-connected, three-phase, common-neutral primary and interconnected secondary.

How to Remedy Inconveniences of Excessive Overload in Three-Phase Network (Comment peut-on remédier aux inconvénients d'une très forte surcharge dans un réseau triphasé), E. Piernet. Revue Générale de l'Electricité, vol 4, no. 15, Oct. 12, 1918, pp. 540-544, 2 figs. Proposes adjustment of step-up and step-down transformers so as to be able to dispose of voltage U so long as delivered power does not exceed a certain limit and of voltage $U\sqrt{3}$ when delivered power exceeds this limit.

Interconnection. More Light on New England Interconnection. Elec. World, vol. 72, no. 22, Nov. 30, 1918, pp. 1027-1029, 1 fig. Estimated savings to be exceeded; convenient energy-exchange arrangements; railroad electrification possible without buying new generators; price at which tie-line energy can be sold. From paper by L. L. Elden before Boston Section of Am. Inst. of Elec. Engrs.

Relays. Factors to Consider in Applying Relays, E. A. Hester, Elec. World, vol. 72, no. 20, Nov. 16, 1918, pp. 931-934, 9 figs. Determination of short-circuit current connections and settings suitable for radial and parallel feeder systems: protection against high-resistance grounds on balance systems.

Relay Protective Devices, C. J. Monk. Tran. South African Inst. Elec. Engrs., vol. 9, part 7, July 1918, pp. 140-143, 1 fig. Proposes short method of obtaining approximate circuit currents by observing voltage drop between two stations at normal load, according to equation; short-circuit current = Normal voltage times load current divided by voltage drop. Discussion of paper published in Jl. of Inst., Oct. 1917.

Substations. Permanence in Outdoor Substations, S. B. Hood. Elec. World, vol. 72, no. 20, Nov. 19, 1918, pp. 928-930, 6 figs. Discussion of standard design used in all sizes from 300 kva. to 2250 kva. in order to eliminate fire losses prevalent in modern structures; increase in cost to secure permanence held to be negligible.

Remote Controlled Substations Described, W. T. Snyder. Blast Furnace, vol. 6, no. 10, Oct. 1918, pp. 408-410, 2 figs. Control for central station and motor-generator substation located about 2200 ft. from main power station, feeding 250-volt direct-current transmission line. Paper before Assn. Iron & Steel Elec. Engrs.

Switches. An Automatic Three-Phase Switch, W. Ernst. Elecn., vol. 81, uo. 2108, Oct. 11, 1918, pp. 491, 4 figs. Abstract of article in Elektrotechnische Zeitschrift, No. 4, 1918.

Safety Features in Switching Installation, M. M. Samuels and F. Bechoff. Elec. World, vol. 72, no. 19, uov. 9, 1918, pp. 878-880, 9 figs. Review of existiug alarm systems used to indicate switch positions and overheating of apparatus; weak points in installations and suggestions designed to bring about their improvement.

Transmission Lines. Locating Troubles in Electric Lines (Note sur les essais et mesures relatifs aux lignes électriques), Louis Puget. Revue Générale de l'Electricité, vol. 4, no. 16, Oct. 19, 1918, pp. 563-565, 2 figs. Method for measuring resistance of line and locating a ground, which author claims to have found serviceable in his experience with underground lines. The methods given are applicable to overhead lines as well.

110,000-Volt Transmission Line over the St. Lawrence River, S. Svenningson. Proc. Am. Inst. Elec. Engrs., vol. 37, no. 11, Nov. 1918, pp. 1275-1284, 3 figs. Account of investigation leading to construction of 350-ft. towers to support transmission wires on a span of 4800 ft.; design of towers and insulators; provisions for protection from ice and method of sag calculations.

WIRING

House Wiring. Three- and Four-Way Switch Circuits, Terrell Croft. Elec. Eng., vol. 52, no. 2, Aug. 1918, pp. 23-25, 5 figs. Cottage wiring; unusual wiring: two-location control. (Concluded.)

GENERAL SCIENCE

CHEMISTRY

Electrolytic Conductivity. Electrolytic Conductivity in Non-Aqueous Solutions. The Electrical Conductance of Trimethyl-Para-Tolyl-Ammonium Iodide in Water and Several Organic Solvents, Henry Jermain, Maude Creighton and D. Herbert Way. Franklin Inst. Jl., vol. 186, no. 6, Dec. 1918, pp. 675-798, 7 figs. Investigations.

Elements. Automic Number and Frequency Differences in Spectral Series, Herbert Bell. Lond., Edinburg & Dublin Phil. Mag., vol. 36, no. 214, Oct. 1918, pp. 337-347, 2 figs. Numerical tests of Rydberg's law that square root of doublet and triplet differences is proportional to automic weights, substituting atomic number for atomic weight.

Elements in the Order of Their Atomic Weights, Raymond Szymanowitz. Chem. News, vol. 117, no. 3059, Oct. 25, 1918, pp. 339-340. Presents table which shows numbers follow scheme of sequence expressed by: X, $X + 3$, $X + 3 + 1$, $X + 3 + 1 + 3$, etc., adding 1 and 3 alternately.

SOLUTIONS. The Electrical Conductivity of Acids and Bases in Aqueous Solutions, Jnanendra Chandra Ghosh. Jl. of the Chem. Soc., vols. 113-114, no. 672, Oct. 1918, pp. 790-799. Explains abnormally high mobility of hydrogen and hydroxylions in aqueous solutions on assumption that electricity is partly carried by ordinary process of convection and partly propagated through water molecules undergoing alternate dissociation and recombination; apparently high activity of strong acids and bases is also traced to this cause; modifies Ostwald equation for electrolytes where degree of rissocation is less than one.

STRUCTURE OF MATTER. Atomic Structure from the Physico-Chemical Standpoint, Alfred W. Stewart. Lond., Edinburgh & Dublin Phil. Mag., vol. 36, no. 214, Oct. 1918, pp. 326-336, 1 fig. Model atom proposed as having a structure accounting for all the facts known concerning elements, including radioactive transformations.

Interfacial Tension and Complex Molecules, G. N. Autonoff. Lond., Edinburgh & Dublin, Phil. Mag., vol. 36, no. 215, Nov. 1918, pp. 377-396, 5 figs. Theory of molecular attraction based on modern representation of nature of atoms and molecules; explanation of phenomena of molecular attraction by action of forces which cause chemical affinity; deduction of relation between surface tension and molecular pressure.

VALENCY. Definition of Valency, F. H. Loring. Chem. News, vol. 117, no. 3058, Oct. 11, 1918, pp. 319-322. Simile to explain significance of term and nature of atoms which exercise variable valencies.

MATHEMATICS

ANALYTICAL FUNCTIONS. Factoring and Prolongation of Analytical Functions (Quelques remarques sur la décomposition en facteurs primaires et le prolongement des fonctions analytiques), Emile Picard. Comptes rendus des séances de l'Académie des Sciences, vol. 167, no. 12, Sept. 16, 1918, pp. 405-408. Further comment on Weierstrass' method of decomposition. In Comptes rendus, vol. 92, 1881, p. 690, author showed application of this method to uniform functions whose roots approach indefinitely a given line.

DIVERGENT SERIES. A Conspectus of the Modern Theory of Divergent Series, Walter B. Ford. Bul. Am. Math. Soc., vol. 25, no. 1, Oct. 1918, pp. 1-15. Review of modern theory of divergent series in regard to (1) the question as to how a sum may be assigned to a divergent series in general, and (2) the functional properties of asymptotic series; proposed limitations to form a consistent general theory of summation.

EQUATIONS. Simultaneous Linear Differential Equations Involving Partial Derivatives and Reduction of Hyper-Geometric Functions of Two Variables (Sur des équations linéares simultanées aux dérivées partielles et sur des cas de réduction des fonctions hyper-géométriques de deux variables), Paul Appell. Comptes rendus des séances de l'Académie des Sciences, vol. 167, no. 12, Sept. 16, 1918, pp. 408-413.

Solution of Partial-Derivative Equations by Means of Hermite's Polynomials (Sur les équations aux dérivées partielles vérinées par les polynomies d'Hermite, déduits d'une exponentielle), Pierre Humbert. Comptes rendus des séances de l'Académie des Sciences, vol. 167, no. 15, Oct. 7, 1918, pp. 522-525. Application of Appell's method (Comptes rendus, vol. 167, 1918, p. 309) to variables obtained from differentiation of exponential function whose exponent is of quadratic form in X and Y.

Solutions of Differential Equations as Functions of the Constants of Integration, Gilbert Ames Bliss. Bul. Am. Math. Soc., vol. 25, no. 1, Oct. 1918, pp. 15-26. Proposes method.

Treatment of Partial-Derivative equations by Hyperspherical Polynomials (Sur les systèmes d'équations aux dérivées particlles vérifiés par les polynomes -hypersphériques). J. Kampé de Fériet. Comptes-rendus des séances de l'Académie des Sciences, vol. 167, no. 15, Oct. 7, 1918, pp. 519-522. Study of case of n linear equations involving partial derivatives of second order.

ISOGENEOUS COMPLEX FUNCTIONS. Note in Isogenous Complex Functions of Curves, W. C. Graustein. Bul. Am. Math. Soc., vol. 24, no. 10, July 1918, pp. 473-477.

ORTHOGONAL SUBSTITUTION. Note on the Construction of an Orthogonant, Thomas Muir. Proc. Roy. Soc. of Edinburgh, vol. 38, part 2, session 1917-1918, pp. 146-153. Comments of and addition of theorems to Cayley's mode of forming an orthogonal substitution.

PROBABILITY. An Elementary Derivation of the Probability Function, Albert A. Bennett. Bul. Am. Math. Soc., vol. 24, no. 10, July 1918, pp. 477-481. Derives by means of elementary considerations equation of probability from sequence of binomial coefficients

PHYSICS

FLAME PROPAGATION. The Propagation of Flame through Tubes of Small Diameter. William Payman and Richard Vernon Wheeler. Jl. Chem. Soc., vols. 113 & 114, no. 670, Aug. 1918, pp. 656-666, 3 figs. Report of experiments, performed in connection with work on construction of miners' safety lamp, on speed of uniform movement during propagation of flame in mixtures of methane and air through tubes of small diameter on the passage of flame through similar tubes filled with mixtures of methane and air and open at both ends and on the passage or projection of flame through short tubes of small diameter.

FLUORESCENCE. On the Phenomena of Fluorescence, Desmond Geoghegan. Chem. News, vol. 117, no. 3058, Oct. 11, 1918 p. 322 Suggests experiment which, it is said, will prove that rays of light passed through a sufficient thickness of a fluorescent substance lose thereby power of exciting fluorescence when they are passed through a second layer of same substance.

MAGNETO-THERMO PHENOMENA. Magneto-thermal Phenomena (Le phénomène magnétocalorique), Pierre Weiss and Auguste Picard. Journal de Physique, vol. 7, May-June 1917, pp. 103-109, 1 fig. Account of pronounced changes in temperature which were observed in course of experimental measurements preliminary to plotting set of isothermals for nickel. Near Curie's point temperature increased 0.7 deg. on establishing field of 15,000 gausses.

OPTICS. The Correction of Telescopic Objectives, T. Smith. Lond., Edinburgh & Dublin Phil. Mag., vol. 36, no. 215, Nov. 1918, pp. 405-412. Criticism of expressions for constructional data for small objectives as given by A. O. Allen in Phil. Mag., June 1918.

The Scattering of Light by Air Molecules, R. J. Srutt. Lond., Edinburgh & Dublin Phil. Mag., vol. 36, no. 214, Oct. 1918, pp. 320-321. Supplements former account of experiments (Proc. Roy. Soc. A., vol. 44, p. 453, 1918) by answering inquiry from R. W. Wood (Phil. Mag., vol. 36, p. 272, Sept. 1918) in regard to precautions taken for drying air in experiments.

QUANTA LAW Researches on the Limit of the Continuous Spectrum of X-Rays (Recherches sur la limite du spectra continu des rayons X), Alex. Muller. Archives des Sciences Physiques et Naturelles, year 123, vol. 46, Aug. 1918, pp. 63-73, 1 fig. Theoretical and experimental verification of Planck's law of quanta as generalized by Einstein by confirming the relation $\epsilon V = h\nu$ in the case of the continuous spectrum of X-rays, and for an interval from 14 to 28 kilovolts.

RADIUM. On Some Properties of the Active Deposit of Radium, S. Ratner. Lond., Edinburgh & Dublin Phil. Mag., vol. 36, no. 215, Nov. 1918, pp. 397-405, 2 figs. Experimental research which leads author to question whether phenomenon of recoil of RaC from RaB has ever been observed, also that proportion of recoil atoms of RaB carrying negative charge in less than 1 to 100,000.

RELATIVITY. On the Essence of Physical Relativity, Joseph Larmor. Proc. Nat. Academy of Sci., vol. 4, no. 11, Nov. 1918, pp. 334-337. Offers objection to Leigh Page's expression (no 4, p. 46) for translatory force required to sustain assigned varying velocity in electrostatic system of type usually investigated as model of electron.

SEMI-FLUIDS. Mechanics of Semi-Fluids (Mécanique des semi-fluides). Comptes Rendus des Séances de l'Académie des Sciences, vol. 167, no. 7, Aug. 12, 1918, pp. 253-256. Discusses possibility of disregarding tangential action of central cylinder on annular part of the limiting surfaces.

VIBRATIONS AND WAVE MOTIONS. Diffraction of Plane Waves by a Screen Bounded by a Straight Edge, F. J. W. Whipple. Lond., Edinburgh & Dublin Phil. Mag., vol. 36, no. 215, Nov. 1918, pp. 420-424. Adaptation of R. Hargreaves' method for simple harmonic wave (Phil. Mag., vol. 36, p. 191), to diffraction of waves of arbitrary type.

Periodic Irrotational Waves of Finite Height T. H. Havelock. Proc. Roy. Soc., vol. 95, no. A665, Sept. 2, 1918, pp. 38-51. Extension of Mitchell's form for highest wave and its generalization by means of surface conditions; method of approximation for coefficient, calculation for highest wave.

The Interferometry of Vibrating Systems, C. Barus. Proc. Nat. Academy of Sci., vol. 4, no. 11, Nov. 1918, pp. 328-333, 4 figs. Report of experimental work.

The Sount Waves and Other Air Waves of the East London Explosion of January 19, 1917, Charles Davison. Proc. Roy. Soc. of Edinburgh, vol. 38, part 2, session 1917-1918, pp. 115-129, 1 fig. Construction of paths followed by air waves and sound waves; offered explanation for fact that inaudible air waves were observed beyond limits of sound areas by reason of their more nearly horizontal path.

ORGANIZATION AND MANAGEMENT

ACCOUNTING

ARMY. Accounting Systems in Army Camps, E. J. Holmes. Jl. Actcy., vol. 26, no. 6, Dec. 1918, pp. 429-435. Explains the system used by the U. S. Army in connection with the disbursement of funds appropriated by Congress.

Carrying on with the Accountants in the American Expeditionary Forces, C. B. Holloway. Jl. Actcy., vol. 26, no. 6, Dec. 1918, pp. 412-416. Specific operations carried on by the accounting personnel.

COST ACCOUNTING. Cost Accounting to Aid Production (III), G. Charter Harrison. Indus. Management, vol. 56, nos. 5 and 6, Nov. and Dec. 1918, pp. 456-463, 2 figs. and 391-398, 1 fig. Emphasizes necessity of cost-accounting system and illustrates its planning with diagram showing basic features of simple system for a business manufacturing various kinds of standard machines. (Continuation of serial.)

Duties of a Factory Cost Accountant, Joseph Gill. Jl. Actcy., vol. 26, no. 6, Dec. 1918, pp. 441-449. A thesis presented at the May examinations of the Am. Inst. of Accountants. Routine work of cost accountants.

Setting Production Standards for Industrial Accounting and Engineering, F. J. Knieppel. Jl. of Accountancy, vol. 26, no. 5, Nov. 1918, pp. 361-375. Explains methods of determining four basic standards.

INVENTORIES. Verification of Inventories, A. L. Philbrick. Jl. Actcy., vol. 26, no. 6, Dec. 1918, pp. 417-428. Briefly outlines the work of the auditor and his responsibilities. Difficulties involved in the verification of the inventory.

MAIL ORDER. Mail Order Accounting, Harry L. Cavanagh. Jl. Actcy., vol. 26, no. 6, Dec. 1918, pp. 436-440. A thesis presented at the May examinations of the Am. Inst. of Accountants.

POWER HOUSE. Economics of the Power House, L. W. Alwyn-Schmidt. Power Plant Eng., vol. 22, no. 23, Dec. 1, 1918, pp. 949-952. Problem of Power-house accounting approached from point of view of economist.

EDUCATION

TRAINING OF EMPLOYEES. Packard Training Schools for Employees, D. G. Stanbrough. Indus. Management, vol. 56, no. 5, Nov. 1918, pp. 378-382, 13 figs. Four schools operated; for men, women, instructors for women and for job setters and foremen.

Vestibule School of Lincoln Motor Co., J. M. Eaton. Indus. Management, vol.. 56, no. 6, Dec. 1918, pp. 452-455, 10 figs. Equipment of training rooms; system of instruction in machine-shop practice.

SOLDIERS. Vocational Training for Returned Soldiers. Jl. Eng. Inst. Can., vol. 1, no. 7, Nov. 1918, pp. 333-334. Work being done at Toronto and McGill Universities.

UNIVERSITY. The Khaki University. Can. Min. Inst., bul. no. 80, Dec. 1918, pp. 985-989. Letter from F. D. Adams giving an account of the work and plans for future development.

FACTORY MANAGEMENT

BOILER SHOP. Business Equipment in the Boiler Shop, Edwin L. Seabrook. Boiler Maker, vol. 18, no. 11, Nov. 1918, pp. 305-307. Suggests items of business conduct in boiler making plant.

EMPLOYMENT MANAGER. The Employment Manager, Edward D. Jones, Wood-Worker, vol. 37, no. 9, Nov. 1918, pp. 38-39. Organization and direction of course offered gratis to representatives of manufacturers by Management Division of War Industries Board.

The Employment Manager in Our Shipyards, Edward B. Jones. Int. Mar. Eng., vol. 23, no. 11, Nov. 1918, pp. 612-614. Duties of general executive; importance of schools; wage system and ideal service; psychology of mass action.

FOREMEN. Instructions to Assistant Foremen, George H. Shepard. Indus. Man., vol. 56, no. 5, Nov. 1918, pp. 403-407. Prepared by plant working extensively on governmental orders to inspire and guide minor executives.

INDUSTRIAL ORGANIZATION. After-War Economics of Engineering. Times Eng. Supp., no. 529, Nov. 1918, pp. 225-226. Suggests that plants review their methods of manufacture and adopt convenient modifications when necessary. Illustrations of practical procedure by reference to foundry work.

Industrial Organization as it Affects Executives and Workers, Charles E. Knoeppel. Jl. Am. Soc. Engrs., vol. 40, no. 12, Dec. 1918, pp. 1031-1033. Proposes rules of efficient organization for practical guidance of executives in developing system of industrial relationship. Presented at annual meeting of the Sos.

Management — The Solution of the Shipbuilding Problem, W. L. Churchill. Indus. Management, vol. 56, no. 5, Nov. 1918, pp. 361-366, 2 figs. Based on study of conditions in 20 shipyards aud pointing to management as developed recently in other industries as proper solution to problems.

Practical System in Factory Operations, M. H. Potter. Can. Machy., vol. 20, no. 20, Nov. 14, 1918, pp. 559-560, 6 figs. Forms of charts developed from investigation of actual case.

Scientific Management Simplified. Malcolm Keir. Sci. Monthly, vol. 7, no. 6, Dec. 1918, pp. 525-529. Adaptability of scientific management to industry; fundamental elements of scientific management.

INDUSTRIES. New Industries, H. W. Gepp. Aust. Min. Std., vol. 60, no. 1564, Oct. 31, 1918, pp. 686-688. Address with discussion before Soc. of Chem. Ind., Melbourne. Essential factors in the successful development of new industries in a young country.

MECHANICAL DEPARTMENT. Coordination in the Mechanical Department, W. U. Appleton. Ry. Rev., vol. 63, no. 22, Nov. 30, 1918, pp. 73-774. Recommendations for system and harmony within department and with other departments. Paper before Canadian Ry. Club, Oct. 1918.

RATE SETTING. Mastering Power Production, Walter N. Polakov. Ind. Man., vol. 56, no. 5, Nov. 1918, pp. 399-403, 6 figs. Conservation of labor, power and fuel in relation to rates. Tenth article.

Time Studies for Rate Settings on Gisholt Boring Mills, Dwight V. Merrick. Indus. Management, vol. 56, no. 5, Nov. 1918, pp. 409-411, 1 fig. Fifth article.

ROUTING. About the Handling of Mill Work (II), Chas. Cloukey. Wood-Worker, vol. 37, no. 9, Nov. 1918, pp. 23-24, 1 fig. Part which routing of work through mill has in economical production.

TASK SETTING. The Human Factor in Task Setting, W. E. Camp. Indus. Management, vol. 56, no. 5, Nov. 1918, pp. 372-374, 1 fig. Chief conditions that affect factor; how they are evaluated; how to predetermine proper allowance.

TOOL DEPARTMENT. Continuous Tooling. Times Eng. Supp., no. 527, Sept. 1918, p. 183. Suggests a means of obtaining increased output from machine-shop tools.

Tool Department of Winchester Works. Iron Age, vol. 102, no. 19, Nov. 7, 1918, pp. 1129-1133, 4 figs. Virtually on factory production basis, workers being trained for single type operation; preparation section's important functions.

FINANCE AND COST

CAPITAL. Capital: Its Waste and Its Conservation, Archibald P. Main. Gas Jl., vol. 144, no. 2894, Oct. 29, 1918, pp. 249-251, and (discussion) pp. 251-252. Means by which author judges British industry can make best use of available credit and financial accommodation. Paper before Soc. of British Gas Industries.

INSPECTION

GRAPHIC CONTROL. Graphic Production Control, C. E. Knoeppel. Indus. Management, vol. 56, nos. 5 and 6, Nov. and Dec. 1918, pp. 383-390, 17 figs., 496-502, 14 figs. Controlling materials and operations. Fourth Article.

PRODUCTION RECORDS. Keeping Close Track of Shop Operation, Robert I. Clegg. Iron Age, vol. 102, no. 21, Nov. 21, 1918, pp. 1251-1253, 6 figs. Records of production and labor bulletined to management; reports with alarm-clock attachment.

SUPERVISION. Mechanical Department Supervision, Frank McManamy. Ry. Mach. Eng., vol. 92, no. 11, Nov. 1918, pp. 597-598. Better supervision and more of it needed to keep up shop output. From paper before New York Ry. Club.

LABOR

BARGAINING (INCLUDING COLLECTIVE SYSTEMS). Agreement vs. Bargaining, Harry Tipper. Automotive Ind., vol. 39, no. 19, Nov. 7, 1918, pp. 784-785. Claims confidence between employer and employee is impossible so long as both basc their relations upon their ability to take advantage of a bargain.

Handling Employment Relations Without Help from the Outside. Automotive Ind., vol. 39, no. 17, Oct. 24, 1918, pp. 722-723, 1 fig. Collective-bargaining plan for handling all matters relating to wages, hours of labor, discipline, discharges aud grievances.

Important Phases of the Labor Problem, Magnus W. Alexander. Iron Age, vol. 102, nos. 21 and 22, Nov. 21 and 28, 1918, pp. 1258-1325. Problems of pensions and insurance; profit sharing in industry; adjustment of labor disputes; working conditions; hours of work. Nov. 21: Recruiting of men; collective bargaining discussed.

BONUSES. Paying Bonuses to Power Plant Employees, Frederick L. Ray. Nat. Engr., vol. 22, no. 10, Oct. 1918, pp. 495-495, and (discussion) pp. 495-497. Account of system followed by Milwaukee Elec. Ry. & Light Co. Paper before Nat. Assn. of Stationary Engrs.

BRITISH LABOR ADMINISTRATION. Labor Administration, Edward T. Elbourne, Engineer, vol. 126, nos. 3276, 3278, 3279, 3280, Oct. 11 and 25, Nov. 1 and 8, 1918, pp. 299-300, 348-350, 2 figs., 365-367, 4 figs., 388-390, 1 fig. Oct. 25: Women; Nov. 1: Time office (men); Nov. 8: Methods of Remuneration.

DILUTION. Labor Dilution as a National Necessity, Frederick A. Waldron. Jl. Am. Soc. Mech. Engrs., vol. 40, no. 12, Dec. 1918, pp. 1033-1035. After referring to work done by British Bureau of Labor, the writer outlines the scope of labor dilution as necessary application to national resources of U. S. Presented at annual meeting of society.

EMPLOYMENT DEPARTMENT. Employment Department Routine of the Curtiss Aeroplane & Motor Corp., Charles E. Fouhy. Ind. Man., vol. 56, no. 5, Nov. 1918, pp. 412-416, 17 figs. Routine and forms of employment department.

INDUSTRIAL RELATIONS. Employment of Labor, Dudley R. Kennedy. Jl. Am. Soc. Mech. Engrs., vol. 40, no. 12, Dec. 1918, pp. 1030-1031. Activities of Industrial Relations Department of Hog Island plant in connection with securing and maintaining a force of 35,000 employees and providing for their needs and comfort. Presented at the annual meeting of society.

Fundamental Factors in Sound Industrial Relations, H. T. Waller. Ind. Management, vol. 56, no. 5, Nov. 1918, pp. 367-371, 8 figs. Seven factors discussed by author and illustrated by cartoons interpreting vital truth.

Use of Non-Financial Incentives in Industry, Robert B. Wolf. Jl. Am. Soc. Mech. Engrs., vol. 40, no. 12, Dec. 1918, pp. 1035-1038, 2 figs. Account of instances where personal interest has been developed in workmen by supplying foremen with information upon costs, methods of operation, possibilities in direction of economy and efficiency, etc. Presented at annual meeting of the A. S. M. E.

LUNCH ROOMS. Feeding Employees at a Steel Plant. Iron Age, vol. 102, no. 19, Nov. 7, 1918, pp. 1136-1138, 2 figs. Reasons for abolishing dinner pail; management of lunchroom; auxiliary room for foreigners; commissary.

NATIONAL WAR LABOR BOARD. The War Labor Board aud the Living Wage, Frank P. Walsh. Survey, vol. 41, no. 10, Dec. 7, 1918, pp. 301-303. Account of origin of National War Labor Board, its purpose and achievements.

PROFIT SHARING. A Tested Profit Sharing Plan, Dale Wolf. Indus. Management, vol. 56, no. 6, Dec. 1918, pp. 486-488, 3 figs. Average of 46 per cent of company's profits are distributed to employees.

SOLDIERS. Returned Soldiers Make Very Good Welders, W. F. Sutherland. Can. Machy., vol. 20, no. 22, Nov. 28, 1918, pp. 618-619, 2 figs. Outline of work done by training school.

The Employment of the Returned Soldier. Can. Machy., vol. 20, no. 20, Nov. 14, 1918, pp. 561-562. Résumé of problem as viewed by English correspondent. From Times Eng. Supp.

The Industrial Restoration of Disabled Soldiers, Bert. J. Morris. Indus. Management, vo.. 56, no. 6, Dec. 1918, pp. 477-481, 4 figs. Review of accomplishments of other nations and notes on organizations preparing to re-educate American soldiers.

TURNOVER. Interpretating Labor Turnover, Luther D. Burlingame. Am. Mach., vol. 49, no. 19, Nov. 7, 1918, pp. 855-858, 1 fig. Discusses real meaning and how it should be computed.

WOMEN. Women in the Machine Shop, S. A. Hand. Am. Mach., vol. 49, no. 23, Dec. 5, 1918, pp. 1035-1037, 9 figs. Successful experience of large firm of machine tool builders in employment of women workers.

WOMEN WORKERS. Women in the Service of the Railways, Pauline Goldmark. Ry. Age, vol. 65, no. 23, Dec. 6, 1918, pp. 1016-1018. Used in a great variety of work. Address before Labor Reconstruction Conference, Academy of Political Science, N. Y.

LEGAL

Boiler Contracts. Construing Boiler Contracts, A. L. H. Street. Power, vol. 48, no. 22, Nov. 26, 1918, pp. 765-766. Case reported in the Maryland Court of Appeals, bearing on obligations of manufacturer under contract for installation of boilers according to particular specifications.

Casual Employment. What Constitutes Casual Employment ? Chesla C. Sherlock. Am. Mach., vol. 49, no. 19, Nov. 7. 1918, pp. 850-852. Discussion of certain legal interpretations.

Contributor in Negligence. Disobedience of Orders by Employees and Its Relation to Compensation. Chesla C. Sherlock. Am. Mach., vol. 49, no. 22, Nov. 28, 1918, pp. 980-982. Review of some court decisions.

Floors, Slippery (accidents from). Injuries Caused by Slippery Floors, Chesla C. Sherlock. Power, vol. 48, no. 22, Nov. 26, 1918, pp. 790. Some court decisions.

Simple Tools (accidents from). Liability in the Use of Simple Tools, Chesla C. Sherlock. Am. Mach., vol. 49, no. 21, Nov. 21, 1918, pp. 939-940. Some legal aspects of employers' liability in use of simple tools.

PUBLIC REGULATION

Government Trading. The Functions of the Government in Relation to Industry, W. L. Hichens. Iron & Steel Trades Jl., nos. 3099 and 3100. Nov. 2 and 9, 1918, pp. 488-489 and 514. Examination of advisability of carrying out suggestions that the Government engage in trading undertakings.

RECONSTRUCTION

Electrical Industry. Problems of the Reconstruction Era. Elec. World, vol. 72, no. 19, Nov. 9, 1918, pp. 877-878. Taking effective part in great world war, this country will necessarily be powerful factor in succeeding period; closer co-operation in electrical industry advocated.

Export Trade. Reconstructing Our Business Fabric. Shipping, vol. 5, no. 8, Nov. 23, 1918, pp. 15-16, 1 fig. Steps being taken and progress made to take advantage of present opportunity United States has of developing internationally.

SAFETY ENGINEERING

Boiler Rooms. Boiler Room Rules. Eng. & Cement World, vol. 13, no. 10, Nov. 15, 1918, p. 66. Suggestions to boiler-room attendants on the care of oilers and prevention of accidents. From Safety Bul.

Boiler Shops. Accident Prevention in Boiler Shops, Boiler Maker, vol. 18, no. 11, Nov. 1918, pp. 315-317, 5 figs. Account of what Bethlehem Steel Co. has accomplished and consideration of causes of accidents.

Disease Prevention. Engineers and Disease Prevention. Times Eng. Supp., no. 529, Nov. 1918, p. 231. Points out part engineers can play.

First Aid. Standardization of First Aid Methods, C. H. Connor. Safety Eng., vol. 36, no. 4, Oct. 1918, pp. 237-238. From Proc. Seventh Annual Safety Congress.

Foundries. Injuries from Molten Metal, Chesla C. Sherlock. Iron Age, vol. 102, no. 21, Nov. 21, 1918, pp. 1262-1262. Ordinary perils; defective tools and appliances; basis of foundryman's responsibility.

Water-Supply Protection. Protection of Water Mains, Fire Hydrants and Valves in Winnipeg. Thomas H. Hooper. Mun. Jl., vol. 45, no. 21, Nov. 23, 1918, p. 410. From Quarterly of Nat. Fire Protection Assn.

Woodworking Industry. Infections and Blood Poisoning in the Woodworking Industry, Leroy Philip Kuhn. Safety Eng., vol. 36, no. 4, Oct. 1918, pp. 228-230. From Proc. Seventh Annual Safety Congress.

SALVAGE

Salvaging and Utilizing Wastes and Scrap in Industry, W. Rockwood Conover. Indus. Management, vol. 56, no. 6, Dec. 1918, pp. 449-451. Significance of salvaging; reclaiming practice for number of classes of materials and wastes.

TRANSPORTATION

Comparative Methods. Light-Traffic Railway vs. Highway and Motor Truck, Clement C. Williams. Eng. News-Rec., vol. 81, no. 22, Nov. 28, 1918, pp. 984-985. Analyses of operating expenses, fixed charges and amount and kind of traffic should be made for each case.

Motor Trucks. Highway-Motor Truck Problem as Viewed by User, Manufacturer and Engineer. Eng. News-Rec., vol. 81, no. 22, Nov. 28, 1918, pp. 968-977, 2 figs. Three Views. Limitations to be Placed on Trucks, from User's Viewpoint, by George H. Pride; Factors that Will Govern Future Road Design, by Edward L. Viets; Highways and Truck Loads they Can Economically Sustain, by H. Eltinge Breed.

Motor Truck Trausportation Growing Rapidly. Ry. Rev., vol. 63, no. 22, Nov. 30, 1918, pp. 763-769, 11 figs. Formerly regarded as competitive, inter-city motor-truck traffic is now encouraged by railroads.

INDUSTRIAL PROCESSES

Alcohol. Industrial Alcohol. Times Eng. Supp., no. 529, Nov. 1918, p. 228. Possible sources of supply.

Asphalt. Chemical Constitution of Artificial Asphalts (La constitution chimique des asphaltes artificiels). Génie Civil, vol. 73, no. 13, Sept. 28, 1918, p. 256. Results of experiments with petroleum residues, lignite, tars and schist. From Zeitschrift fur angewandte Chemie, June 11, 18.

Coal Distillation. Distillation at Low Temperature. Gas Age, vol. 42, no. 11, Dec. 2, 1918, pp. 466-467. Discusses advantages of "coalite" process. From Journal des Usines à Gaz.

Low Thermal Distillation of Coals, G. W. Traer. Coal Industry, vol. 1, no. 10, Oct. 1918, pp. 393-395. Details of experimental plant; characteristics of semi-coke or charcoal; how to make a coke of suitable structure. Am. Inst. Min. Engrs. paper.

Dust Precipitation. Electrastatic Dust Precipitation. William H. Easton. Indus. Management, vol. 56, no. 6, Dec. 1918, pp. 473-475, 5 figs. Dust-laden gases become ionized when passing through field around grounded tubes inside which fine wires are charged with current of 50,000 to 100,000 volts.

Gas Manufacture. Coal Conservation in Relation to Gas Manufacture, Tim Duxbury. Gas Jl., vol. 144, no. 2895, Nov. 5, 1918, pp. 302-305 and (discussion) pp. 305-308. Results of experience with vertical retorts. Paper before Manchester Instn. of Gas Engrs. Also in Gas World, vol. 69, no. 1789, Nov. 2, 1918, pp. 262-263, 1 fig.

Economizing Coal in Gas Manufacture, Frederick Shewring. Gas World, vol. 69, no. 1789, Nov. 2, 1918, p. 261. Comments on steaming retorts.

Inclined Retort Plant at Rome, N. Y., A. Success, S. Bent. Russell. Gas Age, vol. 42, no. 11, Dec. 2, 1918, pp. 463-466, 4 figs. Views and mechanism details of plant having daily capacity of 500,000 cu. ft. of gas.

Institution of Gas Engineers. Gas Investigation Committee. Gas Jl., vol. 144, nos. 2894 and 2895, Oct. 29 and Nov. 5, 1918, pp. 235-249, 3 figs. and (discussion) pp. 291-299. Report of sub-committee appointed to investigate relative efficiency in use of different grades and compositions of gas.

Glass. Substitutes for Glass. Sci. Am. Supp., vol. 86, no. 2235, Nov. 2, 1918, p. 283. Composition of siloxide and artificial mica; possibilities of derivatives of cellulose, oiled cotton cloth and vitro-cellulose. From La Nature.

Leather. Recent Developments in Leather Chemistry. Henry R. Proctor. Jl. Roy. Soc. of Arts, vol. 66, no. 3442, Nov. 8, 1918, pp. 776-781. Discussion of chemical and physical changes taking place in tanning process.

Naphthalene and Benzol. Estimation of Naphthalene in Coal Gas, Harold G. Colman. Gas Jl., vol. 144, no. 2894, Oct. 29, 1918, pp. 231-232. Modifications in Colman-Smith's method (vol. 75, p. 798).

Notes on Benzol and Naphthalene Recovery, Harold E. Copp. Gas Jl., vol. 144, no. 2895, Nov. 5, 1918, pp. 311-313, 2 figs. Results obtained with plant installed at gas works. Paper before Midland Assn. of Gas Engrs. and Mgrs. Also in Gas World, vol. 69, no. 1789, Nov. 2, 1918, pp. 265-266.

Nitric Acid. Nitric Acid as a By-Product of Internal Combustion Engines, A. W. H. Griepe. Am. Gas Eng. Jl., vol. 109, no. 21, Nov. 23, 1918, pp. 487-489, 7 figs. and p. 492. Process to precipitate nitric oxide as by-product of internal-combustion engines, flue gases, illuminating gas, furnace gas, blast-furnace gas, natural gas, etc.

Oxygen and Hydrogen. Electrolytic Oxygen and Hydrogen. Travellers' Standard, vol. 6, no. 7, July 1918, pp. 137-145. Method of producing oxygen and hydrogen and their respective industrial applications.

Potash. Recovery of Potash from Blast Furnaces, Linn Bradley. Iron Age, vol. 102, no. 19, Nov. 7, 1918, pp. 1151-1153. From paper before Fourth Nat. Expos. of Chem. Ind., New York, September 1918.

Stoneware. Chemical Stoneware, Fred A. Whitaker. Brick & Clay Rec., vol. 53, no. 11, Nov. 19, 1918, pp. 875-877, 10 figs. Account of development of industry in United States.

Water Gas. Applications of Peat for the Production of Water Gas (Trvs Anvendels til Fremstilling af Vandagas). Ingeniren, year 27, no. 86, Oct. 26, 1918, pp. 561-562.

MARINE ENGINEERING

AUXILIARY MACHINERY

Boats. Boat Lowering Appliances. J. R. Hodge. Tran. Inst. Marine Engrs., vol. 30, Aug. 1918, pp. 123-127, 4 figs. and (discussion) 127-136, 1 fig. Type of disengaging gear designed to deal simultaneously and automatically at both ends of boat, to free it from davit falls or tackles as soon as boat is waterborne.

General Rules and Regulations Prescribed by the Board of Supervising Inspectors as Amended at Board Meeting of January, 1918. Department of Commerce, Steamboat-Inspection Service, Aug. 1, 1918, 147 pp., 5 figs. Rules for boiler plate, boilers and attachements, boats and their appliances, steamers, barges and duties of inspectors; list of instruments, machines and equipments approved for use on vessels.

Diving Bell. Diving Bell in Use at Halifax Ocean Terminals, J. J. MacDonald. Jl. Eng. Inst. Can., vol. 1, no. 6, Oct. 1918, pp. 252-262, 14 figs. Outline of function design, construction and operation; formulation of principles of design proposed as applicable to future work; survey of fields of activity where plant of this type promises applicability.

SALVAGE

Salvage Methods. Salvage of Wrecked Ships (Le sauvetage des navires coulés), A. Poidlouë. Génie Civil, vol. 73, no. 13, Sept. 28, 1918, pp. 241-244, 6 figs. Review of processes used and considerations on probability of future developments.

Turning Vessel. Salvaging the Steamship St. Paul, Charles M. Horton Int. Mar. Eng., vol. 23, no. 11, Nov. 1918, pp. 644-648, 6 figs. Methods used in turning vessel; Character of problems solved; placing patch under difficulties.

SHIPS

CANADA. A Canadian Shipbuilding Industry, Thomas Cantley. Can. Min. Inst., bul. no. 80, Dec. 1918, pp. 995-1000. Excerpts from paper at 20th annual meeting of the Institute. The question of developing steel shipbuilding in Canada.

CONCRETE SHIPS. Concrete Ship Design, R. J. Wig. Eng. & Cement World, vol. 13, no. 10, Nov. 15, 1918, pp. 15-17, 9 figs. Summary of conclusions on advisability of constructing concrete ships reached by Concrete Ship Department, Emergency Fleet Corporation. From Special Report to Chairman of Shipping Board. Also in Eng. News-Rec., vol. 81, no. 20, Nov. 14, 1918, pp. 903-904, 3 figs.

Concrete Ships. Times Eng. Supp., no. 527, Sept. 1918, pp. 184-185. Account of shipyards where 18 concrete vessels are under construction and others will shortly be started.

Different Types of Framing in Two New Government Reinforced-Concrete Ships. Eng. News-Rec., vol. 81, no. 22, Nov. 28, 1918, pp. 986-989, 6 figs. 7500-ton oil tanker has close-spaced frames with vertical and horizontal reinforcing in shell, while 2500-ton schooner barge has long-span framing system with diagonal shell reinforcement.

Reinforced-Concrete Barges (Barca de hormigon armado), Julio Murúa. Revista de Obras Publicas, year 66, no. 2245, Oct. 3, 1918, pp. 493-497, 10 figs. Calculations of design for 60-ft. barge.

Reinforced Concrete Vessels, Walter Pollock. Can. Engr., vol. 35, no. 17, Oct. 24, 1918, pp. 367-373, 5 figs. Considerations of design and ideals aimed by builders; strength, advantages and disadvantages; classification rules; structural details of hull, steelwork and fittings. Paper before British Instn. of Naval Architects.

DUCT KEELS. Improvements in the Construction of Ships, E. F. Spanner. Shipbuilding and Shipping Rec., vol. 12, no. 9. Nov. 7, 1918, pp. 451-452. Discusses question of duct keels. Before Instn. Engrs. & Shipbuilders.

ISHERWOOD FRAMING. Large Freighters of Isherwood Framing Adapted to Bridge-Shop Fabrication. Eng. News-Rec., vol. 81, no. 19, Nov. 7, 1918, pp. 853-857, 4 figs. Problems worked out by co-operation of naval architect and engineer on barge shop; 200 tons weight saved; time gained in detailing; all molded work done in large shop at shipyard.

REDUCTION GEARING. Italian Reduction-Geared Turbine Cargo-Steamship "Ansaldo I." Shipbuilding & Shipping Rec., vol. 12, nos. 19 and 20, Nov. 7, and 14, 1918, pp. 447-450, 13 figs., 470-471, 4 figs. Principal dimensions, plans and photographs.

RESISTANCE. Effect of Appendages on Resistance and Propulsion. Shipbuilding & Shipping Rec., vol. 12, no. 19, Nov. 7, 1918, pp. 452-453, 2 figs. Account of Luke's experiments with various angles of bossing, with outward- and inward-turning screws; values of wake fractions and hull efficiencies; resistance compared with resistance of naked model. (Concluded.)

ROLLING. The Rolling of Ships. Sci. Am. Supp., vol. 86, no. 2236, Nov. 9, 1918, p. 299 Factors upon which natural period of roll of a ship depends; results obtained by Froude with his apparatus to record angles of roll. From Shipping World.

STANDARDIZED SHIPS. Structural Steel Standardized Cargo Vessels, Henry R. Sutphen. Inst. Mar. Eng., vol. 23, no. 12, Dec. 1918, pp. 695-968, 1 fig. How quantity production was met.

STRESSES. Investigation of Shearing Force and Bending Moment on Ship Structures, A. M. Robb. Int. Mar. Eng., vol. 23, no. 11, Nov. 1918, pp. 637-642, 8 figs. Moderate amplitudes of heave; sagging bending moment; pitching treated graphically; effect of rotational acceleration. (Second article.)

TOW BOATS. Plans and Specifications of New Wood Tow Boats. Inst. Mar. Eng., vol. 23, no. 12, Dec. 1918, pp. 673-674, plate, 1 fig. Built for hard service.

WOODEN SHIPS. Building Wooden Ships for the Emergency Fleet Corporation, E. A. Suverkrop. Am. Mach., vol. 49, no. 20, Nov. 14, 1918, pp. 383-387, 11 figs. Planking and interior work. Third article.

YARDS

CANADA. Canadian Vickers Shipbuilding Works at Montreal. Engineering, vol. 106, no. 2754, Oct. 11, 1918, pp. 395-396, 12 figs. Illustrated description of shipbuilding in Canada.

DEPARTMENTAL ORGANIZATION. Effective Arrangement of Departments in Shipyard Organization, G. F. S. Mann. Int. Mar. Eng., vol. 23, no. 11, Nov. 1918, pp. 615-617. Shipyard divisions; relations between organization departments and production departments; duties of chief engineer.

New Lake Shipyard has Side-Launching Ways Under Cover. Eng. News-Rec., vol. 81, no. 19, Nov. 7, 1918, pp. 839-841, 3 figs. Ships built at Ferguson yard fabricated in company's shops two miles away; berths covered with cantilever roof served by semi-gantry crane.

GREAT LAKES. Great Lakes Yards Lead Coast Districts in Building Ocean-Going Ships. Eng. News-Rec., vol. 81, no. 22, Nov. 28, 1918, pp. 978-980, 4 figs. Canal-size steamers produced in large numbers; spirit of co-operation; yard capacity doubled; no outside fabrication; equipment of varied character; labor shortage.

SHOOTER'S ISLAND. Methods Used at Shooter's Island for Constructing Standard Ships, Charles M. Horton. Int. Mar. Eng., vol. 23, no. 11, Nov. 1918, pp. 618-624, 13 figs. Serving individual ways; method for increasing output; well-lighted boiler shop; handy plate-lifting clamp.

MECHANICAL ENGINEERING

AIR MACHINERY

AIR CONDITIONING. Air Conditioning, Charles L. Hubbard. Domestic Eng., vol. 85, nos. 3 and 4, Oct. 19 and 26, 1918, pp. 82-84, 2 figs. and 118-120, 5 figs. Possibilities of this branch of heating and ventilating engineering and how it may save coal and raise efficiency of employees in industrial plant.

PNEUMATIC TOOLS IN WINTER. Effects of the Use of Pneumatic Tools on the Nervous System, Francis M. Barnes. Safety Eng., vol. 36, no. 4, Oct. 1918, pp.239-240. Recommends warming chisel in cold weather, enlarging or covering shank to prevent cramp in hand muscles, and condemns practice of blocking exhaust outlet, thereby forcing current of cold air over fingers. From Proc. Seventh Annual Safety Congress.

CEMENT AND CONCRETE

AGGREGATE. Clean Aggregates Obtained under Difficult Conditions, C. P. Mowry. Cement & Eng. News, vol. 30, no. 11, Nov. 1918, pp. 31-32, 3 figs. Arrangement and working of a western plant.

Proportioning the Materials of Mortars and Concretes by Surface Areas of Aggregates, L. N. Edwards. Surveyor, vol. 54, no. 1398, No. 1, 1918, pp. 209-210. Results of tests made by Toronto Department of Works with object of developing surface-area method of proportioning and securing information relative to (1) surface area of aggregates of varying granulometric composition, (2) quantity of water necessary to produce a "normal" uniform consistency of mortar for varying sands and cement constant, and (3) strength of mortar attained by varying proportion of cement in mix. Paper before Am. Soc. for Testing Materials.

CEMENT GUN. Cement Gun Used for Repairing Pit Stacks. Blast Furnace, vol. 6, no. 10, Oct. 1918, pp. 399-401, 5 figs. Steel reinforcement placed on old shell and gunite applied.

COLD-WEATHER CONCRETING. Cold Weather Concreting. Eng. & Cement World, vol. 13, no. 10, Nov. 15, 1918, pp. 20-24, 8 figs. Effect of low temperatures on concrete work; suggestions of Portland Cement Assn. in regard to heating materials and protecting work.

DISINTEGRATION. Conclusions on Causes of Concrete Disintegration, A. Blackie. Eng. & Contracting, vol. 50, no. 21, Nov. 20, 1918, pp. 503-505. From paper before Eng. Ins. of Canada.

FORM UNITS. One Set of Tool Forms Used Three Times Completes Concrete Foundry, J. M. Villadsen. Eng. News-Rec., vol. 81, no. 21, Nov. 21, 1918, pp. 950-951, 3 figs. Form units assembled on ground with reinforcement in place erected by derrick; concrete placed by telescoping chute.

FRANCOIS AND PORTIER CEMENTATION PROCESSES. Cementation Processes of Francois and Portier, A. H. Krynauw. Contract Rec., vol. 52, no. 44, Oct. 30, 1918, pp. 864-865. Conditions most suitable for hard setting in shortest time when cement is pumped under pressure into fissures; cases in which cementation has been successfully applied; comparison between two processes. Paper before Chem. Metallurgical & Min. Soc.

MOISTURE. Effect of Water on Strength of Concrete. Contract Rec., vo.. 52, no. 44, Oct. 30, 1918, p. 865, 1 fig. Diagram presenting amount of water used in per cent of quantity giving maximum strength against per cent of maximum strength. Drawn from results of experimental tests.

Saturation of Concrete Reduces Strength and Elasticity, M. B. Lagaard. Eng. News-Rec., vo.. 81, no. 20, Nov. 14, 1918, pp. 908-910, 6 figs. Tests, made at University of Minnesota, show that moisture content of specimens serves to counteract benefits of moist curing.

CORROSION

A Case of Corrosion Caused by Electrolytic Action in a Westinghouse-Leblanc Air Pump (Un cas de corrosion à allure électrolytique dans une pompe à air Westinghouse-Leblanc), L. Conge. Revue Générale de l'Electricité, vol. 4, no. 15, Oct. 12, 1918, pp. 539-540, 2 figs. States that no pipe or machine element intended to operate exposed to direct action of any kind of water should be composed of metals capable of forming a voltaic couple.

FOUNDRIES

BRASS FOUNDRY. A Brass Foundry With Automatic Ventilation, Charles Vickers. Foundry, vol. 46, no. 316, Dec. 1918, pp. 568-574, 11 figs. Description of foundry with its ventilation arrangements.

COREROOM. Modern Coreroom for Malleable Foundry, Donald S. Barrows. Iron Age, vol. 102, no. 21, Nov. 21, 1918, pp. 1254-1255, 5 figs. Designed and constructed for 50,000-ton foundry, provides for economical handling of raw materials and finished cores. Abstract of paper before Am. Foundrymen's Assn., Oct. 1918. Also in Foundry, vol. 46, no. 316, Dec. 1918, pp. 577-578, 5 figs.

DIE CASTING. Die-Casting of Aluminum, H. Rix and H. Whitaker. Sci. Am. Supp., vol. 86, no. 2237, Nov. 16, 1918, pp. 314-315. Advantages; heat treatment; material for dies; cost of process. Paper before Inst. of Metals.

FURNACES. Continuous Tunnel Furnace in Malleable Industry. Philip d'H. Dressler. Foundry, vol. 46, no. 316, Dec. 1918, pp. 566-567, 5 figs. Discussion of paper by H. E. Diller on Experiments in Annealing Malleable Iron, at annual meeting of Am. Foundrymen's Assn., Milwaukee, Oct. 1918.

Electric Furnace in the Steel Foundry, W. E. Moore. Iron Age, vol. 102, no. 20, Nov. 14, 1918, pp. 1206-1207. Comparison of electric and converter costs; relation to power station; future of electric steel foundries. From paper before Am. Foundrymen's Assn., Milwaukee, Oct. 1918.

Oil-Burning Cupola Operations Analyzed, John Howe Hall. Foundry, vol. 46, no. 316, Dec. 1918, p. 558. Results attained in melting iron for 3-ton converter plant point to saving in fuel and labor with more steady output. From paper before Am. Foundrymen's Assn., Milwaukee, Oct. 1918.

LADLES. Suggest Standard Sleeves and Nozzles. Brick & Clay Rec., vol. 53, no. 11, Nov. 19, 1918, pp. 882-883, 21 figs. Standard dimensions for round-face and straight-face nozzle brick for foundry ladles proposed by Am. Face Brick Assn., also dimensions of sleeves for foundry ladles proposed by a committee of steel men and founders in joint assembly with a committee of manufacturers of sleeve and nozle brick.

MALLEABLE IRON. Malleable Iron Castings, P. A. Paulson. Iron Age, vol. 102, no. 21, Nov. 21, 1918, p. 1266. Advantages over steel castings for agricultural purposes. From paper presented at Am. Foundrymen's Assn., Milwaukee, Oct. 1918.
The Integrity of the Malleable Casting, Enrique Touceda. Iron Age vol. 102, no. 20, Nov. 14, 1918, pp. 1204-1205. Possibility of obtaining thoroughly sound castings; use of chills detrimental; effect of war on industry. From paper before Am. Foundrymen's Assn., Milwaukee, Oct. 1918.

MOLDING. How Marine Cylinders are Molded and Cast, F. H. Bell. Can. Machy. vol. 20, no. 22, Nov. 28, 1918, pp. 611-614, 7 figs. Description of method used in a Toronto plant.
Pit Molding an Intricate Condenser Casting. Foundry, vol. 46, no. 316, Dec. 1918, pp. 552-557, 10 figs. Structural difficulties, experienced more generally in light work, attended production of this 34,900-lb. casting.

PATTERNS. The Engineer in Relation to the Foundry, E. S. Carman. Iron Age, vol. 102, no. 20, Nov. 14, 1918, pp. 1200-1202, 13 figs. Machine designs not adapted to advanced foundry practice; comparison of correct and incorrect patterns for floor molding. From paper before Am. Foundrymen's Assn., Milwaukee, Oct. 1918.

POURING. A Modern Pouring System. Iron Age, vol. 102, no. 20, Nov. 14, 1918, p. 1203, 3 figs. New type of pouring device and hand crane.

SAND. Improving Foundry Sand Mixtures, Henry B. Haneley. Iron Age, vol. 102, no. 19, Nov. 7, 1918, pp. 1146-1148, 3 figs. Use of sand-mixing machine; time required for mixing; effect of sea coal and fireclay. From paper before Am. Fdrys. Assoc., Milwaukee, October 1918. Also in Foundry, vol. 46, no. 316, Dec. 1918, pp. 559-562, 5 figs.

SEMI-STEEL. Methods of Manufacturing Semi-Steel for Projectiles (Sui vari metodi di fabbricazione della ghisa per proiettili), Giulio Sirovich. Ingegneria Italiana, vol. 2, no. 4, Sept. 26, 1918, pp. 178-180.
Urgent Shell Need Found Foundries Ready. Foundry, vol. 46, no. 316, Dec. 1918, pp. 581-587, 15 figs. Manufacturing operations and practices developed in American foundries would have furnished tonnage of semi-steel shell beyond all prospective requirements.

SUPERVISION. A Foundry Supervision System, Paul R. Ramp. Iron Age, vol. 102, no. 23, Dec. 5, 1918, pp. 1383-1385, 2 figs. Routine set of reports designed to provide quick and accurate gage of current costs and operations. From paper before Am. Foundrymen's Assn., Milwaukee, Oct. 1918.

FUELS AND FIRING

ASH. Clinker and Ash in Fuel. Times Eng. Supp. no. 527, Sept. 1918, p. 186 Methods employed for curtailing labor entailed in removing large and hard masses of clinker.
The Fusibility of Coal Ash and the Determination of the Softening Temperature, Arno C. Fieldner, Albert E. Hall and Alexander L. Field. Department of Interior, Bureau of Mines, Bul. 129, 1918, 146 pp., 38 figs. Review of literature on subject; effect of various oxidizing, reducing, and neutral atmospheres such as are found in various parts of fuel bed on softening temperature of ash when molded in form of Seger cones; development of method for determining fusibility whereby ash is caused to soften and form slags in which iron exists in approximately same state of oxidation as when in fuel-bed clinkers.

BOILER FIRING. Combustion in Its Relation to Boilers, E. A. Uehling. Power, vol. 48, no. 23, Dec. 3, 1918, pp. 804-806 Describes requirements for complete combustion and discusses combustion efficiency and absorption efficiency.
Generation of Heat and Its Absorption by Boiler, Henry Misostow. Nat. Engr., vol. 22, no. 10, Oct. 1918, pp. 518-522, 4 figs., and (discussion) pp. 522-525. Conditions which will realize an efficient commercial combustion and suggestions to utilize-heat indications in securing good performance in boiler room. Paper before Nat. Assn. of Stationary Engrs.
The Firing of Steam Boilers. English Mechanic & World of Sci., vol. 108, no. 2796, Oct. 25, 1918, p. 155. Report of German patent comprising an air chamber divided by two transverse partitions and placed immediately below top portion of endless chain grate. From Zeitschrift fur Dampfkessel und Maschinenenbetrieb, July 5, 1918.

COAL, COMBUSTION CHARACTERISTICS. Combustion Characteristics of Coals, Joseph G. Worker, Elec. Rev., vol. 73, no. 22, Nov. 30, 1918, pp. 849-851. Combustion characteristics of coals and their influence upon choice of stoker equipement; load conditions also important factor.

CONSERVATION. Coal Conservation. Times Eng. Supp., no. 527, Sept. 1918, p. 187. Abstract of report of Coal Conservation Committee of Ministry of Reconstruction.
England's Fuel Rationing Order. Heat. & Vent. Mag., vol. 15, no. 11, Nov. 1918, pp. 17-21. Provisions of new regulation limiting supply of coal, gas and electricity to domestic consumers.
Fuel Regulation during the War, P. R. Noyes and D. M. Myers. Nat. Engr., vol. 22, no. 10, Oct. 1918, pp. 481-492. Discussion by Federal Government officials before Nat. Assn. of Stationary Engrs.
Industrial Coal Economy, David Wilson. Machy. Market, no. 939, Nov. 1, 1918, pp. 19-20. Suggestions based on the experience of the author who is technical advisor to Coal Controller. Paper before Assn. of Engrs.-in-charge. (To be continued.) Also in Elecn., vol. 81, no. 2110, Oct. 25, 1918, p. 540.
Proposed Coal-Rationing Rules for the United States. Heat. & Vent. Mag., vol. 15, no. 11, Nov. 1918, pp. 21-23. Allowances designed for heating, cooking and hot-water service in residences, flats and apartment houses. Final draft of report of Committee on Fuel Conservation, Am. Soc. of Heating and Vent. Engrs.

Rational Utilization of Commercial Fuels (Sur l'utilisation rationnelle des combustibles dont dispose actuellement l'industrie). Revue Générale de l'Electricité, vol. 4, no. 14, Oct. 5, 1918, pp. 505-511. Report of the Ministry of Armament and War Manufactures. From Bulletin des Usines de Guerre, Aug. 26 and Sept. 2, 1918, pp. 137-149 and 145-147.

GASOLINE. Substitute for Gasoline Tested. Motor Age, vol. 34, no. 23, Dec. 5, 1918, p. 15. Excerpts of tests made by Bureau of Standards on secret product said to be composed of inexpensive and easily obtainable materials.

HAND-FIRED PLANTS. Fuel Economy in Hand-Fired Power Plants. Power Plant Eng., vol. 22, no. 23, Dec. 1, 1918, pp. 953-956, 4 figs. Settings, stacks and breechings. Fourth article.

LOAD FACTOR. Coal Consumption Rates in Various Central Stations and Industrial Plants. Elec. Rev., vol. 73, no. 22, Nov. 30, 1918, pp. 846-848, 2 figs. Result of study by Hydro-Electric Commission of Ontario proves superiority of large power plant and emphasizes economy of high load-factor.

OIL FUEL. California Petroleum as a Fuel Oil, Thomas J. Royer. Nat. Engr., vol. 22, no. 10, Oct. 1918, pp. 525-533, 13 figs., and (discussion) pp. 533-534. Account of development; study of use in steam-boiler practice and suggestions for satisfactory operation; test in a water-works pumping station. Paper before Nat. Assn. of Stationary Engrs.

PULVERIZED COAL. First Pulverized Coal Installation in Western Canada, H. R. Collins. Min. & Eng. Rec., vol. 23, nos. 17 and 18, Sept. 30, 1918, pp. 177-179. Features of pulverizing plant.
Pulverized Fuel, E. R. Knowles. Steam, vol. 22, no. 5, Nov. 1918, pp. 128-133, 10 figs. Temperatures attainable; disadvantages of pulverized coal as fuel; requirements for successful burning. (Concluded.)
Pulverized Fuel in the Oneida Street Plant of the Milwaukee Elec. Ry. & Light Co., F. Dornbrook. Nat. Engr., vol. 22, no. 10, Oct. 1918, pp. 535-537, and (discussion) pp. 537-539. Results obtained with trial installation. Paper before Nat. Assn. of Stationary Engrs.
Pulverizing Coal, J. Cunliffe. Eng. & Cement World, vol. 13, no. 10, Nov. 15, 1918, pp. 56-58. Waste resulting from burning coal in lumps; preparation, application and burning of pulverized coal.

WASTE HEAT. Waste Heat from Steel Furnaces, Thomas B. Mackenzie. Times Eng. Supp., no. 527, Sept. 1918, p. 195. Method of utilizing waste heat from open-hearth furnaces in generation of steam. Paper before Iron & Steel Inst.

HANDLING OF MATERIALS

COAL. Coal Handling Plant of Virginian Railway, E. F. Case. Ry. Rev., vol. 63, no. 21, Nov. 23, 1918, pp. 731-735, 9 figs. Account of extensive additions to this railroad's plant at Sewall's Point, Va.

EXCAVATION MATERIAL. Comparison of Excavation Haulage by Motor Trucks, Industrial Railways and Teams. Eng. News-Rec., vol. 81, no. 22, Nov. 28, 1918, pp. 993-996. 1 fig. Detailed cost accounts on construction of Brooklyn Army Supply Base show that trucks are more economical than teams and less economical but more flexible than railways.

GRAIN. Car Equipment for Loading or Unloading Grain (Installations pour le transport des grains montées sur wagons). Génie Civil, vol. 73, no. 14, Oct. 5, 1918, pp. 261-263, 11 figs. Two systems; by air pressure, and by suction.

ORE. Large Ore Storage in a Limited Space, F. L. Prentiss. Iron Age, vol. 102, no. 22, Nov. 28, 1918, pp. 1311-1313, 4 figs. Double bin system of Iroquois Iron Co solves material-handling problems and results in short haul to skip cars.

SAND. Pneumatic Car Provides Efficient Method of Handling Sand, W. L. Whitlock. Elec. Ry. Jl., vol. 52, no. 22, Nov. 30, 1918, pp. 967-968, 5 figs. By use of new sand car, crew of regular car takes care of sand transportation which formerly required services of three additional men.

HEAT TREATING

MALLEABLE CAST IRON. Experiments in Annealing Malleable Cast-Iron, H. E. Diller. Foundry, vol. 46, no. 316, Dec. 1918, pp. 564-566, 4 figs. Results of several laboratory experiments show that malleable iron can be annealed in tunnel furnace in 48 hours or les. From paper before Am. Foundrymen's Assn., Milwaukee, Oct. 1918.

QUENCHING STEEL. Warping of Steel by Repeated Quenching, J. H. Whiteley. Iron Age, vol. 102, no. 21, Nov. 21, 1918, pp. 1256-1257, 6 figs. How the metal contracts; direction of its flow; interesting features revealed by microscope. From paper before Iron and Steel Inst., London, Sept. 1918.

HEATING AND VENTILATION

EQUIPMENT. Care of Heating and Ventilating Equipment, Harold L. Alt. Power, vol. 48, no. 21, Nov. 19, 1918, pp. 736-738, 3 figs. Down-draft furnace. Also in Power, vol. 48, no. 23, Dec. 3, 1918, pp. 801-803, 5 figs.

FACTORY HEATING. Factory Heating, Charles L. Hubbard. Steam, vol. 22, no. 5, Nov. 1918, pp. 123-127, 9 figs. System of heating with hot water under forced circulation. (To be continued.)
Some Factory Heating Problems, B. C. Moore. Wood-Worker, vol. 37, no. 9, Nov. 1918, pp. 26-27. Considerations of the economical value of keeping a factory heated night and day.

HOT AIR FURNACE. How to Improve the Hot-Air Furnace, Charles Whiting Baker. Department of Interior, Bureau of Mines, Tech. Paper 208, 20 figs. Recommends practice of adding auxiliary cold-air duct by which air supply to furnace may be taken from inside the house, instead of from outdoors, during very cold or windy weather.

HOUSE HEATING. Economical Heating of Cottages and Small Houses, Frederick Grant. Domestic Eng., vol. 85, no. 5, Nov. 2, 1918, pp. 160-162, 4 figs. Suggests features of design for both hot-water and steam-heating systems.

OFFICE BUILDING HEATING. Fuel Economy in the Singer Building, Norman King. Power, vol. 48, no. 20, Nov. 12, 1918, pp. 710-711. Some figures on costs and economies.

VAPOR HEATING. Modern Practice in Vapor Heating. Heat. & Vent. Mag., vol. 15, no. 11, Nov. 1918, pp. 44-46, 5 figs. The Moline System. Sixth article.

VENTILATION. A Discussion of Ventilating Practices, Charles A. Mitke. Coal Industry, vol. 1, no. 10, Oct. 1918, pp. 379-381. Analysis of working conditions as affected by ventilation; installation of mechanical ventilation. Paper before Nat. Safety Congress.

No Quarrel Necessary Between Natural and Mechanical Ventilation Advocates. Heat. & Vent. Mag., vol. 15, no. 11, Nov. 1918, pp. 37-40. Clear and well-defined field for each method depending upon required air conditions with given type of occupancy and occupation. From reply by E. Vernon Hill to newspaper article.

HOISTING AND CONVEYING

CRANES. Handling Shipbuilding Material at Atlanta Shipyard. Eng. News-Rec., vol. 81, no. 23, Dec. 5, 1918, pp. 1020-1022, 8 figs. Planned for direct routing; three craneways in fabricating yard; shape shop in open; turret cranes at shipbuilding berths; assembly yard.

Hoisting and Conveying Machinery (Des appareils de manutention dans l'industrie en général), F. Séba. Revue Générale de l'Electricité, vol. 4, nos. 12 and 14, Sept. 21, and Oct. 5, 1918, pp. 423-433 and 493-501, 39 figs. Sept. 21: construction and arrangement of bridge cranes, traversing jib hoists, ceiling hoists and foundry hoists. Oct. 5, traveling cranes with auxiliary crab, rollers, rails, gear shafts, drums, cables and grab hoists.

Some Heavy Fitting-Out Cranes—I. Fixed Cranes at Kearny and Hog Island Yards. Eng. News-Rec., vol. 81, nos. 20 and 21, Nov. 14 and 21, 1918, pp. 885-890, 6 figs.; 937-941, 6 figs. 100-ton trolley bridge spanning slipway supplemented by portal cranes; platform derrick of unusual capacity and reach uses single-motor hoisting engine at Hell Gate arch-erection plant. Nov. 21: II. Cantilever and Jib Travelers at Newark Bay and Bristol; double cantilever bridge traveling along pier commands line of ships on either side; provision for extension; friction draft gear buffers; tower jib crane fitted with special safety devices.

DRUMS. Drum Shapes as Affecting the Mine Hoist Duty Cycle and Motor Rating, F. L. Stone. Proc. Am. Inst. Elec. Engrs., vol. 37, no. 10, Oct. 1918, pp. 1203-1221, 22 figs. Points out that the problem of drum shape consists in varying diameter of different parts of winding drum so that load may be accelerated and retarded at beginning and end of its travel with minimum consumption of power, and gives numerical examples of performance of various drum shapes under assumed conditions.

ELECTRIC HOISTING MACHINES. Electric Hoisting Machines (Les machines d'extraction à commande électrique), G. Rouet, Revue Générale de l'Electricité, vol. 4, no. 13, Sept. 28, 1918, pp. 451-457, 9 figs. Comparison between Léonard and three-phase types.

ROPES. Ropes for Hoisting Coal from Mines, M. W. Reed. Coal Industry, vol. 1, no. 10, Oct. 1918, pp. 388-391. Discussion concerning strength, elasticity, bending stress, starting, stopping, corrosion, clips and sockets for hoisting ropes; care and life of hoisting ropes. Paper before Nat. Safety Congress.

HYDRAULIC MACHINERY

FLOW OF WATER. A Proposed Hydraulic Experiment, Lord Rayleigh. Lond., Edinburgh & Dublin Phil. Mag., vol. 36, no. 214, Oct. 1918, pp. 315-316, 1 fig. Observation of flow of liquid between two cylinders revolving about their axes in opposite directions for the purpose of testing Froude's explanation regarding phenomena which take place when fluid passing along uniform pipe arrives at place where pipe expands.

Flow of Water in Wash Water Troughs for Rapid Sand Filters. Eng. & Contracting, vol. 50, no. 20, Nov. 13, 1918, pp. 461-462, 2 figs. From description in Cornell Civil Engineer of experiments made by Ernest C. Fortier and Frank V. Fields to determine surface curves for flow of water in wash water troughs and to develop formula for assistance of designers of troughs.

Flow of Water Through One- and One-Half-Inch Pipe and Valves, Frederick W. Greve, Jr., Purdue Univ., Bul. 1, Eng. Experiment Station, vol. 2, no. 2, July 1918, 21 pp. 16 figs. Tables and formulae for determining head losses incurred with use of pipes and valves.

Hydraulic Experiments with Valves, Orifices, Hose, Nozzles, and Orifice Buckets, Arthur N. Talbot, Fred B. Seely, Virgil R. Fleming and Melvin L. Enger. Univ. of Illinois Bul., vol. 15, no. 37, May 13, 1918, Bul. 105, 80 pp., 28 figs. Loss of hydraulic head in small valves; flow of water through submerged orifices; fire streams from small hose and nozzles; orifice bucket for measuring water.

TIDES. Power from the Tides, J. O. Boving. Times Eng. Supp., no. 529, Nov. 1918, pp. 232-233, 6 figs. Design of turbines which author thinks will render utilization of tidal power economically feasible.

WATER HAMMER. Causes of Shock in Hydraulic Mains, Alfred Towler. Machy. Market, no. 942, Nov. 22, 1918, pp. 17-18. Broad consideration of cause and effect in principle of violent collision as determined by momentum. Paper before Leeds Assn. Engrs.

Maxima Excess Pressures Produced by Water Hammer (Etude sur les maxima de surpression dans les phénomènes de coups de bélier), Maurice Gariel. Revue Générale de l'Electricité, vol. 4, nos. 11 and 12, Sept. 21 and Oct. 5, 1918, pp. 403-411, 6 figs., and 483, 490, 4 figs. Analysis of modern theory of water hammer leads author to establish that Michaud's formula for maximum excess pressure applies to great majority of turbine installations; that Joukowski-Alliévi's formula applies to conduits of uniform dimensions when opening closes in less than $2 L/a$ (where L is length in meters and a velocity of propagation of wave; and Sparre's formula in cases of non-uniform conduits and extremely rapid shut-off. Oct. 5: Investigations of phenomena of pressure waves developed in conduit by sudden release at opening and account of experimental verification of theoretical conclusions.

WATERWHEELS. Principles of Waterwheel Design. David R. Shearer. Power, vol. 48, no. 21, Nov. 19, 1918, pp. 732-734, 5 figs. Some of underlying principles simply illustrated, referring particularly to relation between velocity of water and the peripheral velocity of wheel.

INTERNAL COMBUSTION ENGINES

HEAVY OIL ENGINES. The Diesel Engine, Its Fuels and Uses, Herbert Haas. Automotive Eng., vol. 3, no. 9, Oct. 1918, pp. 418-424. General characteristics of oil engines; three general types; various cycles and comparison of advantages of each; comparative economies; detail of construction. (To be continued.) Also in Jl. Soc. Automotive Engrs., vol. 3, no. 5, Nov. 1918, pp. 299-308, 5 figs.

The Heavy Oil Engine, Charles E. Lucke, Int. Mar. Eng., vol. 23, no. 11, Nov. 1918, pp. 625-629 (Conclusion of article.)

The Semi-Diesel Engine. Times Eng. Supp., no. 529, Nov. 1918, p. 245. Characterisitics and design.

The Semi-Diesel Oil Engine, James Richardson. Engineering, vol. 106, no. 2756, Oct. 25, 1918, pp. 461-464, 12 figs. Review of mny types of semi-Diesel engines. Paper before Diesel Engine Users' Asso. Oct. 24, 1918.

HIGH SPEED ENGINE. Modern Types of Engines, Harry R. Ricardo. Machy. Market, no. 941, Nov. 15, 1918, pp. 17-18. Features of high-speed engine design and points upon which designers have concentrated their attention. Paper before North-East Coast Instn. of Engrs. & Shipbuilders. (To be continued.) Also in Int. Mar. Engr., vol. 23, no. 11, Nov. 1918, pp. 650-651.

MAGNETOS. Operation of Internal-Combustion-Engine Magnetos (Sul Funzionamento dei magneti di accensione dei motori a scoppio), Emilio Biffi. l'Electrotecnica, vol. 5, nos. 22, 24 and 28, Aug. 5 and 25, Oct. 5, 1918, pp. 302-306, 326-332 and 386-392, 26 figs. Aug. 5 and 25; theory of the magneto-generator. Oct. 5: theory of formation of spark in secondary coil. (To be continued.)

MARINE ENGINES. Two versus Four-Cycle Internal Combustion Marine Engines. Giovanni Chiesa. Engineering, vol. 106, no. 2757, Nov. 1, 1918, pp. 482, 486, 6 figs. Purpose of article is to coordinate arguments which have been alleged for and against both types in their best form of construction and to endeavor to draw conclusion after careful consideration of all points of question.

MIXTURE. Mixing the Mixture, Robert Miller. Motor Boat, vol. 15, no. 22, Nov. 25, 1918, pp. 11-14, 6 figs. Points out importance of securing uniform mixture in cylinder in order to secure chemical combination and considers the problem of direct injection.

PISTONS. Piston Design, Harry R. Ricardo. Automobile Engr., vol. 8, no. 119 Oct. 1918, pp. 274-278, 12 figs. Design in which connection between ring-carrying portion of piston and slipper surface is severed, so that heat can only be conductd to slipper surfaces by way of main webs, these being so constructed that heat from crown is distributed evenly over surface of slippers. Also in Autocar, vol. 41, no. 1201, Oct. 26, 1918, pp. 409-410, 3 figs.

LUBRICATION

CRANES, ELECTRIC. Electric Crane Lubrication, Geo. R. Rowland. Lubrication, vol. 5, no. 12, Oct. 1918, pp. 2-10, 10 figs. Ring oiling system which consists of oil reservoir and brass ring attached to and revolving with shaft.

CUTTING TOOLS. Cutting lubricants and Cooling Liquids. Shipbuilding & Shipping Rec., vol. 12, no. 19, Nov. 7, 1918, pp. 445-446. Enumeration of factors upon which selection of suitable cutting lubricant or cooling liquid depends and suggestions in regard to their manipulation. From report issued by Advisory Council of Department of Scientific & Indus. Research.

ECONOMY. Lubricant Economy, D. Street. Can. Machy., vol. 20, no. 22, Nov. 28, 1918, p. 617. Necessity for practicing economy and suggestions for reducing waste.

STEAM CYLINDERS. Problems of Steam Cylinder Lubrication (III), W. F. Osborne. Blast Furnace, vol. 6, no. 10, Oct. 1918, pp. 414-416. Factors affecting operation and lubrication of compound engines.

MACHINE ELEMENTS AND DESIGN

BEARINGS. Saving Power by Efficient Bearings, F. H. Lenox. Textile World Jl., vol. 54, no. 23, Dec. 7, 1918, pp. 91-95, 4 figs. Equipment method and results of experiments to determine power required to overcome friction of shaft bearings.

BOLTS AND SCREWS. S. A. E. Standard Screws and Bolts. Jl. Soc. Automotive Engrs., vol. 3, no. 5, Nov. 1918, pp. 333-335, 1 fig. Brief account of development of standards and comparison of standard screw-thread pitches used in five-inch systems most generally adopted in American and British practice,—B. W. S., B. S. F., U. S. S., S. A. E. Reg., S. A. E. Fine.

CRANKSHAFTS. Problems of Crankshaft Design, Otto M. Burkhardt. Aerial Age, vol. 8, no. 7, Oct. 28, 1918, pp. 376-379, 15 figs. Mathematical analysis of three groups of forces necessary to induce and maintain speeds of 3000 r.p.m. or more; pressures due to gaseous mixture, inertia forces and centrifugal forces. Paper before Eng. Soc. of Buffalo.

GEARS. The Internal Gear. Pamphlet published by Fellows Gear Shaper Co., 92 pp., 55 figs. Popular presentation of the comparative tooth action of internal and external gear teeth, together with directions for cutting, and samples of applications .

MACHINE SHOP

TOOL MAKING. Tooling Up Single Spindle Automatics and Lathes. Can. Machy, vol. 20, no. 19, Nov. 7, 1918, pp. 536-537, 6 figs. Operations for British 101 fuse body.

GRINDING. Grinding; Its Utility in the Modern Shop, D. Street. Can. Machy., vol. 20, no. 22, Nov. 28, 1918, p. 623. Convenience of substituting grinding for tooling in certain machine operations.

BELTING. Belting Speeds; Saw Speeds; Bearing Alloys, G. F. Cosgove. Wood-Worker, vol. 37, no. 9, Nov. 1918, pp. 28-29. Account of experiments made with gang ripping machines with saws located above stock to be ripped, feed being by means of a grooved traveling bed which carries the stock beneath saws.

DRILL SHARPENING. Central Plant for Sharpening Drill Steels Saves Money in Quarrying. Eng. News-Rec., vol. 81, no. 21, Nov. 21, 1918, pp. 929-930, 3 figs. Sharpening shop with two men replaces five smithies; steel conveyor, oil-fired furnaces and concrete quenching vat.

GAGES. Making Thread Gages, T. H. Fenner. Can. Machy., vo.. 20, no. 19, Nov. 7, 1918, pp. 529-532, 7 figs. Description of plant and methods of a Canadian firm.

MILLING. Continuous Milling, A. Thomas. Automobile Engr., vol. 8, no. 119, Oct. 1918, pp. 296-298, 12 figs. Notes on operation of Becker machine.

OPERATION. Scientific Organization of the Machine Shop (Organisation Scientifique de l'usinage), P. Denis. Génie Civil, vol. 73, nos. 12, 13 and 14, Sept. 21, 28 and Oct. 5, 1918, pp. 227-230, 246-251 and 268-271, 23 figs. Methodical execution of turning, countersinking and drilling. Sept. 21: selectin of most economical cutting speed by construction of individual tool curves showing cutting speed against volume of material removed by tool at that speed before it needs resharpening. Sept. 28: further study of tool curves and their utilization in determining the most effective thermal treatment for tools used in cutting operations. Oct. 5: numerical illustrations and résumé of conclusions reached.

PUNCH PRESS. Safe Punch Press Operation, W. W. Roach. Safety Eng., vol. 36, no. 4, Oct. 1918, pp. 231-233. Discusses installation and use of mechanical guards, introduction of safe practices and education of press operators. From Proc. Seventh Annual Safety Congress.

SQUARE HOLES. Generating a Square Hole with a Gear Shaper Cutter, Douglas T. Hamilton. Am. Mach., vol. 49, no. 21, Nov. 21, 1918, pp. 949-950, 2 figs.

TOOL DEPARTMENT. Supervising a Large Tool Department, C. W. Starker. Indus. Management, vol. 56, no. 6, Dec. 1918, pp. 481-486. Step toward greater economy in tool department. Methods developed in tool department to coordinate requirements and minimize tool expense.

MACHINERY, METAL WORKING

BORING BAR. Making Boring Bars for Big Guns, M. E. Hoag. Am. Mach., vol. 49, no. 22, Nov. 28, 1918, pp. 987-988, 4 figs. Describing boring of hole 42 feet long 1¼ inches in diameter.

GRINDER. Heald Cylinder Grinder. Am. Mach., vol. 49, no. 23, Dec. 5, 1918, pp. 1053-1054, 2 figs. Description of machine built by Heald Machine Co., Worcester, Mass., with principal dimensions.

LATHE. Amalgamated Shell-Turning Lathe. Am. Mach., vol. 49, no. 19, Nov. 17 1918, p. 869, 1 fig. Short description with principal dimensions.

SLOTTING MACHINE. A New Slotting Machine of the Milling Type, J. V. Hunter. Am. Mach., vol. 49, no. 21, 1918, pp. 953- 56, 9 figs. Description with principal data of new machine tool brought out by Racine Tool and Machine Co., Racine, Wis.

MACHINERY, SPECIAL

CLOCKS. Studies in Clocks and Time-Keeping: No. 1. Theory of the Maintenance of Motion, R. A. Sampson. Proc. Roy. Soc. of Edinburgh, vol. 38, part 1 and 2, session 1917-1918, pp. 75-114, 11 figs., and 169-128. Practical details of three clocks, Riefler, synchronome, and Cottingham; theoretical discussions on maintenance of motion, air resistance, barometric error, escapement error, temperature compensation, and other points connected with exact timekeeping. No. 2: Tables of the Circular Equation.

EVAPORATORS. Lillie Multiple Evaporator. Steam, vol. 22, no. 5, Nov. 1918, pp. 142-143, 3 figs. Evaporator in which liquid is spread over heating surfaces in thin films.

HOISTING JACKS. Hydraulic Car Lift Gives Increased Output to Shops, Homer MacNutt. Elec. Ry. Jl., vol. 52, no. 21, Nov. 23, 1918, pp. 927-928, 4 figs Description with illustrations of hydraulic hoisting jack.

QUARRYING MACHINES. Labor-Saving Methods and Machines in Limestone Quarrying. Eng. & Contracting, vol. 50, no. 21, Nov. 20, 1918, pp. 478-479. From pamphlet by Oliver Bowles issued by U. S. Bureau of Mines.

QUENCHING MACHINE. A Quenching Machine for Hardening Small Drawing Dies. Am. Mach., vol. 49, no. 23, Dec. 5, 1918, pp. 1045-1046, 4 figs. Description of machine developed by S. A. Potter Tool and Machine Works, 70 East 130th St., New York.

ROAD FINISHER. Road Finisher Produces Denser Concrete. Cement & Eng. News, vol. 30, no. 1, Nov. 1918, p. 34, 2 figs. Machine which subjects mixture to continuous agitation by tamper.

SCALES. Modern 150-Ton Track Scale Now in Use, Frank C. Perkins. Can. Machy., vol. 20, no. 19, Nov. 7, 1918, pp. 544-547, 9 figs. Mechanism of design in which plate-steel fulcrums are used.

SCREENS, GRAVEL. Comparative Analysis of Gravel Screens, Raymond W. Dull. Cement & Eng. News, vol.30, no. 11, Nov. 1918, pp. 21-23, 10 figs. Considers gravity, cylinder, overhung conical and inclined conical types.

TOOL-SETTER. Alignment-Tester and Microscopic Tool-Setter. Engineering, vol. 106, no. 2754, Oct. 11, 1918, pp. 398-399, 7 figs. Description of an instrument constructed by Cambridge Scientific Instrument Company, Limited Cambridge.

MATERIALS OF CONSTRUCTION AND TESTING OF MATERIALS

ASPHALT. Standardization of Required Consistency for Asphalt, J. R. Draney. Contract Rec., vol. 32, no. 46, Nov. 13, 1918, p. 910, Quotes present variations and suggests possible specifications.

BOILER PLATE. Materials of Steam Boiler Construction, A. J. Dixon. Boiler Maker, vol. 18, no. 11, Nov. 1918, pp. 317-319. Action of carbon in boiler plate; dangers of free use of cast iron; laminar structure of wrought iron. From Power.

CRACKS. Prevention of Season and Corrosion Cracks, W. B. Price. Am. Machy., vol. 49, no. 19, Nov. 7, 1918, pp. 848-850, 7 figs. Paper before Am. Soc. for Testing Materials, Atlantic City, June 1918.

MONEL METAL. Note on Monel Metal, John Arnott. Engineering, vol. 106, no. 2756, Oct. 25, 1918, p. 451, 3 figs. Composition, microstructure, strength or rolled materials, effect of annealing, strength at high temperature, use.

SILICA BRICK. Silica Brick Tests. Eng. & Cement World. vol. 13, no. 10, Nov. 15, 1918, p. 62. Brief report of experiments conducted in France which revealed that notable quantities of iron oxide do not sensibly lower fusing point of silica, even when lime is present.

MEASUREMENTS AND MEASURING APPARATUS

DEPTH GAUGE. A Micrometer Depth Gauge, C. H. Copland. Model Engr., vol. 39, no. 914, Oct. 31, 1918, pp. 239-240, 6 figs. General arrangement and details of gage intended for use on munition or other fine work.

HARDNESS. The Institution of Mechanical Engineers. Engineering, vol. 106, no. 2756, Oct. 25, 1918, pp. 469-472, 5 figs. Discussion of three papers on hardness testing, "A Law Governing the Resistance to Penetration of Metals When Tested with a 10-mm. Steel Ball; and a New Hardness Scale in Energy Units, by Prof. C. A. Edwards, "The Value of the Indentation Method in the Determination of Hardness," by H. G. C. Batson, and "The Ludwick Hardness Test," by W. C. Unwin, all read at meeting of Inst., Oct. 1918.

The Ludwik Hardness Test, W. C. Unwin. Engineering, vol. 106, no. 2756, Oct. 25, 1918, p. 478. Paper before Inst. of Mech. Engrs., Oct. 1918.

The Resistance of Metals to Penetration Under Impact, C. A. Edwards, Engineering, vol. 126, no. 3276, Oct. 11, 1918, pp. 314. Abstract of paper before Inst. of Mech. Engrs., June 1918.

Value of the Indentation Method in the Determination of Hardness; R. G. C. Batson. Engineering, vol. 106, no. 2756, Oct. 25, 1918, pp. 475-477, 6 figs. Paper before Inst. of Mech. Engrs., Oct. 1918.

HEAT-MEASUREMENT. Heat-Measuring Instruments, C. E. Clewell. Am. Mach., vol. 49, no. 23, Dec. 5, 1918, pp. 1021-1025, 12 figs. Principal types of pyrometers; features connected with their use; typical uses; cases of practical installations of pyrometers illustrated.

INDICATORS. Indicator Cord Connections, R. T. Strohm, Southern Engr., vol. 30, no. 4, Dec. 1918, pp. 40-41, 7 figs. Collection of methods used by engineers to connect cord to reducing motion.

MINIMETER. The Minimeter for Fine Measuring, Frank C. Perkins. Can. Machy., vol. 20, no. 21, Nov. 21, 1918, pp. 592-593, 5 figs. Principle and forms of Hirth apparatus for measuring threads, balls, cylindrical parts and grooves, also for inside measuring of various diameters.

PERMEABILITY. Determination of Permeability of Balloon Fabrics, Junius David Edwards. Aeronautics, vol. 15, no. 261, Oct. 16, 1918, pp. 358-364, 7 figs. Theory of process; volume-loss methods; penetration methods; experimental apparatus; effect of experimental conditions on apparent permeability; operating directions and calculations. From Aviation & Aeronautical Eng.

VARIANCE. Variance of Measuring Instruments and Its Relation to Accuracy and Sensitivity, Frederick J. Schlink. Jl. Franklin Inst., vol. 186, no. 6, Dec. 1918, pp. 743-747. Abstract of notes from U. S. Bureau of Standards.

VISCOSITY. On the Measurement of the Viscosity of Liquids (Sur la mesure de la viscosité des huiles), C. Chéneveau. Journal de Physique, vol. 7, May-June 1917, pp. 109-114, 1 fig. Apparatus for measuring absolute viscosity by application of Poiseuille's law.

MECHANICS

BEAMS. Curved Beams, James J. Guest. Proc. Roy. Soc., vol. 95, no. A665, Sept. 2, 1918, pp. 1-21, 6 figs. Determination of stresses produced by bending moment in uniform curved beams of several special sections; method of estimating maximum stress applicable to sections considered and approximately to any other section not having extraordinary features.

The Buckling of Deep Beams, J. Prescott. Lond., Edinburgh & Dublin Phil. Mag., vol. 36, no. 214, Oct. 1918, pp. 297-314, 7 figs. Attempt to develop mathematical theory of side buckling of beam having a depth much greater than its breadth by assuming buckling has actually occurred and finding value of couples at end which will maintain buckled state of beam..

ELASTICITY. Elastic Solids Under Body Forces, D. N. Mallik. Lond., Edinburgh & Dublin Phil. Mag., vol. 36, no. 214, Oct. 1918, pp. 321-326. Derives from equation of equilibrium of isotropic solid under body forces mathematical expression for its displacement.

Theory of Elastic Phenomena Taking Place in Punching and Drawing of Plastic Blocks (Théorie du poinçonnage et de l'écoulement des blocs plastiques; phase élastique de ces phénomènes), J. Boussinesq. Comptes rendus des séances de l'Académie des Sciences, vol. 167, no. 15, Oct. 7, 1918, pp. 505-510. Studies general case of cylindrical block. Supplement to four previous communications (Comptes rendus, vol. 167, July 29, Aug. 5, 12, 19, pp. 186, 221, 253, 285) on the verification of Trosca's formulæ.

SPRINGS. A New Theory of Plate Springs. David Landau and Percy H. Parr. Jl. Franklin Inst., vol. 186, no. 6, Dec. 1918, pp. 699-721, 8 figs. Mathematical study of effect of tapering ends of leaves on strength of spring. Continued from vol. 185, April 1918, p. 481. (To be continued.)

TUBES. Contribution to Our Knowledge on Calculation of Stresses in Tubes (Bidrag till Kännedom om tubers beräkning). Folke L:son Grange. Teknisk Tidskrift, Väg—och Vatten-Byggnadskonsl, year 48, no. 10, Oct. 1918, pp. 145-147, 4 figs.

MOTOR CAR ENGINEERING

DESIGN. Aeronautical Experience Will Profoundly Affect Motor Car Practice, A. A. Remington. Automotive Ind., vol. 39, no. 18, Oct. 31, 1918, p. 776. Emphasizes necessity for greater standardization and more research work. Presidential address before British Instn. Automobile Engrs.

Post-War Chassis. Automobile Engr., vol. 8, no. 119, Oct. 1918, pp. 279-280. Possible effects of aircraft engine experience and other factors bearing upon design. (To be continued.)

ENGINES GASOLINE. The "American", Sleeve-Valve Motor. Auto, vol. 23, no. 44, Nov. 1, 1918, pp. 820-822, 6 figs. How sleeves are operated; suggestion to overcome tendency not to get rid of exhaust, by offsetting forward sleeve exhaust port from its present direct opposition to inlet and narrowing and deepening both it and others corresponding in cylinder wall and in head.

ENGINES, KEROSENE. Beaver Kerosene Tractor Engines. Automotive Industries, vol. 39, no. 20, Nov. 14, 1918, pp. 839 and 862, 2 figs. Horsepower and torque curves of 4¾ x 6-in. engine and record of 5-hr. endurance test on full-open throttle at 900 r.p.m.

FUEL CONSUMPTION. Tests for Reducing Fuel Consumption on Motor Vehicles (Forsog paa Besparelse af Brændselsolie ved Automobilkorsel), Paul Bergsoe. Ingenioren, year 27, no. 85, Oct. 23, 1918, pp. 557-558.

GAS FUEL. Coal Gas for Motor Vehicles. Times Eng. Supp., no. 527, Sept., 1918, p. 187. Modifications for running under compressed charges introduced by London General Omnibus Co.

KEROSENE BURNING (SEE ENGINES, KEROSENE). Kerosene Vaporization, L. E. French. Automotive Industries, vol. 39, no. 20, Nov. 14, 1918, p. 845, 2 figs. Apparatus embodying tube and hot-spot systems of vaporizing heavy fuel for internal-combustion engines, the two effects being automatically balanced.

The Bellem-Bregeras Kerosene Atomizer, Auto, vol. 23, no. 45, Nov. 8 1918, p. 845, 2 figs. Theoretical value and practical performance results.

LUBRICATION. Lubrication and Fuel Tests, P. J. Dasey. Automotive Ind., vol. 39, no. 21, Nov. 21, 1918, pp. 875-877, 4 figs. Deals with tests made on a Buda tractor-type engine. Devorik's new synthetic gasoline. Paper before section of Soc. Automotive Engrs.

Single-Feed System Oils Car from Scat. Automotive Ind., vol. 39, no. 17, Oct. 24, 1918, p. 719. Multiple-plunger hand pump and reservoir constructed to supply oil under pressure to all points on chassis.

STEAM VEHICLES. Solid Fuels for Steam Vehicles. Motor Traction, vol. 27, no. 709, Oct. 2, 1918, pp. 243-244. Review of tests conducted by coal controller to prove that other fuels than Welsh coal could be used.

TRACTORS. Heider Friction Drive Tractor. Automotive Industries, vol. 39, no. 20, Nov. 14, 1918, pp. 831-832, 4 figs. Friction drive which enables a considerable number of tractor speeds and belt speeds to be obtained without use of shifting gears.

WHEELS. Front Wheel Wobble, Walter Boyle. Motor Traction, vol. 27, no. 712, Oct. 23, 1918, pp. 305-306, 2 figs. Sketch of method to give trailing effort to front wheels by tilting steering heads.

PIPE

TILE. Tile Pipe Versus Iron Pipe for Drains, Osborne Smith. Contract Rec., vol. 32, no. 44, Oct. 30, 1819, p. 873. Brief account of author's experience and suggestions in regard to jointing.

POWER GENERATION

CANADA. Utilizing Canada's Water Powers, J. B. Challies. Can. Mfr., vol. 38, no. 8, Aug. 1918, pp. 25-27. Future possibilities and requirements for their realization. From paper before Can. Soc. Civil Engrs.

POWER PLANTS

BOILER INSPECTION. Ontario Boiler Inspection Office. Power, vol. 48, no. 20, Nov. 12, 1918, pp. 698-699, 13 figs. Examples of dangerous conditions found in boilers described and illustrated.

BOILER OPERATION. Boiler Room Efficiency, A. H. Blackburn. Power Plant Eng., vol. 22, no. 22, Nov. 15, 1918, pp. 919-920. Analysis of fuel; losses in boiler room; instruments; coal handling. Abstract of paper before Annual Convention of Smoke Prevention Assn.

Economic Operation of Steam Turbo-Electric Stations, C. T. Hirshfeld and C. L. Karr. Department of Interior, Bureau of Mines, Tech. Paper 204, 29 pp., 5 figs. Analysis of methods used in boiler from for producing steam required and distributing load between main units available. Discussion of economic source for auxiliary power and conclusion that auxiliary power in excess of that obtainable with exhaust steam absorption can be procured from main generators in electrical form at lower thermal cost than in any other way.

Economical Working of Boiler Plant, P. D. Kirkman. Machy. Market no. 942, Nov. 22, 1918, p. 18. List of modern efficiency apparatus and of items to be studied in connection with waste and efficiency. Address to Manchester Branch of British Assn. of Textile Mgrs.

Economy in Boiler Operation, Thomas M. Gray. Southern Engr., vol. 30, no. 4, Dec. 1918, pp. 42-43, 1 fig. Advantages and disadvantages of high furnace temperatures; conditions produced by forcing boilers considerably beyond their rating; sampling and analyzing of flue gases.

BOILER SETTINGS. Boiler Setting Radiation and Air Leakage, E. S. Hight. Elec World, vol. 72, no. 21, Nov. 23, 1918, pp. 974-975, 1 fig. Results of experiments to determine best method of covering boiler settings to bring about reduction in radiation and escape of air; type of covering which saves $1000 per 500-hp. battery per year.

CENTRAL STATIONS. A Kilowatt Hour and the Coal Required to Produce It, B. H. Blaisdell. Elec. Eng., vol. 52, no. 2, Aug. 1918, pp. 26-28. Waste inherent in present system of generating power and remarks on some of the losses due to imperfect manipulation. Paper before Manila Section of Nat. Elec. Light Assn.

Increasing the Economy of Central Station Operation, J. W. Andree. Elec. World, vol. 72, no. 19, Nov. 9, 1918, pp. 881-882. Overhauling water conduits and prime movers; burning natural gas to save fuel oil; other proved methods.

COKE OVEN PLANTS. Power Plants at By-Product Coke-Ovens, F. E. Harris. Jr. & Cl. Trds. Rev., vol. 96, no. 26117, April 26, 1918, pp. 450-452, 2 figs. Discusses requirements and how to obtain satisfactory results.

CONDENSERS. Condensers and Condenser Engineering Practice, D. D. Pendleton. Power, vol. 48, no. 20 and 21, Nov. 12 and 19, 1918, pp. 720-722 and 756-757. Abstract of paper presented at twelfth annual convention of Assn. of Iron and Steel Elec. En ., Baltimore, Sept. 1918.

COST. Improving Factory Steam Plants (V), H. A. Wilcox. Power Plant Eng. vol. 22, no. 22, Nov. 15, 1918, pp. 915-918, 2 figs. Test to determine proper division of costs; schedule of operation for power department.

ECONOMIZERS. Exact Data on the Running of Steam Boiler Plants, D. Brownlie. Engineering, vol. 106, no. 2757, Nov. 1, 1918, pp. 481-482. Economizers. First article.

EFFICIENCY. Steam Plant Efficiency. Coal Trade Jl., year 50, no. 49, Dec. 4, 1918 pp. 1433-1434. Suggestions addressed operating officers, superintendents, chief engineers, motive power department officials and men in charge of stationary power, heating and pumping plants by U. S. Railroad Administration.

EXHAUST STEAM. Maintenance of a Proper Heat Balance, R. N. Ehrhart. Power, vol. 48, no. 20, Nov. 12, 1918, pp. 692-694, 4 figs. Describing hand and automatic control of exhaust steam from auxiliaries so that quantity of exhaust steam available for feed heating may at all times bo proportioned to. load on main units, thus preventing waste of exhaust at light loads.

HIGH PRESSURE STEAM. The Use of High-Pressure and High-Temperature Steam in Large Power Stations, J. H. Shaw. Inst. E. E., Nov. 1918, pp. 1-10 5 figs. From the point of view of the engineer interested in the generation of electricity. Also in Machy. Market, no. 942, Nov. 22, 1918, pp. 19-20.

INDIVIDUAL PLANTS. New General Electric Steam Turbine Shop, F. L. Prentiss. Iron Ag , vol. 102, no. 20, Nov. 14, 1918, pp. 1195-1199, 6 figs. Construction and other features in large plant designed for heavy machine work; production methods followed.

Plant Arrangement and Cost of Construction. Elec. World, vol. 72, no. 19, Nov. 9, 1918, pp. 888-890, 3 figs. Features of latest station of Turners Falls Power & Electric Co., may become one of most important steam plants in New England. (Second article.)

POWER INDUSTRY. Conditions in the Power Industry, Ludwig W. Schmidt. Power vol. 48, no. 23, Dec. 3, 1918, pp. 798-800. Digest of reports of U. S. consuls on power situation in various parts of world and influence of war upon this industry.

The Power Plant Problem in South China, Harold B. Wilson. Power, vol. 48, no. 21, Nov. 19, 1918, pp. 747-748. Only pioneer work has been done and there is opportunity for America in this field.

SCALE. Heat Loss Due to Scale. Can. Mfr., vol. 38, no. 8, Aug. 1918, p. 31, 1 fig Chart showing approximate annual loss with coal at different prices.

SCREENS, WATER. Screening Condensing Water Efficiently and Economically, Henry J. Edsall. Steam, vol. 22, no. 5, Nov. 1918, pp. 133-137, 7 figs. Describds traveling screens with automatic cleaning features.

STACK LOSSES. Steam Plant Efficiency, Henry Kreisinger. Coal Trade Jl., year 50, no. 47, Nov. 20, 1918, pp. 1392-1393. Causes of high ash loss; methods of determining stack losses; causes of large excess of air and remedy. (To be concluded.)

TEMPERATURE REGULATION. Automatic Temperature Regulation as a Fuel Conservation Measure. Heat. & Vent. Mag., vol. 15, no. 11, Nov. 1918, pp. 40-43, Advance report of a Committee on Automatic Heat Control, as furnished to Fuel Administration. For presentation at annual meeting of Am. Soc. of Heating and Vent. Engrs., New York, Jan. 1918.

WATER SOFTENING. Home-Made Water Softening Plant, H. D. Odell. Power, vol. 48, no. 21, Nov. 19, 1918, pp. 728-731, 3 figs Description of home-made water-softening plant and experiences with it.

WIRE MAKING PLANTS. Power Generation for Wire Making. Power Plant Eng., vol. 22, no. 22, Nov. 15, 1918, pp. 907-914, 15 figs. Description of plant of John A. Roebling Sons Co., Trenton, N. J.

POWER TRANSMISSION

GEARS. Saving Coal at the Gear and Wheel Tread, C. W. Squier. Elec. Ry. Jl., vol. 52, no. 20, Nov. 16, 1918, pp. 876-878, 7 figs. Discussion of losses in gearing; showing how correct gear ratio with low armature speed will save power; comparing gearless and geared motors and two and four motor equipments.

PRODUCER GAS

Machine Shop for Gas Producer Work. Iron Age, vol. 102, no. 23, Dec. 5, 1918, pp. 1373-1378, 14 figs. Features of new plant of Smith Gas Engineering Co., Dayton, Ohio. Producer operation for poewr purposes.

REFRIGERATION

AMMONIA COMPRESSION. Improving a Refrigerating Plant, E. W. Miller. Refrigerating World, vol. 53, no. 9, Sept. 1918, pp. 25-26, 1 fig. Account to work done in installation consisting of a 50-ton horizontal double-acting compressor, a 150-up. combination fire- and water-tube boiler, pumps and a 50-kw. generating unit.

The Ammonia Compression Refrigerating System (XXII), W. S. Doan. Refrigerating World, vol. 53, no. 9 and 10, Sept. and Oct. 1918, pp. 31-32, 3 figs. Troubles likely to develop in piston-rod stuffing box and manner of overcoming them.

AMMONIA LEAKAGE. Finding "Lost" Ammonia in Refrigerating Plants, E. W. Miller. Power, vol. 48, no. 21, Nov. 19, 1918, pp. 734-735. Common causes for leakage of ammonia.

ICE PLANTS. Ice Plant Troubles, E. W. Miller. Southern Engr., vol. 30, no. 4, Dec. 1918, pp. 48-50. Outline of conditions in actual case and suggestions on economical operation.

OPERATION. Making a Neglected Refrigerating Plant Give Capacity, E. W. Miller. Power, vol. 48, no. 23, Dec. 3, 1918, pp. 810-811, 1 fig. What was done to make comparatively new plant give rated capacity.

SMALL MACHINE. Small Refrigerating Machines, John E. Starr. Refrigerating World, vol. 53, no. 9, Sept. 1918, pp. 11-12. Difficulties presented by small machines in addition to the difficulties existing in all machines.

RESEARCH

The National Engineering Societies and the National Research Council, Geo. Ellery Hale, Proc. Am. Inst. Elec. Engrs., vol. 37, no. 10, Oct. 1918, pp. 1223-1236. War duties; present organization of research information service; international cooperation in research.

STANDARDS AND STANDARDIZATION

METRIC SYSTEM. The Metric System, Harry Allcock. Surveyor, vol. 54, no. 1399, Nov. 8, 1918, p. 227. Criticism of arguments presented by Committee on Commercial and Industrial Policy After the War in their report against early introduction of metric system.

Use of the Metric System in the United States. Sci., vol. 48, no. 1248, Nov. 29, 1918, pp. 540-541. Resolution adopted by United States Section of International High Commission regarding use of metric system in U. S. in order to foster Pan-American commercial relations.

SCREW THREADS. Inaugural Presidential Address to the Manchester Association of Engineers. Steamship, vol. 20, no. 353, Nov. 1918, pp. 112-115. Consideration of various aspects of problem of standardizing screw threads and other industrial products.

STEAM ENGINEERING

BOILERS. Safe Working Pressure for Steam Boilers, H. F. Gauss. Power, vol. 48, no. 22, Nov. 26, 1918, pp. 772-774. Simple treatment dealing with efficiency of riveted-joints, bursting and safe working pressures for boilers, and permissible pressure on stayed surfaces.

EXHAUST STEAM. Commercial Value of Exhaust Steam, Frederick C. Ruck. Nat. Engr., vol. 22, no. 10, Oct. 1918, pp. 498-507. Data from actual observations and practical experience covering a period of several years. Paper before Nat. Assn. of Stationary Engrs.

Turbine Gives Additional Line Shaft Power. Blast Furnace, vol. 6, no. 10, Oct. 1918, pp. 430-432, 1 fig. Possiblities for expansion by use of exhaust steam in low-pressure turbines; efficiency of reduction gears.

STRAIGHT-FLOW ENGINES. Details of Construction of Straight-Flow Steam Engines (Constructie-details van gelykstroom-stoommachines), D. A. De Fremery De Ingenieur, year 33, no. 42, Oct. 19, 1918, pp. 807-817, 23 figs.

TURBINES. Avoiding Distortion in Turbine Operation, Webster Tallmadge. Power, vol. 48, no. 22, Nov. 26, 1918, pp. 762-765, 8 figs. Explaining some of careless treatments afforded steam turbines through ignorance and thoughtlessness and how to avoid them.

Care in the Operation of Small Turbines, J. A. MacMurchy. Power, vol. 48, no. 21, Nov. 19, 1918, pp. 744-745. Parts of small steam turbine which should receive particular attention.

The Steam Turbine (IX). Southern Engr., vol. 30, no. 4, Dec. 1918, pp. 52-53, 3 figs. Installation, operation and maintenance of Terry steam turbine. (To be continued.)

THERMODYNAMICS

HEAT TRANSMISSION TABLES. New Heat Transmission Tables (II), William R. Jones. Heat. & Vent. Mag., vol. 15, no. 11, Nov. 1918, pp. 24-29. Compilation of factors as given by leading authorities covering latest types of construction.

SPECIFIC HEATS. The General Character of Specific Heats at High Temperatures. Walter P. White. Proc. Nat. Academy of Sci., vol. 4, no. 11, Nov. 1918, pp. 343-346. Experimental determination of specific heats of three forms of silica and two silicates for temperatures up to 1300.

WELDING

ELECTRIC WELDING. A New Type of Portable Arc Welder. Eng. & Cement World, vol. 13, no. 10, Nov. 15, 1918, p. 64, 2 figs. Arrangement consisting of Lincoln 150-ampere arc-welding generator direct-connected to Wington G. L. 5 gasoline engine and intended for mounting on automobile truck.

Boiler and Other Repairs by Electric Welding. Can. Machy., vol. 20, no. 21, Nov. 21, 1918, pp. 596-599, 4 figs. Development of art and conditions necessary to insure satisfactery results. Paper before Inst. of Marine Engrs.

Electric Arc Welding, Robert E. Kinkead, Power, vol. 48, no. 22, Nov. 26, 1918, pp. 791-792. General descriptive article. Paper before Cleveland Eng. Soc.

Electric Welding—A New Industry, H. A. Horner. Proc. Am. Inst. Elec. Engrs., vol. 37, no. 10, Oct. 1918, pp. 1185-1195, 29 figs. Brief review of uses of electric spot and arc welding in the United States prior to formation of Electric Welding Committee of Emergency Fleet Corporation; developments in apparatus in last six-months, activities of Welding Committee in applying electric welding process to shipbuilding industry.

Electric Welding for Shipbuilding Purposes, W. S. Abell. Shipbuilding & Shipping Rec., vol. 12, no. 20, Nov. 14, 1918, pp. 471-474. Summary of investigations undertaken and of development of industry. Paper before North-East Coast Instn. Engrs. & Shipbuilders.

Electric Welding for Ships. Times Eng. Supp., no. 529, Nov. 1918, p. 239. Results of tests in regard to strength, elasticity, alternating stress and other factors affecting reliability of welded joints.

Electric Welding Nomenclature and Symbols. Ry. Rev., vol. 63, no. 20, Nov. 16, 1918, pp. 702-707, 34 figs. Scheme developed for Emergency Fleet Corporation to indicate types of welds in ship construction.

Electric Welding on the Rock Island Lines, E. Wanamaker. Boiler Maker, vol. 18, no. 11, Nov. 1918, pp. 308-310. Gives actual results which show reduction in maintenance cost. Before Western Ry. Club.

Inspection of Steel Arc Welds, O. S. Escholtz. Iron Age, vol. 102, no. 23, Dec. 5, 1918, pp. 1390-1391, 2 figs. Factors determining their character; penetration and electrical tests; analysis of welds and their heat treatment.

Nomenclature for Electric Welding, H. G. Knox. Engineering, vol. 106,-no. 2758, Nov. 8, 1918, pp. 522-526, 27 figs. From paper before Engrs.' Club of Philadelphia, June 26, 1918

The Welding of Steel, B. K. Smith. Am. Mach., vol. 49, no. 23, Dec. 5, 1918, pp. 1025-1026. From paper before Northwestern Welder's Assn., Minneapolis, Oct. 1918.

HEAT TREATMENT. Treatment of Metals After Welding. Can. Mfr., vol. 38, no. 8, Aug. 1918, pp. 29-30. Practical guide as to correct temperature to which metal should be heated and order of procedure. Prepared by l'Air Liquide Society, Toronto.

OXYACETYLENE WELDING. Defective Oxy-Acetylene Welds, D. Richardson. Flight, vol. 10, no. 42, Oct. 17, 1918, pp. 1175-1176. Brief considerations on six causes of defective welds; impure acetylene, irregular delivery of gases, faulty manipulation of blowpipe, faulty filling materials, faulty preparation and adjustment, and faulty after treatment of welds. Paper before British Acetylene Assn.

Oxy-Acetylene Pipe Welding and Cutting. Gas Age, vol. 42, no. 11, Dec. 2, 1918, pp. 471-474, 7 figs. Résumé of standard practice. (To be continued.)

The Oxy-Acetylene Flame and Blowpipe Efficiency, Arthur Stephenson. Acetylene & Welding Jl., vol. 15, no. 181, Oct. 1918, pp. 174-179, 2 figs. Volumes of air, oxygen and nitrogen required in flame; factor governing heating value per unit volume consumed; conditions which limit temperature of flame. (To be continued.)

The Steel Ship and Oxy-Acetylene Welding, J. F. Springer. Inst. Mar. Eng., vol. 23, no. 12, Dec. 1918, pp. 699-701. Behavior of steel when heated. Restorative measures.

VARIA

ALINEMENT CHARTS. Construction of Alinement Charts, Ralph E. Turner. Power Plant, Eng., vol. 22, no. 23, Dec. 1, 1918, pp. 956-961, 7 figs. Working formulas of three variables into simple alinement charts.

CHINA. China a Market for the American Machine Tool, L. W. Schmidt. Am. Mach., vol. 49, no. 20, Nov. 14, 1918, pp. 893-896. Electric power and industrial development; possibilities for American trade; difficulties to overcome.

ENGINEERS' ACT ON STATUS OF. Draft of Proposed Act for Engineers. Jl. Eng. Inst. Can., vol. 1, no. 7, Nov. 1918, pp. 331-332. Wording of Act proposed in province of Saskatchewan defining status of engineer.

MECHANICAL PROCESSES

BOILER. How to Design and Lay Out a Boiler (1), Wm. C. Strott. Boiler Maker, vol. 18, no. 11, Nov. 1918, pp. 311-313, 4 figs. Formula for safe working pressure; maximum ultimate tensile strength for steel; factors of safety. (To be continued.)

CHAINS, CAST STEEL. Manufacturing a Shorthand Machine, M. E. Hoag. Am. Mach., vol. 49, nos. 19, 20 and 21, Nov. 7, 14 and 21, 1918, pp. 853-854, 8 figs., 902-904, 8 figs. and 946-947, 8 figs. Describing mechanical features of machine, some tools and dies. (First article.)

Rapid Development of Electric Cast Steel Anchor Chain Industry, W. L. Merrill. Int. Mar. Eng., vol. 23, no. 11, Nov. 1918, pp 630-634, 8 figs. Electric welding versus hand welding; tests and results. Abstract of article in Gen. Elec. Rev.

HANDLES. The Uses of Wood (VII), Hu Haxwell. Am. Forestry, vol. 24, no. 299 Nov. 1918, pp. 679-687, 15 ffigs. Woods used in manufacture of handles.

LOGGING. Filling the Allies' Rush Order for Airplane Spruce, Nathan A. Bowers. Eng. News-Rec., vol. 81. no. 23, Dec. 5, 1918, pp. 1023-1031, 11 figs. Best talent of country assembled to develop methods new to logging and sawmill practice; 13 railroads built and 100,000 workers coördinated.

PLIERS. Manufacturing Drop-Forged Pliers, Ellsworth Sheldon. Am. Mach., vol. 49, no. 20, Nov. 14, 1918, pp. 889-893, 14 figs. Describing operations involved in manufacture of drop-forged pliers.

QUARRYING. Quarry Economics, Oliver Bowles. Eng. & Cement World, vol. 13, no. 10, Nov. 15, 1918, pp. 49-50. Labor requirements of various drills; waste of labor through inefficient blasting; effect of physical character of rock.

ROLLING MILLS. Blooming Mill Now Rolling Plates. Iron Trade Rev., vol. 63, no. 23, Dec. 5, 1918, pp. 1285-1288, 4 figs. Transformation at Baldt Works, New Castle, Del. How the plan was worked out.

Electric Rolling Mill Plant. Engineer, vol. 126, no. 3276, Oct. 11, 1918, pp. 312-314, 17 figs. Principles of speed control.

The Predetermination of Power Demands of Rolling Mills (Om bestämning och förutheräkning av energiatgangen vid valsverk), Frithiof Holmgren. Bihand till Jern-Kontorets Annaler, year 19, no. 10, Oct. 15, 1918, pp. 489-515, 6 figs.

SCREENING. Economical Production of Washed Sand and Gravel. Eng. & Cement World, vol. 13, no. 10, Nov. 15, 1918, pp. 52-54, 2 figs. Description of Gilbert screen.

TRACTOR. Manufacturing the Caterpillar Tractor, Frank A. Stanley, Am. Mach., vol. 49, nos. 20, 22 and 23, Nov. 14, 28 and Dec. 5, 1918, pp. 897-901, 14 figs.; 977-980, 9 figs. and 1040-1042, 12 figs.; Nov. 28: Making connecting rods; Dec. 5: Small parts. Milling work.

The Manufacture of Diamond Transmission Chain, J. V. Hunter. Am. Mach., vol. 49, nos. 19 and 23, Nov. 7 and Dec. 5, 1918, pp. 845-848, 9 figs., and 1027-1031, 16 figs. Making rollers; Dec. 5: Making block chain.

METALLURGY

ALUMINUM

Aluminum and Its Alloys, Dr. Rosenhain. Aeronautics, vol. 15, no. 259, Oct. 2, 1918, pp. 321-322. Uses and possibilities in aircraft. Lecture at British Sci. Products Exhibition.

Aluminum and Its Light Alloys—VI. Bibliography, Paul D. Merian. Chem. & Metallurgical Eng., vol. 19, no. 10, Nov. 15, 1918, pp. 729-732. Composition; applications; electrical; vessels; deoxidation; aluminothermy; chemical properties; corrosion; alterability; physical properties; electrical conductivity; thermoelectromotive force characteristics; conductivity; effort of temperature on properties. (To be continued.)

BLAST FURNACE

Fuel Economy in Blast Furnace Practice, T. C. Hutchinson. Blast Furnace, vol. 6, no. 10, Oct. 1918, pp. 419-420, 3 figs. Discussion concerning results obtained with working furnace model built for determination of efficient distribution of charge. Paper before British Iron & Steel Inst. (Concluded.)

COPPER

BRONZES. The Constitution of the Tin Bronzes, Samuel L. Hoyt. A.I.M.E., Bul., no. 144, Dec. 1918, pp. 1721-1727, 14 figs. Notes on progress made in establishing what happens over the upper heat effect.

LEAD IN COPPER. The Spectroscopic Determination of Lead in Copper, C. W. Hill and G. P. Luckey. Bul. Am. Inst. Min. Engrs., no. 142, Oct. 1918, pp. 1581-1592, 4 figs. Details of apparatus and its standardization, and comparison of accuracy of quantitative spectroscopic method for determining small amounts of lead with that of standard electrolytic determination. Variations and other applications of method are found in Proc. Am. Electrochem. Soc. (1918), 32, 191, and in Met. & Chem. Engr. (1917), 17, 659.

UTAH COPPER PLANT. The Utah Copper Enterprise, T. A. Rickard. Min. & Sci. Press, vol. 117, no. 22, Nov. 30, 1918, pp. 713-724, 16 figs. Flow sheet of mill; plan and section of Richards-Janney classifier as used in mill; flow sheet of primary and secondary crushing plants. (To be continued.)

FLOTATION

Mill Practice at Flotation Plant of Utah Leasing Co., H. H. Adams. Salt Lake Min. Rev., vol. 20, no. 15, Nov. 15, 1918, pp. 21-25, 4 figs. Work of reclaiming metal contents from old tailing dumps.

IRON AND STEEL

CAST IRON. The Prevention of Growth in Gray Cast Iron, J. E. Hurst. Iron Age, vol. 102, no. 19, Nov. 7, 1918, pp. 1144-1145, 3 figs. Causes of phenomenon; effect of entrance of oxidizing gases and formation of case; application of dies and permanent molds. Paper before Iron and steel Institute, London, September, 1918. Also in Engineering, vol. 106, no. 2754, Oct. 11, 1918, p. 415, 3 figs.

ELECTRICAL HARDNESS. Electrical Resistance of Hardened Steel, E. D. Campbell. Engineering, vol. 106, no. 2757, Nov. 1, 1918, pp. 509, 2 figs. On rate of change at 100 deg. cent., and of ordinary temperatures in electrical resistance of hardened steel. Paper before Iron and Steel Inst.

INGOTS. Making Sand-Cast Forging Ingots, W. L. Booth. Iron Age, vol. 102, no. 19, Nov. 7, 1918, pp. 1139-1140, 2 figs. Development of practice on Pacific Coast; replacing Eastern ingots; advantages claimed for sand mold. From article in October issue of Metal Trades.

INTERNAL STRESSES. Internal Stresses Developed in Metals and Alloys by Sudden Cooling (Efforts internes développés dans les métaux et alliages par l'effet d'un refroidissement rapide), M. Portevin. Comptes rendus des séances de l'Académie des Sciences, vol. 167, no. 15, Oct. 7, 1918, pp. 531-533. Measurements of dimensional variations in steel specimens. Also in Revue Générale de l'Electricité, vol. 4, no. 18, Nov. 2, 1918, p. 652.

OPEN-HEARTH FURNACES. The Principles of Open-Hearth Furnace Design, Charles H. F. Bagley. Engineering, vol. 106, no. 2754, Oct. 11, 1918, pp. 400-401, 2 figs. From paper before Iron and Steel Inst., Sept. 1918.

STEEL HARDENING. Further Experiments on Spontaneous Generation of Heat in Recently Hardened Steel, Charles F. Brush, Robert A. Hadfield and S. A. Main. Proc. Roy. Soc., vol. 95, no. A666, Oct. 7, 1918, pp. 120-138, 7 figs. Recapitulation of previous investigations; account of recent experimental work which was confined mainly to variations of heat treatment of one particular nickel-chromium steel; presentation of empirical law which seems to regulate approximately gradual diminution of evolution of heat.

OCCLUDED GASES

Gases in Metals. Times Eng. Supp., no. 529, Nov. 1918, p. 243. Influence on mechanical properties; opinions of scientists, industrial research workers and manufacturers. Conference of Faraday Soc.

WASTE RECUPERATION

Recuperation and Utilization of Waste or Copper, Zinc, Lead, Tin, Aluminum and Their Alloys (La récupération et l'utilisation des déchets de cuivre, zinc, plomb, étain, aluminium et de leurs alliages), Paul Raous. Génie Civil, vol. 73, no. 13, Sept. 28, 1918, pp. 251-255, 5 figs. Electrolytic processes for recuperation of tin; recuperation of aluminum; electrolytic separation of metals entering in an alloy. (Concluded.)

MINING ENGINEERING

ALLOYS, FERROUS

ELECTRIC FURNACE. Two-Ton Electric Furnace Makes Alloys. Can. Machy., vol. 20, no. 20, Nov. 14, 1918, pp. 563-565, 10 figs. Equipment of plant using Héroult furnaces for non-ferrous alloys.

BASE MATERIALS

SERPENTINE. The Origin of Serpentine, an Historical and Comparative Study, W. N. Benson. Am. Jl., of Sci., vol. 46, Dec. 1918, pp. 693-731, 4 figs. Concludes from examination of geological data that ultrabasic masses in chrysolite or antigorite-serpentine are alteration product or originally intrusive peridotite often more or less pyroxenic, and that in some cases the hydration was brought about by agency of waters emanating from same magna that produced periodite, the change having been completed by end of one orogenic period of vulcanity.

COAL AND COKE

ANTHRACITE. Anthracite Production and Resources of the United States, Eli T. Connor. Can. Min. Inst., bul. no. 80, Dec. 1918, pp. 1001-1005. Map. Excerpts from address at 20th annual meeting of the Institute. Progress of the anthracite industry since 1895.

BREAKERS AND WASHERIES. Hazards and Safeguards in Anthracite Breakers and Washeries, D. K. Glover. Safety Eng., vol. 36, no. 4, Oct. 1918, pp. 234-236. Recommends clearance of 7 ft. from center of track on each side. From Proc. Seventh Annual Safety Congress.

COKE OVENS. Economic Considerations in Coke-Oven Practice, W. Colquhoun. Ir. & Cl. Trds. Rev., vol. 97, no. 2646, Nov. 15, 1918, pp. 541-543. Advantages of by-product coke-ovens. Abstract of paper and discussion read before Midland Inst. of Min., Civ. & Mech. Engrs.

INSTANTANEOUS COMBUSTION. Instantaneous Combustion of Coal and Gas at Bedford Collieries, Leigh, F. N. Siddall. Trans. Manchester Geol. & Min. Soc., vol. 35, part 10, Aug. 1918, pp. 318-325, 3 figs., and (discussion) pp. 325-327. Account of conditions in shaft before and after occurrence of an outburst.

KENTUCKY. The Hazard Coal Field, P. M. Sherwin. Cl. Age, vol. 14, no. 23, Dec. 5, 1918, pp. 1031-1034, 11 figs. Known chiefly for its hardness and low ash content. Describes region.

SHOVELING MACHINES. Shoveling Machines for Coal Mines. Coal Industry, vol. 1, no. 10, Oct. 1918, pp. 382-384, 4 figs. Development of mines; method of operating shoveling machines; tests under different conditions.

EXPLOSIVES

Permissible Explosives for Mine Use, J. H. Squires. Coal Industry, vol 1, no. 10, Oct. 1918, pp. 375-379, 9 figs. Definition of permissible explosives and description of tests and appliances-necessary to determine classification.

IRON

ALSACE-LORRAINE. Iron Ore Supplies of Alsace-Lorraine, Sidney Paige. Iron Age, vol. 102, no. 19, Nov. 7, 1918, pp. 1149-1150. From symposium on "Certain Ore Resources of the World" prepared for meeting of Iron and Steel section. Am. Inst. of Min. Engrs., Milwaukee, October 1918.

BRIQUETTING. Present Knowledge and Practice in Briquetting Iron Ores (V), Guy Barrett and T. B. Rogerson. Automotive Eng., vol. 3, no. 9, Oct. 1918, p. 425. The Greenwalt, West and other general processes; general observations on briquetting, its applications, cost under various processes, disadvantages and possiblities. (Concluded.)

LEAD

FLOTATION. The Development of Galena Flotation at the Central Mine, Broken Hill, R. J. Harvey. Instn. Min. & Met., bul. 170, Nov. 14, 1918, pp. 1-17, 7 figs. Experimental work and results.

MAJOR INDUSTRIAL MATERIALS

MANGANESE. Manganese Deposits in the Colorado River Region. Salt Lake Min. Rev., vol. 20, no. 15, Nov. 15, 1918, p. 30. Replacement deposits; methods and cost of mining. (Concluded.)

SULPHUR. Sulphur Deposits of the Trans Pecos Region in Texas, Kirby Thomas. Eng. & Min. Jl., vol. 106, no. 23, Dec. 7, 1918, pp. 979-981, 3 figs. Origin, character of deposits, methods of mining, etc.

MINES AND MINING

BOUNCES. An Unsual Bounce Condition, A. C. Watts. Cl. Age. vol. 14, no. 23, Dec. 5, 1918, pp. 1028-1030, 4 figs. Bounces occurred with annoying frequences. A fault was driven through and analysis made of existing conditions.

CEMENTING OF WELLS. Cement Plugging for Exclusion of Bottom Water in the Augusta Field, Kansas. Bul. Am. Inst. Min. Engrs., no. 142, Oct. 1918, pp. 1613-1620, 6 figs. Results obtained from preliminary cementing of wells in effort to cut off bottom water.

FIELD TESTS. Field Tests for the Common Metals in Minerals. Univ. Ariz., bul. no. 93, Min. Tech. Series, no. 21, pp. 1-20. Compiled to be used as a text for lectures on "Prospector's Mineralogy."

GAS DETECTOR. Improved Mine-Gas Detector. Min. & Eng. Rec., vol. 23, nos. 17 & 18, Sept. 30, 1918, pp. 180-181, 1 fig. Apparatus, developed by Bureau of Mines, for determining presence of inflammable gases and proportion of gas present.

MINE TIMBERS. Preservative Treatment of Mine Timbers as a Conservation Measure Kurt C. Barth. Cl. Age, vol. 14, no. 23, Dec. 5, 1918, pp. 1025-1027. Three methods of application available.

MINERALS CONTROL ACT. Will the Government Fulfill Its Obligations to Those Who Undertook Mineral Developments at Its Request? Mfrs. Rec., vol. 74, no. 23, Dec. 5, 1918, pp. 73-74. Discusses the Minerals Control Act and necessary protection to make the United States more self-sustained as a nation.

RESCUE APPARATUS. New Form of Oxygen Mine Rescue Apparatus, H. V. Manning. Min. & Eng. Rec., vol. 23, nos. 17 & 18, Sept. 30, 1918, pp. 179-180, 2 figs. Apparatus, developed by Bureau of Mines, for use poisonous or irrespirable atmospheres in mines after fires or explosions.

STONE DUST REMOVAL. Sprayer for Stone-Dusting in Mines. A. Rushton. Tran. Manchester Geol. & Min. Soc., vol. 35, part 10, Aug. 1918, pp. 327-329. Features of ejector which blows stone dust into atmosphere of mine by-means of compressed air. Stone dust is carried from atmosphere of mine in the same way as coal dust.

TEMPERATURE MEASUREMENTS. Measurement of Temperature at Great Depths (Mesure de la temperature dans les sondages à toute profondeur). M. Verzat. L'Echo des Mines et de la Métallurgie, no. 2582, July 14, 1918, p. 343. Account of the measurement of temperature at a depth of 1616 meters made by the Cie. des Mines du Sud de la Mure.

TIMBERING. Safe and Efficient Mine Timbering, Robert Z. Virgin. Coal Industry, vol. 1, no. 10, Oct. 1918, pp. 369-372, 12 figs. Explains and illustrates different methods and analyzes each with regard to safety and efficiency.

TRANSFER CHUTES. Driving and Timbering Transfer Chutes, C. T. Rice. Eng. & Min. Jl., vol. 106, no. 23, Dec. 7, 1918, pp. 991-993, 3 figs. Method employed the Coeur d'Alene district.

MINOR INDUSTRIAL MATERIALS

ANTIMONY, STRONTIUM, ETC. Antimony, Graphite, Nickel, Potash, Strontium, Tin, E. S. Boalich and W. O. Castello, Cal. State Min. Bur., report no. 5, Mar. 1918, 44 pp. Properties, occurrence and uses of these substances.

TUNGSTEN. Tungsten, Molybdenum and Vanadium, E. S. Boalich and W. O. Castello. Cal. State Min. Bur., report no. 4, Mar. 1918, 34 pp. Properties, ores, occurrence and uses of these minerals.

Wolfram Ore and Tungsten. Chem. News, vol. 117, no. 3059, Oct. 25, 1918, pp. 337-338. Report of Departmental Committee on the Eng. Trades after the War. From Jl. Roy Soc. of Arts, vol. 66, no. 3436.

OIL

WATER TROUBLES. Water Troubles in the Mid-Continent Oil Fields and Their Remedies, Dorsey Hager and G. W. McPherson. Bul. Am. Inst. Min. Engrs., no. 142, Oct. 1918, pp. 1620-1627, 2 figs. Classification of troubles and account of results obtained by shutting off water.

PRECIOUS MINERALS

KALGOORLIE. Kalgoorlie Goldfield. Aust. Min. Std., vol. 60, no. 1564, Oct. 31, 1918, pp. 705 and 707. Report of J. B. Jaquet on circumstances connected with certain earth tremors, presence of methane gas, systems of working, etc.

RARE MINERALS

WILSONIUM. Wilsonium, Henry Bonaparte. Min. & Eng. Rec., vol. 23, nos. 17 and 18, Sept. 30, 1918, pp. 176-177. Chemical and physical nature and occurrence of new mineral named in honor of President Wilson by its discoverer Franklin Heath.

TIN

METALLURGY. Effect of Heating and Heating and Quenching Cornish Tin Ores Before Crushing Arthur Yates. Inst. Min. of Met., bul. 170, Nov. 14, 14, 1913, pp. 1-3. Summary of investigation made in the laboratories of the Royal School of Mines.

ORE HANDLING. Installation for Mechanical Handling of Tin Ore at Boeboes Valley on the Banka (Installaties voor machinale ontginning van tinerts in de Boeboes-vallei op Banka), A. Van. der Ham. De Ingenieur, vol. 33, no. 41, Oct. 12, 1918, pp. 789-802, 19 figs.

TIN CONSERVATION. A Symposium on the Conservation of Tin. A.I.M.E. bul. no. 144, Dec. 1918, pp. 1729-1764. Eight short papers.

Conserving Tin in Different Solder Mixtures, Milton L. Lissberger. Foundry, vol. 46, no. 316, Dec. 1918, pp. 579-580. Experiments indicate that the ideal alloy should contain . . per cent tin and 54 per cent lead; preventing tin waste. From paper before Milwaukee meeting of Inst. of Metals Division of Am. Inst. of Min. Engrs.

TRANSPORTATION

DUMP CARS. Dumps and Dump Hoppers, C. L. Miller. Coal Industry, vol. 1, no. 10, Oct. 1918, pp. 373-374, 2 figs. Suggestions for making layouts addressed to mining engineers having no other data at hand than details of mine car.

MUNICIPAL ENGINEERING

DILUTION. Sewage Disposal by Dilution. Times Eng. Supp., no. 527, Sept. 1918, p. 188. Experimental investigation of Royal Commission on Sewage Disposal into self-purifying capacity of rivers.

DIRECT OXIDATION. Sewage Treatment in Easton. Mun. Jl., vol. 45, no. 20, Nov. 16, 1918, pp. 386-388, 4 figs. Details and method of operation of plant of 1,000,000 gal. capacity of "direct oxidation" type.

SEWER PIPE. Incrustation in Vancouver Sewer Pipe, A. G. Dalzell. Can. Engr., vol. 35, no. 19, Nov. 7, 1918, pp. 403-406, 3 figs. Objectionable features which have developed in machine-made concrete pipe, 8 to 30 in. in diameter.

SLUDGE DEWATERING. Two important Sludge Problems, Arthur J. Martin. Contract Rec., vol. 32, no. 48, Nov. 27, 1918, pp. 941-942. Suggestions in regard to use of compressed air and removal of water contained in sludge.

TOWN PLANNING. The Problem of City Development, An Economic Survey, A. G. Dalzell. Jl. Eng. Inst. Can., vol. 1, no. 7, Nov. 1918, pp. 319-330, 16 figs. Comparison of rectangular and diagonal systems of city outline and study of conditions in Vancouver.

Town Planning in Halifax and Vicinity, H. L. Seymour. Jl. Eng. Inst. Can., vol. 1, no. 6, Oct. 1918, pp. 262-268, 3 figs. Schemes indicating width of streets, open spaces, building lines and character of buildings.

MUNITIONS AND MILITARY ENGINEERING

BALLISTICS. A Field Ballistic Problem, Meade Wildrick. Jl. U. S. Artillery, vol. 49, no. 3, May-Aug. 1918, pp. 159-186, 9 figs. Numerical illustration of (1) construction of range table, (2) construction of range correction curves, (3) construction of deflection correction chart, (4) correction for variation in muzzle velocity due to a variation in weight of projectile, and (5) correction for variation in temperature of powdered charge.

Effect of the Earth's Rotation Upon the Point of Fall, Fred M. Green and C. W. Green. Jl. U. S. Artillery, vol. 49, no. 3, May-Aug. 1918, pp. 192-204, 10 figs. Derives from consideration of effect of difference in velocity of gun and target due to earth's rotation, approximate expressions for corrections required in trajectory of projectile fired at long range.

Notes on Inclined Trajectories, F. M. Green and C. W. Green. Jl. U. S. Artillery, vol. 49, no. 3, May-Aug. 1918, pp. 187-191, 1 fig.

Simpson's Resection, Stanley H. Simpson. Jl. U. S. Artillery, vol. 49, no. 3, May-Aug. 1918, pp. 208-214, 3 figs. Explains method in which, angles being measured in mils, instead of plotting actual arcs, short chords of these arcs are plotted on a scale large enough to make chords practically coincident with arcs.

The Elliptic Trajectory Over the Earth, G. Greenhill. Engineering, vol. 106, no. 2754, Oct. 11, 1918. A mathematical article.

BULLETS. Explosive, Expansive and Perforating Bullets, Claude Pernelle. Sci. Am. Supp., vol. 86, no. 2238, Nov. 23, 1918, pp. 332-333, 5 figs. Types used by German and Austrian armies. Translated from La Nature.

HOWITZERS. How the 155-Mm. Howitzer is Made, J. V. Hunter. Am. Mach., vol. 49, nos. 21 and 22, Nov. 21 and 28, 1918, pp. 941-945, 17 figs., and 983-986, 14 figs. Work on howitzer jacket after it has been rough-machined and heat-treated, Nov. 28: Making the tube.

MOBILE BATTERIES. Railroad Men Man Mobile Battery for Navy. Ry. Age, vol. 65, no. 22, Nov. 29, 1918, pp. 967-969, 4 figs. Description of 14-inch naval guns on railway mounts which worked destruction behind German lines.

Ordnance Manufacture. Finding the "Choke Points" of Ordnance, John H. Van Deventer. Am. Mach., vol. 49, no. 22, Nov. 28, 1918, pp. 967-971, 6 figs. One of series of articles on work of Ordnance Dept.

Munitions Production by British Railways. Ry. Rev., vol. 63, no. 19, Nov. 9, 1918, pp. 671-672. Account of reorganization of railway shops in Great Britain to become one of England's chief sources of supply for munitions of war. Adapted from Board of Trade Journal, London.

The Manufacture of Guns (La fabrication des canons), Ch. Dantin. Génie Civil, vol. 73, no. 1875, July 20, 1918, pp. 41-47, 21 figs. Considerations governing choice of metal and description of manufacturing process.

What Ordnance Is and Does, John H. Van Deventer. Am. Mach., vol. 49, no. 20, Nov. 14, 1918, pp. 876-881, 7 figs. Organization of Ordnance Department and what it does. First article.

Ordnance Plant. A War-Time American Ordnance Plant. Iron Age, vol. 102, no. 22, Nov. 28, 1918, pp. 1326-1328, 5 figs. Description of new plant of Tacony Ordnance Corporation.

Shells. The Manufacture of Semi-Steel Sheels. Iron Age, vol. 102, no. 22, Nov. 28, 1918, pp. 1317-1321, 32 figs. Practice as recommended by Ordnance Department; chemical metallurgical, molding and machining details.

Spotting Board. Spotting Board, G. R. Meyer. Jl. U. S. Artillery, vol. 49, no. 3, May-Aug. 1918, pp. 205-207, 1 fig. Constructed to furnish battery commander with information as to longtitudinal deviation of his shots.

RAILROAD ENGINEERING

BRITISH

British Railways. British Railways Under War Conditions. Engineer, vol. 126, no. 3280, Nov. 8, 1918, pp. 390-391. What they cost the country. Eighth article.

ELECTRIC RAILROADS

(Not including Street and Interurban Lines)

Argentine Railways. Electric Traction on the Central Argentine Railway. Ry. Gaz., vol. 29, no. 18, Nov. 1, 1918, pp. 466-469, 4 figs. Cables; substations. (Continuation of serial.) Also in Engineer, vol. 126, no. 3279, Nov. 1, 1918, pp. 367-370, 12 figs.

Energy Consumption. Energy Consumption of Cars Is Affected by Temperature Changes, M. B. Rosevear. Elec. Ry. Jl., vol. 52, no. 22, Nov. 30, 1918, pp. 958-960, 2 figs. That power required for car operation is affected by variations in schedule speed, number of passengers carried and temperature ir shown by extended study-made by Public Service Railway, Newark, N.J.

Substations. Automatic Substations and Direct-Current Railway Systems (Les sous-stations automatiques et les réseaux de traction à courant continu). Revue Générale de l'Electricité, vol. 4, no. 11, Sept. 14, 1918, pp. 386-392, 7 figs. Details of operation; scheme of connections for 600-volt systems; tables of results obtained in actual installations.

ELECTRIFICATION

Montreal Tunnel. Montreal Tunnel Zone Electrification, William G. Gordon. Elec. Ry. Jl., vol. 52, no. 22, Nov. 30, 1918, pp. 962-965, 5 figs. Summary of details of rolling stock, overhead and substation equipment; design and construction problems. Abstract of paper before Am. Inst. of Elec. Engrs. Toronto, Nov. 1918.

EQUIPMENT

Ditcher. Electrically Operated Ditcher Effects Big Saving, Charles W. Ford. Elec. Ry. Jl., vol. 52, no. 22, Nov. 30, 1918, pp. 960-961, 5 figs. This is first electric-machine built for ditching purposes; operates at 1200 or 1500 volts with 30-hp. motor.

LABOR

British Railways. British Railways Under War Conditions. Engineer, vol. 126, no. 3279, Nov. 1, 1918, pp. 371-372. Railwaymen's war bonus. Seventh article.

MAINTENANCE

Maintenance of Way Records and Reports. Ry. Rev., vol. 63, no. 19, Nov. 9, 1918, pp. 667-668. Methods being worked out by Railroad Administration for establishing accurate records; will standardize reports.

Pacific Electric's New Car Storage and Repair Facilities, Clifford A. Elliott. Elec. Ry. Jl., vol. 52, no. 21, Nov. 23, 1918, pp. 914-917, 11 figs Description of three divisional storage track layouts with car houses and repair shops.

LOCOMOTIVE

Boiler for Mallet Locomotive. Large Boiler for New Mallet Locomotive. Boiler Maker, vol. 18, no. 11, Nov. 1918, pp. 303-304, 4 figs. Sections and elevations of boiler built for heavy grades, having firebox length of 181 1-16 in. and desined for 215-lb. working pressure.

Feed Water Heating. Locomotive Feed Water Heating, H. S. Vincent. Ry Mech. Engr., vol. 92, no. 12, Dec. 1918, serial 1st part, pp. 645-649, 8 figs. Discussion of exhaust steam and waste gas methods of preheating.

French Compound. Recent Locomotives for the French State Railways, F. C. Coleman. Ry. Age, vol. 65, no. 20, Nov. 15, 1918, pp. 861-863, 4 figs. Principal data and decriptions of four-cylinder compound pacific type and simple consolidation type built in Great Britain.

Rock Island Heavy. 2-10-2 Type Locomotive for the Rock Island Lines. Ry. Age, vol. 65, no. 23, Dec. 6, 1918, pp. 992-994, 6 figs. Novel and interesting features.

Santa Fe Heavy. A. T. & S. F. 4-8-2 Type of Locomotives. Ry. Mech. Engr. vol. 92, no. 12, Dec. 1918, pp. 649-652, 3 figs. Heaviest of type yet built. Principal dimensions and data.

Santa Fe Passenger. Mountain Type Locomotive for the Santa Fe. Ry. Rev., vol. 63, no. 20, Nov. 16, 1918, pp. 697-698, 3 figs. Description and principal data of heavy fast passenger locomotive. Also in Ry. Age, vol. 65, no. 22, Nov. 29, 1918, pp. 957-959, 1 fig.

Standard. Data for Standard Locomotives. Ry. Mech. Eng. vol. 92, no. 11, Nov. 1918, pp. 607-610, 12 figs. Tonnage rating charts and clearance and weight diagrams for government locomotives now built.

Standard Switcher. Standard Six-Wheel Switcher. Ry. Mech. Eng., vol. 92. no. 11, Nov. 1918, pp. 593-596, 5 figs. Principal data and description with drawings.

Superheating. Superheater Locomotive Performance. Ry. Mech. Engr., vol. 92, no. 12, Dec. 1918, pp. 652-655, 1 fig. Abstract of committee report presented at the 1918 Convention of the Traveling Engrs. Assn., with discussion.

Virginian Heavy Grade Pusher. Virginian 2-10-10-2 Locomotives. Ry. Mech Eng., vol. 92, no. 11, Nov. 1918, pp. 600-604, 6 figs. Principal data and description with drawings. Built for heavy grade pusher service.

NEW CONSTRUCTION

American-Built Railroad Cutoff will Relieve Traffic Congestion in France, Robert K. Tomlin, Jr. Eng. News-Rec., vol. 81, no. 19, Nov. 7. 1918, pp. 832-835, 14 figs. A 5¼ mile double-track line for Expeditionary forces; big embankment chief feature; bridge half a mile long.

OPERATION AND MANAGEMENT

British Operation. Presidential Address to the Institution of Civil Engineers, John A. F. Aspinall. Ry. Gaz., vol. 29, no. 19, Nov. 8, 1918, pp. 487-494. British railway engineering and operation; immediate problems to be faced.

Fuel Conservation. Conservation of Fuel on the Railroads. Ry. Age, vol. 65, no. 21, Nov. 22, 1918, pp. 913-916. Abstracts of papers presented by railway men before New York Ry. Club.

Work of the Fuel Conservation Section, E. C. Schmidt. Ry. Rev., vol. 63, no. 22, Nov. 30, 1918, pp. 769-772. Organization and work of this department of Railroad Administration.

Supervision of Locomotives, British. District Supervision of Locomotives on British Railways, W. Patterson. Ry. Gaz., vol. 29, no. 18, Nov. 1, 1918, pp. 469-471. Review of work in a typical district with a staff of about 500 persons and sheds to which are allotted 150 engines.

Traffic Control. Controlling the Freight Traffic, North-Eastern Railway. Engineer, vol. 126, no. 3276, Oct. 11, 1918, pp. 305-306, 3 figs. Description of traffic control of North-Eastern Railway, and control board.

PERMANENT WAY AND BUILDINGS

Floor Slabs and Culverts. Railway Practice in Design of Concrete Floor Slabs and Flat Top Culverts. Eng. & Contracting, vol. 50, no. 21, Nov. 20, 1918, pp. 511-512. Results of questionnaire by George H. Tinker. From Oct. Bulletin of Am. Ry. Eng. Assn.

Relocation of Lines. New York Central Relocates Lines to Cross Barge Canal at the Tonawandas. Eng. News-Rec., vol. 81, no. 20, Nov. 14, 1918, pp. 893-896, 2 figs. Detour two miles long around hearts of cities at once combines bridges over waterways and solves difficult problem of eliminating grade crossings and occupation of main business streets.

RAILS

Tranverse Fissures. Tranverse Fissures and Phosphorus Streaks in Rails, G. F. Comstock. Ry. Age, vol. 65, no. 22, Nov. 29, 1918, pp. 961-963, 2 figs. New evidence of influence of segregation and of advantage of reheating blooms. Abstract of paper before Am. Inst. of Min. Engrs.

Transverse Fissures Cause Rail Failures. Ry. Age. vol. 65, no. 23, Dec. 6, 1918, pp. 1007-1009. Abstract of James E. Howard's report of the rail failure at Central Islip, N. Y.

ROLLING STOCK

Cleaning. Passenger Car Cleaning on the Canadian Pacific Railway, E. Eley. Can. Ry. Club, vol. 17, no. 6, Sept. 1918, pp. 19-22, and (discussion) pp. 23-31. Nature and amount of work required by different classes of cars.

Coal Cars. Design of Seventy-Ton Coal Car with Tandem Hoppers. Ry. Mech. Eng., vol. 92, no. 11, Nov. 1918, pp. 611-613, 5 figs. Principal data with description and drawings.

Flat Cars. Shipping Large Marine Boilers. Boiler Maker, vol. 18, no. 11, Nov. 1918, p. 307, 1 fig. Describes special flat car for shipping Scotch boilers. From Marine Jl.

Lighting. Standards of Passenger Car Lighting. Ry. Rev., vol. 63, no. 19, Nov. 9, 1918, pp. 672-673. Specifications prepared by mechanical department of United States Railroad Administration for electric lighting of passengers equipment cars hereafter to be purchased by administration for use of roads under its control.

Refrigerator Cars. Standard U. S. R. A. Refrigerator. Ry. Mech. Engr., vol. 92, no. 12, Dec. 1918, pp. 663-668, 7 figs. Latest practices in design. Also in Ry. Age, vol. 65, no. 21, Nov. 22, 1918, pp. 906-910, 4 figs.

SAFETY AND SIGNALLING SYSTEMS

COUPLING AND UNCOUPLING. Prevention of Accidents Due to Coupling and Uncoupling Cars. E. M. Switzer. Safety Eng., vol. 36, no. 4, Oct 191. pp. 262-264. From Proc. Seventh Annual Safety Congress.

INTERLOCKING. Single Line Interlocking on the New South Wales Railways. Ry. Gaz., vol. 29, no. 19, Nov. 8, 1918, pp. 495-597, 4 figs. Outline of system of interlocking and signalling line stations.

PLANT RAILROAD HAZARDS. Plant Railroad Hazards, C. H. Baltzell. Safety Eng., vol. 36, no. 4, Oct. 1918, pp. 252-256, 2 figs. Possibilities of personal injuries in plants situated on main line tracks and manner of avoiding them. From Proc. Seventh Annual Safety Congress.

SIGNALLING. Proceedings, Annual Meeting, New York, N. Y., Sept. 19-20, 1918, Ry. Signal Assn., Jl. 23d year. No. 4, Dec. 1918, pp. 313-420, 4 figs. Addresses, committee reports, etc.

SHOPS

BOILER TUBE FITTING. Modern Locomotive Boiler Tube Practice at Doncaster Works, Great Northern Railway. Ry. Gaz., vol. 29, no. 19, Nov. 8, 1918, pp. 499-500, 4 figs. Methods employed for fitting and expanding boiler tubes and superheater flues.

CAR REPAIRS. Car Department of the Milwaukee. Ry. Mech. Eng., vol. 92, no. 11, Nov. 1918, pp. 615-620, 9 figs. Organization and methods of handling light and heavy car repairs with samples of forms used.

GRINDING. Grinding in Locomotive Shops, M. H. Williams. Ry. Mech. Eng., vol. 92, no. 11, Nov. 1918, pp. 629-632, 4 figs. Uses to which internal, cylindrical and surface grinding machines may be put with success.

LOCOMOTIVE REPAIRS. Accuracy in Locomotive Repairs, M. H. Williams. Ry Mech. Engr., vol. 92, no. 12, Dec. 1918, pp. 673-677, 8 figs. Methods of making and fitting-men and repair parts for locomotives with gages and micrometers.

REPAIR SHOPS. American Railroad Repair Shops in France, Robert K Tomlin, Jr. Am. Mach., vol. 49, no. 21, Nov. 21, pp. 933-938, 7 figs. How these shops were built by American engineers in France

SPECIAL LINES

LOGGING ROADS. Soldiers Build Logging Roads in Spruce Forests, W. A. Welch Ry. Age, vol. 65, no. 19, Nov. 8, 1918, pp. 805-807, 6 figs. Description of construction of over 350 miles of new railway in Northwest for carrying airplane lumber to mills.

EMPLOYMENT BUREAU

Situations Vacant

Paper Mill Engineer

Young man who is technical graduate and has had four or five years practical experience along paper mill lines. Address Box 25.

Chief Draftsman

Opening for an engineer to take charge of drafting room and also to do some outside work particularly in mill layouts and building construction of a mechanical nature. Address Box 24.

Municipal Engineer.

An engineering graduate of at least one or two years' experience in municipal work for junior roadway assistant. Membership of *The Engineering Institute* and men who have seen active service will be given preferable consideration. Apply E. R. Gray, City Engineer, Hamilton, Ont.

Designing and Mechanical Engineer.

Designing Mechanical Engineer, thoroughly experienced in design of cranes, coal and ore handling bridges and towers, coal tipple equipments, conveying machinery, etc. High grade technical man wanted to take charge of design, state education and experience in detail, age, nationality, salary desired. Information confidential. Location, Canada. Apply Box 23.

Hydrometric Engineer

An Hydrometric Engineer in the Irrigation Branch at Calgary, Department of the Interior, at a salary of $1,500 per annum. Candidates should be science graduates of a recognized university or hold grade in one of the organizations mentioned below or have practical experience sufficient to guarantee a sound knowledge of engineering.

The Engineering Institute of Canada.
British Institute of Civil Engineers.
American Society of Civil Engineers.

Address:—Civil Service Commission, Wm. Foran, Secretary.

An Analyst

An Analyst on the staff of the Laboratory at Halifax, Department of Trade and Commerce, Grade E of the First Division. Appointment is provisional at $1,400 per annum. If satisfactory, permanent employment at $1,700 will be made, subject to passing successfully the examination prescribed by section 9 of The Adulteration Act. Applicants must be graduates of a recognized university with honours in chemistry, and must have had at least one year's subsequent experience in chemical analysis.

Forest Ranger

A Forest Ranger in charge of the Nisbet Reserve, Department of the Interior, at a salary of $1,400 per annum. Candidates must be between the ages of 21 and 45 and must be physically fit. They must have a thorough knowledge of woods work, including scaling timber, elementary surveying, and road construction. They must have sufficient education and ability to carry on the business connected with the administration of the Forest Reserve, to keep office records and prepare reports. The appointee will be required to live in a house provided by the Department on the Forest Reserve and must provide himself with necessary equipment for travelling around the reserve.

Publicity Agent

A Publicity Agent to take charge of the publicity work of the Department of Immigration and Colonization at a salary of $4,000 per annum. Candidates should possess the following qualifications:—ability to prepare and direct newspaper, magazine and farm journal advertising campaigns, both in Canada and elsewhere, setting forth the settlement opportunities in Canada; knowledge and experience with (*a*) follow-up systems, (*b*) the production and circulation of motion pictures, and (*c*) the natural resources of Canada; ability to direct lecture campaigns; a personal acquaintance with writers, publicists and organization now dealing with the opportunities and land settlement problems of Canada.

All applications must be received not later than the 24th day of January. Apply Wm. Foran, Secretary, Civil Service Commission of Canada, Ottawa, Ont.

VOLUME II | FEBRUARY 1919 | NUMBER 2

REPORT OF COUNCIL FOR THE YEAR 1918

In presenting its report for the year Nineteen Hundred and Eighteen, the Council of *The Engineering Institute of Canada* does so with a sense of satisfaction in the progress that has taken place in Institute affairs during the year just past, which, as in the history of the world, also marks an epoch in the affairs of the engineers of Canada.

It is with a spirit of thankfulness that Council is able to record the termination of the devastating world struggle and with a conscious but permissible pride to pay a tribute to the gallant men of the engineering profession of Canada who have taken such a notable part in the war and who have been a factor in contributing to its success. A large number of our overseas members, unfortunately, will not return but their memories will always be cherished A few are with us again and it is hoped that all shall have arrived in Canada before many months have passed.

During the year the new By-Laws, proposed by the Committee on Society Affairs, were finally adopted and have become the official By-Laws of *The Institute.*

The former name, The Canadian Society of Civil Engineers, has been changed by Act of Parliament to *The Engineering Institute of Canada*, and with the change has come a broader outlook and wider possibilities for the organization.

The inauguration of professional meetings and the successful convening of three during the year, one in Toronto, one in Saskatoon and one in Halifax, has given rise to a stronger bond of fellowship and has afforded an additional opportunity of enabling the members to become acquainted, so that these meetings, judging from the results of those held during the year, are bound to knit more closely together the fabric of *The Institute.* The President has been in attendance and has presided at all the professional meetings, which precedent it is hoped will be continued by succeeding Presidents.

Four new Branches have been established, all of them in a flourishing condition, at Montreal, Hamilton, Halifax and St. John. Shortly after their formation, the Halifax and St. John Branches co-operated in arranging for a professional meeting, which has greatly stimulated engineering activities in the Maritime Provinces. In the Montreal Branch, mechanical, electrical, civil and industrial sections have been created, thus increasing the interest of the members in every branch of the profession and enabling all to take an active part in the meetings.

As the result of an earnest desire to place the engineering profession on a higher plane and to give its members the recognition to which they are entitled, the question of legislation has become an active issue in the various Branches in the Dominion. A definite proposal to secure provincial legislation, originated with the western provinces and is being discussed by every Branch. Council has approved of the principle of securing legislation for raising the status of the profession and has encouraged discussion of the subject in order that the various Branches may come to an agreement whereby similar legislation would be sought in every province. While giving every encouragement, Council has felt that its great importance demands that no precipitate action be taken.

With the inauguration of *The Journal* of *The Engineering Institute* there has been established a medium of intercommunication which, from its first issue has received the hearty approval and commendation of the membership. It has been designed to include the engineering literature of Canada, which, naturally, largely originates from the membership of this *Institute;* the papers read at professional meetings or at Branches and any discussion thereon; all news of Branch activity; correspondence; monthly Report of Council; items of personal interest; an employment bureau to bring to the attention of the members positions available and an engineering index. This latter feature comprises a review of eleven hundred engineering and technical magazines every month by a group of experts on the staff of the American Society of Mechanical Engineers, through whose courtesy the index has been made available to our members for a nominal sum. This service also includes the availability of photostat copies of any of these articles through the Engineering Societies Library, whose director, Dr. Harrison W. Craver, has accorded our members the privileges of their magnificent library.

As in 1917 a Tobacco Fund was created and over five hundred members overseas, whose addresses were available, have received Christmas greetings and cigarettes.

Of no small importance to the members is the interest which the Council has taken in advancing the status of the individual. A committee of the Council interviewed the Civil Service Commission and was asked to make recommendations regarding salaries. This has been done, and if accepted, as has been promised, will be a powerful factor in raising the standard of engineers' salaries throughout the Dominion.

A review of the past year would not be complete without recording the marked spirit of loyalty to *The Institute*, which is in evidence in every part of the Dominion, by the individual members and by our splendid Branch organizations and noting the general willingness of the members of every grade to closely co-operate in all matters relating to the affairs of the Institute or designed to promote the welfare of the profession.

H. H. VAUGHAN, President.
FRASER S. KEITH, Secretary.

December 31st, 1918.

ROLL OF THE INSTITUTE.

Elections during the year resulted in the following additions to the Roll: thirty-eight Members; one hundred and two Associate Members; twenty-five Juniors; seven Students and three Associates.

The following transfers were made: twenty-four Associate Members and one Associate to the class of Member; twenty-three Juniors and four Students to the class of Associate Member and eighteen Students to the class of Junior.

There have been removed from the rolls by resignation or on account of non-payment of dues: eight Members; ten Associate Members; one Associate and two Students. A detailed list of resignations accepted is as follows:—

Members:

Burpee, Tyler Coburn.
Crockard, F. H.
Dupont, Victor H.
Harris, William Dale.
Kimball, H. S.
Maunsell, George S.
Mayer, Joseph.
Parent, Paul Etienne.

Associate Members:

Baker, Mason H.
Bankson, E.E.
Buell, W. E.
Corman, W. E.
Glassco, A. P. S.
Grant, William F.
Jacques, H. S.
Mendelssohn, Joseph.
Mulville, John C.
Walker, N. de C.

Associate:

Grant, William H.

Students:

Hooper, Ronald H.
Mathews, J. E.

The following deaths, fifty-three in number have been reported, of which number seventeen were killed in action.

Members.... Beullac, Marcel C. J.
Breen, Thomas.
Brophy, John Byrne.
Bruce, A. H. N.
Carre, Henry.
Darey, Laurence A.
Davis, William Mahlon.
Donaldson, Morley.
Earle, William Zobeski.
Edwards, Prof. William Muir.
Hill, Albert James.
MacLeod, Henry A. F.
Millidge, Edwin Gilpin.
Murray, T. Aird.
Schreiber, Sir Collingwood.
Sidenius, Harry.
Smith, Henry Badeley.
Thibaudeau, W.

Associate Members.... Bayfield, Henry Arthur.
Bodwell, Howard L.
Bromley-Smith, A.
Clarke, Leonard Oswald.
Cowan, William A.
Cronk, Francis Joseph.
Galbraith, William John.
Greenwood, Walter Kendall.
Hyde, Wm. Herbert.
Kemp, Melville A.
O'Donnell, Hugh.
Rainboth, John.
Wood, J. Russell.

Juniors.... Grenier, Hector.
Randall, Henry Edward.

Students.... Boright, George K.
Wilson, Calvin P.

Killed in action, or died while on Active Service:

Members.... Winslow, Rainsford-Hannay.

Associate Members.... Booth, Patrick D.
Henderson, Thomas D.
Kent, Victor J.
McQueen, Howard R.
Meade, Alfred de Courcy.
Richardson, Francis A.
Sailman, Robert T. H. (L.) (1917).

Juniors	Ferguson, L. L.
	Middleton, James R. (1917).
	Milot, J. Adelard (1917).
	Willson, F. J. (1917).
Students	MacLean, Donald Gordon.
	O'Rielly, Richard H.
	Peck, H. M.
	Scott, George M.
	Wilson, William James (1917).

At present the membership stands as follows:

Honorary Members	9
Members	752
Associate Members	1,548
Juniors	373
Students	488
Associates	33
Total	3,203

The membership of the Branches as at December 31st, 1918, is as follows:—

	Members	Assoc. Members	Juniors	Students	Associates	Affiliates
Quebec	18	55	17	14	—	1
Ottawa	65	124	35	29	—	2
Toronto	66	144	34	69	—	5
Manitoba	40	93	26	20	—	1
Vancouver	47	72	7	4	—	—
Kingston	Activities discontinued until the close of the war.					
Victoria	22	30	3	—	—	2
Calgary	21	37	5	—		1
Edmonton	11	31	7	8		-
Saskatchewan	9	67	3	5	1	6
Montreal, H.M. 3	136	250	71	168		11
Halifax	25	30	5	3		—
St. John	13	21	8		—	1
Hamilton	4	18	7	8	—	—

MEETINGS.

(The Montreal Branch took over the meetings at Headquarters in February.)

There have been nine meetings at which the following papers were read:—

"Quebec Bridge," by G. H. Duggan, M. E. I. C.

"Recent Advances in Canadian Metallurgy," by Dr. A. Stansfield.

"Tests of the Chain Fenders in the Locks of the Panama Canal," by Henry Goldmark, M. E. I. C.

"Datum Planes Related to the Tide," by Dr. W. Bell Dawson, M. E. I. C.

"Engineering Activities in Connection with the Navy," by Commander Skentelbery.

"Nicu Steel," by Col. R. W. Leonard, M. E. I. C.

"Kettle Rapids Bridge," by W. Chase Thomson, M. E. I. C.

"Varnish Manufacture," by Norman Holland.

"Champlain Dry Dock for Quebec Harbour," by U. Valiquet, M. E. I. C.

Address on Military matters by Lieut. Ashworth.

INSTITUTE COMMITTEES FOR 1918.

Executive Committee of Council:

Vaughan, H. H., Chairman.

Fairbairn, J. M. R.	Francis, Walter J.
Safford, H. R.	Surveyer, Arthur.
Ross, R. A.	Brown, Ernest.

Finance:

Ross, R. A., Chairman.

Duggan, G. H.	Monsarrat, C. N.
Marceau, Ernest.	Robertson, J. M.

Library and House:

Safford, H. R., Chairman.

Surveyer, Arthur.	Shearwood, F. P.
Frigon, A.	McGuigan, F. H., Jr.

By-Laws:

Safford, H. R., Chairman.

Francis, Walter J.	Brown, Ernest.

Papers (June 1918-19):

Francis, Walter J., Chairman.

Matheson, E. G.	Doucet, A. E.
Duff, W. Arch'd.	Macintyre, R. W.
Gillespie, Peter.	Elliot, L. B.
Gale, G. Gordon.	Mackie, G. D.

Publications:

Brown, Ernest, Chairman.

Robertson, J. M.	French, R. deL.
Thomson, W. Chase.	DeCew, J. A.

Engineering Standards:

Duggan, G. H.	Herdt, L. A.

Electro-Technical:

Herdt, L. A., Chairman.

Gill, L. W.	Lambe, A. B.
Barnes, H. T.	Rosebrugh, T. R.
Higman, O.	Murphy, J.
Kynoch, J.	

Board of Examiners and Education:

MacKay, H. M., Chairman.

Surveyer, A., Secretary.	French, R. deL.
Brown, Ernest.	Lea, R. S.
Robertson, J. M.	Roberts, A. R.

Board of Examiners—Quebec Act:

Surveyer, Arthur, Chairman.

Fairbairn, J. M. R.	Brown, Frederick. B.

MacKay, H. M., McGill University representative.
Surveyer, Arthur, Laval University representative.

Committee on Gzowski Medal and Students' Prizes:

Duggan, G. H., Chairman.

Ambrose, J. R. W.	St. Laurent, A.
Lewis, D. O.	Wilson, R. M.

Honor Roll:

Monsarrat, C. N.	Keith, Fraser S.

Nominating :

Saskatchewan..............MacKenzie, H. R.
Victoria..................Marriott, E. G.
Manitoba..................Chace, W. G.
Toronto...................Harkness, A. H.
Quebec....................Oliver, S. S.
Ottawa....................Dion, A. A.
Montreal..................Tye, W. F.
Lefebvre, O.
Vancouver.................Ker, Newton J.
Calgary...................Porter, Sam. G.
Edmonton..................Gibb, R. J.

Fuel Power:

Murphy, John, Chairman.

Ross, R. A.	Dick, W. J.
Francis, Walter J.	Surveyer, Arthur.
Challies, J. B.	

Steel Bridge Specifications :

Motley, P. B., Chairman.

Monsarrat, C. N.	Thomson, W. Chase.
Stuart, H. B.	Bowden, W. A.
Boden, H. P.	LeGrand, J. G.
Shearwood, F. P.	Craig, George W.
Duggan, G. H.	Cole, F. T.
Johnson, Allan E.	Lyons, M. A.
Montgomery, E. G. W.	Harkness, A. H.
Icke, H. A.	

Steam Boiler Specifications :

Arkley, L. M., Chairman.

Chace, W. G.	Robb, D. W.
Clark, F. G.	Vaughan, H. H.
Durley, R. J.	Waterous, Logan M.

Roads and Pavements: :

McLean, W. A., Chairman.

Brereton, W. P.	MacPherson, A. J.
Duchastel, J.	Mercier, P. E.
Griffith, J. E.	Near, W. P.
Henry, G.	Powell, G. G.
James, E. A.	Rust, C. H.
MaCallum, A. F.	Doane, F. W. W.

LEGISLATION COMMITTEE

Representing Council :

Surveyer, Arthur, Chairman.

Robertson, J. M.	Francis, Walter J.

Representing Branches :

Toronto...................Haultain, H. E. T.
Kerry, J. G. G.
Oliver, E. W.
Calgary...................Dawson, A. S.
Peters, F. H.
Porter, S. G.
Victoria..................MacIntyre, R. W.
Lewis, D. O.
Davis, E.
Ottawa....................Dion, A. A.
MaCallum, A. B.
McRae, J. B.
Manitoba..................Duff, W. Arch'd.
Henry, M. G.
Sauer, M. V.
Saskatchewan..............Thornton, L. A.
Makie, G. D.
Stein, J. N. de.
Quebec....................Decary, A. R.
Doucet, A. E.
Gibault, J. E.
Edmonton..................Cote, J. L.
Fraser, A. T.
Thornton, N. M.
Vancouver.................Kennedy, J. H.
Ker. Newton, J.
White, T. H.

The following is a detailed statement of elections and tranfers which have taken place during the year. These are not included in the official membership roll until acceptances have been received.

January 29th, 1918

Members:

Gore, Wm.

Associate Members:

Cooke, E. F.	Murphy, T. R. H.
Hamilton, G. M.	Newhall, V. A.
Meindl, J. A.	Todd, E. D.
Morris, D.	Wilkinson, J. B.

Transferred from the Class of Associate Member to that of Member:

Goodspeed, F. G.	Winslow, R. H.
Powell, W. H.	

Transferred from the Class of Student to that of Junior:

Flett, F. P.

March 19th, 1918

Associate Members:

Gray, A. W.	Lowden, N.
Greene, J. F.	Swain, R. J.

Transferred from the Class of Associate Member to that of Member:

Atkinson, M. B.	Jones, L. M.
Brereton, W. P.	Meyers, A. J.
Foreman, A. E.	

Transferred from the Class of Junior to that of Associate Member:

Cowley, F. P. V.

Transferred from the Class of Student to that of Junior:

Easton, L. I.	Ross-Ross, D. deC.

April 23rd, 1918

Members:

Bell, F. J.	Johnson, C.
Guy, G. L.	Rindal, H.
Haanel, B. F. C.	

Associate Members:

Campbell, W. G.
Gillies, W. C.
Meade, J. C.
Prevost, R. deM.
Smith, F. G.
Townsend, F. W.
Wotherspoon, W.

Transferred from the Class of Associate Member to that of Member:

Dick, W. J.
Miles, E. L.
Waddell, N. E.

Transferred from the Class of Sudent to that of Associate Member:

Erskine, J.

May 21st, 1918

Members:

Collins, C. D.
Crockard, F. H.
Faibairn, R. P.
Jacobson, E. A.
Smaill, W.
Stansfield, E.

Associate Members:

Adamson, E. K.
Brown, D. M.
Cummings, A.
Hanson, E. C. A.
King, J. A. S.
Marshall, J.
Pratt, G. R.
Puntin, J. H.
Rannie, J. L.
Reilly, F. B.
Smith, W. R.
Warren, W. R.

Juniors:

Allen, R. W.
Bothwell, R. S. C.
Bridges, F. J.
Cassidy, J. F.
Collins, L. E.
Kendall, R.
Wright, W. G.

Transferred from the Class of Associate Member to that of Member:

Hogarth, Geo.

Transferred from the Class of Junior to that of Associate Member:

Somers, N. L.

Transferred from the Class of Student to that of Associate Member:

McKenzie, J. E.

Transferred from the elass of Student to that of Junior:

Bishop, J. M.

June 25th, 1918

Members:

Alexander, K.
Brown, J. E.
Colvocoresses, G. M.
Hamilton, C. B.

Associate Members:

Button, S. A.
Kester, F. H.
Longley, E. H.
Markham, E. A.
Walker, C. M.

Junior:

Mooney, J. P.

Transferred from the Class of Associate Member to that of Member:

Corriveau, R. deB.
Stewart, R. B.

Transferred from the Class of Junior to that of Associate Member:

Bonn, W. E.
Brickenden, F. M.

Transferred from the Class of Student to that of Junior:

Neilson, S. A.

July 23rd, 1918

Members:

Ayars, W. S.
Charlesworth, L. C.
Halford, A.
Wright, C. H.

Associate Members:

Brunton, R.
Corbett, A. H.
Davis, W. E.
Dyer, A. F.
Hackner, J. W.
Horsfall, H.
Hayward, C.
MacKay, R.
Mackenzie, C. G.
McHugh, J.
O'Kelly, E. G.
Rogers, G. W.
Wilshaw, J. H.

Juniors:

Dickinson, J. A.
Gordon, J. M.
Scott, C. R.

Transferred from the Class of Junior to that of Associate Member:

Ross, R. W.

Transferred from the Class of Student to that of Junior:

Bertrand, H.
Browne, E. F.
Greatrex, W. K.
McCully, R. C.

August 28th, 1918

Members:

Chambers, C.
Faulkner, F. R.
MacNab, I. P.
McArthur, J. J.
Stockton, R. S.

Associate Members:

Ayer, K. R.
Ireland, W. J.
McKean, H. S.
Yarrow, N. A.

Juniors:

Ells, J. C.
Penrose, J. M.

Transferred from the Class of Associate Member to that of Member:

Porter, J. W.
Wilson, J. M.

Transferred from the Class of Junior to that of Associate Member:

Grove, H. S.

Transferred from the Class of Student to that of Junior:

Slinn, W. H.

October 22nd, 1918

Members :

Hart, P. E.
Hays, D. W.
Kipp, T. Jr.
Robb, A. G.
Ross, Sir Charles, Bart.
Waters, W. L.
Winfield, J. H.

Associate Members:

Armstrong, H. W.	Macdonald, G. C.
Bateman, E. F.	Mackenzie, W. D.
Belliveau, J. E.	McColough, R. W.
Chown, R. C. F.	Peden, F.
Davies, G. V.	Rome, R.
DeWolf, A. H.	Rowlands, J. F.
Hein, O. J.	Smith, F. R.
Jack, R. T. G.	Wakefield, J. A.
Joyce, W. E.	Wyand, D.
Lamarque, E. C. W.	

Juniors:

Calvert, D. G.	Morrison, J. H. T.
Crossing, W. B.	Nehin, F. O'B.
McKenzie, R. J.	Smith, W. W.
Mifflen, S. C.	

Transferred from the Class of Associate Member to that of Member:

Burnett, A.	Dalziel, N. P.
Freeman, J. R.	French, R. deL.

Transferred from the Class of Associate to that of Member:

Stansfield, A.

Transferred from the Class of Junior to that of Associate Member:

Bernier, J. A.	Jette, J. C. H.
Cox, O. S.	Kendall, L. E.
Dawson, S. G.	Lamont, A. W.
Fredette, J. F.	Lavigne, E. J. T.
Goldman, H. A.	Wall, A. F.
Jamieson, W. T.	Young, R. B.

Transferred from the Class of Student to that of Associate Member:

Hemmerick, G.

Transferred from the Class of Student to that of Junior:

Cimon, J. M. H.	Snider, A. M.
Lake, N. J.	Weldon, R. L.
Milne, A. H.	

November 26th, 1918

Members:

Barnes, J. W.	Roland, J. W.
Misener, J. S.	

Associate Members:

Booker, G. E.	MacNab, S. D.
Boyle, A. J.	McDougall, J. J.
Chisholm, K. G.	Montague, J. R.
Johnson, K. P.	Rochetti, J.
Kent, E. S.	Warren, H. de laG.
Leaver, C. B.	

Junior:

Bowman, C. M.

Student:

Comeau, J.

Associate:

Carmichael, T.

Transferred from the Class of Associate Member to that of Member:

Doncaster, P. E.

Transferred from the Class of Student to that of Associate Member:

Massue, Huet.

Transferred from the Class of Student to that of Junior:

King, W. W.

December 17th, 1918

Members:

Campbell, A. D.	Moodie, W. T.
Jeffrey, G. J.	Russell, H. A.
McLaren, W. F.	Stairs, J. A.

Associate Members:

Berney, K. C.	Lewis, D.
Cameron, J. G.	Markham, E.
Cosser, W. F. J.	Morse, E. H.
Galletly, J. S.	Newton, C. A.
Harris, H. W.	Palmer, R. F.
Ker, F. I.	Scholefield, F. W. B.
Kerr, A. E.	Stuart, W. J.
Levvy, A.	Tait, I. J.

Juniors:

Holland, H. D.	Smart, H.
Sissons, T. E. G.	Swan, A. W.

Students:

Brown, W. J.	Henderson, C. R. D.
Donaldson, A.	Kennedy, C. L.
Fortin, G. L.	Salamis, B. K.

Transferred from the Class of Associate Member to that of Member:

Carson, W. H.	Mackie, G. D.
Johnson, C. V.	

Transferred from the Class of Junior to that of Associate Member:

Crowell, S. W.	McEwen, A. B.
Mahon, H. W.	Scott, P.
Smith, B. O.	

Transferred from the Class of Student to that of Junior:

Harkom, J. F.	Rolland, J. O.

List of Members on Honour Roll.

The following is a statement in regard to the members of *The Institute* who have so far, as information has been received, enlisted for overseas service during the period of the war:—

Honorary members	1
Members	90
Associate Members	379
Juniors	167
Students	231
Associates	3
Making a total of	871

Of these there have been killed in action or died of wounds:—

Members	1
Associate Members	6
Juniors	4
Students	5
In all	16

Report of the Library and House Committee

Safford, H. R., Chairman.
Surveyer, Arthur. Frigon, A.
Shearwood, F. P. McGuigan, F. H. Jr.

To the Council
of the Engineering Institute
of Canada:

I beg leave to present on behalf of the Committee on Library and House, our report for the year just ended.

The following additions in the way of publications were received by the Secretary during the current year:—

By H. H. Vaughan, M. E. I. C.
Photographic Volume, Victoria Bridge (1860).
By E. D. Gray, A. M. E. I. C.
Petroleum in Canada, by Victor Ross.
By John W. LeB. Ross, M. E. I. C.
Statistical Report of Lake Commerce.
By F. W. Cowie, M. E. I. C.
Annual Reports, Harbour Commissioners of Montreal, 1916-17.
By Fraser S. Keith, A. M. E. I. C.
The Honourable Peter White.
By Charles F. Bristol, A. M. E. I. C.
Electric Furnaces in the Iron and Steel Industry, by Rodenhauser, Shoenawa and Von Baur.
By F. A. Bowman, M. E. I. C.
The Monthly Bulletin of the Maritime Telephone and Telegraph Company Limited.
By Walter J. Francis & Company.
1 vol. Annual Report, 1915, Public Service Commission, Massachusetts.
1 vol. Annual Report, 1916, Public Service Commission, Maryland.
2 vols. Annual Report, 1914, 1915, Public Service Commission, Indiana.
1 vol. Annual Report, 1915, Public Service Commission, New Hampshire.
3 vols. Annual Report, 1914, Public Service Commission, New York, 1st District.
1 vol. Annual Report, 1915, Public Service Commission, New York, 2nd District.
3 vols. Annual Report, 1915-1916, Public Utilities Commission, District of Columbia.
1 vol. Annual Report, 1916, Public Utilities Commission, Connecticut.
1 vol. Annual Report, 1916, Public Utilities Commission, Ohio.
1 vol. Annual Report, 1914-1915, Public Utilities Commission, Idaho.
1 vol. Annual Report, 1915, Public Utilities Commission, New Jersey.
1 vol. Annual Report, 1916, Public Utilities Commission, Maine.
1 vol. Annual Report, 1914, Public Utilities Commission, Illinois.
2 vols. Annual Report, 1915, Railroad Commission, Wisconsin.
1 vol. Annual Report, 1915, Railroad Commission, Iowa.
1 vol. Annual Report, 1916, Railroad Commission, Nebraska.
1 vol. Annual Report, 1915, Railroad Commission, Michigan.
1 vol. Annual Report, 1915-1916, Railroad Commission, California.
1 vol. Statistics of Railways in the United States, 1914, Interstate Commerce Commission.
1 vol. Statistics of Common Barriers, 1916, Interstate Commerce Commission.
1 vol. Central Electric Light and Power Stations and Street and Electric Railways, United States, Department of Commerce, 1912.
By Wm. Pearce, M. E. I. C.
Blueprint Giving Coal Statistics on the Colonization and Development Branch for the Canadian Pacific Railway.
By J. J. Salmond, A. E. I. C.
Bound Volume of Canadian Engineer Vol. 34.
By A. E. Doucet, M. E. I. C.
Voyages en Egypte, Volume 1 and 2, and Planches de Voyages dans la Basse et la Haute Egypte, by V. Denon.
By McGraw-Hill Book Company.
Mechanical and Electrical Cost Data, by Gilette and Dana.
By Noel Olgivie, M. E. I. C.
Publication Number One of the Geodetic Survey of Canada, Precise Levelling.
By Lawrence Burpee, Secretary International Joint Commission.

The Application of the St. Lawrence River Power Company.

Interim Order and Opinion, and Opinion, by Mr. Powell.

The works which have been purchased are:

Proceedings of the Twenty-ninth Convention, National Association of Railway Commissioners held at Washington, October, 1917.

The Engineering Index Annual, 1917.

The following additions were made in exchange of transactions:

"Chimie & Industrie," Paris, France.
"Le Génie Civil," Paris, France.
"La Houille Blanche," Lyon, France.

During the year the Committee undertook the preparation of an Engineering Index for the Library, and after consulting with the Librarian of the American Society of Civil Engineers in New York, the Librarian of the United Engineering Societies of New York, the index used by the American Railway Engineering Association, and others, decided to adopt a system quite similar in character to that used in the American Society Library, in New York.

In reaching this conclusion the Committee was guided by two primary considerations:

First, the application of a system which had been well developed after an intensive study in connection with conditions which were not dissimilar to our problem;

Second, the convenience which will result from a membership of so many engineers in both *The Engineering Institute of Canada* and the United Engineering Societies in the United States; and

Third, the moderate expense which would accompany the installation of this system in *The Engineering Isntitute of Canada.*

Arrangements were made with the Librarian of McGill University for assistance to carry out this work, which was done here, the books being all indexed in accordance with the system adopted by the Committee.

During the year an arrangement was made for publishing from month to month, the titles of current engineering papers with name of author, source, and a brief extract of the more important, which is designed to give the members of *The Institute* a survey of all important articles relating to the profession.

This arrangement, we are glad to say, was made in co-operation with the United Engineering Societies, and it is felt it will be extremely helpful to its members.

Respectfully submitted,

H. R. Safford,
Chairman.

Report of Publications Committee

Brown, Ernest, Chairman.

Robertson, J. M.	French, R. deL.
Thomson, W. Chase.	De Cew, J. A.

The past year has been one of transition in regard to publications. The publication of volumes of Transactions has been suspended temporarily by the Council, and attention focussed upon the monthly *Journal*, the first number of which appeared in May last. Some papers read at Montreal, and accepted for publication in the Transactions of the Canadian Society of Civil Engineers before the re-organization of the Society took place, still await publication in final form. It is expected that the series of papers on the Quebec Bridge will be issued as a separate volume of Transactions.

With the return of our membership from overseas' and the establishment of *The Monthly Journal* on a paying basis, the finances of *The Institute* will enable the publication of Transactions to be resumed and brought up to date. Meanwhile, *The Journal* has been the medium through which papers have been issued to the membership, and the Publications Committee has assisted the Secretary in passing upon papers submitted for publication. The normal function of the Publications Committee in future will be to select from the large number of papers published in *The Journal*, such papers and discussions thereon as are worthy of being embodied in permanent form in the Transactions of *The Engineering Institute of Canada.*

E. Brown,
Chairman.

Jan. 2nd, 1919.

Report of Board of Examiners and Education.

MacKay, H. M., Chairman.

Surveyer, Arthur, Secretary.	French, R. de L.
Brown, Ernest.	Lea, R. S.
Robertson, J. M.	Roberts, A. R.

The Board of Examiners and Education has as usual examined the educational qualifications of a large number of candidates for admission, and has transmitted its findings to Council. The number of candidates presenting themselves for the semi-annual examinations during the year was as follows:—

	Examined	Passed
Theory and Practice of Engineering	4	3
Hydraulic Engineering..........	1	1
Mechanical Engineering..........	1	1
Railway Engineering.............	1	1
Total..................	7	6

With the approval of Council, examiners will in future be authorized to set two papers in the professional subjects embraced in schedule C. One of these is to be a paper on the underlying principles, the examination in which is to be conducted under the ordinary rules. For the second paper the candidate may avail himself of handbooks or other appropriate data. It is hoped that the proposed scheme will afford a fairer test of the capacity of applicants, particularly in the case of those who have been engaged in practice for some time, and at the same time make a higher standard of attainment practicable.

The Board is also considering the question of recommending that the examination under Schedule B (Mechanics, Physics, Strength of Materials, etc.) should be set for candidates seeking Junior Membership, instead of reserving the test as a qualification for Associate Membership. While the necessity of a good grounding in these fundamentals will be universally admitted, submission to examination in them becomes, in many cases, more irksome the longer it is deferred, and it is believed that a more satisfactory standard could be maintained by making the change suggested.

Arthur Surveyer, Secretary. — H. M. Mackay, Chairman.

Report of International Electrotechnical Committee

Herdt, Dr. L. A., Chairman.

Gill, L. W.	Barnes, H. T.
Higman, O.	Kynoch, J.
Lambe, A. B.	Roseburgh, T. R.

Murphy, J.

This Committee begs to report that, due to war conditions, the work of the Commission during 1918 has of necessity been very greatly limited. Nevertheless, the central office in London has succeeded in making considerable progress with several subjects, more particularly the question of the Rating of Electrical Machinery. As previously reported, several conferences on this matter have been held in London between English, United States, and Canadian representatives, and it is expected that a report summarizing their deliberations and recommendations will be issued shortly. In the meantime the

French Committee has issued a memorandum on Aluminium Tests, in an effort to formulate standards governing its use in electrical work, and the central office has in hand among other things the questions of Graphical Symbols, Nomenclature for Automatic Telephone Apparatus, and Specifications for Instrument transformers.

The central office has expressed to the Canadian Committee its great thanks for the continued financial support received from Canada, for which your Committee is in turn much indebted to the Dominion Government.

All of which is respectfully submitted.

A. B. LAMBE, Secretary. L. A. HERDT, Chairman.

Report of Roads and Pavements Committee

McLean, W. A., Chairman.

Brereton, W. P.	MacPherson, A. J.
Duchastel, J.	Mercier, P. E.
Griffith, J. E.	Near, W. P.
Henry, G.	Powell, G. G.
James, E. A.	Rust, C. H.
Macallum, A. F.	Doane, F. W. W.

A portion of the work undertaken by the Committee on its formation consisted in the preparation of specifications for road building materials. During 1916, specification for crushed stone, sand and gravel were prepared and tentative specifications for asphaltic road oils were presented.

During the past year the attention of the Committee has been confined to specifications for bituminous materials. Draft specifications were prepared and presented to the members of the Committee for criticism or suggestion. The specifications were revised with consideration for the replies received and are presented herewith. Those for three grades of asphaltic road oils, which were previously presented to *The Institute*, have been revised and specifications for asphalt binder, penetration method, and for three grades of refined coal tar have been added.

Light asphaltic road oil can be used where a dust preventative of more lasting character than the non-asphaltic road oils is desired. It can be applied without heating, in small quantities, and the application repeated if necessary. Medium asphaltic road oil is a heavier grade. It not only acts as a dust palliative but also as a surface preservative. Owing to the heavier body it is more lasting in effect and is adopted for use where the traffic on a macadam road causes a rapid destruction of the binding material. Under favourable circumstances it may be applied cold, but better results are invariably obtained from a hot application. Heavy asphaltic road oil has been extensively used for carpet coats or bituminous mats. Where material of this grade is used it has been found best to apply it in very small quantities with a view to obtaining a penetration of the surface of the macadam and a thin, tough coating of the stone, rather than to securing a thick layer which has a tendency to roll and wave under traffic. Asphalt binder in general, is used where a bituminous surface penetrated to a depth of from two to four inches is desired. While the asphaltic oils can be used on old macadam surfaces, the binder is used where a new surface is constructed. It is applied hot, and under pressure from a tank wagon.

The refined coal tars are used for the same purposes as the asphaltic oils. Light refined coal tar is for cold surface treatment. It acts as a dust preventative and when carefully applied penetrates the surface to some depth. As with the light asphaltic road oil, it is a more or less temporary treatment and the application should be repeated annually or more frequently as occasion may demand. Heavy refined coal tar, if applied in large quantities forms a bituminous mat, which is not desirable where mixed motor and horse-drawn traffic is to be served. If sparingly applied, however, it forms a thin surface dressing which is more lasting in character than the lighter grades of tar or oil. Refined coal tar binder is in general for use in the construction of bituminous surfaces by the penetration method.

The tentative specifications for asphaltic road oils presented to *The Institute* and published in the Annual Report for 1916, have been used by a number of municipal engineers throughout the Dominion. When commencing work the Committee felt the need for such specifications and while these were presented in the nature of a progress report the extent to which they have been used strongly indicates the desire for such specifications on the part of municipal engineers. It is hoped by the Committee that the accompanying specifications will more completely fill this need and that they will be of assistance to engineers throughout the Dominion who are engaged in road and pavement construction. The specifications are presented herewith as an appendix to this report.

W. A. MCLEAN,
Chairman.

APPENDIX

Light Asphaltic Road Oil.

Light oil shall have the following characteristics:—

1. It shall have a specific gravity at 25°C. (77°F.) of not less than 0.92.
2. It shall have an open flash point of not less than 55°C. (130°F.)
3. It shall have a specific viscosity at 25°C. (77°F.) of not more than 70.
4. When fifty grams of the oil are heated in an open vessel at a temperature between 250°C. (480°F.) and 260°C. (500°F.) until the residue has a penetration (100 grams, 5 seconds, 25°C.) of 100° the said residue shall amount to not less than 50 percent nor more than 60 percent by weight of the original oil.
5. Fifty grams of the oil when maintained for five hours at a temperature of 163°C. (325°F) in an open vessel 5.5 millimetres in diameter and 3.5 millimetres deep shall lose not less than 10 percent nor more than 25 percent by weight.
6. It shall be soluble in chemically pure carbon disulphide at room temperature to the extent of not less than 99 percent by weight.
7. It shall contain not less than 6 percent by weight of material insoluble in 76° Baume paraffine petroleum naphtha at room temperature.

8. It shall show not less than 4 percent nor more than 8 percent by weight of fixed carbon on ignition.

Medium Asphaltic Road Oil.

Medium oil shall have the following characteristics:—

1. It shall have a specific gravity at 25°C. (77°F.) of not less than 0.94.

2. It shall have an open flash point of not less than 70°C. (158°F.)

3. It shall have a specific viscosity at 65°C. (150°F.) of not more than 50.

4. When fifty grams of the oil are heated in an open vessel at a temperature between 250°C. (480°F.) and 260°C. (500°F.) until the residue has a penetration (100 grams, 5 seconds, 25°C.) of 100° the said residue shall amount to not less than 60 percent nor more than 70 percent by weight of the original oil.

5. Fifty grams of the oil when heated for five hours at a temperature of 163°C. (325°F.) in an open vessel 5.5 millimetres in diameter and 3.5 millimetres deep shall not lose less than 8 percent nor more than 20 percent by weight.

6. It shall be soluble in chemically pure carbon disulphide at room temperature to the extent of not less than 99 percent by weight.

7. It shall contain not less than 10 percent nor more than 17 percent by weight of material insoluble in 76° Baume paraffine petroleum naphtha at room temperature.

8. It shall show not less than 7 percent nor more than 12 percent by weight of fixed carbon on ignition.

Heavy Asphaltic Road Oil.

Heavy oil shall have the following characteristics:—. .

1. It shall have a specific gravity at 25°C. (77°F.) of not less than 0.96.

2. It shall have an open flash point of not less than 160°C. (320°F.).

3. It shall have a specific viscosity at 100°C. (212°F.) of not more than 50.

4. When fifty grams of the oil are heated in an open vessel at a temperature between 250°C. (480°F.) and 260°C. (500°F.) until the residue has a penetration (100 grams, 5 seconds, 25°C.) of 100°, the said residue shall amount to not less than 80 percent nor more than 90 percent by weight of the original oil.

5. Fifty grams of the oil when heated for five hours at a temperature of 163°C. (325°F.) in an open vessel 5.5 millimetres in diameter and 3.5 millimetres deep shall lost not less than 2 percent nor more than 8 percent by weight.

6. It shall be soluble in chemically pure carbon disulphide at room temperature to the extent of not less than 99 percent by weight.

7. It shall contain not less than 12 percent nor more than 20 percent by weight of material insoluble in 76° Baume paraffine petroleum naphtha at room temperature.

8. It shall show not less than 8 percent nor more than 15 percent by weight of fixed carbon on ignition.

Specification for Asphalt Binder.

Penetration Method.

1. It shall be homogeneous and free from water, and shall not foam when heated to a temperature of 150°C. (302°F.).

2. It shall have a specific gravity at 25°C. (77°F.) of not less than 0.98.

3. It shall have an open flash point of not less than 190°C. (375°F.).

4. It shall have a penetration (No. 2 needle, 100 grams, 5 secs., 25°C.) of not less than 130° nor more than 180°.

5. It shall have a ductility at 25°C. (77°F.) of not less than 75 centimetres.

6. It shall be soluble at room temperature in chemically pure carbon disulphide to the extent of not less than 99.5 percent by weight in the case of oil asphalt, and native asphalts shall show a percentage of the products of the fields from which they come.

7. Of the material soluble in carbon disulphide not less than 14 percent nor more than 30 percent by weight shall be insoluble at room temperature in 76° Baume paraffine petroleum naphtha distilling between 60°C. and 88°C. (140°F. and 190°F.).

8. It shall show not less than 10 percent nor more than 18 percent by weight of fixed carbon on ignition.

9. When fifty grams of the material are heated in a cylindrical vessel 5.5 centimetres in diameter and 3.5 centimetres deep, for 5 hours at a temperature of 163°C. (325°F.) the loss in weight shall not exceed 5 percent, nor shall the penetration of the residue (No. 2 needle, 100 grams, 5 secs., 25°C.) be less than 50 percent of the original penetration.

Specification for Refined and Blended Coal Tar

Cold Application.

1. It shall be homogeneous and free from water.

2. It shall have a specific gravity at 25°C. (77°F.) of not less than 1.14 nor more than 1.18.

3. It shall have a specific viscosity for 50 cubic centimetres at 40° C. (104°F.) of not less than 20 nor more than 30.

4. On distillation the percentages by weight of distillate at the following temperatures shall be:—

To 170°C. (338°F.)	not more than	5	percent.
" 235°C. (455°F.)	" " "	18	"
" 270°C. (518°F.)	" " "	25	"
" 300°C. (572°F.)	" " "	32	"

(a) The residue from the foregoing distillation shall have a melting point of not more than 70°C. (158°F.).

(b) The distillate from the foregoing distillation shall have a specific gravity at 25°C. (77°C.) of not less than 1.01.

5. It shall be insoluble in chemically pure carbon disulphide at room temperature to the extent of not more than 15 percent weight.

Hot Application.

1. It shall be homogeneous and free from water.

2. It shall have a specific gravity at 25°C. (77°F.) of not less than 1.20 nor more than 1.27.

3. It shall show a float test at 50°C. (122°F.) of not less than 65 seconds and not more than 85 seconds.

4. On distillation the percentages by weight of distillate at the following temperatures shall be:—

To 170°C. (338°F.)	not more than	0.0 percent.
" 235°C. (435°F.)	" " "	10 "
" 270°C. (518°F.)	" " "	17 "
" 300°C. (572°F.)	" " "	22 "

(a) The residue from the foregoing distillation shall have a melting point of not more than 75°C. (167°F.).

(b) The distillate from the foregoing distillation shall have a specific gravity at 25°C. (77°F.) of not less than 1.03.

5. It shall be insoluble in chemically pure carbon disulphide at room temperature to the extent of not more than 20 percent.

Binder.

Penetration Method.

1. It shall be homogeneous and free from water.

2. It shall have a specific gravity at 25°C. (77°F.) of not less than 1.20.

3. It shall have a melting point of not less than 28°C. (83°F.) nor more than 35°C. (95°F.).

4. On distillation the percentages by weight of distillate at the following temperatures shall be:—

To 170°C. (338°F.)	not more than	0 percent.
" 235°C. (455°F.)	" " "	3 "
" 270°C. (518°F.)	" " "	11 "
" 300°C. (572°F.)	" " "	15 "

(a) The residue from the foregoing distillation shall have a melting point of not more than 75°C. (167°F.).

(b) The distillate from the foregoing distillation shall have a specific gravity of 25°C. (77°F.) of not less than 1.03.

5. It shall be insoluble in chemically pure carbon disulphide at room temperature to the extent of not more than 22 percent by weight.

Instructions for Taking and Shipping Samples

1. *Sampling.*—Since tests, on a small sample of material, reveal the properties of the material in the sample only, it is necessary that the samples be procured in such a manner that they are representative of the whole shipment. Samples containing material taken from the top or bottom only of a tank car or drum, must be avoided.

2. *Size of Samples.*—In order that sufficient material may be received at the laboratory for all the tests to be made it is necessary that all samples contain at least one imperial pint.

3. *Containers.*—Vessels containing samples should be absolutely clean. Those which have been used to hold oils or greases should not be used. Glass jars should not be used except when there is nothing else available, an they should then be tightly packed with sawdust in stout wooden boxes. Samples which have become contaminated with packing material can not be tested.

For fluid and viscous materials new oil tins with screw caps are suitable and for semi-solid and solid materials new paint tins with tightly fitting pry covers should be used. All containers should be packed in wooden boxes for shipment.

4. *Identification.*—All samples should bear proper identification tags containing the following information:

1. Date that sample was taken.
2. Name of person, corporation, or municipality sending sample.
3. Class of work for which material is to be used.
4. A copy of the specification under which the sample has been submitted.
5. Quantity of material represented by sample.
6. Number of tank or car from which the sample was taken.
7. If the shipment is being held pending the results of the tests.
8. The name of the manufacturer.

Report of Finance Committee

Supplementing the Annual Statement of the Auditors, the Finance Committee submits a table showing receipts and expenditures for the last ten years, upon which the following comments are pertinent:—

1st.—Arrears Collected: There is a large falling off in the arrears collected, due to the fact, that in the three previous years the cream has been extracted.

2nd.—Current Fees Collected: This item now shows that the current fees collected are qual to those of the pre-war period, in spite of the fact that so many members are at the front.

3rd.—Entrance Fees: These have again increased in a satisfactory way.

4th—Salaries and Wages: These have increased, due to expansion of the activities of *The Institute.*

5th.—Branch Societies: There is a large decrease in the amount paid to Branches, under the new by-laws.

6th.—*Journal* Expenses: In Item No. 7, "Miscellaneous Receipts," is included revenue from advertisements in *The Journal,* and List of Members, amounting to $6,008. To offset this in item No. 10, "Printing and Stationery," the cost of *The Journal* is included at $6,032.

7th.—General Results: General results indicate a live Institute rapidly expanding, and going through its most serious period as regards expenses, with the new *Journal* established, a new staff in control, and with 960 members at the front who pay no fees.

R. A. Ross,
Chairman of Finance Committee.

Montreal, January 27th, 1919.

Reports of Branches

Calgary Branch

During the year 1918 there have been held three general meetings and ten Executive Committee Meetings.

The following were the speakers at the general meeting:—

January 30th, A. Ingraham, M.A., Soc. M. E. "Flour Mill Engineering."

March 18th, Mr. Pearce, M.E.I.C. and Mr. Peters, "General Matters."

May 8th, Lewis Stockett, M.E.I.C., "Coal."

May 29th, Mr. G. F. Porter, M.E.I.C., "The Quebec Bridge."

Lecture, illustrated by lantern slides, given in the Public Library Auditorium to which the public were invited, the hall proving much too small to hold the number who wished to attend.

The most important meeting of the year to the Western Branches was the Second Professional Meeting of *The Institute* held at the Saskatchewan University at Saskatoon, August 8, 9 and 10, 1918.

This was attended by about 65 members and was a great success both from the standpoint of the success of the meetings from a professional point of view and from the quality of the entertainment provided.

During the year the new membership joining the Branch is as follows:—

Members	3
Associate Members	4
Associates of Branch	3

And applications received and recommended by Committee on Applications as follows:—

Associate Member	3
Associates of Branch	1

A total of thirteen new members.

Transfers have been made as follows:—

From Associate Member to Member	1
From Student to Associate Member	1
Old members joining or rejoining the Branch:—	
Members	2
Associate Member	1

The present membership of the Branch Totals 72, divided as follows:—

Members	20
Associate Members	34
Junior Members	5
Affiliates	1
Affiliates of the Branch	12
	72

With 3 Associate Members and 1 Associate of Branch to be voted upon to-day makes a total membership at present of 76.

This includes 17 members with the Allied Armies.

As you are all aware, good progress has been made in the matter of proposed Legislation and Committees from the Calgary and Edmonton Branches are preparing to submit an Act to the coming session of the Alberta Legislature.

Financial Statement for the Year Ending, November 30, 1917.

Receipts

Balance in Bank, December 1, 1917	$426.31
Fees from Members	21.75
Rebates from parent *Institute*	135.80
Interest on Bank Account	5.14
Interest on Victory Bond ($300)	16.50
	$605.50

Expenditure

Stationery, Printing and General Expense	$75.09
Books and Magazines	6.35
Balance payment on ($300) Victory Bond	267.33
Miscellaneous	56.10
Balance in Bank, November 30, 1918	200.63

Montreal Branch

To the Members of Council,
The Engineering Institute of Canada,
176 Mansfield Street,
Montreal.

Gentlemen:—

We have the honour to present herewith the first annual report of the Montreal Branch of *The Engineering Institute of Canada.*

On January 23rd, 1918, a petition was presented to Council asking for the formation of a Montreal Branch of the Canadian Society of Civil Engineers. This application was as follows:—

"To the President and Members of the Council of the Canadian Society of Civil Engineers.

We, the undersigned Corporate Members of the Canadian Society of Civil Engineers, resident within twenty-five miles of headquarters, respectfully request that the Council may grant permission to establish "The Montreal Branch of the Canadian Society of Civil Engineers."

Montreal, January 23rd, 1918."

(Signed):

R. M. Hannaford.	Alex. Bertram.
R. S. Lea.	Ls. G. Papineau.
Frederick B. Brown.	J. A. Duchastel.
J. A. Burnett.	W. Chase Thomson.
Geo. K. McDougall.	H. P. Borden.
Onisphore H. Cote.	M. Brodie Atkinson.
A. W. K. Massey.	R. deL. French.
A. J. Matheson.	H. G. Hunter.

To the Members of Council E. I. C.

At a meeting of Council held on the same day this application was presented and permission by Council was granted for the formation of the Branch, and residents of District No. 1 were authorized to proceed with arrangements for organizing into a Montreal Branch.

On February 7th, 1918, the signers of the original petition of January 23rd sent out a circular to all members resident in District No. 1, calling a meeting for the 14th of February to discuss details in connection with the formation of the Branch.

On February 14th a largely attended meeting took place at the headquarters of the Society, 176 Mansfield Street. A committee was named for the purpose of nominating candidates to fill the executive offices of the new Branch and the election by letter ballot was arranged to be declared on March 14th. The Executive of the Branch was discussed and it was decided to have it composed of a Chairman, a Vice-Chairman, a Secretary-Treasurer, these to be elected for one year, and six Committee men, the three receiving the greatest number of votes to serve for two years and the three others for one year, thereafter the Committee men to be elected for two years, three at each election.

A Nominating Committee was selected composed of R. M. Hannaford, Frederick B. Brown, L. G. Papineau, J. A. Duchastel, W. Chase Thomson, M. Brodie Atkinson and H. G. Hunter, and, according to the instructions they received by resolution of the meeting, they were to nominate at least two candidates for each executive office and to add other candidates to the list of nominees provided they had received the certified support of five Corporate Members of the Society.

The Nominating Committee proceeded to carry out their work and on March 14th the following gentlemen were elected to office:

Chairman	Walter J. Francis.
Vice Chairman	Arthur Surveyer.
Secretary-Treasurer	Frederick B. Brown.

Members of the Executive Committe.

F. P. Shearwood, W. Chase Thomson, H. G. Hunter, for two years; and L. G. Papineau, O. O. Lefebvre, K. B. Thornton, for one year.

The first meeting of the newly elected Executive took place at the rooms of the Society on March 21st, 1918, and the organization of the Branch was commenced. A Committee consisting of Messrs. Francis, Safford, Ernest Brown, Surveyer, Lefebvre and Hunter was constituted the Committee on Branch By-Laws to draw up suitable by-laws, working in co-operation with the general By-laws Committee of the Society, namely, Messrs. Francis, Safford and Ernest Brown.

A Papers and Meetings Committee was appointed consisting of R. M. Hannaford, Chairman, together with the Chairmen and Vice-Chairmen of such sections of the Branch as may hereafter be formed. Four suggested Sections of the Branch were named as follows:—

Civil	J. A. Duchastel,	Chairman.
	H. M. Lamb,	Vice-Chairman.
Mechanical	J. A. Burnett,	Chairman.
	J. T. Farmer,	Vice-Chairman.
Electrical	J. A. Shaw,	Chairman.
	A. Frigon,	Vice-Chairman.
Industrial or Manufacturing	S. F. Rutherford	Chairman.
	H. G. Hunter	Vice-Chairman.

Following this meeting the work of organization was continued and the four Sections of the Branch were duly constituted under the leadership of the members of the Papers and Meetings Committee already outlined.

The programme for the balance of the spring season of 1918 being already arranged under the auspices of the Society as a whole, it was decided to continue these as found best from to time until the close of the spring programme, and this arrangement was accordingly carried out.

On May 29th, the Executive of the Branch had the honour of holding the first meeting under the official new name of the Society, the signature of the Governor-General having just been attached to the papers authorizing the change of name to *The Engineering Institute of Canada.*

During the summer considerable progress was made in the drafting of by-laws, discussions on legislation, and suggested formation of a Provincial Division in Quebec. This work was carried on by members of the Committee, and regular meetings of the Committee were resumed early in September. The programme for the fall session was drawn up, and it was decided to hold a discussion on legislation at the first regular meeting of the Branch during the autumn season, commencing on October 10th. The epidemic of influenza, which was at that time commencing to be very severe, caused the Board of Health to issue an order prohibiting all public gatherings in Montreal. This necessitated the postponement of the discussion on legislation until November 28th.

On November 28th the Branch met and commenced the discussion on legislation, about seventy-five members being present. The discussion proved so interesting that it was decided to continue the discussion on legislation, and further meetings were held on December 12th and December 19th. At the meeting on December 19th, following a great deal of discussion, two resolutions were passed by the Branch, one asking Council to appoint a committee to consider the question of legislation throughout Canada, and the other instructing the officers of the Branch to co-operate with the officers of the Quebec Branch in obtaining information regarding legislation from members resident in the Province of Quebec. The text of the two resolutions is as follows:—

Moved by Mr. Tye, Seconded by Mr. Duggan, and carried, that

Whereas it seems advisable that legislation should be sought defining the status of engineers throughout Canada, And

Whereas the widespread activities of the Engineering profession, the great difference in the interests and occupations of the individuals, the necessity of getting satisfactory legislation in the different Provinces, the unsatisfactory result of such legislation as has already been obtained and the dangers and difficulties certain to be encountered by *The Institute* as a whole during the time period of passing of Canadian engineering from an open to a closed or a partially closed profession, make it inadvisable and inexpedient to ask for any further legislation in any Province until the whole question has been thoroughly studied, reported upon and submitted in concrete form to the full corporate membership of *The Institute.*

Be It Resolved:

That the Executive of the Montreal Branch be instructed to ask the Council to arrange for the appointment of a Committee representing all provinces and all branches of the profession to inquire into, study and report upon the whole question of legislation, including a report upon the best method of getting such legislation as will insure a satisfactory and uniform status of engineers throughout Canada, also to draw up such sample legislation as it may deem necessary and advisable in order that the members of *The Institute* in the different provinces may seek legislation on some uniform basis.

That before the final adoption of any proposed act it shall be the duty of the Committee to co-operate as far as possible with similar incorporated technical bodies with a view to harmonizing clauses which might contain points of contention.

That the Secretary of the Montreal Branch be instructed to forward a copy of this Resolution to the Secretary of *The Institute* and to the Secretaries of the Provincial Divisions and the Branches, and to request the Executive of the Provincial Divisions and the Branches to assist the Council in securing the appointment of a strong and representative committee."

Proposed by Mr. Surveyer, seconded by Mr. Brown, and carried,

That the Executive of the Montreal Branch take immediate steps to obtain, in co-operation with the Quebec Branch, and by letter ballot, the views of the members of *The Institute,* residing in the Province of Quebec, on the question of licensing engineers.

And that the following questions for this letter ballot be suggested to the Executives of the Montreal and Quebec Branches for their consideration:

Question 1.—Are you in favour of a closed corporation for engineers having responsible charge of engineering works?

Question 2.—If so, do you favour legislation embracing all engineering works, or only public works?

Question 3.—In the event of the majority of the members of *The Institute* residing in Quebec, declaring in favour of a closed corporation, what are your opinions on the following questions?

(a) Do you consider that the only method of entrance into the engineering profession should be through the engineering colleges?

(b) If not, do you think that candidates who do not follow college engineering courses should be obliged to pass an examination for admission to study somewhat along the lines of the matriculation examination required for university entrance?

(c) Do you think that candidates should be required to pass an examination for admission to practise, similar to the examinations required by the Bar and Medical Associations?

(d) Should candidates be obliged to serve a period of apprenticeship or employment under an engineer, before being allowed to take the final examinations for admission to practise? (The word practise is understood to mean taking responsible charge of engineering works).

(e) If in favour of examination, do you consider that these should be held by the corporation only or by a joint board of the members of the corporation and representatives of the McGill and Laval faculties of applied science?

(f) Do you consider that graduates of engineering schools should be exempted from any or all the examinations?

(g) If so, from what examinations should they be exempted?

(h) Do you think that graduates of engineering schools should be required to prove that they have had experience under some engineer before being admitted to take charge of engineering work?

And that the results of this letter ballot be passed on to the committee appointed under Mr. Tye's motion for their information irrespective of any action the members of *The Institute* in Quebec may wish to take."

The whole subject of legislation is apparently very much alive throughout *The Institute* and the Montreal Branch is taking a keen interest in it.

A programme for the winter and spring season of 1919 has been drawn up by the Branch in accordance with the attached printed list.

Branch Officers, 1918-1919: Walter J. Francis, Chairman; Arthur Surveyer, Vice-Chairman; Frederick B. Brown, Secretary-Treasurer.

Executive Committee: F. P. Shearwood, H. G. Hunter, O. O. Lefebvre, W. Chase Thomson, L. G. Papineau and K. B. Thornton.

Papers and Meetings Committee: R. M. Hannaford, Chairman.

S. F. Rutherford, H. G. Hunter, Industrial Section; J. A. Shaw, A. Frigon, Electrical Section; J. T. Farmer, J. A. Burnett, Mechanical Section; J. Duchastel, H. M. Lamb, Civil Section.

Programme of Meetings, January to April, 1919.

Always at 8.15 p.m. sharp.

Always on Thursday evening, with the exception of February 13th, which is the date of the Annual-Professional Meeting in Ottawa.

Jan. 9—Fire Prevention. Inspection as a Means of Fire Prevention, by George H. Greenfield. *Chairman—Mr. Francis.*

Jan. 16—Design and Construction of Reinforced Concrete Viaducts at Mileages 0.9 and 1.8, North Toronto Sub-division, Canadian Pacific Railway, by B. O. Eriksen, A.M.E.I.C., and S. H. Deubelbeiss, A.M.E.I.C. Some Problems of National Reconstruction, by. W. F. Chipman, K.C. *Chairman—Mr. Surveyer.*

Jan. 23—Coaling Plant for Locomotives, by J. A. Burnett, A.M.E.I.C. Industrial Illumination, by George K. McDougall, A.M.E.I.C. *Chairman—Mr.* Hannaford.

Jan. 30—Modern Boiler Practice, by F. A. Combe, A.M.E.I.C. Coal is King (A motion picture), by R. E. Cleaton Company. *Chairman—Mr. Rutherford.*

Feb. 6—Some Problems in Ocean Transportation, by A. W. Robinson, M.E.I.C. Manufacture of Nitro-Benzol and Aniline Oils, by G. J. Caron, J.E.I.C. *Chairman—Mr. Farmer.*

Feb. 20—Construction of Canadian Northern Railway Tunnel, Montreal, by J. L. Busfield, A.M.E.I.C. *Chairman—Mr. Duchastel.*

Feb. 27—The Effect of Ice on Hydro-Electric Plants, by R. M. Wilson, M.E.I.C. *Chairman—Mr. Francis.*

March 6—Air Drills, by N. M. Campbell, A.M.E.I.C. The Halifax Explosion from a Chemist's and Physicist's Viewpoint, by Dr. Howard Bronson, F. R. S. C. Burroughs Adding Machines (A motion picture), by Burroughs Adding Machine Company. *Chairman—Mr. Hunter.*

March 13—Electrical Welding, by C. V. Holslag. Patents and Engineering, by Hanbury A Budden, A.E.I.C. *Chairman—Mr. Shaw.*

March 20—Ball Bearing Jacks, by W. H. C. Mussen, A.E.I.C. Peat, by Ernest V. Moore, A.M.E.I.C. *Chairman—Mr. Rutherford.*

March 27—Some Notes on the Design and Construction of Reinforced Concrete Covered Reservoirs, by R. deL. French, M.E.I.C. *Chairman—Mr. Surveyer.*

April 3—The Operation of Railways as an Engineering Problem, by V. I. Smart, M.E.I.C. *Chairman—Mr. Frigon.*

April 10—Waterproof Paper Productions and their Industrial Possibilities, by J. A. DeCew, A.M.E.I.C. *Chairman—Mr. Lamb.*

April 17—Quebec Bridge, by Phelps Johnson, M.E.I.C., G. H. Duggan, M.E.I.C., George F. Porter, M.E.I.C. *Chairman—Mr. Francis.*

April 24—Continuation of Paper of April 17th. *Chairman—Mr. Francis.*

The meetings so far held have been very successful and much appreciated by those present.

The Executive Committee of the Montreal Branch feels that a great advance has been made by forming the members resident within twenty-five miles of Headquarters into a separate entity having a Branch standing. In this connection, however, it is felt that certain amendments to the By-laws of *The Institute* are desirable in order to improve certain of the operating conditions of the Montreal Branch and to place the Branch on a footing corresponding to that of the other Branches. At the present time the Montreal Branch members pay much larger fees to *The Institute* than any of the other members of *The Institute*, but the regulations make no provisions for financing the Branch. Being without the funds derived from rebates which constitute the principal revenue of the other Branches, it has been necessary to accept favours of the private members, or to appeal to Headquarters for assistance that does not appear to be provided for in the By-laws of *The Institute*. Up to the present the Council of *The Institute* has kindly undertaken to pay the principal expenses of the Branch, but the Executive Committee of the Branch feels that the Branch should be placed in a position to finance its own expenditures and to make provision for its programme and activities. The Secretary of *The Institute* has also rendered valuable and much appreciated services to the Branch, but the Executive considers that it has no right to thus impose on the Headquarters staff.

The whole question is one of some difficulty and committees are now working in order to prepare amendments to the existing By-laws of *The Institute*, which amendments it is proposed to present at the next annual meeting in order to produce the desired result.

The whole respectfully submitted on behalf of the Montreal Branch.

WALTER J. FRANCIS,
Chairman.

FREDERICK B. BROWN,
Secretary-Treasurer.

Quebec Branch

Quebec, January 12th, 1919.

To the President and Council and Members,
of the Engineering Institute of Canada.

Gentlemen:—

On behalf of the Quebec Branch of *The Engineering Institute of Canada*, we herewith submit our Annual Report for the year 1918.

At the Annual Meeting of the Branch held on the fourteenth of December last, the following officers were elected by ballot for the ensuing year: A. R. Decary, Chairman; J. A. Buteau, Secretary-Treasurer; F. T. Cole, J. E. Gibault, W. Lefebvre, members of Committee.

At this meeting the Secretary-Treasurer's report for the Branch year was read and approved.

The Branch had only five meetings which were fairly well attended. There were no lectures during the season.

During the last Provincial Session, our Legislation Committee took great pains in watching all bills presented to the Legislative Assembly for sanction, so that there would be no infringement on our rights, and have succeeded, together with the influence brought by some of our prominent members, in blocking and having amended certain bills, which formerly had clauses detrimental to the Institute by-laws and regulations.

One of the most important subjects at the meetings was the discussion on ways and means of obtaining Provincial Legislation with clear and well defined charters. Resolution to that effect was sent to the central committee and all the other Branches of *The Institute* for action.

The Branch takes this opportunity of drawing the attention of the central Council to the resolution forwarded to them on the seventh of December last, to the effect that our profession was not having proper representation on various Commissions which have been established to undertake work or problems connected with engineering, earnestly requests that the Executive Council will take immediate action and bring its influence to bear on the Government or Commissions, for the exclusive appointment of corporate members of *The Engineering Institute*, or graduates from recognized engineering universities to fill all engineering positions, thus protecting the public and raising the standing of *The Institute* and the profession.

The financial standing of the Branch is satisfactory, the report showing a balance in bank of $613.93 dollars.

The kindness of the Mayor of Quebec in providing the Branch with free quarters in the City Hall, has largely contributed to this satisfactory financial standing.

The membership of the Branch is as follows:—

Members	18
Associate Members	55
Juniors	17
Students	14
Branch Associate	1

Respectfully submitted,

A. E. DOUCET,
Chairman.

W. LEFEBVRE,
Secretary.

Hamilton Branch

In response to a request from a number of engineers in Hamilton, Fraser S. Keith, Secretary of *The Engineering Institute of Canada*, came to the city on June 14th, 1918, to discuss the question of forming a Branch. Over forty engineers attended the meeting to meet Mr. Keith, and after a discussion it was decided to start a Branch of *The Engineering Institute of Canada* in Hamilton. The necessary application was signed and sent in to Council. The meeting adjourned to an informal dinner.

On July 26th a meeting was held at which Nominating, By-Laws, and Membership Committees were appointed. According to their instructions the Nominating Committee sent out a letter ballot by which the following executive were elected: E. R. Gray, Chairman; H. B. Dwight, Secretary-Treasurer; E. H. Darling and J. A. McFarlane.

The first regular meeting of the Branch was held in the Royal Connaught Hotel on Sept. 21st, 1918, P. M. Lincoln, Past-President of the American Institute of Electrical Engineers, gave a comprehensive and enjoyable lecture on "The Development of Electric Power Transmission." This was followed by a good discussion of the subject by the engineers present.

On Sept. 30th, a meeting was held in the Royal Connaught Hotel. E. R. Gray, the Chairman of the Branch, gave an address on the duties and opportunities of engineers in connection with their professional organization. A set of by-laws for the Branch was then presented by the By-laws Committee, and was amended in some particulars and then forwarded to the Council of *The Engineering Institute of Canada*.

Further meetings for the autumn of 1918 were prevented by the influenza epidemic, although complete arrangements had been made for a joint meeting to be held in Hamilton with the Toronto Section of the American Institute of Electrical Engineers, to be addressed by

G. E. Stoltz of Pittsburgh, on "Steel Mill Electrification." Another lecture which had to be postponed, was the illustrated lecture by Geo. F. Porter on "The Quebec Bridge," which has been given with much success before several other branches.

A meeting of the Branch was held on Jan. 17th, 1919, to discuss the subject of legislation. A Legislation Committee of five members was appointed and it was decided to continue the discussion at a future meeting.

It is planned to hold several meetings this winter, one to be addressed by E. L. Cousins, chief engineer of the Toronto Harbor Commission, on "Harbor Improvements," and one to be addressed by Dr. F. B. Jewett, chief engineer of the Western Electric Co., on "Research."

Since the Hamilton Branch was organized, at least twelve applications have been sent in for corporate membership, and fifteen affiliates have joined the Branch. A financial statement is attached.

H. B. DWIGHT,
Secretary-Treasurer.

Victoria Branch

To the President and Council, Montreal:—

We have pleasure in submitting the following annual report of this Branch for the year 1918:—

One of the main characteristics of the past year has been the demand for the services of engineers, which has prevented as good attendances at headquarters as possible, but the average has been a considerable improvement on the previous year, and altogether there has been a much greater interest taken in the affairs of both the Branch and *The Institute;* the question of obtaining proper recognition for the profession is occupying chief place at the present time.

Our Legislation Committee deserves special thanks for the time and labour spent in opposing a charter sought from the Provincial House by a number of men (including a few members of our *Institute*) who wished to become certified engineers by Provincial Legislation. They were, however, unable to prove their case or substantiate their claim to legal recognition, and the bill failed to pass through committee. Our thanks are tendered to the parent Council for their advice and financial assistance in connection with this matter.

Ten general meetings were held during the year, the influenza ban preventing all meetings for several weeks in the fall.

Papers were given by D. O. Lewis on the History and Development of Railways, and by A. E. Foreman, on the Dewey Decimal System of Filing; and discussions were held as follows:—

Two on W. F. Tye's paper Canada's Railway Problem and its Solution."

One on Dr. Haanel's paper Fuels of Canada.

One on The Sooke Lake Water supply system.

One on Proposed Saskatchewan Legislation.

One on Reclaiming and Developing Land Areas for Returned Soldiers.

G. F. Porter gave his illustrated lecture on the Quebec Bridge on June 12th.

Several volumes have been donated by members to the Branch library the greater part of the library being loaned by F. C. Gamble, Past President of the Society.

During the year W. K. Gwyer was transferred to the Okanagan and his place on the executive was filled by the election of W. Young.

The membership resident within Branch limits at the close of the year was:—

Members	22
Associate Members	30
Juniors	3
Branch Associates	2
Total	57

The return of those who are overseas is expected to bring increased numbers and greater activity in the near future.

Our Annual Branch meeting was held on December 11th, and the following officers were elected for 1919: W. Young, Chairman; R. A. Bainbridge, Vice-Chairman; E. Davis, Treasurer; J. B. Holdcroft, Secretary; The above with W. Everall and A. Yarrow, Executive; D. O. Lewis and R. W. MacIntyre, Past Chairmen, are ex officio members of the Executive; A. F. Mitchell and W. M. Stokes, Auditors.

The financial statement for 1918 is attached.

Respectfully submitted,

E. G. Marriott, Secretary.
R. W. Macintye, Chairman.

Saskatchewan Branch

The second Annual Report of the Saskatchewan Branch of *The Engineering Institute of Canada*, is hereby respectfully submitted:—

At the outset we would like to mention the fact, that it is only four years now, that eight members of the Canadian Society of Civil Engineers gathered in the house of one of the local members and decided to request the approval of the Parent *Institute* for the formation of a Regina Branch. At present after four years, we have a membership of ninety-one members, sixteen of whom are overseas. The membership is composed as follows: 9 Members, 67 Associate Members, 3 Juniors, 5 Students, 1 Associate and 6 Affiliates and means an increase of twenty-two over last report.

As there are at present seven applications from our Province in the hands of the Council of the Parent *Institute* we are certain to arrive at a membership of one hundred early during the coming year.

The past year has been one of considerable activity in the Branch. The dividing of the entire membership into two groups, one on "Power," the other one on "Good Roads," with two Main Committees in charge of proceedings and papers, bore good results and all the meetings during last winter were taken up by papers dealing with some of the phases of the two subjects. Especially the question of "Good Roads" has been thoroughly discussed and our Committee hopes shortly to submit a resumé in form of a Progress Report.

Then came our First Western Professional Meeting at Saskatoon under the auspices of our Branch, with its three days deliberations on technical and professional matters. and the first "getting together" on the subject of "legislation," which we hope sincerely will materialize during this year. Another tangible result of our Western Meeting is a permanent "Concrete" and "Good Roads Committee."

We do not want to overlook to mention the visit of G. F. Porter with his interesting paper on the "Quebec Bridge."

After the Professional Meeting all our sessions were devoted nearly exclusively to "legislation," and a fairly good draft of a proposed Act had been prepared. We intended to submit the same at the present session of our Legislative Assembly here, but decided to withold action in deference to a request of the parent Council.

Altogether 6 Executive, 10 regular and 6 special Meetings were held in addition to a considerable number of Committee Meetings.

The following papers have been read:

R. W. E. Loucks, A.M.E.I.C.—" General Principles affecting the Location of Good Roads."

E. W. Murray, A.M.E.I.C. " Construction and Maintenance of Earth Roads."

H. R. Mackenzie, A.M.E.I.C.—" The Necessity of Engineering Supervision on Construction and Maintenance of Earth Roads."

J. D. Peters, Electrical Superintendent, City of Moose Jaw.—" Load Factor and Diversity Factor and their Effect on the Cost of Production of Power."

W. T. Thompson, M.E.I.C.—" Notes on Location and Construction of Trunk and Feeder Roads with Special Reference to their Grades and Width in Relation to Traffic."

A. A. Murphy, A.M.E.I.C.—" Relative Merits of Various Types of Prime Movers Producing Electrical Energy."

E. H. Phillips, A.M.E.I.C.—"A Consideration Affecting the Location of Roads with Respect to Population, Existing Railroads and Road Building Materials."

C. P. Richards, A.M.E.I.C.—" Legal Interpretation of the Quebec Act."

J. N. deStein, M.E.I.C. –" Remarks Regarding Rural Roads.

The financial situation has been rendered rather difficult through the new By-Laws of *The Institute*, cutting the Branch revenue practically in two. A special levy had to be made upon our members, which brought our income of only $132.40 from the parent *Institute* up to $359.97, with an expenditure of $340.07. It will be necessary again to make a special assessment amongst our Branch Members.

At the Annual Meeting of our Branch held on January 9th, the following were elected officers for the ensuing year: H. S. Carpenter, Regina, Chairman; C. J. Yorath, Saskatoon, Vice-Chairman; J. N. deStein, Sec.-Treasurer; H. R. Mackenzie, Regina, W. R. Warren, Regina, J. R. C. Macredie, Moose Jaw, Prof. A. R. Greig, Saskatoon, H. McIvor Weir, Saskatoon, Executive Committee; L. A. Thornton, Regina, G. D. Mackie, Moose Jaw, ex-officio.

For the Saskatchewan Branch, *The Engineering Institute of Canada*,

J. N. deStein, Sec.-Treasurer.

H. S. Carpenter, Acting Chairman.

St. John Branch

Fraser S. Keith, Secretary of *The Engineering Institute of Canada*, addressed a meeting in the Royal Hotel, on March 17th, last, on the advisability of forming a local Branch of *The Institute*. The twelve members present agreed to this proposal, elected A. Gray, temporary chairman, and A. R. Crookshank, temporary secretary, and make formal application to the Council of *The Institute* for permission to establish the St. John Branch of *The Engineering Institute of Canada*.

The Council authorized this on March 19th, and at a meeting of the members of *The Institute*, called by the temporary chairman, on April 4th, the Branch was established, by-laws adopted, officers nominated, and general plans for the ensuing season made.

On May 7th, the officers for the year were elected and the by-laws amended. At a meeting of the Executive on May 13th, A. Gray was appointed Chairman of Membership Committee, with the rest of the Executive as members.

J. A. Grant was appointed chairman of Publicity Committee and was authorized to appoint two Branch members, outside of the Executive, to act with him. G. G. Murdoch, was appointed Chairman of the Proceedings Committee, with J. A. Grant and C. C. Kirby as members of Committee. Lots were drawn by the three elected Committee men, as called for by the by-laws, and the lot fell to J. A. Grant to serve the one year term; the other two men to serve for two years.

During the year, there was one preliminary and five regular meetings, held with an average attendance of ten members and two visitors, one of these was a joint meeting with the Board of Trade, on Oct. 7th, at which Mr. Gray read his paper on St. John Harbor.

A general professional meeting was held in Halifax, Sept. 11, 12 and 13, under the joint auspices of the St. John and Halifax Branches. Attendance of St. John Branch members was ten with seven other New Brunswick visitors. The report of this meeting is contained in the October number of *The Journal*.

One trip was made to points of interest, when on May 18th, eight members and ten visitors visited Grant & Horne's shipyard and saw the " War Fundy " under process of construction.

The Executive Committee met nine times with an average attendance of five and transacted a large amount of business.

The plans for a programme of interesting meetings last fall were upset and the work disorganized by the Influenza epidemic with its consequent ban on public meetings.

Subscriptions were asked for *The Institute's* overseas tobacco fund, and $22.00 was forwarded to the General Secretary on Nov. 1st by the Secretary, as contributions from twenty-two Branch members.

Considerable corresponding has been carried on during the year, as is shown by the attached statement. The financial and membership reports are also attached.

Respectfully submitted,
A. R. Crookshank,
Secretary-treasurer.

Financial Statement.

1918

Receipts.

Advance on account of 20% rebate of 1918 dues of Branch members from *The Engineering Institute of Canada*	$50.00
Tobacco Fund for Members Over-seas	22.00
Affiliates' Fee for Season 1919	4.00
	$76.00

Expenditures.

The Engineering Institute of Canada Overseas Tobacco Fund	$22.00	
Postage on Notices and Correspondence and Exchange	11.18	
Stationery and Printing	6.55	
Stenography	10.00	
One half of Halifax General Professional Meeting—General Expenses	12.50	
Halifax Photo Group	1.00

Programme of Ottawa Meetings

Arrangements have been completed for the Annual General Meeting and the General Professional Meeting at the Chateau Laurier in Ottawa on Tuesday, Wednesday and Thursday, February 11th, 12th and 13th. The programme is as follows:

Tuesday.

Morning, 10.00 A.M. **Business Session.**

Luncheon, 1.00 P.M. Followed by,
Short Address, by His Excellency the Governor-General.
Short Address, by C. A. Adams, President, A. I. E. E.
Address—International Affiliation of Engineers, by A. D. Flinn, Secretary of the United Engineering Council.

Afternoon, 4.00 P.M. **Business Session.**
President's Address (invitations).

Evening, 7.30 P.M. **Informal Dinner and Smoker.**

Wednesday.

Morning **Unfinished Business of Annual Meeting.**
Standards in Engineering, by Capt. R. J. Durley, M.E.I.C., Chief of Division of Gauges and Standards, Imperial Ministry of Munitions.
Soldiers' Re-establishment, by Major Anthes, of the Department of Soldiers' Civil Re-establishment.
The Development and Future of Aviation in Canada, by M. R. Riddell, Chief Engineer of Canadian Aeroplanes Ltd.

Luncheon, 1.00 P.M. Followed by,
Short Address, by Dr. Ira Hollis, Dean, Worcester Polytechnic, representing A.S.M.E.

Afternoon 2.15 P.M. **National Highways and Good Roads**, by J. Duchastel, M.E.I.C., Hon. President, Good Roads Association.
Frazil, by R. M. Wilson, M.E.I.C., Chief Engineer, Montreal Light, Heat & Power, Ltd.
Mean Sea Level Datum for Canada, by W. Bell Dawson, M.E.I.C., Supt. of Tidal Survey, Department of Naval Service.
The Montreal Tunnel, by J. L. Busfield, A.M.E.I.C. (Illustrated).

Evening 9.00 P.M. **Formal Gathering.**
Reception by President: Ladies, Music, Refreshments, Dancing.

Thursday.

Morning **Topical Discussion on the Economics of Railway Electrification**, opened by John Murphy, M.E.I.C., Department of Railways and Canals, and Railway Commission; followed by discussions by F. H. Shepard, A.A.I.E.E. New York, Director of Heavy Traction, Westinghouse Electric & Mfg. Co.; and W. G. Gordon, F.A.I.E.E. Toronto, Transportation Engineer, Canadian General Electric Co., Ltd.
Mining and Metallurgy of Cobalt Silver-Ores, by Lt.-Col. R. W. Leonard, M.E.I.C., President, Coniagas Mines.

Luncheon, 1.00 P.M. Followed by,
Short Address, by Hon. F. B. Carvell, Minister of Public Works, to be followed by a visit to the New Parliament Buildings, Ladies.

Afternoon, 4.30 P.M. **Motion Pictures.**

Luncheon—Tuesday, 11.00 to 1.00 p.m., at Chateau Laurier.
Complimentary tickets to visiting members.

Informal Dinner and Smoker—
Tickets $2.50, to be obtained on registering.

Luncheon—Wednesday and Thursday, February 12th and 13th, 1.00 p.m., at Chateau Laurier. Tickets $1.00 to be obtained on registering.

Since the last Annual Meeting many changes have taken place in the organization indicative of progressive development and the new spirit that has been aroused in the affairs of the engineering profession. It is already indicated that this will be one of the most largely attended Annual Meetings ever held. Members of the Ottawa Reception Committee, wearing badges, will meet incoming trains and will furnish information regarding accommodation and registration. The registration will take place on the ground floor in the assembly room at the rear of the rotunda.

Mean Sea Level As A General Datum for Canada*

By W. Bell Dawson, M.A., D.Sc., M.E.I.C., M.Inst.C.E., F.R.S.C.

In regard to a general datum for levels in Canada, there can scarcely be a question that the right datum to adopt is Mean Sea level; since this is used in all civilized countries as the general plane of reference for levels. There are some important purposes however, for which other zero levels are preferred; notably the Low-water datum for navigation and harbour works. Another plane of reference that may have some possible claim for consideration, is the level of High water, which some railway companies and some coast cities have adopted. In some cases also, this is made the reference level for the height of mountains. But apart from these, a great number of independent and discordant datums are in use for reference on railways or in our different cities, which are indefensible in the sense that they do not correctly represent any physical plane of reference.

The object of the present Paper is to outline briefly the situation in Canada at the present time; as it is now possible to aim at the use of one general datum, and gradually to do away with all the undesirable ones. The Railway Commission views favorably the adoption of a general datum of this character, wherever it is practicable to connect with it. The Superintendent of the U. S. Coast and Geodetic Survey, in a Paper entitled "The use of Mean Sea level," published in 1917, gives the opinions of a number of Engineers and others throughout the United States on the datum to which elevations should be referred. All are agreed that Mean Sea level should be chosen, and that it should be adopted without further delay. The *Engineering Institute* should therefore discourage the reprehensible practice of Engineers in beginning almost every new undertaking with a fresh and independent datum, without even inquiring what is already in use in the locality. This practice appears to continue to the present time.

In explaining the advantages of Mean Sea level as a datum, we will avoid technicalities; but the way it is arrived at and its degree of accuracy are matters of interest from an engineering standpoint.

On all shores of the Ocean there is a tide which rises and falls twice a day; and the determination of the mean, or true level of the sea, is necessarily a tidal problem. When this has to be done from the beginning, there are several successive steps required; as a zero level from which heights are to be measured must be established; and also a local Bench-mark for reference, to maintain the levels at a uniform elevation from year to year. The best zero level to adopt, is a Low-water datum, which can be decided upon definitely as soon as the first few months of tidal observations are obtained.

This Low-water datum differs essentially from Mean Sea level in not representing a constant or absolute elevation. It is a plane of reference at half the range of the tide below the mean level of the sea; and the range of the tide varies from 4 feet to 50 feet in different regions. The only justification for the Low-water datum is its great convenience to the mariner, in showing the least amount of water available in bays and channels under the influence of the tide. It is therefore universally used in Hydrographic Surveys as the datum for marine charts; and by using the same datum as the zero level in tide tables, the extra depth due to the rise of the tide is made evident. To this practice, Holland may be mentioned as an exception; for although a Low-water datum is used for their charts, it is not accepted for the tide tables, which are everywhere referred to Mean Sea Level at Amsterdam. This gives all High waters a plus value and all Low waters a minus value; which carries the use of this datum to its theoretical limit.

At a fully equipped tidal station the tide is obtained by a recording instrument, as a continuous curve day and night, summer and winter. The equipment necessary to secure such observations, especially in our climate, need not be detailed; but it is evident that the levels at the tidal station must be maintained accurately from year to year with reference to the Bench-mark; the individual observations being to the nearest hundreth of a foot.

The ordinates of the tide curve above the Low-water datum are then measured at each hour throughout the year, and the average of these is accepted as the best value for Mean Sea level. It is necessary to deal with a complete year at a time, to allow for all the astronomical variations in the tide itself. The resulting value being thus the average of 8,760 individual heights, is already reliable when derived from one year. It is clear that from the tidal point of view, the value of Mean Sea level is the final outcome of the observations.

This method, geometrically speaking, makes Mean Sea level the axis line of the tide curve, which bisects its area horizontally. The only other method is to take "Half tide" as the mean level of the sea; that is, half the difference in height between the average levels of High water and Low water. This is less accurate, chiefly because Mean Sea level may not be truly midway between High water and Low water, unless the tide curve itself is perfectly symmetrical; there being regions in which there is an inequality that interferes seriously with its symmetry.

The value of Mean Sea level from the hourly ordinates of the tide on an open coast, at a point unaffected by river outflow, is reliable to the third decimal of a foot in any one year. There is a slight variation from one year to another of perhaps an inch or two from the mean value; for some reason which is not well understood. For example in a series of 15 years at St. Paul Island the extreme values in individual years are from 0.17 to 0.14 of a foot above or below the average value. The average of the determinations in three or four complete years however, must be regarded as correct in the absolute; because the probable error in about 100 miles of land levelling is greater than the residual error in the determination of Mean Sea level. When a long land line connects two well-situated tidal stations, any outstanding error must therefore be adjusted to correspond with Mean Sea level at its two ends. This is recognized in the extended levelling operations through-

*To be read at the General Professional Meeting, Ottawa, February 12th.

out India and the United States. In Great Britain, special tidal stations on the open coast have been established in recent years, to avoid river influence; as all the more important harbors are in the estuaries of rivers.

In Canada our determinations of Mean Sea level have been kept well ahead of levelling requirements. The Survey of Tides and Currents was organized in 1893; its primary purpose being for the benefit of navigation in obtaining data for tide tables, and in the investigation of marine currents, and it was thus made a branch of the Marine department. It soon became evident that tide levels were valuable for construction purposes or dredging, even if only locally determined in individual harbours; and also that Mean Sea level would be of importance at some future time, as a basis for extended levelling. The extra work necessary to maintain accurate levels was, therefore, undertaken from the outset by the Tidal Survey; as it is obviously a very different matter to keep the levels correct to the nearest 0.01 of a foot, as compared with working to the nearest half or quarter foot as required for chart soundings and navigation generally.

By 1903, reliable results became available; and values for Mean Sea level were given, with other tide levels, in a Paper by the Superintendent, published by the Canadian Society of Civil Engineers. These values were based on 4 to 6 complete years of observation. Similar data for harbors on the Pacific coast were published in 1905. About that time also (in the year 1904) the Academy of Sciences of France offered one of its prizes for the best determinations of Mean Sea level in any country bordering on the North Atlantic ocean; the special object being physical, in establishing a basis for detecting any depression or elevation of the coast relatively to the Ocean level. Somewhat to their surprise, Canada took the first place in the competition; as the Tidal Survey had determinations of Mean Sea level covering eight degrees of latitude from southern Nova Scotia to Labrador, and in longitude from Cape Breton to the lower St. Lawrence. Notwithstanding this recognition from France, it was not until five or six years later that our systems of Geodetic or precise levelling were connected with the Canadian tidal stations, at which the determinations of Mean Sea level available in 1903, had been made known by publication to Engineers.

The first accurate levelling which began in the region of Montreal, along the St. Lawrence, the Richelieu and the Ottawa, was based on Bench-marks on the frontier of the United States, connected with sea level at New York by the United States Coast and Geodetic Survey. The most noteworthy of these Bench-marks is at Rouses Point at the north end of Lake Champlain. It appears to be at the end of a line of secondary importance in the United States system; as its original altitude was diminished in 1900 by 1.08 feet, and its elevation was finally revised in 1903 from 110.06 to 107.95, an alteration of 2.11 feet; with possibly a further small correction in 1907. This shows the disadvantage of having to rely on United States levels; when a line of levels from Montreal to a satisfactory tidal station of our own (at Father Point on the Lower St. Lawrence) is no longer than the line connecting Montreal with New York.

The first precise levelling in the Maritime Provinces, was also started from a frontier Bench-mark in the State of Maine, which is nearly twice as far from New York as from our tidal station at Halifax.

These points are mentioned to show that there is no need to make Canada a mere adjunct of the United States, when our Canadian work may be quite as good; and it would be equally unfortunate at the present juncture to miss the opportunity of correlating all existing levels, to place them on a satisfactory basis.

What has already been accomplished in accurate levelling may be mentioned in the briefest way to indicate the present situation; with the endeavor also to state fairly the amount accomplished by each Survey or Department engaged. There was indeed some excellent levelling along our railways, especially in the early days; no such work being better done than on the old European and North American Railway from St. John to Shediac in 1859. We may also recall the careful instructions on levelling for the Intercolonial Railway given by Sir Sanford Fleming about 1870. But all this is now lost, because unrecorded by Bench-marks; and this often happened on our railways built later, through the hurry during construction. Some early levels have been preserved however, on various canal surveys, though more limited in extent.

The first work done under the name of Geodetic levelling, was in 1883 to 1888, from Quebec to Cornwall and southward to connect with Rouses Point; under the direction of Mr. R. Steckel of the Public Works department; the St. Lawrence section from Quebec to Montreal being published in 1891. In 1904 to 1907 these levels were carried through to Lake Huron by the Georgian Bay Canal Survey. In 1906, precise levelling was begun by the Dominion Observatory, their first results being published in the report of the Chief Astronomer for 1910. The lines run in the first years were in western and southern New Brunswick; and from Sherbrooke to Colborne, Ontario. The whole of the work in these regions was based upon Bench-marks on the frontiers of the United States, and chiefly upon Rouses Point; but most of it had the advantage of the revised elevation of 1903 for that Bench-mark; which was carefully correlated with others in the State of New York by the Georgian Bay Canal Survey before the final reduction of their levels in 1907.

It was not until 1910, that the Geodetic levelling in the Public Works department was continued eastward beyond Father Point, and through New Brunswick and Nova Scotia to Halifax. It thus makes connection with two of the tidal stations at which Mean Sea level is accurately determined; and the final revision, based on both stations, was made in 1914. The precise levelling of the Dominion Observatory was also connected with the Halifax tidal station in 1913. This precise levelling has recently been organized as the Geodetic Survey of Canada, in the Interior Department. This then brings us to the date at which the determinations of Mean Sea level made by the Tidal Survey, were first utilized as a basis for extended levelling. When required for levelling operations, determinations were thus found ready to hand, which had gradually been perfected during a series of previous years. The same advantage was obtained afterwards in the two additional provinces of Prince Edward Island and British Columbia.

At this juncture we may indicate concisely the system of principal stations which were established to command all Canadian waters, as reference stations for tides and currents; but most of which are also well situated for the purpose under consideration. There are eight principal tidal stations in Eastern Canada which are maintained summer and winter; but at two of these the value of Mean Sea level is not satisfactory. At Quebec there is still some river slope, and Mean Sea level, determined locally by the method described, is nearly 1½ feet above the true level in the Ocean. Even at St. John, N.B., the influence of the St. John river appears to be appreciable. The station at St. Paul Island in Cabot Strait, though invaluable for general tidal purposes, is inaccessible for connection with land levels. This leaves five, which are well distributed on our Eastern coasts: namely, Father Point, Halifax, Yarmouth, Charlottetown and a station in Belle Isle Strait at the extreme northeast of the country. At all these stations, the results are now highly accurate; and they are referred to local Bench-marks.

The determination of Mean Sea level at Halifax is derived from nine complete years of tidal observation. The other determinations utilized in levelling are derived from ten complete years at Father Point, five years at Charlottetown, and one year at Yarmouth. The value of Mean Sea level at Charlottetown has been made the basis for levelling over the whole of the Railway system of the island, which was begun in 1915 by the Department of Railways. This will place the levels throughout this Province in a very satisfactory position.

The principal line of Geodetic levelling of the Public Works department runs near to the Eastern coast of New Brunswick, and connects Halifax with Father Point. It thus constitutes a line running north and south for 400 miles across three provinces, which is connected at both ends with sea level. The lines of the Geodetic Survey, running from Halifax to the St. Lawrence, lie further in the interior of New Brunswick; and another line extends from Halifax to Yarmouth, being thus checked at both ends. The two systems of level lines have been laid out with care to avoid duplication, as far as this is practicable. By means of these lines the early levelling along the St. Lawrence and in the Montreal region, and the system of lines in the Maritime Provinces, are well connected and brought to a uniform basis. On all such lines, a series of Bench-marks is established for reference.

It may be possible in localities to which precise levelling has not yet reached, to make a determination of Mean Sea level from a few months of tidal observations, to meet some special requirement. In the Pictou and Sydney coal fields in Nova Scotia, contoured maps by the Geological Survey have been based on local determinations of sea level in those harbours, which afforded fairly good values, sufficiently close for the purpose. A basis for levels required also by this Survey in a mining region on Howe Sound, B.C., was obtained similarly from a special reduction of a few months of tidal observations there.

The region of the Great Lakes is related by its situation to sea level on the New England coast directly opposite; and the determination of Mean Sea level at New York thus affords the natural basis for this region. The lines of the United States Coast and Geodetic Survey form a net work by which the Lake levels are well established; and it would appear that the elevations now arrived at, can be accepted without question of further revision. These have been carried across to the Canadian shores by the Hydrographic Survey.

Passing to the Pacific coast, tidal observations were begun there in 1895 and 1902, which now afford accurate determinations of Mean Sea level at Vancouver and Port Simpson, at the north and south extremes of the coast of the mainland; as well as at Prince Rupert, from observations there since it was founded. The Geodetic Survey had thus a sound basis for levelling, when it was begun in the region of the lower Fraser; and it will be possible to connect the land lines which run through the interior of British Columbia, with Mean Sea level at both Vancouver and Prince Rupert; two points on the coast nearly 500 miles apart in a straight line. This is a further example of the advantage of such a double connection for long land lines, especially in so mountainous a country.

There are also tidal records available from which Mean Sea level can be worked out at the heads of any of the long inlets on the coast, which may possibly become Railway terminals in the future.

On Vancouver Island, there are three determinations of Mean Sea level at well situated points; at Victoria and Hardy Bay at the south and north ends, which are 260 miles apart, and at Clayoquot near the middle of the west side. Land lines throughout the length and breadth of the island can be based on the determinations at these three tidal stations. Already the Geological Survey is utilizing the value of Mean Sea level at Victoria for a contoured map in that region.

The Geodetic Survey has recently completed connections which give a through line of levels across the width of Canada from Halifax to Vancouver. These levels are also checked by United States Bench-marks near the boundary in the middle of the Continent. Towards the western side, a net-work of lines now extends from Vancouver to Regina, and from Edmonton to Lethbridge.

In these central regions, levels are also being carried along the meridians and other boundary lines which are laid out by the Surveyor General's department. This can be done by the same surveying parties, and it helps to extend the levels. This work is correlated with the elevations established by the Geodetic Survey and is kept in harmony with it.

A valuable work of reference, entitled "Altitudes in Canada," has been compiled by Mr. James White, which gives the results obtained by all methods, including precise levelling, re-levelling on railways, and reconnaissances. The earliest edition was published by the Geological Survey in 1901; and the later editions have been largely extended, under the Conservation Commission. The elevations throughout are referred to Mean Sea level, and a description of the primary determinations by the Tidal Survey is given. This work is of great assistance in familiarizing Engineers with the use of a general datum throughout the country.

To sum up the situation, we have at present a network of levelling in Eastern Canada, which has been built up by three systems of levelling operations since 1883, and is now correlated accurately with Mean Sea level. The levelling in the Public Works department, extending from Georgian Bay through the Montreal region, and now connected with the tidal stations on the Lower St. Lawrence and at Halifax, was finally revised in 1914. The lines of the Geodetic Survey in the Maritime Provinces, connected with the tidal station at Halifax since 1913, extend by other routes continuously to the region of the Great Lakes. On the Pacific coast, the lines of levels are also beginning to form a net-work; and the two sides of the country are united by a through line across the Continent finally connected in 1916 and 1917, by the comprehensive work of the Geodetic Survey. There is thus at present a system of Bench-marks throughout all the more inhabited parts of Canada for reference; and the dates mentioned show that this is quite recently accomplished. It is obviously desirable therefore, that all Engineers should now utilize the uniform datum thus established, and that all railway profiles should be referred to it, to eliminate the confusion arising from the adoption of independent datums which is still in vogue.

The only necessary exception to this rule is for marine charts and dredging, for which a Low-water datum must be used; as well as for the height of the tide in tide tables. It may be a question whether it is essential to use Low water or High water as the datum for harbour construction and dry docks; but if so, it should be possible to give a correlation with Mean Sea level. These two datums correspond with the land surface of the country which is out of water, and the harbours and maritime approaches to its shores which are below sea level.

LIEUT.-COL. R. W. LEONARD, M.E.I.C.
President, Coniagas Mines, President Elect., The Engineering Institute of Canada.

The Mining and Metallurgy of Cobalt Silver-Ores*

By Lieut-Col. R. W. Leonard, M. E. I. C.

In the Temiskaming & Northern Ontario Railway Commission's Report for 1916 on the Mining Industry in that part of Northern Ontario, served by the T. & N. O. Railway, Mr. Arthur A. Cole, Mining Engineer for the Commission, makes the following remarks:

"Along the Temiskaming & Northern Ontario Railway from Cobalt to Porquis Junction, a distance of 125 miles, it was noticeable this year that there was hardly a station from which some mining operations were not being carried on. New districts were being reported from time to time, and the older districts were looking better as work proceeded.

"Anyone who looked over the unbroken forests of Northern Ontario a dozen years ago and predicted that this district would soon be producing over twenty millions in gold and silver annually would have been put down as a fantastic dreamer; but that figure is surpassed today by three million dollars, and the output is continually increasing.

"And yet only a small portion of the country has been prospected. Running north-east and north-west from Cobalt and extending to the Arctic Ocean is the great pre-Cambrian shield, the basement formation of the Continent. It contains thousands of square miles and offers to prospectors *better chances of locating valuable mineral deposits than can be found in any other country in the world.*"

The principal camps referred to by Mr. Cole are the Cobalt silver and the Porcupine gold areas, and if to this we add the world-famed copper-nickel deposits of the Sudbury district, lying about 160 miles south of Porcupine and 80 miles south-west of Cobalt, we have a very interesting group, of which two are the most wonderful mineral deposits in the world.

In 1918, Sudbury is credited by the Deputy Minister of Mines, Ontario, with a production of Nickel valued, in matte form, at $26,800,000.00, and of Copper, valued in matte form, at $8,500,000.00, making a total of $35,300,000.00. The market value of the refined products would exceed these figures very materially, and in time the refining of these products in Canada will greatly stimulate the production of heavy chemicals, machinery and many other materials required in the process.

In addition to the silver and gold produced in the Northern Ontario district covered by Mr. Cole's Report, we have the metal cobalt, existing in greater concentration than in any other known deposit, enabling Canada to supply for some years past practically the entire world's consumption of refined cobalt products. This metal cobalt, together with nickel and arsenic, are associated with silver in the Cobalt ores, and in this same district served by the T. & N. O. Railway are found copper, molybdenite, barite, fire-clay and pottery-clay, all in notable commercial deposits. For the working of these deposits the district affords an abundance of wood, water-power and large areas of peat which have been favorably reported upon by A. Anrep, peat expert to the Dominion Government, suggesting its use in the form of peat powder, even for locomotive fuel.

Before proceeding to a description of the mining and metallurgy of silver, which is the principal mineral produced in this district up to the present time, just a word in regard to the gold mines of the Porcupine Camp which were discovered in 1907. Since that year to December 31st, 1918, the production of gold has reached a value of $46,000,000.00, and the working mines have paid dividends of $13,312,310.00. Gold has also been discovered in notable deposits in many other parts of this district served by the T. & N. O. Railway, and a number of these occurrences are of a very promising nature.

During the past year the Cobalt Camp produced about 12½% of the total world's output of silver, and this was achieved by a camp about four miles in length and the same in width. The Cobalt silver mines have paid in dividends to December 31st, 1918, over $76,000,000.00, which, added to the dividends paid by the Porcupine gold mines of over $13,000,000.00, gives a grand total of more than $89,000,000.00 paid in dividends by the mines of these two camps since 1904.

Notwithstanding the shortage of labour due to the war, the gold and silver mines of Northern Ontario are employing about 7000 men at present with an annual pay-roll of at least $8,500,000.00; and it is estimated that up to the present time, at least $100,000,000.00 has been spent by the operating mines in labour, equipment and supplies.

The numerous promising discoveries of gold throughout the whole territory served by the railway gives assurance that the gold-mining industry of Northern Ontario is yet in its infancy.

In 1917, there were fifteen dividend-paying silver mines and five dividend-paying gold mines in Northern Ontario, as compared with nine dividend-paying silver mines and three dividend-paying gold mines in 1918.

Notwithstanding that silver was discovered on the north-east side of Lake Temiskaming about a century ago when operations were carried on at the Wright Mine, the history of the Cobalt mining camp began in 1903, when the T. & N. O. Railway was in course of construction, native silver being discovered at that time at both the north and south ends of Cobalt Lake. These spectacular finds of native silver aroused immediate and widespread attention and, as a result of the work done by the large number of miners and prospectors who flocked into the country, a number of mines were rapidly opened up, and these mines paid handsomely from the grass-roots down.

*To be read at the General Professional Meeting, Ottawa, February 12th.

The total output of silver from the Cobalt district from 1904 to the end of 1918, is as follows:—

	Average price, Cents per oz.	Ounces	Value
1904	57.2	206,875	$ 111,887.00
1905	60.4	2,451,356	1,360,503.00
1906	66.8	5,401,766	3,667,551.00
1907	67.5	10,023,311	6,155,391.00
1908	52.9	19,437,875	9,133,378.00
1909	51.5	25,897,825	12,461,576.00
1910	53.5	30,645,181	15,478,047.00
1911	53.3	31,507,791	15,953,847.00
1912	60.8	30,243,859	17,408,935.00
1913	57.8	29,681,975	16,553,981.00
1914	54.8	25,162,841	12,765,461.00
1915	49.69	24,746,534	12,135,816.00
1916	65.661	19,915.090	12,643,175.00
1917	81.418	19,401,893	16,131,013.00
Estimated—1918	96.772	17,500,000	16,935,100.00
		292,224,172	$168,895,661.00

While there is no doubt that the Cobalt Camp is rapidly becoming exhausted, there is every prospect of other workable deposits being discovered of the same geological formation, which covers an enormous area of this Northland, in the vast territory which remains as yet unprospected, and this promise is borne out to a limited extent by notable finds of silver in South Lorraine and Casey Townships, and up the Montreal River.

Geologically, the Cobalt Camp consists of a foundation of Keewatin rocks, upon which a slate conglomerate has been uncomformably deposited, the whole broken in places by eruptions of diabase forming dykes and sills and causing vertical cracks which were afterwards filled with mineral. The most valuable silver deposits are found in these vertical veins cutting through the conglomerate, and the silver almost invariably disappears in depth at the contact with the Keewatin. Some valuable veins have been found in the diabase rocks which have produced a notable amount of silver.

In the opening up of some of the mines in the early days a few hand-drills or a machine-drill, a derrick and a hoisting engine formed the only plant necessary to sacking the rich ore and shipping it in carloads to the smelters, these carloads of ore netting as high as $100,000.00 per car when silver was selling at about 60c. per ounce. This method of mining, however, rapidly gave way to mining from shafts and levels underground with overhand stoping, the rich ore being sorted and sacked in the mine and the remainder sent to concentrating mills before shipment to the smelters. The camp now boasts of some very excellent examples of mining and milling equipment, with resultant up-to-date operating methods, as reflected in the costs of mining and milling at the Coniagas Mine, which mine has produced to date over 26,000,000 ounces of silver and has paid in dividends $9,240,000.00.

The total cost of mining and milling at the Coniagas Mine, including development, head office and administration and all overhead charges, have declined from:

	$19.75	per ton in	1908
to	9.24	" " "	1910
to	6.13	" " "	1915
to	5.67	" " "	1917
and increased to	5.88	" " "	1918

The cost per ounce of fine silver produced, including the above charges, freight, treating and refining at the company's smelter at Thorold, Ont., war taxes and shipment to London, England, have ranged from:

	17.53c.	in 1908
to	11.06	" 1911
to	13.06	" 1913
to	18.26	" 1916
to	25.69	" 1917
to	41.35	" 1918

For the description which follows of the Milling and Hydrometallurgy of Cobalt ores I am indebted to F. D. Reid, Mine Manager, Coniagas Mines, Cobalt; and for that portion which deals with the smelting and refining of these ores, to R. L. Peek, manager, The Coniagas Reduction Co. Ltd., Thorold, Ont.

Ore Treatment.

The outstanding features of the practice of recovery of values from Cobalt ores followed at the various mills are:

1. The utilization of jigs and tables to recover a large percentage of the silver and cobalt content of the ore prior to treatment by flotation or cyanidation
2. The grinding of the table tailing to a slime to obtain a maximum net return from the cyanidation treatment;
3. The necessity of grinding the table tailing to pass a 100-mesh screen to obtain a maximum net return from the flotation process;
4. The use of Sodium Sulphide as a precipitant, and Aluminum in a caustic soda solution as a desulphurizer. (Footnote 1.)
5. The treatment of concentrates by the hypochlorite method. (Footnote 2.)

Since much of the silver now produced comes from low-grade ore, chiefly wall rock, the treatment of this low-grade ore is described more in detail. In this connection cyanidation, flotation and gravity concentration processes are discussed.

The hypochlorite-cyanide process which has been recently introduced for the reduction of high-grade ores is also dealt with somewhat fully.

Brief Historical Review.

For the first three years following discovery only high-grade ore was sought and no attempt was made to extract silver from the low-grade material. Much of the ore was sacked underground and the rest was hand-sorted in washing plants. In this way three products were obtained and shipped to the smelter, viz.: (1) ore carrying from 2000 to 4000 ounces of silver per ton;

(2) ore carrying about 400 ounces; (3) a grizzly product carrying about 125 ounces. The discarded material with a value of from 15 to 30 ounces went to the low-grade dump for future treatment.

In the summer of 1907 the McKinley-Darragh Mining Company erected and put into operation a five-stamp mill equipped with classifiers, a Wilfly table and Frue Vanners, with a view to treating their low-grade ore. Shortly after this the Coniagas Mill was put into operation with a daily capacity of 60 tons. Then followed the Buffalo and others, until to-day there are thirteen mills in operation with a total daily capacity of approximately 3000 tons.

Preliminary Treatment.

The general practice at present is to hand-sort the high-grade ore, either underground or in washing plants and send the low-grade, consisting of country rock containing a portion of the vein matter, to the mill. Here it is crushed in breakers, sized, and given a preliminary treatment on jigs, thereby practically recovering the balance of the vein matter.

The wall-rock, containing finely disseminated mineral and fine leaf silver, passes on to the stamps, ball or Hardinge mills, for further reduction and concentration.

Concentrating by Gravity Machines.

In general it may be said that the silver, when in a gangue of smaltite or niccolite, is readily recoverable by jigging; or, when coarser than 200-mesh and finer than 8-mesh, by concentrating on Wilfly, Deister or James tables. This class of vein matter has a specific gravity of 6 to 6.5, whereas the specific gravity of the wall-rock is 2.7.

Losses occur in concentrating this vein matter when crushed to finer than 200-mesh. Filmy leaf silver, various brittle, complex silver compounds, oxidized vein matter in the form of slime, and silver in a finely disseminated state in the wall rock, are also sources of loss in subsequent treatment. However, from an ore containing 25 ounces of silver to the ton 80% of the values can be recovered by the gravity concentrating methods at a comparatively low cost—the cost depending largely on the capacity of the mill. The cost of crushing the ore to the size required and concentrating on jigs and tables is approximately $1.00 per ton for a mill with a capacity of 200 tons per 24 hours. This does not include overhead charges nor the cost of marketing the concentrates. In general, the cost of concentrating the prepared ore on tables is approximately 20c. per ton. Gravity concentration, therefore, serves its purpose, namely, to reduce the silver content of the ore to approximately 5 ounces, at a low cost.

The introduction of the Cyanide process and later the Flotation process was with a view to recover this elusive five ounces. The cyanide process has the additional advantage of producing silver in the form of bullion.

Note 1.—See "Sodium Sulphite Precipitation of Silver at the Nipissing Mine" (R. B. Watson) Transactions, *Canadian Mining Institute*, 1917.

Note 2.—See "Notes on Metallurgy at Cobalt during 1916." (R. B. Watson), *The Canadian Mining Journal*, March, 1917.

Mechanical Concentration followed by Cyanidation.

Cyanidation as an adjunct to mechanical concentration is employed in three mills, the Cobalt Reduction, O'Brien and Nipissing.

The practice at the Nipissing and Cobalt Reduction Mills, is to concentrate as closely as is economically possible on concentrating tables, and to reconcentrate the rougher concentrates to obtain a product assaying from 2000 to 3000 ounces of silver to the ton. This concentrate is then treated by the hypo-chlorite cyanide process, to be described later. The tailings from the tables after being slimed in tube mills is run to the low-grade cyanide plant for further treatment. The O'Brien practice is similar to that of the Nipissing and Cobalt Reduction, excepting that the concentrate recovered is shipped direct to their smelter at Deloro.

The run of mine ore after receiving a preliminary treatment in the washing plant to recover the vein matter, is crushed in a 0.12% cyanide solution to pass a 4-mesh battery screen. The battery discharge is then concentrated on 12 Wilfly tables, the concentrate going to the hypo-chlorite cyanide plant and the tailings discharging into Dorr classifiers in closed-circuit with tube mills until the product is reduced to a slime. The slime product is re-concentrated on slime tables, the tailing assaying approximately 6 ounces is given a 48 hour treatment in a 0.25% cyanide solution. The pregnant solution is then recovered by filtering in vacuum filters and the residue containing from 2 to 2.5 ounces of silver to the ton, is run to waste. The silver in the pregnant solution is precipitated by the addition of sodium sulphide and the precipitate desulphurized by being brought into contact with aluminum in a caustic soda solution. It is then refined in a reverberatory furnace to 999 parts per thousand fine.

Hypochlorite-Cyanide Process.

The Nipissing Mining Company and the Mining Corporation of Canada, recover approximately 97% of the silver contained in their high-grade ore and concentrates, by the hypo-chlorite cyanide process.

Until recently it was thought that concentrates could not be treated economically by the cyanide process. The method outlined below, however, is now in successful operation, due to the combined efforts of J. J. Denny, research manager of the Nipissing Mining Company and M. F. Fairlie, manager of the Mining Corporation.

Five to seven tons of ore or concentrates is charged into a tube mill along with the required amount of iron balls for grinding and water to give a 1 to 1 dilution. The tube mill is then revolved for 18 hours, as extremely fine grinding is necessary to get maximum results. Calcium-hypo-chlorite is then added at the rate of from 50 to 75 pounds per ton of ore treated, depending on amount of sulphides present, and the grinding continued for an additional six hours. The pulp is then discharged into a tank and fed to a Dorr classifier to separate the coarse metallic silver from the slime pulp. The metallic silver discharged from the Dorr classifier is held over and re-charged into the tube mill, with the next charge of ore, for further grinding. The slime overflow from the Dorr classifier, discharges into a collecting tank and is allowed to settle, the solution is then decanted and the thickened pulp discharged into a vacuum filter to be further de-watered.

The de-watered pulp is then discharged into a cyanide treatment tank and the charge made up to a dilution of 20 to 1 and the cyanide strength maintained at 0.5%. The pulp is then thoroughly agitated and aerated for fourteen hours. The pulp is then allowed to settle and the excess solution decanted. After being again agitated the thickened pulp is pumped to a stock tank for filtering. The discharged residue from the filter, containing from 50 to 75 ounces of silver, with the cobalt, nickel and arsenic content, is sold to the smelters.

The silver is recovered from the pregnant solution by the soldium-sulphide process.

It is possible by this process to recover in the form of fine bullion approximately 97% of the silver content of the ore, in a period of 96 hours.

The Flotation Process

In September, 1916, the Buffalo Mines Limited, put in operation a Callow flotation plant, of 600 tons daily capacity, to treat a arge accummulation of sand tailings and as an adjunct in the treatment of its low-grade ores. Today there are ten mills in the district using the flotation process with a total daily capacity of approximately, 2000 tons.

The flotation machines used are the Callow pneumatic and the Groch centrifugal types. The former depends for its action, entirely on air forced, from below, through a porous medium, at a pressure of 5 pounds; the latter depends on mechanical agitation and air, the air being drawn into the pulp through a hollow shaft by the centrifugal force of impellers.

Oil Mixtures.

Experiments have been carried out with a number of oils and combinations thereof. A mixture of 20% pine oil, 70% coal tar creosote and 10% coal tar, is now in general use, with slight modifications to meet varied conditions.

The amount of oil used ranges from ¾ pound to 1½ pounds per ton, depending upon the dilution of the pulp, the amount of mineral present, the fineness of the product and the skill of the operator.

The oil mixture is usually fed into the tube mills to insure an adequate mixing of the oil with the pulp.

Practice.

The practice in general use, with slight modifications is to concentrate the battery or ball mill discharge on reciprocating tables to recover the coarse free mineral and to reduce the silver content in the slime tailings. The table tailings go direct to the Dorr classifiers and are kept in closed circuit with tube mill, where the oil mixture is added, until ground to pass through a 100-mesh screen.

This product, with a dilution of approximately 4 to 1, is sent to the flotation machines, where it is fed into the rougher cells and agitated or aerated to effect a separation of the mineral from the gangue. The mineral is floated and discharged in the form of a froth, assaying approximately 75 ounces of silver to the ton. The tailing, varying in value from 1 to 3 ounces, is sent to waste.

The rougher concentrate is reconcentrated in cleaner cells to raise the value to, approximately, 250 ounces. The cleaner cells discharge a nine ounce middling product, which is returned to the head of the rougher cells for further treatment. The final concentrate is allowed to settle in Dorr thickeners, filtered, dried and sent to the smelters.

General

The gravity concentration process of Cobalt was developed when the price of silver ranged from 50 to 65 cents an ounce.

Mill operators, employing straight concentrating methods, concluded that an economic limit of extraction had been reached when the silver content of the ore was reduced to 5 ounces. Forty percent of this final tailing was slime, assaying approximately 6 ounces per ton and the balance sand, with a silver content of 4 ounces.

With silver at 55 cents an ounce, it was possible to treat the current slime tailing at a small profit, by the flotation process. It was not, however, until the price of silver advanced to above 65 cents an ounce, that a profit could be made from the 4 ounce sand.

The present activity, in the treatment of these low-grade products cannot be attributed entirely to the flotation process, as, owing to the advance in the price of silver, other attractive processes were available. The cyanide process, which did not look economically attractive when a tailing of only $2.50 was going to waste, was worthy of consideration when this value was raised to $5.00.

It must not be supposed, therefore, that the silver now being recovered by the flotation process would, otherwide, have been lost.

The uncertainty in the price of silver influenced operators, using the gravity concentrating methods, to adopt the flotation process, owing to the comparatively low cost of installation and to the satisfactory results obtained by experiment. On the other hand, the high cost of marketing the flotation concentrates, which is approximately 80 cents per ton of ore, is an objectionable feature to the process. It is possible that research may develop a process to treat this concentrate locally or to raise the value of the concentrate by elimniation of the silica, which is about 65% of the product shipped, and so render this process of more value to the district.

Smelting and Refining.

Up to the early part of 1908 all the ore from the Cobalt camp was shipped to reduction works in the vicinity of New York and Camden, N.J., for treatment. There was previously a natural desire to treat the ores in Canada, coupled with a just appreciation of the complexity of the problem such treatment presented. There was very little useful information bearing on the treatment of these singular ores to be gleaned from the literature available, and it cannot be said that those operating then existing works minimized the difficulties to be met with. That these difficulties—metallurgical, commercial, financial and hygienic—were very real may be inferred from the fact that of eleven works actually built in Ontario for the treatment of Cobalt ores, only three survive as going concerns. To the wastage chargeable against the mining industry as the result of misdirected prospecting, exploitation of unremunerative mineral deposits, and so-called "wildcatting," may be compared the very considerable losses incurred by the backers of the eight defunct plants just referred to.

Leaving out of consideration the methods of treatment that have been used and discontinued, the usual procedure is to first fine-grind and sample the ore or concentrate, and then smelt in a blast furnace. This at once separates the non-metallic or rock materials as a slag; effects a separation of a part of the silver combined with antimony and arsenic—the so-called silver buttons; volatilizes a part of the arsenic as fume, and so leaves the cobalt and nickel combined with arsenic in the blast furnace speiss.

This primary separation having been made by the very simple process of melting the ore with a coke fire, it becomes necessary to consider the four primary products. This consideration leads us far from what has been called "the sweet simplicity of fire," as applied to the the treatment of ores and metals.

The treatment of the slag is summary; it is thrown over the dump or used to ballast the track.

Silver Buttons usually consist of about 80-85% silver, the balance being chiefly antimony. Most of the undesired components may be removed by melting and blowing with air. Silver does not oxidize under the conditions and so remains on the furnace hearth, while the oxides of the impurities either depart as fume or are raked off as skimmings. By appropriate means the silver may be refined on the hearth to the extent desired, or it may be cast as anodes for electrolytic refining.

In the electrolytic refinery the crude silver anodes are treated in an electrolyte of silver and copper nitrates to an electric current. The anode undergoes dissolution and the silver only plates out on the cathodes. The impurities of the anodes remain either in solution or fall as sediment in the anode compartments whence they may be removed and disposed of. The cathode silver is of the highest purity and has only to be washed, melted and cast into bars for shipment.

Arsenical fume from the blast furnace is collected in cloth dust filters called bag houses. As the fume laden gas current from the furnace top is rather hot, it is led through appropriate flues wherein it may partly cool and deposit coarse dust particles before it is filtered. Under proper operating conditions the bag house retains all the solids in the gas stream, and, without it, it may be said that such ores as those of Cobalt could not be safely treated in any even partly settled locality.

After collection in the bag house, the fume is put into refining furnaces from whence white arsenic is volatilized and collected in suitable condensing and filtering arrangements. This white arsenic is sold chiefly to plate glass works and to makers of insecticides. At one time a demand arose from one of the belligerent powers for metallic arsenic. This demand was met by the manufacturers of the metal by the reduction of white arsenic with carbon in large cast iron retorts. This, though but a small matter, is one more item in the record of war time achievement to the credit of this country.

When one takes up the treatment of speiss, he takes upon himself a most grievous task. Essentially an artificial arsenide of a metal or metals of the iron group, it may present a degree of complexity that is quite disconserting. Iron, Cobalt, Nickel, Zinc, Copper, Lead, Silver, Antimony, Sulphur, Arsenic, are the substances practically always present in Cobalt Speiss, and usually small amounts of several other elements are also found.

The practice in one works is to grind and roast the speiss with salt to chloridize the silver and then leach out the silver with a solution of sodium cyanide. The silver is then thrown out with aluminium powder, washed and melted to make bars of great purity. Other practice does not extract the silver at this stage, but recovers it in the smelting of the insoluble residue after separating the greater part of the cobalt and nickel.

All processes separate the cobalt and nickel from the speiss by dissolving them out from the roasted speiss with acids. Sulphuric acid is usually employed on account of its cheapness. The solution of sulphates is next purified until it is technically free from undesirable substances, when the cobalt and nickel are successively precipitated as hydroxides by hypochlorate and alkali respectively. These hydroxides are dehydrated in suitable furnaces and either ground and sold as Cobalt and nickel oxides, or reduced with carbon to produce the metals.

Until the last four or five years practically all the Cobalt produced was utilized in the form of oxide for the manufacture of enamels, ceramic colors and for correcting the color of crockery made from inferior clays. The development of "Stellite," a hard alloy of cobalt, chromium and other metals led to a considerable demand for metallic cobalt. There was also some demand for the metal from the makers of high speed steels, many of whom add small amounts of cobalt to toughen and improve the wearing qualities of their product. Most of the cobalt metal used throughout the world is made in Canadian works by reduction of the oxide with carbon and melting the metal in electric furnaces.

The nickel derived from the cobalt ores is only a trifling part of the Canadian output of that metal, as the very great production from the Sudbury ore entirely overshadows it. Neverthless it is of interest that metallic nickel has been regularly produced in Canadian works from Cobalt ore before any commercial quantity was made in Canada from Sudbury ores.

National Highways and Good Roads*

By Capt. J. A. Duchastel de Montrouge, B.A.Sc. M.E.I.C.,
Hon'y Pres., Canadian Good Roads Association.

It is somewhat embarrassing, addressing a meeting of Engineers on the subject of Good Roads, one would feel more at home in talking to a gathering of the rank and file, men requiring to be taught the gospel of good roads. Every engineer realizes the very great importance of a system of good roads. It will be unnecessary for me to point out the great benefits—material, social and economical—that go with road improvement.

Permit me to bring to your attention some of the conditions we have in Canada today. At the present hour and with increasing rapidity, we will be face to face with the great problem of finding employment for our returned men and munition workers. Many industries will be in the period of reorganization for months to come; railroad construction will practically be at a standstill, and that for many years. Means will have to be taken to create work, and road construction offers in a great measure the opportunity of converting for the good of the country the surplus labor it will have for a long period.

We have to admit to ourselves that, except in a few instances our road construction has been sadly neglected, as compared to European practice. True enough our distances are very large, our population scarcely settled, and our resources limited. Again, nature has in two ways assisted us—first, in providing a wonderful system of navigable streams and chains of lakes, which takes care of the transportation of a great number of our natural products; secondly, the cold weather we experience during several months of the year permits the transformation of many poor country roads into excellent winter roads for sleighing, and in some localities a great deal of our transportation is accomplished during this period.

Railroad companies have expanded in a wonderful manner; we have three transcontinental roads parallelling one another at close range. Many localities depend entirely on the railroad facilities for all their commodities. This condition of affairs is all very well up to a certain point, but there comes a time when feeders, in the way of highways to these railway trunk lines have to be developed. The districts situated twenty miles or more each side of the trunk lines of these railways have to be tapped, and the only way of doing so is to build good roads permitting the settlers and farmers to economically transport their produce to the railroad.

A great deal of talk has recently been indulged about the help the Federal Government should give towards road construction. Several methods of government aid have been advocated. The French system has been advocated by some. There is no question that it is a very wonderful one and its results clearly show its excellence. The roads of France have in a great measure helped to win the great victory of democracy over aristocracy. But unfortunately for us the French road policy is based on a different political organization to ours. In France everything is centralized, the Department of Ponts and Chaussées constructs and maintains all roads—Nationales, Départementales, Vicinales, etc.

Here the situation is quite different; the British North America Act has vested with the different Provinces the obligation of building and maintaining public roads. We know that Provincial rights are sacred and rightly so. Our situation in the road problem is very similar to that of the United States. I would like to study with you an Act passed by Congress in July, 1916, destined to aid the several States of the Union in road construction. I believe that our Federal Government should adopt a measure somewhat on these lines, as in my mind, it is the most practical method to meet our conditions.

These remarks are made with the sole purpose of inviting discussion, and my sincere hope is that it will be extensive and fruitful.

The law in question is entitled "An Act to provide that the United States of America shall aid the States in the construction of Rural Post Roads and for other purposes." It can be summarized as follows:—

1. Congress appropriated a sum of $85,000,000.00 to be apportioned amongst the different States of the Union during a period of five years in the following manner:

$ 5,000,000	to be apportioned during the	fiscal year ending	June 30/1917
10,000,009	do	do	June 30/1918
15,000,000	do	do	June 30/1919
20,000,000	do	do	June 30/1920
25,000,000	do	do	June 30/1921

Also a sum of $1,000,000.00 annually for ten years up to and including the fiscal year ending June 30th, 1926, for the survey, construction and maintenance of roads and trails within or partially within the national forest.

2. The apportionment of the amount available for grants to each State is done in the following manner:

One-third in the ratio which the area of each State bears to the total area of all the States;

One-third in the radio the population of each State bears to the total population of all the States;

One-third in the ratio which the mileage of rural delivery routes and star routes in each State bears to the total mileage of rural delivery routes and star routes in all the States.

*To be read at the General Professional Meeting, Ottawa, February 12th.

3. Any amount apportioned to any State for any fiscal year as remains unexpended at the close there of shall be available for expenditure in that State until the close of the third fiscal succeeding the year for which apportionment was made. Any amount apportioned and unexpended after a period of three years shall be re-apportioned to all the States.

4. The Secretary of Agriculture, who is intrusted with the application of the Law, is authorized to co-operate with the States through their respective *State Highway Department*, in the construction of rural post roads.

5. All roads constructed under the provisions of this Act shall be free from all tolls.

6. The Federal authorities contribute only 50% of the total cost of constructing any portion of road.

7. Any State desiring to avail itself of the benefits of the Act must submit its project to the Federal authorities. Before any grant is made, surveys, plans and specifications must be submitted and approved, as well as the location, character and methods of construction.

8. No payments on account of any work are to be made until the Secretary of Agriculture has assured himself that the work has been constructed according to plans and specifications, and no payment shall be made in excess of $10,000.00 per mile, exclusive of the cost of bridges of more than twenty feet clear span.

9. The construction work and labor in each State shall be done in accordance with its laws and under the direct supervision of the State Highways Department, and subject to inspection and approval of the Secretary of Agriculture.

10. It is the duty of the different States to maintain the roads constructed under the provisions of the Act, and the Secretary of Agriculture shall, if any such road is not being properly maintained, penalize the State by refusing any further grants under the Act.

11. Items including engineering, inspections, and unforseen contingencies, shall not exceed *ten per centum* of the total estimated cost of the work.

12. The cost of administering the provisions of the Act must not exceed *three per centum* of the appropriation of any fiscal year.

13. In the Act:

(a) the term "rural post route" is construed to mean any public road over which the United States mails are now or may hereafter be transported, excluding any street or road in a locality having a population of over 2500 or more, except when on portions of streets or roads along which the distance between the houses average more than 200 feet apart.

(b) the term "construction" is construed to include reconstruction and improvement of roads.

(c) the term "properly maintained" is construed to mean the making of needed repairs and a preservation of reasonably smooth surface, considering the type of the road, but shall not be held to include extraordinary repairs nor reconstruction.

For the purpose of drawing a discussion allow me to present to you my views in the matter of Government aid.

I believe that a Highway Branch of the Public Works Department or Railways and Canals Department should be organized, and that this Branch should be intrusted with the duty of examining and reporting on all projects brought up by the different Provinces, with a view of obtaining Federal aid.

Each province should maintain its sovereignty over the roads constructed within its boundaries, and the Provincial Highway Departments should continue to exercise the same authority and duties they have at the present time.

No project should be considered by the Federal authorities unless presented and vouched for by a Provincial Highway Department.

We should do our best to keep politics out of the administration of a Good Roads Aid Act.

The Federal government should provide but 50% of the funds necessary to build roads of national importance, or international highways. By "roads of national importance," I mean roads connecting centres having a population of at least 20,000 inhabitants.

A sum of $50,000,000. should be voted immediately by the Federal government to aid the construction of roads throughout the different provinces, and this sum should be apportioned to the provinces during a period of five to seven years. Apportionment of this amount should be made only on the basis of population; the areas of our provinces having no relation to their needs or importance. The relation of the mileage of existing roads in each province to the total mileage in the country having, in my mind, little or no importance in our case.

Any amounts unexpended by a province during a given fiscal year should be carried over, for a limited number of years, to the credit of the said province, as in the American Act.

All roads constructed under Federal government aid should be free from tolls.

All road specifications, plans and details should be standardized and adopted by the different Provincial Highway Departments and Federal Department.

A higher limit than $10,000. per mile as the contribution of the Federal Authorities should be fixed. It is the feeling in the United States today that this amount is not always sufficient.

As one of the most important problems in road construction is "maintenance," our bill should go the limit on this score, and compel each province to thoroughly maintain all highways over which the Federal Government has spent money.

No time should be lost in obtaining Federal aid for the construction of roads, because it will take considerable time to organize a Federal Roads Department, and the study of the different problems submitted will also require some time.

Design and Construction of Reinforced Concrete Viaducts

At Mileages 0.9 & 1.8 North Toronto Subdivision, of the Canadian Pacific Railway

By B. O. Eriksen, A.M.E.I.C. and H. S. Deubelbeiss, A.M.E.I.C.

General Description and Design.

The greatly increasing freight traffic and a still greater prospective increase in passenger traffic, due to the agreement between the Canadian Pacific Railway and the Canadian Northern Railway, whereby the latter acquired running rights over the Canadian Pacific Railway, from Leaside Junction to North Toronto Station, necessitated the double-tracking of the line between these two stations.

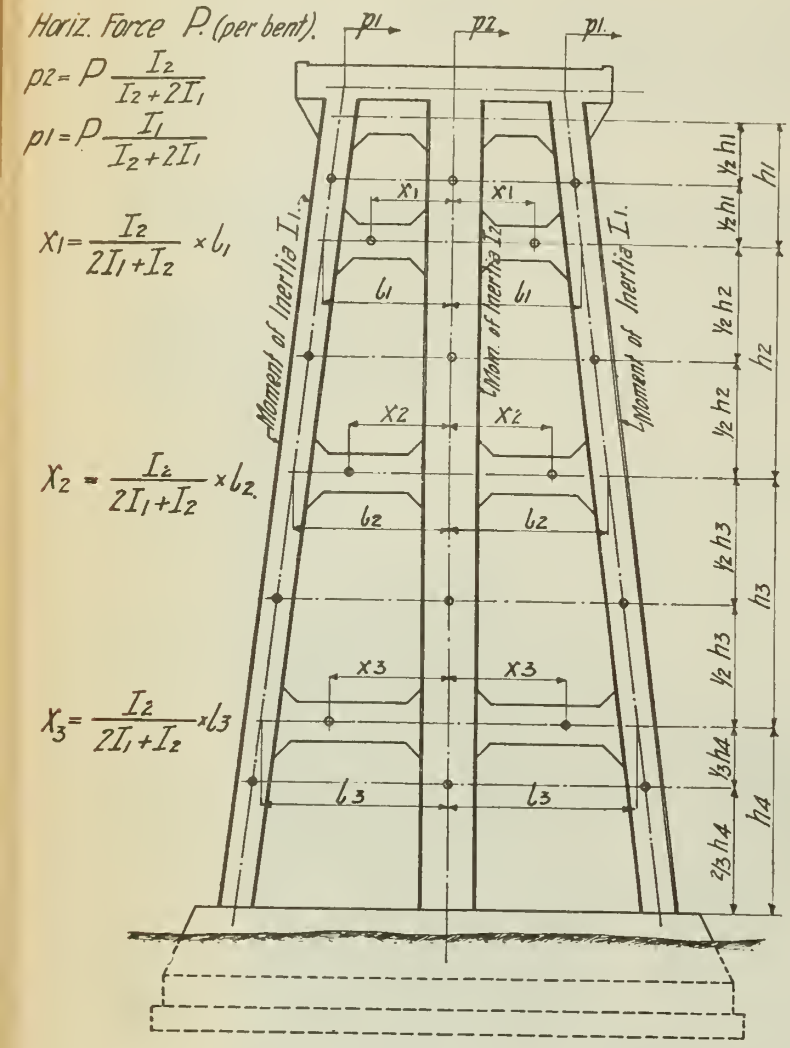
Canadian Pacific Railway Viaduct, Toronto.—Bridge 1.8 Completed.

While this line is only about two miles long, several reinforced concrete culverts required extensions and two important bridges, one at Mileage 0.9 from Leaside Junction and the other at Mileage 1.8 therefrom had to be rebuilt. The existing single track steel viaducts at these two points not being adequate for the present heavy rolling stock, and still less for future requirements, had to be rebuilt, so that these bridges would not limit the use of heavier motive power on this important link. Bridge 1.8, being located at the limit of the North Toronto yard required an extra track for switching purposes, so as not to interfere too much with the main line traffic.

Estimates for both bridges were made for building them in either steel or reinforced concrete. The higher cost of steel viaducts and the uncertainty of the delivery of structural steel were the deciding factors in the choice of Reinforced Concrete Trestles as built and here described.

While no designs were prepared for concrete arches at these points, the possibility of building such was considered. The limited right of way at the bridge sites, however, and the necessity of building temporary trestles within these limits, made the maintenance of traffic in building arch structures a most difficult problem. The designs adopted, where all slabs were pre-moulded and the bulk of the concrete could be cast in forms on the ground, promised a much speedier and safer construction,

*Read at a meeting of Montreal Branch, Thursday, January 16th.



$$p_2 = P\frac{I_2}{I_2+2I_1}$$

$$p_1 = P\frac{I_1}{I_2+2I_1}$$

$$x_1 = \frac{I_2}{2I_1+I_2} \times l_1$$

$$x_2 = \frac{I_2}{2I_1+I_2} \times l_2$$

$$x_3 = \frac{I_2}{2I_1+I_2} \times l_3$$

— FIG. 1.—

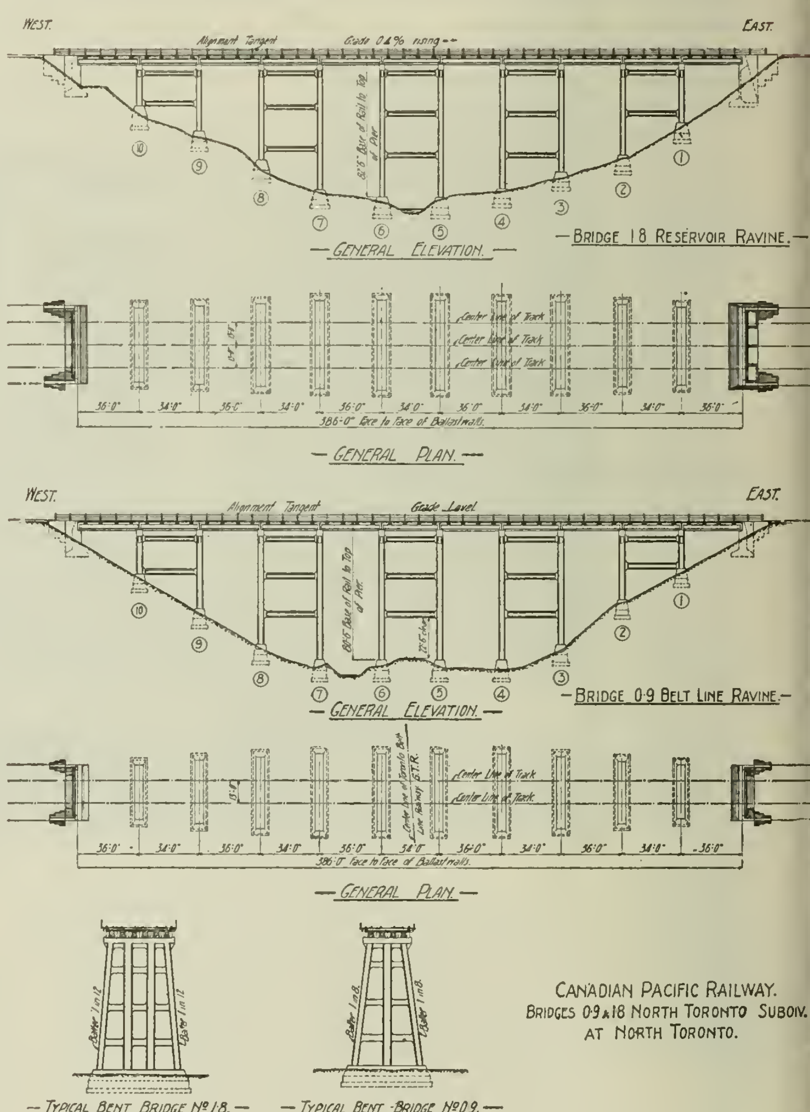
and permitted the carrying of traffic within our right of way without difficulty. These considerations justified the dropping of further studies of reinforced concrete arches, and the adoption of designs of which the principal dimensions are shown on Plate 1.

It will be noted that continuous piers have been used instead of individual pedestals, as is customary for steel viaducts. These, together with the very stiff caps, made each bent act as one unit.

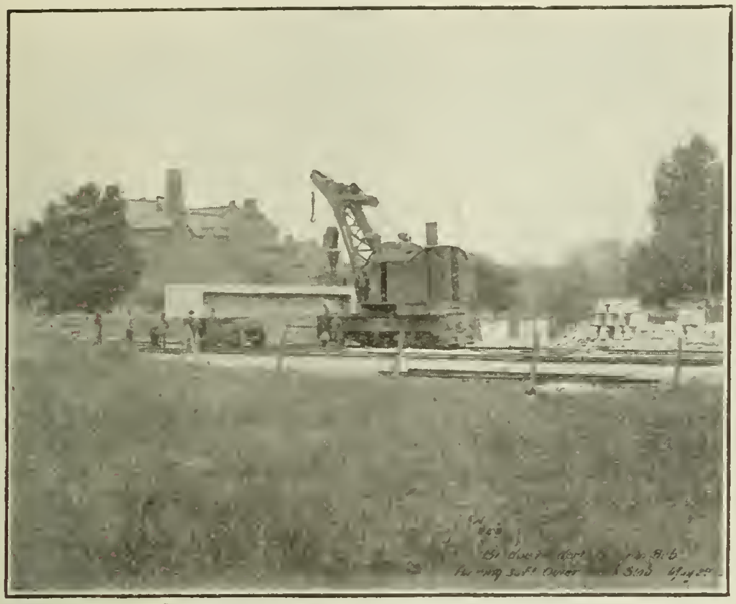
The columns are thoroughly bonded to the piers by the recesses and the rods in tops of same, which correspond to the reinforcing rods in the columns.

In designing the columns, rectangular and octagonal sections were considered; the rectangular section was adopted as the mos suitable to resist the great bending moments that the columns would be subject to. The columns are reinforced with longitudinal rods anchored into the concrete by ⅜″ diameter bands. On account of the unusual size of these columns, these bands were made in sections, so that intermediate bars would be thoroughly anchored into the body of the columns. These bands were not considered to act as hooping owing to their rectangular shape. The tower bracing consists of struts reinforced to resist the bending moments due to their own weight and the various horizontal forces acting on the tower. In order to improve the appearance and reduce the weight, the vertical faces of the longitudinal struts were given a three inch recess. It will be noted that the longitudinal and transverse struts are arranged alternately. At all intermediate points, bending moments, due to transverse forces, will then be practically zero, where the moments caused by the longitudinal forces are maximum. Sliding surfaces for the main slabs are provided by ½″ steel bearing plates on caps of the bents; the plates are held in position by 1½″ dowels. As these plates are continuous over the caps of the bents, they strengthen the caps against stresses produced by longitudinal forces on the bridge.

Each track is supported by two pre-moulded simple T Beams. The end brackets shewn on these slabs do not bear on the caps, but are kept clear by the steel



Bridges 0.9 & 1.8 North Toronto Subdivision at North Toronto.



Canadian Pacific Railway Viaduct, Toronto.—Turning of Slabs.

bearing plates which they overhang; they are intended to strengthen the horizontal flanges and improve the appearance of the structure. The top surfaces of the slabs have a smooth finish and are sloped towards drain pipes, placed along coping blocks and between the tracks.

The ballast is held in position by the coping blocks which were pre-moulded in sections and anchored to the slabs by 1″ dowels. After the erection of the slabs and coping blocks, the surfaces in contact with the ballast were waterproofed with a membrane type of waterproofing. This was laid continuously from abutment to abutment, the gaps between slabs being reinforced by additional layers of felt and mastic.

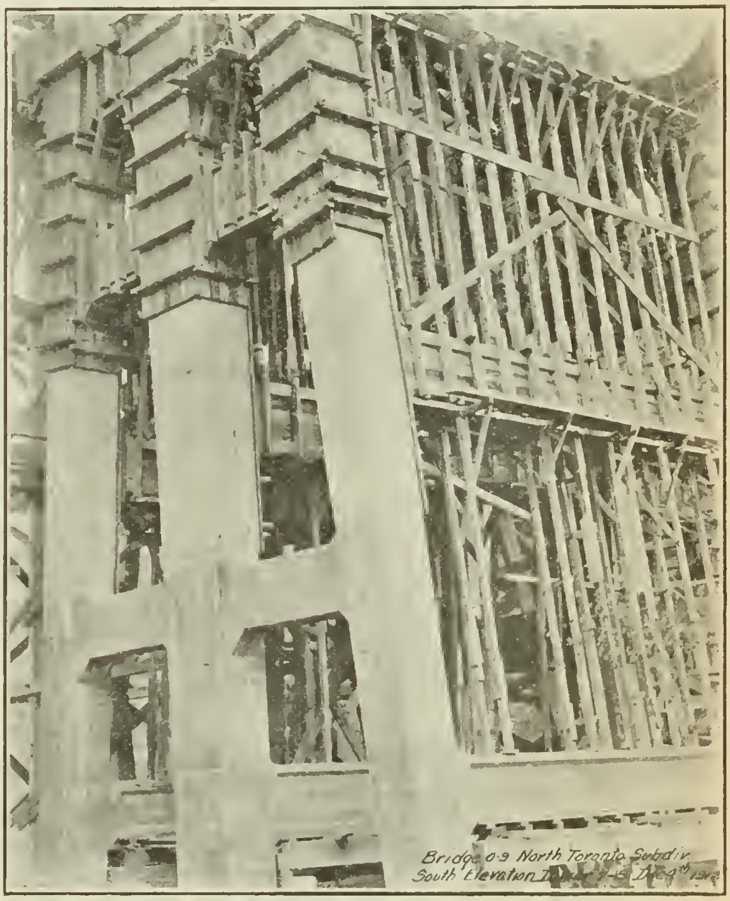
The sidewalks are composed of pre-moulded T shaped slabs, supported on brackets projecting out from the main slabs. The flanges of the sidewalk slabs fit into a horizontal groove in the coping blocks; these coping blocks are heavy enough to counteract any tendency of the T beams to overturn. 1″ dowels hold these slabs in position on the brackets. The hand-railing consists of pre-moulded concrete posts and three rows of 2″ pipe.

The bridges are designed to carry Cooper's E-50 loading, with an impact allowance of $.90\frac{300}{300+l}$ L.L., where L.L. = live load and l = loaded distance in feet. Where stresses are produced by the loading of more than one track l is multiplied by the number of tracks. The design is in accordance with the Specification for Reinforced Concrete of the *Engineering Institute of Canada.*

In addition to dead load, live load and impact, the towers had to be designed to resist stresses due to traction and wind. A traction force equal to 9% of the wheel load was assumed to act at the rail level. This coefficient of traction was derived from diagram in Mr. Blumenthal's paper on " Traction Stresses " (Transaction of the Can. Soc. C. Engrs., vol. xxiv, Part II.).

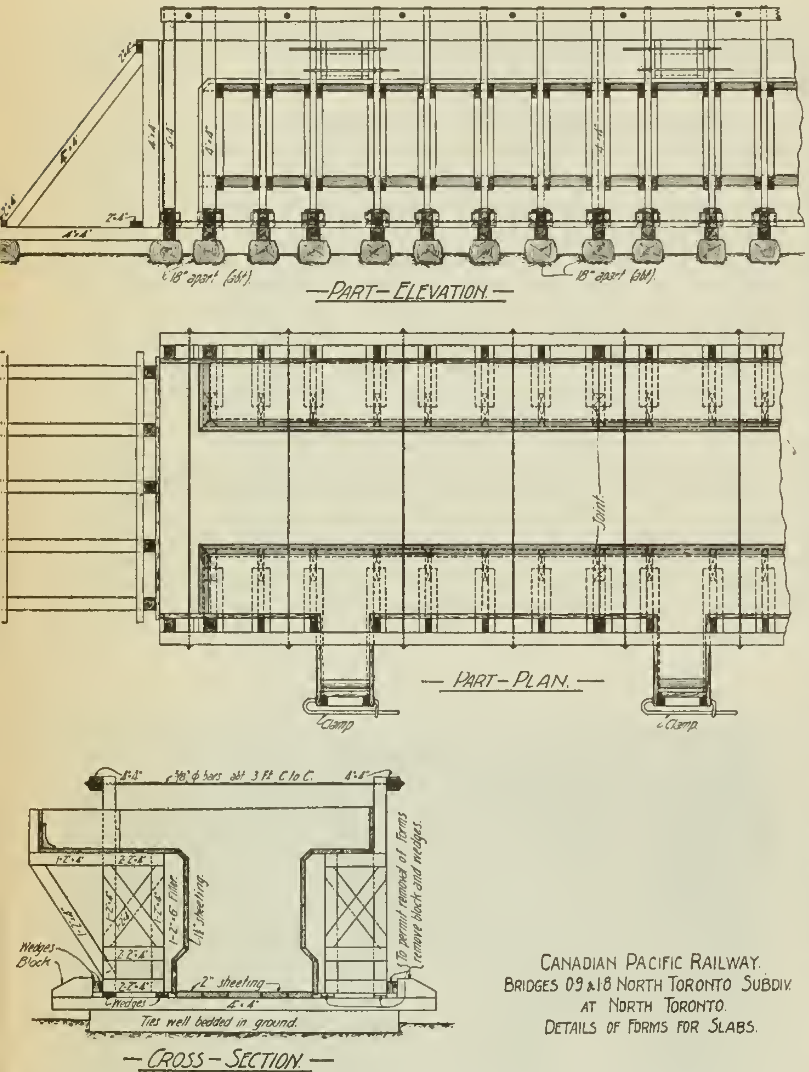
A wind load of 30 pounds per square foot on exposed surfaces of train and slabs, and a similar load on 1½ times the vertical projection of towers was assumed.

Bending moments in columns due to dead load of struts were included in calculations. While this is usually neglected in steel structures, it becomes necessary here, owing to the great weight of the struts. These latter moments, and also the moments due to traction, were calculated by the elastic theory—the equations being solved by the Area Moment Method. Plate X indicates how these equations were developed. The application of this theory, however, for the calculation of moments, due to transverse forces, becomes extremely involved, owing to the shape of the bents. For this reason, points of inflection were assumed as shewn on Fig. 1. Comparison between results obtained by similar assumptions in the case of longitudinal forces with those obtained by the use of the elastic theory shewed that the method adopted would give results sufficiently accurate for the purpose. Stresses in columns including bending moments when one span only was fully loaded were calculated, but found to be below maximum shewn on stress sheet.



Canadian Pacific Railway Viaduct, Toronto.

Bridge 0.9 Tower Partly Stripped.



Bridges 0.9 & 1.8 North Toronto Subdivision at North Toronto. Details of Forms for Slabs.

Maintenance of Traffic.

Traffic on both bridges was maintained on temporary wooden trestles, erected on the north side of the old main line track. This was contemplated from the very first for Bridge 1.8, as the spans of the existing bridge were so arranged, that to build a concrete trestle and keep clear of existing steelwork would be impracticable. At Bridge 0.9, however, it was found, that if the new bridge were laid out with 34 ft. tower and 36 ft. intermediate spans, there would be no interference with existing steelwork and traffic could be maintained on the old bridge. This arrangement of spans was, therefore, adopted for both bridges. However, when excavation was started it was found that the condition of existing masonry would not permit excavation for new piers to be carried down to the required depth without endangering the safety of traffic. It was, therefore, considered advisable to build a temporary wooden trestle for this bridge also, rather than attempt to support masonry pedestals on these steep hillsides.

Plant—Bridge 1.8.

A plant for storage and mixing was installed at each end of the bridge, and one at the slab yard about a quarter of a mile east of the bridge. The stone and sand were piled in the open about 25 feet from the mixer. They were stored on plank bottoms to prevent admixture of earth. The cement was stored in three sheds having capacities of five carloads each. They were built of dressed lumber and roofed with ready roofing paper. The floors were kept about 8" clear of the ground in order to make the sheds damp-proof. Each carload was piled separately; there being a space of at least one foot all around each pile.

The various materials were wheeled in barrows to the mixers—stone and sand were measured by barrow loads. One bag of packed cement was considered one cubic foot. Water barrels were filled from the City line through 2" pipes, and the water was measured with pails. At each

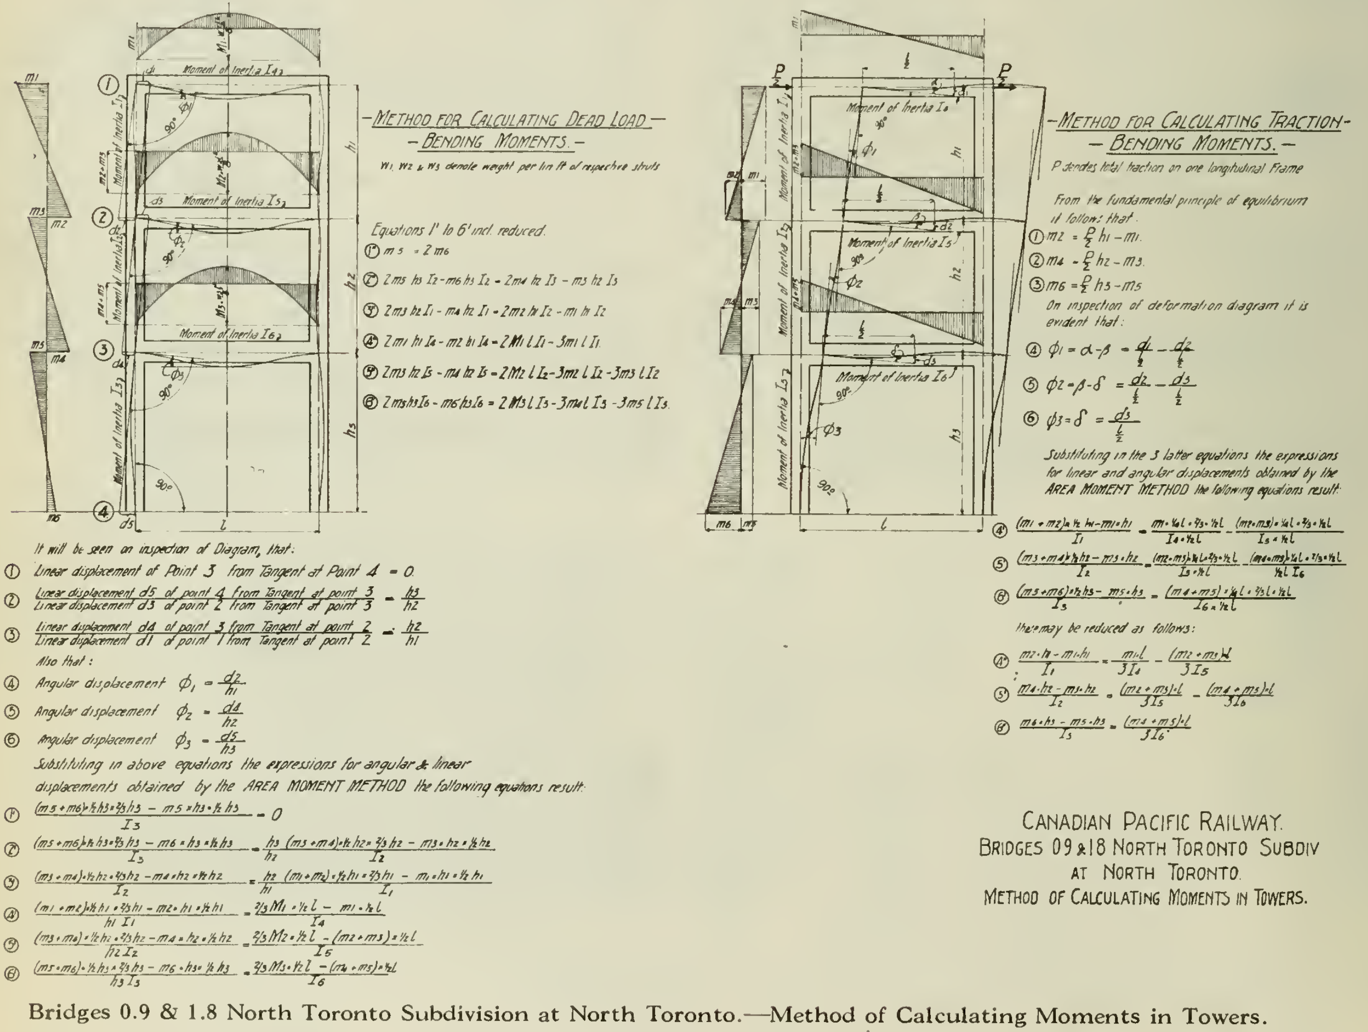
Canadian Pacific Railway Viaduct, Toronto.
Bridge 1.8, Finished Deck.

end of the bridge a 75 ft. hoisting tower was erected from which concrete was conveyed to the various piers and towers by spouting. At the slab yard the concrete was wheeled in buggies along a trestle built on a level with the tops of forms, and dumped directly into the forms.

Plant at Bridge 0.9.

At this bridge only two storage and mixing plants were installed, one at the west end of the bridge and one at the slab yard, half a mile east of the bridge. At the slab yard, materials were stored and handled in the same manner as at Bridge 1.8. The plant at the bridge site, however, was entirely different; the stone received here was too large and had to be crushed and screened to 1″ size. Between the storage pile and the mixer a Gyratory crusher—belt connected to a gasoline engine—was mounted on a platform about 10 ft. high. This crusher was fed from the storage pile by a one yard grab bucket and derrick. The crushed stone dropped through the floor of the platform to an inclined screen, which screened out all particles ¼″ and less. The stone was then delivered from the crusher to an elevated stone bin with an inclined bottom, located directly above the hopper of the mixer,



Bridges 0.9 & 1.8 North Toronto Subdivision at North Toronto.—Method of Calculating Moments in Towers.

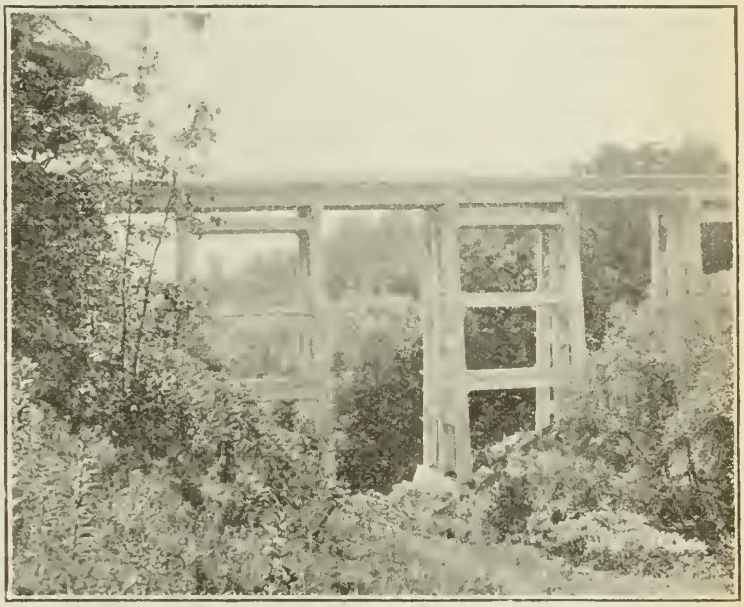
which was set up on a foundation about four feet above the ground. The flow of the stone from stone-bin to hopper was regulated by a steel plate gate, and the hopper was graduated to receive the correct quantities of stone. The screenings from the crusher were used mixed with the sand. The sand was stored on plank bottoms as at Bridge 1.8, and delivered from there to the elevated bin adjacent to the stone bin and handled in same way as the stone. The cement was stored in a shed of similar construction to those at Bridge 1.8 and was delivered to the mixer by the derrick. No hoisting tower was used at this bridge for conveying the concrete. It was wheeled in dump cars running on a narrow gauge track on a trestle constructed at the track level along the bridge. The concrete was dumped into hoppers at various points along the deck of the trestle and delivered from there to piers and towers by metal chutes connected to the hoppers.

Materials.

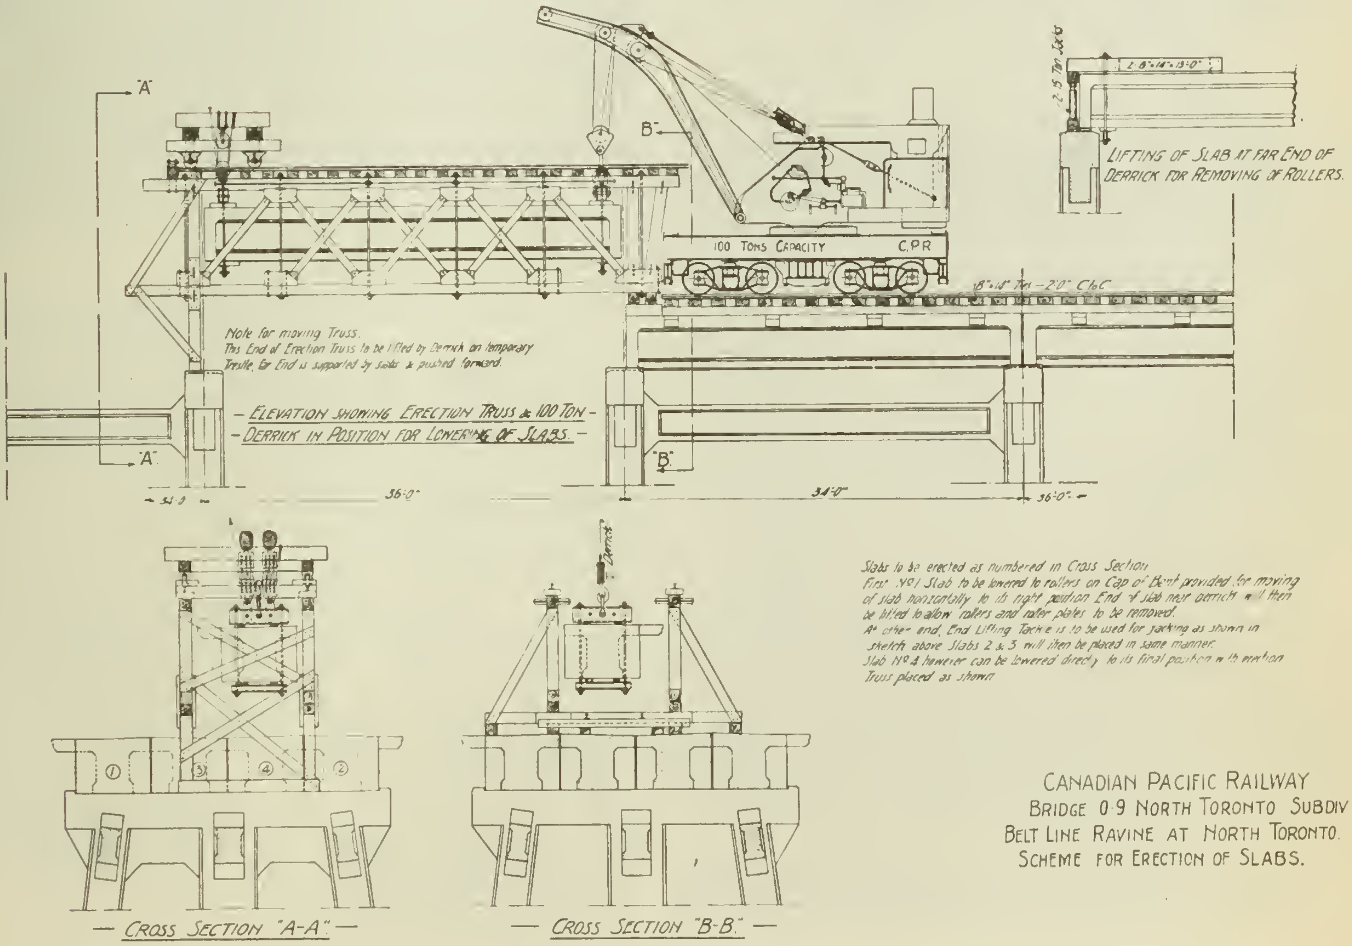
Stone.—The stone used was partly trap rock and partly hard limestone, ranging in size from 1″ down to ¼″.

Sand.—The sand was a natural bank and of a granity composition, well-graded from ¼″ down.

Cement.—Two brands of cement were used. "Pyramid Brand," manufactured by the St. Mary's Cement Company, and "Canada Brand," manufactured by the Canada Cement Company. They were fairly slow setting cements; averaging about 3 hours for initial set, and about 5½ hours for final set.



Canadian Pacific Railway Viaduct, Toronto.
Bridge 0.9 Completed.



Bridge 0.9 North Toronto Subdivision Belt Line Ravine at North Toronto.—Scheme for Erection of Slabs.

While the cement was being unloaded from the cars, one bag in every 50 was opened and a small sample taken from it. These small samples were mixed into one composite sample for each car (one car contained an average of 760 bags). These samples were then forwarded to the testing laboratory in Montreal, shipped in air tight lever top tins which insured that cement did not air slack in transit. Each car load of cement was stored separately in sheds, given a number corresponding to number of sample and held until the inspector was notified that the test had proved satisfactory. All cement used was in conformity with the C. P. R. Cement Specification, 1912.

Treatment of Forms.

The forms were treated with one application of Petrolatum and neutral oil, mixed in the proportion of one of Petrolatum to two of neutral oil, or until a creamy consistency existed. After the forms were fabricated, all holes and large cracks were filled with putty, all knots and putty fillings were then shellacked. The above mixture was then applied on inside of forms with a whitewash brush; the neutral oil penetrated about ¼″ into the wood, leaving a thin waxy film of petrolatum on the surface. The forms, thus treated, did not warp or wind, and moisture did not cause the grain of the wood to rise. A number of the forms were used as often as eight times, and all that was necessary after each stripping was to dust or sweep them off with an old bag or broom.

Heating.

In the month of November, when the temperature dropped to 40°F., heating of the materials was commenced. A live steam jet was introduced into each water barrel, which kept the water nearly to the boiling point while the mixer was running. Sand and stone were heated by perforated steam pipes placed under sand and stone piles. For the very cold weather, the steam was kept on night and day. The temperature of the concrete as it left the mixer was about 55° to 60°F. during the very coldest weather. For the main track slabs, concrete was poured in as low a temperature as 25°F. After pouring of concrete, the tops of slabs were covered with tar paper, kept about 6″ clear of the surface of concrete, a layer of straw was then packed around the entire form and the whole covered with tarpaulins. The sidewalk slabs and coping blocks were protected in a similar manner to the main slabs. The hand-rail posts were cast in a shed heated by a stove.

Bents were housed in from top to bottom with ⅞″ tongued and grooved boards; this housing was built about three feet away from the forms and steam pipes were run into this space. As an auxiliary to the steam heat, a battery of four (4) coke burning salamanders was placed on the ground. With these precautions concrete was poured at a temperature as low as 10° F., and the space around the forms could be kept at a temperature of about 50° F. Heat was maintained for at least three days after pouring was completed.

The longitudinal struts were also housed in and a steam line run along each side near the bottom of the housing. The bottoms of the housings for struts were packed with straw—the tops were covered with tar paper clear of concrete, on this was placed a packing of straw and the whole covered with tarpaulins.

Details of Construction.

Excavation was started during the middle of August, 1917, the soil encountered was generally a hard blue clay, in some cases coarse sand. Before any concrete was placed, each foundation was subjected to a loading test at both ends. An ordinary table having 4-3″ x 3″ legs was used for this purpose; the table was loaded with cement bags filled with sand, the total load corresponding to four (4) tons per square foot.

Piers.—Concrete in the piers was poured in three consecutive runs as follows: The footing course was poured in the open excavation; before this had a chance to set large boulders and stone from the old pedestals, broken up to one man size, were imbedded in the top surface in three rows and about three feet apart; thus a good bond was obtained with the next course. After the footing course had taken its final set, forms were erected for the pier proper and the surface was thoroughly scraped and slushed with water until all signs of laitance had been removed. The concrete was now poured for the vertical portion of pier. After the top surface of same had been treated in the same way as the footing course, concrete was finally poured for the batter course of the pier. For recesses of columns, templets in the shape of a box with proper number of holes spaced to receive the anchor rods were placed and fastened in position to the forms of the batter course. After the last batch of concrete was poured, the anchor rods were inserted in the holes, and driven to the right depth in the wet concrete. The forms of the piers were stripped after two days and the exposed surfaces rubbed with carborundum stones.

Towers.—Details of towers are shewn on Plate IV, and photographs show clearly the details of forms. In erecting the forms great care was taken not to have any parts braced to, or allow any to come in contact with the trestle carrying traffic, so as to avoid disturbance of concrete while it was setting. The concrete was poured from strut to strut, the brackets at the end of each strut forming hoppers to receive concrete. At every construction joint, trap doors had been arranged in the column forms in order to permit removal of all laitance and thoroughly to clean the surface before any new concrete was poured. The concrete in the column forms was spaded by long handled spades, and the outsides of the forms were beaten with wooden mallets to free any air. A good smooth surface with very few air pockets resulted therefrom. The column forms were stripped after four or five days in warm weather, and after a week or ten days in cold weather. The strut sides were stripped after seven days in warm weather and after two weeks in cold weather. The bottoms of the struts were not stripped until absolutely necessary and never before three weeks in warm and four weeks in freezing weather. All surfaces of towers were rubbed down with carborundum stones.

Slabs.—Details of slabs are shown on Plate V and details of forms on Plate VI. Forms were made collapsible, as is clearly shewn in details. A new bottom, however, was made for each slab. After assembling of forms one end was left open until all reinforcing bars were properly placed and wired together. Bars were supported on pre-moulded dove-tailed concrete blocks 1–7/8″ thick; this made suspending wires unnecessary, thus avoiding obstructions to levelling off top surface of slabs. On slabs, only the exposed surfaces of outer slabs were rubbed down with carborundum stones.

Erection of Slabs.—Erection of Main slabs of Bridge 0.9 was started on February 22nd and completed on April 10th, 1918. On Bridge 1.8 erection started on April 11th and the last slab was placed on June 1st, 1918.

The longest slab weighs 56 tons.

As the 100-ton wrecking crane did not have the reach required for placing these heavy slabs, a special scheme of erection had to be devised. This is shewn on Plate VII, and photographs. At the slab yard, one end of the slab was lifted on to a freight car truck, the other end suspended from the crane. The slab was thus pushed ahead by the crane on to the bridge. Two timber trusses specially constructed for the purpose were placed far enough apart to permit the slab to be lowered down to the bents. The end of slab resting on the track was then hitched to a trolley, which was running on rails on top chord of trusses. The derrick was then moved ahead until the slab had reached the position for lowering down to rollers on caps; after the slab was on rollers, it was moved sideways on them to its final position. When all slabs of one span were erected, the erection trusses were moved forward by the crane to the next span and same operation repeated.

The actual cost per cubic yard of concrete in the various parts of the structure at 1.8 North Toronto, was as follows:

Piers.

Forms.—Including labor, o.h. expenses, and contractors' commission	$1.35 per cu. yd.
Concrete.—	
Materials	3.94
Freight for sand, stone and cement	0.87
Labor	1.61
Incidentals, o.h. exp. and comm.	0.98
Steel	1.07
	$9.82 per cu. yd.

Abutments.

Forms.—Including labor, o.h. exp. and commission	$4.38 per cu. yd.
Concrete.—	
Materials	3.70
Freight on sand, stone and cement	0.76
Labor	3.38
Heating	1.28
Drainage and waterproofing	0.16
Incidentals, o.h. exp. and comm.	1.59
Steel	2.54
	$17.79 per cu. yd.

Towers.

Forms.—Material, labor, o.h. exp. and commission	$13.32 per cu. yd.
Concrete.—	
Materials	4.53
Freight on sand, stone and cement	1.00
Labor	5.75
Heating	4.19
Incidentals, o.h. exp. and comm.	2.65
Steel	14.12
	$45.56 per cu. yd.

Slabs.

Forms.—Material, labor, preparing of slab yard, incidentals, o.h. exp. and commission	$9.15 per cu. yd.
Concrete.—	
Materials	5.67
Freight on sand, stone and cement	0.97
Heating	0.20
Labor	3.11
Incidentals, o.h. exp. and com.	1.55
Steel	13.45
	$34.10
Cost of erection of slabs, per cu. yd.	7.18
	$41.28

Regarding the item, Heating of Towers, the average cost of $4.19 is shewn; as, however, only about three fifths of the towers required heating, the actual cost per cu. yd. was approximately $7.00.

The average cost of materials used and the average rates of wages paid were as follows:

Materials.—	
Lumber	$38.50 per M.
Stone	.993 per ton.
Sand	.295 "
Cement (including bags)	2.00 per bbl.
Wages.—	
Carpenters	51 cts. per hour.
Carpenters helpers	40 "
Laborers	37½ "
Engineers on mixers	55 "
Concrete finishers	41 "

The work was carried out under the direction of J. M. R. Fairbairn, chief engineer, P. B. Motley, being Engineer of Bridges — J. H. Barber, with A. H. Munson as assistant, was engineer in charge of construction, while the necessary investigations, calculations and details were worked out by the writers. The contractors for Bridge 1.8 were Wells & Grey Ltd., and for Bridge 0.9 The Dominion Construction Company, both of Toronto.

Can Earth Roads be Made Satisfactory?

By H. S. Carpenter, A.M.E.I.C., Deputy Minister, Department of Highways

Many states south of the International Boundary are known to the road building fraternity as "earth road states." To be thus characterized does not of necessity imply a reflection on the condition of the roads. It may mean that these states like the Province of Saskatchewan have not been supplied by nature with material from which broken stone or other hard road metal can be obtained within their boundaries, and that they are obliged to make the best of the clay, sand and gravel which is found comercially available for road construction purposes. We know that some states have used this inferior road building material to good purpose. If in addition to being known as an "earth road state" a state has earned the right to be called also a "road drag state," it will have gone a long way towards removing any reproach which the former term may imply.

Saskatchewan is an earth road province and although it would be rashness for any one to state that sometime in the future this province may not be served by main roads surfaced with some form of durable road metal we have to face the fact that there is not at present available material from which to obtain broken stone with which to build hard surfaced roads. This material has been shipped into the province for use in paving our city streets. There is also the possibility that it may be obtained from the rock deposits which cover the northern parts of the province. The cost of this material at present makes its use prohibitive for any extensive program of improvement of our country roads. The same may be said of the relatively small amount which can be obtained from field stone.

We sometimes indulge in speculation as to whether or not some process of treatment may not be devised by which our Saskatchewan clays or gumbo soils may be converted into a material which may be used as a substitute for the broken stone, slag, or other hard durable road-building material found in other countries. It is pointed out that it took many years of patient labor and experimenting to demonstrate that the soil of this great northwest would produce crops. Many of us remember not so many years ago when it was said that the Regina plains were barren. Other sections of this country were at one time looked upon as hopeless from an agricultural point of view. Through the hard work, perseverance and intelligence of the earlier settlers all difficulties were overcome and it was demonstrated that Saskatchewan mud could be so treated as to be converted into the very best of farm lands. It is reasoned then that there is reason to hope that the road builder may in a similar manner work out his own salvation, and in time evolve ways and means of converting the prairie soils into serviceable road metal. Certain characteristics of Regina gumbo it must be admitted are such as to lend encouragement to this optimistic outlook. If you will go out onto one of the unpaved streets of this city a few hours after a rain when the surface has dried out sufficiently to have lost its stickiness, but is still plastic, it will be found that portions of the surface which have been rolled out and compressed by heavy motor wheels have been converted into a material which in that state would make a good road surface. It is so hard that it will take a polish, as tough as leather, and so dense that one would expect it to be waterproof, as it dries out under the rolling of traffic these properties increase. If we could devise some means of fixing it in this condition it might be utilized as a serviceable road metal. But we know only too well what happens to it the next time it rains.

Methods of burning clays have been tried in the construction of "burnt clay" roads. This has met with more or less success in districts where fuel is plentiful and cheap, but this treatment does not promise success in this province where fuel is scarce.

We do not wish to dampen the enthusiasm of the optimist or even of the dreamer, on the contrary they should be encouraged, but in the meantime it does not seem wise that we should defer our hopes of providing this province with good roads until some genius has evolved some magical process of transmuting Saskatchewan mud into hard road metal.

It would seem then that we should devote our energies to making the best use of the material commercially available which, generally speaking, is the material which is within scraper haul or at most waggon haul of our roads. This does not imply that we should not make a judicious selection of this material. In fact it is the neglect to exercise judgment in this respect which is responsible for the construction of a great many miles of poor earth roads. Instances of this are noted in the attempt to construct grades across sloughs when advantage is taken of a dry season to build the grade from the soft alkali mud which often forms the bed of the slough regardless of the fact that good material can be obtained from the banks of the slough. Even where it is necessary to cut down these banks to provide a suitable grade at each end of the fill, good material excavated from these banks is sometimes wasted rather than incur the little longer haul that its use involves, as compared with scraping in the material from the bottom of the slough.

Again attempts are made to build a road entirely of light sandy material or even of fine sand, when clay could conveniently be obtained to mix with the sand to construct a sand clay road, or conversely a clay road is built notwithstanding the fact that sand suitable for mixing with the clay can be conveniently obtained.

It may be noted also that we are not making the most of our resources in gravel. In many districts gravel can be obtained convenient to our roads, and although the presence of these gravel deposits is more or less generally known in each locality this is ignored by those in charge of road improvement work. In order that greater advantage may be taken of our gravel supplies it would be well for each rural municipality to undertake a survey of the municipality to ascertain its resources in the way of gravel and sand. This information should be so recorded as to be available in connection with any

*Read before the Annual Meeting of the Saskatchewan Branch, January 9th, 1919.

scheme of road improvement planned by the municipality. Control of many of these deposits could probably be more readily obtained now than later on after the value of the gravel and sand has increased. A start has been made by the Department of Highways to collect information as to location, extent and quality of gravel and sand deposits in the province. It is hoped this information will be very useful both to the department and to the rural municipalities in carrying out, not only road construction, but also in connection with the construction of concrete culverts and bridges.

It cannot be too forcibly insisted on that the question as to whether or not earth roads will prove satisfactory is largely a question of maintenance. The necessity for this should be faced at the inception of any scheme of road improvement. Provision for financing the improvement should also include provision for adequate maintenance.

The satisfactory road to be built in any locality we may assume to be that road which is most suitable to the conditions for which the road is to be used. The conditions to be considered are soil, climate, nature and extent of the traffic, and the materials available, but also unfortunately we cannot overlook the condition that the road must be suitable to our ability to pay for it. This latter condition so dominates the others that it is generally accepted that we are justified in expending on a scheme of highway improvement only so much as will represent a safe sound investment upon which dividends will be paid, not in actual cash disbursements but in actual cash savings to the community to be served and which has to bear the cost. That is, the tax which will have to be borne to finance the improvement must not exceed the tax which is imposed because of the poor condition of the roads.

The suitable class of roads then is the one that can be built, financed, and maintained from the annual savings represented by the difference in cost of hauling over poor roads and the cost of hauling over the improved road. A careful study of the costs of hauling over different classes of roads has been made by the United States Office of Public Roads, and also by officials of some of the highway departments of the different states. The United States Office of Public Roads gives the cost of hauling on unimproved roads throughout several different states as varying from 24 to 37 cents per ton per mile, or an average of 30 cents. From the insuffcient data I have been able to gather it would appear that the cost in Saskatchewan is at least as high as 30 cents.

The cost of hauling on improved roads is given as 10 cents per ton mile on the first class roads in European countries before the war, making allowances for extreme variations in wages between Europe and the United States, the cost in this latter country is given as not to exceed 20 cents on improved earth or sand clay roads, and from 15 to 12 cents on good gravel, macadam or other more expensive pavements. Similar figures for Saskatchewan are for obvious reasons not available.

B. K. Coughlan, Professor of Highway Engineering in the Agricultural and Mechanical College of Texas, gives the following very conservative figures for the saving in the cost of hauling effected by the following classes of improved roads in cents per ton mile: earth or sand clay roads, 7½ cents; gravel roads, 10 cents; bituminous macadam, concrete or other expensive pavements, 15 cents. These figures are made use of in the computations submitted below. It should be noted here that these figures do not take into consideration the saving in wear and tear on vehicles, harness and animals, nor do they include the undoubtedly great benefits to the community from improved social opportunities, greater comforts, and other benefits resulting from improved roads which, however apparent, are difficult to value in dollars and cents.

Having then the annual saving in hauling costs, if we ascertain the annual traffic which the road system slated for improvement will carry reduced to ton miles we can calculate the annual saving to the community which the improvement will produce. We can then capitalize this amount and thus determine the class of road which is economically suitable. Or conversely having the cost of constructing, financing and maintaining a certain class of road it can be ascertained the minimum of traffic which would be necessary to justify the investment.

In this discussion it is assumed the money necessary to cover the improvement will be obtained by the sale of bonds or debentures. This means that included in the cost must be ample provision for annual maintenance sufficient to preserve the investment during the currency of the bond. This provision is a matter that is too frequently overlooked. Bond money should not be spent for road improvement unless the arrangement provides for adequate maintenance.

The annual cost of the improvement then is the interest on the bonds, the annual sum needed to retire the bonds at maturity, and the annual cost of maintenance. The bonds for earth and sand clay roads should not run over 20 years. This may be extended to 30 years for gravel, macadam and the more expensive pavements.

Following then the method of calculation adopted by Professor Coughlan we can determine the amount of traffic which a road will have to carry to justify an issue of bonds to convert it into an improved road of any particular class as follows:

Earth Road.

Cost of construction estimated at $1000 per mile. Annual cost of maintenance at $75 per mile; Interest on bonds at 6%. Interest on sinking fund 3½%. Bonds to run 20 years. The annual cost then equals .09536 x 1000 plus 75 equals $170.36, which at a saving of 7½ cents per ton mile would require a traffic of 2270 tons or about 8 tons for each working day.

Sand Clay Road.

Cost of construction estimated at $1500 per mile. Annual cost of maintenance at $125 per mile. Interest on bonds at 6%. Interest on sinking fund at 3½%. Bonds to run 20 years. The annual cost then equals .09536 x 1500 plus 125 equals 268.04, which at a saving of 7½ cents per ton mile would require a traffic of 3570 tons or about 12 tons for each working day.

Gravel Road.

Cost of construction estimated at $3000 per mile. Annual cost of maintenance at $225 per mile. Interest on bonds at 6%. Interest on sinking fund at 3½%. Bonds to run 30 years. The annual cost then equals 3000 x .07937 plus $225 equals 463.11, which at a saving of 10 cents per ton mile would require a traffic of 4630 tons or about 15 tons for each working day.

Water Bound Macadam Road.

Cost of construction estimated at $9200 per mile. Annual cost of maintenance at $525 per mile. Interest on bonds at 6%. Interest on sinking fund at 3½%. Bonds to run 30 years. The annual cost then equals .07937 x 9200 plus 525 equals 1255.20, which at a saving of 15 cents per ton mile would require a traffic of 8366 tons or about 28 tons for each working day.

Bituminous Bound Macadam Road.

Cost of construction estimated at $10,300 per mile. Annual cost of maintenance at $700 per mile. Interest on bonds at 6%. Interest on sinking fund at 3½%. Bonds to run 30 years. The annual cost then equals .07937 x 10,300 plus 700 equals 1517.50, which at a saving of 15 cents per ton mile would require a traffic of 10,116 tons or about 34 tons for each working day.

The cost of constructing water bound macadam and bituminous bound macadam roads used above at $9200 and $10,300 per mile, respectively, is taken from a report of the United States Office of Public Roads on the average cost of constructing in the years 1908 to 1911 of 137 miles of the former class of road and 85 miles of the latter, the width of the road paved being in both classes 15 feet. I would not venture an estimate of what these two classes of pavement would cost in Saskatchewan.

I have endeavored to give the results of the above calculations a local application, but, unfortunately, traffic census on any of our main roads are not available. Lacking more definite data I have assumed a hypothetical case. Assuming a main market road leading out from a market center in one direction for a distance of twelve miles and considering only the traffic which originates on the farms for which the road is the main market road; neglecting then the traffic in coal, lumber, and other supplies from the market town to the farms, also any traffic which may use the road, but which originates outside the area tributary to the road. I have assumed that each quarter section will annually yield 30 tons of produce or equivalent to 1000 bushels of wheat. The traffic on each mile numbering from the town out would be as follows:

1st mile	7320 tons
2nd "	7200 "
3rd "	6800 "
4th "	6400 "
5th "	5880 "
6th "	5280 "
7th "	4680 "
8th "	4080 "
9th "	3000 "
10th "	2520 "
11th "	900 "
12th "	840 "

Comparing these figures with the results of the computations for each class of road we find that on no part of this road would the traffic warrant the construction of either water bound or bituminous bound macadam surfaces. The theoretically suitable road would be constructed of gravel for the first six miles, sand clay for the next two miles earth for the ninth and tenth miles and the last two miles would not carry sufficient traffic to warrant even an earth road. In actual practice, of course, the total length of the road would be included in the scheme of improvement and the class of road built be that which the average traffic over the whole stretch would justify.

If the road under discussion in addition to being a local market road were also an interurban road or a trunk road there might be added to the local traffic sufficient through traffic to justify more durable and more expensive pavements. We must face the fact, however, that in comparison with our small population we have a very large mileage of roads to construct and maintain; so that when we are confronted with the question as to whether we should use the money available to build one mile of bituminous bound macadam road or ten miles of improved earth road, we are forced to the conclusion that the province will be best served by making the best use of the material commercially available and that for the present at least we should devote our energies to the improvement of our organization for constructing, maintaining and financing our earth roads.

Economy in Ocean Transportation

By A. W. Robinson, M.E.I.C.

The purpose of this paper is to direct attention to a few points connected with ocean transportation which are deserving of special attention now in view of the altered conditions consequent upon the war. In the replacement of lost tonnage we have now an opportunity to make a distinct advance upon previous practice. It is incumbent upon us to make such an advance and to increase the efficiency of everything connected with ocean transportation to the utmost possible extent in view of the new conditions of increased cost of fuel, labor and materials, and the competition of other nations.

*To be read before the Montreal Branch, Thursday, February 6th.

Conservation of fuel whether it be coal or oil is now a national necessity. Economy in the generation and use of propelling power is now highly developed, and the gains that can be made in that direction are comparatively small. It is in the direction of larger units more efficiently employed that we must look in order to obtain a greater output per man and per horse-power.

How can larger and more economical vessels be profitably utilized, what is their relative economy, and what are their limitations? The writer will endeavor to present facts and data that will enable an independent judgment to be formed.

During the four years that have elapsed there would, in ordinary times, have been a natural increase of requirements to be provided for, but this cannot be figured at the normal rate because of the great interruption to trade and commerce. Much of that trade will now have to begin where it left off and the enormously increased transport due to war material having now ceased is no longer a factor.

During the closing months of war a powerful impetus was given to building vessels of any kind that would promise quick delivery, and a large programme was entered upon, the United States alone undertaking to build 25 million tons. All other nations are striving to contribute their quota. It is impossible to foresee the future or to say how far the present building programme will be pushed, but if one may venture on an opinion, there will soon be a superabundant supply of the smaller class of ships now being built. It is now necessary to meet new conditions and build more permanent tonnage. It is most important that the permanent ships now building and to be built, should be in every way suited to carry cargo at the least cost and that all the factors that contribute to this end should be most carefully studied.

The increased cost of construction and of fuel and labor and the likelihood of competition from Japanese and other sources all have to be met. The earlier ships built during the present period will be handicapped by excessive first cost and to some extent also by inferior construction due to haste and inexperience. For reliable service under stress of all weathers and for freedom from repairs and breakdowns nothing but the best and staunchest construction dictated by long sea experience will suffice. In view of the increased cost of fuel and labor it will be necessary to improve the design not only of the ship itself but of every thing connected with ocean transportation, including means for rapid and economical handling of cargo and improved terminal facilities in general.

These questions are receiving close study and attention from both naval architects and ship owners as well as shipping registry societies and port authorities. There is a society of "Terminal Engineers," and a monthly journal called "Freight Handling and Terminal Engineering," now in its fourth volume.

There is also a comprehensive survey of the resources and development of the British Dominions contained in the great report of the Dominions Royal Commission, already referred to. This report being prepared by the most competent authorities and having for its object the economic linking up of the great Dominions of the Empire merits our most careful study and earnest co-operation.

This Commission was appointed by the British Government in April, 1912, and made its final report in March, 1917, so that it covers much of the war period. Its proceedings and evidence are contained in nine volumes and include the most complete and exhaustive study of the relations of the Dominions to the Empire and to each other that has ever been made.

That portion of the report dealing with the question of ocean transportation is so important that I quote a part of it as follows:

"The war has abundantly demonstrated that the life of the Empire depends upon its sea communication. Whatever the existing magnitude of the ocean-borne commerce between the United Kingdom and the Dominions, and whatever the prospect of its development in the future, producer, manufacturer and merchant alike are concerned and vitally concerned with securing cheap, regular and efficient transport for their goods, and consequently with the progressive improvement of the Empire's shipping facilities."

"We emphasize this point for we feel that in discussions as to the best means of fostering trade within the Empire, its importance has been obscured by other factors affecting the exchange of merchandise, and in particular to the prominence given to fiscal legislation. In our view cheap sea transport is not only of importance in relation to other means of fostering exchange of merchandise, but it also confers absolute advantages on the countries which possess it. So long as freights are cheaper and means of communication better between the Mother country and the Dominions overseas, and between the Dominions themselves, than between foreign countries and the Dominions, so long will trade naturally follow Imperial channels. If, therefore, it is possible to devise some means of permanent betterment of sea-routes within the Empire, a powerful impulse will have been given to Imperial trade, while the strength and cohesion of the Empire will be notably increased."

"The development of cheap, regular and efficient transport (and indeed of quick transport) depends in the last resort on increase in the size and draft of sea-going vessels, and consequently on the existence of harbours and waterways of a capacity and particularly of a depth adequate to receive such vessels."

"To some extent these considerations have influenced the minds of ship owners, naval architects and harbour authorities, but the improvement of isolated harbours is of little avail unless all the harbours on a given route are brought up approximately to the same level. Joint co-ordinated action is required. Individual disconnected effort is of little use. It is, therefore obvious that efforts should be made to correlate and develop the existing and future capacity of harbours and waterways on the great trade routes of the Empire, and to suggest a general scheme for improving the ports on these routes."

The report goes on to state that so far as the Dominions are concerned, Canada is most favored by nature with deep and extensive harbours both on the east and west coasts. Full data is given of all trade routes and available depths at present in all principal harbours, and estimated work to be done at various points to bring them up to standard.

A depth of 40 ft. is recommended as being the limit at present available in principal ports, and that can be attained in some other secondary ports within reasonable time. We have, or soon will have this depth at our own ports on the Atlantic and Pacific. The Panama Canal is 40 ft. Hong Kong, Singapore, Sydney, Hobard and Capetown are all 40 ft. Shanghai contemplates 50 ft.

The most efficient size of a vessel fixed upon by this Commission is the largest that can make use of these main ports, and will be a vessel 660 ft. long, 38 ft. draft, and about 25,000 tons deadweight capacity. Vessels of this size are proposed for the main trade routes to Australia, via Capetown, and to Canada. Also a line from a British port to New Zealand, via Halifax, Bermuda, Jamaica and Panama Canal, giving a faster mail route than via Suez. It is not generally realized that the Panama Canal is directly on the shortest sailing line from Britain to New Zealand and that the distance is 560 nautical miles shorter than the mail route via Suez.

Mail services are also an important subject for discussion. Much improvement can be made in the methods that prevailed before the war in our transatlantic mail service. Instead of numerous trans-shipments by methods involving delay, injury and risk of loss, it should be possible to run a mail train alongside the ship and fit portable rubber belt conveyors that would take the mail bags from the railway car and deliver them directly into the mail room of the ship through a door in the ship's side designed for the purpose. A further improvement would be an ample postal station as part of the railway terminal, so that trucking the mail bags through the streets or along station platforms among passengers and baggage would be avoided.

The increased cost of labor and fuel makes it necessary to devise new ways and means to meet this cost. If all countries suffered the same relative increase we would be in much the same position as before. Manual labor must be superseded by mechanical appliances. Where manual labor cannot be dispensed with it should be supplied with such mechanical aids as will render it more effective. In the manufacturing industries it has been shown repeatedly that the most important factor in cheap production is not the rate of wages, but rather the increase of output. We can well afford to pay high wages with efficient plant and large output.

As in railroads economy in haulage has been obtained by increase of train loads, so in marine transport the simplest and most direct way to reduce costs is to increase the capacity of ships so as to carry more tons of freight per unit of labor and fuel. Theoretically the larger the vessel the greater the economy but practically there are limitations. These limitations are not rigid, and do not bind down the ship as do railroad limits of size, but are elastic and depend on commercial considerations of traffic, freight handling and depth of water, and can be expanded to any extent.

The question is, how far can we go efficiently in increasing the size of ships? The discussion which follows will enable us to find the answer.

In November, 1902, the writer read a paper before this Society on "The Economy of Large Ships," in which he stated the principles governing the case and pointed out that when the 30 ft. channel to Montreal was completed, we could employ a vessel 520 ft. long, 61 ft. beam and 30 ft. draft, which would carry 12,000 tons deadweight at 13 knots speed on 5 lbs. of coal per 100 ton miles. He also pointed out the economy that would result in even larger sizes and deeper draft. That limit has been long since reached and passed. A very full discussion was contributed to that paper by the late E. L. Corthell and printed in our transactions, in which he ably reviewed the development of ocean traffic up to that date

The degree to which size can be carried to be profitable is limited, not by any problem of construction but by depth of water and commercial considerations of traffic.

The superior economy of the large vessel is generally recognized. There exists some difference of opinion as to the limits to which great size can be carried to advantage. Economy in railway transport has been attained by heavier train loads and full car loading. The same principle applies to ships except that they are not limited like railways, and hence can derive a greater benefit.

The following table shows the comparative economy of cargo vessels of 2500 to 25,000 tons deadweight capacity:

Deadweight Capacity tons	2500	5000	10,000	15,000	20,000	25,000
Length of vessel....... ft.	215	300	430	510	590	675
Beam " ..... "	36	44	58	68	72	80
Draft of water, loaded. "	22	25	28½	32	34	36
Speed, sea-miles.......	11	11	11	11	11	11
Indicated H. P.........	1460	1900	2800	3750	5000	6000
Coal per hour.........lbs.	2920	3600	5000	6380	7350	7950
Coal consumption lbs. per 100 ton-miles...	10.6	6.5	4.5	3.9	3.3	2.9

In the above table the dimensions may, of course, be varied to suit different designs, as for instance, if deeper draft can be allowed the hulls may have less length and beams, but the comparison is sufficient to illustrate the great saving in coal consumption in the larger sizes. Thus, a vessel of 2500 tons deadweight consumes 10.6 lb. of coal per 100 ton-miles at 11 knots, while a vessel of 25,000 tons only consumes 2.9 lb. per 100 ton-miles at the same speed. In other words: a given amount of cargo is carried in the larger vessel with 27 per cent of the fuel, a saving of 73 per cent, with intermediate sizes in proportion. Not only is there a saving in fuel but in labor also. These savings are cumulative as the space saved by reduced percentage of machinery and fuel goes to increase the paying cargo space. It will be seen that the largest size vessel in the table corresponds closely with that proposed by the Dominions Royal Commission.

The saving in labor in the large vessel is also most important. The question of finding crews for a great number of small vessels is already proving a problem. Inevitably the standard of skill and experience must be lowered and this will result in loss and inefficiency. The number of crew will vary in different services, but roughly speaking a vessel of 5000 tons deadweight may have a crew of 35, while a vessel of 25,000 tons would only require about 68. That is to say twice the crew would carry five times the cargo. For oil-burning vessels the saving would be still more marked.

A further advantage of the large vessel is that less wharf frontage is required for a given tonnage. Thus a berth for one vessel of 25,000 tons deadweight would be about 700 ft. long, whereas berths for two vessels of 12,500 tons would be 1,000 ft. and for four vessels of 6250 tons, about 1500 ft., and so on, in proportion. Consequently the cost of wharfage accommodation is actually less for the large vessels, although the depth of water required is a few feet more. The concentration of so much cargo on a small frontage will, however, make necessary more floor space in the sheds and much better distribution facilities than for the smaller ships. In other words, the harbor accommodation must be designed to suit the vessel and the traffic.

What are the conditions essential to enable us to use successfully these large and efficient vessels?

Unless they can be worked under suitable conditions they will yield no benefit. These are: (1) Sufficient volume of trade on a regular route to furnish full cargoes, or nearly so; (2) Sufficient terminal and warehouse facilities at both ends of the route to collect and hold available a full cargo ready for loading during the time in port; (3) Improved mechanical appliances for rapid loading and unloading so that the time in port can be reduced to a satisfactory minimum; (4) Sufficient depth of water and sufficient space for manoeuvering in port.

Let us consider more specifically the foregoing points. The first condition, that of sufficient traffic, can be determined from statistics of any given trade route, with allowance for future changes. We are not now considering the tramp steamer, which must seek trade where it can find it, and which must necessarily be restricted to the smaller class of vessel. There is no doubt of ample traffic being available on the main trade routes.

The second condition, that of terminal facilities, is one which is now receiving great attention. To utilize the large economical ship, we must assemble 25,000 tons of outgoing cargo at a time in sufficiently close proximity to the ship's side so that it can be rapidly handled, and at the same time provide for incoming cargo. We must also consider the rail and water facilities for assembling this cargo economically. It will require about 15 train loads to fill such a ship.

Improved mechanical appliances for handling cargo are essential to economy. In the case of bulk cargoes as grain, coal or oil, mechanical means can be and are used most efficiently, and the time of loading and unloading is very short. But with miscellaneous freight no means have yet been devised to supersede hoisting by slings or skips which must be loaded by hand in the hold of the ship. The limiting point will be, therefore, the rate at which slings or skips can be loaded. The hoisting apparatus should be so improved that the lifts are made with safety and high speed, and the capacity of the lifts should be in excess of the capacity of the men to load them so that there should be no waiting. The number of hatches should be as many as can be arranged on the vessel, and with as large openings as possible so that two or more lifts can be used at each hatch.

The chief mechanical improvements which can be made are the adoption of electric hoists on shore instead of steam winches on the ship, and electric trucks to receive the load directly from the hoist and carry it away to avoid congestion. In this way manual labor can be reduced and hand trucking done away with. The electric winch should be double drum, and the hoist arranged with two points of suspension, one over the hatch and one over the point of deposit. In this way perfect control at high speed can be obtained, and no swinging booms or derricks are required.

If the 25,000 tons of cargo in the ship proposed by the Dominions Royal Commission can be unloaded at eight hatches with sixteen hoists, each working at 40 tons per hour, the ship can be unloaded in 40 hours. Much depends, of course, on the character of the cargo.

As long as we are obliged to handle miscellaneous freight in packages of every conceivable size and shape so long will the loading process be subject to more or less delay due to hand manipulation. Some improvement might be effected by giving a preferred rate to standardized packages specially adapted to quick loading. Something may also be done to save the ship's time by carrying small freight in large crates or containers that can be quickly lifted and closely stowed.

In repetition work as in unloading a vessel, a time study should be made of each movement to a fraction of a second showing where the losses are and the methods so improved as to eliminate them.

It has been a time-honoured custom for each ship to have a complete outfit of steam winches and derricks to discharge her own cargo. For the tramp steamer and for ports not properly equipped this is, of course, necessary. But why perpetuate it, and why carry a deckload of obsolete winches and derricks cumbering the ship and weighing hundreds of tons when the work can be better done by electrically operated winches on shore? The steam winch as used on shipboard is probably the most wasteful form of power known. With its long steam pipes and general maintenance it costs at least ten times as much to operate as an electric motor on shore. Hatchways could be made larger if the winches were omitted, and the weight of the whole outfit added to paying cargo capacity. Elecricity can also be made available for rapid distribution and stowage of the cargo on shore.

To give effect to this plan requires that all ports of call for this special ship be fully equipped with all the necessary appliances and standardized to suit the ship. A point for discussion is, shall we construct our ships to suit present terminal facilities and channel depths, and thus put a limitation on them, or shall we adopt a size and type of ship that will give the utmost economy for a particular route, and then design the terminals and shore equipment at both ends of the route to suit that ship? The writer believes that the latter should be adopted and that great economies would thereby result.

The most perfect example of the success of this policy is found in the ore-carrying fleet of the Great Lakes. Here, as is well-known, the vessels are standardized, no unloading equipment is carried on them, and the utmost economy and quick despatch is secured. The hatchways are spaced a uniform distance apart so that a vessel of any length and any number of hatchways will fit under a row of fixed loading shoots and also under the unloading equipment. While the Great Lakes type of vessel and unloading equipment would not be suitable for ocean traffic with miscellaneous cargo, the central idea of a standardized vessel with all cargo handling equipment co-ordinated to it and placed on shore finds full vindication. Portable and inexpensive high-speed electric hoists could be spaced along to suit any number and arrangement of hatches, having a double wire-rope tackle carried in snatch-blocks overhead, and requiring no swinging booms or expensive cranes except for special or heavy lifts. They would also be flexible and would suit any spacing of hatches.

The elaborate equipment of travelling and revolving cranes at some foreign ports is often referred to as an example for us to copy. The author thinks that any system of cranes, especially those involving heavy travelling or revolving parts, is much too slow.

It has been customary hitherto to consider the design of a cargo vessel as inseparably connected with the number of hatches and derrick systems that can be arranged along the deck, and to consider the time required to unload the cargo by this means as one of the factors acting adversely to the large vessel. This was brought out by a paper by John Anderson, on "The most suitable sizes and speeds for General Cargo Steamers," read before the Institution of Naval Architects, March, 1918. In this paper the author discusses fully the characteristics of five sizes of cargo vessels with the number and arrangement of winches and derrick systems to each and shows that at the estimated rate of working the time in port would vary from 2.37 days for 1800 tons deadweight to 13 days for 18,000 tons The latter is the largest size he considers and he concludes that at this size the large vessel begins to be less efficient because of the long time required in port. The most efficient cargo liner he places at 450 ft. long and a maximum draft of 28 ft., and in view of this maximum draft he thinks it is an open question whether the proposed deepening of trade routes should be considered prior to other improvements. Mr. Anderson is undoubtedly right in his conclusions, based on the slow unloading rate of ships' winches, but instead of resting content at 28 ft. draft because of inefficient unloading appliances, the writer thinks that the cargo handling arrangements and terminal facilities should be improved so that we can reap the benefit of the large vessel as already pointed out.

The relative advantages and disadvantages of large ships are clearly pointed out by Mr. Anderson in his paper as follows. The principal advantages are: 1st, reduced initial cost in relation to the deadweight; 2nd, reduced horsepower, crew and coal required in relation to the deadweight; and 3rd, greater seaworthiness. These are all indisputable and well recognized.

The disadvantages he states as follows: The increased length of time required to load and discharge; the unsuitability of certain harbors, loading berths and dry docks, and greater loss in case of mishap or disaster. Let us consider these disadvantages specifically. First, as to longer time to load and unload. Undoubtedly it will take longer time to discharge 25,000 tons than a less amount, but this can be greatly reduced by improved and faster methods as already pointed out. Furthermore, the cargo can be discharged from the large ship at a much faster rate than from the small owing to the greater number of hatchways and hoists in use at once, consequently the detention does not increase as the weight of cargo, but in a much smaller ratio.

The second disadvantage is the unsuitability of many harbors, berths and dry docks, etc. My answer is, let these small and unsuitable harbors continue to be served by the smaller vessels and by the tramp steamers, of which we will soon have a superabundance, and let us equip certain harbors on our main trade routes specially for the most economical ship.

The last point is the greater risk of loss in the large vessel. The best answer to this is experience, and statistics show that total losses of large and seaworthy ships are comparatively infrequent. Furthermore, as pointed out in my former paper on "Economy of Large Ships," the risk of accident is in proportion to the number of voyages and these are less in the large ship. Finally the risk of possible loss can hardly be adduced as a valid argument to cause us to forego the undoubted advantages.

The question of draft of water is one of the most important as affecting the use of the large and efficient ship. The 660 ft. ship proposed by the Dominions Royal Commission will have a draft of 38 ft. requiring a 40 ft. channel at least. The ruling depth of ports of the first-class at the present time is 40 ft. The depth of Panama Canal is 40 ft. The present depth of Suez Canal is about 30 ft., but is soon to be 33 ft.

A. D. Swan in his paper on "Deep Water for Harbors and Cargo Handling," read before the American Association of Port Authorities, Sept., 1918, gives a resumé of the question and quotes authorities on the subject. The British authorities "expressed a preference for at least 45 ft. as the minimum depth which harbor engineers should recommend and work for, because although at the present moment 40 ft. might be a satisfactory minimum working depth, the demand for shipping would grow so steadily as to make 45 ft. necessary before even this depth could be achieved."

The same paper also quotes Prof. Biles' calculations showing that the most efficient draft for a ship 1,000 ft. long would be 57 ft. 6 in. and that it was not unreasonable to predict that within 20 or 30 years a depth of harbor of 60 ft. could be profitably employed.

It is clear that deep draft more than any other factor contributes to the economy with which heavy loads can be carried, in fact it is impossible to reap the benefit of cheap transportation without adequate depth of water. Hence the efforts that are now being made to increase the depth in all harbors to a point commensurate with their needs.

Another point in which improvement can be made is in provision for life-saving. By the rules now existing ships are obliged to carry a load of life-boats adequate for the whole population on board. In a passenger liner carrying, say 4000 people this is an onerous and useless requirement. In emergency this fleet of boats cannot be launched, and the history of most disasters is that people are precipitated into the sea and left to cling to a chance oar or piece of wreckage. The writer has long advocated that the life-boat accommodation be reduced and that the supply of automatically floating accommodation be increased in the form of rafts, pontoons or floatable sections of deck-houses. The entire bow and stern superstructure of the ship might be made to float off by disconnecting fastenings. The lifeboat is a survival from early conditions, and while we cannot supersede it entirely we should made a more comfortable and safe means of keeping afloat for the short time now necessary until relief arrives.

In conclusion the writer has endeavored to point out some lines along which progress can be made towards further economy in ocean transportation. The subject is too large and many sided to reach definite conclusions without much further discussion, but it is certain that there is room for great improvement, and that the opportunity is now.

When, as has been shown, the 25,000 ton ship can carry two and a quarter times as much cargo on the same fuel consumption as a 5000 ton ship and do it with two-fifths of the crew and less first cost, it is clear that immense savings can be made that will vitally affect the whole system of ocean transportation. We may not be able to make sweeping changes in the existing order of things, but we can at least endeavor to see that the additions made are in the right direction. It will be an immense step forward if the suggestions of the Dominions Royal Commission can be carried out as to a service of large and efficient cargo liners on our main trade routes.

What we need is co-ordination, co-operation and standardization. By means of these properly applied we can have a merchant marine which will be so efficient as to more than hold its own with any nation, and which will link up the empire with lines of vessels that will be the closest bond of union and that will carry our products to every corner of the globe.

Modern Boiler Practice *

By F. A. Combe, A.M.E.I.C.†

The object of this paper is to give a brief outline of the principles governing boiler and furnace design, with a review of our present knowledge of the laws related thereto, and the trend of modern practice, together with some general notes regarding boiler installation and operation which may be of interest to Canadian engineers and possibly timely in view of the number of new steam plants and extensions to existing plants which it is expected will be undertaken in this country now that war restrictions have been withdrawn.

During the last eight years there has been a considerable advance in the art of generating steam, following a better understanding of the combustion of fuel and heat transmission in boilers, which, while not leading to any radical change in actual construction, has resulted in improved arrangement of boiler heating surface, with more efficient furnaces, boiler settings and plant operation, and engineers and plant owners are beginning to pay more attention to this very important part of power production.

In the past it has been too often thought that anyone could lay out a boiler room, with the result that plants have been put in without proper consideration of their suitability for the particular conditions, or, even when good boilers, stokers and main apparatus were installed, no facilities for economic operation were provided. More money can be saved or lost in the boiler room than in any other part of the plant, yet, while the latest refinements may have been added to the engine room and electrical side, the boiler room has been considered as a necessarily dirty place to be avoided as much as possible. The condition of this same boiler room under operation is, however, usually a direct indication of the ability of the plant designer or management, or both, as a boiler room need not be dirty, and dirt generally means

†Engineer for Canada, for Babcock & Wilcox Limited.

inefficiency and bad management somewhere. At the present time when the question of fuel supply is of such importance in Canada, every effort should be made to ensure its efficient use, and steps taken where possible, through education and control, to cut down the enormous waste which occurs annually through inefficient operation, or the false economy or indifference of the plant management.

The operating efficiency of the engine room machinery is largely inherent in the design, that is to say, beyond the control of the attendant, but, although a boiler and furnace must be properly designed, its actual efficiency in service is to a great extent dependent upon intelligent operation and supervision, and for that reason warrants the placing of the most intelligent and highest priced men with every modern appliance in this part of the plant, since an increase of even a fraction of one per cent in efficiency represents the saving of a considerable quantity of coal annually. Such a distribution of labour and superintendence is very seldom the case at the present time.

The present day tendency towards high steam pressures and temperatures, concentration of power and larger unit capacities have led to the practical elimination of the shell boiler for this service and to certain modifications in the setting and rating of water tube boilers. The different water-tube boilers made to-day, suitable for these conditions, resolve themselves into two general classes,—horizontally inclined straight tube boilers and vertically inclined bent tube boilers. Fig. 1 shows a section of a standard longitudinal drum boiler of sectional header construction with vertical baffles, fitted with a superheater and chain grate stoker, having a high furnace setting; and Fig. 2 shows a large double setting vertically inclined tube boiler with superheater and underfeed stokers. For the purpose of illustrating the application of the principles entering into boiler design, the author will confine his attention chiefly to the former type of boiler and its recent development.

The peculiar conditions under which boilers must necessarily work affect their design to a greater extent than with most machines. It is possible to design a boiler which would give a higher efficiency under test conditions than any yet built, but taking into consideration the general class of service, attention, ease of cleaning, first cost and maintenance, a compromise must be made for continued satisfactory and efficient service.

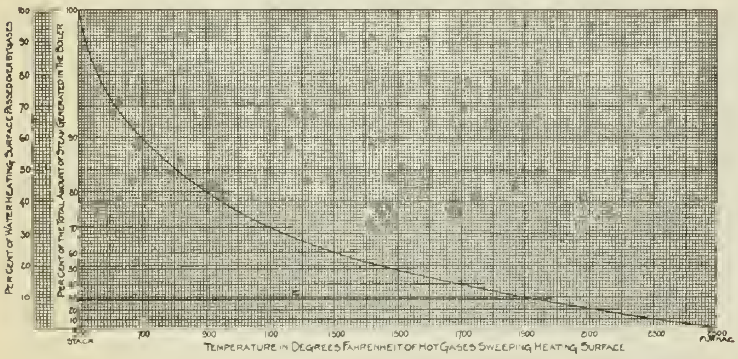

Fig. 3. Heat Absorption by Convection in Standard Boilers.

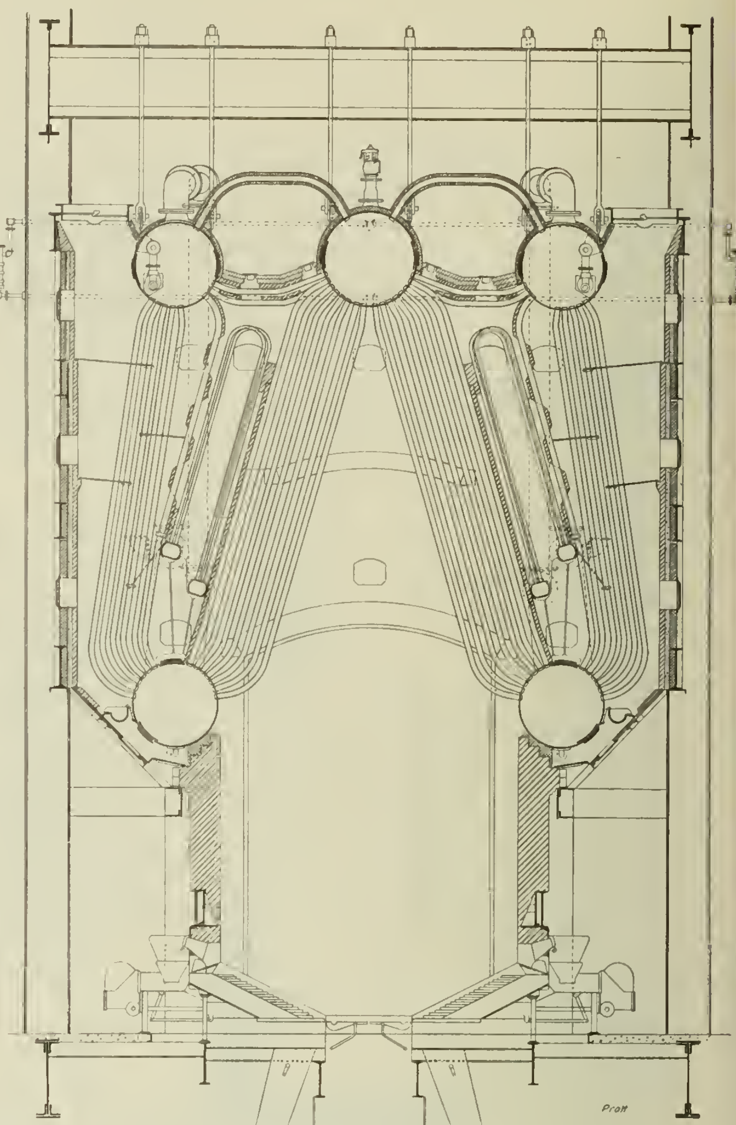

Fig. 2. Double Setting Stirling Boiler.

The more severe demands of modern service and a better realization by engineers of the possible economies to be effected in the boiler room has encouraged the development of boilers for higher efficiency and rating, but it must be understood that, as with any other machine, the higher the rate at which a boiler is operated the more careful attention is needed and the less abuse it will stand. Boilers, engines, or anything else can be, and are, built to stand rough usage, but, if the highest efficiency and rating be desired, they must be treated with respect and for the purpose for which they are designed, for instance:

The function of a boiler is to make steam and it is not at any time the proper place for the treatment and deposit of the impurities in the feed water. Boilers designed for, and operating under, moderate loads will stand a lot of abuse in this way, albeit at a loss in efficiency, and under such conditions the use of chemicals or boiler compounds fed into the boiler with the feed water may be justifiable to lessen adherent scale, but pure soft water

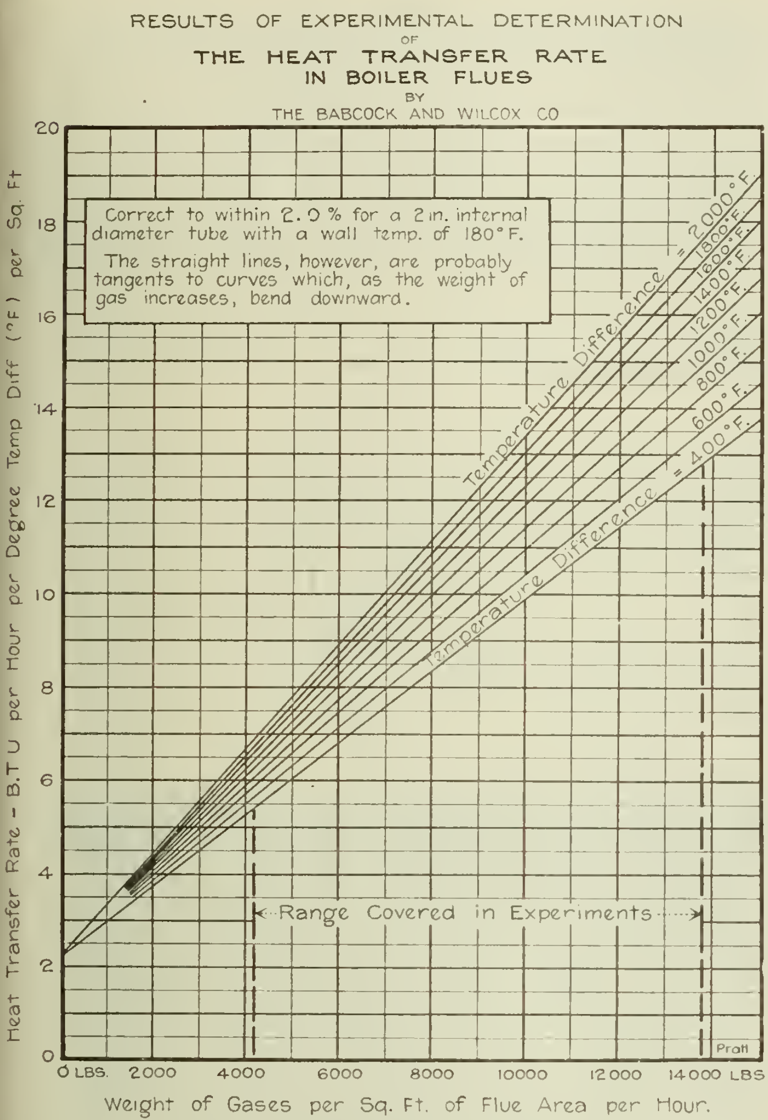

Fig. 4. Heat Transfer in Boiler Tubes.

must be used in any type of boiler which is to be operated at high rates of evaporation in order to get proper benefit from the installation, and to avoid tube troubles, and this usually necessitates the provision of an independent water purifying plant for the raw make up water in the feed supply.

Rating and Capacity.

When speaking of boiler loads or high and low rates of evaporation of boilers, it is necessary to have a clear understanding of the unit on which such evaporations are based, that is, what constitutes a normal full load? In Europe and other countries boilers are usually rated on the quantity of water which they are capable of evaporating per hour under certain conditions with a specified heating surface, but in Canada, following the custom of the United States, boilers are generally rated simply in boiler horsepower, a term often very loosely used.

A boiler horsepower, in its true sense, is solely a unit of evaporation, being equal to 34.5 lbs. of water evaporated per hour from and at 212°F. and equivalent to the standard adopted by the boiler committee of the Centennial Exposition in Philadelphia in 1876. The term has nothing to do, strictly speaking, with the heating surface of the boiler, but at different stages of progress of the art, manufacturers of stationary boilers have adopted as arbitrary standards, certain amounts of boiler heating surface which could be taken as suitable for economically evaporating one boiler horsepower under average conditions of service and with a definite ratio of heating to grate surface. In recent years 10 square feet of heating surface per boiler horsepower or the equivalent of approximately 3½ lbs. evaporation per square foot heating surface has been considered a nominal full load rating for a water tube boiler of standard construction, but considerably higher rates are adopted in modern stationary boilers designed for high duty service, as also in marine boilers where average evaporative rates of 6 lbs. and over per square foot heating surface are usual.

The normal rating, or rate of evaporation, of a boiler, and its point of maximum efficiency is entirely dependent on the design, and while higher rates than 3½ lbs. per square foot heating surface may constitute a so-called overload on a boiler designed for 10 square feet heating surface per boiler horsepower, with a ratio of heating surface to grate area of about 50 to 1, and the efficiency may drop with such overload, it does not follow that the same condition will exist with a boiler and furnace designed for a different rating.

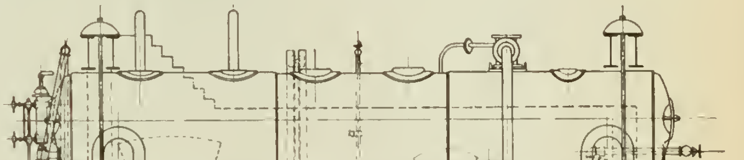

Fig. 5. Modern Waste Heat Boiler.

The rate of conductivity of the metal of the heating surface is sufficiently high to carry away considerably more heat than can possibly be transmitted in boiler service without danger of burning, provided that water be in contact with one side of the metal, so the limit of capacity alone is practically only governed by the positive circulation of the water in the boiler, the cleanliness of the heating surface, inside and out, and the amount of fuel that can be burned, or the gases which can be passed through the boiler.

There is very little difference in temperature of the water throughout any part of a well designed water tube boiler, the circulation being caused by a pumping action set up by the steam bubbles, in a similar manner to an air lift pump, either in the front tubes of a vertically inclined tube boiler, or in the uptake headers of a sectional horizontally inclined tube boiler, and, as with an air lift pump, the rapidity and efficiency of the pumping action is dependent on the avoidance of large chambers in the water passages in which eddies and down currents impede the pumping action. Tests recently carried out on a horizontally inclined tube boiler of the header construction, 28 tubes high, showed that this pumping action amounted to the equivalent of some 18″ of water head when the boiler was operating at rated capacity and that it increased progressively as the load increased. Boilers similar to that shown in Fig. 1, equipped with a duplex furnace are in service operating up to 400% rating during peak load periods or an average evaporative rate of 14 lbs. per square foot heating surface when using purified feed water, so that as far as capacity alone is concerned, a boiler having good circulation can be run at considerably higher rates than has been the usual practice, provided it be kept clean. Cleanliness and positive rapid circulation become of increasing importance as the rate of evaporation is increased.

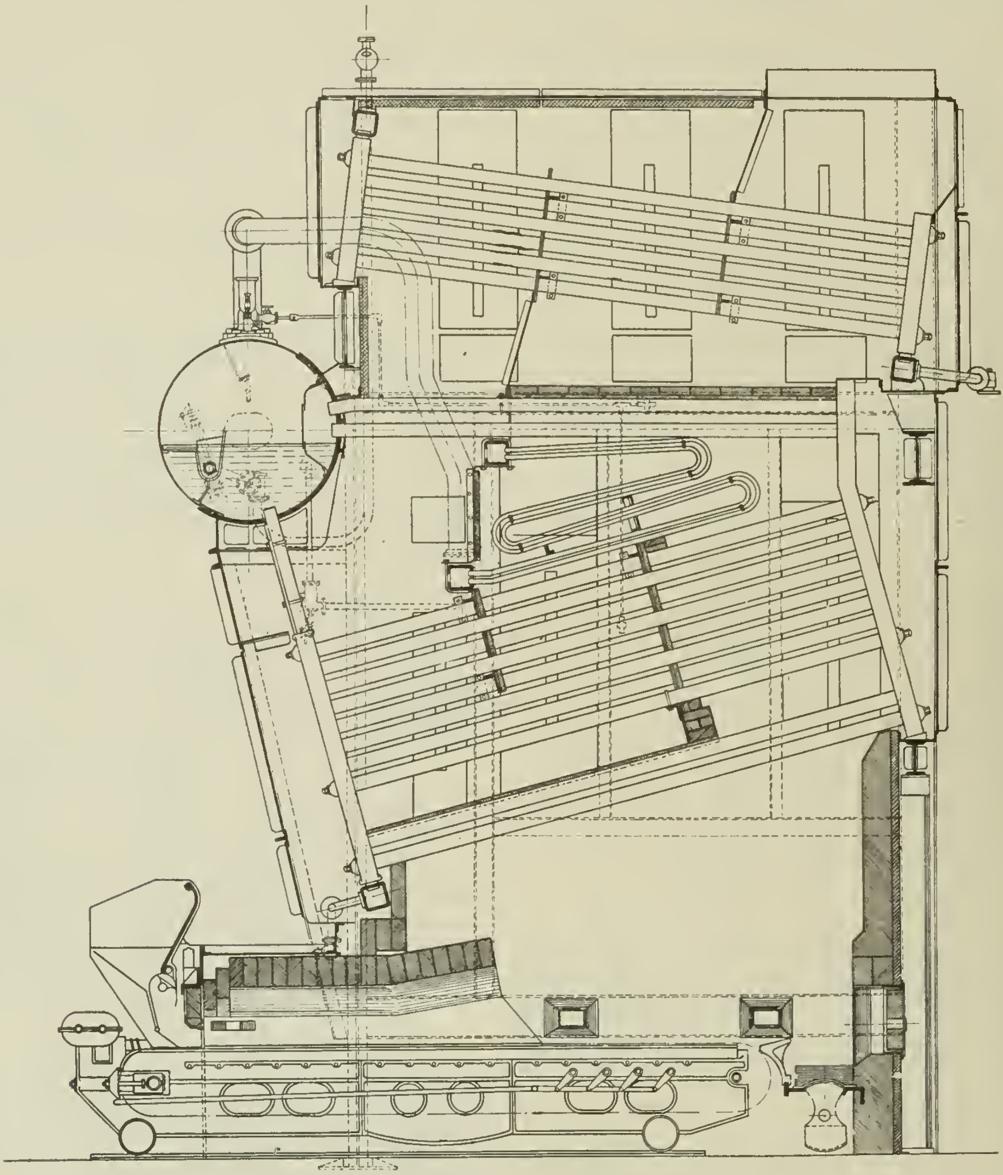

Fig. 6. Cross Drum Boiler with Integral Economizer.

In order to better appreciate the significance of evaporative rates, let us examine the mode of heat transfer in a boiler in the light of our present knowledge, and at the same time see how the general principles are applied in modern boiler design.

Assuming coal to be burned under a water tube boiler at an efficiency equivalent to the production of 12,500 B.T.U. per pound with 18 pounds of gaseous products of combustion; then the temperature above the surface of the fuel bed would theoretically be approximately 2800°. The heat is transmitted to the boiler heating surface, by direct radiation from the surface of the fuel bed and furnace walls and by convection from the hot gases passing over the tubes.

Radiation.

The amount of heat absorbed by the surface of the tubes directly exposed to radiant heat from the furnace is generally proportional to the difference of the fourth powers of the absolute temperatures of the two surfaces, or $= C(T^4-t^4)$ where C is a constant for any unit of surface and time. The laws governing radiant heat or heat rays are analogous to those for light, the heat transfer being extremely rapid, but the great proportion of the heat energy is supplied by the obscure or dark rays, only a very small amount being carried by the actual light or visible rays.

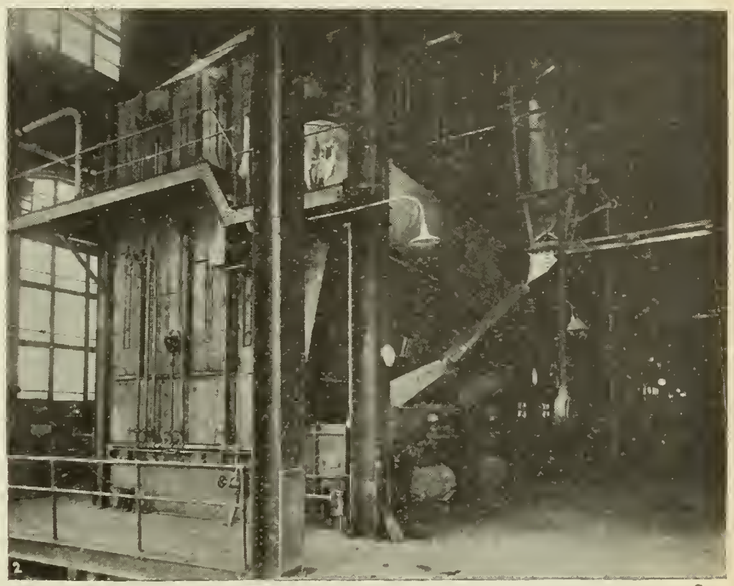

Fig. 8. Boiler Units at Montreal Tramway Company's Plant.

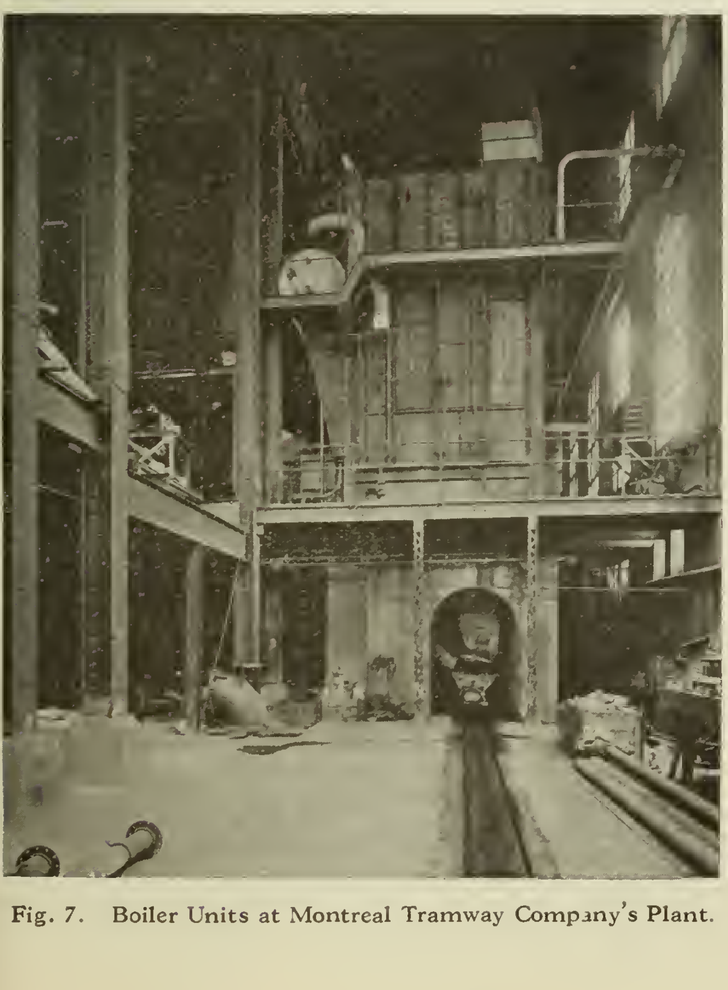

Fig. 7. Boiler Units at Montreal Tramway Company's Plant.

The value of the coefficient in the above radiation formula was determined experimentally for black surfaces by Stefan about 30 years ago, and while this coefficient has been taken as applicable to the partly sooted surfaces in a boiler furnace it is probably far from correct, while the permeability of the gases in the furnace to heat rays, their capability of radiating heat themselves, the reflecting and absorbing power of the fire brick furnace walls and the proper consideration of the exposed areas, are all points on which there is little authoritative data, although investigations are being made into this subject at the present time. Of course a close determination can never be made if the area of the hot surface of the fuel bed is to be a determining factor, as it is obviously impossible to do more than very roughly estimate the average extent of the irregular surface, and there will be, in addition, radiation from the incandescent carbon particles in the gases; but it is questionable if this surface is a necessary factor. With gaseous or oil fuel, we have to deal with

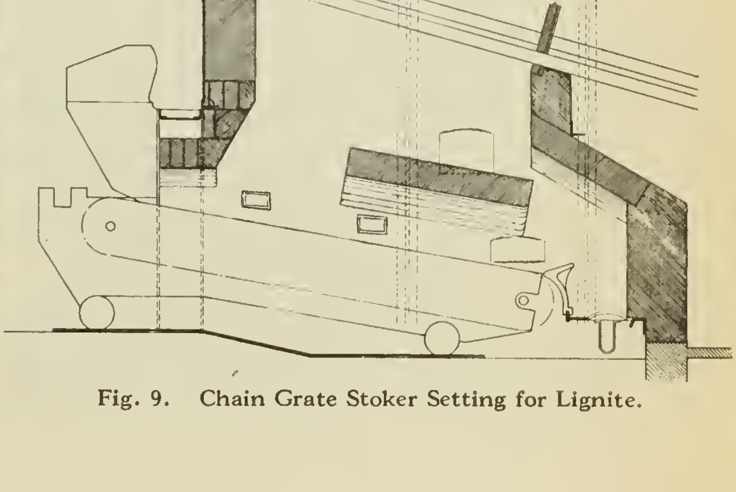

Fig. 9. Chain Grate Stoker Setting for Lignite.

volume radiation which presents a somewhat similar case to that in a gas engine cylinder where the heat from the explosive charge is transmitted to the water jacketed cylinder walls chiefly by radiation, as brought out in investigations undertaken by the explosives committee of the engineering section of the British Association some years ago.

One thing we do know is that in a Babcock and Wilcox boiler, the amount of water evaporated per hour per square foot of surface of the lower rows of tubes exposed to furnace radiation, with a furnace temperature around 2500°F. is at least from 50 to 65 lbs., and as this may represent over one half the total evaporation of the boiler at normal rating, the importance of a full knowledge of the subject of radiation is evident, while it incidentally shows how high the evaporative capacity of a tube is, and that an average evaporation rate of 3½ lbs. per square foot heating surface for the whole boiler gives no indication of the amount of work which any part of the heating surface is doing.

Failure to take into consideration the extent of heat radiation often leads to considerable error in boiler work, both in testing and recording and also in details of the boiler and furnace setting. For instance it is extremely difficult, in fact impossible with the usual type of instruments procurable, to measure exactly the temperature of the gases in a boiler setting owing to radiation from the thermometer bulb or end of pyrometer element to the hot furnace or to the cooler boiler heating surface in close proximity. H. Kreisinger, of the U. S. Bureau of Mines, Washington, presented a paper to the American Society of Mechanical Engineers, in 1917, dealing with this subject, in which he gave the probable error, arrived at by experiment, in temperature measured by a thermocouple placed amongst the tubes of a water tube boiler as from approximately 600° too low at 2000°F. to 40° too low at 500°F. when using a common form of pyrometer with a ½″ diameter element; also showing that the error was proportional to the size or exposed area of the instrument. The author has had some success with a special cap screen surrounding the end of the instrument element, that is, measuring success by the higher temperature recorded, but in any case there will be some correction to make. Even the measurement of the temperature of the flue gases leaving the boiler setting is liable to considerable error unless proper precautions are taken.

Again, the opinion was held until recently that an air space in the walls of a boiler formed a good heat insulator. Actually it is useless and even a disadvantage, as, although still air is a poor conductor of heat, the rate of conduction is proportional only to the actual difference of temperature of the surfaces, whereas radiant heat will pass across the air space at a rate proportional to the difference of the fourth powers of the absolute temperatures of the two surfaces. For low temperatures, as in refrigeration work, air spaces are beneficial, but with a high temperature difference, the heat transfer becomes very great.

To obtain a better insulated wall than that of ordinary red brick for a boiler setting, special insulating material is today often used, either as a middle course between the firebrick lining and the outer wall facing, or on the outside of the brick wall, but it should be realized that if too good an insulation is made, it becomes increasingly difficult with certain types of furnaces to get a firebrick lining to stand the higher temperature attained. Sometimes the entire boiler brick setting is enclosed in a steel casing, but this is rather to give a tight seal preventing the infiltration of air, which occurs through any ordinary brick wall, especially in boilers operated at high ratings with a corresponding greater draft suction in the setting. The cost of these casings is high, but, if properly constructed, are of considerable value and in many cases are undoubtedly a good investment. If they are used, there should always be a course of asbestos or other insulating material between the brickwork and the casing, otherwise the radiation loss may be increased owing to the metal presenting a better radiating surface than the brickwork.

Furnace Duty.

Returning to the furnace and the assumed case, it will be seen that, with the same efficiency of combustion maintained, since heat will be radiated as quickly as generated, the actual apparent temperature will not reach the theoretical figure of 2800° until sufficient coal is being burned to generate the heat necessary to satisfy the radiation equation for 2800° in addition to raising the temperature of the products of combustion to a figure dependent upon their rate of liberation. The stage when this condition is reached will depend on the area of the cool surface exposed to radiation and it does not necessarily mean that apparent high furnace temperature is essential to high efficiency, although they will coincide to an extent dependent upon the constituents of the fuel.

In brick lined extension furnaces or when the lower row of boiler tubes over the fire are encased in brick tiles, as for certain forms of baffling, higher temperatures are attained at a lower rate of combustion on the grate, but this means that the gases also enter the bank of tubes at a higher temperature for the same load, resulting in a corresponding higher exit gas temperature and consequently reduced efficiency, while the higher furnace temperature shortens the life of the furnace brickwork.

With such a horizontal baffling, there will, of course, be radiation from the furnace or hot brickwork to the exposed tubes of the gas passage beyond the tiles, while heat will be conveyed from the furnace to the lower tubes through the encircling tiles by conduction and possibly secondary radiation, but following the fourth power law of temperature difference the amount will be considerably less than for a direct exposure, and it is, therefore, preferable, wherever a high furnace temperature is not necessary for proper combustion, for a lower horizontal baffle to take the form of flat tiles laid on the second row of tubes from the bottom so as to gain the full effect of direct radiation, which is the most active and, therefore, the most economical mode of heat transfer.

If the furnace efficiency could be maintained constant, the temperature of the gases entering and leaving the boiler heating surface would increase with increasing coal consumption, resulting in a continued decrease in overall efficiency as the load increased, but in general practice, the furnace and grate efficiency increases with the load up to a certain point dependent on the proportions of boiler, furnace and grate, so offsetting the drop in efficiency due to the higher flue gas temperature. With a standard setting of boiler designed for 10 square feet of heating surface per boiler horsepower, or an equivalent normal full load evaporation of 3½ lbs. per square foot heating surface, and a ratio of heating surface to grate of about 50 to 1, the maximum efficiency will usually be maintained fairly constant from 90% to 130% rating. Below 90% rating the loss in efficiency is chiefly due to incomplete combustion in the furnace and grate and above 130% rating chiefly due to the increasing exit gas temperatures, the furnace and grate having then reached their highest efficiency. For other proportions and designs of boiler and furnace the point of maximum efficiency will be different; for instance, the very complete tests carried out on the large Stirling boilers at the Detroit Edison Company's plant some years ago showed the highest efficiency of over 80% at 75% rating (based on 3½ lbs. normal evaporation rate) and dropping in a straight line to 76% efficiency at 200% rating. This remarkably high efficiency over such a wide range of load was due to the exceptionally large combustion chamber, promoting almost complete combustion even at low loads; the skilled regulation and operation; and the small proportional radiation loss from the walls with such a large unit. Fig. 2 shows a section of one of these boilers.

The general tendency in modern design is to provide greater and greater furnace volume to ensure more complete combustion before the gases reach the comparatively cool boiler heating surface. Not many years ago the ratio of cubic feet of furnace volume to square foot of grate usually provided was about 3 or 3½ to 1, whereas today we may have 5½ or 6½ to 1 for natural draft stokers and even more for forced draft stokers, particularly when high overloads are demanded. In the Detroit Edison boilers mentioned above the ratio was approximately 9 to 1. For horizontally inclined tube boilers this increased combustion space generally means that the mean height from the floor line to the lower tubes over the fire has been increased from approximately 6 or 7 feet to 9 or 10 feet and over, where conditions permit, and as required by the nature and volatile content of the coal, type of stoker and duty.

Convection.

The best method of passing the gases over the tubes, and the relative advantage of different form of baffling have been discussed at various times, but it seems reasonable that a cross flow over several passes of staggered tubes avoids stratification by ensuring the most thorough breaking up of the gas currents, with the consequently better contact of all particles with the walls of the tubes, while with the first pass at the upper end of the tubes, a contra flow action to the circulation of the water in the boiler is obtained and, at the same time, with a horizontally inclined tube boiler, the circulation will be improved, and the danger of blistering the lower row of tubes lessened by procuring the quick release from the tubes of the steam bubbles formed.

The laws governing heat transfer by convection from the gases passing over the boiler heating surface has been the subject of many investigations, and formulæ have been put forward based on mathematical deduction and laboratory experiment, but the great majority of these formulæ, while holding good within the limits of the experiments, are not applicable without considerable correction for the conditions existing in a full size commercial boiler, especially where the gases pass across a bank of tubes, in which case the area of the gas passage is not constant. In view of the lack of authoritative data on the subject, the Babcock & Wilcox Company, a few years ago, conducted a series of experiments with a specially constructed plant to determine a formulæ with coefficients which could be depended upon, for the rate of heat transfer in boilers.

The relation of the heat absorbed by convection only from the gases to the amount of heating surface passed over in a boiler of standard proportions under coal fired conditions on the basis of 10 square feet heating surface per boiler horsepower is given by the curve, Fig. 3, which shows that the great proportion of the total evaporation takes place in the first pass of the boiler and very little in the last pass; for this reason it does not pay, with these proportions, to increase the heating surface by adding another pass.

A test was published a few years ago of a 4 pass boiler in which the actual drop in temperature through the last pass was only 67° and even this drop was obtained only by reason of the low steam pressure carried (117 lbs. per sq. in.). With a steam pressure of 200 lbs. and a corresponding less difference of temperature between the gases and the water, the flue gas temperature must have been higher and the value of the fourth pass still further reduced.

Waste Heat Boilers.

In direct fired boilers where furnace temperatures are high, and the weight of gas per boiler horsepower comparatively low, there is not a great deal of difference in heat transfer between several different types of standard boilers, fire tube or water tube, when new and clean; but with boilers arranged to utilize the heat from waste gases where larger gas weights are handled, with generally, lower temperature differences, the area, length and arrangement of the gas passages must be very carefully considered in order to obtain transfer rates for an absorption comparable to direct fired practice, and so extract the maximum heat from the gases with an amount of heating surface which will make the installation of a waste heat boiler a commercially economical proposition.

It was principally for such work that the experiments on heat transfer above referred to were undertaken, as with waste gases, the radiation factor being largely negligible, it is possible, with a proper knowledge of the laws governing heat transfer, to calculate very closely the results that will be obtained with a given boiler and vice versa to design a boiler to give the maximum return for the investment.

The results of the investigations are given graphically in Fig. 4, which shows the effect of gas velocity on heat transfer rates. For ease in computation, owing to the variation in density of the gases with the temperature, the velocity is considered in terms of gas weight per unit area.

It will be seen that at low rates of gas flow, as found generally in boiler practice, the transfer rates are affected by the velocity to a much greater extent than by any rate of temperature difference, also that the effect of temperature difference increases as the rate of gas flow increases. The effect of gas velocity on heat absorption had previously been appreciated to a certain extent, but its full importance for waste heat work, as brought out by these experiments, has led to developments in boiler design which has opened up this field to a remarkable extent.

Up to a comparatively few years ago, when boilers were installed to utilize the heat in the waste gases from furnaces, kilns, etc., it was the practice to use boilers of the same general design as for direct coal fired purposes, or even with still larger gas passages in order to interfere as little as possible with the draft at the primary furnace. This meant working on the upper part of the curve, Fig. 3, and necessitated the provision of such an excessive amount of boiler heating surface for the steam produced that the installation became a doubtful investment.

Following the better understanding of the laws governing heat transfer and the possibility of economies from the utilization of a greater proportion of the heat from waste gases, this subject has been receiving particular attention during the last few years and efficient boilers are now in successful operation in connection with all kinds of kilns, furnaces and ovens with temperatures as low as 1000°F.

Fig. 5 shows the side elevation of a typical B. & W. boiler fitted with a superheater, designed for waste heat work.

The high gas velocities necessary for efficiency in waste heat boilers results in greatly increased frictional resistance through the setting, the draft loss running in many cases to over 2″ water pressure and, of course, requiring the use of induced draft fans to handle the gases. The power required to drive the fan is, however, many times offset by the increased efficiency and capacity obtained, while, in many cases, the installation of waste heat boilers has actually resulted in an increased output from the primary furnace owing to the possibility of greater draft at the outlet by the use of a fan in place of the original chimney.

Many factors have to be taken into consideration in waste heat boiler work, peculiar to the particular nature and origin of the gas; for instance the dust held in suspension in many forms of waste gases, especially from cement kilns, has a considerable influence on the weight of gas handled and the draft resistance, and a knowledge of the effect of such factors and the proper way of taking care of them can only be obtained by experience.

Modern Boiler Design.

In modern direct fired boiler design, the principle of higher gas velocities is also adopted where advantage can be gained, and the tendency is to reduce the heating surface, or increase the evaporative rate, of the boiler proper employing it primarily for steam raising, and adding additional independent surface for water heating, in order to get a more efficient total heat transfer by the increase in temperature difference for a portion of the total heating surface. This practically means combining a boiler and economiser in one unit proportioned to give the highest efficiency and resulting in less total heating surface and considerable saving in space and of many of the losses incident to the use of separate economisers.

A cross section of such a boiler is given in Fig. 6., a study of which will show that the maximum effect of direct radiation is obtained while the hot gases, entering the tube bank at the uptake end and passing at right angles across the staggered rows of tubes at high velocity through the long passages of the boilers and economiser fulfil conditions conducive to high efficiency.

In Figs. 7 and 8 are given two views of one of four boilers of this type recently installed at the Montreal Tramway Company's plant at Hochelaga, being the largest boilers in Canada. Each of these boilers contains 5625 square feet heating surface in the boiler proper or steam raising section and 2909 square feet economiser or water heating section, giving a total heating surface for the unit of 8534. These boilers are capable of easily generating over 40,000 lbs. steam per hour at 200 lbs. per square inch steam pressure and 150°F. superheat from a feed water temperature of 120°F. It will be seen that the equivalent evaporative rate for the boiler proper is as high as 8.75 lbs. per square foot heating surface, or 5.75 lbs. for the whole unit, in spite of which, it is possible to reduce the temperature of the gases below what it would be with a standard boiler of 3.5 lbs. normal evaporative rate, that is to say, with considerably more heating surface. Each unit is steel cased, lined with special non-conducting material to minimize air leakage and radiation, and fitted with double chain grate stokers, having a total grate area of 224 square feet.

An interesting feature in connection with these units is the draft apparatus comprising a specially formed stack for each pair of boilers, having a constricted throat into which a high pressure air blast is delivered through a nozzle from a small fan; the action being that of an ejector, inducing a suction in the flue connections to the boilers.

A complete test of these boilers has not been made, but in a paper read before the British Insititute of Civil Engineers about a year ago, details are given of a test made on a boiler of this type, approximately the same capacity, but containing 4963 sq. ft. boiler heating surface and 4086 sq. ft. economiser surface, in which a thermal efficiency of 88.33% for the unit was obtained, the exit gas temperature being 293°F., and the evaporation per sq. ft. boiler heating surface 9.53; while another test made in 1916 at the Hague municipal plant with a slightly smaller unit gave an overall efficiency of 88.41%. It is probably not possible to obtain such efficiencies with the coals usually obtainable here, but it indicates that a very high efficiency in steam generating equipment has been reached.

Boiler Efficiency.

It is to be understood that in a boiler of the usual construction, where the temperature of the water in the boiler is practically at the temperature of the steam, it is obviously impossible to reduce the temperature of gases below that of saturated-steam at the pressure carried, in fact, while it is possible to add heating surface to reduce the gas temperature below 100° above the steam, the very low transfer rate resulting from such a small temperature difference in the last passes of the boiler does not warrant the expense of the additional heating surface.

In a great number of published boiler tests the exit gas temperature is given as near the temperature of the steam, but such temperatures will usually be found to have been incorrectly measured, owing either to air leakage around the boiler damper or to radiation, as pointed out earlier in the paper. The saturated steam temperature referred to in this connection must not be confused with the superheated steam temperature leaving the boiler when a superheater is installed, as the exit gas temperature is often considerably below the superheated steam temperature, the superheater coils being placed in the high temperature gas zone.

For a proper consideration of the efficiency of a boiler, the steam pressure carried must be taken into account. It is not fair to compare the efficiency of a boiler operating at, say 100 lbs. pressure with a boiler operating at 200 lbs. pressure where the temperature of the boiler heating surfaces differs by 50° and the necessarily increased flue gas temperature results in a greater heat loss with a corresponding reduction in the efficiency as usually measured. For this reason it has been proposed that the efficiency of a boiler be measured in terms of its 'true' efficiency, or the ratio of the heat actually absorbed to the heat theoretically available for absorption, which latter value corresponds to a reduction of the temperature of the flue gas to the temperature of the steam. In the same way allowance is made in England and Europe for the burning of the hydrogen in the coal which leaves a boiler in the form of superheated steam, but which in a calorimetric analysis of the coal is condensed and its latent heat added in the heat value obtained. The revised heat value, corrected for the hydrogen content is termed the lower or nett calorific value of the fuel.

Stokers and Fuels.

The greatest factor in the overall efficiency of a boiler unit lies, of course, in the combustion of fuel in the furnace. It is not within the scope of this paper to deal with the theory of combustion, and a great amount of literature has already been published on the subject, but one of the chief causes for inefficient combustion lies in the faulty design of the furnace and the lack of volume provided for the proper mixing and burning of the gases before striking the cool boiler heating surface. With hand firing under small boilers, the skill of the fireman in keeping an even regular fire is also a big factor, but with larger boilers and automatic stokers a great deal of this work is taken care of and, if operated intelligently, with the aid of recording instruments, a high degree of efficiency can be maintained.

The advantage of automatic stokers for plants of over 500 boiler horsepower has now become generally recognized and the only question for the engineer to decide is what stoker to instal. No type is suitable for all coals and conditions of service. Where boilers of a nominal evaporative rate of 3½ lbs. are to be forced to high capacities or where anthracite coal is to be burned, forced draft stokers will probably have to be used and in considering high overloads, allowance should be made for the extra upkeep cost generally entailed and the consequent need for reserve boilers.

Difficulties have frequently occurred through the installation of a chimney of insufficient height to freely take away the products of combustion from the furnace of a forced draft stoker when operating at a high rate, the assumption having been made that as there was an air pressure under the grate, very little chimney draft was necessary. The result has been that a pressure has built up in the furnace, causing excessive burning up of the brick walls by reason of the hot gases being forced into the cracks. A definite suction, say 1/10 inch of water, should always be maintained in a furnace of this type and as with boilers forced considerably above their rating the resistance through the boiler itself becomes considerable, it does not allow of much reduction in the height of chimney to be provided.

For steady running on continuous moderate loads, the natural draft stoker will probably give the best satisfaction; of this type the chain grate is the most common and probably the most logical way of burning high volatile coals, possessing the advantage of simplicity and ease of adjustment to suit the particular grade of coal and load conditions.

In view of the attention now being paid to the utilization of the Western Canadian lignites, it may be of interest to mention that a chain grate stoker was installed in 1913 in the University of Alberta, having a special setting of arches similar to that used in England and Europe and very excellent results have been obtained with the Edmonton lignites on this stoker, so much so, in fact, that several engineers in the Western cities have modified their standard stoker settings as far as possible to conform to it. A similarly set stoker has recently been installed at Moosejaw where the higher moisture Saskatchewan lignites will be burned, and from information received it promises to also prove satisfactory.

Fig. 9 shows the typical setting; the essential feature being the centre and back arch construction, which, by deflecting the gases and reflecting the radiated heat towards the front of the grate, drives off the moisture from the freshly fed coal. A front coking arch of the standard form is of no use for this class of fuel, as the excessive moisture prevents it getting hot and so hinders the ignition. This arrangement of arches is hardly suitable for burning higher grade bituminous coal, as the centre arch would generally not stand up for long against the higher furnace temperatures, but it has been used extensively for low volatile or semi-anthracite coals, which cannot be burned satisfactorily with a natural draft chain grate stoker with the standard arch construction.

Oil and natural gas make excellent fuels in that high combustion efficiency and regulation can be easily attained with low operating cost and with increased cleanliness in the boiler room, but in Canada, oil is generally only economically available on the west coast, while natural gas is confined to but few localities, and the supply limited.

Powdered coal has been receiving considerable attention in recent years. At present the plant required for, and the cost of crushing, pulverizing and drying has generally limited its use to industrial plants where the fuel can be used in heating furnaces in addition to the boilers. For satisfactory operation, the coal must be pulverized to a degree equivalent to 95% through a 100 mesh sieve and should be dried to contain not more than 1% moisture.

A form of extension furnace is commonly used when fired under a boiler, the coal dust being fed through one or more nozzles into the furnace in a fine cloud. Air for combustion is partly carried in with the fuel and partly supplied through annular spaces around the nozzles, either under pressure or simply drawn in by suction. When properly regulated a high efficiency can be obtained and coal utilized which would be difficult to burn in the ordinary way, but care must be taken to avoid unconsumed coal being carried over into the boiler and also in handling the ash which settles in a molten slag condition to the bottom of the furnace, by reason of the high temperature attained, and which, if allowed to solidify, is very difficult to remove. As the finely powdered coal is in a highly combustible state, proper precautions must also be taken in the storing, distribution and firing to prevent explosions. Brickwork troubles, from the high furnace temperature has been one of the difficulties to overcome with the burning of this fuel.

Blast furnace gas and by-product coke oven gas can be used to great advantage under boilers, a considerable advance having been made during the last few years in the efficiency obtained. This has chiefly been brought about through improvements in furnace design and types of burners, while the application of boilers of a similar design to those used for waste heat work now promises a still greater advance in this field.

Selection of Boilers.

The best type of boiler to use in any plant must depend upon the conditions of service. For continuous steady loads such as in manufacturing plants where generally the boiler room does not receive special attention for operation, the standard boiler of 3½ lbs. evaporation per square foot heating surface will usually be found to be the best, with an installation of the regular separate cast iron economizer where conditions show that a saving will be made, and this is usually an easy matter to determine. An automatic stoker should also be chosen with a view to continuous steady service with the minimum cost for upkeep and repairs to stoker and furnace brickwork, and suitable for the particular class of coal which it is intended to burn.

In many manufacturing plants some kind of refuse can be utilized as fuel which usually requires a special form of furnace. Probably saw mills and pulp mills are the chief plants in this country where refuse is burned, being then in the form of hogged bark and edgings; and a straight extension furnace of the Dutch oven type is generally found to be the best, with a large surface of hot brickwork to drive off the moisture when, as is usually the case, the wood is wet. Step grate furnaces are largely used in Europe. To obtain the best results, the areas and proportions of the furnace must be carefully designed; very often the chief consideration appears to be merely to get rid of the refuse without any effort to obtain the maximum efficiency, with the result that a considerable amount of coal is burned as an auxiliary which would not be necessary if the waste were properly utilized.

For large central stations and public service power plants, where floor space is of more value and load conditions special, the selection of boilers and stokers requires more study. In this service the load is usually very variable with short heavy peaks and a more elaborate lay-out and system of operation is justified. The general practice for these plants in the United States has been to get more and more out of the standard boilers of 10 sq.ft. per horsepower normal rating, in conjunction with regular economizers, by forcing them considerably during peaks. Particular attention is paid to good boiler and furnace design, and although the efficiency falls off at the high rates of driving, and the upkeep cost of brickwork and stoker is considerable, owing to the high furnace temperature, the practice has been considered warranted by the advantages gained. In these plants special precautions are taken to supply pure feed water, while expert attention is necessary for successful operation. In England and Europe the practice tends towards the use of boilers of the type shown in Fig. 6.

The proper size of boilers to instal is, of course, governed by the size of the plant and the load conditions and no fixed rules can be laid down. In the United States there are some very large units, considerably larger than any installed in other countries, the Stirling boilers at the Detroit Edison Company's plant, shown in Fig. 2 having a normal rating of 2365 boiler horsepower based on 10 square feet of heating surface per horsepower. In Canadian plants it will probably be a considerable time before units larger than 1000 or 1200 horsepower are warranted. There is a disadvantage in putting "too many eggs in one basket," as the failure of a tube or other cause of shut down means cutting off a big source of power and wasting a lot of coal, but in operation the efficiency is increased through a reduction of radiation and other losses over several smaller units.

Operation.

There are comparatively few plants in Canada where a separate water purifying apparatus is installed; for small plants where moderate loads are carried on the boilers, some form of compound can be fed in with the feed water suitable for the nature of the water used, but as pointed out earlier, the boiler is not the proper place to treat the water and where the highest efficiency is desired or where boilers are to be run at high rates of evaporation, it is essential that the water be treated in a separate apparatus. In the most modern stations, the tendency seems to be towards the use of evaporators to purify the make-up feed water to ensure the absolute removal of all impurities, as in marine practice. It is not sufficient that heavy scale be prevented from actually adhering to the metal of the heating surface, as floating scale, which may temporarily lodge in one place, is apt to cause burning under high rates of evaporation. Oil is one of the most prolific causes for trouble in a boiler, the least sign of it often causing blisters on the boiler heating surface exposed to the furnace heat, even under moderate loads.

A trouble which may arise, unless proper precautions are taken, especially when using as feed water, the condensed steam from a surface condenser, is corrosion in the boiler and economizer from the air entrained in the water. The latest investigations indicate that it is the CO_2, and not the oxygen, present in the air which is the active agent in the corrosion and it is necessary that this be got rid of before feeding the water to the boilers, either by heating and the provision of efficient air escape pipes, or by chemical treatment with calcium hydrate (slaked lime). The use of air pumps which draw off the water and vapour together from surface condensers are particularly undesirable when the condensate is to be used for boiler feed as this water is strongly impregnated with air.

For efficiency and capacity it is also necessary that the outside of the tube heating surface be kept free from soot, and mechanical soot blowers are now being used to a great extent as an easy means of ensuring more regular and effective cleaning than is generally possible with the somewhat arduous task of hand cleaning with a steam lance.

While it is of first importance that good boilers and furnaces be installed, their value is to a great extent lost unless the boilers are kept clean and the plant efficiently run, and it is impossible to expect intelligent operation unless instruments and meters are provided as a guide for the operator. The old idea of the fireman telling by a look at the furnace if coal was being completely burned is obsolete, and, after all, the furnace is only one factor of efficient operation, although the greatest. Some modern boiler rooms are now fitted with regular control boards and instruments by which losses can be immediately detected and located and there is no doubt that the cost of such indicators and the extra supervision entailed is saved many times over in the yearly fuel consumption. Coal scales and water meters are necessary for purposes of record and check on deliveries, yet they do not by themselves ensure efficiency in operation. If thermometers, draft gauges, flue-gas analysers, etc., are used intelligently as a guide for operation, the coal consumption will take care of itself; and with a proper log system, continuous records can be made over extended periods under actual operating conditions which are of real practical value and not subject to the often misleading conclusions resulting from short tests.

Probable Future Development

It does not seem likely that there will be any great departure in the near future from the present general design of boilers, but the probable adoption of steam at higher pressure and temperature in turbines will lead to certain modifications with possibly a more pronounced segregation of the evaporating and water heating surfaces. Several boilers of the type shown in Fig. 6. are already in service in England, and the United States, under a working steam pressure of 350 lbs. per square inch and a steam temperature of 700 to 750°F, and others are under experimentation up to pressures of 500 and 600 lbs. These higher pressures, of course, prohibit the use of any flat stayed surfaces in boiler construction, and the very best material and workmanship must be employed; but from a constructional and operating point of view, higher pressures and temperatures will not be governed by boiler limitations.

With regard to methods of construction, welding of joints in drums does not at present seem likely to replace riveting, although it is receiving some attention and is used in conjunction with riveting on some marine boiler work.

During the last few years, several of the Canadian provinces have put into force very complete regulations to ensure safety in boiler construction and operation and an effort is being made for the adoption of a uniform code of laws for the whole Dominion. The advantage of this, in the protection it would afford to steam users, and the possibility of standardisation for manufacturers would be very great; while if, in addition, a system of control, propaganda and educational work could be carried out by a fuel administration department, it would be of inestimable value to power plant operators and lead to conservation of our fuel resources which form a very large part in the cost of power production.

YOUR ATTENDANCE AT THE ANNUAL MEETING WILL HELP TO MAKE IT WHAT IT IS EXPECTED TO BE---THE LARGEST AND MOST SUCCESSFUL IN THE HISTORY OF ENGINEERING GATHERINGS.

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

VOL. II. FEBRUARY 1919 NO. 2

Summary of Legislation Situation

At the General Professional Meeting held in Saskatoon in August, 1918, the question of Legislation was brought prominently before *The Institute* for the first time, an entire session of the meeting being devoted to this subject. In a paper presented at this session and published in the September issue of *The Journal*, by F. H. Peters, M.E.I.C., of Calgary, a general outline was given of the activity regarding legislation on the part of the western Branches, showing that in the west particularly the subject of Legislation was a live issue and had aroused a great deal of interest.

At the same session of this Professional Meeting a draft act was submitted from the Legislation Committee of the Saskatchewan Branch and after discussion was referred back to the Committee for certain alterations before being forwarded to Council.

On receipt of this Act by Council which was accompanied by a request from the Saskatchewan Branch to be allowed to present it at the fall session of the local Legislature, a special meeting of Council was called and held on October 1st, when the entire session was devoted to the subject. At this meeting a draft act was drawn up based on the Saskatchewan draft, copy of which was forwarded to all branches asking for discussion. This draft was published in the November issue of *The Journal*, page 331, and the Saskatchewan Branch was requested to withhold action until all branches had been given an opportunity of discussing and making recommendations. An editorial on the subject appeared in the November *Journal* on page 335.

As a result of the request of Council to the Branches that legislation be discussed at all branches and the fact Council endorses the principle of legislation to improve the status of Engineers, the question is receiving considerable attention from coast to coast, resulting in a large amount of inter-branch and headquarters correspondence on the subject.

A suggestion of the Manitoba Branch that representatives of each legislation committee of the various branches meet at some central point and agree on a draft act met with general approval in the West, it being felt that this committee should meet and agree so that the question could again come up at the annual meeting. Branch news, pages 409-410 of the December *Journal* contain further reference to the subject. Meanwhile, it became evident to the members of the Saskatchewan Branch that they could secure early legislation and consequently they wired headquarters an urgent request to be permitted to present a draft act immediately. Resulting from this a special meeting was held at headquarters on Tuesday evening, December 3rd, at the call of the President, to consider the request of the Saskatchewan Branch, and to receive the report of a special committee appointed by the President to confer with a special committee of the Mining Institute. At this special meeting of Council it was found that the report of the special committee was unfavorable to any immediate attempt to secure legislation. The draft act submitted was found to differ from the draft submitted by Council. It was considered necessary to advise the Saskatchewan Branch that it was not within the power of Council to approve of the act without a mandate from the membership. Meanwhile the subject has been the foremost topic on the part of the Western Branches, and formed the subject of discussion at two meetings of the Montreal Branch.

A new draft act revised on December 4th has been received from the Alberta Branches where it is believed that immediate Legislation can be secured. This act has not been critically analyzed by the Council. In a letter from Lt.-Col. W. P. Anderson, past President, who was present at the meeting of the Edmonton Branch when Legislation was discussed, he strongly urges that the branches be given authority to secure legislation.

Correspondence from the Prairie Branches shows that there is a strong feeling in favor of early action and that a definite policy be formulated not later than the Annual Meeting.

The Montreal Branch resolved that Council be asked to arrange for the appointment of a committee representing all Provinces and all branches to inquire into, study, and report on the whole question of legislation.

A resolution of the Manitoba Branch held on January 2nd, reads as follows: " That in view of the necessity for prompt action on the question of legislation, the Secretary be instructed to write to all of the other branches requesting that each appoint a representative with full power to act, to attend the coming Annual Meeting to assist in drafting a suitable act for presentation to the various Legislatures."

Victoria and Vancouver Branches have endorsed the action of Council in requesting more mature deliberation. Hamilton, Toronto, Halifax and St. John all favor a general agreement on the question before action is taken to secure legislation.

At the Annual Meeting of the Quebec Branch held on December 21st, it was resolved that it was expedient and urgent to give as soon as possible the member of *The Institute* an opportunity of expressing their views on the necessity of securing legislation similar to that of other professions. That uniform legislation should be enacted for each province in order to enable the engineers of one province to practise civil engineering in another province, consequently the Quebec Branch beg the Council to immediately frame up a legislation project that would meet all the requirements of the situation and then be submitted to the different branches; also to secure through a referendum the opinion of the members of *The Institute* on the opportunity of having such legislation.

The Ottawa Branch has appointed a representative to confer with the representatives of the other branches, and a telegram to the Manitoba Branch included the following: "Your letter of January 6th. Managing Committee in sympathy with your aims to the end that satisfactory legislation should be sought as soon as possible. We believe Council must ultimately direct such action as should be taken after a representative committee has studied and reported on the whole question. We are arranging to have a delegate of the Ottawa Branch meet other representatives here in advance of Annual Meeting which is limited to first day of Convention."

If this meeting is held before February 11th, it will provide an opportunity of having the views of all Branches presented for discussion at the Annual Meeting.

Government Considering Salaries

The Committee of *The Institute* consisting of W. F. Tye, Chairman, H. H. Vaughan, President, and G. Gordon Gale, Chairman of the Ottawa Branch, were pleased with the courteous reception they received from the Honorable Dr. Roche, Chairman of the Civil Service Commission, when they met the Commission to advise regarding the grading of salaries of engineers in the employ of the Government. Not only was consideration promised of the suggestions made, but the committee was requested to make definite recommendations.

P. H. Myers, Acting Chief of Staff Organization Branch, Civil Service Commission, who has charge of drawing up schedules for salary classifications has expressed his appreciation of the advice given, and in thanking the Committee for the information, stated that he would probably have occasion to accept the kind offer of further assistance.

No Railway Rebates

In response to a request to the Eastern Canadian Passenger Association for consideration of rebates on passenger tickets to the Annual Meeting at Ottawa, the following letter was received, showing that no rebates will be available.

Dear Sir:—

The carriers feel that conditions brought about by the war, viz.: shortage of labor and coal, abnormal demands on transportation equipment and power for the handling of returning troops and foodstuffs, do not permit relaxation at the present time of existing restrictions on passenger travel. Reduced fares mean increased travel and, therefore, for reasons stated above, regret to advise you that no reduced fares will be made for special occasions during the year 1919.

Yours truly,
G. H. Webster,
Montreal, Jan. 14th, 1919. Secretary.

Ontario Provincial Division

The Ontario Provincial Division is now established, and it is expected that a meeting of the Executive Committee will take place at an early date for the purpose of electing a chairman and secretary-treasurer or secretary and treasurer. The Executive Committee have suggested Peter Gillespie as chairman pro-tem.

The personnel of the Executive Committee is as follows:—

Councillors:—J. R. W. Ambrose, M.E.I.C., Toronto; Peter Gillespie, M.E.I.C., Toronto; E. D. Lafleur, M.E.I.C., Ottawa; G. A. McCarthy, M.E.I.C., Toronto; John Murphy, M.E.I.C., Ottawa; James White, M.E.I.C., Ottawa; M. H. MacLeod, M.E.I.C., Toronto.

Representing Ottawa Branch:—J. B. Challies, M.E.I.C., Ottawa.

Representing Toronto Branch: — Geo. Hogarth, M.E.I.C., Toronto.

Representing Hamilton Branch: — E. R. Gray, M.E.I.C., Hamilton.

Representing Sault Ste. Marie Branch:—W. S. Wilson, A.M.E.I.C., Sault Ste. Marie.

Non-Resident Members:—Major W. H. Magwood, A.M.E.I.C., Cornwall; G. R. Munroe, A.M.E.I.C., Peterboro; J. L. Morris, M.E.I.C., Pembroke; R. J. McClelland, A.M.E.I.C., Kingston; G. H. Bryson, A.M.E.I.C., Brockville; A. C. D. Blanchard, M.E.I.C., Niagara Falls; T. H. Jones, M.E.I.C., Brantford; J. L. Weller, M.E.I.C., St. Catharines; S. B. Clement, M.E.I.C., North Bay; James A. Bell, M.E.I.C., St. Thomas; R. L. Dobbin, A.M.E.I.C., Peterboro; L. M. Jones, M.E.I.C., Port Arthur; V. A. Belanger, A.M.E.I.C., L'Orignal

Water Resources Conference

A most important Conference of Dominion and Provincial Engineers was held in Ottawa on January 16th and 17th, under the auspices of the Dominion Power Board, of which the Hon. Meighen, Minister of the Interior, is Chairman. A. St. Laurent, the Vice-Chairman of the Board, presided, pointing out as the raison d'être of the meeting that the recent crisis regarding both fuel and power had brought the tremendous importance of both very prominently to the front, and had shown with greater force than ever the necessity among other things of developing and conserving our water powers to the utmost. The first step to this end, seeing that various authorities are handling the problem in different parts of Canada, is to, as far as possible, arrange their methods and organizations along similar lines, viz., the standardization of field and office methods and equipment, uniformity of publications, both in matter and arrangement, period to be covered by each, etc., etc.

The administrative end also had to be considered, with a view to making the requirements and regulations of all the authorities concerned, whether Federal or Provincial, as uniform as possible.

There were present at the Conference:

H. G. Acres.......Chief Hydraulic Engineer, Hydro Power Commission, Ontario.
Arthur Amos......Chief Engineer, Hydraulic Service, Quebec.
R. J. Burley.....Engineer, Reclamation Service, Ottawa.
E. F. Drake......Director, Reclamation Service, Ottawa.
C. O. Foss........Chairman, N. B. Water Power Commission.
T. W. Gibson.....Deputy Minister, Crown Lands, Ontario.
H. W. Grunsky...Legal Adviser, Dominion Water-Power Branch.
J. T. Johnston....Assistant Superintendent, Water-Power Branch.
E. B. Jost........Engineer, Department of Railways and Canals.
R. S. Kelsch......Consulting Engineer, Montreal.
O. Lefebvre.......Chief Engineer, Quebec Streams Commission.
K. H. Smith......Chief Engineer, Nova Scotia Water-Power Commission.
R. G. Swan.......Chief Engineer, British Columbia Hydrometric Survey.
Wm. Young......Comptroller of Water Rights, British Columbia.

together with the following Ottawa Members of the Power Board, viz.:

A. St. Laurent (Vice-Chairman). W. A. Bowden.
D. B. Dowling. B. F. Haanel.
C. N. Monsarrat. John Murphy.
J. B. Challies (Secretary).

As a basis for a uniform system of locating any and all water resources, and analyzing and filing all data of whatever kind concerning them, which is the first requisite to co-ordinated working, there was laid before the meeting a Water Resources Index-Inventory, designed by the Dominion Water Power Branch, and which the Dominion Power Board submitted as one which would suit the needs of any and all authorities concerned with water investigation, whether Federal or Provincial. The basis of the system is the dividing of the country into its main or basic drainage basins, with sub-basins and other divisions, detail maps, a card index system, and a folder equipment, samples of all of which were shown those present, the whole forming an indexing and filing system adaptable to the needs of all the various organizations concerned with any type of water investigation or administration. *The Journal* hopes to publish a full description in an early issue.

After a lengthy discussion as to how various local requirements would be covered by the system, the result of which was to show that it was of such a flexible and comprehensive nature as to cover practically any needs that were likely to arise, and in view of statements by several of those present that they already had the system in use in their offices, in whole or in part, a resolution was passed by the conference recommending its adoption by all Federal and Provincial authorities concerned, and further, to facilitate its adoption, that an explanatory monograph on it, accompanied by maps, diagrams, etc., be prepared for general distribution.

Meteorological data, as a fundamental branch of water survey, was discussed at some length, it being pointed out that continuous and complete meteorological figures were often of inestimable value in deciding as to the water likely to be available for either domestic, irrigation, or power purposes. A Resolution was passed aiming to help the efforts being made to extend the work of the Meteorological Service.

The next matter considered was the co-ordination of the work of investigating water resources, it being pointed out that in view of the fact that several Federal and Provincial organizations were at work on the same matter, in different sections of Canada, it would greatly help if their field and office procedure and their equipment, and finally their publications, could all be largely standardized, both as to form and contents. As a summation of the discussion a resolution was passed recommending the yearly publication of hydrometric data, each report to cover a climatic year, October 1st to September 30th; and to include daily discharge records, but not daily gauge heights, except in those special cases where they are obviously necessary. The Power Board is to prepare and distribute a key map showing the territories covered by the different organizations and surveys. The other details though were thought to be so many and so complex as to require further consideration, and so it was decided to leave them to later conferences, one in the West and one in the East, after which a plenary conference at Ottawa woud make final recommendations on the whole subject.

The final matter before the meeting was that of Water Power Regulations, the question being introduced in the form of a Report prepared by H. W. Grunsky. As the subject is an exceedingly large one, and the report most comprehensive, it was felt that it was impossible to do anything but discuss the main divisions, six in number, viz.: nature of franchise, control of stock and bond issues, rentals, renewal provisions, extent of properties taken over if license terminated, and compensation therefor, in a preliminary way, leaving any decision thereon to a future meeting. The discussion covered such points as sale versus rental, limited versus indefinite franchise, nominal or substantial rentals, uniform regulations, etc., etc., after which the meeting adjourned, first deciding that after the organizations more particularly concerned had gone further into the matter, the Dominion Power Board should call another conference on the subject.

As has been so clearly demonstrated during the last few years, one of the fundamental requisites to the stability and growth of any country is a supply of cheap and dependable power. Canada fortunately possesses the natural sources for this, from coast to coast, in the form of either coal or water, and with a permanently constituted medium like the Dominion Power Board aggressively at work on the problem of co-ordinating the efforts of the various bodies engaged in seeing that these resources are handled to the best advantage, there can be no doubt as to the further progress of the Dominion, as far as water power is concerned. To those who were responsible for the conference, *The Journal* extends heartiest congratulations on the splendid results achieved.

CORRESPONDENCE

The Diving Bell Again

Editor, *Journal:*

I note in the December, 1918, issue of *The Journal,* a letter from Mr. J. J. MacDonald in reply to my letter of October 24th, 1918, with reference to the Caisson used at Halifax Harbor. In his letter Mr. MacDonald assumes that his brief reply clears up the issues raised by me. It would be interesting to know the name of the individual who actually originated the idea of using the outfit of the type employed, and whether the design of the walls was prepared, having in view the use of a caisson of the particular type used.

Mr. MacDonald asserts that the device used by me in Hamilton was lacking in novelty, so far as the regulation of draft is concerned. In making this statement, Mr. MacDonald is either speaking without information as to the actual facts, or deliberately misrepresents them. The device, as used by me here, was capable of being used in depths of water varying between 1 foot 6 inches and 7 feet, and with slight structural modifications, not affecting the principle of the apparatus, this depth could have been increased. The method of obtaining this difference in draft is not in any way fundamentally different from that used in the Halifax outfit. Mr. MacDonald calls the outfit used here, simply a scow with a bottomless central well for working about three feet below the surface, and asserts that any change in draft was impossible. This is not the case. The fact that the Halifax device rested on the bottom when working has nothing whatever to do with the buoyancy and water ballasting principles of the apparatus, except in so far as it aids in maintaining the equilibrium of the apparatus when in operation.

The principle of the bottomless central well is inseparable from diving bells of caissons in any form used in construction work, as a matter of fact, the long air shafts as applied to Mr. MacDonald's device for use in deep water is not at all original as applied to deep water marine work, and the form of the lower part of the caisson is of the general type used on bridge pier foundations. The only parts of the device apparently for which Mr. MacDonald claims originality, are the buoyancy and water ballast chambers. The use of such chambers was made by me on the device used here for floating and moving the outfit when required and for carrying water ballast to increase the dead weight of the apparatus and for regulating the draft of the caisson or bell when in operation.

The matter of the exact name or names which are applied to the device does not alter their functions in any way, and whether Mr. MacDonald calls his device a mobile, pneumatic caisson, or diving bell, or simply a plain floating caisson, as the writer prefers, does not matter and does not affect the fundamental principle in any way. Strictly speaking, the word bell should not be applied to the device, the diving bell proper, so called from its approximate similarity in outline to a bell, has no air lock or shaft, and depends for its ballast on its own dead weight, being suspended in the water from suitable hoisting and lowering apparatus placed above water.

As Mr. MacDonald refers to European practise, it is relevant that I should refer to it also from personal experience in my own particular case. Probably the most extensive recent work carried out by the diving bell type of this device was the construction of the break waters at the Dover Naval Harbor by the contractors, S. Pearson & Son of London. The principles of its operation are too well known to require explanation here. Another device of the type of caisson proper with a shaft and air lock was that used at Plymouth Harbor by the contractors for the removal of a large rocky shoal there for the Admiralty. The writer was at one time a member of the staff of the company carrying out this work, so does not need to generalize or use text book information. In this particular outfit, the air shaft passed through a well in the centre of a large steel scow, which was filled with air compressors, etc., and the air driven rock drills were carried on a track in the working chamber, which was larger than in the Halifax outfit. This particular device, however, was ballasted by the dead weight of the scow When it was desired to float the caisson the ballast connections between the scow and caisson were liberated and the air pressure in the caisson brought it towards the surface. This device was simple and stable in all conditions, and was able to withstand quite a heavy sea, but did not depend for its ballast on excess dead weight or water ballast, there being no buoyancy or water ballast chambers attached. The caissons used in dock wall construction at Antwerp and other ports are of the type which become a part of the permanent structure and are not, strictly speaking, part of the construction machinery or plant.

The writer is quite familiar with the use of ballast and buoyancy chambers as applied to sliding gates for dry docks, etc., but this device is not adapted for construction purposes, and is not generally movable beyond the limits of its berth. The water is simply expelled from a section of the gate, which is built much of the same shape as a ship's hull, in sufficient quantity to permit the gate to lift slightly clear of the sill, and float to one side endwise, not at all an intricate device fundamentally. Mr. MacDonald apparently overlooked the application of ballast and buoyancy chambers to our late friends the "U" Boats.

The writer would be interested in knowing of a case where this principle is applied to scows carrying construction plant in tidal waters as Mr. MacDonald states, and what purpose this is supposed to serve. The writer is aware of a self-dumping deck scow of Norwegian origin, which unloads its deck cargo by alternately flooding and unwatering portions of the subdivided hull, but this has no bottomless central well, and he fails to see where the flooding and emptying of the hull of an ordinary scow, or use of a bottomless central well, presumably for the purpose of turning air in it, serves any purpose.

Mr. MacDonald states that the problem of flotational stability while in a submerged condition was entirely absent, etc. A little superficial examination will correct this statement. Has Mr. MacDonald made any actual calculations in support of this statement, or is this merely an unsupported assertion?

As a matter of fact, the question at issue between the device used at Halifax and that used at Hamilton, is which had priority of design, construction and operation, and whether the principle of attaching compartments to a self-contained movable caisson, or as Mr. MacDonald also calls it, bell, to be used for construction purposes under water, and on which the compartments referred to can be loaded with water to provide additional ballast, or emptied by any suitable means to provide buoyancy or maintain quilibrium in a floating condition is the exclusive monopoly of either apparatus or is common to both. The exact shape of the caisson or the compartments or the position of the latter relative to the working chamber does not affect the principle of the device. Mr. MacDonald says the use of water ballast was not an essential principle of the device used here. Water ballast, as a matter of fact, was a prime necessity, when in operation. A heavier scow, as Mr. MacDonald asserts would not have served the purpose. The *use* of water ballast did not regulate the draft so that it could pass over the piling, as Mr. MacDonald asserts, but rather the *absence* of water ballast permitted this to be done. Mr. MacDonald makes this statement: "In order to float the Halifax caisson when it was required to be moved, the buoyancy chamber was added and this was its only function." Does this mean that the buoyancy chamber shown on figure 5, page 254 of the October issue of *The Journal* of *The Engineering Institute*, is not also used as a ballast chamber by the admission of water into it, and is it not the case that the ballast chamber, as indicated in the same drawing, is also, when required used as a buoyancy chamber, and that this is simply a matter of juggling with names.

The Hamilton apparatus was finally designed in May, 1913, and put in operation in August, 1913, as previously stated, and Mr. MacDonald states he got the idea in 1913, the exact month not being stated, and the design was got out in 1914, rather a remarkable coincidence, to say the least.

In my previous letter in connection with this matter, which was written somewhat hurriedly, I made an error in dictation and got the relative position of the meta centre and centre of gravity in the device used here, misplaced, fortunately these points were misplaced only in my letter and not in the actual apparatus. The theory of the equilibrium of floating bodies to ensure stability, in other words to make sure of them floating right side up, is no doubt more or less generally understood by engineers.

Yours very truly,

John Taylor, A.M.E.I.C.

Hamilton, Jan. 11th.

Institution of Civil Engineers

Dear Sir:

I am in receipt of your letter of the 4th December, and as, owing to the Christmas recess, it will not be practicable to place it before the Council of The Institution until January, I hasten to express on their behalf and on that of the whole body of this Institution, the very cordial appreciation with which the greetings of *The Engineering Institute of Canada* are received here, and to reciprocate the kindly and sympathetic expressions of good will contained in your letter under acknowledgement.

I am,
My dear Sir,
Yours faithfully,
J. H. T. Tudsbery,
Secretary,
The Institution of Civil Engineers,
Great George Street,
Westminster, S.W.,
England.

Overseas Correspondence

Christmas Day, 1918.

Members will be interested to know that a great many replies have been received from our overseas men acknowledging the cigarettes and Xmas greetings sent them. A few of the many are published below.

Dear Mr. Keith:—

I did not answer your last letter in the summer as we were fairly busy, and it did not get any easier in the fall until the 11th of November, when things eased up for most of the Armies, but not for us.

The "hun" has planted a great deal of delay action mines in the railway embankments, yards, stations, bridges, culverts, etc., and in the roads, houses, churches, and large buildings, also in all the ammunition trains, and dumps which he was leaving behind him, and we had to search for them, locate them if we could, and then draw them. The ones in the ammunition were in the form of ordinary looking nose caps set in howitzer shells, and had very very little to distinguish them from the other nose caps in the other shells. These mines were of a chemical mechanical action set at varying periods, and on operating set off the shell in which they were screwed, and that made the train or the dump blow up.

We off-loaded the trains and spread the shells over the fields about ten feet apart so that one going off would not be likely to explode the others. We spread out the dumps in the same manner over large areas, and then anyone who wanted to could start in and unscrew the caps until he found a delay action one. We were in a town that was a big railway junction and there were a large number of dumps and trains on the railways, and as these kept going up at any hour, it was interesting work trying to get them unloaded before they unloaded themselves in a very abrupt manner. Not very many of these nose caps were found at the right time, but I have one which is intact, except that the acid is poured out of it, and if you think the Institute would care to have it, I will give it to you. I enclose a descritpion of a short delay action fuze, the one I have is the long delay action fuze with the red gaine mentioned in the first paragraph.

My fyle of "Mining Notes," "Military Engineering" and "Field Work Notes," is a fairly complete one and would be of interest to the members of our *Institute* as showing some of the works we did and the things we built. They were made up or invented by engineers in the different units and descriptions sent in to G.H.Q., where they were compiled and those of value were issued to all the other units. There was little or no Military engineering that was of use to us at the beginning, and we had to invent things for ourselves. Many of them will appear futile and clumsy, but they were effective as a rule, and handy, and when it is considered that they had to be made in the field with whatever material we could find, mostly under shell fire, a lot can be excused.

In our attack on the Hindenburg line we had a little amusement, and I was awarded the D.S.O. This would not appear in the "Canadian Gazette," as the Imperial authorities had me transferred from the Canadian Army to the "Royal Engineers" of the Imperial Forces, as from January 1st, 1918.

The present of cigarettes was received from *The Institute*, for which I beg to tender my very best thanks, and I will close by wishing all a very happy New Year.

Yours very truly,
Major WILLIAM T. WILSON A.M.E.I.C., D.S.O., M.C.,
"O.C.," Tunnelling Company, R.E.,
B. E. F., France.

The Mount Hospital for Officers,
Parkstone, Dorset,
January 1st, 1919.

Dear Sir:—

I am enclosing the post card found in the box of cigarettes which you were so kind to send me again this Christmas time, and I also wish to add a few words to thank you for your thoughtfulness. It is exceedingly good of the Institute to remember us again in this way, and I appreciate it more than I can say.

As you will see I am in the hospital due to one of the Boche's machine guns locating me and sending me back to Blighty. This happened just before Albert was taken in August last year, and my left hand suffered in consequence, but now it is well on its way and in a few months time, I hope to have complete use of it.

All Canadians, like the rest of the Allied forces, will be rejoicing over the great news of these last two months, and what it means to us all. One certainly has good reason to be thankful whether having taken part or not, and when one sees just what France has suffered these last four years we should be more than thankful that we were victors. Christmas time this year has been a very happy one for those who have not suffered in lost ones, and in the knowledge that it is all over at last.

Great excitement has prevailed over President Wilson's visit and all it means to the Peace Conference. England has given him a most rousing reception and has strengthened the ties that the war has started.

Allow me to wish *The Institute*, through you, a most happy and prosperous New Year, and that nineteen hundred and nineteen will be a real victory year in all ways.

Thanking you again for you Christmas gift, I remain,

Most sincerely yours,
2nd Lieut. J. E. JAFFARY,
34 Redford Place,
Russell Square,
Holborn, London, England.

Just received your very welcome gift of cigarettes for which very many thanks. We are trying to put in our time here preparatory to sailing for England enroute for Canada. The gods be praised its all over but the shouting and the paying.

Sincerely yours,
Sergt. H. P. HEYWOOD,
No. 1039092, 3rd Can. Ry. Tps.,
A. P. O.,
Longon, England.

I desire to acknowledge with many thanks the receipt of the parcel of cigarettes. With best wishes for the future.

Sincerely,
Lieut. THOMAS H. BACON,
Hdqrs., Jura Group,
Can. Forestry Corps,
B.E.F.,
France.

Received cigarettes, also kind wishes from fellow engineers, in Canada. Kindly convey my best thanks, also best wishes for *The Institute* during nineteen hundred and nineteen. I hope to be with you again next year, as soon as my duty towards my country (Canada) is finished.

C. G. READ, Jr., E.I.C.,
"Ravensbourne,"
Victoria Road, Teddington,
Middlesex, England.

Very many thanks for the splendid gift of cigarettes. Best wishes to *The Institute* for nineteen hundred and nineteen.

Yours sincerely,
Lieut. G. E. BELL, M.E.I.C.,
49 Kidbrook Park Rd.,
London, S.E. 3,
England.

Please convey my very best thanks to the members of *The Institute* for the most acceptable Xmas gift and kind wishes.

Yours truly,
Lieut. W. REYNOLDS,
282 Coy. R.E.,
B.E.F.,
France.

Many thanks for kind remembrance. Hope to make a personal call at 176 before very long.

Yours truly,
Captain A. C. REID, A.M.E.I.C.,
R.A.F. Seaplane Base,
(Late R.N.A.S.), Dover, England.

Many thanks for card and smokes, they were both much apreciated.

Yours truly,

Major E. W. Reed-Lewis, A.M.E.I.C.,
6th Batt., Can. Ry. Tps.,
B.E.F.,
France.

May I express my best thanks to *The Engineering Institute of Canada* for the cigarettes, and especially for the kindly thought which prompted so acceptable a gift.

Yours truly,

Captain P. A. Ablett, M.E.I.C.,
Director Board of Administration,
Ministry of Munitions,
32 Nassau Street,
Dublin, Ireland.

I thank the Council and members of *The Institute* for their greetings and good wishes at this time, which I cordially reciprocate. All members overseas will appreciate, I am sure, the kindly spirit which prompted the sending of a remembrance at this season.

Yours truly,

Victor F. Murray, A.M.E.I.C.,
c/o Park Cottage,
N. Union Street,
Cupar Fife,
Scotland.

Your cigarettes have arrived safely and have been greatly appreciated. My best wishes and thanks to *The Institute* for them.

Major G. R. Evans,
55th Field Company,
Royal Engineers,
B.E.F.,
France.

Very many thanks for the kind thoughts expressed by sending the parcel of cigarettes which I have received in good condition.

Yours truly,

Engr. Lieut. Chas. Stephen, A.M.E.I.C.,
24 Handfield Road,
H.M.S. "Glorious,"
Waterloo, Liverpool,
England.

Many thanks for your kind remembrance in the form of cigarettes which we received at a most convenient time. Best regards for the prosperity of *The Institute* in the coming years.

Arthur J. Edwards, S.E.I.C.,

I wish to acknowledge with grateful thanks receipt of cigarettes. Wishing you a very happy New Year.

Yours truly,

Lieut. Philip A. Fetterly, A.M.E.I.C.,
Can. Ry. Tps. Dept,
Witley Camp,
Surrey, England.

The cigarettes arrived safely this morning for which many thanks. It makes us realize that we are not entirely forgotten by our home friends as we sit on the banks of the Rhine here. The wish for a speedy victory expressed on your card has been fulfilled, and it should'nt be long now before we are all back clamouring for positions in the engineering world again. Best of good wishes to the *Institute.*

Yours truly,

Major A. A. Anderson, J.E.I.C.,
2nd Can. Div. Signal Co.,
Bonn, Germany.

Many thanks for your thoughtful gift of cigarettes, which came at a time when they were practically unobtainable in this part of France. Kindest greetings to all your members of the various grades.

Yours truly,

Captain R. McKillop, A.M.E.I.C.,
13th Light Ry. Operating Coy.,
B.E.F.,
France.

The writer has much pleasure in acknowledging receipt of smokes together with the season's greetings from *The Institute*, and wishes you all the compliments of the season.

Yours truly,

Major A. R. Ketterson, A.M.E.I.C.,
No. 1 Canadian Constr. Corps,
Can. Ry. Tps.,
C.E.F.,
France.

Beg to acknowledge with many thanks your thoughtfile remembrance and well wishes.

Sincerely,

Staff-Sergt. W. W. Dynes, J.E.I.C.,
No. 2260308,
Can. Forestry Corps, S. 5,
B.E.F., A.P.O.,
London, England.

In acknowledging the remembrance of cigarettes from *The Engineering Institute of Canada* I wish to add a word of appreciation which I feel is due to those who are bearing the burdens at home while we are away. Many of them are making ends meet on fixed salaries that have not risen with the cost of living, and at the same time they are sending remembrances to us, they are supporting Red Cross and Patriotic Funds and are in many other ways denying themselves.

We, over here, appreciate this, and for this reason value he more highly the remembrances sent us.

Now that our work over here is finished, we await with impatience the time when we may return again to take up the burden alongside you, and to share the economic burdens and problems brought into being by the war.

Yours sincerely,

Floyd K. Beach, A.M.E.I.C.,
8th Batt.,
Can. Ry. Tps.,
B.E.F.,
France.

REPORT OF COUNCIL MEETING

The regular monthly meeting of the Council was held at headquarters on Tuesday, January 21st, at 8.15 p.m.

After confirming the minutes of the previous meeting, the Executive Committee report was presented, the result of one special meeting and three regular meetings held since the last meeting of Council.

The special meeting of the Executive Committee was called to discuss the whole question of *The Institute's* publications and the functions of the committees dealing therewith. In that connection the following recommendations were made, all of which were approved:

Transactions:—That *The Institute* publish the Transactions every year, consisting of papers selected by the Publications Committee. Approved.

Papers Commi tee:—That the Papers Committee shall be responsible for obtaining papers, either through the Branches or from authors direct, and for their allocation to Branch or Profes ional Meetings. Approved.

Journal:—That the Board of Management of *The Journal*, which is the Executive Committee of the Council, shall decide whether papers shall be printed in *The Journal*, either in advance or as a report of a Branch or Professional Meeting, and whether they shall be published in full or in abstract. Approved.

Publications Committee:—That the Publications Committee shall decide what papers shall be printed in the Annual Transactions and will advise regarding their form and editing. Approved.

Technical Press:—That papers read before *The Institute*, either at a Branch or Professional Meeting shall be issued to the technical press on application to the Secretary of the *Institute*, it being a condition of their being given, that the technical press state the meeting at which the paper was read, and give the author's title in *The Institute*, aftr his name. Approved.

Annual Meeting:—That the suggestion of the Professional Meeting Committee that invitations to the Annual Meeting should be sent to His Grace the Duke of Devonshire, the Ministers of the Departments of Public Works, Railways and Canals, Marine, Interior; to the Chairman of the Railway Commission and to the Presidents of the three big railway systems, and the Executive Committee's instructions to the Secretary to send these invitations be approved. Approved.

That the letters from Comfort A. Adams and Ira N. Hollis accepting invitations to Annual Meeting be noted. Noted.

That Council note the cable received from Col. C. H. Mitchell, D.S.O., expressing his inability to be present at the Annual Meeting and approve of its being read at the Annual Meeting. Approved.

Legislation:—That Council approve the instructions to the Secretary to make a summary of the correspondence re legislation and the draft Act received from the Edmonton and Calgary Branches for presentation at the meeting of Council and that he publish an editorial in *The Journal* which would give the membership a general idea of the legislation situation in the different Branches and in view of the activity in the Western Branches, that Council approve of their being asked to send a delegate to the Annual Meeting to constitute a special legislation committee. Approved.

Salaries of Government Engineers:—That Council note the correspondence in connection with the salaries of engineers in the Civil Service and give full approval of the course pursued by the Committee, in meeting the Civil Service Commission and forwarding a letter to the Hon. Dr. Roche recommending a certain standard of salaries and giving specific recommendations regarding positions in the Department of Public Works as an example, this letter being signed by President H. H. Vaughan, J. M. R. Fairbairn, Vice-President, Lieut.-Col. Leonard, President elect, and W. F. Tye, Chairman of the Committee. Noted.

Ontario Provincial Division:—That Council approve the instructions given the Secretary to send a letter to each of the three Ontario Branches, giving the personnel of their executive committees, and suggesting Professor Peter Gillespie as temporary Chairman to elect officers; also to note that the Ontario Provincial Division had thus been established. Approved.

Sault Ste. Marie:—That the application to form a Branch at Sault Ste. Marie be noted and that approval be given to the instructions to the Secretary to visit Sault Ste. Marie in this connection; also approval to the formation of the Branch and their election of Officers, as follows:—Chairman, J. W. LeB. Ross; Secretary-Treasurer, L. R. Brown, Executive Committee, R. S McCormick (two years) B. E. Barnhill (two years), A. G. Tweedie, J. H. Ryckman. Approved.

Windsor and Peterboro Branches:—That the correspondence with reference to the formation of Branches at Windsor and Peterboro, Ont., be noted. Noted.

Resolutions of the Toronto and Quebec Branches:—That the secretary prepare a memorial to the Government, embodying the resolutions of the various Branches, with a view to submitting it at the earliest possible moment. Approved.

Investigation Committee on Cement:—That Council approve the appointment of R. S. Stockton, by the Calgary Branch, on the Committee for Investigation of Disintegration of Cement, to replace H. Sidenius, deceased. Approved.

Joint Committee of Technical Organizations:—That Council approve instructions to the Secretary to write W. G Chace and all the Branches, in view of the letter received from Mr. Chace in answer to the Secretary's letter transmitting Council's decision to withdraw upport from the Joint Committee of Technical Organizations. Approved.

That Council approve the Reports of Committees, the Report of Council for 1918 and the Annual Reports of the Branches for 1918, as follows, also instructions to the Secretary that these be published in the February issue of *The Journal* and that the following Branch officers be approved:—Calgary Branch, Chairman, G. W. Craig; Secretary-Treasurer, C. M. Arnold; Executive

Committee, Wm. Pearce, A. S. Dawson, F. H. Peters, B. L. Thorne, A. S. Chapman; Representatives to Alberta Div sion, F. H. Peters, S. G Porter; Auditors J. S. Tempest, R. C. Gille pie; Quebec Branch, Chairman, A. R. Decary; Secretary-Treasurer, J. A. Buteau; Executive Committee, F. T. Co e, J E Gibault W. Lefebvre, A. E. Doucet, A. Amos S. S. Oliver; Hamilton Branch: Chairman, E. R Gray; Secretary-Treasurer, H. B. Dwight; Executive Committee, E. H. Da ling, J. A. McFarlane; Victoria Branch: Chairman, W. Young; Vice-Chairman, R A. Bainbridge; Treasurer, E. Davis; Secretary, J. B. Holdcroft; Executive Committee, E. Everall, N. A. Yarrow, D. O. Lewis, R. W. Macintyre; Auditors, A. F. Mitchel , W. M. Stokes; Saskatchewan Branch: Chairman, H. S. Carpenter; Vice-Cha rman, C. J. Yorath; Secretary-Treasurer, J. N. deStein; Executive Committee, H. R. Mackenzie, W. R. Warren, J. R. C. Macredie A. R. Greig, H. McIvor Weir, L. A. Thornton, G. D. Mackie St. John Branch: Chairman, C. C. Kirby; Secretary-Treasurer, A. R. Crookshank; Executive Comm ttee, G. G. Murdoch, G. G. Hare, C. O. Foss, A. Gray. Toronto Branch: Chairman, A. H. Harkness; Secretary-Treasurer, W. S. Harvey; Executive Comm ttee, H. G. Acres, Willis Chipman, W. A. Bucke, H. E. T. Haultain, J. R. W. Ambrose, R. O. Wynne-Roberts, Peter Gillespie. Approved.

Programme of the Ottawa Meeting:—That the programme drawn up by the Ottawa Professional Meeting Committee as submitted be approved. Approved.

Memorial to Ontario Government:—That the copy of the Memorial submitted to the Provincial Secretary by the Toronto, Hamilton and Ottawa Branches with the letter by the Secretary of the Toronto Branch, be noted, and the Memorial published in *The Journal.* Noted.

That in view of the desire of the Sault Ste. Marie Branch to have affiliates appointed to their Executive Committee, the Secretary be instructed to write that Council in recommending uniform By-Laws, wishes to have them adopted as uniformly as possible by the various Branches, but is wil ing to recommend a change in the By-Laws to read, that affiliates may hold Branch office. Approved.

Nominating Committee:—That the nominees to the Nominating Committee be approved as follows:—St. John Branch, C. O. Foss· Halifax Branch, J. L. Allan; Vancouver Branch, Newton J. Ker; Quebec Branch, Alex. Fraser; Ottawa Branch, A. A. Dion; Hamilton Branch, H. U. Hart; Toronto Branch, Geo Hogarth; Victoria Branch J. B. Ho dcroft. Approved.

Engineering Index:—The offer made by the American Society of Mechanical Engineers for supplying the index was considered reasonable and its approval recommended. Approved.

Representation on Board of Fire Underwriters:—Alexander Potter, M.E I.C., was nominated as representing *The Institute* on the Board of Fire Underwriters for specifications of Fire Tests. Approved.

That the report of the committee on *The Institute* emblem as submitted by its chairman, Walter J. Francis, be approved, for submission to the Annual General Meeting.

A large number of letters were presented and their contents noted.

Classifications:—Classifications were made for a ballot returnable February 25th.

The following elections and transfers were effected:—

Members.

Albert Johnson Barnes, B.Sc., of Halifax, since 1911, superintendent of Traffic, Maritime Telegraph and Telephone Company, Halifax; Ira Percy MacNab, S.B., of Halifax, since 1915, mechanical superintendent of the Nova Scotia Tramways and Power Company, Halifax; John S. Misene , of Dartmouth, N.S., chief engineer and assistant manager of the Acadia Sugar Refining Company, Halifax.

Associate Members.

John Griffith, of Woolwich, England, assistant superintendent Building Works Department, Royal Arsenal, Woolwich, England; Richard Crosby Harris, with the C. P. R. for twelve years in various capacities, at present time resident engineer at Medicine Hat, Calgary and Edmonton, Alta.; John William Houghton, of Winnipeg, in civil life, with the dept. of City Light and Power, since 1917, Captain in the C.E F.; William Goldsmith Jones, of North Vancouver B.C. since 1916-18, overseas n the C.F.A., at present, representative Imperial Munitions Board at Wallace Shipyard, N. Vancouver, during installing of engines, boilers, etc., in H M.T. War Cayuse and H.M.T. War Atl.n; Alan Thomas Macdonald, of Kentville, N.S., resident engineer with the Halifax Ocean Terminals, since 1917, Major, 1st Batallion, C.R T., France; William Blain MacKay, of Halifax, five years member of firm Farquhar Bros., Ltd., Halifax; Richard Lewis N xon, B.Sc. of Kentville, N.S., since 1916, lecturing in King's College, on mechanics, drawing, surveying and mathematics, in absence of regular professor overseas; Walter Kingston Scott, of Montreal, since 1912, Structural Draftsman with Phoenix Bridge Company; George Leslie Stephens, of Halifax, with the Royal Canadian Navy for seven years, at present, engineer officer of H.M C. Naval Depot, Halifax.

Transferred from *Associate Member* to *Member.*

Cecil Rainsford Crysdale, M.C., of Vancouver, B.C., since 1916, Major Canadian Engineers and Tramway Company, B.E.F., previous to enlistment, asst. div engineer, with the Pacific Great Eastern Ry; Ernest Howard Darling, (graduate of S.P.Sc.), of Hamilton, Ont., in private practice as consulting engineer on bridges, buildings, reinforced concrete, structural steel and industrial engineering.

Transferred from *Junior* to *Associate Member.*

Wilfrid Ernest Hobbs, of East Kildonan, Man., since June, 1918, Captain, 13th Company, Canadian Forestry Corps, B.E.F., on aerodrome construction; David Whittaker, o Pincher Creek, Alta., joined the Canadian Overseas Railway Construction Corps in 1915, 1917, received commission with the Royal Engineers.

BRANCH NEWS

Saskatchewan Branch

J. N. deStein, M.E.I.C. Sec'y.-Treas.

Since the last contribution to *The Journal* from our Branch, the question, which had been uppermost in our minds, namely, legislation, has not advanced one iota. We had an Act ready to submit to the Legislative Assembly of this Province and a delegation appointed to interview the Executive Council of the Government, and it was hoped to get it presented as Government measure. But our Parent Council thought the question should be submitted to the membership at large—and in deference to their wishes we refrained from carrying out our intentions, which, unfortunately meant the postponement of legislation for another year.

Right from the outset (Professional Meeting at Saskatoon), we endeavored to get joint action by at least the Western Branches, and that means the Western members of *The Institute*. But we seemed unable to carry it out, and through no fault of our own. Though we sent copies of the draft of our Act to every Branch of *The Institute* and kept the Western Branches posted as to changes, progress, etc., yet, except a few days ago, we did not receive the copy of a single Act from any of the other Provinces. Recently the Edmonton Branch was courteous enough to send us a copy of the proposed "Alberta Act."

It was the writer's opinion from the very inception of "proposed legislation," that nothing satisfactory could be achieved, except by a meeting of representatives of Branches, who would have to have full authority and would have to be thoroughly posted on the question. And then it would have required a few days of steady "grind" together, preferably with the assistance of an able lawyer. This opinion was voiced by the undersigned at our December meeting, and his motion to that effect carried. We got immediately in touch with all the Western Branches by wire, trying to arrange a meeting of representatives of Western Branches as outlined above.

A satisfactory Act drawn up at that time, could have been submitted to the present sessions of the Legislative Assemblies of the Provinces of Manitoba, Saskatchewan and Alberta and, no doubt, the Parent Council would not have refused their consent to an Act adopted by the Western membership of *The Institute*. The three Prairie Provinces might have had satisfactory Legislation this year.

But the invitation to the meeting was turned down—and now comes the Montreal Branch and practically suggests the same in a resolution passed on December 1918, of which fact the other Branches and Provincial Divisions were not acquainted until January 9th, 1919.

It is nearly six months since the Saskatchewan Branch was instructed at the Western Professional Meeting at Saskatoon to complete the Act and send copies of same to all the Branches of *The Institute*, and we are just now where we started from! Why the delay? I do not think we have maintained the reputation of Western aggressiveness!

And if the Committee, as suggested by the Montreal Branch, should materialize, let it waste not any more valuable time, but get together and "do something!"

As the Duluth Engineers Club in an invitation, dated December 28th, 1918, to form a Union of Engineering Societies, so ably remarks: "The time to do this is now !... We should not lose the momentum we have gained!" Which remark perfectly fits the situation concerning legislation.

Our Annual Meeting, January 9th, at Regina, saw representatives from every city of our Province and was very successful. Several visits had been arranged for the outside members and we hope that our Annual Meeting will be quite an event in the future. H. S. Carpenter, our newly elected Chairman, very ably presented a paper: "Can Earth Roads be made Satisfactory," another important and interesting contribution to our study of the problem of "Good Roads." The Secretary had read a paper at the December meeting on "Remarks concerning Rural Roads," and our February meeting has again the promise of a valuable paper on the road problem in our Province.

The members seem to have taken quite an interest in the exhaustive study of this timely question.

Manitoba Branch

Geo. L. Guy, M.E.I.C. Sec'y.-Treas.

A meeting was held on January 8th at the Engineering Building, Manitoba University, at which consideration of the new by-laws for the section was taken up. A Committee of the local Branch had been working for some time on a revision of these by-laws and a proposed draft had already been submitted to the members for consideration. Subsequent to the issue of this draft the new by-law proposed by Headquarters had appeared in *The Journal*. Professor Brydone-Jack, Chairman of the Committee on By-laws, gave a brief address on the proposed new by-laws pointing out where they differed from the by-laws proposed by the head office. There being no points on which these two drafts essentially differed it was decided to consider the amended draft, clause by clause, and at the same time to consider the points in which they differed from the Headquarters draft. Considerable discussion took place and several minor amendments were proposed. Motion was finally passed that these by-laws be sent back to the Committee with instructions to make the necessary alterations, and that the draft be then submitted to Headquarters for approval.

On January 11th, a luncheon was held at the Fort Garry, at which an address was given by Ex. Controller Puttee on labor and its position with regard to re-organization after the war. Mr. Puttee, who is well known in labor circles in this city, gave an excellent address which was listened to with considerable interest.

At a meeting held in the Engineering Building, Manitoba University, on January 15th, a paper was read by Theo. Kipp, M.E.I.C., on the "Engineer as a Factor in the Development of Agriculture in Western Canada." The paper was of considerable interest to the Members and a good discussion followed.

Among the business transacted at this meeting was the passing of a resolution endorsing the action of the Manitoba Branch of the Mining Institute of Canada in submitting to the Government a protest against the present method of granting mining licenses in Manitoba by Order-in-Council, and requesting that same be altered to Crown grant by Parliament. The Propaganda Committee was instructed to co-operate with the Mining Institute in this matter.

W. M. Scott, M.E.I.C., gave notice of motion that at the next meeting consideration be given as to the best disposition of the railway line of the Greater Winnipeg Water District, which, owing to the completion of the pipe line, is now being considered with reference to whether this line should be disposed of or operated under the Water District management.

Guy C. Dunn and J. M. Leamy were appointed as official representatives of the Branch to represent them at the next general meeting.

Owing to the influenza epidemic no meetings were held during November and December.

On December 21st a luncheon was held at the Fort Garry Hotel at which over sixty members were present. A presentation of a fob with solid gold charm and fastenings, suitably engraved, was made to A. W. Smith, late Secretary of the Branch. The presentation was made by W. P. Brereton, Acting Chairman, who, in a short speech, expressed the appreciation of the Branch for Mr. Smith's valuable service, to which Mr. Smith replied in a happily worded speech.

After luncheon the members visited the tunnel under the Red River, which is being constructed by the Greater Winnipeg Water District.

On January 2nd, the first meeting of the year was held at the Engineering Building, Manitoba University. Con iderable business was put through, including the election of officers for the ensuing year; W. P. Brereton and Geo. L. Guy being elected Chairman and Secretary-Treasurer, respectively, by acclamation, and A. H. O'Rielly and R. W. Moffatt as Auditors. Nominations were also made for the Executive Committee.

A vote of condolence was tendered to the Secretary-Treasurer, Geo. L. Guy, on his recent bereavement in the death of Mrs. Guy.

A resolution was passed instructing the Secretary to write to each Branch of *The Institute* requesting them to appoint a delegate to attend the next annual meeting of *The Institute* in Ottawa, to arrange for proper legislation to be presented to the various Legislatures at an early date, for the registration of Engineers. The motion was made by J. G. Sullivan, Chairman of the Legislative Committee, and was carried unanimously, the Executive being authorized to appoint a representative for this Branch.

An interesting paper was then read by W. J. Dick, M.E.I.C. on "Reconstruction." Considerable discussion took place after the paper, and a Committee was appointed to co-operate with the Winnipeg Board of Trade on forth-coming reconstruction problems.

A full programme has been arranged for the coming season, many interesting papers having been promised. It is hoped by the success of the short season before us to make up for the time lost owing to the recent epidemic.

* * * *

The soft water for Winnipeg, which it was anticipated would be delivered by Christmas, has been delayed owing the late delivery of certain castings, but it is hoped the water will be available early in the year.

Chas. F. Gray, local Associate, was elected Mayor of Winnipeg at the recent elections by an overwhelming majority.

W. A. Duff, Chairman of the Branch, who has been absent from the City for some time, owing to illness, returned for a short time and was welcomed by many of the Members. It is hoped that the will shortly return to Winnipeg permanently.

Grasping an Opportunity.

The action of the Manitoba branch of *The Engineering Institute* in deciding to take a more keen and active interest in matters affecting public welfare calls for commendation. It indicates the trend of the times, that problems vitally affecting the future of the nation are drawing the attention of the right type of men. In other words, the practical as well as the theoretical men are becoming interested. There is little chance of anything "getting past" the engineers save that which will be backed by the best brains in the country on any given subject which has to do with advancement along engineering lines. There will be none of the political element in any of the recommendations which they may make. If a power line is suggested or a waterway advised it will not be recommended until the men best qualified to know its feasibility have pronounced upon it. There will be no wholesale recommendations for roadbuilding in certain constituencies. Neither will there be any moves to spend the public money on bridges which from a utilitarian standpoint give way to the spectacular. It is very easy for a semi-public body to recommend the government to do certain things which, on the surface, appear feasible and are pleasing to the ear. It is, however, another thing for the promoters of such an idea to be able to show the government how the fundamentals of such a plan are possible in conformity with the need of the greatest possible economy in the use of public money. From this standpoint the engineers are at a great advantage. They will not recommend any plan until they find it is feasible and reasonably economical.

But the best sign of all is that these men have been induced to come out publicly and offer their valuable services in advising federal, provincial and municipal authorities on important matters. The value of this cannot be overestimated.—*Winnipeg Free Press*, Jan. 17.

St. John Branch

A. R. Crookshank, M.E.I.C. Secy.-Treas.

The Annual Meeting of the St. John Branch was held in the old Post Office Building, January 14th, at 8 p.m.

The members present were the Chairman and Secretary, and Messrs. Archibald, Baxter, Cameron, Dufresne, Hare, Hatfied, Kirby, and Macdonald; also the following visitors: B. Allen of Dept. Ry. & Canals, Cape

Tormentine; G. B. Ballantyne, F. M. Barnes, J. L. Heans, H. D. Macaulay, T. W. Russell and K. Vavasour, a total of seventeen.

The minutes of the meeting of May 7th, at which the present officers were elected, were read by the Secretary, who also read the minutes of the meetings of October 7th and November 21st, which were then approved.

The Chairman then appointed Messrs. Archibald and Cameron to act as scrutineers.

The Secretary then read his report, which was adopted on motion.

On motion of Mr. Kirby, seconded by Mr. Hare, D. L. Hutchinson's application was received, and he was elected an Affiliate of the Branch.

The Chairman then introduced G. S. Baxter, and called upon him to read his paper, entitled "A Contractor in a Clyde Shipyard." The paper had been carefully prepared, was interesting and well illustrated by photographs and diagrams. It dealt with the work of remodelling, bringing up to date and enlarging the existing facilities of the shipyard to allow of the construction of the largest steamer built up to that time, 1911. This comprised (1) the construction of several ways, with the use of concrete keel blocks, each served by two sets of guyed stiff leg full circle cranes; (2) the equipping of the material yard with railway tracks served by overhead travelling cranes, straddling a track with storage space on each side and a radial gantry 136 feet long, pivoted near the centre and swinging an angle of 180 degrees at the rear of one of the raised traveller crane rails; (3) the lengthening of two fitting out berths so that the new vessel would not stick out into the river and interfere with navigation. This necessitated the sinking at head of a slip within three fee of a railway track and near a heavy building of three curved caissons, with steel cutting edges and working chamber, brick superstructure with a horizontal concrete arch forming the core and tie; (4) the building of a steel sheet pile retaining wall and timber pile wharf, after the removal of the old existing structure. A hearty vote of thanks was tendered to Mr. Baxter by the Chairman for the presentation of his paper.

The report of the scrutineers was then read, and they stated that twenty-three ballots had been received, one was rejected, as improperly marked, that C. C. Kirby had received the plurality of votes for Chairman, A. R. Crookshank for Secretary-Treasurer and G. G. Hare and C. O. Foss for Executive Committee members. The Chairman then declared these gentlemen elected, and welcomed Mr. Kirby to the chair. Mr. Kirby in reply, thanked the members for honouring him and then referred to the General Professional Meeting that is planned for this fall, and asked hat each member begin to think seriously about the matter, to make plans for preparation of papers, entertainment, etc., and to impart all suggestions to the Executive, so that this meeting should be worth while. He then called for a vote of thanks, which was unanimously given to Mr. Gray for all the effective hard work he had done for the Branch during the past year.

Mr. Gray stated he appreciated the kindness of the Meeting and referred to the conscientious work done by the other officers of the Branch. He then strongly emphasized the necessity of each and every member turning out to the meetings, and to give their active assistance and support to the officers in this work, " For the Branch can only be a success, if each member works." The New Brunswick turnout and the part St. John men played in the Halifax General Professional Meeting showed what St. John men can do when they try, so if we all work together the meeting this fall should be equally successful as the Halifax one. Mr. Gray then had to leave to catch his train for home.

The new Chairman then asked the Secretary to read the communications. A number of letters were then read by the Secretary.

Under new business it was decided to have the present and the proposed revised by-laws mimeographed and distributed to members of the Branch. Moved by Mr. Baxter, seconded by Mr. Archibald, that the Executive Committee draw up a set of by-laws based on those recommended by the Council and that would be applicable to our Branch. Carried. Notice of motion of change in by-laws was given by the secretary, seconded by Mr. Macdonald, as follows: " That the fee paid by Affiliates be $5.00, the same to include the subscription to *The Journal* for the concurrent year."

On motion the meeting then adjourned at 11.20 p.m.

Sault Ste. Marie Branch

L. R. Brown, A.M.E.I.C. Secy.-Treas.

The first meeting of the Branch was held in the Y.M.C.A. on the evening of January 9th with about thirty engineers in attendance. Fraser S Keith, Secretary of *The Institute* gave a brief outline about the aims and objects of *The Institute* and of its history and present organization for the benefit of prospective members.

The following Executive was elected for 1919:—Chairman, J. W. LeB Ross; Secretary-Treasurer, L. R. Brown; Executive Committee R. S. McCormick, B. E. Barnhill, A. G. Tweedie, J. H. Ryckman.

It was resolves that a meeting be held on the last Thursday of each month. A membership committee was appointed from the various industries. W. S. Wilson was elected representative on the Ontario Provincial Division. F. F. Griffin read a paper entitled Efficiency Acceptance Tests on a 3200 H.P. Water Turbine.

The next meeting was called for January 30th.

Quebec Branch

J. A. Buteau, A.M.E.I.C. Secy.-Treas.

At the Annual Meeting of the Quebec Branch the following officers were elected: Chairman, A. R. Decary; Secretary-Treasurer, J. A. Buteau; Executive, F. T. Cole, J. E. Gibault, W. Lefebvre.

The past Chairmen of the Branch are A. E. Doucet, A. Amos and S. S. Oliver. Alex. Fraser, 16 Aberdeen Street, has been appointed a member to represent the Quebec Branch on the Nominating Committee.

Vancouver Branch

A. G. Dalzell, A.M.E.I.C., Sec'y.-Treas.

A meeting of the Vancouver Branch was held on December 13th, 1918, at which a paper, illustrated by lantern slides, on The Detroit Tunnel, was read by C. T. Hamilton, A.M.E.I.C., and an interesting discussion took place.

A resolution was passed approving the action of the Council at Montreal regarding proposed legislation.

At an Executive meeting of the Branch it was decided to prepare a memorandum to be presented to the Local Members of Parliament regarding the rating of engineers by the Civil Service Commission. A copy of this memorandum has been sent to all Branches of *The Institute.* A delegation waited upon H. H. Stevens and S. J. Crowe, M.P's. for the Vancouver District and presented the memorandum, and favourable consideration was promised.

A general meeting was held on January 17th, and the communications from the Montreal and Manitoba Branches regarding legislation considered. After discussion it was decided to endorse the attitude of the Montreal Branch with the addition of the word " promptly " in the sentence of their resolution—" to inquire into, study and report (*promptly*) upon the whole question of legislation, etc."

It was decided to send a delegation to interview the Premier of the Province to suggest that the proposed Public Utilities Commission of the Province should consist of: one lawyer, one accountant, one qualified engineer.

A discussion took place regarding a local civic issue:—the control of the watershed area of the waterworks system of Vancouver and adjoining municipalities, and it was decided to submit a resolution to the City Council, suggesting that a commission of three engineers be appointed, to consider the whole question of the watershed area, its development and future control, and to report to the Council so that prompt action could be taken to preserve the rights of the citizens.

The Secretary of the Branch was appointed to represent *The Institute* on the Civic Re-construction League.

A vote of condolence was passed to be sent to the relatives of the late Colonel Bodwell, and express the sympathy of the Branch in the loss of an esteemed colleague, and a true representative of the Canadian Engineers who have served the Empire.

From the last statement of membership the strength of the Branch is as follows: Members 47; Associate Members, 72; Juniors, 7, Students, 4; Total, 130; and out of this number the following have served or are still serving the country, in Army or Navy: Members, 14; Associates, 23; Juniors, 3; Students, 3; Total, 43.

Montreal Branch

Frederick B. Brown, M.E.I.C., Sec'y.-Treas.

The Montreal Branch programme for the session, January to April, 1919, has been issued showing that a meeting will be held every Thursday evening at 8.15, this being the catchword used on the programme and also on the announcements of weekly meetings, the only exception being February 13th, when the Professional Meeting in Ottawa will be held.

On January 9th an interesting paper on Fire Prevention was read by George H. Greenfield. On January 16th, B. O. Eriksen, A.M.E.I.C., read a paper, prepared by himself and S. H. Deubelbeiss, A.M.E.I.C., which was completely illustrated by slides, on The Design and Construction of Reinforced Concrete Viaducts at Mileages 0.9 and 1.8 North Toronto Sub-Division, Canadian Pacific Railway. Following this paper, W. F. Chipman, K. C., chairman of the National Reconstruction Committee, gave an eloquent address on the problems facing Canada, in which he pointed out the necessity for not only a broader policy but for immediate action.

On January 23rd the meeting of the Branch was held at the headquarters of *The Institute*, with R. M. Hannaford in the chair, when J. A. Burnett, A.M.E.I.C., read a paper on Coaling Plant for Locomotives, followed by a treatise on Industrial Illumination, by George K. McDougall.

The programme for the remainder of the session, as at present outlined, is:—

Jan. 30—Coal Briquetting, by Paul Seurot, M.E.I.C. Coal is King (a motion picture), by R. E. Cleaton Company.

Feb. 6—Some Problems in Ocean Transportation, by A. W. Robinson, M.E.I.C. Manufacture of Nitro-Benzol and Aniline Oils, by G. J. Caron, J.E.I.C.

Feb. 20—Construction of Canadian Northern Railway Tunnel, Montreal, by J. L. Busfield, A.M.E.I C.

Feb. 27—The Effect of Ice on Hydro-Electric Plants, by R. M. Wilson, A.M.E.I.C.

March 6—Air Drills, by N. M. Campbell, A.M.E.I.C. The Halifax Explosion from a Chemist's and Physicist's Viewpoint, by Dr. Howard Bronson, F.R.S.C. Burroughs Adding Machines (a motion picture), by Burroughs Adding Machine Company.

March 13—Electrical Welding, by C. V. Holslag. Patents and Engineering by Hanbury A. Budden, A.E.I.C.

March 20—Ball Bearing Jacks, by W. H. C. Mussen. A.E.I.C. Peat, by Ernest V. Moore, A.M.E.I.C.

March 27—Some Notes on the Design and Construction of Reinforced Concrete Covered Reservoirs, by R. deL. French, M.E.I.C.

April 3—The Operation of Railways as an Engineering Problem, by V. I. Smart, M.E.I.C.

April 10—Waterproof Paper Productions and their Industrial Possibilities, by J. A. DeCew, A.M.E.I.C.

April 17—Quebec Bridge, by Phelps Johnston, M.E.I.C., G. H. Duggan, M.E.I.C., George F. Porter, M.E.I.C.

April 24—Continuation of Paper of April 17th.

Calgary Branch

C. M. Arnold, M.E.I.C., Sec.-Treasurer.

The Annual General Meeting of the Branch was held in the Board of Trade rooms on the afternoon of Saturday, December 7th, 1918.

The meeting was preceded by a luncheon, at which twenty-five members were present. During the interval between the luncheon and the meeting, the candidates for Mayor gave short addresses, touching on matters particularly of interest to the engineer.

A. S. Dawson was elected to act as Chairman in the absence of Mr. Pearce, and owing to the indisposition of the Secretary, the position was filled by the Assistant Secretary, M. H. Marshall.

The Chairman called the meeting to order and called for the minutes of the last general meeting to be read. These were adopted and signed by the Chairman.

Communications were read from the Secretary of the Parent Institute, dealing with badges and new certificates, and also canvassing for Associates.

Accounts.—Septimus Burnand, $1.50.
Campbell Floral Co., $10.00.

Moved by P. Turner-Bone, seconded by G. N. Houston, that these be approved.

Applications to join the Branch were received from four candidates with results of elections as noted:—

George S. Deslandes.......Elected Associate of Branch.

James F. McCall.........
Charles Howarth.........
George Phillip Frederick Boese...............
}Elected with status of Associate of Branch, with recommentation for election to *The Institute* as Associate Members.

Reports. — A. S. Dawson, Chairman of the Concrete Committee, stated that he had not as yet prepared a written report, but would do so. He gave a short resumé of the work that had been done to date. He wished to nominate R. S. Stockton as a member of this Committee to fill the vacancy caused by the death of Mr. Sidenius. Moved by Mr. Peters, seconded by Mr. Marshall, that Stockton be elected. Carried.

Mr. Peters, Chairman of the Legislation Committee, stated that he had not prepared a report as the matter was fully discussed at the recent general meeting of the Branch.

In the absence of Mr. Arnold, Secretary-Treasurer, his Annual Report was read by the Assistant Secretary, and is appended as part of these minutes.

A financial statement was submitted showing that the Branch was in a good financial position.

On the motion of the Chairman, seconded by Mr. Houston, the report was adopted, and the financial report was approved subject to auditor's certificate being given.

Elections.—The ballots for Officers for the ensuing year were counted by Scrutineers Gillespie and Chapman, who reported the following officers elected:—

Chairman	G. W. Craig	Member.
Sec.-Treasurer	C. M. Arnold	"
Executive	Wm. Pearce	Member.
	A. S. Dawson	Past Chairman.
	F. H. Peters	Member.
	B. L. Thorne	"
	A. S. Chapman	Assoc. Member.
Executive Alberta Division	F. H. Peters	Member.
	S. G. Porter	"
Auditors	J. S. Tempest	Assoc. Member.
	R. C. Gillespie	"

Mr. Craig was given a hearty reception upon assuming his new duties and made a short address, dealing with the desirability of publicity on engineering matters. This branch News seems to be crowded up more than the others.

General Business.—Mr. Marshall drew attention to the fact that one of the most important matters to come before the new City Council was that of Sewage Disposal, and suggested that this was a question that could very well engage the attention of the Branch this session. After some discussion, Mr. Craig promised to present a paper on the subject, and it was arranged after the matter had been fully discussed to give one or two public lectures, presented in a manner intelligible to the ordinary citizen.

The Branch will also take an active interest in any town planning or housing scheme the city may undertake.

It was announced that W. J. Gale, Associate Member, offered a mounted beaver to the Branch, and suggested that it be placed in a prominent public place as "The First Engineer." The Secretary was instructed to thank Mr. Gale for his offer, which was accepted, and a suitable inscription would be arranged for. The matter would be dealt with by the Executive.

On the motion of Mr. Dawson, it was decided to send a Greeting to members of the Branch on Active Service. It was decided to leave the matter in the hands of the Chairman and Secretary to do what was considered best.

The meeting adjourned at 4 p.m.

AT THE SASKATOON MEETING THE PRESENCE OF LADIES, WIVES AND FRIENDS OF MEMBERS WAS APPRECIATED. A SPECIAL PROGRAMME OF ENTERTAINMENT HAS BEEN ARRANGED FOR VISITING LADIES BY WIVES OF OTTAWA MEMBERS, OTTAWA, FEB. 11th, 12th and 13th.

PERSONALS

O. W. Smith, M.E.I C. (a member of the Sask. Branch) is spending the winter at Victoria, B.C.

E. W. Murray, A.M.E.I.C. (a member of the Sask. Branch) has gone to Montreal for the winter.

W. A Mather, A.M.E.I.C , has been appointed general superintendent, C. P. Ry., at Moose Jaw, Sask.

C. H. Fox, A.M.E I.C., who has recently returned from overseas, has been appointed to Mr. McKenzie's position as resident engineer C. P. Ry., Regina.

A. V. Redmond, A.M.E.I.C., has been moved from Cochrane to Winnipeg, as district engineer of the Canadian National Railways, his district extending from O'Brien, Que., to Brandon, Man.

Murdoch McKenzie, A.M.E.I.C., until recently resident engineer, C. P. Ry. at Regina, has been appointed engineer in charge of a locating party from Swift Current, Sask., eastward.

A. W. Haddow, A.M.E.I.C., city engineer of Edmonton, has been appointed professor of Civil and Municipal Engineering at the University of Alberta, succeeding the late Professor Wm. Muir Edwards. Professor Haddow is a member of the Executive of the Edmonton Branch, and was Branch Secretary for 1917. He will still devote part of his time to the city's engineering department.

Stewart F. Rutherford, A.M.E.I.C., one of the most active members of the Montreal Branch, in which he has taken a prominent part from the start, being Chairman of the Industrial Section, has been elected on the new Council of the City of Westmount at the head of the poll. Those who know Mr. Rutherford predict that he will do credit to his new position.

W. S. Harvey, A.M.E.I.C., has received an appointment with the Toronto Harbour Commission as engineer of sewers and will prepare plans for the drainage of the Ashbridge's Bay Industrial Area and extensions to the city's main sewer outlets beyond the fill along the waterfront. This work will be done under the direction of George T. Clark, A.M.E.I.C., designing engineer to the Harbour Commission. Mr. Harvey has just been elected Secretary of the Toronto Branch of *The Institute* for 1919.

Dr. J. A. L. Waddell, M.E.I.C., Consulting Engineer of Kansas City, U.S A., and a member of this *Institute* since 1903, has been elected a corresponding member of the Academy of Science of France. Only nineteen corresponding members, including Dr. Waddell, have been elected from the United States since the founding of the Academy in 1795, and of these there are living at the present time Drs. Pickering and Hale, astronomers and Dr. Davis, geographer.

W. F. Drysdale, B.Sc. (McGill), A.M.E.I.C., reached New York on the Lorraine on December 6th, from France, and after a conference on business matters arrived in Montreal where he renewed former acquaintances. Mr. Drysdale is a Canadian who is occupying one of the big positions in industrial affairs in Europe, being the European representative of the American Locomotive Sales Corporation, and the Montreal Locomotive Works, Ltd., with headquarters at Paris, his territory being Continental Europe. He proposes sailing for France on February 10th.

Major William Geo. Swan, B.A.Sc. (Univ. Tor.), A.M.E.I.C., has recently added further laurels to his already distinguished military career. He has been twice mentioned in despatches, was decorated with the Croix de Guerre last year, and has just been invested with the Distinguished Service Order. Major Swan, previous to going overseas, was on the engineering department of the Canadian Northern Ry. at Vancouver, with which Company he was for the past fifteen years, his latest position before enlistment being divisional engineer in charge of construction C. N. Ry., from Steveston to Hope, B.C. He is a graduate of the Toronto University, and was a lecturer in the School of Science for two years. He enlisted with the 131st Battalion, and upon arrival overseas was transferred to the Railway Troops. For 20 months he was with the Imperial Army, and later transferred to the Canadians.

G. H. DUGGAN, M.E.I.C.

Newly elected President of the Dominion Bridge Co.

OBITUARIES

James Russell Wood, B.Sc.

James Russell Wood, B.Sc. (McGill), A.M.E.I.C., of Peterboro, died of pneumonia following influenza, on October 29th, 1918. The late Mr. Wood graduated from McGill University in 1911 in civil engineering, his first position being assistant engineer on construction of the Magog Power Plant. Later he was ass'stant on construction, Monreal Harbour Elevator, No. 12, and in 1913 went to Welland where he was doing general enginering work.

The late Mr. Wood was born at Rockland, Ont., August 1st, 1884, and was transferred from Student to Associate Member of *The Institute*, October 20th, 1914.

Captain John Atkinson Tuzo.

Captain John Atkinson Tuzo, A.M.E.I.C., was killed in action in German East Africa, April, 1918, word of which was received from his mother from Warlingham, Surrey, England, on January 13th. The late Captain Tuzo, was born on September 15th, 1874, and was a graduate of Leeds University, England. He came to Canada in 1897, where for eight years he engaged in mining in the Yale district, B.C., and later took up railway work in the Northwestern States and in British Columbia. In 1907 he was resident engineer of the Spokane, Portland and Seattle Railway, Washington, and 1910 was resident engineer, Kettle River Valley Railway, with headquarters at Midway, B.C.

When war broke out he returned to England and received a commission as Captain with the Imperial Forces, and was engaged with them in the successful struggle which ended in the defeat of the German forces in East Africa.

Major Alfred deCourcy Meade, M.C.

Major Alfred deCourcy Meade, A.M.E.I.C., M C., was killed in a motor accident at Painstown near Droheda, Ireland, on Saturday, December 14th. The motor car in which Major Meade was being driven collided with a hackney car.

Previous to enlisting, in 1914, in the Royal Engineers, Major Meade was engaged in railway construction work in Western Canada. He went to France in March, 1915, and won the Military Cross on December of the same year. He left France on the signing of the armistice, having seen three and a half years in the fighting line.

This information was conveyed to *The Institute* by J. C. Meade, A.M.E.I C., of Regina, a brother of Major Meade, to whom, as well as to the widow and infant son, the sympathy of *The Institute* goe; out.

The late Major Meade was born on November 3rd, 1884, and wa elected an Associate Member of *The Institute* in November, 1912. He was also an Associate Member of the Institution of Civil Engineers of Great Britain.

Lieut.-Col. Howard L. Bodwell, C.M.G., D.S.O.

The circumstances surrounding the death of Lieut.-Col. Howard Bodwell, A.M.E.I.C., were particularly sad, as he died in St. John, from pneumonia, while returning from the front, and while his wife was on the road from Vancouver to meet him. The late Lieut.-Col. Bodwell, who was honoured by receiving the C.M.G., D.S.O., Croix de Guerre, was one of the shining examples of a successful military career, having been assistant director of light railways in the military area in France. Born at Ingersoll, Ontario, October 13th, 1881, Howard Lionel Bodwell was educated at and a graduate of the Royal Military College, Kingston.

Lieut.-Col. Bodwell's engineering career was for the most part on railway work and particularly with the Grand Trunk Pacific Railway. Later he was instructor in Civil Engineering at Royal Military College and in 1907 was appointed resident engineer of the Canton, Hankow Railway, Kwong Tung, China, which position he held for two years. Returning to Vancouver he took up his residence at the Coast where he was living when war broke out.

Lieut -Col. Bodwell was associated in railway work in British Columbia with J. W. Stewart and his rise in the service was on a par with the distinguished services rendered by his chief, who is now Brigadier-General, and in charge of all railway operation on the western front.

He was wounded at St. Eloi in April, 1916, and after ten weeks in the hospital, returned to the firing ine. In September of that year he was awarded the D.S.O. for building a piece of roadway under heavy shell fire. In December, 1916, Lieut.-Col. Bodwell was made assistant director of light railways. In January he was made a Companion of St. Michael and St. George, " for services rendered in connection with military operation."

Lieut.-Co'. Bodwell received the Croix de Guerre from the French Government. The official Gazette says: " Lieut -Col. H. L. Bodwell, C.M.G., D.S.O., has directed with great competence and sustained energy and carried to a successful completion in the minimum of time, in spite of conditions of working which were often difficult, the construction and putting into operation of a new system of sixty kilometres of railway which has greatly facilitated supply of the French troops."

He was a member of the well known Bodwell family and a cousin of the late E. V. Bodwell, K.C. His father was Eliphalet Bodwell, of Ingersoll, Ont. His widow was formerly Miss Dulcie Hornby, and she is left with two children to mourn his loss.

Lieut.-Col. Bodwell returned to Canada on the Scandinavian, his death occurring at St. John, N.B., on Wednesday, January 15th.

EMPLOYMENT BUREAU

Situations Vacant

Engineering Salesman.

Splendid opening for a graduate engineer with a large industrial organization. Must be young man, not long out of college; must speak French fluently; be thoroughly reliable; have business instincts which will enable him to develop salesmanship of a high order. This is a very desirable position for an ambitious man of the type required. Address Box No. 26.

Preliminary Notice of Application for Admission and for Transfer

The By-Laws now provide that the Council of the Society shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in February, 1919.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows:—

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course. In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineers' office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the following branches at his option Railway, Municipal, Hydraulic, Mechanical, Mining, or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five years or more years.

Every candidate for election as JUNIOR shall be at least twenty-one years of age, and must have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-five years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects Geography, History (that of Canada in particular), Arithmetic, Geometry Euclid (Books I.-IV. and VI.), Trigonometry, Algebra up to and including quadratic equations.

Every candidate for election as ASSOCIATE shall be one who by his pursuits, scientific acquirements, or practical experience is qualified to co-operate with engineers in the advancement of professional knowledge.

> The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BROWN—GEORGE J., of Winnipeg, Man. Born at Lamberton, Minn., Jan. 4th 1881. Educ., Elec. engr., Univ. of Minnesota, 1908. Elec. dftsman and asst. supt. for W. I. ENGINEERING INDEX

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to the engineering profession and to every branch of the profession.

PHOTOSTATIC PRINTS

Photostatic copies may be obtained of any of the articles listed in this section.
Price of each print (up to 11 x 14 in. in size), 25 cents, plus postage. A separate print is required for each page of the larger-size periodicals, but where possible two pages will be photographed together on the same print. Bill will be mailed with the prints.
Orders should be sent to

Harrisson W. Craver, Director,
Engineering Societies Library,
29 West Thirty-ninth Street, New York, N. Y.

MECHANICAL ENGINEERING

AIR MACHINERY

Turbo-Blowers. Coppus Turbo Blower. Indus. Management, vol. 57, no. 1, Jan. 1919, pp. 74-75, 2 figs. Mechanical features of machine constructed by Coppus Eng. & Equipment Co.

Combined Motor and Turbine Driven Blast-Furnace Blower. Iron & Coal Trades Rev., vol. 47, no. 2645, Nov. 8, 1918, p. 523, 1 fig. Operation of unit consisting of synchronous motor driving blower, this motor being operated in addition as a power-factor adjuster on a 3000-volt 50-cycle supply.

Ventilators. The Largest Round Ventilator in the World. Metal Workers, vol. 91, no. 1, Jan. 3, 1919, pp. 28-29, 3 figs. Details of special construction to withstand wind pressure and secure permanence and service.

CORROSION

Aircraft Parts. Corrosion Prevention on Aircraft Metal Parts. H. A. Gardner. Aviation, vol. 5, no. 9, Dec. 1, 1918, pp. 565. Quotes standard procedure of Navy Department for protection or iron, steel and aluminum aircraft parts.

Pipe. Investigation of Pipe Corrosion in Chicago Buildings, with Special Reference to Durability of Pipe Materials, Thomas J. Claffy. Mun. & County Eng. vol. 55, no. 6, Dec. 1918, pp. 208-210. Data secured from inspection of 63 buildings. Rating of cast iron, wrought iron and steel.

FORGING

Density of Steel. Does Forging Increase Specific Density of Steel? H. E. Doerr. Bul. Am. Inst. Min. Engrs., no. 145, Jan. 1919, pp. 79-81, 2 figs. Table of specific densities of ten ingots of basic open-hearth steel both before and after forging shows little or no change in density with steel initially free from cavities

Drop Forging. Drop Forging in Automobile and Aircraft Work. Part VI. Automobile Engr., vol. 8, no. 120, Nov. 1918, pp. 328-331, 13 figs. Details of typical plant, with description of modern tools and methods.

Gun Forgings. Making Gun Forgings Under War Demands, E. C. Kreutzberg. Iron Trade Rev., vol. 63, no. 22, Nov. 28, 1918, pp. 1240-1242, 6 figs. General character of work done by Tacony Ordnance Coprs., Philadelphia.

Operation. Recommendations for Economical Operation of Iron Works (Dispositions générales qui peuvent être recommandées dans les installations de forges), O. Duperron. Géne Civil, vol. 73, nos. 20 and 21, Nov. 16 and 23, 1918., pp. 387-389 and 404-407, 3 figs. Concerning regenerative devices, use of powdered fuel, continuousness of operation, use of compressed air. Plans of ideal modern smithy.

FOUNDRIES

Brass Melting. Melting Brass in a Rocking Electric Furnace, H. W. Gillett and A. E. Rhoads. Department of Interior, Bur. of Mines, Bul. 171, Min. Technology 23, 131 pp., 6 figs. Sets forth in detail possibilities and limitations of electric brass melting and compares various types of furnaces. Also Water & Gas Rev., vol. 29, no. 6, Dec. 1918, pp. 9-11.

Chaplets. Obtaining Best Results from Use of Chaplets, Ernest Schwartz. Foundry. vo. 47, no. 317, Jan. 1919, pp. 14-15, 14 figs. Removal or prevention of rust and precautions against excessive moisture essential to prevent blowholes; choosing types and sizes for various purposes.

Core Room. Core Room of T. H. Symington Co., Rochester, Donald S. Barrows. Can. Foundryman, vol. 9, no. 12, Dec. 1918, pp. 296-299, 9 figs. Arrangement intended to provide good ventilation and lighting.

Efficiency in the Core Room, J. B. Conway. Am. Mach., vol. 50, no. 1, Jan. 2, 1919, pp. 11-14, 6 figs. Conclusions reached as result of investigation into conditions of efficiency and production in southern factory and remedies applied.

Cupola. Operation of a Cupola, William Lauten. Metal Trades, vol. 9, no. 11, Nov. 1918, pp. 461-463, 2 figs. Account of experiments with colums charging.

Foundries. Continous Two-Story Foundry Proves Economical, J. F Ervin. Foundry, vol. 47, no. 317, Jan. 1919, pp. 40-42, 2 figs. States that extensive handling operations in modern foundry are most readily performed in building of multi-story design. From paper before Am. Foundrymen,s Assn.

Unique Features of an Illinois Foundry, Charles Lundberg. Iron Age, vol. 102, no. 26, Dec. 26, 1918, pp. 1563-1569, 13 figs. Electric steel, gray iron and semi-steel departments; continuous operations with large production in small space; use of molding machines. Description of plant of Avery Co., Peoria, Ill.

Molding. How Gear Cases for Tractors Are Molded, Foundry, vol. 47, no. 317, Jan. 1919, pp. 2-5, 8 figs. Molding machines of large capacity and special core-room equipment are employed; special rigging for economies.

Patterns and Their Relation to Molding Problems, Joseph A. Shelly, Machy., vol. 25, no. 4, Dec. 1918, pp. 310-314, 12 figs. First of series of articles dealing with construction and application of patterns, including use of woodworking tools, art of joinery, and various methods of building patterns and core boxes.

Salvage Work. Reclaiming Wealth in the Foundry Yard, F. B. Hicks. Can. Foundryman, vol. 9, no. 12, Dec. 1918, pp. 302-303. Salvage work conducted by a superintendent of Sawyer-Massey works.

War Demand. Shell Need Found Foundries Ready. Iron Trade Rev., vol. 63, no. 22, Nov. 28, 1918, pp. 1229-1236, 15 figs. Methods developed in American foundries to meet increased demand of production.

See also ELECTRICAL ENGINEERING, Furnaces (Industrial Furnaces, Steel Furnaces).

FUELS AND FIRING

Blast-Furnace Gas. The Use of Blast-Furnace Gas for Heating Boilers and Metallurgical Apparatus (L'emploi du gaz pour le chauffage des chaudières et des appareils métallurgiques), H. Thiry. Génie Civil, vol. 73, no. 21, Nov. 23, 1918, pp. 401-404, 8 figs. Precautions necessary to insure successful operation of Cowper system. Abstract of discussion before South Wales Inst. Engrs. and Cleveland Inst. Engrs.

Briquetting. The Economy of Briquetting Small Coal, J. A. Yeadon. Traus. Instn. Min. Engrs., vol. 56, part 1, Nov. 1918, pp. 31-34 and (discussion), pp. 34-36. Considerations on conservation of coal and utilization of waste materials; advantages of briquetting; method of manufacture; rectangular and ovoid forms of briquets.

Chimney Design. Saving the Waste in the Chimney, Robert Sibley and Chas. H. Delany. Jl. Elec., vol. 41, nos. 10 and 11, Nov. 15 and Dec. 1, 1918, pp. 463-464 and 511, 4 figs. Nov. 15: Fundamental laws of chimney design as applied to economic operation of oil-fired power plant. Dec. 1; Draft formula for modern power plant.

Combustion Characteristics of Coal. Combustion Characteristics of Coals. Blast Furnace, vol. 6, no. 12, Dec. 1918, pp. 495-497, 5 figs. Factors entering into success of equipment selected for burning different kinds of coal; performance of various types of stokers; data on grades of coal.

Generation of Heat from Bituminous Coal and Its Absorption by the Boiler. Henry Misostow. Power, vol. 48, no. 25, Dec. 17, 1918, pp. 898-899, 3 figs. From paper before National Assc. of Stationary Engrs., Cincinnati, Sept. 1918.

Combustion Characteristics of Coal, Joseph G. Worker. Ry. Rev., vol. 63, no. 23, Dec. 7, 1918, pp. 824-827. Behavior of different grades of stationary boiler plant fuel with reference to type of mechanical stoking apparatus best suited for it. Fuels treated range from small sizes of anthracite through several grades and qualities of bituminous and lignites.

Combustion Characteristics of Coals and Selection of Suitable Stoker Equipment, Joseph G. Worker. Railroad Herald, vol. 23, no. 1, Dec. 1918, pp. 9-14, 7 figs. Results of tests on overfeed type of stoker with smaller sizes of nos. 1, 2 and 3 buckwheat coal and tables giving performance of underfeed stoker as applied to various sizes of boilers and burning different grades of coal.

Fuel Conservation. The Fuel Situation in New England, B. B. Pollock. Official Proc. N. Y. R. R. Club, vol. 29, no. 1, Dec. 1918, pp. 5455-5456. Measures taken to meet coal shortage by Federal Administrator, Boston & Maine R. R.

Some Important Points in Fuel Conservation, Robert Collett. Ry. Age, vol. 65, no. 25, Dec. 20, 1918, pp. 1121-1123. Why we must still save fuel; plan of organization; lessons learned from personal experience. From paper before New England Railroad Club.

Hand-Fired Plants. Fuel Economy in Hand-Fired Power Plants—V. Power Plant Eng., vol. 22, no. 24, Dec. 15, 1918, pp. 987-989. Feed water heating and purification. Abstract of circular 7, Univ.Ill. Eng. Experiment Station.

Indiana Coals. Burning Indiana Coal on the Chain Grate, T. A. Marsh. Power, vol. 49, no. 1, Jan. 7, 1919, pp. 17-19, 7 figs. Characteristics of Indiana screenings from four seams supplying most of steaming coal; need of large grate area, large furnace volume and strong draft to give capacity, and long, high-pitched arches.

IOWA COALS. Burning the Low-Grade Coal of Iowa, T. A. Marsh. Power, vol. 48, no. 27, Dec. 31, 1918, pp. 940-941, 4 figs. Burning Iowa coal on chain grate Being low in heat value, high in ash and of clinkering, non-coking variety, this coal requires, for successful burning, practically continuous ash disposal and non-agitation of fire. Also Elec. World, vol. 72, no. 25, Dec. 21, 1918, pp. 1166-1168, 4 figs. General considerations to observe in selecting stokers and in designing furnaces; specific changes which can be made in order to adapt existing stokers to low-grade fuels.

LIGNITES. The Firing of Pulverized Lignite. M. C. Hatch. Jl. Elec., vol. 41, no. 12, Dec. 15, 1918, pp. 539-541. Advantages in pulverizing; methods of handling furnace design for pulverized fuel; caculation of total cost.
Notes on Lignite. Its Characteristics and Utilization, S. M. Darling. Power House, vol. 11, no. 11, Nov. 1918, pp. 328-331. Abstract of U. S. Bureau of Mines paper.

POWDERED COAL. Pulverized Coal and Its Preparation, J. M. Wadsworth. Jl. Elec., vol. 41, no. 11, Dec. 1, 1918, pp. 511-512, 2 figs. Arrangement of machinery in small coal pulverizing plant. Compiled for Western needs by technical staff of Fuel Administration. First of series.

STOKERS. Power Plant Management VI Mechanical Stokers, Robert June, Refrig. World, vol. 53, no. 12, Dec. 1918, pp. 2325, 3 figs. Efficiency of stokers; smoke alleviation; characteristics of individual chain-grate stokers.

STORAGE. Effect of Storage on Coal (II), Coal Trade Jl., year 50, no. 51, Dec. 1918 pp. 1481-1482. Analytical data accumalated during weathering tests made by Eng. Experiment Station of Univ. of Ill. Tests covered period of six years. Coals used were from Illinois field. (Continuation of serial.)

WOOD. Waste Wood as a Fuel Possibility, O. F. Stafford. Jl. Elec., vol. 41, no. 12, Dec. 15, 1918, pp. 541-543. Suggests conversion of wood waste into ethyl alcohol, direct fuel and powdered charcoal which might be sued directly in specially designed Diesel engine.

FURNACES

ANNEALING FURNACES. Continuous Type Annealing Furnace, Philip D'H. Dressler. Iron Trade Rev., vol. 63, no. 25, Dec. 19, 1918, pp. 1416-1417, 5 figs. Deals specially with a form of continuous car-type annealing furnace. Disscusion of H. E. Diller's paper before Am. Foundrymen's Assn.

HEAT TREATING. Equipment Data on Heat Treat Furnaces, Am. Drop Forger, vol. 4, no. 11, Nov. 1918, pp. 437-439, 6 figs. Discusses refractory material, fuel-oil burners and other furnace equipment.

INSULATION. Value of Heat Insulation in Furnaces, A. W. Knight. Am. Drop Forger, vol. 4, no. 11, Nov. 1918, pp. 451-453. Discusses particularly use of insulation as applied to annealing ovens.

PRESSURES. Graphical Examination of Pressures of Hot Gases and Vapors in Furnaces and Chimneys (Etude de quelques cas généraux de pression de gaz chauds et fumées dans les fours et cheminées par représentation graphique), J. Seigle. Bulletin et comptes rendus mensuels de la Société de l'Industrie Minérale, series 5, vol. 14, 3d issue 1918, pp. 133-151, 17 figs. Variation of pressure at different points of enclosure containing hot gases when (1) enclosure is open at top (2) open at bottom, and when (3) it connects with another enclosure by conduit at top.

HANDLING OF MATERIALS

DUMPER. Dumper at Sewalls Point Handles Two Cars at Once. Eng. News-Rec., vol. 81, no. 24, Dec. 12, 1918, pp. 1086-1088, 5 figs. New facilities of Virginian Ry. at coal pier near Norfolk also incude cars of 120 tons capacity, and long incline.
Double Car Dumper for Handling Coal, A. F. Case. Iron Age, vol. 102, no. 24, Dec. 12, 1918, pp. 1435-1438, 7 figs. Description of new Sewalls point plant of Virginian Ry. Co.

HEAT TREATING

MALLEABLE IRON. Tests in Annealing Malleable Iron, H. E. Diller. Iron Trade Rev., vol. 63, no. 25, Dec. 19, 1918, pp. 1414-1416, 4 figs. Experiments conducted to determine time necessary for annealing; study of results and indication of possibility of annealing in 48 hr.: microphotographs, description of continuous car-type heating furnace. Paper at annual meeting of Am. Foundrymen's Assn.

STEEL

STEEL. Art of Heat Treating. D. N. A. Blacet. Ry. Jl., vol. 25, no. 1, Jan. 1919, pp. 18-20. Economical aspect of adding metalurgist to personnel of plants manufacturing steel parts; general considerations regarding selection of specifications. From Jl. Am. Steel Treaters' Soc.

SURFACE COMBUSTION. Application of the Surface Combustion Process to Heat Treating and Similar Work, John H. Bartlett, Jr. Proc. Steel Treating Soc., vol. 1, no. 11, pp. 18-32, 12 figs. Generation and application of heat; proportioning of gas and air mixture; description of several installations for heat treating; automatic heat-treating furnaces for large-size shells.

HEATING AND VENTILATION

CIRCULATING HEATING. Heating Shop Floors by Circulation. Metal Worker, vol. 90, no. 24, Dec. 13, 1918, pp. 662-663, 6 figs. Scheme to draw cold air form the floor.

FACTORY HEATING. Fuel Wastes in Factory Heating.! Charles L. Hubbard. Indus. Management, vol. 57, no. 1, Jan. 1919, pp. 23-25. Sources of losses; suggestions for economies; means for temperature control suited to different systems of heating.

HOSPITALS. Heating and Power Plant Economies for Hospitals, J. D. Kimball. Modern Hospital, vol. 11, no. 6, Dec. 1918, pp. 437-439. Fundamentals and recommendations of National Economy Program. Paper for convention of Am. Hospital Assn.

MOISTURE REMOVAL. The Removal of Moisture from Special Rooms and Buildings, Charles L. Hubbard. Domestic Eng., vol. 85, no. 8, Nov. 23, 1918, pp. 283-285 and 313-315, 6 figs. Notes on installation of ventilating systems in laundries, dye houses, paper mills, foundries, flax mills, etc.

OFFICE-BUILDING, VENTILATION. Air Supply for a Large General Office Building, Samuel R. Lewis. Heat & Vent. Mag., vol. 15, no. 12, Dec. 1918, pp. 21-26, 16 figs. Past and present practice illustrated in remarkable installation for Swift & Co., Chicago.

RADIATORS. Figuring Direct Radiator Heating Service, W. B. Gray. Metal Worker, vol. 90, no. 24, Dec. 13, 1918, pp. 653-655 and 658, 2 figs. Describes method said to insure correctness and to be of practical application by heating contractors.

RECTOR SYSTEM OF GAS HEATING. New Heating System, Geo. S. Barrows. Gas Indus., vol. 18, no. 12, Dec. 1918, pp. 363-369, 7 figs. Extensive description of Rector system of gas heating.

STEAM HEATING. Care of Heating and Ventilating Equipment, Harold L. Alt. Power, vol. 48, no. 26, Dec. 24, 1918, pp. 910-912, 3 figs. Describes gravity one-pipe steam system. (Sixth article.)

HOISTING AND CONVEYING

CABLEWAYS. Aerial Cableways Successful in Northwest Shipyards. Eng. News-Rec., vol. 82, no. 1, Jan. 2, 1919, pp. 37-40, 5 figs' Similar to loggers cableways; ability to get men expert in handling them is one secret of success; well-planned installations are fast and flexible.

CRANES. Stothert-Pitt 35-Ton Locomotive Crane (Grue-locomotive de 35 tonnes système Stothert et Pitt.) Génie Civil, vol. 73, no. 11, Sept. 14, 1918, pp. 201-203, 5 figs. General arrangement and plans showing dimensions.

HYDRAULIC MACHINERY

CONDUITS, LOSS OF PRESSURE HEAD. On the High Velocities of Water in Conduits (Sur les grandes vitesses de l'eau dans les conduites), C. Mamichel. Revue Générale de l'Electricité, vol. 4, no. 21, Nov. 23, 1918, pp. 788-790, 1 fig. Experimental results said to have demonstrated loss of pressure head for velocities up to 260 ft. per sec, to be the same as for velocities of 30 ft. per sec.

PENSTOCK PIPE. Saving the Waste in Penstock Pipe Design (11), B. F. Jakobsen. Jl. Elec., vol. 41, no. 11, Dec. 1, 1918, pp. 504-505, 2 figs. Presentation and discussion of various formulæ to determine manner in which available money should be distributed among different items in order to get maximum economy. (Continued from Nov. 1, issue.)

WATER HAMMER. Maxima Excess Pressures Produced by Water Hammer (Sovrapressioni massime nei fenomeni die colpo d'ariete), Maurice Gariel. Abstract of article published in Revue Générale de l'Electricité, Sept. 21, (See Eng. Index, Jan., Mech. Eng., Hydraulic Machy., Water Hammer.)
Notes on the Size and Location in Forced Conduits of Water Hammer Relief Devices. (Remarques au sujet des conditions à remplir par certains dispositifs destinés à atténuer les coups de bélier dcas les conduites forcées), Compte de Sparre. Revue Générale de l'Electricité, vol. 4, nos. 19 and 20, Nov. 9 and 16, 1918, pp. 685-690 and 731-740, 1 fig. Nov. 9: Mathematical analysis of phenomena taking place, by reason of elasticity of water and conduit, in surge tank which opens a compensating orifice when water hammer reaches a certain value, the orifice having such dimensions that water hammer will never exceed a permissible maximum. Nov. 16: Application of principles established in proceding installment to calculation of permissible minimum dimensions of surge tanks which will insure a constant value of water hammer during compression.

INTERNAL-COMBUSTION ENGINES

BUCKEYE BARRETT ENGINE. Buckeye Barrett Crude Oil Engine. Indus. Management, vol. 57, no. 1, Jan. 1919, pp. 72-73, 2 figs. Low-compression type burning heavier grades of fuel and designed for service where an engine must run for weeks under full load without a stop.

DESIGN. The Working Process of Internal Combustion Engines, E. H. Sherbondy. Aerial Age, vol. 8, no. 11, Nov. 25, 1998, pp. 564-568, 7 figs. Historial review of inventions which have tended to improve engine efficiency.
Internal Combustion Engine Development, R. E. Neale. Eng. Rev., vol. 32, no. 5, Nov. 15, 1918, pp. 130-132. Indicates lines open to further development particularly in direction of lightening low-speed engines by adoption of higher piston speeds. (To be continued.)

DIESEL ENGINE FUEL PUMPS. The Design and Construction of Diesel Engine Fuel Pumps, G. L. Kirk. Engineering, vol. 106, no. 2759, Nov. 15, 1918, pp. 549-551, 10 figs. Four systems of oil distributon; system of regulation; determination of clearances; constructional details; control lever.

IGNITION. Operation of Internal-Combustion-Engine Magnetos (Sul funzionamento del magneti di accensione dei motori a scoppio), Emilio Biffi. L'Elettrotecnica, vol. 5, no. 29, Oct. 15, 1918, pp. 407-411, 6 figs. Various aspects of spark; study of its oscillatory character; conclusions in regard to magneto operaion., (Concluded.)
Ignition Timing and Valve Setting, Vermont Wells. Am. Blacksmith, vol. 17, no. 12, Sept. 1918, pp. 291-293, 4 figs. Rules for timing ignition in different makes of cars.
British Magneto Manufacture. Gas & Oil Power, vol. 14, no. 158, Nov. 7 1918, pp. 20-22, 3 figs. General dimensions and brief outline of magneto manufactured by British Lighting and Ignition Co.
Dixie Standard Aircraft Magnetos. Automotive Indus., vol. 39, no. 23, Dec. 5, 1918, pp. 954-957, 6 figs. Type which may be adapted to various engines; methods used in manufacture of magneto magnets.

Semi-Diesel Engines. Semi-Diesel Oil Engines, F. D. Weber. Jl. Elec., vol. 41, no. 12, Dec. 15, 1918, pp. 549-550, 4 figs. Types being used to equip auxiliary wooden schoo ers of 500 to 3000 tons capacity and straight motor schooners up to 1000 tons capacity.

The Semi-Diesel Oil Engine, James Richardson. Gas & Oil Power, vol. 14, no. 158, Nov. 7, 1918, pp. 23-25, 9 figs. Development and operation. From paper before Diesel Engine Users' Assn. Also Macy. Market, no. 944, Dec. 6, 1918, pp. 17-18, 9 figs. Definition; compression pressure; flexibility; range of working.

Valves, Poppet, Air-Flow Through. Air Flow Through Poppet Valves. Automotive Indus., vol. 39, no. 25, Dec. 19, 1918, pp. 1047-1051, 5 figs. Experimental investigation from which writer concludes that co-efficient of efflux is practically constant for all pressure drops and nearly the same for valves of different sizes, at equal lifts expressed in per cent, of their respective diameters; considerations on number of inlet valves to use.

Air Flow Through Poppet Valves. Automotive Eng., vol. 3, no. 10, Dec. 1918, pp. 461-463, 1 fig. Data on valve sizes; investigation of merits of multiple valves. (To be continued.)

Winton Marine Engine. The Latest Winton Marine Oil Engine. Automotive Eng., vol. 3, no. 10, Dec. 1918, pp. 447-450, 5 figs. Review of mechanical details of 500 and 250-hp. units of Diesel-type revirsible mitor.

See also ELECTRICAL ENGINEERING, Electrophysics (Spark Plug Insulators).

LUBRICATION

Bearing Design. Oiling System and Bearing Designs, A. E. Windram. Tran. Inst. Marine Engrs., vol. 30, no. 238, Oct. 1918, pp. 209-216, 13 figs. Method of making main bearing, crankpin and crosshead brasses oiltight by means of drilling crank webs into oil rings or grooves turned round center of journal, and corresponding oil ring or groove in center of brasses connected with pipes from brasses to brasses, which are made oiltight by sealing rings on ends of brasses.

Oils. Properties of Oils and Their Relation to Lubrication (Propiedades de los aceites; su relacion con la lubricacion). Boletin de la Sociedad de Fomento Fabril, year 35, no. 8, Aug. 1918, pp. 537-542. Significance of tests for acidity, carbon-residue, oxidation, volatility, surface tension, emulsion, heat and density.

See also MARINE ENGINEERING, Ships (Lubrication).

MACHINE ELEMENTS AND DESIGN

Crankshafts. Hair-Line Defects in Crankshafts, P. J. Piccirilli. Automotive Industries vol. 39, nos. 25 and 26, Dec. 19 and 26 ,1918, pp. 1041-1044, 1104-1105 and 1122, 15 figs. Metallographic study and physical tests of chromenickel steel crankshafts to determine nature and effect of so-called hair-lined efects on their physical strength.

Springs. A new theory of Plate Springs, David Landau and Percy H. Parr. Jl. Franklin Inst., vol. 186, no. 6, Dec. 1918, pp. 699-721, 8 figs. Mathematical generalization of propositions advanced in first paper, vol. 185, Apr. 1918, p. 481. Special attention given to effect of tapering ends and constructing springs so that leaves continue in contact everywhere on application of load. (To be concluded.)

The Springs of the Car (IV) F. M. Paul. Am. Blacksmith, vol. 17, no. 12 Spt. 1918, pp. 298-299, 9 figs. Considers effect of thickness in regard to deflection and load.

MACHINE SHOP

Chisel. The Cold Chisel, J. A. Lucas. Power, vol. 48, no. 24, Dec. 10, 1918, pp. 838-841, 27 figs. Description of various types of cold chisels and their uses.

Cylinder Manufacture. Cylinder Boring and Reaming, Franklin D. Jones. Machy., vol. 25, no. 5, January 1919, pp. 383-394, 20 figs. First of series of articles dealing with boring, reaming and grinding of cylinders, and tools, fixtures and machines used.

Manufacture of Cylinders for the Hall-Scott Aeroplane Engine, Richard Vosbrink. Metal Trades, vol. 9, no. 12, Dec. 1918, pp. 475-479, 11 figs, Operations followed at California plant to produce accurate results.

Design. Novel Plant of American Tool Company, C. L. Smith. Iron Age, vol. 103, no. 1, Jan. 2, 1918, pp. 29-33, 10 figs. Latest ideas in heating and ventilating, lighting features, transportation facilities, sanitation, handling turnings; unusual drive for planers; machine foundations.

Designing a Shop for Present Day Needs, C. E. Edmund. Am. Drop Forger, vol. 4, no. 11, Nov. 1918, pp. 431-433. Considerations on location, construction and operation of forge plant.

Gages. Notes on the Computing of Gage Tolerances, M. H. Potter. Can. Machy, vol. 20. no. 24, Dec. 12, 1918, pp. 670-672, 6 figs. Classifies and studies the more frequent troubles experienced with gages and gives rules and formulæ for computing allowable tolerances for various gages. A square hole gage and a depth gage are referred to but the rules proposed apply in general to all gages.

Apparatus for Checking Screw Threads. Automotive Indus., vol. 38, no. 24, Dec. 12, 1918, pp. 1008-1010, 4 figs. Methods of operating machines used for inspection nf plug and ring thread gages and similar threaded parts requiring great accuracy.

Flush-pin, Sliding Bar and Hole Gages, Erik Oberg. Machy. vol. 25, no. 5 Jan. 1919, pp. 404-412, 34 figs. Principles involved and procedure, followed by Pratt & Whitney Co. in developing gaging systems for interchangeable manufacture. Fourth article.

Contour or Profile Gages, Erik Oberg. Machy., vol. 25, no. 4, Dec. 1918, pp. 301-308, 31 figs. Principles involved and procedure followed in developing gaging systems for interchangeable manufacture. Based upon experience of Pratt & Whitney Co. in furnishing gaging equipment for small arms and heavy ordnance work. Third article.

Gear Cutting. The Manufacture of Spiral Bevels. Automobile Engr., vol. 8, no. 121, Dec. 1918, pp. 336-339, 6 figs. Description of Gleason machine for that purpose.

Problem of the Theoretically Correct Involute Hob, Nikola Trbojevich. Machy., vol. 25, no. 5, Jan. 1919, pp. 429-433, 3 figs. Mathematical theory developed.

Grinding. Grinding of Hardened Work, C. H. Norton. Proc. Steel Treating Research Soc., vol. 1, no. 11, pp. 15-17. Norton Grinding Co.'s experience; suggestion in regard to grinding.

Grinding Operations on "Caterpiller" Tractor Parts, Frank A. Stanley. Am. Mach., vol. 50, no. 1, Jan. 2, 1919, pp. 1-417 figs. Grinding operations include finishing of great variety of gears, bushings, shafts, piston pins, case covers, etc.; details of wheels, limits of accuracy, etc.

Grinding Round Work Without Centers. Am. Mach., vol. 50, no. 1, Jan. 2, 1919, pp. 4-5, 4 figs. Describes new grinding machine built by Detroit Tool Co.

Pistons and Rings. The Manufacture of Pistons and Rings, A. Thomas. Automobile Engr., vol. 8, no. 121, Dec. 1918, p. 358, 3 figs. Notes on operation of Potter-Johnson automatic machine.

Repair Work. Automotive Repair Work in the Machine Shop, Donald A. Hampson. Can. Machy., vol. 20, no. 21, Dec. 12, 1918, pp. 665-668, 7 figs. Practical observations on methods of increasing pedal leverage, making a working clutch, inserting cotters in unseen holes, fitting rings in cylinder, increasing size of cast iron parts, reaming undersize in cast iron and other similar operations.

The Repair Shop, Automobile Engr., vol. 8, nos. 120 and 121, Nov. 1918 and Dec. 1918, pp. 312-315 and 341-345, 25 figs. Nov. 1918; Notes on heavy vehicle design from viewpoint of repair and maintenance. Radiator; engine; clutch; engine suspension; gear box; universal joints and brakes. Dec. 1918; Deals with rear axle; road wheels and bearings; chassis lubrication, spring and pins; frame; steering and front axle; controls.

MACHINERY, METAL-WORKING

Boring Mill. Blomquist-Eck Horizontal Boring Mill. Machy., vol. 25, no. 5, Jan. 1919, pp. 465-466, 2 figs. General description with illustrations.

Lathes. Large Lathes for Machining Turbine Spindles, A. M. M. Machy, vol. 25, no. 5, Jan. 1919, pp. 439-442, 3 figs. Illustrated description of some large lathes.

Planer. Newton Upright Generating Planer, Machy., vol. 25, no. 5. Jan. 1919, pp. 473-474, 4 figs. Description of machine built by Newton Machine Tool Works, Inc., Philadelphia, Pa.

Reamers. Types of Reamers and Their Use, E. C. Peck. Machy., vol. 25, no. 4, Dec. 1918, pp. 335-337, 6 figs. Description of various types of reamers.

Relieving Machine. Universal Relieving Machine for Hobs and Cutters. Machy., vol. 25, no. 5, Jan. 1919, pp. 467-468, 2 figs. Description of machine built by T. C. Mfg. Co., Harrison, N.J.

Steel High-Speed. The Evolution of a High-Speed Steel Tool, T. L. Thorne. Proc Steel Treating Research Soc., vol. I, no. 11, pp. 33-43. Analyses of several high-speed steel specimens; influence of silicon, manganese, sulphur, plosphorus chromium, vanadium and tungsten on characteristic properties of steel; practice followed in its manufacture; forms of furnaces used; heat-treating and tools.

A New Air-Hardening High-Speed Steel. Am. Drop Forger, vol. 4, no. 11, Nov. 1918, pp. 435-436, 2 figs. Experiences of users of a steel made without tungsten by Cuyahoga Crucible Foundry Co.

Stellite. Stellite and High-Speed Steel Compared. Iron Age, vol. 102, no. 26, Dec. 26, 1918, pp. 1584-1585, 2 fig. Hardness at different temperatures; stellite softer in raw state; relative cutting tests on three materials.

See also RAILROAD ENGINEERING, Shops (Tools, Brass-Working); MUNITIONS AND MILITARY ENGINEERING, Tools for Shell Manufacture.

MATERIALS OF CONSTRUCTION AND TESTING OF MATERIALS

Notched Bars. Some Experiments on Notched Bars, H. T. Philpot. Jl. Soc Automotive Engrs., vol. 3, no. 6, Dec. 1918, pp. 347-357, 3 figs. Tests to obtain dimensions and shapes for round notched bar for use in acceptance tests on heat-treated steels in place of standard square type A test piece. Paper befor Instn. Automobile Engrs. of Great B itain.

Hardness. The Ludwik Hardness Test, W. Cawthorne Unwin. Jl. Instn. Mech, Engrs., no. 6, Nov. 1918, pp. 485-492. Traces relationship between indentation hardness tests of ductile metals.

The Value of the Indentation Method in the Determination of Hardness, R. G. C. Batson. Jl. Instn. Mech. Enger., no. 6, Nov. 1918, pp. 463-483, 6 figs. Deals with determination or hardness by means of indentation produced by a static load and by impact of a ball or cone.

Malleable Iron. Malleable Iron in Engineering Construction, H. A. Schwartz. Foundry, vol. 47, no. 317, Jan. 1919, pp. 19-24, 16 figs. Engineering properties and characteristics of malleable iron which recommend it for wide range of uses, From paper before Am. Foundrymen's Assn.

Optical Stress Determination. Stress Optical Experiments, A. R. Low. Flight, vol. 10, nos. 48-49, Nov. 28 and Dec. 5, 1918, pp. 1355-1356 and 1379-1381, 12 figs. Determination of stress by optical methods. Nov. 28; Elementary theory; changes in uniform field as stress increases; null method of measurement; appearances in non-uniform field; enutral, isochromatic and isoclinic lines Dec. 5; Simplifications in case of bar under flexure; error of obliquity; observation of errors of parallax; general accuracy of optical obsevations of stress. Paper before Royal Aeronautical Soc. (To be continued.)

Rubber. Ageing cf Vulcanized Plantation Rubber, Henry P. Stevens. Jl. Soc. Chem. Indus., vol. 37, no. 21, Nov. 15, 1918, pp. 305T-306T, 4 figs. Tests or ordinary pale rolled sheet and unrolled sheet.

Testing Machines. Testing Machines in Industrial Laboratories H. S. Primrose and J. S. Glen Primrose. Can. Machy., vol. 20, nos. 23 and 25, Dec. 5 and 19, 1918, pp. 64-647 and 696-699, 17 figs. Necessity of establishing specifications properly controlled by analysis and test in purchasing engineering materials and features of various testing machines. From Engineering.

Testing of Materials. The Experimental Study of the Mechanical Properties of Materials, W. Cawthorne Unwin. Jl. Instn. Mech. Engrs., no. 6, Nov. 1918, pp. 405-439, 13 figs. Early researches; chain-cable testing machines; large testing machines; Emery testing machine at Bureau of Standards; tests of reception tension tests, Wöhler test, hardness tests, notched-bar tests.

Wood. Some Tests of Douglas Fir after Long Use, Arthur C. Alvarez. Univ. of Cal. Publications in Eng., vol. 2, no. 2, Nov. 18, 1918, pp. 57-118, 17 figs Results of 1200 tests on strength, elastic properties and moisture content; includes 27 tables of measured and computed mechanical coefficients.

MEASUREMENTS AND MEASURING APPARATUS

Calibration. On the Choice of a Uniform Temperature for the Calibration of Measuring Instruments (Sur le choix d'un degré uniforme de température pour l'étalonnage des instruments de mesure), Ch. Cochet. Revue Générale de l'Electricité, vol. 4, no. 20, Nov 16, 1918, pp. 740-742. Report of Commission, de Normalisation des Ingénieurs des Arts et Métiers de Boulogne-sur-Seine, recommending adoption of 0 deg. cent. as standard.

Calorimeters. Calorimetric Methods and Devices, Walter P. White, Jl. Am. Chem. Soc., vol. 40, no. 12, Dec. 1918, pp. 1887-1889, 3 figs. Application of rules for calorimetric precision derived by writer to jacket covers and stirrers; vacuum-jacketed vessels; adiabatic method; aneroid or dry calorimeters; double or differential calorimeters; measured-shield calorimeters.

Coke Testing. Coke Factors Affecting Furnace Operation, G. D. Cochrane, Blast Furnace, vol. 6, no. 12, Dec. 1918, pp. 502-504, and 512 1 fig. Coke-testing machine employed in experiment for determining coke hardness. Mechacinal condition of coke an important factor in furnace operation.

Picnometer. A Picnometer Operated as a Volumeter, H. G. Schurecht. Jl. Am. Ceramic Soc., vol. 1, no. 8, Aug. 1918, pp. 556-558, 1 fig. Same as ordinary picnometer but of sufficiently large size and opening to permit introduction of a briquet into the bottle. Volume of briquet determined from standard formula in terms of weight and specific gravity of liquid.

Salinometers. An Instrument for Recording Sea-Water Salinity, A. L. Thuras, Jl. Wash. Acad. Sci., vol. 8, no. 21, Dec. 19, 1918, pp. 676-687, 3 figs. Surface salinity of ocean determined by measuring ratio of resistances of sea water in two similar electrolytic cells. Accuracy limited by that with which salinity of standard sea water carried in sealed cell is known. Table given showing conductivity of sea water throughout range of concentration found in open ocean.

Scales. Oscillations in Scales, Eugene Motchman. Scale Jl., vol. 5, no 3, Dec. 10, 1918, pp. 7-9, 4 figs. Use of modern 150-ton beam applied to railroad track scales without loose weight. (Continuation of serial.)

MECHANICAL PROCESSES

Boilers. Boiler Making in an English Shop, A. L. Haas. Boiler Maker, vol. 18, no. 12, Dec. 1918, pp. 333-337, 11 figs. Hopwood, Cornish, Lancashire and Britannia types; shop conditions; position drilling; combustion chamber crown; seven-hour tests.
Manufacturing Marine Steam Boilers, E. A. Suverkrop. Am. Mach., vol. 49, no. 26, Dec. 26, 1918, pp. 1155-1163, 21 figs. Description of building operations of single-ended, three-furnace Scotch marine boilers at shop of Sun Shipbuilding Co., Chester, Pa., where production has reached as high as nine per month.

Cans. A Modern Can-Making Plant in a Baking Powder Factory, J. V. Hunter. Am. Mach., vol. 49, no. 26, Dec. 26, 1918, pp. 1173-1176, 11 figs. Description of process of making tin cans.

Chains. The Manufacture of Diamond Transmission Chain, J. V. Hunter. Am. Mach., vol. 49, no. 23, Dec. 12, 1918, pp. 1077-1080, 11 figs. Assembling work. Fourth article.

Clocks. Applications of Magnetic Gears in Electric Clockmaking (Engrenages magnétiques. Application à l'horlogerie électrique), Pierre Seve. Comptes rendus des séances de l'Académie des Sciences, vol. 167, no. 19, Nov. 4, 1918, pp 681-683. Mutual action of two disks having magnets attached at regular intervals in their perpheries; disposition to provide magnetic escapement.

Engines, Oil. Quautity Production of Engines at the Skandia Pacific Plant, Geo. N. Somerville. Metal Trades, vol. 9, no. 11, Nov. 1918, pp. 429-434, 10 figs. Operations in various sizes of oil engines.

Lubricator. Manufacturing a Mechanical Lubricator, M. E. Hoag. Am. Mach., vol. 49, no. 26, Dec. 26, 1918, and vol. 50, no. 1, Jan. 2, 1919, pp. 1183-1185 and 23-26, 18 figs.

Plates. See Rolling Mills below.

Quarrying. Rock Quarrying for Cement Manufacture, Oliver Bowles. Department of Interior, Bur of Mines, bul. 160, min. technology 22, 160 pp., 31 figs. Chief types of cement; growth of cement industry in U. S.; character of raw materials used; quarrying method and equipment with special reference to drilling and blasting; rock mining and prospecting.

Radiators. Building Radiators for Automobiles and Other Purposes, Ellsworth Sheldon. Am. Mach., vol. 49, no. 26, Dec. 26, 1918, pp. 1165-1169, 18 figs. Description of certain processes involved in manufacture of cellular type of radiator.

Rolling Mills. Design of Rolls for Making Ship and Boiler Plates, S. W. Staniford. Machy., vol. 25, no. 5, Jan. 1919, pp. 396-400, 1 fig. Rolling-mill practice; drafts of slabbing and plate-mill rolls; universal mill; surface speed of rolls, rolling tin plate.
The Liberty Mill of the Carnegie Steel Company, Charles A. Menk and F. L. Hunt. Elec. Jl., vol. 15, no. 12, Dec. 1, 1918, pp. 483-489, 18 figs. Layout of buildings and equipment of completely electrically-driven plate mill.
Valley Company Now Rolls Plates, Iron Trade Rev., vol. 63, no. 25, Dec. 19, 1918, pp. 1403-1406, 3 figs. Operation and details of electrically-driven steel plant with annual capacity of 350,000 tons.
Selecting Proper Size Mill Rolls, F. Johnson. Iron Trade Rev., vol. 63, no. 26, Dec. 26, 1918, pp. 1466-1468, 7 figs. Outline of relative advantages obtained by using rolls of small or large diameter for effecting a given reduction; effect of cold-working on physical properties of various metals. From paper before Birmingham Metallurgical Soc., England.
A New Departure in Rolling Mills. Iron Age, vol. 103, no. 1, Jan. 2, 1919, pp. 41-44, 6 figs. Neither lifting tables nor reversing drive employed; design developed by Mackintosh, Hemphill & Co.
Lukens Plate Mill is Largest in the World. Iron Age, vol. 103, no. I, Jan. 2, 1919, pp. 56-59, 5 figs. Description of the mill.
Brier Hill Steel Co.'s New Plate Mill. Iron Age, vol. 102, no. 25, Dec. 19, 1918, pp. 1521-1524, 6 figs. World's largest mill building; houses and 84 and 132-in. units; power entirely electric; boiler plant dispensed with.
Blooming Mill Now Rolling Plates. Iron Trade Rev., vol. 63, no. 23, Dec. 5, 1918, pp. 1285-1288, 4 figs. Account of rebuilding of mill, orginally designed for breaking down ingots, to air rapid transformation from shell steel to peace-time commercial product.

Sawmills. Small Sawmills: Their Equipment, Construction and Operation, Daniel F. Seerey. U. S. Department of Agriculture, bul. 718, Dec. 17, 1918, 68 pp. Suggestions to portable sawmill operators regarding methods of organization, milling, and lodging which have been proved by experience to give the best results. Written particularly for operators in National Forest timber.

Shell and Ivory Articles. Making Shell Buckles and Brooches, Robert Mawson. Am. Mach., vol. 50, no. 1, Jan. 2, 1919. pp. 20-22. 13 figs. Making of buckles and brooches from shells and ivory performed as far as possible on machines, but some operations are done by hand.

Shovels. Shovels Made Out of Old Locomotive Tires, W. S. Standiford. Can. Machy., vol. 20, no. 25, Dec. 1918, pp. 693-695, 3 figs. Description of manufacturing process.

Tanks, Pressure. Tables for the Design of Pressure Tanks. John A. Cole. Boiler Maker, vol. 18, no. 12, Dec. 1918, pp. 349-351. Specifications for cylindrical pressure tanks; single-riveted lap girth seams, for use when girth and longitudinal seams are the same size; safe working pressures for cylindrical tanks of various diameters; safe working pressures on convex and dished heads.

Tractor. Manufacturing of Farm Tractor, M. E. Hoag. Am. Mach., vol. 49, no. 25, Dec. 19, 1918, pp. 1135-1137. Description of shop arrangement of Moline Plow Co.

MECHANICS

Balancing. Dynamic and Static Balancing ,Edward K. Hammond. Machy., vol. 25, nos. 4 and 5, Dec 1918 and Jan. 1919, pp 285-292 and 422-426, 26 figs. Two articles explaining conditions which must be fulfilled in balancing machine members, and methods of conducting work.

Stress Theory. The Specification of Stress, Part V, R. F. Gwyther, Memoirs & Proc. Manchester Literary & Phil. Soc., vol. 62, part 1, Aug. 7, 1918, pp. 1-11. Formal solution of elastic stress equations; theory of displacements of materials bodies as consequence of stress; results of hypothesis that nine elements of stress may be functions of nine first differential co-efficients of components of some vector; fundamental equations estimating forces causing rate of change of momentum and expression of corresponding rate of change of momentum.

Vibration. Vibration: Mechanical, Musical and Electrical, Edwin H. Barton. Sci. Am. Supp., vol. 87, no. 2241, Jan. 4, 1919, p. 5. Analogies and experimental verification of laws governing vibratory motion. Discourse delivered at Royal Instn. From Engineering.

MOTOR-CAR ENGINEERING

Acceleration Determined by Mechanical Differentiometer. Automobile Performance Analyzed by Mechanical Differentiation. Armin Elmendorf. Automotive Indus., vol. 40, no. 1, Jan. 2, 1919, pp. 11-46, 17 figs. Determination of accelaration from time and distance observations by means of mechanical differentiometer.

Carburetors. Carburetor Adjustments of Twenty Leading Automobiles. George H. Murphy. Am. Blacksmith, vol. 17, no. 12, Sept. 1918, pp. 301-303, 9 figs. Instructions for making adjustments. (To be concluded.)

Design. Post-War Chassis. Automobile Engr., vol. 8, nos. 120 and 12I, Nov. and Dec. 1918, pp. 304-305 and 339-340. Nov. 1918; possible effects of aircraft engine experience and other factors bearing upon design. Pistons; valve position and actuation; valves. Dec. 1918, Valve springs; valves rockers; connecting rods; crankshafts; lubrication.
Analysis of Gas and Gasoline High-Speed Engine Design, Harry R. Ricardo Int. Mar. Eng., vol. 23, no. 12, Dec. 1918, pp. 673-677. Gorups of mechanical losses depend upon form of pipe work; volumetric efficieny and piston design. Second article.

Differentials. The Allen Self-Locking Differential. Automotive Indus., vol. 39 no. 26, Dec. 26, 1918, p. 1099, 2 figs. Device embodying reversible ratchet principle. Drive on curves is through inner wheel.

Engines. Used Airplane Engines for Automobile Installation, Frank F. Tenney. Automotive Eng., vol. 3 no. 10, Dec. 1918, pp. 457 and 463. Why engines which have outlived their usefulness in air service may still be of service of other uses.

Exports. Export Opportunities for Automotive Products, (11). Automotive Eng., vol. 3, no. 10, Dec. 1918, pp. 454-456. Export of American combustion engine from 1914 to 1917; motor boats and marine machinery in Siam; demand for motor boats in Denmark; high fuel limits in South America; market tractors in Cuba; tractors in farming sections of Walves. Continuation of serial.)
Cultivating Japanese Automotive Field (III), Tom O. Jones. Automotive Indus., vol. 39, no. 23, Dec.5, 1918, pp. 970-971. Types of automobiles desired; equipment and finish; automobile building in Japan. (To be continued).

France. The Automobile after the War, Georges Côté. Automotive Indus., vol. 39, no. 25, Dec. 19, 1918, pp. 1057-1058 and 1075. Views and suggestions to automobile manufacturers of France as to means and methods of meeting reconstruction problems and foreign competition.

Fuels. Benzol Superior to Gasoline as Auto Fuel. Gas Age, vol. 42, no. 12, Dec. 16, 1918, pp. 548-550, 2 figs. Result of comparative tests made by Automobile Club of America; 90 per cent benzol said to give higher brake hp. at less fuel consumption by the motor.

Liberty Fuel. Liberty Fuel. A Chemical Marvel, E. W. Roberts. Gas Eng. vol. 21, no. 1, Jan. 1919, pp. 1-4, 8 figs. Description of fuel with reportof U. S. Government tests.
Properties of Liberty Fuel and Results of Economy Tests. Power, vol. 49 no. 1, Jan. 7, 1919, pp. 9, 2 figs. Particulars as to nature and characteristics of new fuel.

Headlights. Headlamp Glare. Jl. Soc. Automotive Engrs., vol. 3, no. 6, Dec. 1918, pp. 364-366. Account of work done and bases followed by committee of Illum. Eng. Soc. in preparation of headlight specifications.

Manufacturing Problems. Why So Many Motor Models? George F. Crouch. Motor Boat, vol. 15, no. 23, Dec. 10, 1918, pp. 18-20, 3 figs. Osbcrves that concentration by manufacturer on fewer sizes would mean better moters, better service and lower cost.

Radiators. Principles of Tractor Radiator Design, E. Goldberger. Automotive Indus., vol. 38, no. 24, Dec. 12, 1918, pp. 1000-1003, 3 figs. Equations showing dependence of radiator capacity on temperatures, rates of flow and inherent characteristics; advantages of thermosiphon cirulation in tractor work.

Steam Vehicles. A New British Coke-Fired Steam Commercial Vehicle. Automotive Indus., vol. 39, no. 22, Nov. 28, 1918, pp. 919-922, 6 figs. Three-ton chassis having automatic control of steam-generating functions and manual control of devices arranged as on a gasoline vehicle.

Suspension. Houdaille Brings Out Adjustable Car Suspension, F. W. Bradley Automotive Indus., vol. 38, no. 24, Dec. 12, 1918, pp. 1004-1005, 2 figs. Device which permits moving points of attachment of springs to car frame.

Tractors. S. W. H. Tractor, a New Cleveland Product. Automotive Indus., vol. 39, no. 26, Dec. 26, 1918, pp. 1085-1088, 5 figs. Three-plow machine with pressed-steel semi-frame bolted to front end of transmission housing; engine and transmission independent.
The Auto-Tiller, a Two-Horse Team Replacement Unit. Automotive Eng., vol. 3, no. 10, Dec. 1918, pp. 473-477, 5 figs. Field of unity and mechanical details of motor tractor for farm work operated by one man from a fixed position.

Trucks. Regulation of Speed, Weight, Width and Height of Motor Trucks Discussed, George M. Graham. Eng. News-Rec., vol. 81, no. 25, Dec. 19, 1918, pp. 1109-1112. Regulation, while necessary, should not restrict expansion of motor truck; table of proposed dimensions, speeds, weights, and fees presented. From paper before Joint Highway Congress, Chicago, Dec. 1918.
Double Reduction Gear Drive for Heavy Duty Trucks. Am. Blacksmith, vol. 18, no. 2, Nov. 1918, pp. 32-33. Operation of drive in new 3 and 5-ton, White models.

Wheel. An Elastic Wheel (La roue élastique I. D.). Génie Civil, vol. 73, no. 20 Nov. 16, 1918, pp. 393-394, 2 figs. Design which by means of helical springs attached to rim permits tangential effort on wheel to be distributed over a number of contact points of spring.

PIPE

See MECHANICAL ENGINEERING, Corrosion (Pipe).
See also MECHANICAL ENGINEERING, Mechanical Processes (Radiators); Internal Combustion Engines (Buckeye Barrett Engine); Machine Shop (Repair Work).

POWER GENERATION

Exhaust Steam. Utilization of Exhaust Steam in Collieries for the Generation of Electrical Energy (Considérations sur l'utilisation des vapeurs d'échappement dans les bouillères en vue de la production d'énergie électrique), A. Barjou. Industrie Electrique, year 27, nos. 621, 623, 627, 631 and 634, May 10, June 10, Aug. 10, Oct. 10 and Nov. 25, 1918, pp. 166, 171, 212, 217, 287, 293, 373, 379 and 425-430, 26 figs. May 10: theoretical aspect of problem. June 10: systems of regulating exhaust steam. Aug. 10: utilization of exhaust steam in low-pressure turbines. Oct. 10: Westingbouse-Leblanc system of condensation. Nov. 25; Brequet-Delaporte condenser.

Tides. Tides as a Source of Mechanical Power (Etude sur l'utilisation des marées pour la production de la force motrice), F. Maynard, Revue Générale de l'Electricité, vol. 4, nos. 19, 20 and 21, Nov. 9, 16 and 23, 1918, pp. 697-715, 749-762 and 793-802, 14 figs. Brief description of 87 patents granted in France concerning devices for utilization of tidal energy and analyses of their practical values. (To be continued.)

POWER PLANTS

Boiler Water. Control of Concentrated Boiler Water is Essential, Hartley LeH. Smith. Elec. Ry. Jl., vol. 52, no. 25, Dec. 21, 1918, pp. 1087-1091, 1 fig. Methods used for control of concentration in boilers; how ratio of concentration from headwater to boiler water is determined; calculation of boiler concentration control charts.

Coal Economy. Coal Economy in a Small Steam Generating Station. Elec. Rec., vol. 24, no. 6, Dec. 1918, pp. 27-28, 3 figs. Results secured in 290-kw. plant given as example of coal saving.

Flue-Gas Analysis. Controlling Efficiency of Combustion, E. A. Uebling. Power, vol. 48, no. 26, Dec. 24, 1918, pp. 921-923. Use of flue-gas analysis for controlling combustion.

Furnace Indicating Instruments. Meters and Gages in Boiler Operation, E. A. Uehling. Power, vol. 48, no. 24, Dec. 10, 1918, pp. 842-844. Use of meters and gages in diagnosing condition of furnace.

Hand Firing. Power Plant Management; Hand Firing, Robert June. Power House, vol. 11, no. 11, Nov. 1918, pp. 315-317, 3 figs. Standard practice; proper combustion conditions; thickness of fire; minimization of smoke.

Individual Plants. Steam-Generating Equipment of Mark Plant, Gordon Fox and F. E. Grenley. Power Plant Eng., vol. 22, no. 24, Dec. 15, 1918, pp. 981-894, 3 figs. Description of certain features of new plant of Steel & Tube Co. of America.

Power Plants in 1918. Review of the Year in the Power Field. Power, vol. 49, no. 1, Jan. 7, 1919, pp. 2-8. What has been new and of especial interest during 1918.

Scale in Boilers. Scale in Water-Tube Boilers. Monthly Jl. Utah Soc. Engrs., vol. 4, no. 9, Sept. 1918, pp. 175-176. Results of cleaning a 400-hp. Babcock & Wilcox boiler after operating it or six months, with table indicating the amount of scale taken from each of its 14 sections.

Transmission Losses. Wasting Power in the Using, L. W. Alwyn-Schmidt. Power Plant Eng., vol. 22, no. 24, Dec. 15, 1918, pp. 984-987. Transmission losses, waste of power at machine and methods suggested for overcoming them.

Turbo-Generator Plants. Operating Methods That Increase Economy, C. F. Hirshfeld and C. L. Karr. Elec. World, vol. 72, no. 24, Dec. 14, 1918, pp. 1120-1124, 2 figs. Apply to turbo-generator plants; distribution of loads on boilers and turbines and economical operation of auxiliaries discussed.
Economic Operation of Steam Turbo-Electric Stations, T. C. Hirshfeld and C. L. Karr, Elec. Rev., vol. 73, nos. 23 and 24, Dec. 7 and 14, 1918, pp. 886-890 and 923-928, 5 figs. Bureau of Mines Technical Paper discussing fuel-economy factors, load, distribution between units, boiler room and auxiliairies operation.

Waste Heat. Waste Heat for Steam Generation. Thomas B. Mackenzie. Engineering vol. 106 no. 2759 Nov. 15 1918 pp. 567-569, 2 figs. Utilization of waste heat from open-hearth furnaces for generation of steam. Paper before Iron & Steel Inst. Sept. 1918.

PRODUCER GAS

Kiln Gas-Fired. Heat Balance on a Producer-Gas Fired Chamber Kiln, R. K. Hursh. Jl. Am. Ceramic Soc. vol. 1 no. 8, Aug. 1918, pp. 567-577, 1 fig. Data based on tests of a kiln of 16 chambers, each holding 50,000 standard sized brick and on three 6-ft. water-scaled gas producers of the pressure type.

Open-Hearth Furnaces. Waste Heat from Open Hearth Furnaces, Thomas B. Mackenzie. Blast Furnaces, vol. 6, no. 12, Dec. 1918, pp. 488-492, 3 figs. Analysis of producer gas supplied to furnace; theoretical principles governing operation of waste-heat boilers; suggestions concerning layout of plant and boiler setting. Paper before British Iron & Steel Inst. (Concluded.)

Wood. The Production of Power-Gas from Wood, Leslie B. Williams, Min. Mag., vol. 19, no. 5, Nov. 1918, pp. 246-250. Discusses composition of power gas from wood and methods of obtaining largest amounts of most effective components.

PUMPS

Motor-Driven Pumps. High Efficiencies Shown by Motor-Driven Water Works Pumps at St Paul, Minn. Mun. & County Eng., vol. 55, no. 6, Dec. 1918, pp. 202-204, 2 figs. Results obtained from tests of two 12-in. centrifugal pumps.

REFRACTORIES

Classification. Refractories. Clay-Worker, vol. 70, no. 6, Dec. 1918, pp. 504-505. Reasons for classification into acid, basic and neutral; construction, effectiveness and uses of each of these classes; properties of some refractory clays.

Firebrick. How Slag Temperatures Affect Firebrick, Raymond M. Howe. Iron Trade Rev., vol. 63, no. 23, Dec. 5, 1918, pp. 1288-1289. Penetration of slag into brick was determined after allowing bricks, which were previously heated to required temperature, to retain in cavity 35 grams of slag for 2 hrs.; tables given for various temperatures. Paper before Refractories Mfrs. Assn. Also Blast Furnace, vol. 6, no. 12, Dec. 1918, pp. 484-485.

Silica. Silica Refractories, Donald W. Ross, Jl. Am. Ceramic Soc., vol. 1, no. 7, July 1918, pp. 477-499, 6 fifs, and (discussion) pp. 499-501. Experimental data on raw materials, manufacture and burning of silica brick, and properties of burned ware.

REFRIGERATION

Ammonia. What Becomes of the Ammonia in Refrigerating Systems? George L. Reuschline, Am. Soc. Refrig. Engrs. Jl., vol. 5, no. 3, Nov. 1918, pp. 161-167. Production of ammonia from normal sources; amount used in ice and refrigerating plants; actual needs and unavoidable losses; actual ammonia loss per ton of ice made; avoidable losses and how to stop tem; purging; piston-rod leakage; bonus system.

Ammonia, Compression System. The Ammonia Compression Refrigerating System—XXV. W. S. Doan. Refrig. World, vol. 53, no. 12, Dec. 1918, pp. 33-34. 1 fig. Testing of lubricating oil; petroleum oils; necessary quantity to feed bearings. (To be continued.)

Ammonia Piping. Discussion of the Topic — Size of and Proper Vapor Velocity in Ammonia Suction and Discharge Mains. Am. Soc. Refrig. Engrs. Jl., vol. 5, no. 2 Sept. 1918, pp. 120-124, 1 fig. Discussion at Milwaukee meeting.

FORECOOLING. Discussion of the Topic — Advantages of Forecooling Liquid Ammonia Between Receiver and Expansion Valve with Coldest Water Available. Am. Soc. Refrig. Engrs. Jl., vol. 5 no. 2, Sept. 1918, pp. 125-130. Discussion at annual meeting, New York.

HOUSEHOLD REFRIGERATING MACHINE. The Household Refrigerating Machine John E. Starr. Am. Soc Refrig. Engrs. Jl., vol. 5 no. 3, Nov. 1918, pp. 157-160. Attributes difficulty of designing commercial type of small compression machine to leakage at stuffing box small quantity of liquid circulated per minute and gradual projection of lubricant from high-pressure to low-pressure side.

ICE MANUFACTURE. Ice Plant Investments, George E. Wells, Am. Soc. Refrig. Engrs. Jl., vol. 5. no. 3. Nov. 1918, pp. 145-152. Detailed ice-manufacturing costs in 1915 of 20 southwestern ice plants using Corliss steam engines.
Power and Labor Requirements of Detroit Type Ice Plant Donald Cole. Am. Soc. Refrig. Engrs. Jl., vol. 5 no. 2, Sept. 1918 pp. 110-115 and (discussion) pp. 115-119. Operation of electrically driven raw-water plant, low-pressure, drop-pipe system having in conjunction an ice storage house holding full output of thirty to one hundred days.
Motor Driven Raw Water Ice Plant, George E. Chamberlin. Am. Soc. Refrig. Engrs. Jl., vol. 5 no. 2, Sept. 1918, pp. 87-109, 11 figs. Description of electrically driven high-pressure plant making 120 tons of ice per day.

LOW-TEMPERATURE COMPRESSION SYSTEM. The Low-Temperature Compression System in Practice, H. Sloan. Power, vol. 48, no. 25, Dec. 17, 1918, pp. 896-897, 2 figs. From paper before Am. Soc. of Refrig. Engrs., Milwaukee.

RESEARCH

BRITISH. National Laboratory for Industrial Research, Richard T. Glazebrook. Contract Rec., vol. 32, no. 47, Nov. 20, 1918, pp. 924-926. Need of sepcial laboratories for research work; research for trade associations; study of industrial problems in central laboratory. From lecture delivered at Royal Instn.
Science and the Future, A. A. Campbell Swinton. Machy, Market, no. 944, Dec. 6, 1918, pp. 19-20. From address to Roy. Soc. Arts.

NATIONAL RESEARCH COUNCIL, U. S. The Engineering Work of the National Research Council, Henry M. Howe. Bul. Am. Inst. Min. Engrs., no. 144, Dec. 1918, pp. 1715-1719. Purpose, status in October, 1918, and character of researches on pyrometry and electric welding.

STANDARDS AND STANDARDIZATION

ENGINE-TESTING FORMS. Standard Engine Testing Forms. Jl. Soc. Automobile Engrs., vol. 3, no. 6, Dec. 1918, pp. 378-381, 3 figs. Four sheets: one giving rules and direction for use of forms and three providing means for giving information regarding engine conditions of test and plotting curves of results.

GASOLINE. Government Standard Gasoline and Oil Specifications. Jl. Soc. Automotive Engrs., vol. 3, no. 6, Dec. 1918, pp. 405-406. Specifications for aviation gasoline, motor gasoline, and fuel, gas and bunker oils, adopted by Committee on Standardization of Petroleum Specifications.

OILS, ILLUMINATING. Specifications for Illuminating Oils. Oil & Gas Jl., vol. 17, no. 31, Jan. 3, 1919, pp. 50-52. Methods of test and specifications adopted by Committee on Standardization of Petroleum Specifications. Rules were drafted with view to allow making of products from any satisfactory crude petroleum.

STEAM ENGINEERING

BOILERS. Modern Boilers (Les chaudières modernes), L. Conge. Revue Générale de l'Electricité, vol. 4, no. 19, Nov. 1918, pp. 715-718, 11 figs. Several French and American types are considered as usuable in large central turbo-electric stations.

Feeding and Circulating the Water in Steam Boilers, John Watson. Trans. Inst. Marine Engrs., vol. 30, no. 239, Nov. 1918, pp. 225-246 and (discussion) pp. 246-264, 7 figs. Historical account of schemes evolved and experimental work undertaken; analysis of present practices in the various types of boilers; effect of maxing hot boiler water with incoming feed in proportions up to 200 per cent. boiler water.
Mechanical Department Circular No. 11, U. S. Ry. Administration Frank McManamy. Ry. Jl., vol. 25, no. 1, Jan. 1919, pp. 21-22, 1, fig. Rules and instructions for inspection and testing of stationary boilers.
How to Design and Lay Out a Boiler — II, William C. Strott. Boiler Maker, vol. 18, no. 12, Dec. 1918, pp. 353-354, 5 figs. Calculation of proper tube expansion; purpose of beading; use of scant tube lengths; figuring " line-up." (To be continued.)

CONDENSERS. Keeping Up Condenser Performance. Hartley LeH. Smith. Power, vol. 48, no. 25, Dec. 17, 1918, pp. 868-870, 4 figs. How to determine economy which should be obtained and how to correct causes of low vacuum.

STEAM PRESSURE, HIGH. High Steam Pressure and Superheat, Eskil Berg. Power, vol. 48, no. 24, Dec. 10, 1918, pp. 832-835, 3 figs. From a paper before joint meeting of Western Soc. of Engrs., Chicago Section of Am. Soc. of Mech. Engrs. and Am. Inst. of Elec. Engrs.

TURBINES. Steam Turbines for Natural Steam. Power Plant Eng., vol. 22, no. 24, Dec. 15, 1918, pp. 990-993, 7 figs. Power plant at Larderello, Italy, operating large turbine units with natural steam taken from crevices and fissures in ground.
Turbine Engines for Cargo Vessels. Marine Rev., vol. 49, no. 1, Jan. 1919, pp. 31-34, 6 figs. Mechanical features of the geared drives.
Steam Turbine Progress and Possibilities. Blast Furnace, vol. 6, no. 52, Dec. 1918, pp. 481-483, 5 figs. Higher boiler pressures; intermediate steam reheating in large multiple-cylinder machines; feedwater heating; use of economizer.
The Historical Development of Steam Turbine (1). Power House vol. 11, no. 11, Nov. 1918 pp. 311-314, 10 figs. Growth in capacity and in size of individual units during last 30 years. (To be continued.)

VALVES BALANCED SLIDE. Balanced Slide Valve for Andrews-Cameron Steam Engine (Tiroir équilibré pour machine à vapeur système Andrews et Cameron). Génie Civil, vol. 73, no. 17, Oct. 26, 1918, pp. 333-334, 8 figs. Description of two types, one with two and other with three parts.
See also MECHANICAL ENGINEERING, Motor-Car Engineering (Steam Vehicles.)

THERMODYNAMICS

HEAT TRANSMISSION. Heat Transfer Tests of Building Materials L. M. Arkley. Jl. Eng. Inst. Can. vol. 1, no. 8, Dec. 1918 pp. 386-393 6 figs. Account of tests (1) to determine selection of proper materials to be used in buildings, (2) to determine effect on transfer of heat through a 12-in. hollow tile well of laying it up, first with hollow spaces horizontal and second with hollow spaces vertical and directly over each other, (3) to investigate heat-insulating qualities of a number of materials suitable for refrigerating room including buil-up walls, cork walls, and ordinary building papers.
New Heat Transmission Tables, William R. Jones. Heat. & Vent. Mag., vol. 15, no. 12, Dec., 1918, pp. 36-40. Third series of tables.

WELDING

ALUMINUM. How to Use a "Chill" on Aluminum Welding. David Baxter Jl. Acetylene Welding, vol. 20, no. 6, Dec. 1918, pp. 280-282, 3 figs. Method of backing up hole in aluminum crankcase with plate of heavy galvanized iron and welding across to fill hole with aluminum, the iron acting as a sort of chill.

ARC-WELDING TOOL. Improved Arc Welding Tool. Aerial Age, vol. 8, no. 12, Dec. 2, 1918, pp. 619-634, 2 figs. Designed to make operation of changing electrodes definite to permit any amount of pull when electrode freezes to work and capable of eperating for voluntary release.

ELECTRIC WELDING. Comparisons of Processes of Electric Butt Welding, J. B. Clapper. Boiler Maker, vol. 18, no. 12, Dec. 1918, pp. 345-346. Operations in butt welding; transformer control; strength of butt weld; application of point and spot welding; use of resistance process.
Modern Welding by Use of Electricity, Elec. Rev., vol. 73, no. 25, Dec. 21, 1918, pp. 959-962, 3 figs. Principles of electric arc and spot welding; advantages; methods of application; recent developments; extent of field.

Some Recent Developments in Machines for Electric Spot Welding as a Substitute for Riveting, J. M. Weed. Gen. Elec. Rev., vol. 21, no. 12, Dec. 1918, pp. 928-934, 9 figs. Writer claims his experiments have demonstrated that the thickness of parts to be welded is governed by capacity of apparatus available for doing the work..
Electric Welding — A New Industry, H. A. Hornor. Contract Rec., vol. 32, no. 47, Nov. 20, 1918, pp. 931-934. Status of industry; uses of alternating current; methods of welding and of testing a joint: developments. Paper before Am. Inst. Elec. Enger.
Comparative Characteristics of Arc Welders, J. F. Lincoln. Elec. World, vol. 72, no. 24, Dec. 14, 1918, pp. 1119-1120. Discussion to bring out comparative advantages and costs of a. c. and d. c. welders.
Features of Arc Welding Development, O. A. Kenyon. Elec. Rev., vol. 73, no. 25, Dec. 21, 1918, pp. 963-965, 2 figs. Control of welding heat; selection of kind and size of electrodes; kinds of joints and their characteristics; systematic planning of welding method to be used.
The Constant-Energy Arc-Welding Set. P. O. Noble. Gen. Elec. Rev., vol. 21, no. 12, Dec. 1918, pp. 938-940, 6 figs. Type of equipment designed to facilitate maintenance of a short arc and to make it difficult to continue a long one.

Electric Welding at the Erie Works, General Electric Company, H. Lemp and J. R. Brown, Gen. Elec. Rev., vol. 21, no. 12, Dec. 1918, pp. 915-918, 12 figs. Applications of process to welding saws, butt-welding high-speed steel to shank of machine steel in manufacture of machine tools, and various other mechanical purposes.
A Review of Electric Arc Welding, John A. Seede. Gen. Elec. Rev., vol. 21, no. 12, Dec. 1918, pp. 881-886, 10 figs. Evaluation of present practice, with special consideration of carbon electrode welding, metallic electrode, welding electrodes, fluxes, holders, a. c. arc welding, automatic welding and apparatus employed.

INSPECTION OF WELDS. Inspection of Electric Welds, O. H. Escholz. Power, vol. 48, no. 25, Dec. 17, 1918, pp. 872-873, 3 figs. Describes various tests and their efficiencies.
Inspecting Metallic Electrode Arc Welds, O. S. Escholz. Am. Drop Forger, vol. 4, no. 11, Nov. 1918, pp. 448-450, 4 figs. Comments on significance and value of visual inspection, adhesion of deposit, penetration and electrical tests.

JOINTS. Lloyd's Experiments on Electrically Welded Joints, H. Jasper Cox. Gen. Elec. Rev., vol. 21, no. 12, Dec. 1918, pp. 864-870, 16 figs. Results concerning modulus of elasticity, approximate elastic limit, utimate strength, ultimate elongation, alternating stresses, chemical and microscopic analysis, and strength of welds.

NON-FERROUS METALS. The Butt Welding of Some Non-Ferrous Metals, E. F. Collins and W. Jacob. Gen. Elec. Rev., vol. 21, no. 12, Dec. 1918, pp. 958-961, 5 figs. Describes process said to be outcome of search for satisfactory method of connecting end rings to rotor bars of induction motor.

OXIDATION. The Welding of Iron and Steel, W. H. Cathcart. Iron Age, vol. 102, no. 26, Dec. 26, 1918, pp. 1587-1583, 10 figs. Principles governing smithy and forge; effect of oxidation; use of a flux; annealing essential; conditions to be fulfilled. From article in Apr., 1918, issue of Jl. of West of Scotland Iron and Steel Inst., Galsgow.

OXY-ACETYLENE WELDING. Oxy-Acetylene Pipe Welding and Cutting, Gas Age, vol. 42, no. 12, Dec. 16, 1918, pp. 515-516, 5 figs. Practical suggestions on manipulation of blowpipe. (Continuation of serial.)
Handling Acetylene Welding Outfits, E. Wanamaker. Ry. Rev., vol. 63, no. 25, Dec. 21, 1918, pp. 869-871. Discussion of acetylene and oxygen gases and instructions for handling outfits in shops. Paper before Ry. Fire Prevention Assn. Chicago.

Research. Research in Spot Welding of Heavy Plates, W. L. Merrill, Gen. Elec. Rev., vol. 21, no. 12, Dec. 1918, pp. 919-922, 7 figs. Record of experiments with specially built welding machine of 36 tons pressure capaticy and 100,000 amperes current capacity, showing probability that new field of application for spot welding will be developed.

Structure of Iron. Microstructure of Iron Deposited by Electric Arc Welding, George F. Comstock. Bul. Am. Inst. Min. Engrs., no. 145, Jan. 1919, pp. 43-50, 10 figs. From microscopic examination of a weld writer concludes that pale crystals typical of steel fusion welds are not cementite or martensite or any similar carbide product, but probably nitride of iron. Discussion of S. W. Miller's paper. (Bul. A. I. M. E., Feb.-May, 1918.)

A Study of the Joining of Metals, J. A. Capp. Gen. Elec. Rev., vol. 21, no. 12, Dec. 1918, pp. 947-956, 36 figs. Microscopic study of welds made (1) with high current applied for long periods, (2) smaller current applied for shorter time, and (3) current just large enough to procure welding temperature when applied for minimum time; made to determine best practice in making butt welds by Thompson electric welding machine.

The Metallurgy of the Arc Weld, W. E. Ruder. Gen. Elec. Rev., vol. 21, no. 12, Dec. 1918, pp. 941-946, 15 figs. Notes based on microscopical examination of crystal structure, gas holes, slag inclusions, impurities, and composition.

Tank Manufacture. Electric Arc Welding in Tank Construction, R. E. Wagner. Gen. Elec. Rev., vol. 21, no. 12, Dec. 1918, pp. 899-911, 25 figs. Qualifications of successful operator; value of intelligent study of work in hand and its preparation for welding; application of arc welding to tank construction; tabular data for determining cost of process.

Welded Seams. Welded Seams Correct Faults in Converters. Boiler Maker, vol. 18, no. 12, Dec. 1918, pp. 347-348, 6 figs. Experiments on welded-type heaters; difficulties in welding materials of varying thicknesses; automatic cutting machine. From Jl. Acetylene Welding.

Welding. Principles and Practices of Fusion Welding, S. W. Miller. Am. Soc. Refrig. Engrs. Jl., vol. 5, no. 3, Nov. 1918, pp. 168-215, 83 figs. Differences between various systems; principles of successful welding; composition of weld; testing welds; welding practices and materials; metallurgy and heat treatment of welds; variety of welds.

See also ELECTRICAL ENGINEERING, *Transformers, Converters Frequency Changers* (*Welding, Transformers for*); MARINE ENGINEERING *Yards* (*Welding*); RAILROAD ENGINEERING (*Welding*).

VARIA

Metric System. Reflexions on the Arguments For and Against the Metric System (Réflexions sur les pour et les contre du système métrique). Ch. Ed. Guillaume. Industrie Electrique, year 27, no. 624, June 25, 1918, pp. 225-227. Question of fundamental units; decimalization; possible adoption by Anglo-Saxon nations; arguments based on present situation. Remarks on Atkinson's communication to Instn. Elec. Engrs.

Opportunities for Engineers. Broader Opportunities for the Engineer, Charles T. Main. Jl. Am. Soc. Mech. Engrs., vol. 41, no. 1, Jan. 1919, pp. 6-11. Fields of activity opened to engineering societies and individual engineers in consequence of technical and social poportunities which have been created with the advent of world peace. Presidential address delivered at annual meeting of the Society.

Packing Machinery. The Problem of Packing. Cassier's Eng. Monthly. vol. 54, no. 5, Nov. 1918 pp. 257-262, 6 figs. Suggestions in regard to packing machinery for home market and export.

Society Engineering. Aims and Organization of the Society, L. C. Marburg. Jl. Am. Soc. Mech. Engrs., vol. 41, no. 1, Jan. 1919, pp. 12-15. Relations of the mechanical engineer to his work, to the community and other engineers. Report of Committee on Aims and Organization of the Society.

Technical Writing. Obtaining Ideas for Technical Articles, Albert M. Wolf. Wis. Engr., vol. 23, no. 2, Nov. 1918, pp. 40-41. Value of observation and diligent application of menta faculties to gathering technical date.

ELECTRICAL ENGINEERING

ELECTROPHYSICS

A. C. Circuits. The Calculation of Alternating Current Circuits, Gordon Kribs. Power House, vol. 11, no. 11, Nov. 1918, pp. 318-321, 2 figs. Tables of constants offered as readily usable in computing size of wire in a. c. 25-and 60-cycle circuits.

Harmonic Analysis. Harmonic Analysis of Alternating Currents by the Resonance Galvanometer (Sur l'analyse harmonique des courants alternatifs par le galvanomètre de résonnance), André Blondel Comptes rendus des séances de l'Académie des Sciences ,vol. 167, no. 20, Nov. 11, 1918, pp. 711-717, 1 fig. Characteristics of method proposed as modification of Pupin's and Armagnat's Considers (1) non-inductive resistances in circuits of galvanometer, and (2) a circuit having one or several capacities connected in series.

Spark Plug Insulators. Resistance of Hot Spark Plug Insulators, R. H. Cunningham. Automotive Indus., vol. 39, no. 22, Nov. 28, 1918, pp. 907-911, 8 figs. Experimental tests to determine loss of resistance at working temperatures; how such loss affects action of plug.

Vapor Arcs. Low-Voltage Arcs in Metallic Vapours, J. C. LeLennan. Proc. Phys. Soc., Lond., vol. 31, no. 176, Dec. 15, 1918, pp. 30-48, 6 figs. Repetition of experiments by Millikan and Hebb whose results writer believes to be in conflict with quantum theory. Results showed that quantum relation holds good with moderately heated incandescent cathodes and a moderate supply of metallic vapor. It was possible to obtain questioned phenomena, however, by increasing temperature of incandescent cathode.

ELECTROCHEMISTRY

Copper Plating. Automatic Copper Plating, Joseph W. Richards. Bul. Am. Inst. Min. Engrs., no. 145, Jan. 1919, pp. 27-31, 4 figs. Patented process. Basic principle involved lies in application of plating copper while iron sheet is cold and then melting metal under conditions favorable to formation of plating.

FURNACES

Electric Furnace Improvements During 1918, A. V. Farr. Blast Furnace, vol. 7, no. 1, Jan. 1919, pp. 20-24, 9 figs. Efforts to increase output; linings, tilting apparatus and cooling; power supply; comparative date.

Electrodes. Electrodes for Electric Furnaces: Their Manufacture, Properties, and Utilization (11), Jean Escard. Gen. Elec. Rev., vol. 21, no. 11, Nov. 1918, pp. 781-792, 37 figs. Form, dimensions, grouping, and composition of electrodes, and their arrangement in the various types of furnaces; life, wear, and protection of electrodes; electrode holders, cooling systems, and methods of attaching connections. Trnaslated from Le Génie Civil.

Industrial Furnaces. Electric Heated Industrial Furnaces, George J.Krikgasser. Indus. Management, vol. 57, no. 1, Jan. 1919, pp. 26-32, 14 figs. Type of furnaces and accessory apparatus used in melting irons, brasses and bronzes in foundries; for heat-treating metal parts; in the manufacture of special alloys; for annealing, hardening and tempering tools; and for determining decalescent and recalescent points in tool steels.

Nitrogen-Fixation Furnace. Nitrogen Fixation Furnaces, E. Killburn Scott. Gen. Elec. Rev., vol. 21, no. 11, Nov. 1918, pp. 793-804, 16 figs. Salient points of difference between electric furnaces for fixation of nitrogen and those for metallurgical purposes. Discussion of various features in operation, such as phase balance, starting, losses, electrodes, stabilizing arc, power factor, air supply, preheater, absorption, cooling the gas, and theory of reaction. Abstract of paper before Electrochemical Soc.

Steel Furnaces. The Status of the Electric Steel Industry, Edwin F. Cone. Iron Age, vol. 103, no. 1, Jan. 2, 1919, pp. 60-62. United States still leads in output with 287 furnaces; progress since 1910; furnaces in world's industry probably over 815.

Electric Furnaces for the Production of Steel and Ferro-Alloys, J. O. Seede. Gen. Elec. Rev., vol. 21, no 11, Nov. 1918, pp. 767-780, 28 figs. Fundamentals of high-grade steel manufacture; author perfers electric furnace to all other types; classification and sketches of important furnaces.

Adds Electric Unit to Melting Equipment. Iron Trade Rev., vol. 63, no. 24, Dec. 12, 1918, pp. 1353-1354, 10 figs. Installation in which power is supplied through bank of two single-phase, 500-kva. transformers connected to a 2300-volt, 3-phase, 60-cycle supply line. Furnace hearth acts as neutral electrode, bottom connection being made to central point on transformer. Arcs are formed independently of one another.

Electric Furnaces in Metallurgy. Elecn., vol. 81, no. 2113, Nov. 15, 1918, pp. 588-590, 7 figs. Description of Héroult furnace.

The Electric Furnace in the Grey Iron Foundry. Can. Foundryman, vol. 9, no. 12, Dec. 1918, pp. 291-292 and 295, 4 figs. Work being done by Bowmanville Foundry Co. Mechanical feature and electrical control of furnace.

Electric Furnace Data for Ferro-Tungsten, Robert M. Kenney. Blast Furnace, vol. 6, no. 12, Dec. 1918, pp. 486-487. Data and description of ferro-tungsten production; smelting of ferberite concentrate; possibilities of making in one single operation ferro-tungsten containing less than one per cent carbon. Paper before Am. Inst. Min. Engrs.

GENERATING STATIONS

Canada. Electric Power Generation in Ontario on Systems of Hydro-Electric Power Commission, Arthur H. Hull. Can. Engr., vol. 35, no. 25, Dec. 19, 1918, pp. 532-533. Details of generation and electrical distribution: Rideau and Niagara systems: Queenstown development. (Concluded.)

Centralization of Power. Wholesale Power, F. P. Royce. Stone & Webster Jl., vol. 23, no. 5, Nov. 1918, pp. 357-360. Conditions favorable to centralization of electric power. Memorandum of statement made at meeting of New England Section of Nat. Elec. Light Assn.

Hydroelectric Stations. Electric Power Generation in Ontario on Systems of Hydro-Electric Power Commission, Arthur H. Hull. Can. Engr., vol. 35, no. 24, Dec. 12, 1918, pp. 520-523. Paper before Toronto Section Am. Inst. Elec. Engrs. Also Elec. News, vol. 27, no. 23, Dec. 1, 1918, pp. 25-29, 1 fig. General plan and particulars of canal development work and power generation.

The Present Status of Hetch Hetchy, Rudolph W. van Norden. Jl. Elec., vol. 41, no. 10, Nov. 15, 1918, pp. 348-443, 8 figs. Survey, score and present progress of water and power project undertaken by city of San Francisco.

Data Existing in Regard to the Construction of Hydroelectric Power Plants (Sur les données actuelles en matière de construction d'usines hydro-électriques), Denis Eydoux. Annales des Ponts et Chaussées, year 88, vol. 4, no. 18, July-Aug. 1918, pp 7-96, 34 figs. Résumé of theroetical considerations, general equations and present practice, with special reference to groups of French plants in Dauphiné and the arrangement existing between water-courses of the Société Pyrénéenne (Toulouse and Tarn) with those of the Société Méridionale (Aude and Hérault). (To be continued.)

Steam-Electric Stations. A Good Instance of Utilization of Italian Products in Argentine (Uno forte impronta dei produttori italiani nell' Argentina). L'Industria, vol. 32, no. 21, Nov. 15, 1918, pp. 638-464, 13 figs. Details and plans of steam-turbine central station distributing 30 million kw.hr. at 7000 volts to five substations. Substation also described.

GENERATORS AND MOTORS

Dynamical Theory. The Dynamical Theory of Electric Engines, Elecn., vol. 81, no. 2114, Nov. 22, 1918, pp. 616-617, 4 figs. Abstracted from 10th Kelvin lecture delivered by L. B. Atkinson before Inst. of Elec. Engrs.

Alternators. High-Frequency Alternators (Les alternateurs à haute fréquence), O. Billeux. Revue Générale de l'Electricité, vol. 4, no. 21, Nov. 23, 1918, pp. 803-805, 5 figs. Principles of these machines, particularly of the Alexanderson type (frequency, 30,000 per sec.), built for experimental purposes by the Société Française Radio-électrique.

Generators. Construction and Use of Generators Driven by Waterwheels. Elec. Rec., vol. 24, no. 6, Dec. 1918, pp. 60-66, 24 figs. Important features in both vertical and horizontal types.

Induction Motors. Reconnecting Induction Motors — For Change in the Number of Poles, A. M. Dudley. Power, vol. 49, no. 1, Jan. 7, 1919, pp. 9-14, 15 figs. (Third article.)

Rotors. Turbo-Alternator Rotors: Features of Mechanical Design (II), S. F. Barclay. Power House, vol. 11, no. 11, Nov. 1918, pp. 323-327, 17 figs. Suggested specifications for guidance in purchasing equipment.

Synchronous Motors. Magnetization Curves for Synchronous Motors.(Fätkurvordingram och magnetiseringskurvor for fierfasiga synkronmaskiner), John Wennerberg. Teknisk Tidskrift, Elextroteknik, vol. 48, no. 11, Nov. 6, 1918 pp. 138-146.

LIGHTING AND LAMP MANUFACTURE

Fixtures. Linking Science and Art. in Lighting, M. Luckiesh. Elec. Rev., vol. 73, no. 23, Dec. 7, 1918, pp. 884-885. Suggestions for fixture dealer in demonstrating lighting effects. Third article. (First and second appeared in Elec. Rev. Oct. 5 and Nov. 2.)

Lamps, Manufacture. Methods of Manufacturing Incandescent Lamps, H. M. Robins. Wis Engr., vol. 23, no. 3, Dec. 1918, pp. 67-76, 6 figs. Description of required operations with reference to advantageous working conditions of manufacturing establishments.

Light Generation and Distribution. Light Electricity and the Shop C. E. Clewell. Am. Mach. vol. 49 no. 24 Dec. 12 1918 pp. 1051-1055 10 figs. From coal pile to machine tool and lamp losses are considered.

MEASUREMENTS AND TESTS

Loader. The Loader Ross B. Mateer. Jl. Elec. vol. 41 no. 12 Dec. 15, 1918, p. 553, 4 figs. Suggests composite symbol to indicate lead center, density and character of load served.

Meters. Three-Wire D-5 Meters. Jl. Elec., vol. 41, no. 10, Nov. 15, 1918, pp. 474-475. Wiring diagram and features of watthour meter consisting of two- and three-wire elements placed side by side in common base and registering on common recording train so that sum of revolutions of both elements will be added and indicated on dial.

Power-Factor Indicators. Removing Obstacles to Power-Factor Charge, Will Brown. Elec. World, vol. 72, no. 26, Dec. 28, 1918, pp. 1220-1222, I fig. Necessity o standard method of measuring power factor and instrument that would be universally applicable; examination into methods now employed in widely separated plants.

Calibration of Power Factor Indicators, Walter Wescott Hoke. Elec. World, vol. 72, no. 23, Dec. 7, 1918, pp. 1076-1078, 4 figs. Method of calibrating polyphase power-factor indicators of which resistances of potential circuits are not equal; also applies to indicators in which current coil is in one phase of a two-phase line.

Rubber-Goods Testing. Safeguarding Electrical Employees. Elec. World, vol. 72, no. 26, Dec. 28, 1918, pp. 1223-1225, 5 figs. How companies which take active interest in well-being of their employees have made use of protective devices to guard against personal injuries; care and testing of rubber goods.

Transmission Factor for Glass. The Measurement of Transmission-Factor, M. Luckiesh and L. L. Mellor. Jl. Franklin Inst., vol. 186, no. 5, Nov. 1918, pp. 529-545, 8 figs. Investigation of various arrangements of apparatus designen to determine transmission factors for several diffusive glasses for illuminatiod (1) by a narrow beam of light directed perpendicularly to surface of specimen, and (2) uniformly diffused light reaching specimen from all directions; examination of effect on value of transmission factor of position of specimen with respect to light and character of side, smooth or rough, upon which light strikes it.

POWER APPLICATIONS

Alloy Production. New Materials Developed in Germany for Electrical Industry (Les nouveaux matériaux dans l'industries électrique en Allemagne), S. Frid. Industrie Electrique, year 27, no. 624, June 25, 1918, pp. 227-250. Application of alloys such as electron (10 Al + 90 Mn), magnalium, duralumin and other compositions; regulation governing material to be used in various types of electric lines; instruments and apparatus; machines and transformers.

Dairy Farms. Use of Electricity on Dairy Farms to Increase Production. Elec. Rev., vol. 73, no. 26, Dec. 28, 1918, pp. 995-997, 3 figs. Proper lighting and use of electric fans in Georgia farm stables result in greater quantity and better quality of product.

Electrochemical Processes. Electricity Releases Chemistry's Power, James M. Matthews. Gen. Elec. Rev., vol. 21, no. 11, Nov. 1918, pp. 727-750, 46 figs. Some of the uses of electricity in the chemical industry are illustrated with descriptions of uses of electric furnaces and electrically-driven motors and installations of electrolytic works.

Electrolytic and Electrothermic Processes and Products. Gen. Elec. Rev., vol. 21, no. 21, no. 11, Nov. 1918, pp. 756-766, 12 figs. Brief outline of sodium, calcium, magnesium and aluminum; more detailed description of electric-furnace methods of manufacturing calcium carbide, carborundum, silicon, graphite, alundum, fused silica and carbon bisulphide; methods of fixation of atmospheric nitrogen and oxidation of nitrogen; sketches of Birkland-Eyde, Schonherr, and Pauling furnaces.

Gold Dredges. Use of Electricty on Gold Dredges. Elec. Rev., vol. 73, no. 23, Dec. 7, 1918, pp. 881-883, 3 figs. Description of typical dredge; value of central-station service for work; points to observe in selecting apparatus required; description of electrical equipment used.

Harbors. Extensive Use of Electricity for San Francisco Harbor. Elec. Rev., vol. 72, no. 26, Dec. 26, 1918, pp. 1001-1005, 4 figs. Pier, dock and street lighting; electric clock system; harbor lights and fog signals; fire-alarm and telephone system; electric repair and maintenance service; features of wiring.

Shipbuilding. The Application of Electricity in Ships and Shipbuilding, J. F. Nielson. Elecn., vol. 81, no. 2114, Nov. 22, 1918. pp. 621. Abstract paper before Scottish Local Section of Inst. of Elec. Enrgs., Nov. 1918.

Steel Mills. Operating-Electrically-Driven Steel Mills, J. T. Sturtevant. Iron Trade Rev., vol. 63, no. 23, Dec. 5, 1918, pp. 1292-1293, 4 figs. Layout, equipment, power consumption, tonnages and capacities of 11 installations at Lehigh plant of Bethlehem Steel Co.

TELEGRAPHY AND TELEPHONY

Antenna. The Vertical Grounded Antenna as a Generalized Bessel's Antenna, A. Press. Proc. Inst. Radio Engrs., vol. 6, no. 6, Dec. 1918, pp. 317-322, 1 fig. General expression for current at any point of antenna formulated by taking account of variable distribution of inductance and capacity; particular solution for current and voltage distribution in case of antenna having zero current at top and maximum current at bottom.

Capacity of a Horizontal Antenna (Capacité d'une antenne horizontale), J. B. Pompey. Revue Générale de l'Electricité, vol. 4, no. 21, Nov. 23, 1918, pp. 790-792, 1 fig. Modification of original derivation of Pederson's formula.

Duplex Polar Transmission. Improving Polar Duplex Transmission. Telegraph & Telephone Age, no. 24, Dec. 16, 1918, pp. 564-565, 5 figs. Diagrams of five different schemes tried in long lines operated polar duplex.

Photographs, Wireless Transmission of. The Design and Construction of Apparatus for the Wireless Transmission of Photographs, Marcus J. Martin. Wireless World, vol. 6, no. 69, Dec. 1918, pp. 509-513, 7 figs. Describes system outlined in handbook on the Wireless Transmission of Photographs as at present developed. Writer's intention is to provide practical groundwork for improvements. (To be continued.)

Radio Telephony. Some Aspects of Radio Telephony in Japan, Eitaro Yokoyama. Wireless World, vol. 6, no. 69, Dec. 1918, pp. 484-487, 5 figs. Influence of gas clearance, dimensions and shape of electrodes upon discharge. From Proc. Inst. Radio Engrs. (Continuation of serial)

Radio Transmitter. On the Electrical Operation and Mechanical Design of an impulse Excitation Multi-Spark-Group Radio Transmitter, Bowden Washington Proc. Inst. Radio Engrs., vol. 6, no. 6, Dec. 1918, pp. 295-315, 31 figs. Discussion of impulse excitation; description of three forms of gaps suitable for extreme quenching; oscillograms showing operation of such gaps; operation of actual 0.5-kw. and 2-kw. sets.

Spark Discharges. The Revolving Mirror and Spark Discharges, Lindlay Pyle. Wireless World, vol. 6, no. 69, Dec. 1918, pp. 489-490, 1 fig. Shows diagrammatically and describes briefly method of observing and photographing oscillatory nature of " wireless " spark. From Electrical Experimenter.

Spark Gap. A Ventilated Spark Discharge Gap. Wireless Age, vol. 6, no. 3, Dec. 1918, pp. 44-45, 3 figs. Internal construction and action of apparatus said to be silent in operation and to maintain a predetermined operating characteristic.

On the Possibility of Tone Production by Rotary and Stationary Spark Gaps, Hidetsugu Yagi. Proc. Inst. Radio Engrs., vol. 6, no. 6, Dec. 1918, pp. 323-343, 17 figs. Results produced by needle and spherical gaps with a. c. transformer, spark-gap method and with high-tension d. c. spark-gap method; brief treatment of transient conditions existing before establishment of stable tone régime.

Telephone, Sound-Detecting Devices. Telephone Service Standards. Telephony, vol. 76, no. 1, Jan. 4, 1919, pp. 22-23, Investigation of service and transmission standards and experimental work on sound-detecting devices by telephone section of Bureau of Standards, from 1917-1918 report Secretary of Commerce.

Telephone Troubles. How to Locate Telephone Troubles, J. Bernard Hecht. Telephony, vol. 76, no. 1, Jan. 4, 1919, pp. 26-27. Care and maintenance of primary batteries. Instructions to managers, wire chief and troublemen of local battery telephone exchanges. Sixth article.

Vacuum-Tube Electrodes. A Method of Constructing Gas-Free Electrodes. Wireless World, vol. 6, no. 69, Dec. 1918, pp. 488-489. Process of manufacturing vacuum tube in which anode consists of coating of metal sprayed on inside of bulb by incandescing rafractory metallic conductor, such as tungsten, in partial vacuum. From Wireless Age.

Time Signaling. Wireless Time-Signaling Device, Wireless Age, vol. 6, no. 3, Dec. 1918, pp. 13-14, 3 figs. Apparatus for synchronizing time clocks from one main radio station, permitting at predetermined intervals a correction of errors encountered in clock mechanisms.

TRANSFORMERS, CONVERTERS, FREQUENCY CHANGERS

Radio Frequency Changers. Radio Frequency Changers, E. E. Bucher, Wireless Age, vol. 6, nos. 3 and 4, Dec. 1918 and Jan. 1919, pp. 20-22 and 20-22, 13 figs. Reported progress in their application to wireless telegraphic and telephonic communication Control of antenna currents.

Rectifiers. Incandescent-Cathode Arc Device for the Rectification of Alternating Currents. Wireless Age, vol. 6, no. 3, Dec. 1918, pp. 14 and 43-44, 3 figs. Construction and electrical connections of tube; arc started by means of a high-voltage discharge from a pointed cathode.

An Enclosed Rectifier. Wireless Age, vol. 6, no. 3, Dec. 1918, pp. 12-13, 3 figs. Incandescent cathode type. Argon at considerable pressure is injected into enclosed medium.

ROTARY CONVERTERS. The Effect of Power-Factor on Output of Rotary Converters with Reactance Control, R. G. Jakeman. Elecn., vol. 81, no. 2114, Nov. 22, 1918, pp. 614-616, 4 figs. Dealing with effect of power-factor on size of converter.

TRANSFORMER DIMENSIONS. Dimensions of Transformers, A. R. Low. Elecn., vol. 81, no. 2113, Nov. 15, 1918, pp. 597-599. Object of article is to classify principal problems of transformer discussion and compare certain assumptions, methods and results.

TRANSFORMER OIL. Transformer Oil. W. S. Flight. Elecn., vol. 81, no. 2115, Nov. 29, 1918, pp. 636-638, 4 figs. Author discussion types and characteristics of oils; formation of sludge; minor tests.

WELDING, TRANSFORMERS FOR. Transformers for Electric Welding, W. S. Moody. Gen. Elec. Rev., vol. 21, no. 12, Dec. 1918, pp. 935-937. Requirements of those used for spot welding and for arc welding; construction found best to fulfill service specifications of each type.

See also ELECTRICAL ENGINEERING, Transmission, Distribution, Control (Transformer Losses).

TRANSMISSION, DISTRIBUTION, CONTROL

CENTRAL STATION SERVICE. Twenty-Seven Thousand Dollar Saving in Manhattan Building Plant. Power, vol. 48, no. 26, Dec. 24, 1918 pp. 918-919. By using Edition off-peak service during summer months, substituting motor-driven elevator pumps for inefficient steam pumps, installing a feedwater heater and a stoker.

FREQUENCY CONTROL. Better Frequency Control, Henry E. Warren. Gen. Elec. Rev., vol. 21, no. 11, Nov. 1918, pp. 816-819, 3 figs. Method which records revolutions, thus indicating mean frequency and enabling operator to adjust governor-regulating mechanism to maintain average frequency at its normal value practically exact.

GROWTH OF ELECTRIC SYSTEMS. The Growth of Electric Systems, Julian C. Smith. Can. Engr., vol. 35, no. 25, Dec. 1918, pp. 539-540. Evolution since 1882; direct and alternating transmission systems; why the "hydro" is 25 cycles; thrust bearings and vertical units. From one of the J. E. Aldred lectures on engineering practice, Johns Hopkins University.

INTERCONNECTION. Interconnection of Power Systems. Proc. Am. Inst., Elec. Engrs., vol. 37, no. 12, Dec. 1918, pp. 1207-1333, 12 figs. Technical features of interconnection of electric power systems of California; electric power in northern and central California; function of Pacific Gas and Electric Co. in interconnected operation of power companies of central and northern California. Symposium at meeting of San Francisco Section Am. Inst. Elec. Engrs.

POWER FACTOR. Location for Power-Factor Corrective Apparatus, Will Brown. Elec. World, vol. 72, no. 24, Dec. 14, 1918, pp. 1125-1128, 3 figs. Experience with static condensers; dissimilarities in synchronous machines; using idle alternators as condensers; bset motor rating for correction; effect of condenser location on result.

Improvement of Power-Factor by the Operation of Synchronous Motors (Note sur l'emploi des moteurs synchrones pour améliorer le facteur de puissance), Paul Rieunier. Revue Générale de l'Electricité, vol. 4, no. 21, Nov. 23, 1918, pp. 771-788, 15 figs. Mathematical and graphic study of equation.

ST. LAWRENCE RIVER TRANSMISSION LINE. 111,000-Volt Transmission Line Over the St. Lawrence River, S. Svenningson. Elec. News, vol. 27, no. 23, Dec. 1, 1918, pp. 31-34. Crossing consists of central span 4801 ft. long supported by two 350-ft. towers. Author gives special attention to cables, insulators, ice protection and sag calculations. Paper before Toronto meeting of Am. Inst. Elec. Engrs.

SUBSTATIONS. Effect of a Tie-Line Between Two Substations, H. B. Dwight. Elec. Rev., vol. 73, no. 25, Dec. 21, 1918, pp. 966-968, 1 fig. Methods of calculating effect of tie-lines upon current and voltage; several formulæ given.

The Modern Outdoor Substation, M. M. Samuels. Elec. World, vol. 72, no. 23, Dec. 7, 1918, pp. 1068-1073, 20 figs. Apparatus developed until it is as reliable as indoor equipment; station design not greatly improved; notes on transformers, oil circuit breakers, lightning arresters, air-break switches and bus supports.

A Two-Unit Automatic Substation, Walter C. Slade, Elec. Ry. Jl., vol. 52, no. 24, Dec. 14, 1918, pp. 1038-1044, 13, figs. Description of Rhode Island Co.'s substation at Oakland illustrating latest practice. Economics of automatic substation application.

SYNCHRONOUS CONDENSERS. Synchronous Condenser in Fuel Conservation, L. N. Robinson. Jl. Elec., vol. 41, no. 10, Nov. 15, 1918, pp. 456-458, 2 figs. Possibilities due to quadrature phase relation of energy and wattless components of current in virtue of which a synchronous condenser can deliver, under given line regulations, wattless current corresponding to 10,000-kv-a, and simultaneously absorb as motor or deliver as generator 10,000 kw. with total current corresponding to only 14,100 kv-a.

TRANSFORMER LOSSES. Influence of Distributing System on Transformer Losses in Large Networks (Pertes dans les transformateurs des grands réseaux suivant le système de distribution employé). Revue Générale de l'Electricité, vol. 4, no. 19, Nov. 9, 1918, pp. 721-724, 5 figs. Study and comparison of losses in two systems: (1) uniform distribution at 20,000 to 30,000 volts and (2) distribution at 30,000 to 50,000 volts in main network with reduction to 6,000 to 20,000 volts in secondary lines. From Electrotechnische Zeitschrift.

See also ELECTRICAL ENGINEERING, Generating Stations (Steam-Electric Stations).

VARIA

BATTERY CHARGING, A. C. High-Tension Battery Fed with Alternating Current (Sur une batterie à haute tension alimentée à courant alternatif). Industrie Electrique, year 27, no. 633, Nov. 10, 1918, pp. 416-417, 1 fig. Principle and diagram of apparatus which by an arrangement of Grætz valves and condensers connected to secondary winding of transformer permits conversion of alternating current into direct current at voltages up to 10,000. From Bulletin de l'Association Suisse des Electriciens, Apr. 1918.

CONTRACT CLAUSES. Power Factor Clauses in Contracts, Will Brown. Elec. World, vol. 72, no. 25, Dec. 21, 1918, pp. 1164-1165. Commercial problems involved; opinions from widely scattered central stations regarding necessity of considerating power factor; typical clauses of two types of contract which base charges on average power factor.

ELECTROLYSIS PROTECTION. Drainage if Necessary vs. Negative Feeder Electrolysis Protection, D. W. Roper. Elec. Ry. Jl., vol. 52, no. 23, Dec. 7, 1918, pp. 1003-1007, 12 figs. Comparison of plans used in St. Louis and Chicago for eliminating damage to underground structures from power compnay viewpoint. (Abstract of paper before Am. Inst. Elec. Engrs., St. Louis.)

FIRES IN OIL SWITCHES. R. Frère Process of Extinguishing Fires in High-Tension Oil Switches (L'extinction des feux d'huile dans les cellules d'interrupteurs à haute tension par les procédés R. Frère), Ch. Benjamin. Génie Civil, vol. 73, no. 19, Nov. 9, 1918, pp. 361-363, 10 figs. Fundamental principle of process consists in reducing oxygen in atmosphere by a large quantity of inert gas such as nitrogen.

INTERNATIONAL ELECTROTECHNIC COMMISSION. International Electrotechnic Commission (La Commission Electrotécnica Internacional), German Niebuhr. Boletin de la Asociadion Argentina de Electro-Técnicos, vol. 4, no. 8, Aug. 1918, pp. 783-788. Its origin, development and work. (To be continued.)

LIGHTNING ARRESTERS. Substitution of Copper for Platinum in Lightning Rods on Account of Present Shortage of Platinum (L'emploi du platine et du cuivre sur les paratonnerres et la crise du platine), E. Lignorelles. Génie Civil, vol. 73, no. 18, Nov. 2, 1918, pp. 351-353. States that aluminum, copper and iron are satisfactory for lightning rods; gives suggestions as to proper installation.

Storing Direct-Current Aluminum Arresters for the Winter, F. T. Forster. Gen. Elec. Rev., vol. 21, no. 11, Nov. 1918, pp. 820-821. Ill effects of leaving plates standing in electrolyte when arrester is out of service; method of preparing arresters for storage.

CIVIL ENGINEERING

BRIDGES

ARCH BRIDGE. The Rock Island Builds Two Rainbow Arch Bridges. Ry. Age, vol. 65, no. 23, Dec. 6, 1918, pp. 1003-1005, 4 figs. Limited-weight concrete structure with shallow floor.

ERECTION. Erection Experiences at the Sciotoville Bridge, Clyde B. Pyle, Eng. News-Rec., vol. 81, no. 26, Dec. 26, 1918, pp. 1182-1186, 6 figs. Machines used found efficient; adjustment of bridge easy; deflections agreed with computed values; last of three articles on field work.

PONTOON BRIDGE. The Sardah (India) Pontoon Bridge. Ry. Engr., vol. 39, no. 467, Dec. 1918, pp. 221-222, 6 figs. Principles of construction, method of use and structural details of 420-ft. 7-pontoon bridge. From report of Technical Section of Railway Branch, Puplic Works Department, Government of India.

RAILWAY BRIDGES. General Specification for Steel Railway Bridges. Jl. Eng. Inst. Can., vol. 1, no. 8, Dec. 1918, pp. 367-385, 3 figs. Final draft as approved by meeting of committee of the Institute.

Reinforced-Concrete Flat Slab Railway Bridges, A. B. Cohen. Ry. Gaz., vol. 29, no. 20, Nov. 15, 1918, pp. 528-530, 2 figs. Advantages of this type and details of Lackawanna terminal at Buffalo, N. Y. Paper before joint section of Am. Concrete Inst. and Am. Soc. for Testing Materials.

Stress Measurements on Niagara Gorge Railway Bridge, Charles Evans Fowler. Eng. News-Rec., vol. 81, no. 26, Dec. 26, 1918, pp. 1172-1175, 6 figs. Permissible leading studied by strain gage; dead-load condition of arch determined by forcing crown apart and measuring release of stress.

BUILDING AND CONSTRUCTION

BARRACKS. Temporary Barracks at Rosedale Heights. Contract Rec., vol. 32, no. 52, Dec. 25, 1918, pp. 1019-1022, 6 figs. Disposition and finish of 24 buildings rapidly completed for Toronto demobilization depot.

GYPSUM HOUSES. Houses of Gypsum Have Many Advantages. Contract Rec., vol. 32, no. 51, Dec. 18, 1918, pp. 1006-1007, 1 fig. Mode of constructing walls of gypsum blocks cast from gypsum mortar.

HOSPITALS. Details of Hospital Construction, N. V. Perry. Modern Hospital, vol. 11, no. 6, Dec. 1918, pp. 469-471, 5 figs. Remarks on general requirements, adaptable equipments for ward lighting, suitable arrangement of heating system, and special features demanded in floor construction. Paper before convention of Am. Hospital Assn.

MILLS. The Reconstructed Plant of the Quarker Oats Company at Peterboro, Ont. Contract Rec., vol. 32, no. 47, Nov. 20, 1918, pp. 918-921, 6 figs. Work done in clearing site in plant destroyed by fire; layout of new buildings.

ORNAMENTATION. Structural Ornamentation. Vol. 70, no. 6, Dec. 1918, pp. 506-507. Study in face brick, fancy brick, architectural terra cotta and decorative tile as factors in the clayworking industry.

ROOFING. English Slate and Tile Roofing Methods. Metal Worker, vol. 90, no. 26, Dec. 27, 1918, pp. 703-705, 9 figs. Plain and ornamental slating; single and double-nailing methods; hints on making repairs.

SCHOOL. Test of Chicago and Cook County School for Boys, Meyer J. Sturm. Heat. & Vent. Mag., vol. 15, no. 12, Dec. 1918, pp. 41-44, 5 figs. Description of building and its equipment.

SLABS AND CULVERTS. Practice in the Design of Concrete Floor Slabs and Flat Top Culverts, Geo. H. Tinker. Bul. Am. Ry. Eng. Assn., vol. 20, no. 210, Oct. 1918, pp. 3-19. Summary of replies from bridge engineers connected with various railroads to questionnaire in regard to their practice concerning longitudinal, transverse and vertical distribution of axle loads and impact allowance in designing culverts and slabs; a short analysis of the salient points also presented.

TIMBER FRAMING, STEEL IN. How to Use Steel in Timber Framing, Ernest Irving Freese. Building Age, vol. 41, no. 1, Jan. 1919, pp. 13-15, 9 figs. Practical methods of supporting long-span floors and bearing partitions upon structural-steel girders.

CEMENT AND CONCRETE

COLD-WEATHER CONCRETE. Some Temperature Records of Cold Weather Concrete, L. J. Towne. Stone & Webster Jl., vol. 23, no. 6, Dec. 1918, pp. 414-417, 3 figs. Tests made to secure data on amount of protection necessary to prevent concrete from freezing before setting can take place. On account of heat generated as result of chemical actions incident to setting concrete does not follow daily variations in air temperatures.

COMPRESSION TESTS. Some Compression Tests of Portland Cement Mortars and Concrete Containing Various Percentages of Silt, Arthur C. Alvarez and James R. Shields. Univ. of Cal. Publications in Eng., vol. 2, no. 3, Nov. 19, 1918, pp. 119-130, 1 fig. Concludes that at age of 28 days the compressive strength of 1 :2 :4 concrete stored in water increases with increase in percentage of silt for amounts up to 14 per cent by weight of sand, and that of mortars varying in proportion between 1:1 and 1 :4 is reduced on an average by about 4.5 per cent with 10 per cent silt.

OIL. Oil and Concrete. Ry. Engr., vol. 39, nos. 462 and 466, July and Nov. 1918, pp. 135-137 and 207-210. Results of laboratory tests on different specimens and under varied conditions; L. Waller Page's experiments on water-proofing concrete; W. Lawrence Gadd's conclusions from his investigation of Page's results; accounts of other experimenters. (To be continued.)

POLES. Hollow Concrete Poles Made by New Method. Ry. Age, vol. 65, no. 25, Dec. 20, 1918, pp. 1127-1128, 3 figs. Important savings in weight over solid construction are effected by centrifugal process.

Study of the Construction of Latticed Girder Poles for Electrical Lines (Contributo allo studio delle palificazioni per condutture elettriche), Ettore lo Cigno. L'Elettrotecnica, vol. 5, no. 29, Oct. 15, 1918, pp. 402-407, 7 figs. Analytical investigation of stresses in latticed girder poles of square base with formulæ and graphs for examination of relative significance of mechanical coefficients.

SETTING PROCESS. The Setting Process in Lime Mortars and Portland Cements, Cecil H. Desch. Contract Rec., vol. 32, no. 47, Nov. 20, 1918, pp. 922-923. Review of researches undertaken and hypotheses advanced. Paper before Faraday Soc.

WATERPROOFED FLOORS. Waterproofed Floors for Railway Crossings Over Streets, H. T. Welty. Eng. News-Rec., vol. 81, no. 24, Dec. 12, 1918, pp. 1081-1086, 9 figs. Grade-crossing work makes severe demands; troughing unsatisfactory. concrete slab floor; various mehtods of sealing concrete to girders.

See also CIVIL ENGINEERING, Building and Construction (Slabs and Culverts); Earthwork, Rock Excavation, etc., Dams).

EARTHWORK, ROCK EXCAVATION, ETC.

DAMS. Progress on Concrete Dam at Paris, Ont. Contract Rec., vol. 32, no. 49, Dec. 4, 1918, pp. 955-956, 2 figs. Method of bracing framework.

Construction Features of a Multiple Arch Dam, L. R. Jorgensen. Jl. Elec., vol. 41, no. 11, Dec. 1, 1918, pp. 506-508, 3 figs. Considers details of construction methods with reference to an actual case.

A Veritable Niagara Created in the South—Mammoth Hydro-Electric Development in East Tennessee, Stuart Towe. Mfrs. Rec., vol. 75, no. 1, Jan. 2, 1919, pp. 143-145, 3 figs. Brief description of dam 225 ft. high, 725 ft. long at top and 350 ft. at base, 175 ft. thick at base and 12 ft. at top. For a 90,000-hp. hydro-electric development.

New Concrete Dam and Bridge Over Lynn River at Port Dover. Contract Rec., vol. 32, no. 52, Dec. 25, 1918, pp. 1031-1033, 6 figs. Excavation work; specifications for aggregate.

The Lake Eleanor Dam, Rudolph W. Van Norden. Jl. Elec., vol. 41, no. 12, Dec. 15, 1918, pp. 551-553, 4 figs. Plans, essential features and details of construction. Dam contains 11,000 cu. yd. of concrete.

HARBORS

FLOATING DOCKS. Construction and Trials of 30,000-Ton Black Sea Floating Dock. Engineering, vol. 106, no. 2759, Nov. 15, 1918, pp. 551-552, 3 figs. Drawings with principal dimensions and description.

SAN FRANCISCO HARBOR. Harbor Improvements at San Francisco, Charles W. Geiger. Int. Mar. Eng., vol. 24, no. 1, Jan. 1919, pp. 31-35, 7 figs. Extensive enlargement of piers; large bulkhead warehouses; railroad connection with piers; developments in Islais Creek section.

See also ELECTRICAL ENGINEERING, Power Applications (Harbors).

MATERIALS OF CONSTRUCTION

ROAD MATERIALS. Standard Forms for Tests, Reports, and Method of Sampling for Road Materials. Better Roads & Streets, vol. 8, no. 8, Aug. 1918, pp. 300-306, 2 figs. From Bul. 555, issued by office of Public Roads and Rural Eng.

STUCCO. Review of Stucco Tests by Bureau of Standards, J. C. Pearson. Cement & Eng. News, vol. 30, no. 12, Dec. 1918, pp. 36-37. From paper at annual meeting of Am. Concrete Inst.

MECHANICS

ARCHES. Calculation of Built-In Arches Under the Action of Continuous External Loads (Calcul des arcs encastrés sollicités par des charges extérieures continues), P. Ernest Flamard, Génie Civil, vol. 73, no. 11, Sept. 14, 1918, pp. 207-209, 4 figs. Mathematical study of problem with reference to work of deformation.

BEAMS. Beam Deflections Under Distributed or Concentrated Loading, J. B. Kommers. Eng. News-Rec., vol. 82, no. 1, Jan. 2, 1919, pp. 44-46, 10 figs. New algebraic method proposed for cases usually solved by graphical calculation gives accurate results.

Bending Moments in Grillage Beams, R. Fleming. Eng. & Contracting, vol. 50, no. 26, Dec. 25, 1918, pp. 585-586, 1 fig. Outcome of recent review of calculations for proportioning grillage beams in foundations.

Lines of Influence for a Vierendeel Beam (Lignes d'influence pour une poutre Vierendeel), G. Magnel. Génie Civil, vol. 73, no. 18, Nov. 2, 1918, pp. 344-347, 5 figs. Mathematical investigation of bending moments and other mechanical factors in reinforced-concrete beam.

ROADS AND PAVEMENTS

BOULEVARDS. Boulevards of San Francisco, California, Charles W. Geiger. Good Roads, vol. 17, no. 1, Jan. 4, 1919, pp. 1-3, 5 figs. Notes on history and construction of scenic drives in and near city.

CONCRETE PAVEMENTS. Concrete Pavement Subjected to Severe Test, George C. Swan. Concrete Highway Mag., vol. 2, no. 11, Nov. 1918, pp. 246-247, 3 figs. Dammage at crossing where locomotive was thrown off track and dragged itself 40 ft. over concrete surface.

CONSTRUCTION. Construction Methods Employed in Building Lincoln Highway Cut-Off Across the Desert at Gold Hill, Utah, R. E. Dillree. Mun. & County Eng., vol. 55, no. 6, Dec. 1918, pp. 195-197, 12 figs. Building roadway with grade above level of desert under conditions which necessitated using hay to keep beavy equipment from bogging down.

DISINTEGRATION OF ROADS. The Road: Its Paramount Importance as Viewed by a Briton, J. H. A. MacDonald. Mun. & County Eng., vol. 55, no. 6, Dec. 1918, pp. 218-221. Concludes necessity of building good roads from analysis of London traffic statistics and considers problem of road disintegration and that of paying for roads. From chambers' Jl.

HARD SURFACE PAVEMENTS. The Prevention of Longitudinal Cracks in Hard Surfaced Pavements, Wm. C. Perkins. Contract Rec., vol. 32, no. 49, Dec. 4, 1918, pp. 972-973. Suggests use of tile in artificial foundation.

MACADAM ROADS. The Maintenance of Macadam Roadways, R. C. Heath. Contract Rec., vol. 32, no. 52, Dec. 25, 1918, pp. 1033-1034. Preventing wear and raveling; carpet treatment; economic importance of road maintenance. Paper before Ky. Highway Engrs. Assn.

SNOW REMOVAL. Organization, Methods and Equipment Employed in Removing Snow from Main Roads in Pennsylvania, George H. Biles. Mun. & County Eng., vol. 55, no. 6, Dec. 1918, pp. 216-218. Address before Highway Traffic Assn. of N. Y. State.

Snow Removal on Trunk Line Highways, Charles J. Bennett. Mun. & County Eng., vol. 55, no. 6, Dec. 1918, pp. 214-215, 3 figs. Address before Highway Traffic Assn. of N. Y. State.

STATE HIGHWAYS. State Highway Work in 1919. Good Roads, vol. 17, no. 1, Jan. 4, 1919, pp. 4-6. Report of available funds and plans for work in 31 states.

WAR, ROADS DURING. Construction and Maintenance of Roads During War. Better Roads & Streets, vol. 8, no. 8, Aug. 1918, pp. 299 and 324. Policy issued by Council of Nat. Defence.

See also CIVIL ENGINEERING, Materials of Construction (Road Materials).

SANITARY ENGINEERING

SEWAGE DISPOSAL. Sewage Disposal from an Operator's Standpoint, William K. F. Durrant. Can. Engr., vol. 35, no. 24, Dec. 12, 1918, pp. 512-513. Comments on each of features of plant consisting of detritus pit and screen chamber, pump house, plain sedimentation tanks, bacteria beds, disinfecting chambers and humuspond. Abstracted from Western Min. News.

The Private Sewerage Question, D. H. Wyatt. Clay Worker, vol. 70, no. 6, Dec. 1918, pp. 500-501. Analysis of results produced by leaky building drains and sewers. Vitrified pipe advocated as well constituted to withstand chemical action.

The Aqua Privy. Indian Eng. Vol. 64, no. 14, Oct. 5, 1918, pp. 192-103, 3 figs. Special feature is that nightsoil goes straight into small septic tank under seat, where it undergoes septic treatment.

Concrete Septic Tanks and Subsoil Disposal Fields for Country Homes, John H. Perry, Domestic Eng., vol. 85, no. 10, Dec. 7, 1918, pp. 363-365 and 391, 5 figs. Design and construction of such systems.

Sanitary Conveniences and Comforts for Country Homes. Clay-Worker, vol. 70, no. 6, Dec. 1918, pp. 501-503, 3 figs. Illustrates a manner in which ordinary sewer pipe and drain tile may be used.

SEWAGE-PUMPING STATION. Design and Operation of Automatic Sewage Pumping Station at West Haven, Conn., Clyde Potts. Mun. & County Eng., vol. 55, no. 6, Dec. 1918, pp. 199-200, 2 figs. Draining sewage to common point for treatment.

WATER SUPPLY

FREEZING. How to Prevent Freezing of Riser Pipes to Elevated Water Supply Tanks. Mun. & County Eng., vol. 55, no. 6, Dec. 1918, pp. 213-214. Four means: (1) providing method for artificially heating water; (2) conserving heat in water by providing sufficient insulation; (3) maintaining temperature of water above freezing point by pumping and withdrawal of water; (4) adding chemicals to lower freezing point. From Water Tower.

PURIFICATION. Four Years' Operating Results of Minneapolis Water Purification Plant. Contract Rec., vol. 32, no. 47, Nov. 20, 1918, pp. 926-927. Filtration data of plant having capacity of 96,000,000 gal.

Algal Growths and Chlorine Treatment of London Waters, A. C. Houston. Contract Rec., vol. 32, no. 47, Nov. 20, 1918, pp. 929-930, Report of Director of Water Examination.

Water Treatment at Council Grove, Kansas, Louis L. Tribus. Can. Engr. vol. 35, no. 25, Dec. 19, 1918, pp. 536-538, 4 figs. Results obtained unde highly varying conditions of turbidity at plant in operation for three year: Paper before Am. Waterworks Assn.

Reservoir Capacity. Determination of the Available Water Supply in the Haut-Cher Basin (Contribution à la détermination du régime hydraulique du Cher) P. Morin. Revue Générale de l'Electricité, vol. 4, no. 21, Nov. 23, 1918, pp. 805-806, 1 fig. Account of observations made to determine capacity of reservoirs which would insure continuous delivery.

Stream Pollution. Control of Stream Pollution, Earle B. Phelps. Can. Engr., vol. 35, no. 24, Dec. 12, 1918, pp. 515-518. Considers use of streams for waste disposal, effect of stream pollution, self-purification of streams, chemical methods of sewage treatment, biological treatment of sewage, and purification of water. From J. E. Aldred Lecture on Eng. Practice.

Relation of Main Drainage to River and Harbor Front Improvements in Various American Cities, Morris Knowles and John M. Rice. Mun. & County Eng., vol. 55, no. 6, Dec. 1918, pp. 204-205. Special reference to methods adopted for eliminating nuisance caused by discharge of raw sewage at Baltimore, New Bedford, Mass., Cleveland, Toronto, Syracuse, N. Y., Washington, Cincinnati, Waterbury, Conn., and Harrisburg, Pa.

WATERWAYS

Canal Traffic. The Potentialities of Our Inland Water Routes, Robert G. Skerrett, Rudder, vol. 34, no. 12, Dec. 1918, pp. 565-570, 11 figs. Economic and commercial aspects of developing possible canal traffic.

Flumes. Lindsay-Strathmore Irrigation Flume, Stephen E. Kieffer. Can. Engr., vol. 35, no. 25, Dec. 19, 1918, pp. 525-527, 5 figs. Self-supporting, high-level flume with 2-in walls built on inside forms at rate of 130 lin. ft. per 8-hr. day; nearly $1,500,000 expended in improvements to 15,500 acres in Cal.

Groynes. Groynes as Applied to Water Control and Silt Exclusion. Indian Eng. vol. 64, nos. 14, 15 and 16, Oct. 5, 12 and 19, 1918, pp. 194-195, 205-208 and 222-223, 16 figs. Experiments with silt bags from the results of which writer concludes that when a canal is added to a Bell Bund system, flow behing groyne is introduced, but head still exists in pockets so that arrangement retains power of checking and diverting silt.

Navigable Rivers. The Study of Currents in Navigable Rivers (L'étude des courants dans les rivières navigables). P. Dupont. Génie Civil, vol. 73. no. 17, Oct. 26, 1918, pp. 327-329. Recommends study of currents by engineers in order not to differ so often with mariners in regard to construction of improvements.

Calculations in Regard to Improvement of Rivers (Calculs concernant les améliorations de rivières), Alf. Bijls. Génie Civil, vol. 73, no. 19, Nov. 19, 1918, pp. 371-373, 1 fig. Concludes from examination and comparison of formulæ generally use, that in calculations it is advisable to deduce the coefficient of velocity from observations on long sections of 10 to 20 km. and to gage water at all possible levels.

Sediment in Rivers. Sediment in River Waters, J. S. Ryan. Tran. Inst. Marine Engrs., vol. 30, no. 238, Oct. 1918, pp. 217-218, 2 figs. Experience with propeller and shaft due to working amid water mingled with sand.

St. John River. St. John River Affords Big Opportunities, Frank S. Small. Can. Engr., vol. 35, no. 23, Dec. 5, 1918, pp. 489-495, 3 figs. Topographical features; reclamation of waste land by drainage; utilization of water powers; site proposed for tideless harbor.

St. Lawrence River. Canada's Heritage in the St. Lawrence River, Arthur V, White. Can. Engr., vol. 35, no. 24, Dec. 12, 1918, pp. 507-510, 2 figs. Indicates power sites on river and refers to canalization of river as a unit. Address before Elec. Club of Toronto.

Canada's Heritage in the St. Lawrence River, Arthur V. White. Elec. World, vol. 72, no. 26, Dec. 28, 1918, pp. 1216-1217, 1 fig. Estimated low-water power aggregates 2,000,000 h.p., of which greater part is wholly within territorial area of Dominion and capable of development. From address before Elec. Club of Toronto, Nov. 12, 1918.

MINING ENGINEERING

COAL AND COKE

California. Tesla Coal Mine, J. W. Beckman. Jl. Elec., vol. 41, no. 12, Dec. 15, 1918, p. 559. Indicates possibilities of a lignite mine in California.

Colliery Output. South Staffordshire and Warwickshire Institute of Mining Engineers. Presidential address, William Charlton. Trans. Instn. Min. Engrs., vol. 56, part I, Nov. 1918, pp. 13-26. Considers question of output in collieries under two aspects: 1, immediate and pressing need for United Kingdom to produce utmost possible quantity of coal; 2, standpoint of output per unit of person employed, and its bearing on prosperity of coal industry, and those other industries whose ultimate economic position is affected by use and cost of fuel.

What One Coal Mine Has Done. Stone & Webster Jl., vol. 23, no. 5, Nov. 1918, pp. 354-356. Mine in question hoisted 32,514 tons in one week.

GEOLOGY

Lake Michigan District. Explanation of the Abandoned Beaches About the South End of Lake Michigan, G. Frederick Wright. Bul. Geol. Soc. Assn., vol. 29, no. 2, June 1918, pp. 235-244, 3 figs. Peat deposits; series of moraines; supposed changes of level; glacial and clay deposits underneath Chicago; provisional estimates of glacial time afforded in this area. Presented in abstract before the Soc.

MAJOR INDUSTRIAL MATERIALS

Tungsten. Chief Materials Needed in the Electrical Industry; Tungsten (De quelques matières premières nécessaires à l'industrie électrique; le tungstene). D. Pector. Revue Générale de l'Electricité, vol. 4, no. 4, July 27, 1918, pp. 121-125. Metallurgy, uses and ore deposits. Bibliography of documents.

Zinc Concentration. Concentration of Lead-Zinc-Silver Ore at the Zinc Corporation's Mine, George C. Klug. Min. Mag., vol. 19, no. 5, Nov. 1918, pp. 243-245, 1 fig. Methods employed at Broken Hill. Gravity concentration by jigging and tabling for production of high-grade lead concentrate; treatment of zincy tailing by flotation methods (De Bavay, and Delprat); Seale-Shellshear method of cascading as modified by Lyster and Hebbard for selectively separating galena from mill pulp.

Zinc Tailings. Treatment of Accumulated Tailing as Practised by the Zinc Corporation, George C. Klug. Min. Mag., vol. 19, no. 6, Dec. 1918, pp. 298-300, 1 fig. Plant recovering zinc, silver and lead by mineral-separation process of removal in collective float and subsequent separation of a lead concentrate from collective float by tabling methods.

MINES AND MINING

Field Tests. Field Tests for the Common Metals in Minerals, George R. Fansett. Univ. of Ariz. Bul., bul. 93, Min. Technology Series no. 21, Nov. 1918, 20 pp. Compiled for Ariz. State Bur. of Mines and intended as text for lectures on Prospector's Mineralogy.

Fire Protection. Smothering Mine Fires (Note sur l'embouage des feux de mine), M. Cabane. Bulletin et comptes rendus mensuels de la Société de l'Industrie Minérale, series 5, vol. 14, 3d issue 1918, pp. 67-77, 6 figs. Principal features of system developed at Commentry Collieries; arrangement at Decazeville mines designed to deliver dust under pressure; materials used to form dust.

Safety. Miners' Safety and Health Almanac for 1919, R. C. Williams. Department of Interior, Bur. of Mines, Miners' Circular 24; 48 pp., 7 figs. Responsibility of miners concerning their own safety and that of others; pure drinking water for mining camps; prevention of accidents and promotion of sanitation; miners' anemia; disposal of human excreta in rural districts; sewage disposal in mines; mine-rescue cars of Bureau of Mines. Other articles dealing with health conditions and tending to impart information to miners are included in bulletin.

Sampling. Sampling, F. W. Bunyan. Min. & Sci. Press, vol. 117, no. 25, Dec. 21, 1918, pp. 827-832, 2 figs. Emphasizes importance of sampling in analytical work and illustrates with examples value of systematic procedure in performing it.

Stoping Methods. Mining Methods of United Verde Extension Mining Co., Charles A. Mitke. Bul. Am. Inst. Min. Engrs., no. 145, Jan. 1919, pp. 9-22, 3 figs. Considerations which influenced selection and planning of adaptable stoping method. Ore deposit considered as replacement of volcanic schist. Mineralization believed to have taken place after intrusions of diorite and quartz porphyry had folded and faulted schist.

Ventilation. Cooling and Drying the Air in Deep Mines, Sydney F. Walker. Iron & Coal Trades Rev., vol. 47, no. 2645, Nov. 8, 1918, p. 518. Writer believes coal may be mined successfully at depths from 5000 to 6000 ft. by treating each individual mine, each pair of shafts and the workings connecting them, in same manner as modern cold stores are treated. Gives recommendations and refers to actual installations.

Welfare Work. Welfare Work in the Mining Work in the Mining Industry, H. Lipson Hancock. Chem. Eng. & Min. Rev., vol. 10, no. 121, Oct. 5, 1918, pp. 6-13, 18 figs. Betterment work being done by South Australian company.

MINOR INDUSTRIAL MATERIALS

Arsenic. Arsenic and Its Occurrences in South Queensland (1), H. I. Jensen. Queensland Government Min. Jl., vol. 19, no. 221, Oct. 15, 1918, pp. 455-458. Notes on arsenic as a source of trouble in metal extraction and on its origin and extraction.

OIL AND GAS

Gas Pressure. Record of Gas-Pressure from a Borehole, Charles J. Fairbrother. Trans. Instn. Min. Engrs., vol. 56, part 1, Nov. 1918, pp. 6-8, 2 figs. and (discussion) pp. 8-10. Photographs showing gas blowing out of borehole while clear of rods, and borehole with rods in and water being blown in all directions by force of gas.

Gas Storage. Natural-Gas Storage, L. S. Panyity. Bul. Am. Min. Engrs., no. 145, Jan. 1919, pp. 23-25, 2 figs. Scheme to regulate pressure by connecting exhausted well to high-pressure gas line.

Petroleum Hydrology. Petroleum Hydrology Applied to Mid-Continent Field, Roy O. Neal. Bul. Am. Inst. Min. Engrs., no. 145, Jan. 1919, pp. 1-8. Method of distinguishing between waters that encroach upon oil-bearing beds from sources in stratum and waters that reach oil sands from planes above.

PRECIOUS MINERALS

Gold. Two Instances of Mobility of Gold in Solid State, Edward Keller. Bul. Am. Inst. Min. Engrs., no. 145, Jan. 1919, pp. 33-42, 1 fig. Assay results of gold movement on surface of auriferous copper when latter is subjected to oxidation.

RARE MINERALS

New Minerals. Review of New Mineral Species (Revue des espèces minérales nouvelles), P. Gaubert. Bulletin de la Société Française de Minéralogie, vol 41, no. 4-5-6, Apr.-June 1918, pp. 93-96 and 117-130. General notes on appearance, occurrence and constitution of 29 minerals discovered in recent years. Reference made in each case to publication where first account of substance appeared.

See also INDUSTRIAL TECHNOLOGY, *Yttrium*.

METALLURGY

BLAST FURNACES

Development in 1918. 1918 Blast Furnace Development Reviewed, F. H. Wilcox. Blast Furnace, vol. 7, no. 1, Jan. 1919, pp. 30-31. Analysis indicates tendency has been toward large hearths, steep and low boshes, high inwall batters and moderate thickness of lining.

Gases. Remarks on the Composition of Blast-Furnace Gases and Volumetric Methods of Measuring the Gas Produced and the Air Blown In (Remarques relatives à la composition des gaz de haut fourneau et méthodes volumetriques pour le calcul du gaz produit et du vent soufflé). J. Seigle. Bulletin et Comptes rendus mensuels de la Société de l'Industrie Minérale, series 5, vol 14, 3d issue 1918, pp. 113-131, 1 fig. Methods of measuring gases by weight (Gruner and Ledebur); volumetric methods based on combination of carbon or on combination of oxygen; examples of applications; comparison of theoretical results and practical analyses.

Manganese. How to Save Manganese and Coke. Iron Trade Rev., vol. 63, no. 21, Dec. 12, 1918, pp. 1347-1348. Table of operating data of 12 blast furnaces producing ferromanganese and spiegeleisen and 40 per cent of output of manganese alloys in U. S. Conclusion reached that large savings can be effected by using low-ash cokes.

Research. Study of Blast Furnaces, Based on the Researches Undertaken by Francis Mulet (Etude sur les hauts fourneaux d'après les travaux de Francis Mulet), E. Damour. Bulletin et Comptes rendus mensuels de la Société de l'Industrie Minérale, series 5, vol. 14, 3d issue 1918, pp. 5-47, 1 fig. Economical operation of furnaces; analysis of charge and of gaseous products; heat required by chemical reactions; influence of temperature of blast on coke economy; utilization of gases; variation in coke consumption with output.

See also MECHANICAL ENGINEERING, Fuels and Firing (Blast-Furnace Gas).

COPPER

Brass, Cartridge. A Comparison of Grain-Size Measurements and Brinell Hardness of Cartridge Brass, W. H. Bassett and C. H. Davis. Bul. Am. Inst. Min. Engrs., no. 145, Jan. 1919, pp. 57-78, 16 figs. It was found that grain sizes of brasses annealed at low temperatures are greatly affected by previous grain size and reduction by rolling, consequently hardness of cartridge brass may be better determined by Brinell-hardness measurement than from grain size.

Bronzes. The Constitution of the Tin Bronzes, Samuel L. Hoyt. Bul. Am. Inst. Min. Engrs., no. 144, Dec. 1918, pp. 1721-1727, 1, figs. Explains upper heat effect over $a + B$ range.

Chloridizing Roasting. Chloridizing-Roasting of Burnt Pyrites on the Ramen-Beskow System, Peter Klason. Min. Mag., vol. 19, no. 6, Dec. 1918, pp. 301-313, 4 figs. Suggests improvement of Longmaid-Henderson process for extracting copper from pyrites that have been burnt by alkali manufacturers.

Copper-Aluminum Alloys. Constitution and Hardness of Copper-Aluminum Alloys Having High Percentage of Copper (Constitution et dureté des alliages cuivre-aluminium riches en cuivre). La Metallurgie, year 50, no. 45, Nov. 6, 1918, pp. 1631-1633, 1 fig. Effect of temperature of hardening on hardness of alloys containing 9 to 16 per cent. aluminum. (Continuation of serial)

FLOTATION

Ruth Flotation Machine. Ruth Flotation Machine, Arthur J. Hoskin. Queensland Government Min. Jl., vol. 19, no. 222, Nov. 15, 1918, pp. 500-501, 3 figs. Machine for concentrating minerals by oil flotation; designed on principle that best attachment of minerals to bubbles takes place when there is least amount of relative motion.

STEEL AND IRON

Basic Steel. Formula for Strength of Basic Steel, Andrew McWilliam. Iron Age, vol. 102, no. 25, Dec. 19, 1918, pp. 1508-1511, 3 figs. Calculations made from composition; influencing principal elements; application to basic steel. Paper before Iron & Steel Inst., London, Sept. 1918.

Cast Iron. The Mixing and Melting of Cast Iron, J. F. Mullan. Can. Foundryman, vol. 9, no. 12, Dec. 1918, p. 301. Review of opinions expressed by several experts leads writer to assert that success of foundry depends more on proper management of furnace than on any other branch of the trade.

Electric Steel. Making Electric Steel for Roller Bearings, Edward K. Hammond Machy., vol. 25, no. 4, Dec. 1918, pp. 318-326, 20 figs. Methods of operating Héroult electric furnaces, forging ingots, rolling billets and col-drawing steel into solid bars and seamless tubing.

Ferro-Alloys. The Ferro-Alloys, J. W. Richards. Gen. Elec. Rev., vol. 21, no. 11, Nov. 1918, pp. 751-755. Composition of these alloys, method of manufacture, and properties imparted to steel by addition of each of the molten metals. Also Metal Trades, vol. 9, no. 12, Dec. 1918, pp. 488-489, 2 figs. Properties of ferromolybdenum, ferro-vanadium, ferrotitanium and ferroboron. Paper read at Nat. Exposition of Chem. Indus.

The Manufacture of Ferro-Alloys, Robert M. Keeney. Automotive Eng., vol. 3, no. 10, Dec. 1918, pp. 464-468. Ores and furnaces used and methods followed to produce ferrochrome, ferromanganese, ferromolybdenum, ferrotungsten, ferrovanadium and ferrouranium; uses of these metals.

The Manufacture of Ferro-Alloys in the Electric Furnace, E. S. Bartell. Min. Jl., vol. 123, no. 4346, Dec. 7, 1918, p. 708. Comparative efficiency of large and small furnaces used in manufacture of ferromanganese. Discussion of Am. Inst. Min. Engrs. paper by Robert M. Keeney.

Record of an Old Ferro-Silicon Furnace, I. Peterman. Blast Furnace, vol. 6, no. 12, Dec. 1918, pp. 492-493. Historical account of plant built in 1792, now a part of Warner Iron Co.

Forged Steel. Influence of Forging and Rolling on the Properties of Steel (Le corroyage de l'acier. Son influence sur les propriétés du metal), Georges Charpy. Revue de Métallurgie, year 15, no. 5, Sept.-Oct. 1918, pp. 427-448, 9 figs. Experiments conducted by engineering staff of large works; records of deformations by forging of straight lines drawn originally on surface of bar and examination of section of hollow threaded cylinder filled with liquid metal of same composition and rolled after solidifying under pressure of 1200 tons from 530 mm. in diameter to 265 mm.

Metallurgy in 1918. Phases of Iron and Steel Metallurgy in 1918, John Howe Hall. Iron Age, vol. 103, no. 1, Jan. 2, 1919, pp. 27-28. Remedies for ingot defects; strides in steel-casting industry; manganese problem; alloy-steel helmets.

Open-Hearth Furnaces. Principles of Open-Hearth Furnace Design, Chas. H. F. Bagley. Blast Furnace, vol. 6, no. 12, Dec. 1918, pp. 505-507, 3 figs. Calculations relating to pressure in furnace, port ends, ratio of air to gas passages. Flue and valve diagrams. Paper before British Iron & Steel Inst. (Concluded.)

Plate and Structural Mills at Fairfield, Ala. Iron Age, vol. 103, no. 1, Jan. 2, 1919, pp. 47-49, 3 figs. New plant of Tennessee Coal, Iron & Railroad Co., to serve Mobile shipyard; producing steel by triplexing at Ensley open-hearth works.

Oxygen in Steel. Determination of Oxygen in Steel. Iron Age, vol. 102, no. 26, Dec. 26, 1918, pp. 1573, 2 figs. Objections to Ledebur method apparently overcome; details of modifications; interesting comparative analyses.

The Heterogeneity of Steel (L'hétérogénéité de l'acier), H. le Chatelier and B. Bogitch. Génie Civil, vol. 73, no. 18, Nov. 2, 1918, pp. 350-351, 6 figs. Concludes, from experiments with Stead's reagent, that microscopic heterogeneity of steel is due to oxygen in solid solution in metal.

Russian Iron Works. Pre-War Russian Iron and Steel Plants. Iron Age, vol. 102, no. 25, Dec. 19, 1918, pp. 1501-1507, 11 figs. Output and equipment of leading works; prospects after war.

Structure of Steel. Inspecting the Structure of Metals, J. J. McIntyre. Am. Drop Forger, vol. 4, no. 11, Nov. 1918, pp. 443-444. 2 figs. Shows manner of taking structural photographs of metal or similar opaque objects with ordinary camera.

Development of Grain Boundaries in Heat-Treated Alloy Steels, R. S. Archer. Bul. Am. Inst. Min. Engrs., no. 145, Jan. 1919, pp. 51-55, 12 figs. Specimen is etched in 4 per cent solution of picric acid in ethyl alcohol from 5 to 25 min., then carbonaceous smudge is rubbed off on moist broadcloth or kersey.

AERONAUTICS

AEROSTATICS

Ascending and Landing. Military Aerostatics, H. K. Black. Aerial Age, vol. 8, no. 16, Dec. 30, 1918, p. 811. Precaution in ascending and in landing. (Continuation of serial.)

Balloons. Manufacture of War Balloons in U. S., Allen Sinsheimer. Automotive Indus., vol. 39, no. 22, Nov. 28, 1918, pp. 925-927, 6 figs. Adaptation of French Caquot type.

Free Ballooning. Military Aerostatics, H. K. Black. Aerial Age, vol. 8, no. 14, Dec. 16, 1918, p. 705, 1 fig. Training in free ballooning. (Continuation of serial.)

Kites. Meteorological Kites (Cerfs-volants météorologiques), L-P. Frantzen. Aérophile, year 26, nos. 19 and 20, Oct. 1-15, 1918, pp. 298-299, 3 figs. Particulars of German design of " Diamant " type.

AIRCRAFT PRODUCTION

Navy Plant. Our Navy Winged Destroyers, Austin C. Lescarboura. Sci. Am., vo. 119, no. 24, Dec. 14, 1918, pp. 480-481 and 486-487, 8 figs. Work done by Navy in establishing Government-owned aircraft plant for supplying giant seaplanes.

Rigging. From a Rigger's Note-Book. Flight, vol. 10, no. 47, Nov. 21, 1918, pp. 1313-1315, 8 figs. General procedure of rigging. Case of a B. E. 2e is taken up in detail.

U. S. Air Service. Report of the Director of Military Aeronautics. Aerial Age, vol. 8, no. 14, Dec. 16, 1918, pp. 720-722. Story of development of personnel, training and organizing phases of present Air Service.

APPLICATIONS

Aeroplane Business. The Future of the Airplane Business, C. F. Kettering. Jl. Soc. Automotive Engrs., vol. 3, no. 6, Dec. 1918, pp. 358-362 and pp. 362-363 (discussion), 2 figs. Present difficulties in civilian use of airplanes as built at present; types of military airplanes. Presidential address before Detroit Section of Society.

American View. Future of the Aircraft Industry, Harry Bowers Mingle, Aviation, vol. 5, no. 9, Dec 1, 1918, pp. 560-562, 3 figs. Enumerates possible uses of airplane in scientific, civil and sporting fields.

British Civil Transport. Civil Aerial Transport. Flight, vol. 10, no. 48, Nov. 28, 1918, pp. 1350-1351. Outline of report of Civil Aerial Transport Committee regarding steps to be taken to develop aviation for civil and commercial purposes and utilizing trained personnel for that purpose. From London Times.

Control of Aircraft. The Two Futures for Flight, H. Massac Buist. Flight, vol. 10, nos. 48 and 49, Nov. 28 and Dec. 5, 1918, pp. 1352-1354 and 1370-1373. Argues against establishment of bureaucracy in connection with development of aviation alike for military, public and private purposes, and for absolutely free scope for development and application by individuals or companies.

Dutch View of Future. Flying Machines and Air Communication and Navigation in the Near Futuro (Vliegmachines, bestuurbare luchtschepen en het luchtverkeer in de naaste toekomst). Ph. Kapteyn. De Ingenieur, year 33, no. 43, Oct. 26, 1918, pp. 827-845, 41 figs.

Italian View of Commercial Aviation. Commercial Aviation, Gianni Caproni. Aeronautics, vol. 15, no. 264, Nov. 6, 1918, pp. 428-430, 3 figs. From Rivista dei Transporti Aerci.

AUXILIARY SERVICE

Trucks. Building Trucks for the Aviation Service, M. E. Hoag. Am. Mach., vol. 49, no. 23, Dec. 12, 1918, pp. 1089-1092, 13 figs. Description of construction and assembly of some special parts. Second article.)

ENGINES

Austro-Daimler. The 200 H. P. Austro-Daimler Aero Engine. Flight, vol. 10, no. 46, Nov. 14, 1918, pp. 1288-1293, 7 figs. Ignition; carburetor and induction system; petrol tanks; air pump; water pump; water cooling system; calibration and endurance test report; metallurgical test report; general data; general analysis by weights. Issued by Technical Department, Aircraft Production, Ministry of Munitions. Also Automobile Engr., vol. 8, nos. 120 and 121. Nov. and Dec. 1918, pp. 316-319, 350-357, 28 figs.

Design. The Design of Airplane Engines, III, John Wallace. Automotive Engr., vol. 3, no. 10, Dec. 1918, pp.458-460. Mean effective pressure; power; construction of a theoretical diagram; modifying diagram to include practical conditions of ignition; comparison of results. Continuation of serial.)

Hispano-Suiza. The Hispano-Suiza Aircraft Engine, Donald McLeod Lay. Jl. Soc. Automotive Engrs., vol. 3, no. 6, Dec. 1918, pp. 367-372, 9 figs. Historical review of design and development; mechanical features; circulating water and gasoline systems; production problems.

Four Hispano.Suiza Models. Automotive Indus., vol. 39, no. 22, Nov. 28, 1918, pp. 914-915 and 946, 2 figs. Details of models A, I, E, and H, built in U. S.

The Hispano-Suiza Airplane Engine. Aviation, vol. 5, no. 9, Dec. 1, 1918, pp. 549-553, 4 figs. History of development and detailed description of latest type.

Liberty. Details of the Liberty Engine, J. Edward Schipper. Automotive Indus., vol. 38, no. 24, Dec. 12, 1918, pp. 991-995, 12 figs. Mechanical description illustrated with sectional drawings.

Electrical System of the Liberty Engine, J. Edward Schipper. Automotive Indus., vol. 39, no. 26, Dec. 26, 1918, pp. 1089-1092, 14 figs. Special type of interrupter comprising three breakers in parallel. Storage battery designed to permit of upside-down flying.

The Liberty Motor, Douglas Wardrop. Aerial Age, vol. 8, nos. 14 and 15, Dec. 16 and 23, 1918, pp. 706-717, 762-765, 39 figs. Dec. 16; Extensive description of machine and outline of its development. Dec. 23: Oiling system; electric ignition; voltage regulator; duplex Zenith carburetor.

Starter. The Liberty Starter. Aerial Age, vol. 8, no. 16, Dec. 30, 1918, p. 816, 3 figs. Elevation and sections of 4-cylinder radial 2-cycle air motor. As starter it has a 9 to 1 gear reduction on final drive to motor.

HISTORY

Official U. S. History. Official History of Aircraft Production. Automotive Indus., vol. 39, no. 23, Dec. 5, 1918, pp. 968-969 and 987-990. Objects, problems, production, and results of air program.

MATERIALS OF CONSTRUCTION

Spruce. Development of the Aircraft Spruce Industry. Lawrence K. Hodges. Automotive Indus., vol. 39, nos. 25 and 26, Dec. 19 and 26, 1918, pp. 1037-1040 and 1100-1101, 8 figs. Organization of Spruce Production Division. Figures of monthly cut; problem of by-products disposal.

See also MECHANICAL ENGINEERING, Corrosion (Aircraft Parts).

METEOROLOGY

Aerographic Records. Uniformity in Aerographic Records, Alexander McAdie. Sci. Am. Supp., vol. 87, no. 2244, Jan. 4, 1919, pp. 15-16. Discusses desirability of universal scientific units. Special reference is made to meteorological work.

MODELS

Ford-Motored Aeroplane. Elementary Aeronautics and Model Notes, John F. McMahon. Aerial Age, vol. 8, no. 14, Dec. 16, 1918, p. 727, 16 figs. Construction of a Ford-motored airplane.

Model Construction. Model Aeroplane Building as a Step to Aeronautic Engineering, Aerial Age, vol. 8, nos. 11, 12, 15 and 16, Nov. 25, Dec. 2, 23 and 30, 1918. pp. 581, 627, 781 and 826, 16 figs. Table of resistance and weight of spruce struts. Table of plates of different aspect ratios at angles from 5 to 60 deg. showing *Ky*, *Kx* and ratio of lift to drift at the different angles. Bracing fuselage. Construction of seat, gas tank and rudder bar.

PLANES

Berg. The Austrian Berg Single-Seater. Flight, vol. 10, no. 46, Nov. 14, 1918, pp. 1285-1287, 9 figs. Wing section; attachment of struts to fuselage and longerons; details of internal bracing ailerons. (Concluded.):

Bombers. The Gotha Bomber, with Notes on Giant Aeroplanes. Flight, vol. 10, nos. 46, 47, 48 and 49, Nov. 14, 21, 28 and Dec. 5, 1918, pp. 1280-1282, 1318-1322, 1340-1347 and 1375-1378, 84 figs. Nov. 14: Principal dimensions; construction; struts; ailerons; propeller accommodation; empennage; fuselage. Nov. 21: Undercarriage; engine mounting; engines; controls; petrol system; armament; bombs; wireless; Instruments; fabric and dope. Nov. 28: Particulars of four engined giant. Dec. 5: Principal items of interest in five-engined giant brought down by allied forces. Issued by Technical Department, Aircraft Production, Ministry of Munitions. Also Engineer, vol. 126, no. 3281, Nov. 15, 1918, pp. 419-421, 8 figs.; Aeronautics, vol. 15, no. 266, Nov. 20, 1918, pp. 473-486, 79 figs.

De Haviland 4. The De Haviland 4, with Liberty " 12 " Engine. Aerial Age, vol. 8, no. 17, Jan. 6, 1918, pp. 860-861, 5 figs. General dimensions and weights.

Design. The Probable Trend of Aeroplane Design, R. F. Mann. Sci. Am. Supp., vol. 87, no. 2244, Jan. 4, 1919, p. 11, 1 fig: Review of present stage in development and changes likely to be introduced by reason of applications of airplanes to various purposes. From Flight.

The Trend of German Aeroplane Design. Flight, vol. 10, no. 49, Dec. 5, 1918, pp. 1383-1385. Comparison with British machine of principal features of captured German aeroplanes. Also in Aeronautics, vol. 15, no. 268, Dec. 4, 1918, pp. 518-520.

Gallaudet. The Gallaudet D-4 Light Bomber Seaplane. Aerial Age, vol. 8, no. 16, Dec. 30, 1918, pp. 817 and 831, 3 figs. General specifications. Machine is a biplane and is fitted with one 400-hp. Liberty " Twelve " engine

Hannoveraner. The German Airplane Hannoveraner, C. L. II. (Avion allemand Hannoveraner C. L. II). Aérophile, year 26, nos. 19 and 20, Oct. 1-15. 1918, pp. 289-296, 10 figs. Comprehensive description of light biplane fitted with 200-h.p. Opel motor.

Junker. The Junker Armored Biplane. Flight, vol. 10, no. 48, Nov. 28, 1918, pp. 1356-1357, 2 figs. Main characteristics of all-metal aeroplane.

L-W-F. The L-W-F Model G-2 Fighting Airplane, Glenn D. Mitchell. Aviation, vol. 5, no. 9, Dec. 1, 1918, pp. 554-558, 7 figs. General features and dimensions of an all-American design.

Martin. The Martin K-111 Single Seater. Aerial Age, vol. 8, no. 15, Dec. 23, 1918, pp. 759-761, 7 figs. Particulars of biplane specially designed as altitude fighter and equipped with oxygen tanks and provision for electrically heating pilot's clothing.

N. C. 1, U. S. Navy. Our Giant Aircraft. Sci. Am., vol. 120, no. 1, Jan. 4, 1919, pp. 7 and 18. General design of N. C. 1 equipped with three 12-cylinder Liberty engines driving three four-bladed tractor screws; wing spread, 126 ft.

Rumpler. Rumpler Two-Seater Biplane. Automotive Indus., vol. 39, no. 23, Dec. 5, 1918, pp. 962-965, 14 figs. Technical description of model German reconnaissance machine. Issued by British Aircraft Department.

PROPELLERS

Metal. The Metal Airscrew, Vladimir Olhovsky. Aerial Age, vol. 8, no. 12, Dec. 2, 1918, pp. 622-623, 2 figs. Results of experiments on wooden and metal propellers; factors entering in design of hollow metal propeller.

Patterns. Propeller Patterns, Joseph A. Shelly. Machy, vol. 25, no. 5, Jan. 1919, pp. 434-438, 8 figs. Describes method of laying out propeller patterns, assembling different section s and working blades to required form. (Second article.)

Research. Experimental Research on Air Propellers, II, William F. Durand. Automotive Eng., vol. 3, no. 10, Dec. 1918, pp. 478-480, 2 figs. Results of work done by Nat. Advisory Committee for Aeronautics. Torque dynamometer; revolution counter; air-speed meter; tests and calibrations of apparatus; uniformity of velocity over cross-section of air stream; relation between depression within experiment room and air-stream velocity. (To be concluded.)

MARINE ENGINEERING

AUXILIARY EQUIPMENT

Barge. Standard Concrete Barge for Use on the New York State Barge Canal. Engineering, vol. 106, no. 2759, Nov. 15, 1918, pp. 554-556, 6 figs. Drawings showing details of construction.

Bark, Auxiliary. Auxiliary Bark—The France, George Douglas. Rudder, vol. 34, no. 12, Dec. 1918, pp. 590-592, 5 figs. Sail plan, deck arrangement and design features of five-masted bark, 418.8 ft. long, fitted with two Schneider heavy-oil engines.

Fishing Cruiser. An Outdoor Motored Cruiser—Complete Plans and Building Instructions, William Atkin. Motor Boat, vol. 15, no. 23, 6 figs. Model is adaptation of flat-bottomed work boats used by clammers of Lower New York Bay.

Life Boats. Two Lifeboats in Place of One. Rudder, vol. 34, no. 12, Dec. 1918, pp. 588-590, 7 figs. Design providing partial collapse of one so it can be stowed under the other.

Producer-Gas Power Lighter. Design and Construction of Producer Gas Power Lighter, Frederick S. Nock. Int. Mar. Eng., vol. 24, no. 1, Jan. 1919, pp. 36-37, 3 figs. Special central control for engine and hoisting apparatus; double rudder installation; compact engine-room planning.

Towboat. Plans and Specifications of New Wood Tow Boats. Int. Mar. Eng., vol. 23, no. 12, Dec 1918, pp. 673-674, 2 figs. Built for hard service; compound engine of 750 hp.; Scotch boiler with three Morison furnaces.

SALVAGE

Salving of the SS. Frank A. T. Wheeler. Tran. Inst. Marine Engrs., vol. 30, no. 238, Oct. 1918, pp. 218-220, 3 figs. Steps taken to prevent falling over of vessel struck by torpedo on her port side in No. 5 hole, holes being blown in her 'tween deck and starboard side; watertight bulkhead at after end of engine room leaked badly and eventually flooded engine room.

SHIPS

Boilers. Sediment in Marine Boilers, Its Bearing on Furnace Collapse, W. R. Austin. Trans. Inst. Marine Engrs., vol. 30, no. 238, Oct. 1918, pp. 189-196, 1 fig. and (discussion), pp. 196-209. Occasions where risk arises and suggestions to eliminate it: Backing strains from unequal expansion and their prevention by keeping uniform temperature in furnaces; dangers arising from circulation of sediment caused by rolling of ship; possibilities of creating critical situation while cleaning a fire at sea; means of avoiding accident while lying under banked fires.

Concrete Ship. What the Year Has Taught About the Concrete Ship. Eng. News-Rec., vol. 82, no. 1, Jan. 1, 1919, pp. 14-15. Much learned regarding design and construction; future depends on ability to build in cost competition with steel; structurally, ship is success.

Concrete Ships and Barges (Los buques i barcos menores de concreto). Boletin de la Sociedad de Fomento Fabril, year 35, no. 9, Sept. 1918, pp. 614-619 History of development of process from 1849 to present time.

Shear in Concrete Ships Critical Point in Design, A. C. Janni. Eng. News-Rec., vol. 81, no. 24, Dec. 12, 1918, pp. 1089-1091. 1 fig. According to accepted theory, usual thin shell monolithic with frame gives rise to dangerous conditions.

Design. V-Bottom or Round Bilge—Which? George F. Crouch. Motor Boat, vol. 15, no. 23, Dec. 10, 1918, pp. 30-34, 3 figs. Advantages of each shape; diagrams showing relations between lenght aand speed and giving approximate form to use for different speeds.

Best Fore-and-Aft Position of Parallel Middle Body in Single Screw Cargo Ship, William McEntee. Int. Mar. Eng., vol. 24, no. 1, Jan. 1919, pp. 18-23, 8 figs. Effect of variation of position of parallel middle body on shaft horsepower, propulsion coefficient and propeller revolutions. Paper before Soc. of Naval Architects and Marine Eng., Philadelphia, Nov. 1918.

Electric Transmission. Electric Propulsion of Vessels (La propulsion électrique des navires), A. Foillard. Génie Civil, vol. 73, no. 17, Oct. 26, 1918, pp. 321-327, 13 figs. Machinery used and characteristic curves of motors in the vessels Wulsty Castle and Mjôlner.

Lubrication. Uniform and Constant Forced-Feed Lubrication of the Steamchests, Cylinders and Other Parts of Steam Engines. Ry. Engr., vol. 39, no. 466, Nov. 1918, pp. 203-209, 8 figs. Describes "Intensifore" Gorton type developed from exhaustive experiments with various mechanical and hydrostatic lubricators by engineering staff of Great Central Ry.

Power Plant. Marine Power Units, J. G. Callan. Wis. Engr., vol. 23, no. 2. Nov. 1918, pp. 42-47. General characteristics of steam turbines and Diesel engines. Reasonableness of adoption of geared unit.

Standards. Adopt British Ship Steel Standards. Iron Trade Rev., vol. 63, no. 22, Nov. 28, 1918, pp. 1245-1246. Decisions of American Steel manufacturers at conference in Philadelphia.

Standardization of Ship Steel. Steel & Metal Digest, vol. 8, no. 12, Dec. 1918, pp. 690-691. Recommendation of mills to Emergency Fleet Corporation.

Structural Steel Standardization Cargo Vessels, Henry R. Sutphen. Int. Mar. Eng., vol. 23, no. 12, Dec. 1918, pp. 695-698, 1 fig. How quantity production was met; use of structural steel expedient; layout of yard.

Submarines. The Surrender of the Submarines. Min. Jl., vol. 123, no. 4345, Nov. 30, 1918, pp. 688-691, 5 figs. General features of construction of the different types, their propulsive machinery and other engineering details.

See also MECHANICAL ENGINEERING, Internal-Combustion Engines Winton Marine Engine).

YARDS

Concrete Vessels. Build Boats in Dry Docks at New Yards in Detroit. Eng. News-Rec., vol. 82, no. 1, Jan. 2, 1919, pp. 21-24, 9 figs. Concrete barges under construction on concrete floors inside dikes which will be flooded for launching; lighters carry construction machinery alongside dry docks.

Reinforced Concrete Shipbuilding in Dorsetshire. Engineer, vol. 126, no. 3281, Nov. 15, 1918, pp. 408-410, 10 figs. Drawings with descritpion of some concrete ships.

Building a Government 3500-Ton Concrete Ship. Eng. News-Rec., vol. 81, no. 24, Dec. 12, 1918, pp. 1058-1065, 16 figs. Fougner yard has concrete ways; reinforcement tacked to outside forms and finish put on with cement gun; air hammers on forms compact concrete.

Control of Construction. Control of the Construction of a 5000-Ton Deadweight Fabricated Steel Ship, "Fabricator." Int. Mar. Eng., vol. 23, no. 12, and vol. 24, no. 1, Dec. 1918, and Jan. 1919, pp. 691-694 and pp. 29-30, 6 figs. Dec. 1918: Special schedule for ordering and installation of machinery and equipment; correlation between order and purchasing departments. (Fourth article.) Jan. 1919: Forms for following up movement and arrival of steel parts; railway shipments of plates and sheets traced. (Fifth article.)

Costs and Estimates. Shipbuilding Costs and Estimates, James M. Robertson. Int. Mar. Eng., vol. 23, n 12, Dec. 1918, pp. 671-672. Careful reading of specifications necessary; system a requisite; list of items; how to deal with individual items. (Second article.)

Cranes. Pre-Assembly System and Efficient Erection Cranes Speed Up Shipbuilding at Ecorse, Eng. News-Rec., vol. 81, no. 24, Dec. 12, 1918, pp. 1076-1081, 8 figs. Pre-assembling extending rapidly in Lake Yards; reduces erection labor on hulls.

Design. Berth Construction and Side-Launching Practice in Great Lakes Shipyards. Eng. News-Rec., vol. 82, no. 1, Jan. 2, 1919, pp. 7-13, 25 figs. Berth structure simple; timber and concrete foundations for support of ships; concrete launching-way stringers at one yard; keel blocks and cradles variously arranged; trip shores to release ships.

Ship-Design and Quantity-Production Methods of Newark Bay Yard. Eng. News-Rec., vol. 81, no. 25, Dec. 19, 1918, pp. 1122-1125, 4 figs. Project for factory-style shipbuilding based on enlisting new labor supply and using commercial steel; methods dictated by delay in ship orders; bridge shops fabricate straight parts.

Equipment. Fabricating Shop and Berth Equipment at Sun Shipyard. Eng. News-Rec., vol. 82, no. 1, Jan. 1, 1919, pp. 57-61, 9 figs. Assembly bay of shop delivers finished material to shipbuilding cranes; multiple punches and roller tables; reinforced-concrete berths served by bridge cranes.

Fabricated Ship. Fabricated-Ship Construction in One Year's Experience. Eng. News-Rec., vol. 82, no. 1, Jan. 2, 1919, pp. 16-17. New System now tested by large-scale working has proved adaptable and free from inherent difficulties or elements of excess cost.

Ford Eagles. Building the Ford Submarine-Chaser "Eagle." Int. Mar. Eng., vol. 24, no. 1, Jan. 1919, pp. 23-27, 7 figs. Simplicity of hull construction; safety devices on unusual launching platform; routing aids production.

Ford Methods in Ship Manufacture, Fred E. Rogers. Ind. Management, vol. 57, no. 1, Jan. 1919, pp. 1-6, 12 figs. Description of boat with features of plan of manufacture. (First article.)

Building the Ford Submarine Chaser "Eagle." Int. Mar. Eng, vol. 23, no. 12, Dec. 1918, pp. 702-705, 4 figs. Straight-line design; two parts of system; hurried development of process.

Hog Island. Hog Island, the Greatest Shipyard in the World, W. H. Blood, Jr. Int. Mar. Eng., vol. 23, no. 12, Dec. 1918, pp. 678-690, 20 figs. Review of conditions that preceded planning of yard; adopting type and design of boat; troubles encountered and overcome. Before Soc. of Naval Architects and Marine Engrs., Philadelphia, Nov. 1918.

Illumination. A Method of Ship Way Illumination, F. D. Weber. Jl. Elec., vol. 41, no. 11, Dec. 1, 1918, p 503. Outlines method followed by western company.

Laying Out. Laying Down and Taking Off, Charles Desmond. Rudder, vol. 34, no. 12, Dec. 1918, pp. 584-587, 5 figs. How to lay out shape of transom stern inclined aft with rounded after face and intended to be made of pieces of material bent to shape. (Continuation of serial.)

New Yards. Large Addition to Plant of the Tidewater Shipbuilders, Ltd., Cap de la Madeleine, P. Q. Contract Rec., vol. 32, no. 51, Dec. 18, 1918, pp. 1001-1004, 6 figs. Extensions necessitated to build four 5100-ton steel cargo boats.

Shipbuilding at the Pensacola Yards, John M. Sweeney. Int. Mar. Eng., vol. 24, no. 1, Jan. 1919, pp. 12-16, 8 figs. Well-constructed plant for 9000-ton fabricated steel ship; use of permanent scaffolding; powerful plate-bending machine.

Routing of Materials. Routing of Fabricated Ship Material at Bristol. Eng. News-Rec., vol. 82, no. 1, Jan. 2, 1919, pp. 25-30, 9 figs. Hull construction operated on basis of shop-to-storage-to-ship system requires accurate timing of material supply, shop work, and assembly; routing handled by production department.

Welding. The Steel Ship and Oxy-Acetylene Welding, J. F. Springer. Can. Machy., vol. 20, no. 25, Dec. 19, 1918, pp. 701-703. Observations on behavior of metal under welding flame and precautions to be taken. Writer believes tensile strength of material at and near weld is much less that that of the plates. Of the restorative measures available, he considers reheating method the most convenient and effective.

Welding Designs for Shipyard Use, E. G. Rigby. Marine Rev., vol. 49, no. 1, Jan. 1919, pp. 22-29, 22 figs. Practical examples of electric welding in deck, tank and bulkhead structures; how it is applied to armor plate.

Electric Welding in Ship Construction, H. Jasper Cox. Int. Mar. Eng., vol 24, no. 1, Jan. 1919, pp. 42-46, 7 figs. Methods of welding and apparatus described; inspection and testing welds; speed and cost of welding; Lloyd's experiments. Paper before Soc. of Naval Architects and Mar. Eng., Philadelphia, Nov. 1918.

The Steel Ship and Oxy-Acetylene Welding, J. F. Springer. Int. Mar. Eng., vol. 23, no. 12, Dec. 1918, pp. 699-701. Autogenous welding decreases strength of steel; behavior under heat; restorative measures.

The First Electrically Welded Boat, John Liston. Geb. Elec. Rev., vol. 21, no. 12, Dec. 1918, pp. 844-848, 10 figs. Process followed in welding 42-ft. boat of 11-ft. beam said to have been plying Lake Erie for two years when the 275-ton English-built, rivetless welded barge was launched in June 1918.

Electric Welding for Shipbuilding. Elect., vol. 81, no. 2114, Nov. 22, 1918, pp. 619-620. From address by W. S. Abell, Chief Ship Surveyor of Lloyd's Register, before North-East Coast Inst. of Engrs. and Shipbuilders, Tyneside, Nov. 1918.

U. S. Warship Kept on the Job by Oxy-Acetylene Torch. Jl. Acetylen Welding, vol. 20, no. 6, Dec. 1918, pp. 290 and 292. Repair of boiler with oxy acetylene outfit.

Electric Welding for Shipbuilding, W. S. Abell. Nautical Gaz., vol. 94, no. 24, Dec. 14, 1918, pp. 346-347. Past progress; strength of joints; possibility of industry. Paper before British Northeast Coast Instn. Engrs. & Shipbuilders.

The Adequacy of Welding in Constructing Hulls of Ships, H. M. Hobart. Gen. Elec. Rev., vol. 21, no. 12, Dec. 1918, pp. 840-845. Investigations of Welding Research Sub-Committee of Emergency Fleet Corporation in regard to relative merits of different systems and equipments.

Spot Welding and Some of Its Applications to Ship Construction, H. A. Winne. Gen. Elec. Rev., vol. 21, no. 12, Dec. 1918, pp. 923-927, 6 figs. Advantages of spot welding over riveting with respect to strength, time, and labor; limitations of spot welder; application of spot welding to construction of ladders and gratings and to plugging of misplaced holes.

Electric Welding in Navy Yards, H. G. Knox. Gen. Elec. Rev., vol. 21, no. 12, Dec 1918, pp. 849-859, 20 figs. Word conducted in each type of shop in a navy yard; recommendations of welding equipment desirable in each shop; data on speed and cost of welding ship structures; comparative cost data of welding based on records from steam railroads.

The Electric Arc Used in Steamship Overhauling. Can. Machy., vol. 20, no. 24, Dec. 12, 1918, pp. 675-676, 2 figs. Examples of uses of Westinghouse arc welder in repairing marine boiler and furnace while under steam

Arc Welding in Shipyard, W. L. Roberts. Gen. Elec. Rev., vol. 21, no. 12, Dec. 1918, pp. 860-864, 13 figs. Simplification of anglesmith's work by use of arc welding in production of staples; probability of abandoning staples in favor of directly arc-welding parts; application of electric arc to construction of water, oil, a ir tanks, stacks, condensers, and other similar appliances,

Wooden Vessels. Building Wooden Vessels on the Pacific. Int Mar. Eng., vol. 24, no. 1, Jan. 1919, pp. 8-11 8 figs. Record of accomplishment; Hough and Ferris types give way to 5000 ton vessels; wood vessels coming into their own again.

VARIA

Emergency Fleet Corporation. Organization of the U. S. Shipping Board Emergency Fleet Corporation Charles Piez. Jl. Am. Soc. Mech. Engrs , vol. 41, no. 1, Jan. 1919, pp. 32-35, 2 figs. Relationship and functions of Board and construction and operation divisions of Fleet Corporation.

Naval Engineering in War. The Achievements of Naval Engineering in the War, William L. Cathcart. Jl. Am. Soc. Mech. Engrs., vol. 41, no. 1, Jan. 1919, pp. 18-25, 18 figs. Organizations and principal activities of Bureau of Steam Engineering; electric drive for battleships; repair of German merchan ships by oxy-acetylene welding. Delivered at annual meeting of the Society.

U. S. Shipbuilding in 1918. Shipbuilding in the United States in 1918. Int. Mar. Eng., vol. 24, no. 1, Jan. 1919, pp. 5-7. Three million tons of merchant ship completed in first eleven months; rate of production rapidly increasing.

ORGANIZATION AND MANAGEMENT

ACCOUNTING

Expense Distribution. Efficiency and Democracy, H. L. Gantt. Jl Am. Soc. Mech. Engrs., vol. 41, no. 1, Jan. 1919, p. 43. Suggestions in regard to accounting systems. Stress is laid on erroneous process of charging work with expense of idle machines.

EDUCATION

Apprentices. The Training of Engineering Apprentices, T. H. Fenner. Can. Machy., vol. 20, no. 23, Dec. 5, 1918, pp. 641-643, 4 figs. Analyzes necessary standard of education and suggests course of training

Canada. Labor, Apprenticeship and Technical Education. Can. Engr., vol. 35, no. 24, Dec. 12, 1918, p. 511. Report of committee to Ottawa Conference of Assn. of Can. Building and Construction Industries.

Crippled Workers. How to Deal with Crippled Workers, T. Norman Dean. Am Mach., vol. 49, no. 25, Dec. 19, 1918, pp. 1115-1116. Suggestions from deductions from scientific experience to relieve 2,122,000 industrial cripples in United States.

Physical Reconstruction of Crippled Men, Constance Drexel. Blast Furnace, vol. 6, no. 12, Dec. 1918, pp. 508-509. Plan of U. S. Government for rehabilitation and vocational training; schools established giving courses in oxy-acetylene welding, etc.

Re-Educated Soldiers in the Machine Trade, Katherine Freeman. Can. Machy., vol. 20, no. 25, Dec. 1918, pp. 691-692, 2 figs. Instances in which vocational reeducation, together with artificial limbs, have made injured soldiers earn more than in pre-war days.

Industrial Surveys for Physical Readjustment, A. B. Segur. Indus. Management, vol. 57, no. 1, Jan. 1919, pp. 63-65, 2 figs. Method of investigating possibilities of employing disabled persons in industry, developed by Red Cross Institute for the Blind; results shown for few operations in a meat-packing house.

Engineers. The Engineer in Foreign Service, L. S. Rowe. Jl. Am. Soc. Mech. Engrs., vol. 41, no. 1, Jan. 1919, pp. 31-32. Plea to broaden training of engineer in order that he may acquire a greater breadth of view which will permit his adaptability to international service.

English Language. Education in English Language Promotes Efficiency, Sarah Elkus. Nat. Efficiency Quarterly, vol. I, no. 3, Nov. 1918, pp. 140-149. Cooperation of Board of Education in promoting English classes in factories; English as a safety-first method.

S. A. T. C. Students' Army Training Corps. Alexander S. Langsdorf. Proc. St. Louis Ry. Club, vol. 23, no. 7, Nov. 22, 1918, pp. 115-127 and (discussion), pp. 127-129. Educational plan as developed by War Department after series of experiments. Special reference made to features and arrangements of Government contracts with Washington University.

Intensive Training, C. R. Dooley. Jl. Am. Soc. Mech. Enbrs., vol. 41, no. 1, Jan. 1919, pp. 37-38. Program set up by Committee on Education and Special Training. It consisted of (1) military training, (2) sorting and training according to ability, (3) trade fundamentals and combinations, and (4) development of originality and initiative.

Shipyards. Industrial Training in War Time E. E. MacNary. Gen. Elec. Rav., vol 21, no. 12, Dec. 1918, pp. 871-875, 4 figs. Procedure followed and accomplishments performed by Emergency Fleet Corporation. Article deals with teaching of eighteen different trades.

Training 350,000 Men for the Shipyards, J. Will Parry. Eng. News-Rec., vol 82, no. 1, Jan. 1, 1919, pp. 53-56, 1 fig. How Fleet Corporation met problem.

Training Workers in Shipyards, R. V. Rickford. Int. Mar. Eng., vol. 24, no. 1, Jan. 1919, pp. 38-42, 12 figs. Short cut over old apprentice system; work progresses from simple to difficult operations; rivet records show results.

Trade Journals. Technical Journal Best Aid to Education, S. Balmfirth. Can. Foundryman, vol. 9, no. 12, Dec. 1918, pp. 307-309. After analyzing advantages and disadvantages of various sources of technical education writer concludes that technical journals, by reason of their ready availability and simplicity of style, are best help for self-instruction. Also in Can. Machy., vol. 20, no. 23, Dec. 5, 1918, pp. 655 and 657.

Training Factory. Lens Grinding in a Training Factory, Erik Oberg. Machy., vol. 25, no. 4, Dec. 1918, pp. 330-332, 3 figs. Means for meeting war emergencies devised by U. S. Government.

Vocational Schools. Need for vocational Schools in Mining Communities, J. C. Wright. Bul. Am. Inst. Min. Engrs., no. 145, Jan. 1919, pp. 91-94. Kinds of vocational schools which may be organized under the terms of the Federal Vocational Education Act.

Welders. The Training of Eectric Welders, H. A. Horner. Gen. Elec. Rev., vol. 21, no. 12, Dec. 1918, pp. 876-881, 9 figs. Development of ingenuity and manipulating skill necessitated by welding operators said to be principalaim of course given by instructors of Emergency Fleet Corporation.

Women. Service for Women in the Gisholt Shop, J. V. Hunter. Am. Mach., vol. 50, no. 1, Jan. 2, 1919, pp. 6-10, 17 figs. Methods used in training women workers in a Wisconsin shop.

Preliminary Training for Women Workers, Fred. H. Colvin. Am. Mach., vol. 49, no. 24, Dec. 12, 1918, pp. 1067-1070, 9 figs. Account of methods employed in school of Packard Motor Car Co.

Motor Company's Shop Training for Women, F. L. Prentiss. Iron Age, vol. 102, no. 24, Dec. 12, 1918, pp. 1453-1455, 1 fig. Intensive work at Lincoln plant done in threshold school; women employees are protected by enforcement of rigid rules.

Work Schools. New Developments in Industrial Organization. Modern Methods of Port Sunlight (Ill.), W. G. Cass. Cassier's Eng. Monthly, vol. 54, no. 5, No. 1918, pp. 248-256. Work schools at Port Sunlight works.

FACTORY MANAGEMENT

Employment Managers. Aids to Employment Managers and Interviewers on Shipyard Occupations with Description of Such Occupations. Special Bul. U. S. Shipping Board Emergency Fleet Corporation, 1918, 147 pp. List of fundamental trades and occupations with most commonly accepted names used as standard. Specifications describe occupation from shipyard standpoint.

Duties of the Employment Manager, Charles W. Moon. Machy., vol. 25, no. 5, Jan. 1919, pp. 443-447, 9 figs. Fundamental principles involved and methods used successfully by R. K. Le Blond Machine Tool Co.

Employment Managers Graduate at the University of California, A. T. Parsons. Metal Trades, vol. 9, no. 11, Nov. 1918, pp. 450-152. Historical account of development of industrial activity involved in occupation of employment managers.

Handbook on Employment Management in the Shipyard. Organizing the Employment Department—. U. S. Shipping Board Emergency Fleet Corporation 1918, 17 pp. Methods and processes of handling employment problems which have been found successful in some of largest shipyards and corporations in U. S.

The Employment Manager a New Factor in the Industrial Relationship, Edward P. Jones. Wis. Engr., vol. 23, no. 2, Nov. 1918, pp. 48-53. Considerations on necessity for and meaning of formanizing labor as developed in new profession. Also in Metal Trades, vol. 9, no. 12, Dec. 1918, pp. 500-501.

Employment Methods. Installing Employment Methods, William Alfred Sawyer. Indus. Management, vol. 57, no. 1, Jan. 1919, pp. 7-11, 16 figs. Record of first year's work of employment and health department of American Pulley Co.

Interviewing and Selecting, Mark M. Jones. Indus. Management, vol. 57, no. 1, Jan. 1919, pp. 66-67. From address before Am. Assn. of Public Employment Officers.

Environment. Influence of Environment on Production, Lewis J. Brew. Am. Drop Forger, vol. 4, no. 11, Nov. 1918, pp. 428-429. Suggestions in layout and details of forge plant.

Equipment. Equipment for Diversified Production, A. B. Shuart. Am. Drop Forger, vol. 4, no. 11, Nov. 1918, pp. 429-430. Features of forge-plant design contributing to eliminate manual labor to large extent.

Ford Shipbuilding Methods. Ford Methods in Ship Manufacture—I, Fred E. Rogers. Indus. Management, vol. 57, no. 1, Jan. 1919, pp. 1-6, 12 figs. Basic features that made possible the production of Eagle submarine chasers. (To be continued.)

Foundry. Organizing a Foundry to Obtain Top Production, Paul R. Ramp, Foundry, vol. 47, no. 317, Jan. 1919, pp. 8-13, 5 figs. Systematic method of following up work of foremen in each department essential. From paper before Am. Foundrymen's Assn., Milwaukee.

Inter-Departmental Communications. Shooting the Shop Orders to Their Targets, Robert I. Clegg. Iron Age, vol. 103, no. 1, Jan. 2, 1919, pp. 53-55, 4 figs. Simple scheme of Geometric Tool Co. to rush instructions to departments the instant they are required.

Localization of Industry. The Localization of Industry, Malcolm Keir. Sci. Monthly, vol. 8, no. 1, Jan. 1919, pp. 32-48. Localization traceable as response to resources either in raw materials and power, or in unskilled labor; chance and monopoly as contributing factors: requirements of factories utilizing waste products; dependence of localized industries on skilled labor; influence of localization in formation of labor unions; deterrent features of localization.

Material Handling. Saving Tool Materials in Winchester Shop, W. E. Freeland. Iron Age, vol. 102, no. 26, Dec. 26, 1918, pp. 1574-1575, 2 figs. Work of central material planning division. Files are kept on steel basis. Tenth article dealing with methods at Winchester plant.

ORGANIZATION. What Should Organization Achieve? Harry Tipper. Automotive Indus., vol. 40, no. 1, Jan. 2, 1919, pp. 17-18. Its effect on (1) providing incentive to work, (2) settling individual grievances and general disagreements, (3) improving the working force, (4) decreasing labor turnover, and (5) reducing friction between departments.

PRODUCTION CONTROL. Graphic Production Control—V The Control of Equipment and Labor, C. E. Knoeppel, Indus. Management, vol. 57, no. 1, Jan. 1919, pp. 56, 61, 22 figs. Features of control said to improve efficiency of workmen, do away with idleness of equipment and improve faulty shop practice. (To be concluded.)

PUBLIC-UTILITY PLANTS. Practical Measures for Securing Greatest Economy in Public Utility Plant Operation, Charles Brossman. Mun. & County Eng., vol. 55, no. 6, Dec. 1918, pp. 206-208. Proper use of recording and indicating instruments; bonus system; examples of plant neglect.

PURCHASING. Principles of Purchasing and Storing, Dwight T. Farnham, Indus. Management, vol. 57, no. 1, Jan. 1919, pp. 33-38, 6 figs. Instructions concerning storing of materials and supplies, their withdrawal from stock preparing purchasing requisitions, obtaining bids and quotations, placing purchase orders, following up delayed purchase materials, and reporting receipt of materials. From U. S. Employment Service Bulletin.

RATES AND RATE SETTING. Time Studies for Rate Setting on Gisholt Boring Mills (111), Dwight V. Merrick, Cassier's Eng Monthly, vol. 54, no. 5, Nov. 1918, pp. 271-275, 4 figs. Time required in actual manipulation of machine for cuts.

Establishing Basic Rates Saves Time Study Work, Carle M. Bigelow. Indus. Management, vol. 57, no. 1, Jan. 1919, pp. 17-22, 5 figs. Using as examples the determination of basic rate for a machine and finding basic rate for manual labor, writer points out how their use gradually increases usefulness of time-study men by simplifying vexatious problems of determining allowed times and repeated studies due to variation of product for single operation.

SHOP EFFICIENCY. The Cultivation of Shop Efficiency, H. J. MacMillan. Am. Drop Forger, vol. 4, no. 11, Nov. 1918, pp. 446-447, 9 figs. Contrasts present with past conditions in industrial relationship between employees. In illustration quotes work accomplished by Mueller Mfg. Co.

TOOL SYSTEM. A Simple Tool System, B. L. Van Schaick. Indus. Management, vol. 57, no. 1, Jan. 1919, p. 32, 1 fig. Plan based on actual inventory and formation of central crib where all grinding, dressing and repairing is done.

FINANCE AND COST

COST ACCOUNTING. Cost Accounting to Aid Production—IV. The Principles or Burden Distribution, G. Charter Harrison. Indus. Management, vol. 57, no. 1, Jan. 1919, pp. 49-55, 2 figs. Details of method of obtaining machine rates, bringing in use of punched cards and sorting and tabulating machines. (To be continued.)

COST FINDING. True Cost Finding—What It Can Do for the Railroads. Morris Llewellyn Cooke. Indus. Management, vol. 57, no. 1. Jan. 1919, pp. 40-42. States that since main purpose in collecting cost nata is to measure efficiency, its scientific application in railroad operation will provide gage for efficiency of each performance; and that initiative in scheming out an adequate cost finding system should be taken by U. S. Railroad Administration.

COST SYSTEMS AT FACTORIES. Costing at National Factories, W. Webster Jenkinson. Iron and Coal Trades Rev., vol. 47, no. 2645, Nov. 8, 1918, pp. 513-516. Forms of progress records and cost returns; desirability of introducing cost system in a business (Concluded.)

COST SYSTEMS, CONSTRUCTION. How to Figure Construction Costs, Stanley D. Moore. Cement & Eng. News, vol. 30, no. 12, Dec. 1918, pp. 30-32. Note son calculation of sewer system costs. Address at annual meeting of Iowa Eng. Soc.

INSPECTION

FUEL SUPERVISION. Supervision and Fuel Economy. Robert Collett. Official Proc. N. Y. R. R. Club, vol. 29, no. 1, Dec. 1918, pp. 5452-5455. Recommends supervision by friendly counsel and encouragement.

LABOR

BONUSES. Day Labor, Force Account Work and Bonuses, Charles M. Upham. Good Roads, vol. 16, no. 25, Dec. 21, 1918, pp. 239-241. Discusses advantages and disadvantages. Paper presented at meeting of Am. Assn. State Highway Officials, Chicago.

Piece Work and Bonus System (Le travail aux pièces et la prime), M Crémieux. Génie Civil, vol. 73, no. 17, Oct. 26, 1918, pp. 329-333, 8 figs. Established fundamental equations for comparison of these two systems of remunerating workers.

COMPENSATION. Workmen's Compensation, Health Insurance and Hospitals, Thomas Howell. Modern Hospital, vol. 11, no. 5, Nov. 1918, pp. 414-416. Discussion of future relations of charitable hopitals to industry, indicating probable vast changes.

CRIPPLES. An Experimental Employment Bureau for Cripples, Eleanor Adler. Modern Hospital, vol. 11, no. 5, Nov. 1918, pp. 402-405. Brief historical account of efforts to find employment for disabled with reference to establishment of bureau under control of Federation of Assns. for Cripples and the Hudson Guild.

Opportunities for Crippled Soldiers in the Metal Industries, Elsie Plant. Metal Trades, vol. 9, no. 11, Nov. 1918, pp. 448-449, 3 figs. Some of the things disabled men can do, as found by Red Cross Inst. for Crippled and Disabled Men.

DEMOBILZATION. When Labor Comes to Market, Walton H. Hamilton. Survey. vol. 41, no. 14, Jan. 4, 1919, pp. 425-428. Explanation and comment on demobilization chart of U. S. Labor Policies Board showing importance of rate at which demobilization is to be effected, analysis of problem and contingencies upon which solution depends.

Status of the Unproductive Worker, Harry Tipper. Automotive Indus., vol. 39, no. 25, Dec. 1918, pp. 1045-1046. Right of salaried workers to representation in organization with skilled and unskilled employees.

EMPLOYMENT DEPARTMENT. Employment Department. Hog Island Shipyard, Am. Mach., vol. 49, no. 23, Dec. 12, 1918, pp. 1971-1075, 11 figs. Shows forms used and describes process of employing men.

A Definition of "Penny-Wise, Pound Foolish," Applied to the Picking and Developing of Men for Big Jobs, Christian Girl. Monthly Jl., Utah Soc. Engrs., vol. 4, no. 9, Sept. 1918, pp. 169-175. Analysis of characteristics in personnel which contribute to stability of organization. Experience of writer in picking out men. From System.

Selecting Employees. Gas Industry, vol. 18, no. 12, Dec. 1918, pp. 359-362. Forms used by company covering appearance, mentality, and ability of applicants, who are examined on each by different person.

HOUSING. Instances of Industrial Housing. Stone & Webster Jl., vol. 23, no. 6, Dec. 1918, pp. 408-413, 11 figs. General appearance and finish of industrial housing at Mills of Carnegie Steel Co., and Buckeye Coal Co. Developments include building of houses, grading of streets, installation of water and sewer lines, etc

The New E. F. C. Hotel at Hog Island, W. H. Blood. Stone & Webster Jl., vol. 23, no. 5, Nov. 1918, pp. 344-346, 4 figs. Views; rules; conveniences available. Hotel accommodates 2176 men.

INDUSTRIAL COURTS. New Basis for Industrial Relations, Harry P. Kendall. Am. Contractor, vol. 39, no. 52, Dec. 28, 1918, p. 17. Discusses establishment of set of federal industrial courts as in Australia, and formation of boards set by by workmen and their employees with equal representation on each side to determine standards of wages, hours and conditions of employment. Address before Nat. Councillors of Chamber of Commerce of U. S.

LABOR REPRESENTATION. How Labor Representation Operates. Iron Trade Rev., vol. 63, no. 24, Dec. 12, 1918, pp. 1349-1351. Presents plan adopted by Youngstown Sheet & Tube Co., in which the company commits itself to whatever may be declared to be just and equitable.

Political Plan of Organization Satisfactery for Relatively Small Establishments, Harry Tipper. Automotive Indus., vol. 39, no. 26, Dec. 26, 1918, pp. 1083-1084 and 1088. Combined work of employees' representatives and supervisors' committee.

Real Labor Representation, Harry Tipper. Automotive Indus., vol. 39, no. 24, Dec. 12, 1918, pp. 1006-1007 and 1010, 1 fig. Analysis of Midvale Steel & Ordnance Co.'s plan. Organization constituted of legislative and judicial committees elected by employees in the various plants.

LABOR SITUATION. What About Labor? Business Digest & Investment Weekly, vol. 22, no. 12, Dec. 17, 1918, pp. 421-423 and 429. Reasons why, despite resumption of normal business activity, there is hesitancy due to possibilities in labor situation.

MINE LABOR. Employment of Mine Labor, Herbert M. Wilson. Bul. Am. Inst. Min. Engrs., no. 145, Jan. 1919, pp. 83-85. Important aspects of securing and retaining workmen; purpose of Federal Board for Vocational Education.

PIECE-RATE CARD SYSTEM. Layout and Piece-Rate Card Syste n, John J. Borkenhagen. Machy., vol. 25, no. 4, Dec. 1918, pp. 327-329, 13 figs. Forms that assist in efficiency shop management.

RELATIONS BETWEEN EMPLOYEES. A Unique Method of Handling Employees. Jl. Elec., vol. 41, no. 10, Nov. 15, 1918, pp. 443-444. Promoting activities which will foster social relationship between them.

The Human Touch in Supervision, E. C. Clarke. Elec. Ry. Jl., vol. 52, no. 24, Dec. 14, 1918, 1048-1050, 3 figs. Object of management should be to instill spirit of cooperation among employees; how it may be done.

WAGES. The Relation of Wages to Public Health, B. S. Warren and Edgar Sydenstricker. Am. Jl. Public Health, vol. 8, no. 12, Dec. 1918, pp. 883-887. Points out the necessity of providing families with suitable money value commensurate with local necessities and capable of eliminating undesirable factors which may bring about unhealthy conditions. Based on statistics for period 1907-1912.

Standardization and Administration of Wages, H. P. Kendall and E. D. Howard. Jl. Am. Soc. Mech. Engrs., vol. 41, no. 1, Jan. 1919, pp. 35-37. Consequences of system of contractual relations between employers and employees; work of the War Labor Policies Board; post-war labor problems; advisability of establishing system of organized labor participation in management.

WELFARE. Welfare or Manpower Engineering? Frances A. Kellor. Nat. Efficiency Quarterly, vol. 1, no. 3, Nov. 1918, pp. 123-139. Contends that welfare work does not touch basic structure of plant management and that industrial relationship must be built in terms of engineering—impersonal, accurate, just and coordinated.

WOMEN. Wartime Experience With Women Metal Workers. Foundry, vol. 47, no. 317, Jan. 1919, pp. 6-7. Their efficiency has been demonstrated in core shops, foundries and metal-working plants generally and in some respects they have been found superior to men.

Women Workers and Labor Turnover, Ida May Wilson. Indus. Management, vol. 57, no. 1, Jan. 1919, pp. 67-68. Temperamental and psychological factors determining complacency and permanency of women employees.

Women in Industry. Travelers Standard, vol. 6, no. 12, Dec. 1918, pp. 237-256, 9 figs. Present and future need for women; their limitations; selecting and training them; supervision and discipline; special aspects of safety problem; hours of labor; sanitation and general welfare; reference to American and European practices.

Woman's Place in Scientific Industry. Cassier's Eng. Montly, vol. 54, no. 5, Nov. 1918, pp. 263-264. Women's labor after demobilization.

The Women in Our Industries. Jl. Elec., vol. 41, no. 11, Dec. 1, 1918, pp. 499-500. Record of situation in U. S. with special reference to conditions in the West.

Developing Latent Labor Forces, John E. Otterson. Nat. Efficiency Quarterly, vol. 1, no. 3, Nov. 1918, pp. 168-178. Women as laborers.

Let the Women Do the Work, D. C. Fessenden. Metal Trades, vol. 9, no. 11, Nov. 1918, pp. 435-438, 4 figs. Experience of several western companies.

LEGAL

Boiler Making. Legal Decisions Affecting Boiler Makers, John Simpson. Boiler Maker, vol. 18, no. 12, Dec. 1918, pp. 339-340. Employer responsible for condition of tools; employers' liability in America and England; employee's risk when precaution is disregarded; decision covering steam-pipe fitting; liability under federal boiler inspection act.

Change of Appliances. Change of Appliances, Chesla C. Sherlock. Power, vol. 48, no. 25, Dec. 17, 1918, p. 887. Some legal decisions.

Engineering License Laws. Engineering License Laws. Can. Engr., vol. 35, no. 25, Dec. 19, 1918, pp. 530 and 535. Report of committee appointed by Am. Assn. Engrs. to gather information concerning state engineering license laws, either proposed or in operation, and to draw up a standard license law.

Labor Legislation. Coordination of Legislative and Operative Functions in Labor Essential to Success, Harry Tipper. Automotive Indus., vol. 39, no. 23, Dec. 5, 1918, pp. 958-959 and 986. Organizatio- fundamentals and changes; experiments in organization and their advantages. (Second series.)

Power Plants. Some Recent Legal Decisions. Power, vol. 48, no. 27, Dec. 31, 1918, pp. 970, 971. Brief reports of some cases involving power plants.

LIGHTING

Chicago Factories. Productive Intensities, Wm. A. Durgin. Trans. Illum. Eng. Soc., vol. 13, no. 8, Nov. 20, 1918, pp. 417-424, and (discussion), pp. 424-428, 6 figs. Illumination survey of Chicago factories having connected load of 100 kw. or more.

Electrical Manufacturing Plants. Improved Lighting of Electrical Manufacturing Plants, F. H. Bernhard. Elec. Rev., vol. 73, no. 24, Dec. 14, 1918, pp 917-922, 7 figs. Last of series of twelve articles on electric lighting in industries.

Inspection. Light, Electricity and the Shop, C. E. Clewell. Am. Mach., vol. 49, no. no. 25, Dec. 19, 1918, pp. 1117-1122, 11 figs. Description of educational plan for state factory inspectors in New Jersey and Pennsylvania and some results accomplished in these states.

Machine Tools. The Lighting of Machine Tools, Cassier's Eng. Monthly, vol. 54, no. 5, Nov. 1918, pp. 276-279, 4 figs. Schemes for lighting punching machine, bench vises, turret lathe and drilling machine.

War Effects. Lighting Units for Commercial, Office and Home Illumination. Elec. Rec., vol. 24, no. 6, Dec. 1918, pp. 45-53, 37 figs. Discussion of present practice with illustrations of the various types; emphasis laid on effect of war.
Wartime Lighting Economies. Trans. Illum. Eng. Soc., vol. 13, no. 8, No. 20, 1918, pp. 387-400 and (discussion) pp. 400-410. Rules limiting use of artificial light to minimum necessary numbers of hours per day, and promoting efficient use of artificial light during those hours. Prepared by Committee on War Service of Illum, Eng. Soc.
See also MARINE ENGINEERING, Yards (Illumination).

PUBLIC REGULATION

Federal Control of Labor. Effect of Federal Control on Railway Labor, W. S. Carter. Ry. Age, vol. 65, no. 24, Dec. 13, 1918, pp. 1031-1064. Outline of efforts to create improved relations between employer and employee.

Water Power Department. A Plan for Power Development, C. Edward Magnusson. Jl. Elec., vol. 41, no. 10, Nov. 15, 1918, pp. 549-460, 1 fig. Scheme permitting Government aid without doing away with private enterprise and its application to State of Washington.

RECONSTRUCTION

Automobile Industry. Some Probable Effects of the War on the Automobile Industry, A. A. Remington, Automobile Engr., vol.. 8, no. 120, Nov. 1918, pp. 306-311, 2 figs. Presidential address before Instn. Automobile Engrs.

British Export Trade. Quantity or Quality, W. Slater, Cassier's Eng. Monthly, vol. 54, no. 5, Nov. 1918, pp. 284-286. Remarks on British export trade.

Canada. Reconstruction in Canada and the Social and Economic Forces Which Will Condition It, J. A. Stevenson. Survey, vol. 41, no. 14, Jan. 4, 1919, pp. 441-446. Problem of repatriation of troops as being worked out by committee of cabinet.
Canada Readjusting from War to Peace, Carroll E. Williams. Mfrs. Rec., vol. 75, no. 1, Jan. 2, 1919, pp. 159-160. Plans of industrial and agricultural work for returning soldiers.

Dumping. The Truth About German Steel Dumping, E. T. Good. Cassier's Eng. Monthly, vol. 54, no. 5, Nov. 1918, pp. 286-288. Warning against introduction into England of German products; former German policy.

Exports. World Markets for American Manufacturers, Lynn W. Meekins. Sci. Am., vol. 120, no. 1, Jan. 4, 1919, p. 12. Factors limiting market in France; how Germany obtained East Indian business; possibilities in Dutch East Indies.
Cultivating Japanese Automotive Field (V), Tom O. Jones, Automotive Indus., vol. 39, no. 25, Dec. 19, 1918, pp. 1059-1061. Opportunities for American tire makers; suggestions to American manufacturers.
Cultivating the Chinese Automotive Field, Tom O. Jones. Automotive Indus., vol. 39, no. 26, Dec 26, 1918, pp. 1106-1107 and 1122, 5 figs. Conditions of Chinese roads as a factor in automotive development; types of cars for China.

Latin-American Exports. Entering the Export Markets of Latin America. IV The Value of Insurance, Percy F. Martin. Cassier's Eng. Monthly, vol. 54, no. 5, Nov. 1918, pp. 280-283. Advisability of insuring shipments against loss or damage.

Post-War Trade. Obstacles to Post-War Trade, Richard Cooper. Soc. of Engrs. Jl. & Trans., vol. 9, no. 11, Nov. 1918, pp. 169-179 and (discussion) pp. 179-187. Sets forth problems of reorganization of industry to peace work. Possible profit from a system of high wages indicated from author's experience in engineering and chemical industry.

Readjustment Problems. Readjustment Problems Confronting America, Harry A. Wheeler. Gas Age, vol. 42, no. 12, Dec. 16, 1918, pp. 511-514. Presidential address before Chamber of Commerce of United States, Atlantic City. Also in Am. Fertilizer, vol. 49, no. 12, Dec. 7, 1918, pp. 38-39.
Reconstruction Problems, M. F. Chase. Bul Am. Inst. Min. Engrs., no. 145, Jan. 1919, pp. IX-XI. Parallel between European and American reconstruction problems; cancellation of contracts for war materials.
Petroleum and Reconstruction Problems, Chester Naramore. Bul. Am. Inst. Min. Engrs., no. 145, Jan. 1919, pp. XIV-XVIII. Erroneousness of conception that petroleum demands will decrease after signing of peace. Present leading position of U. S. in industry and means to perpetuate it.
Reconstruction of American Business, Edwin L. Seabrook. Boiler Maker, vol. 18, no. 12, Dec. 1918, pp. 338 and 352. Advisability of Government control during tansitional period; adjustment of wages and prices; special legislation.
Organizing the National for Peace, L. W. Alwyn-Schmidt. Indus. Management, vol. 57, no. 1, Jan. 1919, pp. 45-48. Survey of general plans of England, France and Germany for redistributing labor, repatriating army, invalid labor, reestablishing artisans and industrial housing. Also points out difficulties to be faced by United States in meeting world-wide competition.
See also MECHANICAL ENGINEER, Motor-Car Engineering (Exports).

SAFETY ENGINEERING

California State Commission. Accident Prevention, John R. Brownell. Proc. Pacific Ry. Club, vol. 2, no. 8, Nov. 1918, pp. 12-13. Work being done by commission which administers State Compensation Fund created by California legislature in Workmen's Compensation Insurance and Safety Act.

Causes of Industrial Accidents. Factors Concerned in the Causation of Industrial Accidents. Automotive Indus., vol. 39, no. 22, Nov. 28, 1918, pp. 916-918. Comparison of report of Health of Munition Workers Committee of British Ministry of Munitions with U. S. Labor Bureau statistics.
Reduction of Accident Hazard, R. L. Gould, Cassier's Eng. Monthly, vol. 54, no. 5, Nov. 1918, pp. 265-270, 1 fig. Discussion of questions confronting safety engineer in his endeavor to minimize risk of accident to limb and life in industrial plants and suggestions for promoting work.

Cranes. Safety First for Crane and Operator. Jl. Elec., vol. 41, no. 11, Dec. 1, 1918, pp. 524-525, 2 figs. Special protection panel for cranes having three polyphase motors. Panel provides two inverse time-element overload relays for each motor.

Diseases. Diseases and Infections, Chesla C. Sherlock. Am. Mach., vol. 50, no. 1, Jan. 2, 1919, pp. 18-30. Some legal interpretations of liability.

Dust Inhalation. Effects of Dust Inhalation, J. S. Haldane. Queensland Government Min. Jl., vol. 19, no. 222, Nov. 15, 1918, pp. 515-517. Analysis of dust and result of experiments on its reported destructive effects. Paper submitted to Chem. Metallurgical & Min. Soc. of South Africa and to Instn. Min. Engrs.

Eye Protection. Eye Protection in Iron Welding Operations, W. S. Andrews. Gen. Elec. Rev., vol. 21, no. 12, Dec. 1918, pp. 961-966, 7 figs. Charts illustrating spectra of commercially available glasses and their combinations, for use in selecting best protection against radiations of welding arc.

Inflammable Materials. The Dangers of Explosion With Inflammable Liquids and Vapors, W. Payman. Sci. Am. Supp., vol. 87, no. 2244, Jan. 4, 1919, p. 7, Criteria for judging liability of a given liquid to produce dangerous conditions; precautions necessary in handling inflammable liquids. From Jl. Soc. Chem. Indus.
The Dangers of Explosion with Inflammable Liquids and Vapors, W. Payman. Jl. Soc. Chem. Indus., vol. 37, no. 21, Nov. 15, 1918, pp. 406R-408R. Limits of inflammability of commoner organic solvents as recorded by different observers.

Lighting Defects. The Relation Between Light Curtailment and Accidents, R. E. Simpson. Trans. Illum. Eng. Soc., vol. 13, no. 8, Nov. 20, 1918, pp. 429-435 and (discussion), pp. 435-438. Considerations based on statistical figures and present systems of factory illumination.

Metal Industries. Causes and Prevention of Accidents in the Metal Industries, L. W. Chaney and Hugh S. Hanna. Metal Trades, vol. 9, no. 12, Dec. 1918, pp. 498-499, 3 figs. From Bul. 234 of U. S. Department of Labor.

Quarries. Accident Prevention in Quarry Operation, William H. Baker. Cement & Eng. News, vol. 30, no. 12, Dec. 1918, pp. 27-28. Work of Committee on Safety and Welfare of Atlas Portland Cement Co. From Address before Nat. Safety Council.

Shop Safety Organization. Shop Safety Organization. The Bulletin, N. Y. State Indus. Commission, vol. 4, no. 3, Dec. 1918, pp. 48-52 and 57. Plan worked out by Bureau of Statistics and Information of State Industrial Commission and discussed at session of Industrial Safety Congress.

Steel Industry. Hazards Reduced in Steel Industry. Iron Trade Rev., vol. 63, no. 24, Dec. 12, 1918, pp. 1341-1345, 5 figs. Review of safety work of iron and steel industry in the last few years. From Bul. 234 of U. S. Bureau of Labor Statistics.
See also MINING ENGINEERING, Mines and Mining (Fire Protection; Safety).

SALVAGE

Waste Reduction. Conservation of Materials in Our Plants, Francis G. Hall. Am. Drop Forger, vol. 4, no. 11, Nov. 1918, pp. 440-441. Reducing waste by careful handling. (Second of Series.)
Salvaging Miscellaneous Wastes, W. Rockwood Conover. Indus. Management, vol. 57, no. 1, Jan. 1919, pp. 12-16, 3 figs. Methods for salvaging rubber, leather, fibre, rope, string, muslin rags, cloth trimmings, burlap sacks, old belting, asbestos, sheeting, mica, insulation papers, wire, waste paper, boxes, barrels, cans, containers, emery cloth, cotton waste brooms, brushes, oil and fuel gas.
See also MECHANICAL ENGINEERING, Foundries (Salvage Work).

TRANSPORTATION

INLAND WATERWAYS. Handling Freight on Inland Waterways, H. McL. Harding. Inst. Mar. Eng., vol. 23, no. 12, Dec. 1918, pp. 667-670, 6 figs. Advantages of effective inland terminals; operating costs small; importance of mechanical methods.

MOTOR-TRUCK TRANSPORT. Cost and Charges of Motor Truck Service. Ry. Rev., vol. 63, no. 23, Dec. 7, 1918, pp. 805-810, 9 figs. Some motor truck cost figures.
Rural Motor Express, S. W. Fenn. Jl. Soc. Automotive Engrs., vol. 3, no. 6, Dec. 1918, pp. 383-384 and (discussion), pp. 384-388. Work accomplished in Iowa; moving crops by motor trucks in Idaho; organization of rural lines in Tennessee, Alabama and Georgia.

VARIA

CITY MANAGER. Progress, Prospects and Pitfalls of the New Profession of City Manager, O. E. Carr. Can. Engr., vol. 35, no. 24, Dec. 12, 1918, pp. 513-514 and 519. Abstracted from paper before Fifth Annual City Mgrs. Convention.

INDUSTRIAL TECHNOLOGY

ALCOHOL. Industrial Alcohol. Times Eng. Supp., no. 529, Nov. 1918, p. 228. Possible source of supply.

AMMONIUM NITRATE. Coke Makers Now Make Nitrate of Ammonia, Mark Meredith. Chem. Engr., vol. 26, no. 12, Nov. 1918, pp. 451-452. English research proves it is commercially possible to turn ammonia by-product of coke ovens into nitrate of ammonia.

CLAYS. The Nature of the Air Content of Pugged Clays, H. Spurrier. Jl. Am. Ceramic Soc., vol. 1, no. 8, Aug. 1918, pp. 584-585, 1 fig. Apparatus to secure gas occluded in clay and result of analysis of gases collected from pugged-clay samples.
Burning Clay Wares (XXXII), Ellis Lovejoy. Clay-Worker, vol. 70, no. 6, Dec. 1918, pp. 496-498, 12 figs. Principle and arrangement of single outside stack kilns.

CHEMICAL INDUSTRY. The Synthetic Organic Chemical Industry, Francis H. Carr. Jl. Soc. Chem. Indus., vol. 37, no. 22, Nov. 30, 1918, pp. 425-R-428R. Importance of chemistry to the life of a nation and achievements of British chemists during years of war. From chairman's address to Nottingham Section.
Recent Progress and Future Development of Chemical Industries in France (Les progrès récentes et l'avenir des industries chimiques en France), Paul Razous. Génie Civil, vol. 73, nos. 19, 20 and 21, Nov. 9, 19 and 23, 1918, pp. 368-371, 390-393 and 407-410. Nov. 19: Potassium and sodium bichmates; mineral colors and varnishes; electrochemical industries; oils, pastes; fermentation; sugars; Nov. 23: Tanning industry; resins distillation of tars; carbonization of wood; artificial coloring.
The Criteria in the Declaration of Chemical Independence in the United States, I. Newton Kugelmass. Science, vol. 48, no. 1251, Dec. 20, 1918, pp. 608-612. Address at meeting of Alabama Section, Am. Chem. Soc.

COAL PRODUCTS. Utilization of Lignite. Water & Gas Rev., vol. 29, no. 6, Dec. 1918, pp. 13-14. Characteristics of gas, ammonia, oils and tar obtained as by-products from lignite.
Distillation Tar from Mond Gas Plant, A. Gatley Lyons. Chem. Eng. & Min. Rev., vol. 10, no. 121, Oct. 5, 1918, pp. 19-20, 1 fig. Description of installation at Sulphide Corporation Works, New South Wales. Paper before Aust. Inst. Min. Engrs.
The Manufacture of Retort Coal-Gas in the Central States Using Low-Sulphur Coal from Illinois, Indiana and Western Kentucky, W. A. Dunkley and W. W. Odell. State of Ill., Div. Geol. Survey, bul. 21, 24 pp., 3 figs. Present use of central district coals; problems in their use in coal-gas manufacture; results reported; economical advantage of using them.

DUST PRECIPITATION. Removing Foundry Dust by Electric Precipitation, H. D. Egbert. Foundry, vol. 47, no. 317, Jan. 1919, pp. 43-45, 6 figs. Two sets of elecrodes used in Cottrell process, dust being charged with static electricity and attracted to collecting electrodes
Cleaning Blast Furnace Gases by Electrical Precipitation, N. H. Gellert. Mfrs. Rec., vol. 74, no. 24, Dec. 12, 1918, p. 58. Tests on furnace operating on spiegeleisen and having a rated capacity of 200 tons of pig iron per day.

ENAMELS. Antimony Oxide as an Opacifier in Cast-Iron Enamels, J. B. Shaw. Jl. Am. Ceramic Soc., vol. 1, no. 7, July 1918, pp. 502-511 and (discussion) pp. 511-513. Results of experimental efforts to outline satisfactory working formulæ having antimony oxide as chief opacifying agent.
Preparation and Application of Enamels for Cast Iron, Homer F. Staley. Jl. Am. Ceramic Soc., vol. 1, no. 8, Aug. 1918, pp. 534-555, 3 figs. Details and arrangement of machinery in storing, weighing and mixing raw materials, melting enamel, drying grinding and screening; operations followed in enamelling process; enameling-room equipment.
How High-Grade Enameling is Done, E. C. Kreutzberg. Iron Trade Rev., vol. 63, no. 23, Dec. 5, 1918, pp. 1290-1291, 4 figs. Practice followed in a New York plant.

FILTRATION. Filtration in the Laboratory, Robt. T. Smith. Color Trade Jl., vol. 4, no. 1, Jan. 1919, pp. 21-24. Modern methods; natural suction and under hydraulic head. Suggestions in regard to selection of papers and adaptation of accessory apparatus.

GLASS. The Effect of Certain Impurities in Causing Milkiness in Optical Glass, C. N. Fenner and J. B. Ferguson. Jl. Am. Ceramic Soc., vol. 1, no. 7, July 1918, pp. 468-476. Reasons for opalescence with which certain pots of glass were effected at Bausch and Lomb plant and how it was overcome.

GYPSUM. Some Factors Influencing the Time of Set of Calcined Gypsum, F. F. Householder. Jl. Am. Ceramic Soc., vol. 1, no. 8, Aug. 1918, pp. 578-583, 5 figs. Tests to determine effect of varying consistency of mixtures, time and rate of stirring and temperature of water used in mixing.

MANTLE LAMPS. Influence of B.t.u. on Gas Mantle Efficiency, R. S. McBride, W. A. Dunkley, E. C. Crittenden and A. H. Taylor. Gas Age, vol. 42, no. 12, Dec. 16, 1918, pp. 519-521, 3 figs. Extract from technological paper 110 of U. S. Bureau of Standards upon tests made in 1916 and giving data upon operation of mantle lamps.

PHOTOGRAPHY. Dyes in Photography, A. Seyewetz. Sci. Am. Supp., vol. 87, no. 2244, Jan. 4, 1919, p. 6. Their use in orthochromatic work and for non-halatiou plates. Abstract of paper in Chemie et Industrie, published in the Briti Jl. of Photography.

PICKLING. The Chemistry of Pickling Baths. Automotive Indus., vol. 39, no. 23, Dec. 5, 1918, pp. 960-961. Action of acid on metal below scale; effect of variations in strength of bath and in temperature; modifying action of bath by organic and inorganic materials.
Niter Cake Substitute for Pickling Steel, E. E. Corbett. Blast Furnace, vol. 6, no. 12, Dec. 1918, pp. 497-501. Investigation conducted by U. S. Bureau of Mines chiefly for purpose of conserving sulphuric acid.

PICRIC ACID. The Manufacture of Picric Acid, Alexander Murray. Color Trade Jl., vol. 4, no. 1, Jan. 1919, pp. 5-8, 2 figs. General features of nitrating pots; nitrating operation; description of large installation; crystallization of picric acid.

SILICA PRODUCTS. Study of Silica Products, A. Bigot. Iron & Coal Trades Rev., vol. 47, no. 2645, Nov. 8, 1918, pp. 521-522. Recommendations in regard to grinding rocks and burning products. Abstract of paper before Refractories Section of Ceramic Soc. of Swansea.

SUGAR INDUSTRY. On the Manufacture of Polariscopes in the United States, C. A. Browne. Louisiana Planter, vol. 62, no. 1, Jan. 4, 1919, pp. 12-14. Reasons for and against proposed change in manufacture of saccharimeters and getting away from German sugar scale and starting anew upon international scale proposed by Sidersky and Pellet. Opinions from 14 leading American chemists quoted.

ULTRA-VIOLET LIGHT. Ultra Violet Light (XIX), Carleton Ellis and A. A. Wells. Chem. Engr., vol. 26, no. 12, Nov. 1918, pp. 453-454 and 473. Its application in chemical arts.

YTTRIUM. The Preparation and Properties of Yttrium Mixed Metal, J. F. G. Hicks. Jl. Am. Chem. Soc., vol. 40, no. 11, Nov. 1918, pp. 1619-1625, 1 fig. Preparation in powder form by decomposing anhydrous chlorides with sodium in vacuo and by electrolysis of these chlorides infused condition; study of solution of yttrium earth metals in fused cryolite and of loss of yttrium chloride by volatilization.

WATER GAS. Water-Gas Manufacture with Central Bituminous Coals as Generator Fuel, W. W. Odell and W. A. Dunkley. State of Ill., Div. Geol. Survey, bul. 22, 24 pp., 3 figs. Data gathered by writers during inspection of 20 water-gas plants in Illinois and surrounding states, in which bituminous coal from central mining district of Illinois, Indiana and western Kentucky is being used as generator fuel.

WOOD WASTE. Some Uses of Wood Waste, Armin Elmendorf. Wis. Engr., vol. 23, no. 2, Nov. 1918, pp. 33-39, 2 figs. Methods for converting waste material into products valuable for use in industries.

See also ELECTRICAL ENGINEERING, Power Applications (Electrochemical Processes).

RAILROAD ENGINEERING

ELECTRIC RAILWAYS

ARGENTINA. Electric Traction on the Central Argentine Railway. Ry. Gaz., vol. 29, no. 20, Nov. 15, 1918, pp. 518-524, 8 figs. Rolling stock. (Continuation of serial.)

REGENERATIVE BRAKING. Braking System Permitting Recovery of Energy in Vehicles Operated by Single-Phase Commutator Motors (Système de freinage avec récupération d'énergie pour véhicles actionnés par moteurs monophasés à collecteur), Behn-Eschenburg. Génie Civil, vol. 75, no. 18, Nov. 2, 1918, pp. 347-350, 5 figs. Theoretical aspect of question as suggested from new developments permitting recovery of braking energy at all speeds and with any charge.

ROLLING STOCK. The New Rolling Material of the Dutch Electric Railways Co. (Het nieuwe rollend materieel der E. S. M.), H. F. Adams. De Ingenieur, year 33, no. 46, Nov. 16, 1918, pp. 893-904, 13 figs. Description of new electric cars.

ELECTRIFICATION

CALIFORNIA. Railway Electrification Recommended. Jl. Elec., vol. 41, no. 10, Nov. 15, 1918, pp. 465-466. Report of investigations made preliminary to recommending electrification of mountain divisions of Cal. railroads to Director General of Railroads.

MONTREAL TUNNEL. Electrification of the Montreal Tunnel Zone, William G. Gordon. Proc. Am. Inst. Elec. Engrs., vol. 37, no. 12, Dec. 1918, pp. 1235-1296, 7 figs. Method of constructing tunnel 3.1 miles long; details of equipment of substation and dimensions of locomotives and motor cars; features of catenary system due to local conditions and prevailing extremely low temperatures. Also Elec. News, vol. 27, no. 23, Dec. 1, 1918, pp. 29-30.

LABOR.

WOMEN. Women in the Service of the Railways, Pauline Goldmark. Ry. Age, vol. 65, no. 23, Dec. 6, 1918, pp. 1015-1018. Address before Labor Reconstruction Conference, Academy of Political Science, New York, Dec. 6, 1918.

LOCOMOTIVES

BOILERS. Report of Inspection of Locomotive Boilers, Ry. Rev., vol. 63, no. 26, Dec. 28, 1918, pp. 907-909, 1 fig. Department of Locomotive Inspection shows favorable results notwithstanding handicap of war.

DESIGN. Modern Locomotive Engine Design and Construction (XLIII). Ry. Engr., vol. 39, no. 467, Dec. 1918, pp. 222-227, 4 figs. Different types of superheaters for any desired working pressure; design calculations and formulae.

FEEDWATER HEATING. Locomotive Feed Water Heating, H. S. Vincent. Ry. Mech. Engr., vol. 92, no. 12, Dec. 1918, pp. 645-649, 8 figs. Discussion of exhaust-steam and waste-gas methods of preheating for locomotive boilers.

FIREBOXES. Radiant Heat and Firebox Design, J. T. Anthony, Ry. Mech., Engr. vol. 92, no. 12, Dec. 1918, pp. 658-660, 3 figs. Combustion chambers increase furnace efficiency and radiation; long tubes are of little value. From paper before Central Railway Club, May 1918.

INDIVIDUAL TYPES. 4-6-0 Passenger Engine and Double Bogie Tender: London and South-Western Railway. Ry. Engr., vol. 39, no. 467, Dec. 1918, pp. 228-229 and insert, 3 figs. Working drawings of engine and tender built at Eastleigh, Supplement to illustrations and particulars given in Oct. issue, pp. 184-186.

2-10-2 Type Locomotive for the Rock Island Lines. Ry. Age, vol. 65, no. 23, Dec. 6, 1918, pp. 992-994, 5 figs. Description with drawings and principal data.

A. T. & S. F. 4-8-2 Type Locomotives. Ry. Mech. Engr., vol. 92, no. 12, Dec. 1918, pp. 649-652. 2 figs. Drawings, description and principal data.

STANDARD LOCOMOTIVES. Standard 4-8-2 and Light 2-10-2 Locomotives. Ry. Age, vol. 65, no. 24, Dec. 13, 1918, pp. 1057-1073, 12 figs. Drawings, descriptions and principal data.

STOKERS. Mechanical Stoking of Locomotives, W. S. Bartholomew. Southern & Southwestern Ry. Club, vol. 14, no. 11, Sept. 1918, pp. 10-70 and (discussion), pp. 71-76, 62 figs. General arrangement of various types of stokers and their application to large freight and passenger locomotives; development of duplex stoker; result obtained in different types of locomotives.

SUPERHEATERS. Locomotive Superheater Maintenance. Ry. Mech. Eng., vol. 92, no. 11, Nov. 1918, pp. 621-623, 5 figs. From Bulletin No. 4, Locomotive Superheater Company.

Superheater Locomotive Performance. Ry. Mech. Eng., vol. 92, no. 12, Dec. 1918, pp. 652-655, 1 fig. From committee report presented at 1918 convention of Travelling Engrs' Assn.

THREE-CYLINDER LOCOMOTIVES. Three-Cylinder Locomotives, H. Holcroft. Ry. News, vol. 110, no. 2862, Nov. 9, 1918, pp. 331-332. Outline of British practice and study of problems involved in operating three valves by means of two gears. Paper before Instn. Locomotive Engrs.

TIRES. Falling Weight Test on Railway Tyres, J. H. G. Monypenny. Engineering, vol. 106, no. 2759, Nov. 15, 1918. pp. 545-547, 8 figs. General discussion of this method of testing; suggestions in regard to changes in method.

NEW CONSTRUCTION

HETCH-HETCHY PROJECT. San Francisco's Venture in Railroad Construction, A. J. Cleary. Ry. Age, vol. 65, no. 24, Dec. 13, 1918, pp. 1047-1050, 8 figs. Account of completion of 68-mile line as facility for Hetch-Hetchy project.

OPERATION AND MANAGEMENT

BRITISH. British Railways Under War Conditions. Engineer, vol. 126, no. 3281, Nov. 15, 1918, pp. 410-412. Early events after outbreak of hostilities. (Ninth article.)

British Railway Engineering and Operation—Some Immediate Problems to Be Faced, John A. F. Aspinall. Ry. News, vol. 110, no. 2862, Nov. 9, 1918, pp. 326-330. Presidential address before Instn. Civil Engrs.

FOREMAN. Mission of Railway General Foreman, Robert Quayle. Ry. Jl. vol. 25,, no. 1, Jan. 1919, pp. 28-29. Possible ways in which foremen can approach their men and develop in them loyalty to organization.

FUEL CONSERVATION. Cooperation in Fuel Conservation, D. R. MacBrain. Official Proc. N. Y. R. R. Club, vol. 29, no. 1 Dec. 1918, pp. 5447-5452. Necessity to secure interest in fuel conservation of every one in a railroad operating organization; influence of general condition of locomotive on fuel economy; time and experience required by an engineer to become master of locomotive engineering; education of firemen.

The Responsibility of General Officers for Fuel Economy, R. J. Pearson. Official Proc. N. Y. R. R. Club, vol. 29, no. 1, Dec. 1918. pp. 5445-5447. Importance of establishing system of supervision which will enable officers to ascertain consumption of fuel.

Address of Mr. Eugene McAuliffe. Official Proc. N. Y. R.R. Club, vol. 29, no. 1, Dec. 1918, pp. 5437-5445. Railway fuel, and railway fuel conservation. Working details of Fuel Conservation Section.

RECLAMATION. Reclamation on Chicago, Milwaukee & St. Paul. Ry. Rev., vol. 63, no. 26, Dec. 28, 1918, pp. 903-905. Adapted from report of special committee (H. S. Sackett, chairman) investigating status of reclamation with view to formation of future policy.

TONNAGE RATING. Train Resistance and Tonnage Rating. Ry. Jl., vol. 25, no. 1, Jan. 1919, pp. 29-31. Reports received by Committee of Master Mechanics' Convention from 25 roads, dealing with experience, tests conducted, regulations adopted and methods of supervision.

PERMANENT WAY AND BUILDINGS

BALLASTING. Modern Track Needs Good Ballast, R. C. Cram. Elec. Ry. Jl., vol. 52, no. 25, Dec. 21, 1918, pp. 1080-1085, 14 figs. Why well-ballasted track is economical to maintain; types of construction; properties and materials necessary for ideal ballast; ballast and ballasting from standpoint of best engineering practice.

BASE TRACK. Concrete Base Track Gives Good Results on Northern Pacific Railway. Eng. News-Rec., vol. 81, no. 24, Dec. 12, 1918, pp. 1071-1074, 13 figs. New type of construction four years in actual service; concrete slabs built on gravel roadbed have wood supports for rails; no ballast used; maintenance work not continuous but intermittent.

GRADE CROSSINGS. The Proper Engineering Treatment of Necessary Railroad Grade Crossings. Rodman Wiley. Good Reads, vol. 16, no. 26, Dec. 21, 1918, pp. 241-243. Claims no engineering advice has dictated present policy of establishing crossings in railroads. Paper before Am. Assn. of State Highway Officials, Chicago.

STRESSES IN TRACK. Stresses in Permanent Way. Ry. Engr., vol. 39, nos. 464, 465 and 466, Sept., Oct. and Nov. 1918, pp. 179-181, 191-194 and 211-213, 13 figs. Report of joint committee of Am. Soc. Civil Engrs. and Am. Ry. Eng., Assn., appointed to investigate stresses in railway track.

TIES. A New Concrete Railroad Tie. Mun. & County Eng., vol. 55, no. 6, Dec. 1918, pp. 212-213, 3 figs. Details of tie satisfactorily used for several years on municipal railroad of San Francisco, Cal.

Service Tests of Cross-Tie, P. R. Hicks. Bul. Am. Ry. Eng. Assn., vol. 20, no. 210, Oct. 1918, pp. 21-71. Tables comprising 350 service test records on 28 different species of ties, including 30 completed records submitted by 22 railroads.

Resilient Chairs and Reinforced Concrete Ties for Railway Track. Contract Rec., vol. 32, no. 47, Nov. 20, 1918, pp. 921-922, 2 figs. Details of sleeper said to have given satisfactory service on East Indian Ry.

TRACK IMPROVEMENT. Making the Old Track Last a Little Longer, P. Ney Wilson, Elec. Ry. Jl., vol. 52, no. 24, Dec. 14, 1918, pp. 1053-1054, 5 figs. What Connecticut Co. did to extend life of stretch of track in New Haven, with particular reference to arc welding.

See also CIVIL ENGINEER, Bridges (Railway Bridges).

RAILS

TRANSVERSE FISSURES. Transverse Fissures Cause Rail Failures, Ry. Age, vol. 65, no. 23, Dec. 6, 1918, pp. 1007-1009. Suggests that rails are being stressed beyond service limit. (From report by W. P. Borland, chief of Bureau of Safety of Interstate Commerce Commission of an investigation made by James E. Howard, engineer-physicist of Commission.) Also Ry. Rev., vol. 63, no. 24, Dec. 14, 1918, pp. 843-847, 11 figs.

Reheating as Cure for Rail Fissure, G. F. Comstock. Iron Trade Rev., vol. 63, no. 26, Dec. 26, 1918, pp. 1457-1462, 17 figs. Metallographic investigations of transverse fissures, using a special etching reagent; results apparently support theory that transverse failures are due to defect in steel and that reheating of blooms will diffuse bands of phosphorus. From paper to be presented at Feb. meeting of Am. Inst. Min Engrs.

ROLLING STOCK

CLEANING. Rotary Brushes for Cleaning Cars, C. H. Shaffer. Ry. Jl., vol. 25, no. 1, Jan. 1919, pp. 26-27, 2 figs. Brush operated at about 900 r.p.m. through special flexible shaft used in conjunction with air drill.

REFRIGERATOR CAR, STANDARD. Government Standard Refrigerator Car, Ry. Rev., vol. 63, no. 25, Dec. 21, 1918, pp. 865-868, 5 figs. Data and further description of Government's new design. Detail drawings. Also Ry. Mech. Eng., vol. 92, no. 12, Dec. 1918, pp. 633-668, 6 figs. and Ry. Age, vol. 65, no. 25, Dec. 20, 1918, pp. 1115-1117.

WELDED FREIGHT CAR. Electrically Welded Gondola Car. Ry. Rev., vol. 63, no. 24, Dec. 14, 1918, pp. 833-835, 5 figs. Car constructed for C., B. & Q. R.R. pioneer attempt at fabricating steel freight-car structure by process of electric welding. Also Gen. Elec. Rev., vol. 21, no. 12, Dec. 1918, pp. 913-915, 8 figs.

SAFETY AND SIGNALING SYSTEMS

ACCIDENT PREVENTION. The Conservation of Man-Power, H. A. Adams. Proc. Pacific Ry. Club, vol. 2, no. 8, Nov. 1918, pp. 7-11. Brief record of work done by Government, Congress and private agencies to prevent accidents in railroad operation, including present endeavors of U. S. Railroad Administration.

SHOPS

A. E. F. REPAIR SHOPS. Railroad Repair Shops in France Equipped and Operated by American Forces, Robert K. Tomlin, Jr. Eng. News-Rec., vol. 81, no. 26, Dec. 26, 1918, pp. 1178-1182, 6 figs. Features of shops; individual electric drive for all machine tools.

ROUNDHOUSE DESIGN. Locomotive Round-House at San Bernardo, Chile (La maestranza de San Bernardo, Chile), C. V. Cruchaga. Boletin de la Societdad de Fomento Fabril, year 35, no. 9, Sept. 1918, pp. 609-614. Details of American design built of concrete and is said to be largest of its kind in the world.

ROUNDHOUSE METHODS. Mileage of Engines—Its Relation to Cost of Shop and Running Repairs, George H. Logan. Ry. Jl., vol. 25, no. 1, Jan. 1919, pp. 24-26. Remarks on shop practice based on experiences in roundhouses.

Accuracy in Locomotive Repairs, M. H. Williams. Ry. Mech. Eng., vol. 92, no. 12, Dec. 1918, pp. 673-677, 8 figs. Methods of making and of fitting new and repair parts for locomotives with gages and micrometers.

TOOLS, BRASS-WORKING. Brass-Working Tools in a Railroad Shop, Frank A. Stanley. Am. Mach., vol. 49, no. 23, Dec. 12, 1918, pp. 1081-1084, 8 figs. Describes tools for making blow-off valves and their fittings.

WELDING. Arc Welding in Railroad Shops, B. C. Tracy. Gen. Elec. Rev., vol. 21, no. 12, Dec. 1918, pp. 887-898, 20 figs. Based on its success in locomotive repair work, writer believes arc welding must be given serious consideration by railroads, not only from an economic viewpoint, but also to increase transportation facilities.

TERMINALS

South Boston. New Haven Improvements at South Boston Terminal. Ry. Age. vol. 65, no. 26, Dec. 27, 1918, pp. 1149-1152, 7 figs. Involve construction of two additional tracks and depressing old line. All done under heavy traffic.

MUNITIONS AND MILITARY ENGINEERING

Ambulance Trains. Ambulance Train of the American Army (Train-Ambulance de l'armée américaine). Génie Civil, vol. 73, no. 18, Nov. 2, 1918, pp. 341-343, 15 figs. Disposition and arrangement of coaches (built in England) for transportation of wounded soldiers.

Automobile Transport. Organization of the French Army Automobile Service, W. F. Bradley. Automotive Indus., vol. 39, no. 26, Dec. 26, 1918, pp. 1093-1095. How repairs were handled. Equipment included 90,000 trucks and 150,000 men.

Military Transport Chassis. Part IX. Automobile Engr., vol. 8, no. 121, Dec. 1918, pp. 346-349, 4 figs. Their performance under war conditions. Details of Pierce-Arrow 5-ton model R. 8 truck.

Camp Holabird—Largest Truck Overhaul Depot. Automotive Indus., vol. 39, no. 25, Dec. 19, 1918, pp. 1053-1055, 8 figs. Data on plant with capacity for assembling 30 trucks a day and crating 22 an hour for shipment.

Construction Work. How Construction Met the Issue, R. C. Marshall. Am. Contractor, vol. 39, no. 51, Dec. 21, 1918, pp. 22-25. Accomplishments of construction Division of War Department. Functions, organizations and procedure; "cost-plus and sliding scale fee contract." Address delivered at meeting of Gen. Contractors' Assn.

Gun Erosion. Experts Discuss Big Gun Erosion, Hudson Maxim. Iron Trade Rev., vol. 63, no. 26, Dec. 26, 1918, pp. 1463-1464. Analysis of causes producing erosion and study of possibilities to overcome them, together with recommendations in regard to material and method of lining. Discussion of Henry M. Howe's paper before Am. Inst. Min. Engrs.

Hand Grenades. Making the American Hand Grenade, Edward K. Hammond. Machy., vol. 25, no. 5, Jan. 1919, pp. 448-453, 15 figs. First of two articles on methods of machining and loading bodies and assembling bouchons.

H. E. Shells. Manufacture of High Explosive Shells and Detonators, from the Metallurgist's View Point, C. B. Swander. Proc. Steel Treating Research Soc., vol. 1, no. 11, pp. 9-14, 5 figs. Outline of forging operations on an 8-in. American carbon-steel high-explosive shell; machining; nosing operation; heat treating; copper banding; placing detonator; British, French and Russian detonators.

Howitzers. How the 155-Mm. Howitzer Is Made, J. V. Hunter. Am. Mach., vol. 49, no. 25, Dec. 19, 1918, pp. 1123-1129, 28 figs. Third article.

Illuminating Shells. Rockets and Illuminating Shells as Used in the Present War, A. Bergman. Illum. Engr., vol. 11, no. 8, Aug. 1918, pp. 189-191. Composition and data on candlepower developed. From paper before Illum. Eng. Soc.

Military Roads. Some Phases of Military Road Work, Gordon F. Daggett. Wis. Engr., vol. 23, no. 3, Dec. 1918, pp. 79-88. Trend of construction during last two years. Difficulties encountered, organizations required and materials availabe in work undertaken at the front. Requirements of wearing surface for military purposes.

Railway Artillery. Railway Artillery, James B. Dillard. Jl. Am. Soc. Mech. Engrs., vol. 41, no. 1, Jan. 1919, pp. 44-49, 5 figs. Development of models; types of cannon used; problems of design: barbette motar carriages; foreign types; American types; auxiliary cars; tactical uses; value and economy of seacoast defence.

Long-Range Heavy Navy Guns with Railway Mount, D. C. Buell. Jl. Am. Soc. Mech. Engrs., vol. 41, no. 1, Jan. 1919, pp. 25-27, 5 figs. Work done in completing mobile battery of naval 11-in. 50-caliber guns originally built for use in battle cruisers.

The War Department Railway Artillery. Ry. Age. vol. 65, no. 25, Dec. 20, 1918, pp. 1113-1114, 5 figs. Brief descriptions of 8-in., 12-in. anh 14-in. railway mounts.

Semi-Steel Shells. How Semi-steel Shells Are Machined. Iron Trade Rev., vol. 63, no. 22, Nov. 28, 1918, pp. 1236-1237, 17 figs. From circular of Ordnance Department recommending standard practice for manufacture of this class of projectile.

Tanks. The Mark VIII Land Cruiser, J. Edward Schipper. Automotive Indus., vol. 40, no. 1, Jan. 2, 1919, pp. 6-9, 11 figs. Technical description of large-sized battle tank developed during latter period of war; equipped with an adaptation of Liberty aircraft engine and weighs 40 tons. Also Motor Age, vol. 35, no. 1, Jan. 2, 1919, pp. 18-21, 9 figs. Mechanical features of huge model that carries 11 men.

Tools for Shell Manufacture. Special Tools and Appliances for Shell Manufacture, George A. Neubauer and Erik Oberg. Machy., vol. 25, no. 5, Jan. 1919, pp. 416-421, 7 figs. Describes number of devices used by Buffalo Pitts Co. in making 4.7 high-explosive shells. (First article.)

Tools for Boring a Closed-Bottom Shell, M. H. Potter. Machy., vol. 25, no. 5, Jan. 1919, pp. 427-428, 6 figs. Types of blades used in boring heads and methods of grinding and setting blades.

See also MECHANICAL ENGINEERING, Foundries (War Demands) Forging (Gun Forgings).

GENERAL SCIENCE

CHEMISTRY

Analysis. Quantitative Analysis of Metals by Electrolytic Deposit Without Using External Source of Electrical Energy (Sur un procédé de dosage des métaux par dépôt électrolytique sans emploi d'une énergie électrique étrangère), Maurcie François. Comptes rendus des séances de l'Académie des Sciences, vol. 167, no. 20, Nov. 11, 1918, pp. 725-727. From a conductor resting on borders of platinum crucible containing sulphuric acid or similar reagent and salt to be analyzed a zinc or aluminum hook is suspended. Electrolytic action deposits metal in salt at bottom of crucible.

Method of Chromic Oxide Determination, W. C. Kiddell and Esther Kitredge. Chem. Engr., vol. 26, no. 12, Nov. 1918, pp. 457-458. Government chemists claim new method permits rapid handling of ore samples submitted for analysis. (To be concluded.)

Catalytic Exerthermic Gas Reactions. Starting and Stability Phenomena of Ammonia Oxidation and Similar Reactions, F. G. Liljenroth. Gen. Elec. Rev., vol. 21, no. 11, Nov. 1918, pp. 807-815, 7 figs. Explains fundamental characteristics of catalytic exothermic gas reactions.

Methane. Methane, William Matisoff and Gustav Egloff. Jl. Phys. Chem., vol. 22, no. 8, Nov. 1918, pp. 529-575. Formulation of results of research up to date and their classification along physical (constants, specific properties, gas properties, industrial application) and chemical (combustion, explosion, solubility, occlusion, industrial reactions) characteristics; notes on possibilities of research on methane both theoretical and practical.

Occluded Gases in Glass. Gases and Vapors from Glass, R. G. Sherwood. Phys. Rev., vol. 12, no. 6, Dec. 1918, pp. 448-458, 8 figs. Author finds that under the influence of heat there are two distinct kinds of gaseous evolution products, namely, one associated with absorption—readily removable at 200 deg. cent., and other resulting from formation of new chemical equilibria. Also Jl. Am. Chem. Soc., vol. 40, no. 11, Nov. 1918, pp. 1645-1653, 9 figs.

Rare Earths. Observances on the Rare Earths (VIII). The Separation of Yttrium from Erbium: Edward Wichers, B. S. Hopkins and C. W. Balke. Jl. Am. Chem. Soc., vol. 40, no. 11, Nov. 1918, pp. 1615-1619. Comparison between cobalticyanide and nitrite precipitation methods; preparation of erbium material by nitrate fusion method; determination of ratio of erbium oxide to erbium chloride in seven analyses.

Structure of Matter. The Atomic Structure of Carborundum Determined by X-Rays, C. L. Burdick and E. A. Owen. Jl. Am. Chem. Soc. vol. 40, no. 12, Dec. 1918, pp. 1749-1759, 4 figs. Measurements of angles of reflection of palladium X-rays from principal planes of crystal of carborundum and interpretation of measurements of intensities of reflection of different orders. Writers conclude elementary tetrahedron of carborundum differs from that of diamond only in a slight shortening of vertical axis and slight difference in displacement of carbon atoms from centers of tetrahedron.

MATHEMATICS

Elliptic Functions. On the Coefficients in the Expansions of Certain Modular Functions, G. H. Hardy and S. Ramanujan. Proc. Roy. Soc., vol. 95, no. A667, Nov. 7, 1918, pp. 141-155, 2 figs.

Equations. On the Characteristics of Partial Derivative Equations of Second Order (Sur les caractéristiques des équations aux dérivées partielles du second ordre) E. Gau. Comptes rendus des séances de l'Académie des Sciences, vol. 167, no. 19, Nov. 4, 1918, pp. 675-678. Invariant for characteristics of system by two quadratures.

Systems of Coordinates, G. H. Light, G. H. Light. Univ. of Colo. Jl. Eng., vol. 15, no. 1, Oct. 1918, pp. 23-27, 4 figs. Intrinsic equation of catenary and cycloid in system defined by length of arc and radius of curvature.

Heaviside Development Theory. Generalization of Heaviside Development Theorem (Généralisation du théorème du développement de Heaviside), Abraham Press. Revue Générale de l'Electricité, vol. 4, no. 19, Nov. 9, 1918, pp. 691-693. States that Carson (Phys. Rev. Sept. 1917, pp. 217-225) does not quite generalize theorem in question because the applied forces he considers have the exponential form; writer accordingly takes up case of any forced vibration by discussing general differential equation with constant cofficients.

Rectification of Arc. Notes on a Geometrical Construction for Rectifying Any Arc of a Circle, F. A. Lindemann. Lond., Edinburg & Dublin Phil. Mag., vol. 36, no. 216, Dec. 1918, pp. 472-474, 1 fig. Process involving successive bisections and based on rapidly converging trigonometric series.

Single-Sided Surfaces. A Surface Having Only a Single Side, Carl Hering. Jl. Franklin Inst., vol. 186, no. 5, Nov. 1918, pp. 627-630, 4 figs. Further variations and minor corrections in study of surface generated by line moving along circle, always remaining in planes passing through axis of circle and simultaneously revolving around circle as axis at half angular rate of its movement along circle. Addendum to article in Aug. issue.

PHYSICS

Calorimeters. Calorimetric Lag, Walter P. White. Jl. Am. Chem. Soc., vol. 40, no. 12, Dec. 1918, pp. 1858-1872. Mathematical treatment of elimination of three lag effects of bodies external to calorimeters: (1) change in heat capacity of calorimeter, (2) thermal leakage, (3) loss dependent on jacket temperature.

The Conditions of Calorimetric Precision, Walter P. White. Jl. Am. Chem. Soc., vol. 40, no. 12, Dec. 1918, pp. 1872-1886. Expressing leakage effect as a function of time, thermal head for experimental period and leakage modulus of calorimeter, the effects of diminishing each of these on the values of other two are analyzed and rules for calorimetric precision are derived.

Crystals. Experimental Study on the Growth of Crystals (Etude expérimentale sur le dévelopement des cristaux), René Marcelin. Annales de Physique, vol. 10. Sept.-Oct. 1918, pp. 185-188. Report of observations on paratoluidine. It appeared that these crystals grew not in depth but in surface by successive alluvions.

Formation and Optical Study of Sodium Chromate Crystals Having Four Water Molecules (Mode d'obtention et étude optique des critaux de chromate de soude à 4 molécules d'eau), Lucien Delhaye. Bulletin de la Société Française de Minéralogie, vol. 41, nos. 4-5-6, Apr.-June 1918, pp. 80-93, 4 figs. Experimental research; Variation of three principal indices in terms of wave length; variation of apparent and true angles in turns of wave length; variation of position of bisectors in crystal in terms of wave length.

Crystalloluminescence. Crystalloluminescence (11), Harry B. Weiser. Jl. Phys. Chem., vol. 22, no. 8, Nov. 1918, pp. 576-595, 1 fig. Survey of theories advanced by various investigators concerning nature of triboluminescence (property of many crystalline substances which emit phosphorescent light when rubbed or crushed); theory that it is the result of chemical action and is identical with crystalloluminescence so far as chemical reaction is concerned, differing only between themselves in physical process employed to bring about reaction; experiments with arsenic trioxide and with potassium sulphite.

Curie and Haüy Laws. Note on Curie and Haüy Laws (Sur les lois de Curie et de Haüy), C. Viola. Bulletin de la Société Française de Minéralogie, vol. 41, nos. 4-5-6, Apr.-June 1918, pp. 103-116. Demonstrates inter-connection of the two laws, Haüy's being developed analytically from Curie's differential fundamentals.

Curie Point in Iron. Curie's Point in Pure Iron and Ferrosilicon Alloys (Le point de Curie dans le fer pur et les ferro-silliciums), A. Sanfourche. Comptes rendus des séances de l'Académie des Sciences, vol. 167, no. 19, Nov. 4, 1918, pp. 683-685. Experimental measurements of termal manifestation at Curie's point. Alloys experimented contained from 0.5 to 2.5 per cent sillicon.

Density of Gases, Determination. An Accurate Method for Measuring the Density of Gases, O. Maas and J. Russell. Jl. Am. Chem. Soc., vol. 40 no. 12, Dec. 1918, pp. 1847-1852, 1 fig. Applicable to gases which can be condensed by liquid air or some other freezing agent. Known volume at known pressure and temperature is liquefied in bulb attached to containing vessel; bulb is then sealed off and gas weighed at room temperature.

Double-Suspension Mirror. The Double Suspension Mirror, L. Southerns. Lond., Edinburgh and Dublin Phil. Mag., vol. 36, no. 216, Dec. 1918, pp. 477-486, 8 figs. Theory of a method of observing deflections in a delicate balance; method a modification of "double suspension mirror."

Drops. Sounds Produced by Drops Falling on Water, A. Mallock. Prlc. Roy. Soc., vol. 95, no. A667, Nov. 7, 1918, pp. 138-143, 6 figs. Theoretical determination of shape of cavity a falling sphere must make when it penetrates a fluid; experimental confirmation by instantaneous shadow photographs of falling shot.

Electromagnetic Vectors. The Electromagnetic Vectors, H. Bateman. Phys. Rev., vol. 12, no. 6, Dec. 1918, pp. 459-481. Geometrical study of an electromagnetic field in relation to a moving observer and location of vectors with aid of two cones which at each point limit directions of forces acting on electric and magnetic charges moving with velocities less than that of light; expression of electromagnetic laws in terms of forces on unit electric and magnetic charges in motion and deductions relating to lines of force, derived from Hargreaves' theorems for space-time integrals; discussion of energy in electromagnetic field; development of theory in regard to amount of concealed euergy in filed of moving electron.

Explosion, Effects of. On the Rupture of Mirrors and Window-Panes by Explosions (Sur la rupture des glaces et des vitres par les explosions). P. Gaubert. Bulletin de la Société Française de Minéralogie, vol. 41, nos. 4-5-6, Apr.-June 1918, pp. 65-67. Explanation for shapes commonly presented by pieces into which a large plate breaks as result of explosion.

Fluorescence. The Physical Characteristics of X-Ray Fluorescent Intensifying Screens, Millard B. Hodgson. Phys. Rev., vol. 12, no. 6, Dec. 1918, pp. 431-435, 2 figs. Fluorescence of various materials discussed from point of view of photographic efficiency; qualitative determination of spectral distribution of fluorescence from calcium tungstate; photographic efficiency of characteristic radiation from silver, tungsten, platinum and lead.

Fluorescence (La Fluorescence), Jean Perrin. Annals de Physique, vol. 10, Sept.-Oct. 1918, pp. 133-159. Destruction of fluorescent bodies by emission of fluorescence; influence of temperature on intensity of emission; molecular and atomic fluorescence; limiting power; fluorescence of concentrated solution; fragility of fluorescent molecules.

Gravitation. On a Peculiarity of the Normal Component of the Attraction Due to Certain Surface Distributions, Ganesh Prasad. Lond., Edinburgh and Dublin Phil. Mag., vol. 36, no. 216, Dec. 1918, pp. 475-476. Cases in which component N of Newtonian attraction at point P along normal through P meeting surface at O tends to no limit as P approaches O along normal.

Impact. The Photographic Study of Impact at Minimal Velocities, C. V. Roman. Phys. Rev., vol. 12, no. 6, Dec. 1918, pp. 442-447, 6 figs. Graphs showing relation between coefficient of restitution and velocity of impact for polished spheres of equal radius of brass, aluminum, hard bronze, whie marble, and lead.

Inflammability of Gaseous Mixtures. The Inflammation of Mixtures of Methane and Air in a Closed Vessel, Richard Vernon Wheeler. Jl. Chem. Soc., vols. 113 and 114, no. 673, Nov. 1919, pp. 840-859, 7 figs. Results of experiments in spherical vessels. Giving data on maximum pressures developed, rates of development of pressure, and speeds of propagation of flame.

Ionization. Ionization of Mercury, Sodium and Potassium Vapors and the Production of Low Voltage Arcs in These Vapors, T. C. Hebb. Phys. Rev., vol. 12, no. 6, Dec. 1918, pp. 482-490, 2 figs. Concludes from experiments that: Potassium vapor can be ionized at 1.6 volts; sodium vapor at 2.5 volts; D lines of sodium can be excited at less than 1.0 volt; sodium and potassium arcs in mercury vapor can operate below their resonance potentials and as low as 1.4 for sodium and 0.5 volts for potassium; mercury spectrum can be produced at 0.5 volt in atmosphere of mercury and potassium.

Latent Heat of Fusion. Latent Heat of Fusion as the Energy of Molecular Rotations, Kôtarô Honda. Phys. Rev., vol. 12, no. 6, Dec. 1918, pp. 425-430. Tables and calculations, based on Landolt and Bornstein's values, which lead writer to assert that latent heat of fusion consists of energy of rotation of molecules gained during fusion.

Light Emission. On the Light Emitted from a Random Distribution of Luminous Sources, Lord Rayleigh. Lond., Edinburgh & Dublin Phil. Mag., vol. 36, no. 216, Dec. 1918, pp. 429-449, 3 figs. Mathematical treatment of probable expectation of intensity in any direction. By "expectation" is meant the mean of a large number of independent trials, or combinations, in each of which the phases are redistributed at random. Sonorous vibrations are considered but the results are shown to be applicable to electric vibrations.

Light Polarization. The Light Scattered by Gases: Its Polarization and Intensity, R. J. Strutt. Proc. Roy. Soc., vol. 95, no. A667, Nov. 7, 1918, pp. 155-176, 5 figs. Measurements of intensity of vibrations parallel to existing beam of light scattered at right angles by gases and vapors; particular study of behavior of helium; evaluation of intensity of scattering by different gases in terms of refractivity; photographs of polarizations of ether, vapor and nitrous oxide.

Liquid Films. The Stratification of Liquid Films. (La stratification des lames liquides), Jean Perrin. Annales de Physique, vol. 10, Sept.-Oct. 1918, pp. 160-184. Result of Johonnott's microscopical examination of soap bubbles; superficial tension of soap solutions; law of multiple thicknesses; chemical separation by simple extension of free surfaces.

Pitched Baseball. A Pitched Baseball, Willard W. Griffin. Sci. Am. Supp., vol. 87, no. 2244, Jan. 4, 1919, pp. 12-14, 3 figs. Mechanical analysis of a "floater" and other curved ball paths.

Radioactivity. The Problem of Radioactive Lead, Theodore W. Richards. Science, vol. 49, no. 1253, Jan. 3, 1919, pp. 1-11. Account of experimental researches; hypothesis concerning disintegration of uranium; hypothetical calculation of atomic weight of uranium-lead; solubility of two kinds of lead nitrate; comparison of properties of different kinds of lead. Presidential address before Am. Assn. for Advancement of Science.

Sound, Standard of. A Possible Standard of Sound, Chas. T. Knipp. Phys. Rev., vol. 12, no. 6, Dec. 1918, pp. 491-492, 1 fig. Adjustment of mercury vapor trap of pyrex glass to furnish sound of desired pitch. From paper presented at meeting of Am. Phys. Soc.

Specific Heat. Specific Heat Determination at Higher Temperatures, Walter P. White. Am. Jl. Sci., vol. 47, no. 277, Jan. 1919, pp. 44-59, 4 figs. Experimental technique at temperatures up to 1400 deg. cent. by method of mixtures; modifications in furnaces and in methods of transferring to calorimeter; variability of heat losses attending dropping of hot bodies into water; use of aneroid calorimeters.

Silicate Specific Heats, Walter P. White. Am. Jl. Sci., vol. 47, no. 277, Jan. 1919, pp. 1-43, 4 figs. Experimental determination for temperatures from 100 to 1400 deg. cent. by dropping from furnaces into calorimeters; checks and precautions employed; two methods for determining true or atomic heats from interval heats. Paper extends scope of writer's previous communications.

The Specific Heat of Platinum at High Temperatures, Walter P. White. Phys. Rev., vol. 12, no. 6, Dec. 1918, pp. 436-441. Redetermination of specific heat from 100 to 1300 deg. cent. with precision of 0.3 per mile. Results agree with those of Gaede, Plato, Corbino, Magnus and Fabaro.

Spectra. The Origin of Spectra, J. C. McLennan. Proc. Phys. Soc. Lond., vol. 31, no. 176, Dec. 15, 1918, pp. 1-29, 14 figs. Outline of investigations undertaken since Frank and Hertz' measurements of mercury-vapor ionization potential and further experimental researches including also vapors of zinc, cadmium and magnesium. Ultraviolet region investigated with a fluorite spectograph and extreme ultraviolet region with a vacuum grating spectrograph. General discussion of results obtained by writer and other investigators.

On the Ultraviolet Spectra of Magnesium and Selenium, J. C. McLennan. Lond., Edinburgh & Dublin Phil. Mag., vol. 36, no. 216, Dec. 1918, pp. 450-460, 2 figs.

On Fundamental Frequencies in the Spectra of Various Elements, J. C. McLennan. Lond., Edinburgh & Dublin Phil. Mag., vol. 36, no. 216, Dec. 1918, pp. 461-471, 7 figs. Extensive experimental research with photographic records. It is concluded that when zinc and cadmium vapors respectively are bombarded by electrons whose kinetic energy is gradually increased, monochromatic radiation is suddenly emitted by vapor when impact voltage reaches certain value, beyond which no additional relation is produced.

Welsbach Mantle. A Physical Study of the Welsbach Mantle, Herbert E. Ives, E. F. Kingsbury and E. Karrer. Jl. Franklin Inst., vol. 186, no. 5, Nov. 1918, pp. 585-625, 21 figs. Extension of Ruben's work on thoria-ceria mixtures to large family of such combinations; from investigation of conditions under which visible absorption bands of ceria and other materials appear and disappear, an explanation is offered of different behavior of mantle in flame and cathode-discharge heating; attempt to fix possible attainable efficiencies of gas-light production by present methods (Concluded from p. 438, Oct. 1918.)

REPORT OF THIRTY-THIRD ANNUAL MEETING

The Annual General Meeting and a General Professional Meeting were held at Ottawa, February 11th, 12th and 13th at the Chateau Laurier.

Morning Session, February 11th.

The meeting was called to order at ten o'clock a.m. President H. H. Vaughan in the chair.

The Secretary read the minutes of the regular Annual Meeting held in Montreal on January 28th, which adjourned to meet in Ottawa this date, as follows:

Minutes of the Thirty-Third Annual Meeting of *The Engineering Institute of Canada*, held at 176 Mansfield Street, on Tuesday, January 28th.

The meeting was called to order at 10.30 a.m. by President H. H. Vaughan.

Reading of Minutes: The President announced that the first order of business was the reading of the minutes of the last Annual Meeting. On motion by J. A. Burnett, seconded by O. Lefebvre and carried, the minutes of the last Annual Meeting were taken as read.

Appointment of Auditors: It was moved by W. F. Tye, seconded by J. M. R. Fairbairn, that Messrs. Riddell, Stead, Graham & Hutchison be appointed auditors. Carried.

Appointment of Scrutineers: It was explained by the President that it has been the custom for the auditors to count the ballot and report to the scrutineers appointed at the meeting, who in turn report back to the meeting. It was moved by S. F. Rutherford and seconded by L. G. Papineau, that Messrs. Chace Thomson and O. Lefebvre act as scrutineers. Carried.

Adjournment: The President stated that there was no other business on the agenda. It was moved by A. W. Robinson, seconded by P. B. Motley, and carried, that this Annual Meeting be adjourned to meet in Ottawa on February 11th at 10.30 a.m.

The President declared the meeting adjourned and thanked the members for their attendance.

Report of Council for 1918

The Secretary read the first portion of the Report of Council for the year 1918, as set out on pages fifty-nine and sixty of *The Journal of The Institute*, issue of February 1919.

It was moved by Geo. A. Mountain, seconded by W. F. Tye, that the balance of the report be taken as read, and that the report be adopted. Carried.

Report of Finance Committee

In the absence of R. A. Ross, Chairman of Finance Committee, the Secretary read the report as appearing on page sixty-nine of the February issue of *The Journal of The Institute*. Lieut.-Col. R. W. Leonard moved the adoption of the report, seconded by A. W. Robinson. In speaking on the motion Mr. Robinson congratulated *The Institute* and the Secretary for being able to show that *The Journal* is self sustaining. By expanding its usefulness it will be a potent factor in the success of *The Institute*. He called for support for *The Journal* to make it an efficient medium of discussion and a means for the publication of timely articles contributed by the members. President Vaughan in confirming the statement that *The Journal* was now self sustaining, felt that the members should know of the difficulty experienced in obtaining the consent of the postal authorities to grant statutory privileges to *The Journal*. It had been necessary to pay full postage, resulting in an expenditure of eight or nine hundred dollars more than would have been necessary. Opposition from existing technical papers he was convinced, was the cause of this. It had put us to a lot of trouble and inconvience. Continuing, he said, " We are receiving good support from the business firms and every member should realize that the more support he gives *The Journal* the stronger it will be. We want *The Journal* to be something like the Journal of the American Society of Mechanical Engineers, which is an index of the Manufacturing concerns in United States. Incidentally, advertising is not a good thing for a Journal of this kind if the people do not use it as an index. Once we get above a certain point—and we can bring it above that point if we try—we will have a Journal that will really be an index to the manufacturing concerns in the country and then our *Journal* will be on the safe side.

In response to a question by Mr. Mountain, regarding reduced postage on the transactions, the Secretary stated that this privilege had been discontinued years ago and would not be renewed. He referred to a report of the special meeting of the Executive Committee which had been ratified by Council and published in the February *Journal*. It is intended that in addition to publishing *The Journal*, proceedings will be issued each year and to overtake those not issued in 1918 steps have been taken to have them printed and issued to the members in two volumns, one dealing with the Quebec Bridge and the other containing the general papers of *The Institute*. Transactions will be issued as in the past.

Mr. Francis: " May I take the liberty of suggesting to the meeting that *The Institute* is probably in a much better financial condition than the report itself would indicate. I understand that later reference will be made to that great and glorious number of members of *The Institute* who are in Service; the point I wish to make at the moment is that while over one-third of our men are in military service and our exchequer is short to that extent because of their being relieved of the payment of dues, the Finance Committee has been able to produce a report on which I firmly believe that *The Institute* is to be soundly congratulated. We have been going ahead under the greatest sort of handicap, yet we have a very respectable financial report, and in addition to that we have a going *Journal*."

The motion for the adoption of the report was duly carried.

Report of the Library and House Committee

It was moved by Geo. A. Mountain, seconded by Arthur Surveyer that the report of the Library and House Committee set out on page sixty-five of the February issue of *The Journal* be taken as read and adopted. Carried.

Report of Papers Committee

Walter J. Francis, Chairman of the Papers Committee read the report as follows:

The Papers Committee for the year 1918-1919, the first to be appointed under the new by-laws, duly commenced its work of advising and assisting the Branches in obtaining papers and in co-operating for the General Professional Meetings of *The Institute*. The personnel of the Committee consists of the Chairman of each of the Branches of *The Institute*. The number of members is limited to ten by the by-laws. The new Branches formed during the year have had representation on the Committee, each Chairman being invited to co-operate. A recommendation has been made to amend the by-laws so as to fix the personnel of the Committee as one for each Branch, and eliminate the number ten now given in the by-laws. In Montreal the conditions have changed during the year as a result of the formation of the Montreal Branch, and the Papers Committee has exercised itself by co-operating with the Montreal Branch until it was in a position to carry out its own programme independently of the old headquarters arrangements.

It has been difficult to procure a large number of meritorious papers during the year owing to the continuation of war conditions, nevertheless, the Committee has been most fortunate in securing many very worthy papers, some of which have already been read or have been definitely arranged for. Apart from the Quebec Bridge series which has been continued from last year, and to which reference is made in the succeeding paragraph, the following papers are worthy of special reference:— " Frazil Ice," by R. M. Wilson, M.E.I.C., a paper containing much research work of great interest to hydro-electric power engineers as well as to the profession generally; " Reinforced Concrete Covered Reservoirs," by R. deL. French, M.E.I.C., probably the most complete paper on this new branch of engineering art which has yet been written; "A Description of the Reinforced Concrete Viaducts of the C. P. R., near North Toronto," by B. O. Eriksen, A.M.E.I.C., and S. H. Deubelbeiss, A.M.E.I.C., a brief but very comprehensive and valuable description of a unique and highly advanced type of bridgework; " The Mount Royal Tunnel," by J. L. Busfield, A.M.E.I.C., a most comprehensive description of the complete tunnel under Mount Royal for the C. N. R.; " Kettle Rapids Bridge," by W. Chase Thomson, M.E.I.C., a complete description of an unusual bridge problem; " Nicu Steel," by Lt.-Col. R. W. Leonard, M.E.I.C., the presentation of an entirely new metallurgical product; " Champlain Dry Dock," by U. Valiquet, M.E.I.C., a full description of this new structure; " Fuels," by B. F. Haanel, M.E.I.C., a clear-cut statement of the situation in connection with this important Canadian problem; " Progress in Metallurgy," by Dr. A. Stansfield, Assoc. E.I.C. It would be very much in the interest of *The Institute* if more papers were obtainable from points other than Montreal.

The Quebec Bridge series was continued into the present year and following the papers and addresses already given by Lt.-Col. C. N. Monsarrat, M.E.I.C., George F. Porter, M.E.I.C., and Phelps Johnson, M.E.I.C., an exhaustive paper on the original designs of the bridge was presented by G. H. Duggan, M.E.I.C. The series is being concluded by a complete description of the superstructure under the joint authorship of Phelps Johnson, M.E.I.C., G. H. Duggan, M.E.I.C., and George F. Porter, M.E.I.C.

It is felt that a very great service was rendered to *The Institute* in general by the kindness of St. Lawrence Bridge Company and the interest of George F. Porter, M.E.I.C., in enabling him to visit all the Branches of *The Institute* and deliver illustrated addresses on the bridge. The enthusiasm with which this illustrated lecture was received was very marked and your Committee feels that the Branches probably received more value by way of public recognition through the presentation of this address than by any other single effort. The itinerary was arranged through the Papers Committee.

A marked innovation resulting from the new by-laws was the holding of General Professional Meetings during the year, one at Toronto, one at Saskatoon and one at Halifax. The programme for each of these meetings was thoroughly worked out by the local committees co-operating with the Papers Committee, and in each case was intended to be of special interest to the district.

This report should not close without reference to the publication of *The Journal*, which it is believed is proving of great value to *The Institute* as a whole and to every one of its members. The issuing of *The Journal* has rendered it necessary to revise the old system of publishing advance proofs. Your Committee in completing the work of its period, which, although nominally now at an end, actually continues until the close of the season in May, has found great difficulty in arranging for matter for *The Journal* which comes out only once a month, whereas the meetings of the Branches of *The Institute* and the Professional Meetings are held very much more frequently than once a month. The Committee is co-operating with the Council and the other Committees in an effort to bring about the most advantageous use of *The Journal* and all other available means of communication with the members.

On behalf of the Papers Committee,
WALTER J. FRANCIS,
Chairman.

Montreal, January 21st, 1919.

In moving the adoption of the report, Mr. Francis stated that the list of papers submitted reflected great credit on *The Institute*. The motion was seconded by Arthur Surveyer.

Mr. Vaughan: " You will notice that in *The Journal* we have been printing, as referred to in the annual report, an engineering index containing abstracts from eleven hundred publications. This was obtained largely through the kindness and co-operative spirit of the American Society of Mechanical Engineers. It is of very great value to us and greatly improves *The Journal*. It would be entirely in order for us to pass a vote of thanks to the American Society of Mechanical Engineers for their kindly co-operation and their generosity in permitting us to print this engineering index monthly.

Motion for the adoption of the report carried.

Professor H. E. T. Haultain moved, seconded by O. Lefebvre, that the thanks of this *Institute* be tendered to the American Society of Mechanical Engineers for the kindness, generosity and the co-operative spirit that they have shown in permitting *The Engineering Institute of Canada* to print the Engineering index in their *Journal*. Carried.

Report of Publications Committee

W. F. Tye moved, seconded by Col. Harkom that the report of the Publications Committee as set out on page sixty-six of the February *Journal* be taken as read and adopted.

Carried.

Report of Engineering Standards Committee

The report of the Engineering Standards Committee was presented by Mr. Vaughan as follows:—

The Engineering Standards Committee was organized at the request of the Institution of Civil Engineers transmitted to the members of that Institution resident in Canada, of which, as you probably know, a small committee is in existence acting as an advisory committee to the Council of the Institute of Civil Engineers. The request was also transmitted from the Board of Trade through the Canadian Government. As a result of this request a committee was organized having representation from the members of the Institution of Civil Engineers resident in Canada, *The Engineering Institute*, the Mining Institute, the Honourary Advisory Council, the Manufacturers' Association and the various departments of the Dominion Government. That committee appointed a sub-committee on aeroplane parts and another sub-committee on the standardization of screw threads. The matter having been taken up directly through the British and the American Governments, our action was unnecessary, but the committee on aeroplane parts held several meetings and sent delegates to the meeting of the International Aircraft Standard Board held in London, on which are representatives of France, Italy, United States, Great Britain and Canada, Canada having been honored by recognition as a separate nation on that Board. The Committee of the Canadian Engineering Standards Committee was recognized as the Canadian Committee on aircraft matters. Since that time the Canadian Engineering Standards Committee has been incorporated as the Canadian Engineering Standards Association and its organization has been changed to include these members from the Institution of Civil Engineers, three nominations from *The Engineering Institute of Canada*, three from the Mining Institute, three from the Manufacturers' Association, three from McGill, three from Toronto University and three from Laval, with three honourary or advisory members from the departments of the Government. That is the situation to-day. They have applied to the Government for a grant to enable them to carry on their work during the coming year, and while that Association may in some ways be considered as of comparatively little value in Canada, there is quite a prospect as we look into the matter that we shall find an important and useful work to do. This *Institute* is represented on that Committee to-day by G. H. Duggan, Dr. Herdt and H. H. Vaughan. The membership will retire annually and have to be renominated or three members elected from time to time.

Mr. Mountain moved, seconded by Mr. Tye, that the report be received. Carried.

Report of Electro-Technical Committee

Mr. Francis moved, seconded by Mr. Tye, that the report of the Electro-Technical Committee, as printed on page sixty-six of the February *Journal* be taken as read.

Report of Board of Examiners and Education

Mr. Tye moved, seconded by Mr. Kennedy, that the report of the Board of Examiners and Education as set out on page sixty-six of the February *Journal*, be taken as read. Carried.

Board of Examiners—Quebec Act

No report.

Gzowski Medal

The Secretary reported for the Committee on the Gzowski Medal, awarding the medal for the year 1918 to B. F. C. Haanel, member of *The Institute*, for his paper on " Fuels of Canada, " read at the last annual Meeting.

Students Prize

The Secretary announced that heretofore the Students Prize had been awarded by the Gzowski Medal Committee. This year Council requested a Committee of which Professor Mackay of McGill University is the Chairman, to make the award. This Committee finds only one paper of those submitted to be of sufficient merit to award the prize and recommends that for that paper " Scientific Management and Efficiency," by Donald DeC Ross-Ross be awarded the prize.

Plummer Medal

It was announced by the Secretary that the Plummer Medal Committee had been appointed by Council towards the end of the year and had drawn up regulations which had not yet been approved by Council. This Committee desires that the award be made next year on papers presented on a metallurgical subject during 1918 and 1919.

Leonard Medal

Regulations for this medal were drawn up only during the past year and are published in *The Journal.* No award has been made, but it is intended that an award be made in 1919.

Report of Honour Roll Committee

The Secretary read the report of the Honour Roll Committee as follows:

The records of *The Institute* show that nine hundred and sixty of our members have been engaged in active service in connection with the war. It is believed that this will be increased to at least one thousand from the list of the members whose addresses have not been known for several years.

The members known to be engaged in active service represent thirty-six percent of our total membership eligible for military service. The balance of our members were largely engaged in war work in Canada—the manufacture of munitions and other necessary war material. Those not so engaged were contributing to the absolute essentials such as the railroads, municipal works and the engineering and technical departments of the Provincial and Federal Governments.

Of the nine hundred and sixty on the Honour Roll, nine hundred and forty-three are known to be officers. These are:—

Brigadier-Generals	9
Colonels	9
Lieutenant-Colonels	35
Majors	114
Captains	110
Lieutenants	329
Non commissioned officers, etc	377

We have lost of our number, either by being killed in action or having died of wounds, a total of seventy-five.

Within the past three months most of the information regarding decorations given our members has been received, showing that our knowledge at present is limited as to the extent to which our men have been decorated for distinguished services. Even the incomplete information shows that we have reason to be proud of the record they have achieved. Of the known awards there are:—

Victoria Cross	2
K.B.E.	1
C.M.G	9
C.B.	1
D.S.O.	29
M.C.	55
M.M.	2
D.C.M.	2
Croix de Guerre	5
Croix de Légion d'honneur	3
Order of Ste. Anne	1

In addition one of our members Col. C. H. Mitchell, who has been awarded nearly every known decoration has been honoured by the Kings of Belgium and Italy.

History records no more heroic action than that for which one of our Associate Members, Captain Coulson Norman Mitchell, M.C., of Winnipeg, received the Victoria Cross. The bare official citation, giving the account of his heroic triumph is thrilling. It reads:—

" Capt. Coulson Norman Mitchell, M.C., Fourth Battalion, Canadian Engineers, for most conspicious bravery and devotion to duty on the night of October 8th-9th, 1918. At Canal Lescault northeast of Cambrai, he led a small party ahead of the first wave of infantry, in order to examine various bridges on the line of approach, and, if possible, to prevent their demolition. On reaching the canal he found the bridge already blown up. Under a heavy barrage he crossed to the next bridge where he cut a number of lead wires. Then, in total darkness, unaware of the position and strength of the enemy bridgehead, he dashed across the main bridge over the canal bridge. This he found to be heavily charged for demolition. Whilst Capt. Mitchell assisted by his non-com., was cutting the wires, the enemy attempted to rush the bridge in order to blow up the charges, whereupon he at once dashed to the assistance of his sentry who had been wounded. He killed three of the enemy, captured twelve, and maintained the bridgehead until reinforced. Then under a heavy fire he continued the task of cutting the wire, removing charges which he well knew might at any moment have been fired by the enemy. It was entirely due to his valor and decisive action that this important bridge across the canal was saved from destruction."

C. N. Monsarrat,
Fraser S. Keith.

D. B. Dowling, President, Canadian Mining Institute, expressed his keen appreciation of the services which *The Engineering Institute* rendered during the war.

General Specification for Steel Railway Bridges

The Chairman announced that the report of the Committee on Steel Bridges Specifications had been printed in December issue of *The Journal.* It was moved by Geo. A. Mountain and seconded by H. P. Borden, that the report be received and referred to the Council for further action. Carried.

Roads and Pavements Committee

Geo. Hogarth read the report of the Roads and Pavements Committee and moved, seconded by G. H. Bryson that the report be received and referred to Council. Carried.

Steam Boilers Specifications Committee

The Secretary read the report of the Committee on Uniform Boiler Specifications for the Dominion of Canada, consisting of R. J. Durley, W. G. Chace, F. G. Clark, D. N. Robb, Logan Waterous, H. H. Vaughan and L. M. Arkley, Chairman, as follows:

At a meeting of the above committee a sub-committee, consisting of Messrs. F. G. Clark, Chief Engineer, Toronto Power Co.; James Laing, Designing Engineer of the John Inglis Co.; J. O. B. Latour, Chief Engineer, General Accident Assurance Co.; D. M. Metcalf, Chief Boiler Inspector for Ontario, and the writer, were appointed to compare the present Ontario Boiler Rules with those of the Western Provinces and the American Society of Mechanical Engineers, and formulate a set suitable for the whole Dominion.

This sub-committee did a lot of work along the lines suggested, but suspended operations on learning that the Chief Boiler Inspectors for Ontario and the Western Provinces were compiling a similar set of rules. It was felt that by continuing there would be a duplication of effort, and that we might help defeat the object for which the committee was formed.

The Chief Inspectors, together with representatives from Quebec and Nova Scotia, held a conference in Winnipeg last September and the rules formulated are now being put in shape for distribution. They have agreed to furnish your committee with a copy of these for constructive criticism before sending them on to their respective Provincial Legislatures for adoption.

We believe that by co-operating in this way with the Chief Inspectors we can best further the ends for which the committee was appointed, and that in the near future there will be a uniform set of Boiler Rules for the whole Dominion of Canada.

We would, therefore, ask that the committee be continued to carry on the work as outlined above.

Respectfully submitted,
L. M. Arkley,
Chairman.

Reports of Branches

Report of Calgary Branch

The Secretary read the report of the Calgary Branch, which is printed on page seventy-two of the February *Journal*. In the published report the names of the Officers who signed the report were omitted; G. W. Craig, Chairman, and C. M. Arnold, Secretary-Treasurer.

It was moved by the Secretary and seconded by Brigadier-General Sir Alexander Bertram, that the report of the Calgary Branch be adopted. Carried.

Report of the Montreal Branch

Moved by Mr. Francis, seconded by Mr. Surveyer, that the report of the Montreal Branch, as printed on page seventy-three and following pages of the February *Journal* be adopted.

Mr. Vaughan: " I wish to call the attention of the membership to the splendid work that has been done by Mr. Francis and his Committee in the organization of the Montreal Branch this year. As you know it was decided at the last meeting to do away with what we might call Headquarters activity as far as meetings were concerned, this function being carried on by the Montreal Branch, which has set an example that other Branches might follow. You will see from the list of their papers that they have organized civil, electrical, mechanical and industrial sections and they are having papers of interest to every class of engineer. They are holding a meeting practically every week. One week the mechanical section, next week the civil, next week the electrical and the next week the industrial, so that every engineer living in Montreal can become interested in the work of the Branch. The Chairmen of the sections have been appointed and have taken a great interest in working up the papers and the attendance at their respective sections. The attendance at their meetings has been excellent, and I feel that if we are to contine to be successful as *The Engineering Institute of Canada* and to take in all branches of engineers we have to do in each of our large branches just what the men in Montreal Branch have done—that is, develop the section work and get all branches of engineers interested in it. The Montreal Branch has done splendid work this year under very difficult circumstances. They have taken hold of an entirely new proposition, with a large number of members; they have got them organized and held meetings —and this has been done only by an enormous amount of work on the part of the executive. I draw your attention to this not only because *The Institute* owes a debt of gratitude to the officers of the Montreal Branch for the work they have done, but also because what they have done is a model of what might be accomplished in the other large branches of *The Institute.*

Motion for the adoption of the Report carried.

Report of the Quebec Branch

The report of the Quebec Branch was printed on page seventy-six of the February *Journal.*

The President pointed out that in this report of the Quebec Branch attention is drawn to a resolution forwarded by them in December last, to the effect that our profession is not having proper representation on various commissions which have been undertaken in connection with engineering and requesting that the Executive Council bring its influence to bear on the Government for commissions for the apointment of corporate members of *The Engineering Institute* or graduates from recognized engineering universities to fill all engineering positions, thus protecting the public and raising the standing of *The Institute* and the profession. A memorial is now being drawn up requesting the Government to consider the appointment of more engineers on Government positions.

It was moved by Mr. Harkness, seconded by Mr. Dunn, that the report be adopted. Carried.

Report of Hamilton Branch

The Secretary in moving the adoption of the report as published on page seventy-six of *The Journal* of February, stated that it was a very satisfactory report of a new Branch. It was established on July 26th, having held several meetings where important papers were read, the financial statement showing a balance in the bank of seventy-eight dollars and twenty-six cents. The Hamilton Branch has co-operated with the Board of Trade in Hamilton in the matter of public service and has taken an interest in municipal and other matters relating to the general welfare of the public. Such activity deserves special commendation on the part of *The Institute*, the Hamilton Branch having done remarkably for the length of time it has been in existance. Mr. Mountain seconded the motion, stating that he had the pleasure of attending the meeting of the Hamilton Branch the other evening at which there were about one hundred and fifty present. Mr. Vaughan called attention to the fact that the financial statement shows forty-five dollars as having been received by way of fees from affiliates. He wished to direct particular attention to the good work done by the Hamilton Branch in securing affiliates as he had to the Montreal Branch in establishing sections. One of the very large questions before us in trying to carry out our program in building up an engineering society to represent general engineering activities in Canada, is to get every one in who should be interested in the work. There are in Canada, "said Mr. Vaughan," a large number of engineers, who are members of the American Society of Mechanical Engineers, the American Institute of Electrical Engineers, the American Society of Civil Engineers; we cannot expect these men to give up membership in their respective societies. But we can get them interested in our work and bring them into the branches as affiliates, and I am very sure that if our branches carried out the idea of interesting engineers who are residing in their districts in the work of *The Engineering Institute of Canada*, it will not be long before they join us as corporate members and become actively interested in our work.

Motion for the adoption of the report carried.

Report of Victoria Branch

The Secretary read the report of the Victoria Branch, as printed in the February *Journal*, page seventy-seven and moved, seconded by E. Brydone-Jack, that it be adopted. Carried.

Report of Saskatchewan Branch

The Secretary read the report of the Saskatchewan Branch, as printed on page seventy-eight of the February *Journal* and moved, seconded by R. F. Uniacke, that the report be adopted. Carried.

Report of St. John Branch

C. C. Kirby moved the adoption of the report of the St. John Branch, as published on page seventy-nine of the February *Journal*, seconded by Brigadier-General Sir Alexander Bertram. Mr. Kirby drew attention to a new feature in connection with engineering affairs in the Maritime Provinces, resulting from the establishment of Branches at St. John and Halifax, and the holding of a joint Professional Meeting at Halifax. This feature was the interest displayed by the municipalities of St. John and Halifax in our affairs. At the invitation of the Chairman of the St. John Branch the Mayor of St. John and the President of the St. John Board of Trade accompanied the St. John delegation to Halifax and attended the meeting there. We were entertained by the Halifax Commercial Club, and the Halifax Board of Trade arranged a trip around the harbour for us. As a result of that meeting the Mayor of St. John and the President of the Board of Trade have invited *The Institute* to hold the Maritime Professional Meeting this year in St. John. It is very promising indeed for the activities of *The Institute* that such interest should be displayed in our affairs by the municipality.

Motion for the adoption of the report was carried.

Report of Edmonton Branch

The Secretary read the report of the Edmonton Branch as follows:

We beg to submit the 1918 Annual Report of the Edmonton Branch.

The Branch Membership is as follows:—

Members	10
Associate Members	31
Junior Members	7
Student Members	8
	56

Of the above number, 27 are on active service, and the usefulness of the Branch in submission and discussion of engineering papers and problems is much impaired on account of the reduced number of resident members. It is hoped that this condition will improve at an early date, now that the war is over. The Branch lost a very active member through the death of Professor Muir Edwards of the University of Alberta.

Meanwhile the organization has been kept going, and indeed has been quite active with the Calgary Branch in furthering the matter of legislation for engineers. A draft bill was prepared ready for early presentation to the local Legislature, but action has just been postponed largely out of deference to the evident desire of many members of our Branch, and of the Local Branch of the Canadian Mining Institute to proceed along common lines and to the request of the Parent Institute for fuller discussion. The work done to date, and the experience gained thereby, should prove very useful in any general debate.

No papers were read during the season by local members, though the fuel situation in Alberta was discussed at length at a general meeting held on February 27, 1918.

At a general meeting held on May 28th, G. F. Porter gave his lecture on the Quebec Bridge. This was very much appreciated and the Branch wishes to place on record its thanks to Mr. Porter and the St. Lawrence Bridge Company. In all, ten general meetings and twenty executive meetings were held, besides two joint meetings with the Northern Alberta Branch of the Canadian Mining Institute.

The Branch has a cash balance of $29.02 at date, but a special levy which was authorized is not yet fully collected.

The Officers of the Branch previous to date were:—

Chairman, N. M. Thornton; Vice Chairman, J. L. Coté; Secretary-Treasurer, R. J. Gibb.

Executive, A. W. Haddow, A. T. Fraser, D. J. Carter, R. Cunningham.

Owing to the resignation of N. M. Thornton and A. T. Fraser, the following additional officers were elected on February 3rd: R. P. Graves, R. W. Jones, D. Donaldson.

The filling of the chairmanship was left to the Executive.

Yours truly,

J. L. Cote, Vice Chairman.

Robert J. Gibb, Secretary-Treasurer.

Moved by the Secretary, seconded by Mr. Leamy, that the report of the Edmonton Branch be adopted.

Report of Ottawa Branch

G. Gordon Gale retiring Chairman of the Branch read the report of the Ottawa Branch, as follows:—

To the President and Members of
The Engineering Institute of Canada:

Gentlemen:

On behalf of the Managing Committee of the Ottawa Branch, we beg to submit the following report for the calendar year 1918. The precedent of former years has been followed, and a programme of monthly luncheons, addresses and evening papers has been carried out with great success, due to the enthusiastic attendance of members. Under war conditions the strictest economy has been practiced and the Branch is still without permanent quarters.

Membership

We have found it exceedingly difficult to keep in close and constant touch with the Members of *The Institute* residing temporarily in Ottawa. One of the greatest helps in this connection has been the Year Book, issued annually by the Branch, giving the name, occupation, office and house address of every Corporate, Junior and Student Member, and Branch Affiliate. It is hoped that in due time some method will be evolved whereby a more accurate and constant record may be available of the movements of all members of *The Institute*, in order that the privilege of active participation in the activities of the various branches may be enjoyed to the fullest possible extent. The figures for the membership of this Branch for the years 1914, 1915, 1916, 1917 and 1918, are given hereunder:

	1914	1915	1916	1917	1918
Honorary Members	3	1	1	1	1
Members	46	51	60	60	68
Associate Members	113	124	124	113	123
Associates	1	1	1	2	2
Juniors	28	33	36	38	33
Students	16	27	28	25	24
Ottawa Associates	21	17	23	27	28
	228	254	273	266	279

Proceedings

There has been an unusually satisfactory and representative attendance of the members at all of the following regular meetings of the Branch:—

Feb. 7th. H. H. Vaughan, President, E.I.C., Problems Confronting the Society.

Feb. 21st.—F. H. Peters, M.E.I.C. : Ways and Means for Improving and Defining the Status of the Engineer.

Feb. 28th.—J. Blizard, A.M.E.I.C.: Availability of Energy as a Source of Power and Heat.

March 7th.—Hon. F. B. Carvell, K.C., Minister of Public Works : Value of Engineers to the Government and to the Nation.

April 11th.—E. A. Jamieson, A.M.E.I.C. : The Manufacture of Ordnance.

April 25th.—U. Valiquet, M.E.I.C. : Quebec Harbour Dry Dock.

May 18th.—J. B. McRae, M.E.I.C.: Visit to the New Pumphouse, Lemieux Island.

Nov. 15th.—Capt. Baker : Vocational Training.

Nov. 28th.—Jos. Keele, B.A.Sc.: Clay Products in Canada.

Dec. 7th.—Luncheon and Inspection Parliament Buildings.

Library

During 1917, M. F. Cochrane was appointed Librarian, to be responsible for the books and records. There are now about 750 volumes in the library, of which about 100 have been added during the past year. The entire collection has been indexed and classified according to the system devised by the librarians of the United Engineering Society of New York. Special effort is being made to secure an absolute, complete collection of all Government publications issued at Ottawa of interest to the engineering profession. A specially interesting feature of the librarian's efforts during the last year has been the collection of photographs of prominent members of *The Institute* who have resided at Ottawa, especially those who held office either with Council or with the Branch.

Financial

The finances of the Branch are fully set out in the attached statement of assets and liabilities and of revenue and expenditure. The Branch possesses a five hundred dollar Victory Bond, and has a cash balance in the bank of $446.56.

Officers for 1919

The Annual Meeting of the Branch was held on the 9th day of January. The following officers and members of the Managing Committee were elected for the year 1919:—

Chairman, R. deB. Corriveau; Secretary-Treasurer, J. B. Challies; Managing Committee, A. F. Macallum, Col. C. N. Monsarrat, J. Blizard, G. B. Dodge, E. B. Jost.

The Managing Committee of the Ottawa Branch desire to record with appreciation the successful accomplishment of three main achievements of *The Institute* during the past year. First, the change in name; second, the organization of General Professional Meetings; third, the establishment of *The Journal.*

The change of name undoubtedly broadens the scope and field of usefulness of our organization. The General Professional Meetings have afforded the various Branches a long needed opportunity for joint effort under local auspices and to meet particular conditions. *The Journal* going regularly to every member of *The Institute* throughout the world, affords an ideal connection between the members, the Branches and Council. These activities represent a tremendous amount of work, and we respectfully tender the President, the Council, and especially the General Secretary, the congratulations of the Ottawa Branch upon the excellent results already obtained.

G. Gordon Gale, Chairman.
J. B. Challies, Secretary.

Statement of Assets and Liabilities as at December 31st, 1918:—

Assets

Furniture (cost $200)	$ 90.00
Library:	
Book Case (cost $60)	43.20
Bound Magazines (cost $65)	1.00
Books (600) volumes	25.00
Rebates still due from Institute on Account 1918 fees	57.28
Unexpired Insurance	1.00
Stationery and equipment	25.00
Victory Bond	500.00
Cash in Bank	446.56
	$1,189.04

Liabilities

Collections Account Main *Institute* Tobacco Fund	$ 6.00
Printing Account, 1918	25.00
Surplus	1,158.04
	$1,189.04

Revenue and Expenditure for the year ending December 31st, 1918:—

Receipts

Balance on hand Jan. 1st, 1918		$ 587.58
Subscriptions to Tobacco Fund		15.50
Rebates from Main *Institute*, Montreal, Dec. 31st, 1917		48.75
Refund of unexpended balance of amount advanced to H. L. Seymour of Publicity Committee		12.60
Interest on $500 Victory Bond		27.50
Rebates from Main *Institute*, Montreal, January to August 31st, 1918		292.20
Branch Affiliate Fees, A. Anrep, 1918	$2.00	
" " E. Viens, 1918 and 1919	4.00	
		6.00
		$ 990.13

Expenditure

Advertising	$ 8.25
Expenses representative of Branch at Prof. McLeod's funeral	10.00
Wreath for Prof. McLeod's funeral	10.00
Printing F. S. Keith's address (Awakening Recognition of Engineer)	90.15
Insurance on Branch property	4.00
F. S. Keith, balance of subscriptions to Tobacco Fund	30.75
Library sundry expenses	13.77
H. L. Seymour, Publicity Committee	25.00
Stenographic and Clerical Services, Secretary's Office	70.00
Expenses in connection with Branch contribution of exhibit Beavers to Main *Institute* rooms, Montreal	116.00
Postage, Secretary's Office	35.15
Payments to janitors, Carnegie Library and Normal School for attendance at evening meetings	8.00
Printing (Year Book $55.00)	76.10
Sundries (including $14.20 difference between attendance and number guaranteed for luncheon in Daly tea room)	21.40
Advance to Special Committee in connection with meeting of *Institute* to be held in Ottawa in February	25.00
Balance in Bank, Dec. 31st, 1918	446.56
	$ 990.13

It was moved by Mr. Gale, seconded by Mr. Tye, that the report be adopted. In seconding the motion, Mr. Tye commended the Ottawa Branch for their very fine report, showing a large membership and a very satisfactory financial condition. To-day's meeting shows how well the Ottawa Branch is doing. Motion carried.

Report of Toronto Branch

W. S. Harvey, Secretary Treasurer read the report of the Toronto Branch as follows:

To the President and Council:

During the year the Toronto Branch of *The Engineering Institute of Canada* held six regular meetings The list is as follows:—

February 12th.—An address on The Quebec Bridge, by Lt.-Col. C. N. Monsarrat.

March 5th.—Addresses by H. H. Vaughan and Fraser S. Keith, President and Secretary of *The Institute*, respectively. Mr. Vaughan spoke on the wider views of *The Institute*, and Mr. Keith on the status of the engineer in the community.

April 25th.—A meeting to receive and discuss the report of the Committee on Prestige and Influence.

December 3rd.—An address by H. K. Wicksteed on The Montreal Tunnel from an Economic Point of View.

December 10th.—An address by C. H. Rust on The Water Supply of The City of Victoria, B.C.

December 17th.—A meeting to canvas the ballot for the election of officers for 1919.

In addition, the first General Professional Meeting, as provided for in the new by-laws, was held in Toronto on March 26th and 27th, and was devoted to a discussion of the fuel and power situation in Canada.

During its term of office, the Executive held twenty meetings in all.

The Executive regrets to report that owing to the world war and the epidemic of Spanish influenza, the activities of the Branch during the year were adversely influenced. Notwithstanding this, efforts have been made, and with some promise of success, to enlist the co-operation of the Toronto Section of the American Institute of Electrical Engineers, and the Ontario Section of the American Society of Mechanical Engineers to the end that a national and non-sectional Association of Engineers may be built up in this country.

The retiring Executive is gratified to report that the number of comparatively recent applications for membership indicates that new interest in *The Engineering Institute of Canada* has been awakened, as a result of the changes inaugurated a year ago.

In accordance with instructions received at the last Annual Meeting, this Branch, in co-operation with the Ottawa and Hamilton Branches, met the Provincial Secretary for Ontario on December 18th, and discussed with him the modifications in the existing Public Health Act suggested in the report of the Committee on Sewage Disposal for 1917. The Hon. Mr. McPherson received the delegation courteously and promised the sympathetic consideration of himself and his colleagues in respect of the questions contained in the report.

A comparison of the membership of the Branch according to classes for the current year is as follows:—

Members	66
Associate Members	144
Juniors	34
Students	69
Associates	5

During the year, in addition to carrying the unusual expenditures incurred by the General Professional Meeting and paying the house rental for 1917, as well as for 1918, the Executive finds itself with a surplus of $550.96, distributed as follows:—

Victory Loan Bond	$500.00
Cash in Bank	50.96
Total	$550.96

During its term of office the Branch has met all current expenses and leaves the Treasury substantially as it was a year ago.

During the past month the Executive of the new Ontario Provincial Division has been named, and steps have been taken to elect officers at a meeting to be held in Toronto on January 31st, 1919.

The following were elected to office for 1919 by the ballot just received: Chairman, A. H. Harkness; Secretary W. S. Harvey; Committee men, H. G. Acres, Willis Chipman and W. A. Bucke. The members of the Committee elected in 1918 for a two-year term, and, therefore, members of the 1919 Executive are Professor H. E. T. Haultain, J. R. W. Ambrose and R. O. Wynne-Roberts. The retiring Chairman, Professor Gillespie, is also a member of the Executive. Members of Council at Montreal are also members of the Executive of the Toronto Branch.

PETER GILLESPIE,
Chairman.

Toronto, January the 22nd, 1919.

Report of Halifax Branch

The Secretary read the report of the Halifax Branch as follows:—

To the President and Council:—

The chief object of the Halifax branch during that part of the past year in which it has been in existence has been merely to become organized. Under the local conditions which existed, members of the Branch would have been well satisfied with such an accomplishment.

In the first place, the absorption of the former Nova Scotia Society of Engineers extended over a considerable time and involved a large amount of work and attention. In the second place, the enormous disruption of all social and business relations by the Halifax explosion gave local members little opportunity for any interests outside of their immediate personal or business needs.

In the face of all this, the carrying out of the Halifax Professional Meeting is considered a notable achievement. Full accounts of this meeting were given in *The Journal*. So far as the engineering profession in the Maritime Provinces is concerned, such a meeting was unique and represented in a most substantial way, the results of having a local branch of the national society rather than an independent society.

The Halifax Branch was officially organized at a meeting held April 19, 1918. Including the organization meeting, five general meetings were held. As everywhere, regular meetings during the latter part of the year were not possible on account of the Influenza epidemic.

The Branch now has a total enrollment of 66, made up of 23 members, 35 associate members, 6 juniors and 2 branch affiliates. A number of applications are pending and several in immediate prospect.

K. H. SMITH, Branch Secretary.

The Secretary moved the adoption of this report, which was seconded by W. Chase Thomson. President Vaughan pointed out that the formation of the Halifax Branch was more than the mere establishment of a branch, as it involved the absorption of the Nova Scotia Society of Engineers. The latter was an old organization and the willingness of the men in Nova Scotia to give up their local Society and joing forces and interests with *The Engineering Institute* is a notable occurrence of the past year. The motion carried.

Discussion on Branch Reports

Professor Haultain drew attention to the very satisfactory financial condition of all the Branches where the financial condition was given, three of the Branches having over five hundred dollars to their credit. Mr. Robinson stated that one could not fail to be impressed in listening to these reports with the multifarious activities of *The Institute* showing that we are covering a great deal of ground and an immense output of matter of every description. He thought the Publications Committee one of the most important Committees we have as upon that Committee rests the responsibility of all sifting out of the vast array of output and determining what would be retained in our permanent transactions. In the increase of quantity we should not lose sight of quality. He pointed out the importance of *The Journal* in raising the quality of paper at local branches by the author knowing that his paper would get national attention. Mr. Challies stated that at the last annual meeting it was distinctly understood that all Branches should submit a clear financial statement and asked if such had been done. In reply the Secretary stated that there were but two exceptions and these Branches were being asked for same. Mr. Vaughan thought that before closing the subject of Branches it would be well to point out the advances made during the past year in the organization of new branches and the benefit that it is going to be to *The Institute.* Last year four new Branches were established and since the report of the Council has been made up another Branch has been authorized and established at Sault Ste. Marie with several others in immediate contemplation and this is solving the question of getting the membership at large in close touch with the *Institute.* Soon nearly all of the members will be branch members and thus in close touch with Headquarters. He considered that the reports were very satisfactory and that the thanks of *The Institute* as a whole are due to the men who have given so much of their time and done so much hard work—and hard work it is to conduct a Branch properly—during the past year.

At this point Dr. Martin Murphy, one of the early Presidents entered the meeting room and was greeted with hearty applause.

Reports of Divisions

The Chairman announced that there were three divisions now in existence, British Columbia, Alberta and Ontario just formed, with Quebec in process of formation. Both the Saskatchewan and Manitoba Branches, although not divisions take in a large share of the membership in the Provinces. It is hoped that very shortly a branch will be organized in every Province to take up any matters that may be of interest as between the Engineering Profession and the Provincial Government.

At a meeting of the Executive of the Ontario division held concurrently with the annual meeting at the call of the Chairman, pro-tem, Professor Gillespie, at which were present representatives from various parts of Ontario, the following officers were elected: Chairman, J. B. Challies, Ottawa; Secretary-Treasurer, Geo. Hogarth, Toronto.

Communications

A cable from Lieut-Col. Chas. H. Mitchell, M.E.I.C., C.M.G., D.S.O., Croix de Guerre, etc., extending his greetings to the Annual Meeting and expressing his regret at his inability to be present was read by the Secretary. Also a telegram from H. R. Safford, M.E.I.C., Chairman of the Library and House Committee expressing his regret at not being able to be present.

The following telegram of greetings was read by the Secretary from Calvin W. Rice, Secretary of the American Society of Mechanical Engineers and received with enthusiasm.

> "Peace earned at such sacrifice has raised all ideals, none more than those of the engineering profession. The American Society of Mechanical Engineers sends greetings on the occasion of your anniversary, renews its pledges jointly with you to devote supreme efforts to the advancement of the engineering profession through service for the common good."

Report of Emblem Committee

The Chairman announced that at the last meeting of Council the report of the Emblem Committee had been adopted and referred to the annual meeting for any suggestions which the members might have to make. He called upon Mr. Francis, Chairman of the Committee, which consisted of in addition H. R. Safford, Frederick B. Brown and Arthur Surveyer.

Mr. Francis: "Following the suggestion which I had the honor to make at the last Annual Meeting, and what I believe was understood as representing the approval of the Annual Meeting, Council appointed a Committee to study the question of the designing of a suitable emblem for *The Institute.* The committee met a considerable number of times, invited designs, considered suggestions, and finally made a slight modification of the design submitted at the last meeting. The recommendation of the committee which was tentative, being adopted by the Council and passed on for reference to this Annual Meeting—was that the design of the emblem should be in the form of the shield which has been in use by *The Society* for something like fifteen or twenty years; that the shield should bear the design of a working beaver, and that, in order to make the emblem distinctive it should be of fine quality, the die work to be as for coins, without the usual enamel, and that the metal for members should be gold, for the associate members, silver, and for juniors and students bronze. That is the report tentatively adopted by Council, I now submit on behalf of the committee for the approval of the Annual Meeting.

Changes in By-Laws

The Chairman: Our present By-laws make the following provisions with regard to amending or repealing existing By-laws or introducing new ones:

"Section 73.—Proposals to introduce new By-laws or to amend or repeal existing By-laws shall be presented in writing to the Council, signed by at least twenty Corporate Members; and shall reach the Secretary not later than the first day of October. The Council shall consider the proposals and the proposers shall be notified of the opinion of the Council in regard thereto not later than the seventh day of November. The proposers may then withdraw their proposals, accept any changes suggested, or insist on the original form, sending their decision to the Secretary not later than the fifteenth day of December. The proposals, as accepted by the proposers, shall be mailed to Corporate Members not less than twenty-one days before the Annual General Meeting. Proposals to introduce new By-laws or to amend or repeal existing By-laws may also be suggested by the Council and shall be mailed to Corporate Members not less than twenty-one days before the Annual General Meeting.

"All proposals shall be submitted for discussion at the Annual General Meeting and shall then be voted upon by letter ballot by the membership at large. The Secretary shall issue the letter-ballot not later than two months after the Annual General Meeting. The reasons advanced for and against the proposals edited by a Committee appointed by the Chairman consisting of an equal number of members favouring and members opposing the proposals shall accompany the letter ballot. The letter ballot shall be returnable to the Secretary not later than three months after the Annual General Meeting. Scrutineers appointed by the Council shall immediately thereafter count the ballots and report the result to the Council.

"An affirmative vote of two-thirds of all valid ballots shall be necessary to the adoption of any amendment.

"Amendments so adopted shall take effect forthwith, except that Officers of *The Institute*, at the time any amendments may be adopted, shall continue in office until the next Annual Election."

The By-laws were set out in the December number of *The Journal* and have, therefore, been mailed to all the members. A great number of the changes are purely changes in grammar and English. The present By-laws were largely run out by myself and Mr. Dodge after the Committee on Society Affairs got through last year, and they were done in a hurry. When we had Professor Ernest Brown criticize them and analyze our English, we were amazed at what we had done. Professor Brown has spent a great deal of time on the by-laws and has succeeded, I think, in putting them into very much better shape. Some of the amendments are purely changes in the wording and do not in any way change the effect of the existing by-laws, while some of the other revisions are more or less important and should be understood by the general meeting in order to enable the members to discuss them intelligently.

The first change of any importance is in section 18, in which the provision regarding the Papers Committee is changed to agree with section 21 which provides that the Papers Committee shall be composed of the Chairmen of the various Branches.

The amendment to section 24 straightens out a difficulty which arose through last year's by-laws not having been drafted in accordance with what was intended. The important clause is that the Annual General Meeting may recommend to the Council the appointment of special committees and that such recommendations shall be considered by the Council at the first meeting following the Annual General Meeting. That was the intention of the original by-law, but it was not properly drafted. The idea was that committees should not be appointed at an annual meeting, but that the annual meeting should recommend to the Council the appointment of committees and that the committees should operate under the direction of Council and not be appointed by an annual meeting and report to the succeeding annual meeting. The new by-law provides that special committees shall perform their duties under the supervision of the Council and shall report to the Council.

We have a new clause regarding the adoption of specifications. We have been free and easy about the adoption of specifications; the committee could bring in a report and some one could make a motion at the annual meeting that the report be adopted as a standard of *The Institute* and it might go through with the vote of a very small percentage of the membership. We felt that the *Institute* should not lend its name to specifications unless the membership at large is desirous of adopting them. The proposed by-law is as follows:

"Reports of Special Committees on Specifications shall be issued to the membership after presentation to the Council, and shall be open for discussion by all members for a sufficient period. All discussion thereon shall be forwarded to the Special Committee by a date fixed by the Council, and the Committee shall then present a final report to the Council, which report shall be issued to the membership, and the Council shall determine whether it shall be voted upon for adoption by *The Institute*. If the report be submitted for adoption, the Secretary shall issue a letter-ballot to Corporate Members in a form prescribed by the Council, and an affirmative vote of two-thirds of all valid ballots shall be necessary for adoption. The ballot shall be canvassed by scrutineers appointed by the Council, and the result of the voting shall be announced to the membership."

The next important amendment is with regard to the annual fees, section 34, which have been changed on account of the new by-law, section 73, providing that all members shall subscribe for *The Journal of The Institute*. That had to be done in order to make our position clear to the Post Office Department, and the fees have been reduced from $15 to $13. In other words, the fees have been reduced $2 right through, except in the case of non-resident students, who have paid only $2, and whose fee has been reduced to $1.

Then, we have the following new clause in section 38:

" The Council, upon written request and at its discretion may exempt from further payment of annual fees, any Corporate Member who has reached the age of sixty-five or who has been a Corporate Members for thiry years. The names of such members shall be placed on a 'Retired List.' "

Then, under section 57, it is provided that the Secretary of *The Institute* shall each year transmit to each branch, except the Montreal Branch, twenty-five per cent of the annual fees, instead of twenty per cent. This is on account of the change with regard to the subscription and the $2 having been transferred to *The Journal.* It comes out almost exactly the same as it was before.

A new clause, number 73, is introduced, as follows:

" Members of all classes shall subscribe for *The Journal* of *The Institute,* and the subscription shall be payable on the first day of January each year.

" The annual subscription for *The Journal,* for members of *The Institute,* shall be Two Dollars."

In accordance with our existing by-laws these proposals are submitted by the By-law Committee for discussion at the Annual General Meeting and constitute the report of the Committee appointed by the Council on the Revision of By-laws.

The discussion which followed showed that the present report was a compliment to the men who drew up the revised By-Laws recommended by the Committee on Society Affairs. It was moved by Mr. Francis, seconded by Professor Haultain, that the revised By-Laws as submitted be endorsed by the Annual Meeting and referred to the Council for proper action in accordance with existing By-Laws.

The President announced that we were to be honored by the presence of His Excellency The Governor General of Canada at luncheon, and requested that all members be seated by one o'clock except those who were to sit at the head table.

Luncheon

The noon luncheon was held in the main dining hall of the Chateau, there being about two hundred and twenty-five present, at which it had been planned to have addresses from His Excellency the Duke of Devonshire, Hon. M.E.I.C., who had graciously consented to be present and Alfred D. Flinn, Secretary of the Engineering Council of New York, who had kindly come to speak on international co-operation.

With the completion of the meal President Vaughan, on rising voiced the pleasure of the members in the fact that our most distinguished Honourary Member, His Excellency the Governor General of Canada, representing our King, the Head of the Empire for which the overseas Dominion had done such splendid work in the past had honored *The Institute* with his presence. He referred briefly to the part which our members had taken in the War and quoted some of the figures from the report of the Honor Roll Committee, read at the morning Session, and pointed out that we, as engineers, had every reason to be proud of the part Canadian Engineers had taken in the War.

His Excellency the Duke of Devonshire, K.G., G.C.M.G., G.C.V.O., Governor General of Canada:—

"Mr. Chairman and Gentlemen: I know that you are going to be disappointed if you expect from me anything in the nature of a technical speech. After a period approaching thirty years of political parliamentary life, I think I have safely learned the lesson that when one is in the presence of experts it is far better to keep one's ears open and one's tongue silent. But I do wish on this occasion to offer my cordial congratulation to this great *Institute* on the splendid record that we have just heard from the Chair, of the magnificent contribution which you have made to the personnel which is really responsible for the splendid victory which we are now celebrating—to those who when the moment came gave up everything and placed themselves at the service of their King and their country. And in what has been accomplished we have to consider not only the personnel, not only the men who took their places in the fighting line, but also the magnificent work which has been done throughout the length and breadth of Canada; and here you are still deserving of the highest possible praise and congratulation.

I should not like to say that I have seen more of the munition factories in this country than anybody else, but certainly I have, during the two years and three months in which I have had the privilege of holding the great office of Governor General of Canada, had opportunities of seeing something of that tremendous work which has been going on from the Atlantic to the Pacific. Wherever I went I could not help being profoundly impressed not only with the work which was being done, but also with the splendid spirit which was behind it. But quite apart from the results which have been obtained, we have learned what can be done by unity, by co-operation and by capacity for production.

The annual production which you are so largely responsible for has, unfortunately, during the last four years of war, been mainly directed to the purposes of destruction. It is now for us to appreciate to the full the real meaning of all that work. We have seen the very best brains, the very best knowledge, applied solely for the purpose of creating something capable of greater horror and greater destruction than anything of which we had known before. But now we have to turn our attention in another direction, and let us hope that never again in our lifetime or in the lifetime of our children's children for many generations will skill, capacity and intelligence be directed to the purposes of destruction rather than those of construction. Certainly in Canada there is wonderful opportunity for applying these forces now to the purposes of construction. Many of you who are intimately acquainted with engineering developments in this great Dominion are able to look back upon the time—only a very few years ago, indeed—when tasks which are now accomplished would have been considered quite impossible. By skill and by intelligence well applied, these wonderful results have been obtained.

And yet, after all, it is but a commonplace truism to say that Canada is only at its beginning; that what has been accomplished in the past is but an indication, an earnest, of what can be accomplished in the future. We shall have many difficulties to face, but by bringing to bear upon them the same spirit which was so splendidly manifested during the period of the war, we can, I think, look forward with confidence to the future.

At this moment the world is going through critical times. After the vast upheaval which has shaken society to its very foundations, it is inevitable that only after some time can equilibrium be regained. But we have learned in the bitter experience of war what can be accomplished, and you, gentlemen, in your individual capacity, in your capacity as a great Institute, are able to help— I do not mean to use the word " reconstruction," but to help in rebuilding these great industries and in opening fresh fields and pursuing paths of further constructive endeavour.

You have a record of service rendered during these years of war of which any Institute would have reason to be proud. You will pass that position down to future generations. And just as we have achieved this wonderful victory in time of war, so I think you can look forward with the greatest confidence to obtaining even greater victories in the happier times of peace which are to come."

With the conclusion of the Governor General's address President Vaughan introduced Mayor Harold Fisher, of Ottawa, who, on behalf of the City of Ottawa, tendered a welcome to the Engineers of Canada assembled in annual convention. He trusted that the stay in Ottawa would be be profitable and pleasant, and if he could be of any service he would be glad to do so.

Alfred D. Flinn, Secretary, United Engineering Council was then introduced by Mr. Vaughan, who stated that engineers were striving for greater recognition and that they would get it. In United States the great engineering bodies had joined forming a united engineering Council to discuss and take action on matters affecting the interests of engineers throughout the country. The Engineering Council has a membership of thirty eight thousand. In this country, we have embraced the various branches of engineers in one body. It was a pleasure to have Mr. Flinn with us and to call upon him for an address.

International Affiliation

In opening his remarks Mr. Flinn stated that it gave him much pleasure to stand before an audience with such a record and to give expression to his respect and admiration which the members of the organization which he represented felt for their brother engineers in Canada.

Continuing, Mr. Flinn said: "Affiliation across national boundaries, like close association within any nation, and of engineers, like affiliation among other kinds of men, demands intercourse and mutual service. Engineers from the Dominion have singly and in groups made many visits to various places in the States and have thus engendered among American engineers respect and fondness. Your President and Secretary have come among us and we like them. Engineers from the States have gone into the Dominion and have received such warm hospitality that they have been tempted to purchase northbound transportation more frequently. Let this pleasant intercourse continue. Be assured that engineering headquarters in all parts of the States, and especially " grand headquarters " in New York are ever open to our Canadian brothers.

But there are other means of intercourse. We cannot all travel, nor can any of us travel as frequently as we might like. Instead, we have an interchange of messages through our publications. We look forward to receiving the successive issues of *The Journal* of *The Engineering Institute of Canada* as to the coming of letters from friends. Always there is some cordial message, always interesting news of society progress and professional work. You are to be complimented upon your *Journal.*

Exchanges of services are possible between us in many ways large and small, and there are services to our great profession and the world in which we can join. Engineering Societies Library in New York, with its 160,000 titles, is already becoming your library also, and may be yours to the extent to which you will use it. The Engineering Index published in your *Journal* is one way in which the Library is serving you; searches and translations are others. Its doors are always open to visitors. It is only at the beginning of the services its Board hopes to be able to give engineers.

You are concerned with British and American engineering standards and so are we; therefore, both whould work together for the establishment of standards which because of their rightness will be generally honored. On no other authority can any standard really become established. Both of us are interested in international engineering standards and should have a large share in fixing them. There is an American Engineering Standards Committee. Why should it not collaborate with the corresponding organization in Canada?

There are international engineering problems in which both you and we have an interest. Our countries have many industrial interests in common also, with their problems. Personal acquaintance among engineers on both sides of the border will aid the wise and fair solution of all such problems.

Scientific research and its engineering application concern us all. Many fields of research are common to both sides of the invisible boundary which separates us politically. Need this imaginary line prevent co-operation in research between your organizations and our Engineering Foundation and National Research Council? We believe not.

There is another group of interests—those which affect all engineers as residents in a community, citizens of a country and members of a profession—the non-technical relations among engineering societies and between engineers and government, local and national. To deal with these matters there has been established in the States, to represent engineers in all branches of the profession, Engineering Council. Many of its activities are of common concern to all engineers on this continent. There is nothing in its constitution to prevent engineering organizations across the border being represented upon it and sharing in its work and benefits. Are not Canadian engineers interested in the work of such committees as these: Public Affairs, Water Conservation, Fuel Conservation, Reconstruction, Engineering Societies Employment Bureau and on Licensing of Engineers? Even committees whose spheres are national in the immediate application of their efforts, indirectly may be internationally helpful. Is not this true of our Patents Committee, National Service Committee and even our Americanization Committee?

Engineering Council is an organization of national technical societies of America, created to provide for consideration of matters of common concern to engineers, as well as those of public welfare in which the profession is interested in order that united action may be made possible. Engineering Council now has as its member societies the American Society of Civil Engineers, American Institute of Mining Engineers, American Society of Mechanical Engineers, American Institute of Electrical Engineers and American Society for Testing Materials, having an aggregate membership of 38,000. Other national technical societies are eligible.

Now, as to international affiliation, it seems to us quite possible that *The Engineering Institute of Canada* should be in some way associated or connected with the Engineering Council. It may not be convenient or practicable that you should become a member of the Council on the same basis as the American societies which have been named, for reasons which will occur to you. But it seems to us quite feasible that *The Engineering Institute of Canada* and the Engineering Council should have an international co-operative committee—a committee on which both bodies may have members; a committee of interchange of good fellowship, of information and of mutual helpfulness. At least, it occurs to us that would be a good tentative step with which to begin our active and formal co-operation. Then, if as time goes on it develops that further services may be performed in common, further steps in the development of mutual organization may be undertaken as may be suggested by you or by us. I assure you that there is in our midst the heartiest feeling of good fellowship towards you and a desire for closer co-operation between the Engineers of Canada and the Engineers of the United States.

I wish to thank you for the very pleasant hours that I have spent with you, the splendid reception which has been accorded to me, and for the honour of an invitation to be with you at your successful annual meeting. Let me assure you again that my appreciation of being here is none the less hearty because I must leave within a few minutes to continue my journey, and that my good wishes for the successful continuation of your meetings are very genuine."

The proceedings closed with the singing of God Save the King.

Afternoon Session. Tuesday February 11th

Emblem of the Institute

Continuing the business of the afternoon session President Vaughan asked Mr. Francis to enlighten the meeting regarding the emblem—and in response Mr. Francis announced that the Committee had made a unanimous report after having considered a great number of suggestions and after considerable discussion in Council. The Committee recommended the adoption of a badge in the form of a shield so long in use and suggested that the badge should be of metal without enamel, gold for members silver for associate members, and bronze for students and juniors, the badge to be issued only by the Secretary. The back of the badge would be plain and numbered, the number to be registered and the front to bear the legend that was approved of at the last Annual Meeting. "*The Engineering Institute of Canada*, founded 1887." It was further suggested that the die work should be of the best quality obtainable corresponding to the last issue of American coins, and the recommended design illustrating a beaver and containing the recommended legend was passed around for the inspection of the members. Mr. Francis moved the adoption of the design submitted with the reservation that should it be found that the beaver shown on the design should be looking in the opposite direction the Committee was quite agreeable to have it so. The motion was seconded by Mr. Surveyer, after some discussion regarding heraldry. In the discussion that followed it was stated that the magnificient specimen of beaver presented to *The Institute* by S. J. Chapleau, M.E.I.C., formed the basis of the designs ubmitted. A somewhat lengthy discussion ensued and the motion was enlarged to include the carrying out of the details of the design by the Council. The motion was carried.

The President then announced that the meeting would adjourn until four o'clock when the President's address would be given. In the morning the program of the business meeting would be continued receiving the report of the Legislation Committee, the report of the Scrutineers and the nominations to the Nominating Committee made by the various Branches.

President's Address

The session was resumed at four o'clock with Vice-President Haultain in the chair. The President then delivered a remarkable address on the Manufacture of Munitions in Canada " telling in intimate detail for the first time the part played by this country in the production of munitions for the Allies, commencing with the conditions in existence prior to the formation of the original Shell Committee and leading on through successive steps, with details of the products manufactured; the establishment of the Board of Munitions and the growth of the industry to a stage where the output represented fifteen percent of the disbursements of the British Ministry of Munitions.

This address with many illustrations will be produced shortly in the form of a volume of transactions of *The Institute.*

At the conclusion of the address there was thrown upon the screen a highly interesting series of views illustrating the different phases of the subject so exhaustively dealt with by Mr. Vaughan during the course of his address, including different types of shells, fuzes, plants, and processes, and bringing vividly before the meeting the initial difficulties that had to be overcome, the method by which problems were solved and the enormous proportion to which the shell industry attained before the signing of the Armistice. The illustrations also dealt with the manufacture of primers, cordite, nitro-cellulose, T.N.T., fuzes and aeroplanes.

The Chairman stated that all had listened to this remarkable address with the greatest degree of interest and pleasure and that an expression of appreciation would be in order. Col. Leonard moved a hearty vote of thanks to Mr. Vaughan for his magnificient paper, which will form a valuable record for all time to come of one of Canada's great achievements in the war. In seconding the motion, Mr. Tye stated that Mr. Vaughan during his occupancy of the office of President had established a new high water mark in relation to the amount of work he had done and the efficiency with which he had done it. The motion was adopted unanimously.

The session concluded at six o'clock.

Morning Session, Wednesday, February 12th.

The meeting was called to order at ten a.m., the President Mr. Vaughan in the Chair. The Chairman asked for the report of the special Legislation Committee appointed by the various Branches which had met with a view to making recommendations to the Annual Meeting.

The report of the special Legislation Committee was in the form of a motion moved by J. M. Leamy, who represented the Manitoba Branch, seconded by C. C. Kirby, representing St. John Branch.

Whereas it seems that the wishes of the majoirty of the members and of the Branches of *The Engineering Institute of Canada* are that provincial legislation should be obtained to define the status of the engineers throughout Canada.

Whereas the members of this annual meeting are of the opinion that this legislation should be as uniform as possible throughout the provinces.

Be it resolved:

That a special Committee be formed, composed of one delegate appointed by each branch to meet at headquarters before the 15th of April, 1919, to draw up such sample legislation as it may deem necessary and advisable in order that the members of *The Institute* throughout the different provinces may ask for legislation on the same uniform basis.

That the Secretary be instructed to call the first meeting of this Committee.

That this Committee be authorized to obtain the necessary legal advice on the matter.

That this Committee shall submit the proposed legislation to the Council before the 1st of May, 1919.

That the Council shall then ask by letter ballot, before the 1st of June, 1919, the opinion of all the members of *The Institute* regarding the adoption of the proposed legislation prepared by the said special Committee of *The Institute*.

That the Council be authorized to pay all the expenses of this Committee and of each delegate.

That the Council of *The Institute* shall report the result of the ballot to the Branches, and if the vote is favorable to legislation the Council of *The Institute* shall immediately take the necessary measures, in co-operation with the Branches, to have such legislation enacted.

This resolution evoked the most prolonged discussion of any subject introduced at the annual meeting, the discussion hinging principally on the point raised by the Chairman that in passing this motion the power of veto was taken out of the hands of Council entirely. The following participated in the discussion, some of whom spoke at considerable length, Messrs. Leamy, Kirby, Decary, Lambe, Pearce, Surveyer, Dodwell, Francis, Stead, Haultain, Mountain, and Col. Leonard.

It was pointed out that the position of this Committee would be somewhat similar to that of the Committee on Society Affairs, and that it would no doubt be advised by Council individually if not officially in its work. The opinion was unanimous that legislation was advisable and should be sought at the earliest possible moment. The resolution contained in the motion before the meeting provided early action. It also involved committing *The Institute* to an expenditure of several thousand dollars

The discussion brought out the fact that with one or two exceptions the subject has not yet been discussed, every branch has gone on record as favoring legislation. Strong support to the motion was given by a number of members of Council and special representatives from the various branches. On the motion being put to the meeting it was carried.

Scrutineers Report

The Secretary read the Scrutineers Report as follows: We beg to report that the following have been elected to office for the current year: President, Lieut.-Col. R. W. Leonard; Vice-Presidents, Walter J. Francis and D. O. Lewis; Members of Council: District No. 1, Sir Alexander Bertram, and Arthur Surveyer; District No. 2, J. E. Gibault; District No. 3, Alexander Gray; District No. 4, G. Gordon Gale; District No. 5, W. A. McLean; District No. 6, W. P. Brereton; District No. 7, G. D. Mackie (for three year term); A. R. Greig (for one year term); District No. 8, L. B. Elliot (for three year term), F. H. Peters (for one year term); District No. 9, R. W. MacIntyre.

Respectfully submitted by
W. Chase Thomson,
O. Lefebvre,
Scrutineers.

P.S.—The Auditors report is returned herewith.

The report of the Scrutineers was adopted.

New President Introduced

In introducing Lieut.-Col. R. W. Leonard, Mr. Vaughan stated that he needed no introduction as his long experience and his reputation both as a civil and a mining engineer were well known. It gave him very great pleasure to escort the newly elected President Lieut.-Col. R. W. Leonard to the chair. Col. Leonard said: Gentlemen, I wish to thank you for the honor which has been conferred upon me, the highest honor in the gift of the engineering profession in Canada. I realize that the work of my predecessors, the excellent results that have been accomplished in this part of the Dominion, including Montreal, and the magnificient work the Ottawa Branch has done has set up a high mark of efficiency, which it is going to be very difficult for me to follow. However, we, in Ontario, shall try to emulate in some degree the work that has been done here and shall try to hold our own anyway. I thank you very heartily.

Nominating Committee

The Secretary announced the Nominating Committee as appointed by the various branches which constitutes the Nominating Committee for the year nineteen nineteen.

District No. 1, Montreal, headquarters of *The Institute*, and all members resident outside of Canada, H. M. MacKay, A. E. Doucet.

District No. 2, Province of Quebec, Alex. Fraser.

District No. 3, Nova Scotia, New Brunswick, Prince Edward Island, J. L. Allan.

District No. 4, Province of Ontario, east of Lindsay, A. A. Dion.

District No. 5, Province of Ontario, west of Lindsay, G. Hogarth, H. U. Hart.

District No. 6, Manitoba, Guy C. Dunn.

District No. 7, Saskatchewan, O. W. Smith.

District No. 8, Alberta, A. W. Haddow, S. G. Porter.

District No. 9, British Columbia, Newton J. Ker, E. G. Marriott.

The Secretary moved, seconded by Geo. A. Mountain, that the above named constitute the Nominating Committee for the coming year, with H. M. MacKay as Chairman. Carried.

This concluded the business of the Annual General Meeting and the Chairman announced that the meeting would immediately proceed with the general professional meeting and called upon Capt. R. J. Durley, M.E.I.C., Chief of the Division of Gauges and Standards, Imperial Ministry of Munitions, who read his paper: "Standards in Engineering."

Standards in Engineering

1. *Standardization.*

At the present time Canada is passing through a period of industrial readjustment, and many of our manufacturers are endeavouring to change over from the war conditions under which they have been operating, to a state of affairs under which it is anticipated that competition will be extremely keen, while the economic situation for some time to come will hardly lessen the difficulties under which they are working.

It is, therefore, felt that this is an appropriate time for the proceedings of *The Engineering Institute of Canada* to contain a communication drawing attention to the increasing importance of Engineering Standardization, which has proved, both in England, and in the United States, to be one of the most powerful influences in limiting costs of manufacture and facilitating production, not only by reducing the number of kinds of material, or patterns of any given article, which have to be manufactured and kept in stock, but also by rendering available standard specifications and methods of construction.

Mr. Vaughan in his Presidential address has just given a very complete and authoritative account of the phenomenal way in which the munitions industry of this country was developed during the past four years, and has made it clear that success in the production of enormous quantities of such highly complex and accurately made articles as Shell, Fuzes and the like, could never have been achieved in such a short period without making the most complete possible use of the aids afforded by standard types and dimensions and standard specifications for material. While it is true that in ordinary commercial work there are few products whose manufacture is necessary in such gigantic quantities or with such close limits of accuracy as in the case of munitions of war, it must be admitted that similar conditions will apply in many cases during peace time, and that the country which first and most completely seizes and utilizes in its industries the advantages conferred by Engineering Standardization will have a corresponding advantage in the industrial race which has now to be run. It is proposed to give here a brief account of the work which has been accomplished in England and the United States, and the commencement which has been made in Canada.

2. *Work in England.*

In many respects standardization in engineering work has reached its fullest development in England, where for the past seventeen years the voluntary efforts of an influential body, the British Engineering Standards Committee (now the British Engineering Standards Association) have been unceasingly directed towards its establishment. The origin and activities of the British Engineering Standards Association have been described in many publications, among which may be mentioned The "James Forrest" Lecture of the Institution of Civil Engineers, delivered in 1917 by the late Sir John Wolfe Barry; and recently a brief but excellent paper by Mr. LeMaistre, the Secretary of the British Engineering Standards Association, presented to the American Society of Mechanical Engineers at its New York meeting in December, 1918.

It need only be stated here that the British Engineering Standards Association is a semi-official body composed of members prominent in engineering and industrial work, nominated by such bodies as the great Technical Societies of Great Britain, together with some representatives of the large purchasing departments of the British Government and certain scientific members. It is supported by voluntary subscriptions from firms and individuals interested in the engineering industry of the country, and to a smaller degree by a Government grant.

It is important to note that the British Engineering Standards Committee, from which the British Engineering Standards Association has developed, was founded in 1901, at which time an urgent need was felt in England for the replacement of the many existing lists of sections of structural steel by a single standard set, as up to that time every manufacturer had to cut rolls in accordance with the ideas of the individual purchaser or engineer for whom he was working. The same situation had arisen in the case of tramway and railway rails, and the matter was, therefore, placed in the hands of a Committee appointed at the instance of the Institution of Civil Engineers, and having as its members persons nominated not only by that Institution, but also by the Institution of Mechanical Engineers, the Institution of Naval Architects, and the Iron and Steel Institute. These bodies, with the Institution of Electrical Engineers which came in later, were the five Institutions which have supported the Engineering Standards Committee. From its very inception the work of the Committee continued to develop as demand arose, and it rapidly attained greater and greater industrial importance, with the result that in 1918 on the receipt of an assurance of more extended Government support, it was decided to incorporate it under the name of the British Engineering Standards Association, and establish relations with branch or cognate Committees to be formed in various parts of the world.

Inasmuch as some misapprehension exists among engineers as to the way in which engineering standards arise and are formulated, it will be well here to outline the system adopted by the British Engineering Standards Association, which has gradually grown along the lines which experience has proved to be sound. It is obvious that if some official body, without fully consulting the industry concerned, takes upon itself to promulgate a set of rules for standardizing a certain product, and if their enforcement is attempted by employing Governmental or other action, thus endeavouring to compel manufacturers to work to them, failure is inevitable. To ensure success and general acceptance, rules for standardization must be developed with the desire and assistance of the persons concerned in the manufacture and purchase of the articles for which it is needed, and the standards must be good and practical. Standardization in fact is primarily a commercial rather than a scientific question.

The guiding principles which have been adopted by the British Engineering Standards Association since the beginning of its work provide fully for the aspect of the case, and they are so definite and reasonable that no excuse is needed for quoting them here. They may be summarized as follows:—

(*a*) The different interests of producers and purchasers must be fully considered. This result is accomplished by the appointment of a special sectional committee to deal with each subject brought up, the members of such a Sectional Committee comprising engineers who are familiar with the subject, manufacturers actually engaged in production, and representatives of the chief users of the article under consideration, the whole under the chairmanship of a member of the main committee of the Association. It should be particularly noted that members of such a sectional committee, while appointed with the approval of the main committee, are not necessarily members of it, It is arranged in each particular case to secure the services of the men having the best possible qualifications, whether technical, scientific or commercial.

(*b*) As the movement is purely a voluntary one and in the interests of producers and consumers alike, all are asked to give their services gratuitously.

(*c*) The Association only undertakes to deal with any subject when a demand for its services is received. Thus the Association does not take up subjects of its own initiation, but in order to meet recognized wants.

(*d*) The Association is not a testing authority, its work being to set up and formulate the standards desired, leaving it to the purchaser to satisfy himself as to whether or not the material supplied to him complies with the standard requirements. Any experimental or scientific investigation necessary in connection with the Association's work is carried out by the National Physical Laboratory.

(*e*) It is important to provide for the effect of changing industrial or scientific conditions. Thus all standards formulated are subject to periodical revision, so that improvements can be incorporated at any time as experience dictates.

The British Engineering Standards Association since its formation in 1901 has expended approximately £51,000 sterling, and its list of published standards and specifications covers upwards of sixty subjects, a list of some of which is attached as Appendix I. The Association now has some 160 Committees, Sub-Committees and Panels, dealing under its central authority with standards relating to practically the whole field of engineering; and as Mr. LeMaistre says, " for many years past, the British Engineering Standards Association, as it is now called, has provided the neutral ground upon which the producer and the consumer, including the technical officers of the large spending departments of the Government and the great Classification Societies, have met and considered this subject of such vital interest to the well-being of the engineering industry of the country."

It is interesting to note that a very large increase in the Association's activities took place during the war, one of the most conspicuous instances being its work in connection with the recent immense development of the aircraft industry in England. During the first two years of the war, when every effort was being made in England to obtain a supply of serviceable aircraft, it was impossible to pay much regard to uniformity of specification, for the industry was in such a fluid condition that only the beginnings of standardization could be dealt with; but later when a much larger programme was being embarked upon, and when the Department of Aircraft Production had been fully organized, the Ministry of Munitions placed in the hands of the British Engineering Standards Association the whole duty of preparing standard specifications for aircraft materials. We have here an example of the fact that standardization, if properly carried out, does not cramp or limit the efforts of the designer. No attempt, for instance, was made in this case to impose upon aircraft builders any limitation of their freedom in design or in individual methods of construction; but it is safe to say that had each of these manufacturers been allowed to work to his own ideas as regards the particular qualities of the materials to be employed by him, production would have been much delayed by reason of the difficulty of obtaining such materials, many varieties of which would have differed only in unimportant details.

As another example of the special war activity of the Association, it may be mentioned that its services were called for in connection with the building of standard ships, the total number of standard sections of rolled steel used in ship-building by the Mercantile Section of the Admiralty having been reduced to eight, selected from the British Standard list, and important work having also been done in unifying the testing requirements of the three great Marine Classification Societies and of the Board of Trade, so as to facilitate classification.

It is understood that the Association's Sectional Committee dealing with this subject is now taking up many points in greater detail, especially as regards marine machinery, and it is expected that considerable progress will be made along these lines, especially in connection with auxiliary machinery, accessories and fittings. It is thus hoped that in England much of the experience gained during the war in the construction of standard ships and their machinery will be applied with advantage in reducing the cost of marine work done on a post-war basis, by making it possible to produce in quantity many of the items in ship and engine construction which in the past have been designed and made individually by each shipbuilder and marine engineer.

Many other examples might be given, but those mentioned will suffice to give an idea of the wide scope and effective results which have characterized the work of the Association.

Its publications, which are of great technical value, are accessible to the public, as they can be purchased at a nominal price. Arrangements are being made for the maintenance of a stock of these documents in Canada, so that their data will be readily available here.

3. Engineering Standardization in the United States.

In the United States the development of engineering standardization has taken place along quite different lines from those which have obtained in England, and much progress has been made, although a central standardizing body, the American Engineering Standards Committee, has only been formed within the last few months. While the formulation of engineering standards in the United States has hitherto been the more or less independent work of the various technical societies, many of the resulting standards have attained nation-wide acceptance.

The work in standardization done by the American Institute of Electrical Engineers is perhaps the best known and far-reaching in its effects. The American Institute of Electrical Engineers commenced work in 1898 and now has thirty-four Sub-Committees dealing with all phases of electrical work. In March, 1915, representatives from this Committee visited England, and the result of this Anglo-American co-operation has been that certain standardization rules for electrical work in both countries are identical in a number of essential points.

In 1902 the American Society of Mechanical Engineers appointed a Committee to deal with the standard proportions desirable for machine screws, and in later years Committees have been appointed by that Society to deal with such questions as engine tests, standard specifications for the construction of steam boilers, and various points in connection with the testing of materials.

The latter subject, has, however, been more completely dealt with by the American Society for Testing Materials, which has a total membership of about one thousand, and has thirty-eight standing Committees dealing with tests and standard specifications for iron, steel, copper, bronze, cement, road materials, coal and many other items.

A fourth and younger body which has been very active is the Society of Automotive Engineers, whose Standardization Committees have very largely dealt with Automobile work. They originated the well known and widely accepted S. A. E. System of fine screw threads, and their work has recently undergone considerable development in connection with Aircraft and Aero Engine Standardization. The S. A. E. issue not only standard specifications and dimensions, but also documents embodying their "recommended practice."

Finally, attention should be drawn to the very active part which has been taken by the United States Government in connection with Engineering Standardization. The Bureau of Standards at Washington is organized along lines somewhat different from those of the National Physical Laboratory in England, and has been very liberally supported by the United States Government. The Bureau was established in 1901, at first as a development of the then Bureau of Weights and Measures, but its activities have so widened and increased that in 1916 nearly two million dollars were expended, and it deals with a great variety of matters. Besides carrying on through its many departments a vast amount of Industrial and Scientific Research, the Bureau of Standards has within the last few years dealt with many questions of industrial Standardization, particularly in matters having regard to public safety; for example, in formulating safety codes for various kinds of structural work. It has prepared and issued standard cement specifications, and has prescribed standard definitions and methods of test for a number of other important products, such as gasoline.

Quite recently the United States Government has itself entered more definitely upon the field of Engineering Standardization, the Senate having appointed a Screw Threads Commission, with instructions to report on a revised system of screw threads for the United States, the Senate having directed that the findings of this Commission should be adopted by all departments of the United States Government.

It will thus be seen that while in Great Britain Engineering Standardization has been from the first in the hands of one central voluntary Association operating with the support of the Technical Societies, the various industrial interests and the British Government, the corresponding work in the United States has been done through the more or less independent activities of the various Technical Societies, the Bureau of Standards and the Government itself. It is understood that the American Engineering Standards Committee which has just been formed, has as its primary object the co-ordination of all these efforts so as to avoid overlapping, and to make the results of the work of various bodies available as truly national standards.

4. Standardization in Canada.

One purpose of this paper is to inform the engineering profession in Canada regarding the promising commencement which has been made in connection with Engineering Standardization here. The movement was actually initiated in November, 1917, by a communication from the then British Engineering Standards Committee, which was transmitted to the Canadian Government through the British Government, which pointed out the desirability of the formation of a Standards Committee in Canada, and which naturally had regard primarily to the advantages of establishing close relations between such a body and the corresponding body in England. As a result the nomination of a Canadian Engineering Standards Committee was placed by Sir Joseph Pope in the hands of the Administrative Chairman of the Honorary Advisory Council for Industrial and Scientific Research, with the co-operation of a number of prominent members of the engineering profession. The Committee thus formed included twenty-five members under the Chairmanship of Sir John Kennedy. Of this number, eight members may be regarded as in a sense representing the Manufacturers' Association of Canada, two the Canadian Mining Institute, and four *The Engineering Institute of Canada*, while the remainder represent the various Departments of the Canadian Government, including those of Inland Revenue, Interior, Marine, Militia, Public Works, and the Advisory Research Council. A list of the original members of the Canadian Engineering Standards Committee is attached as Appendix II, and it will be seen that approximately two thirds of the number were members of *The Engineering Institute of Canada*.

At the very commencement of the work of the Committee it was felt that its activities should be chiefly directed to the consideration of those questions of Engineering Standardization which particularly affect Canada, while at the same time maintaining close relations with the British Engineering Standards Association. It was agreed that the guiding principles to be adopted in the Committee's work should be those which have proved so satisfactory in dealing with similar problems in Great Britain, and that, further, every effort should be made by the Committee, while acting as the body authorized to represent the British Engineering Standards Association in Canada, to make more widely known to Canadian engineers and manufacturers the excellent work which has been accomplished in England. The exceptional situation of Canadian industries, with their standards partly British and partly American, makes the co-operation of the Canadian Committee especially important in cases where agreement is sought between the standards of the British Empire and those of the United States.

In carrying out the work outlined above it will be the object of the Canadian Engineering Standards Committee, like that of the similar organization in Great Britain, not to attempt to impose standards upon manufacturers and others, but to meet industrial requirements by arranging for the selection of the best standard designs and dimensions and their modification whenever necessary, so as to insure their general adoption. At the urgent request of the British authorities, and in order that Canadian representatives might proceed to England to attend conferences on those subjects, the Canadian Engineering Standards Committee last spring appointed two Sectional Sub-Committees, the first on Screw Threads, and the second on Aeroplane Parts. These Sub-committees will, of course, include in their membership as may be found desirable, representatives of the industries concerned. The special problems arising in connection with Aircraft Standardization are dealt with later in this paper.

The bulk of the work accomplished by the Canadian Engineering Standards Committee during the past six months has thus been in connection with Screw Threads and Aircraft Parts, delegates having been sent to England to represent the Committee at the Conference held in London at the invitation of the Ministry of Munitions in April, 1918, on Screw Thread Standardization, and at the meeting of the International Aircraft Standards Commission held in London in October last. Considerable progress has also been made with the organization of the Committee in other directions. The formation of additional Sectional Committees so that meetings can at once be held whenever need arises, has been arranged for in connection with the following subjects: Cement, Bridges and Building Construction, Aircraft Parts and Materials, Pipe Flanges, Rope Pulley Grooves, Electrical Standards, Iron and Steel Sheets, Wire Ropes, Sections and Tests for Materials used in Ships, etc., Road Materials, Notched Bars, etc., Cast Iron Pipes, Vitirified Pipes, Rails, Automobile Parts, Locomotives, Machine Parts, Gauging, etc., and Railway Rolling Stock.

An application is now before the Government* asking for the incorporation of the Committee under the name of the Canadian Engineering Standards Association, this incorporation being desirable in order to define the status of the body, and to give it a clearly recognized position. It is proposed also to modify somewhat the consitution of the Main Committee, so as to widen the scope of the Association.

During the year 1918 the work of the Committee was brought to the attention of the Canadian Government, and a grant of $3,000 was made through the Advisory Council, on the condition that the sum named would be payable when and as equivalent contributions were received from Technical Societies and industrial bodies interested in the work of the Committee. It is gratifying to note that although during the first few months the Committee's activities have necessarily been confined largely to organization work and to the sending of delegates to the Conventions already mentioned, there is every prospect that the full amount of the Government grant for 1918 will be rendered available, by reason of the prompt response of the industrial interests to the appeal which has been made to them.

As regards the future of the Association, an application for a continuation of and increase in the Government grant under similar conditions has been made, and on receipt of the favourable reply which is anticipated, the services of a Secretary, giving his whole time to the work of the Association will be secured, and the Association will be prepared to deal with the various questions of Standardization which have already been suggested to it as now claiming attention. Under these circumstances experience will soon indicate whether the engineering industry in Canada under "post-war" conditions will be able to show such healthy development along modern lines as will enable the Canadian Engineering Standards Association to demonstrate more fully its usefulness and the necessity for its existence.

5. *International Standardization.*

This paper would be incomplete without some reference to International Engineering Standardization

*Since the time of writing, the incorporation has been accomplished.

and the principal bodies which have so far been concerned with it.

(*a*) Of these perhaps the earliest was the *International Association for Testing Materials*, which dealt, however, primarily with the unification of standard methods for physical tests of materials, and the comparison of results obtained by the divergent methods in use in different countries. The Commission was initiated in Germany in 1884, and a number of congresses have been held, the sixth of which took place in 1912 in New York. The congresses of this Association are open to all, but their findings are not binding upon anybody, and merely serve to express the opinion of the majority present. The work of this organization, however, has no doubt had considera-able influence in encouraging uniformity of testing methods.

(*b*) The *International Electro-Technical Commssion* was formed in 1906, and its establishment was originally due to the efforts of Col. Crompton, a member of the British Engineering Standards Committee. This Commission is composed of a number of national committees, each enjoying in greater or less degree the support of its own Government, and has performed valuable work in connection with the question of an international basis of comparison for the rating of electrical machinery. The work of this body, as well as that of the International Association for Testing Materials, has, of course, been greatly interrupted by the war.

(*c*) *International Standardization as Regards Aircraft Parts and Accessories.*

The Standardization of Aircraft Materials and Parts formed one of the earliest and most important pieces of war work undertaken by the British Engineering Standards Association, and was taken up when a request was received in June, 1917, from the Society of British Aircraft Constructors, asking for the formation of a Sectional Committee for Standardization in this matter. Such a Sectional Committee was at once appointed, and commenced work in August, 1917. Experience with military aircraft under the conditions obtaining in France, where the air forces of several countries were co-operating, soon indicated the need for a certain measure of International Standardization, not as regards the details of aircraft construction in general, but in connection with such points as affect the utilization, by the aircraft of one country, of spare parts, accessories and instruments belonging to the aircraft of another nationality. To take two examples only, the desirability of a standard series of dimensions for the size and spacing of the holes in the wooden hubs of propellers became evident; and it was further obvious that a great saving of time and expense would result if Allied agreement could be reached on the question of standard specifications for aircraft materials, so that materials purchased in one country to the Government specifications ruling there would be at once acceptable for a similar purpose in Government work in another country.

With objects of this kind in view, an invitation was forwarded by the British Engineering Standards Association to a number of representative authorities in the United States, including the U. S. Aircraft Board, the U. S. Bureau of Standards, the U. S. Navy Department, the U. S. War Department, the American Aircraft Manufacturers' Association, the Society of Automotive Engineers, the American Society of Mechanical Engineers, and the American Society for Testing Materials, asking that their delegates might proceed to England to attend an Aircraft Standardization Conference to be held early in 1918. This Conference took place in London in March, and was attended by fourteen American representatives. It considered briefly the differences in British and American Aircraft practice in rgard to a great number of topics, such as:—Nomenclature, Timber, Ply wood, Glue, Propellor Hubs, Electrical Parts, Instruments, Ball and Roller Bearings, Sparking Plugs, Magnetos, Wheels and Tires, Structural Tubing, Rigging, Rubber, Dope, Fabric, and Steels; and the American delegates left for the United States with the understanding that a further conference would be called together in a few months, and that in the meantime everything possible would be done to prepare the ground for an agreement.

As a result of the Anglo-American Conference just described, and at the wish of the Ministry of Munitions, it was decided that the various Allied Governments should be approached with a view to the constitution of an International Aircraft Standards Commission, primarily, of course, as a war measure, but looking also to the international questions which are bound to arise in connection with commercial aviation. An Organization Committee under the Chairmanship of Sir Henry Fowler, Assistant Director General of Aircraft Production, drew up a tentative constitution, under which it was suggested that this Commission should be composed of a number of separate National Committees, resembling in this respect the International Electro-Technical Commission. In the case of those countries having National Standards Committees it was felt that their respective Sectional Committees on Aircraft Parts would naturally be selected as the National Committees representing each country on the International Aircraft Standards Commission. The organization of the Commission proceeded on this basis, and its first plenary meetings were held in London in October, 1918, which the writer attended as one of the Canadian delegates. The countries represented were Great Britain, Canada, France, Italy and the United States, the scheme of organization was fully worked out, and a Constitution formally agreed upon (subject, of course, to ratification by the various Governments), after which the Commission proceeded to consider in detail a number of the points in connection with which the necessity for International Standardization had been suggested. International Advisory Committees were appointed to deal with these questions, and it was arranged that their reports should be considered at the next Plenary Meeting of the Commission, to be held in Paris some time in 1919.

It is, of course, possible that the changed conditions which have arisen since the Commission met will result in some temporary diminution of its activities, but its formation and organization is a very gratifying indication of the possibilities for future International co-operation in aircraft work.

(*d*) *International Screw Thread Standardization.*

During the war the problem of obtaining in large quantities a supply of interchangeable screws assumed considerable importance, and it soon became evident that if a system of screw threads could be obtained which would meet the requirements of two or more of the Allied countries, the supply of munitions would be greatly simplified. Much elaborate work in connection with Screw Thread Standardization had already been done in England, the British Engineering Standards Committee having issued as early as 1907 their report Number 38 on "Standard Systems of Limit Gauges for Screw Threads." In France the Société d'Encouragement pour l'Industrie Nationale appointed a Committee in 1891 for the Standardization of Screw Threads, as a result of which, and of an International Congress held at Zurich in 1898, the Metric "Système International" was decided upon. The Système International has, however, not as yet received very wide acceptance outside of France.

The French have also given considerable attention to the International Standardization of Pipe Threads, and some progress was made in the direction of an International system of pipe threads in 1914 at a Paris Congress, upon which France, the United States, Switzerland, Germany, Italy and Great Britain were represented. The work of this Congress was, however, not completed before the outbreak of the war.

It was felt in England that no agreement regarding the International Standardization of Screw Threads in the widest sense would be possible during the war, as no steps could be taken to that end without the consideration of the Système International and other metric thread systems, and this would widen too much the scope of the discussion. It was thought, however, that some working arrangement might be possible between Great Britain and the United States, which did not involve consideration of the metric system, and early in 1918, in response to an invitation from the British Engineering Standards Committee a preliminary meeting was held in London which was attended by delegates from the United States and Canada, and at which the subject was opened. This meeting was followed by a joint meeting of the various Sub-Committees of the British Engineering Standards Association on Screw Threads and Limit Gauges. From the various discussions it appeared that before any further International Conference on the subject could be held a good deal of preliminary work was necessary, as it was evident that the engineers and manufacturers of each country ought to be made fully acquainted with the work which had been done elsewhere in connection with Screw Thread Standardization. Steps have accordingly been taken by the British Engineering Standards Association to bring to the notice of the United States Government and the engineering profession in the United States the great amount of original work which has been done in England in connection with screw threads and their limit gauges. This work is very clearly set forth in a paper by Sir Richard Glazebrook presented at the New York meeting of the American Society of Mechanical Engineers in December, 1918.

The writer was one of the Canadian delegates present at the Conference in London in April, 1918, and at that meeting presented a memorandum (since published by the British Engineering Standards Association as (C.L. (M) 4537), in which attention was drawn to the very close relation existing between machine shop practice in Canada and that in the United States. This was emphasized by the replies to a questionnaire sent out to a large number of Canadian engineers and manufacturers, the consensus of opinion being that as regards screw thread work in Canada it would be natural to follow the standards of the United States, although the desirability of possible modification was recognized.

At the present time conditions do not seem quite ripe for the proposed Anglo-American Conference, and it is likely that before such a Conference takes place it will be necessary to await the report of the United States Senate Commission on screw threads and the results of other work which is at present going on in the United States.

The foregoing is a very brief and necessarily incomplete presentation of the outlines of an immensely important subject, in regard to which much work still remains to be done. Those interested will find a large amount of information in the various publications of the British Engineering Standards Association, the American Society of Mechanical Engineers, the Society of Automotive Engineers and other bodies already mentioned.

APPENDIX I

Published Standards and Specifications of the British Engineering Standards Association

Rolled Sections for Structural Purposes.
Tramway Rails and Fishplates.
Influence of Gauge Length and Section of Test Bar on the Percentage of Elongation.
Locomotives for Indian Railways.
Copper Conductors.
Tubular Tramway Poles.
Railway Rails.
Pipe Flanges.
Portland Cement.
Structural Steel for Shipbuilding.
Structural Steel for Marine Boilers.
Structural Steel for Bridges and General Building Construction.
Telegraph Material.
Electrical Machinery.
Tensile Test Pieces.
Temperature Experiments on Field Coils of Electrical Machines.
Screw Threads.
Pipe Threads for Iron or Steel Pipes and Tubes.
Trolley Groove and Wire.
Nuts, Bolt Heads and Spanners.
Ingot Steel Forgings for Marine Purposes.
Steel Castings for Marine Purposes.
Steel Conduits for Electrical Wiring.
Steel Bars for use in Automatic Machines.
Carbon Filament Glow Lamps.
Copper Alloy Bars for use in Automatic Machines.
Electricity Meters.
Limit Gauges for Screw Threads.
Cast Iron Low Pressure Heating Pipes.
Cast Iron Flue or Smoke Pipes.
Reciprocating Steam Engines for Electrical Purposes.
Boiler Tubes.
Cast Iron Pipes for Hydraulic Power.

Sparking Plugs for Internal Combustion Engines.
Keys and Keyways.
Steel Fishplates for Bull Head and Flat Bottom Railway Rails.
Wrought Iron of Smithing Quality for Shipbuilding (Grade D.)
Ammeters and Voltmeters.
Wrought Iron for use in Railway Rolling Stock.
Lampholders and Caps.
Cold Drawn Weldless Steel Boiler Tubes for Locomotive Boilers.
Screw Threads, Nuts and Bolt Heads for use in Automobile Construction.
Copper and Bronze Wire.
Heads for small screws.
Cast Iron Soil Pipes.
Cast Iron Waste and Ventilating Pipes.
Tungsten Filament Glow Lamps.
Copper Tubes and their Screw Threads.
Screwing for Marine Boiler Stays.
Broken Stone and Chippings.
Fishbolts and Nuts for Railway Rails.
Salt-Glazed Ware Pipes.
Copper-Alloy Three-Piece Unions.
Ceiling Roses.
Method of Specifying the Resistance of Steel Conductor Rails.
Tungsten Filament Glow Lamps for Automobiles.
Pneumatic Tyre Rims.
Wheel Rims and Tyre Bands for Solid Rubber Tyres for Automobiles.
Wall Plugs and Sockets.
Charging Plugs and Sockets.
Wrought Steels for Automobiles.
Tars, Pitches, Bitumens and Asphalts used for Road Purposes.
Electrical Pressures for New Systems and Installations.
Cast Iron Pipes and Special Castings for Water, Gas and Sewage.
Magnetos for Automobile and Aircraft Purposes.
Dope and Protective Covering for Aircraft.
Steel for Aircraft for Government Purchases in the United States.
Ball Journal Bearings.
French Metric Screw Threads for Aircraft Purposes.

APPENDIX II

Original Members of the Canadian Engineering Standards Committee

Chairman.—Sir John Kennedy, Consulting Engineer, Montreal Harbor Comm. and Chairman Advisory Comm. of Council, Institution of Civil Engineers.

Vice Chairman.—Capt. R. J. Durley, M.B.E., Officer, I/c Div. of Gauges and Standards, I.M.M., Ottawa; H. H. Vaughan, Vice-President and Chief Engineer, Dominion Bridge Co., Montreal.

Hon. Secretary.—Professor J. B. Porter, D.Sc., McGill University.

Lt.-Col. W. P. Anderson, C.M.G., Chief Eng., Dept. Marine, Ottawa.

M. J. Butler, C.M.G., G. M. Armstrong-Whitworth Co., Montreal.

K. M. Cameron, Supervisory Eng., Dept. Public Works, Ottawa.

E. Deville, L.L.D., Surveyor General, Dept. of Interior, Ottawa.

G. H. Duggan, Pres., Dominion Bridge Co., Montreal.

J. M. R. Fairbairn, Chief Eng., Canadian Pacific Ry. Co., Montreal.

L. A. Herdt, D.Sc., Chairman, Can. Electro-Technical Commission, Montreal.

R. Hobson, Pres., Steel Co. of Canada, Hamilton.

Wm. Inglis, Pres., John Inglis Co., Toronto.

Major W. J. Keightly, Chief Inspector, Military Stores, Ottawa.

A. B. Macallum, D.Sc., F.R.S., Chairman, Hon. Advisory Council, Ottawa.

D. H. McDougall, Pres., Nova Scotia Steel Co., New Glasgow.

J. C. McLennan, D.Sc., F.R.S., Professor of Physics, University of Toronto, Toronto.

P. L. Millar, G. M. Canadian Vickers Co., Montreal.

Lt.-Col. C. N. Monsarrat, Con. Eng., Dept. Rys. & Canals, Ottawa.

R. A. Ross, Con. Eng. and Member Hon. Advisory Council, Montreal.

R. F. Ruttan, M.D., Prof. Chemistry, McGill Univ. and Member Hon. Advisory Council, Montreal.

A. Surveyer, Con. Eng. and Member Hon. Advisory Council, Montreal.

A. Stansfield, D.Sc., Prof. Metallurgy, McGill Univ., Montreal.

W. F. Tye, Const. Engineer, Montreal.

E. O. Way, Chief Inspector, Weights and Measures, Ottawa, Ont.

With reference to the International Aircraft Standards Commission, the delegates to that body represented Great Britain, Canada, France, Italy and the United States. We were very gratified to feel that the activity and energy which has been shown in this country in the construction of aircraft during the war was recognized by an invitation to send delegates to this Commission. We hope and expect that the sectional committee of the Association dealing with aircraft parts will be recognized by the Canadian Government as the National Committee representative of Canada in connection with the deliberations of this International Commission.

I should like to add a few words in connection with some of the impressions that I gained during my visit to England to attend these committees.

The thing that impressed me most about the work which had been done in England was the extremely thorough and scientific way in which the Government, the industrial world, and the British Engineering Standards Association committees and sub-committees have gone into original investigations connected with standardization and war work. Take for instance the theory of screw thread measurement, which is really a very complicated and thorny subject. Even although the work was undertaken as a war measure they went about it in a most thorough manner and the amount of data and information accumulated with regard to that one subject is monumental. The whole thing was gone into, one might almost say, from first principles.

For example, when the question was raised in England as regards the desirability of having a thread angle of 55 degrees as in the Whitworth system, or 60 degrees, as in the United States standard form of thread, the matter was not handled by the simple expression of a number of individual opinions. They went into the thing very completely recognizing the necessity for example, that there should be a clearance between the crest and root of the male and female thread and that the fit should be on the working surface of the thread. Then the question of what these clearances should be was considered, what tolerances are possible in quantity production of screwed work, whether made in the lathe or by screwing tackle, or as the case may be. Then they considered the effect of varying the angle of the thread on these clearances. From that point of view a paper by James Taylor of Leicester points out that with very fine pitches it is permissible to employ a narrow thread angle, 45 degrees or something of that sort, whereas for coarser pitches it is desirable to have a wider thread angle which still permits a reasonable tolerance on the crest and root of the thread.

Then, the same question would be attacked by another investigator from the point of view of strength. In this connection research had to be carried out to form an idea of the actual distribution of stress in the body of the bolt, with threads of various forms. By an extremely ingenious method whereby a slice of celluloid was used, cut out into the form of the thread, the thread section was stressed by the action of what corresponded to a nut, and the distribution of stress was then investigated by passing polarized light through the celluloid, and by comparing the colored patterns produced. This example will give you an idea of the way in which such work has been carried on in England.

Similar activity was shown in connection with many other branches, the Aircraft Inspection Department, for instance. I do not think I am letting out a secret in saying that when I was in England they were investigating the possibility of using X-rays for the purpose of examining the structure of timber and much experimental work was in progress along every line of work. The Aircraft Inspection Department and the Aircraft Production Department of the Ministry have carried out a very large amount of original work, much of which, of course, has never been made public and will not be for some time. A great deal of research work in connection with the war has also been carried out at the National Physical Laboratory. Sir Richard Glazebrook was kind enough to show me something of the work which had been done in connection with aircraft design there. Further, in one of the big wind tunnels used for testing the resistance of aeroplane models they had started investigating the resistance of shells. For example, they had a number of model shells which were suspended on a very delicate measuring appliance in a current of air, in order to find out what effect stream lines applied to the shell base had upon its resistance. The same energy and earnestness of purpose characterized all these investigations, whatever branch of work one chanced to examine.

I would like particularly to point out the very great benefits that have accrued to industry from co-operation and through the pooling of information which took place during the war between different manufacturers. It is not too much to say, for instance, that the progress which has been made in the last three years in connection with aircraft design could not have been accomplished under ordinary conditions in much greater time; one estimate I heard gave at least one hundred years as the time during which an equal amount of progress would have been made under pre-war conditions. A great deal of that advance, in my opinion, was due to the fact that everybody was working to a common end. The information and experience obtained at each plant—the essential portion at all events—was communicated to the Aircraft Production Department of the Ministry of Munitions and it was then distributed where it would do the most good, and similar methods were adopted in the other departments of munitions work.

One of the things, sir, that we should guard against as far as possible is that of coming back to the old individualistic methods under which, as far as technical progress is concerned, every manufacturer or industrial concern works independently of the others. Perhaps I am touching on rather a thorny point there, but the progress which has been made, not only in England but in Canada as well, by the dissemination of information in the way that I have described has to me been a very striking circumstance.

I had the pleasure of visiting a large number of plants and engineering factories of different kinds and I should very much like to be able to tell you something of the things I saw. The impression left by a visit of that kind is, of course, very bewildering. For instance, one plant which I visited in Coventry, was turning out from one hundred to one hundred and fifty 300 horsepower aero-engines a week—an accomplishment which is really stupendous when you come to analyze what it means in the way of production I found the same amazing production in France—in every plant where I had the privilege of going, and I certainly came away with the feeling that the industrial development in England and France far exceeded anything that one could have thought to be possible."

H. H. Vaughan: I wish to say a few words in connection with Capt. Durley's most interesting paper. I think we should all thank Capt. Durley for what he has told us. While I have heard Capt. Durley on a previous occasion tell something about the things he saw on his trip, he has told us some things this morning that are really of very great interest. I wish, however, to refer more particularly to the work of the British Engineering Standards Association.

One of the most marvellous things about Britain's effort in this war has been not only the wonderful way in which all our population have entered into it, but—what most of us hardly expected—the deeply scientific manner in which she has tackled her war problems. On this side we are apt to think that English engineering is more a question of rule of thumb than is the case in connection with our Canadian and American work, but it is a fact that England has shown the most extraordinary energy in developing scientific research in connection with her war problems. Capt. Durley has told you some of it. It is amazing to realize what England has done in appointing competent, scientific men to investigate the problems she has come up against. That has not only had its effect on the war, but is going to have its effect in after times of peace. England has certainly revised her methods; she has taken a new lease of life in industrial work, and this country has a task before it not only to hold its export trade, but to hold its own home industries—unless we follow the English system.

The work of the Engineering Standards Association is only a very small item amongst the things that we should do, but I believe it is an item; I believe there are some things to be done here in connection with which this Association can be of value. As you know, I am one of the representatives of *The Institute* on that Committee, and I do not for a moment want to devote any effort to work that is not going to be of some value; I am sure that my associates feel that way too. We are willing to give time to a work if it is to be of any service, but we haven't the faintest desire to engage in a work which is not going to accomplish anything. We believe, however, that there is a field for this Association which will be of service to Canadian industry. We have applied to the Government for a grant. The Committee, as Capt. Durley told you, has been changed to an organized association, and that association has seen two of the Ministers, and the grant is now under consideration. I would much like to see this meeting endorse that application for the grant, and I have prepared a resolution which I move in the following terms:—

> "Resolved, that this meeting endorse the application of the Canadian Engineering Standards Association to the Dominion Government for a grant to partially defray its expenses during the ensuing year, and believe that this Association will be of great service in the industrial development of the Dominion."

The motion was seconded by Mr. Mountain and carried unanimously.

Mr. Francis proposed an expression of appreciation to Capt. Durley for his very excellent address, which, as the Chairman stated was seconded by everyone as the proposal was greeted with applause.

M. R. Riddell, Chief Engineer of Canadian Aeroplanes Limited then read his paper on: " The Development and Future of Aviation in Canada."

During the course of Mr. Riddell's paper the meeting adjourned for luncheon and on resuming for the afternoon session the paper was continued. The paper was illustrated by a series of slides showing the different types of aeroplanes and interesting processes of manufacture.

Discussion

In the discussion following the reading of this paper the author was congratulated on the comprehensive way in which he had covered the subject. It was pointed out that *The Institute* might give attention to two points in this connection, one was the necessity for the development of the technical or engineering side in addition to the practical, where much had already been accomplished by Canadians and the other point was the absolute necessity for the further study of meteorology in connection with flying, as flying depended so much upon weather conditions. *The Institute* should give consideration to both of these points if we are to share in the development of aviation.

Luncheon, Wednesday Noon

From the morning session adjournment was made to luncheon at which President Leonard presided. Hon. Arthur Meighen, Minister of the Interior, was the first speaker on the programme, who gave a brief but very effective address, delivered with the natural grace of a born orator. He felt it an honor to have the privilege of addressing *The Institute*, particularly because the department over which he presides has among its officers a very considerable number of the members of the engineering profession, some eight-six in all, all of whom with one exception are members of *The Engineering Institute of Canada*. In connection with the men in his department his greatest and most lasting impression has been the very high standard of efficiency and the almost universally high standard of devotion of whom he placed at the top the members of the engineering profession. In part, Mr. Meighen said: " Engineering as I understand it in all its phases, has to do with the collection of the energies of nature and their direction toward the uses of man; and if the use of man is in the military field, then the energies of nature come to bear a tremendous part in determining the issue of the conflict. We speak a truth known to all when we say that a great factor in the triumphant issue of the conflict through which we have passed is the part played by the engineering profession in making that success possible. One only has to visit the front in France; indeed, one only has to read what is at hand for all to read, concerning the various war activities, to comprehend how tremendous a part this profession has played in all its activities on both sides, and, fortunately, with greater success on ours." On behalf of the Government, Mr. Meighen extended a cordial welcome to the engineers of Canada.

Dr. Ira N. Hollis

The Chairman then introduced Dr. Ira N. Hollis, Dean of the Worcester Polytechnic Institute, who had kindly come from his home in Worcester as a representative of the American Society of Mechanical Engineers, of which he is a past president as well as one of the eminent engineers of the United States.

Dr. Hollis, who was warmly welcomed, on rising to speak, said:

Mr. Chairman and gentlemen: I want to assure you that for a number of reasons it is a real delight to me to come to Canada, one of them being that I promised two or three times, while I was President of the American Society of Mechanical Engineers to come to Ottawa, and every time I had to break my promise for some reason connected with our entering the war. This is, therefore, a redemption of my promise to friends in Ottawa and Toronto.

Another reason why I am glad to be here is that it affords me an opportunity of congratulating you on the statement of the aims of your *Institute* which appears on the cover of your *Journal*. We, as engineers often fail to understand the significance of our own profession. It is not necessary to shout from the housetops, but who has ever produced a better motto than the following for an *Institute* such as this:—

> "To facilitate the acquirement and interchange of professional knowledge among its members, to promote their professional interests, to encourage original research, to develop and maintain high standards in the engineering profession, and to enhance the usefulness of the profession to the public."

Numerous committees of the American Society of Mechanical Engineers, the Society of Civil Engineers, and the Engineering Council, have endeavoured to state the aims and organization of our societies, but with all our attempts in the past we have not produced anything as good as this. I think in the American Society of Mechanical Engineers that the percentage of technical papers has decreased in proportion as the papers intended to be useful to the public have increased. I do not know whether that is the best thing for a technical society or not, but I do know that it bids fair to make our profession in the United States a profession of better citizenship. With regard to the technical papers, we must never forget that the purpose of any technical organization like ours or like this is mainly educational. That is what the association is for—to teach its members how to do their work better and how to serve and to build up their relations with the public in a better way.

Another reason for my coming here is deeper and broader than anything I could state in regard to our profession; it relates to your part in the war. Although much smaller in population than the United States, you, gentlemen, are our older brothers in arms. Upon your shoulders fell the first shock of the war as you rallied so splendidly to the defence of human liberty. I can state nothing better in this connection than two or three sentences contained in a letter from a relative on the other side, who went in at Chateau Thierry and ended up at Stenay. Every one of his letters contains some stronger statement of this sentiment. He said: "As the time goes on and I learn more about this war, I take my hat off to the British and Canadians who fought here in the beginning. We came in with our army as a large reserve, we fought in some important actions and we were getting more troops to the front, but we came in at a time when the Germans were putting forth their last great effort after time for ample preparation, whereas the British and Canadians had to prepare while they were fighting. I take my hat off to them." I cannot help feeling, gentlemen, that is the finest reason of all for my coming up here, to salute you.

I look upon our race as the inheritors of the liberties of this world. After all, we have the English ideals of government on this continent and we have to make all those who come to our shores from other countries English in ideals. South of the line we call ourselves Americans, and you Canadians, but we are all Americans in the freedom of the atmosphere in which we live. I come from that federation of states which split off from the mother country more than a century ago through a document, after all, gentlemen, written by Englishmen—one of the noblest statements in our language, next to the Magna Charta. We are all Americans, and we have here on this continent the best league of peace that I can imagine. No fortifications on our boundaries and war is unthinkable north of the Rio Grande. Our league is written in the hearts of two peoples who do not resort to bloodshed to settle their differences. As we meet here, the Peace Conference is sitting in Paris and is working toward definite action—for what? It will be the most important decision ever made in the world, and it will be framed into some kind of statute, where the cowardly bully who has bathed the soil of France in the blood of our sons and covered the ocean with ships and the bodies of the innocent is up for sentence and to be rendered impotent until the centuries shall have turned him into a Christian.

So far as our profession is concerned, I am glad to bring to you, gentlemen, the greetings of the American Society of Mechanical Engineers. We have the same warmth of feeling towards you that we have towards our members in the States, and we congratulate you on the formation of an *Institute* containing all the societies of engineers in the youth of those societies. We have a harder task ahead of us in the United States to make one great society of engineers, because each separate society has already crystalized into its own methods and its own policies, thus rendering difficult a union of all.

The world's history has been marked by three periods of progress. I like what Mr. Meighen said about the engineers being a warrior profession. Some creature in the remote past seized a club in his clutches or claws to defend himself against some other creature. He there crossed the border-line between the animal and the man. From that has grown the reasoning power which makes the difference between us and the other creatures that God has placed on this earth. From that period up to the time of a poor Scotchman, we went through the inventions necessary to maintain and sustain life on this earth, and that forms the first great period of recorded history, previous to about 1760. In the interval came the second stage in the development of man; it was that spiritual relation that began with the birth of Jesus Christ, making life worth living. And we have entered in this century, the third period, namely, that period where man makes use of power external to himself.

At the beginning of one of H. G. Wells' books you will find this sentence: "Civilization is advanced in proportion to a man's control over power outside of himself." Through what James Watt gave to mankind a little over a century ago, we have entered this third period of the twentieth and succeeding centuries, the possibilities of which are not even thought of, inasmuch as we can use the power and energy that God placed on this earth for the development of man into something higher and far better. Some day this century will seem but as the dark age to our descendants, and that mainly through the control of power entirely outside of man. I speak of this, gentlemen, because that gives you plainly and at once the function and the place of the engineer. Yet what does all his work amount to without the spirituality that makes life worth living?

I was speaking in New York, not very long ago, on the subject: " Is Science Safe for Mankind?" I dealt with the subject in all seriousness, for if science can be turned into a destructive agency to cover the earth with blood and to destroy all that has been previously produced it is not safe. How can it be made safe? It can be made safe through our profession, gentlemen, by approaching the discoveries of science and the application of science in that reverent attitude that will forever prevent its being used as a destructive agency. That, to me, is what our profession can do. What does it amount to if we produce another railroad, another dock, a finer type of bridge, or a better machine, if it but leads to a conspiracy for the control of the earth? What does efficiency amount to if that, after all, is the end? God deliver us from that kind of efficiency that places in the hands of the privileged few the control of the masses who are to be trained to service very much as the ox or the horse is trained.

Another feature of the engineering profession is its opportunity to teach that proper attitude of mind towards the patrimony that nature has handed down to us on this continent so that we may prevent its being used or wasted in the destruction of mankind by self indulgence or war.

May I add a word or two about what the engineer has learned from this war? I can speak, perhaps, for the United States as I saw it, before we entered the war. One thing I can say: we were the most wasteful people on the face of God's earth. We had found in our country immense resources, which we prided ourselves on exploiting for the luxury and the greed of a great many people. This war has brought to our profession a different vision, and we have certain things to think of. The first is found in the work, " conservation " which has grown up in the United States and which I have no doubt you have in Canada. What is the significance of it? It means the saving of everything that will help to perpetuate the influence of the Anglo-Saxon race; it means the saving of anything that will promote our ideals as a race; that our language and our efforts may civilize this whole world, the Germans as well as the others I cannot help feeling that there are two or three aspects of that to which we have given but little attention. My interest in the matter was aroused in Massachusetts, because during the past year or eighteen months I have assisted in the conservation of fuel for that state. Through propaganda, through speaking on the subject, through indicating to the New England conscience that they ought to save, and, besides, that they had to or they would not get the coal during the winter, we have managed to make a real reform. In Worcester, through an effective committee of manufacturers, where there are 200,000 people, during the past year we saved, not by cutting off any industries, but by actual scientific study of the problem of saving in our power stations and in our factories, 125,000 tons of coal—a million dollars saved for that city alone during the past year. In a state which takes 12,000,000 tons of bituminous coal in the course of a year, we saved at least ten percent, and we were rash enough to promise Mr. Garfield and the Fuel Administration that we would take two and a half million tons less during this year than we took the previous year. Gentlemen, we had just touched the fringe of this subject when the armistice was signed and the bottom dropped out of the whole movement. Are we going to permit this effort throughout the United States to break down? Not at all.

In my state—but it is not my state; I was born in Kentucky—when I went as a professor to Harvard College years ago, my picture was published in the Louisvile Courier Journal; and lest I should become vain on that account, my photograph was bracketed on the same page with a man who had been hanged in Louisville the day before. One of my friends saw that picture, an old farmer whom I had known in my youth, and who was living in Jefferson County, Kentucky. He said to me: " I see you have resigned from the Navy and are going to Harvard College as a professor." I said: " Yes." He said: "For God's sake don't do it; you are going amongst those d—— Yankees." The New England people do not like that story very much, but it shows that sometimes misunderstanding can exist among our states, the same as I have sometimes heard of between Canada and the United States. But whatever misunderstandings have occurred between those two countries, they do not approach some of the former bitterness between the North and the South; do not approach some of the misunderstandings between the different states. You see, that man who was talking to me about New England knew nothing of it; he did not know of the generous impulses that are to be found there, and of the generous attitude of the people towards everything that has a value to the public. Gentlemen, you will find in New England the same broad generosity to be found in Canada, if you look for it.

Coming back to the matter of the question of coal in Massachusetts; by organizing and by co-operation, the things that the war has taught us, we can save at least twenty-five per cent of the coal that has hitherto been used, cutting off three million tons, saving at least $20,000,000, and helping that state to hold its place in the manufacturing activities of my country.

The aspect of saving in connection with coal is only one corner of the picture. We have learned during the past year to effect saving in food, in order that we might supply our Allies on the other side, as well as our own soldiers. We have reduced the amount of transportation for unnecessary commodities and thus we have made our railroads more effective. Saving can be effected in every respect—even in respect of our water power. Indeed, there is nothing in which there is not room for further study and co-operation and co-ordination of effort to the end that America and Canada too may remain as long as possible the chief influence for good on this earth.

I have heard something of standardization since I have been here; I think that next to conservation, that is the most important subject we have to deal with. There is an enormous amount of waste in the production of a great many articles which are duplicates. I cannot tell you how many thousands of different parts and kinds of steel were formerly ordered for automobiles; you probably know that better than I do. But there is not one aspect of manufacturing connected with engineering that is not susceptible of improvement by co-operation amongst manufacturers, to the end that articles for like purposes shall be produced in the same way and shall be standard. I think our economic supremacy among the nations is dependent upon that.

Then, there is the labour question. During the past six months we have in the United States been very much involved in the question of the relation between labour and the employer and in the re-employment of soldiers. I do not know any men who are better qualified to take a hand in that than the engineers. But in this connection I want to destroy what may be called another illusion; a man is not competent to organize and direct industries or to handle labour questions simply because he is an engineer, but he may become competent by interesting himself in them if it is his natural field. I have heard a great many people say: you ought to put engineers into the Administration. I say, not unless they fit themselves to go into the Administration. I have heard again that the engineer ought to take an active part in politics and in the public life of his country—not at all, unless he fits himself for it; and it is his business to fit himself. In other words, our profession is a great profession only in proportion as we make it so, and not by reason of the fact that we are called engineers.

We keep talking about this having been an engineers' war, about machinery having won the war. But it is the blood of our sons which has won the war; it is the men who have done it. When I heard the statistics read by your president yesterday, I rejoiced that men in my profession, members of this *Institute*, could so help the world in this crisis. I am going to ask that our societies in New York prepare similar statistics, and we will see if we can approach your record. Of course, we were not in it so long; I sometimes think we were tardy in getting in. We got there, and we might have done a great deal more and suffered a great deal more if you fellows had not pretty nearly cleaned the thing up before we got in to help. Nevertheless, we ought to keep in mind the fact that machinery alone did not win the war; what brings such a victory as ours is the willingness of men to give their lives for a great cause.

The same thing, gentlemen, may apply in time of peace; a man may help his country and the community by willingness to dedicate himself to a profession, to give himself to the advancement of the human race; and that willingness is expressed in the one word, "service." If I were to try to visualize the condition necessary to the progress of the world to-day, I would express it in two words, in the nature of a formula for our profession: "to serve." At the beginning of the war we heard very much the phrase "to make the world safe for democracy." After all, that is but a method of saying that we are seeking a form of government for the human race that will permit every individual to develop the maximum of his possibilities in the service of mankind. That is what democracy means. Our profession will have great power in the future of peace, in the league of nations, because no league of nations will last if the proper spirit is not there. But we will keep the peace by a reverent attitude of mind towards the energy and materials and that patrimony which the good God has given us. Without that attitude of mind, we cannot achieve what should be our great purpose.

About two months ago it was proposed in New York that the American Society of Mechanical Engineers go to London for a meeting in a year or two. What I want to see within the next two years in London or Paris is a great meeting of all the engineers of this continent—civil, mechanical, electrical, mining—met together to rejoice over that peace that I hope is going to come out of the present proceedings in Paris.

I hope to see you, gentlemen, at some of our meetings in the future.

Afternoon Sessions, Wednesday, February 12th

After the completion of Mr. Riddell's paper and the discussion thereon, Major L. Anthes, member of the Advisory Council of Soldiers' Civil Re-establishment, was introduced and before reading his paper, emphasized the necessity for individual and general co-operation on on the part of everybody who is interested in our national life. The reconstruction period is one in which the engineers of this country can assert themselves. We all admit that they are men highly trained technically broad in their ideas and in their general knowledge. If engineers were much more closely associated with industry in this country it would be very much better for the engineer and the technical man.

Continuing, Major Anthes read his paper, the subject being

Soldiers Civil Re-establishment

Nothing is so disturbing to civilization as a world war carried on for a number of years and increasing in intensity, and involving nation after nation as the years go on. War is most insistent and insatiable in its demands, it takes of our best, and gambles with a world's resources with an intensity that shakes empires to their very foundations. All so-called normal conditions of life are not only disturbed, but in many instances revolutionized, and while we have the precedents of other wars to go on, such are the varying conditions with the march of progress that the problems of reconstruction become more involved, and the readjustment more complex. Happily the advance of intelligence and the adaptability of science have created means whereby solutions may be arrived at which were impossible of attainment in years gone by.

Whereas the shock of war, with the devilish contrivances that modern sicence has contributed to its destructiveness, has carried millions of men through almost inconceivable trials, fortunately an intelligent sympathy has been aroused, and a sense of duty and responsibility awakened in those who have not undergone the stress of battle so that it is easier to obtain the co-operation of a thankful people in helping to reclaim and re-establish those who have faced a sacrifice essential to the deliverance of a democratic world from the soulless might of tyranny.

The accomplishment of placing our war heroes again in civil life, with the greatest of speed and the least disturbance to economic conditions, is in itself the essence of reconstruction. Even as each individual soldier on the battlefield of Europe contributed in a measure to the overthrow of despotism and the winning of a world's freedom, so is it essential that each individual in a community shall contribute in some measure to the task of readjustment which is now demanded of this country.

I desire briefly to outline the machinery that has been designed and put into operation for the accomplishment of the purpose for which our department has been created. The Department of Soldiers' Civil Re-establishment, as is now generally known, taken up the control of the disabled soldier after his discharge, and tries to refit him to a normal condition of life as speedily as possible. For the purpose of re-establishing the soldier who has been more fortunate than his disabled brother, and whose only drawback is his severance from normal pursuits on account of his service overseas, the Information and Service Branch of the S. C. R. (late Demobilization Branch) has been created. After long conferences with the Dominion Department of Labor, Provincial Departments of Labor, and Returned Soldiers' Commissions, it was decided that the opening of a chain of Labor Bureaux from coast to coast, under Provincial control and administration, and with Federal supervision, was a logical means of bringing the man desirous of work into contact with employment. It was unanimously agreed that in all matters of employment the returned soldier was entitled to preference, and that this preference should be shown him. While at first it was suggested that a separate chain of labor bureaux should be established to handle the returned soldier, it was ultimately decided, and I think logically, that the only way in which the soldier could be given preference was to direct all applicants to the one chain of labor bureaux, where all opportunities for employment would be kept on record. In order to make these labor bureaux as efficient as possible it is necessary to win the co-operation of the employer of labor, and to do this he must be given efficient service. Nothing is more aggravating to an employer than to be harassed by a variety of independent solicitors for employment agencies and the confusion which results therefrom. Therefore, under the Employment Co-ordination Act, the Provinces have agreed with the Federal Department of Labor to pass legislation closing the independent labor bureaux, and to co-operate with the Dominion Government in creating a chain of governmentally controlled and supervised bureaux.

Labor scouts, who are, plainly speaking, employment salesmen, solicit the employer for his labor requirements, endeavoring to sell him a satisfactory and efficient labor service. The employer, on the other hand, will communicate his requirements to the nearest Government Labor Bureau, and will report on forms supplied periodically by the Federal Department of Labor, the number of employees on his payroll, and the prospective increase or decrease for the period following. In this way an intelligent survey of employment conditions throughout Canada will be maintained. Federal and Provincial clearing houses, Federal and Provincial superintendents of labor, and standing committees on labor—Federal, Provincial, and Municipal—will contribute to the stabilizing of this all-inclusive system. In each of these labor bureaux throughout Canada will be a representative of the Department of Soldiers' Civil Re-Establishment, whose duty it will be to meet and interrogate each returned soldier applicant, directing him to the proper authorities as his case may require, or if he is ready for employment, obtaining for him that preference over the civilian applicant that is his just due. In each military district is a unit of the Department of Soldiers' Civil Re-establishment which takes up the direction of the disabled and discharged soldier as he is released from the control of the military in his district. A Unit Service Officer administers the machinery which has to do with the soldier who is seeking employment. Special representatives under the direction of Information and Service Headquarters at Ottawa, keep a constant survey of employment conditions and assist in organization in their respective districts. The close liaison between the Department of Soldiers' Civil Re-establishment, the Federal Department of Labor, and the Provincial Departments of Labor, should make for the greatest efficiency in the placing of the soldier in employment and helping him to attain his pre-war efficiency.

The foregoing is an outline of the machinery that is essential in this work, but so far as the returned soldier is concerned, it is only contributory to his re-establishment in civil life. I do not desire to dwell at length on the severe hardships, sacrifices, and disabilities which, during the last five years have tended to remove the man who has served overseas, from normal conditions of pre-war times. If the public at large does not realize by this time that the returned soldier cannot be expected to take up where he left off when the call to arms came, and quietly settle down to pre-war conditions, the fact will never be realized.

Sympathy and co-operation are words which have been extensively used in reference to the re-establishment of the soldier and it is our desire to justify the use of these two words by seeing them put into practical application. It has been necessary to bring to the attention of employers, and especially industrial employers, the fact that a man who has suffered the shock of battle cannot be expected to settle down to his occupational pursuit with the same facility that he did in prewar times. Noisy machinery, the confinement of workshops, and the general change of atmosphere, are bound to have a more or less depressing and disturbing effect. We are asking industrial employers to take a direct interest in the returned soldier going into their plants, give him more or less freedom to come and go at his own pleasure during the first few weeks or months of his employment, and at the same time pay him the standard wage for a full day's work. This, I grant, is asking the employer to make a personal sacrifice, but when it is brought home to him that the sacrifice he makes in this way cannot begin to measure up to the sacrifices that have been made for him, it is not difficult to make him appreciate his responsibility and to win his co-operation.

While the absorption of the mechanic, and the man accustomed to less skilled labor, presents no very serious problem,—what of the thousands of officers, students, and men of professional calling who have lost ground through the hiatus of war? Many of the officers were boys who went from banks, offices, and colleges, joining the ranks before going overseas, and by persistent application, intelligence, and outstanding bravery, won not only minor but senior rank on the field. And, furthermore, senior rank brings senior pay,—and is it to be expected that these men of oustanding ability should go back to the point where they left off when they answered the call to arms? It is true that many of those in the class which I have just referred to, have been promised their old positions upon their return—but is it reasonable to expect that they can accomodate themselves to their individual pre-war status?

Of particular interest to a body such as yourselves is the young engineer and the engineering student. In the ranks of the first contingents of Field Companies that went overseas, was a large number of graduate and undergraduate engineers. Owing to the restricted size of a field company, many men of this class joined the Artillery, Infantry, and other branches of the service. A review of the number of technical students enrolled for technical courses during the past four years, as compared with pre-war enrollments, to say nothing of broken courses, reveals an appalling state of affairs from an economic standpoint. Owing to the necessity of quick decision and immediate action which the exigencies of war demand of the military engineer, there is not time for mathematical precision so necessary in the civil calling of an engineer, and broad formulæ and more or less primitive expedients in many cases are applied. While this had a tendency to broaden a young man's comprehension and make him more self-reliant, how is he going to meet the more technical demands of his profession when he returns to civil life?

In Europe and in the United States, the large engineering bodies have realized their duty towards the man who has contributed so largely to the success of the Allies in a war which has been essentially an engineering war. "In Great Britain, the Ministry of Labour established an Appointments Department early in 1918, to assist and advise those requiring professional and business appointments on their return to civil life. There are two divisions of this department; one deals with training, the other with employment. Before demobilization an officer may fill in a card stating his wishes as to employment, his qualifications, etc., and this will be forwarded to the Appointments Department. The United Kingdom has been divided into eleven districts and in each there is a District Directorate. The number of men placed in positions has increased steadily. In some cities of the United States there are special professional sections of the U. S. Employment Service devoted to the placement of engineers, technicians and teachers. In Chicago there is a special office of the employment service devoted to the placing of qualified engineers and teachers. Its work has been very successful as shown by the following figures:—Organized July 1, 1918, it made 400 placements in July, 1100 in August, and 1600 in September."

Being myself a military engineer, and having come into contact with a great many of the graduate and undergraduate engineers who have gone from this country overseas, this is a matter to which I have given considerable thought.

It has been suggested that all overseas engineers be asked to form an engineering organization for the promotion of their own interests. While there is much that can be said to the advantage of such an organization, I believe that if the engineering bodies of Canada already in existence are willing to bear a proportion of the responsibility of seeing their overseas membership again established in civil life, such a step will be unnecessary.

I have not attempted to outline every feature of the work of the Information and Service Branch of the Department of Soldiers' Civil Re-Establishment, as it would take too long, and the outstanding principle would be more or less submerged in detail. In closing I just wish to draw the attention of your organization to the fact that in the matter of vocational training in our department, the returned engineer is playing the most outstanding part. The Director of the Vocational Branch, Mr. Segsworth, is himself an engineer, and many others will be found throughout his organization. Just as the war has demanded all that is best in engineering skill and operation, so do the problems of reconstruction demand the same application of engineering principles.

In response to a question from E. M. Proctor, A.M.E.I.C., as to whom returned soldiers who are engineers should apply for information, Major Anthes stated that the engineering organizations were being asked to appoint Committees to act in co-operation with the Information and Service Branch of the Department of Soldiers' Civil Re-establishment. Lieut F. S. Rutherford, A.M.E.I.C., was being released from the Militia Department for the purpose of getting in touch with the returned engineers. The head office of the department in Ottawa is at 130 Queen St., and in Toronto at 287 Queen St. West, where information will be given out.

Referring to the part which engineers are taking in addition to the Department of Infoımation and Service of which Major Anthes is the head, Professor Haultain stated that "there are two other branches which have engineers at the head. There is the branch which is responsible for the manufacture and supply of artificial limbs, which has at its head Major Coulthard, a mining engineer. The Vocational Branch has at its head Major Segsworth a mining engineer. Major Segsworth's divisional chief in Nova Scotia is a mining engineer; in Quebec he has an electrical engineer; in Ontario, I am in charge; in Manitoba, another engineer is in charge and in Alberta there is also an engineer; I do not think there are engineers in charge in Saskatchewan and British Columbia. On my own staff there are forty odd engineers and architects and that is in Ontario alone. We have room at the present time for twenty more engineers, if we can get them. If any of you know of any returned engineers who would like to take up this work, we would be glad to hear of them."

Col. Leonard: "I may say, as a concrete example of the work that this Department is doing, that we got from Prof. Haultain's department, in the industry with which I am connected, a man who, before the war, was a labourer. To-day he is one of our assayers, and is performing most excellent service.

The discussion was then closed.

National Highways and Good Roads

Capt. J. Duchastel, M.E.I.C., Honoury President, Good Roads Association, before reading his paper, which appeared in the February issue of *The Journal,* stated that his idea in presenting the paper was to elicit discussion upon this very important subject, which means more to Canada at the present time than it ever did before. It is understood that the Federal Government is on the verge of introducing a measure to aid the construction of good roads in Canada. This is a new venture and probably there may be some difficulties in the way. There are certainly some problems that will have to be dealt with immediately.

Mr. Francis: "Mr. Chairman and Gentlemen: *The Institute* is to be congratulated on having one as competent as Capt. Duchastel to present to it this highly important subject. He points out the four underlying principles in connection with road improvements. We all know that no road improvements can be carried out unless it is part of a comprehensive scheme; unless it is under competent authority, unless a standard specification is adopted, and we will all agree that no grant should be made unless an undertaking is given to keep the roads in proper condition and to provide for their maintenance. I have much pleasure in moving a hearty vote of thanks to Capt. Duchastel for his paper."

C. A. McGrath, M.E.I.C.: "Mr. Chairman, a few years ago, in a moment of weakness, I found myself accepting a seat on the Highways Commission in the Province of Ontario. I repeat, sir, it was in a moment of weakness—possibly a willingness to be agreeable had something to do with it. I think, however, that it was probably due to the fact that the then Premier, the late Sir James Whitney, practically conscripted me. Sir James Whitney, in my judgment, belonged to a type of public man very essential in these days, with the country faced with great problems—problems requiring the best attention of every citizen in the country. Well, I became a member of the Highways Commission, and now I find myself paying the penalty by being called on to discuss very briefly the road question as brought forward by Mr. Duchastel.

Let me confess at once that I never brought to the highway problem any technical training of any value in the building of roads. We all know that the type of highway depends upon the traffic it has to carry and the availability of road material. We all know that not a penny should be put into a good road until there is a thoroughly worked-out scheme for the maintenance of that road, and which would go into effect from the moment the road is completed. We all know that good roads cost from $5,000 a mile up to $20,000 and $25,000 and even higher. Therefore, it is a problem of tremendous financing, especially in a young country where roads are essential to its development.

While it is some time—1914, I believe—since I was associated with the Ontario Highways, and I have not kept myself in touch with road building policy, still I am not disposed to agree with Mr. Duchastel if I understood him to suggest, that the proposed Dominion grant should be divided amongst the provinces on the basis of population alone. That policy might be sound in a thickly settled and finished country, but in a country with large areas in process of settlement, I consider the area factor has to be taken into account. My recollection is, that that principle is embodied in the provision for subsidizing roads in the United States. As I am not a practical road-builder I shall not take up any of your time attempting to discuss that which I know little about. There is, however, a feature of the problem, that I would like to speak on for a few moments.

Those of you who may have looked over the report of the Ontario Highways Commission as presented in 1914, will find a suggestion in connection with road development. It is the making use of a few of our most successful business minds in an advisory way. I am not suggesting that engineers are not business men, but we have men, engineers and others, who have pushed their heads through the crust of the business world, who have got the habit of doing big things in a big way. There is ample work for the biggest of them, in working out ways and means for stimulating road development.

From time to time I have advanced that idea, with, I must confess, no success. Before the war I was told that such men could not be taken from their own business interests. We now know they can, as many rendered very splendid services during the great crisis through which the world passed during the last four years.

As I see it there are two main systems of highways. There is that system necessary to meet the business needs of the producer, the agriculturist, the man engaged in the basic industry of Canada. The construction of roads in that system is of primary importance. The other system is what might be termed revenue producers—motor tourist roads.

Respecting the former—those to meet the business needs of the producers,—I understand the Dominion Government contemplates stimulating their development by large subsidies to the various provinces for expenditure through their respective Highway Departments. The motor tourist road will have to remain in the background unless ways and means are worked out in order to carry their development forward also. To that subject I desire to briefly draw your attention trusting that I can show that they also are very necessary if for no other reason than as producers of revenue to Canada.

We have to the south of us a great people, a nation of one hundred million, with an immigration during the 10 years ending the 30th June, 1914, which averaged 1,000,000 annually. Its natural increase, births over deaths, was probably the same. In other words, in every four or five years it was adding to its population a number equal to the total population of Canada, while without any immigration its natural increase in eight years is equal to our entire population. I think we are pretty well agreed that the United States of America, if not the wealthiest nation in the world, is certainly very close to it. In other words, we have at our very doors a country—a vast reservoir of people—with a vast reservoir of wealth. So far as I am concerned I am not worrying about any Canadian immigration problem. I have a pretty fair idea where to find people to place on our vacant lands. I repeat, a reservoir of people with vast wealth and lying within parallels of latitude where it is uncomfortably hot in mid-summer. That means but one thing, a great amount of wealth expended in travel—to their own mountains, to Europe and Asia—and what about Canada, with its northern latitudes? They will come to Canada, with its cooler summers, if Canada is made attractive for the tourist. Have we then the vision to look forward to the possibilities of such business, with the revenues which will come with it? The tourist traffic has been the life of some of the older countries of Europe. I will put it figuratively; let us prepare the target, provided we believe we can produce the goods.

May I draw your attention to the Laurentian hills that traverse the Province of Quebec and westward through Ontario. I never look at them without feeling that we have great resources in their beauty, such as winding valleys, wooded slopes, towering hills, emerald lakes and fishing streams, and that if we only had them explored with the view of having them used for tourist trade, we would find there an opportunity to do much towards the development of Canada through attractive summer hotels, motor roads, etc. Let us assume that we had a motor road running up the Gatineau Valley for seventy-five miles, thence westward across the mountains to Pembroke, then down through Algonquin Park and on to Toronto. What a wealth of colouring is to be found along such a route in the autumn! Of course, it would cost a vast sum of money, but I have confidence that it would bring a splendid return to the country. If I am right, Canada has a tremendous asset awaiting development. A few years ago I suggested to the Government of the Province of Quebec the desirability of setting apart a few explorers to hunt out the beauty spots for chalets, etc.—the expenditure would be small—they might be organized into a tourist development branch of some existing department of the government.

I go down the St. Lawrence River frequently. Where is there another St. Lawrence River? Fifteen or twenty miles across, with some of the most beautiful scenery within its valley. What are we doing towards developing the St. Lawrence river for tourist purposes? I know of nothing being done in that direction. The one objection to the St. Lawrence is that the water is rather cold for bathing. But that is a problem that engineers can grapple with, and that difficulty can be overcome. If such a government service as I have referred to existed, it could advise those who have summer hotel resorts along the river, where they can find locations in their immediate neighborhood where it is feasible to hold water at high tide in artificial reservoirs which can be heated by the sun's rays or mechanical means. Why should the field geologists and timber explorers of our respective governments not be mobilized under some central organization for a few years, all being called upon to hunt out what Canada has to offer in the way of attracting tourist motor travel?

Now I come to the last stage of my remarks. I know that no nation on earth has the opportunity that Canada has, in view of the enormous population and wealth immediately to the south of us. I believe Canada has outstanding attractions for the tourist. If I am right in this latter view, how are we to connect the two? It will not only be a question of tourist roads, but tourist resorts, with all that that implies, if it is to be successful. I quite appreciate that the Government cannot take, under the country's existing financial obligation, large sums of monies for such roads. How are they to be financed? It is a great problem. It requires the fertility of mind of the business man who has got the habit of doing, as I have already said, big things in a big way, who in pushing his head through the business crust of the country, has been forced to overcome great obstacles. I suggest no solution, though I see no reason why motors using "tourist roads" shall not carry an additional license.

My suggestion is for the government to select, say, three of our most capable men, to work in an honorary way and in an advisory capacity. Give them a very small staff. I am sure each Provincial Government would undertake any work for them looking to the determination of what its asset is in the way of tourist attractions. The problem of financing such roads would be one demanding that resourcefulness of mind and courage that has enabled many great things being done in Canada in the past. In fact it seems to me they might be of very great assistance to the Dominion Government in many issues that will arise in connection with the expenditures of the proposed subsidies to the highways of the country. In connection with this latter, I would say that the chief highway officers of each province should be called into convention and a standard of Provincial Departmental Highway be agreed upon. This is the day of standardization. No Dominion monies should go to any province until the same has a highway department with the necessary technical qualifications fully up to the agreed-upon standard. Occasionally some good thing happens through an accident. The sound way however is through systematic investigation and real thinking. A well-known consulting engineer quite recently said: "the nation that does the deepest thinking in the next ten years, is the nation that is going to lead the world."

A. W. Campbell, M.E.I.C., Dominion Highways Commissioner: "Mr. President, Ladies and Gentlemen; owing to the peculiar nature of my position I am here this afternoon more to listen to your discussion, and to get some information, than to attempt to give any information. I have listened with a great deal of interest to the valuable paper that has been read. It contains a great deal of practical information, and it has marked out some lines in which we might engaged for a little while in a very valuable discussion. The questions which have been brought out by that paper are questions which are of very great interest at the present time, in laying down what may be called the elementary methods of doing something towards the improvement of our roads.

One very important question has been raised by Mr. Magrath and that is as to the development of our natural resources and the opening up of the beautiful scenery which extends throughout the length and breadth of this country from ocean to ocean. The importance of making that development at the present time can be readily appreciated from the fact that the motor vehicle is becoming a very serviceable one now on account of its pleasure-giving proclivities and also on account of its being a business vehicle. In connection with the question of good roads it is interesting to know that the people of this country have something over $200,000,000 invested in motors to-day, and that the revenues derived from the operation of motor cars amount to a very considerable sum. The revenue derived by the province of Ontario is in the neighbourhood of $1,250,000, which should really go towards the improvement of roads.

The broad question of how the resources of this country should be developed along profitable and desirable lines, is a very important one. As Mr. Magrath has already pointed out, it is a question involving very large sums of money, going up into the millions. This is largely an engineering question, and no doubt, in the expenditure of that money, engineers who are working in Canada today will be employed, as well as many more, especially those who have been serving at the front during the last four years, who have been engaged in railway and highway construction, and who have had that peculiar training and experience that will fit them to assist us in the development of these roads.

There are some features in connection with the United States measure which has been brought to our attention in this paper, to which I would like to refer. One of these is as to how any money that may be appropriated by the Federal Government will be divided among the provinces. It has been pointed out that by the legislation in the United States, area, population, and road mileage in the different states are taken as the basis, one-third upon each score. It is suggested by the paper that the distribution should be made on the basis of population. That is a suggestion as to which a discussion has already arisen. I should very much like to hear this point more fully discussed. The question of maintenance has been very prominently brought to our attention, and I do think it is a matter of very great consequence. I particularly agree with that feature of the paper, and also with the suggestion that the provincial department should be responsible for road maintenance. It was not made quite clear to me as to how this was going to be brought about. In order to have jurisdiction, I suppose the jurisdiction of the municipality should pass to the province, and the province should then control the expenditure for maintenance, and also be responsible afterwards for any accident that might happen on the road and for the maintenance of the road in proper condition. These are only some of the smaller points that have been brought to my attention by this paper, and I do hope to get a lot of information from the discussion which will take place pursuant to the paper."

George Hogarth, M.E.I.C., Chief Engineer, Department of Highways, Ontario: "Mr. President, Ladies and Gentlemen, we have all listened with great interest too Mr. Duchastel's paper on national highways and good roads. There has been brought out in that paper the question of federal aid. We do not know the amount of Federal aid that will be granted, we do not know the direction in which the money will be spent, but we do feel that, whatever aid may be granted, it will be adequate for the needs of the provinces, and that it will lead to an era of road-building in Canada, the like of which we have never seen in the past.

For the information of the members of *The Institute* it might be well to go into the question of the organization that we have in Ontario to-day for the purpose of undertaking road work. It is quite possible that this organization that we have now might be used as a means for distributing the federal aid. Federal aid might well be extended to an organization already carrying out an extensive programme of road improvement that covers the construction of every type of road from the earth road to the higher type of pavement. We have really three systems in Ontario, all under different municipal management. First, there is our township system, which is controlled by the township council. The roads which would be constructed by these councils would be the earth roads and probably the gravel, or broken stone roads that would lead the traffic out to the main travelled highways. The next type of management that we have in Ontario is what we call our county good roads system, under which the counties have power to assume control of certain main roads, for the purpose of improvement and construction. That would apply to all those roads that are designated by County by-law, and approved by the Government of Ontario, the province granting aid and encouragement to the extent of forty per cent on the cost of construction, and twenty per cent on the cost of maintenance. These roads are really the main market roads of Ontario. They lead to the important market centres, and furnish the farming communities with the means of transporting the farm produce to the local market centres and shipping points. We have to-day in Ontario some forty counties, nearly all of which are organized and able to enlarge their scheme of road improvement, and to take advantage of any encouragement or aid offered by the federal government.

In addition to the county system we have also got within the last year, what we have designated as provincial county roads. That is a higher type of county road.

These main roads lead through the counties, possibly joining up the larger towns, and in order to encourage the building of such roads up to the proper standard, the province has granted aid to the extent of sixty per cent of the cost of construction and sixty per cent of the cost of maintenance. The next highest type ofroad that we have in Ontario is what is called the provincial highway and within the last year or so we have been authorized to designate a provincial highway from the eastern provincial boundary to the western. That highway will be constructed by the Highways Department of Ontario and the work will be carried out under their direction. The financial burden will be borne by the Government, and thirty per cent of the cost of construction will be charged back to what is termed in our Act the local municipality. That term may apply either to a township or a county according to the wishes of the people affected.

Reference has also been made to the maintenance of our highways. It is very important, when we have constructed these roads, that they should be maintained. In the past it has been the custom in nearly all the municipalities to construct a road and let it wear out. That has resulted in many fine stretches of pavement and roadway going to pieces; whereas, there must be a certain annual expenditure in order to keep the roads in the best condition.

The question of maintenance is a big one with us to-day, but we feel that with encouragement in any direction the roads of Ontario can be kept up, and can be kept in a safe and proper condition, and in such a condition as to enable traffic to travel over them comfortably. In conclusion, I would say that I think we all agree that federal aid for the highways of the Dominion is a very important matter, and that with the encouragement that federal aid will give the municipalities we should build many miles of the best types of highways to be found in any country."

A. B. Macallum, M.E.I.C., Commissioner of Works for Ottawa: Mr. Chairman and Gentlemen, the other evening, at a meeting of the Good Roads Association, I took the opportunity of congratulating the Government upon the wisdom that it had displayed in appointing an engineer to take charge of the Federal Good Roads scheme, and I am living in hopes that the wisdom of appointing engineers to take charge of engineering schemes will be generally recognized.

Touching on the paper, I should like to speak of one point that Mr. Duchastel referred to, and that is the weight of loads that should be carried on a highway. At the present time we do not know what it is. It is manifestly absurd to assume that a locomotive would go over a road with rubber tires. Yet, what limit are we going to put on those loads? In London it is found that passenger trucks require 12-14 inch concrete bases, and that they had worn out a 6-8 inch base. In Ottawa we found it necessary, on Rideau street, to put in an 8-inch concrete base under a pavement. One thing that might help us somewhat is the fact that it has been found that the unit that can be economically used is the 5-ton truck. It has been found that on anything over a seven and a half-ton truck the elastic limit of the tires is exceeded, which is rather odd, and that the rubber tires would not stay on the trucks. It is impossible to widen out the wheels beyond eighteen inches because, with the camber of the road, or the dip beside street car tracks, there would only be a bearing on one edge of the wheel. If it is possible to get to the stage where they can put something else on to take the place of the rubber tire, it is going to increase the weight of the truck. Then we are going to get a load greater than a five-ton truck, and the pavements that are built to-day will not stand up. That has been found to be true in the United States, and there has been a consequent loss of millions of dollars. It means the use of steel trailers. It has been found in New York that trucks are using steel trailers behind the ordinary motor truck upon pavements made of granite rock. The limit of speed is six miles an hour, but it is human nature to run to the speed limit of the vehicle, which means running at twenty miles an hour, and these pavements were all smashed. In any legislation that is brought forward there should be a limit put on wheel loads."

This concluded the discussion.

R. M. Wilson, M.E.I.C., Chief Engineer, Montreal Light, Heat & Power Company, on rising to deliver his paper stated that he wished to correct an error in the program which states that the paper he prepared was on Frazil; the title should read

Design of Hydro-Plants for Combatting Ice Troubles

The paper by Mr. Wilson and the discussion thereon, by K. B. Thornton, A.M.E.I.C., Manager Public Service Corporation, Montreal, John Murphy, M.E.I.C., Electrical Engineer, Department of Railways and Canals, Ottawa, and G. Gordon Gale, M.E.I.C. General Manager, Hull Electric Company, Ottawa, form a very important contribution to the literature on this subject and will appear in full in the next issue of *The Journal*.

President's Reception

In the evening an enjoyable social function was held, attended by about four hundred of the members and their wives and friends, the occasion being the reception of the President.

In receiving the guests, President Leonard was assisted by Mrs. Leonard, Past President H. H. Vaughan and Mrs. Vaughan, Major Corriveau and Mrs. Corriveau.

This was a social event of a brilliant nature which showed that the members of the profession are not devoid of the social graces with which they are generally not credited. It was an evening such as will recall pleasant memories for a long time to those who were present, and for the success of which the members of the Ottawa Branch and their wives deserve great credit.

Thursday Morning, February 13th

The meeting was called to order at nine a.m., by President Leonard, who announced that John Murphy, M.E.I.C., Electrical Engineer, of the Department of Railways and Canals, and the Railway Commission, would give his paper on

Railway Electrification.

This is a subject which touches on the development of electrical engineering and also is a vital factor in the railway situation and in the economic progress of the country. The paper by Mr. Murphy on this subject was followed by papers on F. H. Shepard, Director of Heavy Traction, Westinghouse Electric and Manufacturing Company, and W. G. Gordon, Transportation Engineer, Canadian General Electric Company Limited. Mr. Shepard's paper was illustrated by lantern slides and moving pictures.

These papers together with the discussion thereon will appear in full in the next issue of *The Journal.*

Dr. C. A. Adams, President, A.I.E.E.

During the discussion, Dr. Comfort A. Adams, President of the American Institute of Electrical Engineers, entered the room, his entrance giving rise to a spontaneous, enthusiastic welcome from those present. Dr. Adams' presence was all the more appreciated when it was known that to be present at all it was possible for him to stay only a few hours, and to come all the way from his native city to be present at our gathering when his time was so limited, shows all the more the sincerity of his friendly co-operative spirit. When called upon to address the meeting Dr. Adams said: "Mr. President and gentlemen of *The Engineering Institute of Canada*, I bring you greetings, and most cordial ones, from your sister society across the border, the American Institute of Electrical Engineers. I bring you also congratulations on the formation of this organization which has no specific title. We are all engineers and I think there is hardly any illustration that brings that more forcibly to our attention than the very subject which is before you this morning. It is not a question of electrical engineering or railway engineering, or civil engineering, or mechanical engineering, but it is a subject that involves them all. I am absolutely convinced that you have taken the right step in changing over from the old Society of Civil Engineers to your present form, which takes in all of the engineers of Canada.

Speaking of the border between this and the United States, we like to think of it as a very imaginary line. We are not only of the same blood but in a large degree we are of the same language. We have the same monetary system and the same system of weights and measures. These are, in many cases, barriers between nations, but here we are particularly fortunate in having a marked absence of these barriers. There are no forts on this border, there are no battleships on our Lakes to protect us from invasion. We have no fear of it.

Taking up the subject in hand here, I was very forcibly carried back to the very earliest days of my practical experience in electrical engineering by some of Mr. Shepard's illustrations. Away back in 1891 Mr. Sydney Short, then with the Brown Electric Company in Cleveland, designed the first gearless railway motor. I had a considerable hand in that design and, although I have not been particularly connected with railway interests since that time, I have followed it with a great deal of interest. I had also a hand in the early days in developing the B. & O. locomotive motor and the methods of coupling.

There are two fundamental points which have impressed me in connection with electrical railroading. One is reliability. We used to hear in the old days, and still do hear from those who are not as intimately connected with the subject as some of us are, that electrical apparatus is unreliable, that you cannot depend upon it. I think we have had evidence this morning to show that it is absolutely reliable. I recall an incident that occurred a few years ago when I was called upon to design a particular machine for a client. He asked: "Have you ever done it before; have you ever designed that kind of a machine?" I said: "No, not exactly like this." He said: "How do you know it will work; how do you know that it will do what you claim it will do?" "The General Electric Company and the Westinghouse Company refused to guarantee any such thing as that. "I said: "I am not guaranteeing it, but I know it will do it." I think that is characteristic of the electrical business. It has been true in regard to the electrical drive of battleships and merchant ships and wherever it has been tried out, notwithstanding the fact that the very first instance of the application of a drive of that sort was a success. We may leave the practical details, but fundamentally there is no question about it that there is vastly greater certainty in the design of electrical apparatus to-day than there is in any other type of apparatus that we have.

The second point that impresses me in this connection is the question of conservation. We, on this continent, in Canada and in the United States—the United States particularly—have been squandering our natural resources for generations, and particularly during the past generation. We call it development, but, as a matter of fact it is the most foolhardy squandering of our sources of power. In the evolution of a nation we find a gradual change from the hand to mouth method to the method of co-operation and far-sightedness, and this is one of the steps between the hand to mouth, careless wasting of our resources, and the economical use of those resources, even though it may involve a considerable increase in capital expenditure. The difference between the hand to mouth method and the farsighted method is just that of the change from larger operating costs and smaller capital expenditure to smaller operating cost and larger capital expenditure, because that is absolutely typical of its development. It is not, in the long run, going to be a matter of judgment and opinion; it is going to be a matter of necessity and we have got to come to it. There is no question on that point whatsoever. I look forward to the time, as I think most of us do, when the railways of this country, and of all other countries, will be operated largely by electrical power.

There is one matter that is of a purely general nature that has absorbed a large part of my efforts and attention during the past year or two, and that relates in general to the broad field of co-operation. It has so many branches that I hardly know where to begin. But, as engineers, we are in some degree responsible for the improvement in the bonds which tie the different parts of the country together, both in communication and transportation, and the bonds which similarly tie different countries and nations together. Therefore, it seems to me that as the process of bonding ourselves together is due to our efforts in some degree, we should take the lead in that co-operation without which such bonds cannot exist. In the case of our engineering societies it is absolutely vital that we should feel a closer and more intimate brotherhood, and one of the great advantages of meetings of this sort is that we can all get together, shake each other by the hand, and meet face to face. As has been said so often, the chief barriers between different groups and societies, as between different nations, are the barriers which come from lack of knowledge of each other and lack of association. When we come to know each other, we find we are all the same sort of human beings after all, so that, the chief message that I wish to bring to you from the other side is that we feel a kinship which is most intimate, and that we wish to establish and maintain the most hearty and the most vigorous co-operation in every field of endeavour that we are connected with.

Dr. Adams concluded by extending a hearty invitation to the members of *The Institute* to attend the mid-winter convention of the American Institute of Electrical Engineers.

Thursday Luncheon

Members of *The Institute* who have attended the annual gathering for years state that this luncheon was the most largely attended of any similar function ever held. An hour before sitting down it was no longer possible to furnish tickets so that many were disappointed. The main dining hall of the Chateau Laurier was taxed to its utmost to accommodate the gathering of ladies and gentlemen to the number of nearly four hundred and fifty who attended this luncheon at which President Leonard presided, the guest of the day being Hon. F. B. Carvell, Minister of Public Works of Canada. Dr. R. N. Hollis and Mrs. Hollis and Dr. C. A. Adams were also guests and were seated at the head table together with members of Council of *The Institute*, members of the Ottawa Committee, the visiting ladies and wives of officers of the Ottawa branch.

Hon. F. B. Carvell, Minister of Public Works, gave a somewhat lengthy address which was filled with optimism regarding the future of Canada. In his opening remarks he pointed out that the most important problem the country has before it at the present time is in getting Canada back to a peace basis and it is realized that the Government has great difficulties to face in this respect, and the country at large has a responsibility in this connection as well. There is at present a certain amount of unrest which is natural, due to the abnormal conditions through which we have passed. It is the duty of every man and woman in Canada who has the power of employing labor to see that everything possible is done with a view to helping to relieve the situation.

Possibly no class of people in the whole country have a greater opportunity of working out the problems which the Government and the people have to face, than members of the engineering profession, and it was therefore fitting that the annual meeting of *The Institute* should be held in Ottawa, for the exchange of ideas.

Stating that unemployment existed in some parts of Canada at the present time and in case it might grow worse in the next few months he proposed outlining briefly what the Government was planning to do to promote staple conditions. He felt that the Government's duty to-day was to expend public monies in a way as best to meet conditions which exist. No money would be spent because a member desired public works for his own constituency. The money of the people of Canada will be spent where it will do the most good toward finding employment for laboring men and returned soldiers It is proposed to spend a considerable amount of money in the construction of highways in different parts of Canada in co-operation with the various Provinces, subject to the approval of plans and specifications under which the roads shall be constructed, the location of the roads by the Federal Government and supervision of the manner in which they are constructed. He has always been a firm believer in the principle of expending public money in the construction of highways.

Such projects can only be made a success however if all the Governments concerned realize that they must employ engineers and must act upon their advice. He believed that more money had been squandered in Canada during the past forty-five or fifty years in the attempt to build roads, where engineering supervision was not carried out than in all other public works put together. He hoped all parties concerned will realize that in the expenditure of these millions of public money the engineer must be the first as well as the last man on the job. It is impossible to succeed in any other way. During the past few years the railways of Canada have not been able to keep their equipment up to standard but it was known that the greatest railway system had put aside a very large amount of money for betterment and it was confidently expected that these betterments would be carried out during the coming year. In looking over the estimates of the Minister of Railways and Canals he found that a great deal of money would be required in bringing the Canadian Northern Railway to a proper standard. It was likely that there would be as much money expended on improving the Canadian Government Railway System during the coming year as on any other branch of public work.

It is very likely that there will be supplementary estimates at the coming session of Parliament which will further provide means of relieving unemployment.

The Minister believed that it is not only the Government, which had responsibility in carrying the country through the serious times of bringing it back to a peace basis, but also the great corporations whether industrial or public utilities, and in particular everyone in the country who is in a position to employ labor. The corporations throughout Canada have a duty of carrying on during the next year whether the profits are large or whether there are any profits. A year from now will see settled conditions and the soldiers absorbed once more into civil life.

No country among the warring nations is to-day in a better condition economically than Canada and if every man or woman in the country does his or her duty, there should be no great unrest.

The immense debt with which the country has been burdened by the war means that from now on the interest to be paid every year of from one hundred to one hundred and fifteen million dollars per annum would take nearly as much as the actual liquid revenues amounted to before the war, and in addition it would require another fifty million dollars for pensions. He could not see how we could possibly get along on less revenue than from three hundred to three hundred and fifty million dollars a year and suggested that proper consideration shouid be given to this problem. During the coming year however, will be spent even if necessary to borrow it as it would be a duty to do so in order to bring the country back to a condition of peace.

Continuing Mr. Carvell said:

I hope that no one will consider that I am pessimistic about Canada's future. I have said that probably none of the warring nations are in as good a position as we are, and I repeat it. Probably no country in the world possesses such valuable natural resources as Canada does. All we require is a little time to develop these resources, a little time in order that our people may get back to the ordinary vocations of life, a little time in order that our transportation facilities may be somewhat improved. When that time comes I have no doubt whatever that even with our increased public debt, the resources of our country and the ability of our people will be sufficient to meet all the larger expenditures which we shall be called upon to make.

I do not need to say that it has given me a great deal of pleasure to meet a body of this kind. You are displaying a great deal of public-spiritedness in coming here at great expense and trouble to yourselves; you are coming here, I believe, for the good of the country. I have no doubt that your deliberations will result in great benefit to Canada, because there never was a time in our history when the engineering profession played such a part as that which they have an opportunity of playing during the next three or four years. Nor has there ever been a time in the history of the world when the engineering profession played such a part as it has played during the war. The war has been practically a war of engineering; our success on the western front was largely due to the tremendous engineering abilities of the men that Canada sent over there. I have not had the pleasure of visiting the front, but my colleagues who have been there tell me that in their opinion many of the great military operations carried on would not have been possible had it not been for the railway construction and general engineering work carried on by the Canadian engineers. That is perhaps one of the greatest tributes to the Canadian engineering fraternity which the war has produced; it is another evidence that when Canadians are given an opportunity to do so they rise to the occasion. That brings me back to the last thought that I wish to place before you; it is that when Canada is given a chance to get back to the ordinary times of peace, I have no hesitation whatever in saying that Canada will rise to the occasion. We will carry on the affairs of the country, we will pay the interest on our debt, we will pay our pensions, and we will continue to be one of the most prosperous countries on the earth. (Applause).

The luncheon proceedings concluded by the singing of God Save the King.

Visit to Parliament Buildings.

At the conclusion of the luncheon program, President Leonard announced that immediately following a group photograth would be taken in front of the Chateau, followed by a visit to the Parliament Buildings. At four-thirty p.m. the program would be resumed consisting of the papers which had been postponed from previous sessions.

Besides the group photograph which is reproduced in this issue of *The Journal*, B. E. Norrish, A.M.E.I.C., had motion pictures taken, both in front of the Chateau and as the visitors entered the Parliament Buildings.

The trip to the Parliament Buildings was arranged through the courtesy of J. B. Hunter, Deputy Minister of Public Works, and John A. Pearson, Chief Architect of the Buildings, both of whom accompanied the party.

In the rotunda of the Commons entrance, Mr. Hunter made the following remarks:—

"Mr. President and ladies and gentlemen, I cordially welcome you on the occasion of your visit to the new Parliament Buildings of Canada. You have come in by the new Commons entrance, and I think you have all been pleased with what you have already seen. As you go through the other parts of the building I know that you will be delighted with the development of the plan; there is a largeness of conception which will impress itself upon you and you will appreciate the immense amount of labour and thought which has been put into the design, all of which is due to the great creative genius of that master-builder, John A. Pearson.

May I say a few words about what has led up to the present stage in the construction of this building. By the disastrous fire of February 3rd, 1916, the old building was left practically in ruins. The debris was immediately cleared away. Seven lives were lost in that fire, and of one of the vactims, Mr. Law, M.P., no trace could be found. Owing to the building having rather outgrown its usefulness — it had become badly ventilated, dirty, unsanitary — there was very little regret over the occasion of erecting a new structure in keeping with the needs and future of Canada.

Immediately after the fire the Minister of Public Works summoned Mr. Pearson and Mr. Marchand and asked them to go over the matter and make a report. Afterwards these two gentlemen, Mr. Pearson as Chief Architect and Mr. Marchand as Associate, were commissioned to prepare plans and, departing from the procedure which had been followed in the erection of buildings on previous occasions under government supervision — a practice which had sometimes led to investigations and squabbles under the old party system — it was decided that members from both sides of the House and members of the Senate should form a joint Committee to have superintendence of and direction over the work. I think that this plan has worked out exceptionally well. The gentlemen who were appointed to the Committee took a keen interest in the work. As soon as Messrs. Pearson and Marchand had their plans completed, they were thoroughly discussed and some slight alterations suggested which were heartily co-operated in by the architects. Finally the contract was awarded to Messrs. Lyall & Sons on the basis of these plans, which was another departure for the Department of Public Works, because it was a forced contract. But under the circumstances it was considered that the following of this procedure would enable an earlier start, which it did, and would also ensure the very best workmanship, which it was necessary to have in the Parliament Buildings of Canada.

The work proceeded in 1916 until the foundations were in by September 1st. In that connection, it was possible to arrange a very happy ceremony in the laying of the corner-stone. The old corner-stone was inside the building in the basement, on the Senate side. No doubt a great many Ottawans and visitors to Ottawa in the past have — well, I was going to say stumbled over that stone, because it used to be near the old parliamentary restaurant. But I will not say any more about that; we are not in the old days now. The original corner-stone was laid by the Prince of Wales, who afterwards became King Edward the Seventh, and it was arranged to have the stone re-laid in the new structure by his brother, who fortuitously happened to be in Canada at the time. The Duke of Connaught, therefore, graciously consented to re-lay this stone, and below the previous inscription is the human touch: "Re-laid by his brother, Arthur, Duke of Connaught, September 1st, 1916,"— exactly 57 years from the time the late King Edward laid the stone as Prince of Wales. The monument of the Duke of Connaught's gracious mother, Queen Victoria, was nearby; it had been unveiled by the present King when he was out here as Duke of York. All these circumstances contributed to the Duke of Connaught's being visibly affected.

After the laying of the corner-stone the erection of the walls proceeded and by winter the second storey had been reached. The work on the Hill was closed down for the winter, but on Sussex street work was carried on in the stone sheds on the outside stone, and on a small portion of the interior stone, most of which was not delivered until 1917. Then, in the spring of 1917, the work was got at early and the building made rapid progress. By the fall the roof was on and by heating with salamanders, the brick partitions in the floor and so on were gone on with and carried pretty well to completion. But the feature of 1917 was the semi-centennial of the Confederation of the Canadian provinces, and the building was dedicated by the present Governor-General. Addresses were given by the Prime Minister and other noted men upon this occasion. I want to read to you the inscription on the Confederation column at the main entrence, which you will see as we go through the building:

> "On the fiftieth anniversary of the Confederation of British colonies in North America as the Dominion of Canada the Canadian Parliament and people dedicate this building in process of reconstruction after damage by fire as a memorial of the

deeds of their forefathers and of the valour of those Canadians who in the great War fought for the liberties of Canada, of the Empire and of humanity."

You will see that this is a worthy dedication and a worthy monument to the cause for which our soldiers fought.

In 1918 we went ahead with the heating plant. It was decided to remove all heating appliances from the main building and erect a central heating plant which would take care also of the new departmental buildings which it is intended to erect on what is known as the Wellington street area, west of Parliament grounds. That progressed during 1918, the tunnel was built connecting with this building, and the interior work was proceeded with which you will see to-day.

I will give you a few figures of the dimensions of the building. The building is different in lay-out from the old structure. You will remember that when you came up the stairs of the main entrance of the old building you were faced by a blank wall, and you could go to the right or to the left. By the removal of the heating plant it has now been possible so to develop the plan that when you come up the main steps and stand near this Confederation column you can look north, east and west. The corridors are well-lighted. In order to get better ventilation and light, and on account of various other considerations, the Commons and Senate Chambers have been placed at the extreme ends of the building, the Senate on the East side and the Commons on the West. The restaurant remains in the same position, above the Commons Chamber on the top storey of the west side, and commands that splendid view over the Ottawa river which I do not think can be surpassed. I am told that it cannot be surpassed in the world on a summer evening when the sun is setting; that is quite believable.

The building is 471 feet long from east to west and 194 feet wide, being 245 wide including the pavilions — that is, both ends. It is 90 feet high. The tower, of which you see the connecting walls standing, has not been constructed, but it is expected to start that this year, and by next winter we hope to have four or five storeys of the tower erected. It would be 250 or 260 feet high and will overtop the Mackenzie tower. The old tower did not do that.

The old Commons and Senate Chambers were the same size, 82 feet by 46 feet. The Commons Chamber has now been enlarged; it is 97 feet by 62 feet, so that care has been taken to provide for the increased membership which is expected. The Senate Chamber is a little smaller, 80 feet by 41 feet 6 inches. You know, the Senators do not increase as fast as the Members of the House of Commons. There are 365 offices in the building; there is an increased area over the old building of about 90 per cent. The old building had no cellar; now a cellar has been excavated and so much additional space acquired. A storey has also been added. Eighty-two of the offices are in what we call the office blocks; they are on the sites of the old Chambers, the Senate and the Commons.

You will notice as you pass through the building how well the proportions have been kept by the architect. In these office blocks are the Railway Committee room and the reading room and the Senate Chamber on the other side. Mr. Pearson and myself are, of course, familiar with the building, and if you follow us we will visit the Commons Chamber first and then go right through to the top storey, where the restaurant is placed.

Afternoon Session, Thursday, February 13th

At four-thirty p.m. the meetings were resumed in the Assembly Hall at the Chateau Laurier, President R. W. Loenard in the Chair.

The first paper on the program was by J. L. Busfield, A.M.E.I.C., fully illustrated by latern slides, on the Montreal Tunnel.

Mr. Busfield's paper fully illustrated will be published in the April issue of *The Journal.*

In discussing this paper H. K. Wicksteed, M.E.I.C. stated that Mr. Busfield had given a splendid description of the construction and equipment of the tunnel and the hearty thanks of *The Institute* were due him for the trouble which he had taken in getting all this information together and giving it in such an interesting manner.

In the temporary absence of the President, John Murphy, Member of Council occupied the Chair, and announced that there were still two papers on the program one by Dr. Dawson and one by the President. Dr. W. Bell Dawson, M.E.I.C., Superintendent of Tidal Survey, Dept. of Naval Service then read his paper;

Mean Sea Level Datum for Canada.

This paper was published in full in the February issue of *The Journal.*

Discussing the paper Geo. A. Mountain stated that we were partly in sympathy with Dr. Dawson's suggestion that a mean sea level datum be established throughout Canada. It would facilitate work for everybody. He appreciated Dr. Dawson's paper and was pleased to have heard it.

C. C. Kirby of St. John, N.B., asked if the monuments through the state of Maine placed on bridges by the U.S. Postal Geodetic Survey were for the same datum that Canada has now adopted, and in reply Dr. Dawson stated that the leveling of the frontier of New Brunswick has connected with the United States Geodetic Survey bench marks, and it has since been connected with Halifax. "The mean sea level datum is carried from New York, I assume, along the shore by land levelling, and our levels now connect from the frontier of Maine to Halifax. The final revision of that work, when made by the geodetic survey, will correlate all the levels with the same datum."

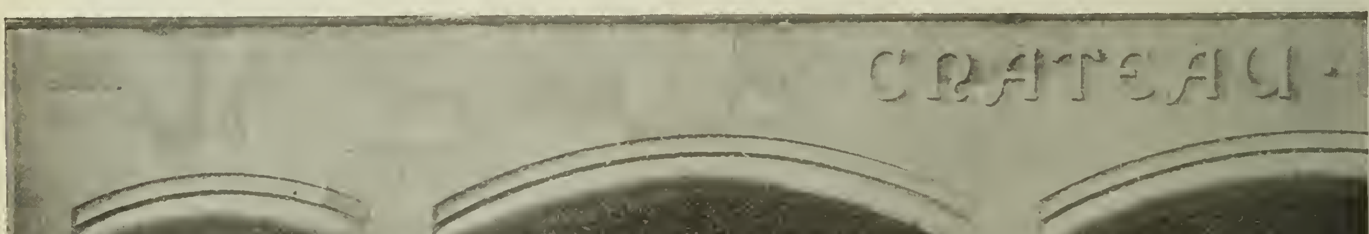
Mr. Wicksteed: No one realizes more completely than I do the importance of Dr. Dawson's work and how much we are indebted to the Government departments for these precise levels. In the case of the Canadian Northern terrain, for instance, we must have run seven thousand or eight thousand miles — probably ten thousand miles of railroad levels. Of course, railroad surveying as a rule is not precise work, but when we have points to which we can close at the end of our individual surveys such as Dr. Dawson and the Geodetic Survey have provided us with, it is a very comfortable feeling to find that we are coming out within a foot or two anyway, at the end of fifty or sixty miles. I hope that Dr. Dawson and the other surveyors will be given the opportunity to complete that work, because the task of establishing levels throughout the different parts of Canada is a very important one indeed in the Government service.

Dr. Dawson: Perhaps I may be allowed to say a word on behalf of Mr. Ogilvie, who is not here. In the geodetic survey, which is under his charge, it is possible to run only main through lines across the country. I can confidently say that he appreciates such levels as you speak of, on railways, which serve to extend the levels in the trunk lines in lateral directions and to carry them from the main line to other points, perhaps cities and towns, which will utilize the same elevations. So that you must not disparage railway levels; in my own experience I have found them extremely accurate. The great difficulty is that very often they are not fixed by bench-marks, and for this reason a very large amount of work has been lost. As there is now a continuous line from Halifax across Canada to Vancouver, railway levelling that would extend these levels laterally in any direction is of great benefit in carrying them over the length and breadth of the country. In the meridian lines and township lines, which the Surveyor General's department is running, they are continually intersecting the main lines of the geodetic levels, and thus extending the network of levelling by establishing lake levels, water-power levels, and so on; in extension of the through line across the continent. So that I think this lateral work is of very great service.

In speaking to Dr. Deville, the Surveyor General, he said that he was quite in accord with the attitude of the Railway Commission, represented by Mr. Mountain, in the principle of adopting mean sea level as a general datum. Thus we have the Railway Commission, the Surveyor General, and the actual surveyors engaged in the work supporting this view; and if we get the interest of the railway engineers and the city engineers it will facilitate the work very much indeed.

G. Blanchard Dodge: The paper is a valuable addition to the literature on Mean Sea Level. The available information on this subject is very meagre. A masterly treatise was written many years ago by Monsieur Lallemard, Chief of the levelling in France, but it is now difficult to obtain.

The connection between the determination of mean sea level by tide gauges around the coast and the transference of such determination to the interior by precise levelling is well brought out. Dr. Dawson, however, does not seem to have referred to his tide gauges at Port



Group Photo Ottawa Professional

Nelson on Hudson Bay. A connection between Hudson Bay and the Pacific is now only waiting the completion of the last 200 miles of the Hudson Bay Railway, as precise levels, of a high order of accuracy, have already been run to the end of the steel by the Surveyor General's Branch. This Branch has run precise levels from Calgary to that point by way of Saskatoon and Prince Albert, a distance of 800 miles, and from Calgary to Vancouver the levelling has been run by the Geodetic Survey.

Dr. Dawson emphasizes the necessity of all organizations using the same datum, but city engineers in the west, where the elevation is very great, do not like, so many figures. This difficulty, of course, could be got over by simply cutting off the thousands and certain of the hundreds, so that a point in a city whose elevation is 2418 feet would be recorded by the city engineer as, say, 118 feet.

Regarding a general precise datum in the west it may be noted that 6,600 miles of precise levels have been already run in the prairie provinces, slightly more than half of this having been done by the Surveyor General's Branch, and slightly less than half by the Geodetic Survey. These two organizations use the same datum, and it is rapidly being adopted by the great railways.

It cannot be too strongly emphasized that work like Dr. Dawson's must always be the real foundation of any system of precise levelling, because no matter how accurate levels are, they cannot carry a datum from one part of the open coast to another part as accurately as the sea itself can record it. Each tide gauge well placed on the open sea must, therefore, always be a new starting point in a level net.

Following the discussion of Dr. Dawson's paper Lieut.-Col. Leonard presented his paper on

Mining and Metallurgy of Cobalt Silver-Ores

which was published in the February *Journal*.

After reading his paper Col. Leonard was asked regarding the large areas of mineral land as to why it was not developed by the Government, to which he replied that the present policy which was almost universal was to encourage individual effort and even then it required much hard work and patient effort to succeed as a mining prospector.

Moving Pictures

The reading of President Leonard's paper and the brief discussion concluded the technical portion of the program of the professional meeting.

In the evening at eight thirty, B. E. Norrish, A.M.E.I.C. presented to an audience of ladies and gentlemen which filled the room, a number of highly interesting motion picture films illustrating the development of

Meeting, February 13th, 1919.

various industries throughout Canada, and which illustrated the splendid work which the Department of Trade and Commerce has been doing in having these educational films prepared in order that the whole world can know of Canada's magnificient scenery, her rich natural resources, and the industrial progress she is making.

This concluded the final session of what is without doubt the most successful gathering of engineers ever held in Canada.

Registration

The official register shows that the following were in attendance and in addition seventy-two ladies signed the register, their presence adding much to the success and enjoyment of the gathering.

Dr. M. Murphy, Ottawa; H. H. Vaughan, Montreal; R. W. Leonard, St. Catherines; W. F. Tye, Montreal; Geo. A. Mountain, Ottawa; J. M. R. Fairbairn, Montreal; James White, Ottawa; John Murphy, Ottawa; C. A. Magrath, Ottawa; Fraser S. Keith, Montreal; T. L. Simmons, Ottawa; C. R. Coutlee, Ottawa; J. A. Robert, Ottawa; H. A. Belanger, Ottawa; B. Stuart McKenzie, Winnipeg, Man.; J. A. Walker, Lieut., Ottawa; A. B. Macallum, Ottawa; F. W. G. Smith, Ottawa; Guy C. Dunn, Winnipeg; H. D. Parizeau, Ottawa; E. A. Stone, Ottawa; Martin Wolff, Ottawa; P. Sherrin, Ottawa; R. de B. Corriveau, Ottawa; H. E. Smaill, Ottawa; H. T. Hazen, Toronto; A. T. Phillips, Ottawa; A. M. Wonfold, New Westminster; Alex. Ferguson, Ottawa; F. W. White, Ottawa; G. B. Dodge, Ottawa; A. R. Decary, Quebec; A. B. Normandin, Quebec; W. R. Gross, New Westminster; Alfred D. Flinn, New York; G. J. Desbarats, Ottawa; J. B. Challies, Ottawa; Major W. G. Swan, Vancouver; V. F. W. Forneret, Ottawa; C. T. Trotter, Ottawa; Col. A. P. Deroche, Ottawa; T. R. Courtright, North Bay; Ralph S. Burley, Ottawa; K. B. Thornton, Montreal; E. Brydone Jack, Winnipeg; W. Bell Dawson, Ottawa; H. M. Davy, Ottawa; H. B. R. Craig, Fort William; J. M. Wilson, Toronto; F. G. Goodspeed, St. John, N.B.; C. P. The Development and Future of Aviation in Canada*

By M. R. Riddell, Chief Engineer Canadian Aeroplanes Ltd.

One of the most notable features of the late European war has been the rapid development of the aeroplane from a more or less experimental toy to one of the most formidable of the many engines of war employed in that great conflict. Of course it may be that the great development along the special line has been at the expense of development in other directions, but even if this is so it is not too much to say that a tremendous impetus has been given by the war to aerial navigation generally.

As far as Canada is concerned, while a Canadian—J. A. D. McCurdy—was one of the earliest aviators, on this side of the Atlantic at any rate, beyond a little experimental work by Messrs. McCurdy and Baldwin in the early days, under the direction of Professor Bell, nothing was done in the line of aerial development until the spring of 1915.

At that time Mr. McCurdy, who had in the meantime become associated with the Curtis Aeroplane Co. of Hammondsport and Buffalo, organized a Canadian company known as Curtiss Aeroplanes and Motors Limited, with headquarters in Toronto. The special object of this new company was the manufacture of aeroplane parts for British orders, but soon much more interesting work was undertaken.

Just before the outbreak of the war a large twin-engined flying boat had been under construction at the Hammondsport works of the Curtiss Co. She was known as the "America," and it had been intended to attempt a Transatlantic flight in her.

This "America" (afterwards known serially as the H-4 type) was the forerunner of the series of large flying boats built by the Curtiss Co. for war service of the Allies. She was of approximately 76 foot wing spread, and was powered with two Curtiss 90 H.P. motors.

While the outbreak of the war put a stop to the proposed Transatlantic flight, it was suggested that a large twin engined bombing plane along the lines of the "America" might be constructed. As the Hammondsport and Buffalo plants were crowded with other work, the working out of this new machine was entrusted to the Canadian plant.

The original intention was to have the "Canada," as this machine was afterwards known, practically a duplicate of the "America," but with fuselage and landing gear instead of a hull, and two of the V.X. type 170 H.P. Curtiss motors instead of the smaller ones fitted in the "America." With these more powerful motors it was expected that a speed of 85 miles per hour would be attained as against the 60 miles per hour speed of the "America." Owing to these changed conditions, however, it was found necessary to change almost every part so that the "Canada" as built was practically a new design throughout.

"Avro 504-K" Type Training Plane (R.A.F. Serial Number C-1501) Built by Canadian Aeroplanes Limited, Toronto, October, 1918.

Actual construction work was begun towards the end of June, 1915, and the first trial flight was made about the end of July. As there had been some delay in the delivery of the V.X. Motors intended for her, for this first trial she was fitted with two 90 H.P. motors similar to those in the "America." This first flight was successful, the "Canada" showing a speed of upwards of 70 miles per hour with these smaller motors, balancing and handling well.

Some slight alterations were made as a result of this initial flight before she was again tried, this time with her proper motors. On this occasion she had a bad mishap on landing, and was partially wrecked. After repairs she was again tried and this time made a most successful flight, attaining a speed of better than 87 miles

*Read at Ottawa Professional Meeting, E.I.C., Wednesday Feb. 12th.

per hour, with a climb of over 3500 ft. in less than 7 minutes.

As a result of this successful trial an order was placed by the British Government for eleven more machines of this type, with certain modifications that had been found desirable.

In the meantime the "Canada" had been shipped to England, where she underwent a series of further tests. On one of these tests after the motors had been "tuned up," and the stranded wire in the interplane bracing replaced by "stream line" wire of much lower resistance an average speed of 102 miles per hour was recorded.

The "C" machines as these next eleven were known were in general similar to the "Canada" but embodied many refinements and improvements in arrangement and detail.

These "C" machines were duly completed and shipped and work was started on a still further improved type to be known as the "C-2," when instructions were received (in June 1916) to cancel the order for "C-2" machines and stop all further work on the type.

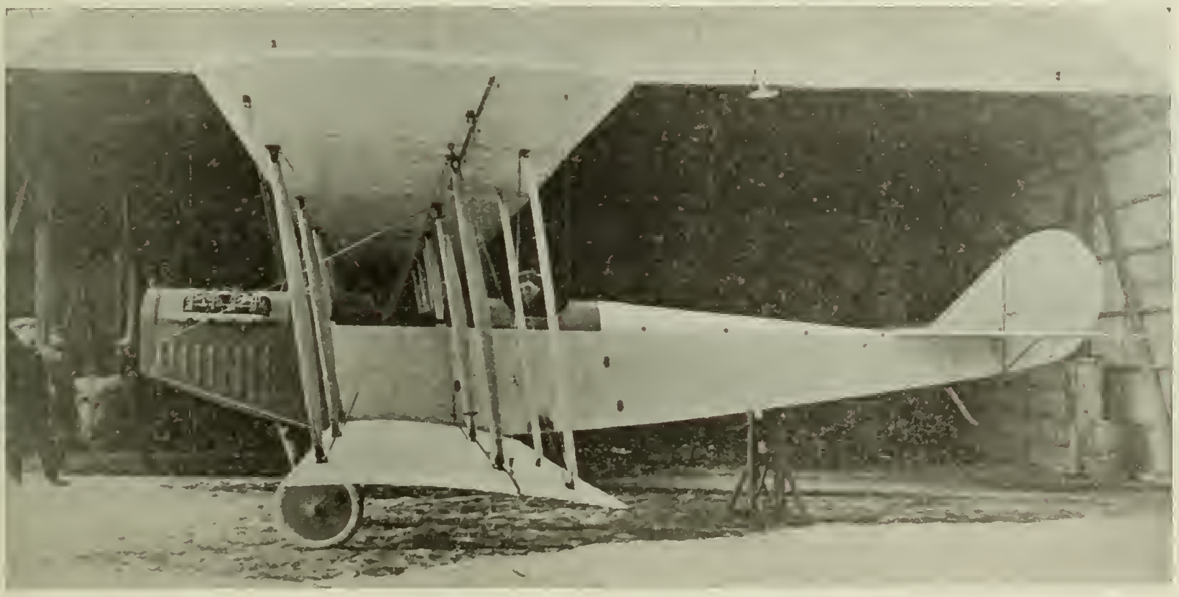
What probably caused this decision on the part of the English authorities was the trouble that had been experienced with the V.X. type of Curtiss motor; also at that time reprisal raids were not in vogue, and the cry was for small machines of very high speed for scouting and fighting.

It seems a pity, however, that none of this "Canada" type were ever used in active service. At the time of their production (late 1915 and early 1916) they were probably quite the best machines of the type in existence, although of course not equal to later larger and more powerful machines of the same general type such as the Handley Pages.

The "Canada" and the "C's" were twin-engined biplanes, with a maximum wing spread of 76 feet, engines of approximately 350 H.P., and a speed of approximately 100 miles per hour (with streamline wire). The total flying weight with a military load of about 1000 pounds, 200 gallons of gasoline and a crew of three, was approximately 7000 pounds. The 200 gallons of gasoline would give a flying radius of between 500 and 600 miles at full power.

While work on the "C's" was at its height a force of about 600 men was employed.

After work on the "C-2's" was stopped, as noted above, the manufacturing activities of the Curtiss Aeroplanes & Motors Limited, were considerably curtailed, the manufacture of spare parts for British Buffalo orders, and the construction of some training planes of the JN-3 type as well as a few hydro aeroplanes for a foreign government, being all that was undertaken until the decision of the British authorities to establish training squadrons in Canada changed the general aeroplane situation considerably.



"JN-4" Type Training Plane (R.A.F. Serial Number C-101) Built by Canadian Aeroplanes Limited, Toronto, January 1917. (First Machine Turned Out by C. A. L.)

From the date of its incorporation Curtiss Aeroplanes and Motors Limited had maintained a flying school for the training of cadets for the air services, which although officially recognized by the British Government, was conducted as a private concern along purely civilian lines.

Pupils first of all received instruction on flying boats and after they had attained sufficient skill on these the course was completed on land machines of the training type. Many aviators were turned out who afterwards won distinction in the air services and the attention of the British Government was called to the fact that not only was there much excellent human material available in Canada, but the Canadian climate was such as to afford a greater number of possible flying hours, during the spring, summer and fall at any rate.

On account of these considerations it was decided to establish extensive training fields in Canada.

For this training, in order to obtain machines quickly it was decided to use the JN type, similar to those employed by the Curtiss School, and an order for a large number of JN-4's (the latest model of the JN type at that time) was issued.

In connection with the order a new firm under the auspices of the Imperial Munitions Board was organized to undertake the work of manufacturing these planes and others which might subsequently be required, as it was felt, rightly or wrongly, that there was no private enterprise existing capable of handling the proposition satisfactorily.

This new firm was known as Canadian Aeroplanes Limited and was under the direction of F. W. (now Sir Frank) Baillie.

Canadian Aeroplanes Limited acquired the manufacturing business of Curtiss Aeroplanes and Motors Limited, except the business of manufacturing parts for the Buffalo firm, and immediately proceeded with the work of turning out the JN-4 machines.

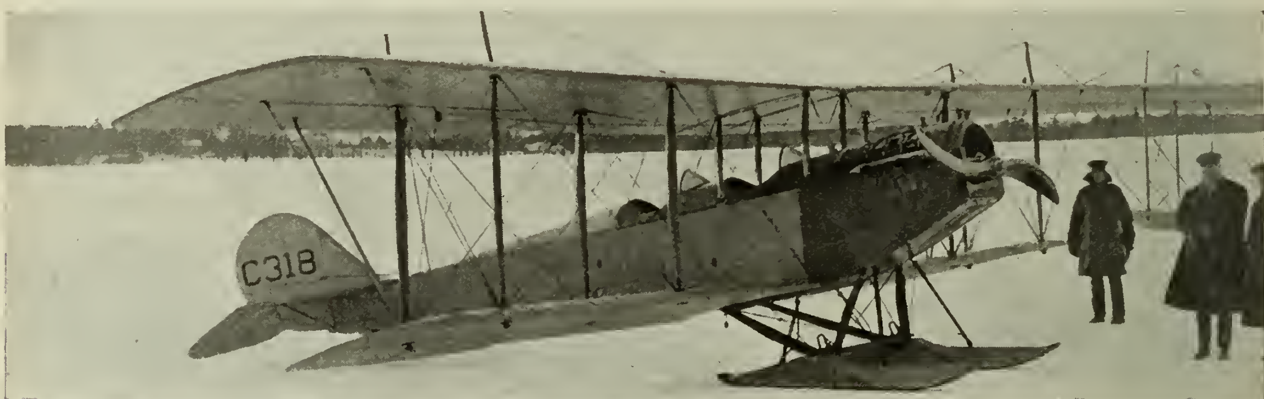
Limited would not be nearly large enough to produce a sufficient number of machines in a reasonable time, and steps were taken to erect a new plant specially for the purpose. A site was chosen, and work was started about the beginning of February. The construction was pushed so rapidly that by May the transfer to the new plant was practically complete.

With some extensions subsequently added the new buildings provided a floor space of approximately 235,000 sq. ft. or about 5½ acres.

The manufacturing equipment was most complete and provided for the production of practically every part of an aeroplane with the exception of the motors and instruments such as tachometers, gauges, altimeters, etc.

A well equipped testing department provided for the testing of all raw materials as well as finished parts; and a research department allowed experiments to be made on the proper heat treatment for various metal parts, the qualities of various samples of dopes and paints, etc.

While production was pushed to the limit, all materials and workmanship had to run the gauntlet of the testing department, the company's inspection department and the A-I-D, or government inspectors, the result of all this care being that as far as I have information no accident ever occurred with one of our machines that could be traced to defective material or workmanship.



"JN-4" Type Training Plane C-318 (Fitted with Snowshoes), February 1918.

The Curtiss Aeroplanes and Motors Limited continued their work of manufacturing spares for British Buffalo orders.

The greater part of the engineering and manufacturing staffs of the Curtis Aeroplanes & Motors remained with the Canadian Aeroplanes Limited.

Before beginning production of JN-4 machines on a large scale, it was found desirable to make some slight changes from the Buffalo design. The bridge type of control with which the Buffalo machines were fitted was changed to the more usual " joy stick, " metal construction was adopted for the rudder, elevators, and fin, and the design of the tail was altered so as to give better " stream lining " and reduce risk of damage in landing. The first machine was completed on January 1st, 1917, and was taken out to the Long Branch flying field for test. The trial flight was very successful, the machine was officially accepted, and production work was started in earnest.

It was soon evident that the premises occupied by the old Curtiss Aeroplanes & Motors Limited which had been taken over by Canadian Aeroplanes

The production records climbed steadily from month to month, slowly at first, then by leaps and bounds until we reached a record of 318 machines in one month by the end of 1917. This result was achieved with a force of about 2500 men, and is a better figure than has been reached on a similar class of work with a similar number of employees anywhere else, as far as I have information.

At this rate the requirements of the Royal Air Force were soon supplied, and we were able to furnish the U. S. training fields with a number of training machines as well.

The total number of JN-4 machines turned out was approximately 1300 and spares sufficient to make the production equal to approximately 3000 complete machines in all; of these, 680 were furnished the U. S. fields.

The JN-4 is of course quite obsolete as a military machine, but has proved very satisfactory for training purposes. There are several variations of this model differing in details, but the Canadian JN-4 is a two-seater biplane of 44 feet wing spread (upper plane), flying weight about 2100 pounds, and fitted with a Curtiss OX motor of 90-100 H.P. The speed is about 70 miles per hour.

While the production of the JN-4 was proceeding, an experimental machine of another type was turned out in the experimental shop. This was the De Haviland 6, a training plane that had been used to a considerable extent in England and which at one time it was proposed to substitute for the JN-4.

This DH-6 was tried out in July, 1917, and was found satisfactory, but by this time production was swinging nicely on the JN-4's, they had proved very suitable for the purpose and it was felt that to change over to the DH-6 would unnecessarily delay the output of machines. No more of this type were therefore built.

The DH-6 is a two-seater biplane of about 36 feet wing spread, both upper and lower planes being alike, flying weight about the same as the JN-4. The DH-6 was designed for a R.A.F. engine of 90 H.P. The one in question was fitted with the same motor as used in the JN-4, and the speed was around 65 miles per hour.

The DH-6 is interesting as having a type of wing suitable for carrying heavy loads, at moderate speeds, the section being much more deeply cambered than that used in the JN-4, which was a modified form of Eiffel No. 36, a good general purpose curve.

When the wants of the R.A.F. had been satisfied for the time being, and there seemed a likelihood of a temporary lull in production a contract was obtained from the U.S. Navy for 50 flying boats of the new F-5 type. This boat had been developed at Felixstowe, England, and found the most suitable for patrol and anti-submarine work.

It is a large twin-engined boat, of about 102 ft. wing span, a total flying weight of around 14,000 lbs., and a a speed, fitted with two 400 H.P. Liberty 12's, of about 100 miles per hour. Its length from nose to tail is about fifty feet. Its armament consists of between four and six machine guns, one Davis six pounder, and four 230 lb. bombs which are hung on racks under the wings.

The crew numbers six men, and a system of inter-communicating telephones is fitted.

There is a wireless cabin in which is fitted a wireless set with a sending radius of about 25 miles and a receiving radius of about 1000 miles.

The engines, armament, bombs, wireless outfit, telephones, etc., were supplied by the U. S. Navy Department, but we had to make provision for the installation.

The construction of the first boat of our contract was commenced on April 22nd, 1918, and the boat was completed by July 15th, shipped to Philadelphia, and successfully tried out.

We afterwards worked up to a production of eight boats per month.

While the contract for F-5 boats was getting under way in the shops work was started on another type of machine for the R.A.F. training fields. While the JN-4 had been found suitable for general training, it was somewhat too slow, and was not sensitive enough to control for advanced work, so that cadets trained in Canada had to take additional training before proceeding to work on actual war machines.

Shipment of Canadian "JN-4" Training Planes to U. S. Training Fields. Mid-winter 1917-1918.

To avoid this it was decided to equip certain training squadrons with the "Avro" 504-K training plane which was in use in England.

The "Avro" 504-K is a biplane of 36 feet wing spread, both upper and lower planes having the same span. It is of lighter construction and considerably greater refinement of design than the JN-4, while the wing section is one adapted for higher speeds. With these differences the "Avro" is a considerably faster machine, the original machines of this model, which appeared in 1915, and were used to some extent at the front, having a speed of 90 miles per hour with an 80 H.P. Gnome Motor.

As a training machine the "Avro" 504-K is adapted to be fitted with seven different types of motor. For the Canadian training squadrons the "Avro" was fitted with 130 H.P. Clerget Motors, which were shipped out from England for the purpose. With this motor a speed of upwards of 100 miles per hour has been obtained.

It was found advisable to make some minor changes in the design on account of difficulty in obtaining material, and in order to reduce the number of spares necessary, by making certain parts interchangeable with corresponding parts of the JN-4. Thus the landing gear was completely redesigned, a V-type being used instead of the regular "Avro" type.

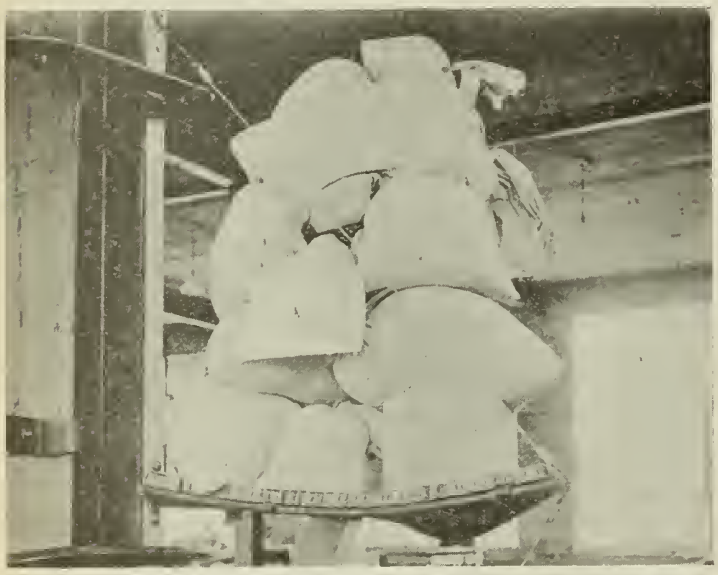
These changes caused delay and while the first machine of this type was delivered by October 1st, production was really only beginning when the armistice was signed and work stopped. We delivered only two machines of this type in all.

With the conclusion of the armistice the activities of the Canadian Aeroplanes came to an end, the R.A.F. order for 500 "Avros" being cancelled immediately and the U. S. contract for F-5 boats being cut from 50 to 30. The distasteful task of gradually discharging the staff of workers was immediately begun and by the end of January, 1919, when the F-5 contract was finally completed, the working force had been entirely disposed of except such office and other help as was necessary to complete the sale of the tools and fixtures, and the huge buildings lately so thronged with busy workers now stand empty and still.

The Curtiss Aeroplanes and Motors Limited which had been working on a contract for F-5 boat spares, has also discontinued aeroplane work, but has been able to retain a portion of its staff on another line of manufacture.

As will be seen from the foregoing the aeroplane industry of Canada during the war grew from nothing to very respectable dimensions. A large number of workmen were employed not only in the aeroplane factories, but also in supplying raw material—such as spruce lumber—and large numbers of machines of different types were successfully turned out. The quality of the workmanship in these machines was certainly equal to that found anywhere else, and the production records were unsurpassed. Canada has no reason to feel ashamed of her part in supplying the aeroplane needs of the Allies.

It is not possible to make more than a passing reference to the work of the R.A.F. in Canada. The complete account of this work is now being prepared in book form by the historical department of the R.A.F. and will shortly be issued.



Sand Bag Loading Test on Vertical Fin, Canadian "JN-4," May 1917.

It will be sufficient to note that as a result of the activities of the R.A.F. in training aviators, and of the firms building aeroplanes, there are now in Canada a large number of skilled workmen ready to produce aeroplanes and of skilled aviators ready to fly them when built.

"De Haviland 6" Type Training Plane Built by Canadian Aeroplanes Limited, July 1917.

Now that war activities are over the question naturally suggests itself—is the aeroplane destined to play a useful part in the industries of peace, or is it to rank in the future as in the past, as a purely military machine, with possibly an occasional one used here and there by an enthusiast for purposes of sport?

A careful study of the question would seem to bring one to the conclusion that there are at any rate several directions in which aeroplanes could be usefully employed apart from war purposes, and in what follows an attempt will be made to show what these appear to the writer to be.

It may be taken for granted that aeroplanes will still be required as a part of the equipment of the armed forces of the country. There are good people who tell us that there will never be another war and, therefore, no more armies or armaments are necessary.

Such statements always remind me of a passage in Scott's "Guy Mannering" where the sturdy yeoman, Dandie Dinmont is warning an English traveller against the dangers of the border wastes, and the female keeper of the wayside inn declares that there is no danger now, as they're all honest on the borders. Dinmont replies: "Aye Tib, that'll be when the deil's blind, and he's e'en no sair yet."

The country that neglects to keep its air service up to date and ready for immediate service will probably have to pay a terrible price sooner or later. Air raids in the next great war will be carried out by larger and more powerful machines used in vastly greater numbers than in the present war, and the country that is not in a position to defend itself from such attack, and loses the control of the air above its territories will be by that very fact defeated.

It seems, therefore certain that a considerable number of planes will be required for military purposes. But while this will, I believe, be the case, I am convinced that it is equally true that if the aeroplane industry is to develop to any respectable dimensions, it will have to be along commercial rather than military lines. This brings us to the question, is the commercial development of the aeroplane possible?

This is the problem that must be solved by businessmen and engineers working together if the aeroplane industry is to be a factor in the commercial life of the country.

The war has developed, in general, the following types of machines:

(*a*) The small fast scout plane, of very high speed and small carrying capacity, generally a single seater—as the Spad, the Sopwith Camel, the SE-5, etc.

(*b*) The larger and more powerful general purpose machine of high speed and fair carrying capacity—generally a double-seater, as the DH-4.

(*c*) The still larger bombing plane, generally at least twin-engined, of somewhat lower speed, but great carrying capacity as the Handley Page, the Super Handley Page, the DH-10, the Caproni, etc.

probably choose a " tank " as a motor vehicle for pleasure or commercial purposes.

In this connection it is interesting to note that the attempt to use DH-4's built for war purposes in the U. S. as mail carrying machines, has so far proved a failure, while machines specially built or adapted for mail carrying —the JN-4 type with the 150 H.P. Hispano Suika motor and the R-4 with the Liberty 12---have been very satisfactory.

For commercial uses more rugged construction will probably be found desirable, particularly with reference to parts affected in landing—greater reliability, and longer service without overhauling in the case of motors. As the attaining of a very high ceiling will not in general be necessary, lower compression pressures could be used satisfactorily, this, with somewhat heavier construction

"Avro 504-K" Type Training Plane C-1502. Last Plane Built by Canadian Aeroplanes Limited for R. A. F. November 1918.

(*d*) The flying boat for naval service, the largest types of which as the F-5 or NC-1 are of large carrying capacity, and in general correspond to the large bombing planes.

(*e*) The training plane, moderately sized, moderately powered, fairly slow and comparatively easily handled as the DH-6, the JN-4, the "Avro " 504-K, etc.

It seems probable that none of these war types at present in use will prove permanently satisfactory for commercial purposes without considerable alteration; in other words an aeroplane for commercial use will probably have to be specially designed for a particular class of service in order to prove satisfactory.

This is not remarkable nor are these considerations confined to aeroplanes. A warship would not make an efficient passenger or cargo vessel, and none of us would would tend to greatly increase the serviceable life of the motors. It should be constantly remembered, however, that increased weight in construction of plane or machinery cuts down the available load capacity.

The peace development of the aeroplane will probably be along the following general lines:

(*a*) Machines for sporting or pleasure purposes.

(*b*) Machines for what are generally termed " commercial " uses, including:

1. Machines for mail carrying;
2. Machines for carrying passengers and freight;
3. Machines for special purposes.

With regard to the use of aeroplanes for sport or pleasure, a considerable development may reasonably be expected along this line but of much smaller dimensions than has occurred in the case of the pleasure automobile.

The reasons are several, perhaps the chief being the aversion that so many have to leaving the safety of terra firma. One may produce facts and figures to prove that flying is really very safe—as for example that the mail carrying planes between New York and Washington during the months of September and October flew over 22,000 miles and carried over 30,000 lbs. of mail in all weathers without serious accident and with only one forced landing—but a certain number will always remain unconvinced.

Another drawback is the space required for taking off and alighting—which certainly limits if it does not entirely preclude the use of aeroplanes in crowded quarters such as cities. Improvement in this respect will probably be made, and already a successful landing has been made on the roof of a building, but this objection will probably remain, more or less.

Another factor is that of cost. Such machines as were available before the war, cost in the neighborhood of $7,500.00 at least, and required the constant attention of skilled mechanics to keep in flying condition—they were at best rich men's toys.

Just at present and for some time there will probably be available numbers of machines which have been built for war purposes, at sacrifice prices, but the upkeep cost of these machines will probably be considerable, and in any case the supply will soon be exhausted.

Since the war several firms have turned their attention to producing small one-man planes of moderate size and power, and with a reasonable first and upkeep cost. Several of these are advertised to sell around $2,500.00.

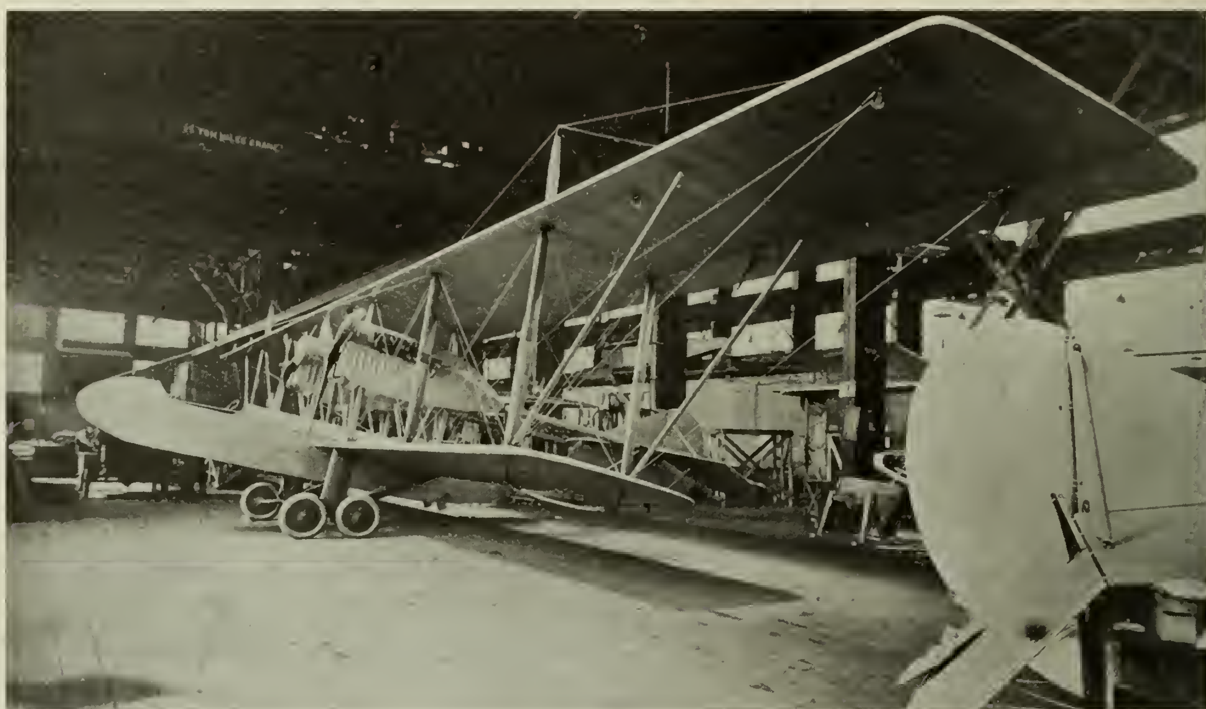
It is practically certain, however, that a five-passenger machine will never be available at anything like the price of a " flivver."

Coming now to the purely commercial machines, those engaged in the transportation of passengers, mail and freight, while reliable data as to running costs of aerial transport under peace conditions are not available, nevertheless it is possible to form some fair estimate of the conditions under which it will be possible to compete with other established means of transport.

In long settled territories where competing methods of transport, such as railways, steam or electric are well developed, the governing advantage of aerial transport will be speed. As the aerodromes will probably have to be located on the outskirts of cities, some time will be lost in conveying passengers or freight from the collection point to the aerodrome. It follows, therefore, that there must be some minimum distance below which the advantage of speed will not exist, and as distances become longer the advantage of aerial transport in this respect will become more apparent. For short distances, therefore, it would seem that aerial transport is not likely to be commercially possible.

The absence of the necessity for a track gives the aerial transport system a great financial advantage, nor will this be nearly offset by the cost of necessary landing grounds at reasonable intervals, wireless installations, weather reporting services and signalling systems, to indicate routes by night or in fog.

Another advantage of the aerial transport lies in the fact that as compared with a railway train an aeroplane is a small traffic unit, and urgent traffic can be handled by a succession of planes from the aerodrome as



"C" Bombing Plane, Built by Curtiss Aeroplanes & Motors Limited, Toronto, 1915-1916.

the occasion arises, with time economy over the train which requires longer intervals between units to allow of the accumulation of sufficient load for a unit.

Considering now specially passenger traffic, this divides itself into two general classes, business and pleasure. At first the greater part of the passenger traffic will be business. On account of the higher speed of the aerial service, many business men will no doubt avail themselves of it, because although the fares will be higher, this will be more than offset by the economy of time. For instance, it will be possible, under favorable conditions, to fly from 400 to 500 miles out and home within the day, with sufficient time between flights for transaction of reasonable business.

Passenger service will probably begin by the use of single machines for rapid journeys in any direction, but later it will become possible to institute regular services along settled routes on scheduled time.

Pleasure traffic will probably be small in volume for some considerable time, and will be confined to those taking a trip for the novelty of the experience.

have to be supplied, and the method of entrance will have to involve less of an acrobatic performance than at present. This will mean added weight and the reduction of the passenger carrying capacity, but these changes will, in the writer's opinion, be found necessary if trade is to be secured.

Freight traffic will include :
(a) Mails.
(b) General Freight.

In mail carrying commercial conditions do not necessarily rigidly apply—in other words national considerations might demand that the use of aircraft should be developed, and in this case it might be good national business to bear part of the cost of an aerial mail service with this object in view.

Mails offer a very satisfactory class of freight for aeroplane carriage, because the load is fairly uniform, the weight small, and the demand for speed urgent.

For the longer distances the saving in time in the delivery of mails by aeroplane will be enormous—for instance it is estimated that mail could be conveyed from

"F5L" Type Flying Boat, Built by Canadian Aeroplanes Limited, Toronto, for U. S. Navy. First Canadian Boat under Test at Navy Yard, Philadelphia, August 1918.

As the safety and convenience of this method of travelling becomes more apparent, this traffic will increase in volume.

For passenger traffic two points will require special attention, safety and comfort. Safety, in fact, will have to be a primary consideration if support from the travelling public is expected. In this connection it may be noted that commercial machines can be made inherently stable and automatic stabilizers can be employed to an extent that has not been practicable in war machines—so that it would appear that commercial machines could be made aerodynamically much safer than the present war types. In use they will not be subjected to the severe and somewhat indeterminate stresses due to "stunting," and, therefore, for the same calculated factor of safety, they will really be structurally much safer.

The question of comfort will also require much attention. The travelling public will demand a much greater degree of comfort than is available in present machines. Some form of comfortably enclosed cabin will

London to Calcutta in four days against 16 days, the best possible at present.

Considerable experimental work has been done already along this line, and the results have in general been so satisfactory that in the immediate future the existing services will be greatly extended.

When we turn to the consideration of other freight, conditions are not quite so favorable. If reasonably high speed (which has already been noted as the principal asset of aerial transport in competition with other methods) is to be maintained, then the commercial load must not exceed approximately 25 per cent. of the total weight of the loaded aeroplane.

It would, therefore, seem that the class of freight that can be commercially handled by aeroplane in competition with other means of transport, will be limited to articles of high intrinsic value and small weight, or articles which are specially "rush." For instance, laces, jewels, precious metals, tea samples, drugs, dyes, chemicals, small spare parts of machines, etc.

For this class of service it would seem that aeroplane transport could only hope to act as auxiliary to surface methods of transport.

In undeveloped parts of the country where there are no established competing methods of transport, aerial transport, providing as it does ready means of reaching points previously practically inaccessible, will show to much greater advantage, and offers proportionately a better commercial proposition. Of course, the volume of such traffic will probably not be large.

In cases where traffic from one place to another is interrupted by some obstacle involving changes in the method of surface transport—such as a sea passage—aerial transport scores a great advantage.

This brings us to an exceedingly interesting question, namely, that of Transatlantic, or perhaps it would be better to say Transoceanic Aerial Service.

While we may reasonably expect a successful Transatlantic flight to be made by aeroplane or flying boat in the near future, possibly this coming summer, it seems probable that when regular aerial service over the Atlantic and other oceans is established, the aeroplane will not be the type of air vessel generally employed. For work of this kind, as well as for long flights overland, involving several days duration, the lighter than airship of the Zeppelin type appears to offer superior advantages in the way of comfort and safety. As compared with an aeroplane, the largest types of dirigible at present in existence have a gross weight of 60 tons with a disposable load of 30 tons—about nine times that of the largest existing type of aeroplane.

The maximum speed possible is probably not over 70 miles per hour as against about 100 miles per hour for the large type of aeroplane adapted to similar service, but even this is much higher than that possible at present with steamships. The large load carrying capacity makes possible the provision of much greater comfort for passengers, and with respect to safety, the breakdown of the machinery would not necessitate immediate landing—a factor of some importance in crossing a large body of water. Minor breakdowns could no doubt be repaired in the air and the journey continued without landing. On the other hand provision for landing and housing at the terminal points would probably be more expensive than in the case of aeroplanes, and the regularity of the service would probably be more adversely affected by bad weather.

Applying this discussion to Canada, this country seems to offer particular advantages for the establishment of aerial transport. Large portions of it are in the undeveloped state as regards transportation facilities. The use of the aeroplane would enable mail and express package freight as well as passenger service to be extended to points at present practically inaccessible, or in other words places which it takes days or weeks to reach under present conditions could be reached in a few hours by aeroplanes.

The development in Canada is likely to be first of all along the lines of a postal service. This will enable considerable experience in commercial flying to be obtained, and will familiarize the mind of the public with the idea of aerial transport, thus creating confidence. It is the lack of confidence on the part of the average man in the safety of aerial travel that is, as stated before, one of the most serious, if not the most serious difficulty in the way of development. This has been created by reading in the public press highly coloured accounts of fatal accidents; where these are considered by themselves, without reference to the peculiar circumstances under which most of them occurred (the intensive system of training in all kinds of stunt flying necessary under the late war conditions), and also without reference to the proportion of accidents to flights, an altogether exaggerated and distorted idea of the dangers of flying is created.

When public confidence in flying is once fairly established, the writer ventures to predict that development of aerial transportation systems along the lines suggested will be rapid.

In the meantime, research work in aerodynamics should be pushed, and it is gratifying to know that several of our universities are already taking the matter up.

A great many other problems will have to be dealt with as flying becomes more common—for instance, the establishing of flying rules of the road; questions with relation to trespass and liability in case of accident incurred in flying over private property; the determinations of the best air routes; custom problems, etc.

All this will take time; but it will be done and the writer is firmly of the opinion that in a comparatively short time flying will be so common as not to excite comment, and no one will think anything of travelling from Toronto to Montreal in about three hours or from Toronto to Winnipeg in ten.

When long distance flying becomes common, it will probably be found necessary to have stores of the spare parts most likely to be required, such as propellers and various engine parts, at conveniently located depots along the courses of travel. In the event of a mishap to any of these parts, repairs could then be quickly made, and the journey continued. On account of the weight it would not be feasible to carry spares (except small parts such as spark plugs, etc.) on board as is done in the case of a steamship. It is in this connection especially that standardization of parts of aircraft will prove so valuable not to say essential, more particularly with reference to international aerial services.

There remains to be considered special uses to which aeroplanes can be put.

One field in which it would appear that useful service could be rendered is that of fire patrol of forests. Destructive bush fires are very small at the beginning, and if immediately detected could be easily dealt with. A fire ranger from an elevation of say 5,000 feet could command a view of a wide stretch of territory and could detect the first signs of a fire.

For this service in Canada it is probable that the small flying boat or at any rate a hydro aeroplane (aeroplane fitted with pontoons instead of wheels) would be found best.

The writer has had survey experience in Northern Ontario and Quebec and can state that as far as his personal observation goes, possible landing grounds for aeroplanes are few and far between. On the other hand there are innumerable small lakes and rivers on which a small flying boat could alight in safety and from the surface of which it could take off.

Flying boats could also be employed in connection with life saving stations along our coasts, and in general coast patrol work.

A question which might reasonably arise in connection with the use of aeroplanes in all seasons in Canada is the question of rising from or alighting on a surface covered with snow, especially if the snow be soft, and of considerable depth. It is obvious that in the case of a machine equipped with the ordinary landing gear with wheels, a depth of soft snow might so impede its progress on the ground that it could never reach a flying speed, particularly in the case of a heavy machine. At the time when the R.A.F. established training squadrons in Canada it was considered so difficult if not impossible to continue flying under the ordinary conditions of a Canadian winter, that for the winter of 1917-1918 the bulk of the training camps were transferred to the South, only a small number remaining, more as an experiment than anything else. Experience proved that while a take off or a landing could be effected without special difficulty from a hard snow surface, there was always the possibility of one of the wheels striking a soft spot, when a spill was practically certain.

Then it was suggested that snow shoes or "skis" might be fitted instead of wheels. This was tried on several machines, and proved so satisfactory that a considerable number of machines were at once equipped with these "skis" and during the later part of the winter 1917-1918 much flying was done with them. It was even reported that a machine equipped in this manner took off and landed on a snow surface more easily than a wheel equipped machine on ordinary ground.

In fact so successful was the experiment that it had been intended during the winter of 1918-1919 to do the bulk of the training work at the Canadian Camps, and a large number of these snow shoes were ordered from Canadian Aeroplanes Limited. This order was partially completed at the time of the armistice.

From the experience of the R.A.F. therefore, it would appear that as far as snow conditions are concerned aeroplane service could be maintained throughout the winter.

D. O. LEWIS, M.E.I.C., Victoria, B.C.
Newly elected Vice President.

WALTER J. FRANCIS, M.E.I.C., Montreal.
Newly elected Vice President.

As commercial aerial service extends, new uses for the aeroplane will be continually found and in a comparatively small number of years instead of considering it as an interesting but somewhat impractical toy, flying will have become a matter of everyday life, and we will wonder how we ever got along without it.

As a result of the higher speed possible with aerial transport, nations will be brought in closer intercourse with one another, mutual understanding promoted and the possibility of international conflict lessened, so that while the aeroplane has proved it can serve its turn in war, it will also prove that it can help to bring about the condition wished for by the poet:—

"Now let us pray that come it may
As come it will for a' that
That man to man the world o'er
Shall brithers be, for a' that."

Industrial Illumination

*Geo. K. McDougall, Esq., A.M.E.I.C.**

Adequate illumination for industrial enterprises, with the improved means for obtaining it, is being appreciated by many and every day more interest is being shown in this subject due to the distinct bearing it has on efficiency and welfare of employees.

With a view of promoting interest and discussion on the subject of illumination, this paper has been prepared. The subject matter contained herein is simply a collection of information, briefly covered, which may be found more fully taken up in textbooks and technical articles on illumination.

Before touching on the practical side, the fundamental laws of reflection and transmission of light will be briefly covered, to allow of the easier understanding of their application.

The common laws of reflection and transmission are well known and widely utilized by designers of lighting equipment but unfortunately many mistakes are made in the application of such equipment by those who are not familiar with these laws.

Touching briefly first on the laws of reflection and transmission of light, we have:—

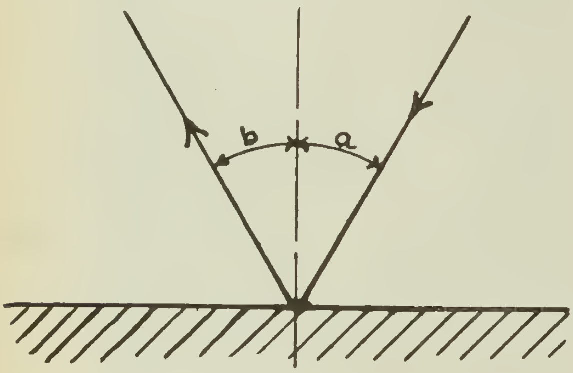


FIG. 1.
REFLECTION

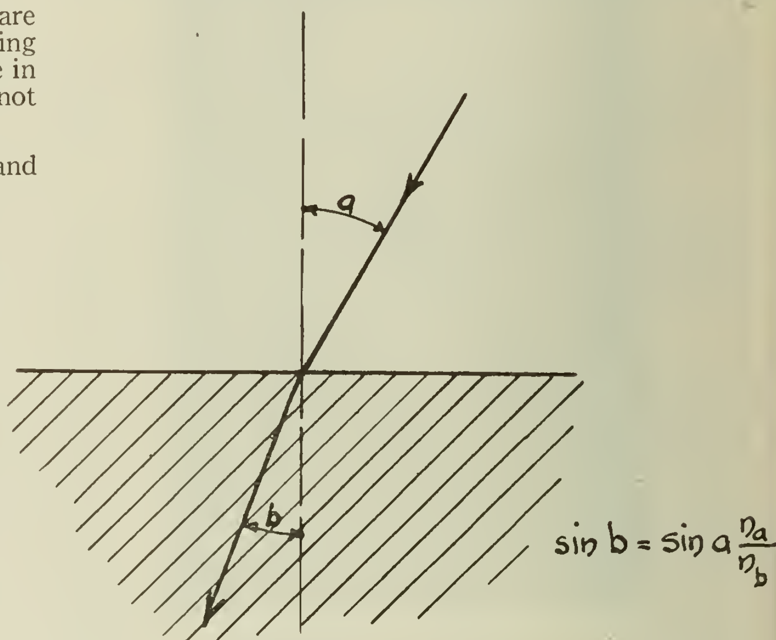

FIG. 2
REFRACTION.

1. *The Law of Reflection.* The angle of reflected light is equal to the angle of incident light.

2. *The Law of Refraction.* The sine of the angle of refraction of a light ray passing from one medium into another is equal to the sine of the angle of incidence multiplied by a factor which is determined by the relative refractive indices, or the relative optical densities of the two media.

The law of reflection is illustrated by Fig. 1. and the law of reflection by Fig. 2.

When we consider the result of a pencil of light rays, i.e., a collection of parallel light rays we may obtain results which appear quite different from those we would expect when applying these laws, due to differences between the different parts of the reflecting or refracting medium scattering the rays. Each individual ray, however, is following the regular laws in spite of the fact that collectively they are not.

This now brings us to the general laws of reflection and refraction of a collection, or pencil of light rays.

First considering the secondary laws of reflection, three in number:—

1. The law of regular or specular reflection.
2. The law of spread reflection.
3. The law of diffuse reflection.

Illustrating these laws — Fig. 3 shows the operation of the law of regular or specular reflection. In this case the angle of incidence of the light rays is equal to their angle of reflection. This kind of reflection is obtained from mirrored glass, prismatic glass and polished metal surfaces.

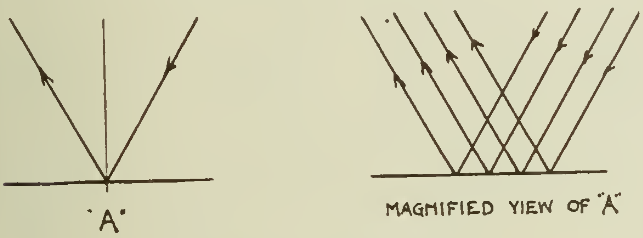
Fig. 4 illustrates the law of spread reflection. Spread reflection is obtained from etched prismatic glass and from rough metallic surfaces. It is to be noted that in this kind of reflection that the maximum intensity of the reflected light is in the same direction as in regular reflection, but a part of the light is scattered slightly out of this line, producing the effect of a spreading beam of light of the same general direction as in regular reflection.

Fig. 5. illustrates the law of diffuse reflection. In the case of diffuse reflection the maximum intensity of reflected light is always normal to the reflecting surface and the light is reflected through an angle of 180°. This holds over a large range in the angle of incidence. If a photometric curve is plotted of the light reflected from a

* Read at a meeting of Montreal Branch, Thursday, January 23rd, 1919.

small surface it will be found that the intensities are represented by a sphere, or considering one plane cutting the point of incidence, by a circle. This distribution of reflected light follows what is known as the cosine law, which is, that the intensity of reflected light at any angle from the normal to the surface is proportional to the cosine of the angle.

Diffuse reflection as ordinarily obtained is caused by reflection from particles beneath the surface. This will be better understood by referring to the magnified



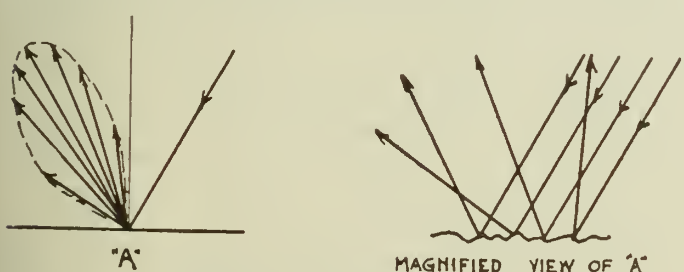
REGULAR REFLECTION

FIG. 3.

view in Fig. 5. The light rays penetrate the material and are reflected back and forth between the minute particles and finally emerge in all directions.

It may appear that diffuse reflection is obtained by surface reflection but if the substance under consideration, which gives diffuse reflection, is examined it will be found otherwise. Taking, for instance, a piece of matt surface paper or blotting paper, which is diffuse reflecting material, it would appear, at first thought, that the reflection of light is from the surface, but holding the paper up to a bright light it is found that it transmits light, which proves that the light is entering the material.

Examples of materials giving diffuse reflection are opal glass, porcelain enamel, paint enamel, also kalsomine



SPREAD REFLECTION

FIG. 4.

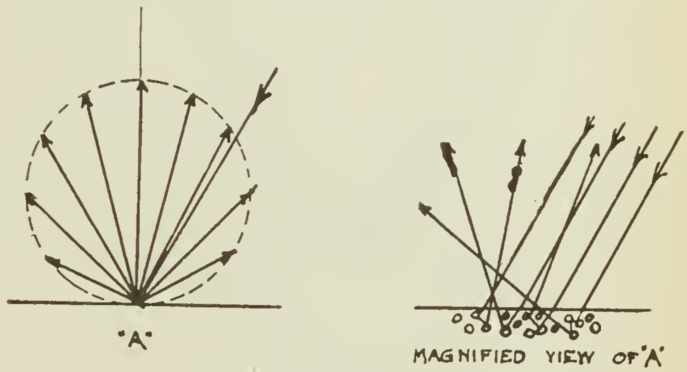
and paint finishes commonly used for walls, ceilings and interior decoration.

The property of diffuse reflection of common interior finishes is a very valuable one from the point of view of interior lighting.

It is possible to obtain combinations of regular and diffuse, spread and diffuse, or regular and spread reflections from the same material. These combinations are illustrated in Fig. 6.

In Fig. 6A is represented the combination of regular and diffuse reflection. The regular component is surface reflection and the diffuse component is sub-surface reflection. This is one of the most important types of reflections met with in practice and is obtained from such materials as porcelain enamel finish, opal glass and paint enamel when the surface has a gloss finish. The component of regularly reflected light, though appearing large, is really comparatively small and unimportant and actually is rarely more than five per cent of the total light reflected.

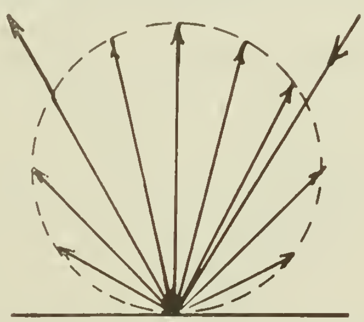
Fig. 6B illustrates the combination of spread and diffuse reflection which is obtained form materials such as porcelain enamel, or opal glass when the finish is rough.



DIFFUSE REFLECTION

FIG. 5.

Fig. 6C shows the combination of regular and spread reflection which is obtained by reflection from two surfaces of a meterial such as the inside and outside of a piece of glass when the outer surface is roughened. Crystal glass roughed outside gives this combination which, in practice, is unimportant as the materials giving it are not satisfactory as reflectors.

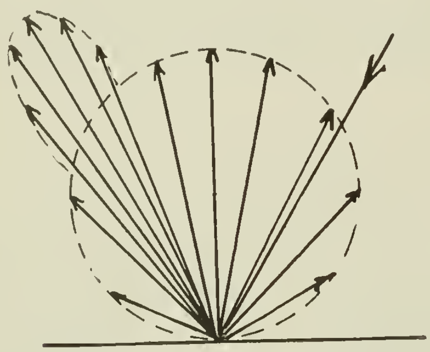


COMBINATION OF REGULAR AND DIFFUSE REFLECTION

FIG. 6A.

Considering the types of reflection from a practical standpoint it is seen that the most accurate control of light is obtained from materials giving regular or specular reflection such as mirrors or polished metal surfaces. This type of material is used in the manufacture of reflectors for searchlights, headlights, etc., where accurate control is required. It is to be noted, however, that this material is not satisfactory for reflectors to be used in general illumination, due to streaks or striations of light resulting from the reproduction of the image of the light source on the illuminated surface. Mirror reflectors having corrugations should not be confused with the above as they give spread reflection.

Surfaces giving spread reflection, such as corrugated mirrors and aluminum paint finish are of great importance and while less accurate in the control of light than those materials giving regular reflection, are sufficiently accurate for most practical requirements in commercial reflectors.

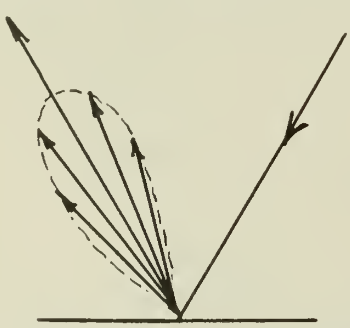


COMBINATION OF SPREAD AND DIFFUSE REFLECTION

FIG. 6B.

With spread reflecting surfaces it is possible to design reflectors whose shape will give all the light distributions required for interior illumination purposes. Striations or streaks on the surface illuminated are eliminated by the use of spread reflecting material in reflectors.

The accurate control of light with diffuse reflecting materials such as porcelain enamel finish and opal glass is difficult. The general direction only of the light can be controlled and reflectors made of this materia' are only useful where a general downward distribution of



COMBINATION OF REGULAR AND SPREAD REFLECTION

FIG. 6C.

light is required. A focussing distribution of light or other extreme distributions are impossible when a diffuse reflecting medium is used. It so happens, however, that the distributions most commonly used in commercial and home lighting fall within the range of those that can be obtained from diffuse reflecting materials.

The prismatic glass reflector belongs to the type of reflector giving spread reflection, and when accurately designed will give a wide range of distributions with considerable accuracy. Fig. 7 is a cross-section of a portion of such a reflector. The light ray passes through the inner surface, where a small portion of it is reflected, the balance is regularly reflected twice from the outer surface and then passes back through the inner surface. Due to the several reflections, the inequalities in the glass

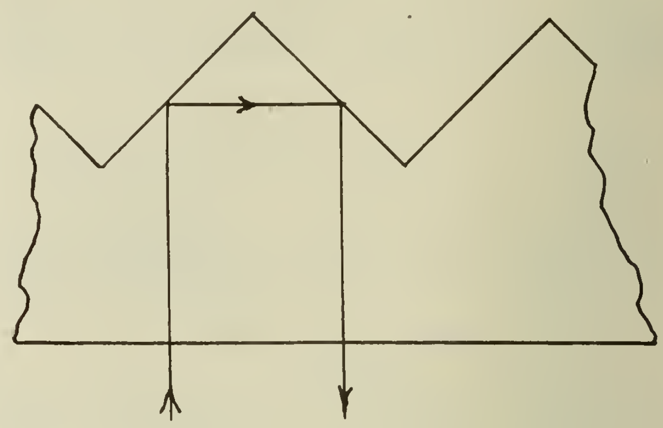


FIG. 7.

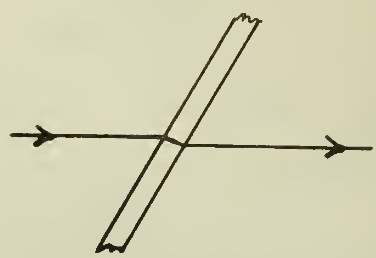
cause the rays to be slightly spread from the direct path of regular reflection. This slight spreading has the advantage of eliminating striations without reducing the control of light, which is one of the important advantages of the prismatic reflector. It should be remembered that in order to get the results for which it was designed, a prismatic reflector should be used with the size lamp and lamp position called for by the manufacturer, otherwise a totally different distribution of light may result.

Summarizing the important uses of the different reflecting media it is observed that for the most accurate



REGULAR TRANSMISSION

FIG. 8A.

control of reflected light, regular or specularly reflecting materials are used. Reflectors of this type are not satisfactory for general purposes of industrial illumination unless some provision is made to get rid of the striations produced.

Spread reflection allows of a fair control of light and materials having this characteristic are of great practical use for industrial reflectors. It is possible with spread reflecting surfaces to design shapes of reflectors giving the distributions most widely used in interior illumination.

Diffuse reflecting materials are difficult to control light with and are only useful where a general distribution of light is required.

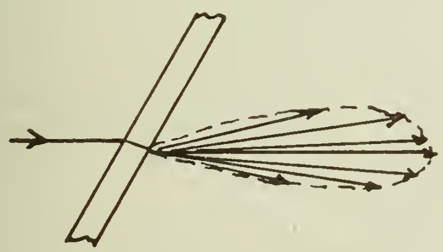
Light Transmission.

The primary law of refraction governs the path of a light ray passing through a material. This law was defined earlier in this paper. When a beam of light, however, passes through and emerges from a medium, the resultant emerging light follows laws very similar to the secondary laws of reflection. For brevity they will be enumerated and illustrated in diagrams only, on account of their similarity to the laws of reflection.

These laws are:—

1. The law of Direct Transmission.
2. The law of Spread Transmission.
3. The law of Diffuse Transmission.

Direct Transmission. Figure 8A, is obtained with clear glass. The light passes through without change in direction except for a slight displacement at each surface due to refraction. A small portion of the light is reflected at both surfaces and absorbed in passing through the medium.



SPREAD TRANSMISSION

FIG. 8 B.

Spread Transmission. Figure 8B, is obtained from materials having an irregular surface such as clear frosted glass and clear glass having a wavy or crinkled surface. The general direction of the emerging light is in same direction as the incident light. The deviation being caused by refraction at the irregular surface.

Diffuse Transmission. Figure 8C, is obtained from opal glass and is caused by the refraction and reflection of the light in passing through the medium. The emerging light follows the cosine law.

It is interesting to note the effect on appearance of globes having different light transmission properties.

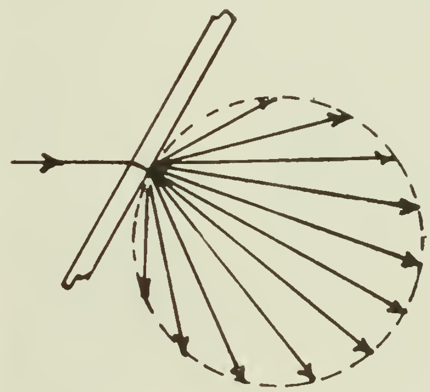
With direct transmission the light source is visible. With spread transmission the light source is seen as a bright spot gradually fading in intensity towards the edges. With perfect diffuse transmission the light source is not distinguishable and the globe appears equally illuminated. It is possible to obtain numerous combinations of the different types of transmission analogous to those obtained in reflection but they will not be touched upon here.

Natural Illumination.

Natural daylight being the most important source of illumination available, it is well to consider briefly its control.

There are numerous different types of window or sheet glass on the market and it is of interest to note their effect on the resultant illumination of a room. First in common use is clear glass, which has direct transmission, i.e. the direction of the light rays after passing through are in the same direction as originally. Between 10 and 20 per cent of the incident light is reflected or absorbed. Objects can be clearly seen through it without material distortion.

Next come the clear sheet glasses having various degrees of spread transmission of light caused by irregular refraction due to their irregular surfaces. The greater the irregularities of surface, the greater the spread of the rays of light. In the use of this type of glass it is to be borne in mind that care must be used in the placing,



DIFFUSE TRANSMISSION

FIG. 8C.

especially where it is exposed to the direct rays of the sun. Most people have experienced the discomfort of facing a window near the eye level, glazed with glass, on which the sun was shining, having a fairly large amount of spread transmission. The glass appears extremely bright due to some of the sun's rays being deflected into the eyes. This property of deflecting some of the rays is extremely useful in increasing the illumination in the part of a room away from the window, but care should be taken to avoid producing a glaring condition.

The ability to see through glass having a spread transmission characteristic depends upon the amount of irregularity in the surface.

Glass having diffuse transmission, such as opal glass, is not used to any great extent for window glass.

Prism glass is frequently used for bending light rays into a new direction where they will be more useful. In the use of prism glass, the angles of the prism must be accurately designed for the particular location, to obtain the results intended.

Artificial Illumination.

From the standpoint of artificial illumination, it is important that the general laws of reflection and transmission be understood as applied to practical problems to enable their proper solution. These laws have been already covered in a general way.

The problems of artificial illumination for industrial purposes may be roughly divided into two general classes:— the lighting of offices and the lighting of workshops. Each one of these has its own particular problems.

In general, good illumination should conform to the following requirements:—

(a) There should be an adequate amount of light coming from the proper direction for the easy performance of the work involved.

(b) Heavy contrasts should be avoided.

(c) Glare should be reduced to a minimum.

The Illuminating Engineering Society specify in their code, which has been adopted by law in numerous States of the U. S., the desirable intensity of artificial illumination for different classes of work as follows:—

Class of work.	Desirable foot-candle intensity.
Storage, passageways, stairways and the like	0.25 to 0.5
Rough manufacturing and other like operations	1.25 to 2.5
Fine manufacturing and other operations of a like character	3.5 to 6.0
Special cases of fine work	10.0 to 15.0

(The foot candle is the illumination produced by a source of 1 candle power at one foot distances. At 2 feet distance the illumination will be one-quarter foot candle as the inverse square law applies.)

The smaller values in the table are minimum intensities, but it will be found, as a rule, that the higher values will be productive of the best results, for daylight conditions, the code states that the figures in the above table should be increased three times for satisfactory conditions on account of the greater intensity of light required in the daytime, due to the physical condition of the eye.

The eye is so constructed that it adapts itself for different intensities of illumination. Out of self protection it adapts itself to the maximum intensity in the field, and it is quite possible, where there is a bright spot in the field, for the eye to be adjusted for this intensity and yet be attempting to see in a less illuminated area, with consequent reduction in powers of vision. This is a common fault in a great many of our old systems of illumination where unshaded lamps are employed. An exaggerated conception of this condition of lighting is illustrated by the automobile headlight in the field of vision of the opposing driver.

Bright reflections from polished surfaces are also conducive of this condition.

Heavy contrasts are produced when local areas are highly illuminated with reference to their surroundings. This condition obtains in the use of shaded lamps close to the work without other general illumination in the room. The glancing from the work to the surroundings causes a large readjustment of the eye, which if continued in will cause eye fatigue and discomfort.

The use of tungsten lamps, particularly the gas filled type, are productive of heavy contrasts. On account of the considerably higher efficiency of these new types of lamps, they have been universally replacing the older types without, in most cases, the necessary change in the equipment.

Modern incandescent lamp filaments must be kept out of the normal field of vision if glare is to be kept down. This can be managed if they are used in proper reflectors and mounted sufficiently high. The consciousness of a bright light source, disappears if it is mounted sufficiently high to subtend at the eye an angle of not less than 25 to 30 degrees with the normal.

Uniformity of illumination has a great bearing upon the ease with which work can be done. This question of uniformity is one which is of great consequence in the design of a lighting system. The direction of the light rays is also very important. There are certain classes of work in which shadows play a great part in assisting to see properly and bring out the proper form and perspective, while in others the elimination of shadows is an advantage. By shadow is not meant dense shade, but simply a grading of the illumination on different parts which is necessary to bring out form or shape without reducing the ability to see distinctly the parts less highly illuminated. In other words, work that requires the distinguishing of length, width and tickness, requires a certain amount of shadow, whereas that done on a plane surface, such as in office work, shadow is not a necessary adjunct.

Absolute uniformity of illumination is productive of monotony and as a rule, should not be the aim of a designer.

The lighting out of doors on an overcast day creates a feeling of depression and lack of interest in ones surroundings, which can be attributed to a great extent to uniformity in the illumination. On the other hand, our interest in things is stimulated on a bright sunshiny day, due to the added beauty and form of our surroundings caused by the high lights and shadows. It is worth noting however that even on a bright day out of doors contrasts between high light and shadow are never very great and seldom exceed ratios of twenty to one.

Glare is the term commonly used to describe the condition obtained when there is a brightness within the field of view of such excessive character as to cause discomfort, annoyance or interference with vision.

The reduction of glare, in lighting, to a minimum, should be kept in mind in the design of lighting systems. Glare is really a condition of intense contrast and may be caused by improperly shaded lamps in the visual field, viewed against a dark background, or reflections of light sources from polished surfaces.

General Types of Lighting.

There are three general types of lighting in use at the present time, namely: Direct lighting, semi-indirect and totally indirect.

In the first, the direct rays from the lamp reach the work. In semi-indirect, part of the light is diffused through a bowl or other shading and diffusing medium and part directed onto the ceiling and re-directed to the work. In totally indirect the light is all directed to the ceiling and re-directed onto the work. Each one of these types of lighting has its particular field of usefulness. The first directs the greatest proportion of the light produced onto the work and is also the most productive of glare. Shadows are sharper and more apparent with direct lighting than with semi-indirect or totally indirect.

In semi-indirect lighting there are two components of light, one from the source diffused through the bowl and the other from the ceiling. The ratio of these two components has a great bearing on the resultant illumination, the shadows produced and the appearance of the fixture.

As a rule, the bowl of a semi-indirect fixture should not transmit too much light, otherwise it will appear very bright and where installed in large rooms with relatively low ceilings will be a cause of glare, also reflections of it on polished surfaces and glossy papers will be troublesome. Where large light sources are used in a semi-indirect fixture, the size of the bowl should be in proportion to the size and intensity of the light source. One of the most common faults of this type of lighting fixture is the over-brightness of the inverted bowl.

Totally indirect lighting fixtures consist of an opaque reflector distributing the light onto the ceiling from which it is redirected into the room. This type of lighting produces the most uniform illumination and freedom from shadows.

As stated before, interior finishes and kalsomine paints are diffusely reflecting media and the maximum intensity of the reflected light is normal to the surface. The advantage of this is at once seen when light falls on the ceiling. In the case of walls, however, it is somewhat of a disadvantage as a considerable proportion of the light is reflected in directions which are not useful.

In order of efficiency of utilization of the light produced, direct lighting comes first, then semi-indirect and last, totally indirect. In considering efficiency of a lighting system, however, the fact should not be overlooked that it is the overall efficiency of the carrying out of an operation that must be considered and that the lighting is simply one item of cost of production which is always a small proportion of the total cost.

Much interesting research work has been done in the last year or two on the effect of illumination on output. At the present time extensive experiments are being carried out by the Illuminating Engineering Department of the Commonwealth Edison Co., of Chicago, along these lines. Transactions Illuminating Engineering Society paper by Wm. A. Durgin, "Productive Intensities" November 1918.

The data they have obtained is most valuable as they have conclusively shown that the production of departments of large manufacturing plants has been increased by at least 15% and in some cases by as much as 100%, by improved illumination. When the cost of bringing about the increase in production is considered it appears as negligible compared with the result.

Analyzing the reasons for increased production under better illumination it is found that more work is turned out by operatives due to reduction of spoilage, improved accuracy, better supervision, reduced eye-strain and brighter and more cheerful surroundings.

Illumination has also a very great influence on accidents and there is cause for assuming that probably 20 per cent of industrial accidents are attributable to lighting. The remedy for this is easy to apply and with the cry of "safety first" being continually heard, there is no reason why lighting should not be included amongst the mechanical safeguards against accident. The proper lighting of a danger point is an effectual way of pointing it out.

ALFRED D. FLINN,
Secretary, United Engineering Council, New York.

In spite of the large amount of advice and data that is appearing every day in technical journals, it is surprising to find that literally thousands of plants are paying very little attention to this advice, when it may mean thousands of dollars in their output with comparatively small expenditure involved for the necessary improvement.

The importance of illumination and its effect on general welfare may be further realized when it is known that many of the United States have adopted codes of illumination for industrial establishments giving extensive powers to inspection boards over systems of illumination and allows them to compel the installation of adequate systems. In our own country, with its short winter days, a large proportion of work is carried out under artificial illumination and consequently the possibility for increasing our efficiency is great.

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

VOL. II. MARCH 1919 No. 3

Thirty-Third Annual Gathering

Dr. Martin Murphy, venerable past President of *The Institute* gave a general interpretation of the views of all who attended the Thirty-Third Annual Meeting of the engineers of Canada, when with an expression of keen enjoyment, and in that delightful Irish accent of his, he exclaimed; "My! What a grand time we are having!" It was even so; speaking volumes for the social arrangements and for the interesting manner in which the many superior papers and thoughtful discussions were presented.

The universal verdict is that the meeting was the most successful yet held. The happy inspiration to hold a combined Annual General Meeting and a General Professional Meeting was an important determining factor. The presence of several distinguished members of the profession from the United States, all of whom contributed by giving addresses added both to the interest and to the enjoyment as did those of the notable Canadians in public life who contributed to the programme.

Nearly every centre from Sydney, N.S. to Vancouver, B.C. was well represented, the outside attendance being particularly gratifying showing what a keen interest the members took in the meeting.

Apart from these, and not to be overlooked as an important influence was the fine spirit of loyalty and enthusiasm everywhere in evidence, which shows in no uncertain manner that the engineers of Canada are taking an interest in their profession as never before, and that we have an organization, the fabric of which is being woven closer and closer, and which is growing stronger day by day.

For weeks before the meeting, the special committee of the Ottawa Branch commenced working for its success and in a very large measure the credit for the various features that will make the Ottawa meeting one long to be remembered is due to the members of the Ottawa Branch who gave up so much of their time, and so many of their nights to arranging and concluding the details. The thanks of *The Institute* is also due to the men who, although not members, presented meritorious and highly acceptable papers.

The business of the Annual Meeting revealed that *The Institute* is in an active state of development under the new name and the new by-laws. The reports of the Branches show a highly satisfactory condition both as to finances and Branch activities. The meeting endorsed a suggestion regarding changes in the by-laws which have already been submitted to the members and for which a ballot will be issued shortly. The adoption of the beaver as the emblem of *The Institute* was also confirmed, the members badge to be of gold, and silver for associate members, to be produced on a par with the best coinage die-work.

Under new business the most notable feature was a discussion on legislation and the resolution of the meeting in this connection is as follows:—

Whereas it seems that the wishes of the majority of the members and of the Branches of *The Engineering Institute of Canada* are that Provincial Legislation should be obtained to define the status of the engineers throughout Canada.

Whereas the members of this annual meeting are of the opinion that this legislation should be as uniform as possible throughout the provinces.

Be it resolved, that a special Committee be formed, composed of one delegate appointed by each branch to meet at headquarters before the 15th of April, 1919 to draw up such sample legislation as it may deem necessary and advisable in order that the members of *The Institute* throughout the different provinces may ask for legislation on the same uniform basis.

That the Secretary be instructed to call the first meeting of this committee.

That this Committee be authorized to obtain the necessary legal advice on the matter.

That this Committee shall submit the proposed legislation to the Council before the first of May 1919.

That the Council shall then ask by letter ballot, before the first of June 1919, the opinion of all the members of *The Institute* regarding the adoption of the proposed legislation prepared by the said special Committee of *The Institute.*

That the Council be authorized to pay all the expenses of this Committee and of each delegate.

That the Council of *The Institute* shall report the result of the ballot to the branches, and if the vote is favorable to legislation the Council of *The Institute* shall immediately take the necessary measures, in co-operation with the Branches, to have such legislation enacted.

The preliminary details of this resolution have already been carried out by the Council and a meeting of the special Committee called for April 5th.

The attitude of *The Institute* regarding Engineering Standards was shown by the resolution which read:

> Resolved that this meeting endorse the application of the Canadian Engineering Standards Association to the Dominion Government for a grant to partially defray its expenses during the ensuing year, and believe that this Association will be of great service in the industrial development of the Dominion."

The text of this resolution has since been sent to the interested members of the Government.

In the report of the meeting published elsewhere it was found necessary to omit some of the papers which will be published in full in the next issue of *The Journal.*

From the viewpoint of attendance, or based on a standard of technical, professional or social achievement this meeting was an unqualified success, and many who have felt in the past that the meetings of engineers were more or less dry affairs, are now looking forward to the next opportunity of foregathering with their brother engineers and enjoying the benefits of fellowship which such an occasion presents.

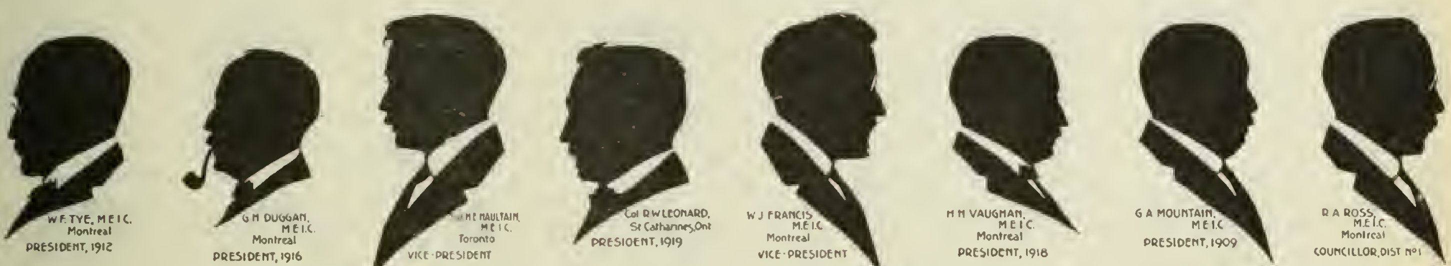
seas, which policy has already been adopted by the Department of Soldiers' Civil Reestablishment, where the work is being very largely done in the various provinces under the direction of and by engineers. The hydro-electric development throughout Canada will absorb some; municipal undertakings in which it is already seen there is some activity, will require others and the industries of Canada, if they can be kept operating at capacity, and it is hoped that before many months they will all be doing so, will require many more.

However, nothing in this connection should be left to chance, but everything that the combined effort of the entire profession can achieve should be done and the machinery without delay set in motion whereby the desired end can be accomplished.

Members are requested to advise the Secretary of all positions available.

Already the President and Council have offered to the Government the services of *The Institute* in any way that may be deemed the most acceptable, and it is expected that definite plans will be worked out in the near future.

As an illustration of how our men at the front view the situation and to what extend they are looking to us



Our Duty and Opportunity

Members of *The Institute* are fast returning from the war zone and while many have their former positions awaiting them, a very large number will need assistance in being placed in suitable positions in civil life. We have been thrilled with what our men have done in the war and we have boasted of their achievements and now that they are returning to be with us once more we cannot be true to our ideals, true to the profession, true to the men who have been away or true to ourselves if we overlook any possible measure by which our gallant brother members may receive every co-operative effort, possible for us to put forth, in aiding them to be suitably placed.

At Headquarters *The Journal* and the facilities of *The Institute* in getting in touch with positions are at their service. Every Branch is being asked by the Council, to take up the responsibility of aiding the men who return to their various branch localities. But this is not enough. Every member of *The Institute,* whether he is in a position to employ engineers or otherwise, should feel a personal responsibility in this connection. We cannot expect the Government to say to us that they have openings for all our returned men. It is expected, however, that the federal government in connection with the resumption of certain public works and in connection with the road problem to be carried on in conjunction with the provincial governments, will require many engineers and there is no doubt that preference will be given to the men who have been over-

to help, is illustrated in a letter received by the President from Col. Macphail, D.S.O., M.E.I.C., which explains itselfs, and which further illustrates the situation.

To the President,
THE ENGINEERING INSTITUTE OF CANADA,
Montreal, Canada.

Belgium, February 2nd, 1919.

Dear Sir:—

The Canadian Government has formed a " Department of Soldiers' Civil Re-establishment " for the purpose of assisting the return to civil occupation, of officers and other ranks of the Canadian forces now overseas. The method consists in filling out a form, giving in detail full particulars of one's occupation in civil life prior to enlistment. This method does not allow the selection best fitted to a professional man. A copy of the form is enclosed.

After four years of active service, without endeavouring to keep in touch with local conditions in Canada, an engineer is not in a financial position to compete with, or capable of competing with those members of the profession who maintained their practice throughout the war. To make this point clear, I will quote a case which has come under my notice, and is representative of scores of others:—

> " In September 1914, my professional practice as a consulting engineer and architect in the city of Saskatoon, Saskatchewan, was worth from 5,000 to 8,000 dollars a year income. I enlisted, expecting the war to last from six months to one year. Now at the end of four years active service, and on receiving information from Canada that conditions in Western Canada will not improve for at least a year, I must, therefore, apply for a position in a new locality."

The Government method of filling out a form and submitting it through the usual channels of communication to the Department of Soldiers' Civil Re-establishment in Canada, will not furnish the required information as to the locality in which an engineer might again continue his profession with prospects and opportunities for advancement. Many members of the profession now serving in France find themselves in this position; they lack the necessary information and the co-operation of engineer and architect associations in Canada, to place them in the best localities and positions to attain their former standard in their profession. A professional man does not like to apply for a position by the " card system " and feels that only by dealing with recognized engineer societies, will he obtain the best results.

If you will place this information before the Council of *The Engineering Institute of Canada,* I feel sure that our organization and connections throughout Canada, combined with organized information bureaus which could be established in the leading centres to furnish information as to prospects in Canada, with reference to employment for returned professional men, would greatly assist in the re-establishment of civil employment. I assure you that we are totally in the dark here in France, and have no information about conditions in Canada.

I am writing you this letter because I have these questions asked me every day, particularly as I am the commanding officer of the Engineer Brigade of the 1st Canadian Division, consisting of 120 officers and 2,500 other ranks; many of the other ranks are graduate, or student engineers.

I am sure that the members of the Council could persuade the Dominion Government to allow *The Engineering Instute of Canada* to handle the re-establishment of all engineers serving with the Canadian forces, and it would be appreciated by all members of the profession serving in France .

It has now become a civil question, and should be handled by a civil organization, and I think the Council should ask the Dominion Government to return immediately to Canada a delegation of officers composed of professional men intending to return to civil occupation, who would bring with them tabulated figures and reports on all members of the profession serving with the Canadian Corps. Sufficient publicity should be given to the organization, in order that all ranks would be fully informed of local conditions in Canada. This delegation would travel across Canada and place the conditions before the local Branches in each Province. You cannot realize the state of mind that men will get into when they are sitting down here in France, waiting for orders to return to Canada to be demobilized, without any information or prospects for the future, and it is only when men employed in the engineering profession have been told that they are being looked after by members of their own profession, that they are satisfied.

All points brought out in the foregoing apply equally to all members of the engineering profession, including mechanical, railway, and structural engineers, contractors, skilled tradesmen, draughtsmen, clerical members of the profession, and, particularly, to the engineer who has completed only two years of his technical school course, prior to his enlistment. They all realize that they must make a new start and continue to take " refresher " courses in order to get back to the standard they attained before enlistment.

Men who have completed, say two years of an engineering course are now majors who have under their command 6 engineer officers and 225 skilled tradesmen. Such men will find it difficult to return to a technical school to mingle with immature boys, and at the same time to be set back a number of years in their profession.

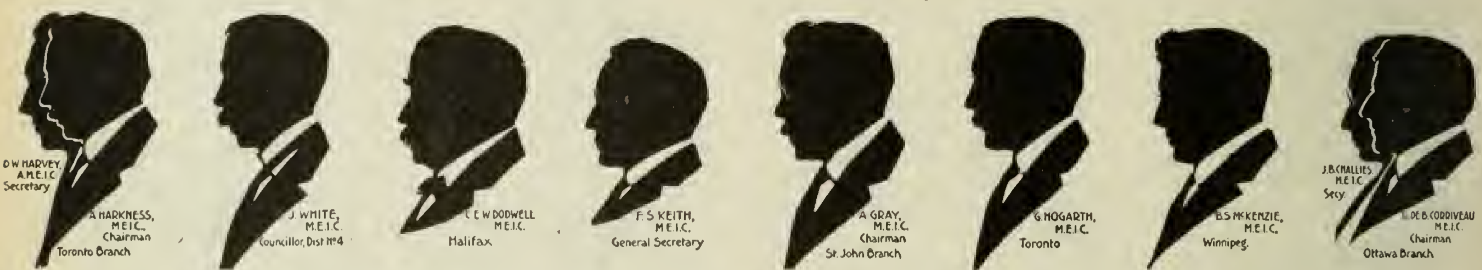
The educational question will involve considerable organization after demobilization, whlch could be instituted throughout Canada by The Engineering Institute arranging with its members to hold night courses, in order that those who return will be able to benefit by the experience gained by these members during our absence in France.

Enclosed are several newspaper clippings showing that Canada is making all preparations for the replacement of labour personnel, but is doing nothing for professional men.

I await your reply in order that I may relieve the minds of many of those who serve in my command, as to their prospects on their return to Canada.

A. Macphail,
Colonel,
Commanding 1st Brigade, C.E.

Headquarters,
1st Brigade, C.E.



A Compliment to The Institute

The eminent engineers from the United States who attended the Annual General and Ottawa Professional Meeting, representing officially the great bodies on the other side, did much to promote the feeling of good will and fellowship between the engineers of the United States and Canada. It was a compliment to *The Institute* to have such men as Alfred D. Flinn, Secretary of the United Engineering Council, Dr. Ira N. Hollis, Past President of the American Society of Mechanical Engineers, and Dr. Comfort A. Adams, President of the American Institute of Electrical Engineers present, and to have them convey the good wishes of their respective organizations to our members.

It is gratifying in the extreme to have these gentlemen all endorse the step which this *Institute* has taken in Canada, to embrace the engineering profession in one organization. The presence officially of members of the profession from across the border and all men prominent in their respective organizations, in Canada, shows that the spirit of unity is growing stronger and stronger.

It is also an evidence that the human element is becoming a greater factor in the affairs of engineers, and it is hoped that this principle will be adopted more and more.

Appreciation from Minister of Militia

Members will be interested in a letter received by Lieut.-Col. Monsarrat from General Mewburn, Minister of Militia, in response to a communication from Col. Monsarrat in which he supplied the Minister with requested information regarding the part taken by our members in the war and in which he also intimated that the Council of *The Institute* was ready to assist the Department of Militia, in any way in connection with the returned soldier problem,

February 21st, 1919.

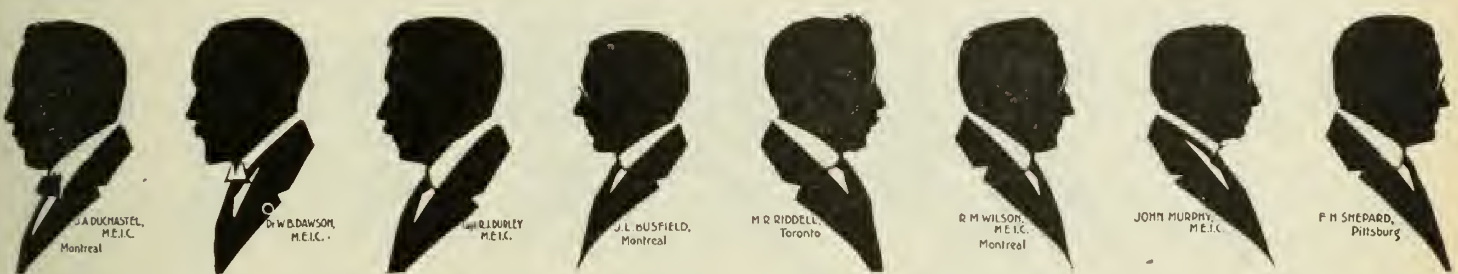
Dear Col. Monsarrat:—

Thank you very much for your letter of the 19th instant, enclosing information regarding the wonderful part taken by the members of *The Engineering Institute of Canada*, in the War.

It is an enviable record, and I am very glad to have the assurance that the Council of *The Institute* will co-operate in the big question of reconstruction.

Yours faithfully,

S. C. Mewburn.



Good Roads and Engineering

Hon. Frank Carvell, Minister of Public Works, made a statement before the members of *The Institute*, their guests and friends at one of the luncheons held during the Ottawa gathering, which although well known to the engineering profession, coming from such a source and at such a time, should be firmly impressed upon the minds of every member of the provincial and federal legislatures in Canada, every alderman and civic official, and should be scattered broadcast so that every citizen of Canada should be well aware of the fact. He stated that *more money had been squandered in Canada during the last forty-five of fifty years in the attempt to build roads, than perhaps in all other public works put together*, the reason being that roads were being built continually by those who knew nothing whatsoever about them. He was confident that *the engineer must be the first as well as the last man on the job*, and only by so doing could any successful road building be accomplished.

There is a satisfaction in knowing that to-day the road building of the various provincial governments is in the hands of qualified engineers who are members of this *Institute*, both as deputy ministers and chief engineers of highways. The good roads movement is one which is impressing upon the minds of the public not only the necessity for good roads but the fact that they should be properly designed, built under proper supervision and maintained by men who have a technical knowledge as to what constitutes a good road. With all that has been written on this subject and all the advice given to rural municipalities from every source, we still find in many rural communities the old mud scraping methods in vogue. This should no longer be tolerated in this new era we are now entering, which, above all is to be one of *economy* and *efficiency*, where these factors are given consideration, the place of the engineer becomes well established.

Students Prizes

For the past seventeen years there has been available, each year, a prize in each of the engineering sections including electrical, mechanical, mining and general, for the best student paper submitted during the prize year, which runs from June to June, in any or all of the four sections named. That is, there are four prizes available every year of twenty-five dollars each, to be won by students for the best paper submitted in the section in which it is desired to compete. Probably due to the fact that this has not been kept prominently in the minds of our student members, there have been a number of years in which no awards were made. During the past three years one award only was given each year. This was not due to poor quality of papers so much as the lack of students papers.

Every student of *The Institute* should be ambitious enough to present a paper in competition for one of these prizes. Such papers may very often be read before the nearest branch and nothing is better calculated to bring the young engineer into prominence and help to establish his position than by the reading of papers before *The Institute.*

Ontario Provincial Division

On Thursday morning, February the 13th, the officers of the Ontario Provincial Division were elected at a meeting of the Executive held at the Chateau Laurier, at the call of Professor Peter Gillespie, M.E.I.C., Chairman pro tem. Both western and eastern Ontario were represented as well as the Branches. After an expression of opinion from each of those present nominations were received resulting in the election of the following officers, the personnel of which ensures that the affairs of the Ontario Provincial Division will be well managed:

Chairman, J. B. Challies, M.E.I.C., Superintendent, Water Powers Branch, Department of the Interior, Ottawa.

Secretary-Treasurer, Geo. Hogarth, M.E.I.C., Chief Engineer, Department of Public Highways, Toronto.

Members of Council for 1919

President.

Lieut.-Col. R. W. Leonard, (M), 50 Ontario Street, St. Catharines, Ont.

Vice-Presidents.

Water J. Francis, (M), 260 St. James Street, Montreal.
Prof. H. E. T. Haultain, (M), Mining Bldg., University of Toronto, Toronto, Ont.

R. F. Hayward, (M), c/o Western Canada Power Co., Ltd., Vancouver, B.C.

D. O. Lewis, (M), P.O. Box 1586, Victoria, B.C.

Past Presidents.

G. H. Duggan, (M), President, Dominion Bridge Co., Montreal.

Col. J. S. Dennis, (M), C.M.G., Chief Commissioner, Colonization & Development Dept., C.P.Ry., Montreal.

H. H. Vaughan, (M), Vice-President and Gen. Mgr., Dominion Bridge Company, Montreal.

M. H. Macleod, (M), Canadian National Railways, Toronto, Ont.

E. G. Matheson, (M), 2909 Alder Street, Vancouver, B.C.

G. A. McCarthy, (M), Dept. of Works, City Hall, Toronto, Ont.

D. H. McDougall, (M), President, Nova Scotia Steel & Coal Co., New Glasgow, N.S.

W. A. McLean, (M), Parliament Buildings, Toronto, Ont.

John Murphy, Electrical Engr., Dept. of Railways and Canals, Ottawa.

Wm. Pearce, (M), Dept. of Natural Resources, C.P. Ry., Calgary, Alta.

F. H. Peters, (M), 513-8th Ave. West, Calgary, Alta.

J. M. Robertson, (M), 101 Board of Trade Bldg., Montreal.

R. A. Ross, (M), 80 St. Francis Xavier St., Montreal.

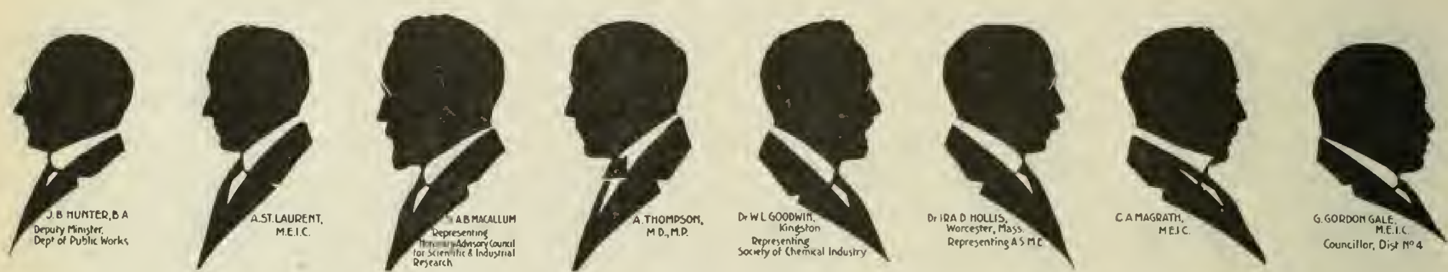
Julian C. Smith, (M), 607 Power Building, Montreal.

J. C. Sullivan, (M), 703 McIntyre Block, Winnipeg, Man.

Arthur Surveyer, (M), 274 Beaver Hall Hill, Montreal.

L. A. Thornton, (M), City Commissioner, Regina, Sask.

James White, (M), Commission of Conservation, Ottawa, Ont.



Councillors.

Brig. Gen., Sir Alex. Bertram, (M), 511 St. Catherine St. West, Montreal.

W. P. Brereton, (M), City Engineer, Winnipeg, Man.

N. E. Brooks, (M), 2 Queen Street, Sherbrooke, Que.

Prof. Ernest Brown, (M), McGill University, Montreal.

A. R. Decary, (M), Supt. Engr., Prov. of Quebec, Public Works of Canada, Quebec.

L. B. Elliot, (M), Box. 957, Edmonton, Alta.

G. Gordon Gale, (M), Hull Electric Co., 117 Main St., Hull, P.Q.

J. E. Gibault, (A.M.), Resident Engineer, Canadian National Railways, Champlain Market Station, Quebec, Que.

Prof. Peter Gillespie, (M), University of Toronto, Toronto, Ont.

Alex. Gray, (M), P.O. Box 1393, St. John, N.B.

The Reclamation Service

Department of the Interior.

Regulations recently promulgated by the Dominion Government, on the recommendation of the Minister of the Interior, for the drainage of vacant Dominion land in the provinces of Alberta and Saskatchewan, should go far towards effecting the reclamation of large areas of now vacant and comparatively valueless swamp land or land covered by shallow lakes.

The ownership and control of all sources of surface water supply in these provinces, including lakes, marshes, etc., is vested in the Dominion Government, which also owns the unalienated public land, while control of the drainage of land is vested in the provincial governments.

This divided jurisdiction has provoked controversy and has seriously interfered with the reclamation of submerged or swamp land and with the construction of roads and generally has materially retarded the settlement and development of districts which comprise considerable areas of such land.

Agreement has at last been reached between the Dominion and the provinces. The Governments of the provinces of Alberta and Saskatchewan have enacted legislation providing a simple and satisfactory method of sharing the responsibility, cost and benefits of such reclamation as may be found feasible, and the Dominion Government, by an Order-in-Council passed some time ago, approved of this legislation and undertook to supplement it by regulations. The regulations now promulgated prescribe in considerable detail the methods agreed upon for carrying on the work.

Recognizing the importance of reclamation, whether of arid or swampy lands, and the desirability of concentrating all such work under the control of some one organization, a branch of the Department of the Interior has been created, to be known as "The Reclamation Service," for the purpose of supervising and controlling all irrigation and drainage work. E. F. Drake, the executive head of the new branch has been appointed "Director of the Reclamation Service" and will, in future, control all reclamation work of this character.

The new regulations provide for four distinct classes of drainage reclamation as summarized in the following statement:—

Synopsis of Regulations for the Reclamation of Dominion Land by Drainage.

(a) *Small Drainage Projects.*

Where the area to be reclaimed does not exceed 1280 acres and the estimated cost of the works is not more than $2,000, the new regulations provide a simple and satisfactory method of procedure. Adequate provision must be made for the disposal of the water, for the protection of roads and other public works, and for the maintenance of the drains after construction. The work will be carried out under the supervision of the Reclamation Service and the reclaimed land will be disposed of to the applicants on terms to be fixed by the Minister of the Interior. The entire cost of the works will be borne by the applicants.

(b) *Drainage in Connection with Road Construction.*

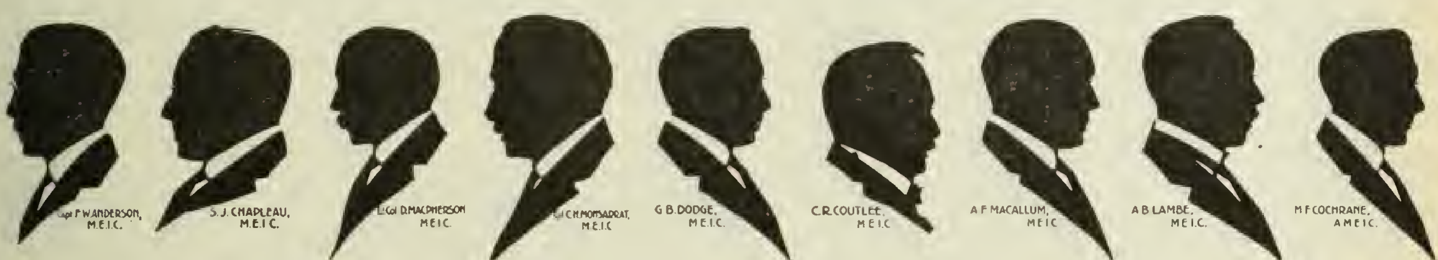
When, in connection with any proposed road work, the Provincial Governments find it desirable to drain swamps of shallow lakes, the Dominion Government will sell to the province, at a nominal price, an area of such swamp land which shall, after reclamation, be sold at public auction. The proceeds of the sale shall be applied towards the cost of the drainage and road work, any surplus being refunded to the Dominion Government. All work of this kind will be carried out by, or under the direction of, the Provincial Government.

(c) *Drainage of Dominion Land in Organized Drainage Districts.*

It has heretofore been impossible to assess any portion of the cost of drainage works upon land owned by the Dominion Government and this has, in many cases, made the cost of drainage prohibitive in districts comprising any considerable area of such land. Under the present arrangement the Dominion Government will sell all such land to the province, at a purely nominal price, subject to the condition that the land shall, after reclamation, be offered for sale at public auction and the proceeds be applied towards the cost of the drainage works. Any surplus remaining after the full cost of the drainage works has been repaid shall be applied towards road and bridge work within the district. All such work will be under the Provincial Drainage Acts.

(d) *Drainage Work Initiated by the Dominion Government.*

Whenever the Dominion Government, as owner of the bulk of the land requiring drainage in any district, desires to reclaim such land it may initiate proceedings under the provincial laws for the organization of a drainage district. All the machinery of the provincial drainage laws is placed at the disposal of the Dominion Government, the surveys and assessments of cost and benefit will be made by an engineer of the Reclamation Service, and, upon the organization of the district, the construction of the works will be carried out by the Reclamation Service. The available Dominion land will, after reclamation, be sold at public auction on terms and conditions to be prescribed by the Minister of the Interior and the proceeds of the sale will be applied towards the cost of the works.



Practical Recognition for the Engineer.

In accordance with the recommendations made by the International Joint Commission for the proper conservation and control of the waters of the Lake of the Woods District, the Dominion Government has, by Order-in-Council, created a Board of Control which will act jointly for the Dominion and Ontario Governments. This Board will be known as the Lake of the Woods Control Board, and consist of four *engineer* members, two appointed by the Dominion, and two by the Province.

The following extract from the Order creating the Board, approved by His Excellency the Governor General on the 13th of January, evidences appreciation by the Government of the necessity for employing engineers for engineering work who should be qualified to be members of *The Engineering Institute of Canada:*—

"The efficient and proper conservation and control of the waters of the Lake of the Woods in the interest of navigation, of water power and of other interests, can best be realized by the creation of a Board of Control representing and acting for the Governments of the Dominion of Canada and the Province of Ontario. This control requires special technical knowledge and careful study, as the unskilful and ignorant manipulation of the same might cause great damage to important interests on both sides of the Interational Boundary. It is, therefore, recommended that a Board, to be known as the Lake of the Woods Control Board, be constituted, to consist of four *qualified civil engineers,* two to represent the Dominion of Canada, and two to represent the Province of Ontario."

The representatives of the Dominion Government on the Board will be W. J. Stewart, M.E.I.C., and J. B. Challies, M.E.I.C. The Provincial Government has appointed H. G. Acres, M.E.I.C., Chief Hydraulic Engineer of the Ontario Hyro-Electric Power Commission, and L. V. Rorke, Engineer of the Department of Lands, Forests & Mines, Toronto.

Power Census

A census and directory of the central electric power stations in Canada, i.e., stations engaged in the sale of electrical energy, just completed, discloses several outstanding features of interest to the engineering profession, particularly those connected with the electrical or hydro-electrical field.

The capital invested in central power stations totals $356,004,168, of which 79.5% is invested in commercial stations and 20.5% in municipal or publicly owned stations. The primary power installation in central electrical stations totals 1,844,571 h.p., of which 1,652,661 h.p. is derived from water, 180,800 from steam and 11,710 from gas or oil. The statistics indicate the outstanding position which water power takes in the central station field, practically 90% of the total primary power being derived from water. This figure is indicative of the extent and availability of the water power resources of the Dominion, and of the remarkable degree to which their adaptability for central electric station work has already been appreciated in principle and realized in practice. The capital cost of central electrical station systems in Canada per primary horse power installed is $193.. This cost includes all actual capital invested in construction and equipment of hydraulic works, power stations, transmission and distribution systems; real estate; cash on hand; current assets; supplies and all other items.

Of special interest is the actual cost of construction of hydro-electric power stations per installed horse power. Omitting all real estate, transmission and distribution equipment, seventy representative hydro-electric stations throughout the Dominion, with an aggregate turbine installation of 745,797 h.p. and a total construction cost of $50,740,458 show an average cost of $69.11 per installed turbine horse power.

The report is to be published in two sections, the statistical section being distributed by the Dominion Bureau of Statistics, while the second section or the Directory is being distributed by the Dominion Water Power Branch. The Directory forms a comprehensive ready reference to the central electric stations of the Dominion, containing in concise form very complete information respecting the stations, including location, officials, history of plant, capital, installation, transmission lines, use of power, accessibility to transportation systems, blocks of power available for sale and further development contemplated.

A further census of the total developed water power in Canada including central electric stations just complete, discloses the fact that a total of 2,305,310 h.p. is at present installed in hydro plants throughout the Dominion. This figure indicates that Canada's utilization of hydro power is even more marked than has been realized. Of the total power installed, some 450,000 h.p. are utilized in the pulp and paper industry.

Silhouettes Ottawa Meeting

To the energy and enterprise of the Ottawa Branch is due an acknowledgement from the Institute for the silhouettes of members in attendance at the Ottawa Meeting and reproduced in this issue. Lack of opportunity prevented securing many others desired.

DISCUSSION

Economy in Ocean Transportation

In Mr. Robinson's paper under the above title as printed in the February number of *The Journal,* the fourth paragraph was inadvertently omitted. This paragraph is important as giving statistics of shipping losses and is as follows:—

The figures recently given out show that the world's total losses of merchant tonnage from the beginning of the war to October, 1918, by enemy action and marine risk, were 15,053,786 gross tons. Of this total the British Merchant losses were 9,031,828 gross tons.

During the same period vessels totalling 10,849,527 tons were constructed and enemy tonnage totalling 2,392,675 was captured, making a net loss of tonnage during the war of 1,811,584 tons.

These figures go to show that the total losses, enormous as they are, have been already largely made up, and that with the great building programme now going on by all nations, the deficiency will probably be made up early in 1919 to the figure at which it stood before the war.

After reading the paper, Mr. Robinson read the following extracts as a discussion of the subject:—

Sir Albert Stanley, President of the British Board of Trade in a speech on Jan. 24th said. There was more shipping available than cargoes, and it was expected that next summer the world tonnage afloat would be equal to the pre-war tonnage". This statement, Mr. Robinson said, appeared since the paper was written and confirmed his own conclusions.

The Engineering News-Record in an editorial urging caution in revising the shipbuilding program, and which appeared since the paper was written said:

"Changes in ship demand came upon the world suddenly with the end of active warfare. A month ago the call was for ships, ships of any kind so long as they were ships—wood, steel or concrete; small or large; economical or wasteful in coal and crew expense — no matter, provided they would float and carry cargo across the seas. Today the demand is for ships that can meet commercial needs and compete on even terms with the rest of the world's fleet".

It is inevitable that shipbuilding should be adjusted to the new demands. The nation's enterprise in building a merchant marine sufficient for all its transportation needs will fail if its ships are not efficient as carriers on the ocean trade route. We must build the best and most serviceable vessels which the naval architect's skill can produce.

No one man, and no small group of men, possesses the foresight needed for safely making far-reaching decisions on future shipping. There are many signs to indicate that, just as life-long shipbuilders have in recent times acquired new views of their art and its possibilities, so the men who carry on the worlds shipping are remodeling their traditions and are arriving at a new knowledge of ships.

It is not the cost of operating a ship that makes freight rates; it is the cost of its idleness. So to reduce the time in port requires much more than mere mechanical fitting of wharf and ship. It means a fresh view of the whole transportation problem, a revised design and operation — from the sources of material up to the hold layout of the ship itself — and an education of the men to the advantages they will gain from the rapid turn-around. That engineers in hitherto unthought of numbers are working on this complex problem indicates a new attitude of mind, which can but result in a successful solution, provided legislators and lay executives have the courage to break the new paths that will be laid out for them."

Sir John Aspinall, in his recent address as President of the Institution of Civil Engineers said:

"Strong comments have been made by some of the recent Government committees upon the want of mechanical appliances at our sea-ports for the loading and unloading of ships, and it cannot be denied that there is a large field for the mechanical engineer in providing up-to-date appliances of a varying kind to suit the trade of each port. Some of the largest ports are said to be the most deficient in handling appliances.

It must however be remembered that the problem of unloading or loading ships is by no means the easy matter which some people suppose, and the very difficulties — not of a mechanical nature —make it the more necessary to have quick and cheap handling of the goods so that every farthing per ton can be saved in manipulation, and quay space, which is always costly, can be rapidly cleared.

All these little points add to the necessity of eliminating hand labor, and doing by quick acting machinery that which is necessary to hurry the vessel away to sea, and thus increase the number of voyages per annum."

CORRESPONDENCE

Technical Co-operation

Editor, *Journal:*—

Permit me to lay before the readers of *The Journal* some ideas suggested by listening to the papers, debates, and addresses of the recent annual meeting in Ottawa. The papers on *Standardization* and *Aeroplanes* brought out very clearly the immense advantage of co-operation in manufactures, as well as in the basis of progress in industries, viz.: research. Individualism is forever discredited as an exclusive method of doing things,—which is not to be interpreted as the destruction of individual initiative,—far from it. It is not only possible to combine the two ideas,—individual effort and co-operation,—but necessary in the interests of efficiency and progress. This applies not only to industries, but also to the organization of those who shape, direct, and advance industries,—the great fraternity of engineers. In all branches of engineering Canada is now at a stage when we may hope to see technically trained men coming into their own. The spirit of appreciation and recognition is abroad, and it only needs wise direction in order to put the engineering profession in the position it should occupy. To this end the obvious thing to do is to secure hearty co-operation of all branches of engineering, civil, mechanical, electrical, mining, chemical, &c. How this is to be done is not altogether an easy problem. There are existing interests to be considered, in the form of societies which have their own ways of doing things, and the constitutions of which may have radical differences. But if these difficulties are faced in a wise, tolerant spirit, they will disappear. I am confident that it is possible to combine all the existing societies into one, for certain purposes,—particularly for two, (1) obtaining protective legislation, and (2) meetings for popular educative work. It was pointed out by one of the speakers that at the meetings of many of the existing technical societies in Canada and the United States, the papers and addresses are taking on more and more of the popular and less of the strictly technical character. They are thus of interest to all. This tendency was well shown in the last Annual Meeting of *The Engineering Institute.* I would suggest the union of all existing technical societies in Canada for these two purposes noted above. To such a union could be safely given the power of regulating the practice of the engineering professions. Its annual meetings would be large gatherings for discussion of the broader aspects of the applications of science to human activities and for the education of the general public. The original societies, viz.: *The Engineering Institute of Canada,* the Canadian Mining Institute, and the Society of Chemical Industry, could continue to meet for the reading of papers and discussion of subjects of a more restricted interest. This, it seems to me, would give us the advantages of both individualism and co-operation. It would at the same time create a strong body of men with interests in common, and ready to act as a unit.

W. L. Goodwin,

Queen's University.

Status of Engineers

Editor, *Journal*:—

I thank you for your courteous reply to my last letter and trust that our Government may eventually deem it advisable to recognize the value of the engineering mind in a manner similar to that which other countries have been and are doing.

I think that during the last four years it has been brought home to us that the status of Canadian engineers is not at all what it should be; if this is due to any defect or inherent weakness, let us start to correct it at once.

Your excellent article on this subject affords food for much thought and in an endeavor to analyze this question it appears to me that we have overlooked or rather failed to take advantage of two powerful forces—the force of "close co-operation" and the force of "educational advertisement." It may be that because these are not static forces the engineering mind refuses to acknowledge that which cannot be accurately measured. Be this as it may, the fact remains that these forces have proven to be of the greatest service to mankind if intelligently applied.

No doubt the conditions under which we engineers serve our apprenticeship have a lot to do with this question—camp life in isolated places is not conducive to that interchange of courtesies and ideas which are necessary in order to truly appreciate the finer qualities and greatness of our fellow members. We are inclined to experience a feeling of wishing to try each other out before extending that trust and welcome which should be a natural sequence of belonging to the same society and, I regret to say it, we are sometimes inclined to criticize each other's works to outsiders without knowing all the details; the immediate work which we may be engaged upon becomes an obsession to the exclusion of everything else,—even the remuneration becomes a secondary consideration; also we are apt to view outsiders and their ideas with a kind of tolerant disapproval, sort of "poor fellows they can't understand" attitude. Of course, very fine and high ideals are bred uuder just such conditions. The work must remain the principal object, therefore it devolves upon us as a body, rather than individually, to obtain easier working conditions so that it will be practicable for every member to attend the annual meetings. Until such time, and as a step towards this condition, would it not be good policy for *The Institute* to take energetic steps to stimulate all members to write more frequently, not only on matters pertaining strictly to engineering, but giving their views on general questions: Government, economics, labor, art, etc. The question of an absolute close corporation of our profession, akin to that of the legal and medical professions, might well be re-discussed.

The second great force, that of educational advertisement, is one which might be given more attention by *The Institute*. The public, as a general rule, seem to have a very vague impression of what even the word "engineer" really means, and of what his work consists. Many of them are inclined to confuse him with an engine-driver or surveyor.

There is an enormous amount of secondary engineering work being undertaken, especially in the Western Provinces, by small private companies or individuals and entrusted to the care of a foreman or ferry-builder; good men perhaps, but not understanding the first principles of economical design, lay-out and operation or the relations they bear to one another. It may sound extravagant, but my observation leads me to believe that nearly as much money is expended in this way as under skilled supervision. Think that it would mean not only to the profession but to national economy if these people would learn to look naturally to technical assistance for even their smallest problems. The fee is a very cold hard fact, whereas the economic loss goes unperceived. There is the rub—we cannot compel these people to utilize our services, but by a judicious educational campaign we may induce them to.

Today educational advertising might almost be called a distinct profession, and just as we engineers expect to be employed on constructional work, so, I think, we might do worse than engage one of this profession to take up our case and advise us, as a body, as to the best methods to pursue in such a campaign. As a suggestion, however, I believe the technical papers are valueless as far as the general public is concerned, and the G. P. is, after all, who we wish to convince.

The daily papers are naturally the most widely read medium and it should not be unduly difficult to induce them to publish interesting articles pertaining to engineering, in say the Sunday supplements. These articles would, however, have to be free from technical detail and written in simple enough terms to be readily comprehended by the lay mind.

An article showing how the engineer figures the economic cost of a structure and how very often the construction cost has the least bearing upon the cost of the finished product, would be interesting and instructive, as would also the facts of the saving upon the Winnipeg aqueduct due to comparative designs and estimates, and so on.

Might it not be a good plan for a start to address a circular letter to each member of *The Institute*, asking their opinions on these matters and urging an immediate reply? Jar them out of the rut a little and get them into the habit of corresponding more freely with headquarters; let them tell their troubles and give them advice and assistance. The individual letter might have this effect where an appeal through *The Journal* would prove fruitless.

Yours very truly,

C. G. Moon.

The Diving Bell

Moncton, N.B., January 29, 1919.

The Editor,
The Journal of The Engineering Institute of Canada,
Montreal, P.Q.

Referring to letter from Mr. Taylor, under date of Jany. 11th with further reference to the mobile caissons used on the harbor works at Halifax and Hamilton, the writer would submit the following for the sake of a higher degree of clearness in connection with the issues originally raised.

The matter at issue in this discussion is resolvable to the following:—

Mr. Taylor, in his first letter, stated that the principle and system of the Halifax Caisson had been anticipated by a device invented and put into operation by him three years previous to the design of the Halifax apparatus and that the Halifax Caisson was virtually merely an infringement of his patents.

In my former letter I stated the case so far as the relative dates are concerned and the letter from Major James MacGregor under date of Dec. 3rd, 1918, already published in *The Journal* adds further corroboration and detail in this connection.

Are the principles and systems of the two devices the same?

The Halifax Caisson in actual work was the same as an ordinary bridge caisson, as Mr. Taylor has observed. In order to move this caisson from place to place in the harbor, it was necessary to float it at a comparatively shallow draft.

The buoyancy chamber was added for this purpose and not to give weight or ballast to the caisson; the caisson would have been heavier in its working load if the buoyancy chamber had not been there.

The function of the ballast chamber on the other hand was to handle the water ballast and to control the caisson in the submerged condition.

These chambers were not convertible or interchangeable in their functions as Mr. Taylor tries to intimate, e.g. in actual operation the caisson could not be sunk by admitting ballast into the buoyancy chamber.

As stated in my last letter, the Halifax caisson, for work on the harbor bottom, had to be submerged or sunk completely below the surface of the water, except the air locks; this necessitated the controlling device which the writer called the "ballast chamber."

The Hamilton caisson, which "actually floated at all times" was designed so that its depth of flotation could be varied for a few feet by the regulation of water ballast. But it was not possible to submerge the device, i.e. to sink it with its deck or roof below the water surface.

If this requirement had entered into its design or operation a new type of problem would have presented itself, viz. the disposition of the water ballast to give stability and a means of controlling the rate of sinking after the deck was submerged.

It would not be sufficient, as Mr. Taylor states, to merely prolong the air shafts so that the lock would remain above the water surface.

Again, in the Hamilton device, the buoyancy chambers were actually used as ballast chambers by elevating the water level in them above the outside water surface. Hence Mr. Taylor rightly calls them convertible ballast and buoyancy chambers.

This principle did not enter into the design or operation of the Halifax machine.

In other words, the Hamilton device was designed to work while afloat with its deck above the water surface. The depth of its draft and working plane was varied by admitting water into compartments or forcing it out as required and weight to resist the air pressure in the working chamber was provided partly by actual water ballast, i.e., water in compartments above the outside water level.

The Halifax caisson was designed for work under its own weight as an ordinary caisson on the foundation bottom. While at work, water ballast, in the sense that Mr. Taylor used it, played no part. The machine was simply under water or submerged except the working chamber and air shafts.

To make the caisson mobile, it was necessary to provide for its flotation, submerging and raising. This was done by the adoption of a special arrangement of compartments or chambers for the handling of water ballast in a special way, i.e. the flotation, submerging and raising of the caisson had to be taken care of by distinctly separate compartments and processes.

The character of the work to be done and the conditions under which the plants were to operate, being quite different, so also the problems of design for the two devices were inherently different and so logically enough the two types of plants were developed.

Yet Mr. Taylor asserts that the "principle and system" of the two devices were the same and that only slight structural modifications were required in order to transform the Hamilton device into a caisson for use at depths up to 55 ft. below the water level. The inference from this statement is that by using the same system of handling water ballast his machine could have been increased in depth so that work could be done at this level with the plant still floating and the difficulties of tidal variation taken care of. This is possible, but the resulting machine would have been very different from the Halifax caisson in construction and operation.

It is difficult to follow Mr. Taylor's argument that, on account of differences in shape of plant and details of operation, the principle of water ballast regulation as applied to sliding gates for dry dock and similar equipment is not essentially the same as that used for the regulation of draft in his floating caisson. At the same time he would brush aside as non-essential the fundamental differences in application and detail of the systems of control by water ballast in the cases of the two devices under consideration.

Re scows carrying construction plant in tidal waters, for Mr. Taylor's information I would cite the case of the scow used on the outer end of the dumping bridge employed in the construction of the breakwater at the Halifax Ocean Terminals by the Cook Construction Co., and Wheaton. This breakwater was built by side dumping from a track carried by a steel span from the construction end of the fill to the scow. The scow, which was a large one, provided tail track for the construction train. The tide variation here was from 5 ft. to 7 ft., and the track on the span was kept approximately level by the operation of the system referred to. This work was begun in 1913.

Mr. Taylor, in the second paragraph of his letter states that my intimation that the means he used for the "*regulation of draft*" in his device were not novel, is incorrect. Then, in the third paragraph he states, Mr. Macdonald asserts that "*any change in draft was impossible.*"

It is evident that Mr. Taylor was writing very hurriedly here. My letter was explicit in this connection as I referred to "regulating or changing the depth of flotation."

As to the first statement, it would be interesting to know wherein Mr. Taylor claims novelty for this method of changing draft and wherein it differs fundamentally from the method used in the case of a sliding gate for a dock or the scow cited above.

Mr. Taylor expresses doubt as to the basis for the writer's statement that the problem of flotational stability *while in the submerged condition was absent in the case of his* (Mr. Taylor's) *design*. Inasmuch as Mr. Taylor's device was designed to *float* at all times and *could not be submerged*, i.e. sunk until the deck was under the water, this condition of its stability *after submergence* would scarcely require extensive calculations.

Again, Mr. Taylor states " Mr. Macdonald says the use of water ballast was not an essential principle of the device used here." This is a misquotation. My statement was " the use of water ballast was not an essential principle of the plant so far as its use as a floating caisson was concerned." In ordinary conditions a heavier scow, or the use of movable kentledge would have answered the purpose of water ballast. In this particular case, the circumstance that the device required an extremely shallow draft in order to get into position made the use of water ballast advantageous, but Mr. Taylor will scarcely argue that this circumstance was a matter of fundamental principle for apparatus of this type. As a matter of fact, it would be necessary for Mr. Taylor to use iron weights or similar ballast in order to work his machine at a depth of 7 ft. (see his original article in the " Engineering News " of April 23, 1914).

However, Mr. Taylor asserts that the *use* of water ballast was a prime necessity when in operation but goes on to say that the writer was in error in stating that the *use* of water ballast was necessary to regulate the draft of machine so that it would pass over the piling and he divulges the secret that it was the *absence* of water ballast which permitted this regulation—and this after Mr. Taylor in several paragraphs of his letter would fain accuse the writer of juggling with terms!

In conclusion, it appears to the writer that between the Halifax and Hamilton caissons, plants of related types but independently evolved to suit their respective requirements, there is no real quarrel.

Mr. Taylor's criticism of the writer's paper and former letter has grown largely out of a misunderstanding or confusion of terms. Perhaps the lack of definite technical terminology for work of this class is somewhat to blame.

Re Mr. Taylor's claims for the invention of the Halifax caisson, or diving bell, by virtue of his design of the apparatus used at Hamilton, it has been the writer's object in this discussion to set out as clearly as possible the fundamental characteristics of the two plants. It is for the profession to pass judgment.

Yours very truly,
J. J. MACDONALD.

Moncton, N.B., Jan. 29, 1919.

Salaries of Engineers

Editor, *Journal:*

The question of salaries paid to engineers has frequently come up of late years. Glaring examples of downright injustice have come to light, such as a university graduate trying to support a wife at a salary of $1200 per annum by doing technical work whilst the pipe fitters, riveters, etc., were making $1800 at skilled labor.

A medical graduate of 1912 said that his practice for 1917 netted him $10,000. This to an engineer, who works much longer hours, and more exacting work, would be the wealth of the Indies. The latest item copied from a Civil Service paper is as follows:—

Civil Service Positions open till February 7th, 1919.

1. Reporter for the House of Commons—salary $2200.
2. Fruit Inspector—salary $2000.
3. HYDROMETRIC ENGINEER—Salary $1500.
4. Legal Clerk—salary $1500.
5. Store keeper at Banff, Alta.—salary $1200.

" C'est à rire."

And how about the Army?

A graduate engineer in 1914 was appointed to a commission as a lieutenant—($2.60 a day). Each time he missed promotion through wounds, etc. (Engineers, by the way get promotion through casualties). A medical graduate at the same time was called a lieutenant but received captain's pay ($3.75, now $4.75) and in one year automatically becomes a Captain. This is the official recognition of the engineer by the State.

The solution is plain—Union and Protection—we, ourselves are to blame for this. How many who were rodmen last year call themselves " engineers " this year? The first step must be " legal protection."

I would be pleased if you could find space for this in your *Journal.*

" SAPPER. "

Legislation

Dear Sir:

In connection with proposed legislation conference at Ottawa it appears to be doubtful whether our Province will be represented by a delegate and I take this means of placing my views on the subject before the members in attendance.

To begin with I am absolutely opposed to any " closed shop " legislation, such as prepared by the Saskatchewan Branch, and thoroughly endorse every word of G. B. McColl's letter regarding same, in January issue of our *Journal*; such legislation embraces the worst features of Trades Unionism and stands for a vicious principle, which is bound to re-act on the dignity and standing of our profession in Canada. That members of a Dominion wide *Institute* should be required to place themselves in the hands of local tribunals, before being allowed to practice anywhere outside their own particular place of residence or Province, is such an utterly parochial and unprofessional method of improving the status of the engineer, as to be classed retrograde in conception—The argument so often advanced " that the surveyors have such legislation," is not a very well chosen one when you find the competent and incompetent equally protected by law, whilst the engineer must rely upon his work and results for protection.

The spirit of the present age is decidedly against special privilege for any class of men and there is no need for us to build a high brick wall around ourselves, but we must have official recognition by the authorities as to what constitutes a qualified engineer and this, of course, involves registration, which will protect the public much more effectually than closed corporation methods. If an engineer cannot stand on his own feet in competition with brother members of the profession, we certainly have no right to bolster him up by Act of Parliament and drag our profession downhill by so doing.

The British Institute owes its great influence and standing throughout the world, not to legislation, but to having achieved recognition through the high standard set to its members; this can be also achieved by our *Institute*, but it will be necessary to take action with Federal and Provincial Governments on the basis outlined in Mr. McColl's letter, which contains a most excellent presentation of our case.

Yours faithfully,
R. W. MACINTYRE.

P.S.—My views as given above are shared by many of our most prominent members in B.C.

Overseas Correspondence

Following are some of the many replies received from our overseas members acknowledging the cigarettes and Xmas Greetings sent them:—

Smokes received. Many thanks for kind message.

Lt.-Col. WALTER H. MOODIE, D.S.O., A.M.E.I.C.,
9th Canadian Railway Troops,
1st Canadian Pioneers,
France.

* * *

Many thanks for the cigarettes which reached me while in hospital in London. Am expecting to be home soon.

Lieut. F. THEO. GNAEDINGER, M.M., Jr., E.I.C.,
1st Battalion,
Can. Railway Troops,
C. E. F.,
France.

* * *

Cigarettes and good wishes received with many thanks, and latter heartily reciprocated. I hope to be back about April, and will indeed be glad to greet you all once more.

Lt.-Col. H. J. LAMB, D.S.O., M.E.I.C.,
The Bath Club,
Dover Street,
London, England.

* * *

Please convey to *The Institute* my grateful thanks for the very handsome parcel of cigarettes received today. I am proud to be the recipient of your greetings, and wish *The Institute* all vigour and prosperity in the coming year.

Major A. M. JACKSON, A.M.E.I.C.,
7th Battalion,
Can. Railway Tps.,
France.

* * *

Many thanks for your splendid parcel of cigarettes, which reached me in good condition and was much appreciated.

Major E. DUNCAN, Jr., E.I.C.,
Canadian Overseas Ry. Constr. Corps,
B.E.F.,
France.

Please accept my very best thanks for the cigarettes so kindly sent me by *The Institute*, and which I very greatly appreciate. Through you may I extend New Year's Greetings to all the members.

Col. T. V. ANDERSON,
D.S.O., Order of St. Anne, A.M.E.I.C.,
Seaford, Sussex,
England.

* * *

The writer has much pleasure in acknowledging receipt of " smokes " together with the seasons greetings from *The Institute*, and wishes you all the compliments of the season.

Major A. R. KETTERSON, A.M.E.I.C.,
1st Battalion,
Canadian Railway Troops,
B.E.F.,
France.

* * *

I beg to acknowledge receipt of cigarettes which followed me since my return from overseas. I wish to convey *The Society* my sincere thanks for the kindness shown me, during the time I was on active service.

Pte. F. G. EARLE, S.E.I.C.,
P.P.C.L.I.,
458–14th Street,
Brandon, Man.

* * *

I wish to thank you very kindly for your good wishes and cigarettes which you sent me for Xmas. It was very kind of *The Institute* to remember us and we all appreciate the interest you take in us.

We expect to leave France before the end of January, and should be in Canada by the end of February or the first of March.

Thanking you again for your remembrance and good wishes.

Yours very sincerely,
Major D. A. GRAHAM, A.M.E.I.C.,
2nd Canadian Rly. Troops,
France.

* * *

Please accept my thanks for the cigarettes which came at a time when there was a shortage and so were doubly welcome.

F. E. LEACH, Lieut.-Col., M.E.I.C.,
Canadian Corps Headquarters.

* * *

Many thanks for the cigarettes which arrived today, the sentiments expressed on the enclosed card are very kind indeed.

The war is over and we hope soon to be home again. At present we are not unhappy being located at Lille which is a very prosperous city of a quarter million population. The people are very kind to us and are pleased to regard the British as their deliverers from four years oppression. Our later advances became more like a parade than the following up of an enemy. Fortunately by that time the Boche had little fight left in him else the civilian demonstrations might have been to our disadvantage for they certainly caused us some delay. Our final real attack on this front was the crossing of the River Scheldt on November 9th. The armistice coming into force on the 11th put a stop to a most successful operation.

Demobilization is going on slowly but surely so in the course of a few months I will be back in Toronto—it really seems too good to be true. The finding of satisfactory civil employment for all the soldiers will be a great problem. I feel confident that the Canadians will deal with this problem in the same marvellous manner and with the same ability that was displayed in munitions and war bonds.

Again thanking *The Institute* for its kindness, I will close.

Capt. E. V. Deverall, M.C., S.E.I.C.,
62nd Field Coy., R.E.,
B.E.F., France.

January 8th, 1919.

* * *

I beg to thank you very much for a parcel containing cigarettes sent by *The Institute.*

Yours very truly,
Edward W. Francis, Lieut., S.E.I.C.

Somerville Hospital,
Oxford, 23-1-19

* * *

I have to thank your *Institute* of Canada for the most welcome Christmas present of cigarettes sent me which arrived safely.

Wishing you and my fellow members all best wishes for 1919, I remain.

Yours very truly,
A. C. J. deLotbiniere, M.E.I.C.,
Major-General.

50 Pall Mall,
London, Eng.
22–1–19

* * *

Your little Christmas gift was appreciated more than I can say, not so much for the sake of the cigarettes as for the warm, friendly spirit in which they were given.

We are all very tired of the army now and are looking forward eagerly to the time when we shall regain our liberty. At present we are doing nothing and many of us object to the needless waste of valuable time, but I suppose we must be patient. However, anything which our *Institute* can do to hasten the return of the boys will be warmly appreciated by those here. It seems to me Canada has done her share and done it well and that she can do nothing more out here. A new army for garrison duty should be enlisted by a volunteer system.

I am looking forward to taking up hydraulic engineering or any other line of civil engineering endeavours. Should you locate a good job not too far away from Montreal for a young McGill graduate, please save it for me.

Wishing you all a very happy New Year, I am,

Most sincerely yours,
W. McG. Gardner, S.E.I.C.,
January 7th, 1919.

* * *

I beg to thank the Council and members of *The Engineering Institute of Canada* for their very kind Christmas gift of cigarettes which duly arrived quite safely and which I very much appreciated. The thought that our old friends in Canada still continue to remember us is very gratifying and I hope before another Christmas comes around I shall have the pleasure of being with you all again. Life out here just now is getting very monotonous and we are all greatly looking forward to the day of demobilization when we can once more settle down to our old occupations.

Again thanking you all for your kind remembrance and good wishes and wishing all the members of *The Engineering Institute of Canada* all happiness and prosperity during the coming year, I remain,

Yours sincerely,

P. R. Warren, M.E.I.C., Major R. E.,
3 P.C., H.Q., France,
8–1–19

* * *

Yesterday I received a packet of cigarettes being your gift to me as a member of *The Institute* overseas. It was with a feeling of surprise and gratefulness that it was received. I can only thank you sincerely for the gift, especially so coming at a time when those luxuries, almost necessities, are hard to obtain.

This battalion—7th C.E.—expects to be in Canada about March when I hope to renew old friendships with *The Institute* at least with its branch in Vancouver. I might say that my address remains the same, P. O. Box 40, New Westminster, B.C.

Trusting *The Institute* will have a prosperous year.

Yours sincerely,
Ken. W. Morton, J.E.I.C., Lieut.,
Belgium, 18th January, 1919.

* * *

Bordon, Hants, Jan. 19th, 1919.

On behalf of *The Institute* please accept my hearty thanks for the parcel of smokes which caught up to me today. I started on the homeward journey on December 22nd, but it is a short road that has no halts in it. However, I hope to start on the last lap soon.

Cigarettes are hard to get here, so the ones sent are very acceptable, and the kind thoughts expressed on the card much appreciated.

Yours very sincerely,
Major S. C. Wilcox, A.M.E.I.C.,
12th Battalion,
Canadian Railway Troops.

* * *

Dear Mr. Keith:

Many thanks for your kindly letter of congratulations and good wishes which I greatly appreciate.

The C. B. came to me as a surprise but it was a pleasure to think that the little I had been able to do during the last year, whilst attached to the Imperial Army as a chief engineer, had been considered by them worthy of an award.

Please accept my thanks also for the cigarettes and tobacco you were so kind to send me. Most acceptable they were.

With all good wishes to yourself and our good friends the members of *The Institute,* believe me.

Yours sincerely,
Chas. J. Armstrong, C.B., C.M.G., M.E.I.C.,
Brig.-Gen.

Sir:

Please accept my best appreciation of the kind gift of "Smokes" received from your Institute.

They arrived at a time when all smokes here were at a premium so I can assure you they were doubly welcome.

Might I extend to the members of *The Institute* my best wishes for the ensuing year.

Yours most sincerely,
W. A. Adam, M.C., M.E.I.C.,
Capt., 6th Bn. C.E.

* * *

I beg to acknowledge with thanks, the receipt of cigarettes forwarded to me.

Geo. F. Alberga,
No. 2 Can. Construction Co.,
24th Jan., 1919. Rly. Camp, North Wales.

* * *

Many thanks for your kind gift which reached me to-day, it having gone to France and then back here.

I am in the Second Western General Hospital, Manchester, England, and was wounded on October 16th, in the leg, near the ankle, when constructing a bridge on the broad gauge railway, five miles East of Cambrai.

Yours very truly,
J. B. Wilkinson,
Can. Rly. Troops.

* * *

Received with many thanks.

G. R. Turner, J.E.I.C.,
Major,
C.E.

* * *

Many thanks for the cigarettes and good wishes. Your hopes have been fulfilled and it is all over now. I hope we shall soon be back in Canada and that I shall have the pleasure of meeting you.

Sincerely,
G. H. Kohl, J.E.I.C.

* * *

Thanks very much for 200 Players. Hope to be back in Montreal by early summer.

A. C. Oxley, A.M.E.I.C.,
Lt., Can. Eng.

* * *

I wish to convey my sincerest thanks to you for your splendid gift and good wishes.

J. E. Pringle, S.M.E.I.C.,
No. 10 Field Company,
2nd Q.V.O. Sappers and Miners,
B.E.F.

* * *

The cigarettes were much appreciated coming at a time when there was a very great shortage of supplies.

Many thanks for same.

J. C. Craig, A.M.E.I.C.,
Major, C.R.T.

* * *

With many thanks receipt is acknowledged and we are glad to think that we may be returning soon.

T .E. Price, A.M.E.I.C.,
Lieut.,
5th Can. Rly. Troops.

REPORT OF COUNCIL MEETING

The regular monthly meeting of the Council was held at the rooms of *The Institute*, 176 Mansfield Street, on Friday, February 21st, at 3.30 p.m.

Present: Lieut.-Col. R. W. Leonard, President, in the chair; H. E. T. Haultain, H. H. Vaughan, John Murphy, Ernest Brown, Julian C. Smith, Arthur Surveyer, J. E. Gibault, W. A. McLean, R. A. Ross, Walter J. Francis, A. R. Decary and G. Gordon Gale.

Committees: After the reading of the minutes of last meeting the following committees were constituted:—

Executive Committee of the Council: Lieut.-Col. R. W. Leonard, Chairman; Walter J. Francis, Vice-Chairman; J. M. Robertson, Brig.-Gen. Sir Alex. Bertram, Julian C. Smith, Ernest Brown, Arthur Surveyer.

Finance Committee: J. M. Robertson, Chairman; H. H. Vaughan, R. A. Ross, G. H. Duggan, Brig,-Gen. Sir Alex. Bertram.

Library and House Committee: Brig.-Gen. Sir Alex. Bertram, Chairman; O. O. Lefebvre, S. F. Rutherford, Frederick, B. Brown, R. deL. French.

Papers Committee: Julian C. Smith, Chairman; G. W. Craig, (Calgary Branch); Walter J. Francis, (Montreal); E. R. Gray, (Hamilton); W. Young, (Victoria); H. S. Carpenter, (Saskatchewan); C. C. Kirby, (St. John); F. A. Bowman, (Halifax); A. R. Decary, (Quebec); R. deB. Corriveau, (Ottawa); A. L. Harkness, (Toronto); J. W. LeB. Ross, (Sault Ste. Marie); W. P. Brereton, (Manitoba); A. W. Haddow, (Edmonton); E. G. Matheson, (Vancouver).

Publications Committee: Ernest Brown, Chairman; Peter Gillespie, W. Chase Thomson, J. A. Shaw, Edgar Stansfield.

By-Laws Committee: Ernest Brown, Chairman; Walter J. Francis, H. E. T. Haultain.

Gzowski Medal and Students Prize: H. H. Vaughan, Chairman.

Honor Roll Committee: Lieut.-Col. C. N. Monsarrat, Col. A. E. Dubuc, C.M.G. D.S.O., Fraser S. Keith, and a member from each branch.

Nominating Committee: District No. 1, H. M. Mackay, Chairman; A. E. Doucet; District No. 2, Alex. Fraser; District No. 3, Capt. J. L. Allan; District No. 4, A. A. Dion; District No. 5, Geo. Hogarth, H. U. Hart; District No. 6, Guy C. Dunn; District No. 7, O. W. Smith; District No. 8, A. W. Haddow, Sam G. Porter; District No. 9, Newton J. Ker, E. G. Marriott.

Steel Bridge Specifications: P. B. Motley, Chairman; C. N. Monsarrat, H. B. Stuart, H. P. Borden, F. P. Shearwood, G. H. Duggan, Allan E. Johnson, E. G. W. Montgomery, H. A. Icke, W. Chase Thomson, W. A. Bowden, J. G. Legrand, Geo. W. Craig, F. T. Cole, M. A. Lyons, A. H. Harkness, H. F. Estrup.

Roads and Pavements: W. A. McLean, Chairman; W. P. Brereton, J. Duchastel, J. E. Griffith, G. Henry, E. A. James, A. F. Macallum, A. J. MacPherson, P. E. Mercier, W. P. Near, G. C. Powell, C. H. Rust, F. W. W. Doane, Alex. Fraser.

Steam Boiler Specifications: L. M. Arkley, Chairman; W. G. Chace, F. G. Clark, R. J. Durley, D. W. Robb, H. H. Vaughan, Logan M. Waterous.

Ernest Marceau was re-appointed Treasurer, and Fraser S. Keith, Secretary.

Ballot re Changes in By-laws: It was resolved that the Secretary send out a ballot calling for a vote on the changes in the by-laws, to be accompanied by a short letter explaining the changes. H. H. Vaughan and Ernest Brown were appointed a committee to edit the letter.

Legislation: The resolution on legislation passed at the Annual Meeting was presented as follows:—

Moved by J. M. Leamy, seconded by C. C. Kirby:

Whereas it seems that the wishes of the majority of the members and of the Branches of *The Engineering Institute of Canada* are that Provincial Legislation should be obtained to define the status of the Engineers throughout Canada:

Whereas the members of this annual meeting are of the opinion that this legislation should be as uniform as possible throughout the provinces;

Be it resolved, that a special committee be formed, composed of one delegate appointed by each branch to meet at headquarters before the 15th of April, 1919, to draw up such ample legislation as it may deem necessary and advisable in order that the members of *The Institute* throughout the different provinces may ask for legislation on the same uniform basis;

That the Secretary be instructed to call the first meeting of this committee;

That this Committee be authorized to obtain the necessary legal advice on the matter.

That this committee shall submit the proposed legislation to the Council before the 1st of May 1919.

That the Council shall then ask by letter ballot, before the 1st of June, 1919, the opinion of all the members of *The Institute* regarding the adoption of the proposed legislation prepared by the said special committee of *The Institute;*

That the Council be authorized to pay all the expenses of this committee and of each delegate;

That the Council of *The Institute* shall report the result of the ballot to the branches, and if the vote is favorable to legislation the Council of *The Institute* shall immediately take the necessary measures in co-operation with the branches, to have such legislation enacted.

The Secretary was instructed to advise all the branches to make an immediate appointment and to call a meeting of this committee at headquarters on April 5th, explaining that it was advisable to do as much work as possible in advance.

Resolutions of thanks: A committee was appointed consisting of Messrs. Vaughan and Francis to co-operate with the Secretary in drafting resolutions.

Budget for 1919: The Secretary was instructed to submit a budget covering the current year, to the Finance Committee at an early date.

Civil Service Salaries: The Committee reported progress dealing with the question of making recommendation to the Government regarding the increased salaries for engineers employed in Government service.

Soldiers Civil Re-establishment: President Leonard presented a letter which he recommended sending the Hon. Gideon Robertson, Minister of Labour, Sir James Lougheed, Chairman of the Soldiers Civil Re-establishment, and Hon. J. A. Calder, Chairman of the Repatriation Committee, offering the support of *The Institute* to this movement. The letter was approved. It was resolved that H. H. Vaughan, G. Gordon Gale and Fraser S. Keith, be appointed a Committee to interview the above named, at a date to be arranged. It was further resolved that all branches be asked to appoint committees to assist in the Soldiers' Civil Re-establishment.

It was resolved that all men not at present employed should have free use of the advertising pages of *The Journal.*

Retiring President H. H. Vaughan agreed to prepare an article on Repatriation for "Back to Mufti" the Government paper on repatriation.

City Improvement League: A letter from the Executive Secretary of the City Improvement League of Montreal was referred to the Montreal Branch.

Post Office Privileges: It was resolved that a record be made of the fact that the Post Office privilages are being granted for *The Journal.* H. H. Vaughan and the Secretary were appointed a committee to draft a second circular letter to the members.

Memorial to the Government: It was resolved that a copy of the memorial read by the Secretary be submitted to all members of the Council, with a request for its consideration and approval.

Western Professional Meeting: Approval was given to the holding of the Western Professional Meeting during the coming summer, at Edmonton.

Detrimental Legislation: A letter from the Quebec Branch pointing out that the enginemen of Quebec were applying for an Act to call themselves "The Engineers of Quebec." Approval was given of the action of the Quebec Branch and authorization to take the necessary steps to oppose the bill of the enginemen of Quebec Province.

New Branches: It was resolved that the Secretary be authorized to attend proposed meetings to establish new branches at Peterboro and Niagara Falls.

Windsor Branch: Approval was given to the establishment of a branch at Windsor, in view of the request received as follows:

Windsor, Ont.,
January 17th, 1919.

Fraser S. Keith Esq.,
Secretary Engineering Institute of Canada,
Montreal, Que.

Dear Sir:—

The undersigned corporate members resident in the Border Cities (which include Sandwich East, Ford, Walkerville, Windsor, Sandwich West, Sandwich and Ojibway) being desirous of establishing a branch of *The Institute* to be known as The Border

Cities Branch, request that you issue the necessary orders for that purpose. The area to include a radius of twenty-five miles from the Windsor Post Office.

Thanking you, we are, F. C. McMath, Willard Pope, Geo. E. Roehm, F. S. Kester, G. C. Williams, John A. W. Brown, A. J. Riddell, Owen McKay Norris Knowles, J. S. Nelles, H. Thorn, R. A. Carlyle A. E. Eastman, David Molitor, Ernest C. Kerrigan, V. R. Heffler, A. H. Aldinger, L. T. Bray, Ernest G. Henderson, M. E. Brian. Alfred J. Stevens.

It was decided, however, that the name "Border Cities Branch" was not desirable and the Secretary was instructed to write requesting that a local geographical name be given.

Assisting Engineering Standards Committee: A request from H. H. Vaughan, Vice-President of the Canadian Engineering Standards Association, was presented, asking for a subscription of $200. from *The Institute*. It was unanimously resolved that this be granted.

President's Address: It was moved by Julian C. Smith, seconded by A. Surveyer, that the presidential address of H. H. Vaughan be printed in special form and issued to the members of *The Institute*, Members of Parliament, both Provincial and Federal, and other leading citizens of the Dominion, and that Mr. Francis and two others be a committee with the Secretary to attend to this matter, with power to act.

The meeting then adjourned to Tuesday, February 25th, at eight o'clock.

Adjourned Meeting

The adjourned Meeting of Council was held on Tuesday, February 25th, at 8.15 p.m. a which a large amount of important business was transacted, including the adoption of Standards stationery, acceptance of the tender for steel engraved certificates, further action on *The Institute* emblem and a large number of personal matters.

Classifications: Classifications were made for a ballot returnable at the March meeting of Council.

Ballot: The ballot was canvassed and the following elections and transfers effected:—

Members.

Thomas Buchanan Campbell, of the Pas, Man. Division engineer and bridge engineer, Hudson Bay Ry. for Dept. Railways & Canals; Frederick Arthur Gaby of Toronto, B.A.Sc. M.E., E.E., chief engineer Hydro-Electric Commission, Toronto; John Girdlestone Glassco, B.Sc., M.Sc., of Winnipeg, Man. manager of City of Winnipeg hydro-electric system; Charles Hawkins Marrs (C.E., Toronto), of Hamilton, Ont., assistant engineer of the Hamilton Bridge Works, in charge of all designs and estimates and work in the field; Frederick Blair Reid, B.A.Sc., supervisor of levelling with Geodetic Survey of Canada.

Associate Members.

John Worthy Battershill Jr. of East Kildonan, Man., municipal engineer for rural municipality of East Kildonan, Man; Henry Carle Dyson Briercliff, B.Sc., of Winnipeg, previous to enlishment was designing, drafting and mechanical engineer at Vulcan Iron Works, Winnipeg, since 1918 with R.A.F., Toronto; Charles Frederick Cameron of Winnipeg, B.A., B.C.E., asst. engineer on track laying demonstrator in physics, University of Manitoba. Charles James Swaffield Orton of Westcliff-on-Sea, Eng., Deputy Asst. Director, Naval Gun Mounting Section, Admiralty; Earle Bedford Patterson of Winnipeg, engineer Manitoba Hydro-metric Survey; H. W. Perkins, prior to enlistment was transitman with Hydro-Electric Power Comm. on Hydro-radial projects. Since 1917 has been on Active Service with the C.E.F. Joseph Dufferin Peters of Moose Jaw, Sask. Supt. Light & Power Dept. City Power Plant, Moose Jaw, Sask; Thomas Edward Powers, Lt.-Col., D.S.O. B.A. Time officer administering R.C.E. and tech. branches in connection with C.E. embracing engineers, Signal Railway Troops and Forestry Corps; Edward A. Ryan, B.Sc. of Westmount, general consulting work with R. J. Durley; Bernard Schachere, B.Sc. of Ottawa, calculator with board of engineers, Quebec Bridge, now with Dept. of Rys. & Canals, Ottawa.

Associates.

John Frederick Samuel Pinder-Moss (Honors Nottingham. Coll., Eng.) of Edmonton, with Dept. of Railways & Canals, and G.T.P. Ry. Edmonton.

Transferred from Associate Member to Member.

George Harrison Burbidge, B.Sc., B.A. of Winnipeg, Man., dist. engineer Dept. Public Works, Can., Dist. of Manitoba; Georges Henri Cagnat of Edmonton, dist. engineer Dept. of Public Works, Edmonton; William Alexander Duff of Moncton, N.B. (S.P.S., Toronto), asst. chief engineer and engineer of bridges Canadian Government Railways Moncton, N.B.; Claude Henry Rogers, B.A.Sc. of Peterboro, Ont., field engineer in charge of work of Forward Tramways 1st Army B.E.F. France. Prior to enlistment in 1915 was general manager of the Peterboro Canoe Co.

Transferred from Junior to Associate Member.

Trevor Eardley-Wilmot, B.Sc. of Montreal, cable engineer with Northern Electric Co.; James Mellon Menzies, B.A.Sc. Captain, officer commanding 108th Chinese Labour Corp's.; France, J. N. E. Romeo Morrissette of Three Rivers, principal asst. district engineer, Public Works Department, Three Rivers.

Transferred from Student to Associate Member.

Barthelemy Rocher, C.E., B.A.Sc. of Quebec, assisting the engineer in charge of District No. 3, Roads Department, City of Montreal.

Transferred from Student to Junior Member.

John Alfred Creasor, B.Sc. of Owen Sound, Staff Capt., 3rd Bde. C.E. Prior to enlishment was asst. superintendent with Kennedy Bros. Montreal; Lieut. William Russell Way, B.Sc. of Montreal, asst. electrical engineer, operating dept., Shawinigan Water & Power Co., Montreal.

BRANCH NEWS

Ottawa Branch

J. B. Challies, M.E.I.C., Sec'y.-Treas.

Good Roads

The Eastern Ontario Good Roads Association met in Convention in Ottawa on February 4th and 5th. This Convention attained the dignity of an inauguration of a great movement towards highway improvement, for Cabinet Ministers from both the Dominion and Provincial Governments attended and gave definite assurance of the respective Government's intention to provide for highway construction on a carefully thought out, systematic and adequate scale.

A. W. Campbell, M.E.I.C. ("Good Roads" Campbell), dealt with the constructive policy of road-making, its effect on the community, the country and its position with regard to the ultimate progress and prosperity of the nation.

The great success of the convention has given the good roads movement such a splendid forward impulse, that it can now be reasonably assured that good roads will soon be one of the actualities of Canadian conditions.

Surveyors Broaden Their Field

The twelfth Annual Meeting of the Association of Dominion Land Surveyors was held at Ottawa on Jan. 29th, 30th and 31st. J. N. Wallace of Calgary, President, in his opening remarks dwelt on the need for a stronger professional spirit among surveyors. The following papers were presented:—Land Settlement, by F. W. Rice; Land Classification, L. Brenot; Aeroplane in Surveying, R. F. Clarke, M.C.; Soil Survey, W. A. Johnston; Roads, A. H. Hawkins; Assessment Survey of Farm Lands, R. W. Cautley; Town Planning, T. Adams; and Honours to Dominion Land Surveyors in the War, E. M. Dennis. The new constitution and by-laws, adopted after lively discussion, place the Association on a broader basis and secure to every member no matter in what part of Canada he may reside, an equal voice in the affairs of the Association.

J. R. Akins, St. Catharines, was elected President for 1919; F. V. Seibert, Edmonton, Vice-President; and F. D. Henderson, Ottawa, Secretary.

Nailacrete

In the last issue of *The Journal*, reference was made to an important discovery by E. Viens, Director of the Public Works Laboratory for Testing Materials, one of the Affiliates of the Ottawa Branch.

As the general adaptability and the commercial value of Nailacrete has been thoroughly well proven by its general use in the new Parliament Buildings at Ottawa, the discovery is of great interest to engineers generally. The following general facts about Nailacrete, hitherto unpublished, have been obtained from Mr. Viens for the information of *The Institute.*

Nailacrete is a composite building material, the binding constituent of which is Portland Cement. The proportions of Portland Cement to the ingredients can be varied within a comparatively wide range, producing a material of various strength, depending on the purpose for which the material is to be applied in the building industry.

Properties

Nailacrete is fireproof, waterproof (when so required) resilient, light in weight as compared with concrete (Nailacrete weighing from 70 lbs. to 100 lbs. per cubic foot, depending on the formula used, as against concrete weighting from 140 lbs. to 155 lbs. per cubic foot). It has no expansion or contraction under ordinary building conditions; that is of such a texture that nails, screws or tacks can be driven therein at any time, except when an extraordinary strong material is desired; in which case, after the material has developed its full strength, it would be necessary to drill holes.

Strength in pounds per square inch

Tensile	Transverse	Compressive
70 to 600	100 to 500	400 to 2500

depending on the formula used.

Should there arise a case where strength alone was required, and not the property of taking in nails or screws greater strength than that given above could be developed.

Force Required to pull nail

Material	Size of Nail	Depth Driven	Pounds
Bass-wood........	2 inch	1.5 inch	47
Spruce...........	"	"	47
Pine..............	"	"	77
Hemlock.........	"	"	153
Ash...............	"	"	223
Birch.............	"	"	263
Red Oak.........	"	"	336
Maple............	"	"	430
Nailacrete........	"	"	50 to 480

depending on the formula used.

Volume

The volume of one ton of Nailacrete in the plastic state varies somewhat with the formula used. With the formula used for the manufacture of the Nailacrete as placed in the New Parliament Buildings, Ottawa, one ton produced 28.63 cubic feet of the material laid in place.

Usages

Nailacrete may be applied over concrete slabs, clay tile, or other material, as a basis to which a wooden floor may be nailed. It may be used with a reinforcement (in light construction) instead of concrete, tile or other material to which a wooden floor may be nailed. It may be used with a reinforcement, or on metal lath, as a roofing material to which a metal, shingle or other kinds of roofing may be nailed or fastened. It may be used as a plaster for walls and ceilings. Further, it may be used as a flooring in itself by treating the surface with a hardener, a filler, paint, varnish or wax, or on the finished surface of same, linoleum may be laid and glued if necessary.

Application

The material may be deposited in place in a plastic state similar to the way in which concrete is laid, or it may be moulded into any shape and put into position.

Calgary Branch

C. M. Arnold, M.E.I.C., Sec'y.-Treas.

At a meeting of the Executive Committee of the Calgary Branch, held on December 13th, the following committees were appointed: Applications and Credentials, F. H. Peters, A. S. Dawson, A. S. Chapman, B. L. Thorne, F. W. Alexander; Finance, G. W. Craig, A. S. Dawson, C. M. Arnold; Membership, Wm. Pearce, P. M. Sauder, W. J. Gale, J. S. Tempest, M. H. Marshall, S. K. Pearce, E. L. Miles; Legislation, F. H. Peters, Wm. Pearce, G. N. Houston.

On January 15th Eugene Coste gave an address on Petroleums and Coals, and on January 29th the subject introduced by Dr. T. H. Blow was Technical and Scientific Education.

A general meeting of the Branch was held in the Board of Trade Rooms on the evening of Wednesday, Jan. 29th, 1919. The meeting was preceded by an address by Dr. T. H. Blow, M.L.A., on Technical and Scientific Education. The speaker declared himself to be somewhat diffident in addressing a body of engineers upon such a subject but as it was one in which he took considerable interest he would like to place some of his views before the meeting. He advocated the establishment of a university for Southern Alberta, the logical situation for which was in the vicinity of Calgary. The speaker was warmly applauded upon the conclusion of his address.

Messrs. Craig, Houston and Arnold were appointed as a committee to draft a resolution to the Minister of Education in reference to the early establishment of a School of Technology in Calgary. It was decided to submit this resolution to the Alberta Division at the Annual Meeting Feb. 1st.

The meeting came to order at 10.45 p.m. and the Secretary read the minutes of the last meeting and executive meetings held since. These were approved and signed by the Chairman G. W. Craig. Mr. Houston read the report of the Legislative Committee and gave a resumé of the reasons which had led to the decision not to present the Act dealing with the profession of engineering at the coming session of the Alberta Legislature.

Mr. Craig corroborated Mr. Houston's statements and stated that the Edmonton Branch had adopted a similar report.

Mr. Marshall moved the adoption of the report and the approval of the action taken by the Executive and the Committee on legislation. Seconded by Mr. Chapman and carried.

The Secretary read a letter from Manitoba Branch suggesting that we send a delegate to Ottawa to attend the adjourned Annual Meeting in the interest of the legislation movement. The Saskatchewan Branch had also written that they were sending a delegate. Mr. Craig suggested that as Mr. Pearce was in, and would probably be in Ottawa at that time, that we ask him to be our delegate. As it was stated that Mr. Peters might be present at this meeting it was decided to ask both gentlemen to act as delegates.

Messrs. Marshall, Gale and Miles were appointed as a Committee to arrange a Ladies' night, which it was decided to hold on Mr. Craig's suggestion. The meeting adjourned at 11 p.m.

Quebec Branch

J. A. Buteau, A.M.E.I.C., Sec'y.-Treas.

On Monday, January 20th, members of the Quebec Branch met to hear a lecture by Professor M. Koetz of the Technical Schools of Quebec, on the subject of the manufacture of artificial colours. This meeting was held under the auspices of the L'Ecole Polytechnique.

Toronto Branch

W. S. Harvey, A.M.E.I.C, Sec'y.-Treas.

The public spiritedness of our Branch is illustrated in the recent action of the Toronto Branch Executive in appointing a Committee for the purpose of reviewing and discussing the Toronto Building By-Laws. The subject of Building By-Laws is one of paramount interest to engineers and their advice is necessary.

The committee consists of A. H. Harkness, M.E.I.C., Chairman, Prof. Peter Gillespie, M.E.I.C., and Geo. Clark, M.E.I.C.

Discussion on By-Laws.

Following the Annual Meeting, the Toronto Branch has lost no time in getting its members together to discuss important questions concerning *The Institute.* Under date of February 24th a letter was sent to all the members, signed by A. H. Harkness, chairman, and W. S. Harvey, secretary-treasurer, as follows:—

Dear Sir,

An open Meeting of the Branch will be held in the Rooms of *The Institute*, at the Engineers' Club, 96 King Street West, at 7.45 p.m., on Friday, February 28th, 1919.

A few short papers will be read by members of the Branch on the subject, "*What the Institute Can do,*" to be followed by discussion.

This meeting promises to be of great interest to all engineers, as the discussion will bear on the economic and social status of the profession, and suggestions are invited as to the necessary steps to be taken to bring about an improvement.

The Legislation Committee of the Council, and a Special Committee of the Montreal Branch have prepared a set of Branch By-laws, with the object of having uniform By-laws for all Branches. A committee appointed by the Executive of the Toronto Branch, has examined these proposed By-laws and has suggested several amendments.

A copy of the proposed By-laws, with the suggested amendments printed in a parallel column is enclosed.

If time permits the By-laws will be submitted to the meeting for discussion before being forwarded to the Council at Montreal.

Attached to this circular is a copy of the Branch by-lays, approved by Council under of December 17th, and in parallel column amendments suggested by the committee appointed by the executive of the Toronto Branch. Several branches have already sent in suggestions, so that, as a result of all the work being done in this connection, it is confidently expected that an ideal set of by-laws will result.

Halifax Branch

K. H. Smith, A.M.E.I.C., Sec'y.-Treas.

The First Annual Meeting of the Halifax Branch was held on Wednesday, January 15. As the business to be transacted was not large, a luncheon meeting was arranged as it is found most convenient for the greater number of the members to attend a meeting at such a time.

The chief business was ascertaining and announcing the result of the ballot for officers. The new Executive Committee is as follows:—F. A. Bowman, Chairman; K. H. Smith, Secretary-Treasurer; J. L. Allan, L. H. Wheaton, A. G. Robb, W. P. Morrison and A. F. Dyer.

Subsequently a meeting of the newly-elected Executive Committee was held for organization purposes and a general discussion of the work for the coming year. One special feature discussed was the question of making the regular meetings of the branch, supper meetings. It was felt that such meetings would be most convenient for the majority of the members and would, therefore, result in increased attendance. They would also largely increase the opportunity for social intercourse between members which is highly desirable. This idea can be carried out very conveniently in Halifax where first class facilities exist for meetings of this kind.

The regular monthly meeting of the Halifax Branch was held on Thursday evening, February 20th, at 6 p.m. While supper and luncheon meetings have previously been held by the local branch for special purposes, this was the first of the regular meetings to be of such type. The results secured however, both from the standpoint of attendance, social intercourse and general interest, highly justified this type of meeting. Hon. E. H. Armstrong, Commissioner of Works and Mines whose department until recently embraced the roads of the province was present as a guest of *The Institute.*

The early part of the meeting was devoted to a paper read by Capt. T. S. Scott, M.E.I.C. on Roads. This paper was unique for its combination of technical and literary qualities. The manner in which it was read added a great deal to its interest.

The reading of Capt. Scott's paper was followed by a most interesting discussion participated in by Hon. Mr. Armstrong, F. W. W. Doane, City Engineer, R. McColl and others. The discussion brought out some of the special difficulties in building roads in Nova Scotia and also the fact that the economic side of road building must be given consideration. That is to say, that in a particular case such a road should be built as will be warranted by the amount of the traffic to be served. It appeared from the discussion that for a large part of the country, all that is warranted or in fact, all that can be expected with any reasonable expenditure of money, is an improved type of earth road with proper provision for maintenance of the same. Hon. Mr. Armstrong pointed out the beneficial influence which engineers as a whole could exercise by directing public opinion along rational lines in this matter. A formal vote of thanks moved and seconded by Messrs. Dodwell and Doane respectively was tendered to Capt. Scott.

The latter part of the meeting after several guests present had retired, was devoted to general business and a report from C. E. W. Dodwell, Branch delegate of the annual meeting at Ottawa.

Hamilton Branch

H. B. Dwight, A.M.E.I.C., Sec'y.-Treas.

A meeting of the Hamilton Branch of *The Engineering Institute of Canada* was held in the Recital Hall of the Conservatory of Music on January 30th, 1919, the attendance being about two hundred. The speaker of the evening was E. L. Cousins, chief engineer and general manager of the Toronto Harbour Commission, who gave a lecture illustrated by a large collection of lantern slides, on the development of Toronto Harbour during the past four years. Since the formation of the Toronto Harbour Commission in 1914, nearly one thousand acres of marsh land have been reclaimed and made suitable for factory sites, the facilities for shipping have been largely increased, and several miles of sheltered lagoons for pleasure boating and many acres of park lands, have been provided. Mr. Cousins pointed out that similar results could be obtained at Hamilton with fewer natural difficulties.

A. C. Garden, of the Hamilton Harbour Board, gave a short talk on Hamilton Harbour. He stated that by the time the new Welland Canal was completed, the development of Hamilton Harbour would be accomplished sufficiently to accommodate the large vessels which would then be admitted to Lake Ontario from the upper Lakes.

J. M. Eastwood gave a description of reclamation work and the building of shipping terminals which had been carried out in Hamilton Harbour a few years ago.

E. R. Gray, city engineer and chairman of the Hamilton Branch of *the Institute* presided at the meeting. A vote of thanks to Mr. Cousins was moved by J. W. Tyrrell and J. A. McFarlane.

On February 10th, Dr. F. B. Jewett, chief engineer of the Western Electric Company, will give a lecture on Industrial and Scientific Research.

On February 10th a very instructive and interesting lecture on Industrial and Scientific Research was given by Lt.-Col. F. B. Jewett, Ph.D., Chief Engineer, Western Electric Co., New York, and Vice-President, American Institute of Electrical Engineers, at a meeting of the Hamilton Branch of *The Engineering Institute of Canada,* in the Royal Connaught Hotel. The lecture room was filled to capacity, and the numerous questions which were asked Dr. Jewett at the close of the lecture showed the keen interest taken by the audience.

Dr. Jewett first gave a discussion of the large problems of starting up and developing research work for manufacturing concerns in general. Very few companies are large enough to establish complete research departments, as the Bell Telephone Co. of the United States, and some other companies, have done. However, the smaller companies should not be deprived of the benefits of having their problems worked out by modern scientific research methods, and some co-operative research organization should be developed. In this the universities, the government, and the manufacturing interests should take part, various methods by which they could do so being discussed by Dr. Jewett.

One of the greatest difficulties encountered in carrying on research work on a large scale is the lack of thoroughly trained scientific investigators. Although Dr. Jewett expressed himself as being a firm believer in the great results to be obtained from properly conducted scientific research, he repeated a note of warning against attempting to build up research organizations without thoroughly educated and experienced research workers. He considered that such organizations should not be built up too rapidly, but should have a normal rate of growth, and he also gave warning against taking from the universities the men who are training future investigators.

Dr. Jewett then showed an interesting collection of slides, illustrating the results of the work of his organization. The long distance telephone line from New York to San Francisco, the multiplex telephone, the wireless telephone as used on war ships, destroyers, aeroplanes, and other remarkable developments in telephone work were described.

A vote of thanks to Dr. Jewett was moved by H. U. Hart, chief engineer of the Canadian Westinghouse Co.

Dr. Jewett addressed the Canadian Manufacturers' Association earlier in the day on the subject of research, and his visit is expected to be productive of valuable results in the campaign for increased research work in Canada.

Manitoba Branch

Geo. L. Guy, M.E.I.C., Sec'y.-Treas.

Luncheon was held at the Fort Garry Hotel on February 1st. After the lunch an address on "Present Practice on Carbonizing and Briquetting of Coal" was given by R. de L. French, M.E.I.C., which was listened to with interest by the members.

On Wednesday, February 5th, a meeting was held in the Engineering Building, Manitoba University, and a paper was read by J. G. Sullivan, M.E.I.C., entitled, Can the Standard Measure of Value be Improved. Mr. Sullivan took for his subject the present unscientific standard of value of the gold dollar, and suggested the use of a multiple standard. The paper created considerable interest and discussion. There were present at the meeting many of the prominent bankers and members of the legal profession, among whom was Isaac Campbell, K.C., who took part in the discussion.

A Committee was appointed to have an illuminated address prepared to be presented, at a dinner, to Capt. C. N. Mitchell, V.C., M.C., upon his return to Winnipeg. Capt. Mitchell, who is an Associate Member of *The Institute*, was well known in the city and active in the Manitoba Branch before his enlistment with the overseas forces.

In view of the unrest and dissatisfaction among the returned soldiers taking the vocational training course in Winnipeg a Committee of four was appointed to look into the question and report to the Branch, so that the Branch can make recommendation, if necessary, to improve the present method of training.

The ballot for members of the Executive Committee was counted: G. C. Dunn, M.E.I.C., W. M. Scott, M.E.I.C., and J. G. Sullivan, M.E.I.C., being elected. G. C. Dunn, M.E.I.C., was eleced as representative of the local branch on the Nominating Committee.

A good representation of the local members is expected at the Annual General Meeting in Ottawa on February 11, 12 and 13. In addition to J. M. Leamy, M.E.I.C., and G. C. Dunn, M.E.I.C., several other members have stated their intention of being present. It is hoped that some appreciable progress will be made on the proposed legislation for engineers.

St. John Branch

A. R. Crookshank, M.E.I.C., Sec'y.-Treas.

The regular monthly meeting of the St. John Branch was held February 20th.

After reading the minutes of the annual meeting, scrutineers were appointed to examine the ballots returned in the vote on the by-laws as revised by the Executive Committee to conform as closely as possible to the standard by-laws of *The Institute*. They reported that the necessary two-thirds vote had been cast in approval of the new code, which was then declared to be carried by the Chairman.

A discussion on the resolution of December 7th last of the Quebec Branch then took place, and on motion it was decided to endorse their action. This resolution calls upon the Council to request the Government to issue instructions to their Commissions and Departments to only appoint members of *The Engineering Institute*, or graduates from recognized engineering universities to fill all engineering positions and thus protect the public and raise the standing of *The Institute* and of the profession.

The Chairman then gave a verbal report of the meeting of the legislation committee, held at Ottawa during the annual meeting of *The Institute*, February 11-13, to which he was a delegate from this Branch. He explained the action taken, and read the resolution, which was adopted by the meeting and prensented at the annual meeting, which called upon *The Institute* to constitute a special committee to be composed of one delegate appointed by each Branch to meet at headquarters before April 15th, to draw up such sample draft of act as it may deem necessary and advisable in order that the members of *The Institute* throughout the different Provinces may ask for legislation on the same uniform basis, to the end that it may be submitted to Council by the 1st of May, and to the membership for ballot by June 1st. Mr. Kirby was appointed delegate with power to send a substitute if unable to attend himself.

The Chairman gave a general outline of the Ottawa meetings and mentioned particularly the effort being made by the Committee of *The Institute* to endeavor to secure proper remuneration for the engineers in the Civil Service.

A very interesting talk was then given by C. O. Foss, M.E.I.C., Chief Engineer of the St. John & Quebec Railway on "Reminiscences of the early days of Railway Location" a synopsis of which is as follows:—

The first railroad in the United States was built from Boston to Lowell in the early forties, was about twenty-five miles in length, and followed the general line of the Canal. This road, like most of the early railroads was built without an engineer, the technical adviser being a Harvard professor. He placed a rough quarried stone post under the ends of each tie. These soon had to be removed as the rails and wheels became badly racked.

The road was extended from Lowell to Nashua, about sixteen miles, and later on to Concord, the objective being to reach the White Mountains for handling tourist traffic. Previous means of locomotion to the now famous resorts in the mountains, were by means of carriers, a man named Crawford having carried many persons on his back.

About this time a company was formed, which erected a stone house on top of Mount Washington. The location was so exposed that it was necessary to fasten the roof on with chains. A bridle path was built over the mountains from the Crawford House to Mount Washington, which at that time was the only means of communication. In 1866 one Sylvester Marsh of Littleton perfected the rack road to the top of Mount Washington, which was then the first of its kind in the world. The speaker gave a description of the construction and operation of the road, outlining the safety devices used to guard against accidents, and stated that it is believed no fatal accidents had over occurred.

For some years tourists coached the twenty-five miles from Littleton to the base of the Mountains, until in 1872 a turnpike road was built to the Fabyan House, then a large hotel of some four hundred rooms. In 1874 the speaker had his first experience in locating a railroad, from the Fabyan House to the base of the Mountain. Later both sides of the Valley were carefully cross sectioned and contoured, and in 1875 a final location made to within a half mile of the rack road, the question then being whether to extend the line to the rack road up the Mountain or to bring the rack road down. The latter course was finally decided upon. Track laying was commenced in 1876, the method being fully explained, with many amusing incidents of getting engines off tracks and so forth.

The maximum grade on this line was five per cent, and the weight of the engines twenty tons.

An interesting account was given of the United States Signal Station on top of Mount Washington, where two men remained throughout the winter.

The meeting closed after a discussion on the definition of the term "engineer," and each member of the Branch is asked to hand in his definition of the word at the next meeting.

Montreal Branch

Frederick B. Brown, M.E.I.C., Sec'y.-Treas.

Nothing of unusual importance has transpired since our Annual General Meeting. The weekly meetings are still being held, three having taken place since the last issue of *The Journal;* on February 6th, "Some Problems in Ocean Transportation," by A. W. Robinson, M.E.I.C., and motion pictures; on February 20th, Construction of Canadian Northern Railway Tunnel, Montreal, an excellent paper by J. L. Busfiled, A.M.E.I.C., showing the construction and electrification of the tunnel, which attracted a great deal of attention, there being an audience of over two hundred, and on February 27th a paper by R. M. Wilson, M.E.I.C., on The Effect of Ice on Hydro-Electric Plants, an illustrated paper giving the results of operation, and of specially conducted observations on ice action. A discussion on this paper took place at the Ottawa General Professional Meeting but was cut short owing to lack of time and its continuation at this meeting produced some lively and timely comments. Many prominent hydraulic engineers and hydraulicians were present at the meeting and took part in the discussion, making a valuable contribution to the literature of the hydro-electric branch of engineering.

The executive is meeting every week; the subject of legislation is taking up a great deal of time, being very carefully considered.

PERSONALS

J. R. W. Ambrose, M.E.I.C., Member of Council, has been honored with the presidency of the Engineers Club in Toronto.

Major W. T. Wilson, A.M.E.I.C., and officers of the 256th Tunnelling Company, R.E., in a handsome greeting card received, extend their good wishes to the members of *The Institute.*

E. W. Oliver, M.E.I.C.,Toronto, has received recognition from the Dominion Government in receiving the appointment to the important position of Superintendent of the Toronto Niagara & St. Catherines electric railway.

Capt. H. R. Carscallen, A.M.E.I.C., arrived in Canada about the middle of January. Capt. Carscallen went to the front in the early days of the war and saw a great deal of active service. He was seriously wounded resulting in the loss of one of his legs.

Brig.-General Andrew G. L. McNaughton, A.M. E.I.C., of Montreal, commanding the Canadian Corps Heavy Artillery, sends his thanks to members for remembering him at Christmas and expresses his appreciation for the cigarettes which he received.

Capt. G. A. Bennet, J.E.I.C., 3rd Batt., Canadian Engineers, acknowledged his parcel of tobacco from Cologne, Germany. He says: Your parcel received yesterday for which I thank you very much. Players are always gratefully received. Boche cigarettes are "napoo." Hope to visit *The Institute* in a few months in Montreal.

H. T. Routly, A.M.E.I.C. honor graduate of the University of Toronto, has received the appointment from the Ontario Government of construction engineer of the Ontario Provincial Highways, to carry out the contract work of road development now under way by the Province of Ontario.

Lieut. A. H. Milne, B.Sc., (McGill, 1917), J., E.I.C. returned from England to his home in Montreal on January 23rd, having landed at Halifax on the "Empress of Britain" on the previous day. Before enlisting with the Canadian Engineers Lieut. Milne was with the Dominion Bridge Company, at Lachine, Que.

Lieut. Frederick O. Mills, R.N. A.M.E.I.C. has returned from active service, and while enroute to his home in Vancouver called at headquarters office. Lieut. Mills was engaged with the Motor Patrol of the British Navy, and was stationed on the "Adriatic" at the time of the famous scrimmage with the Austrian fleet. Before going overseas he was with the Greater Vancouver Sewerage and Water Board, and returns to resume his former position.

Major E. C. Goldie, A.M.E.I.C., Canadian Engineers, who went to the front with the 1st Canadian Contingent, sent a greeting card from the Canadian Corps Headquarters, Belgium, extending good wishes for Christmas and the New Year and expressing his thanks for the parcel of cigarettes. His card embodies the crest of the Canadian Engineers of which the beaver is the central figure, the body of the crest being the words "Canadian Engineers," surmounted by a crown and surrounded by a wreath of maple leaves.

John W. Roland, M.E.I.C., has been appointed chief engineer of the Nova Scotia Highway Board in succession to W. G. Yorston, M.E.I.C., who retires on account of ill health. Mr. Roland is a Nova Scotian. He was for a time on the engineering staff of the Panama Canal and on the completion of that work, held a professorial chair in the Nova Scotia Technical College, later becoming chief engineer for Foley Bros., Welch, Stewart & Fauquier, in the construction of the Halifax Ocean Terminals. Mr. Roland is an active member of the Halifax Branch of *The Institute* and is interested in all matters concerning the public welfare.

Col. C. H. Mitchell, C.M.G., D.S.O., Croix de Guerre, M.E.I.C. whose cable of greetings was read at the Annual Meeting at Ottawa, from London, has been appointed Dean of the Faculty of Applied Science and Engineering at Toronto University. It has been known for some time that this post has been kept open for Col. Mitchell but the official announcement has just been made by President Falconer. Col. Mitchell's hosts of friends in *The Institute* will receive this announcement with feelings of gratification and pleasure, for the work he has accomplished during the war has firmly established his position to a high place in the engineering profession.

Capt. Hobart R. Carscallen, M.C., A.M.E.I.C. Capt. Gerald M. Hamilton, B.A.Sc., M.C., A.M.E.I.C. Among the list of soldiers who were decorated with the Military Cross for conspicuous services, according to a despatch from London dated February 6th, the above are of particular interest to members of *The Institute*. Capt. Carscallen, M.C., is an associate member of *The Institute* and comes from Calgary, Alta. Capt. Hamilton is also an associate member, having been admitted in 1917 while on active service. His home is in Toronto, Ont.

Capt. W. Cornwallis Bate, M.C., A.E.I.C., has been awarded a bar to his Military cross for work done at Amiens. Unfortunately in the engagement at which Captain Bate was awarded this further honor, he was severely wounded in the head and right arm. He is expected to return to Canada shortly.

Greetings from Germany

Lieut.-Col. Harry F. Meurling, M.C., M.E.I.C., has forwarded to the Secretary, greetings from the officers of the 2nd Canadian Motor Machine Gun Brigade, from Bonn, Germany, where the Brigade was established under his command at that time. These greetings are contained in a handsomely printed menu and toast list of the Christmas dinner held by the officers' mess. It is evident that there was no lack of real Christmas food and the toast list and musical programme was of a high order.

Since this greeting card was received it is a pleasure to announce that Lieut.-Col. Meurling has also been awarded the Croix de Guerre.

Capt. Mitchell Wins V.C.

Capt. Coulson Norman Mitchell, V.C., M.C., A.M.E.I.C. The following citation from the London Gazette of February 3rd, contains details of how Capt. C. N. Mitchell, M.C., won the Victoria Cross:

Captain Coulson Norman Mitchell, M.C., Fourth Battalion, Canadian Engineers, for most conspicuous bravery and devotion to duty on the night of Oct. 8-9, 1918. At Canal Lescault, northeast of Cambrai, he led a small party ahead of the first wave of infantry, in order to examine various bridges on the line of approach, and if possible to prevent their demolition. On reaching the canal, he found the bridge already blown up. Under a heavy barrage, he crossed to the next bridge where he cut a number of lead wires. Then, in total darkness, unaware of the position and strength of the enemy bridgehead, he dashed across the main bridge over the canal bridge. This he found to be heavily charged for demolition.

Whilst Captain Mitchell, assisted by his non-com., was cutting the wires, the enemy attempted to rush the bridge in order to blow up the charges, whereupon he at once dashed to the assistance of his sentry who had been wounded. He killed three of the enemy, captured twelve, and maintained the bridgehead until reinforced. Then under a heavy fire, he continued the task of cutting the wire, removing charges which he well knew might at any moment have been fired by the enemy. It was entirely due to his valor and decisive action that this important bridge across the canal was saved from destruction.

Capt. Mitchell has been connected with The Institute since April 1911 and was transferred to associate membership in November 1917, while overseas. His home address is 310 Furby Street, Winnipeg.

OBITUARIES

Richard L. Newman, M.E.I.C.

Word has reached Montreal of the death from influenza of Richard L. Newman, at West Point, Virginia, on January 28th, 1919. The late Mr. Newman was born at Weymouth, England, July 15th, 1865, and received his training in the British Navy. He, however, later severed his connection with the Navy, and has been a resident of Canada and United States since 1890, following the profession of naval architect and consulting engineer, at one time designing and supervising the construction of vessels for the Marine and Fisheries Dept. Mr. Newman has also supervised the construction of ships in different parts of the world, having been in Russia in this capacity in 1916. At the time of his death he was supervising the construction of ships in the United States for the United States Emergency Fleet. He was elected a full member of *The Institute* in August 1914.

Mr. Newman is survived by his wife and two daughters.

Norman M. Thornton, M.E.I.C.

As we go to press just word is received of the death of Norman M. Thornton, M.E.I.C., of Edmonton, Alberta. Mr. Thornton was chairman of the Edmonton Branch for 1918 and had been re-elected for the current year.. Further particulars will be given in the April number.

A British firm of Boiler makers wish to be placed in touch with members of *The Institute* who would be interested in taking delivery of English build stationary boilers and erect same.

EMPLOYMENT BUREAU

Situations Vacant

Electrical Engineer.

Electrical Engineer required who has had sufficient experience to design the layout of a power plant and supervise the installation of machinery. Salary $250.00. Apply Box No. 28.

Municipal Engineer.

Competent municipal engineer with experience in building municipal streets and capable of taking care of public utilities, water and sewerage systems. Salary from $2,400 to $3,000. Apply Box No. 29.

Municipal Assistant.

General Foreman for Municipal work. Must be experienced in construction and maintenance of sewers and pavements. Preference will be given to men having been on Active Service. State experience, salary expected and reference. Box No. 31.

Mechanical Draughtsman.

Mechanical draftsman for large industrial plant, must be thoroughly competent with technical and executive ability. In replying state if strictly temperate, age, experience, education, and salary expected. Married man between 28 and 38 preferred. Address Box No. 30.

Engineer Agents Wanted.

Agents to represent a high class specialty manufactured by a firm in United States, for the selling of which technical knowledge is advantageous. Any reliable distributing concern or agency handling engineering specialties may apply for this Agency by addressing to Box No. 27.

Timber Scaler.

A timber scaler for the New Westminster Timber Agency, Department of the Interior, at a salary of $2,000 per annum. Candidates must hold a scaler's license from the British Columbia Government and must have had experience in the measurement of timber. Address Wm. Foran, Secretary, Civil Service Commission of Canada, Ottawa, Ont.

General Secretary Wanted.

For the new Association of Canadian Building, and Construction Industries. Preference will be given to young men, who have had engineering education, and construction experience. Good salary to the right man. Headquarters will be at Ottawa. Must be good organizer. Send Applications to President of the Association, 65 Victoria St., Montreal.

Astrophysical Observer.

An observer for the Dominion Astrophysical Observatory at Victoria, B.C., Department of the Interior, at salary of $1,700 per annum. Candidates must be graduates in Arts of a recognized university and must have taken an honour course in Astronomy and Mathematics. They should have practical experience in observational and measuring work in some observatory. Address Wm. Foran, Secretary, Civil Service Commission of Canada, Ottawa, Ont.

Engineering Clerk.

An assistant clerk of works in the Department of Public Works at Regina, at a salary of $1,500 per annu m Candidates must be fairly well educated. They must be competent mechanics with a few years experience in supervising building construction. They must be capable of preparing sketch plans and descriptions, also estimates of repairs and alterations to buildings. Address, Wm. Foran, Secretary, Civil Service Commission of Canada, Ottawa, Ont.

Town Engineer.

An Ontario town requires a town engineer capable of planning a system of good roads, specifying the composition of the roads, estimating costs, and supervising construction. Applicants should state education and experience both regarding roads and other municipal work, giving dates and places, references and salary expected. Address Box No. 32.

Immigratiou Commissioner.

A Commissioner of Immigration for the Western District, Department of Immigration and Colonization, at a salary of $2,500 per annum. The office of the Commissioner shall be in Winnipeg. The appointee must be capable of assuming responsibility for the direction, control and supervision of all Immigration employees within his territory and for the transaction of all official business arising from the Immigration Act. Candidates must have a good general education, a knowledge of business, together with executive ability and personality. They should produce credentials as to their general experience and qualifications for the position.

Application forms must be filed in the office of the Civil Service Commission not later than the 18th day of March. Application forms may be obtained from the Postmasters at Vancouver and Kamloops or the Secretary of the Civil Service Commission, Ottawa.

By order of the Commission,

W. Foran,
Secretary.

New Welland Canal Staff.

Applications will be received from persons qualified to fill the following positions on the construction staff of the New Welland Canal; Assistant engineers, instrument men, levellers, rodmen, draughtsmen, inspectors, time-keepers, accountants, store-keepers and chauffeurs. Applicants should apply in writing, on their own paper, to the Secretary of the Civil Service Commission not later then Saturday, March the 8th. Applicants should give full particulars as to name, address, age, qualifications, experience and previous employment, and should furnish the names of three reputable citizens as referees as to qualifications and character.

Application forms must be filed in the office of the Civil Service Commission not later than the 18th day of March. Application forms may be obtained from the Postmasters at Vancouver and Kamloops or the Secretary of the Civil Service Commission, Ottawa.

By order of the Commission,

W. Foran,

Secretary.

Ottawa, 13th February, 1919.

Preliminary Notice of Application for Admission and for Transfer

20th February, 1919.

The By-Laws now provide that the Council of the Society shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in March, 1919.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows:—

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course. In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineers' office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the following branches at his option Railway, Municipal, Hydraulic, Mechanical, Mining, or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five years or more years.

Every candidate for election as JUNIOR shall be at least twenty-one years of age, and must have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-five years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects Geography, History (that of Canada in particular), Arithmetic, Geometry Euclid (Books I.-IV. and VI.), Trigonometry, Algebra up to and including quadratic equations.

Every candidate for election as ASSOCIATE shall be one who by his pursuits, scientific acquirements, or practical experience is qualified to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BALDWIN—ROBERT ARCHER, of Toronto, Ont. Born at Ottawa, Ont., Jan. 10th, 1875. Educ., Ottawa Coll. Inst. and private tuition, etc. 1895-97, with the topog. surveys dept., as rodman, dftsman, etc.; 1897-99, with Chas. E. Goad, Toronto and Montreal, dftsman and suveyor; 1899-1900, with G.T.R., as dftsman and asst. supervisor of bridges and bldgs.; 1900-01, dftsman, transitman, asst. to bridge engr., Algoma Central Ry.; Sept. 1901–May 1904, with N.Y. Central Ry., as follows: 1901-02, transitman; 1902-03, asst. supervisor of tracks; 1903-04, asst. engr. (L. S. & M. D.); 1904-05, ch. dftsman and in chg. of constrn., Wabash Ry., St. Louis, Mo.; with Mackenzie, Mann & Co., as follows: 1905-07, asst. engr.; 1907-11, ch. dftsman; 1911-12, dsgning engr.; 1912-13, div. engr. on constrn.; 1913-14, dist. engr., Toronto-Ottawa line and on surveys, also C. N. R. engr.; 1914-16, engr., 1914-16, engr. maintenance of way, and since March 1916 to date, asst. engr., C.N.R.

WARING—JAMES ATKINSON WILLIS, of St. John, N.B. Born at St. John, N.B., Jan. 3rd, 1875. Educ., grammar school. 1891-94, apprentice machinist and architect; 1894-95, marine engr., B.W.I. Govt.; 1895-97, machinist, C. P. R.; 1898-1900, rodman and dftsman, C. P. R., St. John, N.B.; 1900, machinist, Westgarth Furness Co., and Blair's Ship Yard, England; 1901 to date, dftsman, res. engr. and asst. engr., C. P. R., St. John.

References: J. H. Barber, C. L. Wetmore, C. C. Kirby, G. G. Murdoch, G. S. Baxter.

WHEATLEY—JAMES HOWARD, of Westmount, Que. Born at Troy, N.Y., July 1st, 1890. Educ., B.Sc. (M.E.), McGill Univ., 1912. Machine shop training in Montreal plants of Steel Co. of Canada; several months with Robt. W. Hunt & Co., as inspector, supervising mfr. of railway and gen. industrial equipment; with Northern Elec. Co., 1912-15, in the cable eng. dept., including the design and mfr. of elec. power, telegraph, signal cable and wires, etc.; Feb. 1916-July 1918, with British Munitions Co., Verdun, Que., organizing and in chg. of eng. dept., including design of gauges, jigs, etc.; later factory supt. in chg. of production, etc.; From July 1918 with C. E. F., and at the present time is not employed.

References: H. M. Lamb, E. Brown, C. M. McKergow, H. M. Goodman, A. R. Roberts, J. S. Cameron, C. Warnock.

WHITMAN—CLYDE OLIVER, of Sault Ste. Marie, Ont. Born at New Albany, N.S. May 14th, 1889. Educ., 2 yrs., app. science, Acadia Univ., 1917. Aug. 1910-Sept. 1914, maintenance dept., C. P. R., as stenographer and clerk; 9 mos. in res. engr's. office and doing gen. rodman's work; summer 1916, on eng. staff, Cape Split Development Co., instrumentman, keeping records of tides, etc.; 1915 (6 mos.), on field eng. staff, Algoma Steel Corp., Sault Ste. Marie, as rodman; Oct. 1917, to date, instrumentman on maintenance and constrn.

FOR TRANSFER FROM THE CLASS OF ASSOCIATE MEMBER TO THAT OF MEMBER

CRAIG—JOHN CORMACK (Major), D.S.O., of Vancouver, B.C. Born at Aberdeen, Scotland, July 10th, 1874. Educ., Robt. Gordon Coll., 1890-93, apprentice, Hall Russell & Co., shipbldrs., and engrs.; 1894-1900, apprentice and gen. asst. to city engr., Aberdeen; 1900-03, asst. res. engr; 1903-05, asst. engr., under J. W. D. Bradley, London, Eng., in chg. of reconstrn. of sewers, etc.; 1905-08, res. engr., P. W. D., on constrn.; 1908-13, res. engr., in chg. of harbor extension works, etc.; 1914 (4 mos.), dftsman, P. C. E. Ry., Vancouver; Oct. 1915-1916, capt., front line trenches, tunnelling roads, light railways, etc.; 1916 to 1918, Major, ch. engr. and 2nd in command of Railway Troops; 1918 to present time, asst. director of constrn., light ry. section (awarded D.S.O. and 3 times mentioned in despatches).

References: G. R. G. Conway, P. R. Warren, J. Callaghan, A. D. Creer, R. F. Leslie.

CRAIG—JOHN DAVIDSON, of Ottawa, Ont. Born at Kingston, Ont., Jan. 30th, 1876. Educ., B.A., 1897, B.Sc. (mining), 1900, Queen's Univ., D.L.S. Summer 1899, assayer's asst., Greenwood, B.C.; 1901, articled pupil, D.L.S.; 1900-02, on staff of surveyor-general, Ottawa, drafting, gen. tech. office work, etc.; 1904, inspector of contracts, Dom. Land Surveys, Man. and Sask.; 1905, attache, representing Can. Boundary Comm. on U. S. party, Alaska survey; 1906-08, on survey of boundary between Alaska and B.C.; 1909-13, in chg. for Canada, of survey of boundary between Alaska and the Yukon; 1914-17, asst. supt., geodetic survey; 1918 to date, engr. with the Internat. Boundary Comm., Ottawa.

References: J. J. McArthur, C. A. Bigger, C. R. Coutlee, J. B. Challies, S. J. Chapleau, G. B. Dodge, H. B. R. Craig.

DRYSDALE—WILLIAM FLOCKHART, of Paris, France. Born at St. Andrews East, Que., July 16th, 1881. Educ., private tuition, B.Sc., McGill Univ. 1904. 1899-1904, apprentice with G. T. P. Ry.; 1904-05, dsgn. and calculating locomotives for American Locomotive Co., Schenectady; 1905-06, cost estimating engr., Am. Locomo. Co., N. Y. C.; 1906-08, asst. to ch. engr., on elec. locomo. and trucks, shop machinery and power; 1908-11, power engr. of all plants of Am. Loco. Co.; 1911-14, mech. engr. and asst. supt. of motor power, Ferrocaril de Costa Rica, C. A., and Northern Ry. of Costa Rica; dsgning and erecting re-inforced concrete bldgs., for United Fruit Co., in Costa Rica; special observation car, new loco. and car shops, etc.; 1914-15, asst. to works mgr., Steel Co. of Canada; 1915-16, asst. to vice-pres., Am. Loco. Sales Corp., N. Y.; July 1916 to date, special engr., representative in Europe, having chg. of all contracts and erection of loco. for France and Italy.

References: F. S. Keith, F. A. McKay, F. B. Brown, A. Roberts, H. H. Vaughan, H. M. Jaquays.

ELLIOT—LAURIE BENJAMIN, of Edmonton, Alta. Born at Dartmouth, N.S., May 16th, 1883. Educ., B.Sc., Dalhousie Univ., 1903, private study and I. C. S. 1903-04, 2nd asst. engr., city engr's office, Halifax, N.S.; 1904-09, with T. C. Ry., as rodman, leveller, transitman, res. engr.; 1909, engr. in chg. of party, C. P. R. irrigation dept.; 1909-10, asst. engr., P. W. D., Calgary; 1910-12, acting dist. engr., P. W. D., Canada, Calgary; 1912-to date, dist. engr., P. W. D., Edmonton.

References: J. L. Coté, D. Donaldson, A. T. Fraser, R. J. Gibb, A. W. Haddow.

MOORE—ERNEST VIVIAN, of Montreal. Born at Peterboro, Ont. July 23rd, 1878. Educ., B.Sc., McGill Univ., 1900. 1901-03, asst. engr., Dept. of Railways & Canals, on Port Colborne Entrance improvements; 1904-05, research work connected with mfr. of peat fuel; 1916-17, built and managed plant of the Joliette Steel Co.; Sept. 1917-Jan. 1918, consl. engr., Montreal; Feb. 1918 to date, consl. engr., Peat Committee of the Ont. and Dom. Govts., in full chg. of investigations.

FOR TRANSFER FROM CLASS OF JUNIOR TO HIGHER GRADE

DALZIEL—WILLIAM, of Montreal. Born at Summerside, P.E.I., Aug. 1st, 1885. Educ., B.Sc., Queen's Univ., 1913., accounting and commercial law. Was with accounting, eng. and commercial firms for 9 yrs.; 1 yr. machine shop work and 1 yr. mech. dftsman; engr. in chg. of constrn. and hydraulic power plants under Henry Holgate; 1915-16, efficiency and constrn. engr., Ross Rifle Co.; Jan.-July 1916, asst. inspector of ammunition, Imperial Ministry of Munitions; July-Nov. 1916, dist. inspec. of ammunition, Montreal dist ; 1916-18, inspec. of shell components, etc., Nov. 1918 to present time, mech. supt., Caron Bros., Longue Pointe.

References: H. Holgate, H. H. Vaughan, R. J. Durley, J. L. Allison, H. M. Jaquays, S. F. Rutherford.

McLAREN—WALTER CORNING, of Toronto, Ont. Born at Buckingham, Que., Feb. 15th, 1887. Educ., McMaster Univ. 1906-07, topo. N. T. C. Ry.; 1908-09, rodman on constrn., G. T. P. Ry.; 1909, instrumentman on constrn.; 1911-13, res. engr., C. N. P. Ry.; 1913-14, instru'man, K. V. Ry.; 1916, instru'man, on Toronto Harbor, with T. Stewart Constrn. Co.; 1917, inspector, reinforced concrete subway, C. P. Ry.; 1918 to date, dftsman, estimating, res. engr., C. N. R. and H. & S. F. Ry., Toronto.

References: A. F. Stewart, H. T. Hazen, J. R. MacKenzie, S. H. Sykes, R. Ferguson.

OLIVER—STUART ERSKINE, of Quebec. Born at Quebec, Feb. 23rd, 1888. Educ., B.Sc. (C.E.), McGill Univ., 1911., Q. L. S., 1914. Summers 1906-10, rodman, and leveller on prelim. and locative surveys, C. N. R., T. C. and Que. Ry. Light & Power Co.; 1911-12 (9 mos.) transitman and ch. of party on surveys Q. E. Ry.; 1912-13 (7 mos.) ch. of party, C. & G. T. Ry.; 1913-14, with Evans & Oliver, consl. engrs. and land surveyors; 1915, res. engr., transmission line constrn., Laurentian Power Co,. 1916 (3 mos.), surveys for same company; 1916 to date, res. engr., Que. & Sag. Ry., on constrn.

References: E. A. Evans, J. Ruddick, S. S. Oliver, E. S. Holloway, A. Dick, W. Lefebvre.

PERRIE—WILLIAM WALLACE, of Hamilton, Ont. Born at Hamilton, Ont., June 3rd, 1894. Educ., private tuition, high school and I. C. S. (C.E.)., O. L. S., 1917. Since April 1913, with MacKay, MacKay & Webster, Hamilton, as follows: 3 yrs., apprentice; 1914 (6 mos.), field engr., on sewer constrn., London, Ont.; since 1914, has been in chg. of gen. county and township eng. work and surveying, including dsgn. and constrn of roads, bridges, etc.; and at the present time is carrying on gen. civil eng. and surveying practice with MacKay, Mackay & Perrie.

References: E. H. Darling, F. W. Paulin, W. B. Ford, J. Taylor, J. B. Nicholson, E. R. Gray.

FOR TRANSFER FROM ASSOCIATE TO HIGHER GRADE

GRUNSKY—HERMAN WASHINGTON, of Ottawa, Ont. Born at Stockton, Cal., Jan. 16th, 1873. Educ., A. B. Standford Univ., 1899, LL.B., Harvard Law School, 1903, passed exam. given by the U. S. Dept. of Agric. (Irrigation Branch), as Irrigation Engineer. 1910-12, in chg. of irrigation investigations (U. S. Dept. of Agric.), Oregon; 1912, directed duty-of-water investig'ns, in Deschutes River Basin; also directed preparation of special reports on irrigation in Oregon for the Div. of Irrigation, Washington, D. C.; reported under Dr. Fortier, on arid parts of B.C., to the B.C. lands dept.; 1912-13, in chg. of prep. of annual report of B.C. water rights Branch; 1912-14, specialized on water power administrative problems in B.C., being major-author of the B.C. water rental regulations, including tech. features. Since 1914, legal adviser on water power matters, Dept. of Interior, Ottawa, covering eng. and economic aspects.

FOR TRANSFER FROM CLASS OF STUDENT TO HIGHER GRADE

BOISSEAU—LOUIS JOSEPH GUSTAVE, of Montreal. Born at Montreal, Oct. 29th, 1892. Educ., B.A.Sc., Ecole Poly., 1916. 1913 (vacation), on constrn. of roads; 1915, on survey of Quebec harbor, in chg. of soundings; since June 1916, with Quebec Streams Comm., as follows: 1916, transitman and ch. of party on survey of Lake Kenogami; 1917, in complete chg. of survey near Great Lake Jacques-Cartier; later was engaged in gauging of rivers, and at the present time, superviser of constrn. of Lake Burle storage dam.

References: O. Lefebvre, A. Surveyer, A. O. Bourbonnais, H. Massue, L. Hurtubise.

LECLAIR—WILLIAM JAMES (Capt.), of Ottawa, Ont. Born at Ottawa, Aug. 24th, 1891. Educ., matric. for McGill Univ., 1 yr. Queen's Univ., and C.E. course in S. P. S. Was for several yrs. in the water power development and power house constrn. of the Bronson Co., Ottawa Power Co., and Ottawa Elec. Co., at Ottawa; 6 yrs. in the P. W. D., of Can., latterly as asst. engr. in chg. of work; for the past 3 yrs., Tech. officer in the Can. Forestry Corps, in Britain and France.

References: C. R. Coutlee, S. B. Johnson, J. B. McRae, J. Murphy, A. McDougall.

McNEICE—LEONARD G., of Wallaceburg, Ont. Born at Draper Township, Ont., May 31st. 1890. Educ., B.Sc., Queen's Univ., 1913. 6 mos. apprentice on Dom. land surveys; 1913-14, transitman on A. & H.B.Ry.; 1914-16, asst. with Chipman & Power, Toronto; 1916, to present time, mgr. of Wallaceburg Hydro-Elec. System, water works supt. and town engr., Wallaceburg.

References: W. Chipman, J. A. McPhail, L. Malcolm, G. H. Power, E. M. Proctor.

SCOTT—EDWIN HARRY, of Toronto, Ont. Born at Belmont, Ont., May, 28th, 1889. Educ., B.A.Sc., Toronto Univ., 1915. With Algoma Steel Corp.; 1910 (3 mos.), rodman, inspector, etc.; 1911, rodman on constrn., C. N. R.; 1911 (3 mos.) with A. C. Ry., as instr'man and inspector; 1914, location rodman, C. N. R.; Sept.-Oct. 1915, ballasting instr'man, etc., C. N. R.; 1915-18, on active service; and at the present time with Can. Nat. Rys., as instr'man.

THORN—GEORGE OLIVER, of Saskatoon, Sask. Born at Bristol, Eng., Dec. 12th, 1886. Educ., B.Sc. (C.E.), Sask. Univ., 1916. 1906-10, mason on bldg. constrn.; 1912, in city engr's dept., Saskatoon; 1913, inspector of sidewalks, sewer and water mains; 1914 (7 mos.), inspector, testing cement and gravel and in chg. of pouring of concrete; since May 1916, lieut. in Can. Engrs., at present awaiting discharge.

References: A. R. Greig, G. T. Clark, H. McI. Weir, J. E. Underwood. W. M. Stewart.

WILLIAMS—JACK NORTHMORE, of Paris, Ont. Born at Burlington, Ont., July 29th, 1892. Educ., B.A.Sc., Toronto Univ., 1915. With Tyrrell & Mackay, engr. and surveyors, Hamilton, 15 mos., as rodman, instrumentman, etc.; later with C. N. R., as rodman on constrn. (5 mos.); asst. dsgnr. and inspector with Frank Barber, consl. engr., Toronto (6 mos.); later engr. with Wells & Gray, engrs. and contrs., Toronto; 1915-18, with C. E. F. on active service; at present time, principal asst. engr. on constrn. of Paris dam for the Foundation Co. Ltd., Montrea

ENGINEERING INDEX

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to the engineering profession and to every branch of the profession.

PHOTOSTATIC PRINTS

Photostatic copies may be obtained of any of the articles listed in this section. Price of each print (up to 11 x 14 in. in size), 25 cents, plus postage. A separate print is required for each page of the larger-size periodicals, but where possible two pages will be photographed together on the same print. Bill will be mailed with the prints.

Orders should be sent to

Harrisson W. Craver, Director,
Engineering Societies Library,
29 West Thirty-ninth Street, New York, N. Y.

RAILROAD ENGINEERING

ELECTRIC RAILWAYS

Braking, Regenerative. Brake System with Recuperation of Energy for Vehicles Operates by Single-Phase Commutator Motors (Système de freinage avec récupération d'énergie pour véhicules actionnés par moteurs monophasés à collecteur). Behn-Eschenburg. Revue Générale de l'Electricité, vol. 4 no. 23, Dec. 7, 1918, pp. 877-881 5 figs. Description and theory of system adopted at Oerlikon Construction Works for the St. Gothard locomotives, which permits operation of brakes with recuperation, at all loads and speeds. A coil of known reactance is only apparatus added to normal installation of motor. Also abstracted in Elecn., vol. 81, no. 2118, Dec. 20, 1918, pp. 708-710, 4 figs.

Coasting Clock. The Electric Coasting Clock. Ry. & Locomotive Eng., vol. 32, no. 1, Jan. 1919, pp. 22-23, 3 figs. Instruments which records actual number of minutes an electric train is operated without use of power or brakes.

Government Ownership. Public Ownership the Obvious Policy for Electric Railways, Richard McCullough. Elec. News, vol. 28, no. 1, Jan. 1, 1919, pp. 27-28, Analysis of present situation; advantages of public ownership to public and investor Paper before Elec. Ry. Assn.

Locomotives. Oscillations of Electric Locomotives (Oscillations des locomotives électriques), P. Leboucher. Revue Générale de l'Electricité, vol. 4, No. 24, Dec' 1918, pp. 914-930, 35 figs. Mathematical analysis of forces developed in members when continuous torque is transmitted by a crank The different dispositions, adopted in electric locomotives of this class are considered separately. Writer shows that the combination of crank and connecting rod gives rise to serious vibrations of chassis; he advocates suppression of this mode of transmission on electric locomotives.

Motor-Generator Sets. Performance of Motor-Generator Sets for the Chicago Milwaukee & St. Paul Ry., F. T. Hague. Elec. Jl., vol. 16, no. 2, Feb. 1919, pp. 47-52, 11 figs. Power-factor curves of synchronous motor, temperature curves at full load, and 1.5 load, and direct current short-circuit test at 9.25 load. Special reference is made to commutating machinery of large units.

Track Circuits. The influence of Zinc Ties on Track Circuits, Ry. Age, vol. 66, no. 5, Jan. 31, 1919, pp. 305-306. Report of discussion at the convention of Ry. Signal Assn.

Leakage Resistance of Electric Railway Roadbeds, E. R. Shepard. Elec. Ry. Jl., vol. 53, no. 4, Jan. 25, 1919, pp. 172-178, 7 figs. Results of tests covering a period of more than three years made upon railway tracks in Washington, D. C., and upon short sections of experimental track on the Bureau of Standard grounds.

ELECTRIFICATION

Advantages. Railroad Electrification Facts and Factors, A. J. Manson. Ry. Elec. Engr., vol. 10, no. 1, Jan. 1919, pp. 3-4, 1 fig. Reason for adoption of electric motive power and advantages obtained from its use.

C. M. & St. P. Chicago, Milwaukee and St. Paul Electrification in Washington W. A. Scott, Elec. Rev., vol 74, no. 1, Jan. 4, 1919, pp. 1618, 1 fig. Principal features of power feeder and trolley lines, substation and locomotive equipment.

France. The Partial Electrification of the French Southern Railway (électrification partielle des chemins de fer de la Compagnie d'Orléans). Génie Civil, vol. 74, no. 1, Jan. 4, 1919, pp. 4-9, 4 figs. Program of the Paris & Orleans R. R. Conference before the Société d'Encouragement pour l'Industrie Nationale.

South Africa. S. A. R. Annual Report. S. A. Min. Jl. & Eng. Rec. vol. 28, pt 1, no. 1416, Nov. 16, 1918, pp. 227-228. Electrification and control of shipping in South African Railways. From report of general manager of railways and harbors.

Western States. Transportation and Western Power problems, John H. Lewis, Jl. Elec., vol. 42. no. 1, Jan. 1, 1919, pp. 14-15. Suggestions in regard to railway electrification and development of navigable streams.

EQUIPMENT

Cinder-Handling Plant. A New Type of Locomotive Cinder-Handling Plant. Ry. Age, vcl. 66, no. 5, Jan.31, 1919, pp.319-320. 2 figs. Description of a plant for the Pittsburg and Lake Erie at Hasleton Yard, Youngstown, O., which includes an inclined hoistway to a storage bin.

Coaling Station. New Philadelphia and Reading Coaling Station. Ry. Rev vol. 64, no. 5, Feb. 1, 1919, pp. 174-176, 6 figs. Plant arranged to handle both anthracite and bituminous; elaborate sand-handling features; general description of what is believed to be the largest concrete coaling station in the world.

FOREIGN

British. British Railways Under War Conditions. Engineer, vol. 126, no. 3283, Nov. 29, 1918, pp. 454-455, Railwaymen with the colors. (Tenth Article).

Government Ownership, British. Nationalization of British Railways. Ry. Gaz., vol. 29, no. 24, Dec. 13, 1918, pp. 671-674, 1 fig. Factors bearing on policy of railroad Government ownership; discussion of basis for arriving at price which will be fair alike to state and shareholders.

Peru. Peru and Its Principal Railways, Clayton Sedgwick Cooper, Ry. Rev., vol. 64, nos. 1 & 2, Jan. 4 and 11, 1919, pp. 1-5, 6 figs. and pp. 61-65, 8 figs. Geography and history of railway construction in Andes.

LOCOMOTIVES

British Express. The New Express Engines of the London & South-Western Railway. Ry. Gaz., vol. 29, no. 14, Dec. 13, 1918, pp. 662-669, 13 figs. Sectional drawings, photographic illustrations, general dimensions and data of 4-6-o passenger locomotives recently completed at Eastleigh Works.

Diesel-Electric. Diesel-Electric Locomotives (Automotrices Diesel-électriques). Bulletin Technique de la Suisse Romande, year 44, nos. 14, 15, 16 and 17, July 13 and 27, Aug. 10 and 24, 1918, pp. 129-132, 137-140, 145-149 and 157-158, 13 figs. Extensive descriptions of mechanical arrangement and electrical schemes. A Diesel engine operates a d. c. dynamo; current from the dynamo feeds traction motors; Ward-Léonard system followed. Abstract in Revue Générale de l'Electricité, vol. 4, no. 23, Dec. 7, 1918, pp. 891-896, 6 figs.

Feedwater Heating. Locomotive Feed Water Heating. H. S. Vincent. Ry. Mech. Eng., vol. 93, no. 1, Jan. 1919, pp. 44-47, 4 figs. Discussion of exhaust-steam and waste-gas methods of pre-heating for locomotive boilers. (Second article.)

Fireboxes. A New Departure in Firebox Construction. Ry. Rev., vol. 64, no. 2, Jan. 11, 1919, pp.. 47-51, 5 figs. Means of taking advantage of pricniple of radiant heat transfer.

Lubricators. Force Feed Lubricator. Ry. & Locomotive Eng., vol. 32, no. 1, Jan. 1919, pp. 11-12, 1 fig. Records obtained with Schlacks system of forced-feed lubrication as applied to locomotives.

Mallet. The U. S. Standard Light Mallet Type Locomotive. Ry. Age, vol. 66, no. 5, Jan. 31, 1919, pp. 290-292, 4 figs. 2-6-6-2 wheel arrangement with weight on drivers of 358,000 lb. and tractive effort, compound, of 80,000 lb.. Description with principal data and drawings.

Mallet Type Locomotive for Utah Railway. Ry. Rev., vol. 64, no. 3, Jan. 18, 1919, pp. 85-86, 1 fig. Description with principal data of articulated compound built for heavy freight and pusher service.

Mountain Type. Mountain Type Locomotives for the Atchison, Topeka & Santa Fe. Ry. & Locomotive Eng., vol. 32, no. 1, Jan. 1919, pp. 3-4, 1 fig. Particulars of 4-8-2 type recently completed at Baldwin Locomotive Works.

New Zealand Narrow Gage. Express Locomotives for 3-ft., 6-in. Gauge. Engineering, vol. 106, no. 2760, Nov. 22, 1918, pp. 576-579, 31 figs. Principal data, drawings of details, test results and general description of certain locomotives on New Zealand Government Railways.

Pennsylvania 2-10-2. Heaviest 2-10-2 Type Built for Pennsylvania Lines. Ry. Age, vol. 66, no. 4, Jan. 24, 1919, pp. 249-251, 4 figs. Principal data, drawings and description.

Rock Island 2-10-2. Rock Island 2-10-2 Locomotive. Ry. Mech. Eng., vol. 93, no. 1, Jan. 1919, pp. 41-43, 5 figs. New designs cf cab and spark arrester; grease lubrication used on crossheads and trailer.

Stokers. New Locomotive Stoker Tested Out on Erie. Ry. Age, vol. 66, no. 3, Jan. 17, 1919, pp. 202-204, 4 figs. Mechanical distribution of coal; maintains light fire and reduces cinder and standby losses.

The Elvin Mechanical Stoker for Locomotives. Ry. Rev., vol. 64, no. 4, Jan. 25, 1919, pp. 132-134, 4 figs. Imporatnt features are minimum power requirements and a mechanical means of fuel distribution.

Switches, Geared. Lima Locomotive in Switching Service With the Tennessee Coal, Iron and Railway Company. Ry. and Locomotive Eng., vol. 32, no. 1, Jan. 1919, pp. 10-11, 2 figs. Service given by geared locomotive switching; its special advantages.

Tenders. Canadian Pacific Railway Locomotive Tenders. Can. Ry. & Marine World, no. 251, Jan. 1919, pp. 11-12, 4 figs. Coal container with slope and bottom sheets independent of tank. Coal automatically delivers itself at shovel sheet without coal passer.

Thermic Siphons. Chicago, Milwaukee & St. Paul Railway Test of Locomotive equipped with the Nicholson Termic Syphous. Ry. & Locomotive Eng., vol. 32, no. 1, Jan. 1919, pp. 7-9, 1 fig. Principal dimensions, data and performances of two engines. Firebox of one as equipped with Nicholson thermic syphons supporting brick arch; other had ordinary type of arch supported on four 3-in. arch tubes.

Tires. Shrinkage of Locomotive Tires. Ry. Gaz., vol. 29, no. 25, Dec. 20, 1918, pp. 703-704, 1 fig. Methods adopted at Doncaster Works for determining tire shrinkage and for checking allowance for tires.

U. S. Standard. Two More Standard Locomotives. Ry. Mech. Eng., vol. 93, no. 1, Jan. 1919. pp. 25-30, 12 figs. Heavy 4-8-4 and light 2-10-2 types are well proportioned and have essentially same boiler.

Standard 2-10-2 and 2-8-2 Type Locomotives, Ry. Rev., vol. 64, no. 1, Jan. 4, 1919. pp. 7-12, 9 figs. Principal data and drawings with general description. Two government standard engines whose boilers come nearest interchangeability.

New Locomotives if Standard Design. Boiler Maker, vol. 19, no. 1, Jan. 1919, pp. 1-2, 4 figs. Dimensions of four locomotives recently delivered to U. S. R. R. Administration. Totals of boiler-heating surfaces vary from 1891 to 1285 sq. ft.

NEW CONSTRUCTION

Avlona-Monastir. Avlona-Monastir Railroad Project (Projecto del ferrocarril Avlona-Moaastir). Revista de Obras Publicas, year 66, no. 2257. Dec. 26,1918, pp. 645-647, 2 figs. General plan for consolidation of various lines into Trans-Balkan Italian System with ferry boat service across Otranto Canal. From Giornale del Genio Civile.

Kalka-Simla. The Kalka-Simla Railway and Rolling Stock. Engineer, vol. 126, no. 3283, Nov. 29, 1918, pp. 455-458, 18 figs. General illustrated description of railway and of rolling stock.

Katanga. The Katanga Railway. Engineer, vol. 126, no. 3285, Dec. 13, 1918, pp. 501-504, 17 figs. Description of its construction, some engineering features and equipment.

OPERATION AND MANAGEMENT

British. British Railways Under War Conditions. Engineer, vol. 126, no. 3286, Dec. 20, 1918, pp. 528-529. Twelfth article. The dispatch of the expeditionary force.

British Railways Under War Conditions. Engineer, vol.127, no. 3289, Jan. 10, 1919, pp. 38-39. Fourteenth article. The first six months.

Freight Handling. Proper Methods of Handling Freight, E. P. Nowlin. Ry. Rev., Vol. 64, no. 1, Jan. 4, 1919, pp. 5-6. Introducing scheme of reorganization whereby to reduce loss and damage expense.

French. French Railroads-During the War (Los ferrocarriles franceses durante la guerra) Boletin de Minas, vol. 10, nos. 7-9, Sept. 30, 1918, pp. 106-110. Organization and operation. Executive direction of each road in hands of a commission composed of a military officer and a technical expert. From documents published by Chamber of Commerce, Paris, June, 1918.

Post-War Conditions. The Railway Situation Created by the War. (La crisis ferroviaria antes de la guerra y situacion creada por esta). Revista de Obras Publicas, year 66, no. 2246, Oct. 10, 1918, pp. 509-514. Points out critical financial condition of railways in Spain and generally throughout the world, shown by constantly diminishing scale of profits due to rising expenses for fuel labor and materials. Financial results obtained by railway working in France England and Germany for period 1901-1911 are given in tabular form.

Supervision. Supervision, L. L. Wilkes. Ry. Club of Pittsburg, vol. 18, no. 1, Dec. 19, 1918, pp. 6-17 and (discussion) pp. 17-26. Duties of railroad supervisors; qualifications required to fill positions completely; suggestions to supervisors in regard to efficiency in discharge of their functions.

U. S. Railroad Administration. The Federal Railroad Administration of the United States, W. M. Acworth. Ry. Gaz., vol. 29, no. 24, Dec. 13, 1918, pp. 651-660. Historical account of conditions in the railroads during the years of the war, specially since the Government took over their operation. Compiled from newspapers, unofficial reports, private correspondence, and public documents

PERMANENT WAY AND BUILDINGS

Landslip. A Railway Landslip. Times, Eng. Supp., no. 530, Dec. 1918, p. 253, Incidents attending movement of wall at Wembley on Great Central Ry.; method of reconstruction.

Montreal Tunnel. The Canadian Northern Railway's Montreal Tunnel from an Economic Point of View, H. K. Wickstead. Can. Ry. & Marine World, no. 251, Jan. 1919, pp. 1-5, 1 fig. Economical considerations which decided on selection of tunnel route at Montreal with general reference to economic aspect of tunnel construction in railway lines.

Spikes. Screw-Spikes versus Dog-Spikes. Indian, Eng., vol. 64, no. 16. 17, 18, 19 and 20, Oct. 19, 26, Nov. 2, 9, 16, 1918, pp. 223-224, 237-238, 251-252, 265-266, 279-280. Reports of experience on Indian Railways of comparative efficiency of dog-spikes and screw-spikes for hard and soft wood sleepers. Following points are touched: holding power, gage keeping, creep holding, ease of maintenance and estimated comparative costs, relative advantages in construction, and relative cracking effect on sleepers. (To be continued).

Water Tanks. Concrete Railway Water Tanks. Ry. Gaz., vol. 29, no. 26, Dec. 27, 1918, p. 728, 2 figs. Details of type commonly used for settling basins.

RAILS

Corrugation. Rail Corrugation. Ry. Gaz., vol. 29, no. 26, Dec. 27, 1918, pp. 725-728 3 figs. Wheel tire is provided with groove. the corners of which present angular cutting edge or edges. This form is said to prevent tendency of rails to develop corrugation.

ROLLING STOCK

Couplers. Development and Construction of Standard Couplers. Ry. & Locomotive Eng. vol. 32, no. 1, Jan. 1919, pp. 5-6, 4 figs. Review of work done by committees of Master Car Builders' and Master Mechanics' Assns. to standardize various parts and contour of couple.

Northern Pacific Box Cars. Northern Pacific Builds Box Cars. Ry Mech. Eng. vol. 93, no. 1, Jan. 1919, pp. 37-40, 7 figs. Interesting design of underframe and end on cars being constructed in company shops.

Timber. Use of Treated Timber in Car Construction. Ry. Age, vol. 66, no. 5. Jan. 31, 1919, pp. 295-298, Influence of decay on life of wooden car parts, methods of treating and results secured. From a report presented at the convention of the Am. Wood Preservers' Assn.

Trucks. Car Trucks. L. Brown. Can. Ry. Club, vol. 17, no. 9, Dec. 1918, pp. 17-28 and (discussion) 28-35, 1 fig. Manufacture and mounting of wheels; uses of Master Car Builder's standard mounting; preparation of journal beatings and dust guards; requirements of bolsters; location of brakes.

SAFETY AND SIGNALING SYSTEMS

Car Repairmen. To Prevent Injuries to Car Repairers, H. W Johnston. Official Proc. Car Foremen's Assn., Chicago, vol 14, no. 3, Dec. 1918, pp. 13-25, 4 figs. Records of accidents on N. Y. C. R. R. show that accidents are minimized by careful observation of practices of employees and thoughtful instruction of new men as to hazards peculiar to work; hence responsibility for accidents is placed on foremen.

Grade Crossings. The Prevention of Accidents at Grade Crossings, C. L. Addison, Am. City, vol. 20, no. 1, Jan. 1919, pp. 7-10, 1 fig. Plan of the Grade-crossing publicity campaign conducted by Long Island R. R. Co. means of grade-crossing protection.

SHOPS

Balboa Shops. War Time Work at Balboa Shops, Panama Canal. R. D. Gatewood. Am. Mach., vol. 50, no. 5, Jan. 30, 1919, pp. 191-194, 11 figs. A brief description of some of the great variety of work being done at the Balboa Shops.

Supervision. Efficient Supervision of Railroad Shops, Frank McManamy. Boiler Maker, vol. 19, no.1, Jan. 1919, pp. 4-5. Locomotive mileage increased by speedy repair work at roundhouse; essential of adequate supervision; responsibility of executives.

Welding. Arc Welding in Railroad Shops, B. C. Tracy. Gen. Elec. Rev., vol. 21, no. 12, Dec. 1918, pp. 887-898, 20 figs. Describes more important applications of electric welding in making locomotive repairs.

West Burlington Shops. West Burlington Shops of the C. B. & Q. Ry. Mech. Eng., vol. 93, no. 1, Jan. 1919, pp. 5-16, 21 figs. Equipment and operation of new erecting and machine shop, blacksmith shop and power plant.

SPECIAL LINES

Narrow-Gage Railroads. Narrow-Gage Railroads (Chemins de fer à voie étroite G. Mangin. Génie Civil, vol. 73, no. 26, Dec. 1918, pp. 504-510, 32 figs. Material used in construction of German strategical military railways. Gage 23.6 in. (69 cm.). Data taken from inspection of evacuated areas. Organization of road construction given from official documents left in field by retreating Germans. Supplements article in Génie Civil, vol. 72, no. 14, Apr. 6, 1918, p. 229.

TERMINALS

Cleveland Union Station. Union Depot Project for Cleveland, W. E. Pease. Jl. Cleveland, Eng. Soc., vol. 11, no. 3, Nov. 1918, pp. 179-185 and (discussion) pp. 185-191. Studies of traffic movements undertaken at New York preliminary to designing some of its terminals; application to conditions in Cleveland.

Erie. New Car Barn and Trainsmen's Room at Erie. H. P. Amthor. Elec. Traction, vol. 15, no. 1, Jan. 15, 1919, pp. 15-19, 4 figs Description of terminal of Buffalo and Lake Erie Traction Co., giving details of construction, type of skylight, pit construction and method of fastening rails to pit piers.

Richborough. The Richborough Transportation Depot and Train Ferry Terminus. Engineer, vol. 127, no. 3289, Jan. 10, 1919, pp. 31-34, 9 figs. Construction; railway facilities; traffic organization; signalling arrangements; rolling stock; barge and train ferry services.

St. John, N. B. The Railway Terminals, etc., at St. John, N. B., C. C. Kirby, Can. Ry. & Marine World no. 251, Jan. 1919, pp. 9-11, 1 fig. Problem of their future extension to meet developmnet of port.

Sebastopol, Cal. New Passenger Depot at Sebastopol, California. Elec. Traction, vol. 15, no. 1, Jan. 15, 1919, pp. 19-21, 2 figs. Layout of station of central point where railrod radiates in three directions.

TRAMWAYS

Emergency Work. Some Emergency Special Work Construction. Thomas B. McMarth. Elec. Ry. Jl., vol. 53, no. 3, Jan. 18, 1919, pp. 145-146, 4 figs. Indianapolis company utilizes acetylene cutting and thermit welding in building up curve crosses.

FARES. Is the Zone System the Fare Solution? Thos. Conway Jr. Elec. News, vol. 27, no. 24, Dec. 15, 1918, pp. 29-31. Comparison of fare collection and regulation systems used in U. S. Paper before Am. Elec. Ry. Assn. Also in Street Ry. Bul. vol. 18, no. 12, Dec. 1918, pp. 519-521.

FRANCHISES. Features of Service-at-Cost Plan Franchise. Elec. News, vol. 28, no. 1, Jan. 1, 1919, pp. 29-30. Ordinance containing following principal provisions; General Transfer system; complete control of service and operation by city; right of city to reroute; authority of council to order extensions and establish new and addtional routes; and franchise tax to be paid to city.

MOTORS, HIGH-POWER. High Power Motors in Tramway Service (Sur l'emploi de moteurs puissants par les tramways), Lucien Pahin. Industrie Electrique, year 27, no. 636, Dec. 25, 1918, pp. 464-467, 6 figs. Equipment of 95-hp. Westinghouse Motors used by the Compagnie de Chemins de fer de Paris.

SKIP-STOPS. Skip-Stop Proves Safety Measure. Electric Traction, vol. 15, no. 1, Jan. 15, 1919, pp. 4-6, 3 figs. Diagrams showing reduction in hazard of collisions and boarding and alighting with skip-stop operation, prepared fron records of Detroit United Railway.

TESTS. Car Equipment Service Tests Determine Fitness of Apparatus, C. W. Squier, Elec. Ry. Jl., vol. 53, no. 3, Jan. 18, 1919, pp. 128-133, 12 figs. Method of making operating tests and heat runs; how sections of track can be best laid out to represent actual service requirements; organization necessary for proper test force; results obtained in specific case.

TRACK CONSTRUCTION. Removing Old Paving for New Track Construction, C. W. Geiger. Elec. Traction, vol. 15, no. 1, Jan. 15, 1919, pp. 30-31, 8 figs. To cut through asphalt a flange was heated and shrunk onto roller of a heavy steam-roller; flange was then sharpened so as to cut down through asphalt when roller was run over it.

METALLURGY

ALUMINUM

ALLOYS. Aluminum and Its Light Alloys—IV, Paul D. Merica. Metal Rec & Electroplater, vol. 4, no. 11, Dec. 1918, pp. 384-386, Importances of these light-weight metals for motor and aircraft construction; metallography of commercial aluminum; chemical and physical properties at high and low temperatures; tensile properties of zinc-aluminum alloys. (To be continued.)

ANALYSIS. The Analysis of Aluminum Alloys and Metallic Aluminum, J. J. Fox, E. W. Skelton and F. R. Ennos, Jl. Soc. Chem. Indus., vol. 37, no. 24, Dec. 31, 1918, pp. 328T-333T. Methods writers have found suitable for general-work. Reagents used are a 10 per cent. solution of pure sodium hydroxide, and nitro-sulphuric acid made by mixing 300 cc concentrated sulphuric acid with 300 cc of water: cooling and adding 200 cc of pure nitric acid.
Analysis of hard Aluminum Alloys (Analyse des alliages durs d'aluminum) A. Travers, Chimie & Industrie, vol. 1, no. 7, Dec. 1, 1918, pp. 708-711. Methods in use at Creusot Works for quantitative analysis of zinc, aluminum. magnesium and copper in light alloys.

DUST, INFLAMMABILITY. The Inflammability of Aluminum Dust, Alan Leighton, Department of Interior, Bur. of Mines, Tech. Paper 152, 15 pp. Review of available literature; experimental work; properties affecting explosibility precautions to be observed.

METALLOGRAPHY. The Metallography of Aluminum, Robert J. Anderson, Jl. Franklin Inst., vol. 187, no. 1, Jan. 1919, pp. 147, 65 figs. Discussion of amorphous theory and plastic deformation; observations on grain-growth phenomena; micrographs of various forms of aluminum, cast, worked, and annealed; annealing and recrystallization of aluminum which has undergone plastic deformation; experimental investigation of exaggerated grain growth in aluminum; process of polishing and etching aluminum microsections preparatory to microscopic examination.

BLAST FURNACES

CAR DUMPER. Movable Car Dumper with Rotary Cradle, A. F. Case. Blast Furnace vol. 7, no.1, Jan. 1919, pp. 60-61, 2 figs. Machine located near storage yard for handling ore and limestone at blast-furnace plant. Said to be capable of unloading 30 to 35 cars an hour.

GAS OPERATION. Blast Furnace Plant Blows in First Stack, Blast Furnace, vol 7, no. 1, Jan. 1919, pp. 50-56, 6 figs. Installation of combined blast-furnace gas and chain grate stokers firing on heavy mill loads. Gas cleaning design to keep both stoves and washer clean and in operation throughout entire blast.

POTASH. Potash Content of Blast Furnace Charges, N. H. Gellert. Iron Age, vol. 103, no. 6, Feb. 6, 1919, pp. 355-356. Alabama iron ores and foreign manganese ores contain the most; potash in the burden of American furnaces.

SLAG. Widening Demand for Blast Furnace Slag, Clarence E. Wright. Iron Age, vol. 103, no. 4, Jan. 23, 1919, pp.241-243, 5 figs. Uses to which it has been put; a possible $20,000,000 income to industry.

THICKENER. Dorr Thickener in Blast-Furnace Field. Iron Age, vol. 103, no. 2, Jan. 9. 1919, pp. 112-115, 3 figs. Used in clarification of washer discharge water, it eleminates troublesome problems and yields valuable product; simplicity of operation.

COPPER

BORON DEOXIDIZER. The Boronic Deoxiding of Copper, James Scott, Foundry Trade Jl., vol. 20, no. 203, Nov. 1918, pp. 598-599, 3 figs. Experimental research of proceedure followed by boronic compounds when acting on copper and its alloys.

BRONZE HEAT TREATMENT. Effect of Heat Treatment on Bronze, F. F. Hausen and O. A. Knight. Iron Age, vol. 103, no. 6, Feb. 6, 1919, pp. 347-349, 12 figs. Characteristics disclosed by Brinell hardness tests and photomicropraghs; quenching and drawing give greater hardness than quenching alone.

BRONZE INCLUSIONS. Nonmetallic inclusions in Bronze and Brass, C. F. Comstock, Foundry, vol. 47, no. 318, Feb. 1919, pp. 79-83, 21 figs. From a paper presented at the October meeting of the Institute of Metals Division of the Am. Inst. of Min. Engrs.

HEAP-LEACHING. Metallurgy of Copper, Arthur L. Walker. Eng. & Min. Jl., vol. 107, no. 2, Jan. 11, 1919, pp. 90-92. Heap-leaching experiments being conducted in south-western copper centers; Anaconda fume-dust collector.

FLOTATION

FLOTATION MACHINES. The Flotation Process, A. W. Allen. Eng. & Min. Jl., vol. 107, no. 2, Jan. 11, 1919, pp. 97-100. New flotation machines; progress in selective flotation; development of Galena flotation: separate treatment of colloids.

IRON AND STEEL

CASE-HARDENING. Ancient and Modern Carbonizing Methods. Theodore G. Selleck, Am. Drop Forger, vol. 5, no. 1, Jan. 1919, pp. 7-12, 4 figs. Discusses use of compounds for case-hardening and describes improved methods. Uniform results secured by pre-heating.

CHROME STEEL. Physical Qualities of High Chrome Steel, L. R. Seidell and G. J. Horvitz. Iron Age,vol. 103, no. 5. Jan. 30, 1919, pp. 291-294, 4 figs. Relation between hardness and double carbides in solution; critical temperatures; maximum tensile strength and ductility.

DENSITY. Specific Density of Steel, H. E. Roerr. Irom Age, vol. 103, no. 3, Jan. 16, 1919. p. 184, 1 fig. Extent to which forging compresses or consolidated metal. From paper for Feb. meeting of Am. Inst. of Min. Engrs. New York.

FURNACES. Pulverized Coal for Metallurgical Furnaces. Charles E. Longenecker. Iron Age, vol. 103, no. 6, Feb. 6. 1919, pp. 351-352, 1 fig. Greater efficiency claimed for furnaces of correct design; continuous service more certain; average combustion figures for different furnace types.

GERMANY. The Future of the German Iron Industry. H. Müngesheimer. Cassier's Eng. Monthly, vol. 54, no. 6, Dec. 1918, pp. 340-341. Opinion of General Director of Gelsenkirchen Steel and Iron Works.

HEAT TREATMENT AND GRAIN SIZE. Grain Limits in Heat Treated Alloy Steels R. S. Archer. Iron Age, vol. 103, no. 6, Feb. 1919, pp. 266-367, 12 figs. New etching process which defines the crystals, boundaries and assists in detecting fiaulty heat treatment. From a paper to be presented at the February meetng of the American Institute of Mining Engineers, New York.

HIGH-SPEED STEEL. Durability of High Speed Steels, R. Poliakoff. Iron Age, vol. 103, no. 5, Jan. 30, 1919, pp. 295-296, 2 figs. Russian cutting tests with nine brands; chemical composition and requirements; results compared with Taylor's conclusions.

HOT DEFORMATION ON STEEL. Influence of Hot Deformation on Steel. George Charpy. Am. Drop Forger vol. 4, no. 12, Dec. 1918, pp.482-488, 3 figs. Technical discussion on effect of rolling and forging on structure of steel; data concerning changes on exterior and interior of forgings. From paper presented before Iron & Steel Institute.

LITERATURE FOR 1918. Review of Iron and Steel Literature for 1918, E. H. McClelland Blast Furnace, vol. 7, no. 1, Jan. 1919, pp. 73-75. Classified list of important books, serials and trade publictions.

MOLYBDENUM STEEL. Molybdenum Steel Versus Gun Erosion. Masatosi Okôchi, Massaichi Majima and Naoshi Sato. Jl. College of Eng., Tokyo Imperial Univ., vol 9, no. 5, Oct. 15, 1918, pp. 153-195, 50 figs. Experimental determination of modulus elasticity, modulus of rigidity, Brinell hardness number thermal dilatation, thermal conductivity and magnetization at high temperatures of specimens of gun steel, nickel steel, nickel-molybdenum steel and tungsten steel.

PHOSPHORUS. Effect of Phosphorous in Soft Acid and Basic Open Hearth Steels, J. S. Unger. Proc. Steel Treating Research Soc., vol. 2, no. 1, 1919, pp. 11-23, 11 figs. None of the steels used in the experiments showed the brittleness under cold working, due to phosphorus. Results of various mechanical tests, cold bending of rivets under hammer, upsetting in making large-headed nails or rivets, or fabrication on barrels, automobile parts, and cream separator bowls, indicated increase of hardness with increase of phosphorus.
Phosphorus in Malleable Cast Iron. J. H. Teng. Iron & Steel Can. vol..1 no. 11, Dec. 1918. pp, 445-453, 7 figs. Effects of proportions of phosphorus varying from 0.05 to 0.5 per cent. on mechanical properties of malleable cast iron. Writer concludes that ill effects become marked at 0.2 per cent. Paper presented before Iron & Steel Inst., Sept. 1918.

ROLLING AND GRAIN SIZE. The Grain size in Steel as Influenced by Rolling. W. G. Dauncey. Monthly Bul. Can. Min. Inst., no. 82, Feb. 1919, pp. 164-166, 4 figs. Photomicrographs of portion of rolled basic steel bar.

STEEL FAILURE. The Cause and Mechanism of Steel Failures. Z. W. Zimmerschied. Proc. Steel Treating Research Soc., vol. 2, no. 1, 1919, pp. 24-25 and 28-29. Analysis of Reasons for usual failures of automobile parts.

STEEL INDUSTRY IN 1918.. General Review of Steel Industry in 1918. B. E. V. Luty. Blast Furnace, vol. 7, no. 1, Jan. 1919, pp. 62-65. Quantity and character of output; alignment of belligerents; labor and wages; necessity of labor saving machinery.

TESTS. Tension, Impact and Repeated Impact Test of Mild and Hard Steels, Tsuruzo Matsumura. Memoirs College of Eng., Kyoto Imperial Univ., vol 2, no. 2, July 1918, pp. 63.69, 16 figs. Experiments on six flat bars varying in percentage of carbon from 0.102 to 0.65, to detect cause of unexplained fractures.

OCCLUDED GASES

REACTIONS. Notes on the Occlusion of Gases in Metals. Alfred W. Porter. Chem. Engr., vol. 26, no. 13, Dec. 1918, pp. 499-500, 1 fig. Phases of reactions between gases and metals as determined by various experimenters.

ALLOYS, FERROUS

PRODUCTION. Ferroalloys Production Stimulated Iron Trade Rev., vol. 64, no. 1, Jan. 2, 1919, pp. 118-120. Imports and domestic production of manganese alloys; imports of manganese ore; stimulation in production of spiegeleisen.

1918. Ferro-Alloys in 1918, Robert J. Anderson. Eng. & Minl Jl. vol 107, no. 2, Jan. 11, 1919. pp. 83-86. Technical advances in metallurgical processes.

NON-FERROUS ALLOYS

STELLITE. Stellite—Its Manufacture and Uses. Can. Mfr., vol. 39, no. 1. Jan. 1919, pp. 77-78, 2 fig. How it is manufactured at Deloro, Ont.

WELDING. Behaviour of Non-Ferrous Metals Under Oxy-Acetylene Torch—11, J. F. Springer. Metal Rec. & Electroplater, vol. 4, no. 11, Dec. 1918, pp. 381-383. How copper alloys are welded; process when working with magnesium nickel, silver, gold, lead, tin and zinc.

ZINC ALLOYS. Zinc Alloys instead of Copper Alloys. Iron Age, vol. 103, no. 3, Jan. 16, 1919, p. 175. French experiments on certain combinations of zinc, aluminum and copper as cast, rolled or drawn under a press.

AERONAUTICS

AEROPLANE PARTS.

STARTERS. The Bijur Airplane Engie Starter. Aviation, vol. 6, no. 1, Feb. 1, 1919, pp. 33-34, 3 figs. Characteristics of starter designed with minimum weight and low current consumption combined with maximum of cranking power to break a stiff engine. It is used particularly on seasplanes.

Bijur Starters for Seaplanes and Blimps. Automotive Industries, vol. 40, no. 2, Jan. 9, 1919, p. 51, 3 figs. Fitted to Liberty Engines at propeller end iand crank engine through double-reduction gear with Bijur automatic screw shift.

AEROSTATICS

AIRSHIP POSSIBILITIES. The Case for the Airship, W. Lockwood Marsh. Aviation vol. 5, no. 11, Jan. 1, 1919. pp. 697-699. Salient features and adaptability of lighter-than-air and of heavier-than-air craft.

Future of the Helium Airship, Ladislas d'Orcy. Aviation, vol. 5, no. 11, Jan. 1, 1919. pp. 695-697, 2 figs. How helium was produced; military aspects of discovery.

AIRCRAFT PRODUCTION

NAVAL AIRCRAFT FACTORY. The Naval Aircraft Factory. Aviation, vol. 6, no. 1, Feb. 1, 1919, pp. 28-30, 7 figs. Site, dimensions and internal organization; naval flying boats.

The Naval Aircraft Factory. Mech. Eng., vol. 41. no. 2, Feb. 1919, pp. 142-146, 14 figs. Organization of staff and working force; employment of women; operation of the various departments; features of standardized seaplane manufacture at the plant.

APPLICATIONS

AMERICAN VIEW. The Opportunity of Aviation. William B. Stout. Jl. Soc. Automotive Engrs., vol. 4, no. 1, Jan. 1919, pp. 39-41 and (discussion) pp. 41-42. Difficulties to be overcome; engine development in the war; problem of landing; cost of production.

BRITISH VIEW. Lord Weir on the Future of Flying. Flight, vol. 11, no. 1, Jan. 2, 1919, pp. 16017. Measures upon which development of operational side of air transport depends and part the State is to play in this development.

COMMERCIAL AERONAUTICS. Problems of Commercial Aeronautics, G. Lepere. Aviation, vol. 5, no. 11, Jan. 1, 1919, p. 694. Commercial uses of existing military planes; present possibilities of design.

Commercial Transport by Airplane. Aviation, vol. 6, no. 1, Feb. 1, 1919, pp. 31-32; Aeronautics, vol. 15, nos. 270 and 271, Dec. 18 and 25, 1918, pp. 577-592 and 603-638; Flight, vol. 10, nos. 50, 51, 52 and vol. 11, no. 1, Dec. 12, 19, 25, 1918 and Jan. 2, 1919, pp. 1413-1418,, 1443-1445, 1465-1470, and 22-27. Report of special committee on law and policy; interim report of special committee on technical and practical questions of aerial transport; memorandum on experimental air service; business questions relating to aircraft industry and aerial services; labor; research and export education.

DYNAMICS

AEROFOIL SECTIONS. Selecting Aerofoil Sections for Speed Range, V. E. Clark, Aviation, vol. 6, no. 1, Feb. 1, 1919, pp. 20-22, 2 figs. Charts for selecting approximately best aerofoil section for speed range and to estimate speed performance to be expected in a given airplane.

CALCULATION OF PERFORMANCE. Performance of Aeroplanes, W. L. Cowley. Flight, vol. 11, no. 1, Jan. 2, 1919, pp. 13-15, 7 figs. Mathematical relations between horse power, rate of climb and turning circle; conditions under which circular flight may be extended with greatest rapidity.

FLATTENING-OUT OF AEROPLANES. Flattening out of Aeroplanes after Steep Glides Genjiro Hamabe. Memoirs College of Eng., Kyoto Imperial Univ., vol. 2, no. 1, June 1819, pp. 7-52, 8 figs. Derivation of general equations of rigid dynamics with center of gravity of aeroplane as origin; discussion of symmetric motion of aeroplane; problem of recovery from a steep dive a thigh speed treated by method of approximate calculations to various cases of sharp flattening-out of a military Curtiss JN2 tractor.

PLANES

CHRISTMAS. The Christmas Strutless Biplane. Aerial Age, vol. 8, no. 19, Jan. 20, 1919, pp. 948-949, 8 figs. Struts, cables and wires are entirely eliminated in machine reported to make 170 miles an hour with a 6-cylinder Liberty motor.

GERMAN PLANES. The Trend of German Aeroplane Design. Engineer vol. 127, no. 3289, Jan. 10, 1919, pp. 25-26. From a report issued by the Airplane Production (Technical) Department of the Ministry of Munitions.

HALBERSTADT. Report on the Halberstadt Two-Seater Type, C. L. IV. Aeronautics, vol. 15, no. 269, Dec. 11, 1918, pp. 550-552, 12 pfigs. Flight, vol. 10, no. 50, Dec. 12, 1918, pp. 1404-1407, 12 figs. Aeronautics: Biplane equipped with 180-hp. Mercedes engine;, carries one fixed and one movable gun. Flight: Similar to C. L. 11. type: Issued by Technical Department, Aircraft Productions, Ministry of Munitions.

LOENING. The Loening Two-Seater Fighting Monoplane. Aviation, vol. 5, no. 11, Jan. 1, 1919, p. 689. 1 fig. Brief description of simplified type of fighting airplane designed to facilitate production.

L. V. G. The L. V. G. Two-Seater Biplanes. Engineer, vol. 126, nos. 3284 and 3286, Dec. 6 and 20, 1918, pp. 483-486 and 525-527, 26 figs, and 17 figs,: Flight, vol. 10, nos. 51 and 52, Dec. 19 and 26, 1918, pp. 1426-1431 and 1457-1461, 20 figs; Aero- nautics, vol. 15, no. 267, Nov. 27, 1918, pp. 496-503, 48 figs, Engineer Dec. 6, Description and illustrations of details of construction; Flight, Dec. 19; C. V. and C.VI, types; Dec. 26; Wing construction, struts, ailerons, undercarriage controls, engine mounting, oil system, accessories. Issued by Technical Department Aircraft Production Ministry of Munition; Aeronautics, Nov. 27, C. V. and V. I. types. Report of Technical Department of Air Ministry.

MARTIN. The Martin Twin-Engine Bomber. Donald W. Douglas. Aviation, vol. 5, no 11, Jan. 1, 1919, pp. 677-689, 9 figs, Machine built to fulfill requirements of night bomber, day bomber, long-distance photography, and gun machine.

PFALZ. Report on the Pfalz (Dxii) Single-Seater Fighter. Aeronautics, vol. 15, no. 269, Dec. 11, 1918, pp. 544-549, 19 figs. Biplane equipped with 180-hp. Mercedes engine; carries two Spandan fixed guns. By Technical Department, Aircraft Production, Ministry of Munitioons.

STANDARD C-1. The Standard C-1 Single-Seater. Aerial Age, vol. 8, no. 20, Jan. 27, 1919, pp. 985-987, 6 figs. Characteristics of Standard Aero Corporation biplane designed as secondary training machine.

ENGINES

Altitudes. Performance of Aeronautic Engines at High Altitudes, H. C. Dickinson, Aeronautics, vol. 15, no. 269, Dec. 11, 1918, pp. 542-543. 3 figs. Describes a laboratory building where it is contemplated to study engine performance in general, including carburetion, under conditions corresponding to highest altitudes reached by aviators.

AUSTRO-DAIMLER. Austro-Daimler, 200-Hp. Aircraft Engine, Automotive Industries, vol. 40, no.1, 2, and 3, Jan. 2, 9 and 16, 1919, pp. 21-24, 64-67 and 132 and 134-135, 18 figs. Jan. 2;Detailed report on design, construction and general performance of latest type; Jan. 9.: Details of crankcase construction, ignition, fuel and cooling systems, results of power and endurance tests, analysis of weights and materials of construction; Jan. 16, : metallurgical and mechanical test data, general data, analysis of weights. Issued by Technical Departmet Aircraft Production, Ministry of Munitions.

CARBURETION. Carbureting Conditions characteristic of Aircraft Engines. Jl. Soc. Automotive Engineers, vol. 4, no. 1, Jan. 1919, pp. 9-12, 9 figs. Tests to determine changes in engine performance with changes in atmospheric temperature and pressure at various levels above earth's surface, with special reference to variables affecting functioning of carbureter and changes in performance resulting variables in carbureter itself. From Bur. of Standards report no. 10 on aeronautic power plants.

CURTIS. The Curtis Model K. 12 Cylinder Airplane Engine. Aviation, vol. 5, no. 11. Jan. 1, 1919, pp. 685-689, 7 figs.. Principal features. Engine is of fixed cylinder type and consists of 12 cylinders in two groups of six each with included angle of 60 degrees.

DUSENBURG. The Dusenburg Model H 850-Hp. Motor, G. Douglas Wardrop. Aerial Age, vol. 8, no. 20, Jan. 27, 199,, pp. 991-995, 12 figs. General dimensions and particulars. Motor is of 16-cylinder V type with cylinders at an angle of 45 deg.; weight of power plant with gear drive is 1575 lb.

HISPANO-SUIZA. The Model H, 300-Hp. Hispano-Suiza Engine, Aviation, vol.. 6, no. 1, Feb. 1, 1919, pp. 23-25, 4 figs. Points in which Model H. differs from other Hispano-Suiza engines, and particularly with regard to lubrication.

LIBERTY ENGINE. Ignition on Liberty Engine. Motor Age, vol. 35, no. 2, Jan. 9, 1919, pp. 20-21 and 39., 10 figs. Wiring diagram; arrangement of three arms of circuit breaker; diagram of firing order. Generator-battery type; special Delco system is used.

MILLER. The Miller 125-Hp. Aircraft Engine. Aviation, vol. 6, no. 1, Feb. 1, 1919, pp. 30-31, 2 figs. Features and dimensions of this four-cylinder engine.

Radio-Cylinder. Fixed Radial Cylinder Engines, John W. W. Smith. Jl. Soc. Automotive Engnrs., vol. 4, no. 1, Jan. 1919, pp. 24-26, 5 figs. Weight of power plant; reliability, durability, and balancing; fuel and oil consumption; streamline mounting; cooling. Radial engine is considered as having more advantages than V. type.

Specification of Engines. Complete Technical Specifications of Important American and Foreign Airplane Engines. Automotive Industries, vol. 40, no. 3, Jan. 16, 1919, Supplement, chart between pp. 134-135. Details of 37 different types as compiled by Technical Section. Division of Military Aeronautics.

MATERIALS OF CONSTRUCTION

Plywood. Plywood in Aeroplane Construction, Henry Harrison Suplee. Aerial Age, vol. 8, no. 19, Jan. 20, 1919, pp. 945-947, and 961, 7 figs. Design and construction of Plywood monocoque fuselages, plywood wing ribs and fuselage taps.

MECHANICS

Stress Determination. Stress Optical Experiments. A. R. Low. Flight, vol. 10, nos. 50 and 51, Dec. 12 and 19, 1918, pp. 1409-1410 and 1435-1439, 20 figs. Dec. 12: Examples of optical observations. Dec. 19: Deflection curves for top spar calculated and observed for total loads of 10, 20, 30, 35 and 40 lb.; principle of dynamical similarity applied to deformahle elastic structures. (Concluded.)

Struts. Design of Aeroplane Struts, W. H. Barling and H. A. Webb. Aeronautics, vol. 15, nos. 268 and 269, Dec. 4 and 11, 1918, pp. 521-525, and 538-541, 9 figs. Dec. 4:Analytical determination of shape which will cause strut, when endload rises and it deflects, to be subjected to the same maximum stress at every section; Dec. 11: Mathematical theory and formalæ, numerical examples, crinkling stress of steel tubes. Paper read before Roy. Aeronautical Soc.

An Approximate Graphical Treatmet of Some Strut Problems, John Case. Engineering, vol. 106, no. 2764, Dec. 20, 1918, pp. 669-670, 7 figs. Mathematical article discussing crippling load of a pin-jointed strut of varying section; deflection of a strut subjected to lateral load and terminal couples continuous beams with end load; proofs of formalæ.

Wing Structure Calculation. Incidence Wires in the Strength Calculations of Wing Structures, John Case. Aeronautics, vol. 15, nos. 268, 270 and 271, Dec. 4, 18 and 25, 1918, pp. 516-517, 566-570 and 602-607, 25 figs. Dec. 4, Ordinary processes of statics and principle of least work, as methods of computing thrust in members of frame. Physical aspect of difference between the two methods; Dec. 18: Formalæ for estimating loads in spars, struts, etc., and numerical examples of the methods of using these formalæ; Dec. 25: derivation of formulæ.

MILITARY AIRCRAFT

British Planes. British Airplanes and Seaplanes. Automotive Industries, vol. 40, no. 3, Jan. 16, 1919, pp. 142-143. Principal types of engines and planes in use in the Royal Naval Air Service and in the Army.

U. S. Le Pere. The Le Père Fighter. Aerial Age, vol.. 8 , no. 18, Jan. 13, 1919, pp. 904-905. 5 figs. General dimensions, weights and performances of reconnaissance plane fitted with 400-hp. Liberty engine.

U. S. Planes. Record of Performance of American Planes. Automotive Industries, vol. 40, no. 3, Jan. 16, 1919, p. 103. Table illustrating types and principal features of airplanes built by U. S. Government since June 1917.

MODELS

Model Construction. Model Aeroplane Building as a Step to Aeronautical Engineering. Aerial Age, vol. 8, nos. 18, 19 and 20, Jan. 13, 20 and 27, 1919, pp. 913, 957 and 1001, 11 figs. Jan. 13: Details of wimgs; Jan. 20: Making tail surfaces, fin and rudder; Jan. 27: Details of stabilizer, elevators, fin and rudder for Ford motored airplane.

Model Aeroplanes.—XIX, F. J. Camm, Aeronautics, vol. 15, no. 268, Dec. 4, 1918, p. 529, 6 figs. Notes on driving mechanism.

PROPELLERS

Charts. Nomographic Charts for the Aerial Propeller, S. E. Slocum. Aerial Age, vol. 8, no. 20, Jan. 27, 1919, pp. 988-990, 4 figs. Power, thrust, torque and efficiency charts representing formulæ derived from experimental data. Formulæ were discussed in Aerial Age Aug. 26 and Nov. 18, 1918.

Alcohol. A New Opening for the Electrometallurgical Industry. The manufacture of Alcohol from Calcium Carbide (Un nouveau débouché pour l'industrie électro-métallurgique. La fabrication de l'alcool (en partant du carbure). Revue Générale de l'Electricité vol. 4, no. 24, Dec. 14. 1819, p. 934. A current of acetelyne is passed over dilute solution of sulphuric acid having mercury salts as catalyser; resulting acetaldehyde is boiled and vapor passed over layer of finely powdered nickel. From Chemische Technische Wochenschrift, vol. 23, p. 55.

Ammonia. Commercial "Concentrated Ammonia-Liquor" and Its Impurities, H. G. Colman and E. W. Leoman, Jl. Soc. Chem. Indus., vol. 37, no. 24, Dec. 31, 1918, pp. 319T-323T and (discussion) 323T-324T. Analyses of samples from different plants.

Barium. Future of the Barium Industry—A Protective Tariff Required, Hugh Rollin. Mfrs. Rec. vol. 75, no.3, Jan. 16, 1919, p. 97. Importance of Industry and its present undeveloped stage in U. S. Paper before Am. Inst. Chem. Engrs.

Benzols. Analysis of Commercial "Pure" Benzols, F. Butler Jones. Jl. Soc. Chem. Indus., vol. 37, no. 24, Dec. 31, 1918, pp. 324T-327T, 2 figs. Experimental determination of depression of freezing point of benzene occasioned by presence of carbon bisulphide, thiophen toluene and paraffin. A graph gives volumn percentages of four solutes in terms of observed temperatures and specific gravity.

By-Products. Relation of By-Produxts to Chemical Industries, W. H. Blauvelt. Gas Age, vol. 43, no. 1, Jan. 1919, pp. 19-21, 2 figs. Industries built up by Semet-Solvay Co. to utilize by-product chemicals.

Carbide. Practical Points on Carbide Sizes. Jl. Acetylene Welding, vol. 2, no. 7, Jan. 1919, pp. 330 and 354. Methods of classification according to sizes; relative value of different sizes of carbide. From Bulletin de Journal Suisse d'Acétylene.

Coal-Gas Products. Some Observations concerning (a) Liquid Purification of, and (b) the Simultaneous Recvoery of Sulphur and Ammonia from Coal Gas, P. Parrish. Gas Jl., vol. 144, no. 2897, Nov. 19, 1918, pp. 413-418, and (discussion) pp. 418-420, 4 figs. Brief historical account; theoritical phases of processes; design and arrangement of plants; details of Trepex washer; principles governing dissociation; treatment of waste gases. Paper before Southern District Assn. Gas Engrs, & Mgrs.

Coal-Tar Industry Products, British. Progress in the British Coal Tar Industry J. B. C. Kershaw. Gas Age, vol. 43, no. 2, Jan. 15, 1919, pp. 77-79, 2 figs. English practice in tar distillation and treatment of light oil fraction with dilute caustic soda; brief note on American methods of working up.

Coloring and Lacquering. Approved Practice in Coloring and Lacquering, James Sleetman. Brass World, vol. 14, no. 11, Nov. 1918, pp. 315-317, 6 figs. (Fourth and concluding article.)

Dust Recovery. Dust Recovery from Gas Scrubber Water. Blast Furnace, vol. 7, no. 1, Jan. 1919, p. 48, 1 fig. Dorr thickener installed in blast-furnace plant to provide automatically for settling of dust from gas scrubbers.

Enamels. The Control of the Luster of Enamels, Homer F. Staley. Jl. Am. Ceramic Soc., vol. 1, no. 9, Sept. 1918, pp. 640-647. Effect of crystallization, viscosity, concentrations, sulphur compounds and index of refraction on brilliancy of enamels. Suggestions given are based on considerations regarding chemical and physical phenomena taking place in manufacturing processes.

France. Recent Progress and Future Possibilities of the Chemical Industry in France (Les progrès récentes et l'avenir des industries chimiques en France). Paul Razous. Génie Civil, vol. 73, no. 22, Nov. 30, 1918, pp. 429-433. Pharmaceutical products; petroleum distillation; conditions of growth for industry. (Concluded).

Gas Manufacture. New Signaling Pyrometer, a Means of Contending Against Effects of Inferior Labor. Am. Gas Eng. Jl. vol. 110, no. 2, Jan. 11, 1919, pp. 36-37, 2 figs. Lights inform attendant when damaging variation is approached.

The Utilization of Waste Heat in Gas Works (Die Gewinnung und Verwertung der Abwaerme im Gaswerksbetriebe). A technical and economic study by Director Wenger, Journal fuer Gasbeleuchtung, vol. 61, no. 43, Oct. 26, 1918, pp. 509-513, 3 figs. Continued from p, 501. Concluded Nov. 2. Description of experiments made to secure a higher yield of coke from coal. Waste heat used for heating water of municipal bathouse.

Annual Report of Technical Inspection of Swiss Gas Works (Geschaeftsbericht des Technischen Inspektorates schweizerischer Gaswerke). Journal fuer Gasbeleuchtung, vol. 61 no. 43, Oct. 26, 1918, pp. 505-509, 2 figs. Covers 94 of the 96 gas works in Switzerland and describes equipment used, economies introduced to offset partly the excessively high cost of fuel, accidents, extraction of tar; safety rules and suggestions for further improvements.

Use of the Interferometer in Gas Analysis. Frank M. Seibert and Walter C. Harpster. Water & Gas Rev., vol. 29, no. 7, Jan. 1919, pp. 13-14, 1 fig. Sketch of Laboratory instrument; manner of conducting test. From tech. paper 185, Bur. of Mines.

Carbonization of Wood in Stockholm. Gas Age, vol. 43, no. 2, Jan. 15, 1919, pp. 74-76, 3 figs. Swedish experience in substitution of wood for coal. From Journal für Gasbeleuchung.

Inclined Chamber Ovens at Auburn Junction. Gas Age, vol. 43, no. 2, Jan. 15, 1919, pp. 80-83, 2 figs. Installation comprises two benches of three ovens, each 19 ft. 6 in. long; operation details and results.

Glass, Optical. The Presence of Iron in the Furnace Atmosphere as a Source of Color in the Manufacture of Optical Glasses, Edward W. Washburn. Jl. Am. Seramic Soc., vol. 1, no. 9, Sept. 1918, pp. 637-639. Results of experiments. Writer recommends that interior of furnaces for manufacture of optical glass be lined with course of kaolin bricks, and that in their construction all materials which will give up iron to atmosphere of furnace be excluded.

Glass Pots. Observations on Apparent Causes of Failure of Lead Glass Pots, A. F. Gorton. Jl. Am. Ceramic Soc., vol. 1, no. 9, Sept. 1918, pp. 648-659. Examination of remains of pots leads writer to conclude that cracking and corrosion are chief causes of failure. Cracks attributed principally to insufficient preheating and corrosion to slagging action of iron on clay.

Helium. The Production of Helium from Natural Gas, Frederick G. Cottrell. Mech. Eng. vol. 41, no. 2, Feb. 1919, pp. 155-158 and 188, 6 figs. Reviews recent work in liquefaction and separation of gases and production of helium for use of balloons.

Lime. Reconstruction and Peace Time Problems of Lime Industry, Charles Warner. Concrete, Cement Mill Section, vol. 14, no. 1, Jan. 1919, pp. 7-9. Address by representative of War Service Committee on Lime at Peace Preparedness Congress.

Mustard Gas. Some Physical Constants of Mustard Gas, Leason H. Adams and Erskine D. Williamson. Jl. Wash. Acad. Sci., vol. 9, no. 2, Jan. 19, 1919, pp. 30-35, 2 figs. Measurements of compressiblity and determinations of freezing pressure and resultant change of volumn at various temperatures. Compressibility was determined by method and apparatus described in Jl. Amer. Chem. Soc., vol. 41, Jan. 1919.

NITROGEN PRODUCTS. Nitrogen Industry in Germany during the War (L'industrie de l'azote en Allemagne pendant la guerre). Revue Générale de l'Electricité, vol. 5, no. 2, Jan. 11, 1919, pp. 75-76. Details of partial application of Birkeland-Eyde process and more extensive application of Ostwald process.

Industrial Electrochemical Manufacture of Nitrogenous Compounds: Nitric Acid and its Derivations, Cyanamide, Nitrides (La production électrochimique industrielle des composés nitrés: acide nitriques et derivés, cyanamide, azotures), Jean Escard. Revue Générale de l'Electricité, vol. 4, no. 25, Dec. 21, 1918, pp. 959-972, 20 figs. Scheme of installation for manufacturing nitric acid and nitrates from the air. Following furnaces and processes for producing synthetic nitric acid are described: Birkeland-Eyde, Schonherr, Pauling, Moscicki, Kilburn-Scott and Helbig.

Fixation of Nitrogen. Jl. Soc. Automotive Engrs., vol. 4, no. 1, Jan. 1919, pp. 16-17. Electric-arc process; building of concrete dam 100 ft. high and 1 mile long at Muscle Shoals to deliver 500,000 hp. for nitrogen fixation work; cyanamid and Haber processes.

Industrial Electrochemical Production of Nitrogenous Compounds: Nitric Acid and Derivatives, Cyanamide and Nitrides (La production électrochimique industrielle des composés nitrés; acide nitrique et derivés, cyanamide, azotures), Jean Escard. Revue Générale de l'Electricité, vol. 4, no. 26, Dec. 28..1918, pp. 1008-1012. Manufacture of cyanamide by reaction of nitrogen on calcium carbide; fixation of nitrogen in boron, magnesium and calcium nitrides; preparation and properties of these compounds.

Note on the Bucher Cyanide Process for the Fixation of Nitrogen, Eugen Posnjak and H. E. Merwin. Jl. Wash. Acad. Sci., vol. 9, no. 2, Jan. 19, 1919, pp. 28-30. Experiments with warying amounts of sodium carbonate, carbon and iron; object to determine hether sodium cyanide was formed by Bucher's reaction.

POTASH. Various Methods of Obtaining Potash. Commercial Fertilizer, vol. 17, no. 6, Jan. 1919, pp. 42-46. Developments since 1860.

RUBBER. Imitation Caoutchoucs or Vulcanized Oils. (Les caoutchousc factices on huiles vulcanisées), André Dubose Chimie & Industrie, vol., 1, no. 7, Dec. 1, 1918, pp. 727-732. Historical note of development.; processes of manufacture : classification.

MINING ENGINEERING

BASE MATERIALS

ROCK QUARRYING. Rock Quarrying for Cement Manufacturing. Oliver Bowles. Stone, vol. 40, no. 1, Jan. 1919, pp. 19-21, 2 figs. Efficiency and safety under modern conditions of operation. From Bureau of Mines bulletin.

COAL AND COKE

COAL OXIDATION AND IGNITION. The Oxidation and Ignition of Coal, Richard Vernon Wheeler, Jl. Chem. Soc. ,vols. 113 and 114, no. 674, Dec. 1918, pp. 945-955, 2 figs. Account of work carried out during past nine years by British Coal Dust Experiments Committee, Min. Assn. Great Britain. Hypothesis is advanced that reaction responsible for self-heating of coal is mainly attachment of oxygen to molecules of high carbon content. and subsidiary to this, interaction oxygen thus loosely held, by carbon-like molecules, and other atoms or those molecules, or other portions of coal conglomerate.

COAL PRODUCTION. Coal—Now and Next Year. C. E. Lesher. Coal Age, vol. 15, no. 3, Jan. 16, 1919, pp. 99-104, 4 figs. Statistics of production and consumption.

COKE-OVEN GAS. Washing Light Oil Fractions from Coke Oven Gas, F. D. Schreiber. Gas Age, vol. 43, no. 1, Jan.1, 1919, pp. 22-24, 1 fig. Suggestions from general foreman of benzol plant.

Coke Plant Producing Gas for Domestic Purposes. Gas Age, vol. 43, no. 1, Jan. 1, 1919, pp. 11-12, 3 figs. Example of by-product coking practice Plant consists of 65 Koppers cross-regenerative ovens (12½ tons) witth capacity of 1200 tons coal per day and is complete for recovery of gas, tar, ammonia, and benzols.

Coke-Oven Gas and the Demand for Cheap Fuel. Gas Age, vol. 43, no. 1, Jan. 1, 1919, pp. 16-17. Extent of coke production in ovens and in beehive ovens; importance of metering gas.

Chester Producer Fired by-Product Coke Ovens, J. D. Shattuck, Gas Age vol. 43, no. 1, Jan. 1, 1919, pp. 7-10, 6 figs. Operation of Philadelphia Gas & Elec. Co. plant for production of city gas and also for recovery of by-products.

COKE OVENS. Economic Considerations in Coke Oven Practice. W. Colquhoun. Colliery Guardian, vol. 116, no. 3020, Nov. 15, 1918, pp. 1022-1024. From paper before Midland Inst. of Civ. Min. and Mech. Engs. Nov. 1918. Also in Iron & Coal Trades Rev., vol. 97, no. 2647, Nov. 15, 1918, pp. 541-543.

Change in Beehive Coke Oven Construction Due to Mechanical Operation, George W. Harris. Coal Age, vol. 15, no. 2, Jan. 9, 1919, pp. 44-48, 12 figs. Details of coke ovens for mechanical operation.

A New Coke Oven Installation. Engineer, vol. 126, no. 3282, Nov. 22, 1918, pp. 430-432, 5 figs. Description of battery of thirty-seven 12 ton Semet-Solvay coke ovens witrh washer and by-product recovery plant at one of plants of Newton, Chambers & Co., Ltd.

Economic Considerations in Coke Oveu Practice, W. Colquhoun. Gas World (Coking Section), vol. 69, no. 1794, Dec. 7, 1918, pp. 19-20. Deficiencies in present application of heat necessary to distil coal; advantages of hot direct-recovery process. Paper before Midland Inst. Min. Engrs.

Republic By-Product Coke Plant at Youngstown. Gas Age, vol. 43, no. 1, Jan. 1, 1919, pp. 13-15, 5 figs. Brief description of by-product coke-oven installation of 143 Koppers ovens, producing gas and coke for use iu steel manufacture.

Plant of the Seaboard By-Product Coke Company, D. MacArthur. Gas Age, vol. 43, no. 1, Jan. 1, 1919, pp. 1-6, 9 figs. Oven installation consists of 165 Koppers ovens subdivided into three units. Daily capacity is 3000 tons of coal, yielding 3,200 tons coke, 16½ million cubic feet surplus gas of 610 B. t.u. quality, 75,000 lbs. ammonium sulphate, 24,000 gal. tar and 10,000 gal. ligt oil. (To be continued.)

Insulation for By-Product Coke Ovens, P. A. Boeck. Gas Age, vol. 43, no. 1, Jan. 1, 1919, pp. 24-26, 5 figs. How insulating bricks are placed in wall; heat gradient and saving due to heat insulation; advantages of insulation.

RAIL TRANSPORTATION. Railroad Readjustmeut Problems Confront Coal Operators, John Callahan. Coal Trade Jl., year 51, no. 3, Jan. 15, 1919, pp. 51-52, How mining is affected by transportation control as well as by maintenance or modifications of existing regulations.

ORE DRESSING

TUBE AND BALL MILLS. Notes on Ore Dressing, A. W. Allen, Eng. & Min. Jl. vol. 107, no. 2, Jan. 11, 1919, pp. 100-102. Efficiency of tube mills; progress in ball-milling practice.

GEOLOGY AND MINERALOGY

EARTH MOVEMENTS. Earth Movements. Jl. Chem. Metallurgical & Min. Soc. S. A. vol. 19, no. 1, Oct. 1918. pp. 63-66. Analysis of probable causes which operated in movement of ground at Great Boulder mine. From Jl. Chamber of Mines of W. Australia.

IGNEOUS DIFFERRENTIATION. A Type of Igneous Differentiation, Frank F. Grout. Jl. Geol., vol. 26, no. 7, Oct-Nov. 1918, pp. 626-658, 12 figs. Rocks of Duluth gabbro lopolith are found to fall into two series, one related to gabbro family, other more closely to granites.

MANGANESE DIOXIDE BANDING. Rythmic Banding of Manganese Dioxide in Rhyolite Tuff, W. A. Tarr. Jl. Geol. vol. 26, no. 7, Oct-Nov. 1918, pp. 610-617, 5 figs. Explains origin of eccentric structures of manganese dioxide found near Tucson, Ariz., by manganese dioxide being derived from mineral located at nucleus of structure and being precipitated in successive rings by rhythmic precipitation following mingling of outwardly moving manganese solution with one of oxidizing character.

NEW MINERALS. Review of New Mineral Species (Revue des espèces minérales nouvelles), P. Gaubert. Bulletin de la Societé Française de Minéralogie, vol. 41, nos. 4-5-6, Apr.-June 1918, pp. 117-130. Occurrences of crandallite leifite, griffithite, mullanite, tetarkaite, didymolite, augaralite, arseno-bismite, arseno-ferrite, heliodore, creedite, sulphated cancrinite, cebollite, pintadoite, uvanite, hogbomite, minasragrite, aurobismuthinite, stibiobismuthinite.

Review of New Mineral Species (Revue des espèces minérales nouvelles), P. Gaubert. Bulletin de la Société Française de Minéralogie, vol. 41, nos. 4-5-6, Apr.-June 1918, pp. 93-96. Occurrences of crestmoreite, riverdsideite, katoptrite, ektropite aud flokite.

RADIOLARIAN CHARTS. The Radiolarian Charts of the Franciscan Group, E. F. Davis, Uuiv. Cal. Publications, Bul Dept. Geol., vol.11, no. 3, Dec. 23, 1918. pp. 235-432, 30 figs. Results of investigation to determine their origin.

ROCK DIAGRAMS. A Form of Multiple Rock Diagrams, Frank F. Grout. Jl. Geol. vol. 26, uo. 7, Oct.-Nov. 1918, pp. 622-625, 3 figs. Modification of Adam's method. Individual rock diagrams are not plastered but clamped into position leaving them free for rearrangement as they are studied from various points of view.

TEAR FIGURES AND MINERALS. Tear Figures on certain Minerals, Mikio Kuhara. Memoirs College of Eng. Kyoto Imperial Univ. vol. 2. uos. 2 and 3, July and Nov. 1918, pp. 53-62 and 71-82. 45 figs. July: Characteristics on tear-figures on aragonite, alum and borax; Nov. Characteristics on tear-figures on minerals belonging to retragonal and triclinie systems, wulfenite and cupper-sulphate crystals were selected as representatives of these systems.

IRON

BELCHER ISLANDS' DEPOSITS. Iron Deposits on the Belcher Islands, Hudson Bay, E. S. Moore, Monthly Bulletin. Can. Min. Iust., no. 82, Feb. 1919, pp. 196-206, 4 figs. Topographic features and geology; photomicrographs of granules from iron field; results of snalysis of sample.

PRODUCTION. World's Division of Iron Analyzed, A. J. Haiu. ' Iron Trade Rev., vol. 64, no. 1, Jan. 2, 1919, pp. 28-32, 3 figs. Pig-iron aud steel production in United States, United Kingdom, France and Germany for years 1913-1918.

COPPER

KENNECOTT DISTRICT. Mining Copper at Kennecott, Alaska, Min. & Sci. Press, vol. 118, no. 2, Jan. 11, 1919, pp. 53-56, 3 figs. Mining possibilities in Kennecott district.

MINERAL DETERMINATION. Sulphur Dioxide Method for Determining Copper Minerals in Partly Oxidized Ores, Charles E. Van Barneveld and Edmuud S. Leaver (Department of Interior. Bur. of Mines, tech. paper 198, 14 pp., 1 fig. Sources of error in sulphuric acid method and ammonia method for selective determination of copper minerals; procedure iu sodium tartrate method; sulphur dioxide method; results of leaching chalcolite and chalcopyrite with 5 per cent. solution of different reagents; results with four methods compared.

UTAH. The Utah Copper Enterprise.—IX, T. A. Rickard. Min. & Sci. Press,vol. 117, no. 26, Dec. 28. 1918, pp. 853-860, 9 figs. Smelting of conc entrate at Garfield smelter of Am. Smelting & Refining Co.

LEAD

HYDROMETALLURGY. Innovations in the Metallurgy of Lead, Dorsey A. Lyon and Oliver C. Ralston. Department of Interior, Bur. of Mines, bul. 157, 1918. 176 pp., 13 figs. Application of new hydrometallurgical and other methods to following types: oxidized lead ores, oxidized lead ores containing precious metals, oxidized lead zinc ores, simple sulphide ores of lead, leady zinc concentrates, lead-iron sulphide middlings, and complex sulphides of lead, zinc, iron and copper, with or without precious metals. Results of experiments conducted by Salt Lake City station of Bur. of Mines in co-operation with department of metallurgical research.

SMELTING. Metallurgy of Lead, H. O. Hofman. Eng. & Min. Jl. vol 107, no. 2, Jan. 11, 1919, pp. 88-90. Lead smelting practice; modern silver lead smeltery.

MAJOR INDUSTRIAL MATERIALS

MANGANESE. Electric Smelting on the Pacific Coast. W. L. Morrison. Jl. Elec. vol. 42, no. 2. Jan. 15, 1919, pp. 67-68. States that while absence of cheap power precludes general development of electric furnace, nevertheless there is real opportunity in electric smelting of silicon manganese.

Metallurgical Investigations During 1918, Van H. Manning. Blast Furnace, vol. 7, no. 1, Jan. 1919, pp. 65-67. Production of ferro-manganese: smelting low-garde manganese ores in electric furnace; use of low-grade iron; problems studied by Bureau of Mines.

Manganese Deposits of East Tennessee—II, G. W. Stose and F. C. Schrader. Resources of Tennessee, vol. 8, no. 4, Oct. 1918, pp. 235-324, 14 figs. Report prepared under co-operative agreement between State Geol. Survey and U.S. Geol. Survey. Descriptions of mines based on examination of deposits by authors during three-month field trip. Each description includes location of deposit, extent of development of mine, brief account of plant, character and association of ore, and its geologic relations.

NICKEL. A Process for Electrolytically Refining Nickel, Geo. A. Guess. Gen. Meeting Am. Electrochem. Soc., Apr. 3-5, 1919, advance copy, paper 2, pp. 9-12. Impure nickel containing copper and iron is used as anode; both iron and copper go into solution, but copper is precipited by keeping powdered calcium carbonate suspended in electrolyte; cathode is enclosed in canvas bag; glue is used in solution.

ZINC. Metallurgy of Zinc, W. E. Ingalls. Eng. & Min. Jl., vol. 107, no. 2, Jan. 11, 1919, pp. 87-88. Roasting; distillation furnaces; distilling practice.

Foreign Zinc-Smelting Capacities and Prospects, W. R. Ingalls, Eng. & Min. Jl., vol. 107, no. 5, Feb. 1, 1919, pp. 227-228. Refers partieularly to England, Australia, Belgium and Silesia.

MINES AND MINING

CARS, MINE. Standardization of Mine Cars in Metal Mines, R. M. Raymond. Eng. & Min. Jl., vol. 107, no. 5, Feb. 1, 1919, pp. 220-224, 9 figs. Paper read at Seventh Annual Safety Congress Nat. Safety Council.

CEMENT GUN. Use of the Cement Gun in a Bituminous Coql Mine, M. S. Sloman. Mine and Quarry, vol. 11, no. 1, Nov. 1918, pp. 1002-1005, 2 figs. Results of United Coal Corporation said to prove that a cement coating properly applied will form permanent barrier to action of weathering on roofs susceptible to air slacking; gives cost figures.

DRILLING. The Technique of Diamond-Drilling, J. A. MacVicar. Min. Mag., vol. 20, no. 1, Jan. 1991, pp. 1825. Histoy and utility of the diamond-drill; patent specifications of Leschot diamond-drilling apparatus; operations followed in process of drilling; recent uses of diamond-drills in testing of foundations for dam sites. Paper read before Cornish Inst. Engrs.

Hammer Drills—Their History, Design, and Operation, Henry S. Potter. Jl. S. A. Instn. Engrs., vol. 17, no. 405, Nov.-Dec. 1918, pp. 68-80, 17 figs. Refers especially to popularly called Jack Hammer type. (To be concluded).

The Hand Hammer Drill, James P. Cotter. Monthly Bul. Can. Min. Inst. no. 82, Feb. 1919, pp. 207-211. Purpose in applying water and air to bottom of drill hole while drilling; uses of hammer drills in coal mines...

HYDRAULIC STOWING. Primary Considerations in Hydraulic Stowing, C. A. John Hendry. Colliery Guardian, vol. 116, no. 3016, Oct. 18, 1918, pp. 805-807, 14 figs. From paper before Geol. and Min. Soc. of India.

INSPECTION, IDAHO. Mining in Idaho in 1918, R. N. Bell. Eng. and Min. Jl. vol. 107, no. 5, Feb. 1, 1919, pp. 236-238. Account of State Inspection of mines.

LAWS. Collection of Laws Decrees, Resolutions and Other Acts Concerning Mines Quarries, Sources of Mineral Waters, Steam Apparatus and Railrod Exploitation (Recueil de lois, décrets, arrêtés et autres actes concernant les mines, les carrières, les sources d'eaux minerales, les appareils à vapeur et l'exploitation des chemins de fer). Annales des Mines, Partie Administrative, series 11, vol. 7. 1918, pp. 81-185. Documents of second quarter of 1918 issued by Ministry of Public Works, Frace.

PROSPECTING. Hydraulic Prospecting at the Rooiberg Tin Mines, E. R. Schoeh. Jl. S. A. Instn. Engnrs., vol. 17, no. 4-5, Nov.-Dec., 1918, pp. 61-67, 9 figs. Surface prospecting by means of hydraulic jets or monitors on level ground with artificially conserved return water.

UTAH. Mining in Utah in 1918, Edward R. Zalinski. Eng. & Min. Jl. vol. 107, no. 4, Jan. 25, 1919, pp. 178-183.

1918 BRITISH COLUMBIA. Mining in British Columbia in 1918, Robert Dunn. Eng. & Min. Jl. vol. 107, no. 2, Jan. 11, 1919, pp. 110-111.

1918 U. S. General Review of Mining in the United States in 1918. Eng. & Min. Jl., vol. 107, no. 2, Jan. 11, 1919, pp. 103-107.

MINOR INDUSTRIAL MINERALS

GRAPHITE. Alabama Graphite in 118, W. E. Prouty. Eng. & Min. Jl. vol. 107, no. 4, Jan. 25, 1919, pp. 194-195. Processes in milling; classification of washers; costs.

MONAZITE. Monazite as a Source of Incandescent Lighting, Material. Sydney J. Johnstone. Gas World, vol. 69, no. 1794, Dec. 7, 1918, pp. 350-351. Sources and history of mineral monazite from which are obtained the rare earths composing luminous portion of incandescent gas mantle. From Jl. So. Chem. Indus.

MOLYBDENUM. Molybdenum Within the Empire, Sydney J. Johnstone. Jl. Soc. Chem. Indus., vol. 37, no. 23, Dec. 16, 1918, pp. 448R-450R. Statistics of world production and particularly of progress in mines throughout the British Empire.

TUNGSTEN. The Tungsten Industry in 1918, Geo. J. Young. Eng. & Min. Jl. vol. 107, no. 2, Jan. 11, 1919, pp. 78-80. Difficulties of mining; inconvenience of not having standard specifications for buying tungsten ores; domestic and total world production figures.

Tungsten and the War, Julius L. F. Vogel. Min. Mag., vol. 20, no. 1, Jan. 1919, pp. 12-17, Qualities possessed by high speed tungsten steel; development of tungsten industry in Great Britain; manufacture of tungsten.

The Occurrence, Chemistry, Metallurgy and Uses of Tungsten, with Special Reference to the Black Hills of South Dakota, J. J. Runner and M.L. Hartman. South Dakota School of Mines, bul. 12. Departments of Geol. & Chem., Sept. 1918, pp. 1-159 and 257-252, 20 figs. Parts relating to deposits of Black Hills are the result of field work and laboratory research of authors.

A Bibliography of Tungsten Mines, Louis Hartman. South Dakota School of Mines, bul. 12, Departments of Geol. & Chem. Sept. 1918, pp. 160-255, and 262-264. Divided into following general sections: Early references; preparation of tungsten and its commercial compounds; properties; uses of metallic tungsten; compounds; analytical chemistry; mineralogy; geological occurrence in United States and foreign countries; mining and milling, miscellaneous references. Articles indexed have appeared in technieal periodicals

TUNGSTEN AND MOLYBDENUM. Manufacture of Tungsten and Molybdenum, Paul McJunkin. Am. Mach., vol. 50, no. 3, Jan. 16, 1919, pp. 99-100. How tungsten wire is made; coiling the spiral; properties; applications; use of tungsten disks in wireless apparatus; development of X-ray; tungsten wire data.

VANADIUM. Analysis of Vanadium in the Ferrovanadiums (Método de valoracion del vanadio en los ferrovanadios), Vincente Garcia Rodeja, Boletin des Minas, vol. 10, nos, 7-9, Sept. 30, 1918, pp. 122-128. Survey of methods in use; special reference to Slavig method by treatment with nitric and hydrochloric acids; fusion method of Pinerûa (agent in odium bioxide).

OIL AND GAS

CRUDE OIL PRODUCTION. Production of Crude at New High Level. Automotive Industries, vol 40, no. 3, Jan. 16, 1919, pp. 154-157, 2 figs. Exports of all mineral oil products except kerosene show steady increase for 21 years.

The Passing of Petroleum. Engineering, vol. 105, no. 2762, Dec. 6, 1918, pp. 633-635, 3 figs. Review of the present situation.

Petroleum. A Resource Interpretation, Chester C. Gilbert and Joseph E. Pogue. Jl. Soc. Automotive Engrs., vol. 4, no. 2, Feb. 1919, pp. 100-110, 4 figs. Traces waste in present exploitation of petroleum fields to lack of adjustment between economic circumstances affecting production, and the unique geological conditions under which petroleum occurs. It claims that the geological unit or reservoir, by nature indivisible, is arbitrarily subdivided into small parts for purposes of individualistic production.

GASOLINE. Making Gasoline from Gas. Motor Boating, vol. 23, no. 1, Jan. 1919, pp. 13-14, and 47, 2 figs. General arrangement of apparatus employed in process of recovering gasoline from casing-head gas.

Extraction of Gasoline from Natural Gas by Absorption Methods. George A. Burrell. P. M. Biddison and G. G. Oberfell. Water & Gas Rev., vol. 19, no. 7, Jan. 1919, pp. 25-26. Dry natural gas as source of gasoline; transportation of natural gas; effect of gasoline vapors on pipe-line coupling; development of absorption process; comparison of wet and dry natural gas. From bul. 120, Bur. of Mines.

Determining Gasoline in Natural Gas, W. P. Dykema and Roy C. Neal. Automotive Industries, vol. 40, no. 2, Jan. 9, 1919, pp. 57-59, 2 figs. Method evolved at Bartlesville Experiment Station Bureau of Mines.

Testing Gas for its Gasoline Content, W. P. Dykema and Roy C. Neal. Oil & Gas Jl. vol. 17, no. 32, Jan. 10, 1919, pp. 42 and 44, 2 figs. Absorption apparatus developed by Bureau of Mines experts.

MEXICO. Mexico as a Source of Petroleum and Its Products, R. de Golyer. Jl. Soc. Automotive Engrs., vol. 4, no. 2, Feb. 1919, pp. 74-76. Estimates of Reserves in Mexican oil fields; development since 1910; present conditions.

OIL RECOVERY. Production of Oil from Mineral Sources. F. Mollwo Perkin. Gas Jl. vol. 144, no. 2902, Dec. 24, 1918, pp. 658-660. When to use high or low temperature for carbonizing bituminous material. Paper read before Instn. Petroleum Technologists.

PETROLEUM INDUSTRY. Some General Observations on the Petroleum Industry, V. H. Manning. Jl. Soc. Automotive Engrs. vol. 4, no. 1, Jan. 1919, pp 35-38, 2 figs. Co-operation between Bur. of Mines and petroleum industry; possible technical research work; utilization of oil shales; foreign supply situation. From address by Director, Bur. of Mines, before Reconstruction Conference of Indus. War Service Committees.

SHALE. Commercial Possibilities of Oil Shale, Harry J. Wolf. Eng. & Min. Jl. vol. 107, no. 5, Feb. 1, 1919, pp. 217-219, 2 figs. Oil bearing shales in Colorado and Utah and their present development; methods of mining and milling, comparison with Scottish shale deposits.

WATER. SHUTTING OFF. Methods of Shutting Off Water in Oil and Gas Wells, F. B. Tough. Department of Interior, Bur. of Mines, bul. 163, 122,pp., 27 figs. Summarizes existing knowledge of methods and devices for protecting oil or gas sands from encroachment of water; California laws relating to protection of natural resources of petroleum and natural gas flow. Also in Water and Gas Rev., vol. 29, no. 7, Jan. 1919, pp. 28-29.

One of the Problems involved in excluding Water from Oil or Gas Works F. B. Tough. Water & Gas Rev., vol. 29, no. 7, Jan. 1919, pp. 28-29. Making watertight joint between string of casing and wall of hole at impervious stratum above productive sands and below water horizons; formulæ for collapsing pressures of modern lay-welded bessemer steel tubes.

PRECIOUS MINERALS

GOLD. The Value of Gold in the Economic System. Henry Strakosch. Min. & Sci. Press, vol. 117, no. 26, Dec. 28, 1918, pp. 861-863. Classifies gold mines and suggests means for stimulating production of gold.

Tee Gold Problem. Min. Mag. vol. 20. no. 1, Jan. 1919, pp. 28.31. Report of the British Government Committee, appointed to investigate problem of maintaining output of gold in face of increasing costs of mines

GOLD AND SILVER. Metallurgy of Gold and Silver, A. W. Allen. Eng. & Min. Jl., vol. 107, no. 2, Jan. 11, 1919, pp. 92-96. Amalgamation practice; reinstatement of charcoal as precipitant; South African metallurgical progress; gold extraction with colloidal carbon; refining gold bullion; sodium sulphide in cyaniding.

RARE MINERALS

Uncommon Ores and Metals, H. C. Meyer, Eng. & Min. Jl., vol. 107, no. 2, Jan. 11, 1919, pp. 124-125. Uses and demand of palladium, selenium, strontium ore, thorium ore, titanium, uranium and zirconium.

RADIUM. How Radium Bearing Ore Is Mined. Wallace T. Roberts. Min. & Sci. Press, vol. 118, no. 1, Jan. 4, 1919, p. 30, 3 figs.; Mine & Quarry, vol. 11, no. 1, Nov. 1918, pp. 1105-1110, 8 figs. Nov.: Prospecting carnotite areas in Colorado; Jan. 4; Methods of Prospecting followed by Colorado companies.

RADIUM. Its Properties and Occurrence in Nature—11, Richard B. Moore, Metal Rec. & Electroplater, vol. 4, no. 11, Dec. 1918, pp. 391-393. History of metal; location of principal ores and method of working each; present uses and future possibilities; mesothorium as substitute.

TIN

CONSERVATION. Symposium on the Conservation of Tin. Metal Rec. & Electroplater, vol. 4, no. 11, Dec. 1918, pp. 387-390 and 403. Methods by which tin cane be saved and its use reduced; tin alloys; bearing meals, soldiers, babbitts, bronzes and their substitutes.

VARIA

LAWS, MINING. Mining Law and Economics. Minerals, Mines and Quarries, David Bowen. Quarry, vol. 24, no. 263, Jan. 1919, pp. 5-7. Review of authoritative definitions of mineral, ore, mine and quarry with reference to English and continental European legal decisions establishing scope of signification.

MINERALS, INTERNATIONAL CONTROL. International Control of Minerals, C. K. Leith. Department of Interior, U. S. Geol. Survey, Mineral Resources of U. S., 1917—part 1, Dec. 31, 1918, pp. 7a-16a. Movement of minerals under pre-war conditions of international trade; possibility of post-war international control; specific plans of international control of minerals; position of U. S.; general conclusions from standpoint of U. S.

MINING EFFICIENCY. The Economic Limits to Domestic Independence in Minerals, George Otis Smith. Department of Interior, U. S. Geol. Survey, Min. Resources of U. S., 1917—part I, Dec. 28, 1918, pp. 1a-6a. Points out drawbacks in mining industries and that largest degree of national usefulness will be won from mineral resources only through highest efficiency secured by engineering advance and the linking up of mechanical power and man power.

PRODUCTION, U. S. FOR 40 YEARS. 40 Years of Domestic Metal Productioon. Automotive Industries, vol. 40, no. 3, Jan. 16, 1919, pp. 180-181, 2 figs. Steady increases shown throughout last 50 years; efforts being made to increase production.

CIVIL ENGINEERING

BRIDGES

AQUEDUCT. Aqueduct Crossing Under the Red River, for Winnepeg Water Supply, J. Armstrong, Contract Rec., vol. 33, no. 4, Jan. 22, 1919, pp. 63-67, 13 figs. Plans, cross section and details. Vertical shafts are 60 ft. deep, horizontal tunnel 1030 ft. long.

BASCULE BRIDGE. 138-Ft. Bascule Bridge at the Entrance of La Seyne Port, Toulon Roadstead (Pont basculant de 42 mètres de portée à l' entrée du port de la Seyne, rade de Toulon). Génic Civil, vol. 73, no. 23, Déc. 7, 1918, pp. 441-444, 25 figs. Detailed description of new French design in which span is raised to perfectly vertical position by atriculated system of levers.

COMBINATION GIRDER AND ARCH. An Unusual Bridge Design, Contract Rch., vol. 33, no. 4, Jan. 22, 1919, p. 74, 1 fig. Reinforced concrete structure which is combination of girder and arch design.

DESIGN. Finding the Most Advantageous Construction of a Bridge by Graphical Methods (Die wirtschaftlich guenstigste. Anordnung einer Brueckenanlage auf zeichnerzischem Wege), Prof. Robert Schoenhoefer, Braunschweig, Zeitschrift fuer Bauwesen, vol. 68, no. 10, to 12, 1918, pp. 502-515, 4 figs. Author refers to his book of same title, (1916, Berlin), as well as to 1916 volume of the Zeitschrift, in which he showed the lay-out for any bridge up to 10 arches. The present work extends this to bridges with any number of arches. The aim is to find the design involving the least cost of construction. The method succeeds where calculations would fail.

LONG SPAN. The Reconstruction of a Notable Railroad Bridge. Ry. Age, vol. 66, no. 4, Jan. 24, 1919, pp. 238-243, 9 figs. Reconstruction of the Ohio River Crossing at Louisville, containing the longest simple riveted span in the world.

MATERIALS. Data on Concrete and Steel Bridges, John W. Towle. Concrete Age, vol. 29, no. 3, Dec. 1918, pp. 16-18. Points out it is best to have shorter spans of concrete, longer ones of steel. Address delivered before North Carolina Good Roads Assn.

STEEL. Steel Bridge Replacements on the Sydney subdivision of Canadian Government Railways, A. H. Jones. Contract Rec., vol. 33, no. 2, Jan. 8, 1919, pp. 28-30, 6 figs. Account of alterations in masonry piers and replacements of light spans in 16 steel bridges and viaducts.

STRENGTHENING Stokesay Bridge, Shropshire, W. Noble Twelvetrees. Engineering, vol. 107, no. 2766, Jan. 3, 1919, pp. 3-6, 17 figs. Strengthening a Telford cast-iron bridge by ferro-concrete arch ribs.

Strengthening a Long Steel Viaduct. Ry. Maintenance Engr., vol. 15, no. 1, Jan. 1919, pp. 9-10, 3 figs. Measures taken by Chicago & Eastern Illinois Ry. to reinforce long steel viaduct so as to permit of its use by heavy locomotives.

STRESSES. Contraction Stresses in Bridge and Roof Trusses (Von der Schrumpfarbeit am Fachwerk), Leopold Ellerbeck, Berlin. Zeitschrift fuer Bauwesen, vol. 68, no. 10 to 12, 1918, pp. 472-502, 27 figs. Scientific analysis of the distortions found in all kinds of trusses. Considers the forces exerted upon a group of members.

WILSON BRIDGE, LYONS. The Sejourne System Wilson Bridge at Lyons, France. Eng. & Contracting, vol. 51, no. 4, Jan. 22, 1919, pp. 74-76, 1 fig. Description of certain features of design and construction.

BUILDING AND CONSTRUCTION

CAISSON METHOD. The Caisson Method for Foundations and Mine Shafts, George R. Johnson. Proc. Engrs.' Soc. Western Pa., vol. 34, no. 7, Oct. 1918, pp. 489-514 and (discussion) pp. 514-518, 20 figs. General survey of applications of caisson method in building foundations, bridge piers, and mine shafts, with numerous illustrative examples.

FLOORS. Test of a Flat Slab Floor of the Western Newspaper Union Building, Arthur N. Talbot and Harrison F. Gonnerman. Univ. Ill. Bul., vol. 15, no. 39, bul. 106, May 27, 1918, 52 pp., 22 figs. Building was nine years old at time of test. Stresses up to 30, 000 lb. sq. in., were developed in reinforcing bars. Information is given extensively on action of slab in its various parts.

Test of a Mixedstone Floor (Essai d'un plancher Mixedstone). Bulletin Technique de la Suisse Romande, year 44, no. 26, Dec. 28, 1918, pp. 233-235, 12 figs. Mixedstone floors are made of seprate reinforced concrete standard parts which are placed and cemented together to from a continuous structure. Tests were conducted at University of Paris to ascertain nodulus of elasticity, relative flexibility and ultimate strength of this construction.

HEATHCOTE PRECAST CONSTRUCTION. A New System of Reinforced Concreto Construction. Engineer, vol. 126, no. 3287, Dec. 27, 1918, pp. 551-552, 4 figs. Description of the Heathcote system of precast coucrete construction.

HOUSES. Fifty Double Wall Houses for Carnegie Employees. Concrete, vol. 14, no. 1, Jan. 1919, pp. 24-27, 8 figs. Five-and six-room houses with double 4-in. concrete walls.

281 Fireproof Dwellings Built of Large Precast Concrete Units, Harvey Whipple. Concrete, vol. 14, no. 1, Jan. 1919, pp. 3-8, 26 figs. Layout of housing development and details of houses built at St. Louis for Youngstown Sheet & Tube Co.

Pouring 75 All-Concrete Houses at Phillipsburg, N. J. Concrete, vol. 14, no. 1, Jan. 1919, pp. 9-14, 15 figs. Twenty-five houses are of four-room bath and basement Ingersoll mold and 50 are from new mold producing six-room and bath house. Plans of houses and construction are shown.

Seventy-five dwellings of Monolithic Concrete at Claymont, Del. Concrete, vol. 14, no. 1, Jan. 1919, pp. 15-19, 19 figs. Plans of four, five- and six-room houses.

Build 20 All-Concrete Houses Plan 20 Bungalows. Concrete, vol. 14, no. 1, Jan. 1919, pp. 20-23, 13 figs. Six-room and bath models but with exterior variation in roof and porch treatment to make attractive row.

MILL BUILDING. Erecting a Building of Pre-Cast Concrete Units. Contract Rec., vol. 33, no. 3, Jan. 15, 1919, pp. 46-47, 9 figs. Columns, beams and trusses' first cast as separate units on the ground and then crected after manner of steel building. Building in question is 160 ft. long, 200 ft. wide and 14 ft. high.

RESERVOIRS. 18,000,000 Gallon Reservoir at Winnipeg. Engineer, vol. 126, no. 3287, Dec. 27, 1918, pp. 545-548, 11 figs. Features of design and construction.

SCHOOLS. High School at Ville St. Pierre, P. Q. Contract Rec., vol. 33, no. 1, Jan. 1, 1919, pp. 4-5. 2 figs. Elevation and plan of modern fireproof educational building.

Academy St. Bernard, Shawinigan Falls, Que. Contract Rec., vol. 33, no. 2, Jan. 1, 1919, pp. 8-9, 4 figs. Three-story brick building 140 X 58 ft.

SEWER. Rosedale Creek Sewer Extension, Toronto. Can. Engr., vol. 36, no. 3, Jan. 23, 1919, pp. 163-164, 4 figs. Circular brick sewer 2598 ft. long, 6 ft. 6 in. diameter, one per cent. grade. Constructed partly in tunnel using compressed air.

WING WALL ABUTMENTS. Method and Formalas for Dimensioning Wing Wall Abutments, Benj. J. Parker. Eng. & Contracting, vol. 51, no. 4, Jan. 23, 1919, pp. 80-82, 5 figs.

CEMENT AND CONCRETE

CEMENT MANUFACTURE ECONOMIES. Make Cement Cheaper; Save Two Million Tons Coal, F. G. McKelvy. Concrete, Cement Mill Section, vol. 14, no. 1, Jan. 1919, pp. 1-4, 7 figs. Theory and practice of power production by use of exhaust gases from cement kilns. Paper presented before Portland Cement Assn.

CEMENT, PROPERTIES OF. Formation and Properties of Blast-Furnace Slag and Portland Cement (La Formation et les propriétés des latiers de haut fourneau et du ciment Portland), B. Neumann. Génie Civil, vol. 73, no. 26, Dec. 28, 1918, pp. 512-513. Chemical constitution and data of industrial value. From Stahl und Eisen, Oct. 17, 1918.

CONCRETE STRENGTH AND MIXING LIME. Effect of Time of Mixing on the Strength of Concrete, Duff A. Abrams. Am. Architect, vols. 114 and 115, nos. 2242 2243-2244 and 2246, Dec. 11, 18, 25, 1918 and Jan. 8, 1919, pp. 711-717, 745-750, 775-781 and 85-87, 30 figs. Report of tests conducted at Structural Materials Research Laboratory, Lewis Inst. Tests covered uniformly of machine-mixed concrete; study of time of mixing concrete on its consistency, effect of mix and size of aggregate on mixing time; study of rate of rotation of mixer drum; and effect of temperature of mixing water on strength of concrete. Paper for presentation to Am. Concrete Inst.

Concrete Tile. Making Concrete Tile for Government Housing. Concrete, vol. 14, no. 1, Jan. 1919, pp. 32-34, 4 figs. Concrete wall tile equivalent in volume to 10,000,000 common brick heing manufactured for United States Housing Corporation of Department of Lahor. Erection, equipment and operation of temporary factory on housing site.

Girder Poles. New Process for the Construction of Reinforced-Concrete Girder Poles (Nouveaux procédés pour la constrution de pylones en béton armé), L. Perrin. Génie Civil, vol. 73, no. 23, Dec. 7, 1918, pp. 452-453, 6 figs. Manufactured in pieces of about 10 in. in height and provided with suitable grooves for steel members; when assemhled grooves are covered with layer of cement mortar.

Iron Portland Cement. The Use of Iron Portland Cement in Reinforced Concrete, Edwin H. Lewis. Jl. West of Scotland Iron & Steel Inst., vol. 26, part 2 session 1918-1919, pp. 8-11 and (discussion) pp. 11-16, 5 figs. Records of furnace workings which show that in properly made iron portland cement (70 per cent. clinker and 30 per cent. water granulated slag) there is no difficuly in keeping sulphur content helow requirements of Brirish standard specification.

Pneumatic Method of Concreting. The Pneumatic Method of Concreting, H. B. Kirkland. Contract Rec., vol. 32 no. 2, Jan. 8. 1919, pp. 25-27, 2 figs. Arrangement of plant. Pneumatic method consists in blowing hatches of concrete through a pipe from a central point of supplies to their place in the concrete forms. Curve given shows amount of air required to convey concrete various distances.

Reinforced Concrete. The Factor of Safety in Plain and Reinforced-Concrete Bodies Subjected to Uniform and Eccentric Pressures. Based on the Experiments of C. Bach and O. Graf. (Ueber den Sicherheitsgrad von hewehrten und unbewehrten Betonkoerpern, die auf zentrischen und exzentrischen Druck heanspracht werden. Unter Zugrundelegung der Forsshungsarheiten Heft 166-169). Armierten Beton, vol. 11, no. 9, Sept. 1918, pp. 174-179, figs. 19 to 24. Continued from 158, mathematical discussion of stresses resulting from eccentric loads. Graphical solution of examples of loading causing deformations.

Reinforced Concrete Under Simple Bending Stress (Der auf einfache Eigung heanspruchte Eissenheton Querschnitt), Max Schendera, Armierter Beton, vol. 11, no. 10, Oct. 1918, pp. 195-199. Calculations, formula and tahles pertaining to deflection in slahs. (To be continued.)

Setting Action. Present Knowledge of the Setting Action of Cement and Plasters. Cement & Eng. News, vol. 31, no. 1, Jan. 1919, pp. 22-25. Brief summaries of addresses presented at international discussion of subject held hy Faraday Soc. of Lond. Following are titles: Setting process in plasters and cements; crystalloids against colloids in theory of cements; agglomeration of granular masses; constitution and hydration of portland cement; colloidal theory of setting; ancient and modern mortar; effect of addtion of slag on setting of cement; setting of portland cement in relation to engineering structures. From Concrete.

Wasteful Construction. Useless Waste in Concrete Construction Due to Legal Requirements. W. Stuart Tait. Am. Architect, vols. 114 and 115, nos. 2242, 2243 and 2248, Dec. 11, 18, 1918, and Jan. 2, 1919, pp. 717-718, 750-752 and 79-84, 6 figs. Draws attention to developments which have taken place in analytical side of reinforced concrete design and to improvements in materials used; shows that there is now in existence a large force of skilled mechanics and general contractors fitted to construct reinforced concrete, as compared with time when present methods of design and stresses were established. (To be continued.)

Wear of Concrete. The Wearing Resistance of Concrete, Duff A. Abrams. Contract Rec., vol. 33, no. 4, Jan. 22, 1919, p. 77. Methods for determining maximum resistance to wear.

Winter Concreting. Concreting in Cold Weather, Mun. Jl. vol. 46, no. 1, Jan. 4, 1919, pp. 718. Suggestions offered hy Portland Cement Assn.

Dams. See Earthwork, Rock Excavation, etc., below.

EARTHWORK, ROCK, EXCAVATION, ETC.

Blasting Pole Holes. Digging Pole Holes with Dynamite, C. R. Van Druff. Telephone Engr., vol. 21, no. 1, Jan. 1919, pp. 11-12, 4 figs. Hole is bored with 1.5-in. auger to within 1 ft. of desired depth; then charge is inserted and tamped down with earth and fired hy blasting cap and fuse.

Crushed Stone. Standard Sizes of Crushed Stone from the Standpoint of the Producer, R. W. Scherer. Contract Rec., vol. 33, no. 1, Jan. 1, 1919, pp. 11-13. Affirms that standard sizes of crushed stone throughout the states are possible and highly desirable and proposes that nomenclature he confined to stating maximum and minimum sizes. Suggests 3, 2, 1½, 1, ½, ¼ in. as screen sections.

Dams. Hollow Concrete Dam at the Outlet of Lake St. François. O. Lefebvre. Contract Rec., vol. 33, no. 3, Jan. 15, 1919, pp. 42-45, 6 figs. Plan, elevation, typical section and details of construction. Project calls for expenditure of $101,000.

Big Eddy Conservation Dam. Can. Engr., vol. 36, no. 2, Jan. 9, 1919, pp. 136 and 138. General dimensions of dam under erection at estimated cost of $1,750,000.

The Engineering and Construction of a Concrete Diverting Dam, George M. Bacon. Monthly Jl. Utah Soc. Engrs., vol. 4, no. 11, Nov. 1918, pp. 181-190, 8 figs. Sketch of dam on Boise River, which forms part of Payette-Boise Project of U. S. Reclamation Service. River at point of dam has extreme minimum flow of 650 and a maximum of 40,000 cu. ft. per sec.

Reservoir. Building a Reservoir in a Cavernous Country. Ry. Maintenance Engr., vol. 15, no. 1, Jan. 1919, pp. 15-17, 2 figs. How danger of leakage through subterranean channels was avoided.

Steam Shoveling. Steam Shovel Practice, Llewellyn N. Edwards. Can. Engr., vo. 36, no. 2, Jan. 9, 1919, pp. 123-126, 6 figs. Factors upon which economy of operation depends; essential characteristics of efficient operator.

Tunnels. Economics of the C. N. R. Tunnel at Montreal, H. K. Wicksteed. Can. Engr., vol. 36, no. 4, Jan. 23, 1919, pp. 157-162, 5 figs. Prohlems in location that arose when seeking entrance into that city; observations and incidents regarding construction difficulties. Paper read before the Toronto Branch Eng. Inst. Can.

HARBORS

Hamilton. Recent Harbor Improvement at Hamilton. John Taylor. Contract Rec., vol. 33, no. 3, Jan. 22, 1919, pp. 70-72, 4 figs. Completing construction of wharf wall and reclamation of enclosed area behind it.

Quebec. Champlain Dry Dock for Quebec Harbor, U. Valiquet. Engineering, vol. 106, no. 2762, Dec. 6, 1918, pp. 658-662, 16 figs. Illustrated description from paper before Canadian Soc. of Civil Engrs.

Singapore. Recent Harhor and Dock Works at Singapore, Straits Settlements. Engineering, vol. 106, no. 2761, Nov. 29, 1918, pp. 603-608, 17 figs. Account of recent developments and improvements.

ROADS AND PAVEMENTS

Bituminous Roads. Bituminous Surfaces in York County, Ont., E. A. James. Can. Engr., vol. 36, no. 3, Jan. 16. 1919, pp. 145-146. Classifies hituminous surfaces into surface mats and wearing surfaces; method followed for each is given. Paper hefore Ont. Good Roads Assn.

Canada. Width of Provincial Highways, W. A. McLean. Can. Engr., vol. 36, no. 2, Jan. 9, 1919, pp. 131-133, 5 figs.. Road sections proposed by Ontario Ontario Deputy Minister of Puhlic Highway.

Concrete Roads. The Construction of Concrete Roads, William W. Cox. Contract Rec., vol. 33, no. 3, Jan. 15, 1919, pp. 52-53. Notes on Drainage, preparation of suhgrade, selection of materials, workmanship and prospection. Paper before Mich. State Good Roads Assn.

Cracking of Concrete Roads and Its Prevention by Reinforcing with Steel, W. B. Sawyer, Jr. Cement and Eng. News, vol. 31, no. 1, Jan. 1919, pp. 28-29. Expansion of concrete by change of temperature; change in moisture content; non-uniform hearing on sub-base; expansion or contraction of hub-base due to change in moisture content; placing reinforcing steel. From Western Eng.

Drainage. Drainage, Methods and Foundations for County Roads, E. W. James, Vernon M. Peirce and Charles H. Moorefield. U. S. Department of Agriculture, hul. 724. Dec. 21, 1918, 86 pp., 33 figs. Discussion of important characteristics of different kinds of soils ordinarily encountered in highway construction; proper methods of draining roadbeds constructed of various kinds of soil and under different topographical conditions; explanation of how foundations may be designed to suit soil conditions, road surface and system of drainage.

Engineers, Highway. Engineers for Highway Work, John H. Mullen. Contract Rec., vol. 33, no. 3, Jan. 15, 1919, p. 48. Inadequate pay of highway engineers; qualifications of a highway engineer. From paper before Am. Assn State Highway Officials.

French Roads. American Methods and Machinery Applicable to Construction and Maintenance of French Highways, Arthur H. Blanchard, Mun. Jl., vol. 46, no. 2, Ja., 11, 1919, pp. 23-32, 16 figs. Restoring of French roads that have heen worn out by traffic or destroyed by enemy.

Heavy-Traffic Roads. Notes on Road Construction and Maintenance. Thomas Sawyer Bower. Quarry, vol. 24, no. 263, Jan. 1919, p. 18. Author's experience in regard to securing road which will stand abnormal traffic for long-periods. Abstract of paper before Instn. Civil Engrs.

Minnesota Highways. Proposed Highway System for Minnesota. Good Roads, vol. 16. no. 26, Dec. 28, 1918, pp. 249-250, 1 fig. Description of 6000-mile system of main roads proposed hy State Highway Department.

National Highways. A National Highway Policy and Plan, E. J. Mehren. Am. City, vol., 20, no. 1, Jan. 1919, pp. 1-5. Plea for selection, construction and maintenance by Federal Government of a national highway sytem that shall emhrace entire country. From address before Joint Highway Congress.

Road Surfaces. Investigations in the Structure of the Road Surfaces, Francis Wood. Surveyor, vol. 54, no. 1403, Dec. 6, 1918, p. 267, Quarry, vol. 24, no. 263, Jan. 1919, pp. 16-17. Surveyor: Tests over obstructions and hollows, and concerning two-coat work, remarks on voidless composition. Quarry: Suggests that, provided that a homogeneous mass of material is interposed between a stable suhstructure and wearing surface, foundations need not be more than 4 in. in depth, and such comhinations will satisfy regulations that apply to vehicles in England. Ahstract of paper hefore Instn. Civil Engrs. Also in Times Eng Supp., no. 530, Dec. 1918, p. 267.

Road Corrugation. Road Corrugation, Ernest Leonard Leeming. Surveyor, vol. 54, no. 1403, Dec. 6, 1918, p. 270. Probahle causes; suggestions for preventing or alleviating it. Ahstract of paper before Instn. Civil Engrs. Also in Times Eng. Supp., no. 530, Dec. 1918, p. 267.

San Francisco. Street Paving in San Francisco. Mun. Jl. vol 46, no. 1, Jan. 4, 1919, pp. 1-3, 3 figs. Basalt blocks for heavy traffic, hrick for steep grades, asphalt and hituminous concrete for easy gradees. Methods of constructing hase and wearing surface; grading streets; cost.

Subgrade. Methods for Subgrade Testing on Street Grading Work, E. Earl Glass. Am. City, vol. 20, no. 1, Jan. 1919, pp. 47-48, 2figs. Use of two 8-ft. rods graduated to feet and tenths from middle as zero, fitted with spikes, and having adjustahle targets

Wisconsin Highways. Marking and Mapping the Wisconsin Trunk Lime Highway System, A. R. Horst. Good Roads, vol 17, no. 2, Jan. 11, 1919, pp. 13-15, 3 figs. From a paper entitled The Underlying Principles, controlling the Laying Out., Marking and Maintaining of a State Trunk Highway System, presented at joint session of Am. Assn. State Highway Official and Highway Industries Assn.

SANITARY ENGINEERING

GARBAGE. Methods of Garbage and Rubbish Collection and Disposal in Larger Cities. Contract Rec., vol. 33, no. 2, Jan. 8, 1919, pp. 32-34. Methods followed in Baltimore, Chicago, Cincinnati, Cleveland, Kansas City, Mo., Milwaukee, Minneapolis, New York, St. Louis and St. Paul.

SEWAGE-PLANT OPERATION. Instruction for the Operation of State Sewage Plants. Contract Rec., vol. 33, no. 2, Jan. 8, 1919, pp. 35-37. Bulletin prepared by Bureau of Sanitary Engineers and issued by Texas State Board of Health.
Biological Purification of City Sewage (Die Klaeranlage der staedtischen Kanalisation, in St. Gallen). Schweiz Bauzeitung, vol. 72, no. 24, Dec. 14, 1918, pp. 231-233, 6 figs.Con- cluded in Dec. 21 number. Technical description of sewage purification plant for 60,000 inhabitants. The drip system used in conjunction with a small river.

SEWER CONSTRUCTION. Rideau River Intercepting Sewer, Ottawa, L. McLaren. Contract Rec., vol. 33, no. 2, Jan. 8, 1919, pp. 21-24, 9 figs. Design and construction of interceptor which will drain 1060 acres.
Some Sewer Construction Details. Mon. Jl., vol. 45, no. 26, Dec. 28, 1918, pp. 501-502, 2 figs. Laying a sewer above street grade; excavating. and laying sewer in deep trench in sand and water.

WATER SUPPLY

METERS. Sizes of Service Meters, W. R. Edwards. Mun. Jl., vol. 46, no. 1, Jan.4, 1919, pp. 4-5. Practices and experience of Passaic Water Co. in use of meters, especially in regard to desirable sizes. Paper before N. Y. Section, Am. Water Works Assn.

PIPE MAINTENANCE. Lead Pipe Couplings, J. A. Jensen. Jl. Am. Water Works Assn., vol. 5, no. 4. Dec. 1918, pp. 407-411. Examples of water loss to municipality on account of service leaks occurring between water main and meter; results of experimental examination of conditions developing leaks.
Cold Weather and Mains in Duluth. Mun. Jl., vol. 46, no. 1, Jan. 4, 1919, pp. 6-7. Experience with freezing and thawing by electricity.
Water Main Cleaning in St. Louis. Mun. Jl., vol. 46, no. 1, Jan. 4, 1919, pp. 5-6, 4 figs. Methods and results in cleaning 50 miles of mains.

RESERVOIRS. Waterworks Operation: Maintenance of Reservoirs. Mun. Jl., vol. 45, no. 26, Dec. 28, 1918, pp. 506-507; vol. 46, no. 1, Jan. 4, 1919, pp. 10-12. Dec. 28: Features of maintenance of small reservoirs and of large impounding reservoirs, sodding and other treatment of embankments: Jan. 4: Causes of leakage from reservoirs, their location, stopping them by use of cement, asphalt, clay, etc. (To be continued.)
Construction Methods Employed in Building the New Intake and Remodeled Reservoirs of the Oshkosh, Wis., Water Works, T. B. Jorgen, sen. Cement & Eng. News, vol. 31, no. 1, Jan. 1919, pp. 26-27, 3 figs. Intake consists of 300 ft. of piping connecting shore line with suction well in filtratian plant, and 1200 ft. of piping from shore line out in Lake Winnebago. It is constructed of 24-in. cast-iron piping.

WATER MAINS, PROTECTION OF. Protecting Water Mains, Fire Hydrants and Valves Against Freezing in Winnipeg, F. H. Hooper. Contract Rec., vol. 33, no. 1, Jan. 1, 1919, p. 3. Paper before Nat. Fire Protection Assn.

WATER PURIFICATION. St. Louis Water Purification Plant. Mun. Jl., vol. 45 no. 26, Dec. 28, 1918, pp. 503-505. Amounts and prices of chemicals used; methods and results of operation; cleaning filter sand; effects of chemicals on apparatus; itemized cost of operating plant.

WATER STORAGE. Advantages and Disadvantages of the Storage of Water, Melville C. Whipple. Contract Rec., vol. 33, no. 2, Jan. 1, 1919, pp. 6-7. Claims that storage of surface water affords effectual means of safeguarding its hygienic quality and indicates means to overcome increase of color and production of tastes and odors from growth of microscopic organisms.

WATERWAYS

GEORGIAN BAY CANAL. The Georgian Bay Canal, J. J. Bell. Engineer, vol. 126, no. 3286, Dec. 20, 1918, pp. 527-528, 8 figs. Description of proposed Canadian canal connecting Georgian Bay with the St. Lawrence at Montreal.

INTERIOR NAVIGATION. Notes in Interior Navagation of Various Countries (Apuntes soble la navegacion interior en algunos paises), Carlos Mendnza. Revista de Obras Publicas, year 66, nos. 2256 and 2257, Dec. 19 and 26, 1918, pp. 625-630 and 637-640. Dec. 19: Economical aspect of inland water transportation and railway construction in development of present network of canals and navigable rivers in France; Dec. 26: Data on navigabl courses in England, United States, Germany and Italy. (Concluded).

ITALY. The Port of Ostia Nuova. near Kome, and the Railway from Ostia to Rome (Le port d'Ostia Nuova, près de Rome et le chemin de fer Osti à Rome). Génie Civil, vol. 74, no. 1, Jan. 4, 1919, pp. 12-13, 2 figs. Project to build navigable canal connecting Rome and Ostia Nuova.

U. S. RULES WATER TTANSPORTATION. Rivers, General Rules and Regultions Prescribed by the Board of Supervising Inspectors as Amended at Board Meeting of January 1918, and Further Amended by Action of Executive Committee of the Board of Supervising Inspectors, Meetings of March 15, April 3, May 11, June 5, August 5, and September 24, 1918. Departmet of Commerce, Steamboat-Inspection Service, form 801-D, Nov. 19, 1918, 145 pp. 5 figs. Concerning boilers, attachments, boats, rafters, fire apparatus, ferrybots, barges, lifeboats, steam pumps, safety valves, etc.

MUNICIPAL ENGINEERING

TOWN PLANNING. Town Planning in New Zealand, A. G. Waller. Jl. Am. Inst. Architects. vol. 6, no. 12, Dec. 1918, pp. 567-577. Résumé of town-planning bill; conditions of trade, wealth and production in New Zealand; significance of town-planning in architectural developments.
Relation of the Curve to Town-Planning, H. L. Seymour. Can. Engr. vol. 36, no. 2, Jan. 9, 1919, pp. 119-121, 4 figs. Discussion of methods employed in laying out curves for streets or lot lines.

AUXILIARY EQUIPMENT

CONDENSERS. Auxiliary Machine on British Standard Ships. Shipbuilding and Shipping Rec., vol. 12, no. 25, Dec. 19, 1918, pp. 595-596, 5 figs. General arrangement of auxiliary machinery for A and B types; details of auxiliary condenser incorporated in main engine structure on marine engines

PROPELLERS. Chart for Diameters of 3-Bladed Propellers, Motor Boat, vol. 16, no. 1, Jan. 10, 1919, p. 12, 1 fig. To determine diameter of propeller from desired revolutions and horsepower delivered.
Screw Propellers, C. W. Dyson. Jl. Am. Soc. Naval Engrs., vol. 30, no. 4, Nov. 1918, pp. 753-805. 4 figs. Theoreitical discussion covering thrust deduction and wake gain; slip block coefficient : wiug screws; correction of slip block coefficient for variation of midship section coefficient from standard; mean relative clearance of propellers; resistance of hull appendages; basic conditions for analysis and design of screw propellers;general formulæ for power correction for "cavitation" and "dispersal of thrust column'"; standard forms of projected area ratio; standard forms of blade sections; problems in propeller design.

VALVES AND FITTINGS. Marine Practice in Valves and Fittings, A. G. Christie. Mech. Eng., vol. 41, no. 2, Feb. 1919, pp. 135-136. Suggests that certain features of central-station practice be extended to marine practice.

SALVAGE

SALVAGING DEVICE. Making the Sea Give Up Its Wealth. Am. Marine Engr., vol. 14, no. 1, Jan. 1919, pp. 12-14, 1 fig. Patented salvaging device consisting of dual system of non-capsizing pontoons to serve as lighters for salvage and quarters and workshops for wrecking crews as well as for raising vessels on an even keel.

S. S. ST. PAUL. The Salvage of the St. Paul. Engineer, vol. 126, no. 3284, Dec. 6, 1918, pp. 480-483, 7 figs. Account of raising of liner which sauk at her pier in New York Harbor.

SHIPS

CAMOUFLAGE. Principles Underlying Ship Camouflage, Alon Beent. Int. Mar. Eng., vol. 24, no. 2, Feb. 1919, pp. 90-93, 9 figs. Complementary colors to produce low visibility; dazzle system of ambiguous perspective to disguise ship's course; special color effects.

CASTINGS. Castings Used in Ship Construction. Ben. Shaw and James Edgar. Foundry Trade Jl. vol. 20, no. 203, Nov. 1918, pp. 579-584, 26 figs. Methods adopted in making pattern for and casting rudder; general considerations on large and small castings.

CONCRETE VESSELS. Reinforced Concrete Steamer "Armistice," Engineering, vol 107, no. 2767, Jan. 10, 1919, pp. 46-48, 8 figs. Illustrations with general description of a 205-ft. concrete steamer constructed by the Ferro-Concrete Ship Construction Co., Limited, Barrow-in-Furnass.
Concrete Ships, Times, Eng. Supp., no. 530, Dec. 1018, pp. 252-253, Program at Lancashire yards; equipment of yards.
New Type of Reinforced Concrete Boat. Concrete Age, vol. 29, no. 3, Dec. 1918, pp. 24-25. System followed at Aberthaw yard for building 500-ton lighters.
Structural Details of Concrete Ships, W. Noble Twelvetrees. Nautical Gaz., vol. 95, no. 2, Jan. 11, 1919, pp. 24-25. Systems of concrete shipbuilding followed in British shipyards and advantages claimed by advocates of each system. Frnm the Shipbuilder.
The Waller System of Reinforced Concrete Ship Construction, W. Noble Twelvetrees. Engineering, vnl. 106, no. 2760, Nov. 22, 1918, pp. 580-583, 16 figs. Description of system introducing precast concrete slabs into construction.

DETAIL DRAWING METHODS. Detail Drawing Method Used for 8800-Ton Steel Ships. Eng. News Rec., vol. 82, no. 4, Jan. 23, 1919, pp. 188-190, 3 figs. Adapted successfully to old-style ships of fully curved shape; permits checking pieces before they leave ship.

ELECTRICAL INSTALLATION WORK. Cutting Time on Installatinn Work. Jl. Elec., vol. 42, no. 1, Jan. 1, 1919, pp. 25-26. Systematic planning of electrical installation work as carried out in large shipyard.

ELECTRIC PROPULSION. The Ljungstroöm Turbo-Electric System of Ship Propulsion. Jl. Am. Soc. Naval Engrs., vol. 30, no. 4, Nov. 1918, pp. 813-834, 60 figs. Ljungstrôm turbine consists of two disks carrying intermeshing rings of reaction blading; each disk is direct-coupled to a generator. Turbine, equipment auxiliaries and mountings are treated at length. From Engineering.
Electric Propulsion on the New Mexico Wingrove Bathnn. Elec. World, vnl. 73, nn. 1, Jan. 4, 1919. pp. 7-10, 1 fig. Interview with Rear-Admiral Griffin nf U. S. N. New system nf driving ships adopted as national policy; Great Britain and France probably will follow American lead.

FABRICATED SHIP. The Fabricated Ship in America. Engineer, vol. 126, no. 3286, Dec. 20, 1918, pp. 523-524, 12 figs. Description and discussion of the "fabricated" ship.

FERRY STEAMERS. Train Ferries to France. Times Eng. Supp., no. 530, Dec. 1918, p. 251, 3 figs. Engineering features of ferry steamers and of bridges for loading and unloading them.

FORD CHASERS. Ford Methods in Ship Manufacture—11. Fred E. Rogers. Indus. Management, vol. 57, no. 2, Feb. 1919, pp. 119-124, 12 figs. Layout equipment and tools of shop where 200 tons of interchangeable steel parts for the Eagles are produced in a working day. (To be continued.)
The Building of American Submarine Chasers, Engineering, vol. 106, no. 2761, Nov. 29, 1918, pp. 608-609, 3 figs. Account of construction of "Ford "Eagles"

GROTON SHIPYARD. Groton Shipyard Built on Sloping Limestone Ledge. Eng. News-Rec., vol. 82, no. 3, Jan. 16, 1919, pp. 135-138, 6 figs. Fabricating and storage yards levels with rails on concrete craneways and 22 ft. above concrete shipways set into rock.

Hoo Island Ship. Plans for Hog Island Steel Cargo Ship. Int. Mar. Eng., vol. 24, no. 2, Feb. 1919, pp. 71-74, 3 figs. Design and construction of single-screw vessel of 7500 tons deadweight type; cargo space 380,000 cu. ft.

Launching. Notes on Launching, William Gatewood. Engineering, vol. 106, no. 2764, Dec. 20, 1918, pp. 710-711, 7 figs.; Int. Mar. Eng., vol. 24, no. 2, Feb. 1919, pp. 83-87, 7 figs. Paper before Society of Naval Architects and Marine Engineers, Philadelphia, Nov. 1918.

Refrigerator Ships. The Refrigerator Ship "Belle-Isle" (Le navire frigorifique "Belle-Isle"), Emile Gouault. Génie Civil, vol. 73, no. 26, Dec. 28, 1918, pp. 501-504, 7 figs. Conformation and plans. Ship is three-decked and of awning-deck type, with capacity of 12,000 beeves.

Turbine Propulsion. Italian Geared Turbine Cargo Steamer, Int. Mar. Eng. vol. 24, no.-2, Feb. 1919, pp. 94, 2 figs. Brief description wito plan of ship. Built by N. Odero & Company, at Sestri Ponenti, and fitted with Tosi geared turbie propelling and auxiliary machinery.

Progress in Turbine Ship Propulsion, Francis Hodgkinson. Engineering, vol. 107, no. 2767, Jan. 10, 1919, pp. 42-45, 9 figs. Report, sligthly abbreviated read before the Society of Naval Architects and Marine Engineers, Philadelphia, Nov. 1918.

Progress in Turbine Ship Propulsion, Francis Hodgkinson. Shipping, vol. 5, no. 13, Dec. 28, 1918, pp. 15-16, 1 fig. Auxiliaries used and practice followed. Abstract of paper before Soc. Naval Architects an Marine Engrs.

Ventilating and Heating. Ventilating and Heating from the Marine Point of of View, Chas. F. Gross. Jl. Am. Soc. Naval Engrs., vol. 30, no. 4, Nov 1918, pp. 728-736. Systems followed im merchant ships; design and installation of ventilators: allowance of square feet of radiator surface by leading shipbuilding companies.

Manufacturing a Ship's Ventilator, H. E. McCauley. Am. Mech. vol. 50, no. 2, Jan. 9, 1919, pp. 47-51, 15 figs. Describes manufacture of of American-type ventilator cowls.

Welded Ships. The First Electrically Welded Boat, John Liston. Gen. Elec. Rev., vol. 21, no. 12, Dec. 1918, pp. 844-848, 10 figs. Particulars of boat built in 1915 at Ashtabula, Ohio, and still in service on Great Lakes.

The Adequacy of Welding in Constructing Hulls of Ships. H. M. Hobart. Gen. Electrical Rev., vol. 21, no. 12, Dec. 1918, pp. 840-843. Author expresses belief in adequacy of method.

Rules for Electrically-Welded Ships, Jl. Engrs., Club, St. Louis, vol. 3, no. 6, Nov.-Dec., 1918, pp. 331-334. Regulations adopted by general committee of Lloyd's Register of Shipping, London. From Nauticus, Sept. 7, 1918.

YARDS

Reduction Gears. Mechanical Reduction Gears, J. A. Davies. Jl. Am. Soc. Naval Engrs., vol. 30, no. 4, Nov. 1918, pp. 705-727, 11 figs. Formulæ for designing pinions; consideration on selection of material for bearings; types of couplings; undesirability of flexible couplings in high powered, high-speed machinery; contour used for teeth of marine reduction gears of double-helical type; accidents and changes due to wear or operation.

Shipbuilding, United States and Canada. Shipbuilding Development in the United States and Canada, W. R. Gray and Edward F. Clarke. Engineering, vol. 106, no. 2765, Dec. 27, 1918, pp. 740-742, 3 figs. Paper before North-East Coast Inst. of Engineers and Shipbuilders, December 1918.

Shipyards. Recent Developments in Shipyard Plants, S. M. Henry, Int. Mar. Eng., vol. 24, no. 2, Feb. 1919, pp. 74-76. From a paper before the Society of Naval Architects and Marine Engrs.

Welding. Application of Electric Welding to Shipping. Jl. Am. Soc. Naval Engrs., vol. 30, no. 4, Nov. 1918, pp. 912-919, Summary of experimental results obtained from tests conducted by Llyd's Register of Shipping. From Engineering.

Electric Welding in Ship Construction, H. Jasper Cox. Int. Mar. Eng., vol. 24, no. 2, Feb. 1919, pp. 95-99, 1 fig. Second and concluding article. Results of Lloyd's tests; tentative regulations for arc welding in ship construction; electrically welded vessels and proposed designs.

Oxy-Acetylene Restores Huge Marine Engine for British Navy, Norman MacLeod. Jl. Acetylene Welding, vol. 2, no. 7, Jan. 1919, pp. 336-338, 1 fig. Repairing a 30-ton triple-expansion marine engine all of whose cylinders were fractured.

Arc Welding in Shipyards, W. L. Roberts. Gen. Elec. Rev., vol. 21, no. 12, Dec. 1918, pp. 860-864, 13 figs. Some applications of arc welding.

Electric Welding in Navy Yards, H. G. Knox. Gen. Elec. Rev., vol. 21, no. 12, Dec. 1918, pp. 849-859, 20 figs. Arc-welding and resistance welding processes as related to their general application in navy yard; work conducted in each type of shop; recommendations as to kinds of welding equipment desirable; figures of speed and cost of welding ship structures.

Electric Welding in Ship Construction, H. Jasper Cox. Jl. Engrs.' Club' St. Louis, vol. 3, no. 6, Nov.-Dec. 1918, pp. 323-331. Summary of progress accomplished during recent months in application of electric (and specially arc) welding processes to structural work in shipbuilding. Paper before Soc. Naval Architects and Marine Engers. From Nauticus, Nov. 23, 1919.

ELECTRICAL ENGINEERING

ELECTROCHEMISTRY

Storage Batteries. Hypothesis Concerning the Action of the Negative Plate in a Lead Storage Battery (Hypothèse sur le fonctionnement de la plaque négative de l'accumulateur au plomb). Ch. Féry. Industrie Electrique, year 27, no. 636, Dec. 25, 1918, pp. 467-467.

ELECTRODEPOSITION

Nickel Plating of Cast Iron. Depositing Nickel on Cast Iron from a Hot Electrolyte, Roay F. Clark, Metal Rec. & Electroplater, vol. 4, no. 11, Dec. 1918 pp. 401-402. Results achieved by plater on shears and scissors with date extending over long period; advantages of hot process.

Silver and Gold Refining. Electrolytic Silver and Gold Refining at Perth Amboy, N. J. Geo. G. Griswold. Gen. Meeting Am. Electrochem. Soc., Apr. 3-5, 1919, advance copy, paper 1, pp. 1-7, 8 figs. Refining silver bullion by Morobius process at works of Am. Smelting & Refining Co.; Wohlwill plant for electrolytically refining gold bullion and recovering from it platinum and palladium.

ELECTROPHYSICS

Alternating Currents. Mean Power and Power Factor in a Non-Sinusoidal Alternating-Current Circuit (De la puissance mayenne et du facteur de puissance dans un circuit à courants alternatifs non sinusoidaux), H. Pécheux. Revue Générale de l'Electricité, vol. 4, no. 22, Nov. 30, 1918, pp. 813-816, 2 figs. Calculation of costs from oscillographic records. Method followed for determining non-sinusoidal electromotive force is the one published in R. G. E., Feb. 8, 1918,

Cable, Armored, Resistance of. Effective Resistance and Reactance of a Three-Phase Armored Cable to Current Harmonics (Sur la résistance et la réactance effectives d'un cable armé triphasé pour les harmoniques du courant), R. Swyngedauw. Revue Générale de l'Electricité, vol. 5, no. 1, Jan. 4, 1919, pp. 16-17. Deduces from results of experiments that for third harmonic of fundamental frequency 50 per sec. resistance is comprised between 0.67 and 0.78 ohm per km., and reactance between 0.45 and 0.56 ohm. per km.

Coolidge Tube. On the Theory of the Coolidge Tube (Sur la théorie du tube Coolidge), G. Johannès and F. Wolfers. Revue Générale de l'Electricité, vol. 4, no. 26, Dec. 28, 1918, pp. 991-994. Criticism of A. Dauvillier's article (R. G. E., vol. 4, Sept. 1918, pp. 443-446) written in support of H. Pilon's theory (R. G. E., vol. 4, July 1918, pp. 99-102) concerning action of oxygen in tungsten anticathode of tube. Johannès and Wolfers establish that oxygen emitted by point of impact abates electronic emission.

Electrolytic Cell. Influence of a Magnetic Field and of a Mechanical agitation of Electrolyte on the Potential Difference at the Terminals of an Electrolytic Cell (Influence d'un champ magnétique et d'une agitation mecanique du bain sur la différence de potential aux bornes d'une cuve électrolytique), Toshikozu Mashimo. Revue Générale de l'électricité, vol. 5, no. 1, Jan. 4, 1919, pp. 17-18. Experiments with platinum electrodes in semi-normal solutions of iron chloride. From Memoirs of the College of Science, Kyoto Imperial Univ., vol. 2, no. 6, Oct. 1917, pp. 341-347.

Long Conductors. Some Experiments with Long Electrical Conductors, John H. Morecroft. Elecn., vol. 81, no. 2116, Dec. 6, 1918, pp. 658-660, 7 figs. From paper before Inst. of Radio Engrs.

Long-Line Phenomena. Long Line Phenomena and Vector Locus Diagrams, Edy Velander. Elec. World, vol. 73, no. 5, Feb. 1, 1919, pp. 212-216, 12 figs. Long-line transmission problems may be readily solved by the use of rigorous hyperbolic equations of very simple form; an anlysis of equations of this form with vector diagrams for graphical interpretation.

Parallel Conductors. Determination of the Resistance and Impedance of Any Number of Parallel Conductors (Détermination de la résistance et de l'impédance d'un nombre quelconque de conducteurs associés en parallèle), P. de Bancarel. Revue Générale de l'Electricité, vol. 4, no. 26, Dec. 28, 1918, pp. 989-990, 3 figs. Graphical process based on representation of resistances by trigonometive tangents. Simplification of method suggested by Haudié in Revue Générale de l'Electricité, vol. 3, Aug. 31, 1918, p. 297.

Paramagnetism. The Quantum Theory of Paramagnetism (Zum Quantentheorie des Paramagnetismus), Fritz Reiche. Annalen der Physik, Leipzig, vol. 54, no. 22, 1917, pp. 401-436, 7 figs. Discusses the kinetic theory of paramagnetism from the differential equations proposed by Jacobi, Hamilton, and Planck, and compares them with tests made by Kamerlingh Onnes and Oosterhuis.

Quenched Sparks. Processes Occurring in a Quenched Spark (Ueber die Vergaenge in sogenannten Loeschfunken), V. Pieck, Annalen der Physik, vol. 54, no. 19, pp. 197-244, 14 figs., 3 plates. Relates to electrical vibrations leading to shock. Experiments with various gases at different pressures and with magnesium electrodes. Dynamic theory of quenched sparks. Iron and electrons. Tests at University of Goettingen.

Short-Circuits. Substation Short-Circuits, R. F. Gooding, Elec. Jl., vol. 16, no. 2, Feb. 1919, pp. 61-65, 6 figs. Calculations to determine stresses to which oil circuit breakers, disconnecting switches, bus supports, etc., may be subjected in substations fed by parallel feeders at a time of short circuit. Several typical examples of special systems are selected.

Transverse Magnetization. The Influence of Transverse Magnetization on the Electrical Resistance of Tellurium (Ueber den Einfluss transvaler Magnetisierung auf den elektrischen Widerstand von Tellur), Bengt Beckman. Annalen der Physik, vol. 54, no. 19, 1917, pp. 182-196. Measurements given of the electrical resistance of rods of tellurium and other rare metals at various temperatures.

FURNACES

Electrically Heated Ovens. Electrically-Heated Ovens. Iron Age, vol. 1003, no. 3, Jan. 16, 1919, pp. 188-189, 2 figs. Construction and operation of enameling ovens; efficiency of different types compared.

Electrically-Heated Ovens. Metal Rec. & Electroplater, vol. 4, no. 11, Dec. 1918, pp. 395-396, 3 figs. Material for walls, insulation, floors; disadvantages of through metal; four general types; efficiency of the various form.

ITALY. Future of the Electric Furnace in Italy (Forni elettrici), G. Revessi. L'Elettrotecnica, vol. 5, no. 32, Nov. 15, 1918, pp. 454-456. Treats question from standpoint of economy, fuel shortage, industrial requirements, etc. According to writer, number of furnaces in Italy reaches 270, consuming about 150,000 kw. of energy, with addition of 250 baths for aluminum production.

METALLURGICAL FURNACES. Electric Furnace Developments, J. Bibby. Iron & Coal Trades Rev., vol. 97, no. 2652, Dec. 27, 1918, pp. 719-722, 7 figs. Abstract of paper before Cleveland Inst. of Engrs.

Application of the Electric Furnace to the Metallurgy of Iron and Its Alloys, H. Etchells. Elecn., vol. 81, no. 2119, Dec. 27, 1918, pp. 734-735. Abstract of paper read before the National Association of Industrial Chemists, November, 1918.

Electric Furnaces for Steel Foundry Work, W. E. Moore. Blast Furnace vol. 7, no. 1, Jan. 1919, pp. 76-77. Basic steel recommended on account of possibility of working to closer phosphorus and sulphur limits. Advocates furnace shell of large diameter with shallow bath.

RENNERFELT FURNACE. Developments in the Rennerfelt Furnace, H. A. De Fries and Jonas Hertenius. Iron Age, vol. 103, no. 3, Jan. 16, 1919, pp. 190-191, 1 fig. Important changes from original design; side electrodes now titlt; shape of shell is round.

SMALL FURNACES. Performance of Small Electric Furnace. Am. Drop Forger, vol. 4, no. 12, Dec. 1918, pp. 477-479, 9 figs. Operation and equipment of two-ton electric furnace installed at inchrome plant.

GENERATING STATIONS

CANADA. Statistical Analysis of the Central Electrical Station Situation of Canada. Contract Rec., vol. 33, no. 5, Jan. 29, 1919, pp. 88-92, 7 figs. From data compiled by Dominion Water Power Branch of Department of the Interior, in cooperation with Bureau of Statistics of departmentof Trade and Commerce.

FLOATING STATION. Floating Electric Power Station. Engineering, vol. 106, no. 2762, Dec. 6, 1918, pp. 644-645, 6 figs. Description of floating power station built and operated during war for providing current for variable conditions overseas where mobility and convience were of importance.

LEGAL LIABILITY. Liability of Central Station Company for Failure of Electric Power, Chesla C. Sherlock. Elec. Rev., vol. 74, no. 6, Feb. 8, 1919, pp. 216-217. Several decisions covering the question of power failure, both through negligence of employees of utility company and breach of contract.

THREE-PHASE-TWO-PHASE TYPE. Features of Three-Phase-Two-Phase Generating Station. Elec. Rev., vol. 74, no. 3, Jan. 18, 1919, pp. 85-88, 9 figs. Installation and operation features of Eastern Wisconsin Electric Co's Sheboygan plant.

GENERATORS AND MOTORS

ASYCHRONOUS MOTORS. Asychronous Motor Diagram (Le diagramme des moteurs asynchrones), L. Lagron. Revue Générale de l'Electricité, vol. 4, no. 23, Dec. 7, 1918, pp. 861-863, 1 fig. Indicates method of constructing diagram knowing only value of currents in short-circuit, their augular displacements and resistance of stator and rotor.

CARBON BRUSHES. Characteristics of Carbon Brushes for Electrical Machinery, Warren C. Kalb. Power, vol. 49, no. 6, Feb. 11, 1919, pp. 202-204, 2 figs. Carrying capacities, contact drop co-efficient of friction, abrasiveness and hardness of carbon brushes defined and methods for determining these characteristics explained.

COLLIERY MOTORS. Figures Supplemental to Explosion Proof Equipments of Colliery Motors and Accessories (in Japanese), S. Hayashi, Denki Gakkwai Zasshi, no. 365, Dec. 10, 1918.

COOLING. Cooling Electric Motors, D. A. Mossay, Colliery Guardian, vol. 116, no. 3024, Dec. 13, 1918, pp. 1239-1240, 6 figs. From paper before Min. Inst. of Scotland.

Air-Cooled Electrical Search Light (Di uno speciale dispositivo ad arco raffreddato per proiettori di luce), Virgilio Bellini. Elettrotecnica, vol. 5, no. 21, July 25, 1918, pp. 286-287, 1 fig. Rotary positive carbon is cooled by air jet.

DESIGN. The Advantages of Uniform Motor Design, James Burke. Elec. Wld., vol. 73, no. 4, Jan. 25, 1919, pp. 172-175. From a paper the Electric Power Club, Cleveland, Ohio, January, 1919.

DYNAMICAL THEORY. The Dynamical Theory of Electric Engines, Llewelyn B. Atkinson. Jl. Instn. Elec. Engrs., vol. 57, no. 277, Dec. 1918, pp. 1-26, 26 figs. Kelvin's ideas concerning mechanical values of distributions of electricity, magnetism and galvanism; energy relations of electric and magnetic systems; constructive fundamental types of electric engines converting electric energy into mechanical work; possible primary types of electric engines; engines converting mechanical work into electrical energy; combined generator and motor cycles; similarity between expressions for efficiencies of ideal electric engines and general form or expression for efficiency of a perfect heat engine. Tenth Kelvin Lecture.

INDUCTION MOTORS. Repairing Induction Motors, L. Fokes, Colliery Guardian, vol. 116, no. 3017, Oct. 25, 1918, pp. 859-860, 8 figs. Electrical breakdowns; cleanliess; neatness; repairing a hand-wound coil; shaping and insulating; former-wound coils; rotor repairs.

The Interchangeability of Induction Motors, Gordon Fox. Ry. Elec. Engr., vol. 10, no. 1, Jan. 1919, pp. 5-8, 4 figs. Indicates necessary alterations in windings which will adapt motors for use on currents of different frequency and phase.

POLYPHASE INDUCTION MOTOR. Diagram of Polyphase Induction Motors Taking into Account Magnetic Saturation (Diagramme des moteurs polyphase asynchrones tenant compte de la saturation magnétique), J. Berthenod. Revue Générale de l'Electricité, vol. 4, no. 25, Dec. 21, 1918, pp. 941-946, 6 figs. The various fluxes are reduced to three, a common flux and two others having leakages proportional to primary and secondary currents, respectively; an approximate diagram is thus formed; another diagram is then developed which takes into account actual operating conditions.

POWER AND TORQUE. Power and Torque in Electric Motors, Justin Lebovici. Elec. Rev., vol. 74, nos. 4 and 6, Jan. 25 and Feb. 8, 1919, pp. 134-136, and 213-215, 18 figs. Articles discussing principles of different types of motors from a common standpoint; relations in single-phase induction aud repulsion motors.

REBUILDING GENERATORS. Rebuilding 25,000-kw, Generator, Thomas Wilson. Power, vol. 49, no. 3, Jan. 21, 1919, pp. 76-79, 11 figs. Account of rebuilding of generator of Commonwealth Edison Co., Chicago, which required upturning of 200-ton unit within space of its own foundation.

WINDING. A New Graphic Method for Winding Schemes, L. Fleischmann. Elecn., vol. 81, no. 2117, Dec. 13, 1918, pp. 689-690, 3 figs. Abstract of article in Elektrotechnische Zeitschrift, No. 7, 1918.

LIGHTING AND LAMP MANUFACTURE

COLORED LIGHT. Linking Science and Art in Lighting, M. Luckiesh. Elec. Rev., vol. 74, no. 1, Jan. 4, 1919, pp. 14-15. Possibilities of colored light. (Fourth article.)

HOME LIGHTING. Linking Science and Art in Lighting, M. Luckiesh. Elec. Rev., vol. 74, no. 5, Feb. 1, 1919, pp. 171-173, 2 figs. Fifth of a series of six articles. The lighting of a middle-class home.

LIGHT, MEASUREMENT OF. Photometric Apparatus for Measuring the Illuminating Value of Fluctuating Sources of High Candle Power. Gas Jl., vol. 144, no. 2902, Dec. 24, 1918, p. 658, 3 figs. Tube photometer and supplementary flare photometer which permit measurements of detail revealing power in its relation to rapidly-burning flares of great intensity. From presidential address to Illum. Eng. Soc.

MEASUREMENTS AND TESTS

BOUCHEROT WHEATSTONE BRIDGE. On Boucherot's Constant-Current Distributions (Sur les distributions à intensité constante de M. Boucherot), Tr. Lalesco. Revue Générale de l'Electricité, vol. 4, no. 26, Dec. 28, 1918, pp. 987-988, 3 figs. Shows that in Wheatstone-bridge arrangement for transforming constant-potential alternating current into one of constant intensity, it is not necessary that the four resistances be equal and operation may be secured by having two of the branches of equal resistance and opposite sign.

INDICATING INSTRUMENTS, HYSTERESIS OF. The Determinateness of the Hysteresis of Indicating Instruments, F. J. Schlink. Jl. Wash. Acad. Sci., vol. 9, no. 2, Jan. 19, 1919, pp. 38-45, 2 figs. Result of preliminary experiment to ascertain to what extent hysteresis or variance determinations with respect to non-integrating mechanical measuring instruments are sufficiently definite and reproducible to warrant wide application in instrument testing, calibration and utilization. Conclusion is reached that no extraordinary experimental care is required to arrive at hysteresis determination of very definite utility, and that, under stated conditions, such determinations are of a highly reproducible character.

MAGNET TESTING. Testing Permanent Magnets by Means of a Voltmeter. Elec. Wld., vol. 73, no. 6, Feb. 8, 1919, pp. 267-268, 1 fig. Magnetometer may be devised by modifying a d'Arsonval type voltmeter; descriptions of useful tests.

PORCELAIN INSULATORS. Photographic Study of Porcelain Insulators, Harold G. Tufty. Elec. Wld., vol. 73, no. 6, Feb. 8, 1919, pp. 268-271, 3 figs. Polarized light employed in examination of thin sections of insulators some of which have been properly fired while others were underfired and still others overfired; observations on used insulators.

RAILWAY MOTOR TESTING. Railway Motor Testing — II. Elec. Jl., vol. 16, no. 2, Feb. 1919, pp. 76-79, 3 figs. Survey of practical methods accepted by operating companies. Armature testing of standard four-pole lap or two-circuit wound 500-volt railway motors.

RESISTANCE MEASURING BY VOLTMETER. On the Voltmeter Method of Measuring Resistances (Note sur la mesure d'une résistance par la méthode du voltmètre), H. Panchon. Revue Générale de l'Electricité, vol. 4, no. 25, Dec. 25, 1918, p. 972, 1 fig. In formula $X = (E - U) R/U$. RE is called K and expression reduces to $(X + R) U = K$. The graph presented gives X in terms of U. Discussion of Puget's method in R. G. E., Aug. 31, 1918.

THERMOCOUPLES AND PYROMETERS. Checking Calibration of Thermocouples and Pyrometers. Elec. Rev., vol. 74, no. 2, Jan. 11, 1919, pp. 56-59, 6 figs. Sources of error in thermocouples, pyrometers and leads; methods of testing works units against secondary and works standards; maintenance of standards; apparatus recommended for carrying on work.

VOLTAGE MEASUREMENT. The Measure of High Voltages by Means of Kligelfuss Sclerometer (La mesure des hautes voltages au moyen du scléromètre Klingelfuss). Paul Joye. Archives des Sciences Physiques et Naturelles, vol. 46, Nov. 1918, pp. 243-251. An independent third circuit is introduced in induction coil in space which separates right and left portions of secondary winding; this circuit connected to a voltmeter is the sclerometer. Present article gives analytical discussion and experimental results of effects of voltages in primary aud secondary windings on readings of voltmeters.

WATT-HOURS METERS. Testing Single-Phase Watt-Hour Meters Using a Rotating Standard, P. B. Findley. Power, vol. 49, nos. 4 and 5, Jan. 28 and Feb. 4, 1919, pp. 118-121 and 168-171, 18 figs. Jan. 28: Considers meter used on distributing circuits and method of testing it, using an indicating watt-meter; Feb. 4: Construction of rotating standard watt-meter is described and application to testing single-phase watt-hour meters discussed.

POWER APPLICATIONS

AGRICULTURE, ITALY. Application of Electricity to Agriculture in Italy (Applicazioni agricole dell' elettricita con riferimento speciale alle condizioni dell' Arzo Romano), D'Escani Alessandro. Annali d'Ingegneria e d'Architettura, year 33, no. 21, Nov. 1, 1918, pp. 330-332. Discusses necessity for wider application of electricity to agriculture, especially for ploughing, threshing, pressing hay and traw, and for pumping water for irrigation purposes.

Coal Mines. The Electric Installations of the Coal Mines in Blackhall, England (Les installations électriques des charbonnages de Blackhall, Angleterre). Génie Civil, vol. 74, no. 1, Jan. 4, 1919, pp. 1-4, 6 figs.

Shop Motors. Light, Electricity and the Shop, C. E. Clewell. Am. Mach., vol. 50, no. 4, Jan. 23, 1919, pp. 163-167, 11 figs. Motors for drilling and boring machines.

Steel-Mill Drives. Electric Steel Mill Drive Developments, Brent Wiley. Blast Furnace, vol. 7, no. 1, Jan. 1919, pp. 35-37, 5 figs. Consideration given to standardization; variation in mill schedule permitted by flexibility of electric drive; tendency toward central station and 60-cycle apparatus.

Electrically-Driven Plate Mills, G. E. Stoltz. Elec. Jl., vol. 16, no. 2, Feb. 1919, pp. 68-73, 10 figs. Typical steel mill drives; torque curves of induction motor at various r.p.m. rolling plate from slab; graphic chart of load on a 90-in plate mill; power consumption. Paper road before Phila. Section Assn. Iron & Steel Elec. Engrs.

Modern G. E. Electric Steel Mill Drives, Blast Furnace, vol. 7, no. 1, Jan. 1919, p. 37. Electric drive operating 1200-ton hydraulic bloom shear with rapid acceleration and retardation and distance control.

STANDARDS

Aluminum Conductors, Standards for. Proposed Specifications for Aluminum Electrical Conductors (Projet de conditions de réception des conducteurs d'électricité en aluminum). Revue Générale de l'Electricité. vol. 4, no. 24, Dec. 24, 1918, pp. 931-933. Preliminary report submitted to l'Union des Syndicats by one of their sub-committees. Report comprises chemical definition, mechanical resistance, modulus of elasticity, flexibility, coefficient of expansion and electrical conductivity of aluminum.

Current and Potential Standards. A New Standard of Current and Potential, Chester T. Allcutt. Elecn., vol. 81, no. 2117, Dec. 13, 1918, pp. 684-685, 6 figs. Abstract of paper before the American Institute of Electrical Engineers.

Standardization Division in Plants. Srandardization Division in a Plant Manufacturing Electrical Material (Organisation d'un service d'études des normalisations dans une usine de constructions électriques), J. Fièvez. Revue Générale de l'Electricité, vol. 4, no. 25, Dec. 21, 1918, pp. 975-978, 1 fig. Suggests division, under direction of technical department, to study selection of standards that will meet all conditions which may be required by public. Functions of proposed division and its relation to various other departments are outlined.

Wave-Shape Standards. Review of Work of Sub-Committee on Wave Shape Standard of the Standards Committee, Harold S. Osborne. Proc. Am. Inst Elec. Engrs., vol. 38, no. 1, Jan. 1919, pp. 1-28, 12 figs. After careful considerations and extensive experimental work sub-committee recommends that for the present the 10 per cent deviation rule should be retained and that trial use should be made of a supplementary wave-shape factor, based on the relation between voltage wave shape and interfering effect in telephone circuits when power and telephone lines parallel each other.

TELEGRAPHY AND TELEPHONY

Cables, Fault Location in. A Useful Arrangement of the Murray Loop Test, L. J. Sell. Post Office Elec. Engrs. Jl., vol. 2, pt. 4, Jan. 1919, pp. 225-228, 3 figs. Applicable in case of cable fault when some wires only are seriously affected and a good wire of same gage and length as faulty wires is available.

Fault Location Tests, J. B. Salmon. Post Office Elec. Engrs. Jl., vol.2, pt. 4, Jan. 1919, pp. 215-224, 5 figs. Examination of difficulties incidental with location of cable faults by Varley and Murray loop tests, Anderson and Kennelly overlap test and Blavier test. Conditions under which each of these tests is most suitable.

Central Battery System Telephones. Note on the C. B. S. Telephone System. Post Office Elec. Engrs. Jl., vol. 2, pt. 4, Jan. 1919, pp. 197-203, 6 figs. Essential features of central battery system and comparison with present signaling system; study of main characteristics desirable in an exchange designed for local battery talking and automatic calling and clearing.

Continuous Oscillation Generators. The Oscillating Valve, E. V. Appleton. Wireless World, vol. 6, no. 70, Jan. 1919, pp. 538-543, 6 figs. Elecn., vol. 81, no. 2119, Dec. 27, 1918, pp. 743-744, 3 figs. Wireless World: Formulæ to determine conditions required for production of continous electrical oscillations by any three-electrode valve from knowledge of its static characteristics; Elecn.: Three-electrode thermionic valves, functioning as generator of continuous electrical oscillations, regarded as a tube possessing negative resistance; action analigous to other continuous oscillation generators.

Multiplex Telegraphy. Modus Operandi of Multiplex Telegraphy. Elec. Rev., vol. 74, no. 2, Jan. 11, 1919, pp. 49-51, 6 figs. Further details concerning principles and application of recently developed system of multiplex telephony and telegraphy; equipment and operation of Washington-Pittsburg circuit.

Multiplex Telephony. New Multiplex System of Telephony. Elec. World, vol. 73, no. 1, Jan. 4, 1919, pp. 11-13, 5 figs. System developed to increase manifold the message-carrying capacity of long-distance telephone and telegraph wires; suggestive value of earlier undertakings in this filed.

Perturbations in Lines. Influence of Single-Phase Traction Lines on Lines Carrying Feeble Currents (Influencia de las lineas monofàsicas de traccion sobre las lineas de débil corriente), Francisco Wais San Martin. Revista de Obras Publicas, year 66, no. 2253, Nov. 28, 1918, pp. 590-592, 2 figs. Causes of perturbations in telephone and telegraph lines running parallel to electric roads; devices and arrangements to prevent perturbations.

Phanoplex. Phanoplex Telegraphy (in Japanese), Y. Fuseno. Denki Gakkwai Zasshi, no. 364, Nov. 18, 1918.

Quadruplex Telegraphy. Morse Quadruplex Working. Post Office Elec. Engrs., Jl., vol. 2, pt. 4, Jan. 1919, pp. 209-214, 2 figs. Discusses conditions under which stable quadruplex working on acrial wires may be contained at all times.

Radio Lighthouses. Accident Prevention at Sea by Radio-Lighthouse (La prévention des accidents de mer par radio-phares), A. Poidlouë. Génie Civil, vol. 73, no. 26, Dec. 28, 1918, pp. 510-512, 3 figs. Scheme and operation of Bellini-Tosi azimuth compass for determining direction of sending station; aerial installation consists of four vertical converging antennæ connected by horizontal conductors to compass; a coil is rotated around a divided circle; intensity of sound in telephone receiver is maximum when striking direction of origin of waves.

Radio Telegraphy. Progress of English Radiotelegraphy during the European War, and Notes on Its Application to Post-War Conditions (Exposé des progrès de la radiotélégraphie anglaise pendant la guerre européenne, accompagné de quelques notes sur l'application de cette découverte aux conditions qui existeront après la guerre). Goldfrey Isaac. Industrie Electrique, year 28, no. 637, Jan. 10, 1919, pp. 8-9.

The Vision of a Scientist. Wireless-World, vol. 6, no. 70, Jan. 1919, pp. 554-57. Remarkable forecasts of Sir William Crooks on wireless telegraphy. From Fortnightly Rev., Feb. 1892.

Radio Telephony. Some Aspects of Radio Telephony in Japan Eitaro Yokoyama. Wireless World, vol. 6, no. 70, Jan. 1919, pp. 569-574, 8 figs. Experiments on influence of electrode materials on discharge and of supply voltage on operation of discharger; static frequency transformer of T. Kujirai (Concluded) From Proc. Inst. Radio Engrs.

Sounder Silencers. Sounder Silences, R. T. King. Post Office Elec. Engrs. Jl., vol. 2, pt. 4, Jan. 1919, pp. 206-208, 2 figs. Modification of departmental relay no. 1000A so as to cause bell to ring when distant station holds down key for period of about ten seconds.

Telephone Circuits, Loaded. A Graphical Method of Calculating the Attenuation Constant of Loaded Telephone Circuits, E. S. Ritter. Post Office Elec. Engrs. Jl., vol. 2, pt. 4, Jan. 1919, pp. 187-196, 3 figs. Applicable only to loaded lines, including open wire aerial lines, underground and submarine cable.

Vacuum Tubes. The Development of the Vacuum Valve. Jl. Elec., vol. 42, no. 1, Jan. 1, 1919, pp. 20-22, 8 figs. Manufacturing details; uses in the war; importance in wireless telephony.

Developments in Radio Apparatus, George O. Squier. Elec. World, vol. 73, no. 3, Jan. 18, 1919, pp. 129-130. Application to radio communication of vacuum tube; improvements during war; airplane radio-telephone and radio-telegraph sets. From lecture before A. I. E. E. on Aeronautics in the United States from the Beginning of the War to the Present Time.

Theory of the Electric Oscillation in Vacuum Tubes (in Japanese) Y. Nozuki. Demki Gakkwai Zasshi, no. 365, Dec. 10, 1918.

TRANSFORMERS, CONVERTERS, FREQUENCY CHANGERS

Charts. Formulæ and Charts Relative to the Working under Load of Industrial Transformers (Formules et abaques relatifs au fonctionnement en charge des transformateurs industriels), L. Dubar. Revue Générale de l'Electricité, vol. 4, no. 22, Nov. 30, 1918, pp. 817-821, 7 figs. Output and voltage drop at various loads and with different angular displacements, obtained from construction data and test results.

Electric Furnace Transformers. High Intensity Transformers for Electric Fornaces (Etude sur le calcul de transformateurs à forte intensité pour fours électriques), R. Jacquot. Revue Générale de l'Electricité, vol. 4, no. 17, Oct. 26, 1918, pp. 602-617, 2 figs. Classification of transformers used in electrometallurgy; their respective losses and cost.

Oils. Some Characteristics of Transformer Oils, O. H. Eschholz. Elec. Jl., vol. 16, no. 2, Feb. 1919, pp. 74-76, 2 figs. Test figures comparing vapor pressures of transformer oil with those of liquids of well-known characteristics.

Operation. Essentials of Transformer Practice — XIX. Operating Conditions, E. G. Reed. Elec. Jl., vol. 16, no. 2, Feb. 1919, pp. 66-68. Short-circuits and grounds; drying out transformers; care of insulating oil; mechanical stresses on short circuit.

Starting Current. Calculation of Starting Current in A. C. Transformers for Electric Traction (Der Einschaltstrom von Wechselstrom-Transformatoren fuer die elektrishe Traktion), W. Kummer, Schweiz. Bauzeitung, vol. 72, no. 24, Dec. 14, 1918, pp. 233, abstracted from M. Vidmar's article in Elektrotechnik & Maschinenbau, 1918, p. 273. Gives formulas for calculating the resistance capacity of idle transformers.

TRANSMISSION, DISTRIBUTION, CONTROL

Cables, High Tension. Experimental Investigation of High-Tension Cables, Tsunezo Hada. Denki Gakkwai Zasshi, no. 364, Nov. 10, 1918, 27 pp., 15 figs. Establishes as result of experiments that in a strand cable the minimum potential gradient or the maximum breakdown voltage is practicaly at position where $D/2h = \epsilon$. as as in ease of a single-core conc entric cable.

Distribution Problems. North-Eastern. Centre: Chairman's Address, A. P. Pyne. Jl. Instn. Elec. Engrs., vol. 57, no. 277, Dec. 1918, pp. 53-40. Question of generating electricity in bulk and its distribution over wide areas.

Insulators, Line. An Operating View of High-Tension Insulators, P. Ackerman. Elec. World, vol. 73, no. 3, Jan. 18, 1919, pp. 116-119, 4 figs. Severe operating conditions that have caused failure of line insulators; later designs of pin and suspension types promise to solve insulator problem for some years to come.

Application of Theory and Practice to the Design of Transmission Line Insulators, G. I. Gilchrest and T. A. Klinefelter. Elec. Jl., vol. 16, no. 1, Jan. 1919, pp. 8-16, 28 figs. Laboratory tests of various new designs and comparison of these designs with those now in commercial use.

Line Poles. When a Line Pole Needs a Guy, Charles R. Harte. Elec. Ry. Jl., vol. 53, no. 3, Jan. 18, 1919, pp. 139-142, 7 figs. Summary of experience of telephone and power companies as guide to electric-railway transmission line construction.

METERS. Notes on Demand Meters, H. W. Richardson. Elec. World, vol. 73, no. 5, Feb. 1, 1919, pp. 219-222, 2 figs. Indicating demand meters for small and recording or curve-drawing meters for larger installations; principles upon which modern demand meters operate.

PHASE CONVERSION. The Supply of Single-Phase Power from Three-Phase Systems, Miles Walter. Elecn., vol. 81, no. 2117, Dec. 13, 1918, pp. 682-684, 5 figs. Abstract of paper before the Institution of Electrical Engineers.

POWER CONDUCTORS. Arrangement of Power Conductors. Jl. Elec., vol. 42, no. 2, Jan. 15, 1919, pp. 72-74, 9 figs. Recommendations for spacing of power lines as made by Cal. Committee on Inductive Interference. Figures and comparisons given apply to non-transposed circuits; comparisons of different configurations hold also for transposed circuits, provided circuits are transposed indentically.

POWER CONTROL. The Control of Large Amounts of Power, E. B. Wedmore. Power House, vol. 11, no. 12, Dec. 1918, pp. 363-367, 5 figs. Limitation by sectionalizing and employment of feeder or busbar reactances. Paper before Instn. Elec. Engrs. (To be continued).

POWER FACTOR. Improving Power Factor by Use of Synchronous Motors. (Emploi des moteurs synchrones pour améliorer le facteur de puissance), Paul Rieumier. Revue Gȷnérale de l'Electricité, vol. 5, no. 1, Jan. 4, 1919, pp. 3-16, 5 figs.

POWER TRANSMISSION. Latest Developments in the Electric Transmission of Power, P. M. Lincoln. Jl. Cleveland Eng. Soc., vol. 11, no. 3, Nov. 1918, pp. 153-159 and (discussion) pp. 159-161. Limitation of direct-current transmission; early experiments in transmission by alternating current; Tesla's patents in 1889; Mershon's first observations of corona phenomena; the 40,000-volt installation at Telluride Power Co.; recent discoveries concerning nature of coronas.

RELAYS. The Orling Jct Relay (Le relais Orling à jet), J. Pomey. Revue Générale de l'Electricité, vol. 4, no. 24, Dec. 14, 1918, pp. 899-900, 2 figs. Usage in extensive cable lines of relays constructed on electrocapillary principles.

SUBSTATIONS. Automatic Substations on the North Shore Line, Charles H. Jones. Elec. Ry. Jl., vol. 53, no. 2, Jan. 11, 1919, pp. 84-90, 8 figs. Three new substations in operation and another under construction save 177 miles of 500,000-cir mils cable worth $650,000.

SWITCHES, OIL. Oil Switches (Considérations sur les disjoncteurs à l'huile), W-A. Coales and W-H. Wadmore. Revue Générale de l'Electricité, vol. 4, no. 23, Dec. 7, 1918, pp. 882-887, 7 figs. Provisions which must be made in designing them : their use in connection with time lag relays; characteristic factors; installation.

WIRING, TRANSMISSION. Electric Transmission Wiring from the Viewpoint of Appearance (Zur Aesthetik des Linienbaues bei elektrischen Freileitungen). Dr. P. Neusch-Sigrist, Bern. Schweiz, Elektrotech,Verein Bulletin, vol. 9, No. 12, December 1918, pp. 277-289, 13 figs. Calls attention to the desirability of underground wiring, where feasible, and to the need of using judgment and good taste in the design and location of exposed wire supports.

VARIA

ALUMINUM. Aluminum in Electrical Apparatus (L'aluminum dans l'appareillage électrique), C. Zetter. Revue Générale de l'Electricité, vol. 4, no. 23, Dec. 7, 1918, pp. 887-891, 14 figs. How aluminum ingots, sheets and bars can be used in manufacture of some electrical fixtures which it has been customary to make of copper.

Use of Aluminum in the Electrical Industry (Sur l'emploi de l'aluminum dans l'industrie de l'électricité), E. Dusaugey. Revue Générale de l'Electricité, vol. 5, no. 2, Jan. 11, 1919, pp. 53-58, 14 figs. Aluminum conductors in electric transmission lines; aluminum in electrical machines. Conference before the Société Française des Electriciens. Also abstracted in Bulletin de la Société Française des Electriciens, vol. 8, no. 74, Nov. 1918, pp. 349-377, 14 figs.

LIGHTNING ARRESTERS. Impulse-Gap Lightning Arresters, Q. A. Bracket. Elec. Jl., vol 16, no. 2, Feb. 1919, pp. 52-54, 4 figs. Scheme is essentially a Wheatstone bridge that is balanced at low frequency and unbalanced at high frequency. Diagram and typical com mercial construction are illustrated.

TRANSMISSION LINES, PROTECTION OF. Degradation Perpetrated on Electric Transmission Lines and Their Repression (Des déprédations commises contre les réseaux électriques et de leur répression), Jean de la Ruelle. Revue Générale de l'Electricité, vol. 4, no. 25, Dec. 21, 1918, pp. 981-983. Proposes asking tribunals to establish severe penalties for delinquencies and also to effect such modifications as greater separation of poles, construction of lines through private property, and eventually securing a right of way the same as railroads

MECHANICAL ENGINEERING

AIR PUMPS. Air Ejectors (Les éjecteurs extracteurs d'air), L. Couge. Revue Générale de l'Electricité, vol. 4, no. 17, Oct. 26, 1918, pp. 629-632, 6 figs. Details of Westinghouse-Leblanc air pump, of Breguet ejector and of British Westinghouse apparatus.

CORROSION

WIRE ROPES. Interior Corrosion of Wire Ropes, Wm. Fleet Robertson. Can. Min. Jl., vol. 40, no. 1, Jan. 8, 1919, pp. 6-7. Report of tests undertaken on rope which broke, it is said, by oxidizing of wires, chiefly internally, caused by action of corrosive water and a humid atmosphere.

FORGING

DROP HAMMERS. 4-ton Drop Hammer at Crewe Works. Engineering, vol. 106, no. 2765, Dec. 27, 1918, pp. 736-737, 7 figs. Description with illustrations of the hammer and some of its work. Its development and the necessary equipment.

EUROPEAN SITUATION. Some Drop Forge Possibilities Abroad, L. W. Alwyn-Schmidt. Am. Drop Forger, vol. 4, no. 12, Dec. 1918, pp. 471-473. Review of present conditions; situation in foreign countries; methods of procuring business in Europe.

FORGE-SHOP CAPACITY. Selecting a Source of Supply for Forgings, W. F. Rockwell. Am. Drop Forger, vol. 5, no. 1, Jan. 1919, pp. 1-3. Convenience of enlarging forge-shop capacity; preference of buyers to order forgings by sets.

FORGE SHOP. Pan Motor Forge Shop About Completed. Am. Drop Forger, vol. 4, no. 12, Dec. 1918, pp. 490-492. Details of layout and equipment; methods for handling raw and finished material. Shop to be largest in U. S.

A Progressive Forge Shop in Rockford. Am. Drop Forger, vol. 4, no. 12, Dec. 1918, pp. 480-481, 6 figs. Equipment and general layout of departments.

Modern Forge Shop at the Essington Plant. Am. Drop. Forger, vol. 4, no. 12, Dec. 1918, pp. 474-475, 3 figs. General description of works turning out marine equipment. Layout of Shops allows for future expansiou.

FORGING INDUSTRY. A Review of the Drop Forging Industry, A. W. Peterson. Am. Drop Forger, vol. 5, no. 1, Jan. 1919, pp. 36-38, 2 figs. Data showing production development of forging industry over period of 35 years; importance of forging industry during years of war.

FURNACES. Heating and Preheating Forging Furnaces. Blast Furnace, vol. 7, no. 1, Jan. 1919, pp. 57-59, 4 figs. Recent installation designed to withstand distorting action of heat as well as wear. Combustion chambers on preheating furnaces are stagfered on each side.

HISTORICAL DATA. Historical Data on Hammers and Forgings, Howard Terhune. Am. Drop Forger, vol. 5, no. 1, Jan. 1919, pp. 39-41. Review of improvements since issue of first patent in 1842; introduction of principle of moderu board drop hammer in 1861; present tendencies.

FOUNDRIES

BRASS FOUNDRIES. Materials and Chemicals Used in Brass Fouudry Practice, Charles Vickers. Brass World, vol. 14, no. 12, Dec. 1918, pp. 343-345. Deals with history, properties, appearance, physiological action and commercial use of substances commonly used in brass founding. First of series of articles.

CASTING METHODS. Molding and Pouring a Gasoline Engiue Bed, F. H. Bell. Can. Machy., vol. 21, no. 5, Jan. 30, 1919, pp. 106-108, 4 figs. Shows method of casting a sheet steel bottom into a grey iron casting making entire bed into a tank.

CORE OVENS. The Application of Pyrometers to Core Ovens, G. W. Keller. Foundry, vol. 47, no. 318, Feb. 1919, pp. 72-74, 3 figs. From a paper before Am. Foundrymen's Assn.

FURNACE, ELECTRIC. The Electric Furnace in the Grey Iron Foundry, F. H. Bell. Can. Machy., vol. 21, no. 1, Jan. 2, 1919, pp. 7-8, 4 figs. Practicability of melting gray iron for foundry purposes by electricity; process followed at Bowmanville Foundry Co.

IRONS. Conversion of White Iron into Foundry, C. T. Huang. Iron Age, vol. 103, no. 4, Jan. 23, 1919, pp. 231-232. How Chinese native irons may be made available as a means of relieving the scarcity of other grades in that country.

MOLDING. Molding Shoes for Caterpillar Tractors. Iron Age, vol. 103, no. 2, Jan. 9, 1919, pp. 119-120, 3 figs. Daveuport molding machine with hurriedly devised handling rigging gives satisfactory results; 1000 shoes made per day.

PATTERNS. The Laying Out of Patterns, Joseph A. Shelly, Machy., vol. 25, no. 6, Feb. 1919, pp. 493-497, 12 figs. Methods of making the drawings or layouts that are required by the patternmaker in planning his work, together with allowances necessary for draft and shrinkage and for machining castings in the shop.

STEEL CASTINGS ON PACIFIC COAST. Steel Castings on the Pacific Coast. Iron Age, vol. 103, no 4, Jan. 23, 1919, pp. 233-235, 2 figs. Growth of industry due to the war; good steel made without pig iron; overcoming manufacturing difficulties.

TUMBLING BARRELS. Tumbling Barrels in Foundries (Scheurfaesser und Putztrommeln in Giessereibetrieben), Rauch und Staub, vol. 8, no. 12, Sept. 1918, pp. 113-114. General discussion on construction, use and advantages of tumbling barrels for changing castings. States that castings up to 45 in. long and weighing 2000 lbs. can be cleaned in suitable revolving drums. Describes inclined drums 36 ft. long, 28 in. in diameter.

FUELS AND FIRING

ARGENTINE. Fuels in Argentine (Die Brennstoffe Argentinens), Rauch und Staub, vol. 8, no. 12, Sept. 1918, pp. 114-115. General discussion on the fuel situation in Argentina, abstracted from Berichte ueber Handel und Industrie, vol. 23, no. 4, Feb. 1918.

ASH. Fusibility of West Virginia Coal Ash, Walter Selvig. Coal Age, vol. 15, uo. 1, Jan. 2, 1919, pp. 12-16, 2 figs. Method of preparing ash for fusion test and determining initial softening temperature and interval of fusion. Includes a tabulation of tests on West Virginian coals.

BAGASSE. Bagasse Feeders, Furnace Design and Furnace Control, A. Gartley. La. Planter, vol. 62, no. 21, Jan. 11, 1919, pp. 25-28, 5 figs. Suggestions on design; curves giving pounds of water which can be evaporated per pound of bagasse having differeut percentages of moisture. Paper before Hawaiian Sugar Planters' Assn.

BRIQUET. Some Notes on the Manufacture of Fuel Briquettes, E. H. Robertson. Trans. Min. & Geol. Inst. India, vol. 13, pt. 1, Sept. 1918, pp. 49-61, 6 figs. Analysis of manufacturing methods; results obtained by some experimenters; examples of survivance of briquettes.

The Economy of Briquetting Small Coal, J. A. Yeadon. Trau. Min. Inst. Scotland, vol. 40, pt. 7, 1918-1919, pp. 145-148 and (discussion) pp. 148-150. Gain in calorific power by briquetting with pitch as agglomerant rectangular and " ovoid " forms of briquettes.

COAL SELECTION. Selecting Coal for Power Plant Use, Robert June. Elec. Rev., vol. 74, no. 3, Jan. 18, 1919, pp. 94-97, 4 figs. Characteristics of various coals; influence of coal upon furnace-chamber design; purchase of coal. (First of series on power-plant management.)

CLAY PRODUCTS BURNING. Fuel Economy in Clay Products Burning III, A. V. Bleninger and A. F. Greaves Walker. Can. Mfr., vol. 39, no. 1, Jan. 1919, pp. 87-88. Means of controlling burning.

CONSERVATION. Fuel Conservation, Robert Collett. New England R.R. Club, Dec. 10, 1918, pp. 190-208. Waste of fuel by reason of engines delayed on road and by engines kept under steam unnecessarily at terminals; improper handling of engines; excessive firing; engines not in good condition; fuel not up to contract specification.

The Threatened Coal Shortage and the Possible Methods of Economising Fuel—II, John B. C. Kershaw. Cassier's Eng. Monthly, vol. 54, no. 6, Dec. 1918, pp. 308-315, 2 figs. Applicability of remedies proposed in October issue to English conditions; recommendations of U. S. Fuel Administration; coal-dust firing as an aid to fuel conservation.

Fuel Economy Will Continue a Serious Problem, W. A. Shoudy. Elec. World, vol. 73, no. 1, Jan. 4, 1919, pp. 14-16, 3 figs. Can be improved by proper application of correctly designed apparatus maintaining high vacuum, eliminating small wastes and not operating too many boilers; other suggestions.

DRAFT. Saving the Waste in the Chimney—III, Robert Sibley and Chas. H. Delany. Jl. Elec., vol. 42, no. 2, Jan. 15, 1919, pp. 79-80, 1 fig. Determination of actual draft required for different fuels. Chart showing lbs. of coal burned per sq. ft. grate surface pr hr. against draft between furnace and ash pit in in. of water.

Steam Plant Efficiency. Coal Trade Jl., year 51, no. 2, Jan. 8, 1919, pp. 37-38, 4 figs. Relation between kinds of coal and completeness of combustion for six sets of conditions; gaging air supply for given furnace and fuel. (Concluded.)

FUEL REQUIREMENTS FOR FACTORIES. Fuel Requirements for Factories, Charles L. Hubbard. Indus. Management, vol. 57, no. 2, Feb. 1919, pp. 125-126. How to make tests of fuel requirements for extremes of weather, calculate needs for other conditions and outside temperatures, and estimate amount of fuel needed month by month throughout heating season.

GAS. Uses Gas in Twenty-One Manufacturing Processes, F. M Lester. Gas Age, vol. 43, no. 2, Jan. 15, 1919, pp. 102-104, 6 figs. How gas is used in plant manufacturing gasoline motors and railway supplies and consuming 10,000,000 cu. ft. gas per month.

HEAT VALUE, DETERMINATION OF. Use of the Hydrogen-Volatile-Matter Ratio in Obtaining the Net Heating Value of American Coals, A. C. Fieldner and W. A. Selvig. Department of Interior, Bur. of Mines, tech. paper 1917, 13 pp. 4 figs. Curves, constructed from 2000 analyses, showing relation between percentages of hydrogen and volatile matter of different coals.

Calorific Valuation of Coal Without a Calorimeter, Proctor Smith. Cassier's Eng. Monthly, vol. 54, no. 6, Dec. 1918, pp. 333-334. Approximate analysis by Goutal's formula.

INDIANA COALS. Getting Better Combustion of Indiana Coals, T. A. Marsh. Elec. World, vol. 73, no. 2, Jan. 11, 1919, pp. 72-74, 7 figs. Practical methods by means of which furnace equipment installed years ago can be made to produce results comparable with good modern practice.

LIGNITES. Combustion of Lignite and High-Moisture Fuels, T. A. Marsh. Elec. World, vol. 73, no. 6, Feb. 8, 1919, pp. 265-267, 5 figs. Typical nalyses of high-moisture fuels in the United States and Canada and summary of experience derived from burning fuels of the kinds described in power plants.

Notes on Lignite, S. M. Darling. Power Plant Eng., vol. 23, no. 3, Feb. 1, 1919, pp. 148-150. Characteristics and utilization. Abstract of Technical Paper 178, Bureau of Mines.

LIQUID FUELS. Liquid Fuels (Les combustibles liquides), A. Guiselin. Mémoires et Compte rendu des travaux de la Société des Ingénieurs civils de France, year 71, no. 10, Oct. 1918, pp. 453-548, 2 figs. Study of the means to insure equilibrium between production and consumption of liquid fuels in France. Following topics are considered: Liquid fuels in U. S. and in England; possible progress in distillation of bituminous schists; production of tars and benzol in France; utilization of lignite and peat deposits; other sources of manufacturing liquid fuels with reference to the work done by the Société des Etablissements Simon-Carvès.

MOTOR FUEL. The Motor Fuel Problem, W. R. Ormandy. Colliery Guardian, vol. 116, no. 3021, Nov. 22, 1918, pp. 1076-1077. From paper before Instn. of Petroleum Technologists.

PEAT. Peat and Electrical Industry (La tourbe et l'industrie électrique), Pierre Gieu. Revue Générale de l'Electricité, vol. 4. no. 22, Nov. 30, 1918, pp. 843-851, 3 figs. Artificial drying and gasification of peat; effects of humidity on its calorific value; permissible percentage of humidity. Results of an extended investigation undertaken under the direction of Minister of Mines, Canada.

Peat in 1917, C. C. Osborn. Department of Interior, U. S. Geol. Survey, Mineral Resources of the United States—Part II, Dec. 19, 1918, pp. 257-283, 1 fig. General conditions of peat industry; occurrence, propeities and uses of peat; peat industry in principal foreign countries; selected bibliography; map of U. S. showing principal peat deposits.

POWDER FUEL. Progress Realized During the War in the Utilization of Fuels (Progrès réalisés pendant la guerre dans l'utilisation des combustibles), E. Damour. Industrie Electrique, year 28, no. 637, Jan. 10, 1919, pp. 5-7. Gasification and pulverization of fuels. From extensive account in Chimie et Industrie.

Powdered Coal Advance and Development. H. A. Kimiber. Blast Furnace, vol. 7, no. 1, Jan. 1919, pp. 67-68. Use of powdered fuel for steam generation; improvements in distribution; control of fuel; summary of furnaces for which pulverized coal was installed during 1918.

A review on the Use of Powdered Coal, W. O. Renkin. Am. Drop Forger, vol. 5, no. 1, Jan. 1919, pp. 22-25, 3 figs. Early uses and present methods; comparative data on fuels.

Suggestions for Burning Pulverized Coal, W. G. Wilcox. Am. Drop Forger, vol. 4, no. 12, Dec. 1918, pp. 492-494. Control of combustible and air in burning pulverized coal; method of projecting coal in suspended form into furnace; importance of mixing coal dust properly.

STOKERS. Fuel Burning Equipment of Modern Power Stations, Joseph G. Worker. Elec. Jl., vol. 16, no. 2, Feb. 1919, pp. 55-60, 15 figs. Examples of various installations using underfeed stokers, auxiliary equipment to control their operation.

Mechanical Stokers—II, Robert June. Brick & Clay Rec., vol. 53, no. 14, Dec. 31, 1918, pp. 1147-1149, 3 figs. Concludes from examination of various types that chain-grate stoker is suitable for boilers of good size up to 250 per cent rating and overfeed stoker for medium sized installations up to 200 per cent rating.

WASTE HEAT, UTILIZATION OF. Utilization of Waste Heat at Municipal Gas Works of Tuebingen (Die Abhitzegewinning und verwertung im staedt, Gaswerk Tuebingen), Henig. Journal fuer Gasbeleuchtung, vol. 61, no. 45, Nov. 9, 1918, pp. 529-534, 1 fig. History and performance of rational waste-heat system utilized for heating water for distant muncipal bath. Tests. Costs.

Steam Raising with Waste Heat from Coal and Oil-Fired Furnaces, Iron & Coal Trades Rev., vol. 97, no. 2648, Nov. 22, 1918, pp. 580, 4 figs. Description of standard heat-raising unit (Brett system); embodying coal-fired furnace with boiler.

GAGES

PROFILE GAGES. Grinding Accurate Profile Gages by Means of Master Plates, Herbert M. Darling. Am. Mach., vol. 50, no. 3, Jan. 16, 1919, pp. 105-106, 3 figs. Description of operation.

THREAD AND WING GAGES. Thread Gages; Wing Gages, Erik Oberg. Machy., vol. 25, no. 6, February, 1919, pp. 502-506, 13 figs. Last of a series of articles describing principles involved and procedure followed by the Pratt & Whitney Company in developing gaging systems for interchangeable manufacture.

The Precision Measurement of Thread Gages, Can. Machy., vol. 21, no. 5, Jan. 30, 1919, pp. 113-115, 4 figs. Commercial equipment manufactured by Arthur Knapp Eng. Corporation after models developed by Bur. of Standards.

HANDLING OF MATERIALS

ASH HANDLING. Bennis Ash Handling Plant. Elecn., vol. 82, no. 2121, Jan. 10, 1919, pp. 84-85, 3 figs. Pneumatic ash plant; steam suction conveyors, ash elevators and ash hoists.

COAL HANDLING. Coal Handling at Ports, H. Hubert. Elecn., vol. 82, no. 2121, Jan. 10, 1919, pp. 42-45, 6 figs. An account of a number of modern plants for dealing with coal at ports.

Coal-Handling Appliances at the Coventry Electricity Works, George Frederick Zimmer. Engineering, vol. 107, no. 2767, Jan. 10, 1919, pp. 37-42, 27 figs. Drawings, general data and description of the plant.

Coal Tipple and Washery at Lehigh, Mont., E. P. Stewart, Coal Age, vol. 15, no. 1, Jan. 2, 1919, pp. 9-11, 4 figs. Apparatus designed to clean coal thoroughly and prepare locomotive fuel.

Coal Handling Plant at Sewall's Point, Virginia. Power, vol. 40, no. 2, Jan. 14, 1919, pp. 54-56, 5 figs. Description of new facilities of Virginia Railway at coal pier near Norfolk, Va. From Coal Age.

COKE. The Mechanical Handling of Coke, Alwyne Meade. Elecn., vol. 82, no. 2121, Jan. 10, 1919, pp. 57-61, 8 figs. The problems involved; description of conveyors dsigned to overcome difficulties; aspects of cost.

EXPLOSIVES. Munition Handling Devices. Elecn., vol. 82, no. 2121, Jan. 10, 1919, pp. 73-75, 5 figs. A few examples in which well-known types of conveying apparatus are modified to serve specific purposes in the manufacture of explosives.

GRAVITY ROLLER RUNWAY. The Gravity Roller Runway, George Frederick Zimmer. Elecn., vol. 82, no. 2121, Jan. 10, 1919, pp. 33-41, 28 figs. The component parts of gravity roller runways; accessory plant such as shoots, "humpers," stackers and "gadets."

MECHANICAL HANDLING. The Mechanical Handling of Materials, Percy G. Donald. Elecn., vol. 82, no. 2121, Jan. 10, 1919, pp. 29-32, 8 figs. After discussing objections to mechanical handling, the author deals with such plant as an investment, the speed that is desirable, the importance of a suitable layout, and finally indicates the various types of plant that are available.

PAPER MILL. Material Handling in a Paper Mill, Henry J. Edsall. Indus. Management, vol. 57, no. 2, Feb. 1919, pp. 97-103, 18 figs. Labor-saving equipment of Dill & Collins Co. (To be continued).

PNEUMATIC HANDLING OF CEREALS. Pneumatic Handling of Cereals, C. Bentham, Elecn., vol. 82, no. 2121, Jan. 10, 1919, pp. 61-67, 15 figs. Importance of peneumatic systems in unloading ships; types of plant in operation; the exhauster; problems involved in the design of a suitable nozzle. Portable Pneumatic Grain Unloading Plant. Conveying. Cassier's Eng. Monthly Supp., vol. 1, no. 7, Dec. 1918, pp. lxxxiii-lxxxvi, 4 figs. Equipment includes 6-cylinder Aster petrol engine of 85 hp. with rotary blower, mounted on 4-wheeled, 25-ton railway truck.

HEAT TREATING

DEVELOPMENTS IN 1918. 1918 Developments in Heat Treating, James H. Herron Am. Drop Forger, vol. 5, no. 1, Jan. 1919, pp. 53-54. Changes in methods used for heat-treating materials; scope of heat-treating activities.

FURNACES. Heating Furnaces and Annealing Furnaces—II, W. Trinks. Blast Furnace, vol. 7, no. 1, Jan. 1919, pp. 69-72 and 80, 7 figs. Design, operation and construction. Furnace capacity; rate of heat transfer; temperature to which metal is to be heated.

MALLEABLE IRON. Reducing the Malleable Iron Annealing Period, A. E. White and R. S. Archur. Foundry, vol. 47, no. 318, Feb. 1919, pp. 61-65, 12 figs. Report of an investigation made at the University of Michigan. From a paper before the American Foundrymen's Association.

Steel for Motors. Treatments of Steels Used in the Construction of Light-Weight Engines. (Emplois et traitments des aciers utilisés dans la construction des moteurs légers), M. L. Barbillon. Bulletin Technique de la Suisse Romande, year 44, nos. 15 and 17, July 27 and Aug. 24, 1918, pp. 140-142 and 158-160, 4 figs. July 27; Steel employed for shafts, nuts, bolts and cams. Aug. 24: Soft carbon steels; chrome-nickel steels; nickel steels; tungsten steels; special steel having 0.20C + 0.13 Si + 0.36 mm. + 12 Ni.

Lincoln Motor Co.'s Heat Treating Plant, F. L. Prentiss. Iron Age, vol. 103, no. 2, Jan. 9, 1919, pp. 107-111. 7 figs. Department equipped for quantity production in plant designed for changing from airplane to commercial motor work.

HEATING AND VENTILATION

Air Cooling. Special Applications of Small Air-Cooling Systems. Heat & Vent. Mag., vol. 16, no. 1, Jan. 1919, pp. 43-46, 4 figs. Arrangements with forced and gravity circulation of air.

Boiler Rating. Heating Versus Power Boiler Rating, P. J. Dougherty. Power, vol. 49, no. 3, Jan. 21, 1919, pp. 84-85. Showing why rules in general used for determining and comparing rating or capacity or high-pressure boilers are not applicable to low-pressure or so-called heating boilers.

Central Station Heating. Central Station Heating; Its Economic Features with Reference to Community Service, John C. White. Department of Interior, Bur. of Mines, tech. paper 191, 23 pp., 6 figs. Data on costs and results obtained with central heating stations.

Factory Heating. Modern Factory Heating, Alfred G. King. Domestic Eng., vol. 86, nos. 1 and 2, Jan. 4, 11, 1919, pp. 27-30 and 76-79, 11 figs. Requirements for factory heating; construction details.

Tunnel Ventilation. The Ventilation of Tunnels and Buildings, Francis Fox. Universal Engr., vol. 28, no. 6, Dec. 1918, pp. 40-46. Ventilation systems in operation at several European tunnels; prescribed hygienic practice concerning renovation of air in dwellings.

Ventilation Plant for Simplon Tunnel (Die Ventilationsanlage des Simplon Tunnels), F. Rothpletz. Schweizerische Bauzeitung, vol. 73, no. 1, Jan. 4, 1919, pp. 3-4, 3 figs. Remodeling and enlarging of the ventilation system, located at the north entrance only of the twin-tunnel, operated electrically. South ward air current chosen to avoid rusting of structural steel due to condensation if southern air were sent northward. Total air volume 180 cu. m. per sec. at velocity in tunnel of 3 to 4 m. per sec. Part 1.

Two-Pipe System. Care of Heating and Ventilating Equipment, Harold L. Alt. Power, vol. 49, no. 5, Feb. 4, 1919, pp. 156-159, 14 figs. A discussion of the two-pipe system. Seventh article.

Vapor Heating. Modern Practice in Vapor Heating. Heat & Vent. Mag., vol. 16, no. 1, Jan. 1919, pp. 48-52, 6 figs. The Broomell system.

HOISTING AND CONVEYING

Conveyor Types. Conveyors for Engineering Works. Engineer, vol. 126, no. 3283, Nov. 29, 1918, pp. 462, 3 figs. Deals with types in use in engineering works, wuch as conveyors for rapid assembly of motors, case elevators, and shell conveyors. (Form paper beofre Manchester Assn. of Engrs., by W. H Atherton).

Design. Some Details of Conveyors and Elevators, W. H. Atherton. Elecn., vol. 82, no. 2121, Jan. 10, 1919, pp. 46-49, 20 figs. Design of a number of essential details in conveyors and elevators, dealing with chains, sprocket wheels, buckets, skidders, frames and bearings.

Design of Electrically-Driven Lifting Blocks. Elecn., vol. 81, no. 2115, Nev. 29, 1918, pp. 639-640, 7 figs. Abstract of article in Elektro-technische Zeitschrift, No. 1, 1918.

Electric Haulage. Notes on Three-Phase Electric Haulage Equipment, L. Fokes. Colliery Guardian, vol. 116, no. 3025, Dec. 20, 1918, pp. 1295-1296, 5 figs. Haulage room; motor; slip rings and brush gear; control equipment; isolating switch; reversing switch; controller; resistances; liquid resistance.

History. History of Conveying — II, George Frederick Zimmer. Conveying, Cassier's Eng. Monthly Supp., vol. 1, no. 7, Dec. 1918, pp. lxxv-lvvvii, 9 figs. Bucket elevators; elevator and conveyor chains. (Continued).

Trucks. Shop Trucks. Am. Drop Forger, vol. 5, no. 1, Jan. 1919, pp. 18-22, 16 figs. Discussion and description of different types of industrial trucks.

Wire Rope. The Wire Rope and Its Uses for Conveying Purposes, Elecn., vol. 82, no. 2121, Jan. 10, 1919, pp. 77-79. General principles; single and double ropeway systems; single fixed rope system.

HYDRAULIC MACHINERY

Hydraulic Plants. Extension to the Ontario Power Co.'s Plant, Thos. H. Hogg. Can. Engr., vol. 36, no. 3, Jan. 16, 1919, pp. 139-144, and 149-151 23 figs. Construction of 13 miles of 13.5-ft. diameter wood-stave pipe for 50,000-hp. capacity; steel differential surge tank, 60 ft. in diameter, 94 ft. high; installation of two 20,000-hp. turbines with direct-connected generators.

Turbines. Banki's New Hydraulic Turbine (Neue Wasserturbine von Donat Banki, Professor in Budapest), Schweiz, Bauzeitung, vol. 72, no. 24, Dec. 14, 1918, pp. 235-236, 4 figs. The new turbine fills the gap between the Pelton wheel and the Francis turbine. Vevy compact.

New 2500-Hp. Turbine in the Kubel Hydro-electric Power House, near Saint-Gall, Switzerland (La nouvelle turbine de 2500 ch. de l'usine hydro-électrique de Kubel près Saint-Gall Suisse). Revue Générale de l'Electricité, vol. 5, no. 1, Jan. 4, 1919, pp. 19-25, 9 figs. Results of trials of compact design of turbine with overhanging rotor to determine output, regulation and efficiency. Regulator was specially constructed and is comprehensively described.

Turbine Operation. Economical Operation of Hydraulic Turbines, E. A. Gibbs, Can. Engr., vol. 36, no. 2, Jan. 9, 1919, pp. 127-128. Cleanliness, care and upkeep important factors in obtaining maximum efficiency. Also abstrated in Elec. World, vol. 73, no. 1, Jan. 4, 1919, pp. 25-26.

Turbine Tests Standard Testing Code for Hydraulic Turbines, F. H. Rogers. Elec. Wld., vol. 73, no. 4, Jan. 25, 1919, pp. 164-166. Engineering societies are urged to adopt code of Machinery Builders' Society.

Water Hammer. Charts for Calculating Water Hammer. Jl. Elec., vol. 42, no. 2, Jan. 15, 1919, pp. 74-75, 2 figs. Constructed to give maximum possible rise or fail in pressure due to water hammer as determined form $h = a\ V/g$, a being velocity of wave (in an additional diagram) and velocity of flow in pipe.

INTERNAL-COMBUSTION ENGINES

design. Port Design for Two-Cycle Oil Engines, D. O. Barrett. Gas Engine, vol. 21, no. 2, Feb. 1919, pp. 37-42. Description of some types of two-cycle engines; formulæ for inlet, transfer and exhaust ports.

Diesel Engine. The Diesel Engine, Herbert Haas. Jl. Soc. Automotive Engrs., vol. 4, no. 1, Jan. 1919, pp. 28-34, 2 figs. Motor Boating, vol. 23, no. 1, Jan. 1919, pp. 280-29. 2 figs. Jl. Soc. Automotive Engrs.; Pumps designed to force fuel against high pressure, air compressors and receivers mechanical efficiency characteristics of high-speed engines, desirable properties of petroleum fuel, lubricating oils, ship propulsion (From Bur. Mines Bull, 156, pt. 11); Motor Boating; Pressure-volume diagram, Sabathé four-stroke cycle motor; indicator diagrams of four-cycle Diesel engine, construction of cylinders and cylinder forms. (To be continued).

Oil Engines. The High-Compression Oil Engine, W. G. Gernandt. Jl. Soc. Automotive Engrs., vol. 4, no. 2, Feb. 1919, pp. 112-117 and discussion), pp. 117-118.

Internal Combustion Engine Development, Eng. Rev., vol. 32, no. 6, Dec. 16, 1918, pp. 164-166, 8 figs. Piston designs; leading particulars of engines developing 80 hp. per cylinder. (Continued).

LUBRICATION

Motor-Cylinder Lubrication Motor-Cylinder Lubrication, G. S. Bryan. Universal Engr., vol. 28, no. 4, Oct. 1918, pp. 37-45, 1 fig. Study of conditions under which lubrication takes place and of characteristics of motor-cylinder oils that determine their suitability for these conditions.

MACHINE ELEMENTS AND DESIGN

Ball Bearings. Why Do Ball Bearings Sometimes Fail? F. J. Jarosch. Am. Mach., vol. 50, no. 5, Jan. 30, 1919, pp. 209-213, 23 figs. An analysis of failures arising from poor selection and mis-treatment.

Floating Frame Reduction Gear. The Design and Progress of the Floating-Frame Reduction Gear, John H. Macalpine. Proc Engrs.' Soc. Western Pa., vol. 31, no. 7, Oct 1918, pp. 519-535. Discussion. (Continued from Proc. Feb. 1918, p. 71). Discussor contends regid-frame gears are running continuously, with equally high tooth pressures, at the same speeds as floating-frame gears.

Machine Design. Developing Designs for Machinery and Tools, F. E. Johnson. Machy., vol. 25, no. 6, Feb. 1919, pp. 517-518, 5 figs. Cost of designing a new machine; evolution of design of a specific machine; overcoming defect in original design.

Screws. Optical Projection for Screw-Thread Inspection, James Hartness. Mach. Engr., vol 41, no. 2, Feb. 1919, pp. 127-135, 10 figs. Analysis of screw-thread elements essential to strength and dependability; description of method for their accurate inspection.

Determination of Screw Dimensions (Détermination des dimensions à donner aux vis). La Métallurgie, year 51, no. 1, Jan. 1, 1919, pp. 21-23. Formulæ in three cases; (1) when screw is subject to tension and compression, (2) when screw is subjected to tension of compression by motion of nut, (3) when subjected to shear.

Springs. A Theory of Plate Springs, David Landau and Percy H. Parr. Jl. Soc. Automotive Engrs., vol. 4, no. 2, Feb. 1919, pp. 67-72, 9 figs. Based on assumption that any leaf of a spring can be considered as a beam, encastre at one end, loaded at the other, and having a flexible support somewhere between the point of encastrement and that of application of the load. (To be continued). Form Jl. Franklin Inst.

MACHINE SHOP

Die Making. The question of our Die Room Equipment. Am. Drop Forger, vol. 5, no. 1, Jan. 1919, pp. 26-32, 23 figs. Improvements in die-room practices during years of war; suggestions to executives in regard to selecting equipment.

Grinding. Abrasives for Grinding Malleable Castings, W. T. Montague. Foundry vol. 47, no. 318, Feb. 1919, pp. 74-75. Adapted from a recent publication of the Norton Co.

Machine Shops. Westinghouse Marine Engineering Works, Edward K. Hammond. Machy., vol. 25, no. 6, February, 1919, pp. 538-544, 12 figs. Description of a new plant at South Philadelphia for manufacturing the Westinghouse Marine System.

Milling Cutters. How Milling Cutters Are Made, F. B. Jacobs. Iron Trade Rev., vol 61, no. 2, Jan. 9, 1919, pp. 150-151. 14 figs. How quantity production is secured by modern standard machinery and careful routing of work.

Some Milling Applications and Adaptations. Engineer, vol. 127, no. 3288, Jan. 3, 1919, pp. 6-9, 22 figs. Description of the development and use of the milling cutter in munitions work.

Repair Shop. Camp Holabird Motor Truck Repair Shops. Jl. Soc. Automotive Engrs., vol. 4, no. 2, Feb. 1919, pp. 86-87. Repair shop procedure. Shop does 80 per cent of repair work required by Army trucks.

Tool Casting. Casting Tools from and Air-Hardeinng Steel Foundry, vol. 47, no. 318, Feb. 1919, pp. 66-67, 3 figs. New alloy used successfully in the manufacture of dies and forming tools without forging; tungsten not present in the metal.

Tool Making. The Alfred Herbert Machine Tool Shop. Cassier's Eng. Monthly, vol. 54, no. 6, Dec. 1918, pp. 325-332, 8 figs. Facts about British key industries. (Second article).

Machine Shop Economies. Universal Engr., vol. 28, no. 6, Dec. 1918, pp. 35-39. Manufacture of jigs and special tools; possible economy in selecting speeds and feeds.

MACHINERY, METAL-WORKING

Boring Machine. Cylinder Boring and Reaming Tools, Franklin D. Jones. Machy., vol. 25, no. 6, Feb. 1919, pp. 507-515, 26 figs. Types and designs of cutter heads used for rough-boring and reaming small engine cylinders.

Boring Mill for Precision Work, Iron Trade Rev., vol. 64, no. 2, Jan. 9, 1919, pp. 156-157, 3 figs. Base and column of horizontal boring machine are heavily ribbed and metal distributed to reduce vibration. Operating mechanism is provided with ball thrust bearings.

Drilling Machine. The Hill Multiple-Spindle Drilling Machine. Am. Mach., vol. 50, no. 5, Jan. 30, 1919, pp. 189-190, 2 figs. Spindle drive design permits of close spacing of the drilling heads with a simple mechanism.

Lathes. The Bullard 8-inch Mult-Au-Matic. Am. Mach., vol. 50, no. 5, Feb. 6, 1919, pp. 236-241, 6 figs. A detailed description of the machine.

Marking Machine. Making Milling and Gear Cutting Attachment — II. Robert Mawson. Can. Machy., vol. 21, no. 4, Jan. 23, 1919, pp. 78-81, 17 figs. Tools and methods used by Presto Machine Co., with special reference to marking machine for graduating dividing head base.

Milling Machines. Making Milling and Gear Cutting Attachment — III, Robert Mawson. Can. Machy., vol. 21, no. 5, Jan. 30, 1919, pp. 97-100, 15 figs. Tools and methods followed when machining vertical slide column base, dividing head, index bearing and plates of attachment.

Building the Kempsmith Milling Machine, M. E. Hoag. Am. Mach., vol. 50, nos. 3 and 5, Jan. 16 and 30, 1919, pp. 101-104 and 195-198, 23 figs. Description of some of operations followed in construction of milling machines.

MACHINERY, WOOD WORKING

Felling Trees, Machine. Machine for Felling Trees (Machine abatteuse-billonneuse électrique pour le sciage et l'abatage des bois). Revue Générale de l'Electricité, vol. 4, no. 21, Nov. 23, 1918, pp. 156D-166D, 2 figs. An abstract is given of French patent no. 469,995, describing electrically-driven circular saw for felling trees.

MATERIALS OF CONSTRUCTION AND TESTING OF MATERIALS

Cast Iron. Wearing and Anti-Frictional Qualities of Cast Iron, J. E. Hurst. Iron & Coal Trades Rev., vol. 97, no. 2647, Nov. 15, 1918, pp. 546. Abstract of "Preliminary Note" to a Carnegie Scholarship Memoir.

Porcelain. Some Types of Porcelain, F. H. Riddle and W. W. McDanel. Jl. Am. Ceramic Soc., vol. 1, no. 9, Sept. 1918, pp. 606-627, 13 figs. Determination of burning range of porcelain bodies having covering fired at cone 10 and above. Composition of bodies used varied from 45 to 85 per cent clay content and from 10 to 30 per cent flux.

MEASUREMENTS AND MEASURING APPARATUS

Boiler Feedwater. Measuring Boiler Feedwater, D. L. Fagnan. Nat Engr., vol. 23, no. 1, Jan. 1919, pp. 18-22, 5 figs. Discussion of various methods; principles of operation and construction of representative types. Paper before Nat. Assn. Stationary Engrs.

Calorimeters. The Calorimetry of Coal. Engineering, vol. 107, no. 2767, Jan. 10, 1919, pp. 33-36, 10 figs. A description of the calorimeter and its use.

Hardness. Report on Hardness Testing Relation Between Ball Hardness and Scleroscope Hardness, A. F. Shore. Iron & Steel Can., vol. 1, no. 11, Dec. 1918, pp. 434-445, 9 figs. Charts showing relation (1) between scleroscope and ball tests from hardest to soft metals, using 3000 kg. throughout under 10-mm. steel ball, (2) of ball test and scleroscope, using 62 kg., 250 kg., 500 kg. and 750 kg., and (3) scleroscope against number of pounds required to cause a 10-mm. ball impression of 1 mm. in diameter from softest to hardest metals. Paper presented before Iron & Steel Inst., Supt. 1918.

Hardness of Soft Iron and Copper Compared F. C. Kelley. Iron & Steel Can., vol. 1, no. 11, Dec. 1918, pp. 433-434. Tests by Brinell methods on samples of American ingot iron and ordinary commercial cold-rolled copper which were given similar treatments in an electrically heated vacuum furnace.

Instruments for Hardness Tests, C. E. Clewell. Am. Mach., vol. 50, no. 3, Jan. 16, 1919, pp. 93-96, 5 figs. Importance of hardness tests; early forms of Brinell hardness determination and recent modifications; use of scleroscope as check on pyrometer; methods suggested for holding materials under test.

Testing Materials for Hardness. Howard Ensaw. Am. Mach., vol. 50, no. 6, Feb. 6, 1919, pp. 257-258. Describing some methods of testing materials for hardness.

Pyrometers. How to Test Pyrometer Efficiency. Iron Trade Rev., vol. 64, no. 2, Jan. 9, 1919, pp. 158-159, 5 figs. Method provides for maintenance of calibrated platinum-platinum-rhodium thermocouple and comparison of this standared with instruments to be tested.

Standards of Temperature and Means for Checking Pyrometers. Proc. Steel Treating Research Soc., vol. 2, no. 1, 1919, pp. 30-37, 7 figs. Method for carrying out necessary tests and suggestions of various equipments suitable for determining inaccuracies in pyrometer readings, which, it is said, are always traceable to thermocouple, measuring instruments of lead wires.

Shearing Strength. New Machine for Measuring the Shearing Strength of Cast Iron (Nouvelle machine pour mesurer la résistance de la fonte par la méthode du cisaillement). Ch. Fremont. Génie Civil, vol. 73, no. 26, Dec. 28, 1918, p. l'Academie des Sciences, vol. 167, no. 24, Dec. 516, 9 figs.; Comptes rendus des séances de 9, 1918, pp. 949-952, 9 figs.

Stack Heat Losses. Measurement of Stack Heat Losses, J. H. Blakey. Power Plant Eng., vol. 23, no. 3, Feb. 1, 1919, pp. 151-152, 2 figs. Electrical device embodying simplicity and accuracy for determining stack heat losses.

MECHANICAL PROCESSES

Barrels, Steel. Manufacture of Steel Barrels, Edward K. Hammond. Machy., vol. 25, no. 6, February, 1919, pp. 526-533, 19 figs. Blanking the barrel heads, bending the sheets for the bodies, welding flanging, brazing, bilging, pickling and testing.

Boiler Manufacture. How to Design and Lay Out a Boiler — III, William C. Strott. Boiler Maker, vol. 19, no. 1, Jan. 1919, pp. 10-12, 4 figs. Thickness of butt straps; rivet failures due to tearing of plate, stretching of holes or tendency to shear. (To be continued).

Boiler Smoke Tubes. The Repair of Steel Boiler Smoke-Tubes. Ry. Gaz.. vol. 29, no. 26, Dec. 27, 1918, pp. 729-731, 4 figs. Specifications to which tubes are purchased; operations in repairing of tubes removed from boiler.

Brass Extrusion. The Extension of Brass, Alfred Hutt. The Central (Jl. City & Guilds Eng. Col.), vol. 15, no. 44, Dec. 1918, pp. 68-77, 5 figs. Description of a brass extrusion press. By extrusion is meant process whereby a plastic substance is given a definite shape by being forced through an orifice or die under pressure. Alloy used is Muntz metal consisting of 60 per cent copper and 40 per cent zinc.

Cement Mills. Operating Details of an Electrically Operated Cement Mill. Elec. Rev., vol. 74, no. 6, Feb. 8, 1919, pp. 210-212, 4 figs. Progress of material through mill; process of cement manufacture; apparatus and size of motor utilized.

Chains, Cast Steel. The Manufacture and Testing of Cast Steel Chain Cables. Jl. Am. Soc. Naval Engrs., vol. 30, no. 4, Nov. 1918, pp. 858-862. Memorandum issued by Llyod's Register of Shipping. From Engineer.

Coke Manufacture. Plant of the Seaboard By-Product Coke Company, D. MacArthur. Gas Age, vol. 43, no. 2, Jan. 15, 1919, pp. 68-73, 9 figs. Coke-loading equipment; electrical control switchboard; light-oil extraction and refining. (Concluded.)

Cotton Compression. Economics of High Density Cotton Compression. Richard Hoadley Tingley. Textile World Jl., vol. 55, no. 2, Jan. 11, 1919, pp. 133, 191 and 381, 4 figs. Description of present compression methods; brief history of high-density movement.

Dies. Making Dies for Cutting Robber. Leather, Paper, Cloth, etc., S. A. Hand. Am. Mach., vol. 50, no. 2, Jan. 9, 1919, pp. 52-54, 11 figs.

Kilns. The Use of Car Tunnel Kilns for Brick and Other Products of Crude Clays, Ellis Lovejoy. Jl. Am. Ceramic Soc., vol. 1, no. 9, Sept. 1918, pp. 628-634, and (discussion) pp. 634-636. Features and respective values of (1) direct heating in car-tunnel kilns, (2) indirect heating in tunnel, and (3) compartment-operation types of car-tunnel kilns.

Lubricator, Mechanical. Manufacturing a Mechanical Lubricator, M. E. Hoag. Am. Mech., vol. 50, no. 2, Jan. 9, 1919, pp. 71-74, 13 figs. (Third article).

Machine Knives. Making Machines Knives, W. F. Stutherland. Can. Machy., vol. 21, no. 4, Jan. 23, 1919, pp. 73-77, 8 figs. Operations connected with welding and grinding of knives ofr wood-working tools and paper cutters.

Magnetos. The Magneto Industry. Engineer, vol. 127, no. 3289, Jan. 10, 1919, pp. 26-29, 12 figs. Description of the Thomson-Bennett Works, Birmingham.

Oil House. Modern Steel Mill Oil House Installation Blast Furnace, vol. 7, no. 1, Jan. 1919, pp. 49 and 59, 1 fig. Central distribution point for oil Building is of concrete monolithic construction with brick curtain walls and steel sask 62 by 133 ft.

Plate Mills. New Plate Mills with Modern Lay-Out, Blast Furnace, vol. 7, no. 1, Jan. 1919, pp. 43-47, 8 figs. Designed to give sufficient capacity of heating, finishing and shipping.

Lukens New Mill Largest in the World. Boiler Maker, vol. 19, no. 1, Jan. 1919, pp. 6-10, 6 figs. Mill is of 4-inch type with rolls 204 in. wide, and will roll 5000 tons of plate per week.

Pliers. The Liberty Plier; Drop-Forged Victory. Am. Drop Forger, vol. 5, no. 1, Jan. 1919, pp. 32-35. Distribution of work and sanitary dispositions at Krauter plant where 23,000,000 forgings have been completed during last 18 months.

Sugar Manufacture. Sugar Factory Engineering, C. B. Thompson and J. O. Frazier. Nat. Engr., vol. 23, no. 1, Jan. 1919, pp. 23-26, 2 figs. Problems peculiar to industry and equipment details of factory; preparation and burning of bagasse; arrangement of multiple effect.

Tin Plate. Tin Plate Manufacturing and Detinning. Engineering, vol. 106, no. 2764, Dec. 20, 1918, pp. 701-702. An historial article.

MECHANICS

JOINTS, RIVETED. Rigidity of Riveted Joints of Steel Structures. Engineering, vol. 106, no. 2762, Dec. 6, 1918, pp. 638-640, 9 figs. From bulletin No. 104, Engineering Experiment Station, Univ. of Ill.

SHAFTS, WHIRLING SPEED OF. The Whirling Speed of Shafts Supported in Three Bearings, Arthur Morley. Engineering, vol. 103, no. 2760, Nov. 22, 1918, pp. 573-574, 3 figs. Introduction notation; calculation from equation of energy; method of successive approximation; application o f various forms of support; Dunkerley's empirical rule; Bauman's method. (To be continued).
New Critical Shaft Speeds as Effects of the Gyroscopic Disc-Action, A. Stodola. Engineering, vol. 106, no. 2763, Dec. 13, 1918, pp. 665-666, 4 figs. Mathematical development.

SPRINGS. A New Theory of Plate Springs, David Landau and Percy H. Parr. Jl. Franklin Inst., vol. 187, no. 1, Jan. 1919, pp. 65-97, 14 figs. Study of trapezoidal, circular, parabolic and square leaf points. It is concluded that tapering points of leaves of leaf springs in plane of width only has no parctical effort on strengths, reactions, stresses, or flexibilities of springs. Calculations of stresses, bending moments and deflections. Separation of loads in the top compound plate.

WIRES, TENSION IN. Rapid Determination of the Tension in Stretched Electric Wires (Recherche rapide de la tension à laquelle travaile le metal dans les canalisations électriques sous l'action de l'effort de traction), Jean Hely. Revue Générale de l'Electricité, vol. 5, no. 1, Jan. 4, 1919, pp. 26-27, 1 fig. Chart constructed on physical law of vibration of chords. Tension determined from number of transversal vibration of a known length.

MOTOR-CAR ENGINEERING

AIR CLEANERS. Carbureter Air Cleaners, W. G. Clark. Jl. Soc. Automotive Engrs., vol. 4, no. 1, Jan. 1919, pp. 18-22 and (discussion) pp. 22-23, 14 figs. Classification and description of four types; cleaners having cloths or screens or both, inertia cleaners, those in which water or some other liquid is used to wash air, and centrifugal or gravity cleaners.

DESIGN. 1919 Engineering Trends, H. Ludlow Clayden. Automotive Industries vol. 10, no. 3, Jan. 16, 1919, pp. 88-89, 94-97 and 157, 11 figs. Graphs showing increase of crankshaft revolutions per mile, increase in stroke-bore ratio, tendencies in drive of accessories, comparative percentages of disk and cone clutches, use of vacuum gasoline feed, use of spiral bevel drive and changes in lubricating systems.
Trucks Show Few Mechanical Changes. Automotive Industries, vol. 40, no. 3, Jan. 16, 1919, pp. 110-111, 4 figs. Claims that war activities have retarded mechanical development in commercial vehicle design and that curtailment of supplies of raw material has reduced production originally planned.
Automotive Industry Achievements in 1918. Am. Drop Forger, vol. 5, no. 1, Jan. 1919, pp. 44-48, 2 figs. Development in tractor, truck, trailer and aeroplane manufacture; relation of drop-forging industry to automotive-engine evolution.

FUELS. Benzol as a Motor Fuel, S. E. Whitehead. Gas Jl., vol. 144, no. 2901, Dec. 17, 1918, pp. 615-616. Remarks that a Motor Union Committee in 1907, reported they had successfully used benzol, either alone or in combination with petrol, as motor fuel. It then takes up more in detail properties of benzol and its intrinsic adaptability as motor fuel.
The Motor Fuel Problem, W. R. Ormandy. Petroleum Rev., vol. 39, nos. 853, 854 and 855, Nov. 22 and 30, Dec. 7, 1918, pp. 335-336, 355-356 and 363. Demand and supply of motor fuels in British Empire. Solid gaseous and and liquid fuels are considered separately.

HEADLIGHTS. The Requirements of Automobile Headlights. Illum. Engr., vol. 11, no. 9, Sept. 1918, pp. 209-211. Report of a committee on the Illum. Eng. Soc.

HORN. Electrical and Mechanical Warning Signals for Automobiles, Fred I. Hofman. Automotive Industries, vol. 40, no. 2, Jan. 9, 1919, pp. 47-50, 21 figs. Principles involved in operation of diaphragm signals; relative advantages of electric motor horn, electric vibrator horn and hand-operated horn; variety in mechanism of hand horns.

KEROSENE ENGINES. Bellem-Brégéras Method of Using Refined Petroleum and Heavy Oils in Low-Compression Oil Engines (Emploi du pétrole lampant et des huiles lourdes dans les moteurs à explosion à basse compression. Procédés Bellem et Brégéras. Génie Civil, vol. 73, no. 22, Nov. 30, 1918, pp. 433-435, 3 figs. Description of machine which obtained 50,000 franc prize offered by the Chambre Syndicate des Industrie du Pétrole for best automobile petroleum engine. Account of tests also given.

LOCKING DEVICES. Automobile Locking Devices. Jl. Soc. Automobile Engrs., vol. 4 no. 2, Feb. 1919, pp. 97-98, 1 fig. Result of study of automobile locking devices by committee of Soc. Automobile Engrs.

LUBRICATION. Lubrication and Fuel Tests on Buda Tractor Type Engine, P. J. Dasey. Jl. Soc. Automotive Engrs., vol. 4, no. 1, Jan. 1919. pp. 50-53, 5 figs. Horsepower developed at different speeds by four fuels; power developed per lb. of fuel, fuel consumption in lb. per b-hp. hr.

PRODUCTION. Future Production Plans Will Require Special Machinery, J. Edward Schipper. Automotive Industries, vol. 40, no. 3, Jan. 16, 1919, pp. 145-149, 13 figs. Description of certain machines which permit production on large scale and forecast of develgpments on jigs, tools, gases, etc., necessary to fit into efficient production scheme.

SPARK PLUGS. Effect of Temperature on Spark Plug Insulations. Automotive Industries, vol. 40, no. 1, Jan. 2, 1919, p. 25, 1 fig. Experiments carried out in England show that minimum permissible insulation resistance varies with frequency of sparks and comprehension pressure.

STATISTICS. Truck Production for 1918 Is 250,000. Automotive Industries, vol. 40, no. 3, Jan. 16, 1919, pp. 128-129, 1 fig. Gain of 32 per cent over 1917. Proportion of trucks of each regular capacity shown diagramatically.

TANKS. U. S. A. Two-Man Tank Fitted with Motor Car Engines. Motor Age, vol. 35, no. 2, Jan. 9, 1919, pp. 16-18, 6 figs. Automotive Industries, vol. 40, no. 2, Jan. 9, 1919, pp. 43-46, 6 figs. Motor Age: Adaptation of standard units in construction of Ford tank; Automotive Industries: Two-Man fighting machine having a duplicate Ford automobile power plant, radiator mounted at rear, warm drive.
U. S. Tank and Tractor Details. Motor Age, vol. 34, no. 26. Dec. 26, 1918, pp. 20-21, 4 figs. Cargo carrier Mark VII: Ford tank.

TRACTORS, SPECIFICATIONS FOR. Detailed Technical Specifications of Gasoline Farm Tractors for 1919. Automotive Industries, vol. 40, no. 3, Jan. 10, 1919, pp. 176-179. Tabulated data on 98 different makes of American types produced by 69 manufacturers with makes of principal parts, including engine, governor, lubricator, ignition system, air cleaner, gear set, clutch and axle.

TRUCKS, SPECIFICATIONS FOR. Detailed Technical Specifications of Gasoline Motor Trucks for 1919. Automotive Industries, vol. 40, no. 3, Jan. 16, 1919, pp. 112-127. Full particulars on types and makes of principal truck parts, including engines, clutches, gear sets, rear axles, steering gears, governors and electric and fuel systems; 489 gasoline, 19 electric and one steam motor-truck chassis described.

WATER INJECTION. Mixing Water with Gasoline. Motor Boating, vol. 23, no. 1, Jan. 1919, 25-26, 9 figs. Advantages gained by introducing limited quantities of water into intake manifold. Its use as a decarbonizing medium.

PIPE

ELECTROLYSIS. Fuel Administration Interests Itself in Electrolysis in Natural Gas Mains, Frank H. West. Am. Gas Eng. Jl., vol. 110, no. 2, Jan. 11, 1919, pp. 22-23. Electrolytic action made patent by pipes taken from streets of Kansas City. Claimed that damage by electrolysis amounts to millions annually in U. S.

REINFORCED CONCRETE PIPE. On the Reinforced-Concrete Pressure Pipe (in Japanese), N. Sugimura. Denki Gakwai Zasshi, no. 365, Dec. 10, 1918.
Reinforced Concrete Pressure Pipe, Colman Merriwether. Jl. Am. Water Works Assn., vol. 5, no. 4, Dec. 1918, pp. 419-429, 2 figs.; Water and Gas Rev., vol. 29, no. 7, Jan. 1919, pp. 11-12, 2 figs.; Can. Engr., vol. 36, no. 3, Jan. 16, pp. 146-148, 2 figs. Jl. Am. Water Works Assn.: Details of joint with crimped copper band; Water and Gas Rev.: Action of joint constructed with crimped copper band, details of manufacturing 66-in. reinforced-concrete pressure pipe for 10 miles of Greater Winnipeg water conduit; Can. Engr.: Installation of plant for manufacturing 66-in. reinforced-concrete pressure pipe, details of manufacture, lead gasket cast-iron joint. Paper before Ill. Section Am. Water Works Assn.

TEMPLATES AND PATTERNS. Templates and Patterns for Pipes, James Edgar. Brass World, vol. 14, no. 10, Oct. 1918, pp. 291-294, 34 figs. On construction of templates and patterns for special connections, especially in shipbuilding industry.

POWER GENERATION

APPALACHIANS. New Plant of the Appalachian Power Company, H. S. Slocum. Elec. World, vol. 73, no. 3, Jan. 18, 1919, pp. 123-127, 9 figs. Steam station rated at 20,000 kw. just completed to supplement hydroelectric plants in meeting heavy industrial demands; development of rich mining district due largely to central-station power supply.

CANADA. Electric Power Generation in Ontario on Systems of Hydroelectric Power Commission, Arhur H. Hull. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 1, Jan. 1919, pp. 29-52, 16 figs. Systems of Hydroelectric Power Commission of Ontario.
Canada Builds 300,000 Hp. Niagara Hydro Plant, Louis B. Black. Mine & Quarry, vol. 11, no. 1, Nov. 1918, pp. 1097-1104, 8 figs. Hydro Electric Power Commission of Ontario is engaged upon construction of a canal 8½ miles long, which will divert a flow of 10,000 sec.-ft. of water from Niagara Falls and enable 300,000 hp. to be developed.

CENTRALIZATION. Central Station Power for Mines, A. Taneig. Bul. Affiliated Eng. Societies minn., vol. 3, no. 12, Dec. 1918, pp. 205-207. Advantages to each mine of centralized power generation.
Transportation and Power, C. G. Gilbert and J. E. Pogue. Can. Engr., vol. 36, no. 2, Jan. 9, 1919, pp. 128-130. Advantages and disadvantages of centralization of power stations and generation of electrical energy in bulk. Excerpt. from report to Smithsonian Instn. on Power: Its Significance and Needs.
Centralizing Power Production. Power Plant Eng., vol. 23, no. 2. Jan. 15, 1919, pp. 99-104, 9 figs. Operation of dual driven auxiliaries, induced draft and modern coal and ash handling equipment features of Cromby Station of Philadelphia Suburban Gas & Electric Co.

EASTERN STATES. Development of Hydroelectric Resources in Eastern United States, D. H. Colcord. Elec. Rev., vol. 74, no. 6, Feb. 8, 1919, pp. 207-209, 4 figs. Deterring influences and development outlined; brief review of what has been accomplished; urgent needs and benefits of hydroelectric development.

GLACIERS. Power from Glaciers. Electric Traction, vol. 15, no. 1, Jan. 15, 1919, pp. 1-4, 9 figs. Addition to White River Power Plants of Puget Sound Traction, Light & Power Co. for electrification of Milwaukee Ry.

HETCH HETCHY. The Power Project at Hetch Hetchy, Rudolph W. Van Norden. Jl. Elec., vol. 42, no. 2, Jan. 15, 1919, pp. 65-66, 2 figs. Gives details of 66,000 hp. development at Moccasin Creek, a part of project planned by city of San Francisco.

MAINE. Investigation of Maine Water Powers. Elec. World, vol. 73, no. 3, Jan. 18, 1919, pp. 120-121, 1 map. Publio Utilities Commission sends to governor and council results of an exhaustive study of water-power resources; hydroelectric systems, power sites, plant locations and storage conditions dwelt on.

MASSACHUSETTS. Development of Massachusetts' Water Power. Elec. World, vol. 73, no. 6, Feb. 8, 1919, pp. 272-273, 1 map. From the report of a special commission to investigate the facilities and possibilities in this direction; Action urged; public ownership declared to be of doubtful value as a water-power policy.

MICHIGAN. Simplicity Marks Michigan's Largest Hydroelectric Development. Elec. Rev., vol. 74, no. 5, Feb. 1, 1919, pp. 167-170, 6 figs. Simplicity of layout, coordination of turbines installed to water flow and 140,000 volt transmission line are features of the Junction Development.

PACIFIC COAST. Water-Power Development on the Pacific Coast; George F. Sever. Elec. World, vol. 73, no. 4, Jan. 25, 1919, pp. 177-178; Jl. Elec., vol. 42, no. 1, Jan. 1, 1919, pp. 6-10. Elec. World: Study of economic and financial conditions leads to outline of developments approximating $50,000,000 cost, all power furnished can be absorbed easily within two years after development; Jl. Elec.: Survey of projects in progress of construction in California, rules of Forest Service in their relation to hydroelectric development. From paper before San Francisco Association of Members of Am. Soc. C.E.

TENNESSEE. The Larger Undeveloped Water-Powers of Tennessee, J. A. Switzer. Gen. Meeting Am. Electrochem. Soc., Apr. 30, 1918, paper 24, pp. 169-202, 15 figs. Power sites and essential data pertaining to their development and exploitation.

TIDES. Utilization of Power from Tides (Etude sur l'utilisation des marées pour la production de la force motrice), E. Maynard. Revue Générale de l'Electricité, vol. 4, nos. 22, 23, 24, 25 and 26, Nov. 30, Dec. 7, 14, 21 and 28, 1918, pp. 823-843, 865-877, 903-944, 947-959 and 997-1007, 34 figs. Nov. 30: Derivation of continuous power from tide basins and sea reaches: application of system to St. Malo and La Rochelle regions. Dec. 7: Continuous power of operation at set intervals after high and low tides; application to St. Malo and La Rochelle. Dec. 14: System comprising two basins to utilize ebb and flow currents respectively so as to produce continuous work; application of plan to St. Malo and La Rochelle. Dec. 21: Application of processes described in previous articles to Rotheneuf Bay, near St. Malo. (Ille et-Vilaine), and Bay of La Rochelle. Dec. 28: Possibilities at mouth of La Rance river in 21-km., region where action of tides is felt.

POWER PLANTS

BOILER CORROSION. Action of Water on Metals, S. W. Parr, Can. Engr., vol. 36, no. 3, Jan. 16, 1919, p. 148. Reactions involved when alkaline waters are used in steam generators. Paper before Ill. Section, Am. Water Works Assn.

BOILER OPERATION. Safety and Economy in the Boiler Room, W. E. Snyder. Iron Age, vol. 103, no. 5, Jan. 30, 1919, pp. 303-307. Practical suggestions for reducing hazards and increasing efficiency; thorough inspection and careful training of men required. From a paper before the Engineers' Society of Western Pennsylvania.

BOILER SETTINGS. Combustion and Boiler Settings, A. D. Williams. Power, vol. 49, nos. 2 and 6, Jan. 14 and Feb. 11, 1919, pp. 57-59 and 205-208, 2 figs. Jan. 14: Notes on location of heating surfaces, placing of baffles, and formation of soot in relation to combustion. Feb. 11: Effect produced on combustion reactions and circulation of gases by the chilling due to contact with water-cooled surfaces.

DRIP WATER. Saving and Returning Drip Water, William E. Dixon. Power Plant Eng., vol. 23, no. 2, Jan. 15, 1919, pp. 105-109, 9 figs. Where drip taps should be made; methods employed for returning condensate; utilizing oily drips.

ECONOMIZERS. Care of Economizers, J. F. Daggett. Power, vol. 49, no. 6, Feb. 11, 1916, pp. 192-193. 4 figs. Some suggestions as to the operation and care of economizers.

EQUIPMENT. Power Station at Mark Plant, Gordon Fox. Power Plant Eng., vol. 23, no. 3, Feb. 1, 1919, pp. 141-144, 4 figs. Describes power plant of the Sheet Tube Company of America, dealing with turbine generators and blower, condensing system and electric features. Second article.

EXHAUST STEAM. Utilizing Exhaust Steam in Knitting Mill, L. H. Stark. Nat. Engr., vol. 23, no. 1, Jan. 1919, pp. 2-6, 5 figs. How savings were effected by several changes in equipment and use of indicating and recording devices.

FIREBOX. Boiler Efficiency Increased by New Type of Firebox. Ry. Age, vol. 66, no. 2, Jan. 10, 1919, pp. 151-153, 2 figs. Eighteen per cent greater evaporation per pound of coal secured in tests on C., M. & St. P.

HAND-FIRED PLANTS. Fuel Economy in Hand-Fired Power Plants. Power Plant Eng., vol. 23, no. 2, Jan. 15, 1919, pp. 110-113, 4 figs. Fifth Installment of abstract of Circular No. 7, Univ. of Ill., Eng. Experiment Station.

LOW-GRADE FUELS. Peace Problems in the Power Plant, George H. Perkins and Perry Barker. Textile World Jl., vol. 5, no. 2, Jan. 11, 1919, pp. 391-392. Importance of continuing war economies; difficulties in use of low-grade fuels.

OPERATION. Turbine House Plant Operation, T. G. Otley and V. Pickles. Elecn., vol. 82, no. 2120, Jan. 3, 1919, pp. 4-6. Abstract of a paper read before the South African Institute of Electrical Engineers.

STOKERS. Power Plant Management—VII. Mechanical Stokers, Robert June. Refrig. World, vol. 54, no. 1, Jan. 1919, pp. 25-26, 2 figs. Adaptability of various types of stokers according to ratings of boilers; points to remember regarding stoker operation.

Automatic Cleaning Under-Feed Stoker. Nat. Engr., vol. 23, no. 1, Jan. 1919, pp. 100-102, 4 figs. Type developed by Under-Feed Stoker Co. is similar to standard Jones stoker but is self-cleaning.

PRODUCER GAS

GERMAN PRODUCERS. New Coke-Fired German Gas Producer. Iron Age, vol. 103, no. 3, Jan. 16, 1919, pp. 180-181, 1 fig. Making gas low in moisture and sulphur; pig iron high in manganese and phosphorus a by-product.

PRODUCER-GAS USERS. Modern Applications of Producer Gas, Earl E. Adams. Am. Drop Forger, vol. 5, no. 1, Jan. 1919, pp. 41-44, 2 figs. Its use in heat-treating and carbonizing furnaces; economy and general advantages.

WUERTH PRODUCER. The Wuerth Gas Producer. Foundry Trade Jl., vol. 20, no. 203, Nov. 1918, pp. 600-601, 1 fig. Features of apparatus which is worked on blast furnace principle and consists of a hearth without grating, a bosh and a shaft. From Stahl and Eisen.

PUMPS

CENTRIFUGAL PUMPS. High-Lift Centrifugal Pumps for Irrigation, B. P. Fleming. Power, vol. 49, no. 4, Jan. 28, 1919, pp. 133-136, 3 figs. Water forced through steel manifold to reinforced-concrete conduit leading up to canal; design features; pump test show over 81 per cent efficiency under 90-ft. head.

PUMP STATION. A Non-Drowning Pump-Station, C. Erb Wuench. Min. & Sci. Press, vol. 118, no. 1, Jan. 4, 1919, p. 18, 1 fig. Design utilizing principle of hydraulic diving bell.

VACUUM PUMPS. Automatic Variation of Gas Pressure and Its Application to a Vacuum Pump. Circulation of Gases, Magnetic Stirrer, O. Maas. Jl. Am. Chem. Soc., vol. 41, no. 1, Jan. 1919, pp. 53-59, 3 figs. Control apparatus by means of which pressure established by a Geissler, or any other suction pump, can be automatically varied between definite limits and the period of each variation can be adjusted to any desired length of time.

REFRACTORIES

CORROSION. Report on the "Corrosion Action of Flue Dust on Fire-Bricks," J. W. Mellor. Gas Jl., vol. 144, no. 2897, Nov. 19, 1918, pp. 421-423. Experimental research by refractory materials committee of Instn. Gas Engrs.

CRUSHING RESISTANCE. Crushing Resistances of Refractory Materials (Mesure des résistances à l'écrasement des matériaux réfractaires), A. Bigot. Chimie & Industrie, vol. 1, no. 7, Dec. 1, 1918, pp. 724-726, 7 figs. Gives results of experiments on 1-in. cubes of silicat brick, refrasory argil, white bauxite, carborundum, etc., in charts.

PRODUCTION. Our Present Knowledge Concerning the Industry of Refractory Products (Nos connaissances actuelles sur l'industrie des produits refractaires), J. Bied. Chimie & Industrie, vol. 1, no. 6, Nov. 1918, pp. 579-600, 28 figs. Invention of processes for utilizing dolomitic clinkers; calcination of magnesia from Eubée and Italy; manufacture of bricks; high-temperature resistance of silica-aluminum products.

SILICA PRODUCTS. Silica Products (Les produits de silica). Chemie & Industrie, vol. 1, no. 7, Dec. 1, 1918, pp. 712-723, 7 figs. Chemical and physical analyses of sillceous rocks; photomicrographs of bricks manufactured in Martin furnaces.

SOUTH WALES. The Refractory Materials of South Wales, J. Allen Howe. Quarry, vol. 24, no. 263, Jan. 1919, pp. 11-15. Geological characters of carboniferous strata from which are obtained silica rocks, fireclays and dolomitic limestones, Paper before Refractories Section of Ceramic Soc.

TESTS. Standard Tests for Refractory Materials. Quarry, vol. 24, no. 263, Jan. 1919, pp. 19-20. Chemical analysis of fireclays, dolomite and magnesite; identification of various forms of silica in silica bricks; physical tests. Report of Committee on Standardization of Tests for Refractory Materials. Refractories Section, Ceramic Soc.

ZIRCONIA. Zirconia—Its Possibilities in Metallurgy, Leopold Bradford. Foundry Trade Jl., vol. 20, no. 203, Nov. 1918, pp. 596-597. History, occurrence, composition and uses; its application in refractory brick industry.

REFRIGERATION

AMMONIA COMPRESSORS. The Ammonia Compression Refrigerating System—XXVI, W. S. Doan. Refrig. World, vol. 54, no. 1, Jan. 1919, pp. 33-34, 2 figs. Remarks on oil-cup scheme for external lubrication of open-type ammonia compressors.

Capacity and Power Consumption of Ammonia Compressors, Charles H. Herter. Refrig. World, vol. 34, no. 1, Jan. 1919, pp. 11-13, 1 fig. Graphs for the varying capacity and power consumption of compressors, at different pressures, compared to 20 lb. and 185 lb. as standard pressures.

AMMONIA CONDENSERS. Ammonia Condenser Data, Henry Torrance. Power, vol. 49, no. 3, Jan. 21, 1919, pp. 106-109, 6 figs. Author shows that both flooded atmospheric and flooded injector types of condensers, are wrong in theory and practice. From July Jl. of Am. Soc. Refrig. Engrs.

AMMONIA RECOVERY. Effects of Ammonia Recovery, T. B. Smith. Gas Jl., vol. 144, no. 2902, Dec. 24, 1918, pp. 661-662. Comparison of the effects of the direct and indirect processes upon the working of other parts of the plant.

EXPORT BUSINESS. The Trend of the Foreign Situation, L. W. Alwyn-Schmidt. Refrig. World, vol. 54, no. 1, Jan. 1919, pp. 21-22, and 32. Hints to refrigerating-machine manufacturers as to future of export business and necessity for immediate action.

FREEZING TANKS. Care and Maintenance of Freezing Tanks, F. L. Brewer. Ice and Refrigeration, vol. 56, no. 1, Jan. 1919, pp. 41-42. How to lower cost of freezing tank; erecting and insulating tank; causes of leakage in sides and corners. Paper before Nat. Assn. Practical Refrig. Engrs.

HISTORY. The Growth and History of Refrigeration, James F. Patton. Power House, vol. 11, no. 12, Dec. 1918, pp. 351-353, 5 figs. Dependence of cities, battleships and armies in field on refrigerating plant.

ICE PLANTS. Building Ice Plant Efficiency, G. B. Bright. Ice & Refrig., vol. 56, no. 1, Jan. 1919, pp. 55-56. Tonnage and cost of manufacturing Ice, 1904, 1908, 1918; changes necessary in steam plants to meet new conditions.

Large Converted Steam-Driven Ice Plant. Ice & Refrig., vol. 56, no. 1, Jan. 1919, pp. 63-65. Steam plant replaced by electric power air-ignitating system; cost.

PACKING INDUSTRY. Refrigeration in the Packing House Industry. Refrig. World, vol. 51, no. 1, Jan. 1919, pp. 14-16, 5 figs. Recent improvements and additions to equipment made at plant of Armour Co., Hamilton, Can.
Meat Packing in South America. Refrig. World, vol. 54, no. 1, Jan. 1919, pp. 23-24 and 32. Data and comparisons of requirements and capacity of meat-packing and freezing plants of various companies in Argentina, Brazil, Paraguay, Uruguay and Columbia.

RESEARCH

CHEMICAL RESEARCH. Address by Charles Frederick Juritz. South African Jl. Sci., vol. 15, no. 1, Aug. 1918, pp. 1-30. Exhortation to establish chemical research stations. Position of science in the present age; its use and abuse; its part in the war; industrial potentialities in advancement of chemistry. Presidential address before South African Assn. for Advancement of Sci.

INDUSTRIAL RESEARCH. Science and Industry, J. C. Fields. Can. Engr., vol. 30, no. 2, Jan. 9, 1919, pp. 133-135. What Britain, United States, France and Japan are doing in industrial research. Results being obtained by manufacturers.

SWITZERLAND. Organization for Public Welfare in Switzerland Based on Scientific Research at the Federal University. (Stiftung zur Foerderung Schweizerischer Volkswirtschaft durch Wissenschaftliche Forschung an der Eidgenoessischen Hochschule), Schweizerische Bauzeitung, Zurich, vol. 73, no. 1, Jan. 4, 1919, pp. 1-2. Swiss engineers are raising a fund of at least 500,000 francs with which to conduct researches of the Federal University with the object of assisting Switzerland to practice greater economy and efficiency in national life than in the past, and to help the country in overcoming the losses suffered during the war. The present article describes the organizationa end its onstitution.

STANDARDS AND STANDARDIZATION

S. A. E. STANDARDS. S. A. E. Standardization Work in 1918. Automotive Industries, vol. 40, no. 3, Jan. 16, 1919, pp. 158-171, 31 figs. Tables of new standards put on record, mainly relating to aeronautical, motorcycle and marine work.

TIRES FOR MOTOR CARS. New Standard List of Pneumatic Tire Sizes. Automotive Industries, vol. 40, no. 3, Jan. 16, 1919, pp. 172-174, 21 figs. Collection of recently adopted S. A. E. standards and recommended practices relating to tires and rims.

STEAM ENGINEERING

BOILERS. Espujols Inexplosible and Demountable Boiler (Générateur de vapeur inexplosible démontable, système d'Espujols. Génie Civil vol. 73, no. 23, Dec. 7, 1918, p. 455, 2 figs. Inclination of tubes and other arrangements contribute to facilitate active circulation of water and steam, thus protecting boiler and increasing its efficiency.
Feeding and Circulating the Water in Steam Boilers, John Watson. Jl. Am. Soc. Naval Engrs., vol. 30, no. 4, Nov. 1918, pp. 834-838, 3 figs. Review of adaptation of various appliances. Abstract of paper before Inst. Marine Engineers. From Shipbuilding Shipping Rec.
The Waste Heat Boiler as Practical Steps in FuelConservation, H. D. Baylor, Concrete, Cement Mill Section, vol. 14, no. 1, Jan. 1919, pp. 5-6, 1 fig. Comparative data taken on two cement kilns 10 x 150 ft., dry process, using coal as fuel before and after installation of waste-heat boilers. Paper presented before Portland Cement Assn.

CONDENSERS. The Steam Condenser, Victor J. Azbe. Power Plant, Eng., vol. 23, no. 3, Feb. 1, 1919, pp. 145-158, 4 figs. Gain by condensing, influencing conditions, cleaning tubes, cooling water systems.

SUPERHEAT. Determination of Superheating Surface, C. H. Baker. Power, vol. 49, no. 3, Jan. 21, 1919, pp. 86-89, 4 figs. Author gives charts showing relationship between superheat and factors that influence it.

TURBINE GOVERNORS. Steam Turbine Governors, J. Humphreys. Iron & Coal Trades Rev., vol. 97, no. 2650. Dec. 13, 1918, pp. 661-662, 5 figs. Discussion of several types.

TURBINES. 2500-Hp. Rateau Marine Geared Turbines. Jl. Am. Soc. Naval Engrs., vol. 30, no. 1, Nov. 1918, pp. 842-849, 8 figs. Arrangement of 2500-shaft-hp. turbine set and double reduction gearing at works of British Westinghouse Co. From Engineer.
A New Theory of the Steam Turbine, Harold Medway Martin. Mechanical Engineering, vol. 41, no. 2, Feb. 1919, pp. 150-151, 3 figs. Theory is based on assumption that steam is never in thermal equilibrium until condenser is attained. Abstract of serial in Engineering.
Steam Leakages in Dummies of the Lungstrom Type. Engineering, vol. 107, no. 2766, Jan. 3, 1919, pp. 1-3, 2 figs. Comparison of the results obtained by the use of a formulæ with step by step calculations of the discharge through a labyrinth using the precise formulæ given by Professor Callendar.
Steam Turbine Progress and Possibilities. Am. Drop Forger, vol. 4, no. 12, Dec. 1918, pp. 495-497, 5 figs. Higher boiler pressures. Intermediate steam reheating in large multiple-cylinder machines. Feedwater heating. Economy to be expected from extended use of economizer.
Historical Development of the Steam Turbine—II. Power House, vol. 11, no. 12, Dec. 1918, pp. 346-349, 12 figs. Growth in size of turbo-generator units in recent years.
Operation of Steam Turbines, J. Humphreys. Iron & Coal Trades Rev., vol. 97, no. 2642. Oct. 18, 1918, pp. 430-432. 4 figs. Deals with Parsons turbine.
Land aud Marine Steam Turbines. Engineering, vol. 106, no. 27ye, Dec. 13, 1918, pp. 674-679, 13 figs. Illustrations of details and brief description of steam turbines constructed by the Atlas Engineering Co., Copenhagen.
45,000 kw. Cross-Compound Steam Turbine. Elec. News, vol. 27, no. 24, Dec. 15, 1918, pp. 24-27, 4 figs. Unit consists of separate high and low-pressure elements, each coupled directly to its own generator. High pressure element is a single-now, reaction-type turbine running at 1800 r.p.m. and expanding to atmosphere; low-pressure element is a double-flow turbine of same type, running at 1200 r.p.m. and expanding to vacuum.

TEXTILES

FABRIC LOOMS. An Apparent Revolution in Fabric Looms. Flight, Dec. 26, 1918, pp. 1463-1464, 4 figs. New Trautvetter loom claimed to weave (auto and aero fabric) diagonal threads in two directions as well as ordinary warp and weft.

THERMODYNAMICS

HEAT TRANSMISSION. The Transmission of Heat Through Heavy Building Materials. Engineering, vol. 106, no. 2765, Dec. 27, 1918, pp. 735. From bulletin issued from University of London, University College, Department of Heating and Ventilating Engineering, entitled Report of Research on Transmission of Heat Through Heavy Building Materials, by Arthur H. Barker and W. Kinoshita.

WELDING

ARC WELDING. Electric Arc Welding in Tank Construction, R. E. Wagner. Gen. Elec. Rev., vol. 21, no. 12, Dec. 1918, pp. 899-911. 35 figs. Practice followed at Pittsfield works of General Electric Co.
A Review of Electric Arc Welding, John A. Seede. Gen. Elec. Rev., vol. 21, no. 12, Dec. 1918, pp. 881-886, 11 figs. Evolution of present practice of arc welding.
Equipment Accessories Desirable in Electric Arc Welding. Elec. Ry. Jl., vol. 53, no. 2, Jan. 11, 1919, pp. 93-95, 6 figs. Proper protection of operator is essential and conveniences added insure better workmanship. From 1918 report of committee of Assn. of Ry. Elec. Engrs.
Notes on Regulations for Arc Welding, H. M. Sayers. Elecn., vol. 81, no. 2118, Dec. 20, 1918, pp. 715-717. Abstract of paper with discussion before the Insitution of Electrical Engineers, Dec. 1918.
Arc-Welding Systems, Otis Allen Kenyon. Elec. Wld., vol. 73, no. 4, Jan. 25, 1919, pp. 167-171, 10 figs. Welding system discussed in a broad way, showing advantages and special usefulness of each method.

CUTTING OF METALS. The Cutting of Iron and Steel by Oxygen—XX, M. R. Amedeo. Acetylene & Welding Jl., vol. 15, no. 182, Nov. 1918, pp. 199-200. Cost of Cutting. Translated by a member of the Union de la Soudure Autogene.

INSPECTION. Inspection of Metallic Electrode Arc Welds, O. S. Escholz. Am. Mach., vol. 50, no. 5, Jan. 30, 1919, pp. 215-217, 6 figs. Outlines the methods for satisfactory inspection tests.
Determining the Characteristics of Metallic-Electrode Arc Welds, O. S. Escholz. Elec. Ry. Jl., vol. 53, no. 6, Feb. 8, 1919, pp. 280-282, 3 figs. By testing and inspection of the welds a reliable indication of their soundness may be obtained.

LEAD. The Autogenous Welding of Lead, V. P. Rosenberg. Acetylene & Welding Jl., vol. 15, no. 182, Nov. 1918, pp. 205-206, 2 figs. Power of blowpipe. (To be continued.)

LLOYD'S TESTS. Lloyd's Experiments on Electrically Welded Joints, H. Jasper Cox, Gen. Elec. Rev., vol. 21, no. 12, Dec. 1918, pp. 864-870, 15 figs. Nature and description of experiments; summary of experimental results.

OXY-ACETYLENE. The Oxy-Acetylene Flame and Blowpipe Efficiency, Arthur Stephenson. Acetylene & Welding Jl., vol. 15, no. 182, Nov. 1918, pp. 194-196, and (discussion) pp. 196-198, 5 figs. Diagram giving length of luminous cone in mm. for respective consumption of acetylene in litres per hour; graph showing diversity in acetylene consumption as specified by various makers for welding iron and steel; blowpipe movements. Paper before British Acetylene & Welding Assn. Also abstracted in Jl. Acetylene Welding, vol. 2, no. 7, Jan. 1919, pp. 338-344.
Oxy-Acetylene Welding, Stuart Plumley. Jl. Am. Soc. Naval Engrs., vol. 30, no. 4, Nov. 1918, pp. 737-752, 4 figs. Detailed exposition of methods and usages followed in United States.
Use of Oxy-Acetylene Welding in the French Army. Universal Engr., vol. 28, no. 6, Dec. 1918, pp. 22-28, 8 figs. Uses in manufacturing (practically the same as in U. S.); uses in repair work; outfit.
Oxy-Acetylene in Peace Time Manufacture, David Baxter. Jl. Acetylene Welding, vol. 2, no. 7, Jan. 1919, pp. 345-348, 8 figs. Instruction and information to welders engaged in general repair business. First of series.
Difficult Repairs Successfully Accomplished by Welding. Can. Machy., vol. 21, no. 1, Jan. 2, 1919, p. 15, 2 figs. Repairs effected by oxy-acetylene welding on a crankshaft and piston.
Oxy-Acetylene Pipe Welding and Cutting. Gas Age, vol. 43, nos. 1 and 2, Jan. 1 and 15, 1919, pp. 27-28 and 85-88, 13 figs. Jan. 1: Resumé of best practice; welding gas mains; strength of welds. Jan. 15: Safe radius of bend for wrought Iron or steel pipe; examples of welding operations; welding meter connections.
Oxy-Acetylene Welding and Cutting. Am. Drop Forger, vol. 5, no. 1, Jan. 1919, pp. 48-53, 7 figs. Review of its early history, development and modern application in industry and war with special reference to its use in forge plants.

RAIL JOINTS. New Type of Electrically Welded Joint Successful. Elec. Ry. Jl., vol. 53, no. 4, Jan. 25, 1919, pp. 182-183, 8 figs. Process used at St. Louis believed to eliminate cracking of rail around joing; applicable to new and old track.

RAILROAD SHOPS. Oxy-Acetylene and Electric Welding, A. F. Dyer. Welding Engr., vol. 4, no. 1, Jan. 1919, pp. 45-46. Application of these processes at Grand Trunk Railway shops.

SPOT WELDING. Research in Spot Welding of Heavy Plates, W. L. Merrill. Gen. Elec. Rev., vol. 21, no. 12, Dec. 1918, pp. 919-922, 7 figs. Experiments pointing to new and enlarged field for spot welding.
Spot Welding and Some of its Applications to Ship Construction, H. A. Winnie. Gen. Elec. Rev., vol. 21, no. 12, Dec. 1918, pp. 923-927, 6 figs. Advantages of spot welding over riveting with respect to strength, time and labor; limitations of spot welding.

THERMIT. Modern Welding and Cutting, Ethan Viall. Am. Mach., vol. 50, no. 6, Feb. 6, 1919, pp. 243-248, 6 figs. Firt article. Thermit welding; its history, nature and uses.

VARIA

Inspection and Theory of Probability. Application of the Theory of Probability to the Matter of Inspection (Sull applicazione del calcolo delle probabilita ad una importante categoria di collandi), U. Bordino, L'Elettrotecnica, vol. 5, no. 30, Oct. 25, 1918, pp. 422-430, 8 figs. Mathematical analysis of the problem: what can be asserted of the properties of a number of objects after having examined and tested a determined percentage of the total number.

Silo Granaries. The Equipment of Silo Granaries, R. A. Sidley. Elecn., vol. 82, no. 2121, Jan. 10, 1919, pp. 68-73, 13 figs. General operations carried out in a silo granary.

Tanks, Storage. Round Storage Tanks for Liquids, H. Eisert. Monthly Jl. Engrs. Club of Baltimore, vol. 7, no. 8, Feb. 1919, pp. 155-168, 6 figs. Design formulæ and calculations.

ORGANIZATION AND MANAGEMENT

ACCOUNTING

Ice-Plant Auditing. Auditing and Supervision of Ice Plants, George E. Wells Ice & Refrigeration, vol. 56, no. 1, Jan. 1919, pp. 48-49. Proposes auditing engineering conditions in a plant and gives particulars and audit forms for ice plants.

Appraisals Industrial. Three Industrial Appraisals in One, Charles W. McKay. Indus. Management, vol. 57, no. 2, Feb. 1919, pp. 141-143. For excess-profits tax computation, for plant accounting and for insurance adjustment.

EDUCATION

Agricultural Instruction. Reference Material for Vocational Agricultural Instruction. Federal Board for Vocational Education, bul. 13 and 14, March and June 1918, 42 pp. and 25 pp. March: Outlines provisions to be made by states for meeting requirements of Smith-Hughes Act relating to agricultural instruction. June: Suggestions for cataloging and filing, bulletin, report, etc., for agricultural education.

Airplane Mechanics. Emergency War Training for Airplane Mechanics. Federal Board for Vocational Education, bul. no. 12, April 1918, 62 pp. Outline of course in airplane construction and repair.

Crippled Soldiers. The Evolution of National Systems of Vocational Re-education for Disabled Soldiers and Sailors. Douglas C. McMurtrie. Federal Board of Vocational Education, bul. 15, May 1918, 318 pp., 33 figs. Fundamental principles of rehabilitation; categorical description of methods for vocational rehabilitation in force in the various warring countries, including Germany and Austria-Hungary; extensive bibliography of American and foreign literature, inclu ive of news items in periodicals, relating to vocational rehabilitation.

Cripples. Reducing the Cost of Disability, Douglas C. McMurtrie. Iron Age, vol. 103, no. 6, Feb. 6, 1919, pp. 362-363. Rehabilitation restores and may enhance earning capacity; insurance costs lessened; the economy of liberal medical attention.

The Conservation of Industrial Man Power, Arthur J. Westermayr. Am. Drop Forger, vol. 4, no. 12, Dec. 1918, pp. 501-504, 3 figs. Question of rehabilitating crippled soldiers; how vocational rehabilitation act will be operated.

Engineering Colleges. The Effect of the War on Engineering Education, C. R. Mann. Bul. Soc. Promotion Eng. Education, vol. 9, no. 4, Dec. 1918, pp. 108-118. War experiences analyzed under (1) production of soldiers, and (2) production of supplies. Present college curricula described as aiming to impart knowledge of physical laws and properties of materials exclusively, and as insufficient to develop men who will accomplish reorganization of industrial production, for which task an understanding of the methods by which human wills are co-ordinated for team play is essential.

Export and Shipping. Vocational Education for Foreign Trade and Shipping. Federal Board for Vocational Education, bul 24, Nov. 1918, 85 pp. Present importance of education for foreign trade; advanced courses in shipping; comparative plans for teaching foreign trade; study outlines of fundamental courses; suggested study plans.

Industrial Education. Industrial Education in Wilmington, Delaware. Department of Interior, Bur. of Education, bul. 25, 1918, 97 pp. Report of survey made under direction of Commissioner of Education; suggestions for program of industrial educational.

Industrial Schools. Buildings and Equipment for Schools and Classes in Trade and Industrial Subjects, Federal Board for Vocational Education, bul. 20, Nov. 1918, 75 pp., 25 figs. Type schools and classes; detailed description of building and equipment for a trade or industrial school; equipment, courses of study, and methods of instruction in carpentry.

Evening Industrial Schools. Federal Board for Vocational Educational, bul. 18, Sept. 1918, 55 pp. Possibilities in evening schools under provisions of Smith-Hughes Act; suggestive courses which have been prepared and carried out of evening schools; approved methods of establishing and conducting evening industrial schools for trade workers.

Italy. Need for Increased Technical Education in Italy (Per l'avvenire della industria meccanica in Italia), G. Belluzzo. Industria, vol. 32, no. 21, Nov. 15, 1918, pp. 635-637. Points out defects of Italian system of training as at present conducted and outlines a system which follows closely that given in best shops in England and United States. (Concluded.)

Naval Architecture. The Requirements of a Course of Training in Naval Architecture, Lawrence B. Chapman. Bul. Soc. Promotion Eng. Education, vol. 9, no. 4, Dec. 1918, pp. 119-130. Outlines plan in which professional work starts early in course and parallels outside training.

Part-Time Schools. Part-Time Trade and Industrial Education. Federal Board for Vocational Education, bul. 19, Oct. 1918, 51 pp. Need for part-time schools in United States; school, man and employer as factors in promoting part-time education; part-time studies already established in U. S.; continuation schools in England, France and Germany; types of part-time schools; federal aid; principles which should underlie compulsory legislation.

Physical Education. Recent State Legislation for Physical Education, Thomas A. Storey and Willard S. Small. Department of Interior, Bureau of Education, bul. 40, 1918, 35 pp. Chronological analysist of laws enacted in eight states since the beginning of the war; analysis of purpose and scope of state laws; principles of state legislation for physical education; state laws for physical education.

Radio Operators. Emergency War Training for Radio Mechanics and Radio Operators. Federal Board for Vocational Education, bul, no. 16, Sept. 1918, 74 pp., 8 figs. Outline of course for preliminary training.

Secondary Education. Cardinal Principles of Secondary Education. Department of Interior. Bur. of Education, bul. 35, 1918, 32 pp. Report of Commission on the Reorganization of Secondary Education, appointed by Nat. Education Assn.

Shop Training. Training Operators at Winchester Plant, W. E. Freeland. Iron Age, vol. 103, no. 3, Jan. 16, 1919, pp. 178-179, 2 figs. Short intensive course in training shop for men; three years' apprenticeship in school for boys; details of system. (Eleventh article of series on Winchester plant.)

The Training Department—Past and Future, John C. Spence. Iron Age, vol. 103, no. 4, Jan. 23, 1919, pp. 237-239. The crippling of one plant for another: real and pretended interest in workmen; some training plans for the common good.

Technical Education, Primary. Toronto Builders' Exchange Urges Forward Movement in Technical Education. Contract Rec., vol. 33, no. 3, Jan. 15, 1919, p. 49, Deputation recommends Ministry of Education that technical schools be owned by Government,that education be made compulsory between 14 and 20 years and that parents decide boy's vocation.

Trade and Industrial Education, Organization and Administration. Federal Board for Vocational Education, bul. no. 17, Oct. 1918, 124 pp. Contains information and suggestion concerning organization and administration of trade and industrial schools and class under Federal law.

U. S. Training Service. The U. S. Training Service and Its Work, Charles T. Clayton. Indus. Management, vol. 57, no. 2, Feb. 1919, pp. 103-104. Value of service in saving to manufacturers expense of hiring men; industrial training as a means of lessening turnover and increasing output.

Universities. The Universities and the New World, Geo. F. Swain. Jl Elec., vol. 42, no. 1, Jan. 1, 1919, pp. 12-14. Readjustment of schools and universities to fulfil new demands in education created by general reconstruction of past conditions.

Welders. The Training of Electric Welders, H. A. Horner. Gen. Elec. Rev., vol. 21, no. 12, Dec. 1918, pp. 876-881, 9 figs.

Emergency War Training for Oxy-Acetylene Welders. Federal Board for Vocational Education, bul. no. 11, June 1918, pp. 86. 30 figs. History of development and application of oxy-acetylene in industry and war; U. S. Army course of instruction in oyy-acetylene welding and oxygen cutting.

Operators and Instructors Necessary for Electric Arc Welding. Elec. Ry. Jl., vol. 53, no. 4, Jan. 25, 1919, pp. 191-192, 4 figs. From 1918 report of Committee of Association of Railway Electrical Engineers.

The Future of Army Welding Schools, Cyrus K. Rickel. Jl. Acetylene Welding, vol. 2, no. 7 Jan. 1919, pp. 331-335, 7 figs. Discusses qualifications of successful welding school.

Women Workers. Little Causes and Great Effects (Petites causes et grands effects). François Villain. Société Industrielle de l'Est. bul. 142 Nov. 1918, pp. 7028, 8 figs. Plea for enforcing law which requires teaching of household arts to young girls in elementary schools; influence of this policy on welfare of women. Conference before the Société Scientifique d'Hygiène Alimentaire.

Training Women for Record Output, Robert I Clegg. Iron Age, vol. 103, no. 3, Jan. 16, 1919, pp. 169-174, 11 figs. General results abroad and at home; diligence and industry of women; practical system of schooling on shop production lines.

FACTORY MANAGEMENT

Employment Management. The "Conscience" of Modern Industry. C. T. Clayton. Jl. Engrs. Club St. Louis, vol. 3, no. 6, Nov.-Dec. 1918, pp. 352-354. Employment management as a factor to reduce industrial misunderstanding and friction.

Extreme Methods in Employing, Charles M. Horton. Indus. Management, vol. 57, no. 2, Feb. 1919, pp. 145-148. Criticises some practices of employment managers.

Industrial Fatigue. A Suggestion for the Prevention of Waste of Human Energy in Factories, H. G. P. Castellain. Carrier's Eng. Monthly, vol. 54, no. 6, Dec. 1918, pp. 303-307. Discusses industrial fatigue from a medical point of view and suggests improvement in medical education and establishment of courses for factory inspectors and medical men.

Investigations. Engineer and Plant Management, J. G. Worker. Aera, vol. 7, no. 6, 1919, pp. 596-599. Suggestions as to investigations, reports and installations of waste preventing boiler room methods.

Labor Management. Use of Non-Financial Incentives, Robert B. Wolf. Can. Mfr., vol. 39, no. 1, Jan. 1919, pp. 79-80, 2 figs. Stimulating production in industry by internal motives rather than by external discipline, that is, by making comparisons, cost sheets, etc.

Observation. The Value of Observation in Works Practice, H. H. Ashdown. Engineering, vol. 107, no. 2766, Jan. 3, 1919, pp. 11-14, 14 figs. A paper before the Society of Engineers and Metallurgists, Sheffield, Nov. 1918.

PLANT OPERATION. Lifting Power Plant Capacity by Its Boot Straps, Charles L. Hubbard. Factory, vol. 22, no. 1, Jan. 1919, pp. 35-37, 1 fig. Improvements which contribute to increasing efficiency; how superheating steam increases capacity; how increasing speed affects engine; use of compound engines of low-pressure turbines.

PRODUCTION CONTROL. Graphic Production Control — VI, C. E. Knoeppel. Indus. Management, vol. 57, no. 2, Feb. 1919, pp. 113-118, 10 figs. Two ways to tie together and coordinate various features of control mechanism; by use of charts, and by control boards. Last article of series.

OVERTIME. Graphic Analysis of an Overtime Problem, R. von Huhn. Indus. Management, vol. 57, no. 2, Feb. 1919, pp. 86-88, 5 figs. Casting delivery on a large contract and amount of overtime needed to machine pieces

REPORTS. Facilitating Sewer Pipe Factory Management, W. B. Harris. Brick & Clay Rec., vol. 54, no. 1, Jan. 14, 1919, pp. 39-44, 10 figs. Forms and records of making reports; placing workmen.

STOKERS. Power Plant Management; Mechanical Stockers, Robert June. Power House, vol. 11, no. 12, Dec. 1918, pp. 553-355, 2 figs. Efficiency; characteristics of chain grate; instructions for operation.

STORAGE OF MATERIALS. Principles of Purchasing and Storing Applied to Rough, Bulky Materials in Yard Storage, Dwight T. Farnham. Indus. Management, vol. 57, no. 2, Feb. 1919, pp. 108-112, 7 figs. Six principles are considered in planning yard storage; Effort required to transport; weight and material to be stored on each square foot of space; rate of stores turnover; storage unit; allotted space; efficient package.

TIMEKEEPING. Providing a Double Check on Timekeeping. Factory, vol. 22, no. 1, Jan. 1919, pp. 48-50, 4 figs. Layout of Eastman Kodak Co. time-clock room.

WATER WORKS. Office Records of the St. Louis Water Division, Distribution Section, Thomas E. Flaherty. Jl. Am. Water Works Assn., vol. 5, no. 4, Dec. 1918, pp. 412-418. Brief description of organization for planning, direction and execution of work.

WELFARE WORK. Promoting Employees' Welfare Brings Large Returns. Ry. Maintenance Engr., vol. 15, no. 1, Jan. 1919, pp. 5-8, 8 figs. Policies of Richmond, Fredericksburg & Potomac R. R. Co.

FINANCE AND COST

COST ACCOUNTING. Cost Accounting to Aid Production — V. G. Carter Harrison. Indus. Management, vol. 57, no. 2, Feb. 1919, pp. 131-139, 4 figs. Diagrams illustrating coordinated cost, planning and production systems. (To be continued.)

Costing at Nation Factories, W. Webster Jenkinson. Iron & Coal Trades Rev., vol. 97, no. 26-43, Oct. 25, 1918, pp. 455-458, 10 figs. Beginning series of articles abstracts from address before London School of Ecocomics and Political Science.

POWER COSTS. Simple Method of Determining Power Costs, T. H. Fenner. Power House, vol. 11, no. 12, Dec. 1918, pp. 361-363, 1 fig. How to arrive at costs when no instruments are available.

WORKS COSTS. The Economics of Works Costs, J. R. Dick. Elecn., vol. 81, no. 2115, Nov. 29, 1918, pp. 643-645, 2 figs. (First installment of a continued article).

FOREIGN TRADE

BOILERS. New Foreign Markets for American Made Boiler aud Boiler Equipment, L. W. Alwyn-Schmidt. Boiler Maker, vol. 19, no. 1, Jan. 1919, pp. 3-4. Exports increased over one-sixth. New fields developed is South America and the Far East. European markets remain on war footing.

CANADIAN EXPORTS. Canadian Industries and the Export Trade, J. F. Heffron. Can. Machy., vol. 21, no. 1, Jan. 2, 1919, pp. 9-12. Canadian possibilities in developing foreign trade; German credit methods of fostering export trade; articles for export.

DROP-FORCE EQUIPMENT. Campaigning for Foreign Business, L. W. Alwyn-Schmidt. Am. Drop Forger, vol. 5, no. 1, Jan. 1919, pp. 3-6. Suggestions to obtain foreign drop-forge business.

GERMAN METHODS. Effectiveness and Service in Foreign Trade. Textile World Jl., vol. 55, no. 2, Jan. 11, 1919, pp. 127 and 159. Necessity of considering customer's viewpoint; German commercial vices.

German Foreign Trade Extension Measures, Norman L. Anderson. Blast Furnace, vol. 7, no. 1, Jan. 1919, pp. 78-79. Private associations for promoting foreign trade; German exhibitions; government trade activities; purposes of suggested "Auslandamt."

ITALIAN MARKET. Our Opportunities for Foreign Trade, V. Macchi di Cellere. Am. Drop. Forger, vol. 5, no. 1, Jan. 1919, p. 17. Market possibllities of Italy, from address before Am. Mfrs. Export Assn.

INSPECTION

ORDNANCE DEPARTMENT METHODS. How Ordnance is Inspected, Fred H. Colvin. Am. Mach., vol. 50, no. 6, Feb. 6, 1919, pp. 263-267, 8 figs. Description of organization and methods of Ordnance Department for inspection.

LABOR

BATHHOUSES. Mine Bathhouses in Utah. A. C. Watts. Coal Age, vol. 15, no. 1, Jan. 2, 1919, pp. 4-8, 4 figs. Description of typical bathhouses with comparison of American and European costs.

BLIND. An Experiment in Employing the Blind, Dale Wolf. Indus. Management, vol. 57, no. 2, Feb. 1919, pp. 105-107. How blind men have been put to work ou jig drilling of shackles for locks.

BONUS SYSTEM. Bonus System in Power Generation, W. L. Whitlock. Nat. Engr., vol. 23, no. 1, Jan. 1919, pp. 9-11, 2 figs. Standing order to employees and scale for computing bonus. System of Denver Tramway Co., which is said to effect saving of $150,000 per year.

Bonus System Reduces Coal Consumption at Denver, W. E. Casey and E. Weber. Elec. Ry. Jl., vol. 53, no. 6, Feb. 8, 1919, pp. 266-271, 7 figs. By installation of new turbine and introduction of bonus system, coal consumption on Denver Tramway System in reduced to less than 2.5 per kw-hr., with saving in operating expense of $150,000 per year.

Coal-Economy bonuses in a Ceutral Electric-Power House (Prime au personnel sur les économies de charbon dans une centrale électrique thermique), M. Grospaud. Revue Générale de l'Electricité, vol. 5, no. 2, Jan. 11, 1919, pp. 58-63. From data showing variations in thermal efficiency of coal, writer concludes it is illusory to base bonus system ou coal consumption; he proposes instead a system based on scientific and methodic thermal control and outlines its practical working details.

The Engineer — Worker and Organizer, G. W. Tripp. The Central (Jl. City & Guilds Eng. Col.), vol. 15, no. 44, Dec. 1918, pp. 46-54, 1 fig. Comparison between Rowan bonus scheme and system based on 50 per cent payment. Abstract of lecture to Woolwich Arsenal apprentices.

BRITISH. Paper on "The Industrial Future," Cecil Walton. Jl. West of Scotland Iron & Steel Inst., vol. 26, pt. 2, session 1918-1919, 19-24 and (discussion) pp. 25-31. Labor conditions and the future development of Glasgow. Reference is made to question of wages.

Labor Administration, Edward T. Elbourne, Engineer, vol. 126, nos. 3282, 3283, 3284, 3285, and 3287, Nov. 22, aud 29, Dec. 6, 13 and 27, 1918, pp. 432-435, 7 figs.; pp. 435-454, 3 figs.; pp. 478-480, 5 figs.; pp. 504-507, 5 figs.; pp. 548-550, 4 figs. Nov. 22; Control of production; Nov. 29, The Wages office; Dec. 6; Wages office continued; Dec. 13; Accidents; Dec. 27: General discipline and general facilities. (Articles 9-13 inclusive).

CANADA. Education and Cooperation the Wisest Course in Dealing with Labor, Gideon Robertson and T. Moore. Contract Rec., vol. 33, no. 2, Jan. 8, 1919, pp. 19-20. Opinions and suggestions of Canada Minister of Labor and of the President Trades and Labor Congress.

CRIPPLED WORKERS. Human Reconstruction Reclaims War's Disabled for Industry, W. H. Llyd. Iron Trade Rev., vol. 64, no. 1, Jan. 2, 1919, pp. 80-86, 11 figs. Courses being offered to disabled soldiers and employments being secured for them.

How to Deal with Our Crippled Workers, T. Norman Dean, Am. Drop Forger, vol. 4, no. 12, Dec. 1918, pp. 498-500. Indicates that rehabilitation should be carried on scientifically.

The Conservation of Industrial Man Power, Arthur J. Westermayr. Am. Drop Forger, vol. 4, no. 12, Dec. 1918, pp. 504-506, 3 figs. Question of rehabilitating crippled soldiers so that they can stand on their own merits; discussion of rehabilitation vocational act.

EMPLOYMENT DEPARTMENT. The Principles of Employing Labor, E. H. Fish. Indus. Management, vol. 57, no. 2, Feb. 1919, pp. 81-85. Fundamental principles underlying establishment and mainteuance of employment department, promotion of personal relations. First of five articles.

FEDERAL CONTROL. What Federal Control Has Done for Labor, W. S. Carter. Ry. Maintenance Engr., vol. 15, no. 1, Jan. 1919, pp. 11-12. Résumé of measures taken to improve relations between managements and employees. Abstract from address delivered before convention of Acad Political Sci.

HOUSING. Housing the Workers — An Unfinished Job, George Gove, Am. City, vol. 20, no. 1, Jan. 1919, pp. 23-25. Present status of Government housing projects. Challenge to local chambers of commerce to meet emergency.

The Present and Future Government of War-Created Communities, Ernest Cawcroft. Jl. Am. Inst. Architects, vol. 6, no. 12, Dec. 1918, pp. 553-558. Suggestions in regard to housing projects undertaken by War Department, Navy Department, U. S. Housing Corporation and U. S. Shipping Board.

LABOR PROBLEM. The Labor Problem Analyzed, Magnus W. Alexander. Open Shop Rev., vol. 16, no. 1, Jan. 1919, pp. 3-16. Social, political and economic aspects of labor vroblem. Address delivered at convention of Nat, Founders' Assn. (To be continued).

LUNCH ROOMS. Mill Lunch Rooms for Employees, A. W. Anderson. Textile World Jl., vol. 55, no. 2, Jan. 11, 1919, pp. 397 and 401, 4 figs. Description of employees rooms used by several companies.

OLDER MEN. Superannuation of Technical Men. Times Eng. Supp., no. 530, Dec. 1918, p. 257. Proposes that industrial firms take over policies of technical men in their employment and keep them on same basis as adopted in federation of universities.

PROFIT SHARING. Enlisting Labor in Production, L. W. Schmidt. Am. Mach., vol. 50, no. 6, Feb. 6, 1919, pp. 253-256, 3 figs. Some methods of making labor interested in the part it is playing in production.

Wage Questions Must Be Handled form Inside the Industrial Unit, Harry Tipper, Automotive Industries, vol. 40, no. 2, Jan. 9, 1919, pp. 62-63. Importance of profit-sharing collective agreement.

REPRESENTATION OF EMPLOYEES. Where the Men Settle Their Own Troubles. Factory, vol. 22, no. 1, Jan. 1919, pp. 29-31, 1 fig. A board of appeals, consisting of two representatives from each department, one elected by the workers, the other appointed by management, has jurisdiction over all controversies concerning wages, hours of work, discharges, promotions, etc.

TURNOVER OF LABOR. Labor Maintenance and Its Indices, Winthrop Talbot. Indus. Management, vol. 57, no. 2, Feb. 1919, pp. 127-130, 2 figs. Criticism of accepted theories of labor turnover and methods for computing it as percentage; presentation of theory of labor maintenance and a way of calculating indices to show stability, maintenance and replacement of working force.

WAGES. Notes on the Formulæ of Modern Wages, (Quelques réflexions sur les formules de salaire moderne). Génie Civil, vol. 73, no. 22, Nov. 30, 1918, pp. 425-428, 5 figs.

Labor Share. Min. & Sci. Press. vol. 117, no. 26, Dec. 28, 1918, pp. 864-866. Conditions brought about by abnormal requirements of war; objections raised by workmen to changing war scale.

The Human Factor in Shop Production, Margaret K. Strong. Am. Drop Foeger, vol. 4, no. 12, Dec. 1918, pp. 489-490. Points out that high wages given high productiveness because workman who is well fed and nourished can do greater amount of work.

Wages in War and Peace. Open Shop Rev., vol. 16, no. 1, Jan. 1919, pp. 19-23. Impossibility of maintaining present high wages.

The Modern Wage Rates and the Public Works and Construction (Les tarifs de salaire moderne et l'entreprise de travaux publics et du bâtiment), G. Bouf. Génie Civil, vol. 74, no. 1, Jan. 4, 1919, pp. 9-11, 1 fig. Study of Taylor's system of rational wages; instituting bonuses.

WOMEN. The Employment of Women in Acetylene Welding, Helen G. Fisk. Jl. Acetylene Welding, vol. 2, no. 7, Jan. 1919, pp. 348-354. Abstract of preliminary report of Chicago district ordnance office on activities of women in acetylene-welding field during the war.

The employment of Women in the Machine Tool Industry, Alfred Herbert. Eng. Rev., vol. 32, no. 6, Dec. 16, 1918, pp. 161-163. Scope for their employment after war; plea for fixing minimum wage or maximum working hours. Text of memorandum submitted by Machine Tool & Eng. Assn. to War Cabinet Committee on Women in Industry.

Mental Function in the Work of Women (La fonction mentale dans le travail féminin). Jule Amar. Comptes rendus des séances de l'Académie des Séances, vol. 167, no. 22, Nov. 25, 1918, pp. 788-791. Psycho-motor reactions in women; physiological examination of their endurance.

Women a Fixture in Electrical Industry. Iron Age, vol. 103, no. 6, Feb. 6, 1919, pp. 353-354, 3 figs. Special provision for employment, welfare and safety are made by the Westinghouse Co.; shop and thecnical courses courses are provided.

Women Workers — Have They Made Good? Mary N. Winslow and Edgar E. Adams. Am. Drop Forger, vol. 5, no. 1, Jan. 1919, pp. 12-16, 5 figs. Records of past year; part played by women in war-time industries; presented problems; fact concerning employment of women in various plants.

LEGAL

ACCIDENT COMPENSATION. When is an Industrial Accident? Business Digest & Investment Weekly, vol. 23, no. 3, Jan. 21, 1919, pp. 92-93. Phraseology of compensation insurance laws in various states and legal decisions by different courts in United States and Great Britain.

"Pre-Existing" Condition of the Workman and Its Relation to Compensation for Injury, Chesla C. Sherlock. Am. Mach., vol. 50, no. 2, Jan. 9, 1919, pp. 67-69. Explanation with citations of zone court decisions.

PATENT LAWS. United States Patent Law and Procedure, E. E. Huffman. Jl. Engrs. Club St. Louis, vol. 3, no. 6, Nov.-Dec. 1918, pp. 335-351. Outline of patent system; suggested changes. Address delivered at joint meeting of Assoc. Eng. Soc., St. Louis.

The Rights to Patents and Inventions, Chesla C. Sherlock. Am. Mach., vol. 50, no. 3, Jan. 16, 1919, pp. 115-118. Quotes some notable decisions in respect to patent rights.

The New Patent Law Drafted for Hungary and its Influence Upon Engineers (Der neue ungarische Patengesetzentwurf mit besonderer Ruecksicht auf die Stellung der Techniker), Dr. Rudolf v. Schuster, President of Patent Court. Zeitschrift des Oesterr, Ingenieur, und Orchitekten-Vereines, Vienna, vol. 70, no. 37, Sept. 13, 1918, pp. 399-402. Defends the provisions of the proposed patent law for Hungary. Advocates cooperation of engineers and lawyers.

The Crucial Question of Patents, Robert Hadfield. Eng. Rev., vol. 32, no. 6, Dec. 16, 1918, pp. 157-160. How Board of Trade can provide strong stimulus to British scientific and engineering progress by applying its present powers to effect modification of patent law.

Patent Law Amendment. Jl. Instn. Elec. Engrs., vol. 57, no. 277, Dec. 1918, pp. 64-71. Report of patent-law committee adopted by conference of representatives of 30 leading scientific and technical societies, convened by Instn. Mech. Engrs.

The Patent Situation in the United States. Mech. Eng., vol. 41, no. 2, Feb. 1919, pp. 147-149 and 199. Report of Patent Committee to the National Research Council.

LIGHTING

INDUSTRIAL LIGHTING. Artificial and Natural Industrial Lighting, C. E. Clewell. Elec. World, vol. 73, no. 1, Jan. 4, 1919, pp. 22-25, 8 figs. Their interrelations considered; predetermination of artificial lighting requirements; variation in natural lighting intensities; importance of daylight factor; methods of measurement.

Engineering Aspects of Industrial Lighting, C. E. Clewell. Elec. World, vol. 73, nos. 2 and 6, Jan. 11 and Feb. 8, 1919, pp. 68-71 and 260-262, 7 figs. Jan. 11; Industries should take advantage of studies made under stress of war conditions to promote efficiency of production; specific data now available which aid in selection aud location of lighting units. Feb. 8; Ecomomic considerations of the accident rate; relation to coal conservation; well-lighted versus poorly-lighted aisles; desirability of more widespread and intelligent use of reflectors for all lamps.

MILL LIGHTING. Modern Lighting and Power Installation for Canadian Knitting Mill. Elec. Rev., vol. 74, no. 4, Jan. 25, 1919, pp. 127-130, 7 figs. Electrical equipment complete and designed to minimize fire and accident hazards; details of lighting and power facilities.

Progress in Mill Lighting Practice, H. H. Magdsick. Textile World, Jl., vol. 55, no. 2, Jan. 11, 1919, pp. 401 and 403, 5 figs. State and Federal regulations; development in accessories.

STREET LIGHTING. The Street Lighting of the City of Buffalo, W. F. Schwartz. Am. City, vol. 20, no. 1, Jan. 1919, pp. 48-50, 4 figs. System comprises type C nitrogen-filled lamps, luminous arcs, pendent magnetite arcs, and enclosed carbon arcs, as well as gas lamps of Welsbach boulevard and ornamental types, and gasoline lamps. Number and cost of each type are given.

YARD LIGHTING. Light as an Aid to the Movement of Materials, A. L. Powell and R. E. Harrington. Ry. Elec. Engr., vol. 10, no. 1, Jan. 1919, pp. 9-13, 7 figs. Expedition of freight handling at transfer platforms and piers. Abstract of paper before Illum. Engr. Soc.

PUBLIC REGULATION

PLANT MANAGEMENT. Industrial Economy (Economia Industrial), V. Posada Gavira. Boletin de Minas, vol. 10, nos. 7-9, Sept. 30, 1918, pp. 129-149, 1 fig. Coordination and harmonization of the technical ,economical and human elements in industry by central administration, standardization and specialization.

PUBLIC WORKS. A National Department of Public Works, C. E. Grunsky. Jl. Elec., vol. 42, no. 1, Jan. 1, 1919, pp. 16-17. Advisability of creating department of public works to be represented in President's cabinet. Gain in efficiency is claimed over present distribution of engineering work under five different departments.

STREET CARS. The National Aspect of the Public Utility, Franklin T. Griffith. Jl. Elec., vol. 42, no. 2, Jan. 15, 1919, p. 78. Question of higher street-car fare discussed from standpoint of what may legitimately be done to keep them low.

RECONSTRUCTION

BRITISH PLANS. England's Vast Plans for Peace Work, Carroll E. Williams. Mfrs. Rec., vol. 75, no. 3, Jan. 16, 1919, pp. 90-92. New shipyards built in record time; building of concrete ships; recommendation of British reconstruction committee on relations between employers and employees; reconstruction of iron and steel business.

ENGINEERING PROBLEMS. The Economic Duties of the Engineer, W. R. Ingalls. Eng. & Min. Jl., vol. 107, no. 4, Jan. 25, 1919, pp. 184-190. Engineering problems in reconstruction.

ENGINEERING SOCIETIES. What Engineering Societies Should Do to Assist in Providing Work for Soldiers and Others Who Will Soon Be Out of Work. Bul. Affiliated Eng. Societies Min., vol. 3, no. 12, Dec. 1918, pp. 221-222. From Eng. & Contracting.

FRANCE. America and Reconstruction in Europe. Jl. Elec., vol. 42, uo. 1, Jan. 1, 1919, pp. 18-19. Plans of directors and representatives of large power stations and electric lighting plants situated in devastated regious of France; work done by British Ministry of Reconstruction; post-war preparations in Spain.

Helping France an Aid to America, Jahn V. Schaefer. Iron Trade Rev., vol. 64, no. 3, Jan. 16, 1919, pp. 207-208. Sending of vast stores to army construction material and experts to help rehabilitate country urged as a means of solving our labor problem, securing war loan and laying foundation of future trade.

RECONSTRUCTION PLANS. Industrial Relations After the War, Henry P. Kendall. Textile World Jl., vol. 55, no. 2, Jan. 11, 1919, pp. 121, 247 and 249. Need of constructive plan acceptable to all; basic principles that should control.

The Human Factor in Industry, A. P. M. Fleming. Jl. Instn. Elec. Engrs., vol. 57, no. 277, Dec. 1918, pp. 47-56. Means which make for improvement in material prosperity of those engaged in industry; pressing problems in industrial reconstruction.

RESEARCH. Science and the After-the-War Period, George K. Burgess. Jl. Wash. Acad. Sci., vol. 9, no. 3, Feb. 4, 1919, pp. 57-70. Importance, during transition period, of proper balance and distribution of scientific forces; advisability of retaining more than a nucleus of an organization of scientific men in service of Government and especially in military and naval establishment.

SCIENTIFIC LEADERSHIP. Human Instincts in Reconstruction ,William Henry Smyth. Indus. Managment , vol. 57, no. 2, Feb. 1919, pp. 89-91. Suggests leadership of a national council of scientists as means for directing forces of human instincts.

STEEL TRADE AND SHIPBUILDING. The Steel Trade and Shipbuilding Competition, E. T. Good. Cassier's Eng. Montly, vol. 54, no. 6, Dec. 1918, pp. 342-345. Interdependence of steel trade and shipbuilding industries; warning against separation of their common interests and against German dumping methods.

WAR DEVELOPMENTS. War Developments in Industry, Kellaway. Engineering, vol. 103, no. 2763, Dec. 13, 1918, pp. 672-673. Address before Industrial Reconstruction Council, November 1918.

SAFETY ENGINEERING

ACCIDENTS AND OUTPUT. Welfare and Safety. Cassier's Eng. Monthly, vol. 54, no. 6, Dec. 1918, pp. 316-324, 4 figs. Effect of industrial accidents upon output; means whereby incidence of industrial casualties may be considerably diminished.

CEMENT INDUSTRY. Safety Hazards of Cement Industry, O. C. Soderquist. Concrete Mill Section, vol. 14, no. 1, Jan. 1919, pp. 11-12. Itemizes cement-mill dangers and suggests safety principles and rules.

FIRE PROTECTION. Automatic Sprinklers for Fire Protection. Arthur Bateman. Domestic Eng., vol. 86, no. 2, Jan. 11, 1919, pp. 81-83, 4 figs. Notes on their construction, installation and operation.

GRAIN DUST EXPLOSIVES. Experiments with Grain Dust Explosions, Earle William Gage. Am. Miller, vol. 47, no. 2, Feb. 1, 1919, pp. 137-138, 4 figs. Investigations to determine possible cause of explosion and to test various preventive measures.

LIGHTING. Relation Between Light Curtailment and Accidents, R. E. Simpson. Nat. Engr., vol. 23, no. 1, Jan. 19, 1919, pp. 6-8. Survey of accidents due to improver or inadequate illumination; effect of diminished lighting; suggestions. Paper presented at convention of Illum. Eng. Soc.

Overheating Workmen. The Problems of Overheating Workmen, Chesla C. Sherlock. Am. Drop Forger, vol. 4, no. 12, Dec. 1918, pp. 506-507. Methods of protecting workmen who are in contact with high temperatures; liabilities of employer.

Safety Fuse. Use and Abuse of Safety Fuse. Eng. & Min. Jl., vol. 107, no. 5, Feb. 1, 1919, pp. 229-231. Abstracted from bul. 9 of Indus. Accident commission, Cal.

SALVAGE AND WASTE PREVENTION

High-Speed Steel. The Salvage of High-Speed Steel Tools. J. H. Vincent. Am. Mach., vol. 50, no. 4, Jan. 23, 1919, pp. 169-170, 4 figs. Salvaging milling cutters at comparatively small cost by method of grinding without drawing temper of cutter.

Rust Prevention. Rust Prevention as a Steel Conservation Measure, Denis O'Brien, Elec. Ry. Jl., vol. 53, no. 5, Feb. 1, 1919, pp. 243-244. Writer's experiences in removing rust from steel cars and preventing its spreading to a damaging extent.

Scrap. Saving the Waste with an Electric Furnace, C. B. Merrick. Jl. Elec., vol. 42, no. 1, Jan. 1, 1919, pp. 30-31, 5 figs. Installation of a two-phase Rennerfelt furnace of 750-lb. capacity by Pacific Foundry Co. to utilize small pieces of waste iron such as nails, borings, ect.

Scrap Organization and Scrap Salvaging, CharlesA. Reagan. Jl. Soc. Automotive Engrs., vol. 4, no. 1, Jan. 1919, pp. 47-4R. Work of the Stores and Scrap Section of Ordnance Department; suggestions in regard to scrap segregation.

Waste Utilization. Possibilities in Saving and Utilizing Industrial Wastes, H. E. Howe. Indus. Management, vol. 57, no. 2, Feb. 1919, pp. 92-96. Points out three responsibilities of manufacturers: To use material of no higher grade than necessary for proper production of goods; to reclaim every particle where a salvaging process in known; to search for means to utilize wastes now thrown away.

TRANSPORTATION

Electric Trucks. Electric Truck as a Means of Shop Transportation. Can. Machy., vol. 21, no. 5, Jan. 30, 1919, pp. 103-105, 4 figs. Illustrates uses of electric storage battery trucks in industry for automatic transportation in loading and unloading ships and railway cars, and in the machine shop, tire factory, textile mill aud electric wire insulating and maufacturing plants.

Industrial Electric Trucks, Tractors and Narrow-Gage Locomotives, Raymond J. Mitchell. Elecn., vol. 82, no. 2121, Jan. 10, 1919, pp. 51-57, 16 figs. Conditions under which electric trucks are to be desired; rapidly with which goods may be handled; main features of electric trucks now on the market; results achieved at the Natua Transfer Station of Pennsylvania Railway.

VARIA

Acceptances. Trade Acceptances in the Forging Trade, M. A. McCann. Am. Drop Forger, vol. 4, no. 12, Dec. 1918, pp. 475-477. Presents different phases of subject from viewpoint of salesman. Method of procedure explained.

Engineering Societies. American Engineers Locally and Nationally Associated, Alfred D. Flinn. Jl. Cleveland Eng. Soc., vol. 11, no. 3, Nov. 1918, pp. 163-173 and (discussiou) pp. 173-178. Plea to engineering organizations to give earnest consideration to problem of co-operation; brief account of growth of Founder Societies and creation of Engiueering Foundation; service given by the Engineering Societies Library; advisability of publishing an Engineering Societies periodical.

Engineers. What the War Has Done for Engineers, and the Part Engineers Have to Play in Reconstruction. Engineer, vol. 127, no. 3289, Jan. 10, 1919, pp. 41-42. Abstracted from the Presidential Address of R. E. B. Crompton before the Junior Institution of Engineers.

International Chapters. A New Factor in World Commerce, Richard S. Harvey. Textile World Jl., vol. 55, no. 2, Jan. 11, 1919, pp. 127 and 197. Considerations on advisability of forming international chapters for commercial corporations.

Social Problem. Organizing the State to Assist Individuals — A War Lesson (Die allegemeine Naehrpfiicht iu Licht der Kriegserfahrung), Max Singer, Zeitschrift des Oesterr. Ingenieur-und Architekten-Vereines, vol. 70, no. 38, Sept. 20, 1918, pp. 409-411, Part 1, Indorses the principles propounded by Josef Popper-Lynkeux, that it is the duty of the State to enable each individual to make a fair and useful living. Discusses solutions of the social problem. Part 2 in no. 39. concluded in no. 40, Oct. 4, 1918.

GENERAL SCIENCE

CHEMISTRY

Analytical Chemistry. Method of Least Squares Applied to Estimating Errors in Coal Analysis J. D. Davis and J. G. Fairchild. Department of Interior, Bur. of Mines, Tech. Paper 171, 36 pp., 6 figs. Following limits of error are calculated; for sampling 0.20 per cent; for ash determination, 0.40 cent; for moisture determination, 0.20 per cent; for heating-value determination, 0.75 per cent. Thus writers conclude that limits allowed by committee on coal analysis of Am. Soc. Testing Materials represent values within which a large percentage of errors will actually fall.

Flame Reactions. Flame Reactions; Selenium and Tellurium in the Hydrogen-Air Flame, Jacob Parish. Jl. Phys. Chem., vol. 22, no. 9, Dec. 1918, pp. 640-646. Extension of writer's previous experiments (Jl. Phys. Chem., 22, 430, 1918) to behavior of selenium dioxide, tellurium dioxide, hydrogen telluride, and of elements themselves, in hydrogen-air flame.

Physical Chemistry. Physical Chemistry and Its Bearing on the Chemical and Allied Industries. James C. Philip. Jl. Roy. Soc. Arts, vol. 67, nos. 4503 and 3452, Jan. 3 and 17, 1919, pp. 94-102 and 122-131, 1 fig. Jan. 3: Factors which determine equilibrium in a reversible reastion; thermodynamic equation expressing influence of temperature on equilibrium constant of a reaction, and its relation to heat effect of reaction. Jan. 17; Laws and principles governing absorption of gases and disolved substances.

Structure of Matter. The Atomic Weight of Lead from Samarskite, Arthur L. Davis. Jl. Phys. Chem., vol. 22, no. 9, Dec. 1918, pp. 631-639. Separation of lead from samarskite, its purification, and determination if its atomic weight by analyses of lead chloride obtained; parallel experiments with ordinary lead and comparison of relative values under same conditions of experimentation; correlatiou of results with theory of radioactive changes involved by determination of percentages of uranium and thorium.

The Determination of the Molecular Complexity of Liquid Sulphur, Alex. Mitchell Kellas. Jl. Chem. Soc., vols. 113 and 114, no. 674, Dec. 1918, pp. 903-922, 4 figs. Series of experiments to determine surface tension of liquid sulphur between melting point and boiling point by means of capillary tubes.

Utra-Violet Light. Ultra Violet Light. Its application in Chemical Arts — XX, Carleton Ellis and A. A. Well. Chem. Engr., vol. 26, no. 13, Dec. 1918, pp. 505-506 and 521. Ultra violet absorption of aliphatic ketones and aldehydes. Compilation of researches by different experiments.

MATHEMATICS

Continuous Fraction Algorithm. On Jacobi's Extension of the Continued Fraction Algorithm, D. N. Lehmer. Proc. Nat. Academy Sci., vol. 4, no. 12, Dec. 15, 1918, pp. 360-364. Instead of starting with cubic irrationality and finding expansion to fit it, writer starts with periodic expansion and finds associated with it a definite cubic irrationality.

Coronoid. On the Theory of the Coronoid (Sur la théorie du couronoide), C. Cailler. Archives des Sciences Physiques et Naturelles, vol. 46, Oct. 1918, pp. 191-209. Aims to prove that the fundemental principles of Riemaun's non-Euclidean geometry are identical with the kinematic conceptions of motion of spherical figures on the surface of a sphere. Supplementary to article in Arch. 1918, vol. 46, pp. 119-150.

Elliptical Functions. Elementary Solution of the Inversion of Elliptical Functions (Solution élémentaire du problème de l'inversion des fonctions elliptiques), René Garnier. Comptes rendus des séances de l'Académie des Sciences, vol. 167, no. 22, Nov. 25, 1918, pp. 748-750. Genarlization of Landen's transformation.

Hyperspace. Note on Rotations in Hyperpace, Edwin Bidwell Wilson. Jl. Wash. Acad. Sci., vol. 9, no. 2, Jan. 19, 1919, pp. 25-28. Method of investigation based on general reduction of homogeneous strain to canonical form. Supplement to writer's paper; Note on Multiple Algebra; the Reduction of Real Dyadics and the Classification of Real Homogeneous Strains, published in Jl. Wash. Acad. Sci., vol. 7, 1917, pp. 173-177.

Integration On the complex rational groups and integration by quadratures (Sur les groupes complexes de rationalité et sur l'intégration par quadratures), Jules Drach. Comptes rendus des séances de l'Académie des Sciences, vol. 167, no. 22, Nov. 25, 1918, pp. 743-746. Integrability of equations decomposable into Lie's infinitesimal transformations.

Integration of a Partial Derivative Equation Occurring in Dynamics of Fluids (Intégration d'une équation aux dérivées partielles de la dynamique des fluides), Jules Drach Comptes rendus des séances de l'Académie des Sciences, vol. 167, no. 24, Dec. 9, 1918, pp. 943-945. Motion of a fluid when speeds of particles are parallel to fixed plane and independent of distance to plane studied by Euler's equations in combination with equatiou of continuity and complementary relation.

Laplace Coefficients. On Certain Polynomials which Approach Laplace Cœfficients (Sur certains polynomes se rattachant aux cœfficients de Laplace), Armand Lambert. Comptes rendus des séances de l'Académie des Sciences, vol. 167, no. 24, Dec. 9, 1918, pp. 948-949. Linear relations between hs (k) functions.

Logarithms. Logarithms of Hyperbolic Functions to Twelve Significant Figures, Frederick E. Pernot and Baldwin M. Woods. Univ. of Cal. Publications in Eng., vol. 1, no. 13, Nov. 16, 1918, pp. 297-467. Tables of logarithms to base 10 of three principal hyperbolic functions for range form 0 to 2 with tabulat interval of 0.0001, and auxiliary tables of log (sink x/x) and log (x/tanh x) for range from 0 to 5 with same tabular interval.

Polygonal Functions. On the Periodical Polygonal Functions (Sur les fonctions pulygonales périodiques), Trajan Lalesco. Comptes rendus des séances de l'Académie des Sciences, vol. 167, no. 22, Nov. 25, 1918, pp. 746-748. Theorem concerning application of Fourier's development to functions represented diagrammatically by continuous polygonal contour. Also abstracted in Revue Générale de l'Electricité, vol. 5, no. 2, Jan. 11, 1919, pp. 43-45, 3 figs.

PHYSICS

Atomic Structure. Maxwell's Equations and the Radiation of Atoms (Maxwell's Gleichungen und die Atomstrahlung), Th. Wereide. Annalen der Physik, vol. 54, no. 20, 1917, pp. 323-324. An explanation supplementing the author's original article in vol. 52, 1917, p. 276. Treats of the electrical energy of an electron moving in an electrostatic field, including the electric energy of the outer field, the field of the electron itself, and the kinetic or magnetic energy of the electron. The chief contention of the author is that a circular movement of the electron is not equivalent to the resultant of its linear componential motion.

Capillary Layers. Thickness and Structure of a Capillary Layer of a Liquid in Contact with Its Saturated Vapor (Die und Struktur der Kapillarschicht einer Fluessigkeit in Beruehrung mit ihrem gesattigten Dampf), G. Bakker. Annalen der Physik, vol. 54, no. 20, 1917, pp. 245-295, 5 figs Discussion of potential function of the forces of attraction. Application to thermodyamics. Cnomparison of theoretical results in the experimental determinations made on gases, hydrocarbons, water, alcohols, including their freezing points. Mathematical treatment.

Colors of Colloids. The Colors of Colloids — I, Wilder D. Bancroft. Jl. Phys. Chem., vol. 22, no. 9, Dec. 1918, pp. 601-630. Collection of experiments and studies on colors of bubbles, drops, grains, filaments and films, with reference to and explanation for pigmentary and structural animal colors.

Compressibility of Solutions. Compressibility of Aqueous Solutions, Especially of Urethane, and the Polymerization of Water, Theodore W. Richards and Sven Palitzsch. Jl. Am. Chem. Soc., vol. 41, no. 1, Jan. 1919, pp. 59-61, 1 fig. Compressibilities of aqueous solutions of urethane were measured at 20 deg. cent. over pressure range from 100 to 300 megabars, as were also surface tension, specific volume and viscosity. Bearing of results on theory of Harold Whiting ascribing polymerization to water is emphasized.

Conductivity. Studies in Conductivity — IV. The Conductivity of Alkaline Earth Formates in Anhydrous Formic Acid, H. I. Schlesinger and R. D. Mullinix. Jl. Am. Chem. Soc., vol. 41, no. 1 Jan. 1919, pp. 72-75, 1 fig. Experimental results found for calcium and strontium solutions.

Changes of Electrical Conductivity Under Geotropic Stimulation, James Small. Proc. Roy. Soc., vol. 90, no. B630, Dec. 20, 1918, pp. 349-363, 14 figs. Proves that perception of gravity by the root is a protoplasmic phenomenon by record of changes in electrical resistance of second millimeter of one side of root-tip of Vicia Faba at various angles to vertical changes show same sibmoid curve as is shown by animal tissue in response to stimuli.

Heat Conductivity. Experiments on the Heat Conductivity of Gases (Experimentelle Unterschungen ueber die Waermeieittaehigkeit der Gase), Sophus Weber. Annalen der Physik, vol. 54, no. 21, 1917, part 1, pp. 325-356, 9 figs.; no. 22, part 2, pp. 437-462, 2 figs.

Knudsen's Method for Determining the Ratio of Heat Conductivity to Electrical Conductivity of Metals. Also some physical constants of Wolfram (Die Methode von Martin Knudsen zur Bestimmung des Verhaeltnisses von Waermleitung zur Elektrizitaetsleitung der Metalle, nebst einigen physikalischen Konstanten des Wolframs), Sophus Weber. Annalen der Physik, vol. 54, no. 19, 1917, pp. 165-181, 3 figs. The ratio mentioned is applied in the theory of electrons of metals. For its measurement K. Kohlrausch's method may be used, if a large quantity of the pure metals is available, or Martin Knudsen's method, described in vol. 34. p. 624, 1911, which requires a wire of the metal only.

Internal Friction. On the Interior Friction of Quartz Fibers at Low Temperatures (Remarque sur le frottement intérieur des fils de quartz aux basses températures), C-E. Guye and P. Barbier. Archives des Sciences Physiques et Nautralles, vol. 46, Dec. 1918, pp. 326-328 Experiments to determine cause of slow variation of internal friction as temperature diminishes from —80 to —194 deg. cent.

Light Radiation. Investigations of the Radiating Poperties of Individual Sources of Light by Means of Objective Photometry (Unterschungen von Strahlungseigenshaften einzelner lichtquellen mit Hilfe objektiver photometrie), Frederick Conrad. Annalen der Physik, vol. 54, 1917, pp. 357-400, 5 figs. Dissertation at Breslau. Described method of making tests. Construction of a photometric ray filter. Mechanical equivalent of light. Radiation of platinum. Intensity of sunlight. Photometric economy of sources of light. Tests of the illumination of incandescent lamps, Nernst lamp, gas flame, arc lights, mercury vapor and carbon lamps. Tests made at University of Breslau during 1915 and 1916.

Radiations. The Gamma Ray Activity of Thorium, D. Herbert N. McCoy and G. H. Cartledge. Jl. Am. Chem. Soc., vol. 41, no. 41, Jan. 1919, pp. 50-53. Determination of Th D: The ratio in order to ascertain whether combined mesothorium and thorium D activities would give total V activity.

Relativity. Theory of Relativity in Terms of Universal Time (La Théorie de la relativité en fonction du temps universal), Edouard Guillaume. Archives des Sciences Physiques et Nautralles, vol. 46, Dec. 1918, pp. 281-325, 4 figs. Concept of universal time in theory of relativity permits introduction of physical notions in Doppler's phenomena; thus Lorentz's abstract concepts of relative time and contraction are eliminated.

Sound Waves, Reflected. Submarine Range-Finding by Means of Reflected Sound Waves. Sci. Am., vol. 120, no. 4, Jan. 25, 1919, pp. 67 and 82. Modification by Elias Ries of his apparatus for accurate positioning of icebergs. Subaqueous device consists of two megaphone receivers pivoted at ends of horizontal arm and a sound projector mounted in center; operation similar to that of aerial apparatus.

MUNITIONS AND MILITARY ENGINEERING

Anti-Submarine Devices. The American Destroyer. Sci. Am., vol. 119, no. 26, Dec. 28, 1918, p. 515, 3 figs. 12000-ton destroyer, depth bomb and other accessories which habe contributed to the destruction of U-boats.

Camps. Engineering Features of Camp Dodge, L. P. Wolff. Bul Affiliated Eng. Societies Minn., vol. 3, no. 12, Dec. 1918, pp. 208-220, 1 fig. Waterworks: sewerage system; railroads; streets and highways; heating.

Gun Mounts. Making Naval Gun Mounts, Franklin D. Jones. Machy., vol. 25, no. 6, February 1919, pp. 485-492, 17 figs. First of two articles describing special tools, gages and fitures used at the plant of the Mead-Morrison Mfg. Co., where 1000 complete mounts for 4-inch guns are being constructed for the United States Navy.

Hano Grenades. Making the American Hand Grenade, Edward K. Hammond. Machy., vol. 25, no. 6, February 1919, pp. 519-524, 18 figs. Second of two articles on methods of machining and loading the bodies and assembling the bouchons.

Howitzers. How a 155-Mm. Howitzer is Made, J. V. Hunter. Am. Mach., vol. 50, nos. 5 and 6, Jan. 30 and Feb. 6, 1919, pp. 199-204and 249-252, 32 figs. The breech.

Inspection. The Inspector's Standpoint in Munition Production, John T. Marsh. Jl. Cleveland Eng. Soc., vol. 11, no. 3, Nov. 1918, pp. 131-152, 9 figs. Qualifications required by inspectors; conditions likely to be found in relations between manufacturers and inspectors; rejections for pipe; duties of inspectors in regard to brinelling.

Lewis Machine Gun. The Manufacture of the Lewis Machine Gun, Frank A. Stanley. Am. Mach., vol. 50, no. 2, Jan. 9, 1919, pp. 55-60, 17 figs. The radiation, locking piece and magazine. (Fourteenth article.)

Motor Transport. Engineering Division of the Motor Transport Corps, John Younger. Jl. Soc. Automotive Engrs., vol. 4, nos. 1 and 2, Jan. and Feb. 1919, pp. 5-8 and 77-85, 2 figs. Jan.: Functions of engineering division; organization scheme; work of technical service branch. Feb.: Function of design section, standardized directions for heat treatment of steel; chemical analysis and physical properties of carbon steel; chart of steel specifications, chemical and physical properties.

Ordnance Depot. Huge Steel Buildings at Ordnance Base Depot in France, Robert K. Tomlin. Eng. News-Rec., vol. 82 no. 3, Jan. 16, 1919, pp. 124-129, 10 figs. Project includes both shops and warehouses; all material supplied from United States; transmission line built to supply electric power for machine-tool operation.

Railway Batteries. The 14-in. Naval Railway Batteries, C. L. McCrea. Am. Mach., vol. 50, no. 4, Jan. 23, 1919, pp. 141-149, 11 figs. Story of design, construction, shipping, reecting aboard and placing in action on the fighting front of the U. S. Navy's 14-in. guns on railway mounts.

Railways. Our Railway War Forces Aboard. Ry. Mech. Eng., vol. 93, no. 1, Jan. 1919, pp. 19-22, 6 figs. Account of problems encountered in France and shop facilities for erecting equipment.

Shell Manufacture. Unique Shell-Profile Turning Attachment, Donald A. Baker. Am. Mach., vol. 50 no. 4, Jan. 23, 1919, pp. 161-162, 1 fig. Design made to start cut at small end of shell, turn the radius and continue to turn parallel until disengaged.

High Explosive Shells and Shrapnel, J. M. Hall. Am. Drop Forger vol. 4, no. 12, Dec. 1918, pp. 500-504. How shells are heat treated; physical and chemical requirements; heating of steel for forgings. From paper presented before Steel Treating Research Soc.

Manufacture of Six Inch High Explosive Shells for the United States Army, T. D. Lynch. Elec. Jl., vol. 16, no. 1, Jan. 1919, pp. 17-25, 23 figs. Description of Shadyside Plant of Westinghouse Electric & Mfg. Co., equipped to manufacture 6-in. shells at the rate of 3000 per day, working day and night.

Shell Manufacturing Tools. Special Tools for Shell Manufacture, George A. Neubauer and Erik Oberg. Machy., vol. 25, no. 6, February 1919, pp. 534-537, 12 figs. Second of two articles describing a number devices used by the Buffalo Pitts Co.

The Mount Royal Tunnel *

A Description of the Construction of the Tunnel and Terminal built by the Mount Royal Tunnel & Terminal Company for the Canadian Northern Railway at Montreal.

By

J. L. Busfield, B.Sc., A.M.E.I.C.

INTRODUCTION

History of the Tunnel Project

Previous to the recent opening of the Mount Royal Tunnel for through passenger traffic the Canadian Northern Railway was unfavourably situated in the City of Montreal, only having a small passenger and freight station at Moreau Street in the east end of the City. This station was inadequate even for the handling of the local traffic between Montreal and Quebec, and with the growth of the Canadian Northern to a ten thousand mile transcontinental system it became more than ever essential that adequate and suitable terminal facilities should be provided.

Speaking generally, the City of Montreal proper covers a long narrow area with the central portion confined between two natural barriers, the St. Lawrence River to the south and Mount Royal to the north, with the result that surface railways could only reach the centre of the City after passing through a number of miles of city property which has been rapidly becoming more and more congested. Mount Royal was looked upon as an impassable barrier as far as railway location was concerned until the Canadian Northern put into effect the idea of tunnelling the heart of the mountain in order to reach the most desirable location in the City for both a passenger terminal and also for freight connections. The credit for the conception and elaboration of this project must be given to Mr. H. K. Wicksteed, M.E.I.C., Chief Engineer of Surveys for the Canadian Northern Railway System, who worked out the preliminary location for the tunnel and terminals, and who is generally looked upon as the " father " of the whole project.

Before any publicity was given to the proposition, active steps were taken in the way of quietly acquiring the necessary rights and lands on both sides of the mountain. On the north side a large number of farms between the mountain and St. Laurent were purchased outright with the object of developing a model city to be served by rapid transit through the tunnel; in the City itself properties were acquired forming the nucleus of desirable areas for passenger and freight terminals and connecting right-of-way. Preliminary surveys were commenced late in 1911 and carried on during the early part of 1912, and early in that year Mr. S. P. Brown, M.E.I.C., who had had considerable experience in tunnel construction in the United States was engaged as Chief Engineer. At this date the sale of " Model City " lots was opened to the public, and the survey and the preliminary organization work was earnestly taken in hand, with the result that in June, 1912, the first excavation work was commenced by the Tunnel Company's own forces in the West Portal of the tunnel. Construction was rapidly pushed ahead, the first connection being made through the mountain by the meeting of two bottom headings in

* Read by the Author before the Professional Meeting at Ottawa on February 13th, and before the Montreal Branch on February 20th, 1919.

December, 1913. The work of widening the tunnel to full size proceeded steadily until after the outbreak of the war, when expenditures were necessarily reduced to a minimum and it was not until February, 1916, that the tunnel excavation was completed, and December, 1916, that the concrete lining was entirely in place. After that date the excavation for the station site and temporary terminal in Lagauchetiere Street was proceeded with until the consummation of the project was reached on October 21st, 1918, by the running of the first passenger train carrying the general public.

almost entirely through farming country with comparatively small population. In addition to the above line it was also proposed to provide an easterly connection crossing the Canadian Pacific Railway Quebec line near Jacques Cartier Junction, and joining the existing Canadian Northern Quebec line at a point east of Moreau Street Station. From the point at the north side of Mount Royal a tunnel through the mountain was to give access to a passenger terminal at Dorchester Street and also to a freight terminal in the wholesale district and to the tracks of the Montreal Harbour Commission.

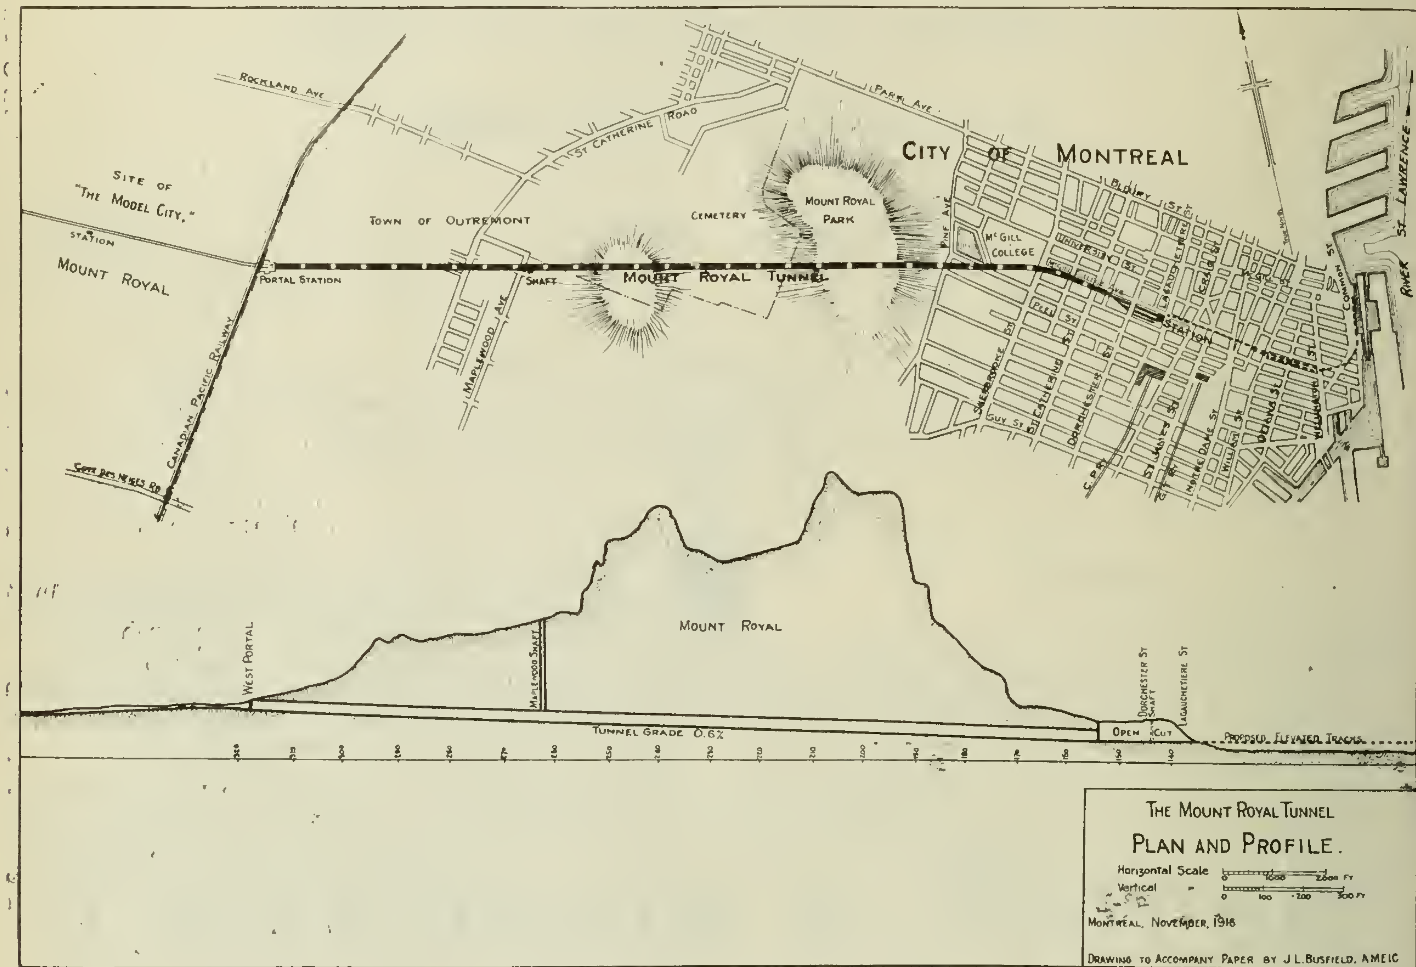

Fig. 1.

General Description

Briefly stated the scheme developed by Mr. Wicksteed and most of which has been carried out with little change, was to build a line of railway from Grenville Junction on the Ottawa-Quebec line to St. Eustache, thence crossing the Back River near Ile Bizard and parallel to the south side of the river to Cartierville and across the Island of Montreal to the north side of Mount Royal, crossing the Canadian Pacific Railway's belt line at a point about one mile west of Mile End Station. This location passed

After studies had been made of a number of alternative schemes, the site for the passenger terminal was located in the two blocks bounded by Cathcart, Lagauchetiere, Mansfield and St. Monique Streets, intersected by Dorchester Street, one of the main east and west thoroughfares of the City as shown on the general plan and profile, Figure 1. From this site the tunnel line was laid out following the centre line of McGill College Avenue to a point near Burnside Place, from which point it curved to the west, to a long tangent passing under the highest part of Mount Royal, while the West Portal was located adjacent to the Canadian Pacific Railway's belt line track connecting Mile End and Montreal West. This location was chosen in order that the tunnel might pass under the minimum amount of built-on property, particularly in the City where the amount of cover was small. From the West Portal the tracks were located in an open cut across the Model City "Mount Royal," and a large sorting yard, engine terminal and engine changing station were located at Cartierville. The original plans provided for a double track tunnel to be operated by electric traction; a large passenger terminal with large office and other buildings situated over the tracks on both sides of Dorchester Street; ample trackage in the city and Cartierville terminals for handling a large amount of suburban traffic in addition to heavy main line taffic, both to the east and to the west; and all the necessary equipment such as electric locomotives, and multiple-unit cars essential for high class service. To the east or south of the passenger terminal provision was made for building a viaduct across the downtown streets to a large elevated freight terminal to be situated on Nazareth Street between William and Wellington Streets with an elevated connection from there to the proposed high level tracks of the Harbour Commissioners' railway. Owing to war conditions, however, these plans have not as yet been carried out in their entirety.

SURVEYS

Preliminary Work

Before describing the nature of the survey work, the general method of the tunnel excavation must be outlined. Briefly stated, this was carried out by sinking a shaft at Dorchester Street to subgrade level so that a heading could be driven towards the mountain without waiting for the general excavation of the station site; by making an open cut excavation at the West Portal, and driving a heading below the C. P. R. tracks towards the city; and thirdly by sinking an intermediate shaft at Maplewood Avenue (about one mile from the West Portal)from which headings were driven in each direction. From these four headings, in turn, breakups were made at intervals, providing a large number of working faces, few of which would be more than a mile from the nearest outlet. Details of the various methods used for the various forms of construction will be described later.

In order to have plans of sufficient accuracy for even preliminary studies of location and alignment a rapid survey was made of the territory on either side of the proposed railway from the water-front to the "Model City," by which streets, railway tracks and other prominent features were located. Sufficient elevations were also taken for the preparation of a working profile over the whole route. This survey was carried out by one party using ordinary methods, the survey lines being laid out principally on the streets but partly over the mountain and through Mount Royal Park. The party consisted at the most of seven men, namely, a chief of a party, two instrumentmen, one rodman, two chainmen, and an axeman. The field notes were plotted partly by the instrumentmen and partly by the office staff, although, as a general rule throughout the whole of the construction work, the field staff prepared their own plans and plotted their own notes.

Another phase of the preliminary work was the preparation of plans showing underground structures and utilities, such as sewers, water mains, electric and telephone conduits, and so forth, in the immediate neighbourhood of the proposed construction work. This involved lengthy studies of plans at the City Hall and other offices, but in many cases the information there available was so meagre that, for example, sewer connections had to be actually traced by experiment on the ground. However, the importance of having correct and reliable plans of these structures could not be over estimated.

The condition of all buildings within reasonable distance of the tunnel line was very carefully determined before the actual commencement of construction work, both by very accurate levelling, and also by plumb lines on the fronts and rears of the various houses. Extensive photographic work was also carried out in order to have a complete record of the condition of all adjacent property.

Precise Surveys

The steep slopes of the mountain made it inadvisable to make direct measurement along the line of the tangent, so it was decided to run accurate traverses around the side of the mountain. Suitable routes were chosen and angle points selected and permanently marked as far apart as possible, keeping away from hills and rough ground. Each angle point was preserved by drilling a ¼-inch hole into the stone or concrete of the sidewalks about half an inch deep, and hammering into this hole a piece of ¼-inch hollow brass tubing. A copper rivet was then hammered into the tube and a punch mark or knife scratch marked the precise point. Ten to fifteen minutes was found to be ample time for the setting of one of these points and many of them are still in place. In the city itself, in order to hold the survey lines even more permanently, monuments were set at a few important locations, and in order to insure that they would not be disturbed by frost, the foundation of each was set down about 7 feet below the ground surface. The type of monument used is illustrated by Figure 2a.

In order to make the traverse around the mountain sufficiently accurate, the length of the route being about four miles, it was necessary to adopt some form of precise measurement. A large proportion of the lines to be measured came on sidewalks or roads so it would have been impossible to use any form of measurement requiring stakes, and a form of portable measuring point, called a "spider," was, therefore, used. It was made of a cast iron wheel carried on screw legs and supporting a vertical member with a brass head on which is the cross scratch to which measurements are made, the details being shown in Figure 2b. Four of these spiders were used, each weighing about forty-four pounds.

Previous to making the precise measurements, "spider points" were marked on the sidewalks by means of a chiselled cross every 99 feet on the lines of the traverse, being put on line either by eye or by a transit. Where the lines were not on sidewalks the spider points were marked by driving ship spikes into the ground. While these were being marked by one party of four men at the rate of about two miles per day, a second party consisting of a leveller

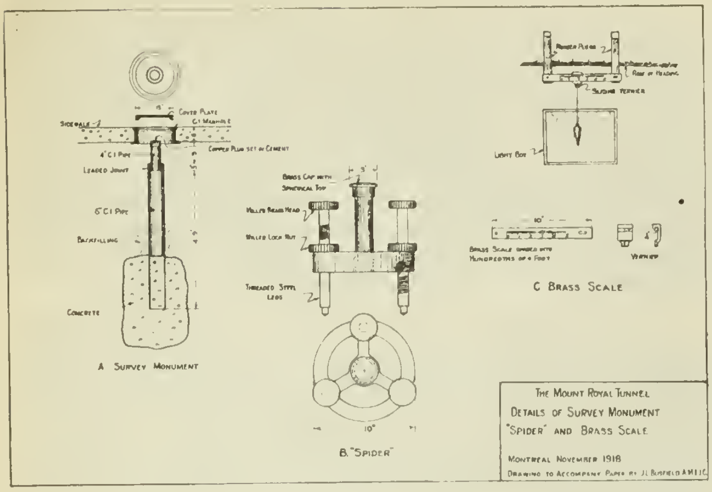

Fig. 2.

and rodman was following and taking the elevations of all the spider points and entering them in a book specially provided for that purpose.

Before any of the actual measurements were made all the tapes that were used were compared with a tape standardized by the Washington Bureau of Standards under the same condition as were to be employed in the field, namely, under a tension of 12 pounds and supported at intervals of 20 feet. Corrections were also made to a temperature of 62° Fahrenheit. Chesterman steel tapes 100 feet long and ¼-inch wide, divided into hundredths of a foot, were used, the observer estimating to thousandths.

The actual modus operandi of making the measurements (illustrated in Figure 3) was as follows: two spiders would be set up at adjacent spider points and the tape stretched across their tops, attached to a forestay at the front end and to a cord passing around a bicycle wheel with a 12 pound wieght attached at its rear end. Four wooden standards were then lined in by eye at 20 feet intervals, and the hooks for supporting the tape set on a straight line between the tops of the spiders so that when hooked up and with tension applied the tape would practically conform to a straight line between the tops of the spiders. The height of each spider above its spider point being measured and the elevation of the spider point being known, the difference in elevation of the two ends of the tape could then be obtained and hence the correction to horizontal. Thermometers were suspended from the standards and readings taken for every set up so that the proper correction for the expansion or contraction of the tape could be made. When the tape was properly hooked up and had the tension applied, readings of the intersection of the cross scratches on the two spiders were taken by the two observers at either end of the tape and called out to a recorder, who entered them in the field notebook and rapidly subtracted the two readings. The tape would then be allowed to slide over the tops of the spiders so that a different pair of readings would be obtained and again called out to the recorder. At least four pairs of readings would be taken in this way, but if the difference thus obtained varied more than one or two thousandths, the readings were continued until a reliable measurement was obtained. In addition to the tape readings the recorder also booked the height of the spiders and the mean temperatures. Corrections to horizontal and for temperature were later made in the office from special tables and charts. After a set of readings had been completed the whole apparatus was carried ahead and a new measurement made in the same way, but one spider was always left in place behind the one actually being measured from, so that in case of a spider being accidentally moved the other could be used again, thus saving the party from having to go back to the nearest angle point and, therefore, over the same ground twice. At the starting point and at all rivet stations instead of one of the spiders being placed over the rivet it was set up merely as a support for the tape, the reading on which was obtained by transferring the point on the rivet vertically up to the tape by means of a transit placed a short distance away from, and at right angles to the tape.

This method of measuring required ten men, namely, a chief of party, a transitman, a recorder, two chainmen, two spider-placers, a thermometer reader, a man for forestay, a man for tension wheel. Under favourable conditions as much as 1,500 to 1,800 feet was measured per hour, but ten spider points per hour made a good average for a day's work on sidewalks. The majority of the work was done in the daytime but in the busy sections of the city it was necessary to work during the night, small acetylene lamps being used for illumination. Great care having to be taken in reading the angles of the traverse, a Berger transit, 7¼-inch plate, reading to ten seconds was used. In setting the instrument up over the angle points a second transit was used to insure the placing of

Fig. 3. Survey Party making Precise Measurements.

the vertical axis of the large instrument exactly over the centre of the cross on the rivet, thus eliminating any error due to inaccurate centering of the plumb-bob. At the two points sighted at, wooden targets were used, being set up vertically and precisely over the points by means of a transit. In reading the angle one observer would read the angle once, " wrap it up " five times, and then reverse until zero was again reached on sighting at the foresight target. This method would give a very close approximation of the angle to two seconds, and this process being repeated by an independent observer a reading reliable to about one second could be obtained. This part of the work was necessarily slow and tedious, requiring a party of four men, who were only able to read about five or six angles per day.

A very important part of the preliminary work was that of establishing over the mountain a tangent in the same vertical plane as the tunnel centre line. The line was first run over the mountain in short stages and after the necessary cutting had been done through the wooded parts the transit points were reduced to three in number. At one of these bed rock was obtained but at the other two, concrete monuments had to be built to hold the line permanently.

Underground Alignment

The headings were completely holed through from end to end in December, 1913, with an error in alignment of less than one inch, and in grade of one-quarter of an inch at the final meeting point, which was below the highest point of the mountain. Throughout the work at the western end the tunnel centre line was determined and permanently marked in the floor of the headings by monuments, but at the eastern end it was found advisable on account of the curve to run an engineers' line independent of the tunnel centre line, with tables giving the relation of the latter to the former.

Before proceeding with a description of the methods used in laying out the lines described above, note must be made of a piece of apparatus used very frequently and found almost invaluable in the alignment work. This was a brass scale fitted with a sliding vernier as shown by Figure 2c. Whenever it was necessary to obtain an average of a number of points set by a transit one of these scales was used. It was rigidly attached to the roof timbers or to plugs set into the roof, as shown in Figure 2c, and the instrument man sighted on to a plumb-bob suspended from the sliding vernier in front of a light box or illuminated screen. They were used as a means of obtaining averages and for temporarily holding the engineers' line, and as soon as a good average reading was obtained the line was, in most cases, transferred to a permanent monument set in the floor of the heading. Different types of monuments were used but the one found most satisfactory was made from a two feet length of 1½-inch gas pipe with a piece of brass solidly riveted into the top on which the centre mark was made. The pipe was cemented into a hole drilled down into the floor of the heading. For giving centre line and grade at the working face, " spads " were set in the roof every fifty or sixty feet throughout the length of the tunnel.

At the West Portal the heading was driven direct from an open cut so the alignment was readily transferred into the heading by setting up a transit in the cut and sighting directly on to a scale placed as far into the heading as possible. At the Dorchester Street shaft the line had to be transferred down the shaft, which was 20 feet long by 10 feet wide, and before the main tunnel tangent was reached four angles had to be turned, two on account of the curve at McGill University, and two because the shaft had to be located 30 feet to the north of the tunnel centre line. The whole tunnel alignment from the east end depended entirely on the accurate location and deflection of these angles. In order to secure the requisite accuracy, the chainage was carefully transferred down the shaft by means of a plumb line, and from there to the last angle point base line measurements were made in the same way as already described for the surface surveys.

The Maplewood shaft had to be located about twenty feet to the south of the tunnel centre line, consequently the lines for driving the headings had to be transferred down the shaft and then offset to the centre line, and run east and west. Great accuracy was not so essential in this part of the work as the heading only had to be driven a little over two thousand feet before meeting the heading from the West Portal, after which the line was carried through from the portal. However, when the headings were actually holed through the error in alignment was less than the thickness of a plumb-bob cord, while between the West Portal and the City the error was less than one inch.

For transferring the survey lines down the shafts, No. 8 steel piano wires were used, suspended as far apart as possible. They were hung from reels attached to heavy wooden frames and at the surface were passed over a notch in a tangent screw on the front of the frame by means of which screw they were finally adjusted to their precise position. The two wires were very carefully set on line at the surface and an instrument man was continually on watch during any series of observations, a precaution which was fully justified, as frequently the wires would be jarred off line by some careless labourer or by the vibration caused by the nearby hoisting engine or by passing traffic. At the lower ends of the wires 12 and 30-pound weights were suspended at the Dorchester and Maplewood shafts respectively, and immersed in pails of water to reduce the swinging and oscillation to a minimum. In producing the line into the heading the transitman would set up the transit about ten feet away from the nearest wire and would then " buck " into line until the transit cross hair would bisect each wire. The view in Figure 4 shows the instrumentman with a transit set up under a scale, in the act of bucking into line. When the transitman had got on line he would sight ahead onto a scale which had been previously set up as far away from the instrument as possible, an observer at the scale taking the reading of the vernier as it was set. The operation was repeated a large number of times and continued until enough readings had been obtained on the scale to leave no room for error. The observers at transit and scales were frequently changed. The transit was also always reversed and set off line between all readings, and the whole process of shaft plumbing was carried out on a number of different days.

It has already been mentioned that in the heading from the Dorchester shaft it was necessary to turn off four angles very precisely as the exactitude of the main tangent depended largely on the accuracy with which these angles were turned off. The ten second transit already referred to was used, and as on the surface it was set up over an angle point by means of a second transit. The angle was then turned off roughly and a small mark made on the foresight monument, the precise angle to this point being obtained by wrapping up the angle five times and taking the mean. By taking the difference between the angle thus obtained and the angle as it should be, the distance between monuments being known, it was then possible to calculate the distance the true point should be to the right or left of the preliminary point. After a new point had been taken in this way the angle was again wrapped up five times, by different observers, and the operation repeated until there was no possibility of an error of even one second.

After the last angle had been turned off to a point as far away as possible, it was necessary to produce the tangent westwards and at the same time the tangent was gradually being produced eastwards from the west portal.

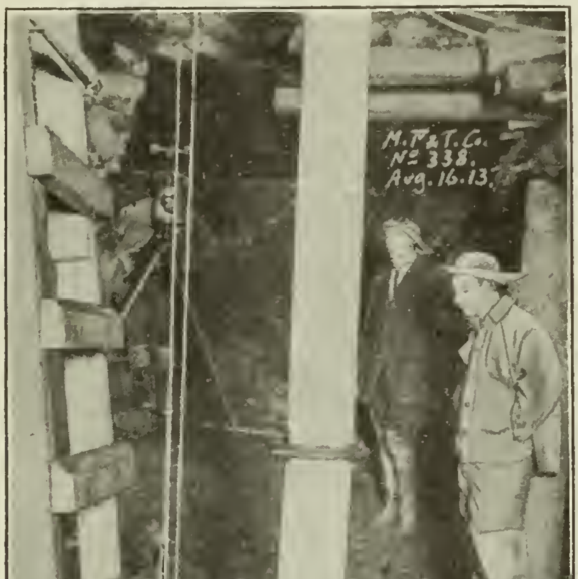

Fig. 4 Shaft Plumbing. - "Bucking" into line.

In order to produce the line from any two monuments a scale was set up at the foresight and instead of setting up the transit immediately over the intermediate monument it was set up about ten feet away and bucked into line between the adjacent monument and the backsight, thus eliminating the use of a plumb-bob. A large number of readings would be taken on the scale and the average transferred to the monument below by means of a transit. In making some of the long sights necessary on the tangent the ordinary plumb-bob was not satisfactory as a sighting point and some special targets were used.

A great deal of the precise alignment work had to be carried out on Sunday nights as this was the only time at which the heading was clear of smoke and at which the work could be carried on without interruption from the construction work. For the actual alignment of the headings alone great precision would not have been necessary, as an error of even two or three feet in line would have caused no serious effects, but a great deal of excavation work was being done back of the headings, in breakups, and it was essential that the alignment should be fairly accurate for this part of the work.

Levelling

It was of equal importance that correct elevations should be adhered to throughout the work as lines and distances. Accurate elevations of bench marks throughout the construction territory were determined by independent observers, each using numerous set-ups at each turning point, and taking every known precaution to eliminate errors. Eighteen-inch Berger Y levels were used for this work. Elevations were transferred down the shafts with steel tapes, applying the same tension as that under which they were standardized, and also making correction for temperature. In the tunnel itself, the elevations were carefully determined of each monument as it was set, while for the actual driving of the heading the elevation of the alignment spads were taken, from which the inspectors were able to mark a point on the face so many feet above subgrade for the guidance of the drillers. The error in elevations at the meeting point was less than one quarter of an inch.

GEOLOGICAL CHARACTERISTICS

Generally speaking the central part of Mount Royal is formed of an igneous volcanic instrusion throught what was originally a bed of Trenton limestone, the relative locations being such that the east and west ends of the tunnel were driven through limestone while the central portion was through the large body of igneous rock called essexite. The relative positions of the different rocks are shown at the foot of the progress diagram, Figure 7.

The Trenton limestone at a considerable depth was found to be excellent tunnelling rock, being crystalline and hard, but difficulties were encountered owing to the limestone bed being broken up by the igneous intrusion causing numerous dykes and fractures running in all directions. These dykes, varying from a few inches to many feet in thickness, were generally extremely hard, consisting principally of nepheline syenite, camptonite and bostonite. In some cases drill steels of two different tempers had to be used in the one heading on account of the variation in the hardness of the rock, and the general unevenness in such places caused no little difficulty in drilling. At the junction between the limestone and essexite on the east side the former was found to be in a partly marmorized condition heavily impregnated with quartz, and was not only hard to drill and shoot, but owing to its cementing nature caused considerable delay by setting in the heading and muck-cars. Numerous cavities filled with calcite crystals were found, as were also gypsum, arsenic and feldspar in small quantities.

The essexite was an extremely hard rock to drill, but even with this objection, was a good tunnelling rock. It of the tunnel, and at St. Catherine Street was down as low as sub-grade; the earth above consisted of different forms of clay with layers of fine sand and hardpan. A special form of construction was used in this locality.

EXCAVATION

Tunnel Cross Sections

From the station site to the neighbourhood of Pine Avenue a number of borings were made to determine the nature of the ground through which the tunnel was to be driven. From the information thus obtained, and from

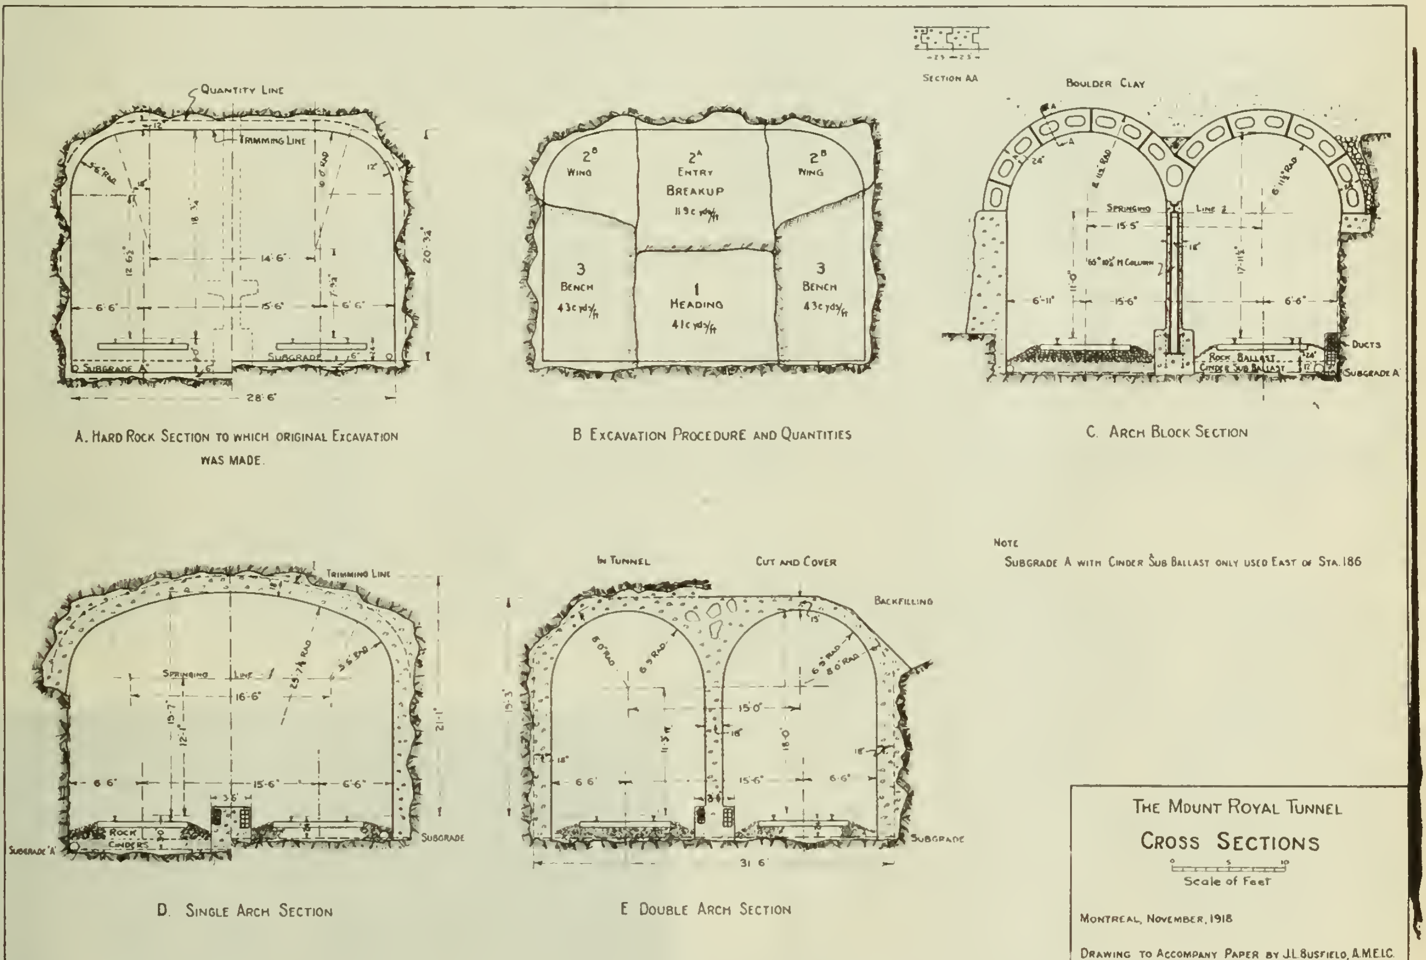

Fig. 5

was found to contain pyroxene, magnetite, hornblend and feldspar, all in small quantities.

Although the tunnel was driven through these hard rocks there were only short distances where a concrete lining could be dispensed with. By far the greater portion had to be lined and some parts timbered immediately after excavation owing to the distortions and internal strains in the rock caused by the igneous intrusion.

From the station site to a point below McGill Campus the surface of the limestone was generally below the roof

general knowledge of the geological characteristics of the mountain preliminary designs for the tunnel cross sections were prepared. Advantage was taken, however, of the work being carried out by Mackenzie, Mann & Company's own forces to leave the final design until such time as the tunnel excavation was approaching completion, and a careful study could be made of the actual conditions underground. In figure 5A is shown the cross section which was used during the greater part of the excavation work. In figure 5B is shown the sequence of excavation for this same section. The relative yardage of the headings, breakups and benches varied considerably in different parts of the tunnel but the figures given represent average conditions. In some cases only one wing of the breakup was excavated, leaving the other to be removed with the bench, and also for some distance the benches were not removed simultaneously. From the station site to Sherbrooke Street the roof of the tunnel was in soft ground and a special section using O'Rourke interlocking concrete arch blocks was adopted as shown in figure 5C. A total of 1650 linear feet of this type of construction was used.

After the excavation of the breakups was completed a series of cross sections of the tunnel roof and sides as actually excavated was made, and from the information thus obtained the single arch section in figure 5D was designed so as to require the minimum amount of trimming and at the same time, the smallest amount of concrete. This section was used for a distance of 12,322 feet between the arch block section and the twin arch section at the West Portal leaving a distance of 2,063 feet unlined. In the neighbourhood of the West Portal where the depth of cover was comparatively small, 300 feet were built in the form of a twin arch as shown in figure 5E. Part of this section was built on the cut and cover principle. Between this section and the West Portal special construction was adopted for the Portal Heights Station.

The tunnel cross sections throughout were designed with the idea of using a centre wall as shown dotted in Figure 5A, which, if found desirable, can be built into the section actually used for the major part of the tunnel. The object of the centre wall was to facilitate ventilation and provide greater safety in case of a derailment, and also to provide a roof support.

Shafts

In order that the tunnel excavation might proceed at the city end without waiting for the excavation of the open cut for the station site, a shaft 20 feet long by 10 feet wide, inside the lining timbers, was sunk immediately east of Dorchester Street with a total depth of 58 feet. Until a depth of about 45 feet was reached only soft ground was encountered and as the excavation proceeded heavy sheathing was placed around the sides, kept in place by heavy timbers. Below this depth limestone rock was encountered. Hand-drills were used, and the excavated material was hoisted out by a skip and steam derrick. The excavation of this shaft was commenced on August 3rd and completed on August 28th, 1912.

A second shaft was located adjacent to Maplewood Avenue at a point about 2¼ miles from Dorchester Street, and one mile from the West Portal. This location was not only convenient to roads and the Montreal Tramways lines, but also occurred at the bottom of the main part of the western slope of the mountain, thus giving the minimum depth obtainable at a reasonable distance from either of the portals. This shaft was excavated through solid rock for practically its entire depth of 238 feet and was made 21 feet long by 10 feet wide at the top, but reduced to 16 feet in length in the solid rock a short distance below the surface. For a number of reasons it was decided not to excavate the shaft immediately over the tunnel but at a distance of about twenty feet to the south, the only objection to this offset being the difficulty of transferring the alignment into the headings, but this was overcome in the manner already described, and the distance the heading had to be produced from this line was in any event not great. The Maplewood shaft was commenced on July 22nd and completed on October 12th, 1912.

Two additional shafts were sunk, one near Sherbrooke Street, in the grounds of McGill Campus, and the other adjacent to Cathcart Street. The former of these, which was about ten feet by twelve feet, was used for the ventilation of the heading and for the passage of drainage pipes. It was also found convenient as a check on the alignment although it was too small to obtain a line with any greater accuracy than was already laid out from the Dorchester Street shaft. The Cathcart Street shaft (14 feet long by 12 feet wide) was used for lowering the H columns and steel used in connection with the arch block construction, and later for dumping the material from the Terminal site excavation.

Heading Excavation

A number of alternative schemes for the tunnel excavation were studied but finally the method of using bottom headings and breakups was adopted as being most suitable for the particular conditions encountered. The advantage of this method was considered to be that the action of gravity could be utilized in the loading of the breakup excavation into cars handled on tracks in the bottom heading, kept clear throughout its length for transportation purposes. The excavation procedure, therefore adopted has been shown in Figure 5B.

A bottom heading was driven on the centre line of the tunnel throughout its entire length by four different workings. From the Dorchester Street shaft a heading averaging eight to nine feet high and twelve to thirteen feet wide was driven west a distance of 6,365 feet, with a total excavation of 23,442 yards of rock. From the Maple-

wood shaft headings were driven east and west measuring about nine to ten feet high and thirteen to fourteen feet wide, for distances of 5,560 feet and 2,150 feet respectively with corresponding excavations of 25,424 and 6,915 yards of rock. Similarly a heading was driven east from the West Portal averaging nine to ten feet high by thirteen to fourteen feet wide for a distance of 3,126 feet, with an excavation of 10,538 yards of rock, making a total of 17,201 linear feet of heading with 66,319 yards of excavation.

By the first method 13,000 feet of heading was driven, being 76% of the total. Four drills were carried on a horizontal quarry bar firmly wedged across the end of the heading about midway between the floor and the roof, and during each set up 20 to 25 holes, varying from five feet to eight feet in depth, were drilled in the face. A view of the drilling gang is shown in Figure 6. Different procedures were adopted in the " shooting " of the face. One practice was to fire four independent rounds using electric detonators connected with the tunnel lighting circuit

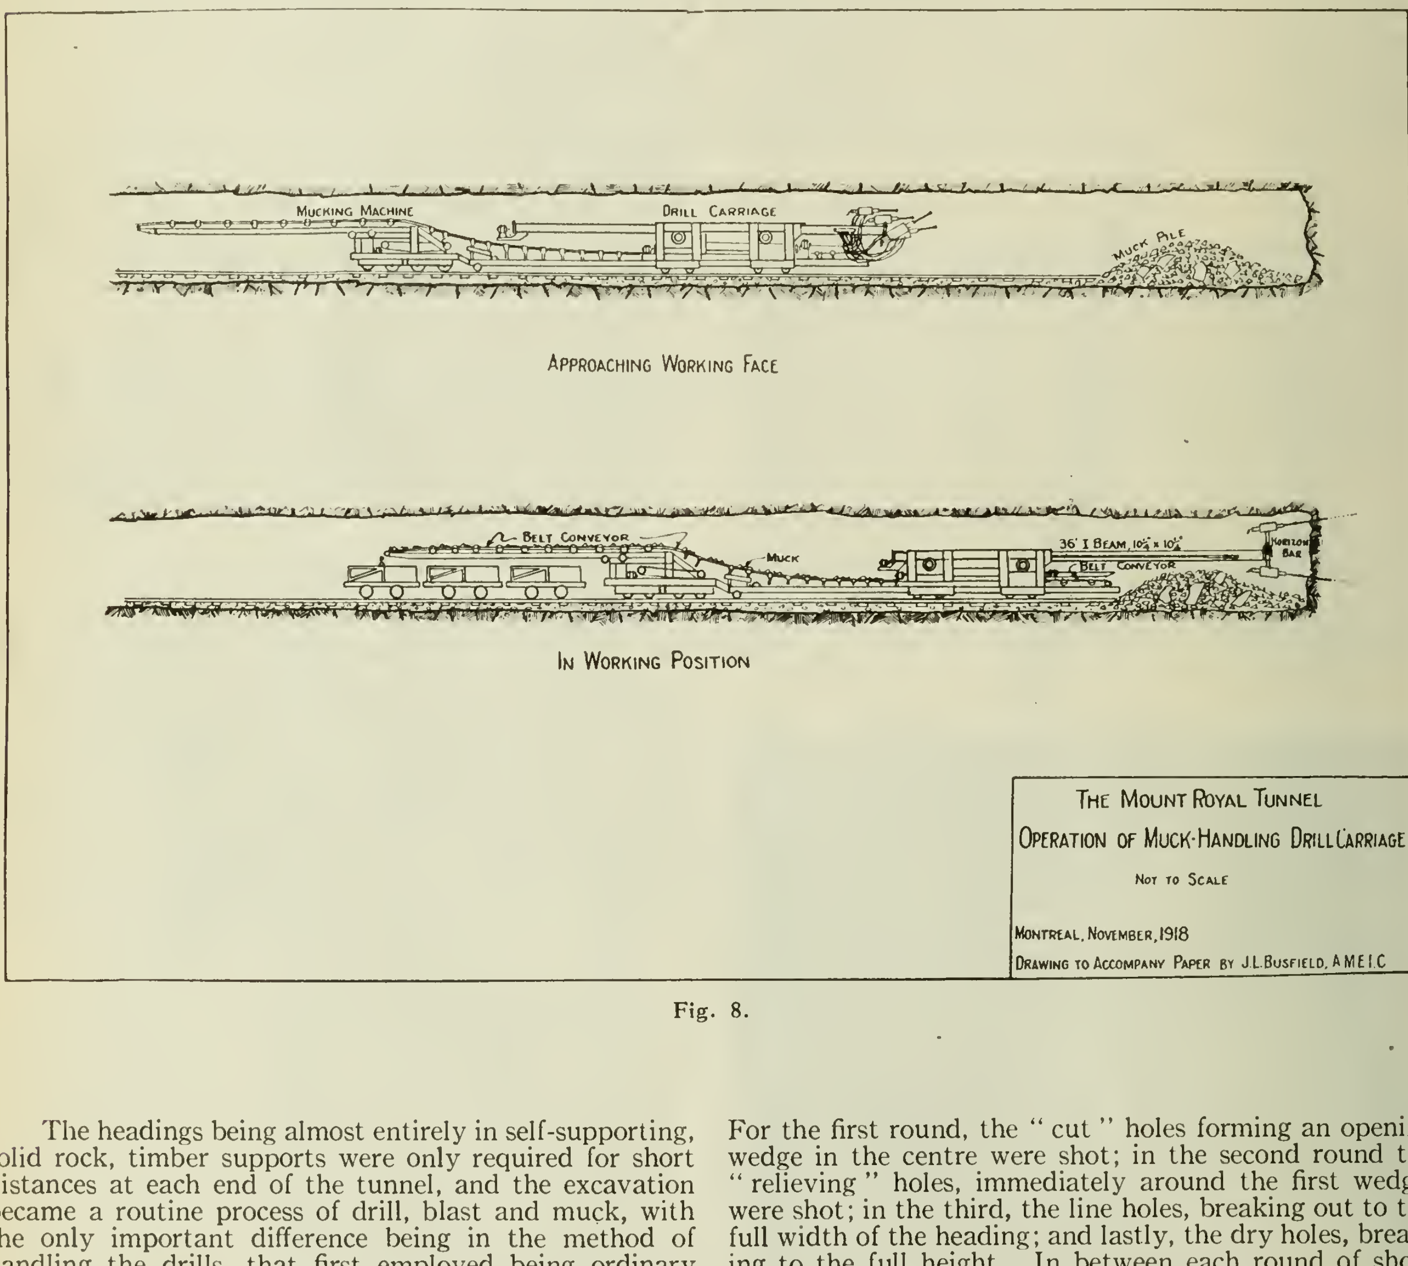

Fig. 8.

The headings being almost entirely in self-supporting, solid rock, timber supports were only required for short distances at each end of the tunnel, and the excavation became a routine process of drill, blast and muck, with the only important difference being in the method of handling the drills, that first employed being ordinary hand work with horizontal quarry bar, replaced later by a muck-handling drill carriage at the westerly end and a simple drill carriage at the easterly working.

For the first round, the " cut " holes forming an opening wedge in the centre were shot; in the second round the " relieving " holes, immediately around the first wedge, were shot; in the third, the line holes, breaking out to the full width of the heading; and lastly, the dry holes, breaking to the full height. In between each round of shots the loading gang would penetrate the smoke caused by the previous blast and load the next series of holes. In order to eliminate the loss of time and also the ill-effects on the men, of this intermediate loading, time fuses were put into use with satisfactory results. In this case the cut holes were loaded and fired first, and then the remaining holes were all loaded at the same time, but time fuses, cut at two inch intervals were used to insure the proper sequence of shots, the fuses being ignited simultaneously by electric detonators.

After shooting, the muckers immediately made their way to the face to clear a space for the drill gang, while at the same time pipefitters and electricians attended to the connecting up of the air and water pipes and electric lighting wires. As soon as sufficient space was cleared the drill runners set up the horizontal bar, mounted their drills, and again set to work. The muckers continued the removal of the blasted rock, three men shovelling from the pile onto "slick sheets" (sheets of metal placed on the floor of the heading to facilitate shovelling) from which four other men loaded the muck into cars. During periods when the work progressed at such a rate that two complete rounds of drilling, blasting and muck were carried out per shift each man would handle from 10 to 15 cubic yards of rock in about six hours of working time, the other two hours of the eight hour shift being lost during the shooting. A double track was always maintained close to the working face to facilitate the handling of the muck cars, and to insure that the muckers should not be delayed through lack of cars.

Contrary to expectation very little trouble was experienced with water in the tunnel. The only place where water was encountered to any extent was at a point about midway between the West Portal and the Maplewood Shaft. At no time, however, was there any more than could be readily taken care of by air-driven Cameron pumps. The tunnel grade descending towards the city enabled the water above referred to, to be collected in a sump at the Maplewood Shaft and pumped from there to the surface.

The rate of progress of driving the headings naturally varied under different conditions, but the maximum reached was 810 feet in the 31 working days commencing May 1st, 1913. This constituted an average of over 26 feet per day and was carried out in hard Trenton limestone. It was claimed to be the record for heading excavation in hard rock for the American Continent, but this has since been exceeded at the Rogers Pass Tunnel. Throughout this period the gangs were organized to perform perfect teamwork and with only one exception two rounds of drilling and shooting were maintained in each shift. Progress, however, throughout the main portion of heading excavation was naturally considerably less than this figure and is shown in detail in Table 2 (see Appendix), and also on the progress diagram, Figure 7. It is noticeable from the diagram that notwithstanding the extremely hard essexite encountered in the central portion of the mountain steady progress was maintained, largely due to the use of heavier equipment carried on drill carriages to be described later.

Sullivan water drills were used throughout the work. In the heading excavations described above the 2⅝-inch size were almost entirely used, but in the very hard rock the 3⅝-inch size was required. The machines employ a hollow drill steel, through the centre of which an emulsion of air and water is automatically forced, having the effect of cleaning out the hole as it is drilled. For light trimming work Hardy "Simplex," 25 pound self-rotating hammer drills were used with satisfactory results. In the essexite rock five to seven steels had to be used per foot of hole, while as many as one thousand drills had to be sharpened per day; special Ward drill sharpeners, operated on the steam hammer principle, located in the blacksmith shops on the surface, being used for this purpose. The drills were operated by compressed air supplied to a 10-inch pipe line at 100 pounds per square inch. A manifold was carried up close to the working face, to which the drills were individually connected.

Sixty per cent dynamite (Forcite) was used almost entirely, an average round requiring about 100 pounds or as much as 150 pounds for very hard rock, about fifteen to twenty cubic yards of solid rock being loosened each round.

In the heading procedure described above it was unadvoidable that there should be considerable time lost every round by the dismantling and re-assembling of the drills. With the 3⅝-inch heavy type of drill used in the very hard rock it became very difficult to handle the drilling equipment, consequently a form of drill carriage was designed to carry the frills along the headings away from the immediate working face without the necessity of dismantling and disconnecting them.

Drill Carriages

The type of drill carriage first installed in the heading being driven towards the city was evolved by the tunnel engineers and designed to suit the particular conditions to be contended with. As in the ordinary heading work, the four drills were carried on a horizontal bar which, however, was mounted at the end of a 10¾-inch I-beam, 36 feet long, supported by an H frame carried on wheels. Electric motors were provided to give three motions to the I-beam, namely, longitudinal, vertical and horizontal, so that the horizontal bar, carrying the drills could readily be adjusted to the correct position at the face. In operation the carriage was run as close to the muck pile as possible, the last few feet of track being portable and combined with slick sheets. The length of the I-beam permitted the passing of the drills over the top of the muck pile. A muck handling machine was combined with the drill carriage, in order to overcome the difficulty of the heading being blocked by the latter. A belt conveyor passing under the H-frame, as close to the ground as possible, elevated the muck and dumped it into the tunnel cars below. The diagram in Figure 8 shows the method of operation of this carriage, while the photographs in Figures 9 and 10 show the general appearance of the machine before it entered the heading.

This drill carriage and muck-handling machine was built in the tunnel company's own shops and when put into operation fully met with expectations. It was used for a period of over six and a half months, during which time about three thousand feet of heading was driven. The advantages over the ordinary method of heading excavation were many. The time of assembling and dismantling the drills at each round was very materially reduced; the saving of wear and tear on the drills was considerable; the massiveness of the whole equipment reduced vibration, and consequently gave a greater

Fig. 9. Front View of Muck-Handling Drill Carriage.

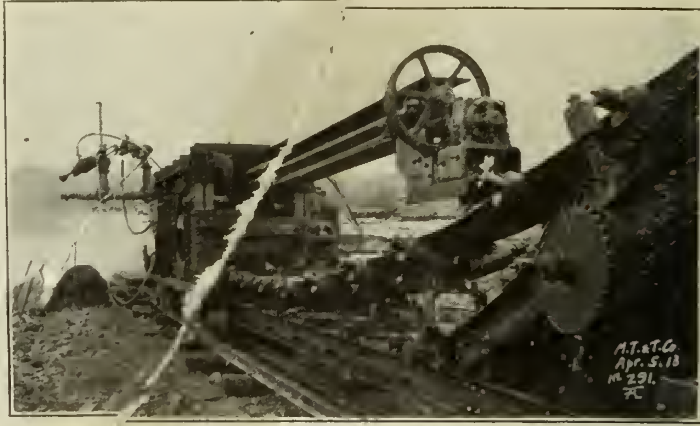

Fig. 10. Rear View of Muck-Handling Drill Carriage.

drilling rate; and the low belt conveyor facilitated the work of the mucker. There was no actual saving of labour with this machine, but the rate of progress was increased as shown by the fact that during the five months previous to the installation of the machine, December to May, inclusive, the progress averaged 346 feet per month, whereas from July to December inclusive the average progress was 484 feet per month, an increase of nearly 40 per cent, notwithstanding the fact that the rock was very much harder. The extreme regularity of the progress of the drill carriage was very striking, and is well illustrated in the Progress Diagram, Figure 7.

The drill carriage described above proved so satisfactory in operation that it was decided to install a machine in the heading being driven west from the city. By this time, however, there was comparatively little heading work remaining to be done, and the expense of an elaborate machine was not warranted. A simple form of drill carriage was, therefore, devised, with the object of producing the same results as the heavy electrically equipped machine, but at a more or less nominal cost. In this machine the drills were carried as usual on a horizontal bar, which mounted at the end of an 11 inch I-beam, 36 feet long, by means of a swivel joint, so that the bar could be swung around parallel to the heading during the movement of the carriage. The beam was carried on two small trucks with no other mechanical equipment than jacks, the latter being used to move the beam vertically to its working position. In operation, the carriage was pushed forward as soon after a blast as possible, the I-beam projecting the drills over the top of the muck pile up to the working face. In order that the heading might be left clear for mucking the rear end of the I-beam was then jacked up close to the roof of the heading and supported by wooden A-frames on each side of the heading and spanned by a piece of iron pipe. The two small trucks were then withdrawn by the locomotive and put on a siding until again required to withdraw the I-beam and drills. This carriage was only used for a period of two months, driving about nine hundred feet of heading, but practically all the advantages of the muck-handling drill carriage were obtained, including the remarkably uniform rate of progress. In fact for the last few weeks before the meeting the progress in the two headings were almost identical. The general scheme of operation of this carriage is shown in figure 11.

Breakups

At intervals of 500 to 800 feet the excavation was opened up to its full height and to the full width of the upper half of the tunnel by means of "breakups." (See Figure 5B). In order to preserve the continuity of the heading at each breakup a temporary roof was built of heavy "jumbo" timbers spaced about two feet apart, which were planked over so as to form a working floor for the breakup, small openings being left between the planks through which the muck was shovelled into cars spotted on a siding below. The general appearance of a breakup is shown in Figure 12 which also shows the heading and jumbo timbers.

The breakup was first "stoped" to the full height of the tunnel for a length of about fifty feet before the wings were excavated and as the complete breakup was continued east and west "entries" were excavated the same width as the heading to the full tunnel height and kept about fifteen or twenty feet ahead of the wings. In drilling the entry the horizontal bar was first set up at such an elevation that the drillers were able to stand on the plank floor over the jumbo timbers, and after shooting the lower half thus drilled they would stand on the muck pile and set their drills in position for the upper half of the entry. While this operation was being carried on the wings were also drilled by means of single drills set up on vertical columns. The rate of excavation of the breakups, per cubic yard, was naturally very much in excess of that in the headings, conditions all being very much more favourable. The blasting was always against two open faces and the handling of the muck was very much simplified.

By far the greater part of the breakup excavation was in sound rock requiring no support even when excavated to the full width of thirty feet but there occurred a few places where bad rock and internal strains in the roof required heavy timber supports until such time as the permanent lining was installed. The rate of progress has been shown diagrammatically in Figure 7 which also shows the relation of the breakup to the heading work. It must, however, be remembered that a linear foot of breakup was equivalent in yardage to nearly three feet of heading excavation. The actual yardage removed monthly is given in the excavation table No. 3.

haunch provided at the springing line for the concrete arch, it was not necessary to mount the machines for drilling the vertical line holes very close to the outside limit of the excavation.

In order to facilitate drilling under these conditions two drill carriages of the form shown in Figure 13 were built and used for this work. Each carriage was thirty feet in length and built up of heavy timbers, mounted on double flanged wheels. Four to six drills were mounted on each of the two horizontal quarry bars, held by four outriggers from the body of the carriage. At the ends of the outriggers jacks were provided for the purpose of rigidly holding the carriage in place. A clear opening was provided below the carriage for the passage of cars on the narrow gauge tunnel track. The quarry bars were held in such a position that with the drills set on the outside they were in position for the line holes, while from the inside of the bar the break holes were drilled. Advantages similar to those of the heading drill carriages were obtained with particular reference to the saving of time due to not having to dismount the drills while moving, and the rigidity of the carriage.

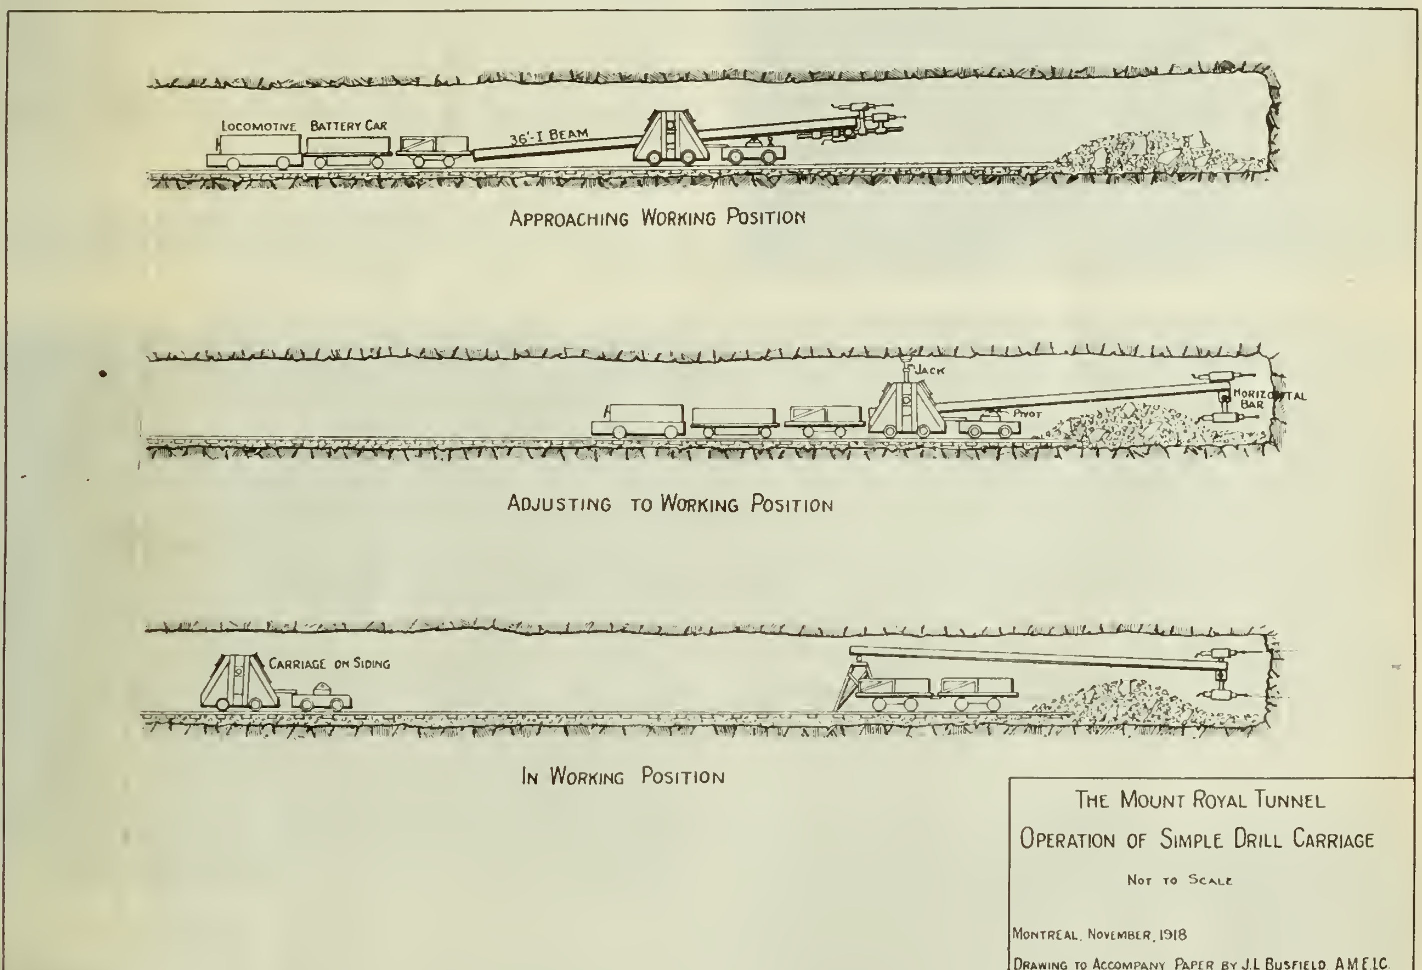

Fig. 11.

Benches

The third stage in the tunnelling operation was the removal of the benches. A condition somewhat different from either the heading or breakup excavation had to be contended with, and new factors had to be studied before a satisfactory method of attack could be evolved. Financial and labour conditions were also very much disturbed at that time by the outbreak of the war. The benches contained between eight and ten cubic yards of rock in place per linear foot and were very irregular both with regard to height and also in the sloping top, the latter making it difficult in many places for a man to keep his footing. Fortunately, however, on account of the

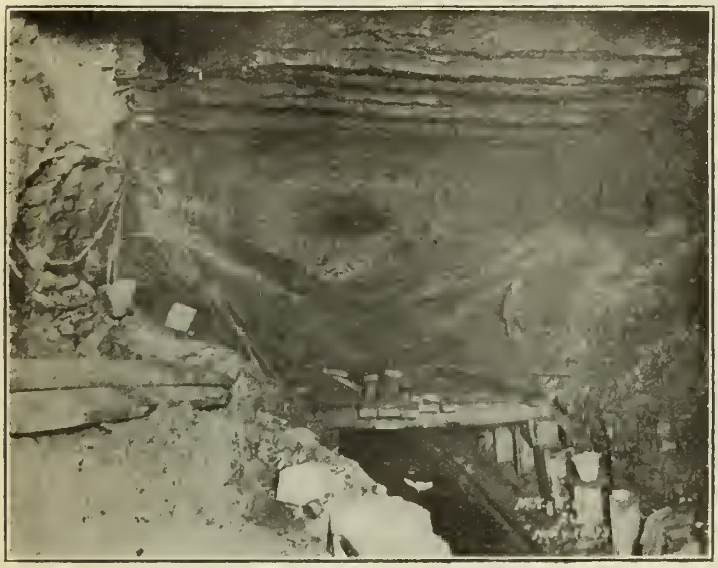

Fig. 12. Breakup showing Heading and Jumbo Timbers.

Progress reached as much as 1,500 feet per month, there being no interference from blasting as this was always done at a considerable distance behind the drill carriage. In addition to the eight to twelve drill-runners two helpers were required, while the services of an electrician and pipe fitter were distributed over the twc carriages which were used.

The removal of the rock was only performed at a considerable distance behind the drilling and shooting, again eliminating delay from the latter source. The blasted rock was entirely removed by a No. 41 Marion shovel operated by compressed air and equipped with a 1¼ yard bucket. In a working day of two ten-hour shifts over one thousand cars of muck would be handled and under average conditions 1,400 to 1,800 cubic yards of loose rock was removed from the tunnel per day. The view in Figure 14 shows the shovel in operation, while the diagram, Figure 7, shoes its progress, and table 3 gives the monthly quantities excavated.

In blasting the benches the break holes were first shot, and then the line holes, as little as one pound of dynamite being used per cubic yard of rock. In fact the removal of the benches was performed so economically throughout that the rock obtained from them was crushed and then sold for more than the actual cost of excavation and crushing even allowing for overhead charges for the plant and equipment.

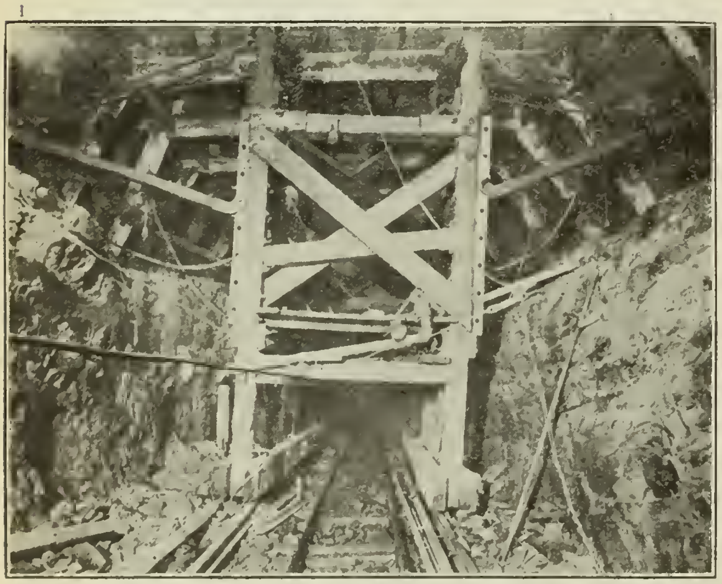

Fig. 13. Bench Drill Carriage.

Trimming

The final process in the tunnel excavation was the trimming. It is invariably found more desirable to have a special gang carry out this operation rather than hold up the breakup and bench gangs in order to make them clean out to the next excavation line. In this particular case, also, the tunnel section was not finally decided upon until after the completion of the breakup excavation, and a certain amount of additional trimming was necessitated by the final design. The greater part of the trimming, however, was required at the bottom corners of the tunnel where the drill steels from the benches had not been able to reach.

Fig. 14. Marion Shovel excavating Benches.

In order to facilitate the trimming work a carriage as shown in Figure 15 was built. It was made twenty feet in length and similar in design to the bench drill carriage. Quarry bars (as shown in Figure 15) were carried by outriggers near the bottom of the carriage so that heavy drills could be used for the corners referred to above. Hand drills were used for the sides and top, the drill-runners standing on platforms built up at suitable places on the carriage. A unique feature of the trimming work was the use of the "travelling jumbo" shown in Figure 16, which fulfilled the object of catching the blasted rock, thus keeping the track clear. The rock was dumped into cars through trap-doors in the centre.

Summary of Tunnel Excavation

The following table gives the quantities of rock excavated in the manner described above in that portion of the tunnel, comprising a length of 14,645 feet or 2¾ miles, situated between the arch block section and Portal Heights station.

	Cubic Yards	Yards per Foot	Percentage
Bottom Heading	60,667	4.1	15.3
Breakups	174,688	11.9	44.8
Benches	127,200	8.7	32.6
Trimming	19,561	1.3	5.0
Open Cut	7,150	....	2.3
Total	390,266	26.6	100.0

Disposal of Excavated Material

The muck brought out at the Dorchester Street shaft consisted of all the heading excavation between the city and the meeting point, and all the breakup excavation in this section which was made previous to the meeting of the headings in December, 1913. This excavated material was all deposited in the lower end of the station site, between Dorchester and Lagauchetiere Streets, being handled by means of side-dump cars hauled by an hoisting engine on the dump. The rock was eventually sold to a contractor who erected a crusher plant adjacent to the dump and disposed of the material as crushed rock.

Previous to the meeting of the headings between the West Portal and the Maplewood shaft, the muck was hoisted up the shaft, loaded into wagons and deposited as filling in a number of low-lying lots along Maplewood Avenue.

By far the greater part of the excavated rock was hauled to the crusher plant at the West Portal where it was disposed of in various ways.

Fig. 15. Trimming Carriage.

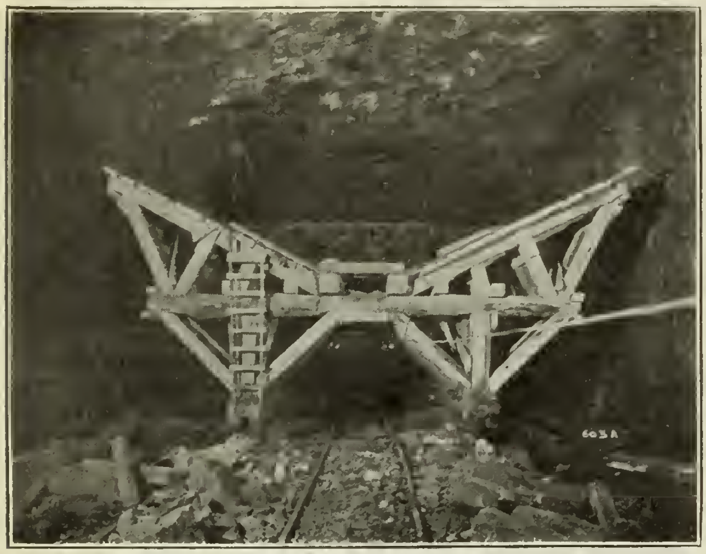

Fig. 16. Travelling "Jumbo" for Roof Trimming.

Open Cut Excavations

Excluding the open cut through the Model City west of the West Portal the first open cut excavation to be made was at the Portal Heights station site and for a short section of the tunnel in which the cut and cover system was adopted, immediately east of the station. This open cut was made by the No. 41 Marion shovel, and a total of 12,078 cubic yards of rock and 39,296 cubic yards of earth were removed. This work was commenced in March, 1914, and completed in October, 1914.

The largest open cut excavation, however, was made for the passenger terminal site, betwen Cathcart and Lagauchetiere Streets. This excavation was performed by contract, Norcross Brothers removing 20,173 cubic yards of earth from the site of the station building and Angus Sinclair 18,689 cubic yards of rock and 263,073 cubic yards of earth from the terminal yard site. Both contractors commenced their excavation in April, 1917, and Norcross Brothers completed theirs in July, 1917, and Angus Sinclair in September, 1918, although the last four months of this period were only occupied in trimming work.

The principal difficulty encountered in connection with this excavation work was the maintaining of Dorchester Street and the five feet circular brick sewer below the street. A trench was first dug along the street and the brick sewer replaced by two 48 inch cast iron pipes, side by side, connected to the sewer by concrete chambers clear of the proposed excavation. At the same time shafts were sunk down to the level of subgrade in which the steel columns for the viaduct were erected, Only one half of the street width was opened up at one time so that the remaining half was always open for traffic, with the exception of street cars which were diverted to St. Catherine Street. The main body of the excavation was commenced with a No. 20 Marion shovel ⅝ yard bucket. The earth was loaded into side dump-cars which were hauled to the Cathcart Street shaft by small steam locomotives. The material was dumped down the shaft to standard railway cars spotted below, baffles being inserted to break the fall of the muck, the drop being over forty feet. As the excavation proceeded a No. 60 shovel with a 1½ yard bucket was introduced into the cut, and as the depth increased it became possible to run a track direct from the tunnel into the cut.

The terminal site was only excavated to a sufficient width for a maximum of five tracks with three platforms, and in order to keep the top width within certain limits one to one slopes were made, while retaining walls of varying heights were built where necessary on each side. The banks were carefully graded and then covered with rip-rap 18 inches thick placed by hand. If found necessary the slopes may be given a coating of concrete in order to prevent scouring. Open tile drains are laid throughout the station site, all being connected, together with the drain from the tunnel to the city sewers.

ROOF SHIELD CONSTRUCTION

As already stated that portion of the tunnel between the terminal station site and a point below McGill College Campus, comprising a length of 1650 feet, had to be constructed with the roof above the rock surface, and it was, therefore essential that a form of construction should be adopted which would at no time leave unsupported the earth above the tunnel. After considerable study had been given to alternative methods of dealing with this condition it was decided to use a roof shield together with O'Rourke patented interlocking concrete lining blocks.

The tunnel cross section for this type of construction has been illustrated in Figure 5 C. It will be noted that the Section is of the twin arch form, the centre wall consisting of 65 pound, 10¼ inch Bethlehem H columns, spaced 2 feet 3 inches centre to centre, embedded in a continuous concrete wall. The columns were spanned by built-up steel lintels, which, in turn, carried the centre block of the twin arches. The concrete blocks were 2 feet thick radially and 2 feet 8 inches long in the direction of the tunnel. The oval tenons 12 inches by 20 inches by 7 inches deep were cast on one side of each block, while corresponding depressions were cast on the opposite side to engage the tenons on the blocks in the adjacent ring of the arch. At the side of the tunnel the arch blocks rested on concrete walls built into the solid rock.

A special plant was installed between Dorchester and Cathcart Streets for the casting of the concrete blocks. The plant consisted of travelling cranes with hand hoists for handling the forms and blocks, and with an elevated runway for the concrete mixing plant, from which the concrete was fed to the forms by gravity. The forms themselves were built up of flanged cast iron sections mounted on a steel plate. The tenons were filled to overflowing and smoothed off to correct level when the concrete was commencing to set. A tapered steel mandrel through the centre of the form held a special 2-inch nut in such position that it was cast into the centre of the block and could be reached through the hole left by the mandrel. This nut was used for attaching the block to the erector on the shield. A general view of the block plant is shown in Figure 17.

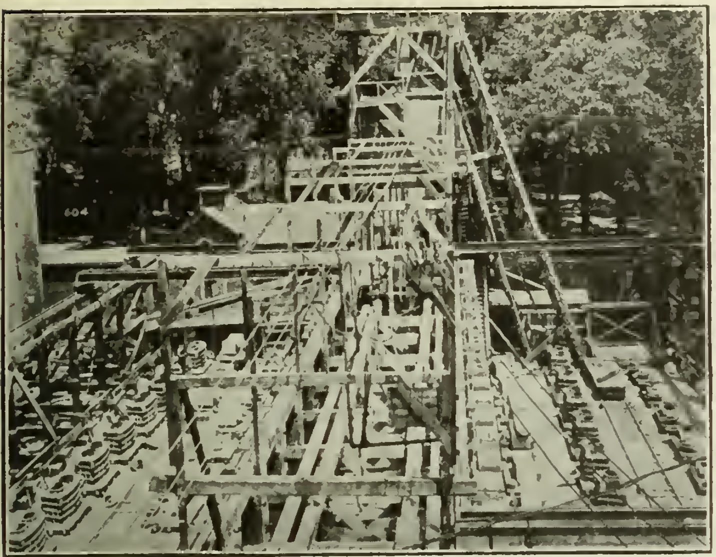

Fig. 17. Plant for casting Concrete Arch Blocks.

The roof shield, as shown in Figure 18, was built up of structural steel, the two semi-circular arches being made of 1⅛ inch steel plates stiffened by structural steel diaphragms and girders, which also contained the operating galleries. The cover plate was made of sufficient length to project forward of the girders to form a cutting edge, and to extend back over two or three of the arch rings last placed. Horizontal motion was obtained by means of seventeen 8½ inch hydraulic jacks placed around the circumference of the steel girders. The jacks pushed against the arch blocks, a maximum pressure of 6,000 pounds per square inch, or a total of over three hundred thousand pounds, being available to force the shield ahead. For the majority of the distance through which the shield travelled, the rock line although below the crown was above the bottom of the shield and it had to be drilled and blasted before the shield could be moved. Very small shots were used in order to avoid damage to the shield or to the blocks immediately behind, and also to reduce the disturbance to the buildings at the surface to a minimum, the depth of cover varying from thirty to sixty feet.

At the rear of the shield two mechanical erectors were provided for placing the arch blocks in position. Each erector was pivoted under the working gallery and by means of hydraulic rams, racks and pinions, was able to make four distinct motions, namely, rotation about the central pivot, longitudinal motion along the axis of the pivot, radial motion, and rotation on its own axis. By this means the erector could pick up a block from a car in the heading, revolve it, and swing it until it was opposite its position in the ring, then push it into line so that the tenons fitted into the depressions in the blocks already in place. The block would then be held in position by the circumferential hydraulic jacks until the complete arch was erected. After the erection of the blocks, the joints, the bolt holes and also the space over the blocks left by the skin of the shield were all closed up with a cement gun and grouting machine.

In order that the shield should have suitable runways, and also that the blocks should be placed on their permanent foundation the erection of the columns and the construction of the concrete side walls had to be carried on ahead of the shield. For the former, the bottom heading timbers had to be removed and the centre of the heading raised high enough to permit the erection of the columns and lintels. In the case of the side walls special "side wall headings" three or four feet in width and of sufficient height to accommodate the wall were excavated and the concrete poured into forms built in these small headings. The appearance of one side of this type of construction partly completed is shown in Figure 19.

The rate of progress of the shield work was somewhat hampered by the disturbed conditions due to the outbreak of the war. For a great part of the time, however, one ten-hour shift per day was operated during which, as a general rule, three rings were erected, but it actually took fourteen months to travel the whole distance, being an average of 118 feet per month, equivalent to about two rings per working day. At the west end progress was necessarily slow because the excavation was entirely in rock, and for a short distance thin structural steel ribs conforming to the shape of the twin arches were erected between each set of rings on account of the tunnel passing under private property on which it might later be desired to erect large buildings.

As previously stated, the roof of the tunnel in the arch block section came within thirty to sixty feet of the ground surface, the intervening material being clay and sand. Notwithstanding every possible precaution there was some disturbance at the surface and immediately over the shield the ground sank from six to ten inches.

Fig. 18. Rear View of Roof Shield erecting Arch Block.

The depression followed the shield as it advanced with the greatest regularity, and daily observations were made to follow possible surface changes.

At the intersection of McGill College Avenue and St. Catherine Street there existed a network of underground utilities, consisting of two 24 inch water mains on McGill College Avenue connecting with two 30-inch mains on St. Catherine Street, a 12 inch high pressure water main, various sewers, Bell Telephone and high voltage electric conduits, gas mains and so forth, and on the surface the double track of the Montreal Tramways Company with very heavy traffic. It would, of course, have been disastrous to practically all of these structures

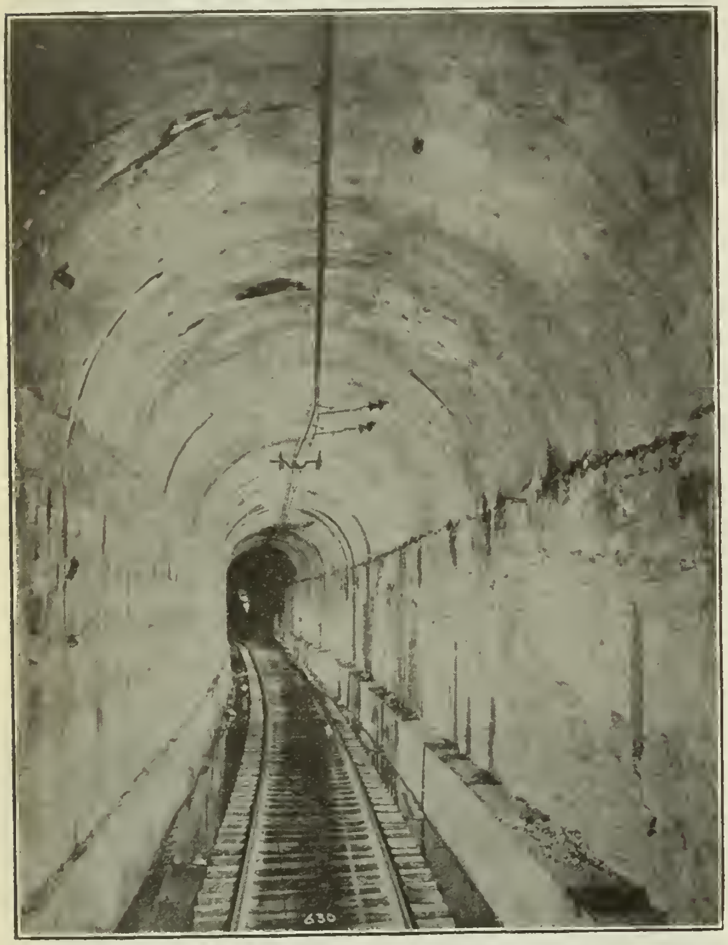

Fig. 19. Completed Arch Block Section.

to have allowed a depression of over six inches in a distance of less than thirty feet. An excavation was, therefore, made from the surface over the whole intersection, roadways being temporarily provided by planking carried on heavy timbers. All the structures were then supported on timbers, and numerous elevations taken of marked points and as the shield advanced, causing the shrinkage of the sub-soil, the timbers were jacked and blocked up to keep all the structures to their original elevation. In this manner the shield passed the complicated intersection causing practically no damage. The excavation was then filled in and the street surface restored with paving.

CONCRETE LINING

Between the west end of the arch block section and Portal Heights station, a total of 12,622 linear feet of concrete lining was placed, leaving 2,063 feet of unlined tunnel which, however, will in all probability eventually be lined to eliminate danger from scaling. Immediately east of Portal Heights station the cover was very small, and partly in earth. A double arch section as shown in Figure 5E was, therefore, built for a distance of 300 feet. Part of this section was built on the cut and cover principle, and the concrete was placed by chutes leading from a portable rotary mixer.

Immediately west of the arch block section the rock was in a very unstable condition and the concrete lining conforming to the single arch section, Figure 5D, had to be placed in very short stretches so that there should not be any very great length of roof unsupported either by timbers or concrete at any one time. There were 5,680 cubic yards, corresponding to 1,122 feet, of concrete placed under this condition. The main body of tunnel lining contained 58,360 cubic yards of concrete, and covered a distance of 12,322 feet, with an average quantity of 5.2 yards per linear foot. In placing the lining in the single arch section the depth of the side walls was made to suit local conditions regardless of obtaining a uniform appearance. For a great part of the distance they were finished off in hitches cut well into the sides a few feet below the springing line, but at other places they were extended down various distances to the level of subgrade.

Forms

The forms for the arch were built up of heavy timbers covered with planking and a steel skin plate, and were supported on carriages mounted on double flanged wheels running on a 13 feet gauge track, spanning the regular tunnel track, as shown in Figure 20. Each form was mounted rigidly on its own carriage at a height of about one and one half feet lower than the required elevation of the lining. After being placed in position the carriage and form were raised from the track by jacks and blocked up until the correct elevation was reached. They were built up in 5 feet lengths, the general practice being to use a form 30 feet long, but in the short bad rock section, lengths of 5, 10 and 15 feet were used. The side wall forms were hung from the same carriage, except in the short section where they were built up separately for each set up.

Mixing Plants

At the time the method to be used in placing the concrete lining was first discussed the pneumatic concrete placing machine was still comparatively in its infancy, but it seemed to have great possibilities for this class of work, and one machine was installed partly as an experiment before finally adopting this system on a large scale. It was found, however, to be capable of satisfactory development, and eventually two machines were used, one rated at half-yard, and the other at quarter-yard capacity. Unlike the more recent types of pneumatic mixers, these machines depended solely on the air pressure and shooting through the discharge pipe for the proper mixing of the concrete. As far as the mixer itself is concerned it is possible to handle two batches a minute, but in order to reach such a speed, very large quantities of raw materials have to be supplied to the mixer with considerable rapidity, and this constituted the principal problem to be dealt with in connection with this phase of

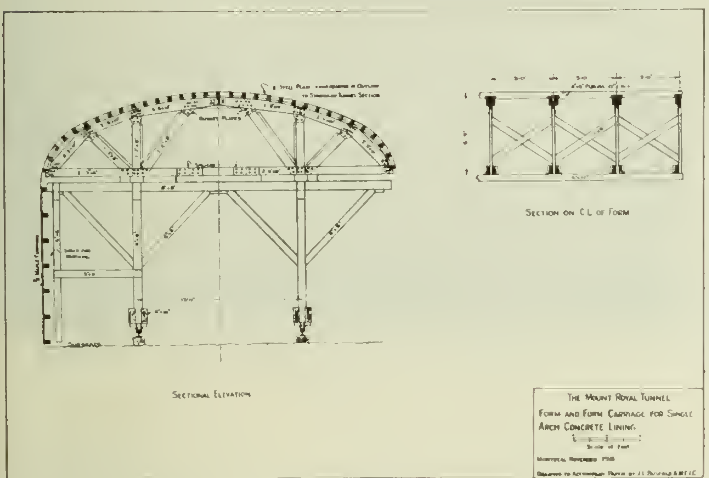

Fig. 20.

the work, and one made difficult on account of the restricted working space available.

The first plant that was put into operation was of a stationary type and was designed with the idea of shooting the concrete as far as possible in each direction, and then transporting the plant to a new location. In this plant sand and stone were hauled in the regular tunnel cars over an elevated track and dumped into pits, from which bucket elevators fed two storage bins, built as high and as large as the tunnel limits would allow. A batch hopper was placed below the bins and discharged by a single gate into the mixer, which in turn was placed as low as possible in the plant, with the discharge pipe or elbow practically resting on the subgrade. The half-yard capacity mixer was used and it was found impracticable to shoot more than one bag batch of 1: 2½: 4½ concrete with any degree of reliability. Two bag batches were attempted but they generally plugged the pipe. The 8-inch, mild steel discharge pipe was laid directly on the subgrade and connected to a vertical pipe at the form by two 45 degree steel elbows, 30 inches radius, with two similar elbows at the top, with a swivel connection to the nozzle. In placing the concrete, the side walls were first built up and then the arch filled in. The front end of the form was bulkheaded with the exception of an opening at the centre about twelve feet long through which the pipe was passed, and which was finally closed by means of sand bags.

The supply of sand and stone was obtained from the Tunnel Company's own crusher plant at the West Portal, special bins having been erected so that the tunnel cars could be loaded with the minimum of delay. Fines and screenings were used in the place of sand, and were found to answer the purpose fairly satisfactorily.

The second plant was built especially to meet the requirements in the bad rock section, where it would be impossible to run the mixer at anything like its full output capacity, owing to the short sections which it was possible to concrete at one time. The large storage bins were, therefore, not used, and the sand and stone was dumped directly into bins under a trestle over which the tunnel cars were run. The mixer which was of the quarter-yard capacity was loaded from the bins by means of a small shuttle car with two compartments, the dividing partition being moveable so that the aggregate could be mixed to a certain extent while discharging into the mixer. The operation of this plant was satisfactory but progress was slow, not on account of the design of the plant, but on account of the condition of the rock. The total distance of 1,122 feet with 5,680 cubic yards of concrete was covered in a period of six months. The plant, however, was found to be so satisfactory that the construction of another one, with a half-yard mixer and similar loading features was decided upon.

This plant, which made the third put into operation, was installed at a point about eight hundred feet east of the first plant, which had been travelling east from the West Portal. It was in continuous operation from October, 1915, until the end of April, 1916, during which time 18,000 cubic yards of concrete were placed with a maximum of 4,170 cubic yards, or nearly double the average, during the month of March. Five forms were used, and the force consisted of seven men on the plant itself, three men on the forms, with two carpenters spending part of their time repairing forms. The greatest distance from the mixer to the form did not, as a rule, exceed six hundred feet, but in concreting the section to which the plant was to be moved, a distance as great as twelve hundred feet was covered, nearly one minute being required for the passage of a batch of concrete through this length of pipe.

As the work progressed two difficulties were encountered with this type of machine. The first was the enormous quantity of air required to shoot the concrete through the longer distances, with the consequent drop in pressure, and plugging of the line. The second was the excessive amount of wear on the pipe, requiring continual renewals. The former of these difficulties would naturally tend to increase as the plant receded further from the compressor plant, and the latter would naturally not improve without a radical change in conditions.

Portable Mixing Plant

A fourth plant was, therefore, designed to overcome both these obstacles, and eventually proved to be the most satisfactory type of all those that were used. It was in operation continuously from May to December, 1916, when the lining work was completed, placing 37,265 cubic yards of concrete, an average of 4,658 cubic yards per month, with a maximum of 5,811 cubic yards during October. With the object of overcoming the difficulties referred to above, the fourth plant was made portable so that the mixer could be kept within one hundred feet of the form to be filled. The plant had to be designed to run on the 3 feet gauge tunnel track, and also to pass through the openings in the form carriages, which were only 12 feet high by 12 feet wide. The general principle of the design adopted is shown in Figure 21. The tunnel cars were run over longitudinal hoppers, 31 feet long, stone cars dumping through the bottom, and sand cars dumping sidewise. A batch hopper, located between the longitudinal hoppers and the mixer was fed by means of two belt conveyors passing under the former, one carrying sand and the other stone. The mixer, in turn, was loaded by means of a shuttle car passing under the batch hopper. Cement was unloaded and stored on small

Considerable experimenting was carried out to determine the best material for the elbows, as the amount of wear was so great that they had to be continually replaced. Eventually, the type that was found to be the most satisfactory was made in two halves, and the outer half was lined with removable cast-iron blocks, the result being that instead of having to dismantle the whole elbow, with this system only the outer half was removed and new lining blocks put into place.

Table 4, in the appendix, gives the quantities of

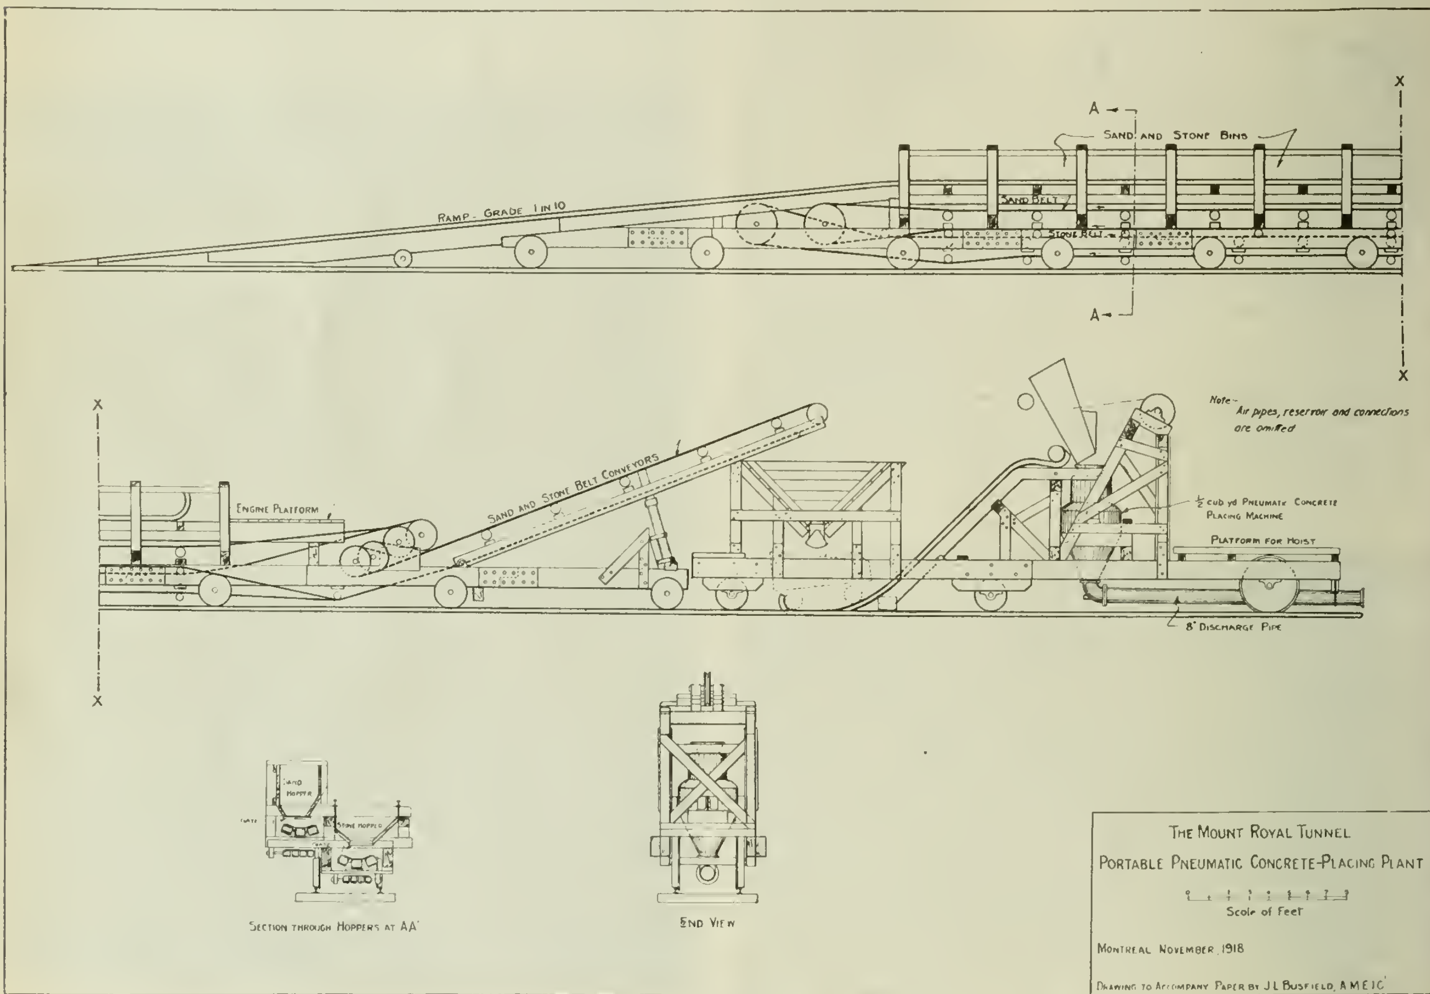

Fig. 21.

platforms and dumped into the shuttle car as required. The half-yard mixer was used and the discharge pipe was carried partly on the mixer car, and partly on special trucks built for the purpose. It was found necessary to have at least three 12 feet lengths of pipe between the mixer and the vertical elbow to obtain a proper mix. The force required for the operation of this portable plant consisted of a foreman, mixer operator, hoist runner, thirteen labourers, a pipe-fitter, and a handy man, in addition to those required for operating the trains. Two shifts worked each day, but carpenters only worked for one shift. Seven sets of forms were used.

concrete placed each month by each of the four different types of plant. A view of part of the finished concrete lining is shown in Figure 22.

UNDERGROUND TRANSPORTATION

The efficiency of the underground transportation system was of the greatest importance, as a breakdown of any branch of the system could cause serious disorganization of the excavation work. The importance of efficient service can be readily understood when it is borne in mind that over 422,000 cubic yards of solid rock, equivalent

Fig. 22. Concrete Lining in Place.

to considerably over 700,000 cubic yards of broken rock, were handled by the narrow gauge tunnel cars, and also all the material for over 64,000 cubic yards of concrete. In fact, during the Marion shovel excavation of the benches over a thousand cars of muck per day would frequently be hauled out of the tunnel.

Tracks were built to a three feet gauge throughout, using 45 pound rails, which, however, had to be replaced by 60 pound rails for the passage of the portable concrete mixing plant, the former rails being too light to carry the load. Stub, split and movable centre rail switches were used, and sidetracks were installed wherever necessary, their locations being changed from time to time to suit the varying conditions, it always being arranged that loading could take place on sidetracks so as to leave the main line clear for through haulage.

Fig. 23. Eight ton Construction Locomotive.

The motive power passed through various stages from horses to ten ton electric trolley locomotives. The former were used for a short period only during the commencement of the heading excavation west of the Dorchester Street shaft. A type of gasoline locomotive was tried, and as far as haulage was concerned it was satisfactory, but the exhaust gases vitiated the atmosphere to such an extent that notwithstanding the use of blowers the gangs were entirely incapacitated. The gasoline engines were removed from the frames of these locomotives and electric motors substituted, converting them into five ton electric locomotives. The electric current was obtained from

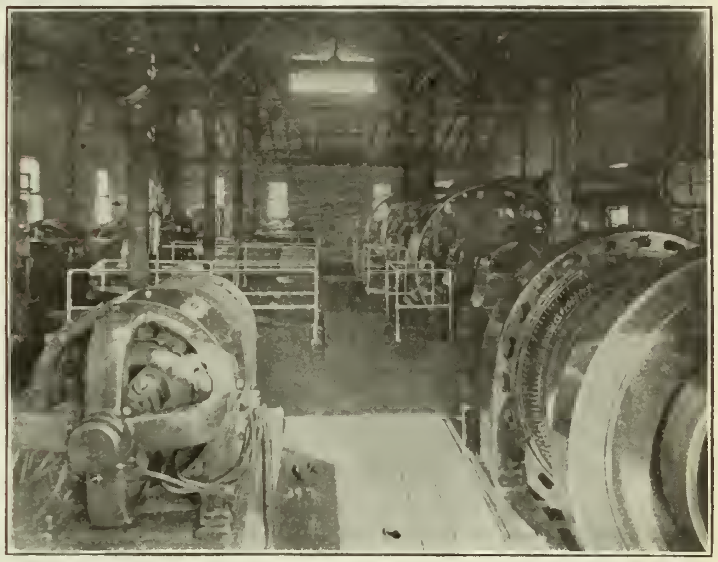

Fig. 24. Compressor Plant at West Portal.

storage batteries carried on a truck separate from the locomotive. Two sets of batteries were provided for each locomotive so that one set could be kept on the surface charging while the other was in use. There were two of this type used, both being made in the shops at the West Portal. In figure 23 is shown an 8-ton trolley locomotive also built at the Company's own shops, and equipped with two 20 horse power, 110 volt motors in series. As the transportation requirements became heavier 10-ton General Electric locomotives of the mining type were installed. The trolley locomotives obtained current from a trolley wire fed by a generator at 275 volts and fastened to the roof of the heading and to the breakup jumbo timbers. A certain amount of inconvenience was caused the workers by the trolley wire being so low, but there were no serious accidents from this cause.

The muck cars had to be something more than merely a means of carrying the muck. They were designed with a great deal of attention to the obtaining of a car which

Fig. 26. Panoramic View of West Portal from Crusher Plant.

should be reasonably low to facilitate loading by hand, and yet have as large a capacity as possible; which should be strong and able to withstand extremely hard usage, and also which should have a low frictional resistance. The car eventually designed had an overall height of 3 feet 4 inches, and inside dimensions of 3 feet 2 inches wide, by 20 inches deep and 6 feet 6 inches long. It was carried on 18 inch wheels with a spring on the axles and had a capacity of two tons. It was of the end dumping type lined with steel plate on the bottom and also at the dumping end. Between two and three hundred of these cars were built in the shops at the West Portal. They were dumped by automatic cages at the two shafts, and by a tipple at the crusher plant at the West Portal. At the latter point the cars were hauled up an inclined track by a hoisting engine.

For handling the material for the concrete mixer a number of the same cars were converted into bottom dump cars for the stone, and side dump for the sand.

PLANT

A very comprehensive plant and mechanical equipment was provided for the proper carrying on of the construction work. The principal features consisted of two compressor plants, shaft and other hoisting gear, general workshops, and a stone crushing plant.

Compressor Plants

Large quantities of compressed air had to be supplied at all times for the operation of the drills, of the Marion shovel, of the pneumatic concrete mixer, and of numerous

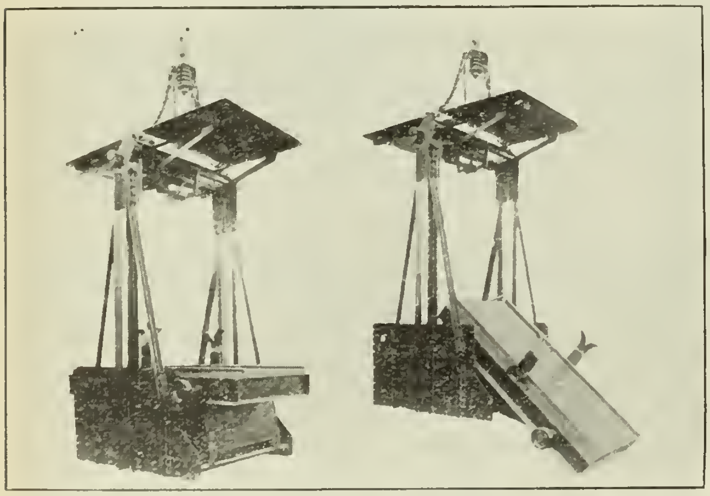

Fig. 25. Automatic Self-Dumping Cage.

Fig. 27. Rock-Crushing Plant at West Portal.

tools in the workshops. Two plants were originally built, one immediately north of Dorchester Street, the other at the West Portal. Each plant as originally installed had a capacity of 5,100 cubic feet of free air per minute, delivered at a pressure of 100 pounds per square inch. A Canadian General Electric 400 horse power synchronous motor was direct-connected to a Sullivan two-Stage compressor with a capacity of 1800 cubic feet per minute, while three Blaisdell cross compound compressors each with a capacity of 1100 cubic feet per minute were driven by 225 horse power, three-phase motors. All machines were fitted with unloading valves automatically cutting off the supply of air to the compressor when the pressure in the receiver reached a predetermined amount, thus compensating for the fluctuation in the quantity of air being used at any one time. It is of interest to note that these machines were frequently run continuously day and night for many days on end. A general view of a compressor plant is shown in Figure 24.

The air was delivered to the tunnel through 10-inch cast iron pipes which were passed down the Dorchester and Maplewood shafts and into the tunnel at the West Portal. Between the plant at the latter point and the Maplewood shaft a surface pipe was laid, following the company's private road, and passing under public streets. As the demand for air increased at the west end of the tunnel some of the machines were transferred from the city to the West Portal plant.

Shaft Gear

At both the shafts heavy timber headhouses were built suitable for the operation of automatic self-dumping cages. They provided not only for the running of cars off or on the cage at the ground level, but they were high enough to allow the cars to be hoisted up and automatically dumped into hoppers connected with the headhouse. The Lidgerwood hoists were operated by 50 horse power electric motors, with special braking attachments, the cages also being provided with self acting safety grips. A view of the cage in the hoisting and dumping positions is shown in Figure 25.

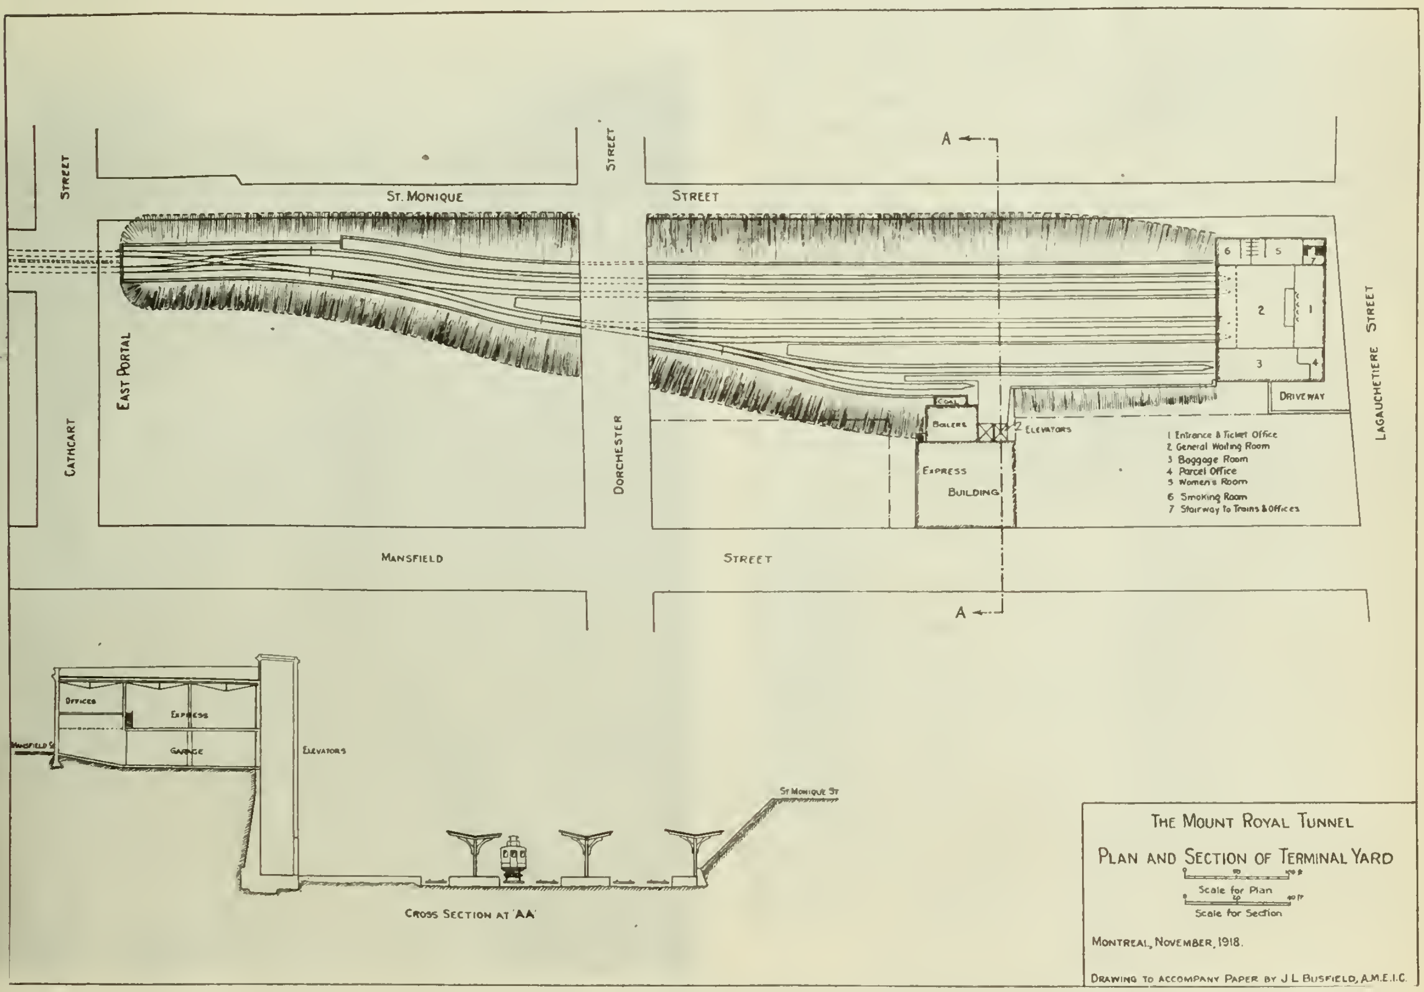

Fig. 28.

Fig. 29. "Tunnel Terminal" from Dorchester Street.

Workshops

At the city end of the tunnel a comparatively small plant was maintained, the principal feature being a blacksmith shop equipped with a Ward drill sharpener (a special machine of the steam hammer type), besides the usual hand equipment. A small machine shop equipped with lathe, drill, power hack saw and hand tools was able to undertake light repairs to machinery and equipment. A carpenters' shop equipped with a band and a circular saw handled lagging timbers, wedges, and other wood work used at the east end of the tunnel. A garage for the company's automobiles and trucks was also maintained near the Dorchester Street Office.

In order to make the company independent of local machine shops for repair work and also because it was found cheaper to build the tunnel cars rather than to buy them, a quite elaborate plant was installed at the West Portal, a general view of the buildings being shown in Figure 26. In the central background the roofs of the boarding houses for the men, and of the emergency hospital are seen, while immediately to the left of the open cut are the store and office building, machine shop, carpenters' shops, blacksmith shop, compressor house (white), and the dry house in the left foreground. The machine shop was provided with a complete equipment consisting of a 60-inch and 24-inch lathe; two 30-inch radial drills; combined shear and punch for plate work; two power drill presses; a power hack saw; pipe and bolt machine; a shaper; emery wheels, grindstones, and oxy-acetylene apparatus. The blacksmith shop was equipeed with a Ward drill sharpener, and a steam hammer operated with compressed air. The carpenters' shop had circular and band saws. In addition to the power tools a complete outfit of hand and small tools was provided for each shop. In fact the capacity of the whole plant is well illustrated by the construction of the muck-handling drill carriage.

At the Maplewood shaft a third blacksmith shop was located, equipped with a Ward drill sharpener.

Crusher Plant

A stone crushing plant was installed at the West Portal with a capacity of about 1,600 tons per day. The loaded tunnel cars were hoisted up inclines by a " dumby " to automatic tipples from which the rock was passed through two No. 7 Kennedy gyratory crushers. The broken stone was then elevated by Stevens-Adamson bucket elevators, passed through revolving and oscillating screens and was distributed by chutes into various bins. The greater portion, however, was conveyed to large stock piles by belt conveyors, different sizes of stone being kept in separate piles. After the tunnel cars had been dumped at the tipple they were automatically returned to the down track by a gravity switchback. A general view of the plant with the inclined track and stock piles is shown in Figure 27.

With the exception of what was required for the company's own purposes for concrete and ballast the crushed stone was sold to outside parties. From the bins it could be loaded direct into cars on tracks connected with the Canadian Pacific Railway, and from the stock piles a locomotive crane with clam shell bucket loaded either railway cars or motor trucks.

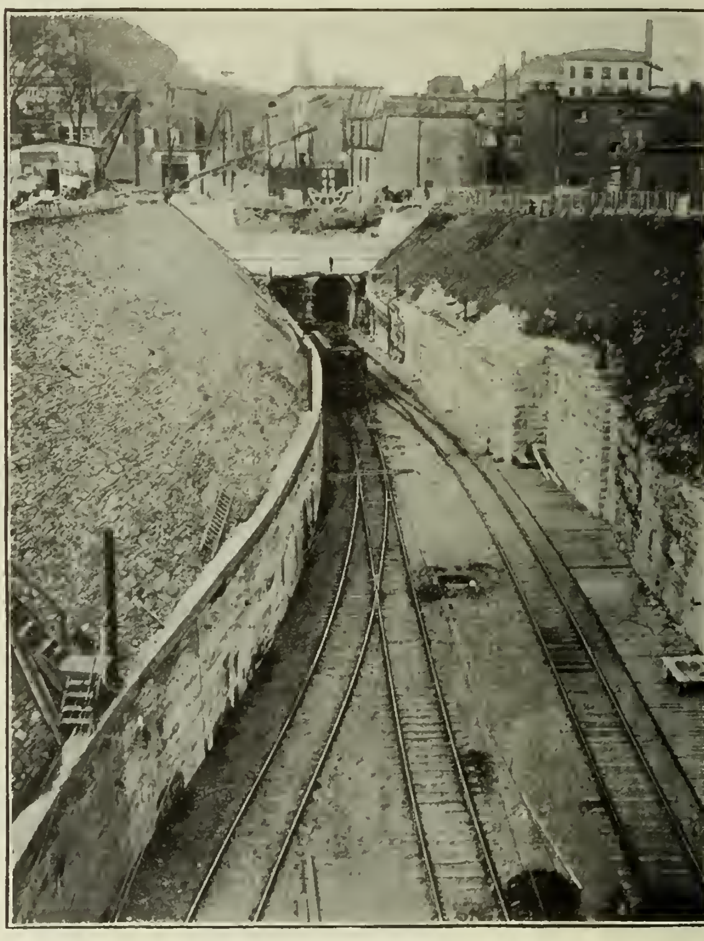

Fig. 30. East Portal of Tunnel from Dorchester Street.

MISCELLANEOUS STRUCTURES

Terminal Station and Yard

The facilities now provided at the " Tunnel Terminal" are only of a temporary nature and, therefore, will only be described briefly. A rear view of the station building is shown in Figure 29, while the general layout of the whole yard and buildings is shown in figure 28. The station itself is a reinforced concrete structure in which octagonal reinforcing bars were used and in addition to the public facilities indicated in Figure 28 contains offices on the second floor for the railway company's officials. The entrance of the building is located on Lagauchetiere Street. The east portal of the tunnel and the west end of the terminal yard is shown in Figure 30.

In the centre of the layout on the Mansfield Street side a building for the Canadian Northern Express has been built. This building is of brick construction on concrete foundations, with a cement finish to match the station. The basement is used as a garage for the company's trucks. Two elevators handle the express matter between track and street levels. A retaining wall of unique design has been built at the express building, detail plans of which are shown in Figures 31, 32 and 33. The wall was designed by Mr. J. C. Krumm in the office of Mr. C. C. Briggs, Superviser of Buildings, Canadian Northern Railway, and the writer is indebted to Mr. Briggs for the following information explaining the assumptions upon which the design was based.

> " These walls were primarily built as retaining walls, except walls C and E, which two walls also serve as foundations for the east wall of the express building and south wall of the elevator shaft respectively. Top of walls A and D are stopped to serve as foundations for brick walls for extensions which are being contemplated. Although for this height of wall counterfort types under ordinary conditions would be the cheapest local conditions such as expensive properties bordering on the work, etc., made it necessary to select the cantilever type with a reversed base. All walls are designed for stability against overturning without the extra load from the buildings, which load in every case tends to decrease

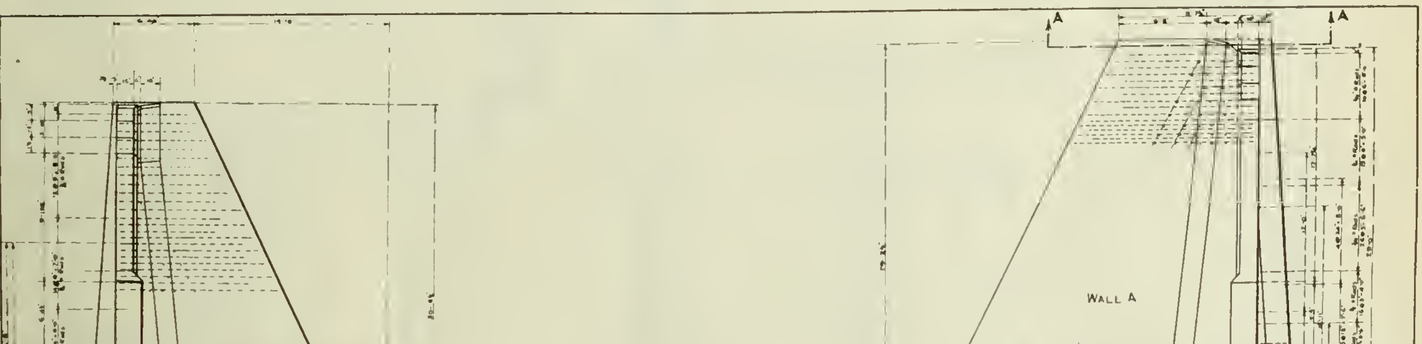

Fig. 31.

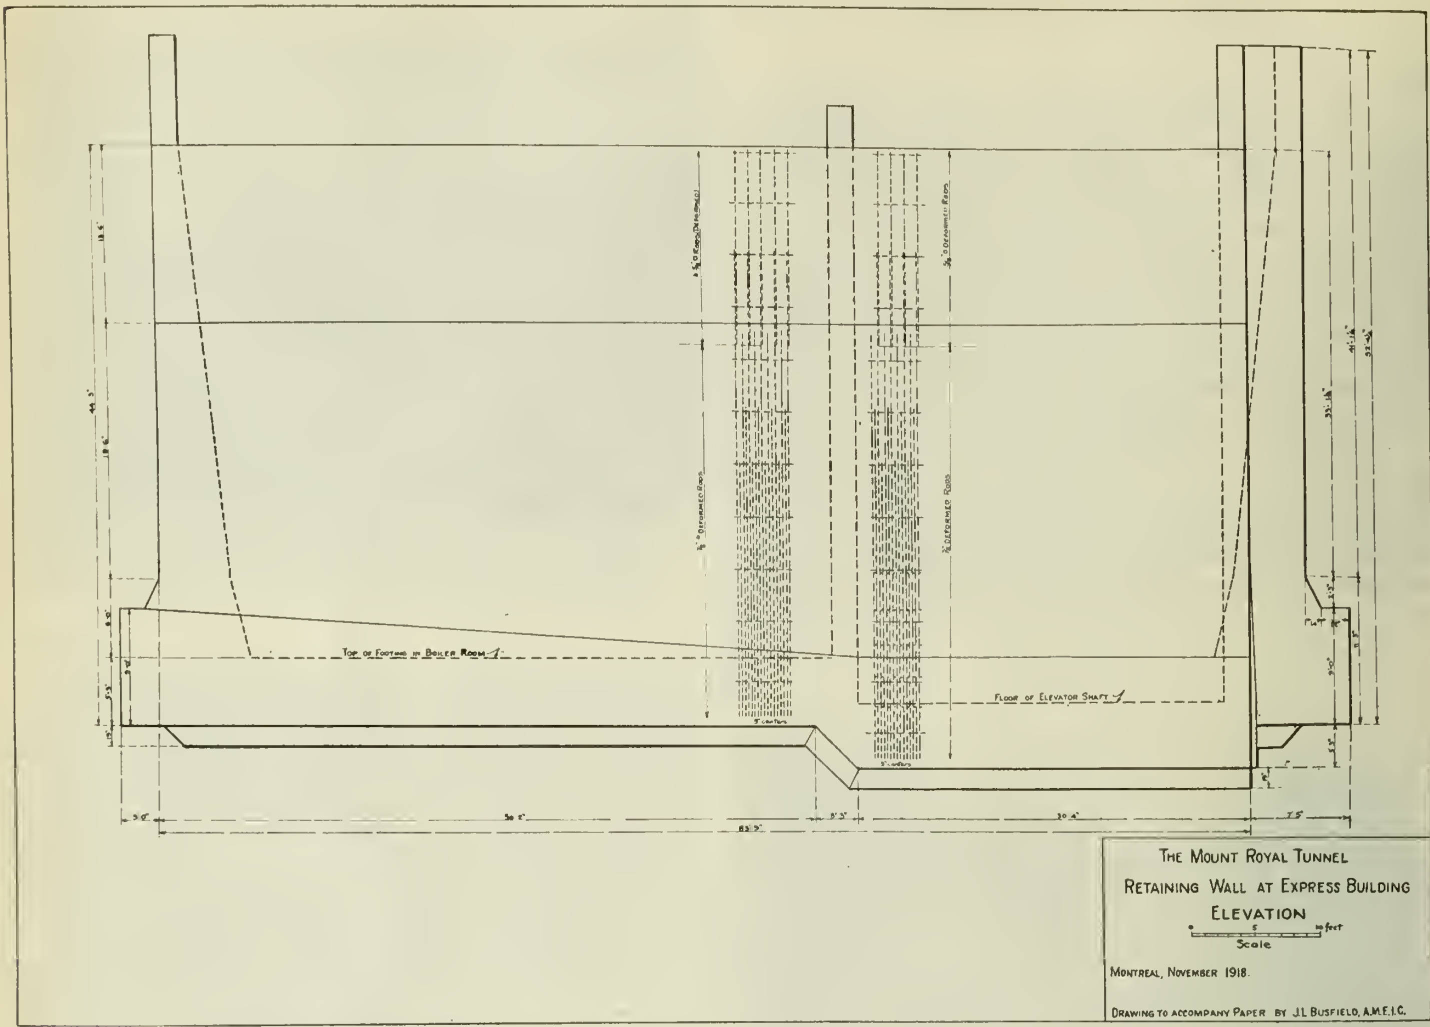

Fig. 32.

the toe pressures, and the reinforcement arranged to take care of cantilever action.

A surcharge of 200 pounds per square foot from the floor of the garage in the express building was assumed for wall C. Wall E makes an exception to this, however, and it is designed as a flat slab supported by wall C and the east wall of the elevator shaft.

While the ground is very hard and stands up nearly vertically, we assumed an angle of repose of 30 degrees, partly to guard against any slip caused by possible seams or pockets, and also any partial hydraulic pressure behind the wall, although in the design great care has been taken to provide sufficient drainage to eliminate this last mentioned danger.

The foundation is hard pan."

The walls contain a total of 2,256 cubic yards of concrete, and 143,330 pounds of reinforcing steel.

Dorchester Street Viaduct

Dorchester Street is carried over the open cut on a viaduct 163 feet long 60 feet wide. The details of the construction are shown in Figure 34. The floor system consists of monolithic concrete spanning I-beams carried, in turn, by plate girders resting on a steel tower in the centre, and two steel bents, and two timber bents. Provision had to be made on the north side for the two cast iron sewer pipes. The columns were founded on bed rock in every case.

Undercrossing of Canadian Pacific Railway

The details of the undercrossing of the Canadian Pacific Railway at the West Portal of the tunnel are shown in Figure 35. It will be noted that this bridge is of reinforced concrete and not only spans the Canadian Northern tracks but also the platforms of the Portal Heights station. The latter are shown at the car floor level which will be the standard height for platforms throughout the electric zone where multiple-unit cars will be operated. The roof of the crossing is built up of pre-cast reinforced concrete slabs which were put in place by means of a travelling locomotive crane. This method enabled the construction to be carried on with the minimum interference to the Canadian Pacific tracks.

ELECTRICAL EQUIPMENT

Substation

One of the essentials of a power supply for an electric railway is that it should be as free from the danger of a shut-down as is physically possible. With this object in view power is supplied to the Canadian Northern substation at the West Portal by the Montreal Light, Heat & Power Company over two distinct feeder systems. The first consists of feeder cables through the tunnel itself and connected to the Power Company's central station which, in turn, is fed by hydro-electric plants at Cedars Rapids, Soulanges, Lachine, Chambly, Shawinigan Falls and from a steam auxiliary station. The second system consists of an overhead line from a transformer station on Mentana Street, about two miles away. A shut-down due to lack of power, therefore, should be a most unusual occurrence.

Considerable study was made of alternative schemes of electrification, not only from the viewpoint of initial cost but also from the viewpoint of operating cost; in addition, local factors and the nature of the power supply available had to be taken into consideration. It was eventually decided to use a 2400-volt, direct current trolley system. Power is supplied by the Montreal Light, Heat & Power Company through the feeders referred to above at 11,000 volts, 3 phase, 60 cycles and is transformed to 2400-volt, direct current at the West Portal substation.

The building itself is 88 feet long by 70 feet wide, and, in addition to the main transformer room, has separate rooms for switches, lightning arresters and auxiliary apparatus. Two 1500 kilowatt synchronous motor-generator sets have been installed, and the foundation for a third set has been provided. Under present conditions one set is capable of handling the load while the second is used as a standby. A 2500-ton travelling crane spans the transformer room. Each motor generator is driven by an 11,000-volt synchronous motor direct connected to 750 kilowatt, compound wound, commutating pole, compensating generators operated at a speed of 600 revolutions per minute. The two generators in each set are permanently connected together in series in order to

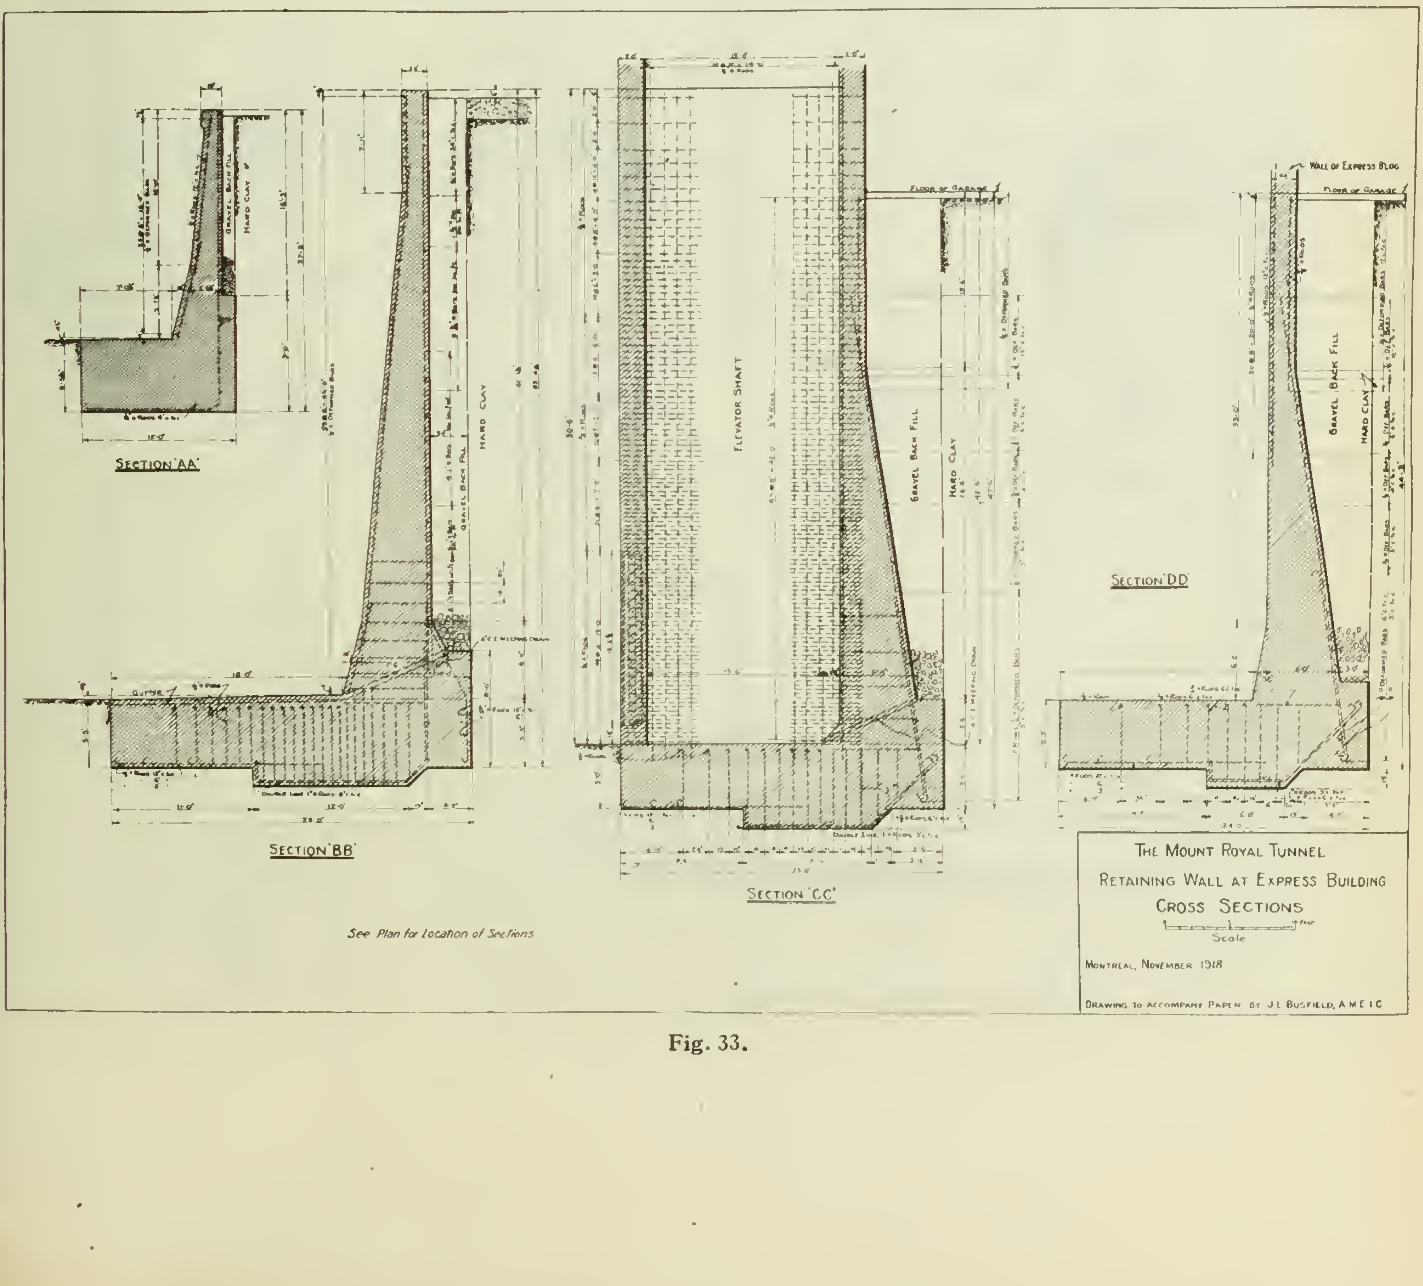

Fig. 33.

give a total of 2400 volts and are designed to withstand an overload of 200 per cent for five minutes.

Three motor-generator exciter sets have been installed, each consisting of an 125-volt generator of the commutating pole type driven by a 550-volt induction motor at 1200 revolutions per minute. One exciter furnishes current to the four generators, the second to the fields of the motors, while the third is retained as a spare. Two banks of three 100-kilowatt transformers step down the current from 11,000 to 550 volts the latter being used for the induction motors of the exciting sets, while other small transformers step down from 550 to 110 volts for the lighting circuits.

A 32-panel switchboard built of black slate is provided for the control of the various power circuits.

A general view of the exterior of the substation is shown in Figure 36, and of the interior in Figure. 37. In this latter view the switchboard can be seen on the left, the motor generators in the centre and the foundation for the third set in the lower right-hand corner.

Locomotives

Six locomotives of the type illustrated in Figure 38 have been put into service. Each locomotive was built by the General Electric Company and is equipped with four commutating pole motors permanently connected in series in pairs. The one hour rating of each motor is 350-horse power at 1200 volts, forced ventilation being provided by a blower. A small motor generator set provides current at 120 volts for lighting circuits and for operating the contactors. This set also drives the blower and through slip rings supplies alternating current for the headlight circuit. A 2400 volt motor-driven air

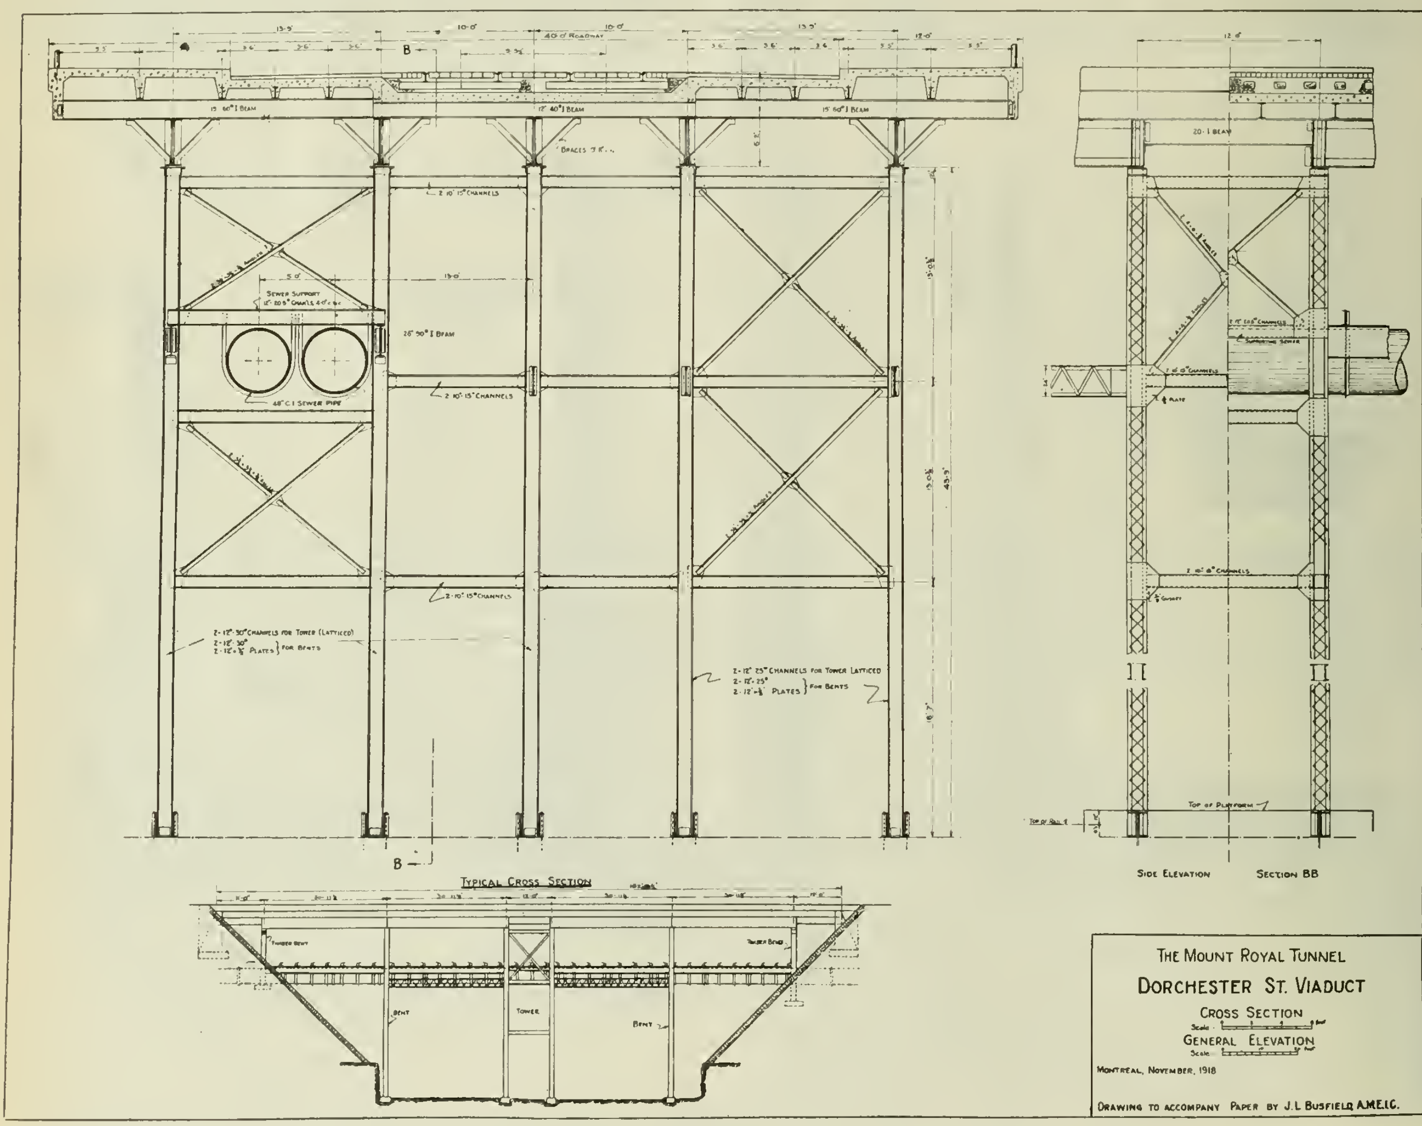

Fig. 34.

compressor with a capacity of 100 cubic feet of free air per minute is used for the air-brake equipment.

The cab is divided into three compartments, the two end compartments being identical in every way and supplied with all the controlling apparatus, including controller and switches, various meters, pantograph control, bell, whistle, and so forth, giving complete double end control. A view of the motorman's seat and the arrangement of the control apparatus is shown in Figure 39. Current is collected from the trolley line by means of a sliding pantograph, pneumatically operated and mounted on an insulated base, two being provided on each locomotive. The principal dimensions of these locomotives are given in Table 5 in the Appendix.

Overhead Construction

The catenary type of trolley construction is used throughout. In the tunnel a messenger cable which also acts as a feeder and is, therefore, made of phosphor-bronze, is supported by iron yokes located 90 feet apart, hung by special bolts from the concrete roof, a near view of the support being shown in Figure 40. It will be noted that the yokes are arranged so as to permit lateral adjustment so as to bring the trolley to correct alignment, and also that they are provided with two insulators in series between the live wire and ground. Two 4/0 "phono-electric" trolley wires are suspended from the messenger cable by loop hangers spaced 15 feet apart and staggered on each trolley. Two trolley wires were used so as to provide additional weight and thus reduce the amount of vertical movement from the pantograph, the limits naturally being very confined in the tunnel. The two wires also have the advantage of reducing wear and sparking.

Through the Model City the same general type of construction is adopted with the difference that the messenger is a seven-strand ½ inch steel cable and is supported by cross spans and wooden poles instead of the special yokes employed in the tunnel. The poles are placed 150 feet apart and the general appearance of this form of construction can be seen in Figure 38.

CONCLUSION

Organization

The Mount Royal Tunnel was built by a special force under the control of Mackenzie, Mann and Company, Limited, for the Canadian Northern Montreal Tunnel and Terminal Company, Limited, the name of which, however, was changed to Mount Royal Tunnel and Terminal Company, Limited, of which, Sir William Mackenzie was President and Sir Donald Mann, Vice-President. The construction work of the tunnel was carried out entirely under the direction of Mr. S. P. Brown, B.Sc., M.E.I.C., as Managing Engineer for Mackenzie, Mann & Company, and Chief Engineer of the Mount Royal Tun-

nel and Terminal Company. In the Department of Design, Mr. W. C. Lancaster, E.E., M.E., was in charge of all electrical and mechanical work, his office being taken over recently by Mr. C. P. Price, as Electrical Superintendent. The Structural Department was in charge of Mr. Holton D. Robinson, B.Sc., and more recently of Mr. W. E. Joyce, A.M.E.I.C., as Engineer of Design. The Department of Surveys and Alignment was in charge of Mr. Howell T. Fisher, M.E.I.C., his organization consisting of survey parties for the eastern and western divisions, and a staff of inspectors. Mr. J. C. K. Stuart, A.M.E.I.C., had charge of the Department of Construction, with Edward Duffy as General Superintendent on the Eastern Division and Richard Byers in a similar position on the Western Division. The Purchasing and Accounting Departments were in charge of Mr. C. C. Labree, Managing Accountant, with a staff of storekeepers, timekeepers, cashiers, and clerks. The inspection of buildings was under the direction of Mr. C. Gordon Mitchell, Inspecting Architect, while a medical department was operated under the supervision of Mackenzie and Mackenzie, Limited. Upon the resignation of Mr. S. P. Brown to take up important war work in the United States, the work was carried on with Mr. Angus Sinclair as General Manager, under the direction of Mr. A. F. Stewart, Chief Engineer of the Canadian Northern Railway.

Acknowledgments

The writer wishes to express his sincere appreciation of numerous courtesies extended to him in connection with the preparation of the foregoing description of the tunnel work, and particularly to Mr. A. F. Stewart and the Executive of the Canadian Northern Railway, under whose authority this paper has ben prepared. Mr. W. E. Joyce, Mr. C. P. Price and the whole of the tunnel staff have most willingly co-operated with the writer, giving every possible assistance. The writer's thanks are also due to Messrs. Walter J. Francis & Company, for giving him every facility for the preparation of the paper and accompanying drawings.

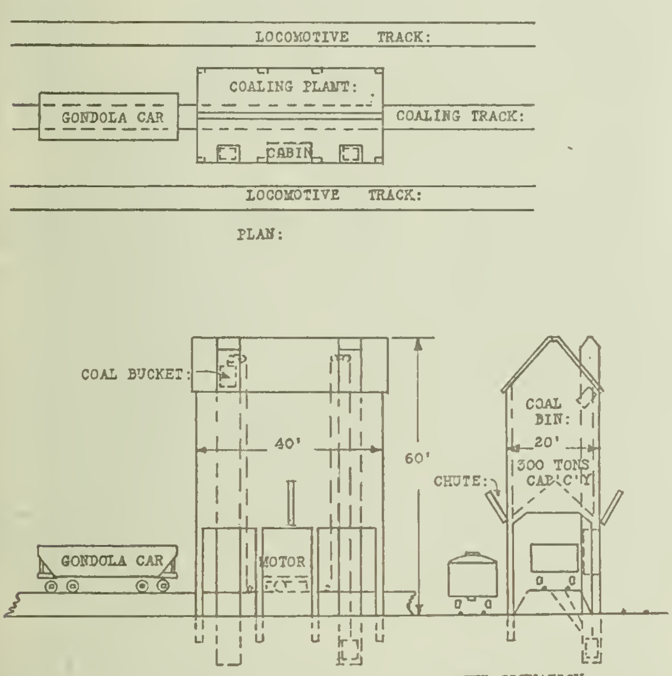
Locomotive Coaling Plants

*By J. A. Burnett, A.M.E.I.C.**

The subject of coal handling for locomotives is one of considerable importance and as improvements have been introduced within the last few years, it is thought that the subject may be of interest to the members of *The Engineering Institute of Canada*.

Formerly the ramp or gravity system was in use. This comprised a long ramp or incline of about 5% grade, then a series of bins or pockets. These bins were furnished with side chutes to allow the coal to be dumped into the locomotive tenders. However, the Holman type of coaling

LOCOMOTIVE COALING PLANTS:



plant was introduced, using the balanced bucket system and with a storage bin overhead. The advantages were many, among them being, saving in land area, less fire risk, and inasmuch as it frequently happened that a locomotive ran out over the end of the coal shed it was a safer arrangement. It was also found that only light weight engines were able to climb the ramp and these often had to be brought on from a distance, adding to the expense. It would be safe to say, therefore, that no more gravity coaling plants will be installed on our railways.

The balanced bucket type has been found easier to maintain than any hoist using the continuous bucket or conveyor system, and where electric power is available the electric driven hoist is preferred, and in most cases the cost for electric power does not come very high. The attached plate shows plan, and side elevations of the structure.

In general it is found that the hoisting is done during the day time and about three hours are needed to dump the gondola cars and hoist the coal to the bin overhead. The maximum load on the motor is about 10 to 12 H.P., the speed of hoisting being 70′ per minute. The buckets are designed to hoist 2000 lbs. per lift, but at times the weight runs to 3000 lbs.

The motor, if electric, is of the wound rotor type, and controlled by reversing drum controller, and solenoid brake. A powerful hand brake is also provided operated by a lever in the cabin and applying by a band to the end of the cable drum. This is seldom used, and is merely a precautionary measure. The cabin should be quite small, about 5′ x 9′ to save heating in winter time and should be well boarded in with well fitted door and windows. The roof of this cabin should be well waterproofed as water drips in quantity from the coal bin above.

The buckets are prevented from over-running by means of a limit switch installed at the top of each bucket shaft and are actuated by means of a steel ear rivetted to the bucket. The motor is at once cut off and the solenoid brake holds the mechanism at a stop, meanwhile the coal is dumped and fills the bin overhead.

The night attendant has only to keep guard, there being no hoisting of coal at night. At times in severe winter weather the night attendant will be obliged to trim the coal in the bin to premit it to flow into the chutes, and thence into the locomotive tender.

The bucket pits should be waterproofed below the ground line, and all pitches for the flow of coal should be steep enough so that the coal shall flow freely. Sixty degrees from the horizontal is recommended.

Where fleeting sheaves are used, they should be of C. I. bronze bushed and equipped with grease cups.

Where sheaves are running idle they should be securely keyed to the shaft, and the shaft should turn in its bearings in preference to the sheave turning on the shaft as is sometimes done.

The electrical control should comprise an ammeter of rugged design and a main switch, mounted with fuses on a panel about 18″ x 24″. As the prevailing voltage throughout Canada is 550 for 3-phase service, the slate used must be carefully selected otherwise metallic veins will result in burning and damage to parts.

In connecting the limit switches the wire used should not be smaller than No. 10 B. & S. Guage, as there is considerable vibration to the structure and a lighter wire will break.

The roof of the coaling plant should be covered with asbestos shingle so as to fireproof the structure.

Costs relative to 300-ton coaling plant, operating at 80% capacity or 240 tons daily.

First cost	$15,000.00
Interest per annum, $15,000 @ 6%	900.00
Electric Power 10 H.P. @ $30.00 per H.P.	300.00
1 day attendant, partly skilled, @ 75	900.00
2 day helpers, @ 60	1,440.00
1 night attendant, unskilled, @ 60	720.00
Maintenance, 5% on $15,000.00	750.00
Insurance, 2% on $15,000.00	300.00
Engine service in spotting 5 cars coal per diem, $5.00 per day (nominal)	1,825.00
Total cost per annum	$7,135.00

Coal handled per day .... 240 Tons.
" " " annum .... 87,600 "
Cost per ton for storing and handling, $.082 (8.2 cents) per ton of 2,000 lbs.

In general this type of coaling plant has been found to be safe, economical and of pleasing appearance, and it can be operated by electric, steam or gasoline power.

*Read before the Montreal Branch of the E.I.C., Jan. 23rd, 1919.

Notes on the Test of a Girderless Floor

By Peter Gillespie, M.E.I.C., & T. D. Mylrea, A.M.W.S.E.

Introductory

Until the advent of the reinforced concrete ship, the flat slab type of floor was very properly regarded as the most recent development in reinforced concrete, and for buildings which can be divided into rectangular bays nearly square, it is by far the most popular. The principal reasons for this popularity: (1) ease in construction of form; (2) economy in steel and concrete; (3) ease in placing steel; (4) saving in story heights; (5) absence of deep shadows on ceiling; and (6) adaptability to automatic sprinkler lay-out—owing to the absence of beams and girders—are too well known to need more than passing mention. Some conception of this popularity may be had from a study of the records of the Building Departments of some of the larger American cities. In 1916, for example, the total value of buildings of the flat slab type erected in the city of Cleveland was about $1,300,000; in the city of Pittsburg approximately $1,200,000; while in the city of Philadelphia it was over $6,300,000. Information furnished by Building Commissioners shows that it representes about 7% of the total, and from 40% to 90% of the concrete building operations carried on in recent years in the larger cities of the United States.

The chief difficulty in the design of the flat slab, and the one which delayed its more rapid adoption, is that the stresses therein are not readily subject to analysis. From the year 1905, when it was first proposed by the man who later became its most enthusiastic sponsor, until about 1909 it was bitterly opposed by nearly all engineers because of this difficulty. But, by this time, it had established itself commercially and as a type of construction whose strength had been proven by many load tests. From 1910 on, many articles, based on theoretical considerations, appeared in the technical press suggesting methods of analysis. Many of these, however, have since been modified to accord with principles deduced from extensometer tests.

Coincident with the publication of methods of analysis came a flood of so-called "systems" developed in the effort to avoid patent infringements. These "systems" fall into three general classes, viz.:—(1) the 4-way system, in which bands of rods run directly and diagonally between columns, the steel being all or partially raised to the upper part of the slab in the region of the column heads; (2) the 2-way system, in which diagonal bands are omitted, extra steel being placed parallel to the direct bands to compensate therefor; and (3) combinations of the two preceeding.

The City of Chicago was the first whose building department was seriously confronted with the issuing of permits for this type of building, and solved the difficulty by appointing commissions of consulting engineers to report on all proposed systems. Approval by a commission was necessary before building permits could be obtained. Subsequently the city authorities required extensometer tests to be conducted until data, judged to be sufficient for the compilation of a city ordinance governing flat slab floors, had been accumulated. Such an ordinance—the first of its kind— was compiled and published in 1914, and remains, with but slight modification, in force to-day.

The testing of flat slab buildings under load by means of the extensometer was carried on in the United States through the combined efforts of several universities, construction companies and consulting engineers. Much of the test data was kept as private information by the construction companies concerned. Some of it appeared later in the form of University Bulletins.

Early in 1916, the Building Department of the City of Toronto was asked for a permit to erect a large warehouse of the flat slab type. As Toronto had no building by-law of its own governing flat slabs, an examination was made of those in force in the principal American cities, but it was discovered that there was a marked lack of agreement among them. The City Architect's Department thereupon decided to grant permits for buildings designed according to the Chicago building ordinance previously mentioned, on condition that the buildings when completed be subjected to extensometer tests. Accordingly five buildings, designed for different live loads, and having various panel lengths and schemes of reinforcement, were subjected to such tests by the City Architect's Department working in conjunction with the Department of Applied Mechanics, University of Toronto.

Of these the T. Eaton factory, the last one tested, has been chosen as the subject of this paper, because in the conduct of the test, there was available the experience and skill in observation acquired from its predecessors.

The form of the paper is somewhat out of the ordinary, in that all observed data are presented. Great difficulty was encountered by the writers when attempts were made to check the published results of others who had conducted similar building tests. In some cases full data as to the structure and a mere summary of the results of the tests were given. In others, rather more complete results of the tests were given, but with an entire omission of the details of reinforcing and other constructional features. In consequence it was impossible to check the conclusions reported from the data available. For this reason it was deemed advisable to give full information as to the structure as well as all the observed data, even though the results have been worked out for one live load only. It is the purpose of the writers to compare the bending moments which were found to exist in the actual slab under test, with those prescribed in the better known regulations governing flat slab construction, namely, the "Report of the Joint Committee." "The Recommendations of the American Concrete Institute," and "The Ordinances of the City of Chicago."

Fig. 1

The Building

The building, see Fig. 1, is twelve stories high and has a frontage of about 228 feet on Alice Street and 166 feet on Downey's Lane. It was designed by the William Steele Coy. of Philadelphia, and erected under their supervision by the Raymond Construction Co., of Toronto. To both of these companies, as well as to the T. Eaton Co., and the City Architect's Department, acknowledgment is made for permission to put the results of the test into print.

With certain exceptions the floor slabs were similar and were designed for a live load of 125 pounds per square foot. The reinforcement differed from that in any of the other buildings tested, in that the rods resisting positive moment were independent of those resisting negative moment. In the bottom of the slab, short rods, less than one panel in length, were used as a 4-way reinforcement, while over each column cap a mat composed of rods running in two directions only, parallel to the panel sides resisted the negative moments. Another feature was the use of structural steel columns, enclosed in a concrete envelope. These steel cores, in the case of the wall columns, extended to the 8th floor, and in the case of the interior columns, to the 10th floor. By this means the size of column in the lower stories was much reduced. Fig. 2 shows clearly the scheme of the slab and column construction, while details are shown on Plates I and II.

The reinforcing steel was of the grade known as Munition steel and Table 1 gives a summary of tests showing its physical and chemical properties. The structural steel used in the columns was of a much softer quality, as may be seen by comparison with Table 2. The concrete used throughout was a 1-2-4 mix, with a limestone coarse aggregate of ¾″ size. At the time the tested floor was poured, control cylinders were taken and these were tested at the age of 60 days at the University of Toronto. These cylinders showed an average compressive strength of 2950 pounds per square inch, and an average modulus of elasticity of 2,350,000 lbs. per square inch which latter value was used in converting concrete deformations into stresses.

The Test

The test was made on four panels on the 8th floor. Observations were also made on one wall column and one interior column in the story below, since it was desired to determine the stresses in the structural steel column cores as well as in the floor slabs. The test load was applied by means of cement in bags, and Fig. 3 shows the masimum load in place.

By means of a Berry strain gauge, deformation readings were taken on the concrete and reinforcing steel on 243 gauge lines, 89 of which were upon the upper surface of the slab, 121 on the lower surface, 13 on the wall column and 20 on the interior column. The dial of the strain gauge was graduated to read in thousandths of an inch, and with an arm ratio of five to one a change in reading of one division on the dial represented an actual deformation of one five-thousandth of an inch. In the tabulated deformations on Plate III one unit represents one division on the dial of the strain gauge, or a deformation of one five-thousandth of an inch in an eight-inch gauge length. In order that the reinforcing steel might be readily located at the points where gauge holes were to be drilled, small tapered wooden plugs were attached to the reinforcement of these points previous to pouring the concrete, and were readily removed after it had set. Where readings were to be taken on the concrete, small metal plugs were attached to the forms. Removal of the forms exposed the metal surface for the drilling of gauge holes. Figs. 4 and 5 show some of these blocks and plugs in place ready for the pouring of the concrete. The general appearance of these gauge lines when ready for the test may be seen in Figs. 6, 7 and 8, and Plates I and II give their exact location.

There were no construction joints in the floor panels under test, but in the interior column such a joint occurred just below the flared head, and one in the wall column immediately below the bracket, as shown on Plate II.

On the 8th floor one series of gauge lines Nos. 201 to 207, was located on the negative reinforcing rod nearest the lintel at column 27. Two other gauge lines, Nos. 208 and 209, were located on the outside rod of this band; No. 208 being across the centre line between columns 26 and 27, and No. 209 directly opposite the edge of the dropped head. At column 21 another series of gauge lines Nos. 215 to 221, and 229 and 240 are similarly located, and at right angles to this series were gauge lines Nos. 222 to 228 and 236 to 239 upon the outer and centre rods respectively of the mat. Two rows of gauge lines, Nos. 243 to 249 and 261 to 267, were located symmetrically with the centre line of column 20 upon the middle rod of the mat for this column, and gauge lines, Nos. 254, 255 and 256, were upon the outside rod of this mat. At column 19 upon the middle and outer rods of the mat were located gauge lines, Nos. 270 to 276 and 278 to 284, respectively. Gauge lines, Nos. 207, 215, 228, 229, 239, 243, 267 and 270, were less than 8 inches from the ends of rods.

For investigation of positive moments at the intersection of diagonal lines in the wall panel and interior panel, two other series of gauge lines Nos. 211 to 214 and 285 to 288 were located, and midway between the columns over the direct bands were located gauge lines Nos. 241 and 268, and 242 and 269 for positive and negative deformations in the concrete. Gauge line No. 210 was located as near the lintel as possible, so that the bending moment in that member might be investigated.

Since there were no diagonal bands to resist negative moment, it was necessary to insert steel plugs in the floor surface in order to investigate the deformation along diagonal lines. Such deformations were measured over the edges of the column capitals and in the neighborhood of the drop head corners at both wall and interior columns.

The gauge lines on the ceiling were so arranged that as nearly as possible they would pair with corresponding gauge lines on the floor above. In general the ceiling gauge lines were on the steel reinforcement, but on the drop heads, and at No. 20 on the lintel, as well as at several other places where check deformations were measured, they were located on the surface of the concrete. It was hoped that the line of inflection surrounding the column heads might be determined, and gauge lines on both floor and ceiling were located with a view to determing its position.

Fig. 2. View Showing Slab Reinforcement and Steel Cores of Columns, The T. Eaton Company's New Factory, Toronto.

The gauge lines on the columns formed an upper and a lower series; the upper one on both wall and interior columns being across the construction joint. On the wall column two gauge lines were located one above the other on each of the four corner reinforcing rods. Two were on the concrete face, and three on the face of the bracket. On the interior column two gauge lines were located one above the other on each corner of the structural steel core and on each of the reinforcing rods. Check readings were taken on the concrete on opposite faces, gauge lines C 14 and C 15 being on the side nearest the windows.

Before applying any load, all gauge lines were read and then a load of 125 lbs. per square foot was put on all 4 panels, leaving uncovered only enough room for the observer. To compensate for this sufficient additional material was piled around the edges of the unloaded spaces. When a new set of readings had been taken, an additional 125 lbs. per square foot was added to all 4 panels. This gave a live load of 250 lbs. per square foot or twice that for which the floor was designed. Another set of readings was then taken, and after three days without any alteration in the test load, a further set was taken to note any change in deformations due to the lapse of time. After this the two interior panels were completely unloaded, leaving 250 lbs. per square foot on the two wall panels. The deformations were again observed and the two wall panels unloaded. After the complete removal of the load, a final set of readings was taken to observe the extent of the permanent set.

Plate III gives the observed deformations under the various conditions of loading, and on Plates I and II these deformations have been converted into stresses in the usual way, assuming the modulus of elasticity for concrete to be the same in tension as in compression.

Deflections

In this test no attempt was made to determine deflection. In some of the previous tests attempts had been made but the difficulties encountered far outweighed the information obtained. In the earlier tests where deflections were measured a substantial scaffold was erected to within a few inches of the ceiling and an Ames dial mounted on a suitable base was used as a deflectometer. Another scaffold, in no way connected to the first one, was erected as an observer's platform. It was often found that the workmen drove spikes into the framing upon which to hand coats with the result that reliable readings were almost impossible to obtain. Fences or barricades merely served to attract attention.

Plate IV gives deflection contours of the slab surface of the Robert Simpson Building under the design load, the vertical interval being .01 of an inch. This diagram is presented for the reason that the recorded deflections for this test were considered the most reliable. From such a diagram it might be possible to check computed moments by means of the slope deflection method. No attempt has been made to make such a check however since this deflection diagram pertains to another building.

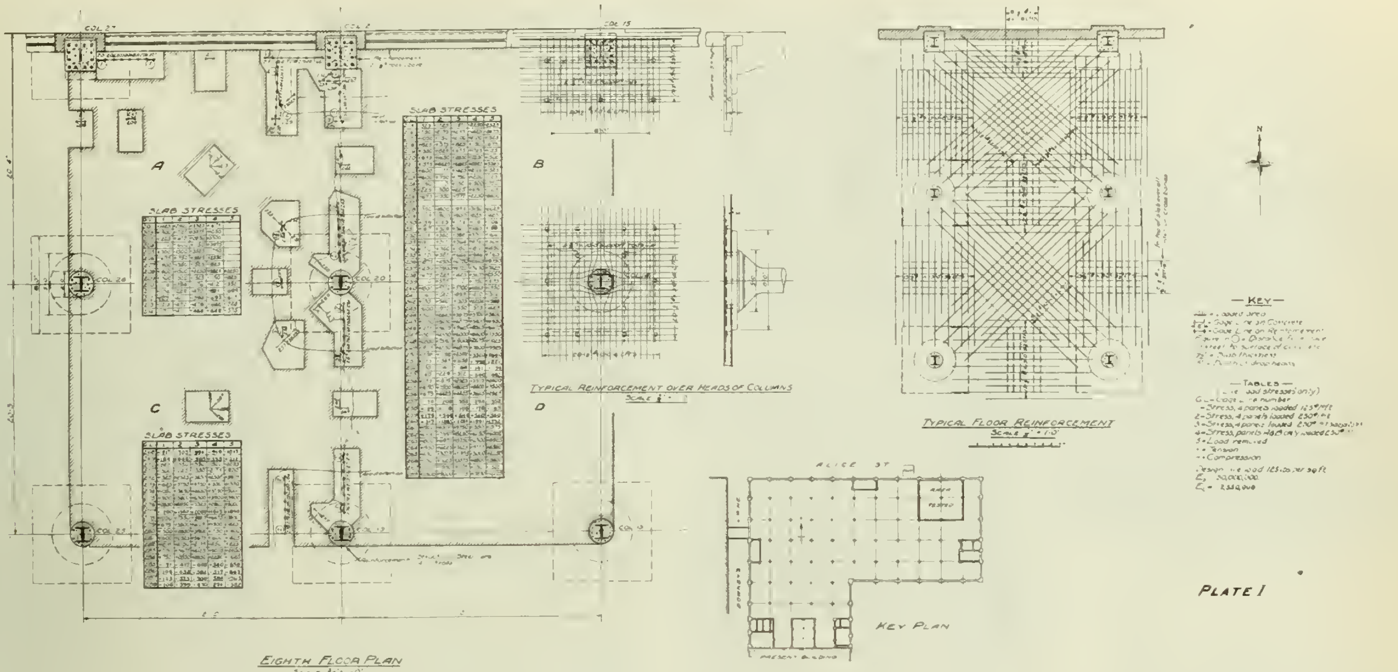
One peculiarity of the diagram seems to merit attention. It will be noticed that across a line joining wall column No. 10 with the interior columns Nos. 23 and 36, the curvature appears to be more abrupt than that across a line parallel to the wall joining interior columns. This would seem to be the opposite of what would be expected for, with a comparatively rigid lintel along one edge, one could readily conceive of the wall panels troughing parallel to the wall. A striking confimation of this peculiarity was afforded by the excessive sagging of the floor slabs in the concrete warehouse of the Quaker Oats Co., Peterborough, Ont., which was destroyed by fire Dec. 11th, 1916. Before the building was razed deflection readings were taken on one typical sagging wall panel, the results of which are plotted on Plate V. The vertical interval in this case is one inch instead of .01 inch.

Fig. 3

Cracks

Under a live load of 125 lbs. per square foot no cracks were visible, but with the increase to 250 lbs. per square foot they became apparent. Those which were visible to the naked eye both on the upper surface of the slab and on the ceiling have been carefully mapped on Plates I and II. The phenomenon of troughing perpendicular to the wall is again indicated by the formation of a very clearly defined crack in the upper surface of the slab, extending from column No. 19 to column No. 21 in an almost unbroken line. Fig. 9 is a photograph tracing the course of this crack between two columns and Fig. 10 is a view of it at close range. It will be noted that the crack extends into the slab to the reinforcement, thus indicating the necessity of providing reinforcing metal across the direct bands.

In the tensile stresses tabulated on Plates I and II this cracking of the concrete must be taken into account particularly where the gauge line is on the concrete rather than on the reinforcement. An illustration will make this clear. Take as an example, gauge line No. 250, on the upper surface of the slab near the column No. 20, where no diagonal reinforcement existed.



It will be noticed that a crack in the concrete occurred directly between the two gauge points under a 250 lb. load, and that the indicated tensile stress therein is 1789 lbs. per sq. inch, increasing to 2580 lbs. per sq. in. after the load had been in place 3 days, and further increasing to 3320 lbs. per sq. in. when the load was removed from the two interior panels. These stresses are clearly impossible, for a live load of 125 lbs. per sq. ft. produced a tension of only 258 lbs. per sq. inch in the concrete, which was probably very nearly its ultimate value at this place. When the crack occurred the tension for some little distance on both sides of it was relieved resulting in the drawing back of the edges and the indication of excessive deformations. Had a gauge line on diagonal reinforcement been possible, the indications would doubtless have been different.

Part of Plate I (enlarged)

The Line of Inflection

The position of the line of inflection was readily determined by following radially from the column several series of consecutive gauge lines and noting where the tabulated stresses changed from negative to positive or *vice versa*. On the floor it was found to be at an average distance of about 5′ 6″ from the central column while on the ceiling it varied from 6′ 0″ in the interior panel to

Part of Plate II (enlarged)

6′ 6″ in the wall panel. A general average would be about .28L which is larger than the .2L commonly assumed. The reason for this probably lies in the fact that the drop panels were larger than usual, being about .38L as against .33L found in common practice. It will be noted that in the wall panel the center-to-center distance between columns is smaller than elsewhere. The effect of the large drop panels is thus increased, causing the line of inflection to move toward the center of the span.

On the ceiling the distance from column center to line of inflection appears to be greater than on the floor. A horizontal thrust of some magnitude due to arch action existed in the slab, and was probably the cause of the difference. Assume for example, that at a certain section of a slab, a negative bending moment exists producing tension on the upper surface and compression on the lower surface. Any central thrust acting toward the support would decrease the tension in the upper surface of the slab thus bringing the line of inflection closer to the support. At the same time it would increase the compression at the lower surface, which would have the effect of moving the line of inflection there, farther from the support. It will be seen later that the line of action of the thrust was practically central in the region of contraflexure.

Tension in Concrete

The assumption that in a reinforced concrete beam the concrete takes no tension, is known to be erroneous. The same holds true for the flat slab. Under moderate loads a very large amount of the tensile resistance is undoubtedly furnished by the concrete. As the loading increases and the tensile deformations become greater than the extensibility of the concrete, rupture occurs at the surface. With the continued addition of load the rupture approaches nearer and nearer to the neutral surface, and owing to its shortened lever arm, the resultant of the tensile stress in the unbroken concrete supplies a resisting moment of diminishing magnitude. For this reason it is justifiable in design to neglect the part that the tensile resistance of the concrete may play. A casual inspection of the tabulated deformations on Plate III and stresses on Plates I and II, will make this point clear, for it will be noted that the deformations and stresses as recorded in column No. 2 are out of proportion to those appearing in column No. 1. The sudden increase with the change of load is probably due to the fact that rupture of the concrete occurred, throwing upon the reinforcement a larger proportion of the tension.

DEFORMATIONS IN 8″ GAUGE LENGTH

1 Unit = 1/5000″ $n = 12.76$
1 Unit = 750 #/□″ • Stress in Steel — E_s = 30,000,000
1 Unit = 58.75 #/□″ • Stress in Concrete — E_c = 2,350,000

PLATE III

The stress at which concrete ruptures is a variable quantity even in the same slab. In order to take account of it in the computations it was necessary to fix upon some arbitrary value. After an examination of the results of computations based on various assumed values of strength and a consideration of the tests on the control cylinders, this was finally placed at 200 pounds per square inch. It was assumed that unobserved stresses due to dead load are proportional to those produced by live load. If, for example, the dead load is 94 lbs. per sq. ft., the live load 125 lbs. per sq. ft. and the observed stress due to the latter in a specific instance is 115 lbs. per sq. in., the assumed unobserved stress due to dead load only is $\frac{94}{125}$ x 115 or 85 lbs. per sq. in. The total existing stress is therefore the sum of these or 200 lbs. per sq. in., the ultimate tensile value assumed as above. This condition would be produced by an actual tensile deformation of 3.4 divisions on the dial or by an indicated tensile deformation of 1.93 divisions.

Plates VI and VII have been prepared showing to scale the deformations at 17 pairs of gauge lines on the upper and lower surfaces of the slab between columns Nos. 19 and 21. The thickness of the slab, the amount of reinforcement present and its position are shown, as is also the loading which produced these deformations. A line joining the ordinates representing the respective deformations on the upper and lower surfaces, intersects the vertical plane of the section at the neutral axis in accordance with usual assumptions. On these diagrams interesting conditions are revealed. In any vertical series for example, the shifting of the neutral axis at the section due to changing load is shown. Again under constant load, the movement of the neutral axis and the variation in stress from section to section can be observed by following any horizontal series.

In many places particularly under the heavy loads, it will be noticed that the compressive deformations indicated appear to be excessive. This is observed at

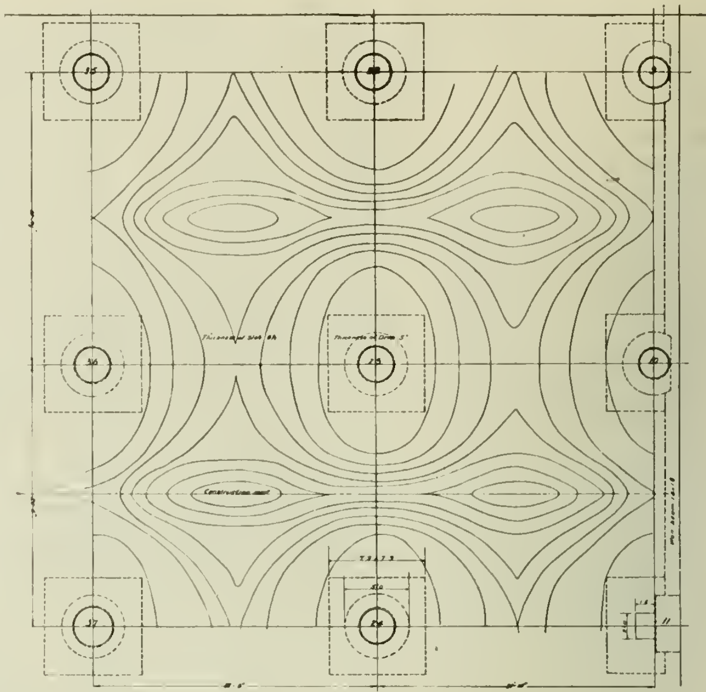

PLATE IV

pair No. 9 after the full load had been left in place for 3 days and indicates that the linear law had probably been exceeded. This assumption seems to be verified by pair No. 2 where under a live load of 250 lbs. per sq. ft. the indicated deformation in the concrete is 11.3 divisions while the computed deformation as figured from the corresponding steel deformation is but 9.7. In the reduction of the data however this has been ignored and the linear law assumed to be in operation. An analogous condition obtains at pair No. 5. These facts should be kept in mind in considering the question of thrusts along lines connecting columns.

As indicated above, at any point on the tensile side of a neutral surface where the scaled deformation exceeds 1.93 divisions concrete is assumed to have ruptured.

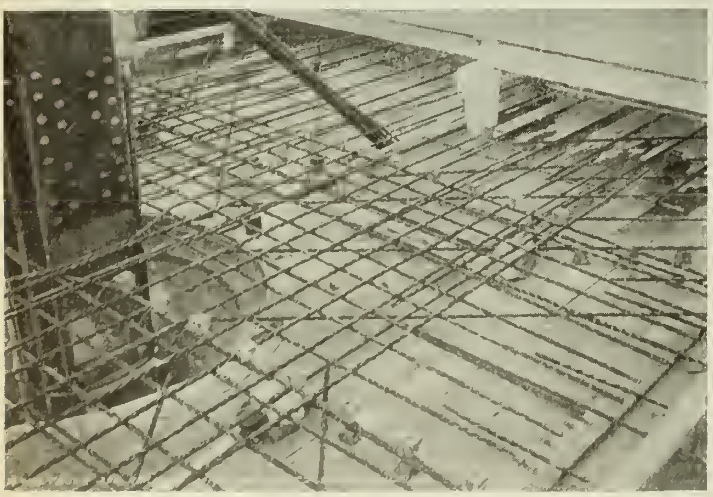

Fig. 4

Combined Bending Moments and Thrusts

Preliminary to a further examination of Plates VI, VII and IX a brief consideration will be given to the phenomena of thrust combined with bending. Assume a beam of solid section and of homogeneous material of cross-section 6″ x 6″ subjected to such an external action that stresses on two opposite faces of 300 lbs. per sq. in. in compression and 100 lbs. per sq. in. in tension exist, these stresses having been presumably observed with the aid of an extensometer. In accordance with usual assumptions, the average stress existing at the cross-section (and the actual stress at the Center of Gravity) is a compression of 100 lbs. per sq. in. and the consequent resultant thrust is 3600 pounds. Now the observed phenomena of stress in this instance may be due to:

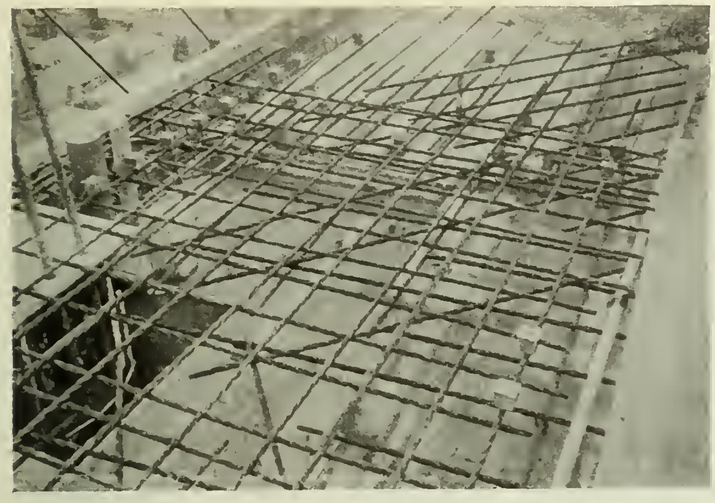

Fig. 5

(1) a central thrust of 3600 lbs., plus an external bending moment of 7200 in-lbs.; or (2) a thrust of 3600 lbs. acting with an eccentricity of 2 ins. toward the face which is known to be in compression.

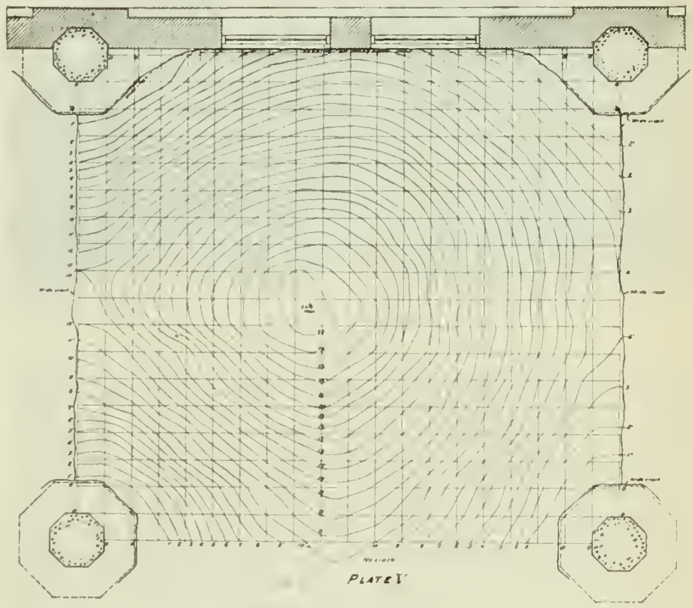
A little reflection will show that the external bending moment is a maximum when the eccentricity is zero, and is zero when the eccentricity is at its maximum of 2 inches, the thrust being constant. Indeed the two conditions above indicated are but the limits in an infinite series, the inch-pounds following being some of the intermediate steps:—(3) a thrust of 3600 lbs. whose eccentricity is 1 inch combined with a true external bending moment of 3600 inch-pounds; and (4) a thrust 3600 lbs. whose eccentricity is ½ inch combined with a true external bending moment of 5400 inch-pounds. The member, it will be seen, may act as a true column with eccentric oad or one of many combinations of true column and true beam; which of these the observer has perhaps no means of knowing. Of one thing, however, he may be sure and that is the magnitude of the thrust.

Fig. 6

Thrusts

In this test, much evidence as to the presence of thrust has been found, as an examination of Plates VI, VII and IX will show. In all instances where tension exists in the concrete at a section it is impossible to be certain as to the amount of the thrust. In such cases the values given are to be regarded as indications of what probably occurs. Where observation showed compression to exist in both faces of the slab, there is little doubt as to the extent of the thrust, except such as is due to the inevitable inaccuracies of the instrument which was employed.

The deformations indicated on Plates VI, VII and IX were converted into stresses in the usual way and the total tension and total compression for one foot width of slab found for each pair of gauge lines under the 125 lb.



load. In determing the amount of tension taken by concrete it was considered advisable to ignore all concrete nearer to the surface of the slab than the outer fibre of the tensile reinforcement because this concrete in all cases had been much cut up by gauge holes, and as before mentioned, only that concrete between the neutral axis and the point where its extension would indicate a stress of 200 lbs. per square inch due to dead and live load was considered. When the total tension at any one section was compared with the total compression at the same section, it was found that in every case the total compression exceeded the total tension, and the amount of this excess, for the 125 lb. load has been designated by the letter " H " on these diagrams.

With the span as an axis for ordinates, these thrusts have been plotted vertically in Plate VIII and the thrust curve drawn. The features of the curve are that the thrust apparently increases toward the column and diminishes toward midspan, and that the thrusts are generally less in the wall panel than in the interior one.

Fig. 7

thrust existing at each section was divided by the transformed area of the section, neglecting, as in the previous case, all concrete on the tension side of the slab more remote from the neutral surface than the outer fibre of the tensile reinforcement. This gave the average stress due to thrust from which was determined the corresponding deformation. Since the thrust was assumed as being applied at the center of gravity, the deformation would be uniform over all portions of the cross section.

On each section another deformation line was drawn, parallel to the original and at a distance from it equal to the deformation corresponding to the average stress due to thrust. Thus for each section a new neutral surface was located depending solely on the beam action existing. Values of k and j were then readily computed, and from the formula $M = \frac{e_c}{2} \times bd^2 \times k \times j \times 58.7$, the resisting moments in inch-pounds for a strip one foot in width were found for all sections, e_c being the maximum compressive deformation at the section in dial divisions. The constant 58.7 is the stress in the concrete corresponding to a reading of one division on the dial. Since, as may be seen from an inspection of Plates I and II, the stress at the edge of a band of reinforcement is practically the same as that at the centre of the band, the resisting moments for the one-foot strip above mentioned were multiplied by the half

This latter phenomenon is really not difficult to understand since the capacity of wall columns to resist thrust is obviously less than that of interior columns. Why the thrust should augment toward the column is, however, not so clear. Had the slab consisted of a series of radiating spoke-like elements, each independent of its neighbor except at the common hub-like drop panel, the increased radial compression toward the centre would be perhaps capable of explanation. But the independence of radiating elements in the slab cannot, by any reasonable effort of the imagination, be said to exist.

On the same drawing is shown an approximate line of thrust for the slab considered as an arch. It was constructed on the assumption that the slab behaved entirely as a continuous column without the existence of beam action as such. This is equivalent to assuming the existence of maximum eccentricity and that all bending is due thereto. With the thrust at each section known, its point of application was determined. These points were plotted in position on the cross-section of the slab and connected as shown.

Moments

For the derivation of bending moment coefficients it is better to consider that all the bending is due to beam action. This is equivalent to saying that the thrusts act at the centers of gravity of the various sections. Plates VI, VII and IX, were again made use of in the following manner to determine these coefficients. The

Fig. 8

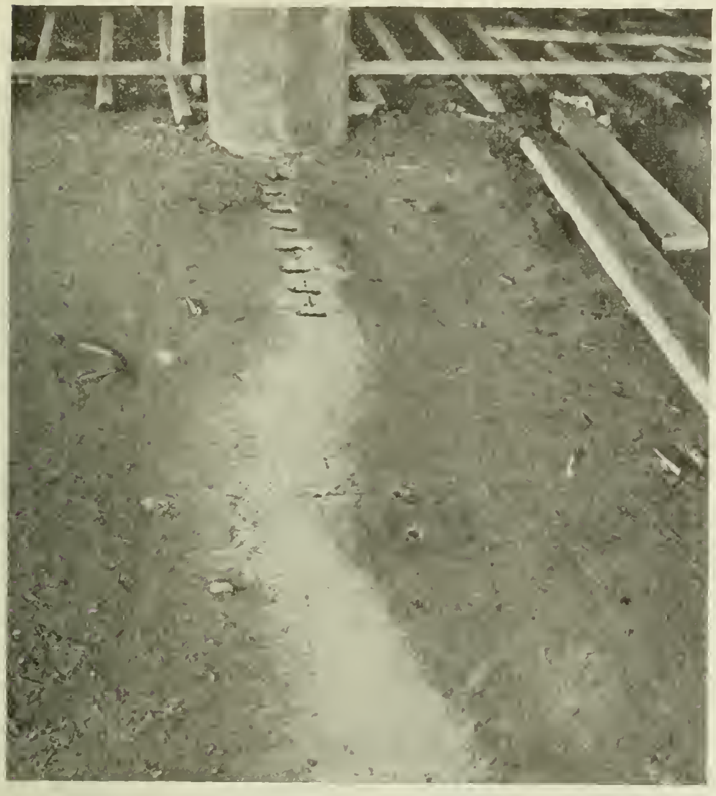


Fig. 9

panel width, to give the moments for the respective "strips" or "sections" of the various ordinances with which comparison was made.

Bending moments at the various sections are expressed in the Chicago ordinance as M = C W L, in which C is a constant depending upon the location of the section under consideration, W is the total panel load, and L the panel length. Given the values of M, W. & L, the coefficient C may be determined from the formula $C = \frac{M}{WL}$ For the interior panel under consideration WL = 125 (20.25 x 21) 20.66 x 12 = 13,170,000 in-lbs. For the wall panel WL = 125 (21.0 x 18.7) 19.9 x 12 = 11,720,000 in-lbs. or 125 (18.7 x 18.7) 18.7 x 12 = 9,820,000 in lbs. depending multiplication on whether the diagonal or the direct bend is under examination. The coefficients may, therefore, be found at any point by dividing the moment of a half panel strip by the proper value of WL. Plate X gives in compact form the computations for selected gauge lines, and also a comparison of the constants at the critical points with those prescribed in the various ordinances.

In the case of the rulings of the Joint Committee and the American Concrete Institute a more ready comparison was made by computing the moment for a strip one foot wide as determined by these rulings. The relation of the computed moments to the actual "M" for strips one foot wide given in Plate X may be seen at once. Where the Joint Committee ruling specifies that the sum of the moments in certain "sections" shall be not less than a certain quantity, such an addition has been made both for the required moment and the actual moment. The American Concrete Institute specifies a total moment for four "sections" and subdivides it into four parts, giving a minimum requirement for each of the four. The aggregate of these four comprises but 90% of the total specified moment, it being assumed that the remaining 10% will be distributed according to the judgment of the designer. Consequently the computed moments have been added and multiplied by $\frac{100}{90}$ for comparison with the sum of the actual moments. Without such an augmentation the American Concrete Institute moments appear small.

On the whole, the coefficients derived correspond very closely with those prescribed by the Chicago Building Ordinance and by the American Concrete Institute. At sections No. 1 and No. 17 the former being adjacent to an unloaded panel and the latter to the wall, the coefficients are almost identical and slightly lower than those prescribed by the Chicago ordinance. At sections No. 9 and 10, the coefficients are again almost identical, but in this case somewhat larger than those prescribed by the Chicago ordinance. Had the load extended indefinitely in all directions, the coefficients for sections No. 1 and 17 would probably have been larger, and those for sections 9 and 10 smaller. At midlength of the direct band in the interior panel, section No. 5, the coefficient is again somewhat larger than that prescribed by the Chicago ordinance, which is again due no doubt to the unloaded conditions of the adjoining panel. The influence of the large drop head on the short panel lengths between columns 20 and 21 may be seen in the fact that at section No. 14 the coefficient is considerably smaller than that required by the Chicago ordinance. In general the bending moment coefficients as determined from this test approximated very closely those prescribed by the City of Chicago.

As a practical suggestion for the consideration of thrust in design, it might be feasible to so modify the working stresses in concrete and steel by lowering the former and raising the latter so that these when corrected by the effect of the thrust would approach those values in reinforced concrete design which present practice favours.

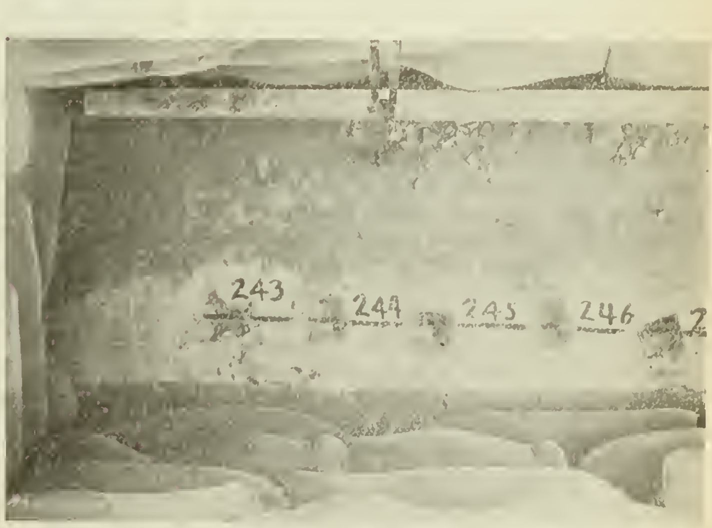

Fig. 10

To illustrate, consider a slab in which sufficient steel is imbedded to take care of tension in bending. Suppose a thrust of 7200 lbs. per square foot, acting centrally, is anticipated in the constructed slab. This will mean 50 lbs. per square inch compression in the concrete and 750 lbs. per square inch compression in the steel, over and above that which beam action would create. If then instead of stresses of say 750 lbs. per square inch in the concrete and 17,000 lbs. per sq. inch in the steel, which present practice seem to favour, values of 700 lbs. per sq. inch and 17,750 lbs. per sq. inch be adopted for flat slab design, the stresses resulting from the combination of bending and thrust in the finished structure in service would approximate more nearly those which the designer anticipated.

Bending Moments in Columns Under Eccentric Loadings

On Plate III will be found in addition to the deformations obtained on the gauge lines on the slab, those located on the wall and interior columns. It will be observed that for the interior column under an applied live load of 125 lbs. per sq. ft. the average deformations are 2.63 and 2.06 divisions for the lower and upper groups respectively. Similarly for an applied live load of 250 lbs. per sq. ft. these deformations become 4.98 and 5.53 divisions respectively. This column has an external diameter of 26 inches and contains a steel core consisting of a 14-inch, 138 lbs. per ft. Bethlehem H section with two 10″ x ½″ and two 10″ x ⅜″ steel web plates. In addition there are four 1″ diameter round steel rods.

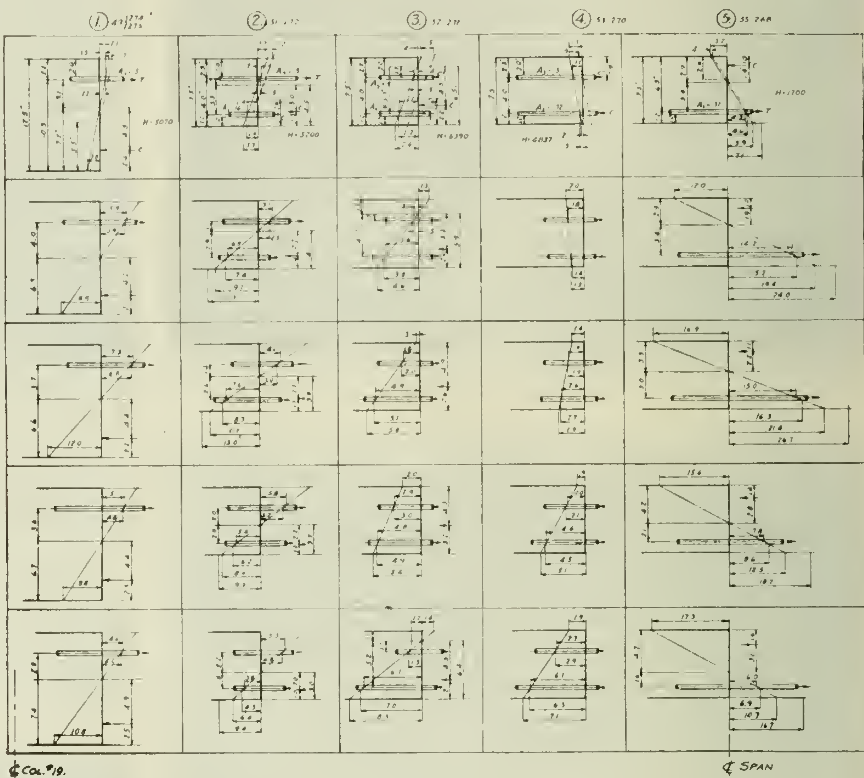

PLATE VI

In general the thrust would not affect the thickness of the slab at sections remote from the column, since at these points the percentage of steel is so low that the concrete stresses are quite small, as is verified by the tabulated values. Around the column capital and near the periphery of the drop head on the under surface of the slab, the compression due to beam action will be considerably augmented. That this is not a mere assumption, but an actual fact, is shown by the comparatively high stresses recorded under the heavier loadings. There has been a tendency on the part of some to lower unduly the bending moments and increase the allowable stresses in flat slab design. While this may be satisfactory on sections remote from the columns, great care should be exercised in formulating regulations governing the depth and width of drop panels in order that compressive stresses due to negative moment and thrust may not run too high.

The total area of steel is, therefore, 61.2 square inches, giving a net area of concrete of 469.7 square inches. Assuming an elastic modulus for concrete of 2,350,000 lbs. per sq. in. the load producing a dial reading of one division is 469.7 x 58.7 or 27,500 lbs. for the concrete; and 61.2 x 750 or 45,700 lbs. for the steel core, making a total of 73,200 lbs. in accordance with the usually accepted theory for the longitudinally reinforced concrete column. The roof slab having been poured during the interval which elapsed between the taking of the initial readings and observing the deformation after the application of the 125 lb. load, its weight must properly be added to the latter. This gives an aggregate load of 200 lbs. per sq. ft. or 82,000 lbs. per panel. The dial reading corresponding to this panel load computed as above should be $\frac{82,000}{73,200} \times 1$ or 1.12 divisions. But the actual deformation corresponding to this load was, as stated above, 2.63 divisions in one case and 2.06 in the other, values approximately twice as great as those computed on a theoretical basis. When, however, the 250 lbs. per sq. ft. was removed from two of the four panels (equivalent to removing 125 lbs. per sq. ft. from four panels) the average recovery on the lower series of gauge lines was .875 divisions as against the .70 divisions arrived at from computation. This is the only instance in the behaviour of this column in which approximate agreement between the observed and the figured deformations occurs. A study of the recorded behaviour for wall column No. 21 shows a similar discrepancy between computed and observed deformations to exist.

Let it be assumed that the uniformly distributed load on any interior panel is lifted. The tangent to the beam axis over either support adjacent to the unloaded panel is no longer horizontal, but the angle of movement is less than it would be were there neither continuity of beam nor rigidity of column to influence the performance. (In that case the bending moment at either support would be zero). Actually this moment is greater than zero, but less than 1/12 WL and the restraint supplied by the column plus that afforded by the beam sustaining its dead load only is obviously its equivalent. So it follows that at a panel point for the conditions laid down, the sum of the restraining moments in beam and support will not exceed 1/12 WL and may be much less than this value.

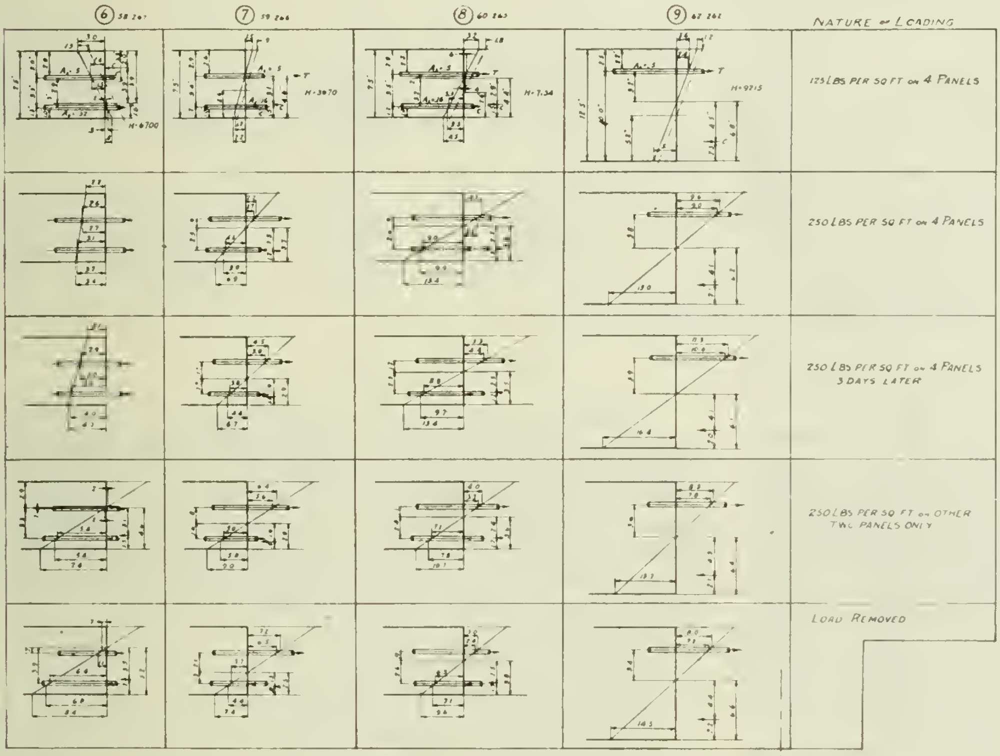

PLATE VI

Consider an indefinitely large series of equal and continuous beams, spans all equally and uniformly loaded and similarly constructed. The moments over supports and at midspans approach as limits, 1/12 WL and 1/24 WL respectively, giving a sum of negative and positive elements of 1/8 WL as its limit. This state of affairs would result if all supports were knife edges or the equivalent thereof. It will also be clear that by special or supplementary additions to the loading assumed, the coefficient 1/24 may be increased by diminishing 1/12 to a smaller value and may be decreased by raising 1/12 to a greater value. If in place of rockerlike supports, columns more or less rigid be substituted, the same statement will hold and moments will remain unchanged, because all tangents to the floor axis are horizontal over supports.

This hypothetical condition is doubtless almost never realized, since there is rarely either equality in rigidities or equality between story height and beam span. Moreover, in the flat slab type of construction the comparison is further affected by the fact that the beam is supplanted by a slab whose width is equal to the distance between column centres. It can be shown that the moment at the support in a cantilever of uniform section sustaining an end load varies directly as $\frac{E\,I\,\triangle}{L^2}$, where $\triangle$ is the end deflection. Since $\triangle$ is proportional to the product L $\ominus$, $\ominus$ being the angle of elastic deformation at the junction of column and beam, it follows that the moment of resistance is proportional to $\frac{1}{L}$ where E and $\ominus$ are constants for the three elements previously considered.

A computation, made with this principle in mind, shows that for a flat slab of the proportions of the one tested, the column even if unreinforced could not exceed 20″ in diameter without having a greater value of $\frac{1}{L}$ than the slab; and a 20″ column is the minimum allowable under good practice for the given panel dimensions. This would indicate that column No. 20, owing to its size and high percentage of reinforcement, was restraining the larger portion of the bending moment created by the unsymmetrical load, possibly 12/13 of the whole, half of it above and half of it below the floor line. The lower group of gauge lines on column No. 20 was located above the theoretical line of column contra-flexure, a distance equal to one third the distance of the latter from the ceiling and should, therefore, indicate about one third the bending moment in the column at the ceiling line.

Consider now a column of any constant section fixed at the end as in Fig. 11. If a couple M whose plane is vertical, be applied at mid-height, the axis of the column will assume a sinuous form with three points of contra-flexure, one of which is located 1/6 of the column height below the top, the second of which is 1/6 of the column height above the bottom, and the third at the point where the couple is applied. Further consideration will show that the bending moments in the column immediately below and immediately above the point of application of the couple are $\frac{M}{2}$ and $\frac{M}{2}$. Similarly the bending moments at top and bottom are $\frac{M}{4}$ and $-\frac{M}{4}$ respectively. Let now another restraining element, a beam for example be framed at the point of application of the couple and in the plane thereof. This element will be supposed to have a length equal to half the column length. Its rigidity for purposes of discussion will be considered equal to that of the half column and its remote end will be considered fixed. It will be clear that since there are now three restraining elements to oppose the couple M, each will contribute something to the resistance and from the conditions assumed, the contributions of all will be equal.

If instead of the combination described above, there is a series of columns rigidly connected by beams on any floor of a building, the analogy between the hypothetical and the real will be apparent. Let it be imagined that one beam only in the supposed series is loaded. Its ends are obviously restrained more or less where they join the columns and the moment existing at either end will be resisted by three elements, viz.: the column above the floor in question, the column below and the beam in the adjacent panel. If all of these possess equal rigidities, using the word in its broad sense, the restraining moments in all three will be equal. If, for example, the bending moment at one extremity of the loaded beam were $\frac{1}{20}$ WL the restraining moment in the column above the floor at the floor line, the restraining moment in the column below the floor at the ceiling line, and the restraining moment in the unloaded beam at its junction with the column might without great error, be taken as $\frac{WL}{60}$.

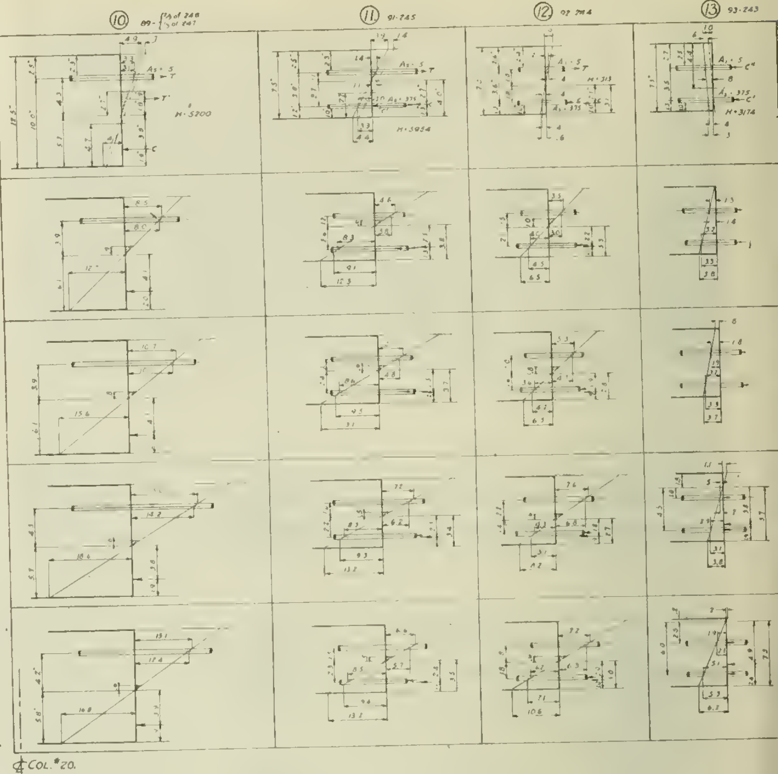

PLATE VII

When an attempt was made to check the behaviour of column No. 20 somewhat according to the foregoing, serious difficulties presented themselves as will be presently indicated. Assuming that the concrete had remained intact, it seemed proper to consider its behaviour in flexure by first computing the moment of inertia of its cross-section. This was done by the usual method for heterogeneous sections with the following results.

Moment of inertia of steel area........23,200 ins.^{4}
Moment of inertia of concrete area....18,700 ins.^{4}
Moment of intertia of entire area......41,900 ins.^{4}

On Fig. 12 will be seen a curve purporting to show how the bending strains appear to have varied across a right section of this column on the removal of a load of 250 lbs. per sq. ft. from two of the four contributing panels. This change of loading it will be remembered is the one that produced an average deformation approaching somewhat the computed value. The maximum flexural deformation shown on this graph is 4 divisions, the equivalent of a stress of 232 lbs. per sq. in. in the concrete. The average deformation due to the indicated change in loading, as distinct from bending, is .875 divisions. The bending moment computed from the formula M = S f, is 757,000 inch-pounds of which 337,000 inch-pounds is resisted by the concrete and 420,000 by the metal. Moreover since the position of the gauge lines on the column is one-third of the distance between the theoretical point of contra-flexure and the plane of the floor slab above, the computed maximum bending moment for the column would be three times the value given or 2,271,000 inch pounds and this takes no account of the nearly equivalent resistance offered by the column above the floor. The Chicago

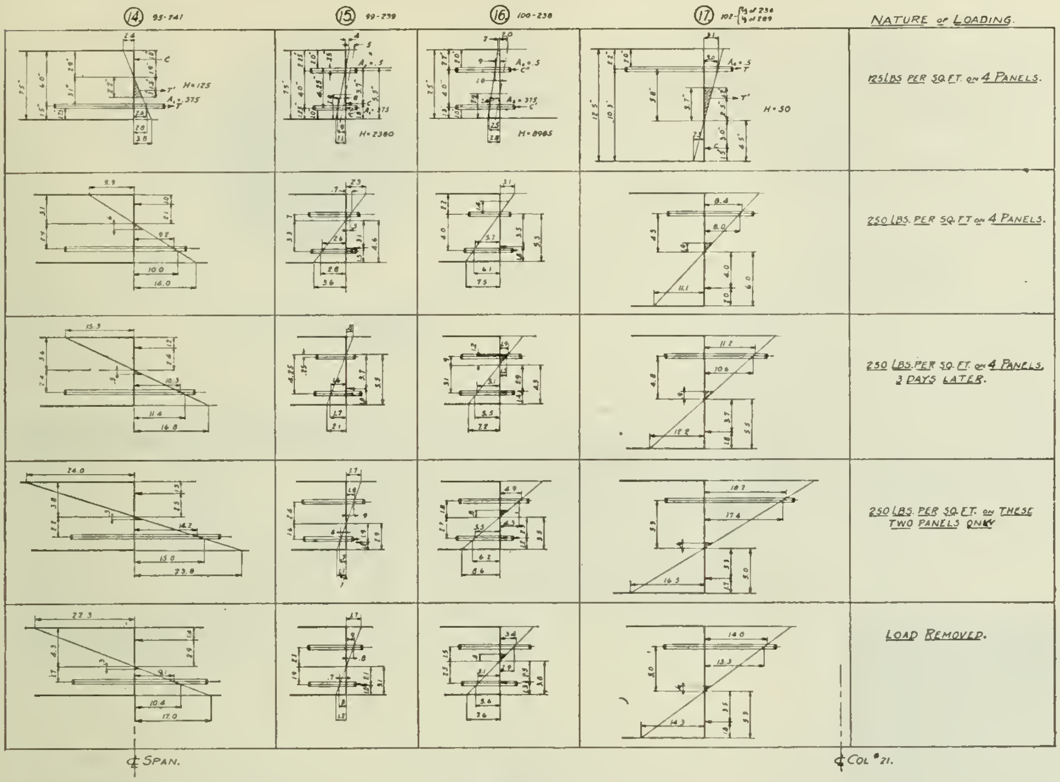

PLATE VII

flat slab code suggests $\frac{WL}{30}$ as a bending moment to be provided for in column design. For the case in hand this would be equal to 438,000 inch-pounds. Apparently then the steel core itself has provided a resistance to bending much greater than is called for by this regulation and the whole column is supplying one many times in excess of the same requirement and much greater than what seems to be indicated by theory. At the upper series of gauge lines on the same column, a similar state exists. In addition it should be borne in mind that the gauge lines in this series bridged a construction joint and that little if any tension in the concrete could exist there.

The features then of the column tests is the lack of agreement between the evidence of the extensometer and the facts as they are known. This applies to both the direct stress and the bending phenomena. As possible explanations the shrinkage of the concrete, the existence of unrecorded loads and the inaccuracy of the instrument have suggested themselves.

F. R. McMillan, in a discussion on the phenomenon of "flow" in concrete under load in Transactions of the American Concrete Institute, 1917, exhibited a graph showing the behaviour of concrete columns under load, in which the relative deformation or "flow" at 60 days following construction, varied from 1 in 10,000 to 2 in 10,000. Moreover this deformation seemed to be more or less proportional to the age of the member up to a six months' limit. Mr. Considere asserts that the shrinkage of mortars in air will vary from 3 in 10,000 to 5 in 10,000, although no time interval is given. So far as the evidence of the extensometer is concerned, it would seem that "flow" and shrinkage would be similar.

If shrinkage be restrained by the presence of a metal core (the non-shrinking element) the envelop of concrete will be in tension and the core in compression. This, of course, assumes that a perfect bond between the two materials exists. In addition to this the core will have to sustain the major portion of the applied load. If the restraint be equal to 1 in 20,000, it would account for a tension in the concrete envelope of nearly 120 lbs. per sq. in. and the resulting and, in the aggregate, equal compression thrown into the steel would be sufficient to account for some of the excessive deformation previously referred to. On the removal of the 250 lbs. per sq. ft. load from two

$M = \frac{1}{2} \cdot bd^2 \cdot j \cdot k \cdot \epsilon E$

ϵ being compressive deformation due to bending

* depends on relative rigidity of slab and wall col.

† Taken but once [illegible]

PLATE X

of the four panels, it might with some show of reason be assumed that because of the greater age of the concrete and the diminished loading the tendency to shrink would partially disappear. This assumption receives color from the fact that the mean changes in deformation observed agree roughly with the computed value as stated previously, the former being .875 and 1.1. divisions for the lower and upper series respectively and the latter .70.

Another circumstance which would operate to produce a discrepancy between the observed and the computed readings, was the fact that during the test the material required for the brick curtain walls was being elevated to the floors where it was to be used. The practice was to pile it on the floor adjacent to the hoist until such time as the workmen would require it. As the hoist was located in the panel immediately to the West of those under test, it is conceivable that some of the material which had been hoisted was placed on floor area above and tributary to column 20, and that its presence there was evidenced in the large readings obtained. This circumstance is one, the influence of which cannot be estimated in any quantitative way. Even though this additional loading on the upper floors were present, it will be conceded that it would operate almost entirely as a centric load on the column and that all manifestations of eccentricity in the column and of bending therein could not properly be attributed thereto.

Finally it might be suggested that the element of error in observation is much greater here than elsewhere because of the cramped position of the observer and because the axis of the instrument must be held vertically.

The writers do not believe that shrinkage of concrete about the steel core would create therein such compressive
